Is legal to do this in Ebay?

*Message #1 Posted by **John Macy** on 13 Apr 2005, 5:23 a.m.*

I have tracked an Ebay item of Ebay seller coburlin and suddenly it changed to "HP USB Optical Scroll Mouse Brand New" !? Seeing his items for sale, it shows that all items near to finish are all "HP USB Optical Scroll Mouse Brand New". Can a seller change completely the product when the auction has not finished yet?

Re: Is legal to do this in Ebay?

*Message #2 Posted by **Giancarlo** on 13 Apr 2005, 6:06 a.m.,*
in response to message #1 by John Macy

Please have a look at the following thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=70383 It is quite instructive about your question, and features a reply by Coburlin himself! Hope this helps. Cheers. Giancarlo

Re: Is legal to do this in Ebay?

*Message #3 Posted by **Pascal** on 13 Apr 2005, 6:07 a.m.,*
in response to message #1 by John Macy

I think he is trying to avoid paying high insertion fees if he sees that his item will not sell. The insertion fees are based on the buy-it-now value. The highest the value, the highest the insertion fees. By swapping his auction before it ends with an item of a low value, he might get an insertion fees refund from ebay. This seems strange, as I thought that insertion fees were charged at insertion time and were not refundable. The only way to be sure is to report this to ebay and to see their reaction...

Re: Is legal to do this in Ebay?

*Message #4 Posted by **Juergen (CH)** on 13 Apr 2005, 7:58 a.m.,*
in response to message #1 by John Macy

What is the item number? This is required to send a complaint to eBay. I suppose it's not legal to change a fixed price listing to an auction-style listing.

Re: Is legal to do this in Ebay?

*Message #5 Posted by **Pascal** on 13 Apr 2005, 9:39 a.m.,*
in response to message #4 by Juergen (CH)

Just do an advanced search / items by seller and type coburlin as seller's user ID.

Re: Is legal to do this in Ebay?

*Message #6 Posted by **Ron Ross** on 13 Apr 2005, 9:52 a.m.,*
in response to message #1 by John Macy

If no one has made any bid on an item, I believe the auction rules allow the seller to make any changes they please. I suspect coburlin is exploiting this ebay policy. This is probably a legal requirement of auctions, ie it is supposed to be for the auction an extra incentive to entice a bidder, once a bid is placed, the transaction item is now frozen, but prior to a bid, in an auction, the seller usually is at liberty to toss in more goodies or make a better description. That coburlin is using it to switch before a bid (no one has entered a bid, so no contract is imminent) he is entitled to do so. That he is downgrading his auction is unusual (and may even be not ethical) but it is allowed. If he were to switch after a bid is place is probably not possible (ebay freezes the ability to change an auction after a bid is placed, I believe.).

Myself, I despise ebay, not because it has lead to the sky high prices of our collectables, but because of how it is administered. It is very biased towards the seller. I would like the format changed just a little to somewhat level the playing field. As it presently is, you are arm twisted to leave positive feedback for normal service. Normal feedback is taken as an insult. Red is war!

I would like the seller to have to leave feed back when he recieves payment or at least be unable to leave feedback once the buyer leaves feedback. It is the buyer who risks his payment for an item. He is the one at risk. If he is satisfied, he will leave a glowing response. I admit this may sound somewhat Polyanna, but if I were selling, I would hope that I would take care of the buyer in a way to earn a positive response instead of the current trend of extorting a positive from the buyers that is so prevalent on ebay today.

As it is, much feedback is not worth looking at. I carefully bid only on the best feedback, realizing most sellers on ebay require feedback before they leave feedback. I have abstained from their auctions and only bother to leave feedback after it is left for me. Fortunately I have always been very lucky (until recently).

Until ebay modifies this, I won't use ebay extensively (and I am thinking to just quit). But ebay is not paid for by the buyers, but from the sellers. And ebay doesn't want to drive away this customer. All seems swell from their perspective, so no need to rock the boat.

Re: Is legal to do this in Ebay?

*Message #7 Posted by **bill platt** on 13 Apr 2005, 10:37 a.m.,*
in response to message #6 by Ron Ross

Hi Ron,

You are absolutely correct aboout the feedback issue being skewed. I have had sellers tell me "I will leave feedback after you do" to which I reply to them, "why? I paid you, yes? What else do you want?!" If they do not leave me feedback, then they don't get any.

Coversely, when I sell, I leave positive feedback to the buyer when I receive bona-fide payment. I do not see why I should do anything else. It is so clear--buyer puts out money--if the money clears, then that is all there is to it.

Also some sellers have inflated positive feedback which they have earned through bogus "feedback auctions". These are auctions for extremely cheap items--usually things like "happygrams" which you can do scores of, and then you have positive feedback--either as seller or buyer! Once those transactions "age" it is impossible to look at them in the history, and so there is no way to tell, unless it was carried out recently.

Regards,

Bill

hp-21 key malfunction

*Message #1 Posted by **Marc Pepin** on 12 Apr 2005, 4:03 p.m.*

The battery pack leaked in my hp-21.I've clean the calculator put new batteries in.The calculator works well when I test it outside the beige casing, but when I put all the thing together the blue, rcl and clx key don't work. (The battery pack fit real tight in the casing. It seems wider a bit because i've pry the old batteries out.) Hope someone has a clue on this. Thank you Marc Pépin

Re: hp-21 key malfunction

*Message #2 Posted by **Phil** on 12 Apr 2005, 4:28 p.m.,*
in response to message #1 by Marc Pepin

Hi Marc, try a cleaning with printed board solder flux cleaner like Electrolube "Flux Clean" or contact cleaner like Chemitronics "Pow-R-Wash" without warranty. Fortunatly, if it's ok afeter cleaning, protect the contacts with Electrolube "contact Grease" and remove all Nicad battery when calculator is not used Regards. Philippe

Reading HP 150 floppies

*Message #1 Posted by **Derek Jones** on 12 Apr 2005, 8:09 a.m.*

I have been trying to read some floppies written on a HP 150 using fdutils (http://fdutils.linux.lu/) to configure the floppy controller. As I understand it the floppy has 70 tracks (10 are spares), 16 sectors, with 256 bytes per sector, single sided.

My lack of success in reading anything (not even the first track) may be due to age (the floppies are 20 years old), but I have managed to read some 5 1/4" floppies that are this old (presumably 3 1/2" floppies have similar aging characteristics).

Does anybody have any alternative ideas (yes I could go to a company that offer a copying service, but the contents are not that valuable).

Re: Reading HP 150 floppies

*Message #2 Posted by **Raymond Del Tondo** on 12 Apr 2005, 8:56 a.m.,*
in response to message #1 by Derek Jones

Hi,

have you tried with the LifUtils,
available from this site?

An alternative could be AnaDisk,
which is a tool for analyzing/reading
diskettes in strange formats.

I was able to save the operating system diskettes
of an HP 64000 Logic Development System with this tool.

Raymond

Re: Reading HP 150 floppies

*Message #3 Posted by **Derek Jones** on 12 Apr 2005, 9:30 a.m.,*
in response to message #2 by Raymond Del Tondo

Raymond,

Thanks for the suggestion.

lif_utils was able to read the first track of the floppy (an improvement on what I had previously managed to do).

My floppies are single sided. I edited lifimage.c to use a single head and got the same error message (Error reading cylinder 0, head 0, sector 16).

I will continue to experiment and report back if I manage to read any more tracks.

Re: Reading HP 150 floppies

*Message #4 Posted by **Derek Jones** on 12 Apr 2005, 12:24 p.m.,*
in response to message #3 by Derek Jones

As an experiment I tried using sector numbers that started at zero rather than one and it seemed to work.

Editing lifimage.c

line 65 now reads

for (head=0; head<1; head++)

and line 67 now reads

for (sector=0; sector<16; sector++)

I managed to 286,720 bytes off one floppy (i.e., upto cylinder 70) and 18K off another (looks like a problem reading one of the sectors).

Re: Reading HP 150 floppies

*Message #5 Posted by **Vassilis Prevelakis** on 12 Apr 2005, 12:29 p.m.,*
in response to message #1 by Derek Jones

Try Tony Duell's Linux utilities: http://www.hpcc.org/datafile/hpil/lif_utils.html

**vp

Re: Reading HP 150 floppies

*Message #6 Posted by **Eric Smith** on 12 Apr 2005, 2:41 p.m.,*
in response to message #1 by Derek Jones

You might try using the "rfloppy" program that is part of dmklib. It's not very user-friendly, but it will read anything that **can** be read by a PC floppy controller. After that produces a DMK image file, you can run it through the inluded dmk2raw program to get just the raw bits. Then you might be able to mount the raw file as a FAT file system using the loopback device.

New - HP33C Simulator - BETA

*Message #1 Posted by **Mike T.** on 11 Apr 2005, 7:26 p.m.*

OK - For those of you who allways wondered what it was like to use an old HP33C now is your chance to find out!!

It has been a long, long time in the making and may not be of interest to every one but Dave has very kindly placed a copy of a ZIP file containing my own HP33C simulator here.

I started work on this a few years after my own HP33C died, and originally it was just intended to be a simple RPN calculator, written as introductory project to keep me interested while I learnt Visual BASIC - but I over the years I've kept on adding features and slowly refining it.

Numeric accuracy is about as good as I can make it given that it uses IEEE floating point underneath and though I'm thinking about writing my own BCD routines I think it is good enough for now, I've been using it for a couple of months and havn't noticed anything obvious - yet. I believe I have trapped all the error conditions properly but know that I have some work to do to handle numeric overflow correctly.

I did add a few 'enhancements' to the original, the backspace key deletes the last digit entered, and the insert key in program mode toggles an insert mode, allowing instructions to be inserted, renumbering GTOs and GSBs as needed.

To run the simulator extract the contents of the ZIP file to a folder and just double click on 'rpncalc33.exe', it will run on Windows NT 4.0, Windows 2K, and Windows XP (but NOT Windows 95/98/Me) providing that the Visual BASIC 5.0 runtime is installed. The program saves it's state in an INI file in the same directory as itself and does not use the registry.

Eventually I intend to release this simulator under the GPL, if possible, but for now am only making the binary available (it did start life as a learning exercise for Visual BASIC, and I'm not really a programmer so I would like to tidy things up a bit more first - you will have to be patient).

Please treat this as a BETA release, for use entirely at your own risk.

Please post any feedback here.

Mike T.

Re: New - HP33C Simulator - BETA

*Message #2 Posted by **hugh steers** on 11 Apr 2005, 7:44 p.m.,*
in response to message #1 by Mike T.

neat! i particularly like the way it just works from the keypad. although mouse clicking is a bit slow, but hey, the enter key works and so does E.

so how does your treatment of ieee work? for example 61/60 ->HMS gets the right answer and so does stuff

like 4.6 - 0.2 - 0.2 - 0.2 - 4.0. but when i take, say sqrt(99) and subtract 9.94987437, multiply and subtract again, i don't get zero, so there is some non-base 10 appearing in the low digits. but this is my only clue is not really base 10??

Re: New - HP33C Simulator - BETA

*Message #3 Posted by **Mike T.** on 12 Apr 2005, 5:50 p.m.,*
in response to message #2 by hugh steers

Yippee - a bug !!

Well spotted, the problem seems to be that when you key in 9.949874371 the simulator is not accepting the last digit, believing the mantessa to be full - but this only appears to be happening when the decimal point occurs after the first digit. The result, you can't enter '9.949874371', but you can enter '99.49874371'.

Thank you for spotting this ... now to figure out why it is happening, and how to fix it.

My treatment of IEEE floating point results is actually quite simple, a double float has a 16 or 17 digit mantessa, which seems to be just enough to produce the results expected of decimal arithmetic when the mantessa is truncated to 10 digits, rounding the 11 digit up or down as appropriate. If there is any trick to this at all it is remembering to truncate any intermediate results (though I did have a lot of fun with conversions from H.MS to decimal hours which required quite a bit of type coercion as well).

Mike T.

PS - Try 99; SQRT; 10; *; 99.49874371; -

Re: New - HP33C Simulator - BETA

*Message #4 Posted by **Mike (Stgt)** on 12 Apr 2005, 5:20 a.m.,*
in response to message #1 by Mike T.

Hello!

Just tried it alas with an older vbrun300.dll, so I can only say: looks quit nice. Would it be possible to restart the minimized application from the system-tray with a single click?

Ciao.....Mike

Re: New - HP33C Simulator - BETA

*Message #5 Posted by **Mike T.** on 12 Apr 2005, 6:15 p.m.,*
in response to message #4 by Mike (Stgt)

I based the behaviour on the Windows NT task manager which uses a single right click for the context menu, and a double left click to restore application window. I'm rather surprised that the program runs at all if you only have the Visual BASIC 3.0 runtime installed. Take a look in %windir%\system32 for msvbvm50.dll...

Mike T.

Re: New - HP33C Simulator - BETA (Visual BASIC runtime)

*Message #6 Posted by **Mike T.** on 12 Apr 2005, 5:51 a.m.,*
in response to message #1 by Mike T.

Visual BASIC 5.0 runtime can be found on the Microsoft web site here.

Mike T.

(Visual BASIC runtime) and acorn Emulator

*Message #7 Posted by **Mike (Stgt)** on 12 Apr 2005, 7:49 a.m.,*
in response to message #6 by Mike T.

Thank you very much for that link. Alas I am not allowed to use it at work. I'll try at home and let you know.

BTW - for those on this list interested in computer history, see this emulator: http://www.cary.demon.co.uk/acorn/acornEmulator.html (Once more the name Mike Cowlishaw pops up, he coded the interpreter language REXX _after_ the documentation of it was written!)

Ciao.....Mike

Re: (Visual BASIC runtime) and acorn Emulator

*Message #8 Posted by **Thibaut.be** on 12 Apr 2005, 9:35 a.m.,*
in response to message #7 by Mike (Stgt)

Is this the same company that created the BBC Micro computer ? All my teens...

Re: acorn Emulator

*Message #9 Posted by **Mike (Stgt)** on 12 Apr 2005, 11:00 a.m.,*
in response to message #8 by Thibaut.be

Yep, seems so. One link shows devices that used this CPU. Reads like a sellers list on a electronics flea market. They say the MPS6502 is still build today. But - frankly spoken - up to now I can not see any use of such a machine other than educational purpose. Anyone here with a hint point me to the right direction?

Ciao.....Mike

Acorn : Inventors of the ARM architecture

*Message #10 Posted by **Marcus von Cube** on 12 Apr 2005, 4:26 p.m.,*
in response to message #9 by Mike (Stgt)

The now famous ARM processor architecture is nothing else than an "Acorn Risc Machine", the processor behind later Acorn computers. The company specialized on processor *designs* later and sold intellectual property to manufacturers like Intel (Xscale architecture).

Re: Acorn Emulator

*Message #11 Posted by **Mike T.** on 12 Apr 2005, 6:07 p.m.,*
in response to message #8 by Thibaut.be

I think the chronology was something like this

1979 Acorn System 1 - 6502
1980 Acorn Atom - 6502

1981 BBC Model A/B - 6502 (+ 6502/Z80)
1983 Acorn Electron - 6502
1986 BBC Master - 6502 (+ 6502/Z80)

Spot the pattern, someone at Acorn liked the 6502, guess I did too come to think of it, though I never did quite get used to page zero addressing modes...

Mike T.

VB runtime

*Message #12 Posted by **Mike (Stgt)** on 13 Apr 2005, 4:42 a.m.,*
in response to message #6 by Mike T.

Well, first I looked for DLLs starting with "VBRUN" and did not find a version 5 of it. At home I installed it from the link you gave us here. But still no VBRUNxxx.DLL found. Aha, seems since version 5 the DLLs have a new name. There now are MSVBVM50.DLL _and_ MSVBVM60.DLL -- but your simulator still has some slipups: decimal point not operable (1,2 from keybord or mouse results in 12), ->HMS does not care for decimal places. Then I gave up.

The behaviour is the same on XP (w/o service pack 2) and W2kP. BTW: in your EXE I found a directory mentioned that does not exist on my PCs: E:\BIN\System32

Ciao.....Mike

Re: VB runtime

*Message #13 Posted by **Mike T.** on 13 Apr 2005, 11:44 a.m.,*
in response to message #12 by Mike (Stgt)

Do you expect 1.2 or 1,2 ?

Given you write 1.2 as 1,2 I suspect that you have the same locale issue as Michel Beaulieu...

The good news is that I've figured out how to detect which number format to use depending on your locale settings.

Mike T.

Run time error

*Message #14 Posted by **Michel Beaulieu** on 12 Apr 2005, 4:31 p.m.,*
in response to message #1 by Mike T.

Hi, i have already visual studio 6.0 installed but when i run the emulator, it start well but as soon i push a number on the keyboard, i got "Run time error 13" and the program close. What is it suppose to be.

Michel

Edited: 12 Apr 2005, 4:31 p.m.

Re: Run time error

*Message #15 Posted by **Mike T.** on 12 Apr 2005, 5:17 p.m.,*
in response to message #14 by Michel Beaulieu

Thank you for you feedback, I've had to think about this one a bit ... Even though you have Visual Studio 6.0 installed I think you must have the Visual BASIC 5.0 runtime installed as well for the program run at all.

You didn't say which version of Windows you are using - so my best guess (for now) is that you are using Windows 2000, in which case the following Knowledge Base article may be of some relevence as the buttons and display are custom controls.

http://support.microsoft.com/kb/297692/EN-US/

Mike T.

Re: Run time error

*Message #16 Posted by **Michel Beaulieu** on 12 Apr 2005, 7:33 p.m.,*
in response to message #15 by Mike T.

I have windows XP. The problem arise "only" when i push numbers, decimal point and EE. All other keys seems to work properly. I will try to install runtime 5 insted of runtime 6.

Michel

Re: Run time error

*Message #17 Posted by **Michel Beaulieu** on 12 Apr 2005, 8:36 p.m.,*
in response to message #16 by Michel Beaulieu

I install runtime 5 and still not working. Even on another machine running win XP.

Re: Run time error

*Message #18 Posted by **Mike T.** on 13 Apr 2005, 10:08 a.m.,*
in response to message #17 by Michel Beaulieu

Michel - This was a tough one!

I'm pleased to say that I was able to reproduce the problem - eventually. I suspect that your locale (country settings) are set to use a comma as a decimal separator (and point as a digit separator). This results in an error when converting any digits you enter to a floating point value since the CDBL function is locale aware, the good news is that I think I've figured out a solution - which will also result in the display being formatted correctly depending on your regional settings.

To confirm my suspicions this could you tell me if the simulator displays Pi as 3,1416 or 3.1416?

Mike T.

PS If you want to use the simulator it should work if change your regional settings...

Re: Run time error

*Message #19 Posted by **Michel Beaulieu** on 13 Apr 2005, 11:44 a.m.,*
in response to message #18 by Mike T.

Wow! you are as great as a debugger! I change my decimal from , to . in windows and the program works great!

You were right, i live in Québec and the separator is officially , for numbers...

Thanks for your debogging and your great program.

Michel

RE: hp 17BII

*Message #1 Posted by **Peter** on 11 Apr 2005, 6:38 p.m.*

Anyone have/used an hp 17BII (not 17BII+)? I would like to know if this model allows differing compounding periods to payment periods? I ask this because in Canada the mortgage calaculations -- P/Y=12, C/Y=2 -- are slightly different than in the US. Thanks!

~Peter

Re: RE: hp 17BII

*Message #2 Posted by **bill platt** on 11 Apr 2005, 7:40 p.m.,*
in response to message #1 by Peter

Hi. I don't have my manual in front of me, but I have a pretty strong memory that yes, in fact, this is explicitly covered in the 17bii manual. (I remember finding it interesting).

BTW, there are two different 17bii models: US/Canad, and International. THe only difference I have found is the ability to change language (In Other Words the CDN compounding business is in both).

Yo might also go to www.hp.com/go/calculators and search for support--discontinued models (or something like that).

Best of luck

Bill

Re: RE: hp 17BII

*Message #3 Posted by **Peter** on 11 Apr 2005, 7:53 p.m.,*
in response to message #2 by bill platt

WHEW! I am awaiting shipment of an hp 17BII from samsoncables.com and it just occured to me that (unlike my old TI-BA II Plus) it may not allow for differing P/Y and C/Y. Thanks a million, Bill!

HP 49g+ serial number CNA-452

*Message #1 Posted by **J.C. boco** on 11 Apr 2005, 10:19 a.m.*

On the

http://groups-beta.google.com/group/comp.sys.hp48/browse_thread/thread/4e7efb17e5ac7fc3/91e0498b6d0f3f16#91e0498b6d0f3f16

board someone has a calculator of this serial number (first 6 digits) and suggests it's the new enhanced keyboard. Has anyone experience with this newly-made HP, and how does the keyboard work, especially with respect to those "Keyskips" that occur about 5% of the time.

Re: HP 49g+ serial number CNA-452

*Message #2 Posted by **Diogenes** on 11 Apr 2005, 12:15 p.m.,*
in response to message #1 by J.C. boco

Don't hold your breath... there have been many rumored "improved" keyboards, but then still have the keypress bug. I'd have to read nothing but good reviews of these "improved" keyboards for some time before I even thought about buying a 49+ again.

Re: HP 49g+ serial number CNA-452

*Message #3 Posted by **Eric Lundgren** on 11 Apr 2005, 2:40 p.m.,*
in response to message #2 by Diogenes

I've tried three replacements from HP. The kbds all felt different, with each replacement requiring less force (and also more sloppiness/vibration)

The clockspeed tools found on hpcalc.org have resolved most problems, but others point out that the issue is more subtle.

I have, for the most part, lost much time with the new machines. They're primarily supposed to save time, right?

Eric

HP-42S fail message

*Message #1 Posted by **John** on 11 Apr 2005, 2:38 a.m.*

I just bought an HP-42S (without batteries) at a flea market. Back home I put batteries in and when I ran the self test I get a "fail 00020" message. What does this mean and can this be fixed?

Re: HP-42S fail message

*Message #2 Posted by **Erik Ehrling (Sweden)** on 11 Apr 2005, 9:45 a.m.,*
in response to message #1 by John

I suppose that you are running the EXIT + LN test? It is normal for this test to display "FAIL 00020" when you break out of the test by pressing any key. What is important is whether it displays the "OK-42S-E" message or not before the test loops... Hopefully it does display the "OK-42S-E" message - and your HP-42S is all OK!

Best regards,
Erik Ehrling (Sweden)

Re: HP-42S fail message

*Message #3 Posted by **John** on 11 Apr 2005, 10:37 a.m.,*
in response to message #2 by Erik Ehrling (Sweden)

Hi Erik, Nope, I'm not getting that "OK-42S-E" message during the manual self test. The other self test, the continual test does not run. Odd thing is that I am sometimes getting a "Machine Reset" or a "Memory Clear" message when I press the LN, XEQ, COS, TAN, or E key. Occasionally the ENTER key or EXIT key produces a continual beep sound. I am definitely baffled. John

Re: HP-42S fail message

*Message #4 Posted by **Nelson M. Sicuro (Brasil)** on 11 Apr 2005, 1:25 p.m.,*
in response to message #3 by John

Maybe this can be a bad contact on the memory chip (broken/cold solder?)...

Best regards,

Nelson

Re: HP-42S fail message

Rechargeable Batteries

*Message #1 Posted by **Howard** on 10 Apr 2005, 7:40 a.m.*

This might be a super dumb question. I recently made up a battery pack for one of my HP calcs. The replacement batteries were of a very much higher mAhr capacity. How can I tell when they are full? If I get a voltmeter can I measure the voltage and assume they are full when the voltage gets to 2.4v (2*1.2v in series}? Thank you.

Re: Rechargeable Batteries

*Message #2 Posted by **John Limpert** on 10 Apr 2005, 8:04 a.m.,*
in response to message #1 by Howard

There's no easy way to tell if the batteries are fully charged. Output voltage on NiCD cells is fairly constant until they near exhaustion. You can trickle-charge the cells at 0.1c for about 14-16 hours. Charging them at a faster rate requires a temperature sensor that can detect increases in cell temperature that occur when a cell is nearing full charge.

Re: Rechargeable Batteries

*Message #3 Posted by **Howard** on 10 Apr 2005, 8:09 a.m.,*
in response to message #2 by John Limpert

Thank you. I'll leave them on for a couple of days. That should charge them up. The trouble is the new ones are 2000mAhr vs 700mAhr of the originals.

Re: Rechargeable Batteries

*Message #4 Posted by **Steve A** on 10 Apr 2005, 10:21 a.m.,*
in response to message #3 by Howard

Of course you could charge them with a ndv charger outside the calc, as many ndv chargers are made to charge cell pairs.

Re: Rechargeable Batteries

*Message #5 Posted by **Gileno** on 10 Apr 2005, 1:53 p.m.,*
in response to message #1 by Howard

Which the battery model that you used, and did where buy (site)?

Re: NiCad voltages

*Message #6 Posted by **Randy** on 10 Apr 2005, 11:37 p.m.,*
in response to message #1 by Howard

Many conditionals apply to the following general statement: Ni-cads are considered to be fully charged when they reach approximately 1.35-1.4 vdc per cell. Not perfect for many reasons but a good place to begin

discussions. 1.1 vdc is (generally) considered to be the bottom of the discharge curve, that is when it begins to fall like a rock.

Another (inaccurate) way to assume full charge is (cell capacity/charge rate) = time required. For example: an original 600 mah classic nicad pack requires 10 hours at the standard 82002 charger rate of 60ma. Change those to 1100mah cells and it *should* require ~18 hours to reach full charge. Extrapolate to suit.

Re: NiCad voltages

*Message #7 Posted by **John Limpert** on 11 Apr 2005, 3:49 a.m.,*
in response to message #6 by Randy

Your calculations for charge time ignore the inefficiency of the charging process. For a trickle charge, it take about 1.4c to fully charge the battery.

32sii Silver more reliable? / and other rants

*Message #1 Posted by **Eric Lundgren** on 9 Apr 2005, 11:16 p.m.*

Hi all,

Anyone have an idea why a new (in box) silver bezel 32sii would be more attractive than a n-i-b brown bezel?

On a side note, I've gotten a very nice 42s from my father, and it appears to have the molded keys that I've read about! Also, the first thing in the manual is a series of statements regarding HP's belief in the quality of their products, designed and built to last, etc..

Paging through the 33s manual, however...:)

Another point: HP released the 12c-Plat while still selling the gold 12c, using the traditional casing, yet the engineers, pleading for voyagers and pioneers get the "mind bender 33?"

The 33s would be less offensive, were the business types being fed similar "CAD-borne curvature." Ok, well at least I can store more progs w/o "MEMORY FULL" :)

servicing 15c keyboard

*Message #1 Posted by **sig** on 9 Apr 2005, 4:12 p.m.*

hey all,

the page on this web site re: Voyager internals implies that the keyboard (plus circuitboard) are permanently applied to the front part of the 15c (11c, 12c, etc.) case. does anyone know if this is true or not?

to be even more specific, i have a 15c that needs some keyboard maintenance, and i'm reluctant to do anything that might be irreversable. so ... how easy is it to open up any voyager calc (the 15c in my case), access the keyboard, close up the calc, and have it working normally again?

thanks, steve

Re: servicing 15c keyboard

*Message #2 Posted by **Randy** on 9 Apr 2005, 7:28 p.m.,*
in response to message #1 by sig

All Voyager keyboards are attached to the body of the calculator by plastic heat fused rivets. Keyboard maintenance is without a doubt the hardest thing to do - you'll get only one chance to remove the keyboard properly and then reinstall with (maybe) good results. The second time you try you'll wish you didn't. It helps to practice your techniques on several throw-away 12C's first.

The term "keyboard maintenance" covers alot of issues - could you be more specific? Unless you have a broken hinge on a keytop, you generally don't need to remove the pc board.

HP-16C limits?

*Message #1 Posted by **VPN** on 9 Apr 2005, 3:33 p.m.*

Can anyone code this:
http://www2.hursley.ibm.com/decimal/DPDecimal.html
[VPN]

Re: HP-16C limits?

*Message #2 Posted by **Gunnar Degnbol** on 10 Apr 2005, 10:22 a.m.,*
in response to message #1 by VPN

I don't think it can be squeezed into an HP-16C. I implemented it in Java, and the classes are about 5 KB in total. You can get my Java code, if you want, but it is just a translation of the NetRexx code.

Re: HP-16C limits?

*Message #3 Posted by **Patrice** on 11 Apr 2005, 11:41 a.m.,*
in response to message #1 by VPN

This quick and dirty HP16C program must do for the compressor !

001- LBL C STO 0 8 8 8 AND STO 2 RCL 0 XOR 010- 7 7 X<>Y AND LST X + SR STO 1 RCL 2 X=0? 020- GTO 1 0 GSB 0 GSB 0 GSB 0 3 RLn STO 2 X<>I RCL 1 030- 8 + STO 1 GTO I 034- LBL 0 x<>Y 4 RRn X<>Y RRC RTN 041- LBL 1 RCL 1 RTN 044- LBL 3 4 6 RCL 1 OR RTN 050- LBL 7 6 6 RCL 1 OR RTN 056- LBL 2 2 ENTER 4 ENTER 6 GTO 8 063- LBL 4 4 ENTER 7 ENTER 6 GTO 8 070- LBL 6 6 ENTER 7 ENTER 6 GTO 8 077- LBL 5 2 6 ENTER 3 ENTER 6 0 GTO 8 086- LBL 8 RCL 1 XOR RCL 1 X<>Y XOR x<>Y LST X X<>Y RLn OR OR STO 1 099- RTN

Patrice Torchet

Allow me? (was: Re: HP-16C limits?)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 11 Apr 2005, 1:50 p.m.,*
in response to message #3 by Patrice

Hi, Patrice;

I see you are trying to format your listing. Please, let me know if this is what you want:

```
001- LBL C  STO 0  8 8 8 AND STO 2  RCL 0  XOR
010- 7 7 X<>Y AND LST X  + SR STO 1  RCL 2 X=0?
020- GTO 1  0 GSB 0  GSB 0  GSB 0  3 RLn STO 2 X<>I RCL 1
030- 8 + STO 1  GTO I
034- LBL 0  x<>Y 4 RRn X<>Y RRC RTN
041- LBL 1  RCL 1 RTN
044- LBL 3  4 6 RCL 1  OR RTN
050- LBL 7  6 6 RCL 1  OR RTN
056- LBL 2  2 ENTER 4 ENTER 6 GTO 8
063- LBL 4  4 ENTER 7 ENTER 6 GTO 8
```

```
070- LBL 6  6 ENTER 7 ENTER 6 GTO 8
077- LBL 5  2 6 ENTER 3 ENTER 6 0 GTO 8
086- LBL 8  RCL 1  XOR RCL 1  X<>Y XOR x<>Y LST X  X<>Y RLn OR OR STO 1
099- RTN
```

To accomplish this, add a [pre] in the begining of the listing, and a [/pre] in the end of it. Like this:

```
[pre]001- LBL C  STO 0  8 8 8 AND STO 2  RCL 0  XOR
010- 7 7 X<>Y AND LST X  + SR STO 1  RCL 2 X=0?
020- GTO 1  0 GSB 0  GSB 0  GSB 0  3 RLn STO 2 X<>I RCL 1
030- 8 + STO 1  GTO I
034- LBL 0  x<>Y 4 RRn X<>Y RRC RTN
041- LBL 1  RCL 1 RTN
044- LBL 3  4 6 RCL 1  OR RTN
050- LBL 7  6 6 RCL 1  OR RTN
056- LBL 2  2 ENTER 4 ENTER 6 GTO 8
063- LBL 4  4 ENTER 7 ENTER 6 GTO 8
070- LBL 6  6 ENTER 7 ENTER 6 GTO 8
077- LBL 5  2 6 ENTER 3 ENTER 6 0 GTO 8
086- LBL 8  RCL 1  XOR RCL 1  X<>Y XOR x<>Y LST X  X<>Y RLn OR OR STO 1
099- RTN [/pre]
```

and, of course, congrats. Your suggestion is a very good example of efficient programming with the HP16C.

Cheers.

*Message #8 Posted by **Gunnar Degnbol** on 11 Apr 2005, 4:07 p.m.,*
in response to message #3 by Patrice

I think this is the IEEE 754 binary floating point format. The question was about the upcoming IEEE 754R decimal format. It is a kind of Huffman compressed BCD, with some bits carrying information on both the exponent and the coefficient (mantissa). This gives 16 digits of precision, with an exponent from -383 to 384.

This format is designed to be hardware-friendly, so a decimal FPU can easily split it into BCD digits. The IEEE 754R guys think that decimal arithmetic will take over from binary.

As I said, it is 5 KB of Java classes, and though RPN may be more compact, there is no way to squeeze it into an HP 16C.

HP-97 reverse engineering progress

*Message #1 Posted by **Eric Smith** on 9 Apr 2005, 2:58 p.m.*

I've been studying logic analyzer traces of the HP-97 bus. I was surprised to find that there are a lot more hitherto unknown instructions than I expected. From the HP Journal article on the 91 (or was it the 92?) I knew that there were about six instructions for the printer, and an unknown number for the keyboard and card reader, but thus far I haven't captured any traces involving printing.

The PIK chip controls both the printer and the keyboard (with buffer), so I expected that there would be at least one new keyboard-related instruction. I've been able to identify the instruction that tests whether there are any keycodes available in the buffer.

Reading a keycode out of the buffer doesn't use a new instruction; actually it can't, because it's not possible for chips external to the ACT processor to add new instructions that transfer data into ACT internal registers. So instead, it is mapped as RAM, to address 0xFF. (The actual RAM inside the combined RAM/ROM chips appears to be mapped from 0x00 through 0x3F.) I've determined a portion of the hardware keycode encoding information, but not yet all of it.

Thus far I've seen 13 "new" instructions, of which one is the keyboard status test.

Probably some of the extra instructions are asking the card reader whether a card has been inserted, and asking the printer whether it is in the home position. Maybe this will become more apparent when I capture traces with the printer or card reader in active use. I will need to refurbish the card readers in my 97 (and 67) before doing any reverse-engineering of that.

The ROM bank switching on the 97 does NOT appear to use the same instruction as used in the Spice models. I know there is some form of ROM bank switching going on, because the ACT can only address 4K of ROM, but the 97 has 6K, and some other ACT-based calculators including the 67 and 19C have 5K. I'm hoping that it uses essentially the same scheme they used in the later Spice series and merely a different opcode, but I don't yet have enough trace data to find it.

Right now I'm limited to capturing about six seconds of execution at a time.

I think it will take a long time to build up a full understanding of the HP-97, but once that is done I should be able to simulate all of the Topcat models as well as the HP-19C.

Re: HP-97 reverse engineering progress

*Message #2 Posted by **Eric Smith** on 9 Apr 2005, 11:48 p.m.,*
in response to message #1 by Eric Smith

Finished mapping all of the internal keycodes.

I think I've identified which instruction asks the CRC chip for the state of the PRGM/RUN switch. Should be fairly easy to find the instruction that ask the CRC about the NORM and ALL states of the printer switch (TRACE is encoded as the absence of either NORM or ALL).

Edited: 10 Apr 2005, 4:09 a.m.

*Message #3 Posted by **Peter Monta** on 10 Apr 2005, 4:37 a.m.,*
in response to message #1 by Eric Smith

It would be interesting to do gate-level simulations of these machines---for one thing, a gate model would be more debuggable than the real hardware and might help with this sort of instruction-inference. It would certainly be the authoritative source for instruction semantics if it could be understood.

A netlist of each chip would be needed, which would be challenging to construct (I've been wanting to try this, but there just hasn't been time). An FPGA with the actual ACT and ROM guts inside would be amusing. The synthesis tool would optimize the design, though, so if one didn't entirely trust the tool, for extra correctness one could do a really dumb translation directly to LUT primitives and accept a slow cycle time (probably this is overly paranoid).

Or I imagine a desktop machine with a reasonably clever cycle-based simulator might come close to real time.

*Message #4 Posted by **Eric Smith** on 10 Apr 2005, 1:18 p.m.,*
in response to message #3 by Peter Monta

> Quote:
>
> It would be interesting to do gate-level simulations of these machines

Definitely an interesting idea.

I'm told that there are services that will take a chip and return you a netlist or even an HDL model, but that they are very expensive.

There was a CAE tool named "LayBool" developed at a university that did part of this process; it would turn geometric layout information into logic equations. I'm not sure that it would be able to handle old dynamic PMOS stuff. But it was acquired by a CAE tool vendor. It may or may not still be available (perhaps under a different name now), but it was incredibly expensive at one time, and probably still is.

I'm going to try to glean as much as I can from logic analyzer captures, but if that isn't satisfactory, the next step will be to replace the ACT with my own hardware that can act as a stimulus to probe the behavior of the PIC and CRC chips.

If all else fails, maybe these chips are simple enough (compared to even 1980s chips) to decapsulate and photomicrograph, and generate a netlist by hand. I know a tiny amount about CMOS circuit design, and have an old book by AMI (one of the fab houses HP used for these chips) on PMOS design, so I suppose I could learn enough to do it.

And once I had the photomicrographs, mabye I could write tools to automatically recognize certain features and do some of the work.

What is the price for an HP-42s?

*Message #1 Posted by **Marcus von Cube** on 9 Apr 2005, 11:20 a.m.*

Someone is offering an HP-42s for 220 Euro. (German Manual) Is that ok? He says, that the machine is in good shape.

Re: What is the price for an HP-42s?

*Message #2 Posted by **Raymond Del Tondo** on 9 Apr 2005, 12:25 p.m.,*
in response to message #1 by Marcus von Cube

Hi Marcus,

the machine went for 251 Euros.
It it were my auction, I'd at least offer it with a manual.

As you know, an item is worth exactly what you pay for,
at least at that very moment;-)

Regards

Raymond

x-memory vs novram

*Message #1 Posted by **fulcrum** on 9 Apr 2005, 7:02 a.m.*

Hello, I want to know if there is some advantage in the x-memory that has not the main memory in a hp41, and also how it compares with a novram module in terms of functionality, I mena, which of this three memory tipes has more advantages, and if the ram in a novram module has some inconvenient versus the x-memory. Thank you

Re: x-memory vs novram

*Message #2 Posted by **Raymond Del Tondo** on 9 Apr 2005, 12:41 p.m.,*
in response to message #1 by fulcrum

Hello,

X-Memory modules are used to extend the adressable
RAM range of an HP-41 to it's full extent.

Due to other (OS addressing) limitations, this RAM will
not be usable asmain memory from the user's point of view,
but instead it will be usable as kinda RAM disc.

Please refer to the suitable manuals,
available either on TOS, or on the hpmuseum CDs.

The NoVRAM module is a module simulator,
and although it has RAM inside the module,
this RAM is used to hold either ROM blocks or other data,
and does not use the main RAM area of the HP-41,
but occupies part of the ROM range,
which is a completely different story.

Please refer to the suitable documents,
available either on TOS, or on the hpmuseum CDs.

To scramble things completely, NoVRAM or a variation of it,
could even be used to emulate X-Memory,
at least if I got the right info from Diego.

Regards

Raymond

*Message #5 Posted by **fulcrum** on 9 Apr 2005, 5:33 p.m.,*
in response to message #4 by Ángel Martin

So the editor ed can be used directly in the ram files, and also manipulate them with the extended functions? Thank you Ángel

Re: x-memory vs novram

*Message #6 Posted by **DavidMY** on 9 Apr 2005, 8:47 p.m.,*
in response to message #5 by fulcrum

There are effectively 3 types of "memory" modules available for the 41 calculator. From HP: Standard -- only for the 41C. These expand the main memory, sometimes refered to as program memory, to the full 319 registers addressed by the 41C firmware. This is the memory the SIZE command lets you divide between programmable and storage registers. The 41CV and 41CX include these internally so these modules are useless in them.

X-Memory -- this memory is only usable with the X-Functions ROM module. There are two types a X-Function/X-Memory module usable only with the 41C and CV (the 41CX has the X-Function ROM integrated internally) and X-Memory modules with only memory. An X-Memory module in a 41C or 41CV is useless without a X-Function/Memory module present. HP chose to configure this as a RAM disk, i.e. storage rather than as having the calculator be able to run programs directly in this space. This is basicly due to the origional firmware programming as the CPU can directly address this space and by using synthetic techniques it is possible to run programs stored in this memory.

3rd Party "RAM" modules: These were developed to use ROM module space (the 41's CPU designates seperate spaces for RAM (0-1023) and ROM (4K blocks 0,1,2,3,4,5 reserved for the system and 6-15 for modules) as storage.

NoVRAM memory is technically not RAM. It is non-volitile EEPROM(Electrically Erasable Programable Memory). Diago's excellent module has a microcontroller and EEPROM chips. The microcontroller maps the module's memory into the module memory space. The advantage to this is that anything in its memory is NOT lost when the module is removed from the calculator. All other memory modules (Standard or XMemory) lose their information when removed.

Diago developed the module as a clone of a module called HEPAX, probably the most advanced 3rd party module developed before the end of the 41 line. HEPAX followed the concept of the X-Functions and came as a HEPAX Function+Memory module and HEPAX MEMORY modules. You always needed the HEPAX Functions code to use its memory. Fully implemented you could have over 2300 registers available of HEPAX memory.

So with a 41CX you could potentially have: 319 registers of "main" memory, 600 registers of XMemory and over 2300 registers of "HEPAX" memory.

The disadvantage is that HEPAX memory reduces the number of modules you can have plugged in as its memory occupies ROM space.

The NoVRAM module is worth much more than simply as memory. With the HEPAX firmware installed HEPAX memory can be divided and a portion used as a ROM module: with User code (ie. programs) and/or firmware (i.e. assembly) stored in it. The HEPAX code can create the Cat2 catalog and entries for user programs which then can be run from that memory just as if they were in a ROM based module. With a knowledge of 41 assembly code the HEPAX editor and utilites allows you to enter assembly routines. With a PC and external programmer you can use the NoVRAM as like Diago's Clonix and program it with various module's images and run virually any of the modules developed for the 41.

With a PC and programmer the NoVRAM can even be programmed with an extra 8K ROM module as it has extra space even with the HEPAX ROM and full HEPAX memory set up.

Re: x-memory vs novram

*Message #10 Posted by **fulcrum** on 11 Apr 2005, 3:32 a.m.,*
in response to message #9 by Christoph Klug

Thank you all for your explanations, so the question I have now is there seems that

there would be no point having any x-memory when you have a novram, or there is any advantage in xmemory overnovram that I am missing? Regards

Re: x-memory vs novram

*Message #11 Posted by **Gene** on 11 Apr 2005, 7:36 a.m.,*
in response to message #10 by fulcrum

No advantage to x-memory that I am aware of.

The Hepax functions include "copies" of functions similar to the X-memory functions but that they work on Hepax ram and files.

Gene

Re: x-memory vs novram

*Message #12 Posted by **Christoph Klug** on 11 Apr 2005, 7:36 a.m.,*
in response to message #10 by fulcrum

Dear Fulcrum,

for storing and executing own program code the NoVRAM is a great solution. Because using NoVRAM for executing your user programms you get more free main memory for data. Furthermore with NoVRAM you are able to run really great program applications :-)

X-Memory is a great solution for data storing. For example ASCII text files or special CCD-Module matrix files. I use the X-Memory as data memory for data logging applications.

For an advanced HP41 configuration using both would be the best : A Double X-Memory plus NoVRAM :-))

The W&W RAM-Box operating system also includes commands for data storing to the NoVRAM. Last not least, the special MBK-Profiset RAM-Box operating system includes advanced storing commands for compressed data storage.

Best wishes - Christoph Klug

Re: x-memory vs novram

*Message #13 Posted by **fulcrum** on 11 Apr 2005, 8:01 a.m.,*
in response to message #12 by Christoph Klug

That is just was thinking myself. However, the ram with hepax os can store also the registers with hsaver, what gives a great capability of storage, with 16k of "RAM" you can store a lot of programs, data and text files, at least for my use is enough Thank you and regards

Re: x-memory vs novram

*Message #14 Posted by **Ángel Martin** on 11 Apr 2005, 4:32 p.m.,*
in response to message #12 by Christoph Klug

Christoph is (rightfully so) biased toward the Rambox solution, but I should

mention that the HEPAX firmware (included into every standard NoVRAM) also provides the capability to store data into the Quasi-RAM area (i.e. the ROM space seen as RAM by it).

Both standard registers and ASCII files can be happilly stored there.. in fact, in my humble opinion the HEPAX solution is every bit as good as the Rambox, and then something better :-)

Best, AM

BCD Division

*Message #1 Posted by **Mike >t** on 8 Apr 2005, 6:48 p.m.*

One time 'quiche eater' seeks a (clear) description of the algorithm to perform the division of two (unpacked) BCD numbers (10 digit mantessa + 2 digit exponent - now where might you have seen that format before).

I know it is shift and subtract but I can't remember exactly how it was supposed to work - I do remember it wasn't obvious!

Mike T.

PS I don't want to use an existing library like BIGINT or similar.

Re: BCD Division

*Message #2 Posted by **John Limpert** on 8 Apr 2005, 7:13 p.m.,*
in response to message #1 by Mike >t

I'd start at http://www2.hursley.ibm.com/decimal. The web page's author is the expert on decimal arithmetic.

Re: BCD Division

*Message #3 Posted by **Mike T.** on 9 Apr 2005, 4:37 p.m.,*
in response to message #2 by John Limpert

Many thanks, I'd had found the site earlier but not that page - must have missed it.

I'll have to read it slowly to make sense of it properly (and I guess I'll have to create my own flowchart or structure diagram as there wasn't one) but I think that given a few days, and no too many late nights I should be able to cut some useful code...

Mike T.

Re: BCD Division

*Message #4 Posted by **hugh steers** on 11 Apr 2005, 7:31 p.m.,*
in response to message #1 by Mike >t

to perform U/V where these are bcd floats. first unpack the mantissas, exponents and signs so that you have two positive mantissas u/v. start by settings the exponent of the result, w, to be exp(U) - exp(V). now perform the u/v division as follows:

```
(1)     ensure that u >= v. if not, shift u left 1 packed bcd digit and decrement w, if
quotient = 0, otherwise shift quotient left 1 digit.. goto (1)
(2)     while u >= v, perform u = u - v. count the number of subtractions, q. this is the
next digit of the answer. goto (1)
```

there’s a bit more to it than this but essentially you are shifting until you’ve got something to subtract then you

subtract all you can at each digit and put the number of subtractions into the answer and continue until you've got a full house of quotient mantissa.

lastly fix up the signs and exponent of the quotient.

i wrote some `C' code one for this here: http://www.voidware.com/bcdfloats.htm

Re: BCD Division

*Message #5 Posted by **Mike T.** on 12 Apr 2005, 6:33 p.m.,*
in response to message #4 by hugh steers

Now I can make a connection - I did find your web site a while ago, and I should have guessed you would be reading these posts! Unfortunately I haven't yet got the hang of unravelling somebody else's code and have been having more than a little difficulty sorting out what was going on as your routines use packed BCD which makes life a little more interesting. Thank you for the precis.

Mike T.

Re: BCD Division

*Message #6 Posted by **hugh steers** on 13 Apr 2005, 12:04 p.m.,*
in response to message #5 by Mike T.

those routines are a bit old. i have a new 20 digit bcd library now. i keep meaning to put this up for download.

Getting U.S. to compete with overseas labor

*Message #1 Posted by **Frank Travis** on 8 Apr 2005, 2:52 p.m.*

I know that much U.S. manufacturing and services (help desks, etc.) have been outsourced to countries such as Mexico, China, and India. Yet there are examples of good products and services still in the U.S. Over 80 persent of Sears Craftsman tools are made in the U.S. They carry a lifetime warranty, and are used extensively in auto and truck racing. MPC Computer Corporation (formerly MICRONPC--which spun off from MICRON Electronics Corp.) has all of its Computer Help Desk reps and Technicians/Engineers based in the U.S. What can the U.S. do to be more competitive in the world market?

Re: Getting U.S. to compete with overseas labor

*Message #2 Posted by **bill platt** on 8 Apr 2005, 3:38 p.m.,*
in response to message #1 by Frank Travis

Not much. However, the Fed. res. keeps printing money, the Fed. gov't keeps issuing dept--->together, this amounts to currency devaluation, and so, in time, our currency will sink and we will compete again. Never mind that the $8 indian flute and $6 malaysian t-shirt will each rise to $200 in today's money.

Oh well. Might as well bite the bullet and go earn an MBA and do some "financial services." After all, if you get to touch a lot of money, a little bit of it aught to rub off on you ;-)

regards,

Bill

Re: Getting U.S. to compete with overseas labor

*Message #3 Posted by **Bill Wiese** on 8 Apr 2005, 3:49 p.m.,*
in response to message #1 by Frank Travis

Frank,

The only 'advantage' non-US/non-European economies have is the ability/tolerance of their populations to defecate in their own water supplies. Lack of civilzation = lower overhead.

Some companies in US are already noticing that many help-desk issues are not well-served by shipping overseas and some of this is coming back to US esp where communications skills are important. Also product design seems to be staying in US/Europe for many things.

Your Craftsman tool example is a good one: they get lotsa business from "Made in USA" folks and don't want to lose that. The tooling/metal quality etc is better than any schlocky import (excepting quality European imports like Proto).

Manufacturing labor costs for many consumer items is only a few percent of the total price of the item even when made in US/Europe in modern automated factories. I'll gladly pay 20% more to not enrich China.

I regard execs of American cos that outsource to Red China as traitorous - not because of the labor issues, but because they are financially strengthening a country that is/will be a US enemy. WalMart, for example, is essentially the funding agency for Red China's military.

The only thing I want shipped to Red China from these shores is ammunition - while being expended.

Workers in China and India both have a 'bargain basement' approach to quality. And it's not about assembly quality, it's about fundamental design quality. Look at today's Chinese HP12C vs an original US (or even Singapore) HP12C: worlds of difference.

Bill Wiese
San Jose

*Message #4 Posted by **Garth Wilson** on 8 Apr 2005, 5:52 p.m.,*
in response to message #3 by Bill Wiese

> Manufacturing labor costs for many consumer items is only a few percent of the total price of the item

One of the electronics industry magazines recently said that one of the American semiconductor manufacturers just opened a huge, new plant in Texas. The stockholders were asking, "Why didn't you put it in the orient where labor is cheaper?" The answer was that by far the major expense was in the equipment, and the labor cost was almost insignificant by comparison, even in the U.S..

Just do your best

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Apr 2005, 11:24 a.m.,*
in response to message #3 by Bill Wiese

Quote:

"The only 'advantage' non-US/non-European economies have is the ability/tolerance of their populations to defecate in their own water supplies. Lack of civilzation = lower overhead."

This is false and unfair. I would not use my time here or this wonderful MoHPC site and its technical resources (storage/bandwidth) to prove it. Usually absolute generalizations in complex matters like human behaviour and national relationships are of low value; the development of historical and social processes cannot be synthesized in an insulting manner.

And, yes, I know; my own country has much to improve in. But I can assure you that we are not living by the "quoted rule".

Re: Just do your best

*Message #6 Posted by **Nenad (Croatia)** on 9 Apr 2005, 12:46 p.m.,*

just nuke'em!

Understood

*Message #9 Posted by **Andrés C. Rodríguez (Argentina)** on 9 Apr 2005, 5:08 p.m.,*
in response to message #7 by Bill Wiese

Bill: I accept your clarification. I cannot talk about nor criticize the countries you mention, because I have little contact with them, have not visited them, had no business with them (at least, by now), etc. And I prefer to relativize the indirect information appearing in the media. But I think they may just be trying very hard to improve their standard of living, as many other countries have struggled for years before. That doesn´t make them an enemy, in my humble opinion. Perhaps that may make them a rival, but the meaning is very different. The approach should be different too.

One of the things I used to admire in my visits to the USA (28 times) was the respect for the individual. I don't think all the people from any country should be considered the same, as if them (or we) were just identical atoms of a chemical element, and only counted by number.

I still hope my daughters will live in a plural, varied and respectful world, in a future which appears to be not soon enough...

