As an aside, I think HP missed an opportunity of not incorporating the scientific functions into the HP 17BII. Although this is a business calculator, it would have being trivial to include the addition functions. Such a calculator would have being an ideal replacement for the HP 27S and would have included the option of RPN.

L, G, and some trig functions

*Message #4 Posted by **Eddie Shore** on 11 Jan 2005, 11:23 p.m.,*
in response to message #3 by Nick Nicholas

Agree. SIN, COS, TAN, and others (LN, EXP, ASIN, ACOS, ATAN, GAMMA) should be part of EVERY calculator beyond the four-function calculator. However, try this:

sin x = sum((-1)^(n)*x^(2n+1)/(2n+1)!,n,0,t)

t = an upper limit of your desire. The higher t is, the more accurate, but increases the calculation time. I would use 50 to 200 terms to get machine accuracy. (It's been a while since I worked on the 17BII+, but that is what I used)

cos x = sum((-1)^n*x^(2n)/(2n)!,n,0,t)

t = number of terms

I used the tan x = sin x/cos x property... so I had to calcuate sin then cos, then use the division key.

The format was If(S(SIN),sine,cosine) [if memory serves me correctly]

** Power series - pg. 879: Britton, Jack R. et al. Calculus and Analytic Geometry W.H. Freeman & Company: 1966

For the Gamma Function (more like an approximation), check out the R/S Key Website (rskey.org) for a great article on the Gamma function

Re: L() and G() unsupported on NEW HP17BII+ (Long)

*Message #5 Posted by **John** on 11 Jan 2005, 11:37 p.m.,*
in response to message #3 by Nick Nicholas

They ARE undocumented on the 17bII+.

If you can point to a document from HP where they acknowledge these functions being present in the 17bII+ then you may have a point.

Re: L() and G() unsupported on NEW HP17BII+ (Long)

*Message #6 Posted by **Nick Nicholas** on 12 Jan 2005, 3:14 p.m.,*
in response to message #5 by John

They ARE documented on pages 169 and 170 of the HP 17BII+ manual, second edition, downloaded from HP's website.

Someone should point that out to HP if told that undocumented features are not supported.

Unfortunately, the manual does not provide examples of the use of these features so the Technical Applications manual is still required.

It's strange that these features were available in the HP 17BII but not documented but not vise versa.

HP web pages gives you "How to use" the hp 17bII+
"Calculating Skipped Payments" uses L() and G()
Also "Calculating the Mortgage-Equity Analysis"
and "Preliminary Qualification of a Buyer"
The manual v2 on the web shows an example on page 170

in response to message #9 by Veli-Pekka Nousiainen

Terve Veli-Pekka!

Back in the old days, when the 19b and 17b were in production, there was such a manual, which covered a wide range of really useful stuff--including complete documentation of the Let and Get functions. It can be found out in cyberspace; I just cannot remember where.

Best regards,

Bill Platt

The "Technical solutions" maual for the 19bII and 17bII is on Dave Hicks' CD manual set

*Message #11 Posted by **Gene** on 21 Jan 2005, 10:11 a.m.,*
in response to message #10 by bill platt

Buy a copy of the great CD set (or DVD) from Dave and you'll have that useful manual (and much more).

Gene

*Message #12 Posted by **George** on 11 Jan 2005, 9:53 p.m.,*
in response to message #1 by Bob Wang

L and G functions are now documented in the manual. The problem is that it would not return the results we are expected as before. Now will HP honor replacement for the 'replaced/2nd unit' when the warranty of the 1st unit has expired?

I had my unit replaced and am facing the same problem as Bob. My unit was purchased in Hong Kong where consumer protection is almost none and I just wonder whether the local agent will entertain my 2nd replacement request.

Returning to the solver problem, I am no expert in writing it. I am just thinking if it is only the first part that is not evaluated and the pattern is fixed, can we adapt it to modify the BS formula?

Re: L() and G() unsupported on NEW HP17BII+ (Long)

*Message #13 Posted by **Eddie Shore** on 11 Jan 2005, 11:08 p.m.,*
in response to message #1 by Bob Wang

First of all, what terrible service. I feel bad for you having to go through that for nothing.

I have not obtained a replacement since I wanted to wait for the Let and Get, and I am right to do that.

Maybe I'll consider getting the new 19 (if it comes out) as to add to my collection.

Re: L() and G() unsupported on NEW HP17BII+ (Long)

*Message #14 Posted by **Scuba Diver** on 12 Jan 2005, 6:34 p.m.,*
in response to message #13 by Eddie Shore

Other than L() and G(), were there any other differences noted? Are they keyboards similar (quality-wise)?

I also wonder if they deactivated something that they describe as a "feature" that I found incredibly annoying. I have found on a few occasions that I cannot turn my 17BII+ on. According to HP, this "feature" keeps the batteries from wearing out. If the calculator senses that the "ON" button is held down for too long a period, it shuts off and will not turn back on until you perform a reset (kiss all of your formulas good-bye!)

B.

49g+ comma in display

*Message #1 Posted by **Joe** on 11 Jan 2005, 8:51 a.m.*

I recenty purchased an HP49g+. Is there any way to set the display so that a comma seperates the thousands, millions, etc.? (I'm not talking about the comma replacing the decimal point.) The comma seems to be included in other HP calculators, surely there is a way to set it on the 49g+.

Thanks, Joe

Re: 49g+ comma in display

*Message #2 Posted by **Karl-Ludwig Butte** on 11 Jan 2005, 10:50 a.m.,*
in response to message #1 by Joe

Hello,

try MODE then check _FM with F2. Although I looked this up with a 49g and not a 49g+ it should be the same.

FM = Fraction Mark

*Message #3 Posted by **Eddie Shore** on 11 Jan 2005, 11:01 p.m.,*
in response to message #2 by Karl-Ludwig Butte

So European Fraction Mark is noted (Checked): 12,38

As opposed to American Fraction Mark (Unchecked): 12.38

Re: FM = Fraction Mark

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 12 Jan 2005, 2:21 a.m.,*
in response to message #3 by Eddie Shore

Hi, Eddie;

In Brazil we follow the European "comma" fraction mark with "dot" as thousands separators.

I remember reading (in HP manuals) that some European countries use comma as fraction mark. Is there any (e-)reference where one could read about this? I'm curious, now.

Thanks.

Luiz (Brazil)

Edited: 12 Jan 2005, 2:22 a.m.

Re: FM = Fraction Mark

*Message #5 Posted by **Eddie Shore** on 13 Jan 2005, 1:04 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

This page lists a short history of the "decimal mark" plus all the countries that use the decimal point as apposed to the comma:

http://en.wikipedia.org/wiki/Decimal_point

I'd bet it gets confusing in Canada, since both formats are used in that country.

Fraction Mark; thanks, Eddie! (NT)

Production Dates

*Message #1 Posted by **Walter B** on 10 Jan 2005, 6:16 p.m.*

According to hpmuseum, HP 48 S & SX were produced from 1990 to 1993. According to Matthias Wehrli, HP 48 G & GX went into production in 1996. So, HP did not produce any calculator of type 48 in 1994 & 1995 ?? I can't believe it - does anyone of the experts here know what is right?

Re: Production Dates

*Message #2 Posted by **Matthias** on 10 Jan 2005, 6:30 p.m.,*
in response to message #1 by Walter B

Hi Walter

I can tell you what is right... Certainly it was my fault, the introduction of the G/GX was in 1993 and not in 1996. As we all know there are units with serial codes that will proove that. So, thanks Walter for this bug, I just corrected it (as I still wants you keep you up-to-date). Service.

Matthias

HP 01 calc/ watch setup

*Message #1 Posted by **Sam** on 10 Jan 2005, 4:17 p.m.*

I just acquired an HP calculator/watch. I need to set the time and date.

Also, does any one have a copy of the quick reference guide?

Thanks

Sam

Re: HP 01 calc/ watch setup

*Message #2 Posted by **David Ramsey** on 10 Jan 2005, 8:04 p.m.,*
in response to message #1 by Sam

Setting the time and date is amazingly easy.

To set the time: enter

hh:mm:ss, them press the "p" key (rightmost key, third row) if PM. Press the delta key (middle key, bottom row), then press "T" to set the time.

To set the date: enter

dd/mm/yyyy

...then press delta-D.

in response to message #1 by Jon

```
Dear Jon,
I'm using a 25 to 9 pins adapter ;o)
but the RS232c signal lines supported in the HP82164A are the following ones :
PIN     SIGNAL  DIRECTION (HP82164-device)
2       TD              ->
3       RD              <-
4       RTS             ->
5       CTS             <-
6       DSR             <-
7       SG              <->
8       DCD             <-
20      DTR             ->
```

http://membres.lycos.fr/emmanuelcompes/xtra/dte.jpg

http://membres.lycos.fr/emmanuelcompes/xtra/dce.jpg

```
On the device, replace the 25 pin config' by the 9 pin :
25 pins 2   3   4   5   6   7   8   20
9 pins  3   2   7   8   6   5   1   4
Yours.
Emmanuel
```

HP 32s & 48gx

*Message #1 Posted by **Monty Hall** on 8 Jan 2005, 9:17 p.m.*

I'm going back to school to get a masters and was going dig up my old 48gx or my 32s. Instead of unpacking my storage shed, I was entertaining getting one of these calcs used on ebay. The prices are much higher than expected....

I was expecting to get the calcs for ~$10 bucks. Why are they so expensive? Heck, I can buy a new 48gii for $110 where a 48gx is going for $130+ on ebay. Something isn't adding up.

Since the "price wasn't right", you don't want to "make a deal" on eBay. [er, sorry, (ahem) ...]

Although older and with fewer features, HP's calculators from the 1980's are better in design, engineering, and construction than today's outsourced models. This explains the enduring demand for the best RPN and RPL models, which, by the way, inlcudes the even-older 11C, 15C, and 41CX among others.

I don;t believe that the new 48Gii has the two ports for plug-in cards, as the 48GX had. Neither does the new 49G+, to my recollection.

"I don;t believe that the new 48Gii has the two ports for plug-in cards, as the 48GX had. Neither does the new 49G+, to my recollection."

No, the 49g+ has a slot for SD cards. These are industry standard Flash Memory devices, ranging from 16MB up to a gigabyte. You can buy a 32MB SD card for about ten dollars or so.

Given the choice between a 49gii and 49g+, I'd choose the 49. Its faster, has a much better screen, and more memory. The gii can not be upgraded.

Re: HP 32s & 48gx

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 9 Jan 2005, 1:03 p.m.,*
in response to message #3 by .

Hi;

I own an HP49G+ with a 256MB SD card. It's something to try out prior to copare, as 'dot' mentions. I read once here that the fixed user memory (RAM) in the HP48GII is smaller than the one available in the HP48G+ (less than 100KBytes?). Should it be because of the new features, like resident CAS in the HP48GII?

Luiz (Brazil)

"No"? What I really had in mind was the ROM application cards that the old 48GX would accept. (Of course, RAM cards were also available.) Can the 49G+ accept those same ROM cards? If not, that might explain why the 48GX retains its value.

Re: HP 32s & 48gx

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 9 Jan 2005, 7:27 p.m.,*
in response to message #5 by Karl Schneider

Hi, Karl;

the only "extension" slot available in the HP49G+ is the SD-compatible. No previous ROM card available for the HP48GX can be used (there is no extra slot at all). The "advantage" is the HP49+ IR input/output, not available in the HP49G.

Cheers.

Luiz (Brazil)

Hi,

> ROM cards? If not, that might explain
> why the 48GX retains its value
>
That may be one reason.
Another one is that the HP-48 has a real keyboard, of course.
You know, with the right layout and the ENTER bar,
and with a reliable key action.
The third one could be the cheaper hard- & software
of the 'successors' of the HP-48.
Don't forget that it took more than two years after market
introducing of the 49g to get the OS somewhat stable...

Raymond

I don't understand why supporting ROM card would be an advantage.

The old cards from the HP48gx/sx cards are very, very expensive. The software probably wouldn't work anyway. Many entry points have moved. And what % of people these days would have use for such an old card?

If you wanted new ROM cards, how would that work? As far as I know there is no standard form factor for ROM cards. It is much more expensive anyway, compared to simply storing the software in the onboard flash. And what companies today would even make software to put on cards?

.

Re: HP 32s & 48gx

*Message #9 Posted by **Jeff O.** on 9 Jan 2005, 12:43 a.m.,*
in response to message #1 by Monty Hall

The 48 series had a large, loyal following. This following does not feel that current HP products are up to the standards of the earlier models. The only source for the old models is eBay, or at least eBay sets the price for knowledgeable sellers. So the price has risen to what the market will bear. Even earlier models are of course now collected, so their value is set as such, rather than as useless old garage sale junk.
It will obviously worth your while to dig through your storage shed.

Re: HP 32s & 48gx

*Message #10 Posted by **Norris** on 9 Jan 2005, 12:56 a.m.,*
in response to message #1 by Monty Hall

"HP" brand calculators are now developed and manufactured by Kinpo, a Taiwanese company. There is a widespread perception that the design, manufacturing quality, and documentation of current models is inferior

to that of older models. Since it is no longer possible to buy new calculators with traditional HP quality and attention to detail, older models have become quite valuable.

The bottom line is that many people (especially on this forum) feel that the 32S is a better calculator than today's 33S, and that the 48GX is a better calculator than today's 48GII. In general, the new calculators are clearly superior in some respects (e.g. faster, more memory), but they are also distinctly worse in other respects (e.g. inferior keyboards, poor keyboard layout, overall ugliness, bugs).

Now's The Time To Try A TI89

*Message #11 Posted by **J.C. Randerson** on 9 Jan 2005, 8:42 a.m.,*
in response to message #1 by Monty Hall

Dig out your old machines, put your brand on them, and guard them with vigilance, they're not easily replaced, as you've discovered.

The current output of HP calcs are junk. I've been through 3 defective HP49+s. As they say, third time's the charm.

If you can't find your old machines, buy a TI89. The performance, fit and finish is superior to anything HP is producing. Specifically, the computer algebra system of the 89 is outstanding. Also, programming the 89 is quite easy, once you make the switch from thinking in RPL to Basic.

Re: Now's The Time To Try A TI89

*Message #12 Posted by **Bill Wiese** on 10 Jan 2005, 1:00 p.m.,*
in response to message #11 by J.C. Randerson

Hi JC...

I don't have much of an issue with programming in BASIC vs. HP keystroke programming. I've programmed various pocket computers years ago (Casio-derived ones sold by Radio Snack) and programming was easy, though I wish extra functions were included.

While I love HP41s, I'd've been perfectly happy if its programming language were BASIC (i.e, an HP71B in a 41C shell). BASIC's string handline is quite good for quick & dirty work.

I just want RPN - with LastX, RUp and RDn - and a large ENTER key above the keyboard (except for 'landscape' calcs like 11C/12C/15C/16C) for direct-mode use.

The latest TIs seem to have fair keyboards and readable displays. They're easy to hack apparently (Z80-based) - if their case/shell could be adapted to a large ENTER key and firmware updated to allow direct RPN usage, I'd be very happy.

Bill Wiese San Jose

Re: Now's The Time To Try A TI89 and then sell it

*Message #13 Posted by **Veli-Pekka Nousiainen** on 13 Jan 2005, 7:51 a.m.,*
in response to message #11 by J.C. Randerson

The new Titanic is as slow as the older TI
The new OS is not as compatible as it should be
The keys are still mushy and generally worse then any HP
The keyboard layout & ALPHA keyboard usage is not on the 49 series level.

Even Steen now reports in the comp.sys.hp48
that he has now a perfect keyboard in his latest 49g+.
If you don't 1st succeed then try, try again.

Re: HP 32s & 48gx

*Message #14 Posted by **Monty Hall** on 9 Jan 2005, 1:58 p.m.,*
in response to message #1 by Monty Hall

All,

I haven't been paying attention to the HP scene since school ~8 years ago. After looking @ the new HP calcs, I would have to agree - not fond of the new calcs. When I graduated and entered the workforce, I used my PC for all calcs (I was a mathcad & mathematica head in school) and my calculators collected dust.

Started w/ a 48s until it broke, purchased a used 48GX until I lost it, then purchased a 32s, found my 48GX and recieved a 48G as an award(pristine).

Toss up between the 32 and 48. Form factor, simplicity, basic 4 + function calculations(99% of what I used it for) the 32s is pretty darn nice. Unit conversions, matricies w/ inv, phasor math, timing, alarm, some equation solving & symbolics, of course the 48G is the winner.

Since I really only used 4-10 functions a majority of the time, the 48 was underutilitized. I will have to admit, I really liked being able to see the stack on the 48. I sometimes wished the 32 had a few more lines. Regardless, it seems HP doesn't make 'em like they used to.

Re: HP 32s & 48gx

*Message #15 Posted by **Norris** on 9 Jan 2005, 5:14 p.m.,*
in response to message #14 by Monty Hall

<< Regardless, it seems HP doesn't make 'em like they used to. >>

Yes, that's the issue in a nutshell. Older HP calculators have a reputation for rock-solid reliability and durability. The newer ones don't.

. . . all correct, but consider giving the 33s a try.

*Message #16 Posted by **Paul Brogger** on 10 Jan 2005, 11:58 a.m.,*
in response to message #14 by Monty Hall

I won't argue -- "they ain't what they used to be."

That said, the 33s is a mighty fun little toy, with what I believe is the simplest-ever programmer's user interface, essentially unlimited program memory (the real limitation is the 32 data registers), a two-line display, and a convenient size.

Sure, the size could have been smaller, the keyboard layout more rational, the enter key wider and the decimal point (more) legible.

Despite what may initially appear to be overwhelming drawbacks, it can be (for some people, at least) a very usable -- even enjoyable -- device.

Re: . . . all correct, but consider giving the 33s a try.
*Message #17 Posted by **Dave** on 10 Jan 2005, 6:27 p.m.,*
in response to message #16 by Paul Brogger

I agree, the 33S works fine, the keys are excellent and it is an easy calc to pick up and use.

Re: . . . all correct, but consider giving the 33s a try.
*Message #18 Posted by **Ed Look** on 10 Jan 2005, 9:54 p.m.,*
in response to message #16 by Paul Brogger

Paul, I totally agree about the 33S; I enjoy using it nowadays. In fact, unless I have to use my mini databases or memory hogging preprogrammed functions during the work day, I reach for my 33S.

Re: . . . all correct, but consider giving the 33s a try.
*Message #19 Posted by **Bill Wiese** on 11 Jan 2005, 2:34 p.m.,*
in response to message #18 by Ed Look

I have a 33S and it is just "OK". I bought it to play with, not to use.

I really wish the display had more contrast - there's $5 calcs with brighter displays! And decimal point visibilty is terrible.

And, of course, the chevron keyboard and small, inappropriately placed ENTER key mean it's not a "real" HP.

Re: . . . all correct, but consider giving the 33s a try.
*Message #20 Posted by **Dave** on 11 Jan 2005, 7:28 p.m.,*
in response to message #19 by Bill Wiese

You know a real HP has:

RPN (or RPL) Positive Tactile key feedback

Yes the display on the 33S could be improved, but get over the chevron shape & Enter key location. The key layout is fine and if you want to relocate the Enter key to any other spot it is trivial to implement.

Re: . . . all correct, but consider giving the 33s a try.
*Message #21 Posted by **Wayne Brown** on 12 Jan 2005, 12:43 p.m.,*
in response to message #20 by Dave

> Quote:
>
> ...get over the chevron shape & Enter key location. The key layout is fine...

The chevron keyboard layout is *not* "fine," it's an abomination. With that keyboard, and without a double-sized, centrally-located **ENTER** key it doesn't *look* like a traditional Hewlett-Packard calculator, and that, for me, makes any other so-called features irrelevant. I will not pay one cent for an embarassment that I have to try to "get over" every time I look

at it.

Re: . . . all correct, but consider giving the 33s a try.

*Message #22 Posted by **Dave** on 12 Jan 2005, 5:25 p.m.,*
in response to message #21 by Wayne Brown

You know, no company wants or needs your red cent. You wouldn't be happy no matter what came about. Somehow you seem to think you are the only customer out there.

*Message #23 Posted by **Veli-Pekka Nousiainen** on 13 Jan 2005, 7:55 a.m.,*
in response to message #22 by Dave

I agree with you both
Yes, the 33s is in many ways better than the old model
No, it does not look like the old one:
The [ENTER] is small and in the corner
BUT
The chevron keyboard is more ergonomic for "thumbing"
Opinions?

in response to message #23 by Veli-Pekka Nousiainen

After reading not to bad news I tought I have to have a 33s to, so I bought one and I'm rather happy with it. No doubt the old ones and the 12C still is our loved calc but 33s isn't bad at all but ...

In US the thing cost 49$ and I had to pay (and did several checks) 85 Euros (or 112$) !!!

... and the decimal point is very hard to see

Re: . . . all correct, but consider giving the 33s a try.

in response to message #22 by Dave

> Quote:
>
> You know, no company wants or needs your red cent.

No, I'm sure they don't care about losing my little pittance. They *might* be a little more interested in the much larger amounts spent by others, like my employer, to whom I make recommendations against HP. (It came as a surprise to my coworkers, who knew what an HP-lover I used to be, when I recommended buying a large Sun server rather than the equivalent HP machine, despite the fact that I had over a decade of experience as a sysadmin on HP systems. But we bought the Sun system; and guess what I'll be recommending for the considerable number of servers we're probably going to purchase in the not-too-distant future?)

> Quote:
>
> You wouldn't be happy no matter what came about.

On the contrary, there are a number of things HP could do that would make me happy. But it's true that there is almost zero chance that they will do any of those things.

> Quote:
>
> Somehow you seem to think you are the only customer out there.

Judging by comments I've read here and elsewhere, I don't think I'm the only one who thinks HP quality and design excellence have gone down the tubes in recent years.

how trivial to implement?

*Message #27 Posted by **db (martinez, ca.)** on 13 Jan 2005, 12:05 a.m.,*
in response to message #20 by Dave

Can i do it? Will i kill my calc if i do it wrong? Are instructions posted anywhere?

Re: how trivial to implement?

*Message #28 Posted by **Hugh Evans** on 13 Jan 2005, 11:26 a.m.,*
in response to message #27 by db (martinez, ca.)

Trivial from a design and manufacturing standpoint. For the end user it would be more difficult.

Re: how trivial to implement?

*Message #29 Posted by **Dave** on 14 Jan 2005, 10:15 a.m.,*
in response to message #27 by db (martinez, ca.)

All you have to do is assign a key to a program and the program is simply the enter or duplicate function. For me this is assigned to the R/S key which is located upper left of the numbers to simulate position in older calcs.

Re: how trivial to implement?

*Message #30 Posted by **mvdn** on 14 Jan 2005, 10:58 a.m.,*
in response to message #29 by Dave

And how to do that ! Do you have step by step instructions for a simple person as I am.

Re: not so trivial to implement?

*Message #31 Posted by **Paul Brogger** on 14 Jan 2005, 1:45 p.m.,*
in response to message #29 by Dave

I don't believe there is a way to programmatically redefine the Enter key on the 33s.

It may be possible to swap keyboard electrical connections between (for example) the Enter and XEQ keys. I took one apart with this in mind, but after seeing the density of the circuit board, and the sticky plastic film holding the keyboard sandwich to the PCB, I decided against it.

Even if the electrical changes were to be accomplished, the keyboard legends would be misleading. (And not only for the primary functions, but the left- and right-shifted functions as well.)

A dedicated hobbyist could probably overcome that, too, but for me it was way too far to go for very little real gain.

Re: not so trivial to implement?

*Message #32 Posted by **Dave** on 15 Jan 2005, 11:55 a.m.,*
in response to message #31 by Paul Brogger

I will post details when Iget back to the office on Monday or Tue.

Dave

Re: not so trivial to implement?

*Message #33 Posted by **Dave** on 17 Jan 2005, 3:34 p.m.,*
in response to message #32 by Dave

As promised (no it is not a replacement for a properly sized and located enter key):

Go into PRGM Mode (Left Green PRGM)

LBL A - (Left Green LBL A)

You can use any label A-Z

R/S

ENTER

GTO A (Left Green GTO)

Exit Prgm mode (Left Green PRGM)

Now any time you want to use the R/S key as the ENTER function just press XEQ A.

You need the XEQ A to assure your R/S as an enter does not start in some undefined program you have loaded.

This cannot be used in programming without unexpected results...

Dave

Re: not so trivial to implement?

*Message #34 Posted by **mvdn** on 18 Jan 2005, 3:37 a.m.,*
in response to message #33 by Dave

Thanks Dave ! I will give it a try.

And it does what you have promised ! Great! Thanks!

Re: HP 32s & 48gx

*Message #36 Posted by **ned** on 11 Jan 2005, 10:11 p.m.,*
in response to message #1 by Monty Hall

Mr. Hall- what's your masters degree major? Surely not financial or you'd be talking 12c etc. Engineering? Physics? Chemistry? Of course, certain majors will require certain 'kinds' of math. I agree that the best bet all around unit for the money would be the TI89, cause there are loads of users and I think it has a great display. For laboratory work i think the 33s would be great.

If you're really looking to buy HP, take a look at samsoncables.com. They have a decent price on the 33s, but the best bang for your buck in HP gear is the 39g on clearance. Sure it has rubber keys, but for $25, it does eeeevvrything, including complex matrices and (limited) symbolic solving. And if you lose it on campus, you won't worry about it too much. Not RPN tho, and programming is in basic. Just a suggestion...

-Ned

HP 41 module 82500B-A22

*Message #1 Posted by **Hans Bloemen** on 8 Jan 2005, 2:44 p.m.*

I have for sale a module on Ebay named 82500B-A22 . It has also mentioned TINKER AFB ID/31 and E3A FMS MOD9 on it. It was sold to me as an aviation module. Does anybody know more about this cartridge ?

Re: HP 41 module 82500B-A22

*Message #2 Posted by **Matthias** on 8 Jan 2005, 3:51 p.m.,*
in response to message #1 by Hans Bloemen

As you know I didn´t know about it yet, but I just added it to my new database for spring 05. Only the CAT2 header is missing... Without manual the module is not very usefull, only a small gadget for hardcore collectors as me... The template you sell with it is a standard HP-41 template I think.

Re: HP 41 module 82500B-A22

*Message #3 Posted by **Les Bell [Sydney]** on 8 Jan 2005, 4:55 p.m.,*
in response to message #1 by Hans Bloemen

> Quote:
>
> It has also mentioned TINKER AFB ID/31 and E3A FMS MOD9 on it.

I add a little information in confirmation of the fact it's an aviation-related module. Tinker AFB, in Oklahoma, is home to several squadrons of E3-A AWACS aircraft. This module is probably for use with the FMS (Flight Management System) on that aircraft.

Best,

--- Les Bell

Help! I am getting scammed

*Message #1 Posted by **Aleph Mobius** on 7 Jan 2005, 11:41 p.m.*

I have recieved several of those generic bot generated emails offering to buy my "item" after I posted an ad on the museum classifieds. Some of these are obviously scams but there is one I can not tell either way. I do not understand how this scam works. Can I still be scammed if I insist on a US Postal Service money order sent to my PO Box? Here is a copy of the latest email I have gotten. I really think it is a scam since he hasn't insisted on pictures, makes the characteristic spelling mistakes, and seems to be in quite a hurry. However, I do not remember ever telling him I was selling a "calculator". All he should know from his bot is that I am selling an "HP-48GX". Maybe he just does his homework.

DEAR i told you before that i am very much intrested in your calculator, and i kneed it urgently.

You said the you will like to collect $300, and you prefer money order.

That is ok by me. All i want from you is your adress and phone number so that my client will issue you the money order check that will cover both the price and the shipment.

Do that without delay.

BEST REGARD

Dico Chuks

Re: Help! I am getting scammed

*Message #2 Posted by **Steve K.** on 8 Jan 2005, 9:00 a.m.,*
in response to message #1 by Aleph Mobius

I have had many honest buyers that were in a hurry to get the item. That alone is no indicator. My overseas buyers have been quite literate and honest and a pleasure to deal with.

You may be asking for a US Postal Money Order, but the buyer is only noting Money Order. Big difference. If it is an overseas address, be wary. Be wary of identity theft and of monetary scams.

If the deal seems too good to be true, it probably is.

Delete with 123.

*Message #3 Posted by **Aleph Mobius** on 9 Jan 2005, 1:31 a.m.,*
in response to message #2 by Steve K.

You make some good points. If I don't give them my name, can't they still issue the money order? Is identity theft still possible with only a PO Box?

delete ABC

Re: Help! I am getting scammed

*Message #4 Posted by **unspellable** on 11 Jan 2005, 2:08 p.m.,*
in response to message #3 by Aleph Mobius

There is also a problem with bogus money orders and bogus cashier's checks. Some what to my surprise, my credit union tells me the problem is more likley to occur with cashier's checks than with money orders.

It's a pretty safe bet that if they offer a cashier's check for an amount well over the asking price and expecting you to refund the difference that it's a bogus cashier's check. The idea is they get your refund and evaporate before the check bounces.

Re: Help! I am getting scammed

*Message #5 Posted by **Ron Ross** on 11 Jan 2005, 3:21 p.m.,*
in response to message #4 by unspellable

I would love to see someone accept the check then contact the bank or firm the check is drawn on, fax them the bogus check (maybe send to them for proof of fraud). Then contact the buyer and say you haven't recieve the check, but would wait until they got their refund from their MO, bank check, whatever and could send you another after stopping in and getting their funds back. It is a check after all, they should have a reciept.

The bank or firm on which the funds are drawn will be (or should be) waiting for them to claim their $5-10 check (who knows, they may be dumb enough to get it, thinking, what the hell, the check might really be lost and they probably make a couple of trips to that bank every week anyway). It is in the banks or MO firms best interest to reduce this type of fraud and perhaps they may do it (I know, it isn't likely).

At the very least they will have an afternoon of hassle, alas probably nothing more.

Beta testers wanted for new forum software

*Message #1 Posted by **Dave Hicks** on 7 Jan 2005, 6:07 p.m.*

Hi everyone. I've just installed a new beta version of the forum software:

Start here:
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/new/forum.cgi
(This has links to the other beta forums.)

The first things you'll notice are

1. There are now formatting buttons on the new message posting forms,
2. On Search / Personalize Display page there are options to display an entire thread on one page.
3. Ability to optionally create an account and login (see "login / register" in the upper right corner of each forum),
4. Each forum now displays (new) that is tailored to you personally and the basic personalization settings are now "sticky" ie if you set it to display the last day's worth, that's how it will stay even if you go away and return later. (Note that these features require your browser to be set to accept cookies and the formatting buttons require javascript be enabled. The cookies are used ONLY by the forum software. I can't use them to track you in the museum let alone the rest of the Internet.)
5. Posting to the classified ads, warns you about scammers.

These forums are using a snapshot of the forum messages from some time ago. When the beta ends, these messages will be lost, so have fun in the beta forums but please keep the important HP-related messages here in the "real" forums. Likewise, any account names you create in the beta forums are only temporary.

Details

Accounts

It is now possible to create an account and to log in to the forum. Having an account gives you several advantages: It prevents other people from using your (exact) name and logging in allows you to enter your name and password just once. Once you are logged in, you can create, edit and delete your posts without reentering a name, password, and email address each time. You can also create an account to reserve your name yet continue to post as before without logging in. In this case, you will need to supply your account password on each post. You can also mix and match - for example, log in on your home computer but post without logging in on a public computer.

Accounts are currently optional and I think you'll find that they make the forum more convenient. However, another reason for creating accounts is that we now occasionally get spammed. A few moderators have been successful in keeping most of you from seeing these spams, but if the spammers get more aggressive, the new software provides several new options such as requiring an account to post or sending anything posted without an account to the

moderators for approval before it appears on the forum. If you use an account, you'll never notice if these features are needed ever needed.

Email Options / Private email

If you create an account, you have several email options. You can provide no forum email or obscure it in any way you like (such as meNO@SPAMdomain.com) or you can enter a valid email address but keep it private. If you use the latter option, someone who wishes to contact you will do so by clicking on your name and filling in a form. The text will be emailed to you, but your address will never be visible. In most forums, only forum users who are logged in can send you emails in this way. The exception is the classified ads where people who aren't logged in can send emails to people with private email (but still can't see the email address.) This is done under the assumption that anyone posting an ad does not want to place any limitations on responses. WARN ABOUT SPAM!!!!!! NOT RESPONSIBLE

When you create an account, your are asked for two email addresses (which may be the same.). Your "Forum email address" is the address you wish other forum members to use (and possibly see). This could be your normal email address, a hotmail account, an obscured address or it could be left blank if you wish no email contact. Your "Activation Email Address" is the address that will be used to activate the account. It will never be displayed to other users. This address must be a valid non-blank non-obscured address and can't be a disposable "freemail" address such as hotmail, yahoo etc. These freemail addresses make it much too easy to a spammers to create accounts to be used only for activation of spam-and-run accounts. (The software checks for known freemail domains. If you manage to use an obscure freemail domain, it may work but your account might be deleted later if you draw attention to yourself by spamming or trolling.)

Accounts and older Posts

When a new account is created, the forum treats any existing posts made without an account but with the same name as being possibly owned by this account. For anyone clicking on a name field, the forum will honor the email options of the current account of that name. This means that you can hide the email addresses in your previous posts by creating an account with the same name and setting the private email option. (Old Biographies require one additional step - see " Taking Ownership of your Biography" below.)

In order to edit or delete a post created before your account was created, your account password will need to match the password that was given when the message was saved. (In the case of the Classified ads, it is the forum email address on old ads that must match. This is because the Classified Ads posted without accounts don't have passwords.) This prevents random people from creating accounts that match existing messages and then editing or deleting those messages. Any NEW messages that you create are linked to your account such that you can freely change your account password and still be able to edit them. If you have an account with a new password but need to edit an old message, the easiest thing to do is to logout from your account, edit your old message the old way, and then log back in.

Classified ads posted with an account are protected by casual deletion by people typing in the email address. If you use an account, only you and moderators can delete your ads.

Taking Ownership of your Biography.

Unlike the other forums, messages in the Biographies forum are stored under a person's Family Name, Given Name and there's no 100% safe programmatic way to link this format to the way you usually list your name. Therefore simply creating an account named Given Name Family Name, will not immediately cause your biography's email address to become private. To do this, your account must have the same password as your Biography and you must edit your biography. When you exit the edit screen by saving, the Biography will be assigned to your account and options like "Private email" will apply.

Contact Page

When you click on a poster's name, you are now taken to a contact page, which may provide an email address, or a contact form if the user has selected private email. This page will also tell you if the person you are contacting is a registered user. (new) in all forums - now personalized The main forum used to print (new) on the last 20 posts. ALL forums now print (new) based on posts made since your last visit. (If you have cookies enabled.)

Basic personalization preferences are maintained ("sticky") Under "Search / Personalize Display", "List messages", "Display Messages" and "Posted within the last" are now "sticky" if you have cookies enabled. They are set on a per-forum basis and will be remembered even if you stay away for months. (astute readers will note that setting "Posted within the last" to "Two days" makes the daily view redundant and the daily view URL may be phased out over time. "Display Messages Grouped into threads" is new on the "Search / Personalize Display". Setting this causes an entire thread to be displayed with one click. Indentation and information in each message header will guide you on the thread structure. (There is also an option to display the entire thread flush left which is meant for very small displays as on PDAs.)

Formatting buttons

The Post Message forms now include a row of buttons for adding links, images etc. These buttons require javascript to work but if you don't run Javascript, you can click on the "more" link to see a page which describes the formatting codes which you can just type in. You can thank Paul Brogger for this idea.

Cookies and Privacy

The forum software now sends cookies under these conditions:

Logging in to the forum: Login in is optional but you must have cookies turned on in order to do so. You can an create an account and not log in if you really dislike cookies. This keeps people from using your name and deleting your ads but requires you to enter your password on each post/edit/delete.

Each display of the Index and Posting messages: These are simply set to save your list style and time preferences as well as to save the last message seen in order to update the (new) display. If you block these features then you won't see (new) and you're list style preferences won't stay "stuck" for very long.

If you really dislike cookies, then don't log in and blocking the preferences cookies will cause mostly the loss of minor conveniences. However, please note that these cookies are used ONLY in the HP forums. They are not shared with other sites or used to track you across the Internet or even in other parts of the HP museum. (They aren't even logged anywhere.) Also note that the information contained in the cookies is the information that you normally enter to post messages and set forum options. The just automate providing the information that you have been giving the forum software by hand all along. The museum does NOT send any third party cookies that would allow some third party to track you around the Internet.

Some Browsers such as Internet Explorer allow you to set cookie options on a site-by-site basis. For example, in IE you can go to Tools/Internet Options/Privacy and then click the Edit... button in the Websites panel. Then enter hpmuseum.org (and/or hpmuseum.com if you use that URL) and click Allow. This will allow the new forum features without affecting your cookie policies for other sites. (Likewise, you can go to Security and decide on which sites to allow Javascript. IE calls it "Active Scripting".) Javascript is required only to make the format buttons work.

Bravo! Good Job Dave (NT)

Account/e-mail & Login NONOP with WebTV

*Message #4 Posted by **Don Leonard** on 8 Jan 2005, 3:57 a.m.,*
in response to message #1 by Dave Hicks

I am sad that your new software is no longer compatable with my WebTV system. It now appears that we Webbies will no longer be able to participate here when the new software is switched over.

I tried logging in using my old user name/password - it did not work. It gave the "Invalid" error flag. Next tried setting up a new account using the same user name/password as the old forum and then logging in - still did not work. I did NOT receive the activation e-mail.

I am not sure what is gained from the new software that makes it worthwhile to emplement, even if it locks out existing forum members. But, if it happens, I'll just have to live with it I guess. That is the price of progress. I will miss it though. I check here EVERY night for the latest info.

Don

Re: Account/e-mail & Login NONOP with WebTV

*Message #5 Posted by **Dave Hicks** on 8 Jan 2005, 12:13 p.m.,*
in response to message #4 by Don Leonard

Hi Don,

The current forum software has no user names so there is really no "old user name/password" with which to log in to the new system. However, creating a new account should have worked. Can you tell me what name you used when you created a new account? I can't see any sign of any attempt to create an account "Don Leonard" or similar but perhaps you used a different name. Did the system tell you that it sent you an activation email?

Dave

Re: Account/e-mail & Login NONOP with WebTV (Dave Hicks)

*Message #6 Posted by **Don Leonard** on 8 Jan 2005, 10:21 p.m.,*
in response to message #5 by Dave Hicks

I used both Don Leonard and Donald1800 which I've used in previous posts. After completing the new account page and selecting the mandatory 'Continue' button, I was taken to the login page. I didn't get the activation e-mail under either user name, so I was not surprised that my login attempt resulted in the 'Invalid' error message. I did, however, get the hpmuseum cookie.

I will try it again now and re-post only if it finally goes through.

Thanks for the update. If anyone else sees something like this, please let me know!

Re: Beta testers wanted for new forum software

*Message #9 Posted by **GE** on 9 Jan 2005, 4:59 p.m.,*
in response to message #1 by Dave Hicks

Thank you Dave for caring.

As I said before, I will not register a login/password on this forum. It's nice that it is not mandatory.

After visiting the test forum, here are three remarks : 1 - it looks really nice, a little bit verbose though 2 - nice to see all the thread at once, however messages that are viewable that way don't have their links marked as 'visited' in the main page. So you don't know which messages are really unread. 3 - indenting looks good, but eats space. It is also hard to read on lesser hardware like PDAs etc. I guess pages are heavier too (like in 'bytes count').

I hope you see these remarks as ways to make something even better. Thanks for a great forum, with good people.

Re: Beta testers wanted for new forum software

*Message #10 Posted by **Dave Hicks** on 10 Jan 2005, 12:58 p.m.,*
in response to message #9 by GE

Hi GE

1: Could you be more specific about "verbose"? (Is this also covered in #3 or something different?)

2: Yes, the "visited" links is a browser function that I don't think I can affect at all. However, if you go away (for more than 30 minutes) and then come back, the (new) indicator should appear on any posts that have been added. You might want to experiment with listing messages using the "Compressed" view in "Search / Personalize Display" both for byte count and for making the visited links act more like you expect.

3: The indenting can be turned off if you like. Go to "Search / Personalize Display", and under "Display messages", you have a choice of " Individually" (the old way), "Grouped into threads, indented", or "Grouped into threads, flush left".

Thank you!

Dave

in response to message #9 by GE

> Quote:
>
> 2 - nice to see all the thread at once, however messages that are viewable that way don't have their links marked as 'visited' in the main page. So you don't know which messages are really unread.

I also like to have each message's link marked as "visited" so that unread messages stand out better. That's one of the features other web formums lack that makes this one so much better. I also prefer the "look" of the current style better than the multi-message display. However, the "old" view can be selected as a user preference, and the new formatting buttons still display in that mode. So that gives me the best of both the old and new formats.

When comparing USENET newsgroups and web forums I always tell people that I think newsgroups are better, with ***one*** exception: The MoHP Forum, which has the best user interface of any web-based message system I've seen anywhere. Thanks, Dave, for taking something already great and making it even better! I wish certain *other* parties could understand that adding new features doesn't require throwing away the best parts of the old design...

Very good job, Dave! - Just a minor comment...

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 15 Jan 2005, 11:13 a.m.,*
in response to message #1 by Dave Hicks

When you send an email message to a registered user who kept his/her forum-email-address private, the recipient will see display name of the sender with quote marks between words. For example, the header will be more or less like:

```
From: "Andrés" C. "Rodríguez"
Date: 15 January 2005 10:12
To: /* here goes the recipient address, which the sender had not seen */
Subject: Re: Your HP 41C program
```

I appreciate that the accented characters in the display name are not lost or miscoded, which is a fine detail!

Congratulations again!!

PS: Please see that the "Interests/ Hobbies" field may be not long enough. I would like that, after collecting some statistics, hobbies and interests could be selected via checkboxes; you may even let us find other registered users with similar interests, etc. Also "Languages" may be an useful field for some new or casual user, who may come asking for help in a particular language (It is clear, however, that posting must remain in English; no doubt about it)

Re: Very good job, Dave! - Just a minor comment...

*Message #13 Posted by **Dave Hicks** on 15 Jan 2005, 7:55 p.m.,*
in response to message #12 by Andrés C. Rodríguez (Argentina)

Thanks Andrés! The quoting bug should be fixed now. (That only happened on names with accented characters so I'm glad you tested that.)

I'll think about the enhancements next week but I wanted to get the bug fixed right away.

Source for plastic battery holders

*Message #1 Posted by **Dan** on 7 Jan 2005, 5:47 p.m.*

I'm a newbie here, so sorry if this has been covered but I haven't been able to find it. Anyone know of a source, either NOS or reproduction of the battery holders for Woodstock pocket calculators such as the 21? Trying to either get my old college calculator fired up again or sell it.

Thanks in advance for any tips.

Dan

Re: Source for plastic battery holders

*Message #2 Posted by **Jeff O.** on 9 Jan 2005, 12:28 a.m.,*
in response to message #1 by Dan

In my experience, no such easy sources for woodstock battery packs exist. You might try placing a wanted to buy ad in the MoHPC classified section. They occasionally show up on eBay, but the prices aren't necessarily low. Sometimes it's cheaper to buy a common woodstock (such as the HP-22) to get a pack you can rebuild. Search the Forum for threads about rebuilding the packs if you find one.
Sorry for the discouraging words, perhaps others will have better advice.
Good luck.

Re: Source for plastic battery holders

*Message #3 Posted by **Dan** on 9 Jan 2005, 3:43 p.m.,*
in response to message #2 by Jeff O.

I was afraid of that. Probably like others, I set the calculator aside instead of continuing to pay what seemed like a lot of money in the 1970s for replacement packs from HP. As I remember they didn't last very long and would leak. To keep it from damaging the terminals I removed it and tossed it, plastics and all. Didn't think in those days about HP discontinuing support, but understand it doesn't make sense for anyone to do a reproduction for such low demand product. I will watch Ebay and the Forum Classifieds. For some reason I really like the 21 and want to start using it again.

Thanks a lot for the response Jeff.

Dan

Re: Source for plastic battery holders

*Message #4 Posted by **Larry Corrado (USA, WI)** on 10 Jan 2005, 6:11 p.m.,*
in response to message #1 by Dan

Dan:

I have an extra Woodstock battery holder from my old Woodstocks. I'll send it out. What's your address? I'll

send it to you.

Regards, Larry

Thanks!!

*Message #5 Posted by **Dan** on 10 Jan 2005, 11:59 p.m.,*
in response to message #4 by Larry Corrado (USA, WI)

Larry,

Wow, what a great offer..... Can't thank you enough. I know you didn't ask for anything in return, but can you use a spare Spice charger I have in exchange?

And is there a way I could email my physical address to you rather than posting it here? My email is danNOSPAMlauritsen@earthlink.net , removing of course the NOSPAM.

Trying to cut down on all the "offshore offers" I am receiving since posting in this forum.

Thanks again! Can't wait to build up the battery pack with new cells. My model 21 will be warmed up for the first time in a very long time.

HP and their strategy on RPN

*Message #1 Posted by **Mvdn** on 6 Jan 2005, 8:00 a.m.*

HP and their strategy on RPN (and calculators in general)

First I will introduce myself. I am a RPN calculator enthusiastic for many years owning different 12C's, a 48G+ and using different emulators on my PC and Palm Tungsten T5. Power48 is a great emulator compiled in Nov 2004. (http://power48.mobilevoodoo.com) Reading different articles on www.hpcalc.org on 'HP's Industry departure' ano 2001 I was convinced Hp was walking away and leave us, the RPN fan without new RPN calculator material. Today I have the impression HP saw things happen (initiatives like OpenRPN, but also the different sites like this one with forum's about RPN) and they changed their strategy ! Even It is via OEM (Kinpo Inc. www.kinpo.com.tw , manufacturer of the 12C Platinum and 33S, isn't it) HP has a lot of initiatives going on. They have the 33S launched, have emulator programs for educational purposes and even have (all published on www.hp.com/calculators) a competition in developing a new model (for students).

Are they really changing their strategy?

Re: HP and their strategy on RPN

*Message #2 Posted by **Namir** on 6 Jan 2005, 11:33 a.m.,*
in response to message #1 by Mvdn

Hello Mvdn,

I attended the HHC2004 conference in San Jose where several folks from HP came and listed and also talked. The HP calculator division is a relatively profitable one albeit it small (that is the % profit is small compared to other HP divisions). So HP's resources for developing HP calculators and really sticking it to TI (like in the old days) is very toned down. For example the R&D for the calculator is sparsly populated by relatively few, yet still, enthusiastic and knowledgable folks. I talked to the R&D guy (I think it was Cyril) about my son's idea for the clauclator contest you mentioned. Cyril gave me a very quick and sharp response evaluating my son's idea.

Basically, the HP calculator division is gently trucking along. They no longer hold the same place they did in the 70s and 80s. This is part of progress. I tell my son that as much I love vintage HP calculators, like the 41, today's PCs with applications like Excel, Derive6, MATLAB, MINITAB, SPSS, and the like, run circles around the capabilities of our beloved handheld machines.

Namir

Re: HP and their strategy on RPN

*Message #3 Posted by **Ed Look** on 6 Jan 2005, 11:49 a.m.,*
in response to message #2 by Namir

Yes, Namir, you are right, but short of carrying an expensive and heavy laptop, I can do most of what I often do in Excel and to a much lighter degree, a little of what the calculational software can do, on a 48G, 48G+, or 49G+. And these last three are quite portable, if not in a regular shirt pocket (I have carried them

in a coat pocket).

This, for me is the attraction to powerful calculators: their "compactness to power ratio"- what you CAN do with them for machines their size. I also had two voltmeters; one the size of a 48 or 49 series calculator and one the size of a credit card. Even though the bigger one has more features, better display, etc., I most often use the little one. Besides, the computer is for posting to MoHPC forums, anyway.

Re: HP and their strategy on RPN

*Message #4 Posted by **Erik Ehrling (Sweden)** on 6 Jan 2005, 3:47 p.m.,*
in response to message #3 by Ed Look

And we must remember that the calculators we have today only represent a fraction of what is technically possible. For example I can't see any reason why a calculator couldn't be powerful enough to run Matlab *on* the calculator itself...

Regards, Erik

Re: HP and their strategy on RPN

*Message #5 Posted by **Ed Look** on 6 Jan 2005, 10:24 p.m.,*
in response to message #4 by Erik Ehrling (Sweden)

Erik, I suppose the only reason would be cost... maybe weight. I love calculators because they are useful mostly for what I need, small, and light.

So, I'd favor a very powerful calculator over carrying a laptop. But I fear that if more and more features or capabilities are loaded onto a calculator, even a Pioneer form factor would get very heavy.

Re: HP and their strategy on RPN

*Message #6 Posted by **Eddie Shore** on 6 Jan 2005, 11:47 p.m.,*
in response to message #5 by Ed Look

Good point. However, would calculators start using higher quality chips to reduce the calculator size? Probably today's chips can carry a lot more calculations than a chip did in the 1970s.

I would favor a larger calculator over a small one where I couldn't see the screen or touch the keyboard with my "big" fingers.

For the next batch, RPN should be a regular feature in all HP's calculators (including the update to the 38/39G and 6S/9G series) since they are the only brand with RPN built in the box.

Re: HP and their strategy on RPN

*Message #7 Posted by **Erik Ehrling (Sweden)** on 7 Jan 2005, 4:36 a.m.,*
in response to message #5 by Ed Look

Well, think of a Pocket PC, these can carry a 624MHz CPU, 128MB RAM and even a backlit colour VGA display in a very small form factor; so I don't think it necessarily has to be a very big and bulky unit.

Speaking about costs it must of course be made in very large series in order to reach the price/performance ratio of the Pocket PC:s.

Regards, Erik

Re: Hydrix and their strategy on RPN (Qonos)

*Message #8 Posted by **Veli-Pekka Nousiainen** on 13 Jan 2005, 7:34 a.m.,*
in response to message #5 by Ed Look

What about Qonos? It has the usual 49G CAS plus the TI-89 CAS
Both calcs are emulated in the CPU level
The memory is static RAM 1/2 MB
The PDA side has 63MB DRAM and Parisse's new Xiac
and MathExplorer plus GnuPlot.

*Message #10 Posted by **Fred Lusk** on 6 Jan 2005, 9:00 p.m.,*
in response to message #1 by Mvdn

Mvdn…

A bit off topic, but how do you like your Tungsten T5. I am thinking about upgrading from my original Tungsten T--mainly for more memory and for what appears to be an easier interface between PC and PDA.

Fred

Re: HP and their strategy on RPN

*Message #11 Posted by **mvdn** on 7 Jan 2005, 4:07 a.m.,*
in response to message #10 by Fred Lusk

... well (off topic) - The Tungsten T5 is great. I also had a Tungsten T (however is was OK the T5 is much better). Of course the bigger screen - no mechnical -opening back to the Palm V (sliding to open). It seems power consumption is very good (much better then the T3 model friend of me own. And of course with a 1GB SD card in it very handy (work as a USB stick in drive mode). The Power48 emulator is working well in de full screen mode! A cradle is no longer standard in het box (that's the only negative point) It is also very stable. I now have it for 6 weeks and it never crashed (even with older software running)

Re: HP and their strategy on RPN

*Message #12 Posted by **GWB** on 7 Jan 2005, 4:43 p.m.,*
in response to message #11 by mvdn

Still off topic.

I bought my first palm just six months ago (a Zire 72), not because I needed it, but because I wanted it.

Though I don't use it to store addresses and phone numbers, I have found some unexpected utilities for it, for example: reading e-books! - Though I have read just a book in it: The Wizard of OZ (I have eReader Pro and Merriam Webster's Collegiate Dictionary installed - just 11 MB in the SD Card versus 1,500 plus pages in the printed edition!). As I barely use the built-in digital camera the T5,or Tungsten T3 available then would have been a better choice due to its larger screen. Also, as you have pointed out, Power48 would run just fine in full screen mode. However, operating the calculator with a stylus and once in a while having to depend on a wall outlet is rather cumbersome. That is why the real calculator (42S, 48G-GX-G+, 49G-G+) is still indispensable, no matter how good the emulator or simulator is (Free 42, Power48). Thanks for the tips (I had read somewhere the Tungsten T5 was buggy and unstable - perhaps the reviewer didn't know how to operate it). Getting back to the topic, I think HP should release a 43S (not Chevron-styled and a not a faint decimal point, please!)

Regards,

GWB.

Re: HP and their strategy on RPN

*Message #13 Posted by **Fred Lusk** on 8 Jan 2005, 2:40 a.m.,*
in response to message #11 by mvdn

mvdn…

Thanks for the report. I too had seen a few somewhat unfavorables reviews as GWB mentioned. However, some of them lamented the lack of WiFi and voice recorder. I don't need either one. So…my wish list has not gotten one item longer.

Thanks again, Fred

Re: still OT: transition from Tungsten T to T5

*Message #14 Posted by **Mark A. Ordal** on 8 Jan 2005, 2:25 p.m.,*
in response to message #11 by mvdn

If I recall correctly, the Palm "Tungsten T" was the last model to use "Graffiti" handwriting recognition. Due to a patent-infringement lawsuit by Xerox, Palm licensed a version of JOT, changed it a bit, called it "Graffiti2", and used it to replace "Graffiti" for the T2 and later models.

I had a Palm V for a few years and replaced it with an m505, which I've had for about 3 years. I've tried the "Graffiti2" models in stores and found "Graffiti2" very alien and unintuitive for a user of the original Graffiti.

The whole "Graffiti2" business has me looking at the new Pocket PC models and comparing them to the T5. Where's my incentive to stay loyal to Palm if I have to learn a new handwriting input system?

What about your experiences in adapting to the new handwriting recognizer?

--Mark

Re: still OT: transition from Tungsten T to T5

*Message #15 Posted by **Fred Lusk** on 8 Jan 2005, 3:13 p.m.,*
in response to message #14 by Mark A. Ordal

Mark…

I guess everyone's experience is different. My son, who is now 17 and is dyslexic, mastered graffiti much faster than I did and is much better at it. On the other hand, I am faster still using the tappable on-screen keyboard. My oldest daughter has a friend who takes all his college lecture notes in graffiti (he's majoring in philosphy). In the end, I don't write too much on my Palm, so entry methods aren't too important to me. I mainly use my Palm for syncing appointments and contact info from my computer, plus I have several HP calc emulators, a planetarium program, a chess program, some photos, etc.

Fred

Re: still OT: transition from Tungsten T to T5

*Message #16 Posted by **Scuba Diver** on 8 Jan 2005, 3:51 p.m.,*
in response to message #15 by Fred Lusk

As an aside, I use FitalyStamp (www.fitaly.com) instead of graffiti. I've been using it on my Vx for 2 years now, and I can tap much more quickly than I could ever input using graffiti.

I just checked the website and they have a version for T3 and T5.

You may want to check it out. B. 12345 to delete

HP 71 - serial interface

*Message #1 Posted by **Karel Kupka** on 6 Jan 2005, 7:39 a.m.*

Hello. Does there exist any interface or cable for HP 71 or HP 41 to send and receive data via RS232 serial link (with 9-pin Canon connector on the other end)? And of course any program or system command support like OUT and IN on the respective device?

Re: HP 71 - serial interface

*Message #2 Posted by **Emmanuel, France** on 6 Jan 2005, 12:57 p.m.,*
in response to message #1 by Karel Kupka

[pre]Dear Karel, I only know two interfaces: HP82164A made by HP, and one made by Hand Held Products (32k buffer & autopowered). ;o) Emmanuel [pre]

Re: HP 71 - serial interface

*Message #3 Posted by **Garth Wilson** on 6 Jan 2005, 2:21 p.m.,*
in response to message #2 by Emmanuel, France

Add to that the FSI164A from Firmware Specialists, Inc., which is virtually 100% compatible with the HP unit but came with two RS-232 channels and optionally up to 8, and also offered the option to go battery-powered. Mine is only two channels and not battery-powered. I've used it a lot with both the 41cx and the 71B. A scan of the manual (actually mine) is available on the HP-41 website.

There was a way to make a serial port on the 71 by soldering a couple of wires onto uncommitted I/O pins on the processor IC. (There would not be any line drivers or receivers though.) It doesn't seem to be in the book "Control the World With HP-IL", so maybe it was in one of the CHHU Chronicles. It would take me some digging to find it. I definitely would not risk damaging either of my 71's though when they both work 100% like new and there's no support for them anymore if I damage anything.

HP 27s keyboard problem

*Message #1 Posted by **Nick Nicholas** on 6 Jan 2005, 1:46 a.m.*

I recently obtained an used HP 27s from eBay. Unfortunately, I discovered that the number 1 key does not always register. If I tap this key like I do with all the other keys, this particular key registers about 80% of the time. When it fails to register, I need to make a hard press to get the key to register and sometimes I get duplicate registrations of the key when I do this. I find this behavior rather strange. Can anyone explain why this key behaves like this and if there is a possible fix?

Edited: 6 Jan 2005, 1:48 a.m.

Re: HP 27s keyboard problem

*Message #2 Posted by **Jeff O.** on 6 Jan 2005, 7:18 a.m.,*
in response to message #1 by Nick Nicholas

Such problems seem to be common on aging pioneer keyboards. While difficult, successful repairs of pioneer keyboards have been reported, see this thread for example.

Re: HP 27s keyboard problem

*Message #3 Posted by **Randy** on 6 Jan 2005, 5:46 p.m.,*
in response to message #1 by Nick Nicholas

It really depends on what is wrong. You might have:

1. Dirt in the key. Not bad, it should clean up.
2. Something spilled in the keyboard. Okay, but tougher to clean since you don't know what it is.
3. A just plain worn out key contact. Ugly. Major surgery, follow the previous link and good luck.

If it is just a dirty key, in the order of effectiveness:

1. Ultrasonic cleaning of the entire unit which cleans inside the keyboard.
2. Placing a few drops of isopropyl alcohol between the key and the surround and pressing the key a few times. Works many times for not-so-bad units.

Any cleaning should be done with batteries out and allowed to dry throughly before reinstalling. Leaving batteries in a wet Pioneer will result in keyboard destruction via electrolysis in about 24 hours.

Re: HP 27s keyboard problem

*Message #4 Posted by **Nick Nicholas** on 6 Jan 2005, 7:44 p.m.,*
in response to message #3 by Randy

Thanks to those who responded to my post.

I don't know whether it was my pressing of that key a few thousand times or the isopropyl alcohol or a

combination of both but the key registration seems to have improved.

Incidently, I don't have access to a chemistry lab where ultrasonic cleaners are used. Where do you suggest I can get hold of one to use if I have a need for such equipment?

Re: HP 27s keyboard problem

*Message #5 Posted by **Randy** on 6 Jan 2005, 10:19 p.m.,*
in response to message #4 by Nick Nicholas

It's not something you would buy for a one-time cleaning. Units large enough to do the job are $200 and up.

Math Societies

*Message #1 Posted by **Eddie Shore** on 5 Jan 2005, 10:45 p.m.*

Does any one on this board belong to a professional (or even ametur) math society? I am thinking about joining one this year. Thanks!

Re: Math Societies

*Message #2 Posted by **Nenad (Croatia)** on 6 Jan 2005, 6:05 a.m.,*
in response to message #1 by Eddie Shore

Five years ago I joined Croatian Mathematical Society, its branch here in Split. A year after I was elected chairman of its engineering subbranch.

All in all it was not too exciting experience. In general, real mathematicians often live in their own world, which does not have too much with reality. One of my very appreciated comembers (she was even the chairlady of scientific subbranch and a professor at the Science and Mathematic Faculty, University of Split), when we were talking about themes for graduation theses for her undergraduate students said: "It is not important what is a student working on; it is only important that it is difficult!" (sic). This is the way of thinking rather different than mine.

Some other time we were discussing a reward/present for the high school student most successful in local mathematical contests. When I proposed to buy him/her a 48G+, or a GX, almost all the colleagues from the branch board responded: "A calculator?! What can a mathematician do with it, at all?".

These are only the two "case studies" described. I would not pretend that all the math people do think in such a way, but these are the ones I personally know.

IMHO, it would be far more interesting and exciting to try to join a Society of Cured Nymphomaniacs, but it is not so easy to find one...

Re: Math Societies

*Message #3 Posted by **Eddie Shore** on 6 Jan 2005, 11:53 p.m.,*
in response to message #2 by Nenad (Croatia)

So mathematicians are more into theory than applications. Did they have a lot of public presentaitons?

Re: Math Societies

*Message #4 Posted by **Nenad (Croatia)** on 7 Jan 2005, 1:08 p.m.,*
in response to message #3 by Eddie Shore

There was a public presentation of a prepared lecture each month. Most of these presentations were purely theoretical (difficult topics from group theory, topology, etc.). Almost every lecturer wanted to impress the auditorium with the fact that he (in most cases: she) was working on a topic extremely difficult to understand by "ordinary" people.

The most interesting presentations were the ones prepared by mathematicians working as high-school lecturers. They dealt with very interesting topics related to triangles, inequalities, algebraic equations, stereometry and how to present this topics using the easiest and the most understandable way.

AFAIR, when I presented my lecture "Application of program Derive in engineering mathematics", all of the auditorium responded with a unisone question: "Shall we lose our (lecturer) jobs if this comes out?". My response was also simple: "Hopefully!". They did not like it at all, but who can stop the progress.

Anyway, my impression was that they did not like engineers at all, particularly the ones somewhat skilled in mathematics, especially applied numerical methods. The approach of Math Society members was always based upon the thinking that mathematics is a self-sustained deductive theory and that its application is only a consequence of theory.

How wrong they were (and still are), at least IMHO.

Re: Math Societies

*Message #5 Posted by **Wayne Brown** on 6 Jan 2005, 11:36 a.m.,*
in response to message #1 by Eddie Shore

I'm a member of the American Mathematical Society. Membership includes free subscriptions to paper copies of two excellent publications, the Bulletin of the AMS and the Notices of the AMS. (You can read the online versions of both of these without being a member.) Another good organization is the Mathematical Association of America.

HP-41CX New-in-the-Box

*Message #1 Posted by **Praxitelosk** on 5 Jan 2005, 3:54 p.m.*

I have several of these and am considering selling them since I have caught a photographic bug and need some cash.

Not knowing what these are worth, I am seeking advice as to what their value is and how I should try to sell them.

Prax

Re: HP-41CX New-in-the-Box

*Message #2 Posted by **Erik Ehrling (Sweden)** on 5 Jan 2005, 4:44 p.m.,*
in response to message #1 by Praxitelosk

The best thing is probably to sell them on eBay...

Regards, Erik

Re: HP-41CX New-in-the-Box

*Message #3 Posted by **Tim Wessman** on 5 Jan 2005, 4:51 p.m.,*
in response to message #1 by Praxitelosk

Mail me one and I will appraise it for you for free! =)

I'll even throw in a $4,500 check from my brother-in-law who has been trying to buy one for his banker at the Nigerian trust fund bank! ;-)

Re: HP-41CX New-in-the-Box

*Message #4 Posted by **Randy** on 5 Jan 2005, 5:38 p.m.,*
in response to message #3 by Tim Wessman

They have sold for $250 to $600 in last few years on eBay.

The musuem classifieds is a great place to start, zero cost. Expect to be asked for photographs of the units along with serial numbers and other details of condition.

Nice scam attempt...

*Message #5 Posted by **Realistic** on 6 Jan 2005, 11:51 p.m.,*
in response to message #1 by Praxitelosk

These scammers are not only in the "Ads" section, now also in the forum itself ...

HP48GX woes

*Message #1 Posted by **Mcmillian** on 5 Jan 2005, 1:34 p.m.*

Thought I was lucky when I got a brand new 48GX to buy. I only loaded programs on it and it worked about 2 hours today before it locked up. I took out the batteries and when I replaced them, the entire screen got blue. Any advice? Thanks

Re: HP48GX woes

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 Jan 2005, 4:25 p.m.,*
in response to message #1 by Mcmillian

Hi, Mcmillian;

please, try the following:

turn the back face up, as if you'd do to replace the batteries;
with the battery comparment in the bottom, gently remove the upper-right rubber feet; it looses easily, so you should carefuly "rotate it" to the right side;
you should see a small hole with a small 'R' written close to it inside the rubber feet "place";
unfold a paper clip and insert the loose tip in the hole till you sense some mechanical resistance; keep it there for about two to four seconds.

This should 'R'eset the calculator (hardware) and turn it off, too. After you turn it back on, if the LCD is still totally blue, try: (calculator frontface facing up, now)

press [ON] and hold it;
while holding [ON] key down, press [-] and check if the LCD lightens up;
if it is too light now, hold [ON] key down and press [+] to darken it.

Maybe these procedures will help.

Hope you succeed.

Luiz (Brazil)

Edited: 5 Jan 2005, 4:32 p.m.

Re: HP48GX woes

*Message #3 Posted by **Mcmillian** on 5 Jan 2005, 5:30 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

It seems something squeezed the "+" button and it was locked. I had to actually shift the overlay at the bottom of the button so it would free the movement of the + button. From now on I am getting a hardcase for my prize possession. Maybe the tripod somehow squeezed it.

9825B/T schematics

*Message #1 Posted by **Achim** on 5 Jan 2005, 12:58 p.m.*

I need technical infos (schematics, service manuals) about the 9825T. In my machine obviously some build-in ROMs (Strings, Adv.Prog., Ext. I/O) are either defective or can't be addressed. I have to know which IC contains which ROM. The adress logic in the 9825B/T is different from the 9825A. So the schematics for the latter don't help.

Achim

Re: 9825B/T schematics

*Message #2 Posted by **Tony Duell** on 5 Jan 2005, 3:50 p.m.,*
in response to message #1 by Achim

HPCC has reverse-engineered schematics for whichever 9825 has 64K RAM and almost all the ROMs built-in (and also similar schematics for the 9831, including both the 4K and 8K RAM boards that were used in the other 9825 versions).

The only problem is that AFAIK said schematics just show the ROM chips and don't indicate which of the extension ROMs is in each chip. Still, if you think these might be of help, get in touch.

Re: 9825B/T schematics

*Message #3 Posted by **Achim** on 6 Jan 2005, 8:27 a.m.,*
in response to message #2 by Tony Duell

Whom should I contact at HPCC?

620lx replacement adapter voltage?

*Message #1 Posted by **Gene** on 5 Jan 2005, 9:35 a.m.*

Picked up an HP620LX palmtop. To use one of these universal ac adapters, does anyone know the voltage it should supply?

3? 4.5? 6? 7.5? 9? or 12?

:-)

Gene

Re: 620lx replacement adapter voltage?

*Message #2 Posted by **Bill (Smithville, NJ)** on 5 Jan 2005, 11:31 a.m.,*
in response to message #1 by Gene

Gene,

Congraduations on finding the HP-620LX. Although a little slow, still a fun unit to play with. As to the AC adapter, I found the following info about a "house brand" substitute ac adapter. 12V at 1.5 amp. See following link:

http://www.dealtime.com/xPF-House_AC_Adapter_for_HP

If you didn't get manuals with it, then the following links may be of some help:

The 620 Zone web page:

http://www.geocities.com/SiliconValley/Way/3121/620tips.htm

The HP Palmtopper Page - Most of this is about the HP200lx, but it does include some 620lx items also:

http://www.palmtoppaper.com

Have Fun with it.

Bill

Thanks!

*Message #3 Posted by **Gene** on 5 Jan 2005, 11:36 a.m.,*
in response to message #2 by Bill (Smithville, NJ)

I've got it plugged in at 12V of DC (but it's not 1.5 Amps - only 1/3 of that).

The "orange" charge light is now on. I'll give it a few minutes and then see if it will turn on.

Re: Thanks!

*Message #4 Posted by **Raymond Del Tondo** on 5 Jan 2005, 12:49 p.m.,*
in response to message #3 by Gene

It'll take a while (few hours) to turn the light into green,
at least with that 'weak' AC adapter;-)

Raymond

Should it power on anyway? Orange but in the dock?

*Message #5 Posted by **Gene** on 5 Jan 2005, 1:03 p.m.,*
in response to message #4 by Raymond Del Tondo

?

Re: Should it power on anyway? Orange but in the dock?

*Message #6 Posted by **Raymond Del Tondo** on 5 Jan 2005, 2:44 p.m.,*
in response to message #5 by Gene

Normally it will power on,
but if not, you could try a reset.
The (red) reset button is behind the
small door where the backup cell also sits.
You can press that reset button with
the stylus for a second.

Re: Should it power on anyway? Orange but in the dock?

*Message #7 Posted by **Gene** on 5 Jan 2005, 2:52 p.m.,*
in response to message #6 by Raymond Del Tondo

Tried that. Nothing. :-(

When in the dock, it will glow "orange" or if I wiggle the adapter cord, it will sometimes be blinking "green".

I have the universal AC adapter set to 12.5V, but it is providing 500ma, not the 1.5 amps the original adapter gave.

Re: Should it power on anyway? Orange but in the dock?

*Message #8 Posted by **Bill (Smithville, NJ)** on 5 Jan 2005, 3:45 p.m.,*
in response to message #7 by Gene

Gene,

0.5 amp should be enough to operate the 620lx. I can't remember if the docking station directly puts the adapter power to the coaxial adapter connector on the 620 or if it's transfering the power through the multi-pin connector. I would try removing the unit from the docking station and pluging the ac adapter directly into the unit.

I would also try the following:

1. Remove the Lithium battery and check to see if show's any effect from the charging. If after plugged in for several hours, the battery voltage is still low, then the battery is probally done for. You'll need a new battery.

2. If battery seems to be accepting the charge, and unit still won't power up, remove both battery and backup battery and let unit set for a day or two. Then reinstall and see if it will power up. I'm assuming that the backup batter is good? But even with a dead or missing backup battery the unit should power up and then give you a message saying "replace backup battery".

3. Last resort - remove main lithium battery. Plug in the adapter and see if it powers up. this "should" be safe, but I'm not 100% sure that it won't damage the unit. That's why I say last resort.

4. If you do Item (3) - and all is well, then check the unit's battery contacts to see if the adapter is apply voltage to them.

Good luck,

Bill

Re: Should it power on anyway? Orange but in the dock?

*Message #9 Posted by **Raymond Del Tondo** on 5 Jan 2005, 4:42 p.m.,*
in response to message #8 by Bill (Smithville, NJ)

A small addition:

I think I remember that my old 620LX
sometimes stuck in the same way.

Somewhere I read (maybe in the manual?)
that removing both batteries and then pressing
the reset pin for 10 or 30 seconds would do s.t.
like a hard reset.

At least worth a try.

Raymond

It's dead, Jim

*Message #10 Posted by **Gene** on 5 Jan 2005, 5:21 p.m.,*
in response to message #9 by Raymond Del Tondo

Sorry for the Star Trek line.

I think the 620LX is dead.

Took both batteries out for 45 minutes. Pressed the red reset pin for 30 seconds, etc.

Nothing.

When in the dock, it will display an orange light which indicates it should be charging. Sometimes, it will show a solid green light, which indicates charged,

and sometimes it flashes green (which isn't defined in the manual) :-)

In no circumstance can I get it to turn on.

I think she goes back to the seller. Oh well. Thanks for the efforts, folks!

Well, that's impossible...

*Message #11 Posted by **Raymond Del Tondo** on 6 Jan 2005, 2:23 a.m.,*
in response to message #10 by Gene

Sorry for the Star Trek like answer,
but to get on-topic again:
Have you checked if the WinCE
module is plugged correctly?
It's a small pcb which sits in a slot
inside the main battery compartment.
When the batt is removed, you'll
see a strip of black film,
optionally covered by an aluminium shield.
If there's no plug-in module,
the unit is just a no-brainer;-)
In that case I could offer a fully
working 660LX module with 32MB RAM,
which is left from a 660LX with bad display.

If there is a module, maybe it doesn't sit correctly.
To verify this, just pull it out carefully,
and reinsert it. You'll know when it's fully inserted,
because it's edge is aligned with the slot edge.

Just another idea.

Raymond

Question about Russian RPN Calculators

*Message #1 Posted by **Namir** on 4 Jan 2005, 7:22 p.m.*

Has anyone on this website purchased any Russian RPN from eBay? What was your experience with the seller? What was your experience with the product?

Namir

Re: Question about Russian RPN Calculators

*Message #2 Posted by **Chris Woodhouse** on 4 Jan 2005, 9:30 p.m.,*
in response to message #1 by Namir

I purchased one of the landscape layout ones with the green display (MK 52). It came in good condition even though the packing wasn't all that great. Took a little less than 2 weeks to get to Oklahoma City. Mine came from Ukraine not Russia. It certainly isn't of the same quality of the hp machines. For example 2^3 comes out as 7.9999993 instead of 8. and it is X^Y not y^x I haven't played with it all that much so I can't say much more. The buttons don't have a very consistent feel. Some times they click sometimes not.

Chris W

Re: Question about Russian RPN Calculators

*Message #3 Posted by **db (martinez, ca.)** on 4 Jan 2005, 11:25 p.m.,*
in response to message #1 by Namir

Hi Namir. We met at the San Jose confrence. I've bought six "red" RPNs from the former eastern block and traded for two more from Germany. One took 89 days to get here from Ukrane. One from Russia was broken but he took it back (i paid shipping back there). As Chris said; the quality of an hp (or Corvus or Heathkit or Privileg) is not there but they are RPN and quite original, although one is said to use an hp display. The packaging was adequate and although two were wrapped in twine they got here fine.

Did you ever see my little RPN collection? Thanks to Mike Davis, it's at

http://www.msdsite.com/forums/upload.php?upload=view&uid=482

Re: Question about Russian RPN Calculators

*Message #4 Posted by **Aleph Mobius** on 5 Jan 2005, 1:11 a.m.,*
in response to message #1 by Namir

I bought an MK-61. It's identical to the MK-52 already mentioned except that it is in the traditional calculator shape and it does not have permanent storage. It takes mine a second or two to compute trig identities and as already mentioned it is a bit inaccurate at times. However, you have to consider that it came out in the mid 1980s using Soviet technology. I only payed $15 plus shipping from the Ukraine for mine and it arrived here

in the US in 2 or 3 weeks. I don't use it from day to day but it is a neat calculator I play with from time to time. In my opninion, it was a good buy.

Re: Question about Russian RPN Calculators

*Message #5 Posted by **Namir** on 5 Jan 2005, 2:37 p.m.,*
in response to message #4 by Aleph Mobius

Thank you all folks for your comments and for the link to the non-HP RPN calculator website.

Namir

Re: Question about Russian RPN Calculators

*Message #6 Posted by **GE (France)** on 5 Jan 2005, 5:43 p.m.,*
in response to message #5 by Namir

Andrew Davie sold a couple of models to me, he is (with Sergei Frolov) a prominent soviet calculators figure. So with these sellers trust is not a problem, delivery was a few weeks (from australia). These machines have a real personality, with quirks, tricks, workarounds and are collectible, overall harder to find than usual stuff. Take the plunge !

BTW, A.Davie sells his collection, see http://www.taswegian.com/MOSCOW/soviet.html, if you have $100,000 to spare.

I hope no name is unappropriately used here - 123 to delete

Re: Question about Russian RPN Calculators

*Message #7 Posted by **Aleph Mobius** on 5 Jan 2005, 9:55 p.m.,*
in response to message #6 by GE (France)

Here is a story that is a bit of a coincidence. I became interested in writing a game for the old Atari 2600 system last summer. I found a great tutorial by Andrew Davie. One morning I was reading this tutorial when the postman brought my MK-61. I searched Google for some information and read everything one of the sites had to say about it. It turns out the MK-61 website was made by Andrew Davie. I emailed him and it turns out he is also the guy who made the 2600 tutorial. By the way, Sergei Frolov is selling his collection for $100,000, not Andrew Davie.

Re: Question about Russian RPN Calculators

*Message #8 Posted by **Namir** on 6 Jan 2005, 12:30 a.m.,*
in response to message #7 by Aleph Mobius

I will check the web site and sigh since I don't have 100,000 to blow away just like that ... besides it will cost me more to house the new collection since I will probably need to buy a bigger house!!!!

Many thanks for all your comments!

:-)

Namir

Re: Question about Russian RPN Calculators

*Message #9 Posted by **Ed Look** on 6 Jan 2005, 10:27 p.m.,*
in response to message #8 by Namir

Ha ha ha! I'd settle for ONE RPN Elektronika!

Re: Question about Russian RPN Calculators

*Message #10 Posted by **db (martinez, ca.)** on 7 Jan 2005, 12:20 a.m.,*
in response to message #9 by Ed Look

Ed; Try ebay. I will say that magnetty is honest, but slow. That seller has auctions up on ebay regularly. If you are you in the SF area, i have one spare elektronika that you can buy.

Re: Question about Russian RPN Calculators

Any Inside Photos of HP 12C Platinum

*Message #1 Posted by **Dave** on 4 Jan 2005, 4:58 p.m.*

I'd love to see photos of the innards of the 12C Platinum. Are any available? Thanks.

Re: Any Inside Photos of HP 12C Platinum

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Jan 2005, 10:36 p.m.,*
in response to message #1 by Dave

Hi;

I know that one guy that contributes here has once posted some photos of an HP12C Platinum beta unit, both external view and "inner guts", but I do not have the images. I own an HP12C Platinum and I'm about to "have a look inside". If the contributor does not post it (maybe he doesn't have the photos any longer), I'll try to do that.

Gimme a couple of days...

Cheers.

Luiz (Brazil)

Re: Any Inside Photos of HP 12C Platinum

*Message #3 Posted by **Gene** on 4 Jan 2005, 11:09 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

It was me, but I think they are gone.

I can always take more, but may not have the chance to do so soon.

Gene :-)

Re: Any Inside Photos of HP 12C Platinum

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 5 Jan 2005, 12:44 a.m.,*
in response to message #3 by Gene

Hi, Gene;

thank you to remind me... I was almost sure it was you, but I was affraid giving the wrong credits.

BTW, I wrote an interface for the HP48/49 (User RPL) that emulates almost all of the functionalities found in the HP12C when dealing with cash flow analisys, I mean, data input and edition. I borrowed someone else's computation for IRR and NPV to test the interface, so I cannot disclose it publicly. Anyway, I'd like sending you a copy of it so you can tell me what do you think of the interface itself.

I'll write my own IRR and NPV routines soon, but having your opinion and necessary suggestions would surely help improving it.

I have lost almost all of my contacts e-addresses, and I cannot find yours, too. So, if you can send me an e-mail tellin me if you'd like to test it, I'd send you a copy of it. I searched hpcalc dot org and found some advanced libraries, but have not found such HP12C-based interface.

If so, please send an e-mail to:

lcviera at quantica dot com dot br (I guess you still have it, right?)

I'd also add some news related to that contact with HP, A.G., remember?

Best regards, Gene. Please, feel free deleting this message after reading: the password is my midname, all lowercase, no accented letters.

Cheers.

Luiz (Brazil)

Help Luiz, Please..

*Message #1 Posted by **Rick** on 4 Jan 2005, 3:46 p.m.*

Having separated NE and 34.2345 from "N34.2345E" to get : 34.2345 "NE", I need a some more help.

I further need to do the following:

If NE then, leave as is; if NW then NEG 360 HMS+; if SW then 180 +; if SE then NEG 180 +

How can I add all these clauses into one test clause. I am really having problems.

Actually, I am trying to write a program [with great difficulty] that converts quadrant bearings to Whole Circle bearings [clockwise from north].

Re: Help Luiz, Please..

*Message #2 Posted by **Forrest** on 4 Jan 2005, 10:15 p.m.,*
in response to message #1 by Rick

Rick,

I don't know what you are trying to do but the conversation is interesting and reminds me of things done many years ago. I also don't know if you are in control of your environment but the use of N34.2345E for a bearing is rather inconvenient. NE34.2345 is easier because you only make one transfer from the alphabetic keyboard to the numeric, and most surveyors would prefer using numeric codes for the quadrants where 1 is NE, 2 is SE, 3 is SW, and 4 is NW. If numeric quadrants are used then you never have to use anything but the numeric keypad. This can simplify this whole process quite a lot. Since bearings only have degrees up to 90 (two digits) then they can be expressed as Q.ddmmss, where Q is the quadrant number. The quadrant can then be separated by using the interger portion of the number and assigning it to a variable (Q=1). The remaining fractional part of the number can be multiplied by 100 to get the bearing numbers (B)as you have listed them (B=34.2345). The bearing numbers can then be modified through a series of tests (if Q=2 then B=180-B, if Q=3 then B=180+B, if Q=4 then B=360-B). Of course if Q=1 then you don't have to do anything. This will result in a north azimuth in degrees, minutes, seconds clockwise format.

I wouldn't do it quite like this because I would also want to do some checking for an illegal quadrant number. I would also have an if statement for Q=1 and in all cases would transfer to a different part of the program so that if Q was not equal to 1-4 then I would continue into an error blocking statement.

Of course you can use the built in conversion to decimal degrees (HR) or the HMS+ and HMS- if you are going to do calculations with the angles.

Again maybe you don't have any control over the format of the bearings being input, in which case the testing will have to be done on an alphabetic character match instead. If you have control over the input then you will find the numeric quadrants much faster and more accurate.

Best Regards and don't give up.

Forrest

Re: Help Luiz, Please..

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 Jan 2005, 10:23 p.m.,*
in response to message #1 by Rick

Hi, Rick; sorry taking too long (I just accessed www right now).

I remember dealing with Survey programs some time ago (about twelve years or more) and I am aware of what you want, I guess. There is a CASE structure that may be of help (any HP48 or HP49). The CASE is like this:

```
CASE
test1 THEN action if test1 is true END
test2 THEN action if test2 is true END
.
.
.
default action if no test is true (optional)
END
```

By using RPL and operations directly in stack contents is also easy, but demands a bit of "daring". So, using CASE, you can try this: (consider you have the resulting values from previous sequence, meaning number in level two and quadrant identifier in level 1)

```
.
.
.
-> QI
  « CASE QI "NW" == THEN NEG 360 HMS+ END
         QI "SW" == THEN 180 + END
         QI "SE" == THEN NEG 180 HMS+ END
    END QI
  »
```

After this, you'll have the quadrant identifier back to level 1 and the correct bearing in level 2. If you want to discard the quadrant identifier, simply suppres the las QI (after the last END).

Hope this helps. In fact, I did not test it, I just wrote it in a rush to answer you. If it does not work, please, post again.

Cheers.

Can someone help me with today's Dilbert?

*Message #1 Posted by **Paul Brogger** on 4 Jan 2005, 1:15 p.m.*

I don't "get" the final line in today's Dilbert strip. Is it something that should be obvious?

Re: Can someone help me with today's Dilbert?

*Message #2 Posted by **Barry Schwartz** on 4 Jan 2005, 1:24 p.m.,*
in response to message #1 by Paul Brogger

57 is the part number of a HP inkjet cartridge. Note that the man is a printer cartridge salesman.

Thanks

*Message #3 Posted by **Paul Brogger** on 5 Jan 2005, 5:14 p.m.,*
in response to message #2 by Barry Schwartz

I appreciate that.

in response to message #2 by Barry Schwartz

Know I understand the meaning, but is it funny?

A smirk; no more.

*Message #5 Posted by **Cameron** on 5 Jan 2005, 11:51 p.m.,*
in response to message #4 by Tracy

Humour is much more subjective than the value of an old HP!

I think both the salesman's responses are supposed to be sarcastic. The "receptionist" earnestly introduces herself and then sarcastically dismisses his comment about being the CEO by suggesting that *he* must be Carly. He attempts a weak riposte--lamely misidentifying her as a printer cartridge--and he ultimately loses the exchange.

I'd rate it as a smirk. I guess it depends on your view of the stereotypical receptionist and toner salesman.

Cameron

PS: Happy New Year to all.

Re: A smirk; no more.

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 6 Jan 2005, 12:09 a.m.,*
in response to message #5 by Cameron

Hi Cameron, all;

should it reffer to some weird situation involving Carly, mainly her being missidentified or misidentifying someone/something else? I don't follow economics backstages, maybe someone here does...

Just a guess.

Luiz (Brazil)

HP 12C -- Stuck Key

*Message #1 Posted by **P. Simon** on 4 Jan 2005, 11:30 a.m.*

I have a fairly new 12C (but no store receipt, darn!). The "7" key and its associated "BEG" function don't depress all the way and therefore don't enter.

Any repair ideas or better yet, repair services? BTW, "fixthatcalc.com" -- for some reason doesn't repair 12Cs (but does several other HPs).

Thanks for any ideas.

Peter

Edited: 4 Jan 2005, 11:33 a.m.

old vs. new "equivalent"

*Message #1 Posted by **Jay** on 4 Jan 2005, 10:58 a.m.*

I have an HP 41c (with quad memory module) that has an unreliable keyboard. Been fixed several times, but never permanently and so I have basically given up. Can anyone tell me what current new HP calculator would be the best equivalent? HP sales indicated the Graphing line (either the 48gll or 49g+), but the 33s Scientific looks attractive.

Any guidance would be greatly appreciated. And if I do purchase a new model, I would be happy to discuss selling my 41c, albeit non-reliable at this time.

Thank you, Jay

Re: old vs. new "equivalent"

*Message #2 Posted by **Ron Ross** on 4 Jan 2005, 11:31 a.m.,*
in response to message #1 by Jay

If you don't need trig functions, I would also suggest you look at an Hp17Bii (actually the older ones are still easy to find and not all that expensive). It will have a quality keyboard, 7K RAM, a nice solver (You give up programming, but the solver is actually easier to use). And you keep the enter key in the old location. Form factor is better than the newer Hp33s (even the new Hp17Bii+, which has 32K of real usuable RAM, but enter key is moved and all newer keyboards are quality suspect, though may still be acceptable).

If you DO need trig, you could consider an Hp19Bii which is a bi-fold device with similiar specs and behavior to the Hp17Bii. But you could also buy a used Hp28s or 48G. Both are about $50 via ebay (same price as a new Hp33s). Both are better than an Hp33s for power, but both are graphics and bigger in size as well (though the HP28s probably isn't much bigger).

For power, the Hp48GII/Hp49G+ series blows the poor Hp33s out of the water. The Hp33s specs measure up close to the Hp41c for features. The Hp33s is basically an Hp32sii with extra RAM and a redesigned keyboard. You can find some comparisions with that in mind. The Hp41c is of course a much more versatile instrument than an Hp33s, but for number crunching, you might be very well served with the Hp33s. Similiar programming in RPN, plus you would also get an algebraic solver. You would be hampered by a 26 variable limit with no way around for program usuage ie, while you do gete 32K ram, you get no way to use more than 3-4 K in reality. All I/O is done through your fingers and the LCD.

But it is the best available retail for an RPN scientific (basically the only thing available).

The Graphics calculators are actually RPL and have no 4 line limit of the RPN programmables.

You would probably like the older Hp17Bii best if you don't need trig, if you do need trig, you are best off with the Hp33s. If you want a powerful new calculator, the Hp48/49 series is great, but lots of new things to learn.

Re: old vs. new "equivalent"

*Message #3 Posted by **Erik Ehrling (Sweden)** on 4 Jan 2005, 12:53 p.m.,*
in response to message #1 by Jay

I guess the best thing for you would be a HP-49G+ with Hrastprogrammer's HP-41 emulator on it ("http://www.geocities.com/hrastprogrammer/").

Best regards, Erik Ehrling (Sweden)

Re: old vs. new "equivalent"

*Message #4 Posted by **Veli-Pekka Nousiainen** on 6 Jan 2005, 9:40 a.m.,*
in response to message #3 by Erik Ehrling (Sweden)

Warning: the 49G is much better than the new plus in emulating a full-blown 41CX system [VPN]

Re: old vs. new "equivalent"

*Message #5 Posted by **bill platt** on 6 Jan 2005, 12:43 p.m.,*
in response to message #4 by Veli-Pekka Nousiainen

And, the original 49G is only $50 used (in the US). A very good deal. (If you are from Europe, you can get one for even less---as the US dollar is quickly becoming a third world currency...)

BTW, although the rubber buttons of the 49g are slower to type on than the 48 series, I have found them reliable. Just get used to the "Garbage collection", or put a forced garbage collection routine on. They are not cheap mushy buttons--there is a click.

Regards,

Bill

Re: old vs. new "equivalent"

*Message #6 Posted by **Cyril R** on 11 Jan 2005, 7:29 a.m.,*
in response to message #5 by bill platt

I think that someone who worked several years with a hp-41, will forever work with such a model. All other models will seem unperfect for a 41 user. You should try to buy an other 41c on ebay, it won't be much expensive that a new 33s. Or maybe a 42s.

*Message #3 Posted by **hugh steers** on 4 Jan 2005, 1:08 p.m.,*
in response to message #1 by Tan

i had an idea for umbrellas once.

nowdays its mostly too windy for umbrellas. the wind tends to turn them inside out. you see people fighting with their umbrellas in the wind. so why not have an umbrella built like a fan, with overlapping vanes, of course, but angled so that the wind turns the umbrella round like a top. there'd be a pivot at the apex to turn. that way the wind energy would turn the umbrella rather than fight against it.

?

Re: Fanbrella

*Message #4 Posted by **Paul Brogger** on 4 Jan 2005, 1:23 p.m.,*
in response to message #3 by hugh steers

. . . and the centrifugal force would shed any rain that might be falling. (Actually, it would throw it on everyone around the holder, but we'll not let that smear the concept.)

You may be on to something.

chinese umbrella factory,promotion umbrella,advertisement umbrella

Angle those vanes just right and even Mary Poppins will be interested!

Re: Fanbrella

*Message #5 Posted by **hugh steers** on 4 Jan 2005, 5:55 p.m.,*
in response to message #4 by Paul Brogger

well, i wasnt supposing there'd be a lot of force left to throw it outwards. if so, you could adjust the pivot or turn it into a generator for your calculator - or something.

:-)

experimental pocket pc calculator

*Message #1 Posted by **hugh steers** on 3 Jan 2005, 4:12 p.m.*

i'm writing a new calculator for the pocket pc. its called Exact! right now i've put out an early test version, but i've got a lot of great ideas i want to do with it. if anyone would like to try it out, its over at www.voidware.com/exact

its built for arm and i haven't tested it on anything but ppc 2003 se, although it doesn't use .net, hurrah!

there's an rpn mode selectable from the settings menu, but i think the button layout is currently confusing for rpn. ie two equals buttons and enter!! if anyone's keen to try it, let me know. in the mean time, i'll carry on trying to make the rpn mode work better and putting in the missing features.

suggestions most welcome.

Re: experimental pocket pc calculator

WARINING (PSA): unusual replies to HP classifieds

*Message #1 Posted by **Mike** on 3 Jan 2005, 1:58 p.m.*

Just curious, if others have received these type emails in replies to ads on HP classified site. I have received two (2 more since composing this) very nearly identical emails expressing interest in one of my HP classified ads.

Here was the most recent:

> Quote:
>
> hello seller,
>
> I am XXXXX (name omitted) by name am from YYYYY (location omitted) and am a very good business man, i came accros your ads and am evry much interedted in buying it and i will also like to know if it is still for sale or not and i will also wanna know the last price and also wanna see the picx and my mode of payment will be by a cashier check okay hope to hear from you soon....
>
> regards

Both emails had identical subjects: interested in your... (HP Museum Ad title was here)

What is suspicious about them?

nearly identical content. Have the last line as "Powered by outblaze" Have an apparently scanned subject line. Begin "Dear seller" rather than by name.

In the case of my ad, it was for a "Huge lot" of many different things but was referred to as "it" in both emails. Both emails arrived at nearly the same time. Had a third a couple of days ago that was also identical.

While the questions asked might seem appropriate, the timing of these two, the nearly identical content, the same ending line, the fact that they reference "it" instead of recognizing it was a lot, make me a bit suspicious about the replies. Anyway, I thought I'd just ask others.

And it just gets stranger

I have just received a 4th reply. This one really looks strange. All 4 of these were from foreign solicitators. **Here is that content**

> Quote:
>
> Hello, How are you today , am very much interested in buying the ZZZZ (item deleted; cost $200) , to hasten up this transaction and to make it easier there is an associte of mine in uk who i will instruct to issue out payment to you immediately.i had a dicussion with not quit long, of what i am about to buy from you . he has agreed to issuing you a MONEY ORDER CHECK ,i will instruct him to issue out the check in your name, so a total check of ($4,500) will be send to you because this is the total money i need from him .pls after the payment is in your possesion you will faithfully deduct your own part of

> it.More so i have discuss this transaction with my SOLICITOR and he told me that i should not be AFRAID , I don't know if I can ENTRUST YOU with my balance after you have deducted your own part of it ,the balance will be sent to my shipper for the pick-up of the bus i bougth from you and with the other goods i bougth from MR TTTT (name deleted) in Sweden . I have informed my transporter(shipper) of my intension to buy this from someone inUS .pls let me know if you are okay with my method of pay can forward it to my client to issue out payment to you as soon as possible

WARNING: These might be perfectly legit but sending $4500 to someone for a $200 item sounds like a potential scam. I have declined such offers but will let you know of any followups.

Anyone else experience this? (4 offers in a couple of days, all from foreign bidders wanting to pay by certified checks, with the same ending line in their emails.) I'm not normally this suspicious but 4 nearly identical emails from four foreign buyers is a bit of a coincidence, don't you think?

NOTICE: Be very careful about accepting any form of checks, especially from foreign buyers. There is no way to verify checks. You may wind up sending items and later find out that these supposedly certified cashier's checks were bad.

Apologies to anyone that might have sent me a legitimate request that was similar to these.

in response to message #1 by Mike

Hi Mike,

ever heard of 'Nigeria Connection' ?
;-)

I wouldn't waste my time with these people.

Raymond

this is a new phenomena, I think

*Message #3 Posted by **Mike** on 3 Jan 2005, 2:37 p.m.,*
in response to message #2 by Raymond Del Tondo

I have advertized before on the HP Museum site. I have never seen this type of reply before. It may be a new phenomena and I just wanted to warn others.

The first 3 didn't trip any flags, individually. But all 4 (together) definitely did. The last one that offered to send me $4500 for a $200 item, set off every flag I have.

Don't want to see anyone get scammed by thinking a cashier's check somehow protects them. They can't be verified instantly at any bank.

Just a word to the wise.

in response to message #1 by Mike

Hi Mike

Cool, someone hs the same problems like me. I also got some of these mails during the last 3-4 month. But I ´ve learned a lot: These mails are SPAMS and are directly copied into the trashcan. I suppose, these might be persons trying money laundering. So take care of them and do not respond to them, just use them as normal SPAM

Re: WARINING (PSA): unusual replies to HP classifieds

*Message #5 Posted by **Larry Corrado** on 3 Jan 2005, 5:59 p.m.,*
in response to message #1 by Mike

I've heard this scam discussed a number of times recently at various places. Evidently phony cashiers checks are becoming very common because of modern printer technology. And it takes a week or more for a bank to discover that a check is phony. So, they send you a big cashiers check and ask you to send part of it to someone they supposedly owe money to. Then, sometime later, you find out that the check is bogus, and you're out the money you sent.

Steer clear of this "buyer."

Regards, Larry

Re: WARINING (PSA): unusual replies to HP classifieds

*Message #6 Posted by **Les Bell [Sydney]** on 3 Jan 2005, 6:01 p.m.,*
in response to message #1 by Mike

These are a variation of the so-called "advance fee fraud". What would happen is that you would receive a forged bank check for $4,500, which you would deposit at your bank. Give it a couple of days, everything seems fine, so you buy a bank check for $4,300 and ship it, with the goods, to the scammer. Around three to five days later, your bank finally discovers the check you deposited was forged, so they reverse the transaction and you're left $4,300 and some calculators down.

It's not a new scheme, but it's possibly a new twist for the scammers to be using the Museum classifieds as a source.

Best,

--- Les Bell, CISSP

*Message #9 Posted by **Frank Boehm** on 4 Jan 2005, 2:45 a.m.,*
in response to message #7 by Jeff D

Agree to the deal. Let them send you a check. Ready a good deal of stuff to be picked up (your old toaster, stones, junk) and remember to put a really high customs value on it. Have them send a parcel service to pick it up. Even if they stole the shipping account #, they still have to pay the customs, which is quite a lot (considering your old junk has a customs value of at least $1000). They have to pay for the fraudulent checks as well (which they tend to send via FedEx), so it'a a total loss.

There is a nice forum for this kind of scams:

http://www.419eater.com/

There was a 100+ pages thread until a couple of weeks ago. One fellow managed to have them pick up three!! shipments full of junk. The scammers paid 20000+ for customs :)

Don't waste your time

*Message #10 Posted by **Mike** on 4 Jan 2005, 9:09 a.m.,*
in response to message #9 by Frank Boehm

Do you really think anyone will pick anything up? The scammer won't bother to pick anything up. They certainly will never go to the customs office to pick up something on a stolen account.

Most scammers that I'm seeing are requesting the overpayment to be sent via seperate service (like Western Union).

Don't waste your time with them.

Re: Don't waste your time-and other fun things

*Message #11 Posted by **C. Johnson** on 4 Jan 2005, 5:20 p.m.,*
in response to message #10 by Mike

I've received a few of these also. I also "supposedly" sold my items and never received payment. The person seemed legit and sent me there mailing address. I am still waiting for the payment since before Christmas. My linuxmail account(hp41c@linuxmail.org) has been deactivated also. Either from a high volume of spam or someone just deactivated it. After some investigating seems it's rather easy to do.

Is HP stuff this popular desirable now. I just wanted to sell a few things I have that I just don't use and wanted someone who could use them to have them.

Oh well, I'll try agian or maybe just keep the stuff if this is what people have to go through just to sell a few HP items. Sad to have the HP commmunity infiltrated by scams like this.

Chris

Re: WARINING (PSA): unusual replies to HP classifieds

*Message #14 Posted by **Ron Ross** on 3 Jan 2005, 9:08 p.m.,*
in response to message #1 by Mike

I have often considered taking them up on their generous offer, only letting them mail their check directly to whatever bank they claim to have their funds drawn from (ie ask which MO service they intend to use and find a local branch and local rep, give his name and office address) If its legit, they will probably just get their check back, if not, the MO service may just have a good enough lead to prosecute. Since it is the MO services name and reputation at stake, they may just aggressively try to correct the situation.

I would love to see these scumbags get their just rewards.

Re: WARINING (PSA): unusual replies to HP classifieds

*Message #15 Posted by **Palmer O. Hanson, Jr.** on 3 Jan 2005, 9:56 p.m.,*
in response to message #14 by Ron Ross

When I tried to sell a couple of HP-12's last fall I received several of these offers which involved my receiving a large sum of money from which I was to take my price and forward the rest to another individual. I trash those "offers" as soon as possible.

Re: WARINING (PSA): unusual replies to HP classifieds

*Message #16 Posted by **Eddie Shore** on 3 Jan 2005, 11:46 p.m.,*
in response to message #1 by Mike

Concur with all the posters. This email smells like a scam, looks like a scam, tastes like a scam... it is a scam.

My father had an "offer" for a large sum of money when he tried to sell his motorcycle. He didn't respond. Then he received a check, but did not cash it and called the bank. The check was bogus. So no transaction.

same scam

*Message #17 Posted by **Bill Smith** on 5 Jan 2005, 12:59 p.m.,*
in response to message #1 by Mike

i also was targeted, though the offer looked real enough. buyer asked for a photo and my best price, before offering to pay for a $20 item with a $1200 check. i'm both trusting and dumb, but not that dumb. according to my bank an electronic direct funds transfer is the only secure way to go.

it's really unfortunate that the classified section has been compromised in this way. i always preferred to trade there first before listing an item on ebay.

same scam

*Message #18 Posted by **Thomas** on 10 Jan 2005, 8:43 a.m.,*
in response to message #1 by Mike

Hi,

I was offered US$ 3000.- for some magnetic cards that I have offered for free (only postage fees must be paid).

The wording was the same as Mike has described.

Kind regards, Thomas

Hi,

the right size is LR44 ;-)

Raymond

Re: HP42s

*Message #3 Posted by **Richard Garner** on 3 Jan 2005, 10:46 a.m.,*
in response to message #1 by Al Wilson

In alkaline use LR44 but for long life using the Silver Oxide 357 is best. Silver Oxide batteries are a little more expensive than alkaline, about $9 for 3, but depending on use the Silver Oxide can last a couple of years to the alkaline couple of months.

Programming Help 48GX

*Message #1 Posted by **Rick** on 2 Jan 2005, 8:32 p.m.*

Given : N45.5645E , How can I drop the number and get NE alone?

Re: Programming Help 48GX

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2005, 9:37 p.m.,*
in response to message #1 by Rick

Hi, Rick;

the following solution is completely focussed on User RPL, O.K.?

If **N45.5645E** is a string, you could use the following routine:

```
2 OVER SIZE 1 - SUB OBJ->
```

This only works if both left- and right-most characters must be discarded and the number within has a valid syntax.

Hope this helps.

(there are SYSRPL solutions, but I guess others can place them here; I'm just standing in front of the rabit's hole and observing...)

Luiz (Brazil)

Edited: 2 Jan 2005, 9:38 p.m.

Re: Programming Help 48GX

*Message #3 Posted by **Veli-Pekka Nousiainen** on 3 Jan 2005, 12:08 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Q:"Given : N45.5645E , How can I drop the number and get NE alone?"

A: "N45.5645E" is a string at level 1, right?
<< DUP 1 DUP SUB SWAP DUP SIZE DUP SUB + >> 'F&L' STO
You can use the 'F&L' (first and last *) in a program or assign it to a key.

(*) You may substitute Alpha & Omega at will.
[VPN]

Oops! My answer does the opposite... Sorry!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 3 Jan 2005, 12:22 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, Rick;

After reading VPN's (correct) answer I realized that I dropped what you wanted to be kept and kept what you wanted to drop... My mistake!

Sorry...

Luiz (Brazil)

Thanks guys, I love this site.

*Message #5 Posted by **Rick** on 3 Jan 2005, 5:39 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Glad for both solutions Luiz. I also needed the value. Thanks again.

Re: Thanks guys, I love this site.

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 3 Jan 2005, 8:12 a.m.,*
in response to message #5 by Rick

HI, Rick;

if you want to put both in the same "package", maybe using local variables is easier. You can try this: (VPN, I'm using part of your 'engine', O.K.?)

```
« DUP SIZE OVER -> S T
  « T 2 S 1 - SUB OBJ->
    T 1 1 SUB T S S SUB +
  »
»

   L1                L3          L2      L1
"Z123.456W"   -> "Z123.456W"  123.456  "ZW"
```

The program holds a copy of the original string and returns both the number and the two ASCII characters bordering it. If you don't need a copy of the original argument, you can try this one:

```
« DUP SIZE -> T S
  « T 2 S 1 - SUB OBJ->
    T 1 1 SUB T S S SUB +
  »
»

   L1                L2      L1
"Z123.456W"   ->   123.456  "ZW"
```

Hope this is closer to what you actualy want.

Cheers.

Luiz (Brazil)

*Message #7 Posted by **Veli-Pekka Nousiainen** on 3 Jan 2005, 11:38 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

One possible solution:
/<< DUP 2 OVER SIZE SUB STR/->
/->STR 2 2 SUB ROT 1 1 SUB SWAP +
/>> 'F&L' STO
"Z123.456W"
F&L =>
123.456
"ZW"
[VPN]

HP-IL RS232 Interface & Windows

*Message #1 Posted by **Jon** on 2 Jan 2005, 5:08 p.m.*

I would like to connect the HP41 to the computer using the 82164A interface and the Extended I/o module. I have read the article sent by Tony Duell, but I am afraid that it is only for linux. Is there something similar for windows?

Thanks in advance

Jon

HP11C

*Message #1 Posted by **Fred Rumak** on 2 Jan 2005, 4:30 p.m.*

I have an HP 11C that has the third digit after the decimal that is partly missing. I bought and installed a display from a 12C as someone told me this would work. It did not. After running the diagnostics, the display should read 11, but read 12. Also, some functions such as roots and squares do not work correctly.

I need some help.....thanks!

Re: HP11C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2005, 4:48 p.m.,*
in response to message #1 by Fred Rumak

Hi, Fred;

can you describe what part of the display you actually replaced? For me, it's enough to see the

```
[    12    ]
```

after testing the keyboard to tell you that this is an HP12C, not an HP11C. That would also explain the "awkward" operation. Please, have a look at the image below:

If this is what you replaced, you actually brought an entire HP12C to the inside of an HP11C (this image shows the inside of an HP15C, in fact, but they all look alike). In fact, the LCD itself cannot hold information related to the calculator operation. One single test you can perform is keying in a number and after the third digit ahead you press the back-arrow key [<-] and see if the rightmost digit is cleared. If the entire display returns to [0.00] than you are operating an HP12C. Also, after a memory clear procedure ([ON]&[-]) you should see four decimal places if it is an HP11C. The HP12C's default is two decimal places (financial default).

Let us know if you need more advice.

Luiz (Brazil)

HP 11C

*Message #3 Posted by **Fred Rumak** on 2 Jan 2005, 8:30 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks LUIZ,

I replaced the whole thing. The whole picture of what you sent in your email. The display, battery contacts and the like.

I used one from a 12C, because somebody told me it would work. It doesn't.

I need to buy one from an old 11C.

Thank you for your reply.

Happy New Years to you and your family,

Fred Rumak Calgary, Alberta, Canada

Re: HP 11C - again

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2005, 9:29 p.m.,*
in response to message #3 by Fred Rumak

Hi, Fred;

I'm glad you could identify it.

The fact is that it is possible to X-change the LCD assembly, but I had no good experience when dealing with this type of construction. There is no need for soldering, but electronics and "mechanical" expertise is required, because there is a metal frame (that you have probably seen in the front side of the display assy) that needs to be carefully bent to release the LCD and both polymers. The structural shape of this frame must not be changed, because it must be used to keep everything back in place.

You may find some serious, pro technician that is able to exchange the LCD assy only. If not, try fixthatcalc and they'll surely put things back togheter.

Best regards.

Luiz (Brazil)

Re: HP 11C - again

*Message #5 Posted by **Artur** on 3 Jan 2005, 6:17 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi to all of you! Vieira is correct about taking care in exchanging the display only. I've already done this in one HP15C and it was tedious to put all the display's digits to work properly back again. Remove the metal frames, remove the displays (take care do not remove the spaget rubber back it) and exchange them. Replace the frame and tight it well. With a small screw driver, adjust the spaget over the PCB contacts until you get the display working correctly. By these days, I'll make this procedure again with another 15C and the display of one old 12C.

Best regards - Artur - Brazil!

GPS Software

*Message #1 Posted by **Matthias** on 2 Jan 2005, 3:32 p.m.*

Hi

I´m using a Jornada 720 as my PDA. I have a Holux GPS reveiver that works well in it. Now I´m using a version of Teletype, the only GPS software I know for this machine. But it does not allows you to plan a route. Is there a newer version or another software, that shows a map and can plan routes?

Matthias

Re: GPS Software

*Message #2 Posted by **hugh steers** on 2 Jan 2005, 9:06 p.m.,*
in response to message #1 by Matthias

you could try mapopolis. the app is free and claims to talk to gps. you pay for the maps. so you could, try it at least.

?

Re: GPS Software

*Message #3 Posted by **Matthias** on 3 Jan 2005, 12:26 a.m.,*
in response to message #2 by hugh steers

As I see, Mapopolis is only for the common PDAs. The Jornada 720 has a keyboard, a larger display and another WindowsCE version than Mapopolis requires.

Strange Jornada 680

*Message #1 Posted by **David Ramsey** on 1 Jan 2005, 9:49 p.m.*

Bought a cheap 680 WinCE device off eBay. The machine works, but the row of function keys above the number keys has been replaced with a black brushed metal strip.

I'm guessing this was some special variant produced for for corporate use, but I've never seen anything like it. Does it ring any bells here?

$2,000,000 calculators for sale. Scam or optimism?

*Message #1 Posted by **Mike** on 1 Jan 2005, 10:30 a.m.*

This seller is selling 100 calculators for $2,000,000.

He claims the "net" is for Tsunami Relief. "Net profits" not defined. Photo link do not work.

Does this look legit or do you think it's a scam? Anyone know this seller? He claims to be a designer of the HP-35 **Look alike** shown.

$2,000,000 HP-35 look alike for sale

I'm not sure what the value of this is but I seriously doubt it is $2,000,000.

Edited: 1 Jan 2005, 10:39 a.m.

Re: $2,000,000 calculators for sale. Scam or optimism?

*Message #5 Posted by **Namir** on 1 Jan 2005, 3:16 p.m.,*
in response to message #1 by Mike

I thought about doing a few Ebay auctions for calculators and books (that I wrote myself) to benefit the tsunami victims. After some thought I decided not to, since we can give directly to the Red Cross, UNICEF, and other organization without sales-for-benefit gimicks.

If you want to help teh tsunami victims, give directly to releif oragnization and jeep eBay, PayPal, and the like out of it.

Namir

MLDL2000 Update

*Message #1 Posted by **Meindert Kuipers** on 31 Dec 2004, 10:02 a.m.*

Hello all,

Some good news at the end of the year: The proto's of the MLDL2000 are now fully working, with only a few minor features to be tested. The most difficult part, being able to program SRAM and FLASH through USB, is now working great.

I will now finish some further testing and will be able to supply the protos to the first beta testers before the end of January.

Wishing all of you a good 2005 and please do not forget the victims of the tsunamis in Asia

Meindert Kuipers

HP-67 ROM 1818-0551 broken

*Message #1 Posted by **Eddie C. Dost** on 31 Dec 2004, 9:52 a.m.*

Hi,

I have a HP-67 with a (probably) broken ROM 1818-0551. The symptoms are as follows:

When started it shows

```
"0.           00"
```

in the display. If you type any number, e.g. "5", the display shows

```
"5.0000000000000",
```

if you then type "Enter", the display shows

```
"5.           00"
```

You can calculate with this, i.e. hitting the sqrt key gives

```
"2.           00"
```

on the display. So basically the machine looks quite ok, except that it is not in FIX 2 mode after starting, and entering numbers does not work.

Measuring the interconnections shows no Problem, i.e. all ROMs, the ACT and all others seem to be interconnected just fine. Measuring the separate signals on an Oscilloscope and also with a Logic Analyzer shows no abnormalties.

After that I desoldered the ROMs one after another to figure what is wrong, and found that when the ROM "1818-0551" is taken out, the calculator still starts and behaves the same as described above.

From this I assume the 1818-0551 ROM is broken. Does anyone here have one of these ROMs as spare, and would be willing to help me out with this? I would pay for the ROM.

Any help, hints as what else this could be are very wellcome!

Thanks,

Eddie

HP41C vs HP67/97 mag cards

*Message #1 Posted by **Robert** on 31 Dec 2004, 12:06 a.m.*

Are HP67/97 pre-programmed magnetic cards compatible with the HP41 and its plug-in card reader? Are there separate program cards for the 41 series? Thank you

Re: HP41C vs HP67/97 mag cards (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 31 Dec 2004, 1:11 a.m.,*
in response to message #1 by Robert

Hi, Robert;

I use the same magnetic cards for both HP41 and HP97. Some of the main issues about this "sharing" are:

cards with data written in an HP67/97 can be read by an HP41 w. card reader; the opposite is not true;
same applied to programs;
cards with pre-written programs for the HP67/97 can be read by an HP41 w. card reader, but there are some small "adjustments" to be made (please, read below);
cards written in an HP67/97 can be verified by an HP41 w. card reader (VER function).

The HP82104A Card Reader User's Manual (or Owner's Guide, I have none in hands) has an specific chapter that deals with these details. There is also a complete chapter (or appendix) that describes all changes and/or specific usage procedures that must be performed when using pre-written cards from the HP67/97 program packs.

I actually mark the cards in such a way I can identify what calculator actually wrote it. As a matter of fact, cards with data written by an HP41 w. card reader can be overwritten by an HP67/97 at any moment. The opposite is true.

And a 'last minute' warnning: the HP41 allows overwritting "protected" (clipped) cards (flag 14); I don't know a way to overwrite protected (clipped) cards in an HP67/97.

Hope this helps.

Luiz (Brazil)

Hi Luiz,

Nice explanation and timing. You hit on some things I missed. If I hadn't tried to find my card reader

manual we could have had a tie on responding.

Hope you're having a great holiday. Richard

Re: HP41C vs HP67/97 mag cards(edited)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 31 Dec 2004, 1:40 p.m.,*
in response to message #3 by Richard Garner

Hey, Richard; thanks for your words!

You see, sometimes I lack some knowledge, others it seems that they are "on the edge". I was lucky enough pressing [ENTER] a few minutes before you. And you menitoned an important aspect: the equivalent 67/97 functions only exist in the HP41 as long as the reader is attached. Also, we both did not mention the backwards 67/97 relative jumping that can be accomplished with [GTO][I] or [GSB][I] when [I] register contents is a negative number; it does not exist in the HP41.

The main issue is that we all share the same enthusiasm and a sort of a "need to make things work" around here, right? I'm glad guys like you can see that. Thanks!

About holiday time, if I tell you that except for a five-day lasting in'flu'enza, I'm working the s... out of me so I can organize my home, my own working place and get ready for the new subjects I'm gonna teach next year, mainly AI (the basics) and Operational Research. And I have till February 1st to accomplish all of that. I can do that, just cannot miss the timing.

Forgot to add: hope you are, too, having good moments in these holidays.

Best regards.

Luiz (Brazil)

Edited: 31 Dec 2004, 9:18 p.m.

Re: HP41C vs HP67/97 mag cards

*Message #5 Posted by **Richard Garner** on 31 Dec 2004, 1:20 a.m.,*
in response to message #1 by Robert

Robert,

The 41C card reader has the 67/97 specific commands built-in. It will read the 67/97 cards and when run on the 41C, it will run as if they were on the 67/97 pulling the 67/97 specific commands from the card reader. The 41C, however, will not translate the programs from the 67/97 to the 41C. The blank cards themselves can be used with either machine. All 67/97 specific commands will have a 7 preceding the function. An example of a 67/97 specific command that will display on the 41C; 7CLREG would be the [f] CL REG on the 67/97. Although the print is small, the 41C card reader manual has a section on the 67/97 commands and a chart that shows how the different commands from the 67/97 will look in the 41C display.

I hope this helps. Richard

CMT-300 and CMT-200

*Message #1 Posted by **Mike** on 30 Dec 2004, 8:15 p.m.*

Can anyone give me an idea what all these can be used for? I have just purchased both of these with manuals.

CMT-300 Programmable Measurement System, CMT-200 Data Acquisition and Control System

I haven't received them yet but I was looking for a heads up on how useful they are. These are the first I have ever seen. I have tried searching the internet but very little shows up.

Best I can tell the 300 is for an analog to digital type function (i.e. DVM) while the 200 is for data logging. Is that about it or is there more to these?

Do they require any other HP 41 Modules to be useful?

Thanks,

Edited: 31 Dec 2004, 8:00 a.m.

Re: CMT-300 and CMT-200

*Message #2 Posted by **Raymond Del Tondo** on 31 Dec 2004, 8:51 a.m.,*
in response to message #1 by Mike

Hi,

AFAIK they require at least the HP-IL module and maybe the TIME module to be useful;-)

Raymond

Pioneer Keyboard Fixes -- they ARE possible

*Message #1 Posted by **Paul Brogger** on 30 Dec 2004, 7:07 p.m.*

FYI, I just repaired two Pioneer keyboards (a 17B and a 42S) using slightly different techniques, and have thus resurrected two failing units.

On the 42s, after removing the PCB, I cut off the heads of the heat stakes bonding the metal backing plate to the plastic front. (I saved the cut-off heads for later.)

A four-piece sandwich of two flat sheets of mylar with holes, one flexible printed contact circuit, and a dome sheeet came out easily. On this unit, several of the domes' internal conductive ink spots had been worn away, and a loose flake was shorting the on/off contacts.

I ordered a conductive ink pen -- one specifically advertised as flexible and durable -- and "drew" a horizontal swath across the dot in each dome. (The contact fingers are interlaced and run vertically, so I figured a horizontal line of conducting ink in the domes should do the trick.)

I reassembled everything how it seemed it should go together, and put the whole assembly in a jig that applies pressure to the LCD and keyboard contacts without re-twisting the metal tabs that normally hold the keyboard and PCB together. (Thanks to Randy Sloyer for sharing pictures of his similar jig -- such a device is absolutely indespensible for working with Pioneers.)

Nothing. Turns out, I'd not put the mylar sheets together correctly -- one of the flat sheets with holes is meant to insulate the contact flex circuit from the metal backing plate. After getting that fixed, everything checked out perfect!

To re-bond the backing plate and plastic front, I used a small soldering iron with a pointed tip. Without the PCB in place (you probably would have guessed that), I picked up a cut-off rivet head with the hot tip of the soldering iron, placed that over one of the cut-off heat stakes, then pushed the iron point through the rivet head and into the remainder of the stake. This melts the two pieces of plastic, and forces a bit more out of the stake and up toward the metal plate. I then rotate the soldering iron, remove it, and press down on the warm (HOT!) plastic with my thumb. This re-forms a sort of rivet head that, while not as strong as the original, seems strong enough.

With all of my ersatz rivet heads rebuilt, the keyboard seems nearly as good as new. It certainly functions like a new unit, though it may not stand up to abuse quite as well.

To enhance the process, I tried a slightly different tack on the 17B. I took a short length of ~ 1/8" brass tubing and rotated it while dragging the end along a file at an acute angle, creating a tiny "hole saw". I chose the tubing so that its inside diameter was just greater than the o.d. of the heat stakes.

With this tool chucked in a nice pin vise, I tried to "saw" away the mushroomed parts of the 17B's heat stakes. This was a rather more involved process than simply cutting them off, but it left more of the heat stake protruding and made later re-fastening much simpler.

The 17B had a contaminated "STO" key, and after cleaning everything up, I could simply reassemble it. (There was no need for more conductive ink.) Like I say, disassembly was much more involved, but the reassembly went like a charm, and I didn't have to melt cut-off parts onto the heat stakes to make them work.

Both of these calcs work great, and I thought I'd share my experience in case any of you are facing similar problems.

Sometime (soon?) I'll rewrite this as an article for the Articles Forum -- with some pictures.

Good luck with your own Pioneer repairs -- and don't give up on that flaky 42S!

Re: Pioneer Keyboard Fixes -- they ARE possible

*Message #2 Posted by **Hugh Evans** on 31 Dec 2004, 1:55 a.m.,*
in response to message #1 by Paul Brogger

Congrats on your successes, Paul! The approach you used for the 17B is intriguing. I wonder if using a similar brass tube heated to the plastic's melting temperature could be used to draw the heat stake up via capillary action. Absolutely no material would be lost that way.

It would be interesting to know if anyone on these boards has made any other tools specifically for dealing with heat stakes.

Thanks for your report, it's always interesting to hear of new techniques.

Best Regards, HDE

Re: Pioneer Keyboard Fixes -- they ARE possible

*Message #3 Posted by **Chas** on 12 Jan 2005, 10:19 p.m.,*
in response to message #1 by Paul Brogger

Congradulations on your keyboard fixes. Your Pioneer posts have been wonderful and this is great news!

Er, Where do I order one of those conductive ink pens, please sir?

Re: Conductive Ink Pen

*Message #4 Posted by **Paul Brogger** on 14 Jan 2005, 1:50 p.m.,*
in response to message #3 by Chas

I don't remember where I got mine, but I can give you the recipe: Google search for "conductive ink pen".

The top link (today) is "PASCO Scientific" -- The pen image looks like the one I got.

Shop around, & good luck!

Spice "2 Disease" -- Any Treatment?

*Message #1 Posted by **Paul Brogger** on 30 Dec 2004, 6:39 p.m.*

I just got a solderless 31E working (replaced corroded flex conductors between battery compartment and power board with wire) and notice it has the "2 Disease". Every time I press the "2", the minus sign and commas light up.

I remember a discussion of this condition (by Norm, I think) but don't recall a solution ever having been arrived at. Is there one? Should I do anything to prevent further deterioration?

Just curious ...

Re: Spice "2 Disease" -- Any Treatment?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Dec 2004, 7:38 p.m.,*
in response to message #1 by Paul Brogger

Hi Paul, guys;

I and Norm had discussed the "2 disease" for some time (in one of our last post about this I think I assumed an unflexible position at that time, and I still believe Norm resents the episode; I apologized by e-mail but seldom saw his posts here after that... I wish it never happened. In fact, I thought about removing these words before posting, but there is no harm, keeping), and we both disagreed in one particular point: I still think it's a firm/soft/hard characteristic and Norm believes it is a malfunction. Norm tells all Spices come without the "2 disease" in essence (he did not use this very expression, I'm just posting my own expressions), meaning there is nothing wrong with the design, and after some specific cause, the "2 disease" appears. I myself believe that it is an intrinsic, harmless "characteristic", that have probably been seen by the HP designers and (for not being harmfull) corrected later.

Whom of us is right, just time (or an HP designer) will tell. All I believe is that a malfunction (ESD?) that could permanently destroy a "blank", cutting switch (MOS transistor) responsible exactly for turnning of a "2" and a sequence of commas/dots is unlikely to be, but I accept the possibility of. Also, the "2 disease" was found in some of all Spices, being them of either soldered or solderless type. I think this is the biggest reason Norm believes it is a malfunction. I think a serial # track was started in order to figure out a possible period in time when the "2 disease" appeared, but I am not quite sure if anyone got thru it.

I had some Spices (thanks to someone I'm supposed not to mention, but I can thank him anyway :-) and I actually gifted a few, trade two or three and kept five with me: one HP31E, one HP34C (my dearest of them), one HP37E, one HP38E and two HP38C (one of them is not working; I used parts of it to repair the others). At least two of them have the "2 disease", and I take it as a funny characteristic: "these babes have personality", I'd say.

So far, I have not been told about a "cure". I guess taht we could "isolate" the "infected" IC by "transplating" parts of identical units (solderless type, preferably) having one the "2 disease" and the other without "infection" till the infected one becomes healed. Unfortunately I have no such two identical units in this condition.

Cheers.

Luiz (Brazil)

Re: Spice "2 Disease" -- Any Treatment?

*Message #3 Posted by **Randy** on 30 Dec 2004, 8:08 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Most all of the spices I've ever fooled with exhibit the "2" ghosting problem. I long ago concluded it was a firmware/hardware issue, not a failure of any kind. Too many units have the identical behavior to think it is anything other than a unintended feature.

Re: Spice "2 Disease" -- O.K., so I have too much time on my hands . . .

*Message #4 Posted by **Paul Brogger** on 31 Dec 2004, 11:45 a.m.,*
in response to message #1 by Paul Brogger

One possibility: I'm running Energizer "e2" batteries rather than NiCds -- sometime today I'll fetch my 34c and swap in the rechargeables and see if the voltage difference changes anything.

Meanwhile, however I'm messing with a 31e at an advertised 3 volts, and . . .

I see two distinct forms of "ghosting". The minus sign flashes, and commas appear, whenever there is a "2" in any position in the display.

It appears that the brightness of the minus sign's flash is directly related to how many 2's are being displayed. That's weird, and it doesn't seem to appear with any other digits, in any combination. But whenever 2's are in the displayed value, the minus sign flashes, and the more 2's in the display, the brighter the flash.

The ghosting appears identically with whatever keypress results in a particular display.

The flashing commas are *really* weird.

I'm experimenting after setting <f> <FIX> <9>, entering something like "0.020020002" and pressing <+> or <ENTER> repeatedly. With this example, the ghosting display shows briefly "-0.020,0200,02" . Notice the positions of the decimal point and ghosting commas relative to the 2's.

A few more examples with 2's and 0's:

```
 0.2 0 0 2 0 0 0 2 0
-0.2 0 0,2 0 0 0,2 0

 0.0 0 2 0 0 0 2 0 0
-0.0 0 2 0,0 0 2 0 0

 0.0 0 0 2 0 0 0 0 2
-0.0 0 0 2 0,0 0 0 2
```

So it seems the ghosting commas appear, relative to the 2nd & subsequent 2's, in postitions analogous to that of the decimal point relative to the first 2.

Erk.

Then it gets weirder yet.

A few more examples, this time with 2's and other mixed, zero and non-zero digits:

```
 0.3 0 2 0 0 2 0 0 0
-0.3 0,2 0 0,2 0 0 0

 0.0 1 1 1 2 3 4 5 2
-0.0 1 1,1 2 3 4,5 2

 1.0 2 3 4 2 5 6 7 2
-1.0 2,3 4 2,5 6 7 2,
```

So it seems the ghosting commas actually appear, relative to 2's following any non-zero digit, in postitions analogous to that of the decimal point relative to the first non-zero digit.

Double-erk.

I'm sure there's a (perhaps not-so-straightforward) physical explanation for this behavior, but it is a different case!

But now, I've been staring at my calculator display a bit too long -- time to get back to life . . .

in response to message #1 by phil 78

You can download the manual here: http://www.casiotechno.com/download/manual/FX-3600PV.pdf

Regards,

Jeroen

Re: casio fx3600p

*Message #4 Posted by **Karl Schneider** on 1 Jan 2005, 5:09 a.m.,*
in response to message #3 by Jeroen

Jeroen --

Thanks for looking that up! I happen to have an fx-3600P, which I got new in 1981. Still have it, although the key contacts aren't very reliable any more. It does a few things better and runs faster than the HP-15C I bought in 1983:

- statistics (SD/LR)
- Engineering display mode
- Fractions

HP didn't have a monopoly on all the good ideas.

HP-42S & 32S Compatibility

*Message #1 Posted by **George Rose** on 29 Dec 2004, 5:02 p.m.*

I am thinking of trying to get an hp42S. I have written some programs that I use at work for my 32S. Can someone tell me if my 32S programs will work in a 42S? I would like to know in advance if I am going to have to convert the progams to be 42S compatible.

Re: HP-42S & 32S Compatibility

*Message #2 Posted by **Randy** on 29 Dec 2004, 5:48 p.m.,*
in response to message #1 by George Rose

Can't think of anything the 32S can do that the 42S can't do, going the other way would be a problem though with some programs.

As they are both RPN keystoke prgrammables, there should be next to nothing to do in program conversion other than the positive differences in the 42S mainly real names for programs and variables rather than single letters. You can still use the single 32S names if desired but then why get a 42S?

Be sure to get the programming examples book from the Museum CD to use the full power of the 42S menu system, thats where it makes the money well spent, IMO. Did I mention HP41 program compatibility? Two line display? Okay, so the alpha entry could be better but you'll get used to it :)

Edited: 29 Dec 2004, 5:57 p.m.

Agree with Randy, plus....

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 30 Dec 2004, 7:48 p.m.,*
in response to message #1 by George Rose

Hi;

just a few (amongst many other) HP42S improvements:

ACTUAL complex arithmetic with the HP42S;
COMPLETE set of matrix tools (math, mostly, no symbolic);
concise use of the original 8Kbytes RAM (upgradable to 32K) that would make them value almost enough the original 32K of the HP33S.

A few HP42S disadvantages: no fractions as original resources in the HP42S, no algebraic expressions and no algebraic mode. I don't miss the algebraic mode, but sometimes the ability of dealing with algebraic expressions "as is" is handy...

Cheers.

Luiz (Brazil)

Special Functions Library Available

*Message #1 Posted by **Eddie Shore** on 29 Dec 2004, 2:30 p.m.*

I have completed the Special Function Library 817 (12/04 edition) featuring these functions: * Base conversions, continued fractions, rectangular to polar conversions regardless of coordinate settings, digital root (adding each digit of a number until the result is a single digit) * Bernouli numbers, Fibinacci (sp?) Numbers, Sine, Cosine, Exponential, and Logarithmic integrals, Zeta, Beta, and some Bessel Functions * Programs that allow you to map any function to a list, put text on the graph screen * Percent Change Solver, Cost of Goods Sold Solver * Finance: net present value, net future value, net utility stream, depreciation * and more.

Please send me an email if you are interested. Size is approx. 15.1 KB.

For which platform?

*Message #2 Posted by **Raymond Del Tondo** on 29 Dec 2004, 4:22 p.m.,*
in response to message #1 by Eddie Shore

As subject indicates;-)

I assume it's for the HP-48 or its drop-offs.

Raymond

Re: For which platform?

*Message #3 Posted by **Eddie Shore** on 30 Dec 2004, 9:15 a.m.,*
in response to message #2 by Raymond Del Tondo

Everything was done on the HP49G+. I could send separate program files, since all the programming was done in userRPL. Some however, will need modification, i.e. the DERXN function (which uses the 49's DERVX function).

Re: For which platform?

*Message #4 Posted by **Veli-Pekka Nousiainen** on 30 Dec 2004, 8:47 p.m.,*
in response to message #3 by Eddie Shore

I could use it.
Why not also upload it to the www.hpcalc.org
[VPN]

Morse code with a CX

*Message #1 Posted by **Giuseppe Marullo** on 29 Dec 2004, 8:57 a.m.*

Hi all, just trying to find a morse generator (text to morse) using a CX. Is there anything pre-cooked around? TIA,

Giuseppe Marullo

Re: Morse code with a CX

*Message #2 Posted by **Wilson (Bill) Holes** on 29 Dec 2004, 11:26 a.m.,*
in response to message #1 by Giuseppe Marullo

Hi Giuseppe,

You'll find a morse code program written by Richard Nelson in the Feb-Mar 1980 PPC Journal (V7 N2) on pages 50 and 51. I didn't take the time to do a exhaustive search but I'd guess that many more such programs exist for the 41CX.

Best, Wilson

Re: Morse code with a CX

*Message #3 Posted by **Giuseppe Marullo** on 29 Dec 2004, 9:54 p.m.,*
in response to message #2 by Wilson (Bill) Holes

Thanks Wilson, it is exactly what I was looking for.

Giuseppe

Re: Morse code with a CX

*Message #4 Posted by **Michel** on 31 Dec 2004, 1:27 p.m.,*
in response to message #2 by Wilson (Bill) Holes

I looked on the CD kit of the museum number 1 to 7 and i didn'T find ppc journal for this date : where can i find this article or journal?

Thanks Michel

Re: Morse code with a CX

*Message #5 Posted by **Wilson (Bill) Holes** on 1 Jan 2005, 8:09 p.m.,*
in response to message #4 by Michel

Hi Michael,

You can find it on TOS. Hopefully you are a regular visitor to this forum, that way you'll understand

what "TOS" means and why it's used.

Best, Wilson

Re: Morse code with a CX

*Message #6 Posted by **Garth Wilson** on 31 Dec 2004, 2:45 p.m.,*
in response to message #1 by Giuseppe Marullo

This is not the complete text-to-morse solution, but tones 6 and 54 get you about 4wpm, 7 and 87 get you about 12wpm, and tones 73 and 57 get you about 40wpm. At the slower speeds you'll need to add some delay between tones.

Interesting 41C customization

*Message #1 Posted by **Katie** on 29 Dec 2004, 1:25 a.m.*

Here's what appears to be a highly customized 41C(V/X?) for surveying that I've never run across before:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=26204&item=3863570706&rd=1

(Unfortunately the calculator itself is not included in the auction, but it's shown.)

Do serious 41 collectors know about this?

Re: Interesting 41C customization

*Message #2 Posted by **Diego Diaz** on 29 Dec 2004, 8:21 a.m.,*
in response to message #1 by Katie

Hi Katie,

There is little info on such devices available. AFAIK these data collector units were developed by a Swedish company (Geotronics), Geodat-126 and Geodat-400, 500 & 600 series. Surprisingly the 400 holds 900 points while 126 holds 1.500 points.

The waterproof shell-like enclosure shown in the auction is equiped with an HP-IL inteface (82160A) and a proprietary serial adapter wich identifies itself on the loop as Device #78 [AID] named "GDAT 126" [ID].

I've got the 126 enclosure, and would like to know if someone out there has got a full working unit...

Best wishes

Diego

hp28s

*Message #1 Posted by **peter** on 28 Dec 2004, 2:14 p.m.*

I have two hp28s models and now both of them have broken at the battery cover. the first unit broke just after the warrantee, so I purchased a second unit. now it has broken at the exact same place in the main casing. have contacted hp and they are not interested in the above. can I repair either of the two or purchase a new unit. are they worth anything to a collector.

Re: hp28s

*Message #2 Posted by **Richard Garner** on 28 Dec 2004, 3:02 p.m.,*
in response to message #1 by peter

Check with calcpro.com. They have them listed for $3.50. Look in the Obsolete Calculator Accessories section.

Re: hp28s

*Message #3 Posted by **Ron Ross** on 28 Dec 2004, 3:21 p.m.,*
in response to message #2 by Richard Garner

Thanks for the new source for parts.

However the poster above seems to have problems with the outer case and not the door itself.

Peter, You are Screwed!

But you can defer your dilema by buying a new set of batteries, a hot melt gun, and some strong heavy duty Rubber bands.

Insert new batteries and hold in place with a couple of strong rubber bands, then glue the door on with an ample amount of hot glue. Let cool, and shave off excess. The hot melt glue can be removed later by applying heat from tip of hot melt glue gun later. If you do this right, you will probably get two or three battery changes out of this using this method.

I would also suggest buying a used Hp48G and upgrading (or some other RPN, if you really want to continue using RPN in the distant future). I suggest the Hp48G as it is most similiar and yet improves upon the battery door of the 28 series. However, the 28 series is also fairly reasonable to still buy, even on ebay.

Re: hp28s

Egad! I dropped a stapler on my 12C!!!!

*Message #1 Posted by **Barry** on 28 Dec 2004, 11:37 a.m.*

Fell from the top bookshelf to my desktop where my innocent and (until now) unscathed 1984 12C was sitting. Ouch! Put a nice little dent on the gold display surround. Still works like a charm, though, of course. It stinks that it's marred now, but I guess that just gives it a little character.

Aargh! I dropped my 15C twice in a backpack!

*Message #2 Posted by **Karl Schneider** on 28 Dec 2004, 8:57 p.m.,*
in response to message #1 by Barry

I usually carried my 15C (purchased Nov 83) in the outer pocket of my backback. Twice, the book-laden pack slipped from my fingers and landed on the ground, damaging the bezel of the 15C. The second time caused a deep scratch from a loose mechanical pencil. Fortunately, the display window was unscathed and the calc works perfectly to this day.

Re: Aargh! I dropped my 15C twice in a backpack!

*Message #3 Posted by **Trent Moseley** on 29 Dec 2004, 1:43 p.m.,*
in response to message #2 by Karl Schneider

I remember years ago reading in "Key Notes" about some guy accidently running his car over his 15C, and it still worked afterwards!

tm

Re: Aargh! I dropped my 15C twice in a backpack!

*Message #4 Posted by **Ed Look** on 29 Dec 2004, 7:50 p.m.,*
in response to message #3 by Trent Moseley

Don't try this at home, folks.

Re: Aargh! I dropped my 15C twice in a backpack!

*Message #5 Posted by **david bowers** on 8 Jan 2005, 9:13 a.m.,*
in response to message #4 by Ed Look

hi i am an aussie surveyor, i drop my hp 42 about twice a week onto concrete from 1 to 3 feet and it still ticks along,they used to say you could drop them from 3 feet, i have done that onto wooden floors off plan desks lots of times and no probs i have 2 48g a 48gx with cogo, 2 32s and the 42, one 32s needs repairs, does randy have a tel no. i keep the 48s in the office except when doing setout but i use the older ones to rule marks on slabs, scrape away the dust etc, and they are great i ordered a 33 then read reviews and cancelled it cheers david

Re: Aargh! I dropped my 15C twice in a backpack!

*Message #6 Posted by **Ed Look** on 8 Jan 2005, 3:04 p.m.,*
in response to message #5 by david bowers

Oh, you shouldn't have cancelled it! I've dropped my 33S, too once or twice and it still works.

Further, it has grown on me since I bought it and in my heart, it has come to almost occupy the same place as my 32SII. Again, the ONLY real complaints I have with the 33S are the femtoscopic decimal point and comma. I have to look twice sometimes to be sure of an order of magnitude.

Otherwise, it is a pleasure to use. Cosmetics? For kids.

Re: Aargh! I dropped my 15C twice in a backpack!

*Message #7 Posted by **david bowers** on 11 Jan 2005, 7:56 a.m.,*
in response to message #6 by Ed Look

well i would like to buy some 12/15/32s if anyone wants to sell, they are great for the site work, i need a clear decimal point as i work in dim light when the stuctures are up setting gridlines and that complaint would bug me, i need clear displays always anyone know where i can send my 32s for a fix cheers david

Re: Aargh! I dropped my 15C twice in a backpack!

I have a feeling they would be up to at least testing the rhino story involving a 12c. They have the budget to afford an old 12c easily.

As for surviving being run over by a truck, I have personally seen an 11c back in the '80s that met with an 18-wheeler. It was somewhat slimmer to say the least.

about the dropping, when i was a student,30 years ago, another engineer with a late 70,s model dropped it on the site office wooden floor,intentionally, he told me they were able to withstand a 3 foot drop, i always believed him and never worried about not dropping them, he said they were drop proof i would have dropped my 42 and my 32 at least100 times each onto the office floors and i still use both, they get caught between the plans, when i hang up the plans they slide onto the floor, as for concrete i have lost count, many times they fall out of my survey pouch,most times i can break the fall with my workboot, i have had both since new. the metal trum plate have come off the older ones i dont use anymore, i have had more trouble with faulty keys sticking in the older ones the 32s that doesnt work,it always stays in the office and it never restarted one day after changing the batteries i take them o/s hiking and i really say they are robust

The HP41 machines seldom survive a drop onto hard surfaces. The upper screw bosses in the case are sure to go. In hard drops the lower screw posts will break.

i thought i would get intelligent responses from others who drop them also, not those who are scared to do just that.yesterday i dropped the 42s onto the level 5 concrete deck from 700mm and its fine , i guess the 100 times would include the dirt i walk on as well so in 15 years or more the 100 times includes concrete dirt and timber site shed floors i always thought they were made, as i was told , to survive desktop falls, and again i say they do, maybe positive thinking does it, who knows, i get more worried about them being stolen as the second hand price increases than dropping, they slip out of my field bag when i pull out my plumbob and string line. if you sit at a desk and dont go into the real world, try it, its no use having a logical calculator and no brain to match. if the person hadnt written voicing concern about dropping the hp then i would not have written saying, from my own long experience that i dont consider the dropping part a big concern. i wouldnt drop my 48 gx for that matter, but my oldies have hung in there, which is why i use them outside, i climb thru handrails,and they pop out when the survey bag gets caught up, also i often dont use the cover so they get scratched from mickey pins and nails and chalk reel dust. if they broke as easily as people say, then i

would have bought countless ones to replace the 42s and 32 s, and i havent thanks david

Wasn't that an...

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 30 Dec 2004, 10:10 p.m.,*
in response to message #3 by Trent Moseley

... HP12C found "spread around" the street, as if a car had ran over it? At least I remember someone at this very forum mentioning this particular event.

Anyway, I keep an intriguing Educalc Catalog (# 59) with the title "Fake Displays?". It shows both an HP42S 'bitten by a dog' and an HP48SX after an "18-wheeled road hazard". Jim Carter's issue letter mentions, amongst others, an HP32S that survived a fire accident in Ithaca. Its owner had his building burned up and found the HP32S working fine, X-contents unchanged, inside his "charred book-bag".

I would not doubt about anything else.

Cheers.

Does anyone know how to open a Sparcom "Drive 95"?

*Message #1 Posted by **db (martinez, ca.)** on 26 Dec 2004, 10:15 p.m.*

I found one at the junque store and it doesn't start up when i connect it to an ac adapter. With luck the problem is just a fuse.

Re: Does anyone know how to open a Sparcom "Drive 95"?

*Message #2 Posted by **Raymond Del Tondo** on 27 Dec 2004, 9:17 a.m.,*
in response to message #1 by db (martinez, ca.)

Hi,

in most cases it's not a fuse, but the battery.

To open the Drive95, just *carefully* lever out the back pane.
It's only held by flat plastic rivets (?) . After lifting the pane, you'll see the pcb,
and the battery with it's connectors on the left side of the case.
To remove the battery, you may have to pull out the pcb,
which can be done after pulling the screws under the rubber feet.
The battery may be held in place by a plastic strip.

On 'newer' Drive95 units, the battery is
connected to the pcb with a removeable connector,
on older units the connection is made with tin points.
The suitable relacement battery block is avialable in electronics stores.

Have a nice 2005;-)

Regards,

Raymond

Thanks Raymond and two more short questions

*Message #3 Posted by **db (martinez, ca.)** on 27 Dec 2004, 2:10 p.m.,*
in response to message #2 by Raymond Del Tondo

It is just as you said. I never would have started prying on it if you hadn't have said so. I'll get a new battery for it.

I didn't get a battery charger with it, or the manual :-(The back pannel says that it will use "9-18v ac/dc" and i have several that will work but that's a pretty wide range. Do you think it has a prefered flavor of power?

BTW: is there any downloadable info on this beast? I have a 95 to use it with (and that manual) if i can learn how.

Edited: 27 Dec 2004, 3:26 p.m.

Re: Thanks Raymond and two more short questions

*Message #4 Posted by **Raymond Del Tondo** on 27 Dec 2004, 5:04 p.m.,*
in response to message #3 by db (martinez, ca.)

Hi,

the original power adapter shipped with the drive is a Panasonic KX-A11,
Input: 120V 60Hz 12W
Output: DC 12V 500mA, Plus pole on the outer side of the plug.

You can also use the adaptor (82240A) for the HP infrared printer (82241A or B) .

I can send you the files of the main driver diskette via eMail.
Just drop me a note at M a g i c 4 8 g e s @ g m x . d e (remove the obvious;-)

For any computer, the Drive95 will be a KERMIT server.
To access media inside the drive, perform a Directory Get command.

Regards,

Raymond

Thanks Raymond (no text)

HP-41 CX ED command on CV

*Message #1 Posted by **Mutsch** on 26 Dec 2004, 12:32 p.m.*

I was wondering if there is a equivalent of the ED command on the HP-41 CX available for the HP-41 CV (of course equiped with a X-Functions module).

Does anybody know about this?

Mutsch

in response to message #1 by Mutsch

Hi,

I think you'll need a HEPAX then...

Raymond

Re: HP-41 CX ED command on CV

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 26 Dec 2004, 5:45 p.m.,*
in response to message #1 by Mutsch

Hi, Mutsch;

Unfotunately, the CX-only ED command/function is not available through the X-Functions, as you already know. I am not aware of other original,standard Hewlett-Packard ROM modules for the HP41 that offer this feature. As Raymond says, HEPAX (maybe other thirdy-part ROM modules, too) has it. Also you could use newer options, like some amazing devices made by some contributors in here: MLDL2000 by Meindert Kuipers, NoVRAM by Diego Diaz and and some other developments by Christoph Klug. These modules (and others, like HEPAX itself) allow you to develop your own ROM, as you can see in this thread and this article by Christof Kulg. There is another thread I did not locate so far about a custom HP41 ROM by one of this fourm's contributors with complex functions.

Hope this helps a bit.

Luiz (Brazil)

*Message #4 Posted by **Richard Garner** on 26 Dec 2004, 7:42 p.m.,*
in response to message #1 by Mutsch

I remember reading in one of the later PPC or CHHU Journals of a synthetic program that did the same thing

as the CX ED command. What issue or what it was called I do not remember though.

Re: HP-41 CX ED command on CV

*Message #5 Posted by **Garth Wilson** on 27 Dec 2004, 3:33 p.m.,*
in response to message #4 by Richard Garner

The 41cx's text editor, written in assembly, is only marginally fast enough to be useful, so I wouldn't put any hopes on any synthetic program to do the same job.

Re: HP-41 CX ED command alternatives

*Message #7 Posted by **Wlodek Mier-Jedrzejowicz** on 27 Dec 2004, 8:55 p.m.,*
in response to message #6 by Mutsch

Two excellent programs to replace ED for people without an HP-41CX were published in user club journals. A very powerful editor by Frank Wales is in the journal of the British club HPCC (www.hpcc.org), Datafile, Volume 2, Number 2, pages 23-26, including barcode for the program. A good short editor by Arend van den Brug is in the PPC Calculator Journal, Volume 11, Number 6, pages 28-30. More such programs can be found in these and other journals. Both journals are available on CD-ROM from Jake Schwartz - Dave, am I allowed to give details here, or does that count as advertising? BTW, the above information is in my book "Extend Your HP-41", which I am sure I am allowed to mention, since it is available on Dave's Museum DVD and CD-ROM set.

HP82164 HPIL-RS232 connection to PC

*Message #1 Posted by **Nick Nicholas** on 24 Dec 2004, 4:32 a.m.*

With regard to the article at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=118 regarding the connection of the HPIL-RS232C to the PC, I would appreciate clarification on the following based on my background of no exposure to serial interfacing.

The purpose of the special adapter is to correct the positions of the pins of the HPIL RS232C interface to that expected for a RS232C interface for a PC (DTE device) as well as to provide for the null modem functionality of connecting two DTE devices serially.

The diagram on the above web page indicates the corresponding pins to be connected from the HPIL RS232C interface to the PC (DB25-S). I would like to use a 9 pin serial cable to the PC, instead of the 25 pin cable. All the pins are accounted for on the 9 pin serial cable except the protective ground, pin 1. Is this pin on the HPIL RS232C interface required to be connected to the PC?

Can any damage be caused to the PC or the HPIL RS232C interface if the pin connections are incorrect in the adapter?

Does this pin assignment work for the HP 71B connected to a PC through the HPIL RS232C interface?

Re: HP82164 HPIL-RS232 connection to PC

*Message #2 Posted by **Tony Duell** on 24 Dec 2004, 6:12 a.m.,*
in response to message #1 by Nick Nicholas

As the author of that document, I think I can answer some of your questions :

(This doesn't apply to one of your questions, but I found it best to ignore the jumper plug inside the 82164 -- leave it at the DTE position -- and make up the right external cable. That jumper does some rather odd things!)

Now, for 9 pin serial ports. My PC has such a port. I just used a normal 'Modem' cable with a DE9 socket on one end (to fit the PC) and a DB25 plug on the other (to fit a modem). In fact I use that cable with my dial-up modem too. If you want to make your own cable, just match up the signal names. You can ignore pin 1 (Protective ground) if you like. Some cables wire it to the overall cable shield ('screening braid' in the UK), and connect that to the shell of the DE9 (9 pin) connector, and thus to the PC case.

The RS232 interface is very tolerant of misconnections and it's unlikely you'll do any damage if you get the connections wrong (I won't say "can't do any damage" because somebody will find a way :-)). Even if you do damage something in the 82164, the RS232 interface chips are the standard 1488 and 1489 ones that are easy to get and easy to replace.

Yes, it does work with the HP71B. I've used it with that machine. I've got linux software (part of the 'LIF Utilities for Linux' available from the HPCC web site) to transfer files to/from an HP71B.

It should work with an HP75 too, although you won't be able to transfer files directly (you'll have to write a BASIC program on the 75 to read in data and store it in a text file). I've never tried that, though.

Re: Keep the HP spirit alive! (Happy Holidays/Merry Christmas!)

*Message #7 Posted by **Erik Ehrling (Sweden)** on 24 Dec 2004, 3:07 a.m.,*
in response to message #1 by Eddie Shore

When looking back on the year that has passed there are two major aspects that for me, personally, stand out from the rest.

First of all this is the year when I have given up hope altogether about Hewlett Packard's calculator division. After endless email conversations with people at different levels in the HP organisation it is to me perfectly clear that HP will never do anything whatsoever (profit or non-profit) to serve its RPN user community - a user community that nonetheless is blindly loyal to the HP spirit of old days.

Just to name a few of the things I am thinking of -

- HP will never release the HP-42S ROM to the public domain. Neither in binary format nor as commented source code.
- HP will never put the HP-42S back into production again (so why being so strict on retaining the copyright in the first place!?)
- HP will never start to include Hrastprogrammer's HP-42X with every sold HP-49G+ (that might however been good a way to boost sales figures killed by the rumours about low keyboard quality - remember high keyboard quality was once something HP was famous for!)
- HP will never include Emu42 and the HP-42S ROM in the factory setup of their Pocket PC:s (why not include the HP-17BII and the HP-27S ROM at the same time and no-one would ever ask for another calculator program installed on their PDA:s...).

The fundamental laws of business hasn't changed so much in the 21st century that it is now possible to ignore your customers - rather the opposite. And most ironically at the same time as the HP calculator business is fading away the HP spirit lives on stronger than ever - outside HP...

Because (and this is the flip side of the same coin) there are values buried deep in the HP spirit strong enough to bring together developers and users from all over the world willing to take the HP-42S into the future. Here the commitment to high quality, accuracy and reliability unites and this is what the HP spirit in essence stands for. It is indeed much more than just being nostalgic about an old calculator considered "the best ever made", it is about the true belief that persistently paying attention to the triplet of quality, accuracy and reliability will eventually push the very limits for our capabilities forward. Quality lives on, cheap solutions are only for the moment.

The last year more things has happened on the HP-42S horizon than, I would say, the five years previous to that.

- Emu42 by Christoph Giesselink was released after a successful campaign (again thanks to all contributors!) and now makes the HP-42S available in emulated format both on Windows and Pocket PC:s. I would say that Emu42 is an essential piece of software for any RPN enthusiast.
- Thomas Okken announced his work on Free42 and has shown an impressive pace with new releases every week. There is a long way to go before full compatibility can be achieved (LOAD / SAVE, decimal arithmetic, internal representation etc.) but I am not doubtful that all this will once see the light

of day. Most imporantly Free42 is already today a working HP-42S calculator for both the Palm Pilot and Linux platforms and as it is built as a reverse engineering of the HP-42S there are no copyright issues.
- HP-42X by Hrastprogrammer was ported also to the HP-49G+ thereby becoming the fastest handheld device for running HP-42S programs with a calculator keyboard.
- Luiz C. Vieira produced some very good looking TTF fonts for both the internal LCD display and for the IR printer.
- Several additions were made to the HP-42S catalog of programs by Paul Dale, Christoph Giesselink, Richard Garner and Ton van de Burgt (thanks!). I would also recommend trying to get hold of the latest issue of the HPCC Datafile which contains a very enjoyable article by Valentin Albillo - "Long live the HP-42S!" - with an elegant program listing for a solver for the "Eight Queen" problem, that also displays the solutions graphically).
- Nelson M Sciuro discovered that a 32K RAM chip could be soldered to the place holder for additional ROM and provide continues memory for testing small Saturn Assembly programs. Much more convenient than entering them into unused memory of the RPN program area.

This is keeping the HP spirit alive!

Merry Christmas and a Happy New Year to everyone!

Erik Ehrling (Sweden)
www.hp42s.com

Edited: 24 Dec 2004, 5:09 p.m. after one or more responses were posted

*Message #9 Posted by **Bram** on 24 Dec 2004, 8:20 a.m.,*
in response to message #7 by Erik Ehrling (Sweden)

Still haven't managed to get myself a 42S, so

> Quote:
>
> article by Albillo - "Long live the HP-42S!" - with an elegant program listing for a solver for the "Eight Queen" problem

is not much use to me (<sob>). I'll have to stick to this one:

```
;
;       8 Queens on a chess board for Hewlett-Packard 32SII
;       April 29, 2004
;
;       This program can solve for different numbers of queens
;       any value N from 4 until 9 will solve for N queens on an NxN board
```

```
;
;       key in the program
;       start by keying N XEQ S
;       f.e. 5 XEQ S -> 53142
;                R/S -> 52413
;                R/S -> 42531
;                R/S -> 41352
;                etc.
;       the result denotes the row positions in the N columns
;       f.e. the results above:
;       53142 means QOOOO
;                   OOOQO
;                   OQOOO
;                   OOOOQ
;                   OOQOO
;
;       41352 means OOOQO
;                   QOOOO
;                   OOQOO
;                   OOOOQ
;                   OQOOO

On the topic of including emulators with Pocket PCs:

Yesterday I was setting up a network for a friend. We unplugged her Pentium I from the wall and the CMOS battery was bad. Well to make a long story short, we replaced it with some extra parts we had (Athlon 850, 256 mb, 10 gb, geforce 2). So, we went to migrate files from her old HP computer and I noticed that there was a folder called "HPCALC." Of course I opened it and it had a financial calculator emulator. I am pretty sure that the owner of this computer did not put it on.

I didn't have much time to look at it, but it didn't look to be amazingly good (didn't seem to have a good keyboard on screen... just a few buttons). It did support ALG and RPN and seemed to be a 12c emulator.

Has anyone else ever seen this?

-Ben Salinas

Oh, and Merry Christmas to all!

HPCALC & HPPIM - WAS Keep the HP spirit alive! (Happy Holidays/Merry Christmas!)

in response to message #10 by Ben Salinas

Hi Ben,

HPCALC and the associated program HPPIM came with the HP OMNIBOOK computers. They were both derivatives of the programs in the HP-200LX handheld calculators and are quite good. From the HPCALC Application menu, you could select Arithmethic, TVM, Business, Solver, Conversion and Math style calculators. For those of us that used the HP-200LX, it was a very familar calculator.

The HPPIM was a PIM program that directly used the files from the 200LX. Another very nice program.

Since I used a HP-200LX for many years, I still use the windows HPPIM program to access archived data. And I still used HPCALC to quickly do TVM problems - especially when I was purchasing and refinacing my home.

Both programs are loaded on all my PC's. Hopefully you saved a copy for reloading onto the new configuration. If not, there are several locations on the Net where they can be downloaded from, such as the following link:

http://24.237.160.4/files/omnibook/ob430/Software/430_win31_special_files/

While HPCALC may not be as fancy as some of the new calculators, it does have a very simple and elegant interface I find very appealing.

Happy Holidays & Merry Christmas,

Bill

Basic HP Calculator

*Message #1 Posted by **Eddie Shore** on 23 Dec 2004, 9:20 a.m.*

Due to the lack of basic HP calculator (except 9-E which is a one-line algebraic calculator) should we send suggestions to build a basic calcualtor with algebraic AND RPN entry (think circa 70's HP 25)?

Features:

* LOG, LN, EXP, 10^X * SIN, COS, TAN, ASIN, ACOS, ATAN, HYP, PI * x! (for ALL real numbers), 1/x, %, POWER, ROOT, SQ, SQRT * 3-4?, 9? Memories * Solar and Battery Power * RPN Stack Functions: Swap, Roll Down, Drop

Good for an entry level calcualtor?

Re: Basic HP Calculator

*Message #2 Posted by **Namir** on 23 Dec 2004, 10:19 a.m.,*
in response to message #1 by Eddie Shore

Hello Eddie,

During the HHC2004 workshop in San Jose last September, Richard Nelson suggested to the HP folks who were there to build a cheap HP-45-like calculator. Eichard suggested that HP can use such an "affordable" machine to popularize RPN. Moreover, Richard said that HP could hand out such a calculator to teachers attending conferences that involve eductaion and calculators. This approach will help HP put its foot in the door with educators who are TI-fans. HP listened. Time will tell.

Re: Basic HP Calculator

*Message #3 Posted by **Ed Look** on 23 Dec 2004, 1:03 p.m.,*
in response to message #2 by Namir

Gentlemen, in "real life" would most RPN users find a "basic machine" + some programming capability a little more practical, even high school or college students?

Re: Basic HP Calculator

*Message #4 Posted by **Bill Wiese** on 23 Dec 2004, 2:07 p.m.,*
in response to message #3 by Ed Look

Eddie Shore's post is a good one.

The TI25X (now discuntinued)

http://education.ti.com/us/product/tech/25x/features/features.html

has a nice form factor.

[If the keys were slighly 'clicky' without bounce and it had RPN with a large ENTER key above the numeric area I'd be eternally happy. If the keys were real plastic and not rubbery that'd be even better.]

Right now (for me at least) programmability is of less import than a few other things... my features I'd like, in no particular order: - 10 digit display - RPN, 4 level stack + LastX, RDn and RUp - some memories - storage arithmetic (STO+ 05, ST/ Z etc.) - log, ln, exp, 10^x, y^x, xth root of Y - circular & hyperbolic trig and P->R/R->P - usu "stats" function, n!, nPr, nCr - multibase operation (dec/oct/bin/hex) - H.MS<->HR conversion - Fix/Sci/Eng/float modes - basic financial funcs: PV/FV/PMT/i/n

in response to message #4 by Bill Wiese

Bill Wiese gives a good abstract.

[Right now (for me at least) programmability is of less import than a few other things... my features I'd like, in no particular order: - 10 digit display - RPN, 4 level stack + LastX, RDn and RUp - some memories - storage arithmetic (STO+ 05, ST/ Z etc.) - ...]

A few more ideas and personal opinions: I really would buy a NEW hp if it has a formfactor +/- the pioneers, GOOD keyboard (a click = an entry!), IR-printer port. And - today - I'm shure you can have programmability, equation entry/solver and even more for a few bucks.

What about someting like a 27S? http://www.hpmuseum.org/27s.jpg

It was THE do-everything; including the IR-printer Port. But it lacks RPN! (good for those who comes from TI? ;-)

Or an RPN programmable scientific 32S? http://www.hpmuseum.org/32s.jpg

Or better the revised 32SII? http://home.tiscalinet.ch/ducativ/calculus/hp32sii.jpg

Like the new 33S they have both a big minus (beeing hp calculators): why don't they have the IR-printer port? really don't know what hp thought those days...

I suppose today you have cheap chips and displays in good quality. What you still don't got, is cheap but good keyboard and cheap but ergonomic design and mix of menues and many direct keyboard functions as well! I believe that this two factors still need some special engineering effort and that's definitly not cheap. But it would be worth any penny and make again THE difference between a hp and another one...

...my hopes...

HP 42S with 64K of RAM, PC connection, clock functions of the 41C/CX Time Module and

the unit conversion of the 48G.

Re: Basic HP Calculator

*Message #7 Posted by **Walter B** on 24 Dec 2004, 2:00 a.m.,*
in response to message #6 by Richard Garner

... don't forget a clear, sharp 2-line display - I agree with almost everything else posted already.

Well, let's sum it up:

- Basic math in direct access (no menus at this level, I'd like blue/gold/black keyboard design of the HP34C)

- Basic 2 parameter stats (including L.R.)

- 10 general purpose storage registers (plus stats registers in background)

- RPN programmability (like HP42s)

Just my 0,01 Euros

in response to message #4 by Bill Wiese

I tutored an algebra student with a TI-25 Solar, and ended up giving the calculator to the student. That was a nice little basic calculator.

Many of the entry level calcs have what we want, minus the RPN.

Re: Basic HP Calculator

*Message #13 Posted by **Hans Schmellenkamp** on 23 Dec 2004, 9:59 p.m.,*
in response to message #12 by Eddie Shore

I have been wishing for a "basic" RPN for quite some time now. I have a 48GX but do not use it to its potential, and I do not like its rather large size. Since I couldn't buy a "basic" calculator with RPN, I decided to get my 41CV repaired. If they could bring back the 41 again and put the +-/* keys on the right hand side, and sell it for under $100 I would go out and buy one.

Re: Basic HP Calculator

*Message #14 Posted by **Ben Salinas** on 24 Dec 2004, 10:28 a.m.,*
in response to message #1 by Eddie Shore

The way I see it, most of HP's real calculators are built with the logic: "If it is more powerful, then someone can use it to do less or more... it's up to them" Unfortunately, this is not true. Parents want to buy something cheap and easy to use (does that rule out RPN for first time users?). Furthermore, teachers don't always like overly powerful calculators. During my freshman year, a teacher had a ban on all Programmable calculators (so students couldn't use graphing calculators.) Unfortunately this also meant I couldnt use any RPN calculator. I missed more problems from making mistakes in Algebraic than anything else.

Just some thoughts

Re: Basic HP Calculator (long)

*Message #15 Posted by **Wlodek Mier-Jedrzejowicz** on 27 Dec 2004, 8:31 p.m.,*
in response to message #14 by Ben Salinas

This thread has drifted away from the original subject of a "Basic HP Calculator", which meant a simple RPN calculator from HP. One with only + - * /, and maybe % and square root. People were asking for this as early as 1978 when John Ball suggested "El Cheapo" in his book "Algorithms for RPN Calculators."

Reasons why we want one include 1/ It would be really nice to be able to buy a cheap and simple RPN calculator for us (readers of Dave's site) to use. 2/ It would let us introduce friends and relatives to RPN. 3/ A simple and affordable RPN calculator could be used at introductory level in schools. I think this last particularly important, as elementary arithmetic _is_ RPN (or at least stack notation), and teachers willing to use such a calculator would actually find it easier to teach the use of calculators. Then HP would have a ready market for more advanced models.

Reasons why HP have never introduced such a model include 1/ Introducing and selling a calculator costs much the same, way over a million US dollars, whether it is a simple model or a complicated one - things like getting electrical approval from many countries or setting up a production line, packaging, and promotional material, cost nearly the same for any model. 2/ But profit margins on a low-cost model are far smaller, so HP would have to sell far more of these than of more expensive models just to cover the cost. Yet this low-cost model would take away sales from the previously least expensive model, which brings in more profit per unit sold. 3/ Therefore the bean-counters at HP will not provide the funds for the calculator group to introduce such a model unless the calculator group can _guarantee_ huge sales.

What can we do to change this? 1/ Find someone to place a firm order with HP for at least a million such low-cost calculators. Do you know anyone like that? Do you control the policy of your local math education board? No, I thought not. 2/ Keep pressing HP. After all, we've only been trying for 26 years so far. 3/ Find someone else to do it - maybe the Open RPN project can make a really simple version as well as the really advanced one.

Any ideas?

Would that be possible... (was: Basic HP Calculator)

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 28 Dec 2004, 9:07 a.m.,*
in response to message #15 by Wlodek Mier-Jedrzejowicz

Hi Wlodek, all;

I know this is somehow controvesial, but I wonder that such "El Cheapo" (I was given John Ball's book sometime ago; thanks, G.D.!) is an easy implementation, even with a bit more of memory and functions (maybe 1/x, x^2, and a few others), by using a single, commercially available multipurpose controler (ATMEL, PIC, etc.). The three problems I see so far are:

1) housing and keyboard;
2) LCD/OLED commercial display, and
3) Ownership issues.

The third one relates to HP and RPN: does RPN as both a "name" and a "protocol", in its deepest meaning, belong to HP?

I am completely aware of some private iniciatives around developing RPN calculators outside HP "borders" (I myself encouraged some researches, and right now I'm getting myself ready to go ahead with the HW stuff), but I guess that a downloadable "Do it yourself" booklet with complete instructions on how to build your own RPN-based "El Cheapo" for some of the most common controllers available and their related core systems would be, at least, "pretty neat". I am not straightly following the OpenRPN projet (I must update myself...), but I guess that they have probably got closer, if not surpassed, the "El Cheapo" basic needs. Youngers would also find their own motivation.

Any suggestions?

Cheers.

Luiz (Brazil)

Re: Would that be possible... (was: Basic HP Calculator)

*Message #17 Posted by **Mike Sebastian** on 28 Dec 2004, 1:14 p.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

Luiz,

As to your third issue, ownership of RPN, I don't believe HP has ever claimed ownership of RPN. Further, I've got a non-HP book with a 1967 copyright date that specifically refers to reverse Polish notation. The book is *Computer Programming and Computer Systems* by Anthony Hassitt. The RPN discussion is on pages 95-98, and after a brief introduction to RPN, the discussion focuses on RPN as implemented on the KDF9 computer.

A Google search on the KDF9 computer eventually lead me to this article on RPN: http://www.searchspaniel.com/index.php/Reverse_Polish_notation. RPN was invented in the 1950s by Australian computer scientist Charles Hamblin.

Re: Would that be possible... (was: Basic HP Calculator)

*Message #18 Posted by **Ron Ross** on 28 Dec 2004, 3:35 p.m.,*
in response to message #17 by Mike Sebastian

Further evidence of non-infringement is the NOVUS line of RPN calculators.

The real hope for a cheap entry calculator is the Hp33s at a street price of about $30. It is both Algebraic and RPN.

Actually Hp made the Hp20s that could have easily filled this void at a price of $30. It was a quality LCD calculator with an enter (ok INPUT) key where it was supposed to be.

If Hp had released this, it would have done well, maybe too well, because many RPN addicts would bypass the $60 Hp32s/33s line.

I would love a $30 Hp20s with RPN. It would be quality and a low price with enough features for general use. Just give the community that and many of us would SHUT UP! But that won't happen because HP would lose at least 10% of their present Hp49G+ sales and probably 30+% of their HP33s sales (never mind follow up sales, 1-3 years down the road, by new converts who start out on the low end, marketing doesn't know these potential customers exist, they can only count the existing sales base). Short Sited ^%$#!!!

Just me Ranting again.

Re: Would that be possible... (was: Basic HP Calculator)

*Message #19 Posted by **Bill Wiese** on 28 Dec 2004, 4:34 p.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

Hi folks,

I've prob said this before awhile back - the issues and difficulties in building/selling a new calc of

any type are NOT of chip selection, writing firmware, or the even cost of the actual electronics (CPU, LCD, zebra connector, PCB, batt clip). There are probably a couple of dozen folks here that can write a good RPN calculator for any of a number of eligible microcontrollers, with some fraction thereof who can prob get the floating point and transcendatals "just right". (Plan B would be to just do a Nut CPU emulator and paraphrase sections of HP Woodstock or 41 code - some of this may not be copyrighted??)

RPN has no patent protection or licensing requirements. Any such items would have passed by way more than 17 yrs ago. And even when HP was selling calcs, there were other RPN calcs on market (Nat'l Semiconductor/NOVUS, APF, Corvus?). Even the truly HP combo of 4 level RPN with T reg copy-down and with a Last X register is free for all to use.

The real costs are setting up injection molds, dealing with vendors that expect orders in at least hundreds of thousands, and creating a 'hole' in the sales channel for your product. Making a blister pack with instruction book and shipping/boxing etc. may cost as much or more than the actual electronics!!

Products don't make it past the marketing gate unless they hit the right price point for their feature set. It costs relatively little to add "features" to a calc (other than some ROM space and key legends) once it exists, so a higher price can be charged.

The elegance of a stripped-down RPN calc - even a 20S w/RPN - while eminently logical to the folks here, doesn't pass the the multiple mfgr/distributor/dealer marketing gates who need to have a given product in a given slot. Explaining such 'elegance' to folks marketing to folks buying blister pack calcs for their kids at a drugstore will just elicit a laugh from them.

Remember, calculators are not what they used to be: high-priced, higher-margin items whose cost alone justified careful selection by knowledgable folks - some of whom were using prog calcs to avoid using minicomputer time back then. No real worry about lifespan on a $20 calc either.

Bill Wiese San Jose

Well, *somebody* is making money selling cheap algebraics for a few dollars at the drugstore, or they wouldn't be available. Selling basic RPN models in the same places at the same prices (under what's left of the "prestige" of the HP brand name) -- or better yet, making them available in large quantities at low cost (or no cost) to schools -- would help create a market for the higher-priced RPN models later. A kid whose first calculator was an HP RPN is more likely to want an expensive RPN model in high school or college than a kid who's grown up with TI, Casio, etc.

Sure it's possible. Ask Aurora.

*Message #21 Posted by **Norris** on 29 Dec 2004, 1:13 p.m.,*
in response to message #20 by Wayne Brown

It is apparently quite feasible to copy the functionality of classic HP calculators, since Aurora currently markets a cheap RPN clone of the HP-12C, the $25 FN-1000. You can get it from Fry's.

http://shop4.outpost.com/product/3783316?site=sr:SEARCH:MAIN_RSLT_PG

I suspect that Aurora would be more likely to market a cheap RPN scientific than HP.

Ask Aurora ...

... if they could remake their Compact Scientific SC150 calculator model with RPN instead of/in addition to Algebraic notation.

It is small, cheap, lightweight, compact and has a nice form factor IMHO

The basic idea would be....

*Message #23 Posted by **Vieira, Luiz C. (Brazil)** on 30 Dec 2004, 9:19 a.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

Hi, all;

as I see, many good ideas and suggestions arose, so I decided to add that I thought about a "do it yourself", homebrew custom calc with a downloadable/upgradable (RPN?) system so you could enhance it. I remember I saw a Psion when the HP41 was available. The model I saw at that time (1984 or 1986) was almost like a brick, a big, squared calculator with four ports in the upper side, below the display (a dot-matrix, two line, if I am not wrong). The owner showed me that the ROM/RAM modules could be inserted/removed when the calculator was ON or OFF, no matter at all.

I always kept that image in mind, because it inspired me to think of a custom calculator. That model had no specific characteristic for me, and it looked like it could be in hands of a Physician, or an Engineer, or a Mathematician or any one that might use it. So I considered how good it would be if that calculator could be customized for anyone else's needs.

A cheap, expandable (ROM/RAM) platform with the possibility of downloadable O.S. would satisfy many users. Yeap, I know that the HP49G/G+ are almost like this, but I had something simpler, yet powerfull, in mind.

Just an idea.

Luiz (Brazil)

in response to message #23 by Vieira, Luiz C. (Brazil)

Hi, Luiz-Claudio,

The "brick" you described is the Psion Organizer II. Five years ago I have obtained this calculator (in fact, it is a highly customisable computer with Basic) from my friend who was to throw it away as a useless machine.

When my wife started her new pediatric office, she needed a tool to help her coworkers count white blood cell types (leucocytes) in her paediatric medical laboratory. I wrote a program in Basic for this machine and it still works prefectly. The lady working in her lab proudly shows this tool to her colleagues from other labs.

The problem arises only when you have to exchange the battery, but has been solved by storing a copy of program in a 16 kB memory module.

Just to illustrate that very old obsolete machines can still find their everyday use.

Thanks, Nenad! ;-)

*Message #25 Posted by **Vieira, Luiz C. (Brazil)** on 30 Dec 2004, 3:18 p.m.,*
in response to message #24 by Nenad (Croatia)

Hi Nenad;

thanks for your (always thoughtful) words. Your wife's example fits perfectly in!

It reminds me that I have to see the Croatian Calculator's Club (is it the correct name?) page/site. I have "cleaned up" my computer's HD about three times this year, and I lost some precious info, the Croatian Club correct name and related e-address.

Best regards (same to Hrast).

Cheers.

Re: The basic idea would be....

*Message #26 Posted by **Hugh Evans** on 31 Dec 2004, 12:46 a.m.,*
in response to message #23 by Vieira, Luiz C. (Brazil)

What you've described is very similar to what we're working on at OpenRPN. Graphical (dot matrix) LCD, flash, IrDA and sram. What's missing is the four spaces for expansion modules. Instead we've elected to have plenty of memory in the machine and a connector with enough pins to handle general communication with computers, calculators, and extra pins for other applications.

Some extra room will likely be left inside the case for small modules and a few useful traces will be run out to an edge of the PCB for easy access.

We're designing a versatile and open platform. To give you some idea, there will not be individual models. Just form factors. It can be made into any kind of calculator the end user desires. Thanks to laser etching we will be able to offer custom molded key legends. Hackers won't have to spend vast lengths of time reverse engineering their calculators to learn about how they work. We will publish schematics, algorithms, ROM source code, everything.

I've only scratched the surface here and have left out a ton of details. If there are any questions I would be happy to answer them.

Wow!

*Message #27 Posted by **Vieira, Luiz C. (Brazil)** on 31 Dec 2004, 1:32 a.m.,*
in response to message #26 by Hugh Evans

Hi, Hugh; thanks for your answer.

After reading your post, I just stopped, breath a little and concluded that I'd have no "global" answer so far. Your description is actually close to what I had in mind.

You see, when OpenRPN began, I saw that I'd have nothing but some spread ideas that you, guys, surely already had. Maybe I know what I'd like to see, but I'm not sure I'd be able to go for final implementation. I developped some programming in both low (assembler) and high "user level" languages, I also designed a few hardware (PC to analog interfaces, independent digital controlers, digital data collectors and other devices) but only as spare, either personal or professional "serving" activities. This sort of "wide range" activity is vital for us, in my country, to experience some professional stability and "presence", but is not a good practice if you want to work on specific design. I have not worked, neither alone nor with a team, in a whole design, and dealing with portables (battery operated) always demands a lot of time in reducing current consumption. Any ideas not exactly related to the main subjects would surely lead outway and cause unnecessary delays. I thought I should wait and, if applicable, suggest something acceptable after the design is ready for testing.

I'm glad you reached the point you mention. For me, the heaviest part would be both developing the floating-point algorithms and joining all routines as a single, stable, self-contained operating system. This is a huge task.

Congrats. I'm looking forward to see the final product.

Best regards.

Luiz (Brazil)

How about a 10C w/o programming?

*Message #28 Posted by **Karl Schneider** on 28 Dec 2004, 9:43 p.m.,*
in response to message #15 by Wlodek Mier-Jedrzejowicz

One product that would "fill the niche" is a 10C without its (virtually useless) programming capabilities, which unfortunately persist in the 12C and 12C Platinum.

The 10C ran from 1982-84, when it was discontinued due to poor sales. In this Forum, I have criticized its introduction as a "programmable" $80 alternative to the excellent 11C and 15C, which sold for not much more. However, with a few missing functions (e.g., hyperbolics and delta-%) to replace the crummy programming, and sold at a lower price, it could be a fine entry-level RPN calc that would pass any scholastic or testing-board criteria.

The 10C keyboard, with only one shift key, could provide only a limited number of functions. Removal of programming capability would render unnecessary nine of them (GTO, PSE, R/S, SST, BST, P/R, x<=y, x=0, MEM), and two more (INT, FRAC) would become expendable. That's a lot of space for useful functions. (Why didn't HP do that in the first place?)

Of course, as Wlodek and Bill have stated, the real hurdle would be the production costs. Much of the "body" is still in production, but the firmware and electronic documentation might no longer be available.

Edited: 28 Dec 2004, 11:36 p.m.

I'd vote for a 32S (or a 20S with RPN;-)

*Message #29 Posted by **Raymond Del Tondo** on 29 Dec 2004, 10:18 a.m.,*
in response to message #28 by Karl Schneider

As subject says, I'd prefer something in the case of a 32S,
because the ENTER bar on the 10C series is a mess IMHO.
On many of my 10C series machines, the ENTER bar has
to be pressed with much more force than the other keys,
while on the portrait layout machines,
all keys need nearly the same force.

The form factor of the 10C series machines is a bit better,
so they better fit into a shirt pocket.
but what counts in the end is usability, not only portability.
So in this respect the Pioneer series machines are better IMHO.

Raymond

Re: I'd vote for a 32S (or a 20S with RPN;-)

*Message #30 Posted by **Ron Ross** on 29 Dec 2004, 10:27 a.m.,*
in response to message #29 by Raymond Del Tondo

Karl is probably voting for the 10C because HP still makes the 12c. Hp no longer makes the Pioneer case. But HP makes a 10Bii which could be trasformed into an Hp20s with RPN rather easily.

I like the 10c form and layout a bit better, but lets face it, Hp needs to make the calculator with RPN/algebraic selection to sell to as many potential customers as possible. And that means abandoning the 10c layout. I suspect the 12c platinium's algebraic mode is considered useless to perhaps worse than useless.

A 32S with both RPN/ALG is a good suggestion

*Message #31 Posted by **Eddie Shore** on 29 Dec 2004, 2:32 p.m.,*
in response to message #30 by Ron Ross

Minus the programming or minimal programming. Even if HP decides to spruce up the 9S to make it a two line ALG/RPN calculator would make a good intro calculator.

Re: A nice HP calc with both RPN/ALG is a good suggestion

*Message #32 Posted by **Luis** on 29 Dec 2004, 8:02 p.m.,*
in response to message #31 by Eddie Shore

We had such a calculator in the past, and it was the plain slide rule HP-35. With modern chips, a Voyager shape and dimensions, LCD display, long-life batteries, RPN logic, and the removal of unnecessary programming capabilities, we would go back to the

good old days of the HP 35. Hopefully the price will be in the $25-$35 range to attract new users, and start building customer loyalty and product reputation at HP again.

Greetings,

Re: A nice HP calc with both RPN/ALG is a good suggestion

*Message #33 Posted by **Michael F. Coyle** on 30 Dec 2004, 12:09 a.m.,*
in response to message #32 by Luis

Hi Luis!

Maybe we shouldn't go all the way back to the HP-35!

For the last 15 or 20 years I've used the 11C as my main calculator. I also have a 16C and 48GX but use them less.

A couple of years ago, just for fun, I bought an HP-21 on ebay. (It's roughly equivalent to the 35.) It worked fine but I found it a little too constraining for use on typical light math/science/engineering, mainly from not having enough storage registers.

I then bought an HP-25 and I've loved using it ever since! For the last year I've been using it in undergraduate science and math courses (Statistics, Physical Chemistry and Organic Chemistry) with no problem.

My classmates used algebraic calculators of similar complexity: Casios and various TI-30s and they had no trouble either. Some people tried to use their cell phones but this proved unsatisfactory.

This "from the trenches" experience convinces me that HP-45 or HP-25 or HP-29C level functionality should work well, even at college level. I would suggest a $20 calculator with algebraic/RPN, a 2-line display (would make learning RPN easier) and the same function set as other low-end calcs out there. And non-volatile memory, which is sort of a given these days. TI already does all this, except it use the "wrong" entry system.

Comments, anyone?

(And let me join in to wish everyone a Merry Christmas (or equivalent) and a happy, safe 2005.)

- Michael

Re: A nice HP calc with both RPN/ALG is a good suggestion

*Message #34 Posted by **Walter B** on 30 Dec 2004, 4:30 p.m.,*
in response to message #33 by Michael F. Coyle

Just took a look to the features page of hpmuseum. If keystroke programming is not necessary for this basic RPN calc, the features of the (old) HP27 cover almost every "basic" function you will need. A calc with less functions will hardly be sellable for 25 US$.

If we want to include keystroke programming (as an appetizer), I agree the 11C

or even 10C is a good model. Program steps should show the functions instead of key codes, however, creating a user friendly interface.

Just my 0,01 Euros again.

The OpenRPN Project

*Message #35 Posted by **Hugh Evans** on 31 Dec 2004, 12:58 a.m.,*
in response to message #1 by Eddie Shore

I invite all of you to please stop by OpenRPN if you are intrigued by the contents of this thread. Our current objectives are more complex than what is being discussed here, but I am open to providing enclosures, assistance, and (if enough interest arises) producing entire units.

Best Regards, HDE

HP PSC 1210 all-in-one - scanning

*Message #1 Posted by **Karen Miller** on 22 Dec 2004, 3:58 p.m.*

I understand I have scanning software that comes with this scanner. I have been using AdobePhotoDeluxe which has failed on me.

Just how do I use this HP scanning process which comes with the 1210?

Are there clear directins on the web somewhere>?

Thank you

Karen

HP-41CV clearing malfunction

*Message #1 Posted by **Tom Storino** on 22 Dec 2004, 3:46 p.m.*

I have two HP-41CV calculators with surveying pacs that I have used for many years (trouble free). Recently, one has been not clearing properly. When you attempt a routine: press the gold shift key, then press the clear x/a key, instead of the display showing 0.0000, it shows "DSP BRG?" This calculator otherwise appears to perform all other related (surveying) functions properly. I wondered if anyone has ever experienced this problem and if so, if they might have any ideas regarding a repair solution? If so I would appreciate if that someone would consider sharing same with me. Thank-you.

Tom Storino

Re: HP-41CV clearing malfunction

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Dec 2004, 4:36 p.m.,*
in response to message #1 by Tom Storino

Hi, Tom;

please, allow me a silly question. Have you tried either of both:

1)removing the SURVEY module, or
2)checking if USER mode is active?

Maybe, just maybe, the 'Display bearing' routine is assigned to the [CLx] key, and either of both actions should solve the problem. The worst case would be removing the module (calculator OFF, of course), trying [CLx] while USER mode is active and having a NONEXISTENT message, meaning an internal function/program was actually assigned to it (XROM something).

BTW, if USER mode is active, simply press the [USER] key to deactivate it (it's a toggle key, so you can turn USER mode back on again anytime you need).

Hope this helps.

Cheers.

Luiz (Brazil)

Re: HP-41CV clearing malfunction

*Message #3 Posted by **Tom Storino** on 27 Dec 2004, 10:58 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Dear Luiz and Emmanuel:

Thank-you both for the quick response. You were both right on track with identifying the problem! Once I determined that a function had somehow been incorrectly assigned to CLx key, it was a simple fix. Your help is greatly appreciated. THANK-YOU.

MERRY CHRISTMAS!

Tom Storino

Re: HP-41CV clearing malfunction

*Message #4 Posted by **Emmanuel aka xeq41** on 22 Dec 2004, 4:41 p.m.,*
in response to message #1 by Tom Storino

```
Dear Tom,
He is right. I don't know this module a lot.
But did you made a key asignment?
Please remove your module(s) and press SHIFT <-.
If you see something like XROM ... , you have a key assignment on that key.
You can easily remove it (display shows " "):
SHIFT ASN                "ASN _"
ALPHA ALPHA              "ASN  _"
SHIFT                    "ASN  -_"
<-                       "ASN  -44"
That's all ...

HP35 serial number

*Message #1 Posted by **Frank Boehm** on 22 Dec 2004, 12:08 p.m.*

Hello,

hope someone can help me with this ;)

I have a HP 45 which supposed to have been a tinkering device from HPs calc division. It has a serial# of 1230A82394 - I suspect, the frame/number might be from a HP 35, can anybody deny or confirm this? (I only know 1143 and 1302...)

Thanks Frank

Re: HP35 serial number

*Message #2 Posted by **Jeff O.** on 22 Dec 2004, 11:00 p.m.,*
in response to message #1 by Frank Boehm

According to Dave's list of serial numbers here, the earliest HP-45 serial number begins with 1301. If I recall correctly, there was a batch of HP-35s that began with 1230.

(O/T) Interesting article on Apples graphing calculator

*Message #1 Posted by **Jim Creybohm** on 22 Dec 2004, 10:57 a.m.*

I recently purchased a used Mac OSX laptop. In it,I found a unique and very powerful graphing calculator program that I was previously unaware of. This link provides some detail to the development of this very nice piece of software.

http://www.pacifict.com/Story/

It is similar to Mathematica in some ways, but for a fossil like me it is a little easier to use. The webpage http://www.pacifict.com/ outlines the actual calculator software. An interesting read - but not about HP calcs unfortunately.

49g+

*Message #1 Posted by **Abel López** on 21 Dec 2004, 11:44 p.m.*

I've used an HP48GX for about 3 years and suddenly doesn't work... the reason: any body don't know. I followed every tip for the problem's manual, but nothing.

Now a days, I bought a 49G+ ($190.00), and it doesn't works well. If I push many fast the butons, the display doesn't show that. I.E. if I push very quickly 3005, the display showme 305 or 005 or 300 or 3 or 5 or 00. It is the same case with every combination of buttons, and if i apply the "SELF TEST" sayd that: every is OK.

I've started to think that HP is an fraud.

What do you recomend me for this case? The guaranty for the seller, is dead, works only for 3 months and the problem rise just after this time.

If you known any solution, Please, tell me. Any way, thank you for your time.

Abel López

Re: 49g+

*Message #2 Posted by **Wlodek Mier-Jedrzejowicz** on 22 Dec 2004, 12:35 a.m.,*
in response to message #1 by Abel López

Hello Abel. A lot of people have reported these problems with their HP49G+. HP have trouble with this! Try the following. First, when you use the calculator, press the keys at the middle of the bottom of the key, pushing from the bottom into the calculator, and a little towards the display at the top of the calculator. (The keys work less well if you press from one side, or at the top of the keys.) Second, try turning off the display of the clock if that is turned on. (Some specialists think that the calculator does not check the keyboard while it is updating the clock.) Third, try pressing every key a few times, and "rotating" it. (Some people - me too - have found that this makes the keys more loose, and more reliable.) Fourth, if none of these help, demand that HP replace your HP49G+ with another one!

Re: 49g+

*Message #3 Posted by **Ed Look** on 22 Dec 2004, 12:47 a.m.,*
in response to message #1 by Abel López

I can say that HP WILL replace your 49G+ if it seems to suffer from a bad keyboard. I got a replacement and it is a little better: it still misses keypresses, not nearly as often and yes, turning the clock off does help.

For heavier calculating (to me, that means calculating that requires a bit of light programming), I depended in recent years on the 48G, 48G+ models. Fortunately for me, they still work fine, but I decided to get a 49G+ anyway. The short of the story is that I continued to rely on the 48G units because the 49G+ was a pain to use due mainly to the problems we just mentioned (and maybe one or two others mentioned in this forum).