Re: Getting U.S. to compete with overseas labor

*Message #10 Posted by **USA First** on 8 Apr 2005, 5:00 p.m.,*
in response to message #1 by Frank Travis

We're in an ever-descending spiral of globalization. The US should go back to an isolation policy. We should be independent,self-reliant, and not meddle in outside politics. We should require that all goods sold here be produced here from our own raw materials, built by our own citizens. We should secure our borders and tell the rest of the world to go its own way, without our aid. If we're left alone, all will be fine. If attacked, we should bomb 'em back to the stone age.

Re: Getting U.S. to compete with overseas labor

*Message #11 Posted by **Vassilis Prevelakis** on 8 Apr 2005, 10:21 p.m.,*
in response to message #10 by USA First

```
USA First wrote:
>The US should go back to an isolation policy. [...]
```

You obviously do not believe this, otherwise you would not hide behind an alias.

While I believe that the US should limit its involvement with other nations, especially in cases (e.g. Somalia) where there is little or no gain to be made from such interference, the reality is that the US is dependent on outside imports (oil in particular). Even opening up the Alaska Wildlife National Reserve will only provide oil for 2 or 3 years. So any isolationist talk is meaningless.

Re: Getting U.S. to compete with overseas labor

*Message #12 Posted by **John L. Shelton** on 8 Apr 2005, 6:33 p.m.,*
in response to message #1 by Frank Travis

Perhaps I hold a minority opinion, but I believe world trade to be a good thing. We all benefit through voluntary trade with others, and I don't see a big distinction between my City, my State, or my Country; if someone else can supply my needs better than I can, I trade with him. The extreme opposite of globalization is individual isolationism - self sufficiency. I'm glad I don't have to hunt/grow my own food.

Our best chance of achieving peace with others is through trade. Vendors don't bomb their customers. A growing, happy middle class in China is absolutely the best thing to keep that country peaceful. People with cell phones and PCs at home don't want to go to war.

Our biggest fears now should be the small-group terrorists who don't want consumer electronics and Starbucks, and who will gas/explode/poison us just for the hell of it.

How to be competitive?? Keep the US as the best place for free-market economics. Attract innovators here. Minimize bureaucracy. Maintain the rule of law. Teach our children a love of knowledge. Tame the lawsuits and the "entitlement" mentality. Let people know the way to riches is through hard work and intelligence. Learn the cultures of the world, so we can market to them. Our music and movies sell well around the world - so can our other products if we work at it.

=John=

*Message #15 Posted by **Eddie Shore** on 9 Apr 2005, 8:46 a.m.,*
in response to message #1 by Frank Travis

The United States should encourage development in the United States and not use outsourcing as a first resort. This may include the following actions:

* Implmenting a high tax rate for importing goods - raise the cost of using cheap labor. * Improve labor relations with unions and open more local plants. * Find a way to reduce the cost of health care so everyone can afford it. * Offer vocational training at the high school level for students who are interested, or at-risk students. * Put the tax advantages where it benefits the U.S. the most: propose lower taxes for companies who

open factories here.

It is nice to get someone who is in the U.S. in customer service for a U.S. product.

Re: Getting U.S. to compete with overseas labor

*Message #16 Posted by **John L. Shelton** on 9 Apr 2005, 1:21 p.m.,*
in response to message #15 by Eddie Shore

It is morally wrong to use taxes to encourage or discourage behavior. That makes government the arbitrator of good and bad. Actions should be legal, or illegal, and generally illegal only if the actions involve the use of force or fraud against another person.

Raising taxes on imported goods reduces the competitive drive necessary to build better products here. Our auto industry demonstrated how lack of competition allowed it to drop quality in the 1960s and 1970s. Raising taxes on imported goods also raises all prices to US consumers. Those who wish to pay more for goods are welcome to do so, but don't mandate higher prices for the rest of us.

Health care costs will respond to market pressure when they are subject to market forces. The free market has delivered us dirt-cheap cell phones, clothing, air travel, and food. It can do the same with health care if we let it. Once people have to shop for medical care using their own money, they will choose prudently, perhaps leaving themselves enough money to buy their plasma screen TVs.

If it's "nice" to get US customer service, then reward the service provider. Thank them, and buy their products. There is no stronger economic force than that of consumer preference. Consumers killed Sears, Digital Equipment, A&P Grocery, etc, and they can kill other companies or trends. But to do so, consumers must truly value the better product, and be willing to pay for it. WalMart's success says that many consumers prefer low prices over US manufacture. Whole Foods' success says that some customers value quality over price.

We are lucky that we have a mostly free marketplace where consumers can choose. Some of us suffer, when high-volume replaces high-quality (like in calculators), but for the most part, all are served here.

Sounds sensible! (until one thinks about it)

*Message #17 Posted by **Karl Schneider** on 9 Apr 2005, 9:46 p.m.,*
in response to message #16 by John L. Shelton

John --

Your short essay probably sounds sensible on initial reading, and is articulately written. However, I think many of us would disagree with quite a bit of it:

> Quote:
>
> It is morally wrong to use taxes to encourage or discourage behavior. That makes government the arbitrator of good and bad. Actions should be legal, or illegal, and generally illegal only if the actions involve the use of force or fraud against another person.

That's a bunch of hooey. It is absolutely the role of good government to reward activities that benefit societal good, and to discourage those activities that detract from it. Nothing "morally wrong" about it. Hence, tax breaks for investment in downtrodden areas, and "gas-guzzler" taxes for thirsty vehicles, for example. Needless to say, tax incentives can be unwise, excessive or exploited, but the principle stands.

As for limiting illegality to coercion or fraud, where would that leave land-use planning?

> Quote:
>
> Our auto industry demonstrated how lack of competition allowed it to drop quality in the 1960s and 1970s.

"Drop quality" from when, the 1950's? US-made cars of the late 1950's were a monument to wretched excess. Huge, heavy, thirsty, and stylized, they were unsustainable products of an indulgent automotive era. In the mid-1960's, good taste and sensibility returned (e.g., 1964-68 Ford Mustang), but gasoline was still over-abundant and underpriced in the US, compelling economy-minded motorists to buy European. Most of Volkswagen's product line was readily available to US consumers without excessive tariffs.

The bad US-made cars of the 1970's were a consequence of high inflation and outdated engineering. US makers were not well prepared to meet the new challenges of tough standards for emissions and fuel economy.

> Quote:
>
> The free market has delivered us dirt-cheap cell phones, clothing, air travel, and food.

Advanced technology (as well as free enterprise) has made cellular telephony possible. "Dirt-cheap" foreign labor has delivered us inexpensive clothing. Deregulation's complex tiered pricing has made air travel economical for many of us. Questionable and inhumane practices in the meat industry, as well as inferior ingredients (e.g, high-fructose corn syrup) have made food cheap.

> Quote:
>
> Health care costs will respond to market pressure when they are subject to market forces. Once people have to shop for medical care using their own money, they will choose prudently...

There's a real danger in treating health care as just another commodity, as you seem to advocate. Health care isn't something people "shop for"; it's something they use only when they need it. Oftentimes, there just isn't time for informed comparison shopping.

What would really help to control health care costs while still providing needed services are three things:

- Practice of healthful activities and ways of life.
- Emphasis on greatest-return expenditures (e.g., prenatal and primary care).
- Provision of full coverage for routine care, in order to prevent unfunded trips to the emergency room.

> Quote:
>
> WalMart's success says that many consumers prefer low prices over US manufacture.

Maybe so, but for those who can afford to pay higher prices at a small local store, it's a shortsighted preference. The reasons are too numerous to mention here.

For those who shop at Wal-Mart by economic necessity, that tells another story...

>What would really help to control health care costs while still providing needed services are three things:

> > 1. Practice of healthful activities and ways of life.

You can say that again. When we had the supermarket strike here last year, it was pathetic to see the picketers on the TV news, crying for someone to pay for their health insurance, standing out there weighing 300 pounds each. They seemed to have no awareness or concern that such overweight makes it cost double to take care of all their health problems they incur. It's like saying you want to drive like you're doing bumper cars, and expect someone else to pay for your irresponsibility.

Of course it will also help to put a lid on the frivolous lawsuits. Living is risky, but some people want to take it out on others who are also in the same risky business of living. It again gets back to taking responsibility for one's own choices, and not expecting any doctor to be unhumanly perfect.

Then there's the matter of several parties abusing insurance and other involved parties.

I try not to post things that are not calculator-related, but I had to sound off on this one. Oh-- there's the matter of health insurance for the workers that are assembling calculators. There-- I got some calculator content in.

Re: Sounds sensible! (until one thinks about it)

*Message #19 Posted by **John L. Shelton** on 11 Apr 2005, 1:02 a.m.,*
in response to message #17 by Karl Schneider

I promise this is my last posting in this thread. After this, back to calculator thinking, mostly.

America has an unfortunate history of majority ganging up on minority. Until relatively recently, we had overt discrimination against blacks and other "minorities." Today, we have "politically correct" discrimination against meat eaters, smokers, big-car drivers, etc. But we are still ganging-up on the minority.

To be fair, rules should apply to all, not just a minority. Special taxes on only smokers, or only cheeseburger-eaters are wrong. Some cities in California are debating extra taxes on plastic surgery. Good grief. Perhaps the worst example is extra taxes on travelers - let's soak the visitor, because he/she doesn't vote here. (Hotel taxes of 15% or more.)

Most government meddling to tinker with a problem turns out to have unintended consequences. Tax breaks for blighted zones turn into "loopholes" for the rich, and the need for AMT to fix the problem. The very idea that tax breaks for some are good lead our politicians to invent tax breaks for the really special, like the Frank Perdue Chicken tax break, benefiting guess-who and no-one else.

As for charities, I'm very concerned that only the politically correct charities survive. Others, those whose advocacy may be less respected, get shot down. Does it really make sense to say that we question an educational charity because its students might be terrorists (i.e. Middle Eastern descent), but it's OK to have the millionaire's Opera Club be tax exempt? In reality, a good charity would owe little or no taxes as a regular corporation, because its expenses would match its income, leaving no net profit. Charities survived just fine before 1920, when there was no income tax. There's no need for an income-tax-deduction now to keep charity alive.

Health care is no more necessary than food or housing. Yet we are expected to shop for those. Indeed, our food choices influence our health. Imagine a world where food was treated like health care. Dining out would cost $50 per person minimum, but we'd expect 80% refunded by our food insurance plan. Anyone practicing "cooking at home without a license" would be considered suspect. We'd need a prescription for groceries, or at least for protein. People without food insurance couldn't afford food, so would go to the emergency kitchen, wait 5 hours for a meal, the cost of which, $500, would be billed to the county as a necessary expense. Give me a break. Medicine was free-market, mostly, until WW2. Insurance plans for medicine used to cover catastrophe, not routine visits. Doctors charged reasonable prices, and were reimbursed promptly by patients, rather than charging some $500 per visit to cover the loss of taking medicare patients at $20 per visit, and having to pay a full-time person to negotiate the insurance bureaucracy. (Yes, I do know about this, having a bro-in-law who runs his own medical practice.)

I'd love to continue debating all the points, but this is the wrong forum. Thanks for everyone's patience. Time to finish reading the manual for my new HP-28S, a daunting task.

Charities and income tax

*Message #20 Posted by **Don Davis** on 12 Apr 2005, 3:16 a.m.,*
in response to message #19 by John L. Shelton

"Charities survived just fine before 1920, when there was no income tax. There's no need for an income-tax-deduction now to keep charity alive."

I agree, but now that we do have income tax, I wonder if it would be the same if charities were non-exempt. Saying that well-run charities themselves would not have to pay taxes (due to income being matched by out-go) is not the same as eliminating tax deductions for contributors, unless I misunderstood your point.

In either case, I'd be happier if the US Gov. did not forcibly take a significant portion of my earnings and give it to various 'charities' for me! Charities such as under-employed goverment workers, ex-presidents who like to travel, people who choose not to work, artists who cannot sell their work in the free market, and the list goes on - are charities to which I involuntarily contribute. This leaves less money (but some) for the charities I truly believe in. All in fun...

Best regards, Don

Re: Getting U.S. to compete with overseas labor

*Message #21 Posted by **Eddie Shore** on 10 Apr 2005, 12:56 a.m.,*
in response to message #16 by John L. Shelton

I disagree that it is morally right or wrong to use tax incentives and/or hikes. Is it morally wrong to give tax breaks to encourage people to go to college or to give tax breaks to invest in troubled areas of the U.S.? If it is morally wrong to do so, then why are colleges, hospitals, and charitable organizations not taxed like coporations?

As for consumer preference, I agree that preference is a huge factor. However, talking about morality, if more people knew (and perhaps cared?) about the bad labor practices Wal Mart uses (i.e. keep people overtime and then forcing payroll clerks to erase the time cards, refusing to pay health care and make employees "an hour" short of full time to avoid costs), Wal Mart would lose a lot of business. Everyone has China produced products: Target, K-Mart, and every other store we can think of.

Use Ipaq as 19BII Financial Calc

*Message #1 Posted by **Gus** on 8 Apr 2005, 1:31 p.m.*

Hello, I have Emu48 and a 19BII calc. I need a KML script and instructions on how to extract the ROM out of my calc.

I surfed Christoph Giabelink's website and found some comments and instructions but not on the 19BII specifically.

Could someone give me a hand?

Thanks Gus

Re: Use Ipaq as 19BII Financial Calc

*Message #2 Posted by **Erik Ehrling (Sweden)** on 8 Apr 2005, 2:09 p.m.,*
in response to message #1 by Gus

Hi Gus!

> Quote:
>
> I need a KML script and instructions on how to extract the ROM out of my calc.

Even if Emu42 technically could emulate the HP-19BII the real problem is that there is no known way to extract the ROM from it. This is the same issue, as for example, with the HP-32SII.

My suggestion would be to buy a cosmetically imperfect but working HP-17BII off eBay and dump the ROM from it instead (if you can live with an emulated HP-17BII instead of a HP-19BII that is). The dumping process is actually very fast and not at all diffucult. Note, however, that you must also have access to a HP-48GX to use as the receiver during the process. (A HP-48G+, or a HP-48SX with a 128K RAM card, should also work fine).

There is also already a KML script for Pocket PC for the HP-17BII...

Good luck! And if it works for you, do not forget to post your successful ROM dump story here. It's always nice to see people joining the "ROM dumping" club...

Best regards,
Erik Ehrling (Sweden)

Keep the batteries in the calc

*Message #1 Posted by **Arnaud Amiel** on 8 Apr 2005, 2:24 a.m.*

I am beginning to have a sizeable collection and for the moment I was playing with all my calculators so they all have batteries in. However, I am starting to strugle and it regularly takes me one month to go around all of them.

So now I fear that I may get battery leakage and was wondering if it wouldn't be better to remove all the batteries. Then I realised it may not be a good idea as I may damage some fragile battery covers (28s, Xpander...)

So my question to the user of this museum is: Do you keep the batteries inside your calculators? Why? Why not?

Thanks

Arnaud

in response to message #2 by VPN

What about the capacitors in the calculator? Some capacitors will deteriorate if they don't have voltage applied to them on a regular basis.

I recently saw an example of this. I took a television set out of storage. It hadn't been used for about a year. When I plugged it in, and turned it on, it went berserk. It randomly changed channels on its own, and ignored all of the controls on the front panel and IR commands from the remote control. After about 15 minutes, it settled down and started operating normally.

Re: Keep the batteries in the calc

*Message #4 Posted by **Giancarlo** on 8 Apr 2005, 7:41 a.m.,*
in response to message #3 by John Limpert

It *might* also have been a problem of codensation, which, after the TV set became slightly warm, evapourated, or a problem of some components which might have absorbed some humidity... It can happen if some dielcetric material were hygroscopic. On my side, I would anyway put the batteries out of the calcs... Cheers. Giancarlo

Re: Keep the batteries in the calc

*Message #6 Posted by **John Limpert** on 8 Apr 2005, 10:22 a.m.,*
in response to message #5 by VPN

The television set was stored in an area with regulated temperature and humidity, so temperature changes and condensation were not an issue.

I used to have similar problems with vacuum tube based electronics equipment, like high-fidelity audio amplifiers and FM tuners, that were stored in somebody's attic for years before being sold or given away as junk.

I'm curious about the shelf-life of HP calculators. I have some that are still in their original sealed retail packaging. Will they still work in 10 or 20 years? I know that some plastics out-gas, become brittle, or turn to goo with time. On the other hand, I have a slide rule manufactured in 1935 with no obvious signs of deterioration on its plastic components.

> I'm curious about the shelf-life of HP calculators. I have some that are still in their original sealed retail packaging. Will they still work in 10 or 20 years?

I managed to get an HP-71 for $25 from a surplus store about 15 years after HP quit making the 71. It was absolutely brand-new. Even the lexan overlay around the keys still smelled new. This thing apparently had never had batteries in it except maybe for initial testing at the factory. Everything works perfectly.

Now if I could just get the same insanely low price for duplicates of all the modules I have in my main HP-71, to outfit the second one!

Re: Keep the batteries in the calc

*Message #8 Posted by **Katie** on 8 Apr 2005, 10:15 a.m.,*
in response to message #3 by John Limpert

Electrolytic capacitors do deteriorate over time if they are not used. This is particularly true for those with large capacitance values and for those that were manufactured many years ago.

The electrolytics in handheld calculators don't have this problem too often because they're usually quite small in value and not that old (by definition). However this is a common problem in large desktop calculators that use large power supply capacitors. The HP-46 is one calculator in particular that this occurs in. (see: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=138)

I try to avoid this problem by running the old desktop calculators in my collect for several hours a

month at least.

Re: Keep the batteries in the calc

*Message #9 Posted by **Garth Wilson** on 8 Apr 2005, 5:45 p.m.,*
in response to message #8 by Katie

The small values of electrolytic capacitors generally have much higher voltage ratings than the calculator would need. For example, you'll seldom find a 1µF electrolytic with a WVDC of less than 50V. These will last longer than you will.

OTOH, I worked at TEAC in the early 1980's, repairing semi-professional tape recorders. I found quickly that TEAC had a habit of cutting corners on the larger power supply capacitors, using for example a 16V capacitor for a 16V application, such that they didn't last nearly as long as they should. If they'd go for at least a 25V if not a 35V for the same application, it would never need replacement. A larger capacitance value would also reduce the ripple voltage. All of this means a larger capacitor too, which generally means a lower ESR, which results in less heating and longer life. I guess they didn't care though, as long as it made it through the warranty period.

I have a quarter million parts here in the office for electronic prototyping. As you can guess, some of those are electrolytic capacitors, and most of them have been sitting in the parts bins for 15 years. I use them regularly in prototyping and never have any trouble.

On those rare occasions when I need to use an older, large power supply capacitor, I restore it first by bringing the voltage up on it very slowly, discharging periodically in the process.

Re: Keep the batteries in the calc

*Message #10 Posted by **Bill (Smithville, NJ)** on 8 Apr 2005, 11:59 a.m.,*
in response to message #1 by Arnaud Amiel

Hi Arnaud,

What a nice problem to have - too many calculators - not enough time to play with them all. :)

I'm like you - I really enjoy playing with the calculators much more than just letting them sit on display - actually none of mine are on display.

As to batteries. I'm fortunate to have at least two of each calculator I have. The set of calculators that are in the best condition, I keep the batteries out of them. The set of calculators that are in worst condition I keep batteries in them and they are usually just sitting out where I can easily get my hands on them.

I'm not really concerned if the batteries leak or not. It's more important to me to enjoy them while I can.

So have fun with them, enjoy them, and don't sweat over the small stuff such as battery leakage.

Bill

Nearly all my calculators are in my desk drawer at work. Somebody stealing in there could get themselves nice holidays. Unfortunately, I only have one of each (except for a bunch of 45s). So I believe I will just store a few that I don't really use (hp-38g or 28s for instance) and keep a few working that I can check regularly.

I also saw that I store my pioneer and voyager the wrong way up as I read somewhere on this forum that upsise down will avoid dust problem. I will be tidying up on monday. Thank you for your answers.

Arnaud

PS: my only desktop is a 97 which I use regularly so I am not too worried about capacitors.

Re: Keep the batteries in the calc

*Message #12 Posted by **bill platt** on 8 Apr 2005, 1:28 p.m.,*
in response to message #1 by Arnaud Amiel

I believe you should replace all alkalines with silver oxide. Ag batteries last a really long time. Also, if you keep a pioneer face up, but slanted down slightly towards the LCD, tehn if there is a leak, it will drain away from the innards. same goes for the voyagers.

I only buy silver oxide batteries now. The only down side to them is that when they run out of juice, it is very little warning time, relative to an alkaline.

Does anyone know whether Silver Ocide are less (or more) lilely to leak than alkalines?

regards,

Bill

It doesn't matter what you do...

*Message #13 Posted by **Randy** on 9 Apr 2005, 1:00 a.m.,*
in response to message #12 by bill platt

With the notable exception of the early desktops, none of the capacitors in common hand-held HP calculators are subjected to high ripple currents. In other words, they're not power supply filter caps - they are used to lower supply (battery) impedance and provide continuous memory backup. The real point here is that they never get hot which is what kills aluminum electrolytics. The difference in the two applications (filter vrs bypass) is huge.

The majority of 1uf and larger capacitors in HP calculators are not aluminum electrolytic, they are the more expensive tantalum varieties. The classics with the exception of the 400uf cap in the wall wart are hermetically sealed tantalums - those will no doubt out-live us. Yes, there are some regular old aluminums in our calcs but they are not problematic due to a lack of applied battery voltage.

IMO, the far bigger evil is leaving batteries in units that don't get regular use. Just about all common batteries can and will leak when discharged. I NEVER put cheesy batteries in an HP, why ask for trouble? I've seen plenty of 48's killed by junk dollar store AAA cells. How dumb is that? On the topic of watch cells in the Voyagers and Pioneers - the only cells I've ever seen leak are the el-cheap-o Chinese cells - no

doubt alkaline.

Bill's comment is on the money - a calculator stored face up is far less likely to be damaged by leaking electrolyte. But the best way to avoid leaking cells is to just change them on a regular basis - a sticky label with an installation date inside the battery box is very cheap insurance.

Just my two bits worth.

Reading 9845 tapes in HP-85

*Message #1 Posted by **Chuck Guzis** on 7 Apr 2005, 9:06 p.m.*

I've been asked to read a bunch of DC100A tapes created on an HP9845. While I don't have access to a 9845, I know where I can borrow an HP-85.

Can the 85 read these tapes or am I expecting too much?

Thanks, Chuck

Re: Reading 9845 tapes in HP-85

*Message #2 Posted by **Vassilis Prevelakis** on 7 Apr 2005, 10:50 p.m.,*
in response to message #1 by Chuck Guzis

If you are asking whether you can insert a tape, type CAT and get a listing, the answer is, unfortunately, no.

If you are willing to write a program to read the tapes, I think it can be done, but it'll have to be in assembly as BASIC does not allow low-level access to the tape drive.

You may have more luck interfacing the HP-85 with an external (HP-IB) tape drive that is compatible with the HP-9845 tapes.

BTW anybody knows whether the 9845 tapes were read/writable by the 9825?

JasonG

Not so fast there pardner...

*Message #5 Posted by **Matt Kernal (US)** on 8 Apr 2005, 3:46 p.m.,*
in response to message #3 by eBay Seller

Seems a person who goes by the name of "eBay Seller" would WANT the exact scenario you describe.

In other words, if by "ruined everything" you mean those [sic] "moeny-spending engineers", are helping you achieve higher profit margins, then by all means, ruin away!!

eBay Seller said, "Bottom line Freddy. You have to pay dearly! No two ways about it." Don't believe it Freddy! I have accumulated many, many, more HP's from garage sales, thrift stores, classified ads, etc.. than I have ever bought on eBay (three total, all less than $60.. 32S 50th. Anniversay edition, and 41C Blanknut, for example).

In fact, I picked up a pristine 11C for a whopping $3.99 at Goodwill yesterday. What made me laugh was that the $19.99 to $39.99 Sharp, TI, and Casio calculators were behind a glass display case because they were "valuable", while the lowly 11C was loose and alone in a bin, separated from it's case (in a different bin). Sorry, the 11C isn't for sale.

Matt Kernal, a patient and frugal "moeny-spending engineer"

Old vs. New HP 12c

*Message #1 Posted by **Peter** on 6 Apr 2005, 8:31 p.m.*

Hi.

Reading the commentary on amazon.com regarding the Hp 12c, the biggest complaint seems to be that the newer models that have been manufactured overseas -- China, Maylasia, etc. -- are nowhere near as reliable and sturdy as those made in the 1980s in the USA. I see many American-made Hp 12cs on sale on ebay. Would an old American-made HP 12c, in very good condition (as claimed by the seller) from the 1980s work as well a new HP 12c made overseas? I find it hard to believe that a calculator that's nearly 20 years old would be a better buy than a new one.

Take care,

~Peter

Re: Old vs. New HP 12c

*Message #2 Posted by **Don Shepherd** on 6 Apr 2005, 8:45 p.m.,*
in response to message #1 by Peter

Peter, I bought a 12c about 3 years ago, and it is fine. It was made in China, but it is just as reliable as my 1983 16c.

Re: Old vs. New HP 12c

*Message #3 Posted by **bill platt** on 6 Apr 2005, 11:38 p.m.,*
in response to message #2 by Don Shepherd

Condition varies widely. 12c machines often see enormoius use. I know a real estate agent who has used the same one for about 12 years, and the paint is all worn off!

I have a fairly old brazilian unit whichg does not even have scratch marks on the feet. This is of the old 3-button battery type, and would certainly last a long time.

On a really heavily used voyager, the keys are somewhat mushy or not as hard to push, and occasionally you will even see keybounce problems on really worn ones (never as bad as TI-itis though).

The thing about the "voyagers is that they are an exceptyion to all other electronic gadgets. They were just built really well.

Regards,

Bill

in response to message #2 by Don Shepherd

> Peter, I bought a 12c about 3 years ago, and it is fine. It was made in China, but it is just as reliable as my 1983 16c.

The 1983 16c probably has a lot more good years left in it though than the 3-year-old Chinese unit does. I've used my HP-41cx every day for nearly 20 years, and it's practically good as new; but I'm sick of Chinese things that only last typically a few months.

Re: Old vs. New HP 12c

*Message #5 Posted by **Arnaud Amiel** on 7 Apr 2005, 3:51 a.m.,*
in response to message #4 by Garth Wilson

Not all chinese things last for 2 or 3 years. At home I have a vase made in China that I still use from time to time that is at least 1700 years old. These models are not very rare and can usually be acquired for a few $100.

Arnaud

*Message #7 Posted by **Oronet_Commander** on 7 Apr 2005, 10:09 a.m.,*
in response to message #6 by Andre Koppel

I got a Chinese 12C a few months ago and felt very disappointed about its quality. The ENTER key was nearly loose, the keyboard feel was dull, and the general feeling was "cheesy", way far from the usual "pro" feeling of an HP (I own a 48G, a 41CV and a 35).

Thank goodness, it was very cheap....

Re: Old vs. New HP 12c

*Message #8 Posted by **Arnaud Amiel** on 7 Apr 2005, 10:14 a.m.,*
in response to message #7 by Oronet_Commander

Mine is a Malaysian one from 91 (3 batteries) with painted keys but I feel the keyboard is better than my 48gx or original 15c. I only wish these were molded keys.

Arnaud

Re: Old vs. New HP 12c

*Message #9 Posted by **Steve A** on 7 Apr 2005, 2:38 p.m.,*
in response to message #8 by Arnaud Amiel

Arnaud, you're not the only one who misses the molded keys. Paint wears off mighty

quickly when a machine is used around abrasive dust. Why doesn't HP (or any other brand I've seen) make molded keys anymore? Is the cost prohibitive even at Chinese wages?

Re: Old vs. New HP 12c

*Message #10 Posted by **John** on 8 Apr 2005, 8:13 a.m.,*
in response to message #9 by Steve A

Yes, it is.

Re: Old vs. New HP 12c

*Message #11 Posted by **Steve A** on 8 Apr 2005, 2:11 p.m.,*
in response to message #10 by John

Good one. I was interested in the cost of tooling for double-shot keys. Twenty years ago even the cheap little machines from Sharp had molded-in numbers, so it's hard to understand why the "better" HP machines are no longer made that way.

Re: Old vs. New HP 12c - better keys

*Message #12 Posted by **John L. Shelton** on 9 Apr 2005, 12:16 a.m.,*
in response to message #9 by Steve A

Some day, someone is going to make a top-quality key that has a small, back-lit display in it, so the label is electronically driven. Pressing a shift key would re-label the rest of the keys. Now that would make a nice calculator.

Re: Old vs. New HP 12c - better keys

*Message #13 Posted by **Garth Wilson** on 9 Apr 2005, 1:36 a.m.,*
in response to message #12 by John L. Shelton

That has existed for 15-20 years already, but they're big and have been extremely expensive, used mainly in military applications like fighter jet control panels. IEE used to make the Pixie, a push-button switch with a 24x36 LCD with a serial interface, for about $50 each. They were about 7/8" by 5/8" IIRC. There is another company making them now with multi-colored backlighting. Unfortunately the name escapes me.

Re: Old vs. New HP 12c

*Message #14 Posted by **Thibaut.be** on 7 Apr 2005, 5:21 a.m.,*
in response to message #1 by Peter

Having US, CN, BR and MY 12C, I can confirm you that the quality is NOT the same.

I use my US 12C on a daily basis, mainly as number cruncher.

The keyboard quality is not the same, The MY and CN units show painted keys while the first models are moulded keys. After some use the paint tend to fade and even disappear. Furthermore the special HP "click" is less present on newer models. Finally the texture of the last series is not as solid as from the earlier series. The keys "rattle" in the last series while they remain well steady even after having been longly used. You

sometimes need to press harder on certain keys of the last series.

The case is less solid on last series. The display is lest contrasted than the 1st series.

So I would definitely pay the price of a new 12C for a used on ebay.

Re: Old vs. New HP 12c

*Message #15 Posted by **will** on 7 Apr 2005, 11:31 a.m.,*
in response to message #14 by Thibaut.be

I got a 12c made almost 20 years ago at ebay for 60 dollars which is BY FAR BETTER than a brand new condition one, in fact, appears to be never touched..its quality much better than new ones made in china...i recommend this way to get one...its manual still wrapped...

HP-80 working like new

*Message #1 Posted by **Mike Barry** on 6 Apr 2005, 10:39 a.m.*

This post is for the forum in general. I recently purchased an HP-80 that had a few problems. It was missing a battery, the zero and five keys were not working properly and the on/off switch worked intermittently. Thanks to this forum and the archives, I was able to purchase a battery that works flawlessly and disassemble and repair the keys and on/off switch. I also followed the recommendations for cleaning the calculator before putting it back together. The results... I have a like-new HP-80 that has all of the wonderful characteristics that make the "classics" well - classic. All of this was made possible by the knowledge and experience captured by this website. Keep up the great posts and articles and thanks so much for the good information.

Best regards, Mike

Re: HP-80 working like new

*Message #2 Posted by **Jeff O.** on 6 Apr 2005, 12:22 p.m.,*
in response to message #1 by Mike Barry

That's good news. Did you peel back and re-stick the label, if so, what technique did you use and how did it work?

Re: HP-80 working like new

*Message #3 Posted by **Mike** on 6 Apr 2005, 4:57 p.m.,*
in response to message #2 by Jeff O.

I gave some thought to it, but I decided to cut out the holes for easy access to the screws both now and in the future. I know this goes against the purists in this forum, but I don't plan on reselling the calulator and am actually using it at work. If you haven't already done so, I would recommend searching the archives and "Repairs and Battery" section under Collecting & Using for some suggestions on how to remove the label. It appears that people have had success using the techniques described.

Mike

HP17BII+ Questions

*Message #1 Posted by **Eddie Shore** on 6 Apr 2005, 9:07 a.m.*

1. How is the battery life on the "new" HP17BII+ (those manufactured in 2004 and later)? Can you carry it in a backpack or luggage with the unit turned off and still be able to turn it on days later without replacing the batteries?

2. Keyboard: are the keys loud and hard to press?

Thanks in advance.

Re: HP17BII+ Questions

*Message #2 Posted by **VPN** on 6 Apr 2005, 10:48 a.m.,*
in response to message #1 by Eddie Shore

days later? - rather months later!
33s keys are better, but the 17bII+ are ok.
[VPN] - opinions only

Re: HP17BII+ Questions - Got a Replacement and...

*Message #3 Posted by **Eddie Shore** on 9 Apr 2005, 12:55 a.m.,*
in response to message #2 by VPN

I hate to say but Bob Wang was right! Using L() and G() does not return expected results.

For example,

L(A:LN(X+1))+Y÷G(A)

If I put X=3, then Y returns 0. (when it should return -1.92) If I put any number for Y, X returns SOLUTION NOT FOUND (Example: if let Y=-5, I should get 8.35 for X)

Now for something really weird...

L(A:LN(X+1)+Y÷A

If I let X=3, then I get the Y=-1.92 result. BUT If I try to solve for X, I get BAD GUESS; and if I try to solve for A, I get 0.

I am not sure if this is worth justifying replacing my old one and spending another $99.

Re: HP17BII+ Questions - Got a Replacement and...

*Message #4 Posted by **VPN** on 9 Apr 2005, 3:52 a.m.,*
in response to message #3 by Eddie Shore

What happens if you change the order?
Y÷G(A)+L(A:LN(X+1))
[VPN]

Re: HP17BII+ Questions - Got a Replacement and...

*Message #5 Posted by **Eddie Shore** on 9 Apr 2005, 8:23 a.m.,*
in response to message #4 by VPN

I would get Y=0 if I input for X and NO SOLUTION FOUND when I try to solve for X.

There is not a lot of documentation on these functions. In fact the package came with the Edition 1 Manual, which does not mention them at all.

BTW, I did manage to reset my old one and it is still alive (thankfully). I'll have to find another case for it.

and to my last message (traded 17 for a 12)

*Message #6 Posted by **Eddie Shore** on 10 Apr 2005, 12:47 a.m.,*
in response to message #5 by Eddie Shore

I ended up returning the new 17BII+ (not much keyboard difference and the Let and Get were not working the way it was supposed to anyway) and got a 12C (Platinum) instead. What the heck, I have not a version of the 12C or an HP voyage to begin with. I am keeping my old (2003) 17BII+ because I can live the keyboard and live without any reincarnation of Let and Get.

Going through the first few chapters of the 12C(Platinum), I can see why everyone gushes about the HP 12C series (I was wrong thinking it was overrated). ;)

HP-16C Programing

*Message #1 Posted by **Trent Moseley** on 5 Apr 2005, 2:54 p.m.*

In programing the 16-C in DECIMAL mode, is there any work-around to obtain either the INT or the FRAC function?

tm

Re: HP-16C Programing

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 Apr 2005, 5:18 p.m.,*
in response to message #1 by Trent Moseley

Hello, Trent;

back to some years ago, I remembered Nenad Vulic gave us a brilliant solution for this matter. Follow this thread and you'll see a very good approach from him.

Best regards.

Luiz (Brazil)

Re: HP-16C Programing

*Message #3 Posted by **Trent Moseley** on 5 Apr 2005, 7:45 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz,

Vulic's program works! Thank you so much.

tm

A minor improvement

*Message #4 Posted by **Cameron** on 6 Apr 2005, 2:03 p.m.,*
in response to message #3 by Trent Moseley

If you can afford the program storage and the convenience of sign preservation is helpful, you could add a few steps to Vulic's program:

```
LBL A
X<0?
SF 0
ABS
ENTER
ENTER
EEX
[9]
[+]
```

```
LSTx
[-]
x>y?
[1]
[0]
ENTER
[1]
[0]
[/]
[-]
F? 0
CHS
CF 0
RTN
```

Unfortunately this solution won't work on my simulator because I'm using the IEEE FPU. The design of my BCD FP simulator is well advanced so this limitation will go away in the future.

Cameron

Re: HP-16C Programing

*Message #9 Posted by **GWB** on 5 Apr 2005, 8:27 p.m.,*
in response to message #8 by Trent Moseley

Thanks for the feedback.

I've tested it on Emmet Gray's WRPN (HP16C Simulator). Maybe that's not an exact simulator.

In fact, on another simulator

http://www.flounder.com/hp16c.htm

rotation instructions don't seem to work in float mode, what I suppose is the behavior of the real 16C. Sorry.

Gerson.

Edited: 5 Apr 2005, 8:50 p.m.

Re: HP-16C Programing

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 6 Apr 2005, 3:20 a.m.,*
in response to message #9 by GWB

Hi Gerson, guys;

Except for the four arithmetic basic ones (+, -, × and ÷), the only arithmetic functions that work in floating point mode (actual HP16C) are square root and reciprocal (1/x). Also, number entry, stack manipulation and programming work as well. All of the integer-number related functions (bit manipulation, boolean operators, double-precision, etc.) are disabled in floating-point mode. If I am not worng, the only function disabled in integer mode operation is the reciprocal.

Cheers.

*Message #2 Posted by **Michael F. Coyle** on 4 Apr 2005, 9:45 p.m.,*
in response to message #1 by Gene

Wow. That brings back memories.

I had a job once (1976) programming the SR-60. It was like a really souped-up SR-52 with lots of program steps, alpha prompting and a built-in printer.

It also had the most static-sensitive $700 memory boards in existance. (Guess how we found that out! Several times.)

- Michael

in response to message #1 by Gene

Mhh, maybe it's a bit much, but thanks to the good $ to Euro exchange it's not more than I payed for a good HP desktop. I have most of the bigger HP desktops but also collect TI calcs and I'm not that kind of religious believer in HP calcs. Nevertheless is the SR-60 is an interesting part of calculator history. Achim (achim-b)

Re: Close to a record for a TI calculator! (ebay)

*Message #5 Posted by **Eric Smith** on 7 Apr 2005, 1:21 a.m.,*
in response to message #1 by Gene

Wish I'd seen that, I would have bid it up even higher. After I get more of the HPs working in simulation, I eventually plan to simulate some TIs as well, and the SR-60 is on my list, but I don't have one from which to dump the ROMs.

I don't watch eBay any more, but I used to have the SR-60 on my notification list. They never showed up during the three or four years I was watching. Sigh.

Anyhow, most of the other models I want to simulate are nearly as common as dirt. It will be relatively easy to dump the ROMs of the SR-52, SR-56, and TI-58/59, and those all use variants of the TMC0501 processor (as does the SR-60). I'd like to simulate the TI-30, Programmer, and Business Analyst, which all use the same chip with different ROM code, but the only way I know of to dump the ROM will be to deencapsulate it and photomicrograph it. I'm told to expect a cost about $300-$500 each to have that done.

Aside from the SR-60, in the rare category I want to simulate the SR-22. I've got one, but I'm not about to decap the ROM chip. There's a ROM listing in the patent, but there are very obvious errors in the listing, and the PLA contents which are also needed are not present. If I ever obtained another SR-22, even a broken one, I might contemplate decapping the chips from that.

Re: Close to a record for a TI calculator! (ebay)

*Message #6 Posted by **Eric Smith** on 7 Apr 2005, 1:28 a.m.,*
in response to message #5 by Eric Smith

I wrote:

> Quote:

> Wish I'd seen that, I would have bid it up even higher.

I should perhaps add that the SR-22 and SR-60 are pretty much the only TI models that I would pay significant money for. I'm really not a big fan of TI calculators, but TI was an important part of the scientific calculator market back then, so even though their products mostly sucked (IMNSHO), I sill want to simulate some of them.

Old Sharp and Casio scientific calculators are arguably more interesting to me than old TIs, but getting enough technical information together to simulate one appears to be nearly impossible. I'm not willing to invest nearly as much time and money in that as I have on HPs and TIs.

This "business" of simulating old HPs has proven to be very expensive. I think I've spent about $6000 on it over the last decade. Even if I sell the Windows version of Nonpareil I don't expect I'll be able to recoup most of that. But then, when I started the project, it wasn't intended as a money-making operation.

Eric

Re: Close to a record for a TI calculator! (ebay)

*Message #7 Posted by **Bill Wiese** on 7 Apr 2005, 3:48 p.m.,*
in response to message #6 by Eric Smith

Yeah, Eric & I would be warring for the SR60: it's pretty cool.

Clearly this calc was a piece of 'capital equipment' for folks that couldn't get (enough) time on minicomputer.

IMHO TI calc architectures are kinda funky and not as well thought-out as HP's. HP defined a calc then created a refined CPU architecture around it; TI had a 4bit CPU and somehow got a calc out of it. I do like the SR52 & 56 calcs and enjoyed tinkering with my TI58 in high school.

Nevertheless the TI CPUs had some interesting features, esp the PLAs for instruction configuration and output control.

Wish I knew some more about TI58/59 oddities...

Re: Close to a record for a TI calculator! (ebay)

*Message #9 Posted by **Garth Wilson** on 7 Apr 2005, 4:48 p.m.,*
in response to message #8 by Ron Ross

Thanks for the link! I put my TI-59, printer, and modules to a lot of good use before I had the 41cx, so I have some good memories of it. However upon going to the website, what immediately made me laugh was the phrase near the top, "The best programmable calculator in the world"! Thanks for the humor. Yes, it was good, but I would have had an HP if I had the budget. I originally budgetted $100, and the TI-58c seemed to give the most for the money at that price, so I got it. (Bill Cosby was advertising the 58 and 59 for TI. Remember that?) Not long after, I was in the right place at the right time to trade with a friend my 58C+$100 for his 59 and printer and four modules and some applications books.

Later I took the big step up to the HP-41cx, HPIL+Extended I/O (combined module), Advantage ROM, Zenrom, Thinkjet printer, 82161A tape drive, and several applications books and other books including Vlodek's "Extend Your HP-41".

Later a co-worker _gave_ me his TI-59 saying he never used it and probably never would. He was the kind that would buy on impulse and not think anything of it, and get rid of something just as impulsively. Later I bought a TI-58 and a TI-59 for a couple of bucks each at a yard sale held by a new widdow who didn't know what her late husband's stuff was all about but was just happy to get rid of it. I sold a couple of those for $60 bucks each when times were tough for us. The engineering manager who gave me his 59 apparently didn't think much of it, but the man who bought two units from me at $60 each thought they were the best. I'm sure they're going for more now on eBay, but I don't think it existed yet at that time.

> (Bill Cosby was advertising the 58 and 59 for TI. Remember that?)

I don't quite remember Bill Cosby hawking TI, but do remember his commercials for Ford, Coca-Cola, and Jello about that time (late '70s, early '80s). The era was between his "Mod Squad" and "Cosby" TV shows.

I also remember the SR-51-II from Texas Instruments. I assume that it was the predecessor of the TI-59.

The TI "Lineage" leading to the TI-59

*Message #11 Posted by **Gene** on 8 Apr 2005, 11:47 a.m.,*
in response to message #10 by Karl Schneider

Pictures of most of these can be found at my website www.rskey.org/gene and you can see the functions for yourself. :-)

```
In rough order, you had the:

SR-10 (Basic slide rule - square root, 1/x, x^2)
SR-11 (slimmer keys than the SR-10)
SR-16 (Added logs, 10^x and y^x and memory)
SR-50 and SR-51 (added trigs, hyperbolics and lots more!)
SR-52 then SR-56
(SR52 had 224 unmerged steps, card reader, indirect addressing of 22
memories...SR-56 had 100 unmerged steps, no card reader, 10 memories)
SR-16-II (same functionality as the  SR-16 but different case)
SR-50A and SR-51A (same functionality as the  SR-50 and SR-51 but
different case)
SR-51-II (update of the SR-51 line)
TI-55
TI-57, 58, and 59
(TI-57 had 49 fully merged steps, 58 had up to 480 steps or 60 memories
and the first plug-in rom (5000 steps), but no card reader - turn it off
and poof goes your program...the TI-59 added the card reader and more
steps/memories).
```

I do remember Bill Cosby sponsoring TI.

*Message #12 Posted by **Eddie Shore** on 9 Apr 2005, 8:27 a.m.,*
in response to message #9 by Garth Wilson

I believe Cosby was plugging educational products from TI. There was a calculator wizard that had arithmatic drills that I had way back when.

I still have a Children's Discovery System from TI. The system is a mini-computer geared towards education of math, music, and words.

in response to message #16 by Charlie O.

Apparently there is one model in existence (see links above). No other exists to my knowledge, but there were probably a few made as prototypes (I think less than 5).

On the other hand, I know no one who (publicly) has an HP95C...

Also, I'm sure many of you have unique items.

TI-88's

*Message #18 Posted by **Palmer O. Hanson,Jr.** on 11 Apr 2005, 10:29 p.m.,*
in response to message #17 by GE

I know that Maurice Swinnen, who was the editor of TI PPC Notes, and Richard Nelson, who was the editor of the PPC Calculator Journal, received prototype TI-88's. I suspect that additional units were provided to other editors at periodicals such as EDN and Computer Shopper. I believe that Maurice sold his unit to Dave Leising. I do not know the provenance of Viktor's unit.

I also do not know if the delivered units were fully operational. The reason that I raise that question is that in early 1983 I received a prototype TI CC-40 for evaluation. The accompanying literature described the HexBus peripheral interface in detail, but when the first peripheral became available I found that it would not run with my CC-40. When I opened my CC-40 I found that there were no wires connected to the interface connectors! I traded my prototype in for a production unit and the peripheral worked properly.

The TI-59...

*Message #19 Posted by **Gene** on 8 Apr 2005, 10:20 a.m.,*
in response to message #6 by Eric Smith

IMO, did not stink.

Remember and compare the two offerings from HP and TI from 1977 to 1979.

HP 67/97 224 merged steps with 26 memories.

TI-59 960 semi-merged steps or 100 memories. With 30 memories, you had about 700 steps.

IMO, 700 TI-59 steps > 224 HP67 steps from a brute force standpoint.

I would like to note that I do not enjoy programming in algebraic / AOS at all, and I do know that RPN is MUCH more efficient at programming, but...

For 2 years, there were many types of problems that the HP67/97 just could not do.

Like: Sorting 60 full-precision numbers :-) A full backgammon game and others.

Competition is always good for the consumer.

TI vs. HP gave everyone more goodies and better ones.

Today, the competition between HP and TI isn't as fierce (TI almost seems to even ignore HP) and Casio has some group of devotees too.

Still, better products for us all with competition.

So, don't pooh-pooh the TI-59 too much. If the Card Reader quality had been much better, if it had continuous memory, if programming in algebraic really wasn't as "tough", then...things might have been different. :-)

Personally, I think the TI-59 is one reason we got the HP41!

Gene

> So, don't pooh-pooh the TI-59 too much. If the Card Reader quality had been much better, if it had continuous memory, if programming in algebraic really wasn't as "tough", then...things might have been different. :-)

Sure. And if my grandmother had had wheels, she'd have been a carriage.

TI had the lead on memory size for a very short time. If HP hadn't had the HP-41C already in development, they probably would have introduced enhanced versions of the HP-67 and HP-97

with more memory; that wouldn't have been that hard for them to do, and there are some hints that rudiments of support for more program memory exist in the ROMs. Possibly they didn't finalize the decision on the amount of RAM to put into the 67/97 until late in the development cycle.

The 67/97 cardreader worked quite well, and it was not too hard to write program overlays to solve larger problems. That wasn't feasible for all problems, but it was sometimes helpful.

Re: The TI-59...

*Message #21 Posted by **Gene** on 8 Apr 2005, 6:02 p.m.,*
in response to message #20 by Eric Smith

Guess it depends on what "short time" means.

The first programmable was introduced in 1974. The TI-59 was introduced in 1977. The HP41C in 1979.

In the 5 years there, the TI was ahead for 2 years. That's 40% of the total lifetime of programmables up to that point.

AND, during that time, they had the solid state software plug-in modules that gave it quite a bit of power too.

Gene

P.S. What converted me (finally) to the HP world was the alpha capability of the HP41C. I was a (gasp) TI guy before that. :-)

Not worry Gene, I was a TI person too. It only took me years (I won't say how many) before I gave RPN the chance and now prefer it over ALG.

Re: The TI-59...

*Message #23 Posted by **Vassilis Prevelakis** on 8 Apr 2005, 10:04 p.m.,*
in response to message #20 by Eric Smith

The advantage of the TI-59 over the HP-67 wasn't just the larger memory.

The ability to interface to an external printer was a tremendous advantage, because you could use the calculator as a handheld device and then connect it to the printer to print the results.

Also the fact that you could buy the calculator and then the printer made the purchase of a complete system much easier.

Moreover, that printer was FAST! It is a line printer (similar to that used in the 9845, but much narrower) unlike the printers used on the 97 and the HP-41 which move the printhead to and fro.

Finally, the TI-59 was cheaper than the HP-67. Of course it was of inferior quality as well, the

card reader was lousy, the keyboard cheap and the display had fewer digits than the 67.

Having said that, I bought a TI-59 a few weeks ago, and it can read cards that I got from another seller. Quite impressive for a 25+ year card reader.

Compared to the 41, the TI-59 loses in all respects, but the comparison is not fair. During the 70s the evolution in calculators was staggering, so the two year difference between the 59 and the 41 places them in different generations.

I remember buying a TI-58 initially and then upgrading to a TI-59 almost immediately because I wanted the card reader.

Shortly afterwards I bought the PC100C print cradle, but then the TI-59 started having problems (keyboard initially, and then with the card reader), so I sold it and bought an HP-19C. When the HP-41C came out I upgraded to that one selling the HP-19C.

In the mid-eighties I bought an HP67 second hand (the external charger had a break in the cord and could not charge the battery or power the calculator, so the owner was getting rid of the whole calculator).

I had to wait till 2000 (and eBay) till I was able to reunite myself with an HP-19C and an HP-34C, and now a TI-59 with PC100C cradle.

These are all very useful calculators, each with their advantages and disadvantages, but the most versatile of all of them is my HP-41C, that has been with me for 25+ years.

I used a number of TI-59's for several years before encountering card reader problems. I may have been living in a non-typical world because I had obtained my TI-59 through the TI Productivity Program where I worked. It was rumored, but never proven to my knowledge, that TI delivered design-centered devices to the Productivity Programs to ensure that the participating individuals could read each other cards.

Many of the TI-59 card reader problems were really battery pack problems. It turned out that the TI-59 would run properly in every respect but card reading and writing if one of the three cells in the battery pack was shorted. So, as the TI-59's became older and the cells in the battery packs startd to short, as NiCad cells will do, the users would see card reader problems. I helped many users solve their card reader problems by shocking their battery

pack to restore all three cells to workiing condition.

There were other problems with the card readers that could not be cleared with the head and roller cleaning cards and there is little doubt in my mind that the HP-67 reader was a better device.

I preferred AOS over RPN for the simple reason that AOS was a higher order language which made translation of my library of older BASIC programs much easier.

*Message #26 Posted by **Garth Wilson** on 12 Apr 2005, 1:24 a.m.,*
in response to message #25 by Palmer O. Hanson, Jr.

Interesting. I used my TI-59 for years though, and never had any card reader problem at all while I was using it. I got the tape drive for my 41 (and also used it with the 71 later) and never did get the card readers for those. I have 96KB of RAM in the card reader port of my 71. (CMT had 160KB available, but I got all I could afford at the time.) Without experience, I'd have to think that the 71's and 75's hand-pulled card reader was much better because there was little of anything mechanical to go wrong. OTOH, I pulled out my TI-59 after not using it for more than 15 years, and the rubber wheel had turned to mush. I've seen this happen to belts in tape recorders, but the HP tape drive had no rubber parts AFAIK-- just direct drive, with not even a pinch roller.

I have purchased several used TI-59's that had developed the squishy roller problem. In some of them the rollers had turned gummy. I have also purchased several used TI-59's which do not have the roller problems and which read my 25 year old magnetic cards flawlessly. I have no idea why some rollers go bad and others survive.

One possible source of gummy rollers might be use of the third party cleaning card (CCL something, as I remember) which carried some solvent through the card mechanism. I managed to get some card readers to work by using the cleaning card, but in one instance the use of the cleaning card in a reader which had worked part of the time turned the rollers to gum.

Old Software found - OT

*Message #1 Posted by **Bob** on 4 Apr 2005, 9:17 a.m.*

In cleaning the basement, I found a box of old software, primarily for the IBM/PC family of computers. It is probably 12-15 years old.

These include DOS 5, Win 3.0, Lotus 123, Word, Excel, PCTools, and a graphics package. I also found some PC games like SimCity, SimEarth, Jeopardy, and a couple of fantasy/role-playing games. Several of the productivity packages are still shrinkwrapped.

I really don't know whether there is a place to advertise these or if there is an audience out there that might want these, or not. I thought I would start here, since we are all collecting dated material as well.

Is there a classic computer forum or audience similar to this one that might be interested in this "find" ?

*Message #2 Posted by **Jim Creybohm** on 4 Apr 2005, 9:45 a.m.,*
in response to message #1 by Bob

Good find Bob!

There are some sites on the 'net for abandoned software but they exist mostly for games. (for example, abandonia.com and they have links to others). They have zipped versions of the original games, with authors blessing if the company that originally published it is defunct.

Whether or not there is any money in them is another thing. There are some Commodore/Amiga and Atari personal computer sites, but I don't know of any classic windows/DOS sites.

Had the 32sii at least 2KB RAM, matrix operations and a decent complex mode, local numeric labels and shared numeric registers in addition to the 26 alpha variables it would be close to perfection. One could say the 32sii is better than the 42s only if these features aren't required.

My thoughts exactly. I think a 32SII with the following:

- better organization
- adequate RAM
- the missing 15C functionality (matrices, solve w/integ)
- more scratch registers and local labels
- real good complex number support (better than the 15C, 42S, or 48G)

would be the ideal target for the OpenRPN initiative.

For much more functionality than that, the PDA might be the industry-preferred platform.

HP has implemented only the second suggestion on the praised 33S, actually the easiest one to do. Why have other obvious improvements not been made? Lack of skill or just

marketing reasons?

Regards,

Gerson.

reason-NCEES

*Message #11 Posted by **Ron Ross** on 6 Apr 2005, 1:17 p.m.,*
in response to message #10 by GWB

I suspect that Hp found out the limitations and direction of this agency and then beefed up their Hp32sii to that ceiling without going over. Any long variable names were out (to close to text editing I suspect for the NCEES). That matrix features were left out is because it may open all sorts of problems and bugs that Hp did not want to address if they tried to shoehorn these features into an Hp32sii. I/O was definitly out if you want NCEES approval.

Since this is a very important exam, Hp wanted a compliant calculator (and now that the NCEES now specifically allows only listed 6 calculators) and we have the Hp33s as a result/compromise.

Re: 32SII -- well-said!

*Message #12 Posted by **Thomas Okken** on 7 Apr 2005, 8:28 a.m.,*
in response to message #9 by Karl Schneider

My thoughts exactly. I think a 32SII with [...] real good complex number support (better than the 15C, 42S, or 48G) would be the ideal target for the OpenRPN initiative.

How would you wish to improve the 42S's complex number support? For Free42, I have received some interesting suggestions, like allowing polar entry while in rectangular mode, or adding a 'mixed' mode where a complex number's representation becomes a property of the number, rather than a global setting. Those features may make it into Free42 eventually (if I can still stand the sight of the $#*^%(* thing once I'm done with BCD support...). I'm interested in hearing what other suggestions for improvement people might have -- not promising to implement any of them; partly I'm just curious, because I, personally, have always felt 100% happy with the way the HP-42S does complex numbers.

If the OpenRPN hardware will support flash programming, it will probably be an easy matter to port Free42 to run on it. The perfect non-RPL calculator may yet come to be one day!

- Thomas

Complex Number Support (was: Re: 32SII -- well-said!)

*Message #16 Posted by **Jeff O.** on 7 Apr 2005, 12:50 p.m.,*
in response to message #12 by Thomas Okken

Thomas,
I have made some suggestions directly to you, but for the benefit of others and to solicit opinions, I'll repeat them here. The way the 42S handles complex numbers is very good, by far the best of **any** hp calculator. However, if I could, I would enhance the way complex numbers are entered, displayed, and converted back and forth between rectangular and polar form. To make entry more natural, I propose that a key labelled "i" be included on the keyboard. This would be the label on the face of the key for the primary function, not a shifted function. When entering a complex number in rectangular form, one would merely key in the real part, then press "i" to terminate entry of the real part and begin entering the imaginary part. When done, you would press ENTER or any other operation as usual after keying in any number. Both the real and imaginary parts of the number would be displayed on one line in the display in the same way the 42S does it (NOT the way the 28, 48 and 49 display complex numbers). To key in a number in polar form, one would not need to switch to polar display mode. Either there would be a separate key, or the "i" key would have a shifted function, labelled with the angle symbol. To enter a number in polar form, you would merely enter the magnitude, then press the angle key (or shift "i"), then enter the angle. The number would be displayed on one line in the display in polar form, again exactly as the 42S does. Complex numbers in rectangular form and complex numbers in polar form would be allowed to exist in the stack and/or any memory registers at the same time. You could key in a rectangular form number, press enter, key in a polar form number, press multiply, divide, etc. and get your answer immediately with no worry about being in polar display mode or rectangular display mode. The answer would by default be displayed in the format of the number in the X register. As I see things, there would be

no real need for "polar" or "rectangular" display modes. There should be keys with rectangular to polar and polar to rectangular conversion functions. (Please label them as ->R and ->P, not the ->phi,r and ->y,x labelling of the 33S.) These keys would function as they do on the 42S. If the displayed number is complex and displayed in polar form and you press the ->R key, it takes the two components, treats them as magnitude and angle and converts and displays them in rectangular form. If the displayed number is complex and displayed in rectangular form and you press the ->P key, it takes the two components, treats them as real and imaginary components and converts and displays them in polar form. (If you try to convert a polar form number to polar form or convert a rectangular form number to rectangular form, nothing would happen.) If the X-register contains a real number, it takes the numbers in the X and Y registers and converts and displays them accordingly. In a complex functions menu, there would be a global command to convert all numbers currently stored in the calculator to either polar or rectangular display. In this case, it would not alter numbers already in rectangular form when converting all to rectangular, and would not alter numbers already in polar form when converting to polar. As an alternative, the “mixed” display mode described above could be an optional mode, along with all polar and all rectangular. If rectangular and polar display modes are available, you could still enter a polar form number directly using the “angle” key when in rectangular mode. The number would be converted to rectangular form when you press ENTER.
That summarizes my ideas on the perfect complex number support system. I will readily note that similar ideas were expressed by Karl Schneider in this post a while back. I think I had thought of having the “i” key and some of the other ideas before then, but I’ll be happy to share credit with Karl :-)

R->P and P->R
as there might be other functions, like R->D, D->R (Radians to Degrees & vv) which are too similar thus a possibility for misunderstanding.

Thanks! I was wondering how you expressed my thoughts almost exactly. :-) I was going to dig up that post as a response to Thomas, but you saved me the trouble.

I would differ on only several points:

> Quote:
>
> The answer would by default be displayed in the format of the number in the X register. As I see things, there would be no real need for "polar" or "rectangular" display modes.

No -- I think there should be a user-specified display mode for complex-valued results. For certain applications, either a polar representation or a rectanglular representation might not be meaningful.

My "inspriration" for this was complex-valued calculation for AC power systems. AC voltage and current phasors are usually given in polar form; impedance, admittance, and complex power are usually given in rectangular form.

For example, complex power injected into a short line with impedance Z = R + jX between voltages V1@ang1 and V2@ang2:

```
S = P + jQ =  V1@ang1 * conj(I)
           =  V1@ang1 * conj[(V1@ang1 - V2@ang2) / Z]
           =  [V1@ang1 * conj(V1@ang1) - V1@ang1 * conj(V2@ang2)] /
conj (R + jX)
           =  [V1^2 - V1*V2@(ang1-ang2)] / (R - jX)
```

The user would enter V1 and V2 in polar form, Z in rectangular form, and view the result S in rectangular form.

Or,

```
I = (V1@ang1 - V2@ang2) / Z
  = (V1@ang1 - V2@ang2) / (R + jX)
```

The user would enter V1 and V2 in polar form, Z in rectangular form, and view the result I (phasor current) in polar form.

Complex display mode: Rectangle; Polar; follow X; Last entered (default);

I'd back up and have everything carry its "mode" about, especially since I want to have some of the 16c functions. One's compliment, Two's complement, Sign-Magnitude, Unsigned for bitstrings. Big-endian and small-endian tracking.

(the list gets very large, I'll stop.)

Karl,

You and I are obviously pretty close on this. We use complex numbers for the same thing, AC power system analysis. I'd have no problem with having the ability to force the results of calculations involving two complex numbers in different display formats to either polar or rectangular form. I think we would both be happy with the entry and display method described in our posts (using "i" and angle keys), and the following mode settings:

General entry and display of complex numbers modes:
1. preserve entered format
2. convert to polar upon entry regardless of entry format
3. convert to rectangular upon entry regardless of entry format

Display mode for results of calculations involving two complex numbers of differing display formats:
1. match X value
2. force polar
3. force rectangular

Obviously, you would only need to choose the results display format if you choose entry and display mode 1.
How does that sound?

*Message #21 Posted by **Karl Schneider** on 10 Apr 2005, 4:30 a.m.,*
in response to message #20 by Jeff O.

Jeff --

I'd say that your complex-number display format options make things a bit complicated.

As a general principle, I'd prefer that the calculator not change the format of a displayed number unless I request it. Hence, I would not favor options 2 or 3 of display. (That's what bugs me about the 48: The user can enter a complex value in either mode, but it will be displayed in the set mode after entry, as will all other complex numbers in the stack.)

Regarding, "3. match X value", I also would have qualms about forcing the format of a complex-valued result to match that of the "Last x" value. Obviously, it would not apply if a real number were in the x-reg. What's special about the x-input? In my example where I is calculated by V/Z, I would be displayed in rectangular format if Z were, which is probably not what the user wanted.

In essence, I'd want only option 1 for display of entries, and option 2 or 3 for display of results.

Additionally, I would prefer that the user be allowed to attach a unit of measurement for every angle -- degree, radian, or gradient. If a scalar and an angle are assembled to produce a complex number (using "R->C"), then that number is in polar form. If two scalars are assembled, "R->C" produces a rectangular-form number.

This would come in handy for trigonometric calculations: cos 0.6 would display 53.13^{o} in DEG mode.

You are not the first person to accuse me of making things overly complicated. I prefer to think of it as covering all of the bases.

> Quote:
>
> As a general principle, I'd prefer that the calculator not change the format of a displayed number unless I request it....(That's what bugs me about the 48...)

I agree completely. I would include those modes only in case someone else might actually prefer them.

> Quote:
>

There's nothing special about the x-input. If we allow mixed format display, there obviously would have to be some rule to handle the situation. I was just suggesting another method. Actually I guess you could also have a "match y-value", but that really would be overly complicated. Also, if the x-value is a real number, the result would automatically default to the y-value's format.
Your suggestion for tagging angle values with a degree, rad or grad unit sounds good to me.

*Message #23 Posted by **htom** on 11 Apr 2005, 5:15 p.m.,*
in response to message #22 by Jeff O.

I goofed that up big time. I thought that there were two other cases (than rect and polar), but there are three.

R) Rectangular (result always in R)

P) Polar (result always in P)

L) Last complex entry (result in whichever, R, or P, was used as a complex entry; use that format, changing when an entry -- not a result -- is made in the other) (default)

O) Other than complex entry (result in whichever, R or P, that the entry wasn't. "Last", only with a flip of the result, for when you're doing a series of things that start with R entries and you want the result in P, or vice versa.)

D) Displayed as x is (result comes back R or P, whichever most recent x, result or entry, was)

*Message #24 Posted by **Thomas Okken** on 12 Apr 2005, 3:54 a.m.,*
in response to message #23 by htom

Personally, I like Jeff's original proposal better, because it adds a lot of convenience while adding minimal complexity to the user interface. It's possible to cover more scenarios, but the additional modes or keystrokes could easily become confusing and hard to remember.

I think there's always a danger, when trying to design improvements to classics like the 32SII or 42S, of turning them into something too complex to use (like the 48G -- I bought one recently so I could run INPRT, and then I tried playing with it, just for fun, and as usual, I end up tearing my hair out).

Dave,

Dems fightin' woids!

But (Lotus') Ami Pro for Windows was better than both WP or WordStar... or even Word... especially WS for Windows, which really stunk.

As to the 80486, in the lab, we have an old SPEX fluorescence spectrometer controlled by a 486

proprietarily modified to control the grating positioning and shutters. The slits are manual, of course. Now, the data that comes out of the spectrometer is fed to a second 486 that runs proprietary SPEX data collection software in DOS. This latter one actually was a 486 DX4, running, for those days, at an incredibly blazing rate of 100 MHz.

Unfortunately, much less than a year ago the DX4 bought the far... uh, foundry and everyone was affected. Then I remembered I had in by basement an old Gateway 486, with a clock speed of 66 MHz. It still ran and sported a combo 5.25" and 3.5" floppy drive (in one unit!!) and two hard drives, again, for those days, a fairly generous 420 Mb each. I dusted it off and carted into the lab and there is still is processing our data. Now, the coolest part is that in doing so, I found my old DOS based software, my old Win 3.11 software. I do have a soft spot for WordStar DOS; I think sometimes I still silently mouth the key sequences for bold, italic, superscript, cut, paste, etc. I think I also ran Star Trek: Judgment Rites and EGATrek on it!

I miss using Quattro Pro. I think it was (emphasis on past tense) superior to Excel. Unfortunately, some guy on the West Coast made it so that competitors' products either couldn't run or ran poorly in Windows...

... what to do with a (still functioning) Toshiba P321 dot matrix printer?!

Finally, apologies for this totally OT and potentially HP calc fan boring post.

Thanks for the memory stimulation, Dave, though!

what to do with a (still functioning) Toshiba P321 dot matrix printer?!

I once wondered the same thing about an ancient but indestructible Apple Imagewriter printer. I hacked up something that converted PBM bitmaps to ImageWriter graphics escapes, and by using ghostscript's pbm driver, I managed to configure it all so that you could 'lpr' PostScript files to it, from a Sun SPARCstation IPC, like any old (or new!) laser printer.
Pretty neat, I thought, if a wee bit slow...

What makes a Word Processor Good - really OT

*Message #28 Posted by **John L. Shelton** on 5 Apr 2005, 7:42 p.m.,*
in response to message #6 by Dave Shaffer

Dave posts an interesting challenge. Why is Word Perfect, Word Star, or Word (or Apple's new Pages) better than any other? Here are some attributes of a winning word processor:

- **WYSIWYG** - it's easy to see an accurate representation on-screen of what will appear on paper, and this accurate representation is manipulable. (as opposed to those word processors that ask you to switch between editing mode and accurate-view mode.)
- **Rich formatting power** - it is possible to control placement of text and graphics throughout a document, with various styles of text. It should be possible to produce a high-quality book using the tool. Documents can have one or more columns per page. Left/right pages can be formatted differently. Alternate text threads can be accomodated (*e.g.*, a main flow and a running commentary in the margin.) Complex tables that span pages, with column headings that repeat.
- **Ability to apply standards** - designers should be able to specify layouts and formatting, to be easily applied by writers. Writers should be able to specify conceptual ideas such as Chapter

Titles, Footnotes, and designers should specify how they look. This makes it possible to have consistent style throughout a document, and keeps the writer from having to learn arcane formatting techniques. A library of templates helps with this concept.
- **Ease of use** - Mouse and keyboard should work together to make it easy to get the job done in a natural manner. Users familiar with a particular command set should be able to map keystrokes to functions to emulate a past environment. Most mouse operations should be achievable from the keyboard.
- **Support for beyond English text** - Ability to work in other languages, with other character sets and fonts. Ability to integrate graphics, as either glyphs (artificial characters laid out in-line with text) or as illustrations.
- **Robustness** - as a software program, the application should be fast and reliable. It should leave documents intact, minimizing document corruption. It should support reversal of mistakes ("undo"), importation from industry-standard formats, and exportation to industry standard formats.
- **Labor saving** - it should offer, perhaps optionally, or through user programming, features that work with traditional word processing, such as mail-merging or web page design. Users should be able to extend the capabilities through a macro or other programming language, to reduce complex repetitive tasks.

Are there other attributes of a "good" word processor? How does yours fare against this checklist?

33s PC interface

*Message #1 Posted by **Klaus** on 4 Apr 2005, 3:51 a.m.*

My plan:

Using a PC-interface, one might be able to load programs into the 33s, and read them back into the PC. One might also be able to program "unprogrammable" keystrokes like the "GTO .nnn". If the goal is oonly to load and store programs, and not entering calculations from the PC, it shouldn't be too hard to modify the 33s.

Necessary modifications: We want to read and change the contents of the ram, so there is a need to propagate the pins of the ram-chip to the outside of the case. Depending on the type (serial/parallel), it means soldering 5 to 27 wires to the ram-chip.

The 33s could then be plugged into the interface (consisting of a microcontroller or some logic-chips) that is connected to the PC.

What I have to do:

1. buy a 33s

2. open it and identify the ram-chip

3. solder the wires

4. build the interface

5. analyse the way programs and variables are stored

6. write a compiler/decompiler

Since one is not able to read the ROM, this should be perfectly legal.

Any help is appreciated! I would like to hear some comments about my plan, too! Klaus

Re: 33s PC interface

in response to message #1 by Klaus

> Quote:
>
> 2. open it and identify the ram-chip

It's a commodity 32K SRAM, nothing special

> Quote:

> it means soldering 5 to 27 wires to the ram-chip [...] 3. solder the wires

That's going to be the tricky part. It's a bare die under a blob of epoxy. If you're lucky, you might be able to get at the traces that connect it to the Sunplus processor, but it's quite likely that some of those traces will be on the wrong side of the PCB.

> Quote:
>
> Since one is not able to read the ROM, this should be perfectly legal.

If it was able to read the ROM, it would still be perfectly legal. At least in the US; maybe there are some strange laws in other countries, though usually the US is just about the worst as far as ridiculous "intellectual property" laws (e.g., DMCA).

Re: 33s PC interface

in response to message #1 by Klaus

> Quote:
>
> 5. analyse the way programs and variables are stored

The variables might simply be stored in the on-board RAM of the Sunplus processor. Programs and equations must be in the separate RAM chip, though.

in response to message #5 by Dave

Only the Hp41c series has what these fellows want: A pocket calculator with I/O.

The 42s holds the most promise in that perhaps a boot up program could be keyed in and then the serial I/O capabilities could be tapped into. There is no POCKET calculator today that does what they want. Sure, there are plenty of graphics and for many people this is fine (must be most people, else we should have a pocket solution by now). I suspect PDA's will invade this sector and satisfy (perhaps wrong word, but fill this niche) 90% of this market, leaving to few customers for a real pocket calculator to be worth marketing.

I am planning on returning to my Hp42s after using my Hp33s as soon as I can. It isn't that the Hp33s is bad, it is actually quite good (for what it is). And it does address the shortcomings of the Hp32s (insufficient memory). But it doesn't compare in real number crunching ability to a 42s. But for 90+% of the RPN calculator crowd, it is sufficient. For the rest of us, well, we aren't worth the extra $0.50 in material (I/O port, and long variable names and other software issues) to pursue. As far as Hp (or Ti, or Casio, or Sharp) is concerned, the high end pocket calculator geek can be satisfied with a new PDA. We will adapt, is their belief (I don't believe this to be true, as a calculator is the perfect tool for napkin or other on the fly engineering). Many engineers have abandoned this philosphy and the Business model certainly discourages this.

Victory! or - 10.000 pages later

*Message #1 Posted by **Peter** on 4 Apr 2005, 1:04 a.m.*

As only those similarily infatuated with the HP 41 can understand this - and I need to share this - here is a post with very little value to anyone else, other than to create either smirks, sympathy or empathy.

Over the last few weeks I have been working my way throug all the PPC journals, Data file journals, CHHU journals and HPX journals that are available on the combined DVD set from here and TOS. Some 10000 pages I reccon.

Each issue was scanned for HP 41 related material, finds where carefully extracted and sorted, chronoligically, into 36 categories (e.g. Synthetic Programming, M-Code, Wand, Cassette drive, CCD, Conversion-routines, curve fitting, games, etc), stapled and punched, put into 2 large binder (next to one which has all repair related stuff I could find on the fori of this site). Now I think I will get some more sleep over the next few days.

The pleasure it gives me to know, that if I were to, for example, look for prime factor programs on the HP 41, I could go to my binder, open the relevant section and have all programs that were ever published in any of the above magazine neatly sorted by date, is simply imensurable. Well, it is definitely imensurable for my girlfriend, who ist just happy that it is over (and is claiming that I am walking a fine line between passion and obsession. I will have to think about that one...)

Anyway, just needed to share this victory over the sheer mass of information.

Cheers

Peter

A Woodstock/Spice hardware design mystery solved

*Message #1 Posted by **Eric Smith** on 3 Apr 2005, 1:57 a.m.*

Ever since I've been working on reverse-engineering the Woodstock/Spice era hardware for use in simulators (such as my Nonpareil), and figured out how the bank-switching works on Spice (and probably on Woodstock, though I haven't yet confirmed that), I've wondered how the multiple ROM chips all make sure they agree on the bank, and how they're forced to start in bank 0 at power-up. The mystery is that there is no reset signal going to the ROM chips (or ROM/RAM chips).

In theory it would be possible for the chips to each have their own internal power-up-reset logic, but in practice this would increase chip area and might not reliably get them all reset properly. Using 1970s technology, this would have required external RC components. It would have made even less sense for HP to put those in for each ROM than just to bus a reset signal from the ACT to the ROMs. But they didn't do either.

Studying a logic analyzer trace, I think I now know the answer. Each word cycle consists of 56 bit cycles, which are defined by the two-phase clock pulses. The various chips have to know when a word cycle begins, and they do that by watching the SYNC line, which is generated by the ACT. The SYNC line is low most of the time, but goes high for ten bit cycles of each word. Those are the ten cycles in which a ROM instruction is read out. Each chip on the bus other than the ACT has an internal counter that tracks the current bit time, and it uses the SYNC line to initialize that.

There are some two-word instructions, and the ACT does not raise the SYNC line while fetching the second word, so the counters in the chips are designed to "ride through" the missing SYNC period. They also know that they shouldn't try to interpret the ROM words bits that are read out when SYNC is not present as an instruction, because it's really a branch target.

I've captured a lot of logic analyzer traces in the past, but tonight I captured one from an HP-97 during initial power-up, and I think I now understand how the system-wide reset is implemented. At powerup, the ACT starts generating the clocks, and it holds the SYNC line low for about four milliseconds to allow various things in the system to stabilize. Then it starts generating narrow SYNC pulses once per clock. It generates about 30 of those, with somewhat variable width, then starts holding SYNC high. It keeps SYNC high for about 22 ms. Finally, it lowers SYNC, then begins pulsing it at the usual rate (10 bit times high out of every 56, except for the second word of two-word instructions).

So it appears that the ROMs and other "peripheral chips" are designed to reset themselves if they seen SYNC high for more than ten bits consecutively. Quite a clever solution to having a hardware reset without any extra pins.

I think the narrow SYNC pulses before the 22 ms high time are probably just an artifact of the ACT implementation; the ACT likely is not yet fully initialized yet. I doubt that any of the other chips notice these pulses at all, because they happen after the phase 2 pulse, rather than staying high throughout the phase 2 pulse.

Eric

Logic analyzer utility (was Re: A Woodstock/Spice hardware design mystery solved)

*Message #6 Posted by **Eric Smith** on 6 Apr 2005, 2:51 a.m.,*
in response to message #1 by Eric Smith

I had to write some utilities to get logic analyzer traces from my HP 16500B into a useful form, and one of them might be useful to anyone else that's working on old calculators using old HP (or Agilent) logic analyzers.

When you transfer the captured data from the analyzer (over Ethernet, serial, or IEEE-488), you get separate ASCII text files for each signal. I wrote the program la2vcd to convert those files into a VCD file which should work with any VCD waveform viewer application; I use GTKWave.

Knowing the nuts and bolts (Re: Logic analyzer utility)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 6 Apr 2005, 3:31 a.m.,*
in response to message #6 by Eric Smith

Hi, Eric;

again, thanks for the valuable contribution. Although I don't own a logic analyzer myself, I'm aware of what some HP models (and other brands) offer as helping aids, like programming and customization. Well, knowing what they are capable of doing is not exactly being able to do what you've done. Congratulations! This is something to be proud of!

Best regards.

Luiz (Brazil)

Well, actually it was my dad's. He let me use it during the school year :)

Who can beat this story

*Message #8 Posted by **another Mike** on 2 Apr 2005, 2:18 p.m.,*
in response to message #1 by Sean

... Ya, I know what you mean ... listen to this story, it was San Francisco, CA, back in 1979, at the end of my first 2 weeks on the job I'd received permission to take the engineering office's new HP-55, with its cool plactic case etc, home for the weekend to learn it's features. I'd just cashed my first 2 weeks paycheck right after work and was meeting up with my Friday night DATE for dinner and movie. I was so jazzed!

After the movie, we walked hand in hand down the sidewalk, looking at the shop windows, heading towards where I'd parked my cherry '63 Chevy 2-Door Impalla, with it's pristine red interior, my college engineering survey books, my cashed paycheck and the office's HP-55.

OH MY GOD ... MY CAR ... IT'S GONE!!!

Long story short ... my stolen car was found 7 days later abandoned on the railroad tracks in Oakland, CA, minus it's pristine red interior, my college engineering survey text books, my cashed paycheck, the office's HP-55, and my pride.

And NO ... the train did not crash into the Chevy.

Re: Who can beat this story

*Message #9 Posted by **Ben Salinas** on 4 Apr 2005, 12:36 a.m.,*
in response to message #8 by another Mike

I'll try. This story is a bit more recent, and happened to a friend.

She had a 32sii checked out from the school. Well she lost it at Barnes and Nobles one day. The rule if you lose the school's HP 32sii is that you pay the going ebay price for it, rather than the $55 the school paid for it. She was very worried about this. Well 2 months later, a friend says that he has her calcualtor. It turns out someone else had found it at B&N and took it to a restaurant, where he lost it. A violin teacher then found it. Knowing that his student liked math, he gave it to him. This student was this friend, who gave it back to the owner.

So, after being lost for 2 months, and being in the possession of 3 different people, it was returned.

How's that for a happy story:)

I can't beat these crazy stories, but I can say my life was affected by calculator theft. When my brother was just entering high school (I was just leaving), he won a 20s in a computer programming contest. I used to borrow it, being in upper level math classes, and got hooked. He won another one in the next year's challange, which he gave me. Well, he ended up having the 20s stolen, so I unhappily gave him the 'spare' which also got stolen. I forgot all about hp's during college, probably cause of the 'high' price. In the past 5 years I've acquired a bunch of the modern rpn's, but always wanted a 20s again. Well, just yesterday I finally got a 20s 'back' for $5 at the local junk store.

in response to message #1 by Sean

I'm looking for that &ç"%rtµ*£§ who stole my 15C back in 1983 in the lockers of the squash club "Fort Jaco" in Brussels.

The amazing side is that the next week a guy was selling 15C in the main classified ads paper (Vlan, for those who know Brussels). You would usually see some 41C there, but never other models. A schoolmate told me this. When I called the number, the seller told me it was sold. I asked him why he was selling his calculator, he hummed and welled, and he told me a weird story about a gift he had received that was not interesting anymore. I still believe that I was talking to my robber, but unable to prove it...

The 15C purchase also has its own story. 2 years earlier I purchased a brand new 11C. I can still remember the sweet smell of the pink foam pouch. As calculator robberies were quite frequent, I was always carrying my 11C in the inner pocket of my jackets. BTW the voyager series were the coolest calculator to carry, and definitely I was envied by all the nerds of my school. We had a room that we were able to use during breaks. I put my jacket one one of the radiators, and someone (Didier, if you can recognize yourself) sat on it, breaking the LCD screen. His liability insurance covered that, and with a few more money I was able to purchase my brand new 15C... with the destiny that you all know.

I kept the broken 11C, the original boxes and documents of both 11C and 15C, but some time after I left the house my mother decided to tidy up my cabinets... and after sentencing these were useless, she threw everything away... I could have sold these for at least $300 !

I was collecting soft cover short stories (before calcs)
and one day my father got angry at me and my school records
he thought that I read those stories (instead of collecting them)
and thus tore them at half
Those collectables would be more than my 88_m^2 flat today!!

Now - is that more due to your savvy as a short story collector or your current appartment? Which is ruled by a non-RPN wife, right?

27S lost in the airport

*Message #14 Posted by **Jan (Switzerland)** on 4 Apr 2005, 8:28 a.m.,*
in response to message #13 by peter

About 7 years ago, in the airport of Milan, I was waiting for a delayed aircraft. I took my 27S and did some calculations. After each step I placed the calc on the small panel between the seats,

transferred the result into a table and took it gain for the next step. Imagine the surprise, when I wanted to pick the calc for the next calculation… and it was not there anymore.

To make the story even worse: back to Switzerland, I wanted to buy another 27S and found out, that my workhorse became collector's item… it took me almost 2 years and lot of money to get another one. Now I'm much more careful where I put it

I believe that last week I misplaced a 33s somewhere between Seattle & San Diego. It has textured, non-skid stuff attached to the back, and my name & number inside the battery compartment cover, so if found there should be no trouble contacting the original owner.

But unlike the other stories here, my lost article is still available via retail at (most would agree) a reasonable price. Not quite the same . . .

Re: Looking for ...

*Message #18 Posted by **Bob** on 4 Apr 2005, 3:19 p.m.,*
in response to message #1 by Sean

All of these stories reminds me of the reason that I stopped carrying my HP42S's a few years ago.

Outside of occasionally carrying my trusty 48GX, I only carry low rent TI-36XII's ($7 each) as everyday calcs.

I still have to find a reason to order a new 33S, but after using my friend's, I think it is a solid calc.

Re: Looking for ...

*Message #19 Posted by **Ed Look** on 4 Apr 2005, 4:33 p.m.,*
in response to message #18 by Bob

I know it costs a bit more, but I am currently using my 33S as my "TI36XII"; it just feels too funny not to be using RPN. Having the constants library and programmability doesn't hurt one bit either... very handy!

The first graphic RPN calculator emulator was made by Apple in 1983 !!

*Message #1 Posted by **Pascal** on 2 Apr 2005, 11:50 a.m.*

Today I was "playing" with my Apple Lisa 2 computer and I noticed that the calculator included with the OS had a RPN mode ! I found a link that shows the several options of this calculator, see http://www.aci.com.pl/mwichary/guidebook/extras/spotlights/lisa/photos/stepleton10

I think this is the very first graphic RPN calculator emulator ever made, and it was back in 1983 ! Or maybe has someone found an older one ?

By the way, it's amazing what this machine could do for it's time: it had a word processor, a spreadsheet, a project planner, a drawing software, a database, a graphing software, etc. !! Bill Gates came only 2 years later with his Windows 1.0 which didn't have overlapping windows, had only a word processor and a calculator (but no RPN).

The Lisa didn't run MacOS, unless you ran MacWorks. The native operating system, which included the calculator with RPN mode, was the Lisa OS.

*Message #4 Posted by **Les Bell [Sydney]** on 3 Apr 2005, 3:26 a.m.,*
in response to message #3 by Eric Smith

. . . the Lisa OS, which was actually written in an early object-oriented language called Clascal. It was multitasking, had overlapping windows, and a lot of other features; it was way ahead of its time.

Best,

--- Les

*Message #6 Posted by **Thomas Okken** on 2 Apr 2005, 2:18 p.m.,*
in response to message #1 by Pascal

...and then the Lisa failed because it cost as much as a nice car, and a stripped-down version of its OS was developed which became the MacOS 1.0 we all know and love. And then Apple sold the MacOS source code to Microsoft, which enabled M$ to transform their product into something you could actually use... Isn't it amazing that MacOS has stayed ahead of Windows in terms of quality, for so long? :-)

Oops, I'm getting seriously off-topic. Obligatory calculator reference: the original MacOS calculator was *very* basic. I have no idea about recent MacOS versions -- I haven't used Macs in years. The Windows 98 calculator is nice, if you can live with the fact that it has no RPN and is not programmable...

xcalc is probably a bit later than the Lisa calculator. Anyone know? xcalc is interesting because it, too, has algebraic *and* RPN modes.

- Thomas

The only thing in common between the Lisa OS and MacOS was the QuickDraw graphics library.

> Quote:
>
> then Apple sold the MacOS source code to Microsoft

No, that never happened. Apple sold Microsoft a limited license to use certain aspects of the Mac user interface in Windows 1.0. That didn't include any transfer of MacOS source code.

Wrong!

*Message #8 Posted by **another Mike** on 2 Apr 2005, 2:46 p.m.,*
in response to message #6 by Thomas Okken

The Lisa's system was dropped and replaced by the new MacIntosh computer. MAC OS as you know it, was born back at that time. Read on.

Today's FYI History Lession:

Jef Raskin, who dreamed up the affordable, user-friendly computer that became Apple's Macintosh and replaced the Lisa, died this last February,26, 2005 at his Pacifica, CA, home.

He was employee No. 31 at Apple when he joined in 1978.

Raskin, who had been diagnosed with pancreatic cancer a few months ago, was 61. He was employee No. 31 at Apple when he joined in 1978. By the next year, he began to pursue his goal of simplifying the computer user's experience, focusing on a faster and more logical interface. And the computer should sell for less than $1,000. He named the project after one of his favorite fruits as a child in Manhattan: the McIntosh apple. The computer's moniker was spelled differently to avoid trademark issues. He recalled, "I figured if I was going to name an Apple, it might as well be my favorite

But when he clashed with another Apple visionary, co-founder Steve Jobs, Jobs took over Raskin's team "by fiat," Raskin once said, and he resigned in 1981. Apple co-founder Steve Wozniak said many of Raskin's groundbreaking user-interface features remained part of the Mac when it was released in 1984 -- at a price of $2,495. "Jef's dream changed the world," Wozniak said Sunday. "Making technology work simpler, he was at the heart of that from the first days at Apple." Wozniak said Raskin also convinced Jobs to spend time at Xerox PARC to see how to develop cutting-edge technology. "Jef Raskin is one of the most important people in personal computers, to this day," he added. Raski n contended over the years that Jobs had taken credit for his work developing the Mac. But most Apple observers credit Jobs for the marketing genius behind the Mac.

After leaving Apple, Raskin coined the term "information appliance" -- the name of his company -- and developed the Canon Cat, with backing from Canon. Though he incorporated features learned from extensive study of cognitive psychology, the Cat never gained popularity. Raskin believed a computer should be as easy to use as any other household appliance, like a toaster or a washing machine. "Have you ever noticed there are no Maytag users groups?" he once asked a Mercury News reporter. "That's because you just put the clothes in, push the button and they get clean." Raskin was also an accomplished musician and artist. His artwork was once displayed at New York's Museum of Modern Art and he conducted the San Francisco Chamber Opera Society. He also was a model airplane designer, an archer and an occasional race car driver.

Calculator timing problem (49G+)

*Message #1 Posted by **Abilio Marques** on 2 Apr 2005, 9:08 a.m.*

Hi,

I own a HP 49g+ since the last summer, and since I opened it, the calculator presents the same problem, I can't correctly set the time and the date (ie: I put 8:34 am of 4/2/2005, and I get 7:54 am of 3/12/2005). Also, even when I say "lets see if at least it keeps the time", the calculator does it while is on, but if I turn it off, it remains in the same time, as in a deep turn-off (by the way, I cant put it into deep off shift space doesnt work as they say in the end of the user manual). I wish to know what to do, I've tried changing the small buttonlike battery, I made a firmware update (to the same version I had) just to see. I wonder why the last upgrade available is only from 2004. Anyway, my 3.54 build 31, and the serial number in the plastic is CN40700966

What in this world can I do?

Thanks in advance

Abilio Marques

PS: anyone knows how to contact HP? Im not longer in USA, but the calculator is from there, HP people in the country I am says is not their problem, and people in USA only offers phone support

PS2: is this calculator prone to get keys lose? I've seen calculators from other people that have dancing zeros, enters and space keys, they lost the thing that kept them up, so now when they press these keys, they dont get anything, or get multiple keystrokes

Re: Calculator timing problem (49G+)

*Message #2 Posted by **Raymond Del Tondo** on 2 Apr 2005, 2:29 p.m.,*
in response to message #1 by Abilio Marques

Hi,

the issue with loosing key strokes is a typical hp49g/g+ problem.
There seem to exist some workarounds,
but they only seem to treat the symptoms, not the cause;-)

AFAIK there is a firmware version 1.24 . Just upgrade.

More info on this: Newsgroup comp.sys.hp48

Raymond

No, theres not...

Maybe...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 3 Apr 2005, 5:48 a.m.,*
in response to message #1 by Abilio Marques

Hi, Abilio;

chances are the battery contacts for the single 3V, CR2032-like cell are bent or no longer in place. Is it possible to check if some misalignment occurred when you were putting the HP49G+ back togheter in one piece? This 3V battery is the back-up memory (like a holder) and I did not test how does the HP49G+ behaves if it is removed. I am almost sure it is mostly usefull when replacing the three regular batteries (hold memory contents), but its worht checking', don't you agree?

Cheers.

Luiz (Brazil)

a preserved era

*Message #1 Posted by **Eric Lundgren** on 2 Apr 2005, 1:08 a.m.*

Hey all,

The neatest thing happened this week, I met the guy in charge of our wind tunnels at university. A prof led me down there on a mission to get mat'ls and shop access. When we walked through the supersonic tunnel shop, I had flashes of my childhood. I imagined the brown cases used by 41's as I was met by the crisply neat hand-made bookshelf wrapped around the desk of the aging engineer in command. An hp I couldn't identify sat on the desk. It looked like a 65 with a light tan case. Mark's Handbook, Peery, and Rourke's formulas for stress and strain were among the 150+ books shelved. These books could refresh you on the formulas for notch sensitivity, and an entire era of short-sleeved NASA engineers. I thought of Kelly Johnson in Burbank, growling at engineers suffocating in smoke filled rooms working sleeve-to-sleeve on "hiding" the U2 from Russian sky-eyes.

My father was one of them, of the era at least, I remember the red graphic of the hp user manuals, the mag-strips, the structured thought. Trips (EVENTS) to buy the new super hand helds, followed by a grand dinner out.

The first HP laptop, the conical teeth of the printer guide wheels, all great memories. *Don't waste printer paper!* I'd love to go back, but we've got something now.

Right? The 33s and 49g+ might have some flaws, but they're growing on me. My 32sii trained me well to be conscious of wastefull memory allocation. So, while the 33s may have a large var/ram ratio, its got some strong points too.

Klaus had some great drive earlier this week. I'd love to participate in exploiting the 33s for all we can squeeze out of it.

Anyone know of a San Diego hp club? If not, anyone interested in scraping one up?

At worst, I'm very happy to have the museum to check in on. Eric

HP 12c

*Message #1 Posted by **Peter Dimopoulos** on 1 Apr 2005, 11:54 p.m.*

Hi! What year did production of the HP 12c cease in the USA? Thanks.

Re: HP 12c

*Message #2 Posted by **Eric Lundgren** on 2 Apr 2005, 1:23 a.m.,*
in response to message #1 by Peter Dimopoulos

Peter,

Well.....I see the gold face models still on shelves here...along with the new platinum models. My mother's 12c still works, its gotta be pushing a few years. She uses it daily. Yes, my father is an engineer. :)

...On that point, why would they reproduce the 12c plat, yet play with the engineers by mfg something that looked like the kbd had endured a three point bending test up to failure? (33s) ;) Eric

Re: HP 12c

*Message #3 Posted by **Randy** on 2 Apr 2005, 9:23 a.m.,*
in response to message #1 by Peter Dimopoulos

AFAIK, 1989, concurrent with the discontinuance of the 11C and 15C. The 12C then moved to Singapore, then Malaysia and then China where it is still produced. Some were also made in Brazil during the late 80's and early 90's.

Re: HP 12c

33s: section properties for rectangular composite bodies

*Message #1 Posted by **Eric Lundgren** on 1 Apr 2005, 1:45 p.m.*

If anyone's interested, I've written a program that computes the neutral axis (Ybar) and x-section moment of inertia (Ix)for any build up of n rectangular components (ie. uneven I-beam, sandwich construction).

Inputs are prompted: N (no. of components) Prompted for each component: B (base dimension) H (height dim)

Outputs to the x and y register: Y: neutral axis of composite X: x-sect moment of inertia of composite

It uses two labels (could be done with one, but as it is it works) I'm sure there's others out there. Happy to share, send an email to erikuma815@yahoo.com Eric

Re: 33s: section properties for rectangular composite bodies

News flash: Fiorina to IBM

*Message #1 Posted by **Ronald** on 1 Apr 2005, 10:11 a.m.*

http://www.iseriesnetwork.com/content/f3/index.cfm?fuseaction=news.viewArticle&webID=1001&newsID=5021&issueID=5139&articleID=50656

*Fiorina to Head IBM's iSeries Division by Grimm N. Barrett , Editor-at-Large

March 31, 2005 - In a surprise announcement, IBM today appointed dethroned HP honcho Carly Fiorina to head its iSeries Division. In so doing, IBM signaled it will take a more aggressive approach to dealing with the iSeries' competition. "She was a free agent with star power, so we just had to sign her," commented IBM Chairman Sam Palmisano, whose fantasy football team reportedly went 2-12 last year.

Big Blue waxed enthusiastic for Fiorina, who becomes the iSeries fourth general manager in the past six months. "IBM is not afraid to change direction when circumstances warrant. Carly's tanned, she's rested, she's ready to kick HP into the gutter," gushed IBM spokesblabber Rocky Minn at a press conference following the announcement. "When AD/Cycle wasn't working out, we recognized it was time to change horses in midstream, and this situation is no different," Minn continued.

Current iSeries GM Mark Shearer will head up IBM's new Household Appliances Division, where every toaster and mini-vac comes hard-wired with and intelligent POWER5 chip. "My iSeries experience will stand me in good stead selling blenders," a dazed Shearer uttered. He reportedly brightened when an IBM engineer in the audience pointed out that IBM's coffee urn line, at least, will process java.

When asked what Shearer's departure will mean for the recently announced initiative to pump more advertising dollars into the iSeries brand, Minn said IBM has decided to use the money to advertise luxury cars. "That's the only type of TV advertisement our key demographic pays attention to anyway," Minn explained. "So we figure that way we'll get the maximum bang for our advertising buck."

Minn then introduced Fiorina, who faced a skeptical press and outlined her bold plans for the future. "I didn't give enough thought to PC strategy when I was at HP," Fiorina admitted. "I won't make that mistake again!" To show her commitment to that ideal, Fiorina announced that her first act will be to port OS/400 to the PC. "The iSeries line has models big enough to handle work that used to be reserved for mainframes," Fiorina pointed out. "Soon PCs will be big enough to handle the work of low-end iSeries models, so this is a logical step."

Second on the to-do list is porting HP-UX to the iSeries so it can compete head-to-head with the HP-9000. "The performance benchmarks will leave HP in the dust," Fiorina promised, "and nobody can say we won't be comparing apples to apples!"

Her third priority will be to pursue a merger of IBM with PriceWaterhouseCoopers. "IBM has the financial clout to make it work this time! And what better way to make the iSeries a household word than by using it to tabulate the Academy Award(tm) ballots(tm) every(tm) year(tm)?" she declared, in a fit of coughing.

Her final strategic dictum will be to give future iSeries models a built-in printer so documents come straight out of the cabinet. "Think of the saved space in IT data centers that won't need to make room for a separate iSeries printer! Think of the iSeries user who will have the cathartic experience of seeing the iSeries itself giving symbolic birth to that needed document! A merger of print and processing functions is the wave of the 90s . . .uh, the FUTURE!"

Fiorina concluded.

In response to questions, Fiorina didn't deny rumors of negotiations underway for a parallel arrangement to her HP partnership with DreamWorks, this time between IBM and George Lucas. The rumor of a product-placement deal for the final Star Wars film that would replace the android R2D2 with an iSeries model 800 on wheels remains speculative. "I see nothing wrong with IBM getting a reputation as a company that builds cool gadgets," is all Fiorina would say. An anonymous source at LucasArts insists the crucial holdup is a glitch with the 800's voice synthesizer that makes it sound like Lou Gerstner. "And that's way too Twentieth Century," the source insisted.

HP41 Card Reader can read/write HP-71 cards

*Message #1 Posted by **Vassilis Prevelakis** on 1 Apr 2005, 2:05 a.m.*

After going through the HP82104A ROM code, I discovered that HP intended to make the HP-41 card reader able to accept the longer cards used in the HP-71B and HP-75C. The longer cards have much increased capacity (up to 160 registers per card versus 32 registers for the normal cards).

Unfortunately, not all card readers support the longer cards. I have found that only card readers manufactured after 1984 have the necessary code in their ROM.

Use of the longer cards increases the drain on the HP-41 batteries, so be aware that you need a fresh set of batteries or a newly charged NiCd pack.

The bad news is that, so far I have been unable to transfer any data between my HP-41 and my HP-71B or HP-75C. I guess the manual card readers on these machines have a different format.

Another problem I encountered was that the longer cards are narrower than the HP-41 cards, so you need to make sure that the card is placed towards the bottom of the slot. The newer card readers have little "fingers" on the top of the mechanism that ensure that the card does not move sideways, as it passes through the card reader.

The code that allows the long cards to be accessed is not enabled by default. You need to create a link on the card reader PCB. This enables the code and allows the long cards to be read.

Unfortunately my web site is currently down, but I will post pictures of the operation to enable the link as soon as possible.

In the mean time, here is a picture of a long card being VERified:

http://www.cs.drexel.edu/~vp/Private/LongCard.jpg

If anybody has any ideas as to why HP did not enable the code or advertise the fact that the HP-41 could use the longer cards, please let me know. I assume that they did not want to create competition of their HP-IL storage devices.

Best Regards

**vp

HP-33 User's Manual

*Message #1 Posted by **Trent Moseley** on 31 Mar 2005, 2:50 p.m.*

On the inside back cover of the HP-33 User's Manual near the middle of the cover is this message:

Hewlett-Packard Company Emerging Business Unit

What is this supposed to mean?

tm

Re: HP-33 User's Manual

*Message #2 Posted by **Paul Brogger** on 31 Mar 2005, 6:33 p.m.,*
in response to message #1 by Trent Moseley

It looks to me like the "signature" of the unit charged with assuring the European community that the calculator meets certain specifications ("CISPR / EN55022 classe B", "EN55024").

I wouldn't be surprised if the "Emerging Business Unit" has been renamed and/or reorganized three times since the manual went to the printer.

I doubt it means all that much.

HP-97 batteries

*Message #1 Posted by **PekkaPärsson** on 31 Mar 2005, 7:50 a.m.*

Hi I need helpin starting my HP-97, live in Sweden and have two (empty) battery packs and the european battery charger. But I cannot get it started now. It have worked about a year ago, but now it´s dead :-(

Any help would be appreciated. /Pekka

Re: HP-97 batteries

*Message #2 Posted by **Vassilis Prevelakis** on 31 Mar 2005, 12:55 p.m.,*
in response to message #1 by PekkaPärsson

I assume that when you say "empty" you mean that they hold no charge. So you can either replace the dead cells with sub-C NiCd or NiMH type cells or you can just buy a new (or remade) pack on eBay.

HP 11 Display

*Message #1 Posted by **john** on 30 Mar 2005, 5:33 p.m.*

Can I replace the HP 11c display with one from a 12c? If possible, is this hard to do? How does the case come apart? Thanks for any suggestions.

Re: HP 11 Display

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Mar 2005, 11:24 p.m.,*
in response to message #1 by john

Hi, John;

I'm not going to straight answer your question, instead I'll tell you that the newer HP12C (flat, not the Platinum) units have an LCD that's not compatible with the ones found in the earlier Voyagers. There are earlier HP12C units with an LCD that's compatible with the HP11C, but these must be units almost as old as the HP11C itself. I saw at least four types of internal design, and two of them have different LCD assemblies.

I am not sure if one can identify the LCD by external inspection; IIRC someone posted some matrial about this, maybe the status indicators have a difference. Based on what I saw so far, there are two different 'pin arrangement', and the newer ones (single 3V battery) also have different display because they operate with different voltages.

To separate the upper and lower cases is another issue. Under each of the rubber feet there's a screw, Philips-type head. And keep in mind that there are two small springs contacting both display and keyboard bezels (aluminum) with the back plane (also in Aluminun) and form an ESD-aware protetion.

Getting to the LCD itself is another issue...

Cheers.

Luiz (Brazil)

Getting to HP 11 Display

*Message #3 Posted by **Artur - Brasil** on 31 Mar 2005, 12:40 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

... and the history goes one here: To remove the PCB, you must cut off the melted plastic heads. After workng on display and cleaning the rubber pad and keys, put the pcb back, make a support for the calculator, cut some small pins and prepare a fast epoxi glue. Drop the glue over the plastic pins and put something heavy over the pcb (actually I use small pins over pcb, in order the heavy mass do not touch the pcb). After 1~2 hours it is done. Good luck! Artur

breaking the limits of the 33s with a compiler?

*Message #1 Posted by **Klaus** on 30 Mar 2005, 9:27 a.m.*

I have written a compiler that takes a deviceinfo file and a sourcecode file as input and outputs RPN-code. With the deviceinfo file it should be configurable for any device that understands RPN.

My vision was that you write a program in a High-level language, and compile it. The compiler notes the program lines occupied by the program in the deviceinfo file, so you can compile your programs separately. The compiled programs can then be typed into the calc. You can write your library of commonly used programs in a high-level language, compile the programs you need and key the output 1 : 1 into the calc.

Unfortunately, the calculators I own do not have a 'GOTO linenumber' command, so the Index register has to be loaded with the negative linenumber and a GOTO I has to be executed. This makes the code bigger than I thought.

Now I read coomplaints about the new 33s, saying "it has sooo much storage, and only 26 labels to use". This might be a good target for the Compiler, because the compiler emits big code with little Labels.

So perhaps a compiler could use the potential of the 33s?

As I don't have a 33s, what are your opinions?

Re: breaking the limits of the 33s with a compiler?

*Message #9 Posted by **Klaus** on 30 Mar 2005, 12:04 p.m.,*
in response to message #1 by Klaus

Well, I have posted some example code. My compiler is rather a proof-of-concept, so I haven't tested its output.

If enough people are interested, we can make our own grammar and I will write everything from scratch. Ideas for code-optimization are also welcome!

Klaus

On most (all?) of the earlier calculators that had this feature, called Rapid Reverse Branching, the number in the accumulator was not directly related to the line number of the target, but rather a relative count of lines from the GOTO to the target. In other words, if the I register contained -8 and the instruction at line 37 was GTO I, it would branch to line 29. Obviously a compiler can take this into account, though if you edit a program using RRB you may have to make a lot of adjustments.

The HP-41C family does not have this feature, so it wouldn't be useful there. Does the 33S actually have RRB? Did the 32S and 32SII?

Well, I didn't know about that different behavior. I used the behavior from the 11c, where a negative number describes the absolute address. With different machines, I can describe the GOTO-behavior in the device-info and thus emit correct code.

Greeting, Klaus

Re: breaking the limits of the 33s with a compiler?

*Message #12 Posted by **Namir** on 30 Mar 2005, 2:55 p.m.,*
in response to message #10 by Eric Smith

How common is the use of GOTOs for RRB jumps? I have always avoided that kind of GOTO because the program can become buggy if new commends are inserted. I always use labels with GOTOs.

Namir

Re: breaking the limits of the 33s with a compiler?

*Message #13 Posted by **Klaus** on 30 Mar 2005, 5:02 p.m.,*
in response to message #12 by Namir

The program can become buggy, if you edit it by hand. If you add something to the high-level language and compile it, the code [should be] or [is] correct.

One more thing about my compiler: The parser generates some RPN code, and this code is optimized later. (You can still see the #PUT and #UNPUT that have to be optimized). The RPN code goes throough several optimization passes: 1. If supported, add RECALL-arith 2. Optimize procedure calls ... 10. Move the fixups for if to end of program ... 13. Add line numbers and replace GOTO-labels 14. Use index Register for GOTO

The optimization can also take place if the code is not generated by a parser, but written by a user. True, but using the stack the user can pack the code tighter, but one could think of a RPN-language containing higher-level commands for GOTO, IF, WHILE,... and is then optimized.