But the replacement does work much better than the original one I bought and I have noticed that I reach for it

more and more. The ability to accept a SD flash memory card is a superb touch. I don't have to worry about storing my long and stinky programs in a limited, hardwired RAM space.

Re: 49g+

Replacement NiCads for HP82033A battery

*Message #1 Posted by **Tracy** on 21 Dec 2004, 10:07 p.m.*

I purchased a replacement battery for a HP-97 from Digi-Key (as recommended by Katie) and found out the part number has changed to P175-L022-ND and the cost per unit has dropped to $10.06. Hopefully, the article on replacement batteries can be updated to include this change. I was assured by Digi-key that the new model has the same form and function as the obsolete model.

Tracy

Re: Replacement NiCads for HP82033A battery

*Message #2 Posted by **Katie** on 22 Dec 2004, 12:20 a.m.,*
in response to message #1 by Tracy

Tracy,

Thanks for the updated information. I've made the change to my article. Indeed the battery pack you get from Digikey should work just fine, in fact a little bit better in that's it's 1500mah capacity verses the old part number at 1400mah.

Happy Holidays - I have five $5 rebate coupons for the TI BAII Professional - first 5 responders!

*Message #1 Posted by **Gene** on 21 Dec 2004, 6:25 p.m.*

These are a $5 rebate expiring 3/31/2005. You have to fill out the coupon and mail it with your proof of purchase. It says "buy at any retailer or online vendor".

I would have to physically mail these to you...they are physical copies and not electronic.

The first five people who email me at the address:

Genewright143

at

hotmail.com

AND <=========

who post a reply to this thread will get them. I need your mailing address to put these in an envelope.

One per person.

Happy Holidays...anyone want $5 off? :-) Gene

in response to message #1 by Gene

Sounds like I've got myself a birthday present. Thanks, Gene.

Two down...still have three rebates :-)

*Message #5 Posted by **Gene** on 23 Dec 2004, 3:58 p.m.,*
in response to message #4 by Eddie Shore

Enjoy all. Sorry they are limited to the US. :-(

I'm very glad about the TI BAII Plus Professional. I think TI is continuing to improve their business calculators (the keyboard on this new model is much better than the mushy-I-can't-tell-if-I-pressed-it-or-not keyboard of the old BAII Plus models.

Competition is a good thing. We should all be glad HP is continuing to make high-end scientific calculators, since that will ensure more models from TI, which will ensure more models from HP, etc.

And, we should be glad TI is improving their business line for the same reason. :-)

Have you noticed...

*Message #1 Posted by **Matthias** on 21 Dec 2004, 10:43 a.m.*

... that there are two different HP 81161A tapes? One that is black (2232Axxxxx) and a second that is brown (mine has 2449Axxxxx).

Ther are also two sorts of tapes: one is sealed in cellophane that is labeld "Assembled in Mexico" and another that is sealed in a small bag with no printing on it.

There are even two different boxes for the two different tapes. One is 6.5cm x 5.5cm x 14cm and one is 8cm x 7cm x10.5cm. The blue label on the two boxes is the same.

There are more that two different power supplies for the tape drive.

Maybe someone finds two different rechargable batteries or two different boxes for the set (I think there are two, but I only have one yet....

Re: Have you noticed...

*Message #2 Posted by **Emmanuel aka xeq41, France** on 21 Dec 2004, 1:22 p.m.,*
in response to message #1 by Matthias

I had both Verbatim with labels, and HP82176A with & without label. Seemed to have been made by Verbatim in any case?!

Re: Have you noticed...

*Message #3 Posted by **Tony Duell** on 21 Dec 2004, 5:04 p.m.,*
in response to message #2 by Emmanuel aka xeq41, France

The 82161 service manual shows a photo of the alignment tape for said tape drive. It has a very obvious 'Verbatim' logo...

Incidentally, a friend of mine scanned that manual (and some other service manuals) with the intention of offering them to the museum. Alas Dave Hicks couldn't use the file format said friend produced (or something, I don't pretend to understand such things), which rather put us off scanning any of the other goodies I've got (like the HP75 ROM source, the HP71 Forth/assembler source and explanation), and so on.

Re: Have you noticed...

*Message #4 Posted by **Dave Mabry** on 21 Dec 2004, 9:26 p.m.,*
in response to message #3 by Tony Duell

Tony,

Any chance of sending that scan of the tape drive service manual my way? I'll use whatever format it is

and even convert it for Dave if he might be interested.

Thanks, Dave Mabry (MDS user as well as HP calculator user)

AFAIK the HP-75 CPU is a CMOS version of the series 80 Desktop PC CPU.

Maybe more info on www.series80.org ...

Raymond

Re: Have you noticed...

*Message #12 Posted by **Tony Duell** on 22 Dec 2004, 3:44 p.m.,*
in response to message #5 by J-F Garnier

The HP75 ROM source is a good few hundred pages (maybe 1000 pages). I also have the description of it (about 1/4 the thickness) and the I/O ROM source (a bit thinner again). Quite a bit of work to scan that!

For obvious reasons I am not going to copy it, and I won't send it by post (sorry, this is not something I could easily replace if anything happened!). I hope I can find somebody in the UK who is prepared to scan it.

As regards the HP71 Forth listings, the document I have is called an 'Internal Maintenance Specification' I think. It's the source of the Forth and Assembler sections (but not the editor), description of the Forth dictionary, and so on. It's probably the same as the one on the CD-ROM

Re: Have you noticed...

*Message #13 Posted by **Olivier De Smet** on 3 Jan 2005, 6:07 a.m.,*
in response to message #12 by Tony Duell

Hi,

I could be interested in the HP75 rom's dump. I already done an HP86/87 emulator and it could be fun to try an HP75 one.

P.S. the rom listing could also be interesting. André Koppel had a FULL HP86 listing rom in pdf and it was very interesting to use. Especially to enable an 1016x480 graphic mode :)

American AC adapter/charger in Europe

*Message #1 Posted by **Rodolfo Canet** on 21 Dec 2004, 7:08 a.m.*

Hi all,

Probably this is a very simple question, but it is getting me very anxious. If I buy an American HP calculator (most of those sold in eBay are American), would I have problems with the AC charger? I know the plug is different, but that shouldn't be difficult to fix. I mean problems about voltage, 50/60 Hz, and so on. Any feeback?

Re: American AC adapter/charger in Europe

*Message #2 Posted by **Walter B** on 21 Dec 2004, 7:55 a.m.,*
in response to message #1 by Rodolfo Canet

Hi Rodolfo,

the only REAL problem is you have 230 VAC in Europe instead of 120 VAC in North America. Everything else will not affect your adapter, but this will! Last time I was in USA I tried to find and buy a transformer 2:1 -- assuming US citizens will also meet this problem when they leave their continent. Apparently, however, the number of people doing this is too small to offer such a product in "normal" shops. I do not have a better explanation so far.

Good luck!

Re: American AC adapter/charger in Europe

in response to message #2 by Walter B

Some of the classic (meaning old, not referring the classics series) power supplies are switchable. You can use them anywhere!

Re: American AC adapter/charger in Europe

*Message #4 Posted by **unspellable** on 21 Dec 2004, 11:14 a.m.,*
in response to message #2 by Walter B

There are two types of converters. The first is simply a transfomer and is suitable for small loads. This the type you want.

The second is an SCR pack and is suitable for large resistive loads such as an iron. They are not compatible with most electronic equipment such as a radio or calculator. This is the kind you don't want.

Both types can be found in most luggage stores in the malls. Radio Shack or some such might have them at a better price.

Re: American AC adapter/charger in Europe

*Message #5 Posted by **Gordon Dyer** on 22 Dec 2004, 4:56 p.m.,*
in response to message #1 by Rodolfo Canet

Using American AC adapters is no problem in the UK. Just buy a US to UK adapter from Maplin, this has a 240v to 110v transformer inside and the adapter and the right UK plug and US socked built in. See this link: http://www.maplin.co.uk/search.aspx?MenuNo=365&MenuName=Convertors&FromMenu=y&doy=22m12&worldid=3

DONT try to connect a US AC adapter direct to UK mains!!!!!
Happy Christmas.

hp 15C blinking *

*Message #1 Posted by **ralph perez** on 20 Dec 2004, 8:36 p.m.*

My hp15C has a blinking "*" at the lower left of the display. What does this indicate?

Re: hp 15C blinking *

*Message #2 Posted by **Namir** on 20 Dec 2004, 8:59 p.m.,*
in response to message #1 by ralph perez

Low battery indicator.

Re: hp 15C blinking *

*Message #3 Posted by **Karl Schneider** on 20 Dec 2004, 10:37 p.m.,*
in response to message #1 by ralph perez

Low battery -- use three alkaline or silver oxide cells of type 44, 76, or 357.

Re: hp 15C blinking *

*Message #4 Posted by **John Smitherman** on 21 Dec 2004, 11:13 a.m.,*
in response to message #3 by Karl Schneider

Thanks Namir and Karl. I also have a blinking * on my 15c. I purchased it in May 1987 and this will be my first battery change!

John

HP-49g units simplifications

*Message #1 Posted by **Michel Beaulieu** on 20 Dec 2004, 8:23 p.m.*

Hi! I have recently tried to manage units on my HP-49g. I certainly don't do the right thing because when i make, for exemple, a multiplication involving units like 3Kg * 5m/ss i don't get 15 N (netons). Or, worst, if i divise 10 m/s by 2 m i don't get 5 m but 5 m/ms. I even get units ansers like Km/m, MPc/pc ; What a i doing wrong?

The manual talks about an advanced manual that can be found on HP but i can't locate the PDFl where is tha manual?

Thanks Michel

Re: HP-49g units simplifications

*Message #2 Posted by **Veli-Pekka Nousiainen** on 21 Dec 2004, 2:27 a.m.,*
in response to message #1 by Michel Beaulieu

automatic simplification is done here:
10_m/s 2_m / => 5_1/s

These need CONVERT:
15_kg*m/s^2 1_N CONVERT => 15_N
VPN

Re: HP-49g units simplifications

*Message #3 Posted by **Norris** on 21 Dec 2004, 12:30 p.m.,*
in response to message #2 by Veli-Pekka Nousiainen

These need CONVERT: 15_kg*m/s^2 1_N CONVERT => 15_N

****

You may find it more convenient to convert units by simply adding zero of the desired units. This is easier than typing in the CONVERT command, or switching menus to find the CONV button. Example:

15_kg*m/s^2
0_N
+

Result: 15_N

This works on the 48G; I assume that it works on the 49G as well

Re: HP-49g units simplifications

*Message #4 Posted by **Ron Ross** on 21 Dec 2004, 12:56 p.m.,*

in response to message #3 by Norris

While this works (and I used it often, BEFORE I learned:

use left shift button push then push the soft key units you wish to convert to. If the desired units are not compatable you will get a zero unit addition to the stack w/o modifying your original entry.

using previous example:

15 Kg*m/s^2 (on the stack)

<- (left shift key)

press the units ie N under the force menu and Voila 15 N .

Re: HP-49g units simplifications

*Message #5 Posted by **Veli-Pekka Nousiainen** on 21 Dec 2004, 1:27 p.m.,*
in response to message #4 by Ron Ross

In programs I would still use CONVERT

Re: HP-49g units simplifications

*Message #6 Posted by **Francesc Casanellas** on 21 Dec 2004, 4:15 p.m.,*
in response to message #1 by Michel Beaulieu

I recommend you to get the HP48 "Advanced User Reference Manual" (HP part no. 00048-90136) which is (or was) available in printed form from HP calculators suppliers - 99% usefull for the HP49G. You can download it form http://www.hpcalc.org/hp48/docs/misc/

You cannot get more than 10% of the HP49 without this manual.

The HP49+ has a very complete manual ... but only in PFD format. You have to print 860 pages. More on it is also usefull for the HP49G so you can download it too, either from www.hp.com (handheld devices/calculators/calculator support/... or from http://www.hpcalc.org/hp49/docs/misc/

Edited: 21 Dec 2004, 4:44 p.m.

Re: HP-49g units simplifications

*Message #7 Posted by **Veli-Pekka Nousiainen** on 21 Dec 2004, 4:44 p.m.,*
in response to message #6 by Francesc Casanellas

You don't have to print 860 pages.
Just print those that you on the long run find really useful (as printed).
[VPN]

Re: HP-49g units simplifications

*Message #8 Posted by **Tom Sherman** on 21 Dec 2004, 6:44 p.m.,*
in response to message #6 by Francesc Casanellas

Another excellent source is Chris Coffin, An Easy Course in Programming the HP 48G/GX, still available for $19.99 (e.g. Samson Cables). For units, see pages 68-73.

And for many topics, LaTorre, Kreider, and Proctor, HP-48G/GX, Investigations in Mathematics, is very helpful. Some have been sold on eBay for $0.99 plus $5.00 postage.

I am assuming that most of what pertains to the 48G also works for the 49G.

Tom

My 48gx will not allow me to delete any files.

Re: 48gx

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 Dec 2004, 4:06 p.m.,*
in response to message #1 by bob smith

Hi, Bob;

what happens when you attempt to purge the variables? Any particular message?

Can you describe the problem, maybe with a keystroke and related resulting message?

Best regards.

Luiz (Brazil)

Re: 48gx

*Message #3 Posted by **Wayne Brown** on 20 Dec 2004, 6:43 p.m.,*
in response to message #1 by bob smith

Are the files on a **RAM** card? If so, have you checked to see if the write-protect switch is set to the **RAM** position? If it's set to **ROM** then you'll get an error when you try to delete (or save) anything to the port(s) on the card.

Also, are the files you're trying to delete actually directories? If so, then you need to delete any files in them *before* trying to delete the directory itself. (Unless you're using the MetaKernel, of course; its Filer lets you delete directories *and* their contents at the same time.)

HP 97S Please Help..

*Message #1 Posted by **Dennis** on 20 Dec 2004, 8:24 a.m.*

Hello, I need help with my HP 97S. I got almoust the HP97S working again, but one issue is open. The I/O interface was disconnected from the calculator board and I need the pinout to reconnect it again, so which of the small little cable are to be connected to which pin on the circuit board. Please help if you can. I would like to thank everyone in advance for helping me out. Thanks very much !

Re: HP 97S Please Help..

*Message #2 Posted by **Katie** on 20 Dec 2004, 10:36 a.m.,*
in response to message #1 by Dennis

If you have the CD/DVD manual set from this museum, there's a picture of the internal connection called: 97SINT.JPG that shows the connection in enough(?) detail to reconnect it. I think that this picture used to be on this web site, so perhaps Dave still has it in higher resolution if it's not quite good enough.

-Katie

Re: HP 97S Please Help..

*Message #3 Posted by **dennis** on 20 Dec 2004, 10:44 a.m.,*
in response to message #2 by Katie

Thanks Katie for the fast reply. I only saw the photo from the 97S listed on the museum page. The problem is that each wire is connected below the red connector, so I am not able to determine which wire goes to which pin below this red cover. If there is another photo I do not have it. Thanks Dennis !

Re: HP 97S Please Help..

*Message #4 Posted by **Ronald** on 20 Dec 2004, 5:13 p.m.,*
in response to message #3 by dennis

Hi Dennis,

I have a HP97S, so I could open it and take a picture next week (after Christmas when I have some time off.

Let me know at that time if you still need it.

Success

Ronald

Re: HP 97S Please Help..

*Message #5 Posted by **Katie** on 21 Dec 2004, 1:24 a.m.,*

in response to message #3 by dennis

I took a picture of the connector in my 97S and I think the order is:

```
1 - white/yellow
2 - black
3 - orange
4 - white/green
5 - yellow
6 - red
7 - green
8 - brown
9 - blue
10 - pink
11 - grey
12 - white/red
13 - white/brown
14 - white
15 - white/orange
16 - white/black
```

and the larger diameter lead that connects outside of the 16-pin header

Here's the picture: http://www.wass.net/pictures/97s.jpg

-Katie

9810 service manual

*Message #1 Posted by **marais** on 19 Dec 2004, 5:01 p.m.*

Time to look after my 9810! Tony was so kind to send me his reverse-engineered schematics. I noticed that the museum CD only contains 9805 service documentation. Would that be of any help for my task, or does anybody know of any other source for the 9810 service manual? I just got myself a digital scope; the old analogue one doesn't help much with this machine.

Andreas

Re: 9810 service manual

*Message #2 Posted by **Tony Duell** on 19 Dec 2004, 9:07 p.m.,*
in response to message #1 by marais

AFAIK the 9805 is a very different machine to the 9810 (in fact the thing closest to a 9805 is the 46 and 81 series, I think, although I've never seen the 9805). And I am told that the 9810 service manual contains schematics and troubleshootying infoemation for the power supply _only_. Everything else is a board-swapper guide :-(. You, of course, have the PSU disgamrs in my set anyway. So I am not sure that the 9810 service manual is going to be much use (I don't have it, though, so I can't be sure). What's the problem with your 9810? I've debuged 3 of them so far, and I have a reasonable idea as to what goes on inside. Let me know if I can be of any help.

Re: 9810 service manual

*Message #3 Posted by **marais** on 20 Dec 2004, 2:39 p.m.,*
in response to message #2 by Tony Duell

Tony, I haven't pushed my analysis very far; I'll work on the machine between the 25th and the 29th. If you are available during that time, I'd be happy to contact you by mail (or on the forum, if our exchange is of interest for others). The machine powers up with "Status", "Fix( )", "Run" and "Insert Card" LEDs on; apparently that's an arbitrary state, and the cpu does nothing of the things it's supposed to do during init. Quite desperate as a starting point! Thank you for your offer, I'll gladly get back to it!

Andreas

Re: 9810 service manual

*Message #4 Posted by **Tony Duell** on 21 Dec 2004, 5:02 p.m.,*
in response to message #3 by marais

I should be reading e-mail (and looking here) at least once a day through that period, so I can probably help you. I am happy to do it by private e-mail, or carry on posting here, the former is, however, slightly easier for long messages.

Anyway, do you have my list of initial checks? Things like checking the PSU outputs (voltage and lack of ripple), removing all that's not necessary (card reader interface, printer, I/O backplane, ROM module backplane, keyboard) and seeing what happens?

I assume you have a totally blank display. This, alas, means there could be a fault in any part of the processor, memory system, or, of course, the display board itself. Quite a bit to work through, but some areas can be eliminated easily. One thing I would do early on is look for activity on the display strobe signal on the display connector. I will guess it's not doing anything, though.

You say the processor isn't doing the things it should after INIT. OK, so what is it doing? Is it doing anything? Is the microcode program counter (accessible on the test connector on the -66513 PCB) changing. Do you have an 8-channel logic analyser? If so, you could grab the microcode addresses and see just what the CPU thinks it's doing (I have a commented source to the CPU microcode, BTW). Is it even trying to access main memory (look at the R(3) and R(6) signals (my names, my schematics), one is read, the other is write)?

Re: 9810 service manual

*Message #5 Posted by **Achim** on 21 Dec 2004, 8:12 p.m.,*
in response to message #3 by marais

I have a copy of the 9810/9820 service manual and it really won't help much to repair a dead machine. You need the schematics and they are not included.

Achim

Re: 9810 service manual

*Message #6 Posted by **Tony Duell** on 22 Dec 2004, 6:13 a.m.,*
in response to message #5 by Achim

That's what I'd heard, it was just a board-swapping guide (the HP desktop calculator service manuals never include full schematics in my experience). It might be interesting to see that manual sometime, but I doubt I _need_ it.

Marias (the originator of this thread) has schematics, though, I believe. HPCC has reverse-engineered schematics of that machine, and quite a few others. However, to be fair, the schematics alone, while a great help, are not that easy to follow unless you know how the machine works (it's bit-serial, some of the logic isn't on the boards you'd expect (a classic example of that is that one of the ALU input multiplexers is on one of the boards in the memory cardcage, the other is on the data path board), and so on).

I'm happy to continue a discussion here of how to repair these machines if nobody objects. Or I can do it by private e-mail.

Re: 9810 service manual

*Message #7 Posted by **Vassilis Prevelakis** on 22 Dec 2004, 8:13 a.m.,*
in response to message #6 by Tony Duell

please keep the discussion on this forum, it is very interesting and educational even though I do not have a 9810.

Re: 9810 service manual

*Message #8 Posted by **marais** on 22 Dec 2004, 10:09 a.m.,*
in response to message #7 by Vassilis Prevelakis

I confirm that the display is blank. I understand that as opposed to the 97, it IS possible to remove the peripheral interfaces without inhibiting the main board to operate. I will carry out your suggested initial checks saturday, and check the display strobe. I don't have a logic analyser, just an analog and a 2-channel digital scope. I should be able to test the R/W strobes, but I won't be able to get a hold on the uC addresses with my equipment. So - let's take a deep breath and calm down, before the patient will be opened in less than 72h from now.

Re: 9810 service manual

*Message #9 Posted by **Tony Duell** on 22 Dec 2004, 3:41 p.m.,*
in response to message #8 by marais

Yes, unlike the 9100 (and several other machines), the 9810 will give a normal display without the printer, card reader, I/O backplane, ROM cartridge backplane (there's no need to physically remove this, just unplug the edge connector with all the wires going to it under the memory cardcage) and keyboard. You have to keep the mains switch cable (5 pin Molex/AMP thing) connected of course so that the PSU can power up.

Without a logic analyser, you can't (easily) trace the microcode. But you should be able to see if the CPU is trying to access memory (it should obviously be reading machien code instructions). You can also probably look at the data flowing through the ALU, since that's all bit-serial.

Two other hints :

Firstly, I've had a lot of problems with the 74Hxx chips in these machines. They fail in such a way that the outputs no longer swing to valid levels. You might want to check these with your 'scope if you suspect a data path problem.

Secondly, you can put just the CPU clock generator card (-66512, brown/red handles) and the PSU boards into the backplane and power up. That's to say, remove the other 3 CPU cards, the display, and the complete memory cardcage. You can now look at the 2 main clocks (bitclock and the CPU microcode clocks) on the outputs of the 74H40 chip on the bottom row of the clock card (look at the schematics!). They should both show activity, with the microcode clock pulsing once for every 16 bitclocks (the clock count lines are all pulled high in this configuration). If that's OK, then it's a fair bet that the clock is not the problem.

Re: 9810 service manual

*Message #10 Posted by **marais** on 25 Dec 2004, 11:29 a.m.,*
in response to message #9 by Tony Duell

Tony, the show begins! I followed your advice and first powered up with the backplane plug at the side (for the I/O stuff) removed. It didn't change much - most of the time when I turn on the machine, it comes up with the LEDs Status, Fix, Run and Insert Card on. Sometimes nothing lights up.

I checked the PSU, all voltages there.

I then plugged the scope ton the 6813 test connector. I couldn't find the pinout in your documentation, however I found 1MHz clock and strobe signals on several pins. I think that's a good sign.

I then removed everything but the 6812 clock board. Interesting! I don't have a 74H40 chip on the card (mine's a revision C), but I checked the signals on the backplane. uClk

shows a 500kHz strobe, Dispclk2 constant 2V, Bitclk a 6.5MHz signal that looks more like a sine than a clock, Mclk the same. Outclk is dead.

I think we have to take a closer look at the clock board. Unfortunately I don't have a clock generator to inject an external clock - I saw in the schematics that the 9810 allows this.

I continue...

Re: 9810 service manual

*Message #11 Posted by **Tony Duell** on 25 Dec 2004, 12:39 p.m.,*
in response to message #10 by marais

My clock card is a Rev C too. The 74H40 in question is the second chip from the left in the bottom row (board component side up, edge fingers towards you). It may, of course, have an HP 1820-xxxx number. Don't worry about the dismuclk signals. They're to _disable_ the clocks and aren't really used on the 9810. They're used on the 9830 (and 9820?) for DMA operations, etc. I ma a bit worried about your biclock. It should be a good, square, clock. I don't know how good your scope is (if it's a 10MHz unit, then all bets are off!), but if it's reasonable (50MHz+), then you should see a square wave. Maybe that 74H40 is defective, I did mention that one problem with them is that the outputs don't switch properly Outclk should be 'dead' unless the rest of the CPU is there and trying to run I/O operations. For the moment, I'd look at the Bitclock a bit more. Incidentally, if you have an 1820-xxxx chips in this machine that you can't indentify, I can try to corss-reference them to normal numbers.

Re: 9810 service manual

*Message #12 Posted by **Tony Duell** on 25 Dec 2004, 2:14 p.m.,*
in response to message #11 by Tony Duell

A few more things : The CPU control board test connector is shown on sheet 3 of the CPU control schematic (my diagrams), in the bottom right corner. The rest of this sheet shows the microcode ROMs. If you've got bitclock working, then I'd put in the rest of the CPU and the memory box (oh, you might as well put in the display too). Then, look at the R(6) signal (output 2 from section a of U18 on the CPU control card (sheet 4, top left). This goes low when the machine tries to read from main memory. Make sure it is -- the CPU should be fetching instructions. Now look at the M lines (Memory address) mon the test connector on the memory box (sheet 3 of the memory backplane (09810-66527), right hand side). Since it's a bit-serial machine, they'll be changing all the time (they're only valid during a memory cycle), but you should see them changing. If so, then there's a chance that the CPU data path is doing something sane -- data is being clocked into the M register. Other good places to look at are the inputs to the ALU. One of them is the output of U17 (74H54) on the memory timing PCB, sheet 4 bottom right corner. The other is the output of U3 (74H53) on the Data path PCB (left side of sheet 3). Being 74Hxx chips, they tend to fail. THer easiest way to test on IC pins in this machine is to power down, pull the card, and solder a short length of wire to the PCB pad (solder side of the PCB). Then put the board back in, power up, and probe the other end of the wire. These machines are slow enough that a few inches of wire doesn't cause any problems.

Re: 9810 service manual

*Message #13 Posted by **marais** on 25 Dec 2004, 3:39 p.m.,*
in response to message #12 by Tony Duell

Tony, I hooked up the clock card on a 5V power supply to have better access. Using a 60MHz scope with 1:10 divider probes, I get reasonably good signal quality on BitClk, and I verified it's 1/16th of the main clock. I took a digital picture I'll send when back in Paris. So i put back in all the cards and the memory cage and checked the test connector on the memory box. The M-lines are static! Some 0, some 1, but no transitions whatsoever. Same with the T-Lines. Let's resume: Clock seems good - cpu does not cycle however. Are there other checks on the clock to be made on other boards?

Andreas

Re: 9810 service manual

*Message #14 Posted by **Tony Duell** on 25 Dec 2004, 5:31 p.m.,*
in response to message #13 by marais

OK, if M and T are both static then either the CPU is not trying to access memory at all (and of course it should be fetching instructions), or there's a problem in the control logic for the M and T registers. The next thing is to find out just which of those is the case. It's a pity we can't trace the microcode (that would tell me if it had got into the fetch-execute loop), but I think I would now look at the M register control circuitry. I will point you in the right direction if you can't find it (it's eitehr on the memory adddres or memory timing boards).

Re: 9810 service manual

*Message #15 Posted by **Tony Duell** on 25 Dec 2004, 6:53 p.m.,*
in response to message #14 by Tony Duell

OK, some more thoughts. Take a look at the Memory Address PCB (09810-66523) (sheet one of my schematic). It shows the M register (4 off 7495) and the simple control logic needed to load it. For the moment ignore the RotClk signa and U9c that produces it - that's used for _reading_ the M register. Take a look, though at SRclk, the output of U9d (74H08. This is the clock for loading the M register. Does it ever clock? If not, look at the mu(27) line, which is one of the outputs of the CPU microcode PROM. It goes low to load the M register? Does it ever do so? If so, does the output of U13c (74H01) go high? If so, check bitclk again!. Now, what if mu(27 never goes low)? Well, tjhat measn there's a CPU problem. Either a PROM failure (every unlikely), or the microocde is not running the right routine. I am not sure what happens if a 9810 fails the power-on microocde test (yes, there is one), maybe it locks up (I am almost sure some of the other machines in the range do, but I can't instantly see how the 9810 would do this). Now, you say you don't have a logic analyser, so you can't trace the microcode. But maybe we can get some clues. Go to the test connector on the CPU control (09810-66513) board. Look at the 8 signals I've called muAddr(0) to muAddr(7). Are any of them static (if so, what state)? If we really

get desparte, it might be worth wiring up an 8 bit comparator (a 74LS688, or a couple of 74LS85s, or something) with one set of inputs coming from the muAddr lines, the other set from a DIP switch and pull-ups. The equality output ges to your 'scope. We can then set particular addresses on the switch (addresses in the fetch/execute cycle) and see if they're ever hit.

Re: 9810 service manual

*Message #16 Posted by **Tony Duell** on 25 Dec 2004, 7:26 p.m.,*
in response to message #15 by Tony Duell

And some more thoughts. There are some other things that can effectively lock up a 9810. The first is if it's stuck in the refresh cycle (that is, the Wait/ signal, e.g. on sheet 2 of the clock schecmatic, is low (asseted). I think tha will casue the Bitclk and muclk signals to stop. Are they both active when the all 4 CPU boards and the memory cardcage are installed? Another possibility is tha the machine is stuck executing an I/O operation. THe I/O circuit -- HP called it a 'processor' -- puts the CPU microcode into a tight loop (locations 5A and A7 hex I think), waiting for the I/O circuiit to finish. This is the I/O op signal (output of U1, 74H101) on the clock PCB (sheet 4, top left corner), buffered by U2c (3001,this is like a 74H08) on the same PCB (sheet 3, bottom left corner), then fed to input 15 on the condtion code multiplexer (CPU control sheet 2, left side). If that's malfunctioning, or if, for some reason, the I/O 'processor' is never clearing the I/O Op flip-flop, then the CPU will lock up.

Re: 9810 service manual

*Message #17 Posted by **marais** on 26 Dec 2004, 6:17 a.m.,*
in response to message #16 by Tony Duell

I soldered some ribbon cable to the 66523 board to probe the 7495 shift registers. SRclk and Rotclk are on 0V (or maybe floating, but definitely not Hi) all the time. I'll check the mode input from u27 and the clock circuitry next. I'm moving on slowly, as my data books are mostly CMOS and I have to look up pinouts on the internet instead. HP using its own part numbers also doesn't help. The clock circuitry on the 66423 driving the shift registers looks quite simple; if BitClk arrives on the input of the H08, maybe the H08 itself is dead. I'll report...and check the I/O hypothesis you mentioned later on. Stay tuned!

Re: 9810 repair - first clue

*Message #18 Posted by **marais** on 26 Dec 2004, 7:37 a.m.,*
in response to message #17 by marais

Tony, I probed the SRclk input of the shift registers for the M-register on the 66523 board: No signal. Then I checked the clock input circuitry, which is drawn on the same sheet in your documentation: SRclk and Rotclk are

the outputs of two AND-gates of a 74H08 chip. They both take BitClk as one input (which is pulsing). The other input of the AND generating SRclk is the pulled up output of an inverter, built with a H01. I checked the input (that is to say, the output of the inverter U13c), and I get a signal! This also proves that u27 must work (which also drives the mode input of the 7495 shift registers). I conclude that the 74H08 AND gate is dead - do you concur? I will properly document these findings together with the scope images and put them on my website; since the signal quality is quite poor, you may have additional comments on them. My scope is a 60MHz one with 1:10 divider probes which I recalibrated on a 1MHz test signal...of course, the 10" wires I soldered to probe the chips degrade the signal significantly. Now the question is: Do I have a 74H08 (1820-0141) in spare? I'll check...

Re: 9810 repair - first clue

*Message #19 Posted by **Tony Duell** on 26 Dec 2004, 9:36 a.m.,*
in response to message #18 by marais

A bit of background (and also for the benefit of others trying to follow this). The M register has effectively 2 clock inputs, SRclk and Rotclk. The former is enabled by mu(27), and is used to load the M register from the ALU. The latter, enabled by RotEn, causes the M register to do a 'rotate right' operation. This is used to load from the M register into some other register, via the ALU -- the bits are grabed as the pass through bit 0 fo the M register, the register is clocked 16 times, so at the end it's unchanged. OK, if you've got mu(27) and bitclock both active, it's a fair bet that H08 is dead. I mentioned I've had problems with the 74Hxx chips. Fortunately the 'H08 has the smae pinout as the other 74x08 chips (this is not the case for some more exotic functions, be careful!). If you can't get an 74H08 (and this family is not common), then a 74S08 ora 74F08 will probably work. A 74LS08 _might_, but it's pushing it a bit. If you need any pinouts, hp-numbers conveted to normal IC numbers, etc, just post (or e-mail me). I've got the information to hand here.

Re: 9810 service manual -- A useful trick

*Message #20 Posted by **Tony Duell** on 26 Dec 2004, 9:31 a.m.,*
in response to message #17 by marais

A useful trick for distinguishing a ground (or logic 0) signal from a floating one is to make a potential divider (say a couple of 100k resistors in series) across the 5V

power supply, clip the 'scope on the middle of that, and also connect the signal-under-test there. A floating signal then shows up as a 2.5V line on the 'scope, which is different to 0V (I assume your scope is DC-coupled!)

Re: 9810 service manual -- A useful trick

*Message #21 Posted by **marais** on 26 Dec 2004, 10:36 a.m.,*
in response to message #20 by Tony Duell

I am still worried about the signal quality. I get signals, but they don't look like rectangles. Do you think it is possible to test the board statically, that is to say, being directly connected to 5V, out of the machine, without the other boards? That's what I did with the clock board. I assume if I connect the board to 5V without a clock input, I should get a static response, allowing me to check the TTL levels. I could then inject = or 1 to see what happens. In fact, I re-checked SR, and SCLK, and there is some small signal - like 2V or so, with lots of noise. I need to re-verify my measurements. I took photographs of the scope screen; I'll post them next week-end when I'm back in France. I need your opinion on the signal quality.

RE: 9810 - static test

*Message #22 Posted by **marais** on 26 Dec 2004, 11:26 a.m.,*
in response to message #21 by marais

I pulled out the board and started my static tests. If I pull u27 low, SRCLK goes up as it should. I admit I'm confused. Should my problems be noise-related? I continue the static tests...a pulse on rotclk should load the 16 bit data into the shift register, a pulse on srclk should rotate the data I suppose. MAybe I can clock something in serially using the Alu0 input. That should be a concluding test.

Re: RE: 9810 - static test

*Message #23 Posted by **Tony Duell** on 26 Dec 2004, 11:55 a.m.,*
in response to message #22 by marais

It's not unkonwn for an IC to work correctly at low speeds, and fail at everal MHz!

Re: 9810 service manual -- A useful trick

*Message #24 Posted by **Tony Duell** on 26 Dec 2004, 11:54 a.m.,*
in response to message #21 by marais

The signals looked pretty good in my machine on my 'scope (an old Tekky 555). If yours are poor, then either the driver chip is defective, or your 'scope (or probes) are not up to the job. Go back to the clock card. Look at the output of the 8MHz master clock (I think I called it MClk). If that looks poor, I really would check your 'scope is working correcly, that you've adjusted your probe compensation trimmers properly, that sort of thing. Do you have anything else you could get a couple of MHz TTL clock from to check the 'scope?

Re: 9810 service manual -- A useful trick

*Message #25 Posted by **marais** on 26 Dec 2004, 12:33 p.m.,*
in response to message #24 by Tony Duell

Tony, I already did that; I pulled out the clock card again and took pictures of the 8MHz clock. It looks ok (I'll send a picture friday). Here's what I found out in my static tests so far: Pulling down u27 actives SRCLK as it should. The output level is only about 3.25V, but maybe that's ok? However, a 1 on bitclk does NOT activate SRCLK. Can that be true? I also found that pulling u27 loads values into the shift register. However, I need u27=1 (mode) and Bitclk=1 to generate just a shift - can't do that with my broken 74H08. I'll re-do my tests to be sure...it's weird for an AND-gate to work for one input but not for the other, I've always seen them fail entirely (on the LS logic family, that was).

Re: 9810 service manual -- IC failure

*Message #26 Posted by **Tony Duell** on 26 Dec 2004, 4:08 p.m.,*
in response to message #25 by marais

What if the bond-out wire connecting one of the input pins to the silicon die had broken? That input pin would no longer be connected, it would float high in the chip. So the other input would do something in the case of a '08 (it's an AND gate, you'd be ANDing with 1, remember a TTL input floats high). I have come across failures

like this before, BTW.

Re: 9810 service manual -- IC failure

*Message #27 Posted by **marais** on 26 Dec 2004, 6:14 p.m.,*
in response to message #26 by Tony Duell

That was my next question - not trusting my own diagnosis, i wanted to know how likely such a fault would be. Anyway, I removed the chip, put in a DIL14 socket, and hope to find a replacement H08 tomorrow. I'll report in the late afternoon! It's exciting to work on that beauty.

Re: 9810 service -- scope shots

*Message #28 Posted by **marais** on 27 Dec 2004, 5:08 a.m.,*
in response to message #27 by marais

I put some screenshots of my scope images on the web:

http://www.rheinfeld.de/andreas/hp9810.htm

If Tony allows me to add some excerpts of his sheet #1 to explain the context, I can add a more concise description, so that this discussion becomes more valuable for other forum visitors.

*Message #29 Posted by **marais** on 28 Dec 2004, 1:34 p.m.,*
in response to message #28 by marais

After replacing the faulty H08, the uProgram counter is doing something. After start-up, it goes through a short sequence (which I am unable to trace without a logic analyzer), and then hangs between two logic states. Following your advice, I built a small 8bit logic comparator, and found that the machine alternates between addresses $a3 and $5a. (or 5c and 65, if these need to be inverted). I don't think we can go much further without a logic analzer.

Andreas

Re: 9810 service -

*Message #30 Posted by **Tony Duell** on 28 Dec 2004, 7:27 p.m.,*
in response to message #29 by marais

I owuld check thsoe microcode address states very carefully! Is it possible they're actually Is it possible they're actually $5a and $a7? That's a 2-instruction loop that'the microcode runs round when it's doing an I/O operation -- the 9810 has what HP call an 'I/O processor' -- I think that's rather over-claiming, I'd call it a state machine. Anyway, that's set going, and the main CPU microcode waits for it to complete. Go back to the clock board. There's a flip-flop -- a 74H101 I think -- that produces a signal that I call I/O Op. See if that's being asserted (for various reasons, that actually means the flip-flop is 'cleared -- Q low and Q/ high). If it is, then find out why that flip-flop is never being set again (this should happen when the I/O command decoder -- the '154 in the middle of the clock PCB -- output 15 goes low. I don't think you need a logic analyser just yet!

Re: 9810 service -

*Message #31 Posted by **marais** on 29 Dec 2004, 10:50 a.m.,*
in response to message #30 by Tony Duell

Ok, the vicious circle actually is 5a and a7, and the flip flop is not asserted: IOOP/ is 0, IOOP is 1, and since IOOP/ is taken from the Q output and fed into the 154, it would be defined as unasserted - am I right or do we get the terms mixed up? Anyway, IOCMD15 is permanently 1, the 4 inputs shorted to go into the J input of the 101 FF are permanently 0. Let's make sure the terms are right: If IOOP / is 0, it means we are in an I/O operation?

Edited: 29 Dec 2004, 10:51 a.m.

Re: 9810 service -

*Message #32 Posted by **Tony Duell** on 29 Dec 2004, 3:30 p.m.,*
in response to message #31 by marais

OK. You are stuck in the 'wait for I/O

processor' loop. That's good in a way -- it's something that we'ce (you've) definitely identified, and it means that the proecessor microcode is at least doing something right 9in that this is a possible loop) Now for the I/O Op flip-flop. If I/O Op (the Q/ output) is 1 (high) and I/O Op/ (the Q output) is 0 (low), then I would describe I/O OP as 'asserted. In particualr, I/O Op/ being low will enable the '154 I/O Command decoder. Go bavk to the 7474 D-types that make the 4-bit 'I/O command register' and which feed the A, B, C, D inputs of that '154. Are they being clocked (if not, check back to, IIRC, an H00 NAND gate that drives them). What are the D inputs doing?. What are the A, B, C, D inputs to the '154?

Re: 9810 service -

*Message #33 Posted by **marais** on 29 Dec 2004, 4:05 p.m.,*
in response to message #32 by Tony Duell

The last thing I did was to check the ABCD inputs of the 154. They are 0011, so line 12 should be asserted. Does this particular I/O-uInstruction ring a bell? Unfortunately, my time here with my 9810 is up, I will have to leave the machine here with in my parents' home and return to where I work tomorrow morning, leaving without my 9810, and without my test equipment. I will order some 74F chips, especially the one with the weird logic level an uAddr(2), and return in 8 weeks. I will also properly document our findings on my website, and dig deeper into the documentation. I realize I am stealing a lot of your time - would you be available for an equally intensive hardware debugging session in two months from now? And for those who followed this thread: If you think this conversation should take please in private by mail, please say so.

Re: 9810 service -

*Message #35 Posted by **Tony Duell** on 29 Dec 2004, 6:33 p.m.,*
in response to message #33 by marais

OK, If the I/O Cmd Register (that's the 4 D-types in U16 and U17, both 7474a) is 0011 (with A listed first), then that's an OT (Output) instruction. Output 12 of the '154 should be pulsing (it's gated bu I/O Cmd En, from the NAND gate U6d (74H00) in the clock generator circuit), and should generate I/O clock via U3a (7410) -- you could look for this on pin 12 of this chip. I/O clock should clock the I/O bit counter U4 (74193) via U10a (7402), which should count down. When it crosses 0, then I/O Br is asserted, this causes the I/O command register to change to 1011 (again, A first) via its input gates. The bit counter now stops, and on the next cycle, the I/O cmd register becomes 1111. Then output 15 pulses low, clearing the I/O Operation flip-flop (U1, a 74H101) via U10b (7402). That should give you some signals to check, at least!. I am happy to keep this public, but I can't help feeling we're totally boring everybody else here :-)

Re: 9810 service - not boring !

*Message #36 Posted by **Marc** on 30 Dec 2004, 1:48 a.m.,*
in response to message #35 by Tony Duell

Hi,

A few words to tell how I'm impressed and interested in your work, Tony and Marais. Boring ? I'd rather say that it brings us great knowledge. Please keep posting on this forum. Some of my colleagues never heard about TTL chips... Gasp ! It would be a pity that the 98xx series become as mysterious as the 9100...

Just a few thoughts from France

Marc

Re: 9810 service - not boring !

*Message #37 Posted by **Tony Duell** on 30 Dec 2004, 3:47 p.m.,*
in response to message #36 by Marc

And just what is mysterious about the 9100? It's just discrete transistors and diodes, and not that many of them either...

Heck, there's only 44 flip-flops (IIRC) in the 9100B. An amazingly low total! The rest of the circuitry is not that bad either

Re: 9810 service - not boring !

*Message #38 Posted by **Marc** on 3 Jan 2005, 2:14 a.m.,*
in response to message #37 by Tony Duell

Hi Tony !

You're right, technologically speaking the 9100 isn't that mysterious. I forgot to say that my point of view was related to it's microcode and firmware... Not to mention the fact that the patents give only partial informations.

Cheers, Marc

Hp-45 timer

*Message #1 Posted by **Pierre Brial** on 19 Dec 2004, 12:44 p.m.*

Hello, I have opened my Hp-45 to fix some keys, and I wish to take the opportunity to add a crystal, in order to improve the accuracy of the undocumented timer. I suppose that the crystal value given in http://www.hpmuseum.org/45crys.htm, that is 784 khz, is compulsory. I tried with 768 khz, slightly too slow, and with 1 Mhz, too fast. But where could I find a 784 khz crystal ? It is not a common value.

As for the keys, some metallic spring strips (for lack of proper name) were cracked. This gave a keyboard feel similar to a casio. I fixed this by putting some soldiering tin on the cracks. I'm not sure of the durability of the fix as tin is a bit too soft, but I don't know better way to do. Any idea ?

All the best,

Pierre Brial

HP-41CX & 41CY

*Message #1 Posted by **Jon** on 19 Dec 2004, 5:35 a.m.*

Hi:

Just wondering what is the difference between these models. I can´t find good information about the 41CY. Probably is has been discussed before but I can´t find the thread.

Regards

Jon

Re: HP-41CX & 41CY

*Message #2 Posted by **Matthias** on 19 Dec 2004, 5:47 a.m.,*
in response to message #1 by Jon

The CY was a upgraded CX, made by W&W:

- double speed (switchable on the side of the calculator) - internal RAMbox with 64k (2x 32k) - new template

(There was also a CW with only 32k RAMbox)

The CY is extremly rare and I doubt that you find one, cause they are all in collector´s hand. also do not know, when W&W strated and discounted the HP-41CY. Maybe someone can help us....

Survey routine for GX

*Message #1 Posted by **Rick** on 18 Dec 2004, 2:49 p.m.*

I have looked and looked but can't find a program to convert quadrant bearings to azimuth and viceversa. Has anyone seen this program?

Re: Survey routine for GX

*Message #2 Posted by **Raymond Del Tondo** on 18 Dec 2004, 3:31 p.m.,*
in response to message #1 by Rick

Maybe try www.hpcalc.org , *the* source for HP-48 programs.

Raymond

assembler programmer's reference manual

*Message #1 Posted by **Klaus** on 18 Dec 2004, 3:56 a.m.*

Hello, forum!

Has anyone seen the "assembler programmer's reference manual"? It is mentioned in some patents regarding the classic desktop calculators? It doesn't seem to be on the museum cds. Thanks, Klaus

Re: assembler programmer's reference manual

*Message #2 Posted by **Raymond Del Tondo** on 18 Dec 2004, 7:51 a.m.,*
in response to message #1 by Klaus

Hello Klaus,

maybe you should indicate for which
machine this manual could be used;-)

Raymond

Re: assembler programmer's reference manual

*Message #3 Posted by **Klaus** on 19 Dec 2004, 6:54 a.m.,*
in response to message #2 by Raymond Del Tondo

It is mentioned in a patent regarding the HP9815, but I think it can also be used for the HP9825!

Google returned no results, so I tried it here!

Thanks, Klaus

Re: assembler programmer's reference manual

*Message #4 Posted by **Raymond Del Tondo** on 19 Dec 2004, 11:18 a.m.,*
in response to message #3 by Klaus

Hi,

I don't know much about these machines,
but I think there were threads here in the hpmuseum
dealing with those patents.

Raymond

Re: assembler programmer's reference manual

*Message #5 Posted by **Tony Duell** on 19 Dec 2004, 9:10 p.m.,*

in response to message #3 by Klaus

Well, the 9815 is based round a Motorola 6800 microprocessor, while the 9825 uses an HP custom thing. I think it's unlikely the same assembly language manual is used for both!

Re: assembler programmer's reference manual

*Message #6 Posted by **Klaus** on 20 Dec 2004, 3:41 a.m.,*
in response to message #5 by Tony Duell

Hi!

I am only interested in some of the assembler commands. These are the same in both patents! The assembler manual is not tooo important, but it would make my life a little easier!

Thanks, Klaus

i need help powering up hp48sx

*Message #1 Posted by **ross denys** on 17 Dec 2004, 7:49 p.m.*

i have a 48sx that sat in my briefcase forever. i used it very little and changed the batterries on a regular basis. one day it wouldn't power up. i have tried reseting it with a paper clip under the upper rubber foot. i've tried leaving te batterries out for days to eliminate the static.no luck. can anyone help me.thankyou for your interest

Re: i need help powering up hp48sx

*Message #2 Posted by **Namir** on 17 Dec 2004, 9:06 p.m.,*
in response to message #1 by ross denys

Have you tried to connect the terminals (while the batteries are removed) with a papeer clip to possibly discharge any static build up?

Re: i need help powering up hp48sx

*Message #3 Posted by **Raymond Del Tondo** on 17 Dec 2004, 10:49 p.m.,*
in response to message #2 by Namir

A small but important addendum:
NEVER put in the batteries with wrong polarity,
unless you want to take the risk destroying the zener diode.
This topic has been discussed before several times.

Re: i need help powering up hp48sx

*Message #4 Posted by **Randy** on 18 Dec 2004, 12:17 a.m.,*
in response to message #1 by ross denys

Try this: Press lightly on the rasised part of the bezel above and between the B and C keys in the top row. While maintaining the pressure, try turning it on.

If it turns on, the problem is a loss of contact between the logic board and keyboard due to shrinkage of a foam pad.

in response to message #1 by Namir

When I try to print to the Printout Window I get the error message: "Printing is Disabled". What do I do to emable printing? Thanks...

Re: Free42s Update from Tom Okken

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 19 Dec 2004, 7:51 a.m.,*
in response to message #3 by Gordon Dyer

Hi, Gordon; are you well?

Allow me a sily question? Have you checked printer output status? (sorry asking the question before you alow me to ask...) The original HP42S allows printing to be enable and/or disable with the commands PON and POFF, also available with the PRINT menu. Maybe (if you have not checked yet) printing is indeed disabled. You can either try to execute PON or press the [PON] softkey through the PRINT menu. In the HP41, enabling and disabling printing capabilities depended on having a printer connected to the calculator (system flag 55, if I am not wrong) and controling flag 21 (flag 21 works "almost" the same in the HP42S). I consider that the printing interface is always "connected" to the HP42S (what is actually a fact), and the disconnection is "emulated" through the POFF. PON restores it. Flag 21 follows POFF (clear) and PON (set).

I downloaded the emulator right now and I checked printer status: it is disabled. Please, try: [SHIFT][PRINT][up-arrow] and you'll see [POFF]. Simply press [PON] (softkey for [Sigma+]) and the printer becomes enable.

Hope this helps.

Luiz (Brazil)

hp 17bII & hp91 test

*Message #1 Posted by **Julius** on 17 Dec 2004, 7:31 a.m.*

Hi,

I need your help : I would like to perform a key test and a system test on my hp 17bII & hp91 . Can someone post the key sentence ? Thanks . Julius

Re: hp 17bII & hp91 test

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 17 Dec 2004, 11:24 a.m.,*
in response to message #1 by Julius

Hi, Julius;

to perform the tests in the HP17BII, please locate the [CLR]ON key and the three keys in the first, top row over the [MATH], [MODES] and [PRINTER] keys. Now, with the calculator turned to ON, simultaneously press:

[CLR]ON & the key over [PRINTER] key to start an endless selftest; you should see, at some point:

```
 _____________________
|OK-17B II-x          |
|_____________________|
```

and a copyright notice. The 'x' is the firmware version identifier;
[CLR]ON & the key over [MATH] to interrupt this test;
[CLR]ON & the key over [MODES] key to start an interactive test; then, press [STO] key and you'll see:

```
 _____________________
|KBD                  |
|_____________________|
```

now press each key, left to right, on each row, top to bottom, till the [+] key. BTW, each key pressed returns a short beep. If everything goes right, you should see:

```
 _____________________
|KBD   OK   |         |
|___________|_________|
```

Then you press [CLR]ON & the key over [MATH] to interrupt this test.

Hope this helps. (I don't know the HP91, sorry.)

Cheers.

Luiz (Brazil)

HP48/49 screen capture; any guidance?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 15 Dec 2004, 1:15 p.m.*

Hi, all;

as always, sorry asking for an OT issue again.

Can anyone add any links to any source for screen capture tools for the HP48/49 series? I know that it is easier to use an EMU and capture it onscreen (computer), but I'd like not depending on it.

In the HP48S/G there is a [ON]key sequence that "prints" the LCD contents to the current printer output (IR or wire) and I used this feature many times, successfuly, by running INPRT in another 48G/S. Now I'd like to actually save the LCD contents as a GROB (PICT, perhaps?) and transfer it to the computer for future use.

I think that it's time for me to go asking these questions in the appropriate forum. In time: I'm gonna search hpcalc.org right now (I'm positive I'm gonna find there many good stuff about this), but I'd like to know where else could I search for this sort of info.

So... can anyone lead me there, please?

lcvieira at quantica dot com dot br

Thanks a lot.

Luiz (Brazil)

*Message #3 Posted by **karl** on 15 Dec 2004, 2:00 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

You can do that with the hpcomm, just put the flag of the printer in wire mode

Re: HP48/49 screen capture; any guidance?

*Message #4 Posted by **Jordi Hidalgo** on 15 Dec 2004, 2:01 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

As for the 'INPRT string to GROB' conversion, try with this library for the HP48S/G (here is a related article). I don't know much about the author, but he's said to be a nice guy. :-)

Regards,

Jordi

Conn4X

*Message #5 Posted by **Gene** on 15 Dec 2004, 2:07 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

If you're pulling from the 49g+ or 48gII, just capture the screen from Conn4x. That's what we did for the learning modules.

Works with the 49g too.

Re: Conn4X

*Message #6 Posted by **Veli-Pekka Nousiainen** on 16 Dec 2004, 10:48 a.m.,*
in response to message #5 by Gene

Learning modules? Like...plotting?
Oh, I wish it were Xmas already, I want a new PC to accept some 3D plots from my 49g+ and only thing missing is the 3,06 GHz CPU...
[VPN]

Re: Conn4X

*Message #7 Posted by **Gene** on 16 Dec 2004, 11:40 a.m.,*
in response to message #6 by Veli-Pekka Nousiainen

How true. :-) I'm waiting on the US postal service to make some deliveries to me...still no sign.

I guess patience is a virtue...I just want patience NOW! :-)

Gene

Thank you all! ;-)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 15 Dec 2004, 7:57 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

I'll be doing some experiments based on your guidance, folks.

Thanks!

Best regards.

(and Jordi, your suggestion - the article about the Spices, remember? - is "inside the oven" already... Thanks!)

Luiz (Brazil)

Re: Thank you all! ;-)

*Message #9 Posted by **Jordi Hidalgo** on 16 Dec 2004, 1:01 p.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Thank *you*, Luiz. Bruce will love it, I'm sure!

Jordi

Re: HP48/49 screen capture; any guidance?

*Message #10 Posted by **Arnaud** on 16 Dec 2004, 11:36 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

If I understand correctly you want to use the LCD-> command.

You may want to have it as a program so you don't change the command line of your screenshot.

Arnaud

Re: HP48/49 screen capture; any guidance?

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 16 Dec 2004, 12:12 p.m.,*
in response to message #10 by Arnaud

Hi, Arnaud;

Thank you for your LCD-> suggestion, it works fine, indeed. The problem is when you have a temporary screen, like a message or a menu, or anything else where the softkeys already have temporary assignments and you cannot run LCD->. Also, in some cases, LCD-> is not able to capture all screen information. The [ON][I/O] sequence in the HP48G (maybe it's the HP48S, I don't remember) sends the entire screen contents to the current output (IR or wire) and you can actually capture it as a GROB with another HP48 running INPRT. I'd like having this sort of functionality with the HP49G+, but I guess that using Conn4X and capturing the screen as a standard image is easier and faster, though.

Thanks a lot.

Luiz (Brazil)

HP 33C

*Message #1 Posted by **Patrick** on 15 Dec 2004, 10:50 a.m.*

Hello, could somebody tell me what is the type and the voltage of the battery pack of a HP 33C Thank a lot Patrick

FRANCE

Re: HP 33C

*Message #2 Posted by **Mike H** on 15 Dec 2004, 11:34 a.m.,*
in response to message #1 by Patrick

Spice Series

Battery HP 82109A (2 x AA 700mah) The Spice battery pack consists of 2 AA NiCd batteries providing 2.5 volts. The keying on this pack is subtle but important. The area under the recycle logo is flat, but on the other side of the pack, there is no flat bar between the batteries. A ridge in the battery compartment assures that the pack is installed correctly. Radio Shack "Replace-A-Cell" (cat. no. 23-191) batteries are said to work well as replacements.

Chargers HP82090B (Europe, 220V) : Open Circuit Voltage = 10.26V, R(int) = 14.34 Ohms

More info here: http://www.hpmuseum.org/repair.htm#batteries

Voyager keyboards - Rattle effect

*Message #1 Posted by **Frank** on 14 Dec 2004, 9:25 p.m.*

Hello, Does anybody know if it is normal for the keyboard of a Voyager to produce rattling sounds as if the keys were loose? If it is a damage, is it possible to fix that issue? Thanks,

Edited: 14 Dec 2004, 9:25 p.m.

Re: Voyager keyboards - Rattle effect

*Message #2 Posted by **Raymond Del Tondo** on 14 Dec 2004, 10:54 p.m.,*
in response to message #1 by Frank

Hello,

this is normal, as long as the keys work.
Not every unit has 'rattling' keys,
it's a production issue.
However, unlike most of the newer HPs (except HP-41),
the voyagers have at least separate keys;-)

Raymond

Re: Voyager keyboards - Rattle effect

*Message #3 Posted by **Luis** on 15 Dec 2004, 8:32 p.m.,*
in response to message #2 by Raymond Del Tondo

Very true. I have a USA 15C (1982) that rattles, but a Malaysian 12C (92) and a USA 11C (1986) that do not. As long as the keyboard works, that will be fine!

Edited: 16 Dec 2004, 11:29 a.m.

Re: Voyager keyboards - Rattle effect

*Message #4 Posted by **Karl Schneider** on 14 Dec 2004, 11:28 p.m.,*
in response to message #1 by Frank

As Raymond says, it's aproduction issue. I have an American 15C from 1983 and a Singpore 12C from 1993 that rattle. I also have an American 11C from 1986 and 16C from 1985 that don't rattle.

Edited: 14 Dec 2004, 11:29 p.m.

Re: Voyager keyboards - Rattle effect

in response to message #1 by Frank

I know it's a different breed of cat, but turn a 67 upside down and shake and you can do the samba.

tm

Re: Voyager keyboards - Rattle effect

*Message #6 Posted by **ned** on 16 Dec 2004, 11:22 a.m.,*
in response to message #1 by Frank

Key rattle in the old units is okay because the keyboard is not a membrane, the key 'snaps' are attached to the board. The keys rattle if enough of the plastic welds inside pop, causing the board to come away from the front chassis. I cut all of the welds in my 12c to clean inside the keyboard, so now all my keys rattle. I like the individual keys because it allows one to replace scratched or worn keys with ones from a 'parts' body.

-ned

Who is Dr. Robert J. Glaser?

*Message #1 Posted by **Matthias** on 14 Dec 2004, 3:41 p.m.*

In my hand I have a HP-35 Red Dot, that has the label "DR. ROBERT J.GLASER" instead of the common "HEWLETT*PACKARD".

Since my last meeting here in Allschwil I have new knowledge. There must have been three typs of Red Dots. The first was the common serie, the second was made for a (unknown to me) company (maybe they have a sign?) and third there was a release for special people that helped developing the HP-35. These units were produced for the 5th anniversary of the HP-35. I think, these units were labeled individualy for the customers. So, Robert J. Glaser must be on of the developer of the HP-35. Does someone of you knows more about this person or the three typs of Red Dots?

Yours

Matthias

Help for a friend with a HP 48 Gii

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 12 Dec 2004, 11:20 a.m.*

While I am not a RPL or 48-any fan (I admit I have a 48 G+ just for the fact of owning it); I am looking for help or counsel for a friend who bought a 48 Gii, S/N CN407.....

The calculator worked OK for some time, but then the batteries drained out. Now the calculator refuses to start working again with new batteries, even after a hardware reset via the recessed button in the unit's back.

If I recall correctly, there was a firmware bug which made the first-batch Gii power hungry and, as this model has no flash memory, little can be done short of a warranty exchange. The S/N suggests this may be one of such early units...

Despite such non-encouraging facts, there may be some way to make it work again, even with short battery life...

Suggestions? Thank you in advance.

Re: Help for a friend with a HP 48 Gii

*Message #2 Posted by **Namir** on 12 Dec 2004, 11:44 a.m.,*
in response to message #1 by Andrés C. Rodríguez (Argentina)

I suggest you return the calculator to HP and get a replacement. The second option is to take at least one battery out after you turn it off. This way your batteries won't drain.

Namir

67 display failure - npn transistor array replacement

*Message #1 Posted by **marais** on 12 Dec 2004, 11:19 a.m.*

I think I tracked down the origin of my faulty 67 to the 1858-0050 npn transistor array on the keyboard pcb. The machine pulls 150mA, but the display is blank. The logic board works in another machine, the cathode driver 1820-1749 has a 5ms period signal on the RCD line and a 1ms period signal on the strobe, so I figure it's ok. I know the 1858-0050 is a standard array, but I was unable so far to come up with the pinout. What bothers me is that the low battery output doesnt work, even if i lower the voltage down to 1.5V - it's not driven by the transistor array, so if my diagnosis is correct at least the led should come up. What's wrong with my diagnosis? Any help appreciated.

Andraes

Andreas

Re: 67 display failure - npn transistor array replacement

*Message #2 Posted by **Albert** on 12 Dec 2004, 2:27 p.m.,*
in response to message #1 by marais

Hi Andreas,

The normal 1858-0050-1D spare part is a RCA IC: CA 3082 NPN Transistor (Tr) array Common Collector (obsolete product). You can find the pin out serching via Google (a *.pdf file); anyway, following the "raw" pin out version:

1 Em Tr1 2 Em Tr2 3 Ba Tr2 4 Em Tr5 5 Substrate 6 Ba Tr5 7 Em Tr6 8 Ba Tr6 9 Em Tr7 10 Ba Tr7 11 Ba Tr4 12 Em Tr4 13 Ba Tr3 14 Em Tr3 15 Common Collector 16 Ba Tr1

Good Luck!

Re: 67 display failure - npn transistor array replacement

*Message #3 Posted by **marais** on 13 Dec 2004, 5:26 a.m.,*
in response to message #2 by Albert

Thank you, got that. It is the strangest thing: All emitters show pulses on the scope, but the display is blank. I'll keep searching...

The end of my 67

*Message #4 Posted by **marais** on 13 Dec 2004, 9:44 a.m.,*
in response to message #3 by marais

...if I interpret what I read on the forum correctly, this is it for my 67: AFter replacing the 1858-0050 with a CA3082 array, the display comes up with 0.00, but the keyboard does not respond. If I'm not

wrong, this means the 1820-1749 cathode driver, which also generates a clock, is dead...STB and RCD work though. IS this the end? Using a 2nd logic board shows the same behaviour.

Sadly Andreas

in response to message #4 by marais

Hi Andreas,

I'm very sorry but my "wisdom" regarding Timing Diagrams is limited. Perhaps someone could help you on the right way. Good luck!

Re: The end of my 67

*Message #7 Posted by **Tony Duell** on 13 Dec 2004, 3:06 p.m.,*
in response to message #4 by marais

The cathode driver doesn't generate the clock. In Classics, the clock is generated by the anode driver, but the 67 is not a classic inside, it's a Woodstock. And on Woodstocks (and for that matter Topcats and the 19C), the clock generator is in the ACT CPU chip.

If you're getting a sane display (0.00, for example), then the clock is running. In fact the ACT, ROM0, anode driver transistor array and cathode driver are all at least partially working.

Now, in the 67 the keyboard is scanned by the cathode driver outputs, and feeds into 5 inputs on the ACT chip. Since you've swapped out the logic board (including the ACT), I would assume the ACT is good (at least for the moment), and the cathode driver is doing something.

Have you checked for a short in the keyboard matrix (for example, a key that's electrically pressed all the time). I'm pretty sure that will disable the keyboard on these machines. If you have the pinouts and a 'scope or logic analyser, look at the 5 KA...KE pins on the ACT or on the keyboard-logic board connector. They should all be 'dead'. If you get a signal on one of them, you've got a key shorted.

Re: The end of my 67

*Message #8 Posted by **marais** on 14 Dec 2004, 3:36 p.m.,*
in response to message #7 by Tony Duell

Tony, you brought me back on track. I measure 6V on KC1 to KC4 and 0V on KC5. I suppose that means KC5 is permanently pressed...I have to find where this comes from. The keys look ok. As long as there's hope! Thank you so far

Andreas

Re: The end of my 67

*Message #9 Posted by **Tony Duell** on 14 Dec 2004, 4:00 p.m.,*
in response to message #8 by marais

I think the next thing to do is to find out what KC5 is shorted to. I would guess it's either ground (which you can find at the -ve side of the battery pack) or one of the outputs of the cathode driver.

Do this test first with the keyboard/chassis plate screwed in place in the top case. I remember a nasty fault (that took me a long time to track down) where one of the battery contacts shorted to a trace on the keyboard PCB when the machine was assembled.

Anyway, it sounds like it should be repairable.

Re: The end of my 67

*Message #10 Posted by **Randy** on 14 Dec 2004, 9:00 p.m.,*
in response to message #9 by Tony Duell

I have seen several shorts in classics caused by incredibly small slivers of fractured key strips. You can't see them with the naked eye. They seem to get stuck in the upper area of the board, above the top row of strips. Perhaps the old sticky switch grease is a contributing factor. A good wash with isopropyl usually flushes them away.

Thank you gentlemen!

*Message #11 Posted by **marais** on 15 Dec 2004, 7:57 a.m.,*
in response to message #10 by Randy

Gentlemen and fellow collectors, I am pleased to announce that through your expert advice I was able to repair my 67. The problem was indeed due to a battery contact shorting a trace on the keyboard/display pcb. Once I realized that, I felt stupid for not having been able to identify the cause myself. Thank you again for your most useful help! Now more daunting tasks lie ahead - with a working 67, I should be able to restore my second 67 with a defective anode driver (so I do think), and if I am courageous enough, the dead 9010 waiting to be repaired for several months now, for which Tony was so kind to send me schematics. GEntlemen, it's been a pleasure! Long live this forum.

Andreas

Emu41 versions for HP 95/100/200LX and Portable Plus

*Message #1 Posted by **J-F Garnier** on 12 Dec 2004, 8:38 a.m.*

Hello all,

The Emu41 versions for the HP 95/100/200LX and HP Portable Plus that I presented at the Allschwil meeting are now available (freeware). You can find them at:
http://membres.lycos.fr/jeffcalc/emu41.html

Although I don't intend to provide special support for them, I will appreciate any comment, feedback, bug reports, or improvement ideas...

J-F

to Tony: Emu41 versions for HP 95/100/200LX and Portable Plus

*Message #2 Posted by **Mike (Stgt)** on 14 Dec 2004, 3:15 a.m.,*
in response to message #1 by J-F Garnier

Hi Tony!

Did you see that one!?! It's a 'must have' for every serious HP calculator fan. Could you pls x-post it on HPLX-L, I still did not sign up.

Ciao.....Mike

BTW: Sorry for a private addressed append on this public list.

Allschwil Report 2004

*Message #1 Posted by **Matthias** on 11 Dec 2004, 6:21 a.m.*

Finally Wlodek Mier-Jędrzejowicz and I finished our work. Wlodek worte a report of the last European HP meeting here in Switzerland. I made a summary of it and put it onto my website. If you want to read the full report, read it in the next DATAfile, the isses of the HPCC. If you are not a member, you can become one! Go on their website (www.hpcc.org) or use my link to them. By the way I also added a new veryion of the module database. I fulfiled a desire of many users and added the shreadsheet´s head on every page. I also get knowledge of some modules and fixed some bugs in the database, so please download it and use this one. I will post an update of it about 4 times a year. Please keep informed.

in response to message #5 by Wlodek Mier-Jedrzejowicz

Helsinki 2005 would be a great idea! Why not already in the spring?

Regards, Erik

Re: Helsinki 2005 would be a great idea!

*Message #8 Posted by **Wlodek Mier-Jedrzejowicz** on 17 Dec 2004, 10:32 p.m.,*
in response to message #7 by Erik Ehrling (Sweden)

Erik asks - why not in the Spring? Well, to most of us on Dave's Forum, making a long trip just to meet other HP handhelds fans is too much effort/ expense/ time anyway, and for most of those those willing to make such trips, the effort/ expense/ time mean that we make only one long-distance trip a year. So, if there will be a Helsinki meeting in Spring after the Basel/ Allschwil meeting in November, then not everyone who wants would come. It also depends on when VPN can arrange it! But if there is a meeting in Helsinki in Spring 2005, and one in Allschwil in November 2005, then people in Europe could come to one or the other. Or come to HHC 2005 in Chicago in September :-)

Re: Helsinki 2005 would be a great idea!

*Message #9 Posted by **Matthias** on 18 Dec 2004, 7:06 a.m.,*
in response to message #8 by Wlodek Mier-Jedrzejowicz

TO be honest: I would rather come to the Chicago meeting than to the Helsinki, although Helsinki is a very nice place. I will go on holiday to Finnland with my girlfriend once.. Maybe I can visit you in Helsinki then.

Matthias

HP-67 read/write head

*Message #1 Posted by **Jon** on 10 Dec 2004, 7:09 p.m.*

Hi everybody:

I have an HP-67 that writes but doesn´t read. I think that it is a problem of the head. Sometime ago I read a post regarding the test of this head. I remember that it was tested with a voltmeter. Does anybody know where can I find that information?

Thanks in advance

Jon

Re: HP-67 read/write head

*Message #2 Posted by **Randy** on 10 Dec 2004, 8:15 p.m.,*
in response to message #1 by Jon

How do you know it writes properly? If you've tested the recorded card in another unit and it works, that problem is usually caused by a bad bypass capacitor across the motor.

You'll find LOTS of postings on the subject in the archives, the easiest way to start is to search for posts by David Smith and Tony Duell. Tony posted an article on 67 internals here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=394

At the bottom of the article, he lists the color coding of the head leads, each winding measures typically 50 ohms. If one is open, it will not write properly which lead to my opening question.

Re: HP-67 read/write head

*Message #3 Posted by **David Smith** on 11 Dec 2004, 10:14 a.m.,*
in response to message #2 by Randy

The bad cap is not the one across the motor. It is a small blue dipped tantalum cap usually located at one end of the reader board chip.

Re: HP-67 read/write head

*Message #4 Posted by **Jon** on 11 Dec 2004, 10:24 a.m.,*
in response to message #3 by David Smith

Hi:

I am afraid that the head itself is damaged. I can read 50 ohms in blue-orange wires but the red-yellow widing is open (I don´t measure any value with the voltmeter). Bad luck

I have some HP-41 card readers and I see that the head is just the same. It seems to be glued to the

plastic holder. Has anybody tried to use one of those heads in a HP-67?.

Regards

Jon

Re: HP-67 read/write head

*Message #5 Posted by **Gordon Dyer** on 19 Dec 2004, 6:47 a.m.,*
in response to message #4 by Jon

When I had the same problem with my HP-41C card reader I used an old broken reader with a good head assembly and swapped it over. Gluing in a head from another machine will be difficult because of head alignment, but worth a try if you have no alternative. I don't know how easy it is to remove the old head from its base, but make some sort of marks on the base or a template before removing the old head to help align the new one. Good Luck!

The Joy of Keystroke Programming

*Message #1 Posted by **Ben Salinas** on 9 Dec 2004, 11:55 p.m.*

I am quite a big fan of keystroke programming, for its on-the-fly programming advantage. I was reminded of this a few days ago. In Calculus we were going over Euler's Method and had a classwork assignment. One of the questions instructed us to either write a program or download one for our calculators to do Euler's Method. When everyone saw this, they ran back to the computer to find one. In the mean time I stayed at my table and quickly programmed Euler's method on my 32sii (I later transferred it to my 33s for the extra speed). I had finished within a few minutes. To be fair, one of my friends (who is very big into comp sci) stayed and wrote his own program as well, in TI-Basic for his 89. Needless to say, I finished much quicker than he did (of course his interface was probably nicer).

The other serious advantage with keystroke is the quick editing. One of the questions asked to use dx=.01 and find the y values for x=0,1,2,3,4,5,6,7. Now, I had written the program to output the x, y, dy, and dy/dx value for every x value. This of course would not work, as I would have to press R/S about 400 times to get from 0 to 1. I wrote a quick subroutine, and only displayed integer values. (This is where I used the 33s...each integer would take about 2 minutes on the 32sii, and only about 45 seconds on the 33s).

Just some thoughts,

Ben Salinas

12345

Re: The Joy of Keystroke Programming

*Message #2 Posted by **Nenad (Croatia)** on 10 Dec 2004, 4:11 a.m.,*
in response to message #1 by Ben Salinas

Hi Ben, from Split

It would be great if you would be more specific, e.g. quote the exact question from your assignment. I would like to get some more impression what kind of tasks to be solved by a programmable calculator you receive at school. Thks

12345

Re: The Joy of Keystroke Programming

*Message #3 Posted by **Ben Salinas** on 10 Dec 2004, 6:29 p.m.,*
in response to message #2 by Nenad (Croatia)

Hmmm...

As far as calculator use at school,there are not too many programs used, because of the abundant number of features on the graphing calculators everyone uses. On occasion there is a need for a function the calculator doesn't have (i.e: Newton's Method, Euler's Method, Reimann Sums). But, it seems that we

really don't use calculator programs or functions to do most of our work.

For example, when we did integration by Partial Fractions, we could have easily wrote a program, but as we usually have to show our work anyhow, there is no point. Plus, it isnt all that tedious. This summer I took a number theory course, and programming was helpful (even though number theory doesn't have very many numbers). For example, we covered the Euclidean Algorithm, so we knew how to find common divisors, BUT it is tedious so I wrote a quick program to do Euclid's Algorithm. Later we worked with the number of numbers coprime to a number (too many uses of the word number). For this I also wrote a program, just to make things faster when testing theorems.

I turned in the Euler's Method worksheet, but the question basically told you to write a program to do Euler's Method. It then had you use the program (after we had already done a few questions by hand). It is a way of implementing technology or something silly like that.

As far as the other "offensive" comments. Personally, I am not offended by them at all. I probably was too broad in my generalizations. The other reason it took 5-10 minutes for my friend to write a program is that he is not too familiar with TI-Basic nor Euler's Method. We had done one example of it when he wrote the program.

That's all for now.

-Ben

12345

Re: The Joy of Keystroke Programming

*Message #4 Posted by **Valentin Albillo** on 10 Dec 2004, 5:08 a.m.,*
in response to message #1 by Ben Salinas

Hi, Ben:

Ben posted:

"I am quite a big fan of keystroke programming, for its on-the-fly programming advantage."

I mostly agree, but mainly when comparing classic "keystroke programming" RPN versus all-object-oriented-and-structured RPL. As for other programming languages or styles, read on ...

"I was reminded of this a few days ago. In Calculus we were going over Euler's Method and had a classwork assignment [...] and [I] quickly programmed Euler's method on my 32sii [...] I had finished within a few minutes. [...] To be fair, one of my friends (who is very big into comp sci) stayed and wrote his own program as well, in TI-Basic for his 89. Needless to say, I finished much quicker than he did (of course his interface was probably nicer).

You're not being fair. I've never used a TI-89 and TI-Basic, but either that machine/language combination is *very* awkward to use or your "very-big-into-comp-sci" friend is *not* as efficient as you want him to seem, because, after reading your post, it took me *a minute* (give or take a few seconds) to write this plain-vanilla, 3-line implementation of Euler's method on HP-71B BASIC:

```
10 INPUT "X0,Y0,H=";X0,Y0,H @ DELAY .1,0 @ FIX 5
20 Y1=Y0+H*FNF(X0,Y0) @ X1=X0+H @ DISP X1,Y1 @ X0=X1 @ Y0=Y1 @ GOTO 20
90 DEF FNF(X,Y)=Y
```

where you define your y'=f(x,y) as a user-defined function in line (say) 90 (here, it is y' = y), and just input your initial conditions (x0,y0) and step size (h) when prompted. The program runs non-stop, outputting each successive (xi,yi) at 0.1 seconds interval, rounded for display to 5 decimal places.

If it took you "a few minutes" to write an equivalent program for your "keystroke programmable" HP model, you see, you weren't that fast, after all.

The bottom line: against such easygoing, powerful languages as HP-71B BASIC, RPN keystroke programming is far, far, far from being the simplest, fastest way of getting things done. Not that I don't like RPN, mind you, but as they say, "to each his own".

Best regards from V.

Valentin,
I'm sure that you intended no insult, but I feel that you were a little harsh with the above statements and the overall tone of your reply. You do realize that Ben and his friend are high-school students, don't you? From your many posts here, I infer that you have many, many years of experience programming all types of calculators, and are basically a mathematics genius (that is a sincere comment.) My guess is that you also already knew Euler's method before you wrote your one-minute program. Ben and his friend were learning the method and at the same time trying to write programs to implement it, so it was bound to take them a little longer. Based on his input here at the MoHPC, Ben is a fine young man and is to be commended for his accomplishments. (His friend is also probably a good kid, even if he does use a TI.) We readers of the HP Museum Forum are lucky to have him posting here, so we get a fresh perspective and can have some hope for the future. I think we should encourage his apparent joy in learning, and his continued input here, rather than belittling his efforts.

*Message #6 Posted by **Valentin Albillo** on 10 Dec 2004, 9:04 a.m.,*
in response to message #5 by Jeff O.

Hi, Jeff:

Yes, yes, you're absolutely right and correct, thanks a lot for pointing it out to me, and of course, no offence to either Ben or his friend was intended, honest.

It's just that I tend to forget that not everyone here is a forty-sixer, and also that not everyone understands or likes my usually somewhat 'aggressive' sense of humor and associated remarks. I'll try to amend it a little, but can't promise. You know, it's not easy to teach an old dog like myself learn new tricks ! :-)

Thanks again to you, my apologies to Ben should he feel offended, and

Best regards from V.

Re: The Joy of Keystroke Programming

*Message #8 Posted by **Ron Ross** on 10 Dec 2004, 8:43 a.m.,*
in response to message #4 by Valentin Albillo

I suspect Ben's friend isn't in the same league as you Valentin (boy is that probably an understatement). However, he could still be very good and has to overcome the Ti-89's notorious poor keyboard layout. That machine/language combination is indeed very awkward to use. It is not a QWERTY keyboard nor is it even well laid out for its vertical shape. Many Ti geeks use their PCs to hammer out any real programs.

And while the Ti-89 has CAS and is a fairly sophisticated device, its BASIC may not be on pair with the Hp71B and may not be able to stuff so many commands on a single line. And while I do have a Ti-89, I personally do not like its keyboard layout either.

And then as Jeff O. did point out, I doubt if one can readily find a high school student that can program in BASIC as efficiently as yourself. These kids are learning both the math and their mathematical tools. You already know both (or know these subjects better than most). What takes them (or even many of the rest of us) 5-10 or maybe 60 minutes, may indeed take you mere minutes (or less) to creank out. I have read a few of your articles and have no doubts to your abilities.

Please try to take into account your audience.

If I had posted about my discovery of the Pathagorian Therom and you were curt with me (or worse), I would deserve your scorn and ridicule. If a 4th grader makes the same discovery, well, do they not deserve a nice pat on the head?

Re: The Joy of Keystroke Programming

*Message #9 Posted by **Valentin Albillo** on 10 Dec 2004, 9:22 a.m.,*
in response to message #8 by Ron Ross

Hi, Ron:

You're also absolutely correct. What a day, two reprimands in a row ! :-)

"Please try to take into account your audience."

I'll do, I'll do, but ... audience ... what audience ?

"If a 4th grader makes the same discovery, well, do they not deserve a nice pat on the head? "

Indeed. Any 4th graders out there in the "audience" making said discoveries, consider yourserlves patted: Pat, Pat ...

Thanks for your recommendations, sorry again, and

Best regards from V.

*Message #12 Posted by **Valentin Albillo** on 10 Dec 2004, 12:34 p.m.,*
in response to message #11 by Gene

Hi, Gene !

Not yet, regrettably. That is, the site does exist, here, but it's still lacking most of the contents I intend to feature there eventually.

Anyway, you do have available at your site some of the very programs you mention, right ? Or do you mean a particular version of some of the programs and/or their associated documentation ?

Whatever the case, I hope to use some of the free Xmas time ahead to revamp the site with new, worthwhile contents, at the very least they will be mostly unpublished, the sole exception being my "HP-71B Modest Mater" article & program, which was published several months ago in Datafile and which I intend to make available online at my site in PDF format, as always.

Thanks for your interest and best regards from V.

*Message #18 Posted by **Ed Look** on 11 Dec 2004, 1:12 a.m.,*
in response to message #17 by Ben Salinas

Hey Ben! I still use keystroke programming; learned it well on a 34C. It came in handy on the job with the 32SII and now with the 33S! It makes automating some relatively tedious calculations fairly easy. It IS easier than the RPL of the 48's and the 49's, which is more like a full blown computer language (and so it is, I'm told by some here!)

And if you took any FORTRAN, the "frame" the HP keystroke programming is set in is rather FORTRAN-like, making all the more easy to at least do simple to medium complexity programs... assuming you have the memory overhead!

Hey Ben!

*Message #19 Posted by **bill platt** on 10 Dec 2004, 10:58 a.m.,*
in response to message #1 by Ben Salinas

Hi Ben,

It is fun to see your discovery (keystroke programming) as it is both fresh and new, as well as nostalgic. I had the same wonderful discoveries with my 11c back in 1983! (The joy of being able to program on the fly, in class, to do something that nobody else could do quite so elegantly).

Today, I am continuing with the practice, as I am doing vibration analysis on some masts and antennas--something I do only once in a while (and therfore have not programmed into a computer)--and so the keystoke

(in this case, 48g and 27s style equations) are just great for speed and accuracy and being able to check etc.....although I have not made use of the units function on the 48----problably should do that! {rely on regular old algebra to do dimensional analysis})

(Something tells me that you have no problem taking the constructive criticism here--regardless of your age).

Best of luck with your studies.

regards,

Bill

*Message #21 Posted by **Fred Lusk (CA)** on 11 Dec 2004, 3:48 a.m.,*
in response to message #1 by Ben Salinas

Ben…

Nice story. One of life's lessons--which you have obviously figured out--is that you can learn a whole lot more about the math at hand and the problems the math is intended to solve by writing your own program(s) than by using a canned feature in a calculator or computer.

I started RPN keystroke programming in 1975 with an HP-55 (49 steps of very tight code). I was a high school senior and wrote programs for various problems in physics, though I don't remember writing any for calculus. I continued programming in college (civil engineering) with the HP-55, then an HP-34C. An HP-41CV, HP-41CX, and HP-42S became my professional tools. I still write programs, though less frequently because so many of the ones I wrote 20-25 years ago I still use. I figure that when my last RPN calculator finally dies it will be time to retire!

Fred

FLASH NEED UPDATE

*Message #1 Posted by **Marcel MAIER** on 9 Dec 2004, 2:18 p.m.*

hello my hp49g+ shows this

FLASH NEED UPDATE. 1.USB 2.CARD

BOOT VERSION:3.19 SERIAL:CN347.....

i've got no sd card what can i do ????

Re: FLASH NEED UPDATE

*Message #2 Posted by **Gene** on 9 Dec 2004, 2:53 p.m.,*
in response to message #1 by Marcel MAIER

Hook it up to a PC using the USB cable and the connectivity kit and load the 49g+ rom.

The ROM can be found on HP's site. Might also be at hpcalc.org.

www.hp.com/calculators

then go to the 49g+ site.

Re: FLASH NEED UPDATE

*Message #3 Posted by **James M. Prange** on 9 Dec 2004, 2:58 p.m.,*
in response to message #1 by Marcel MAIER

Make sure that you have the latest update from HP's Web site available, and then update the flash ROM via USB.

By the way, do you any idea of how the 49g+ got into that state?

Regards,
James

HP 82104A Card Readers (HP41)

*Message #1 Posted by **Dave Allen** on 9 Dec 2004, 10:59 a.m.*

I am looking for someone prepared to service some HP41C/CV/CX card readers for me. Mainly this will involve replacement of a perished rubber capstan drive but there may be other problems. Please indicate how many you have tackled, rate of success and what you will charge me. If I accept your proposal I will send you a batch of 5 or 10 at a time. Some are needed by engineers and land surveyors who do not wish to change from familiar HP RPN methods before their retirement, some as backups. Payment method can be worked out to best advantage. Some excellent 82104A repair routines have been posted on HP Forum from time to time. Please say where you are based and any known customs problem.

Edited: 10 Dec 2004, 5:13 a.m.

Re: HP 82104A Card Readers (HP41)

Origin of RPN

*Message #1 Posted by **db(martinez,california)** on 8 Dec 2004, 7:12 p.m.*

I found an article on the web and thought someone might be interested in it. Here's some excerpts:

Charles Leonard Hamblin (1922-1985)was an Australian philosopher and computer scientist. His main early contributions to computing, which date from the mid 1950s, were the development of Reverse Polish Notation. RPN, also known as postfix notation, is an arithmetic formula notation, derived from the polish notation introduced in 1920 by the Polish mathematician Jan Lukasiewicz.

RPN was invented by Australian philosopher and computer scientist Charles Hamblin in the mid-1950s, to enable zero-address memory stores. Since his death, his ideas have become influential in the design of computer interaction protocols, and are expected to shape the next generation of e-commerce.

The complete article can be found at http://encyclopedia.thefreedictionary.com/Charles%20Hamblin

HP49G+ connectivity kit: my own experience

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 8 Dec 2004, 10:04 a.m.*

Hi, all HP49G+ users;

in brief (respecting the "legacy" basis of the MoHPC): I had to use the latest HP connectivity kit available here to succeed connecting and xchanging data from an HP49G+ and two PC, specs below:

```
MB                    PROCESSOR        MEM     OS

PC CHIPS M748LMRT  CELERON 433MHz    128MB  W98SE
PC CHIPS M812      ATHLON 1.1GHz     256MB  WXPpro
```

I could not connect the calculator with any of these computers by using the original connectivity SW that comes with the HP49G+ (CD). After replacing (unstalling the original pack and installing the one mentioned above) everything worked fine.

Hope this info helps others.

Cheers.

Luiz (Brazil)

HP-67 w/melted Battery Compartment Door

*Message #1 Posted by **Paul Brogger** on 8 Dec 2004, 5:47 a.m.*

I just picked up a 67 with neither a charger nor a battery pack (so I'll be looking for those . . .)

The calculator is in generally VERY good condition, except for the heat-distorted battery compartment door -- a distortion which unfortunately extends (only very slightly) to the back case of the calculator itself.

A new battery cover will almost entirely solve the cosmetic problem, but can anyone venture a guess as to what that says about the electronics?

Edited: 8 Dec 2004, 2:34 p.m. after one or more responses were posted

Re: HP-67 w/melted Battery Compartment Door

*Message #2 Posted by **Jeff O.** on 8 Dec 2004, 8:02 a.m.,*
in response to message #1 by Paul Brogger

What is the condition of the compartment itself? Is there any melting/distortion, etc.? If the case below the compartment has only slight damage, and the compartment has little or no damage, I'd guess the electronics are OK.
Good to hear from you again Paul.

NO60hzSPAMatFORieeedotMEorg (remove NO SPAM FOR ME and change the at and dot.)

Re: HP-67 w/melted Battery Compartment Door

*Message #3 Posted by **Paul Brogger** on 8 Dec 2004, 2:45 p.m.,*
in response to message #2 by Jeff O.

The interior of the battery compartment looks fine. The heat distorted the upper outer edge of the compartment opening, near the rubber foot, roughly opposite the "A" key. Other than that, it looks great.

I fixed my 97's card reader, so I guess I'll be working on this one, sooner or later.

BTW, the serial # on this seems to have been mis-struck -- I can only make out the digits "...81552" between the upper feet -- and at a weird angle no less (not quite parallel to the case-bottom's "folded" edge). Curious.

But, with a replaced back case & battery cover, this thing may someday qualify as "near mint".

Re: HP-67 w/melted Battery Compartment Door -- It Works!

*Message #4 Posted by **Paul Brogger** on 14 Dec 2004, 11:35 a.m.,*
in response to message #2 by Jeff O.

A generous soul offered the use of a charged battery pack, and the thing works GREAT! (Even the card

reader, after a few runs through, reads a short program successfully.)

(I think I've got a new favorite.)

I do have a question: Is it possible the process of charging the pack in the calculator is what caused the battery cover to melt? (Even the back case is a bit distorted along the "latch edge".)

Maybe it would be best to charge the battery pack elsewhere -- say, in my 45? (Which as well, by the way, I found out works now that I have a battery pack to play with.) I just don't want risk any more damage.

But, hey! I'm happy! Merrrrrry Christmas!

Re: HP-67 w/melted Battery Compartment Door -- It Works!

*Message #5 Posted by **Jeff O.** on 15 Dec 2004, 7:28 a.m.,*
in response to message #4 by Paul Brogger

Paul,
Good news about your 67.
Regarding the original cause of the melting, in my marginally educated opinion it probably was caused by an overheated battery. However, I think it was likely a one-time event, caused by a defective battery or perhaps a defective charger. The manual states (Appendix B, page 311 of the Revision C, 12/76 manual):

"If desired, the HP-67 can be operated continuously from the AC line. The battery pack is in no danger of becoming overcharged."

If you use the calculator normally, it should be safe to charge it up in the calculator. Of course if you have some way to charge it externally, that would provide an added measure of safety. Just don't forget that the pack is out and run it off of the charger without the pack, as the manual also states (page 312):

"CAUTION Operating the HP-67 from the ac line with the battery pack removed may result in damage to your calculator."

HP 34C and HP 48GX questions

*Message #1 Posted by **Nick Nicholas** on 8 Dec 2004, 3:32 a.m.*

Regarding the HP 34C, is it possible to determine whether it is the soldered version from the serial number? If not, what other ways is there to determine this version from physical inspection.

Regarding the HP 48GX, do all the blister packed units have the newer black screen?

Re: HP 34C and HP 48GX questions

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 8 Dec 2004, 6:33 a.m.,*
in response to message #1 by Nick Nicholas

Hi, Nick;

I own some Spices (HP3xE/C) and I think it's somehow easy to identify which one is a soldered or solderless unit. The fastest way is by comaparing two units so you can create your own reference, but there is a small keyboard test you can perform.

Pick one key (calculator ON or OFF), perhaps [ENTER] key and slowly press it till it "clicks" and stops. If the key's upper face (not the top of the key) hides itself in a way the top face almost reaches the keyboard level, then it is a solderless unit. If the key moves just a little bit and the upper face keeps half of it hidden and half appearing, then it is a soldered unit. This is because the solderless units have a single flex circuit that "plays the role" of keyboard contacts, circuit trails and IC's connectors, and the bubble caps for each key are somehow "far" from the keys contacts. The soldered units use metal caps almost like the ones used in the HP41 (and HP75C/D and HP71B) for each key, and their "moving range" is a lot smaller.

The other external "difference" is related to the weight. The solderless units have a "heavy" metal plate that assures the IC's terminals are uniformly pressed against the IC's tabs in the flex circuit, and this plate weights almost the weight of the batteries. So, a solderless unit without batteries weights almost the same as a soldered unit WITH batteries.

I also own two HP48G+, one with a blue-dot screen with a pale green background and another with black-dot screen with light gray background (same one used with the HP49G). With the calculators turned to off, it is somehow easy th see the difference by inspecting the background. I'm not sure if it is also easy to check for the difference when you have not seen each type as for having a parameter.

Hope this helps a bit.

Luiz (Brazil)

HP48SX time capsule!

*Message #1 Posted by **Mike** on 8 Dec 2004, 1:52 a.m.*

I want to place my HP-48SX in a time capsule. I will need to remove the batteries and put it in a 'Pelican' case. My question is, will the calculator still power up and run normally after 20 or so years without batteries? Will the "firmware" be corrupted or erased after that long? Please, someone who knows respond, maybe a HP Engineer or the Museum owner, I need to know for sure. Serial #3030A00535, Corvalis USA-made. Thank you, happy holidays! -Mike

Re: HP48SX time capsule!

*Message #2 Posted by **Tim Wessman** on 8 Dec 2004, 2:36 a.m.,*
in response to message #1 by Mike

I have two questions.

1. Are you going to bury any cards with it?

2. Where EXACTLY are you going to bury the thing??? ;-)

Re: HP48SX time capsule!

*Message #3 Posted by **Frank Boehm** on 8 Dec 2004, 10:57 a.m.,*
in response to message #1 by Mike

I would go for a dry and semi-cold environment; probably 10oC should be the best. If you are able to seal the capsule, put some silica gel pads into it.

It is probably impossible to say, if it will survive or not. The LCD might fail, the FLASH-memory is even more likely to fail, plastics might degrade, contacts may corrode.

Judging from my collection, 20 years should be easy - think of all the 41Cs on ebay, those are around 20 years old and most of them work.

Re: HP48SX time capsule!

*Message #4 Posted by **Raymond Del Tondo** on 8 Dec 2004, 1:32 p.m.,*
in response to message #3 by Frank Boehm

Fortunately the HP-48 doesn't have FLASH;-)

I think everything will be fine except the compressive foam used to apply pressure to the LCD and keypad. If that doesn't exert enough force (and it softens with time, NO MATTER WHAT!) the contacts can form an oxide and/or the on contact for the on key and many other keys will fail to register. This is the number one failure aside from mechanical abuse ie broken LCD's for the 48 series. That is why a 48 works one day and fails to turn on the next.

Correct that ageing flaw and you will basically be able to extend the period to 40+ years (Capacitor lifetimes anyway).

Don't forget to put a manual ! (NT)

in response to message #1 by Derek

The HP-67 Standard Pac contains a diagnostic program which checks many functions. If your card reader works I can send you a copy on a magnetic card. It's 201 steps long so it would take some time to enter it manually...

Regards, Juergen

In my opinion, in the core of our hearts in this country, we really don't value schooling and education. Math, science, are considered "yucky", "nerdy", "geeky", and/or "boring" and other epithets.

Teaching is not respected so it does not attract the best practitioners (not by a longshot). Research does not

really get our respect, either, and these attitudes are either symptomatic or causative or both of the disdain most people have for math (and science, and English, and history, and geography, and foreign languages, and etc.

I have seen the 'math problems' posed in this survey. Several of them are not basic math probs, but rather like common IQ-probs. They can be solved 'in the head' without paper-and-pencil. Based on pure reasoning. The few real math probs are possibly beyond what can be expected from normal 15 year old capabilities.

in response to message #1 by bill duncan

Bill asks "...and what can we do to improve?"

I believe the greatest indicator of scholastic success in the US is that the student has a stable two parent home life that takes education seriously. This has been shown that the States that have highest scores also have the highest percentage of two parent households.

We're not talking (typing) about a Math problem, or a calculator problem, but a societal problem.

So, this topic is "Officially Off Topic (TM)", but that doesn't mean the topic is taboo. Questions like this need to be answered rationally, (i.e. with the smallest consideration for emotional input or 'sacred cows').

As the past 30 years have shown, neither Central Planning for education nor throwing massive amounts of money at "education" have improved test scores, instead the trend is worse test scores.

To fix "the problem" we have to evaluate which teaching methods, which schools, which communities, which textbooks, which social pressures are contributing to "the problem" and seek out those methods, schools, teachers, texts, communities, and societal inputs that currently have positive results, and follow their lead. It may mean a total overhaul of of America to succeed, but what other choice is there?

Re: Math Skills Survey Shows U.S. Lags Behind

*Message #12 Posted by **Ed Look** on 9 Dec 2004, 1:30 a.m.,*
in response to message #11 by Ren

Interesting. More and more of us who are concerned (parents) are realizing just these things, but more and more of the "elite" (the professional educators and education policymakers) seem to be drifting deeper into liberal practice.

To me the former cares about the(ir) kids while the latter cares about their careers, "success", and sociopolitical agenda.

I am now hearing that in New York, one way to raise scores on a chemistry test is to take topics out of the curriculum, so that it won't be on the test to bedevil the (underachieving) students! What will happen when they get to college, if they get that far??

Literally: a pox on these stupid, so-called educators. May even the near future show the stupidity of their measures and may the schools smarten up and simply adopt the known ways that work, regardless of whether it's "progressive" or conform to any given political agenda.

After having said this, I think I can go to bed.

The solution is already strikingly clear: family support and a consistent home life in which learning is an engaging family trait is, without a doubt, the most important aspect.

Home schooling is on the rise, and numerous studies have been conducted by various agencies and private researchers, to see whether the chidren are "learning."

What is clear is that a number of top colleges have found that the home schoolers are, on average, better prepared for college--both the academic, as well as the social aspects.

What I see in the public schools is an appalling lack of perspective. There is an over-focus on tests, and a tyrannical pedagogical epistemology driving the whole process towards longer days, shorter lunches (20 minutes *total*!), shorter free "unstructured" time, "multitasking (or as my 2nd grade son says, "we have to do math games while we eat our morning snack)....it is as if someone is saying, "see, we are adding all these programs--you said we are not good enough, so HERE--here is more action!"

The result is that the student is bombarded with information, much of it not synchronised with her own learning level, with essentially no time for self-directed learning.

From my own experience, it is clear that the most important thing to learn is how to teach yourself----and to that end, the public school curricula are at cross purposes with that ultimate goal.

Regards,

Bill

I believe the greatest indicator of scholastic success in the US is that the student has a stable two parent home life that takes education seriously. This has been shown that the States that have highest scores also have the highest percentage of two parent households.

Next thing you know, someone is going to start harping about family values again. Heck, maybe divorce should be illegal.
I'm from a broken home myself -- I sighed a big sigh of relief when my parents finally split up, and my only wish is that they'd done so sooner... And none of that stopped me from being the over-all head of my class, all the way from kindergarten through high school graduation (that's 6 years before the divorce and 6 years after), and always scoring especially high in math.
Of course I was also a geek. Test scores may be better in Holland (that's where I'm from) than in the USA, but I don't see a lot of respect for learning here, either. I think the schools are better, underpaid teaching staff or not.

My wife teaches 2nd grade. She can always tell how well things are going at home by how well a student is able to pay attention, get the work done, and do well on tests.

One of our friends who's a high school teacher said it's quite typical that when a child he thought was a good student begins doing consistently poorly, one of the parents will meet with him and say something like, "Mr. Long, I know John isn't doing well. Please understand. My husband and I are going through a divorce."

There are many more factors too though. I have a couple of articles about high-schoolers typically getting consistently too little sleep. Our throw-away society mentality doesn't help either. It's all "quick-- use this gadget," and when it quits working, you throw it out. There's no motivation to dig in and learn anything even to use your own stuff because it'll get replaced with something newer too soon. I also kept an article about an experiment in a school district in the midwestern U.S. where they were allowed to spend as much money as they wanted to improve learning. They spent $20,000 per year per child, yet every single one of the major performance indicators failed to improve even a little bit. A documentary video we have on child obesity says many schools are cutting out physical education to spend more time on improving the academic areas; and yet the statistics show that children do better in academics when they get plenty of exercise.

I do wish that all married couples would fully honour all of their marriage vows, stick together, and live happily ever after (or until death parts them, whichever comes first), but sometimes one or the other or both parties fail to honour the solemn contract. When they can't (or won't) work things out, it sometimes seems better for all concerned if they go their separate ways.

I can't blame someone who lives up to the marriage promises, but has a spouse who doesn't. Nor can I attach too much blame to someone who made the wrong choice as a young adult and married someone who wasn't deserving of it. But I do think that it would be best to consider long, carefully, and realistically before saying "I do." Every person is always changing, whether we like it or not, and not always in the ways that we'd prefer. Getting divorced is usually a lot more expensive than getting married in all ways except paying for the celebration.

Being single and childless, it's easy enough for me to criticise someone else's marriage or children. "If that were my kid...." Yeah, sure, we'd all raise perfect children, wouldn't we? And of course, if I were married, my wife would be perfect, which perhaps explains why I'm single. Or maybe it's more that any wife of mine would prefer a perfect (or at least tolerably good) husband.

But regarding the school systems, I'm sometimes amazed. For example, at least locally, they insist that youngsters must learn to read without "sounding out" new words; supposedly, the only right way to read is "sight reading", where you recognise a particular pattern of printed letters as being a particular word. Okay, in fact, that's exactly how I read, for words that I already know. But for new words (and there are still some new words for me, even at my age), I still "sound them out", although silently. How else am I supposed to learn them in the first place? Aren't we supposed to reason out how a word sounds, not just

that a word that has a particular appearance has a particular meaning? I at least assign a provisional sound until I have a chance to look it up in a dictionary to find out how it really sounds in actual usage (or maybe how the editors guess that it would sound). I thought that the idea was that a particular sequence of letters should sound (well, more or less) a particular way.

But no, it seems as if the school system thinks that letters, letter groups, and letter patterns aren't supposed to have any sounds or sound rules associated with them until they make up a complete word, that a particular random and arbitrary sequence of letters should be associated with a particular sequence of sounds known as a word, to be somehow memorized. To be sure, often the spelling of a word seems somewhat arbitrary in relation to its current pronunciation, but it's certainly not random. Have these people all lost their minds?

These days, it seems that "phonics" has nothing to do with letters and sounds, but rather "how are these little pictures different" and "how are these little pictures alike". Okay, I realize that recognizing that p, q, b, and d are different although in some ways they look alike, and that the same letter may look a little different depending on the typeface, are indeed important for learning to read, but I think that they've gotten a bit off-track with pictures of dogs, cows, bushes, and trees, to the exclusion of letters and sounds.

So we teach the kids at home, saying "try to sound it out, now", and "what sound does the letter 'ennn...' make", for example, and when they say "but we're not supposed to do it that way", we assure them that that's exactly how they're supposed to do it, until they've learned the word, except silently instead of out loud at school.

I can't help feeling that the reading program at school does a lot more harm than good. I expect that some children are being taught by the school system to hate reading. What is more helpful to learning other things than being able to read well? The thought that very likely some children don't get much (if any) help at home with learning to read is frightening.

Parents complain, relatives complain, professional tutors complain, private remedial school staff complain, but the school system won't change that policy; after all, they're professional educators, so they always know better than anyone else how to educate. We should all just mind our own business, and not stick our noses into the wonderful modern methods that they're using to teach the children.

Well, at least it provides employment opportunities for tutors and business for private remedial schools. I often feel as if I may as well be flushing the school district tax money down the commode.

The situation with mathematics and science education may leave an awful lot to be desired, but to me, basic literacy seems a much bigger concern. How much are they going to learn if they can't read their textbooks well?

How much of our knowledge is gained from personal experience and experimentation, compared to what we've read? To be sure, experience may well be the best teacher, but it's sometimes a painful way to learn something, and it's relatively slow. I trust an experiment that I've done myself a lot farther than I trust anything that I've ever read, but I don't have the time or equipment to test everything experimentally, so more often I just take what I read from a (more or less) trusted source as probably true, unless I have reason to believe otherwise. Many experiments would never occur to me if I hadn't read something to suggest them.

I'm certainly thankful that when I was learning to read, phonics (with actual letters and sounds) came first. What letters and groups of letters sounded like, how some letters determined which particular sound some other letters represented, all sorts of useful rules, and that rules always had exceptions. That went together with learning to read about all the namby-pamby things that those city slicker kids, Dick and Jane, baby sister Sally, and their oh-so-cute little pets Spot and Puff, were up to.

I'm sure glad that there were more interesting things available to read, but we certainly did have a lot of fun

with Dick and Jane. We usually all got a good laugh out of Dick and Jane, and especially with the ad-libbing and sometimes acting that we loved to do when Sister was busy with another group. Sometimes we had that happy little family doing and saying some outrageous (but perhaps more realistic) things, occasionally using words that definitely weren't supposed to be in our vocabularies.

"Puff saw some funny things."

Dick fell off of the tin roof on the shed into the honey wagon. Dick did not seem happy. Dick's mouth was full of manure. Dick cried, "Manure, manure, manure!" Puff saw this from the haymow, and laughed because it seemed so funny. Puff laughed, "Meow, meow, meow!" Jane came to help Dick, but Jane fell in too. Jane cried, "Help, help, help!" Sally came to help, but Sally's barn boots stuck in the manure pile. Sally walked out of her barn boots, so Spot came to help. Spot licked Sally's feet clean. Spot barked, "Good, good, good!" Sally cried, "Help, help, help!" Sally fell down. Spot licked Sally's hands clean too. Spot barked more, "Good, good, good!" Sally cried more, "Help, help, help!" It all seemed so funny to Puff. Puff laughed and laughed, "Meow, meow, meow, meow!" Jane cried more, "Help, help, help!" Father came to help. It all seemed funny to Father, but Father did not laugh. Father cried, "I will fix it all!". Father fixed it all, but Mother did not seem too happy. It did not seem funny to Mother at all. Jane said "Thank you, thank you, thank you!" Spot barked "Ow, ow, ow, ow!" Sally said "Thank you, thank you, thank you!" Dick said, "Manure, manure, manure!" Mother did not laugh. Mother cried, "Shame, shame, shame!" Mother washed Dick's mouth clean. Dick cried, "Ouch, ouch, ouch, ouch!" Father was happy that he did not laugh. Puff fell asleep in the haymow. Puff had happy dreams about funny things. Puff had a good day.

Well, Sister Michael Marie never seemed to get a laugh out of our little dramas, but I'd never imagined that she'd ever laughed in her entire life. I'm not at all sure that I quite realized that she'd once been a little girl, or anything except an awesomely tall nun. Maybe she grew up in Dick and Jane's neighbourhood, and had no idea that there were children like us. Now, I suppose that either she was laughing as soon as she got inside of the convent, or else she cried herself to sleep every night; we must've been quite a learning experience as her very first class. I do hope that she's developed into a sweet old lady instead of a horrible old crab. She did manage to teach all 48 of us quite a lot (or maybe we learned even more from each other), even though she wasn't able to teach us to urinate strictly as scheduled, whether we felt even the faintest urge to do so or not. I suspect that that may well have been what she tried the hardest to teach us (it sure seemed to be). But she had a good point there too; being able to urinate even when the urge isn't felt turns out to be a very useful skill, especially when there won't be a convenient opportunity to do it again for quite a long time.

Regards,
James

In my childrens' school district they no longer have a math textbook, having abandoned the traditional effective methods of teaching for a new 'intuitive' method. My second grader's teacher, when challenged about the child's woeful lack of basic math skills, told my wife that homework was a waste of time and that the memorization of facts such as addition and multiplication tables was optional. I fear for the future of America's school. BTW, I live in a college town in the buckle of the Bible belt so its not a demographic problem...

I have had some inkling by friends and relatives who are teachers and have taken education courses that our educational academic elite is to blame. They set the "trends" as to what is "hip" or "in" in education. Some of these ideas of theirs are not even half-baked; they are plain dangerous. I call New York City's use of such stupid curricula as sequential math, rainbow curriculum, and whatever the new vogue is in math education. I forget its name; I wish they would forget it completely and go back to the original way that used to work. Unfortunately, they are also playing politics- which makes it very hard to correct- in catering to the worst performing students due in great part to politically correct pressure making the education establishment cave into politically correct postures, which screws our children('s minds).

And, to my DIRECT knowledge, there are in our major American urban centers, teachers of all subjects, but notably math and science and sometimes history, who truly do not know what they teach.

I am a chemist. I sometimes get (unsolicited) visits from active or retired high school faculty trying to get some scientific or safety information. In the course of our conversations, it is appalling how little they know and understand, and it is they who are teaching our children. I am not remembering through a rose-colored fog when I say this- my elementary and high school teachers were truly SUPERIOR BY FAR to these that I have seen in the last twenty or so years. Fear, anyone?

And, I apologize for this passionate rant. I have school aged children and know all too much about the education racket, though mainly from an (inner) urban perspective.

Although I see plenty of reason for giving special attention to "challenged" or "disadvantaged" students, it often seems to be the attitude that "gifted" students will do okay anyway, so no special attention should be paid to them. Yes, a "gifted" student will probably do okay, but may be far from reaching his full potential without special attention. Surely every student should be treated as an individual. Even the "average" student is likely to be held back to the pace of the slowest student in the class; I don't know of a good way to entirely correct that, but what ever happened to flunking (excuse me, I should say "holding back") a student who hasn't learned what's required? It seems that these days, that's only (rather reluctantly) done when the parents insist on it, so more often the failing student goes on to classes that he's not prepared for, and does even worse there, and eventually ends up with a diploma that means only that his attendance and behaviour have been good enough to get through the system. I've no desire to

destroy anyone's "self-esteem", but telling a student that he's doing just fine when he's clearly not isn't helping him.

Answering my own question, probably the one thing more useful (in the U.S.A.) than learning to read well is learning to be fluent in Standard American English. Teaching other classes in his first language until the student is fluent in English may be okay, but teaching him English should have the highest priority. How many different languages are we able to competently teach general education classes in anyway? My impression is that most immigrant parents put a very high priority on their children learning English well, yet the school systems seem to be happy to have them remain ignorant of English for as long as possible.

That's not to say that foreign-speaking students should forget their "mother tongues". Being fluent is more than one language is a valuable skill; one much neglected in the U.S.A.

Far too much time is spent memorizing answers to questions that just might happen to show up on standardized state-wide examinations. There are good arguments for state or federal educational standards, but it seems to me that memorizing answers to particular questions is a very poor substitute for learning a subject.

> Quote:
>
> And, to my DIRECT knowledge, there are in our major American urban centers, teachers of all subjects, but notably math and science and sometimes history, who truly do not know what they teach.

Unfortunately, all too true, and for little rural school districts too. Yet there are many teachers who could be excellent, but have to go along with the methods, textbooks, and curricula set by their school boards, instead of doing their best.

Regarding history, I think that a biased record is the rule rather than the exception. Around here, the history of the U.S. "Civil War" seemed to boil down to that the dastardly Southerners wanted to keep slaves to abuse, so committed mass treason to make sure that the Federal government never prevented that. After the traitors began making war on the nation, the virtuous Northerners valorously defeated them, freed the slaves, and, partly because hanging all of the traitors so richly deserving of it would be too great a task, the nation generously granted partial amnesty to the treacherous Southerners. I expect that it was taught a bit differently in the Southern states, and surely the true history is much more complicated than any of us learned in school.

This is all off of the general topic of HP calculators of course, but I'm especially interested in the education of particular children, and education is very important to the future of the world in general.

Regards
James

My experience with a school system was different. My children were judged to be "gifted" early in their schooling. The school system provided them with enrichment programs, advanced placement high school classes which qualified for college credit, magnet school programs, and such like. The "challenged" or "disadvantaged" students were also provided with special classes which addressed their needs. It was the so-called "average" students who suffered in my estimation. They were judged to be neither "gifted" enough nor "challenged" enough to merit any special attention. Curiously, the school system didn't seem to understand that small improvements in the performance of the large number of "average" students would translate into greater improvement in the overall test score for the school system than larger improvements in the performance of the smaller numbers of "gifted" or "challenged" students.

Ah, but it is more rewarding to the teacher to deal with the so-called gifted kids than to fight the Vietnam War of the other kids.

This is made worse today by parents in many places that do not support their teachers. Rather, they will protect every move and mistake of their children, discouraging and intimidating teachers.

It is no wonder they'd prefer to deal with the gifted; they deal with the problem children because they absolutely have to due to pressure from administrators and parents. Who speaks vigorously enough for the "regular" kids??

in response to message #22 by Ed Look

If it is more rewarding for the teacers to work with the "gifted" then the school systems should be able to pay smaller salaries to those who teach the "gifted". In our school systm the opposite is true.

Re: Math Skills Survey Shows U.S. Lags Behind

*Message #24 Posted by **Ren** on 22 Dec 2004, 5:40 p.m.,*
in response to message #23 by Palmer O. Hanson, Jr.

Palmer,

If you mean by "opposite is true", that your school district pays more for Special Education teachers, I can understand that. (For international readers, Special Education is a politically correct term for teaching the mentally or physically handicapped). Such teachers need additional teaching qualifications as well as "a thicker skin and a softer heart".

Or do you mean that the teachers of the TAG (Talented and Gifted) programs are paid less? Or do you mean they are paid less in respect to their additional program loads?

Re: Math Skills Survey Shows U.S. Lags Behind

*Message #25 Posted by **Palmer O. Hanson, Jr.** on 23 Dec 2004, 4:03 a.m.,*
in response to message #24 by Ren

Our school system offers the International Baccalaureate (IB) program at two schools. The teachers in that program are paid more than the teachers in other programs. The result is that the more capable teachers tend to gravitate to the IB programs. I was suggesting that if it is true that teaching the IB students was more rewarding then perhaps it would make sense to pay the IB teachers less not more.

Which HP98xx desktops used std non-HP CPU??

*Message #1 Posted by **Bill Wiese** on 7 Dec 2004, 12:14 p.m.*

Hi...

I've seen a few items saying that a couple of HP 98XX desktops used nonproprietary CPUs - specifically, something in the 6800 series.

Anyone know if this is true?

Thanks!

Bill Wiese
San Jose

Re: Which HP98xx desktops used std non-HP CPU??

*Message #2 Posted by **Alex K.** on 7 Dec 2004, 12:28 p.m.,*
in response to message #1 by Bill Wiese

The HP9815A/S used a Motorola 6800 microprocessor along with a 6800-family peripheral chip (I think it was a 6820 but I can't be certain without looking), standard RAM, etc.

The other machines featured on the Museum website (9810/20/30 and 9825) all used HP proprietary CPUs.

The later 9826/9836 machines use a Motorola 68000-family microprocessor.

I hope this helps,

Alex K. The Calculator Museum Web Page

Re: Which HP98xx desktops used std non-HP CPU??

*Message #3 Posted by **Tony Duell** on 7 Dec 2004, 3:12 p.m.,*
in response to message #2 by Alex K.

Yes, the 9815 uses a Motorola 6800. I thought the other 40 pin chip was a 6821, but that's very similar to a 6820 anyway. The 9810/20/30 use 4 boards of mostly TTL chips with some small PROMs to make a bit-serial 16 bit processor.

The 9825, etc have an HP multi-chip module with a large heatsink on top.

Looney Auctions

*Message #1 Posted by **Les Bell [Sydney]** on 6 Dec 2004, 6:24 p.m.*

When our local newspaper covered this one (http://www.smh.com.au/news/Unusual-Tales/Bid-for-grandpas-ghost/2004/12/06/1102182228216.html) I could hardly believe my eyes, but I found the actual auction at http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5539709069.

I'm still highly doubtful of the winning bid of $65,100.00, though.

What next? We all know that disreputable operators have auctioned off "mint" calculators that have, in fact, given up the ghost. Maybe that will be auctioned separately?

And how long before Carly turns up auctioning the spirit of the old HP?

Best,

--- Les Bell

several ways downloading SW to 48S/GX?

*Message #1 Posted by **Valentino Ducati** on 5 Dec 2004, 5:27 p.m.*

Hi all

I'm a 48 newbe, working for years with the 41. I read very much about th 48 series in the last days (manuals, hpcalc.org and many other internet sources) but I didn't find the following: What are the several ways of downloading a program to a 48? Which are the file format 48 SW can be stored?

Please have a look here at http://www.hpmuseum.org/software/41td/41docs.htm#how There are 6 (six!) ways and many formats to input a program into a 41. And they are all well explained. And, if you fail with all other you have still #6: Keyboard input! (And there are more, if you had the card reader of HP-IL...)

Now to the 48 series. Having (yet) no cable I found a program to enhance the IR port to connect with PCs. But here begins the problem: It seems no more usual to print the program listing to the internet (even if it is only User/SysRPL). That leads to the further problem, that I have no chance to use any of the many programs in the internet, because it seems only to exist one way: PC -> connection SW -> CABLE -> hp48.

Or did I miss something? Please help.

Re: several ways downloading SW to 48S/GX?

*Message #2 Posted by **Jonathan Purvis (New Zealand)** on 5 Dec 2004, 6:01 p.m.,*
in response to message #1 by Valentino Ducati

Cables for the 48 are easy to build. The connector has 2mm pin spacing, rather than the usual 0.1", but they are often found in CD-ROM audio cables and serial mice.

There are 2 types of file for the 48. ASCII ones are User-RPL souce code and have a header similar to "%%HP: T(3)A(D)F(.);" (specifying the level of character to \ escape sequences, angle mode and fraction mode). Binary files have a header of "HPHP48-A" where the "A" is the ROM version (A-J for 48S series and K-R for 48G series).

The only ways to get files onto a 48 are RS-232 cable, IR, memory card (for the SX and GX) and typing it in. If you really want to type in a program that you only have as a binary version, you could use Bill Wickes' ASC program, which converts programs to hexidecimal strings. It comes with a User-RPL decoder and ASC'd Sys-RPL decoder/encoder and is in the comp.sys.hp48 FAQ and at http://www.hpcalc.org/details.php?id=2377. There is a MS-DOS program to do the same at http://www.hpcalc.org/details.php?id=3671.

Re: several ways downloading SW to 48S/GX?

*Message #3 Posted by **Ed Look** on 5 Dec 2004, 7:24 p.m.,*
in response to message #1 by Valentino Ducati

As far as I know, you are right. The 48 series machines can only be accessed for communication via cable.

My recommendation is to buy one; I made one once, and it was hard to use (and just a few days ago, the

connector fell off the cable). The commerical one is more robust and easier to use.

Re: several ways downloading SW to 48S/GX?

*Message #4 Posted by **James M. Prange** on 6 Dec 2004, 4:08 a.m.,*
in response to message #1 by Valentino Ducati

All 48 and 49 series work with the Kermit File Transfer Protocol, and include a Kermit server. For so-called "ASCII" (decompiled) transfers, optional special translation sequences for non-ASCII character are built-in. Kermit also handles "binary" transfers of compiled objects. Any Kermit based application ought to work with these calculators.

All 48G series have XModem built-in, and the 49 series also has a special XModem server mode. An XModem server library for the 48G series is packaged with Conn4x, designed for the 49g+, but designed to be compatible with the 48G series and 49G too. All XModem transfers are binary only, but Conn4x can do a "text" transfer by using to XModem server to tell the calculator decompile/compile objects. Conn4x optionally does translations of non-ASCII characters, and as a separate option, ASCII control codes, on the PC. Conn4x doesn't work with the 48SX and 48S, which don't have XModem built-in.

For posting source code online, I strongly recommand that you use a Kermit ASCII translation mode 3 transfer or a Conn4x "text" transfer with all translation enabed, and include the transfer header. This makes it easy for anyone to download the source code to his calculator, without editing the text or keying it in manually. It also means that everyone who uses an ASCII-based character set will see the same thing.

Physically, the "Via wire" connections on the 48 series and 49G are "3-wire" RS-232 compatible. The "Serial IR" (SIR) signal is similar to the RS-232 signal. Building an SIR to RS-232 adapter should be relatively simple, and they might be commercially available. For details of the 48 series I/O, see here. The 49G has four additional speeds easily available; multiple the 48 series speed by 1.6 to find these extra speeds. Note that the 49g+ uses USB and IrDA instead. Also note that the 49G doesn't have the hardware for IR.

The 48 series and 49g+ also have a special IR encoding ("RedEye") for sending to the printers. See here for details. HP published an INPRT program, intended for capturing IR printer output from earlier calculators. INPRT remaps some (not all) "Roman 8" characters to the modified ECMA 94 Latin No. 1 character set used on the 48 series. There are variations available that don't do the remapping. Note that INPRT on a 48 series isn't able to capture the weak IR signal from the 49g+

For a lot more information on the RPL models, see the newsgroup comp.sys.hp48, and please search the newsgroup archive before posting a question.

Regards,
James

*Message #2 Posted by **Veli-Pekka Nousiainen** on 5 Dec 2004, 8:17 p.m.,*
in response to message #1 by Harry

The software is as much as possible the same.
The difference is mostly in the hardware.
The speed increase only will do the trick IMO.
You can even change the CPU speed using software.
The only small waiting you get is the CAT
The "Y=", "WIN", "2D/3D" will change instantly.
The Garbage Collector has been enhanced.

Also you will get the possibility for ARM C/ASM.
http://alpage.ath.cx/hptute/arm.htm
Plus an SD/MMC-card interface.
12xconnection speed to a PC using USB at 115200.
IrDA at 115200 (but range is about an inch).
RedEye output to old HP printer (and some Martel).
BUT
You also get a keyboard that will cause you trouble.
[VPN]

Thanks to both of you! But what is the keyboard trouble about?

*Message #3 Posted by **Harry** on 6 Dec 2004, 9:24 a.m.,*
in response to message #2 by Veli-Pekka Nousiainen

I never saw a real G+ so far, but tried a G for a few minutes once. I wasn't too impressed by its keyboard either. So is the G+ keyboard even worse?

How to solder

*Message #1 Posted by **Matthias** on 5 Dec 2004, 9:26 a.m.*

Hi

I want to combine a MATH/STAT and a MACHINE module for the HP-41 in one module shell. Does someone has a diagram which pin has to be combined / crossed?

1 2 3 4 5 6 7 8 9 A B C Pins

o o o o o o o o o o o o Upper module (MACHINE for example)

o o o o o o o o o o o o Lower module (MATH/STAT)

Matthias

Re: How to solder

*Message #2 Posted by **patrice** on 5 Dec 2004, 10:43 a.m.,*
in response to message #1 by Matthias

Hi, Mathias, If I understand well, you want to do a double rom module for a 41. I think you can have some usefull ints by looking at the article about how to do a double xmemory module in the museum.

Bye, Patrice

Re: How to solder

*Message #3 Posted by **Matthias** on 5 Dec 2004, 11:32 a.m.,*
in response to message #2 by patrice

I don´t think that this is the same procedure. In case of the double ROM module the calculator only reads from the module. In case of the double XMEM, the claculator writes into the module, so that you have to address the memory. My speculation is, that I can solder the pins strait together (1-1, 2-2, 3-3, ...), cause the calc doen´t matter, from which circuit board the commands come.

Re: How to solder

*Message #4 Posted by **patrice** on 5 Dec 2004, 11:59 a.m.,*
in response to message #3 by Matthias

Your speculation is good if the modules address does not depend on the port number, otherwise you will have to device something like for the double XMEM, to make the 41 feel like the 2 roms are in different ports and at dif addresses.

Re: How to solder

*Message #5 Posted by **Raymond Del Tondo** on 5 Dec 2004, 12:06 p.m.,*
in response to message #1 by Matthias

Hi,

AFAIK at least the Math/Stat is an 8K module,
so both upper and lower page of the port are used.
Considering this, you can't combine another ROM
with the Math/Stat ROM.

Raymond

Re: How to solder

*Message #6 Posted by **MAtthias** on 5 Dec 2004, 12:26 p.m.,*
in response to message #5 by Raymond Del Tondo

Why not? There are also combinations with three modules..

Matthias

Re: How to solder

*Message #7 Posted by **Raymond Del Tondo** on 5 Dec 2004, 1:18 p.m.,*
in response to message #6 by MAtthias

Yes,

but AFAIK these combinations consist of one or two memory modules,
and one or two 4K ROMs. The memory modules don't take ROM address space,
so that won't be a problem.
Combining three ROMs into one module would only work if
one of the ROMs is hard-configured, like the TIME module,
so it won't overlap one of the other two ROMs.

Raymond

Re: How to solder

*Message #8 Posted by **MAtthias** on 5 Dec 2004, 1:26 p.m.,*
in response to message #7 by Raymond Del Tondo

And what about port replicators? They do not contain electronic. You can also plug in three applications that are plugged into the same port of the calculator

Re: How to solder

*Message #9 Posted by **Raymond Del Tondo** on 5 Dec 2004, 2:34 p.m.,*
in response to message #8 by MAtthias

Port replicators are a different thing.
They have one general plug,
but coded (and numbered) slots for modules.
Some replicators also may have switches
to either activate or deactivate a specifiec slot,
or to shift a port assignment.

Maybe there would be a possibility to pack
three ROMs into one module, how would you define
their address assignment?

AFAIK you can designate a ROM to be either on
the lower or upper half of the current port,
or at a fixed address.

I don't know if there's an option to define a ROM
to be addressed at the current upper page + one.

If that would be possible, plugging the ROM pac
into port 4 would invalidate/deactivate a ROM
with a designation like above, or in the worst case,
it would be mapped to address page zero,
which would crash the calc.

So if you have the Math/Stat, I think you can
only add a memory module into the same housing.

However, maybe some other HP-41 specialist
could shed some more light on this topic;-)

Raymond

Re: How to solder

*Message #10 Posted by **Diego Diaz** on 5 Dec 2004, 5:07 p.m.,*
in response to message #9 by Raymond Del Tondo

Hi all,

AFAIK, the wiring scheme is identical to the doubled X-Memory or the old "dules" (2x82106A), namely B3 line must be connected to GND for one of the modules while kept to V+ for the other.

Indeed, DATA and FI lines don't need to be connected at all, as ROM Pacs don't make any use of'em. Connecting them will increase mechanical strength though.

Obviously the 41 will "see" both modules as if they were plugged into adjacents ports, so you can only plug a "System" module in the "almost freed" port.

Best wishes to everybody :-)

Diego.

Re: How to solder

*Message #11 Posted by **Holger Veit** on 6 Dec 2004, 8:30 a.m.,*
in response to message #10 by Diego Diaz

Careful, as others already pointed out, there is a difference between ROMs and memory modules, and there are also special ROM modules.

First of all: the lines B3 and B4 are hardwired chip select lines; a module can thus find

out in which slot it is located. This is important for the old 41C memory modules, because their slot assignment determines which RAM address range they occupy. The 41C wants to see contiguous memory, so if you have single modules, you have to put them into contiguous port slots (you can't put the first one in port 1 and the second one in port 4 - the latter won't be visible to the CPU. With Quad memories and CVs and CXs, this is nowadays barely known. With X-Memory, the same effect happens: you mustn't put two XMEM modules "vertically" in the slots, as they only use one of these B3/B4 lines; so then they would be addressed at the same time. If you want to create a double-X-Memory module, you have to wire them in a way as if they were located in the correct slots. You can combine without problems a memory module with an xmemory, a memory module with ANY ROM, and an xmemory module with ANY ROM.

There are two kinds of ROMs, ones which are internally hardwired, and occupy a fixed address range, and those that adapt to the port they are plugged into. Fixed ROMs are for instance: Printer (any kind), HP-IL, Time, Diagnostics, and surprisingly: the card reader (which has a fixed address of 0xe000-0xefff, the low range of port 4). Each port can physically address 8K, but this can be extended by bank switching. So, for example, if you'd like to add a ROM to the card reader case, it would have to be a ROM module that is either fixed, thus out of the way, or would have to be addressed to 0xf000-0xffff. Unfortunately, there are IIRC no natural 4K modules that use a high port range, because HP didn't expect people to assemble multiple 4K ROMs in a single case. This means, you can only combine a fixed module (e.g. Time) in the card reader, or you have to use an artificial ROM, like the NovRAM which you can wire to any address.

The diagnostics ROM is a special case, it is fixed to 0x4000 and will take over control of the whole calculator when plugged in (there is a check in base ROMs whether there is a ROM at 0x4000, and if so it is jumped to).

If you have an 8K (or more, via bank-switching) module: you can combine those only with fixed ROMs, like Time or HP-IL, or with memory/X-memory, because these use different methods of addressing (memory modules don't write to the ISA line, they just monitor it).

Some useful recommendations: make a "double X-Memory" in slot 2/3, and combine it with a Time/Xfunctions in slot 1. Should be the base for each collection...

Or combine XIO/ILDEV with HPIL, or Printer with some 4/8K-module.

Re: How to solder

*Message #12 Posted by **MAtthias** on 6 Dec 2004, 5:52 p.m.,*
in response to message #11 by Holger Veit

Ok, let´s talk about a combination of a HP-IL module with a 4k/8k module.. DOes this requires the same whire connections like the other possibilities (crossing B3-B5)

Matthias

"HP IL" + ROM

*Message #13 Posted by **Diego Diaz** on 6 Dec 2004, 7:23 p.m.,*
in response to message #12 by MAtthias

Hi again,

82160A HP-IL Adapter doesn't care about B3/B4 lines. To merge any ROM Pac into an HP-IL enclosure just make a straight connection for every wire.

Cheers

Re: How to solder

*Message #14 Posted by **Holger Veit** on 7 Dec 2004, 7:37 a.m.,*
in response to message #12 by MAtthias

HPIL (fixed) + a 4/8K (B3/B4-adapting) is exactly the situation I described as the example HPIL/Extended-I/O which I myself have built (quite a useful combination, one might argue that HPIL/IL-DEV might be even better, but that time I hadn't the latter).

As a combination of a fixed and an adapting ROM, you simply connect all wires one-by-one together. Don't think about any special wiring to move the adapting ROM to a specific slot, it would just result in subtle restrictions on where to plug in the module, or other modules when this pair is attached.

Re: How to solder

*Message #15 Posted by **Wlodek Mier-Jedrzejowicz** on 6 Dec 2004, 11:39 p.m.,*
in response to message #11 by Holger Veit

Holger thinks that there are "no natural 4K modules that use a high port range, because HP didn't expect people to assemble multiple 4K ROMs in a single case", so no ordinary module can be doubled with the Card Reader. Ah, but Zengrange _did_ think exactly this, so the ZENROM is an upper 4k module precisely so that it can be doubled with an ordinary 4k ROM. This means that a ZENROM can also be doubled into a Card Reader - a useful hack but I have not heard of anyone who did it.

Re: How to solder

*Message #16 Posted by **Holger Veit** on 7 Dec 2004, 7:50 a.m.,*
in response to message #15 by Wlodek Mier-Jedrzejowicz

> Ah, but Zengrange _did_ think exactly this, so the ZENROM is > an upper 4k module precisely so that it can be doubled with > an ordinary 4k ROM. This means that a ZENROM can also be > doubled into a Card Reader - a useful hack but I have not > heard of anyone who did it.

Thanks for the correction. But did Zengrange actually have module tinkers in mind for that design? Or didn't they rather wanted to provide a development ROM which does not occupy the normal address space a later retail ROM would reside? You can hardwire RAM into the low range, and the resulting code won't need further changes even if it used absolute addresses (forcing the module into a specific port).

It's been a long time since I wrote HP41 code, but there is also a subtle difference between the low and the high range of a module port, namely the order of execution of the xFFx hooks. Don't remember whether 8ffx or 9ffx hooks would be called first in an 8K module, but there are interdependencies in which port you can put for instance CCD and other ROMs which both intercept

the keyboard hook.

Re: How to solder

*Message #17 Posted by **Ángel Martin** on 8 Dec 2004, 2:52 a.m.,*
in response to message #16 by Holger Veit

From my own fumbling and stumbling (which some people would call experience), I'd say that the order of polling-points execution is sequential, starting from the lowest addresses.

The classic example is combining the CCD and the ZenROM, but there are other cases where the order does matter as well (SandBox, AECROM, etc.)

Best, ÁM

*Message #19 Posted by **Meindert Kuipers** on 8 Dec 2004, 7:13 a.m.,*
in response to message #1 by Matthias

Why bother? With Clonix, NoVram and MLDL2000 you can plug almost any combination of ROMS in any port?

Only ROMS with specific hardware makes sense to combine, like XFUN and XMEM, and the ROMS that control I/O like IL, Wand etc ...

Meindert

Re: How to solder

*Message #20 Posted by **Christoph Klug** on 9 Dec 2004, 3:19 a.m.,*
in response to message #19 by Meindert Kuipers

Dear HP41 enthusiasts,

I correspond completely with Meindert. Today hardware ROM combinations are more of historical interest, because we are able to use ZEPROM, CLONIX, NoVRAM or MLDL2000. Only DOUBLE X-MEMORY Modules making much sense – in combination with the advanced plug in module solutions above.

For breaking the 32KByte address limit of the HP41 system we need more bank switched ROM solutions, therefore Raymond is working on the right way.

Up to now most HP41 enthusiasts neglect the creation of their own and individual user code ROM solutions, which are now possible with help of EMU41 plus ZEPROM, CLONIX, NoVRAM and MLDL2000. Own user code ROM solutions will extend the power of the HP41 system essential. May be there are some Mcode specialists like Angel or Raymond who are able to developing new ROM solutions, for example like SANDBOX.

With best regards - Christoph Klug

Re: How to solder

*Message #21 Posted by **Ángel Martin** on 9 Dec 2004, 6:12 a.m.,*
in response to message #20 by Christoph Klug

Christoph's summary is very sensible, and sure I wish I had more time to spend on the wonders and intricacies of MCODE programming - but unfortunately such isn't the case for the time being.

Maybe the MLDL_2000 triggers a new spur of activity! (it must be closer to release every day now, or so I hope).

Best, ÁM

member of hpmuseum?

*Message #1 Posted by **Perry Smith** on 4 Dec 2004, 7:33 p.m.*

Is coburlin (ebay name) a member of hpmuseum? Maybe he´s the supplier of the hp material to hpmuseum?

Re: member of hpmuseum?

*Message #2 Posted by **Miki Mihajlovic** on 5 Dec 2004, 12:04 a.m.,*
in response to message #1 by Perry Smith

I strongly doubt that Dave would have anything to do with that person. I you watched his ebay behavior you see that he is bidding on pretty much everything related to HP calcs (and who knows what else under different ID) and reseling it at 10x the price. Not a bad way to make a buck but it certainly doesn't get you any points among people on this forum.

HP 67 card reader

*Message #1 Posted by **Derek** on 4 Dec 2004, 2:32 p.m.*

I was wondering if there is a way to test the operation of an HP 67 card reader without any magnetic cards. I have been unable to find any and am preparing to sell this thing but don't know of any way to verify its operation.

Any suggestions would be appreciated.

Thanks, Derek

Re: HP 67 card reader

*Message #2 Posted by **Erik Wahlin** on 5 Dec 2004, 1:52 p.m.,*
in response to message #1 by Derek

I would be happy to mail you a few cards in an envelope. Send me your address. Erik

Re: HP 67 card reader

*Message #3 Posted by **David Smith** on 5 Dec 2004, 4:02 p.m.,*
in response to message #1 by Derek

Unless you (or somebody else) has replaced the drive wheel rubber then it is pretty much guaranteed that the reader will not work.

Re: HP 67 card reader

*Message #4 Posted by **Derek** on 5 Dec 2004, 8:50 p.m.,*
in response to message #3 by David Smith

You're right I don't think it works. Does anyone know if they're easy to repair? Or have an opinion if it is really worth my time to fix it before sale? If a working card reader is only going to add $20 or so to its value then its definitely not worth fixing to me.

I just got a new battery for the thing and am surprised at how well this old beast still works. I used this same calculator when programming in my physics formlas back in high school in 1980/81.

Derek

Re: HP 67 card reader

*Message #5 Posted by **Vassilis Prevelakis** on 6 Dec 2004, 9:18 a.m.,*
in response to message #4 by Derek

I you were selling the '67 to me, I would rather you left it alone so that I did all the work.

Others may prefer that they get a working calculator.

**vp

Are you interested in it?

*Message #6 Posted by **Derek** on 6 Dec 2004, 2:24 p.m.,*
in response to message #5 by Vassilis Prevelakis

Well after scrounging around a bit I've found some instructions on how to repair the wheel. I think I'm gonna go for it and do it myself. Unless you or someone else express a real interest in getting if from me in an unrepaired state.

Derek

only to US!

*Message #1 Posted by **Matthias** on 3 Dec 2004, 12:51 a.m.*

This is the first part of a mail I got when I asked a ebay seller if he would also send his item to Switzerland. Have a look at it. I thought I was reading wrong when I first read it. Small people try to make politics! Happily this man was not elected for president:

Hi HP Collector

I don't want to get into a big political debate or trouble with ebay, but this is a PRIVATE aution and because of that, I am not dealing with any known American-hating countries or Bush-bashers, that's why I will not deal with shipping to Canada or European countries... You have to understand that some of us are really fired up over all this anti-american stuff and we're the ones paying all the bills!! A lot of us have decided to "return the hatred"!

Re: only to US!

*Message #2 Posted by **Namir** on 3 Dec 2004, 1:06 a.m.,*
in response to message #1 by Matthias

Hi Matthias,

I do not know the person who wrote back, but my guess (and it's only a guess and I may be off the mark) that he is using this pretext to avoid the extra few steps involved in sending a package outside the USA. This includes mainly filling a customs form. I say big deal! I will be happy to fill these forms (and I do) when I mail an eBay item to Europe or other destinations.

I do not share this person's views. I enjoy visiting Europe (I did visit France and your beautiful country this year where I met some new friends and visited childhood stomping grounds) and enjoyed my stay in Europe as a tourist and for work. There is more to life than being ego-centric and money-centric. We should feel secure enough to be able to disagree with our friends without having a fit of anger. After all, friends are friends and not employees who must agree with us on every matter to avoid losing their jobs.

Namir

Re: only to US!

*Message #3 Posted by **Harry (Germany)** on 3 Dec 2004, 6:11 a.m.,*
in response to message #2 by Namir

I can't even receive any mail since I was in the US in September 2002. All the mail "disapers" and can't be found. I guess it has something to do with the fact that I visited Morocco a year before, I am a pilot and I study electrical engineering. That matches some points of the terrorist profile. What sets me up is not only the fact, that they definatly check my mail, but that they throw it away afterwards! This shows that some Americans think Europeans are not worth as much as Americans and therefor can be treated diffrently.

The ebay seller could be that kind of American. Next question that comes up is, will he ship to Kerry supporters?!? :)

Harry

in response to message #1 by Matthias

It's amazing to see that some people have such sharply cut advices on everything... All at a sudden all European countries and Canada became the enemy of Europe...

Maybe he'd gladly send to Spain, UK, and Poland...

Re: only to US!

*Message #6 Posted by **Jeroen** on 3 Dec 2004, 6:51 a.m.,*
in response to message #5 by Thibaut.be

Not to Spain anymore, I guess, since Zapatero withdrew his troops from Iraq. OTOH, citizenship of Italy may also qualify you for this seller.

But more OT: it IS indeed a private auction. The seller has the right not to sell to specific persons/countries, even for political reasons (ebay permitting), as long as they are not racist/sexist/religious. Just pass on and feel pity for his rather crude political insight if you really want to. There are many US sellers who don't let political convictions interfere with their business.

*Message #9 Posted by **Eddie Shore** on 3 Dec 2004, 8:11 a.m.,*

in response to message #1 by Matthias

This is a first. 40% of the country doesn't even like Bush. Hopefully he is trying to sell the item to the Mid West or Southern US.

However, he can sell it to whoever he wants...

Re: only to US!

*Message #10 Posted by **Mike (Stgt)** on 3 Dec 2004, 8:47 a.m.,*
in response to message #1 by Matthias

I regard it just as an other little indicator that the US of A. exceeded the apex (zenith) of power and are on the down grade, similar the ancient Romans.

One question (to bring the discussion back the subject of this Forum), there once was an index which goods are not allowed to sell in communist countries. IMHO the HP-41 was on that list too. When (if at all) was that calculator taken off that list?

Ciao.....Mike

May I suggest....

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 3 Dec 2004, 9:28 a.m.,*
in response to message #1 by Matthias

Hi, all; (123456 to remove)

I guess I'm the last person to post about what I'm about to, but I think that, as openminded people, you'll get the point.

I sent a private message to Matthias where I expressed my thoughts as a non-norhtamerican (a foreigner, in fact) and I actually see no trouble on posting my message publicly. What I wanted to avoid was to call the MoHPC Forum to a debate about this issues. Controversial or not, I think that, as a foreigner, I'll never have a true perspective a northamreican has, and my own point of view will be firstly based on my own experiences and the relation my country/people has with a particular country/people/government.

I also apologize (pleas, guys, forgive me) for these words, mostly because only openminded people are involved and you are completely aware of these all, but I'm affraid for the possibility of having "thirdy part" comments and ranting, I mean, non-regular contributors finding a place here for "heavy ranting" and, consequently, disturb our peace.

If other regular contributors post about this subject, I believe it's fine at all because we "e-know" each other, but have we percieved external activities from non-regular contributors or excessive ranting, I'd like having the chance to express my position against them. Or even wait for some good soul to whipe them out...

Thanks and forgive me again. I'm far from trying to do something I'm not eleged to, and I'll kindly accept any "shout up!" from you, guys.

Luiz (Brazil)

Re: May I suggest....

*Message #12 Posted by **Mike (Stgt)** on 3 Dec 2004, 10:20 a.m.,*

in response to message #11 by Vieira, Luiz C. (Brazil)

Oh! What an appropriate verbalism: we "e-know" each other. Thank you very much for this one. Up to now I had to circumscribe that kind of acquaintanceship. Now I may say "I e-know her" and "I work(ed) on e-Doc" and "I still e-use some old HP-calculators" (in their emulators).

Tnx 4 the e-lucidation.....Mike

Re: May I suggest....

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 3 Dec 2004, 11:29 a.m.,*
in response to message #12 by Mike (Stgt)

Hi, Mike;

it's just a shorten for "we know each other by electronic means". I am not the creator, I cannot take the ownership of the expression, I just read it once (with some other extensions, as you also pointed some by your own) and found it somehow handy.

Anyway, I was (and still am) much more concerned about the main issue.

Best regards.

Luiz (Brazil)

OT: May I suggest....

*Message #14 Posted by **Mike (Stgt)** on 3 Dec 2004, 12:18 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Sorry for the subject drift, but the main issue is _not_ a subject for this Forum. IMHO, _we_ as contributors may keep the quality of the Forum high if we do not stress the bandwidth too much. OTOH it is absolutely OK from Matthias to point fingers in this case as the replay is an issue: there _is_ definitively something wrong and he is against that. That gives us the chance to accede in public and show all ogling with the "return the hatred"-idea that they are on the wrong tack.

But: where is the limit that allows (or coerces!) an off topic append?

Ciao.....Mike (to be clear: I do not care about who uses an HP or an TI and who is uncircumcised an who is not)

Re: OT: May I suggest....

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 3 Dec 2004, 4:59 p.m.,*
in response to message #14 by Mike (Stgt)

Hi, Mike;

I´m not sure if you actually took my post as if it is directly to your own. By no means I inteded to address to a particular post. Yours was the last one in thread, that´s why mine was right after it.

Anyway, have you found in my words something offensive, either to the forum or to yourself, please, let me know how did it happen. I still did not get the point.

In order to avoid stressing the bandwidth, feel free writing to lcvieira at quantica dot com dot br,

if you prefer.

BTW, the main issue I was refering to was not the thread issue, instead was having the chance to read posts here from others ("foreigners" to the MoHPC Forum) that would take this place as for ranting. I have seen and read your posts here, you are by no means a stranger to this forum.

Best regards.

Luiz (Brazil)

Re: only to US!

*Message #16 Posted by **Chris W** on 3 Dec 2004, 10:00 a.m.,*
in response to message #1 by Matthias

This guy is an idiot. I can see not want to **buy** products from countries like Canada and France but what's the point of not selling things there? Selling the item outside the USA only improves our trade deficit and makes theirs worse, however insignificantly. Besides I pay fairly close attention to the news and I can see his point about Canada, France and a few others but I have never heard anything about Switzerland in this regard. I think he is just lazy, or stupid or both.

This guy needs to take a chill pill. Like I said, he will not get any sales except if he was trying to sell to the MidWest/Southern US.

Re: only to US!

*Message #19 Posted by **Ed Look** on 3 Dec 2004, 12:02 p.m.,*
in response to message #1 by Matthias

Hey, Matthias,

There are fools in every country.

But they TYPE of fool varies; America has had a strong history of isolationism, urged by no less than George Washington, himself (he might even be chagrined if he were here today to find a city named after himself that is essentially a center of international influence[s]).

While I myself as an American am no big fan of unrestricted, open internationalism, the reality is that we all DO LIVE on this big blue ball and in reality DO DEPEND on each other in too many ways to count.

Trading with and visiting other countries and learning about them should always be encouraged, for personal, spiritual, and cultural reasons as well as those very practical ones Mr. Platt (I think) enumerated.

If this guy doesn't like your money, don't give him any. As you said, this guy is a small spirited person; you don't see him posting here, do you? ;)

Re: only to US!

*Message #20 Posted by **Bill Wiese** on 7 Dec 2004, 12:10 p.m.,*
in response to message #19 by Ed Look

Hi folks...

I'll skip the politics here (I'll even sell a calculator to a Kerry supporter or a non-NRA member ;))... but:

When I've sold stuff on EBay I specify USA/Canada only. I'm sorry, it's just plain easier for me - for the average widget I'd be selling if it takes too much time for me to do anything beyond mailing it, it's not worth my time selling it.

My experience on EBay has been colored by transactions by 5 Europeans and one HK resident. I am sure there are millions of other Europeans, etc. that follow thru in their deals, I just didn't run into any for my particular auctions (some DEC stuff, etc.) All my other transactions with others have gone great.

[Before that I'd dealt with individuals from Europe on a private basis sale, non-EBay, and all was well.]

These folks that won my auctions flaked, "didn't realize how much shipping/ insurance would cost before bidding", etc. (I had of course noted that they were responsible for those costs, to be aware of that before bidding, and I would be happy to ship in the lowest cost manner they preferred.) Another one - I still have the email - said something like, "on second thought I will not have a use for this unit."

Since life's too busy to sweat the small stuff, I just try to make my life easier.

in response to message #20 by Bill Wiese

What a bulls*, sorry. FOr international shipping you have to fill *ONE* more formular, that is all! In exchange to that you get many, many buyers more! So you will earn more money. ISn´t that the cause why you use ebay, to get that much money as you can?

Matthias

Re: only to US!

*Message #22 Posted by **Katie** on 8 Dec 2004, 12:33 a.m.,*
in response to message #21 by Matthias

I sometimes sell on ebay and sometimes will ship to Europe and elsewhere. In fact I've sold/shipped to a few of you in the past.

But sort-of in Bill's defense, it is more work to ship to Europe, not just an extra form. You have to go to the post office and wait in line, if you send packages domestically you can drop small ones (under 1 pound) in any mailbox. Larger ones can be sent though many non-post office shipping places like Post Net (they don't accept international packages). Furthermore, collecting on insurance claims is nearly impossible when you use the US Postal Service. I like to ship more valuable domestic packages via UPS because insurance claims with them are relatively painless. UPS is not generally an option when shipping to Europe because of the extreme cost.

-Katie

Re: only to US!

*Message #23 Posted by **db(martinez,california)** on 8 Dec 2004, 2:09 a.m.,*
in response to message #22 by Katie

To add to Katie's sort-of defence of Bill: If you ship overseas (except to Canada, which is fairly easy and reasonable in price) and use surface rate to cut down on cost; you can not insure it. You can register it but that makes the seller seal every seam on the box with glued paper tape so the Post Office can stamp each edge. That takes time.

Matthias and Raymond: To ship a package to Brazil today, i had to kill about a half an hour at the Post Office re-wraping and filling out two forms. I did not charge a "handling fee" on this $25 auction and it was not really worth my time to do it. In retrospect i would have taken a fifty cent lower bid to simplify my life. If one of you two buy something from me in the future - will you pay me 30 minutes at my rate of pay to deal with the trouble? I can send that hypothetical calc to the second highest bidder if he is in the US by putting it in a self sealing Priority Mail box and leaving it in my home mail box to be picked up.

And where is the so called "service to to buyer"? Are you that economical thinking persons? I often send parcels to all arround the world and for me it is clear, that I go to the postal office, wait in a line and will out 1-2 formulars! Maybe I´m too honest and too gentle?

Matthias

Re: only to US!

*Message #25 Posted by **Gene** on 8 Dec 2004, 9:01 a.m.,*
in response to message #24 by Matthias

It isn't a question of service to the buyer or not.

The seller has decided because of their time/money trade-off NOT to sell to those overseas because of the time and trouble it creates.

If they lose bids, that's part of the equation.

Consider:

Item sells to the US only for $50. Takes 5 minutes to pack and drop in mailbox.

Item sells to Brazil/Italy(some of my worst experiences have been the the Italian postal service) for $80, but takes 10 minutes to drive to post office and 30 minutes in line and 2 extra custom forms.

A seller has to decide if the extra $30 is worth the time spent. Perhaps, but perhaps not.

> And where is the so called "service to to buyer"?

Many sellers on eBay are not professional sellers so you can not expect the same service.

> Are you that economical thinking persons?

I think that's not the reason. IT'S THE SELLERS FREEDOM where he wants to deliver the goods. Be somewhat more liberal instead of complaining about "economical thinking persons". US and Switzerland are different in size, there is not a post office around each corner.

Juergen

Re: only to US!

*Message #29 Posted by **Randy** on 8 Dec 2004, 1:09 p.m.,*
in response to message #28 by Juergen (CH)

In addition to the topics already discussed on why not to sell outside of the USA, I would like to add one more:

Without very expensive Express Mail or registered parcels which are about the same cost with yet more forms, the seller has absolutely no protection against loosing the item and their money. Paypal wil reverse the charges to the seller, charging their credit card if there is not sufficent monies in the account if the buyer claims non-delivery and the seller has no proof of same.

Bottom line is that it is a gamble to sell and ship by the lower cost methods that most buyers want when you accept Paypal. It is now very easy to have USPS Global Express fees in your eBay rate calculators. Include them and see just how many are willing to pay those prices.

Just my 2 cents worth.

Um, sorry Mathias, to reliably/insured ship stuff from US to Europe can involve extra standing in line, etc.

I only sell items on EBay to recover a bit of cash to fund some other 'toys'. It is not a business for me - just wanna recover a reasonable amount and move on. (If it were a business I'd be starving.) So maybe my top bid might be 5% higher, who cares?

It is not worth my time (effective hourly rate) to deal with any grief like this and there are plenty of buyers in USA.

Only to US!!!

*Message #31 Posted by **Nenad (Croatia)** on 10 Dec 2004, 4:43 a.m.,*
in response to message #30 by W

This might look weird, but I would *strongly* support the decision of our American friends to post to U.S. (even conUS, or 48 states) only!

Please look at this: if I were to sell a lot of recently found MIB HP95C's, or a lot of canes with a ghost installed, or a lot of well-known V.M. cheese sandwiches, I would also say "to U.S.

only".

If I say "to Europe only", I am sure that it would be impossible for me to find a buyer!

Hi,

filling in an international shipping form,
including the customs form, is simply two checkmarks,
two signings, and two words describing the contents.
As Matthias indicated, offering items worldwide
can increase your profit at no cost.

However, it is my experience that there are many US
eBay members who have no problem selling items worldwide,
or buying items from outside the US.

Don't get me wronng:
Of course you can restrict your selling range at will,
but to me it simply makes no sense to do so,
because restricting the range to a narrow window
lets you loose potential buyers,
and this is just like burning money...

in response to message #20 by Bill Wiese

Hi Bill,

To give a better sense of your experience, can you confirm that you have only had 5 total Euro e-bay transactions, and that *all* of them failed?

What percentage of your US transactions have failed?

I think this will get more to the point....

I have had 30 transactions total on E-bay. Three items I purchased from England with a perfect experience. All other buy/sell has been U.S., though I have always offered worldwide. I have had only one bona fide absolute scam against me. All others were ok or really good. The poorly disclosed items for which I complained, I was satisfied with an adjustment. So, e-bay has been a really remarkably good experience--all around.

Best regards,

Bill

in response to message #35 by bill platt

Hi Bill

This has been quite some time now - 1998/99? Maybe it was 4 Euro + 1 HK transaction. One of them I actually pulled out of auction for a 'starving student' so he could get a DEC Alpha board at a nice price.

Broadly speaking the people involved didn't seem to understand winning a bid was a contract. I did get the perception that these folks may have been young/student.

I didn't file 'bad reports' on these folks on EBay - sometimes that gets into warring counterratacks. Just reposted the items and sold them fine.

*Message #37 Posted by **Andrés C. Rodríguez** on 8 Dec 2004, 5:12 p.m.,*
in response to message #36 by Bill Wiese

It is understandable that selling inside each one's country is easier and safer than selling abroad. However, it would be nice to give the chance to foreign people to buy; provided that all the extra costs (insurance, etc.) are set on the buyer side.

I have bought some few items via eBay USA, had no problems with payment, shipping, etc. I was prepared to pay in advance, freeing the seller from any shipping/customs/etc. claim (but not from a misleading description or condition statement, which had not happened)

In one case, I preferred the item to be sent to a friend who lives in San Diego, as I would pick it up in a planned business trip. Surprisingly, it was difficult to use PayPal to pay for an item to be shipped inside the USA if you were a non-USA resident customer. (It could have been a gift for my friend).

Now, what I would like to recall, is that the seller involved in this transaction refused to sell based in political (unproven) prejudices and, worse, stated them in a non-civilized manner. I think such attitude was the main concern. It should be clear that the place of birth or the place of residence is not what makes a person "good" or "bad", "friend" or "foe". To learn a little geography and history usually helps.

*Message #40 Posted by **Reinhard (Germany)** on 13 Dec 2004, 6:55 a.m.,*
in response to message #39 by hpuser name

To all HP-Fans and others,

it's everybody's own decision, where to buy or sell!

... But, if Germans would think so, they would be compared with the initiator of World War II, so most of us will never do so and millions before haven't done so!

It's also a big mistake to compare people with their government. THAT seller is probably not selling to foreign country presidents, like Schroeder, Blair, Putin, ... or even Mr. Bush, right?

I'm against wars without ANY exception. And mostly against wars, which are SOLD OVER WRONG OR INCOMPLETE KNOWLEDGE SHARING. And who really nows the real, true reason why this war was initiated? There are so many still open questions...

I strongly agree, that the whole free world, west and east of the Atlantic ocean, and all other oceans, too, should and must find ways to stop terrorism, but wars are not the solution. There are other ways. Remember those millions soldiers, civilists, children, mother's, father's, sister's and brother's who gaved their life within the last 100 years... for what?

Did their unneccessary death really changed something???

Today, we are at the same or higher risk as on 9/11. Thank you very much! Probably somebody at the Pentagon knows about the details of Abu Musab al Sarkawi's -new?- plans. Will this person share it's knowledge to everybody? Probably not! Mr. Bush needs a lot reasons to send his soldiers into a war.

Thank you very much Mr. Bush.

Again, terrorism must be stopped. And everybody without exception should help, mee too, but killing people is not a solution!

It may sound that I am against Mr. Bush. This is NOT TRUE. It is just the way he does. His words: 'Everybody, who will not fight with us, is against us...' are simply a lie. It's his way to sell his very own financial interests to Americans. Unfortunately - in 2003 - I meat people in California, who asked me if Germany is somewhere in the US. That told me a lot (about true knowledge).

What would the seller think, if the rest of the world would be against the US? 6 000 000 000 people against 280 000 000? Should we all stop any contacts to our friends, colleagues or families? Probably not! Should we stop buying excellent american products? Not really. It probably would shutdown the US-industry and financial markets.

But this will never stop terrorism, nowhere.

Have a peacefull Christmas time and a happy new year, together with your families and hopefully many friends all over the world.

Reinhard

in response to message #1 by jose goncalves (brasil)

Well, as the name suggests, the HP-75 Plug-in Module Simulator simulates plug-in modules for the HP-75 and therefore operates with the HP-75 - which is not exactly a calculator, but rather a handheld computer that some people use as a calculator.

The Simulator (PMS) allows (allowed?) developers to test programs being developed for plug-in modules before the final version was written and actually put into a module. A second use of the PMS was to provide an HP-75 with extra program memory, even if the program was being written for use by only one person or organisation, not for putting in a real module.

*Message #3 Posted by **Yos Feit** on 3 Dec 2004, 12:10 p.m.,*
in response to message #2 by Wlodek Mier-Jedrzejowicz

It also has significant value. It was originally sold for $500. Given some of today's Ebay prices, it might fetch that today. Also note that it uses an internal battery that would need replacement by now. The original documentation stated that only HP should change it. You can change it yourself, but it is not convenient, and you must take static precautions.

e^A where A is a Matrix

*Message #1 Posted by **Harry** on 2 Dec 2004, 4:57 p.m.*

Ok, I didn't know this calculation is possible until a few month ago. But it realy makes sence (or sense? Whats the correct spelling there?) to calculate e^A and I need it for an exam at univerity. So how do I get my HP42s or Hp48 to do that? The HP48 says "Bad Argument Type"

Regards, Harry from Germany

Re: e^A where A is a Matrix

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Dec 2004, 5:36 p.m.,*
in response to message #1 by Harry

Hi, Harry;

I'm curious, now. Is there any e-place where one (I, in this case) can read about e^A? I was also not aware of the fact it is possible (makes sense... the correct spelling, as you asked for), too.

If there is no e-place that you know there is additional info, could you point out the calculations involved in e^A? I'd like to try a program in the HP42S, if applicable.

Best regards.

Luiz (Brazil)

Re: e^A where A is a Matrix

*Message #3 Posted by **Harry** on 2 Dec 2004, 6:17 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

As we know e^x = 1 + x/1! + x^2/2! + ... + x^n/n!

Now e^A is defined the same way. This gives a very easy result for a diagonal matrix (not sure if this is the correct word, I don't usualy talk about math in english :)):

http://tinypic.com/pyjyh

Things aren't that easy anymore for other nxn matrizes, because then you will have to calculate A^2, A^3 and so on until you get to a point where your result is good enough.

I hope you understand what I am trying to tell you. I didn't talk about mathmatics in english a lot before, and I need to practice that :)

Re: e^A where A is a Matrix

*Message #4 Posted by **Harry** on 2 Dec 2004, 6:25 p.m.,*

in response to message #3 by Harry

I think I will try and write a program for that too. Maybe first step would be to write a a program that calculates e^x. I'm am not sure how many steps I need to get a result that is correct for all displayed digits. Does anyone know how the HP calculaters internally calculate e^x? Do they also use e^x= 1 + x^1/1! + x^2/2! + ... ?

Best regards, Harry

in response to message #5 by Veli-Pekka Nousiainen

Does that mean I finaly found a reason to buy a 49G+?!?

Thanks for the info!

Re: e^A where A is a Matrix

*Message #7 Posted by **Karl Schneider** on 2 Dec 2004, 10:52 p.m.,*
in response to message #5 by Veli-Pekka Nousiainen

The original question was, which HP calculators can perform exponentials of *(square)* matrices.

So, the "49 series (48gII, 49G, 49g+): MAP" can? I assume that MAP stands for "Mathematical Applications Package" or similar. My unenhanced 49G also returns, "EXP Error: Bad Argument Type".

BTW, I thought that my 42S did square-matrix exponentials. However, doing e^x on any matrix simply takes the natural antilog of each element.

Re: e^A where A is a Matrix

*Message #8 Posted by **Harry** on 3 Dec 2004, 12:15 a.m.,*
in response to message #7 by Karl Schneider

BTW, I thought that my 42S did square-matrix exponentials. However, doing e^x on any matrix simply takes the natural antilog of each element.

This is exactly what the HP42 does. But it is not what e^A really is by the definition I gave in a previous post. An easier example for this is the following. If you got a matrix in the stack of the HP42 and then press 1/x, it doesn't calculate the invers of that matrix, but it it calculates the invers of each element of the matrix. So if you have a 0 in your matrix you

get a "division by zero". Its the same with e^x, it also works element by element.

This is a rather funny behavior an quite confusing, as the HP48 for example calculates the invers of the matrix after pressing 1/x (wich i think the HP42s should do as well insted of calculating the invers of each element)

Best Regards, Harry

Re: e^A where A is a Matrix

*Message #9 Posted by **Imad Eddine Srairi** on 3 Dec 2004, 2:03 a.m.,*
in response to message #8 by Harry

Hi,

Notice that Harry's calculations applies to any matrix which may be diagonalized, that is which may be written as A=P^-1 . D . P , where P is inversible and D only has diagonal terms (the eigenvalues). In this case, A^n=P^-1 . D^n . P^and D^n is easy to compute; exp(A) is therefore easy to compute too since its elements are simple the exponential of each eagenvalue i.e. denoting by li the eigenvalues

exp(A) = P^-1 . Diag (exp(l1), ..., exp(ln)) P.

I think that some HP calculators can compute the eigenvalues and anyway there are programs to achieve that. P is a basis of linearly independant eigenvectors. The only hard problem is finding whether it is possible to diagonalize A or not. Sometimes we easily know we can, for instance when A is symetric and positive (that is (tX).A.X is positive for any X - in this case all eigenvalues are positive).

Hope it helps.

Best regards,

Imad

Re: e^A where A is a Matrix

*Message #10 Posted by **Axel** on 3 Dec 2004, 3:01 a.m.,*
in response to message #9 by Imad Eddine Srairi

MAP applies a function on each element of a matrix. Hence,
MAP([[a,0],[0,b]],EXP[x]) would give [[e^a,1],[1,e^b]] and not [[e^a,0],[0,e^b]].

Greetings Axel

Re: e^A where A is a Matrix

Sometimes we easily know we can, for instance when A is symetric and positive (that is (tX).A.X is positive for any X - in this case all eigenvalues are positive).

Hope it helps.

Yes, it does help!

I didn't think about diagonalizing the matrix. It is a good way if it can be diagonalized. But that does not work if the matrix is not of full rank, then P can't be calculated as it consists of the eigenvektors of A.

Best regards, Harry

Re: e^A where A is a Matrix

*Message #15 Posted by **Valentin Albillo** on 3 Dec 2004, 4:39 a.m.,*
in response to message #1 by Harry

Have a look at this

It even gives the *exact* (not an infinite Taylor series expansion applied to matrices) expression for e^A, where A is a general 2x2 square matrix:

```
A = |  a   b  |
    |  c   d  |
```

As you may see, the resulting expression is quite complicated, even for such a simple case. Don't want to think what it may look like for, say, a 5x5 matrix.

However, this explicit formula for the 2x2 case, when programmed, runs rings around any iterative series expansion, so if your matrices are 2x2, that's the way.

Best regards from V.

A program to compute e^A

*Message #16 Posted by **Valentin Albillo** on 3 Dec 2004, 7:52 a.m.,*
in response to message #1 by Harry

Hi, Harry:

To further show just how easy is it to compute **e^A** for arbitrary numeric square matrices, here's a subprogram for the HP-71B I've just written right now to prove the point. If you don't have a real 71B and/or its Math ROM to test this program, hold on: you can download an excellent emulator for free (Math ROM included!) from the homepage of Emu71.

For greatest convenience, the computation of e^A is performed by calling a subprogram, **MATEXP**, which accepts two parameters, the original matrix **A**, passed *by value*, and the resulting matrix **B = e^A**, passed *by reference*, which will be filled up by the subprogram and returned to the caller.

The subprogram is just 3 lines long (not counting the END SUB instruction which can be omitted), and it's completely general, dealing with arbitrary NxN matrices. Notice that you aren't required to pass N as a further parameter.

```
100 SUB MATEXP(A(,),B(,)) @ DIM T(UBND(A,1),UBND(A,2)),P,I
110 MAT B=IDN @ MAT T=IDN @ I=1 @ P=1.E-12
120 MAT T=A*T @ MAT T=(1/I)*T @ IF RNORM(T)>P THEN MAT B=B+T @ I=I+1 @ GOTO 120
130 END SUB
```

As an example, let's find e^A, where A is the 2x2 matrix:

```
A = |  1/3   1/6  |
    | -1/3   5/6  |
```

Here's a sample calling program, though you could call this subprogram right from the keyboard, as we'll see later:

```
10 DESTROY ALL @ OPTION BASE 1 @ DIM A(2,2),B(2,2) @ READ A(,)
20 DATA 1/3,1/6,-1/3,5/6
30 CALL MATEXP(A,B) @ MAT DISP B @ END
```

Now, simply RUN it:

```
>RUN [ENTER]

       1.34970850034         .299012770355
      -.598025540708         2.2467468114
```

Let's test the result versus the exact values:

```
>EXP(1/2)*2-EXP(2/3),EXP(2/3)-EXP(1/2)

       1.34970850034         .29901277036

>EXP(1/2)*2-2*EXP(2/3),2*EXP(2/3)-EXP(1/2)

      -.59802554072          2.24674681142
```

So, as you can see, accuracy is good to a few ulps. As stated, you don't need to write a calling program, you could do it as easily right from the keyboard, like this:

```
>DESTROYALL @ OPTION BASE 1 @ DIM A(2,2),B(2,2) @ MAT INPUT A [ENTER]

A(1,1)? 1/3   [ENTER]
A(1,2)? 1/6   [ENTER]
A(2,1)? -1/3  [ENTER]
A(2,2)? -5/6  [ENTER]

>CALL MATEXP(A,B) @ MAT DISP B  [ENTER]

      1.36849513056         .136047911528
     -.272095823052         .416159749881
```

There's no problem at all in adapting this simple subprogram for any other HP model which has built-ín matrix operations, such as the HP-15C, HP-41C, and HP42S, to name a few. All you need to know is that, in the previous BASIC code:

- **UBND(A,1)** gives the Upper Bound for the index of the first dimension in matrix A. In our example, this returns 2. Likewise for **UBND(A,2)** which returns the upper bound for the second dimension (2, as well; it's a square matrix).

  This is used just to dimension auxiliar matrix T (term) to have the same dimensions as A (and B), thus no need to pass N (i.e: they are NxN matrices) as an extra parameter to the subprogram.

- **MAT B=IDN** just makes matrix B equal to the identity matrix corresponding to its dimensions.

- **P** is the precision we want. You may use 1E-10 in an HP-15C or HP-41C instead. Also, the smaller the precision, the faster the running time. You might be perfectly happy with 1E-5, say.

- **MAT T=A*T** is a true matrix multiplication, while **MAT T=(1/I)*T** simply divides each element of matrix T by the scalar I.

- **RNORM(T)** return the Row Norm of matrix T, **MAT B=B+T** is a simple matrix addition

And that's all there's to it. Writing the corresponding HP-15C/HP-41C/HP42S program is now quite affordable, and is left as an exercise to the reader ! :-)

Best regards from V.

When do you use e^A

*Message #20 Posted by **Thibaut.be** on 3 Dec 2004, 9:53 a.m.,*
in response to message #16 by Valentin Albillo

Hi Valentin (and everybody else of course),

I find it very instructing to learn a matrix functions that I didn't know.

All my apologizes for being such a pragmatic, but in what applications one uses e^A ?

Re: When do you use e^A

*Message #21 Posted by **Valentin Albillo** on 3 Dec 2004, 10:11 a.m.,*
in response to message #20 by Thibaut.be

Hi, Thibaut:

Thibaut posted:

"I find it very instructing to learn a matrix functions that I didn't know.

All my apologizes for being such a pragmatic, but in what applications one uses e^A ?"

Many, in fact, but the one that instantly comes to my mind is as one of the most elegant (as well as practical) ways of solving a linear system of Ordinary Differential Equations (O.D.E.'s, for short), and of course, such systems do appear absolutely all the time in real-life applications in all fields of science, industry, and economics.

Have a look at this excellent link, for instance.

Best regards from V.

Re: When do you use e^A

*Message #22 Posted by **Patrick** on 3 Dec 2004, 9:56 p.m.,*
in response to message #21 by Valentin Albillo

The same principle which leads to exp(A) leads to sin(A), cos(A), etc. In general, if you've got a convergent Taylor series, you can get a corresponding convergent series when the argument, x, is replaced by a matrix, A.

These functions satisfy certain multivariate differential equations in the same manner as their scalar cousins. Valentin pointed out a link which shows how exp(At) satisfies f' = Af, just like in the scalar case. Pretty neat, if you ask me.

Ah, enlightenment!

*Message #23 Posted by **Karl Schneider** on 3 Dec 2004, 11:36 p.m.,*
in response to message #21 by Valentin Albillo

Thanks again, Valentin, for providing insight and informative links.

I was familiar with the Taylor-series definition of the matrix exponential from a graduate-level linear algebra course, but was unaware until now of any closed-form expression.

Recently, I'd considered writing a program to calculate it on the 42S, but hadn't determined what test to use for convergence.

With no real need to compute e^A on a handheld calculator, I'm content to allow Matlab to handle the chore, if it ever arises.

Calculation with Vandermonde matrix

*Message #24 Posted by **Tizedes Csaba [Hungary]** on 9 Dec 2004, 6:39 a.m.,*
in response to message #20 by Thibaut.be

Hello, I used it in controlling of systems... The real case this was an element of solution differential equations. Here is the Maple version of calculating e^(A*t) simbolically, with Vandermonde-matrix: (I'm not an Maple-guru, sorry...)

If the eigenvalues are not equals, this method works perfectly. If they are same, you must to make new e() "lines": make derivative one of that equation, what contain one of the same eigenvalue...!

Sorry for my terrible english, I cant to say what I want...

Csaba

Re: A program to compute e^A

*Message #25 Posted by **Harry** on 4 Dec 2004, 9:26 a.m.,*
in response to message #16 by Valentin Albillo

Thank you very much Valentin!

Especially for explaning the HP71B syntax afterwards, without that, I would not have been able to understand the Program you wrote.

What I like most about this forum is that most of the people here do not only know a lot about calculators, but also they are very good at mathmatics. Every time I ask a question about how to repair a calculator or how to solve a mathmatical problem with it, I get very good answers. Thanks to all of you!

Best regards, Harry

My Program

*Message #26 Posted by **Harry** on 4 Dec 2004, 3:38 p.m.,*
in response to message #16 by Valentin Albillo

I wrote a program for the HP48 now. What I din'd do so far is to program a stop criteria. I don not quite understand yours, valentin, as I do not know what the "row norm" of a matrix is. Could you or anybody else please explain that?

```
<< DUP IND DUP -> A E S
  << 1 25 FOR I
           A I / 'S' STO* 'E' STO+
         NEXT
     E
  >>
>>
```

Regards, Harry

Sorry, its IDN, not IND of course.

in response to message #26 by Harry

.

HP48/49 RNRM (aka: Row Norm)

*Message #28 Posted by **Vieira, Luiz C. (Brazil)** on 4 Dec 2004, 8:34 p.m.,*
in response to message #26 by Harry

Hi, Harry;

the "row norm" of a matrix is the highest value amongst the sum of the elements of each row. See this:

```
[[1 2 3]
 [7 8 9]
 [4 5 6]]
```

The column with the sum of each row is:

```
[[6]  (=1+2+3)
 [24] (=7+8+9)
 [15]](=4+5+6)
```

And in this case, the row norm is 24. The function that returns the row norm of a matrix is RNRM.

Hope this helps.

Luiz (Brazil)

*Message #30 Posted by **will** on 3 Dec 2004, 4:18 p.m.,*
in response to message #1 by Harry

You will be better served using a CAS software..mathematica 5 does this problem quite well.

Re: e^A where A is a Matrix

*Message #31 Posted by **Scott Guth** on 4 Dec 2004, 1:15 a.m.,*
in response to message #1 by Harry

Hi all!

I hate to say this, and please forgive this devoted HP fan for speaking of the "dark side", but my TI85 could do e^A back in 1992.

My TI89 Titanium can do e^A, ln(A), sin(A), cos(A), arcsin(A), arccos(A), sinh(A), cosh(A), arcsinh(A), arccosh(A) ...

The TI85, TI86, TI89 series, TI92, and TI Voyage are all capable of these.

The only requirement is that the matrix is diagonalizable. The main application for such operations is in solving linear systems of differential equations.

Regards, Scott

Re: e^A where A is a Matrix

*Message #32 Posted by **Rodger Rosenbaum** on 4 Dec 2004, 8:37 a.m.,*
in response to message #31 by Scott Guth

For diagonalizable matrices, the following HP48G program will work well. And in fact it can compute all the things Scott mentioned and MatrixSqrt, too (for those matrices that have a square root, that is). Just put the appropriate function in place of EXP.
<< EGV OBJ-> 0BJ-> DROP ->LIST EXP OBJ-> 1 ->LIST ->ARRY DUP SIZE OBJ-> DROP DIAG-> OVER INV * * >>

I made no attempt to optimize this; I just left everything inline to make it easier to understand. It works on complex matrices, too. And, don't forget, if you use trig functions to do, for example, MatrixSine, put the calculator in radians mode. The HP48G could do this in 1992, or whenever it came out; I forget. It's fun to play with.

Try [[1 2][3 4]] MatrixSqrt, then square the result. Try [[0 1][1 0]] MatrixSqrt.

Re: e^A where A is a Matrix

*Message #33 Posted by **Eddie Shore** on 4 Dec 2004, 9:48 a.m.,*
in response to message #32 by Rodger Rosenbaum

Thank you, Rodger (and everyone else in this wonderful forum). I am surprised to find that the HP does not have functions for square matrices. Ironically the TIs do.

Re: e^A where A is a Matrix

*Message #34 Posted by **Ren** on 6 Dec 2004, 6:05 p.m.,*
in response to message #32 by Rodger Rosenbaum

My College Algebra class (a "100 level" course) just finished a section on Matrices and Determinants. I was going to ask the same question Thibault.be asked regarding "real-world applications of e^A matrices". Unfortunately, the only answer that has been posted is over my head.

If some kind soul would enlighten this HPcalc wannabe as to what is meant by eigenvalue (not mentioned in my textbook) and the term "diagonalize" (does that relate to Identity Matrix?) I would appreciate it.

Thanks

Ren dona nobis pacem

HP 41 Time/PPC Mod operations

*Message #1 Posted by **Derek** on 2 Dec 2004, 2:31 p.m.*

Hi,

I was wondering if someone could tell me an easy way to verify whether or not my modules are working in my HP-41CV. I have a time module with no manual, and PPC ROM.

I'm sure I'll be able to figure out the PPC Rom after reading the manual, but if you know of something obvious please let me know.

Thanks, Derek

Re: HP 41 Time/PPC Mod operations

*Message #2 Posted by **Miki Mihajlovic** on 2 Dec 2004, 3:01 p.m.,*
in response to message #1 by Derek

You can execute CATALOG 2 function which will list all the plug-in modules in your 41CV. However, CV unlike CX, will list all the functions in each module what (with PPC) takes long time and can be confusing. The easy way is to execute TIME function from time module -> [XEQ]{ALPHA]TIME[ALPHA] what should show the time on LCD (probably incorrect since you haven't set it up). From PPC module you can execute any of several hundred functions but the most striking one is DT -> [XEQ][ALPHA]DT[ALPHA]. This will test your LCD display by turning on all of its segments and announciators. To get out of it switch to program mode -> press [PRGM] and press R/S.

Manuals for pretty much everything are available on CDs/DVD from this site, see here.

Which HPs have RPN ?

*Message #1 Posted by **Martin** on 2 Dec 2004, 3:01 a.m.*

Dear List

Can any of you experts provide an overview of: "Which of the HP calcylaturs uses/can use RPN?"

Best Regards Martin

Any specific period in time?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Dec 2004, 4:59 a.m.,*
in response to message #1 by Martin

Hi, Martin;

I'm adding this question because at a certain point, just a few HP calculators since the HP35 were not RPN only. If I am not wrong, only after the Voyagers that HP offered pocket algebraic calculators. If we consider the earlier desktop models (HP9xxx), the initial page at the MoHPC counts the story: 9100A/B and 9810A being first and second generation RPN models, 9830A being also programmable in BASIC (algebraic operation to follow the programming language or vice-versa?), 9805 an algebraic statistics, the HP9815A/B being the third generation RPN and so on.

Except for the "adding machine" HP10 and the wrist watch HP01, all of these "species" are RPN: the Classic models (HP45, 35, 80, 70, 65, etc), Woodstock series (67, 97, 21, 22, 25...), the Spice series (HP31E, 32E, 33E/C, 34C, 37E and 38E/C), the HP41 (all models) and the voyager series (HP10C, 11C, 12C, 15C and 16C).

Some pocket/portable models are not RPN, but I believe they are taken as handheld computers, like the HP75C/D (series 80 portable with LCD), the HP71B and the HP94, being these BASIC machines (although BASIC is a programmable language and not necessarily a keystroke user interface; you can use the HP71 or the HP57 as an algebraic calculator without the need for programming, right?)

Both the HP18C (financial algebraic) and the HP28C (RPN, scientific) introduced the RPL platform, and after these ones we had the Pioneers, with some interesting **algebraic** models, like the scientific models HP20S, HP22S, HP27S (do everything, like its predecessor, the HP27) and financial models like the HP10B, HP14B, HP17B and HP19B. The RPN pioneers are the HP32S, 32SII (with algebraic expression capabilities) and the HP42S.

Although the HP28C/S and the HP48 series allow algebraic expression evaluation, they are essentially RPL models, considered by HP as the evolution from RPN (I bought that idea) while some RPN users do not accept it as truth (I respect them, some points are valid).

There are also the HP38G, 39G and 40G, all algebraicmodels.

Anyway, after these ones, a mix of "RPN/Algebric selectable" models became available: the financial models HP19BII, HP17BII, HP12C Platinum and the scientific models HP33S and the HP49G/G+. These units perform either RPN or algebraic operations as the user wishes to.

Well, I wrote about 90% of this by heart, I read a bit about the desktop series I'm not familiar with and the earlier Pioneer algebraic units, so I accept the possibility of adding wrong, not accurate info and missing some particular model, sorry! If I have the time to correct any existing errors, I'll do that prior to additional posts.

Hope this gives you a glimpse...

Cheers.

Luiz (Brazil)

Edited: 2 Dec 2004, 12:50 p.m.

Re: Any specific period in time?

*Message #3 Posted by **Wlodek Mier-Jedrzejowicz** on 2 Dec 2004, 10:20 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

That's a great summary from Luiz! I'd like to ask exactly what Martin, the original questioner, wants. Plenty of people have listed RPN, algebraic, and mixed models, on their web sites (such as this one), in newsgroup articles, and even in books - naming no names :-)

Does the questioner want to know all the models that _can_ use RPN? In that case, we could add the HP-71B, since the HP-41 emulator module for it adds RPN capabilities, and the HP-75 models, since these could be programmed in Basic to run an RPN calculator program. The FORTH programming language, which uses RPN, is also available for both. On the other hand, the HP-18C and the HP19B have RPL built in, but do not make it available to the casual user - you have to break into their internal software to to use RPL, and hence RPN.

And does Martin include the larger desktop calculators, beginning with the HP9100 models, or only handhelds, when asking about "calculators"?

did i forget any?

*Message #4 Posted by **db(martinez,california)** on 2 Dec 2004, 10:19 p.m.,*
in response to message #1 by Martin

I included RPL but did not figure that the RPN calculators in the 95, 100, & 200 would count. Do they?

Anyway, like luiz said, but in list form:

hp 10c

*Message #5 Posted by **Wlodek Mier-Jedrzejowicz** on 2 Dec 2004, 10:33 p.m.,*
in response to message #4 by db(martinez,california)

Well, I guess you should add the HP48G+ and the HP49G to your otherwise very comprehensive list :-)

Re: did i forget any?

*Message #6 Posted by **db(martinez,california)** on 2 Dec 2004, 11:58 p.m.,*
in response to message #5 by Wlodek Mier-Jedrzejowicz

And so i should. Thanks. BTW: I read that copy of RCL 20 i got from you in San Jose. It was a good read, and will be again in a few years.

Re: did i forget any?

*Message #7 Posted by **Valentin Albillo** on 3 Dec 2004, 4:48 a.m.,*
in response to message #4 by db(martinez,california)

I feel the HP-71B + HP-41C Translator/FORTH ROM would also qualify. Once in 41C mode, you've got pure classical RPN right from the keyboard.

Also, any 48/49 model or other HP calculators *emulating* RPN machines (such as the 41C or 42S) would qualify as well if fitted with the emulator.

Come to think of it, you could compound it further: have a 48/49 model emulating the HP-71B plus HP-41C Translator/FORTH ROM (using, for instance, HP-71X by Hrastprogrammer), and then using RPN in the 41C mode of the emulated HP-71B.

Though this seems overkill, it would run, and as the emulated 71B is 2x faster than the real thing, and the real 71B+Translator ROM is up to 12 times faster than a 41C, you'll end up having RPN at 20-24x the speed of a real 41C, despite one layer of true emulation and another of 'mere' simulation :-)

Best regards from V.

Re: did i forget any?

*Message #8 Posted by **Veli-Pekka Nousiainen** on 3 Dec 2004, 6:19 a.m.,*
in response to message #7 by Valentin Albillo

You could compound it *even* further:
have a Qonos
emulating 49G model
emulating the HP-71B plus HP-41C Translator/FORTH ROM
(using, for instance, HP-71X by Hrastprogrammer),
and then using RPN in the 41C mode
of the emulated HP-71B
in the emulated 49G
*** NOTE: the 49g+ is already an ARM emulating a 49
*** BUT since it has
*** A) not "host" operating system for the user
*** B) only 128K ERAM, not allowing for the 71B ROM
*** It does not qualify (IMO)
[VPN]

Re: Which HPs have RPN ?

*Message #9 Posted by **Martin** on 3 Dec 2004, 5:04 a.m.,*
in response to message #1 by Martin

Thanks to all of you for most comprehensive and details ansvers...

I see now that I could have been more specific in my question.

Story is: I resently discovered that several of my colleges have old HP calculators in their position. Some of them is not used simply because they ran out of power and they can't get that lid open...

I got an old HP21 as a gift, and presently know about a 41CX.

Then I started thinking if I should collect as many as I could. But I don't want them if they don't work (I'll anounce these for give-away in this forum) And I only want them if they are RPN. My fingers refuse othervise.

Therefore I wandered how many, and which, HP calc.s are RPN

Thats all there is to it, but I still appresiate the very nice ansvers.

Best Regards Martin Hvidberg

Re: Which HPs have RPN ?

*Message #10 Posted by **valentino ducati** on 3 Dec 2004, 8:18 a.m.,*
in response to message #9 by Martin

Interesting thread...

@Martin If you really DON'T want a 27S at all; please remember me if you find one in a desk ! It is the only Pioneer algebraic I would buy, but ebay prices are prohibitive.

@all, slightly joking off topic Speaking of emulators with RPN: Do you think a big multiprocessor server with Free42 (or similar) isntalled would count as "RPN calculator"?

:-D

Re: Which HPs have RPN ?

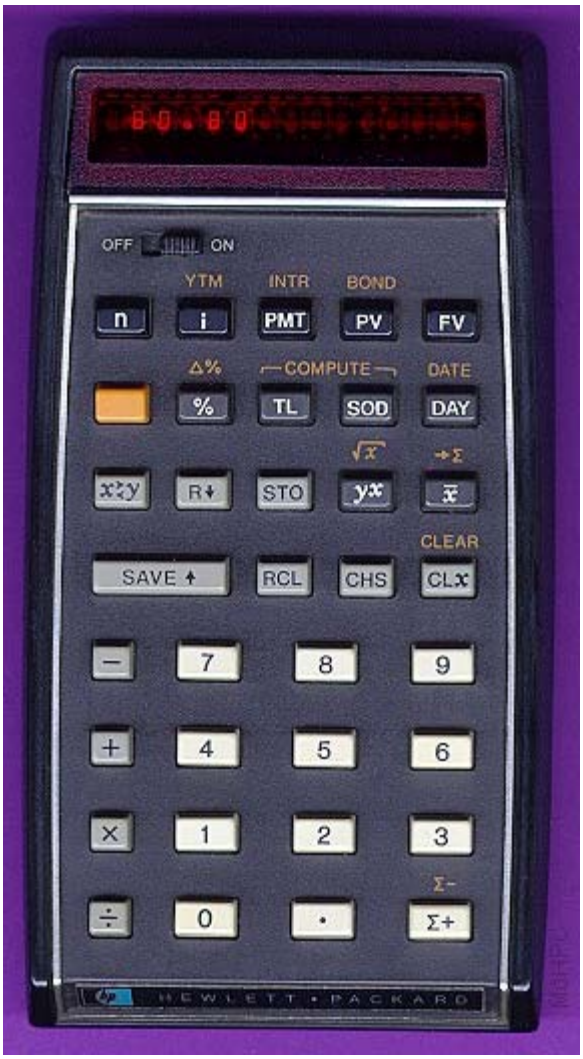
*Message #11 Posted by **Chan Tran** on 3 Dec 2004, 10:57 a.m.,*
in response to message #10 by valentino ducati

Martin if you simply want to know among the calculators at your college are RPN, just look for the big ENTER key.

Re: Which HPs have RPN ?

*Message #12 Posted by **Valentin Albillo** on 3 Dec 2004, 11:10 a.m.,*
in response to message #11 by Chan Tran

... save for the HP-80, which has a big SAVE key instead.



Best regards from V.

Edited: 3 Dec 2004, 11:14 a.m.

Re: Which HPs have RPN ?

*Message #13 Posted by **Dave Shaffer** on 3 Dec 2004, 11:15 a.m.,*
in response to message #11 by Chan Tran

Chan Tran,

Unfortunately, a big ENTER key is NOT proof of RPN status.

I learned this the hard way when I bought a 38G, based only on the picture shown in the eBay offering (and before, sob, I was aware of MoHPC, which would have set me straight!) At that time, I thought HP produced ONLY RPN models.

I then compounded my error by buying a 30S, which also features a (not so large) ENTER key (with a tiny little = sign above it).

I would not be surprised to find out that HP was banking on the fact that us old timers would see the ENTER key and assume that we were getting a RPN model!! Anybody else have thoughts on this? i.e. why didn't they feature prominently the = key, as on all other algebraic calculators?!?!