Alvaro Gerardo Suarez (www.geocities.com/algesuar)

Sorry but no

*Message #15 Posted by **Valentin Albillo** on 31 Mar 2005, 5:52 a.m.,*
in response to message #1 by Klaus

Hi, Klaus:

It's quite a bold and worthy move on your side to attempt this, but unfortunately the HP33S' GOTO instruction *cannot* branch to *line numbers*, only to *labels*, so your innovative approach won't work for this particular machine.

Sorry about that and best regards from V.

Re: Sorry but no

*Message #16 Posted by **Klaus** on 31 Mar 2005, 10:03 a.m.,*
in response to message #15 by Valentin Albillo

Hello Valentin,

this morning i downloaded the 33s manual and noticed what you mentioned. Unfortunately the GOTO .nnn is not programmable. Maybe someone will find a way to drop this statement in program memory (sort of synthetic programming). I also read some manuals on the CD-Set and was surprised by differences in calculators.

Well, at least I regained some practice in writing Compilers!

Klaus

Re: Sorry but no

*Message #17 Posted by **Namir** on 31 Mar 2005, 11:15 a.m.,*
in response to message #16 by Klaus

Klaus,

I certainly applaud your effort. My suggestion is to target popular vintage HP calculates like the HP41C and HP42s. These calculators have good emulators that can read source code and convert into .raw files. This feature with your compiler will be excellent combination. In the case of the HP42s you can kee the name of the variables since the 42s support named variables (like the 48SX/GX, 49G, and 49G+).

Namir

HP's new CEO

*Message #1 Posted by **Jim Creybohm** on 29 Mar 2005, 6:48 p.m.*

Might be a good time to buy HP stock. They just announced their new CEO. Mark Hurd, from NCR.

So, the question is; how will he treat the calculator line? Just another marketting drone? An engineering type?

http://businessweek.com/technology/content/mar2005/tc20050328_3476_tc024.htm

Since I am a reader (normally a lurker) I am hopeful that we will see some ingenuity in the calculator division. Anyone have opinions or ideas?

May be HP calculators will have the Tax+ and Tax- functions?

Re: HP's new CEO

*Message #3 Posted by **Katie** on 30 Mar 2005, 9:00 a.m.,*
in response to message #1 by Jim Creybohm

He seems like a realist and I don't think that we can expect much innovation from him given this quote from his recent book:

> Quote:
>
> As much as we'd like to believe that our product is superior and unique, the reality is that the differences between one product and a competitor's is a nuance a customer may not even discern.

Re: HP's new CEO

*Message #4 Posted by **Chan Tran** on 30 Mar 2005, 10:53 a.m.,*
in response to message #3 by Katie

Hmm! That's a pretty bad attitude. What he meant in term of calculators we are the exception who can see the difference between an HP, a TI or Casio.

Re: HP's new CEO

*Message #5 Posted by **Raymond Del Tondo** on 31 Mar 2005, 1:49 p.m.,*
in response to message #4 by Chan Tran

Regarding quality of the current models,
the difference between TI, Casio, and hp
seems to be that the other brands are better now;-)

Interesting quote, Katie, and sadly I would agree that if that's his viewpoint there isn't much hope.

However, judging by eBay prices, including what I've paid to acquire 20 to 30 year old HPs for daily use, there are quite a few people who can discern such nuances!!

Re: HP's new CEO

*Message #8 Posted by **Larry Corrado, USA (WI)** on 30 Mar 2005, 9:37 p.m.,*

Just a small comment about a comment in the previous post:

"However, judging by eBay prices, including what I've paid to acquire 20 to 30 year old HPs for daily use, there are quite a few people who can discern such nuances!!"

First, we should keep in mind that it only takes two people to drive up the price of any given sale on ebay.

Sure, there are a few hundred (?) people on this forum who love HP calculators, and probably a similar number who buy them on ebay, but even if they would all buy whatever new HP model came out, they would not comprise a decent-size market for the new machine. I'm not a business person, but I would guess that HP (or any other company) would have to sell many tens of thousands (or maybe a few hundred thousand) units to reap a decent profit from a new machine.

Just my thoughts...

Larry

*Message #9 Posted by **Namir** on 31 Mar 2005, 12:51 a.m.,*
in response to message #8 by Larry Corrado, USA (WI)

Larry,

You hit it on the nail! The calculator market today brings small revenues to HP, compared to PCs, printers and cameras. For HP to recapture its old enthusiasm for new calculators (and kick TI's butt like it used to) people (and I am talking about common folks) have to go wild about buying HP calculators! In other words, H calculator sales must be like wild fires for the calculator division to regain its old prominant place. This is the feeling I got from listening to HP folks at the HHC2004 in San Jose. That meeting was akin to running into an old veteran actor or actorss who gave a talk about the good old days when he/she was hot in the acting business.

*Message #22 Posted by **Wayne Brown** on 3 Apr 2005, 1:26 a.m.,*
in response to message #18 by Palmer O. Hanson, Jr.

It depends on his viewpoint. If all he cares about is how much money his customer base brings in, then he'll ignore us no matter what we say; there aren't enough of us to make any real difference in the bottom line. If he cares less about money than about impressing scientists and engineers who use the products -- if he's the kind of person who says, "Who cares about profits, as long as the techies respect and admire us" -- the kind of person that *I* would *love* to see running HP -- then he'll pay attention and try to act in such a way as to change our perceptions.

in response to message #22 by Wayne Brown

"Who cares about profits, as long as the techies respect and admire us"

I'm not sure thats a great attitude for a CEO to have. His job is to help make profits. The main purpose of a company is to profit.

I don't endorse the 'profit at all costs' mentality, but all decisions must take economics strongly into consideration.

That's fine for an ordinary company, but as I 've said before, I don't consider Hewlett-Packard an ordinary company, but something unique -- different from any other company that ever was or ever will be. I see it primarily as a living memorial to Bill & Dave, and secondarily as a sort of playground for the engineers in the HP R&D labs, and everything else (especially profits) comes third. That's why I think they should not have spun off the test & measurements division, and why they should keep making their traditional lines of test equiment, calculators and HP3000 minicomputers, even if those products lose money and their divisions have to be subsidized with profits from the other divisions (like the one that makes those expensive inkjet and laser toner cartridges). As long as they make enough money to keep the doors open, that's good enough.

> Quote:
>
> I see it primarily as a living memorial to Bill & Dave, and secondarily as a sort of playground for the engineers in the HP R&D labs, and everything else (especially profits) comes third.

I expect that most of the current owners (stockholders) see profit as the primary (or only) reason for the existence of HP. Unfortunately, most stockholders and directors seem to take a very short-term view; never mind what shape the corporation will be in five, ten, or twenty years from now; what will the next quarter's, or maybe next year's, situation be?

CEOs and other top management types tend to move on to a "new opportunites" after a relatively short time, so they also tend to have a short-term outlook. Maximise their salary and bonuses while they're there, and if the company is facing disaster after they leave, well, that's someone else's problem, isn't it? I would that Carly had seen a "better opportunity" at some other corporation.

We wish that Bill & Dave, or someone much like them, were still in charge at HP, but I expect that most stockholders, if they even know who Bill & Dave were, regard them as ancient (and mostly irrelevant) history. What has HP done lately? Is owning HP stock likely to result in a good (short-term) profit?

As for the engineers, does their playing around produce something that's likely to produce a good profit in the immediate future? If not, those in charge are likely to see them as a millstone around the corporate neck. Hey, the quality assurance department is a bunch of expensive nay-sayers who don't produce a damn thing; let's get rid of them too. And who cares about the "factory rats" who are actually producing something? Let's outsource production to the lowest bidder. Let's

outsource design too; whoever's willing to work for the lowest cost. As long as the ones who sit in well-padded chairs behind big desks in nice offices are happy, that's all that matters, right? And when it looks as if it's all about to hit the fan, surely there'll be another company to plunder; time to move on to "another opportunity".

When a company announces a big layoff, I personally see that as a sign that's something's gone very wrong and it's in trouble, but note that the stock price commonly goes up with such news.

Yes, I think that spinning off Agilent was ultimately bad for all concerned; I expect that HP and Agilent would be stronger together than they are apart. I wish that the calculator part of the corporation had gone to Agilent, but I can see the logic of lumping it with computers, printers, and such "office machines".

I wish that HP would sell the calculator division to Agilent. I expect that there'd be a return to high quality, both design quality and production quality. (That said, note that earlier models had their weak points too.) I'm convinced that a line of high quality calculators could be an important "profit center", but with HP's recent offerings, it's on the road to being a "loss center"; from my experience with the 49g+, I'm not likely to be an "early adopter" of any new "bleeding edge" calculator. "Brand loyalty" may carry a company for a while, but customers also remember bad experiences for a very long time. But who knows? With the change in management, maybe, just maybe, HP might start doing things right.

As for the new CEO, I know very little about him. I gather that NCR has done okay under his leadership, and there's certainly nothing wrong with making a profit. Certainly giving Carly her walking papers strikes me as the best news from HP that I've heard in a long time. Will Mark Hurd turn things around and make the "HP Invent" logo meaningful? I don't know, I just hope for the best.

Regards,
James

*Message #27 Posted by **Garth Wilson** on 4 Apr 2005, 12:47 a.m.,*
in response to message #22 by Wayne Brown

I don't know the story behind HP and Agilent splitting up, but I expect there was some disagreement about where the potential for continued profit lies, with HP siding with the consumer market and Agilent siding with the scientist/engineer market. Maybe we should be looking to Agilent instead of HP to pick up again the good thing HP had going in the 80's.

Re: Biting the hand you want to feed you

*Message #28 Posted by **bill platt** on 4 Apr 2005, 9:40 a.m.,*
in response to message #18 by Palmer O. Hanson, Jr.

Hi Palmer,

I understand the idea that one should be nice to your feed-master if one is to eat, yet there are very important exceptions to this rule.

1. When you the hand that is feeding you is actually poisoning you.

2. When the hand that feeds you is also your slave-master.

In either case, it is best to bite and move on--which is my opinion of the HP we are now dealing with. Yes, it is nice that there is a 33s, but I am much more excited about openRPN.

For HP, the calulators are a proud, if quaint, piece of history. That they stay in the market at all is quite remarkable--I think it must be that there are some people--like Fred Valdez--still have real interest--and have been able to turn enough of a profit--at low overhead--to keep the division in action. THis is a point we do not often hear discussed in this forum--that there are strong allies at HP to this day. To that extent, we should support them.

But as far as CEO's go, I think cynicism is the only appropriate reaction today. They are, in my opinion, worth nothing but dirt until they have actually proven themselves in the business. (After Enron, Worldcom, Adelphia, Anderson.....what else is an honest person to do?!).

Regards,

Bill

Re: Biting the hand you want to feed you

in response to message #28 by bill platt

You write "In either case, it is best to bite and move on--..." That can be a good idea, but only if one has a place to move on to. Where might that be?

Re: Biting the hand you want to feed you

*Message #30 Posted by **bill platt** on 5 Apr 2005, 10:06 a.m.,*
in response to message #29 by Palmer O. Hanson, Jr.

Hi Palmer,

1. OpenRPN 2. Hydrix 3. Abundant used machines.

I am not afraid of losing HP anymore. We already did, when the y originally cancelled the 32sii with no replacement. As a result, the 32sii went up to 150 bucks--no higher--and there were plenty of them.

Someone will fill in the void.

Also, RPN itself is not the end-all be-all. So, I can get along without it.

Regards,

Bill

Emu42PPC now available with VGA support

*Message #1 Posted by **Christoph Giesselink** on 29 Mar 2005, 1:25 p.m.*

Emu42PPC v1.02 What's new?

- solved problems with "Topbar 0" on WM 2003 devices
- speed improvement
- added VGA support (Background section, "Vga 1")
- added Zoom factors 3 and 4
- added RLE4 and RLE8 compressed bitmap support

Emu48PPC v1.02 What's new?

- added RLE4 and RLE8 compressed bitmap support

The programs are available at http://privat.swol.de/ChristophGiesselink/. The latest VGA KML script for the HP42S I use was mainly written by Erik Ehrling, so I'm sorry you have to wait until he's publishing the script.

Best Regards,

Christoph Giesselink

in response to message #1 by Christoph Giesselink

I have downloaded the actual version. It did not run on my HP hx4700 because it's running Pocket Windows 2003. Not even I get a warning while installing the program, the program simply finishes working after showing the GNU-copyleft for a small moment :-(

Re: Emu42PPC now available with VGA support

*Message #4 Posted by **Christoph Giesselink** on 31 Mar 2005, 5:34 p.m.,*
in response to message #3 by Andre Koppel

This has nothing to do with WM 2003, I know at last five different devices with WM 2003 where Emu42/48 is running perfectly on. Finally my VGA device, a Dell Axim X50v, is running with WM 2003 SE.

The problem is that the devices are quite different, because any manufacturer can config the operating system in a wide range. Furthermore you can solve problems in applications by different ways, so there's no "must go" way. Because of that there can be incompatibilities between a Windows Mobile device and an application. Or just bugs, it's quite hard to detect memory access misalignments, sometimes the software crash immediately at the misalignment or never. Or a bug in the OS, that "Topbar 0" wasn't working properly under WM 2003 (SE) is a bug of OS not of the emulator. This bug was introduced in WM 2003, Pocket PC 2002 behave like expected.

Because I have no hx4700 (too expensive IMHO), I'm sorry I have no real chance to detect the misbehavior and so to be able to fix it.

Regards

Christoph

in response to message #4 by Christoph Giesselink

IS there is a chance to write some kind of debugging stuff into a textfile on the ppc? In this case, it should be possible to detect the position that causes the problem. Regards Andre

Re: Emu42PPC now available with VGA support

*Message #6 Posted by **Christoph Giesselink** on 1 Apr 2005, 10:00 a.m.,*
in response to message #5 by Andre Koppel

Possible is everything, but I wouldn't spend time to add additional debugging stuff to the dozen of called functions.

But I found two uninitialized global variables in the KML script handler. This is of course absolutely dangerous and I'm really wondering that this was never detected before, because this is an "original" bug from Emu48 v1.0 from 1997!

I can send you a Debug version with some assertions lines and a bug fixed version of Emu42 for testing to the Email address you used in the MoHPC header next week.

Regards

Christoph, c dot giesselink at gmx dot de

2nd slot on HP-46

*Message #1 Posted by **Frank Boehm** on 29 Mar 2005, 10:54 a.m.*

Hello all,

I noticed a 2nd slot, right next to the display slot. What was the use of this? Was it possible to add buffered input as an option - hpmuseum.org says it wasn't? machine is # 222

Re: 2nd slot on HP-46 - (aux. ROM card? plotter card? KB buffer card?)

*Message #2 Posted by **Bill Wiese** on 29 Mar 2005, 1:18 p.m.,*
in response to message #1 by Frank Boehm

Frank...

I had an HP46 for awhile before selling it (unfortunately).

I vaguely recall something 'interesting' on PCB....

Could you send/post a picture of the innards in that area?

The HP9805 'Algebraic Statistics Desktop' and the HP81 both share much in common with the HP46.

It perhaps could be some kinda ROM slot, slot for external plotter (on HP9805 calc), or a keyboard buffer option slot (used on HP81). Perhaps the PCB is common for all these variants...

From this HP Musuem's website's HP 9805 commentary:

> Quote:
>
> ### Key and ROM Blocks
> ....The HP 9805 took this idea a step further with a plug-in block of keys that also contained the appropriate ROM. The 15 keys on the left side of the machine could easily be replaced.
>
> In addition one ROM block without keys could be added under the printer cover. Functions in this block were accessed by the CALL key and other program-oriented keys on the keyboard

The HP9805 could also interface to a plotter somehow; this picture (http://www.hpmuseum.org/9805.jpg) shows a 9805 calc with what's described as "Another picture of HP-9805. (An additional key block and an interface card are sitting next to the calculator.)"

On the HP81 'business' calc, a buffered keyboard was sold as an option. As the text on Museum's HP81 page (http://www.hpmuseum.org/hp81.htm) says,

> Quote:

Unlike the HP46, the HP81 had the option of a buffered keyboard. (Probably only offered on the 81, because it could take some time to solve pre-programmed business problems.) .....

```
Price:
  $925 with printer only
 $1025 with printer and LED display
 $1150 with printer & buffered keyboard but no LED display
 $1250 with printer, buffered keyboard, LED Display
```

I don't know if most HP81s were or weren't sold w/keyboard buffering.

Perhaps this helps...

in response to message #2 by Bill Wiese

Here are some pictures of the inside of an 81 with printer, LED display and keyboard buffer and a 46 with printer and LED display. They seem to share a common motherboard that is populated with different chips but has just a single expansion slot. The 81 uses this slot for a combination keyboard buffer and LED display card -- note how the keyboard cable daisy chains through this card on the 81. Also note how there's an extra soldered-in wire on the back of this card going to the motherboard. Clearly this made the buffer not a user installable upgrade.

HP-81:

http://www.wass.net/pictures/HP81-2.JPG http://www.wass.net/pictures/HP81-1.JPG
http://www.wass.net/pictures/HP81-3.JPG

HP-46:

Re: 2nd slot on HP-46 - (aux. ROM card? plotter card? KB buffer card?)

*Message #4 Posted by **Tony Duell** on 30 Mar 2005, 1:08 p.m.,*
in response to message #3 by Katie Wasserman

Having reverse-engineered the HP46 and HP81 for the HPCC schematics CD-ROM, I can confirm that they do share the mainboard, with different ROMs fitted (and IIRC extra RAM on the 81).

I don't recall there being a second edge connector on the board -- if there was then it'll be in the schematics which I can check later.

Neither of the machines I borrowed for this had the buffered keyboard option, so I can't tell you anything about that.

Re: [OT] RPN Calc for Motorola mobile

*Message #3 Posted by **Raymond Del Tondo** on 11 Apr 2005, 6:42 p.m.,*
in response to message #1 by R Lion

Hi Raul,

I have an older version of that calc on my K700i,
and it's really nice.

I just noticed on the Calc website that the
newer versions are even kinda programmable.

Maybe the jre on the Motorolas is incompatible?

Regards

Raymond

Voyager key click

*Message #1 Posted by **i^4** on 29 Mar 2005, 7:47 a.m.*

The divide key on my 11c clicks loudly when released after pressing it only slightly (less than 0.1mm). The key works normally except for the noise. Is the noise likely from a fractured snap disk or some other cause? On another note, if a person writes a calculator program based on a unique published formula, can the program be published free w/o copyright problem?

Re: Voyager key click

*Message #2 Posted by **John Limpert** on 29 Mar 2005, 11:58 a.m.,*

Help with HP42S program input

*Message #1 Posted by **Dannyg77** on 28 Mar 2005, 4:44 p.m.*

I have the following lines to input:

475 1 476 -1 477 PIXEL

I have no clue on what combination of key strokes causes a '-1' to be displayed on one line. I have tried hitting the 1 and the +/- key, that gives me two lines. I have tried the minus key followed by the number 1 and that also gives me two program lines. I have tried looking in the alpha menus and anything in there will give me the quotes around the -1...

I suspect that the lines 1 and -1 are pixel coordinates for the display so I believe that if I try to fudge this command it will have a very bad consequence.

*Message #2 Posted by **Vieira, Luiz C.(Brazil)** on 28 Mar 2005, 6:09 p.m.,*
in response to message #1 by Dannyg77

Hi, Danny;

the [1] followed by the [+/-] key should work; I am not sure, but you could also reverse the order.. It changes the sign of the number you are entering as a program line.

Luiz (Brazil)

Edited: 28 Mar 2005, 6:10 p.m.

Oops! (was: Help with HP42S program input)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 29 Mar 2005, 7:30 a.m.,*
in response to message #2 by Vieira, Luiz C.(Brazil)

Hi;

I just realized after Gerson's answer that the issue was actually separating two numbers in a program sequence without [ENTER]... Not exactly entering a negative number.

A senior moment of mine, perhaps...

Sorry!

Luiz (Brazil)

Edited: 29 Mar 2005, 7:42 a.m.

Re: Help with HP42S program input

*Message #4 Posted by **GWB** on 28 Mar 2005, 6:13 p.m.,*
in response to message #1 by Dannyg77

Input the following, considering you're at step 475:

1 ENTER 1 +/-

Then press the UP key (BST) to go back to step 476 and press the Back Arrow key (CLEAR) to clear the "ENTER".

Regards,

Gerson.

Re: Help with HP42S program input

in response to message #4 by GWB

That worked quite nicely, Gerson! Very many thanks.

Dan

Re: Help with HP42S program input

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 29 Mar 2005, 7:38 a.m.,*
in response to message #1 by Dannyg77

Hi, Danny;

just to add that the PIXEL command (function) in the HP42S uses only two numbers as coordinates, so after the sequence:

```
475
1
476
-1
477
PIXEL
```

PIXEL will actually use both (-1) and (477) as arguments. In fact, I'm not quite sure if negative values will cause the pixel to be off the display limit OR if only the integer part is used, meaning (-1) (477) PIXEL is the same as (1) (477) PIXEL. Also, after the very sequence you mention, (475) is lost without being used as argument.

Cheers.

HP-71B Development ROM from Erik Wahlin

*Message #1 Posted by **Patrice** on 28 Mar 2005, 12:20 p.m.*

from Classified Adds What Erik calls a development ROM is furiously similar to the 71B end of my father's CMT Eprom Burner for 71B. The main difference is that my father's have no writing on it. The module like end is to plug in a port of the 71B, the eprom module is to be plugged on the other end. There must be a cable starting from the socket, the cable go to the burner itself. I don't think one can do anything whith this part unless to repair a burner. Patrice Torchet

Repairing a weird HP12C

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 27 Mar 2005, 10:40 p.m.*

Hi, all;

based on what happened, I guess that this would be of interest for those who repair Voyagers and newer calcs. Having my bother in a rush (hollydays), he asked me to try finding what was wrong with his HP12C: it did not turn on. Fresh bateries, slight twist and voilà!

```
[ Pr  Error ]
```

'It's alive...' Then the problem: each time it was turned to off, it was necessary to twist it back again so it would turn to ON with a big **Pr Error** in the display. It was too fast to be a bad contact, maybe the internal capacitor itself was bad. After openning it up I saw one of the internal assemblies I was searching for: the one board only style, three batteries and two IC's, mainboard layout like the HP11C/15C. With this one, I have already seen at least three different HP12C internals with three batteries, missing only the one with flex circuit (earliest of them all).

Now the works: resolder all terminals in both IC's and components, because if comms fail between them two, I guess that it would cause a Pr Error as well. O.K., IC's terminals resoldered, turn the calculator ON and no way to start the self test. Awkward: keys in both right-side rows 2 and 3 generating similar codes. Press [1] and 4 appears in the display, press [2] and 5 appears in the display... either {+] or [-] generate code 20 in program mode. My conclusion: short circuit in row lines. Open it again and visual check: nothing. Clean all solder pads and... nothing. I decided to go for awkward tests and firmly pressed the processor against the m-board: calculator works perfectly fine! What to do? Surgery! I removed the IC. Look below:

http://www.logeng.com.br/images/hp12cint_2s.jpg Click to enlarge

I inspected the surface and it was not hard to see some green crusts over some golden-coated trails, suggesting some corrosive product or residual liquid was allowed to get inside the calculator. Unfortunately I tried to remove them prior to take the picture below, but some remaining dust can be seen:

http://www.logeng.com.br/images/hp12cint_1s.jpg Click to enlarge

I carefully cleaned the surface, removed all visible dust (I use a small lens) and soldered the IC back:

http://www.logeng.com.br/images/hp12cint_3s.jpg Click to enlarge

My brother is happy, and one other HP12C is alive again!

Cheers.

(to my three friends that have calculators with me: M.B. (41CX), R.T. (29C) and J.E.G.(25,41CV), please be sure that this experience enhanced my wish on having your calculators back to life... I'm regrouping and getting ready to attack!)

Re: Repairing a weird HP12C

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 28 Mar 2005, 2:31 a.m.,*
in response to message #2 by Pierre Brial

Hi, Pierre; thanks for your kind words.

If you take a look at the first picture, you'll see the tip of a sewing needle close to the Voyager's processor. In fact, I use dessoldering mash to remove the excess of solder and then I ground the needle, wrist and batteries contacts altogether. Then I use a small soldering iron with a thin tip and for each terminal I briefly heat the cooper trail wihle I pull the therminal with the needle. The needle tip is positioned between the IC's body and the terminal to be pulled. Sometimes you need to go gently inserting the needle and pulling as many terminals as possible. The needle itself helps part of the heat not to get inside the IC, protecting it. It takes some time, but if you are patient enough, I tell you it can be done. Most important of all: brief touching the thin cooper trails. They tend to get loose when excessive heated. After removed, the terminals must be realigned. I proposedly left them "twisted" in the picture so you can see the SMD IC after removed. Also, don't bend them more than enough to remove, or they may be broken when realigning.

I know that it can be done with special tools, mostly when you have them... I do what can be done with what I have in hands, otherwise I go for my own solutions. Sometimes works, others I must face a failure and start again. So far I successfuly removed and resoldered many SMD devices, and I recall one single time I was not able to remove and had to let the dammaged IC in place.

Cheers.

HP-19C key trouble

*Message #1 Posted by **laget** on 27 Mar 2005, 11:37 a.m.*

Each time a number is entered, the led return something like 0.00000000 The Item looks perfectly clean and almost unused. Somebody knows the test I could do in order to fix and solve the problem ? Many thanks

Re: HP-19C key trouble

*Message #2 Posted by **David Smith** on 28 Mar 2005, 5:24 p.m.,*
in response to message #1 by laget

A display of 000000000 (usually without a decimal point) in a Spice series machine is almost always caused by a bad ACT chip. This is the big chip on the circuit board. The only source of a replacement is another Spice series machine (21/25/25C/67/91/92/97). Different machines have different part numbers on the chip, but they all seem compatible. The HP27 chip is NOT compatible.

Re: HP-19C key trouble

HP-33S user opinion

*Message #1 Posted by **KC** on 27 Mar 2005, 2:54 a.m.*

After working (and playing) with my HP-33S for a couple of months, I begin to enjoy using it. Sure, there is a lot of controversy over this "third-party-made" calculator, but here is some of my comments:

1. There is the problem of chevron keyboard layout, and the small enter key. But after using for some time, I become so accustomed to the keyboard that when I once revert to use my 32SII, I pressed wrongly the R/S key (the position where the ENTER key for 33S is located). I think it is truly a matter of familarity/habit. And you complain about the small size of the "ENTER" key? I don't find any problem with that. Afterall, the number keys and the +-*/ keys are used so often that it is strange then why nobody ever complained about their small sizes?

2. About the small no. of labels. True we can never use all the available memories with the 26 (or 27?) labels. We all hope that we can use infinite no. of labels, like the 42s do. But when I got my first 32sII, I thought that the calculator would be quite perfect if its memory can be increased from 384 bytes to 2kb. And now comes 32k. I am already quite satisfied with that. Also, I have learned to change my programming style so that now I can use less labels in programs (by extensive use of flags).

True 33s has still a lot to improve: the small period, the polar/rectangular bugs, the finite no. of labels, etc, but I think it is already a good calculator. It has some advantages over the 32SII: large memory, readable X,Y stack, easier to use "algebraic mode" of complex number operations. It is strange to me that people are still eager to buy expensive 32SII on ebay when inexpensive 33s is on the market. And you say, well, the quality of 33s is far inferior to that of 32sII. People said that 32sII (and the other old HP calculators) are very robust. Then how "unrobust" is 33s? I don't know. Maybe somebody can give me some figure. (percentage of deficient models, the no. of times it drops to the floor before it failed to work, etc) Also, some people like the "feel" of older models. Then it is truly a matter of subjective view. HP introduces the "interesting" 33S keyboard in the hope of attracting students and teenagers (I think), and they party succeeded.

No, I am not against the old calculator models. (and I am not an HP employee either). I have 32SII and 42S, and I LOVED them, but I think 33S deserves to have a better reputation.

KC

Scientific Functions for the 12CP - Which should have been added?

*Message #1 Posted by **GWB** on 26 Mar 2005, 8:45 p.m.*

While I realize the average HP-12C user would never need to use trigonometric functions, I still think these should have been built-in in the 12-C Platinum. The lack of trigs, LOGx, 10^x, pi, etc. made sense in 1981 when the 12-C was released, because memory was expensive back then. I would like to know if people here think HP should release an improved version of the HP-12CP or let it unchanged for ever. Which functions should be added and why? I myself think trigs and RAD/DEGREE modes would be enough.

Regards,

Gerson.

Re: Scientific Functions for the 12CP - Which should have been added?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 26 Mar 2005, 11:23 p.m.,*
in response to message #1 by GWB

E aí, Gerson; are you well?

I agree with you that the HP12C could be used by a larger number of users if some extra functionality is added. You see, when I read about HP12C Platinum for the first time(here), I thought that it would have some extra functions, maybe by simply filling the gap of using both [f] and [g] applied to the four aritmetic functions ({+], [-], [×] and [÷]), but the only 'extra' function was the [x^2]. We cannot forget the algebraic functionality, 299 extra program steps and possibility of computing IRR and NPV with up to 30 'cash flows' (instead of the possible 20 in the HP12C 'flat').

The HP19BII has trigonometrics applied to either DEGrees or RADians (has both trigonometric mode), it computes coordinate convertions and has a lot more functionality. If I have to pick a financial calculator with extra functionality, I'd go for the HP19BII. In fact, I'm waiting to see if the HP19BII+ is actualy comming or not. If not, I'd accept the [f] and [g] extensions in the [+], [-], [×] and [÷] keys (except for the [g][LSTx] and [g][x^2], that I'd find a way to put somewhere else...)

Best regards.

Luiz (Brasil)

> trigonometric mode), it computes coordinate convertions and has a lot more functionality. If I have to pick a financial calculator with extra functionality, I'd go for the HP19BII.

Surely HP has more powerful financial calculator options. But the 12C form-factor is unique. Do you know what the Voyagers have in common with the Parthenon? The golden ratio!

I still remember the day I bought my HP-15C as a replacement for a TI-59 which had been stolen (Thanks, Mr. Thief!). It was the most beautiful calculator I had ever seen, in fact it looked like a jewel. At first I thought I had been lured, when I tried to add 2 + 2... (where is the '=' key that was supposed to be here? - but that's another story). However, though not as beautiful as its older sister, the 42S does a better job, and has been chose as my everyday calculator. By the way, what do you think of a 42S soul in a Voyager body? (Sorry, subject for antother topic...)

Best regards,

Gerson.

Re: Scientific Functions for the 12CP - Which should have been added?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 27 Mar 2005, 5:17 p.m.,*
in response to message #3 by GWB

Hi, Gerson; evrthng fine here, thanks!

> Quote:
>
> Do you know what the Voyagers have in common with the Parthenon? The golden ratio!

Yeap, that justifies the pleasant look: 3 × 2, right?

> Quote:
>
> It *(HP15C)* was the most beautiful calculator I had ever seen, in fact it looked like a jewel.

It makes me remember the day I saw an HP15C for the first time... Cannot agree more! I felt the same, when the look is the issue, after buying my (first) HP41. I saw the HP15C and thought 'Why can't the HP41 have the same extended functions I need so much in my daily activities as an (yet a student) engineer and why can't it look the same?' About one year later I had my own HP15C. As you say, a jewel! Valentin seems to feel the same about it and I don't blame him; the HP15C is something more.

> Quote:
>
> By the way, what do you think of a 42S soul in a Voyager body?

I agree with you that applying the vertical 'golden ratio' to the HP42S layout is something to think seriously about (I would like it very much!), and I bet a complete new design would actualy be the best choice, so we could fit the two-line display and keyboard layout accordingly. When the look is an issue, I still look at the HP71B (thanks, M.M.) and think that it goes to the first place in my judgement. Taht is a beauty. If you place a Voyager's keyboard aligned above the HP71B's qwerty keyboard, you'll see that the dimensions match: key size, vertical and horizontal alignment. Only the true, early HP style can match these.

Oops, off topic issues...

Best regards.

Luiz

> >
> > Do you know what the Voyagers have in common with the Parthenon? The golden ratio!
>
> Yeap, that justifies the pleasant look: 3 × 2, right?

You're right if we consider you're using a rough approximation: Fib(4)/Fib(3) (fourth term / third term in the Fibonacci sequence).

As we remember, given a rectangle with sides **a** and **b**, it is said to be a golden rectangle if their sides obbey to this proportion:

(a+b)/a=a/b

making b=1 we get:

a^2-a-1=0

the positive root, (sqrt(5)+1)/2), is know as the "golden number".

Now, what does this have to do with Voyagers?

At

http://www.hp.com/calculators/financial/12c/specs.html

we can find the HP-12C dimensions if we are lazy enough to take a ruler and measure it ourselves:

12.70 × 7.87 × 1.52 cm (5 × 3.1 × 0.6 in)

If we divide 12.70 by 7.87 we get 1.614, very close to the golden number to three decimal places: 1.618. We can notice that coincidentally the dimensions in centimeters are close to Fib(7)=13 and Fib(6)=8 and the dimensions in inches are close to Fib(5)=5 and Fib(4)=3. I wonder who was the designer of the Voyager series, he or she knew what was doing.

When I first saw a 41C (or CV) at Carrefour I found it a beautiful calculator too. I just couldn't afford it as it cost twice or three times the price of the 15C.

Regards,

Gerson.

P<>R & R<>P would have been nice too

*Message #6 Posted by **db (Martinez Ca.)** on 27 Mar 2005, 12:08 a.m.,*
in response to message #1 by GWB

Your eight functions along with my two would just about fill up the unused f key spaces. They coulda called it the 17c. Let's not hold our collective (or collector) breaths waiting for it though.

I've never had to use logs or grads. In fact i just saw grads used for the first time two weeks ago, on the rough azimuth ring (along with a 360 degrees scale above them) on a new Lieca digital level.

Re: P<>R & R<>P would have been nice too

That's the first use of GRAD I ever heard of. As of coordinate conversions I fear they don't seem to fit in a financial calculator. Anyway, that could be easily programmed, with little memory usage. We should ask for a 15C Platinum instead (if that's all HP could offer...).

Best regards,

Gerson.

Re: Scientific Functions for the 12CP - Which should have been added?

*Message #8 Posted by **Don Shepherd** on 27 Mar 2005, 11:34 a.m.,*
in response to message #1 by GWB

Hi Gerson.

Since I am sure HP considers the 12c and 12cp to be "financial" calculators, I doubt that they would consider adding these "scientific" functions. Face it, 99.99% of the buyers of these models are mortgage bankers and stocks and bonds guys, not HP collectors like us. We buy it because they don't make any other Voyager form-factor models anymore, but we are a very tiny minority. We will have to suffice with the trig functions implemented on the 12c via programs, as Valentin and others have posted.

> We buy it because they don't make any other Voyager form-factor models anymore, but we are a very tiny minority.

You are quite right. I never thought one day I would buy a financial calculator. I just did it because I realized the 12C was the only Voyager left, so that should be my last chance to have a brand new one. Well, I discovered I am not alone: the guy I recently bought a like-new 42S from, a telecom engineer, uses a 12C on a dayly basis. I also got back the very 15C I bought 22 years ago, but my calculator of choice for everyday use is the 42S. Back to the topic, I just think it would not have been difficult for HP to have added some extra functionality when they designed the 12CP. Is this just a business decision or HP has lost its know how? I read somewhere the source code of Voyagers is lost, what could have made things more difficult.

Regards,

Gerson.

Re: Scientific Functions for the 12CP - Which should have been added?

*Message #10 Posted by **Don Shepherd** on 27 Mar 2005, 3:17 p.m.,*
in response to message #9 by GWB

I have always believed that 99% of the people who buy the 12c NEVER use the programming capability, and the other 1% (us) NEVER (or maybe rarely) use the financial functions. I have 4 Voyagers (11c, 12c, 12cp, and 16c) and I enjoy programming each of them, but the 12c may be my favorite because of its challenges: pitiful editing, two conditionals, no subroutines, and max of 99 instructions. Still, I find ways to do productive things on it, even using indirect addressing using the CF key. And if it ever breaks, I can get a new one at Staples or a used one pretty cheaply on ebay. I've always thought the 12c would be a good platform to teach assembly language programming at the community college, but that would be a very unmarketable skill these days.

Re: Scientific Functions for the 12CP - Which should have been added?

*Message #11 Posted by **Eddie Shore** on 29 Mar 2005, 9:50 a.m.,*
in response to message #10 by Don Shepherd

Not exactly, the skills cold be transfered to the 33S. Working in the accounting field, most do not use a calculator beyond the four-function ten-key.

#1 Post from some time ago: What should go into a 12c+?

*Message #12 Posted by **Gene** on 27 Mar 2005, 6:48 p.m.,*
in response to message #1 by GWB

Back when I was dreaming, here's what I had posted several years ago about an improved 12c+. Sometime later (I can't find it now - it might be on the forum in an archive somewhere), I actually laid out these functions onto the 12c keyboard. They KEY (ha) change is putting a FIX function into the 12c. That frees up the yellow-shifted 0-9 keys for more functions.

However, I don't see this coming, and no, I have no inside knowledge either way...that's just my guess/assessment.

Gene ==========

What should go into a 12c+? 1) Faster. Solve for i in a second or two, rather than 10-15. 2) Programming features: Add subroutines/return; add x>y and x NOT EQUAL 0 3) Add fix function for formatting display, replacing using f [digit], which uses up the yellow-shifted locations of each numeric digit 4) Add direct computation of slope and intercept for linear regression 5) Add permutations and combinations 6) Add x^2 7) Add trig and inverses, common log and antilog, degrees or radians mode 8) Fix solution given when solving for n to be actual # of periods, not rounded up automatically 9) Add hyperbolic trig functions (using a prefix key perhaps) 10) Add more memory for programs 11) Add Normal Distribution and Inverse Normal Distribution 12) Add population standard deviation calculation There are 26 easy to use unoccupied locations on the 12C keyboard that are available for functions. My suggestions use: #1 - None #2 - 4 locations #3 - 1 location #3 - 2 locations #5 - 2 locations #6 - 1 location #7 - 10 locations #8 - None #9 - 1 location #10 - None #11 - 2 locations #12 - 1 location a total of 24 of these 26 locations. C'mon HP, you've got 2 locations free! Gene P.S. The unused locations are: yellow shifted locations of the STO, RCL, CHS, EEX, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, ., E+, /, *, -, + keys; blue shifted locations of the STO, RCL, /, *, -, + keys. Note that being able to use the yellow shift locations of 0 - 9 REQUIRES a FIX function.

Re: #1 Post from some time ago: What should go into a 12c+?

*Message #13 Posted by **GWB** on 27 Mar 2005, 7:38 p.m.,*
in response to message #12 by Gene

Hi,

I had read this posting more than once and every time I thought: "why not?". After all, there have been at least a do-everything (except for programming) calculator before: the HP-27. Perhaps as a second Voyager-style option.

Maybe what some of us really want is a new 15C, but that's definitely out of question.

This longing for discontinued products makes me remember what happened here in 1993: former Brazilian President, Itamar Franco, an Electrical Engineer, convinced VW to make the beetle again after it had been discontinued for years. And just because he believed it was the best popular car ever made . Despite jokes like "the President prefers the beetle because he does not know how to run Brasília" (Brasília = capital of Brasil, and another VW popular model, 'run' =same as 'drive' in Portuguese) he made it, retired VW were called back to factory and the beetles started to be made again. For two or three years beetle lovers had the chance of their lifetimes...

Anyone of you wanting to run for President? Vieira? :)

Regards,

Gerson.

I wish I could...

*Message #14 Posted by **Vieira, Luiz C. (Brazil)** on 28 Mar 2005, 2:15 a.m.,*
in response to message #13 by GWB

... do something even if I am the President; anyway, thanks for *your vote*, Gerson...8-). Well, at least I

am an Electrical Engineer already.

Back to the issue: may I play a Devil's Advocate? I read a lot of posts about poducts (calculators) being brought back to production, and some of them called my (enginer) attention because of a particular issue: profit. Some guys called my (our) attention to the fact that if the HP12C has not been sold in quantities that justify having them in production AND if, even so, it is not profitable, it was no longer under production. Dom Shepherd's post emphasizes these facts again, and he also calls us a *very tiny minority*; for me, he is not far from the truth. You see, today's needs demand professionals able to operate tools that did not exist, say, thirty years ago. And todays professionals must improve their skills to go ahead and be prepared for what's to come. One thing I tell my students everytime I can: 'If you have a good idea and you want it to become a product or any sort of goodies to interact with people, do not waste more than three months developing it, because if the idea does not become an actual product in less than six months, all of the environment you created it for may no longer exist and your product will no longer be needed.' I am almost sure that others in here that worked on R&D a few decades ago remember that a product should leave production line without any potential flaw. Today we got used to read about 'recall', 'replacement', '***countless patches***', meaning that neither the producer has an idea about how good or bad the products are. Why? R&D can no longer spend time in testing, adjustments, corrections and the like because whatever needs to be corrected will actualy make a difference when someone finds it out. Otherwise, correcting everything prior to put a product for sale is money loss. So, engineers should not waste their time and company's resources by computing and computing and recomputing to reduce production line losses and enhance product quality, just let financial staff to compute and recompute how much money we gain when reducing product quality to an acceptable level and how much money we lose (investment in R&D, production delay,...) if quality is enhanced and all products need more than the necessary time to leave production line. In a financial view, it is a loss.

To improve design and testing, powerfull workstations run all sort of CAx (CAD, CAM, HDL environment, etc.) and close-to-real simulations, so a good idea goes straight from the workstation to produciton line in a flash, and final products are packed and sold in a couple of months after being conceived.

A few decades ago we could afford using our personal, powerfull (HP) calculators and take months to refine a product based on many simulations that ran in RPN-based programs. Many HP calculators themselves needed some time from their conception till the day they were 'made public' and finaly sold.

Yeap, I know, this is 'cold water', but we must face current facts and have a solid proposal. I guess the best personal computing device is about to come, and either the Xpander or the newer Qonos are the HP's demonstration that it (HP) wants to set standards again.

I believe it can be done. I'm not quite sure if it will be.

> Quote:
>
> I've always thought the 12c would be a good platform to teach assembly language programming at the community college, but that would be a very unmarketable skill these days.

I'd go further: a "blank" Voyager with upgradable OS. Whatever you need, simply set your prefered pack of functions and download it from a PC. I think this so called 'Voyager' should have a two-line grahics display (like the HP42S) or a four-line (like the HP28S) and offer the standard arithmetic plus financial functions in some 'hot keys', while others close to the display would work as softkeys, with shift functionality. That would be a great platform for doing everything, even to "teach assembly language".

I wrote too much, again.

Cheers.

Luiz

Re: I wish I could...

*Message #15 Posted by **Garth Wilson** on 30 Mar 2005, 3:11 a.m.,*
in response to message #14 by Vieira, Luiz C. (Brazil)

I have to disagree. I read in the electronics industry magazines all the time about "increasing time-to-market pressures", but they're obviously referring to the big markets-- cell phones, PC products, MP3 players, etc.. Niche markets don't work that way. Their market windows are extremely wide by comparison. Two of our own products (high-end intercoms for private aircraft) have been out for about ten years and the competition still hasn't caught up. I developed each for about $20,000, the retail price of about 20 of one unit and 40 of the other. We don't have to compete with big companies like Sony because although it's a valid market, it is nevertheless a niche market, too small for them to be interested. We might see a similar situation with OpenRPN.

To answer your comment about R&D no longer being able to spend the time to finish making a design correct: Many people, including our customers and including me, don't tolerate that idea. If I buy something and find out from experience that it was slopped together to get it out the door fast, I won't buy that company's products again. They get one chance only, and I expect the product to work right as long as I want to use it. I rather go without than to buy another product that's full of bugs or not durable. My experience with 1980's HP handhelds has been outstanding. But from what I read of the newer HPs, there's no chance I'd buy one. "Disposable" is acceptable for paper towels and certain other things, but not calculators.

Re: I wish I could...

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 30 Mar 2005, 12:24 p.m.,*
in response to message #15 by Garth Wilson

Hi Garth, all;

Garth, I'm not sure about what do you disagree with, but based on what you wrote I think you are right with your thoughts. In fact, I actualy focused on the big market, the one that can be felt all over the world. I am not sure if I am wrong about what I'm writing now, but niche markets are mostly local, right? HP calculators, our main issue here, is world wide, it can't be a niche market; am I right?

You see, I'm an engineer and I must think of enhancing quality and increasing production line and, as much as possible, at a smaller cost. Although I do not accept it quite well, it seems to me that today the 'at a smaller cost'-part comes as the main issue. I read this and this posts right now and it makes me think I'm not too far from what is actually going out there.

In Brazil we are able to see, thru cable TV, some north-american series. I've been watching two of them with some interest: The Aprentice (Trump) and American Chopper (Orange County). I do not see all of the episodes, but I see these as two different aspects of the economy nowadays. If I had to choose, I'd go for the Orange County. If I am a business man, I'd probably go for Trump. Because I'm an Engineer I cannot simply close my eyes to the business universe, but I'd

surely never be a part of it as I am, I'd need major changes in almost all of my values to effectively be a part of the business world.

You see, that's why I agree with you when I think of the way I act. I'm mainly a DIY professional when I'm in my working field, and I interact with all other areas as I can, but when dealing with business, corporation and administrative structures I'm an expectator. I'd barely suggest changes...

> Quote:

If I buy something and find out from experience that it was slopped together to get it out the door fast, I won't buy that company's products again.

I myself, as a customer, think, feel and act the same.

Thanks for postings about your thoughts after mine. It is always good to read things we'd not actually write, although they are in the heart of the matter.

Cheers.

Re: I wish I could...

*Message #17 Posted by **Garth Wilson** on 30 Mar 2005, 1:41 p.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

I apologize if I seemed a bit abrasive. It was late.

"Niche" market just means it's specialized, something that only a small group of people would be interested in. There is no one on my block, and very few in our city, who would be interested in my designs that are flying in small aircraft all over the world. Yet my next technical-service call might be from someone installing our equipment in an aircraft in a hangar in South Africa, Australia, or the other side of the U.S., wanting to do something unusual in a custom installation. This market is very different from the kinds of products you'd find in Circuit City, Fry's, or Best Buy where you see lots of people who don't know anything at all about electronics (and don't want to) looking for a big-screen TV or a digital camera or a hiker's GPS, and who will lose the manual as soon as the box is open.

We who appreciate the HP calculator products of the 1980's are definitely not part of the general public, or of the group that is buying a calculator from Wal-Mart for our child because the teacher requires it. Yes, we make up a small market, but I don't think it's impossible to address that market again. Some things have changed, but not others. Technology has advanced, but certain needs remain. Certain myths remain as well, like that a 4GHz PC can always replace a slower HP hand-held.

As you see, I was not aware of the meaning of the word, but I am aware of what "niche" reffers to. It's enlightment, and I am always interested on new info. Thanks! I see now that, based on the meaning, highly advanced calculator users' are actually attached to a niche market.

> Quote:
>
> Technology has advanced, but certain needs remain.

I like vintage technology for both private and learning reasons. By analyzing the circuit diagram and board wiring of an electronic equipment from the 70's/80's, one can always find some interesting arrangement. You se, I have some vintage Philips cassette recorders, about 95% "discrete" components (almost no IC's) and following their 'blueprints' is the same as to study electronics.

> Quote:
>
> Certain myths remain as well, like that a 4GHz PC can always replace a slower HP hand-held.

That IS a myth...

Cheers. And there's no need to apologize; we're amongst friendly, reasonable and mainly passionate people around here... like when we're home ;-)

hp28s a row doesn't work

*Message #1 Posted by **fabio** on 26 Mar 2005, 4:23 a.m.*

an entire row (from S to X and from STO to x) doesn't work anymore. I would like to have some suggestions about it and about how to open the calculator.

Thanks in advance

Fabio

Re: hp28s a row doesn't work

*Message #2 Posted by **Randy** on 26 Mar 2005, 9:33 a.m.,*
in response to message #1 by fabio

The problem is most likely one or more failed heat stake pins that hold the front and back case halves together, especially below the LCD. This causes a loss in contact between the keyboard connector and logic board.

It's not something that can be repaired... at least in a reliable or transparent way.

You can peel away the upper 28 logo label on the top half of the calculator and the lower keyboard surround label. Once they are off, you'll see a number of recessed plastic holes that are melted plastic pins that extend from the back half of the case into the front. Several will most likely fall out once the labels are off, those are what caused the problem, they shear off the back of the case. All the remaining heads will need to be drilled off for the case halves to separate.

Once done, there is no known good way to put Humpty Dumpty back together again...

Re: hp28s a row doesn't work

*Message #3 Posted by **Tom Sherman** on 26 Mar 2005, 2:17 p.m.,*
in response to message #2 by Randy

Thanks, Randy, for the interesting explanation. I have a 19B with a similar problem for the bottom row of keys (probably related to its having been mailed to me in an unpadded envelop!) By trial and error, I discovered that mine will work if I apply gentle (very gentle) pressure below the LCD. I need apply the pressure only once, each time I use the unit. How long this hocus-pocus will work remains to be seen.

Cheers, Tom

Inside my 93

*Message #1 Posted by **Arnaud Amiel** on 25 Mar 2005, 2:10 p.m.*

Having problems with my 93 printer, basically it gives Error any time I want to do anything with it, I decided to open it to check if anything looked wrong. A piece of black plastic fell but I have no idea where it belongs. Help would be appreciated to fix this. It is a cone 14mm long of 1.5mm diameter on its small end and 2mm diameter where it broke off. If anyone has any idea as to the printer or this piece it will be greatly appreciated.

Thanks,

Arnaud

in response to message #1 by Arnaud Amiel

I am sorry I actually am talking of a 97.

Arnaud

Re: Inside my 97

*Message #3 Posted by **Randy** on 25 Mar 2005, 9:55 p.m.,*
in response to message #1 by Arnaud Amiel

It has nothing to do with your printer problem - it is an inner chassis screw boss. It is one of three identical bosses along the back edge that hold the inner chassis to the top cover. You'll have to remove the chassis and epoxy back on.

The printer - could be the small gear on the left side that always strips or the head home switch. Does the motor always run?

Re: Inside my 97

*Message #4 Posted by **Erik Wahlin** on 26 Mar 2005, 12:23 a.m.,*
in response to message #3 by Randy

Common problems are: 1. Printer dirty, needs to be cleaned. (Jamming up) 2. Out of paper. If you have paper in it, it could be that the out of paper switch is not closing properly (making good electrical contact) 3. Printer sprocket wheel broken. Listen for printer motor whirring. 4. Printer head not in park location (all the way to the right). The head activates a magnetic reed switch that lets the calculator know it is in the home position. Sometimes the magnet falls out and will cause problems too.

Re: Inside my 97

*Message #5 Posted by **Arnaud Amiel** on 27 Mar 2005, 4:29 p.m.,*

in response to message #4 by Erik Wahlin

I found where the plastic bit came from: It is a post that keeps the printer ribbon cable in place on the printer chassis. There are 4 others so I believe I can live without it, what is more it is hard to glue something so tiny there.

As for the printer, when I move the head out of the "park" position, as soon as I turn the calc on, it moves back. But there is no sign of the motor starting otherwise. Paper is feeding normally when the printing head is moving as described above. So it looks like the calculator does not detect that it has paper. I will look a bit more into this and hope it is nothing to do with some blown electronics.

Thanks for your help,

Arnaud

Re: Inside my 97

*Message #6 Posted by **David Smith** on 28 Mar 2005, 5:26 p.m.,*
in response to message #5 by Arnaud Amiel

Some later versions of this machine did not have a paper-out switch.

Re: Inside my 97

*Message #7 Posted by **Arnaud Amiel** on 26 Mar 2005, 3:03 a.m.,*
in response to message #3 by Randy

Thanks for your messages, I will look for the right place to glue the plastic bit. As for the printer, the motor is not moving and I immediately get an Error message. I will look a bit more into what Erik suggested.

Thanks,

Arnaud

17bII+

*Message #1 Posted by **Eric Lundgren** on 25 Mar 2005, 12:54 p.m.*

Hi all,

Does anyone have a 17bII+? Since it supports menus, it seems like a nice little machine to carry around..assuming one can store the trig series approxs, for engineers at least.