Re: Which HPs have RPN ?

*Message #14 Posted by **Eddie Shore** on 4 Dec 2004, 9:52 a.m.,*
in response to message #1 by Martin

Of the current models: 48GII, 49G+, 17BII+, 33S. I have all but the 48GII. I use the 49G+ daily. I believe anyone can use RPN (being an RPN convert two years ago)

in response to message #3 by Emmanuel aka xeq41, France

Hi Emmanuel,

good luck, it will be some work to do;-)

It's not only the RAM addresses which are tied to the SX,
there are also some internal ROM calls which are different
between the SX and the GX.

And there *exists* a version of these libraries already converted for the GX.
However these libs only have the RAM addresses converted,
so you won't have too much fun, and FOCAL programs
and some of the menus still won't work.

And no, I don't have this semi-converted version.
I think it was on one of the goodies disks,
maybe there's a suitable link on hpcalc.org...

Regards

Raymond

ROW- behaves differently in the HP49G

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 1 Dec 2004, 6:25 a.m.*

Hi, all RPL users and programmers;

as it's been mentioned here from time to time, I am aware of the fact that there are altready other specific forums to debate HP48G and HP49G related subjects, but I'd like to ask you please to consider the fact that most of the minds visiting the MoHPC Forum behave so gently and politely that I feel sort of "compelled" to post here. Can you forgive me?

Maybe this is something you already know, and I must confess I saw this particular different behavior when I got my HP49G a couple of years ago, but I did not took it so seriously at that time.

Consider a matrix with a single line, even a single element, and try removing this line with ROW- by using an HP48G. A 'Invalid Dimension' error is generated and no element is extracted. A different approach, that I consider a better behavior, is observed in the HP49G/G+. The single element is removed and an empty matrix is returned to level 1. Try this:

```
[[2]] 1 ROW-
```

The HP48G returns a Invalid Dimension, and the HP49G returns:

```
2: []
1: [2]
```

I'd like to hear from you about this (if privately, please be my guest: lcvieira at quantica dot com dot br): what do you think? Based on what I saw, in some circumstances it's necessary to add error traps to avoid problems in the HP48G, while in the HP49G the action is taken naturally.

Cheers.

Luiz (Brazil)

Re: ROW- behaves differently in the HP49G

*Message #2 Posted by **James M. Prange** on 1 Dec 2004, 8:30 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Interesting. Note that it works that way only with a symbolic (type 29.) matrix, not with a real (type 3) or complex (type 4) matrix.

Also note that it won't accept an empty matrix [] or [[]] from the command line.

If I run SIZE on the resulting [], then it returns { 0. 0. }. Shouldn't it return just { 0. }?

Somehow, the idea of an array with 0 rows or 0 columns seems rather strange to me.

Regards,
James

Re: ROW- behaves differently in the HP49G

*Message #3 Posted by **Valentin Albillo** on 1 Dec 2004, 10:12 a.m.,*
in response to message #2 by James M. Prange

Hi, James:

James M. Prange posted: *"Somehow, the idea of an array with 0 rows or 0 columns seems rather strange to me."*

It has its uses, and the idea of such arrays goes back to the times of the HP-85, if not further. As you may know, there was a Matrix ROM for the HP-85, from which the best algorithms were incorporated into the HP-71B Math ROM, from which the best code was adapted for such machines as the HP-42S and the 48/49 models.

See what the HP-85 Matrix ROM manual has to say about these "empty" arrays (HP-85 Matrix ROM Owner's Handbook, page 46):

```
"Arrays with zero rows or zero columns can be considered
 to be "empty", since they contain no elements [...]
 Empty arrays can be specified in subsequent statements
 and functions with meaningful results [...]
 The following situations are of particular interest: [...]

 For example, if the operand array has been redimensioned
 to be 0x3, the statement MAT A=B would redimension the
 result array to be 0x3, while the statement MAT A=TRN(B)
 would redimension the result array to be 3x0

 The matrix multiplication statement, if both operand
 arrays are empty, can yield a result array that is *not*
 empty [...]

 For example, if matrix B has been redimensioned to be
 3x0, and matrix C has been redimensioned to be 0x1,
 the statement MAT A=B*C redimensions matrix A to be
 (3x0)x(0x1) = 3x1. The result array is not empty, since
 neither the number of rows nor the number of columns is
 zero"
```

So you see, it seems you can matrix multiply a, say, 5x0 empty matrix and a 0x5 empty matrix and get a 5x5 non-empty matrix ! :-)

The Matrix ROM Owner's Handbook discusses the topic further and gives an example where this behavior is advantageous. I don't know (but mostly doubt) if the 48/49 models do allow for such operations on empty arrays, so perhaps this useful and advanced feature was lost in the way.

Best regards from V.

Personal Triumph

*Message #1 Posted by **Ed Look** on 30 Nov 2004, 10:40 p.m.*

Heh. Not much, really, but to me it is!

I needed some basic quick functions to do simple average, median, etc. and a PC is not always available, so I beat my head against the HP 48G AUR for many weeks and wrote some programs to do those things on the 48G+. But the G+ is home and the G is the one carried. Bummer. Ah! Thank God for IR!

Then, I needed another cheap quickie to do some light crunching of some data. I just received my exchanged 49G+ with better keyboard, and am really excited by it all. So I bumble my way around the programming functions of the 49G+ and write the darn thing. Of course, I cheated- I relied on the good ol' 48G AUR again. (I gave up trying to read the 49G+'s own online; I prefer to read a bound paper copy much, much more than on a glowing screen, any day!) The little program did great at home, as I won't bring the 49G+ to work... but I need the prog there, too!

Wait, genius, if you relied on the 48G AUR, IT MUST RUN ON THOSE CALCS, TOO! Crap. It's on the 49G+. Whoa! Each one of these babies has its own umbilical! And PCs these days still retain one serial port whereby a 48G cable can plug, and lots of USBs whereby a 49G+ can plug!

Running both Conn 4x and HPComm, I was able to, given more than several minutes, as this process seems a tad slow, transfer from 49G+ via cable to PC... and then from PC to 48 G, which then beamed via infrared to the G+!

And much thanks to James M. Prange, who pointed out to me with simplicity and clarity how to handle calc files on the PC and troubleshoot HP calc to PC communication and connection problems.

Okay. I know, ho-hum. But for me, this is a biggie! (I'm still slightly buzzing about it!)

*Message #2 Posted by **Eddie Shore** on 30 Nov 2004, 11:02 p.m.,*
in response to message #1 by Ed Look

Where would we be without having our trusty HP calcualtors around? (High Five)

Yes, getting the PC to work with the HP49G+ is a challenge for me at times also.

Re: Personal Triumph

*Message #3 Posted by **James M. Prange** on 1 Dec 2004, 5:55 a.m.,*
in response to message #1 by Ed Look

You're welcome.

Note that the cable that comes with the 49G can connect it directly to the 48 series using the adapter, as well as another 49G without the adapter. If you have two adapters, you can use it to connect two 48 series. Other than that, it's not at all difficult to make a cable to connect two 48 series. IR is okay for small transfers, but it's 2400 bps only (as built-in). Of course, for the 49g+, you pretty well have to use your PC as a go-between for

anything except a connection to another IrDA device.

Of course, if you want the programs to run on both the 49 series and the 48 series, then rely on the 48 series documentation. As long as you stick to 48 series compatible commands, you can write the programs on the 49 series and transfer them (in a round-about way, in the case of the 49g+) to the 48 series. The 49 series keyboards and menu layouts are flawed, but they have the advantages that the cursor movement keys are independent of the alpha keys, scrolling is much faster, the editor has search and search & replace, copy/cut/paste, you have the SREPL command built-in, and so on.

But for larger programs, I usually write them in a text editor on the PC and transfer them to the calculator for debugging and use.

I'll also point out that the 49g+'s command set seems to be identical to the 49G's, exceptions being if you get down to programming the underlying Kinpo operating system for the ARM processor, and maybe in a few cases, SysRPL commands. Other differences are the screen dimensions, RedEye to the printers, IrDA and USB instead of (3-wire) RS-232 compatible, the memory available (including in the ports), and the MMC/SD card.

Anyway, fotr the 49g+, download the 49G Advanced User's guide, available at http://www.hpcalc.org/search.php?query=Advanced+Guide&hp49=1 Note that the "CAS commands" and "other commands" are listed separately. A few commands were added after the guide was published; these can be found under the "What's New from Release..." notes at http://etud.epita.fr/~avenar_j/hp/49.html

For information on the system flags and reserved variables, see Federico's submissions at http://www.hpcalc.org/search.php?query=Federico&hp49=1&author=1

It was kind of a pain printing it all out, but using my good old Epson dot-matrix impact printer with re-inked ribbons, not very expensive. Of course, it's black on white only (no colors), but for a user's guide, who needs color?

Regards,
James

*Message #4 Posted by **Ed Look** on 3 Dec 2004, 12:07 p.m.,*
in response to message #3 by James M. Prange

James,

I was not aware of an adaptor that would connect a 49G+ to a 48G!

Do you know the model number and/or where it can be obtained?

Fascinating news (to me, at least)!

Re: Personal Triumph

*Message #6 Posted by **Ed Look** on 3 Dec 2004, 9:29 p.m.,*
in response to message #5 by Veli-Pekka Nousiainen

Hi, there, Veli-Pekka! This one made me laugh.

It must be the world's most expensive and unwieldy "adaptor"!

I have an old fashioned HP49G (no +) emulator, I downloaded a long time ago from HP when they were trying to advertise the coming of the "new" 49G.

But I'd rather hook up cables than use the emulator. Adaptor it is!

Re: Personal Triumph

*Message #7 Posted by **James M. Prange** on 4 Dec 2004, 8:16 p.m.,*
in response to message #4 by Ed Look

No, not an adapter to hook up a 49g+ to any 48 series, or even (via wire) another 49g+, a 49G, or a 48gII. As far as I know, the 49g+ can connect only to a USB host (PC, Mac, etc.), or another IrDA device (including another 49g+, and presumably a 48gII). Note that it can't connect to any other USB device either. Also note that the 48 series' "Serial IR" doesn't work with the 49g+'s IrDA. Of course the 49g+ can also send to a RedEye printer, such as the 82240A and 82240B, and some Martel Instruments models, although the range is greatly reduced from what the 48 series could use. Note that INPRT on a 48 series isn't able to capture the 49g+'s RedEye printing signal either.

A few people have been writing about making the 49g+'s USB host port able to also function as a USB device port, but I don't know whether they'll ever succeed. Another idea is to use the SD card port for communications, but again, that's still just an idea (as far as I know).

The adapter that I meant (HP part #F1633-66001) is for connecting the 49G (not 49g+) 10-pin to 10-pin cable (HP part# F1633-66000) to a 48 series calculator; both of these came with my 49G. The cable connects two 49Gs, or with the adapter, a 49G to a 48. Later 49Gs also came with an adapter (HP part# F1906-66000) from the 10-pin cable to a DB-9 connector, and perhaps a longer cable (HP part# F1633-66050).

Another of these adapters plus a 10-pin to DB-9 cable (HP part# F1897-66000) came with the free ROM upgrade package for my 49G. With the adpater, this cable also works with a 48 series.

The 10-pin to 10-pin cable with an adapter on each end is convenient for connecting two 48 series via wire.

By the way, my F1633-66000 cable is about 28 inches (0.7 metre) long. If someone has a 10-pin to 10-pin F1633-66050 cable, I'm curious as to how long it really is. My thinking is that they probably would have made it about the same length as the F1897-66000 cable, about 60 inches (1.5 metre).

There are also adapters that allow connecting a 4-pin 48 series cable to the 49G's 10 pin connection, but I don't have one of those.

See Joe Horn's Cable Table for more information on "Genuine HP" cables and connectors for these calculators.

hpcalc.org probably has instuctions for making your own cables, but adapting whatever cables you already have or making a new one shouldn't be difficult; only four wires are involved. Basically you

want the Signal Ground pins on the calculators connected, the Transmit Data pin on each calculator connected to the Receive Data pin on the other, and the cable's Shield connected to the Shield pin on one or both calculators. DC ground loops aren't a problem because the shield pin on the calculator is isolated from the calculator's ground by a capacitor. I expect that leaving the cable's shield completely disconnected would still work in most cases.

In case anyone is wondering about the 49G having a 10-pin connection instead of the 4-pin connection, the extra pins are intended for connection to an overhead projector display. These used a card slot on the 48 series, but of course the 49G lacks any card slot, so the signals are on the extra pins on the port. These extra pins aren't used for RS-232 compatible connections.

Whether there'll be an overhead projector for the 49g+, I don't know. Both HPComm and Conn4x can do "screen captures" (using PRLCD), which, together with a projector for a PC, have some of the functionality of the overhead projector accessories. It seems to me that it would be simple enough to write a 49g+ program that would do a PRLCD every time that the calculator finished what it was doing and was ready to take another keystroke. Offhand, vectored ENTER comes to mind. Now, if someone were to write a program for a PC that would watch for these to arrive at the USB port and automatically project them, that would add some more functionality.

Note that with XModem Server, Conn4x can operate the calculator remotely, much like using a Kermit remote host command with the calculator in Kermit server mode. The remote stack display in Conn4x is text only with optionally the character translations.

I suppose that someone who knows what he's doing could write a program for the computer to pass information between a USB port and a COM port, or between any two ports, for that matter. Maybe someone's already done this. But for transferring between calculators, I just use my PC as a place to store files received from one calculator before sending them to another calculator.

Note that I can open two separate instance of Conn4x, with one connected to a 48GX and the other connected to the 49g+ for example, and then just drag and drop (or copy and paste) between the two windows. Of course the variables have to be compatible without editing, so transfers between a 49 and a 48 have to be "text" mode, at the least. This also leaves a copy of the file in my Windows %temp% directory.

A similar technique with HPComm, or perhaps one instance of HPComm and one of Conn4x, might work, but I haven't tried it.

Regards,
James

Weak printing HP97 printer

*Message #1 Posted by **Ronald** on 30 Nov 2004, 4:13 p.m.*

Hello,

I have a HP 97 who is printing quite dim. The printed characters are evenly dim, so not there is not one element of the head defective as far as my logic goes. I have cleaned the printer, cleaned and checked the presure plate, clened the printing head and still it stays quite dim. I tried paper from the same roll in another 97 I have but there the letters are full and bright, so it is not old paper. The circuit board is the second revision (where also the connections are for the external pod of the HP97 I/O model)

Any suggestion for further exploration/repairing ?

Thanks

Ronald

Re: Weak printing HP97 printer

*Message #2 Posted by **Randy** on 30 Nov 2004, 7:52 p.m.,*
in response to message #1 by Ronald

Start with the sometimes not so obvious: a new battery and fresh paper.

Chances are it's one or both at fault.

Re: Weak printing HP97 printer

*Message #3 Posted by **Ronald** on 1 Dec 2004, 11:43 a.m.,*
in response to message #2 by Randy

Hi Randy,

That is what I did, I used the paper from my other HP97 and his battery. It prints on that machine very dark blue, then I switch to the other HP 97 the battery and the paper and then it is very light.

Ronald

Re: Weak printing HP97 printer

*Message #4 Posted by **Katie** on 1 Dec 2004, 12:25 p.m.,*
in response to message #3 by Ronald

There's a fixed resistor (R8) on the printer driver board that governs the current sent to the print head. You can change it to a higher value and the print will darken. See the note in the 97 service manual page 4-19/20.

I've done this a few times to different 97's and it works fine.

Re: Weak printing HP97 printer

*Message #5 Posted by **Ronald** on 1 Dec 2004, 4:55 p.m.,*
in response to message #4 by Katie

Hi Katie,

I will give it a try tomorrow evening. To be honest I did not know I had the service manual. I have the DVD, but I missed this guide.

Ronald

Re: Weak printing HP97 printer

*Message #6 Posted by **Ronald** on 2 Dec 2004, 4:43 p.m.,*
in response to message #4 by Katie

Hi Katie,

I changed R8 and now it is printing like new !

Thank you

Ronald

Re: Weak printing HP97 printer

*Message #7 Posted by **Katie** on 2 Dec 2004, 5:45 p.m.,*
in response to message #6 by Ronald

Ronald,

Glad I could help. I suspect that the printhead loses efficiency over time and requires more current to print well. No doubt that this was the reason for the note in the service manual as well as both your experience and mine.

-Katie

Re: Weak printing HP97 printer

*Message #8 Posted by **David Smith** on 1 Dec 2004, 4:26 p.m.,*
in response to message #3 by Ronald

Go to your local office supply store and buy some modern paper. It may save you some resistor surgery on your machine. Pretty much ALL the old HP paper has gone stale by now. It may work in some machines, but not all of them.

Re: Weak printing HP97 printer

*Message #9 Posted by **Ronald** on 1 Dec 2004, 4:58 p.m.,*
in response to message #8 by David Smith

Hi David,

The printer is at this moment lying in 25 pieces on my desk for final assembly after cleaning/lubricating so accesing the resistor is not a problem.

I will however also try some new paper to see how it compares to what I have from the old days.

Thank you

Ronald

Dust removal - Voyagers

*Message #1 Posted by **Margaret** on 30 Nov 2004, 10:35 a.m.*

Hello,

Does somebody know how I can have my 12C cleaned up? The LCD has some dust inside, and would like to have it cleaned. Please share the info! Greetings,

Re: Dust removal - Voyagers

*Message #2 Posted by **Nick** on 30 Nov 2004, 1:23 p.m.,*
in response to message #1 by Margaret

I have the same problem with a 32s that I'd like to clean up. Happy Holidays!

*Message #3 Posted by **Will** on 30 Nov 2004, 2:24 p.m.,*
in response to message #2 by Nick

I am also in the list....i have a 11c which has the same problem...

Re: Dust removal - Voyagers

*Message #4 Posted by **Garth Wilson** on 30 Nov 2004, 6:07 p.m.,*
in response to message #1 by Margaret

I can't tell you how to clean it up, but will suggest that for preventative maintenance (or actually just handling) after the clean-up or for other units, when you lay it down on the desk between uses, just put it face down on its soft case to keep the dust from entering the unit through the keyboard. I've always done this since my 41 and 71 were new, and have no dust in the display areas or around the keys. If you do see some dust around the keys, hold the unit up side down and use something like a small, soft, clean paint brush to get it out before it works its way to the calc's innards.

Re: Dust removal - Voyagers

*Message #5 Posted by **Randy** on 30 Nov 2004, 7:49 p.m.,*
in response to message #4 by Garth Wilson

Dust enters a Voyager around the seams in the case halves, not the keyboard which is sealed with a rubber gasket.

Using a very small flat screwdriver, lift the four rubber feet off the bottom. Remove the four screws (probably #0 Phillips but may be torx T6) and lift the case back off. Remove the two very small ESD springs from the top left and bottom right sides, they are inside a small molded tube. The longer one lives next to the battery holder.

You'll see one of two version units. The early units have the logic module encased in black plastic anti-static film. The later units present a bare pc board. The early units can be disassembled a bit further by removing the logic module and you'll have access to the window and lcd to clean with canned air and some glass cleaner. Don't rub hard on the lcd, the polarizer is soft and scratches easily.

The later one board models - are tougher. You can blast with canned air around the lcd to remove dirt specs. If you have any stubborn specs, use a strip of coated slippery paper (the backing paper from a label works well) to slide down from the top and dislodge the stubborn bits. Again, the polarizer is soft so be careful.

Once clean, pop the springs back in, cover on and stick the feet back on. Should be good for another 20 years.

Pioneers with that nasty lcd cover - shoot the canned air in the side seams of the case. You can also try in the battery compartment directed down the two metal contacts as the case is open to the lcd in that area. With patience, you can slip a piece of coated paper in from the side if you have nasty hangers on.

The final solution: several cycles through an ultrasonic cleaner takes care of all dirt if you have one handy.

Re: Dust removal - Voyagers

*Message #6 Posted by **Ronald** on 1 Dec 2004, 11:46 a.m.,*
in response to message #5 by Randy

Hi,

You mention a sonic cleaner. Do you mean emerge to total, not taken apart, machine in the cleaning fluid ?

What fluid do you use, demineralised water or also some additions to it ?

Thank you

Ronald

Re: Dust removal - Voyagers

*Message #7 Posted by **Randy** on 1 Dec 2004, 8:34 p.m.,*
in response to message #6 by Ronald

It is best to clean Voyagers with the back off.

Pioneers and 48's clean up fine with the battery doors off but take a bit longer to dry since it is harder to get all the water out once clean.

I use a mild citric cleaner made by the u/s manufacturer followed by a rinse in distilled water.

Re: Dust removal - Voyagers

*Message #8 Posted by **Ronald** on 3 Dec 2004, 4:24 a.m.,*
in response to message #7 by Randy

Hi Randy,

One more question to set my mind at ease cleaning when needed: The LCD display was in the macine when you cleaned it, no problems with fluid leaking in the display itself ?

Thank you

Ronald

Re: Dust removal - Voyagers

*Message #9 Posted by **Randy** on 4 Dec 2004, 9:12 a.m.,*
in response to message #8 by Ronald

Let's just say that if the display is intact, you should have no problems.

If it shows any sign of black spots, rainbow effects or has had lots of rough treatment, you may rupture the display.

Re: Dust removal - Voyagers

Series 80 Programmable ROM module clone - update

*Message #1 Posted by **John** on 29 Nov 2004, 7:59 p.m.*

Hi,

As announced earlier I have been in contact with a fellow HP-85 fan who has made a working prototype clone of the HP-85/87 Programmable ROM Module.

Here is a photo of the prototype board, note this has to be connected to a standard ROM Module, the final version will plug directly into the Series 80 expansion port:

http://www.vintagecomputers.freeserve.co.uk/hp80/pics/prmclone.jpg

For comparison, here is the inside of the original HP module:
http://www.vintagecomputers.freeserve.co.uk/hp80/pics/progrom1.jpg

More details to follow!

Regards, John

Re: Series 80 Programmable ROM module clone - update

*Message #2 Posted by **Olivier De Smet** on 30 Nov 2004, 11:50 a.m.,*
in response to message #1 by John

Hi,

Very good news. Sound very nice. But I have some questions.

Is this ROM module the same for an HP85 and HP86/87 ?

Is the limit of 6 roms still here ? (for an HP86, the software allows up to 15 ROMs, counting the included ones, see the HP86 emulator I send to some people)

Olivier

Re: Series 80 Programmable ROM module clone - update

*Message #3 Posted by **john** on 30 Nov 2004, 4:39 p.m.,*
in response to message #2 by Olivier De Smet

Hi Olivier,

I don't think there is a limit of 6 ROMs, for example I can run a ROM Module with 6 ROMs plus a Prog ROM Module with 2 more ROMs. I havn't tried running two ROM modules on one machine - is this dangerous?

The designer of the clone module is thinking of extending it to use larger EPROMs (say 27256) with multiple ROM images loaded (eg 4) concurrently. This would require only a bit of extra logic (he is planning on using PLAs or similar) plus an extra 8-way DIL switch per 'ROM'.

BTW your emulator is now on the web at Andre Kopel's site:

http://www2.akso.de/files/series_80/

Not pretty but functional (his web site not your emulator!)

Regards, John

Re: Series 80 Programmable ROM module clone - update

*Message #4 Posted by **Olivier De Smet** on 1 Dec 2004, 5:05 a.m.,*
in response to message #3 by john

I think the limit is that you can only use 1 ROM module (written somewhere in the manual I think) due to electrical decoding of lines over the bus.

You can then add 2 roms with a Programmable rom module.

You can have 5 included roms in an HP86B.

So a max of 13 roms and a software limit of 15 or 16 (have to look at the system sources).

In fact the REAL HARD part is the connection of this module to the specific HP8x bus. Then you need to decode the IO adress to select the current rom. After that, the number of rom allowed is just a eeprom capacity limit (and a software one).

Perhaps creating a new ROM expansion module could be easier that mapping the rom module pins.

André Koppel has some nice pdf for a 'system' view of the HP 8x series.

Olivier

Re: Series 80 Programmable ROM module clone - update

*Message #5 Posted by **John** on 30 Nov 2004, 4:48 p.m.,*
in response to message #2 by Olivier De Smet

and yes the module is the same for the HP-85 and HP-87 families, as are the Prog ROM Module, the ROM Drawer and every other module I know of except memory modules and the CP/M / Aux Processor module.

If this module becomes common then it will open up the Series 80 quite a bit, the main benefits being support for a wide range of HP floppy drives and the Assembler.

There is another project I have seen mention of, which is to clone a disk drive eg use a PC as a mass sotrage device, but I think this is in the concept phase. My thoughts would be to run an HP-IB card on a PC, and then emulate an Amigo drive in software but then this would cost as much as a SS-80 drive would anyway. Perhaps some bright person can work out a way to go straight from the Series 80 bus to USB!

Regards, John

Data translation 80 Emulators to...

*Message #6 Posted by **chris** on 2 Dec 2004, 6:48 p.m.,*
in response to message #5 by John

And what happen if you use a unix computer with the C like a assembler or emulated it like 80 series?? ???? to make what ? data translation. . I would like to speak with for example very super guys who concept a computer... by HP only HP The names are Thomas A Pearo the man who make a click with his eye on a HP review speeking about the clever team who has create a computer which could do the job. It s because they are all five or six the hp 80 s + DOS or OS and WINDOWS specialists and multitasking !!!! on a portable HP yes HP computer and in the year.... 1985 .yes sirs a large time before the all all other like big ...hum i don t say more about the OTHER..... It s my opinion I d ont like the OTHERS So the last thing I know is there were selled 17 computers in France.I know were there are 2 of them.And another one is in germany. Finally if Thomas a Pearo from HP in the past or the beared man who has managed the project or the other like the specialist from polarized screens for this computer could give information thru it could be cool....they have the Knowledge!!!for this inthe past big today future machine.yes Sirs on one screen two programms running simultaneously .the one plots the curves the other displays the computing datas relating the plotting!!!at the same time.Time sharing on a portable in the year 1985!!!! Incredible but it do the job.with.....Windows Question when the Other bring the Window concept?? Many years AFTER.....HP HP FIRST !

in response to message #7 by Vassilis Prevelakis

Dear vassili I red many of your forum and investments in helping other 80 s users..your have big knowledge. Now for the double screen time sharing with the 68000 you load two time the system and you run with the screen adjustment like a splitting in 123 lotus.if you run both you have the result the hp IPC yes that s the before talken system.. do the job.the only one condition . load two time the programming language and run one text and data two the plotting and start both. Do you have one form 80 s machines or IPC I m looking for the M68000 assembler i lost the book and i can t remenber a 220 page book all over!!!!!plus other books on IPC or a serial card for IPC!!!Thank for help

Carry Flag

*Message #1 Posted by **flexten** on 29 Nov 2004, 11:19 a.m.*

Anyone here understand the carry flag in HP41C ? The carry flag is actually two flags! The process of the carry flag is automatic with every fetch. The CPU cannot overburden every possible instruction with overhead. The NULL instruction does nothing to the carry flag! Here is one possible method to implement carry:

C= carry flag

A= "carry was set flag" = Aux carry

At every fetch the fetch process does this automatically, it has nothing to do with the particular function being loaded:

1: clear the "carry was set flag" (A)

2: swap the carry flag with the A flag.

That's it, and it's automatic.

Re: Carry Flag

in response to message #1 by Mike (Stgt)

Thanks - but I'm not sure Dave will approve of this use of the Forum. Anyway, the meeting of HP enthusiasts in Allschwil was excellent - a pity more people from around Europe did not come! After all, people from all round the US, and beyond, come to the annual HHC meetings. Just a reminder that Chicago, next September, will be the next one, in case anyone wants to start making plans to come!

in response to message #2 by Wlodek Mier-Jedrzejowicz

Dear Sir, most repected Esquire,

I re-read the terms of use and could not find a violation of the rules. Anyway I changed the immediate pop-up of the photo to a link where you may find it (what makes not realy a difference from my point of view).

The Allschwil meeting showed again that there still are enthusiasts, and for several reasons not all could join. It does not help that I too feel sad about that. But Chicago is waaaaay too far away for me as hobbyist.

Best, Mike

Re: Allschwil postprocessing

*Message #5 Posted by **Wlodek Mier-Jedrzejowicz** on 1 Dec 2004, 11:17 p.m.,*
in response to message #4 by Mike (Stgt)

Thanks for the follow-ups on this. It is unavoidable that some people can not come - but a pity just the same. Thanks to everyone who did come and made it so interesting - some fascinating new hardware was shown - and some of us hobbyists spend masses of money on adding to their collections - while others spend money on travelling to meetings. Chacun a son gout!

Re: Allschwil postprocessing

*Message #6 Posted by **Mike (Stgt)** on 3 Dec 2004, 9:22 a.m.,*
in response to message #5 by Wlodek Mier-Jedrzejowicz

Quite possible that next year I will have no spare cash for both, neither collecting nor meetings. Anybody here who needs a "Big Blue"-dinosaur who did an HP-41-emulator on VM/ESA with FORTRAN, REXX, PIPEing?

Ciao.....Mike

HP 48g11 Ascii transfer to PC

*Message #1 Posted by **Stuart Sprott** on 29 Nov 2004, 6:34 a.m.*

Hi,

As far as I can see you can only transfer data from the HP to a PC in binary form. It would be handy to be able to transfer in Ascii also. In Ascii you can can read it and numerical data can be used in PC programs such Excel.

I know you can do the above on a HP 48GX. Is there any way around this problem ?

Re: HP 48g11 Ascii transfer to PC

*Message #2 Posted by **Ed Look** on 29 Nov 2004, 12:02 p.m.,*
in response to message #1 by Stuart Sprott

I believe the 48GII is similar enough to the 49G+, and someone correct me for Mr. Sprott's sake if I'm wrong, but if you shift (right, I think) and choose I/O, you can set the calculator to transfer in ASCII mode. It should be a choice on one of the "choose boxes" within the I/O menu.

Re: HP 48g11 Ascii transfer to PC

*Message #3 Posted by **James M. Prange** on 30 Nov 2004, 2:19 a.m.,*
in response to message #2 by Ed Look

I don't a 48gII, but I guess that it's similar to the 49G and 49g+.

If using HPComm (or any other Kermit-based application), then yes, use an ASCII transfer, either by choosing it in an input form or by clearing flag -35. HPComm is available here.

If using Conn4x, be sure to use the current build, available here, and use a "text" transfer, chosen in Conn4x itself. Conn4x doesn't use flag -35.

Regards,
James

HP49G+: Nested Menus

*Message #1 Posted by **Eddie Shore** on 28 Nov 2004, 3:59 p.m.*

How can I program nested soft menus?

i.e.

MATH ALG LIST...

Pressing MATH gives a submenu GAMMA BETA DBLFACT... Pressing ALG gives submenu RISINGFACT SQWAVE SIMULT... Pressing LIST gives submenu MAKELIST APPLYHP... and so on

I tried nested TMENU commands and had no success. Thanks in advance!

Re: HP49G+: Nested Menus

*Message #2 Posted by **Tim Wessman** on 28 Nov 2004, 10:30 p.m.,*
in response to message #1 by Eddie Shore

{ { NEST << { MENU1 MENU2 ... } TMENU >> } ... }

That should work. (didn't check though)

Re: HP49G+: Nested Menus

*Message #3 Posted by **Eddie Shore** on 29 Nov 2004, 9:47 p.m.,*
in response to message #2 by Tim Wessman

I tried

{{ TRIG << {SIN COS TAN} TMENU>> }} TMENU

and when I press TRIG, {SIN COS TAN} comes to the stack.

I'll have to try some way to manipulate this to get nested menus to work (will I have to resort to SysRPL?)

Re: HP49G+: Nested Menus

*Message #4 Posted by **Tim Wessman** on 30 Nov 2004, 1:11 a.m.,*
in response to message #3 by Eddie Shore

Of course. I wasn't thinking. The menu structure in the 48 series needs a small sysRPL command named TakeOver to run the menu context. If you have emacs/jazz isntalled, this is quite easy to do.

However, you can also use Wolfgang's program Keyman. One of the commands is ->TO or something similar. This appends this sysRPL command to the a program. Then you can build the list on the stack and it will work.

You won't see TakeOver in the program wafter running ->TO, but it is there. So you'll need { { TRIG << *(TakeOver)* { SIN COS TAN } TMENU >> } } and that will work.

Re: HP49G+: Nested Menus

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 30 Nov 2004, 1:14 a.m.,*
in response to message #3 by Eddie Shore

Hi, Eddie;

I know the approach I'm showing here looks more like a cheating than a solution (in fact, it IS a cheating) but it works as it is a submenu. If what you want is the functionality instead of an actual submenu structure, this works. I based this sort of construction in the HP42S suggestion for submenu available in the HP42S Owner's Manual, when a program creates submenus for names of the month (or smething like this).I used this approach in some programs with a softmenu that "calls" another menu.

Try this:

```
MAIN
«
 {
  {"TXT1"«PROG1»}
  {"TXT2"«PROG2»}
  {"TXT3"«PROG3»}
  ""
  {"GO 1"«MEN1»}
  {"GO 2"«MEN2»}
 } TMENU
»

MEN1
«
 {
  {"TXT4" «PROG4»}
  {"TXT5" «PROG5»}
  {"TXT6" «PROG6»}
  {"TXT7" «PROG7»}
  ""
  {"BACK" «MAIN»}
 } TMENU
»

MEN2
«
 {
  {"TXT8" «PROG8»}
  {"TXT9" «PROG9»}
  {"TXTA" «PROGA»}
  {"TXTB" «PROGB»}
  ""
  {"BACK" «MAIN»}
 } TMENU
»
```

After executing [MAIN] you'l see:

```
[TXT1] [TXT2] [TXT3] [    ]  [GO 1] [GO 2]
```

If you press either [GO 1] or [GO 2] you'll see each corresponding "submenu" with a rightmost [BACK] softkey that will bring the MAIN menu back. Either [GO 1] or [GO 2] surelly accept nesting structures like this one.

Hope this "cheating" gives you a chance of doing something closer to what you want. I'm shure the compiled SysRPL version will do the trick, but I'd like knowing if there is actually some sort of submenu nesting capabilities inside the HP48 O.S.

Cheers.

Luiz (Brazil)

Edited: 30 Nov 2004, 1:16 a.m.

Re: HP49G+: Nested Menus

*Message #6 Posted by **Eddie Shore** on 30 Nov 2004, 11:06 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Why did I think of that, Luiz? LOL Your method looks very practical to me, light years away from cheating.

I would like to try Tim's command as well.

Thanks to you both.

Re: HP49G+: Nested Menus from CST

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 1 Dec 2004, 1:28 a.m.,*
in response to message #6 by Eddie Shore

Hi, Eddie;

thanks for your comments. I'm glad for my suggestion being handy. Great!

Now there's another possibility if you don't care using CST menu with actually nested temporary menus. Try this:

```
TEST
«
 {
  { "OPT"
   «
    {
     { "YES" « "YES IS CHOSEN" 3 DISP 3 FREEZE 1 MENU » }
     ""       ; blank softkey
     ""       ; blank softkey
     ""       ; blank softkey
     ""       ; blank softkey
     { "NO"  « "BAD CHOICE..." 3 DISP 3 FREEZE 1 MENU » }
    } TMENU CLLCD " SELECT AN OPTION" 3 DISP 3 FREEZE
   »
  }
  ""       ; blank softkey
  ""       ; blank softkey
  { "PRG1" « "PROGRAM ONE OK" 3 DISP 3 FREEZE » }
  ""       ; blank softkey
  { "PRG2" "JUST A STRING" }
 }'CST' STO 1 MENU
»
```

The "nested-like" structure is just for clarity (I hope...). All "3 DISP 3 FREEZE" are there as support so the example returns visual results.

In this case, all options are in the same object (in previous example there were three programs). The CST menu accepts temporary menus contained in programs (I guess the TMENU allows this as well, I did not check for). the actual "trick" (another cheat, perhaps... Shame on me!) is the use of ***1 MENU*** to call CST menu back after running TMENU options. If you load it and runn, you'll see that it produces the submenu effect as well. The biggest enhancement is the use of a single object, as I already mentioned, instead of many.

That's why I like programming RPL: it allows so many options we can't imagine. I'll dare going deep in SYSRPL soon, but I think I did not even touch UserRPL possibilities. I'm still finding UserRPl new possibilities as I'm going further.

Best regards.

Luiz (Brazil)

HP 9815A or 9815S?

*Message #1 Posted by **Ken** on 28 Nov 2004, 12:34 p.m.*

I have a HP 9815A or S model desktop calculator, but I am trying to find out some information. The keyboard is marked 9815A, but under the printer cover there is an added label that says 9815S and two other lables that say "option 001" and "option 002". Is this a 9815A that was upgraded to the "s" configuration? It seems the primary difference is the number of program steps. How do you get the calculator to list the total number of program steps available? Also, is this a thermal printer similar to the hp 97 or a regular printer? The serial number starts with 16 indicating it was built in 1796 and the ship date marked on the label is 1978. This seems to pre-date the S model, but when I switch to program, 3720 is listed on the right of the display (I assume this is the number of program steps) and it counts down when steps are entered. This seems to imply the 3800 steps available only in the S model. The A model could have upgrades to increase the number of steps to 2008. It does have the two IO ports. I don't know what the options 1 and 2 are?

Edited: 28 Nov 2004, 1:08 p.m.

Is it really that old? :-)

*Message #2 Posted by **Marcus von Cube** on 29 Nov 2004, 8:11 a.m.,*
in response to message #1 by Ken

Hi,

"...indicating it was built in 1796..."

Are you sure?

Marcus

Re: HP 9815A or 9815S?

*Message #3 Posted by **Tony Duell** on 29 Nov 2004, 3:32 p.m.,*
in response to message #1 by Ken

As I understand it, the difference between the -A and -S models is the CPU board.

The -A CPU board uses 2111 RAMs, 256 nybles each. There are 6 on the CPU board (for a total of 768 bytes of memory), and you can add a daughterboard with a further 12 chips on it, adding 1536 bytes of memory. This board also uses 2K byte ROM chips -- 7 of them for 14K bytes of firmware.

The -S CPU board uses 2114 RAMs, 1K nybbles each. There are 8 of them, so 4096 bytes of memory. You can't add any more RAM to this board. It also uses a pair of 8K byte ROMs, of which 2K of one of the chips isn't used (so again 14K of firmware).

[Now for something interesting. That 2K is not blank, it looks to be a valid extension ROM for the 9815. If you add a soldered jumper on the board you enable it, and the machine will certainly recognise it. I've not figured out what the functions are yet, though]

I believe one of the OPTions you have is the I/O slot assembly. No idea what the other is. Maybe the extra RAM daughterboard. Maybe your machine started off as a -A, and was later upgraded to a -S by replacing the CPU board -- this is entirely possible to do

Re: HP 9815A or 9815S?

*Message #4 Posted by **Jim Butch** on 1 Dec 2004, 12:16 p.m.,*
in response to message #3 by Tony Duell

I have two hp-9815s calculators. Both of them are labeled 9815A on the keyboard and 9815S under the printer cover. I am the original owner of one of them. It was ordered as a 9815S in 1978. I have found a great deal of technical information on the 9815 on a web site that has many hp patents listed. Many of the patents can be downloaded. The site is www.brouhaha.com/~eric/hpcalc/patents/. There are two patents on the 9815 if I remember correctly. One of them documents the entire design, right down to a flowchart of the program and an assembled listing in MC6800 assembly language. It also includes the complete schematic diagram of each board. You might be able to find the hidden 2K in this documentation. Let me know....

Jim Butch

Re: HP 9815A or 9815S?

*Message #5 Posted by **Tony Duell** on 1 Dec 2004, 3:18 p.m.,*
in response to message #4 by Jim Butch

Yes, I've seen that patent. There are _some_ minor differences between the machine in the patent and the 9815A, and the 9815S, of course, has even more differences. It's still a useful resource....

Anyway, the ROM listing is incomplete (it doesn't contain the maths routines), but there is a description of the extension ROM format, which is how I recognised the extra 2K in the 9815S. But since the patent really describes the 9815A, it doesn't mention this block of code at all.

Re: HP 9815A or 9815S?

*Message #6 Posted by **Ken Delano** on 2 Dec 2004, 9:56 p.m.,*
in response to message #4 by Jim Butch

So it is a 9815S. Can you provide any insight into what Option 001 and Option 002 are?

Ken

41cx doesn´t recognise 319 registers

*Message #1 Posted by **Gonzalo Fernandez** on 28 Nov 2004, 11:28 a.m.*

I have an HP41cx fullnut that after doing SIZE 000, shows only 255 (it is missing 64 registers). I have reset the calculator with no luck, only shows 255 registers instead 319 registers. Also, EMDIR shows 124, so extended memory is OK. What memory chip/chips (upper, lower or both) I must change to repair the memory? Please see the photo http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5733774885&ssPageName=STRK:MEWA:IT

to let me know which of the 5 top memory modules I must change (each memory module comprised with two soldered chips)

thanks!

Re: 41cx doesn´t recognise 319 registers

*Message #2 Posted by **Miki Mihajlovic** on 28 Nov 2004, 10:56 p.m.,*
in response to message #1 by Gonzalo Fernandez

According to the service manual figure 4-8f, table 4-5f and Diagnostic Test Procedure outlined on page 4-31 the D/S 5 is bad, which is U9. That should be the upper chip first from the left one that reads 1LH505.

"fixthatcalc.com" working OK?

*Message #1 Posted by **Simon Lockyer** on 28 Nov 2004, 5:55 a.m.*

Someone recently kindly suggested that I consider Randy Sloyer of fixthatcalc.com for repairing my misbehaving 32SII, but when I try to go that site I get an error saying that the site cannot be found, or some such.

Has anyone else had this problem going to fixthatcalc.com, or is it just me? Does anyone have an e-mail address for Randy Sloyer so that I try to contact him directly? Lastly, if that service is no longer available, can anyone else suggest how I go about repairing my 32SII, which works OK, but only if you press *very* hard on the operator keys.

Many thanks,

Simon Lockyer

PS please e-mail me directly at slockyer@cox.net

j^j and the HP-33S

*Message #1 Posted by **Karl Schneider** on 27 Nov 2004, 11:57 p.m.*

An unintuitive mathematical fact:

$j^j = e^{-pi/2} = 0.207879576$

where $j = sqrt(-1)$ and $j^2 = -1$

The proof (which is left as an exercise for the reader) requires the use of Euler's identity and trigonometric/hyperbolic identities derived therefrom:

$e^{jx} = (\cos x) + j*(\sin x)$

$\sin jx = j * \sinh x$

$\cos jx = \cosh x$

On any RPN or RPL calculator designed and engineered by Hewlett-Packard with complex-number capabilities, j^j can always be evaluated correctly. For example:

```
HP-15C          HP-42S

1               0
f Re<->Im       ENTER
ENTER           1
y^x             f CMPLX
                ENTER
                y^x
```

For the 32S, 32SII, 33S, and 41C* with Math or Advantage ROM, a different approach is used:

```
1
ENTER
0
ENTER
1
ENTER
0
f CMPLXy^x        XEQ Z^W
(32/33)       (41/Math/Adv)
```

This procedure works for all four calculators, but the 33S gives the incorrect answer $e^{-3*pi/2} = 0.008983291$ when the zero in the z-register is negated (-0).

The root cause of this problem is the same one that causes the incorrect rectangular-to-polar conversions with 0 or -0 in the x-register, which I and others documented fully, several months ago in this forum.

Calculation of j^j requires the calculation of ln(j).

$\text{Re}[\ln(a+jb)] = \ln(\sqrt{a^2+b^2})$
$\text{Im}[\ln(a+jb)] = \text{atan2}(a, b)$ [in radians] -- primary solution

The antilogarithm of the j residing in the "upper" part of the stack is taken. Since the 33S calculates the phase angle of (-0 + j1) incorrectly, the answer given for j^j is incorrect.

Norris (or anyone else), has HP addressed the polar-angle and other bugs?

"Norris (or anyone else), has HP addressed the polar-angle and other bugs?"

The best thing HP might do is to give a workaround example
To really fix the ROM?
I would not do it in the first year,
since new bugs are found every now and then
[VPN]
PS: opinions only...

Re: j^j and the HP-33S

*Message #3 Posted by **Norris** on 28 Nov 2004, 3:43 p.m.,*
in response to message #1 by Karl Schneider

HP has published a 33S "User's Manual Update" that acknowledges the rectangular->polar conversion bug, the ->HMS bug, and the nCr bug, and offers workarounds.

For the rect-polar bug, the suggested workaround is to take the absolute value of any zeros in the input (x,y) data.

As far as I know, publication of the "update" is the only action that HP has taken to address 33S bugs.

I have a "substitute" rect-polar conversion routine assigned to XEQ T on my 33S; it checks for zeros and "fixes" them before doing the conversion (I originally used CLx, instead of ABS; they both seem to work). It would, of course, be possible to prepare similar "substitute" routines for complex math functions, if you needed them. Not the best possible use of scarce 33S labels, though.

Edited: 28 Nov 2004, 3:51 p.m.

Re: j^j and the HP-33S

*Message #4 Posted by **Valentin Albillo** on 29 Nov 2004, 8:00 a.m.,*
in response to message #1 by Karl Schneider

Hi, all

Karl posted:

"An unintuitive mathematical fact: j^j = e-pi/2 = 0.207879576"

For an added counterintuitive "thrill", try and plot the values of

```
i, i^i, i^i^i, i^i^i^i, i^i^i^i^i, ...
```

in graph paper (any HP calculator will do, save perhaps some of the latest KinHPo crap) or using your graphics HP model. As usual, the horizontal axis denotes the real part, the vertical axis denotes the imaginary part of the result, and expressions of the type a^b^c^... should be calculated right-to-left, i.e: a^b^c^d = a^(b^(c^d)).

You'll be quite surprised at the beautiful resulting graphic, and it's highly improbable that you would have foreseen in advance its 'three-pronged' shape. :-)

Best regards from V.

Re: Keyboard Issue HP-49G+

*Message #6 Posted by **Eddie Shore** on 28 Nov 2004, 8:24 a.m.,*
in response to message #3 by Nick Nicholas

If people are expecting the HP-49G+ keyboards to be like the 48G series, forget it. However, the latest 49G+ (CNA436....) have keyboards that are tactile and users can live with. I have one and so far I am satisfied with it.

I am with you that HP has lost tons of sales and potential customers that it took so long to correct the keyboard problems. Hardware counts as much as software.

(going off topic) Also, the calculator marketing has no priority either. HP needs to expand their market beyond Fry's. Maybe they wanted to test the market before entering the calculator market in full force again.

Re: Keyboard Issue HP-49G+

*Message #7 Posted by **Ron Ross** on 30 Nov 2004, 8:55 a.m.,*
in response to message #6 by Eddie Shore

There is no marketing via retail (except Fry's perhaps). Staples, Office Max, Office Depot: none of these large retail office supply stores carry any Hp's except the Hp10B and the Hp12c. Nothing else.

And the Calculator salesman is usually some High School geek (nothing really wrong with this, if he is truly knowledgable) who often recommends the calculator he uses in High School ie a Ti-83(now 84) cause it can do everything I have ever seen. So whoever carries a graphics line, sells the Ti-83/84 by default (one of the weakest graphics calculators available, except in statistics).

machined housing

*Message #1 Posted by **Jeff Brower** on 26 Nov 2004, 6:43 p.m.*

I wonder if a 'machined from solid' housing would be economical to produce. It would use screws for assembly and re-assembly, would have to be plastic or aluminum and have insulating material in certain places. It should be close to the original size but stronger and made to be taken apart.

Transfering the face plate may be the most challenging part, not bending it during removal...

Rubber feet, battery compartments, ir ports... oh my!

Making them would be the easy part, engineering the design and transfering the components may be the real issues.

Have I had too much turkey leftovers?

What model to look at first?

I suppose that an outer shell that screwed together around the existing case may be functional to hold it together, but it would be too clunky.

Any thoughts?

Jeff

Any specific model/family in mind? (N.T.)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 26 Nov 2004, 10:31 p.m.,*
in response to message #1 by Jeff Brower

Not yet, looking for input and direction

*Message #3 Posted by **Jeff Brower** on 26 Nov 2004, 11:35 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I suppose the models that most often need to be opened and are difficult to repair the housing on would have the most need. If it covered many models it would have a better chance of actually being produced.

Re: Not yet, looking for input and direction

*Message #4 Posted by **Iqbal** on 27 Nov 2004, 4:53 a.m.,*
in response to message #3 by Jeff Brower

The 49G+ would have been a better machine if it could allow overlays to be used as with the 48 series.

Re: Not yet, looking for input and direction

*Message #5 Posted by **Thomas Okken** on 27 Nov 2004, 8:19 a.m.,*
in response to message #3 by Jeff Brower

That sounds like "pioneer" -- some of them develop keyboard problems that require the calculator to be opened to fix. They're very hard to open and even harder to reassemble, and they cover an interesting range of models.

Re: Not yet, looking for input and direction

*Message #6 Posted by **Jeff Brower** on 27 Nov 2004, 2:16 p.m.,*
in response to message #5 by Thomas Okken

Does anybody know if the same housing would work for all or most of the pioneers?

Re: machined housing

*Message #7 Posted by **David Smith** on 27 Nov 2004, 11:17 a.m.,*
in response to message #1 by Jeff Brower

I have a friend who does custom jewelry, etc. She had made solid gold/silver/platinum / jewel encrusted, etc cases for cell phones, PDA's, etc. If you don't have 5-6 digits buring a hole in your wallet don't bother calling though. Also she is booked years in advance.

Re: machined housing

*Message #8 Posted by **Hugh Evans** on 29 Nov 2004, 2:14 p.m.,*
in response to message #7 by David Smith

Perhaps this is the new direction HP seems to be looking for. Add a bit more of the bling-bling factor to their machines. 24K gold plated, iced out, gemstone shift keys... Oh, and it should play mp3s too!

Re: machined housing

*Message #9 Posted by **David Smith** on 29 Nov 2004, 5:15 p.m.,*
in response to message #8 by Hugh Evans

No gold plating here... they be solid gold. Real bling rocks too.

Re: machined housing

*Message #10 Posted by **Hugh Evans** on 29 Nov 2004, 2:10 p.m.,*
in response to message #1 by Jeff Brower

Machining an enclosure from a solid block of material is one of the more expensive ways to go, even if there were no tooling costs to speak of. The real problem is that so much material is wasted in the process. There are benefits to such an approach, such as improved strength properties. Since we're talking about calculators and not engine blocks, I think it would be overkill.

Let's look at some more practical options: Vacuum/pressure forming, die casting, and injection molding. Vacuum/pressure forming is by far the most economical choice for the kind of enclosures we're discussing. Tooling is dirt cheap (only in the thousands) and it works very well for small runs between 1 and 50-100,000 units. At that point injection molding is a better option. Die casting is more or less metal's answer to injection molding.

I've spent a good deal of time looking into manufacturing enclosures for the OpenRPN project. After going

through many options and quotes it looks as though we will be going with injection molding (possibly an ABS/PC blend). The dimensions of our machines will be the same as the voyagers and pioneers and all of the holes for keys, LCD, etc. are going to be laser cut. So if the innards of voyagers and pioneers can be retrofitted I see it as a win-win situation.

PPU of the enclosures will be in the neighborhood of $10US. If there is any interest in this idea I can post some renderings of the plain enclosures.

Jeff, feel free to send me an e-mail if you have any other questions about this topic. I'd be happy to help.

Best Regards, Hugh Evans

HP-41cv PPC Rom?

*Message #1 Posted by **Derek** on 26 Nov 2004, 5:19 p.m.*

I've got an HP-41CV and several of the plug in modules. Most are fairly worthless, but I haven't been able to find out much about the PPC ROMs. These apparently have had a lot of work put into them by a number of people in a community effort. And there must be lotsa routines given the size of the manuals!

Anyway, I've got 2 PPC ROMs and 3 manuals (1 bound, 2 unbound). Are these worth putting up on ebay, or are they of as little value as time and memory modules?

Thanks, Derek

Re: HP-41cv PPC Rom?

*Message #2 Posted by **Namir** on 26 Nov 2004, 6:24 p.m.,*
in response to message #1 by Derek

Yes, the PPC ROM is a valuable collector's item. They often sell for as much as an 41CV or 41CX calculator!

Ebay item # 5733875807 : CCD Module for HP-41C/CV/CX

*Message #1 Posted by **Florian Gaillard** on 26 Nov 2004, 2:49 p.m.*

I'm new on ebay and in HP calculator collection.I'm wondering what is the real price of a CCD Modul.

Re: Ebay item # 5733875807 : CCD Module for HP-41C/CV/CX

*Message #2 Posted by **Massimo (Italy)** on 26 Nov 2004, 3:31 p.m.,*
in response to message #1 by Florian Gaillard

We exchanged some opinions about this some days back...
But you're lucky: that same module had a *Buy It Now!* price of $499.95 just a week ago; this week it was lowered to $199.95
Real price? You decide.

Massimo

Re: Ebay item # 5733875807 : CCD Module for HP-41C/CV/CX

*Message #3 Posted by **Miki Mihajlovic** on 26 Nov 2004, 4:20 p.m.,*
in response to message #2 by Massimo (Italy)

I didn't see buy-now for $200 on this auction. That ($200) for CCD module would be a very good price, especially since Emanuel is including the documentation and overlay. This is a collector's item and in last couple of years I have seen only one on eBay where seller was not aware of what is he selling (it was a part of a calculator lot). I think that the biggest determent is that he (Emanuel) doesn't accept PayPal, BidPay or money orders. Sending that much cash in an envelope makes most people a bit nervous and direct wire transfers are quite pricy.

So if you are collecting HP-41 related items this one is a must-have module. If you are looking just to use it, one of Diego's modules is much better and more economic solution.

My $200E-4 worth.

How to open a 10b? I have the user manual! My 10bII dissapointment

*Message #1 Posted by **Geir** on 26 Nov 2004, 4:14 a.m.*

Hi

Nice forum!

I have a 10b and a recently purchased 10bII.

The 10b has served me well for 14 years now, but the +, - and * buttons only work when pressed very very hard. I thought that if I could open it I could spray some contact fluid on the contacs inside - Question: How do I open it.

I searched for 10B service manual, and I found a some posts on this forum requesting it - I have one.

I purchased the 10bII because the other developed this error. Price in Norway about 100USD. I see that it is being discontinued - is that correct. I had all sorts of trouble getting one. And yes, teh keys are not the same quality as the 10b, though I do not have a problem with them getting stuck (yet)...

HP 67 printer port

*Message #1 Posted by **Gilles C.** on 26 Nov 2004, 3:59 a.m.*

Bonjour. Does anyone knows if it is possible to adapt a printer port to the HP 67 and use the included printer instructions ? Thanks.

Re: HP 67 printer port

*Message #2 Posted by **Karl-Ludwig Butte** on 29 Nov 2004, 10:08 a.m.,*
in response to message #1 by Gilles C.

I don't think so. Even if it would be possible to connect a printer to the 67 (have a look at the block diagrams of the 67 and 92 (I know it's a 92 and not a 97) HP Journal November 1976) you would need to exchange the firmware to be able to use the printer hardware.

Re: HP 67 printer port

*Message #3 Posted by **Vassilis Prevelakis** on 29 Nov 2004, 1:54 p.m.,*
in response to message #2 by Karl-Ludwig Butte

The PPC Journal (then called 65 Notes) had an article on how to modify an HP 65 so that it could be connected to a printer.

(65 Notes, V.2 N.6, July 1975, pp 2-4)

One more slice of PI

*Message #1 Posted by **GWB** on 25 Nov 2004, 7:54 p.m.*

From an earlier posting by Bill (Smithville, NJ):

"Another Slice of PI

Posted by Bill (Smithville, NJ) on 11 May 2004, 2:32 p.m.

For those who are curious....

I entered the PI program from PPC V7N5 Page 9 & 10 into the 42S. Just ran it for 500 digits in standard speed mode.

Took 1 hour and 20 minutes.

Now to do a 1,000 digits in both normal and Fast modes.

..."

Later in the thread there is reference to a revised version of Ron Knapp's program (PPC Journal V8N6P69 Aug-Dec 1981).

Questions:

1) Where can this revised version be found online?

2) How to set the fast speed mode on the HP 42S?

Thanks.

P.S.: It is possible to calculate 4020 decimal places of pi on the 42S, if SIZE is set to 811 and PI is the only program in memory. It would take about eight days to run, though. (This is a rough estimate based on the time it took to run with Emu42 - don't have the 42S anymore...).

*Message #2 Posted by **hugh steers** on 26 Nov 2004, 6:00 a.m.,*
in response to message #1 by GWB

hi there,

out of interest, its actually possible to calculate pi to arbitrary length on the 42s. but there's a catch: it takes too long.

a while back, i wrote a program i called "deep pi" for the 41c that calculates the next 6 digits of pi from any given point in the decimal expansion. note: its possible to do this without having to precalculate all previous digits!

some of the guys on this forum converted the program to the 42s, but still it was way too slow. i was hoping, for example, to get about 1000 digits in only about twice the time of previous programs, buts its longer than that.

maybe when i get time, i will try again to improve it. but i cant see it suddently being *that* much faster. plan b: wait for some more pi theory to be disovered!

anyway, there's a copy of my program on my 41cv page.

regards,

http://www.voidware.com/calcs/hp41cv.htm

Hugh:

I don't think I've ever heard of a program that lets you find 6-digits of pi starting anywhere without finding earlier digits. Would you have a reference for the algorithm? I did look at your Web site, but don't really want to try to deconstruct your HP-41 code.

Thanks. Larry

Larry posted:

"I don't think I've ever heard of a program that lets you find 6-digits of pi starting anywhere without finding earlier digits."

Have a look at this

The caveat is, it only works for hexadecimal digits of Pi. No such formulae are known or believed to exist for base-10 digits, though they actually exist for some transcendental constants, such as log(9/10), where the corresponding formula has been used recently to compute its ten billionth decimal digit (US 'billions', i.e., 10^9).

This also applies to other bases and constants, such as base 2, for which you can compute individual digits of log(n), for n=2,3,5,7,11,13,17,19,29,31,37,41,43,61,73,... ...,18837001, 22366891, ...

Alas, no such luck for base-10 and Pi.

Best regards from V.

*Message #5 Posted by **hugh steers** on 27 Nov 2004, 6:11 a.m.,*
in response to message #4 by Valentin Albillo

yes, indeed. thanks valentin. this is the information i used to try to write it on the 41.

i used the methods described in this paper for the decimal version.
http://numbers.computation.free.fr/Constants/Algorithms/nthdecimaldigit.pdf

what i did is take their code and hack it down as much as possible for calculators. here is my final "C" version before i translated it for the 41. if you know C, this is much easier to understand than the 41c code. you're quite welcome to try to improve it. i dont take any credit for the method.

in response to message #5 by hugh steers

Greetings Hugh!

I've been running your Deep Pi program simultaneously on 2 HP 41CVs as an exercise in "verifying" the digits of pi. I have one calculator generate 6 digits and the other calculator generate the next 6 digits, then the first calculator generate the following 6 digits, on and on. Currently working on digits 349 thru 354 and 355 thru 360. It's now taking about 3 days +/- per set of 6 digits. Couldn't do it without the AC adapters and rechargeable battery packs.

Comment: On 2 separate trials, when I've asked for digits 73 thru 78, my calculator has returned "286209". The 78th digit should be an "8" rather than a "9". The 79th, 80th and 81st digits of pi are "9", "9", and "8", respectively. So, just wondering if you were aware of this apparent roundoff error. There is a comment in your code about rounding error accumulation.

Very best regards, Mark Taylor

Re: One more slice of PI

*Message #9 Posted by **hugh steers** on 28 Nov 2004, 4:38 p.m.,*
in response to message #6 by Mark Taylor

hi mark,

this is very depressing. you are right about the 73rd digit. the main part of the pi program performs the summation and the code right at the start of the program is the bit that does the 1e6 * INT for display. i commented this out to see the floating sum at 73. the 41 gets 0.286209003. as you can see, cumulative errors in the summation have caused it turn over a 9 whilst it should be 8 then 998628 as you correctly point out.

i was hoping to get away with 6 at a time. unfortunately, although the theory behind the algorithm gives you the number of summation terms, there is no way i'm aware of to know how to compensate cumulative summation errors. consequently, i have down graded the correct payload to only 5 digits. this, of course, makes the method even worse and would almost take for ever to get even 1000 digits this way on a real 41.

one possibility for improvement would be to perform less terms of the summation. the idea being that, although the theory gives the sum length, but if only half (say) of the resultant digits are trusted, maybe a lot less summing can be done.

indeed, the method derives from one designed to give binary answers. in fact, for binary, the method is algorithmically quicker than the best known decimal pi method. although a version of pi in binary isn't very useful and this method was derived to give a decimal expansion. the people behind it know that it's a bit hacky. maybe in due course there will be a better way to collect the decimal expansion from the binary method. that would be good.

originally, i was motivated to write this program with the idea that one could leave a 41 (or 42s) and a printer going whilst it went on and on printing out pi. the concept of having no state between output batches is very attractive for a low memory calculator program.

thanks for pointing this out and if you think of any good ideas, please pass them on.

PS. i put the "pi.raw" binary here http://www.voidware.com/calcs/pi.raw i test it by loading it into v41 and jamming TAB down...

*Message #10 Posted by **Mark Taylor** on 29 Nov 2004, 1:50 a.m.,*
in response to message #9 by hugh steers

Hi again Hugh,

Thanks for your response. I don't understand much about the algorithms and programming but I've enjoyed making my HP-41's really work in generating the digits of pi. Also, keying in the 511 program steps of Deep Pi without making a mistake is a challenge!

Undoubtedly, there must be other groups of 6 digits in which the last digit may show a roundoff error. The 78th digit(by 6s) is the only one I've encountered so far.

My two 41's are still going, currently working on digits 355-360 and 361-366.

Will you be posting a new Deep Pi program on voidware.com in which just 5 digits at a time are generated?

Thanks again, Mark Taylor, Civil Engineer and Land Surveyor, California, USA

HP49g+ and SD/USB file storing

*Message #1 Posted by **kfg** on 25 Nov 2004, 11:36 a.m.*

Does anyone know if the HP 49g+ be used like a USB stick to store any type of files on the SD card and then transferred to other computers?

Re: HP49g+ and SD/USB file storing

*Message #2 Posted by **Arnaud Amiel** on 26 Nov 2004, 7:50 a.m.,*
in response to message #1 by kfg

the files have to go through the calc, there is not direct connection to the SD card. The calc OS at the moment, and I guess for ever, limits the size of files to 128k.

So yes you can, and I do. But it is only for very small files. I usually carry a small USB SD card reader with my 49g+

Arnaud

Re: HP49g+ and SD/USB file storing

*Message #3 Posted by **James M. Prange** on 28 Nov 2004, 4:53 a.m.,*
in response to message #2 by Arnaud Amiel

Besides the file size limitations, when the calculator receives a file without a valid transfer header, it stores it as a character string. That is, it prepends the 5-nibble prologue for a character string object, followed by the 5-nibble length field, so now you have 5 extra bytes at the beginning of the file.

When the 49g+ stores anything on the SD card, it stores it as a binary transferred file. That is, it prepends an 8-byte binary transfer header HPHP49-X, which is followed by the compiled object itself, starting with it's prologue. Of course, if it's moved back to the 49g+'s memory, the header is discarded. But if you put the card in a PC's card reader, you now have 13 extra bytes at the beginning of the file.

So the 49g+ and its SD card can be used to store arbitrary files of limited size with minor modifications, but it may well make more sense to simply use a USB stick.

Re: HP49G+: Nested Menus

*Message #4 Posted by **Tim Wessman** on 29 Nov 2004, 2:01 a.m.,*
in response to message #2 by Arnaud Amiel

I think the 128K limit is only port 1/2. I've stored 220K files from main RAM into SD without problem.

Is it the on/off button, or all the buttons in the column of the on/off button?? If so, is a poping/flexing sensation felt when pushing between the display and the top row of buttons and when pressing on it does the on/off button work right?? If yes, it may be a cold/broken solder on the display twisty hold downs where they are soldered. IF AT ALL POSSIBLE DON"T REMOVE THE DISPLAY...it will not work right ever again if you do, to my knowledge. (prove me wrong) If you take your calulator apart; I suggest drilling the rivets heads from the top and repacing the rivet with some appropriate screw; "IF" you can remove the beyboard overlay without bending it. If I had to do over, I would drill the rivets from the top without removing the overlay. But, if you cut the case rivets (the other way of taking it apart) from the inside of the calculator you will loose some

rigidity of the calulator. If it is the actual on/off button by itself, the calculator is a thow away, to my knowledge.

HP 9114A floppy drive

*Message #1 Posted by **David Osborne** on 24 Nov 2004, 3:53 p.m.*

I've just acquired one of these, but there's a problem with the power supply inside the unit. I can charge up the 6 V battery, but I don't get power to the output socket. I suspect a component on the little circuit board is dead. Does anyone have a circuit diagram for the board? I think I know which component has blown, but I'd like to be sure.

Many thanks for any help.

David

Re: HP 9114A floppy drive

*Message #2 Posted by **chris** on 24 Nov 2004, 4:56 p.m.,*
in response to message #1 by David Osborne

hi david please let me have a look i have the same problems and searching for a hp 9114 a or b. By the way check in the power suplly box (open with screw driver (flat)) You find a big matsushita battery 6,75 V 3 amps average (i pick up in my mind) plus a print with little diode bidge 1 tip 41c transistor and some zener or other parts: One of these is a fuse .I supposed it a long time .Recently i discover this forum and i found Tony Duell for sample who repaired this unit with an other HP user thru the forum .Tony Duell confirmed my supposition the resistor have already a siver or gold ring for tolerance and which one looks like a resistor but doesn t be one. i check in my data and give you the colors from the fuse.Tony Duell said it could be a 3 amps use...which is logically adapted for the battery capacity.

Re: HP 9114A floppy drive

*Message #3 Posted by **David Osborne** on 25 Nov 2004, 2:20 p.m.,*
in response to message #2 by chris

Yes, I have the board with the TIP41A part, and three resistor-like parts in a row, of which the bottom one seems to be open-circuit. If I know what that part is I'll replace it, but I don't know how to tell. It's not marked like a resistor.

in response to message #1 by David Osborne

There's a schematic of the battery pack (both versions), along with the rest of the 9114A and many other HP calculators and peripherals on the HPCC schematics CD-ROM.

There's a picofuse in these battery packs on the PCB, connected between the battery +ve terminal and the output. It looks like a resistor, and is normally rated at 2A (although I have seen 5A ones that don't look like they've ever been replaced. I would check this first.

HP-67 Power Adapter replacement?

*Message #1 Posted by **Derek** on 24 Nov 2004, 1:52 a.m.*

Hi,

I'm preparing my old HP-67 for sale and want to have everything in tip top shape. I've found a source for a new battery pack, but haven't been able to locate a replacement adapter. My current adapter works (barely) and requires a lot of wiggling to get the broken wire to connect and power the calculator.

It appears that the break is right at the end where it plugs into the calculator, so the only way to fix it myself would be to destroy the plug so I could solder the wire back together. I was hoping to find a better solution.

Does anyone know of a source?

Thanks, Derek

Re: HP-67 Power Adapter replacement?

*Message #2 Posted by **Jeff O.** on 24 Nov 2004, 2:19 p.m.,*
in response to message #1 by Derek

If you mean a source for the connector, the only source would be another power adapter. If you mean a source for a power adapter, try eBay, or place a want ad in the MoHPC classified section.
The problem you describe is quite common, and often repairable. It should not be necessary to destroy the plug. Try slicing the top of the plug off, cut, splice and solder the wires, then glue the top back on.
Good luck!

CLEAR HARD DRIVE

*Message #1 Posted by **LARRY PRUDHOMME** on 23 Nov 2004, 8:49 p.m.*

I NEED HELP AS HOW T CEAR MY HARD DRIVE AND TO RUN MY EIGHT RECOVERY DISK . I HAVE A HP AMD XP 1800, 1.53 GHz, 480 mb of ram. please give me instructions on how to do this. thankfully yous.

LARRY PRUDHOMME

Re: CLEAR HARD DRIVE

*Message #2 Posted by **DavidY** on 23 Nov 2004, 10:19 p.m.,*
in response to message #1 by LARRY PRUDHOMME

Larry:

Actually this is a Calculator forum but...

Assuming that the computer will boot insert the first recovery disk and follow the instructions. Recovery disks are almost always autobooting.

Be aware that a recovery disk will totally wipe the hard drive--ALL YOUR DATA, PASSWORDS, AND SETTINGS WILL BE GONE, GONE GONE!

Finally, if you or someone has changed the CMOS setting involving which disk boots first you must change the setting to CD as the first boot device. You will need the instructions that came with your PC for the exact procedure. If you do not have the instructions go to the HP site: www.hp.com and select the support option. From there you can select your system and should be able to download the manual, etc.

AGAIN REMEMBER RUNNING RECOVERY WILL DESTROY YOUR DATA SO IF YOU HAVE THE OPTION SAVE YOUR DATA FIRST. AT THE VERY LEAST MAKE SURE YOU SAVE ALL YOUR USER NAMES, PASSWORDS, PHONE ACCESS NUMBERS(IF APPLICABLE)

GOOD LUCK!

NCEES policies for 2006 ?

*Message #1 Posted by **Norris** on 23 Nov 2004, 5:54 p.m.*

For 2004, NCEES banned graphing calculators.

For 2005, NCEES banned all calculators, except for 7 models (including the HP9S and 33S).

So what will NCEES do for 2006?

There is a possible clue in the 12/04 issue of the NCEES "Licensure Exchange" newsletter, p. 6:

<< The Examination Administration Task Force will also tackle calculator issues. It will review Exam Policy 15 as amended by the Council during this year's Annual Meeting and consider adding the words "or supplied" to the policy so that it reads "Only models of calculators as specified or supplied by NCEES are permitted in the examination room." The task force members will also revise exam policies to minimize objects allowed in the exam room and maximize security. >>

Currently, NCEES examinees cannot have any personal items during an exam, except for their clothes and their calculator. The implication is that candidates may be barred from bringing their own calculators in the future, just as they are now barred from bringing their own pencils or erasers. NCEES could start issuing calculators inside the exam room, just as they currently issue mechanical pencils.

If NCEES elects to go this route in 2006, it could possibly threaten the use of RPN on professional engineering and land surveying exams. It seems more likely that NCEES would issue $15 algebraic scientifics (which are probably even cheaper in bulk) than the $55 HP-33S, which is the only remaining RPN option.

So what will NCEES do for 2007?

Well, we can only speculate. But if NCEES elects to issue calculators in the exam room, then the only personal items that examinees will still be allowed to have during the exam will be their clothes. Perhaps it's just a coincidence, but NCEES recently began manufacturing official NCEES clothing...

Edited: 23 Nov 2004, 6:08 p.m.

Re: NCEES policies for 2006 ?

*Message #2 Posted by **J.C. Randerson** on 24 Nov 2004, 2:57 a.m.,*
in response to message #1 by Norris

When the NCEES originally came out with this policy, it really ticked me off as I love my calculators. When I criticized the policy in this forum, all the old timers hammered me. I've enjoyed seeing them complain too now that all that their old favorites have been banned.

It shouldn't suprise anybody one bit when NCEES starts issuing their own calculators or banning them altogether. Something is very wrong with these Luddites. Who made them god, anyway? Why isn't there an alternative licensure available to aspiring engineers? The closest thing to a solution is tests for licenses from a governing body that understands technology, not from pinheads who want to ban it.

Re: NCEES policies for 2006 ?

*Message #3 Posted by **Tom (UK)** on 24 Nov 2004, 8:14 a.m.,*
in response to message #2 by J.C. Randerson

Depends what you want to test, if it's ability to think and know the subject then a calculator is not needed. It comes down to the skill of the examiner to test the right things. Do NCEES exams require alot of number crunching? If so what are they actually testing with such questions?

Here in the UK when I took A level maths (exam for 18 year olds) in the mid 1980's did not need a calculator, the actual numbers were 'easy' and required a few simple button presses at the end to evaluate pi or e or a log and give a numerical answer - all the working had to be shown and counted for at least half the marks.

The same happened when I studied electronics at degree level in the late 80's, you had to show you understood the subject, the actual number crunching could be done in your head, some equation manipulation and a few key strokes on a low/mid priced scientific (from memory a FX570 in my case).

However if a calculator is a must then some choice should be left to the examinee, or plenty of notice of a policy change so they can get used to the standard calc.

PS Does the NCEES allow: Spectacles, medication, hats, watch, jewellery? :-)

Re: NCEES policies for 2006 ?

*Message #4 Posted by **Norris** on 24 Nov 2004, 12:30 p.m.,*
in response to message #3 by Tom (UK)

<< PS Does the NCEES allow: Spectacles, medication, hats, watch, jewellery? :-) >>

Watches are subject to regulation. In California, digital watches are explicitly banned; you can bring a watch, but it must be analog. Don't know if this policy is specific to the California Board, or if it is enforced nationally by NCEES.

Medication should be OK. Food and drink are typically banned at the exam desks, so you might need to request permission to leave your seat and take your pills in the bathroom or at the drinking fountain.

The other listed items should be OK

Re: NCEES policies for 2006 ?

*Message #5 Posted by **bill platt** on 24 Nov 2004, 9:52 a.m.,*
in response to message #2 by J.C. Randerson

Many of the most important and challenging exams I took in graduate school (materials science) did not require a calculator. Sure, you could bring one (I had my trusty 11c :-), but it wouldn't help you one bit. In fact, I never turned it on---nothing to use it for!

As I have been considering taking a PE exam myself, I have been interested to see this development going on. I see both "camps' points. However, I think what is generally being missed by the "pro calculator" camp is that the exams are (probably) being restructured as well----in other words, you think you will need that fancy whiz-bang---but your need is based on the assumption that future tests will be like those in the past.

Perhaps this is the real problem---NCEES is not communicating what their real intentions are?

Regards,

BIll

*Message #6 Posted by **Will (Spain)** on 24 Nov 2004, 11:27 a.m.,*
in response to message #5 by bill platt

Well...as i wrote before i think the most important thing regarding this exam is the exam itself....the contents should be matched with the calculations requirements...maybe for the future exams a junk 15$ calculator will be enough..(i shere the bill´s opinions)in case the contents and its develoment will be more important than the final numerical answer...i do not know how this will be evaluated...i remember long time ago when i took a numerical methods course i used a very simple 15$ scientific casio calculator..the teacher in this case actually did not match the exam with the calculation requirements (his 2 exams spanned for more than 8 hours each even for people using programs in their calculator!!!!!!) ..i remember that for the next courses bought my first hp calculator (28s) which was VERY useful for subjects handling linear algebra...i agree that the calculator list allowed should be controlled BUT the list HAVE to be wide enough and each people should carry on their own unit. actually i have never seen this test so i have no a real and proper opinion about it.

Re: NCEES policies for 2006 ?

*Message #7 Posted by **Norris** on 24 Nov 2004, 3:22 p.m.,*
in response to message #5 by bill platt

No, NCEES is *not* restructuring any of their exams. They have *always* maintained that all of their exam problems can be solved with a basic scientific calculator (supplemented, in some cases, by NCEES-supplied tables). This was true in the past, and it remains true today. People routinely pass the EIT and PE exams with cheap TIs, Casios, and Sharps, and have been doing so for years.

Why, then, are so many people so upset by the NCEES ban on more powerful calculators ?

First issue: powerful calculators (like the HP48) were never “necessary” for NCEES exams – but they sure were convenient. Not all 48 owners knew how to exploit its features, but if you did, then you enjoyed some distinct advantages that weren't available with basic calculators.

I used an HP48GX on the EIT exam (before it was banned), and on California-specific PE exams (where it is still legal). I probably could have passed these exams without the 48, but I am convinced that I worked faster and scored higher with the 48. So obviously I was reluctant to give it up.

Second issue: the NCEES policies have troubling implications for RPN addicts. RPN is only available on relatively advanced calculators; there are no truly "basic" scientific RPN models in production. The 33S is no 48GX, but it is still much more powerful than the approved algebraic models on the NCEES list. If NCEES ultimately standardizes on "basic" scientific calculators, the 33S may not make the cut, and this would represent a de facto ban on RPN. Many RPN users wouldn't object to using a basic calculator per se, but they don't want to switch to algebraic.

When NCEES initially announced its new policies, back in late 2003, it came close to a de facto RPN ban. The 48GII and the 49G+ were explicitly banned, and the 33S was not yet available. So there were no NCEES-compliant scientific calculators in production. You could only use RPN if you could get your hands on an older model, like the 11C, 15C, or 32SII (ironically, all of these have now been banned as well).

HP deserves part of the blame for this situation. HP can make inexpensive "basic" scientific calculators, like the NCEES-approved 9S (just $11.99 at HP.com). But whatever reason, HP won't make an equivalent model with RPN.

Re: NCEES policies for 2006 ?

*Message #8 Posted by **Will** on 24 Nov 2004, 4:01 p.m.,*
in response to message #7 by Norris

Why HP do not make cheap RPN cals?..easy...they know that RPN fans are willing to pay more for these calcs due to HP is the only brand which actually make them..why sell a cheap calc when is possible to design more profitable ones?...monopoly is always a bad thing...just a look into ebay auctions on 32sII, 11c,15c, 22s, 48GX, etc shows how bad are the units made now.

in fact the day that hp do not make RPN anymore i´m sure i won´t buy its calcs..casio makes very goods units for 12$.

Re: NCEES policies for 2006 ?

*Message #9 Posted by **Veli-Pekka Nousiainen** on 24 Nov 2004, 12:07 p.m.,*
in response to message #1 by Norris

The official NCEES calculator should be the HP-33S, which offers both RPN and AOS logic.
Maybe HP could have a deal with NCEES for a lower price?

in response to message #1 by deleted

By going to the HP website and downloading the manual for the M50 monitor these are what I found. The yellow connector is not for speaker but rather for the built in microphone. The speakers are mounted on the slots on the side of the monitor and the wiring to the computer are separate. It's a wrong forum but I hope it helps.

CCD OS-Extensions: how to toggle Alpha mode

*Message #1 Posted by **Marcus von Cube** on 22 Nov 2004, 5:32 p.m.*

Hi,

Diego Diaz (thanks!) just sent me my new Clonix41 and NoVRAM modules preprogrammed with (among others) the CCD-OS-Extensions. I'd like to toggle Alpha mode but I can't enter the "TLC" program because PEEKB/POKEB isn't included in the CCD short version. Are there any other options or do I need to install the modified or original CCD ROM instead?

Re: CCD OS-Extensions: how to toggle Alpha mode

*Message #2 Posted by **Raymond Del Tondo** on 22 Nov 2004, 9:40 p.m.,*
in response to message #1 by Marcus von Cube

Hi,

I have never used or needed PEEKB or POKEB,
and there wasn't room to include these functions
in the single page version of the CCD OS/X.

You should be able to toggle the appriorate bit
using some synthetic instructions, or you could write
a *very* small ML program to do the toggle.
If I find some free minutes these days,
maybe I'll add a function like TLC to the CCD OS/X...

However, the planned bank switched version of the
CCD OS/X will include most of the CCD module functionality
except the matrix stuff, and things like PPLNG...

Raymond

Bank switched versions...

*Message #3 Posted by **Gene** on 22 Nov 2004, 10:08 p.m.,*
in response to message #2 by Raymond Del Tondo

How will bank-switched versions of roms work in the novram module?

I'd love to have a bank switched version of some roms to use with the module. The sandbox rom would be great that way. :-)

Re: Bank switched versions...

*Message #4 Posted by **Raymond Del Tondo** on 23 Nov 2004, 1:54 a.m.,*
in response to message #3 by Gene

Hi,

the NoVRAM supports different kinds of bank switching,
the HEPAX, the Advantage ROM, and the 41CX OS are examples.
The aboves use the same principal mechanism.
where the HEPAX is the only one so far using all possible four banks,
and another unique feature, it's auto-configuration.

The planned CCD OS/X will use a compatible mechanism,
thus needing only one ROM ID number.
A bank switched combined Extended IO and Extended IL ROM
is in the pipeline, too, but this will happen after the CCD OS/X...

Raymond

Re: CCD OS-Extensions: how to toggle Alpha mode

*Message #5 Posted by **Poul Kaarup (Denmark)** on 23 Nov 2004, 1:09 p.m.,*
in response to message #2 by Raymond Del Tondo

Here's an mcode program that toggles the alpha mode:

```
F1E6 083 "C"
F1E7 00C "L"
F1E8 014 "T"
F1E9 378 READ 13(c)
F1EA 27C RCR 9
F1EB 3D8 C<>ST XP
F1EC 00C ?FSET 3
F1ED 01B JNC F1F0 +03
F1EE 004 CLRF 3
F1EF 013 JNC F1F1 +02
F1F0 008 SETF 3
F1F1 3D8 C<>ST XP
F1F2 0BC RCR 5
F1F3 368 WRIT 13(c)
F1F4 3E0 RTN
```

I just copied the code from a module that I programmed in the late 80's. Hope you can use it. /Poul

Re: CCD OS-Extensions: how to toggle Alpha mode

*Message #6 Posted by **Marcus von Cube** on 24 Nov 2004, 3:51 a.m.,*
in response to message #5 by Poul Kaarup (Denmark)

Thanks. That will be my very first M code program. NoVRAM with HEPAX ROM will help me to enter it into my calculator.

Re: CCD OS-Extensions: how to toggle Alpha mode

*Message #7 Posted by **Raymond Del Tondo** on 24 Nov 2004, 4:29 a.m.,*
in response to message #6 by Marcus von Cube

Hi,

you could also use David-Assembler to enter the code.
DA is *MUCH* nicer than the HEPAX built-in HEX editor...

Raymond

Re: CCD OS-Extensions: how to toggle Alpha mode

*Message #8 Posted by **Marcus von Cube** on 24 Nov 2004, 4:37 a.m.,*
in response to message #7 by Raymond Del Tondo

Interesting info! But since the hex code is given in the "TLC" example, HEPAX might be ok for this tiny program. For further playing around I'm going to load David Assembler in my NoVRAM. But that'l take some more time...

Where to find zebra connectors for HP-41

*Message #1 Posted by **Miki Mihajlovic** on 22 Nov 2004, 3:17 p.m.*

I need couple of zebra connectors for HP-41 that I am trying to fix. Zebras in the calc are squished and bent so I figure that they are connecting to the 'side' so I got garbage when the calc is turned on. I checked with Fujipoly but they are not quite willing to sell anything less than for ~ 1000 units and some of their connectors from their web site are discontinued.

Does anybody have an idea where to find them, what are the real specs for the one in HP-41 etc. If you by any chance have some spare, I would be glad to take (buy) them from you.

OT: dictionary

*Message #1 Posted by **Mike (Stgt)** on 22 Nov 2004, 8:16 a.m.*

For sure my own appends are not always orthographic correct or may contain typos. Quite often I need the help of this free dictionary and I assume it would help an other native German speaker too. It could even help for 'emoticons' in German. In one case it was not translatable for other readers of this forum and resulted in an eMail to _me_: What did he mean by that??? Entering the word with typo in QuickDic led to a totaly false direction as words popped up like veneral diseases, genderless, pubescent, and rumpy-pumpy as the corresponding German words all contain the same letters sequence. Originally he just tried to express "(I am very) thirsty".

Ciao.....Mike -- funny thing such a forum <G>

www.kuipers.to/hp41, foillow the link to the MLDL2000 pictures

Meindert

Re: Photo's are now online

*Message #8 Posted by **Donald Leonard (Donald1800)** on 25 Nov 2004, 3:40 a.m.,*
in response to message #4 by Meindert Kuipers

I noticed that there is no Lithium battery SRAM backup or physical bank/grouping switches shown in the photos. Were the pictures taken before these were installed, or are they not going to be used?

I personally would prefer that ALL selected active RAM/ROM pages be selected by register - NO mechanical switches anywhere. But I was led to believe that they were going to be used.

I would also personally prefer a small SRAM backup battery to prevent accidental data/program loss by unthinking removal before transfer to eeprom. There are many small Lithium batteries to choose from.

Don

Re: Photo's are now online

*Message #9 Posted by **Meindert Kuipers** on 25 Nov 2004, 1:14 p.m.,*
in response to message #8 by Donald Leonard (Donald1800)

The pictures show the assembled PCB's, wires have to be added to interconnect everything. There is the option to add a battery (or goldcap), that is the choice of the owner, since it is relatively simple to add. Simply add the device, a diode and wire it to the right places on the PCB.

The switch is not assembled here (yet). It will be a tiny SMD switch with 4 contacts to choose between any of 8 configurations. The 4th switch is to fully disable the MLDL2000. Which ROMS are in which port is fully soft configurable, but the prime way of configuring is by using a PC and the USB connection. In theory it is possible with an HP41 mcode program but I do no intend to create the software for it. Please go through the specifications that can be found at www.kuipers.to/hp41, it explains it all in great detail.

Alternatively, come join us in Basel this weekend and ask me in person ;)

Meindert

And it works!

*Message #10 Posted by **Meindert Kuipers** on 23 Nov 2004, 2:54 p.m.,*
in response to message #1 by Meindert Kuipers

First test have shown that I can succesfully copy ROM pages from an old Eramco box to the SRAM of the MLDL2000. After disconnecting the Eramco box the two pages show in CAT 2!

This means that the MLDL2000 is now really coming alive.

Meindert

Re: And it works!

*Message #11 Posted by **JeffD** on 23 Nov 2004, 6:03 p.m.,*
in response to message #10 by Meindert Kuipers

This is great news! Please keep us all informed regarding the progress. I look forward to owning and using one of your MLDL2000 units. Thanks

Re: MLDL2000 & Allschwil

Vector Issues (49g+)

*Message #1 Posted by **Tim Wessman** on 22 Nov 2004, 12:31 a.m.*

I recently came across something that is driving me nuts.

I have two cattesian coordinates, lets say [10. 10.] [5. 5.]. Now i want to find the angle that [5. 5.] is in relationship to [10. 10.] . In other words, where it lies with respect to the "origin" point of 10,10. (225 deg)

Now my calculator gives me back 7.0... @ 45 deg. It is giving the relation from 0,0. How can i get it to give the angle FROM the other point?

examples of what i want:

[10 10] [11 10] -> [1 a0] [10 10] [5 5] -> [7.01... a225] [-25 -25] [-25 -20] -> [5 a90]

I've tried subtracting, every command in the VECT menu (I didn't know what they did, now I do=) and many other things.

So how would I go about doing this?

TW

12345

Re: Vector Issues (49g+) (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Nov 2004, 1:07 a.m.,*
in response to message #1 by Tim Wessman

Hi, Tim;

I read what you post and I guess I'm reasoning "too low", so I thought a "lower view" would get you into the right direction... I mean, if a kid shows you a way too far from what you want, at the moment you reason back to the actual problem you may see something you didn't see before. Kinda "reset". So, consider it as a "moskito" point of view.

You see, as an Engineer I sometimes confuse myself with the vector, complex and matrix entities representation for 2 and/or 3 dimension figures. This is someting I try to deal with, but I actually need to think two or three ways prior to get to a conclusion. After using the HP15C for a long time before having an HP28S and then get into the wonderland of the RPL objects, I got used to convert between polar to rectangular and use both as numbers, as I think most of us here do. Then I bought an HP48G and things became a little complicated at the begining.

In fact, after tasting the frustration of not having the angle and intensitiy of the vectors as numbers directly (instead simply representations) I figure that the need for numbers was only in my head. In fact, (5+i5) represents the same entity represented by (sqrt(50)<45°). And that's how I deal with vectors, complex numbers and linear matrix with less than 4 elements: I no longer convert between representations, I simply read them. I

actually don't need to convert when using the calculator (HP42S, HP28S, any HP48/49) because the calculator itself deals with them "as is". If I need any part of a 2D entity, I use RE (real part), IM (imaginary part), ARG (argument, or angle) or ABS (intensity).

So, have you tried:

```
(5 5) (10 10) -
```

instead of:

```
[5 5] [10 10] -
```

Then you can see the polar representation of the resulting complex number (you could use [MODE][Coord System][CHOOS] and select Polar or Spherical). You'll see (7.07106... <-135) (I don't know how to show it as (7.07106... <225), sorry...). As an alternate method of getting the argument:

```
(5 5) (10 10) - ARG
```

and you'll have the angle.

I am not aware of your specific needs, so I hope you forgive me posting a message that will probably not fit your needs, but I guess that someone else's point of view (even if it is a "moskito" point of view) might give you the chance to reason in another way and find your own solution.

Cheers.

Luiz (Brazil)

Re: Vector Issues (49g+) (edited)

*Message #3 Posted by **Francesc Casanellas** on 1 Dec 2004, 2:42 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

You do not need to work with complex numbers to see them in polar notation.

When entering vectors if you enter integer numbers, the calculator keeps them as such. So you have to enter them as REAL, just adding a dot at the end, i.e.:

[10. 10.] [5. 5.] and then you will see the polar result if cylindrical mode in vector menu or polar in MODE, is selected.

Re: Vector Issues (49g+) (edited)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 1 Dec 2004, 6:35 a.m.,*
in response to message #3 by Francesc Casanellas

Hi, Francesc;

thank you for your additional info (at least for me). I was not aware of this real and integer different behavior when entering vectors. After reading your post I relized that I've been taking as a curiosity the fact that the HP49 always adds a dot to a real number when STD mode is set, and the HP48 doesn't. Now I see taht this "dot" must be taken into account!

Thanks!

Luiz (Brazil)

Real numbers and exact integers (49 series)

*Message #5 Posted by **James M. Prange** on 1 Dec 2004, 10:05 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Well, make that "Exact" and "Approximate" modes for how the calculator treats integer valued numbers without decimal points. STD mode affects how reals are displayed.

This applies to the 49 series only.

An "exact integer" (also known as a "zint") can often be used where you'd normally use a "real" number because many commands start out by converting it to a real, but actually they're distinct object types, type 0 for reals, and type 28 for zints. In other cases, if any reals are involved in the operation, then all zints involved are converted to reals. In exact mode, if no reals are involved, then the result of an operation with zints is either a single zint or an algebraic (symbolic) object. With the calculator in exact mode, 1. 2 / returns .5, but 1 2 / returns '1/2'. Perhaps more to the point, 1. 3 / returns .333333333333 (an approximate result), but 1 3 / returns '1/3' (an exact result).

As you've noticed, zints and reals can't always be used interchangeably. Note that in IOPAR and PRTPAR, zints can't be substituted for reals.

In the case of arrays, if the elements aren't either all real numbers or all complex numbers, then it's a symbolic array (type 29). Symbolic arrays can include names, algebraic objects, and zints as elements, as well as real and complex numbers.

Note that a zint can have as many digits as can fit into the available memory.

To force a zint to a real, use the \->NUM command (over RightShift [ENTER]). To change all zints in a composite (program, list, or algebraic) to reals, with the 49 in approxomate mode, EDIT the object, and then press ENTER to recompile it. To toggle between exact and approximate mode, press [ENTER] while holding down RightShift. In the status area, note the = for exact or ~ for approximate.

Regards,
James

Re: Real numbers and exact integers (49 series)

*Message #6 Posted by **James M. Prange** on 1 Dec 2004, 11:54 a.m.,*
in response to message #5 by James M. Prange

PS:

There's also an I\->R command, which changes a zint to a real and leaves a real as is, and an R\->I command, which changes a real to a zint and leaves a zint as is. These can also be used on a list, provided that all elements are either reals or zints.

Regards,
James

Re: Real numbers and exact integers (49 series)

*Message #7 Posted by **bill platt** on 1 Dec 2004, 12:24 p.m.,*
in response to message #6 by James M. Prange

Hi James,

I once had both Erable and ALG48 on my 48gx, for a short time (and then "invalid card data" ended it). I seem to remember that there was support for this business there. In fact, how similar is the 49G (not the G+ necessarily) to either/or Erable/Alg48? Didn't the Authors of those applications work directly for HP in the 49 development, just as JYA did in migrating MetaKernel over to the 49?

I guess what I am interested in, is whether this interesting discussion applies also to our "vintage" models--provided that one has the cards. If so, it is useful to know this.

Regards,

Bill

regards,

Bill

Re: Real numbers and exact integers (49 series)

*Message #8 Posted by **James M. Prange** on 1 Dec 2004, 10:18 p.m.,*
in response to message #7 by bill platt

I'm not very familiar with either ALG48 or Erable (it's been a long time since I've had them on my 48), but the 49 series' CAS (Computer Algebra System) is supposed to be a superset of Erable. I don't think that Bernard Parisse (Erable's author) was an HP employee, but rather that the CAS development for the 49G was outsourced to him. I understand that the functionality of ALG48 is pretty much incorporated into the 49G, but I don't know what connection its authors (Claude-Nicolas Fiechter and Mika Heiskanen) might have with HP. Of course, the 49g+ pretty much uses the 49G ROM with few changes running on emulated 49G hardware.

For a lot more information on these matters, try some searches of the comp.sys.hp48 newsgroup archive, and if that doesn't tell you enough, then post a question to the newsgroup.

Regards,
James

HP 71B-CMT 128K Module: which ports?

*Message #1 Posted by **Marcus von Cube** on 21 Nov 2004, 6:29 p.m.*

Hi,

I recently found a CMT 128K RAM module for the card reader port my 71B. Can someone tell me how it is organized and which port numbers are occupied by the module and can therefore be freed with FREEPORT?

Marcus

Re: HP 71B-CMT 128K Module: which ports?

*Message #2 Posted by **Garth Wilson** on 21 Nov 2004, 8:26 p.m.,*
in response to message #1 by Marcus von Cube

Card reader port is port 5, so you'll have 5.00 for the first 32KB, 5.01 for the next 32KB, then 5.02, and 5.03.

I got the same thing in 96KB. At the time, they were available up to 160KB, but memory was very expensive back then, and I had set a budget, and bought the biggest one it would allow for. Later I was able to get another 64KB for a front port. There was also a service that would hard-wire in 256KB if you'd send them the computer, so you could still have all your ports available for other uses.

Re: HP 71B-CMT 128K Module: which ports?

*Message #3 Posted by **Marcus von Cube** on 22 Nov 2004, 6:01 p.m.,*
in response to message #2 by Garth Wilson

Thanks, I freed two ports (5.03 & 5.02)

Now I have to organize my files (to be honest, it's just one file for now but I want to see that changed...)

HP49g+ Keyboard

*Message #1 Posted by **Eddie Shore** on 21 Nov 2004, 2:19 p.m.*

First of all, the keys on the newer batches CNA 426-436 are the best keyboards yet. See holyjoe.net (Joeseph Horn) to order 49G+s for a great deal.

I have also noticed that there can be a significant improvement in keyboard performance if the clock is turned off. Could the clock on the display be blocking keypresses?

Re: HP49g+ Keyboard:Junk

*Message #2 Posted by **J.C. Randerson** on 21 Nov 2004, 3:18 p.m.,*
in response to message #1 by Eddie Shore

After several with bad keyboards, the hassle of exchanging them, and the disappointment of getting yet another defective, I've given up on that machine. The 49+ is a failure, due it's malfunctioning keyboard. You couldn't give me one right now.

The whole keyboard issue really started with the first 49. Those awful rubber keys had to be one of the worst designs in calculator history. I had one where the paint wore off some keys in just a month.

Sad part is, I have a 48 that still functions perfectly, and a great workhorse TI89 that gets most of the calc use I do. The machine I really wanted, the 49+, is gathering dust. I see no hope for HP calculators as long as the company is run by Fiorina and non-engineering oriented consumer-market types.

Re: HP49g+ Keyboard:Junk

*Message #3 Posted by **John** on 21 Nov 2004, 5:13 p.m.,*
in response to message #2 by J.C. Randerson

Might have been your experience and certainly others have reported similar problems.

However, the original poster was trying to convey how GOOD the keyboard is on his new 49g+ with the S/N as listed.

Why go back and trash the product after you've given up on it?

perhaps now is the time to try it again. If HP improves it now, and you never give it a chance now, then you'll never know.

Re: HP49g+ Keyboard:Junk

*Message #4 Posted by **J.C. Randerson** on 21 Nov 2004, 6:38 p.m.,*
in response to message #3 by John

>Why go back and trash the product after you've given up on it?

To warn others not to waste their money on it.

>...perhaps now is the time to try it again. If HP improves it now, and you never give it a chance now, then you'll never know.

Considering that I went through 3 bad units of different serial numbers, each supposedly "improved", what is the probability of getting another bad unit on the fourth try? At this point, 3 times is enough, I'm done with it.

Re: HP49g+ Keyboard:Junk

*Message #5 Posted by **Eddie Shore** on 21 Nov 2004, 7:40 p.m.,*
in response to message #4 by J.C. Randerson

I understand your frustration, J.C. The first batch that was released in 2003 was horrible, not only the keypad was bad, but also the trim on mine started to fall off! I sent it back for a replacement in March 2004. That model, which I still have, the keyboard has improved, but is loud. The latest batch September/October 2004 the keyboards are far better. The keys are not hard to press and they register (does taking the clock off the display help?).

The HP team better take the keyboard design and taticality into consideration because they are losing customers.

Re: HP49g+ Keyboard:Junk

*Message #6 Posted by **Ed Look** on 22 Nov 2004, 9:19 p.m.,*
in response to message #5 by Eddie Shore

Well, to be fair, I very recently sent my original pre-ordered model in exchange for these newly manufactured ones and while the keypresses still miss every now and every then, it is really much, much better and feels okay.

In fact, my original one was pristine when I sent it back, as I would reach for my other HPs instead. But with this exchanged unit, I have actually begun to use it.

Now, where was that constants library to be found... ?

Re: HP49g+ Keyboard:Junk

*Message #7 Posted by **Eddie Shore** on 22 Nov 2004, 11:37 p.m.,*
in response to message #6 by Ed Look

Accessing the constants library:

1. Type CONLIB

-or-

2. Press APPS, 3, ENTER

Re: HP49g+ Keyboard:Junk

*Message #8 Posted by **Ed Look** on 23 Nov 2004, 8:16 p.m.,*
in response to message #7 by Eddie Shore

Like a certain cartoon I don't really want my kids to watch, from one Ed to another-

thanks!

It truly has been quite some time since I actually used the 49G+, so I've forgotten quite a bit about how to navigate it. But now, I most probably will use it a lot. Since in this category I only have a 48G and 48G+, and their program memory is limited (severely in the former case), I'll most likely start putting little personal programs... nothing really sophisticated... on it and go from there.

It's really an excellent idea by HP to make it use relatively cheap SD cards for memory, as all those little nickel and dime programs may add up to a megabuck... or gigabuck if I'm sloppy!

As soon as I get acclimated more with it, I'll try to remember to post my opinion of how it compares to the original 48G series, the Charlemagnes, I believe.

I must say, I did enjoy using the 48G series, though I have never used a GX.

A real dream would be to somehow circumvent the limitations and hook a 34C up to some cheap sticks of RAM!

Again, thanks a giga!

I have a 64MB card...

*Message #9 Posted by **Eddie Shore** on 25 Nov 2004, 1:13 a.m.,*
in response to message #8 by Ed Look

and I still have not filled it up. I have two home backups on it.

HP should make the calculator case accomodate space for the SD card.

Re: I have a 64MB card...

*Message #10 Posted by **Homer** on 25 Nov 2004, 1:06 p.m.,*
in response to message #9 by Eddie Shore

Hi Eddie,

I have an HP49G+ calculator and a panasonic 64MB SD Card (from a Digital Camera), but my calculator didnt recognize this SD Card. The SD card must be special for HP or I can use wichever ??

Thanks.

*Message #11 Posted by **Ed Look** on 25 Nov 2004, 11:47 p.m.,*
in response to message #10 by Homer

I think the SD card has to be formatted properly; that is, in FAT, I believe. I could be wrong I hope someone who knows for sure speaks up, as I don't remember!

Re: I have a 64MB card...

*Message #12 Posted by **James M. Prange** on 26 Nov 2004, 2:40 a.m.,*

in response to message #11 by Ed Look

The SD card has to be formatted with the FAT16 file system.

Try using the 49g+'s built-in formatting capability: Hold down [ON], press and release [D}, release [ON]. After briefly displaying some information about the flash ROM version and build, it will display a list of options, mostly tests, but also FORMAT; press [9]. When it's finished, to get out of the tests mode, hold down [ON], press and release [C], release [ON] to force a warmstart.

If that doesn't work, use your PC to format the card to "FAT" or "FAT16"; not "FAT32". If you have a choice, use the appropriate cluster size for your card, that is, 512 bytes for 32MB or smaller cards, 1024 bytes for 64 MB cards, 2048 bytes for 128MB cards, and so on.

For formatting on the PC, be sure that the switch on the card isn't in the "Lock" position.

Note that the 49g+ itself ignores the "Lock" switch on the card.

It may be a good idea to use the 49g+ to format the card again once the PC has formatted it to the FAT16 file system.

Regards,
James

Re: I have a 64MB card...

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 26 Nov 2004, 5:14 a.m.,*
in response to message #12 by James M. Prange

Hi;

I have a 256MB SD card and I just inserted it in my HP49G+ and used it. The calculator promptly recognized the card and free space (through [FILES]). Should that mean the card I have is already formatted? It is a regular card, there is no specific mention on its brief about formatted contents, only that it can be used with any electronic (digital) device, such as digital cameras, recorders, calculators, etc. I did not find the brief, but I kept it somewhere, so I can add a post with the specs (brand, model, etc.)

Cheers.

Luiz (Brazil)

Re: I have a 64MB card...

*Message #14 Posted by **Ed Look** on 26 Nov 2004, 12:59 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

I think many, of not most SD cards come preformatted from the factory.

Re: I have a 64MB card...

*Message #15 Posted by **Homer** on 26 Nov 2004, 10:21 a.m.,*
in response to message #12 by James M. Prange

Hi James,

I tried to format the SD card on HP49G+ as you said but the display showme CARD TEST FAIL.

I tried too formating the card on my PC, the format is Ok but in the HP49G+ didnt work.

I think the card is Ok, because in the camera is working.

Any other idea ??

Regards.

Re: I have a 64MB card...

*Message #16 Posted by **Ed Look** on 26 Nov 2004, 12:58 p.m.,*
in response to message #15 by Homer

Well, all SD cards have a tiny sliding switch that toggles it between being write-protected and being recordable.

Perhaps it may be a good idea just to check it.

Other than that, it may be formatted in a different system.

If you want to reformat, save your photograph images on your PC or CD or something before you do so.

SanDisk cards did not require preformatting.

*Message #17 Posted by **Eddie Shore** on 26 Nov 2004, 1:29 p.m.,*
in response to message #16 by Ed Look

All I had to do was insert the card, pressing Green-Left Shift, Files and I was ready to go.

Re: SanDisk cards did not require preformatting.

*Message #18 Posted by **Mark A. Ordal** on 29 Nov 2004, 10:20 a.m.,*
in response to message #17 by Eddie Shore

I had the same experience as Eddie Shore when using a 128 M Toshiba SD card---just insert the card and start using it.

HOWEVER, my previous experience with a Sandisk 128

M SD card was quite different. I never did get that card to work in a 49G+ (neither my own nor a friend's). I ended up using the Sandisk card in my trusty old Palm m505.

--Mark

Re: SanDisk cards did not require preformatting.

*Message #19 Posted by **Jeroen** on 29 Nov 2004, 3:47 p.m.,*
in response to message #18 by Mark A. Ordal

FWIW: I never had any problems using a Sandisk 256M SD card in my 49G+. It worked straightaway, without the need to format it.

Re: I have a 64MB card...

*Message #20 Posted by **James M. Prange** on 28 Nov 2004, 12:41 a.m.,*
in response to message #15 by Homer

Try a disc drive checking utility such as MS ScanDisk or Norton Disk Doctor on the card in the reader. Make sure that it's formatted with the FAT16 filesystem.

Did you try formatting the card with the 49g+ again after formatting it with your PC?

There have been some reports of 49g+es with a problem with the SD card.

What would be ideal would be to try the card in a known good 49g+, or a card known to work in another 49g+ in your calculator, but I realize that it may not be feasible for you.

Do you have a different SD card or MultiMedia Card (MMC) that you could try in your 49g+?

Regards,
James

Re: I have a 64MB card...

*Message #21 Posted by **Homer** on 29 Nov 2004, 10:21 a.m.,*
in response to message #20 by James M. Prange

Hi James,

I tried to format the SD card on HP49G+, but the calculator didn't recognize the card.

I think the problem is the card, because I tried in other calculator (exhibition calculator on Office Depot store, Mexico) and the SD card didnt work again.

May be the solution is to buy a new SD card, but Im worry because Im not sure if the problem is the card.

Let me try using the scan disc utility.

I tell you tomorrow the results.

Thank you for you help.

Re: I have a 64MB card...

*Message #22 Posted by **Homer** on 29 Nov 2004, 10:30 a.m.,*
in response to message #20 by James M. Prange

When I try to format the SD card, the computer show me 3 options :

- FAT - FAT32 - NTFS

Im using FAT, but the card didnt work on my calculator. How can I format with FAT16 filesystem ??

Re: I have a 64MB card...

*Message #23 Posted by **James M. Prange** on 29 Nov 2004, 3:48 p.m.,*
in response to message #22 by Homer

Given those three choices, "FAT" is almost certainly FAT16. "FAT32" and "NTFS" are definitely wrong for using the card in the 49g+.

MS Windows Explorer "Properties" says "File system: FAT" for my card.

Regards,
James

Re: I have a 64MB card...

*Message #24 Posted by **Eddie Shore** on 26 Nov 2004, 1:27 p.m.,*
in response to message #10 by Homer

I have a SanDisk card. Even though the manual doesn't specify which brand works, so maybe the Panasonic was formatted only for pictues?

Re: HP49g+ Keyboard:Junk

*Message #25 Posted by **Veli-Pekka Nousiainen** on 24 Nov 2004, 11:45 a.m.,*
in response to message #4 by J.C. Randerson

Bad luck! I'm using one old and one new 49g+.

The first one is wiggle fixed and the second needed single lock alpha.
Also I have used several others and I can confirm that while this is a problem for HP (and JC) it's not a problem to me and many others.

41 Auto shut-off

*Message #1 Posted by **Ulrich Heller** on 21 Nov 2004, 3:08 a.m.*

Hi 41-world out there !

I´m a HP (41)-collector for roundabout 1 year. I got two CV´s (fullnut) and several peripherals for them. All is in excellent optical and working condition. The only problem is : auto shut-down occurs after a mere 30 seconds. For my older brain this is often too fast to finish thinking about the next keystroke. The Handbook tells that i have 10 minutes time until shut-off. I guessed that there is a certain R/C-circuitry controlling this time and that a capacitor is just fatigue an should be changed. But looking at the schematics i could not identify the appropriate circuitry and the capacitor. Can anyone help me fixing that problem ?

Kind regards Uli

in response to message #2 by Randy

Thanks Randy!

That was a great hint!

I tried it out immediately and for the first time i saw the inner life of that miracolous machine. First i thought "sh.." when i saw the fine-line contactors. But after thoroughly cleaning and drying i reassembled the 41. After the first power-on the display shows crazy signs. "Gulp". So i did shortcut the power contacts and inserted the bateries again. WHHHEEEE !!!! It runs and even my programs are still there! Shut-down time is now 9:30 minutes and that´s O.K. for me. By the way: can i use this time as an indicator for cleaning-service intervals? Nevertheless, i would never have found that thread without your assistance

THANK YOU RANDY!

Greetings

Uli

Re: 41 Auto shut-off

*Message #4 Posted by **Garth Wilson** on 21 Nov 2004, 5:21 p.m.,*
in response to message #3 by Ulrich Heller

I always disable the time-out. You can do that by executing ON or setting flag 44. Since I have my 41cx automatically do various things at turn off and turn on, I assigned the sumation key to my TOFF (turn-off) routine. One of the things TOFF does is set flag 11 so immediately upon turn-on, the program picks up execution again automatically. When it turns on, it sets the continuous-on flag (44), and checks to see if there's anything in my DAYTMR (daytimer) file that it's time to remind me of. If not, it goes on to see if there's an alarm pending, and if so, shows how much time is left before it comes due. Otherwise, it just puts the time and date in the display. Being on a 41, it's not instant, but the small delay is not a problem. I never use the ON key to turn the machine off, or let it time out. I suppose the time-out is good for forgetful people, but I find it quite annoying.

HP-41C high freq. beep

*Message #1 Posted by **Erik Wahlin** on 21 Nov 2004, 1:17 a.m.*

I ahve a couple of HP-41CV calculators tghat just emit a high frequency beep when they are turned on. Does anybody know what might be the problem? Thanks!

Re: HP-41C high freq. beep

*Message #2 Posted by **Karl Schneider** on 21 Nov 2004, 1:54 a.m.,*
in response to message #1 by Erik Wahlin

Are these fullnut (1979-1984) or halfnut (1985-1990) units? (Check out this website for details.)

I bought a fullnut 41CX that displayed gibberish and emitted a high-pitched tone, punctuated by pulses at-one-second intervals. (The CX clock might have explained the pulses.)

An ultrasonic cleaning and resoldering of bad contacts by www.fixthatcalc.com fixed the problems.

NOTE: Fullnuts are more servicable and repairable than halfnuts.

Re: HP-41C high freq. beep

*Message #3 Posted by **Raymond Del Tondo** on 21 Nov 2004, 12:00 p.m.,*
in response to message #1 by Erik Wahlin

Hi,

this usually occurs when the tone register hasn't benn resetted properly,
which can be the case after a lockup or after inserting batteries

Perform a BEEP (press SHIFT 4) and the HF tone will go away.

Raymond

Re: HP-41C high freq. beep

*Message #4 Posted by **Jon** on 21 Nov 2004, 1:54 p.m.,*
in response to message #1 by Erik Wahlin

Hi:

A full reset should solve that problem. Schitch off the calculator. Press "del" (keep it preseed)and then "on/off". Release "on/off" and finally release "del". If you read MEMORY LOST the reset is done.

Good luck

Re: HP-41C high freq. beep

*Message #5 Posted by **Erik Wahlin** on 23 Nov 2004, 11:19 a.m.,*
in response to message #1 by Erik Wahlin

I could not perform a machine reset and the squeeling persists.

Re: HP-41C high freq. beep

*Message #6 Posted by **Jon** on 23 Nov 2004, 12:21 p.m.,*
in response to message #5 by Erik Wahlin

Hi:

Remove the battery pack and short the end battery terminals together (just for a moment). Install batteries again. May be you have to press the ON key more than once to turn the calculator on. If it doesn´t work you need it to be internally cleaned.

Regards

Jon

"Cheap" HP 32SII

*Message #1 Posted by **Ronald** on 20 Nov 2004, 5:27 p.m.*

Hi,

Interested in the buy of the month, see: http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58039&item=5733118848&rd=1

It is with free shipping.

Ronald

Re: "Cheap" HP 32SII

*Message #2 Posted by **Luis** on 20 Nov 2004, 6:07 p.m.,*
in response to message #1 by Ronald

I believe he forgot to divide that number by 10!

Re: "Cheap" HP 32SII

*Message #3 Posted by **Namir** on 20 Nov 2004, 9:15 p.m.,*
in response to message #2 by Luis

Maybe he was using an HP33s (with it's tiny decimal) to calculate the selling price. LCD must have looked like 999.

<VBG>

Re: "Cheap" HP 32SII

*Message #4 Posted by **Ronald** on 21 Nov 2004, 6:33 a.m.,*
in response to message #3 by Namir

I honestly feel that the oldies are the best, so back to the classics and voyagers, saves some embaresments.

However I will take your avise and give a 33 to my manager when the annual salary review is up.....

Ronald

Re: "Cheap" HP 32SII

*Message #5 Posted by **Namir** on 21 Nov 2004, 9:26 a.m.,*
in response to message #4 by Ronald

Ronald,

I like your idea about putting the 33s into good use (at job review times). That makes the 33s a winner!

Re: "Cheap" HP 32SII

*Message #6 Posted by **Bram** on 22 Nov 2004, 6:25 a.m.,*
in response to message #1 by Ronald

The dollar rates rather low against the euro lately, but not that low, does it?

Re: "Cheap" HP 32SII

*Message #7 Posted by **Chan Tran** on 22 Nov 2004, 12:00 p.m.,*
in response to message #6 by Bram

Well nobody bid on it. I have one of those 32SII also in perfect condition and with manual. I guess I can just keep the manual but I wonder what name he engraved on the back of the calc to make it's so valuable?

Flash memory

*Message #1 Posted by **Gary** on 20 Nov 2004, 2:08 p.m.*

Hello, Does more flash memory improve speed as far as 3D graphing goes? Has anyone tried comparing the calculating time required before displaying a graph on the TI-92 plus vs TI Voyage 200 vs HP graphing calcs (I am not familiar with the various HPs , which would be the best graphing one?) The TI-92 plus has 384K of flash mem vs the Voyage 200 having 2.5MB of flash... big difference. Or, is flash tied in only to amt of storage, and not actual run time ? Do the HPs graphers work better/ faster than the TIs ? What are the differences between Cabri geometry and Geometers sketchpad ? I am familiar w sketchpad. What would be some compelling reasons to choose an HP grapher over a TI ? I am familiar w RPN from owning an HP 12C. Sorry, lots of questions :) I am looking to get a great graphing calc, and trying to make an informed decision....

Thanks , Gary

Re: Flash memory

*Message #2 Posted by **Hugh Evans** on 20 Nov 2004, 3:36 p.m.,*
in response to message #1 by Gary

The amount of flash memory shouldn't have an impact on graphing speed. How quickly a graph is rendered depends on processor speed, the efficiency of the code and RAM. I'm not sure if much has been done to compare speed between the 49G+ and TIs for graphing, which would probably provide a more useful answer to your question.

I would venture to guess that the 49G+ will be the fastest.

Re: Flash memory

*Message #3 Posted by **Ed Look** on 20 Nov 2004, 5:33 p.m.,*
in response to message #2 by Hugh Evans

Well, on Colin Croft's 38G/39G/40G/39G+ site, he features an excellent comparison of the 39G vs. the TI83+ :

http://members.iinet.net.au/~ccroft/timwesmn/ti83-hp39.pdf

but I don't know if this is valid for the comparisons you want to make, Gary.

Re: Flash memory

*Message #4 Posted by **Gary** on 21 Nov 2004, 1:50 a.m.,*
in response to message #3 by Ed Look

Hugh and Ed, Thanks kindly for the info.

Gary

HP-42S + 82240: what do NORM and TRACE modes do?

*Message #1 Posted by **Thomas Okken** on 20 Nov 2004, 11:01 a.m.*

Hi all,

For the printer emulation in Free42, I need to find out what the NORM and TRACE printer modes are supposed to do -- what do they print, and when, and maybe what side effects they have (IIRC the HP-82143 prints programs in a compact format if TRACE mode is on; does the 42S/82240 combo do something similar? -- things like that). Any information will be of help, and some samples (scans, INPRT grabs, whatever) would be terrific.

Thanks!

- Thomas

Re: HP-42S + 82240: what do NORM and TRACE modes do?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 Nov 2004, 11:42 a.m.,*
in response to message #1 by Thomas Okken

Hi, Thomas;

TRACE mode enables the HP42S printer output to literaly trace any calculator operation, even in a running program. Whatever you do will be "followed" by the IR output (ALPHA code for each key pressed, every resulting value, etc.).

NORM(al) mode enables the HP42S output to send all resulting display from operations to the printer. It's sort of a "short form" for TRACE.

If it helps, I can detail it for you and even "capture" some output data from an HP42S through an HP48G IR input (with inprt running) as an example of what you should have. In fact, I have already some stuff ready, I just need to find it. Just send me an e-mail with a valid e-address and I'll do that:

lcvieira at quantica dot com dot br

Best regards.

Luiz (Brazil)

Edited: 20 Nov 2004, 11:50 a.m.

Re: HP-42S + 82240: what do NORM and TRACE modes do?

*Message #3 Posted by **Chan Tran** on 23 Nov 2004, 3:00 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I believe in NORM the printer would print out all data entries and operation (+,-,*,/ etc..) but not print out any intermediate or final results.

You're right!!!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 23 Nov 2004, 4:00 p.m.,*
in response to message #3 by Chan Tran

Hi, Chan Tran;

you are correct, my fault. I remembered NORM was sort of a "restricted" trace, but I hasd in mind it followed the resulting actions. In fact, it follows the actions themselves, without intermediate results, unless you actually PRINT something.

Thanks!

Luiz (Brazil)

Hp 17BII NEEDS URGENT HELP

*Message #1 Posted by **Will** on 20 Nov 2004, 10:31 a.m.*

Hi dear friends...

my almost new hp 17bII, which i use very few and always worked very well began to have serius problems....

i fit it with new bateries yesterday (i actually bought them for other calc) and it was working OK..i use the batteries a little for test a hp 12c and then i use the same batteries for my trusty 17BII (which already had worked with these batteries as i said)...but it´s not working well...in fact have a serious malfunction...as soon as i power it up..it shows the following message: STMPA DOPPIO SPZIO:

IT do appears to pass the selftest but as soon as it is recovered after this selftest returns again to this message: STMPA DOPPIO SPZIO: as waiting for a answer from the menu keys (which do not appear anyway)...i pushed the menu keys, the message dissapears but the things goes worst..the screen turned blank and do not work at all...if you wait a little and power it up again the cycle repeat...I would be VERY grateful if some of you could help me..it´s real pity to loose this excelent calculator...

Re: Hp 17BII NEEDS URGENT HELP

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 Nov 2004, 4:31 p.m.,*
in response to message #1 by Will

Hi, Will;

I suspected that this is an italian message, so I used AltaVista Babel fish translator with the following sentece:

```
STAMPA DOPPIO SPAZIO
```

and it returned the following as the English equivalent:

```
Press double quantity space
```

In fact, this is one of the standard Italian messages available in the HP17BII (print with double space, or double space printing). I guess it is now locked in an internal loop with Italian language set as current language.

Have you tried to reset the calculator contents to the default? I mean, maybe after changing batteries with the HP12C (or any other calculator) you allowed a small quantity of electrostatic charge to interfere in the HP17BII circuits. You could try a brief short circuit (just a small touch) connecting the calculator's batteries contacts while the batteries are in. That would prevetn ESD to spread inside the calcualtor (as it seems this has already happened).

After that, try the calcualtor again and let us know.

Success.

Luiz (Brazil)

Edited: 21 Nov 2004, 11:17 a.m.

Re: Hp 17BII NEEDS URGENT HELP

*Message #3 Posted by **will** on 21 Nov 2004, 12:57 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz..i just reset the calculator memory pressing clear(on)+left upper menu key +right menu key(as i found at the HP website´s support pages) and the calc began to work well again...thinking now as you said maybe was a electrostatic discharge due to the batteries change, this appears to be a common problem shown by this model because it´s outlined in the manual as well as the procedure you told me..

thanks a lot...

Will.

broken screen

*Message #1 Posted by **Lawrence** on 19 Nov 2004, 3:21 p.m.*

The new HP 49g+ has a design problem with the carring case. If the screen is facing the medal snap, pressure could cause the screen to break. I would like to know if there were anyone else that had this problem. Maybe a new medal carring case would fix the problem.

Re: broken screen

*Message #2 Posted by **Ed Look** on 20 Nov 2004, 2:21 p.m.,*
in response to message #1 by Lawrence

Lawrence, this may sound like a stupid reply, but I am serious. I noticed that too, so when I remove my 49G+ from its case, since I'm righthanded, I use my right to hold the case while my left hand pulls the calculator out. If you do it this way, the back of the left hand keeps the flap with the metal button from touching the calculator while it is being taken out.

Re: 41 translation module for the HP-71B

*Message #3 Posted by **Joao** on 19 Nov 2004, 1:55 p.m.,*
in response to message #2 by Mike (Stgt)

Great, now I know two ways of turning it off. But how do I turn it on?

Re: 41 translation module for the HP-71B

*Message #4 Posted by **Diego Diaz** on 19 Nov 2004, 2:36 p.m.,*
in response to message #3 by Joao

Hi there,

In case you don't feel comfortable with any of the advices above, you may want to try the following:

Type "BASIC" to get your 71B to "normal" Basic operation.

A look at page 18 on the manual (or the MoHPC's CD for that matter) will show the whole "Environment" switching table.

Best.

Thank Goodness for MoHPC

*Message #1 Posted by **Fred Lusk** on 18 Nov 2004, 10:01 p.m.*

It's a scary world out there. During a recent Google search for "HP-35" I ran across the following gems. This esteemed group needs no help figuring these out, but comment I must.

*** Paraphrased: "I bought my HP-35 when it first came out in 1972 for $150." [Must have been stolen.] *** Paraphrased: "The HP-35 was the world's first programmable calculator. I spent countless hours programming my HP-35." [Mine must be defective.] *** A direct quote from Mathpad.com: "Calculators that use Direct Algebraic Logic are favored by most scientists and engineers over the more common Reverse Polish Notation type of calculator." [(1) At least the smart scientists and engineers still favor RPN. (2) Did HP really produce enough HP-41s, HP-32SIIs, and HP48s to overtake all the $1.98 algebraic logic masterpieces at the grocery store?]

Fred

Precious gems you posted! (EDITED)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 Nov 2004, 10:05 p.m.,*
in response to message #1 by Fred Lusk

Hi, Fred;

Wow! Where did these guys find the HP35 (supposedly new) in 1972 for US$150.00 (it was introduced for almost $400,00 in the same year)? And where did they find the PRGM/RUN switch in the HP35? Now let me know where in the planet is RPN so common that the (?) Direct Algebraic Logic (DAL?) is something to be "favored" instead of simply used?

Precious gems!!!! Thanks.

Luiz (Brazil)

Edited: 19 Nov 2004, 2:51 p.m.

Re: Thank Goodness for MoHPC

*Message #3 Posted by **Ed Look** on 18 Nov 2004, 11:32 p.m.,*
in response to message #1 by Fred Lusk

Fearing that my 48G was too bulky to use everyday at one time, and taking my 32SII out of the house was simply out of the question, I picked up one of those grocery store algebraic scientific specials.

It would have been slightly tolerable if I didn't have to resolder the lead from the circuit board to the LCD to get my display back. It hasn't been used in a long time.

Re: Thank Goodness for MoHPC

*Message #4 Posted by **Peter Khor** on 19 Nov 2004, 1:39 a.m.,*

in response to message #3 by Ed Look

"I picked up one of those grocery store algebraic scientific specials. It would have been slightly tolerable if I didn't have to resolder the lead from the circuit board to the LCD"

Why not spend a little more and get a great value sci. calc like a Casio fx-115MS for rough use?

interesting calc you got - I would have thot that 100% of calcs (esp cheap calcs) in the past decade uses film/ribbon cable btwn LCD and main board, and can't be solder easily.

Re: Thank Goodness for MoHPC

*Message #5 Posted by **Ed Look** on 19 Nov 2004, 1:46 p.m.,*
in response to message #4 by Peter Khor

Mr. Khor, this calculator is sold under the "Sentry" brand name and has a simple LCD display that is TILTABLE! there are two simple wires leading to the tilting display section from the body of the calculator. I guess I tilted it one too many times and one day, the fatiguing just broke the solder!

I don't know what I was thinking, except that I did not want to carry my 32SII when I bought that calculator... at the time HP had not come out with the 33S, (I now use for work a combination of the 33S and 48G, the latter for use a very handy portable data storage device, especially with the software I put on it [not much, as I leave the 48G+ home]). I do have a Casio, the fx-4200p, a nice machine, and quite powerful with a very nice display, but I have, like most of you, an overweening fondness for RPN.

Re: Thank Goodness for MoHPC

*Message #6 Posted by **Peter Khor** on 23 Nov 2004, 12:46 a.m.,*
in response to message #5 by Ed Look

Thanks for the info; haven't seen that calc (yet). fwiw, fortunately for me, my needs for a work calc during the past couple of years has drifted towards financial aspects, with the 17/19bii being my usual calcs these days (if not a PDA, but where the fun in those ;)). 42S, 15C, and the others sit nicely on display for a well deserved retirement. The Casio's nice to have one to throw in the car, etc.

Re: Thank Goodness for MoHPC

*Message #7 Posted by **Bob** on 19 Nov 2004, 9:02 a.m.,*
in response to message #3 by Ed Look

Although I have a variety of HP's (mostly too valuable to carry), I carry 48GX's when I am doing regular work.

...However, I carry a $7 TI36X Solar calculator in my portfolio for casual use. It has been dropped about 1000 times and I don't mind loaning it to others in meetings. Besides, I bought a pile of them at that price. If it happens to break, I will just throw it as far as I can and pop open a new one. (It's going on 2 years now) I give them to the kids when they forget their calcs at school. It is tough, cheap, capable, and works everytime. You can't ask for more than that.

I am a die-hard HP fan, but since they took away the 42S and the 48G series, they have not given me much to cheer about. JMHO.

Re: Thank Goodness for MoHPC

*Message #8 Posted by **Trent Moseley** on 19 Nov 2004, 2:49 p.m.,*
in response to message #1 by Fred Lusk

Reading this thread reminded me of my first HP calc I purchased in 1978, a 25C (which I still have and it works beaufifuly). I bought it through an ad in "Scientific American", but I can't remember what I paid for it.

Can someone remember what they were going for mail-order?

Where to buy an HP49+ ?

*Message #1 Posted by **Bob** on 18 Nov 2004, 9:19 a.m.*

I was wondering where is the best place to buy a new HP49+ ? I remember seeing some wide swings in price, but don't have the links anymore.

(It was either a 49+ or a 33S, but I don't care for the layout of the 33.)

I'd buy from hpcalc.org (Eric)

*Message #2 Posted by **Gene** on 18 Nov 2004, 9:20 a.m.,*
in response to message #1 by Bob

Good price and you'd be helping support the great software archive at hpcalc.org too.

Gene

Re: I'd buy from hpcalc.org (Eric)

*Message #3 Posted by **Namir** on 18 Nov 2004, 10:50 a.m.,*
in response to message #2 by Gene

Good call Gene! I assume that Eric has the latest versions of the 49G+ with the better keyboard.

Namir

Re: Where to buy an HP49+ ?

*Message #4 Posted by **John Smitherman** on 18 Nov 2004, 10:48 p.m.,*
in response to message #1 by Bob

Hi Bob. It looks like Sam's Club has a club member price of $114.77 for the 49G+. I'm not sure what a membership costs these but I think it is $30 - $35. So, the first 49+ purchased would be break even and the member savings would kick in with subsequent purchases.

Here's a link with more information:

http://www.samsclub.com/eclub/main_shopping.jsp?coe=0&oidPath=0%3a-23542%3a-23589%3a-37823&mt=a&n=0&BV_SessionID=_SC_1234850349.1100835548_CS_&BV_EngineID=ccccaddddjkmhmgcfkfcfkjdgoodflg.0

I hope that this helps.

Good luck shopping,

John

Re: Where to buy an HP49+ ?

*Message #5 Posted by **Bob,** on 19 Nov 2004, 9:04 a.m.,*
in response to message #4 by John Smitherman

Great, I am already a Sam's club member.

I will also check hpcalc.org for comparison.

Thanks for the help.

Transposing a matrix on a 48GX

*Message #1 Posted by **McKinley Lewis** on 18 Nov 2004, 7:55 a.m.*

I am looking to find out how I may perform a transpose on a matrix using a 48GX?

Re: Transposing a matrix on a 48GX

*Message #2 Posted by **Raymond Del Tondo** on 18 Nov 2004, 8:10 a.m.,*
in response to message #1 by McKinley Lewis

There should be a command like TRN...

Re: Transposing a matrix on a 48GX

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 Nov 2004, 12:37 p.m.,*
in response to message #1 by McKinley Lewis

Hi;

adding to Raymond's answer:

1 - you should have either the matrix itself or the name of the variable containing the matrix you want to transpose in stack level 1:
2 - execute TRN comand (like [MTH][MATR][MAKE][TRN])

That would do the trick.

Cheers.

Luiz (Brazil)

RPN demo with PC simulation HP-41

*Message #1 Posted by **Mike (Stgt)** on 18 Nov 2004, 6:34 a.m.*

If you need a 'life' demonstration of RPN I recomend RPNDEMO.EXE which runs in a Windows DOS-box if you use a slow down utility for fast PCs (option -f1 50000 -f2 30000 work fine for me) and Runtime Error 200-fix (no need to modify RPMDEMO.EXE). With the hope this info may be useful for someone. Have fun!

Ciao.....Mike

Precision of HP 30S

*Message #1 Posted by **Markus Sigg** on 18 Nov 2004, 5:27 a.m.*

Hi,

I read that the 30S works with binary representations of numbers, whereas most other pocket calculators use decimal numbers. And I read that its precision is equivalent to 24 decimal places.

Does anybody have an explanation for following results?

(a) 1E10 + 0.11 - 1E10 gives 0.11 (b) 1E10 + 0.01 - 1E10 gives 0

Instead of 0.11 in (a) you can use 0.12345678 also and still get the correct result. So what's happening in (b)???

Things like these make it rather difficult to rely on the precision of this calculator or to estimate error bounds.

Markus

Re: Precision of HP 30S

*Message #2 Posted by **hugh steers** on 18 Nov 2004, 7:56 a.m.,*
in response to message #1 by Markus Sigg

the hp30s and 9g models do, in fact, work in binary. they also, generally get the correct answers. but there are drawbacks to binary requiring the extra internal precision and also some devious value suppression going on.

its the supression that's expressing the behaviour you've seen. i wrote some stuff about working in binary here:

http://www.voidware.com/binarycalculators.htm

Re: Precision of HP 30S

*Message #3 Posted by **Markus Sigg** on 18 Nov 2004, 12:53 p.m.,*
in response to message #2 by hugh steers

I think a rounding scheme like that makes the 24 internal digits somewhat useless. I don't see a rational justification for supressing x=0.01, x=0.02, and x=0.03 when calculating 1E10+x but keeping all digits of x=0.11 or even of x=0.12345678.

Are you able to explain the mechanism a bit more detailed? It seems that 1E10+0.01 is changed to 1E10, but 1E10+0.11 is kept. What's the exact rule? Suppose the result of an operation is a. What does the calculator do with this number? Your rounding algorithm needs a second number b to check whether a~b. How does it find b? It seems to me that the decimal expansion of the numbers is used here. Doesn't this imply that a decimal number representation is used?

Markus

Re: Precision of HP 30S

*Message #4 Posted by **hugh steers** on 18 Nov 2004, 2:16 p.m.,*
in response to message #3 by Markus Sigg

its because 0.11 is roughly ten times bigger than 0.01.

here's how i think it works (really i'm guessing). it doesn't just use the final answer `a'. it compares `a' to one of the terms of the input 'b'. this suppression only applies to ADD and SUB at the top level and not to adds and subs used internally.

define ADD(x, y) to be 0 if |(x + y)/x| < eps, where eps = 1e-12, say. and ADD(x,y) to be x + y, otherwise.

define SUB(x, y) to be 0 if |(x - y)/x| < eps, where eps = 1e-12, say. and SUB(x,y) to be x - y, otherwise.

in the above "+" means the result of the floating point binary add (ie not true real number addition).

so, in your examples. ex1: 1e10 + 0.11 - 1e10 = 0.11 we have SUB(ADD(1e10,0.11), 1e10) = SUB(10000000000.11,1e10) = 0.11 because (10000000000.11-1e10)/10000000000.11 = 1.0999999..e-11 > eps

but, ex2: 1e10 + 0.01 - 1e10 = 0 because SUB(ADD(1e10,0.01),1e10) = SUB(10000000000.01,1e10) = 0, since (10000000000.01-1e10)/10000000000.01 = 9.9999999..e-13 < eps

Re: Precision of HP 30S

*Message #5 Posted by **Markus Sigg** on 21 Nov 2004, 7:10 a.m.,*
in response to message #4 by hugh steers

Your algorithm seems to be correct, thanks. Maybe eps=2e-12 is actually used.

My first thought was that certainly instead of |x+y|/|x| they use |x+y|/max(|x|,|y|), because the addition should be commutative. But they don't. So, for the HP 30S, 1e12 + 1 <> 1 + 1e12, and

1e12 + 1 - 1e12 = 0 1 + 1e12 - 1e12 = 1

Horrible! They build a calculator with excellent internal precision and blow it up by a stupid rounding algorithm.

NCEES new "approved calculator" list

*Message #1 Posted by **Karl Schneider** on 18 Nov 2004, 1:41 a.m.*

Yesterday, NCEES updated the "approved calculator" list on its website.

Bad news: They reduced the number of approved models in order to "reduce confusion among proctors and examinees". Now, the only permitted HP models are the 9S and 33S.

My lobbying effort -- a carefully-written 1-page letter advocating approval of the the 11C, 15C, and 20S -- unfortunately has failed. NCEES went the other way by eliminating all discontinued models, notably the ideally-suited, RPN-based 32S and 32SII.

They will review and revise the list annually, but I suspect that the only models approved under the new policy will be ones that are still in production.

Bummer!

Re: NCEES new "approved calculator" list

*Message #2 Posted by **Tom (UK)** on 18 Nov 2004, 7:22 a.m.,*
in response to message #1 by Karl Schneider

That's real bad news, even though I'm not directly affected. Someone who bought a new HP32SII a year or two ago would have to buy a new calculator.

Who or what funds the NCEES? Who act as a lobby for students and employers? If you want to change things follow the money...

I've not looked at the list but if the trend is true does that also eliminate many of the old TI and Casio calcs? If so collectively the young (and not so young) will be facing a big bill.

Re: NCEES new "approved calculator" list

*Message #3 Posted by **Ron Ross** on 18 Nov 2004, 8:26 a.m.,*
in response to message #2 by Tom (UK)

Years ago the NCEES was to certify the compentency of practicing engineers and to maintain that level regardless of whether the individual graduated from a presitigous school or what not. Nothing mattered except solid recommendations and how well you did on the exam.

As better tools became available the tests also made use of the extra power you were able to carry into the exam (as well as your references).

Today however the NCEES has evolved into a REAL business to large for the engineering core to really manage. And this core has been diluted by a more reasonable (actually less reasonable, but I am speaking about business policies) business management bunch.

And this bunch hires or provides one or two real professionals whose job is to oversee 10 part-time proctors (exam monitors) to administer the exam. These 10 people have NO idea or clue about what they are looking at. So to make it fair for all (remember, business fair and implementation), they list what is on the retail shelf today that is not a graphics or any out of date RPN or any other old POS. That way the procter can examine from a short list (the shorter the better) and judge whether the examinee is using an APPROVED calculator. Simple and easy.

And that is the easy way out. The calculators on the shelf today for $10-20 are supposed to be powerful enough for their exam. Good luck trying to argue otherwise.

I am hoping to be able to take the next exam. I am and will be ticked off their policies, but I am planning to work around any obsticales that are put between me and passing. I would prefer an Hp48G (which I used to pass my EIT). I would even prefer to use my Hp42s+ more than the 48G, but without real I/O it is always risky to bank on the memory with no fast restore or backup (for units conversions as I really like the units conversions of the 48G, but otherwise, I prefer the 42s). And that is not allowed either.

I have been using my Hp32sii quite a bit as I prefer the older keyboard layout and didn't want to buy another new Hp so quickly (I have the 49G+, actually my second).

Once you are used to a 42s and its extra features (and especially how well it handles matrices and complex numbers), it is tough to settle for an Hp32sii (or Hp33s).

But it is just another challenge. Of course, if I fail by even a single measely 1% point (and especially if I fail by 1%), I will have a different view.

Rant off.

Re: NCEES new "approved calculator" list

*Message #4 Posted by **Luis** on 18 Nov 2004, 8:51 a.m.,*
in response to message #3 by Ron Ross

The explanation makes sense, but I find it a very silly attitude from NCEES. Old timers took this exam many years ago with a slide rule, log and trig tables, and used interpolating techniques to calculate trig functions and logs for numerical values not included in the tables. Many other professionals took more recent exams, and passed them with HP versions 35, 45, 11C, 15C which may be better built than today's HP products, but at the same time, are far less powerful than modern calculators, in terms of speed, memory, and mathematical features.

It is simply absurd not to permit older calculators at NCEES-administered exams, and accept only what is available in the market today. I wonder if they would allow slide rules and tables again!

Re: NCEES new "approved calculator" list

*Message #5 Posted by **revenger...** on 18 Nov 2004, 11:51 a.m.,*
in response to message #4 by Luis

Friends..i´m just a little forum reader with no knowledge about these tests (in fact i live overseas as you can figure out for my writing)but reading the news ncees rules about calculators i think are not so bad as mostly people say...why?

1.- I don´t want to spent money in other calc....well..i think these tests are by far more important than a 50$ calculator (i´m sure we spend a lot more money in other silly things)..

2.- I don´t agree with the list because:

2.1 the calcs are not powerfull enough or are not as a graphing one...in the past, the exam had to be scaring just imagine to do it using tables and slide rules...i think the exam must be done under controlled conditions (including calculation gear) and doing the cals list short improved this goal and avoid troubles due to these things...in fact if we need power why don´t bring a laptop with math & engineering software to the exam .???

2.2 why can i not use my hp 11 or 15c or something like this?...

just imagine the ebay market on voyagers calcs if these are included in the list...well i have 2 maybe will be a good idea to sell them a very good price...

my impression is that too many people are complaing about calcs...i would be more concerned about the exam contents...

Re: NCEES new "approved calculator" list

*Message #6 Posted by **Norris** on 18 Nov 2004, 1:41 p.m.,*
in response to message #5 by revenger...

I understand the rationale for the current NCEES calculator policy. However, I don't like the confusing way that NCEES has implemented this policy; it has caused considerable trouble and expense for RPN users.

Here is a real example, from a user that I met in a different forum:

2002: User buys new HP-48GX. This calculator had been allowed on NCEES exams for many years, and was a very popular choice for these exams. Spends ~ $350 for calculator, memory cards, link cable, and Advanced User's Guide.

2003: NCEES suddenly, without warning, bans HP48s and HP 49s. User's HP48 becomes worthless for exam purposes. No other RPN scientific calculators were in production; the HP-33S was not yet available. User wants an RPN calculator, notes that the 42S was not on the NCEES "banned" list. User buys old 42S from eBay for ~$250.

2004: NCEES adds the 42S to the "banned" list. User's 42S becomes worthless for exam purposes. Still no other RPN scientific calculators in production; the HP-33S was not widely available in time for the April 2004 exam. User still wants an RPN calculator, notes that the 32SII was on the NCEES "approved" list. User buys old 32SII from eBay for ~$200.

2005: NCEES bans 32SII. Haven't heard from User recently, and don't know if he passed the exams in 2004. But his 32SII has become worthless for exam purposes. If User still wants an RPN calculator for the 2005 exams, he will need to spend another ~$60 for a 33S.

Re: NCEES new "approved calculator" list

*Message #7 Posted by **Richard Garner** on 18 Nov 2004, 3:44 p.m.,*
in response to message #6 by Norris

Hi Norris,

I feel for the person you described. I had a similar situation with income and taxes a few years ago. Over a 5 year period my gross income due to cost of living increases went up by $2,000 but my take home pay due to taxes went down by $3,000. There was not only more money coming out of the pay check for taxes, but I was having to pay more in at the end of the year. That was not fun.

I do not agree with the NCEES rules. I think you should be able to use what you have learned on and know how to use best. I've never taken any of the tests, I'm a drafter and CAD/GIS Operator. When I was taking engineering classes in the early 80's most everyone used the biggest baddest calc you could afford. That was either an TI 55, TI 58/59 HP 15C or an HP 41C/V/X. It was your responsibility to know how your calc worked and how to operate it.

I think some of the blame needs to be put on the schools. If the NCEES is to be the Lord & Master of the calc list, then the schools should use them as the standard and not allow any calcs but what is on the list to be used in class. I also think the lower classes and schools should take note as well. If your career coarse classes, like engineering, architecture, surveying, etc., can't use anything other than an HP33s or TI30s then other classes like calculus, chemistry, geometry, etc. can't either. My nephew is in the 9th grade and he was told he had to have a TI83+ for his math classes. When I was in 9th grade we had just been allowed to use calcs to check our answers. I feel that a graphing calc is too much for a 13/14 year old to use for trig, algebra, and geometry in junior high and high school.

I just think if you can only take the test calc X,Y or Z then you should not be able to use anything other than those in class.

Now after you have passed that tests and get out in the work force you can use whatever you want. At that point it becomes a different story.

Re: NCEES new "approved calculator" list

*Message #8 Posted by **Ron Ross** on 18 Nov 2004, 4:19 p.m.,*
in response to message #7 by Richard Garner

It really isn't that simple.

I use a 48G at work because I can quickly punch in a working eq for Lighting calculations, single and three phase voltage drops (with my wire sizes stored as named variables) etc. This could all be done with Excel also, but if I am doing a review at another office, I don't want to lug my PC over there (I hate even using the 48G and have actually set up an Hp17Bii for this as well).

And I take courses for a Master's degree as well. None of the calculators allowed by the NCEES are all that good for my needs. Yet my company likes its engineers to have a PE. My own preferences are to get/use the best, NCEES wants me to use 2nd string equipment. I view it as just a challenge to overcome.

But it still goes against conventional wisdom to buy 2nd rate tools to do a first rate job. That is really my gripe with the NCEES. The best craftsmen try to use the best tools. The NCEES exam wants us to use the 5&10 store tools to work on our exam. A true craftsman will still do well, its just that the better tools make the job that much easier.

Re: NCEES new "approved calculator" list

*Message #9 Posted by **Norris** on 18 Nov 2004, 4:55 p.m.,*
in response to message #7 by Richard Garner

<< I think some of the blame needs to be put on the schools. >>

Most engineers in the US, around 80%, are not licensed. If you exclude civil engineers, the figure probably exceeds 90%. Why should schools enforce NCEES requirements for calculators when most of their engineering graduates will never take an NCEES licensing exam?

<< Now after you have passed that tests and get out in the work force you can use whatever you want. At that point it becomes a different story. >>

No, it doesn't. Most people take NCEES exams after they become working professionals, not as students. Some people do take the Engineer-in-Training or Land Surveyor-in-Training exams as college seniors, but even if you do, that's only the beginning. You still can't take the Professional Engineering or Professional Land Surveyor exams until you have at least a few years of acceptable work experience. People routinely take both the "In-Training" and "Professional" exams after they have been out of school for many years.

Edited: 18 Nov 2004, 5:38 p.m.

Re: NCEES new "approved calculator" list

*Message #10 Posted by **Norris** on 18 Nov 2004, 11:54 a.m.,*
in response to message #2 by Tom (UK)

NCEES is an organization sponsored by the 50 US state licensing boards for engineers and land surveyors (plus the boards for other jurisdictions under US administration, like DC and Puerto Rico).

Most state boards apparently support the current NCEES policy, so it would be difficult to change. Some state boards, notably California's, are known to be opposed. The California Board currently has an unusual dual policy on calculators: they enforce the NCEES calculator policy on the national NCEES exams, but they continue to allow any non-QWERTY calculator on California-specific, non-NCEES exams.

The complete list of NCEES-approved calculators includes the following:

Hewlett-Packard: 9S, 33S
Casio: FX-115MS, FX-115MS Plus
Texas Instruments: TI-30X IIS, TI-30X IIB, TI-36X

Many formerly acceptable Casio and TI models have been banned. On the other hand, most of the approved models (with the obvious exception of the 33S) are priced at just $10-$20, so the costs of calculator replacement are not extreme.

It would be tough if you just spent $200+ on a 32SII, 11C, or 15C for use on an NCEES exam. On the other hand, NCEES has been signalling this move for months, so it should come as no surprise. Possibly the market value of such older models will now drop.

Karl…

I notice the NCEES didn't state a policy regarding slide rules. I wonder if they're still OK? :-)

Fortunately, I passed my civil exam more than 20 years ago. I used my HP-41CV + survey pac + structures pac and I had my HP-34C for backup. Oh…I also had my Concise/Sama & Etani pocket circular slide rule just in case.

I think the NCEES policy is generally correct, but the impelementation is seriously flawed. Those boys obviously need a calculator expert on their staff.

Fred

HP Calculators Rant

*Message #1 Posted by **Nick Nicholas** on 18 Nov 2004, 12:15 a.m.*

Where are HP calculators available for sale in Canada? In the metropolitan area that I live the only places that stock any HP calculators is Staples and they ususally only stock the 30s. If I want to purchase the 33s or the 49G+, they are available only at the university bookstore, which is not convienent unless you attend the university. In contrast, the TI calculators can be found virtually anywhere calculators are sold. On a price comparison, the HP 49+ is about the same price as a TI89. Secondly, the HP calculators are sold only in blister packs so there is no way to try them out. In comparison, many places have demos of the TI calculators (although some of the demos are not powered).

Forget the inferior engineering that goes into the calculators. Unless HP does a marketting job on educators to require students to buy the calculators, I can't see HP calculators penetrating the education market.

I can only rant about the local market. Perhaps it's different in the US.

Re: HP Calculators Rant

*Message #2 Posted by **Ron Ross** on 18 Nov 2004, 8:30 a.m.,*
in response to message #1 by Nick Nicholas

No different here in the Washington, Baltimore, Philidelphia corridor either.

And I lived in the Atlanta, GA area two+ years ago, no different there either. And I did field service 3-5 years ago, and no different throughout the south or eastern seaboard either.

I agree with your analasys.

Re: HP Calculators Rant

*Message #3 Posted by **Luis** on 18 Nov 2004, 9:06 a.m.,*
in response to message #2 by Ron Ross

HP only markets its calculator line via the HP web page only, and has not, over the past 10 years, put one of its calculators for sale on the shelves of retailers, or at bookstores at universities, except for a handful of cases like WalMart, OfficeMax, and Office Depot, to my knowledge.

With that marketing strategy, the only likely buyers are going to be people with access to computers connected the internet who can pass the word of mouth of HP calcs to other potential buyers. Gone are the days of the 70s and 80s when I bought my 11C at the bookstore in my university!.

Greetings,

Not quite true...

*Message #4 Posted by **John** on 18 Nov 2004, 11:46 a.m.,*
in response to message #3 by Luis

Most of the HP line is available at Frys, for example.

I imagine shelf space is tough to get from many of the big stores.

I also can't imagine HP isn't trying to get more.

Re: Not quite true...

*Message #5 Posted by **Jerry Doctor** on 18 Nov 2004, 1:25 p.m.,*
in response to message #4 by John

I'm a chem lab instructor at the University of Nebraska at Omaha. The bookstore in the student union carries pretty much the whole HP calculator line. However... $69.99 for an HP33?

Re: Not quite true...

*Message #6 Posted by **Sam Hughes** on 18 Nov 2004, 1:36 p.m.,*
in response to message #5 by Jerry Doctor

I remember that the University of Nebraska at Lincoln's bookstore had no HP calculators when I was there, but that was a couple of years ago. RPI's bookstore is currently selling the 12C, 33s, 49G+, and 48GII, all of which they recently stocked. During the summer, I saw for sale a used 19BII or something.

Re: HP Calculators Rant

*Message #7 Posted by **Norris** on 18 Nov 2004, 2:55 p.m.,*
in response to message #2 by Ron Ross

In California, the most likely places to find HP calculators in stock would be either

(1) A university bookstore, or
(2) A Fry's Electronics store

Sometimes you will find HP financial calculators, particularly the 12C, at an office supply store, like Staples or Office Depot.

I don't think I've seen an HP calculator sold anywhere else in years.

Re: HP Calculators Rant

*Message #8 Posted by **Ron Ross** on 18 Nov 2004, 3:16 p.m.,*
in response to message #1 by Nick Nicholas

My daughter has often heard, "I didn't know Hp made calculators." from her fellow school mates.

I think that says a lot.

When I was in school, we KNEW Hp made calculators and they were considered the best. We could only afford the Ti's. Now that Hp is on par price wise with Ti, I would buy an Hp in a second over Ti except that Hp's name and quality have fallen so far. Obsurity or worse bad name recognition play a very negative role in sales.

Re: HP Calculators Rant

*Message #9 Posted by **Luis** on 18 Nov 2004, 7:31 p.m.,*

in response to message #8 by Ron Ross

HP calcs, either scientific or financial, are not available at universities in the Miami area such as U of M and FIU. These ones only sell TIs and Casios. I have seen 12Cs, 10BIIs, and 17BII+ at Office Max and Office Depot, and that's it. Other models can only be bought via the Internet. I went to California State University in Fresno during the late 80s and early 90s, and the bookstore carried at that time a complete line of HP calcs. I do not know now.

Dear Fred,

Greetings from fellow FSU Bulldog (MBA 1992). I have very fond memories of the Sid Craig School of Business, and glad to hear that the Kennel Bookstore by the fountain is selling all HP models. That's where I got my first 12C and a back up 11C in 1988. Do they by any chance have a forgotten 15C over there? :-)

Edited: 19 Nov 2004, 3:37 p.m.

Re: HP Calculators Rant

*Message #12 Posted by **Fred** on 21 Nov 2004, 12:43 a.m.,*
in response to message #11 by Luis

Luis…

I'm afraid it would be too much to ask for a forgotten 15C. I was there a couple of weeks ago… my oldest daughter--a junior at CSUF--used her student ID so I could get a copy of Adobe Acrobat at a decent price. I saw several HPs on display (48GII, 49G+, and a couple of others, but alas, no 15C). Current bookstore staff knows virtually nothing about calculators, so they probably wouldn't know if they had a hidden gem. However, back in the late 70s, there were a couple of people there who were pretty well informed about HPs (one guy I knew--he was a physics major).

As a practicing civil engineer who uses his HP42S evey day (and sometimes my 48G+ or HP-32Sii) along with Excel, Mathcad, Autocad, etc, I know how valuable it is to have a well-built RPN calculator. A world without would be a dull world indeed.

Fred

Re: HP Calculators Rant

*Message #13 Posted by **Eddie Shore** on 21 Nov 2004, 2:09 p.m.,*
in response to message #10 by Fred

Greetings from a fellow CSU Graduate. I am a Cal Poly Pomona alumni and employee. At CPP they have all the HPs as well as TIs at the bookstore. In fact, one of the professors REQUIRES a HP48G in his engineering class (he may have included the 49 due to lack of 48s in the market).

Re: HP Calculators Rant

*Message #14 Posted by **Scuba Diver** on 19 Nov 2004, 4:43 p.m.,*
in response to message #8 by Ron Ross

Actually, your daughter is right! HP doeesn't make calculators anymore...Kinpo does!

B.

HP-34C repair

*Message #1 Posted by **Fred G** on 17 Nov 2004, 10:15 p.m.*

My HP-34C (the solderless type) has green corrosion leading from the battery terminals along the traces on the ribbon that connects to the interior. First, what is the best way to remove the corrosion? Second, if the trace has become interrupted, what is the best way to restore the continuity, should I use conductive paint?

Re: HP-34C repair

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 Nov 2004, 1:27 a.m.,*
in response to message #1 by Fred G

Hi;

I had two spices with corrosion in the battery connectors and the flex circuit (ribbon) that lead to corrode part of the power supply copper trails. Both units had soldered IC's and I mannaged to replace the ribbon for a piece of flat cable of the type used in computers.

In your case, being your HP34C a solderless-type Spice, I'd mannage to remove the corroded trails off the ribbon and clean (using chemicals) all of the oxidation left in the copper trails. Then I'd rebuild the removed trails with new, self adherent copper strips (there is a company that sales self adherent cooper foil you can "cut and past"; I don't remember the name) by using the remaining non-conductive part of the flex circuit.

I know it is a little bit vage, but when I face new situations I try to apply new solutions, if the known ones cannot fix the problem. I have in my mind what to do, and I have made some interesting repairs in "troubled" calculators. I wish I could help more.

Hope you succeed.

Luiz (Brazil)

Re: HP-34C repair

*Message #3 Posted by **Fred G** on 18 Nov 2004, 8:57 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks for the tip. What chemicals will remove the oxidation? Also, let me know the name of the company that sells the conductive foil if you think of it.

Re: HP-34C repair

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 18 Nov 2004, 12:12 p.m.,*
in response to message #3 by Fred G

Hi, Fred;

about the chemicals for cleaning the corrosive material. I use (it would be a good idea to use other

sources of information) weak acid, like vinegar with warm water. I use a particular type of vinegar that is based on alcohol instead of grape juice (it is transparent and leaves no purple spots).

I mannaged to remember the name of the company that **sells** (thanks for reminding me...) the conductive foil: it is Chomerics and the one that told me about it i Renato, another brazilian contributor.

(still) Hope you succeed. Let us know.

Cheers.

Luiz (Brazil)

Re: HP-34C repair

*Message #5 Posted by **Jon** on 18 Nov 2004, 1:38 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi:

I have repaired a lot of spices with that problem. In my opinion the best option is rewiring. You should locate the three connection points in the AC/DC circuit and use silicone wires to restore the connection. It works excellent. I have some photographs of the work if you are interested.

Regards

Jon

Re: HP-34C repair

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 18 Nov 2004, 10:02 p.m.,*
in response to message #5 by Jon

Hi, Jon;

thank you for your support. I actually rewired two Spices already with the flat cable used in computers (that's the raw material I had in hands...) but the units where both of the soldered type. So, I removed the partially destroyed ribbon and rewired the whole thing. It worked fine, an dI also have at least one picture (I just need to find it).

You mentioned silcon wires. I'd like very much to see the final aspect. Do you already have the pictures or you'd need to open the calculator to take them? I've once tried to solder patches over flex circuit, but I did not succeed doing a clean job. I tried using a 220Vac soldering iron connected to the 127Vac oulet, and this gave better results (by simply not melting the flex base...).

Thanks a lot.

Luiz (Brazil)

HP: Thank's for the HP-49G+

*Message #1 Posted by **Erwin** on 17 Nov 2004, 3:14 p.m.*

It seems that i finaly have a decent manual now for my HP-49G, freely downloadeble and in my own language. Is'nt that great?

Re: HP: Thank's for the HP-49G+

*Message #2 Posted by **Ed Look** on 17 Nov 2004, 5:53 p.m.,*
in response to message #1 by Erwin

Yes, trying to operate something as complex as a 49G+ without the manual is... not easy.

(In America decades ago, there was a television show about a human given superhuman powers by some alien... and a manual, which, being human, he promptly lost. The show was quite funny!)

Re: HP: Thank's for the HP-49G+ (slightly off topic)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 Nov 2004, 1:38 a.m.,*
in response to message #2 by Ed Look

off topic: Wasn't the main theme the song "Believe it or not"?

Back to topic: I was reading the English version of the HP49G+ manual and it seems that this time there is no specific preference for showing the calculator usage in RPN or algebraic mode. At least almost all examples I mannaged to read where like this.

In time: mine came with a (standard?) CD-ROM with many manuals already available. Erwin, do you have the CD as well? If so, did you mannage to download a different manual, I mean, one that is available only for downloading? I'm curious, now, because I thought all of the available manuals were on the CD. Had HP updated the site? I know it"s a matter of checking myself, but I'm just curious.

Thanks.

Luiz (Brazil)

Re: HP: Thank's for the HP-49G+ (slightly off topic)

*Message #4 Posted by **Erwin (NL)** on 18 Nov 2004, 3:41 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hello Luiz and other readers,

I brought some confusion here, i think.

My postingsaid:---------- HP: Thank'sfor the HP-49G+

Posted by Erwin on 17 Nov 2004, 3:14 p.m.

It seems that i finaly have a decent manual now for my HP-49G, freely downloadeble and in my own language.Is'ntthatgreat? ----------

What did i mean by this?

Well, i do not own a HP-49G+, but i do have a HP-49G (the metallic blue one, with the rubber key's... etc). The 49G came with a terribly bad manual. I had to buy a HP-48G to get some sort of manual for my newly bought 49G. With the introduction of the 49G+ came a fairly good manual for it. And being curious about the 49G+, i downloaded it's manual from the HP side, to see what this new machine was all about. Only to find out that it is in fact a 49G, only a lot faster!

You get the picture now? :-)

One thing though, maby you can anwser this. HP claims in an article on there webside that the HP-49G+ is much more robust then the 49G. Is this true? Is the 49G+ a more quality product, in terms of casing; keyboard etc , then the 49G was? Is it as robust as the 48 series was?

Kind regards, Erwin

Re: HP: Thank's for the HP-49G+ (slightly off topic)

*Message #5 Posted by **Ron Ross** on 18 Nov 2004, 9:02 a.m.,*
in response to message #4 by Erwin (NL)

Wish I could say it had the same keyboard as the 48G series. It has a similiar look and feel to the 48G, unfortunately, it isn't nearly as reliable. But the keys AINT rubber and it is faster. The keyboard feels very much like a 48G series except a bit louder and a more pronounce click (which and here is the flaw, only provides a click, the actual keystroke registration is just below the click). What this means is Hp provided a keyclick to mimic the older line of Hp's without providing an equal keyboard.

New user's just press all the way down, but diehards, such as ourselves expect the keyclick to be an key entry. And that is the way it should be, but argue that with someone who is simply making as cheap a replica of the original and marketing at $150 a copy (the original price of the Hp48S/G series was $2-300, depending on whether you bought a S/G or SX/GX). For the $$$ it is a phenominal calculator, but I would have considered it a great calculator if it had the pioneer type keyboard (with a better connection to the PCB of course).

Ditto! And...

*Message #6 Posted by **Vieira, Luiz C> (Brazil)** on 18 Nov 2004, 12:26 p.m.,*
in response to message #5 by Ron Ross

Hi Erwin, Ron;

I agree with Ron's point of view and considerations. I'd not try adding/removing/changing anything on the subjects Ron mentioned.

About what the HP49G+ can do when comparing to the HP49G. Well, I'd say that based on both HP49G's models, having an upgradable O.S. leads to whatever improvement being made whenever available, agree? So, we may have upgraded O.S. in any or both that has extra functionality, and that would lead to some differences.

What I mostly like in the HP49G+ are the updated I/O capabilities: bidirectional IR is back, USB instead of RS232 (I'd try having both, but...) and expandability 'thru' SD cards (mine has a 256MB RAM card... I still figure what to do with such an amount of RAM).

Well, now it is up to make a choice... without the need of getting into the Matrix (kidding...). I still keep my two HP49G (one is almost for running Hrast's HP41 emulator... it's worth having an HP49G for this sole purpose, right?), and I'm having good moments with the HP49G+. Oh, yes, sometimes one or another key fails.

Cheers.

Luiz (Brazil)

Edited: 18 Nov 2004, 12:29 p.m.

Re: Ditto! And...

*Message #7 Posted by **Ed Look** on 18 Nov 2004, 11:44 p.m.,*
in response to message #6 by Vieira, Luiz C> (Brazil)

Well, about the missed keypresses in the 49G+, at least one poster has figured out that this is due not so much to an improperly registering key, but a processing delay, due to "garbage collection" in the background. This apparently takes up quite a bit of the system memory (temporarily) and so when it occurs, it delays EVERYTHING, including and most notably, keypresses.

Re: Ditto! And...

*Message #8 Posted by **Erwin (NL)** on 19 Nov 2004, 3:21 a.m.,*
in response to message #7 by Ed Look

As I remember well, the HP-49G had the same problem in the beginning with ROM 1.10. So, it's probebly time for a ROM upgrade for the 49G+ ?

Re: Ditto! And...

*Message #9 Posted by **Ed Look** on 19 Nov 2004, 1:48 p.m.,*
in response to message #8 by Erwin (NL)

Currently, the 49G+, is up to ROM version 1.23, I think, and this is fairly recent. I think we may have to wait a little while more for an update.

Re: HP: Thank's for the HP-49G+ (totally off topic)

*Message #10 Posted by **Ed Look** on 19 Nov 2004, 11:19 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Oh, and believe it or not, HP has released in this past many months a whole slew of RPN machines!!

Believe it or not, I'm walking on air!

Connection HP-49G+ problems

*Message #11 Posted by **Homer** on 25 Nov 2004, 12:21 p.m.,*
in response to message #2 by Ed Look

Last month I bought an HP49G+ and all was Ok (except for the keyboard, that is not sensitive). I check the HP-PC connection an was working OK. Last week, whwn I try to connect it to PC (using the usb cable) in xmodem server, the HP display Sending $$$t and the the calculator frezze, I need to take away the batteries. Can any body help me ??

Homer, Mexico

HP9825 Calculator

*Message #1 Posted by **Marie-Helene** on 17 Nov 2004, 9:49 a.m.*

Hi !

I would like to buy a HP9825 calculator. Do you have one for me ?

Do you know where I can find that ?

Thank you,

Marie-Hélène

Re: HP9825 Calculator

*Message #2 Posted by **Ron Ross** on 17 Nov 2004, 10:24 a.m.,*
in response to message #1 by Marie-Helene

You might also post in the classified section as this is the discussion board.

You might also consider broadening your search in both item ie Hp9830 or an Hp9820 if you are looking for nostaligia. If you are looking to replace a worn out machine you may find someone who can fix your old one also.

Ebay is another option. Good luck as I suspect that there is no low cost option.

HP-85/87 Programmable ROM module - clone version coming soon

*Message #1 Posted by **John** on 17 Nov 2004, 4:56 a.m.*

Hi,

I've heard from a contact that he has successfully made a wire-wrap board that is a clone of the Programmable ROM Module for the HP-85/86/87. This allows EPROM copies of ROMs such as Assembler, Extended Mass Storage etc. to be used in place of 'real' ROMs. Further details and pictures coming soon.

Regards, John

PS Please don't e-mail me offering to buy anything as I have nothing for sale!!!

Re: HP-85/87 Programmable ROM module - clone version coming soon

*Message #2 Posted by **marais** on 17 Nov 2004, 1:25 p.m.,*
in response to message #1 by John

Cool! That's waht I#ve been waiting for! I encourage you to go further!

Arithmetic operators don't work on my 32SII

*Message #1 Posted by **Simon Lockyer** on 17 Nov 2004, 3:38 a.m.*

The subject says it all -- if I flex the body of the calculator a little, the situation improves a little, temporarily, but if the machine has been left sitting overnight, then I have to lean hard on the +, -, x, or ÷ for anything to happen. I've already had one 32SII die on me (replaced for around $200!), please tell me how to fix this one, somebody, it's not on its last legs, is it?

Please e-mail responses to slockyer@cox.net as I don't visit the forum as often as I should.

Many thanks, Simon

Re: Arithmetic operators don't work on my 32SII

*Message #2 Posted by **bill platt** on 17 Nov 2004, 8:48 a.m.,*
in response to message #1 by Simon Lockyer

Hi Simon,

Yes, you may be in a "un" fix. Yet, before you open it up, try removing the batteries, and soaking in distilled water for a day, and then thoroughly dry it in natural air, with a fan if you like, for about 3 days. Sometimes, the pad that puts pressure on the connectors becomes compressed, and the moisture sems to re-liven it (it is made from foam).

Generally, with this sort of problem, you also see the ability to make the operators work again by simply putting gentle but firm pressure to the bezel just below the display. If this is the case with you, then do not fret--just try this first.

I also suggest that you be patient with purchasing a back-up 32sii--I have never paid more than $ 130 for one--and the last one I bought 3 months ago, I got for under $100.

You might also go get a 33s. I know, it isn't as nice--except that you never run out of memory ever--and the equation list is better--the unary minus is no longer precedent. There are some bugs--which have been thoroughly analyzed here---but they can be worked around (worst is the sexagesimal, and the polar conversion bugs--and the RAD annunciator bug after reset). It is only $43 if you buy from Amazon and get the $10 rebate.

Best regards,

Bill

Re: Arithmetic operators don't work on my 32SII

*Message #3 Posted by **Ed Look** on 17 Nov 2004, 9:17 p.m.,*
in response to message #2 by bill platt

As much as I love using my 32SII, and because of that I don't take it work and use it at home, I use the

33S at work. But in doing so, it has grown on me, and it is now hard for me to say that it isn't as nice as the 32SII.

Of course, to me, aesthetics isn't everything! Besides, you can get used to the look of something. And, as you say, it has more memory and the constants list.

*** AND, IT'S RPN !! ***

keyboard problem

*Message #4 Posted by **Frank B. (Germany)** on 17 Nov 2004, 9:06 a.m.,*
in response to message #1 by Simon Lockyer

I had the same problem with a 32sII. If pressing the bezel just below the display resolves the problem, it is probably a contact problem. For me it helped prying open the calculator at the right hand side a little bit (maybe 1 mm) using a toothpick. Then I inserted a bit of cardboard (about 3 cm long, 0.5 cm wide, .5 mm thick) using a tweezer, so that the pressure at the magic spot is increased. Since that the calculator works like a champ. It has been used on a daily basis for more than 4 months now, no keyboard problems.

Frank.

Re: keyboard problem

*Message #5 Posted by **Simon Lockyer** on 28 Nov 2004, 6:09 a.m.,*
in response to message #4 by Frank B. (Germany)

Frank B. -- thanks for your suggestion, a very practical fix which I will probably try as pressing under the bezel works for my machine --thanks!

Simon

PS I think I'd rather lose my left pinkie than my 32SII!

Re: keyboard problem

*Message #6 Posted by **Veli-Pekka Nousiainen** on 28 Nov 2004, 6:23 a.m.,*
in response to message #5 by Simon Lockyer

You just might try the hp 33s with over 30,000. bytes of MEM

Oldie question...HPX V1N4 Space Shuttle Lander game

*Message #1 Posted by **Gene** on 16 Nov 2004, 3:38 p.m.*

Page 19 and 20 of the HPX Journal V1N4.

Has a space shuttle landing simulator for the HP41.

Questions:

1) Steps 109 and 155 are listed as "EXP". The other steps in the listing are fairly evident, but this one I'm not sure about. Is this "e^x"? or "10^x"? or ? The program has number entry lines where the EEX key is used to enter 1E3 for example. The program has -15 in the X register prior to this step.

2) More general question, I guess. Anyone ever try this? :-)

Re: Oldie question...HPX V1N4 Space Shuttle Lander game

*Message #2 Posted by **bill platt** on 16 Nov 2004, 5:40 p.m.,*
in response to message #1 by Gene

Hi,

I don't know much at all about the 41c, but isn't EXP usually natural, and ALOG usually the "antilog" of Log base 10?

Re: Oldie question...HPX V1N4 Space Shuttle Lander game

*Message #3 Posted by **Gene** on 16 Nov 2004, 11:23 p.m.,*
in response to message #2 by bill platt

True, but since the listing shows x^2 and y^x, I would have thought that the exponential function would have been e^x.

That's what I think it is, but the program listing didn't explain that abbreviation. :-)

Gene

RPN, SVPAM, AOS EOS etc..

*Message #1 Posted by **Michel Beaulieu** on 16 Nov 2004, 12:38 p.m.*

I need to know all these entry method for my students; they all throw away their manuals... They all have differents calculators with differents abreviations on them. Where can i find, on the web, the description and differences between these methods.

This will help me in my teaching of "Les calculatrices et leurs applications" course level...

Thanks Michel

Re: RPN, SVPAM, AOS EOS etc..

*Message #2 Posted by **Chan Tran** on 16 Nov 2004, 1:31 p.m.,*
in response to message #1 by Michel Beaulieu

Most of the manuals can be downloaded at the manufacturer's websites. I wonder do you take off points on the students that throw away their manuals?

Re: RPN, SVPAM, AOS EOS etc..

*Message #3 Posted by **Mike (Stgt)** on 16 Nov 2004, 2:55 p.m.,*
in response to message #1 by Michel Beaulieu

Is this what you are looking for?

Ciao.....Mike

Re: RPN, SVPAM, AOS EOS etc..

*Message #4 Posted by **valentino ducati** on 17 Nov 2004, 2:48 a.m.,*
in response to message #3 by Mike (Stgt)

@Mike: I don't think Michel was looking for a CBT (apart that it IS really interesting for 1st steps).

@Michel: Please correct me if I'm wrong, but I suppose you asked for a comparison table/matrix about the differences of the entry notations. I give an example:

17-4x3=5

hp RPN (classic) --> 17 ENTER 4 ENTER 3 x -

hp RPN including algebraic notation: hp algebraic notation of newer high end calculators is far away from the classic RPN entry notation. I don't own any 48/49 but have a look at the article about RPL (http://www.hpmuseum.org/rpl.htm) here and you will notice the great difference.

hp algebraic calculators (e.g. 17Bx) --> 17 - (4 x 3 = [or, if you wish, 17 - (4 x 3) =] You NEED at least

the 1st "(", because this simple algebraic notation has no precedence (^ before */ before +-)

hp solver in calculators (e.g. 17Bx) --> X=17-4x3 The equation solver DOES know precedence and so it works without parenthesis!

hp CAS solver in calcluators (e.g. hp-40G) I don't own and don't know the syntax, but CAS gives you exact algebraic expressions instead of approximated numerical values. See article at http://www.hpcalc.org/details.php?id=4999

I really too would like to have a comparison table that covers also the input notations of the other most important brands (TI, SHARP...).

Someone else?

RPNdemo.exe

*Message #5 Posted by **Mike (Stgt)** on 17 Nov 2004, 4:33 a.m.,*
in response to message #4 by valentino ducati

Hi Valentino!

May be you are right. But I assume Michel B. to be a teacher and as such wants a) to show the sources (Jan Łukasiewicz) and b) demonstrate the implementation of RPN on a computer with a program that is made for demonstration purpose. I can not give a complete comparison of the different systems, but hope to help a bit if I give some information about RPN.

About Lukasiewicz there are several articles in the internet, about RPN see PPC Calculator Journal V9N5P26b, here an old flyer from HP about RPN, and that RPNdemo.EXE. It is mentioned here (see 13th abstract) and you may download it there, alas I am not able to run it neither on WinXP nor W2kP: Runtime error 200 at 0E6B:0091. On the HP200LX it looks as if it uses colors, so I assume, you need an elder PC for it. IMHO it _is_ worth the effort as for RPN-demonstation it's top. (Anyone here knows about e newer version? There is an RPNdemo for WinCE - but...you know...)

Ciao.....Mike

Edited: 17 Nov 2004, 4:36 a.m.

RPNdemo.exe fixed

*Message #6 Posted by **Mike (Stgt)** on 18 Nov 2004, 4:24 a.m.,*
in response to message #5 by Mike (Stgt)

I was able to fix RPNDEMO.EXE so it runs now on Wk2Pro, alas much too fast to watch shifting numbers on the stack. What I did: I unpacked the EXE with DIET v.1.45F and applied TpPatch.exe found here. Well, that was a blind hit, as the patch is a fix for "Runtime Error 200" bug of Borland Pascal 7 on fast PCs -- and w/o source code I did not know if RPNDEMO was originaly Borland Pascal 7.

Ciao.....Mike

Addendum: The TP7P5FIX in the a. m. link works too (no need to unpack RPNdemo.exe), now I only need a way to slow down execution in the DOS-Box. Who knows a solution for that? Then we would not only have one more HP-41 simulator but a valuable educational tool. - M.

Congratulations! (almost every old HP manual begins like this)

Finaly we have received a Nigerian scam directly. This proves that our famous Nigerian friends also watch this site, take our E-mail addresses, etc. I have received the same letter a few days ago directly to my E-mail address.

Hopefully, I would recommend Mrs Abacha to buy the slice of cheese sandwich from E-bay (at 14.995 USD only). It would not be a big issue for her and will certainly help a lot.

> I need to know all these entry method for my students; they all throw away their manuals.

I don't know what the course of study is; but if it's engineering, you would probably do such students a favor if you tell them they are not engineering material instead of letting them find out the hard way later. If their personality has such a lack of attention to detail, they probably need to pursue something different.

HP-41 viewscreen?

*Message #1 Posted by **Michel Beaulieu** on 16 Nov 2004, 12:33 p.m.*

Hi, i'm a teacher and i'm looking for something that can let my students view what i'm doing on my claculator when i push buttons on it!

Like a "viewscreen" that connect on the calculator and project on a TV or a retroprojector.

Or is there another calculator (not a graphing one) that can do the same thing to teach them RPN.

Thanks

Michel

Re: HP-41 viewscreen?

*Message #2 Posted by **Raymond Del Tondo** on 16 Nov 2004, 12:44 p.m.,*
in response to message #1 by Michel Beaulieu

Hi,

you could use an HP-41 emulator for Windows,
like V41, which is available on TOS.
This way, you'd only have to beam your Windows desktop
onto the wall with a projector.

Raymond

Re: HP-41 viewscreen?

*Message #3 Posted by **Jeff O.** on 16 Nov 2004, 12:56 p.m.,*
in response to message #1 by Michel Beaulieu

As an educator, you can get emulators for your PC for the 33S and the 49g+ from HP. Emu48, emulating the HP48 family is freely available at hpcalc.org. Emu42, emulating the 42S, 17BII and others is freely available, but you need rom images to run them. If you have a 42S or 17BII and a 48G+ or GX, the rom dumping procedure is not too difficult. There is also Free42, a very nice simulation of the 42S. Any of these options would allow you to do as Raymond suggests, just project your PC screen to teach your students RPN.

Re: HP-41 viewscreen?

*Message #4 Posted by **Mike (Stgt)** on 16 Nov 2004, 3:04 p.m.,*
in response to message #1 by Michel Beaulieu

If it's for teaching RPN there exists a RPN-Demo.EXE somewhere that runs on DOS (even on a HP200LX), I have to dig it out again (Tony, are you faster than me?). If any RPN calculator is OK there are several emulator and simulators (I do list them here, if I forget one the author may be upset.)

Ciao.....Mike

Re: HP-41 viewscreen?

*Message #8 Posted by **db(martinez,california)** on 16 Nov 2004, 8:57 p.m.,*
in response to message #1 by Michel Beaulieu

There was at least one third party item (maybe by Mountain Computer or Southern Software?) that was sold by Educalc which connected a 41 to a PC to allowuse of the screen, disk drive, printer etc. I don't know about the ability to project the image from there.

Re: HP-41 viewscreen?

*Message #9 Posted by **Raymond Del Tondo** on 16 Nov 2004, 9:09 p.m.,*
in response to message #8 by db(martinez,california)

Hi,

I think you mean something like an HPIL-PC card for the ISA slot,
along with software like HPILLink or TRANS41.
The card was available from at least three producers,
namely , InterLoop, and Christoph Klug.

AFAIK the software mentioned above only outputs results,
and does not directly visualize key strokes.

HP27S - dumb way to enter negative exponents?

*Message #1 Posted by **Gene** on 16 Nov 2004, 9:44 a.m.*

Spent about 15 minutes last night trying to figure out how to enter a negative exponent (such as 1E-6) on the HP27S.

Try it. Press 1 shift E then +/-. Won't work.

Try 1 shift E 6 then +/-. Won't work.

After quite a few minutes, I thought..."Surely, HP didn't mean for the MINUS key to be used?"

Voila.

Who on earth built it to use the minus key to enter a negative exponent? :-) I have to correct that mistake all the time in my students...they are always wanting to press the minus key to enter a negative number.

:-) Gene

Negatives of HP (**edited)

*Message #2 Posted by **bill platt** on 16 Nov 2004, 11:27 a.m.,*
in response to message #1 by Gene

Hi Gene,

15 minutes! It only took me 1 minute of confusion!

Seriously though, I think the whole handling of "minus" is the weakest, most poorly implemented part of the whole proud history of hp calculators.

That is, it seems that as long as HP was strictly RPN, it was nice. But all the algebraics, with exception of the RPL family, have a consternation factor near "10"

For instance:

32sii has a bug----a "unary minus" takes precedence over exponentiation in an equation---except that it does not function as such if it is the first character in the equation list. (In fact, it does not even show up as a "unary minus" in this position--it looks like a minus sign, so maybe it isn't really a bug!) Further, the CHS key will type either a unary minus, or a minus, depending on the context--very confusing!

33s: Improved on the 32sii by eliminating the precedence of "unary minus", yet, they retained the unary minus (a high placed minus) in the character set--confusing!

27s and 19b in my opinion are better--there is no unary minus---and in the equation list, it is a consistent system--if you want - (x^2) you write -x^2, but if you want (-x)^2 you write (-x)^2. In the 27s, the CHS key is simply that--a Change Sign key.

30s: the CHS key is a unary minus key--except it is infix, never postfix. However, this machine does not use the unary minus any more than the 33s--there is no good reason for it--except that they require it for the negative exponent. At least the 30s will give you a "syn error" if you do it the "wrong" way.

My absolute favorite machine for simplicity is the 48gx and its family. Here, there is no "unary minus" and the CHS key is merely that--a post-fix change sign key. You can use the minus sign anywhere you need a minus sign--and you can change the sign of the last + or - in the string by using the CHS key. Even better, the 48g will parse the command line to the stack, and in so doing, simplify extra minuses.

Intersting to note that the 27s/19b do not parse them out but allow extra minuses, e.g. 67---7 = 60. THe 30s does not allow extras--it returns a syntax error. The 32sii will allow double minuses, but not triples, however, you can get a double minus, followed by a "unary minus" to parse in the 32sii.

Note that where I say CHS above, I am referring to the key that says "+/-" Interesting that the old voyagers all used CHS--it also wold have been a better choice for the 48.

Perhaps the most surprising thing in a good way is the 33s ALGEbraic mode. When using the calculator line, you do all "one number functions" postfix (like RPN) and you add, subtract etc infix. Yet, the upper line display is parsed to proper algebraic notation, e.g. 30 sin parses to sin(30). Even better, the potential confusion involving the "unary minus", and also negative exponents, is resolved as well. If you do this on the 33s in ALG:

4 + 3 CHS ^ 2, the machine will parse it to:

4 + (-3)^2 so you can see what you are asctually doing.

**{Someone with a 33s, please confirm this--I don't have it at the office and I don't want to mislead).

Best regards,

Bill

CAS vs Plot

*Message #1 Posted by **Mike (Stgt)** on 16 Nov 2004, 8:26 a.m.*

Hi all!

I am _not_ the mathematician so I need some help for following function I found in the CAS examples.

```
      SIN(X)^2
    ------------
    COS(X)TAN(X)
---------------------- = 1
_  +-----------------
|/  SIN(X)COS(X)TAN(X)
```

On the emulated HP40 with CAS version 4 (4/27/2000) I get this result too (after TAN2SC and EXPAND). But if I plot this function it shows a square wave between 1 and -1. Question: CAS does not respect the sign?

Ciao.....Mike

Re: CAS vs Plot

*Message #2 Posted by **Dave Shaffer** on 16 Nov 2004, 9:22 a.m.,*
in response to message #1 by Mike (Stgt)

Mike,

It depends on where the square should be on the top term.

Is it (sin(x))^2 (i.e. the entire sin function that is squared) or sin (x^2) (i.e. the argument of the sin function that is squared)?

If it is the first, then this set of trig functions does not even have to be evaluated! It reduces exactly to 1.

Why? Well, you can express tan(x) as sin(x)/cos(x). If you do this, then everything cancels out. In the denominator square root, for instance, you'd get (leaving off the (x) arguments for ease of notation)

sqrt(sin cos (sin/cos)) = sqrt (sin^2) = sin

Similarly, the top of your equation reduces first to

sin^2/sin = sin

Leaving for the final step, sin/sin = 1

Re: CAS vs Plot

*Message #3 Posted by **Mike (Stgt)** on 16 Nov 2004, 11:03 a.m.,*
in response to message #2 by Dave Shaffer

Thank you Dave for your investigation, but I am not convinced: in the denominator you may reduce to

sqrt(sin^2) what is never negative due to square. Further reduction would be abs(sin). But as numerator you get after reduction sin^2/sin what keeps the sign of sin (even if you keep your fingers crossed <G>).

So the overall reduction would be sin/abs(sin) what is 1 or -1 every now and again. So the plot on the HP-40G revealed a nasty surprise (as ugly as sin or remissible peccadillo?) in it's own CAS. Bombs on Babylon! Mathematical gomorrah!! The 40G was made to use at school.

Ciao.....Mike (sinning, pondering, scapegoat) No-no abs(sin) has nothing to do with absinth and I did not drink too much of it...

Edited: 16 Nov 2004, 11:05 a.m.

Re: CAS vs Plot

*Message #4 Posted by **Mark A. Ordal** on 18 Nov 2004, 9:18 a.m.,*
in response to message #3 by Mike (Stgt)

Mike says: "Thank you Dave for your investigation, but I am not convinced: in the denominator you may reduce to sqrt(sin^2) what is never negative due to square."

NO! because

sqrt(anything^2) = +/-anything

So, in the end, Mike's original expression reduces to *either* +1 or -1, depending on your choice of root. The "abs" function has no relevence here.

(I am assuming that when Mike writes "SIN(X)^2" he means exactly that---namely "(SIN(X))^2" which mathematicians prefer to write as "SIN^2(X)".)

--Mark

Re: CAS vs Plot

*Message #5 Posted by **Mike (Stgt)** on 22 Nov 2004, 3:54 a.m.,*
in response to message #4 by Mark A. Ordal

Yep - you are correct! Now when I read

```
sqrt(anything^2) = +/-anything
```

I remember. How could I forget.

So the correct answer would be sign(sin(x)) or abs(sin(x))/sin(x)?

Ciao.....Mike

HP 21

*Message #1 Posted by **Martin Hvidberg** on 16 Nov 2004, 12:49 a.m.*

I have a HP 21 (the old one from the 70's) It's out of battery and I want it recharged. I don't have the original charger and was going to use another power source. It seems (from HPmuseum) that 10 Volt AC / 1.8 VA is what I need.

Questions: Is that right, should I really use AC not DC? What are + and - in the little conector on the back?

Any help is apprisiated

Re: HP 21

*Message #2 Posted by **Mike (Stgt)** on 16 Nov 2004, 3:08 a.m.,*
in response to message #1 by Martin Hvidberg

Hi!

Is the rechargeable battery pack from the 70's still OK?? I replaced mine with new accus and charge them outside the calculator.

Ciao.....Mike

HP 21

*Message #3 Posted by **Martin Hvidberg** on 16 Nov 2004, 4:34 a.m.,*
in response to message #2 by Mike (Stgt)

The battery pack is most likely original. but I cant get the the little door open. Do you think there ar any risk of damages to the calculator (or my health) ?

Do you know how to open the door - it seems to be stuck.

I'm aware that the battery pack can, with some work, be replased, but I would like to try to recharge them first...

Best regards Martin

Re: HP 21

*Message #4 Posted by **Klaus** on 16 Nov 2004, 7:19 a.m.,*
in response to message #3 by Martin Hvidberg

Well, I have a charger for the HP-21. I don´t have a HP-21, so I don´t use it. It is switchable 220/110 Volt. I live in Germany. If you have a chance to pick it up....

Klaus

Re: HP 21

*Message #5 Posted by **Martin Hvidberg** on 17 Nov 2004, 2:58 a.m.,*
in response to message #4 by Klaus

Thanks Klaus for your most kind offer.

Considering the advice from others I fear that the accu.pack is not in good shape. I will try to open it to check that.

If the pack, against all ods, seems okay. I would like to get back to you on your offer.

Martin

Re: HP 21

*Message #7 Posted by **Martin Hvidberg** on 17 Nov 2004, 3:22 a.m.,*
in response to message #6 by deleted

Hi Jeff

Thanks for the good instructions. I have, with little success, tried to open the back and remove the accu's.

Thanks to your hint about removing the rubber feet, and unscrewing and disasembeling the calculater I now got the accu.pack out, without use of force...

The accu.s are, as expected, corroded and have leaked. One of them has some small white crystals on the surface, especially arround the +pole.

I have no hope of reviving them though I have read about a electro chock treatment on HPmuseum.

Question: Dose anyone know about a good way to clean up the cellpack, some way to dissolve the corrotion? Would vinager be usefull here?

Best Regards Martin

Re: HP 21

*Message #8 Posted by **Mike (Stgt)** on 16 Nov 2004, 7:45 a.m.,*
in response to message #3 by Martin Hvidberg

If you can't take out the battery pack it may be a hint that the accus leaked and the springs are corroded. I would check first that the accus are OK _before_ applying any tension. It could cause very bad effects to your health if you damage the calculator. An HP-21 is a gem.

Ciao.....Mike

Re: HP 21

*Message #9 Posted by **David Smith** on 16 Nov 2004, 5:53 p.m.,*
in response to message #3 by Martin Hvidberg

The 21 does use an AC power supply. If you cannot get the battery pack out it is a very good indication that the pack has leaked. You may have to pry it out with a thin bladed screwdriver. Or try opening up the machine with the pack in it (two screws under the top two rubber feet).

If the pack has leaked, most likely you will have to clean up a lot of corrosion, etc. Vinegar and an ultrasonic cleaner help. Rinse very well with water. Shake dry. Let dry at least 24 hours (or overnight in an oven on LOW (like 140F).

Re: HP 21

*Message #10 Posted by **Martin Hvidberg** on 17 Nov 2004, 3:28 a.m.,*
in response to message #9 by David Smith

Hi David

Re: HP 21

*Message #11 Posted by **David Smith** on 17 Nov 2004, 4:12 p.m.,*
in response to message #10 by Martin Hvidberg

It is very easy to slice open the battery pack and replace the battery cells with new ones (use modern high capacity Nickle metal-hydride cells). Any good battery store will be able to do this for you for a very affordable price.

Re: HP 21

*Message #12 Posted by **Paul Johnson** on 17 Nov 2004, 5:39 p.m.,*
in response to message #10 by Martin Hvidberg

I used to have an HP-25, same basic construction. If you cut the narrow plastic rib between the batteries you can get the batteries out. It is possible to replace them with rechargable cells, but if you don't plan on heavy use consider using Akaline. I ran mine on alkaline cells for several years. Also eleminates the charger problem. I've heard that reversing the polarity WILL cause immediate damage, so be carefull! I marked my battery holder so I wouldn't forget which way to install them.

Woodstock batteries

*Message #13 Posted by **Randy** on 17 Nov 2004, 9:03 p.m.,*
in response to message #12 by Paul Johnson

If you separate the pack at the seam as David suggests so that it can be re-celled properly, rather than cutting out the center rib (uuggh), you'll find HP permanently molded the cell polarity into the case for all to see. You can still install alkaline cells and put a small piece of tape on either side to hold the pack together.

If you recell it with rechargables, a few drops of plastic welding solvent will hold it together until the next time it needs new cells. It's then a simple matter to pry the case apart and repeat the process.

I cringe every time I see a mutilated pack missing the center rib :-(

PS: Paul is correct, reverse polarity cells kills a diode in the power supply instantly. Be careful!

Edited: 17 Nov 2004, 9:06 p.m.

Re: Woodstock batteries

*Message #14 Posted by **David Smith** on 19 Nov 2004, 12:33 p.m.,*
in response to message #13 by Randy

I have reversed polarity on these beaties more times than I can 1 + without any damage... just lucky?

Re: Woodstock batteries

*Message #15 Posted by **Randy** on 20 Nov 2004, 7:08 p.m.,*
in response to message #14 by David Smith

Lucky? Dunno - I'm 2 for 2 in killing a diode in the PS. Never have drawn out the circuit to see what was going on, I just put in a new one and try to remember positive is on the right side.

HP 21

*Message #16 Posted by **Martin Hvidberg** on 23 Nov 2004, 6:26 a.m.,*
in response to message #13 by Randy

I would like to make the calculator look as original as possibly, but I'm a bit in doubt here.

What, precisely, is the difference between "separate the pack at the seam" and "cutting out the center rib".

Would anybody have a photo of how this is done the good and/or the bad way.

:-) Martin

Sorry if this is clear to native english speakers, unfortunately I'm only a guest in your language...

Re: HP 21

*Message #17 Posted by **David Smith** on 23 Nov 2004, 2:53 p.m.,*
in response to message #16 by Martin Hvidberg

If you look closely at the battery pack you will notice a heat-sealed seam around the top edge of the pack. You can slice this seam open with a razor blade, replace the cells, and glue the seam back together again. If done carefully it will be hard to notice the repair.

The other fix is to hack out the center rib that lies between the two battery cells (on the bottom of the pack)and remove the batteries. This method is hard to disguise the repair.

Re: HP 21

*Message #18 Posted by **Martin Hvidberg** on 24 Nov 2004, 2:35 a.m.,*
in response to message #17 by David Smith

Sorry frinds - opening the seam seemed to provide more visible damage to the casing thean cutting out the center rib.

I have now replased the orgiginal NiCd cells with a pare of AA non-chargebel Alcaline cells.

The unit seams to work perfectly...!

Since I have no manual I might have a load of new questions now, but see you in another thread for that - A milion thanks to all of you.

:-) Martin Hvidberg

Appreciate if you can indicate specs for the replacement batteries.

(Says NI-CD on side of the pack)

Voltage of the installed (and presumably) the repalcement bateries?

Re: HP 21

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 8 Dec 2004, 7:37 p.m.,*
in response to message #19 by Perry Schwartz

Hi, Perry;

excuse me answering (or posting an aswer to) a question direct to another contributor, but I guess I can tell you about my own experience.

I bought many commercial National NiCad´s, 850mAh, and used them mostly to replace regular NiCad battery in standard HP battery packs: Classics (HP45, HP55, HP65...), Woodstocks (vintage HP2x, HP67), Spices (not so vintage HP3xE/C) and I also rebuilt a pack for an HP75D, but in this case I used a commercial, slightly modified walkie-talkie battery (pack of three regular NiCads; I had to remove a diode used for charging purposes, but the pack fit almost exactly in place). I rebuilt two pack for the HP97 (Topcat) with a couple of four NiCad cells from two mobile (cell phone) faulty battery packs. Most of the earlier cell phones used a five-cells battery pack, and in most cases, the faulty packs have only one deffective cell.

I also used regular NiCads with higher capacity, about 1100mAh, but they need extended charging time to fully charge. Because of the awkward "memory effect" observed in most NiCad batteries when not being fully charged and/or discharged, I also successfuly tested some NiMH cells. These batteries are more "well behaved" related to the memory effect. I currently use NiMH AAA cells (650 mAh) in my HP48/49 units mostly because of the power drain when communicating. In this case they are externally charged, so I always keep some ready to use spare units. The HP49G+ is the one that needs fresh cells more often.

About voltages: the NiCad units operate in the range 1.25Vcc (fully charged) to about 1.17Vcc (low-power indication) or less, depends on the voltage sensing circuit. The NiMH are close to that, and I remember reading that they actually go a bit higher. I found out later that my personal measurement instruments have not enough accuracy to indicate such difference, so I take them as close enough to work about the same.

Hope this helps a bit.

Luiz (Brazil)

in response to message #19 by Perry Schwartz

Just about any AA size NiCad or NiMH cells will work.I use 1800 maH NiMH cells. These are now a bit old technology and you can get up to 2400 maH cells in this size (but those are marketing department specs, not what you will get out of them in real life). To fully charge the NiMH cells you will need to keep the on the charger for at least 24-36 hours.

I have my local battery store spot weld a connecting strap between the two cells (you do not want to trust the spring alone to connect the cells electrically). You do not want the cells themselves glued together. They must be able to move up and down independently so that they can make reliable connection to the battery conatcts in the calculator.

41CV Display problem

*Message #1 Posted by **Mike** on 16 Nov 2004, 12:01 a.m.*

The bottom half of the display on my 41cv is faint I can barely see the words on the bottom of the screen. Do I need to replace the screen and If i need to open the case how do I do that I have never opened the case and the last thing I want to do is mess it up.Thanks for the help Mike

Re: 41CV Display problem

*Message #2 Posted by **Jeff O.** on 16 Nov 2004, 7:08 a.m.,*
in response to message #1 by Mike

Perhaps this will get you started. You might also search the Forum archives, problems with and repairs to the 41 series have been discussed many times over the years.
Good luck.

NEW calculators quality.

*Message #1 Posted by **Will** on 15 Nov 2004, 12:25 p.m.*

Dear friends....I´ve had received a lot of very BAD feedback about the manufacturing quality of the new HP´s models.I am interesting in a "new age" HP but would be useful to know about the opinions about the new ones 33s and 49g+. All the models i own are olds ones(2 voyagers, 1 pioneer, 48g and my trusty but broken 28s, its battery door design is the worst even sold by hp). I usually works using THE PC power using my 11c as supporting calculator to get 2x2 or get my account balance and these things but soon maybe i will need a calculator for an university task (aka. exams) so this is a good excuse to get a new one for my collection. i´ve not decided yet which one..i think would be more likely a 33s (cheaper and good enough in theory) but i don´t discard the 49g+ option yet. The small decimal point and the cheap construction, bad ergomics and other concerns in the first makes a lot of doubts.

Re: NEW calculators quality.

*Message #2 Posted by **Ron Ross** on 15 Nov 2004, 2:48 p.m.,*
in response to message #1 by Will

Today's Hp's are not of the same construction of the past. That said however, they are good calculator's, just not what we are accustomed to. But neither are they anywhere near the cost of the older calculators either (even factoring in inflation!!).

The Hp33s is a direct upgrade of the Hp32sii and only really offers extra memory, a two line display and an algebraic mode.

The Hp49G+ is a big step up in performance and features over its predecessor the Hp48g series. It is faster, faster, faster and has lots more usable memory than the Hp48G. And did I mention, it is faster?

However, the 49G+ doesn't have as nice of keyboard entry as the Hp48G (I still use a 48G at work). However as a school calculator where I check my input, the 49G+ does return answers a lot faster. I wouldn't consider it for repetitive number crunching as it Does miss keystrokes every so often (not often, but just enough that I will never trust it). And I believe it to be a latent hardware issue (in other words, I don't think it will be solved by any real software patch). I also believe that if you never owned another Hp to compare against, you might develop a keyboarding techniqe to overcome this flaw.

Old Hp's worked that if you felt the keyclick you had registered a key entry. Hp's new design is such that you must bottom out the key past the familiar keyclick we are used to. Therefore, keyclick does not mean key entry. That is my point.

Depending upon the class which I would choose. The Hp49G+ does offer some really great features and I don't regret having it. But at work, I use the 48G (I have a PC with a math package that I don't use all that much either).

For school I use my 49G+ for the homework, but I could certainly use less.

If you aren't taking an engineering or scientific course, I would also suggest an older Hp17Bii or Hp19Bii. The 17Bii is very portable and has a great solver. The Hp19Bii has everything the 17Bii has plus trig and units

conversions.

Re: NEW calculators quality.

*Message #3 Posted by **Raymond Del Tondo** on 15 Nov 2004, 4:22 p.m.,*
in response to message #2 by Ron Ross

49g+: In other words, the 49g+ also misses keys faster :-)))

Re: NEW calculators quality.

*Message #4 Posted by **Eddie Shore** on 15 Nov 2004, 9:41 p.m.,*
in response to message #1 by Will

The HP49G+ wins in:

* Screen Quality * Arrangement of the keyboard, especially if you do not the Chevron design * Definable keys, and symbolic math

Both keyboards are good, and are reasonable in price.

If you do go for the hp49G+, get one with at least the series number CNA436xxxxx. The later batches have keyboards that are hundreds of times better than the 2003 batches. Check out Joe Horn's site.

Placement of chips in HP 34C

*Message #1 Posted by **Hans-Erik Lehndal** on 15 Nov 2004, 11:07 a.m.*

I just opened my 34C (the solderless...)to fix some bad connections.

The chips just chipped out and now I don´t know where to put them.. Can anyone please help me?

Re: Placement of chips in HP 34C

*Message #2 Posted by **Jon** on 15 Nov 2004, 1:15 p.m.,*
in response to message #1 by Hans-Erik Lehndal

Hi:

First you should make us know the id number of each one.

Regards

Jon

Re: Placement of chips in HP 34C

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 15 Nov 2004, 2:37 p.m.,*
in response to message #1 by Hans-Erik Lehndal

Hi Hans-Erik, Jon;

I have an HP34C and I have opened (and successfuly closed) some solderless Spice's. What I can tell you is that if you look at it with the display in the upper position, all IC's are lined with their terminal (pin) #1 facing up (all of them, including the bigger one).

There are three places where you can mount the small 8-pin DIP IC's. The upper one is the only one that is kept fed while the calculator is switched to off (continuous memory). This is the place where the RAM IC must go. If you place a ROM IC in this upmost position, [Pr Error] will be shown every time you switch your calculator back on.

Take the three small 8-pin DIP IC's and check for their ID. The one with a completely different ID is the RAM IC. There will be two of them with closer identifiers, differing in one or two digits and having a common literal (ALPHA) chain.

If you still need advice (as Jon mentions correctly), post again with the IC's ID codes.

Hope you succeed.

Luiz (Brazil)

in response to message #3 by Vieira, Luiz C. (Brazil)

Thanks for the tip. I love the Internet, lots of friendly people with good advise out there. The calculator is now running again, but - alas - one (insignificant but irritating) segment is still down and out. As all connectors now are cleaned, I guess the LED module is to blame.

Anybody out there with a LED to spare?

Re: Placement of chips in HP 34C

*Message #5 Posted by **Tony Duell** on 16 Nov 2004, 6:58 a.m.,*
in response to message #4 by Hans-Erik Lehndal

Unfortunately if only one segment of one digit is out, it's almost certainly the display module. It _could_ be the processor chip (the 40 pin one), but that's unlikely.

A display from any Spice series calculator should work.

HP-48GX strange corrosion problem

*Message #1 Posted by **JeffD** on 14 Nov 2004, 7:22 p.m.*

I have a HP-48GX that was in mint condition but, there seems to be some corrsion growing on the edges of the screen and the edges of the keyboard around the keys. The battery compartment is perfectly clean. Any ideas what this might be? Thanks, JeffD

Re: HP-48GX strange corrosion problem

*Message #2 Posted by **Raymond Del Tondo** on 14 Nov 2004, 7:36 p.m.,*
in response to message #1 by JeffD

You may have stored the unit in a very hot and/or humid area,
or at least somewhere outside the specs given in the manual...

Raymond

Re: HP-48GX strange corrosion problem

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2004, 8:03 p.m.,*
in response to message #1 by JeffD

Hi;

I've seen corrosion like this, in fact a few of the units I own have this problem: an HP48SX, a non-working HP42S, an HP15C and an HP11C. All of these have aluminum bezels, and I guess the contamination (oxidation, in my case) is due to one of both causes I can identify: bad environment (as Raymond says) or previous contamination at the production line/chemical aluminun treating. As I have other calculators of the same model without any trouble, and they also have aluminum bezels, I guess this contamination occurs in isolated cases, only.

My 1¢.

Luiz (Brazil)

Re: HP-48GX strange corrosion problem

*Message #4 Posted by **JeffD** on 14 Nov 2004, 10:05 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Thanks for the responses. I was keeping this unit as my mint condition unit but unfortunately it has this problem. Is there any way to stop the issue from happening any further? Thanks, Jeff

ultrasonic wave cleaner may help

Re: HP-48GX strange corrosion problem

*Message #6 Posted by **bill platt** on 15 Nov 2004, 11:03 a.m.,*
in response to message #4 by JeffD

If you have salts or other water-woluble materials acting as electolyes, floating around inside, then you might try removing the batteries, and immersing in pure distilled water, rinsing with this distilled water thoroughly, and then drying completely over a period of days.

This wil lremove the electrolyte--thereby stopping the source of corrosion.

regards,

Bill

Re: HP-48GX strange corrosion problem

*Message #7 Posted by **JeffD** on 15 Nov 2004, 7:06 p.m.,*
in response to message #6 by bill platt

Would the entire calc get immersed? Thanks, Jeff

Re: HP-48GX strange corrosion problem

*Message #8 Posted by **bill platt** on 15 Nov 2004, 8:16 p.m.,*
in response to message #7 by JeffD

Yes indeed! Just be sure the batteries are out. I know it seems strange, but it has been done many timess---and by some really good experts---seemed strange to me too at first!

Do a search of this forum & archives and you will find a number of discussions---search "distilled" "water" "wash" "clean" "corrosion" etc

Best regards, and do tell how it comes out!

Bill

One question: (was: HP-48GX strange corrosion problem)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 15 Nov 2004, 8:29 p.m.,*
in response to message #8 by bill platt

Hi, Bill;

I read Jeff's first post again and it seems to me that the corrosion/contamination happens only in the external bezel. I am completely sure about the fact that using distilled water to completely emerse the calculator is one (if not THE one) of the best options/procedures, but I wonder if it is necesary in this case. Indeed, having the calculator cleaned this way is also a great benefit for the fuure.

Just to know: should it be necessary if the corrosion proves being external only?

Thanks and best regards.

Luiz (Brazil)

Re: One question: (was: HP-48GX strange corrosion problem)

*Message #10 Posted by **bill platt** on 16 Nov 2004, 12:29 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I think that even if the corrosion is "external" the electrolyte must needs be below the surface for corrosion to occur, and therefore in the electronics as well, if it is causing corrosion. For, if it were only on the surface, then the paint would be adequate protection from salts etc.

So the question then becomes, will the transient solution cause any harm? My sense is not (provided the batteries are out), as if there is a hydrophyllic corrosive salt in there, it will have been "wet" already, merely from vapor.

Off topic, can you email me? (south american musical instruments)

Graphing calculator form factor opinions

*Message #1 Posted by **Hugh Evans** on 14 Nov 2004, 3:20 p.m.*

I'm rather satisfied with how the landscape and portrait form factors are developing. The graphing calculator is a bit more of a challenge since I'm not entirely certain of what this community really wants out of one. I'll post a few of my remarks and would then greatly appreciate a thorough discussion (not that anyone around here would have an opinion ;-)

First, I think the 48g reached the maximum acceptable number of keys.

I suspect screen resolution and color v. black and white will be the biggest debate. Would a larger screen be worth losing a row or two of keys?

The big question these days seems to be managing the balance between a PDA and a calculator. What we know of Qonos is a great example of the search for this balance between the qualities of each device. Do people here want an improved 49g with excellent keys, high quality of build and extra speed? Or do you want a PDA interface with a lower number of keys?

I could go on and on, but you get the idea. I'm looking forward to watching this thread.

Best Regards, HDE

Re: Graphing calculator form factor opinions

*Message #2 Posted by **Sam Hughes** on 14 Nov 2004, 4:20 p.m.,*
in response to message #1 by Hugh Evans

Speed is important to me, as is programming. I do not use graphing calculators for graphing much. I'd say speed, programmability, and a decent keyboard is what I'm looking for. Screen size does not matter too much to me - I find 131x64 to be fine -- of course, bigger is better, but not at the expense of rows of keys. I like the 48's layout, though the 49 fit an extra row... maybe a combination thereof would be good (with a sickening amount of keys available -- 54 total (eep)).

Color is irrelevant to me. This is mainly because I see the HP graphing calculators' primary function as that of a portable interactive Forth interface. Therefore, I list characteristics by this order of importance:

Forth or RPL-like language/interface Keyboard quality/layout Speed Screen resolution ... ... Manual ... ... Color (totally unimportant).

Re: Graphing calculator form factor opinions

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 14 Nov 2004, 7:55 p.m.,*
in response to message #1 by Hugh Evans

HI, Hugh;

I think this thread is a valid search for opinions; thank you! It's a good idea.

I think that without knowing what users want, it is hard to meet their needs. Nowadays, knowing what people want is somehow hard as well, because what you need today may not be in your list tomorrow. And I guess calculators resources are somehow like this.

That's the main reason I'd firstly search for a calculator with an upgradable O.S., like the HP49 'series' (of two, so far). My first option for a graphic calculator would be the one with an upgradable O.S. After that, I'd search for as much documentation as possible about the calc so I'd be able to access its inner resources. A NOMAS-based (NO MAnufacturer Support) open hardware (extended information, like the HP71) would be nice as well.

If applicable, I'd trade colors for 'easy' gray scale and higher resolution. I saw the images taken from the Xpander hi-res LCD and I found them a lot better. What I think is that graphics with low resolution may not be as practical today as they were in the end of the 80's, when the HP28C was introduced. I believe that calculators should have advantages against computers (or related resources) so they'd not be a weak concurrent. Anyway, if color AND hi-res display is possible, even better.

Along with the upgradable O.S., programming would be availble at the user needs. Why not adding small, instead powerfull compilers as the user needs them? The key would be a basic O.S. able to run all compiled applications and the user having the choice to develop them in his prefered language, amongst the ones avalilable. Not necessary to say that duplex I/O capability is mandatory.

About keyboard and number of keys: for me, whatever allows easy, reliable access to all resources (at least the most important ones) would be acceptable.

Cheers.

Luiz (Brazil)

Re: Graphing calculator form factor opinions

*Message #4 Posted by **Garth Wilson** on 14 Nov 2004, 8:35 p.m.,*
in response to message #1 by Hugh Evans

Keys: A huge number of keys is not needed unless it's made for touch-typing. If users will be typing that much on it, maybe it should be able to be interfaced to a PC keyboard.

Color: Color virtually _requires_ backlighting, right? That would cut battery life way down. Either way, it needs to be sunlight-readable. Color seems to be mostly a gee-whiz factor to attract non-professional consumers and has very little practical use among the people who would probably be buying this unit (assuming the gaming audience is _not_ targeted!)

And please, no touchscreen!

Re: Graphing calculator form factor opinions

*Message #5 Posted by **Eddie Shore** on 14 Nov 2004, 9:40 p.m.,*
in response to message #1 by Hugh Evans

Number of Keys: the number of keys on the 49 and 48 are acceptable. Functions that should never be shifted: SIN, COS, TAN, LN, Y^X, the var X, +/-, SYMB, MATHS, VAR

The screen on the 48 and 49 are good. As long as the screen can display crisp graphics and be read in adequate light, I'm happy with its size. Enlarging the screen maybe be good for losing one row of keys, but not two. Color on the screen is good only if we have control of what colors show up on the screen.

For the keypad, I like contrast. Black base, light blues, greens, yellows seem to work best. But whatever is functional.

Re: Graphing calculator form factor opinions

*Message #6 Posted by **Cyril** on 15 Nov 2004, 5:52 a.m.,*
in response to message #1 by Hugh Evans

And, what about a TFT grayscale screen ? I think it would be the best screen possible for such a device. Otherwise, I like the classic Enter key (41/42/48/28...). A larger screen isn't necessary but a better résolution would be great. I think a VGA screen would be enough combined with a very powerful RPN calculator.

Keyboard Layouts

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 13 Nov 2004, 9:09 p.m.*

I was working with my HP-41 and my HP-28 side by side to compare results. I suddenly noticed something that as a relative newcomer to the HP product line I had not noticed before. The HP-41 has the arithmetical operations keys to the left of the numerical keyboard while the HP-28 has the arithmetical operations keys to the right of the numerical keyboard. Furthermore, reading the operations keys from the bottom up on the HP-41 the sequence is / x + - while for the HP-28 the sequence is - + x / . The layout on the HP-41 seems to have been used on every HP handheld from the HP-35 through the HP-41 with the exception of the HP-10. The layout on the HP-28, which is the same as that on the TI's and most other calculators, seems to have started with the Voyagers and persisted in the HP product line ever since. Back in the HP-35 days the desktops such as the HP-91 and HP-97 had the HP-28 layout.

Why did HP decide to place the operation keys to the left of the numeric keypad on handheld calculators from the HP-35 through the HP-41?

Why was the change made with the Voyagers and beyond?

Re: Keyboard Layouts

*Message #2 Posted by **Raymond Del Tondo** on 13 Nov 2004, 9:23 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi,

maybe this has been discussed here before,
but I think the 'classic' arithmetic key layout
simply was very ergonomical to use when holding the calc
in the right hand, and pushing the keys with the right thumb.
You'll notice that you'll easily reach the most important keys,
namely plus and minus with your thumb,
whereas you'll have to stretch your thumb more from the
center of the keyboard to reach the multiply and divide keys.

Raymond

Re: Keyboard Layouts

*Message #3 Posted by **Karl Schneider** on 13 Nov 2004, 10:16 p.m.,*
in response to message #2 by Raymond Del Tondo

I think Raymond's explanation is as good as any. Starting with the Voyagers in 1981, though, HP finally got smart and realized that most users don't hold and operate the calc in the same hand. Since 90% of people are right-handed, prevailing practice is one of the following:

1. Hold in left hand; operate with right hand.
2. Place on table; operate with right hand.

With the newer arrangement, the right-handed user does not obscure the numeric keys when pressing an arithmetic key.

This detail of ergonomics also explains why (non-cellular) telephone handsets are connected to the left side of the phone base. Right-handed users would tend to operate the rotary dial with the right-hand index finger. When the handset is held in the left hand, the cord will not drape across the base.

-- KS

Re: Keyboard Layouts

*Message #4 Posted by **Sam Hughes** on 14 Nov 2004, 9:57 a.m.,*
in response to message #2 by Raymond Del Tondo

You might notice that most younger people hold calculators in both hands and use their left-and-right thumbs (a behavior learned and coordination built from video game controllers). With this behavior, the left side would be the appropriate place for the operators, because when doing a series of operations, the left thumb would always press an operator or ENTER after each number entered, which would be the more-consistant behavior. The right hand would end up "covering" across the keyboard more, dominating the center column of keys more than the left hand, instead of having to move left and right to handle operators (as would happen of they were on the right side).

As a result, there would be space on the right side of the number pad for some keys, which might be shift keys, in which case it would be good to have the more-commonly used shifted functions on the left side of the keyboard (the left hand already being used for many operators, plus it being easier to use both hands instead of one). With the left hand being the main "operator" key, it would make sense to favor the left side for the most-common nonshifted operations as well (the right side of the row containing the ENTER key might be preferred to the keys just above the ENTER key, though).

Of course, this depends on how the person holds the calculator. I know somebody who held his TI-89 in both hands, with thumbs for the lower keys, but his index fingers, instead of sitting behind the keypad, curled up over the sides for pressing shift keys in the upper left and the arrow pad in the upper right.

This is the method I have always used with my 11c and 15c. That was before any of those video game controllers existed. It is the best way to operate a landscape layout calculator while holding it in your hand, which is why the landscape layout is the layout for hand held use. Thumbs are far more agile than the rest of the fingers, which makes them faster on the keyboard than poking around with your index finger.

A Possessed 32sii

*Message #1 Posted by **Ben Salinas** on 13 Nov 2004, 5:36 p.m.*

Well, it happened. My 32sii finally died. I am getting a replacement (well it will be loaned to me for the next 7 months of school). At first it just froze, and so I used the dime trick to fix it. That worked for about 5 minutes. It froze again. It sporadically works and doesnt work. I used it today for a few minutes and when I pressed the 4, I would get a "46." When I pressed the second button, sometimes I would get ->DEG.

This leads me to believe that it is a problem with the keyboard. I know it is possible to open it up and possibly resolder the contacts or something of the sort. Does anyone know of an article which explains this process?

I am currently using my 33s, which isn't all that bad.

-Ben

Re: A Possessed 32sii

*Message #2 Posted by **Vieira, Luiz C.** on 13 Nov 2004, 8:41 p.m.,*
in response to message #1 by Ben Salinas

Hi, Ben;

I guess these images might help you somehow; at least it seems to me you did not open your HP32SII so far, did you? I'm almost sure that there is an article about how to open Pioneers, but I did not find it... Sorry.

These are the images:

http://www.logeng.com.br/images/32sii_mb_s.jpg After opening (Click to enlarge)
http://www.logeng.com.br/images/32sii_mbi_s.jpg After removing the MBoard (Click to enlarge)
(Obs: it's necessary to GENTLY, CAREFULY 'untwist' the six metal tabs in order to preserve them for 'twisting' back to place when rebuilding the calculator).

I'd resolder all main IC's and components terminals prior to rebuild the calculator. Sometimes, as you probably know, you do not see a cold soldering in order to identify which terminal do solder, so I always solder them all.

Please, let us know if you succeed or if you need extra advice.

Best regards.

Luiz (Brazil)

Re: A Possessed 32sii

*Message #3 Posted by **ned** on 14 Nov 2004, 10:39 p.m.,*

in response to message #1 by Ben Salinas

did you read this?: http://www.hpmuseum.org/guest/brogpion.htm

I recently posted about a keyboard prob with my 32s, and the solution was to take the metal faceplate and the back cover off, and reattach the 2 teeth that hold the front cover to the metal inner chassis just below the lcd. These 2 teeth provide the pressure necessary to hold the keyboard flexible connector to the main circuitboard. When the 2 teeth let go from the metal subframe, the keyboard flexi circuit had a poor connection unless the calculator was pushed together in the middle. Maybe the 32sii is built differently tho. oh, did you try changing the batteries? Hope this helps.

in response to message #3 by ned

Thank you for the suggestions. Once I get some free time (hahaha... between school and college apps, that doesnt exist... it does help that we just finished our renaissance festival on Friday... http://www.valleystar.com/localnews_more.php?id=55618_0_19_0_C ... it went quite well).

Hopefully I will work on this next weekend, or over Thanksgiving break.

HP-9G adding angles

*Message #1 Posted by **Mary** on 13 Nov 2004, 2:21 p.m.*

Does anyone know if the HP-9g can add or subtract andles in degrees minutes and seconds?

Re: HP-9G adding angles

*Message #2 Posted by **Norris** on 13 Nov 2004, 2:53 p.m.,*
in response to message #1 by Mary

I don't have a 9G, but my guess is that it probably does *not* have built-in functions for adding or subtracting values in degree/minute/second (DMS) format. However, the 9G is programmable, and it should it be easy to create simple programs to add this functionality. The programs simply need to do the following:

(1) take two entered values in DMS and convert them to decimal degrees

(2) add or subtract the two values, yielding a result in decimal degrees

(3) convert the result from decimal degrees to DMS

I've used programs of this sort on the 32SII and 33S. The 48GX has this capability built-in.

HP9G learning module for this available

*Message #3 Posted by **Gene** on 13 Nov 2004, 3:11 p.m.,*
in response to message #1 by Mary

http://www.hp.com/calculators/graphing/9g/technical.html

Choose the learning module dealing with Angles and Times from the list.

HP 17bII+ stats bug

*Message #1 Posted by **DSS** on 13 Nov 2004, 3:00 a.m.*

(I originally posted this to comp.sys.hp48... with 2 ppl confirming that this is a bug, user beware... just glad i didn't find this while taking a test or something!)

This many simply be a misunderstanding of how the calculator works, but if you have one, can you please try the following? (I am using RPN mode)

Create a list "X", 5 items: 10 15 20 25 30

Create a list "Y", 5 items: 1003 1005 1010 1011 1014

Do stat calculations on the lists. CALC->MORE->FRCST

X Variable is "X" Y Variable is "Y"

Switch to LINEAR mode (MODL->LIN)

In the FRCST menu press "MORE" until you see the sumX, sumY, sumX2, sumY2... menu (Don't press CORR, M, or B at any point during this time)

Verify: sumX = 100 sumY = 5,043 sumX2 = 2,250 sumY2 = 5,086,451 sumXY = 101,000

Now, press "MORE" until you get to the "X Y CORR M B" menu. Press "CORR" to calculate the correlation value. The value displayed should be 0.9826...

Now, press "MORE" until you are back at the summation screen. See if the summation values show the following:

sumX = 100 sumY = 5,043 sumX2 = 250 sumY2 = 81.20 sumXY = 140

Why did the last 3 sums change??? The same seems to happen if you choose M or B instead of CORR. The only way to get 101,000 for sumXY is to exit the FRCST menu completely and rechoosing the X Y lists again...

Pilot error or bug???

hp 32sii programs on hp 42s

*Message #1 Posted by **LH Chan** on 13 Nov 2004, 1:44 a.m.*

hello,

i have a program writen for hp 32sii and i want to run it on a hp 42s. i typed it into the 42s. but it doesnt work. are there any operations on hp 32sii that works differetly on a hp 42s? is it true that of the hp 32sii is supposed to be simpler, all fuctions on a hp 32sii should be available on a hp 42s?

Thanks - LH Chan

Do you have a manual for either calc?

*Message #2 Posted by **Karl Schneider** on 13 Nov 2004, 3:29 a.m.,*
in response to message #1 by LH Chan

> Quote:

> are there any operations on hp 32sii that works differetly on a hp 42s?

I question how much you know about the 42S. Its programming paradigm is basically that of the 41C/CV/CX, which means, for example, that labels can be internal or external, "END" statements are the dividers between programs. There might be a problem with your entry f the single-letter labels you carried over from the 32SII program. Single-letter variable names must be delimited by double quotes on the 42S.

Complex numbers are completely different on the 42S, and some function names are probably different.

I would advise that you fully understand the 32SII program, then obtain a manual for the 42S to figure out what its "rules" and conventions are. Blindly copying the listing of one calc's program into another calc using a different paradigm isn't likely to work.

Re: hp 32sii programs on hp 42s

*Message #3 Posted by **Robin** on 13 Nov 2004, 4:36 a.m.,*
in response to message #1 by LH Chan

You could post the program here to let someone convert it for you - im pretty shure someone will. Comparing is an easy way to learn the differences - provided that you to know what your programm on the 32SII does ;-)

HP 41C Batteries

*Message #1 Posted by **Willis Wilson** on 12 Nov 2004, 10:20 p.m.*

I need a new/replacement rechargeable battery pack for my 41C. Does anyone know of a source and what I should expect to pay?

Vendor on ebay is selling them

*Message #2 Posted by **Gene** on 12 Nov 2004, 11:47 p.m.,*
in response to message #1 by Willis Wilson

I saw it last week. About $30 if you send your old 41c rechargeable battery pack to him. He then sends you a new one.

Search there.

Other possibilities: Buy n-size nicads from www.thenicadlady.com - these are about $1.50 each. If you have a charger that charges n-size, that's the best deal.

Gene

Link to an auction of the rebuilt HP41 battery packs...

*Message #3 Posted by **Gene** on 13 Nov 2004, 11:15 a.m.,*
in response to message #2 by Gene

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58039&item=5728743853&rd=1

Note: I have not bought from this individual. I have no connection with them at all. All I know is what he says on this sale page. He does have a +144 feedback rating with 0 negatives, so he's obviously concluded quite a few good transactions.

He doesn't list any of these for sale right now, but an email to him would find out if he will be doing so in the future.

FYI. Gene

Re: Link to an auction of the rebuilt HP41 battery packs...

*Message #4 Posted by **Peter Khor** on 15 Nov 2004, 12:27 a.m.,*
in response to message #3 by Gene

On the cheap, re-building a pack yourself isn't all that difficult either. You might look around locally to see if you have a battery supply store that has an impact welder to weld tabs, cost might be very reasonable (couple of bucks). fwiw I solder packs for my other 'hobby' (electric R/C planes), re-built several of my HP packs and haven't had any problems with leaks.

Transferring files between HP 41 and PC using serial interface

*Message #1 Posted by **Nick Nicholas** on 12 Nov 2004, 7:18 p.m.*

Is there any software that is compatible with Windows XP that would facilitate transfer of files with a HP 41 over a serial link. It is surprising to me that four accessories (the IL module, the RS232C interface, the Extended I/O module and a serial cable) are required for serial communication. Was there ever an optional module that could be plugged into a HP 41 port that allowed direct connection to the PC's serial port (i.e. it provided the functionality of all the four accessories)?

What would be the transfer rate of such a serial connection?

Is the HP82164 HP-IL to RS232 serial port interface a rather rare or expensive accessory to obtain on eBay?

Re: Transferring files between HP 41 and PC using serial interface

*Message #2 Posted by **Garth Wilson** on 12 Nov 2004, 8:22 p.m.,*
in response to message #1 by Nick Nicholas

I've used a little GWBASIC file to run on the PC to take text in from RS-232 and put it in a file, but I've never tried doing anything other than text between the hand-held HP's and the PC.

AFAIK, they never made an HP-41 module that directly interfaced to RS-232 because the required power would be awfully hard on the batteries. What manufacturers of some hand-held terminals have done however is to power the terminal, or at least the line drivers, from power received from the PC via the line receivers. Of course that means you couldn't put two of these together since neither one would be supplying power. The interface could be made to use internal power if the other end wasn't supplying it.

Somewhere I saw an article on how to open up the HP71 and connect some wires in someplace to make an RS-232 link. I don't remember if it was in the book "Control the World with HPIL" or in the CHHU Chronicle. Personally, I'm not about to open up either of my 71's which are in perfect condition to add an interface that I can't imagine would work very well without even any way for the line "driver" to go below ground. Instead I got the FSI164A which has two RS-232 channels and has worked perfectly with both the 41 and the 71. (It does have a bug with even parity, but who uses that?)

The HP-41's HPIL speed is very, very slow compared to that of the 71, at something like 150 bytes per second. Still, it's fast enough for most things you'd do with the 41.

I do remember HPIL boards you could plug into the PC, but I never bought one. I did get "71B-Talk" PC software to connect the 71 via RS-232. It was rather problematic (all from the PC end).

One of the electronics industry trade magazines had an editorial last year declaring RS-232 to be dead. They got so much mail from various companies telling why they still use it and it wouldn't be practical to switch to something else that the magazine had to retract their announcement. I for one hope it never dies. It's a simple workhorse that's much easier to incorporate into things than something like USB is.

*Message #3 Posted by **andy** on 12 Nov 2004, 8:46 p.m.,*
in response to message #2 by Garth Wilson

Hans Brueggemann wrote a program called "HPILCOM" which works great. He once posted a message with his email address on this site:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=49307

I'm fairly certain it requires the extended i/o rom though.

Hopefully you can contact Hans and get a copy from him.

*Message #4 Posted by **Raymond Del Tondo** on 12 Nov 2004, 9:35 p.m.,*
in response to message #1 by Nick Nicholas

Hi,

an alternative could be using an HPIL-PC card
in combination with Emu41, at least if your PC has an ISA slot.
The above combination is the easiest-to-use solution,
as it requires no special software on the HP-41 side,
just an HP-IL module.

Raymond

*Message #6 Posted by **Hans Brueggemann** on 13 Nov 2004, 5:33 p.m.,*
in response to message #1 by Nick Nicholas

hi nicholas, maybe HPILCOM can do the trick. just drop me a line, and i'll be sending you the latest version.

yes, x/io is required because of "INP". however, it should be possible to handle program input via "INA" (XF/M module) and some additional programming on the 41.

cheers, hans

Re: Transferring files between HP 41 and PC using serial interface

*Message #7 Posted by **Nick Nicholas** on 13 Nov 2004, 10:08 p.m.,*
in response to message #1 by Nick Nicholas

In retrospect, the HP 41 series calculators were sold at a time when the majority of the users did not own a desktop or laptop computer so the idea of a cheap method of transferring files to a PC was not relevant. I suppose by the time the PC was common, the HP 41 series was near the end of it's product life and HP was developing the HP 48 series as a replacement so the idea of developing a module for interfacing with a PC would not have made economic sense.

Does the HP82164A RS232C interface use rechargeable batteries as a power source?

Re: Transferring files between HP 41 and PC using serial interface

*Message #8 Posted by **Andy** on 13 Nov 2004, 11:06 p.m.,*
in response to message #7 by Nick Nicholas

The hp82164a uses the typical AC power supply that a lot of the other hp devices use (the 71, 75, 97, thinkjet, 9114a/b, ...). Its worth having one if you like the 41, 71, and 75 because it works with all of them. I've even used it with hyperterm (windows built-in terminal program) to provide an external keyboard/display for my 71b. Plus, like I said, hpilcom written by Hans B. works really nicely for the 41.

You should be able to find one on ebay for ~ $50.00 if you look for a while. The manual is in the mohpc dvd.

Andy

Re: Transferring files between HP 41 and PC using serial interface

*Message #9 Posted by **Tony Duell** on 16 Nov 2004, 7:04 a.m.,*
in response to message #8 by Andy

And the 82164 _requires_ an AC input. The other interface modules (82163 video, 82165 GPIO, 82169 HPIB) just rectify the power input and feed it to a 7805 regulator to get 5V for the logic chips. Those can (in theory) be used with a DC input. But the 82164 does that _and_ it feeds the input to a little step-up transformer which feeds more rectifiers and regulators to get the +/-12V supply for the RS232 driver chips. You can't, therefore, run an 82164 off a DC input.

Re: Transferring files between HP 41 and PC using serial interface

*Message #10 Posted by **Garth Wilson** on 14 Nov 2004, 12:24 a.m.,*
in response to message #7 by Nick Nicholas

> Does the HP82164A RS232C interface use rechargeable > batteries as a power source?

Andy told about the HP, so I'll tell about the FSI164A. The FSI has a DC-10 jack in the side for 9VDC, the pin being +. I think there was an option for battery power, but I didn't get it. (It also had an option for 8 RS-232 channels, but I only got the standard 2.) Since the input is not AC, it looks like it would be easy enough to connect an external battery pack if you wanted to.

Re: Transferring files between HP 41 and PC using serial interface

*Message #11 Posted by **Christoph Klug** on 15 Nov 2004, 4:13 a.m.,*
in response to message #10 by Garth Wilson

Dear HP41-PC interfacing enthusiasts :-)

A small companie called Handheld Portable Products = HPP produced a special version of the HP82164 RS232-IL interface which is battery powered for mobile applications.

Also CMT produced a very nice device, called IL-RAM-Disk unit, which includes a RS232 interface option. Also this device is battery powered for mobile applications.

Actual the standard Windows solution for interfacing HP41 to PC by using RS232 is the software form Hans Brueggemann. As I know Tony Duell created a software solution for Linux operating system.

Alternatively you can use the HP-IL/PC interface card for interfacing your handheld to PC world. For this some different software solutions exist : HP41.com LINK PLUS, TRANS41 EMU41 and EMU71. By taking this solutions you are able to interface HP41, HP71 and HP75 handheld computer to PC world.

For parctical work with HP41 I prefer using EMU41, because this powerfully software is an advanced emulator , includes some virtuaL IL-Devices and also acts as HP-IL controller for controlling real IL-Devices.

For EMU41 exist user code software solutions for transfering any tpye of HP41 files (data, programm, ASCII, CCD-Module matrix files and NNN´s = non normalised numbers). Also EMU41 includes up and download of complete HP41 rom images (plug in modules). This is helpfull for creating own rom solutions and for programming new hardware devices like CLONIX or NoVRAM...

Best regards - Christoph Klug

*Message #12 Posted by **Tony Duell** on 16 Nov 2004, 7:00 a.m.,*
in response to message #11 by Christoph Klug

The programs I've written for linux allow you to use the Extended I/O INP and OUTP functions to transfer programs between the HP41 and a PC. I've distributed them as commented C source code, and I'd be happy if somebody wants to try porting them to other OSes.

hp41cv repair question

*Message #1 Posted by **Andy** on 12 Nov 2004, 6:40 p.m.*

Hi,

I am reparing an hp41cv. The "2" key was missing strokes. I took the 41cv apart and everything inside looked fine (its a fullnut but its posts were not cracked). Next I removed the lcd (de-soldered) and sonicated the keypad for about 1 hour in 39C deionized water. Then I let the keypad dry by placing it on the top of my computer monitor for 4 days.

Upon complete re-assembly the 41cv does not respond. So I replaced the keypad/display with a spare keypad/display from another 41. With the spare keypad display everything works so the problem is in the original keypad/display.

Any thoughts? What could have gone wrong? I was very careful when I removed/replaced the lcd and made sure all the solder joints were continuous with a multimeter. Is it possible there is still water causing shorts?

Thanks,

Andy

Re: hp41cv repair question

*Message #2 Posted by **Raymond Del Tondo** on 12 Nov 2004, 7:30 p.m.,*
in response to message #1 by Andy

Hi,

it seems the I/O assembly of your first kbd/dsp combination is faulty,
and/or the zebra stripe between the CPU board and the main pcb is bad.

Or maybe one or more contacts got too hot while resoldering the display...

The I/O assembly is the block where the battery and port connctors are located on.

Raymond

Re: hp41cv repair question

*Message #3 Posted by **Randy** on 12 Nov 2004, 11:16 p.m.,*
in response to message #1 by Andy

Five to ten minutes is all you need in an ultrasonic cleaner.

ANY moisture inside the keyboard will cause problems. Four days should have been enough time though if you shook it out well afterwards and pressed all the keys to expell the water inside. If in doubt, the 41 service manual (on CD5 or the DVD) details the keyboard connections, I would ohm out the matrix to see if there is

leakage anywhere.

Residual flux on the display connections will cause trouble as well, they need to be spotless. Clean with isopropyl alcohol or the proper flux remover for the type of solder used. Do not allow the flux remover to get into the keys or on the display window or you'll have intermittant keys and white haze on the lcd.

If your units logic board to keyboard interconnects are the early pink elastomeric strips, try exchanging them with the later gold metal type. They tend to be very problematic.

Re: hp41cv repair question

*Message #4 Posted by **andy** on 13 Nov 2004, 11:11 p.m.,*
in response to message #1 by Andy

I printed the keyboard pinout from the service manual. After testing many of the keys I decided they were probably all okay.

Then I removed the display again. Next I removed the two c-shaped clips which hold the lcd-sandwich together. I squeezed the clips and put them back on in hopes they would provide a little more clamping force. Then I re-soldered the lcd back in place, put it all back together and it works. I'm not sure what was wrong before ?.

Now I have a very very clean 41cv with a "2" key that works much better!

Thanks for the help, Andy

Private ROM on HP-41, some observations (long)

*Message #1 Posted by **Miki Mihajlovic** on 11 Nov 2004, 9:11 p.m.*

Here is some information about PRIVATE ROM for HP-41 that I gathered mostly by deduction and information from SDSII manual.

HP made it possible for people putting their programs in ROM images to make them PRIVATE. It is assumed that you are using SDSII kit to create your ROM images. Chapters 7 and 8 of SDSII manual contain some guidence but no detailed explanation since the whole process is rather automatic.

In your ROM define file the line that defines ROM number, header etc. can contain PRIVATE command:

&ROM#=17,HEADER=MYROMNAME.1A,PRIVATE

This will change some bits and add some level 0 code to the ROM image automaticaly by BUILD utility.

I have built two identical ROM images (from Geometry solutions book) and comaped them. Here are the differences:

```
ROM FAT:

C000 011 XROM NO.=17
C001 00B 11 FUNCTIONS
C002 000 FCT:GEOMETRY 1A
C003 025 ADR: C025
C004 200 FCT:`TANGENT
C005 028 ADR: C028
C006 201 FCT:`DIST
C007 020 ADR: C120
...

1) 1st word before program entry point has bit 9 set if PRIVATE :

Non-PRIVATE                     PRIVATE
-----------------               -----------------
...                             ...
C027 210 PLDI: 84               C027 310 PLDI: C4
C028 1C4 PLDI: 71               C028 1C4 PLDI: 71
C029 001 PLDI: 00               C029 001 PLDI: 00
...                             ...

2) Last word of the program has bit 8 set if PRIVATE:

Non-PRIVATE                     PRIVATE
-----------------               -----------------
...                             ...
C11D 22F JC C0E2 -3B            C11D 26F JC C0EA -33
C11E 01C PT= 3                  C11E 01C PT= 3
C11F 250 LD@PT- 9               C11F 350 LD@PT- D
C120 1CA A=A-C PT<-             C120 1CA A=A-C PT<-
...                             ...

3) After all the programs the following 13 words are added if PRIVATE :
```

```
Non-PRIVATE                     PRIVATE
-----------------               -----------------
...                             ...
C7E1 01B JNC C7E4 +03           C7E1 01B JNC C7E4 +03
C7E2 22F JC C7A7 -3B            C7E2 26F JC C7AF -33
C7E3 000 NOP                    C7E3 0CC ?FSET 10
C7E4 000 NOP                    C7E4 05B JNC C7EF +0B
C7E5 000 NOP                    C7E5 34C ?FSET 12
C7E6 000 NOP                    C7E6 04F JC C7EF +09
C7E7 000 NOP                    C7E7 10E A=C ALL
C7E8 000 NOP                    C7E8 338 READ 12(b)
C7E9 000 NOP                    C7E9 1BC RCR 11
C7EA 000 NOP                    C7EA 0AE A<>C ALL
C7EB 000 NOP                    C7EB 15C PT= 6
C7EC 000 NOP                    C7EC 362 ?AC @PT
C7ED 000 NOP                    C7ED 017 JC C7EF +02
C7EE 000 NOP                    C7EE 348 SETF 12
C7EF 000 NOP                    C7EF 1E0 GOTO ADR
...                             ...

4) At the end of the listing at address (CFB2-CFF3, CFF8) a code (microcode table?)
   is included about which I have no knowledge or any information from SDSII manual.
   However, if you are not worried about polling points and have no MCODE routines
   just FOCAL programs I assume that it is safe to zero out all that to the CFFB.
   If somebody knows something more about this, please correct me.

Re: Private ROM on HP-41, some observations (long)

*Message #2 Posted by **Emmanuel, France** on 12 Nov 2004, 2:34 a.m.,*
in response to message #1 by Miki Mihajlovic

```
Another point :
Before Clonix41, I was only using SDS-II.
I was loading programs(read41p), creating my own ROMs (build),
dumping the others (readmldl), creating EPROM sets (highlow, eprom).
The most important thing that rom images (*.41R) had the same size as Clonix41 images
(*.ROM),
i.e. 8192 bytes.
Under DOS command window, I RENAMEd rom_image.41R rom_image.ROM
And it worked in a Clonix41. It's magical, isn't it?

in response to message #1 by Miki Mihajlovic

Hi Miki!

Tnx U a lot 4 sharing your observations. I never used SDS-II, only ZEN-ROM and RAM-Box from W&W. May be I find an hour this WE to have a closer look (after I did reply some postponed eMails - sorry Tony).

Ciao.....Mike

in response to message #3 by Mike (Stgt)

Hi Mike,

why use SDSII, when you can use SDK41 from TOS ?
It's easy to use.

Regards,

Raymond

Re: Private ROM on HP-41

*Message #5 Posted by **Miki Mihajlovic** on 12 Nov 2004, 12:25 p.m.,*
in response to message #4 by Raymond Del Tondo

Hi Raymond,

You are right to say that SDK41 is much easier to use and more powerful but there are some bugs in D41, A41... Try it yourself, disassemble a ROM (I used Sandbox) and assemble it again and there will be some differences. Some macro commands are different, I let Warren know about it but I guess he has no time or interest to debug it.

in response to message #4 by Raymond Del Tondo

Hi Raymond!

Thank you 4 your hint, but I like to see what code SDS-II put in in addition if you "private" user code in ROM. Just curious if it's something useful.

Ciao.....Mike

free42s matrix inverse

*Message #1 Posted by **hugh steers** on 11 Nov 2004, 8:44 p.m.*

hi there,

ive been going through the 42s owners manual trying stuff on free42. its great! now i'm even more impressed that every little detail appears to be there.

ive gotten onto trying out the matrices and for fun, ive feed it some nasty ones. there appears to be a problem with inverse that’s not down to floating point error nor the method used (ie lu-decomposition & back substitution. i'm reading the code).

i'm trying this

```
3              1              2
1          1e-040         1e-040
2          1e-040        -1e-040
```

ok, so its nearly singular (this example is treated in the 15c advanced function handbook p105). i tried it with my own matrix code which gives the right answer using 1eee754 doubles as,

```
   -2e-040              3             -1
         3         -4e+040         2e+040
        -1          2e+040        -1e+040
```

but free42 is wildly out. i tied to debug it. i don’t think its your use of “tiny” for the pivot because that happens to be calculated as 1e-20 (the same as i use). so i suspect the backsubstitution. my version doesn’t have an inner loop. is there a bug here?

and many thanks for making all the fix releases. much appreciated.

Re: free42s matrix inverse

*Message #2 Posted by **whuy** on 12 Nov 2004, 2:06 a.m.,*
in response to message #1 by hugh steers

Well, that's my point. If the matrix is singular to calculator precision, the result you get is effectively 'anything and nothing'. A slight change - algorithmic, order of operations - may return completely different answers, that's what a badly conditioned problem is all about. The result is meaningless, and what is worse - you are not told that it is, there is no 'singularity indicator'.

Werner

Re: free42s matrix inverse

*Message #3 Posted by **hugh steers** on 12 Nov 2004, 7:05 a.m.,*
in response to message #2 by whuy

yes indeed, i completely agree. although ive found that this example is within the limits of 1eee754, albeit out of range for the 15c.

this came up whilst testing the matrix implementation. i'm thinking that free42s should be able to cope with this case. what im doing is comparing the results of my own matrix library with free42's answers. both use the same underlying number representation.

Re: free42s matrix inverse

*Message #4 Posted by **Thomas Okken** on 12 Nov 2004, 6:41 p.m.,*
in response to message #1 by hugh steers

I'll look into it this weekend. BTW, you mention your code does give the correct answer. Does your code agree with mine as far as the LU decomposition is concerned?
I'll just step through the code with the NR original for reference, but maybe we can narrow this down a bit beforehand.
Thanks!

P.S. I'm posting another bug fix release (1.0.8) as I write this, but it does NOT fix this particular bug yet, just a couple of minor ones.

Again, thanks for the bug report!

Re: free42s matrix inverse

*Message #5 Posted by **hugh steers** on 12 Nov 2004, 7:28 p.m.,*
in response to message #4 by Thomas Okken

hi there,

ive done some more investigations using different inversion techniques as an experiment. firstly, it looks like i was too hasty in my accusation of a bug in free42 and Whuy was right in this respect. what started it, is that inverting the matrix,

```
3                   1                   2
1                   1e-040              1e-040
2                   1e-040              -1e-040
```

gave the exact correct answer in my code when using lu decomposition then backsubstitution. however, examples using numbers less far out than 10^40 wind up with worse answers. this leads me to think that the result was a fluke. here's what i get with the above under different inversion algorithms (all use 1eee754 doubles):

```
original matrix:
3                   1                   2
1                   1e-040              1e-040
2                   1e-040              -1e-040
LU Inverse Matrix:
-2e-040             3                   -1
3                   -4e+040             2e+040
-1                  2e+040              -1e+040
SVD Inverse Matrix:
2.77555756156289e-017 0.2                 0.4
0.2                 -0.12               -0.24
0.4                 -0.24               -0.48
Gauss Inverse Matrix:
0                   0                   0.5
0                   0                   -0.5
```

```
0.5                   0.5                   -0.75
```

as you can see, the lu inverse is spot on but the other methods, like svd (which is sometimes better) are way off. i now think this is a fluke and your code is different because its different and i just got lucky.

taking 10^-40 down to 10^-10, say, i get a different picture:

```
original matrix:
3                     1                     2
1                     1e-010                1e-010
2                     1e-010                -1e-010
LU Inverse Matrix:
-2.0000000012e-010    3.0000000018          -1.0000000006
3.0000000018          -40000000027          20000000009
-1.0000000006         20000000009           -10000000003
SVD Inverse Matrix:
-1.99999246971831e-010 2.99999065204657      -0.999995325723285
2.99998375179818      -39999820941.8902     19999910466.4451
-0.999991875599092    19999910466.4451      -9999955231.72258
Gauss Inverse Matrix:
-2.00000016548074e-010 3                      -0.9999999997
3                     -39999996690.3854     19999998340.6927
-0.9999999997         19999998340.6927      -9999999168.84636
```

now the lu isn't spot on anymore and the others are still worse. trying again, in range at 10^-5

```
original matrix:
3                     1                     2
1                     1e-005                1e-005
2                     1e-005                -1e-005
LU Inverse Matrix:
-2.00012000720043e-005 3.00018001080065      -1.00006000360022
3.00018001080065      -400027.001620097     200009.000540032
-1.00006000360022     200009.000540032      -100003.000180011
SVD Inverse Matrix:
-2.00012000714772e-005 3.00018001076159      -1.00006000358069
3.00018001074169      -400027.001613791     200009.000536879
-1.00006000357074     200009.00053688       -100003.000178434
Gauss Inverse Matrix:
-2.00012000719087e-005 3.00018001078885      -1.00006000359432
3.00018001078885      -400027.001617928     200009.000538948
-1.00006000359432     200009.000538948      -100003.000179468
```

we're seeing about 9 correct digits for lud & svd. so the picture is more like what you'd expect, except that 10^-40 just happend to work for lud :-)

Re: free42s matrix inverse

*Message #6 Posted by **Thomas Okken** on 13 Nov 2004, 8:52 p.m.,*
in response to message #5 by hugh steers

I'm glad to hear it! Having copied the code straight out of Numerical Recipes, I was kinda hoping it would be OK. :-D
Still intrigued, though. My first gut feeling was that with numbers 40 powers of 10 apart, you wouldn't have a chance in hell of getting any result -- I'm thinking with IEEE-754 having just about 16 decimal digits, you'd be looking at an end result with -24 significant digits. When I tried e-10 instead of e-40, my results were consistent with that thought.
Oh, well, I'm still intrigued but I guess this issue does not count as an actual bug, then. So I can enjoy a quiet Sunday!

Cheers,

- Thomas

Suggestion to extend tests for Free42

*Message #1 Posted by **Namir** on 11 Nov 2004, 1:48 p.m.*

Hi Thomas,

I have a suggestion regarding HP42s tests (like X=0?, x>y? and so on). How about allowing the test to execute a subsequent "BLOCK" or statement that appears after the test, if the test is true, or skip that block if teh test is flase. The block is enclose by { and }. The open brace appears right after the test.

Here is an example:

2 STO 00 0.01 STO 01 RCL 00 ABS 1 X>Y? { RCL 00 STO* 01 } <more commands here>

If the test X>Y? is true then the processor executes the block of commands (RCL 00 and STO* 01 that are in the block that appears after the test. If the tested condition is false the processor skips the block altogether. Of course a block MAY contain other tests with their own blocks, so there should be a counter to detect the appropriate }.

Namir

Re: Suggestion to extend tests for Free42

*Message #2 Posted by **Thomas Okken** on 12 Nov 2004, 6:52 p.m.,*
in response to message #1 by Namir

I'm not a big fan of that type of feature, I must admit. It seems like syntactic sugar that doesn't make anything easier that wasn't pretty easy to begin with.
My solution to skipping a block of instructions is usually to set aside a small number of labels for short-range forward-only jumps (so you can reuse them over and over within the same program), and then use X<=Y? GTO 00 RCL 00 STO* 01 LBL 00 (in your example; note that the sense of the test has been reversed). I think this has actually been HP recommended practice for a long time -- I seem to remember reading this in the HP-19C manual, or maybe it was the HP-41C manual? I personally think it's adequate.

May be an HP-34CX...

Re: eBay, where else?

*Message #4 Posted by **Chan Tran** on 11 Nov 2004, 3:06 p.m.,*
in response to message #3 by Emmanuel, France

When I fried my HP25, I went out and bought the 34C as a replacement. It was cheaper ($150) and had a whole lot more features and capabilities than the 25. After playing with it for a week, I got bored so I returned it and bought the 41C. What if I didn't return the thing and got the 41C??? Well I would be missing out so much fun using the 41's..

Re: eBay, where else?

*Message #6 Posted by **Matthias** on 12 Nov 2004, 12:40 p.m.,*

in response to message #5 by Massimo (Italy)

Massimo. As you have seen, Daniel´s Clonix with a CCD module inside and the original foldered manual reaches more than $400 (or were it Euro?). I would also say that a original module increases the value. I also have a W&W CDD module for sale and I also take arround the same price.

Re: eBay, where else?

*Message #7 Posted by **Massimo (Italy)** on 12 Nov 2004, 12:51 p.m.,*
in response to message #6 by Matthias

Matthias: one's madness doesn't have to set a new standard price for an item or, else, we should all buy boxes for hundreds of dollars (sorry).

With Clonix and NoVRAM there's no point in buying an HP-41's module for such a price, even if in NIB condition.

My .001¢

Greetings,
Massimo

Re: eBay, where else?

*Message #8 Posted by **Thibaut** on 12 Nov 2004, 1:29 p.m.,*
in response to message #7 by Massimo (Italy)

It is true that nearly all of us have bought fantastic items for nothing and sold tehm on ebay a good item that reached sky high prices.

I would not blame anyone for that, because I know that we'll use this money to purchase ohter items to update or improve our collections.

If there are people wealthy enough to pay top dollars for certain items, why blame them ? I know that this pollutes the market, as everybody tend to think that because it's written HP on it, it's worth hundreds of greens, but there's more than ebay to get beautiful calcs, and frankly speaking, the best out of them are not on ebay (excepted the ones I sell ;-))

Re: eBay, where else?

*Message #9 Posted by **Massimo (Italy)** on 12 Nov 2004, 1:41 p.m.,*
in response to message #8 by Thibaut

Hi Thibaut,
sorry but I didn't blame anybody: everyone can make what he/she wants with that hardly earned money.
I simply don't like the equation "I saw it for +++$, so this is its true value" because I could reply with "well, I could find it for --$, so **this** is its real price".

Sorry if I offended someone, it was not my intention.

Massimo

Re: eBay, where else?

*Message #10 Posted by **Matthias** on 12 Nov 2004, 2:21 p.m.,*
in response to message #9 by Massimo (Italy)

But it is also the demand that can control the offer. I agree with Thibaut. We all sell items for higher price than we get them, otherwise it´s not economical. What is wrong selling an item for the highest offered price? This is also what auctions are for. I can also agree to you Massimo, that for 90% of all HP enthusiast a Clonix has the same worth like the original, maybe more cause it is free programmable and has more memory. But there is also a small core of collectors and for them, a Clonix is only worth the material. as you know, I sometimes pay very high prices for items, so I may also aks for it. This is hard sometimes, when I see that people bid on items up to a high price (for instance a HP-41 module9 and when I get the advice they ask me for a copy of the module for free. What would you do in this case?

Re: eBay, where else?

*Message #11 Posted by **Thibaut.be** on 13 Nov 2004, 4:52 a.m.,*
in response to message #9 by Massimo (Italy)

Hi Massimo,

No offense at all, I just wanted to point out that it could happen to everybody amongst us to buy or sell top dollars item.

And I totally agree with you, ebay is NOT a place to determinate a market price. It has been debated in the past, my position was that we are on a pseudo-oligopoly, with a few sellers and many buyers, hence price raise, which becomes psychologically more acceptable due to the fact that you only have to bid 2.5$ more than highest bidder to win.

Re: eBay, where else?

*Message #12 Posted by **Emmanuel, France** on 12 Nov 2004, 3:34 p.m.,*
in response to message #5 by Massimo (Italy)

```
Dear Massimo,
I was just joking and you did not offense me.
Your point of view is really interessant and I respect it.
I'm not collecting HP items, just using them for my activities.
I'm astronomer amateur and HP-41 is a useful calc'.
Clonix41 and Novram effectively replace my old RAM and EPROM boxes.
I worked a lot on / with them.
I always have my Zenrom, my MLDL and my ERAMCO Rambox for example.
Certainly the last things I will come apart because I still 'love' them and taste
original things.
Why then using HP-41s when you have powerful emulators on PC?
Would you like at home a copy of a book written by Baudelaire for instance,
on a CDR (pdf format) or just paper, divx copy of The Party with Peter Sellers,
or a MP3 copy of your favourite music band?
I'm not a merchant but Ebay is made for selling and buying.
It's not a secret, I need money in order to buy interesting items.
Our 'Classified ads' for more things, trading included.
To be continued ...
```

Imaginary numbers in 33S equation mode

*Message #1 Posted by **RB** on 11 Nov 2004, 3:18 a.m.*

Hi. I'm trying to put an equation in my 33S involving complex numbers, but there's no apparent way to enter i. For example, how would I enter the equation y=x+i in my 33S (i being the unit imaginary)? Thanks

Re: Imaginary numbers in 33S equation mode

*Message #2 Posted by **Mike H** on 11 Nov 2004, 10:40 a.m.,*
in response to message #1 by RB

The 33 uses the expression Z=X+Yi for complex numbers. Like you I could not use the CMPX function in an equation. It did work when I wrote a program however.

From the learning module on Complex numbers the following example is given:

(3+2i)/(4-4i) The answer is 0.125 + 0.625i.

Programming the 33S as follows

C001 LBL C

C002 RCL A

C003 Enter

C004 RCL B

C005 Enter

C006 RCL C

C007 Enter

C008 RCL D

C009 CMPLX/

Store 3 in A

Store 2 in B

Store -4 in C

Store 4 in D

R/S results

0.6250 0.1250

I am no programmer, so I am sure there are better ways to express the program, but at least will allow you to enter imaginary parts into an equation.

Mike

Edited: 11 Nov 2004, 10:42 a.m.

Are those ENTERs necessary?

*Message #3 Posted by **John** on 11 Nov 2004, 10:43 a.m.,*
in response to message #2 by Mike H

I thought that RCL A RCL B RCL C RCL D would fill the stack with 4 numbers. Does the 33S require ENTER between those in a program?

no, they are not (NT)

Thanks for the reply. I was actually trying to use complex numbers in the equation mode (where you input an equation and it solves for a variable), but I'm glad I can at least write programs with complex support. Thanks.

Re: Imaginary numbers in 33S equation mode

*Message #6 Posted by **Eddie Shore** on 11 Nov 2004, 10:42 a.m.,*
in response to message #1 by RB

Unfortunately, equations on the HP33s does not support complex numbers. The i is used as an indirection variable rather than SQRT(-1).

Imaginary numbers in 33S equation mode

*Message #7 Posted by **RB** on 12 Nov 2004, 2:56 p.m.,*
in response to message #6 by Eddie Shore

Thats terrible! I finally find a good use for equation mode, and it can't do what I want! Complex support really seem to be lacking on the 33S, I'm actually regretting buying it now. Thanks.

Re: Imaginary numbers in 33S equation mode

*Message #8 Posted by **Tony Aponick** on 16 Nov 2004, 5:06 a.m.,*
in response to message #7 by RB

Just out of curiosity, what is the equation you want to solve with complex numbers??

Often if you just plug in (a + ib) into the equation, you can solve the real and imaginary parts separately. These separated equations *can* be solved numerically on the calculator

Imaginary numbers in 33S equation mode

*Message #9 Posted by **RB** on 16 Nov 2004, 10:59 p.m.,*
in response to message #8 by Tony Aponick

The equation was sqrt[(R + jwL)/(G + jwc)]. It was tedious to retype this equations for various values. I know it would be simple to seperate it into real and imaginary parts, but I figured the equation mode could handle it.

Using HP-33S SOLVE with complex numbers

*Message #10 Posted by **Karl Schneider** on 17 Nov 2004, 3:45 a.m.,*
in response to message #9 by RB

> Quote:
>
> The equation *[to be used in an equation for solving]* was "sqrt[(R + jwL)/(G + jwc)]."

This expression can be used within a program fed to the SOLVE function, which will solve for only one real-valued variable at a time:

```
          x     y      z     t
RCL L
RCL W
*
RCL R
RCL C
RCL W
*
RCL G     G     wC     R     wL
CMPLX/
0
ENTER
0.5
CMPLXy^x
```

This will place Re {sqrt[(R + jwL)/(G + jwc)]} in the x-register and Im {sqrt[(R + jwL)/(G + jwc)]} in the y-register. Taking to the 0.5 power is the only workaround for finding square roots of complex-valued arguments.

HP48GX - HP49G+ = ? missing

*Message #1 Posted by **George** on 10 Nov 2004, 9:12 p.m.*

I use an HP-48GX & COGO card to do construction stakeout for a local heavy construction company. I was very disappointed to hear that the 48's have been discontinued without a suitable replacement. The 48's have the ability to communicate with our total-station instruments. But I hear that the 49G+ calculators can not. Can anyone here tell me what the 48GX has, that the 49G+ doesn't, that allows this communication? Would it really have added that much more cost to include it in the 49's? From the beginning, HP has always provided surveyors with the latest and greatest calculators. I can only hope they will continue to serve the surveying industry in the future.

Re: HP48GX - HP49G+ = ? missing

*Message #2 Posted by **Jonathan Purvis (NZ)** on 10 Nov 2004, 9:27 p.m.,*
in response to message #1 by George

The 48GX calculators have an RS-232 (serial) interface. The 49G+ has only USB (device mode, so it can only talk to a PC or other USB host). The 48GXII has RS-232, but it's really a cut-down version of the 49G+, it runs the OS of the 49G, not the 48G series. The 48GXII also doesn't take plugin cards like the 48GX did.

The 49G+ also has IrDA, so you might be able to use an IrDA to RS-232 adapter.

And, 48gx can still be found on ebay

*Message #3 Posted by **Gene** on 10 Nov 2004, 10:56 p.m.,*
in response to message #2 by Jonathan Purvis (NZ)

So don't think you can't find a couple of replacements. If you want dozens, then you may have a problem.

Gene

Re: HP48GX - HP49G+ = ? missing

*Message #4 Posted by **Raymond Del Tondo** on 10 Nov 2004, 11:19 p.m.,*
in response to message #2 by Jonathan Purvis (NZ)

Hi,

a small correction:
What you call '48GXII' is actually called '48GII'.
The model name given by hp is totally irritating,
because (as you indicated) the 48GII has nothing to do with a real HP-48 .

To George:
Get some spare HP-48GX units as long as they are available.

Raymond

USB to RS232

*Message #5 Posted by **Tom (UK)** on 11 Nov 2004, 7:13 a.m.,*
in response to message #2 by Jonathan Purvis (NZ)

To convert from USB to RS232 could you use one of these:

http://www.ramelectronics.net/html/usb_serial.htm

???

Re: USB to RS232

*Message #6 Posted by **James M. Prange** on 11 Nov 2004, 10:13 a.m.,*
in response to message #5 by Tom (UK)

Converters such as that are for adding RS-232 capability to a USB **host** that lacks it. It may, for example, be ok for connecting a 48 series, 49G, and possibly a 48gII, to a newer computer that lacks any RS-232 port.

But does anyone know of a reasonably-priced adapter for adding RS-232 capability to a USB **device**, such as the 49g+?

Regards,
James

Re: USB to RS232

*Message #7 Posted by **Hugh Evans** on 11 Nov 2004, 1:14 p.m.,*
in response to message #6 by James M. Prange

This could make a neat project if anyone is so inclined. There are several ways it could be accomplished (some are more invasive than others). Perhaps the least invasive method would be to make use of its' SD/MMC host port (aka the card slot). I'm not sure if this is within the scope of HPGCC yet but it should be possible to make a device to plug into the slot and write drivers for it on the 49G+.

One of the more invasive and power hungry methods would be to use one of the host controllers (there are 2 onboard). This method would require drivers and surgery.

These are just the first two ideas that come to mind. Unfortunately device-device won't fly... It needs a host in the chain somewhere.

Good luck, HDE

Re: USB to RS232

*Message #8 Posted by **James M. Prange** on 11 Nov 2004, 1:43 p.m.,*
in response to message #7 by Hugh Evans

There are indeed potential work-arounds.

Of course a computer that has USB host capabilities could act as a bridge to RS-232.

The Samsung microprocessor package used in the 49g+ does have two UARTs that aren't being used, and if the signals from one of them are accessible, then it could be used for RS-232,

although of course a level shifter would also be required. It's occurred to me that the 48gII might use the same PCB; if so, that might show us where the signals are available. Of course, this would require hardware modification.

Regards,
James

Re: USB to RS232

*Message #9 Posted by **Nelson M. Sicuro (Brazil)** on 11 Nov 2004, 2:53 p.m.,*
in response to message #8 by James M. Prange

If I'm not wrong, the Samsung ARM processor that those calculators use are a ball-grid tipe of package. The unused pins are inaccessible unless its PCB design has some spare tracks to use the serial comms.

Best regards,

Nelson

in response to message #2 by Jonathan Purvis (NZ)

> Quote:
>
> The 49G+ also has IrDA, so you might be able to use an IrDA to RS-232 adapter.

Maybe, but note that most of the IrDA to RS-232 adapters on the market expect to steal power from a PC's COM port and also require that you install a device driver on the PC. Adapters without these requirements are available, but are considerably more expensive.

I have an IrDA to COM port adapter, and for some things, it works fairly well.

However, if I plug it into my USB host to RS-232 adapter instead of to the PC's built-in COM port, it doesn't seem to get enough power; the visible red LED still flashes when signals should be being exchanged, but not as brightly. I guess that the IrDA may be working, but not well enough to work with the 49g+'s intentionally crippled IrDA. Maybe it would work with an IrDA compliant device.

The 49g+'s IrDA is supposed to be limited to 10 cm (4 inches) to satisfy the "educational community", and that does indeed seem to be about the maximum range to my IrDA/Rs-232 converter.

Like the 49G and 48gII "via wire" connections, the 49g+'s IrDA has a flow control problem. SRECV can't reliably handle more than 255 bytes in a "chunk" without overrunning the receive buffer. With my PC under extremely heavy load, some bytes are lost from an XMIT command. Note that Kermit and Xmodem aren't affected by this.

You have to make sure that an IrDA connection has already been established before using XMIT or a printing command, otherwise bytes from the beginning of the transmission until the connection is established are lost.

The 49g+ (but not the 48gII) can take MMC or SD cards. Anything that the calculator stores on the card is formatted as a binary-transferred file. Also note that the 49g+ uses only the DOS-style "8.3" "short" filenames for the card. If you want to do Kermit ASCII compatible transfers via the card, see my "49G+

ASCII on SD" programs at http://www.hpcalc.org/details.php?id=6017 for a work-around.

The comp.sys.hp48 usenet group has much more information about the 48 and 49 series.

Regards,
James

Re: HP48GX - HP49G+ = ? missing

*Message #11 Posted by **George** on 11 Nov 2004, 7:58 a.m.,*
in response to message #1 by George

Thanks for all the responses. I have purchased a backup, but I'm actually using outdated equipment now. If I understand you, Jonathan, correctly I could probably use the 48gII model to communicate with my total-station if I entered the program thats on the card directly into the calculators memory? I already own a USB to SERIAL adapter as Tom suggested but I thought that there was a sofware issue in the calculator that prevented communication.

Re: HP48GX - HP49G+ = ? missing

*Message #12 Posted by **bill platt** on 11 Nov 2004, 9:26 a.m.,*
in response to message #11 by George

Hi,

Search these forum archives one and two arcives back (archive 14 etc) and you will find a discussion of the "rs232" issues---because the 48GII (what should be called 49gminus) does not have the same type of rs232---it is somewhat disabled, iirc

regards,

Bill

Re: HP48GX - HP49G+ = ? missing

*Message #13 Posted by **James M. Prange** on 11 Nov 2004, 10:51 a.m.,*
in response to message #12 by bill platt

Specifically, on the 48gII, the signals at the calculator are at the chip's logic levels; not at RS-232 levels. The level shifter is built-in to the cable, and "steals" power from other RS-232 signals normally present at a PC's COM port. But if you want to connect the 48gII to an RS-232 "3-wire" device, it won't work. For my suggestion of an adapter that I think should work, see the following comp.sys.hp48 post.

The other issue is that, like the 49G's RS-232 compatible "via wire" communications, XON/XOFF software flow control is missing. This doesn't matter for Kermit and Xmodem, but, depending on what you're trying to connect to, it may for XMIT and the printing commands, and for SRECV, you can reliably receive chunks only up to 255 bytes at a time without overrunning the receive buffer.

Note that anything that I write about the 48gII is "second-hand" information; I'm not about to waste any money on it.

Regards,
James

Re: HP48GX - HP49G+ = ? missing

*Message #14 Posted by **James M. Prange** on 11 Nov 2004, 1:28 p.m.,*
in response to message #13 by James M. Prange

PS:

You **might** be able to successfully connect a 48gII directly to another device (such as another 48gII) that uses 0V and 3.3V for the signals.

But I expect that attempting to connect it directly to a true RS-232 device without a level shifter, such as in the supplied cable, would result in a fried 48gII.

Regards,
James

Re: HP48GX - HP49G+ = ? missing

in response to message #11 by George

Most, if not all total stations now come with built in data logging software together withmany programs. Why buy an external logger? A friend bought a TDS Recon [for $2000] and he says it works great. And this was a guy who believed in the GX. His stock equipment now is the hp33S and the TDS Recon.

Calculator for the blind

*Message #1 Posted by **Tom(UK)** on 10 Nov 2004, 7:52 a.m.*

Out of curiosity has anyone made a calculator for the blind? Output could by brail or speech. Input by standard keyboard for a simple calculator (function keys on 28/42/48 wouldn't be a good idea!) or have custom keyboard.

I'd guess an HP41 would be an ideal basis for such a calculator. The HP97 had many good features for this (lots of keys and a built in printer that could be replaced with a brail output?)

Re: Calculator for the blind

*Message #2 Posted by **cyril rabih** on 10 Nov 2004, 9:37 a.m.,*
in response to message #1 by Tom(UK)

Ti made the Calcu-talk, a version of the ti-66 with voice. I think it was made for blind people.

Re: Calculator for the blind

*Message #3 Posted by **Ron Ross** on 10 Nov 2004, 10:30 a.m.,*
in response to message #1 by Tom(UK)

If you are looking for a low cost but fast to market approach (or acquire), I would consider the Hp 38/48G series and take their serial output to a serial speech synthesier (sp). I believe both can be set up to print out their displays and this could be then be translated into speech by the (RS232 serial) sythasier (sp again). The Hard plastic keys of the 38/48 series would be the easiest to attach brail onto and just leave the unneeded keys bare (and intoduce a clear key sequence to get out of any mistaken functions).

The Ti-66 option is very hard to get today.

Hp38/48's are very cheap and easy to get in comparision.

And the 38G is an algebraic, so no need to learn RPN and has that large = key in a unique location that might also be a benefit. Hard durable fold over cover that doesn't come off the calculator. Basic scientific functions just above the regular keyboard. May need to install an applet for serial conversion. But is probably a very good calc for this use.

Re: Calculator for the blind

*Message #4 Posted by **Richard Garner** on 10 Nov 2004, 11:01 a.m.,*
in response to message #1 by Tom(UK)

About a year and a half to 2 years ago someone on eBay was selling an HP 41C with braille keys and it was connected to a voice box. I don't remember what it went for, but it was the first one that I had seen using a 41C.

Re: Calculator for the blind

*Message #5 Posted by **Barry** on 10 Nov 2004, 1:21 p.m.,*
in response to message #1 by Tom(UK)

There is a significant number of products to aid the blind in all facets of social activities. Included are devices to permit blind people to tell the time, take notes, access the Internet, and use calculators. Talking calculators for the blind are available starting at prices below $20. A sophisticated example of such a device is called Braille'n Speak which includes a full word processor for note taking plus a talking clock and a talking scientific calculator. For more details on this and other devices go to, for example, this site: www.blazie.com. Other devices can readily be found by searching the Internet. The collective term for technology applied to help the handicapped is "assistive technology".

Re: Calculator for the blind

*Message #6 Posted by **db(martinez,california)** on 10 Nov 2004, 2:29 p.m.,*
in response to message #1 by Tom(UK)

The Panasonic "Compuvoice" from 1981 did this. It was a 4+ function LCD with a small speaker and took aa cells.

Re: Calculator for the blind

*Message #7 Posted by **Katie** on 10 Nov 2004, 10:10 p.m.,*
in response to message #1 by Tom(UK)

Possibly the first talking calculator was the Speech+ from TSI
http://www.vintagecalculators.com/html/speech_.html

I have one of these and it's quite cool to listen too -- very mechanical sounding -- and because it instantly responds to key-presses it allows you to interrupt it's speech and make really weird echo-like sounds. It also came with an instruction manual on cassette tape.

It sold for a small fortune (around $1000, I think) when it first came out and several libraries obtained one or two for shared use. Although the web sites I've seen describe the speech chip set as being made by GI, the chips in my calculator say that HP made them, IIRC.

Edited: 11 Nov 2004, 1:51 a.m.

Re: Calculator for the blind

*Message #8 Posted by **Norris** on 10 Nov 2004, 10:31 p.m.,*
in response to message #1 by Tom(UK)

A mechanical calculator, the Cranmer Abacus, has been used extensively by the blind since the 1960s. It is similar to a soroban, but the beads do not slip as easily and the rods are spread further apart.

Re: Calculator for the blind

*Message #9 Posted by **Gianmaria** on 11 Nov 2004, 2:53 a.m.,*
in response to message #1 by Tom(UK)

Some time ago I bought on eBay a nice HP-11C customized for the blind, it was a normal calculator HP labelled with a black box attached in the back with inside a speaker, alternatively it was possible to use also an earpiece. The keys ENTER and 5 were rised for tactile reasons. Indeed a good exeample of customization.

Re: Calculator for the blind

*Message #10 Posted by **Tom (UK)** on 11 Nov 2004, 3:30 a.m.,*
in response to message #9 by Gianmaria

Any chance of some photo's of this beast?

Who made / altered the HP calc? To convert to speech would be tricky, I wonder if they interfaced to the LCD and keyboard and perhaps the enter key would trigger the speach box to say what was on the display?

Re: Calculator for the blind

*Message #11 Posted by **Tom(UK)** on 11 Nov 2004, 3:28 a.m.,*
in response to message #1 by Tom(UK)

I suppose the TI 'Speak and Math' (rarer version of the 'Speak and Spell') could be considered a calculator for the blind.

Re: Calculator for the blind

*Message #12 Posted by **Eddie Shore** on 11 Nov 2004, 10:34 a.m.,*
in response to message #11 by Tom(UK)

TI's Speak and Math can be a calculator for the blind, to a certain extent. The TI's "Speak &" series are more education devices rather than industrial calculators. I'm not happy that TI cancelled that line in the 80s since the "Speak &" series are excellent learning tools, having a Speak & Spell myself when I was a kid.

I am surpised that HP or TI doesn't have a line built for those needing assistence (maybe I'm not looking hard enough?).

The End of an Era

*Message #1 Posted by **Jeff O.** on 10 Nov 2004, 7:51 a.m.*

I came across this, thought some might find it interesting.

Re: The End of an Era

*Message #2 Posted by **Ángel Martin** on 11 Nov 2004, 2:02 a.m.,*
in response to message #1 by Jeff O.

Very interesting article that also adds some light to the 41 module enigmas of today...

Re: The End of an Era - for TDS?

*Message #3 Posted by **Tom (UK)** on 11 Nov 2004, 7:09 a.m.,*
in response to message #1 by Jeff O.

I read the artical breifly and found it a bit sentimental. There was no mention of the HP49G+ which does most of what the HP48 can do, a USB interface could act as a data storage and for input of data. PDA's and PC's have now taken over the role of the HP48 in this field.

Re: The End of an Era - for TDS?

*Message #4 Posted by **db(martinez,california)** on 11 Nov 2004, 11:30 a.m.,*
in response to message #3 by Tom (UK)

Tom; Over here the most common replacements for the 48 are the Husky and TDS platforms (the TDS looks like Husky may have made it). Now that D'zign is marketing a program for the 49 we will start seeing some of them but since Ted doesn't like to support direct instrument hook-up they will be personal devices and the companies will still buy some kind of data collector. I have played with a PDA based GPS surveying platform. It was slick.

Re: The End of an Era - for TDS?

*Message #5 Posted by **James F. Chumbley** on 12 Nov 2004, 5:22 a.m.,*

Calcs on display - what lighting?

*Message #1 Posted by **Peter Khor** on 10 Nov 2004, 4:45 a.m.*

For those of you that 'display' your collection (or part of), what's your thot on lighting?

1) Incandescent 2) CF tube (does K temp color matter?) 3) Halogen (w/UV filter)

Specifically with regards to deterioration (I'd suppose UV would damage the plastic.

Also, for 'yellow lcd' (non HP calcs), are they more sensitive to UV than regular LCD's?

Re: Calcs on display - what lighting?

*Message #2 Posted by **Johnny Bjoern Rasmussen** on 10 Nov 2004, 6:20 a.m.,*
in response to message #1 by Peter Khor

Hi

I have no lights in my display rack yet. But I'm thinking of putting in a kind of 'cold' light, as neon, in small tubes. I have the IKEA BERTBY rack, and all the shelfs are in glass, and the rack is therefore very suitable for lightning.

As you write Peter, it's not a good idea to have halogen spots, and due to my racks compact design, I will not have halogen for another reason; heat.

Regards

Johnny

Re: Calcs on display - what lighting?

*Message #3 Posted by **Massimo (Italy)** on 10 Nov 2004, 7:21 a.m.,*
in response to message #2 by Johnny Bjoern Rasmussen

Watch out!

Massimo

Re: Calcs on display - what lighting?

*Message #4 Posted by **Frank Boehm** on 10 Nov 2004, 11:54 a.m.,*
in response to message #3 by Massimo (Italy)

LOL, that's what I thought too :) (In fact, I have the very same one and already replaced the screws before the announcement, since they appeared to be not good enough...)

Back on topic, I would suggest a non-UV at all light - even better would be no light at all though, since

most mid-70s plastics is very cheap and will yellow or degrade. This is not the case for HP calculators though ;) The yellow LCDs are yellow because of their UV-filter screen, so better store them away from light.

Re: Calcs on display - what lighting?

*Message #5 Posted by **Johnny Bjoern Rasmussen** on 11 Nov 2004, 6:00 a.m.,*
in response to message #3 by Massimo (Italy)

I know about the mounting issue from IKEA. But as I bought the rack second hand, I applied the screws myself.

Sorry I could not resist

*Message #6 Posted by **Tom (UK)** on 11 Nov 2004, 2:13 p.m.,*
in response to message #3 by Massimo (Italy)

Americans seem to have such a way with words - "beads may be inhaled into the child's lung and affect the lung function." Or put another way the child may choke to death?

The site also says "Please take the toy away from your child immediately and return it to your nearest IKEA Store!" If you were the child could you sue Ikea for trauma after the toy was taken from you, possibly forcably?

:-)

Sorry; I could not resist either.

*Message #7 Posted by **James F. Chumbley** on 12 Nov 2004, 5:37 a.m.,*
in response to message #6 by Tom (UK)

Hey, Tom, If you want to criticize us Americans for our "way with words," that's OK; much of the time we deserve it. But weren't you also amused by the IKEA warning? "Please take the toy away from your child immediately and return it to your nearest IKEA Store!" Technically, I believe, the warning really means to return your CHILD to the IKEA store, "it" referring backwards to the closest noun preceding.

Re: Sorry; I could not resist either.

*Message #8 Posted by **Sam Hughes** on 14 Nov 2004, 10:17 a.m.,*
in response to message #7 by James F. Chumbley

No, the sentence is worded correctly.

I could resist, but didn't.

*Message #9 Posted by **Sean** on 15 Nov 2004, 9:56 a.m.,*
in response to message #8 by Sam Hughes

You are CORRECT, sir! In the sentence, "it" refers back to the subject, not the "closest noun".

Re: I could resist, but didn't.

What is the GPIO interface HP 82165A

*Message #1 Posted by **Thomas Falk** on 9 Nov 2004, 4:14 p.m.*

Hi everybody,

what function does the HP 82165A GPIO interface have?

By the name I would expect some General Purpose IO.

Thanks for hints,

Thomas

Re: What is the GPIO interface HP 82165A

*Message #2 Posted by **Christoph Klug** on 10 Nov 2004, 3:19 a.m.,*
in response to message #1 by Thomas Falk

Dear Thomas,

the HP82165 supports you with an parallel 8bit or 16bit interface port plus some handshake lines.

Most people use the HP82165 for interfacing a parallel Printer (centronics). Unfortunately the HP82166 is AC powered - and therefore not compatible to mobile applications. Furthermore the TRIGGER output control line is not available for this unit, needed for some advanced interface applications.

Therefore I prefer the HP82166 IL-Converter : This is function compatible to the HP82165, supports also the TRIGGER output control line and needs a DC power supply.

Some mobile interface applications like measurement- and datalogger applications developed from me for the HP82166 Il-Converter. More detail about this nice projects you get by searching the subjects I/O-Board and IL2000 System...

Best regards from Germany - Christoph Klug

EBAY DICTIONARY

*Message #1 Posted by **Matthias** on 9 Nov 2004, 12:17 p.m.*

EBAY DICTIONARY

Hard to Find --> "It's the only one I'm auctioning today."

Rare --> "It's the only one I'm auctioning this week." Very Rare --> "It's the only one I'm auctioning this month." Unique --> "It's the only one I'm willing to sell."

Mint --> "It looks more-or-less like it did when I bought/inherited/salvaged/found/stole it."

Minty --> "It's mint (q.v.), except for the funny green sauce I dribbled on it while eating lamb chops the other night."

New in Box (NIB) --> "I bought this with the sole intent of selling it for many times what I paid for it."

Nice --> "Looks great-- doesn't work."

Complete --> "Except for the valuable, hard-to-find bits required to make it work."

Not Tested/Sold As-Is --> "12VDC? 120VAC? There's a difference?" Like New --> "Like running over it with a car could really be that bad for it."

With Extras --> "I didn't feel like auctioning the manual and case separately."

Buy It Now --> "...for twice what it's worth, or risk paying three times as much to stave off snipers."

Re: EBAY DICTIONARY

in response to message #1 by Matthias

Another couple:

"Postal insurance: Not available"

means "it will get 'lost in the post' after I don't send it and you will be out of pocket."

"Just like the one in the picture, I haven't got a digital camera"

means "nothing like the mint condition one in the photo".

"Location = New York, UK" and "all import duties will be paid"

means "I'm lying about where the calculator comes from and tough on you when customs want import duty."

Does it work or doesn't it?

*Message #4 Posted by **db(martinez,california)** on 9 Nov 2004, 10:28 p.m.,*
in response to message #1 by Matthias

I coppied the Ebay dictionary here a couple of years ago and used to put it on my auctions. It's amazing how many earnest serious people would "ask the seller a question" about why i said it had a battery door and then i said it didn't or do i mean that i will be auctioning another one tomorrow? I guess i should have expected to explain how it could be nice and not work even though i said it was working :-)

Free42 matrix-matrix division bug

*Message #1 Posted by **Thomas Okken** on 9 Nov 2004, 11:41 a.m.*

Hi all,

An hour ago, I was reading an HP Journal article about the HP-15C. It mentions that the "divide" key on that machine divides matrices by computing inv(X) * Y, and points out how convenient that is for solving systems of linear equations.

I got a nasty feeling and checked the behavior of the HP-42S. Sure enough, Y / X yields inv(X) * Y. Which means that the Free42 version, which computes Y * inv(X), is wrong.

So, we get to version 1.0.6, which fixes this rather serious bug, and one not-so-serious menu glitch. As always, the goods are here.

- Thomas

Re: Free42 matrix-matrix division bug

*Message #2 Posted by **hugh steers** on 9 Nov 2004, 2:48 p.m.,*
in response to message #1 by Thomas Okken

the 15c had some clever way to deal with ill-conditioned matrices who were close to singular. does anyone know exactly what it did. add noise?

Re: Free42 matrix-matrix division bug

*Message #3 Posted by **Thomas Okken** on 10 Nov 2004, 10:16 a.m.,*
in response to message #2 by hugh steers

According to the HP Journal article (May 1983, page 33-34),

if a calculated diagonal element of U, which we call a pivot, is found to be zero during the LU decomposition, rather than aborting the matrix calculation and reporting the input matrix to be singular, the HP-15C replaces the zero pivot by a small positive number and continues with the calculation. This number is usually small compared to the rounding errors involved in the calculations. Specifically, it will be about 10^-10 times the largest absolute value of any element in that column of the original matrix.

The article also points out why testing for singularity by looking for zero pivots is unreliable, and why continuing despite finding zero pivots is useful in certain applications.

When I copied the LU decomposition code from Numerical Recipes in Fortran, I noticed something similar; I replaced it with a fatal error because I didn't like what the NR code did: it uses an arbitrary small value, which is not in any way guaranteed to have the right scale, and there's no explanation why this is done, either.

I think I'll use the HP-15C approach instead, now. I'll have to study the issue a bit more but when I make

this change to lu_decomp_r() and lu_decomp_c(), that would probably also be a good moment to add proper overflow checking and reporting to those routines.

UPDATE -- I just checked and the 15C and 42S have another interesting property: they won't even report that a matrix is singular even if it contains nothing but zeroes. This is a different case than what is mentioned in the NR book and the HPJ article. Apparently, a zero column in the original matrix simply results in a zero column with a large number (1e99 on the 15C, 9.999...e499 on the 42S) on the diagonal position. Just wondering: does anybody know what that is for?

Edited: 10 Nov 2004, 11:19 a.m.

Re: Free42 matrix-matrix division bug

*Message #4 Posted by **whuy** on 11 Nov 2004, 3:47 a.m.,*
in response to message #3 by Thomas Okken

Kahan must have been absent when that particular decision was taken.. Thankfully, from the 48 on (or even the 28? I don't know), a singularity causes an error, as it should. Replacing it by a relatively small number and continuing just returns a meaningless result - and it is not flagged as such.

Re: Free42 matrix-matrix division bug

*Message #5 Posted by **Thomas Okken** on 11 Nov 2004, 7:48 a.m.,*
in response to message #4 by whuy

For now, I've changed the behavior of Free42 to match that of the 42S. Later on, when I add a proper configuration panel, I'll add options to make zero pivots cause the "Singular Matrix" error again, and also to check flag 24 when overflows occur. (The 42S never signals overflows in matrix-matrix multiplication and division -- I don't know if that's another Kahan-wasn't-there type thing or if it's intentional, but as long as I don't fully understand why these decisions were taken, I'll hedge my bets.)

*Message #6 Posted by **Whuy** on 10 Nov 2004, 4:21 a.m.,*
in response to message #1 by Thomas Okken

That is to say - it solves X*A = Y, and returns A. Not altogether equivalent (in a numerical sense) to INV(X)*Y.

Werner

Re: Free42 matrix-matrix division bug

*Message #7 Posted by **Thomas Okken** on 10 Nov 2004, 10:21 a.m.,*
in response to message #6 by Whuy

*hat is to say - it solves X*A = Y, and returns A. Not altogether equivalent (in a numerical sense) to INV(X)*Y.*

I stand corrected. The Free42 pre-1.0.6 version of matrix-matrix division solved AX=Y and returned A; from 1.0.6 onwards, it solves XA=Y, like the 15C and 42S.
When I was talking about inv(X)*Y vs. Y*inv(X), I was merely trying to express the nature of the bug in the briefest possible terms, but you're right that it is not the same. The computation that the 15C/42S/Free42 *actually* perform is faster and more accurate.

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 10 Nov 2004, 10:33 p.m.,*
in response to message #7 by Thomas Okken

Hi, all;

Forgive me asking for an obvious answer, but I didn't get these last comments. May I?

Fron Werner, we have:

> Quote:
>
> That is to say - it solves X*A = Y, and returns A. Not altogether equivalent (in a numerical sense) to INV(X)*Y.

I see like this:

```
X*A = Y   so:
inv(X)*X*A = inv(X)*Y
indent*A = inv(X)*Y
A = inv(X)*Y
```

Thinking of matrix algebra, if Y is a [n×1] matrix (coefficients matrix) and considering X a square [n×n] matrix (constants matrix, the one that should not be singular) then inv(X)×Y is possible, and Y×inv(X) is not. Unless you change Y dimmension from [n×1] to [1×n] and transpose X. I remember that I fought against this idea for some time, before accepting the actual order of the operands in the register stack. And it is a fact that the LU decomposition proposed for the HP15C solution (explained with some details at *HP15C Adv Fcn Handbook*) leads us to conclude that, in fact, no inversion occurs, and in the case the constants matrix is a singular matrix, some elements with their values set to zero in the LU diagonal have their values slightly changed (as explained by Tomas here) in order to allow the variables in the linear system to be computed.

Please, having my considerations proven wrong, I'd like to be set in the correct reasoning. I'd gladly accept any corrections (and I actually would like to read them) on my post, if any.

Cheers.

Luiz (Brazil)

Re: Free42 matrix-matrix division bug

*Message #9 Posted by **Thomas Okken** on 11 Nov 2004, 7:36 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Mathematically speaking, solving for A in XA=Y is the same as computing inv(X)*Y. However, numerically speaking, it's different: solving for A is done by computing the LU decomposition of X, and then performing back-substitution on each of the columns of Y; computing inv(X)*Y is done by computing the LU decomposition of X, then performing back-substitution on the columns of an identity matrix to construct the inverse of X, and finally multiplying the inverse of X with Y. The latter takes a lot more steps, which means it's slower and there's more opportunity for numerical errors to creep in.

BTW...(was: Free42 matrix-matrix division bug)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 11 Nov 2004, 3:32 p.m.,*
in response to message #9 by Thomas Okken

Hi, Thomas;

I forgot to congratulate you for the excelent emulator. Building it from scratch is a great achievement! In fact, I should have add these congrats prior to comment about matrix division. Sorry! What you achieved with the HP42S emulator is a lot more important. Bugs are part of any design...

Best regards.

Luiz (Brazil)

Re: BTW...(was: Free42 matrix-matrix division bug)

*Message #11 Posted by **Thomas Okken** on 12 Nov 2004, 6:25 p.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Thanks for your comments, Luiz!
Actually, I had designed Free42 to be bug-free, but I guess I screwed up somewhere. ;-)
Sigh... There's just so MUCH to test... Whenever I wrote something this size in the past, I had a team of full-time testers, but with a hobby project, unfortunately it's the users who wind up doing much of that task...

Free42 functionality

*Message #1 Posted by **Vincent Weber** on 9 Nov 2004, 8:54 a.m.*

Hi Thomas,

First, I really want to congratulate you for your simulator. I have it running just fine on my gold old Palm M500. I have started (but not finished) such a simulator myself, and I know how much work it is. Congrats !

Then, I think that what would be great is to take advantage of the freedom you get by writting a simulator instead of an emulator to actually -improve- the original calculator. Here is a list of what could be great improvements over the (already impressive) features of an HP-42S:

1) Direct alpha entry a la HP-41, with labeled letters, rather than the ennoying 2-stroke letter entry. 2) Algeabraic equations, with full editing capabilities, a la 17BII/27S rather than a la 32SII. This is great when solving complex multi-var equations. 3) Fraction mode, a la 32SII 4) Matrix descriptors a la 15C rather than a la 42S, i.e. explicit name (e.g A(3,3)) rather than [3x3 matrix] where you loose track of the content. You could even have a 'RESULT' 15-C equivalent to manipulate matrixes directly rather than having to 'STO' them back in their original variables. 5) Having a complex entry mode different from the display mode, i.e. entering them in polar form while the current display is rectangular (a la HP-48) 6) File and time functions a la HP-41.

This would make the best calc even done by HP ! What do you think ? Again congrats and thanks, Vincent

Re: Free42 functionality

*Message #2 Posted by **Thibaut.be** on 9 Nov 2004, 11:07 a.m.,*
in response to message #1 by Vincent Weber

Hi Thomas,

I guess everybody has his own dream of the perfect calculator, but unfortunately only few of us have the particular knowledge of implementing it.

I'm really happy that your emulator is available to us, and, cherry on the cake, for free !

So far it worked perfect for me, though I did not check advanced functions.

I won't request many improvements, but just one for user-friendliness, as I wish it to be my permanent calculator on my desktop. Could you implement computr keyboard input for the essential keys, such as numbers, arithmetic operators, and of course ENTER... ?

And once again, good job !

Re: Free42 functionality

*Message #3 Posted by **Thomas Okken** on 9 Nov 2004, 11:51 a.m.,*
in response to message #2 by Thibaut.be

Could you implement computer keyboard input for the essential keys, such as numbers, arithmetic operators, and of course ENTER... ?

Absolutely. Configurable keyboard mapping would be a big plus, and it will definitely be available in the next major release (1.1).
I'm not exactly sure how it will work, but I'm leaning towards adopting the KML format used by Emu42, so you would be able to use the same keyboard mappings (and the same skins) as Emu42.
Expect this sometime early next year. Right now I'm just fixing bugs, and once that winds down I need a bit of a break, to get my energy back for all the cool stuff that's still on my wish list.

Re: Free42 functionality

*Message #4 Posted by **Thomas Okken** on 9 Nov 2004, 12:41 p.m.,*
in response to message #1 by Vincent Weber

Here is a list of what could be great improvements over the (already impressive) features of an HP-42S: [...]

Direct alpha entry is on my own TODO list, too. Perhaps it will be done by PC keyboard mapping, like Emu42, or maybe something more direct -- things like PalmOS Graffiti input, and alternative input methods for the disabled, are all things I have to consider, too.

Complex data entry independent of the display mode, and things like HP-41CX-type file and time functions, are easy to add. As long as a new function can be implemented using the 5 data types of the 42S, adding it to Free42 is pretty simple. (Display-mode-independent complex data entry can also be accomplished in about a dozen lines of user code.)

Fractions and algebraic equations are a different story, because you have to add new data types. These would require new code all over the place, because almost every command has to be modified to handle them.

Speaking for myself, regarding algebraic equations: I have tried the HP-28S and the HP-48G in the past. I thought they were really clever and very elegant, but in the end, not really very useful. For symbolic math, anything less than Mathematica or Maple is useless (and handhelds necessarily don't have the full-size keyboards and displays that you need in order to work with that type of software). For programming, structured languages are a poor fit for handhelds too, again because of keyboard and display limitations. (Try writing functions with conditionals and/or loops nested more than a couple of levels deep. You will not be a happy camper editing such code on a 28/48 -- been there, done that.)
For handhelds, I'm much happier, and more productive, with keystroke programming. I'll leave the algebraic and RPL stuff to those who like it. If I liked it myself, I'd have written Free48, not Free42. :-)

Re: Free42 functionality

*Message #5 Posted by **Vincent Weber** on 9 Nov 2004, 2:39 p.m.,*
in response to message #4 by Thomas Okken

Hi Thomas, Thanks a lot for your reply. I agree with most of the things you said. I can understand your position on RPL, although in my view RPL does not really require more keystrokes than RPN. I even find the loops easier in RPL than RPN... :) More fundamentally for Free42, I think the algebraic equations are a different discussion altogether. Neither the 17BII nor the 32SII are RPL machines, but they implement algebraic expressions. If you want to implement, let's say, a Time Value of Money, this is more naturally done if you can time the expression rather than building a RPN program. The 32SII is unique in that it combines both the power of RPN programming with the convenience of equation entry.

Just my 2 cents :) Cheers, Vincent

Re: Free42 functionality

*Message #6 Posted by **Erik Ehrling (Sweden)** on 9 Nov 2004, 4:23 p.m.,*
in response to message #5 by Vincent Weber

The reason I once wrote a version of QPI for the HP-42S was that I missed the possibility to calculate with fractions. Given the speed of Free42 it should give an almost immediate answer - even though its all written in FOCAL. (However, I am a little bit curious on how it behaves on the binary artithmetic implementation in Free42.)

And besides I think it is more important to "fool proof" the functionality of the existing HP-42S functions *first* before going off for something new. This way we would get a very stable implementation that we could trust in the same way we can trust the results on the HP-42S. Only then would I try to extend the functionality base beyond the original.

Best regards,
Erik Ehrling

Re: Free42 functionality

*Message #7 Posted by **Thomas Okken** on 9 Nov 2004, 8:53 p.m.,*
in response to message #5 by Vincent Weber

Well, I guess one way to add symbolic equations to the Free42 architecture would be to simply support unlimited-length strings, plus an EVAL function that maps names to variables and/or user programs and/or built-in functions and basically transforms infix notation to RPN on the fly. For maximum geek points, I probably wouldn't be able to resist writing a COMPILE function that transforms an expression to a regular stored user program, MVAR declarations and all. :-)
Of course if you expect things like "a" ENTER "b" + to return "a+b", things will get uglier, because then you're back to having to add that type of functionality everywhere... And before too long you'll start wishing for an expression simplifier, and symbolic SOLVE and INTEG, and that's when I'll start thinking about Mathematica again...

On the topic of rational numbers: if that can be done adequately as just another display mode, without adding a new type, than that's pretty easy... But just out of curiosity: who would actually *use* such a mode? (I can just feel another discussion about the (non)importance of "exact" results coming on! Like it's not enough having to put the BCD crowd in their place. <g>)

Re: Free42 functionality

*Message #8 Posted by **Thomas Okken** on 9 Nov 2004, 9:15 p.m.,*
in response to message #5 by Vincent Weber

If you want to implement, let's say, a Time Value of Money, this is more naturally done if you can type the expression rather than building a RPN program.

FWIW, this kind of stuff is totally easy on the 42S.
What you do is, you write a program like this:

```
01 LBL "TVM"
02 MVAR "N"
03 MVAR "I"
04 MVAR "PMT"
05 MVAR "PV"
06 MVAR "FV"
...now write the code that computes FV as a function of the
other four parameters, which you can fetch using RCL "N",
RCL "I" etc...
41 RCL- "FV"
```

```
42 END
```

Then go to SOLVE, select "TVM" from the menu, and presto, you have TVM, just like on a real financial calculator. The solver shows a menu consisting of the names listed in the MVAR instructions, and you can set the corresponding variables, and solve for any of them, by pressing the corresponding keys. It's not the most efficient approach in terms of CPU usage, but even the real 42S is fast enough to make this usable.
It's been a while since I used the 28S and 48G, but I think the 42S solver works just as well, and is just as easy to use, as the one on the RPL machines. The only difference is you have to do RPN keystroke programming instead of equations or RPL, but hey, if you don't like RPN or keystroke programming, the 42S (or a 42S emulator) is probably not for you anyway.

Re: Free42 functionality

*Message #9 Posted by **hugh steers** on 9 Nov 2004, 3:01 p.m.,*
in response to message #4 by Thomas Okken

i have a suggestion for implementing fractions without requiring new types. provide a rationalizer that turns X into P/Q. what i did in scicalc is compute P and Q no bigger than a max size (eg 6 digits each) and if P/Q was within a very small error of X, say 1e-20 (in my case, maybe 1e-10 for you), then accept it, otherwise reject. that is to say my “rationalizer” would only rationalise number it believed to be rational rather than find rational approximations for an X (of course the latter might also be useful).

my algorithm was based on continued fractions (i can give you some code if you like). alternatively, there is a better algorithm designed by joe horn, detailed in datafile V22N6 called the PDQ algorithm. unfortunately, i cant untangle it from the code. does anyone know any other references to this method, joe horn??

Re: Free42 functionality

*Message #10 Posted by **Vincent Weber** on 10 Nov 2004, 4:17 p.m.,*
in response to message #4 by Thomas Okken

Hi Thomas, Thanks for your answer. I beg to differ, though. Although TVM is a fairly trivial exmaple to implement in RPN, some other equations may require to store a lot of intermediate results in registers, and it makes sense to code them in algebraic form. And this holds, even if you love RPN ! Both methods are complentary - RPN for keystroke programming, equations for complex formulas. That's why the 32SII was the most sold RPN calculator, even though its way to enter equations is more primitive than the 17BII/27S :) Cheers, Vincent

Re: Free42 functionality

*Message #11 Posted by **Thomas Okken** on 10 Nov 2004, 7:15 p.m.,*
in response to message #10 by Vincent Weber

Although TVM is a fairly trivial exmaple to implement in RPN, some other equations may require to store a lot of intermediate results in registers, and it makes sense to code them in algebraic form.

I see your point, but still, how do you envision adding that kind of capability to the HP-42S? I still think that once you start dealing with the secondary issues of supporting complicated algebraic expressions, you'll find yourself having to implement an unlimited-depth stack, and a sophisticated expression editor, and support things like expression simplification and other symbolic operations (derivatives, at least, and before you know it you'll want symbolic integration and root finding, too).

I think once you start going down that road, it will lead you straight to the HP-28[CS] and its

successors. There's nothing wrong with that per se, but for me, the biggest asset of the HP-42S is its simplicity (as in "its ease of use", not as in "its limitations"), and for me, losing that simplicity is not acceptable.

Having said that, if you could suggest a user interface design that supports algebraic expressions, *without* adding any keystrokes, or complexity in the display, for when you're doing the kinds of things people use the HP-42S for today, I would be interested to hear about it.

Re: Free42 functionality

*Message #12 Posted by **Nenad (Croatia)** on 11 Nov 2004, 7:53 a.m.,*
in response to message #11 by Thomas Okken

IMHO, you, Thomas, have already done a great-great job and the present release is fully functional for me.

The only possibilities I would like you to add refer to:

a) the use of keyboard : 0-9, ., +, -, *, /, ENTER, A-Z to be entered directly from the keyboard;

b) the use of shift key (press the function above the key directly, instead of using the shift key to do it).

Both of the above have already been mentioned by other posters. If we discuss the functionality of the calculator itself, we may always come to another calculator, not the 42s any more.

On my PCs I always use good old ttCalc v1.3 as the Windows calculator and would be happy to replace it by a Free42.

Re: Free42 functionality

*Message #13 Posted by **Vincent Weber** on 11 Nov 2004, 10:25 a.m.,*
in response to message #11 by Thomas Okken

Hi Thomas,

Do you own a 17B/17BII/18C/19B/19BII or 27S? There is a nice equation editor, which does not do derivatives or anything complexe like this, but just allow you to specify multi-variables equations, with a IF and SUM functionality a la Excel, and L() and G() (LET and GET) functionality to store intermediate results. These advanced functionality would not be needed in the 42, which has more advanced RPN programmability. Alternativelly, the 32SII is even less complex. You are restricted to one character variables, you have no editing capabilities, and no IF nor SUM.

None of these model have anything to do with the complex RPL system of the 28/48. The equation functionality fits nicely in the calculator - as a complement to RPN (in the case of the 32SII).

Cheers, Vincent

*Message #14 Posted by **Thomas Okken** on 12 Nov 2004, 6:19 p.m.,*
in response to message #13 by Vincent Weber

I don't own any of those machines, I'm afraid. I'll have to take a look if I can find manual scans for any of them on the HP Museum CDs... I know there's a 32S manual there, but none for the

32SII... Do you know if that makes much difference, regarding the equation functionality? Thanks!

- Thomas

Re: Free42 functionality

*Message #15 Posted by **Thomas Okken** on 13 Nov 2004, 8:42 p.m.,*
in response to message #14 by Thomas Okken

I found some relevant manuals on the HP Museum CDs -- 18C, 27S, 32S, and 27S/19B Technical Applications.
I think I'm up to speed with those machines' algebraic equation functionality now... And as far as adding that type of feature to Free42 is concerned, I don't see any major obstacles. It *will* require unlimited-length strings, and an unlimited-length alpha register, but that's all doable without too much pain.
Don't hold your breath just yet, though! There is a lot to do for Free42 1.1, and I think all the stuff on that to-do list (program import/export, PC keyboard and PalmOS graffiti mapping, printer emulation, and customizable skins) should come first.
So, equations look like a good candidate for Free42 1.2 enhancements. Probably 2Q2005, unless I go insane and go on another mad hacking run (like the one that brought forth Free42 1.0!)... Then it could be sooner. Who knows? :-)

Re: Free42 functionality

*Message #16 Posted by **Vincent Weber** on 14 Nov 2004, 12:29 p.m.,*
in response to message #15 by Thomas Okken

Hi Thomas,

Thanks a lot for this investigation - much appreciated. The 32S does not have the equation functionality the 32SII has, so you won't find it. But you can still find the 32SII/33S manual on the HP web site. Basically, the 32SII equation functionality is less sophisticated than the 17BII/27S one, and therefore it is better to implement the latter way; however, the 32SII is the only machine that has -both- the equation functionality -and- RPN programming; hence, you can have an equation directly in a RPN program, which is useful when you have a complex expression with a lot of variables to evaluate in a program.

Just one more thing - there is a small behaviour difference between the real HP-42S and Free42: if you type XEQ, STO or RCL on a real HP-42S, you can then enter alpha mode (to enter a variable or lable) EITHER by pressing enter directly (as in Free42) or by shift-ENTER (which is legal on the HP-42S, but not in Free42). Small matter, but anyway :)

I understand your priorites. Thanks for your openness to other ideas, and congrats for this great program.

Cheers, Vincent

[...]the 32SII is the only machine that has -both- the equation functionality -and- RPN programming; hence, you can have an equation directly in a RPN program, which is useful when you have a complex expression with a lot of variables to evaluate in a program.

OK... I found those manuals you mentioned on the HP web site; I'll take a look at them later on. When I do add equation functionality to Free42, I'll try and make sure I borrow *all* the neat ideas I can find.
Well, maybe not quite all, but good integration with the rest of the 42S is of course a must. You should be able to evaluate equations from an RPN program, and use them from the solver, the integrator, DPLOT, etc. I have some ideas how to achieve that but of course it's still a long way off.

Just one more thing - there is a small behaviour difference between the real HP-42S and Free42: if you type XEQ, STO or RCL on a real HP-42S, you can then enter alpha mode (to enter a variable or lable) EITHER by pressing enter directly (as in Free42) or by shift-ENTER (which is legal on the HP-42S, but not in Free42). Small matter, but anyway :)

A bug is a bug! Thanks for letting me know. This will be fixed in Free42 1.0.9, probably later this week.
Just started work on the printer emulation for 1.1...

in response to message #19 by Thomas Okken

Dear Thomas, I'm sure one day soon Free42 will look as nice as P41CX...:) By the way, on both versions 1.0.9 and 1.0.10, calling 'BST'

on a dummy argument from the catalog crashes the simulator (Fatal Alert). I guess this is not normal behaviour... :) Thanks and cheers,

Vincent

Re: Free42 functionality

*Message #21 Posted by **Thomas Okken** on 19 Nov 2004, 6:59 p.m.,*
in response to message #20 by Vincent Weber

Dear Thomas, I'm sure one day soon Free42 will look as nice as P41CX...:)

I hope so but for now, my to-do list only keeps on getting longer and longer! I'll never get around to it...

By the way, on both versions 1.0.9 and 1.0.10, calling 'BST' on a dummy argument from the catalog crashes the simulator (Fatal Alert). I guess this is not normal behaviour... :)

Of course it's normal. All software longer than 1,000 lines of code is supposed to crash every now and then, by Microsoft decree. :-D
What do you mean by "calling BST on a dummy argument"? I don't know how to reproduce this problem.

Thanks!

- Thomas

*Message #22 Posted by **Vincent Weber** on 20 Nov 2004, 6:30 a.m.,*
in response to message #21 by Thomas Okken

Dear Thomas,

Congrats for starting on the printer emulation! Do you intend (on Palm) to print to memos, like P41CX, for export to the PC, or to make a on-screen printer, or both (which would be great ? ;)).

For the bug I was mentionning, sorry, the 'dummy argument' is irrelevant. Just go to the CATALOG, skim through until your reach 'BST', and press the soft-key - on Palm, you get a 'Fatal exception error' and you have to reset. Not a big deal since it is pretty silly to call BST this way, but still a bug, as you would say :)

Thanks and cheers, Vincent

Congrats for starting on the printer emulation! Do you intend (on Palm) to print to memos, like P41CX, for export to the PC, or to make a on-screen printer, or both (which would be great ? ;)).

Print on-screen, print to memos, print to unlimited-size text files (on SD card), print to GIF files (so PLOT and other PRLCD-using programs can be used), the works. Needless to say, supporting all of that without turning the user interface into Frankenstein's Monster is a bit of a challenge, and it doesn't help that I want it all to work on all the three platforms I currently support... So I'm still spending a lot of time lying on the couch and staring at the ceiling, waiting for my moment of Zen. :-)

For the bug I was mentionning, sorry, the 'dummy argument' is irrelevant. Just go to the CATALOG, skim through until your reach 'BST', and press the soft-key - on Palm, you get a 'Fatal exception error' and you have to reset. Not a big deal since it is pretty silly to call BST this way, but still a bug, as you would say :)

Indeed, a bug. I need to check if there are any more lurking like that -- all those functions that are usually invoked through special-case logic rather than the more general mechanisms. Some of these functions have NULL function pointers in the great big master function table, but if there turns out to be a way to invoke them in a way I hadn't anticipated, crash! CLALL suffered from this type of problem, too.
Thanks for the heads-up!

Solver in the HP 200LX

*Message #1 Posted by **Nick Nicholas** on 8 Nov 2004, 8:44 p.m.*

Although there are the L() and G() functions in the solver of the HP 200LX, they may not work the same as the solver on the calculator models. I tried A=G(A)+1 but the A does not increment each time I press the soft key. Could someone clarify this matter for me?

Re: Solver in the HP 200LX

*Message #2 Posted by **Mike (Stgt)** on 9 Nov 2004, 3:19 a.m.,*
in response to message #1 by Nick Nicholas

Sorry, on mine it works. SN = SG60503543, Euro-English version, can't currently not remember what "Felix" version, as with double speed the selftest screen is blured and the SW to read it from storage is "at home".

Ciao.....Mike

Interesting S/N

*Message #3 Posted by **Scuba Diver** on 9 Nov 2004, 12:08 p.m.,*
in response to message #2 by Mike (Stgt)

Interesting...your 200LX is from 1996, yet it uses the new serial number format.

I have a 48GX from 1997 (3702SXXXXX) and it's in the old format...

I guess the change in serial number was done on a product-by-product basis???

Any ideas?

B.

Re: Interesting S/N

*Message #4 Posted by **Mike (Stgt)** on 10 Nov 2004, 3:56 a.m.,*
in response to message #3 by Scuba Diver

Well, I never noticed that circumstance. If it's of any help, the SN of my two HP100LX is SG32803216 and SG34501591 (which does it's daily job as least cost router - see http://hplx.pgdn.de/lxtel.zip) and of the 200LX it is SG52102337, SG60503543, SG62301597 and the 700LX is SG60900143. And now: ABB3145A01503 was a 95LX I once had and ABD3151S000342 is the one I still have.

So the change of the SN format was from "Jaguar" to "Cougar" already. If only the follower of "Puma" and "Felix", the "Lion", would have come to life. Sigh.

Ciao.....Mike

P form factor concept

*Message #1 Posted by **Hugh Evans** on 8 Nov 2004, 1:53 p.m.*

Here is yet another one of my OpenRPN design concepts-- This time in the portrait (pioneer) configuration. I will be updating both of the art concepts soon with accurate representations of the LCDs. Comments/criticism are appreciated!

http://www.openrpn.org/images/userimages/Pproto1.jpg

Re: P form factor concept

*Message #2 Posted by **Jeff O.** on 8 Nov 2004, 4:23 p.m.,*
in response to message #1 by Hugh Evans

Hugh,
Your P form factor concept looks pretty good. Is it intended to be the same nominal 3" x 6" as your L form factor concept? It looks a little taller than that. It has 49 keys (same as a 48). We could probably get by with one (for 43 keys) or two (for 37 keys, same as a 42S) fewer rows to keep the size in the "shirt-pocket" range. Any way you go, it looks like you are on the right track. Please keep up the good work.

Re: P form factor concept

*Message #3 Posted by **Richard Garner** on 8 Nov 2004, 5:15 p.m.,*
in response to message #2 by Jeff O.

I agree, this looks great, but in keeping with the idea that this is a pocket calculator, this is a little long. This one appears to be about the size of the 48G in length. I check the 48G for pocket-ability and found it protruded about 2.5 inches above the pocket. If one row of keys were removed it would reduce the size by 0.5 inches and two rows would reduce it by 1 inch and make it close to the size of the 42S and fit the pocket better. Anything greater than 5.5 to 6.0 inches or checkbook size, as the 48G and 49G are can really no longer be considered a pocket calculator. Suit pocket yes barley, but shirt pocket no. All in all the designs are looking good. They're looking like calculators are suppose to look like.

why not the HP-28 design (or Qonos)
[VPN]

Re: P form factor concept

*Message #5 Posted by **Hugh Evans** on 9 Nov 2004, 9:54 a.m.,*

in response to message #3 by Richard Garner

This actually is the same size as a 42s right now, so shrinking it a bit would bring it into the same size as a voyager. That's a concept that I like *a lot* since I know that the pioneers are only questionably pocketable. I'll put together a revision and scale it back to 5"x3".

Before I start work on the graphing model: I should be able to do it as a 3"x6" (only slightly larger than the P type in this thread). Does this sound about right?

Once all of the initial form factors are deemed acceptible I'll get started on LCD specifications so I can get some quotes.

Thanks again to everyone for your input.

Re: P form factor concept

*Message #6 Posted by **Richard Garner** on 9 Nov 2004, 12:44 p.m.,*
in response to message #5 by Hugh Evans

I misunderstood the size. Looking at the key configuration I jumped to the conclusion that the P-Type was the same size as the 48G. If it is the size of the 42S and the added keys do not detract from the labeling, I can deal with that. The image and key configuration made it appear to be larger than it has now been indicated to be. It would be nice to have more of the commonly used functions on the keyboard than hidden in a menu somewhere.

Re: P form factor concept

*Message #7 Posted by **Walter B** on 8 Nov 2004, 5:12 p.m.,*
in response to message #1 by Hugh Evans

Hugh,

thanks for your design work. I fully agree with Jeff. Shirt pocket size is a must for me - no fun carrying a large and heavy calc bar. It seems you want to use the good old big keys (last used in voyagers). I welcome this very much, since it will help to keep the keyboard clean.

Thanks and keep on designing!

Re: P form factor concept

*Message #8 Posted by **bill platt** on 8 Nov 2004, 6:11 p.m.,*
in response to message #1 by Hugh Evans

Hi Hugh,

Again, looks great. But, for size, I think, in HP terms, that the Pioneers are the absolute largest you can go and be pocket---marginally. The voyager is much more pocketable--that fraction of an inch makes a big difference.

And, note that even the voyagers were much bigger than machines in the same general class at the time, produced by other makers such as Sharp.

We should be able to be small--and that, today, is what it is all about---when not at your computer-----etc.

But, looks good!

Best regards,

Bill

HP-01 Simulator

*Message #1 Posted by **Valter** on 8 Nov 2004, 10:02 a.m.*

Hi all,

after almost 10 years I finally got my HP-01! Wonderful design and piece of hardware expecially if you think when it was made! Wondering...just to practice on it without running down the batteries would'nt it be nice to have a PC simulator? I think that with some little of time many people of us would benefit from such application.

Please advise

Re: HP-01 Simulator

*Message #2 Posted by **Klaus** on 9 Nov 2004, 11:12 a.m.,*
in response to message #1 by Valter

Hi Valter,

There is are HP patents describing the HP01, but that is not the version HP produced later. Eric Smith wants to include the HP01 in his great emulator collection (nonpareil), but he needs the microcode. To get the Microcode, he needs a damaged watch (or at least the rom chips).

A HP01-emulator would be very nice, but I don´t think someone will ever use it to do calculations.

Re: HP-01 Simulator

*Message #3 Posted by **Chan Tran** on 10 Nov 2004, 2:00 p.m.,*
in response to message #2 by Klaus

The HP-01 emulator is not going to be very useful. An emulator would be difficult as you need the microcode but a simulator should be fairly easy. But again what are we going to use such a thing for? After all it's not RPN.

Re: HP-01 Simulator

*Message #4 Posted by **Valter** on 11 Nov 2004, 7:03 a.m.,*
in response to message #3 by Chan Tran

Hi all,

useful because i'd love to see HP-01 face on My PC and operate it...then the simulator would be useful for learning how to operate HP-01 friendly and without running down the battery, nothing else. As a HP-01 owner, I know how thirsty this watch is with battery.

Regards

HP 67 displaying all 0's

*Message #1 Posted by **Marco** on 8 Nov 2004, 12:00 a.m.*

Hi Everyone,

I have an old HP67 that was working beautifully (except the card reader). I wrote a program to make sure it was all working ok and accidentally left it running all night. In the morning when I returned, the HP67 was displaying: -00000000000 00, with some segments brighter than others. I turned it off and on but still the same problem. It now consistantly shows the above when power is applied. If anyone has any suggestions I would be very grateful. I would love to get it going again.

Cheers

Marco

Re: HP 67 displaying all 0's

*Message #2 Posted by **David Smith** on 8 Nov 2004, 4:07 p.m.,*
in response to message #1 by Marco

A display of all 000000000 is THE classic symptom of a bad ACT chip (very rare for it to occur in an HP67 though). Only source of the chip is another machine. The ACT chip from the HP21/25/25C/67/97 should work. Can't use the HP27 ACT though.

Re: HP 67 displaying all 0's

*Message #3 Posted by **Marco** on 8 Nov 2004, 5:41 p.m.,*
in response to message #2 by David Smith

Thanks for your response David, I appreciate your time. I'll look for an old ACT chip, hopefully from a dead HP somewhere (I'm in Australia). Otherwise, I'll have to beg someone on this forum if they have a spare floating around. Do you think the running all night may have fried the ACT?

Thanks again.

Regards

Marco

Re: HP 67 displaying all 0's

*Message #4 Posted by **Albert** on 9 Nov 2004, 8:28 a.m.,*
in response to message #3 by Marco

Hello Marco,

It isn’t a reason of damage to leave your calculator working all night long. You can leave your machine

more than 24 hours without any kind of problem, normally. In fact, for instance, after a huge repair in my HP-67 (I changed the lateral PCB –with a Fender guitar shape- that had a big hole in the middle of the lines), I designed and rebuilt a new one. Afterwards, I left the machine running within an infinite loop with the SD-15C Standard Diagnosis Program some days, and no problem. Regards and good luck!

Re: HP 67 displaying all 0's

*Message #5 Posted by **David Smith** on 9 Nov 2004, 11:58 a.m.,*
in response to message #3 by Marco

I have seen several machines that died shortly after being used for the first time in many years. The problem has always been a chip failure. I suspect that some minor corrosion problem accumulated in storage and the stress of being put under voltage caused it to finally give way.

Free42 1.0.4: better SOLVE and INTEG

*Message #1 Posted by **Thomas Okken** on 7 Nov 2004, 9:05 p.m.*

Hi all,

I just posted Free42 version 1.0.4 here.

It features much improved SOLVE and INTEG performance. For SOLVE, I switched from interpolating using the secant method to Ridders' method; for INTEG, I switched from using Simpson's Rule to the Romberg method. In terms of the number of times the user function has to be evaluated to get a result, these new versions are very close to the performance of the HP-42S now.

Many thanks to Hugh Steers for the Romberg implementation, and for reminding me of the Numerical Recipes book where I got the Ridders code.

- Thomas

Re: Free42 1.0.4: better SOLVE and INTEG

*Message #2 Posted by **hugh steers** on 8 Nov 2004, 4:05 a.m.,*
in response to message #1 by Thomas Okken

the Romberg version uses a refinement suggested in the 15c advanced function handbook and used by the 15c and others to redistribute the samples in a clever way. ive found this simple transform to be very effective and substantially improves this method over the usual textbook “Romberg” implementation.

Re: Free42 1.0.4: AVIEW bug

*Message #3 Posted by **Ton van de Burgt** on 8 Nov 2004, 4:20 a.m.,*
in response to message #1 by Thomas Okken

When a LF character is on the 23st place in a string, AVIEW does not show the second line, only the first line.

Regards, Ton

Re: Free42 1.0.4: AVIEW bug

*Message #4 Posted by **Thomas Okken** on 8 Nov 2004, 3:33 p.m.,*
in response to message #3 by Ton van de Burgt

Oops! Thanks for the heads-up.
This is what happens when I forget to compare my code's performance with the real thing... Ahem... Sorry about that.
It will be fixed in the next release, probably tomorrow.

Free42 1.0.4 - Pocket PC Version?

*Message #5 Posted by **Jeff O.** on 8 Nov 2004, 7:39 a.m.,*
in response to message #1 by Thomas Okken

Thomas,
Let me add my thanks and appreciation to those expressed by all of the others for your efforts.
What are the chances that a Pocket PC 2002/2003 version will be produced? (I reviewed the various messages and did not find any mention of this issue. If it has already been discussed, please forgive me.)

Re: Free42 1.0.4 - Pocket PC Version?

*Message #6 Posted by **Thomas Okken** on 8 Nov 2004, 3:28 p.m.,*
in response to message #5 by Jeff O.

Chances of a Pocket PC version: hmmm, well, I don't know anything about that platform. I don't own one (I'm happy with my Palm) and I don't have any tools for Pocket PC development etc.

I someone else is interested in doing it, I'll be glad to help. It's not a big task, once you understand how the core-shell interface works. For example, it took me only 3 days to write the Windows front-end, and I'm not an experienced Windows programmer.

All the OS-dependent functionality is in shell.c/shell.cpp; the three versions I have at the moment are all about 800-900 lines of code. Not trivial, but not a mega project, either.

Unfortunately, I haven't a clue about such things, so I will have to rely on the kindness of strangers. Hopefully someone as generous as you will take on this task.

in response to message #1 by Thomas Okken

Algorithm

The modified Bisection alters the selection of the mid-interval guess by comparing the absolute values of the functions at the interval's ends [a. b]. The mid-interval valuae is calculated as:

m = a + 0.25 * (b – a) if |Fa| < |Fb|

or

m = a + 0.75 * (b – a) if |Fa| >= |Fb|

P-Code

Give the root-containing interval [a, b] and the tolerance of the root: 1. Let Fa = f(a) and Fb = f(b) 2. If |Fa| < |Fb| then alpha = 0.25 else alpha = 0.75 3. m = a + alpha * (b – a) 4. Let Fm = f(m) 5. If Fm * Fa > 0 then let a = m and Fa = Fm else let b = m and Fb = Fm 6. If |a – b| > Tolerance resume at step 2 7. Return root as the value of m.

HP-71B & HP-75C/D module list?

*Message #1 Posted by **Matthias** on 7 Nov 2004, 6:35 p.m.*

Hi

As you know I´m anxious to provide you a detailed list of all known HP-41 modules. But does someone of you does this with the HP-71B or the HP-75C/D? I know there are much less modules but I am really interested to know which modules exist...

Matthias

Re: HP-71B & HP-75C/D module list?

*Message #2 Posted by **Garth Wilson** on 8 Nov 2004, 2:56 a.m.,*
in response to message #1 by Matthias

This is from Educalc's catalog #35 from 1987, the one in which they announced HP was discontinuing the HP-75. The 82... stock numbers undoubtedly are exact HP numbers.

HP75:

Stock #92267A [HP-75 hi-res wand] List price $160

Stock #92267B [HP-75 med-res wand] List price $150

Stock #82725A (bar code module) List price $75

Stock #82718A expansion pod (contains 300 bps direct-connect modem, 32K RAM disc, and two bar code decoders built in) List price $875

Stock #F15001 (75-15001 I/O module) List price $95 (but didn't the 75 come with the HPIL built in?)

Stock #82700 (8K memory module) List price $195

Stock #75-669 (blank 32K EPROM module made by CMT, not HP) List price $229

Stock #15012 (75 surveying module) List price $295

Stock #F15015 (75-15015 math module) List price $145

Stock #F15019 (75-15019 text formatter module) List price $95

I know VisiCalc was also available in a module.

HP-71: Stock #82400 [71 card reader] List price $165

Stock #71-ZWD [Zenwand bar code reading, analyzing, and printing system, made by Zengrange, not HP] List price $400

Stock #82401 [71 HPIL] List price $125

Stock #82402 [71 dual IL adapter] List price $99

Stock #71-672 [32K front port EPROM, made by CMT, not HP] List price $100

Stock #71-731 [64K front port EPROM, made by CMT, not HP] List price $156

Stock #71-656 [32K front port RAM, made by CMT, not HP] List price $150

Stock #71-845A [CMT-CR-32R 32K card reader port RAM, made by CMT, not HP] List price $150

Stock #71-845B [CMT-CR-64R 64K card reader port RAM, made by CMT, not HP] List price $270

Stock #71-845C [CMT-CR-96R 96K card reader port RAM, made by CMT, not HP] List price $360

Stock #71-845D [CMT-CR-128R 128K card reader port RAM, made by CMT, not HP] List price $446

Stock #71-845E [CMT-CR-32/32 32K RAM and 32K EPROM in card reader port, made by CMT, not HP] List price $226

Stock #82420 [4K RAM, made by HP] List price $75

Stock #71-789A [32K OTP ROM] $92/ea for 5-9, $85/ea for 10-99, $80/ea for 100+

Stock #71-790A [64K OTP ROM] $130/ea for 5-9, $125/ea for 10-99, $118/ea for 100+

Stock #82488 [71 front port datacomm module] List price $95

Stock #82482 [71 finance module] List price $75

Stock #82480 [71 math module] List price $95

Stock #82483 [71 survey module] List price $95

Stock #82490 [71/41 translator module] List price $95

Stock #71-837 [HP-11C, -12C, -16C emulator module, made by CMT] List price $140

Stock #82485 [71 text editor module] List price $75

Stock #82484 [71 curve fitting module] List price $95

Stock #82489 [71 statistics module] List price $95

Stock #71-818 [log analysis module, for petroleum geologists and engineers, by Petrologic] List price $395

Stock #82481 [71 AC circuit analysis module] List price $75

Stock #82479 [71 data acquisition module] List price $195

I also have the HP 82441A Forth/Assembler module, but I know there was another one beside that one.

I seem to remember there was a Paname module put out by the Paris user group. One of the things it added to the BASIC IIRC was a CASE structure.

Various other solutions were offered in book form, on magnetic cards, on cassette, or disc, both for the HP-71 and -75.

> I seem to remember there was a Paname module put out by the Paris user group. One of the things it added to the BASIC IIRC was a CASE structure

Actually, it was the JPCROM that added many features to the HP-71B, including structured programming keywords (multiline IF-THEN-ELSE, CASE, REPEAT-UNTIL, DO-WHILE, LEAVE, ...).

Paname was a module for the HP-41C.

JPC ROM

*Message #4 Posted by **Gene** on 8 Nov 2004, 10:09 a.m.,*
in response to message #3 by J-F Garnier

And, the actual JPC ROM lex file (version X - "fully debugged) is available for download on the net (but I forget where right now). If you have the ability to download and transfer a file over to your HP71B, then this is a great file to add to your machine.

Anyone remember where this can be found?

I know the PDF of the user manual is out there too.

Re: JPC ROM

*Message #5 Posted by **Garth Wilson** on 8 Nov 2004, 1:32 p.m.,*
in response to message #4 by Gene

Is it available to enter by keyboard as well, like there were so many LEX files in the CHHU Journal? Those were gold. The keying-in was a minor price to pay, and not susceptible to problems with incompatible media formats, drives going bad, or media getting damaged over the years.

Re: JPC ROM

*Message #6 Posted by **Gene** on 8 Nov 2004, 2:03 p.m.,*
in response to message #5 by Garth Wilson

Well, it is about 25K or so in length. That would take a LONG time to key.

Anyone who has it could run "dumplex" on it and get the lines to input. I don't know anyone who has done that.

My copy is (fortunately) on an eprom module always plugged into my 71B. :-)

Gene

Re: JPC ROM

*Message #7 Posted by **Garth Wilson** on 9 Nov 2004, 4:26 p.m.,*
in response to message #6 by Gene

Yes, >50,000 keystrokes. The multi-line program structures by themselves sure don't warrant that kind of length, and it would be hard to justify taking that much RAM for it. But I suppose there are a lot of other things in it that I already have in RAM, so the duplicates can be removed to free-up space. Can you give me a list of what else is in it? I expect it has most of the wealth that was in the CHHU Chronicle V2N7 from Nov/Dec '85 in the article "LEXFiles from Paris", although that one does not have the multi-line program structures.

I'm still an advocate for having the ultimate back-up on paper though. I have various inch-thick printouts of my work. If all the electronic media or no-longer-available drives fail over time, you have some recourse besides completely starting over from scratch or going without.

Re: Breaking Private on HP71

*Message #5 Posted by **J-F Garnier** on 7 Nov 2004, 9:43 a.m.,*
in response to message #4 by Emmanuel, France

One way is to copy the ROM to a independant RAM (32k if it is the size of the target ROM) with a

non-restricted PEEK function like found in the JPCROM, then POKE at the right nibbles to remove the PRIVATE status.

J-F

Re: Breaking Private on HP71

*Message #6 Posted by **Forrest** on 7 Nov 2004, 3:03 p.m.,*
in response to message #5 by J-F Garnier

Dear J-F,

Thank you for the help. I guess the question now is which is easier to obtain - a Forth Assembler Rom or the JPCROM. I did a lot of programming for the HP41 back in its day, creating survey programs that did things that the module didn't, like remembering coordinate points by number. Later that became an interest with the HP71 which had a unique survey module. My interest in the HP71 has been re-kindled and I have a couple of survey ROMS (not HP) that are well out of date, but my interest is in what problems they solved and how they solved them.

Your suggestion also seems to be a viable solution. I assume that the JPCROM is as hard to obtain at the Forth ROM. I am sure that I used to have information on what nibbles made the program "Private" but I will have to look through my owners and reference manuals.

It is one of those things where I used to have all the PPC issues, and everything associated with the HP41 and HP71 but alas it disappeared a number of years ago. Oh, do I wish I could find it someplace in my storage.

Thanks, It is greatly appreciated.

41CV keyboard cleaning

*Message #1 Posted by **andy** on 6 Nov 2004, 5:31 p.m.*

Hi,

I have an older model 41cv (square corners on the display) which is having trouble registering the "2" key. Is it the elastomer interconnect failing or is it just dirt? I have taken the calculator apart and it looks good internally (no battery corrosion or visible dirt inside).

The keyboard/display are fairly dirty though. Now that I have it apart, is it safe to clean the keyboard/display half of the 41cv in distilled water?

Thanks, Andy

Re: 41CV keyboard cleaning

*Message #2 Posted by **Randy** on 6 Nov 2004, 8:06 p.m.,*
in response to message #1 by andy

If it's a single key, it's dirt since the keyboard is row/column multiplexed.

Don't immerse the display, it's just not a good idea. Unsolder first and set aside. Ultrasonically clean the keyboard in distilled water if possible, that should solve the problem. If that's not an option, try a few drops of Caig DeoxIT D5 in the hole of the pcb for the key in question.

How to UNPRIVATE a program in ROM on HP-41?

*Message #1 Posted by **Miki Mihajlovic** on 6 Nov 2004, 3:31 p.m.*

My HP-41 ROM module (INFOH1) for which I now have the image files (.bin .rom) consists of several FOCAL programs that are all protected as PRIVATE so I can't COPY them into the RAM. I want to be able to have the individual listings for all the programs from the module. I am familiar with a procedure of UNPRIVATING the programs in RAM but how to get them there first? So far the only way I found to list a PRIVATE program is CSST routine from SANDBOX ROM, however, it doesn't echo the printout to DISPLAY device of EMU41 so I can't capture the listing in the DISP.LOG file.

Since I have the disassembled listing of the ROM image is there an easy way to change some flags or similar indicators at MCODE level and assemble the image again.

*Message #2 Posted by **Emmanuel, France** on 7 Nov 2004, 4:03 a.m.,*
in response to message #1 by Miki Mihajlovic

If I remember well, there's a special code (such 000h) between function name and code listing. In the fat, 201h and 047h (for instance) instead of 001h and 047h for a program (located at X147h... To be continued

12345

Re: How to UNPRIVATE a program in ROM on HP-41?

*Message #3 Posted by **Mike (Stgt)** on 8 Nov 2004, 7:51 a.m.,*
in response to message #2 by Emmanuel, France

Salut Emmanuel!

For User Code there are no words between function name and code, there are two word before the user code and the function name is taken from the globel alpha-label in the code. When I look at the difference of a cracked Bobby Schenk Yacht Module and the original I find following:

```
                                    MAT=  135
I - 8087 250 NCXQ   9440            RPL=    1 00136 00136
D - E087 350 NCXQ   D440
                                    MAT= 1798
I - 878E 260 SETHEX                 RPL=    1 01935 01935
D - E78E 360 CRTN
                                    MAT= 1281
I - 8C90 260 SETHEX                 RPL=    1 03217 03217
D - EC90 360 CRTN
...
```

Note: the ZEN-ROM disassembly is not valid for user code

The entry in FAT points to the first byte of the global alpha-label and here you find following:

```
8086 101 (n-2)
8087 250 (n-1)
8088 1CA global Label
8089 000 @ of global chain here if in RAM
808A 0F3 # chars + 1
808B 000 in RAM key assignment here
808C 041 "A"
808D 035 "5"
```

So the PRIVATE status in ROM is indicated by the 9th bit of word (n-1). The meaning of the rest may be described in the ZEN-ROM manual, or MCode for Beginners, or somewhere in PPC-CN.

Hope this helps.

Ciao.....Mike

Re: How to UNPRIVATE a program in ROM on HP-41?

*Message #4 Posted by **Miki Mihajlovic** on 9 Nov 2004, 11:21 p.m.,*
in response to message #3 by Mike (Stgt)

You were right Mike, bit 9 of word (n-1) controls the ROM PRIVATE status. I tested it with my ROM listing in the following manner:

```
E000 01F XROM NO.=31
E001 01E 30 FUNCTIONS
E002 000 FCT:INFOH 1
E003 048 ADR: E048
E004 200 FCT:`TEMP
E005 04B ADR: E04B
E006 200 FCT:`PRES
...
E04A 350 LD@PT- D
E04B 1CA A=A-C PT<-
E04C 000 NOP
...
```

So I changed 350 at address E04A to 250, left the rest unchanged and assembled the ROM again. Then, I was able to COPY 'TEMP program to RAM. The program was still showing as PRIVATE but this time is in the RAM so I can use the procedure described here to remove the PRIVATE flag and get the listing.

By the way Meindert's disassembler has done all this automatically.

Re: How to UNPRIVATE a program in ROM on HP-41?

*Message #5 Posted by **Mike (Stgt)** on 10 Nov 2004, 4:19 a.m.,*
in response to message #4 by Miki Mihajlovic

Thank you, Miki, for sharing your observation. I can't remember such troubles.

What I wrote yesterday was just from my poor memory and the compare of the cracked vs the original Schenk Module. That was years ago when I did that, so for sure there are others today who know better and have the appropriate routines at hand. I "use" the HP-41 for long time only in it's emulators (Emu41, V41, and of cause my NutEm) and there I have other potentialities to flip some bits or decode some ROM. I just do it outside the emulator. On a real HP-41 only with a RAM-Box

and a ZEN-ROM it's quite a challenge.

Ciao.....Mike

HP-01 Repair/Service

*Message #1 Posted by **Jerry Hayes** on 6 Nov 2004, 2:58 p.m.*

HP-01 Watch that I bought new in 1970 is having problems with its LEDs not completely working. Some not at all, while others just the top half light up. I've replaced the batteries without any luck in resolving the problem. Can anyone suggest a repair/service location that can help?

Re: HP-01 Repair/Service

*Message #2 Posted by **Eric Smith** on 6 Nov 2004, 10:01 p.m.,*
in response to message #1 by Jerry Hayes

Sadly there is basically no way to fix them. There was never component-level repair of the electronics module; HP replaced it as a unit. And HP has not had spares for more than twenty years now.

I'm still looking for a broken HP-01 to buy (for less money than a good one) to extract the ROM contents for simulation, i.e., for my Nonpareil simulator.

Yes, give it to Eric! (nt)

HP-33C with 9V supply?

*Message #1 Posted by **J-F Garnier** on 6 Nov 2004, 4:53 a.m.*

Look at:

http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&category=38876&item=3849820953&rd=1&ssPageName=WDVW

The display seems quite bright, it seems to work but I won't buy it...

J-F

Free42 1.0.1

*Message #1 Posted by **Thomas Okken** on 5 Nov 2004, 7:26 p.m.*

I thought a few of the bugs that I had heard about were serious enough that I didn't want anyone to wait any longer than necessary for a fixed version. Version 1.0.1 is here, and a list of fixed bugs is here.

Enjoy, and thanks to all for your feedback!

- Thomas

in response to message #1 by Thomas Okken

Now I really want to hunt a HP42S for real... I didn't know the HP42 graphed equations. How do you graph equations on the HP42S please?

Anyway, much thanks as Free42 has been a fine addition to my comptuer.

Re: Free42 1.0.1

*Message #6 Posted by **Thomas Okken** on 5 Nov 2004, 11:46 p.m.,*
in response to message #5 by Eddie Shore

The HP-42S does not have a function plotter built in (unlike the 28 and 48 series), but it does have a bit-

mapped display and a PIXEL instruction that lets you control individual pixels.

The HP-42S manual has a program listing for a function plotter called DPLOT, which plots a function using the PIXEL command; the version of DPLOT that's in the Free42 state files on the Free42 home page is an improved version that works with functions that have MVAR instructions, so you can plot any two parameters of a multi-parameter function against each other (it gives you the option to use SOLVE if necessary).

So, it's not a standard feature, but it's not terribly hard to program, either. And, obligatory Free42 plug: on a really fast 42S, the combination of SOLVE and plotting can be very handy. :-)

Re: Free42 1.0.1

practical joke

*Message #1 Posted by **William** on 5 Nov 2004, 8:39 a.m.*

Hello,

I and my friends have hp 39g's and I want to pull a prank on them as muck up day is coming up very soon.

At the moment my coding knowledge goes as far as <html></html> and I know nothing about calculator coding.

What I want to do is change the F keys on the home screen to include MSN (messenger) and SELF DESTRUCT.

I also want to change the applet screen so that the all the F keys say "DEL ALL" but disable them so they don't edit their programmes in the confusion.

any help would be appreciated

thanks in advance, William Munzer

Disassembling 12k ROM on HP-41

*Message #1 Posted by **Miki Mihajlovic** on 4 Nov 2004, 10:17 p.m.*

How would I check if a module that I have is a 12k module and how would I go about disassembling it. If I put my module into slot #4 with NoVRAM in #1 I could DISASM E000-EFFF and F000-FFFF but what about the third 4k bank. I suspect that it is 12k module since in the listing of the first bank I have seen several ENBAK 3 commands.

I am using TRANS41 to capture the listing.

1234

Re: Disassembling 12k ROM on HP-41

*Message #2 Posted by **Raymond Del Tondo** on 5 Nov 2004, 2:13 a.m.,*
in response to message #1 by Miki Mihajlovic

Hi,

the ENBANK3 opcodes don't automatically mean there's a third page, they could simply be data, or part of an instruction.
Regarding disassembling bank switched ROMs, I think the HEPAX manual talks about this topic.

Which ROM are you talking about?
Maybe a query of Matthias' module list (at www.hp-collection.org) could answer some questions .

Raymond

Re: Disassembling 12k ROM on HP-41

*Message #3 Posted by **Mike (Stgt)** on 5 Nov 2004, 3:14 a.m.,*
in response to message #1 by Miki Mihajlovic

You have to find a way to enable that second bank _before_ disassembling it. IIRC the secondary banks may be enabled/disabled idependently, as such you may *not* call the switch routine of the HP-41CX in page 5 to switch the secondary page of the Advantage Module for example. You have to find the switch routine of your module. Be careful, as Raymond remarked, the ENBANK 3 in your disassembly may be wrong interpreted by your disassembler.

Ciao.....Mike

Re: Disassembling 12k ROM on HP-41

*Message #4 Posted by **Ángel Martin** on 5 Nov 2004, 7:20 a.m.,*
in response to message #1 by Miki Mihajlovic

A common mistake is FOCAL programs being "disassembled", generating lots of ENBK3 mnemonics but obviously not being such.

The HEPAX function "HEXEDIT" (included in your NoVRAM) can switch between banks, just press the "+" and "-" keys as requested. The appropriate flag indicator (1-4) will also come up to let you know which bank it's looking at.(Unfortunately this function is "disabled" for itself, so you wan't see the HEPAX ROM contents).

A couple of examples are the IR_Printer module, and of course the Advantage.

You can also use the nice MCODE program posted in T.O.S.

Best, ÁM

Re: Disassembling 12k ROM on HP-41

*Message #5 Posted by **Miki Mihajlovic** on 5 Nov 2004, 11:57 a.m.,*
in response to message #4 by Ángel Martin

Thanks for your answers. You were all right that ENBANK3 was actually not enabling the third (nonexistent bank). The module in question is INFOH1 module made by Flopetrol Schlumberger (my former employer) and was intended for surface flow measurements calculations of oil wells with some unit conversions etc.

I got the module as a loaner from a colleague from UK (after several months of trying) and was downloading its content. I finally succeeded late last nite and as Angel guessed the module is just a bunch of FOCAL code in 8k module. I disassembled the first page and I saw several ENBANKS there so I figured I better ask. After that NoVram-IL-TARNS41 was giving me some trouble so the disassembly was not smooth (I had to reburn NoVRAM few times) but finally succeeded and the images run on Clonix, EMU41 and V41. Now the problem will be to convince Schlumbeger to allow publishing it.

Nasty Way to Crash a Voyager

*Message #1 Posted by **Katie** on 4 Nov 2004, 3:24 p.m.*

In playing around with some of the information talked about in this thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=64172

I stumbled across a nasty way to crash a Voyager -- any of them: 10C, 11C, 12C (at least the original ones), 15C and 16C. On the 16C you need to do this in FLOAT mode.

Here's how:

I'm going to refer to the simultaneous key sequence [ON]+[TOP LEFT KEY] as [ON-TLK] because the keyboard labels are different on each calc.

1) put a 10 in the X-register 2) press [ON] - calc turns off 3) press [ON-TLK] - this rotates the X-register by 22 bits(?) 4) press [ON] - calc turns off 5) press [ON-TLK] - you'll see something like "0.0000 10" (an unnormalized number) 6) press [1/x] - try to take the reciprocal of this number

Your calc will lock up in a tight (battery draining) loop that even an [ON]+[-] won't break out of. The only way that I've found to break this (other than power reset) is to do another [ON-TLK] and turn it back on again. Luckily operation does not destroy the contents of memory, at least not that I've encountered.

Re: Nasty Way to Crash a Voyager

*Message #2 Posted by **bill platt** on 5 Nov 2004, 9:29 a.m.,*
in response to message #1 by Katie

Hi Katie!

Very cool discovery. How did you know it is looping, rather than off? When I do your keystroke sequence, the screen goes blank.....

Best regards,

bill

Re: Nasty Way to Crash a Voyager

*Message #3 Posted by **Katie** on 5 Nov 2004, 6:05 p.m.,*
in response to message #2 by bill platt

I don't know that's looping for certain, but it's quite likely. I measured the current draw when the display is blanked by this key sequence and it equaled that of when the calculator is running an infinite loop (I tested with a simple LBL-GTO program) about 0.5ma. CMOS doesn't draw significant current when it's not being clocked, and since the calculator doesn't come out of the blank display mode on it's own, it's got to be in some kind of loop.

Re: Nasty Way to Crash a Voyager

*Message #4 Posted by **Arnaud Amiel** on 8 Nov 2004, 6:26 a.m.,*
in response to message #1 by Katie

Just as a side note, your procedure makes my 12C change from END to BEGIN mode and at the end the number 0.40 is in X

Free42 version 1.0 released

*Message #1 Posted by **Thomas Okken** on 4 Nov 2004, 1:35 p.m.*

Hi all,

I just finished version 1.0 of *Free42*, a new HP-42S emulator. It's not as pretty as Emu42 yet, and there's no printer emulation yet, nor is there a facility for importing/exporting programs (RAW or otherwise). All these things are planned for the next release, probably 1st quarter 2005.

Meanwhile, what you do get with Free42 is: speed (no Saturn emulation layer slowing things down; I rewrote the entire HP-42S in C) and PalmOS, Linux, and Windows support. And best of all, it's freely redistributable and requires no ROM image.

The goods are at http://home.planet.nl/~demun000/thomas_projects/free42/

Enjoy!

- Thomas

Re: Free42 version 1.0 released

*Message #2 Posted by **Erik Ehrling (Sweden)** on 4 Nov 2004, 2:32 p.m.,*
in response to message #1 by Thomas Okken

Good job! I really hope that the OpenRPN people sees this! This would be great on a small Embedded Linux device...

Best regards,
Erik Ehrling (Sweden)

Re: Free42 version 1.0 released

*Message #3 Posted by **hugh steers** on 4 Nov 2004, 6:39 p.m.,*
in response to message #1 by Thomas Okken

hi there,

this is really cool indeed. i like the palm version, it works well, although the beep is a bit loud.

i have a few ideas that might help it to become even better. firstly, your wrestle with bcd vs binary is something ive been struggling with for some time. i can well understand your use of ieee754 not least from a performance point of view. i did the same in my implementation of scicalc http://www.voidware.com/scic.html but more and more recently i am going away from binary back to bcd. here are some things that increasingly bug me (and you). try, 2 enter .2 + .2 + .2 + .2 + .2 + 3 - you get 8.8818e-16 also, 1 enter 1e-13 + 1 - to get 9.9920e-14 both of these are really annoying.

i have an alternative implementation of the gamma function you might like,

http://www.voidware.com/gamma2.htm http://www.voidware.com/gamma.htm

i see you need a ln1(x) = ln(x+1), here's one i wrote for scicalc,

```
double ln1(double x)
{
    double s = x;
    double c = 2;
    double t;
    double s1;
    if (fabs(x) >= 0.01) return log(1+x);
    x = -x;
    t = x;
    for (;;) {
        t *= x;
        s1 = s - t/c;
        if (s1 == s) break;
        c += 1;
        s = s1;
    }
    return s1;
}
```

also, i can suggest a better integ algorithm. this code i developed by trying to reverse engineer the method used on the 15c and it performs about the same, http://www.voidware.com/rombint.htm it was part an attempt to recreate the missing solve and integ features on the hp9g http://www.voidware.com/calcs/hp9g.htm

also, i had a substantial improvement for solve by moving from the secant method to ridder's method as described there. i can give you some c code for ridders if you like, but i just cribbed it from numerical algorithms in C.

lastly, thanks for writing this calculator!

PS. can you supply the bmp resource files to build the windows version.

Re: Free42 version 1.0 released

*Message #4 Posted by **hugh steers** on 4 Nov 2004, 7:54 p.m.,*
in response to message #3 by hugh steers

a few more discoveries. sin(360) degrees isn't zero. this is a bug.

also, binary is hampering mod. for example 1e50 enter 9 mod, comes out at 3 instead of 1. i had real trouble fixing this in scicalc for the same binary reasons. what i did in the end, and this approach works with similar decimal problems, is to decimalise the number by re-representing binary X by M*10^E where M is a binary integer. this is another way to tackle bcd, ie to have a binary integer mantissa and a power of 10 exponent. some decimal systems work entirely like this (ie using a binary mantissa), but the problem is that you have to cope with denomalised numbers. so anyway, what im doing is temporarily recasting X into a decimal form but i store M in my floating point representation even though it is actually an integer (that's because ints arn't big enough). what then happens, is that digits below M in significance are regarded as zero, although they wouldn't be zero if kept in binary (there is implied decimal garbage if multiplied). ok, so then after effectively converting to decimal, i can algorithmically treat each part (M and E) separately eg mod(mod(M,r) + mod(10^E,r), r). how nasty!

Re: Free42 version 1.0 released

*Message #5 Posted by **Thomas Okken** on 4 Nov 2004, 9:53 p.m.,*
in response to message #4 by hugh steers

[...]but more and more recently i am going away from binary back to bcd. here are some things that increasingly bug me (and you). try, 2 enter .2 + .2 + .2 + .2 + .2 + 3 - you get 8.8818e-16 also, 1 enter

1e-13 + 1 - to get 9.9920e-14 both of these are really annoying.

I suppose it depends on what you're used to. I started computer programming on a Commodore PET, 28 years ago, and one of the first things I noticed were numerical quirks like that. And even today, programming in C or FORTRAN or Java it's the same.

I don't understand what the fuss is about. I can understand it for financial applications, I guess, but even there it's hard to see what problem would be caused by having $2 plus 5 times 20 cents minus $3 come out less than one tenth of one trillionth of a cent wrong. Presumably you're going to round money amounts to two decimals before printing your bill? :-)

But all kidding aside, outside of financial applications, all you're dealing with in the example given above is a misconception of how computers store numbers, and about the limits of precision. Personally, I don't like it very much that 1/7 + 1/7 + 1/7 + 1/7 + 1/7 + 1/7 + 1/7 does not come out as 1, but that's life, or rather, that's limited precision. Just because BCD can calculate certain special cases exactly does not make it more accurate in general, and for the scientific applications I'm primarily interested in, it's accuracy **in the general case** that matters.

i have an alternative implementation of the gamma function you might like, http://www.voidware.com/gamma2.htm http://www.voidware.com/gamma.htm

i see you need a ln1(x) = ln(x+1), here's one i wrote for scicalc,

Thanks! It is much appreciated. I will also take a look at your INTEG implementation and take a look at the Numerical Algorithms book. Hopefully all those improvements will make it into Free42 version 1.1.

a few more discoveries. sin(360) degrees isn't zero. this is a bug.

Good point. I missed that -- and there's really no excuse because only a week ago, I was reading an article about the HP-91 on the HP Museum CD set, where they mention doing user-unit argument reduction for trig functions, for preventing precisely that type of inaccuracy! Oops.

also, binary is hampering mod. for example 1e50 enter 9 mod, comes out at 3 instead of 1.

Whether or not that's a bug is a matter of perspective. If you feel that an HP-42S emulator has to go to every possible length to disguise the fact that it's using binary under the hood, then that's a bug -- but if you're comfortable with the notion of binary under the hood (I am, but I suspect I may be in the minority on that issue, at least among HP handheld fans), it's different, because the number you enter as 1e50 is stored as 1.000100011011... * 2^166, and for all I know the remainder of THAT divided by 9 could well be 3 (I'd have to check but that kind of integer algebra is beyond me, as I keep finding out whenever I try to understand how modern encryption algorithms work).

The solution you suggest works, but this does not seem to me like a problem, or rather, I prefer to do things the "binary" way throughout, so I'll stick with the current fmod()-based implementation.

Still, if enough people keep complaining about the numerical behavior of Free42, maybe I'll add support for other number representations. If there is a BCD library available under the LGPL or similar, and if it includes the full complement of trig, log, etc., then I'd certainly be interested in evaluating it.

PS. can you supply the bmp resource files to build the windows version.

When I build the Windows version, I run the make-images script to create them. You can generate them from the images in the 'common' directory simply by converting the 8 GIFs and the one PBM (for the 7 annunciators, the skin, and the keyboard mask) to monochrome BMPs while enlarging them by a

factor of exactly 2.

lastly, thanks for writing this calculator!

My pleasure! I'm glad you like it, even if we may not see eye to eye in the great binary-vs-decimal debate. :-)

- Thomas

Re: Free42 version 1.0 released

*Message #6 Posted by **hugh steers** on 5 Nov 2004, 7:38 a.m.,*
in response to message #5 by Thomas Okken

hi thomas,

i completely agree with your sentiment regarding accuracy and representation. its one of the reasons i tried the binary route as well. since, in the main, its better. ie you get more bits of accuracy out of a given number size than in a corresponding binary version. however, its one of those things that bothers calculator people and i wanted to pass on information about some of the troubles i have had trying to make a native binary implementation behave like a decimal one. i kept thinking that there's no fundamental reason why binary shouldn't be adequate. i still do.

fyi, i am currently working on a 24 decimal digit number class for the openrpn project. so far it does the basic ops and square root. when i get time, i'll add the scientific functions. this might turn into a freely available bcd library. at least, that's my understanding of "open".

here follows a wish for the palm version;

going over to arm native would be cool. you could keep your 1.x version as is for compatibility, but fix any bugs. also have a 2.x version that's arm native. with this, it could use hires and therefore have a true 42s skin and use the larger screen size (ie 480x320). the additional performance boost could mean having a really superlative solve and integ implementations that are even better than a real 42s plus truly excellent program execution speed.

one other small palm wish, is the ability to tap on the shifted name without pressing the shift key.

thanks again and keep posted.

Rest assured that when I do get around to making an ARM version for PalmOS, it will not replace the 68k version. I'll probably build 68k-only and 68k/ARM-mixed versions for public download. As far as feature sets are concerned, again I don't know when exactly I'll get around to any of this, but the plan is to support whatever screen sizes the OS supports, regardless of whether you're on an ARM-based machine or not. (I don't know if there are 68k-based PalmOS

devices with big screens, but if there are, it's no extra effort to support them as well; from a coding point of view, it's just a matter of checking the OS version and hardware characteristics and using them the best you can.) In terms of the Free42 architecture, I'll only compile ARM versions of the "core" code, while the "shell" code will remain 68k.

one other small palm wish, is the ability to tap on the shifted name without pressing the shift key.

Interesting! That hadn't occurred to me yet. It seems easy enough to support; I'll just have to add another option to the configuration dialog. Erm, I'll have to add a configuration dialog first. :-)

BTW, the fact that clicking on the label above a key also presses that key is deliberate; on really tiny screens like the m100's, I wanted to maximize the area you could hit, the reason being that my aging tendons give me tons of grief when I have to do super-accurate clicking for long periods of time. But, of course that's not to say I couldn't add something to help people whose fine motor ability is better than mine!

Thanks for a great job!

I've found a small display issue when there is a two line alpha display at the end of a program and a softkey menu is active - such as the custom menu has been used to run the program. When this occurs, keyboard number entry does not cause the softkeys to be displayed. Instead the second alpha line is displayed on the bottom line and the data is entered in the top line.

Again, Thanks for the program

Thanks for the feedback -- I'm glad you like it!

Thanks for the bug report; I'm putting it on my list. I'll put a bug fix release on my web page soon, probably in a week or so. I found a couple of bugs myself too (less than a day after the release -- how embarrassing), and I'd like to put the fixes "out there" without making people wait for the next major release (major == PalmOS ARM version, printer emulation, pluggable skins... those things will take a while).

*Message #15 Posted by **Mike (Stgt)** on 5 Nov 2004, 4:41 a.m.,*
in response to message #1 by Thomas Okken

Hi Thomas!

Quite nice, but I assume it's still a beta version. When I enter a little test routine (LBL 00, SQRT, VIEW ST X, LASTX, DSE ST X, GTO 00) your Free42 shows "20-Byte Prgm", if I count correctly there are 9 bytes only (one for the statements LBL 00, SQRT, LASTX and 2 for the others).

Ciao.....Mike

Re: Free42 version 1.0 released

*Message #16 Posted by **Thomas Okken** on 5 Nov 2004, 12:15 p.m.,*
in response to message #15 by Mike (Stgt)

When I enter a little test routine (LBL 00, SQRT, VIEW ST X, LASTX, DSE ST X, GTO 00) your Free42 shows "20-Byte Prgm", if I count correctly there are 9 bytes only (one for the statements LBL 00, SQRT, LASTX and 2 for the others).

Actually, there are 20 bytes -- Free42 uses a different format for storing instructions. My format uses more space, but it's easier to decode... One feature I wanted especially was for numbers to be stored in binary, so you don't incur the cost of a decimal-to-binary conversion each time a program hits a "number" line. Also, all local GTO/XEQ targets are stored using 4 bytes, so all local labels are long range. All instructions are at least 2 bytes: byte 1 and the top 4 bits of byte 2 are the command code, and the lower 4 bits of byte 2 are the argument type. Take a look at common/core_globals.h if you're interested in the details.

As far as your example is concerned: LBL 00: 3 bytes, SQRT: 2 bytes, VIEW ST X: 3 bytes, LASTX: 2 bytes, DSE ST X: 3 bytes, GTO 00: 7 bytes -- for a total of 20. I'm not counting the END, which is another 2 bytes, because the 42S doesn't either. (Actually, the memory usage picture is a bit more complicated still, because I maintain an additional array of pointers to global labels and ENDs, and those array entries take up space, too -- but that is not included in the byte count at line 00.)

(When I implement program import/export, I'll support the HP-42S original program format externally, but for Free42 internally, I don't think I'll bother... Unless someone can suggest a good reason why I should! It could be done; program storage is not encapsulated particularly well at the moment but that would not be too hard to fix.)

Ciao.....Mike

Free42 vs. Emu42 state files

*Message #18 Posted by **Thomas Okken** on 8 Nov 2004, 5:51 p.m.,*
in response to message #17 by Mike (Stgt)

So I assume, the state files of your Free42 and Emu42 are not interchangable.

That is correct. I'm no Emu42 expert, but I believe the Emu42 state file is essentially an HP-42S RAM snapshot. Since Free42 is a complete re-write, without any use or even knowledge of how the HP-42S ROM is organized, there are bound to be major differences in storage layout.

Once I implement program import/export in Free42 1.1, I will make sure that the program files, at least, are interchangeable with those of Emu42. I hope that will be adequate... State file compatibility just seems impractical to accomplish.

*Message #19 Posted by **Ton van de Burgt** on 5 Nov 2004, 9:11 a.m.,*
in response to message #1 by Thomas Okken

Hi Thomas,

First of all: You did a great job, amazing calculator, fast, a lot of user memory.

I have keyed in some of my programs into Free42 and I saw some differences between Free42 and a real HP42S:

I am missing the hidden matrix functions [MAX], [MIN], [FIND]

When in an alpha string the LF character is on the 23th place, then AVIEW show that character on the display, on the second row.

It is impossible to create a global label with only numbers in it. EG: LBL “1234”

When executing a Base mode command in a program, the calculator returns not to normal when the program is stopped. This little test routine shows the problem: (BINM, VIEW ST X, EXITALL). The calculator stays in Binary mode.

When the matrix editor is on, flag 65 is not set.

I don’t want to criticize you, but I want to help you making a better calculator.

Regards, Ton van de Burgt

Noted. These will all be fixed in the upcoming bug fix release.

It is impossible to create a global label with only numbers in it. EG: LBL “1234”

No, it's not: type LBL, CATALOG, ENTER (SHIFT, PGM.FCN, LBL, SHIFT, +, ENTER). Then you can type numbers and they will be treated as alphanumeric instead of numeric. (It's a bit awkward, I guess, but that's how the real HP-42S does it -- or did I miss an easier way?)

I don’t want to criticize you, but I want to help you making a better calculator.

And it is appreciated! Thanks for letting me know.

in response to message #19 by Ton van de Burgt

It is impossible to create a global label with only numbers in it. EG: LBL “1234”

My HP42S won't do that either! There appears to be no way enter a global "numeric only" label, since entering a number as the first character in a label instruction forces it to be a local label. It is possible to create a numeric only GTO "1234" instruction, but the corresponding label can't exist.

Regards,

Bruce

in response to message #23 by Thomas Okken

Way too cool!

Thanks for doing this (though I'm sure it was not just for the betterment of your fellow man)...

I work mostly on a *nix box @ work and have been looking for an emulator for my 42S for when I leave it at home. Actually, seeing how valuable they are now, I'm tempted just to leave it at home anyway.

I don't have a good way to extract the ROM contents to try the other emulators other then to compile it manually (not attractive), so I was happy to see someone generated another solution.

US Supplier for n-cell rechargeables?

*Message #1 Posted by **Gene** on 4 Nov 2004, 12:17 p.m.*

Anyone have a link to any website where N-cell rechargeables are still sold?

Is there anyone on ebay that is selling these?

I have seen a seller on ebay who is selling rebuilt HP rechargeable HP41 battery packs (and has replaced the original nicads with nimh batteries), but I'd like to find some individual n-cell rechargeables.

I had some Radio Shack batteries, but I don't think they sell them any more.

Any link to someone who is still selling these would be appreciated.

Thanks, Gene

in response to message #1 by Gene

The Nicad Lady sells Sanyo N-size nicads:

http://nicdlady.com/cell_pr.html#nicads

Thanks, Katie...looks like Radio Shack in Canada still carries the rechargeables

*Message #3 Posted by **Gene** on 4 Nov 2004, 2:01 p.m.,*
in response to message #2 by Katie

http://www.radioshack.ca/estore/Product.aspx?language=en-CA&catalog=RadioShack&category=Ni-MH+Batteries&product=2300521

This is roughly $8 (US) per 2 battery set.

Alkalines don't last that long if you're running the NoVRAM module, a card reader, etc.

And, rechargeables will last a pretty long time. :-)

Re: US Supplier for n-cell rechargeables?

*Message #4 Posted by **Garth Wilson** on 4 Nov 2004, 12:52 p.m.,*
in response to message #1 by Gene

Try www.nicdlady.com . I see them at local electronic swapmeets. They can rebuild battery packs too and you may not be able to tell it from a factory job.

It seems like we keep going through this on the forum though. Why would you want rechargeables? A set of

alkalines probably lasts me 2-3 years, with no attention to having to recharge them. It's so much easier. If you have a card reader, that takes a lot of current, but for such short periods of time that I wouldn't expect it to have a significant effect on battery life.

Re: US Supplier for n-cell rechargeables?

*Message #5 Posted by **chas** on 4 Nov 2004, 10:12 p.m.,*
in response to message #4 by Garth Wilson

Never had a nicad leak! Never had a set of alkalines last 6 months. My 41cv just passed it's 26th anniversy with uncorroded contacts.

Re: US Supplier for n-cell rechargeables?

*Message #6 Posted by **Garth Wilson** on 4 Nov 2004, 11:55 p.m.,*
in response to message #5 by chas

Just replace the alkalines (all of them at once) when the low-battery indicator comes on, and they'll never leak either. My 41cx is almost 20 years old and in perfect condition. You'd have a hard time telling it from a brand new one (if brand new ones exited). It has probably been through 15-20 sets of batteries, although many of those were when the 41 was being used 8 hours a day for controlling automated test equipment and a set of batteries lasted maybe a month. I had to put instructions in the program to test the batteries (flag 49) and make the calculator give a message and turn itself off if they were low because the production operator would otherwise run them down until it wouldn't work anymore and it would start losing its memory.

I used to hate the fact that the tape drive was not made to take alkalines. With the rechargeables, you couldn't leave it unattended with the 41 logging data and go more than half a day on one charge. With alkalines you could probably go a couple of days if they were an option.

Re: US Supplier for n-cell rechargeables?

*Message #7 Posted by **unspellable** on 5 Nov 2004, 10:06 a.m.,*
in response to message #6 by Garth Wilson

My HP28S goes for a long time on a set of three alkaline N cells so I wouldn't monkey with rechargables.

On the other hand, I have some flashlights that use N cells and rechargables would be nice in that application. They use LED's and I am wondering about how compatible the internal resistance of a rechargable would be. I suspect the LED's are using the internal resistance of the alkalines as part of the ballast resistance.

Re: US Supplier for n-cell rechargeables?

*Message #8 Posted by **Dave Shaffer** on 5 Nov 2004, 10:51 a.m.,*
in response to message #7 by unspellable

re: "I suspect the LED's are using the internal resistance of the alkalines as part of the ballast resistance."

I doubt it. If I remember correctly, a single LED needs a current of a few to perhaps a few tens of milliamps. For a 1.5 V battery, if I am playing with LEDs, I put a 100-200 ohm or so resistor in series with the LED.

> Conversely, the internal resistance of a good battery must be under an ohm, or it wouldn't deliver much in the way of peak current.

Re: rechargeables -- a "zap treatment" testimonial

*Message #9 Posted by **Paul Brogger** on 5 Nov 2004, 12:15 p.m.,*
in response to message #1 by Gene

If certain rechargeables are hard to find or expensive, you might consider trying the "zap treatment".

I just bought a used Makita 12V cordless VSR drill/driver on eBay for parts. It came with two *absolutely dead* battery packs. These are obsolete and run something like $40.00 each, so I thought I'd give 'em a try.

I bought a "slave" flash unit from the local camera store ($20.00, runs on two AAA's) and hooked up wires and my multimeter as described in the article. I disassembled the battery packs, cut away openings in the insulating cardboard tubes, figured out the batteries' connections, and methodically zapped 'em once each, one by one.

Worked like a charm! (So far, at least.) I can't yet vouch for their longevity, but the two packs each hold far better charge than do my own original batteries. (They're next.)

One thing I did that I won't repeat: For convenience, I usually zapped the batteries by touching the electrodes to the batteries' cases. Since then, I've reflected that I may have weakened the cases and invited premature leaks. (Each **zap** leaves a little "spot weld" mark.) Next time, I'll do the extra work necessary to touch only the spot-welded metal connectors that hold the batteries together.

Anyway, just thought I'd share -- the technique is effective and (more importantly) *very satisfying*.

HP41 Short form exponent question

*Message #1 Posted by **Gene** on 4 Nov 2004, 11:21 a.m.*

Hope this isnt' a stupid question, but here goes.

I'm looking for the easiest/quickest way to enter E3 rather than 1 E3 into a program.

I have available/plugged-in the CCD-OSX rom and the Sandbox rom.

It appears I can't use the extended XEQ function of CCD to enter it into a program (or run mode for that matter). Pressing XEQ ENTER (to put the _ _ _ : _ _ _ prompts in the display) followed by 027 019 places a 1 in a program when the bytes should be E 3. Am I doing something wrong?

Re: HP41 Short form exponent question

*Message #2 Posted by **Richard Garner** on 4 Nov 2004, 12:26 p.m.,*
in response to message #1 by Gene

Gene,

The pseudo-synthetic form for entering 1000 in a program line is [EEX] [3] from the keyboard. As long as it is a power of 10 with an assumed 1 in the mantissa you do not have to put the leading 1 as part of your entry. The 41C will assume that is what you are doing. The display will show the program line as 1E3, but in the print out it should show just E3. Hope this helps.

Not quite what I was asking

*Message #3 Posted by **Gene** on 4 Nov 2004, 4:00 p.m.,*
in response to message #2 by Richard Garner

I know that using LB of the PPC Rom to Load 027 019 will give a synthetic program line of E3, without the leading 1 as in 1 E3.

I'm looking for a way to key that in directly using the extended XEQ of the CCD rom.

Appears as if that doesn't work.

When I press XEQ ENTER and then type in 027 019 in the prompts, I get an "E" by itself on a line and then text garbage in the next program line.

I read Mike's comment about using the Zenrom to do this, but it would be nice if I didn't have to use an entire 4K of the NoVRAM module just to get the short-form exponent entry capability.

Gene

Re: Not quite what I was asking

*Message #4 Posted by **Mike (Stgt)** on 5 Nov 2004, 5:20 a.m.,*
in response to message #3 by Gene

You only need the ZEN-ROM for entering the short form. The short form En and Emn (instead of 1En or 1Emn) will do w/o the ZEN-ROM.

An other - antiquated - way is using the "byte graber". But it still works. Alas I do not know by heart how to get it assigned to a key, was something using the CAT bug to change a one byte key assignment to Alpha-7...(?) -- Who remembers better?

Ciao.....Mike

Re: Not quite what I was asking

*Message #5 Posted by **Ángel Martin** on 5 Nov 2004, 7:26 a.m.,*
in response to message #3 by Gene

From memory, the Byte Grabber (BG) was 247,063. You do the following:

- ussing the CCD's ASN, assign such codes to any key

- input "1 E3" as usual

- back up one step, (pack if needed)

- press once the BG (or twice if you didn't pack)

et voila!

Re: chowchow for HP-42S

*Message #3 Posted by **Mike (Stgt)** on 5 Nov 2004, 6:11 a.m.,*
in response to message #2 by Robin (CH)

Hi Robin!

Tnx a lot 4 your routine. Reminds me that I should dig out mine for calculating with fractions on the HP-41. There is one in the PPC-ROM, but - you know - re-invent a wheel is great fun when it works as designed <VBG>

Ciao.....Mike

BTW - see you in Allschwil?

Re: chowchow for HP-42S

*Message #4 Posted by **Robin (CH)** on 5 Nov 2004, 5:33 p.m.,*
in response to message #3 by Mike (Stgt)

You're welcome :-)

I'm not familar with the HP-41, but I'm sure it's a great calc according to what I've read about it several places.

Conc. Allschwil: No, it's my birthday on the 27th, and I've already fully planed this day.

Programming HP12C

*Message #1 Posted by **Don** on 3 Nov 2004, 8:14 p.m.*

How do I program an alpha formula (a note actually) on a 12C? I can do it on a 17BII and want to know how on a 12C?

Re: Programming HP12C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 3 Nov 2004, 10:53 p.m.,*
in response to message #1 by Don

Hi, Don;

the HP12C has no ALPHA capabilities. in order to enter a math expression/formula, it must be first generated an RPN-like keystroke sequence prior to program it (or, if you are able to, key in the keystroke sequence directly in program mode). In the HP17B you can use variable names and have these names as menu keys. In the HP12C, each variable should be stored in a numbered register. The HP12C is not able to solve generical expressions (programs) as you can do with the HP17B/BII.

If you actually need to use the HP12C, please post an additional message with the expression(s) you want to enter in the HP12C and let us (I and the other contributors) try to generate a program, if applicable.

Best regards.

Luiz (Brazil)

Re: Programming HP12C

*Message #3 Posted by **bill platt** on 4 Nov 2004, 10:02 a.m.,*
in response to message #1 by Don

Hi Don,

If you started out with the 17bii, and now have a 12c, you will feel like you are going backwards. The 17bii is much more versatile and powerful.

In my opinion, the programming on the 12c is almost useless--you cannot edit a program. If you make a mistake, you have to play silly tricks with GTO jumps, or erase and start over!

With "Let" and "Get", as well as "If" with AND OR XOR etc, you can do a whole lot in the solver on the 17bii.

I had an 11c years ago, and always assumed that the 12c would be similar in programming. Not So! The 12c has a very restricted programming feature, compared to its scientific cousin.

But there are some great things about the 12c---and some here have written some really neat stuff for them--even taken advantage of the TVM solver as a general solver----but in reality this is sort of arcane stuff, and I

find that the machine is a relic.....but I still own a couple! (They are great for non-programmed straight financial stuff).

Regards,

Bill

Strange CD reading problems

Message #1 Posted by >~\\\\\`> on 3 Nov 2004, 5:12 p.m.

All of a sudden, I can't read any burned CD's on my laptop??!! If it came from a company, they read fine, but if they are burned, no go. I've got a DVD/CD rom with no burn capabilities. In one strange case, I took a CD that I couldn't read on the laptop and took it to a friends where he could read it fine (only had data on it not music). We made a copy of this burned CD and tried it on the laptop thinking that perhaps the previous one was not finalized. Turns out that the new burn copy would read ok, and suddenly the old burned copy would read (keeping in mind they are identical). My other burned cd's won't work. Any ideas??

Sorry, just realized, wrong kind of forum

HP9825A

*Message #1 Posted by **Larry Guzan** on 3 Nov 2004, 2:51 p.m.*

hi when i was in college in 1980 i used an HP9825A desktop calculator in a physics lab. Connected to this thru what i think was the hp-ib bus(that was new at the time, i think)was a real nifty printer/plotter. I cannot find the model number of this thing anywhere. It is not the 9862A. the plotter that i remember did not use any multi-pen setup. it used a cool printing head that looked like a little hand that moved to white letters like a human hand would spell them out - it didnt stamp them like a typewriter. I appreciate any and all help in this matter.

Re: HP9825A

*Message #2 Posted by **Wayne Brown** on 4 Nov 2004, 12:58 p.m.,*
in response to message #1 by Larry Guzan

You're probably talking about the 7470A. This plotter came with one of three interface options: Option 001 was RS232, Option 002 was HP-IB, and Option 003 was HP-IL. (I have one with the HP-IL interface.) It uses 2 pens, which are mounted under the front cover, one on the left and the other on the right. The pen holder has a couple of little "fingers" to hold the pens. When plotting the pen holder slides over to one side or the other, grabs a pen, and moves from side to side while the paper moves backward and forward. The combination of movements allows any shape to be plotted. If two colors are being used the plotter draws all of one color's lines first. Then it puts the first pen back, goes to the other side and grabs the other pen, and draws the rest of the lines. It's pretty fascinating to watch.

hp49g+ connectivity

*Message #1 Posted by **John Carter** on 3 Nov 2004, 12:01 p.m.*

I just purchased the hp49g+. After installing the connectivity kit and USB driver (the latest available on the web) on my WinXP Pro system, Conn4x is unable to find the calculator. Can anyone help me troubleshoot and fix this? Thanks.

HP49+ Connectivity kit

*Message #2 Posted by **Francesc Casanellas** on 3 Nov 2004, 3:19 p.m.,*
in response to message #1 by John Carter

I recommend you to follow these steps:

1. Turn on the calculator

2. Start the connectivity software.

3. Turn on the calculator.

4. WAIT for a warning sound

5. In "Connect using"... select HP49G+

6. Go to File/Connect

7. You are prompted to press the right shift (red) key and THEN (not at the same time) the right arrow (in the group of the 4 round keys).

8. Click on OK

If your USB port is right this should work

Edited: 3 Nov 2004, 3:22 p.m.

Re: hp49g+ connectivity

*Message #3 Posted by **Erik Ehrling (Sweden)** on 3 Nov 2004, 4:33 p.m.,*
in response to message #1 by John Carter

For some reason I cannot run the connectivity software and Microsoft ActiveSync (if you happen to have a Pocket PC etc) at the same time. I use to kill the process called Wcescomm before running the connectivity software. Other than that it works just fine...