Also, on the hp site, I found this statement:

"These documents have been prepared for scientists and engineers to provide useful information about using the hp 17bII+ financial calculator."

...do they really mean the scientists and engineers...or did they just forget to edit the field from the previous calc template? ;) Eric

Re: 17bII+

*Message #3 Posted by **Eddie Shore** on 25 Mar 2005, 11:47 p.m.,*
in response to message #1 by Eric Lundgren

The 17BII+ is primarily a business calculator. Do a search on this board to find approximation formulas for some engineering functions.

If you do get a 17, please be aware of the battery consumption. I had to change batteries several times after two-three uses and memory is not retained when changing batteries.

Help on printing circuit boards

*Message #1 Posted by **Artur -Brazil** on 25 Mar 2005, 8:55 a.m.*

Hi! Although not directly linked to HP calculators, but as I see this site is plenty of engineers, I would like to get some help about printing PCBs. I was looking in Ebay there are some HP plotter, like HP 7475, and others X-Y plotters/recorders. First: the small ones, like 7475 could be used to draft printed circuit boards (remember the board can not be bended). Second: is difficulto to use them, if I would like to connect to my HP calculator? Third: what are the X-Y recorders? I could see some specs telling about calibration up to 10Vdc? I have to connect them directly to a power source? If so, why the RS232 connection? Any advice would be greatly appreciated! Artur

Re: Help on printing circuit boards

*Message #2 Posted by **John Limpert** on 25 Mar 2005, 11:08 a.m.,*
in response to message #1 by Artur -Brazil

Why would you put the printed circuit board in the plotter? All of the printed circuit boards that I have seen made were created by putting the artwork on flexible mylar film, either by hand or with a computer. The mylar film is then used to expose the photoresist coating on the printed circuit board, which is then etched and drilled.

Re: Help on printing circuit boards

*Message #3 Posted by **Eric Smith** on 26 Mar 2005, 1:52 a.m.,*
in response to message #1 by Artur -Brazil

Someone I know modified an old HP 9872A flatbed plotter to plot resist directly onto copper-clad PCB material. He had to modify the pen holder/lift assembly to account for the thickness of the PCB.

For the non-flatbed plotters, in which the pen is moved on one axis and the paper is moved on the other, this would be difficult if not impossible. They are designed specifically to grip and move paper or similarly thin and lightweight material.

Re: Help on printing circuit boards

*Message #4 Posted by **James** on 27 Mar 2005, 5:14 p.m.,*
in response to message #1 by Artur -Brazil

Having used a 7475A plotter to make circuit board images on drafting film, I think you will get much better, faster and easier results using a laser printer and the "Toner Transfer" system.

http://www.google.com/search?q=%22toner+transfer%22+pcb

$15 for 10 sheets at Digikey. Part # 182-1003-ND

I haven't actually tried toner transfer, but I would if I were to make homemade boards again.

Good luck!

E-bay auctions: the best way to collection?

*Message #1 Posted by **Giancarlo** on 25 Mar 2005, 2:19 a.m.*

Hello everybody. I'm not really a HP collector, but I like some old models (41-CX, 15, 16) and I had a look on e-bay... I was horrified for two main reasons: 1) unapproachable (even if starting) prices; 2) "magnificent" descriptions, praising perfections everywhere (sometimes ridiculous: I read a seller explaining that "RPN" stands for "Random Polish Notation"... Should I comment about that?) Is it there any hope to find items at reasonable prices and/or discussing with people aware of what they're selling? (maybe it's more difficult living in Italy, like me...). Any feedback welcome. Regards. Giancarlo

Re: E-bay auctions: the best way to collection?

*Message #2 Posted by **Massimo (Italy)** on 25 Mar 2005, 2:49 a.m.,*
in response to message #1 by Giancarlo

Hi Giancarlo,
you can ***rarely*** find bargains, even on eBay.
And you're not alone, I'm from Italy too ;-)

Massimo

*Message #3 Posted by **Giancarlo** on 25 Mar 2005, 4:11 a.m.,*
in response to message #2 by Massimo (Italy)

So, how did you manage to find items you were interested to, living in Italy (which seems not to be a favourable place as far as this matter is concerned ;-))? Ciao. Giancarlo

Re: E-bay auctions: the best way to collection?

*Message #4 Posted by **Massimo (Italy)** on 26 Mar 2005, 12:27 a.m.,*
in response to message #3 by Giancarlo

Hello Giancarlo,
where to find those calcs, uh?
Well I bought them from ads in local newspapers (the owner usually had other items he wouldn't part with at first: express your ***moderate*** interest and after months or years you could be rewarded with an offer or a present); coworkers; classified ads on this site; local online auction sites (iBazaar) and, of course, eBay...
And friends, too. Being friends I hadn't to pay either (at least not with money **;-)**)

As I wrote you can find bargains on eBay: strange how I paid more for some common items, say a 41CX, than for rare birds such as a *red dot* or a 94E. Sure, you have to spend a **lot** of time searching for misplaced/misspelled ads.

I realize that I really spent too much time doing this: I consider my collection complete now (I won't

die for those 4 desktop models I miss) and this room is far too small to stock them all, go figure display them in a nice fashion!

Maybe I've gone too far now: time for another hobby?

Greetings,
Massimo

*Message #5 Posted by **valentino ducati (switzerland)** on 30 Mar 2005, 12:44 a.m.,*
in response to message #4 by Massimo (Italy)

Ciao Giancarlo!

I have to support the ideas of Massimo, beside ebay.

My experience collecting a hp oldies since a few year is:

a) ebay is the best place to find something you don't find at any other places

b) the cheapest place to find online (or in newspapers) some hp marvel are local or regional advertisment. There I've got a mint 12C for EUR 20 and a mint 48CV with many accessories for EUR 35! You have only to be fast, because there is no bidding window: fixed price and the 1st wins.

c) next cheaper place are the local or regional online markets. They have usually a lot smaller offer then ebay; but also very interesting start and end prices because you have only to bid against the few other local interested.

In (b) and (c) you can usually discuss the affair in your local language (italiano) and, sometime, go personally pick up the item at a meeting place.

I never had any payment/quality/delivery issues with (a), (b) or (c).

*Message #6 Posted by **VPN** on 25 Mar 2005, 4:44 a.m.,*
in response to message #2 by Massimo (Italy)

Yes you _can_ get a bargain!

Just send me 999 £ (including shipping via hitch hikers or bikers - your choise)
and I send you my HP-16C <very small print>about 9 months or years later</very small print>
It's in mint condition, just a few cracks on the LCD and almost every other or third key working! [VPN]

*Message #8 Posted by **John L. Shelton** on 25 Mar 2005, 6:11 p.m.,*
in response to message #1 by Giancarlo

For a long time, the garage sale (in US) was the best place to pick up HP calculators. Often, the items were sold by unsuspecting relatives of the calculator owner, not realizing that the HP calculators have collector value. I've picked up a couple for USD5.00 or so. I've also bought one or two in "thrift shops" run by charitable organizations like Goodwill.

These sources are less fruitful today.

Re: E-bay auctions: the best way to collection?

*Message #9 Posted by **Karl Schneider** on 26 Mar 2005, 12:47 a.m.,*
in response to message #1 by Giancarlo

Giancarlo --

Here in the US, I'd say that eBay is certainly the most effective way to build a collection, because just about everything is available for the nationwide going rate. But, it's certainly not the cheapest.

In addition to garage sales, flea markets, and thrift shops as sources of bargains, perhaps a better bet is the estate sale of a scientist or engineer.

Change the Name of this Forum?

*Message #1 Posted by **Tim Wessman** on 24 Mar 2005, 11:55 p.m.*

I was wondering why there always seem to be so many people that think this is for any general HP info. . . and then it ocoured to me that the giant black HP "Forum" title on the main page is decieving. True, there is a paragraph explaining this is for calculators and a "MoHPC" up top, but that big black title seems to grab your attention and never let go. Even the Post Message screen lacks any sort of info that really attracts your attention.

I imagine this has been discussed before, but what about change the title of the main page to "HP Calculator Forum" in big bold letters. In the new message screen, change it to "Post a New Message to the Calculator Forum"

When you search "HP forum" in google. . . guess which site comes up first? ;-)

HP Integral PC Info

*Message #1 Posted by **Andre Koppel** on 24 Mar 2005, 7:58 p.m.*

Hi all, some time ago I have purchased a fully working HP IPC on Ebay. I have replaced the broken floppy with a fully renewed replacement (same type) and meanwhile I got some copies of the floppies. But because I don't have any manual, I have absolutely no idea how to access the programs on the floppies. I don't know a way to use the PAM to start anything usefull. Is there anyone who can give me a hint? An additional question. Is there anyone who has a copy of the HP Journal Oct 1985 (can't be found at HP). Kind regards Andre

Re: HP Integral PC Info

*Message #2 Posted by **Les Bell [Sydney]** on 25 Mar 2005, 6:35 p.m.,*
in response to message #1 by Andre Koppel

Andre, take a look at http://www.coho.org/~pete/IPC/integral.html as a starting point.

In order to use programs on floppy, you'll need to mount the floppy - essentially you'd use the same command to do this as modern UNIXen and Linux. I'm not sure what the mount point would be, though; I only used an Integral briefly when they were first introduced.

Best,

--- Les Bell

in response to message #2 by Les Bell [Sydney]

```
Les Bell [Sydney] wrote:
> In order to use programs on floppy, you'll need to mount the floppy
```

Actually it is not necessary to mount the floppy, the system detects that you have inserted a floppy and mounts it automatically.

Each floppy has a volume label, and the system automatically mounts it in a directory with the same name as the volume label. So if you insert a floppy with a volume label of foo, it will be mounted in /foo

*Message #4 Posted by **Andre Koppel** on 27 Mar 2005, 10:42 a.m.,*
in response to message #3 by Vassilis Prevelakis

Hi Vassilis, you are right. The internal Disk-Drive wasn't able to detect the disk, but an externel 9122D works quite well with the IPC and the both disks are mounted. But what must be to format a HPIB-

Harddisk. I have a spare one and I want to copy all the disks to the HD? Kind regards Andre

Re: HP Integral PC Info

*Message #5 Posted by **Vassilis Prevelakis** on 27 Mar 2005, 11:29 a.m.,*
in response to message #4 by Andre Koppel

Connect the external HP-IB hard drive and look in /dev to see the name(s) assigned to the hard drive. Then use the format_disc utility (int he Utilities diskette) to format it.

I hope this is correct because its been ages since I formatted my hard disk.

Re: HP Integral PC Info

*Message #6 Posted by **Andre Koppel** on 28 Mar 2005, 4:16 a.m.,*
in response to message #5 by Vassilis Prevelakis

Hi Vassilie, thanks for the HP-Journal Article. I have searched for it, but not found it until today :-) Another question concerning an HP9133 Hard Disk Drive. I have a spare one and want to use it for the IPC. But whatever i try to select on the address switch, the drive wasn't detected by the IPC. A HP9122 dual disk drive was seen by the IPC within /dev, but not the HP9133. Do you have an idea what must be changed? There is an IP-address selector and okay I know about IB-addressing, I hvae tried several addresses. And on the back of the HP9133 there is an additional selector with positions numbered 0-9. I have no idea what this means.

Re: HP Integral PC Info

*Message #7 Posted by **Vasilis Prevelakis** on 28 Mar 2005, 11:40 p.m.,*
in response to message #6 by Andre Koppel

There are many different models in the 9133 family and they are VERY different between each other. Early ones are amigo, while later ones are CS-80.

I have a 9133H connected to my IPC. I have the manual for this drive but it is written by brain dead people (whenever a manual starts with "Don't let the terminology scare you", you know that the manual is not worth the paper its printed on). Anyway it says zip about the configuration switch other than "it changes disc formatting". Thanks!

Anyway the setting that works for me is Configuration switch in position 1, address in position 0.

With these settings, I get:

```
/dev/A          built-in floppy
/dev/D000       9133H hard drive
/dev/D001       9133H floppy
```

Re: HP Integral PC Info

*Message #8 Posted by **Andre Koppel** on 12 Apr 2005, 10:23 a.m.,*
in response to message #5 by Vassilis Prevelakis

Vassilis, meanwhile I have received a still working HP7597 Hard Disk drive. The IPC was able

to detect the drive(it is shown in /dev). I also have a bunch of floppy disks. But no one of the disks contains a format utility (the utilities disk contains some other tools). I have found the disk images at http://www.coho.org/~pete/IPC/images.html but I wasn't able to generate disks from the images. I have tried original HP-floppies from the 80ies (double sided, non high density). But neither Linux (using dd) nor Windows (using rawritewin) was able to write the images to the disks. Do you have an idea on how to create disks from the images?

Re: HP Integral PC Info

*Message #9 Posted by **Vassilis Prevelakis** on 12 Apr 2005, 12:38 p.m.,*
in response to message #8 by Andre Koppel

I use an original double sided **double density** PC disk drive connected to a Unix system (OpenBSD). I then use the Unix utility dd to copy the image to the drive.

You may be able to use Tony Duell's LIFDUMP utility instead http://www.hpcc.org/datafile/hpil/lif_utils.html although the IPC floppies are NOT LIF.

**vp

Re: HP Integral PC Info

*Message #10 Posted by **Tony Duell** on 30 Mar 2005, 1:17 p.m.,*
in response to message #4 by Andre Koppel

If you have an HP device that used the original full-height Sony drives (HP9122, HP9123, HP9133, HP9114A, Integral, etc), then you MUST strip down the eject mechanism and regrease it. If you don't there's a very real risk that it won't latch up properly and when you try to eject a disk, the upper head will catch in the disk and be ripped off its mounting.

The only cure for that is to replace the head carriage assembly and do a full alignment. Needless to say this is a lot more work...

Basically, you take the drive out of the machine and remove the mounting brackets. Take off the top cover (1 screw), the logic board (3 screws and connectors), the front panel if fitted (it isn't in the Integral), then the eject damper (1 screw, rear left of the drive), the head load solenoid/bracket (2 screws) and finally the disk holder itself (4 screws).

That then comes apart by removing 1 more screw and slipping off the E-circlips. Clean off all the old grease using a suitable solvent and apply a _trace_ of new grease. Put it all back together.

One other point: High density disks do not work in these drives. Not only is the coercivity wrong, but the disk-inserted sensor lines up with the HD-detect hole, so it's not operated. The result is that the drive thinks it doesn't have a disk installed.

Re: HP Integral PC Info

*Message #11 Posted by **Andre Koppel** on 31 Mar 2005, 7:58 a.m.,*
in response to message #10 by Tony Duell

You are right, I have killed one drive this way. Now If I get a new system, first of all I disassemble the disk drive, cleaning it completely (lot of work) and most of the time it works if everything was made well. Additionally the heads of my IPC must be cleaned by an antioxidant. After I have done this, I was able to read the disk that I have received from Joe. Now I am trying to get a 9133 HD (or similiar) running. I have two pieces, but both of them are not

detected by the IPC. An 9122 double disk drive was detected, but not the HD. I have tried everything, but not found a way (possibly the HDs are broken)

Re: HP Integral PC Info

*Message #12 Posted by **Vassilis Prevelakis** on 31 Mar 2005, 12:58 p.m.,*
in response to message #11 by Andre Koppel

a) you did not mention which TYPE of 9133 you have. The front label will prob. just say 9133, but the back label should include the letter designation. I assume you have the 9133H but I am only guessing.

b) When you power up the 9133 what is the behaviour of the two LEDs in the front of the drive?

**vp

Re: HP Integral PC Info

*Message #13 Posted by **Andre Koppel** on 1 Apr 2005, 1:19 a.m.,*
in response to message #12 by Vassilis Prevelakis

Hi Vassilis, both drives that I have tried are 9133H type drives from 1986 (if HP-numbering within serial numbers follows the know scheme). Both drives do need a while until they get running. Beginning with a red light that changes to yellow. The yellow LED looks correct for me because I have removed the floppy drive (it's broken). I have removed a floppy drive from another HP9133 in the past, the HD has worked quite well even with yellow a LED indicator, showing that's something wrong. For me it looks like if there is no red LED indicator, everything is quite well. Kind regards Andre

Re: HP Integral PC Info

*Message #14 Posted by **Vassilis Prevelakis** on 2 Apr 2005, 2:19 p.m.,*
in response to message #13 by Andre Koppel

There are two LEDs the RED (fault) and the YELLOW (access). It looks strange that the access LED is always on. Why did you remove the floppy? Mine is also broken, but I have left it in and simply not use it.

For normal operation, both LEDs should be off with the YELLOW one coming on when there are accesses to the disc.

Re: HP Integral PC Info

*Message #15 Posted by **Andre Koppel** on 3 Apr 2005, 12:02 a.m.,*
in response to message #14 by Vassilis Prevelakis

The floppy drive of one 9133 now works as replacement drive within another 9133 and the other floppy drive of a 9133 works as a replacement drive within an integral pc. The replacement drives are running quite well, but I have simply not put the broken drives into the 9133. While the floppy drive of one of my used 9133 was removed, the hd has worked quite well (even with a yellow LED glowing all the time). So I think there is no problem, running these combo drived

with a floppy drive removed. Regards Andre

```

I went and removed the floppy drive from my 9133H. The yellow LED indeed stays always on. Despite this, the IPC recognises the drive and mounts the partition.

I assume that you have tried the 9133H with another computer and it works OK. I am completely perplexed.

Mounting disc on IPC

*Message #18 Posted by **Joe Panico** on 29 Mar 2005, 8:00 p.m.,*
in response to message #3 by Vassilis Prevelakis

Actually, Les and Vassilis are both correct. The first release of the IPC was a mix resembling UNIX System 3. That required the mount disc to run. An upgrade, System V made the mount disc automatic. I wound up with both versions after I returned the computer for repair and HP gave me a System V module. I always ran V.

Joe

There is a little snippet of JavaScript code at the bottom of the home page -- it sounds like that is what's causing the reloads. Try turning off JavaScript and see if that makes the problem go away... I don't see anything wrong with this code, but then again, JavaScript is a bit of a black art sometimes.

```
<SCRIPT language="JavaScript">
```

(deleted post)

```
< !--
setTimeout ("unFrameMe()", 1000);

function unFrameMe() {
if (self.parent.frames.length != 0)
self.parent.location="http://www.hpmuseum.org/"
}
// --> </SCRIPT>
```

(Note: I had to mess up the opening comment delimiter so that it doesn't become an actual comment in this message -- looks like a bug in the forum's submission handling code. Not that that has anything to do with anything...)

Re: What's with the homepage hiccups?

*Message #6 Posted by **Eduardo** on 27 Mar 2005, 8:10 p.m.,*
in response to message #1 by deleted

Thanks for the replies.

I am now connected from home and cannot reproduce the problem. I can only surmise it was related to Javascript, as Thomas suggested.

HP 33s - Equation Solve

*Message #1 Posted by **Dan** on 24 Mar 2005, 5:55 p.m.*

Hello,

I have a 33s and when using the SOLVE for an equation I get SELECT FN instead of continuing with unkown variables.

What am I doing wrong?

Thanks.

Re: HP 33s - Equation Solve

*Message #2 Posted by **bill platt** on 24 Mar 2005, 6:27 p.m.,*
in response to message #1 by Dan

Hi,

Read the manual closely here: you must be in the equation list when you push solve, if you want to solve an equation in the equation list. If you are looking at the stack (just in normal calculator mode) and you push solve, then the machine will solve a program that is saved in the program space. Same thing goes for Integrate--it works the same way. THe machine is asking you for the program label (a letter) that identifies the program that you want to solve.

Remember, you have 3 logical spaces in this machine:

1. Keyboard, Calculator (stack) 2. Program 3. Equation list.

The variables (which are really storage registers) are available in all three logical spaces.

The program space can be interactive with the stack and with keyboard calculation, whereas the equation list can only take registers, operate, and then write to registers and/or the stack, but cannot be interactive with the keyboard control of the user.

Remember, too, that you can use equations inside programs--but that these are in the program logical space--not in the equation list, and so their interaction follows the same rules as programs. And also, the solve function will solve either an RPN expression, or an equation in a program--it is very flexible.

One more thing: you are also allowed to program the "solve" function inside a program--and it can solve an eqwuation that is saved in that program, or another program inside hte program space. There is just no way to get at the equation list from a program.

Best of luck,

And you should see some useful stuff in the archives about nuances of solving.

Bill

Edited: 24 Mar 2005, 6:37 p.m.

Re: HP 33s - Equation Solve

*Message #3 Posted by **dford** on 25 Mar 2005, 10:25 a.m.,*
in response to message #2 by bill platt

Thank you Bill.

Struggled with this for some time. The problem I found was that I was brining up the equation from the equation list and hitting ENTER to "place it on the stack". I found this is not correct. By brining up the equation in the list with the equation in the X register and then pressing the SOLVE button I am now able to solve for the Unknown variable.

Thank you again for your prompt reply.

Calculator Idiosyncrasies

*Message #1 Posted by **Michael Barry** on 24 Mar 2005, 4:14 p.m.*

I finally received my HP-80 and everything seems to be working fine, but I noticed some little idiosyncrasies with operations. I noticed the first one when I turned it on. In order to have the calculator turn on, I have to not only slide the on/off switch, but press and wiggle it a little bit when it is in the on position or the calculator will turn itself off. After I do this little maneuver it stays on and works fine - it's just a little diconcerting because I wonder if this will give me problems later?? The other idioysncrasy is with the zero key. I have to apply a significant bit of pressure to have it register and this sometimes causes multiple entries. I realize that this is part of the fun of owning a "Classic," but when does the concern rise to the level of attempting a fix. I'm sure others have similar experiences...? BTW - I love the LED's! They predate the time when I started using calculators, so this is new for me and I'm a convert.

Cheers, Mike

Re: Calculator Idiosyncrasies

*Message #2 Posted by **Jon** on 24 Mar 2005, 4:54 p.m.,*
in response to message #1 by Michael Barry

The problem of the on/off switch is caused by the old grease. You should open the calculator, clean it and apply new silicone grease. The 0 key will work perfect again if you clean the metallic part under it with isopropilic alcohol. Use a small piece of cloth impregnated with alcohol. Place it under the metallic part, press it and move the cloth until it is clean. I have done it hundreds of times with excellent result.

Re: Calculator Idiosyncrasies

*Message #3 Posted by **Michael Barry** on 24 Mar 2005, 9:04 p.m.,*
in response to message #2 by Jon

Opening it makes me a little nervous as I don't see how that can be done. Is there a simple way to get the HP-80 open without causing any damage? I would prefer to live with these issues instead of potentially damaging the calculator case.

Re: Calculator Idiosyncrasies

*Message #4 Posted by **Jeff O.** on 24 Mar 2005, 9:03 p.m.,*
in response to message #1 by Michael Barry

By all means, open the machine up. The problems you describe are common and easy to fix. Perhaps this old post may be of use.

Re: Calculator Idiosyncrasies

*Message #5 Posted by **Mike** on 25 Mar 2005, 11:02 a.m.,*
in response to message #4 by Jeff O.

Thanks for the link. Obviously, the screws in the battery compartment are easy to get to in order to remove. However, it's not clear to me on how to remove the feet in order to get to those screws. Is there a method for removing them?

Re: Calculator Idiosyncrasies

*Message #6 Posted by **Jeff O.** on 25 Mar 2005, 12:16 p.m.,*
in response to message #5 by Mike

You don't have to remove the feet, just pry up one side (the outside edge) to get at the screws. You do realize that there are also screws underneath the label (at the upper left and upper right corners, about 1 cm in from the edges) right?

Re: Calculator Idiosyncrasies

*Message #7 Posted by **Mike** on 25 Mar 2005, 1:43 p.m.,*
in response to message #6 by Jeff O.

I do realize that these screws are hidden under the label. And from what I gather, these are trickiest to deal with if one wants to preserve the label. I've heard some suggestions on how to do it, but I would be curious to hear success stories and the methodology used.

Re: Calculator Idiosyncrasies

*Message #8 Posted by **Jeff O.** on 28 Mar 2005, 3:18 p.m.,*
in response to message #7 by Mike

Here's one method. I have also heard or read of using a solvent of some kind and a fine wire or thread to sort of "saw" the label off. If you search the Forum Archives, you might find some old posts that discuss this topic.
I have no personal success stories regarding either of the above, but I have never figured I had the ability or patience to try either. I personally don't think it looks all that bad to just cut a clean hole in the label, using a sharp knife and the edges of the hole as a guide. That will sure make future repairs easier.

Re: Calculator Idiosyncrasies

*Message #9 Posted by **David Smith** on 28 Mar 2005, 5:33 p.m.,*
in response to message #8 by Jeff O.

I never try to totally remove the label. I just peel back the upper corners to expose the two screws. If you are careful and do not bend the label back sharpley, it can be hardly noticeable that it was repaired. I always leave the screws out so that future work does not risk more damage to the label.

To peel back the corners, I place a drop of UnDu (the solvent heptane) on the corner, a carefully work a razor blade dipped in more UnDu under the corner. The UnDu causes any adhesive to temporarily forget how to stick.

Usually the corners will stick back down just fine. Sometimes you have to reglue them. To do this I clean off all the old adhesive with alcohol. Then I use some Elmers contact cement. You brush the cement on the label corner and case. Don't let it pool in the label-case seam. Let the cement dry, the press down the label and rub with a soft cloth. The cement is neoprene rubber based and any excess rubs off.

Re: Calculator Idiosyncrasies

*Message #10 Posted by **Gordon** on 24 Mar 2005, 11:33 p.m.,*
in response to message #1 by Michael Barry

If you do not feel comfortable opening up the calculator for the repair, or simply do not feel like goofing around with it, I highly suggest sending the calculator to Randy at Fixthatcalc.com and let him give it a full service.

He serviced my HP67 and did a great job with it.

HP 9825B printer connection, parallel port

*Message #1 Posted by **Stephan** on 24 Mar 2005, 3:47 a.m.*

Hello!

I want to connect a HP 9825B to a Deskjet 550C via the parallel bus. The 9825 has got the I/O-Interface and I have got all the manuals for it. I opened the plugs of the Centronix-cable and tried to connect the right pins.

My question is if anyone has experience in this and could help me finish my work.

Many thanks in advance, greetings Stephan

Re: HP 9825B printer connection, parallel port

*Message #2 Posted by **Thomas Okken** on 25 Mar 2005, 11:24 a.m.,*
in response to message #1 by Stephan

IIRC, the HP's I/O interface is HP-IB, while the printer has a standard parallel printer port. On the printer side, they use the same type of plug, but it's not the same bus -- you have more to do than just figuring out which pins to connect, I'm afraid!

There are companies that sell HP-IB to Centronics converters. Just Google for HP-IB (or IEEE-488) and Centronics and you'll find several.

HP-32S vs. HP-32SII

*Message #1 Posted by **Karl Schneider** on 24 Mar 2005, 2:22 a.m.*

I just received a nice 32S today (1990, with newer Pioneer display), and explored it to find all the differences against the 32SII. There were more than I thought!

Several people dabbled at this comparison in the Forum a few weeks ago, but I can't find the posts. Since the 32SII is not yet "enshrined" in the main pages of MoHPC, no automated comparison is available. Here's what I found:

```
   HP-32S                        HP-32SII

One shift key                 Two shift keys
All menus in keyrows 3-6      Menu placement not organized
Some menus are two-level      All menus are one level
Eight conditional tests       Twelve conditional tests
(not available)               Equations: editing and usage
(not available)               Fractions: conversion and math
(not available)               Population standard deviation
(not available)               Some English-metric conversions
(not available)               x-th root of y
(not available)               Exchange x with letter variable
(not available)               Roll up
```

The 32/32SII offers a nifty programming platform for reasonably compact computational tasks: Single-letter named variables and labels, alphanumeric display, fast processor, complex math functions, program management with catalogs.

However, when entering my 32SII/33S two-bus AC power-transfer program into the 32S, I was chagrined to find that the "Exchange x with letter variable" function was missing! I successfully devised a work-around at a cost of two labels and 11 bytes.

The incomplete set of conditional tests on the 32S (consisting of the eight tests offered by the 11C and 34C, instead of the full twelve of the 15C, 32SII, and 42S) might have caused other users some annoyance.

I hope to upload that AC power-transfer program to the MoHPC Software Library soon. It's a very good application for the 32S, 32SII, and 33S.

Re: HP-32S vs. HP-32SII

*Message #2 Posted by **Raymond Del Tondo** on 24 Mar 2005, 3:01 a.m.,*
in response to message #1 by Karl Schneider

Hello,

> I just received a nice 32S today
> (1990, with newer Pioneer display)
>
So I assume your 32S has the 32SII display,

with somewhat bigger pixels,
and maybe an unused 2nd shift annunciator?

Or do you mean the recessed display
instead of the flat one with display glass?

Regards

Raymond

Re: HP-32S vs. HP-32SII

*Message #3 Posted by **Karl Schneider** on 24 Mar 2005, 3:44 a.m.,*
in response to message #2 by Raymond Del Tondo

Raymond --

Actually, both are correct -- it has the taller-pixel 12-character 7x5 LCD with the matching single shift-key annunciator, as well as the recessed, sealed, non-glare display window.

HP-67 battery advice needed

*Message #1 Posted by **Thomas Okken** on 23 Mar 2005, 3:25 p.m.*

Hi all,

A few months ago, I bought an HP-67 on eBay. I've been too busy to do anything but gaze at it lovingly since, but now I would like to actually start using it. (OK, play with it, at least!)

The problem is, I don't have a charger for it. So, I figured I'd do the same I did with the HP-25 I bought at around the same time -- which I don't have a charger for, either -- that is, I'll just take apart the battery pack, get rid of the old NiCd cells (they're probably shot anyway), and replace them with NiMH cells which I'll charge outside the calculator.

This approach worked fine with the HP-25: I managed to pry the pack apart with my fingers, so if I ever want to sell it, I can glue it back together and it will be as good as new -- I didn't have to break out the piece of plastic in the middle like you see on a lot of old Woodstocks. All I have to do is glue the thing together with a few inches of Scotch tape whenever I change the batteries.

No such luck with the HP-67 battery pack, though: I can't figure out how to pry it apart without damaging it! The plastic seems to be a lot softer than the stuff they used for the HP-25 pack; when I try to pry it apart with a screwdriver, I just end up cutting notches into it, and when I try to pull it apart with my fingers, it gives a little, and then snaps right back the moment I let go.

I'm thinking I should just build my own pack -- fortunately the Classics don't have a pack that doubles as the battery compartment door, like the Woodstocks, so it's OK if it isn't pretty -- and then, if I do it right, I'll be able to take it apart and charge the batteries outside the calculator.

I'm wondering: is there a better way? I have heard there are companies that supply rebuilt Classic battery packs -- are there any that supply battery packs that are easy to take apart, so charger-less individuals like myself can charge the batteries using a regular off-the-shelf NiMH charger?

Thanks for your insights --

- Thomas

Re: HP-67 battery advice needed

*Message #2 Posted by **Klaus** on 23 Mar 2005, 4:57 p.m.,*
in response to message #1 by Thomas Okken

Hello Thomas,

to get a new battery pack, I just soldere 3 AA type cells together (without the plastic pack). To prevent "rattling" of the pack inside the calc, you can put anything from clothes to polyfoam between the lid and the battery pack. Soldering such a pack takes 5 min, so you could solder 3 batteries together, or use NiMH and take the pack apart for charging.

There might be easier ways, but this way, you don´t need to damage the old pack!

Klaus

Re: HP-67 battery advice needed

*Message #3 Posted by **Thomas Okken** on 25 Mar 2005, 11:33 a.m.,*
in response to message #2 by Klaus

I just thought of another possibility -- you can get AA battery holders, made of some rather soft plastic and with a coil spring on one end; I think they're meant to be mounted on PCBs etc.
I played with these a long time ago, and I remember discovering that three of those holders will actually fit side by side inside a Classic's battery compartment.
The soft plastic is a pain to work with, and I think I'll need to cut the bottoms off the holders to make the whole assembly flat enough, but I think I'm going to try this -- hopefully I'll be able to constuct a pack this way, that fits inside my HP-67 **and** from which the cells can easily be removed for charging in a standard charger.

If I get something to work, I'll post a picture later on. Probably next week or so...

- Thomas

Re: HP-67 battery advice needed

*Message #4 Posted by **DavidY** on 23 Mar 2005, 5:01 p.m.,*
in response to message #1 by Thomas Okken

I've opened a couple of battery packs (mine and a friend's) and the best way seem to be to use a Xacto knife or single edged razer blade. I clamped the pack in a vise and carefully sliced along the seam. The trick is to take time, making multiple strokes along the seam and slowly cutting the welds. The first time I did one I was a bit too impatient and dinged up the plastic prying when the welds weren't totally cut. The second one I took my time and you can hardly tell.

BTW, In my unit I had replaced the NiCADs twice. I finally replaced them with NiMH batteries and after testing I found the charger handled them without problem--though it took longer to charge--but it's been working 2+years without a problem.

Re: HP-67 battery advice needed

*Message #6 Posted by **Jeff O.** on 24 Mar 2005, 7:30 a.m.,*
in response to message #1 by Thomas Okken

Thomas,

The other replies to your post describe how to open the pack and other possible replacements. One thing, the original pack is welded only along the flat ends (the ends that the battery terminals "point" to). The side seams are not welded.
As far as battery packs that you can take apart to enable outside recharging, I have never seen or heard of such a thing. To provide the necessary stability, the individual cells have to either be glued to each other or in a shell, with the necessary connections between the terminals. This would make removal and separation of the cells for charging somewhat difficult. Perhaps you could modify a standard pack to do what you need, by gluing the needed connector strips into the shell such that the batteries could just be inserted. Not sure how you would insure contact pressure, but you could probably come up with something. The shell could be taped together while in use.

Best regards, and keep up the good work on Free42!

HP 42S plotting capability?

*Message #1 Posted by **Denis** on 23 Mar 2005, 6:43 a.m.*

Hi all, I read that the hp42S have graphic capabilitys. Can the calc plot a graph like sin(x) ?? I use C.G emulator under windows, but I'm unable to find how to plot a single function. Can anybody give me a single example ?

Thanks all, -Denis.

Re: HP 42S plotting capability?

*Message #2 Posted by **Thomas Okken** on 23 Mar 2005, 8:11 a.m.,*
in response to message #1 by Denis

The HP-42S does not have a built-in function plotting facility like the 48 series, but the HP-42S manual has two programs that accomplish the job -- one that uses only the display, and one that creates a much nicer plot but requires a printer.

I have "raw" files for both programs at http://home.planet.nl/~demun000/thomas_projects/free42/42progs/; you can see an example of the printing version of the program at http://home.planet.nl/~demun000/thomas_projects/free42/82240/.

I can send you plain-text listings of both programs if you like.

HP41 NoVRAM

*Message #1 Posted by **Christoph Klug** on 23 Mar 2005, 3:40 a.m.*

Dear HP41 enthusiasts,

yesterday I get the nice NoVRAM plug in module from Diego Diaz. I prefer the following port configuration :

Port 8.....11 = ROM

Port 8 = W&W RAM-Box operating system Port 9 = EXT-I/O Module Port 10 = CCD-1B Port 11 = CCD-2B

Port 12. ..15 = RAM

NoVRAM is placed to plug in slot 1, Double X-Memory to plug in slot 2, IL-Module to plug in slot 3, plug in slot 4 is free.

Using this module configutation gives great power for HP41 system. May be we get some bank switched mcode ROM applications in future time - using the complete 24KByte ROM capacity of the NoVRAM...

Thanks a lot Diego for creating this really advanced plug in module hardware solution :-))

With best regards - Christoph Klug

Re: HP41 NoVRAM

*Message #2 Posted by **Diego Díaz** on 23 Mar 2005, 10:27 a.m.,*
in response to message #1 by Christoph Klug

Hi Christoph,

Thanks a lot for your kind words. :-)

I'm on vacation thus seldomly access the I'net. Just to point out for the rest of NoVRAM users:

The configuration above mentioned by Christoph is not possible with the standard NoVRAM-H.exe utility. I just prepared a freely configurable utility (NoVRAM-R.exe, where "R" stands for RAM-Box) that allows RAM allocation on pages #8-#B or #C-#F, as well as .ROM images loaded in the remaining pages in the range #4-#F.

I haven't got the time to make it public but I will do as soon as I get back home. Meanwhile, I grant Christoph full permission to freely distribute as many copies as requested of said utility.

Thank you all and kind regards from Seville.

Diego.

Did the "Correct' function disappear after the HP 41

*Message #1 Posted by **Gordon** on 22 Mar 2005, 10:15 p.m.*

I was going over the 41CX manual tonight and I was surprised to find the "Correct" function call to automatically adjust the accuracy of the internal clock.

As far as I can tell, such function is no longer available in the 48 SX/GX and 49G+ series, which all have fairly poor clock accuracy.

Am I missing something here? It is fairly rare that an existing function got completely eliminated (rather than recast) in a later generation machine.

Re: Did the "Correct' function disappear after the HP 41

*Message #2 Posted by **Garth Wilson** on 22 Mar 2005, 11:26 p.m.,*
in response to message #1 by Gordon

The HP-71 has it (ADJUST, AF, EXACT)

Actually, my HP handhelds' clocks have been accurate enough without it though, unlike my PC's which loses ten minutes a day.

Edited: 23 Mar 2005, 5:09 a.m.

Re: Did the "Correct' function disappear after the HP 41

*Message #3 Posted by **Gordon** on 23 Mar 2005, 6:57 p.m.,*
in response to message #2 by Garth Wilson

Thanks Garth,

I ran into the same problem on my PC, it turns out the clock backup battery was low. So if you have had it for a few years, it may worth checking and replacing the battery.

Re: Did the "Correct' function disappear after the HP 41 (O.T.)

*Message #4 Posted by **Garth Wilson** on 23 Mar 2005, 7:49 p.m.,*
in response to message #3 by Gordon

I never turn the PC off because it takes too long to boot up for how often I use it. Would the back-up battery still be an issue?

Re: Did the "Correct' function disappear after the HP 41 (O.T.)

*Message #5 Posted by **Gordon** on 24 Mar 2005, 7:39 p.m.,*
in response to message #4 by Garth Wilson

That I am not sure, I guess that would depend on the design of the motherboard.

If the machine is always on and connected to the Internet, you can always tell it to sync against NIST. This is build into to XP itself, otherwise, you can download the sync program from NIST directly and set up a periodic auto sync.

Re: Did the "Correct' function disappear after the HP 41

*Message #6 Posted by **Raymond Del Tondo** on 23 Mar 2005, 12:46 a.m.,*
in response to message #1 by Gordon

AFAIK there exist some clock accuracy related programs
for the HP-48 on www.hpcalc.org.

HPIL via USB : a propose for emulators

*Message #1 Posted by **Claudio** on 22 Mar 2005, 3:08 p.m.*

Hi everyone (and excuse me for my bad english),
I think that all we (HP41/HP71/HP75 fans) will be in front of several troubles in the near future.
Indeed we are all migrating (before or after) our PC to the next generation of motherboard/cpu. So....**goodbye ISA slot!!** And.....**goodbye HPIL PC interface!!!!! :-(((**
And the PCI slots are going away too (will we have PCI-Express slots only???). Furthermore not all we will be able to maintain a second working PC for this purpose only. So I think that we must think about some alternatives.

I suggest that a effective option could be a little and portable USB interface. With this little piece of hardware we could travel from one PC to another, with only our beloved HP's calculator and a USB-Disk with the wonderful Jean-Francois's "Emu41"!!

Despite my medium knowledge of hardware and software, I don't know if this is a possible way. But I'm sure that however we need some solutions!

What do you think about this idea?
And are there some people able to realize this?
(**I haven't any doubt about Jean-Francois's and Christoph Klug's competence.....so if they want... ;-)**

Re: HPIL via USB : a propose for emulators

*Message #2 Posted by **peter** on 22 Mar 2005, 5:39 p.m.,*
in response to message #1 by Claudio

There is a company out there which produces for 100 USD an interface from ISA to USB in a nice little enclosure. I have forwarded their info already to Christoph for his expert opinion. here is a link to the product for those so inclined to check it out: http://www.arstech.com/usb2isa.htm.

Cheers

Peter

Re: HPIL via USB : a propose for emulators

*Message #3 Posted by **Bill Wiese** on 23 Mar 2005, 1:36 p.m.,*
in response to message #2 by peter

As I recall it, the HP-IL PC link card required, minimally, an 8-bit ISA slot on a PC.

So if your PC didn't have an ISA slot, you can't do HPIL anymore (unless there was a 3rd-party serial<->HPIL converter).

Also, this required an application+driver that I think runs only under a real DOS (not Windows emulation

thereof).

If HPIL chips were available still, these could be wired to another small microcontroller (8051, 68HC05/11, PIC, MSP430, etc.) to achieve 'outside world' connectivity for HPIL.

As I recall, HPIL controller chips were really just programmed 8048? 8044? chips using some special features of their serial ports (addressability etc). There also must've been some analog line driver considerations too. The firmware could probably be extracted from these chips and ported/modified to another CPU that had a similar very flexible serial port.

Bill Wiese San Jose

Re: HPIL via USB : a propose for emulators

in response to message #3 by Bill Wiese

> Quote:
>
> As I recall, HPIL controller chips were really just programmed 8048? 8044?

All HP-made HP-IL peripherals, and most (if not all) third-party peripherals, used HP's custom CMOS 1LB3 HP-IL interface chip, or the 1LR4 which replaced it. The 1LB3 is an 8-bit peripheral chip with eight addressable registers. It is conceptually akin a UART, HDLC controller, FDC, or the like, except that the interface out the other side is HP-IL. The chip takes care of all of the HP-IL timing and much of the protocol.

The peripherals also all contain a microprocessor. HP variously used the MK3870, 8048, and 6809, though really any microprocessor or microcontroller could be used.

At one time, National Semiconductor was going to second-source the 1LB3 as the NSC851. A data sheet was published, but AFAIK the part did not actually get introduced.

Since the 1LB3 and 1LR4 have not been made for many years, they would not be a good design choice for any new HP-IL devices. Most of the equivalent functionality of the 1LB3 could be implemented today in a small FPGA (e.g., Xilinx XC3S50). A comparator for receive and an opamp for transmit would probably be necessary to meet the required waveshapes given in the HP-IL specification.

I believe I understand the HP-IL protocol and the 1LB3 operation sufficiently that I could implement the digital portion of an FPGA-based replacement, but I do not have time to do so unless I can come up with a way to make some money on it (e.g., if people would actually buy a USB-to-HP-IL interface box that would work with simulators).

Re: HPIL via USB : a propose for emulators

That sounds interesting:-)

I think 'd buy such an interface if it's somewhat affordable.
If only a modular win32 version of Emu41 would exist...J-F?

Regards

Raymond

Re: HPIL via USB : a propose for emulators

*Message #6 Posted by **Marcus von Cube** on 22 Mar 2005, 5:45 p.m.,*
in response to message #1 by Claudio

Good Idea but not an easy task!

One problem is that USB needs operating system support on the PC which is not available under (emulated) DOS. Emu41 runs under DOS and needs a major redesign to operate under Windows.

Would it be an option to attach HP-IL to an ordinary serial port? Serial interfaces should be quick enough for HP-IL traffic and can be replaced by USB/RS232 converters on newer machines. If the HP-IL needs power that con only be supplied by USB, the internal design could nevertheless be based on a regular COM port, i. e. the USB to RS232 converter could be part of the design. The main advantage would be that this port is still recognized by modern operating systems as a COM port, hopefully reachable from DOS applications.

Re: HPIL via USB : a propose for emulators

*Message #7 Posted by **Raymond Del Tondo** on 22 Mar 2005, 6:49 p.m.,*
in response to message #6 by Marcus von Cube

Hi,

there exist some HPIL-to-serial converters,
the most common is the 82164A box from HP,
and compatible devices from FSi and CMT.

But I don't know whether this device
can be controlled from the serial side.

However, there also exists another serial-to-HPIL interface,
which is actually controlled from the serial side.
It was originally made to help customers
to get their data files from an HP-IL device
into the HP-48SX, or in other words, as a migration tool.
For this task there is a special HP-48 library
which includes all the HP-IL module keywords needed.

I demonstrated that device on the 2004 Allschwill meeting,
where we sent data back and forth (both directions) between my
HP-48G+ and Jean-Francois Garnier's HP Portable Plus PC *via HP-IL*.

Before you ask: No, I don't have any further
technical info on this device except the user manual,
which only covers the keywords, not the technical aspect.

And the HP-48 library is nearly twenty KB in size,
with much code written in assembly language.

I think the best solution would be a portable USB-to-HPIL interface,

combined with a software layer which adapts Emu41's HP-IL features to USB.

Regards

Raymond

My concern about the use of RS-232 is that serial and parallel interfaces too ... **are going away! :-(**. Perhaps not so quickly, but the motherboards manufacturers think that these are obsolete interfaces!
I think that the only actual interface that will have long life into ours PC is USB interface.

About the use of USB from DOS, I don't know if it's possible to do, but I remember that exists some programs. You can find them with Google searching for "usbaspi.sys" and in some pages at http://www.freedos.org/.

May be I missed the point, but I bought recently a USB2COM device to connect my HP200LX with my XP "abacus". The LX acts as server and the laptop acts like an HP-40G using Emu48. Of cause, Emu48 is not a DOS program, but why should a DOS-emulation _not_ be able to access the COM port?

Ciao.....Mike

Claudio wrote: My concern about the use of RS-232 is that serial and parallel interfaces too ... are going away! :-(. Perhaps not so quickly, but the motherboards manufacturers think that these are obsolete interfaces! (end quote)

The consumer PC industry is tunnel-visioned on non-technical desk-top applications. I think they probably want the older interfaces to go away, and they certainly don't want to be bothered with any of us who have legitimate uses for something other than what they've dictated we should need.

Last year there was an editorial in one of the electronics industry magazines announcing that RS-232 was dead. I believe it was written by ECN's Aimee Kalnoskas. She got quite a flood of responses from people in industry telling why other options were not options at all for them in their work. She had to retract the "death certificate" she had written.

To respond to another post however, even though RS-232 does not have a dedicated power conductor, it definitely supplies enough power for running an interface converter to HPIL. I regularly use Radio Shack's mini tester with seven bi-color LEDs which get lit up plenty bright in spite of the fact that those older bi-color LEDs were very inefficient. The tester has never loaded

the lines enough to be any problem to the data getting through. I have seen hand-held terminals advertised that were operated only on the power they scavenged off the RS-232 connection to the host computer.

I don't have any problem however with keeping an older computer along with the newer. I have two here, and use a switchbox to select which one the keyboard and monitor get connected to. (I do have two mice though.) I keep much of the important company work on the one that does not have internet access, which has proved extremely valuable when I was hit with a virus on a couple of occasions.

Actually I have a lot of devices that are connected to the RS-232 ports. I have 3 switchboxes to use these devices!!
And I'm concerned about my next PC. Sure it will have only one RS-232 port!! :-(((
However I'm sure that like in the past, when consumer PC industry will decide to move from serial interface we will have no chance and no choice!! :-(((

Fortunately there will always be companies like Sealevel Systems, Inc. www.sealevel.com and B&B Electronics www.bb-elec.com who provide solutions to the kind of problems you're talking about, regardless of the computer's internal bus type. In fact, I just saw an ad for Sealevel yesterday showing their internal USB-to-RS232 converters that take a slot in the back of the computer but don't actually plug in to any bus. They're only suspended by the little sheet-metal thing that's at the end of normal plug-in boards. I think many of the solutions you'll find however are external, and so can be used even with a laptop that has no place to add a card.

Hmmm... how about a Nonpareil version (including HP-41 simulation) developed with GTK+ that runs under Windows and Linux?

Nonpareil currently supports the 41CV, but doesn't yet save state to disk. I'm working on that.

The Windows port of Nonpareil is now mostly functional.

Re: HPIL via USB : a propose for emulators

*Message #19 Posted by **Meindert Kuipers** on 23 Mar 2005, 3:11 a.m.,*
in response to message #18 by Ángel Martin

The MLDL2000 indeed has USB, but this is not an emulator but the real thing with USB! So far USB can only be used for up- and downloading ROM images, but with the proper support on the HP41 (a ROM has to be made for this) is is pretty easy to exchange information between the HP41 and the PC, but this requires PC software as well, for example to 'simulate' mass storage or the printer.

BTW, I am waiting for a new quote from the PCB manufacturer to confirm pricing, and then the MLDL2000 will be offered to the community.

Meindert

IL device on PC

*Message #20 Posted by **Mike (Stgt)** on 23 Mar 2005, 3:58 a.m.,*
in response to message #19 by Meindert Kuipers

There exist two programs that act as IL-console via COM port from Hrastprogrammer. Then (IMHO) JF's emu41 and emu71 are quite advanced interfaces for IL signals to the PC paltform. So big parts of the puzzle are ready, we need just some glue to put them togehter.

Ciao.....Mike

USB on MLDL-2000

*Message #21 Posted by **Mike (Stgt)** on 23 Mar 2005, 3:14 a.m.,*
in response to message #18 by Ángel Martin

Yes, but it is not a IL device.

BTW, I'll buy a MLDL2000 as soon as it's available. Meindert - where do I have to queue up?

Ciao.....Mike

Re: HP-IL/PC interface card

*Message #22 Posted by **Christoph Klug** on 23 Mar 2005, 4:52 a.m.,*
in response to message #21 by Mike (Stgt)

Dear HP41 enthusiasts :-)

Thanks for your interest about HP-IL/PC interface card and about EMU41. You are right, a HP-IL / USB interface would be a future orientated system solution. May be there is someone in the handheld computer world, who creates such a modern solution. But up to now the old fashioned HP-IL/PC interface card is the proofed reference system for HP-IL / PC interfacing.

SOFTWARE :

Some different software tools exist for HP-IL / PC interfacing : The classic Link Plus and TRANS41 software and the fantastic EMU41 and EMU71 from Jean-Francois Garnier. Some handheld computer collectors run different software solutions for different handheld computer systems. The software packages above support HP41, HP71 and HP75. Furthermore EMU41 and EMU71 are able to control different HP-IL devices like IL-Plotter, IL-Voltmeter, IL-Mass storage and so on. A modern HP-IL / USB interface solution have to sum up the complete range of features form the well known software solutions above.

HARDWARE :

The actual users of the HP-IL/PC interface card own and uses some HP handheld computers : Minimal they have two handhelds available, in most cases some more machines, and some own a great number of handhelds. This users are advanced users, power users, enthusiasts, collectors, professionals and last not least also fans of nostalgic computer systems. This specific group of people have available some handheld computers – and also some PC hardware. For this group exist minimal one PC, which includes the needed ISA-Bus. If not, they buy an old PC including ISA-Bus from a garage buy next door for really less money. At the other hand, for professional PC users, the ISA-Bus is an industrial standard, which is supported also by modern industrial PC hardware. The reason behind this is, that much exotic industrial computer applications exist which includes ISA-Bus based hardware. This applications are running for much years, and there is no idea to change or replace them by new solutions. In fact there exist some professional / industrial applications, using the HP-IL/PC interface card for measurement, control and data logger applications, and for replacing handhelds by PC hardware.

CONCLUSION :

A modern solution like a HP-IL to USB interface would be nice to have, today the actual existing ISB-Bus based solution would be the reference solution. Remember that the group of handheld users and enthusiasts is limited – and most of them use the actual solution with great benefit and success. Therefore the story of the HP-IL/PC interface card also will go on to future times, and some more handheld computer enthusiasts will start to work with this solution. May be we get additional RS232 support for EMU41, this item have highest importance on the add on feature list for Jean-Francois Garnier.

With best wishes – Christoph Klug

Quote:

> today the actual existing ISA-Bus based solution would be the reference solution

I'm sure that this is real. I haven't any doubt that professional users will continue to use this standard solution, with ISA slots into their PC.

> Quote:
>
> For this group exist minimal one PC, which includes the needed ISA-Bus

Instead IMHO this is the problem. Enthusiasts and collectors HP users (not professional with HPIL data sampler, logic analyzer etc..), wants to use their calculators, but wants to upgrade their PC too. And not so much people can maintain active 2 computers (i.e. think at the space at disposal for our hobbies in our little houses...).
COM ports can be a good temporary solution, but IMHO only USB can be a long stable solution.

The final target would be a system exactly like the actual (Emu41 - HPIL emulation of mass storage/display/print - PC interface - HP Calculators) with the only change between PC interface and HPIL-USB interface.

Just my 2 eurocent... ;-)

*Message #27 Posted by **Richard Garner** on 23 Mar 2005, 10:53 a.m.,*
in response to message #26 by Claudio

I wouldn't be too sure about USB hardware not becoming obsolete over night. I have seen in the CAD industry new hardware being supported by CAD software in the current version of the software, being unsupported in the next version of the software. Have you ever had to explain to your boss that the Top Of The Line $15,000 plotter that your company bought last year (which has only been in production for 2 years) is now unsupported by the $2,000 CAD software upgrade the company just bought? I had to do that once with a $2,000 digitizer not a plotter. But I thought the plotter would make a larger mental impact.

Re: HPIL via USB : a propose for emulators

*Message #28 Posted by **Mike (Stgt)** on 23 Mar 2005, 11:22 a.m.,*
in response to message #26 by Claudio

Do not take all of my append too serious. I just discussed COM/USB/FierWire with a colleague and he mentioned the chance that there may be a change in future just to give the industry a chance to sell new devices.

> Even if IMHO a fast transfer rate is full useless with a transfer rate like slow HPIL! ;-)

HPIL with the HP-71 was much, much faster than the standard RS-232 speeds (although now I've seen some RS-232 up to about 1Mbps), but modems in its heyday were generally 2400bps, IIRC. But who cared? Modems were mostly used for BBSs for plain text which you couldn't read as fast as a 2400bps link could bring you the info anyway. As long as we're not transferring bloatware (which our dear little HP handhelds hopefully will never have) or music files or large, hi-res graphics, HPIL should remain fast enough.

Re: HPIL via USB : a propose for emulators - USB etc not dead!

*Message #30 Posted by **Bill Wiese** on 23 Mar 2005, 1:29 p.m.,*
in response to message #29 by Garth Wilson

Folks...

Mainstream PC hardware - both desktops and laptops - will increasingly have BOTH USB2.0 and IEEE1394 (Firewire) ports. Most of this functionality will be included in the motherboard support 'chipset' - only the 'PHY' physical analog/line-level interface chips may be external.

Lower cost PCs may not actually bring the connector out of the motherboard, but the motherboard silicon will likely have these features. The amount of silicon area required for these in proportion to other features is minimal: most of the cost will be for the connector(s)!

Yes, you're seeing RS232 and parallel ports unfortunately being dropped. There will always be aftermarket PCI, USB, 1394, etc. cards + drivers available to support these necessary evils though. For PC peripherals like printers, scanners, disks, etc. a faster connection than what's offered by legacy connectivity (RS232, parallel) is very useful today though I'm not sure I'm fond of all the software layers + drivers involved (!!)

I do note that quite a few RS232-via-USB converter widgets do have some problems and that some are much better than others. If one doesn't work for you in your application try another that uses a different brand of chip. [A variety of these products from different mfgrs sometime all use the same chip!]

I myself am a fan of ethernet - and silicon is getting cheap. If I had things my way, every non-keyboard/non-mouse device would be a 'smart' web-enabled device on ethernet, have its own webpage+webserver for configuration, etc. PCs would have built-in ethernet switches/routers and local devices (printers, ext. disks, etc.) could be on a separate tree from external connectivity links.

But in its standard configuration it doesn't supply power to the devices, the cables are stiff and RJ connectors aren't built to last for years :-(

Ethernet is OK for stationary equipment (PCs, printers, routers, PBXs and the like) but not for the standard peripherals (keyboard, mouse, HP-41C).

Could Bluetooth be a better solution? It's not very power hungry, would fit in a standard HP-41 expansion housing, ...

USB is pretty brain-dead and too complex. I've been dealing with some 1394 stuff (RAM disk prototype) and it's more graceful - though the PC 1394 driver can be a bit lame.

My dream: Ethernet everything.

Not really. Typically the best you could get about about 50 Kbps, while serial ports at that time would commonly work at up to 115.2 Kbps.

Re: HPIL via USB : a propose for emulators

*Message #35 Posted by **Garth Wilson** on 24 Mar 2005, 5:43 a.m.,*
in response to message #34 by Eric Smith

My understanding was that HP-IL with the 71 could do 5,000 data bytes per second, not including overhead bytes, and that the IL spec. limit was 8,000 bytes per second. The "standard" RS-232 speeds I was referring to were the 19,200bps and down that you could specify in the DOS "MODE" command, for example, MODE COM1:9600,N,8,1,P

The HP-41 could only do about 150 bytes per second on HP-IL IIRC.

Re: HPIL via USB : STATISTICAL SURVEY

*Message #36 Posted by **Claudio** on 24 Mar 2005, 4:57 a.m.,*
in response to message #1 by Claudio

I'm happy to see that perhaps this is one of the most interesting matters for HP's calculators enthusiasts.
I can see from all these posts that exist several and valid proposals:

1. ISA-USB adapter;
2. HPIL-USB interface;
3. HPIL-COM adapter;
4. HPIL-Firewire interface;
5. HPIL-Ethernet interface;

I'm not full convinced about the simplicity and the portability of the solutions number 1 and 5.
My preference is still for **HPIL-USB interface**, however IMHO the most important thing is that **someone realizes one solution**, and not the kind of solution.

So I propose to do a little game: we can declare our preference and our availability to pay some money for a solution that allows to work exactly like the actual Emu41 with the HPIL-PC interface.

I'm available to pay some money like 50 Eur for a Windows/Linux software like Emu41 with HPIL emulation via USB. And I'm available too to pay other 50 Eur (more or less) for a simple HPIL-USB interface.

Re: HPIL / PC Interfacing

*Message #37 Posted by **Christoph Klug** on 24 Mar 2005, 6:06 a.m.,*
in response to message #36 by Claudio

Dear HP-IL enthusiasts,

I am really enjoyed about the great response of members of the HP-Museum forum about IL/PC interfacing. I think, most of the users, who are discussing this subject are also active users of the EMU41 & HP-IL/PC interface card solution. Seems to be, that handheld computer / PC interfacing have a key function for the today activities of handheld computer enthusiasts :-)

Remember, that a new and modern IL/USB hardware solution also have to replace the classic IL-Transformer and IL-Chip by using modern hardware parts. Furthermore the wanted Windows version of EMU41 would include a complete new software development process. Therefore the whole project grow up to high dimensions - independent of the realised interface type like USB, Firewire or something else, which is acting as gateway to PC world.

Comparing the future hardware design of the IL/USB interface with actual hardware projects like CLONIX, NoVRAM or MLDL2000, the price for an IL/USB interface would be placed in the range of 200 Euro. May be there exist a small group of 20 people up to maximally 50 people worldwide, who would

take and use a future IL/USB interface solution ???

Last not least – anything you can do with this future hardware & software system solution, is already available today. You only need the reference EMU41 & HP-IL/PC interface card plus low price PC hardware, which includes the old fashioned ISA-BUS…

With best regards – Christoph Klug

Re: HPIL / PC Interfacing

*Message #38 Posted by **J-F Garnier** on 24 Mar 2005, 7:14 a.m.,*
in response to message #37 by Christoph Klug

Hello all,

I think I have to give my own point of view regarding this interesting discussion.

My first level answer is that if you have some interest in old calculators and computers (especially HP, like me), you *should* have an old PC with ISA capability. I personnally still use my early HP Vectra (286@8MHz) for this purpose. So I share Christoph's opinion that the current ISA board should be the prefered solution for most of us involved in old hardware.

BUT I can understand that it would be convenient to have physical HPIL capability on modern PC without ISA support. Since a long time I think to develop a smart RS232/HPIL converter to let a computer (whatever type or OS) controls the HPIL from any serial port. From the discussion I see now that USB would be a better choice, but I don't have any plan to support USB.

Be sure that I'm thinking to solutions, and I may have some news for all of you in the next months!

Best regards to all!

Jean-Francois

Re: HPIL / PC Interfacing - EMU41 & RS232

*Message #39 Posted by **Christoph Klug** on 24 Mar 2005, 8:30 a.m.,*
in response to message #38 by J-F Garnier

Dear Jean-Francois,

Thanks a lot for your statement about HPIL/PC interfacing. Because I am realist, therefore also for the next time we take EMU41 as the reference. At the other hand I am also a creative and fantastical dreamer or visionary, actual I prefer small steps of progress. Therefore implementing basic RS232 features to EMU41 would be a great support from your side. We discussed this item about future software features for EMU41 during the last Allschwil meeting.

By using the HP-IL/RS232 interface we get an alternative transfer gateway between PC and handheld computers – independently of the HP-IL/PC interface card. May be, in a second step it would be possible to expand this new link also by a RS232/USB interface, helpfully for modern laptop or notebook PC´s.

With best wishes for Eastern – Christoph Klug

Re: HPIL via USB : STATISTICAL SURVEY

*Message #41 Posted by **Peter** on 24 Mar 2005, 9:46 a.m.,*
in response to message #36 by Claudio

I think that is a fabulous idea, I'm in as well for the same solutions (some way to connect HP to PC via USB) and the same amounts (50 Euro).

While I agree with Christoph about the availability of ISA on an old computer, I'd like to throw in a couple additional thoughts:

1) For no appearant reason (maybe it has to do with the shoe-box sized appartments in New York) the female member of the household (aka 'The Boss') has strong objections against wire and techno creep in our place. While I get already trouble for a thing the size of the HP 41 ("Why do you need two of them? Only because one has a C and the other a CX? here, I draw an X on the firts one...") I can't imagine the brownie points I'd loose for logging in a second computer ("So this one is much faster than your curren one? no honey. But it has better software? No honey. it helps me cooking? No honey...)

2) I actually use my HP for work and I do travel with my laptop. So I'd really like to be able to have a way to connect the HP to my PC while traveling. For play and also for work (e.g. I'd like to use the PC to download prices of securities from the internet and send it over to my HP as I need them in calculations). So for that a HP-IL to USB interface would be fabulous.

Again, notwithstanding the very sensible arguments from Christoph and others, just thought I throw out a couple more points to ponder.

Cheers

Peter

Re: HPIL via USB : STATISTICAL SURVEY

*Message #42 Posted by **Meindert Kuipers** on 24 Mar 2005, 3:17 p.m.,*
in response to message #41 by Peter

I like this discussion. After all, I seem to be the first who really has connected the HP41 to USB ;)

The big question here is: what do we want the USB to do, or better: do we want a USB Host interface (very complicated, especially in software) or a USB device (very simple). For example controller a USB printer from a calculator will require a very complex software stack.

When developing the MLDL2000 I wanted to have just a fast, cheap and easy conection between the HP41 and the PC world, so the PC could take care of printing, storage, backup etc. The MLDL2000 used an FTDI 2232C chip that comes with free drives, example programs and a very simple interface to any hardware. It costs about EUR 8 in small quantities, an small EEPROM, XTAL and a few R's and C's. There is hardly any software required on the '41, and the PC software is not extremely complex. I just cannot connect a memory stick, printer, USB disk drive or my digital camera to the HP41.

A USB device to HP-IL would be pretty simple and not exensive at all. Christoph should be able to give an idea of the cost of the IL part.

Before we make something, let us first find out what is has to do.

BTW, I like Ethernet too, just a bit more power hungry than USB, because USB can be powered from the cable ....

in response to message #44 by Claudio

Claudio,

The FTID website has some information, appnotes and programming examples. For communication with the MLDL2000 I use the FT2232 in MPSSE mode through the D2XX driver. The specification of the MLDL2000 explains the timing in some detail.

Meindert

This is a very interesting discussion topic for me, and I agree that we need to define the use for an interface.
I would be very interested to buy either an HP-IL to USB or HP-IL to RS232.
My use would be to transfer programs and data files between the PC and my HP-71B (also HP41). If I could also use the PC printer direct from the 71B then that would be a nice bonus.

So if anyone is willing to develop the interface I will buy!

Handheld Calculator Power Supplies

*Message #1 Posted by **John Limpert** on 22 Mar 2005, 2:46 p.m.*

I was recently given a TI-55 calculator. One of its interesting features was a dc-to-dc converter module in the battery pack that converted the 2.4V from the two NiCD cells to 9V to run the calculator. The previous owner had replaced the battery pack with an ordinary 9V battery.

I can't recall ever seeing an HP calculator with a dc-to-dc converter in the battery pack. HP's battery packs always appeared to be simple assemblies of NiCD cells. The dc-to-dc converter, if any, was located on the main printed circuit board.

Not having opened many of the calculators that I've owned over the years, I was curious about which HP models ran directly off the batteries and which ones needed a dc-to-dc converter for a voltage boost and possibly voltage regulation.

I've noticed that HP's graphing calculators do not seem to be afflicted with a problem that I've noticed in TI's graphing calculators, an LCD display that fades as the batteries are losing their charge, requiring the LCD contrast to be adjusted. Which suggests that HP uses a voltage booster/regulator and TI doesn't.

Re: Handheld Calculator Power Supplies

*Message #2 Posted by **Katie Wasserman** on 22 Mar 2005, 10:40 p.m.,*
in response to message #1 by John Limpert

All the HP LED display calculators had an internal dc-to-dc converter. I've opened many pre-LCD handheld calculators to fix them and/or replace the nicad batteries. The TI's are the only ones that I've come across with the dc-to-dc converter in the battery pack -- it was a nifty idea. But it had one huge drawback: the charge would drain off exceptionally quickly (much faster than the nicad's self-discharge time) because the conversion circuit would drain the batteries even when the load was zero.

Moreover, aside from the HP's and the TI's very few calculators even had removable battery "packs". The early Sanyo and Sharp models are notable exceptions.

Re: Handheld Calculator Power Supplies

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 23 Mar 2005, 10:29 a.m.,*
in response to message #2 by Katie Wasserman

The really huge drawback of all the TI battery packs which used dc-to-dc converters was that Ni-Cad cell leakage or outgassing would destroy the printed circuit paths on the converter board (and in some cases the wiring from the cells to the converter board) with the result that the battery pack could not be repaired by simply replacing defective Ni-Cad cells.

Of course the plastic container would also reduce the corrosion to the rest of the calculator.

You can make a DC-DC converter much more easily than repairing the whole calculator.

I have an HP-67 with immaculate shell (essentially unused), but all the internal components are completely corroded.

*Message #5 Posted by **Palmer O. Hanson, Jr.** on 23 Mar 2005, 11:01 p.m.,*
in response to message #4 by Vassilis Prevelakis

Are we talking about the same battery packs? The battery packs used in the TI-55 has two AA size NiCad cells and the dc-to-dc converter which generates the nine volts used by the calculator all inside the battery pack envelope.

The BP-7 which is used in the TI-55, TI-57 and TI MBA has a dippy little three pin connector. To use a standard nine volt battery in those devices the user has to fabricate some sort of adapter. The BP-8 used in the TI-30, SR-40 and Business Analyst I has the same internal configuration as the BP-7 but has a standard nine volt connector.

Daily use of a Classic

*Message #1 Posted by **Michael Barry** on 22 Mar 2005, 11:18 a.m.*

Does anyone in this forum still use any of the Classic calculators on a daily basis? As you can see by my earlier post, I recently purchased an HP-80. I have been considering using it at work. I do most of my number crunching on my PC, but I am still tied to my HP-12c for some quick and dirty calculations. I would love to switch to the HP-80, but I don't want to burn it out - if that's possible. Any thoughts?

Re: Daily use of a Classic

*Message #2 Posted by **Richard Garner** on 22 Mar 2005, 12:39 p.m.,*
in response to message #1 by Michael Barry

I have a 48GX at home and at work. The 48 at work gets used a lot for unit conversion from old property deeds. The 48 at home does not get used often. If I need to do some calculations at home, I reach for my 42S or my 41CX. These are the 2 that I use the most. They are the easiest to program for things on the fly.

Re: Daily use of a Classic

*Message #3 Posted by **Jeff O.** on 22 Mar 2005, 12:55 p.m.,*
in response to message #1 by Michael Barry

I say use it!
I have seen many classic (35,45,55,65,70,80) models that obviously saw very heavy use in their day that still work. I doubt that you'll wear your 80 out. From what I have heard, the LEDs dim with time, but I think that is due to age more than use (experts, feel free to correct me on that). The ON/OFF switch probably sees the most wear and tear. If you take the machine apart and clean and lubricate the switch once in a while (instructions available on request), the calculator should work for a long time.

PS - the above advice is guaranteed to be worth what you paid for it, so follow at your own risk :-)

Re: Daily use of a Classic

*Message #4 Posted by **marais** on 22 Mar 2005, 1:19 p.m.,*
in response to message #3 by Jeff O.

I use a 28C at work all the time, and a 97 on my desk at home. I also have a 12C and a 41C in use. My 16C was my companion at work for many years and became obsolete about 10yrs ago. And on rare occasions I dare to travel with my 15C, if I know I have to deal with complex numbers (quite common in eddy current NDE). I'd like to be able to keep a more precious machine at work, but I'm too scared about theft. I never worried about wear and tear.

Andreas

in response to message #1 by Michael Barry

Good evening Michael,

Using a different Hp calculator every single day of a month is my objective.

However, there are times where quality and reliability push me to use the same model every day on a long timeframe.

And this model is the Hp 80 (version 1). The keyboard is not cluttered, keys are contrasty, no need of a gold bezel to do finance calc, NiMh rebuilt batteries that last hours, ...and.....guess what.....correct answers to my everyday problems.

If you seek a reliable no-fuss calc, stick to your Hp80, it has calculated my house monthly loans and the number of days my daughters have lived till today.

And yes, it can also calculate logs, nth root of numbers and do linear regression...

Get a nice leather case, charge the battery and enjoy !

And congrats from another Hp80 lover !