Regards, Erik Ehrling (Sweden)

1F3  FJ  JNC+62        213  GJ  JNC-62        1F7  FN  JC+62        217  GN  JC-62
1FB  FR  JNC+63        20B  GB  JNC-63        1FF  FV  JC+63        20F  GF  JC-63
                       203  G3  JNC-64                              207  G7  JC-64

Notes
1. The second column is base 32 (0-9,A-V). In base 32 "C=0?  RTNNC"  is NET0.
2. Copy and paste into a text processor. If you like another opcode, use search
and replace (eg: replace JNC with NCGO). I prefer "Jump if Not Carry".
```

Re: HP41C Class 3

*Message #2 Posted by **Mike (Stgt)** on 3 Nov 2004, 10:45 a.m.,*
in response to message #1 by flexten

The binary view on Nut class 3 instructions: dj jjjj js11 with d=Direction, j=Jump distance, s=carry Sense, and $(11)_2=(3)_{10}$ (hence Class **3**). So with all variables declared integer and INSREM=(10-bit instruction word)/4 you may FORTRAN like this:

```
if (carry1 .eqv. btest(insrem, 0)) then
  DIST = INSREM / 2                     ! shift off CRY sense
  IF (DIST .GE. 64) DIST = DIST - 128   ! adjust direction
  PC = PC + DIST - 1                    ! modifiy prgm counter
  END IF                                ! if sense = CRY
RETURN                                  ! next instruction
END
```

Hope this helps.

Ciao.....Mike

want something .....

*Message #1 Posted by **Cannondale** on 3 Nov 2004, 5:12 a.m.*

hello , i am first time joint this forum . i come from hong kong . i want to request some " MATRIX PROGRAM "& some advance function FOR HP - 15C calculator , because i """" lost """" my manual , english version please (if) ..... my english quite poor .... >.< anyone can held me ? my e - mail : josephlee0110@sinaman.com . thx you ....

HP-15C manuals

*Message #2 Posted by **Karl Schneider** on 3 Nov 2004, 11:40 p.m.,*
in response to message #1 by Cannondale

The complete HP-15C manual (Owner's Handbook) as well as the Advanced Functions Handbook, scanned into separate PDF files, can be purchased for a nominal price on a CD-ROM or DVD-ROM from this Website.

Actual used lithographed copies of the manuals are usually available for purchase on eBay, this website's classified-advertising section, or other web merchants.

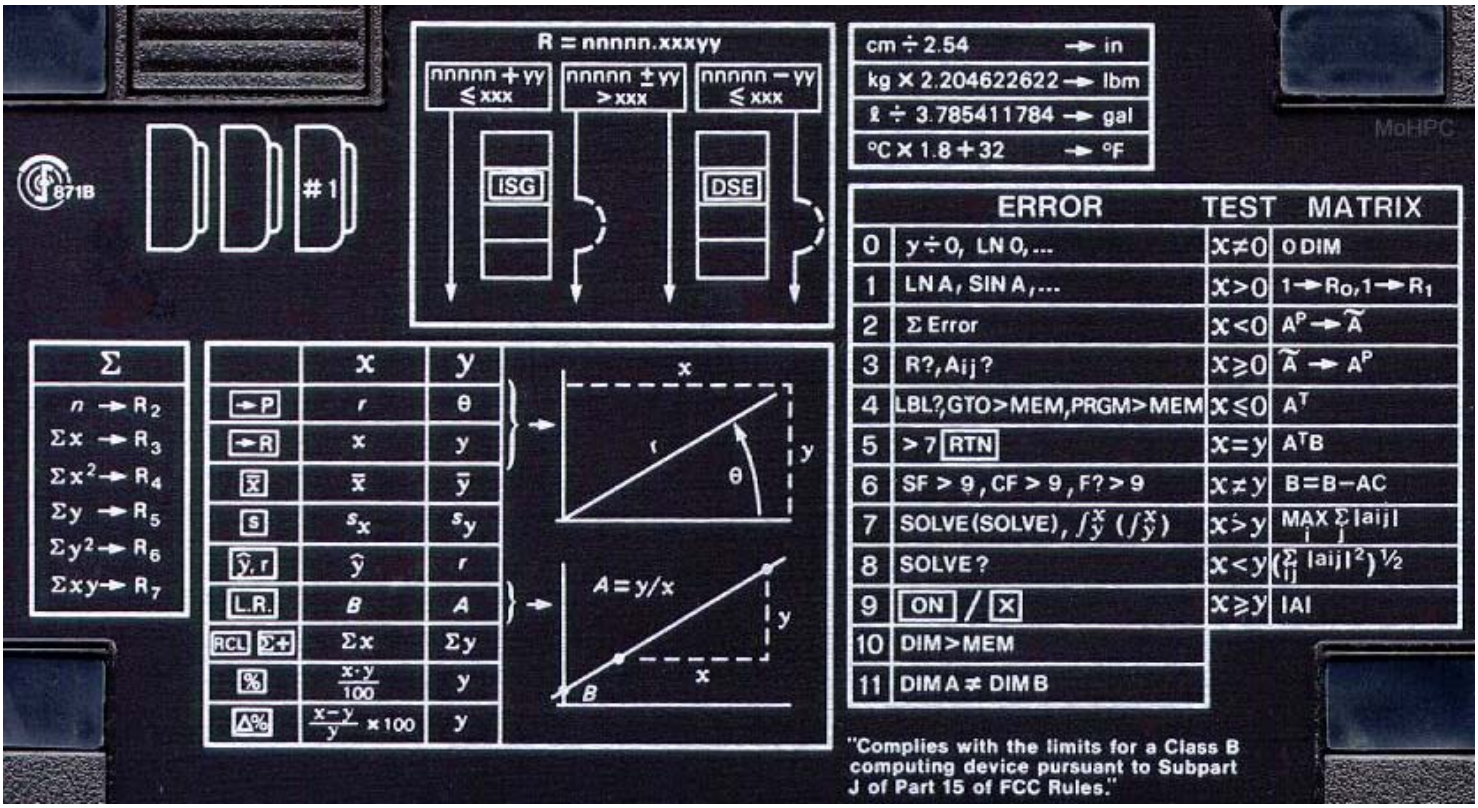
Re: want something .....

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 Nov 2004, 6:09 a.m.,*
in response to message #1 by Cannondale

Hi;

I'd like to ask about one thing. The HP15C already has matrix operations available for use (inversion, transposition, etc.) and maybe one of the things that you want is actually a description of these matrix operations. You can see the [f][MATRIX] over the [EEX] key) and there is a list of available MATRIX operations in the back of the calculator. If yours is weared out and hard to read, try this:



There's a few information here that might be of some use for you, as well. Maybe your needs can be satisfied with the existing HP15C resources.

If what you need is actually general programming, then Karl's suggestion is the best choice.

Let us know.

Cheers.

Luiz (Brazil)

HP28C

*Message #1 Posted by **Van-Trang Nguyen** on 3 Nov 2004, 3:54 a.m.*

I've got a HP28C that hasn't been used for years. I've changed the batteries and run the self test. But it can't be switched on. Anybody knows what's the problem is? and how to deal with it? I'll be grateful to hear from you.

Re: HP28C

*Message #2 Posted by **Mike (Stgt)** on 3 Nov 2004, 7:07 a.m.,*
in response to message #1 by Van-Trang Nguyen

How could you run the self test if you can't switch it on? If you mean you can't switch it _OFF_ then pls note that the on/off key is not a toggle, press Shift then ON to put it off (that's like M$: "press Start for shutdown").

Ciao.....Mike

*Message #3 Posted by **Van-Trang Nguyen** on 4 Nov 2004, 3:39 a.m.,*
in response to message #2 by Mike (Stgt)

That's why I couldn't understand why the screen was black when I pressed the on button.

But I've solved the problem now. Got a tip to short circuit the battery spring. It's working now.

If US Presidential votes were counted with an HP...vs...If votes were counted with a TI...

*Message #1 Posted by **Gene** on 2 Nov 2004, 8:56 p.m.*

Looking for humorous ends to those sentences. :-)

Any takes? And, don't pick on either brand to the exclusion of the other.

And, finally, don't pick on either candidate. Let's pick on the calculator manufacturers!

:-)

Gene

Re: If US Presidential votes were counted with an HP...vs...If votes were counted with a TI...

*Message #2 Posted by **Ed Look** on 2 Nov 2004, 10:08 p.m.,*
in response to message #1 by Gene

Heh.

I don't know about the manufacturers, but if an advanced HP machine was used, say, any of the 48 series, 42S, 34C (maybe), 49 series, etc., I'm sure someone could write and someone else download programs to put any kind of projected spin on the eventual outcome.

It depends on the state the HP calculator is used in, and I don't mean solid, liquid, nor gas.

;)

*Message #6 Posted by **Mike (Stgt)** on 3 Nov 2004, 7:17 a.m.,*
in response to message #1 by Gene

"One man one vote" -- To add 1+1+1+... on a TI-89 you have press 1 ENTER + 1 ENTER ENTER ENTER... On an HP-42S you have to press 1 ENTER ENTER ENTER + + + + + + + +...

Now you clearly see what's more positive <G>

Re: If US Presidential votes were counted with an HP...vs...If votes were counted with a TI...

*Message #8 Posted by **Hugh Evans** on 3 Nov 2004, 12:13 p.m.,*
in response to message #1 by Gene

HP: On the 49G+ voters would raise concerns that they weren't sure if their vote had registered. States using older HPs note that while votes are tabulated more slowly, their reliability and accuracy make the trouble worthwhile.

TI: Some voters question the reliability of these machines claiming they both are inefficient and cheaply made. For the vast majority of the public, however, they are standard equipment (and are rarely questioned).

Re: If US Presidential votes were counted with an HP...vs...If votes were counted with a TI...

*Message #9 Posted by **Palmer O. Hanson, Jr.** on 3 Nov 2004, 7:45 p.m.,*
in response to message #1 by Gene

If U.S. presidential votes were counted with an HP machine the loser would protest that use of such a machine would be more appropriate in a backward Eastern European (reverse Polish) election.

In U.S. presidential votes were counted with a TI machine the loser would protest that votes are never counted

honestly in Texas (remember LBJ's congrssional election), by Texans or on a machine made in Texas.

*Message #10 Posted by **Eddie Shore** on 4 Nov 2004, 1:31 a.m.,*
in response to message #1 by Gene

If US Presidential votes were counted with an HP, we would have immediate results, not counting the missed keystrokes.

If votes were counted with a TI, we would wait a long time for the results. Or votes for people only from Texas would be counted.

LOL

Re: If US Presidential votes were counted with an HP...vs...If votes were counted with a TI...

*Message #11 Posted by **Cyril RABIH** on 4 Nov 2004, 8:01 a.m.,*
in response to message #10 by Eddie Shore

If US Presidential votes were counted with an HP or a TI, the US wouldn't have any président for a long time. Try to press "enter" 55000000 times on such a machine, if you're quick enough, you can press 4 times "enter" 4 times in a second. So you'll have the final result in...160 days.

HP 41 in election times...

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 4 Nov 2004, 1:46 p.m.,*
in response to message #1 by Gene

If Kerry had won, an HP 41 on Bush's hands would have displayed "PACKING". As Bush won, indeed, an HP 41 on Kerry´s hands should now display "TRY AGAIN".

Cute!

Given my sympathies, though, Kerry's HP41 should reflect his chances of future election/ relevancy: "NONEXISTENT" ;)

Har, har.

Given the stigma that Americans attach to having lost an election for the highest office, I doubt that John Kerry would run again for President. But, he's still a Senator in a "safe" state with plenty of time left on his term, so he's hardly irrelevant.

There didn't used to be a stigma. Even after Adlai Stevenson lost in successive presidential elections to Dwight Eisenhower in 1952 and 1956, Richard Nixon was able to run again and win in 1968 after having lost a close election in 1960.

48gx infrared printer

*Message #1 Posted by **johann** on 2 Nov 2004, 5:16 p.m.*

I know that hp had the small battery operated infrared printers for the 48gx, which can be pricey on ebay. Is there any new printers available that hook to the computer and also has the infrared printing mode? If so has anyone used this method?

thanks

Re: 48gx infrared printer

*Message #2 Posted by **Mike H** on 2 Nov 2004, 6:15 p.m.,*
in response to message #1 by johann

The HP LaserJet 2100 Printer has IR port and works with my palm pilot; however, it did not work with the 49G+, 48GX, or 41cx with IR module. The only IR printer listed in the manual for the 48GX is the 82240B. I did test all three calculators with the 82240A and it worked fine.

Re: 48gx infrared printer

*Message #3 Posted by **Chan Tran** on 2 Nov 2004, 7:46 p.m.,*
in response to message #2 by Mike H

You can print from the 48GX to any laserjet or most older deskjet printer if the print has a serial port. Can't use IR however.

Re: 48gx compatible infrared printer

*Message #4 Posted by **Nick Nicholas** on 3 Nov 2004, 9:21 p.m.,*
in response to message #1 by johann

Has anyone tried using the HP 48GX on the printer advertised at http://www.calculatorsource.com/m-mcp8850b.html? It is advertised as HP-82240B compatible. Who is the manufacturer of this printer?

HP49+ keyboard problem solved ?

*Message #1 Posted by **Francesc Casanellas** on 2 Nov 2004, 3:48 p.m.*

Many has written here about this problem. After many trials and discussions with other users I advise the following:

1. If your S.N. is CNA 42... or higher you should not have a hardware problem and could go to 3. But in any case better try this:

2. Turn the key click on and press very gently and slowly all the keys. If some key fail ... return the unit.

3. If the above test is successful and you have the ROM version 1.23 TURN THE CLOCK OFF (clear flag 40). It seems to solve the problem. And then wait patiently the new ROM relase to turn the clock on.

Edited: 2 Nov 2004, 3:50 p.m.

*Message #12 Posted by **Francis** on 17 Nov 2004, 5:16 a.m.,*
in response to message #11 by David Smith

It's just a pocket calculator. :-)

A very nice calculator, maybe, but that's all it is. It's not like it's some ancient antique with bucket loads of aesthetic value, so all this market inflation is, quite frankly, ridiculous. In terms of what it is, and how useful it is to me, I wouldn't pay any more than, say, 120 euro or 150 usd for an HP-15c, no matter how good its condition. I can't blame the eBay sellers whose auctions go stratospheric, but for buyers with any sense of perspective, there has to be a limit.

Re: That's pretty reassonable--considering its a 15c!

hp designjet 10 ps blue color problem!

*Message #1 Posted by **Jadranko** on 2 Nov 2004, 10:03 a.m.*

HP designjet 10 ps is installed properly, all color cartridges are at ok status. Persistant color mismatch problem seems to appear when printing on default printer: 10ps RIP - BLUE ISNT BLUE! its magenta, very dark magenta. Ive done color calibration, manual adjusting of color curves, loaded various color profiles - nothing helped! Easiest way to explain this: when in MS Word and setting font text to Blue, i get really bad magenta on paper. Any ideas or usefull information?

Re: hp designjet 10 ps blue color problem!

*Message #2 Posted by **Arnaud** on 2 Nov 2004, 11:04 a.m.,*
in response to message #1 by Jadranko

I think you should flash to the latest ROM, my calculator display is black and white.

Arnaud

HP49G+ questions

*Message #1 Posted by **Francesc Casanellas** on 2 Nov 2004, 9:31 a.m.*

Does anyone know how to execute from a program, the equivalent of the key CMD (LS CMD), and get the last cmd. (top of list of the CMD)?

Or any other way to know if when the programs starts (i.e. through an asigned key), there was something in the command line or not. Note that even if you asign << >> (an empty program) to a key this acts as the Enter or oder operator key and what was in the command line goes to the 1st line of the stack.

And what the following commands, listed in the calculator but not explained in the manual, mean:

UNPICK UNBIND

This would help me to find a solution to the problem of missing keystrokes. Thank you in advance.

Edited: 2 Nov 2004, 9:32 a.m.

I don't speak German, but I can see she is a very, very good looking woman, and I hope she will bring us a new round of HP calculators shaped as Voyagers!

Re: The Liquid Gold Of Carly....

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 1 Nov 2004, 8:51 p.m.,*
in response to message #2 by Luis

Hi, Luis;

Carly is at HP for a long time (is it more than four years? I'm not sure...). And she did not bring us, HP users, the "good news" we expected....

The problem is that HP's ink cartridges (Inkjet printers) are some of the most expensive liquids in the world (~ 1700 Euro per liter), compared only to the most expensive champaings and Chanel parfum.

There's more about the need of buying original cartridges, and the fact that if you buy two new color cartriges you'd pay about the price of a new printer.

And there's more. BTW, I don't speak German as well (but I'm still studying...) and I must confess I used Alta-vista's Babel fish translator... Shame on me!

About Carly being a beautiful woman... that's another story.

Cheers.

Luiz (Brazil)

HP 12c's made in Malasia??..quality comments?

*Message #1 Posted by **will** on 1 Nov 2004, 4:26 a.m.*

Dear friends...have some of you own hp 12c´s made in malasia??? 1998-99-2000 ones or something like this? ..what is its overall quality??..i looking for 12c but i don´t know its quality compared to ones made in brazil, indonesia or us (we surely know the poor manufacturing of the new ones made in china)...thanks in advance for your feedbacks, the last post have been very useful for me...

will

Re: HP 12c's made in Malasia??..quality comments?

*Message #2 Posted by **Etienne victoria** on 1 Nov 2004, 5:50 a.m.,*
in response to message #1 by will

Good morning Will,

Yes, I have an MY 12c :

S/N : MY83605999

Bought in 1999 in the US.

Power = 3 batteries never changed since purchase

Paperback (not spiral bound) manual

Used as backup of my Hp 80.

I'm not an expert of the painted v/s engraved keys but looking closely to the calc doesn't reveal an "overpainted keyboard"...maybe it's just painted...

All legends are readable and centered on keys.

Keys don't rattle much. Case doesn't squeak although the calc fell down on the floor quite a couple of times.

Along with the 41 CX, it's the only LCD modern calc I own.

Sorry for the lack of picture but I still have to enter the digital photography era.

Best regards from France.

Etienne

Re: HP 12c's made in Malasia??..quality comments?

*Message #3 Posted by **OJM** on 1 Nov 2004, 10:30 a.m.,*
in response to message #2 by Etienne victoria

I have two HP-12c calculators (found dumped on a clearance sale shelf at Wal-Mart). One is a Malaysian unit with the original three-button-cell design, and the other is a Chinese unit with the single lithium coin cell.

In my honest opinion, the Malaysian unit is definitely better. My only complaint about it is that some of the painted-on labels on the keys aren't perfectly aligned (I really miss the double-shot keys). Otherwise it's pretty well put together, and the keys feel almost the same as my old HP-15C.

The Chinese unit has more misaligned painted key labels, has more key rattle, sharp edges of untrimmed excess plastic (flashing) on the edges & corners of the molded outer case, some of the keys don't click properly when pressed down, and others have a very loud annoying "pop" when released.

HP41 Emulator -- Bluetooth Module

*Message #1 Posted by **Vassilis Prevelakis** on 31 Oct 2004, 9:24 p.m.*

Some time ago we were discussing in this Forum the pros/cons of having the PIC-based HP41 emulator communicate with the outside world via a USB interface.

I suggested that Bluetooth may be better, but I was tald that its too complicated/expensive.

Well, there is an off-the-shelf module that allows serial comms over Bluetooth.

http://www.lemosint.com/scripts/bluetooth_promiesd_02.asp

The is also an article in the Circuit Cellar Magazine explaining how the PromiESD-02 module can be interfaced with PIC processors. (#171, Oct 2004, Big PICs by Fred Eady).

http://www.circuitcellar.com/magazine/

Re: HP41 Emulator -- Bluetooth Module

*Message #2 Posted by **Meindert Kuipers** on 1 Nov 2004, 2:48 a.m.,*
in response to message #1 by Vassilis Prevelakis

Vassilis,

The mentioned Bluetooth module is close to $80, a USB chip will cost you less then $10. Bluetooth is complicated, especially when you start working on the software. In addition Bluetooth will consume more power, while when a machine is connected to USB it will allows power to be supplied over USB (and charge batteries for example.

Last but not least USB is myuch faster. My vote is for USB, which is implemented in my MLDL2000!

Meindert

Re: HP41 Emulator -- Bluetooth Module

*Message #3 Posted by **Klaus** on 1 Nov 2004, 3:24 a.m.,*
in response to message #2 by Meindert Kuipers

I have a "crippled" version of nsim for microcontroller use. The code runs, but I am currently stuck with the i2c bus on my PIC. I have included RS/232. My motto is: Let everyone design his own. If someone needs a bluetooth, then he can modify the code. (I haven't really tested my code, so I have not made it available, but you can request it via eMail).

So you either have to build your own, or you have to present your arguments why bluetooth is a must!

in response to message #2 by marais

It takes only 5 seconds to take a picture .....

Re: How bright is your HP33E

*Message #4 Posted by **Chan Tran** on 1 Nov 2004, 11:38 a.m.,*
in response to message #3 by Ronald

I don't know about that 33E on ebay but I had the 9825B for a few years. As you all know the 9825B has 32 character 5x7 LED dot matrix display. The display is so bright that after a night working with it the next morning I saw everything cyan...

Re: How bright is your HP33E

*Message #5 Posted by **Ronald** on 1 Nov 2004, 3:18 p.m.,*
in response to message #4 by Chan Tran

So that was by design. This Seller put a 9 volt battery where it was designed only for 2.4 volts. I am not so sure if this calculator will last a night.

Re: How bright is your HP33E

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 2 Nov 2004, 12:19 a.m.,*
in response to message #5 by Ronald

Hi;

I could not believe that! How come this poor HP33E is still alive after having 4 times its original voltage? After reading that a 9-volt battery was installed in the batteries compartment, I could figure out why was it so bright... In fact, if the LED display were eyes, their eyeballs would be popped out already... and if the IC's were brain cells, they'd be fried, too.

Poor little babe... What a loss! I guess it will never be able to work with 2.4 volts again.

What a loss...

Luiz (Brazil)

Re: How bright is your HP33E

*Message #7 Posted by **John Limpert** on 2 Nov 2004, 4:56 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Some logic families, like the old 4000 series CMOS chips, had a very wide range on the input voltage. I would be more concerned about the display overheating and failing due to excessive current.

Re: How bright is your HP33E

*Message #8 Posted by **Larry Corrado** on 2 Nov 2004, 6:00 p.m.,*
in response to message #2 by marais

Perhaps the battery is used, and internal resistance is decreasing the output voltage to somewhat less than its nominal value.

Larry

Why 'metal' labels instead of grabbed serial no.?

*Message #1 Posted by **Emmanuel, France** on 31 Oct 2004, 4:32 p.m.*

```
Few years ago two HP-41CVs bought from Singapore Factory :
```

http://membres.lycos.fr/emmanuelcompes/forsale/41cv1_7.JPG
http://membres.lycos.fr/emmanuelcompes/forsale/41cv2_7.JPG

```
One is a Fullnut () and the other an Halfnut ().
Both according the seller have been used for production test.
I saw that sort of label on one of my previous HP-34Cs.
Thanks for help. Before I put them on ebay.
```

Why 'metal' labels instead of grabbed serial no.? (Addendum)

Re: Why 'metal' labels instead of grabbed serial no.? (Addendum)

*Message #3 Posted by **Ronald** on 31 Oct 2004, 5:03 p.m.,*
in response to message #2 by Emmanuel, France

I heard once a story on that this is happening with certain repairs were the serial number gets lost in the proces, like when the back side had te be replaced. In order to keep track of the serial number was made up on metal.

Ronald

Re: Why 'metal' labels instead of grabbed serial no.? (Addendum)

*Message #4 Posted by **Les Bell [Sydney]** on 1 Nov 2004, 12:57 a.m.,*
in response to message #3 by Ronald

I had a 41CV repaired by HP once. The complete calculator was replaced, and the serial number of the old calculator was engraved into the replacement unit. I can't see why they'd need to use an adhesive metal label instead.

Best,

--- Les Bell
[http://www.lesbell.com.au]

metal label on a 97s too

*Message #5 Posted by **db(martinez,california)** on 31 Oct 2004, 5:48 p.m.,*

in response to message #1 by Emmanuel, France

I just bought a 97s with an aluminum label covering the place which should have the serial number stamped into the plastic. It was made in America in 1978. I have no idea of the significance of the metal.

BTW: Does anyone have an interface pod for a 97s that they can spare?

Re: metal label on a 97s too

*Message #6 Posted by **David Smith** on 31 Oct 2004, 8:04 p.m.,*
in response to message #5 by db(martinez,california)

All the 97S machines seem to have a metal serial number label. The 97S was sold mainly through the test equipment divison. They bought the machines from the calculator division and modified them with the pod and added new front and rear labels.

I wish I was a millionnaire ... (off topic)

*Message #1 Posted by **Pascal** on 31 Oct 2004, 9:05 a.m.*

... so that I could buy this fabulous collection !

See http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5133926413&ssPageName=STRK:MEWA:IT

(sorry the link was wrong on my first post)

Re: I wish I was a millionnaire ... (off topic)

*Message #2 Posted by **Raymond Del Tondo** on 31 Oct 2004, 1:10 p.m.,*
in response to message #1 by Pascal

Nice collection,
but you'll need a BIG stock room for *that* amount of computers.
The shipping cost alone will be gigantic.
That's one of the reasons I only collect calculators;-)

Raymond

Re: I wish I was a millionnaire ... (off topic)

*Message #3 Posted by **Walter B** on 1 Nov 2004, 8:44 a.m.,*
in response to message #2 by Raymond Del Tondo

Oh, that's my basic reason, too! (i.e. lack of money is not the first reason, of course ;-))

You must be a real addict to buy this collection. And have a *very* understanding wife (or call her nurse).

Re: I wish I was a millionnaire ... (off topic)

*Message #4 Posted by **Namir** on 1 Nov 2004, 3:46 p.m.,*
in response to message #3 by Walter B

Hi Walter,

I have had the priviledge of visiting Pascal in his home ealier this year. Pascal is a collector of both calculators and PCs. He showed me old PCs running Windows 1.0 and 2.0 in addition to a fine collection of calculators!! Pascal has a separate room with PCs nicely arranged on shelves. I am not surprise at Pascal's noticing that rather unusual auction for a collection of PCs.

Namir

Talking HP-33C

*Message #5 Posted by **Namir** on 1 Nov 2004, 4:07 p.m.,*

in response to message #3 by Walter B

I forgot to mention that Pascal showed me the talking HP-33C that he is selling on eBay. The machine has a speach module that tells you what the display is.

Re: Talking HP-33C

*Message #6 Posted by **Walter B** on 1 Nov 2004, 6:46 p.m.,*
in response to message #5 by Namir

Namir,

suppose you were talking about a HP-34C? This is the only model with a speach synthesizer I've seen offered in ebay so far. It wasn't sold yet. Or did I miss anything?

Back to the collection topic: Really, I didn't want to offend anybody. Just gave you my spontaneous thoughts when seeing the offer of this collection and reading the messages. Like every opinion, this isn't the only one - but should we apologize each and every time we write an opinion we aren't sure everybody else in this forum will share? How politically correct! How boring!

Just my 0,01€ again, of course.

My Bad!

*Message #7 Posted by **Namir** on 1 Nov 2004, 11:00 p.m.,*
in response to message #6 by Walter B

Walter,

You are right! It's a talking HP-34C!! My Bad!!!

Namir

Re: Talking HP-34C

*Message #8 Posted by **Pascal** on 1 Nov 2004, 9:46 p.m.,*
in response to message #5 by Namir

Thanks Namir for your kind message ! I think that many of us in this forum have this passion for collecting old stuff and like any passion, it's not always reasonable...

PS to Walter: my wife is not a nurse but you were quite close: she's a pediatrist ;-)

I wish I were a millionaire ... (off topic)

*Message #9 Posted by **James M. Prange** on 2 Nov 2004, 7:25 a.m.,*
in response to message #1 by Pascal

Sorry, but sometimes grammatical and spelling errors annoy me.

Come to think of it, why just a millionaire? I wouldn't mind trying out being a billionaire.

I've heard that money can't buy happiness, but I'm quite certain that a lack of money doesn't buy happiness either.

Regards,

James

HP-34C construction question

*Message #1 Posted by **Ed Look** on 31 Oct 2004, 1:40 a.m.*

Does anyone here know when HP shifted from the solderless 34C (or other Spices) to the soldered? It's a made in USA unit.

Not an answer to your question...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 Nov 2004, 10:53 p.m.,*
in response to message #1 by Ed Look

Hi, Ed;

I read your post thinking I could help, but I have no information about soldered/solderless serial numbers. I own a few Spices (I had about twelve units, but I traded and gifted some of them...) and some have different assemblies. Because of reasons I'd never asked about, the serial numbers were erased, and it's a fact that the back half case can be changed with one another, so if units were refurbished, their serial # were also changed.

I remember reading some posts from other guys mentioning that either soldered or solderless units of the same type had a different number of the small, 8-pin DIP IC's (ROM and RAM). I saw an HP37E with three 8-pin DIP IC's, and if I'm not wrong, I read something about an HP37E with a single 8-pin DIP IC.

All of this information does not answer your question, but I thought I should tell you, based on my own observations, that you might find either an Spice with a construction type that does not match the serial # range for that particular case or a Spice with serial # that actually does not fit in that particular model range. Even if you have the serial # range, I'd guess that, in some cases, you'd not find a match.

Best regards.

Luiz (Brazil)

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=3284&item=5727466320&rd=1

What does it mean?????

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Oct 2004, 7:30 p.m.,*
in response to message #1 by Noname

Hi;

I saw the e-bay announcent and it contains a copy of the HoHPC's HP80 page contents, including the links to the images. It's disgusting! We can read the following at the end of the e-bay advertisemetn:

> Quote:
>
> I recently visted HP headquaters in the states where I visited Mr Hewlett and Mr Packards offices and one of these calulators was on display on Mr Packards Desk as he never went anywhere without one. It comes complete with the quick reference Guide, owner's handbook and the service information which shows serial number and indicates that this was infact the 84th unit sold.

What does it mean? Why not to mention Dave's page and add a link to it instead of copying its contents?

Sorry to add such a d..n post here, but I cannot actually accept this gladly.

FE in the morning, need help with 33s!

*Message #1 Posted by **shane** on 29 Oct 2004, 8:33 p.m.*

I have the FE (Fundamentals of Engineering exam) in the morning and desperately need help figuring out this new calculator. I am reading through the calc manual and it's in a different language...metaphorically unfortunately. Help please! I need to at least master the integral calc part.

Re: FE in the morning, need help with 33s!

*Message #2 Posted by **Karl Schneider** on 30 Oct 2004, 12:32 a.m.,*
in response to message #1 by shane

Shane --

Well, I hope that you have your subject matter down; otherwise, the calculator won't matter a bit.

For starters, the HP-33S can be operated in either RPN or algebraic modes. Select whichever mode you prefer using the shifted "RPN" or "ALG" function abov e the "x-root-y" key -- 2nd row, 4th column.

In ALG mode, the "=" key is marked "ENTER". The small shifted "=" function above the backarrow key (4th row, 5th column) is only for entering expressions.

For integration of an expression (same in RPN or ALG), do the following:

1. Enter equation mode by executing the shifted function "EQN" above the "STO" key, 3rd row 1st column).
2. Type in an expression without "=". A single-letter variable is entered into the expression by pressing "RCL" followed by the desired letter, which appears below and to the right of its key.
3. Press "ENTER" to complete the expression.
4. Exit equation mode by executing "EQN" again.
5. Enter the limits of integration -- (lower) "ENTER" (upper).
6. Enter equation mode again, and ensure that the expression appears on the bottom line of the display.
7. Execute the shifted function integration -- elongated "S" on the e^x key, 1st row, 1st column.
8. Enter the variable of integration by pressing the key corresponding to its letter. (Do not press "RCL").
9. Enter the values of the others variables, which remain constant; press "R/S" after each value.
10. Wait, and get answer.

Good luck!

-- KS

Re: FE in the morning, need help with 33s!

*Message #3 Posted by **Norris** on 30 Oct 2004, 1:20 a.m.,*
in response to message #2 by Karl Schneider

Here is a simple example. Integrate X^2 from 3 to 5.

1. Enter the function.
Hit [right-shift] EQN to enter equation mode.
Hit RCL X y^x 2 to enter X^2. The X is on the 2 key.
Hit [right-shift] EQN again to exit equation mode.

2. Enter the limits of integration, from lower to upper.
If you use RPN mode, it's 3 ENTER 5.
For ALG mode, it's 3 x<>y 5..

3. Return to equation mode with [right-shift] EQN.
The X^2 equation entered in (1) should still be displayed.

4. While the X^2 equation is displayed, hit [right-shift] [Integral-symbol].
The integral symbol is on the e^x key in the upper left corner of the keyboard.

5. The display prompts you for the variable of integration.
Hit X (which you will recall is on the 2 key).

6. Answer is 32.67.

****

Obviously you could solve this problem *without* the integration function of the 33S by applying fundamental principles of calculus. Then the answer is simply 125/3 - 27/3. Any such problem on the EIT exam will also be solvable with a knowledge of basic principles and a cheap calculator.

Edited: 30 Oct 2004, 1:23 a.m.

Re: FE in the morning, need help with 33s!

*Message #4 Posted by **KC** on 31 Oct 2004, 10:44 p.m.,*
in response to message #3 by Norris

Just one reminder for integration on 33S: set the significant figure to the lowest no. of decimal places (e.g. 3 or 4 instead of 8) that is required by the exam. before integration. If the calculator is set to ALL (i.e. display up to 12 decimal places), then it will take the calulcator forever to integrate.

KC

Re: FE in the morning, need help with 33s!

*Message #5 Posted by **Norris** on 30 Oct 2004, 12:56 a.m.,*
in response to message #1 by shane

The best advice I can give you is this:

Put aside the 33S and take some other calculator, one that you are comfortable with, to the exam. *Every* problem on the EIT exam can be solved with a basic $15 scientific calculator, as long as you know the material. You will see lots of cheapo calculators in the exam room, and most of the people using them will pass.

The 33S can give you a slight advantage *IF* you are quite familiar with it and understand how to exploit its programmability and other features. But this takes practice; it won't happen overnight.

If you aren't comfortable with the 33S, then it will hurt you, rather than help you, in the exam room. If there is

some trusty old scientific calculator lying around that you used for years before getting the 33S, then by all means take that one instead.

And don't panic about integration. There might be one question on the whole exam that requires calculation of a definite integral. And you will be able to solve it symbolically if you know your calculus.

That's my opinion too! (nt)

Another eBay craziness

*Message #1 Posted by **Raymond Del Tondo** on 29 Oct 2004, 8:22 p.m.*

Hi,

IMHO this is a very questionable auction: 5727250602
because you can clearly see that the unit has a broken
or more exactly a bleeded out display.
So how could that unit be in good working order?

In the best case, the seller really doesn't have
any knowledge about the items they're selling...

Raymond

Re: Another eBay craziness

*Message #2 Posted by **Chris Woodhouse** on 29 Oct 2004, 9:57 p.m.,*
in response to message #1 by Raymond Del Tondo

It's a pretty poor photo, but I can't see any other way to explain what's in the photo other than a bleeding display. I guess you could give the benefit of the doubt and send a message stating that is what it looks like and tell them that it almost always keeps getting worse to the point where it is not usable, and see what they say.

Chris

Not Getting the gifts you want? The Wish Zone Can help.

Re: Another eBay craziness

*Message #3 Posted by **Raymond Del Tondo** on 31 Oct 2004, 1:23 p.m.,*
in response to message #2 by Chris Woodhouse

Hi,

I sent an eBay mail to the seller a few days ago, but got no answer so far.
Maybe the seller doesn't care for this kind of mail, or whatever.

I consider the unit as broken.

Raymond

Below is the mail I sent:

Hello,

I don't know if are aware of the fact that your HP-41 has a broken display.
The unit can be considered as non-working, since the display has 'bleeded' out.
I'd mention this in the auction description, after checking it.

Regards,

Magic48ges

Re: Another eBay craziness

*Message #4 Posted by **Frank Boehm** on 30 Oct 2004, 5:31 p.m.,*
in response to message #1 by Raymond Del Tondo

obviously he didn't test the calc - a bleeding display doesn't stop the calculator from working though, so it might be technically fine, but doesn't look great...

Comparison between the new 12c and the old 12c

*Message #1 Posted by **Will** on 29 Oct 2004, 11:41 a.m.*

Dear friends...i´d try to make the question in other way:

is the quality of the "new" manufactured 12c as good as the traditional 12c use to be????..it´s because i´d want to get a new one but JUST and ONLY if this new one has the same quality of at least good enough compared to the older made ones...i already know that the 12c platinum is a piece of sh....but i would like to know if the 12c (the gold one) has the same depressing quality...

thanks for yours inputs i´m quite interested to know the TRUTH...

Will...

Re: Comparison between the new 12c and the old 12c

*Message #2 Posted by **bill platt** on 29 Oct 2004, 12:35 p.m.,*
in response to message #1 by Will

Hi,

From the units I have held in my hand, there is no comparison--the older units are far better. And this goes for USA, Brazil, and Singapore units. Not sure about Indonesia--never seen one of those.

I have a USA and a Brazil, and I find both of them really solid. By comparison, a brand-new Chinese one that my brother bought, had very shaky loose keys, right out of the box. (All voyagers have this to some extent---but the degree of rattling in this CN 12c was unbelieveable--he was afraid it would break if he shook too hard!).

The other differences are electronic--there was a significant change in the physical electronic architecure some years ago. Luiz Vieira knows the detail--if you searh 2 or three archives back in the forum under Luiz, or 12c, you might find it.

I do not remember whether the electronic architecture changes were before the China production.

Also, older units had nice spiral bound manuals, whereas the newer ones are paperback.

And, my Brazil and USA manuals (both spiral) have examples with high interest rates (it was the 80's after all!). I think the 12cp has the rates lowered in the examples--not sure about the 12c manual.

One of my projects is to compile a revision history of the 12c manual--a dauntintg task! For instance, my Brazil and USA manuals have different edition numbers, but I have not found a difference---but it must be there somewhere!

In other voyagers---my 11c for instance--there were errors in the first manual I recieved--and I received corrigenda cards in the mail (yes, I had registered my machine). I still have those--even though I lost the original maunal and bought a new one some years later.....

This is the long of the short answer.

BTW are you looking for a used 12c :-)

Best regards,

Bill

*Message #3 Posted by **Luis** on 29 Oct 2004, 8:21 p.m.,*
in response to message #1 by Will

The units made in Malaysia are also outstanding, and they might be the best out of all the Asian production. They are solid, compact, and practically flawless!

Re: Comparison between the new 12c and the old 12c

*Message #4 Posted by **JDH** on 29 Oct 2004, 10:43 p.m.,*
in response to message #3 by Luis

I own a number of HP 12c calculators, ie. USA, Singapore and Chinese made ones. Basically the Chinese ones function OK but are made very poorly ie. poor moulded slip case instead of stitched, painted on keys not moulded through ones, rattling keys, poor quality made user manual, I even noticed the HP 12c badge isn't even glued on properly with the Chinese ones.

Basically you would do better buying an as new USA made or Singapore HP 12c on Ebay. Can't comment on the Malaysian or Brazilian made ones but I'm sure they are of similar standard.

If you do buy a USA made HP 12c you would be best to avoid ones made in the first half of 1988 as I have found that they all have HP 11C/15C keys which have been painted over to make them Hp 12C keys (I don't know why HP did this, maybe a supply shortage of HP 12C keys?). The 1989 USA model and Singapore model have the original molded keys.

Molded v printed keys

*Message #6 Posted by **bill platt** on 30 Oct 2004, 5:50 p.m.,*
in response to message #4 by JDH

Hi,

All of the voyagers I presently own have some keys apparently "overpainted". (Although I have to dbl check my 15c).

I have nevere noticed any "wearing off" of the "paint" and I'm not sure that they areally are overpainted anyway--it may be "ghosts" in the mold, from spashing a new mold off an old key-----

Regards,

Bill

Re: Molded v printed keys

*Message #7 Posted by **Raymond Del Tondo** on 30 Oct 2004, 7:00 p.m.,*
in response to message #6 by bill platt

Hi,

somewhere here in the hpmuseum are explanations for the 'ghost letters'.
Obviously HP reused keyboards from specific voyager calcs for other calcs
of the same series, e.g. 12C kbds for replacement 16C's.
For this, some of the keys had to be reassigned by putting
a different symbol on it.

So far the only keyboards on HP calcs with wearing out legends
I know of are those with the rubber keys.

Regards,

Raymond

Re: Molded v printed keys

*Message #8 Posted by **Luis** on 30 Oct 2004, 7:58 p.m.,*
in response to message #6 by bill platt

I noticed that a USA made 12C had the artwork on the keyboard painted white, as opposed to a Malaysian unit which is painted in an off-white, kind of light sky blue color. Yet, the fonts on the keyboard and the artwork in general of the Asian unit seem to be prettier. Anybody has noticed this?

Re: Comparison between the new 12c and the old 12c

*Message #9 Posted by **Guy François** on 31 Oct 2004, 5:30 a.m.,*
in response to message #3 by Luis

I have a 12C made in Malaysia which I have won at classiccalculators.com and I am very satisfied with it; apart from the printed keys instead of the molded keys of my 11C, bought back in the early eightees, I feel no difference. The 11C has been used and abused and still works like the first day I bought it (second set of batteries). I have a 41CX as well which I use because of its extended programming capabilities and ease of use and of course because it's the all time classic. In terms of built construction I think no calculator surpasses the 10-11-12-15-16 C series.

Kind regards!

Feature request: PREVAL should support matrices

*Message #1 Posted by **Eric Guo** on 29 Oct 2004, 10:11 a.m.*

Hello HP,

Algebraic mode calculate(RPN is same):

PREVAL([[X][X^2]],1,2)

I expect "[[1][3]]" but HP49G+(ROM 1.23) just say "Bad Argument Type", it seems HP49G+ MATRICES and CALC still need integrate more.

I don't know where to report such feedback, so I post it here.

BTW: Such matrix operation was quite normal operation in Linear System Theory if you want some more example.

Re: Feature request: PREVAL should support matrices

*Message #2 Posted by **Jeff O.** on 29 Oct 2004, 12:39 p.m.,*
in response to message #1 by Eric Guo

Eric,
I am not optimistic that posting your suggestion here will do any good. This site is in no way connected to hp. The wants and desires expressed at this forum do not seem to have any impact on hp. Otherwise, there would be a 42Sii or 43SX calculator on the market, and the 33S would not look like it does. I offer two possibilities to bring this to the attention of hp:
1. Call hp calculator support. Dial 1-800-HPINVEN. DO NOT press any buttons on your phone to choose any of the selections offered by the automated call director. Just say "something else" a couple of times. That should connect you to a live operator. Ask that operator to connect you to calculator support. Then give them your suggestion.
2. Post your suggestion at comp.sys.hp48. Supposedly one or more of the people in the hp calculator division watches this site.

Good luck!

Re: Feature request: PREVAL should support matrices

*Message #3 Posted by **Eric Guo** on 29 Oct 2004, 11:30 p.m.,*
in response to message #2 by Jeff O.

Thank you a lot!

Followed your suggestion, I had already post a suggestion at comp.sys.hp48, I'm so unlucky that I born and lived in Shanghai, China. :-), so there is no 800 phone to reach HP and many useful sites(including www.hpcalc.org, but lucky http://hpcalc.kn.vutbr.cz/ is accessible) was blocked due to some unknown political reason.

> Well, it seems too far from discussing just Calculators.

Tech Design in the Media

*Message #1 Posted by **EdLook** on 28 Oct 2004, 9:52 p.m.*

I may be somewhat prejudiced, but I think all HP calcs, old AND new, look better than some of the sci-fi props, though on Star Trek: the Next Generation, some of their handhelds looked like Pioneers made bigger with primary colors, as if they were HPs made for kids!

in response to message #1 by EdLook

IMHO, it's the same as with wrist watches or coins and bank notes: the design of a calculator should reflect it's value.

Ciao.....Mike

A "shell" that runs on different brands of calcs.

*Message #1 Posted by **Madskillz, 4nic8** on 28 Oct 2004, 8:19 p.m.*

I was wondering if anybody would like to hook up with some Casio/TI guys! You have to have a fair amount of knowledge in programming. This will be no easy task, we actually have a version that works on the TI-86 and with similar code works on the Casio AFX! (Almost exactly the same code) This is an amazing feat! We would like to incorporate an HP guy/guys...Thanks in advance for all your help!

-Madskillz, 4nic8

If you mean programming HP's new calculators, this is probably the wrong forum. Please see the newsgroup comp.sys.hp48 instead.

Re: A "shell" that runs on different brands of calcs.

*Message #3 Posted by **Madskillz** on 29 Oct 2004, 11:58 p.m.,*
in response to message #2 by .

No...we are creating a universal language that will work on all different brands/makes of calcs. I.E. Casio, TI, and now, hopefully, HP. We are asking if anybody would make a version for the HP? Like I said we actually have code that works on between the casio and TI...the exact same code. Thus we are making interpreters for each type of calc, taht will read the code. So you will be able to code a program on the TI-83+, than put that on your computer. Once the file is on your computer, than you can transfer it to your Casio or HP brand calc, and play the game/program. This isn't just a slow language, it'll be faster than TI/Casio's BASIC programming. Plus with the interpreters, you'll be able to make files and test them right on the calc! Oh, one more detail, grayscale will be/is and option too!Thanks for your time!

-Madskillz

Re: A "shell" that runs on different brands of calcs.

Re: A "shell" that runs on different brands of calcs.

Message #5 Posted by **.** *on 30 Oct 2004, 12:13 a.m.,*
in response to message #4 by Madskillz

Comp.sys.hp48 isn't a web forum, but a newsgroup. Your ISP should give you access to newsgroups. You could also use a web based interface like google: http://groups.google.com/groups?q=comp.sys.hp48&hl=en&btnG=Google+Search

My point is that while this is a good forum, its geared towards older HP calculators. Comp.sys.hp48 is probably more relevant.

HP Calcs in the Media - HP-48's and the X-Prize (Space Ship One)

*Message #1 Posted by **Peter Khor** on 28 Oct 2004, 4:47 p.m.*

fwiw ... don't know if it's been mentioned before, and/or posted:

Before/After winning the X-Prize, Discovery Channel had a special on it - in one shot of 'mission control', you can clearly see a Charlemagne type HP calc on the table top (can't make out which one it is). Kinda gave me a good feeling that they are still relied on, and a 'good-old-days' nostalgia (okay, 48's aren't that old yet, but considering they were the last of the HP days). I had it on Tivo, and should have taken a screen cap. before I deleted it - anybody got a copy or the DVD (I think they're out already).

hmm, wonder why they'd use a discontinued HP calc, and not one of the 'new' 49 series ;)

Othere than that, any other recent sightings of HP calcs in the media?

in response to message #1 by Jim Creybohm

In 1995 my wife and I went to Florida in December for two weeks holiday. We missed a launch of a conventional rocket (Delta) by 3 secs, apparently they stopped it just before ignition some technical problem. We had a good look around the Space Centre and I bought a book by Sally Ride one of the Shuttle Astronaunts called to "Space and Back". On one of the pages it shows Sally floating around on the flight deck and in the background are three custom templated HP41's. It is a great book and I love to read it as I get great inspiration from it on dark winter nights. I would copy the picture and send it but I think it would infringe copyright. Best Regards Richard. [I have 2 41's]

solar powered programmable

*Message #1 Posted by **hugh steers** on 28 Oct 2004, 3:54 p.m.*

why isn't there a solar powered programmable. i want one. as far as i know, hp never made any solar calculators. presumably this was because (a) their models always had excellent battery life and (b) all case series had at least one programmable and that didn't mix at the time.

however, in these heady days of graphical user interfaces with animated dogs and paperclips, you'd think that someone could make a programmable solar calculator with some form of flash or nv ram.

ok, the casio fx-50f was programmable, but not in the sense i want with proper loops and conditional branches.

what am i supposed to do if im stranded on a desert island like robinson crusoe for years with nothing to do except develop highly advanced and even more sophisticated algorithms for contingent claims analysis, for instance.

Re: solar powered programmable. . . WHY?

*Message #2 Posted by **Chris Woodhouse** on 28 Oct 2004, 4:55 p.m.,*
in response to message #1 by hugh steers

Why on earth would you want one? When you can have one that takes inexpensive, readily available batteries that last for YEARS, what's the point? What happens to those programmes when you solar cells are hidden in your desk for a week while you are on vacation? Do you leave the lights on in your office when you are away so your solar calculator keeps it's memory? Not to mention every solar powered calculator I have ever used requires much more light to work than I require to use a calculator and that can be very annoying. If you want to help the environment, do something that will actually make a difference, like solar heat your house, convert your car to run a natural gas, or get a battery powered calculator so you don't have to keep the lighting in your office so bright ;)

Chris W

Re: solar powered programmable. . . WHY?

*Message #3 Posted by **hugh steers** on 29 Oct 2004, 6:13 a.m.,*
in response to message #2 by Chris Woodhouse

its not about the environment or anything like that. its about batteries being a pain. they run down at inconvenient times. battery level indicators tend to be lame. they say, low battery, then the next thing you know, its dead. im assuming that when its in the draw for months, theres no power needed at all. the memory is flash or something like that and the programs dont fade and the batteries dont leak. thats better than having batteries that are dead when you come back from vacation. i think early solar models did have fairly poor solar performance. some later models were a *lot* better. remember the ones that were good enough that only a small black square at the top was needed for the panel. imagine those high gain panels but a bit bigger (ie not so cheap) and there's your operation under low lighting.

also, the cpu could be variable power drain. if you want your program to run faster and its sunny, just step outside and clock up your calculator. a real excuse for catching some rays outside on a hot day. and you

dont see people dissing kinetic or automatic watches. people know that batteries are a liability.

i still want one.

Re: solar powered programmable

*Message #4 Posted by **Peter Khor** on 28 Oct 2004, 5:02 p.m.,*
in response to message #1 by hugh steers

Casio's FX-3650P is a current model, has conditional jumps (basic Casio programming logic - what else would you expect ;))- AND has a solar cell.

NOT available in the US market though.

Re: solar powered programmable

*Message #6 Posted by **Mike (Stgt)** on 29 Oct 2004, 4:00 a.m.,*
in response to message #1 by hugh steers

There was (or is?) a solar model from HP, but not programmable: the HP-6S Solar -- with a backup battery.

OTOH, with a programmable solar model if the sun is down you have to hope for a bright full moon, otherwise your programms perish in the dark like a fly-by-night.

Ciao.....Mike

Re: solar powered programmable

*Message #7 Posted by **Chan Tran** on 29 Oct 2004, 8:12 a.m.,*
in response to message #6 by Mike (Stgt)

The batteries on the LED models were a pain and still are if you use any of them. Since HP-41 battery is not an issue any more. My several 41's,10C, 20S, 32SII, 28 and 48's batteries last long enough for me to ever become an issue. I don't think solar make sense at all. I heard that the new 48GII and 49G+ have short battery life. Isn't it true?

Re: solar powered programmable

*Message #8 Posted by **Tom (UK)** on 29 Oct 2004, 10:39 a.m.,*
in response to message #1 by hugh steers

Possibly because:

1) Most programmables are also graphic calcs and front panel real estate is taken up with display and buttons. Not much room for a solar cell left even on a non graphic programmable because of loads of buttons (OK HP42S did have room because of clever key use).

2) Programmable calcs are power hungry so either a large solar cell is required or internal battery or big capacitor to supply brief ammounts of high current. For long running programs capacitor may not be enough.

3) Programmable calcs require a reliable power source to keep the large ammount of memory alive. No big deal if you loose 1 memory space on a basic calc, but loosing loads of data on a programmable is a pain.

Newest hp-12c quality issues

*Message #1 Posted by **Will** on 28 Oct 2004, 2:11 p.m.*

Dear forum friends..

I have several HP models..but i like to buy a 12c (everyone has one except me) ...i´ve heard several concerns about the quality in the calculators made for hp now, in fact some users report VERY bad things about the new HP12c platinum version, he reported cheap material and very bad overall quality, low processing speed (even slower than 12c!!!) ..the thing is: is the Classical 12c the same as used to be or is a NEW?? one made using cheaper materials and construction as the platinum version appears to be????..

thanks for yours feedbacks...

Will.

Re: Newest hp-12c quality issues

*Message #2 Posted by **hugh steers** on 28 Oct 2004, 3:10 p.m.,*
in response to message #1 by Will

i made a comparison of the last generation (Chinese) 12c's with the 12CP. i did find that the 12c had declined considerably in quality from its original manufacture and the Chinese versions were definitely of inferior quality. i found it somewhat subjective whether a last generation 12c or a 12cp is preferable. for example, some people like the new 12cp style and some people hate it. some people think the 12cp keys are not so bad and some think they are poor. i thought they were adequate but could be better.

in terms of bugs and performance, the 12cp is faster but less stable at certain edge-case calculations. not sure if these cases really matter for real world calculations. the 12cp has more memory but theres a bug in the rom that prevents it from being fully utilised. is this still true, anyone?

personally, if you are thinking of buying a new 12cp, consider paying the same money for a good condition older 12c. you can get a older 12c for cheap if it's a bit beaten up. i don't necessarily recommend this, but i have two that are beaten up and yet the keys and display are still fine to use.

not sure of the lifetime of the 12cp keyboard or batteries.

7470a plotter gummy wheel question

*Message #1 Posted by **andy** on 28 Oct 2004, 12:43 p.m.*

The 7470a plotter has two wedge-shaped gummy wheels located over the two abrasive wheels which move the paper back and forth. One of my gummy wheels has developed a flat spot in it. This causes quite a bit of chatter when the paper is being moved back and forth.

Has anyone here repaired one of these before? Is the wedge shape critical or will a straight cylinder work?

Thanks, Andy

Re: 7470a plotter gummy wheel question

*Message #2 Posted by **David Smith** on 28 Oct 2004, 3:11 p.m.,*
in response to message #1 by andy

The paper drive wheels in the HP97, etc also develop flat spots. A little careful work with some sandpaper can work wonders in getting them going again.

Re: 7470a plotter gummy wheel question

*Message #3 Posted by **James** on 29 Oct 2004, 7:41 p.m.,*
in response to message #1 by andy

From an article I believe I read in HP Digest a long time ago, the tapered roller shape is designed to keep the paper taught and against the guide at one side.

So, I would attempt to maintain/reproduce the shape as much as possible, although the overall diameter may not be critical.

If the flat spot is a result of leaving the roller pressure engaged for a long time, perhaps it will improve a bit after some relaxation and use.

If you find/develop a good replacement, please let us know.

Good luck!

C compiler for HP calcs (offtopic?)

*Message #1 Posted by **Paul** on 28 Oct 2004, 6:30 a.m.*

Seen on Comp.sys.hp48: http://hpgcc.sourceforge.net

"HP-GCC is a suite of programs that allow you to program ARM-based HP calculators in C. Being released under the GPL, it is free to use and modify. HP-GCC is a project aiming to make advanced programming in C easy."

"We are proud to announce the first public Beta of HP-GCC. This version is meant for Windows PC's without Cygwin installed. There are still many things to do but this release has a lot of features. It includes a greyscale library, SD card access, several examples programs (including Tetris and Chess games) and many other cool things. Being the first release it's likely to be full of bugs though. Download it Here - the .zip file contains everything you need."

"Why should you program in C?

Ease of use. SysRPL is only found on HP calculators, and it is not trivial to master. Being stack based, it is very different from most languages. C is in industry standard, with only a few HP specific things to learn. Experienced programmers can apply their knowledge without the burden of learning a whole new programming language.

Speed. The most commonly used language for advanced programming is 'System RPL', or 'SysRPL'. On modern calculators, SysRPL is mostly executed by an emulated 'Saturn' processor. C on the other hand is executed directly by the ARM chip. The same program written in C will be many (up to 100) times faster then the equivalent SysRPL program.

Power. There are many things that can be controlled via a C program, but not by a SysRPL program. For instance, a C program could alter the CPU speed, display flicker-less greyscale, or control the beeper precisely. A pure sysRPL program could not."

Re: C compiler for HP calcs (offtopic?)

*Message #2 Posted by **Raymond Del Tondo** on 28 Oct 2004, 7:30 a.m.,*
in response to message #1 by Paul

However, once you learned SysRPL,
you'll see that it's a powerful language,
and it has advantages to understand how
the RPL OS works, especially if you want to
write system compliant applications.
Just try to emulate a Parameterized Outer Loop in C;-)

Re: C compiler for HP calcs (offtopic?)

*Message #3 Posted by **Arnaud** on 28 Oct 2004, 10:02 a.m.,*
in response to message #2 by Raymond Del Tondo

An other advantage of USR-RPL and SysRPL is that you can actually write program on the calc. I will

however give a try to hpgcc once I have time

in response to message #4 by Chris Woodhouse

Hee hee; forgive me, but even RPL, the little that I've used on the 48G models, are still somewhat FORTRAN like! I mean if it weren't for FORTRAN, I'd be totally lost as to RPL!

Re: C compiler for HP calcs (offtopic?)

*Message #6 Posted by **Mike (Stgt)** on 29 Oct 2004, 4:16 a.m.,*
in response to message #5 by Ed Look

A good FORTRAN programmer may do FORTRAN in any language.

Ciao.....Mike

BTW, I did an HP-41 emulator in FORTRAN (alas only useful on IBM mainframes).

Re: C compiler for HP calcs (offtopic?)

*Message #7 Posted by **Raymond Del Tondo** on 29 Oct 2004, 2:21 a.m.,*
in response to message #4 by Chris Woodhouse

Hi Chris,

I'll try to explain in a more general manner.

Almost everything in the HP-48 which you can interact with
is realized in the form of a Parameterized Outer Loop (POL).

When you turn on the machine, normally the first thing
you'll see is the stack, which is a special POL.
When you enter numbers into a command line,
you're inside a POL.

On the G(X) you have an input form engine,
which is also based on a POL.

A POL is a framework for system compliant applications.
It defines standard mechanisms for user interface handling,
like keyboard input, display, and data output.

A POL also includes a level of error trapping,
event handling (alarms, turn off,...), power management, and more.

This is important on feature-loaded machines like the HP-48.
Otherwise, every simple application would have to manage
system events on it's own.

To learn more about POLs and system RPL programming please refer
to RPLMAN.DOC and some tutorials on www.hpcalc.org .

HTH

Re: C compiler for HP calcs (offtopic?)

*Message #8 Posted by **Chris Woodhouse** on 29 Oct 2004, 8:33 p.m.,*
in response to message #7 by Raymond Del Tondo

Sounds like an ordinary event loop to me. There is no built in language construct in C to specifically do that, but there's no reason it can't be done in C. In fact many applications written in C do just that.

Chris W

Not Getting the gifts you want? The Wish Zone Can help.

Re: C compiler for HP calcs (offtopic?)

*Message #9 Posted by **Raymond Del Tondo** on 29 Oct 2004, 11:35 p.m.,*
in response to message #8 by Chris Woodhouse

Hi,

I didn't say that it's impossible to build a POL in C,
but it doesn't make sense on Saturn-based
(even when emulated) machines, because it's built-in.
It's one of the fundamental user interface mechanics
in RPL machines, which to understand and use is
mandatory for any programmer of serious interactive
applications for the HP-48/49.

Exceptions may be some real-time games,
which define their own limited event handling.

However, IMHO the first thing in this area is to learn SysRPL,
to get an idea of the capabilities of the RPL system,
before reinventing the wheel;-)

Raymond

Re: C compiler for HP calcs (offtopic?)

*Message #14 Posted by **unspellable** on 1 Nov 2004, 6:16 p.m.,*
in response to message #12 by .

RPL was originally designed for a calculator where memory was at a premium and speed was not. When an RPL program is compiled the excutable code will be much smaller than the source code. This because the excutable commands will be in the form of pointers that point to the routine in PROM.

C, on the other hand, compiles into an executable code that is generally larger than the source code. One of the reasons for this is that the compiler imports libraries of routines most of which may or may not be used.

It came as rather a shock to me in the begining days of my first C class to see a program intended to display "Hello World" on the screen compile into more than 10 Kbytes of executable code. I realize this is an extreme example of the ratio of executable code to source code, but the principle holds, a C program will use a lot more memory than an RPL program. If you have memory to burn this is no big deal, but in a calculator you do not have memory to burn.

Re: C compiler for HP calcs (offtopic?)

*Message #15 Posted by **Raymond Del Tondo** on 1 Nov 2004, 10:17 p.m.,*
in response to message #14 by unspellable

Hmm, one could say that the 49g+ has lots of memory...
However, I'm a friend of memory-efficient programming,
so RPL and assembly language are my favourites on RPL machines.

Maybe someone should try to write a program like SpeedMiner
(available on hpcalc.org for the HP-48 and 49g)
in C...it won't have a much faster feel,
but occupy multiples of memory of the original SpeedMiner,
and will be likely to consume more battery power.

Raymond

Re: C compiler for HP calcs (long)

*Message #16 Posted by **Al** on 2 Nov 2004, 3:22 a.m.,*
in response to message #15 by Raymond Del Tondo

(replying to Raymond and 'unspellable' at once)

Hi,

(regarding size of C programs vs RPL)

"This because the excutable commands will be in the form of pointers that point to the routine in PROM."

Yes, using built in routines makes the final binary smaller. At present, C programs have to contain most of the library calls within the binary. There are some simple OS calls which are in the ROM that don't consume space, but these are not terribly helpful for the average program.

"It came as rather a shock to me in the begining days of my first C class to see a program intended to display "Hello World" on the screen compile into more than 10 Kbytes of executable code."

I hope you remembered to turn on optimizations. Even so, alot of that is unused bloat. The executable format has alot of slack. Considering the average cluster size on hard drives these

days, there is no difference between a 1 byte and a 1kb file. They consume the same amount of hard drive space.

"Hello World" with HPGCC takes less then 1kb. 1kb is still huge for "hello world". Why is it so big?

Basically it has to run in a vacume. The binary must set up the MMU, allocate itself memory, and do many other tasks that really should be handled by an OS. I'm guessing this accounts for half of the 1kb. Also, as you mentioned, there is no runtime library to use. All functions currently have to be provided in the binary.

There are 2 ways to fix this though: Firstly, it is entirely possible to just have one copy of the runtime in memory, as a library. This should cut down code bloat considerably.

Secondly, the binaries are currently compiled as true ARM instructions. With a little tweaking they could be compiled for Thumb mode. This should reduce the size by about 30-40 percent on average.

" If you have memory to burn this is no big deal, but in a calculator you do not have memory to burn."

Considering you can have hundreds of megabytes on an SD card, I'd say there is memory to burn. Even without an SD card, you have 450kb of RAM and 600kb or flash ROM to use.

"Maybe someone should try to write a program like SpeedMiner (available on hpcalc.org for the HP-48 and 49g) in C...it won't have a much faster feel, but occupy multiples of memory of the original SpeedMiner,

I'm sure a C speedminer would be perhaps 5 times the size of the asm version. I also bet it would be much quicker to write :-)

"and will be likely to consume more battery power.""

Why would it use more battery power? If anything, it would use far less. With an emulated Saturn program, the CPU runs at 75MHz - you can't control it. 75MHz is extreme overkill for a simple game.

Using a C program, you have the power to adjust the clock. You could easily underclock to 12MHz or less. This should save battery power.

best,

Al

Re: C compiler for HP calcs (long)

*Message #17 Posted by **Raymond Del Tondo** on 2 Nov 2004, 1:27 p.m.,*
in response to message #16 by Al

Hi,

regarding the power:
This could be true.
On a real HP-48, the program performs a CPU shutdown after each game step,
providing the lowest possible power consumption.

Only the display and keyboard lines are active at this point.
This may be problematic on the emulated CPU in the 49g+,
except if they have put some more brains behind the Saturn
shutdown mechanics emulation.

Regarding the time to write SpeedMiner in C:
Yes, maybe someone can do it quick'n'dirty,
but that was not the objective for writing the program.
I wrote it especially to demonstrate efficient resource
usage on an HP-48 (and 49g).
I don't remember how long it actually took to finish the program
it was the thrill to make it possible,
and it didn't take that long.

I don't know if you know the program,
it's only about 1KB in size, and has all bells and whistles.
A considerable amount of development time was used to introduce
a new and ultra-fast pseudo-random number generator
to place the mines. I limited the mines to 200,
but not because of speed.
The 'mine-thrower', as I called the generator,
is able to generate more than 400 random numbers in an eye glimpse,
and an important point is that it uses absolutley no RAM.

To make it short, I think C and ARM assembly have their uses
where you aren't able to solve a problem withRPL/ML
but many tasks can be efficiently done in RPL/Saturn assembly.

However, since I don't use my 49g+ because it has quality problems
like an unreliable keyboard, and user interface drawbacks like
the uncomfortable keyboard layout (for me),
because the ENTER key isn't where it's on my HP-48,
I don't care too much for the 49g+ ;-)

Regards,

Raymond

*Message #18 Posted by **Garth Wilson** on 2 Nov 2004, 2:17 p.m.,*
in response to message #17 by Raymond Del Tondo

Forth, Inc. has loads of stories from their experience where for example it was estimated that a team of C programmers would need two years to complete a certain job, but it was finally decided that it would be done in Forth, and one man did it by himself in six months, reducing the hardware requirements in the process. They commonly find that projects can be completed in one-tenth the man-months that would have been needed in C.

I don't speak RPL, but I understand it is very Forth-like. I see C as a very inefficient language with serious limitations, but it's amazing what company politics and marketing can do.

Re: C compiler for HP calcs (long)

*Message #19 Posted by **Al** on 3 Nov 2004, 3:33 a.m.,*
in response to message #18 by Garth Wilson

Hi,

If you like Forth, there is no reason why someone couldn't write a Forth interpreter in arm code (either assembly or C). The problem with the current sysRPL implementation is that it is an interpreted language running under an emulator. Hence it is much, much slower then it could be.

This isn't an issue for simple mathematical programs of course. Things like numerical integration would benefit from being rewritten, as would more advanced games (think Doom on a calculator!). And because native code is much faster, you can afford to underclock the CPU to save battery power.

Personally I prefer languages like C or Basic to Forth/RPL, but thats just subjective opinion.

cheers,

Al

*Message #20 Posted by **Garth Wilson** on 3 Nov 2004, 5:26 p.m.,*
in response to message #19 by Al

The HP-41 sold me on reverse-polish notation. Until I started using it for data acquisition and control, I could have gone either way (algebraic or RPN); but RPN suddenly proved to be much better for the data acquisition and control, where the HP-41 was interfaced to several instruments at once (as was later the HP-71).

The HP-71 got me into Forth. What a polarization though! When you include the HPIL, Math, and Forth/assembler modules as well as scores of LEX files from the user groups, that BASIC was by far the best I've seen. In constrast, the HP-71's Forth was very poorly done-- kind of slopped together with apparently little serious thought. It sounds like you're saying they did a rather poor job of the current sysRPL too, at least by neglecting to optimize its critical parts in the HP-48's native assembly language.

In going to Forth, I was glad to be rid of most of the syntax rules and punctuation. That part mostly does fall under the heading of "subjective opinion" as you say. Reverse-polish vs. algebraic is also partly a matter of how the individual thinks. But for my own uses (which may not be typical), one of C's limitations is that its compiler is not part of the user-accessible system, so the language itself is not fully extensible like Forth is. BTW, about the "Forth interpreter" comment-- There are various types of threading in Forth, but they are all compiled. Interpretation does not occur during normal program execution.

Paul wrote, > a C program could alter the CPU speed, display flicker-less greyscale, or control the beeper precisely. A pure sysRPL program could not."

Flicker-less grayscale capability would depend on the LCD's controller. Is the

48's LCD controller separate from the processor? Controlling the beeper and altering the clock speed could be done in any language that gives full access to the hardware, if the hardware design allows it. Does the possibility exist with HP-48 for users to write the equivalent of the 71's LEX (Language EXtension) files in assembly, not only to speed up critical processes, but also to get direct control of the hardware?

Re: C compiler for HP calcs (long)

*Message #21 Posted by **Al** on 4 Nov 2004, 2:27 a.m.,*
in response to message #20 by Garth Wilson

Hi,

I think you are confusing the HP48 with the HP49g+. The HP48 is based on the Saturn processor. All the ROM is written in sysRPL and Saturn asm and executes nativly. The HP49G is basically a HP48 but with enhanced software. It still runs a Saturn processor, at 4MHz.

The 49g+ has an ARM processor at 75MHz (which is much faster then a Saturn clock-for-clock), however it mainly runs a saturn emulator. This emulator executes the old HP49g ROM. This ROM has been patched so critical operations are in native ARM code, but most things are still emulated.

"Flicker-less grayscale capability would depend on the LCD's controller. Is the 48's LCD controller separate from the processor?"

Again, you mean the HP49g+, NOT hp48. On the 49g+ everything is built into a single chip - including a LCD controller with _hardware_ greyscale.

"Controlling the beeper and altering the clock speed could be done in any language that gives full access to the hardware, if the hardware design allows it."

Of course. My point is that sysRPL is currently emulated, and does not offer easy access to hardware. A new language needed to ported to allow this hardware access and admittedly C is much more popular in industry then Forth.

cheers,

Al

Finally, I have HP-15C

*Message #1 Posted by **Pavel Korensky** on 27 Oct 2004, 7:28 p.m.*

Today is a great day. Finally, I am a proud owner of HP-15C. I immediately put the Casio in the drawer and HP-15C has a nice place on my desk in the office (just beside my pipes).

Congrats!

*Message #2 Posted by **Raymond Del Tondo** on 28 Oct 2004, 1:58 a.m.,*
in response to message #1 by Pavel Korensky

Just have fun with the unit:-)

Raymond

Re: Congrats!

*Message #3 Posted by **OJM** on 28 Oct 2004, 9:48 a.m.,*
in response to message #2 by Raymond Del Tondo

I do just the opposite. I leave the cheap calculator out on the desktop most of the time for the simple stuff.

The HP15C only comes out when I need it, and the rest of the time it stays locked inside the desk.

Unfortunately, things sometimes get "borrowed" or lost at my workplace.

Re: Congrats!

*Message #4 Posted by **Bill (Smithville, NJ)** on 28 Oct 2004, 10:29 a.m.,*
in response to message #3 by OJM

Congrauations Paul - it's a great calculator. You'll have a lot of fun with it.

OJM wrote: "The HP15C only comes out when I need it, and the rest of the time it stays locked inside the desk."

There's no fun to be had with it locked in the desk.

I just did a quick look at my desk:

```
HP-11C
HP-41CX
HP-42S
Cell Phone
Dell X30 Pocket PPC
Yaesu VX-5 Handheld Transceiver
Panasonic RF-2200 Shortwave Reveiver
Sony Minidisc Player/Recorder
```

The above are all my personal items (not the company's) and they stay out on the desk all the time.

Looking around the office at other people's desktops, I find similar relatively expensive and sometimes rare items laying out. So far, none have decided to take a walk.

The price for a HP-42S or HP-15C on e-bay is probally in the same range that many of us pay for our cell phones, PDA's, ham radio toys, etc. And many of these items we change on a fairly regular basis. I typically get a new cell phone every other year, a new PDA every year or so, etc.

Just curious as to why we treasure a HP calculator to the point that we lock it up instead of having the fun of using it on a daily basis. Granted, it may get stolen, lost, broke, damaged,.... but we would have the daily fun of it. AND while it may not be cheap to replace it, it is replaceable at realtively resonable prices when compared to the price we routinely pay for our many other toys.

Paul - Again, Congraulations - and YES place it proudly out on your desk and enjoy it!! Dont't hide it!

Bill WD9EQD

Why I was away for a long time ?

*Message #7 Posted by **Pavel Korensky** on 28 Oct 2004, 8:09 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

The answer is simple. A lot of work. The situation in my country is not good, because we have the socialist government for more than 6 years and now, it is a hard time for mid-sized private companies. So, I am spending 95% of time working (I have several employees and they suppose that they will have the salary next month), 4.99% of time I am spending with my wife and daughter. The rest is 0.01% for my hobbies. :-)

Brown HP 41 ?

*Message #1 Posted by **Ronald** on 27 Oct 2004, 4:53 p.m.*

Hello,

On Ebay (#=3847759895) a "brown" version of the HP 41 is offered. Is this really a rare colour to you knowledge ?

Thank you

Ronald

Re: Brown HP 41 ?

*Message #2 Posted by **Raymond Del Tondo** on 27 Oct 2004, 5:10 p.m.,*
in response to message #1 by Ronald

Hello,

all HP-41s are brown, except the transparent one of Matthias.
Seriously, the color is a very dark brown,
where the newer (halfnut) units are somewhat lighter,
which has the effect that the brown is easier to see.

That's all:-)

Raymond

Re: Brown HP 41 ?

*Message #3 Posted by **Chan Tran** on 27 Oct 2004, 5:43 p.m.,*
in response to message #2 by Raymond Del Tondo

When the 41 was first introduced HP called it "Ink Brown". So it's always brown.

Re: Brown HP 41 ?

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 27 Oct 2004, 8:48 p.m.,*
in response to message #1 by Ronald

An issue of the HP Calculator Digest explained the color choice. If my memory is right, a dark color was selected because it is less sensitive to dirt, etc, and also makes the device look thinner. But black was regarded as a cold color, while brown is warmer. And the "coconut" name is consistent with brown, too!

Re: Brown HP 41 ?

*Message #5 Posted by **Ronald** on 28 Oct 2004, 9:20 a.m.,*
in response to message #1 by Ronald

Hi,

That's what I thought already, I looked at my collection (5 different HP41 versions) and ther was no real brown one in, so it's marketing again.....on Ebay, it got my attention, which is good and you confirmed is was as usual, which is also good for I do not have to buy a 6th one, except maybe the transparant one.

Thanks

Ronald

Palm/CE use as HP48G

*Message #1 Posted by **George Leger** on 27 Oct 2004, 1:00 p.m.*

I was told of a freeware utility that allows one to download the entire HP 48G functionality to a Palm or Windows CE handheld! Does anyone know where to find this utility?

Re: Palm/CE use as HP48G

*Message #2 Posted by **Bill (Smithville, NJ)** on 27 Oct 2004, 1:25 p.m.,*
in response to message #1 by George Leger

George,

For Palm systems, use Power48. See following link:

http://www.mobilevoodoo.com/power48.htm

It'll emulate the 48GX and the 49. I've used it on a Sony Clie NX-60 and it works fine.

For the PocketPC, you can find EMU48 on the HPCALC site:

http://www.hpcalc.org/

Have fun.

Bill

Re: Palm/CE use as HP48G

*Message #3 Posted by **Jeff O.** on 28 Oct 2004, 7:51 a.m.,*
in response to message #1 by George Leger

I can report success in using emu48 on a Pocket PC 2002 (or later) device. You will probably want to install emu48 on your PC to use in conjunction with the pocket PC version. The pocket PC version can be found here. The PC version can be found here. Feel free to ask if you need assistance in getting these up and running.

The Power48 applications for Palm OS are also available here. I have not used these so I can’t offer any advice on them.

HP42S + HP82240 information needed

*Message #1 Posted by **Thomas Okken** on 27 Oct 2004, 7:13 a.m.*

Hi all,

I'm working on an HP-42S emulator. It's almost done, but the one part I can't do at the moment are the various printing functions. The problem is, I have an HP-42S, so whenever I'm unclear about exactly how any of its functions behave, I can run a few test cases and find out... But I don't have an HP-82240, and frankly I'm not very interested in buying one -- I just want to make sure that all the printing functions in my emulator yield the exact same output that a real printer listening to a real HP-42S would.

I checked my copy of the HP Museum CD set (the old 5-cd set) and the Museum web site, but I can't find an 82240 manual scan there.

Could someone help me out? A photocopy of the manual would be great (I'm assuming it contains facsimiles of actual printer output?), or else a few photocopies or scans of samples of actual 82240 output would be fine too. Of course I'd be happy to pay for any costs that the sender would have to incur... Please contact me if you can help.

Thanks!

- Thomas

Re: HP42S + HP82240 information needed

*Message #2 Posted by **Mike (Stgt)** on 27 Oct 2004, 7:38 a.m.,*
in response to message #1 by Thomas Okken

Well, if you like to see how the output could look just see at http://www.hp42s.com/pc/42s2html.html.

Re: HP42S + HP82240 information needed

*Message #3 Posted by **Thomas Okken** on 27 Oct 2004, 7:45 a.m.,*
in response to message #2 by Mike (Stgt)

Thanks -- that helps, BUT it's only part of what I'm looking for. I wasn't actually too worried about what the individual characters look like (I can always use the same character matrix as the 42S itself); the big problem is how the output from commands such as PRSigma and PRV is laid out.

- Thomas

Re: HP42S + HP82240 information needed

*Message #4 Posted by **Mike (Stgt)** on 27 Oct 2004, 8:27 a.m.,*
in response to message #3 by Thomas Okken

I hope you have an HP-48GX at hand, or SX (? not sure if an HP49G works too). AFAIK there are routines at www.hpcalc.org that take the IR output to a file.

Ciao.....Mike

Re: HP42S + HP82240 information needed

*Message #5 Posted by **Thomas Okken** on 27 Oct 2004, 8:43 a.m.,*
in response to message #4 by Mike (Stgt)

Alas, no, I don't have a 48 -- but if someone who *does* could capture a some samples of output from all of the HP-42S's print functions and email be the files, that would solve my problem, I'd imagine.

Re: HP42S + HP82240 information needed

*Message #6 Posted by **Mike (Stgt)** on 27 Oct 2004, 9:18 a.m.,*
in response to message #5 by Thomas Okken

Hmm ... yes, but not this week and next only 1 hr.

Ciao.....Mike

Re: HP42S + HP82240 information needed

*Message #7 Posted by **James M. Prange** on 27 Oct 2004, 9:33 a.m.,*
in response to message #5 by Thomas Okken

If you'll give me a 42S, I'll be happy to capture the output on a 48 series, as well as print out to an actual printer and e-mail you scans of the result.

But seriously, it looks like you're more interested in what a 42S sends out for the various printing commands than what an 82240 does with the data that it receives. The printer manual and interfacing guide probably wouldn't be of much help to you. There's a 42S manual on Museum CD 1, but it doesn't seem that informative as to what the output will actually look like; I suppose that they expect the users to print things out and see for themselves.

But I suppose that I could scan the 82240A and 82240B manuals. If Dave can get permission from HP, they could even go into a future DVD/CD-ROM set.

Regards,
James

Edited: 27 Oct 2004, 9:40 a.m.

Re: HP42S + HP82240 information needed

*Message #8 Posted by **Thomas Okken** on 31 Oct 2004, 12:33 a.m.,*
in response to message #7 by James M. Prange

I wouldn't want to ask you to scan the entire 82240 manual (although it would make a great addition to a future version of the HP Museum CD-ROM/DVD set!) -- but if you would be willing to scan just the pages that show samples of the kind of output you should get from the various HP-42S print commands (PRSTK, PRSigma, PRV,...), that would be a HUGE help!

Re: HP42S + HP82240 information needed

*Message #9 Posted by **James M. Prange** on 2 Nov 2004, 7:49 a.m.,*
in response to message #8 by Thomas Okken

Sorry, the printer manuals don't have any example printouts from a 42S, or any other readily identifiable calculator either.

The only example printouts are from the self-test, and very brief printouts from who-knows-what calculator showing what they print for an uncorrectable data error and for an input buffer overrun. The character set tables show the dots (visible with a magnifier) in the characters too, but I don't think that that's what you want.

For what you want, I think that you need someone who has a 42S and a printer to print some examples for you.

Note that an 82240B should work as well; it has the same "Roman 8" character set as the 82240A by default, and can be switched to the modified "ECMA 94" character set with an escape sequence.

The font for ASCII characters with descenders is modified on the 82240B, to not use the bottom row of dots. On the 82240A, the bottom row dots are used in these characters, so they can appear to be "merged" with a character that has a top row dot on the line below.

Regards,
James

Re: HP42S + HP82240 information needed

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 31 Oct 2004, 1:05 a.m.,*
in response to message #1 by Thomas Okken

Hi, Tomas;

I read all posts till now in this thread and I'd like to add a few comments.

Jordi Hidalgo wrote an e-doc (hpcc.org, but I don't know where is it available, if so) explaining some facts about the remapping that happens inside the HP42S prior to printing. This remapping is due to different character codes in the HP42S when compared to the ones available with the HP82240. If I am not wrong, the HP42S IR output is set to the HP82240A default character set, so some characters like the up- and down-arrow are printed differently: a 'v' instead of down-arrow (e.g.: Rv) and a '^' instead of up-arrow (e.g.: R^). Also, the first 32 symbols defined in the HP42S character code (might be seen with XTOA with values from 0 to 31 in X-register) are remapped to match the ones in the HP82240. I know about this because I had a few problems developping an HP42S compatible TTF that would match both ptinting output and LCD representation: I

failed to do so.

There are a few other characters that have their codes remapped prior to be printed, but I have no information in hands right now (I'll search for it later; it's 01:50AM in Brazil right now). Gimme a few-hours nap and I'll post again. Meanwhile, maybe you can find Jordi's e-doc and have a look at it.

Cheers.

Luiz (Brazil)

Emulators

*Message #1 Posted by **Mike (Stgt)** on 27 Oct 2004, 6:34 a.m.*

Well, we have Emu41, V41, Emu71, and Emu48, Emu42, and Emu28, and HP-41X, -42X, -71X, and TI95E. Alas not all ROMs for all calculators are "out". Since 2 days I know about VTI and found quite a bunch of ROMs in the internet, even TI offers one or more O/S of it's calcs for free.

Now my question: are there adequate emulators for Casio and Sharp somewhere? And the ROMs too? TIA!

Ciao.....Mike

Re: Emulators

*Message #2 Posted by **Thomas Okken** on 27 Oct 2004, 7:18 a.m.,*
in response to message #1 by Mike (Stgt)

This isn't really an answer to your question, but in case the availability of ROM images, or rather the lack thereof, is bugging you, wait a week or two until I finish my HP-42S emulator. It will NOT require a ROM image (I got tired of waiting for HP to release it so I went and rewrote it from scratch).

- Thomas

Re: Emulators

*Message #3 Posted by **Mike (Stgt)** on 27 Oct 2004, 8:09 a.m.,*
in response to message #2 by Thomas Okken

Thank you for your hint, but do I understand you correctly: you rewrite the ROM of the HP-42S??? Well, a silly question I suppose, as I assume you're writing a simulation of the HP-42S. Nice, but (not to upset you, but you know http://www.hp42s.com?), you do not need to wait for HP releasing the ROM: if you own an HP-42S you may migrate it to your PC (of cause for your personal use only). There is a slight hope that HP might offer at least one version of the ROM for download, just to give "us" one platform to hand out state files that work for everybody (see http://www.hp42s.com/news/romsonline.html).

BTW, in difference to TI you may find only very few ROMs of HP calculators on the internet (5 if I count correctly: HP-41C/CV/CX, -39/40G, -48SX, -GX, and HP-49G). Seems the HP-users respect the intulectual property of an OS.

Ciao.....Mike

in response to message #3 by Mike (Stgt)

What I would like to see is an HP-42S emulator (simulator, clone, whatever) that can be freely sold or shared without infringing on HP's copyrights. As long as HP doesn't release the 42S ROM under suitable terms, that means the only people who can legally use Emu42 are people who own an actual HP-42S.

My emulator does not contain any HP code, so I can do with it whatever I want. Plus, it's a lot faster than Emu42, and you get IEEE-754 floating point, which is a lot more accurate. So what if it's a lot of work to write. It's fun. :-)

Re: Emulators

*Message #5 Posted by **Mike (Stgt)** on 27 Oct 2004, 9:03 a.m.,*
in response to message #4 by Thomas Okken

I absolutely _do_ agree to that: it's fun. My NutEm (Coconut-Emulator) just works for me, but it's great fun. <G>

in response to message #4 by Thomas Okken

You are building a simulator, not an emulator. And the IEEE-754 floating point isn't accurate enought for a lot of things! It doesn't store numbers right, just an approximation. For high precision/accuracy, BCD is better. For IEEE-754 you'll need a lot of care with roundings and "residues".

My 2¢...

Best regards and good luck!

Nelson

[...] The IEEE-754 floating point isn't accurate enough for a lot of things! It doesn't store numbers right, just an approximation. For high precision/accuracy, BCD is better. For IEEE-754 you'll need a lot of care with roundings and "residues".

I have to disagree with you there. IEEE-754 is a binary format, which means that **decimal** fractions can't be represented exactly, but it's not true that it is "less accurate". It is, in actual fact, MORE accurate -- with BCD, you are only using 10 out of 16 possible values for each group of 4 bits, but with a binary representation, you are using all 16.

The IEEE-754 double-precision floating point format gets 16 (decimal) digits of precision, plus an exponent of up to +-308 (again, decimal) out of 64 bits. The HP-42S gets 12 digits plus an exponent of up to +-499, out of that same number of bits. The HP only scores better on the exponent part, and even there it beats IEEE-754 by only about 1 bit... So, it has a slightly larger range, but in terms of accuracy, it loses by quite a big margin.

BCD is only better if you need an exact representation of **decimal** fractions -- which pretty much means "financial applications". For scientific, engineering, or mathematical work, binary is better -- more precision out of your available bits... **and** faster performance.

- Thomas

*Message #8 Posted by **Nelson M. Sicuro (Brazil)** on 28 Oct 2004, 8:59 a.m.,*
in response to message #7 by Thomas Okken

Please try to represent 0.1 in IEEE math. And BCD isn't limited to only 12 digits - you can make routines for any BCD digits you want - mine is about 27 digits.

Binary is more "dense" than BCD, not more precise: 16 representations for binary and 10 representations for BCD, at nibble (4 bits) level. And with the right CPU, BCD is as fast as binary.

There are some extensive discussions on BCD x IEEE number representations at OpenRPN forum, take a look there.

Best regards,

Nelson

*Message #9 Posted by **.** on 28 Oct 2004, 9:25 a.m.,*
in response to message #8 by Nelson M. Sicuro (Brazil)

Given 'x' bits to represent a number, you can generally represent it better with binary. Binary is also much faster to calculate with on conventional hardware.

There is a good website comparing binary to BCD at
http://www2.hursley.ibm.com/decimal/

"And with the right CPU, BCD is as fast as binary."

On what modern CPUs is this the case? I can't think of any off-hand.

thanks,

.

*Message #10 Posted by **Thomas Okken** on 28 Oct 2004, 7:16 p.m.,*
in response to message #8 by Nelson M. Sicuro (Brazil)

Please try to represent 0.1 in IEEE math.

I assume your point is that IEEE is bad because you can't represent 0.1 exactly. This is true, but for which applications is that a problem?

Consider this: try to represent 2 ^ (-20) using HP-style 12-digit BCD. Can't be done, but IEEE-754 does it just fine.

Next, try to represent 1/3 exactly on either system. Can't be done.

With IEEE-754 double precision, you get a 53 bit mantissa, which means a relative error of 2^(-53), or about 1.11 * 10^(-16). On the HP-42S, you get a 12 digit mantissa, which means a relative error of 10^(-12). That's nearly 4 decimal digits less.

If you're writing applications where it is essential that you can represent **decimal** fractions (that is, numbers of the form Integer * 10^(Integer)) exactly, you want BCD, or things like java.math.BigDecimal. But if you're writing applications where you want the smallest possible relative error, you want binary, because it squeezes the most out of your bits.

*Message #11 Posted by **Gunnar Degnbol** on 6 Nov 2004, 8:47 a.m.,*
in response to message #10 by Thomas Okken

The biggest advantage to decimal arithmetic in an interactive calculator is WYSIWYG - the result you see is the result calculated, not the result converted from binary to decimal. If you understand that the calculation does not have infinite precision, it is not too hard to accept that 1 / 3 * 3 is 0.9999..., but 0.1 + 0.1 + 0.1 - 0.3 = 5.551115123E-17 does not make much sense.

This is less of an issue in computers (programs), where you don't see all the intermediate results.

Binary floating point is more dense than BCD, because it stores 16 values in 4 bits instead of only 10. However, BCD is not the only way to store decimal numbers. The IEEE 754R draft standard uses Densely Packed Decimal, a kind of Huffman-compressed BCD. DPD is rather complicated, but can be implemented in fast hardware.

Any decimal system represented in binary will be still slightly less dense than binary, but only by a few bits. With four bits for the mantissa, a binary format can store 4 bits of information, while a decimal format may have 4 (if the value is 8 or 9) or 1 (if the value is 1). But this difference (0-3 bits) is the same if the mantissa is 40 bits.

In Stak, my RPN calculator for mobile phones and PCs, the coefficeint (mantissa) and the exponent are binary numbers, but the exponent counts powers of ten instead of two.

Another advantage of decimal arithmetic is that it does not have to be normalized. Unnormalized arithmetic, as in Mike Cowlishaw's decimal standard, followed by IEE 754R (and my program), preserves trailing zeros which may contain information relevant to the user in the context.

in response to message #2 by Thomas Okken

Thomas,

Eagerly looking forward to seeing your emulator. I wrote an a few hp emulators, and like yourself, had the freedom to extend features and make them formidable. You may want to create a base version that is reasonably close to the actual HP42s and another souped up version that provides more features and memory (i.e. a version more geared to be used with a PC).

I hope you have func creating the emulator and I hope we will have fun using it.

Namir

Re: Emulators

*Message #13 Posted by **Thomas Okken** on 28 Oct 2004, 7:28 p.m.,*
in response to message #12 by Namir

Eagerly looking forward to seeing your emulator.

Thanks! I love positive feedback. :-)

I'm currently getting close to finishing SOLVE, and after that there's still INTEG and the printer functions to be done. I estimate about a week to finish SOLVE and INTEG, and another two or three days for some regression testing, and then I'll release the first alpha version. (The printer stuff isn't critical, as far as I'm concerned -- I never owned a 82240 so I don't miss it when those features are absent... I just want to do them because the emulator wouldn't be truly "complete" without them.)

Things like having a settings menu, where you can choose to enable unlimited-depth RTN stack, bigger display size, etc., are all planned for version 1.1. Right now the goal is pure HP-42S compatibility and nothing more. (But even now I'm able to create 1000x1000 matrices and invert them faster than you can blink (well, almost :-)).)

FOCAL engine?

*Message #14 Posted by **Raymond Del Tondo** on 29 Oct 2004, 1:52 a.m.,*
in response to message #13 by Thomas Okken

Hi,

one important point:
Do you include a binary compatible FOCAL execution engine?
This is important if you want to import programs from
other platforms, like Emu42, the HP-41, or the 42S,
or the Emu41CV card for the HP-48...

Also the solver & integrator make use of FOCAL programs.

Raymond

Re: FOCAL engine?

*Message #15 Posted by **Thomas Okken** on 31 Oct 2004, 12:19 a.m.,*
in response to message #14 by Raymond Del Tondo

I don't know anything about FOCAL. Could you fill me in?

For what it's worth, I have implemented my own versions of SOLVE and INTEG; they work but they're not quite as good as the originals yet (the HP-42S SOLVE has some smart logic for

dealing with asymptotic behavior and such; my version is already pretty good at *converging* even in difficult situations, but it does tend to take more iterations to get there. Good thing it's also screamingly fast, so you still won't get old waiting for your results... :-) As for INTEG, I currently have a Simpson's Rule integrator that keeps halving its step size until two successive approximations differ by less than ACC; again, that works pretty well most of the time, but it *can* take forever on poorly behaved functions -- it needs something like the HP-42S's selective refinement, but I've had my hands full just dealing with the issues of calling HP-42S programs from the emulator and such... Hopefully I'll be able to improve that sometime soon.)

Re: FOCAL engine?

*Message #16 Posted by **Raymond Del Tondo** on 31 Oct 2004, 9:09 a.m.,*
in response to message #15 by Thomas Okken

Hi,

I don't want to repeat all that has been written about FOCAL here,
there were several threads in the hpmuseum forum about this topic.
Please take a look into the archives.

Only a short description:
FOCAL stands (amongst other things) for FourtyOne CAlculator Language.

When I write FOCAL, I usually mean this in combination
with the HP-41 programming language.

Did you know that the original HP-41 programs can run in the HP-42S, too?
I mean the binary representation, not only the text form!

As I wrote in a previous mail, HP-41 programs (binary) can
be even used in the HP41CV Emulator card for the HP-48SX.

This is because the execution engine is compatible.
The memory mangagement of the various platforms is different,
but the FOCAL programs work the same.
This has also been discussed here,
and can be found in the archives.

Hmm, to simplify things, you can say FOCAL was kinda portable,
at least to some specific platforms, long before something like JAVA was even invented.

Raymond

*Message #17 Posted by **Namir** on 29 Oct 2004, 11:32 a.m.,*
in response to message #13 by Thomas Okken

I remember writing a GUI version of the HP41 and added SOLVE and INTEGRATE to it. These features were a bit of a challenge because thei required another set of program execution pointers. I was a wonderful feeling to see it work.

More power to you Thomas!!!!!!!!

Re: Emulators

*Message #18 Posted by **Thomas Okken** on 31 Oct 2004, 12:27 a.m.,*
in response to message #17 by Namir

I know the feeling. :-)

It's quite a thrill once some actual heavy-duty HP-42S programs actually run all the way on the emulator. You know you're on the right track when you keep forgetting it's not a real HP you're working with! And seeing Erik Ehrling's PRM? program figure out that 999,999,999,961 is prime in less than half a second (on a 233 MHz Pentium MMX) is pretty neat too.

Just a few more days before I'm ready for a public release... Gotta write a Windows front-end to add to the ones for Linux and PalmOS I already have (one or two days' work, tops), plus some more regression testing... I wish it were done already, I could use a good night's sleep. :-)

*Message #19 Posted by **Aleph Mobius** on 27 Oct 2004, 6:07 p.m.,*
in response to message #1 by Mike (Stgt)

I could be wrong but hasn't HP released the 49G ROM for free use? I think anyone who pleases may download the file. Some TI ROMs are available from their site but technically you aren't supposed to download them unless you own the origional calculator. I remember seeing at least one emulator for an older Sharp calculator (PC-E500 maybe?) but I am almost positive there are no emulators for their newer models. There is an emulator that runs BASIC programs from the casio CFX line. There is also an emulator for the AFX line (they have x86 compatible CPUs and run DOS) but it only emulates compiled programs and has no math functionality of the actual calculator.

Re: Emulators

*Message #20 Posted by **Thomas Okken** on 27 Oct 2004, 10:06 p.m.,*
in response to message #19 by Aleph Mobius

I could be wrong but hasn't HP released the 49G ROM for free use?

I think so -- I know you can get ROM images for several of the 48 series models directly from HP.

But what's the point? The 48 series may be a neat toy for college students and hardware hackers, but of you want a calculator you can actually USE, the 42S beats the sh*t out of anything.

(I tried using Power48, with those HP ROM images, on my Palm, but it only reminded me of why I like the 42S better than the 48G.)

OK, I'm going off to look for my asbestos suit now. Flame away... ;-)

Directly from HP?? Did I miss something??? Where?!?

Ciao.....Mike

Re: Emulators

*Message #24 Posted by **Thomas Okken** on 31 Oct 2004, 12:51 a.m.,*
in response to message #23 by Mike (Stgt)

Erm, I may have goofed there -- I don't actually know just where in hp.com you can get those images. I seem to remember reading somewhere that HP released the 48 series ROMs for free download, but I didn't get them from HP myself; I downloaded Power48 (HP-48 emulator for PalmOS) and I think I got my ROM images from the same place where I got the emulator.

I later ditched Power48 because it wasn't stable -- it crashed my Palm pretty badly a few times, making me lose some stuff from my address book and memo pad -- and besides, it mostly reminded me of why I got rid of my *real* HP-48G years ago...

But if you're still looking for those ROMs, give me a holler and I think I can still retrace my steps and figure out where I got them.

Re: Emulators

*Message #25 Posted by **HrastProgrammer** on 28 Oct 2004, 1:34 a.m.,*

Re: Emulators

*Message #29 Posted by **Aleph Mobius** on 28 Oct 2004, 10:04 a.m.,*
in response to message #25 by HrastProgrammer

I forgot to add that Casio has released an emulator for their newest calculator the ClassPad. I don't know if they have changed it but when I downloaded it several months ago, several areas of the program were unavailable and it stopped working after 180 days. I don't know if these two restrictions are still in place or if there is any way to unlock them. IIRC, ClassPad users get a version of the emulator on a CD when they buy their ClassPad.

Re: Emulators

*Message #30 Posted by **Mike (Stgt)** on 3 Nov 2004, 8:36 a.m.,*
in response to message #29 by Aleph Mobius

From a jp Casio site

Note: The part in the software which operates equivalent to the actual ClassPad 300 operations expires after 180 days. However, the communications part for communication between the ClassPad 300 and the PC can be used continuously.

Nice, anything more durable out there?

HP-97 wihtout battery pack?

*Message #1 Posted by **Wolfgang** on 27 Oct 2004, 12:53 a.m.*

May I use my HP-97 without a battery pack, just with the power supply? I would like to youse it as my desctop calculator. I know that the Woodstock serie will be damaged just with power supply, but what about the HP-97? I do not have a spare battery pack.

Re: HP-97 wihtout battery pack?

*Message #2 Posted by **Mike (Stgt)** on 27 Oct 2004, 3:06 a.m.,*
in response to message #1 by Wolfgang

I would not branch it w/o battery pack. As minimal safety messure I would just use a big electrolytic capacitor.

Ciao.....Mike

Re: HP-97 wihtout battery pack?

*Message #3 Posted by **Tony Duell** on 27 Oct 2004, 6:51 a.m.,*
in response to message #2 by Mike (Stgt)

It is safe to use the 97 without a battery pack (there is a special circuit intended to prevent the incoming voltage exceeding the Vss rail), but you won't be able to use the printer or card reader (which take too much current for the HP mains adapter).

This circuit is present in all Topcat models, but it only works when the machine is on. For this reason, if you are lucky enough to have an HP95C, do _NOT_ connect it to the adapter without a good battery pack in the machine. You can easily damage the CMOS RAM chips (same as in some Woodstocks IIRC), and maybe other chips. If you kill the ROMs in a 95C you're in big trouble. This is based on reading the schematics for all said machines...

Re: HP-97 wihtout battery pack?

*Message #4 Posted by **Chan Tran** on 27 Oct 2004, 10:00 a.m.,*
in response to message #3 by Tony Duell

I don't dare to do it on my 97 but many years ago I killed my 25 by putting a capacitor in place of the battery pack and plug the charger in. Without the cap the display would flicker but after installing the battery it was fine. The cap raise the voltage higher and killed the calc.

Re: HP-97 wihtout battery pack?

*Message #5 Posted by **Dave** on 27 Oct 2004, 12:57 p.m.,*
in response to message #1 by Wolfgang

Never operate the 97 w/o battery. the printer will be destroyed the first time you try to use it. The circuits may work until a spike comes through.

Re: HP-97 wihtout battery pack?

*Message #6 Posted by **Peter Khor** on 28 Oct 2004, 1:02 a.m.,*
in response to message #5 by Dave

fwiw, if you can find original pack and/or get it re-built - just use a 4xAA Nicad flat pack with stranded wires, loop it around the 2 contacts in the battery compartment and then fill the empty space around the battery with some sponge foam - works pretty well.

L-form factor Concept

*Message #1 Posted by **Hugh Evans** on 26 Oct 2004, 8:46 p.m.*

I've finally gotten around to producing an initial concept for the L(landscape) or voyager style form factor. It would help me out immensley to hear your thoughts if this were a calculator you were considering purchasing. Don't be afraid to be critical! We are going to start prototyping cases around spring 2005 and your input will have a direct input on the design.

http://www.openrpn.org/images/userimages/Lproto.jpg

I'm working on a new version with proper vertical key spacing to make room for shifted labels. The logic behind the additional row of narrow keys along the top is to allow for menu navigation and some extra blank user assignable keys.

Best Regards,

Re: L-form factor Concept

*Message #2 Posted by **hugh steers** on 26 Oct 2004, 8:57 p.m.,*
in response to message #1 by Hugh Evans

do you envisage possible keyboard overlays, or is this a thing of the past.

Re: L-form factor Concept

*Message #3 Posted by **Hugh Evans** on 26 Oct 2004, 9:41 p.m.,*
in response to message #2 by hugh steers

Yes sir, we're actually going to be molding labels into the keyboard area (not just the keys), but are planning to make keyboard overlay sheets as well. We're all about making custom, one-off keys and overlays using the same process as our normal lines.

Re: L-form factor Concept

*Message #4 Posted by **Karl Schneider** on 27 Oct 2004, 1:07 a.m.,*
in response to message #3 by Hugh Evans

Hugh --

I would like to see a non-graphical, NCEES-compliant calc with all the best features of the HP-32SII and HP-15C, with a few other features of the HP-27S and HP-42S included. I think that's your concept, also.

I think that the wider keys for data entry (0-9, .) and arithmetic found in the Pioneer models and the HP-71B was a very good idea, which should be used.

The beveled keys with yellow-shift above and and blue-shift or alpha characters below on the bevel

(Voyagers, 41C*, 71B) was another good idea, which you are maintaining. Note that blue shows up just as well on light-colored keys as on dark ones (71B).

I would stay away from HP-48 mini-keys -- neither durable nor ergonomic. Every menu position on the display should directly correspond to a top-row key.

The L-configuration is better for desktop use, and allows for display of longer equations and complete complex numbers.

More suggestions for features later.

-- KS

It is also better for hand held use! See my page on Keyboard layout on my "Bring Back the HP 15C" site for the reasoning behind that. One thing I didn't mention on that page is the advantage of a longer display.

Chris W

Re: L-form factor Concept

*Message #6 Posted by **Thomas Okken** on 27 Oct 2004, 8:24 a.m.,*
in response to message #4 by Karl Schneider

> The L-configuration is better for desktop use

Is that statement based on a survey? I presonally prefer the vertical layout, both when the calculator is in my hand and when it's lying on a desk. Also, I'd worry about the fact that the horizontal layout makes the device less than ideal as a hand-held. (Anything with more than 7 rows or more than 5 columns of keys is very awkward if you're trying to operate it with one hand -- there's only so much ground one thumb can cover, and if you have to shift the calculator in your hand all the time, you're going to drop it eventually, probably into a muddy puddle -- I imagine you may have a tough time selling something like that to civil engineers and such!)

Just my $0.02.

- Thomas

Re: L-form factor Concept

*Message #7 Posted by **Hugh Evans** on 27 Oct 2004, 10:01 a.m.,*
in response to message #6 by Thomas Okken

All of our models will be waterproof, so that at least cover the mud scenario. I do anticipate that civil engineers will prefer the P (Portrait) form factor as well as the G (graphing). In situations where it is advantageous to hold the machine in one hand and press keys with the other, vertical

layouts are the better choice.

The discussion going on in this thread shows exactly why multiple form-factors are necessary. Most people have a pretty strong opinion regarding their favorite layout. My guess is that the P-type would end up slightly (5% or so) ahead of L. P is more traditional and more commonly seen in current designs, but people who got used to the L-type are typically hooked. I see both as being excellent designs.

build it and they will come

*Message #8 Posted by **Ned** on 27 Oct 2004, 8:46 p.m.,*
in response to message #7 by Hugh Evans

My 2 pennys: On the one side, if this is just an exercise funded by money to burn, I think it looks cool. The soft menu keys are a little too close to the second row down. I find the weight of my 12c makes it easier to do 2 thumbed typing, but I know the 'heft factor' has already been mentioned.

On the other side, if plans are to actually *sell* this design or a series based on one chassis, pleeeeaze concentrate instead on designing a cheap single low power chip, and an easy to build snappy keyboard. There is no market for a 'bombproof' calc. A funny coincidence is that a 32s and a casio fx-260 have the same number of keys. Stuff the logic of a 32s or 42s into some modern tiny silicon, give the thing hard keys glued to a silicone membrane, and you get a casioesque rpn calc you could sell for $15-20 in volume. Think 'casio does the 33s sans chevron keypad'. I'd buy 5 of those, but not one of some 'luxury' model for over $100 just to take a PE exam.

I've had this discussion here once before with someone, but I much strongly more prefer the "portrait" configuration of the Pioneers, Spices, etc.

However, this is not to say you didn't do a good job... ... it's just me!

Re: L-form factor Concept

in response to message #9 by Ed Look

Funny you should mention that. I put together a rough draft of such a beast this evening. Should be ready within the next couple of weeks! Currently, it's using the same ~3"x6" size with a larger screen and some extra keys. The other option is to reduce the size, take out a few extra keys, and shrink the screen. Any thoughts on that?

Thanks

Re: L-form factor Concept

*Message #11 Posted by **Jeff O.** on 27 Oct 2004, 7:57 a.m.,*
in response to message #10 by Hugh Evans

For the portrait format, the 3"x6" (or 7.5 X 15 cm) size, (being essentially the same as the much-loved 42S) should be fine. I think there is a place for a bigger display, I think many users would like to see all four levels of the stack, for example, and some graphing capabilities might be nice also.
So rotate your L-form factor 90 degrees, move the display to the top and make it about 3 rows tall. That would leave room for a row of 6 soft keys and seven rows of other keys, which could be 5 or 6 keys wide or some combination. That may not be completely clear, so I made a quick cut and paste depiction of such an arrangement. I have no way to host it, so I'll e-mail it too you.

*Message #12 Posted by **Ed Look** on 27 Oct 2004, 11:23 a.m.,*
in response to message #11 by Jeff O.

One poster here not too long ago mentioned that if you were an experienced and confident stack user, all you need is to see the X level. With a bit of practice (just a little, in my experience) this should be true for most users. However, another line or two ought to be added and used for other information, as modes, status annunciators, soft buttons, maybe even owner's name, time and date, etc.

> One poster here not too long ago mentioned that if you were an experienced and confident stack user, all you need is to see the X level.

Well, I guess all you ***need*** is the X level. It is certainly not my intention to belittle or denigrate your point of view. As you said in your earlier post, it's just me, but I find the Y-level display of the 42S (and now 33S) to be quite useful, and figure having the Z and T would be helpful also. If a taller display that would allow all four levels, plus status indicators, time, etc., is easily obtainable, why not do it? Hugh indicated that he is working on a portrait style alternative of the same dimensions as his landscape. It sure looks like there would be room for a near 48G-sized display plus 6 softkeys plus 37 to 42 other keys in the same area as shown in his picture of his landscape prototype. Hopefully, the OpenRPN project will allow a variety of preferences to be served. If you want a short, wide display, get the landscape version. If you want a tall and narrow display, get the portrait. Of course, I get the impression you would prefer a portrait-style with a short and narrow display. It's probably asking too much for that much flexibility. Maybe he could include an accessory cover plate to cover the top half of the display for those that don't want to use it (just kidding).

Re: Portrait-form factor Concept

*Message #14 Posted by **Ed Look** on 27 Oct 2004, 8:43 p.m.,*
in response to message #13 by Jeff O.

LOL!

Nah, taping LCD windows leaves ugly glue marks.

It would not figure into any buying decision if it showed all four stack levels; it's only an aesthetic preference. I'll readily admit that being able to see X, Y, Z, and T at the same time would be more useful.

Of course, I also have a soft spot for red LEDs, and the only thing that deters me from championing them are that they consume so much power!

*Message #15 Posted by **Mike (Stgt)** on 27 Oct 2004, 4:10 a.m.,*
in response to message #1 by Hugh Evans

Sorry, no. Even HP's line of Voyagers are not the calculators I like to use. I always regarded it as a "design capriole", probably driven by marketing coercion: 'we have to show up with something new'. Well, it worked for HP.

If I only need a calculator as a replacement of a slide rule I prefere something like an HP-21 what comes close to a "tamagotchi": you may put it in one hand and type with the thumb (hence a "thumb rule"). An aspect of the man-machine-interface (MMI) is the look-and-feel when you touch it.

You won't get the same feeling if you take an HP-42S, it will stay a foreign substance, it's too flat.

At most you will put an calculator on a desk to use it. Even then I prefere those machines I may operate with one hand. Now pls do a simple test: put your arm on the desk and move your fingers. What would be best under those fingers -- yes -- of cause -- an HP-41CX!!! With it's slanting keybord, and the best haptics in the keys, it's MMI is second to none.

My very personal opinion.

Ciao.....Mike

*Message #16 Posted by **Raymond Del Tondo** on 27 Oct 2004, 5:50 a.m.,*
in response to message #1 by Hugh Evans

Hi,

as Mike wrote, the keyboard feel is very important.
A big problem with the voyagers is the hard-to-press ENTER bar.
This could be resolved by placing only one contact dome
under the ENTER key.

However, as I wrote earlier in other threads,
my favourite layout is that of the Pioneers,
at least for the block of control keys,
with a horizontal double-wide ENTER bar at the usual location,
and the '+' key at the downright edge.
The 41 has the best tactile response,
not too hard to press, yet still clean contact.

Alpha capabilities would be nice,
but aren't really important.
Maybe reduced Alpha features,
lik in the mid-range Pioneers (22S, 32S, ...)
would be enough.
When an Alpha mode will be included,
a dot matrix display seems to be mandatory.
If no Alpha is needed, a segmented display
would be sufficient.

Raymond

*Message #17 Posted by **db(martinez,california)** on 27 Oct 2004, 11:14 a.m.,*
in response to message #1 by Hugh Evans

It looks great. I will buy two. I have three comments:

Someone mentioned the EIT/LSIT exam compliance. It looks like this one will not meet current rules because of alpha capabilitiy.

I hope that the battery system is like the new 33s so that there is NO chance of loosing memory when changing them out. That never happened to me with an 11c but it did on a 42 - with 6k of programs in it!

There was discussion of a future portrait style and different screen sizes for those of us who work in the field.

I like someone's idea of a 4 line screen because it could show things like the entire stack. It could also clearly display northing / easting / elevation OR azimuth / horizontal distance / vertical difference along with the softkey labels. It will/would be useful in any configuration.

Re: L-form factor Concept

*Message #18 Posted by **Hugh Evans** on 27 Oct 2004, 12:06 p.m.,*
in response to message #17 by db(martinez,california)

I stated long ago that exam compliance is not a consideration in the design. I have also said that if anyone wishes to take on the task of getting the final product approved for exams they are welcome to do so.

The main battery will be Li-Polymer, which probably won't need to be changed much (if ever). I'll bring this topic up in the OpenRPN forums. Between the fact that everything can be backed up to on-board flash or a computer, as well as having access to external charging pins... I'm not sure there will be a good case for using a backup button cell.

I'll play around with it a bit. I don't expect a 4-line display to pose any problem. All models are to use graphical LCDs (highest contrast we can get). Display of the entire traditional stack and graphical capabilities will be great features.

Thanks for your input.

*Message #19 Posted by **db(martinez,california)** on 27 Oct 2004, 11:33 p.m.,*
in response to message #18 by Hugh Evans

Exam compliance is not a consideration for me either. It sounds like you have the battery system dialed too. I'm ready, start selling them.

OpenRPN design vs. NCEES

*Message #20 Posted by **Norris** on 27 Oct 2004, 1:57 p.m.,*
in response to message #17 by db(martinez,california)

The NCEES criteria for banning or approving calculators are not entirely clear. However, alpha capability alone apparently does not disqualify a particular model. NCEES currently lists both the TI-81 and HP-33S as "acceptable", and they are both capable of storing long text strings (as an "equation" in the case of the 33S).

It appears that what NCEES really objects to is the combination of (1) text storage capability, **plus** (2) PC connectivity. Neither the TI-81 nor the HP-33S have any IR or serial ports, so they would pass under the second criterion.

The proposed OpenRPN design probably would not be NCEES-compliant, since it appears to fail both (1) and (2).

I certainly respect the decision of the OpenRPN team to make the calculator that they want, rather than the calculator that NCEES wants. However, it's worth noting that something like 100,000 people take NCEES exams every year, and that a significant fraction would be very interested in a powerful NCEES-compliant RPN model. If OpenRPN could produce an NCEES-compliant model that was superior to the 33S (which doesn't seem like an impossible challenge), then they might have a good chance of finding a real market and raising some real cash. Which could possibly help fund the development of other, more interesting, models.

Re: OpenRPN design vs. NCEES

*Message #21 Posted by **Jonathan Purvis (NZ)** on 27 Oct 2004, 9:31 p.m.,*
in response to message #20 by Norris

I did attempt to come up with a solution to this on the OpenRPN.org board, but got shot down. You would have to have a "closed" design with a non-flashable ROM and no I/O to meet the NCEES requirements. So you'd have a calculator that is only useful for taking exams. More on my ideas at http://openrpn.org/index.php?name=PNphpBB2&file=viewtopic&t=37&highlight=

Re: OpenRPN design vs. NCEES

*Message #22 Posted by **Norris** on 28 Oct 2004, 2:00 a.m.,*
in response to message #21 by Jonathan Purvis (NZ)

You are absolutely right. An NCEES-compliant design would have to be completely "closed", and it would therefore be less than ideal for non-exam purposes.

My point, however, is that people would still buy it -- even if they never planned to use it again after taking the exam. Passing the PE or PLS exam is a major career milestone; exam candidates (or their employers) routinely pay hundreds or thousands of dollars for exam fees, travel costs, books, and review courses. Many candidates would be willing to pay a premium price for a good NCEES exam calculator, even if that's the only thing that it would be useful for.

That's why the HP-33S sells. Let's face it: the 33S is an uninspired design at an uncompetitive price, but it's still the best available choice for NCEES exams. That one selling point is enough to guarantee a niche market for it. However, the weaknesses of the 33S are pretty clear, and it could easily lose that niche to an better-designed competitor.

*Message #23 Posted by **Walter B** on 27 Oct 2004, 5:48 p.m.,*
in response to message #1 by Hugh Evans

Thx for your design sketch! As others did already, I support a second display line (for soft keys or second stack level or whatever) and sufficient space for annunciators, too. And I propose to either extend the display width or drop the 2 outmost white keys - as soft keys they make sense directly under the display only.

By using soft keys, you have to use dot matrix. Please take care for best contrast - imho this is the biggest disadvantage of 42s compared to earlier models.

Just my 0.01€, of course.

Re: L-form factor Concept

*Message #24 Posted by **bill platt** on 28 Oct 2004, 10:31 a.m.,*
in response to message #1 by Hugh Evans

Hi Hugh,

Thank you for posting your latest progress here. I am very impressed to see this progress.

I also agree that it would not be any advantage to force compliance with the "NCEES" exam. For one thing,

their requirements are arbitrary and subject to change. For another, they artificially destroy the potential for progress in device design.

Let the ChineseHP work that market. I am looking forward to a real machine. (I am tired of being forced to depend on cheezy chinese garbage. I am constantly amazed at the success of this Chinese import revolution--most of the stuff is so bad that using it is terribly UNeconomical---flashlights which work for one day, fiberglass which is so out of spec that it will not mold, and has unpredictable strength characteristics, container unloading cranes made out of pot metal, bolts stamped "grade 8" which fail at less than grade 5 loads, "316L" stainless steel which corrodes and pits.....it is pretty scary. Nobody in China appears to be accountable for anything---but it is the US side with the egregfious errors--accepting this sort of nonsense! And the scariest part is that we, both consumers and industrial users, put up with it! I suspect that it will bust though--just as the Japanese economy did, when it got too "hot". There is a "run on the market" right now--a mass "feeding frenzy" for inexpensive chinese labor. It is an unsustainable activity--I hope).

Best regards,

Bill

Well said, Bill

Re: L-form factor Concept

*Message #26 Posted by **Norris** on 28 Oct 2004, 3:53 p.m.,*
in response to message #24 by bill platt

<< I also agree that it would not be any advantage to force compliance with the "NCEES" exam. >>

Let's think about this for just a minute.

On the one hand, we have the OpenRPN team. They aren't satisfied with modern PCs, PDAs, or HP48s. Instead, they would like to make some really good old-fashioned programmable scientific calculators.

On the other hand, we have NCEES exam candidates. They are barred from using modern PCs, PDAs, or HP48s. So they would like to buy some really good old-fashioned programmable scientific calculators.

Question: Could these two groups come together for their mutual benefit?

Answer: Obviously not.

Oh well. No one ever accused RPN advocates of slick marketing skills.

Re: L-form factor Concept

*Message #27 Posted by **Hugh Evans** on 28 Oct 2004, 6:25 p.m.,*
in response to message #26 by Norris

To the contrary, we are satisfied with each, but...

Computers are useful only for exceptionally complex work. PDAs are excellent but lack tactile keys (poor MMI) HP48s are fine but are gradually becoming dated technology.

Our compromise? Modernize classic designs and embellish upon them by using current embedded technologies and adding to the feature set.

I will give it another consideration... If there is sufficient demand I am willing to flex a bit and make an additional machine outside of our standard line for exams. I *will* consider it.

Re: L-form factor Concept

Message #28 Posted by . on 28 Oct 2004, 8:43 p.m.,
in response to message #26 by Norris

"Instead, they would like to make some really good old-fashioned programmable scientific calculators."

I thought that openRPN were only interested in a powerful device, that was only "old fashioned" in terms of high build quality. Not "old fashioned" as in "very limited functionality"

Emanuel Verbeeck is a thief

*Message #1 Posted by **Tony** on 26 Oct 2004, 2:04 a.m.*

He ripped me off on eBay. He bought a NIB Mint unused TI CC-40 in August, replaced the new unit with a broken, tampered, damaged by trying to open it, unit, kept the manuals, and re-listed it on eBay as new, unused, mint in box. Original August purchase: 5118488377 My Oct 5 2004 purchase: 5127154622.

I have filed an eBay fraud alert, and will file for Fraud Protection on Nov 5 2004 (30-day mandatory wait) and hopefully they will shut down his account then for STEALING.

BEWARE! HE WILL RIP YOU OFF! email me for more details/proof

Tony

Strong words...

*Message #2 Posted by **Raymond Del Tondo** on 26 Oct 2004, 3:28 a.m.,*
in response to message #1 by Tony

Hello,

I don't know what happened here,
but you use strong words in public,
where it may be more appriorate to discuss
this issue with Mr. Verbeek directly.

As far as I can see, your eBay profile
shows a fraud, too (item 2027432338),
which relativates your words...

I don't take party for anyone of you both,
but maybe it was only a misunderstanding,
or a packing error. You should make this clear first.

Raymond

in response to message #2 by Raymond Del Tondo

No...that person just didn't read the auctions, and the emails that I sent to him. And at least I responded to him. Mr. Verbeeck refuses to even answer my emails.

Strange; not in my experience

*Message #4 Posted by **Charles (FRANCE)** on 26 Oct 2004, 12:10 p.m.,*

in response to message #1 by Tony

I do not know about your auction, but I personally bought Mr Verbeeck two Sharp calculators which were exactly as described (both mint). He even helped me by mail when I had a question about opening it and hard-resetting it. May I suggest that instead of cursing this person (or any person for that matter), you send a kind email? Being aggressive (or, as above, plain diffamatory) will not help resolve this minor issue. My two cents.

Re: Strange; not in my experience

*Message #5 Posted by **Tony** on 26 Oct 2004, 1:39 p.m.,*
in response to message #4 by Charles (FRANCE)

I've sent him at LEAST 6 emails, none of which has been answered. I sent him one upon opening the package, and seeing that he gave a non-working, damaged, unit, with the screw still loose, and the metal back cover bent from screwdriver prying. I sent him another email 3 days later, notifying him that I was contacting PayPal about it. No response. I emailed him before I filed a fraud alert with eBay. no response. And I emailed him again last night. Of course, surprise, no response. Looking at the two auctions, the fraud was intentional. He kept the good unit, and sold the bad one as new, unused, mint in box. And, he kept the manuals.

Re: Strange; not in my experience

*Message #6 Posted by **Charles (FRANCE)** on 26 Oct 2004, 2:58 p.m.,*
in response to message #5 by Tony

FYI, it is useless to beg Paypal for a refund, because you did receive the package, so their responsibility stops there. It is also useless to bother eBay, unless this is a zero-feedback seller, or one with clear negative feedback. In this case, your seller has very excellent feedback for several years -- unless your aggressive one : the case will be closed without any debate, nothing will be done, but you will only know it in 30 days.

Also, the auction contains pictures and clear wording; you won't be able to claim for a wrong description. As far as eBay is concerned, it is your word against your seller's. How do you prove you didn't damage the stuff yourself?

Proceed with life, imho there are much, much more important things.

Re: Strange; not in my experience

*Message #7 Posted by **Tony** on 26 Oct 2004, 3:05 p.m.,*
in response to message #6 by Charles (FRANCE)

eBay has Fraud Protection: amount -$25 processign fee.

As to the auction, it says "This is an unique chance to buy a mint, new-in-box (NIB) Texas Instruments TI-CC40 computer and its dedicated TI Printer/Plotter. They have never been used, and as you can see on the photos, the two boxes contain everything. The computer works on 4 AA batteries (not included), the printer/plotter works with its power adapter (supplied). This is the ideal, new-old-stock (NOS) complete package, ideal for collectors!"

From the auction he bought it in, you can see the sticker on the CC-40. This one has none.

Face it. He bought a new one, switched the unit with a bad unit, took all the manuals and everything, and then listed it as a new item in box, with fraudulent intentions.

Worse comes to worse, I'm going to Europe in a couple of months anyway.

Re: Emanuel Verbeeck is a thief

*Message #8 Posted by **Namir** on 26 Oct 2004, 5:16 p.m.,*
in response to message #1 by Tony

This is a website for old (and new) HP calculators. We share information about using, programming, fixing, and working with old and new HP calculators. We also share about updates in documentation and firmware for HP calculators.

Having said that. This is NOT a site for TI computers and it is NOT a site for eBay complaints at large. I understand your displeasure with your transaction. Please respect us and this site and channel your complaints to the proper parties (eBay and PayPal).

> Now, actually on topic, is the HP 16 hex calc still made? Anyone have one available?

The HP-16C was discontinued in 1989. You might have some luck if you post a "wanted to buy" ad here. Otherwise your best hope to find one is probably eBay. Expect to pay $150 or higher no matter where you find one, unless you have time to scrounge garage sales and/or estate auctions.

HP41CX Copper Interconnectors

*Message #1 Posted by **J.W.** on 25 Oct 2004, 11:59 p.m.*

How many copper interconnectors are there on the HP41CX - 2 or 3? (near the bottom of the calculator between the screw posts). On the HP41CV there are only 2 - their size is about an inch long by 1/8" wide by 1/16" thick held parallel by flexible clear plastc.

I was led to believe that on the HP41CX there were these 2 plus a third middle short copper interconnector about 3/8" long - is this correct?, and if so, why was a third copper interconnector added? - was it because of the added timer/clock module on the HP41CX?

Any photos of all the HP41CX copper interconnectors anywhere?

Re: HP41CX Copper Interconnectors

*Message #2 Posted by **Raymond Del Tondo** on 26 Oct 2004, 1:32 a.m.,*
in response to message #1 by J.W.

The connection between the main pcb and the CPU board
is the same on the fullnut C, CV, and CX .
I have a C case with a CX CPU board inside,
and it works as it should.

The halfnut units have a redesigned hardware layout,
with the components near the top.
But I think that the board layout of halfnut
machines is the same for all configs (C, CV, CX).

Photos should be available here in the museum in the HP-41 section,
or in the repair/articles section.

Re: HP41CX Copper Interconnectors

*Message #3 Posted by **Randy** on 26 Oct 2004, 6:59 p.m.,*
in response to message #2 by Raymond Del Tondo

All fullnut 41's are the same interconnect scheme regardless of model type (C,CV,CX). There are the two connection strips you describe opposite the two lower screw posts and the battery/port connector on the top posts. The only difference on the CX was the addition of the clock chip along with rom changes. This all fit on the same size circuit board. On later CV's, look for an empty 20 pin dip area - it's were the CX clock chip fit along the right side of the module.

The lower interconnects had three different forms over the life of the product (pink elastomerics, single thin gold wire strip, double thick wire strips).

The battery/port connector evolved as well with a foam pressure pad giving way to a harder rubber strip in later models.

Later halfnuts have only the battery/port connector. Everything else is on one single board for the C and CV, the CX clock module is an additional piggy back card that rests over the main cpu.

Re: HP41CX Copper Interconnectors

*Message #4 Posted by **Raymond Del Tondo** on 26 Oct 2004, 7:52 p.m.,*
in response to message #3 by Randy

I'm not quite sure,
but I think my first 41C had those metal needle pins
like in the card reader or the older HPs
to connect the CPU board to the kbd pcb.
At least some of my HP-41 CPU boards
still have the row of holes for the pins.

Raymond

I've seen the holes but never the pins. Where is David Smith when we need him?

Edited: 26 Oct 2004, 8:23 p.m.

Re: HP41CX Copper Interconnectors

*Message #6 Posted by **Tony Duell** on 27 Oct 2004, 6:54 a.m.,*
in response to message #4 by Raymond Del Tondo

I've never seen one with pin contacts (and it's not mentioned in the service manual either). My early (1940Axxxx serial number, still with all the bugs mentioned in Wlodek's book) 41C has the pressure connector.

Re: HP41CX Copper Interconnectors

*Message #7 Posted by **J.W.** on 27 Oct 2004, 11:05 a.m.,*
in response to message #3 by Randy

I checked on the Museum web site as Raymond suggested and found this by Stefan Vorkoetter (under the Museum Home Page under Repairs and Batteries - Repairing the HP41CX):

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=2

and I quote from this artcle by Stefan:

"Notice the two rows of contact fingers between the top screw posts, and the two long rows and one short row between the bottom screw posts. (I think the 41C and 41CV don't have the short interconnect.)"

and

"On my HP-41CX, one of the three flexible CPU board to keyboard interconnects was missing. It was most likely lost during a previous repair attempt (the rubber feet were also missing). I decided to do away with the interconnects entirely, and hardwire the CPU board to the keyboard. This has the advantage that the connection will no longer rely on the integrity of the bottom screw posts."

and

"Next, cut 4 pieces of wire of the appropriate length to reach from the middle row of contacts on the keyboard to the corresponding contacts on the CPU board. Strip 1/8" insulation from each end, and solder them in place as shown."

This indicates on the HP41CX model that Stefan had, that there were 3 copper interconnectors between the screw posts - 2 long and 1 short(middle) - which he replaced with 16 + 16 + 4 soldered wire connections.

On the second of the pictures in this article by Stefan you can just make out the row of 4 extra contacts (LHS)in between the 2 rows of 16 contacts near the bottom screw posts.

Re: HP41CX Copper Interconnectors

*Message #8 Posted by **Diego Diaz** on 27 Oct 2004, 12:53 p.m.,*
in response to message #1 by J.W.

Hi all,

Those pins are not intended for connecting the CPU board as they are "already" connected to it thru the "main" two rows.

Namely, (facing keyboard PCB with display on top) numbering left to rigth bottom and right to left top (just like the pins on an IC), we find that these four pads are connected to:

1 - 2 GND

2 - 32 Vcc

3 - 31 Vbat

4 - 23 Vin

It looks like just testing/power purposes so far.

Hope this helps.

Diego.

Memory Failure

*Message #1 Posted by **Ed Look** on 25 Oct 2004, 8:49 p.m.*

Sorry, didn't mean to scare anyone; I meant my noggin, not any calculator.

I have forgotten: what was included in the package the HP39G (no +) came in? Was there a connectivity cable?

Re: Memory Failure

*Message #2 Posted by **Mike (Stgt)** on 26 Oct 2004, 4:20 a.m.,*
in response to message #1 by Ed Look

IMHO there had been different packages, those w/o and later _with_ cable and SW. At least my HP-40G was with everything at the same price as formerly the bare calculator, IIRC.

Ciao.....Mike

Re: Memory Failure

*Message #3 Posted by **Ron Ross** on 26 Oct 2004, 10:55 a.m.,*
in response to message #2 by Mike (Stgt)

I don't believe Hp supplied a cable with the Hp39G (as it had IR, and they were CHEAP!!!!). Later they may have provided a cable, but the early released Hp39G had nothing but a book and batteries. The Hp 40G came with a cable.

It is unfortunate that Hp did not provide any cable with the Hp39G and more or less figured one geek would buy and then share with the rest of the class via IR. What really happened was a geek would buy an HP49G and pass on the Hp39G. Anyone dumb enough to buy a 39G was left in the cold for support as a geek would have a 49G and not share his cable (would you trust your only cable to an obvious unknowledgable user). And usually this same customer actually just bought a Ti anyway.

Just my ranting AGAIN.

Gee, why doesn't HP just listen to me? I could solve all of these problems. .. 8^)

Re: Memory Failure

*Message #4 Posted by **Mike (Stgt)** on 26 Oct 2004, 11:02 a.m.,*
in response to message #3 by Ron Ross

So the subject line was correct for my append too <VBG>

Ciao.....Mike

Re: Memory Failure

*Message #5 Posted by **Ed Look** on 26 Oct 2004, 1:56 p.m.,*
in response to message #3 by Ron Ross

Ron, would a 49G cable do?

Though, I wonder if I should pursue this anymore, as when my son gets to high school (still a few years off), I think I'll spring RPN on him.

The only reason why I got this one, the 39G, for him was that it was cheap as you said, it was algebraic, since he's really barely out of grade school, and it's HP. Yeah, yeah, I've read all the rants on this forum and on the 48 newsgroup; it's a loyalty out of memory...memories of how a versatile, rugged, and powerful 34C rescued me from hours of drudgery by its power from the keyboard and program memory. I myself started out with a TI algebraic until it bit the dust (only a year or so of use!!!) from wear. After discovering RPN... well, there's no turning back! At least his 39G will last much more than the year+ that my TI SR-40 lasted.

The cables are the same

*Message #6 Posted by **Ron Ross** on 26 Oct 2004, 2:40 p.m.,*
in response to message #5 by Ed Look

Yes, the cable for the 49G is the same cable for the 39/40G. In fact there is an adapter plug that should have come with the 49G so that the cable will also work for the 48G also.

Casio 115, A Better FE Calculator Alternative For Those Short On Bucks

*Message #1 Posted by **J.C. Randerson** on 25 Oct 2004, 2:47 p.m.*

Lent my 33s to a guy to prepare for the fall FE test. Despite this guy's long HP48 use, he did not like/could not get used to the 33s. He returned my 33s and went out and bought a Casio 115 for just $14.95 at Walmart.

I played with his Casio for a while. I liked the looks of of the machine, a sleek silver design. Considering the ugliness of the 33s cowcatcher design, the Casio looks better. Using it was very easy and intuitive, algebraic entry, while not my favorite, has the beauty of being able to enter in very long expressions with no error. The features included exact fractions, numeric differentiation and integration, matrices, complex numbers and a solver. All of these worked without a hitch.

In short, I was suprised at all the features included in a machine just $15 in cost. To anyone out there needing a calculator to take that abomination of an FE test, and not wanting to spend hundred$ on an HP32 or even $60 on an HP33, I would heartily recommend the Casio.

All of this begs the question that others have asked here off and on: where is HP's great little rocksolid, bulletproof, works like a champ, cheap, (say < $25) RPN scientific? Only in our dreams, I fear...

Re: Casio 115, A Better FE Calculator Alternative For Those Short On Bucks

*Message #2 Posted by **Ron Ross** on 25 Oct 2004, 2:53 p.m.,*
in response to message #1 by J.C. Randerson

Considering that Hp used to sell the Hp20s for about $30, why can't they sell a great $30 RPN. The Hp20s was an excellent quality calculator with the preferred (by us RPN bigots) keyboard and layout. Could have included an RPN mode and would have made this a great must have calculator. Sold well even though it was 2-3 times more than other algebraics. Only recently discontinued to sell the $15-20 Hp30s or $10-15 Hp9s. What progress!!!

Re: Casio 115, A Better FE Calculator Alternative For Those Short On Bucks

*Message #3 Posted by **hugh steers** on 25 Oct 2004, 7:42 p.m.,*
in response to message #2 by Ron Ross

indeed. ive often said that the hp20s is an underrated machine. its biggest drawback for hp fans is the lack of rpn, which is a mistake. otherwise, the machine itself is a great little scientific. just the sort of thing to use on the road. compared to the 32sii and the like, its light on functionality, but it benefits from a much cleaner layout and highly readable display. the well built pioneer style and slim design makes for excellent pocket size.

the rom program idea is quite neat. a great plus for a remake (as well as more memory), would be to be the ability to call up a whole library of programs. roms are cheap now.

Re: Casio 115, A Better FE Calculator Alternative For Those Short On Bucks

*Message #4 Posted by **Namir** on 25 Oct 2004, 2:59 p.m.,*

in response to message #1 by J.C. Randerson

During the HHC 2005 conference in San Jose, Richard Nelson made an interesting comment to the folks from HP's calculator division. Richard suggested that HP manufacturs an HP-45-like calculator and sell it for $20. HP can also give it away to teachers' conference to get folks' feet wet with RPN.

*Message #5 Posted by **Chan Tran** on 25 Oct 2004, 3:02 p.m.,*
in response to message #4 by Namir

My brother who teaches math in college recommends the 115 for his students. He likes the thing quite a bit. His favorite calc is a 41CX blanknut I gave him years ago.

...or, how about a TI36X as an FE Calculator Alternative For Those Short On Bucks

*Message #6 Posted by **Bob** on 25 Oct 2004, 4:14 p.m.,*
in response to message #1 by J.C. Randerson

This is exactly why when I saw TI36X solar powered calcs for sale for about $7 each, I bought a half dozen of the things. By buying that many, I actually got a better price. I also bought some HP10BII's at about $8 each.

I am a die-hard RPN fan, and for real calculating I prefer a 42S or a 48GX, but for less than $10 the TI36X is a great calculator. (It is about $18-20 at your local Walmart)

Besides, when it falls on the floor, I don't gasp and inspect it for damage. When one of our kids forget their calc (college), I just give them a new TI36X to use as a backup.

I prepared for and took the FE and PE with my 42S and 48GX calcs, but they are not necessary to pass the test. Mastery of your subject area, knowing your calc of choice inside and out, time management, and controlling your anxiety are the essential components of passing.

Re: ...or, how about a TI36X as an FE Calculator Alternative For Those Short On Bucks

*Message #7 Posted by **Norris** on 25 Oct 2004, 7:38 p.m.,*
in response to message #6 by Bob

TI does not seem to be keeping pace in the non-graphing scientific market. For $15, you can get a Casio 115 that can do complex math, numeric integration and differentiation, solve cubic and quadratic equations, and solve simultaneous linear equations with 2 or 3 unknowns. It doesn't hurt to have these features for the EIT exam; they can save time if you know how to use them.

The TI-36 offers fewer features for (typically) about the same price, so it seems less attractive than the Casio.

You are right, for $15, it sounds hard to beat. However, I do all of simultaneous equations, quadratics, and calculus by hand anyway, testing or at work. I don't want to make a keying mistake. Besides, I was faster that way. The FE/PE exams are all about time management. I saw several folks growling and smacking their calc during these exams. Just having a powerful calculator will not allow folks to pass these tests.

Still, for a combined cost of about $14 I could take my TI36X and my HP10BII and have a great combination for these tests.

Re: Casio 115, A Better FE Calculator Alternative For Those Short On Bucks

*Message #9 Posted by **Norris** on 25 Oct 2004, 6:20 p.m.,*
in response to message #1 by J.C. Randerson

The current-model calculators that seem to get the most mention among EIT/PE candidates are the Casio 115 (full model name is the Casio FX-115MS Plus), the HP-9G, and the HP-33S. The 115 is the value choice for $15. The 9G is more expensive, at $30, but offers some programmability. The 33S is the most expensive, at $60; it offers nearly unlimited equation storage, the most programmability, and RPN.

A few limitations to the 115:

-- The 115 has no financial functions. These come up on the EIT exam, which includes engineering economics problems. The 33S can be easily programmed with the time value of money equation, and is therefore much faster for such problems. If I were using the 115 on an EIT exam, I might take a cheap financial calculator as well.

-- The 115 has an equation solver, but I believe that it only handles cubic and quadratic equations. It is not nearly as versatile as the solver in the 33S.

HP can sell inexpensive scientific calculators (6S, 9G, 9S, 20S, 30S). But for whatever reason, they cannot or will not sell inexpensive scientific calculators with RPN.

Casio 115 and solvers [long]

*Message #10 Posted by **Crawl** on 25 Oct 2004, 8:36 p.m.,*
in response to message #9 by Norris

>-- The 115 has an equation solver, but I believe that it >only handles cubic and quadratic equations. It is not >nearly as versatile as the solver in the 33S.

The quadratic and cubic solvers can give imaginary and real roots. But it also has a general solver that can find a real root to (virtually) any equation with something like Newton's method.

Actually, virtually *any* current 2-line algebraic calculator with an "ANS" memory key can fairly easily find roots. Just enter any number as a seed, hit equals, then type "ANS - f(ANS)/f'(ANS)", (with f and f' being the function you're zeroing and its derivative) and hit "=" over and over to iterate. (This could be used, for example, with the TI-30XII, which doesn't have a solver)

But the 115 does it better, since you don't need to find the derivative, and it iterates automatically, without need to hit "=" over and over.

BUT, the 115 has an overlooked feature that I have used to solve 2 variable equations with Newton's method!

It's based on the line copy feature. It's possible to copy several commands to one line, and then repeatedly step through all of them by hitting "=" over and over. The example the manual gives makes this seem like a completely useless feature, until you realize the lines can both make use of variables and update them.

It's not that great compared to calculators that can *really* program, and this method only works for simple cases (there's something like a 70 keystroke limit). But maybe some calculator junkies would be interested nevertheless.

As an example, I once tried to solve the complex equation Z = exp(Z), or (x + y i) = exp(x)(cos(y) + isin(y)), or

x - exp(x)cos(y) = 0 = a y - exp(x)sin(y) = 0 = b

So, Newton's method would involve

[da/dx da/dy] [-dx]

[db/dx db/dy] [-dy]

==

[a]

[b]

It turns out for this example, da/dx = db/dy, da/dy = -db/dx. To store da/dx, I used the variable "C", and for da/dy I used "D".

So, this is how you type in the problem.

2 -> X

2 -> Y [Arbitrary seeds]

X-eXcosY -> A

Y-eXsinY -> B

1-eXcosY-> C

eXsinY -> D

X + (BD - AC)/(C2 + D2 -> X

Y - (CB + DA)/ (C2 + D2 -> Y [Cramer's rule]

After this, you hit "up" enough times to take you to the first non-seed line (X-eXcosY -> A) and hit copy. Then hitting "=" over and over iterates. This sure beats typing in those formulas over and over for every step, and it converges pretty quickly, too.

You can also use this sort of trick with this calculator to, for example, making adding series easier.

A critique of the Casio fx-115MS

*Message #12 Posted by **Karl Schneider** on 26 Oct 2004, 4:08 a.m.,*
in response to message #1 by J.C. Randerson

I have a fx-115MS (not "Plus") that I bought about a year ago. I was intrigued by its complex-number functions for a mere $15 price. I wanted to see "modern thinking" in calc design, and see how good the complex-number capability was.

Summary: Very impressive set of features, speedy, and a crisp, highly-legible LCD display. Lotta stuff for the price. However, it is not a well-engineered, cohesive tool; it is more of a "learning aid" for pre-collegiate students.

J.C. Randerson posted about the "Casio 115":

> Quote:
>
> Using it was very easy and intuitive,

Can't say that I agree with that:

- The keyboard is a bit cluttered; a few things are unintuitive.
- The so-called "Super Visually Perfect Algebraic Method" (S-V.P.A.M.) offers little consistency for entering operations in expressions -- sometimes prefix, sometimes postfix, sometimes infix...
- Simple tasks are buried in deep "mode menus". How does one speciffy 5 decimal places via "fix"? [mode][mode][mode][mode][mode][1][5]. Yeesh!

> Quote:
>
> The features included exact fractions, numeric differentiation and integration, matrices, complex numbers and a solver. All of these worked without a hitch.

Yep, it's got all that -- although "matrices" is limited to solution of real exactly-determined linear systems of order 2 or 3; and the "complex numbers" function set is limited to basic arithmetic and integer-valued exponents.

But, here's the problem: These functions are executed though different "modes", which don't work together *cohesively* as on, for example, the HP-15C. The fx-115 user enters "CMPLX" mode to perform complex-number calculations, which makes other features temporarily unavailable. The fx-115 user enters "EQN" mode to solve a linear system or polynomial of order 2 or 3, then loses all the entered coefficients when a different mode is selected.

As long as the user does only one thing at a time (whatever the "lesson of the day" is), I guess that's OK.

> Quote:
>
> In short, I was suprised at all the features included in a machine just $15 in cost.

Me too, but if I wanted a straightforward NCEES-approved calc for the PE exam, I'd go with my HP-32SII or TI-36X. The 33S could be a repository of equations, including TVM.

I'd also prefer the discontinued HP-11C, HP-15C, or HP-20S over the Casio. All of these meet their standards, and I have lobbied NCEES to add them to their list.

HP-95LX Info for those who need it

*Message #1 Posted by **Bill (Smithville, NJ)** on 25 Oct 2004, 1:19 p.m.*

There's been several posts requesting info on the HP-95LX.

The following Web site has some good technical information along with links to the various memory card drivers sundrv and acecard. Hope this is of some help.

http://www.daniel-hertrich.de/95lx/

To my knowledge, no HP-95lx manual exists in PDF format... but the Super HP-200 web site does have the HP-200LX manual in PDF -

http://www.palmtop.net/cgi-bin/search.pl?Query=manual

Part of the HP-95LX developer guide is at-

http://www.daniel-hertrich.de/download/

A text file on using Stacker on a 95LX memory card:

http://www.textfiles.com/computers/tec029.txt

Interesting article on HP-95 used by Marine:

http://www.cicorp.com/palmtop/USMC/Marines.htm

The HP-95LX was my first PDA, then moved to HP-200LX which I still have and use. Hopefully the above will be of some help to those just now discovering these neat machines.

Bill (12345)

The 12MB manual is at http://h10032.www1.hp.com/ctg/Manual/bpia5259.pdf

Ciao.....Mike

Re: HP-200LX Manual

*Message #6 Posted by **Bill (Smithville, NJ)** on 26 Oct 2004, 7:47 a.m.,*
in response to message #4 by Bill (Smitchville, NJ)

Gordon,

Thanks for the e-mail. It's interesting - the manual you sent, which is the same one that's on the HP site, is Edition 1 dated January 1996. The manual at the Super site is Edition 1, dated October 1996. There seems to be some differences between the two. Both manuals list a HP Singapore address, but each have different street addresses.

I wonder if the manuals were for different markets.

New Allschwil meeting date !

*Message #1 Posted by **Raymond Del Tondo** on 25 Oct 2004, 12:08 p.m.*

Hello all,

as subject indicates, we worked out a new meeting date.

It's the 27th of November, 2004 .

Wlodek Mier-Jedrzejowicz plans to attend,
as well as Christoph Giesselink (Mr Emu48),
Raymond Del Tondo (me;-),
and Matthias Wehrli (as host).

We hope to have as many attendees as possible.

Please use this unique chance to meet Wlodek,
one of the internationally well known persons
who has done very much for the HP community.

It's also a good place to meet other HP fans,
the more the better.

Please reply to this posting, so Matthias can get
an idea how many people will actually attend,
which is important for the room planning.

Detailed questions can be directed to Matthias at
museum@hp-collection.org

Remember:
You won't have another chance to meet Wlodek
in your neighbourhood in the near future,
so please make it possible.

Hope to see you all in Allschwil on 27th of November, 2004

Regards,

Raymond

Guten Tag.

Ich habe interresse an Ihrem Meeting teil zu nehmen in Allschwill bei Basel und einige Erfahrung uber HP Computewr zu teilen warte auf ihre Nachricht. Danke:

Gaston So I m most interested in your meeting to exchange informations about HP computers waiting for info Place is Allschwill near Basle?ok

Re: New Allschwil meeting date !

*Message #3 Posted by **Meindert Kuipers** on 25 Oct 2004, 1:42 p.m.,*
in response to message #1 by Raymond Del Tondo

This looks like a good date for me, I will check my schedules and let you know in a week or so.

Meindert

Re: New Allschwil meeting date !

*Message #4 Posted by **Mike (Stgt)** on 25 Oct 2004, 1:58 p.m.,*
in response to message #1 by Raymond Del Tondo

Not sure yet.

Ciao.....Mike

Re: New Allschwil meeting date !

*Message #5 Posted by **Robin (CH)** on 25 Oct 2004, 4:54 p.m.,*
in response to message #1 by Raymond Del Tondo

Hmm, that's right on my birthday! Maybe I could expect some nice old HP's as present, if I could manage to be there ;-) ;-) ;-)

But seriously, I'm already busy on this day..

I wish all who does participiate an very interesting meeting :-)

Robin

Preliminary topic list...

*Message #6 Posted by **Raymond Del Tondo** on 26 Oct 2004, 7:44 p.m.,*
in response to message #1 by Raymond Del Tondo

Wow, the list is growing!
That's great:-)

Some topics of the meeting include:

- Wlodek's books & infos from overseas (Wlodek M-J)
- Interfacing & external device control with HP-IL (with papers from Christoph Klug)
- Emu41 & HP-IL data transfer
- burning EPROMs for the HP-41
- Clonix41 & NoVRAM
- Saturn emulators: Emu42, Emu48,... (Christoph Giesselink)

- Serial data input on the HP-28S (Christoph Giesselink)
- MLDL2000 (Meindert Kuipers)
- something special (maybe Emu41 related?) by Francois Garnier

- CCD OS/X and future extensions to this ROM (me)
- Tips on using Warren Furlow's SDK41 (me)
- Demo of the unique W&W HP-IL interface for the *HP-48* (me)
- Modular system extensions for the HP-48 G series (me)
- ... (more to come. See the 'edited' symbol)

This is a good place to discuss HP portable
computer related stuff with other HP enthusiasts,
and this is also a good place for trading...

Also you'll have the chance to see parts of one of
the biggest collections of HP calculators in Europe,
including some rare birds, which you may have never seen before.

Any further suggestions are welcome!

Raymond

*Message #8 Posted by **J-F Garnier** on 1 Nov 2004, 6:04 a.m.,*
in response to message #6 by Raymond Del Tondo

I will attend, too!

I'm going to prepare something to present...

Jean-Francois

Re: Preliminary topic list...

*Message #9 Posted by **Mike (Stgt)** on 2 Nov 2004, 5:28 a.m.,*
in response to message #8 by J-F Garnier

Hi Matthias!

Do you have an adequate room for the meeting? Otherwise I could offer a photo studio with all facilities: an italian resto and the most authentic chinese one in the surrounding of Basle, both to reach within 1 minute on foot. I tried to phone you when I was on the "Häfelimärt" this WE, but w/o phone number it's a bit difficult <G>

Anyway, it was funny to see the tramway No. 6 with destination "Allschwil", what has an additional aspect owing to your meeting.

Ciao.....Mike

Re: Preliminary topic list...

*Message #10 Posted by **Erik Ehrling (Sweden)** on 2 Nov 2004, 6:03 a.m.,*
in response to message #9 by Mike (Stgt)

Hi!

I am considering joining in at the meeting if I manage to find a good flight ticket. Do you have a fixed starting time for the meeting? (Something in the afternoon like 15.00 would suit me absolutely best as it would allow for some travel time during the Saturday).

What room/sleeping options are there?

Best regards,
Erik Ehrling (Sweden)

Re: Preliminary topic list...

*Message #11 Posted by **Mike (Stgt)** on 2 Nov 2004, 7:09 a.m.,*
in response to message #10 by Erik Ehrling (Sweden)

Yes, if possible with a sleeping bag as the washing machine needs some fixing.

Ciao.....Mike

Re: Preliminary topic list...

*Message #12 Posted by **Matthias** on 2 Nov 2004, 8:44 a.m.,*
in response to message #11 by Mike (Stgt)

Hi party-people

Last time we met we started the meeting at 10h a.m. in my appartment.We had a small appetizer and some very interesting talks. As I see this time we have guest from all over Europe (what I´m very happy, thanks a lot to all of you!), so maybe we start the meeting at 11h, but you are wellcome the whole day fro 9h - xxh. Last time the last participants left arround 2h a.m. on Sunday. I can offer you a trip through Basel as well, just let me know when (Friday/Sunday). I got the same location room for workshops as last year, so we have place, tables, chairs, and sockets enough. Maybe it would be nice, when everyone brings along so small food/beverage from his home, so that we have an international buffet. Please let me know, if you will join our lunch, so that I can reserve place in a restaurant. Please let me also know, if I may share your email address to all participants, so that I can send you last infos by a circular mail.

Yours

Matthias

Re: Preliminary topic list...

*Message #13 Posted by **Mike (Stgt)** on 2 Nov 2004, 8:58 a.m.,*
in response to message #12 by Matthias

OK - so I cancel the photo studio.

Hi! I have checked on flight schedules and unfortunately there does not seem to be any direct connections from Gothenburg to Basel, and no alternative arrives before 2pm in the afternoon, so unfortunately it will not be worth the effort, maybe next year if I have more time to take a long weekend off.

My best regards to all participants in the meeting!
/Erik

Hi, Raymond.

Living in Switzerland, it would be possible to meet Allschwil near Basle.

Please give us some more information: are you a club, do you have some internet site regarding your activities? Where is the meeting point? Do you need some fee for your organization costs?

Thank you for information.

Valentino

Hi Valentino!

The page I made for the last year's meeting is a very-very limited focus on just one subject. I tried to deal old machines and in the end I was lucky not to take home again an HP9000-300 with all peripherals. But mainly the subject is on _using and emulating_ HP's calculators. For the first time I may show my NutEm to an interested audience and how it's useless as it runs only on IBM mainframes (and emulations thereof).

For your other questions, I am sure Matthias sent/sends you an eMail.

Ciao.....Mike

Hi Valentino,

it would be nice to meet you in Allschwil, too.
Most of us are just HP calculator fans,
who met somehow through either comp.sys.hp48 ,
the hpmuseum forum, TOS, or maybe eBay .
Some are even members of the HPCC (www.hpcc.org) .
Amongst us there are collectors of HP related stuff,
mostly users of HP equipment, and even some people
who still develop hardware and/or software for HPcalculators.

We had a very interesting meeting in Allschwil last year,
and want to continue with a meeting on 27th of November this year.

Matthias Wehrli is our host for the meeting. You can contact him directly
regarding any detail questions at museum@hp-collection.org .

He also has an interesting web site: http://www.hp-collection.org/

Regards,

Raymond

Hi fans, collectors, users, developpers, programmers

The time runs fast and our Allschwil meeting is right next door. Please let me know if you want to join us too. The date is the 27.11.2004. Up to now we are 8-9 persons. I will contact all participants in about 5 days for

further informations.

Matthias

Allschwil meeting and real world interfacing

*Message #21 Posted by **Christoph Klug** on 8 Nov 2004, 4:13 a.m.,*
in response to message #20 by Matthias

Dear handheld computer enthusiasts,

First of all, great thanks to Matthias and Raymond, for managing the Allschwil meeting at 27. November 2004.

Now it seems, that this meeting will be bring together the gigantic people of the European handheld computer scene. Reading the participant names is like discovering the best list of today HP handheld computer specialists, leaded by star guest Wlodek.

Long time it seems, that it will not possible from me side, to come to Allschwil. But after some discussions with my family, after shifting some target dates and by booking an overnight train transfer to Basel now I am able to come.

As most of you expect from me, I will present you some nice HP41 and HP-IL interface applications during the meeting :

+ HP-IL/PC Interface Card

+ Uploading ROM´s from HP41 to EMU41 and CLONIX

+ HP41 & HP3468 Digitalmultimeter

+ I/O-Board (temperature measurement)

+ IL2000 (audio measurement / loudspeaker measurement)

With best regards and waiting to meet you - Christoph Klug

Well, my belly has a noticeable size, but the word "gigantic" is _not_ adequate. OK, compared with you, you may be right <sigh>

Your overwhelming words may be adequate for the announced participants, anyway I feel a bit sad about other HP41-emulator programmers are missing: Hrastprogrammmer, Berd Abel, ... and the non-European too.

Ciao.....Mike

BTW: I was asked about an HP41 emulator for Linux. TIA 4 all hints.

HP41 ROM Checksum

*Message #1 Posted by **Meindert Kuipers** on 25 Oct 2004, 10:18 a.m.*

While writing the PC user interface for the MLDL2000 I thought it would be nice to show some info about the ROM being loaded into the MLDL. One of the items would be the ROM checksum at the end of the ROM with the indocation if it is OK or not. I thought I had figured out the algorithm, but I am failing miserably in translating it to Delphi.

My interpretation is:

Simply add all 10-bit ROM words together, except the checksum itself. For any overflow (carry) generated in a 10-bit addition a 1 extra is added. The calculated checksum is the 1's complement of the result of the additions. What am I missing here?

Re: HP41 ROM Checksum

Are there any HP calculators used in German schools?

*Message #1 Posted by **Mike (Stgt)** on 25 Oct 2004, 8:55 a.m.*

I just looked through some "Bildungsserver" (information offered by ministry of education) to find a list of calculators allowed at schools. What I found are links to three "market companions" of HP, one of them showing a list in which county which of his models is allowed at what school. Nothing from HP.

And then this http://www.landeswettbewerb-mathematik.de

Anybody here who knows which HP calcs are allowed in which school? Seems to be an issue to find out.

Ciao.....Mike

Re: Are there any HP calculators used in German schools?

*Message #2 Posted by **Frank Boehm** on 25 Oct 2004, 4:52 p.m.,*
in response to message #1 by Mike (Stgt)

There is no common rule which calculator to use. This is mostly a school-wide decision; general consent is that the calculator has to be of common (AOL) logic and being non-programmable, preferably being cheap and non-destructable too. To reduce support (aka teaching) troubles, a class purchase is offered at a discounted price, at times a certain model is required (this might be the case in some states). Usually you could use whatever you want though (which happens in higher classes). I remember using my Casio fx-7000 and later 28 C - good thing the teachers didn't know about them being programmable :)

The link you posted is for a state-wide challenge targeted at schools. TI being a sponsor is not a surprise - TI has been a supplier of "standard calculators" for 25 years now; with HP being far too expensive.

Re: Are there any HP calculators used in German schools?

*Message #3 Posted by **Mike (Stgt)** on 26 Oct 2004, 5:10 a.m.,*
in response to message #2 by Frank Boehm

Yes, HP = High Price <G>, as student I payed 500 Deutsch Marks for a *used* HP-41C, that was the complete monthly budget. Well, others laught at me, "look what I payed for my XYZ", but I was at most the first with correct results when others still typed on their XYZ.

I have not the right to compare HP with XYZ, I never ever after touched something else than HPs, but at school the price is an heavy argument. My decission as student was driven by 'RPN and programmable'. Last WE I talked with a Math teacher and understand now a bit his point of view. But when I scann the internet with this viewing angle I am very astonished that HP calcs seem to be not even a choice to think about - at least here in Germany. I had to learn that looking at Colin Croft's site only for Math education is a limited focus.

HP 49G+ keypad fixed?

*Message #1 Posted by **Jake** on 24 Oct 2004, 8:57 p.m.*

So I finally broke down and turned in my old 49G for the 49G+. The 49G, although a great calculator, was just too slow to operate. Well the university bookstore had two different packages. I picked the wrong one apparently. The serial number on my unit begins with CN334... So that places it's manufacturing sometime in 2003 (September?). Don't ask me why they still had one that old. It's interesting. The right half of the keyboard seems perfect. The keys aren't noisy at all. But as you move to the left side of the keyboard, every key is extremely loud (especially toward the bottom). Also, the ON key sits slightly more sunken than the others (by design?). Some of the keys miss but not if I consistently press firmly. When you press any of the keys on the lower left side, you can see the rest of the keys sink slightly as if the circuit board is not really secured on that side. So here is my question. I know that HP will replace the calculator. But have they really fixed the keys? Is it even worth replacing it? Does anyone out there have one of the more recent units? If so, how does the key situation seem?

Thanks, Jake

Re: HP 49G+ keypad fixed?

*Message #2 Posted by **James M. Prange** on 24 Oct 2004, 10:28 p.m.,*
in response to message #1 by Jake

As for the ON key being lower than the rest, I think that it's safe to assume that that's by design. The same is true of all the 48 series, the 49G, 16C, and I suppose many other HP calculators. The idea is that with the ON key being lower than the rest, the calculator is less likely to be accidentally turned on when it's stored in its case. Note that the 28 series, with its folding design, has the ON key the same height as the others.

Regarding serial numbers, the newest ones have a sticker on the back of the package with a serial number on it. The serial on the outside of the package doesn't match the serial on the back of the calculator, but I expect that there should be some correlation between them. My second replacement 49g+ came with a package serial of CNA423xxxxx, a serial of CNA419xxxxx stamped in the back of the case, and an internal serial of CN424xxxxx.

Regarding the keyboards, the newer ones aren't as bad. The keys seem quieter, perhaps a little easier to press, and I haven't seen reports of some keys seeming poorly attached on them. There's still a problem of keystrokes not always registering if I press only until I feel the click. My first 49g+, serial CN331xxxxx was very inconsistent in registering keystrokes; some keys were much worse than others. My first replacement, CN402xxxxx, was noticeably better, but one side of the hinge for the ENTER key eventually broke. My current replacement seems the same, but whether they've corrected the problem with key hinges breaking, I suppose that time will tell.

Regarding the missing keystroke problems, I'm used to the 48 series keys, where when I feel the "click", I can be sure that the keystroke has registered. On my 49g+, if I press until I feel the key definitely "bottom out", then I can be sure that the keystroke has registered, but if I type "normally", perhaps 5% of the keystrokes will be missed. When I realize that some keystrokes have been missed, I remember that the "just press firmly" method is required for the 49 series, and all is well for a while, until I forget and revert to my normal typing style. All keys seem about the same on both of my replacements.

Some users write that their 49g+ doesn't miss any keystrokes. I expect that it's a matter of individual typing styles.

Turning on the "Key Click" in MODE causes a short beep when a key registers. If you're in an environment where it's quiet enough to actually hear the beep, and it's not annoying to others, this may help to alert you to missing keystrokes. Other than that, watch the display, especially for the shift and ALPHA keys, and before any "execution" keys. Of course, "just press firmly".

Some insist that the missing keystrokes are due to a software problem that can be fixed in the next ROM. I suppose that there could also be a software problem, but I'm sure that there's a hardware problem.

For the problems you describe with your CN334xxxxx, I'd say that it would be worthwhile to ask for a warranty replacement. The new one may not completely satisfy you, but it won't be as bad.

For my second replacement, they offered me the option of giving them my credit card number, and keeping my current 49g+ until the replacement arrived with a prepaid return shipping label. The old one had to be returned within ten business days to avoid having my credit card charged for the replacement.

The replacement came with a postcard to receive a free subscription to a business magazine, but the fine print says that there's an alternative of receiving $9.99 instead, provided that I send the UPS barcode and the original receipt within 90 days of the original purchase. I didn't qualify, but as long as you still have your original purchase receipt, you may be able to get the $9.99.

Regards,
James

Me neither, but in the words of Robin Williams' Genie, it made me look!

Re: HP 49G+ keypad fixed?

*Message #4 Posted by **Francesc Casanellas** on 26 Oct 2004, 6:16 a.m.,*
in response to message #1 by Jake

I decided also to buy an HP49G+ recently, ensuring that it was a recent manufactured one. (I was using an HP49 after having used practically all HP calculators)

1. The ON key has been always shorter in most HP calculators, to avoid the calculator to be inadvertently turned on. Note that this was not needed in the HP49G because it had a hard cover, but the HP49G+ has a soft cover again as the HP48.

2. My calculator has a serial number CAN 429… I was very critical with previous units and the HP49G, but I have to recognise that my HP49G+ is blameless. So I would recommend anyone the new HP49G+ (be sure that the number is > 400).

Perhaps you would like to use the ->KEYTIME feature to adjust the anti-bouncing time of the keyboard. It comes with the value 0 from factory and I did not need to increase the value in my unit (this was a must in the HP49G).

Edited: 26 Oct 2004, 6:19 a.m.

Re: HP 49G+ keypad fixed?

*Message #5 Posted by **Ed Look** on 26 Oct 2004, 2:00 p.m.,*
in response to message #4 by Francesc Casanellas

By and large, I agree, but I must still testify that there are still a few missed keypresses, though now much, much fewer.

But admittedly, sometimes, if I am slightly distracted, I press the keys... well, abnormally, that is, differently than I ordinarily would and I notice that it kind of then that there is the highest chance of a missed keypress, for example if I gently and slowly squeeze down, sometimes, it doesn't register. A sharp, quick push usually works (better).

Re: HP 49G+ keypad fixed?

*Message #6 Posted by **Francesc Casanellas** on 26 Oct 2004, 5:48 p.m.,*
in response to message #5 by Ed Look

I have tried for a long time to press very gently and slowly all the keys and I have been unable to get a missed keypress.

It would be interesting to know if the different behaviour between your machine and mine depends on manufacturing tolerances or on manufacturing improvements.

According to the salesman, my calculator was imported very recently (I live in Spain) and has the number CNA 42900683.

Could you please tell me which is your serial number?

Note: As James M. Prange suspects, this is NOT a software problem. It is just a hardware problem (I am a design engineer well acquainted with this problem). So if someone has this problem, it will NEVER be solved by a new software. Perhaps pressing hard and many times the faulty key will help.

Edited: 26 Oct 2004, 6:03 p.m.

Re: HP 49G+ keypad fixed?

*Message #7 Posted by **Ed Look** on 26 Oct 2004, 8:24 p.m.,*
in response to message #6 by Francesc Casanellas

After you posted, I tried the same thing on my 49G+. Admittedly, I didn't find any missed presses this time... at all. I sincerely hope I am remembering incorrectly.

Honestly, if from now on I find one, maybe two or three more missed keypresses over a reasonable period of time, I won't care at all.

I do know that even with the 34C, 32SII, 48G, and 48G+, every long once in a while, I miss a press.

Like one person here said, it just might be the way I hit the keys. I'm glad you posted.

Re: HP 49G+ keypad fixed?

*Message #8 Posted by **Ed Look** on 26 Oct 2004, 8:27 p.m.,*
in response to message #6 by Francesc Casanellas

Oh, and my S/N begins with CNA41... on the back of the calculator; the label on the packaging says instead, CNA42...

Re: HP 49G+ keypad fixed?

*Message #9 Posted by **Framcesc Casanellas** on 28 Oct 2004, 6:30 a.m.,*
in response to message #8 by Ed Look

After having used a lot my new HP49G+ these last days I regret to recognize that I do have missing keystrokes.

This will never happens when I just try the keys one by one, regardless of how I press them, but after the machine has been working hard.

So my conclusion is: - Mechanically, the new keyboards are blameless.

- I suspect that from time to time the garbage collector operates and during this time the keyboard is inoperative. It is just like in the HP49G with the original software, but becausse the machine is faster, the default is less aparent.

I have to contradict me, and say that in this case the default can be corrected by software. I think that the HP49G+ is worse in this aspect than the HP49G with the new software 1.19-6 which made the problem practically unnoticeable.

Edited: 28 Oct 2004, 6:33 a.m.

Re: HP 49G+ keypad fixed?

*Message #10 Posted by **Raymond Del Tondo** on 28 Oct 2004, 7:23 a.m.,*
in response to message #9 by Framcesc Casanellas

The bottom line is: The 49G/G+ miss key strokes.

Re: HP 49G+ keypad fixed?

*Message #11 Posted by **James M. Prange** on 28 Oct 2004, 1:34 p.m.,*
in response to message #9 by Framcesc Casanellas

Actually, "type ahead" still works while it's doing a garbage collection. Up to 15 keystrokes can be stored in the keyboard buffer.

But until the garbage collection is over, they won't be processed, and if the "Key Click" mode is enabled, there won't be any beeps. It's easy to think that a keystroke was missed, so I'll hit it again, and then when the garbage collection is over, all of the keystrokes will be fed in and the beeps will sound like a "chirp". It can be rather disconcerting.

But the key buffer and garbage collection are nothing new, although garbage collection may take longer with more free memory.

Regards,
James

Re: HP 49G+ keypad fixed?

I stand corrected. If I hold something flat against the keys, I see that it's the same height as the others. Somehow, when I look at the keybaord straight on, it looks lower to me. Maybe the color?

Regards,
James

Re: HP 49G+ ON key

*Message #13 Posted by **Francesc Casanellas** on 28 Oct 2004, 3:20 p.m.,*
in response to message #12 by James M. Prange

It is not the colour - in the HP49G+, many other keys are black. All the keys measure about 1.8 mm but the ON key is about 1.3 mm height. The 48 series has also a lower key and for the same reason. As I said, in the 49G the ON key has the same heigth as the other ones because the stiff protecting cover avoids the calculator to be turned on.

Re: HP 49G+ ON key

*Message #14 Posted by **Ed Look** on 28 Oct 2004, 10:04 p.m.,*
in response to message #13 by Francesc Casanellas

If I recall, many people here stated that they did not like the hard sliding cover of the 39G/40G. I watch my son with his (algebraic) HP (39G). He isn't like I was with my 34C (though I was probably fifteen years older than he is at the time I bought a 34C); he drops it (not often, thank God!), leaves it on the coffee table, dining table, floor (everywhere except desk)... and the thing still looks kind of new!

I wonder, would I like a sliding hard cover over my 33S or 49G+ (or even 48G) rather than the soft slipcases? The Charlemagnes, Pioneers, Voyagers, and Spices had very soft cases. I do remember feeling always quite nervous whenever I had to transport or carry my HP around. Hmmm... what would a 48G, G+, or GX look like with a sliding hard cover!!

Re: HP 49G+ ON key

*Message #15 Posted by **Francesc Casanellas** on 1 Nov 2004, 1:42 p.m.,*
in response to message #14 by Ed Look

After having used for many years the HP41, 48 series, and now the 49G+ with soft case, I can compare it with the HP49G with hard sliding cover.

The advantage of the sliding cover of the HP49G is that it can be fitted in the back of the calculator. This is invaluable when you work in a small place as in planes or trains: I remember

I was always worried trying to found a place to keep the case of the HP48G when I was flying.

In my opinion it is a pity that the HP49G+ has not a cover as the 49G. Just it had to be improved a little, as with time it becames too loose. The HP49 sliding cover idea was copied from a Japanese unit (I think it was a Casio), but mechanically the japanese I tried was better finished.

Actually, my Sharp EL-5520 that I purchased in 1987, although a "landscape" design, has a slide-on cover that can also be slid on underneath, and from either end, for that matter.

Regards,
James

Re: HP 49G+ update

*Message #17 Posted by **Jake** on 29 Oct 2004, 2:41 a.m.,*
in response to message #1 by Jake

Well I ordered the replacement unit from HP on Monday morning and it arrived here this afternoon (Thursday). Interesting though. My new one did not come in the retail package like I've seen some individual's have. It was just in a padded envelope in a box. Anyway, the SN# on this one is CN407... So that puts it in February of this year. I hoped for a newer one but it is obvious that there is a vast difference between this unit and the CN334... that I have. Obviously HP did make a small change in the keyboard design. Not nearly as many keys miss and the unit looks and feels more solid. So let's hope that this one either works like a champ or dies before my warranty is up. Thanks to everyone for your responses.

Probably not made in the same place.

Packaging for many things is made somewhere other than the stuff put in the package.

Re: HP 49G+ update

*Message #20 Posted by **Ed Look** on 30 Oct 2004, 1:02 a.m.,*
in response to message #19 by John

Yes, but they both refer to the calculator, not one to the calc and the other to the box! (Uh, right?)

Re: HP 49G+ update

*Message #21 Posted by **John** on 30 Oct 2004, 10:13 a.m.,*
in response to message #20 by Ed Look

What's your big deal with this? Guess I don't understand.

For some time now, the internal serial number hasn't matched the serial number on the back of the calculator. Now the one on the back of the box doesn't match.

So what?

Re: HP 49G+ update

*Message #22 Posted by **Ed Look** on 30 Oct 2004, 11:50 a.m.,*
in response to message #21 by John

Indeed!

Well, thanks for telling me that. I was wondering if one ever had to contact them and needed a serial number, whether it might ever get confusing.

Re: HP 49G+ update

*Message #23 Posted by **John** on 30 Oct 2004, 12:28 p.m.,*
in response to message #22 by Ed Look

The S/N on the back of the calculator is the one to use if you have to talk to HP. One could always ask HP if necessary which S/N they considered the one to use.

HP-33s variable programming

*Message #1 Posted by **Michel** on 24 Oct 2004, 6:55 p.m.*

Hi. I just bought a HP-33S and i don'T have any complaint about is physical proprieties. I just tried to program it but it seams that i have problem with variables.

Before, i have to told you that this calc is the only one i try younger than my HP-41CV.

So as my HP-41CV have, i cannot find the equivalent of the alpha toggle key. Well my native language is french but i can read english not to bad... If i name variables, the alphs seems to be on automatically but i can only enter one letter and that's it.

If i understand well the booklet, i have the choice of 26 letters but i'm unable to choose number names as variables. How to do that?

Like i want a variable to be A1, A2, A3 but after enterine the A, nothing else can be enter; where is the toggle switch for letter/number variables?

Thanks Michel

Re: HP-33s variable programming

*Message #2 Posted by **Norris** on 24 Oct 2004, 7:47 p.m.,*
in response to message #1 by Michel

The 33S (like its ancestors, the 32S and 32SII) can only use 1-letter variable names. Your only choices are the 26 letters from A to Z. You cannot have longer variable names, like A1 or A2 or AB or AC. Sorry.

However, you can also store values in the i-register and the 6 statistics registers (accessed indirectly). So the 33S has a total of 33 storage registers (not just 26).

Edited: 24 Oct 2004, 7:55 p.m.

Re: HP-33s variable programming

*Message #3 Posted by **Michel** on 24 Oct 2004, 8:10 p.m.,*
in response to message #2 by Norris

Well, i have a lot of programs to transpose from my HP-41 to my 33S; i will forget it because naming programs is the same law as naming variables as i can understand and i have more than 26 programs and variables...

What happens with time; technology is not suppose to improve? Does it cost more to make a calculator that can handle long name variables than a one character variable or program name?

I also just look for time and date setting but no more time module in that calculator! How much does it cost to add these in a calculator?

So i will wait for someone to hack the calculator in order to have long name variables and programs.

Is there another calculator for transfering my 41 programs so i can retire it - you know a lot of my coworkers are laughing about my 41 saying that it's "une antiquité" :-)). The real reason is that i don't want to break or lost it at work and want to leave it safely at home...

Re: HP41 replacement

*Message #4 Posted by **Randy** on 24 Oct 2004, 8:45 p.m.,*
in response to message #3 by Michel

The replacement for the 41 was the 42S. It had no clock, I/O (other than I/R printing) or expansion of any kind. The backward trend began there and never stopped. The 33S contains more memory than the 42S but it can only use one letter variables because it was designed to be a 32Sii replacement, HP's best selling RPN calculator of all time.

The move forward for many but not all was to RPL and the 28/48 series.

Yes, we may be dinosaurs but we're not yet extinct :^)

Re: HP-33s variable programming

*Message #5 Posted by **Norris** on 24 Oct 2004, 9:01 p.m.,*
in response to message #3 by Michel

If you want an HP calculator with powerful programming capabilities, then you should get a 48 or 49 series model. These can do everything that a 41 can do, plus a whole lot more. However, the programming language (RPL) is more complex than that used on the 41, and the documentation may not be as helpful.

The 33S is not intended to be comparable to the high-end 41, 48, or 49; it is an inexpensive low-end model. The 33S is a redesigned version of the older 32S and 32SII. These models had only 384 bytes of memory, so they weren't intended for serious programming. The 33S has much more memory, but it inherited the same limited number of variable names and labels as the 32S and 32SII. Apparently it was easy to add a larger memory chip, but hard to overhaul the firmware for more variables and labels.

I don't think the 33S can be hacked. The 32S and 32SII have the same architecture as the 33S, have been around since 1988, and have not been hacked.

Edited: 25 Oct 2004, 1:07 a.m.

*Message #6 Posted by **bill platt** on 25 Oct 2004, 9:33 a.m.,*
in response to message #5 by Norris

Hi Michel,

If you like the HP-41 logic and memory/programming structure, then you can run one of HrastProgrammer's hp-41c/cv/cx emulators on a 48g or gx and have a replacement for your 41. I think he also wrote it for the 49g---take a look:

http://www.geocities.com/hrastprogrammer/

regards (et regardez ;^),

Bill

HP 32SII key noise

*Message #1 Posted by **John Smith** on 24 Oct 2004, 5:08 p.m.*

I have two HP 32SII calculators that I bought two years ago. They are in mint condition, hardly used, but both of the calculators backspace key makes an audible "clicking" or "snapping" sound when coming back to the up position after being pressed. None of the others keys make this noise. The key feels exactly the same as the others, that is it has good travel.

Two questions. First, does anyone know what is causing the clicking sound? And will this affect its value?

Thanks.

Re: HP 32SII key noise

*Message #2 Posted by **Raymond Del Tondo** on 24 Oct 2004, 5:36 p.m.,*
in response to message #1 by John Smith

This sound can indicate broken or sticky plastic contact domes.
This normally isn't a problem for usage,
as long as the keys still register well,
but it's a sign of aging, and so this will reduce value significantly.

Raymond

Re: HP 32SII key noise

*Message #3 Posted by **Randy** on 24 Oct 2004, 6:44 p.m.,*
in response to message #2 by Raymond Del Tondo

Raymond, I agree to disagree. While it can be broken domes and contamination, it is normal on just about every Inodnesian Pioneer manufactured from about 1997 to the time they shut down the Pioneer line in 2001.

We had rather lengthy discussions concerning this back when the 32Sii was discontinued. Here is the start of the thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=24550

For my two cents worth, it does not reduce the value of the unit as they almost all have the behavior, one or two keys usually along the edge of the case. When it's two or more keys, they are almost always next to one another. I had one that both right and left shift keys sounded like it had crickets inside. The later black and silver 32Sii's seem to be worse than the browns. Even the service replacement 42S's had the problem. If it was made in Indonesia, there is a good chance it will be noisy.

You will not find the problem in made in USA or Singapore Pioneers.

Re: HP 32SII key noise

*Message #4 Posted by **John Smith** on 24 Oct 2004, 7:29 p.m.,*
in response to message #3 by Randy

Randy,

Thanks for the information. I was getting a little bummed out that the two mint 32SII's I have were not worth very much. Not suprisingly, both calculators are in fact made in Indonesia. The serial number of one of them is ID92600858. They are both brown models as well.

John

Re: HP 32SII key noise

*Message #5 Posted by **Raymond Del Tondo** on 25 Oct 2004, 4:39 a.m.,*
in response to message #3 by Randy

Hi Randy,

agreed that the ID and CN units are generally a bit louder,
due to cheapo construction.

But as I wrote in that same thread from 2002, my 1989 Rev A 42S
(US made) had exactly that problem. Please see this article:
http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=24591

Regards,

Raymond

Randy is right...

*Message #6 Posted by **Karl Schneider** on 26 Oct 2004, 4:32 a.m.,*
in response to message #3 by Randy

I have a 2001 black-and-silver 32SII. The noise is caused by a tab on the key rapping the underside of the faceplate. The better-constructed earlier models don't make the annoying noise, but they all work equally well.

38G

*Message #1 Posted by **Frank Eichel** on 24 Oct 2004, 4:54 p.m.*

Does anyone know how to disassemble a 38G? Mine is dead and I am wondering if it is something that can be easily fixed. Any suggestions?

Re: 38G

*Message #2 Posted by **Raymond Del Tondo** on 24 Oct 2004, 5:39 p.m.,*
in response to message #1 by Frank Eichel

Please take a look at www.hpcalc.org,
where the 38G is covered in detail.

My suggestion would be to just buy another unit,
because 38Gs are cheap (even on eBay).

Raymond

Re: 38G

*Message #3 Posted by **Jordi Hidalgo** on 25 Oct 2004, 6:21 a.m.,*
in response to message #1 by Frank Eichel

Hope this helps.

Jordi

Re: 38G

*Message #4 Posted by **Frank Eichel** on 25 Oct 2004, 2:56 p.m.,*
in response to message #3 by Jordi Hidalgo

Thank you, that might do it. I since discovered I can turn on the unit by pressing (really hard) the ENTER and ON keys simultaneously but I have to use a hard reset to turn it off. The lower half of the keyboard does not respond but the upper does. So, I suspect there is a seating problem between the keyboard and the PCB. I'll try to get it apart when I have more time on my hands.

Re: 38G

*Message #5 Posted by **Jordi Hidalgo** on 26 Oct 2004, 12:53 p.m.,*
in response to message #4 by Frank Eichel

That seems to be a common problem, Frank. Take a look at this FAQ, and at this thread.

Jordi

HP27S Inherent problem with the equation solver

*Message #1 Posted by **Bruce Cohen** on 24 Oct 2004, 5:31 a.m.*

I was trying to transfer a conduit flow equation from my HP42S solver to my HP27S just to see how complicated it would be, since there is no way to store intermediate calculations. As you can see by the equation, this was not a trivial task. When I finished and had the equation working properly, I did a test calculation, solving for each of the variables to detect physically impossible solutions. The results of this test has revealed this problem.

PROBLEM: THIS DOG WON'T HUNT!

The consequences of an overly agressive direct solver prevents the discovery of the desired roots of some equations.

The variable E~IN is second order in the equation below; but, since it only appears once in the equation, the direct solver is able to isolate it to one side of the equation. This allows rapid answers for one root but with no way to calculate the other root, since direct solutions don't permit the use of guesses to "HUNT" for the other root.

VARIBLES

```
!RE      395,319.5445  Reynolds number - dimensionless
!V~FT/S 6.3828         Fluid velocity - feet per second
!Q~GAL  2,611.2000     Pipeline volume - gallons
F~GPM            1000  Flowrate - gallons per minute
D~#/GAL          8.34  Density - pounds per gallon
ID~IN            8.0   Pipe inside diameter - inches
L~FT             1000  Pipe length - feet
E~IN             .0018 Roughness - inches
VIS~CP           1.0   Viscosity - centipoise
P~PSI   12.0034  calc  Pressure - pounds per square inch
K                20.0  Fitting coefficents - dimensionless
```

Variables preceeded by a (!) are outputs only.

After solving for P~PSI, solve for E~IN and you get the answer E~IN=280,727.6311 which is the physically meaningless root.

EQUATION ---- The equation is entered into the HP27S solver as a single string, the line breaks are for readability.

```
HYDRAULICS
:IF(S(!RE):F~GPMx379.2034xD~#/GAL÷ID~IN÷VIS~CP-!RE
:IF(S(!V~FT/S):F~GPMx0.4085÷ID~IN^2-!V~FT/S
:IF(S(!Q~GAL):ID~IN^2x0.0408xL~FT-!Q~GAL
:(IF(F~GPMx379.2034xD~#/GAL÷ID~IN÷VIS~CP>2300:0.0772÷LOG((E~IN÷3.7÷)^1.111+6.9÷(F~GPMx379.2034xD~#/GAL÷ID~IN÷VIS~CP))^2
:16÷(F~GPMx379.2034xD~#/GAL÷ID~IN÷VIS~CP))x24xL~FT÷ID~IN+K÷2)x(F~GPMx.0485÷ID~IN^2)^2÷618.87-P~PSI÷D~#/GAL)))
```

This problem seems to be affected by the number of times a variable appears in an equation.

For example:

A=LOG((X^PI)^5.124)^1.23 Yields a direct solution

A=X+X requires an iterative solution

Re: HP27S Inherent problem with the equation solver

*Message #2 Posted by **Vincent Weber** on 25 Oct 2004, 11:26 a.m.,*
in response to message #1 by Bruce Cohen

Hi Bruce, This is a problem identified in the advanced book for the 27S and 19BII. What you need to do is to put another occurence of the variable, without modifying the equation, like '..+0*A'. As soon as you have at least two occurences of the variable, the solver will not attempt to isolate it, and you can store whatever initial values you want to want THE root you want. Hope this helps. Cheers, Vincent

19bII no power

*Message #1 Posted by **Mike H** on 23 Oct 2004, 11:29 p.m.*

I recently acquired an HP 19BII that will not power up. The voltage across the batteries reads 4.15 V when installed in the calc, but each measure 1.5+ V individually. Otherwise, the battery cover is in good shape and the calculator looks good.

Has anyone seen this problem before, or know of any thing to try?

Thanks Mike

Re: 19bII no power

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 Oct 2004, 11:54 p.m.,*
in response to message #1 by Mike H

Hi;

Do you have the means for measuring the current consumption? I mean, if you have a multimeter (the one you used to measure the voltage across the batteries and with them in place), can you use it to measure the current as well? If the batteries voltage drops to 4.15 (less .35), then the calculator circuitry is draining more power (current) than it should, OR one of the batteries is not good (if they are fresh units, the first is mostly likely to happen).

I know that in some circumstances, internal software/firmware loop may cause the equipment to consume more power than in normal operation, mostly if it has I/O ports or devices that consume power. The HP19BII has an IR output, and if by any reason there's an active SW loop triggering the IR, that would be the reason for the voltage drop as well.

I'd suggest removing the batteries and keep the [ON] key pressed for some time. OR try the [ON][upper-left][upper-right] reset key sequence, if you have not yet tried it out. Maybe one of these procedures can bring it back to normal operation. If not... well, I'd not consider that for now, but burned IC's would cause this as well.

Let us know if you succeed.

Luiz (Brazil)

Edited: 24 Oct 2004, 12:00 a.m.

Re: 19bII no power

*Message #3 Posted by **Randy** on 24 Oct 2004, 9:50 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

The most common and fatal failure in any of the clamshell machines is fracturing of the plastic heat stakes that hold the case halves together.

A simple test: With known good batteries installed, place the open unit on a flat surface in front of you. With one hand, press lightly on the raised part of the display bezel as shown here:

http://fixthatcalc.com/images/19Bii_front_300.jpg

Then try turning it on with the other hand. If it works, it has suffered the usual clamshell failure. The plastic heat stakes have broken and allowed the back and front case halves to separate causing a loss in connection between the keyboard connector and logic board. You can confirm this by peeling away the keyboard surround overlay (a reversible process) and looking at the heat stake heads. Several will probably fall out or be attached to the overlay. The ones that cause the contact problem are shown here:

http://fixthatcalc.com/images/19Bii_stakes_300.jpg

There is no good or simple way to repair once the stakes break.

Re: 19bII still no power

*Message #4 Posted by **Mike H** on 24 Oct 2004, 12:16 p.m.,*
in response to message #3 by Randy

Luiz and Randy, thanks, but still no luck.

I attempted the reset as described by Luiz and nothing.

I tried direct pressure...nothing. I then removed the cover and checked the heatstakes, all OK.

At one piont when I removed and re-installed the batteries, the calculator did make a soft buzzing noise, but did not power up.

Any other suggestions would be greatly appreciated.

Mike

Re: 19bII still no power

*Message #5 Posted by **Randy** on 24 Oct 2004, 3:11 p.m.,*
in response to message #4 by Mike H

Buy a replacement... as there's not much you can do to repair it. Once you pop the heat stakes to see what is wrong, you can't reclose it.

Re: 19bII still no power

*Message #6 Posted by **Mike H** on 24 Oct 2004, 6:25 p.m.,*
in response to message #5 by Randy

I did not open the case, I simply peeled back the plastic sheeting to expose the tops of the heatstakes, none are broken.

Re: 19bII still no power

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 25 Oct 2004, 1:09 a.m.,*
in response to message #6 by Mike H

Hi, Mike;

have you found a way to measure how many (mili)Amps are drained by the circuits?

Just for checking purposes.

Luiz (Brazil)

Re: 19bII still no power

*Message #8 Posted by **Randy** on 26 Oct 2004, 8:20 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Luiz,

I don't think he really cares to fix it unless it will make him $$$. You see, he is just another eBay bottom feeder coming here for help. Here's the calculator we've been trying to help him with. At least he didn't list it for $100.00. I suspect if I dug deep enough, I could find where he bought it but I don't care to waste the time as his eBay history is full of such examples as this purchase: 32S 50th and then it's resale: this way

Then to come here and use the free classifieds to promote his eBay sales is nothing short of shameful. Give people like this an inch and they will take the preverbal mile.

I'm done wasting my time with this type of person, this is the second one for me this week. Here's the other one. The only problem is, you never know were the next one is going to appear. :-(

Edited: 26 Oct 2004, 8:29 p.m.

Thanks. And...

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 27 Oct 2004, 1:02 a.m.,*
in response to message #8 by Randy

Hi, Randy;

I'd like to thank you for your warnning. I'd rather sending you an e-mail for private thanks, but I think your constant transparency and willing to help that's been shown here in every post of yours lead me to post an answer here as well, because you deserve a transparent answer. Thank you again.

I'm not following e-bay mostly because of difficulties on transportation, delivery and, if applicable, devolution of faulty, wrongly announced equipment when dealers are not in the same country. So, I'm not aware of these facts.

Best regards, Randy.

Luiz (Brazil)

Edited: 27 Oct 2004, 1:38 a.m.

Shameful (edited)

*Message #10 Posted by **Mike H** on 27 Oct 2004, 5:09 p.m.,*
in response to message #8 by Randy

Randy, I have had several personal emails from you in the past and have always respected your opinion. And yes I do buy and sell calculators on ebay for profit.

I search ebay for really good deals and sell them at market value. I see no difference than you fixing a calc for set price regardless of the money or time you have invested. If you had an opportunity to purchase a 32S 50th for $60, what would be the selling price in your new store?

Some type of HP calculator has been on my desk since 1982, I use it almost daily. I have offered my input into this forum and well as advice to those I could help. To slander me in this forum, is not in keeping with your true character.

"Thank you" to you and Luiz for your time.

Re: 19bII no power

*Message #13 Posted by **Forrest** on 27 Oct 2004, 12:03 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

I have two 28S calculators. One works and the other wont turn on. The pressure doesn't work. I tried to measure the current and thru the working one, I cannot get a measurement (less than 1/1000 amp). Through the one that wont work I am reading 0.022 amps. What is the suggestion - waste basket? I bought the non working one with the understanding that it worked. Not too disapointed though because I did get excellent manuals.

Forrest

Re: 19bII no power

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 27 Oct 2004, 1:32 a.m.,*
in response to message #13 by Forrest

Hi, Forrest;

first of all: never give up an (original) HP device! :-)

Now for the facts: as you see, others like Randy have many good, applicable techniques and suggestions, and I guess that if you followed the ones Randy posted here and the calculator still does not respond, chances are you have a faulty IC. I had in hands an HP41 that had average current drain when the batteries were installed and about a current consumption 5 times higher than average when turnned on. The display was too dimm, and this sympton lead me to check the LCD driver. After replaced, the calculator returned to normal. This sort of maneuvre is not possible in the HP28 because of this:

http://www.logeng.com.br/images/internals_.jpg
(Hewlett-Packard Journal, August 1987, p.26)

The hybrid IC's (upper image) contain the LCD drivers: no way to replace any. And the excessive current consumption when the calculator is turned off worries me, because either a faulty electrolytic capacitor or the small IR LED driver (SMD transistor/FET?) may cause it. Even After Randy's precise explanations, I'd at least save it for future experiments. I have one HP28S and I'd like having another, broken one for spare parts... Better yet, having two working units!

As I always say: hope you succeed. Let us know if you want to go ahead and open it.

Best regards.

in response to message #1 by Juergen (CH)

Probably, they have been moved back in time for 20 years, when they tryed to find a handy solution for a trivial problem on a PC, running 'W.....ws'. Now they figured out that THIS calculator is often better to get it right.

Regards, Reinhard

It is the International HP Calculator Conference! :)

or

Maybe they are posing for a classic HP ad.

Re: Quiz of the day

*Message #10 Posted by **Walter B** on 23 Oct 2004, 6:04 p.m.,*
in response to message #1 by Juergen (CH)

Because they knew what they did when they calculated?

OR

Because they could trust their results?

OR

Because most of them had a real rugged pocket solution?

OR

Because they did not know about a "fatal protection violation" yet?

OR

Because they used their little computing power to produce great results - whereas nowadays immense computing power is wasted in a "popular" operating system?

OR

Because they knew every fashion style will come back after about 25 to 30 years? What they didn't know, this law doesn't cover calculators ;-)

Re: Quiz of the day

in response to message #1 by Juergen (CH)

Hello, dear customers;

due to a recent invasion in our internal data bank, the file that actually contains this photograph was incidentally "shared" with the unknown guest. Anyway, we talked to Carly (she took the photograph) and she allowed us to explain.

This is a regular day at the Development Board when we actually develop and discuss what is going ahead. As you can see, you should all be confident on our new products because we use the best development tools ever available to design them.

And, of course, we are happy using them.

BTW, this is a two to three weeks due photograph. We hope you enjoy it.

With our best wishes.

The Hewlett-Packard Development Team

48G Series - Are there two different screens?

*Message #1 Posted by **Barry** on 22 Oct 2004, 4:07 p.m.*

I have owned a 48GX for a few years now and love it...well, except for the display, which is very difficult to see in my opinion. There doesn't seem to be a contrast setting that can make it "just right." It's either washed out or bled over. Anyway, I seem to recall some mention of "newer" 48's having a better, higher resolution (maybe even a different color) screen. Is this true? If so, are the newer screens worth upgrading to? Is there a way to determine whether it has one of these good screens by looking at the serial number? My current 48GX was made in Singapore and has outstanding build quality and keyboard feel. I hate the thought of having to move to an Indonesian model to get the better screen because my perception is that the Indonesian units may not measure up to the same build quality. Thoughts?

Re: 48G Series - Are there two different screens?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Oct 2004, 5:02 p.m.,*
in response to message #1 by Barry

Hi, Barry;

yes, it is a fact. I own two HP48G+, each with a different LCD. One is a "classic" blue-dots over pale-green background. The new one has black-dots over light-gray background, the same one found in the HP49G. And if I am not wrong, only the 48G units from Indonesia have this sort of LCD. BTW, the black-dot LCD is a lot easier to read.

I hope this is the information you want.

Cheers.

Luiz

Re: 48G Series - Are there two different screens?

*Message #3 Posted by **Raymond Del Tondo** on 22 Oct 2004, 5:12 p.m.,*
in response to message #1 by Barry

Please take a look into hpmuseum archive 14,
there are some threads about the different screens.
I also set up an article with links to pictures of GXs
with THREE different screens.
I don't have the article number handy here,
please do a search for s.t. like black & white, high contrast,
SpeedUp, etc...

Conclusion: The Indonesian units have painted keys,
but a much better display contrast,
at least from a specific batch on.
IMHO the display is definitely worth a consideration,

as the key feel is ok.

Raymond

Re: 48G Series - Are there two different screens?

*Message #5 Posted by **Barry** on 22 Oct 2004, 8:07 p.m.,*
in response to message #4 by Raymond Del Tondo

Thanks a bunch, guys, for the info. The photos in the links were a great help. The black and white display is significantly better it seems.

Now I'm confused about which display I actually have. Your post showed THREE displays. Other than the newer black and white, there was a GX Rev M with a so-so blue/green display (I think this is what I have) and a GX Rev L with a comparably terrible blue SX screen. I'll have to check out my GX when I get home to see which model it is, but I'm guessing it's the blue/green one.

If the keyboard feel is just as good (or nearly so), I must say I am tempted to go out and find one of the better displays. Does anyone know what batch/serial number the good displays start at?

Re: 48G Series - Are there two different screens?

*Message #6 Posted by **Randy** on 22 Oct 2004, 9:59 p.m.,*
in response to message #5 by Barry

It's a catch 22. The newer black screen machines have the printed keys. The good keyboards have the blue screens.

Actually, only the VERY early Singapore GX's had the bad SX style screen. They fixed that by sometime in late 93 or 1994. I could refine that a bit if it helps but suffice it to say that if the unit has the dull, non-glossy finish aluminum keyboard surround, you've got at least a 50-50 chance of having an SX style low contrast more easily broken screen.

Raymond's photos shows two early GX, one with the early dull plate and SX display (center unit) and the later glossy plate with better display (left unit). I can't make out the serial number of the left side unit but that would help narrow down the change over date.

AFAIK the black screens started appearing in 2001. I have one that starts with ID121 - anybody have an earlier black screen version?

Edited: 22 Oct 2004, 10:05 p.m.

Re: 48G Series - Are there two different screens?

*Message #7 Posted by **Thomas Radtke** on 23 Oct 2004, 10:37 a.m.,*
in response to message #5 by Barry

Don't be too dissapointed to get a machine w/ painted labels and the blue/greeen display. I've got such a unit and while others may think I'm bitten here, I still find it to be a great machine. You can feel the paint at your fingertips, no doubt my old 32SII with glossy and plain keytops feel a lot better, but that doesn't really hurt. About the green display, I've always thought I got on with the 'good' display since it is actually very readable. The newer one might be better but the old one is not that bad.

Thomas

hp calc and RPN spotted

*Message #1 Posted by **Arnaud** on 22 Oct 2004, 2:14 p.m.*

Last week I was in Canada and waiting for my flight home I went to the newsagent. There was a science magasine with a title along the line of "science for dummies" (I don't remember the exact title) the cover and main article featured batteries. I browsed through it and towards the end there was some guy recommending his hp12c and they were saying that the best thing about it was RPN on which that magazine had run an article a few issues before.

Is Square Trade a scam?

*Message #1 Posted by **Vassilis Prevelakis** on 22 Oct 2004, 3:47 a.m.*

I have been looking at the small print that describe the "protection" offered by square trade, and it looks totally bogus.

E.g. a trader may be a member of square trade and display its "seal of approval" on the auction listing, but the specific auction may not be covered by square trade (no explanation is given or any rules provided to determine coverage -- i.e. appears to be arbitrary).

They also say that they can look into a complaint but they are not obliged to take action: *The SquareTrade Dispute Resolution service does not guarantee a settlement.*

Sounds like vapour to me.

The real question though is whether SquareTrade is a cover for scams (i.e. you get the "30 day free trial" and then you scam people knowing that the "dispute resolution" is totally bogus).

**vp

Re: Is Square Trade a scam?

*Message #2 Posted by **Randy** on 22 Oct 2004, 5:42 p.m.,*
in response to message #1 by Vassilis Prevelakis

I would call it a joke, not a scam as I'm sure there are isolated cases where they mediate some form of settlement.

Realistically, any "service" that takes your money with no promise of any return is bad purchase. Save that money for the stock market, you've a better chance there.

HP41C -> RAW -> HP42S

*Message #1 Posted by **Mike (Stgt)** on 22 Oct 2004, 3:08 a.m.*

Hello all!

Anybody here who has a _complete list_ of incompatibleness? TIA

Ciao.....Mike

Re: HP41C -> RAW -> HP42S

*Message #2 Posted by **Richard Garner** on 22 Oct 2004, 12:50 p.m.,*
in response to message #1 by Mike (Stgt)

Mike,

A couple of months back either in this forum or on a newsgroup, there was a discussion about 41C RAW files and using them in Emu42. If I remember things correctly, you could use the 41C RAW files in Emu42 with little to no modifications. If the function names were identical Emu42 would read and run it. Some editing had to be done of functions that spelling changed. Example, return the fractional part of a number to the X-Register, HP41C (FRC) HP42S (FP). As long as it was a function original to the 41C/CV and the spelling had not changed from the 41C to the 42S the 41C RAW file should work.

Re: HP41C -> RAW -> HP42S

*Message #3 Posted by **Mike (Stgt)** on 23 Oct 2004, 4:10 a.m.,*
in response to message #2 by Richard Garner

Thank you for your replay, I'll scann through the forum. Do you remember what newsgroup?

Ciao.....Mike

Funniest picture in an HP Calculator Digest

*Message #1 Posted by **Gene** on 21 Oct 2004, 5:08 p.m.*

My vote: Volume 8, page 16-17. This is the two page spread for the HP67/97 calculators (amazing to me that HP continued to make those for SO long after the 41C was out, but that's a different story).

Look at the picture on that two page spread on page 17, bottom right corner.

It is a picture of an airplane cockpit. Shows a calculator on a briefcase in the pilot's seat ready to be used.

Which calculator is shown and why is it funny? :-)

Gene

Is this guy honest ?

*Message #1 Posted by **Pascal** on 21 Oct 2004, 4:27 p.m.*

6 months ago I sent to Daniel Digglemann (in Switzerland) an HP-41C and 2 card reader for repair, as he did put an ad saying he could do such a job. After a few months telling me that he would soon do the job but was very busy, I asked him to send the items back because I wanted to find another way to repair them. It's been now 4 months and many e-mails later but I still havent received my items back. He always find excuses not to ship them back.

Does anyone know this guy ? is he honest or is he just playing with me and I will never find my items back ?

Re: Is this guy honest ?

*Message #2 Posted by **bill platt** on 21 Oct 2004, 5:17 p.m.,*
in response to message #1 by Pascal

FWIW, he hasbeen a contributor here before:

Re: Is this guy honest ?

*Message #3 Posted by **Massimo (Italy)** on 21 Oct 2004, 5:18 p.m.,*
in response to message #1 by Pascal

I did some deals with Daniel during the last three years and I shall say that everything was OK, every time.

He has always been very cooperative and helpful, sometimes the parcels took a long time to be delivered... but those were Mail Service faults.

Just my 2¢... well, a little more, actually ;-)

Massimo

Re: Is this guy honest ?

*Message #4 Posted by **Matthias** on 21 Oct 2004, 7:09 p.m.,*
in response to message #1 by Pascal

Hi Pascal

Daniel is a very good friend of mine, we met sometimes and dealt about 8 times. I´m shure, there is a reason, why se didn´t send your items back. Last time we had a telefon call (we do this about once a month) he told me, that his job takes very much time and he does not has time for his collection. I also send him some items for repair and he did a great job although it took a long time. By the way, as you he lives in Switzerland. Maybe a short trip to him and a nice talk would change your opinion ...

Greetings

Matthias

Re: Is this guy honest ?

*Message #5 Posted by **Daniel Diggelmann** on 22 Oct 2004, 12:55 a.m.,*
in response to message #4 by Matthias

Hi Pascal, I'm very sorry to have made you wait for so long. Yes I was ultra busy the last few months. The items have been shipped today. Best Regards Daniel

General comment about availability

*Message #6 Posted by **Vassilis Prevelakis** on 22 Oct 2004, 2:51 a.m.,*
in response to message #1 by Pascal

This is not directly related to Pascal and Daniel, but a more general observation regarding availability.

I don't know about the rest of you but for me, this is a hobby, and as such is by necessity a low priority item.

While I like playing around with old calculators and computers (e.g. the HP Series 80, and the BBC microcomputer), I still have to earn a living.

I try to help people and have fixed components from time to time, but I cannot promise that something will be turned around in say a week, two weeks, a month or even a year (although the latter hasn't occurred yet ;-).

Everybody is eager to play with their newest toy, and I understand that, but everything has to be kept within the general context of a hobbyist activity (i.e. not a professional repair service).

I find that the people in this forum are very helpful and often offer their services gratis.

So rather than jumping the gun and start sending messages asking about the trustworthiness of any one of us, it may be more advantageous to just go the archives and spend some time reading what these people have been doing over the past couple of years.

Finally, do be aware that even professional repair services (SONY and SONY Ericsson are examples of this), often take for ever to fix things and they usually charge hundreds of dollars for their services.

Best Regards (and peace unto all :-)

**vp

Re: General comment about availability

*Message #7 Posted by **Massimo (Italy)** on 22 Oct 2004, 3:50 a.m.,*
in response to message #6 by Vassilis Prevelakis

Well said Vassilis!

I find this kind of messages irritating: if you send your precious relics to somebody you don't know in person I hope that - at least - you trust his/her *internet personality* you formed in your mind during the years...

And I too bet that most of us still have to earn a living.

Massimo

Re: General comment about availability

*Message #8 Posted by **Thibaut.be** on 22 Oct 2004, 6:22 a.m.,*
in response to message #6 by Vassilis Prevelakis

Yes, you are very much right, Vassilis.

BTW, my first contact with computing was with a BBC, too. We purchased it together with my brother a model B. Had a lot of fun with it. I wrote some programs to derive functions, print a graph of them (this was most impressive), calculate limits and so on. There were a lot of applications for this machine. My preferred was "GB", a macro economics simulation of a country where you needed to adjust tax rates, social security contribution and so on, ... the aim was having your GNP increased otherwise you would not be reelected... Does this ring you a bell ?

Re: General comment about availability

*Message #9 Posted by **Pascal** on 22 Oct 2004, 2:43 p.m.,*
in response to message #6 by Vassilis Prevelakis

I'm sorry if my post was interpreted as if I was complaining that Mr. Diggelmann was slow to do the repairs. This is absolutely not the case. I know that people like him are doing this as a hobby, otherwise he would have asked me much more to do the job in order to cover the real cost of the repair. As he said that he was very busy (once again I don't blame him for that), I asked him to send the items back, so that I could find another way to fix them. The problem was just that after 4 months he had still not shipped them back and I was beginning to worry.

I'm glad that he is finally sending back the items and thanks to everyone for your comments on this post.

Re: General comment about availability

*Message #10 Posted by **Raymond Del Tondo** on 22 Oct 2004, 5:17 p.m.,*

Connecting HP48G, G+ to Win XP

*Message #1 Posted by **Ed Look** on 20 Oct 2004, 11:51 p.m.*

I noticed www.hp.com does not have a connectivity kit that'll work with Win XP.

Would the software for Win 2000, Me, 98, and 95 work in XP's "Compatibility Modes" with these older operating systems?

I haven't had the need to hook my 48Gs to a computer since I last had an oldie with Win 98 on it.

Re: Connecting HP48G, G+ to Win XP

*Message #2 Posted by **Raymond Del Tondo** on 21 Oct 2004, 2:43 a.m.,*
in response to message #1 by Ed Look

Hi,

since W2K and WXP are similar in many respects,
many programs for W2K will run under WXP, too.
If a prog won't run directly, the suitable
compatibility mode should help in most cases.

However, there's absolutely no need for the connectivity kit
as long as you have a prog that's capable of KERMIT or XMODEM protocols,
and the cable, of course;-)

Raymond

HPCOMM 3.0 runs fine on XP

Re: Connecting HP48G, G+ to Win XP

*Message #4 Posted by **Michel** on 21 Oct 2004, 8:24 p.m.,*
in response to message #3 by Randy

I tried to install HPCOMM 3 on my winXP yesterday (service pack 2) and i cannot install it at all.
SETUP.EXE is doing nothing at all. Even with compatibility with win98 check box...

Re: Connecting HP48G, G+ to Win XP

*Message #5 Posted by **Ed Look** on 22 Oct 2004, 1:09 a.m.,*
in response to message #4 by Michel

Michel,

I, following Randy's advice, installed HPCOMM version 3.0r4 in my Win XP system and it works flawlessly. Check to see if you have this or a newer (if such exists anymore!) version. Perhaps you have an older version?

In fact, it works much better than Conn4x for my 49G+. Now, if there's a better replacement (like HPCOMM) for the 49G+, that'd be great.

Re: Connecting HP48G, G+ to Win XP

*Message #6 Posted by **James M. Prange** on 22 Oct 2004, 2:58 a.m.,*

> In fact, it works much better than Conn4x for my 49G+. Now, if there's a better replacement (like HPCOMM) for the 49G+, that'd be great.

I hope that you're using the latest version of Conn4x (currently Version 2.2 Build 2353), which is much improved over the version on the CD-ROM; it allows "text" transfers (similar to Kermit "ASCII" transfers) and remote operation of the calculator for a start.

The latest Conn4x should be available here, and the latest HPComm here.

But note that Conn4x translations differ from Kermit translations for NUL, literal ", and \. Conn4x may also have a problem with these characters outside of a quote-delimited character string. For transfers from the calculator, <CR><LF> pairs are also different (better).

Note that the MMC/SD card on the 49g+ allows very fast transfers. If you want Kermit ASCII compatible transfers via the card, see my programs at http://www.hpcalc.org/details.php?id=6017.

Conn4x also works with the 48G series for Xmodem binary transfers, and with the addition of the included Xmodem server library to the calculator, can do the text transfers and the rest as well.

Regards,
James

HP-41C Financial Decisions Pac

*Message #1 Posted by **Luis** on 20 Oct 2004, 9:02 p.m.*

Hi! Does anyone have the list of software corrections issued by Hewlett-Packard for the Finance (or Real Estate) module?

Thanks

Couple of mistakes in Finance 1B

*Message #2 Posted by **Gene** on 21 Oct 2004, 3:43 p.m.,*
in response to message #1 by Luis

1) The safe rate and risk rate prompts are reversed. When "safe rate" is prompted, enter the risk rate and vice versa.

2) The BONDS program does not correctly calculate the yield of a short-term bond. To do so for a bond held for one coupon period or less, you must a) store either the call price or 100 in register 19, b) CF 22, and c) Press E to calculate the yield.

Don't know of any others. This may be wrong in the original finance rom, but I know these are problems with Finance 1B.

gene

Couple of mistakes in Finance 1C

*Message #3 Posted by **Gene** on 22 Oct 2004, 2:38 p.m.,*
in response to message #1 by Luis

Finance ROM 1c:

1) The 360 calendar mode in DAYS does not calculate the correct number of days between dates when the first date occurs on the 31st of the month and the 2nd date occurs on any day other than the 31st. The result is 1 day less than the correct answer.

2) After initiatization of the MONEY program or after clearing the financial registers (shift E), if I is the variable solved for when N, PV and FV are known (and the PMT is = 0), you cannot solve for another variable until a new value has been stored in some of the registers.

3) When I=0 in the MONEY program, you cannot solve for N, PV, PMT or FV (you get DATA ERROR or an incorrect result).

Re: Couple of mistakes in Finance 1C

*Message #4 Posted by **Luis** on 22 Oct 2004, 7:34 p.m.,*

HP 33s Updated Manual

*Message #1 Posted by **Chuck Westen** on 20 Oct 2004, 1:53 p.m.*

I don't know if anyone has already discussed this but HP has issued a manual update, dated 9/2/2004, at HP.com.

I appears that HP acknowledges the problems identified in this forum with the HMS & retangular to polar conversions and the combination function. The maunual update gives "workarounds" for these problems.

Re: HP 33s Updated Manual

*Message #2 Posted by **bill platt** on 20 Oct 2004, 4:26 p.m.,*
in response to message #1 by Chuck Westen

Hi Chuck,

Thanks for the tip.

I had noticed that they had gone to edition 2 of the manual, fixing the errata on page 13-9.

Re: HP 33s Updated Manual

*Message #3 Posted by **Norris** on 20 Oct 2004, 4:27 p.m.,*
in response to message #1 by Chuck Westen

As previously discussed on this forum, the 33S can be programmed with "replacement" functions that automatically incorporate the same workarounds suggested by HP. Examples:

Replacement polar conversion function
(XEQ T):

```
LBL T
x=0?
ABS
x<>y
x=0?
ABS
x<>y
y,x->theta,r
RTN
```

Replacement HMS conversion function
(XEQ U):

```
LBL U
CF 4
x<0?
SF 4
```

FS? 4
+/-
->HMS
FS? 4
+/-
CF 4
RTN

HP-33S bug list.

*Message #4 Posted by **Michel** on 20 Oct 2004, 4:36 p.m.,*
in response to message #3 by Norris

I just receive my HP-33S and don't notice @bug@ with polar conversion. Can someone tell me where to read all the bugs that the HP-33S had or still have (for now...).

Thank you Michel

Re: HP-33S bug list.

*Message #5 Posted by **bill platt** on 20 Oct 2004, 5:20 p.m.,*
in response to message #4 by Michel

search for bug list 33s (slelct "all") in a search of archive 14

Re: HP-33S bug list.

*Message #6 Posted by **Norris** on 20 Oct 2004, 5:38 p.m.,*
in response to message #4 by Michel

The recent 33S User's Manual Update, which is currently posted at

http://h10032.www1.hp.com/ctg/Manual/c00251639.pdf

describes the most serious bugs identified to date, and includes examples.

The polar conversion bug can affect (x,y) values where x or y equals 0. Try this for entertainment:

3
ENTER
0
->polar
->rect
->polar
->rect

Re: HP-33S bug list.

*Message #7 Posted by **Michel** on 21 Oct 2004, 8:51 p.m.,*
in response to message #6 by Norris

Wow, on the HP update manual it is said to produce error only with -0 (if i understand the update...).

With your simple example, it shows that it is always the case with a "normal" zero...

I think it's the worst but i encounter with the calculator.

Re: HP 33s Updated Manual, but not updated calc.

*Message #9 Posted by **Tom (UK)** on 21 Oct 2004, 3:38 a.m.,*
in response to message #1 by Chuck Westen

As HP have issued 'work arounds' does that mean they are NOT going to fix the calculator? If that is so HP will go down another notch in my estimation. These bugs should be fixed, I can't think of another calculator maker with bugs that affect simple 'every day' calculations.

Re: HP 33s Updated Manual, but not updated calc.

*Message #10 Posted by **John** on 21 Oct 2004, 7:37 a.m.,*
in response to message #9 by Tom (UK)

My guess is that it may be much quicker to fix a PDF to include fixes for these bugs than to get them taken out of the rom by a fix.

I would guess a fix is coming, but that HP wants to give their customers a work-around until that time.

Why is it that HP is always thought of as Mr. Evil around here?

Re: HP as Mr. Evil?

HP Voyager keyfeel

*Message #1 Posted by **joebob** on 19 Oct 2004, 9:09 p.m.*

I have been looking at getting a HP-15C, since it seems to be a pretty classic model. I had a chance to play with someone's voyager style keyboard which had the "hp feel" except for the ENTER key which seemed harder to press, and without the same "keybreak" that all the other keys had.

I figure the ENTER key might get worn out faster, but this calculator was really mint looking and showed no signs of heavy use, so I just wanted to check whether that is normal for a voyager-style HP.

PS, Thanks to everyone. I have learned a lot from this board.

Voyager keyboards

*Message #2 Posted by **Randy** on 19 Oct 2004, 9:17 p.m.,*
in response to message #1 by joebob

The Enter key on Voyagers actually has two metal discs underneath so they could use the same stamped keystrip throughout the keyboard. See Dave's internal photos of 15C for a visual on this http://www.hpmuseum.org/tech10.htm

The Enter key is hinged at the bottom and only presses on the top disc so when you press in the middle of the key, you're pressing in the middle of the lever, not on the end, thus the higher force required to actuate the key.

A very fine point, something we tend to forget and quickly get used to in day to day use.

Edited: 20 Oct 2004, 9:13 a.m. after one or more responses were posted

Re: Voyager keyboards

*Message #3 Posted by **joebob** on 19 Oct 2004, 9:52 p.m.,*
in response to message #2 by Randy

Thanks for the reply and the pointer to the packaging page.

When I was playing with the ENTER key, I noticed that it was easier to press at the top, which falls in line with your observations. That just leaves the keybreak issue. Should I figure that his calculator has a worn-out snap disk on the ENTER key, since the keybreak/snap was almost nonexistent?

I guess my next question is whether that is pretty common with the 10 series? If everyone's 20 year old voyager ENTER keys have lost their crispness, then its probably not worth worrying about when shopping.

Re: Voyager Keys

*Message #4 Posted by **Randy** on 19 Oct 2004, 11:36 p.m.,*
in response to message #3 by joebob

Voyagers and 41's have VERY good keyboards. Wear and dirt are the two factors that you must be concerned with. If it's been pounded on for 20 years, it's tired and needs a rest. If you count on your calculator, avoid those no matter how much a bargain they may seem . There are lots of nice Voyagers out there, it's worth the extra money to get a low usage unit. Not necessarily mint, just low use. Keyboards tell the tale.

There are several things that I have seen that go wrong with Voyager and 41 keyboards (similar design) in the order of observation:

1) LOTS of dirt inside the calculator which works it way inside the workings of the key snap disc chamber. The keys don't click at all and have little physical travel. This can usually be cleaned. This is about the only easy fix, the others below require major surgery.

2) The rubber sheet between the snap discs and the keys gets holes worn through the rubber from the key pin that pushes on the snap disk. This results in keys that are lower than surrounding key. They otherwise work okay, they just don't have the correct or same physical travel as the others. This is most common on the right hand side of the keyboard, i.e. the heaviest use keys (0 and . seem to go first).

3) The keytop itself can break at the bottom hinge half of the key, this results in a loose, wobbling keytop which reminds me of a loose tooth in its socket. The key has its normal click but the keytop is lower than normal and is hard to press since the force is not directed due to the loss of the hinge point.

4) The snap disk fractures. Pretty rare actually, the key is flat and has no click, similar to #1. Sometimes you'll hear a weird cricket like click when pressed.

A good indication of heavy use is if the sides of the keys are worn with shiny and rounded edges. If the lower blue shift legend is missing or worn, it has seen a LOT of use as well.

Very Informative. Thank you for the info. *NM*

NullMessage

Re: Voyager keyboards ('83-'93)

*Message #6 Posted by **Karl Schneider** on 20 Oct 2004, 3:20 a.m.,*
in response to message #2 by Randy

Randy posted,

> Quote:
>
> The bottom line is the Enter key, when pressed in the middle of the key, requires a much higher force to regsister a keypress since you are pushing on two discs. Pressing towards the top of the key will result in a much lower force required to actuate the key since you are only pressing on one.

The user is pressing against two discs on any place on the button; it's easiest at the top (and toughest at the bottom) due to force-moment -- distance of the applied force from the axis of rotation at the bottom edge. Kinda like pressing against a door at the doorknob versus near the hinge.

With that bit of physics out of the way, on to something constructive. :^)

I have a 1983 15C, '85 16C, '86 11C, and '93 12C. The first three are US-made; the last one, Singapore. All are well-constructed. The 15C I bought new; the other three are very lightly-used models I bought in the last two years. All work perfectly and are in good-to-excellent cosmetic shape.

- The 15C's keys are a little stiffer with less travel than the other three.
- The keys at rest have some freeplay (rattle when shook) on the 15C and 12C, but not on the other two.
- Some printed legends (yellow and blue) are not quite centered on the 11C, 12C, and 16C.

Re: Voyager keyboards ('83-'93)

*Message #7 Posted by **Randy** on 20 Oct 2004, 9:15 a.m.,*
in response to message #6 by Karl Schneider

Karl, when I reread my quote with your commentary, I realized my original statement was incorrect. You are never pressing on two discs, the enter key actuation pin only presses on the top disc.

I edited my original post to read:

> Quote:
>
> The Enter key is hinged at the bottom and only presses on the top disc so when you press in the middle of the key, you're pressing in the middle of the lever, not on the end, thus the higher force required to actuate the key.

in response to message #7 by Randy

I have an 11C and a 10C, both clearly well-used, especially the latter, but in good working order. On both, the enter key has a slightly different feel from the others, without quite the same "over-center" pop.

By the way, I got the 10C at a yard sale a couple of weeks ago. The seller had used it in college. He was happy I knew what it was. The price: one dollar.

in response to message #1 by marais

As mentioned in the auction title :

> Quote:
>
> The HP 12C is now available in a strictly limited exclusive PRESENTATION EDITION. Mounted in a British made varnished hardwood presentation case. The HP 12 C and its manual sit securely against a satin style background. The hardwood case has brass fixings and is supplied with a self adhesive brass plate suitable for you to engrave. The brass engraving plate fits flush in a cut-out in the centre of the hardwood case. The HP 12C PRESENTATION EDITION is only available from Classic Calculators and makes a stunning award, presentation or prize for any finance or business professional. It also makes a superb and genuinely useful gift for important clients and customers.

It's thus a third party box.

Q: CASrelease w/o LGPL license

*Message #1 Posted by **Mike (Stgt)** on 19 Oct 2004, 10:56 a.m.*

Bernard Parisse offers his CAS for the HP49G but states clearly: Warning, the file casrelease.zip is not released under the LGPL license and may not be redistributed as is.

Now a colleague from work wants this ROM on his real HP49G. Is it a violation of the a. m. license if I hand over the binaries from "my" compilation run (I had to use 'make clean' on cygwin)? Are there any other reasons _not_ to transfer that "Version HP49-C, Revision #1.24" to a *real* machine? Well, I could take Christoph G. at his word: if it works in Emu48 it works on a real machine too. (Or was it negatived: what's _not_ possible in Emu48 is _not_ possible on the calculator either. -1 -1 * = 1, anyhow.)

I ask as it's not my own HP49G, it's the first time I flash an HP49G ROM, and I know nothing more than from http://www.hpcalc.org/hp49/pc/rom.

Every hint is appreciated. TIA.

Ciao.....Mike (with a sligth shiver)

Re: Q: CASrelease w/o LGPL license

*Message #2 Posted by **Bruce Horrocks** on 22 Oct 2004, 9:56 a.m.,*
in response to message #1 by Mike (Stgt)

I do not see anything in the license terms that prevents your colleague from:

1. obtaining a copy of the CASRelease files (either by download or unmodified from you)
2. Agreeing to the licence terms therein
3. Contracting you to compile and install the ROM in his calculator on his behalf. This contract may be formally for money or informally for a favour/goodwill.

HTH

floating Decimals HP 12c

*Message #1 Posted by **Marge** on 19 Oct 2004, 12:34 a.m.*

Hi, Does the HP 12c have a floating decimal and if so how do you get it to work? Thanks!

Floating decimal? f 0, f 1, f 2, etc...

*Message #2 Posted by **Karl Schneider** on 19 Oct 2004, 1:53 a.m.,*
in response to message #1 by Marge

.... There is no "FIX" function explicitly on the keyboard, but pressing the "f" shift key, followed by the number of desired decimal places, will specify the precision.

Scientific and Engineering notation are not available on the 12C.

As on all Voyager-series models, there is no setting to display as many decimal digits as necessary ("ALL" on the 20S, 32S/II, 42S, and others).

-- KS

Re: Floating decimal? f 0, f 1, f 2, etc...

*Message #3 Posted by **Thibaut.be** on 19 Oct 2004, 9:10 a.m.,*
in response to message #2 by Karl Schneider

The alternative being f ENTER, or clear prefix, that will show the full mantissa for one or two seconds.

Scientific notation IS available on the 12c <===============

*Message #4 Posted by **Gene** on 19 Oct 2004, 9:46 a.m.,*
in response to message #2 by Karl Schneider

Try [f] [.]

and you'll have scientific notation.

Gene

Indeed ! (NT)

*Message #5 Posted by **Thibaut.be** on 19 Oct 2004, 11:07 a.m.,*
in response to message #4 by Gene

Mea culpa! You are right...

*Message #6 Posted by **Karl Schneider** on 19 Oct 2004, 11:00 p.m.,*

in response to message #4 by Gene

I knew that scientific-notation display mode wasn't listed on the keyboard of my 12C, but didn't bother to verify my conclusion with the manual. Yep, it's there on p. 83.

It's certainly proper that sci display mode would be available since EEX with sci display was present.

Ya learn something every day...

Sinking keys in HP Classics

*Message #1 Posted by **Bo** on 18 Oct 2004, 10:41 p.m.*

Hi,

Many (most?) HP Classics appear to have the “sinking keys” flaw to a lesser or larger degree. By sinking keys I mean that the individual keys sink down into their openings. It does not affect all keys to the same degree, as the central keys, e.g. 7, 8, CHS, EEX sink the most, whereas the keys in the upper, lower, left- and right-most rows sink less. It appears that the contact board below the keys flexes downwards in a concave fashion – like an old and used bed. Although the keys sink on all models, it is more apparent on the models with the larger keys, e.g. a HP-67.

The sinking keys do not impair contact function, however, it makes the keys rattle, it makes gabs between the keys and the keyboard which collect dirt, and it looks “stupid” – at least to me. HP quality?

The above appears not to be related to use as this flaw sometimes can be seen to a small degree in much worn examples whereas mint, hardly used examples can have keys sitting pretty deep.

So what is going on? Did the calculators originally all come with the keys in the correct place, or was this flaw created during assembly, e.g. the planar (I assume) contact boards being flexed when mounted in the calculator housing? Or did the contact board flex with age?

Does anyone know the answer to the above or have some theory as to what is going on?

Also, would it be possible to fix the problem when taking a given calculator apart or is something permanently out of shape?

Re: Sinking keys in HP Classics

*Message #2 Posted by **Randy** on 19 Oct 2004, 7:15 a.m.,*
in response to message #1 by Bo

The flexing metal key strip has fractured. This is common in heavily used units. They can be repaired with strips from another unit. I've never seen any other reason for a key to be lower than others around it on a classic.

The keyboard PCB is made rigid by the back plate of the calculator which forms the battery box. The PCB cannot bow unless the 6 to 8 screws holding the back plate in place are striped or missing.

Re: Sinking keys in HP Classics

*Message #3 Posted by **Vassilis Prevelakis** on 19 Oct 2004, 12:39 p.m.,*
in response to message #2 by Randy

So how do you attach the replacement strip?

**vp

Re: Sinking keys in HP Classics

*Message #4 Posted by **David Smith** on 19 Oct 2004, 3:40 p.m.,*
in response to message #3 by Vassilis Prevelakis

Attach with solder.

Re: Sinking keys in HP Classics

*Message #5 Posted by **Bo** on 19 Oct 2004, 12:57 p.m.,*
in response to message #2 by Randy

I don't think broken strips are the reason to "my" problem. This would mean that most strips should brake on hardly used calculators, very unlikely. Also, it wouldn't explain the keys sinking in a concave manner.

Re: Sinking keys in HP Classics

*Message #6 Posted by **Randy** on 19 Oct 2004, 7:01 p.m.,*
in response to message #1 by Bo

I re-read your original post. You mention "classics" several times. To me, the only classics are the early LED machines: 35,45,55,65,67,70,80. Are you confining your discussion to those machines or does classic to you mean something different?

As for your "hardly used" units, I've seen absolutely pristine 67's with several fractured strips. Let's get real - most of these machines are 30 years old.

I've never seen a key with a bow in the keytop. Any chance you could post some photos?

Edited: 19 Oct 2004, 7:04 p.m.

Re: Sinking keys in HP Classics

*Message #7 Posted by **Wayne Brown** on 20 Oct 2004, 12:35 p.m.,*
in response to message #6 by Randy

> Quote:
>
> I've never seen a key with a bow in the keytop.

By "the keys sinking in a concave manner" I think he means the keys near the edges of the keyboard are the highest, and get progressively lower as you move to the center of the keyboard from any direction -- as if the bottom of the keyboard were bowl-shaped.

Re: Sinking keys in HP Classics

*Message #8 Posted by **Bo** on 22 Oct 2004, 12:15 a.m.,*
in response to message #7 by Wayne Brown

Yes, that is exactly what I mean - and what I wrote. By "Classic" I refer to what is called classic on this site: HP-35, 80 etc.

As to an example, see e.g. the hpmuseum's HP-67 at http://www.hpmuseum.org/3qs/673q.jpg

Even this pristine example has the flaw I am talking about: the 7, 8, CHS and EEX keys clearly sit very

deep and are tilted rearwardly, just take a look at the side surfaces of the keys and compare with the other keys in the same row.

Still, I can't believe that all the contact strips broke on hardly used examples whereas they didn't breake on some very used examples.

BR, Bo

Updated HP-41 module list

*Message #1 Posted by **Matthias** on 18 Oct 2004, 6:28 p.m.*

Hi, it´s me again. About three weeks I published a new module list for HP-41 modules. After this I got many feedbacks from some of you. Thanks a lot, you are doing a great job for the community here by sending me informations and bugfixes. Now the real update is finished, so let´s call the other as a pre-release. You can download the new one here:

http://www.hp-collection.org

Matthias

Re: Updated HP-41 module list

*Message #2 Posted by **Mike (Stgt)** on 19 Oct 2004, 4:45 a.m.,*
in response to message #1 by Matthias

Hi Matthias!

I hope you don't mind if I found at least one little negligibleness. My MCode compilation version 1A displays "-MCODE 1A" in CAT 2, not "MF1A" as shown in your list. The later is the ID of the ROM reported by the Service Module's check function.

BTW, be warned to use the function "AA" of my ROM, IIRC I used it to migrate all HP41 ROMs using an HP-71B as printer. I did that by jumping behind the "correct printer in trace mode"-check of the ZENROM's disassembly routine. W/o the correct module in place "AA" will do nothing useful (MEMORY LOST is quite possible). So be warned or use an HP41-emulator with all appropriate safety measures.

But if you like to impress others, you may run "XX" to just display the "G" of the RAD/GRAD annunciator. <G>

Ciao.....Mike

Sorry, I can't remember if I copied that one or did it on my own:

Re: Updated HP-41 module list

*Message #3 Posted by **Mike (Stgt)** on 19 Oct 2004, 4:56 a.m.,*
in response to message #1 by Matthias

I hope you don't mind me disturbing again: Your list shows only one "Skwid Ink BarCode" ROM, but there are two versions. Alas I have only one of them.

Ciao.....Mike

Re: Updated HP-41 module list

*Message #4 Posted by **Matthias** on 19 Oct 2004, 6:46 a.m.,*
in response to message #3 by Mike (Stgt)

SO, please let me know your details of the other version and I will ad it in a new release...

Re: Updated HP-41 module list

*Message #5 Posted by **Mike (Stgt)** on 19 Oct 2004, 8:07 a.m.,*
in response to message #4 by Matthias

From your list I can't see which version you own. Mine has the "BC41" as ID (what is displayed with the service module, you know) and '206'x as checksum and 22 entries in the FAT. My information about the existence of the second version is just from the manual or an addendum of it, that you may exchange the module at EduCalc (IIRC). The second version was for an other printer and as such much faster.

Now, my question to all: who has more details? Who knows the copyright owner of the a. m. module? Who may help some collectors of HP41 ROMs? For me an image would be OK.

Ciao.....Mike

PS: You know how to make an image?

Re: Updated HP-41 module list

*Message #6 Posted by **Diego Diaz** on 19 Oct 2004, 7:58 a.m.,*
in response to message #1 by Matthias

Hi Matthias,

I find your list as a handy instrument to keep track on ROM/images collection, so I use a hardcopy quite often.

If I can make a suggestion I'd like to have the header rows from the first page reproduced on every page. I think it will be useful as reference for the colums.

Keep up the good job.

Cheers

Diego.

Re: Updated HP-41 module list

*Message #7 Posted by **Angel Martin** on 20 Oct 2004, 10:41 a.m.,*
in response to message #6 by Diego Diaz

I second Diego's request, and would also suggest that you reduce the size of your "logo" on the top. (real state matters!)

Best, AM

48SX storage

*Message #1 Posted by **Mike S.** on 18 Oct 2004, 3:38 p.m.*

Id like to store my HP 48SX. Can I remove the main batteries for a extended time, or will some of it's firmware be lost, does it have firmware? This is a 1st-year 48SX made in Corvallis OR. -Thanks, Mike.

Re: 48SX storage

*Message #2 Posted by **Raymond Del Tondo** on 18 Oct 2004, 6:42 p.m.,*
in response to message #1 by Mike S.

Hi,

you should remove the batts to avoid damage to the battery terminals,
which can occur by battery leakage.
The HP-48SX has it's 'firmware' or operating system in ROM,
so it won't get lost even after many years.

HTH

Raymond

BTW: Could you provide th serial number of your unit?

Re: 48SX storage-serial#

*Message #3 Posted by **Mike S** on 18 Oct 2004, 9:55 p.m.,*
in response to message #2 by Raymond Del Tondo

Sure- it's 3030A00535. And thanks very much. -Mike

Deluxe Leather Case for Voyagers

*Message #1 Posted by **Chris W** on 18 Oct 2004, 1:40 p.m.*

This is the really nice fold over flap leather case. Does anyone have the old inserts that came with the 15C, or a really old educalc catalog, that had prices for this deluxe case for the Voyager calculators? I'm just curious how much they cost back then.

Chris W

Bring Back the HP 15C

Re: Deluxe Leather Case for Voyagers

*Message #2 Posted by **Ron Ross** on 18 Oct 2004, 1:45 p.m.,*
in response to message #1 by Chris W

I believe they sold for $19 ea IIRC.

My wife bought a couple direct when they discontinued them for about $3-4 and kicked herself for not buying more. I certainly wished she had also.

There were two sizes, one for the Hp19b/28s series which also fit the Hp95/100/200 and a slightly smaller one that loosely fit everything else ie the Pioneer and Voyager series.

Re: Deluxe Leather Case for Voyagers

*Message #3 Posted by **marais** on 18 Oct 2004, 2:14 p.m.,*
in response to message #2 by Ron Ross

Owning both, I can confirm and add that they also came in two different colours: black and burgundy. Maybe it's because of the leather case that my 28s is still going strong...

I don't think we are talking about the same case. I have a 15 C in one, while it isn't a tight fit, it is a very good fit. I just tried to put my 42S in the same case and the thickness fit isn't near as good because of the taper of the 42s case, and the 42S is way too long for the fold over flap to tuck in the little strap. Also $39 sitcks in my mind for some reason, but from 1985, who can remember that far back?

Chris W

Re: Deluxe Leather Case for Voyagers

*Message #5 Posted by **Tom Sherman** on 18 Oct 2004, 4:35 p.m.,*
in response to message #4 by Chris W

Altogether, HP had three sizes of leather cases: approx. 88x135x19 mm. for the 15C series; 82x154x20 mm., with slight taper, for the 42S series; and 98x164x22 mm. for the 28S series. Also three colors: black, brown, and burgundy. The HP 1987 retail price was $15 for the smallest size and (as Ron says) $19 for the largest.

Re: Deluxe Leather Case for Voyagers

*Message #6 Posted by **Bo** on 19 Oct 2004, 12:52 p.m.,*
in response to message #5 by Tom Sherman

In the same series there was also a nice case - with strap - for the IR printer.

hp 71b sighting: Movie "Real Genius"

*Message #1 Posted by **andy** on 18 Oct 2004, 11:31 a.m.*

I watched the great 80's movie "Real Genius" over the weekend. Near the end, you can see an hp 71b prominantly displayed for 10 or 15 seconds. If you want more specific information on the exact scene then let me know.

This movie is worth watching even without the 71b sighting...

Andy

need some advice

*Message #1 Posted by **Jim** on 18 Oct 2004, 11:07 a.m.*

I bought an Ipaq rx3715, which supports Pocket PC Internet Explorer software through 4.6. However, I need v. 5.5. I can get this through RegKing but I have tell them which software and here are the options.

Or RegKing2002 for Pocket PC 2002 devices...

I have a Pocket PC 2002 device (Compaq 3800, Toshiba, HP 56x, etc.) I have a Pocket PC 2002 device, but would like a Mac installer. Or RegKing2003 for Pocket PC 2003 devices...

I have a Pocket PC 2003 device (iPaq 194x, 221x, 555x, Viewsonic V37, etc.)

So, I'm surmising I would choose Pocket PC 2003. I've asked HP but that may take a while, they said. What do you folks advise? I imagine some of you have been there and done that.

Thanks as always.

HP 21 Calculator repair!

*Message #1 Posted by **Christine** on 18 Oct 2004, 10:23 a.m.*

Please help!! I need to get this fixed!

Re: HP 21 Calculator repair!

*Message #2 Posted by **Ron Ross** on 18 Oct 2004, 11:23 a.m.,*
in response to message #1 by Christine

Which Hp21??? I suspect you mean the original Hp21, and I suggest digging through the Hpmuseum want ads as there are a couple of reputable people who post Services available and they repair the older LED calculators.

If you mean the newer Hp21s, then I suggest fixthatcalc.com.

Voyager logos

*Message #2 Posted by **Randy** on 17 Oct 2004, 10:04 p.m.,*
in response to message #1 by deleted

The black matte one used to be gold and shiny before it went in and out of the case a couple of thousand times...

Re: Voyager logos

*Message #3 Posted by **Mike H** on 17 Oct 2004, 11:01 p.m.,*
in response to message #2 by Randy

I have seen two 15C logos, one embossed base metal, the other solid plastic. Which came first?

Re: Voyager logos

*Message #4 Posted by **Raymond Del Tondo** on 18 Oct 2004, 3:02 a.m.,*
in response to message #3 by Mike H

Hi,

I think the metal one came first,
as my first 11C which I bought in 1981 or 82 came
with the shiny metal one.
At least I think it was metal, since it didn't wear off
even after many times of putting the calc in and out of the case,
and the plastic logos don't have an even surface.

Remember the HP-48SX?
This calc also has the HP logo as a separate embossed metal piece,
whereas the 48S and the later G/G+/GX have the logo printed on.
This reduced cost, but doesn't look as good as on the SX, of course.

Raymond

There seems to be an explanation for the 48S logo (see difference #6 in this post). Unfortunately, it became a habit :-(

Jordi

Re: Voyager logos

*Message #6 Posted by **Raymond Del Tondo** on 18 Oct 2004, 6:52 p.m.,*
in response to message #5 by Jordi Hidalgo

Hi,

maybe there were different versions of the separate HP logo.
The one I have from an opened SX is definitely made of thin metal,
whereas JKH writes about a plastic one, See (6) in his article.

Raymond

HP-32SII Viewing Angle

*Message #1 Posted by **Jay Lucas** on 17 Oct 2004, 4:37 p.m.*

Just changed the batteries in my 32SII and the viewing angle went wacko. I can tell it powers on/off by looking at an extreme angle.

How do you change the viewing angle. I'm sure my manuals are in some box somewhere, but...

Email addy is "cc-siATswbell.net". Written this way to keep some of the bots from picking it up.

Thx,

Jay

Re: HP-32SII Viewing Angle

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 17 Oct 2004, 4:46 p.m.,*
in response to message #1 by Jay Lucas

Hi, Jay;

please, do this:

```
with the calculator on, press and hold [ON] key;
press either [+] (enhance) or [-] (reduce) keys to change contrast (and find the best
viewing angle);
after setting the contrast as you want, release the [ON] key;
```

Hope this is what you want.

Cheers.

Luiz (Brazil)

Edited: 17 Oct 2004, 4:47 p.m.

Re: HP-32SII Viewing Angle

*Message #3 Posted by **Jay Lucas** on 17 Oct 2004, 6:16 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

That did it. Thx much.

Once you mentioned it, I realized I knew this, but it has been many years since I had to adjust the contrast on one of my calculators.

However... now that I can see the screen, I find that, literally, everything is on. The micro appears to be working properly since I see variations as I press keys and can sort of make out the answers if I know what I'm looking for ahead of time. Must be display related. Guess I'll have to crack the case and look.

Thx again.

Jay

Would you try a reset?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 17 Oct 2004, 7:14 p.m.,*
in response to message #3 by Jay Lucas

Hi, Jay;

in some cases, briefly shortenning the calculator battery connectors (with batteries inserted to prevent ESD dammage) brings the calculator back to normal operation. If you don't care for a memory loss...

Let us know.

Cheers and success.

Luiz (Brazil)

Re: Would you try a reset?

*Message #5 Posted by **Jay Lucas** on 17 Oct 2004, 8:10 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Thx again. Didn't have to do this, but I will keep it in mind. It is working properly now, though.

I removed the batteries and started prying gingerly to see how the casing was put together. I had just identified the catch points when I decided to see if you had responded. When I put the batteries back in as preperation for trying your method, the calculator came alive properly.

Apparently my prying reseated whatever had come loose from the display. The results of my prior key entries was present in the display, confirming the micro was performing properly, but the display was not.

Thx again,

Jay

TTF files @ HPCC

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 17 Oct 2004, 10:47 a.m.*

Hi, all;

I know this sounds like "Look what I've done!", but I guess these files may help you preparing HP-related docs.

After many e-mails being xchanged with Jordi Hidalgo, I contacted the HPCC publishers and prepared a main document and sent them with all TTF files I had "drawn", and I also add some vector templates that allow display representation to be built easily.

With no further ado: The HPCC Datafile Index and you'll see a link to luizfonts.zip in September/October 2004, V23N5P14. I thought about adding a link directly to the zipped file, but I think Mrs. Bruce and Mark must have their site being seen, first.

I know that the TTF files have already been mentioned here many times, but I guess that this is the first time I have them all together available for downloading.

I'd like to thank (again) Jordi Hidalgo for his contiuous support on having the fonts and related article available at the HPCC site, and to Dave Hicks, who was the first one having some of them available for downloading at the MoHPC.

BTW, Dave, I'd like to add a new article here about these fonts as well. The fonts are the same as the ones available at the HPCC article, but in this case, you'd only have a smaller zipped file with the TTF files in it. What do you think?

Cheers.

Luiz (Brazil)

Edited: 17 Oct 2004, 1:27 p.m.

Charger confusion

*Message #1 Posted by **Charger** on 17 Oct 2004, 6:07 a.m.*

Hi! I own a AC adaptor for the HP-67 and one for the HP-21. The one for the HP-67 has 3 pins on the plug and the one for the HP-21 has two pins and is switchable(85-127/172-354V). But both adaptors are called "82010A". The information on the adaptors is the same, only the switch for the HP-67-adaptor is sealed. Both seem to be unopened! so why are they called the same?

O-Rings for HP9825

*Message #1 Posted by **Andre Koppel** on 17 Oct 2004, 5:31 a.m.*

Hi all, I got a well working HP9825 from Ebay. It contains GPIB and a BCD-Interface. The Printer is in a good condintion also. Looks like the computer is running well. But there is one problem (the same for all of these machines). The gummi-wheels for the cartrige-drive are gone. I have tried to get the approbriate O-Rings here in Germany, but I have not found a reseller. Is anyone in the states willing to send an amount of O-Rings to me so I am able to repair the drive (details for the O-Rings are given in the repair-section of HPMOC)? Kind regards Andre

Re: O-Rings for HP9825

*Message #2 Posted by **Vassilis Prevelakis** on 19 Oct 2004, 1:32 a.m.,*
in response to message #1 by Andre Koppel

To the best of my knowledge the 9825 tape drive is very similar to the HP-85 tape drive.

I have repaired quite a few capstans for HP-85 and 9915A/B drives without ever using o-rings.

Have a look at http://www.series80.org/Articles/capstan-repair.html for some notes and pictures of the HP-85 repair.

"New" 17BII+ L() and G() strange behaviour

*Message #1 Posted by **Vincent Weber** on 16 Oct 2004, 3:02 p.m.*

Hi all,

I finally managed to get one of these "new" 17BII+, supporting L() and G() functions. I tested this quickly in the shop, and I was so happy to see that L() and G() were back, that I think I was too quick to buy. If you enter the following equation in this 17BII+:

L(A:2*X)+G(A)=B

If you enter 5 for X, you get 10 (2*5) for B, whereas what you should get is 20 (2*5 + 2*5). My 17BII (not +) gives the correct result.

So, I thought, Ok, well, the 17BII+ makes the L() function returns 0 instead of the value it assigns. Strange, but I may be able to live with it. But even stranger, consider the equation:

L(A:2*X)=B

This time the 17B++ gives the correct result for B when X=5, i.e. 2*5=10.

So it seems that the L() function has the right behaviour, but that the G() function is not evaluated AFTER the L() function - hence, answers 0. I could verifying this by replacing G(A) with 3*G(A) in the first equation - still the same result (10 !).

Is this ony me, or HP has really screwed up the implementation of L() and G(), and I wasted my money ? :(

Cheers, Vincent

Re: "New" 17BII+ L() and G() strange behaviour

*Message #2 Posted by **Bob Wang** on 16 Oct 2004, 9:05 p.m.,*
in response to message #1 by Vincent Weber

Vincent:

Thanks for posting this behavior. May I ask you to enter the equation as:

L(A:2*X)+G(A)- B = 0

And see if the behavior is the same. Thanks very much.

Bob

HP screwed up again - I'm done with them:(

*Message #3 Posted by **Vincent Weber** on 19 Oct 2004, 3:59 a.m.,*

in response to message #2 by Bob Wang

I tried, and same results. Actually the results are arbitrary. Sometimes when you change the variable name and try again your get the correct result, most often not. As it you had 2 concurrent processes trying to evaluate L() and G(), when most often G() would win, and sometimes L(). This 17BII+ is a piece of crap, useless to business programmers, and HP never bothered to test it obviously. I am -done- with "new" HP calculators.

Disgusted Vincent

Re: HP screwed up again - I'm done with them:(

*Message #4 Posted by **mark** on 19 Oct 2004, 9:32 a.m.,*
in response to message #3 by Vincent Weber

I also Tried this on a New hp 17Bii+ (bought in the UK) and an old hp17Bii. I can confirm the same behaviour, the New hp17Bii+ doesnt solve the equation in the same way as the old HP 17Bii.

Re: HP screwed up again - I'm done with them:(

*Message #5 Posted by **Bobby Wang** on 19 Oct 2004, 10:13 a.m.,*
in response to message #4 by mark

Vincent and Mark:

Thanks very much for testing the new 17BII+. Before you give up, maybe one of the gurus can compile a bug list, and workarounds to make these units "reliable".

Once I get my replacement unit, I'll try to pin down some of the quirks. It is a shame that the Solver implementation leaves so much to be desired.

Bob

Re: HP screwed up again - I'm done with them:(

*Message #6 Posted by **George** on 20 Oct 2004, 12:00 a.m.,*
in response to message #5 by Bobby Wang

I got my 17bii+ exchanged with serial CNA416xxxxx in Hong Kong two weeks ago.

Following the equation from Vincent, I got 20 and 10 respectively. The result for Bob's suggestion is 20. It seems okay for my calculator.

Very strange

*Message #7 Posted by **Bob Wang** on 20 Oct 2004, 11:55 a.m.,*
in response to message #6 by George

George:

Thanks for posting your results. I can't wait to get my unit replaced so I can check out this behavior.

Bob

Be sure to send your discovereies to HP

*Message #8 Posted by **bill platt** on 19 Oct 2004, 10:41 a.m.,*
in response to message #1 by Vincent Weber

I sent in a comprehensive Bug List to HP regarding the 33s, and they "escalated" my claim.....

We'll see what happens.

I suspect that unless we speak up, nothing will happen--but that if we do, we may actually move them!

It is thoroughly frustrating, though!

Regards,

Bill

Re: Be sure to send your discovereies to HP

*Message #9 Posted by **Mike H** on 19 Oct 2004, 1:31 p.m.,*
in response to message #8 by bill platt

I recently (last week) sent my 49G+ back to HP for exchange... keyboard issues. While I had tech support on the phone, I ask if they were aware of any changes/updates for the 33s.

Her response was "not officially".

I then ask if unofficially she was aware of any updates to the bugs on the 33s. She responded that they have only been informed of the "swap bug" between older Wal-Mart versions and the newer version. They have not “officially” been informed of any other problems with the 33S!!!

Re: Be sure to send your discovereies to HP

*Message #10 Posted by **bill platt** on 19 Oct 2004, 2:38 p.m.,*
in response to message #9 by Mike H

Hi Mike,

I think it is a case of the tech support people not being kept in the loop.

Also, interesting to hear the swap as a "bug" as the swap feature is not documented at all in the manual, anyway.

And, in fact, depending on your preference, both the 1st Walmart release (has an algebraic swap operationally identical to the 20s0 and the later release (has a dual calculator algebraic line) have their advantages and disadvantages.

Interestingly, Włodek's training aid, avaialable on the HP website, only acknowledges the early swap version (see the file with the filename "...33sRPN.pdf"---see the bottom of page 9. Yet, I would imagine that most of the 33s macines out there are the newer release (they have an "A" in the serial number.)

17BII+ S/N CN4130 gives right answer

*Message #11 Posted by **Gene** on 25 Oct 2004, 10:43 a.m.,*
in response to message #1 by Vincent Weber

Try this:

A = L(D:B+C) + G(D)

Put in 5 for B and 5 for C and then solve for A.

A is returned as 20, which is correct.

Trying the L(A:2*X)+G(A)=B equation above, I get the correct answer.

What S/N are the machines not giving the correct answers?

Gene

I am done with KinHPo - Valentin was right

*Message #12 Posted by **Vincent Weber** on 25 Oct 2004, 11:30 a.m.,*
in response to message #11 by Gene

Hi Gene, I don't know, and I don't care anymore. I am *done* with them and their crap. I have bought two 17BII+, none of which is able to solve a simple equation with L() and G() properly, and none of which being nicely made (the painting is fading away, the keyboard is cheap). I don't want to have anything to do with them anymore. Good luck to those who still have hopes. I initially thought that Valentin was too harsh, but now I think he was quite moderate in his comments on "New HP".

Cheers, Vincent

"AND ANOTHER UN-SATISFIED CUSTOMER!!!" enuff said

*Message #13 Posted by **Ron Ross** on 25 Oct 2004, 12:00 p.m.,*
in response to message #12 by Vincent Weber

Hp, ARE YOU LISTENING???

And the 17Bii+ is actually the best pocket calculator available as it can use the 32K that it comes with vs the Hp33s cannot.

S/N CNA416 - Strange Behaviour

*Message #14 Posted by **George** on 26 Oct 2004, 11:18 p.m.,*
in response to message #13 by Ron Ross

Results of my S/N CNA416 replacement:

L(A:2*X)+G(A)=B input X=5 and solve for B=20

L(A:2*X)+G(A)-B=0 input X=5 and solve for B=20

So far so good, BUT

A=L(D:B+C)+G(D) input B=5 and C=5 and solve for A=10 !!!

The inconsistancy is driving me crazy. I am wondering how long it will take HP to make any correction and whether they will still do the exchange when my warranty period lapsed already!

Deluge of fake buyers in response to advert on MoHPC

*Message #1 Posted by **John** on 16 Oct 2004, 2:17 p.m.*

Hi,

Just had my fifth e-mail in 2 days offering to buy my HP, payment by cheque from reputable person, shipping to be arranged by shipping company, mostly from Nigeria, etc. etc. all in response to one ad on the MoHPC Classified Ads forum. I guess I need better filtering software on my e-mail!

Do these people have robots that scan the web for adverts?

On the web its just as much 'seller beware' as 'buyer beware'. Every week there are more stories in the news about people being conned in this way, I reluctantly suppose this is a strong reason for the growth of Paypal, it may seem to cost a lot but you do have protection against fraud (allegedly).

Rant over, John

Re: Deluge of fake buyers in response to advert on MoHPC

*Message #2 Posted by **Namir** on 16 Oct 2004, 4:08 p.m.,*
in response to message #1 by John

John,

When placing an ad on this forum, use a fake email that includes words, like NOSPAM, in the email address. Include a reminder for legit website members to remove that extra word from the pseudo-email. Do this and you will not be bothered by eCriminals.

Namir

*Message #3 Posted by **Eddie Shore** on 17 Oct 2004, 1:04 p.m.,*
in response to message #2 by Namir

Do you get e-mails from people trying to get you to take their money and put in the bank? I do from time to time and they get immediately dumped in the trash can.

Sadly it is too easy for fakers to fake legitmacy while scamming others.

Re: OT Paypal rant

*Message #5 Posted by **JDH** on 18 Oct 2004, 9:28 a.m.,*
in response to message #4 by deleted

I agree about the scammers in the classifieds area, I'm selling my unused HP 42s at the moment (hopefully sold soon!!!), I think I had emails from about 5 to 10 scammers. When I sell things I tend to have a junk mail email rather than my normal email address which I can get rid of if the junk mail gets really bad. I think next time I post an add I'll try the NOSPAM in the email, I didn't bother as I assumed they where manually reading them.

One easy way to tell how genuine they are is to see whether they are happy with your terms of sale, and secondly whether they know anything about what they are tryng to purchase!!! Generally the scammers emails are so similar in the wording you would have to be pretty silly to be fooled with it. Most of the emails I've receiver I haven't even bothered replying too as I can tell they are not are not real buyers.

Re: OT Paypal rant

*Message #6 Posted by **unspellable** on 19 Oct 2004, 12:58 p.m.,*
in response to message #5 by JDH

I, and some other people leave spaces (as above) in the email address for the repsondent to remove as a counter to atumated whazzits.

I'm thinking of selling an HP38G. If any one here is interested, I'd give them a legitiamtae price, but I'm tempted to post it in the ads for $470 just to see what sort of replies I'd get.

Re: OT Paypal rant

where did you get that, I thought you could not waive this option. In fact PayPal says that if the buyer reverses a credit card payment, they will recover the money from the seller. (section 5.1 Credit Card Funded Payments).

```

Phewww, the only reason I use PayPal is that I can pay using my credit card and have the security of having my credit card company deal with unreliable sellers.

Note though that wise-guys have added their own exclusions:

E.g. surplus-supply-com which includes in their auctions the following disclaimer:

If you opt to use PayPal to pay for your auction purchase, you agree to the following conditions. All items sold by SURPLUS-SUPPLY-COM "the seller¿ and purchased by you "the buyer" are subject to the following terms. This contract agreement supercedes any and all agreements that you may have previously made with PayPal. WE, OUR PARENT, SUBSIDIARIES, EMPLOYEES AND OUR SUPPLIERS PROVIDE OUR PRODUCTS "AS IS" AND WITHOUT ANY WARRANTY OR CONDITION, EXPRESS, IMPLIED OR STATUTORY. WE, OUR PARENT, SUBSIDIARIES, EMPLOYEES AND OUR SUPPLIERS SPECIFICALLY DISCLAIM ANY IMPLIED WARRANTIES OF TITLE, MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT. Under no circumstances may the buyer without prior consent from SURPLUS-SUPPLY-COM seek reversal of any payments made to SURPLUS-SUPPLY-COM by the PayPal payment service. This Agreement is governed by and interpreted under the laws of the state of Texas, U.S. If for any reason you are not in agreement with this contract, please do not use PayPal for your purchase. Recent changes in the PayPal user agreement have made this necessary.

So its buyer beware as usual, although I wish them luck trying to enforce this with a credit card company

The power of the 49g+ over the TI-89

*Message #1 Posted by **Ben Salinas** on 16 Oct 2004, 1:38 p.m.*

On Friday in Calculus II, we were covering integrals which are generally done by looking at tables or solved using a CAS (computer algebra systems). The other 17 people in my class (though about 4 of them use HP scientific calculators) use the TI-89 as their primary calculator. I use my 49g+. So, we were working problems as a class, and so everyone was punching them into their calculator. My teacher (who really likes the HP calculators) would get the answer from the TI-89 first, and then from my 49g+. For every single one of the integrals we did, the 89 would return an answer which was several screens long (very very very large answers). My calculator would consistently return a 1 or 2 term answer. Everyone would ask, "How does it do that?!? My answer takes the whole board (literally), and his answer is tiny."

It was really quite funny. And I didn't even bring up the trying to add 1 to 1000! (to add 1 to a large number, it takes the 89 about 30 seconds... the 49g+ does it instantly)

-Ben Salinas 12345

Could you provide a couple examples?

*Message #2 Posted by **Karl Schneider** on 16 Oct 2004, 4:03 p.m.,*
in response to message #1 by Ben Salinas

Ben --

I'd be interested to see the difference in performance of symbolic calculus between the HP-49 and TI-89 series models. I have a 49G, but I'd doubt that the 49G+ is any different.

Can you provide several of the integral problems in question?

On the second item, (1000! + 1), I assume that "exact" mode is required; the result exceeds 10^{500}. Please see also the "hp 49g+" thread stated by Pascal Jerney, immediately below this thread.

-- KS

Re: Could you provide a couple examples?

*Message #3 Posted by **Ben Salinas** on 16 Oct 2004, 11:38 p.m.,*
in response to message #2 by Karl Schneider

Sure. The examples we did were as follows:

sin^2(x)*cos^3(x) (x^2)*SQRT(A^2+x^2) (arccos(ax))^2

I am sure there are countless other examples that would also illustrate the point.

I believe that the 89 just uses a ported version of Derive. I guess that just goes to show you that actually writing your own software yields better results.

-Ben

Re: Could you provide a couple examples?

*Message #4 Posted by **Eddie Shore** on 17 Oct 2004, 12:52 p.m.,*
in response to message #3 by Ben Salinas

You are correct, the TI CAS caluclators use Derive.

Performance notes:

For TI: TI-89 Titanium using 2nd Integral command For HP: HP-49G+ Use SYMB-CALC-INTVX command; Real Mode

1. integral((sin x)^2 * (cos x)^3) = -((sin x)^5 ÷ 5 - (sin x)^3 ÷ 3) TI was slightly faster, but HP's answer was more simplified.

2. integral(x^2 * sqrt(x^2 + a^2)) TI returned (-a^4 * ln(sqrt(x^2+a^2)+x)÷8 + (x*(x^2+a^2)^1.5)÷4 - (a^2*x*sqrt(x^2+a^2))÷8

HP returned

Both returned the answer in the same time, with both answers several screens long.

3. integral(acos(a* x)^2) TI returned (4*a*x*(asin(a*x))^2 + 4*(2*sqrt(1-a^2*x^2)-a*pi*x)*asin(a*x)-4*pi*sqrt(1-a^2*x^2)+a*(pi^2-8)*x)÷(4*a)

HP returned -(2*acos(x*a)÷a*sqrt(-(x^2*a^2-a))) + (acos(x*a)^2 -2)÷a *x *a

TI was slightly faster, but returned the answer in one fraction, as apposed to HP "breaking up" the fraction into a few terms. The latter I think is easier to read.

Re: Could you provide a couple examples?

*Message #5 Posted by **Erik Ehrling (Sweden)** on 17 Oct 2004, 2:59 p.m.,*
in response to message #3 by Ben Salinas

Being a great fan of HP calculators I however still regard Derive as one of the better DOS programs ever written...

Best regards, Erik Ehrling (Sweden)

Re: Could you provide a couple examples?

*Message #6 Posted by **martin cohen** on 17 Oct 2004, 6:32 p.m.,*
in response to message #5 by Erik Ehrling (Sweden)

Actually, the TI CAS is not Derive, but a similar program written by the authors of Derive.

Similar, but not the same.

Solving integrals with pencil and paper

*Message #7 Posted by **Nenad (Croatia)** on 18 Oct 2004, 4:45 a.m.,*
in response to message #3 by Ben Salinas

IMHO, it would have been a much better exercise if the task was to solve these integrals without a calculator or a computer. The class would have learned much more.

It is not easy to understand (at least for me) what is the point in solving integrals in the classroom by typing them either into a TI89, or a HP49G+, or Derive on PC, or Mathematica, or naything else? You do not see all the necessary transformations needed to find the solution out.

Maybe, I am a bit old-fashioned...

Re: Solving integrals with pencil and paper

*Message #8 Posted by **John Smitherman** on 18 Oct 2004, 3:06 p.m.,*
in response to message #7 by Nenad (Croatia)

Hi Nenand. Maybe you and I belong in a different museum (one with dinosaurs) because I agree with your questioning the use of calculators for this purpose. With my 3 children I have emphasized doing math with pencil and paper and only using a calculator to check arithmetic. Thus far, this philosophy has served them well. However, the world around us is changing and who knows, in the future the student that succeeds may be the one who enters numbers or equations into a calculator or computer the quickest.

Regards,

John

Re: Solving integrals with pencil and paper

*Message #9 Posted by **bill platt** on 18 Oct 2004, 4:22 p.m.,*
in response to message #8 by John Smitherman

Hi John,

[qoute] ...in the future the student that succeeds may be the one who enters numbers or equations into a calculator or computer the quickest.

[/quote]

Well, this is true for the "Student"--but not for the person, in the "real world."

In the Real World, you have to figure it out for yourself---and if you don't understand the problem or how to construct a solution, then you are SOL.

I hope we are not dinosaurs---I would rather be an opthalmasaurus, or a pterosaur or something.....

Best regards,

Bill

Re: Solving integrals with pencil and paper

*Message #10 Posted by **Ben Salinas** on 18 Oct 2004, 6:32 p.m.,*
in response to message #7 by Nenad (Croatia)

I agree...

The focus of most of calculus I and calculus 2 thus far has been doing calculus without relying on the crutch of a calulator. This is why we have done integrals by hand for a total of about 3 months time, and solely with a calculator for 1 period.

-Ben Salinas 12345

Re: The power of the 49g+ over the TI-89

*Message #11 Posted by **bill platt** on 18 Oct 2004, 4:23 p.m.,*
in response to message #1 by Ben Salinas

Hi Ben!

Hey, why don't you try (numerically) integrating in class with the 15C? Now THAT whould make an impression :^)

Best regards,

Bill

HP 49g+

*Message #1 Posted by **Pascal Jerney** on 16 Oct 2004, 11:00 a.m.*

Hi there!

I own a HP 49g+ Calculator and I have a problem:

When I bought it, i wanted to test it and calculated the factorial of 1000. No problem, after 30 seconds I had the result with all digits. But now, 2 days later, if I want to calculate this factorial again, the calculator only shows 9E499 or shows the "Overflow"-Error if system flag 21 is turned on.

Please help me!

Pascal

Re: HP 49g+

*Message #2 Posted by **John** on 16 Oct 2004, 11:04 a.m.,*
in response to message #1 by Pascal Jerney

You may have set it in 'approx' mode; on the top of the screen there should be an 'X'. To the left of it, is there an equals sign, or 2 wavey lines?

Re: HP 49g+

*Message #3 Posted by **Pascal Jerney** on 16 Oct 2004, 11:29 a.m.,*
in response to message #2 by John

Now, I succeeded to do this factorial again! In CAS settings, "Numeric" checkbox was checked. But thanks nevertheless!

Greez Pascal

Re: HP 49g+

*Message #4 Posted by **John** on 16 Oct 2004, 11:44 a.m.,*
in response to message #3 by Pascal Jerney

If you want to do factorials, I think someone wrote a "quick factorial" program that does them very speedily.

Re: HP 49g+

*Message #5 Posted by **Pascal Jerney** on 16 Oct 2004, 11:51 a.m.,*
in response to message #4 by John

Yes, I saw it on www.hpcalc.org It's the FastFactorial 3.00 program It calculates the factorial of

1000 in one second, showing all the digits.

Greez

Programming a Clonix Module with Laptop

*Message #1 Posted by **Gary Owen** on 15 Oct 2004, 10:16 p.m.*

Was wondering if anyone has tried to use a USB to RS-232 converter connected to a laptop to interface with the programmer for the Clonix-41/NoVRAM modules? If so, what make/model of converter is known to work (i.e., one that has the proper voltages present on the RS-232 side of the converter)? The problem is the voltage output from the laptop serial port is usually ± 3.6v whereas the programmer requires something in the range ± 6v to ± 9v.

Any help/info would be greatly appreciated.

Re: Programming a Clonix Module with Laptop

*Message #2 Posted by **Wilson (Bill) Holes** on 16 Oct 2004, 9:30 a.m.,*
in response to message #1 by Gary Owen

Hi Gary,

Like you I've had no luck in programming a Clonix using my laptop (Compaq EVO N600c). The USB on my laptop is ver. 1.1, I doubt this matters as I suspect the voltage is the problem as you suggested.

A little side note... I recently acquired a new Sony PCV RX54G Desktop. It's a good box but lacks a native RS232 port (all USB). I purchased a USB to RS232 cable expecting it would allow me to program a Clonix... no such luck.

I also own an old ISA based PC in which I have installed one of Christoph Klug's HP-IL interface cards. It has two RS232 ports and no USB ports. Neither of the serial ports seem to drive the PIC programmer so I installed a USB card with hopes the USB to RS232 cable would work in this box. Again, no such luck. Murphy at his best!!!

Like you, I'm hoping someone on this forum can shed some light on the situation as I'm currently without a means to program my Clonix or NoVRAM.

Best, Wilson (Bill)

Edited: 16 Oct 2004, 9:32 a.m.

Re: Programming a Clonix Module with Laptop

*Message #3 Posted by **Gene** on 16 Oct 2004, 11:30 a.m.,*
in response to message #2 by Wilson (Bill) Holes

My desktop (an HP Pavillion 760N) has USB 1.1 but also 2 serial ports.

I just bought a keyboard extension cable (making sure the genders of both ends was correct) and hooked up the PIC programmer to the cable to the serial RS232 port.

Works like a charm.

I have not been able to program it with my Omnibook 3100 laptop. No big deal...probably voltage issues.

Gene

Re: Programming a Clonix Module with Laptop

*Message #4 Posted by **Diego Diaz** on 17 Oct 2004, 4:54 p.m.,*
in response to message #2 by Wilson (Bill) Holes

Hi Bill,

Will you please make a test for me?? If you will, this is the job:

Just take a 100 - 150pF cap. (not a critical value) and place it between pins 3 & 4 (the two in the middle) of the white connector.

Then make a try to see if your laptop is now able to read and verify (do not try to program for now) any Clonix/NoVRAM modules.

Best.

Diego.

P.S. Whomever is willing to make this little mod (and knows how to handle a solder iron) is more than welcomed. Please let me know the results. BTW, by doing this mod you cannot damage anything.

Re: Programming a Clonix Module with Laptop

*Message #5 Posted by **Wilson (Bill) Holes** on 17 Oct 2004, 10:05 p.m.,*
in response to message #4 by Diego Diaz

Hi Diego,

I'm currently on a month long holiday in Destin, FL. so cannot do any testing since all my 41 stuff is still in Houston. I'll be more than happy to help solve the USB/RS232 riddle shortly after my return. In the meanwhile I'll keep abreast of the issue via my laptop and dial-up.

Best Regards, Bill

Re: Programming a Clonix Module with Laptop

*Message #6 Posted by **Chris Roccati** on 17 Oct 2004, 4:51 a.m.,*
in response to message #1 by Gary Owen

It is quite likely that the pic programmer does not really use the serial port but simply directly drives some of the control lines CTS/DTR etc...

This means that it will only work on a "real" serial port...

Re: Programming a Clonix Module with Laptop

*Message #7 Posted by **Angel Martin** on 17 Oct 2004, 5:08 a.m.,*
in response to message #1 by Gary Owen

It works fine with my Omnibook 800 - but of course I realize such a model isn't a "real" laptop in the common sense, instead it's really a much better design (the last from the ground up designed in Corvallis, I'm afraid).

I couldn't get it to work with either the Omnibook 4400, nor with the 6000. That's called progress in PC design, no doubt.

Best, AM

Re: Programming a Clonix Module with Laptop

*Message #8 Posted by **Raymond Del Tondo** on 17 Oct 2004, 8:03 a.m.,*
in response to message #7 by Angel Martin

Hi Angel,

you're right regarding the OB 800.

A few years ago I had to work on an interface software
for a REFA related handheld data collecting device,
and to make it work under W2K.
My OB 800CT was the only notebook in the company I worked for
which was able to communicate with the handheld device.
None of the newer OmniBooks (4150B, XE3, ...) was able
to connect to the device via the serial port.
The only drawbacks of the OB 800 are the RAM limitations to 80MB,
and the CPU limitation to the Pentium 166MHz MMX,
so W2K runs too slowly.
If it had at least a 233MHz MMX CPU and expandability
to about 256MB of RAM, I think I'd still use it.
However, I settled for an IBM X31 (1GB RAM:-)

Regards,

Raymond

Re: Programming a Clonix Module with Laptop

*Message #9 Posted by **Gary Owen** on 17 Oct 2004, 10:19 a.m.,*
in response to message #8 by Raymond Del Tondo

Thanks to all who responded to my original post.

Looks like I'm hosed as the only PC platforms that I use these days are Dell laptops -- one is an Inspiron 8000 and the other is a Latitude D600. Has anyone successfully used either of these models with the Clonix programmer?

As a side note I've been playing 20 questions with Diego prior to purchasing his modules and programmer. He has really been excellent to work with. I just wanted to check things out a little before I spent that kind of money only to realize things wouldn't work.

I would really like to use the Clonix with my -41 but if I can't program the thing then what's the point. Bummer!

Thanks again everybody, Gary

Re: Programming a Clonix Module with Laptop

*Message #10 Posted by **Diego Diaz** on 17 Oct 2004, 10:14 a.m.,*
in response to message #1 by Gary Owen

Hi all,

Well, it seems like RS-232 is (almost) dead... long live to USB.

I must admit I didn't suppose that the programmer interface was called to become a major issue... it has happened though, so let's go face it.

Bill, I'm really sorry to know of your troubles, I thought you had managed to (re)-pogram your modules since you didn't mention further problems after I sent your Clonix back.

Chris is more than probably right, RS-232 shouldn't be being used (in that programmer) as a "real" serial inteface, but as a simple "signals & timing generator" controlled by the software. Thus the USB<>RS-232 adapter more likely won't work at all.

Fortunatelly, other chances are... , unfortunatelly (as usual), some more expensive ones. Namely, "real" USB programmer (some $30 - $40); and Parallel port Programmer, just about the same price.

Drawbacks (appart from the price itself):

- They both need an external power supply to operate. Mostly any wall-wart over 12v - 15v DC fits the task.

- IC-Prog does not seem to support USB programmers. This is not a big deal really, since every programmer has its own software and .HEX files, generated during the configuration process, are standard and fully interchangeable.

Anyhow I'm now testing with an external supply for the programming voltage (the "real" problem with laptops) and will inform you along the next week.

Best wishes.

Diego.

Re: Programming a Clonix Module with Laptop

*Message #11 Posted by **Diego Diaz** on 17 Oct 2004, 1:59 p.m.,*
in response to message #10 by Diego Diaz

Hi again,

I think I've got good news for you laptop users. It happens that I've just successfully programmed one of my Clonix with a Fujitsu-Siemens Lifebook.

It has been impossible to do so up to now and, sincerely, I had not paid much attention as I had (wrongly) assumed that every Clonix/NOVRAM user have access to a "working" serial port...

I took the dust off the thick 18LF252 Data Sheet to dig into its programming specs and... there it was!!

This little wonder has a "LVICSP"... (I know, I also have to dig a bit deeper to find out what the h**l that meant), namely, Low Voltage In Circuit Serial Programming.

So, there's no need of such (difficult to reach) +12.5v programming voltages... even more, this is the *default* mode after erasing the whole device... then, why it didn't work at first??

Well, pin nr. 26 (RB5) *must* be at Vdd level... and it's wired into module connector, but to the bottom side of the adapter, thus, no track is there to set this pin at Vdd.

I've made a modified adapter to do the test described above... still need more testing and some help:

Can some/all? of you, with a laptop nearby, check if you can "READ" the contents of a Clonix/NoVRAM? Please include info regarding model of your laptop.

Will keep you informed.

Best wishes.

Diego

Re: Using LIFUTIL

*Message #3 Posted by **Raymond Del Tondo** on 27 Oct 2004, 4:39 a.m.,*
in response to message #2 by chris

For the HP9000 series computers, no conversion was necessary,
because they used LIF format for diskette media.

IIRC, HP Vectra PCs, and maybe the older Series 100 machines like the HP-150,
had a conversion utility (LIFUTIL..) shipped with the OS (CP/M or DOS).

For the other calculators which are not capable of HP-IL,
and which cannot make use of files on LIF media,
there are no conversion utilities.

Raymond

in response to message #3 by Raymond Del Tondo

hi raymond many of your infos are useful... do you know the structure of the lif format? or perhaps the old dif format translator? i have some info else where.looking...

Re: Using LIFUTIL

*Message #5 Posted by **Raymond Del Tondo** on 27 Oct 2004, 6:04 p.m.,*

in response to message #4 by chris

Hi Chris,

the LIF structure is explained in some articles
in the articles section of the hpmuseum,
and to a certain extent, in the HP-IL module,
Extended IO module, or 9114 disc drive manual.

Keywords for the hpmuseum articles: Tony Duell, Christoph Klug, ...

There's a chance that you'll find additional info on www.series80.org

Regards,

Raymond

Re: Using LIFUTIL

hp-9815 Tape Drive problem

*Message #1 Posted by **Jim Butch** on 15 Oct 2004, 10:53 a.m.*

I have two hp-9815S calculators. I have replaced the rubber drive wheel for the tape in both units. They seem to operate smooth and go through all of the motions properly when you press REWIND, MARK and IDENTIFY. But if you record anything and try to LOAD it or VERIFY it, all you get is CHECKSUM ERROR. I have selected a tape with a "tight belt" for this test. It would appear that the record level is too low. Is there an easy fix? Is the schematic diagram available for the 9815?

Thanks,

Jim Butch

Re: hp-9815 Tape Drive problem

*Message #2 Posted by **Katie** on 15 Oct 2004, 6:40 p.m.,*
in response to message #1 by Jim Butch

The problem may be still be with your tape(s), despite having good tension. Have you tried using a known good tape? Often these tapes loose their coercivity as they age especially if stored at high temperatures and you'll get exactly the behavior your describe.

Edited: 15 Oct 2004, 6:41 p.m.

Re: hp-9815 Tape Drive problem

*Message #3 Posted by **Jim Butch** on 19 Oct 2004, 11:04 a.m.,*
in response to message #2 by Katie

Katie:

Thanks for the input on the tapes. I have many DC100A tapes, both used and NOS. Most of these tapes, both used and NOS, do not work. They report and "end of tape" error on an hp-85 and simply do not work on the 9815. Even if you wind the tape to the middle manually and place the tape in the unit, it will rewind and report the same error. These tapes are 20+ years old. I have a few in the 10-12 year old range. These are all made by 3M and have tape feed problems. What is the cause of the end of tape error? I did find the Athana brand and plan to order a few to try.

Also, I did find the technical documentation on the 9815. There is a 1978 patent on the 9815 that includes everything. It can be downloaded from www.decodesystems.com. There is also a similar patent on the 9825.

Thanks, Jim Butch

Re: hp-9815 Tape Drive problem

*Message #4 Posted by **Vassilis Prevelakis** on 19 Oct 2004, 12:54 p.m.,*

in response to message #3 by Jim Butch

if you get an "END OF TAPE" error, it means that the oxide on the tape has fallen off.

The BOT/EOT sensor (beginning/end of tape) is optical. It detects light shining through a small hole on the tape. If the oxide falls off, then the tape becomes transparent fooling the sensor.

Check here for an example of how the tape looks like after the oxide has fallen off leaving a transparent "window" on the tape.

http://www.series80.org/Articles/DamagedTape-lr.jpg

Re: hp-9815 Tape Drive problem

*Message #5 Posted by **Katie** on 19 Oct 2004, 10:01 p.m.,*
in response to message #3 by Jim Butch

Jim,

I've tried many NOS tapes in both my 9815 and 9825 and they usually work. I find that the DC1000 tapes have always worked while the DC100A tapes have more problems. The DC1000 tapes are a higher coercivity replacement for the DC100A tapes with a slightly longer length. 3M (Imation) made them more recently than the DC100A tapes and probably used batter manufacturing techniques in their construction. They're not too hard to find on ebay but if you have trouble email me (katie10543@yahoo.com) I have extras.

HP-41c(V/X) memory testing...

*Message #1 Posted by **WigglePig** on 15 Oct 2004, 10:26 a.m.*

Hi all,

I'm looking to see if anyone has already written a program to run through all the memory which might be present in a 41, writing and reading to test the memory is OK.

Any ideas? Failing that, I suppose I'm gonna have to get writing!

ttfn...happy Friday afternoon!

WigglePig

Re: HP-41c(V/X) memory testing...

*Message #2 Posted by **Emmanuel, France** on 15 Oct 2004, 10:40 a.m.,*
in response to message #1 by WigglePig

```
Standard solution is a SIZE 000 and PRGM
in order to see the available registers in program memory :
63 for a C and additional 64 for each Memory Module (256 for a QUADRAM)
319 for a CV/CX
if there's no key assignment, alarm or program
To be continued ...
```

Edited: 15 Oct 2004, 10:42 a.m.

Re: HP-41c(V/X) memory testing... EDITED!!

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 15 Oct 2004, 3:32 p.m.,*
in response to message #1 by WigglePig

Hi;

If you wanna give this a try...

```
LBL`MTST
SF 25
(your pattern number)
ENTER^  (this ENTER was missing)
-
LBL 00
LASTX
STO IND Y
FC? 25
GTO 02
RCL IND Y
-
X!=0?  (!= means "different")
GTO 01
1
ST+ Z
RDN
RDN
```

```
GTO 00
LBL 01
'ERROR!
PROMPT
LBL 02
'REG=
ARCL Y
AVIEW
END
```

I did not test it because I wrote it now. It is too simple, I know, but maybe it will give you a hint of what can be done.

If it does not work and some good soul finds the cause, please, feel free correcting it and posting, please. I'm in a rush, now.

Cheers.

Luiz (Brazil)

Re: HP-41c(V/X) memory testing... EDITED!!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 19 Oct 2004, 11:34 p.m.,*
in response to message #4 by JasonG

Hi, Jason; thank you for your interest. What I guess helps more than adding comments is a stack trace. But these are just my thoughts, please, feel free asking for additional explanations. I'd gladly comment it.

As Eric have correctly posted, this is just a simple program and does not effectively test all bits in memory. It is necessary to add some sort of "sweep" in data range. Also, the HP41 system tests for higher existing memory address (register) and highest contiguous program RAM. It is easily seen when you remove a standard memory module from an HP41C that contains program data. At the first attempt to turn the calcualtor ON results in immediate MEMORY LOST. But it is acceptable having gaps in register area. Also, there are some synthetic code that allow checking for memory SIZE and, surely, for memory integrity. What I wanted most was to give an example that it can be done with a simple code (and check if my brain cells in the 'HP41 programming area' still respond to external stymulus...). At least it's been fun to program and debug without using the calculator to check it. I confess I did not load it yet and ran it. But I was able to trace it...

```
                  L        X          Y          Z          T
01 LBL`MTST       ?        ?          ?          ?          ?
02 SF 25
03 pattern        ?       patn        ?          ?          ?
```

```
04 ENTER^          ?       patn       patn        ?          ?
05 -             patn     0.00        ?          ?          ?
06 LBL 00        patn     cntr        ?          ?          ?
07 LASTX         patn     patn       cntr        ?          ?
08 STO IND Y
09 FC? 25
10 GTO 02
11 RCL IND Y     patn    patn(r)     patn(o)    cntr        ?
12 -             patn(r) (o)-(r)     cntr        ?          ?
13 X!=0?         patn(r) (o)-(r)     cntr        ?          ?
14 GTO 01        patn(r) (o)-(r)     cntr        ?          ?
15 1             patn       1        0.00       cntr       ?
16 ST+ Z         patn       1        0.00      cntr+1      ?
17 RDN           patn      0.00     cntr+1       ?          1
18 RDN           patn     cntr+1      ?          1         0.00
19 GTO 00        patn     cntr+1      ?          1         0.00
20 LBL 01        patn(r) (o)-(r)     cntr        ?          ?
21 'ERROR!
22 PROMPT
23 LBL 02        patn      patn      cntr        ?          ?
24 'REG=
25 ARCL Y
26 AVIEW
27 END           patn      patn      cntr(last reg)
```

If the stack diagram fails explaining, let me know and I'll add comments. In time: (o) and (r), from line 11 on, are respectively (o)riginal and memory (r)etrieved pattern.

Cheers.

Luiz (Brazil)

Re: HP-41c(V/X) memory testing... EDITED!!

*Message #6 Posted by **JasonG** on 21 Oct 2004, 6:55 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

AHA!

Many thanks Luiz...that does indeed explain what's going on. It was actually working fine but I had set SIZE 000 some time in the past so it ran rather quickly!

Setting SIZE nnn, where nnn!=000 give much better results. :-)

I will now begin work on somethingthat exercises all bits in the whole of the adressable memory and I will post the results here, of course!

ttfn

JasonG

Re: HP-41c(V/X) memory testing... EDITED!!

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 21 Oct 2004, 11:16 a.m.,*
in response to message #6 by JasonG

Hi, Jason;

in fact, if you set SIZE 000 there are no registers to be tested, and all remaining main memory (about 2KBytes for the CV/CX or C with all memory modules or one quad mem moule) is set to programs, alarms, function assignments OR some 'transcendential' thirdy-part functions. Wit

SIZE 000, my programstops without testing any register because there is none available: after finding FC? 25 (step # 09) for the first time, it jumps to LBL 02 and stops because STO IND Y (step # 08) found no exisiting R00 to store the pattern so flag 25 is cleared (error "detection" flag). Hence, no futher STO/RCL neither comparisons are performed.

Just a question: are you new for the 41 system? Please, this is just to know, no offense neither a bothering question. There is a universe of teasing and mysteries related to it. This is just about to be the first step after openning the door... or falling into the rabbit's hole!

Cheers and success.

Luiz (Brazil)

Re: HP-41c(V/X) memory testing... EDITED!!

*Message #8 Posted by **Eric Smith** on 19 Oct 2004, 7:57 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

There's a somewhat more thorough test in this thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=54123

Most of the simply memory test programs (including the 41C coldstart memory test) will succeed even if a fair number of register bits are stuck at zero. The test program in that thread is not exhaustive but does store values (resulting from trig functions) that exercise many more of the bits. It's also slower, though.

Re: HP-41c(V/X) memory testing...

*Message #9 Posted by **Mike (Stgt)** on 19 Oct 2004, 8:12 a.m.,*
in response to message #1 by WigglePig

Yes, I know such a program. It is built in the HP-41 and executed every time you switch it on. NO! Sorry, I have to correct: at MEMORY LOST only.

```
0255: 0AE A<>C   ALL
0256: 270 RAMSLCT
0257: 0AE A<>C   ALL
0258: 2F0 WDATA
0259: 1A6 A=A-1  X
025A: 3DB JNC    -05 0255
```

Ciao.....Mike

32S probably dead

*Message #1 Posted by **David Ramsey** on 15 Oct 2004, 1:01 a.m.*

I was recently checking my calcs and discovered that the entire rightmost vertical column of keys on my 32S is non-responsive. Everything else on the calc works fine.

Flexing the case doesn't seem to have any effect.

I 'spect this means it's toast, but thought I would check here first...

Re: 32S probably dead

*Message #2 Posted by **Namir** on 15 Oct 2004, 3:41 a.m.,*
in response to message #1 by David Ramsey

Two years ago I bought TWO HP-32S from eBay. BOTH had that problem!!! I ended up selling them from parts. I think it's a model problem.

Namir

Re: 32S probably dead - NOT

*Message #3 Posted by **Randy** on 15 Oct 2004, 8:57 a.m.,*
in response to message #2 by Namir

Yes, it's a desgin issue but it's usually quite repairable. Most times it's the pressure pad on the keyboard connector that has gone soft. Sometimes dirt can cause problems.

48's have the same issues since they are just a bigger Pioneer.

Lots of threads here on how to repair. See Paul Broggers Pioneer internals piece in the articles section for how to open.

What is the Drive 95 for the 48series?

*Message #1 Posted by **kirsten** on 14 Oct 2004, 3:30 p.m.*

it is a 3.5" drive for the Hp48 series machines, but din't know what it is.

Re: What is the Drive 95 for the 48series?

*Message #2 Posted by **Raymond Del Tondo** on 14 Oct 2004, 4:50 p.m.,*
in response to message #1 by kirsten

As you wrote, it's a portable 3.5" disk drive
which can be used with the HP-48 or HP-95LX,
or all other devices which implement the KERMIT protocol.
KERMIT is used to communicate with the drive.
Since the file format on the disks is FAT,
they can be used in PCs, too.

HP-42S rest to mfg conditions

*Message #1 Posted by **Rick Noyes** on 14 Oct 2004, 4:45 a.m.*

Anyone out there know how to reset the HP-42s back to the as manufactured condition? I was messing about with mine and have managed to screw something up and now it doesn't think as well as it once did.

Re: HP-42S rest to mfg conditions

*Message #2 Posted by **Raymond Del Tondo** on 14 Oct 2004, 5:33 a.m.,*
in response to message #1 by Rick Noyes

Hi,

the normal reset is to press and hold the ON key,
then press and release the SQRT (square root) key.
This performs a so-called warmstart,
which is useful when the calc is locked for some reason.
The calc displays 'Machine reset'.

The big hammer is the 'ON-A-F' key combination,
which clears all user memory.

Press and hold the ON key,
press and hold the Sigma+ key,
press and hold the XEQ key.
Release all keys.
The calc displays 'Memory Lost' or alike.

HTH

Raymond

Re: HP-42S rest to mfg conditions

*Message #3 Posted by **Rick** on 29 Oct 2004, 4:28 a.m.,*
in response to message #2 by Raymond Del Tondo

For all of you who responded to my plea. Thanks. The big hammer worked.

Re: HP-42S rest to mfg conditions

*Message #4 Posted by **Mike (Stgt)** on 14 Oct 2004, 5:49 a.m.,*
in response to message #1 by Rick Noyes

First try to press and hold the EXIT key and next hit the SQRT key (square root), release it and release EXIT too. This should lead to the display "Machine Reset". If that does not help try to press and hold the EXIT key, next press and hold the Sigma add key (the leftmost in the top row), and then hit the XEQ key and release all

keys in inverse order. This should lead to "Memory Clear".

If this did still not help, take out the batteries over night. Or -- if you dare even with the batteries in place -- shorten the contacts for less than a 1/10th of a second.

Ciao.....Mike

BTW, I am not sure if this procedure will realy reset to NIB condition. Isn't there a counter how often you did such a reset?

Re: HP-42S rest to mfg conditions

*Message #5 Posted by **Raymond Del Tondo** on 14 Oct 2004, 6:39 a.m.,*
in response to message #4 by Mike (Stgt)

Hi,

no, there's not a counter,
but if the internal mechanics are like in the HP-48 series,
a warm start log entry will be generated.
On the HP-48, this entry indicates the reason for the last warm start.

Raymond

Re: HP-42S rest to mfg conditions

*Message #6 Posted by **HrastProgrammer** on 14 Oct 2004, 7:56 a.m.,*
in response to message #5 by Raymond Del Tondo

but if the internal mechanics are like in the HP-48 series, a warm start log entry will be generated.

AFAIK, there is no warmstart log inside HP-42S (or at least I haven't found any sign of such code inside HP-42S ROM) ...

*Message #7 Posted by **J-F Garnier** on 14 Oct 2004, 3:57 p.m.,*
in response to message #6 by HrastProgrammer

Hi Hrast,

I did find it, actually the wslog value is stored at #4025f, see below. Any new emulator projects from your side?

J-F

```
some wslog values:
1: restart after comma mode
2: IR hardware failure? (cf hp48)
3: exec through addr 0
6 (not used on HP48 serie): invalid XROM
7: CMOS test word corrupted

; --- HP42S version C partial disassembly listing
; J-F Garnier 2001-2002

reset:
```

```
00000 23                P=     3                        ; wslog=3: exec through
addr 0
00002 6B93              GOTO   #0039E
...
0039E 850               ST=1   0
003A1 6600              GOTO   #003A8
-----
003A5 840               ST=0   0
003A8 1BF5204           D0=(5) #4025F   ! wslog
003AF 80C0              C=P    0
003B3 15C0              DAT0=C 1        ! save wslog value
```

Re: HP-42S rest to mfg conditions

*Message #8 Posted by **HrastProgrammer** on 15 Oct 2004, 12:17 a.m.,*
in response to message #7 by J-F Garnier

I did find it, actually the wslog value is stored at #4025f, see below.

Hi Jean-Francois,

Thank you very much! I was wondering what is this #4025F nibble but never thought it could be WSLOG - I called it 'Reset Nibble' inside HP-42X which is obviously the same thing :-(

Any new emulator projects from your side?

Nothing much. I finished TI-95 emulator for Windows (you can download it from http://www.geocities.com/hrastprogrammer). HP-12/15/16C emulators are planned but I am still searching for the real machines and ROMs.

Best regards.

Re: HP-42S rest to mfg conditions

32s keyboard flex problem

*Message #1 Posted by **ned** on 14 Oct 2004, 12:09 a.m.*

I tend to inherit broken things other people think I can fix, as is the case with my 'new' 32s: The middle keys esp. the "[sst] 4 5 6 [multiply]" row don't register unless the upper chassis is pushed down. The whole chassis has a permanent bow to it, bowed up across the short section, bowed down across it's length. I read the archived posts by Mr's Brogger & Duell regarding opening up pioneers, and the opening was a success. 'Unflexing' the upper plastic seems a bit difficult without cutting all the plastic welds, which would really screw things up. Anyone have a method of fixing this problem? I seem to remember reading about Pioneer series keyboard flex before but couldn't find the post.

AtDhVaAnNkCsE Ned

Re: 32s keyboard flex problem

*Message #2 Posted by **Randy** on 14 Oct 2004, 8:47 a.m.,*
in response to message #1 by ned

The bow in the plate is common in older Pioneers and is not the problem. The problem is the small foam pad under the keyboard connector - it is either out of position or it has lost is spring force, perhaps a combination of both. Shimming the pad with several layers of flexible tape is usually all that is required.

Re: 32s keyboard flex problem

*Message #3 Posted by **bill platt** on 14 Oct 2004, 9:06 a.m.,*
in response to message #2 by Randy

Hi Randy,

In order to shim, do you need to take the chassis all the way apart?

Does this rule--shimming to bring a keyboard back to life-- also apply to the 48 series?

Best regards,

Bill

Re: 32s keyboard flex problem

*Message #4 Posted by **Randy** on 14 Oct 2004, 1:01 p.m.,*
in response to message #3 by bill platt

I'm not sure what you mean by "taking the chassis all the way apart". You only have to remove the logic board from the frame. Anything beyond that and it's tough to get it back together.

The 48's have identical issues/fixes.

Re: 32s keyboard flex problem

*Message #5 Posted by **ned** on 14 Oct 2004, 3:22 p.m.,*
in response to message #4 by Randy

Yes, turning the metal keeper tabs back parallel with the slots should free the circuit board. See: http://www.hpmuseum.org/guest/brogpion.htm thanks for the tip about the pad. I'll take the leap tonite and undo the tabs.

-Ned

problem sovled

*Message #6 Posted by **ned** on 20 Oct 2004, 9:53 p.m.,*
in response to message #5 by ned

okay upon removing the rear chassis and the pcb, I saw that the problem (with most pioneers maybe) is that 2 hooks, or teeth on the front chassis became detached from the metal plate. In this case, the front chassis was allowed to flex out, causing lack of contact at the keyboard connector. This is just below the lcd, where the keyboard connects to the pcb via the printed mylar. Shimming the foam pad might work also, but hooking the teeth back to the metal solves the problem. Poor design IMHO. The front chassis provides no stiffness, the metal plate should have been channelled for stiffness.

HP-85 ROM Pin Configurations

*Message #1 Posted by **JeffD** on 13 Oct 2004, 7:41 p.m.*

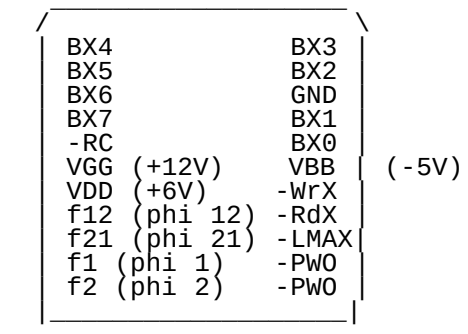
Does anyone know what the pin configurations are for the HP-85 ROMS? Is there any documentation to describe how the HP-85 communicates with the ROM modules? It would be an interesting project to develop a "programmable ROM drawer" but possibly hold many ROM images like the MLDL2000 or clonix. Please let me know if you have ever seen documentation for such or have successfully built one.

Re: HP-85 ROM Pin Configurations

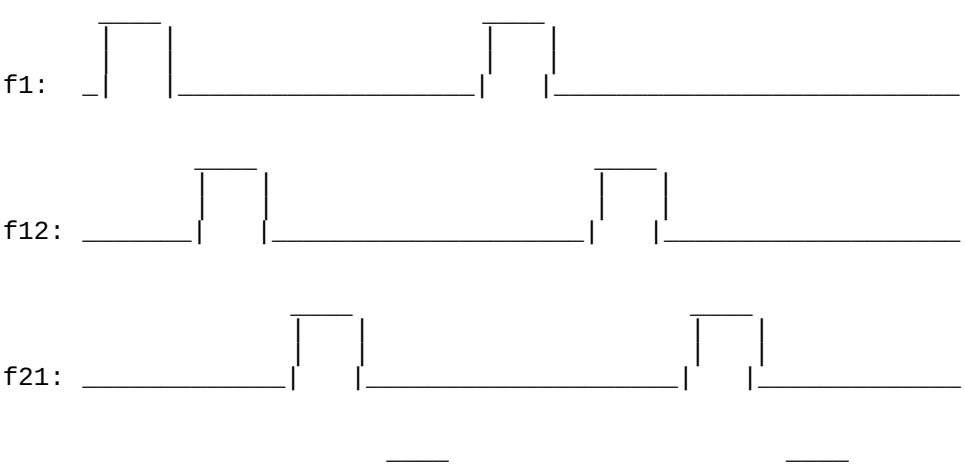
*Message #2 Posted by **Vassilis Prevelakis** on 14 Oct 2004, 4:56 a.m.,*
in response to message #1 by JeffD

The circuit diagrams of the HP-85 are included in the service manual of the HP-85 in the MoHPC CDROM collection.

Here are the option ROM pinouts:



```
PWO: Power On Signal
LMA: Valid Address on Bus
Rd:  Read Data
Wr:  Write Data
RC:  ???
```



Note that the logic is 6V and the clocks are 12V !!!

The ROM pinouts are all the same, the ROM socket pins are also all the same. Each ROM selects itself if it sees its id . This is the reason that if you plug two (say) I/O ROMS, you may damage your HP-85.

Re: HP-85 ROM Pin Configurations

*Message #3 Posted by **JeffD** on 16 Oct 2004, 10:13 p.m.,*
in response to message #2 by Vassilis Prevelakis

Would the 2708 EPROM work? It has the 12V, -5V but it only has a +5v. The spec states that that it would accept 5.25v max. Do you know of an EPROM that would compare to this HP-85 specification? Thanks, Jeff

```
JeffD wrote:
> Would the 2708 EPROM work?
```

Sorry, the HP ROMs have a lot of logic built into them. They are rather comparable to the HP-41 ROMs where you actually need a microcontroller to emulate the ROM.

Alternatively you may use a programmable ROM drawer (HP 82929A)

http://www.series80.org/Manuals/HP82929A.pdf

Unfortunately they are rather rare and fetch a high price on eBay (latest one went for $159.25, http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5128991233)

HP-67 card reader

*Message #1 Posted by **Jon** on 13 Oct 2004, 12:47 p.m.*

Hi:

I have replaced the gummy wheel to one HP-67. Now it writes but don´t read. I read some time ago that sometimes we have to replace the blue capacitor. I have done it using one 4.7uF as spare part, but nothing changes. Contacts ´alignement seem to be ok and everything is clean. Any idea? Can I use spare parts from a 41 card reader?. I mean motor, and head

Thanks in advance

Jon

Re: HP-67 card reader

*Message #2 Posted by **David Smith** on 13 Oct 2004, 6:00 p.m.,*
in response to message #1 by Jon

Well, if you replaced the proper cap then the next thing to try is to make sure that all three leaf spring switches are closing and opening in the proper sequence. Trace them to the connector pins and monitor the signals (to ground) with an ohm meter while manually inserting and removing a card (do this with no power on)

Re: HP-67 card reader

*Message #3 Posted by **Jon** on 16 Oct 2004, 2:11 p.m.,*
in response to message #2 by David Smith

Hi David:

I have done it and it is clear that all three leaf spring switches work properly. I have several HP-41 card readers and I see that most parts seem to be the same (motor, head, ICs). If neccessary I could use one of them as source for spare parts.

Regards

Jon

beta test

*Message #1 Posted by **Scuba Diver** on 13 Oct 2004, 10:37 a.m.*

Hi there!

I am a part-time MBA student with a focus on finance. I am also employed in the finance industry and (obviously) an HP fan. I know that the 19BII+ "may" be coming out soon, and thought that beta testing should be starting up shortly. If there is an opportunity to beta test the new 19BII+, I would like to participate.

Does anyone know how to contact HP to find out how to become a beta tester? I know that there are some beta testers out there on the site, how did you apply?

I have added my email address above so anyone who has done this in the past can reply confidentially.

Thanks in advance! B.

probability

*Message #1 Posted by **KC** on 13 Oct 2004, 5:15 a.m.*

Sorry for posting a maths question here rather than calculator question. Some day ago someone ask me the following question:

Suppose you enter a sugar shop and there are 10 different types of sugars. You're going to pick out 10 sugars. For each type of sugar you can pick from none to all 10. How many possibilities do you have? Is there a general theorum or equation for such type of question? Also, can such kind of question be programmed? I obtained the answer, and my friend thought I was clever. The thing I didn't tell him is that I obtained the answer by COUNTING!

KC

Re: probability

2^10 = 1024 ?

Re: probability

*Message #3 Posted by **Dave Shaffer** on 13 Oct 2004, 11:49 a.m.,*
in response to message #1 by KC

KC,

I think you need to restate your problem. Please confirm if this is the correct statement:

"There are 10 different kinds of sugar. You are going to make 10 individual choices of what kind of sugar to buy. (i.e. you are first going to buy one kind of sugar, choosing from the 10 varieties; after that you are going to buy your second kind of sugar, again choosing from all 10 varieties, and so on, for 10 times) You can buy the same type of sugar as many times as you want (up to 10, of course!). How many different combinations of sugar buys can you make?"

If that is the problem, then the answer is pretty big: 10^10. In other words, at each purchasing decision, you can choose from 10 different products, and you get to choose 10 times.

Another way to look at it: give each sugar type a number value from 0 to 9. Your first overall purchasing decision might be to make 10 purchases of sugar type 0, and you purchase listing would be 0000000000. Then you might say, "hey this is kind of boring, I'd like to try type 1 at least once." Then, if you choose type 1 last, your purchase list would be 0000000001. Since you could choose any type at any point in your sequence, you would ultimately cover all the numbers between 0000000000 and 9999999999.

Re: probability

*Message #4 Posted by **Thibaut.be** on 13 Oct 2004, 12:47 p.m.,*
in response to message #3 by Dave Shaffer

I agree with your understanding of the statement, which at first was not clear to me.

But I think we want to go into deeper in the analysis.

As a matter of fact, you can choose out of 10 candies, any one you like, and this 10 times.

So the logical answer would be : 10*10*10...*10 = 10^10.

But this is the amount of possibilities of arranging the candies, whare place of the candies is important. To tka your example of numbers, 8181800081 does count as well as 1118888000, which is, to my understanding, the same possibility.

My understanding of the statement is how many different possibilities do you have to pick out 10 candies out of 10 different boxes. Hence no matter the place.

In this sense, we are facing to a situation where you can choose 10 * (10-1) * (10-2) *...* (10-8) * (10-9) = 10 ! candies = 3,628,800 possibilities on my 41CX !

Re: probability

*Message #5 Posted by **Mike H** on 13 Oct 2004, 4:48 p.m.,*
in response to message #1 by KC

Imagine a coffee shop with 10 flavors of coffee; you are to purchase 10 cups of coffee. You can choose 10 cups of the same flavor, one cup of each of the 10 flavors, or a combination of flavors. How many combinations are there.

10 possible choices for each cup

10*10*10*10*10*10*10*10*10*10 = 10^10 = 10,000,000,000

If there is to be no duplicates, that is you can only choose each flavor once, but the order in which the flavors are selected is counted then Pr,n = n!/(n-r)! = 10!/(10-10)! = 10! = 3,628,800

*Message #6 Posted by **Thibaut.be** on 14 Oct 2004, 4:24 a.m.,*
in response to message #5 by Mike H

Agreed

Re: Probability

*Message #7 Posted by **Andrés C. Rodríguez** on 13 Oct 2004, 8:10 p.m.,*
in response to message #1 by KC

Some of the answers given before, based on 10^10 are right as far as order is considered important. (i.e.: 12 and 21 are considered different combinations).

The case in which order is disregarded (i.e.: 12 and 21 are deemed the same) is more complex, and my first trials at it were unsuccessful... I am sure there is a better answer, but I have not found it yet...

Re: probability

*Message #8 Posted by **KC** on 13 Oct 2004, 10:34 p.m.,*
in response to message #1 by KC

First of all thanks for all of your responses. Let me make things simpler and clearer. Suppose the sugar shop has only 3 different types of sugars and I had to pick 3 only. I can list all the possibilites out. Let's label each type of sugar to be 1, 2 and 3 respectively:

111

112

113

122

123

133

222

223

233

333

I have 10 possibilities. Order is not important, so 321 and 213 is the same as 123, and that's why it cannot be 3^3. From the above listing, one can see that the tenth digit can never be larger than the unit digit, and the hundredth digit can never be larger than the tenth digit, and so on. Therefore I think somehow I can programmed that in my HP calculator according to the above rule, but I haven't figure it out.

KC

Re: probability

*Message #9 Posted by **Karl Schneider** on 14 Oct 2004, 2:13 a.m.,*
in response to message #8 by KC

The problem can be approached as a "nested recursive summation" that is not too difficult to program on an RPL-based HP calc (28/48/49 series).

For the 3-variable example (let's call it red, green, and blue marbles), the 10 ways to choose three marbles is as follows:

```
R G B   arrangements
3 0 0       1
2 1 0       3
2 0 1       3
1 2 0       3
1 1 1       6
1 0 2       3
0 3 0       1
0 2 1       3
0 1 2       3
0 0 3       1

total:     27
```

There are (R+G+B)!/(R!G!B!) number of each arrangement

The RPL expression (Sig = Greek letter sigma)

```
'Sig(R=0,3,Sig(G=0,3-R,1))'
```

can quickly be evaluated as 10.

(NOTE: Knowing the number of red and green marbles, there is only one possible value for the number of blue ones. So, it is not necessary to include it in the summation.)

Neither my 48G nor my 49G could procude the correct answer for the 10-variable case, the way I programmed it. THe 48G got stuck in a loop; the 49G seems to have different syntax.

Re: probability

*Message #10 Posted by **Raul L** on 14 Oct 2004, 9:30 a.m.,*
in response to message #8 by KC

CR(3,3)=C(5,3)=10

CR(m,n)=C(m+n-1,n)

Is this ok?

Re: probability

*Message #11 Posted by **Mike H** on 14 Oct 2004, 11:43 a.m.,*
in response to message #10 by Raul L

C(m+n-1,n)= C(19,10)= 92,378. Raul, was there a reference to this, or did you deduce by trial and error. KC, what was your answer?

Re: probability

*Message #12 Posted by **Raul L** on 14 Oct 2004, 12:27 p.m.,*
in response to message #11 by Mike H

> Quote:
>
> Raul, was there a reference to this, or did you deduce by trial and error

No: I'm not a genious :-(but I know this expresion since I was 14... and I teach it to my students. Combinations with repetition (as explained by KC in his example): we have m diferent elements for doing groups of m elements, don't worry about order (123=321=231=...) and we can repeat elements (111 or 112, etc)

so for the 10 sugar problem:
CR(m,n)=C(m+n-1,n)=CR(10,10)=C(19,10)=92378

Edited: 14 Oct 2004, 12:30 p.m.

Re: probability

*Message #13 Posted by **KC** on 14 Oct 2004, 10:25 p.m.,*
in response to message #12 by Raul L

Excellent Raul! It was such a beautiful and elegant expression! I apologize for my early claim that I was able to count m=10 and n=10 case. It was in fact a case where m=n=7, and I spent 2 hours or so to work out the answer. For the case where m=n=10, I don't think I have the gut to count overnight!

Once again, thanks very much,

KC

Re: probability

*Message #14 Posted by **KC** on 14 Oct 2004, 10:53 p.m.,*
in response to message #12 by Raul L

Hi Raul, I'm so impressed you told me you learned this expression at the age of 14. At my age of 14, I learned something like "what's the probability of getting two heads by flipping two coins?" Nevertheless, I love probability very much.

KC

Combinations with Repetition in RPL

*Message #15 Posted by **Raul L** on 15 Oct 2004, 2:04 p.m.,*
in response to message #12 by Raul L

Perhaps someone could be interested in this "new command":

COMBR

« DUP ROT + 1 - SWAP COMB »

But if you are using Erable in a 48GX, you can use this version:

« DUP ROT + 1 - SWAP 15 FC? IF THEN COMB ELSE comb END »

so, you will obtain exact results (all digits) or approximated results (scientific notation) depending on user flag 15. (This is not necessary with the 49)

An equivalent in RPN

*Message #16 Posted by **Karl Schneider** on 19 Oct 2004, 11:09 p.m.,*
in response to message #15 by Raul L

Raul provided the following RPL routines:

```
« DUP ROT + 1 - SWAP COMB »

« DUP ROT + 1 - SWAP 15 FC? IF THEN COMB ELSE comb END »
```

The first of which does indeed work on a 48G and 49G, but can't work on a 28C or any 41 (no statistical combination function "COMB").

Here are the RPN versions of the first program:

```
(others)          (HP-42)

LBL C             LBL "COMBR"
ENTER             ENTER
RDN               RDN
+                 +
1                 1
-                 -
RUP               RUP
Cy,x              COMB
RTN               END
```

No real difference in understandability, but that second RPL routine sure looks like jibberish to me.

The first routine is quickest and easiest to program and invoke on any non-alphanumeric RPN programmable.

Fie upon RPL! :^)

-- KS

Re: An equivalent in RPN

*Message #17 Posted by **tony h** on 20 Oct 2004, 12:34 a.m.,*
in response to message #16 by Karl Schneider

Karl, Instead of your "ENTER RDN + 1 - RUP" I did "X<>Y 1 - X<>Y + LASTX" here. Any reason to prefer one over the other? If COMB is replaced by PERM (or equivalents) in these routines then we have Pochhammer's Symbol, the rising factorial. Now this sounds like something to hit RPL with<G>

A better 42S program

*Message #18 Posted by **Karl Schneider** on 21 Oct 2004, 12:33 a.m.,*
in response to message #17 by tony h

Tony posted,

> Quote:
>
> Instead of your "ENTER RDN + 1 - RUP" I did "X<>Y 1 - X<>Y + LASTX" here. Any reason to prefer one over the other?

No preference; you program is just as good as mine -- six steps to set up the inputs to the C(y,x), using one extra stack level.

Now, here's a better RPN program for the 42S, using only three steps and no extra stack levels to set up the argument,. It should also work in conjunction with Raul's "COMB" program on the 41's.

```
LBL "COMBR"
+
LAST X
DSE ST Y
COMB
END
```

Version for the 41 (edited)

*Message #19 Posted by **Raul Lion** on 20 Oct 2004, 1:50 p.m.,*
in response to message #16 by Karl Schneider

```
This is COMB for the 41. I wrote it the last summer,
adapting this program from the MoHPC's Library,

(Caution with RND and RDN)

LBL COMB (uses R00 and R01)
-
LAST X
X<Y?
X<>Y
STO 00
1
STO 01
+
STO 02
RDN
X=0?
GTO 00
LBL 02
1
RCL 01
+
STO 01
X<=Y?
GTO 01
RCL 02
FIX 0
RND
FIX 4
GTO 04
LBL 01
RCL 00
+
RCL 01
/
STO*02
RDN
GTO 02
LBL 00
1
LBL 04
END

And this is the COMBR I use in my 41:

LBL COMBR
1
ST - Z
RDN
+
LAST X
XEQ COMB
END
```

in response to message #1 by bill platt

I don´t know any emulator of the 9820A, but I think I have some HP patents describing this piece, including a listing of the microcode. If you want to read the patent, I will search the number for you. It shouldn´t be too difficult to emulate, as there is much information in the patent, but since it´s alg.....

Greetings, Klaus

Re: Emulator of 9820A?

*Message #3 Posted by **bill platt** on 13 Oct 2004, 3:27 p.m.,*
in response to message #2 by Klaus

Hi Klaus,

Thanks for the offer. I am not sure whether that will get me what I want to know. Basically, I would like to see how the front end handles expression input and interpretation--what the syntax is, whether there are any inconsistencies or bugs, etc.

Perhaps I need to find an actual unit and try it out!

And yes, this is all because it is alg not RPN (if it were RPN, then we would already know the answer:-)

Seriously, though, I think it is too bad that RPN has become the focus for HP machines. There is so much more than the choice of operator "logic" to the making of a successful and useful calculator. A consistent, logical and well thought out algebraic interface is a joy to use---too bad it is so hard to find one!

And think of all the other things which go into a good calculator---robust routines for all the mathematical functions, an ergonomic and logical layout, dependable keys...etc.

Really, when I look at the total picture of the voyagers, for instance, it is not fundamentally RPN which makes them so special---rather, it is all the other good design and construction. I come to this opinion after having been exposed to over a dozen different hp machines--and it starts to become clear that some algebraics are nicer overall than others which happen to be RPN etc.

Example: from a "unity of design" standpoint, the 11c is a real gem compared to her ultimate replacement, the 32sii, and the especially the kinhp33s. The 32s, on the other hand, is quite nice from a design standpoint. (Though I gladly and happily learned to deal with the somewhat confusing layout of the 32sii, as there were so many great new features!)

For instance, compare the 27s design to the 32sii. Except for the advantage of complex numbers and keystroke programming, the 27s has more and better mathematical features, and is a much more logical machine to boot, with a truly versatile "solver." (If I had realized that this machine had such great features, I would have been very happy to have owned one back in 1990--but I was "blinded" by my RPN feelings at the time. I do remember seeing the Algebraics at the time, and thinking 'oh no, yuck!' Live and learn.)

It seems to me that RPN turns out to be a bit of a cop-out--a very simple, robust and logical, albeit rather obtuse, method of solving the problem (a non-trival problem) of how to parse mathematical expressions into computer coding. To develop a good algebraic system--that takes real skill, effort, and thought.

To that end, I am extremley curious to see what HP came up with all those decades ago with the 9820A.

Best regards,

Bill

NiMH in HP battery packs

*Message #1 Posted by **Bo** on 11 Oct 2004, 10:44 p.m.*

Hi all, This subject is not new but perhaps someone would repeat the conclusions for me. A classic HP battery pack with 450mAh NiCd cells needs 14 hours to fully charge using the standard charger. Theoretically, a pack with 1800mAh NiMH needs 56 hours using the same charger. My question: is the current from a classic charger sufficient to fully charge 1800 NiMH cells or will they never reach full capacity? Do NiMH cells self-discharge just as fast as NiCd cells, i.e. 1% per day?

Thanks.

Re: NiMH in HP battery packs

*Message #2 Posted by **Chris Woodhouse** on 11 Oct 2004, 11:34 p.m.,*
in response to message #1 by Bo

NiMH self discharge a little faster than NiCd's. The standard charger probably would charge the NiMH eventually but I would try and find a higher current charger or get a universal charger that can charge at various currents and various voltages. I have one that will charge from 1 to 30 cells at from .05 to 6 amps. These are common in the RC plane and car hobby and aren't too expensive. Then you could put the right connector together and charge it that way. If you want to go with the standard charger I would opt for a little higher capacity NiCd, you should be able to get 800 or 1000 mah cells that size now days.

*Message #3 Posted by **Frank Boehm** on 12 Oct 2004, 1:50 a.m.,*
in response to message #1 by Bo

don't don't don't try this - your NiMH cells might explode, these things need special chargers, preventing overcharging better stick to standard NiCd cells (they are available in much higher capacity than the old ones)

Re: NiMH in HP battery packs

*Message #4 Posted by **Chris Woodhouse** on 12 Oct 2004, 10:53 a.m.,*
in response to message #3 by Frank Boehm

> Quote:
>
> your NiMH cells might explode

You are thinking of lithium polymer cells. NiMH only need a special charger if you are going to fast (1 to 3 hours) charge them. And even then it's not much different than a NiCd fast charger, but it is different. For slow charging NiCd and NiMH are the same, you charge them at 1/10c for 14 hours. For example a 450 mAh pack needs to be charged at 45 mA to do a slow charge. When fast charging, NiCd's can be charged

as fast as 3C (not recommended if you want the most life out of them though). Where NiMH can only be fast charged up to 1C. The peak detection of a fast charger is also different for NiCd's and NiMH's but most modern chargers have a setting for both.

When several hundred dollars and hours upon hours of work goes into an RC airplane, and the life of that plane is dependent on the batteries, you tend to learn a few things about batteries.

Chris W

Re: NiMH in HP battery packs

*Message #5 Posted by **Giuseppe Marullo** on 12 Oct 2004, 7:06 p.m.,*
in response to message #4 by Chris Woodhouse

Chris (and others), AFAIK they differ about trickle charge tolerance, better not leave NiMH into a NiCD charger. NiMH are not forgiving about leaving them charging compared to NiCd.

I have a NiCd field charger that does not handle NiHM batteries very well, sometimes it just desn't stop! It does not seem to me they are SO compatible.

Giuseppe Marullo

Re: NiMH in HP battery packs

*Message #6 Posted by **Frank Boehm** on 13 Oct 2004, 2:26 a.m.,*
in response to message #4 by Chris Woodhouse

Well, I disagree on this point. The end of the charging cycle is determined differently on NiMH / NiCd cells (I think it's determined by the charging current, if the cell is fully charged; the charger then has to start trickle load. The difference in current empty / charged is not huge, so this requires good electronics).

An interesting read: http://store.yahoo.com/greenbatteries-store/bachfa.html

After all, it is unlikely to damage the cell (or your health) when charged for only a couple of hourse and due to the low charging current. But: if left being charged for a longer period, damages are quite possible, since the charger won't stop and the cell overheats.

Re: NiMH in HP battery packs

*Message #7 Posted by **David Smith** on 12 Oct 2004, 12:13 p.m.,*
in response to message #1 by Bo

The NiMH cells will charge just fine in these machines or any other NiCad device that uses slow trickle charging. No worries about small thermonuclear explosions, reaching full charge, etc. Don't substitute NiMH cells in systems use fast NiCad chargers. Also NiMH cells are not nearly as bad as NiCads about having to fully charge/discharge them. I have been using NiMH cells in my HP's since the batteries first came on the market. I have also confirmed the charger compatibility issues with the battery manufacturer's field apps engineer.

Re: NiMH in HP battery packs

*Message #8 Posted by **unspellable** on 12 Oct 2004, 1:49 p.m.,*
in response to message #7 by David Smith

The time to full charge is no big deal either. You get most of the charge in the first half of the charge time. If you put your NiMH cells on a NiCd trickle charger for 16 hours you will have a 95% charge which is still more than a NiCd at 100% charge. I don't worry about getting a full 100% charge anyway. That last 5% of the charge accounts for a much bigger percentage of total wear the battery gets while charging.

Biggest wear factor on either type is usually overcharging.

Full ACK!

*Message #9 Posted by **Hans Brueggemann [GER]** on 12 Oct 2004, 1:56 p.m.,*
in response to message #7 by David Smith

David is right: most hp chargers(*) work perfectly together with NiMH, and yes, Bo did correctly calculate the charging time. to my experience, NiMHs are a bid unforgiving concerning 'deep discharge', i.e., running the calculator until the voltage of the individual NiMH cells drops below 1 Volt. That's easy to handle: at the first sign of low bat indication (be it the red LED on a '67 or the BAT annunciator on the '41), give them a full charge, and that's it.

(*) tested with '67 adaptor and '41 batt pack. on '97 and models with similar charger hardware (cassette drives, printers...) i recommend disconnecting the charger after raeching the calculated charging time. these models really "eat" accumulators because of their crude charging "strategy" (i.e.,there is no such thing like current regulation or voltage limiting to protect the cells).

cheers, hans

CCD-OSX alpha bug?

*Message #1 Posted by **Gene** on 11 Oct 2004, 10:19 p.m.*

I think I'm using the latest/greatest CCD-OSX rom image from TOS, but when I'm in alpha mode withOUT user mode on, I can press one letter but that locks up my fullnut 41CX. I have to take the batteries out and back on to reset it. It doesn't lose any information, but it does bug me. Ha!

Is this a problem with the CCD-OSX or ?

I had a real CCD module for a long time and it didn't behave this way.

And, finally, did the "space" bug in the CCD 1A rom get fixed in this version? Anyone know? :-)

Gene

Re: CCD-OSX alpha bug?

*Message #2 Posted by **Raymond Del Tondo** on 12 Oct 2004, 2:00 a.m.,*
in response to message #1 by Gene

Hi,

when did you download the CCD OS/X image?
AFAIR the latest version on TOS (from August 2004)
should run in LC ALPHA mode w/o problems.
.

Is there a chance that you are using any other 'critical' software at the same time?

However, can you provide me the exact keystroke sequence
which leads to your mentioned lockup,
starting from ALPHA mode on?

Regards,

Raymond

Re: CCD-OSX alpha bug?

*Message #3 Posted by **Gene** on 12 Oct 2004, 7:20 a.m.,*
in response to message #2 by Raymond Del Tondo

I turn the HP41CX on. I press ALPHA I then press the letter A then the letter B and it locks up without USER mode on.

I have a normal 41CX with the novram module plugged in.

The novram module contains the HEPAX rom, about 12k with user programs in it, the CCD-OSX rom in the fourth Ram bank (put there with copyrom), and the Sandbox ROM is in the two rom pages.

I pulled the CCD-OSX rom off TOS about 2-3 weeks ago.

Gene

Re: CCD-OSX alpha bug?

*Message #4 Posted by **Raymond Del Tondo** on 12 Oct 2004, 8:26 a.m.,*
in response to message #3 by Gene

Hmm, as J-F wrote, I updated the CCD OS/X code related to some ALPHA key stuff a while ago. Nonetheless, afterwards I updated some other stuff in my version, which not an TOS yet.

If you drop me a mail to R D T @ g m x . d e
then I'll send you my latest version, which will be uploaded to TOS soon, too.

Another idea:
Did you try to use the CCD OS/X w/o the Sandbox installed?
It's just an idea because I don't know if the Sandbox implements an extended ALPHA mode, too...

Raymond

Re: CCD-OSX alpha bug? or only with the Sandbox ROM?

*Message #5 Posted by **Gene** on 12 Oct 2004, 9:32 a.m.,*
in response to message #4 by Raymond Del Tondo

Thanks...email sent.

I'll try the CCD-OSX without the sandbox rom. Be a real shame if that causes the problem, since both might be trying to implement special alpha modes, as you indicate. :-(

Regarding the CCD-1A "space in alpha mode bug", it was described in the PPC Journal in 1986 by Wlodek (I think it is the issue where the 18C is announced...the particular page can be found on TOS). It is really nasty since if you press space it will alter a couple of bytes in the calculator that don't kill anything at that time but inevitably cause a memory loss within a few days.

My problem was I could a) never quite remember if this happened in USER mode or OUT of USER mode and b) I'd forget to check before pressing SPACE even when I remembered.

Very nasty bug.

Gene

Re: CCD-OSX alpha bug?

*Message #6 Posted by **Ángel Martin** on 12 Oct 2004, 12:15 p.m.,*
in response to message #4 by Raymond Del Tondo

The SandBox should be neutral to this, as it doesn't use any extended alpha features (namely polling points).

Good luck, ÁM.

Re: CCD-OSX alpha bug?

*Message #7 Posted by **Gene** on 12 Oct 2004, 12:41 p.m.,*
in response to message #6 by Ángel Martin

Ok, that should mean that someone with a NoVRAM module could check this by installing the CCD-OSX rom, copying it to Bank "B" and then loading the Sandbox rom into pages C and D.

That's the configuration I have and it locks up if USER mode is off and I press an alpha character.

My 41CX is a fullnut...could that be it? The original CCD rom worked ok with a fullnut, but ...

Thanks guys! Gene

Re: CCD-OSX alpha bug?

*Message #8 Posted by **Miki Mihajlovic** on 12 Oct 2004, 9:56 p.m.,*
in response to message #7 by Gene

I checked the mentioned configuration (CCD OS copied to page B, Sandbox burned at C & D). Alpha mode works fine on my halfnut CX and fullnut CV in both USER and standard mode.

1234

Re: CCD-OSX alpha bug?... 2nd NoVRAM bug.

*Message #9 Posted by **Diego Diaz** on 12 Oct 2004, 10:48 p.m.,*
in response to message #8 by Miki Mihajlovic

Hi all,

I've replicated said config, and have found erratic behavior on different 41's (full/half, CV/CX...)

Further more, I think I've found the "offending bit"... and corrected it!! :-)

Yes, there was a trouble when RAM was used as ROM, with an M-code ROM image loaded into it. Namely, the FETCH cycle indicator bit was (wrongly) erased during the RAM read cycle, thus fooling 41's behavior.

I cannot tell how Miki's config has got to work ok but I recommend you all to substitute your current "NoVRAM-H.ASM" file with the one at my site:

Go to NoVRAM page, right click on the "NoVRAM bugs fix" link and "save target as" (do not change the file name, simply replace the old one in your Clonix/NoVRAM directory)

Thanks a lot to Gene for reporting this bug and my apologies for the inconveniences.

Best wishes.

Diego

P.S. As it's 3:41 a.m. here (half my neurons are sleeping long ago ;-) I have been unable

to test this new file throughoutly so, I'll beg you to check its functionality in detail and, of course, report wichever anomaly you may found.

Re: CCD-OSX alpha bug?... 2nd NoVRAM bug.

Gene

No apology needed!

*Message #12 Posted by **Gene** on 13 Oct 2004, 7:36 a.m.,*
in response to message #9 by Diego Diaz

Look, more than half of my questions have been because I haven't paid enough attention to various manuals. :-)

But, by asking these things here, someone who comes after me that is even more of a beginner into these things than I am will be able to find answers to these types of questions in the forum and the archives.

That's the real beauty of the forum.

Thanks Diego...I'm glag it wasn't a RTFM problem (again). :-)

Re: No apology needed!

*Message #13 Posted by **Diego Diaz** on 13 Oct 2004, 10:10 a.m.,*
in response to message #12 by Gene

Hi all...

Here you are the NoVRAM page link:

http://www.iespana.es/clonix-41/novram.htm

Raymond, Angel, your ROM's have been found not-guilty of the charges... I know you knew :-)

Of course, it's assumed (and verified) that most questions I receive are on the RTFM category. I myself seldomly read a manual... ;-) so I don't really expect

others to do so, and I often like joking about that but no claim is involved whatsoever. Sincerely hope noone has misunderstood previous replies (and silly jokes) on the subject, I'm glad to answer even the most obvious questions, as many good ideas may arise from them.

Gene, I'm pretty sure your bug discovery had definitely redeemed you from the "NoVRAM's newbies group"... this also granted you a free coupon for three more RTMF questions ;-))

I also agree with you in that this forum (thanks Dave) is the place to come to make questions, (hopefully) find answers and share info.

No Clonix/NoVRAM could have ever been made without the unvaluable help I received (and keep on receiving) from the good people here. I wholeheartedly thank you all.

Just a (somewhat off topic) tech-note to finish:

- On its current implementation NoVRAM RAM can not be used from ROM pacs/images out of the module itself, i.e. you cannot plug-in a real David Assembler module into port #4 and read/write NoVRAM RAM on pages #8 to #B.

I've developed a new code to correct this limitation and it's working fine, but has not been fully tested yet.

Best wishes.

Diego.

Ok, did that, but...

*Message #14 Posted by **Gene** on 14 Oct 2004, 10:32 a.m.,*
in response to message #9 by Diego Diaz

Hi Diego.

I replaced the NoVRAM-H.ASM file and redid the NoVRAM module. No change. Still get the "lock-up" in alpha.

Specifically, what I did was:

1) An erase all. 2) Programmed the NoVRAM module and loaded the Sandbox rom in C and D. 3) I LEFT the CCD-OSX rom copied in bank B. Did not change the RAM in the Hepax area in the NoVRAM module. Should I have?

I type A and it locks unless USER is on.

Did I miss something? :-) Gene

Check list

*Message #15 Posted by **Diego Diaz** on 14 Oct 2004, 12:15 p.m.,*
in response to message #14 by Gene

Hi Gene,

Would you please try this check-list/procedure for me?

I'm not at home now so I cannot test myself.

1- Verify you've downloaded ONLY the NoVRAM-H.ASM file... I mean that the old NoVRAM-H.ASM is still into the NoVRAM-H.ZIP archive as I haven't had time to replace it. (You can search for your name "Gene" and you'd find it besides the corrected code lines.)

2- Do a NoVCLEAR, just to make sure no ill/corrupted code is left into RAM.

3- Re-program with NoVRAM-H.exe and burn CCD-OSX into any free page (C-F)

4- MEMORY LOST!!! your 41 may looks good but it can still has some corrupted areas.

5- COPYROM such page to page B. It's advisable to switch calc off inmediatelly after the COPYROM process has finished, otherwise you'll have two identical copies of CDD-OSX (with the same XROM-ID) and this may also lead to some sort of confilcts.

6- Re-program NoVRAM with SandBox into C & D...

At least this is *exactly* what I did, and I have it working flawlessly.

I'll make further test this evening as I get back home.

Please keep me/us informed.

Best regards.

Diego.

Fixed it!

*Message #16 Posted by **Gene** on 14 Oct 2004, 1:50 p.m.,*
in response to message #15 by Diego Diaz

Thanks again. It works properly now! Gene

Music to my ears!! ;-) [N.T.]

*Message #17 Posted by **Diego Diaz** on 14 Oct 2004, 2:19 p.m.,*
in response to message #16 by Gene

.

Re: CCD-OSX alpha bug?

*Message #18 Posted by **J-F Garnier** on 12 Oct 2004, 6:35 a.m.,*
in response to message #1 by Gene

Hi Gene,

I reported to Raymond a bug related to ALPHA in USER mode but I didn't notice anymore bugs in the last release of CCD-OSX.

What was the "space" bug in the CCD-1A?

J-F

HP-41C Flags

*Message #1 Posted by **Dave Moss** on 11 Oct 2004, 8:41 p.m.*

I've an HP-41C, that was purchased in my Freshman year in engineering school. It's OLD...but, but I've grown a bit attached to it (got me through 4 years of engineering school...and now through almost 20 years of work and kids). Still works great, and I know the system backwards and forwards.

Question: Over the past few months, the "flag" feature of the calculator has not been correct. Specifically, flags higher than 30 (31 through 55)are shown as "non-existant". Flags 00 through 30 are fine. What could be the problem, and how do I get it fixed? The calculator was purchased in December of 1983....so realize it's a bit of a "classic". Would appreciate any help that you could offer.

Re: HP-41C Flags

*Message #2 Posted by **DavidY** on 11 Oct 2004, 8:51 p.m.,*
in response to message #1 by Dave Moss

Hi David: You are probably trying to set or clear one of these flags???

Try testing one (31-55) manually with a FS? test--you should see "YES" or "NO" displayed.

Flags above 30 are considered "system" flags and "test only". They are changed only by the 41-OS. (Actually there ARE synthetic means to change them).

Hope this helps.

DavidY

HP 33C PR error

*Message #1 Posted by **Ronald** on 10 Oct 2004, 4:18 p.m.*

Hello,

I have a HP 33C (Spice) which give's an error "pr error".

The battery is fully charged. I switch it on. It is oké. Then you switch it off for 30 secinds and when you switch it on again it gives the above mentioned error. The other functions are 100%.

Any idea were to look for the make the memory again continious ?

Thank you

Ronald

*Message #2 Posted by **Thibaut.be** on 11 Oct 2004, 4:10 a.m.,*
in response to message #1 by Ronald

Are you sure that your battery pack is good ? You can try with 2 AA batteries (beware of the polarity) and connect them with a paper clip...

Re: HP 33C PR error

*Message #3 Posted by **Michel Beaulieu** on 11 Oct 2004, 9:31 a.m.,*
in response to message #1 by Ronald

I got this trouble on a HP-34C once after installing a power board coming from another calculator of that series without constant memory. Someone here explain me that these board looks the same but don't give power to memory when switch off.

I you donT' suspect that, it's perhaps a bad component on the power board... If the battery is ok at least...

Re: HP 33C PR error

*Message #4 Posted by **Ronald** on 11 Oct 2004, 3:01 p.m.,*
in response to message #3 by Michel Beaulieu

Hi,

The battery is fine, just rebuild and charged with a full 1600 MH NiMH battery.

The power board could be the case, I bought it as defective with some other stuff like keyus, chips, displays, the works, so It could very well be the board. I will make a check if the board make proper contacts.

Thank you.

Re: HP 33C PR error

*Message #5 Posted by **Jon** on 11 Oct 2004, 3:38 p.m.,*
in response to message #4 by Ronald

Hi:

With 33C, 34C and 38C models it is important the position of the small ICs. I have some experience (not all have the same ICs). If you make me know the id. number I can check my notes. If they are in wrong position the calculator works but not the continuous memory.

Regards

Jon

Re: HP 33C PR error

*Message #6 Posted by **Ronald** on 11 Oct 2004, 4:40 p.m.,*
in response to message #5 by Jon

Hi Jon,

I will open him tommorrow evening and take notes on the position.

Ronald

Re: HP 33C PR error

*Message #7 Posted by **Ronald** on 12 Oct 2004, 4:39 p.m.,*
in response to message #5 by Jon

Hi Jon,

There is next to the large IC only one (1) small IC. marked with LB901, 79364, SGP 01. The mark on the IC is, if you look from the back with the display on top in left top corner.

Ronald

Re: HP 33C PR error

*Message #8 Posted by **Tony Duell** on 13 Oct 2004, 7:05 a.m.,*
in response to message #7 by Ronald

It's possible there should only be one 8 pin chip (I believe there are several versions of some of these machines), but it _must_ be in the position closest to the display end of the calculator (and with the notch towards the display). On the -C models, the 8 pin chip nearest the display gets the backup supply to maintain continuous memory.

Re: HP 33C PR error

*Message #9 Posted by **Jon** on 13 Oct 2004, 12:38 p.m.,*
in response to message #8 by Tony Duell

Hi:

Just to confirm that Tony is right. My own 33C has only one 8pin IC.

Regards

Jon

Re: HP 33C PR error

*Message #10 Posted by **Ronald** on 13 Oct 2004, 4:28 p.m.,*
in response to message #9 by Jon

Yes, in my HP33C is only one small chip and is located closest to the display.

I think I have to look into more detail to the powersupply, maybe there is a broken line which shoul keep power to the memory chip. Do you have any idea to which pin of the chip the always present power is connected, so I back trace ?

Thank yoy

Calc-41

*Message #1 Posted by **Matthias** on 10 Oct 2004, 8:06 a.m.*

In EduCALC 52, 1991 (p 52) I found a DOS software called "CALC-41" by Sparcom. It seems that this is some sort of Emul41 made in the 80th by Sparcom. Does someone knows this software?

Matthias

Re: Calc-41

*Message #2 Posted by **Massimo (Italy)** on 10 Oct 2004, 9:20 a.m.,*
in response to message #1 by Matthias

Hi Matthias,
I have it on two 3.5 floppy disks (one for the manual and the other for the emulator) with registration form, one page installation guide (!) another "welcome" page and a reprint from PC Magazine Feb. 16, 1988 with HP calculator emulators software review (it was their Editor's Choice, BTW).
Nothing more to say: today's emulators and simulators are way ahead of it.

Ah, it was formerly known as ELI-41 from Eclipse Logic.

Massimo

in response to message #3 by Matthias

> Quote:
>
> May I get it anyway?

Since you asked so politely... ;-)

Seriously, I am reading debates about copyright everyday and I see this on the disks: "(c) Copyright 1986-90 by Tacit Logic Systems".
I don't know if (C) still applies to such material or not.

Should anybody provide evidence that Sparcom Co., da Vinci Tech., Tacit Logic Sys., EduCALC and who knows who else agreed to release such material I would be glad to provide a copy of software, manual, and scans of relative documentation to Dave (if interested) for inclusion on this site.

Greetings,
Massimo

             Added GTO .---  function within the Program Editor.
             During Editing, if R/S key is pressed STOP function is inserted.
             Combined Both ELI-41 and ELI-41SX products into a single package
             called Calc/41.
             The Calc41.exe program supplied is same as the ELI-41SX program.
             The Calc41P.exe program is the POP-UP program.
             Added /B parameter to Calc41P.exe program to display on composite
             monitors.
             Instructions for running these programs are the same as the ones
             provided in the manual, except for the POP-UP. The Calc41P is loaded
             as a POP-UP by default. Another words there is no command line option
             to make it a POP-Up.

Re: Calc-41

*Message #7 Posted by **Christoph Klug** on 11 Oct 2004, 5:43 a.m.,*
in response to message #6 by Massimo (Italy)

Dear Matthias,

today CALC-41 and TRANS-41 are only of historical interest. Much better is EMU41 which

includes much more features than CALC-41 and TRANS-41 in combination...

May be it is nice for a collector to store software tools like CALC-41 plus TRANS-41 and LinkPlus to the harddisc drive on a PC, which runs HP41 applications. I do this - but for practical work now I only use EMU41 :-)

Regards - Christoph Klug

Re: Calc-41

*Message #8 Posted by **Massimo (Italy)** on 11 Oct 2004, 6:38 a.m.,*
in response to message #7 by Christoph Klug

That's right Christoph,
I bought it only for collecting sake; no practical use nowadays.

Massimo

Re: Calc-41

*Message #9 Posted by **Bill Smith** on 11 Oct 2004, 5:59 p.m.,*
in response to message #1 by Matthias

I have both Calc41 and Trans41. It's true that emu41 is much better, especially with use of ROM image files. But Trans41 is very useful if you have a 82973 PC-IL interface, for storing files on a PC, or downloading files from the internet via a PC.

I tried to find Tacit Logic to explore copyright issues, but their phone was disconnected.

Re: Calc-41

*Message #10 Posted by **Christoph Klug** on 12 Oct 2004, 3:12 a.m.,*
in response to message #9 by Bill Smith

Dear Bill,

remember that also EMU41 is compatible to the HP-IL/PC Interface card.

The full software version of EMU41 includes advanced HP-IL support - than EMU41 is able to control external, real IL-Devices plus some internal, virtual IL-Devices.

EMU41 includes two virtual hard disc drives for storing data. Furthermore a DOS file, which works as gateway to external PC and WEB applications.

Therefore EMU41 replaces TRANS41 completely...

Best regards - Christoph Klug

Re: Calc-41

*Message #11 Posted by **Mike (Stgt)** on 12 Oct 2004, 6:20 a.m.,*
in response to message #10 by Christoph Klug

BTW: is there still a special EMU41 for the HP200LX?

Ciao.....Mike

Re: Calc-41

*Message #12 Posted by **J-F Garnier** on 12 Oct 2004, 6:47 a.m.,*
in response to message #11 by Mike (Stgt)

There is a special Emu41 version running on HP95/100/200LX. I presented it during the Allschwil meeting last year on my HP95LX, see
http://membres.lycos.fr/jeffcalc/allschwil.html

If there is enough interest for it, I may work on it a little bit more to make it more confortable. HP-IL will not be supported on 95/100/200LX machines...

J-F

Re: Calc-41

*Message #13 Posted by **Mike (Stgt)** on 12 Oct 2004, 7:40 a.m.,*
in response to message #12 by J-F Garnier

Hello JF!

You gave me your "EMU41 special LX" in Allschwil, my question is: did you update it too when you published a new revision of EMU41 "public version"? The 200LX is still "my" working horse, all PCs arround the donkeys for backup <G>. And for Emu48, Emu42, and Emu28 of cause <VBG>.

Ciao.....Mike

BTW: the explanation for my routine names of NutEm will follow offlist. C'est trop special pour expliquer ici. M.

Re: Calc-41

*Message #15 Posted by **Emmanuel, France** on 12 Oct 2004, 11:53 a.m.,*
in response to message #10 by Christoph Klug

```
Just a question of point of view...
I always use Calc41 and specially Trans41 for dissasembling HP-41
and storing/downloading programs or ROM images.
Calc41 uses Trans41 program files translated into *.PGM
and Trans41 make those built on Calc41 available to HP-41.
Those programs were the first I got with an IBM 80286 and its HP82973A HP-IL/PC
Card. ;o)
```

Re: Calc-41

*Message #16 Posted by **Bill Smith** on 12 Oct 2004, 12:49 p.m.,*
in response to message #10 by Christoph Klug

Yes, I am aware of the expanded capabilities of the latest emu41; at this point I still use the free version. Probably will upgrade this winter, when the nights are long and I can spend time with my old computers and calcs instead of my old bikes and fishing poles.

Best regards,

bs

Has any one bought a HP49G+/HP17BII+ lately?

*Message #1 Posted by **Eddie Shore** on 10 Oct 2004, 1:08 a.m.*

If so,

HP49G+: Is the keyboard better, or at least closer to the classic HP48G series?

HP17BII+: I read that they had Let and Get functions back into the calculator. Is this true?

Thanks!

Re: Has any one bought a HP49G+/HP17BII+ lately?

*Message #2 Posted by **Erik Ehrling (Sweden)** on 10 Oct 2004, 4:55 a.m.,*
in response to message #1 by Eddie Shore

I bought my HP-49G+ some months ago, supposed to be the "new" version with improved keyboard. I would say that the keyboard is OK, but not in par with the HP-48G series...

Regards,
Erik

The new 17bII+ do have Let and Get

*Message #3 Posted by **Gene** on 10 Oct 2004, 4:54 p.m.,*
in response to message #2 by Erik Ehrling (Sweden)

Problem may arise if you buy a unit that is "older stock". There is no way from the outside of the package to tell which unit(s) have these functions.

And, I'm not sure the lack of those functions would be a valid reason to return the unit if you wanted to do so. I would check that out in advance with the merchant.

Re: The new 17bII+ do have Let and Get

*Message #4 Posted by **George** on 11 Oct 2004, 4:16 a.m.,*
in response to message #3 by Gene

I got mine exchanged from the local distributor in Hong Kong last Friday after having a lengthy discussion with HP. They told me that they will do the exchange for customers in NA and Mexico and promised to pass my case to the master distributor in my region. The distributor in Hong Kong is .. Ricoh and they are quite helpful at the beginning. However, when they learned my 1 year warrranty period has just lapsed they are quite reluctant to do so. Anyway, they finally agreed to exchange mine. For those who wish to have the exchange, I suggest that you do act fast before your warranty period.

The L and G functions are back but I still cannot implement my old Black Sholes formula. It may due to my input error and any hidden changes that HP has not spelled out. I shall try again later.

Overall speaking, the keyboard feel is better and I am quite pleased to have a new version. The serial number at the back of calculator is CNA416xxxxx whereas a sticker on the face of the package shows CNA423xxxxx. Similiar for the new 49G+? It is rather confusing and may eventually causes problem if the merchant copied this number to the sale invoice but when you present the physical calculator and the invoice for servicing ....

The manual (version 2) states that it is applicable to units bearing serial numbers CNA410xxxxx or later. I hope this piece of informaiton may help but you really cannot have a look of the serial number from the package. Perhaps the unusual sticker appearing on the package is a clue!

1(800)HPINVENT says to wait

*Message #5 Posted by **Bob Wang** on 11 Oct 2004, 11:44 a.m.,*
in response to message #4 by George

George:

Thanks for posting your experience. HPINVENT told me this morning that they are still working on the procedure to guarantee that exchanged units have the new ROM. I was advised to call back later in the month.

Bob

49g+ serials

*Message #6 Posted by **James M. Prange** on 12 Oct 2004, 4:26 a.m.,*
in response to message #4 by George

My latest 49g+ warranty replacement came with a serial of CNA423xxxxx on the sticker on the back of the package, serial CNA419xxxxx on the calculator case, and an internal serial of CN424xxxxx.

Voyager Hexadecimal tests

*Message #1 Posted by **bill platt** on 8 Oct 2004, 2:43 p.m.*

(Thanks to Jordi Hidalgo for the 12c ON-PMT key sequnce info below. I have added what I noticed on the 11c. Have at it--what do you think of this? Try it on the 15c, and 10c and 16c, too, if you can). I don't know if this sequence "messes up" operation, requiring master clear--doesn't seem to).

FASCINATING! try "ON-PMT" simultaneously on the 12c. (put the number three in the x-register first. Then, go f-prefix and hold, and you will see: 0000000o000)

Now, the ON-PMT also toggles the "BEGIN" annunciator--in an interesting way: start with machine on, do ON-PMT. Nothing different.

Now, start with the machine off, and do ON-PMT, and you get the "BEGIN" annunciator. now do PMT-ON and the BEGIN goes off, now do it again--no change.now do it the other way, and the "BEGIN" is back.

Actually, do the ON-PMT, then push PMT and hold, and toggle the ON button, and you see the begin come on--and you also see the x-register start toggling through previous values of some sort---

There is also a scrolling or toggling (not sure which) with the ON-PMT or PMT-ON sequence, which brings back older x-register contents--but it does not seem to be R-down--something else entirely!

Are we onto something hackable?

BTW, try the same thing with the 11c, except use ON-Y^x, and you get exactly the same thing as the 12c! (use f-prefix again to see the hex code). Except you cannot get the BEGIN annunciator behavior :-((the y^x function does its thing).

Actually, there is something strange on the 11c here, too:

Do exactly this:

2 ENT ENT ENT 3 Y^X and hold the button push on and release, leaving your button still depressing the Y^X.

You get 1.000046053

Sometime, I get the "USER" annunciator hfter these sequences on teh 11c, but I am not able to reliably reproduce it----maybe it is because I have a program labelled "D"

Lots of food for thought here.

Regards,

Bill Platt

Re: Voyager Hexadecimal tests

*Message #2 Posted by **Nelson M. Sicuro** on 8 Oct 2004, 3:56 p.m.,*
in response to message #1 by bill platt

Take a look at this page, it is a description of this behaviour on the HP-15C and using it to "browse" its internal registers!

The same key-sequence on the 15C is ON/D, this is a RESET procedure and actually changes some bits on the X register, showing some very weird numbers on the display. He said something about hex digits on it, but I'm not so certain about it - I think that our friend Erik Smith can explain it better.

Best regards,

Nelson

The HP16C gives interesting results as well...

Re: Voyager Hexadecimal tests (longer)

*Message #4 Posted by **Cameron** on 10 Oct 2004, 8:55 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hello Luiz. Interesting, yes! Very curious too. Let me quote from the source code of my 16C simulator:

```
// Believe it or not, this is the effect of ON/A and ON/D on the X
// register. I cannot fathom what really goes on under the bonnet
// but I can observe that this is the manifest result. What we're
// doing here is converting the first bit pattern into the second.
// The values of the bits are not relevant. Focus on the positions.
//    6         5         4         3         2         1         0
// 3210987654321098765432109876543210987654321098765432109876543210
// ########HHHHHHHHHHHHHHHHHHHHHHHHhhhhhhhhhhhhLLLLLLLLLLLLLLLLLLLL
//
// ########LLLLLLLLLLLLLLLLLLLLLHHHHHHHHHHHHHHHHHHHHHHHHhhhhhhhhhhhh
//
// For example, the value on the left is transformed into the value
// on the right.
//
//            0x88fffffc003fffff ==> 0x88fffffffffff000
//
// Excuse the profligate use of intermediate values. This won't get
// run too often and they allow me to see what's going on in the
// debugger.
//
WDINT64 mask = 0xff;
mask <<= 56;
WDINT64 HH = xval;
WDINT64 hi = HH & mask;
HH = HH & ~mask;
mask = (1 << 22) - 1;
WDINT64 LL = HH & mask;
HH >>= 22;
LL <<= 34;
WDINT64 result = hi | LL | HH;
xval = result;
dispval = xval;
```

That's what I observe that it does. The real question in my mind is "why"?

Cameron

Copying a ROM to HePax Ram without HP-IL - how?

*Message #1 Posted by **Gene** on 8 Oct 2004, 11:51 a.m.*

Say I have a rom plugged into my 41CX and I want to copy it to a 4k page of the RAM in the HePAX.

How can this be done? Without HP-IL?

There seems to be a way if you can get the ROM onto HP-IL storage using the Hepax instructions, but is there a way to do it without having to use HP-IL as a medium?

Any ideas? I have plenty of RAM room and would love to copy over the CCD-OSX rom into one of the ram pages of my NoVRAM Hepax module and leave the remaining 2 pages free for other rom goodies.

Re: Copying a ROM to HePax Ram without HP-IL - how?

*Message #2 Posted by **Diego Díaz** on 8 Oct 2004, 12:38 p.m.,*
in response to message #1 by Gene

Hi Gene,

You must use the COPYROM command, please see details on HEPAX manual vol.1 page 66.

Please note that 4K ROM's can be copied into an even or odd page, but you should keep Lower (even) and Upper (odd) page order when copying 8K ROM's, otherwise addressing problems are likely to arise.

Best regards.

Diego.

Copying a ROM from HePax Ram with HP-IL - how?

*Message #3 Posted by **Miki Mihajlovic** on 8 Oct 2004, 6:50 p.m.,*
in response to message #1 by Gene

Let me borrow this tread and ask a complementary question. How can I copy a ROM image with HPIL to a simulated mass storage via TRANS41 from one of the HEPAX RAM pages. I do not have a real HP mass storage but TRANS41 said it simulates the tape drive through HPSIDE1.PAK (LIF) file. I copied a 4K ROM (CCD OS/X) image to HEPAX RAM, connected to PC through HPIL and 82973A card and executed HEPAX command WRTROM. Everything seems to goes fine and HPSIDE1.PAK file contains one file called NAME. Now, hp41uc can convert LIF to BIN but it says that NAME can't be found.

I am not quite sure what happened and what would be a proper workflow to get a copy of ROM image to PC without going into HEXEDIT (or similar ZENROM function) and listing the MCODE to TRANS41 that can be captured and later recompiling it.

New emulation on PIC

*Message #1 Posted by **Klaus** on 8 Oct 2004, 11:44 a.m.*

Hello HP-community!

Running the HP-41 emulation on a PIC16f877 might soon come true. I succeedes in porting Eric´s nsim to the PIC. A keyboard and standard dot-matrix lcd serve for input and output, a RS-232 is also included. I am currently uploading the microcode via RS-232. The Program memory consists of 2 eeproms 24LC128, and the ram consists of 3 24LC128. Therefore the question: since the eeproms are slow and have about 1000000 write cycles, what would you want first: a static ram or support for additional modules? (I am currently using my good old PIC16f877, but I just need 12 of its 33 I/O Pins, so I will downgrade). Once I have tested all, I will release the source code and hex files.

Greetings, Klaus

HP 12c Manual Revisions

*Message #1 Posted by **bill platt** on 8 Oct 2004, 10:27 a.m.*

Hi all 12c collectors ;-|

As Luiz and Randy have pointed out in the past, there are many different internal revisions to the 12c hardware.

I have also noticed that there are a number of revisions to the Manuals, too.

Does anyone know of a compilation of this information?

The manual revisions are also of more general interest across all HP calculators---For instance, to make sure that a particular unit in a collection, has the manual appropriate to its serial number.

I know this is rather arcane minutiae---yet I suppose we are bound to move in this direction as we dig ever deeper in to the art of "collecting" rather than merely using these machines.

Best regards,

Bill Platt

my first name can be concatenated with the "at" sign and the word "plattdesign" followed by net, in order to construct my email.

or go to http://plattdesign.net and find it there

Re: HP 12c Manual Revisions

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2004, 7:49 p.m.,*
in response to message #1 by bill platt

Hi, Bill;

I mostly agree with your concerns because of the fact that the HP12C has been under production for such a long time. And you started the test with a "Hi all 12C collectors!", and for a collector, you pointed out a very important issue.

I have at least four HP12C prints: two in English and two in Portuguese, but they are not with me now. Late, when I'm home, I'm posting their related information, O.K.? Maybe we can track them down.

I guess in how many languages is this manual available...

Cheers.

Luiz (Brazil)

Congratulation!

*Message #1 Posted by **Mike (Stgt)** on 8 Oct 2004, 8:53 a.m.*

Hello Tony!

Pls allow me a "hats off" in public for finding your name here http://h10032.www1.hp.com/ctg/Manual/bpia5184.pdf. Great pleasure to see your name on the cover sheet. Of cause congratulation for Luiz and Gene too.

Ciao.....Mike

Congratulations Luiz Vieira

*Message #2 Posted by **Artur - Brasil** on 8 Oct 2004, 12:31 p.m.,*
in response to message #1 by Mike (Stgt)

A great work by a great person! Congratulations! Artur

We had a good time working together on that

*Message #3 Posted by **Gene** on 8 Oct 2004, 2:33 p.m.,*
in response to message #1 by Mike (Stgt)

Thanks for the compliments. :-)

Re: Congratulation! (edited, I used a verb wrongly)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2004, 7:39 p.m.,*
in response to message #1 by Mike (Stgt)

Hi, all;

I have already thanked (as many times as I could) the guy that allowed me to compose, I mean, be one of the guys of the 'team', and I'd add that it's been a great pleasure to work with both, Gene and Tony, in this particular subject. Working with great guys eases the job. d8^D

Thank you for the compliments, Mike and Artur. I know that this is too much "clichè", but I cannot think of a better expression: "I hope you have as much fun reading it as we had writing."

Cheers.

Luiz (Brazil)

Edited: 8 Oct 2004, 11:26 p.m.

Cheers!

*Message #5 Posted by **Eddie Shore** on 9 Oct 2004, 1:00 a.m.,*
in response to message #1 by Mike (Stgt)

Ditto Mike's Congratulations.

Re: Congratulation!

*Message #6 Posted by **tony** on 11 Oct 2004, 2:03 a.m.,*
in response to message #1 by Mike (Stgt)

Thanks Mike! I just wish I'd known about Peter Carr's Black Scholes program for the 12c earlier and we could have got that in.

different magnetic cards

*Message #1 Posted by **Ronald** on 8 Oct 2004, 8:53 a.m.*

Hi

I have a big problem. I have a lot of magnetic cards, but do not know which belongs to which calculator:

I have two short cards: one is devided in 5 small parts with small lines, the other card has a simle line instead of the division of 5. Can you help me? Which is for HP-41, HP-65, HP-67/97, HP-71?

The long cards are for the HP-75C/D I know

Re: different magnetic cards

*Message #2 Posted by **David Smith** on 8 Oct 2004, 12:20 p.m.,*
in response to message #1 by Ronald

The HP65/67/97/41 cards are all compatible (but not the programs written on them). The ones with the 5 little divisons were old style HP65 cards. Later they went to the undivided cards. The HP41 reader can usually translate and run HP67/97 programs but not HP65 programs.

Re: different magnetic cards

*Message #3 Posted by **Roland** on 8 Oct 2004, 3:49 p.m.,*
in response to message #2 by David Smith

Thanks a lot... David

I also sayw that the 71/75 cards are identical..

Re: different magnetic cards

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 8 Oct 2004, 8:00 p.m.,*
in response to message #2 by David Smith

Hi;

if you have the HP41 card reader (HP82104A) attached to an HP41, you can use the VER function and check the following:

for HP41 programs, they can be type A (all), D (data), P (program) or S (status). In this case, the card # is shown.

for HP67/97 ptrograms, VER returns type 7 (I´m not sure about other information, I think this is all)

The HP41 system does not read HP65 cards.

And you are correct: the HP71 and HP75 share the same cards. If I am not wrong, only HP75 standard program and data cards can be read in an HP71. Program cards from the HP71 that contain HP71-only functions not available in the HP75 will not work (the cards are read, data is loaded but generates error messages if handled). In some circumstances, HP71 cards can be used with an HP75. I know I tested some, but I did not went to an 'in-deep' research. Sorry!

Not much of a help, but may lead you to better experimentation.

Cheers.

Luiz (Brazil)

Charger for 67

*Message #1 Posted by **Mike H** on 7 Oct 2004, 10:45 p.m.*

Which HP charger does the 67 use. What are the specs if I were to use third party? Thanks in advance, Mike

Re: Charger for 67

*Message #2 Posted by **Jeff O.** on 8 Oct 2004, 7:50 a.m.,*
in response to message #1 by Mike H

The 67 uses the same chargers as all of the "classic" models (35, 45, 55, 65, 70, 80), although it is electronically a woodstock. In any case, they are listed here.

These chargers produce two output voltages: regulated 4.5 Volts to power the calculator electronics, and one unregulated that varies as required, used to charge the batteries in the calculator. If you look at the place where the charger connects on the back of your calculator, the center contact is common. The outer two contacts are bridged by a springy contact that connects them together when no charger plug is inserted. When you insert the charger plug, it pushes the contact away and disconnects the outer two contacts. It then supplies the regulated 4.5 Volts between the center and right contacts, and the variable charging voltage between the center and left contacts. (left and right as viewed from the back of the calculator.) I doubt that you will find a third party device that will have this combination, let alone the proper connector to actually plug into the calculator. Your best bet would probably be to get a power supply that can give you regulated 4.5 volts and just clip it to the contacts in the battery compartment.

E-mail or post if you have any questions.

NO60hzSPAMatFORieeedotorgME (remove NO SPAM FOR ME and change the at and dot.)

Thank you Jeff

Anyone has remote control software for the 49G+?

*Message #1 Posted by **Chan Tran** on 7 Oct 2004, 12:47 p.m.*

Thinking about buying one of these and it hit me that if I really hate it may be I can use it as a programmable remote control for TV etc...? I have a remote package that run on the 48GX very well. For $139 it is relatively cheap for a remote control.

Re: Anyone has remote control software for the 49G+?

*Message #2 Posted by **karl** on 7 Oct 2004, 1:53 p.m.,*
in response to message #1 by Chan Tran

no software able, and Irda mode is not the same as used in the 48G series.

Bye

Re: Anyone has remote control software for the 49G+?

*Message #3 Posted by **Wayne Brown** on 7 Oct 2004, 3:21 p.m.,*
in response to message #1 by Chan Tran

If such software existed it wouldn't do you any good; the range of the IR transmitter on the 49G+ has been crippled so that you'd have to hold it very close to the TV for it to work.

Re: Anyone has remote control software for the 49G+?

*Message #4 Posted by **Chan Tran** on 7 Oct 2004, 3:48 p.m.,*
in response to message #3 by Wayne Brown

I don't know about the 49+ but the 48GX has very short range IR too when they're communication with each other but when using as remote control it works at distance better than 10ft.

Re: Anyone has remote control software for the 49G+?

*Message #5 Posted by **Wayne Brown** on 7 Oct 2004, 4:10 p.m.,*
in response to message #4 by Chan Tran

Yes, the receiver of the 48 series is limited to short-range use only, but the transmiter has a much greater range, so it makes a good remote control. But the range of the transmitter of the 49G+ has also been reduced. Here's a link to an article from Jean-Yves Avenard in which he says, among other things:

> Quote:
>
> Also, the IR LED is seriously crippled to no more than 5cm, so unlike the HP48 where only the receive LED was crippled having a remote with such a short range woulb be useless IMO anyway.

How about for the 48?

*Message #6 Posted by **db(martinez,california)** on 7 Oct 2004, 8:30 p.m.,*
in response to message #5 by Wayne Brown

Can someone tell me how to find the software for a 48 remote?

Re: How about for the 48?

*Message #7 Posted by **James M. Prange** on 7 Oct 2004, 9:17 p.m.,*
in response to message #6 by db(martinez,california)

Just a wild guess, but you might try: http://www.hpcalc.org/search.php?query=remote&hp48=1

Regards,
James

Re: How about for the 48?

*Message #8 Posted by **Chan Tran** on 11 Oct 2004, 8:57 a.m.,*
in response to message #6 by db(martinez,california)

I used this software on my 48GX and it works great. It does not work as well on the 48SX though.

http://www.hpcalc.org/hp48/utils/comms/rem34bg.zip

Re: Anyone has remote control software for the 49G+?

*Message #9 Posted by **James M. Prange** on 7 Oct 2004, 9:53 p.m.,*
in response to message #5 by Wayne Brown

I'm surprised that JYA wrote that, and that I apparently didn't notice at the time. I expect that he meant "SIR" instead of "RedEye".

The 49g+ does have the capability to send in "RedEye" mode to the 82240A and 82240B printers, but, experimentally, the range is about 5 cm, compared to 1-2 m from a 48 series.

As far as I've been able to determine, the "Serial IR" used on the 48 series isn't available on the 49g+.

The 49g+'s "IrDA" is seriously (and intentionally) crippled to 10 cm on the 49g+ to accomodate the "educational community". Cyrille wrote that both the transmitter power and the receiver sensitivity are low. Experimentally, 10 cm does indeed seem to be about the maximum range that I can get between my 49g+ and IrDA/RS-232 converter.

It **might** be possible, using ARM programming, to directly control the IR transmitter and detect light pulses at the receiver in a "raw" state, but I expect that the extremely short range would make it rather impractical to use it as a remote control.

Of course, it might be possible to modify the hardware to increase the range to the 1 m that's normal for an IrDA device.

Another idea is to build an "IR amplifier" that would be slipped onto the 49g+.

Regards,
James

Re: Anyone has remote control software for the 49G+?

*Message #10 Posted by **Dimitri Turbiner** on 16 Oct 2004, 10:43 p.m.,*
in response to message #9 by James M. Prange

"Another idea is to build an "IR amplifier" that would be slipped onto the 49g+."

Or to unsolder the transmitter resistor used to reduce current (I think there is one). I was actually looking at some photos of the inside of the hp and saw a bunch of SMT resistors and condensators around the IR and usb plug.

Have a nice time everybody! Dimitri

Re: Anyone has remote control software for the 49G+?

*Message #11 Posted by **James M. Prange** on 17 Oct 2004, 2:36 a.m.,*
in response to message #10 by Dimitri Turbiner

Actually, short out whatever limits the power, presumably a resistor. Or, more likely, replace it whith a lower resistance. But which one? And of course it would void any remaining warranty.

Emulators from HP

*Message #1 Posted by **Mike (Stgt)** on 7 Oct 2004, 11:55 a.m.*

Probably nothing new for you, but HP now offers "Finance emulators" at http://www.hp.com/calculators/emulators. That is one of 3 different order forms, alas for educators only. (You find the 2 other at http://www.hp.com/hpinfo/newsroom/press/2004/041004a.html.)

Question to those who know better: is the HP12c Pt. a "Pioneer" inside so it's emulator could be the Carlier/Giesselink type?

Ciao.....Mike

HP28S:how to display on 4 lines ?

*Message #1 Posted by **Jean-Pierre** on 7 Oct 2004, 10:42 a.m.*

Hi all,

A long time ago I was a HP28S user (15 years). I lost the userguide.

I would like to know how to display a string memory over the 4 lines of the screen.

Could anybody help me ?

Cheers.

Re: HP28S:how to display on 4 lines ?

*Message #2 Posted by **James M. Prange** on 7 Oct 2004, 10:10 p.m.,*
in response to message #1 by Jean-Pierre

Press the key immediately to the right of the shift key, the one with four arrowheads on it, to toggle the menu labels off or on, and thus between 3-line or 4-line stack display. Of course, to display a single string over four lines, you have to use some "NEWLINE" characters, from the "shifted SPACE" key.

Regards,
James

File type

*Message #1 Posted by **Peter** on 7 Oct 2004, 7:20 a.m.*

How do I convert the HP-41 module files (.MOD) to .ROM and .BIN files?

Re: File type

*Message #2 Posted by **Mike (Stgt)** on 7 Oct 2004, 7:34 a.m.,*
in response to message #1 by Peter

Do you have access to VM/ESA? Then try this http://ourworld.compuserve.com/homepages/nutem/rxtls.htm

Else try Leo Duran's HP41UC.EXE from eslewhere.

Ciao.....Mike

Re: File type

*Message #3 Posted by **Wilson (Bill) Holes** on 7 Oct 2004, 9:26 a.m.,*
in response to message #1 by Peter

The best method I've discovered is to use the Clonix Configuration Builder available on TOS (under utilities). Download it, unzip it and install. Click on the .exe, click on Add, click on the desired .Mod, highlight the description in the Config. Builder dialog box, click on info. This results in a complete text based description being displayed - and - the creation of a .ROM file in your .Mod directory.

HP-12C bug

*Message #1 Posted by **Kalevipoeg** on 7 Oct 2004, 3:43 a.m.*

Have you noticed the following HP-12C bug:

Clearing statistical registers CLEAR Sigma in program prevents the "running" message.

For example run the following program

01 CLEAR Sigma

02 GTO 01

and compare to

01 CLEAR FIN

02 GTO 01

This is not a serious bug but a bug anyway I guess.

My HP-12C is year 2003 model (Made in China). Is it the same thing with earlier 12C calculators?

Re: HP-12C bug

*Message #2 Posted by **James Summers** on 7 Oct 2004, 8:45 a.m.,*
in response to message #1 by Kalevipoeg

Same thing with my Brazilian 12C s/n 3203B.

Well spotted.

Re: HP-12C bug - Not with the HP12Cp

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2004, 9:00 a.m.,*
in response to message #2 by James Summers

Hi;

I tried a longer program to check if there was no "reset", but it indeed "clears the display":

```
f CLEAR FIN
f CLEAR sigma
  1
  2
  0
  +
g GTO 01
```

The 120 + sequnce is just for setting the loop longer and allow "running" to appear, if so. But nothing

happens, it acts as if the calculator is switched to off. If it is left in ths condition, batteries wold "drain out" without any warning. Mine is a Chinese unit, Serial # CN1180xxxx.

I have a Chinese Platinum (CN3290xxxx) and this "bug" does not seem to happen: the "running" message prevails.

Good posted.

Luiz (Brazil)

Mine, too, but...

*Message #4 Posted by **Karl Schneider** on 7 Oct 2004, 11:13 p.m.,*
in response to message #1 by Kalevipoeg

Yep! My 1993 Singapore-made 12C does as you describe.

But, the better question is, "What would prompt someone to write such a program?"

-- KS

Re: Mine, too, but...

*Message #5 Posted by **Kalevipoeg** on 8 Oct 2004, 2:05 a.m.,*
in response to message #4 by Karl Schneider

This was the shortest possible example to show the effect of CLEAR sigma.

CLEAR sigma in any HP-12C program prevents the "running" message. Add CLEAR sigma in the beginning of any HP-12C program and see the effect!

Another HP33s Difference

*Message #1 Posted by **John Smitherman** on 6 Oct 2004, 10:17 p.m.*

All, I have found another difference between the HP 33s and HP 32sii. While using the seed and random functions I noticed that the two handle a seed of zero differently. With a seed of zero the 32sii consistently generates 0.03136 but the 33s actually produces a random number between 0 and 1.

Example:

32sii: 0 enter, seed, random: 0.03136, 0.03136, 0.03136, etc.

33s: 0 enter, seed, random: 0.86939, 0.74239, 0.34987, etc.

Consulting the 33s User's Manual I found the following on page 4-15:

"The RANDOM function uses a seed to generate a random number. Each random number generated becomes the seed for the next random number. Therefore, a sequence of random numbers can be repeated by starting with the same seed. You can store a new seed with the SEED function. If memory is cleared, the seed is reset to zero."

Up to this point the description of the seed and random functions in the 32sii and 33s User's Manuals are identical. But then the 33s adds the following sentence:

"A seed of zero will result in the calculator generating its own seed."

I am not sure how many users will be affected by this difference but I thought it to be important to post this to the forum. The important issue is that when using the 33s (and any calculator) the user should carefully read the manual to make sure that he/she understands how each function is designed to be used and what are the limits of the function, etc. This is especially important if you are a current or former 32sii user as the 33s is not turning out to be a 1 for 1 replacement. The good news is that this particular difference is documented in the manual although it would have been nice to have had it highlighted.

Regards,

John

Re: Another HP33s Difference

*Message #2 Posted by **E_Look** on 7 Oct 2004, 5:27 p.m.,*
in response to message #1 by John Smitherman

As much as I love my 32SII, the 33S is fast catching up in that department. What you've just reported and the fact that it has a built-in constants library and a little extra wiggle room (raam?) in the PRGM mode has raised my esteem of that model. Good discovery, John. But to be a wiseguy, I don't think it's really too possible to have a true random number generator on any electronic device, save having a dedicated sensor port to catch gamma ray bursts or neutrino fluxes from space.(.. and even then, I wonder!)

Re: Another HP33s Difference

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 7 Oct 2004, 7:27 p.m.,*
in response to message #2 by E_Look

There are devices based on the thermal noise which appears on any electronic device. Their output are as random as it gets.

On a simpler approach, if you have a free-running counter inside your device, and the counter is not closely tied to the processor, and if you just take a sample with such a frequency as to allow for many counter cycles between samples, you can consider it random enough.

Pseudorandom sequences can be good enough or very bad, and anyone interested on them should read Donald Knuth's "The Art of Computer Programming" Vol 2, "Seminumerical Algorithms"

Just my 0.02$

Re: Another HP33s Difference

*Message #4 Posted by **E_Look** on 7 Oct 2004, 9:09 p.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

Thermal noise! I should have known that! What could be easier, as it is, as you said, an accompanying, natural facet of anything, not just electronic devices.

Re: Another HP33s Difference

*Message #5 Posted by **John Limpert** on 8 Oct 2004, 8:46 a.m.,*
in response to message #2 by E_Look

In many cases, you don't want a true random number generator. A PRNG with a user-settable seed allows for reproducible results, which is useful when testing software.

Re: Another HP33s Difference

*Message #6 Posted by **John Smitherman** on 9 Oct 2004, 7:43 p.m.,*
in response to message #2 by E_Look

If HP will rework the LCD and clean up some of the functions the 33s will definitely go from acceptable to good in my opinion.

Regards,

John

33S: How much improvement is needed?

*Message #7 Posted by **Karl Schneider** on 10 Oct 2004, 1:50 a.m.,*
in response to message #6 by John Smitherman

John stated,

> Quote:
>
> If HP will rework the LCD and clean up some of the functions the 33s will definitely go from acceptable to good in my opinion.

My opinion is, it'll take more than that. My diatribe on this matter is in the recent Forum Archives.

Re: 33S: How much improvement is needed?

*Message #8 Posted by **John Smitherman** on 10 Oct 2004, 8:30 a.m.,*
in response to message #7 by Karl Schneider

Hi Karl. Implementing the observations and suggestions in your note would then take the 33s from good to great.

Regards,

John

Re: 33S: How much improvement is needed?

*Message #9 Posted by **Ed Look** on 10 Oct 2004, 3:20 p.m.,*
in response to message #8 by John Smitherman

Forgive the cynicism, but if (or when) the 33S does have these features implemented, thereby making it great, we won't be able to buy it anymore for $50-65 USD.

But, if I recally, the 32S and 32SII were both around $70 USD (I got mine during a special at MicroCenter for $60) and the 20S was also about $60-70... the 34C was $125-250, if memory serves!

Again, we all have different task needs/pain tolerance levels, but I think that for its current price, the 33S is actually a steal! (Consider, after all we've said [in the negative sense], it is at least better in mechanical quality and basic features than the $10 drugstore scientific or the $7 "$0.99 store" scientific calc... which are only algebraic!)

Re: 33S: How much improvement is needed?

*Message #10 Posted by **Joel Kolstad** on 22 Oct 2004, 9:03 p.m.,*
in response to message #9 by Ed Look

"Forgive the cynicism, but if (or when) the 33S does have these features implemented, thereby making it great, we won't be able to buy it anymore for $50-65 USD"

@#?$ Why? Almost all the feature improvements suggested are software-only, and as it is now the HP-33S actually has far more RAM than one could realistically ever use, so reducing that and getting a larger ROM instead could keep the manufacturing price the same.

You do bring up a good point that the HP-33S is cheaper than the older machines... mine was $50, whereas I seem to recall my 32SII was $65 -- which I did consider a little pricey at the time. Still, I'd happily pay up to about $100 for a REALLY GOOD small programmable scientific calculator.

Has any one else noticed that the 33S is the only non-graphing programmable calculator left on the market today? Pretty sad, IMO.

---Joel Kolstad

in response to message #10 by Joel Kolstad

"... Has any one else noticed that the 33S is the only non-graphing programmable calculator left on the market today? Pretty sad, IMO.

---Joel Kolstad"

Thanks for your comments, Joel. To your unquoted comments first- you're right, as I was not aware until just a couple of days ago by reading in this forum that these improvements are software or firmware modifications.

And as to your quoted comment, I agree, if it's true; doesn't TI still make a programmable non-graphing scientific... or Casio? I haven't checked into their wares for a while now, so I don't really know.

Anyhow, I too, personally find the lighter mass and smaller form factor of a scientific to be MUCH more convenient to realistically use on a day to day basis and the "added bonus" (actually, in my opinion often a necessity) of powerful programmability makes calculator of this kind a joy to use.

Re: 33S: How much improvement is needed?

*Message #12 Posted by **Julián Miranda (Spain)** on 23 Oct 2004, 7:44 a.m.,*
in response to message #10 by Joel Kolstad

Well, Ed Look says TI doesn't have a non-graphic programmable, Casio at least has one the fx-3950p (3650p solar) but it changes from country to country. There are places where it is not sold or maybe it has a different name.

Re: 33S: How much improvement is needed?

*Message #13 Posted by **Ed Look** on 23 Oct 2004, 5:29 p.m.,*
in response to message #12 by Julián Miranda (Spain)

Oh, no, Julian!

I merely said I did not know whether TI made one. The last ones I remember are the TI-57 or 59 models. Since then, I've really only been interested in HP (RPN) models.

I'm sure it varies from country to country, according to demand. But, it is good for these companies to all have a little competition... good for us!

Re: 33S: How much improvement is needed?

*Message #14 Posted by **Norris** on 23 Oct 2004, 7:38 p.m.,*
in response to message #10 by Joel Kolstad

<< Has any one else noticed that the 33S is the only non-graphing programmable calculator left on the market today? Pretty sad, IMO. >>

The harsh realities of the programmable calculator market in the U.S. in the 21st Century are as follows:

1. The average professional today does not perceive any need for a programmable calculator (either graphing or non-graphing). He has a PC on his desktop at work, another PC on his desktop at home, and a laptop for use on the road. He probably does keep a calculator in a desk drawer, but only for quick and simple calculations; PCs are used for all serious number crunching. The spreadsheet has replaced the programmable calculator in the professional market, just as the calculator replaced the slide rule.

2. In contrast, the average high school student does not have a PC on his desktop at school. So the programmable calculator still rules in the educational market. This market is large, lucrative, and almost completely owned by TI (Casio is also a player, HP is trying to be one). However, students want graphing calculators: they expect their calculators to have menus, to display mathematical formulas, to do symbolic math, to plot graphs, and to play games. A non-graphing programmable, like the 41C or 42S, is as obsolete as a DOS computer as far as the education market is concerned.

3. There is only one remaining niche for non-graphing programmable calculators: NCEES licensing exams. At present, PCs, PDAs, and graphing calculators are not allowed on the Engineer-in-Training exam, the Professional Engineering exam, or the corresponding exams for Land Surveyors. The 33S is the most powerful permissible model; it is therefore quite popular among NCEES exam candidates. Some vendors are actually marketing 33S exam software (is anyone else selling calculator software these days?). However, the NCEES exam market for the 33S is trivial in size compared to the high school market for graphing calculators.

Re: 33S: How much improvement is needed?

*Message #15 Posted by **Ron Ross** on 25 Oct 2004, 9:43 a.m.,*
in response to message #10 by Joel Kolstad

Yes, it is a sad state of calculator affairs. The responses above are very accurate of what corporate America and others perceive the market to be like and therefore do not bother to develop a powerful pocket calculator. Instead, Hp invested in an older Hp32sii design that would not violate the NCEES exam policies that were going to be in effect when Hp released the Hp33s. Any additional feature (ANY!!!) would have gotten the Hp33s banned from said exam. Therefore the Hp33s was released as you know it. Not a great calculator by any means, but the best that can be sold and used in the NCEES exam.

Are there better pocket calculators?? The Hp17Bii+ is probably better, if YOU DON'T neeed Trig (nearly every one of us does!). If you can get hold of an Hp42s (and $$$ isn't a big deal), you will get a significant step up in power and features. But you won't get real I/O that an Hp41c series offers. Hp could have released an Hp42sx, but did not want to rob from their precious 28/48s line.

Sadly, the corporate leaders feel that PC's are what you should be using, if you need more than a four function calculator (and there is some truth in this for tracking and accountability). But pure R&D or napkin engineering suffers from this as, I sometimes don't have my PC or I am not going to drag this anchor around with me. I hate to drag out my Hp48 as I feel it is to big and bulky.

RANT OFF.

Re: 33S: How much improvement is needed?

*Message #16 Posted by **Norris** on 25 Oct 2004, 2:01 p.m.,*
in response to message #15 by Ron Ross

NCEES has never clearly explained how they determine which calculators are "acceptable" and which are "banned". But they recently made an interesting move: they put a genuine graphing calculator, the TI-81, on the "acceptable" list. You can see it on their list here.

Why is the TI-81 OK? It is an old discontinued model, but the manual and other details are available on the Web. It seems to have rudimentary text handling capability; it can store long text strings for display in programs. The key difference between the TI-81 and the "banned" models seems to be that the TI-81 has absolutely no means of I/O. No IR port, no cable port.

The acceptability of the TI-81 implies that NCEES **might** accept more advanced calculators than the HP-33S, **if I/O was crippled.** For example, a remodeled 41C or 42S might be OK, as long as the text handling was primitive and there was no IR or cable port.

There would actually be a small, but real, niche for such a device among NCEES exam candidates. On the other hand, I don't think it would sell at all in the education market, which is by far the most important for calculator sales.

HP-28S

*Message #1 Posted by **ambro** on 6 Oct 2004, 6:16 p.m.*

Anyone know how much the HP-28S are going for? Where can I find one besides ebay?

Re: HP-28S

*Message #2 Posted by **Raymond Del Tondo** on 6 Oct 2004, 6:51 p.m.,*
in response to message #1 by ambro

Have you checked the classified ads section here in the hpmuseum?

Prices vary from $20 to nearly $100,
depending on appearance and completeness.
For a new-in-box unit you'll propably pay more than $100...

Raymond

HP17bii Trigonometry

*Message #1 Posted by **Charles** on 6 Oct 2004, 6:10 p.m.*

I've bought a 17bii and programmed in the trigonometric equations in the posting by Bruce Maguire. I've got the SIN+ COS to work along with the ATAN but I can't get past INVALID EQUATION with the ASIN and ACOS. It's probably my typing but after nearly a week, I'm going nuts. I've tried to contact Bruce but the email address was rejected.

I've noticed that there are a couple of oddities (typos ?) in the listing and wondered if anyone could help ?

There seem to be 32 "(" but only 31 ")"s and there are two "=" where they should be ":"'s (?). My ability to programme the 17Bii is very limited so thanks for any help from someone who has got this to work.

Regards Charles

Re: HP17bii Trigonometry

*Message #2 Posted by **Josef** on 7 Oct 2004, 3:50 a.m.,*
in response to message #1 by Charles

I did this a few weeks ago, so I'm not completely sure what I replaced. But start with the = in the L and G functions converting them to :. Then I think "or" needs a space before and after. If this doesn't make it work just ask again. Perhaps I find out, if I have changed anything else.

Regards Josef

Re: HP17bii Trigonometry

*Message #3 Posted by **Bob Wang** on 7 Oct 2004, 10:36 a.m.,*
in response to message #1 by Charles

Charles:

I agree with Josef. I just entered the equation into my 19BII and it works, so the parentheses match up as is.

Bob

Re: HP17bii Trigonometry- the answer !

*Message #4 Posted by **Charles** on 7 Oct 2004, 6:19 p.m.,*
in response to message #3 by Bob Wang

Josef, Bob,

Thanks very much. I now understand what happened, I typed the programme in from a printout which had left the last three lines off ! Once those went in, the ")"s balanced and it was fine. It was good to know that someone else had been successful.

Regards Charles

Re: HP17bii Trigonometry

*Message #5 Posted by **Wlodek Mier-Jedrzejowicz** on 10 Oct 2004, 10:51 p.m.,*
in response to message #1 by Charles

I recently bought a new HP17bii with Let and Get and would like to enter trig functions too. You refer to trig functions posted by Bruce Maguire, but you give no clue when he posted them and where (in this Forum?). Searching the Forum for articles by "B Maguire", "B. Maguire", "Bruce Maguire", or for items with "17bii" and "Trigonometry" does not find the posting. Help! Thanks, Wlodek

Upgrade card for 41CV

*Message #1 Posted by **Mike H** on 6 Oct 2004, 5:33 p.m.*

Saw an interesting item on eBay, an upgrade card to change a CV to a CX. Has anyone seen these before. I wonder if it has the time applications

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58039&item=5724561953&rd=1

It will not make a CV into a CX

*Message #2 Posted by **Randy** on 6 Oct 2004, 6:03 p.m.,*
in response to message #1 by Mike H

You're only getting half the story:

You'll get time functions but you will not have a full CX, only a CV with "Time" and "CX Time" functions. To have a CX you need the extended memory functions which are in the rom contained within the lcd module. Parts not included.

And now the really big omission: The module will only fit in a halfnut version unit.

Edited: 6 Oct 2004, 6:05 p.m.

Re: It will not make a CV into a CX

*Message #3 Posted by **Tony Duell** on 7 Oct 2004, 7:03 a.m.,*
in response to message #2 by Randy

The service manual is not particualarly clear about this, but I believe the extended functions ROM and the extended memory RAM are in this module (along with the timer chip, crystal, time functions ROM, etc).

HOWEVER the 41CV main ROM (which is in the LCD driver hybrid) will not look for the extended functions ROM. If yo add this module to a halfnut CV, then you get the time functions, but not the extended functions (I have actually done this to see what would happen).

how does an ultrasonic cleaner works with calculators Randy

*Message #1 Posted by **karl** on 6 Oct 2004, 3:31 p.m.*

that's my question, does it uses water or alcohol. I'm looking on google, but no great conclusions.

Re: how does an ultrasonic cleaner works with calculators Randy

*Message #2 Posted by **David Smith** on 6 Oct 2004, 4:02 p.m.,*
in response to message #1 by karl

I use distilled water in mine. Alcohol can cloud the plastic display window. Generally you want to do three cycles with fresh water each time. Shake as much water out of the machine as possible. I have also used a little Kodak PhotoFlo wetting agent in the last bath, but if your water is clean you should not be getting water spots with just plain water.