```
Michael Barry wrote:
> but I am still tied to my HP-12c ...
```

I have news for you :-) The 12c **is** a classic calculator. Have you read the manual? Even on brand new 12c calculators, the examples still use late 70s era interest rates, etc. BTW the manual itself is classic as it still carries the early 80s copyright (and still gives advice on changing the batterieS, rather then the single battery used in the "new" 12c).

Anyway, to answer your question, I use my "classics". I love my HP-97 (I loved it back when it was new and could not afford it, now I have 3 and use them regularly). Of course I also use my HP-41CXs and my HP-19Cs (I used to own an HP-19C back when it was state of the art, but had to sell it to buy my HP-41C, which I still own). Now, thanks to eBay I have my HP-19C back.

BTW although not calculators as such, I still use my HP-85 and my HP-IPC in my "retrolab"

Best Regards

*Message #11 Posted by **Arnaud Amiel** on 23 Mar 2005, 4:58 a.m.,*
in response to message #1 by Michael Barry

I have a 45 on my desk at work. It is the one I use most of the time. I have no problem with it and although it is older than me, it does nearly all I need from a calculator. I have a dozen other hps in the drawer of my desk but the 45 (I guess the engineers' equivalent to the 80) is the one on the desk. The others just come out once in a while.

Arnaud

PS: when I am stuck I usually take the 49g+. It is also the one I use for fun

Re: Daily use of a Classic

*Message #12 Posted by **Garth Wilson** on 23 Mar 2005, 5:58 a.m.,*
in response to message #1 by Michael Barry

> Does anyone in this forum still use any of the Classic calculators on a daily basis?

Absolutely. To me my HP41cx's value is in its practical usefulness, not nostalgia or historic value (yet). Since most interfacing to instrumentation was taken over by my 71 and other computers, I definitely would not pay

the 1986 price again today for another 41 and various modules, but it is nevertheless a very good unit that gets daily use.

One thing I wrote for the 71 was a full-featured, veratile text editor. I used to do a lot of typing on the 71 until they discontinued it, and then I decided I better not wear out the keyboard because there wouldn't be any replacements coming. I never have had any key problems though.

Until recently I carried an HP10C in my briefcase at work but I recently replaced this with an HP11C as I was all too often frustrated by the limited conditional tests and absence of subroutines.

At home on my desk I have an HP34C and an even older (circa '79) HP32E on the shelf just above, both are still used regularly...

Mike T.

Re: Daily use of a Classic

*Message #16 Posted by **Maximilian H.** on 23 Mar 2005, 9:50 a.m.,*
in response to message #1 by Michael Barry

Hello!

My first post here, I think ... although I have been reading silently for some time - many thanks to everybody for all the precious information so far!

Yes, I too am using classic (mostly HP) calculators daily and it does not seem to harm them much.

I'd love to be able to really use them for my work (mostly engineering software development and consulting with some flying in between) - but the machines we work with perform more computations in one second than a classic calculator in 100.000 years, and the customers tend to be in a bit of a hurry novadays!

On most days I take a HP-25 with me, which I think is my favourite among my small collection of classical

pocket calculators. Today I have a 48SX in my bag (not a real "classic" in my opinion, since it has an LC display!). Incredible thing, the 48, I always feel a bit sorry, that I waste its capabilities on summing up working hours and other ridiculous tasks.

Greetings, Max.

*Message #17 Posted by **bill platt** on 23 Mar 2005, 11:18 a.m.,*
in response to message #1 by Michael Barry

Hi, When I am involved in a project which requires frequent conversion of units -- which sometimes cannot be "neatly handled" in a spreadsheet etc, then I put my 11c or 15c as primary on my desk. With the "User" feature, I have 5 one button routines (plus one more with R/S if the machine is at line 000). That they are all in a row (top row) makes it even sweeter. It is just so *satisfying* to use in that context--more so than any other machine--even the 48, which I can have a soft menu to do the same thing, takes too long to "set up" to do this, and it is somehow less satisfying.

I waffle back and forth for primary on the desk. For some weeks, I'll really enjoy the 27s--especially if I am working with a bunch of equations---so cool on that machine! Other times, I will be on the 48gx. Then I'll go for a long time on the 32sii. Occasionally I'll even be infatuated with the 30s (I know--how!) for its huge clear display and "direct" equation method).

And the 20s also.

I have a 45 which I need to rebuild hte battery for, and then it will live on my desk!

I think it is in some ways good for the brain to go back and forth between using the 30s style, to RPN. It is good for the head because it keeps you thinking of ways to set up the problem in your head, rather than merely punching buttons....

Regards,

Bill

I have around half a dozen HP41 machines that get used all the time (one upstairs, downstairs, workshop, each car). I also use HP97 and HP9100 desktop machines.

When my company went public, I gave an HP80 to one of the finance/stockbroker guys that we worked with. He showed it to a friend, etc and I wound up supplying over a dozen people with them. Sadly, MANY of them had offices in the World Trade Center...

Re: Daily use of a Classic

*Message #19 Posted by **Paul Brogger** on 24 Mar 2005, 12:10 p.m.,*
in response to message #1 by Michael Barry

Well, I can't claim "daily" use, but my 97 is on my desk at work, as is my 34C. At home, I've got a 31E.

Those are the units I put to use for the odd calculation. Norm has convinced me: if it don't have LED's, it ain't

very "classic". (But then, I've never had a working 41, and so haven't yet fallen under its spell.)

41CV keypad

*Message #1 Posted by **Rob Cook** on 21 Mar 2005, 6:04 p.m.*

I have bought a 41CV and the R/S button is not working properly, It requires alot of pressure to be activated . The key does not seem as firm as the others. I am hoping that someone might have a solution or idea to remedy the problem. I have tried to assign the R/S function to another key ie the LN button but this only comes up None Existent.Does anyone know how this can be done or is it not possible . I would greatly appreciate any type of feedback. Thanks .

Re: 41CV keypad

*Message #2 Posted by **Klaus** on 23 Mar 2005, 5:06 p.m.,*
in response to message #1 by Rob Cook

Hello Rob,

I don't own a HP41, but I had key problems with the 0 of a HP67. I took it apart and cleaned the key, so it worked again.

As nobody else has answered you, I recommend the following: If you have a little experience in taking things apart, then you should try it, and if you see any specific problems, post a new message in this forum. If you hesitate to take it apart, you might search commercial help, or ask a "techie" in your neighbourhood.

Klaus

HP-80 Battery

*Message #1 Posted by **Michael Barry** on 21 Mar 2005, 4:13 p.m.*

I recently purchased an HP80 with no battery - it does have the charger. I don't have the calculator yet, but the battery compartment looks to be very clean. I will either make a battery per the directions given by Doug Jones or buy the Panasonic HHR-P505 battery. Using the Panasonic battery Doug Jones references seems to be the quick route, but is it the best route? Does anyone have hands-on experience with either method? I'm very excited about getting this calculator and I want to be sure to handle the battery issue properly.

Thanks, Mike

Building Accu Packs from Scratch (was: HP-80 Battery)

Re: Complementary answer for the Hp-19C

*Message #4 Posted by **Etienne Victoria** on 22 Mar 2005, 2:55 a.m.,*
in response to message #2 by valentino ducati (switzerland)

Hi,

Yes Mark's Hoskins batteries do work flawlessly in the Classics !

To complement Karl's answer, the 19C is not a classic :

It uses a 4xAA battery pack.

The best thing is to use ready-made welded 4xAA or refer to this specific excellent article from Katie Wasserman :

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=335

I differ from Katie in the fact that I prefer not to assemble the pack from scratch but use a 4xAA ready welded pack.

Please note that the rightmost & leftmost elements of the pack must be able to move freely to allow proper positioning in the calc.

Now for the connection to the calc. This connection must be absolutely reliable especially if you intend to charge the battery in the Hp-19C.

So :

- either you go for soldering clips to the pack and then "clip" them to the calculator contacts

- OR you go my way which means soldering the battery contacts to the calculator contacts.

BEWARE : Use a temperature controlled iron AND turn off the iron before soldering to avoid current leaks to the calculator.

The Hp-19C is very fragile and I fail to understand why Hp chose to save a few cents on power regulation & limitation when they designed the Woodstock series.

Oh I forgot : my advice is to avoid NiMH packs for the Hp-19C as I wouldn't rely on the Woodstock charger to charge this type of batteries in the calc.

Best regards from a french Clyde.

Etienne

I have used NiMH batteries in all my Woodstocks including the 19C. They work great and charge just fine... actually they charge better than the NiCads since they are not at the high end of their suggested continuous charge current like the NiCads would be.

Re: HP-80 Battery

*Message #7 Posted by **Gordon** on 22 Mar 2005, 12:24 p.m.,*
in response to message #1 by Michael Barry

I have a HP35, I went to the local Battery Plus store and they custom built a pack for me using NiMH cells (better for the environment, but they let you pick whatever cells you want). They also took care of soldering in the V shape contact plates for me, so it was a turnkey solution.

You will find spaces around the pack when you insert it in the HP Classic, and I solved that with thin strips of neoprene with a sticky back to them. When there is no play, you have a lot less problem with the contacts.

The charger seems to work fine with the new cells, and one full charge can last me a whole day.

Hope this helps.

in response to message #1 by Ronald

Could it be a replacement unit used by HP for servicing warranties ?

Re: HP-55 Prototype

*Message #4 Posted by **Gene** on 21 Mar 2005, 2:51 p.m.,*
in response to message #3 by Pascal

Quite correct. I could have several of these by removing the label, model number and pads.

Just no way to know if it is a prototype.

Better keep your fingers away

*Message #5 Posted by **Frank Boehm** on 21 Mar 2005, 3:03 p.m.,*
in response to message #1 by Ronald

Pro: a non-standard sticker was on the back; could have been anything though

Con: a manual is included, all prototypes I am aware of do have a model label on the front case (even clear test shots have them), prototypes usually have engraved keys (this one doesn't, it uses standard two-shot moulded keys) and/or use a diffent case (grabbed from another calc, this one uses the standard case)

At 50 bucks, I would give it a try, but it's over 300 now <g>

Re: HP-55 Prototype

*Message #8 Posted by **kim** on 22 Mar 2005, 1:21 p.m.,*
in response to message #7 by Namir

I have a prototype of the 48GX - is a 48SX with an eprom (standard off the shelf) cut out on the back. That's an easy one.....

I have a pre intro demo unit of an 80 - empty shell no serial.

Finally service untis would have a heatstake serial number normally more rough than the manufactured one would have, they put the number on in the service centres.

Re: HP-55 Prototype

in response to message #8 by kim

The serial numbers on these machines was on a stick on label in the battery compartment. Easy to remove. Easy for HP service people to duplicate.

HP-20S

*Message #1 Posted by **Marc B.** on 21 Mar 2005, 12:29 p.m.*

I read on the forum some time to time great comments about the HP-20S, HP-32SII so i decided to buy one of them or two!

I went on eBay and found the 2 calculators for sale, but WOW the 32SII is A LOT MORE expensive than than the 32SII. I bided on a 20S, received it and try it! I LOVED it. The keyboard, the siaplay, the color scheme, the form factor, key programming and formulas too!

My question is why is the 32SII, even beaten, is a lot more expensive than a new HP-20S?!?! It's the same series, keyboard, memories are alike. Is the 32SII a lot more rare to find?

Re: HP-20S

*Message #2 Posted by **Ed Look** on 21 Mar 2005, 1:01 p.m.,*
in response to message #1 by Marc B.

The 32SII operates under RPN, or reverse Polish notation, adapted from the algorithms or methods of Jan Lukasawicz, a mathematician. The 32SII, to add 4 and 7 would require the user to first input 4 or 7, then hit the "enter" key, enter the other number, and then hit the "+" key; there is NO equal sign. Then to add or multiply or subtract or divide subsequent numbers, just enter the number followed by the operation.

The 20S uses the algebraic system; i.e., 4 then + then 7 then =, which puts 11 on the display. Many of us find RPN to be far more preferable as our calculator entry method than algebraic. I suppose this is what makes for the price difference.

Otherwise, both are equally very nice calculators!

Re: HP-20S

*Message #3 Posted by **bill platt** on 21 Mar 2005, 1:20 p.m.,*
in response to message #1 by Marc B.

Hi,

In addition to what Ed points out:

Perhaps at least if not more importantly, the 32sii is fully programmable, and is compatible with previous programmable HP code. The 20s is only partially programmable and stands by itself (along with its cousing the 21s) in programming. As a bonus, it even handles equations as a special extra logical solver space--as well as an integratable part of the programming space.

So, the 32sii is the last in a direct lineage of RPN programmable calculators, starting in the early 1970's.

Going in reverse order:

32sii, 32s, 15c/11c, 34c/33E, 67, 29C, 25, 55, 65, {9810A, 9100B, 9100A}.

(This list is intended to incite controversy, or at least academic discussion :-)

(It is worth noting that other Algebraic scientifics made by HP from the "pioneer" family command higher prices than the "lowly" 20s. (But I like the 20s, too--I have "converted" three guys at the office to it.)

Regards,

Bill

I hope Marc forgives me for hijacking this thread, Bill, but wasn't there a 25C? I could have sworn there was continuous memory 25 model.

I know, I could look it up elsewhere on this site; I might do that later :) .

"I hope Marc forgives me for hijacking this thread, Bill, but wasn't there a 25C? I could have sworn there was continuous memory 25 model."

I bought my first programmable computer ever, the HP-25
Right after that HP started to sell a model, which said, in golden script "Continuous Memory" written in the small "front" panel of the model HP-25C.
One friend of my father, diploma engineer Heikki Torvela (now a Dr.) bought that model.
Boy did I envy!

>
> (This list is intended to incite controversy, or at least academic discussion :-)

Per your request for *discussion*.....
I think you left out a couple of **very** important models, and the timeline is a little off. I believe the following is a more complete and accurate listing of the handheld RPN programmables:
32SII (3/1/1991)
42S (10/31/1988)

32S (6/1/1988)
41CX (10/1/1983)
15C (7/1/1982)
11C (9/1/1981)
41CV (12/15/1980)
41C (7/1/1979)
34C (7/1/1979)
33C (7/1/1979)
33E (5/1/1978)
19C (9/1/1977)
29C (7/1/1977)
67 (7/1/1976)
25C(7/1/1976)
25 (8/1/1975)
55 (1/1/1975)
65 (1/19/1974)
Release dates are from the always excellent *A Guide to HP Handheld Calculators and Computers* by W. A. C. Mier-Jedrzejowicz.

*Message #7 Posted by **bill platt** on 22 Mar 2005, 11:46 a.m.,*
in response to message #6 by Jeff O.

Hi Jeff,

Thanks for your post.

I left out the 41c & 42s families because they are different branches. The 25C I forgot -- but it is a 25 .

I included the 11c/15c and the 34C/33E because it is not clear to me that one could make a clear lineage divid with theses, in the sense that the 32sii is both a direct replacement for the 11c, but also carries some of the 15C features (integration). Similarly, the 34C clearly evolves into the 15c, and the 11c from the 33E, so I have to include both in the lineage.

All of the machines older than that have so much less memory that the 11c and the 32s can more than implement everything offered, with two exceptions: external storage, and printing. So to some extent, it is not correct to put the 67 and 65 in the lineage, except that the 32s and 32sii have every feature and more from a programming and math capability standpoint. In other words, you should be able to take any program written for the 65 or 67 and translate it directly onto the 32sii.

revisitny the 15c, we see that the 32s does not have all of the capabilities. So, at this point, we see the first time in the HP lineage development where the replacement is not completly compatible with itws predecessor. You had to jump to a different line to carry all the 15c capability (either 41c with various pacs) or 42s.

But, the 32s family is much closer to the 15c in terms of programming than the 41c/42s lineage, which is why, ultimately, I think of the 32s as a decendant from the 15c as well as the 11c.

Regards,

Bill

Re: RPN Programmable History (was Re: HP-20S)

*Message #8 Posted by **Jeff O.** on 23 Mar 2005, 7:40 a.m.,*
in response to message #7 by bill platt

Bill,
I guess I misinterpreted your original post. I thought you were providing a list of all RPN programmables, not proposing a direct ancestral lineage to the 32SII. Based on that concept, your assessment seems logical, although I still feel that after the 19C there were two branches:

```
33E/C -> 11C -> 32S -> 32SII and
34C -> 15C -> 42S
```

I also plead guilty to leaving out the financial RPN programmables and the 10C per Gene's post. Not sure if that was intentional or on purpose. (The financials would be dandy machines if they had just included sine, cosine and tangent functions.)
Best Regards

Actually the 19BII is the one you are looking for : it has the triginometric functions, + additional logs, Pi, roots, ... And the beauty is its solver that can emulate even more complicated functions.

Now wif you want to restrict to the 12C or 17BII, there have been posts in the past that showed how to emulate trignometric functions (yes, even on the ridiculous 49 steps of a 12C, it's possible) using the financial solver.

There's always something more to learn about our calculators...

Actually, there are 99 steps, which makes the 12C programming capacity not so ridiculous (or at least half as ridiculous).

Gerson.

*Message #11 Posted by **Thibaut.be** on 24 Mar 2005, 3:48 a.m.,*
in response to message #10 by GWB

Sorry for that.

Actually I almost never entered a program in my 12C. The only tiles I did that was when the Euro was introduced, I used to store the conversion rates on it and accesses them with GTO

Another solution would have been to use RCL* or RCL/ by a register, by I use them as for what they've been disgned for, ie memories...

Re: RPN Programmable History (was Re: HP-20S)

in response to message #11 by Thibaut.be

What is really annoying in the 12C is its limited program editing capability. AFAIK there are 399 programming steps available in the 12CP, but program editing has not been improved. Will there ever be a 12CP with built-in trigs and better program editing? (I'm going off topic, sorry...)

> Sure, as soon as it becomes a common business practice to use the arcsine as part of an amortization calculation.

The question is not using trigs in business work. Business students might use a subset of scientific functions during their first college year. The 12C being somewhat expensive could offer these as a bonus, so students don't have to buy a second calculator for math classes.

Furthermore, contrary to what most people believe, trigonometric functions are used in advanced financial applications. See the following paper, published in the Journal of Financial Economics:

http://www.mbs.umd.edu/Finance/dmadan/spander.pdf/

(Thanks Valentin, for having provided me the link)

But we are going way off topic. I would suggest starting a new topic to discuss this, if you wish.

Best regards,

Gerson.

> Furthermore, contrary to what most people believe, trigonometric functions are used in advanced financial applications.

The keyword in my statement was "commonly". HP probably doesn't expect people to use the HP 12C Platinum for "advanced financial applications".

For years they seemed to be hoping that the 12C demand would go away, in favor of the 17B and 19B series, but they found that there are too many customers that want a 12C either because they were trained on it, or because so much training material is still available for it. The 12C Platinum was an attempt to expand it modestly as well as cost-reducing it. There is virtually no motivation for HP to expand on it significantly, as anyone doing more advanced work should be capable of figuring out how to use a more advanced calculator.

That said, if you're convinced that HP is missing the boat on this, one of the benefits of capitalism is that you're free to build a super-duper-12C clone with trig, Bessel functions, hypergeometric functions, or whatever else you think should be added, and try to sell it.

Hi Jeff,

> Quote:
>
> 33E/C -> 11C -> 32S -> 32SII and
>
> 34C -> 15C -> 42S

I like this idea--I think you are correct--that this is the most logical way to branch the development--as the features are always increasing as you go newer and newer.

The pesky thing is the 41c and therefore 42s--which though generally similar to the old RPN, is a family unto itself with alpha and etc.

But I agree with you. It is the most logical way to analyse the development.

It is interesting how quickly this whole cylce of development has come to an end. For years, many HP users (I would imagine) would eagerly await the next new development--something faster, better, for less money--always improving----. It was almost a feeling you could taste.

Then, calculators basically finished evolving--at the 48 series, there was nowhere else to go in an increasing evolution---

Now, we are into a new paradigm form a development standpoint: What I would call "feature Balancing" as opposed to "feature growth" and so we now see the idea of the development of products with less capability than their predecessors as being a good idea--to fit a niche that was identified during the growth phase. "Bring Back the 15c" and "Open RPN" are two resulting projects in this direction.

Regards,

Bill

41C in development history

*Message #17 Posted by **Thibaut** on 23 Mar 2005, 12:04 p.m.,*

My personal impression is that the 41C is something apart. It was developed and marketed quite a long time before the voyager series arouse. It was deemed to be the true follower of the 67, as it had the necessary extensions for external memory (not only continuouos memory, but also card, tape or even disc). The 41C was built to be fully extendable, and no other HP calculator (even the 48 series) matched this.

You will argue that the 42S is an enhanced 41. You will be right, as it even includes 41 compatibility, just as the 41 was 67 compatible. But the 42S lacks expandibility, and therefore I'm more keen on saying that it's the true follower of the 15C, even if it widely took inspiration from the 15C.

My 2 cents worth... I guess HP people who took part of this project must burst into laughter when reading this...

July 1979 for the HP-41C, vs. Sept. 1981 for the HP-11C. That is definitely not a "long time" as development cycles go, especially considering that the Voyager was radically different physical packaging than anything HP had done before. Even the HP-15C, the most sophisticated Voyager, was introduced in July 1982, less than a year after the HP-11C.

By comparison, the previous high-end programmables, the HP-67 and HP-97, were introduced in July 1976, three years before the HP-41C.

Then, calculators basically finished evolving--at the 48 series, there was nowhere else to go in an increasing evolution---

There is one line of evolution that could and should have been continued: high-end keystroke programmables. If HP were to release an HP-42S successor, with more memory, serial or USB I/O, and possibly directories and a bigger display, I'd buy one in a heartbeat. I think a lot of people would -- i.e. all the people who use the 48 or 49 series because they need the power, but who hate RPL and the general weirdness and awkwardness of those machines.

I guess the reason it didn't happen (and won't happen) is because HP worries about competing with their own products. So much for diversity -- score one for the bean-counters. :-(

- Thomas

Except for the ...

...and the 16C.

I know it's not a *real* calculator to many of you since it lacks even the most basic scientific functions. But it was programmable and it provided its vertically targeted customers with a staggering amount of functionality for its time.

Perhaps I wax enthusiastic about this little Voyager too much. However it's the one I have used the most and I return to it at least once a week (23 years later). In this sense it has a longevity on par with the other Voyager even if it doesn't have the numeric, scientific and engineering functions offered by its peers.

in response to message #28 by valentino ducati (switzerland)

Ok, i understand for the 32SII : RPN is THE reason for high price in the advertising part of the site. But i saw the 33S and read on HP site that it is also with this entry mode. This calculator is still more expensive than the 20S but at a lower price compare to the 32SII. I read that the 33S have more power than the 32SII. Is the difference in price in favor of the 32sII explain because it's a collector's item and the 33S is still in production? I think i will try RPN, but the 32SII is too expensive for me : is there another solution for RPN appart the 32 and 33?

Is there still a programmable calculator made by HP or TI that can do RPN and fully prog? When i was "young" my father gave me a TI-59 and i us it till it died 5 years ago. Can i find here someone that still have TI-59 to sell? Or another HP with RPN :-) so i can try this?

Hi Marc, Valentino, guys;

thank you for your reply, folks; I appreciate that.

Marc, I'd tell you that one of the reasons of the HP32SII being more expensive when compared to the HP33S is that it is still a genuine HP calculator, while the HP33S comes form a thirdy-part manufacturer. You see, the last genuine HP calculators keep the HP quality as-is, while newer models are mainly 'getting to the point' after many complains from users related to low quality. I read here that many problems observed in the HP49G+ have already been fixed. What I am not sure about is if the too-small comma in the HP33S display has already been fixed or not.

There are some other issues related to the calculator and keyboard layout, key feeling, colors... Well, time will tell.

My 2¢.

Luiz (Brazil)

33s and 49g+ comments(Was Re: A question: how much for an HP20S today?)

*Message #31 Posted by **Eric Lundgren** on 23 Mar 2005, 12:56 a.m.,*
in response to message #30 by Vieira, Luiz C. (Brazil)

Luis,

I'm on my third 49g+, the problem remains. If anyone can benefit, here are my findings:

49g+: 1. Overclock (hpcalc.org => search "overclock") solves the missed repetitive keys (ie. 333 will get all three '3's. 2. The time flag (ie. 5:36, 3/18/2005) must be turned off. 3. I have compared the 49g+ to my 48g. On my 49g+, I am often able to **CAREFULLY** press a button to "click" but NOT actually depress deep enough to register = missed keystroke. This is especially true with the soft menu buttons at the top. The 48g is different. It is very hard to get the "click" without actually registering a press.

33s: 1. I have two of them. I am very happy with the reliability of the kbd. If I feel the click, it always registers as a "press", so far, at least. I've had them about 1.5 months now.

2. I do have a *minor* problem sometimes with the size and shape of buttons. If I hit "4", I also sometimes slightly hit the sharp edge of the "5" key. BUT, I "feel" this, and therefore I am aware of what is going on. I can always check the display. The 49g+ is different, I feel obligated to check the screen after almost every press. (Today in class, using my 49g+, I gave two incorrect responses during lecture...only to be corrected by TI-89titanium-carbonfiber-plasma-flatscreen users..!!

3. I do feel that the "two-line" display is a positive step. The ENTER key is something one can adjust to. The SQRT and SQ keys should be shifted of eachother. "slanted" keys seem to cause

some error, but I can adjust.

Observation: The 33s kbd is only 5 keys wide at the upper section. The 32sii has 6 keys per row. Yet, the 32sii feels roomier..

Conclusions, I will no longer use the 49g+. My 48g has two keys that are getting a bit tired. If I had two 32sii's I'd use them on exams, but since I don't, the 33s's will do fine. Plus they are permitted on the EIT engineer's exam (as of now, at least).

Now, together we have 4¢! Eric

Hi,

'49g+: 1. Overclock (hpcalc.org => search "overclock") solves the missed repetitive keys (ie. 333 will get all three '3's'

As the author of the overclocking program, I'm not sure how it is helping with your keystroke issues. All it does is alter the clock multiplier. It doesn't prevent the 12Mhz -> High Speed transition, that I think cause the misses.

The problem is the 'missing keystrokes' issue is very subtle and its easy to think you've fixed it when you haven't. Witness the dozens of 'cures', such as adjusting keytime, that really don't help.

Personally I am confident that it is a software problem on newer 49g+'s. To see for yourself try one of the test pograms at http://alpage.ath.cx/keys/ - These use a more direct key handler then HP's OS/Emulator scheme. For more information see the newsgroup comp.sys.hp48. This forum is intended for older hardware.

best,

Al

*Message #33 Posted by **Vieira, Luiz C. (Brazil)** on 23 Mar 2005, 6:09 a.m.,*
in response to message #31 by Eric Lundgren

Hi Eric, guys;

thanks for your additional impressions, Eric. They add extra information. I own an HP33S and an HP49G+, but I actualy do not use them too often. I had some problems related to data entry in the HP49G+ and I agree wit you that checking for data after keying them in is a must. And despite of some particular impressions of mine, mostly when comparing to 'true' HP calculators, I too consider the HP33S a good calculator. You see, students at the local university I teach in do not use top calcs, mostly low-cost, 'brand aware' algebraic

scientific (in fact, I had never heard of some brands before, like Truly and others). I take mainly an old HP15C and another old HP16C to classes, but I keep one HP9S and and two HP30S to lend to students that forget their calcs at home...

And Al, congratulations for your overclocking program. You see, what I most like in this Museum of HP Calculator's forum is that most vintage HP calculators work perfectly fine nowadays and they actualy face their newer 'counterparts' without loosing points; I take it too hard thinking of my HP97 or my HP55 as retired equipments... ;-) To be honest, I prefer talking about how to repair vintage calculators, how to use their resources and how to program in RPN environment, but I also take as a chalenge to understand and even to risk posting an answer to questions posted here related to new calculators. And I guess we can consider that either the HP28C/S, the HP48S/SX and soon the HP48G/GX/G+ are taking their places at the MoHPC...

Best regards.

Luiz (Brazil)

in response to message #33 by Vieira, Luiz C. (Brazil)

Hi,

'And Al, congratulations for your overclocking program'

Thanks, but its nothing special. Just changing the values in a few registers :)

'To be honest, I prefer talking about how to repair vintage calculators, how to use their resources and how to program in RPN environment, but I also take as a chalenge to understand and even to risk posting an answer to questions posted here related to new calculators'

Sorry, I didn't mean to say "Do not post about new calculators here". Rather, more technical information on the new ones may be found on the newsgroup.

best,

Al

32SII prices

*Message #35 Posted by **Thibaut** on 22 Mar 2005, 4:15 a.m.,*
in response to message #29 by Marc B.

When the 32SII was still available on the shelves back in 99-00, the 32SII would not go higher on ebay than $30-$40. At that time top dollars were paid for 42S and somewhat nice 41CX's notwithsanding older collectible models.

As soon as the 32SII disappeared from the shelves, it reached rocket prices, similar and often higher than the 42S, though far better in any sense.

My opinion is that as long as the 20S can be found in stores, even if discontinued, it won't go higher

than $20-$40 on ebay. But on shortfall everybody will be sorry not to find anymore the Pioneer make quality, and it will reach higher prices. Though, never as the 32SII as it is not RPN.

It's amazing that the 33S is so unpopular. After all, it's the best RPN calculator money can buy, and cherry on the sundae, you can find as many units as you want at any decent store. Of course its quality (built or even OS) is nothing to be compared with the Pioneer series, but we need to recognize that HP did somewhat heard our "Bring RPN back" message.

Re: 32SII prices

*Message #38 Posted by **Christoph Giesselink** on 3 Apr 2005, 6:39 p.m.,*
in response to message #36 by Raymond Del Tondo

But when we are taking about quality, we must say that the quality of the last Indonesia 32SII models wasn't good also. I exchanged my "every day" HP32SII (ID906...) with a HP32S (3038S...), because of the much better keyboard of this model.

I don't want to say too much about the 33S, but this calculator was never a replacement for the HP32SII for me, because for _one_ reason: It's too _big_! It don't fit into any pocket of my jacket.

Regards

Christoph

32SII and 32S

*Message #39 Posted by **Karl Schneider** on 3 Apr 2005, 9:56 p.m.,*
in response to message #38 by Christoph Giesselink

Christoph posted,

> Quote:

keyboard of this model.

Certainly, the constuction-quality of the USA- and Singapore-made Pioneers is better than that of the Indonesian-made ones. I recently got a 1990 32S to supplelement my 2001 Indonesian 32SII with silver bezel, as well as to help complete the collection.

(BTW, I've seen Indoesian-made 32SII's with both brown bezel (1997) and silver (2001). Which is yours?)

I posted recently all the differences I found between the 32S and 32SII. Subsequently, I discovered that the late-run 32SII is somewhat faster than the 32S.

Re: 32SII and 32S

*Message #40 Posted by **Christoph Giesselink** on 4 Apr 2005, 1:20 p.m.,*
in response to message #39 by Karl Schneider

Both of my HP32SII ID906xxxxx and ID916xxxxx have brown bezel.

BTW, as I read your 32S <-> 32SII comparision I was very surprised that the HP32S has no "x-th root of y"? I found it:

Instead of pressing

<LS> <Y^X>

on the 32SII, you have to press

<1/X> <Y^X>

on the 32S. So is the <1/X> key a kind of shift key? ;-)

Cheers

Christoph

>
> on the 32S. So is the <1/X> key a kind of shift key? ;-)

Try this on the 32S:

<8> <+/-> <3> <1/3> <y^x>

If the expected resuld "-2" shows we can say the 32S has "x-th root of y". However, it is more likely we get an "INVALID y^x" message instead.

If such is the case an xROOTy instruction line in a 32SII program would require eight lines (perhaps less?) in a 32S program, if negative arguments are possible:

<ENTER> <ABS> </> <LSTx> <3> <1/x> <y^x> <*>

Regards,

Gerson.

Re: 32SII prices

*Message #42 Posted by **Bernardo Vargas** on 23 Mar 2005, 6:25 a.m.,*
in response to message #35 by Thibaut

Yes, the 32SII is expensive, but if there are so many people who pay such high prices for it, that means the prices are correct. The 32SII is a very nice machine; I don't think the 42S could be ranked above it. The former has a feature the latter doesn't: SIMPLICITY. Perhaps that is what makes the 32SII so beloved.

Re: 32SII prices

*Message #43 Posted by **Raymond Del Tondo** on 23 Mar 2005, 9:32 a.m.,*
in response to message #42 by Bernardo Vargas

Hello,

from the keyboard legend layout side,
the 32SII is *much* more cluttered.

The 42S is much more powerful than the 32SII.
It has much more memory, which can actually be used.
Additionally, the 42S has a display with
a much better resolution than the 32SII.
The only drawbacks of the 42S are the low contrast of
the display, where the 32SII display is better readable,
and the lack of I/O in the 42S.

For all other aspects, the 32SII and
the 42S play on very different levels;-)

Regards

Raymond

Re: 32SII prices

*Message #44 Posted by **Bernardo Vargas** on 2 Apr 2005, 9:40 a.m.,*
in response to message #43 by Raymond Del Tondo

@Raymond:

I think the 32SII is a better CALCULATOR than the 42S. The latter is, to my taste, very complicated. It doesn't matter how much memory it's got; it's not easy to handle.

Re: 32SII prices

*Message #45 Posted by **Thibaut.be** on 23 Mar 2005, 9:38 a.m.,*
in response to message #42 by Bernardo Vargas

> Quote:

Of course the 32SII is a wonderful machine.

But, IMHO, the 42S beats the 32S on many points. Check here

```
- 2 lines display on the 42S v. 1 line
- matrixes, complex, graphs available on the 42S only
- 7200 bytes on the 42S and 26 registers on the 32SII
- full alpha on the 42S
- notwithstanding other minor enhancements
```

These 2 calculators simply don't play in the same category. Roughly, the 34C evolved to the 15C which evolved to the 42S. The 33 evolved to the 11c which evolved to the 32S.

IMHO again, the 42S is also a very simple calculator to use. A poll in 2001 hase elected as the best HP calculator ever made (Here to the poll results) and it has been confirmed by a recent survey. I love both calculators, and certainly for a daily use, but I would never give away 1 42S for 2 32SII's !

Re: HP-20S

*Message #47 Posted by **John Smitherman** on 21 Mar 2005, 9:59 p.m.,*
in response to message #1 by Marc B.

Marc, below is a link to an HP web site that contains a table that compares the 6s, 20s, 30s and 32sii:

http://h10025.www1.hp.com/ewfrf/wc/document?dlc=en&lc=en&product=60738&lang=en&cc=us&docname=bpia5154

The table shows that the 20s is missing several functions that the 32sii and 33s contain. I guess the question is whether or not you can do without those functions.

Happy calculator hunting!

John

"Pioneer" Overview (incl. HP-20S vs. HP-32SII)

*Message #48 Posted by **Karl Schneider** on 21 Mar 2005, 10:39 p.m.,*
in response to message #1 by Marc B.

Marc --

No, even though the 20S and 32SII have the same processor and form factor (known as the "Pioneer" series that debuted in 1988 and was finally discontinued in 2002), the 32SII is more capable, and desirable to real HP fans for its RPN entry than is the Algebraic-entry (AOS)20C. That mainly accounts for the price difference.

The 32SII has better programming capabilities, with built-in microprocessor-coded routines for numerical integration, numerical rootfinding, and complex-number mathematics. The 20S has built-in keystroke programs for these three applications. However, these programs run slower, are unintuitive, and erase user programs when they are loaded in. This is the primary shortcoming of the 20S that makes it a compromised product, in my opinion.

That having been said, the Pioneer series as a whole is a remarkable achievement of thoroughly-planned product development. The series of calculators featured the following:

1. Nine different original models plus two successor models, all utilizing the same basic packaging and the excellent "Saturn" microprocessor introduced in 1984:
    - Three AOS business models (10B, 14B, 17B)
    - One AOS/RPN business model (17BII)
    - Four AOS scientific models (20S, 21S, 22S, 27S)
    - Three RPN scientific models (32S, 32SII, 42S)
2. These 11 models were based upon three distinct levels of sophistication and price, characterized by different kinds of LCD readouts provided:
    - High end: Small-pixel, two-line, solid-grid, dot-matrix (17B, 17BII, 27S, 42S)
    - Mid-range: Large-pixel, one-line, 12-character, dot-matrix (14B, 22S, 32S, 32SII)
    - Low-end: 12-number, seven-segment (10B, 20S, 21S)

The above is a general overview of the Pioneer series. I expect that eventually, this discontinued series of models will have its own section in the Museum (several are listed now). However, it is a fair undertaking to fully document each of these models. Maybe some of us should chip in with some help for Dave!

*Message #49 Posted by **Eddie Shore** on 21 Mar 2005, 11:28 p.m.,*

in response to message #1 by Marc B.

If a HP-32S is too expensive, you can try the current HP-33S (about $50). The programming is similar to the 32S with 30K memory as opposed to about 7K bytes.

Re: HP-20S

*Message #50 Posted by **VPN** on 22 Mar 2005, 1:46 a.m.,*
in response to message #49 by Eddie Shore

"If a HP-32S is too expensive, you can try the current HP-33S (about $50). The programming is similar to the 32S with 30K memory as opposed to about 7K bytes."

There is not even 1K byte for programs steps in either 32S or 32SII.
I can recommend the 33S for a replacement (if you can see the decimal point), just try before buy

Help with X and Y register!!

*Message #1 Posted by **Denis** on 21 Mar 2005, 7:54 a.m.*

I have a serious problem of comprehension on how does the stack work on my 41 (same with a 32s). I only used a 48 before... Let me explain:

Assume the 4 levels stack are empty. (I type zero folowed byt four ENTER for that)

If I type 50 ENTER 2 /

The result is 25, but if I type X<>Y The machine show me ZERO!!

And if I do the follow sequences: 50 ENTER X<>Y 2 /

The result is 25 but if I type X<>Y The machine show me (the expected) 50!

In the first exemple I don't understand why the value 50 disapear!! For me it's like if the ENTER key doesn't do is job and dont copy X in the Y register.

Can you explain me that please ??

Thanks, Denis.

P.S I experiment the same problem with RDN instead of X<>Y

Re: Help with X and Y register!!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 Mar 2005, 8:11 a.m.,*
in response to message #1 by Denis

Hi, Denis;

please, let me clear a few points out:

> Quote:
>
> Assume the 4 levels stack are empty.

Keep in mind that the 'empty stack' means one thing in RPL-based calculators (e.g.: HP48) and that all stack registers in the HP41 (X, Y, Z and T; consider also the LASTx) exist all times, even when the calculator is turnned off, and that they may contain any valid data (a number, even if zero, an ALPHA set with up to six characters, and some other 'transcendental' contents...).

> Quote:
>
> If I type 50 ENTER 2 / (...) The result is 25, but if I type X<>Y The machine show me ZERO!!

Very true! Follow the stack diagram below: (first column under X is what you see)

```
Key         X     Y    Z     T
            a     b    c     d  (if so, consider a=b=c=d=0.00)
50         50     a    b     c  (d is lost)
ENTER      50    50    a     b  (C is lost; stack lift DISABLE)
2           2    50    a     b  (50 is overwriten)
÷          25     a    b     b  (stack contents DROP)
```

Yes, this is quite unusual for those acquainted to RPL-only. The remarks are:

keep in mind that the stack is composed by exisitng, fixed registers;
ENTER disables stack lift for next entry, so the copy left in X after ENTER is overwriten.

Follow this example, please: (observe that Rv is meant to be the roll-down key, R with an arrow pointed down)

```
Key         X     Y    Z     T
4           4     a    b     c
ENTER       4     4    a     b
3           3     4    a     b
ENTER       3     3    4     a
50         50     3    4     a
ENTER      50    50    3     4
2           2    50    3     4
÷          25     3    4     4
x<>y        3    25    4     4
Rv         25     4    4     3
Rv          4     4    3    25
Rv          4     3   25     4
Rv          3    25    4     4
x<>y       25     3    4     4
x<>y        3    25    4     4
```

Hope this helps.

Luiz (Brazil)

Edited: 21 Mar 2005, 8:27 a.m.

By the way...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 21 Mar 2005, 8:35 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, Denis;

I thought it would be a good idea to post a new message instead of editing the previous one. The issue here is that if you decide to check what happens after ENTER key is pressed, the stack lift becomes enable again. Please, follow this:)

```
Key         X     Y    Z     T
4           4     a    b     c
ENTER       4     4    a     b
x<>y        4     4    a     b
x<>y        4     4    a     b
```

This is because x<>y (among with almost all other functions in the HP41 'repertoire') cause the automatic stack lift to be enable. Now, please, try this::)

```
Key         X     Y    Z     T
4           4     a    b     c
ENTER       4     4    a     b
3           3     4    a     b
x<>y        4     3    a     b
x<>y        3     4    a     b
```

Maybe now you can see a bit more...

Cheers.

Hi, Denis;

In fact, I once wrote a book...

The English translation for the title would be 'From the HP41 to the HP48'. It was written in 1995, published only in Portuguese. At that time, I was not aware of, say, 10% of what I am aware of today about how are HP calculators seen and used in the world. Have I met some guys earlier, I'd be where I am today (regarding HP calculators) at least ten years ago. I have all information contained on it yet in my computer, and I am going to find some time to prepare an English version and allow Dave to put it in the CD pack.

Best regards.

Thanks.

*Message #2 Posted by **Wlodek Mier-Jedrzejowicz** on 23 Mar 2005, 10:51 p.m.,*
in response to message #1 by Charles

Hi Charles,

When UPLE was closed, the HP UPLE programs in some languages were given to user clubs active at the time that worked in those languages. The English language section was passed to HPCC, which is still active (see www.hpcc.org). We retained some programs for distribution in the club, and the entire set of originals is in an attic, very hard to get to, but not lost. If you happen to be in London, let me know, and we can arrange for you to visit the attic and hunt for this program.

Best Regards,

Wlodek Mier-Jedrzejowicz

2 Wlodek: Euro2005 Calculator Conference

```
Hello, Wlodek!