Re: how does an ultrasonic cleaner works with calculators Randy

*Message #3 Posted by **Lars** on 6 Oct 2004, 4:07 p.m.,*
in response to message #1 by karl

I cleaned the keyboard on a 41 with an ultrasonic cleaner using water, then squirted ethyl alcohol on it to drive out the water, worked fine. When I did the same thing on a 25, however, a white residue appeared on the side with the keys, which I don't seem to be able to remove without removing the painted legends. I'm not entirely sure when the disaster occured, but I tend to believe it was when I squirted the alcohol on it.

--Lars

Re: how does an ultrasonic cleaner works with calculators Randy

*Message #4 Posted by **Lars** on 6 Oct 2004, 4:19 p.m.,*
in response to message #3 by Lars

P.S. The displays were kept away from both the water and the alcohol in both the success and the disaster.

--Lars

*Message #5 Posted by **Randy** on 6 Oct 2004, 5:30 p.m.,*
in response to message #4 by Lars

Danger, Will Robinson, Danger.

Using alcohol in an ultrasonic cleaner creates an explosive atmosphere.

Distilled water is good for the final pass, but I would start with one of the citrus based electronic cleaners designed for ultrasonic use and you'll get a better result.

The clear coatings on classics, woodstocks and topcats will turn white if you leave it in any cleaning solution too long. Use Armor All or Novus #1 polish to reduce the clouding.

Edited: 6 Oct 2004, 5:33 p.m.

Re: how does an ultrasonic cleaner works with calculators Randy

*Message #6 Posted by **David Smith** on 7 Oct 2004, 4:29 p.m.,*
in response to message #3 by Lars

Armor All makes your keyboard stains less rotten. I spray a very small amount on a small piece of folded paper towel and wipe between the keys. Then wipe it all off with another piece of paper towel. Change the towel often.

Meeting in Allschwil

*Message #1 Posted by **Matthias** on 6 Oct 2004, 1:33 p.m.*

Hi Folks

Between 23.10. - 07.11.2004 the "Basler Herbstmesse", a famous exhibition takes place here in Basel. This could be a nice chance to have a reunion with our HP friends. I will not have the time to organize a full meeting like last time (or only a small one in my appartment, you know it), but it would still be nice to talk with you and to go to the "Herbstmesse". I know for some of you this is no more a long time to choose, it was only a sontain idea right now. Please let me know, if you have time to come to Basel again. Publish this mail to all interested people and tell us here in this forum, if you would come or not.

Matthias

Re: Meeting in Allschwil

*Message #2 Posted by **Meindert Kuipers** on 6 Oct 2004, 2:46 p.m.,*
in response to message #1 by Matthias

Looks like a good idea to me! The problem is that it may be a bit too soon for my wrist to fully heal and make it safe for me to drive. I will be travelling to Southern Germany beginning December, which is probably better for me. I should be able to show the first proto's of the MLDL2000 then, but I am not certain if they will be fully debugged at that time.

Meindert

Re: Meeting in Allschwil

*Message #3 Posted by **Mike (Stgt)** on 7 Oct 2004, 4:08 a.m.,*
in response to message #1 by Matthias

30.10. or 06.11. would be ok, but if I go to "Herbstmesse" I _must_ go there with my kids. My idea of a meeting came up when I saw your list of modules (Do you have a copy of them for Emu41 or V41? Do you have all manuals as PDF? We have an inhouse, high quality copyshop for that.)

If we meet we should not go for the rollercoaster and if Meindert Kuipers could join, that would be nice.

Ciao.....Mike

Re: Meeting in Allschwil

*Message #4 Posted by **Ronald** on 7 Oct 2004, 4:12 p.m.,*

sequence on HP39G

*Message #1 Posted by **katana** on 6 Oct 2004, 7:57 a.m.*

first of all, i hope y'all understand what i am saying, since english isnt my native language (?).

i have the HP39G and i dont really understand how the sequence aplet works. when we have to make Sn= blabla (for instance: how many are the first 10 terms (?) put together) how do i do that on the HP?

Re: sequence on HP39G

*Message #2 Posted by **Mike (Stgt)** on 6 Oct 2004, 9:23 a.m.,*
in response to message #1 by katana

Set U1(1)=1 and U1(2)=1, then U1(N)=U1(N-2)+U1(N-1), next hit PLOT and see if you can find a correlation. Hope this helps for your Sn=blabla problem.

Ciao.....Mike

32 - 20 - 33

*Message #1 Posted by **Arnaud** on 6 Oct 2004, 3:59 a.m.*

Suddenly this morning I realised something. It may not be news to you but I just wanted to share.

When I turn off my 32SII, it keeps the last result on the screen (and the whole stack for that matter.

When I turn on my 20s, it displays 0

When I turn on my 33s, in RPN or ALG mode it displays the last result (stack).

Seems an odd behaviour from the 20s. Any reason why?

Arnaud

Re: 32 - 20 - 33

*Message #2 Posted by **John Limpert** on 6 Oct 2004, 6:30 a.m.,*
in response to message #1 by Arnaud

I suppose it depends on what is defined as being part of "continuous memory". There are many old computers where the CPU registers were volatile, even though main memory was nonvolatile. Some of them had a power-fail interrupt that allowed the computer to save the contents of the registers in main memory before the power supply shut itself down. I don't know if any calculators have a similar feature. Most modern calculators seem to have "soft" power switches instead of a hardware switch in series with the battery, like those on early calculators.

Re: 32 - 20 - 33

*Message #3 Posted by **bill platt** on 6 Oct 2004, 9:12 a.m.,*
in response to message #1 by Arnaud

Hi Arnaud,

Now that you have our attention :^)

Further interesting on the 20 is that the LAST register is saved--so if you want a result to survive power-down, just swap it into the LASTx register before power down---LASTx toggles between the calculator line and the LASTx register.

A nuance is htat when you power up again, LASTx will not toggle the "0" in and out--pressing LASTx merely fetches the same result to the calculator line.

Regards,

Bill

in response to message #1 by Arnaud

I thought I had the answer, but obviously the 33 wipes out my reasoning.

A question on your web site

*Message #5 Posted by **Valentin Albillo** on 6 Oct 2004, 12:04 p.m.,*
in response to message #4 by Bram

Hi, Bram:

Following your posted link, I saw this question on your site:

"Properties of a number. Does the number 3.35988566622 ring a bell? In connection with Fibonacci? You'll get this number adding the reciprocals of the elements of the Fibonacci series (the HP-32SII program needed 56 of them to yield 11 stable decimals). It's not twice the golden ratio Phi nor have I found any other relation between Phi and the summed value. [...] From all these ratios and reciprocals I concluded that the sum of reciprocals of the Fib series must have a relation with Phi, but I'm still searching."

Just in case you're still searching (or interested), you'll find some interesting facts about your constant,

```
3.359885666243177553172011302918927179688905133655...
```

at these URLs:

On-Line Encyclopedia of Integer Sequences!

MathWorld

In particular, your constant it's been proved irrational, but doesn't seem to be trivially expressible in terms of other known constants (such as Pi, e, the golden ratio, etc), so either stop searching altogether to save effort, or else persevere and should you find some representation in terms of other known constants you'll make mathematical headlines all over the world.

Menwhile, to help alleviate the frustration and for sheer fun, instead of summing the reciprocals of the Fibonacci numbers, try and find the related sum:

$$S = \sum_{n=1}^{n\to\infty} \frac{1}{10} * \frac{Fib(n)}{10^n}$$

where Fib(n) is the n-th Fibonacci number, like this:

```
Fib(1)=1, Fib(2)=1, Fib(3)=2, Fib(4)=3, Fib(5)=5, etc.
```

First obtain the value of the sum to a suitable precision, then see if you can recognize what the resulting constant is made of.

Best regards from V.

Edited: 6 Oct 2004, 12:59 p.m.

tnx 4 the URLs

Re: A new question in the forum

*Message #7 Posted by **Bram** on 7 Oct 2004, 7:36 a.m.,*
in response to message #5 by Valentin Albillo

Good morning Valentin,

Thanks for your comment. I happen to have hit your second link before, hence the Lucas numbers comment in the program. I should update my site on this point (and find plenty of time to read much more about it).

About the summation:

```
0.01
0.001
0.0002
0.00003
0.000005
0.0000008
0.00000013
0.000000021
...
```

add up to 0.0112359550561798...
which appears to look like the reciprocal of 89
One more number to STO in my INC. (interesting number cabinet)

Hard Leather Case for hp 48 series

*Message #1 Posted by **William L. Drylie** on 5 Oct 2004, 4:07 p.m.*

Hi; Does anyone know who still makes or sells hard leather field cases for the hp 48 series line? There was a survey sales company that used to, but I don't see it listed there anymore. I had a nice one made by Bolen leather products who went out of business a few years back, but it was pilfered out of my office a couple of weeks ago. I crawl through large banks of boiler tubes in power plants and the hard case is a must for that situation. Any leads would be greatly appreciated and rewarded, I came accross an original brochure for the hp 42S and will send it to a collector who first gives a lead on the cases. Thanks, Bill

Re: Hard Leather Case for hp 48 series

in response to message #1 by William L. Drylie

William,

Lo Ink Specialties still shows that they carry them in their fall/winter 2004 catalog. website is www.loink.com. Page 15 of the catalog, Item 293, $49.95. You might also check calcpro.com as well.

Re: Hard Leather Case for hp 48 series

*Message #3 Posted by **Iqbal** on 5 Oct 2004, 5:07 p.m.,*
in response to message #1 by William L. Drylie

I use a case made by Ripoffs http://www.holster-depot.com/shoppro/electronics1.html Seem to be waterproof also. It's definitely not as hard as the leather cases but they are padded, and most important, I don't need to take out my belt to remove the case.

Re: Hard Leather Case for hp 48 series

*Message #4 Posted by **Larry E** on 19 Oct 2004, 10:40 p.m.,*
in response to message #1 by William L. Drylie

I have a Bolen S3048 which I assume is meant for the 48 series. It came with 41-cv stuff I bought - will hold a 41 w/ or w/o a card reader -- OR more to the point, HOLDS MY 48G PERFECTLY.

It is in excellent shape, if you want pictures, email me.

Responses to sale ad - hmmm

*Message #1 Posted by **Don Davis** on 5 Oct 2004, 1:04 p.m.*

I posted a calculator for sale, and so far I have 2 customers who would like to buy it. The first plans to send me a $4000 check from Canada and have me refund the $3750 difference. The second plans to have a colage (I think that means colleague) send me a $3000 check from Germany, at which time I am supposed to deduct the $250 selling price plus another $50 for my trouble, and refund the difference via Western Union.

Hmmm - it is so difficult to decide which of these generous offers to accept. Perhaps I should simply post my bank account numbers somewhere and allow them to carry out the transactions in a way that would take all of the load off of me - that would really simplify things.

Don (born at night, but not LAST night) Davis

Re: Responses to sale ad - hmmm

*Message #2 Posted by **unspellable** on 5 Oct 2004, 1:43 p.m.,*
in response to message #1 by Don Davis

I think either of the above transactions would be fine as is. Just tell the buyer you will wait for the standard ten years for the check to clear.

Re: Responses to sale ad - hmmm

*Message #3 Posted by **Don Davis** on 5 Oct 2004, 7:29 p.m.,*
in response to message #2 by unspellable

I like the thought. Maybe I could suggest that they use Western Union Bidpay to send me the $3000, since that is their preferred method for the refund!

Re: Responses to sale ad - hmmm

*Message #4 Posted by **Wayne Brown** on 5 Oct 2004, 1:54 p.m.,*
in response to message #1 by Don Davis

Perhaps you could put these two customers in contact with each other so that they could do business with each other. *That* ought to be entertaining.

Re: Responses to sale ad - hmmm

probability

*Message #1 Posted by **Jim** on 5 Oct 2004, 11:20 a.m.*

Hi, folks. I need some facts checked. Please tell me what you get for probability and odds for picking 10 out of 10 winners on a football ballot if all games are a 50/50 toss-up and what would the probability and odds be if 10 teams were favored at 90% chance of winning and you chose all favorites. If you get the same numbers I did, I will assume that is correct. Verification from two or more of you would be even better. It's always good to know that I have reliable help on the HP Forum

Re: probability

*Message #2 Posted by **Ron Ross** on 5 Oct 2004, 11:26 a.m.,*
in response to message #1 by Jim

I get an answer of 0.00098 or 98/100,000 for a 50/50 chance. The odds are much better at 90% favorites and I get: 35% chance of winning.

Re: probability

*Message #3 Posted by **Jim** on 5 Oct 2004, 6:15 p.m.,*
in response to message #2 by Ron Ross

Thanks, Ron and Larry. Your numbers corroborate mine.

Re: probability

*Message #4 Posted by **Larry Corrado** on 5 Oct 2004, 11:56 a.m.,*
in response to message #1 by Jim

Jim:

Since you are requiring 10 independent events in each case, the overall probability is simply the product of the individual probabilities. For the 50% case the overall probability is (0.5)^10 or 0.000977 acording to my HP-11C.

For the 90% case, (0.9)^10 = 0.349.

This reminds me of the problem our math instructor gave us, about the British avaitors who were flying bombing missions during World War II. Supposedly they had a 20%(!) chance of being shot down on any one mission. The question asked was what is the probability of being shot down after five missions. Some of the students came up with 100% (5 x 20%).

Larry

Re: probability

*Message #5 Posted by **Mike (Stgt)** on 5 Oct 2004, 12:00 p.m.,*

in response to message #4 by Larry Corrado

The chance is always 50% -- it hapens or not <G>

Ciao.....Mike

A subset of the binomial distribution...

*Message #6 Posted by **Karl Schneider** on 5 Oct 2004, 11:52 p.m.,*
in response to message #1 by Jim

The answers that others have given are correct; this is a simple problem. A tougher question is, what are the chances of getting, say, 8 out of 10 right?

The binomial distribution is as follows:

$$P(n,k,p) = C(n,k) * p^k * (1-p)^{(n-k)}$$

```
P is the overall probability
n is the number of trials
k is the specified number of successes
p is the probability of success of each trial
```

C(n,k) is the statistical combination function

Now, if there are n successes in n trials (get 'em all correct), this reduces to

$$P(n,n,p) = p^n$$

If you have a 65% chance of picking each of 10 teams correctly, your chances of getting 8 correct are:

$$P(0.65, 10, 8) = C(10,8) * 0.65^8 * (1-0.65)^{(10-8)} = 0.175652953$$

New List

*Message #1 Posted by **Matthias** on 5 Oct 2004, 10:20 a.m.*

Hi

I just uploaded a new HP-41 module list with new datas and some bug fixes. New is on the right side a part for your collection. Print out the paper and you have a full database of your HP-41 modules.

http://www.hp-collection.org/Modul%fcbersicht.pdf

Yours, Matthias

Re: New List

*Message #2 Posted by **Matthias** on 5 Oct 2004, 4:46 p.m.,*
in response to message #1 by Matthias

On my work I posed a lot of question. Maybe someone can answer at least one of them:

0) Are the "P-3B/C APAC 82 module" and the "C141B FSC module" a Boeing module? 1) Are all modules described as Boeing modules really from Boeing? I´m not a aviation freak and do not know the airplanes, sorry. 2) Does someone has a manual of any of the Aviation modules (Boeing, Cessna, Airforce, not the HP-Aviation)? 3) Is there a manual for the "3421 CONTROL" module or is there only the HP-41 library "Control Systems"? 4) Is it correct that "AstroROM" and "AstroROM 2" have the same manual? 5) There are 3 different colored overlays for GMAC I-III. The label on it is allways the same. What´s the use of these three overlays? 6) Hase anybody a overlay or a manual for the "Forecaster 2 module"? Does it exists? 7) What sort of module is the "HEPAX 1B"? Standard or Advanced? Does the CAT2 really not show the "-" before "HEPAX 1B"? 8) Are there really two "NavCom" modules? I have one module that says NavCom 2 in CAT2, but the overlay says NavCom. 9) Does the "Speed machine module" and the "Speed machine II module" really have the same oberlays? A) Who produced the "Sun Shooter 41TM CO-OP Module"? B) What is the difference between the "Dr. Z Ractrack module" and the "RACETRACK EC41-533 module"? C) Does a special "Zengrange programmer ROM" exists, or were the 4k copied on the empty ZEPROM by standard? D) Has someone more informations concerning the following modules: BCMC (what is this?), CvPAK, Educalc Service ROM, Flight Test, HPCC-Keys 2, HPCC-Keys 3, ICODE , JimROM, LandNav, LAITRAM XQ-2, MCODE 1A, PARIO 1A, SMI Plotter Module, SV-ROM 01, SURV -505-1/-505-2, SURV -505-3/-403-4, Tools, ToulROM

If you have a manual of one of the custom modules, please let me know. I would like to collect as many of them as possible.

Additions to my list are very welcome. Please send me any information you have, any correction on my list, so that the HP-41 community can benefit from this list. I will do my very best to keep you informed with all informations I have.

Yours, Matthias www.hp-collection.org

Re: New List

*Message #4 Posted by **J-F Garnier** on 6 Oct 2004, 6:59 a.m.,*
in response to message #3 by Matthias

Hello Matthias,

Some partial answers:

3) Is there a manual for the "3421 CONTROL" module or is there only the HP-41 library "Control Systems"?
The only HP-41C ROM I know related to HP3421 is the 44468A DataAcquisition-Control Pac and there is a manual for it.

7) What sort of module is the "HEPAX 1B"? Standard or Advanced? Does the CAT2 really not show the "-" before "HEPAX 1B"?
Hepax Sandard and Advanced use the same ROM 'HEPAX 1x'. The letter 'A' to 'D' indicates the software revision. AFAIK, there is a leading '-', at least on the C revision. I will check all the revisions on Emu41 (I own all the revision images, but only one real module...)

D) Has someone more informations concerning the following modules: BCMC (what is this?), CvPAK, Educalc Service ROM, Flight Test, HPCC-Keys 2, HPCC-Keys 3, ICODE , JimROM, LandNav, LAITRAM XQ-2, MCODE 1A, PARIO 1A, SMI Plotter Module, SV-ROM 01, SURV -505-1/-505-2, SURV -505-3/-403-4, Tools, ToulROM
Do you mean BCMC or BCMW? BCMW was (still is?) a french company who was involved a lot in HP applications. I have ROM images of some BCMW ROMs, some partially corrupted, so I never successed to make them run or even understand their purpose.
I have some information on LAITRAM XQ-2, but no ROM or ROM image.
SV-ROM1 is a EPROM set (not a module) made by Serge Vaudenay (can be found somewhere, maybe on Emmanuel Compes site)
ToulROM was a EPROM set made by PPC-Toulouse (France). 'Toul' in french is pronounced like 'tool' ...

in response to message #5 by Mike (Stgt)

Hi Mike,

This file was generated from the HP SDS II development system, I don't remember the exact tool I used to do it. So it's the only official list I know.

J-F

Re: New List

*Message #7 Posted by **Mike (Stgt)** on 7 Oct 2004, 7:40 a.m.,*
in response to message #6 by J-F Garnier

Hi JF!

Seems I shoud type it as it helps a bit to read trace outputs.

Ciao.....Mike

BTW: isn't there a list in David ASS? at least in the add-on? ...

Re: New List

*Message #8 Posted by **Matthias** on 6 Oct 2004, 1:02 p.m.,*
in response to message #4 by J-F Garnier

Hi J-F

I do not know the "44468A DataAcquisition-Control Pac". Do you have a manual for this? I got a HP-41 Library called "Control Systems" with the module. WHat´s the use of this library?

Matthias

Re: New List

*Message #9 Posted by **J-F Garnier** on 7 Oct 2004, 6:20 a.m.,*
in response to message #8 by Matthias

Matthias,

You can find more info on it at TOS (as we still have to call it like this...) in the HP-IL peripheral section.

J-F

Re: New List

*Message #10 Posted by **Emmanuel, France** on 7 Oct 2004, 10:23 a.m.,*
in response to message #3 by Matthias

```
0) Are the "P-3B/C APAC 82 module" and the "C141B FSC module" a Boeing module?
1) Are all modules described as Boeing modules really from Boeing? I´m not a aviation
freak and do not know the airplanes, sorry.

>P-3B or P-3C is a Lockheed aircraft named Orion.
APAC for Aviation PAC and 82 for 1982 (?!)
C141B made by the same manufacter is a Starlifter.
```

```
7) What sort of module is the "HEPAX 1B"? Standard or Advanced? Does the CAT2 really
not show the "-" before "HEPAX 1B"?

>I only know three versions of Hepax ROM : 1B, 1C and 1D.
I had a Standard Hepax with 8K RAM and 16K ROM, and an Advanced Hepax with 16K RAM
and 16K ROM. I read that Hepax Memory module (8K) and Hepax Double Memory Module
(16K) also existed.

C) Does a special "Zengrange programmer ROM" exists, or were the 4k copied on the
empty ZEPROM by standard?

>Programmer was a ROM made by Zengrange Ltd for burning Zeprom Module on a Zeprom
Programmer, ... I have a Gunzen with 'HP' module and had another one with 'Zengrange'
reprogrammable Zeprom Module. Zengrange Module policy was quite curious.

D) Has someone more informations concerning the following modules :
- BCMC : Certainly BCMW, specially for merchandising
- HPCC-Keys 2 and HPCC-Keys 3 : cf. HPCC UK
- LandNav : by Warren Furlow ?!
- PARIO 1A : ProtoPARIO ?!
- SV-ROM 01 : or ROMSV-01 for ROM Serge Vaudenay 01
- ToulROM : Toulouse Rom (former PPC Chapter), 4 versions (1A, 1B, 1C, 1D)
To be continued...

Hmmmm, I wonder which of the three MCODE 1A ROMs I have EPROMs of are yours (if any) Mike. All three are different!!! Any ideas?? Again, I'll not have access to my 41 stuff until I return home on Nov. 2nd. so can't provide specifics until then.

Best, Wilson

Re: New List

*Message #14 Posted by **Mike (Stgt)** on 8 Oct 2004, 3:57 a.m.,*
in response to message #13 by Wilson (Bill) Holes

Hi! None of the MCode modules are from me as I never published it, I only mentioned it on my list. For more see here: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=64041.

To be clear: when I tell Matthias to kick out -MCODE 1A and TOOLS 1A from his list I had in mind they where my two collections of functions and programs I had set up in the W&W RAM-BOX (and accidentally mentioned it's singular existence on my HP41). I did not know there are other modules named -MCODE 1A, existing as HW or as SW for a RAM-BOX or an emulator.

Ciao.....Mike

*Message #15 Posted by **Wilson (Bill) Holes** on 8 Oct 2004, 11:27 p.m.,*
in response to message #14 by Mike (Stgt)

Hi Mike,

I'm especially interested in 41 ROMs so this one really has me curious. I'm willing to send you a cat listing of the MCODE 1A's I own upon my return to Houston (early Nov.) in hopes that you are willing to compare them with your's. From what you stated I'm guessing that you never distributed your MCODE 1A's. Is it possible that 4 different ROMs with the same name and rev's exist?? Seems impossible but...

Best, Wilson

Re: New List

*Message #16 Posted by **Mike (Stgt)** on 11 Oct 2004, 4:59 a.m.,*
in response to message #15 by Wilson (Bill) Holes

No, not impossible. It would even be possible that two MCode programmers baptized independantly their ROMs "MFFOMCR" (My Favourite Forty-One MCode Routines") <VBG>. I suppose, you agree that the chance for more than one "-MCODE 1A" is somewhat higher.

Ciao.....Mike

Re: New List

in response to message #11 by Wilson (Bill) Holes

Thanks a lot Wilson

Re: New List

*Message #18 Posted by **Mike (Stgt)** on 6 Oct 2004, 5:48 a.m.,*
in response to message #2 by Matthias

Hallo Matthias!

First: tnx a lot 4 publishing your list -- when will be the nxt meeting in Allschwil? <VBG>

Second: your question D) throw out -MCODE 1A and TOOLS 1A. There was, is, and never will be a piece of hardware of it. You probably found them in my list at http://ourworld.compuserve.com/homepages/nutem/romim.htm. Those two are my collections of programs and functions in the RAM-BOX, the first is from walking through "MCode 4 beginners" (only SEED and RN are my own work), and the second one contains some everydays tools and a barcode printer (my own, started from the scratch) for the HP2225B as for long time I had no SquidBC.

Ciao.....Mike

Here the listing of RN and SEED (CX only, IIRC move only 1k (x400, x800, xC00) Without seed part of time is used as seed and stored in buffer #9 - which is deleted by OFF/ON or PACK.

*Message #5 Posted by **Mike** on 5 Oct 2004, 8:56 a.m.,*
in response to message #1 by Mike

RE: Calculators

I was primarily wondering where one might come across vintage calculators. What types of shops or places might one find old calculators (electronic or mechanical)?

OT:

Well, I guess I should check this out on a travel site but since there are people from France that visit this forum, I thought it might be a good place to ask.

What type of power do they have in France? Do I need an adapter for my AC powered devices like laptops and cell phone chargers.

Also, I have a **Treo 600 GSM phone** that is supposed to work in France. Anyone know for sure?

Edited: 5 Oct 2004, 8:57 a.m.

Re: OT: French power and cell phone coverage

*Message #6 Posted by **Thibaut.be** on 5 Oct 2004, 9:22 a.m.,*
in response to message #5 by Mike

Voltage is 220V AND 50Hz.

Most modern adapters can cope with ranges of 100 to 240V, as I can notice on the one opf my laptop and of my mobile for example. In case of doubt, refrain, as you can fry your adapters and devices.

If your mobile is tri-band, no problem, you'lle be fine.

There is at my knowledge no specialized store in vintage calculators, but I occasionally spot a few in pawn shops such as "Cash Converters" and "Troc de l'Ile".

Enjoy your trip in Paris, and make sure you get French Euros !

in response to message #7 by Mike

Euros have the same value in each country that uses them, but each country issues their own, with their own distinctive designs. They can be used interchangeably. When we were in London recently my son wanted to get samples of Euro coins from various countries, but all the currency exchanges we visited carried only Euro notes, not coins. We did bring back a nice selection of British coins and currency, though.

You can find pictures of the various Euro coin designs here:

Euro coins

in response to message #7 by Mike

It's trap in which you did not fall in.

When, in early 2002, Euro became a reality to us European guys (at least for the ones who dared to join the €), my wife and I went to Paris to do some shopping. I withdrew brand new € at a cash dispenser in Belgium.

When I wanted to pay our (understand : my wife's) purchases at the "Galleries Lafayette" till, I asked the salesperson if it mattered that these were Belgian Euros. She was dazzled, asked her supervisor, who asked her supervisor... well, a lot of people were advised and no one seemed to dare to give the correct answer. The chief accountant, at least I understood he had a high level of responsability in the business, arrived, said he was sorry for the inconvenience, (I was burtsing into laughter, but could not show it), took his mobile and asked his banker if there were some exchange fees to accept belgian Euros. He was reassured that not, and took the responsability to accept them.

There had been such a € campaign on all national TV's, and in a store such as Lafayette, which is a kind of Wall-Mart, not only the salespersons but the supervisors had no idea how to treat our new currency.

As a finance guy, this is probably the funniest thing I ever encountered.

in response to message #5 by Mike

be very careful with roaming in Europe. I have just had a nasty experience with some totally outrageous roaming charges. Read the following text from two emails I got from the T-Mobile tech support.

```
While you are overseas and your handset is turned on, you are using
a carrier that charges roaming rates for users who are temporarily
using their network. Once attached to that network, you are accepting
that carriers user agreement, and accepting to pay all associated
charges that may be a result of you using their network. As soon
as you receive a call to your T-Mobile handset, because it is turned
on and waiting for a call, we send the call through to your handset.
Because the handset is using an International carriers signal to
receives that call, they will charge you for the connection. Some
carriers do not charge for the airtime and network resources that
are used while the handset is ringing and waiting for a connection,
and there are some carriers that do charge for the same time.

------------------------------
If you do not answer an incoming call, the call is forwarded from
overseas to the states. Again, calls are rounded to nearest minute,
so a one-minute charge with roaming charges is added again.  In
effect, a two-minute call will be charged to your account for every
unanswered call while overseas when the call forwarding is active.
```

In my case this "forwarding" business included calls to voice-mail. So somebody called and left a 5 minute message on my voice-mail, and I was asked to pay for 10 minutes of roaming ($15). This is the type of "feature" that can bankrupt you.

Say what?

*Message #11 Posted by **Mike** on 6 Oct 2004, 9:05 p.m.,*
in response to message #10 by Vassilis Prevelakis

I have international roaming discount package.

But are you saying that you accrue minutes by just having the phone on, even if no one calls you?

Re: Say what?

in response to message #11 by Mike

```
Mike wrote:
> are you saying that you accrue minutes by just having the phone on, even if no
one calls you?
```

No, but they appear to imply that if somebody calls you, you may be cahrged even if you leave the phone ringing.

Essentially what I am saying is that you'll have a hard time arguing about bogus charges. Although having said that, I did manage to get T-Mobile to cancel these charges, but it was a one-off.

The statements I quoted in my previous email are statements made IN WRITING by T-Mobile support.

Hi Mike,

to make it short, the most important points are:
Turn off your phone mailbox while outside the U.S. ,
and leave your mobile phone off when not in use.
This way you'll minimize superfluous service fees (roaming).

Bon Voyage!

Raymond

HP48G

*Message #1 Posted by **Paul Marin** on 4 Oct 2004, 8:29 p.m.*

I was about to sell my 48G to a guy in the USA, until I took it out of storage and powered it up with some new batteries. On start up, I get slow keystroke response, the right shift appearing all the time and it won't go off. The calculator takes too long to any calculations and they take longer to appear on screen. I've ried everything, including shorting the terminals with batteries out (advice from HP head office here in Australia) I'm at the point where I want to break it open, just to see if the right shift key may be stuck. I've done all the self help available in the manuals but nothing worked. I don't care if I break it because I have other units that I use. Can anyone advise a solution otherwise I'm going to take a hammer to it. I dont want to because it was a nice unit when I first got it. But I put it away for future use, just in case, but bought a 33S instead

Thanking in advance

Paul Marin

Re: HP48G

*Message #2 Posted by **Randy Sloyer** on 4 Oct 2004, 9:49 p.m.,*
in response to message #1 by Paul Marin

Don't take a hammer to it, it's pointless. Opening the unit will bring you no closer to a solution, only closer to a pile of useless electronic bits.

Yes, it is a shorted key. A closed key is somewhere around 10k ohms. Anything from 10k up to several meg ohms will result in the behavior you are seeing. The offending key will usually be displayed with very slow response.

Try a few drops of isopropyl alcohol around the key, allow to penetrate for a second turn on it's side and press a few times. Repeat once or twice and allow to dry. An ultrasonic cleaner works well for these problems if the simple flush doesn't work.

You'll find problems of this type fall into one of two possibilities. One, it was just some crud that worked it's way into the key and it will be good as new with cleaning. Two, it will work for a while but then the problem comes back. Those you'll find to be migration of the conductive material from the top half of the switch embedding itself in the bottom cross point with each key press. Those are destined for the rubbish bin.

HP 16-like calculator for J2ME phones and other computers

*Message #1 Posted by **Gunnar Degnbol** on 4 Oct 2004, 5:25 p.m.*

I have updated my RPN calculator for J2ME phones. There are now two versions: Stak, a simple calculator, and Stak16, a programmer's calculator with the integer functions of the HP 16c and full IEEE 854 arithmetic. Stak16 also has a user-definable keyboard like the HP 41. It does not have any scientific functions, and still lacks a manual.

The PC version has two keyboard layouts, the phone keyboard (3 cols * 7 rows) and a voyager style keyboard. The voyager keyboard is mapped to the number row and the letter rows on the PC keyboard. The PC versions can be downloaded as a jar file, a zip file for Windows (with a launcher exe) and as a Macintosh disk image. There is also a version for the Sharp Zaurus (with phone keyboard layout).

I have moved the page to my other ISP, at http://home.tiscali.dk/gdegnbol/stak. It is now possible to download the programs via WAP directly to a (Nokia) phone, from http://home.tiscali.dk/gdegnbol/stak/index.wml

Re: HP 16-like calculator for J2ME phones and other computers

*Message #2 Posted by **Thibaut Cousin** on 5 Oct 2004, 11:39 a.m.,*
in response to message #1 by Gunnar Degnbol

Hi,

I own a 6310i Nokia phone. I tried to download your file, but there is an error message "file is too large to be downloaded".

Can you help in this sense ?

Thanks in advance !

Re: HP 16-like calculator for J2ME phones and other computers

*Message #3 Posted by **Gunnar Degnbol** on 5 Oct 2004, 2:29 p.m.,*
in response to message #2 by Thibaut Cousin

That is strange. I just checked again, and it works on my 6310i. Did you download the one labeled "Nokia 6310i"? Only the simple version (Stak) works on the 6310i, the other (Stak16) is too big.

If you got the right version, I'd like to ask about the firmware version of the 6310i (press *#0000#). Mine is 5.50. There might be small differences between firmware versions, and my 6310i midlet is just below the 30K maximum. If this is the problem I will see if I can squeeze a few more bytes out of it.

Another possible problem is a limitation in the WAP gateway. The error I get when I try to download one of the other versions is simply "File too big" (after switching the phone to english messages), as an error message from the phone. Does the error message look like a WAP page or a phone error message?

HP48 garbage collection

*Message #1 Posted by **Chan Tran** on 4 Oct 2004, 3:39 p.m.*

My 48GX and also the SX, but I haven't used the SX for quite sometime so I don't remember, tends to freeze for a couple of seconds after I key in a few entries. I think this is due to garbage collection but how to I reduce the frequency of this action as it really slow me down. It's a shame as these calculators are significantly faster than the 41's that I have.

Re: HP48 garbage collection

*Message #2 Posted by **Raymond Del Tondo** on 4 Oct 2004, 3:57 p.m.,*
in response to message #1 by Chan Tran

Hi,

I think the answer is in the FAQ at www.hpcalc.org ;-)

Raymond

Re: HP48 garbage collection

*Message #3 Posted by **Rick** on 4 Oct 2004, 5:54 p.m.,*
in response to message #2 by Raymond Del Tondo

Hi, Please show me where, because my calculator does the same thing. It is quite irritating sometimes.

Re: HP48 garbage collection

*Message #4 Posted by **Raymond Del Tondo** on 5 Oct 2004, 8:14 a.m.,*
in response to message #3 by Rick

Hi,

be assured this is normal for RPL machines.
The delay effect has many parameters, like stack depth,
free RAM, etc...
Usually it helps much to have not too many objects on the data stack.

Please take a look there:

http://www.hpcalc.org/hp48/docs/faq/

and maybe there

http://www.hpcalc.org/search.php?query=Garbage+Collection&hp48=1

Raymond

Re: HP48 garbage collection

*Message #5 Posted by **Francesc Casanellas** on 5 Oct 2004, 10:35 a.m.,*
in response to message #4 by Raymond Del Tondo

I do not agree that this is normal in a well engineered RPN machine.

I have had nearly all HP RPN calculators from the beginning: I do not remember HP25C, 29C, 67C, 41, etc. to have the pausing problem.

In my HP48G the problem was still passed unnoticed.

When I bought an HP49G I returned it (HP accepted the return) because the garbage collector problem was so bad that it made the machine unusable for any serious continous work.

Later on, the ROM version 1.19-6 appeared (not supported by HP), where the pausing appears only from time to time. I have a new HP49G (one of the latest to be manufactured) with this software version and although the problem is not absolutely fixed, is bearable.

So pausing owing to garbage collector depends NOT on being a RPN machine but on how the software is made. HP is giving examples of how thinks can be worsened: i.e. in some aspects new HP49G+ were worse than HP49: even worse keyboard, battery problems, etc., and HP49G had some features worse than HP48 (of course there have been improvements in speed and other features).

Edited: 5 Oct 2004, 4:53 p.m. after one or more responses were posted

Re: HP48 garbage collection

*Message #6 Posted by **Ron Ross** on 5 Oct 2004, 10:57 a.m.,*
in response to message #5 by Francesc Casanellas

Actually the lower end 32K RAM 48G didn't really suffer from this problem to a noticiable extent, because of its small amount of RAM. Kinda makes the plain 48G somewhat better for general number crunching. I too, did not really mind when I had only a low end 48G, but quickly found out about the long delay when I acquired a 48GX and added RAM cards.

And my 49G did act worse until I upgraded the ROM. Of course the newest 49G+ is so fast that even if there is garbage collection, I haven't noticed.

Re: HP48 garbage collection

*Message #7 Posted by **Chan Tran** on 5 Oct 2004, 12:08 p.m.,*
in response to message #6 by Ron Ross

May be that is what it is. My 48SX has only 32K of RAM the GX has 256K (with the added 128K RAM card) and it is quite bad in this respect.

Re: HP48 garbage collection

*Message #8 Posted by **James M. Prange** on 6 Oct 2004, 2:49 a.m.,*
in response to message #5 by Francesc Casanellas

Raymond mentioned **RPL**, not **RPN**. RPL does use Reverse Polish Notation, but it's not the same programming language used on earlier HP RPN models, and "Garbage Collection" is very

much part of RPL. Actually, it may better be considered "Memory Packing"; it's a matter of moving still referenced objects in temporary memory to occupy contiguous memory, overwriting unreferenced objects. Garbage collection is done whenever the amount of free memory gets too low.

In general, having more free memory means that garbage collection won't need to be done so often, but when it is done, it takes longer. This explains why it's less noticeable on a 48S/G (or 48SX/GX without any merged memory).

Of course, fewer objects (actually, pointers to objects) on the stack will generally result in a faster garbage collection too. Avoid filling up the stack with objects that you no longer need.

John H Meyers wrote some posts on reducing free memory so that the garbage collections were fast enough to be less of an annoyance to some. Personally, I prefer less frequent garbage collections, even though they do take longer. See this search for some of John's posts on this matter. He might have something about it on http://www.hpcalc.org/ too.

Garbage collection can be drastically slowed when the stack contains many pointers into composite objects. Typically, the composite will be a list type object. See my post for some demonstration programs on this effect. Note that if you know that a program could suffer from this, then you **might** be able to avoid it by forcing a garbage collection ahead of time.

Regards,
James

Re: HP48 garbage collection

*Message #9 Posted by **James M. Prange** on 6 Oct 2004, 5:47 a.m.,*
in response to message #8 by James M. Prange

PS:

My demonstration programs use the TEVAL command, which is available only in the 49 series. See http://www.hpcalc.org/details.php?id=6112 for a UserRPL timer program which will also work on the other RPL models. I expect that it's more accurate than TEVAL too, plus it works regardless of the wordsize.

Also, one of the programs uses UNPICK, which is another 49 series only command. For that one, I suppose that using ROLL in place of PICK and ROLLD in place of UNPICK ought to work, athough they'll be slower.

Also note that the results from the BYTES command are for the 49g+; expect them to be different on the 48 series.

Regards,
James

Re: HP48 garbage collection

*Message #10 Posted by **James M. Prange** on 6 Oct 2004, 3:41 a.m.,*
in response to message #1 by Chan Tran

Note that the RPL calculators have some "type-ahead" capability. Up to 15 keystrokes can be stored in a First-

In First-Out buffer while the "busy" annunciator is on, and this buffer is checked for unprocessed keystrokes when the calculator finishes with whatever it's doing.

For example, I can execute 30 WAIT, and then type in "HELLO WORLD" [ENTER] (14 keystrokes, with flag -60 set) during the wait time, to have the string appear on the stack after the 30 seconds are up. On the 48 and 49 series, after 15 keystrokes are in the buffer, pressing a key results in a "warble" type sound; the 28 series silently ignores additional keystrokes.

But it can be a bit disconcerting to press a key and not see (or hear) anything immediately happen because the calculator is busy doing something else, such as a garbage collection.

Regards,
James

Should we invest in HP stocks?

*Message #1 Posted by **Chan Tran** on 4 Oct 2004, 1:55 p.m.*

This is totally 20/20 hindsight and HP stock is not the stock on Wall Street but their calculators. It all started with the 42S. Shortly after the 42S discontinued the price jumped from less than $80 to $200 or so. And then we saw the price jump on the $58 32SII. And now the 48GX which could be had for $100 not too long ago went for over $200. I wonder why all these people who pay such a high price for the old calculators now did not buy them when they were cheap?

Re: Should we invest in HP stocks?

*Message #2 Posted by **Richard Garner** on 4 Oct 2004, 3:13 p.m.,*
in response to message #1 by Chan Tran

They/We did. While the models you mentioned were in production, if you lost one or needed a new one, you just went out and bought a new one. The problem is if you are a surveyor, drafter or engineer that use one of these models on a daily basis and have lots of programs that you have written or bought and rely on the quality and reliability of that model you would do almost anything to keep from having to start over again.

Also the models that have come out after the 48G have all been redesigned in where the ENTER key is placed and its size. The quality and reliability of these new models have been worst than that of TI in the late 70's and early 80's when keyboards would not work or system logic would give you wrong or different answers every time you solved for the same set of numbers.

The older models are simply better. Better built, better reliability, better accuracy, better designed, and from a better time when HP was a leader not a follower in there development.

in response to message #1 by Gene

I was watching a documentary about this last night on the Discovery channel... and the aerodynamics guy was using an HP-48GX while sitting at his station monitoring one of the flights...

Re: OT: Spaceship One claims the $10 Million X-Prize!

*Message #3 Posted by **Thomas Cox** on 5 Oct 2004, 7:24 p.m.,*
in response to message #1 by Gene

Note that NASA has just announced that the "EDGE" of space is at 150 miles, so that as far as NASA is concerned Spaceship One reached only approximately half-way.

Sour-Grapes I think.

A new limit for space?

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 5 Oct 2004, 8:36 p.m.,*
in response to message #3 by Thomas Cox

Alan Shepard was the first american in space (Mercury was a NASA project, wasn't it?) reaching 115 miles in 1961. A 150 miles limit makes the Space Shuttle a not-so-spacial vehicle...

Re: OT: Spaceship One claims the $10 Million X-Prize!

*Message #5 Posted by **bill platt** on 6 Oct 2004, 9:39 a.m.,*
in response to message #3 by Thomas Cox

To me, the interesting thing to realize is that this business of "getting to space" (meaning merely going high up) is really not so terribly difficult today, relatively speaking. The fact is, there has simply not been a commercially viable reason to try before now--and that is the only real reason nobody tried to do this before the X-prize was introduced.

The real challenge is getting into orbit---and especially back again--and so by that measure, only the Soviet space programme and NASA can claim to be truly space-capable.

How fast did Spaceshipeone go relative to earth? 2800 MPH? (Maybe not even that fast, as they are

powering during a significant portion of the climb, so the velocity to achieve altitude is less than that due merely to the gravitational acceleration vis-a-vis "exit velocity"). I'm not sure exactly, but that seems about right.

By contrast, to achieve orbit,, one needs to get up to approximately 18000 mph (depending on altitude). In terms of kinetic energy, that is 18000^2 / 2800^2 = 41 times more energy.

This is not to belittle Mr. Rutan's accomplishment--I am elated by the success.

"Scaled Composites" not only won the Ansari X-prize--they did it with real style, élan, poise.

The "ships" they built are beautiful. The approach so well thought out and thorough---I love the identical cockpits of the White Knight and the spaceship---even the names are good--White Knight looks like a knight with his jousting lance.

It will be interesting to see if Mr. Rutan and his team have a simple solution to the de-orbit problem capable of trumping the government-sponsored programs of the past.

Regards,

Bill

Re: OT: Spaceship One claims the $10 Million X-Prize!

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 6 Oct 2004, 12:49 p.m.,*
in response to message #5 by bill platt

Bill:

I agree, "orbit" (and, BTW, de-orbit & reentry) is the name of the game. But, just as a minor conversation remark, Alan Shepard and Gus Grissom missions (Mercury capsule, Redstone rocket) were considered spacial enough by NASA in 1961, even when they were suborbital trajectories with a maximum of some 115 miles. After them, John Glenn (Mercury-Atlas) was the first US astronaut in orbit, not just in space.

Re: OT: Spaceship One claims the $10 Million X-Prize!

*Message #7 Posted by **bill platt** on 6 Oct 2004, 1:53 p.m.,*
in response to message #6 by Andrés C. Rodríguez (Argentina)

Hi Andrés,

Yes, absolutely.

The trick is that the word "space' is very potent.

To really get a sense of perspective, a picture is just so much more powerful:

Draw a circle with a diameter of 6875 Nautical miles (approximately the diameter of the earth)

And then, draw a little parabola, sticking off of that big circle. Height of the parabola: 60 miles.

When you look at that picture, two things come to mind:

1. That is not a long trip 2. If that is space, then there isn't much "air" .

In fact, it really is not space, if you think of "space' as being outside the atmosphere---the most important layer of the so-called "Ionosphere"--the layer responsible for long-distance radio signals in the "shortwave" bands, is right at and above the 100 mile mark. (The "f" and "f2" layers). The "E" layer, which is responsible for extraordinary VHF propagation, is centered at about 60 miles--right where SpaceShipOne topped-out.

So, technically speaking, the trip to 60 miles high is a trip to the Ionosphere--not to space.

The space shuttle, when returning from orbit, is covered in plasma at this altitude, yes?

Best regards,

Bill

HP41 half nut internal swap??

*Message #1 Posted by **Chan Tran (USA)** on 4 Oct 2004, 9:21 a.m.*

I just got a 41CV in excellent condition and I have a 41CX blank nut for a long time. Both are of the halfnut version. I wonder if I can swap the guts of the 2 calculators so that I would have a CX with the labeled keyboard? I know that the CX blank nut is quite rare and valuable but it's a pain to use it and I do want the extra CX functions.

Re: HP41 half nut internal swap??

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Oct 2004, 9:58 a.m.,*
in response to message #1 by Chan Tran (USA)

Hi, Chan Tran;

As I have changed "guts" between halfnuts and fullnuts, I can tell you it is possible. You'll have to cut ALL plastic rivets in both units and change the mainboard (it's a keyboard/mainboard/display driver in one piece). Then you'll have to fix both units back, using one of the techniques already mentioned here.

If you want to keep the blanknut "layer", I see no other solution. BUT... if you are not willing to keep it, maybe you can trade your CX blank nut for a conventional CX halfnut and have some money back, if applicable. Rememember that many CX in a box were found last year and sold as new units. If you believe it's a good deal, a "fresh new" CX might be a good solution as well, and you'd keep both CV and CX (plus the blank nut) untouched.

If you still need to change their guts, I have some images with the location of the rivets. To be honest, I'd not disassemble a working 41... It's a pain to dismantle it and join the pieces back together. I've done it a few times, and the units actually needed service. Otherwise, I'd not do that. My opinion, of course. (and I apologize posting it here because I was not asked to...)

Success.

Luiz (Brazil)

Re: HP41 half nut internal swap??

*Message #3 Posted by **Chan Tran** on 4 Oct 2004, 10:33 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thank Luiz, It seems to me much more involved that I imagined so I think I won't do it as both of them are in excellent condition and I know it's hard not so damage them just a bit. As for buying a regular CX, I don't think I will do that as they are very expensive and I don't believe in that. I paid over $300 for the 41C it was introduced and also $300 for a CV to replaced it a couple of years later after the 41C was stolen. However, I don't want to pay big bucks for them now. I bought 6 CX blanknuts in brand new condition for $5 each in 93. I have given 5 of them away as gifts. I just bought another like new CV for 50 cents at an estate sale.

Re: HP41 half nut internal swap??

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 4 Oct 2004, 11:41 a.m.,*
in response to message #3 by Chan Tran

You lucky guy...

Keep them all and, as it happens that you have another golden chance like these ones, please, let us know... Five blank nuts for $5 each... Wow! I'm not a collector, I keep with me all calculators I know I'll use somehow, so I cannot think of what to do with a blanknut. BUT if it is an HP41CX... That's another story.

Congrats!

Luiz (Brazil)

ERAMCO ESMLDL

*Message #1 Posted by **Matthias** on 4 Oct 2004, 5:22 a.m.*

Hi

Just before I got a second ERAMCO ESMLDL 1 EPROM box. I compared it with my old one and was wondering. One is in a plastic case, the other in a metal box with about half the high. Both have the same Label on it, expect the bigger plasic case has also a "Eramco Systems" label. Both are the same type ES 83120A. I opened the boxes. The plastic box contains three circuit board, some additional dips and a backup battery. The metal box contains two dark green circuit board and no bacpup battery. Here the EPROMS with the Sytsems are installed, but CAT2 does not shows anything.

Any ideas?

Yours Matthias

Re: ERAMCO ESMLDL

*Message #2 Posted by **Ronald** on 4 Oct 2004, 8:31 a.m.,*
in response to message #1 by Matthias

The Eramco story is as follows:

At first Arne Luhrs (works now at HP France) made a wirewrap version based on the original ideas as described in the PPC Journal.

Later 3 people met each other at "Prins kantoorboekhandel" in Delft decided their to start Eramco. Prins Kantooboekhandel was at that time a HP dealer and partner.

Prins Kantoorboekhandel had a customer (Has Konings: enginering copmpany) who had ordered custom made modules but unfortunately they had an error, so very nice modules but unusable. This question was asked to the above mentioned 3 people who took the challenge to produce EPROM boxes. For that the production proces was first done very primitive by making the printed circuit boards themselve (lightning, etching etc.) This was no good at all, so this was outsourced to a professional print maker in Belgium. The next trouble was getting a right size box. Off course this was not available when you do not design for it, nor was there money to have it custum made in plastic. So metal boxes were bought and a small firm in Amstelveen/Ouderkerk aan de Amstel in the Netherlands was able to paint them black. The needed connectors were gotten from USA contacts via ad's and the other activity Eramco did "combining modules and building modules inside the HP 41 itself.

The box you have is one of that first series. If I remember correctly there were +/- 100 ofthat of boxes produced (2 circuit boards, one for the Eproms, one for the logic)

After that there were others, like the MLDL with bankswitchable RAM (you have on your website, there were 2 versions, one with the bankselect rotary switches for the RAM at the top, so you could adjust when the box was closed and one with all the swithes on the inside) and also a pure EPROM version with 2 * 32K eproms (You have 6 * 4K eproms). That one was designed to fit in a small box and had only circuit board needed.

Here were 3 circuit boards, one with the epromns, one with the logic and one with RAM chips and logic belonging to that.

HP 48 sighting

*Message #1 Posted by **db(martinez,california)** on 4 Oct 2004, 1:57 a.m.*

I watched a show about Spaceship One on Discovery Channel tonight. During a sequence where the ship had been dropped and was having control problems, they had to decide quickly to either land with a full load of fuel or to risk the burn. There was a quick shot of someone on the ground consulting his 48.

HP note: With all their computer power the bottom line was still something that works. That life or death decision was not made with his Apple or some Casio or TI or PDA. What it was made on was 15 year old technology.

Re: HP 48 sighting

*Message #2 Posted by **Katie** on 4 Oct 2004, 3:07 a.m.,*
in response to message #1 by db(martinez,california)

db-

I saw that on the show too. But to tell the truth it looked that guy was using his 48 to add up his gambling losses from the prior night's outing to Las Vegas. He didn't seem that into trying to figure out if his buddy was going to make it down safely :)

Undocumented HP-41 Coconut opcodes

*Message #1 Posted by **J-F Garnier** on 3 Oct 2004, 4:06 p.m.*

Sometime ago, it was reported some undocumented opcodes like GO->XQ, ?OFF, POWON, ?WKUP, KEYS=C that are supposed to be used in the HP-41 internal Master Control Program. For instance, a description is found in the english edition of J-D Dodin's book "Inside the HP-41".

Having received my Datafile archive CD from Jake Schwartz a few days ago, I came accross the original description of these instructions as published in Datafile V3N2p15 under the "April Column" by Bill Reggusy, who was supposed to have made his discovery on his HP-41C SN 2321S010484 (!).

Do you see now where I want to come to?

Actually Bill Reggusy wrote a small note in Datafile later to make clear for everybody that it was just a hoax. The funny thing is that it this hoax was seriously reproduced in a book, and maybe in some other publications.

I must admit I thought to support these opcodes in my Emu41...

strange opening at back of an HP 46

*Message #1 Posted by **jan** on 3 Oct 2004, 3:51 p.m.*

I just got an HP 46 (#1338S01941, no display option). Someone has made an additional big rectangular opening and two screw holes in the back panel by extending the ventilation slots on the right side.

I've put two pictures at http://jan.our-isp.org/hp46/img1.jpg and http://jan.our-isp.org/hp46/img2.jpg

I'd like to know what the reason for this might have been. My guess is, that the calculator was connected to some laboratory equipment in order to collect data from experiments. Is this possible with an HP 46?

Re: strange opening at back of an HP 46

*Message #2 Posted by **Bill Wiese** on 4 Oct 2004, 1:52 p.m.,*
in response to message #1 by jan

I used to have an HP46.

It was really an HP45 architecturally. As I recall, but came out of the Loveland, CO (USA) computing instrument (?) group instead of the calculator group.

Since the HP45/46 weren't programmable, they really wouldn't be useful as controllers. I have no idea why the cutouts were made.

BTW, it seems some HP46s were shipped without LED displays - the LED apparently was an "option" and the HP46 could be used with the (noisy) printer as its only "display".

Bill Wiese
San Jose CA USA

Re: strange opening at back of an HP 46: one hypothesis

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 4 Oct 2004, 7:31 p.m.,*
in response to message #1 by jan

If the stopwatch function (officialy unsupported but available on the HP45) was available in the HP46 (may it be or not); then some switches, wired to the individual key contacts may have been used to capture the timing of up to 10 events.

When the HP45 was used as a stopwatch, and the clock was running, you can press any of the numeric keys and the time will be stored on the corresponding register (R0-R9). When the clock was stopped, pressing the same key will show the time previously stored on that register.

Please note that these comments are based on 30-years old memories (I never had an HP45), so there may be some inaccuracies...

Re: strange opening at back of an HP 46: one hypothesis

*Message #4 Posted by **Tony Duell** on 5 Oct 2004, 3:19 p.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

I am pretty sure the stopwatch function is not available on the HP46. I think the ROM space was taken over for some of the printer fuctions. And, unlike the HP45, where there was an unused key position that was used to access the stopwatch, there are no unused key positions on the HP46 (or HP81 for that matter) -- all 40 possible positions in the matrix are used.

My guess is that if this 'hole' was used for a connector, then it was wired to the keyboard connector so that some external device could simulate keypresses. It wouldn't matter that the HP46 was not programmable, the external device could incorporate a sequencer (effectively a fixed program) to 'press' the right keys in the right order.

Kenko FX-82LB breaks $1 price barrier

*Message #1 Posted by **Norris** on 1 Oct 2004, 6:02 p.m.*

The Kenko FX-82LB scientific calculator is now being distributed in California and other parts of the southwestern US. It is not innovative in terms of features or quality, but it may be noteworthy for its price: 99¢. Check your local 99¢ Only store; they've got lots.

So how much scientific calculator can you get for less than one dollar?

Most of the expected functionality is there: four levels of parentheses, trig and hyperbolic functions, deg/rad/grad modes, logs, factorial, binary/octal/hex modes, complex number operations, statistics, random number generator, DEG<>DMS, rect<>polar, etc.

Complex numbers are handled in CPLX mode, using an "a" and "b" key for real and imaginary parts. So adding (6 + 3i) and (4 + 2i) goes like this: 6 a 3 b + 4 a 2 b = 10 (real part). You then hit the "b" key to get 5 (imaginary part).

Uses 10 digits plus a 2-digit exponent. Only one storage register. No programmability (although the = key has a "constant" function).

Limitations: no combinations and permutations, no way to seed the random number generator, STAT mode can only handle one variable -- not (x,y) values, no linear regression, no fraction mode (although there is a big "FRACTION" label above the display).

Construction feels, well, cheap. Keys are rubber; the function keys are so small that it is hard to press them accurately. No case is provided, but there is a hard cover that is attached to the top of the calculator by a hinge. The cover has 3 modes: (1) it fastens over the keyboard when closed, (2) it swings out of the way behind the calculator to serve as a stand, and (3) it falls off sometimes.

The manual is 32 small pages. The documentation is sparse, poorly translated, and riddled with typos, but mostly comprehensible.

The 1-line display is surprisingly good (at least to a heavy HP 33S user). Big clear digits and legible decimal point, which is offset downward. No commas.

The packaging makes a number of questionable claims, with a few outright lies:

"Scientific" (OK, but this is accompanied by a picture of a graph, which seems misleading in a non-graphing model)

"229 functions" (I haven't tried to count them, but this seems awfully high)

"2-Line Big Display" (nope, only 1 line)

"S-V.P.A.M." (I don't remember what this stands for, but I suspect that Casio's lawyers would not approve)

"Plastic Keys" (nope, rubber)

But I don't want to end this review on a negative note. The Kenko FX-82LB is, to the best of my knowledge, the most powerful calculator that you can get today in the sub-$1.00 price range. It's worth every penny.

Edited: 1 Oct 2004, 7:45 p.m. after one or more responses were posted

Re: Kenko FX-82LB breaks $1 price barrier

*Message #2 Posted by **Dave Shaffer** on 1 Oct 2004, 6:58 p.m.,*
in response to message #1 by Norris

Does it have an "enter exponent" (E, EE, or EXP (not exponential)) key?

If so, I'll buy $10 worth and give them to my astronomy lab students, so they can quit bitchin' about having to do "so much math"!

Re: Kenko FX-82LB breaks $1 price barrier

*Message #3 Posted by **Nelson M. Sicuro** on 1 Oct 2004, 7:49 p.m.,*
in response to message #2 by Dave Shaffer

Yes, it has.

Can this one be this calculator? It is an OEM display/chip kit assembled by many companies.

http://www.takshun.com.hk/product_photos/KD-1006.jpg

Best regards,

Nelson

Re: Kenko FX-82LB breaks $1 price barrier

*Message #4 Posted by **Norris** on 1 Oct 2004, 8:15 p.m.,*
in response to message #3 by Nelson M. Sicuro

Absolutely it has an EXP key. As stated clearly in the manual (p. 15):

"EXP: To enter number in scienthic noation"

Accepts values from 10^-99 to 10^99; anything larger or smaller generates an overflow error

The Kenko FX-82LB appears to be a close relative of the Kadio KD-1006 shown by Nelson Sicuro. The Kenko has exactly the same functions, grouped in exactly the same way; the display also appears to be the same.

However, the Kenko is laid out in the conventional vertically-oriented calculator format; it's roughly the same dimensions as a 32SII or 33S. It is not horizontally oriented, like the Kadio or an 11C.

Re: Kenko FX-82LB breaks $1 price barrier

*Message #5 Posted by **Ed Look** on 2 Oct 2004, 12:42 a.m.,*
in response to message #4 by Norris

I'm impressed! The cheapest scientific calculator I've ever seen is $7 USD, a fairly nice algebraic nonprogrammable scientific from Radio Shack (solar with removable cover, too!).

What's interesting is that it includes the logic operators, OR, AND, NOT, XOR, XNOR. Apparently, they are not programming test commands; they return a truth value on the display as used from the keyboard. Interesting, but as a lousy programmer, and nonengineer, how would these operators be used in such a calculator (I use them only in programs).

It is also built with much higher quality than the $9-10 USD ones available in drugstores or seconds shops, though these have a COMPLEX mode. But I had to resolder the lead to my display in one of these drugstore algebraic scientifics.

Alas as well, neither has RPN even as an alternate mode.

Re: Kenko FX-82LB breaks $1 price barrier

*Message #6 Posted by **rsenzer** on 2 Oct 2004, 11:25 a.m.,*
in response to message #5 by Ed Look

I'll still cast my vote for the Tozai ATC-763 [which somebody pointed out is the equivalent of the Karce KC-186] that I purchased for well under $10 at Walgreens as the best no-name cheapo value for your money calculator currently available.

Perfect for Halloween, but no complex number or bin hex oct calculations. For that the Spectra 220, which I haven't seen in awhile may be more appropriate for about $5. However, this calc has a terrible fraction mode.

Still, for the price of one of those, you can buy many Kenkos.

Kadio KD-1006 details

*Message #7 Posted by **Nelson M. Sicuro** on 2 Oct 2004, 8:09 a.m.,*
in response to message #4 by Norris

I forgot to post its measures (KD-1006): 97mm x 61mm x 11mm... is really small, smaller than an 8mm video tape!!

I have one of these. The display is excellent, the keyboard is acceptable (rubber) and don't miss keystrokes, but its internal construction sucks! I have disassembled it (of course!) and the LCD flex cable become loose. Any idea on how to replace a flex LCD contact, for the sake of a challenge? (This calculator I paid about $4.50 here, but the store has't another to replace it).

I can take some pictures of its interior if anyone is interested.

(the calculator page is from here)

Best regards,

Nelson

A photo of the intenal would be quite interesting.

Kenko FX-82LB vs. Casio FX-82LB

*Message #9 Posted by **Norris** on 2 Oct 2004, 1:19 a.m.,*
in response to message #1 by Norris

While looking for info on the Kenko FX-82LB on the web, I noticed that there also just happens to be a Casio FX-82LB. It looks suspiciously as though the Kenko FX-82LB may be an unauthorized knockoff of the Casio FX-82LB as pictured here.

The Kenko has "fx-82LB FRACTION" printed above the display in exactly the same way as the Casio -- despite the fact that it completely lacks any fraction capability. The Kenko packaging was also probably also copied directly from the Casio packaging, which would explain the inappropriate Casio-like claims ("V-SPAM", "plastic keys", "229 Functions").

This just may be the cheapest and sleaziest scientific calculator in existence, so naturally I am delighted to add it to my collection. I will try to put up a picture this weekend, but I'm afraid that you have to hold it in your hand before you can really appreciate its shoddiness.

And I still can't get over the pricing. Aren't the two watch batteries alone worth more than 99¢?

S- V.P.A.M. & the wry humor of Norris

*Message #10 Posted by **Karl Schneider** on 2 Oct 2004, 9:53 p.m.,*
in response to message #9 by Norris

Here's a collection of Norris' wry wit in this thread he started. It's rather Tom Lehrer-ish (which I really like):

> Quote:
>
> *This just may be the cheapest and sleaziest scientific calculator in existence, so naturally I am delighted to add it to my collection.*
>
> *I will try to put up a picture this weekend, but I'm afraid that you have to hold it in your hand before you can really appreciate its shoddiness.*
>
> *For those outside the US, I should acknowledge that retail prices in this country do *not* include taxes. In this case, the California and local sales taxes added an additional 8¢ to the total price, so in fact the overall retail cost of this calculator came to $1.07.*
>
> *And the Kenko is obviously much more competitively priced. Even when US sales taxes are included, the Waltham at $1.78 is selling at a 66% premium relative to the Kenko at $1.07.*
>
> *The cover has 3 modes: (1) it fastens over the keyboard when closed, (2) it swings out of the way behind the calculator to serve as a stand, and (3) it falls off sometimes.*
>
> *As stated clearly in the manual (p. 15): "EXP: To enter number in scienthic noation"*
>
> *And note that "Each unit can easily sell up to $40.00 in RETAIL!" I got a 97.5% discount simply by shopping at my local 99¢ Only store. If you don't live in their sales territory, well, you should move.*
>
> *The Kenko FX-82LB is, to the best of my knowledge, the most powerful calculator that you can get today in the sub-$1.00 price range. It's worth every penny.*

S-V.P.A.M. (not "V-SPAM") stands for Casio's(Scientific?) "Visually Perfect Algebraic Method" --

information that I couldn't find in my Casio fx-115MS manual even after unfolding the large single sheet it's printed on. I read the definition from a document published by a British educator and critic. He and I both agree that there's nothing perfect about V.P.A.M. The straightforward Casio fx-3600P I got in 1981 is a much more usable tool, even though it doesn't have as many features.

Looking at the pictures posted in this thread, these cheap calcs do appear to be dubious knockoffs of Casio and Sharp models. I'm not sure where the profit is at such prices, even if the perpetrators can escape legal challenges.

The S in S-VPAM

*Message #11 Posted by **Norris** on 3 Oct 2004, 1:27 a.m.,*
in response to message #10 by Karl Schneider

Karl Schneider's post obviously raises some troubling issues. Like what exactly is the S in S-VPAM ? And how does S-VPAM differ from ordinary VPAM anyway ?

Fortunately for us all, Casio's official Scientific Calculator FAQs reveal the definitive answers.

****

Q3. What do the letters V.P.A.M. stand for (fx-992s, fx-670s, fx-122s, etc.)?

A3. V.P.A.M. stands for "Visually Perfect Algebraic Method." It is a system that makes it possible for the calculator to display expressions and for you to input expressions the way they are written. With a model not equipped with V.P.A.M., for example, you would input the expression sin90º using the key operation: [9][0][sin][=]. With a V.P.A.M. calculator, you would input [sin] [9][0][=].

Q4. What do the letters S-V.P.A.M. stand for (fx-991MS, fx-570W, fx-350TLG, etc.)?

A4. S-V.P.A.M. stands for "Super Visually Perfect Algebraic Method." With this method, you get the same V.P.A.M. ability to input mathematical expressions as they are written, along with the ability to view expressions and results at the same time. The display of S-V.P.A.M. shows two lines at a time. You can recall an expression with the Replay feature, make any changes that you want, and then recalculate.

Re: Kenko FX-82LB breaks $1 price barrier

HP48SX/GX vs. HP49G+

*Message #1 Posted by **Jeff** on 1 Oct 2004, 5:43 p.m.*

This may be a stupid question but what is the allure of the HP 48GX/SX versus the newer HP49G+?

My HP48SX was stolen a couple of weeks ago, so I checked E-Bay to see how much it would cost to replace it. My jaw dropped to the floor. People are paying $80-$100 for the SX, while the GX will sell for $270-$280.

I liked my SX and I wouldn't mind having another one. The prices that are being realized are making me consider buying the HP49G+. What gives with the prices?

Re: HP48SX/GX vs. HP49G+

*Message #2 Posted by **John Limpert** on 2 Oct 2004, 2:10 p.m.,*
in response to message #1 by Jeff

The HP-48 has a keyboard and documentation that don't suck.

You should be able to find a replacement on Ebay for a reasonable price. People seem to be willing to pay a substantial premium for the SX and GX, which is a waste if you don't have a need for expansion slots. I've seen plenty of 48S, 48G and 48G+ models being sold at relatively low prices.

Re: HP48SX/GX vs. HP49G+

*Message #3 Posted by **Norris** on 2 Oct 2004, 4:48 p.m.,*
in response to message #1 by Jeff

There is a widespread perception that HP's current calculators do not match older models in terms of construction quality, appearance, or attention to detail. So the value of older models has steadily climbed. The market value of many old HPs (not just the 48GX) is now in the $200-400 range; this includes less powerful models like the 11C, 15C, or 32SII. A 48SX for $80-100 strikes me as a good deal.

There may be a couple of reasons why the 48GX is particularly valuable.

First, the GX is more upgradeable than other old 48 series models (S, SX, G, G+). If you have a GX, you can add more memory via expansion cards, and then you can also add improved operating systems (Java, Metakernel) and computer algebra systems (Alg48, Erable). With sufficient effort and expense, a GX can be upgraded to have most of the same state-of-the-art functionality as a 49G+, plus it offers a classic appearance, more robust construction, and superior keyboard. (In fairness, it should be noted that a new 49G+ would be much less expensive, with much more speed and a larger display).

Second, the GX remains irreplaceable for certain applications, because newer HPs have only limited backwards compatibility. If you are accustomed to using GX software cards, or using a GX to interface with other hardware, then the newer models may not be suitable substitutes.

For example, the GX was widely adopted by surveyors during the 1990s; it interfaced with surveying equipment via a standard serial port and ran commercial surveying software loaded on GX cards. But the

newer models that replaced it (the 48GII and 49G+) have different ports, and can't use GX cards. So surveyors that work with GXs are still willing to pay top dollar for a used one.

*Message #4 Posted by **Raymond Del Tondo** on 2 Oct 2004, 5:58 p.m.,*
in response to message #1 by Jeff

Hello,

as the other posters wrote, the real HP-48 series (S, SX, G, GX, G+)
have their advantages.
I'd like to add one (at least for me) important thing: the Display!
Try to get one of the newer HP-48GX or G+ with the high contrast display.
It's much better readable than the display of the SX, or even the GX.
For reference, check these links:

*Message #5 Posted by **Jeff** on 2 Oct 2004, 6:19 p.m.,*
in response to message #1 by Jeff

Thanks. That answers many of my questions. I'll just have to bite the bullet and buy the GX. If I have to buy a replacement, I might as well get the updated version.

Re: HP48SX/GX vs. HP49G+

*Message #6 Posted by **Norris** on 2 Oct 2004, 7:09 p.m.,*
in response to message #5 by Jeff

The fact that you plan to buy a GX, instead of the less expensive G+, implies that you want to put memory cards into it. The only difference between the G+ and the GX (besides price) is the two card slots.

If you were shocked at the current market price of a GX, you may also want to check on the price of GX memory cards. Typically you would want a 128K card for Slot 1 and a 512K or 1M card for Slot 2. These two cards together will cost you another $100-150 or so.

So you are looking at ~$400 for a GX plus extra memory, plus the hassle of downloading and installing upgraded software.

A new 49G+ will only cost about $125, and it will be much faster, with a larger display.

I have a GX with cards, which I bought before the 49 series was available. I like it a lot, but if I lost it and had to replace it, I would probably get a 49G+ instead.

Re: HP48SX/GX vs. HP49G+

*Message #7 Posted by **Ed Look** on 2 Oct 2004, 10:19 p.m.,*
in response to message #6 by Norris

I have a G+ (blue display; must be older) and I don't even mind programming it (I'm not a programming guy) when I need to (thank God for the AUR!!!) and for applications a bit much for a plain scientific like the 33S or 32SII but not enough to go to a PC, it does the job well and this takes into account its relative portability (it's a briefcase sized calc, not pocket).

But if I need expanded memory for whatever reason, I'll go to my 49G+, as it uses relatively cheap SD cards for memory expansion. And, these great HP calc fans with their incredible talent have begun to build a software base for the 49G+ that should soon rival the 48G series' collection of goodies.

I actually desperately wanted a 42S and a 48GX, but after seeing the expansion card prices, and the prices of the nonexpandable (though powerful and pocket sized and aesthetically pleasing) 42S, I opted for a 48G+, even though I already had a 48G, for the G's memory was too restrictively small.

I hope you can get a reasonably priced GX and cards in good shape.

Re: HP48SX/GX vs. HP49G+

*Message #8 Posted by **Jeff** on 3 Oct 2004, 12:19 a.m.,*
in response to message #7 by Ed Look

Thanks for the advice. It's still a little puzzling that the 48GX/SX and the accessories are going for such high prices. It's not like there is a 1/4 oz. of gold in the plastic box.

I said previously that I may bite the bullet and buy one off of EBay. I'm not so sure anymore.

I'm looking for reports from 49G+ owners on the quality of the machine. Anyone have one? How is it working for you? Any gripes? Any favorable remarks?

Re: HP48SX/GX vs. HP49G+

*Message #10 Posted by **Erik Ehrling (Sweden)** on 3 Oct 2004, 12:48 p.m.,*
in response to message #8 by Jeff

I use to think that the HP-42S is the best calculator for numerics (other would say the HP-15C for its smaller size etc.) and that the HP-48GX with 128K+1MB expansion, MetaKernal/Java+Erable+Alg48 is the best for calculations involving symbolics. However, I recently bought a HP-49G+ (mainly to run HrastProgrammer's HP-42X on) and my overall impression is that the HP-49G+ is in no way a bad calculator.

If you can stand average keyboard quality instead of highest quality, and a tiny ENTER key in the lower right corner instead of large ENTER key above '7 8 9' then the HP-49G+ actually

has a very good price/performance ratio. The LCD looks good, and the CPU is fast. The efforts to port the GNU C-compiler to it is promising (if you're into C-programming). You don't have to install a lot of software to configure it (i.e. MetaKernal/Java+Erable+Alg48) but have a quite powerful configuration right out of the box.

I am however, not very fond of the menu system on the HP-49 and the way things have moved around from the HP-48. I quite often hit ENTER instead of '+', '+' instead of '-' and so on because these keys have been pushed upwards one row by the new position of the ENTER key. But I suppose these things are mainly due to the fact that I have used the HP-48 quite a lot more than the HP-49.

Best regards, Erik Ehrling (Sweden)

Re: HP48SX/GX vs. HP49G+

*Message #11 Posted by **Thibaut.be** on 3 Oct 2004, 3:20 p.m.,*
in response to message #10 by Erik Ehrling (Sweden)

I totally agree with Erik's statement.

The 49G is not bad at all. It's fast, complete, open, powerful. I simply hate its rubber keyboard. The worst thing HP has done was to suppress the "clicky" touches.

Re: HP48SX/GX vs. HP49G+

*Message #12 Posted by **Jeff** on 3 Oct 2004, 9:06 p.m.,*
in response to message #11 by Thibaut.be

I appreciate the responses. The problem that I am running into is that I have no access to the HP49G+ to make a comparison to the 48. For some reason, the brilliant marketing department at HP have not made the 49G+ widely available in the U.S. stores (ie. Wal-Mart, Staples, Office Depot, etc.). They are listed on the Wal-Mart and Staples websites. They are not physically in the stores. I know TI has seemed to corner the market in the U.S. but I would have expected HP to make a better effort to sell in the stores. Since I have no access to a display model, I have rely on those who know. Again, thanks for the responses.

Re: HP48SX/GX vs. HP49G+

*Message #13 Posted by **Gene** on 3 Oct 2004, 9:26 p.m.,*
in response to message #12 by Jeff

I imagine a lot of it has to do perhaps more with the stores than HP.

Do you have any idea how tough it is to get stores to physically carry products these days?

Re: HP48SX/GX vs. HP49G+

*Message #14 Posted by **James M. Prange** on 3 Oct 2004, 9:43 p.m.,*
in response to message #12 by Jeff

You might try some of the emulators available at http://www.hpcalc.org/ to get an idea of what's changed from the 48 series to the 49 series, although trying an emulator isn't the same as trying an actual calculator.

I don't think that a 49g+ emulator is publicly available, but, at least as far as UserRPL goes, it's very similar to the 49G. Some differences are the LCD dimensions, the keyboard layout, external I/O, the SD card, and the memory available in the various ports. A few differences show up in SysRPL, and of course accessing the underlying ARM processor is being investigated.

Regards,
James

Re: HP48SX/GX vs. HP49G+

*Message #15 Posted by **Norris** on 3 Oct 2004, 11:30 p.m.,*
in response to message #12 by Jeff

You can still find HP calculators in major retail stores, but only the financial models (particularly the 12C). The average retailer does not want to stock the 49G+, because it is a high-cost, low-volume item. The fact is that there is relatively little demand for expensive graphing calculators except among high school students, and they want TIs, which are the standard in the US education market.

In California, the best places to find a 49G+ in stock would be (1) a Fry's Electronics store, or (2) a university bookstore. But even then there is no assurance that there will be a display model; they might all be in blister packs.

Re: HP48SX/GX vs. HP49G+

*Message #16 Posted by **Jeff O.** on 5 Oct 2004, 7:33 a.m.,*
in response to message #12 by Jeff

Jeff,
I don't know if it is likely, but perhaps one of the on-line sources (hpcalc.org, samsoncables.com, others) would agree to sell you a 49G+ and take it back if you were not satisfied. Another alternative would be Wal-Mart. They carry the 49G+ for on-line ordering only here. When I bought my 33S from them, they included a return form which would have allowed me to return it for any reason. I don't remember if it was postage paid.

Take a look here

Re:special offer in RAM card prices

*Message #18 Posted by **Norris** on 3 Oct 2004, 12:55 p.m.,*
in response to message #17 by R Lion

Yes, that is very competitive pricing. Two 48GX memory cards (a 128K card for Slot 1 and a big 2MB card for Slot 2), including shipping, for 90 euros, or about $112. If you need memory cards

for a 48GX, you should probably take advantage of this deal.

Unfortunately, the 48GX itself is not included, and it will probably run another $250 or so. Add another $20 for a PC cable. Total cost is still around $400.

I like my upgraded 48GX (128K and 512K cards, Java, Erable, Alg48), but a HP49G+ for $125 seems like the better buy today.

For $300, you could get BOTH a 49G+ (for symbolic math) AND a 48G+ (for general calculating). A 48G+, including manual, is only $175 at hpcalcman.com. So the 48G+ and 49G+ together would be only about $300 -- still less than one fully equipped 48GX.

Re: HP48SX/GX vs. HP49G+

*Message #19 Posted by **Ron Ross** on 4 Oct 2004, 9:35 a.m.,*
in response to message #5 by Jeff

If you didn't have cards, I would suggest you consider the Hp48G+ for the money. You would get a better screen (any G series screen is better than any S series, and even more so if you get the newer black screen which is highly likely with the G+ model).

Or just buy the 49G+. It isn't bad and if you are not using it as a no look key entry system, will work well ie, check your numbers every so often. Keyboard feel is compariable to the 48 series and it is much faster. Would I take it to an accounting class? NO! I don't trust the keyboard that well, but I use mine and almost never miss keystrokes, but every once in a while and I feel it is a software issue at this time (and technique, full heavy keyboarding works over light touch feel the click only). The new keyboard is designed to give you the keyclick feeling but the keyclick doesn't neccissarly mean a contact has been made.

That said, again, the 49G+ is a good deal at less than 1/2 the price of what a 48GX sold for when it was first released. And it is cheap to maintain. But if you need a perfect, non worry keyboard, I suggest you acquire a 48G series calculator.

You might consider a 49G+ and a $50 48G. The G series had the Eq lib built in vs having to buy a Card for the SX. That is a nice freebee of the G series. And the G series is faster (only about a 50% improvement) over the S series and as stated earlier a better LCD. A low end 48G will have the blue LCD, but even it is a step up from the S series LCD.

Just some comments.

PS, I use a 48G at my work, I could use anything, but use it because it has a great keyboard, lots of features (mainly the units conversions), AND IS cheap to replace. No other scientific RPN calculator (aside from the newest Hp33s) can make that claim.

Re: HP48SX/GX vs. HP49G+

*Message #20 Posted by **Eddie Shore** on 3 Oct 2004, 2:06 p.m.,*
in response to message #1 by Jeff

HP48 SX/GX is a collector's item, as well as a celebrated calculator from HP, with its 10+ years of development. HP 48G Series demands more money, because the G (G+ and GX) series has more memory than the 48S series.

HP 49G+ (I wouldn't consider the 49G nor 48GII unless you having a collection) offers the following advantages over the 48GX:

* The 49G+ can store programs on SD Cards (security digital-I think that is the name of these things). SD Cards are $30 compared to hundreds for RAM cards, and have megabites of memory. * The 49G+ expands off the 48GX's basic commnand set and adds algebriac commands. You'll have to load in the equation library yourself though. I miss the DEG/RAD toggle button also. * The 49G+ is very fast on most calcuations. But be aware on infinite sums. * The batch that is out in stores now have better keyboards. When they first came out, the keyboards had questionable quality.

I will say that the colors of the 48SX are cooler than the 49G+. My favorite color is blue.

My $2 (hey prices have one up!) Eddie

I think it's about time for me to get the 49G+ and may be a 48GII. I don't like them as much as the 48SX and GX but then I have both a 48SX and a 48GX. I can buy the two new calculators now with warranty and not costing me an arm and a leg and they sure gives me hours of excitement exploring them. Years from now hmm.. may be they became as valuable as the 48's?? Not too long ago used 48SX and GX are a dime a dozen.

That's how my collection got started!

*Message #22 Posted by **Eddie Shore** on 4 Oct 2004, 10:46 p.m.,*
in response to message #21 by Chan Tran

They are blast to work with. Of the HPs, I have 17BII+s (minus the Let and Get), 33S (but I'm a RPL person), 48G, 49G+, and 39G.

Mouse (cusor) freeze-up

*Message #1 Posted by **James Wert** on 1 Oct 2004, 2:03 p.m.*

The mouse (cursor)freezes up frequently. I have replace the mouse twixe and it does not correct the problem. Also, drops ISP connection when freeze-up occurs. Does not happen when off-line. I have a HP Pavillion 7840.

Re: Mouse (cusor) freeze-up

*Message #2 Posted by **So???** on 1 Oct 2004, 2:09 p.m.,*
in response to message #1 by James Wert

Reload your windows OS. You really can't expect to get reliable help here. Really wrong forum. I'll be surprised if you find your way back.

Re: Mouse (cusor) freeze-up

*Message #3 Posted by **John Smitherman** on 1 Oct 2004, 3:57 p.m.,*
in response to message #1 by James Wert

Sell it and buy an HP 32sii calculator.

Regards,

John

Re: Mouse (cusor) freeze-up

*Message #4 Posted by **Ed Look** on 2 Oct 2004, 2:59 p.m.,*
in response to message #1 by James Wert

I really must admonish the rudeness shown to a person asking an innocuous, if misdirected question.

Mr. Wert, my apologies simply as just one of the calculator nuts on this forum. See, this is really, strictly a HP calculator forum.

Still, let me recommend that rather than investigating the mouse, check the drivers (little programs that come with Windows that tell your computer how to communicate with a specific device) for your modem, since you mentioned an ISP. (I assume you are using a 56k modem.) Worse, the modem itself may be bad.

However, sometimes, it is either the telephone company furnishing the actual lines and connections and they are not maintaining it properly or the ISP company booting you offline because of bandwith crowding.

But since you mentioned cursor freezing, I suspect it might be either the modem itself or its drivers. But I am no expert; I recommend that you go to HP's own site:

www.hp.com

and navigate over to their support section for PCs and just follow their instructions. They aren't so bad when it comes to answering PC customers' tech questions.

I wish you well in your effort to fix the problem.

HP 12c battery 1.5volt vs. 1.55volt

*Message #1 Posted by **robdi** on 30 Sept 2004, 7:07 p.m.*

Would I harm my 1984 HP 12c by using 3 x 1.55 volt silver oxide batteries instead of the recommended 3 x 1.5 volt?

Thanks in advance for your response.

Re: HP 12c battery 1.5volt vs. 1.55volt

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Sept 2004, 8:30 p.m.,*
in response to message #1 by robdi

Hi;

Silver-oxide batteries are also recommended in the HP12C OH&PSG (Owner´s Handbook & Problem Solving Guide) and in all other 3 x 1.5V Voyagers (HP10C, 11C, 15C and 16C). You won´t harm it at all.

Cheers.

Luiz (Brazil)

Nominal vs. actual V in dc cells

*Message #3 Posted by **Karl Schneider** on 1 Oct 2004, 2:55 a.m.,*
in response to message #1 by robdi

"robdi" --

I can't recall having seen a dc cell with a nominal rating of 1.55 V, but I can attest that the "1.5 V" dc cells I've bought generally deliver about 1.58-1.62 V fresh out of the package.

Three "1.5 V" alkaline or silver-oxide dc cells are recommended in the manual. Types 44, 76, or 357 are all suitable. It might be best to use the same chemistry for all 3 cells, but rechargable cells in this size are not available, to my knowledge.

-- KS

Re: Nominal vs. actual V in dc cells

*Message #4 Posted by **bkr** on 1 Oct 2004, 3:05 a.m.,*
in response to message #3 by Karl Schneider

0.05 volts is a tiny difference, as far as batteries go. "Batteries" are NOT constant voltage devices, despite what the markings on the package might say. A "1.5" volt cell can be anywhere from about 0 to 1.75 volts

in its lifetime. A well-engineered device will accept a pretty large range of voltages, above some minimum necessary for operation. 1.5V vs. 1.55V is nothing.

Re: Nominal vs. actual V in dc cells

*Message #5 Posted by **Ed Look** on 2 Oct 2004, 10:21 p.m.,*
in response to message #4 by bkr

As Karl said, don't mix batteries of different chemical compositions; there is a chance that potential differentials in the wrong direction might induce leakage (though theoretically, blowing up could happen, too, but highly unlikely).

Re: Nominal vs. actual V in dc cells

*Message #6 Posted by **Dave Shaffer** on 4 Oct 2004, 11:48 a.m.,*
in response to message #5 by Ed Look

I can't see ANY possible harm in mixing battery types as long as everything is in series. In that case, one battery has no idea what other voltage sources are in the system. In any case, as the batteries age, they will age somewhat differently, and their internal voltage and resistance will all be different. Next time you need to change the AAA's in your '48, grab a voltmeter and check out the old ones. I did this a few days ago, and the no-load (except for the very high resistance voltmeter) voltages ranged from 1.1 to 1.3 volts.

Batteries in parallel, of course, is another matter!

Re: Nominal vs. actual V in dc cells

*Message #7 Posted by **Garth Wilson** on 4 Oct 2004, 3:06 p.m.,*
in response to message #6 by Dave Shaffer

The problem with mixing different chemistries is that when they don't all have the same life span, one with a shorter lifespan may not only get completely discharged while another battery still has useful life left in it, but worse, will get charged in reverse as current continues to flow through it after its voltage has reached 0. Then it will be likely to leak. Actually, you don't even have to mix battery chemistries to do this. It will also happen if you have all alkaline batteries but one has significantly less life left in it than another because of prior use. That's partly why they tell you to replace all the batteries at once. I've had the negative-voltage occurrence a few times (and resulting leakage a couple of times) from trying to squeeze the last bit of life out of used alkalines in projectcs cobbled together on breadboards on the workbench, where I didn't need the full voltage anyway and where leakage would easily be detected and there was no threat to expensive equipment. You can bet I don't gamble with my irreplaceable HPs though. They receive only fully new sets of batteries, and the batteries are replaced as soon as the low-battery annunciator comes on.

Re: Nominal vs. actual V in dc cells

*Message #8 Posted by **Chan Tran** on 4 Oct 2004, 3:35 p.m.,*
in response to message #7 by Garth Wilson

While actual battery voltage is generally different from the rated nominal voltage, I saw that on the Enegizer website the EPX76 is rated at 1.55V nominal.

Re: Nominal vs. actual V in dc cells

*Message #9 Posted by **OJM** on 4 Oct 2004, 5:10 p.m.,*
in response to message #8 by Chan Tran

I took a look in the technical data section of the Energizer web site:

http://data.energizer.com/batteryinfo/application_manuals/silver_oxide.htm

This page indicates that the initial open circuit voltage of a silver oxide cell is 1.6 volts. Since the HP Voyager calculators impose such an extremely low current drain, the voltage when newly installed in the calculator must be nearly the same as the open circuit voltage. This would mean that the calculator would receive 4.8 volts from a new set of silver oxide cells. On another post on this forum I mentioned my experience with a friend's HP15C which refuses to operate on silver oxide cells. It runs perfectly on alkaline button cells, but just does not turn on when silver cells are inserted (this is after checking for the usual things such as poor electrical contact, cleaning off finger oil on batteries, trying another set of silver cells, etc.). Is it possible that 4.8 volts versus 4.5 volts could cause this behavior?

For the record, my own HP15C doesn't seem to care, and runs just fine on both alkaline and silver oxide cells.

More NCEES restrictions on the way

*Message #1 Posted by **Norris** on 30 Sept 2004, 3:05 p.m.*

NCEES has announced that their calculator rules were changed at the August 2004 Annual Meeting. See page 7 here. The move was widely expected.

A sentence was added to Exam Policy 15 (Materials Permitted in Examination Room), stating, “Only models of calculators as specified by NCEES are permitted in the examination room.”

It is not yet known which models will be specified by NCEES, or when the new policy will take effect. Currently NCEES recognizes the HP 9G, 9S, 30S, 32S, 32SII, and 33S as "approved".

The NCEES page on calculator policy (which is here), has not been updated to reflect the new policy. It therefore seems likely that other calculators, such as the 11C, 15C, or 20S, will still be legal for the October 2004 exams (as they were in April 2004).

Most likely the new policy will take effect starting in April 2005, and the full details will not be announced until after the October 2004 exams.

Re: More NCEES restrictions on the way

You're probably right. I've been in contact with NCEES officeholders on the topic by phone and e-mail, and I seem to recall one officer mentioning that no change would be made for October.

I notice your mention of the 11C, 15C, and 20S in two recent posts now. You might be interested that I submitted a one-page letter specficially advocating and justifying the inclusion of those three specific models on the eventual comprehensive "Approved" list. If you provide or point me to your e-mail or mailing address (or fax #), I'll send you a copy. Perhaps you can follow with your own missive to NCEES.

Regards,

-- KS

Re: More NCEES restrictions on the way

*Message #5 Posted by **Norris** on 1 Oct 2004, 12:43 p.m.,*
in response to message #3 by LH Chan

In the US, the NCEES rules undoubtedly affect the market for both new and used HP calculators.

For example, consider the situation that arose last year. In August 2003, NCEES unexpectedly announced that high-end HP calculators (including the 41, 42S, 48, and 49 series) would be banned on future professional engineering and surveying exams. Some 50,000 to 100,000 people take these exams every year, and a significant percentage of them are addicted to RPN calculators (especially the HP48). It is reasonable to assume that thousands of people (perhaps tens of thousands) suddenly started looking for low-end RPN calculators in late 2003, as a direct result of the NCEES ban. I was one myself.

And there wasn't much available. HP had discontinued production of the 32SII in 2002, and the new 33S did not become available until early 2004. In 2003, there were literally *no* RPN scientific calculators in production that met NCEES standards. So the value of a used 11C, 15C, or 32SII soared. And the 33S flew off the shelves as soon as it became available.

If you need further proof of the impact of NCEES exams, look at the market for commercial calculator software. Nobody markets calculator software anymore -- except for several vendors that offer NCEES exam software for the 33S (e.g. chotkeh.com, 33ssurveyor.com).

Re: More NCEES restrictions on the way

*Message #6 Posted by **Norris** on 1 Oct 2004, 1:31 p.m.,*
in response to message #2 by Karl Schneider

I have previously expressed my views to both NCEES and the California Engineering Board.

The California Board has implicitly rejected the NCEES position. They continue to allow any non-QWERTY calculators on state-specific, non-NCEES PE and PLS exams. This may not be entirely due to my persuasive lobbying, however.

NCEES, of course, hasn't budged, except to become more restrictive.

HP 15C

*Message #1 Posted by **Thibaut.be** on 30 Sept 2004, 8:42 a.m.*

On this post, ? says :

> Quote:
>
> While the HP15c is a great tool for number crunching, I don't think that type of solving is one of its strengths. If you must have RPN, and you are permitted graphical calcs, maybe a 48gii / 49g+ would be the way to go.

I am terribly sorry, but I do not abide to this statement. The 15C is much more than a number cruncher, and the power of a 48 or a 49 is offset by their size and their less user friendliness.

Some time ago, 2 or 3 years if I can remember, I asked the folks of this forum to provide me with a list of their top 5 calculators. Results are to be found here. Many people did answer, but I'd like to do this poll again.

So please email me you 5 preferred HP calculators (no 1: 41 : 2: 41 : 3 : 41, please), and I'll draw a new HP community top preferred calculator list !

HP 15C opinions, or 'RPL vs RPN'

*Message #2 Posted by **.** on 30 Sept 2004, 9:04 a.m.,*
in response to message #1 by Thibaut.be

That post is my opinion only. I don't wish to start a flame war. However I will try and justify myself (and probably get roasted alive by the HP15c fans :-)

"and the power of a 48 or a 49 is offset by their size and their less user friendliness."

Physical size? Sure. The 15c is easier to carry around in a shirt pocket. However the person asking the question said they wanted it for a financial exam, and were considering buying a newer calculator. For college purposes size really isn't a big issue.

When it comes to being user friendly, I think the 48/49 RPL series are _more_ user friendly then the 15c (My opinion only). Why? First, I like RPL over HP's old RPN implementation. Never having to worry about exceeding the 4 level stack is nice. The big, big advantage for me is that I can see the bottom 5 or so stack levels. With the 49, expressions are shown in 'pretty print', not just the raw numeric result of 'classical' RPN.

The equation writer is another big plus.

As I said, the person wanted the calculator for an exam. Exams are by nature highly competetive. His fellow test-takers have "calculators that do the thinking for them" - this is an advantage, and in an exam power helps. With the 48/49, you can easily download programs from the internet without having to type them in. Memory is effectivly unlimited. Compare this to having to type in HP15c programs in by hand. Sure you can do it, but it takes longer.

My opions only,

.

Re: HP 15C opinions, or 'RPL vs RPN'

*Message #3 Posted by **Thibaut.be** on 30 Sept 2004, 9:30 a.m.,*
in response to message #2 by .

I guess this forum is absolutely not the place to have flame war, and the huge majority of the folks here do respect everyone's opinions. You're most welcome to tell us what you think.

In addition, a lot of people here grew with classics, woodstocks, spices, voyagers and 41's, and yes, I have to admit that the HP time stopped in 1986 as far as I'm concerned.

I'd be stupid to try to convice anyone that the 15C is as powerful as a 48 or 49. My point was that the 15C is far more than a number cruncher. It can handle matrixes, complex numbers, solve equations, plus a honorable amount of memory. There have been a lot of programs written for it, that were definitely solving complex matters. This was at the time where one could spend 2 hours rewriting a routine to save one register !

48's and 49's are more in between computers and calculators. There's a lot of dicussion about them. The main advantage, under my opinion, on a 15C (or a 41, a 42S, ...) is that they behave like calculatorsr rather than powerful computers than can eventually behave like a calculator. For instance, try a rather long sequence of calculations on a 49G and on a 15C, you'll see that the result we come faster on the 15C. You'll also notice that your 49G will buffer your keyboard, which I personally consider as most disturbing.

Coming back to the initial question on the previous thread, I again wish to draw the attention to the fact that downloading a program on the internet is absolutely no guarantee that you will better succeed in doing your test. A machine cannot do for you what you don't know how to do by yourself. On the other side, if you know what you expect, then your machine will save you some much precious time.

Re: HP 15C opinions, or 'RPL vs RPN'

*Message #4 Posted by **.** on 30 Sept 2004, 9:49 a.m.,*
in response to message #3 by Thibaut.be

"My point was that the 15C is far more than a number cruncher. It can handle matrixes, complex numbers, solve equations, plus a honorable amount of memory."

What I meant by 'number cruncher' is that is does numerical calculations, and is designed for doing them easily. So it is more like a true calculator. Contrast this to a device with symbolics, where you basically have a handheld version of Mathematica. This is more like a PC.

"For instance, try a rather long sequence of calculations on a 49G and on a 15C, you'll see that the result we come faster on the 15C."

I don't own a 49g, only a 49g plus. Could you give me an example of where a 15c would be faster please? I'd be interested in a timing comparision.

"Coming back to the initial question on the previous thread, I again wish to draw the attention to the fact that downloading a program on the internet is absolutely no guarantee that you will better succeed in doing your test.

Agreed.

"A machine cannot do for you what you don't know how to do by yourself."

That depends on what the question is. If it is, say, an exam "invert this 3 by 3 matrix", then the 49g plus will actually not only do the problem, but give you all the working required ("Multiply this row by 4, add this row to that row, etc"). Thats basically cheating, but the calculator will do it.

If the question involves actual thinking, like a story problem, then the user is stuck if they don't know the theory.

"On the other side, if you know what you expect, then your machine will save you some much precious time."

I think thats the big advantage - time is very precious in a test.

.

Faster results because...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 30 Sept 2004, 9:57 a.m.,*
in response to message #4 by .

Hi dot, all;

I think Thibaut reffers to the fact taht every possible function (not all combinations) are availble through direct keystroke sequences in the HP15C (any Voyager, all Classics, and so). Most of the resources in the HP48 series are accessed through menu and softkeys. In some cases, you'll need to press many buttons to perform an operation that will need one, two or three key pressing in the HP15C.

I myself appreciate the multiline display and RPL more than RPN, but sometimes I wish the HP48/49 had a RPN mode key...

My 2¢.

Luiz (Brazil)

RPN, RPL and BASIC

*Message #6 Posted by **Vincent Weber** on 30 Sept 2004, 10:42 a.m.,*
in response to message #3 by Thibaut.be

Hi all,

I do not want to start a flame war either. I actually love almost every single calculator HP did, whether 'pure' RPN or RPL. I have used the 41CX, the 15C, the 12C, the 71B, the 28S, the 32SII, the 42S, the 48SX (my first HP...), the 17BII and the 19BII. I love -all- these models, almost equally.

I just think that RPL is treated a bit unfairly in this forum. The commun opinion is that RPN is simple, pure, and requires less keystrokes, while RPL would a bulky, intimidating, overkill and clumsly full-blown object-oriented language, a la C++. Valentin, for instance (Hi Valentin :-)), advocates the small-size 15C for daily computations, and the Sharp BASIC computers (or the 71B) for more complex programming, while hinting that RPL is not appealing...

Well, I slightly disagree, and I would like to demonstrate that with a few facts:

1) RPN and RPL are very much alike, to start with. The way to enter operations is the same, and do not require any extra keystrokes in RPL; in fact, it could be argued that <PGM> 'LBL PROG, ..., RTN' <PGM> on a 41 takes even more keystrokes than <<...>> 'PROG' STO on the 28/48 ;)

2) Loops are simpler, in my mind, to do in RPL than in RPN. If I take an definite loop from 1 to a non-constant number, stored in the register 00 (on the 41), or in the 'A' global variable (on the 28/48). Which of the following is more concise and/or intuitive for newcommers to programming:

- 41: 'RCL 00,1000,/,1.00001 +, STO 01, LBL 00, ..., ISZ 01, GTO 00'

or:

- 28/48: '1 A FOR I ... NEXT' ?

3) Doing a IF-THEN-ELSE alternative with GTOs is quite tricky and inelegant in RPN. Something like:

'X>0?,GTO 01, GTO 02, LBL 03,...,LBL 01,...,GTO 03, LBL 02,..., GTO 03'.

To be compared with:

'IF X 0 > THEN... ELSE...END'.

4) True, when coming to indirect addressing, RPN is more concise: it is simpler to do a 'STO IND 00' than go for PUTI commands while iterating on an array; still quite feasible, though... and it is still quite possible to emulate registers on the 28/48, and corresponding STO/RCL functions, with an array (this is explicitely described in the 28C/S manual)

5) The ability to use local variables is a HUGE plus of RPL - especially with recursive altgorithms.

6) The "infinite" stack have some drawbacks, agreed:I miss the lack of replication of the 'T' register; I also hate it to have to 'DUP' every argument to be re-used, since RPL fanatically removes arguments from the stack systematically. But it has also some -hudge- advantages !! Namely, never have to worry about loosing the older results and store then into registers back and forth... And being able to see 4 objects at a glance, and scroll the view for the rest, is extremely handy.

7) Being able to use algebraic expressions, like in BASIC, is a great plus for complex equations. The only RPN-programmable calculator with this feature is the 32SII; yet, the equation support is far from perfect: each letter require 2 keystrokes (RCL A..Z), despite the crowded keyboard; there are no editing capabilities; variables must be one character long only, which does not even come with the advantage of implicit multiplication ! Next to the 28/48, this only satisfactory calculators in that sense are the 18C/19B/19BII familty (even though inserting characters is clumsy...)

8) The extra features of RPL are there, but you are not forced to use them... All in all, these features makes RPL much more powerful and elegant than BASIC to me, and I think it is not a coincidence if BASIC computers more or less disappeared when RPL came. Manipulation of Matrixes, Lists, even dynamic creation of programs, is extremely concise and elegant in RPL, while it requires calls to external functions in BASIC.

My conclusion is: RPN is great. RPL -does- have drawbacks compared to RPN, but often simple programs can be done simpler in RPL than in RPN - while complex programs can often be made more elegantly in RPL than in BASIC. This makes RPL a very serious candidate for the best programming method on a handled machine. I fully understand that some people do not like the 48SX because of its

'bulky' size (less than a TI-92, though...), but this criticism disappear when you consider emulation on a PocketPC, like I do... :-)

No flames - long live the 41CX and the 15C, and even the 71B - but also, long live the 28S and the 48SX ! :-)

Cheers,

Vincent

Re: RPN, RPL and BASIC [LONG]

*Message #7 Posted by **Valentin Albillo** on 30 Sept 2004, 12:33 p.m.,*
in response to message #6 by Vincent Weber

Hi, Vincent:

I really think your interesting post deserves a thorough answer. No flames, of course, but some points need to be made, I'll write my remarks interspersed with your original post:

"The commun opinion is that RPN is simple, pure, and requires less keystrokes, while RPL would a bulky, intimidating, overkill and clumsly full-blown object-oriented language, a la C++. Valentin, for instance (Hi Valentin :-)), advocates the small-size 15C for daily computations, and the Sharp BASIC computers (or the 71B) for more complex programming, while hinting that RPL is not appealing..."

(Hi Vincent :-) Yes, you absolutely nailed my current opinion on the subject, and may I say you've probably nailed the "common opinion" as well.

"it could be argued that <PGM> 'LBL PROG, ..., RTN' <PGM> on a 41 takes even more keystrokes than <<...>> 'PROG' STO on the 28/48 ;)"

Well, not counting the name "PROG" (which is arbitrary and could equally well be "PROGRAMA" or "P"), you just can assign LBL and RTN to keys in the 41 and enter said code snippet in just **4 keypresses**, namely [PRGM][LBL][RTN][PRGM]. Anyway I don't think this kind of example is very much relevant.

"Which of the following is more concise and/or intuitive for newcommers to programming: - 41: 'RCL 00,1000,/,1.00001 +, STO 01, LBL 00, ..., ISZ 01, GTO 00' or: - 28/48: '1 A FOR I ... NEXT' ? "

Well, actually the 41C loop would begin

```
RCL 00, E3, /, 1, +, STO 01,
```

i.e, you need only two keypresses (E3) instead of four to enter the constant '1000', plus you need just one keypress (1) to enter the initial value and increment value for the variable, instead of seven (1.00001). Also, depending on the loop's contents, you might well be able to use a stack register for the counter (LASTX, for instance) and avoid the STO 01 altogether. As I once said, and please take no offence as none is meant, this is a typical example of someone writing code in some program language ineptly, then pointing to the defficiencies in the code he just wrote as being inherent in the language. This is not the exact case here, but close.

Also, your RPL code ('1 A FOR I ... NEXT') looks far too weird and twisted compared to the natural HP-71B's

```
FOR I=1 TO A ... NEXT I
```

"for variable i equals one to value of A" seems far more sensible than "one value of A for variable i", don't you think ? Also, why is it "1 A FOR I" ? Wouldn't it be more consistent with RPL to have instead "1 A I FOR" or some similar permutation, with the "FOR" being last ?

"Doing a IF-THEN-ELSE alternative with GTOs is quite tricky and inelegant in RPN. Something like: 'X>0?,GTO 01, GTO 02, LBL 03,...,LBL 01,...,GTO 03, LBL 02,..., GTO 03'. To be compared with: 'IF X 0 > THEN... ELSE...END'."

First, if you've got several actions to perform depending on a comparison, or else two very different set of actions, much cleaner code would be:

```
X>0 ?            LBL "DOTHIS"    LBL "DOTHAT"
GTO "DOTHIS"     ...             ...
X<0 ?            ...             ...
GTO "DOTHAT"     GTO "GO-ON"     GTO "GO-ON"
LBL "GO-ON"
...
```

I think this is pretty clean and easily understandable. Even cleaner would be to use a flag to record the test result, then use XEQ instead of GTO, thus avoiding the LBL "GO-ON" and in fact all four GTO's altogether.

Again, your RPL "IF X 0 > THEN... ELSE...END'." looks unnnatural and contrived when compared to HP-71B's:

```
IF X>0 THEN ... ELSE ...
```

If in doubt, just read loud and clear both statements as they're written.

"it is still quite possible to emulate registers on the 28/48, and corresponding STO/RCL functions, with an array [...] The ability to use local variables is a HUGE plus of RPL - especially with recursive altgorithms."

By the same token, the RPN calculator named HP42S can have both numbered registers AND named variables and you're free to use the ones that best suit your problem. Which is more, you can handle all numbered registers *en masse* as a named variable (REGS), which allows you to keep several distinct copies at any given time, thus easily achieving a powerful kind of 'local variables' mechanism.

Also, in the HP-71B you've got scalar and array variables, of numeric and string types, and in several precisions, including INTEGER, REAL, SHORT, COMPLEX, and COMPLEX SHORT, easy to use as pie, not to mention fully recursive subprograms and user-defined functions with *explicit* parameter passing by both value and reference. Try that with a stack-based machine, where you are frequently at a total loss about the required stack contents before calling a routine and the resulting stack contents at termination, even if it can terminate several ways, some of them abnormal and/or unforeseen.

I miss the lack of replication of the 'T' register; I also hate it to have to 'DUP' every argument to be re-used, since RPL fanatically removes arguments from the stack systematically."

Not to mention the fact that the stack might get empty and thus give you a nice error message as you simply press the [+] key. Agreed, it is an error trying to add two values that aren't there, but all the same the very fact that the stack can hold less than four entries down to no entry at all gets very easily on the nerves of anyone who's grown fond of the comfy 4-levels-at-all-times-no-matter-what RPN stack.

The fact that an RPN stack had 4 levels was one of the accepted facts of life to HP lovers, just as death, taxes, etc. You don't remove such "facts" without nasty consequences.

"never have to worry about loosing the older results and store then into registers back and forth..."

Seasoned 4-level RPN stack uses *never* lose older results in the stack, is something automatic. It's just like never falling from your bed when you're asleep, no matter how much your roll left and right. You don't consciously think about it, it just never happens by sheer acquired reflexes. Same with "losing items" from the four level stack. After a while you just don't.

"And being able to see 4 objects at a glance, and scroll the view for the rest, is extremely handy."

In such a small screen, I find it actually somewhat confusing, distracting. I'd rather have a look at the result I want as the single item on the display, than be forced to also see previous results or unneeded garbage left out in the upper levels by previous, not-relevant-now calculations. It is a well-known fact that RPL users find themselves clearing the stack at all times, to remove unneeded leftovers, while a veteran RPN user needs to clear the 4-level stack next to never. Anyway, that's just my own, personal feeling on the matter.

"Next to the 28/48, this only satisfactory calculators in that sense are the 18C/19B/19BII familty (even though inserting characters is clumsy...)"

I think you forgot to mention the HP-71B here, unless you're restricting your comparisons to Goliath vs. David, i.e., mighty RPL vs. humble RPN. If Titans are allowed to enter the fray, HP-71B direct evaluation of algebraic expressions and further, its CALC mode, are a worthy opponent, don't you think ?

"I think it is not a coincidence if BASIC computers more or less disappeared when RPL came."

You must be joking here, no doubt. Do you really think RPL was noticed at all by much of the handheld computing community when it appeared ? Think again ... There's been hundreds of BASIC handhelds sold by the likes of CASIO, SHARP, etc, for each and every RPL machine sold by HP.

"Manipulation of Matrixes, Lists, even dynamic creation of programs, is extremely concise and elegant in RPL, while it requires calls to external functions in BASIC."

In HP-71B's BASIC:

```
MAT A=SYS(B,C)  'solve M systems of N equations, real or complex, at once
MAT A=FOUR(B)   'compute the Fourier/Inverse Fourier transform
MAT A=TRN(B)*C  'matrix-multiply the transpose of B by C
MAT A=PROOT(B)  'find all real/complex roots of polynomial B
```

Are these examples inelegant to you ? And as for 'external', I've told a number of times why the Matrix ROM (ROM 2) was taken apart from mainframe ROMs (ROM 0 and 1) after being there for a number of reasons. It was an integral part of the machine in the original design, not an external ROM, and as far as I'm concerned, it still is.

"My conclusion is: RPN is great. RPL -does- have drawbacks compared to RPN, but often simple programs can be done simpler in RPL than in RPN - while complex programs can often be made more elegantly in RPL than in BASIC. This makes RPL a very serious candidate for the best programming method on a handled machine."

That's your conclusion and that's your opinion, which I beg to difer. Each machine and each language is better suited for some tasks than it is for others, and while RPL has its merits it also has horrible faults that most definitely make it unsuitable for many a purpose and for many a person.

I think this was really a case of HP disregarding the old but essential American proverb: *"If it ain't broke, don't fix it !"*. I don't think RPN was broken, at all. The HP42S is a living, breathing example of what HP could have done with RPN: expand it while preserving its very soul. HP42S' RPN is awesome, what with its powerful types such as matrices and complex numbers perfectly integrated in the whole RPN paradigm, its named variables alongside numbered registers, its menu system.

I'm sure I'm not alone if I say that people would've given an arm and a leg for a 42SX, with furtherly enhanced classic RPN, plus full I/O and a faster CPU, preferring it over most any RPL model. RPN **wasn't** broken. But HP did try to fix it, regardless. And RPL was the result, deeply unsatisfying for many.

As for me, my stand is well known. I use an HP-15C for everyday normal chores, an HP-71B in emulated form for really complex math-related computations, and a SHARP PC-1360 when a lot of data and results are needed and thus a large, perfectly readable screen, QWERTY keyboard, plus computing muscle are a must. For instance, for the equivalent of filling up IRS forms: having your data in sensibly named array variables and being able to see lots of info on the screen, while comfortably resting in your bubble bath is awesome. :-)

Long live to most any HP calculators and a lot of SHARP's.

Best regards from V.

Re: RPN, RPL and BASIC [LONG]

*Message #8 Posted by **Vincent Weber** on 30 Sept 2004, 1:19 p.m.,*
in response to message #7 by Valentin Albillo

Hi, Valentin

Thanks a lot for your detailed and constructive answer - much appreciated ! :-) I also want to adress some of your points:

"Well, actually the 41C loop would begin

RCL 00, E3, /, 1, +, STO 01,

i.e, you need only two keypresses (E3) instead of four to enter the constant '1000', plus you need just one keypress (1) to enter the initial value and increment value for the variable, instead of seven (1.00001). Also, depending on the loop's contents, you might well be able to use a stack register for the counter (LASTX, for instance) and avoid the STO 01 altogether. As I once said, and please take no offence as none is meant, this is a typical example of someone writing code in some program language ineptly, then pointing to the defficiencies in the code he just wrote as being inherent in the language. This is not the exact case here, but close"

I agree with you that my code was not optimized. You can always hunt for keystroke-cutting when you know the machine well (in fact, this was a common game during the days of the good old Casio fx-4000P, when saving one program step meant a lot). I don't deny that. But this is more a "geek" activity than anything else :-) It is still less intuitive than a good FOR loop... :-)

"Also, your RPL code ('1 A FOR I ... NEXT') looks far too weird and twisted compared to the natural HP-71B's

FOR I=1 TO A ... NEXT I

"for variable i equals one to value of A" seems far more sensible than "one value of A for variable i", don't you think ? Also, why is it "1 A FOR I" ? Wouldn't it be more consistent with RPL to have instead "1 A I FOR" or some similar permutation, with the "FOR" being last ? "

I can agree with you on this - but I don't think it is a big deal once you are used to it. The same reproach could be addressed to RPN: why 'STO 00' instead of '00 STO' ? Just because that's the way the instructions are. Matter of conventions (and not disturbing the stack, in this case).

"First, if you've got several actions to perform depending on a comparison, or else two very different set of actions, much cleaner code would be:

X>0 ? LBL "DOTHIS" LBL "DOTHAT" GTO "DOTHIS" ... ... X<0 ? ... ... GTO "DOTHAT" GTO "GO-ON" GTO "GO-ON" LBL "GO-ON" ...

I think this is pretty clean and easily understandable. Even cleaner would be to use a flag to record the test result, then use XEQ instead of GTO, thus avoiding the LBL "GO-ON" and in fact all four GTO's altogether"

Sure, but this implies redundant tests - and again are less intuitive than the good old 'IF THEN ELSE'.. :-)

"By the same token, the RPN calculator named HP42S can have both numbered registers AND named variables and you're free to use the ones that best suit your problem. Which is more, you can handle all numbered registers en masse as a named variable (REGS), which allows you to keep several distinct copies at any given time, thus easily achieving a powerful kind of 'local variables' mechanism."

Sure - you can save the registers at each function calls. That's what I used to do on my Amiga when I was enjoying Motorola 68K assembly programming. This works, but this is a low-level mechanism for computer-litterate people - a person with no programming background will understand much easier the -> << >> local variable mechanism, IMHO.

"Also, in the HP-71B you've got scalar and array variables, of numeric and string types, and in several precisions, including INTEGER, REAL, SHORT, COMPLEX, and COMPLEX SHORT, easy to use as pie, not to mention fully recursive subprograms and user-defined functions with explicit parameter passing by both value and reference. Try that with a stack-based machine, where you are frequently at a total loss about the required stack contents before calling a routine and the resulting stack contents at termination, even if it can terminate several ways, some of them abnormal and/or unforeseen."

You have a point here regarding the ease of passing parameters. Well, what can I say - just that once you are used to the stack, you actually come to love it - because everything you need is here...

"Not to mention the fact that the stack might get empty and thus give you a nice error message as you simply press the [+] key. Agreed, it is an error trying to add two values that aren't there, but all the same the very fact that the stack can hold less than four entries down to no entry at all gets very easily on the nerves of anyone who's grown fond of the comfy 4-levels-at-all-times-no-matter-what RPN stack."

Well, I consider that you should know what is on your stack before calling a function - I would rather have an error than believing that everything is fine ! It never bothered me - matter of taste...

"Seasoned 4-level RPN stack uses *never* lose older results in the stack, is something

automatic. It's just like never falling from your bed when you're asleep, no matter how much your roll left and right. You don't consciously think about it, it just never happens by sheer acquired reflexes. Same with "losing items" from the four level stack. After a while you just don't."

.. and then, when you try to code, let's say a TVM equation, if you find out that you don't have enough levels to perform the computation, what do you do ? You use registers are temporary variable... which turns the simple coding of an equation into complex programming. As much as I love the 42S (and I really do - this is one of the finest machines ever made), I really think that the lack of equations is one of its biggest drawbacks. I am sure you agree, as you once said that RPN was not all all the way to go to code complex equations. The 32SII does have equations, but is such a weaker calculator than the 42S in almost every single area... What the 42S would have needed is an equation solver a la 17BII/27S. Then, I'll be happy with a 4-level stack...

"I think you forgot to mention the HP-71B here, unless you're restricting your comparisons to Goliath vs. David, i.e., mighty RPL vs. humble RPN. If Titans are allowed to enter the fray, HP-71B direct evaluation of algebraic expressions and further, its CALC mode, are a worthy opponent, don't you think ?"

Fair enough, Valentin. I did not mean to remove the 71B from this, and I actually do like its algebraic mode. Just to make it clear, the 71B was a fantastic machine, the first saturn-based one, with support for IEEE math, and I do not mean to dismiss it !

"You must be joking here, no doubt. Do you really think RPL was noticed at all by much of the handheld computing community when it appeared ? Think again ... There's been hundreds of BASIC handhelds sold by the likes of CASIO, SHARP, etc, for each and every RPL machine sold by HP".

Well, to be honest, when I looked at the various BASIC computers made on www.rskey.org, I noticed that most of them were made before 1990, i.e. before the introduction of the HP-48SX. There are a few exceptions - I own a nice PB-2000C, "C" programmable from Casio, made in 1993. But the *stars* (among all of which you mentionned) have been made in the 80s. Even the Casio fx-880P, which I own, which is one of the most recent Casios, was done in 1988 or so, if I'm not wrong. So I got the feeling that the HP-48SX kind of killed the BASIC computers - if not in the heart of their users, at least in the wallets of the vendors... :-)

"Manipulation of Matrixes, Lists, even dynamic creation of programs, is extremely concise and elegant in RPL, while it requires calls to external functions in BASIC."

"In HP-71B's BASIC:

MAT A=SYS(B,C) 'solve M systems of N equations, real or complex, at once MAT A=FOUR(B) 'compute the Fourier/Inverse Fourier transform MAT A=TRN(B)*C 'matrix-multiply the transpose of B by C MAT A=PROOT(B) 'find all real/complex roots of polynomial B

Are these examples inelegant to you ?"

No, this is quite fine; I just love the multi-type stack of the 28/48, but I have to admit that the above example is quite powerful programming.

"I think this was really a case of HP disregarding the old but essential American proverb: "If it ain't broke, don't fix it !". I don't think RPN was broken, at all. The HP42S is a living, breathing example of what HP could have done with RPN: expand it while preserving its very soul.

HP42S' RPN is awesome, what with its powerful types such as matrices and complex numbers perfectly integrated in the whole RPN paradigm, its named variables alongside numbered registers, its menu system."

Agreed fully - if not again for the lack of algebraic equations, which is sorely missed.

"As for me, my stand is well known. I use an HP-15C for everyday normal chores, an HP-71B in emulated form for really complex math-related computations, and a SHARP PC-1360 when a lot of data and results are needed and thus a large, perfectly readable screen, QWERTY keyboard, plus computing muscle are a must. For instance, for the equivalent of filling up IRS forms: having your data in sensibly named array variables and being able to see lots of info on the screen, while comfortably resting in your bubble bath is awesome. :-)"

Actually, I did a lot of finance this year, and sadly, I have to confess that the most useful tool for me was... Excel !! The ability to see all the numbers at once on a page, linked with cells, has revolutionarized computing. If I don't need pocketability, Excel is now my computation platform of choice. Sadly (I hate Micro$oft...).

"Long live to most any HP calculators and a lot of SHARP's"

Not to forget Casio, too often contempted, while it came with its awsome fx-602P (a good, faster rival to the HP-41), its marvelous fx-4000P (the first pocket calculator with both formulas and programming), and the incredible fx-7000G (first graphic calculator ever... in 1985 !!).

Thanks again and cheers,

Vincent

Re: RPN, RPL and BASIC [LONG]

*Message #9 Posted by **Valentin Albillo** on 1 Oct 2004, 7:32 a.m.,*
in response to message #8 by Vincent Weber

Hi again, Vincent:

A pleasure to read your friendly reply, some very minor remarks:

"The same reproach could be addressed to RPN: why 'STO 00' instead of '00 STO' ? Just because that's the way the instructions are. Matter of conventions (and not disturbing the stack, in this case)."

I don't concur. Classic RPN programming is historically based upon *keystroke programming*, where the user simply enters into program memory *the very same keys* he would use manually to perform a calculation. Now, since the earliest non-programmable RPN calculators, you would press:

```
[5] [STO] [0]
```

to store the value 5 into storage register 0, so this must lead to the program steps:

```
5
STO 00
```

if the very valuable 'keystroke programming' paradigm has to be preserved. There's really no choice unless you abandon it altogether. Also, there's the fact that in the earlier HP calculators, memory was *extremely limited*, with just a handful of storage registers available, so the stack had to do double duty both as a calculating stack where arguments were placed

and results were returned, and also as a place to store intermediate results.

That being so, and being a 4-level stack, it's obvious you can't waste a valuable stack level by using one to place the address of the storage register, like this:

```
[5] [ENTER] [0] [STO]
```

as it would be awfully awkward for the earlier calculators (and HP already had a hot potato in their hands trying to sell RPN as it was), would need a full stack level losing "T" just to place the 0, and would need an extra keystroke [ENTER] to separate both arguments. This is inefficient in the extreme, and HP-engineers' loving mothers didn't raise any fools.

On the other hand, RPL was designed from scratch, with no regards to legacy machines or compatibility, and they chose the 5, 0, STO way for the sake of consistency. Fine, except that consistency is broken by the FOR construct and others, as FOR would have to be the very last statement, taking three arguments or four arguments, namely the initial value, final value, step value, and the variable to use for looping, placed on the stack prior to the FOR. It does not, and this detracts from consistency big time, methinks.

"Sure, but this implies redundant tests"

Not at all, in my example. My code snippet is three-pronged: it does "DOTHIS" if X is greater than 0, it does "DOTHAT" if X is less than 0, and it does *nothing* is X=0 ! Not only there's no redundancy at all, but further the X=0? test is actually *removed* ! :-)

"once you are used to the stack, you actually come to love it - because everything you need is here..."

Yes, and regrettably, a much larger lot of things that you *don't* need but that waste RAM and slow down the processing unless you remember to get rid of them constantly.

On the other hand, Classic RPN has no problem with this, the 4-level stack is fixed for all time and takes no extra memory whatever, plus you never have more than 4 items you don't need in it, which nevertheless will automatically get lost over the top the next time you enter the data you actually need, no cleaning required, no RAM wasted, no slowing down.

"if you find out that you don't have enough levels to perform the computation, what do you do ? You use registers are temporary variable... which turns the simple coding of an equation into complex programming."

Keystroke programming can never be complex programming, because that would imply that doing that computation in the calculator by hand using RPN is complex on itself, which it normally isn't. The fact that you need to do a STO 00 or RCL 00 from time to time (rarely, actually) does not detract from simplicity at all, and certainly is much preferable to the bunch of DROP, DUP, ROT, or whatever you constantly need to do in RPL to get your arguments when and where you need them. I'd rather do a simple STO/RCL than a complicated sequence of stack commands to duplicate-save-up-there and recall-from-that-level-whatever this piece of data.

Not to mention the very important point that it's much easier to keep a consistent *mental image* of 4 fixed levels, at all times, than doing the same with a much larger stack where all kind of things are constantly going in and out and changing positions like mad. Seasoned Classic RPN users are never at a loss with regard with what they have on the stack and in which levels it resides, so handling data is fast and automatic, a simple X<>Y or RDOWN is all you usually need.

"So I got the feeling that the HP-48SX kind of killed the BASIC computers"

I don't think RPL had any impact at all on the BASIC handhelds' demise, I really think it's just a mere coincidence if it actually happened at the same time, which I don't know. Certainly, RPL's appeal has always been very limited for the vast majority of handheld users, just as Classic RPN did.

"Not to forget Casio [...] the incredible fx-7000G (first graphic calculator ever... in 1985 !!)."

Agreed. I own a Casio FX-7500G and it's one of the most incredible calculators you can own, namely:

- Fully programmable, with loops, subroutines, separated program spaces, arrays, hyperbolics, whatever.
- 4,214 bytes for programs & variables
- Full graphics screen (96 x 64 pixels) and alphanumeric screen (8 rows x 16 characters) both at the same time, in separate logical planes (!) with a full complement of graphics functions and statements, including plotting
- incredibly fast, faster than the earlier HP48 models, for example
- foldable (! "clamshell") and *extremely* small, smaller than even an HP-15C !

This is, a delight to program and a delight to use. You could carry one on your shirt pocket and it would go unnoticed, so small is this machine.

For any of you interested in this awesome machine and its capabilities, you can have a look at its extraordinary manual, downloadable in English, PDF format, from here. It's well worth the read and will certainly help broaden your views.

Best regards from V.

Re: RPN, RPL and BASIC [LONG]

*Message #10 Posted by **Vincent Weber** on 1 Oct 2004, 7:55 a.m.,*
in response to message #9 by Valentin Albillo

Hi again Valentin ;-)

Thanks for your very interesting reply. I can see where you are coming from, and I do agree about the 4-level stack simplicity. My goal was just to show that RPL is not that bad and can be efficient. Both systems have their merits - and BASIC certainly have some as well.

I would love to test the HP-71B in details, but the only thing I have is Emu71 under PocketDOS (or HP71X under Emu48)with the BASIC ROM. Do you know where I could find the MATH ROM ?

I'll just say that at least, RPL allows for algebraic expressions in ' ' when you need them, instead of DUP ROT etc. I am sure you will agree that this is sorely missed from the HP-15C/42S, and that even though 'STO 00' and 'RCL 00' are not too complex, they are no match to natural equation writing. The HP-42S multi-var solver is nice, but I prefer *by far* the 27S/17B/17BII/19B/19BII/95LX/100LX/200LX natural way (the 32SII does an attempt, but not that good, IMHO). But these calcs' programmability, although cute with the SUM and IF functions a la Excel, is kind of limited in terms of subroutines, inderect addressing, and indefinite loops. The ideal RPN calc should merge the 42S and

the 27S features (equations, clock) and add some I/OIs.

Think about it, aside from the 71B which is nice but bulky, and the 32SII which is not bulky but is very limited, the 28S is the smallest HP calc with BOTH structural programming AND formula programming AND a decent alpha keyboard, while being simpler than the 48/49. This is worth emulating on my Ipaq :-)

I know the FX-7500G, some friends had it in high-school. A truly cute device - really makes me wonder why HP users contempt Casio so much. I have more respect for Casio that for TI. TI, in my mind, only shined in 1977 with the TI-59 and its expansion ports; The TI-92 is overelly bulky to be a calculator, and the TI-89, although nice, came late: it is easy to develop powerful algrebra software in C on a M68K ! As for TI other graphing models, there ware mere copies of Casio - who invented the graphic calculator long ago (1985).

Thanks again and cheers,

Vincent

You have mail ! :-) [No text]

Re: RPN, RPL and BASIC (long again)

*Message #12 Posted by **bill platt** on 30 Sept 2004, 1:32 p.m.,*
in response to message #7 by Valentin Albillo

Valentin,

Thanks for contributing to this thread. As usual, much comes to light.

I thought I would mention a few things in this RPL regard. A positive with RPL is the ability to deal with algebraic objects within a reverse-polish stack-based program. By usding single quotes, you can put an algebraic right in. I have found this to be quite useful at times.

But I agree that the whole RPL interface, and the programming method, is so different for all but simple things, that it can be a real brain stretcher to convert from either RPN or BASIC to RPL programming. It is worth noting that if you spend time over at Comp.sys.hp48, the overwhelming majority of contributors are not familiar with RPN style machines, though there are some notable and esteemed exceptions including Wayne Brown, and Raul.

It is also interesting to note that Jean-Yves A. stated on C.S.hp48 that he hated the 42s and could not understand why anyone eould want one---apparently there are some very strong views out there about what a calculator should be! More to the point, is that there are different philosophies.

I have personally found it difficult to convert wholeheartedly over to the 48. I see and appreciate many of the features, and yet I often find that in actual practice, using it is slower and more cumbersome than doing something more by hand. A perfect example is the equation solving system, which is soooo slow that you can do the whole process faster on a 15c, including writing a program and solving for any variable. I have been very disappointed by that

feature, and find that the 17bii is so superior for repetitive use of an equation that it makes absolutely no sense why I cannot do that on the 48. (Note that Ron Ross answered a post regarding this which states that in fact I could do this on the 48, but I have not yet figured that out).

Basically, there is a huge amount of overhead to learn how to use RPL. This is its biggest flaw. Yet I wish I could make better use of it, as it seems to have so much potential. Yet if I am to spend time learning something, I would rather that be how to use ALGOR or Solidworks or ProSurf or Excel or Access better etc---as the these are the tools which I really use.

The hp RPN keystroke programming has been a tool which, honestly, if I didn't already know it from the 1980's, I probably would have zero interest in learning. And RPL, well, I only got "sucked in" by my calculator collecting interest and general curiosity.

Best regards,

Bill

*Message #16 Posted by **.** on 1 Oct 2004, 3:31 a.m.,*
in response to message #15 by HrastProgrammer

Thanks, thats an interesting site. I looked into some of your emulators for the 49g plus, and found

http://www.geocities.com/hrastprogrammer/hp49gp.htm

"Port1 has been cut down to only 128K on HP-49G+ (very, very bad HP decision)"

Just curious, do people actually use port 1 for anything (besides your emulators)? I thought that the flash in port 2 would be enough. I prefer flash, as it is much more reliable.

At any rate, if you were willing to go into ARM programming, most of that 128kb is still free.

From Jean-Yves - "Then look at it this way... When ARM native application will finally be possible they will have access to 128KB of RAM on their own without eating any memory of the 49G original memory!"

Also, please see http://hpgcc.sourceforge.net - "the HP49g+ has an extra 'hidden' 100kb free RAM built in"

--

"Handling hexadecimal values in decimal mode of the CPU (after SETDEC) has been totally screwed up on Saturn/ARM causing some parts of the HP-71B ROM code to malfunction"...."On the real Saturn it gives #C in C(S) while on the Saturn/ARM it gives #6 in C(S)"

Interesting. Were these features of the Saturn documented? If not, you can't reasonably expect undocumented features to work in new versions. If so, this was very sloppy.

thanks,

.

Just curious, do people actually use port 1 for anything (besides your emulators)? I thought that the flash in port 2 would be enough. I prefer flash, as it is much more reliable.

Please understand that I really don't want to waste my time arguing whether it is better to have 128K or 256K of Port1 on HP-49G+. I even don't want to discuss about HP-49G+ at all here. Opinions expressed on my page are my personal opinions collected during the development of my emulators on HP-49G+ but these are also facts which everyone can check and confirm.

But, I will try to answer your question from the technical side. You must know how memory mapping on Saturn works in order to understand the problem. For my emulators to work properly, I must have the ability to map (using the CONFIG CPU instruction) a single 128K port page to the absolute address #00000 in the Saturn address space for the following reasons:

(1) To map the HP-42S or HP-71B ROM to the address #00000 because ROM

(obviously) must be on the right place.
(2) To intercept the interrupts because interrupt handler on the Saturn CPU must be located on the address #0000F.

For various configurations of my emulators there is also a need for mapping these pages to addresses #40000, #80000 and #C0000. The only pages on HP-49G which fully satisfy this requirements are 128K pages from Port1. Port2 pages can be mapped to #00000 address but (simplified) every Flash ROM page has one 256 byte header at the beginning so, if I map it to #00000, the actual contents of the ROM will start from #00200 and I cannot store any of my code bellow #00200. I don't know about Port3 on HP-49G+ but I assume the situation is even worse because it is organized in files. On HP-48GX, you can map any 128K page from ports 1..31 to the #00000, #40000, #80000 and #C0000 addresses.

Again, I don't want to argue about HP-49G+ ... if it is fine for you to have 128K of Port1 then it is fine for me, too.

At any rate, if you were willing to go into ARM programming, most of that 128kb is still free.

I am not willing to go into ARM programming because I am not interested in ARM programming and because I want to preserve the 100% compatibility of my emulators with HP-48GX/49G (based on the real, true Saturn). If you want to go into it, then go into it ...

Interesting. Were these features of the Saturn documented? If not, you can't reasonably expect undocumented features to work in new versions. If so, this was very sloppy.

You're right. I would be very unreasonable to expect something like that. HP programmers used these features in HP-71B so they should have been documented somehow inside HP because Saturn works this way from the very beginning until HP-49G. And Emu48 emulator supports these undocumented features, too. But to expect that they will be preserved on HP-49G+? No ...

Regards.

Hi, Hrastprogrammer !

Über-Hrastprogrammer wrote:

"RPN, RPL and BASIC ... they are all the same - I have all of them on HP-48GX :-)"

Yes, indeed. I'm still amazed no end at how efficiently and accurately you managed to code those wonderful emulators. Matter of fact, they're one of the mightiest appeals for owning an HP48GX, and it's certainly worthwhile getting one if only to run them all on the fly.

Even for someone who doesn't specially like 48/49 models, the fact that you can have full-featured classic RPN (i.e.: HP42), full featured HP BASIC (HP-71B), plus RPL if you ever feel attracted to it, all in a single, *portable* machine with a *real keyboard*, at such speeds as your emulators run even if the underlying hardware is but a 'mere calculator', is nothing sort of miraculous ! A real must.

"BTW, Valentin, have you received that XY-99Z ROM I sent you few weeks ago? Does it work?"

Yes, yes, it works fine, thank you *very* much !!. Excuse me for not answering sooner, but as soon as I got it I immediately went out to work on entering, finishing, testing and debuging my looooooong program for it (which takes a sizable amount of time), and intended to send you the finished article-program attached to my reply, which is still two days from finishing. I hope you'll enjoy it and might consider running it yourself in your hardware, time permitting.

By the way, you have a small typo here. Flamagas Magiclick's ROM I is actually model XY-99ZT, not XY-99Z. Seems you lost "T" out of the top. Damned 4-level stack, where's RPL when one needs it ? :-)

Best regards from V.

I am very sorry, Valentin ... it seems that I have sent you an older version of the ROM. AFAIK, there isn't a lot of problems with this particular version, except perhaps a little bug: it will clear everything on your machine on, I think, october 1st, 15:00 CET ... ouch :-)

Excellent "counterpoint", and about 48/RPL

Valentin --

An excellent and thorough response, as usual. I don't know how you can deliver such quality "short essays" in a reasonable amount of time, particularly in your "secondary" (tertiary?) language.

The following stated my feeling on multi-line displays:

> Quote:
>
> In such a small screen, I find it actually somewhat confusing, distracting. I'd rather have a look at the result I want as the single item on the display, than be forced to also see previous results or unneeded garbage left out in the upper levels by previous, not-relevant-now *(no-longer-relevant)* calculations.

Also about the "42SX" vs the 48S/SX:

I think the 48-series should have been a "super 42" implemented with true RPN (with perhaps a larger user-definable stack), and the equation editor of the 27S and 17B/BII. If a programming paradigm more advanced than RPN-keystroke was needed, the HP-71B BASIC would have been a better choice. Heck, these advanced features were already available concurrently (or nearly so) with the introduction of the original 42S.

The 28S was worth developing and releasing, I think, just to get the 28C right. The 28's RPL system, preserved for those who liked it (disciples of object-oriented programming, for example), could have been evaluated, like Prohibition, as a failed "Noble Experiment".

Sure, the 48-series has a large "fan club", but is its popularity among these users based upon RPL or upon the advanced functions, storage, expandability and comm capabilities of the calculator? One has to admit, not everything offered by the 48S was available in either the 41CX, the 28S, or the 42S.

Hi, Karl:

Karl posted:

"An excellent and thorough response, as usual. I don't know how you can deliver such quality "short essays" in a reasonable amount of time, particularly in your "secondary" (tertiary?) language."

Thank you very much for your kind words and appreciation, I must say I also get considerable enjoyment from your postings, always interesting and well reasoned.

As for the "reasonable amount of time", you just can't imagine the *extreme* speed at which they get written, because I usually have to post my answers in the very few minutes I stay at my working desk daily, so please excuse any typos or misconstructed idioms such as your pointing out my hasty "not-relevant-now" for the correct "no-longer-relevant". I knew the proper idiom but as I was writing in a real hurry (just like right now!) I, absentmindedly, translated the equivalent Spanish idiom literally, sorry.

"I think the 48-series should have been a "super 42" implemented with true RPN (with perhaps a larger user-definable stack), and the equation editor of the 27S and 17B/BII."

I couldn't agree more. What I'm going to say right now might be construed as 'heretic' by some HP fans, but I think I must tell you (and everyone else reading this) what I *honestly* think on this subject, which goes like this:

Mr. William Wickes, of synthetic programming fame among 41C users, did a great *disservice* to the HP RPN community when, after joining HP, he went on to develop RPL and its first hardware incarnation, the HP28C. Certainly, I can recognize its many good points and the boldness of breaking nearly completely with tradition and compatibility by issuing a totally different paradigm, affecting to all calculator's functionalities, from pure usability for on-the-fly calculations, to programming, and even the hardware itself, all of this when all HP RPN users, most definitely 41C users, were *expecting* just a much improved, faster, powerful "42C" machine. It was a real *shock* and, definitely, most unexpected and least of all from a man who had distinguished himself in further expanding the in-built 41C's capabilities to unimagined heights, which got him universal recognition plus a grand-style entry to the ranks of HP's staff.

Was it for good ? Well, I'm sure all 48/49 lovers will certainly agree that this was for the best, and resulted in the most powerful, most capable calculators the world has seen. But while this is certainly debatable right now (I understand that TI has models that equal or even surpass the 48/49), there's no way to know what could have happened at the time if Mr. Wickes had concentrated his considerable skills in launching the much desired HP-42C.

Though this enters the realm of fiction history, it seems plausible that it would have featured a Saturn CPU, a multi-line dot matrix display, lots of RAM, and full I/O, plus extensions to classic RPN to handle matrices, complex numbers, named variables, and more. In other words, it would have been an non-crippled HP42S *years ahead* of its time. It would have *united* HP fans even more, and it would have made the *absolute best* calculator of its time, bar none. It would have made it exceedingly difficult for other manufacturers to cope with. Surely, it could have changed calculator history *dramatically*.

Instead of that, HP fans found themselves utterly shocked, with a calculator using a non-compatible language and having even less real RAM than the 41C had, with no I/O, with rather poor documentation, which they were supposed to like, and root for, and buy in vast quantities, even though it was outrageously expensive. Many tried to like it, even forced themselves to like it, and some even succeeded up to a point.

But many did *not*. While the HP-41C was an unmitigated success, selling in the millions, and every HP fan's wet dream, the RPL machines actually created an *schism*, sort of. Instead of being a monolithic group of RPN fans versus algebraic, you then had Classic RPN fans on the one side, versus RPL fans on the other, and both groups were highly *immiscible*, to the point that there was no way most RPN users would use an RPL machine instead, and mostly vice versa. You had two camps were previously there was but *one*.

I feel that this sad state of affairs did play a very important role in *ending* HP calculator's

supremacy. If non-HP fans were difficult to convert to RPN, converting them to RPL was next to impossible. Not having a real successor to the 41C meant that other makes went on to get the torch instead and reign supreme. The ultra-powerful 42C we all *rightly* expected was never to be, and even a lame attempt by HP releasing the 42S was utterly emasculated by removing all I/O and other important features, lest it would lower sales of their flagship RPL models. Even the meager graphical features the 42S sports were crossed out as well and wouldn't be there were it not for the fact that the programmer in charge of them worked *for free* in his own time to finish them at all costs. Even then, HP did not see fit to include their full description and capabilities in the very Owner's Handbook, to the point that their most powerful capabilities were left *undocumented* in the manual the user got with the machine. Even so, the HP42S excels as one of the best RPN calculators ever, so who knows what the HP-42C *we all rightly deserved and rightly expected* would have been if left to happen.

The sad conclusion is that, if nothing else, RPL machines brought out division among HP fans and stagnation in the calculator race for an extended period, so ultimately resulting in HP losing it big time. *"And if a house be divided against itself, that house cannot stand" (Mark 3:25)*.

Was it worth it ?

I don't think so.

Have a nice weekend and best regards from V.

Hey Valentin :-)

Hopefully I am not that a RPL-fanatic, or, given the religious tone of your posting, I would declare that you should burn in the flames of hell for Heresy :-))

On a more serious note, that's a bit harsh for the HP-28C, which was arguably the most innovative device in History, altough the pathetic RAM and the lack of I/O seriously limited its power...

Well, I suggest a Concile to re-unite our Church, where both 41 and 48 lovers will shake hands, acknowledge their respective merit, and sware to God (whichever they pray to) to united until the Evil (TI) is completely defeated ;)

Cheers and have a nice week-end :)

Vincent

*Message #25 Posted by **Ron Ross** on 1 Oct 2004, 11:21 a.m.,*
in response to message #23 by Valentin Albillo

I couldn't agree more on the evolution of the RPN calculator. My first was an Hp15c, and then I bought both a 42s and a 48s. I never, ever loved that 48s. It was just to big, bulky and complex.

I switched over to the 42s from the 15c out of need for the extra features, alpha capabilities and a better solver. I always liked the size and layout of the 15c better, but I gave that up for the extras of the 42s.

Today I use a 48G on my desk at work, because of the units conversions I often need for unusual applications. Its like having a reference table at my fingertips. And it is a calculator. But it AINT no pocket calculator. I miss that, and if I take anything to a meeting, it is a pocket calculator. For a field calculator, I take either an Hp48G or a 20s. Why? because both are expendable, but I would rather take a 42s.

When I worked as a controls engineer and needed time constants or valve response times, I would haul the Hp48G along, but if the 42s had had a clock and units conversions, I would have taken that (when it was still replaceable).

Oh well, I try not to get into a rant about what could have or should have happened.

I have grown to appreciate RPL and it is/can be a very powerful way to program with. But it is also very criptic and hard to read any code quickly (Unless you are super proficient). But I wish Hp had released an expandable 42s with real I/O, units conversions 32K or more RAM and an RS-232 port like the 48 in the same form factor as the 42s.

Would it have robbed from the 48 line?? Probably, but the 48 line was/is still a market. Many looking for a portable calculator, may later buy the 48 to have all the toys (geeks often buy more than they need, I seem to have anyhow).

All this demand for the great Hp32s would be for the Hp42s if more had tasted this forbidden fruit. Granted, the display wasn't as clear as a 32s, but it was a two line model and smaller LCD pixal layout squeezed into the same window as the rest in this voyager line. Everywhere else the 42s ruled, it just wasn't as good as it could have been. And that is/has been my gripe with Hp for the last 10-15 years. They may make the best, but they could have even made better. However out of fear by the marketing group as to not compete with THEIR other calculators, they cut and withheld features.

The Hp41c was pushing the limits when it was introduced. Later, the Hp15c forced Hp to expand it capabilities to an Hp41cv and the HP41cx to keep its flagship out front. Noble endevers, each and everyone. The Hp28c broke from that mold and should have included 8K out of the box with a real serial interface (I won't go into other design issues). These are two points that are inexcusable. The voyagers were in the pipeline and the highend ones were getting 8K RAM. It wasn't until the 48 series that Hp corrected all the shortcomings of the Hp28 line (and now these beasts were no where near pocket sized).

Bill Hewlett envisioned a pocket calculator. This new line is a desk unit for most uses. The new evolution of the pocket calculator has deviated away from its primary use. If I need a computer, I have a computer on my desk.

The only reason my 48g lives on my desk is because it is a calculator, but it don't travel with me. A pocket calculator would.

Did'nt I see a wink over there ?

I don't agree with you. While one offers plenty of advanced functions, the latter offers a few functions that will be daily fully used, on the contrary of the former. In addition, the former will offer the [italic]crème de la crème[italic] way of providing solutions.

Once again, time has stopped in 1986 under my opinion as far as calculators are concerned : there is a point where I'll be so partial that my argumentation won't be credible.

Re: HP 15C opinions

*Message #31 Posted by **.** on 1 Oct 2004, 4:47 a.m.,*
in response to message #30 by Thibaut.be

If you are talking watches, then they are obviously for different purposes.

The Rolex looks great, and is very classy, and does one thing well. It'd look nice at a dinner party.

The GPS watch would look out of place at a party. It looks ugly. However if I was going somewhere remote, say hiking or mountain climbing, it could be very usedul. I wouldn't want to wear a rolex while hanging off the side of a cliff.

Of course, for most 'normal' people, both of these devices are overkill. If you just want to know the time, and don't care about looks, then a $20 digital watch will probably be just as good.

regards,

.

Once again I have to disagree, with full respect of your opinions.

A Rolex watch (or better Patek Philippe) is not only great to stare at, but it's a reliable

timepiece, where engineers have spent a lot of time to provide a accurate tool. A bit like how HP was the leader in calculators till the late eighties.

You might prefer such a watch when you're off-road as it will be more reliable and probably ess sensitive to hazards than your Casio GPS watch, which needs a lot of extra batteries in you pocket to work properly and longly.

Re: HP 15C opinions

*Message #33 Posted by **Chris Woodhouse** on 1 Oct 2004, 9:55 a.m.,*
in response to message #26 by Valentin Albillo

I like your comparison but the watch I would use for the 15C is this. . .

http://hp15c.org/Movado1.jpg

To me the Movado is the ultimate in elegant simplicity, while still being very functional. I will concede, though, that your Rolex example does show the durability better. I'm sure the Rolex is much more rugged than the Movado, probably more rugged than the 15C too.

Let's not forget this...

Bring Back the HP 15C

solving problems with the HP-15C

*Message #1 Posted by **Iron Horse Tamer** on 29 Sept 2004, 5:52 p.m.*

I'm trying to figure out if this thing has a solver function, without using programming.

What I'd like to do is simply enter an equation with one variable, such as:

45,000 = ((1.05)^n -1)/(.05*(1.05)^n) solve for n

I would normally do this stuff in excel, but I have a test and they won't let me use my laptop.

Thanks!

Re: solving problems with the HP-15C

*Message #2 Posted by **Karl Schneider** on 29 Sept 2004, 10:58 p.m.,*
in response to message #1 by Iron Horse Tamer

IHT --

I take it tht you don't have an HP-15C manual, because this is all clearly documented in the book. PDF scans can be purchased from this website, or a used copy can generally be bought from internet-based sites and individuals for $25-$35.

The procedure for using "SOLVE" (f-shifted on the "divide" key) to solve a programmed function f(x) = 0 is as follows:

1. Go into program mode ("g P/R") and write a program with the following attributes:
   - Begins with a LBL instruction specifying a unique label {A-E, 0-9, or .0-.9}
   - In the x-register, accepts a value of the variable to be solved
   - Computes the value of the function, such that 0 will be returned if the input value in the x-register was a solution
   - Ends with a RTN instruction
2. Exit program mode ("g P/R")
3. Enter a search range as lower and upper values in the x and y registers
4. Hit "f SOLVE {program label of the function}"
5. Wait up to a minute or two for the result

-- KS

Edited: 29 Sept 2004, 11:00 p.m.

Thanks Karl, as you correctly

*Message #3 Posted by **Iron Horse Tamer** on 30 Sept 2004, 12:57 a.m.,*
in response to message #2 by Karl Schneider

guessed, I do not have a manual. It might be in storage, but which box to look in?

In short, I am trying to figure out if this calculator will help me on a test, or if I need to go spend the money on a new-fangled calc. I like the RPN a lot.

But, we have to solve a lot of questions where there is one equation with one variable, but it is not nice and tidy on the left-hand side. My classmates half my age are all using modern financial calculators that do all the thinking for them but I'd like to do this stuff the old fashioned way.

I'd like to be able to solve stuff like:

45=12(1.04)^n

without trying to juggle n off on it's own. Sure, it would be easy in this case with logs, but many of the equations are more complex. As you probably figured out, the equation shown with my initial question has no solution. It wasn't a real problem, rather just one I made up.

Any additional help you care to give, such as specifically what keys to hit to solve the equation above would be greatly appreciated. I will go struggle with your first response and see if I can figure it out from there. (I'm kind'a old and my noggin isn't what it used to be)

Re: Thanks Karl, as you correctly

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Sept 2004, 1:27 a.m.,*
in response to message #3 by Iron Horse Tamer

Hi, IHT;

may I try some answer?

The HP15C has a [SOLVE] 'application' already built in, so you need only to write your expression accordingly. In your example:

45=12(1.04)^n

can be written as a program like this: (consider n in the 'X-register', or in the display)

```
g P/R
f LBL 0
  1
  .
  0
  4
  x<>y
  y^x
  1
  2
  x
  4
  5
  -
g RTN
g P/R
```

Both [g][P/R] ensure you get in and out of program memory so you can load the program. After loading the program in memory, you can test it by keying in any value fo 'n' and pressing [GSB][0]. The calculator returns the resulting value. What SOLVE does is setting as many values for 'n' as necessary so your program returns zero. When it happens, the last 'n' value is your root. Try this:

```
0   [GSB][0]  returns -33.0000
1   [GSB][0]  returns -32.5200
2   [GSB][0]  returns -32.0208
```

```
10  [GSB][0]  returns -27.2371
100 [GSB][0]  returns 561.0594
```

The root must be between 10 and 100. Now do this:

```
[g][CLx][ENTER]
[f][SOLVE][0]
```

The display shows [running] for a while and then it stops with 33.7005.

If you want additional info, let us know.

Cheers.

15C guidance

in response to message #3 by Iron Horse Tamer

IHT --

> Quote:
>
> In short, I am trying to figure out if this calculator will help me on a test, or if I need to go spend the money on a new-fangled calc. I like the RPN a lot.

I've had my 15C since when I bought it new in late 1983 (which suggests my own age). It has seen me through three collegiate science and engineering degree programs. It's about the best calculator for these exams, when the student doesn't need a library of programs or equations entered beforehand. Very capable; quick, easy and intuitive to use. Newer isn't always better, and modern calculators can't match the no-nonsense utility of the 15C.

> Quote:
>
> But, we have to solve a lot of questions where there is one equation with one variable, but it is not nice and tidy on the left-hand side. My classmates half my age are all using modern financial calculators that do all the thinking for them but I'd like to do this stuff the old fashioned way.

If the test problems are in business/finance classes, a financial calculator would be better-suited to the task. The only RPN financial calc's presently retailed are the HP-12C and HP-12C Platinum, which share the 15C's "form factor". The original 12C is the better of the two, but both have crummy programming, and are rather slow computationally.

> Quote:
>
> 45=12(1.04)^n

Here's how to solve for n, using SOLVE:

```
keystrokes    line(s)    comments

g RTN                    positions at start of program mem
g P/R                    enters program mode
```

```
f LBL A       001         program label (entry point) is A
1.04          002-005     1.04, one digit per line
x<>y          006         swaps 1.04 with value of n
y^x           007         takes (1.04)^n
12            008-009     12, one digit per line
*             010         calculates 12*(1.04)^n
45            011-012     45, one digit per line
-             013         calculates 12*(1.04)^n - 45
g RTN         014         end program of function

g P/R                     exits program mode to run mode
25                        give 25 as low end of guess range
ENTER
75                        give 75 as high end of guess range
f SOLVE A                 solve the function defined as "A"
```

The answer of 33.700454 will appear after less than 30 seconds. It can be verified by solving algebraically)

The programmed instructions will appear as numerical keycodes on the display, which indicate the row and column of the keys pressed. Instructions are not executed when they are entered.

Several requirements:

- 2 registers are required to store the function, and 5 more to run SOLVE. Thus, the second number displayed by "g MEM" keystroke sequence must be 7 or more, to allow programming and solving of this problem.
- There must be no other "f LBL A" instruction preceding the program in memory. Doing the "g RTN" as listed prior to programming will ensure this.

Message #6 Posted by **.** *on 30 Sept 2004, 3:24 a.m.,*
in response to message #5 by Karl Schneider

All that to solve 45=12(1.04)^n, and the answer takes "less then 30 seconds"? While you are messing about with that, your classmates have already soplved the equation and have moved on.

While the HP15c is a great tool for number crunching, I don't think that type of solving is one of its strengths. If you must have RPN, and you are permitted graphical calcs, maybe a 48gii / 49g+ would be the way to go.

'45=12(1.04)^n'

Num Slv -> 'Solve Equation' -> fill in "45=12(1.04)^n" and go SOLVE, to give the answer in a second or so. No need to fiddle about trying to write programs.

Just something to consider...

Loosing the main subject...

Message #7 Posted by ***Vieira, Luiz C. (Brazil)*** *on 30 Sept 2004, 4:08 a.m.,*
in response to message #6 by .

Hi, dot;

I guess you did not read the thread as a whole. If so, you'd see that this is not mainly solving a problem, instead it is how to use the HP15C built-in solver. And for what it is, the example is enough as a starting point. And if you want it faster, try 30 [ENTER] 35 [f][SOLVE] A: less than 10 seconds.

Cheers.

Luiz (Brazil)

Yes, I read your followup, but...

Message #10 Posted by ***Karl Schneider*** *on 1 Oct 2004, 1:15 a.m.,*
in response to message #6 by .

... your statements still deserve comment, even though you subsequently admitted to not having read the full context of the thread:

> Quote:
>
> All that to solve 45=12(1.04)^n, and the answer takes "less then 30 seconds"? While you are messing about with that, your classmates have already solved the equation and have moved on.

Only if they solved it algebraically, as is easy to do on the 11C/15C. BTW, it's "than 30 seconds", as I wrote. Faster if the initial guess is close...

> Quote:
>
> While the HP15c is a great tool for number crunching, I don't think that type of solving is one of its strengths. If you must have RPN, and you are permitted graphical calcs, maybe a 48gii / 49g+ would be the way to go.

Sure, the 48G-series and 49-series models have the slick fill-in-the-blank equation solver. To get it on the HP 48G-series, hit right-shift SOLVE (but not left-shift SOLVE). On the HP-49G, first locate the "NUM.SLV" in red print on blue. I hope that the KinHPo 48GII and 49G+ are clearer and more intuitive, but I'm not paying good money to find out.

> Quote:
>
> Num Slv -> 'Solve Equation' -> fill in "45=12(1.04)^n" and go SOLVE, to give the

> answer in a second or so. No need to fiddle about trying to write programs.

This doesn't work on the HP 48/49 models as stated ("invalid syntax") because implicit multiplication is not supported. After making this mistake, more time is spent editing the equation to read '45=12*(1.04)^n'

BTW, the 15C program is not all difficult to enter; it can be done in less than 15 seconds. No hunting for "=" and "N" (don't forget to use ALPHA mode).

On solving functions defined as programs on any RPL-based 28/48/49: Can it even be done? If not, how would the user solve some "function" that included a loop or conditional test? I asked this question in this Forum a while ago, and got no satisfactory answer from anyone.

> Quote:
>
> Just something to consider...

Consider it considered. ;-)

Even without the text-field menus and high computational speed, single answers to problems like these can often be obtained more quickly start-to-finish with less mental effort on the 15C, because there's no hunting for functions or correcting syntactical errors.

What don't you use logs ?

*Message #11 Posted by **Thibaut.be** on 30 Sept 2004, 5:43 a.m.,*
in response to message #3 by Iron Horse Tamer

Sure that your HP 15C can help with that.

It seems you'll have a financal manths test, right ? With such question as how long will it take for a capital of 12 to reach the value of 45 with an interest rate of 4%, right ?

Well, if you have a 12C, then you're the king.

Otherwise, you can go to simple maths to solve this : 45=12(1.04)^n 45/12 = 1.04^n

ln(45/12) = ln(1.04^n) ln(45/12) = n ln(1.04) = n = ln(45/12)/ln(1.04) -> n = 33.70

My point is that it's much easy to mistype numbers, and that you can get to a result that is far away from the expected result. Also double check your results and ask yourself the question "Is this result credible and realistic ?"

Using a solver without mastering your 15C can lead you to maybe fast answers, but with some risks regarding accuracy.

Therefore, and especially for "simple" maths (I'm not a mathematician at all, but just love the ln and exponent rules), I'd highly recommend to use your brain rather than your calculator for attending tests. Of course your calculator can help you to double check your results.

There is this site where it was said that if you are talking about investment with a banker or a broker

who does not own a 12C or similar, just walk away.

This statement is so much true. When we purchased our house 4 years ago, I visited several banks and NOT ANY SIGLE ONE was able to explain me what their payment calculations meant. Some were using formulaes where the interest rate was compounded differently, sometimes with a 20% difference on the actual interest rate (such as you US people have between the yield and the APR : this is not legal in Belgium). I was so p*** off that I built my own site where I developed and demonstrated the well known financial formulaes and how to use them with a HP financial calculator. http://hpcalc.multimania.com You might find there some interesting addisitonal documentation to your courses.

I wish you good luck !

Re: I suggest an Hp17Bii or Hp17Bii+

*Message #12 Posted by **Ron Ross** on 30 Sept 2004, 9:19 a.m.,*
in response to message #1 by Iron Horse Tamer

The calculator is RPN, Financial, and has a solver that a 5 year old can use. That can't be said for the 15c solver.

I suggest the 17Bii over the graphics option unless you have other higher end mathematics to take afterwards. The Hp17Bii is well equiped to handle financial and statistics based courses. The Hp graphics would also work well, but other than the B&W and other business type plotsand graphs, offer no significant advantages over the Hp17Bii to a business major.

Now if you have any physics, mathematics or engineering courses in your way, I would offer other advice.

Re: I suggest an Hp17Bii or Hp17Bii+

*Message #13 Posted by **Thibaut.be** on 30 Sept 2004, 9:30 a.m.,*
in response to message #12 by Ron Ross

Agreed. And even a 19BII is a great machine too.

Re: I suggest an Hp17Bii or Hp17Bii+

*Message #14 Posted by **Ron Ross** on 30 Sept 2004, 10:32 a.m.,*
in response to message #13 by Thibaut.be

And I would suggest that also, except that it isn't nearly as easy to get. But it does have trig and units conversions. I would love to see Hp re-release a new Hp19Bii+ as implied by some other sites.

HP15 Statistics problem

*Message #1 Posted by **Mark Balcom** on 29 Sept 2004, 5:41 p.m.*

If I enter a number and follow it with with the <summation+> key I get "error 3". The same thing if I enter <gold F> < clear reg>. It appears that my machine has forgotten how to calculate mean, standard deviation, etc. Is there a fix?

Re: HP15 Statistics problem

*Message #2 Posted by **Nelson M. Sicuro** on 29 Sept 2004, 7:10 p.m.,*
in response to message #1 by Mark Balcom

If you press f MEM how much registers it shows on the rightmost number? I think that if you haven't at least 7 storage registers the statistics doesn't work. I need to read again my user's manual, but I think that "Error 3" is memory error (not enough registers).

If this is correct, you need to redimension the storage registers. Place the number of registers (at least 7!!) and press f DIM (i) .

Best regards,

Nelson

Nelson is right; here's a bit more detail..

*Message #3 Posted by **Karl Schneider** on 29 Sept 2004, 10:26 p.m.,*
in response to message #2 by Nelson M. Sicuro

Nelson is right -- do as he says.

As indicated on the back plate of the HP-15C (see table with capital Sigma on left side), statistical summations use numbered registers 2-7. So, highest-numbered register allocated for use from free memory must be at least 7. (BTW, registers 0 and 1 can never be deallocated.)

The "MEM" command will identify the present highest-numbered allocated register as the leftmost number displayed by the command.

Error 3 (as shown by the ERROR table on the back plate) indicates an attempt to use a register (R?) or array element (Aij?) that has not been made available by the "DIM" command.

17b or 27s style "solver" app for 48GX

*Message #1 Posted by **bill platt** on 29 Sept 2004, 5:29 p.m.*

Does anyone know whether someone has made an interface like this?

Best regards,

Bill

Re: No real need

*Message #2 Posted by **Ron Ross** on 30 Sept 2004, 8:24 a.m.,*
in response to message #1 by bill platt

The 48G series has a solver that is very similiar to the 17 or 27s in use, features and functionality. In many ways it is better. Use EQ Writer to make your eq (just as you would make an eq on the 17 or 27s). When you are through, press enter to put on stack, type a descriptive name, then store. When you pull up the numeric solver, choose your new eq and Voila! there it is. It will behave just like the financial solver or any other solver eq like on the 17 or 27s as well. A somewhat different layout, but you just toggle to the numbers you wish to change.

The 48G also allows you to grab the Eq Lib equations and load into the solver AND also correctly keeps track of the units. This is something 17 and 27s cannot do.

Long live the HP-28S on my Ipaq !

*Message #1 Posted by **Vincent Weber** on 29 Sept 2004, 10:42 a.m.*

Hi all,

Now that I have so many calculators emulated on my Ipaq (namely: 41CX, 12C, 15C, 10BII, 42S, 28S, 27S, 17BII, 48GX, 49G) !, I had to select one for daily use... The winner is: the 28S !! The emulation through Emu42 and Erik's nice bitmap and KML is very nice and makes the best use of the PocketPC screen; the major reproaches to the 28S (not optimized for one-hand holding, horrible battery compartment, lack of I/O, poor display) are irrelevant to the emulator, which fits both sides of the 28S nicely on the screen, which a clear, readable, full-size display. I can easily load text strings, objects, and create multiple instances of the calc. I also found out that I liked it better for simple use than the 48: the 28 has many of the 48 features, but is simpler, with a less crowded keyboard, has catalogs, a display that is actually larger than the 48 (it can fit one more character, and display as many stack lines as the 48 using the 'toggle' button). Program editing is easier with the dedicated arrow keys in alpha mode. It is most sufficient for what I do, i.e. play with RPL and makes standards computation, plus equation solving. I don't care about large graphics, I/O (this is addressed by the PocketPC), time functions (the PocketPC does a better job than the 48 at that !), equation editor (ironacally, the 28S is faster with its 'FORM' menu than the 48 with its fancy equation editor). I would like a matrix editor, though, but not that often - the infinite stack + ->ARRAY command can create a matrix pretty efficienly. I like it also better than the 42, for its equation feature, and better than the 27S, for its direct alpha keyboard. I rediscovered RPL and I am surprised to see that, unlike a commun opinion here ("RPL is heavier than RPN and forces you to learn an overkill object-oriented languages"), RPL does actually uses less keystrokes than RPN for common operations such as loops. The use of 'FOR NEXT' structures, I believe, is actually more intuitive for newcommers to programming that labels, counters and gotos... Plus, the feeling to use the classy pioneer of RPL machines. All in all - surprising that the "winner" is what this underrated calc, perceived as cute, but more as a prototype of the 48. Anybody agrees ? :) Cheers, Vincent

*Message #4 Posted by **Mike (Stgt)** on 30 Sept 2004, 5:19 a.m.,*
in response to message #1 by Vincent Weber

Oops, did I miss something? You list 12C, 15C, and 10BII. For the later the only emulator I know is from "sebc", but the other two??? Where did you get the ROM files for an emulator??

Ciao.....Mike

Re: Long live the HP-28S on my Ipaq !

*Message #5 Posted by **Vincent Weber** on 30 Sept 2004, 7:40 a.m.,*
in response to message #4 by Mike (Stgt)

Hi, I don't know about "sebc"'s emulator. What I was refering to is not emulators actually, but simulators of 12C, 15C, 16C and 10B/10BII by Lygea. See www.lygea.com. Hence, there is no need for ROM images. The simulators are pretty good, complete, and improve on the originals in terms of speed, memory, display, and alphanumerics display of key codes. Very good programs indeed.

Cheers, Vincent

Vectors addition on HP28S

*Message #1 Posted by **JuanMi** on 29 Sept 2004, 7:20 a.m.*

Dear HP Gurus :),

I have recently purchased on ebay an HP28S (at last!!!!) which works fine but unfortunately with no owner manuals.

My question is:

I have to work with very simple vectors calculations (speed and course of a ship added to speed and course of a stream/tide) and I get "strange" results from my HP28S (sure, I'm doing something wrong).

Let's show a very simple (and quite stupid, I know!) example:

Speed of ship: 10 kts. Ship Course: 0 degrees (north)

stream speed: 5kts. stream course/direction: 180 degrees (south).

Of course, anybody needs a calculator for this example!!!. Resulting vector is: (5,0). So, real speed 5 kts, real course 0 deg (no changes).

Ok, but when I do the vector summation, I get: (15,180)

My inputs: (10,0) as first vector (5,180) as second vector + (addition) (15,180).

On my Hp48GX needed to change to cyl coordinates...

What am I doing wrong?...

any advice will be highly appreciated. Inbetween, I look for a manual...

Best regards and greetings from Spain!,

JuanMi

Re: Vectors addition on HP28S

*Message #2 Posted by **John Limpert** on 29 Sept 2004, 9:08 a.m.,*
in response to message #1 by JuanMi

The HP-28S does everything in rectangular coordinates. You need to convert your data to rectangular coordinates, do the mathematical operations, and convert the result back to polar coordinates. See the P->R and R->P keys on the CMPLX menu (press CMPLX NEXT).

Re: Vectors addition on HP28S

*Message #3 Posted by **JuanMi** on 29 Sept 2004, 10:12 a.m.,*
in response to message #2 by John Limpert

Yeah!

It worked. Thank you very much for the info... I did'nt realize...

Best regards,

JuanMi

in response to message #1 by Juergen Rodenkirchen

Juergen, I dropped you an email giving the info. You can also use Google and do a simple search on "HP41" and turn up the site link.

People posting on this forum don't give the link out of respect for Dave Hicks. DavidY

Re: That other site

*Message #3 Posted by **Garth Wilson** on 28 Sept 2004, 7:28 p.m.,*
in response to message #2 by DavidY

> People posting on this forum don't give the link out of respect for Dave Hicks.

How does that constitute respect? Are they in competition? Or both trying to preserve and promote our interest in the old HP calculators? How could Dave Hicks have a problem with that?!

Re: That other site

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Sept 2004, 8:57 p.m.,*
in response to message #3 by Garth Wilson

The problem is that the people who created and/or operate "that other site" seems to be involved in (or somehow affected by) some kind of legal situation; may it be kind of a claim from a third party (a calculator manufacturer, perhaps?), or something similar.

The legal situation, whatever it may be, is such that Dave Hicks may get involved and affected just by allowing the name of that site to appear here, even as a simple character string. I assume that a hyperlink could be taken as a greater offense. So he asked us not to include such ASCII strings in our postings, and he even needed to devise filters that will detect that particular sequence of characters. He also needed to spend part of his time in manually deleting the potentially harmful messages.

While all this is most strange (it may be natural for lawyers; I don't know), it seems to be the way things are in the period of history we are living in.

FAQ on "That other site"

*Message #5 Posted by **HrastProgrammer** on 29 Sept 2004, 7:44 a.m.,*
in response to message #4 by Andrés C. Rodríguez (Argentina)

This is what Warren said in the FAQ on his site regarding this subject:

Why are links to this site banned on the MoHPC forum?

I really don't know for sure, but this question keeps being asked, so I will tell you what I know. When I first started this site, I did not have permission to distribute HP-41 materials. The hpmuseum.org forum would not let anyone post a "reference to a site that contains unauthorized copies of copyrighted materials". Since this was true, I decided to take down TOS if I could not obtain permission from HP. Fortunately, I was able to obtain permission and I asked Dave Hicks to remove the warning message. It seems Dave's objection comes down to the fact that for some reason I have permission to distribute HP-41 ROM images and he does not. It is not clear to me if he either does not believe I actually have permission, or he is being advised by his contacts at HP to distance himself, or he views this site as some sort of competition. Anyway, after asking nicely, I finally insisted that he remove any "defamatory statements" about my site because it was "causing people to view it as a disreputable source and damaging my personal reputation". I never made any threats, and never said I was going to take "legal action". Dave's only response was to change the message to what you see now, and refuse to talk about it.

It costs a lot of time and money to run this site and it is purely a hobby for me, but I think it is worthwhile and a lot of people seem to appreciate it. MoHPC is a great site and I really regret this situation and hope that someday this can be resolved.

12345 to delete ...

Re: FAQ on "That other site"

*Message #6 Posted by **Dave Hicks** on 29 Sept 2004, 12:47 p.m.,*
in response to message #5 by HrastProgrammer

I visited HP headquarters last week and brought this up - again. Sorry - no change.

I had talked about it until accusations of defamation were made over a forum error message that was generated about 7 times a year and seen only by the poster of the message. Now I have a much more vague message. That's all I can say.

Re: FAQ on "That other site"

*Message #7 Posted by **Mike (Stgt)** on 30 Sept 2004, 5:13 a.m.,*
in response to message #6 by Dave Hicks

Hi Dave!

Tnx 4 the clarification, seems I was wrong with my assumption. So it was pure coincidence that the ban of "that other site" started when his freeware was offered for $ on a M$-site? I'd like to know if I do something unlawful if I link to W. from my site or if I do use his emulator?

Inquisitive.....Mike

Re: FAQ on "That other site"

*Message #8 Posted by **Dave Hicks** on 1 Oct 2004, 2:43 p.m.,*
in response to message #7 by Mike (Stgt)

Sorry Mike but I don't know if there was any relation to "$ on a M$-site" or not. I don't even know exactly what that means and if I did, I think I still wouldn't know whether it relates.

Re: FAQ on "That other site"

*Message #9 Posted by **Mike (Stgt)** on 4 Oct 2004, 3:17 a.m.,*
in response to message #8 by Dave Hicks

Sorry if I was not clear for everybody: $ stands for money, and M$ for MicroSoft.

Ciao.....Mike

Re: FAQ on "That other site"

*Message #10 Posted by **Warren Furlow** on 1 Oct 2004, 10:22 p.m.,*
in response to message #6 by Dave Hicks

To the best of my knowledge, EVERYTHING on my site is completely legal. I have written permission from each copyright holder to distribute their manuals, programs, etc. Some holders released material under GNU GPL, some to public domain, some gave me specific permission to distribute their materials, which they may or may not have given to anyone else.

My site has apparently been singled out and banned from this forum for vague, unsupported reasons. People wonder if I am doing something wrong, as evidenced by some of these postings.

If you have any doubt, I assure you, there are no claims whatsoever against what I am doing. If anyone can show otherwise, please do so. Dave, if you have evidence from HP that I am doing something that they consider to be a violation of their copyright then please make it known. I think this is all about nothing.

What more can I say? Thanks to all of you!

Yours, Warren Furlow 770-822-0030

"D-R-I-N-K O-V-A-L-T-I-N-E" [Re: TOS]

*Message #11 Posted by **Karl Schneider** on 2 Oct 2004, 1:39 a.m.,*
in response to message #10 by Warren Furlow

For many months, I'd wondered about the mysterious "other site" (TOS) dedicated to HP calculators, but which was not to be mentioned or linked on MoHPC. I never came out and asked anyone its identity, but it bothered me not to be one of the *cognoscenti(?)* after having been a regular participant for years.

I imagined the treasure-trove of forbidden information that awaited me, once I obtained the secret word.

The recent messages in this thread finally revealed giveaway clues about the identity of TOS: "Warren", "google 'HP-41'"... TOS must have been the site that I had visited and

from which I had purchased the product more than a year ago!

Aw, gee whiz... I felt like little Ralphie in "A Christmas Story", who obtained his long-awaited Secret Decoder Ring only to receive the message "Drink Ovaltine" when he then got a chance to use it.

Seriously, I hope that the situation is resolved to satisfaction of all parties.

Re: FAQ on "That other site"

*Message #12 Posted by **Warren Furlow** on 3 Oct 2004, 2:11 p.m.,*
in response to message #10 by Warren Furlow

I see no response (Ovaltine notwithstanding!), so I have to conclude there are no legal issues. Is there some other issue? Lets work it out, but I have got to know what it is first!

I hear the house analogy and to some extent I will go with that. But a leader is expected to be fair and reasonable.

I think it is time to end this and get back to the great hobby we all love. This is a great website with a great bunch of people that frequent it and share information freely - with one exception. May my site please be off the "blacklist"?

Best wishes to all of you!

Yours, Warren

Warren, how about posting the letters you have from HP here?

*Message #13 Posted by **Gene** on 3 Oct 2004, 2:41 p.m.,*
in response to message #12 by Warren Furlow

Perhaps if you post your "permission" letters from HP, then a discussion could be held on them.

apparently, somebody at HP thinks you don't have permission, but you say you do.

Should be easy enough to settle, I woudl think. I mean, either you do or you do not. :-)

Gene

I'm trying to ask Fred Valdez in a different way than I tried previously.

However, I wouldn't expect an answer until during the workweek at best.

Re: FAQ on "That other site"

*Message #15 Posted by **Warren Furlow** on 3 Oct 2004, 4:07 p.m.,*
in response to message #14 by Dave Hicks

Gene, I don't have an objection to doing that, per-se, however I am not sure HP would appreciate me releasing their correspondance, especially to the public.

It is possible this is a case of the right hand not knowing what the left hand is up to. I hesitate to even mention the names of HP people publically but I did provide my contacts to Dave several years ago. Dave, in case you don't have that info anymore, I will send you a private email with the name of the person in HP legal that wrote my letter, so you may address your message to both of them.

No one from HP has ever contacted me to object to anything.

Thanks, Warren

a response

*Message #16 Posted by **DavidY** on 28 Sept 2004, 10:24 p.m.,*
in response to message #3 by Garth Wilson

Andres, thanks for that answer.

Garth, Sorry, I simply thought that anyone curious about all the dancing about "that other site" would have done a search on this site's archives for some background and would have gotten some information about the situation and that I didn't need to be explict.

In so far as "respect". When I visit a friend's house or use his possessions common courtsy dictates I respect his wishes. This is Dave Hicks site. He gracious allows us to use this forum. And, he deserves respect for the work he's put in producing this site, he didn't/doesn't have to share it with us.

Also,Dave and Warren are both good guys. They have given invaluable resourses for 41 users. They both should be respected for that.

Re: a response

*Message #17 Posted by **Garth Wilson** on 29 Sept 2004, 2:07 a.m.,*
in response to message #16 by DavidY

I don't see the conflict, myself. Warren's site is more HP-41-specific, whereas this one is more general for all the HP calculators. I myself have provided several pieces of material for Warren to put up on his site, and when I asked if he knew if there was a forum anywhere, he told me about this one. As I see it, the sites complement each other, not conflict. I'm glad to have found both, and it seems that Dave and Warren each would be glad for the other's contributions to the preservation of our interest. I would be.

Can't toggle 15C user off?

*Message #1 Posted by **Saragrace Knauf** on 28 Sept 2004, 3:05 p.m.*

Okay, I admit it, I can't find my user manual and have gotten the user function on some how. (user is displayed below the numbers). It seems to be screwing up my abillity to store numbers??

Thanks for any help.

I found a keystroke to reset the calculator, but it didn't work....grrrr

Re: Can't toggle 15C user off?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 Sept 2004, 3:10 p.m.,*
in response to message #1 by Saragrace Knauf

Hi, Saragrace;

please, have a look at the yellow inscription over the [RCL] (recall) key, in the keyboard faceplate: it must be [USER], right? Now, locate the [f] key beside the [ON] key. With the calculator turned to on, please do this:

```
- press the [f] (yellow) key and note if the small 'f' annunciator in the display turns itself on;
- now press the [RCL] key;
```

If everything worked fine, the USER annunciator is no longer in the display.

Let us know if you need more advice.

Cheers.

Luiz (Brazil)

*Message #9 Posted by **Saragrace Knauf** on 28 Sept 2004, 6:07 p.m.,*
in response to message #8 by Miki Mihajlovic

In response to Mike's suggestion: Nope! Doesn't like that either...

Just in case someone is wondering if the calculator works, I did run the test sequence I found here:

http://www.finseth.com/hpdata/hp15c.html

ON + + inititate continuous self-test

and it did what it was supposed to. I have not done a keyboard test yet....??

More suggestions?

Thanks, Sg :}

Re: Can't toggle 15C user off?

*Message #10 Posted by **Thibaut.be** on 28 Sept 2004, 8:38 p.m.,*
in response to message #9 by Saragrace Knauf

ON/+ sequence will run a loop test. You don't want this one.

Self test is as follows : - turn your calculator OFF (press the ON button, make sure the screen clears) - press the X key (multiply key) AND DO NOT RELEASE IT - press the ON key and RELEASE IT - NOW release the X key

The calculator should show a flashing "running" message for 15 seconds, then finish up with a screen where all segments are litten up. This means that the self-test is successful.

Now you want to test the keyboard.

- turn your calculator OFF (press the ON button, make sure the screen clears) - press the ./. (divide key) AND DO NOT RELEASE IT - press the ON key and RELEASE IT - NOW release the ./. divide key - you should see strange characters - begin pressing the top right key (square root key), then press the next key to the right (e^x), then next (key (10^x), till you reach the divide key. All key should show a different weird display - do gain the sequence starting with SST, then again starting with R/S, then again with ON. NOTE that the ENTER key needs to be pressed twice, once for the 3rd and once for the 4th column - Once you've reached the + ke, you should read 15 at the middle of the display, evidence that your keyboard passes the test.

There is the same sequence as the ON/X with ON/-, this will reset your calculator. All programs and registers will be lost, but your indicator will clear. Quite hard ball method.

Finally, the ON/. sequence will toggle between european and US number format (point/comma decimal point, and comma/point '000 separators)

Re: Can't toggle 15C user off?

*Message #11 Posted by **Saragrace Knauf** on 28 Sept 2004, 11:14 p.m.,*
in response to message #10 by Thibaut.be

Thibaut.be !! You are my hero! ;)

The ON/- cleared it. (It passed all the other tests too!)

I love this calculator...I hope it never dies. I started using it in a math class I am currently

taking. Even after almost 20 years of rare use, I still am so used to the key strokes I can't change over to a newer HP!

Thanks so much for everyone's help!

Sg

Re: Can't toggle 15C user off?

*Message #12 Posted by **Thibaut.be** on 29 Sept 2004, 3:47 a.m.,*
in response to message #11 by Saragrace Knauf

Thanks for having been of any support. I guess nearly every memeber of this forum could have helped you.

As a side note, I'd recommend you to tun the self test and keyboard test sequences, just to make sure your calculator is not damaged.

As many of us, no one would part of a 11c or a 15C. I'd highly recommend you to get a copy of the user manual, paper or digital version, as your calc does holds a lot of other treasures !

Is the radian a more "natural" unit than the degree?

*Message #1 Posted by **Tom Sherman** on 28 Sept 2004, 2:26 p.m.*

Recent posts about the RAD and DEG modes of HP calculators started me musing about angle units.

Somewhere in my mathematical education (such as it was), I acquired the notion that the radian is a more "natural" or more "mathematical" unit for an angle than is the degree. Certainly the radian has elegance and simplicity, being an arc length equal to the radius of the circle divided by the radius itself. But the degree is almost as simple. Suppose we compare an arc length equal to the circumference of the circle to the circumference itself, and call the resulting unit a "circumian". This may sound moronic, dividing a circle by itself and calling it a unit. But from such a dimensionless unit, subunits can be cut which are rationally related to the whole circle, which the radian can never be. It is, after all, whole circles or rational parts thereof that often are required. Since the "circumian" is too large a unit to measure parts of the circle (the radian is also a little clumsy in this respect), it needs to be broken into smaller parts. The obvious choice might be 100, but someone chose 360 instead. Where did the 360 degrees in a circle come from? Probably from Babylonian (yes, it started in Iraq) and Mayan astronomers, who liked the number's easy divisibility, combined with its approximate correspondence to the number of days in a year. The degree likely derives from the observation that the sun moves against the stars (as seen at sunrise or sunset) about that angle per day around the zodiacal circle of the year. In that sense, for those of us on earth, it is a rather "natural" unit.

The degree, like the foot or pound or hour, is such a familiar everyday unit that it is often thought to have dimension, but actually it is just as dimensionless as the radian. The "circumian" is certainly dimensionless in the same obvious way as the radian, and the unit created by dividing it by 360 is therefore also dimensionless. In normal usage, all units for angles are dimensionless, and the ordinary trigonometric functions require dimensionless arguments.

So where in mathematics was I made to feel that the radian is, in some fundamental way, purer or better than a degree? The answer comes from the calculus, in a way that I never fully appreciated, or have long forgotten. The derivative of the sine is the cosine, right? Well, it depends on the unit of the angle. It is so if angles are expressed in radians, but not otherwise. If the angles are in degrees, the derivative of the sine is not the cosine, but the cosine multiplied by (pi/180). That is not nice! And things get worse. The derivative of the cosine is a negative sine muliplied by (pi/180), and the second derivative of the sine is a negative sine multiplied by (pi/180)^2. The sequence of the derivatives of the sine and cosine, instead of forming the remarkable cycle we are accustomed to, forms a spiral of ever-diminishing values. Bizaare! The number (pi/180), which is of course the number of radians in a degree, starts to pop up in its various powers all over the place in the calculus of trigonometric functions if we try to use degrees instead of radians. Why is this so?

It all has to do with an important limit, the limit of the ratio of the sine (or tangent) to its angle, as the angle becomes very small. This limit is unity -- but only if the angles are expressed in radians. That is, sin(x)/x goes to 1 as x goes to 0 only if x is in radians. If we use degrees, the limit is -- you guessed it -- (pi/180). The radian is the only measure of angle that will give us unity for this limit instead of some other constant. (Try this on your calculator: calculate sin(x)/x for small x, first in degree mode, and then again in radian mode.)

This is a little like the case for the natural logarithms compared to any other logarithms such as the common logs. Just as the number e provides the only base such that e^x divided by its own derivative is unity rather than some other constant, so the radian provides the only angle unit for which that important limit of sin(x)/x is unity rather

than some other constant.

Because the limit of sin(x)/x enters into the derivation of the derivatives of the trigonometric functions, the nice clean relationships that we remember depend upon that limit being unity, which requires that the angles be in radians. Thus too the simple polynomial for calculating a sine or cosine from a Taylor series is valid only if the angles are in radians. If degrees are used, the Taylor series for the sine is:

sin(x) = (pi/180)x - [(pi/180)^3]x^3/3! + [(pi/180)^5]x^5/5! .... ,

which reverts to the familiar form if we just convert degrees to radians by letting x (or x') equal (pi/180)x.

So while the degree and radian are both useful in plane and spherical trigonometry, in calculus the radian emerges with an elegance (or radiance!) that the degree can hardly match. Nevertheless, I am glad that my compass, protractor, and sextant are scribed with degrees rather than radians. Since there are 2pi radians in a circle, and pi is irrational, no rational unit based on the radian could be scribed in such a way as to cover exactly the circle of my compass, the half-circle of my protractor, or the 90-degree arc from my horizon to my zenith. I guess we will keep both the degree and the radian, and be glad that our HP calculators have both modes available for most calculations.

The angle as I see it (probably obtusely!),

Cheers, Tom

Re: Is the radian a more "natural" unit than the degree?

*Message #2 Posted by **Wayne Brown** on 28 Sept 2004, 2:50 p.m.,*
in response to message #1 by Tom Sherman

Thanks for the interesting thoughts, Tom. It's things like this that make mathematics interesting to me.

Re: Is the radian a more "natural" unit than the degree?

*Message #3 Posted by **Bill Wiese** on 28 Sept 2004, 2:53 p.m.,*
in response to message #1 by Tom Sherman

Yes, you could say radians are more 'natural'.

In fact, radians are a "basic unit": they need no conversion to another system before being used as input to trig algorithms calculating sin, cos, tan etc. And the arc (inverse trig) functions naturally deliver a radian value. Employing other than radians in these algorithms would either require preamble or epilogue conversions or have a more complex derivation with conversion constants folded into terms in the infinite series...

Radian use is much like use of Base 'e' for natural logs.

Bill W
San Jose CA USA

Re: Is the radian a more "natural" unit than the degree?

*Message #4 Posted by **unspellable** on 28 Sept 2004, 6:15 p.m.,*
in response to message #3 by Bill Wiese

There are several misconceptions at work here. It's unfortunate that there is never time in a school math class to delve into these things.

It's commonly stated that the degree is based on the Bablonian calender of 360 days plus a five day holiday, but kiddies, it just ain't so. The actual derivation is from the very early devlopement of

trigonometry and involves a convenient number to simplify calculations. Much like we buy eggs by the dozen because 12 is divisable by 6, 4, 3, 2, & 1 without resorting to paper and pencil. An important point in a country market where few of the customers could read, write, or 'rithmetic. I have some articles on this derivation, but would have to refresh my memory to go into detail.

The grad of course, was an attempt at metrification.

Now on to the radian, or "natural" unit.

First, by definiton, an angle is equal to twice the area it sweeps in its unit figure of generation. (remember this definition, not all angles behave in the same manner! More on this later.) In the case of a circular angle (the common garden variety)a bit of math will quickly show that an angle of one radian sweeps an area of one half in the unit circle. The unit circle has an area of pi so a complete circle has 2pi radians.

Now we will get messy. In the case of a hyperbolic angle, the figure of generation is the unit parabola. Here we find that as the angle approaches 45 degrees as measured with a protractor its actual value approaches infinity. A hyperbolic angle is NOT the same animal as a circular angle.

It is also commonly stated that "natural" logs have e as a base. This is not true. Natural logs have no base what so ever. They are defined as an integral, not as the power to raise some base to a certain number.

Ordinary logs may be to any base you like, including complex numbers. We can choose e as a base. Surprise! Log to base e of X equals ln X! How ever we should preserve the distinction that natural logs have no base.

Another common error is the habit of calling natural logs or log base e "Napierian" logs. Actually Naperian logs do not look at all like common logs or ordinary logs. The mthod of calculating them and of using them in calculations does not look at all like ordinary log calculations.

I wrote a program for my HP-48SX to calculate Napierian logs or Nog X and the antilogs.

If any body here has too much time on their hands and desires to be bored stiff I can explain the Nog function later.

Re: Is the radian a more "natural" unit than the degree?

*Message #6 Posted by **hugh steers** on 29 Sept 2004, 11:00 a.m.,*
in response to message #3 by Bill Wiese

i discovered that, for a calculator, you cant just convert into radians as the preamble for trig functions.

for example, if your calculator has modes, say deg or rad. then in deg mode the sequence 36e20 sin should be 0 (which it is on some hps). however, if you go into radians and calculate 36e20 pi * 180 / sin, then you dont get zero.

so you cant internally just secretly convert to radians and get away with it.

Back from the HHC2004 Conference

*Message #1 Posted by **Namir** on 28 Sept 2004, 1:42 p.m.*

Well I am back from the HHC2004 conference in San Jose. I really had a wonderful time. I saw old friends from the PPC that I have known since 1980!! I also met new friends some of which are regulars on this website. Of course it was a pleasure to meet the museum's curator. Meeting Gene Wright was special too since he has shared a lot. Gene showed me his NoVRAM module that works for the HP41C. I was impressed with it's features AND it's price! I also met author Wlodek Mier-Jedzrejowicz who has written the famous RCL 20 (among other several HP calculator books) and contributes with Gene to HP calculator documentation. I also met Eric Rechlin, the curator of the hpcalc.org web site.

HP sent some of its calculator division people, including the calculator R&D man—a very energetic Frenchman, Cyril, originally from Lyon. HP was kind enough to pass free HP-33s calculator to each attendee!! Yes they sure did that. They also heard our complaints and critical feedback. Gene eloquently reminded HP that despite our critical feedback, we were at the conference because the HP calculators (old and new) meant something important for us.

The HHC2004 was two days of sold fellowship between calculator enthusiasts. There were many talks about different aspects of calculators. Gene, for example, talked about keyboard contrasts and how to quantify that aspect of the calculator. David Hicks talked about the HP Museum and was very generous in handing free copies of the museum's CD (both CD and DVD versions). Eric Rechlin talked about the hpcacl.org web site and gave free CDs for that website. Wlodek gave two talks—the first about 10 (well almost ten) things the calculators can't do, and about the conference of educators in Copenhagen that took place this past summer. Eric Smith talked about emulators for various HP calculators. His emulators are currently for LINUX and should be available for Windows. Other speakers discussed various topics such as HP-33s programming, speeding up the HP-41C by a factor of FIFTY, and keyboard layouts.

We hope that Richard Nelson and other folks behind the HHC2004 conference will announce the conference for next year.

I hope more folks who are regulars in this website will attend … or have to offer a very good explanation why they did not to Mr T who will come knocking at their doors! Don't say no one warned you!

:-D

in response to message #1 by Namir

Thanks for your awful post.

Well, it's most selfish to pretend your post is awful, as the only reason why it is so is because one wishes he was there.

I really am sorry to be so far away from what seems to be the only places in the world where several people can spend one full day just talking about HP calculators.

You know, every time we have an off-site at work, the first session is kinda introducing yourself, such as your name, function, grade, seniority, and something personal. Rather than telling that I'm married and proud father of 3 kids, I usually say 'I'm the nerdest of you all, 'coz I collect HP calculators, and I've got more than one hundred of these'. Guaranteed laughter in the room, but also a few guys waiving at me and showing me their 11C or 15C they've never parted of since the time they were students. I even impressed my new boss as he just bought a 12C, and having had a self test finishing with all digits litten on. He was amazed !

But here I'm impressed with all you've could lived at this session. Yes, Matthias prganized one in Basel, there was this 25th anniversary of the HPPCC in London 2 years ago, but I really wish there were some more informal meetings.

Now I'm curious : what are amongst the 10 things a calculator can't do ? do you have minutes of Wlodek's speech ? I'd be delighted to know that !

You CAN always get the video of the event!

*Message #3 Posted by **Gene** on 28 Sept 2004, 3:36 p.m.,*
in response to message #2 by Thibaut.be

Jake Schwartz will (eventually) produce DVDs of this conference like he has all the earlier ones.

Gene

P.S. Door prizes included 3 49g+ calculators, 5 48g+ calculators, a 17bII+ (with the let and get functions), and a host of other goodies, such as an 18c and 20s calculator, some great books and more.

Most everyone went home with more than they brought.

Rumor has it that next year's conference may be in Chicago!

Re: You CAN always get the video of the event!

*Message #4 Posted by **thibaut.be** on 28 Sept 2004, 8:42 p.m.,*

Not paypal ONLY, but paypal + other methods. :-)

Gene

A calculator can't do

*Message #10 Posted by **Tom (UK)** on 29 Sept 2004, 8:01 a.m.,*
in response to message #2 by Thibaut.be

Amongst the 10 things (in base 5) a calculator can't do:

1) Increase profit by 10% per year with no investment

2) Operate very well with a 2 page manual

3) Have any keys marked 'Enter'

4) Have any keys twice as wide as any others

5) Be long lasting if made after about 1999

Enjoy!

Re: A calculator can't do

*Message #11 Posted by **John Smitherman** on 29 Sept 2004, 4:20 p.m.,*
in response to message #10 by Tom (UK)

Hi Tom. Good list!

6) Catch a virus.

Regards,

John

Re: A calculator can't infect others...

*Message #12 Posted by **Andrés C. Rodríguez (Argentina)** on 29 Sept 2004, 6:30 p.m.,*
in response to message #11 by John Smitherman

Well, I think it may be possible to create a "self-replicating" magnetic card in a HP41 system and, using synthetic programming, do something like:

```
01 LBL "VIRUS"
02 SF 11
03 CLX
04 OFF
05 "FORMATTING RAM"
06 AVIEW
07 BEEP
08 STO C
09 ; irrelevant
```

It will need some actions from the user side, but it maybe somehow comparable to a diskette-propagated virus in the '80s-'90s.

Now, could someone create a piece of SystemRPL code (something I'm not familiar with at all) so such code could be broadcasted via IR to a neigboring HP48/49, and then force a cold reset with memory loss in the "infected" machine?

It all sounds very unlikely, but "impossible"... I would not say!

Re: A calculator can't do

*Message #13 Posted by **Norris** on 29 Sept 2004, 10:14 p.m.,*
in response to message #11 by John Smitherman

HP48 and HP49 viruses exist, as do antivirus programs. At least some are spread by IR. For examples, search for "virus" at hpcalc.org

Edited: 29 Sept 2004, 10:15 p.m.

What a calculator will never do

*Message #14 Posted by **Dave Hicks** on 29 Sept 2004, 1:03 p.m.,*

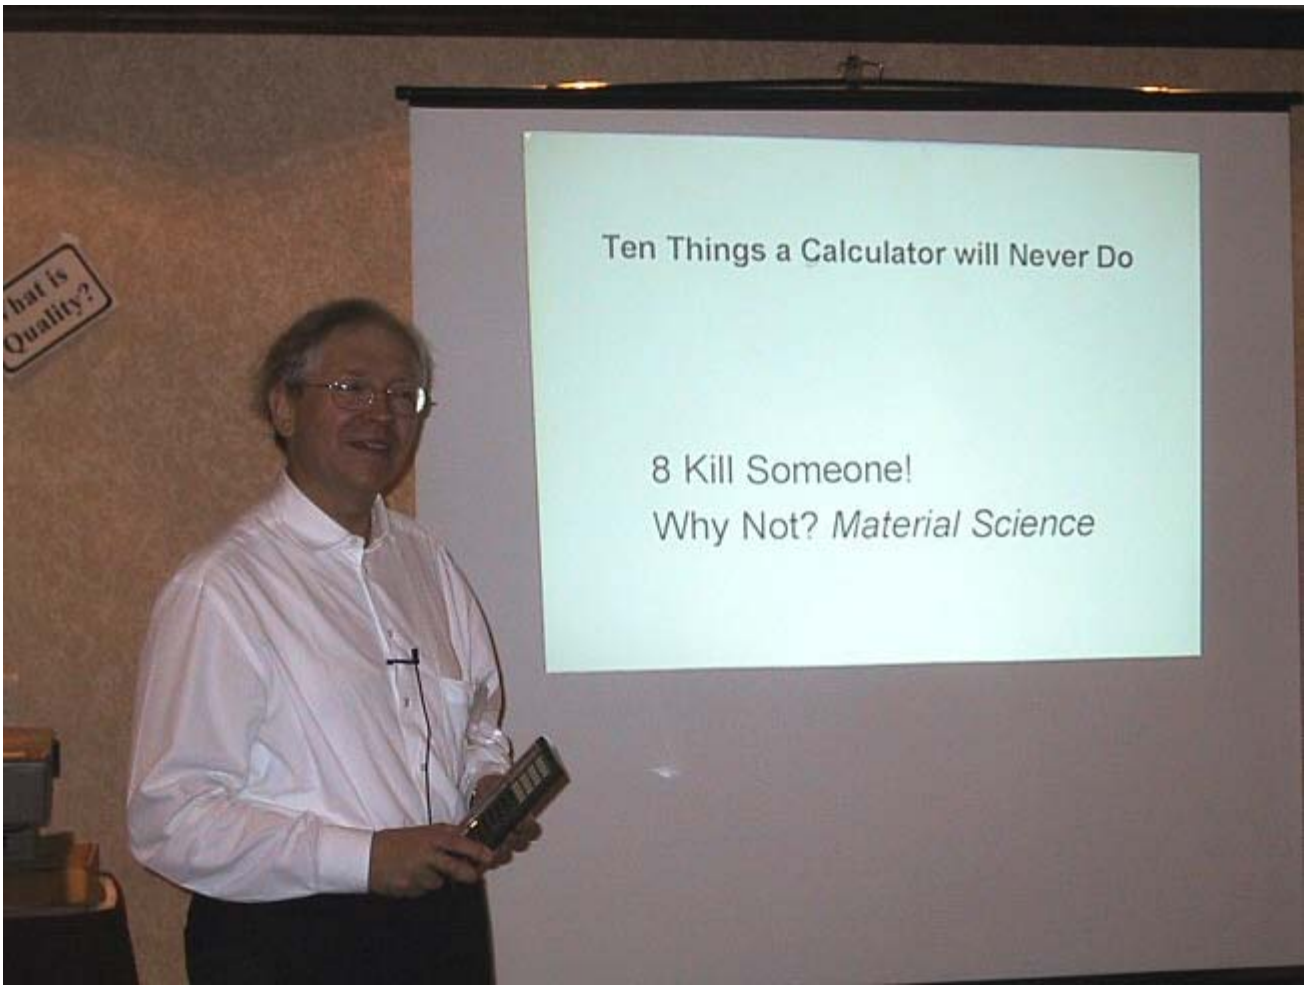
Just a teaser:



Of course this was controversial.

(Most of the presentation was mathematical.)

Re: Back from the HHC2004 Conference

*Message #15 Posted by **Richard Garner** on 28 Sept 2004, 5:49 p.m.,*
in response to message #1 by Namir

Hi All,

So one is going to ask, so I will be the first. From one who could not attend due to work and finances, was there any talk from the HP Reps about new products, problem fixes of current products or were they just interested our opinions of products already out there? It would be nice to know if there is something waiting in the wings to keep new products rolling out or that they will really take our criticism, suggestions and dreams to heart and give us something to be proud of in a year or two.

Think about this...

*Message #16 Posted by **Gene** on 28 Sept 2004, 5:58 p.m.,*
in response to message #15 by Richard Garner

There's just no way a company would tell you something like that.

It would be the equivalent of saying "I know we're trying to sell product X, but you know, in 10 days product Y will cost 20% of X and will be 100,000 times faster. Still, go buy X because we have a lot of

them".

It would be crazy. Why is that so hard for people to understand?

HP has a full line and has already been making incremental improvements (witness revised 17bII+ to put let and get back in). My guess is that will continue.

But to expect pre-announcements like this is unrealistic, IMO.

I'm shocked they have introduced as many items in the last 15 months as they have. That's really quite an accomplishment.

Gene

Re: Think about this...

*Message #17 Posted by **Wayne Brown** on 29 Sept 2004, 2:10 p.m.,*
in response to message #16 by Gene

> Quote:
>
> Why is that so hard for people to understand?

It's not hard to understand if you think of HP as a business that wants more than anything else to make money. It's harder to understand if you think of HP as being something more important than that... which, I have to admit, they no longer are.

Re: Think about this...

*Message #18 Posted by **Gene** on 29 Sept 2004, 3:15 p.m.,*
in response to message #17 by Wayne Brown

A corporation is owned by the shareholders, who give it their money with the charge to make more money.

Therefore, the reason a company does anything is to make more money for their shareholders.

Finance 101. Should be a required course for Engineers.

And, I don't believe your objection is relevant to the point. ANY company that announces what their next product is and when it will be introduced is just asking for sales to tank.

That's not a very good way to have money to produce the new product.

Re: Thinking about this...

*Message #19 Posted by **Andrés C. Rodríguez (Argentina)** on 29 Sept 2004, 6:53 p.m.,*
in response to message #18 by Gene

> Quote:
>
> the reason a company does anything is to make more money for their shareholders

As a seasoned engineer, I do agree, with some comments:

- It may be an idiomatic distinction, but I think it is not the same to say "... the reason a company does anything is to make more money..." than "...a company does anything to make more money..."

To make money and to keep a steady cash flow, your products should have competitive features and price. That means quality, innovation, value for the customer, good ergonomics, durability (OK, not too much of this, so you will come back from time to time), etc. For a calculator, accurate and dependable results is a must. Some of these features prevent "anything" from becoming "anything".

Companies (including HP calculator division) do usually announce product roadmaps, statements of direction, things like "we will keep offering RPN versions", "we will introduce N new models before the end of the year". Of course, they do so in a manner which preserves their current offerings.

As they (of course!) are not saying "On day X we will introduce the new YYY model with the following features set (include complete details here), and at ZZ dollars; so to replace the current TTT model", they are not killing their current offerings at all.

And, even after the announcements, a good strategy for the price points of the old and new products will allow the old products to keep selling for quite a time (i.e.: HP 12C).

Just my engineered 0.02$

Re: Think about this...

*Message #20 Posted by **Wayne Brown** on 30 Sept 2004, 3:20 p.m.,*
in response to message #18 by Gene

As I said, if you think of HP as "just a business," then everything you said applies. However, I think of HP (or rather, Hewlett-Packard, a name that HP no longer uses or deserves) as something higher, greater, more important that just another crass money-grubbing business. I see HP as something different from any other organization, and I see what the current management has done not in terms of good or bad business decisions, but almost as a desecration of something sacred.

Let me finish by explaining it like this: I can remember reading criticism in the 1970s and 1980s by business analysts who thought HP was controlled too much by engineers; that these engineers cared more about their status among their fellow engineers than about market share; that their dedication was not to making products that would earn money for the company, but to inventing things that other engineers and scientists would buy because "they're such elegant gadgets!" The analysts painted a picture of HP as a company that behaved more like a pie-in-the-sky academic research project than a money-making business. Well, *that* was what I loved about HP. I knew people who worked there (not in the calculator division, though) who saw the marketing and sales departments as necessary evils who were tolerated because they were needed to stay in business. All that mattered to my friends about that side of the company was whether they made enough money to keep the doors open and keep funding the labs.

Those days clearly are over; some people don't believe it ever really was that way, except maybe for a few "techies" in the labs. Well, to me those "techies" and their interests were far more important than the interests of all the shareholders put together. Not that anybody wanted the shareholders to know that, of course...

The perils of going public..

*Message #21 Posted by **bill platt** on 30 Sept 2004, 4:03 p.m.,*
in response to message #20 by Wayne Brown

Hi Wayne,

You have made an eloquent and I believe important point--and said it with clarity. No, you are not merely waxing nostalgic---indeed there was something diffrent, admirable about the old HP. The fact that the old HP came to be so wealthy came directly from those core beliefs about engineering--a sense of higher purpose if you will. The money flowed because the products were truly the best, and it mattered.

I will point out that Gene is also perfectly correct, and therein lies the conundrum: By going public, a company will, by the very nature of the joint stock company, come to the "End of the Road" with regards to company Philosophy (remember Horatio and his "Philosophy"? I am afraid there is also more to business than the founder's philosophy).

Many other fine companies have also suffered after a prosperous and honorable run:

Strawbridge & Clothier (Philadelphia) now Strawbridges' and owned by May & co.;

Insurance Company of North America, now CIGNA. The core of the business, property & casualy, sold off to a Bermuda interest a few years ago;

Google? (wait and see....);

Apple Computer. remember the good old days?;

West Marine. Once, a small up-start, private business out West, very friendly, helpful, successful. Now, a behemoth, second only to Wal-Mart in sheer growth and dominance in a major consumer market.

I am sure there are many others....perhaps even WAl-Mart!

So, let us all give our thoughts and otherwise to Hugh and the whole group over at OpenRPN, who may in fact be capturing that spirit of the old HP.

Best regards,

Billl

Re: The perils of going public..

*Message #22 Posted by **Wayne Brown** on 30 Sept 2004, 4:50 p.m.,*
in response to message #21 by bill platt

Yes Bill, I'm coming to realize that Hewlett-Packard is dead and gone, with the current HP merely an interloper trying to trade on their good name...

I applaud Hugh's efforts and wish him (and the rest of the OpenRPN folks) the best. Anything is better when it comes from the efforts of people who love their work for its own sake.

*Message #23 Posted by **Garth Wilson** on 30 Sept 2004, 8:09 p.m.,*
in response to message #21 by bill platt

And then there was Commodore with good engineers, but whose president Jack Tramiel had the philosophy that business is war, and did all kinds of lousy things to make money and ended up destroying his own company instead. Too bad he didn't conduct himself honorably and let the company be promoted by good engineering instead of "the bottom line" as he saw it.

Re: The perils of going public..

*Message #24 Posted by **Wayne Brown** on 1 Oct 2004, 11:04 a.m.,*
in response to message #23 by Garth Wilson

Yes, I agree. I was a big Commodore fan at one time; my first personal computer was a Commodore 64. But I always found Tramiel's attitude very irritating.

Re: Think about this...

*Message #25 Posted by **Ren** on 30 Sept 2004, 7:57 p.m.,*
in response to message #20 by Wayne Brown

Sometimes I wonder why Agilent didn't get the calculator division when the company split...

Agilent has always (to me) represented the spirit and quality of HP. I was told by someone in Agilent (just after the split) that Carly's group got the HP name because it needed the value behind the name if it were to survive. If true, so sad...

While Agilent is not rolling in the money, I feel they would put reliability and function in the calculators over HP's cheap glitz.

Re: Think about this...

*Message #26 Posted by **Ed Look** on 1 Oct 2004, 12:23 a.m.,*
in response to message #20 by Wayne Brown

I only knew of HP initially from their Spice series calculators and later because of the verrrrry nice lab equipment they produced.

But it was still a profit-seeking enterprise. They may have had pride in their craftsmanship and design, but it was still a business.

But the world has seen a change, maybe almost a paradigm change, in the way businesses are run and especially in the financial environment in which they must exist.

While they may very well be quite guilty of some of the smoke and mirrors and unsubstantial flash many companies engage in these days to sell products rather than using actual quality as one of the weapons, they and all corporations must adapt to survive.

I myself started to be quite disappointed first when there were so few affordable scientific RPN models by them (at one time there were the 31E, 32E, and 33E, all fairly affordable; the 33C and 34C taxed you a bit and the 41C series to most of us were just "dream machines"... then all I saw were the 20S, 22S, 27S, 30S and the financial calcs) and worst of all when I bought one of their PCs... shocking, to say the least!

But consider, Kaypro disappeared, Digital Equipment Corporation disappeared(!!!; I've always had a soft spot for DEC over IBM... anyday!), Wang Labs bit it, AST, Northgate, Commodore, Atari... all gone. I suspect all of these "guys" had their loyal following, too.

Well, this company may carry on only the name, but it DID spring genealogically from the one we all admired at one time and it's still here. Again, the climate has shifted and they're still here and the 33S and 49G+ to me were more than halfhearted stabs at regaining the status they once held through some quality. I think it's just that we all have waited so long we all came down like a school of hungry sharks with criticism.

I forget who, but a poster in this board mentioned the realities of silicon fabs and foundries a short time ago in one of our threads here. The Second Law tells us there's no turning back and that unless perhaps millions (billions?) of dollars of un-entropy were poured in, it would be quite difficult to duplicate the machines we all held with such affection, up to and including the Pioneers.

I plan to support their current direction in RPN calculators, including with my pocket. The two recent offerings I do possess and through use have found them to be satisfactory functional replacements for my 34C and 32SII, if not satisfactory emotional replacements (Capt. Picard? Who's he??). In fact, despite my attachment to the 32SII, I have found the similarity of function to it AND THE ADDITION OF A CONSTANTS LIBRARY and somewhat larger program memory to have sweetened the transition over and above even the somewhat puerile cosmetics.

Re: Think about this...

*Message #27 Posted by **Dave Hicks** on 29 Sept 2004, 3:23 p.m.,*
in response to message #17 by Wayne Brown

Remember that even the "old HP" was secretive about new models. I saw this as a "feature" because some of their competitors used to advertise products that couldn't be found in stores for months - if ever.

As for making money - they are doing that in calculators now. I think that's a really good thing. I think that HP brought calculators back largely for "good will" reasons but if they also manage a more direct business case of: "and they make money too!" then so much the better.

Re: Think about this...

*Message #28 Posted by **Richard Garner** on 29 Sept 2004, 4:49 p.m.,*
in response to message #27 by Dave Hicks

It seem that I stirred up a hornet's nest when that was not my intentions. Sorry Dave. I was simply asking if HP is working on fixing the problems with the current products or this is as good as it gets until the next new product. I like many others here feel that the 48GII and 49G+ machines are too complex and too large for my needs and the 33S is not enough for my needs. What I need is something in-between. For me that would be the mythical 43S. All the power and small size of the 42S with some of the features of the 48/49 added in.

The second bit of information that I was looking for was, do the HP Reps really listen to our criticisms, suggestions and dreams or are they going to blow it all off and go on as if we had said nothing. If they are listening, it would be nice to know that in X amount of time a new product will implement as much of the changes/fixes as possible. I'm not looking for Product ABC will be released 2 months from now. What I am looking for from the HP Reps is. We understand the problems that everyone has had with our current line and the needs of those that

are in need of something different and we think we can satisfy most of those needs in our next product line.

Re: Think about this...

*Message #29 Posted by **Dave Hicks** on 29 Sept 2004, 5:40 p.m.,*
in response to message #28 by Richard Garner

> Quote:
>
> Sorry Dave. I was simply asking if HP is working on fixing the problems with the current products or this is as good as it gets until the next new product.

No problem. Yes they are working on fixes. A number of changes have been worked into the current line already. (Causing a different issue in that it's not always clear which version you're buying.) Also the China manufacture adds a shipping delay which lengthens bug fix cycles.

> Quote:
>
> do the HP Reps really listen to our criticisms, suggestions and dreams or are they going to blow it all off

Well how can we know? If you make a suggestion and it's implemented, was it your suggestion or was it the obvious next thing to do? If you make a suggestion and they don't implement it, were they not listening or did your suggestion not line up with broader market realities?

I think that HP sending 3 people to talk to a group of 30 says that they are certainly trying to listen. How our feedback fits in the current calculator market remains to be seen. I think the most common request at HHC was for a very simple RPN calculator to get the next generation started. I don't remember a 43S-like proposal coming up.

Another suggestion that came up a couple of times was HP adding a simple Windows RPN calculator to all HP PCs - another attempt to hook the next generation on RPN. They said they had looked at that but it was... "complicated" I think was the word they used.

Thanks Dave

*Message #30 Posted by **Richard Garner** on 29 Sept 2004, 6:43 p.m.,*
in response to message #29 by Dave Hicks

This is pretty much what I was looking for in information. A low end RPN in the $5 to $10 range with no more than a 2 functions per key and about 24 to 30 functions total may help get more people interested in HP calcs. I still think that HP is missing a much larger group that really need an RPN calc that is between the 33S and 48/49 series. This gives me some hope that things are getting better. Thanks again Dave.

2 things

*Message #31 Posted by **db(martinez,california)** on 29 Sept 2004, 11:42 p.m.,*
in response to message #30 by Richard Garner

1)The above subject at the confrence was someone's suggestion that a new rpn with

the functionality of the 45 would be a good beginer/student/promo-give away calc. It was well recieved all around, and was interesting to one of the HP folks too. I'd buy 3 myself.

2) How can i post two photos i took there? One is of Dave speaking. The other is of the host, Ted Kirber. The back of Gene's head is in one of the shots.

To place the photos here...

*Message #32 Posted by **Vieira, Luiz C. (Brazil)** on 30 Sept 2004, 12:12 a.m.,*
in response to message #31 by db(martinez,california)

Hi, D.B.;

the first step to place the photos' image here is having them both availble through the web (a valid e-address). In other words, there must exist a link to them.

After that, add the follwoing to your post at the place you want each photo:

[img:*the complete link starting with http://...*]

If you have any doubt, let us know. OR you can edit someone's post with an image (like this one by Dave) and you'll see an example of how to do that. In this case:

Hope this helps.

Cheers.

Luiz (Brazil)

Edited: 30 Sept 2004, 12:17 a.m.

Re: 2 things - I'd add...(long)

*Message #33 Posted by **Vieira, Luiz C. (Brazil)** on 30 Sept 2004, 1:08 a.m.,*
in response to message #31 by db(martinez,california)

Hi D.B., all;

please, allow me to add some words and thoughts to the following:

> Quote:
>
> (...) a new RPN with the functionality of the 45 would be a good beginner/student/promo-give away calc.

As many of you already know, I'm a teacher at the local university and I deal with math, logic, analog and digital electronics (design and maintenance), computers, telecom, pedagogic matters and related subjects as both a teacher and a professional. What I see in some Brazilian students is the 'need' of doing more and more with less and less effort. They don't read, they don't learn, they don't want to understand. All they want is DOING! They want to DO this, and DO

that, and DO that other. They want to invade someone's cyberspace, they want to create a virus, they want to break access codes, to download tons and tons of gigabytes overnight... but if you ask any of them to seat down a bit and listen to your explanations about how do this all work and what you need to know to develop such systems, they prefer to cut and past some ASP code and change a few parameters to get to road again. Without having a clue about how does that heck works.

I see young guys like Ben Salinas posting high-quality texts here (congrats, Ben; keep tracking this wonderful path of yours) and I think how many others are and where are they. These are the ones we need to lead the others so they can 'wake up' and become future 'creators' instead of simply 'dependant' users. I know that high-level, object-oriented and functional languages are essential to allow non-programmers to develop their skills with computers, and I see no trouble on that. High level programming languages allow high-level professionals in distinct areas to 'talk' to computers easily, without the need of spending hours and hours by learning an imperative men-machine interface (I am a C/C++ programmer and had not found the time to go through some CLEAN or OCAML development so far...). I guess that in most cases, high-level languages simply 'make it happen'.

Without low-level codes, existing processors don't do the job. It is necessary to develop and debug I/O machine-coded routines. Yes, I know that high-level compilers exist to do that as well, and also that some processing cores are already running high-level codes, and that from now to some time, machine coding will be paleontology.

BUT... when these days come, who will care for new developments? The integrated systems themselves? Well, we are reaching the SciFi level of seeing machines coding machines and designing machines and building machines. Soon we are having HAD (Human-Aided Design) systems instead of CAD, where humans simply play a go/no go role on machines final design. O.K., O.K., I know I am asking for being blamed, but I would like you to reason about this for a bit.

There was a time where many guys specialized in calculus took months to compose log and trigonometric tables with as any significant digits as needed. Later the slide-rules replaced these tables. After that the mechanical calculators stood beside the slide rules and, finally, the 'electronic brains' became so small that could fit in our pockets (HP35): the electronic slide rules. TI offered some SR models in an attempt to make them resemble their mechanical cousins.

But calculus is still being taught and aided machines still make it fast, if used accordingly.

As a teacher, have HP finally assumed again the RPN as an operating system for low-end models, I'm writing as many books as needed to support students/beginners/professionals as I'd also stimulate my 'pupils' to use them the best way. The post-sales support from HP would be invaluable in this case so we can 'spread RPN around' as it happened in the 70's. I see RPN as an alternative reasoning way, as there are so many programming languages and paradigms. I'm not stating it is the best or the most efficient or whatever, I only would like knowing that students might have the chance to have the same alternative I was given when I began attending the University classes. I remember that HP

calculators were used by many students and those who preferred having AOS-based models did not care for their choices. My first pocket calculator was a TI57, and I remember it took me a while to have money enough to buy an HP41C in 1982 (still with me and working fine). I remember that when I was in trouble trying to understand some subjects, I used to grab my HP41 and try to find the RPN way to solve it and even to write a program in order to make it easy to calculate. I confess that I learned a lot more because of it.

So, folks, if HP actually introduces a low-end RPN calculator, I offer my skills to support any user that wants to go further and I'd write as many papers and books as needed to do so. In Portuguese first, and I think I can offer a raw English text ready to be reviewed and adapted by a native English speaker.

I wrote too much, again. Sorry.

Can I say it is some .2¢?

Cheers.

*Message #34 Posted by **Naim** on 30 Sept 2004, 4:56 a.m.,*
in response to message #16 by Gene

"It would be the equivalent of saying "I know we're trying to sell product X, but you know, in 10 days product Y will cost 20% of X and will be 100,000 times faster. Still, go buy X because we have a lot of them"."

Gene, I beg to differ. They came out with a calculator that is much faster than the GX [29G+], cost less than the GX, but why is the GX selling for twice the original price on ebay. Or better yet, the 33S has roughly 80 times more memory than the 32SII, but yet still judging from recent trends on ebay, it sells for 2-3 times more than a 33S.

Re: OpenRPN.org Relaunched

*Message #4 Posted by **Hugh Evans** on 29 Sept 2004, 12:18 a.m.,*
in response to message #3 by Anon

Most of the current discussion is about design specifications. Remember, the whole concept was spawned from discussion. Next came a forum (out of respect for not clogging things up here), and then the first incarnation of our web page. We implimented a basic wiki for documentation needs and later added a CVS.

With all of that said. The first few months helped us (the management) figure out what tools the community would need to really start development work. Most of the tools are now in place (we're really only waiting on the new wiki).

At this point concise formal definitions are our top priority. The *fix command reference should be nearing completion by the end of this year. A hardware definition should be ready long before that, and I would like to have prototype mainboards in that same timeframe.

So to answer your question: For an open development project things are coming along very nicely. To most people I'm sure it looks slow... But that's the nature of the beast to some extent (volunteer labor).

HP48GX how many years will it last?

*Message #1 Posted by **Karl** on 28 Sept 2004, 9:11 a.m.*

I have a question I do have 4 GX, 2 used everyday. The other 2 are well packed, but without batteries. I would like to know what do I have to do to mantain this 2 new units for years without use. Do I have to put sometimes the batteries? Or never put the batteries, and the capacitor? Thanks.

Re: HP48GX how many years will it last?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 28 Sept 2004, 10:20 a.m.,*
in response to message #1 by Karl

Hi, Karl;

although this is not a direct answer to your question, I'd consider those packed HP42S found last year. How long had they been stored and under which conditions?

If HP is still HP (I doubt), I'd tell you they'd be the best source of information regarding your question. But I'd not be surprised if the attendant asks you back what sort of mainframe is that...

I'd keep them in the box the way they are now. And see what happens when you finally insert the batteries and turn it on. Would you let your grand-children have the honor? Kidding...

Cheers.

Luiz (Brazil)

Re: HP48GX how many years will it last?

*Message #3 Posted by **Ron Ross** on 28 Sept 2004, 10:46 a.m.,*
in response to message #1 by Karl

I would power them up with batteries every couple of years just to charge the capacitors (just in case).

The weak spot for the 48G series is the compression pads just below the LCD screen. When these soften up with age (and nothing can slow this ageing process), the keyboards fail, especially the ON key. Many people believe their keyboards may suffer from dirt and wash their keyboards in the belief that they are removing dirt or other mat'l from the keypad, when in reality, they are probably just adding moisture to this pad and restoring its pressure and therefore fixing their keyboards. That is my belief, for what its worth.

I plan to experiment with a syringe and a chemical to fix/expand seals in automatic transmissions (balloons our rubber to 1.5-3x upon contact. It is supposed to fix seals, but I am hoping to have it restore the compressive force of the pad to its old self. I prefer this approach to removing the faceplate and adding more material as any work on the faceplate becomes ugly. I have yet tried this yet, but feel it holds promise.

That is what I feel is the Archilles heal of the 48g series.

Re: HP48GX how many years will it last?

*Message #4 Posted by **andy** on 28 Sept 2004, 11:45 a.m.,*
in response to message #3 by Ron Ross

WOW! so that's what was wrong with this 48S I found in the trash can. When I found it, it had sticky residue on it so I washed it in an ultrasonic bath of warm d/i water. After drying it for several days it still didn't work but it looked so good I didn't have the heart to just throw it away.

After reading the post about the compression pad beneath the LCD I put batteries back in it and squeezed the area below the LCD and above the soft-keys between my thumb and forefinger. What excitement! When I pressed the on key it powered up. The 48s lives!

Now the question is how do I permanantly restore the pad so I don't have to keep squeezing the calc to use it?

Andy

Re: how many years (just a thought)

*Message #5 Posted by **Bram** on 28 Sept 2004, 10:50 a.m.,*
in response to message #1 by Karl

The electronics won't deteriorate, but I'm not at all sure about the display. Nor do I know whether regular powering will do any good.
I think one has to know about lcd technology to answer your question. Not me. Sorry.

Re: how many years (just a thought)

*Message #6 Posted by **unspellable** on 28 Sept 2004, 1:37 p.m.,*
in response to message #5 by Bram

If the calculator has any aluminum electrolytic capacitors (I can't say if it doe or doesn't.) it should be briefly powered up once every three months or so to keep the dielectric formed. If it has tantalum electrolytic capacitors this is unnecessary.

Store in a place that's cool and not too humid.

Re: how many years (just a thought)

*Message #7 Posted by **Tom (UK)** on 29 Sept 2004, 8:38 a.m.,*
in response to message #5 by Bram

"The electronics won't deteriorate"

Not completely true, electrolytic capacitors will deteriorate over time, perhaps 10 years before they start showing problems. Occasional powering up may help but won't avoid the problem completely. Solder joints can also go 'dry' and loose contact, the only cure I know is to re-heat them while adding a touch of new solder.

Various plastics and foams will deteriorate over time from UV and the chemicals in air.

I'm not sure about the LCD - when first introduced LCD's had a yellow filter as UV? could damage them. Contrast on some LCD's seems to be lost with age but they rarely fail. LED displays were thought to be much more reliable - the displays may be but the high(ish) current display drivers can suffer.

Keep them wrapped up in a cool and dry place and power up every 6 months.

39G

*Message #1 Posted by **Anthony** on 28 Sept 2004, 1:38 a.m.*

I have a hp 39G and wish to enable Cas. Does any one have or know where can get the enabling applet?

Re: 39G

*Message #2 Posted by **Mike (Stgt)** on 28 Sept 2004, 3:42 a.m.,*
in response to message #1 by Anthony

AFAIK that is not possible. If there is an IR port CAS is disabled. That would be a "big big easter egg" if I am wrong.

Ciao.....Mike

Re: 39G

*Message #3 Posted by **Arnaud** on 28 Sept 2004, 6:37 a.m.,*
in response to message #2 by Mike (Stgt)

I think Jordi did write an applet that enables the CAS on the 39G. I seem to remember it does not work on the 39G+. I guess hp would not be very happy if this applet was distributed.

Arnaud

Re: 39G

*Message #4 Posted by **Ron Ross** on 28 Sept 2004, 9:16 a.m.,*
in response to message #1 by Anthony

Speaking about the Hp40G to clarify.

CAS allows you to have the Eq Writer, which is not active on the Hp39G.

But you can do symbolic manipulation with the Hp39G without enabling the CAS. You work with variables S1-S6 and use them in place of a normal a-z variable.

CAS does give you an Eq Writer which is one of the best features of the HP40, 48 or 49. You do get to show your eq on the screen of a 38/39, but you need to enter it in correct format on line entry, then show. It will then display the work in textbook format.

The Hp39G is certainly at bargain rates on ebay. And it is a big step up from a Ti-83/84 for math features. Unfortunately, it is algebraic only and has the infamous RUBBER keys. Still a good number cruncher though at a great price.

AND if anyone ever develops an RPN applet for the 38/39 series, it may add another good quality RPN basic calculator to the mix (the Hp38G anyway, kinda ugly, but a true Hp quality keyboard).

Re: 39G

*Message #5 Posted by **Jordi Hidalgo** on 28 Sept 2004, 1:17 p.m.,*
in response to message #1 by Anthony

Mike is right: one cannot have both IR and CAS at the same time. That's why my aplet works as a toggle. (BTW, the correct spelling, however odd it may seem, is indeed 'APLET' which stands for Animated Personal LEarning Tool. See Datafile V14N2p6). My aplet is not the only way of enabling the CAS, though.

Ron, "CAS" allows you to have the EQW and about 200 CAS commands, many of which are not usable in the EQW.

Now that the 39G has been discontinued, I guess it's only a matter of time before it all comes out. Exactly how much time is needed depends on how soon the 39G, which is still widely used in WA, will be replaced by the 39G+.

Anyway, I've always found it a banal secret. ;-)

Jordi

Re: 39G

*Message #6 Posted by **Mike (Stgt)** on 30 Sept 2004, 5:47 a.m.,*
in response to message #5 by Jordi Hidalgo

Hi Jordi!

An other question: I have 3 different ROM files here that work well in Emu48, two of them are 4MB in size. Is there somewhere a note published about the differences?

Ciao.....Mike

Re: 39G

*Message #7 Posted by **Jordi Hidalgo** on 30 Sept 2004, 1:51 p.m.,*
in response to message #6 by Mike (Stgt)

There's only one production 39/40G ROM version ("A1.40" -- the ROM can be uploaded using this aplet by Christoph Giesselink). An earlier beta version was released for evaluation. I think it's the one in this file (for the YorkeM emulator) and this one (for Emu48). IIRC, there were few bug reports, so there can't be many differences (all betas released after March 29th, 2000 share the same supported entry point list). And see also this post. Remember that there's also a flash file *for the 49G* to emulate the 39/40G. Hope this helps!

Regarding the CAS enabler aplet, it seems that the aplet (or at least its existence) is now becoming public knowledge in Western Australia, despite the precautions taken. In fact, a copy of the aplet was handed out (!!) at the State Conference MAWA 2004 (page 3) ... May I remind them that it is postcardware :-) Here are some reactions to the aplet: see page 10 of this PDF, page 3 of this one, and page 2 of this other paper. And see also http://members.iinet.net.au/~ccroft/faqs_70-79.htm#79. Fortunately, the aplet can be easily detected (it can't be renamed) and deleted from the calculators of cheating students ;-)

Jordi

Re: 39G--am I missing something?

*Message #8 Posted by **bill platt** on 30 Sept 2004, 2:41 p.m.,*
in response to message #7 by Jordi Hidalgo

Hi Jordi,

What is this about a 39g and a 40G? Are they actually the same machine but different? (Because they were not RPN I did not look at them in the past...but I am now a changed man, and I will even look at algebraic machines :^). Was the 39G sold in Austrailia only? What is this CAS controversy---you mean Austrailian academia (prudently) believes that high school students should practice their algebra skills at all opportunities, while US academics believe in machines? What's going on? (I am getting too old to be in the loop, but my 7 year old is getting older all the time...).

Regards,

Bill

Re: 39G--am I missing something?

*Message #9 Posted by **Ron Ross** on 30 Sept 2004, 3:26 p.m.,*
in response to message #8 by bill platt

Jordi developed an enabler that is rumored to make the Hp39G into an Hp40G. And since Jordi is now providing proof positive of his excellent work, you used to be able to get a copy of his enabler by sending him a postcard with your email address and he used to graciously send a working version of his enabler (I suspect he still does, but I don't want to make commitments for him).

This has been a behind the scenes secret that Hp did not want to leak out and probably unfairly got Jordi to agree to keep silent about. Now that the new 39G+ is in reality an 39G - (they cut something off err out). Hp did not want their Hp39G banned from exams (ACT banned it already and SAT doesn't care).

That said, you can buy an Hp39G off of ebay for peanuts and get a CAS enabler that effectively makes the 39G rival the Casio FX 2.0. Mathematically, it makes it on par with even the Ti-89 (there is more to a graphics than math horsepower, and the Ti-89 will blow an Hp39/40G away in all else).

But the Hp40G (or 39G with enabler) is a very simple calculator to use as flag settings aren't there to mess up. The screen is cleaner with no clutter and with only 27 variables, any variables are instantly assumed to be implied multiplication. And only with the CAS do you get the Eq Writer vs doing without on the standard Hp39G.

Sadly, the Hp39G has the rubber keyboard and no RPN aplet available. It suffers from the same afflictions as the Hp49G.

Re: 39G

*Message #10 Posted by **Mike (Stgt)** on 1 Oct 2004, 6:12 a.m.,*

Re: 39G -- new skins for Emu48

*Message #11 Posted by **Mike (Stgt)** on 4 Oct 2004, 5:33 a.m.,*
in response to message #7 by Jordi Hidalgo

Hi all!

If you like the HP-40G you probably like it's emulation on a PC too. Maybe you find my skins colored in grape-green and peach flesh usefull, see
http://ourworld.compuserve.com/homepages/nutem/pioneer.htm

Well. I just saw that the "queezed HP-40G" skin is too dark on a CRT, on a laptop's LCD the black keys show clear on the dark blue surface. I'll fix that ASAP <G>

Ciao.....Mike

Re: 39G

*Message #12 Posted by **Adam** on 11 Oct 2004, 8:40 p.m.,*
in response to message #11 by Mike (Stgt)

i think the cas enabler applet should be aloud to be downloaded off the net. If Jordi says its easy to detect on the calculator then there should be no problem with cheating student. I am currently studying mechanical engineering and have been looking for a CAS enabler applet for a couple of weeks now because i don't want to have to by a new calculator (ie hp49g). so is there anyware i can get this applet from?

Re: 39G

*Message #13 Posted by **Mike (Stgt)** on 12 Oct 2004, 6:16 a.m.,*
in response to message #12 by Adam

From my point of view, you ask for something illegal. If I sell you a gun that has a security mechanism ("Stolpersteine") to use only blank cartridges to make some noise and you remove that security measures and aim on people with real ammunition -- I would not like you to do so.

Well, Jordi's aplet is postcard-ware, I don't need it as I have an HP40G (which is not an advantageous tool in my hands, too often I had to do a reset, but it was great fun to do the back-up on my HP200LX). What I want to say: why don't you use an emulated HP40G and test if you _realy_ need that CAS. (Maybe CAS was the wrong tool in my hands anyway <G>)

Ciao.....Mike

Re: 39G

*Message #14 Posted by **.** on 12 Oct 2004, 8:38 a.m.,*
in response to message #13 by Mike (Stgt)

"From my point of view, you ask for something illegal."

How is it possibly illegal? He owns the hardware.

Ethically it may be a different story. The problem is students could use it to cheat in exams. This could have hurt sales in the past - even though if HP was stupid enough to

include a CAS that could be easily activated, it's their own dumb fault.

The 39g isn't sold anymore. I hope one day this aplet is released.

"If I sell you a gun that has a security mechanism ("Stolpersteine") to use only blank cartridges to make some noise and you remove that security measures and aim on people with real ammunition -- I would not like you to do so."

This is a bad analogy, because this kind of menacing with firearms is illegal. What if you sold him a special computer, and he figured out that by flipping a switch, he could double the speed? Would that be illegal?

regards,

.

Re: 39G

*Message #15 Posted by **Mike (Stgt)** on 12 Oct 2004, 11:38 a.m.,*
in response to message #14 by .

Hello "."!

You are right, it is a bad analogy. But there is a little bit of truth in it: if Adam might use CAS in the exam he uses his knowledge against the other students, so the HP39 is the "boum" and the HP40 is the "PANG!" The aim is to learn to cheat w/o to be caught.

Ciao.....Mike

BTW: With your logic I might be senteced for adultery or gang bang, at least I own the hardware for it <VBG>

Re: 39G

*Message #16 Posted by **Adam** on 12 Oct 2004, 10:04 p.m.,*
in response to message #15 by Mike (Stgt)

I can't beleive this subject about CAS is so damn sensitive. I just thought finding this aplet would be just like finding any other hp aplet. I understand that for students studying for there University Entrance Examinations it should be banned. But CAS is alloud in engineering exams in fact it's advised that you should have a calculator with CAS on it. It becomes a realy good tool when your doing thermodynamics, beams stress calculations etc. For someone like me who is allways short on money and cant exactly afford a new calculator this CAS aplet would be great thats why I ask any of you out there to please send me a copy.

cheers.

p.s. email is adam.francki@gmail.com

Re: 39G/CAS enabler

*Message #17 Posted by **Mike (Stgt)** on 13 Oct 2004, 4:20 a.m.,*

in response to message #16 by Adam

Hi Adam!

It's only my bad analogy that makes the CAS-enabler look like an issue. On the other side I suppose you found following hint at http://members.iinet.net.au/~ccroft/faqs_70-79.htm#79

Anyway: I do not have more knowledge about the aplet that this: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=63737

Ciao.....Mike

Re: 39G

*Message #18 Posted by **Ron Ross** on 13 Oct 2004, 9:31 a.m.,*
in response to message #16 by Adam

It is an applet that is not mine to give. It is post card ware and you should send a postcard to Jordi with your Email address and then, magically, one day, you will see a nice attached file in your email. If he still does this. As to why he doesn't just post it somewhere, is because Hp approached him with the horror story of folding up shop if CAS was ever discovered to be available to the Hp39G. He is probably honor bound by his agreement.

About his method of distribution, well it is HIS software and his pricing stratagy (???). His price is as cheap as anyone could ask. Now your asking us to undercut him???

Just send the postcard and your email address.

Re: 39G

*Message #19 Posted by **Jordi Hidalgo** on 14 Oct 2004, 6:53 a.m.,*
in response to message #18 by Ron Ross

To say that one used to be able to get a copy of my aplet by sending me a postcard is an overstatement, Ron. Let me explain. Yes, all the people who sent me a postcard initially (about a dozen) got the aplet, but that's because they were either fellow members of the club (even though they don't really need it), regular posters or well-known enthusiasts, and I made them promise a couple of things, as you can tell.

Jordi

Re: 39G

*Message #20 Posted by **Mike (Stgt)** on 14 Oct 2004, 9:07 a.m.,*
in response to message #19 by Jordi Hidalgo

What did they have to promise? 10 pushup, abstain from using 4-letter-words, and never smoke in public? <VBG>

Re: 39G

*Message #21 Posted by **Mike (Stgt)** on 14 Oct 2004, 6:32 a.m.,*
in response to message #16 by Adam

Just an additional word about "sensitive subjects": Last year in Allschwil (a suburb of Basle) at the "Emulator programmers Meeting" (alas not all could join) it was a topic of a long discussion, where is the limit to something illegal? IMHO, it's not only question of felony and jurisdiction, an other aspect is the respect for the work of art programming the 12k OS of an HP-41 for instance. Today HP itself offers emulators for educators and I am sure this decision will pay off.

Ciao.....Mike

HP-97 flex cable replacement

*Message #1 Posted by **Michel** on 27 Sept 2004, 8:29 p.m.*

The flex 13 contacts cable between the main board and the card reader of my HP-97 is completely destroy; unusable safely and cause bad contact and even short circuit. Where can i find a replacement cable in modern electronic.

Do you think it's a good idea to hard-wire the 2 boards with hard drive wire (40 contacts but i can remove all extra one with a knife).

Thanks again! Michel

Re: HP-97 flex cable replacement

*Message #2 Posted by **David Smith** on 28 Sept 2004, 12:36 p.m.,*
in response to message #1 by Michel

Suitible replacements for the flex cable are very difficult to find. In the past I have just unsoldered the connectors on the CPU board and reader board and then hard wired the connections with individual pieces of stranded wire.

Re: HP-97 flex cable replacement

*Message #3 Posted by **Tony Duell** on 29 Sept 2004, 4:00 p.m.,*
in response to message #2 by David Smith

What I did in my 97 was to use a piece of 26 way IDC ribbon cable fitted with the normal IDC sockets at each end (like an IDE cable, but only 26 way). Don't forget to feed it through the chassis plate before fitting the second socket :-).

I then soldered 13 pin right-angle headers to the logic and card reader PCBs. You have to fiddle things a bit since you have to use the same row of holes in each socket, IIRC the card reader end (where there's more headroom) is actually a 26 pin header with the bottom row of PCB pins cut off, and I used the row of holes in each connector nearest the top of the calculator in each case.

Works fine, and I can easily remove the logic board or card reader for repairs.

Never repaired a voyager's back plate, but well on a 67, and was very patient. It worked quite well with very little wrinkles, but still one cane notice that it had been unglued and re-glued.

Uploading ROM´s for HP41, EMU41, CLONIX, NoVRAM...

*Message #1 Posted by **Christoph Klug** on 27 Sept 2004, 10:35 a.m.*

Dear HP41 enthusiasts,

Please refer to HP-Museum article forum item 448. This document gives you some details about uploading ROM-images (plug in modules) from HP41 to EMU41 by using ZENROM or HEPAX or W&W RAM-Box or ERAMCO RAM-Box or MBK-ProfiSET.

Two appendixes gives knowledge about ROM image file format conversion between HEPAX, MBK-ProfiSET and RAM-Box.

A third appendix describes the generation of .rom files which are needed for programming ZEPROM or CLONIX and NoVRAM plug in modules.

Only less really advanced HP41 enthusiasts like Angel or Raymond are able to create mcode solutions for HP41. But by using EMU41 it is easy for you, to create your individual and voluminous user code software application and store them to a 4KByte page. Than transfer your own private ROM application to CLONIX or NoVRAM

Last not least the document gives you some details about creating back up, about storing ROM-image files on tape and about email transfer.

The first version of this article was published in HPCC Datafile Journal, now here you get the enlarged version which also includes the latest development like CLONIX and NoVRAM....

Best wishes - Christoph Klug

Re: Uploading ROM´s for HP41, EMU41, CLONIX, NoVRAM...

*Message #3 Posted by **DavidY** on 27 Sept 2004, 4:37 p.m.,*
in response to message #1 by Christoph Klug

Very nice article Christoph!

I suspect that Diago's NoVRam module/Hepax emulation could also work for transfering rom images from a module to PC without the need for IL.

The big "ifs": (1) whether the external programmer's software has the ability to upload data from the

NoVRAM memory. Specificly the "ram" area as well as the "eprom" area. and (2) whether the hex file can be translated back to binary.

If these conditions are met the using Hexpax commands pages of ram can be mapped out of the "hexpax" memory map and appear as writable module rom. A hexpax command to "copy" rom pages also exists. So: Using the 41 with NoVRAM and the module to be copied one could copy 4k (or 8k pages) to the NoVRAM from the module rom then shut down and remove the NoVRAM. Next couple the NoVRAM module to the programmer, connect the programmer to a PC, powerup and use the programmer software to upload the NoVRAM memory. Finally, break out the hex files data for the copied module code and convert to binary.

So, Diago (or anyone with a NoVRAM) has this been tried??

David

PS. Damn, after considering this, I got to get a NoVRAM module. Diago, if you read this, what's the easiest way to get you the payment from the US? And what's the cost for NoVRAM in $US w/shipping?

Memory expansion on GX

*Message #1 Posted by **Ric Manohar** on 26 Sept 2004, 6:20 p.m.*

This might sound dumb, but is memory cards for the GX available that doesn't use a backup battery.

Re: Memory expansion on GX

*Message #2 Posted by **Cyril RABIH** on 27 Sept 2004, 8:42 a.m.,*
in response to message #1 by Ric Manohar

I don't think so but there's an easy way to test it. Just remove the batteries from your card and I think that the card will use the calculator's batteries to keep data. Disable message errors when you start the calculator. The problem is that the 48 series canno't use flash memory but RAM memory instead. RAM needs to be permanently powered and if you doesn't have enough power, the card will use the unit's power. I hope it will help you. Best regards, Cyril

Re: Memory expansion on GX

*Message #3 Posted by **James M. Prange** on 27 Sept 2004, 8:43 a.m.,*
in response to message #1 by Ric Manohar

Not that I know of, but the newer SMI RAM cards have a rechargeable "10-year" battery. It's recharged from the AAA cells, provided that they're strong enough. My impression is that the 10-year battery is non-replaceable, but I may be mistaken about that. How well it works out, for example, what happens if the 10-year battery is allowed to go completely dead, I don't know. See:

`How to Resolve the HP 48 "low battery p(2)" Message`

at http://www.smi.com/Support/topics.htm.

I don't expect that flash memory would work with the 48 design without extensive modification.

Regards,
James

How did you that Raymond????

Re: Memory expansion on GX

*Message #8 Posted by **Raymond Del Tondo** on 27 Sept 2004, 7:04 p.m.,*
in response to message #7 by Karl

Long time ago EPSON sold suitable 8bit EPROM cards to OEMs.
If you are lucky having bought a W&W software card for the HP-48,
like the Assembler ROM, or the Surveying Pac,
you're likely to have an EPROM card:-)

At W&W we used an EPROM burner called SprintPlus,
at home I used a small ISA slot unit called PB-10 from Needhams's Electronics.
Both have optional slots/sockets for those EPSON cards.

There were several ways to produce the image needed for the EPROM.
The easiest way was to read the contents of an HP-48 RAM card into the burner buffer,
then burning the buffer contents.

Regards,

Raymond

HP-41 three column program listing

*Message #1 Posted by **John Pierce** on 25 Sept 2004, 6:57 p.m.*

Hello all, I seem to remember seeing a procedure to print an HP-41 program listing in three columns via HP-IL to a Thinkjet printer. Can anyone help me find this procedure. Thanks and best regards, John Pierce

Re: HP-41 three column program listing

*Message #2 Posted by **Emmanuel, France** on 26 Sept 2004, 3:55 a.m.,*
in response to message #1 by John Pierce

```
If I remember well, Extended IL ROM has a function about that.
I will check.
```

Re: HP-41 three column program listing

*Message #3 Posted by **Raymond Del Tondo** on 26 Sept 2004, 7:41 a.m.,*
in response to message #2 by Emmanuel, France

HI,

yes, the ExtIL functions MCPRP and MCLIST do that job.
AFAIR you can create a similar function yourself,
but it'll be easier to use the given ones;-)

Raymond

Re: HP-41 three column program listing

*Message #4 Posted by **Christoph Klug** on 27 Sept 2004, 3:17 a.m.,*
in response to message #3 by Raymond Del Tondo

dear John,

Yes - with EXT-IL ROM it is possible to print up to six columns. If you have no EXT-IL available, than take EMU41.

Your modern PC printer have a much better printing quality than the ThinkJet.

For EMU41 I create some software tools for setting left margin of paper, three column or six column print and last not least advanced HP-41 barcode print by using the SKWIDINK ROM....

Regards - Christoph Klug

Re: HP-41 three column program listing

*Message #5 Posted by **John Pierce** on 27 Sept 2004, 9:30 a.m.,*
in response to message #4 by Christoph Klug

Thanks to all you've been helpful. I don't have the EXT-IL ROM but I will try EMU-41.

Re: HP-41 three column program listing

*Message #6 Posted by **Mike (Stgt)** on 28 Sept 2004, 4:56 a.m.,*
in response to message #5 by John Pierce

AFAIK there is the Ext-IL ROM out somewhere...

Ciao.....Mike

time function

*Message #1 Posted by **tom ryan** on 25 Sept 2004, 3:10 p.m.*

after picking up a 41-CX the other day and i need/want to program in the time and date. the 41-C manual i have does not say what registers are used.

i offered a surveyor a 100 bucks which seemed fair. it has the survey module and an memory module. my old 41-c served me faithfully for 20 years and died when one of the kids dropped it out of the truck.

Re: time function

*Message #2 Posted by **Richard Garner** on 25 Sept 2004, 3:37 p.m.,*
in response to message #1 by tom ryan

Tom,

To set the time enter the time in the format HH.mmss in the X Register and them XEQ SETIME. The same for the date. MM.ddyyyy the XEQ SETDATE. To change between 12/24 time use CLK12 or CLK24. To adjust the clock like at Daylight Savings or Standard Time enter the adjustment +/- H.mmss in the X Register and XEQ T+X. On the 41CX the SHIFT ON will display a running clock.

This will get you started. The rest of the time function names can be found in Catalog 2.

thanks

*Message #3 Posted by **tom ryan** on 25 Sept 2004, 4:34 p.m.,*
in response to message #2 by Richard Garner

thanks richard! i am heaven with my new/old toy.

the CX came with an 82181A module but it won't let me use a SIZE function greater than 318. (do you think the memory module is bad or is the 82180 required to access the extended memory?)

Re: thanks

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 25 Sept 2004, 5:54 p.m.,*
in response to message #3 by tom ryan

Hi, Tom;

although the CX has some extended capabilities, the 319-register limitation for standard memory remains. The extra memory can be reached through X-Memory access. Try CAT 4 (CX and some extra ROM modules only) and you'll see a directory of existing files (if any) and the number of available register after the directory reaches the end. Or try XEQ EMROOM (CX only) to obtain the same value after CAT 4.

There is a lot more about the CX. If you have already used X-functions/Memory, you're actualy in

heaven...

Congrats!

Luiz (Brazil)

Re: thanks

*Message #5 Posted by **Richard Garner** on 25 Sept 2004, 6:08 p.m.,*
in response to message #3 by tom ryan

Tom,

The 41CX is equivalent to the 41C with 4 memory modules or the 41CV. The default main memory is configured as 100 storage registers and 219 program registers. The CX then adds the Time Module plus a few extras and the Extended Function/Memory Module plus a few extras. So the 41CX gives you 319 registers of Storage/Program Main Memory and 124 registers of Extended Memory. If you have an Extended Memory Module on top of that it will give you an additional 238 registers of Extended Memory. I look at Extended Memory as Offline Program and Data storage. You can store programs and data there, but you have to bring it back into the main memory to actually use it. If you do a Catalog 6 it should tell you what the total amount of Extended Memory you have. The base CX will have 124 registers 1 additional Extended Memory Module will give you 238 more or 362 register total. You can have a maximum of 2 Extended Memory Modules for a total of 600 registers in the CX.

Re: thanks oops

*Message #6 Posted by **Richard Garner** on 25 Sept 2004, 6:12 p.m.,*
in response to message #5 by Richard Garner

Sorry it is Catalog 4 not 6. That's what I get for not trying it before I write it.

memory access

*Message #7 Posted by **tom ryan** on 25 Sept 2004, 7:27 p.m.,*
in response to message #6 by Richard Garner

thanks. it's been 15 years since i have programed on an hp. the old 41-C book helps, but this forum will be a wealth of info. i was module poor way back when.....

Re: time function

*Message #8 Posted by **Garth Wilson** on 25 Sept 2004, 5:50 p.m.,*
in response to message #2 by Richard Garner

Do try to get the 41cx manuals. There's a lot of capability there that does not meet the eye. Although I seldom use my 41 for controlling equipment anymore, it is still my only alarm clock, it reminds me of appointments when I turn it on within a couple of days before the appointments, it tells me how long 'til the next alarm is due (if one is pending), and otherwise just gives me the time and date. This is all automatic upon turn-on. It's nice to be able to time- and date-stamp data you've collected, or even have the 41 turn itself on at planned intervals to take data from equipment and then turn itself back off until the next time is due.

How do I transfer to ports 1 or 2 using Conn4x?

*Message #1 Posted by **Bob Poole** on 25 Sept 2004, 1:35 p.m.*

Boy, since I got this 49+ I am really finding out I am a rank amateur. I have downloaded some utilities and the equation library. The documentation says load them in port 1 or 2 using Conn4x. When I connect to the 49+ all I find on the PC screen is the "home" directory, and sub directories. Where do I go from here?

Thanks for any help.

Bob

Edited: 25 Sept 2004, 4:58 p.m.

Re: How do I transfer to ports 1 or 2 using Conn4x?

*Message #2 Posted by **.** on 25 Sept 2004, 10:10 p.m.,*
in response to message #1 by Bob Poole

You can't use Conn4x directly. Just put them in HOME, then on the calculator open the filer (left shift, then APPS). Copy the files to the port by hand.

If you look, there are lots of documenation/tutorials for this calculator floating around. See the HP website or google.

Unknwown ROMs for HP-41

*Message #1 Posted by **Emmanuel, France** on 25 Sept 2004, 10:03 a.m.*

```
I got two 4K ROMs for HP-41:
C 1983TRINH
(XROM 9)
NEWROM
LOADP
LOADPV
RVER?
PVIEW
BLKCAT
CODE
DECODE
and
SIMPLEX ROM
(XROM 31)
'GO
'IN
'LP
'PRREG
'LINXYP
'CPM
'CV+
'TF
If I understand the purpose of the first ROM, is there any documentation for both? Thanks.
```

Addendum to 'Unknwown ROMs for HP-41'

*Message #2 Posted by **Emmanuel, France** on 26 Sept 2004, 9:18 a.m.,*
in response to message #1 by Emmanuel, France

```
I programmed C 1983 TRINH and SIMPLEX ROM into a Clonix41 and tested it.

C 1983 TRINH
------------

NEWROM initializes a RAM page
y= XROM #
X= Page #
ALPHA= ROM Name

LOADP loads a program from memory to a RAM page after a GTO..
LOADPV does the same and 'privates' this program
X= Page #
ALPHA= Program Name

RVER? returns page n status
After ROM n, gives ROM n INTACT or ROM n BROKEN

PVIEW shows the remaining registers in program memory (?!)

BLKCAT follown by page # gives the ROM catalog

CODE cf. Zenrom, ...
```

```
DECODE cf. Zenrom, ...

Any idea about ROM name?
C for copyright, 1983 for year 1983 and TRINH, a Thai name?

SIMPLEX ROM
-----------

Some functions require another ROM with XROM 20 and a (sub)routine named B EERST.
This ROM seems to have been made for stat' studying with columns printing.

To be continued ...
-------------------

In order to contact me, please remove spam from my email.
```

Edited: 26 Sept 2004, 11:55 a.m.

Re: Addendum to 'Unknwown ROMs for HP-41'

*Message #3 Posted by **Ronald** on 26 Sept 2004, 3:55 p.m.,*
in response to message #2 by Emmanuel, France

In respect to the Simplex rom, I think to remember that PVIEW is the same function as VIEW, but then progammable. Try to put the registernumber in the X-register and then execute in a programe the PVIEW function.

Re: Addendum to 'Unknwown ROMs for HP-41'

*Message #4 Posted by **Emmanuel, France** on 27 Sept 2004, 12:15 p.m.,*
in response to message #3 by Ronald

```
Dear Ronald,
I put pi into register # 99.
When 99 XEQ 'PVIEW',
00 REG 46
.END. REG 46
00 REG 46
and so on (?!)
Anyway thanks.

Recommendations for 11C/15C/42S emulation

*Message #1 Posted by **Jerry D** on 25 Sept 2004, 9:39 a.m.*

I'm looking for an emulator of the 11C, 15C, or 42S with a skin that looks good in 800x600. I'd like it to look good when I project it in front of a class to teach with it from my Windows based laptop.

I've found a nice looking 11C emulator for the Mac, but not for Windows machines. The skins for the 42S look great but, while I have an HP-42S, I don't have access to an HP-48 to dump the 42S's ROM.

I've considered using an HP-48SX through EMU48, but can't find an S skin that looks good at 800x600. Oddly, I have found nice G skins.

Have I overlooked something? Is there a piece of software or skin out there that I've overlooked? It would be ideal if it were no-cost so that my students could grab it, too.

Fot those who've been through this before, would my time be better spent trying to locate an HP-48 so that I can do the 42S ROM dump or figuring out how to write my own skin for EMU48?

I've seen discussion that HP might release tht HP-42S ROM. Has a release data been announced?

Thanks!

Ditto.

Re: Recommendations for 11C/15C/42S emulation

*Message #6 Posted by **Jerry D** on 27 Sept 2004, 12:38 p.m.,*
in response to message #1 by Jerry D

I *definitely* need a break!

What was I thinking?! The skins for the 42S are among the best out there and two of the best of those come in two flavors, one of which is 800x600!

I went to do an "added in edit" and ended up Deleting instead.

I think it's time to call it a day and go home before I do some real damage, except that I've got a class of 70 to tend to. :-)

I'm now all set with the ROM and everything, as they say, is copacetic.

Funny thing is that, at the moment, I like the 42S emulator better than my handheld! (No, my 42S is NOT for sale! :-))

Thanks for all of the advice and pointers.

[LONG] User-friendly complex-number calculations

*Message #1 Posted by **Karl Schneider** on 25 Sept 2004, 3:27 a.m.*

A few of HP's calculator models have introduced useful capabilities for calculating with complex numbers. These include the 15C, the 28C, the 42S, the 48S/SX, and their direct descendants. Other HP models and accessories have provided complex-number capabilities that are incomplete or downright impractical. These models include the 41C Math Pac, the 20S, and the 32S and 32SII.

Each calculator in the former group has pioneered a good idea:

- 15C: Provided complete functionality in the mathematical domain of complex numbers
- 28C: Provided straightforward single-line entry and a comprehensive menu of relevant functions
- 42S: Provided rectangular or polar modes for entry and calculation, with easy-to-read full display
- 48S/SX: Allowed entry of complex numbers in either form while set in either rectangular or polar mode

However, each of these models had its own shortcomings in regards to complex-number functionality. I have yet to see an HP calculator model offer such capability that I consider to be complete and user-friendly. Here's a functional specification of what I believe that would entail:

==========

Convenient one-line entry in either rectangular or polar form:

There should be a "[+i*]" unshifted key that would allow keypad entry of both components of a complex number with only a single extra keystroke. For example, "3.25 [+i*] [+/-] 5.64" would display "3.25 - i5.64", as the 42S does. The "[+i*]" key would function like "[EEX]", deletable by backarrow to allow correction of the real part.

As the 48-series models do, the "[+i*]" key could be shifted to enter the angle of a polar-form number. As the 42S and 48-series models do, the angle symbol would be displayed between the components.

The form of a complex number would not change upon entry, unary (one-input) operation, or binary (two-input) operation with scalar. However, rectangular-to-polar and polar-to-rectangular conversions would also change the indicator between "i" and the angle symbol as appropriate.

No parentheses or commas in the display! The tidy 42S-style, representation is preferable to the messy 28C/S and the 48-series representation of complex-number "objects", particularly when these are included within bracketed vector and matrix "objects".

Rectangular or polar mode result setting:

The user could set either a rectagular or polar result mode, which would only determine the form of a binary operation involving one complex number in rectangular form with another in polar form. The mode setting would not automatically change the form of complex numbers in the stack (as the 42S and 48-series models do).

Full menu of mathematical operations for complex numbers:

Another single-button would bring up a "CMPLX" menu like the one of the 28C/S, offering as a minimum R->C,

C->R, R->P, P->R, ABS, CONJ, RE, IM. The SIGN and ARG functions would be optional. Also, RRES and CRES from the 42S could be included.

Complete set of matrix operations for complex-valued matrices:

42S-style editing and display of complex-valued matrix elements would be used, although the convenient single-line entry described above would replace the assembly of numbers with the 42S's "CMPLX" function, which incorporates R->C and C->R.

The full functionality for complex-valued matrices found in the 28C/S, 42S, and 48-series would be included.

==========

Do the high-end TI's (e.,g TI-89) already offer what I have described? Perhaps I should sumbit this to the OpenRPN effort...

-- KS

Edited: 25 Sept 2004, 3:30 a.m.

Re: [LONG] User-friendly complex-number calculations

*Message #2 Posted by **Jeff O.** on 26 Sept 2004, 1:10 a.m.,*
in response to message #1 by Karl Schneider

Karl,
Your ideas sound great to me and are very similar to concepts I have though of in the past. I submitted similar concepts to Hugh at OpenRPN a while back. He seemed to appreciate my ideas, but did not promise anything.

Another concept would be to create an application for the 48 and/or 49 serious that would do the same thing. I have absolutely no idea how or if it could be done, but there are a lot of smart people out there writing amazing applicants for these machines.

HP-97 printer

*Message #1 Posted by **Michel** on 24 Sept 2004, 10:18 p.m.*

Hi, i have a HP-97 that i want to change the printer head. I just tried with the HP-41 external printer head but when i try to print, the printer move but nothing print on the paper. I verify all connections and the ohmeter says all it's right... SO why i get nothing on the paper? Is the 97 and the 41 pinter head compatible (except for the wire connector tha is longer thant the 97)?

Than you for answering my question.

Re: HP-97 printer

*Message #2 Posted by **David Smith** on 26 Sept 2004, 8:44 p.m.,*
in response to message #1 by Michel

The heads are NOT electrically compatible. The '41 printer uses a high impedance head driven by a higher voltage than the HP97 head.

Re: HP-97 printer

Thans for help... Is there a way to repair the head of my 97; two rows shows no resistance at all ant the third one is weak?

Michel

Re: HP-97 printer

*Message #4 Posted by **David Smith** on 27 Sept 2004, 3:39 p.m.,*
in response to message #3 by Michel

Unless the break is in the flex cable itself there is no practical way to fix it. Only source of replacements is another HP97/91/92.

HP-85 repair help!

*Message #1 Posted by **John** on 24 Sept 2004, 6:06 p.m.*

Hi,

I am looking for a couple of keys to repair an HP-85, specifically the letter 'O' and the 'Reset (' key (which is on the top row of the numeric keypad). If anyone has some spare keys or is breaking an HP-85 (or 86 or 87) for spares please can you get in touch.

Regards, John

PS I am assisting someone in trying to clone the Series 80 Programmable ROM module (he has identified all the chips and I am checking a few PCB tracks) so watch this space!

Clonix, NoVRAM vs MLDL

*Message #1 Posted by **Juergen Rodenkirchen** on 24 Sept 2004, 2:09 p.m.*

Following the latest discussions on NoVRAM and Clonix Modules, I understood that either can be considered as Eprom boxes. Morever, if I did understand right, either can be used also for M-Code programming. So, do the Clonix/NoVRAM - among other things - in fact have full MLDL functionality?

Juergen

A personal observation (long)

*Message #2 Posted by **DavidY** on 24 Sept 2004, 6:26 p.m.,*
in response to message #1 by Juergen Rodenkirchen

The answer is yes and no...

Clonix and NoVRAM are hardware emulators of 41C ROM modules using a microcontroller with internal and external memory fitted to the footprint of a ROM module.

Clonix is effectively ROM only. While memory is eprom the module can only be programmed EXTERNALLY with a PC attached programmer. This means any mcode (or FOCAL) program development would be done on a PC based emulator and compiled-to-Rom image code then would be burnt to the Clonix module. For most 41 users this module is best for providing the chance to use images of ROM modules which are unobtainable now. Plus because it allows for 24K+ of space it also allows 41C and/or CV machines to fit multiple "ROM modules" into the physical space of one module even if the images take up multiple "ROM addresses". This is because so-called "system" modules (memory, xmemory,etc.) do not take up module addresses (slot 8-f).

NoVRAM can be though of as a specialized version of Clonix designed to emulate a VERY specialized module from a 41 developer: the HePax. This module was quite probably the hight of development for the 41. It was a module contain ROM and RAM, with the RAM mapped into the ROM address space (8-f). The Rom code portion to care of mapping the Ram, provided initializing and loading code into ram, creating a standard address structure,etc. As initially set up NoVRAM has ram configured for use similar in concept to the 41's extended memory. The bonus is that HePax stores programs such that they appear in a directory as if they are a ROM module of user code. NoVRAM also has some free eprom space in which rom module images can be programmed. But, again, the eprom space holding the 4 pages of HePax code and extra pages are effectively only programmable externally by way of a PC.

Because of the adoption of a standard way of using an unused CPU opcode to access ROM space for reading or writing and because the Hepax provides a way to "map out" ram from HePax use; blocks of ram in the NoVRAM can be used to directly develop mcode with a 41. In fact, the HePax includes a hex editor and other routines to facilitate this. Also if one knows what to do the Hepax Rom code can be deleted and/or overwritten with other rom images leaving the full amount of ram available for use for programming with code like the David Assembler (I'm NOT that David, by the way) or ZenRom.

MLDL is, I believe, designed to fit a Card Reader sized case. Reading the documentation it appears to be designed to provide maximum space for module images, to allow for bank switching of multiple pages (read

entire ROM address spaces), and potentially provide for IO mapping into ROM address space to facilitate direct 41 to PC (or other device) interconnection. The MLDL's design allows for programming directly from a 41 or indirectly from a PC.

My personal view is that (1) both designs Clonix/NoVRAM and MLDL are amazing developments. The work done is excellent, and (2) the impact the 41 from opposite directions: the MLDL is a modern updating of those devices designed during the 41's "active" life to provide users with the ability to create their own ROM code but with many more pluses. The Clonix/NoVRAM comes from the path of providing those who still use the 41 with the ability to "use" those ROM modules which we never could get and which are impossible to find now. Think Clonix/NoVRAM for day-to-day transparent use and MLDL for development and/or big time special use. They all complement each other and don't compete.

Disclaimer: I don't have either Clonix or NoVRAM (yet!) and of course the MLDL isn't yet "released for production" so all this comes from their available documentation and my (small) knowledge/practice of 41 mcode development on 41 emulators (thank you "TOS" webmaster) so please take the above as a personal and in no way official explaination. I am no way in a league with the very talented gentlemen who actually developed these amazing devices. When you consider the 41 is 20+ years old the phrase "labor of love" in no way approaches their dedication.

MLDL and MLDL2000

*Message #3 Posted by **Meindert Kuipers** on 25 Sept 2004, 8:39 a.m.,*
in response to message #2 by DavidY

David, thanks for this great explanation!

The 'original' MLDL was published in the PPC magazine, and a version made by Eramco consisted of 3 stacked PCB's (each appr. 14*7 cm in size) holding EPROMs and RAM. A German company made an SMD version of it that fitted in a card reader huosing, but it could not hold EPROM, only SRAM.

The MLDL was the greatest toy that you could add to the HP41, allowing to develop your own ROMs (or make copies of them). The original HEPAX module went even further and put MLDL functionality plus more in a module sized housing, based on a custom made IC.

Clonix and Novram are based on a PIC microcontroller and fit in a single module housing. The logic is implemented in software that makes the module behave like an HP41 module or HEPAX. A single memory IC is added to Clonix to offer RAM to better emulate HEPAX or an MLDL.

I developed the MLDL2000 based on the original MLDL design with many additions. It will fit in a cardreader and is based on a CPLD where the logic is implemented in nonvolatile (but reprogrammable) cells operating as a bunch of flip-flops and combinatorial logic. There is SRAM and FLASH memory as well, plus a USB interface for communication and programming. The MLDL2000 is intended both for development and daily use, as it offers large amounts of storage for many ROM images that can be switched relatively easy.

I do not compete with Clonix or Novram, and have been emailing frequently with Diego Diaz, the creator of Clonix and Novram. I am just very glad that there are so many people around to keep the HP41 alive!

Meindert

19BII manual

*Message #1 Posted by **Gavin Coppin** on 24 Sept 2004, 1:38 p.m.*

I ordered a 19BII manual via the museum. Two weeks later I received a CD4. It does not contain the 19BII manual as ordered. Can somebody help? What do I do now?

Kind Regards Gavin

Re: 19BII manual

*Message #2 Posted by **Ron Ross** on 24 Sept 2004, 1:52 p.m.,*
in response to message #1 by Gavin Coppin

Not to help your problem with the museum, buuuuttt! you can download the Hp17Bii+ manual from Hp. This calculator has 90% of the features of the Hp19Bii and all the features and functions of the 17B are applicable to the Hp19bii. Only key locations are changed.

19BII manual not in the museum

*Message #3 Posted by **Mike H** on 24 Sept 2004, 2:38 p.m.,*
in response to message #2 by Ron Ross

CD 4 contains Calculator Software Manuals, not owners manuals. Further, the 19BII is not covered. CD 4 contains the HP-19C/29C Applications. The 19C was a printing programable calculator.
http://www.hpmuseum.org/19.jpg

You might ask Luiz, at one time had a copy in PDF format.

Edited: 24 Sept 2004, 3:01 p.m.

(edited) I 'heard'my name...(was: 19BII manual not in the museum)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 24 Sept 2004, 4:20 p.m.,*
in response to message #3 by Mike H

Hi Mike, folks; thanks, Mike, for mentioning my name.

Yes, in fact I kept a copy of the PDF files available at HP sometime ago of the HP19BII manuals, but they are in Portuguese (~8MB) and Spanish (~24MB >8^O), and at the time I downloaded these two there was no English version to download. About a week ago I was asked about a copy of the Spanish version, but I was not able to upload it (it reminds me I did not contact the person who asked me... Gee, I actually forgot!).

I am not sure if it is possible (and if one is allowed) to 'disassemble' the pdf file, reduce colors and resolution of the resulting pages (most likely that they are high resolution bitmapped images, what explains the 24 MBytes) and rebuild it in order to obtain a smaller file. I tried to zip it and got only a ~21.5MBytes zipped file, what I think is still a big chunk.

As I find a better solution I'm telling you all. Meanwhile, have anyone another guess or suggestion, let me kow.

Best regards (I'll contact the guy who asked me a copy tonight... I don't like mentioning the names of people who contacted me in private without asking for permission, so if he is reading, please forgive me... And Mike, your mentioning of my name fits perfectly fine, because it is a public fact in this forum that I have the copies of these files, so I am actualy thanked for you mentioning, O.K.?)

Luiz (Brazil)

Edited: 24 Sept 2004, 4:55 p.m.

Re: (edited) I 'heard'my name...(was: 19BII manual not in the museum)

*Message #5 Posted by **Gordon Dyer** on 25 Sept 2004, 2:27 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi, I can optimise .pdf files using Acrobat to reduce the file size, but you would have to be able to get the big files to me.
Email the portugese one first because it is small and I will try that one.
It is a pity that HP did not publish the manual in English as a .pdf.

Re: (edited) I 'heard'my name...(was: 19BII manual not in the museum)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 25 Sept 2004, 2:37 p.m.,*
in response to message #5 by Gordon Dyer

Hi, Gordon;

thank you so much.

I´m not home now, I´ve just finished attending my German class (hope this is the correct way to ´say´ that...). I´ll be home later and I´ll send you the Portuguese version.

As soon as the ´shrunk´ PDF´s are ready, I´ll try finding a place to hold them.

Best regards.

Luiz (Brazil)

disappearing manuals

*Message #7 Posted by **Bram** on 27 Sept 2004, 4:50 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Sounds familiar.
It looks like HP is stripping support for non-current calcs. No support => no questions => no costs.
Advice: download whatever you can before it's gone.

2 centjes.....

Re: (edited) I 'heard'my name...(was: 19BII manual not in the museum)

*Message #8 Posted by **Sergio** on 30 Sept 2004, 8:09 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Dear Luiz,

Could you send me a portuguese copy of HP19BII manual? I can receive on E-mail 10MB. Best Regards, Sergio josergio@uai.com.br

Third party book(s) on 49G+ ?

*Message #1 Posted by **Bob Poole** on 24 Sept 2004, 11:49 a.m.*

I just bought a HP 49G+. I have owned a 35, 25C, 67, 11C, 12C, 28S, and 48SX. I would still be using the 48 if the display hadn't given up. The documentation for the 49G+ is absolutely terrible in comparison. Just spent a few minutes looking back over the documentation for the 48. It is great, two sprial bound manuals, plus a third progammer's reference. What I wouldn't give for a set of hard copy manuals for the 49g+ that were written as clearly and organized as well. When did HP give up on printed manuals, and good tech writers?

Are there any good third party books available on using the 49G+?

Re: Third party book(s) on 49G+ ?

*Message #2 Posted by **Ron Ross** on 24 Sept 2004, 12:37 p.m.,*
in response to message #1 by Bob Poole

http://www.engineering.usu.edu/cee/faculty/gurro/myBooks.htm

Here is one site that you can reference. Also the manuals from your 48SX are also applicable for your 49G+ as well when you use the 49G+ in RPL mode (and who wouldn't???). Nearly every feature and function has been included in the 49G+ (I can't think of any that aren't). Hp also included a more detailed manual on your CD that was included with your Hp49G+ as well (actually by the same author as above, I believe). Of course you will need additional information to make use of the CAS and extra functions that are now included as well. Out of the Box, the 49G series left out only the Eq Lib of the 48G series (which the Sx required a card to get). This is now a freebe that is available via download from Hpcalc.org (which you have probably used since you also had a 48SX).

As far as why Hp gave up on these manuals, $$$$ pure and simple. Hp marketing surveyed the graphics calculator base (95% Ti users) and determined that most manuals were not read or used (I suspect that this survey would have been totally different if Hp had surveyed their own customer base). But marketing is always looking at the big picture (sell to as many as possible, whether that is possible or practical).

Sorry all, I tend to rant when the NEW Hp is brought up.

Don't forget the 49g+ learning modules either

*Message #3 Posted by **Gene** on 24 Sept 2004, 12:53 p.m.,*
in response to message #2 by Ron Ross

www.hp.com/calculators

Then go to the calculator page you're interested in and click on the audience you're a part of on the right side (students and educators, technical professionals, etc).

There are 55 learning modules free on HP's site for the HP49g+ covering a wide variety of problems.

Gene

Gilberto Urroz's books, and...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 25 Sept 2004, 7:13 p.m.,*
in response to message #3 by Gene

Hi;

I'd add to Gene's excelent suggestion the Great Unpuplished, but I tried to find them and it seems that they no longer exist, at least with this name. Actually, the above link falls into the last link (booksurge) mentioned by James M. Prangue in his post in this very thread. Have anyone any information about them, please, let me know.

Anyway, I bought three titles written by Gilberto Urroz printed by Great Unpublished that might also fit your needs: "Science and Engineering Mathematics with the HP49G+" (V.1 and V.2), "Applications of the HP g series calculators in Probability and Statistics" and "Analytical and Numerical Methods with the HP48 g/g+/gx", all of them dated Y2000. These are valuable books. I also have 'An HP48 Calculus Companion' (1994), by Jerold Matthews (Iowa State University) and Jack Eidswick (California State University - San Bernardino). This is a mid-level, high-school aid book that actually applies HP48G tools to solve math problems. I like reading it. Unfortunately I have not seen any of these titles available for download.

Hope you find something that fits your needs.

Cheers.

Luiz (Brazil)

Re: Third party book(s) on 49G+ ?

*Message #5 Posted by **Bob Poole** on 24 Sept 2004, 1:06 p.m.,*
in response to message #2 by Ron Ross

Thanks for the reply, Ron. It is good news to learn that I can use my 48 manuals. I already copied the manual from the CD to my hard drive. That is the documentation I referred to as being not up to the standard of that from the 48. In particular it lacks a lot of the detail about the structure of the calculator, and clear explanations of some of the menus, and working with the directory tree, and I/O functions... things like that, as opposed to simply solving math problems. It is a real wonder that people who invest in a sophisticated calculator would not read the manual. How will they ever really learn how to use the advanced features? For one, I would gladly pay more for a good set of manuals. I know what you mean about the new HP. As a matter of fact I worked for them for a while, up on the hill, back in the golden days, when Bill and Dave themselves would get on the paging system and give us updates on the latest happenings. Ah well...

Re: Third party book(s) on 49G+ ?

*Message #6 Posted by **James M. Prange** on 25 Sept 2004, 2:28 a.m.,*
in response to message #5 by Bob Poole

At least as far as UserRPL goes, except for I/O and the MMC / SD card, the 49g+ is very similar to the 49G.

Download the 49G Advanced User's Guide from http://www.hpcalc.org/search.php?query=Advanced+Guide&hp49=1

There's a lot of other information available at hpcalc.org, and through http://m.webring.com/hub?

ring=hp48.

There's a very active newsgroup, comp.sys.hp48, which is really about RPL calculators in general, and mostly about the more recent models. You can search the newsgroup archive from http://groups.google.com/advanced_group_search?group=comp.sys.hp48. If you can't subscribe through your own news client and server, then try http://groups-beta.google.com/group/comp.sys.hp48

If you'll settle for third-party books about the 49G, see http://www.booksurge.com/ and search by author for Urroz.

Regards,
James

Thanks to all!

*Message #7 Posted by **Bob Poole** on 25 Sept 2004, 12:23 p.m.,*
in response to message #1 by Bob Poole

Thanks to everyone who responded with all this helpful information. I still lament over the fact that the documentation that does exist isn't done as well as in the old days, but that is progress and economics for you.

HP-95LX Documentation

*Message #1 Posted by **Karl-Ludwig Butte** on 24 Sept 2004, 8:40 a.m.*

Hello, I was able to buy a used HP-95LX in good condition. Alas, there were no documentation like eg. Owner's Manual etc. acompanying the machine. Does anybody of you know where I can download the Owner's manual and other doumentation ? Any hint will be very much appreciated - thank you in advance

Re: HP-95LX Documentation

*Message #2 Posted by **Bill (Smithville, NJ)** on 24 Sept 2004, 9:14 a.m.,*
in response to message #1 by Karl-Ludwig Butte

You may want to try the HP Palmtopper web site at:

http://www.palmtoppaper.com

While they don't have the manuals on-line, they do have a wealth of information about the 95LX and the 200LX. Plus they have the magazine articles on line - the early magazines (1991-) has lots of info on the 95LX and its use.

They also sell used copies of the manual.

Bill

Re: HP-95LX Documentation

*Message #3 Posted by **Karl-Ludwig Butte** on 24 Sept 2004, 10:53 a.m.,*
in response to message #2 by Bill (Smithville, NJ)

Hi Bill,

thank you very much for your response - but isn't there a site where the manual can be downloaded without cost ?

Re: HP-95LX Documentation

*Message #4 Posted by **Don Redding** on 2 Oct 2004, 5:09 p.m.,*
in response to message #1 by Karl-Ludwig Butte

I also recently received a HP 95LX, complete with User's guide (part number F1000-90003 Edition 8),two copies of the HP palmtop PC Accessory Guide, the HP95LX Quick Start Guide, Hp Deskjet 520 setup guide, PFS: Resume & Job Search Pro (TM) User's Guide, Accessories booklet, and also it came with a HPF1001A Connectivity Pack and the original AC adapter. It works fine. This is the first time I've researched the HP95LX on line so I don't have any info for you. If you do not find manuals anywhere else, I could posssibly give you the info contained in these manuals some how.

Re: HP-95LX Documentation

*Message #5 Posted by **Karl-Ludwig Butte** on 7 Oct 2004, 10:52 a.m.,*
in response to message #4 by Don Redding

Hello Don,

thanks for your answer. You're really lucky to get a 95 complete with all these goodies you mentioned. I've done several Web-searches after my posting here but couldn't find any downloadable 95-manuals. I'm most interested in the specifications of the AC-adapter (volts, watts, and polarity of the plug) and in how to work with the 95 in DOS-Mode, e.g. is there a possibility to leave the shell which automatically starts at power-on. Or, if not, does it use any RAM or is it run directly from ROM ? Thank you very much in advance.

Regards

Karl

Re: HP-95LX Documentation

*Message #6 Posted by **Raymond Del Tondo** on 7 Oct 2004, 5:08 p.m.,*
in response to message #5 by Karl-Ludwig Butte

Hello Karl,

there are (at least) two ways to get into DOS mode on the LX series.
One is though the filer, which has a menu point for DOS shell.

The other way will go through the autoexec.bat file.
Theoretically a file like 95.exe or alike will have to be commented out,
at least on the 100LX/200LX there is a 100.exe (resp. 200.exe),
which lets you start the application environment if you somehow
booted to DOS only, which is possible on the 100LX/200LX
through the normal startup options.

HTH

Raymond

*Message #8 Posted by **jim w.** on 24 Oct 2004, 1:15 p.m.,*
in response to message #6 by Raymond Del Tondo

Raymond,

I have the 95LX and a serial cable but nothing else.

I am looking for:

* A manual

* A copy of the file "SUNDRV.ZIP" to allow Flash memory

* detailed instructions on file transfer over the serial cable.

Regards,

-Jim

95 LX transfers

*Message #9 Posted by **Bill Smith** on 25 Oct 2004, 1:26 p.m.,*
in response to message #8 by jim w.

Life is pretty good for file transfers if you have the connectivity pack. Both the filer and drive access software are in the CP95. Otherwise, you are left with the built-in terminal software, which functions just like other old DOS stuff (uses Kermit, I think).

I have had no luck getting any flash drives to work on the 95. Only the SRAM card that came with it seems to work on the 95. I have several flash cards from 8MB to 256MB that work with varying success on the 100 and 200, but not on the 95. If you have a 100 or 200, the IR transfer works well.

I have a 95 manual, and would be willing to scan a few pages for email (it's thick!) if you have a specific question covered therein.

regards,

Bill

HP49G+ vs HP49G

*Message #1 Posted by **RMSe17** on 23 Sept 2004, 11:11 p.m.*

Is there a comprehensive side by side comparison chart? Or a link to a good comparison of abilites and differences? I am interested in features, hardware components (like what processor is used?) etc..

Re: HP49G+ vs HP49G

*Message #2 Posted by **Raymond Del Tondo** on 24 Sept 2004, 1:54 a.m.,*
in response to message #1 by RMSe17

Please visit www.hpcalc.org , and read the newsgroup comp.sys.hp48 .

The two above are *the* sources for information on the HP-48 and HP49x series calculators.

BTW: If you don't have neither the 49G nor the 49g+,
just forget about the 49G, which is simply trash IMHO.
The 49g+ is far superior to the 49G in *every* aspect.

Faster, better display, much better keys, much nicer look (no frozen hamster butt),
expandability (SD cards), more programming options (ARM core access), and more...

Raymond

Re: HP49G+ vs HP49G

*Message #3 Posted by **James M. Prange** on 24 Sept 2004, 4:43 a.m.,*
in response to message #2 by Raymond Del Tondo

I'm not so sure about the keyboard. I don't like the feel of the rubbery keyboard on the 49G and it occasionally misses keystrokes, but the 49g+ misses a lot more keystrokes, and already there have been numerous reports of broken key hinges.

But in other ways, yes, the 49g+ is superior.

Regards,
James

>
That's why I don't use either of them;-)
My favourite in this class is my HP-48G+ Turbo,
with the high contrast display, a reliable keyboard,
with a real ENTER bar, speedup,
,and more RAM than needed...

Regards,

Raymond

Re: HP49G+ vs HP49G

*Message #5 Posted by **Eddie Shore** on 26 Sept 2004, 4:36 p.m.,*
in response to message #1 by RMSe17

HP49G+ is an upgrade of the HP49G:

* A SD Card Port * Faster Processor (I'm not sure what MHZ) * Price $139 as opposed to $189.

The big con, the keyboard can be a problem, but I hear that HP has fixed the keyboards.

> The big con, the keyboard can be a problem, but I hear that HP has fixed the keyboards.

Perhaps, but I'll believe it when I see it. My second warranty replacement 49g+ has a package serial of CNA423xxxxx,, case serial CNA419xxxxx, and ROM serial CN420xxxxx, and still misses keystrokes if I type normally. That said, if I'm careful to "bottom out" the keys every time, it does register all keystrokes, so I think that a lot of the problems depend on the user's typing style.

Whether they've fixed the problem with key hinges breaking will probably take a few months to tell.

But if you want to read discussions about RPL calculators, you'll find a lot more information in the usenet group comp.sys.hp48.

Regards,
James

Adding notes to HP49G+

*Message #1 Posted by **Tony** on 23 Sept 2004, 9:02 p.m.*

hello

How do i access notes i've written with WinHP and sent to the HP 49G+?

I have tried to follow the documentation that comes with the calculator, and looked around on the net, but haven't found exact details on how to add a library 7 be able to veiw it

thanks for any help

Re: Adding notes to HP49G+

*Message #2 Posted by **James M. Prange** on 24 Sept 2004, 4:38 a.m.,*
in response to message #1 by Tony

What's WinHP?

Why not just write the notes as character strings and transfer them to the calculator? Or if the "note" is an algebraic formula, write it as an algebraic object and transfer that. Any text editor should work.

Regards,
James

HP 12C

*Message #1 Posted by **German** on 23 Sept 2004, 2:27 p.m.*

Hello,

I just bought an HP 12c calculator in excellent condition, however, I realized that it was produced in 1986. I even have 3 manuals for it, printed in 1982 or 1984. Should I hold on to this calculator? I am not sure if anything has changed since 1986.

Thanks, G

Re: HP 12C

*Message #2 Posted by **bill platt** on 23 Sept 2004, 3:24 p.m.,*
in response to message #1 by German

Hi German,

The 12c has been made in many places, and has evolved--or in some cases devolved over the years. The "front end" has remained the same, but the details of manufacture have changed.

Nevertheless, the USA made units are genereally agreed to be the finest, with Brazilian and Singaporean of equal stature, but others inferiour.

In terms of holding on to it, that is the question. There is relatively high demand for the 12c, but it is still in production and most new buyers are unaware of the inferior nature of the new units. Further, there are huge numbers of existing units---both USA made and foreign, and so prices do not move much.

What will happen if HP discontinues the 12c? Good question. With the Scientifics, in the past 3 years, every discontinued RPN model, with exception of the 49g, has seen a dramatic increase in value. For the 17bii, which is a much more powerful machine than the 12c IMO, the price has stayed flat with discontinuation.

Apparently, business machines are not as interesting to collelctors---or maybe engineers are less cold hearted and tend to be more nostalgic.....

At any rate, that's what I know, and what I don't know.

HP-97 (Diagnostic) Program Question

*Message #1 Posted by **Olaf** on 23 Sept 2004, 12:39 p.m.*

Hi, I have a HP-97 incl. all cards from the standard pac but the diagnostic card sd-15 is missing. In the service manual there is a listing on page C-4 but in row (register ?) 005 there is a instruction which i dont know what it should be... it looks like "C53"... Does anyone know which instruction this should be ?!

And another problem i have is with the program "Factors & Primes". Several Times in the program listings there is a function "X!=Y?". Which keycode does this have on the hp-97 ?? Only function which looks similar is "X=Y?"

I would appreciate any help ! :-)

Greetings,

Olaf

in response to message #1 by Olaf

Okay, i found the answer to the "x!=Y?" question by myself :-) How dumb... its just x not equal to y..

But i still dont know what those "C53" should be...

Re: HP-97 (Diagnostic) Program Question

*Message #3 Posted by **Victor** on 23 Sept 2004, 2:14 p.m.,*
in response to message #1 by Olaf

In the HP-67 diagnostic listing, step number 5 is CF3. On the HP-97, you would get this by pressing f, CLF (on the GTO key), and 3.

Ok, here's what I did with NoVRAM ROM burning

*Message #1 Posted by **Gene** on 22 Sept 2004, 12:26 p.m.*

I loaded up page "C" with the SANDBXL.rom file and page "D" with the SANDBXU.rom file.

Burning the first time had a verification problem, the second time went through ok.

Plugged the ROM back into the 41CX (after turning it off) :-)

Yippee! The HEPAX stuff is still there along with the HePAX ram and its files.

The Sandbox rom lower page seems to work fine. I can execute BIT56, and other functions no problem.

The Sandbox rom upper page shows up in Cat 2, but all of the functions give "nonexistent" when I try to execute them.

I loaded SANDBXL to C000, bank 1 and SANDBXU to D000, bank 1.

Was this the correct thing to do?

I'm getting close! Gene

Re: Ok, here's what I did with NoVRAM ROM burning

in response to message #1 by Gene

I'm lost. Are these messages something to do about HP calcs?

tm

Yes, they do

*Message #3 Posted by **Gene** on 22 Sept 2004, 9:57 p.m.,*
in response to message #2 by Trent Moseley

The NoVRAM module is a new plug-in module for the HP41 series calculators that gives you the HePAX rom, 16K of ram and another 8K of rom images, all in the same plug in rom.

Some of the guys here have even written their own new mcode roms for the HP41.

I'm new to this area of calc-dom and have been trying to get answers to questions that may be too basic sometimes. :-)

Re: Ok, here's what I did with NoVRAM ROM burning

*Message #4 Posted by **Ángel Martin** on 23 Sept 2004, 2:11 a.m.,*
in response to message #2 by Trent Moseley

Ok, after a flippant moment (I also have a day job that erases part of my brain every day), I think I figured it out. You must have a ROM id# conflict between the Sandbox pages and some of the HEPAX RAM pages.

When this happens you see the functions on CAT'2, but they can't be executed by the OS and the NONEXISTENT message is displayed.

To fix it, you need to make sure that your HEPAX RAM pages do not have an XROM_id# (very first word on the page) that conflicts (i.e. same as) with any ROM plugged in (or burned into the NoVRAM). The Sandbox uses id's# 8 and 13 (D in hex).

You can check this using HEXEDIT, then input the RAM address you want to edit. If the word is either 8 or D you'd need to change it to another value (make sure it isn't already used by another RAM page!)

All this stems from the HEPAX, nothing to do with the NoVRAM. The id# assignment for the HEPAX RAM is done automatically the first time you plug the HEPAX module in the calc, and it remains the same until you change it by hand. So if another module is inserted afterwards, conflicts may occur...

Hope this helps, let me know how it goes.

Best, ÁM

Re: Ok, here's what I did with NoVRAM ROM burning

*Message #5 Posted by **Gene** on 23 Sept 2004, 7:41 a.m.,*
in response to message #4 by Ángel Martin

That sounds like exactly what is happening. I can see the functions, but trying to execute any of them (SINH, ROLLERS) gives me a nonexistent error.

I'll try the HEXEDIT function, but another question:

Should I have enabled the RAM at the first prompt? I didn't, but I dont' think that would be a problem.

And, I've had a few verify errors at H'0000. Not sure why.

That fixed it...and a question on ROLLERS and another Hepax Q...

*Message #6 Posted by **Gene** on 23 Sept 2004, 9:29 a.m.,*
in response to message #5 by Gene

Thanks. That did the trick! Yippee! I can now find the SINH of 2! :-)

I had plugged the NoVRAM into my 41CX with the rom pages blank originally, and the HePAX ram pages at 8000, 9000, A000, and B000 had been assigned IDs of B, C, D, and E respectively. I changed the D and E to E and F, then reburned the module and all Sandbox functions are now working!

Questions:

Rollers works, but each time I press a digit key to take numbers off the board, it types a 0 first. So if I want to remove the 4 and 5 because I rolled a 9, I press 4 (it shows 0) then I press 4 again and then 5. Quirk?

Second question (HePAX related): I have about 810 registers of programs stored in the Hepax ram.

I know there must be some overhead, but when I perform HEPROOM, I get 341 returned. Shouldn't there be more registers available for programs?

What am I missing with this second piece?

Ok, still have the ROLLERS question, but found answer to Hepax Mem question

*Message #7 Posted by **Gene** on 23 Sept 2004, 11:47 a.m.,*
in response to message #6 by Gene

Blocks A and B were showing up as "HEPAX RAM" in the Block Catalog (BLCAT) instruction.

I was also only getting 33 available hepax registers doing HEPROOM even though I had only loaded 1067 registers worth of programs.

I had to execute a CLRAM instruction with 10 in the stack and OK in alpha to clear block A. Turn the 41CX off and on again and HEPROOM had increased. Did the same thing for Block B (put 11 in X) and it now shows well over 1000 registers still free.

Perhaps someone else who gets this module will benefit from my questions and a few answers. Might just have to write it all down..."A VERY beginners guide to using the NoVRAM module with HePAX". :-)

Still have that question about Rollers however! Gene

Re: Ok, still have the ROLLERS question, but found answer to Hepax Mem question

*Message #8 Posted by **Etienne VICTORIA** on 23 Sept 2004, 4:07 p.m.,*
in response to message #7 by Gene

Hi Gene,

Yes, I also experience the "0" syndrom on input of the Rollers game.

Mine is Clonixed, so it's definitely not an issue with the NovRam.

Sorry for this meager contribution...

Best regards

Etienne

Thanks for the reply!

*Message #9 Posted by **Gene** on 23 Sept 2004, 7:23 p.m.,*
in response to message #8 by Etienne VICTORIA

Means that I don't have anything wrong with mine. :-)

These things ROCK. -- Gene

Re: That fixed it...and a question on ROLLERS and another Hepax Q...

*Message #10 Posted by **Ángel Martin** on 24 Sept 2004, 3:27 a.m.,*
in response to message #6 by Gene

Gene,

your question should really be posed to Ross Cooling, as he wrote the MCODE version of HighRollers present on the SandBox:- he deserves all he credit and the praise!

Not being a HR expert myself, I always thought the leading zero was there to make sure you don't cheat and input R/S without any number entered. So far it has worked like a champ for me, you just need to get used to it.

Best, ÁM

Re: Ok, here's what I did with NoVRAM ROM burning

*Message #11 Posted by **Ángel Martin** on 23 Sept 2004, 1:53 a.m.,*
in response to message #1 by Gene

Hi Gene,- Yes, it looks to me you did the right thing so I'm not sure why you're getting the NONEXISTENT errors. Does it happen with all functions in the upper page?? Try with GEULER, as this is just a constant retrieval. And do they all show up during a CAT'2 listing?

My CLONIX burning station is on loan at the moment, so I cannot replicate your settings, maybe Diego is listening and can chime in on this as well (but I'm pretty sure he's already tested this configuration).

More on this later.

ÁM

ignore this message, the answer is above (NT}

Another OpenRPN Update

*Message #1 Posted by **Hugh Evans** on 22 Sept 2004, 11:53 a.m.*

Just a few short news items to mention:

Guests have read/write access to the forums.

A discussion is underway at the OpenRPN forums to define the actual hardware to be used for the first form factor (voyager style). It can be found in General Discussion under the topic Definition Time.

The *fix command reference is being written in the wiki and I'm working on a *fix Command Definition Standard to help new contributors get started.

Last but not least: the OpenRPN site will be relaunched before the weekend.

As always, questions, comments, suggestions are welcome.

Best Regards, HDE

Re: Another OpenRPN Update

*Message #2 Posted by **Bill Wiese** on 22 Sept 2004, 3:08 p.m.,*
in response to message #1 by Hugh Evans

Hugh,

I applaud OpenRPN folks for thinking of making nice calculators but in my limited perusal I see lots of efforts in the feautures, & firware area and not really much in manufacturing a real calc.

I really think you guys need to work on manufacturability. Do you have any money pooled????

First figure out who will make a calc for you (at a reasonable-for-fanatics price) - incl. case, keyboard legends & keycaps. Otherwise the firmware effort will be for an ungainly tin box with wires hanging out of it which no one wants. You might be able to find some small mfgr that will even talk to you given for around $60/calc and warp an existing product for you with a big ENTER key.

Putting a PCB w/LCD and flash uC CPU is relatively trivial. And you can figure out the firmware as you go - you can always take an Classic/Nut emulator, add an I/O escape layer, and run HP firmware on it.

Firmware & electronics is the easiest part.

Bring Back the HP 15C

Re: Another OpenRPN Update

*Message #4 Posted by **Hugh Evans** on 23 Sept 2004, 8:57 a.m.,*
in response to message #2 by Bill Wiese

Manufacturability has been an important issue since the very beginning. Before bringing up the project here at MoHPC I made sure that it would be feasible to manufacture calculator hardware at a relatively low cost.

If you wade through the forums a bit more you will find that a good deal of discussion has taken place on this topic. I have been doing even more work behind the scenes obtaining quotes, etc.

As it stands right now, Chad and I are going to register an LLC to function as the business half OpenRPN. We plan to cover the majority of production costs through grants and investors. Unfortunately I can't elaborate on investors other than to say that discussions are taking place.

So the short answer is: We're on it. But we're doing the tedious stuff ourselves.

Re: Another OpenRPN Update

*Message #5 Posted by **Bill Wiese** on 23 Sept 2004, 1:23 p.m.,*
in response to message #4 by Hugh Evans

Hi Hugh

I trolled thru, maybe I missed it. Wasn't trying to 'dis' the effort. It just seemed like you guys were more worried about which CPU to use, when that is almost immaterial - you could make a nice calc, even a 42S+ with any 8 bitter CMOS job. Everyone focuses on what they like to do best ("when you have a hammer, everything's a nail") which for folks here is probably to write calc software or test features or write embedded firmware or emulators, and to do the nice keyboard layout artwork, CAD design, etc.

It just seems far harder to deal with injection molders, keycap mfgrs, etc. esp for small runs. That's hard work esp as there's likely a language gap.

Finding an existing commodity calc mfgr in Far East that does small custom production runs of stylized promotional items might be one thing I'd investigate.

BTW please DON'T use rubberized keys. They don't last - esp if logos on 'em.

Bill Wiese San Jose

Re: Another OpenRPN Update

*Message #6 Posted by **Hugh Evans** on 24 Sept 2004, 1:00 a.m.,*

in response to message #5 by Bill Wiese

No offense taken at all, Bill. We have spent a good deal of effort on choosing components (and we're finally about to decide on exact hardware so we can move that department into the prototyping stage).

I've been taking on the less glamorous stuff myself. Putting all of the UserRPL commands into a wiki page was no fun at all!

For the most part I'm not looking at companies in the far east. Yes it would be cheaper, but I would like to keep the majority of the production in the US. There won't be a language barrier with people in QC and it will be good for the economy.

Keytops are one area Chad and I are going to take on personally. We plan to lease a commercial laser cutter/etching machine to make custom sets a standard option and a cheap upgrade.

BTW: Keys will be hinged and made from plastic. Labels will be as good as double shot injection molded. Tactile feedback *will* be the best anyone has ever experienced on a calculator.

I'll stop before this turns into a full out rant. :^)

Best Regards, Hugh

*Message #7 Posted by **Ren** on 24 Sept 2004, 4:42 p.m.,*
in response to message #6 by Hugh Evans

On the subject of calculator keys...

I finally noticed the "chevron" design of the -33S.

I had imagined it to have the uppermost key in the middle of the keyboard, or left of center. That way it would correspond to the longest finger on the right hand.

Ditto here. We're still mostly able to (and do) avoid Chinese products.

Re: Another OpenRPN Update

*Message #11 Posted by **Ren** on 27 Sept 2004, 6:44 p.m.,*
in response to message #8 by abc

abc,

If you're replying to my post, I meant in the sense of ergonomics, a chevron keyboard with the middle keys higher on the Y-axis than the outer keys would probably be easier and more comfortable to use. I haven't held a 33S in my hands, but if its "V" shaped chevron is opposite of this, what were the designers possibly thinking?

Fashion over function?

Re: Another OpenRPN Update

HP-48GX crackling keys

*Message #1 Posted by **Isabel** on 22 Sept 2004, 11:50 a.m.*

Hi, I had a smal mishap yesterday: I spilled some energy drink on my HP. I managed to clean it right away, but now the six keys on the far left make this "crackling" or "clicking" sound which just drives me nuts!!! Hoped that since the drink was "sugarfree", it would not be too sticky... wrong. Otherwise it works fine, though.

Does anybody know how to "repair" this? Do you think this problem will solve itself as time go by?

Thanx!

Re: HP-48GX crackling keys

*Message #2 Posted by **Randy Sloyer** on 22 Sept 2004, 1:09 p.m.,*
in response to message #1 by Isabel

It will not get better, only worse in that it may start to miss keypresses. It's easy to clean.

Back up your programs, remove the batteries* and covers and give the unit a bath in distilled water. Press all the keys while it is underwater. Let it soak for five minutes. Press all the keys again. Take it out, shake out all the water from the unit, change your bath water and repeat the process.

Shake it out really well, put it in a warm place to dry, keyboard side up. A small fan blowing over it will speed the process. Give it 24 hours. Put the batteries back in and it should be good as new.

* - Failure to remove the batteries will result in a dead, non-repairable calculator. Liquids and 48's don't mix well when batteries are in place.

Re: HP-48GX crackling keys

*Message #3 Posted by **Isabel (Austria)** on 22 Sept 2004, 1:56 p.m.,*
in response to message #2 by Randy Sloyer

Randy: Just to confirm: Batteries out, ok- no problem. Covers: the only covers I can remove are those for the batteries and the top cover for the cards.

I cannot dismantle it any further.

Are you positive it won´t hurt my calculator? (perhaps I´m just used to my cell phone, which "fractionize" far too easily)

Thank you!

Re: HP-48GX crackling keys

*Message #4 Posted by **Ronald** on 22 Sept 2004, 4:52 p.m.,*
in response to message #3 by Isabel (Austria)

Hi,

It certainly is worth a try, but make sure you do no have the display itself getting wet. I think that is not the best for the calculator.

After taking it out of the water I would try to get as much water out as possible, maybe you can use a lectuce centrifuge or something like that so you can spin the calc already a bit dry ?

Succes

Let us know if it worked.

Ronald

Re: HP-48GX crackling keys

*Message #5 Posted by **Randy Sloyer** on 22 Sept 2004, 6:41 p.m.,*
in response to message #3 by Isabel (Austria)

Distilled water will not harm anything electronic, the LCD display is glass and is totally sealed. Everything electronic, your cell phone included, was washed during the assembly process. So long as the unit is not energized and the water is shaken out of the device it will only clean it, not damage it. No need to spin dry, air drying is sufficent. Less risk of damage as well.

You are correct, the battery and port cover are the only pieces you can remove. This is only to allow more water to come out when you shake it. Just hold the unit tightly, don't send it across the room or to the floor. Press all the keys and shake again, do this until no more water can be removed.

Re: HP-48GX crackling keys

*Message #6 Posted by **bill platt** on 23 Sept 2004, 12:07 p.m.,*
in response to message #1 by Isabel

Hi Isabel,

I know it seems counter-intuitive to dunk a piece of electronic equipment.

But what Randy is not telling you (because he is being modest) is that he has done this many times berfore, and it worked. He has fixed a lot of calculators :-)

Best regards,

Bill

Hey guys, and specially to Randy!

Thank you so very much... it worked out perfect! My beloved HP 48GX is as good as new again! And Bill was right saying that it was "counter-intuitive" diving an electronical device into any fluid :)

Thanx again for your time and expertise,

Isabel

MLDL2000 for HP41 Update

*Message #1 Posted by **Meindert Kuipers** on 22 Sept 2004, 3:58 a.m.*

Hello all,

Just a quick update about the MLDL2000. As usual there is good news and bad news. The PCB's for the protos are about ready and will be populated in the next week or so. That was the good news.

The bad news is that I broke my left wrist and will not be able to do anything remotely resembling soldering for the next 5 or 6 weeks, so testing is out of the question. I am making some progress on the software for the user interface, but writing code with one hand is pretty tedious.

Will keep you all updated!

Meindert

Re: MLDL2000 for HP41 Update

*Message #8 Posted by **Donald1800** on 23 Sept 2004, 2:48 a.m.,*
in response to message #1 by Meindert Kuipers

Ditto on the wish for your prompt recovery.

Just wanted to also let you know that the community is anxiously awaiting the availabiity of this major HP41 project. Since my old european MLDL prototype died about a week after delivery, I have been frustated by my inability to learn/practice Mcode with my copy of Squid Ink's "Mcode Programmng". I had just started into this text when the box died. I still want the MLDL2000.

Don

Re: MLDL2000 for HP41 Update

*Message #9 Posted by **Ángel Martin** on 23 Sept 2004, 12:35 p.m.,*
in response to message #8 by Donald1800

Ditto here on the recovery wishes and the anxious wait for the MLDL_2000.

Best, ÁM.

BTW, if learning MCODE is all what you want to do, you can start with the NoVRAM already, also a marvel of a gizmo.

Meeting in Portland Powell's after HHC2004

*Message #1 Posted by **Wlodek Mier-Jedrzejowicz** on 21 Sept 2004, 11:57 p.m.*

Some readers of this Forum probably know that this coming weekend (Sept 25/26) the annual HP Handhelds User Conference (HHC 2004) is being held in San Jose. After this meeting, Dave Hicks and I (Wlodek Mier-Jedrzejowicz, author of some books about HP handhelds) will be in the big Powell's in Portland (Dave's home territory). We'll be in the coffee area on Tuesday September 28 from about 11.45 till well after 12 noon and will be happy to talk about the HHC and about HP calculators in general.

If anyone is interested and can come, we'll be happy to see you. We can be identified by the HP handhelds on the coffee table.... Someone from the HP Corvallis calculator team might be there too.

Wlodek

spam from HP about 12C-Platinum

*Message #1 Posted by **Bill Wiese** on 21 Sept 2004, 3:26 p.m.*

Interesting that I'd get spam from HP touting new 12C Platinum calc. I've included their agitprop below minus formatting (lines divide different page sections/blocks).

And it's in HTML. :(

Notice how they try to explain away RPN.

[They do have my email from past msgs awhile back to Fred Valdez & Lee Goh about what a _real_ RPN calc should look like/ perform/ endure. So that's prob where they got it from. You'd figure I'd be on the sci. calc list instead - but then, these are marketing droids.]

Bill Wiese San Jose

========== ========== Take a different approach to the same information.

The business world has counted on the HP 12C financial calculator for the last 23 years. This legacy of efficiency continues in the HP 12C Platinum. It allows you to switch easily between traditional algebraic and highly efficient Reverse Polish Notation (RPN)** data entry modes, so you can ramp up to RPN at your own pace and still have instant access to a familiar algebraic world.

You also have four times more memory to work with. That means you can program the HP 12C Platinum to calculate equations with up to 400 steps.

More features at the push of a button.

The HP 12C Platinum boasts over 130 built-in functions so you can quickly calculate loan payments, interest rates and conversions, standard deviations, cash flows, bonds, and much more. Combine this with a sleek, easy-to-use interface, and you'll see why the HP 12C Platinum calculator is the definitive choice for finance, banking, and real estate professionals.

The financial calculator trusted by millions is better than ever. Click here to see what the 12C Platinum can do for you.

---------- The financialworld'sleadingcalculatoroffersmorethan ever.

Ready to boost efficiency in your day-to-day operations?

Grab the HP 12C Platinum financial calculator. It picks up where the 12C left off, with more power, more memory, and more features than ever before.

Buy now $104.99*

The 12C Platinum

Manufacturer's suggested retail price. Retailer prices may vary. Price is shown in U.S. dollars, does not include applicable sales tax and shipping, is valid in the U.S. only, and is subject to cancellation or change without notice.

**Reverse Polish Notation (RPN) is an efficient data entry system that can significantly reduce keystrokes. More information is located at www.hp.com/go/rpn.

• Efficient RPN** and traditional algebraic data entry

• Calculate TVM, NPV, IRR, cash flows, bonds, amortization, depreciation, and more

• Four times more memory, allowing for programming of up to 400 steps

• Over 130 built-in functions

• Permitted for use on the CFP® and CFA® Certification Exams***

• A sleek, updated design with a platinum face

Re: spam from HP about 12C-Platinum

*Message #2 Posted by **Katie** on 21 Sept 2004, 5:11 p.m.,*
in response to message #1 by Bill Wiese

I got that too. This is the first time that I can remember receiving anything from them. They must be desperate to get rid of these 12C Platinum's.

Re: spam from HP about 12C-Platinum

*Message #3 Posted by **Bill Wiese** on 21 Sept 2004, 5:22 p.m.,*
in response to message #2 by Katie

Hi Katie

(BTW Your 41CX I bought is doing great :)

Actually my new sofa needs some better low-profile feet. Perhaps I should just buy a four-pack of 12C Platinums as 'skids' :)

Yes, I really got the feeling this was far more than an informational ad - almost like hyperpromotional schlock I get every week from Gevalia coffee.

IIRC, I got one of these about a year ago for a 48 or 49 calc. Again, it was direct from HP and not a distribution partner etc.

Bill Wiese San Jose

I received it too!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 21 Sept 2004, 8:37 p.m.,*
in response to message #1 by Bill Wiese

Hi, folks;

I opened my e-box right now and I saw it. Would they use this forum's participants as a reference? I want not to think about this, because we're the last ones (most, most of us) they'd try to explain what is RPN and what is the 12Cp capable of doing... as if we do not know it already.

I actually did not understand the point here...

Any clues why us included???

Cheers.

Luiz (Brazil)

I opened my email and...

*Message #5 Posted by **db(martinez,california)** on 21 Sept 2004, 11:08 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

...HP sent me one too!

I feel like Steve Martin when he found his name in the phone book in "The Jerk".

I'M SOMEBODY!!!!!!!!!!!!

Re: spam from HP about 12C-Platinum

*Message #6 Posted by **John Smitherman** on 21 Sept 2004, 11:09 p.m.,*
in response to message #1 by Bill Wiese

Hi, Bill. For what it's worth... based on 19 customer reviews the 12c platinum currently has a rating of 2 stars (out of 5) on www.amazon.com.

Makes me want to run out and buy one! :(

Regards,

John

Did you try to sign up as Developers?

*Message #7 Posted by **Mike (Stgt)** on 22 Sept 2004, 6:53 a.m.,*
in response to message #1 by Bill Wiese

I suppose you did sign up at http://www.hp.com/calculators/developers.html

It seems to work even if the 'Submit' resulted in a "page not found".

Ciao.....Mike

Ok. Have NoVRAM - what are first steps?

*Message #1 Posted by **Gene** on 21 Sept 2004, 1:05 p.m.*

Ok, just got it from the post office. It is supposed to come pre-loaded with the HePAX rom image.

To plug it in and use it for HePAX and saving programs to the RAM, what are the exact steps I have to do? I'm trying to wade through the Clonix manual, but I am confused. :-)

I know something must be done, since if I plug it into my 41CX now, the 41CX turns off and locks when I turn it on.

So, what do I need to do to use my new baby? I'll worry about loading ROMs later. :-)

Gene

Re: Ok. Have NoVRAM - what are first steps?

*Message #2 Posted by **Wilson (Bill) Holes** on 21 Sept 2004, 4:40 p.m.,*
in response to message #1 by Gene

Hi Gene,

In regards to your statement "I know something must be done, since if I plug it into my 41CX now, the 41CX turns off and locks when I turn it on.". The 41CX should be OFF before you plug in any module, including the NoVRAM. Also, the HEPAX is a real monster (endearingly speaking) so it's important you become familiar with its functions and operations before trying to do too much with it. The manual(s) are available for download from TOS (the other site).

The problem of the machine locking up is way beyond my limited abilities but I'd bet that Diego can help.

Best, Wilson (Bill)

Re: Ok. Have NoVRAM - what are first steps?

*Message #3 Posted by **Gene** on 21 Sept 2004, 5:20 p.m.,*
in response to message #2 by Wilson (Bill) Holes

Well, I wasn't clear in the first message. I put the module in while the 41CX was off, turned the 41CX on, and then it would turn off/lock up, etc.

I imagine it hasnt' been properly "initialized" or something. :-)

Thanks however for offering the advice...that's what makes it so helpful for newbies when they come by here!

Gene

RTFM [was: Ok. Have NoVRAM - what are first steps?]

*Message #4 Posted by **Raymond Del Tondo** on 21 Sept 2004, 5:15 p.m.,*
in response to message #1 by Gene

Hi,

as Bill states, always turn off the calc *before* plugging/unplugging modules.

Now you could try a calc reset (ENTER+ON).

If you got it working, that is the calc turns on again,
and you downloaded the manual from TOS,
you'll see some HEPAX functions like HSAVEP, HGETP, and alike.
Yes, to store user code programs in HEPAX RAM there are easy-to-use
functions available, the saved program(s) will appear in CAT 2,
you can run it from there, as usual. HEPAX cares for the details.

As always, and especially for such a complex piece of hardware and software, RTFM FIRST;-)

Raymond

Re: RTFM [was: Ok. Have NoVRAM - what are first steps?]

*Message #5 Posted by **Gene** on 21 Sept 2004, 5:25 p.m.,*
in response to message #4 by Raymond Del Tondo

Hi Raymond!

Raymond: as Bill states, always turn off the calc *before* plugging/unplugging modules.

GENE: Yep, had been doing that. Wasn't clear before. I've had a 41C since 1980, so I knew to do that.

Raymond: Now you could try a calc reset (ENTER+ON).

GENE: Did that, and I think it may require leaving the batteries OUT overnight. Still turns off quickly. Might be that the batteries got drained (they are rechargeables) right when the module was put in...who knows...static discharge is a pain.

Raymond: As always, and especially for such a complex piece of hardware and software, RTFM FIRST;-)

GENE: My beef wasn't with the HePAX manual which I have read from the other site, but with the instructions on what to do with a just-out-of-the-envelope NoVRAM module. Is it different than the Clonix module? Do you follow the steps in the Clonix manual? If not, what steps are different? Again, I just figured that there must be differences in the INITIAL operating/setup instructions for the NoVRAM module compared to a vanilla Clonix.

And, there is no "manual" as yet specifically for the NoVRAM module - only the Clonix. Makes it tough to read. :-)

Batts? [was: Re: RTFM]

*Message #6 Posted by **Raymond Del Tondo** on 21 Sept 2004, 5:40 p.m.,*
in response to message #5 by Gene

Hi Gene,

maybe the batts are the key. Since the NoVRAM (and also the Clonix)
draw some more power than a passive module, there is a chance
your batteries went flat in a short time.
How does it work with fully charged batteries?

Raymond

Re: Batts? [was: Re: RTFM]

*Message #7 Posted by **Gene** on 21 Sept 2004, 5:46 p.m.,*
in response to message #6 by Raymond Del Tondo

That's what I'll try tonight.

:-)

THOUGHT they were fully charged!

Gene

Ok...it was the batteries...HePAX works!

*Message #8 Posted by **Gene** on 21 Sept 2004, 11:47 p.m.,*
in response to message #7 by Gene

Sorry for the confusion all. My rechargeable battery pack was NOT showing "BAT" but went that way as soon as the HePAX was plugged in.

Went to alkalines I had and it works fine.

And, yes, I'm reading the HePAX manual. :-)

Gene

HP-19BII Batteries size

*Message #1 Posted by **Albert** on 21 Sept 2004, 8:03 a.m.*

Hi everybody, I'd like to know what kind of batteries uses the HP-19BII; size in millimetres will be useful. TIA, Albert.

Re: HP-19BII Batteries size

*Message #2 Posted by **Mike H** on 21 Sept 2004, 11:07 a.m.,*
in response to message #1 by Albert

Albert, The 19BII uses size N batteries.

1.5-volt N-cell x3

11.5 mm diameter, 28 mm length

Mike

Edited: 21 Sept 2004, 11:08 a.m.

Re: HP-19BII Batteries size

*Message #3 Posted by **David Smith** on 21 Sept 2004, 2:33 p.m.,*
in response to message #2 by Mike H

And be VERY careful not to use those 12V batteries that are the same size as the 1.5V N cells...

HHC2004 Speaker and Topic List - Still time to come!

*Message #1 Posted by **Gene** on 20 Sept 2004, 9:57 p.m.*

Registration information at www.holyjoe.net/hhc2004/

1. Bill Butler Title: How I use my HP-XX Synopsis: An HP48/49-centered user-level programming odyssey is sketched with attention given to the development of an effective user protocol, a couple of examples of extreme multi-machine calculating and perhaps 1-1/2 HP49 bugs.

2. Martin Cohen Title: Programming the HP-33s

Synopsis: The HP-33s is the new version of the HP-32sii calculator. I describe some of the characteristics of the 33s and present four programs (commentary and code) for it: (1) Solving 3x3 and 2x2 linear equations; (2) bit-fiddling (AND, OR, XOR, ...); (3) sorting; and (4) linear least squares. Techniques for addressing the shortage of Labels are also covered.

3. Monte Dalrymple Title: The NEWT (Nut, Extended, With Turbo) Microprocessor and 41CL Calculator

Synopsis: Contrary to popular myth, moving an obsolete microprocessor to a newer technology isn't that hard and doesn't need to be that expensive. the original nut microprocessor, used in the HP41C, is a prime candicate for this kind of redesign. The NEWT design wraps extra logic around a clone of the Nut microprocessor, adding a parallel memory interface (1Mx16) and higher-speed operation (up to 50x) while maintaining bus compatibility for the 41C ports. this will allow a replacement CPU board to be implemented and substituted into a HP41C body. This enhanced calculator (A 41CL?) can hold numerous ROM images, a complete MLDL, and operate up to fifty times faster than the original HP-41C

4. Cyrille de Brebisson & Art Garcia of HP Title: None, Q & A

5. Joseph K. Horn Title: PDQ Unbound: No More Limitations

Synopsis: PDQ's only two limitations have been removed, namely, the allowable size of the input, and the accuracy of the output, both formerly limited to the computer's number of internal decimal places. Now ANY input is allowed (any number of decimal places, AND a new option: fractions with numerator & denominator of any size), AND the desired precision can be HIGHER than the native ability of the computer, and in fact can be ANY desired precision. For example, using an hp49g+, I can input a 30-digit decimal number, and specify that I want the best fraction that evaluates to the same thing +/- 1 digit in the 26th decimal place. Or 50th decimal place! Or whatever, without limitation. Overhead.

6. Dave Hicks Title: The Hitchhiker's Guide to the HP Museum

My informal talk will cover: Site inspiration and objective; Peer pressure from total strangers; Implementation and running of the site, The classified ads and forums, Spammers, trolls, and ebay warriors; CDs and DVDs, past, present, future; Website future.

7. Paul Hubbert Title: Latest Electronics Handheld "Toy" Bargains

Synopsis: Each year the electronics industry packs more technology into ever smaller packages. What was a

complex function costing hundreds of dollars is now available from an Asia manufacturer (usually China) for tens of dollars. Add to this the low sales cost of the Internet and there are thousands of bargains to be found - if you have the time and dollars to risk. I will make a short presentation of the results of my search for items related to HP Handhelds and . . . . Imagine a 2.2 GB microdrive delivered for $142, or a 256 MB SD memory for your HP49 for $ 35. Examples on hand.

8. Ted Kerber Title: Third-Party Applications for the HP49G+

Synopsis: Some suggestions for protecting your application from copying. Also takes a brief look at how applications help sell calculators, from the HP65 to the HP41CV/CX, in comparison to the 48 and 49 series of calculators, solution books, learning aids and teaching aids. Addresses HP support for applications, then and now and how the current tool of “partnering” can help both the manufacturer and the developer.

9. Wlodek Mier-Jedrzejowicz Title: 10 Things a Calculator Will Never Do

Synopsis: Instead of looking for ever more features a calculator could have, I want to ask what sort of things an electronic handheld calculator will never do. Some of the answers to such a question can help us define what a calculator is, for example a calculator is not a word processor. Other answers will serve as reminders of the limitations that nature puts on the process of calculation. Thirdly, a few of the answers may be seen as challenges to future developers. Audience participation will be very welcome what do you think a calculator cannot do or should not do?

10. Wlodek Mier-Jedrzejowicz Title: Report on ICME 2004 Conference for Maths Educators in Copenhagen

Synopsis: At HP’s invitation, I presented a workshop at the International Conference of Mathematics Educators in Copenhagen, in July this year. This talk will be an informal description of my experiences at this conference. In particular, I want to compare the ways in which HP, Casio and TI presented themselves and their products to the conference attendees.

11. Richard J. Nelson Title: Personal Low Cost Book Binding

Synopsis: Many manufacturers like HP provide their equipment manuals on CD ROMs. This means that you must print your own manuals. With a $30 equipment investment and a supplies cost of about 30 cents per book, you may bind up to 320 pages in an attractive "hard bound" style book using this system. Examples of various colors and cover styles will be presented. Books will be "bound" during the talk to illustrate how simple and easy the system works. Demonstration.

12. Richard J. Nelson Title: Superman Looks at the HP17BII+

Synopsis: Historically users would disassemble their machines and photograph them using macro photography to document new models. Presentations made at HHC projected these 35 mm slides using a long throw zoom lens to provide as much magnification as possible to study new calculator technology. More recent techniques utilized video cameras and monitors for this purpose. Modern X-ray machines provide a high tech noninvasive examination technique suitable for viewing calculators. Machines designed for circuit board inspection provide magnifications of up to 1600x if the parts are small and may be moved very close to the X-ray tube. A Power Point presentation will provide a "tour" of the internals of the new HP17BII+ calculator. Astounding images of the complete machine and of individual components will be presented. Power Point.

13. Erich Reclin Title: The History and Operation of hpcalc.org

Synopsis: Although the hpcalc.org web site has been visited by millions of people over the last seven years, very little has been shared about either its history or its inner workings. I will explain both my reasons for and the process of starting the site, how it has evolved over the years, and difficulties that have been overcome. I will also give an overview of how the site currently operates, including technical details of the code that runs it.

14. Jake Schwartz Title: Proper Calculator Keyboards and Attachable Overlays

Synopsis: From the HP-35 in 1972 up to the HP48GX in 1993, we have experienced a consistency in keyboard key placement and a steady increase in calculator user-customizability. However, with the movement of the calculator organization from Corvallis to Singapore to Australia and to San Diego over the past decade, personnel and priorities have changed. This is one user's perspective on the current situation and a personal approach to getting "back on track." Emphasis will be placed on the current HP49G+ and the HP33S calculators.

15. David Shier Title: Present and Future PDA's

The buzzword for today is "convergence". PDAs, phones, digital cameras and MP3 players are all merging into one. All that's missing for the student is a decent calculator. While the Pocket PCs from HP are now coming from the old Compaq group out of Houston, now is the time for HP to consider a convergence of their industry leading calculators and PDAs. In this presentation we will look at the current incarnations of the PDA. In addition, as someone that has been around HP calculators since the 34c and their PDAs from the first 95LX until their newest iPAQ 6315 phone, David will present his vision for a future calculator/PDA - including thoughts for solving certain keyboard dilemmas.

16. Eric Smith Title: Update on Microcode Simulation of Early HP Calculators

Simulation of HP calculators may be useful to run older calculator software without porting, for general calculator usage (because most modern computing environments including computers, PDAs, and phones have woefully inadequate calculators), and for historical interest. Many HP calculator simulators are available, but most of the ones that simulate the pre-1986 calculator models only perform only a user-level simulation, and often produce different results and behavior than the real calculator. Microcode-level simulation can potentially be much more accurate, to the point of reproducing the bugs in the original calculator.

17. Gene Wright Title: Calculating Contrast

Synopsis: The choice of colors for use on calculator keyboards generates great debate between users and designers. For example, the color scheme of the HP48GX is generally considered less readable than the one used for the HP48SX. Using a formula, the presentation will attempt to quantify the degree of contrast involved in the color choices used on present HP calculators. Recommendations will be made regarding "good" or "not-so-good" combinations used. A recommendation will also be made for HP to consider when choosing future color combinations. Power Point.

HP 15-C Help

*Message #1 Posted by **Chuck** on 20 Sept 2004, 8:59 p.m.*

Can anyone tell me how to change the decimal point marker from a comma to a decimal point? Thanks,

Chuck

Re: HP 15-C Help

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 Sept 2004, 12:28 a.m.,*
in response to message #1 by Chuck

Hi, Chuck;

try this:

```
with the calculator off, press and hold the [.] key;
while holding [.] down, turn the calculator to on;
release the [.] key.
```

Anytime you want to toggle the radix mark (from dot to comma and conversely) you can follow this keystroke sequence.

Cheers.

Luiz (Brazil)

HP 48SX calculator

*Message #1 Posted by **Diane** on 20 Sept 2004, 3:22 p.m.*

Help! I've lost the manual to my old HP Scientific Expandable 48SX calculator. Was goofing around, hit the wrong button and now can't get back to the "regular" mode (i.e., add, subtract, multiply, divide). Does anyone have any idea how to get back to that screen? Thanks!

Re: HP 48SX calculator

*Message #2 Posted by **Raymond Del Tondo** on 20 Sept 2004, 3:56 p.m.,*
in response to message #1 by Diane

Hi,

first press and hold the ON key,
then press and release the 'C' menu key.

This should get you back to the main screen.
The manual and much more info on this machine can
be found at www.hpcalc.org

Raymond

Re: HP 48SX calculator

Exchange 17BII+

*Message #1 Posted by **Bob Wang** on 20 Sept 2004, 12:26 p.m.*

Just spoke with a very helpful young lady at 1(800)HPINVENT. She said that HP is still in the process of establishing return policies for the old 17BII+'s without L() and G(). She suggested that I call back in about a month to ensure that my replacement will be the updated ROM. She also asked where I purchased my calculator for internal purposes, but that even without a receipt there should be no problem since the calculator has not even be out for a year.

Give HP credit for addressing this problem!

Now if they'd only release the 19BII+ ...

Re: Exchange 17BII+

*Message #2 Posted by **Scuba Diver** on 21 Sept 2004, 4:24 p.m.,*
in response to message #1 by Bob Wang

Bob, is that the only change, or did they also include any other enhancements in this ROM release?

B.

Program size limits in 17BII+

*Message #3 Posted by **Bob Wang** on 21 Sept 2004, 6:40 p.m.,*
in response to message #2 by Scuba Diver

The worst thing about not having let and get functions on the old 17BII+ is that there is also a program size limitation. Because of that, many of the more accurate versions of Black-Scholes cannot be implemented on the old 17BII+.

There are also quirks as in (x + y)/z returning an error, and having to be written as x/z + y/z. To tell the truth, I got fed up with wrestling with that beast and put it away.

Once I get a replacement unit, I'll start playing with it again.

Re: Exchange 17BII+: serial # ????

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 21 Sept 2004, 8:41 p.m.,*
in response to message #1 by Bob Wang

Hi;

for those who intend (I am one of them, as a teacher) to buy an HP17BII+, would you, guys, who get the newer models allow us to check for the serial #? That would avoid people buying older (?) units...

Thanks.

Luiz (Brazil)

Just bought 17bII+ and Let and Get are back!

*Message #1 Posted by **John** on 20 Sept 2004, 7:45 a.m.*

FYI. Looks like an update under the hood has occurred.

Good news! Thanks HP!

John

Re: Just bought 17bII+ and Let and Get are back!

*Message #2 Posted by **bill platt** on 20 Sept 2004, 11:46 a.m.,*
in response to message #1 by John

Hi John,

Thank you very much for the heads up. There had been a post here some months back, from either Eddie Shore or one of the other contributors with interest in business programming, about having spoken to customer service about the 17bii+. Apparantly, he was told, at that time, that the L() and G() would be returned--and so they have!

Please let us know more about the machina, as you use it. for instance, is the keyboard reliable? do you have any missed keystrokes? How about the display? Any bugs? etc.

Best regards,

Bill

Re: We all should be GLAD!

*Message #3 Posted by **Ron Ross** on 20 Sept 2004, 11:54 a.m.,*
in response to message #2 by bill platt

This is a good sign. Actually the 17Bii+ could easily be reshaped into an Hp42s+ also. And since it has long variable names and as such, never allowed by the NCEES, toss in a USB serial port as well (and units conversions while your at it, and you can drop the IR). I'd buy a couple if the keyboard quality is there.

17Bii+ is non-Saturn '8502' CPU ; 10Bii is Hitachi H8 - code quality ??

*Message #4 Posted by **Bill Wiese** on 20 Sept 2004, 12:33 p.m.,*
in response to message #3 by Ron Ross

Ron Ross wrote:

Perhaps. USB unlikely w/chips this low cost. The USB core & I/O drivers alone may take much more chip area than the little 6502-compatible CPU core + registers. Could double or triple price of chip. +5V serial easier, more generic.

HP lists the 17Bii+ as having an '8502' CPU, same as 33S. (I think this refers to a broad category of newer 65C02s incl. the Sunplus microcontrollers.)

The odd man out is the new-format HP10Bii. It uses an Hitachi H8 CPU, which is a pretty capable little engine. This calc may well have come down a different evolutionary tree than the Kinpo stuff.

I wonder if the 17Bii+ is running an emulation layer on top of the 6502-compatible CPU, or if they've rewritten the 17Bii+ code a la the 32S (Saturn) vs new 33S.

Rewrites always include bugs. Emulation is much better: any screwups in emulation layer often effect multiple parts of emulated firmware, making these bugs easier to find early. This does not overrule problems in I/O escape layers but if emulated the calculations should come out identical to Saturn 17BII.

BTW, has anyone compared answers btwn orig HP10B (Saturn) and the newer-style 10Bii (H8 CPU)? ? Esp interesting would be TVM use of solver...

Bill Wiese San Jose

Re: 17Bii+ is non-Saturn '8502' CPU ; 10Bii is Hitachi H8 - code quality ??

*Message #5 Posted by **David Smith** on 20 Sept 2004, 8:11 p.m.,*
in response to message #4 by Bill Wiese

I would suspect that the die size of the CPU chip is "pad limited". The number of bonding pads to the outside world determine the minimum chip size. In a modern semiconductor process I would suspect that you could toss in several USB cores, etc in the leftover space.

Re: 17Bii+ is non-Saturn '8502' CPU ; 10Bii is Hitachi H8 - code quality ??

*Message #6 Posted by **Bill Wiese** on 20 Sept 2004, 8:52 p.m.,*
in response to message #5 by David Smith

David,

For many simple designs w/lots of I/O that is true, design is pad limited. Sometimes getting rid of pins instead of functions can indeed lower chip price substantially.

However, the complexity of a USB core w/buffers is roughly on order of the 65C02 CPU core + RAM. The output line drivers can take quite a bit of chip area - I saw the area budget for a .50u consumer product chip (circa 1999-2000) and for the whole USB subsystem it was 25% chip area w/ about 1/3 of that for USB line drivers. Because of layout issues, if we _could_ have removed that we coulda saved some nice die area.

Many co's that do not have good mixed signal processes for their lower end chips have ICs that have the USB protocol engine but require external USB driver chip.

Bill Wiese San Jose

Re: Just bought 17bII+ and Let and Get are back!

*Message #7 Posted by **Phil** on 20 Sept 2004, 3:25 p.m.,*
in response to message #1 by John

Is there a simple way to test a 17bii+ to see if it has this feature (somthing that you can do in a couple of minutes in a shop for example!)?

Re: Just bought 17bII+ and Let and Get are back!

*Message #8 Posted by **Bob Wang** on 20 Sept 2004, 8:37 p.m.,*
in response to message #7 by Phil

```
Try entering the following equation into the Solver:

L(Z:X)+G(Z)+Y=0

Entering a value for X and solving for Y returns -2*X, i.e.

X=1, Y=-2
X=2, Y=-4
X=3, Y=-6

etc.
```

Re: Just bought 17bII+ and Let and Get are back!

*Message #9 Posted by **Eddie Shore** on 24 Sept 2004, 9:31 p.m.,*
in response to message #8 by Bob Wang

Looks like I'll have to budget some money from my next paycheck and check out the "new" new 17BII+. :)

In the mean time, I've been concentrating on more on the algebraic math on the 49G+.

HP32Sii - information

*Message #1 Posted by **Artur - Brazil** on 19 Sept 2004, 11:18 a.m.*

Hi,

Does anybody has some information about the HP32Sii calculator with a alluminum bezel (not the brown one) ?

Best regards Artur

Re: HP32Sii - information

*Message #2 Posted by **Norris** on 19 Sept 2004, 1:32 p.m.,*
in response to message #1 by Artur - Brazil

The original 32SII had a brown bezel around the display and orange and blue labels above the keys. It was packaged inside a box.

At some point the 32SII was redesigned. The newer version had a silver bezel around the display, and green and purple labels above the keys. It came in a see-through plastic blister pack. Perhaps the redesigned version was thought to look better in the new packaging.

Thanks!!!

*Message #3 Posted by **Artur - Brazil** on 19 Sept 2004, 9:11 p.m.,*
in response to message #2 by Norris

.

Re: Thanks!!!

*Message #4 Posted by **Norris** on 20 Sept 2004, 12:54 a.m.,*
in response to message #3 by Artur - Brazil

You can see both versions of the 32SII here

In this case, the "old" brown-bezel 32SII was manufactured in Singapore in 1992. The web page indicates that the "new" silver-bezel 32SII was manufactured in Indonesia in 1991. However, I suspect that the date code on the silver-bezel model may have been misinterpreted, and that it may actually have been manufactured in 2001.

Re: Thanks!!!

*Message #5 Posted by **Norris** on 20 Sept 2004, 11:23 a.m.,*
in response to message #4 by Norris

There is an earlier post in this forum about 32SII variants here

Don't know exactly when the switch from brown-bezel to silver-bezel occurred. My 32SII is a brown-bezel with a serial number that implies manufacture in Indonesia in 1998. I would assume that the switch was sometime between 1998 and 2001

Re: HP32Sii - information

*Message #6 Posted by **Raymond Del Tondo** on 20 Sept 2004, 8:59 a.m.,*
in response to message #2 by Norris

Hi,

one small addition: The silver-bezel 32SII also came in a cardboard box,
at least in Europe.

The box is blue, with a very bad photograph of the calculator on it.
I assume the carton graphics designer was forced to jump from a bridge...

Raymond

HP97 Card Reader Repair

*Message #1 Posted by **Martin** on 19 Sept 2004, 6:59 a.m.*

Hi all you HP calculator specialits,

I read the article at www.rskey.org/hp97reader.htm on how to repair the HP97 transport wheel in the card reader. A very good article! I managed to do all the necessary steps.

My problem: I didn't find the right silicon tube. It seems that the inner and outer diameter as well as the hardness (40 shore or more..?) have to fit exactly. All the different tubes I tried didn't transport the magnetic card!

Question: Could anyone possibly send me a piece of silicon tube that works? I would appreciate that very much and could also send him some dollars to compensate for his expenses.

My address:

Mr. Martin Baumgartner Ringstrasse 2 4556 Aeschi Switzerland

Kind regards Martin

Re: HP97 Card Reader Repair

*Message #2 Posted by **Juergen (CH)** on 19 Sept 2004, 12:55 p.m.,*
in response to message #1 by Martin

Martin,

you can buy them on eBay (seller waterhosko, very honest guy). I have still some spare O-Rings and will send you two.

Best Regards, Juergen

Re: HP97 Card Reader Repair

*Message #3 Posted by **Martin** on 21 Sept 2004, 3:49 p.m.,*
in response to message #2 by Juergen (CH)

Hi Juergen,

Thanks a lot for your support. The two o-rings already arrived on my desk. Now it's my turn to bring them at the right place in the HP-97!

Best Regards Martin

Re: HP "Create-a-Calculator" Contest

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 19 Sept 2004, 11:04 a.m.,*
in response to message #1 by Mike H

I'm disappointed because it lacks a satellite dish receiver, to allow for watching sports TV channels, one of the most required features for a scientific calculator. Perhaps great sports events (football, boxing, baseball, hockey, etc.) could also be delivered via ROM-based modules.

(The financial calculator version will use the dish receiver to obtain current stock quotations, and the ROM modules for reality shows)

Re: HP "Create-a-Calculator" Contest

*Message #6 Posted by **GE (France)** on 19 Sept 2004, 3:18 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Batteries will last enough to move from one room to the other. And it will cost less than $10000. All good stuff.

Re: HP "Create-a-Calculator" Contest

*Message #7 Posted by **Garth Wilson** on 21 Sept 2004, 5:26 a.m.,*
in response to message #1 by Mike H

Touch screen? I hate 'em! And wireless remote keyboard? Why not just build the calculator into the keyboard like everyone did 30 years ago?

Re: HP "Create-a-Calculator" Contest

*Message #8 Posted by **bill platt** on 21 Sept 2004, 11:18 a.m.,*
in response to message #7 by Garth Wilson

Ji Garth,

I think the wireless keyboard is a great idea--my co-worker thought of that just last week while I was showing him some ideas. It eliminates the clambshell problem, and makes it possible to have a very compact package which expands to be large enough to have good keys and a good screen.

Best regards,

bill

HP 33S CPU speed

*Message #1 Posted by **Ed Look** on 17 Sept 2004, 10:28 p.m.*

I know that the 49G+ is powered at its core by a 75 MHz ARM CPU.

If I'm not mistaken, the 48GII has an ARM running at what, 25 MHz?

But what is the 33S' processor and how fast does it run in terms of clock speed? (Is it still slower than an 80286?... j/k ;))

Re: HP 33S CPU speed

*Message #2 Posted by **John Limpert** on 17 Sept 2004, 11:41 p.m.,*
in response to message #1 by Ed Look

It uses a Sunplus SPLB31A, which is an enhanced 6502 core with a LCD controller, integrated RAM/ROM and other stuff. Not sure what the clock rate is. Fast enough for a calculator.

Re: HP 33S CPU speed

*Message #3 Posted by **Ed Look** on 18 Sept 2004, 12:46 a.m.,*
in response to message #2 by John Limpert

Hey John, thanks!

The only reason why I ask is that I took my HP 33S and programmed in a (silly?) infinite series that converges toward a value, and I made the cutoff to be if a term is less than 1 E -6.

Man! It took over six hours! (Well, that isn't precise; I let it run overnight and checked it when I got up.)

I was just wondering after that, "How fast(/slow) is that thing, anyway??"

But, if I made the cutoff to be 1 E -3, it was over in some minutes. At 1 E -4, it was many more minutes; over a half hour at least if 1 E -5. So, as I said, I was just wondering.

Re: HP 33S CPU speed

*Message #4 Posted by **Norris** on 18 Sept 2004, 3:50 p.m.,*
in response to message #2 by John Limpert

There are some specs for the SPLB31A at:

http://w3.sunplus.com.tw/products/lcdcontroller/splb.asp

Don't actually understand the specs myself, but they indicate a "Max Speed" of 5 MHz, if that helps

Re: HP 33S CPU speed

*Message #5 Posted by **Ed Look** on 18 Sept 2004, 4:11 p.m.,*
in response to message #4 by Norris

Norris, thanks for the link. So, it's top speed is 5 MHz. Okay. It's like the 80286 or 80486, then... sort of; I know it's comparing apples to oranges. Now at least I know why the calculation too a little while on my 33S.

(Is this faster or just as fast as the 32S and 32SII?)

Re: HP 33S CPU speed

*Message #6 Posted by **martin cohen** on 18 Sept 2004, 8:58 p.m.,*
in response to message #5 by Ed Look

That's slow!

The original 6502 in the Apple ii and Commodore PET was 1 MHZ - in 1977!

Re: HP 33S CPU speed

*Message #7 Posted by **Ed Look** on 19 Sept 2004, 1:00 a.m.,*
in response to message #6 by martin cohen

LOL!

... and I used to look down on the Commodores because my baby brother had one, and he only played games or programmed images with it. I guess I considered it a toy, but 1 MHz! That's a serious number for any machine in those days. I'm amazed!

Does anyone know the speed of the processor (I don't think it's a Saturn, though) of the 32SII?

Re: HP 33S CPU speed

*Message #8 Posted by **John Smitherman** on 20 Sept 2004, 6:50 p.m.,*
in response to message #1 by Ed Look

Hi Ed. I am not sure of the absolute CPU speed but the relative speed that I measure for the 33s using the method given at:

http://www.thimet.de/CalcCollection/CalcPerformance.html

is about a 44. This places the 33s as follows:

42s: 13

32sii: 25

32s: 33

33s: 44

48GII: 46

28s: 93

* Note: higher numbers represent faster performance on this benchmark.

Have others run speed benchmarks on the 33s?

Regards,

John

Re: HP 33S CPU speed

*Message #9 Posted by **Ed Look** on 20 Sept 2004, 9:37 p.m.,*
in response to message #8 by John Smitherman

Thanks, John. It isn't too bad as far as that list is concerned, anyway.

But the 48GII doesn't look so good compared to these others!

I assume the 49G+ is a little better?

Re: HP 33S CPU speed

*Message #10 Posted by **John Smitherman** on 21 Sept 2004, 5:23 p.m.,*
in response to message #9 by Ed Look

Ed, there are results given for many models of calculators at the web site in my previous post. Specifically, there are 2 results (46 and 221) given for the 48GII which vary significantly. I do not understand the footnotes which I assume help explain the difference. It does not show a result for the 49G+.

Happy computing!

Regards,

John

Re: HP 33S CPU speed

*Message #11 Posted by **Richard** on 21 Sept 2004, 9:28 p.m.,*
in response to message #10 by John Smitherman

Ed, The HP-33 is 2x faster then the HP-32SII for the integral (4 X sqr(1-x^2)dx)with full precision (pi to 12 digits)14 sec / 28 sec (8 sec on 48G+)

Bad LCD contrast display but faster CPU then HP-32SII...

Regards

Re: HP 33S CPU speed

*Message #12 Posted by **Ed Look** on 22 Sept 2004, 1:29 a.m.,*
in response to message #11 by Richard

I used to say to myself that I'd be really happy if the 33s came packaged in a Pioneer or Pioneer-based form. While that is always going to be very true, I have found the 33s growing on me:

I don't really see the chevron shape so much anymore, unless I somehow recall our moanings about it.

The presence of a built-in constants list does make life a little easier for me.

As you guys have all pointed out, it is pretty fast for most calculations I need, infinite series convergence calculations notwithstanding.

And, despite the small relative increase in program memory when translated into 32SII terms, it IS STILL an increase, and any extra RAM in any electronic device is always welcome; the more the merrier. Well, a few more registers or labels would be very welcome, too.

The silvery overall color isn't really so bad, nor the display font...

... but that radix... a decimal point that an AFM couldn't pick up... that will still take some getting used to, especially since it really doesn't look all that different from the comma!

Oh, yeah, I don't mind green and purple on a silver background, but I think they could have picked shades of green and purple that might have contrasted with each other and the metal of the faceplate a little more.

All in all, not a bad little calculator for (serious) everyday use, especially in a laboratory.

Another oh yeah- pretty nice case it came with, with a cool, embossed "hp" logo.

33S colors

*Message #13 Posted by **Gene** on 23 Sept 2004, 1:32 p.m.,*
in response to message #12 by Ed Look

"Oh, yeah, I don't mind green and purple on a silver background, but I think they could have picked shades of green and purple that might have contrasted with each other and the metal of the faceplate a little more."

Gene: And this is exactly one of the examples I'll be presenting at HHC2004 this weekend. I have established a numerical calculation for contrast between colors and examined quite a few HP choices of current (and older) calculators. Some are pretty good, some are, ahem, not so good.

After the conference, I'll see about putting the powerpoint file up for anyone to download, if interested.

Re: 33S colors

Please do so. I could really use such a document!

Benchmarks

*Message #16 Posted by **Tizedes Csaba [Hungary]** on 23 Sept 2004, 7:00 a.m.,*
in response to message #11 by Richard

Hello,

I was send a letter about HP32SII and HP15C benchmarking with correct running time measures in 5 case (built-in looping/DSE,ISG/, counting, storing, basic arithmetics and subroutine calling), (about in 27th February 2004) but I cant to find that...

Where is my response??? :)

Csaba

The 28S has a P.I. of 54, not 93...

*Message #17 Posted by **Karl Schneider** on 22 Sept 2004, 1:43 a.m.,*
in response to message #8 by John Smitherman

... but thanks for the link. I might try several, out of curiosity.

I suspect that the Voyagers (at least the 15C) could be speeded up by GTO'ing a line number rather than a label.

-- KS

Re: The 28S has a P.I. of 54, not 93...

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 22 Sept 2004, 3:02 a.m.,*
in response to message #17 by Karl Schneider

Hi, Karl;

About GTO'ing a line number, I'd like to know one thing. Should this sort of GTO be faster if # of bytes for program line is fixed-ratio only? I mean, if each program holds a one-byte instruction, I see that the GTO (line#) is a linear biased operation. Otherwise, if a different byte count is found in line numbers, there's a need for computing before jumping. As the only original Voyager with a different byte count for program instructions is the HP15C (I'm not counting the HP12Cp), I guess that in some cases it is probably slower than an HP11C if [GTO][I] is executed when [I] has a negative number (backwards relative jump). Did anyone try/benhcmark this?

Just reasoning about.

Luiz (Brazil)

Edited: 22 Sept 2004, 3:02 a.m.

GTO line # on HP-11C & -15C

*Message #19 Posted by **Karl Schneider** on 22 Sept 2004, 9:57 p.m.,*
in response to message #18 by Vieira, Luiz C. (Brazil)

Luis --

I did benchmark the test program on my HP-15C and my recently-acquired 11C, with and without

the "GTO line #" technique. Valentin Albillo advocates it as a speed-up trick. Both the 11C and the 15C took 22-25 seconds to run the program, with "GTO lbl" and "GTO I" [with -line # in I]. BTW, this contradicts the table, which suggests taht the 15C is considerably faster than the 11C.

I suspect that "GTO I" [with -line # in I] could execute faster than "GTO lbl" because the calc is being told exactly where to branch, rather than searching for a label. How much run time is saved would depend upon number of loop executions and how many instructions must be scanned before the label is found.

BTW, "GTO I" [with -line # in I] goes directly to the specified line # on the 11C and on the 15C. This is documented on pp. 108-109 of the English-language HP-15C manual. (I'm still awaiting my 11C manual via the USPS' fine Media Mail service.) There is no "backward relative jump".

-- KS

Edited: 22 Sept 2004, 10:17 p.m.

Oops!

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 23 Sept 2004, 2:18 a.m.,*
in response to message #19 by Karl Schneider

Hi, Karl;

You're right. I confused with the HP67/97 "GTO (i)" mechanics. In these calculators, if I-register contents is a negative number, the program counter jumps backwards the number of steps defined in the integer part of the number. It even goes through line 000- when needed. (sometimes I should read manuals prior to write answers... In fact, always!)

Cheers and thank you for your measurements.

Luiz (Brazil)

Re: The 28S has a P.I. of 54, not 93...

*Message #21 Posted by **John Smitherman** on 22 Sept 2004, 9:29 a.m.,*
in response to message #17 by Karl Schneider

You are right Karl. Looking back I think that I intended to type 48s and 83 instead of 28s and 93. Must have been having a bad day!

I ran the benchmark on the 33s with values of 10, 20, 50 and 100 in the outer loop to get a sense of how much variability there would be. I then took and reported the average of the 4 test results.

Regards,

John

hp15c built in constants?

*Message #1 Posted by **bill** on 16 Sept 2004, 7:30 p.m.*

Have 15c - no manual. does it have any built-in physical constants?

Nope! [NT]

*Message #2 Posted by **Karl Schneider** on 16 Sept 2004, 9:20 p.m.,*
in response to message #1 by bill

OK, I'll elaborate...

*Message #3 Posted by **Karl Schneider** on 18 Sept 2004, 12:14 a.m.,*
in response to message #2 by Karl Schneider

To offer a usable library of physical constants on a calculator would require either a menuing multi-line dot-matrix display (e.g, HP-30S, -33S, -48G) or a multitude of keyboard positions with a 7-segment digital display (e.g., TI-36).

The HP-15C, with its 7-segment LCD, was too jam-packed with useful functions to use keyboard positions for mere "lookup values". If you needed a few constants for a test, you could store them in some numbered registers.

-- KS

Re: hp15c built in constants?

*Message #4 Posted by **hugh steers** on 17 Sept 2004, 6:13 a.m.,*
in response to message #1 by bill

no, but in any case, they would have changed by now!

here's a thing,

using old scientific calculations let me to spot the slow changes to physical constants. interesting is the change to avagadro's. NA is slowly being changed, and i think, deliberately. the idea is to eventually replace the physical mass constant and redefine 1g = NA of carbon 12. like this, you have to slowly tweak NA so that no one notices any jump when you switch standards.

that's my friday conspiracy theory for you anyway..

Edited: 17 Sept 2004, 6:16 a.m.

Re: hp15c built in constants?

*Message #5 Posted by **Ed Look** on 18 Sept 2004, 2:15 a.m.,*

in response to message #4 by hugh steers

Nah, nothing so cool.

The IUPAC (etc.) folks just get together, stand on a pedestal, point their fingers at the rest of the scientific world, and say, "Now, this constant has this value."

Then the publishers, other scientists, teachers, engineers, and calculator physical constant library programmers all have to catch up. (Takes up to a decade! In my head, I'm still using old constants; I know because some table or one of my HP calcs with constants wakes me up from time to time.)

Re: hp15c built in constants?

*Message #6 Posted by **Bill (Smithville, NJ)** on 18 Sept 2004, 11:52 a.m.,*
in response to message #4 by hugh steers

Hi Hugh,

>> no, but in any case, they would have changed by now!

Quite True. The easy way is how the State of Indiana tried to handle the problem with PI. From A History of PI at http://www-gap.dcs.st-and.ac.uk/~history/HistTopics/Pi_through_the_ages.html

------- Quote -------

In the USA the value of PI gave rise to heated political debate. In the State of Indiana in 1897 the House of Representatives unanimously passed a Bill introducing a new mathematical truth.

Be it enacted by the General Assembly of the State of Indiana: It has been found that a circular area is to the square on a line equal to the quadrant of the circumference, as the area of an equilateral rectangle is to the square of one side. (Section I, House Bill No. 246, 1897)

The Senate of Indiana showed a little more sense and postponed indefinitely the adoption of the Act!

--------- End Quote ---------

Bill

HP 15C Problem

*Message #1 Posted by **Curtis Quist** on 16 Sept 2004, 7:06 p.m.*

My 15C will not do trig calculations in degrees. You can set the calculator to degrees or radians, but the calculator only produces results as if in radians. If you set the calculator in degrees, the "rad" sign on the display disappears, but it still calculates in radians. Any thoughts?

Thanks ahead of time,

Curtis Quist

Try a reset ...

*Message #2 Posted by **Karl Schneider** on 16 Sept 2004, 9:23 p.m.,*
in response to message #1 by Curtis Quist

Interesting; I've never heard of this problem...

Turn the calc off, then press and hold "ON", press and hold "-", then release "ON", then release "-".

You should see "Pr Error" in the display, and everything will be in its default state.

Re: HP 15C Problem

*Message #3 Posted by **Jeff O.** on 17 Sept 2004, 7:17 a.m.,*
in response to message #1 by Curtis Quist

Is it in complex mode? For trig functions the calculator considers the arguments to be in radians, or expresses results in radians for the inverse functions, when in complex mode regardless of the trig mode set.

Re: HP 15C Problem

*Message #4 Posted by **Curtis Quist** on 17 Sept 2004, 11:04 a.m.,*
in response to message #3 by Jeff O.

Interesting. I haven't used this calculator for ever. It is at home and I am at work so when I get home I will look at it and see if the C is on, but I think it is. So my question is "How do I get it out of complex mode?"

Curtis

Re: HP 15C Problem

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 17 Sept 2004, 11:26 a.m.,*
in response to message #4 by Curtis Quist

Hi, Curtis;

to get rid of Complex Mode, clear flag 8:

```
[g][CF] 8
```

[CF] is associated to the [5] key. Based on what you wrote, this is most likely to happen. If you take a look at the HP15C Advanced Functions Handbook, p. 68 under Trigonometric Modes, you'll see that

> Quote:
>
> Although the trigonometric mode annunciator remains lit in Complex Mode, complex functions are *always* computed using *radians* measure.

When converting from rectangular to polar and opposedly in Complex Mode, the trigonometric mode is taken into account. But in this case, the conversions work differently and use only the complex number in X-register.

Hope you can work correctly, now.

Cheers.

Luiz (Brazil)

Edited: 17 Sept 2004, 11:27 a.m.

[HP-15C] I'm sure that Jeff is right, but...

*Message #6 Posted by **Karl Schneider** on 17 Sept 2004, 11:56 p.m.,*
in response to message #3 by Jeff O.

...my "reset" solution would have worked, too, by clearing complex mode!

A bit of mathematical insight:

The reason that trigonometric functions assume complex-valued arguments in radians (no matter the angular setting) is that hyperbolic functions are used for the solution. Arguments for sinh, cosh, and tanh must be physically dimensionless, which the radian is.

For example:

```
sin (a + j*b) = (sin a)*(cos j*b) + (cos a)*(sin j*b)
              = (sin a)*(cosh b)  + (cos a)*(j sinh b)
              = (sin a)*(cosh b) + j*(cos a)*(sinh b)

By electical-engineering convention, j = sqrt(-1)
```

Conversion of a complex-valued argument between rectangular and polar coordinates is different, because hyperbolics are not involved. Luis mentioned that the Advanced Functions Handbook (which is optional at extra cost) documents this operating convention, but it is also documented clearly in the regular Owner's Handbook on p. 121 and pp. 133-134.

-- KS

Re: [HP-15C] A bit more of hyperbolic fcn...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 18 Sept 2004, 1:33 a.m.,*
in response to message #6 by Karl Schneider

Hi Karl, guys;

Karl, thanks for mentioning the pages in the HP15C Owner's Handbook. To be honest, I had just the HP15C Owner's Handbook, Portuguese version in hands, and I know page numbers don't match English version, so I decided to mention the ADV FCN Handbook instead. ;-)

A few weeks ago I found this page when searching for Hyperbolic Functions and I kept a copy of it in my HD so I can use in the classroom. I felt its contents are condensed and complete, maybe it can be of help for any others in the need for concise info.

About the 'j' for engineers and 'i' for mathematicians when dealing with complex numbers: I've been curious about this for a long time when I was at the university and I simply forgot about that. Now I read your words and decided to ask again: do you have any idea about the use of different symbols? I used to think it was only to allow a unit being attached to a complex quantity (engineering) instead of using a 'pure' number (math) for that matter, but this is only a reasoning of mine.

Again, this is the kind of thread I like reading and posting about. Cheers.

Luiz (Brazil)

Edited: 18 Sept 2004, 1:40 a.m.

"i" vs. "j"

*Message #8 Posted by **Karl Schneider** on 18 Sept 2004, 2:41 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Lui**z** --

Sorry for the brain-lapse misspelling in my last post...

Thanks for providing the link to Mathematica's pages, which are good refernces. Valentin Albillo often links to them in his posts here.

"j" is used in EE to denote the base of imaginary numbers because "i" and "I" are conventionally used for electrical current. "j" stands out a little better from numerals, too.

-- KS

Re: "i" vs. "j"

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 18 Sept 2004, 4:05 a.m.,*
in response to message #8 by Karl Schneider

Hi Karl, folks;

I'm scratching the top of my head now and thinking: what an obvious reason... Thank you for taking your time to answer. You see, I'm an Electrical Engineer too, and sometimes I have my own doubts being taken away by obvious answers.

And the 'z' in Luiz is somehow unusual. Luis is most commonly found. (thanks for the politeness)

Cheers.

Luiz (Brazil)

Re: "i" vs. "j"

*Message #10 Posted by **Curtis Quist** on 20 Sept 2004, 9:38 a.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Thanks everyone. That fixed it. A guy in my office wanted to buy this thing from me about 8 years ago. He found the radians problem with it. I really wasn't in the mood to get rid of it. Because of this "radians problem" he didn't buy it. I am glad it was there, because I now still have the calculator. But for many years I didn't bother using it because I thought it didn't work properly, and now it works.

Regards,

Curtis Quist

RPN calculator for J2ME phones

*Message #1 Posted by **Gunnar Degnbol** on 16 Sept 2004, 2:50 p.m.*

I have written NVC, an RPN calculator program for Java phones. The first version runs only on Nokia phones, other phones may be added later. An applet version is also available.

NVC is a simple calculator for everyday calculations, the kind of problems you might want to solve with a phone calculator.

RPN seems to be be a good fit to the limited keyboard of a phone, as it does not require alphanumeric input to be usable.

NVC has a number of unique features, such as multilevel undo/redo, noun-verb syntax everywhere (including memory and modes), editing of the X register, LastX have been replaced by a list of the last 100 arguments, configurable digit shapes (Arabic-Indic, Thai etc.) and unnormalized decimal arithmetic.

Re: RPN calculator for J2ME phones

*Message #2 Posted by **Gordon Dyer** on 16 Sept 2004, 7:27 p.m.,*
in response to message #1 by Gunnar Degnbol

It's a nice idea. I have tried the applet and I would like to see the Enter function behave the same as HP RPN calcs. Will it work on a Nokia 6310i ? I have a bluetooth connection to my PC. How can I load the app onto my phone to try it?

Re: RPN calculator for J2ME phones

*Message #3 Posted by **Gunnar Degnbol** on 17 Sept 2004, 7:54 a.m.,*
in response to message #2 by Gordon Dyer

There is an option to make the enter function work as in HP RPN calculators: [2nd] [MODES] stacklift [CHANGE] (to classic instead of new). I prefer the RPL enter key, it seems more logical when you can see the entire stack.

Unfortunately, the program does not work on the Nokia 6310i. I started out with a 6310i, but it has a maximum program size of only 30K (the program is now 38K), and lacks left/right keys and the middle softkey. I gave up trying to make it fit soon after I got a 6230.

If it could run, you would use Nokia Application Installer (if you can get it to work) to transfer it.

I have addded a link to download the applet. When run locally, it remembers the state between runs. It also has a more usable 10 cols * 4 rows keyboard, mapped to the PC keyboard.

Re: RPN calculator for J2ME phones

*Message #4 Posted by **Gunnar Degnbol** on 18 Sept 2004, 3:52 p.m.,*
in response to message #2 by Gordon Dyer

I have made a version for Nokia 6310i. It lacks editing, undo/redo, time operations, autodetection of decimal separator (defaults to US), and alternative digits.

Maybe I can squeeze 1 KB more out of it, then I can put the time functions back.

Re: RPN calculator for J2ME phones

*Message #5 Posted by **Gordon Dyer** on 20 Sept 2004, 3:58 p.m.,*
in response to message #4 by Gunnar Degnbol

Thanks for the 6310i version, I will try to load it.

EMU42 on Dell AXIM X30 - Benchmark

*Message #1 Posted by **Bill (Smithville, NJ)** on 16 Sept 2004, 11:47 a.m.*

Just got the new Dell AXIM X30.

Emu42 looks very nice on it and is very fast.

The benchmark that Erik has on his site runs in 18 seconds at maximum (624 MHz) processor speed.

Thanks Christoph for a great emulator and thanks Erik for your work in getting it released.

Bill

Re: EMU42 on Dell AXIM X30 - Benchmark

*Message #2 Posted by **Erik Ehrling (Sweden)** on 16 Sept 2004, 3:40 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Hi Bill!

These are good news indeed! This means that it runs at more than 19 times the speed of the original HP-42S! I just looked at the prices for the Axim X30 at Dell's website; actually it seems to have a very good price/performance ratio making it very tempting to get one...

Best regards, Erik Ehrling (Sweden)

PS. And yes, I *know* I should fix the PRM? program on my homepage... just hadn't had the occasion to dig into it yet... :-)

Re: EMU42 on Dell AXIM X30 - Benchmark

*Message #3 Posted by **Bill (Smithville, NJ)** on 17 Sept 2004, 3:25 p.m.,*
in response to message #2 by Erik Ehrling (Sweden)

Hi Erik,

>>PS. And yes, I *know* I should fix the PRM? program on my homepage... just hadn't had the occasion to dig into it yet... :-)

What's wrong with the PRM program?

For the test on the X30, I just loaded the PRM.RAW file and it worked great.

Unfortunatelly, I can't say the same about the X30. It's got the "refusing to turn on" problem. So they're shipping me a new one next week. Hopefully, it won;t exhibit the same problem. I really like the device - small & fast.

Bill

Re: EMU42 on Dell AXIM X30 - Benchmark

NoVRAM HePAX questions (for you guys who have them already)

*Message #1 Posted by **Gene** on 15 Sept 2004, 11:31 p.m.*

Mine is on the way.

1) If I copy user programs into the Hepax ram portion of the NoVRAM module, do I need to always have the HePAX pages still "burned" to access the programs in the ram? I assume so, but had wondered if they might be "reburned" with other ROMS once you had the 16K of ram full.

Does the HePAX rom provide OS extensions to run the programs once they are there? The manual for the HEPAX rom just says to execute them and it will find them in the ram. Does that mean that the ROM must be there for that to happen?

2) What ROMS have you guys put in the 8K rom space? I'm thinking the Sandbox rom, but ... ?

Re: NoVRAM HePAX questions (for you guys who have them already)

*Message #2 Posted by **Ángel Martin** on 16 Sept 2004, 9:23 a.m.,*
in response to message #1 by Gene

Gene,

1. I don't think there's need to have the HEPAX pages loaded to run the FOCAL programs loaded on the NoVRAM. Of course you'll need them there to *load* the programs in the first place, but once there, they should behave like any other ROM page.

You will need the HEPAX pages present if what you upload there are data or ascii files, but that of course is another story.

2. I, of course, use the extra 8k for the SandBox_3D. Other alternatives I'd recommend are the modified_CCD (Array-less), but it's all a personal choice of course.

Best, ÁM.

Thanks! And, thanks for the Sandbox to play in!

*Message #3 Posted by **Gene** on 16 Sept 2004, 9:54 a.m.,*
in response to message #2 by Ángel Martin

It looks really, really nice. :-) Can't wait to play with it.

And, High Rollers is one of my all-time favorite HP41 games.

Be great to see how fast it is in mcode.

Gene

Re: NoVRAM HePAX questions (for you guys who have them already)

*Message #4 Posted by **Diego Diaz** on 16 Sept 2004, 7:18 p.m.,*
in response to message #1 by Gene

Hi Gene, Angel

Certainly NoVRAM RAM pages can be used in a ROM-like fashion without the presence of HEPAX code.

NoVRAM-H.EXE does not allow you to build such configuration though. Anyhow, I've made an *experimental* config utility to use the upper four pages (#C to #F) as ROM while preserving the contents of RAM in pages #8 to #B.

I'll gladly mail you the required files (please take into account they're *experimental*) for you to play with (... enjoy High Rollers ;-) and (hopefully) show some NoVRAM features at HHC 2004.

Currently I'm using this config utility, NoVRAM-F.EXE ("F" stands for Free-config), to prepare some other RAM-Boxes code implementation into NoVRAM, as well as developing my new 2005 project's "page manager".

As a preliminary advance, said '05 project will handle 48K ROM and 64K RAM into a single module. Obviously it requires an efficient method to switch pages on and off at user's will (this is the difficult part :-)

On the HardWare side, the needed new PIC processor samples are not available yet (will probably be by end '04), so I'm testing with a bread-board *reduced* version with 24K ROM + 32K RAM in the meanwhile.

More to come as I finish my holidays... time to rest ;-))

Best wishes.

Diego. 123456

NOTE: RAM pages are still writable, provided you load any ROM image that's able to send the WRITE command (H'040) like David assembler for example.

So I stand corrected! This is obviously another difference between the original Hepax (remember that?) and the NoVRAM. Thanks Diego for the carification.

Best, ÁM

Changes to the sandbox?

*Message #6 Posted by **Gene** on 17 Sept 2004, 12:16 p.m.,*
in response to message #5 by Ángel Martin

Angel, how much trouble is involved in potentially moving some functions between one ROM page and another?

I've been looking over the ROM manual and the MATH rom page also has the hacker subsection on it.

I've been wondering...how much trouble is it/would it be to move the hacker lab piece over to the other rom page and drop in some of the very useful alpha and programming features from the Sandbox3d rom page?

For example, the functions: CALLXM, CFX, SFX, CSST, FC?S, FS?S, RCLF, REPLX, SFX, SKIPN, STOF, TOGF, and then the alpha functions such as AINT, AREV, MID$, LEFT$, RIGHT$, VIEWA and XTOAL would be wonderful USER-level programming features to have. That's 18 functions.

The HackerLAB contains 20 functions, many/most of which aren't directly for user-level programming.

What kinda work would be involved in doing that sort of shuffle? It would leave a 4K rom with all the math functions, the programming functions and a good deal of the alpha functions with another 4K rom with more of the really heavy Mcode goodies in it.

That would mean users would put one of the 4K roms in the NoVRAM and have a 4K rom page free for the CCD/OS page or some other 4K rom.

My fear is that you'll reply "It would take months!" :-)

And, of course, I don't have any clue whether the functions are about the same size in bytes, so this might be a false hope to begin with.

:-)

Gene

Re: Changes to the sandbox?

*Message #7 Posted by **Ángel Martin** on 20 Sept 2004, 11:30 a.m.,*
in response to message #6 by Gene

Hi Gene,

Well, even if it won't take months, it wouldn't be as simple as reshuffling the source code on a spreadsheet. MCODE is particulary nasty in that it sometimes is address-dependent code, and squeezing words into ROM pages is more an art than a science. Another little issue are the FAT's, which in the SandBox are "cross-referrenced", meaning that to overcome the 64-function barrier, some functions are included in the FAT they don't belong to, so to speak. This is done to go around the 4k space limitation per page, in case you wonder. (one particuler page can have just a handle of very long code functions, and thus exhaust its FAT quite quickly).

At any rate, it would take the time that I don't have in my hand right now, otherwise I'd be more than glad to take it for a spin for you.

Have you looked at my modified CCD-ROM? It has many of the functions you mention anyway, so it may be a good compromise in the mean time.

Best, ÁM

HP-10BII

*Message #1 Posted by **Thomas Cox** on 15 Sept 2004, 8:23 p.m.*

Perhaps this model is being discontinued as Staples is selling off their stock for $14.99 each. Out of curiosity I purchased the last unit in the local store. Based on what I had read in the forum I expected that I might get a defective keyboard -- and I did, the FV key is intermittent.

The only good thing I can say about calculator is that the display is very clear. In my opinion the display for numbers is clearer and larger than on HP-12C, and larger (but not clearer) than on HP-17BII.

For ease of use, the menu system on HP-17BII can't be beat.

HP 11c chg batteries, not working

*Message #1 Posted by **janedibber** on 15 Sept 2004, 11:31 a.m.*

Ack...the batteries in my favorite calculator died. Purchased three new SO 1.5v replacements. Put them in and nothing. Ran through the battery replacement troubleshooting script ...nothing. What happened?

Thanks!

Re: HP 11c chg batteries, not working

*Message #2 Posted by **Mike** on 15 Sept 2004, 12:01 p.m.,*
in response to message #1 by janedibber

I once had a 17B that had a broken battery clip. When I installed the new batteries, the unit did not turn on. Fearing that I completely broke the battery connection, I took the unit apart. It was then that I noticed I had placed the batteries in backwards. Glued the unit back together, turned the batteries around and it worked fine.

Re: HP 11c chg batteries, not working

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 15 Sept 2004, 12:16 p.m.,*
in response to message #1 by janedibber

Hi;

there is one keyboard sequence (operation) that is suggested in the HP11C manual in the case the calculator do not respond to keystrokes: simultaneously press [ON] and [D] (or [y^x] key). If the calculator 'reacts', chances are that the number in the display is unreadable and you need to press the [<-] (left-arrow, or backwards) key.

About batteries, there is also a suggestion in the manual: use a piece of conductive wire and briefly connect both positive and negative battery connectors with each other. In order to avoid electrostatic discharge and damage your HP11C, do not remove the batteries. A brief shorting will not damage the batteries.

A third option is checking all batteries one at a time. I once found one N-cell in an HP41 that had an interesting behavior. All batteries measured about 1.45 to 1.49 Volts, but the calculator briefly flash a 0.0000 and turned itself off. I tested each battery for current with a 45 ohms load resistor, brief contact. One of the batteries barely indicated some current, and when connected to the resistor its terminal voltage dropped to less than .7 Volts.

Maybe after either a brief short in the batteries terminals or using three undoubtedly fresh batteries your HP11C will be back to business.

Success.

Luiz (Brazil)

Re: HP 11c chg batteries, not working

*Message #4 Posted by **janedibber** on 15 Sept 2004, 1:14 p.m.,*
in response to message #1 by janedibber

the battery posts are clean and appear to be structurally intact. I have followed the troubleshooting guidelines to a "T" a few times now (ON and y^x, short the terminals)

I tested the new batteries on a DMM. All three batteries ring 1.56 +/-

argh. is the calculator worth "servicing" vs buying new?

thanks

These babies are though...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 15 Sept 2004, 2:38 p.m.,*
in response to message #4 by janedibber

Hi, Jane;

I'd not take a "last shot" considering service for now. One last suggestion: as it seems you have knowledge about electricity (mentioning a DMM and shorting terminals), believe me when I tell you that even when electrical terminals look clean, cleaning them may help solving the problem. MOS-based, portable devices, as all LCD-type HP calculators, consume such a few power that the few µamps necessary to power them up may be reduced to a lower amount by thin coats of dust or even human fat, resulting in bad contact. I am sure that you were carefull enough making a good check, but gently rubbing the contacts with a swab moisted (not dripping) with alcohol (dry it right after) may also solve the problem.

Let us know if you succeed or if you need guidance. If service is needed, chances are you'll find someone close to you that's able to repair it. Unfortunately, HP no longer supports Voyagers (HP10C, 11C, 15C and 16C).

Success.

Luiz (Brazil)

Re: These babies are though...

*Message #6 Posted by **.** on 15 Sept 2004, 10:02 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

"...consume such a few power that the few µamps necessary to power them up may be reduced to a lower amount by thin coats of dust or even human fat..."

I thought it would have been around the other way. Modelling the dust/fat as a resistance, very low current means very little voltage drop across the resistor. I'd have thought that a low power device should handle higher resistances then a higher powered one.

Re: These babies are though...

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 16 Sept 2004, 12:25 a.m.,*
in response to message #6 by .

Hi, dot;

I agree with you when "linear", pure resistance is considered. I am not actually sure if this is the case here. Human fat is not also a pure insulating material because of the organic and composite

saline found on it. But in many circumstances, after trying to turn some Pioneers and Voyagers on without success, simply spinning batteries around their axle with the thumb or removing and inserting them back was enough to bring the calculators back to business. In fact, having these "MOS-based units" being design with low current, low power consumption in mind, batteries and related connectors are not exactly design to handle high current, so they do not need higher physical pressure to keep their contacts with the lowest resistance possible. You can compare Voyagers battery contacts with the golden platted battery contacts found in Classics and higher current devices, like Topcats (HP9x), printers and tape drivers. They are designed to bent when battery is inserted, providing lower-resistance contact surfaces and allowing higher current, hence lower voltage drop.

Thank you for pointing this fact out, and please, I'd like knowing if my reasoning fails somehow. I am always interested on discussing technology and, mostly, unusual situation. Any other comments? Anyone?

Cheers.

Luiz (Brazil)

Sealing Current

*Message #8 Posted by **John Limpert** on 16 Sept 2004, 1:34 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

The telephone company designs their analog circuits so that a small current is always flowing through the wires, even when idle. They found that without the current, splices and other mechanical connections would develop a thin layer of corrosion, causing circuit degradation and outages.

Re: HP 11c chg batteries, not working

*Message #9 Posted by **bill platt** on 15 Sept 2004, 3:06 p.m.,*
in response to message #4 by janedibber

Hi Jane,

Currently, 11c units in working condition go on e-bay for between $90 and $150 routinely, and in perfect condition with manuals, for more than that!

So, yes, it is worth fixing in that sense.

Or swapping etc.

May we ask you to describe why the 11c is your favorite? Is it out of long experience and familiarity (with ignorance of other designs) or have you come to that feeling through experience with other calculator designs?

There have been many interesting discussions regarding design and ergonomics, man-machine interface, aesthetics, tactile aesthetics etc here, and your input will be both appreciated and enjoyed!

Best regards,

Bill

well, i think i need to go the service route. cleaned all the batteries and battery contacts. took the back cover off too and tested for loose connections around the battery area. i'm at loss. dang.

bill - my affection towards the 11c is akin to a toddler's desire of his favorite stuffed animal. Been using the 11c, problem free, since the mid 80's. If I had to put my finger on something, it would be the stack manipulation.

Options

*Message #11 Posted by **Ron Ross** on 16 Sept 2004, 8:10 a.m.,*
in response to message #10 by janedibber

I would consider using fixthatcalc.com to have it repaired or consider a new HP33s. If you go the new route, you could probably sell your 11c for something to help you pay for a new Hp.

The Hp12c is the basic same layout as your 11c and works nearly the same if you don't need trig. However number correction is not as nice ie a backspace on the 11c will clear the whole number on the 12c.

Re: Options

*Message #12 Posted by **janedibber** on 16 Sept 2004, 8:35 a.m.,*
in response to message #11 by Ron Ross

amazon (quick search) sells the hp33s for $47

fixthatcalc charges flat rate of $59 plus shipping, if it's repairable. If non-repairable, I'm out $29

It doesn't seem worth repairing a 20 year old calculator for $60!

Once you use the 33S you might just change your mind...

Re: HP 11c chg batteries, not working

*Message #15 Posted by **bill platt** on 16 Sept 2004, 11:18 a.m.,*
in response to message #10 by janedibber

Hi Jane,

I understand your feelings. I too used one from 1982 through 1995, when I lost it on an airplane. (replaced it with a 32sii which I was very happy with--more powerful in every way than the 11c for 1/2 the price at the time).

When I suddenly became a "collector" 1-1/2 years ago, I bought an 11c again and it was very much like "coming home".

Now that I have used a whole range of these HP calculators, I think I can make a few observations which may or may not be helpful to you.

If you do a lot of programming, then the 32s (and 32sii) is much nicer than the 11c. And, the 33s has yet even more power, as it has the equivalent of 7 kb of 32s memory. The 33s is great for memory!

If you find that you need to solve "equations" or "expressions" but do not need a looping capability, then again, the 32sii and the 33s are better in that you have a built-in algebraic expression interpreter. (Of course they also have RPN programming as well so you can do looping if you want).

Note also that the 11c does not have a built-in solver routine. The 32s, 32sii and 33s have a solver.

However, if you do not take advantage of the programming capability of the 11c, but rather do manual things, and you like the ergonomics of the stack functions, then you will be greatly disappointed by the 33s. The 32s and the 32sii will not disappoint you so much here, although stuff is in a different location. The 33s has the stack buttons scattered all over the place.

The 32s is the same as the 32sii expcept that it is older and does not have the following: kg-->lb, in-->cm, fahr--celcius conversions, roll up (R up), equation capability, fraction entry and display capability. But, the 32s menu system is more logical than the 32sii--there is a bit of "cramming" in the 32sii and in attempting to keep as much of the 32sii arrgt as possible, some things are not quite so smoothly organized in the arrangement.

The 33s has all of the conversions that the 32sii has, plus some "constants". However, there are three significant bugs in the built-in functions: 1. rectangular to polar conversion 2. decimal hours --> H.ms conversion. 3. Reset does not properly reset RAD to DEG setting but removes RAD annunciator.

Fortunately, for the first two bugs, it is possible to input robust, small program routines to return the correct answers--developed here on the Forum by a guy called "Norris".

The 3rd bug merely requires vigilance after a reset!

I hope this information helps you.

Ironically, by becoming a collector, I have now opened my eyes up to all the other possibilities--and so now I see regular RPN in a much less favorable light than I once did. I am now very happy to have an editable algebraic command line for instance. I find this superior for so much work--as you can see and check, or later modify, a solution, rather than retyping everything. This is also greatly helpful when doing sums--as you have a record of the input to check! Much faster than re-doing! In other words, the Algebraic command line machines, including most sharp "PC" series, and the HP 30s, and some of the Casios, are really great---better even. Sharps are even programmable.

If you like RPN and HP, and you are not needing trigonometry, then I recommend the 17bii, which is RPN and has an algebraic solver, and as such, effectively has an editable command-line parser. If you go into the solver and type "X=" and then the expression you want to solve, you can then solve for "x' and you get the answer--and it goes to teh stack as well. (The big downer on the 32sii and 33s is that the equation list is not editable!!!).

I like the 17bii perhaps more than any other HP in fact, for genereal non-geometry use. (And there are some clever solver routines for the trigs available).

Best regards,

bill

Before you give up on that calculator.....

*Message #16 Posted by **OJM** on 16 Sept 2004, 4:33 p.m.,*
in response to message #1 by janedibber

I have a friend in my office who has a 15C which simply refuses to operate on the Silver Oxide button cell batteries, but which works fine with the alkaline button cells (eg. LR44). Strange behavior, since I also have a 15C, and my calculator doesn't seem to mind if it's using alkaline or silver oxide. We checked everything, cleaned the contacts & the battery faces, cleared & reset his calculator, and even did the momentary short-circuit across the battery contacts, but his 15C still refused to run on the silver oxide cells. Ultimately, we just traded batteries - he got my alkaline cells, I got his silver oxides, and both calculators seem to be happy. Are there any other people out there that have seen one of these Voyagers refuse to work on Silver Oxide cells?

Re: Before you give up on that calculator.....

*Message #17 Posted by **janedibber** on 16 Sept 2004, 7:55 p.m.,*
in response to message #16 by OJM

hmmm...the old batteries were the LR44s. I can't recall what the batteries before then. Oddly, even the manual states the SOs would be ok. i'll give it a shot. thanks.

Re: Before you give up on that calculator.....

*Message #18 Posted by **Ed Look** on 16 Sept 2004, 8:40 p.m.,*
in response to message #17 by janedibber

Well, folks, remember that different battery formulations MUST have different cell potentials, even if very similar. If the calculator was (accidentally??) designed to be fussy about power input, then you will have to just stick with the mercury cells or whatever it was designed with in mind.

There is no true equivalence here, only strong similarities (or not, as in this case).

11C R.I.P.

*Message #19 Posted by **bkr** on 17 Sept 2004, 12:42 a.m.,*
in response to message #1 by janedibber

Same thing happened to my 11C 10 years ago. One day it just wouldn't turn on anymore. Fortunately I was

able to get one of the last 15C's available at the bookstore. Now the 11C just sits in a drawer thinking of the good old days..

HP 55 Manuals

*Message #1 Posted by **Thibaut.be** on 15 Sept 2004, 7:19 a.m.*

Hi There,

You won't beleive it, I just purchased a brand new complete in box 55. It's absolutely mint, flawless, ... it would be the best item of my collection if I did not get in addition a 29C in exactly the same condition !

Now I would like to share, as it includes a French QRG and a maths library that does not exist in te MoHPC catalogue.