Is it possible that you could attend the Euro2005 Calculator Conference,
which is held in Finland at 2nd July, Saturnday?

We would love to see you as a speaker.

Veli-Pekka Nousiainen
STaK President

in response to message #3 by Veli-Pekka Nousiainen

Hi VPN!

I really want to go to your meeting in Finland - but there are 3 other HP handhelds meetings this year -

or 4 if the one Raymond and Christoph planned does work out. Obviously I plan to be at our HPCC meeting in September in London, and as usual I want to be at the HHC meeting in the US, in Chicago this year. Ask me again in a few weeks? ;-) How are the preparations going? I hope all is well!

Anyone else ready to tell us now that they are going? It should be a very interesting place and meeting!

Best Wishes,

Wlodek

Emu41 - Advantage - CCD compatibility

*Message #1 Posted by **Claudio** on 20 Mar 2005, 12:50 p.m.*

With my "Emu41" (thanks Jean-Francois !!!!) I can't work with these settings:

[MODULES] ; page size filename 0 12 Rom41-CX.bin 3 4 XFuns-CX.bin 5 8 Time-CX.bin 6 4 Prter1E.bin 7 4 ILmod-1H.bin 8 8 Ccd-b.bin A 12 Adv1B.bin

All it's OK if I set only CCD or only Advantage at page 8.

Are CCD and Advantage modules compatible? Thanks for any info. (remove all "_NOSPAM_" from my e-mail address)

1234

Re: Emu41 - Advantage - CCD compatibility

*Message #2 Posted by **Claudio** on 20 Mar 2005, 12:54 p.m.,*
in response to message #1 by Claudio

Sorry for bad layout.

The settings are:

[MODULES]
0 12 Rom41-CX.bin
3 4 XFuns-CX.bin
5 8 Time-CX.bin
6 4 Prter1E.bin
7 4 ILmod-1H.bin
8 8 Ccd-b.bin
C 12 Adv1B.bin

Thanks again

Re: Emu41 - Advantage - CCD compatibility

*Message #3 Posted by **Raymond Del Tondo** on 20 Mar 2005, 1:32 p.m.,*
in response to message #2 by Claudio

Hi,

my suggestion is to use the CCD OS/X file
from TOS instead of the normal CCD-B.
This way you'll have all the CCD OS extensions nad more,
but without duplicated matrix stuff.
Apart from that, the CCDD (or CCD OS/X)

only uses one 4K block, not two.

Just take a look at TOS (The Other Site)

Raymond

Re: Emu41 - Advantage - CCD compatibility

*Message #4 Posted by **J-F Garnier** on 20 Mar 2005, 2:54 p.m.,*
in response to message #2 by Claudio

Hi Claudio,

What problem did you get? CCD and Advantage use same ressources (buffer number, X-M files, ...), so it is not recommended to mix matrix functions of both modules. Apart of that, it should possible to install both of them in the same machine.

But I agree with Raymond, the best configuration is CCD OS/X + Advantage.

J-F

Re: Emu41 - Advantage - CCD compatibility

*Message #5 Posted by **Claudio** on 20 Mar 2005, 5:20 p.m.,*
in response to message #4 by J-F Garnier

> Quote:
>
> What problem did you get?

```
With this .ini:
8  8 Ccd-b.bin
A 12 Adv1B.bin

the output of CAT 2 is:
-EXT FCN 2D
-CX EXT FCN
-TIME  2C
-CX TIME
-PRINTER-
-MASS ST 1H
--
-CTL FNS
-W&W CCD B
-ARR FNS
-HEX FNS
-I/O FNS
-ADV FNS
-XF/M FNS

If I switch the 2 modules with this .ini:
8 12 Adv1B.bin
A  8 Ccd-b.bin

the output of CAT 2 is:
-TIME  2C
-CX TIME
-PRINTER-
-MASS ST 1H
-CTL FNS
-ADV CONV B
```

```
-ADV MTRX
-ADV MATH
-ADV TVM
-EXT FCN 2D
-CX EXT FCN

You can see that I can have or CCD or Adv, but not all two together.
CCD OS/X is a great module, but I can't understand why the
old CCD-B can't work with Advantage. They have different page,
different XROM numbers, so ........ why..????

1234
```

KARL S. /thoughts for the EIT

*Message #1 Posted by **Eric Lundgren** on 19 Mar 2005, 11:20 p.m.*

KS,

Thanks for your advice this past month regarding the EIT/PE exams.

I've been agonizing recently, after getting my 49g+ to work rather well, and a buying backup 48G for peace of mind. I will graduate next x-mas with my BS in mechanical engrg. In my courses, two fellow students use HPs, and everyone else is joyous with their TI-Voyagers (the querty machine).

As I had mentioned, I'm planning on the EIT soon. I will be in Heat Transf next semester, so it is still uncertain if I can take the EIT in October (I'll be halfway thru HtTrnsfr), or postponing until April 06.

My dilemma is: I love my 32sii, and am VERY close to ordering an extra refurb brown bezel 32sii from hpcalculators.com. I'd like two machines for university exams, on account of a blank flash on my 32sii during a test last year.

The reason I am shuffling is that I question NCEES's plans. Since my EIT date may not occur until next April, is there much point to using the 33s instead of my 32sii? Do you have any advice?

Thanks, Eric

Re: KARL S. /thoughts for the EIT

*Message #2 Posted by **John Smitherman** on 19 Mar 2005, 11:47 p.m.,*
in response to message #1 by Eric Lundgren

This isn't the calculator advice that you were looking for but here's a link to an interesting book on heat transfer that you might find useful. I haven't made my way through all of it yet but I like what I've seen so far. It's available at an excellent price - free!

http://web.mit.edu/lienhard/www/ahtt.html

Regards,

John

in response to message #2 by John Smitherman

Thanks, John!

I've used the mit OCR before, but this looks different, I'll look into it.

Regards, Eric

Re: KARL S. /thoughts for the EIT

*Message #4 Posted by **Karl Schneider** on 20 Mar 2005, 1:51 a.m.,*
in response to message #1 by Eric Lundgren

Eric --

I remember my advice being along the lines of, "Focus on your course of study, not thoroughly mastering a calculator." This is based on my own experience with the EIT/FE in Spring 1994, in which the only section I did poorly is the one for which I had never taken a collegiate course. (I passed the exam first time, using a HP-15C.)

As for calc's to use for your collegiate exams, I'd use the 32SII over the 33S (I have both). If you want to spend money for a backup unit, that's up to you. The 32SII display is vastly better than that of the 33S; you can tell the shift-key legends apart on the 32SII, and its faceplate is much less cluttered. You don't want mistakes and aggravation during exams. Going from one to the other shouldn't be too hard.

Re: KARL S. /thoughts for the EIT

*Message #6 Posted by **Norris** on 20 Mar 2005, 1:53 p.m.,*
in response to message #1 by Eric Lundgren

You might want to put off purchasing a 33S until you know when you are taking the EIT exam.

Suppose you qualify to take the October 2005 EIT exam. In that case, you will presumably need a 33S, since none of your other calculators are allowed under current NCEES policy. But there's no need to rush, because switching from the 32SII to the 33S should not be difficult. You should be thoroughly comfortable with the 33S if you study with it for just a few weeks.

On the other hand, suppose you won't take the EIT exam until April 2006. In that case, you should *not* order a 33S until NCEES announces their calculator policy for 2006. According to http://www.ncees.org/exams/calculators :

"Each year, an NCEES subcommittee on calculators will review and revise the approved calculator list. It will provide an updated list by November 15."

There is no way to predict NCEES calculator policies in advance, and there is no guarantee that NCEES will reapprove the 33S for 2006. I would be surprised if they didn't, but then again NCEES has been known to surprise everyone in the past.

42S Programing Problem

*Message #1 Posted by **Trent Moseley** on 19 Mar 2005, 6:18 p.m.*

I somehow screwed-up and got .END. in my program catalog as a program! How do I get rid of it on the program menu?

The program reads thus:

00 (0-Byte Prgm) 01 .END.

tm

Re: 42S Programming Problem

*Message #2 Posted by **Karl Schneider** on 19 Mar 2005, 7:08 p.m.,*
in response to message #1 by Trent Moseley

Mine (S/N 29nnAnnnnn) does that, too. I think that it's the permanent .END. instruction (note: 0-byte program), as the 41's have in program memory. It also serves as an entry placeholder for the next user program.

Entering an external label in the program, then "CLP"'ing the program, does not eliminate the .END. "program".

-- KS

Re: 42S Programing Problem

*Message #3 Posted by **Raymond Del Tondo** on 19 Mar 2005, 7:11 p.m.,*
in response to message #1 by Trent Moseley

That's the permanent .END.
Your calc always maintains this .END.
Maybe the manual could help?

Raymond

Re: 42S Programing Problem

*Message #4 Posted by **Chad Wagner** on 20 Mar 2005, 12:53 a.m.,*
in response to message #1 by Trent Moseley

Trent, Go to your last program you entered and delete the END from the end. The permanent END will take it's place and you will no longer have an .END. in your program menu. Hope that helps. -Chad

Spice chargers

*Message #1 Posted by **Stephen Vater** on 19 Mar 2005, 3:04 p.m.*

I've recently been attempting to revive my 34c after many years in storage. I've acquired replacement battery packs from Digikey (they were great to deal with!)as recommended by Katie Wasserman's article in the museum (the part number has changed from p253-f021 to p229-f021, by the way). The calculator works as I remember, and passes the self test. Which brings me to the charger. The original was lost or discarded inadvertently (though I recall a certain cat chewing through one power brick's cord, perhaps this one.) I found one in short order on ebay, anxiously waited for it to arrive, only to find that though it was the correct model 82087b, the adapter plug did not snap into the calculator snugly, and when jostled caused random segments to light up in the display. The calculator is fine, but makes me wonder about this adapter, as I never put the calculator to hard use and always remember the power plug snapping into place. Does anyone have any experience or suggestions with revitalizing heavily used contacts as these may be? Does anyone have a picture of a connector in prime shape? To my untrained eye it almost looks like there might be a plastic insert missing on the back side of the connector that would provide additional tension on the contacts that would make for a good fit. There's no apparrent damage, but I can't be sure. And as another alternative, I've pondered looking for another calculator in the Spice series in order to get my hands on a working adapter. The question here is which calculators shipped with the 82087b chargers? Just the "c" series calcs, or did the later "e" series as well? My thanks to any and all that have any information on these questions. I appreciate your time. This web site really is a wonderful thing!!

Re: Spice chargers

*Message #2 Posted by **Mike T.** on 19 Mar 2005, 3:23 p.m.,*
in response to message #1 by Stephen Vater

I've owned the HP32E, HP33C (sadly now broken), and an HP34C and the chargers appear to be inter-changeable.

I think that all the spice series used the same charger though I cannot be certain as I've only ever seen three.

I expect that the retaining clip on your charger is broken as I have one with in a similar state though it still works fine providing I don't move it about...

Mike T.

Re: Spice chargers

*Message #3 Posted by **Vassilis Prevelakis** on 19 Mar 2005, 7:31 p.m.,*
in response to message #1 by Stephen Vater

My advice is to avoid connecting a charger to your calculator.

Just charge the batteries with an external battery charger.

You can get the HP external battery charger for the Series 30 (which is compatible with the adapter you have) on eBay.

Of course any battery charger will work (even cheap ones). You can remove the batteries from the pack to insert them in the charger, or modify the charger to accommodate the HP battery pack.

**vp

Re: Spice chargers

*Message #4 Posted by **db (martinez, ca.)** on 20 Mar 2005, 1:42 a.m.,*
in response to message #1 by Stephen Vater

The "e" series can use either the a or b model charger.

The "c" series needs the b model and can not use the a.

It sounds like your charger may have lost the springy tab in the center. In any case; if i was you i would use slightly used alkalines or charge the rechargables outside the calculator. Even with a good plug the batteries themselves can have itermitent contact and if this happens while charging it can fry the calculator.

15C back label

*Message #1 Posted by **Arnaud Amiel** on 19 Mar 2005, 12:47 p.m.*

I was looking at the pictures on the museum and just noticed that my 15C has a slightly different back label from the one pictured. Mine (serial 2248A....) doesn't have the logo (what is it?) on the top left hand corner nor the Class B statement on the bottom right corner. Any other back label version around? Just curious... Arnaud

Re: 15C back label

*Message #2 Posted by **GWB** on 19 Mar 2005, 2:21 p.m.,*
in response to message #1 by Arnaud Amiel

Mine lacks these too. (Serial 2343B75099)

Gerson.

Re: 15C back label

*Message #3 Posted by **bill platt** on 21 Mar 2005, 1:56 p.m.,*
in response to message #1 by Arnaud Amiel

Hi,

This was discussed about a year ago here (somewhere in the archives).

I have two 15c's: one is from the very beginning, and it does not have the musical note-looking thing (871b), but my newer one does. I think it worked out to be various governmental required approvals---perhaps german or european?

regards,

BIll

btw, my 27s has the "871b" "musical note" looking mark, as well as my brazilian 12c; my 32sii & a 20s (singapore) has the CE91 stamp instead, my very late run 11c has the 871b stamp, as well as the FCC class B statement, one 48gx (singapore) has a CE93 stamp,and my indonesian 20s has the CE but no year designation.

My late 15c is lent out, and my other is at home. If you want to know more, just let me know.

Regards,

Bill

We can't complain...

*Message #1 Posted by **Eric Lundgren** on 19 Mar 2005, 3:17 a.m.*

While HP has stumped me with certain traits of the 33s-

Since it has menus (flags menu, memory menu) , why not user definable, DIRs, soft menus...etc, even if only usable for the expansive equation library one can create.

But things could be worse..if you were a champion of this brand... http://education.ti.com/us/student/main.html

Note that the screen is displaying a phone directory. :)

Incidentally, I just cleaned up my 32sii, and thought about what I must have: quadratic root, cross product, and a few stored eqns...I can only fit 3 before I run out of memory! So, the 33s feels forgiving in that respect. I had forgotten how tight space was...

But side by side...boy that 32sii has a beautiful display!

Eric

Re: We can't complain...

*Message #2 Posted by **Ed Look** on 19 Mar 2005, 12:35 p.m.,*
in response to message #1 by Eric Lundgren

You're absolutely right about all you posted.

However, and I hope I don't sound like I'm complaining, put the 32SII side by side with the 20S and you'll say that the 20S has a more beautiful display! I think the 20S is the last HP calc to have the old-fashioned hand-cut LCD segments so that you see more continuous black line instead of more dotted lines. But yes, I see your point about the "dottiness" of the 33S display.

But all-in-all, I agree, the 33S is a nice unit, highly recommendable to those who need a good RPN scientific, not graphing, unit.

Re: We can't complain...

*Message #3 Posted by **Arnaud Amiel** on 19 Mar 2005, 12:44 p.m.,*
in response to message #2 by Ed Look

I don't want to look heretic but what about the 12C platinum? I haven't seen it but I guess it has a good segmented display. So hp still can have them produced.

Arnaud

Re: We can't complain...

*Message #4 Posted by **Ed Look** on 19 Mar 2005, 10:28 p.m.,*
in response to message #3 by Arnaud Amiel

Oh, it's not heretical. I had to resist my impulse to buy a 15C or 16C when they first came out (boy was I stupid!) because in those days, my 34C was still going strong and I knew how to use it inside out. Heck, I'd STILL use it if it wasn't giving me erratic displays so often.

So, I remember the 12C through 16C calcs. Yes, the display on that series was beautiful, too, but they (way) predated the 20S. I really believe the 20S was the last HP calculator to have a less segmented LCD display. The display on the 48G series too a little getting used to, but after a while, they were fine, too, even if the native fonts reminded me a bit too much of that in the old DOS command line displays.

But seriously, I loved using my 32SII so much (oh, it so reminds me of the 34C except for its [dare I say it?... yeah, why not:] reeeeeeeddddd LED display) that I didn't even notice its more segmented display until I had it side by side with the 20S.

The HP10BII uses 7-segment display, too (n.t.)

32S/SII vs. 42S vs. 33S

*Message #6 Posted by **Karl Schneider** on 19 Mar 2005, 12:42 p.m.,*
in response to message #1 by Eric Lundgren

Eric --

The 33S, of course, was based upon the 32SII. Every shortcoming -- real or perceived -- of the 32SII is present in the 33S. I agree with you that the big, bold, glare-free one-line 33SII display is better than the two-line display of the 33S with none of these attributes. Also, the 32SII keyboard and legends are better.

I would have been more pleased with a 32SII having 4 kB or 8 kB of RAM.

The 42S had some of the things you mentioned -- e.g., softkey menus, and vector cross product.

-- KS

Edited: 19 Mar 2005, 12:42 p.m.

Re: 32S/SII vs. 42S vs. 33S

*Message #7 Posted by **Eric Lundgren** on 19 Mar 2005, 10:42 p.m.,*
in response to message #6 by Karl Schneider

Karl,

About the 42s, right, my father has a 42s that I occasionally get to use. He was very kind and bought twin 42s machines for us both, while I was in elementary school. It was not useful, however, since we were doing mostly algebra, and was shelved..so where it is....I'll have to make a trip home someday!

Your comment about all 32sii shortcomings being carried over to the 33s is ironic in that 32sii MEM/REG is small, and the 33s INV(MEM/REG) is small (why?! why?!) :)

I agree with the 32sii/4k idea. Boy, do I agree! As supportive as my wife is, she's almost written me off after my heavy HP research :)

Thanks, Eric

Re: We can't complain...

*Message #8 Posted by **Ben Salinas** on 19 Mar 2005, 9:34 p.m.,*
in response to message #1 by Eric Lundgren

I truly believe that the 33s was not created for calculator collectors; let's face it, they (we) won't be totally content with anything.

The 33s was created for those who don't have access to 15 other HP calculators and those who have never used an HP calculator. And those who have not used the beauty that is the (insert favorite calculator here) do not realize the shortcomings of the 33s. I have several friends who use the 33s having used nothing but a TI-30xa and a TI-83, and they love it. I never hear them complain about the decimal point being hard to see, nor the enter key being clumsyly located, nor the quality or the screen, nor the lack of memory locations, nor the lack of options. They don't complain about any of this, and so in that respect HP has definitely succeeded. They created a calculator which is enjoyed by new users.

Granted, I wish I could go out and buy a new calculator which had the old enter key and was in every way like the 32sii, except with more memory, but I can't. I am counting down the days to graduation partially because it is the day I will say goodbye to all my friends, but also because it is the day I have to return my almost constant companion for the past 4 years, my 32sii- then it will be nothing but the 49g+ and 33s for me.

Alack, alas!

-Ben Salinas

Re: We can't complain...

*Message #9 Posted by **Eric Lundgren** on 19 Mar 2005, 10:59 p.m.,*
in response to message #8 by Ben Salinas

I sympathize Ben,

I have a 32sii (which I paid only $26 for!!) and for those of us (hp41cxERA < THOSE OF US < 33sERA), the 32sii has special meaning. Its the last of the traditional-case HPs, well spaced keys, fits in the pocket (the ultimate engineer's tool!).

We are lucky that the 49g+ and 33s have the hinged keys, its a step toward the missed age. BTW, I have, thanks to VPN and hpcalc.org, no more missed keystrokes on my 49g+. Have you experienced the same problem?

Also, you are right. The 33s is a great machine. I am lucky to have another chance at non-graphing RPN, after missing out on a shelf FULL of 32sii's at a store here back in 2001. (I'll never out live that mistake)

BTW are you going into math, engineering, physics..any ideas yet?

Regards, Eric

in response to message #9 by Eric Lundgren

I am more than likely going to go into engineering. I haven't ruled math out, but it will probably be engineering (maybe mech, or EE... I am not sure).

And schools- well I got accepted to Stanford, but I don't know if I want to go there. Everyone is telling me that Stanford is a great school (even the interviewer from Harvard told me to go to Stanford), but I found this small school outside of Boston called Olin. It is 3 years old (first graduating class next year) and currently has 75 students per class. I went and visited for Candidate's Weekend (the name ~175 applicants "Candidates" and then from there choose about 120-130 to admit), and I really liked it a lot (due to the size and the nature of their classes).

It seemed like an awesome school, oh and they pay tuition also, so it will only be about 15k per year before any other financial aid. www.olin.edu for more info on the school.

33s - If SQRT( ) must be INV of SQ( )

*Message #1 Posted by **Eric Lundgren** on 19 Mar 2005, 2:46 a.m.*

I agree that the ^2 button should be LS of the ^0.5 button. So its simple, but it works-

G0001 LBL G, G0002 x^2, G0003 RTN

Of course, it is wasteful of variables in short supply. But my index finger invariably wants to return to the same button when doing root of two squared terms being added.. Eric

Interfacing HP82161A to HP-85

*Message #1 Posted by **Johnsay** on 18 Mar 2005, 4:23 p.m.*

Hi All: I'm attempting to interface an HP 82161A HP-IL cassette drive to a an HP-85B. This is being attempted via the HP-IB card in the HP-85 working through the HP 82169 HP-IL/HP-IB interface. The system has been verified to work with an HP-IL printer. Is it even possible to do mass storage operations with this setup? Tape operations seem slaved to the unit in the '85 and none of the tricks for redirecting I/O seem to work. Thanks Johnsay

Re: Interfacing HP82161A to HP-85

*Message #2 Posted by **Andre Koppel** on 24 Mar 2005, 4:34 p.m.,*
in response to message #1 by Johnsay

Very long time ago (20 years) we have tried this. No way, interfacing and command language of an HP-IL Diskdrive is completely different from the GPIB massstorages like 9121. Even if you have installed the ROMs into the HP85, you are not able to access the IL disk like a GPIB disk. The only way is to access the IL disk on a low level with direct IL programming (reading and writing sectors).

Sorry, its off topic, but does walmart sell the 49g+?

*Message #1 Posted by **Harry** on 18 Mar 2005, 3:36 p.m.*

The website says its "Online Only". But what does that mean? Is it not available at the stores, or are the $138 online only? A Friend of mine is visiting the states now, and as the 49G+ is rather expensive in Germany (where I live) I wanted to ask him to get one for me in the states. So I need to know where he can buy it, and how much it costs. And where can you get the 48GII?

Thanks for your help, Harry from Germany

online only means not in stores

*Message #2 Posted by **Gene** on 18 Mar 2005, 4:57 p.m.,*
in response to message #1 by Harry

Only HP I have ever seen in a Walmart physical store is the HP10bII.

HP33S bug subtracting degrees from minutes?

*Message #1 Posted by **John P** on 18 Mar 2005, 11:00 a.m.*

Is the following a known HP33S bug?

Subtract ONE DEGREE from ONE MINUTE and you should get NEGATIVE 0 DEGREES 59 SECONDS. However, the HP33S returns NEGATIVE 0 DEGREES 58 MINUTES 20 SECONDS.

If you subtract ONE DEGREE from 4 MINUTES, you should get NEGATIVE 56 MINUTES, but instead, the HP33S returns NEGATIVE 55 MINUTES 20 SECONDS.

Am I doing something wrong?

in response to message #1 by John P

>> you should get NEGATIVE 0 DEGREES 59 SECONDS

Sorry about the typo... I should have typed NEGATIVE 0 DEGREES 59 MINUTES 0 SECONDS...

Re: HP33S bug subtracting degrees from minutes?

*Message #3 Posted by **Norris** on 18 Mar 2005, 12:35 p.m.,*
in response to message #1 by John P

The ->HMS function on the 33S has a bug; it does not always work correctly with negative numbers. It apparently can be trusted with positive numbers. This has been documented by HP in the "User's Manual Update" at

http://h10032.www1.hp.com/ctg/Manual/c00251639.pdf

I programmed a simple "alternative" ->HMS function on my 33S, which is assigned to XEQ 5 (instead of right-shift 5). The "alternative" function checks to see if the input is negative. If it is, then it changes the sign, runs ->HMS, and restores a negative sign to the result. The program uses flag 4.

```
LBL U
CF 4
x<0 ?
SF 4
FS? 4
+/-
->HMS
FS? 4
+/-
CF 4
```

RTN

You should also be aware of the polar conversion bug, which is also documented in the "User's Manual Update"

eBay Descriptions

*Message #1 Posted by **gifron** on 18 Mar 2005, 10:55 a.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=50575&item=5761554535&rd=1

This used calculator is perfect and good, but has light scratches and a dent.

Re: eBay Descriptions

*Message #2 Posted by **Bill (Smithville, NJ)** on 18 Mar 2005, 11:24 a.m.,*
in response to message #1 by gifron

The phase used in the description is

"...bidding on used and in perfect good working condition.."

I would read it as the "working condition" is perfect and good and not the visual. He discloses the visual as "light scratches, dent", etc.

Maybe he didn't use the best English, but I really don't see a problem with his description.

Opening the HP-71B

*Message #1 Posted by **John Pierce** on 18 Mar 2005, 10:42 a.m.*

I need to open my HP-71B because it works perfectly on ac power but does not work using batteries. I believe the springs or contacts from the batteries inside the case have separated. I have searched for the mechanical drawings or other information in the HP-71B documentation on the MoHPC DVD with no success. How do I open the HP-71B without causing any damage? Thanks for you help. John Pierce

Re: Opening the HP-71B

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 18 Mar 2005, 3:34 p.m.,*
in response to message #1 by John Pierce

Hi, John;

I openned mine once for checking purposes, and I found no problems separating half cases after removing (a bunch of) screws. I am not sure if there are screws under the rubber feet, but I think it's worth checking it, too.

On the other hand, I had some doubts about openning the HP75D because I felt some mechanical resistence on separating both halves after removing all screws (a bunch, too). After some reasoning, I forced it a bit and heard a loud 'cracking' sound. Fortunately it was super glue. I think that someone opened it and glued it back, but I am almost sure it was not any HP guy. As it has an AT&T label, I guess AT&T tech personal decided to glue the halves to avoid the computer to be inadvertently opened by other curious people... like me!

If you find yourself in trouble, I can take som epictures showing my HP71B opened.

Cheers.

Luiz (brazil)

in response to message #3 by John Pierce

Hi, John;

I checked the HP71B right now an it has:

one screw under each rubber feet; (except for the rubber feet in the cover of the card reader compartment)
three screws inside the battery compartment;
one screw inside the compartment used by the card-reader (empty if none).

If I did not miss any, there's a total of seven small screws to unscrew. Another fact: take care when screwing them back after closing the HP71B; the thread in the plastic tends to get loose if you miss it and force the screw driver.

Thh picture below shows the back side of the HP71B with the locations of the screws.

http://www.logeng.com.br/images/HP71B_screws.jpg

Hope this helps.

Cheers.

Re: Opening the HP-71B

*Message #11 Posted by **Tony Duell** on 19 Mar 2005, 6:36 a.m.,*
in response to message #1 by John Pierce

You mentioned in another message that it was the old-style one...

In that case, remove the card reader port cover, the battery cover, and batteries. Peel off the 3 feet remaining on the machine. Undo the 2 tiny screws close together near the edge of the machine -- LEAVE THE OTHER ONE ALONE. Undo the 5 TX6 screws (one in the battery compartment, one in the card reader compartment, one under each of the feet you removed.

Carefully separate the case halves. On old machines like this one, they're linked by a flexible PCB that you

must take care of. Don't just yank the case apart. If you mangle that flexible PCB you have a long day ahead of you replacing it with ribbon cable.

I can't remember quite how the battery and AC adapter are connected (but there's a schematic on the MoHPC CD-ROM in the hardware IDS). Most likely there's a diode in series with the +ve terminal of the battery, and a bridge rectifier on the AC input. All standard parts that are easy to check and replace

how calculator works (aritmethics)

*Message #1 Posted by **Diana Ramírez** on 17 Mar 2005, 7:34 p.m.*

Can somebody please give me some information about how HP calculators works internally, how the calculator make operations, how does it´s microprocessor work and any information that can bring me.

Re: how calculator works (aritmethics)

*Message #2 Posted by **Karl Schneider** on 17 Mar 2005, 9:47 p.m.,*
in response to message #1 by Diana Ramírez

Diana --

I'd say that you need to focus the question -- that's avery broad topic.

It seems that you are concerned about the microprocessor operations rather than the mathematical algorithms. There are a wide range of HP handheld calculators, spanning from 1972 to the present, with different architectures. Extremely detailed information is available for older, discontinued models such as the HP-41, but information on new ones might be proprietary.

-- KS

Re: how calculator works (aritmethics)

*Message #3 Posted by **Eric Smith** on 18 Mar 2005, 1:20 a.m.,*
in response to message #1 by Diana Ramírez

Generally all recent calculators (including HPs made since 1979) and microprocessors work internally by using an electric field applied to a polysilicon "gate" to control the conductivity through a doped silicon "channel", which is separated from the gate by a very thin layer of silicon dioxide. This device is called a Metal Oxide Semiconductor Field Effect Transistor, or MOSFET.

By carefully arranging the connections between hundreds of thousands of these devices, they can be made to perform useful calculations. How to connect them in such a manner is typically the subject of a multi-year course of study at a university, in the Electrical Engineering and/or Computer Science departments.

Re: how calculator works (aritmethics)

*Message #4 Posted by **valentino ducati (switzerland)** on 18 Mar 2005, 1:59 a.m.,*
in response to message #3 by Eric Smith

@Erich Smith:

Nice to read such posts in the morning... :D :D

Re: how calculator works (aritmethics)

*Message #5 Posted by **John L. Shelton** on 18 Mar 2005, 1:44 p.m.,*
in response to message #4 by valentino ducati (switzerland)

There is considerable discussion in the technology sections of the MOHPC, and more detailed discussion in some of the forum threads. Perhaps some of the best reading is done in back issues of the HP Journal, copies of which are found on the Museum's CD/DVD distribution. These older articles go into great detail.

As was asked before, Diana, what kind of information are you looking for? Do you want to know more about how chemicals are assembled to make digital electronics? How digital electronics can be used to perform decimal calculations and program control? How decimal calculations and program control combine to make keystroke operations work? How about how would a calculator be built today?

One interesting thing to consider is that many calculators use internal decimal math instead of binary math as is done with most computers. Binary math works great because it's much easier to build, and can thus be very fast. But binary math doesn't allow for exact representation of decimal numbers, leading to minor errors. Most calculators take the trade - spending more effort on decimal math to get answers that are exactly right. (Of course, some functions, like trig and log, will never be exactly right.)

Re: how calculator works (aritmethics)

*Message #6 Posted by **Garth Wilson** on 18 Mar 2005, 1:59 p.m.,*
in response to message #5 by John L. Shelton

It looks to me like she's looking for things like the programmer's model of the processor, the instruction set, and the source code showing how various functions are calculated. It appears you can get that from CD #5 from this website at www.hpmuseum.org/software/swcd.htm which includes the HP-41C VASM listing.

Re: how calculator works (aritmethics)

*Message #7 Posted by **David Smith** on 18 Mar 2005, 4:51 p.m.,*
in response to message #3 by Eric Smith

This "silicon" story is just a myth. All electronic devices actually contain magic smoke. Once you let the smoke out of the device, it stops working.

Re: how calculator works (aritmethics)

*Message #8 Posted by **Diana Ramìrez** on 18 Mar 2005, 7:46 a.m.,*
in response to message #1 by Diana Ramírez

How do they make mathematical operations? thats my question.

Re: how calculator works (aritmethics)

*Message #9 Posted by **Eric Smith** on 18 Mar 2005, 9:22 p.m.,*
in response to message #8 by Diana Ramìrez

Those MOSFETs I mentioned previously are wired to act as logic gates that perform logical functions on binary digits (bits). For instance, one of the most common gates is the NAND gate, which produces a '0' output only if both of its inputs are '1', and otherwise produces a '1' output.

Several of these gates wired together form a "half-adder", which can add two addends of one bit each to produce a two bit result. By itself, that's not very useful, but two half-adders together can be wired as a

full-adder, which will add three bits to produce a two bit result. That is useful because you can chain full-adders together to add wider data words.

In an HP calculator, the adders are a little more complex because they can be switched between pure binary mode, in which four bits represent a hexadecimal digit between 0 and 15 (F), or BCD mode, in which they represent a decimal digit between 0 and 9. BCD mode is used to implement the higher-level arithmetic functions.

HP calculators use a 56-bit or 64-bit word (48-bit in the case of the HP-01 watch). This is considered to be 14 or 16 digits. The digits are divided into a mantissa and an exponent field in order to represent floating point numbers.

To add two user-entered floating point numbers, the calculator firmware (also sometimes known as microcode) first compares the exponents to see if the numbers have the same scaling. If not, one of the numbers is repeatedly shifted left, and its exponent adjusted, until the exponents match. Then the mantissas are added. The result may have a carry, in which case the result is shifted right and the exponent adjusted again.

There is some additional complication relating to the handling of negative numbers, but this is basically how it works.

Multiplication is performed using repeated shifts and additions. Division is performed using repeated shifts and subtractions. Logarithmic, exponential, trigonometric, and inverse trigonometric functions are performed using a CORDIC technique or series approximations.

Re: how calculator works (aritmethics)

*Message #10 Posted by **Klaus** on 19 Mar 2005, 1:17 p.m.,*
in response to message #9 by Eric Smith

If you are into the C programming language, you should look at Eric's wonderful Nonpareil. It contains a emulator for the hardware written in C and the original assembler code of the Calculator. If you start the debugger and step through the execution of sin(), you will know hot it works...!

41C Quad Memory

*Message #1 Posted by **Carlos A. Monje** on 17 Mar 2005, 7:08 p.m.*

How do I install the Quad Memory in my 41C? Not the physical installation, but the steps in the keyboard to get access to it.

Re: 41C Quad Memory

*Message #2 Posted by **Raymond Del Tondo** on 17 Mar 2005, 7:20 p.m.,*
in response to message #1 by Carlos A. Monje

No special installation necessary.
Just plug and play;-)
Seriously, once the QUAD is plugged,
you have access to all 319 registers.
Take a look into the manual about the SIZE function.

HTH

Raymond

Re: 41C Quad Memory

*Message #3 Posted by **John Pierce** on 17 Mar 2005, 7:40 p.m.,*
in response to message #1 by Carlos A. Monje

You must XEQ SIZE nnn where n is a digit.

Re: 41C Quad Memory

*Message #4 Posted by **Garth Wilson** on 17 Mar 2005, 9:55 p.m.,*
in response to message #3 by John Pierce

SIZE is to tell it how much of the already-available memory you want set aside for registers for variables, but the memory is immediately available when you plug the module in and turn the calculator on. HP handhelds had plug-and-play long before they were even talking about it for PCs. It's not even "plug and wait awhile for it to configure itself and automatically install various software"-- it's truly plug-and-play.

48GX (R) & 48G AURM 4th Ed. erratta

*Message #1 Posted by **sbirdasn** on 17 Mar 2005, 6:05 p.m.*

In the interests of learning more about my 48GX (Rev. R firmware), I've been reading my Advanced User's Reference book from cover to cover (Reads like a dictionary, strange plot... ;)).

Anyway, several program examples obviously don't work as shown, for various reasons like missing stack arguments, etc. Fine. I can figure out the missing thing and get them to work.

Even the program mode grob entry was figured out (e.g. GXOR example- pg. 3-135), though nowhere in the entire set of manuals is there an explanation of "x" between the grob size values being *inserted* during processing to push it onto the stack (but don't type the "x" yourself, but you see it when you view/edit the program object later though).

But, for my version "R" firmware, the RCLF (pg. 3-262-3) & STOF (3-327-8) commands don't seem to care about the current wordsize as the text would have you believe.

Try this:

HEX @ show integers in hexadecimal @

-64 SF 64 SF 32 STWS @ set sys & user flg 64, set w size 32 @

RCLF @ system & user flags list on stack @

You will see that the user flag portion does not display on the stack/view/edit modes as having sys & user flags 64 set.

Save the flags list object if you want to continue to test with them later...

Now change word size to 64 then back to 32 to verify that the sys/user flags 64 is still inside the object, but is simply not being displayed when smaller word sizes are set.

Next, do the following (w/ orig flag list on level 1):

32 STWS 64 CF @ set word to 32 (if reqd), clear UF 64 @

STOF @ my calc writes *all* flag bits, man says clears upper ones @

RCLF RCWS 64 SF? -64 SF? @ See what happened... @

Manual says that upper bits above the word size will be cleared, but the STOF writes all bits, regardless of word size. My 48GX now has both system and user flags 64 set, with the word size at 32-bits.

The behavior I describe seems more correct, as you can do in a single step saving/restoring the system flag states without having to remember the original word size separately. (Like RCWS 64 STWS RCLF 2 PICK STWS to get full set without disturbing things, but you will still need original word size to restore things fully again if the

manual was right.)

So, when did system flag handling change? Or has it always been this way? This seems like a pretty substantial difference in behavior, if you ask me.

Now, I don't expect this to work if I start manipulating the objects with bitwise operations when the word size is less than 64.

Oh, and they neglect to tell you that word size bits are encoded as (wordsize - 1) i.e. 1 STWS => flag bits 000000b, 64 STWS => flag bits 111111b (Brings up the old 16C's word size = 1 becoming so inarticulate that you use setting word size = 0 to get it back to maximum word size again...)

Any other real howlers you've found?

Anthony Naef.

Re: 48GX (R) & 48G AURM 4th Ed. erratta

*Message #2 Posted by **Raymond Del Tondo** on 17 Mar 2005, 6:56 p.m.,*
in response to message #1 by sbirdasn

Hello,

thanks for the info on the AUR errata.

For the wordsize: You could check it
with Emu48 and an older ROM file.
Both should be available on www.hpcalc.org

Regards

Raymond

Re: 48GX (R) & 48G AURM 4th Ed. erratta

*Message #3 Posted by **sbirdasn** on 17 Mar 2005, 10:05 p.m.,*
in response to message #2 by Raymond Del Tondo

True, but *I* don't own any older firmware rev. 48's, so there is that sticky bit about copyright. I know that it's a minor technicality in a discontinued line no longer supported by HP-- Still, I'm one for standing on principle whenever I can.

Besides, I'm still interested in knowing if anyone else has noticed this thing before as well.

Re: 48GX (R) & 48G AURM 4th Ed. erratta

*Message #5 Posted by **sbirdasn** on 18 Mar 2005, 3:02 a.m.,*
in response to message #4 by VPN

I agree that it's *not* a "bug" either. That's why I didn't use that term in my analysis. But it is a discrepancy between the documentation and the real product. By erratta, I was allowing for the discrepancy to be in either the manual or the device, or even both. The real behavior in my 48GX-(R) makes much more sense than the behavior described in the programmer's reference.

I'm more curious about if it changed somewhere in the 48 evolution itself or between the 28 -> 48 porting process.

The point being, someone at HP writing the manual went to a lot of trouble to describe what they *thought* was supposed to happen, but that's not what I'm seeing in real world on real hardware. That being said, the 48G AURM went through *four* revisions in rapid succession (1.5 yrs). That is a sure sign that things were thrown together in a hurry or munged from some previous document(s) with little time/resources for proper editorial oversight and cross-checking.

sbirdasn.

Finding unknown variables (OT)

*Message #1 Posted by **Frank** on 17 Mar 2005, 7:17 a.m.*

Greetings,

My daughter received this problem to solve. She is presently in 5th grade. We have tried to solve it, to no avail. Thanks you for your help, here it is:

c=4

d-a=i

b-c=g

ac+ic=de

sg-de=hi

We need to know the values of all the variables. TIA.

123 to delete

Re: Finding unknown variables (OT)

*Message #2 Posted by **John Limpert** on 17 Mar 2005, 8:42 a.m.,*
in response to message #1 by Frank

It looks more like an arithmetic cryptogram than a set of equations. In an arithmetic cryptogram, each digit in the solution is replaced with a letter. In your example, you are given a starting clue, that C stands for 4. Using the rules of mathematics and logic, the goal is to deduce which letters stand for which digits. For example, E = C + C, therefore E stands for 8.

I think your right.

*Message #3 Posted by **Larry Corrado** on 17 Mar 2005, 8:01 p.m.,*
in response to message #2 by John Limpert

When I first read the problem, I thought the same thing, that this is really an "arithmetic cryptogram," with letters respresenting digits of numbers.

I doubt that fifth graders are solving simultaneous equations in this many unknowns.

Ciao, larry

Me too !

*Message #4 Posted by **Tom Sherman** on 18 Mar 2005, 10:50 a.m.,*

in response to message #3 by Larry Corrado

John and Larry are right. ac, for example, should probably be read in this puzzle as a two-digit number rather than as a product.

The solution then would be: 1= a, 2= h, 3= g, 4= c, 5= i, 6= d, 7= b, 8= e, 9= s

May Frank's daughter enjoy mathematics all her life, remembering the good times she had with her dad!

Cheers, Tom

in response to message #3 by Larry Corrado

Oh, I don't know about that...

... one does wonder how Ben Salinas got his start!

Re: Finding unknown variables (OT)

*Message #8 Posted by **Tom Sherman** on 17 Mar 2005, 2:28 p.m.,*
in response to message #1 by Frank

Frank,

If this is a problem in numbers (rather than some sort of word code game), here is one amateur's initial reaction:

C is given as a constant, so we have 8 variables and 4 equations, and therefore no unique solution. An infinite number of solutions can be found if we assign enough (but not too many) zero values to the variables.

Here is one possibility. Let g, e, h, and d all be zero. Then b=c=4, -a=i, and s = anything. So one solution

would be:

c= 4, b= 4, a= -1, i= 1, s= 1, g= 0, e= 0, h= 0, d= 0

Not very pretty. I'm sure that more interesting solutions can be found!

Cheers, Tom

P.S.

*Message #9 Posted by **Tom Sherman** on 17 Mar 2005, 6:21 p.m.,*
in response to message #8 by Tom Sherman

Here's one with fewer zero values:

c= 4, e= 4, b= 4, h= -4, d= 1, i= 1, s= 1, a= 0, g= 0

s could be any number; so could d and i, so long as they equal one another.

P.S.2

*Message #10 Posted by **Tom Sherman** on 17 Mar 2005, 6:56 p.m.,*
in response to message #9 by Tom Sherman

Hence if a and g are zero, all the other variables can be 4 (with a minus for h).

Re: Finding unknown variables (OT)

*Message #11 Posted by **Frank** on 17 Mar 2005, 8:15 p.m.,*
in response to message #1 by Frank

Thanks for all your input. I concur with the majority and feel that this is an arithmetic cryptogram.

Re: Finding unknown variables (OT)

*Message #12 Posted by **Eric Lundgren** on 18 Mar 2005, 1:50 a.m.,*
in response to message #11 by Frank

I'll say that E = 4..

Leaving 3eq in 7unkn...a task indeed! :)

in response to message #1 by A. L.

Geek engineers with pockets full of money are my best friends.

Re: I love eBay

*Message #3 Posted by **Chan Tran** on 17 Mar 2005, 10:20 a.m.,*
in response to message #2 by Coburlin

I see no reason to stop buyers from paying high prices on old HP calcs. It only means that our calcs are now worth more. Don't we all have some old HP calcs???

Re: I love eBay

*Message #4 Posted by **A. L.** on 17 Mar 2005, 10:50 a.m.,*
in response to message #3 by Chan Tran

I suppose the high prices paid for old HP calculators are due the actual HP models are of poor quality (HP49G onwards)

Re: I love eBay

*Message #5 Posted by **Hugh Evans** on 17 Mar 2005, 11:32 a.m.,*
in response to message #4 by A. L.

This is exactly what makes OpenRPN more feasible and logical by the day. It was a no-brainer for me to recognize that we could make a product that surpasses the quality of the classic HPs and still sell them for a fraction of what you would have to pay otherwise.

The ebay sellers will still have the same market, because the old machines are worth more to them than someone with utilitarian motives. Exactly the same situation has existed in the musical instrument market for years longer than what we've seen for calculators.

So the purpose of OpenRPN is to supply actual end-users with a viable alternative. Auctioners such as Coburlin are exactly the equivalent of antique dealers. Prices prices may fluctuate but will continue on an upward trend. Look into the economics of antiques.

HDE

Re: I love eBay

*Message #6 Posted by **Richard Garner** on 17 Mar 2005, 11:26 a.m.,*
in response to message #3 by Chan Tran

The only problem with higher sell prices is that it drives the price out of the range for users of the calculators. A collector will still pay high prices for items but a user won't unless they have to.

Re: I love eBay

*Message #7 Posted by **Giancarlo** on 31 Mar 2005, 1:09 a.m.,*
in response to message #6 by Richard Garner

Right! That's why many people (I suppose) are almost compelled to become "collectors" (i.e. to provide a huge cash flow out of their pockets...) even though their primary aim would be to be "users".... My two cents... Cheers. Giancarlo

the curse...

*Message #8 Posted by **Hans Brueggemann [GER]** on 31 Mar 2005, 4:35 a.m.,*
in response to message #7 by Giancarlo

...of collecting is, that the collectors steer the prices. it will always be that way. no reason to cry. and, come to think of being a "user", i have to buy 41s wherever i see them. just in case. because you never know when it is going to flip off the table. have one spare. sleep better. my girl friend only asked me once, whether she could borrow one of my 41s to do some household calculations... gents, that was disgusting!

cheers, hans

Quote (from some wise book...) "Marrying the right person is the single most important decision in anyones life. That single decision will influnce 90% of ones happiness (or unhappiness)."

Seems that quite a few here have implemented that saying very successfully.

Re: the curse...

*Message #14 Posted by **Eric Lundgren** on 2 Apr 2005, 1:18 a.m.,*
in response to message #13 by Peter

Yep...

tis true. My wife of 9.3 months has patiently accompanied me on many many hp-search-and-rescue missions. They haven't always been successes, but we somehow always manage to have fun in the process.

We rescued my 32sii in Burbank, CA (a 5.5hr roundtrip drive) , and I remember ordering "as long as it comes with pancakes" from IHOP as I inspected the *CHEAP* floor model I'd luckily picked up. My wife (g.f. at the time) simply smiled and understood. I'm very lucky. Plus, I'm occasionally allowed to key-stroke before we order at restaurants...*if I quickly decide on an entree* But the "chips and salsa" ceremony is sacred, and I must participate, :)

Ok, I feel pretty lucky and happy.

Eric

hp49g+ "automatic" overclock upon "On"

*Message #1 Posted by **Eric Lundgren** on 17 Mar 2005, 1:08 a.m.*

Hi all,

Now that I understand it [thanks VPN and Alistair Borowski!], here's the steps to make your 49g+ automatically increase clockspeed when you turn it on..if anyone else has had difficulty.

(this has fixed my keyboard probs, no more missed keystrokes)

NOTE: you must get the program first from: http://www.hpcalc.org/details.php?id=6081

Place the program (I use the c124s program) in HOME dir. Now, in the stack:

<< OFF ON C124S >> ENTER 'STARTOFF' STO 'STARTOFF' 101.3 ASN

Note that VPN suggested slowing it down (placing C34 right after the OFF command) which I will have to do later. But for now...!! Its GREAT! I no longer have to worry about whether I forgot to run the speed tool each time the machine shuts off during an exam.. *happy HP user* Eric

Re: hp49g+ "automatic" overclock upon "On"

in response to message #1 by Eric Lundgren

Please report on your battery usage when you have tried it a little.

Thanks

Arnaud

Re: hp49g+ "automatic" overclock upon "On"

*Message #3 Posted by **Eric Lundgren** on 18 Mar 2005, 1:17 a.m.,*
in response to message #2 by Arnaud Amiel

I've been thinking the same thing..

Yes, I'll be sure and post if the life span drops significantly. However, if that is the case, I'll have to shelve the machine.

Its already distressing enough imagining a *memory clear* during a test (its done that three times or so in the last few days, but I'm new to the machine, and it is much more complex than the 32sii and 33s I'm used to).

I'm also concerned with my growing habit of writing routines for things that I should just know, along with trying to build an engineering "library" to carry in my pocket...where's the cutoff point..?

Keyboard problem HP 41

*Message #1 Posted by **Peter** on 17 Mar 2005, 12:34 a.m.*

Hi,

I got an HP 41CV which works fine, just one row (the + 5 6 7) row does not work. The keys click just fine, I dusted the whole thing inside out a few times, cleaned all internal contacts with alcohol.

Any ideas? Thanks so much in advance.

Peter

Re: Keyboard problem HP 41

*Message #2 Posted by **Raymond Del Tondo** on 17 Mar 2005, 5:30 a.m.,*
in response to message #1 by Peter

Hi Peter,

if you have some spares, have you tried replacing
the CPU pcb and of course the zebra stripe ?

I had a similar case some time ago, where the rightmost
column of keys didn't work partially.

Replacing the zebra stripe alone didin't help,
but replacing the CPU pcb was the solution.

It's not necessarily the solution for your case,
but it's an option to try;-)

Another possibility is corrosion and/or a broken
lane on the keyboard pcb.

Regards,

Raymond

Unexpected Rounding

*Message #1 Posted by **D Davis** on 16 Mar 2005, 2:59 p.m.*

I am doing some FV & PV calculations on my 12c and encountering some rounding errors.

example- calc # of periods need to compound to reach FV.

1000 invested at 8% compounded annually to reach 3670 should equal 16.89 periods, my 12c says 17 periods

1000 invested at 8% compounded semi annually to reach 3670 should equal 33.15/2=16.58 periods, my 12c says 34/2=17 periods

Have I a setting to change?

Re: Unexpected Rounding

*Message #2 Posted by **Mike T.** on 16 Mar 2005, 3:43 p.m.,*
in response to message #1 by D Davis

OK - Unfortunately I'm not yet proficient enough with my own 'new' HP12C so I can't check your findings but I'll be the first to ask the obvious anyway - how many decimal places are shown in your result?

(I assume you have pressed **[f] [2]** to display 2 decimal places).

Hope this helps.

Mike T.

Re: Unexpected Rounding

*Message #3 Posted by **D Davis** on 16 Mar 2005, 3:56 p.m.,*
in response to message #2 by Mike T.

Mike- Thanks for replying. I am showing 2 or greater decimal places when this happens.

The 12c rounds n to the "nearest" integer...

*Message #4 Posted by **Gene** on 16 Mar 2005, 3:57 p.m.,*
in response to message #2 by Mike T.

except for a few cases.

Examples:

If the true calculated n is 18.6, it rounds up to 19.

If the true calculated n is 18.1, it rounds up to 19.

If the true calculated n is 18.0002, it rounds down to 18.

Been that way since the 12c's release back in 1981. It is described in the 12c owners manual (and the 12c platinum owners manual is available free at www.hp.com/calculators. It works for the original 12c in almost all respects.

Gene

Re: Unexpected Rounding

*Message #5 Posted by **Tony** on 17 Mar 2005, 8:27 p.m.,*
in response to message #1 by D Davis

Hello,

> Quote:
>
> 1000 invested at 8% compounded annually to reach 3670 should equal 16.89 periods, my 12c says 17 periods

You'll get the 16.89 on the HP-38C, which was the HP Financial Calculator(HPFC) just prior to the 12C, and also on the HP-18C, which was the HPFC that followed the 12C.

I just found my old program for the 12C which makes it also give the 16.89. I call it the "pulveriser" as it takes i and PMT and creates tiny but equivalent replicas of them :-).

Here is the pulveriser, in 15 lines:
1 [n] [STO][PV] [FV] [X<>Y] 0 [PMT] [FV] [RDN] [n] [i] [RDN] [FV] [PMT] [g][GTO]00

For your case where PMT=0 the above could be simplified of course, or you could just calculate n as LN(3.67)/LN(1.08).

Or, try this, where [R/S] runs the pulveriser:
8 [i] 0 [PMT]
[EEX] 9 [R/S]
1000 [CHS] [PV] 3670 [FV] [n]
[EEX] 9 [/] ->16.89215375

This method also works for calculating n for non-zero PMT.

Ironically the method used in the pulveriser above does *not* work at all well on the HP-38C or the HP-18C (or in fact any other HP TVM implementation). One could argue that it is not of course needed on those machines, but it is also useful for finding equivalent effective rates of interest and PMT in real life - with a factor if 12 or 52 for example.

Anyway, while I too found the n-solving on the 12C unexpected, I am at least pleased to report that the 12C represented a peak in HP financial mathematics knowledge/implementation. For example, look at what you get for i when trying this on HP TVM programs:

[EEX] 9 [n] 1 [PV] 0 [PMT] 1.05 [CHS] [FV] [i] [RCL][n] [*]

On the 12C we get:4.879016417 (exactly 100*LN(1.05))
On the 38C we get:4.800000000
On the 18C we get:4.87900000000
On the 49G we get: the same as the 18C

On the 200LX :4.8790164000000

It appears that when HP re-did their TVM application for the 18C, they went back to the 38C microcode. Our 12C stands alone! It has an aura of reliability, not without reason, and it shows in delightfully unexpected ways.

Cheers, Tony

Mouldy calc

*Message #1 Posted by **Arnaud Amiel** on 16 Mar 2005, 3:42 a.m.*

I have an hp55 that was certainly kept in the wrong place by its previous owner so now it smells very mouldy. After a bit of work, it is now quite clean and working properly but the smell is unpleasant even after seveal months in a dry environment. Does anyone know how I can get rid of it without damageing anything. Here I am talking not only about the calc but also the case, charger, manual, slip case, reference guide...

Any idea will be welcome.

Thanks a lot,

Arnaud

PS: Does anyone know of a website that has instruction about how to properly clean and restore books and cardboard boxes?

in response to message #1 by Arnaud Amiel

Hi Arnaud,

I've heard of people using Ozone generators to eliminate smells in cars (such as after hitting a skunk). I wonder if it would help with a smelly calculator?

Does anyone know if ozone would harm any of the calculator parts? Not exactly sure how you would do it - I know you don't want to breathe very much of it. And, of course, where do you find an ozone machine?

Last year I aquired a bunch of calculators with their manuals from an estate and they had been stored in a heavy smoker's house. They smelled like they had just come out of a house fire. Forturnatelly, after several months of fresh air they have lost their smokey smell.

Hopefully, yours will fade with time also,

Bill

Store with baking soda or charcoal briquets. Both have odor eating abilities.

The Library of Congress has info on care and repair of paper products. The Gemmary has archival materials.

Re: Mouldy calc

*Message #4 Posted by **Ed Look** on 16 Mar 2005, 11:47 a.m.,*
in response to message #1 by Arnaud Amiel

Arnaud, it is best as they have said, to just let it continue to air out, and if you like, use baking soda or charcoal to try to absorb some of the odors to hasten the process.

But don't mess with ozone; it's an oxidant. In other words, it may cause corrosion and other adverse effects in something so sensitive as an electronic circuit with fine connections and joints, like your HP 55.

Re: Mouldy calc

*Message #5 Posted by **Bill (Smithville, NJ)** on 16 Mar 2005, 1:24 p.m.,*
in response to message #4 by Ed Look

Hi Ed,

"But don't mess with ozone; it's an oxidant. In other words, it may cause corrosion and other adverse effects in something so sensitive as an electronic circuit with fine connections and joints, like your HP 55."

Good point. I just did a little more search on oxone and can only find references to using it to get rid of smells in clothes, furniture, car interiors, etc - but no reference to using it with electrical gear. They also advise that ozone will "eat" organic material - so excess use would damage natural rubber, wood, etc.

I agree - ozone mught not be a good idea.

Thanks,

Bill

And, Ozone will eat your lungs.

OT: Re: ozone

*Message #7 Posted by **Bill (Smithville, NJ)** on 17 Mar 2005, 7:23 a.m.,*
in response to message #6 by bill platt

Hi Bill,

"And, Ozone will eat your lungs."

Several years ago, I ran across a Book at an Antique Store titled: "Air Conditioning and Ozone Facts", published in 1939. Since I'm in the field od HVAC design, I had to buy it. The first two-thirds of the book is about the state of the art (at least in 1939) of Air Conditioning - but the last third is the most fascinating. This dealt with the use of Ozone Generation in the ventilating systems to "purify" the air and to have the "oxygen content increased". Also discusses using ozone to purify drinking water in European cities, sewage treatment, swimming pools.

The best quote is "The author, in order to disprove the theory often advanced in recent years that ozone is a poisononous gas, installed in his home in October, 1934, the ozone generator shown in

Figure 59."

I did a search for the author on the web and can only come up that he authored this book - no other data concerning his research or the results of his test using ozone in his home.....

Sorry for the off topic subject.

Bill

*Message #8 Posted by **Steve A** on 17 Mar 2005, 4:29 p.m.,*
in response to message #7 by Bill (Smithville, NJ)

I don't know about electronics, but optical goods stored in damp conditions often grow fungi on inner surfaces, and if the surfaces aren't cleaned the fungi will eventually etch the glass. Washing surfaces with household ammonia and then acetone will kill the fungi and remove traces from the glass, but they would probably wreak havoc on electronics. Isopropyl alcohol 91% (not the 70% stuff in the medicine cabinet) commonly used to remove flux residue from PCBs might kill fungi too without causing more harm.

Ozone is useful sometimes. I put an ozone generator (that makes ozone by flowing air around a strong ultraviolet lamp) in a hot tub system, and it keeps the water clean without forming chloramines (carcinogenic compounds). Ozone generators are used similarly in swimming pools ,more commonly in Europe than the US.

*Message #9 Posted by **Arnaud Amiel** on 17 Mar 2005, 7:55 a.m.,*
in response to message #5 by Bill (Smithville, NJ)

Thanks for all your help! I guess lots of sun and fresh air will be the best cure. My only problem is that I live in a North facing flat in England. So it will not be easy. Also, my landlord put a microwave oven in the flat that I believe is as old as my hp55 and it regurlarly makes electric arc that are a nice show and generate ozone. I may just put an old book in there see what happens...

Arnaud

Re: Mouldy calc

*Message #10 Posted by **bill platt** on 17 Mar 2005, 10:13 a.m.,*
in response to message #9 by Arnaud Amiel

Hi Arnaud,

You might want to check that microwave for radiation leakage.

Especially in a small flat. You can buy little stckybacked microwave dosimeters.

Regards,

Bill

Re: Mouldy calc

*Message #11 Posted by **Ed Look** on 17 Mar 2005, 10:26 a.m.,*
in response to message #10 by bill platt

Hey Gentlemen!

Don't even bother with measuring the microwave emissions; if it's so old it arcs when you use it, I'M PRETTY SURE IT LEAKS MICROWAVES, as shielding in early models were poor and over time, it just gets worse.

If he won't replace it for you, get your own (they're pretty good and inexpensive these days) and stick his under the couch or in a closet somewhere.

As to ozone, Bill is right. On the surface of the Earth, it is considered by all rights to be a pollutant. It is an oxidant and so will cause chemical (hence, tissue) damage. It's good only in the upper atmosphere!

And Arnaud, I feel bad for you. As the rest of you, I am a HP calc nut, and years ago, I had to throw out my disintegrating case for my 34C. It didn't smell, but had a similar effect: the polymers of the inner lining was crumbling into this oily feeling powder (only later through this board did I realize you could simply wash it out) and bothered so much I got rid of it. (Fortunately, someone had an abandoned old 45 brown case that is still good lying around, so it's in that nowadays.)

Re: Mouldy calc & Ozone

*Message #12 Posted by **John L. Shelton** on 18 Mar 2005, 2:13 p.m.,*
in response to message #1 by Arnaud Amiel

I have experience with Ozone use at home. We have several ozone generators, for air-freshening and for medical treatment. Ozone is very useful for treating mold and smoke damage, but as pointed out by others, can damage organic parts.

Ozone is a molecule consisting of 3 oxygen atoms. It is rather unstable, and easily gives up one oxygen atom, reverting to O2 (ordinary oxygen.) Organic molecules often greedily mate with ozone to become oxidized. Mold is particularly susceptible. Smoke particles, which are the results of incomplete combustion, oxidize into harmless CO2 and other particulates which fall out of the air. Rubber loves to combine with oxygen, turning into a slimy mess. (I lost the spark plug wires in a car I was trying to de-smoke.)

Small amounts of ozone in the air are harmless to humans. The fresh smell after an electrical storm is caused by ozone naturally generated. Ozone is preferred over chlorine for water treatment in many countries because once it does the work, the resulting oxygen is harmless. Ozone can easily be manufactured from room air or pure oxygen.

I would not recommend using ozone to treat the calculators. Sunshine kills mold, though may age plastic. Cleaning with baking soda and/or activated carbon will be less effective, but far less likely to damage the calculator.

attaching a routine to the 'ON' key?

*Message #1 Posted by **Eric Lundgren** on 15 Mar 2005, 1:18 p.m.*

Hi all,

I recall VPN posting something about being able to assign coomands to the 'ON' key?

My hope is that I could assign the overclocking routine found on hpcalc.org (which makes my 49g+ finally usable!)

This way, everytime the calc is turned on, it automatically starts the overclock routine?

I'm worried to experiment, as I've suffered 3 memory losses this past evening..any ideas? Eric

Re: attaching a routine to the 'ON' key?

*Message #2 Posted by **VPN** on 15 Mar 2005, 2:18 p.m.,*
in response to message #1 by Eric Lundgren

```
Actually you should assign it to OFF key!!
AND when you change the 49G/49g+/48gII STARTOFF
then you're set to TURBO when you press ON
<< OFF @ continues here, when you press ON
TURBO >>
HOME 'STARTOFF' DUPDUP 101.3 ASN 101.6 ASN STO
[VPN]
```

Re: attaching a routine to the 'ON' key?

*Message #3 Posted by **Eric Lundgren** on 16 Mar 2005, 8:04 p.m.,*
in response to message #2 by VPN

VPN, thank you for helping.

Could you tell me how to do this? ie: 1. Home directory 2. 'STARTOFF' 3. DUPDUP 4. 101.3 ENTER 5. ASN 6. 101.6 ENTER 7. ASN 8. STO

Where do I put the overclock routine? I now have it in the VAR of HOME. I am having trouble..

Thanks, Eric Lundgren

Re: attaching a routine to the 'ON' key?

*Message #4 Posted by **VPN** on 17 Mar 2005, 2:04 a.m.,*
in response to message #3 by Eric Lundgren

Well you don't key in the numbers 1. 2. 3. 4. 5. 6. 7. 8.(-:
Please re-read my perivous post
and
TURBO is the command for overclocking
[VPN]

Re: attaching a routine to the 'ON' key?

*Message #5 Posted by **Eric Lundgren** on 18 Mar 2005, 1:24 a.m.,*
in response to message #4 by VPN

Aha! Ok, TURBO is a system recognized command! Yes, I succeeded by an identical method.

<< OFF ON C124S >> STO 'STARTOFF' 101.3 ASN

also interesting, I found that << ON c124s >> instead will keep the calculator from turning off! This may be convenient during exams...

So far, it is performing very well.

Is TURBO clockspeed faster than the C124S routine? How is battery life for you?

Also, do you think it will significantly reduce life of the calculator?

Thank you again VPN, you have been very helpful.

Eric

Re: attaching a routine to the 'ON' key?

*Message #6 Posted by **VPN** on 18 Mar 2005, 2:22 a.m.,*
in response to message #5 by Eric Lundgren

```
"Aha! Ok, TURBO is a system recognized command!"
VPN> no, it's on of the overclock binaries.

"<< OFF ON C124S >> STO 'STARTOFF' 101.3 ASN"
VPN> Take OFF "ON" and do also 101.6 ASN

"<< ON c124s >> instead will keep the calculator from turning off!"
VPN> You don't need "ON", it's not a command

"Is TURBO clockspeed faster than the C124S routine?"
VPN> Just keep using the c124s
VPN> Be sure the case is correct, 49 is case sensitive

"How is battery life for you?"
VPN> Terrible - I use reloadables

"do you think it will reduce life of the calculator?"
VPN> not at all, the samsung is undeclocked as is
VPN> the SRAM speed is the limiting factor
```

Clonix & NoVRAM FAQ

*Message #1 Posted by **Diego Diaz** on 15 Mar 2005, 10:43 a.m.*

Hi,

Since I finished Clonix and NoVRAM first production run, I've been receiving mails asking several common questions.

As this is the "meeting point" for most of us, I think it would save time if I post it here. Dave, if you consider this an innapropriate use of this forum, just wipe this message.

FAQ:

Q- Will you plan start production again?

A- Yes, as stated in the ad, I'm planning a small run (about 20-25 units) by mid/end summer.

Q- Are new modules in developement?

A- Yes, a new NoV-64 (48K ROM + 64K RAM) is being developed right now.

Q- What will be the price tag for the modules?

A- Clonix=100Euro, NoVRAM=135Euro, NoV-64<200Euro (not calculated yet)

Q- Will new NoV-64 be compatible with previous modules?

A- This is the main target, anyhow IC-Prog new release can't handle the new module's microcontroller, so I'm seeking for other suitable programming solutions.

Q- What if my Clonix/NoVRAM requires service?

A- Should any of my modules turns to be faulty I have saved some spare parts to fix them. (So far only one module have required such replacement... :-)

Q- Are there any site where I can download the software from?

A- The original Clonix6P.ZIP archive contains some .ROM images, that's why it was available *only* at Warren Furlow's site. I've got no permission to make such images publicly available, so I cannot place this archive on my site. Anyhow I'll prepare a new .ZIP *without* .ROM images for downloading.

NOTE: I'll be out until Apr. 18th, thus I won't be able to keep daily track of my mail... please be patient, I'll answer ASAP.

Thanks so much and best wishes.

Diego.

Love Bytes
(or sex and the single computer)

They say that computers do not think like human beings. But do they *feel* like humans? A certain computer, to which (to whom?) we have guaranteed absolute anonymity, has supplied us with this peace of computer-style hex-gossip that is going the rounds of the sophisticated number crunchers in the web. If you have an under-age computer around, on no account let it see this - it might be totally diskusted(!) and even corrupt it's little CPU forever!

```
Micro was a real-time operator and
dedicated multi-user. His broad-band
protocol made it easy for him to inter-
face with numerous input/output de-
vices, even if it meant time-sharing.
  One evening he arrived home just as
the sun was crashing, and had parked
his Motorola 68060 in the main drive (he
had missed the 5100 bus that morning),
when he noticed an elegant piece of
liveware admiring the daisy wheels in
his garden. He thought to himself, "She
looks user-friendly. I'll C if she'd like an
update tonight."
  Mini was her name, and she was
delightfully engineered with eyes like
FORTH and a Prime mainframe archi-
tecture that set Micro's peripherals
networking all over the place.
  He browsed over to her casually,
admiring the power of her twin, 64-bit
floating point processors and enquired,
"How are you Honeywell?" "Yes, I am
well", she responded, batting her optical
```

```
fibres engagingly and smoothing her
console over her curvilinear functions.
  Micro settled for a straight line
approximation. "I'm stand-alone to-
night", he said. "How about computing a
vector to my base address. I'll output a
byte to eat, and maybe we could get
offset later on."
  Mini ran a priority process for 2.6
nanoseconds then transmitted "8K, I've
been dumped myself recently, and a
new page is just what I need to refresh
my disks. I'll park my machine cycle in
your background and meet you inside."
She walked off, leaving Micro admiring
her solenoids and thinking "Wow, what
a global variable, I wonder if she'll like
my firmware."
They sat down at the process table to
a top of form feed of fiche and chips and a
bucket of Baudot. Mini was in conversa-
tional mode and expanded on ambi-
guous arguments while Micro gave
occational acknowledgements although,
in reality, he was analysing the shortest
and least critical path to her entry point.
He finally settled for the old "would you
like to see my benchmark subroutine",
but Mini was again one step ahead.
  Suddenly she was up and stripping off
her parity bits to reveal the full functio-
nality operating system software. "Let's
get BASIC, you RAM", she said. Micro
was loaded by this stage, but his
hardware policing module had a pro-
cessor of its own and was in danger of
overflowing its output buffer, a hang-ip
that Micro had consulted his analyst
about. "Core", was all he could say.
<CONT>

Identifying calc type in RPL

*Message #1 Posted by **valentino ducati (switzerland)** on 15 Mar 2005, 8:25 a.m.*

Hi all

I'm a RPN (hp41 system) fellow. Back to that times it was fairly easy to check for memory (SIZE), peripherals (FS? 21, XROM...) and many other environment details (maybe with some synthetic commands) for a program package.

This to allow single source for hp41 with few/much memory, with or without printer, with or without X-Functions etc.

After aquiring a 48SX and two 48GX now I will give a try to the 49G+. My question:

Are there any Flag combinations or SYSEVAL or some other way to check if my program is running on a 48S, 48G or /X or 49 series? Provided it uses only backward compatible functions in the main \<< \>> brackets?

Thank you for help.

Re: Identifying calc type in RPL

*Message #2 Posted by **Raymond Del Tondo** on 15 Mar 2005, 9:43 a.m.,*
in response to message #1 by valentino ducati (switzerland)

On the 'G' or 'g' type calcs,
you can use the keyword VERSION.
If the version returned is higher than "HP48-J", it's a G type.
If VERSION returns something with "HP49" somewhere
in the string, it's a 'g' (small G) type, or in other words, a 49g...
The 'S' type calcs don't have the VERSION keyword.
On the S types, there exists a suitable SYSEVAL address,
which I don't recall right now.
In most cases, I used the following code,
which returns TRUE if the current machine is a G type,
or FALSE if the code is running on an S type:

```
*NULLNAME GX?
CODE
addrVDISP EQU #1263A
GOSBVL =SAVPTR
D1=(5) (addrVDISP)+6
C=DAT1 A
?CBIT=1 3
GOYES isGX
isGX GOVLNG =GPPushT/FLp
ENDCODE
```

HTH

*Message #3 Posted by **Arnaud Amiel** on 15 Mar 2005, 10:16 a.m.,*
in response to message #2 by Raymond Del Tondo

And on teh 28, VERSION returns 'VERSION' at least on the S, I don't have a C so can't comment on this one.

Arnaud

Version

*Message #4 Posted by **Raymond Del Tondo** on 15 Mar 2005, 12:13 p.m.,*
in response to message #3 by Arnaud Amiel

That's normal, because the word VERSION will be treated as
an unevaluated expression, or just a name;-)

Raymond

```
This is an untested program for all RPL models

<< IF ? TYPE 6. # THEN "49G"
ELSE IF ! TYPE 6. # THEN "48"
NOVAL TYPE 6. # "G" "S" ITE +
ELSE "28" PATH TYPE 6. # "S"
"C" ITE + END END >>

Could you all kindly test it, please?
[VPN]
```

NO-VAL on the S

*Message #6 Posted by **Raymond Del Tondo** on 15 Mar 2005, 8:57 p.m.,*
in response to message #5 by VPN

I haven't tested your program (did you?),
but the 48S series doesn't have the self-referencing keyword NOVAL,
so it can't be created or used on the 48S.
The 28C doesn't have the keyword PATH,
so same effect as above (not usable;-)...

BTW: A test for the HP-28 C/S is somewhat pathetic, isn't it?

Raymond

Edited: 15 Mar 2005, 8:59 p.m.

HP 9825A

*Message #1 Posted by **Stephan** on 15 Mar 2005, 8:00 a.m.*

Hello everybody! I have got the following problem. I want to (exactly my boss wants me to) connect an HP 550C-printer to an HP 9825A. The manual gives me the pin names and I found a table of the official parallel-port settings. My problem is that I don't know the meanings of "HLT", FLG", "On Cover" and so on and can not say which pins have to be connected. Does anyone have an idea and/or experience in this topic?

Many thanks in advance! Greetings, Stephan

Re: HP 9825A

*Message #2 Posted by **Tony Duell** on 17 Mar 2005, 7:48 a.m.,*
in response to message #1 by Stephan

Do you have an HP98032 GPIO (16 bit parallel) interface module?

The I/O slots at the back of the 9825 are essentially the processor I/O bus, and certainly can't be directly connected to the printer.

If you don't have the interface, I would seriously recomend looking at the operation/service manual for it (it's on the MoHPC CD-ROMs, I think). That will give you some idea of the circuitry required.

If you do have the interface, I'll look in the manual and see if I can work out how to link it to a normal Centronics port.

Re: HP 9825A

*Message #3 Posted by **Vassilis Prevelakis** on 17 Mar 2005, 11:08 a.m.,*
in response to message #1 by Stephan

What kind of adapters do you have for your 9825? (E.g. the GPIO card that Tony suggested, but also HP-IB would also be OK).

**vp

Re: HP 9825A

*Message #4 Posted by **Stephan** on 21 Mar 2005, 3:46 a.m.,*
in response to message #3 by Vassilis Prevelakis

Thanks a lot! There is an interface card and someone else hase already connected some cables to the centronics port. After starting the print job, the printer says 'busy', but nothing else happens. The original printer belonging to the calculator had the cover on function, I put it on ground (it is not[cover on]), I did the same with the not[ready] pin. Do you know something about problems with the timing for the handshake and so on? Is it just a standard parallel bus?

Thanks again! Stephan

hp49g+ bug? Combinations, sums, and equivalence

*Message #1 Posted by **Eddie Shore** on 15 Mar 2005, 1:07 a.m.*

The following is true: COMB(n, 2) + n = Sum of all integers from 1 to n

i.e. if n = 5

COMB(5, 2) + 5 = 5! ÷ (3!*2!) + 5 = 10 + 5 = 15 and 1 + 2 + 3 + 4 + 5 = 15

However, when I input 'COMB(5,2) + 5' on one level, and '[Capital Sigma symbol](X=1,5,X)' on the other, and I execute the == command on the Program-Test Menu, I get a 0 as a result (incorrect result)

Both objects inputed are same type (9 - algebriac expressions?).

A bug in the 49g+ CAS perhaps.

Re: hp49g+ bug? Combinations, sums, and equivalence

*Message #2 Posted by **Arnaud Amiel** on 15 Mar 2005, 2:00 a.m.,*
in response to message #1 by Eddie Shore

Strange: In the stack I can't recreate your bug: I do: Experssion 1 [ENTER] Expression 2 [ENTER] == [EVAL] I get 1.

If I put the same in a program, I get 0.

Arnaud

Re: hp49g+ bug? Combinations, sums, and equivalence

*Message #3 Posted by **Raymond Del Tondo** on 15 Mar 2005, 2:07 a.m.,*
in response to message #1 by Eddie Shore

Hi,

the 0 doesn't mean 'incorrect result'.
The result is correct, the expressions are simply not the same,
as you can easily see on the stack.

Maybe it also depends on the status of the evaluation flags,
this may be a case for RTFM;-)

Raymond

What's RTFM? :)

*Message #4 Posted by **Eddie Shore** on 15 Mar 2005, 9:41 a.m.,*

in response to message #3 by Raymond Del Tondo

NM

Re: What's RTFM? :)

*Message #5 Posted by **Raymond Del Tondo** on 15 Mar 2005, 10:07 a.m.,*
in response to message #4 by Eddie Shore

RTFM ~ Read The 'Fascinating' Manual...;-)

As VPN pointed out, the result seems to depend on either the mode,
and/or the type of arguments.

Raymond

Re: What's RTFM? :)

*Message #6 Posted by **bill platt** on 16 Mar 2005, 10:56 a.m.,*
in response to message #5 by Raymond Del Tondo

Which is actually taken as a friendly reminder or suggesttion among friends. It only shows irritation when you get to, "RTFM-41" which means, "read the "funny" manual for once!"

Another version is RTFD41 for which "D" stands for "drawing" as in mechanical drawing.

regards,

Bill

Re: hp49g+ bug? Combinations, sums, and equivalence

*Message #7 Posted by **Veli-Pekka Nousiainen** on 15 Mar 2005, 7:56 a.m.,*
in response to message #1 by Eddie Shore

Seems to be one of the "features of the calc
Using Approx ~ mode or reals (5.) will give the correct answer.

HP 32SII silver bezel

*Message #1 Posted by **Alexandre** on 14 Mar 2005, 9:34 p.m.*

Hi everybody! I know that most of people here are outside Brazil but maybe some of you can tell me if the 32SII silver bezel was sold here in Brazil because I have never seen this one here to sold.Thanks!!

Re: HP 32SII silver bezel

*Message #2 Posted by **GWB** on 15 Mar 2005, 11:48 a.m.,*
in response to message #1 by Alexandre

Olá Alexandre,

Também nunca vi nenhuma à venda por aqui. Comprei uma novinha na caixa há dois anos, mas essa deve ter vindo do Paraguai. Mas eu ainda prefiro o modelo antigo (32SII Brown Bezel) que comprei há uns dois meses numa loja perto de casa (praticamente nova). (I too have never seen any for sale here. The one I bought brand-new in box two years ago must have come from Paraguay. Anyway I prefer the older model (32SII Brown Bezel) I bought two months ago in a store next to my place (like-new).

Até,

Gerson.

Re: HP 32SII silver bezel

*Message #3 Posted by **Alexandre** on 15 Mar 2005, 6:02 p.m.,*
in response to message #2 by GWB

Olá Gerson,

Está no Brasil ou não?Prazer em contatar você.Bem eu gostaria de comprar uma 32SII "silver bezel" mas como te falei nunca vi por aqui :(Tenho uma "brown bezel" também que comprei fechada na caixa mas tive que cortar um pedaço do pezinho de borracha da parte superior porque ele estava curvo e a calculadora ficava balançando quando eu digitava...horrível...e era "made in Singapore"...As feitas no Brasil e Indonésia que tenho são todas muito boas... Se quiser vender a sua "silver bezel" me envie um e-mail,ok? Are you in Brazil?Please to contact you.Well I would like to buy a 32SII silver bezel but as I said before I haven´t seen it here for sale :((I have a 32SII brown bezel too that I bought new in box but its rubber feet was curved and it didn´t lie flat so I cut the middle part of it and now it is ok...it was made in Singapore ...the others that I have are made in Brazil and Indonésia and are all very good ones. Thanks!!

Alexandre

HP41 Flags

*Message #1 Posted by **Gileno** on 14 Mar 2005, 7:26 p.m.*

How is it that I do, using PPC or other method, to put in a program line the status of all of the flags? Excuses my English: -)

Re: HP41 Flags

*Message #2 Posted by **Mike (Stgt)** on 15 Mar 2005, 9:32 a.m.,*
in response to message #1 by Gileno

With XF Module use RCLFLAG and later STOFLAG, with "Synthetic programming" put an alpha string in your program and ASTO d. Next CF 03. That later way you clear flags 0-7.

Ciao.....Mike

Re: HP41 Flags

*Message #3 Posted by **Gileno** on 15 Mar 2005, 2:46 p.m.,*
in response to message #2 by Mike (Stgt)

Which the method using "Synthetic programming" I put the string alpha in my program?

Re: HP41 Flags

*Message #4 Posted by **Mike (Stgt)** on 16 Mar 2005, 3:45 a.m.,*
in response to message #3 by Gileno

See here: http://www.hpmuseum.org/prog/synth41.htm

Ciao.....Mike

Free42 1.2 released

*Message #1 Posted by **Thomas Okken** on 14 Mar 2005, 3:39 p.m.*

Hi all,

I released Free42 version 1.2 today. I thought it was time for a new "major" version number, having achieved most of the major development goals, including, most recently, keyboard mapping and copy/paste. (No BCD yet, though.)

I think I need a break from this project, so expect no major new releases in the next few weeks; however, I will keep an eye on my email and on this forum and fix bugs and such.

Happy RPNing!

- Thomas

Re: Free42 1.2 released

*Message #2 Posted by **Namir** on 14 Mar 2005, 4:38 p.m.,*
in response to message #1 by Thomas Okken

Your HP42s is looking good!! Thanks for all the work you put into it.

Namir

Re: Free42 1.2 released

*Message #3 Posted by **Gordon Dyer** on 14 Mar 2005, 6:51 p.m.,*
in response to message #1 by Thomas Okken

Thanks for yet another improvement, Free 42 is now really good and I am using it regularly, the keyboard mapping makes it a lot more useful.

Just one problem, the skins don't seen to work, I have put the skin files into "My Documents"\Free42\ and the Skin menu expands to show them, but the alternative skins won't select from the menu. The new default skin is a great improvement, but I was looking forward to using the "real" one.

Also I would really like a PPC version....
Keep up the good work and THANKS again for a great emulator.

Skin menu works again

*Message #4 Posted by **Thomas Okken** on 14 Mar 2005, 10:12 p.m.,*
in response to message #3 by Gordon Dyer

I broke the Skin menu in the Windows version, release 1.2.
I just posted version 1.2.1 which fixes this problem.

- Thomas

Free42 for PPC?

*Message #5 Posted by **Thomas Okken** on 14 Mar 2005, 10:26 p.m.,*
in response to message #3 by Gordon Dyer

Also I would really like a PPC version....

I'd like to port Free42 to the Pocket PC, but at the moment the problem is that I don't have one, nor do I have any development tools for PPC. It bugs me a bit to buy all that stuff while my Palm already satisfies my modest PDA needs...
I'll do it eventually, partly out of curiosity, partly to diversify my resume, but the project could be speeded up if I were to receive the required hard- and software as a donation. Maybe I should get PayPal and then just solicit donations? Apparently it worked for Christoph Gießelink, so why not for me? Hmmm...

- Thomas

Re: Free42 for PPC?

*Message #6 Posted by **Mike T.** on 15 Mar 2005, 5:14 a.m.,*
in response to message #5 by Thomas Okken

Real hardware is always nicer (particularly if it understands RPN) but you might find the following useful...

- eMbedded Visual C++ 4.0
- Emulator Images for Windows Mobile 2003 Second Edition software for Pocket PC
- Developer Resources for Windows Mobile 2003 Second Edition

Mike T.

Re: Free42 for PPC?

*Message #7 Posted by **Thomas Okken** on 15 Mar 2005, 5:32 p.m.,*
in response to message #6 by Mike T.

Thanks -- I'll take a look at those sites soon (when I feel up to climbing yet another learning curve :-)).

- Thomas

Re: Free42 for PPC?

*Message #8 Posted by **Gordon Dyer** on 15 Mar 2005, 10:02 a.m.,*
in response to message #5 by Thomas Okken

I am sure you would get some donations if you set up a PayPal account. There must be many of us who use Free42 and would be hapy to make a donation.

Re: Free42 1.2 released

*Message #9 Posted by **Thibaut.be** on 15 Mar 2005, 11:32 a.m.,*
in response to message #1 by Thomas Okken

Fantastic ! Now the keyboard input really works ! It will surely be my desktop calculator now.

And yes, open up a paypal donation account !

Congratulations and Proficiaat !

Thibaut

Decimal Position on HP-15C

*Message #1 Posted by **Cecylia Escarceg** on 14 Mar 2005, 2:21 p.m.*

Dear HP Forum:

I need to change the decimal position on display for HP-15C and can't figure out how to do this. If anyone knows how to do this, please e-mail right away. Thank you.

Cecylia Escarcega San Diego, CA

Re: Decimal Position on HP-15C

*Message #2 Posted by **Richard Garner** on 14 Mar 2005, 3:49 p.m.,*
in response to message #1 by Cecylia Escarceg

If I remember correctly enter in the number of decimal places you want, say 5 the press the f or gold key then 7 for FIX. This should give you 5 fixed decimal places. If you are looking for either setting up for scientific or engineering notation the 8 key will give you scientific notation and the 9 key will give you engineering notation.

In fact...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 14 Mar 2005, 6:05 p.m.,*
in response to message #2 by Richard Garner

Hi, Richard;

just to add that the Voyagers use postfixed notation for FIX, SCI and ENG, i.e., the sequence should be:

```
[f][FIX] 5
```

instead of

```
5 [f][FIX]
```

Exceptions for sequencies are the HP12C/12Cp ([f] number or [f] [.]) and the HP16C ([f][FLOAT] number or [f][FLOAT] [.]).

My 2 cents.

Luiz (Brazil)

Re: In fact...

*Message #4 Posted by **Richard Garner** on 14 Mar 2005, 6:47 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I couldn't remember. It has been a couple years sense I owned a 15C. I could not remember if it was postfixed entry or not. I bought a 15C about 20 years ago as a backup for my 41CX and wound up

selling it a couple years ago because I hardly ever used it.

Updates from OpenRPN

*Message #1 Posted by **Hugh Evans** on 14 Mar 2005, 1:41 p.m.*

As promised since the project's conception, here is another periodic update on what's new at OpenRPN.

After a great deal of research and hard labor, we have established a documentation site, located here, using the UniWakka wiki engine. In the near future we should have a working roadmap complete with development milestones. Work is just beginning on the *fix Command Reference, as we put the finishing touches on the *fix Command Definition Standard.

As a bit of background. *fix uses the UserRPL command set (all command names and function are identical), and extends it to allow programming in multiple forms of syntax. In addition to postfix, you can also use infix or prefix if you are more comfortable using those styles.

The development of our target form factors is becoming more active and work on CAD models is just getting underway. Once we're happy with the designs, we will ask this community at MoHPC as well as the hp48 newsgroup for additional input and seek general approval of the design. The final designs will be used to define physical constraints for our hardware designers.

We have devised a rather clever way to improve our sales by marketing our products as single board computers/development kits. There are countless alternate uses for our platform, and increasing sales volume is the only method by which we will attempt to decrease prices. Most calculators on the market today cost very little to produce but a lot to develop. We're in the opposite position. What you will be paying for is hardware, publishing, and shipping. Profits on our end will be slim, and will be devoted to future development (rather than $40 million severance packages).

More help is always needed, even in the form of sending a link to openrpn to a friend who might be interested.

Thank you to everyone here for taking an interest in our project, and to Dave for allowing us to post our slightly off-topic but halfway relevant news.

Best Regards, HDE

Re: Updates from OpenRPN

*Message #2 Posted by **valentino ducati (switzerland)** on 15 Mar 2005, 7:53 a.m.,*
in response to message #1 by Hugh Evans

Thank you Hugh for the interesting article.

I hope you will find interested people from the following groups:

. Hardware oriented guys with connections to possible manufacturers of the shell, keyboard, LCD and other electronics

. Software experts who can help implement *fix to something usefeul

. Normal end user interested in the final product

I'm IT consultant, but was never hardware related and 15 years ago I wrote my last Cobol program (never changed side to C, VB, Java etc.). So I count me to the last group.

And I suppose the normal end users are the big venue here (and in comp.sys.hp48). Apart from the very impressive shell designs in Voyager, Pioneer and "big" Pioneer style: Can you condense in a few statement what we end user can expect to get in a first production lot?

To make my question concrete, a few questions from my personal point of view:

a) of which material will the shell be made of (alu? inox? some plastic?)

b) will there be a choice in formfactor (P/L) for the 1st series?

c) may I buy a fully customized keyboard (and labels and functions)? E.G. I like many shift keys rather then menus (f,g,h like hp67)

d) will there be a choice for inyard technical details (amount of RAM, MHz of processor, real time clock...) leading to a openRPN43 S or G or V?

e) will there be a choice for external peripheral connection features (HP-IR, serial, USB, SD, LAN, WLAN hehe, I'm dreaming...)? Like a openRPN43G vs GX.

I will stop here. I could write a book about my wishes! Hope you see the point of my introductory question.

Thank you for the lot of work until today. Valentino

Re: Updates from OpenRPN

*Message #3 Posted by **Hugh Evans** on 17 Mar 2005, 4:26 a.m.,*
in response to message #2 by valentino ducati (switzerland)

Thanks for all of your questions, and please don't hesitate to ask more if you have any!

a) of which material will the shell be made of (alu? inox? some plastic?)

Our current plan is to use plastics, with additives if necessary, and possibly offer die-cast aluminum in the future.

b) will there be a choice in formfactor (P/L) for the 1st series?

It's too early for me to make an absolute guarantee, but I think a simultaneous release is *extremely* probable.

c) may I buy a fully customized keyboard (and labels and functions)? E.G. I like many shift keys rather then menus (f,g,h like hp67)

That has been one of the requirements of our design since the beginning. Not only can you have a custom keyboard, we're developing a method to embed the labels so end users can effectively have custom mutliple-shot molded keys.

d) will there be a choice for inyard technical details (amount of RAM, MHz of processor, real time clock...) leading to a openRPN43 S or G or V?

No there will not. Instead, we're going to create excessive overhead since maximizing profit margins isn't a

priority for us. You'll get more processing power, and RAM than you'll need. Enough room will be left in the case for internal daughterboards and some form of flash storage (probably compact flash or MMC/SD)

e) will there be a choice for external peripheral connection features (HP-IR, serial, USB, SD, LAN, WLAN hehe, I'm dreaming...)? Like a openRPN43G vs GX.

A fine pitch connector with more pins than we need will provide connections or the potential for connections to just about anything a user could want. IrDA is planned as well. USB, RS-232, and many other connection types will be supported.

I'll address your questions in more detail in the new FAQ I am writing.

Best Regards, HDE

OpenRPN account cannot be reached?

*Message #4 Posted by **VPN** on 17 Mar 2005, 4:56 a.m.,*
in response to message #3 by Hugh Evans

My OpenRPL account seems to be missing the ".com" at the end of my msn-mail account so I can't get my password nor anything else done.
[VPN]

"coburlin": That's Outrageous!

*Message #1 Posted by **K** on 13 Mar 2005, 3:40 p.m.*

"coburlin", The eBay buyer/seller of HP calculator products has been discussed here before. Several years ago, he was snapping up HP calc's at astonishing top-dollar prices, and driving up the market.

He's still bidding on these items (more reasonably now, it seems); he's now trying to sell ordinary stuff at sky-high fixed prices, with "immediate payment required". I wonder how successful he's been, because only suckers and those with much more money than time would pay what he's demanding. Yes, "demanding", because he's essentially running a clip-joint store in the auction department, instead of offering products at auction.

Here are some of his more egregious present listings:

- HP-41CX "Scientific Calculator with X Memory Module" for $389 So, what is this really? It is described as a 41CX with a 1986 serial number. However, the low-resolution picture appears to show a 41C, with a fullnut display and silver border. No case or manuals, apparently. "*Guaranteed in working condition and sold as is pictured"*; however, "*No returns or refunds as all items are sold as-is.*" So what's the "guarantee"? **Caveat emptor!**

- Banged-up "HP-16C Computer Scientist Calculator & Manual" for $289 Here's a 16C with a deep dent on the bezel and a flat-bound manual, offered at an exorbitant fixed price without insurance -- like everything else from "coburlin".

- "HP-41C Scientific Calculator Original Box Set" for $289 That's quite a high price for a 41C with one 64-register memory module, even if it does have the lower half of the box included.

- Also offered are an 11C for $289, another 16C for $319, a 45 for $289 and a halfnut 41CX for $429. All have manuals and slipcovers/cases, but are in used condition with scratches.

Only the first item seems to be misrepresented (perhaps inadvertently), and "coburlin" does ship to some foreign countries (unlike some sellers).

However, I think that eBay should change some policies to discourage those who offer price-gouging non-auctions. Maybe a non-refundable fee should be imposed, even for unsuccessful auctions. Perhaps a separate section should be reserved for "fixed price" offerings (like Half.com)

What do y'all think?

Edited: 13 Mar 2005, 10:17 p.m. after one or more responses were posted

Re: "coburlin": That's Outrageous!

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 Mar 2005, 5:58 p.m.,*
in response to message #1 by K

My thoughts about this.

He's a poor little thing... If he finds anyone dumb enough to buy the stuff he once thought about selling these high prices, then we have at least two poor little things. And BTW, the HP16C's protective case shonw in the picture is, in fact, a Pioneer one, not the standard Voyager case.

Too bad we find people like him sniffing around here.

My opinion.

Luiz (Brazil)

Edited: 13 Mar 2005, 6:06 p.m.

Re: "coburlin": That's Outrageous!

*Message #3 Posted by **Larry Corrado, USA (WI)** on 13 Mar 2005, 6:45 p.m.,*
in response to message #1 by K

It's a free market. Let him ask as much as he wants. The market will determine if he's asking too much.

Larry

Re: "coburlin": Nah, just foolish

*Message #4 Posted by **Randy** on 13 Mar 2005, 7:07 p.m.,*
in response to message #1 by K

It's a free market - don't get wound up by one seller. Have you checked his buyers feedback? He almost never sells any of his overpriced stuff.

Maybe you're not aware of eBay policy - that auctions with high reserves or "buy-it-now" auctions are still charged rather high listing fees regardless if they close or not. eBay understands that people that try to scalp things should pay more up front than those who will use a real auction and take their chances. Check out the prices to just to list things - you'll be surprised.

Rest assured that most of the money made on those overpriced b.i.n. sales go back to eBay in form of listing fees... It's really rather comical. Just have a look at what he actually sells verses what is listed time after time. Sure, a few things went around Christmas but since than, he's lucky if he's sold more than one or two calculators.

There are fewer fools out there than you may think - he's one of bigger ones if you ask me.

PS: He also emails just about every seller of things HP and asks for a BIN price so that he can grab stuff early at low prices and prevent it going through a normal auction. I once saw him convince a seller to do a b.i.n. on a 29C really cheap (<$50)- which he resold a month or so later for >$200.00. Even a blind squirrel finds a nut once in awhile...

Re: "coburlin": Nah, just foolish

*Message #5 Posted by **Bill Wiese** on 13 Mar 2005, 7:16 p.m.,*
in response to message #4 by Randy

I'd also be wary in an EBay transaction, of someone asking you to 'pull the auction' and where he then buys directly from you, the seller.

That's not BuyItNow, that's totally bypassing whatever minimal EBay protections, etc. exist.

I've also made enquiries about a few EBay non-calculator item details (technical and condition questions) and the seller also offered to pull the auction and sell direct to me. Given I had questions in the 1st place, this made me even more wary - esp when he suggested it first.

Bill Wiese
San Jose

Re: "coburlin": Nah, just foolish

*Message #6 Posted by **Namir** on 13 Mar 2005, 8:34 p.m.,*
in response to message #4 by Randy

I agree with you. eBay is alughing all the way to the bank. They are the ones making money!!!!

Re: "coburlin": Nah, just foolish

*Message #7 Posted by **George Rose** on 13 Mar 2005, 9:53 p.m.,*
in response to message #4 by Randy

I too have watched'coburlin' simply because he always places a bid on something HP that I have decided to bid on. Like you all have pointed out, he bids on anything HP. But I have also noticed that if a high dollar auction is not selling, he changes the auction to a "PS2 mouse" priced at $0.99 and about $25.00 shipping, being sold as-is. That way he is only charged for listing a $0.99 item. I bet Ebay would really frown on that practice if they knew.

Re: "coburlin": Nah, just foolish

*Message #8 Posted by **Namir** on 13 Mar 2005, 10:02 p.m.,*
in response to message #7 by George Rose

eBay is supposed to assess the ORIGINAL auction and prevent last minutes changes.

Re: "coburlin": Nah, just foolish

*Message #9 Posted by **George Rose** on 13 Mar 2005, 10:36 p.m.,*
in response to message #8 by Namir

As long as there has been no bids, the seller can revise the auction up until there is 12 hours left. The seller can not revise, only make additions to the description, if there has been a bid placed or there is less than 12 hours remaining.

Change auction?

*Message #10 Posted by **Namir** on 13 Mar 2005, 11:19 p.m.,*
in response to message #9 by George Rose

Can one change the auction (within the conditons and time limits you mentioned) such that eBay's charges drop down?

Namir

eBay and Half.com

*Message #11 Posted by **K** on 13 Mar 2005, 10:36 p.m.,*
in response to message #7 by George Rose

Thanks, all, for your enlightening responses. I admit to not knowing eBay's policies for sellers very well. It still bothers me, though, when I see sham "auctions" cluttering up the listings. I don't like to be repeatedly confronted with sky-high "take it or leave it" prices. These sellers are taking advantage of eBay's name recognition, when they ought to be using Half.com, eBay Stores, or their own Web-based store for fixed-price merchandise.

What eBay ought to do (if they don't already) is charge an up-front listing fee that is based on the lowest acceptable bid price (Minimum, Reserve) and is non-refundable in most cases. Any additional fees can be collected upon successful sale.

Also, that Minimum or Reserve price should be no greater than 80% or so of the BIN price. Merchandise sold at fixed prices should be listed in Half.com, which eBay has made easier to access than three years ago.

This is true. I had one of his calculator in Ebay "Watching" status and some days later suddenly the item appears as a PS/2 mouse ?!

Hey "engineers", it's called the real world.

*Message #16 Posted by **Coburlin** on 14 Mar 2005, 4:08 a.m.,*

in response to message #1 by K

Some people are dumb enough to pay high price for obsolete vintage hardware, so what? Do you know why engineers never climb the corporate ladder high enough? Because they live in a fantasy, technical world cut out from the real, marketing world. They even buy things from me, 'nough said!

Re: Hey "engineers", it's called the real world.

*Message #17 Posted by **Vieira, Luiz C. (Brazil)** on 14 Mar 2005, 6:11 a.m.,*
in response to message #16 by Coburlin

Pardon me, but this 'fantasy, technical world' is in fact what financial-only people (I mean financial-only people, those who can only count profit from products they deal with) have to deal in order to exist. I'm an engineer, and I have no interest on 'climbing corporate highs' because both (1)I have no skills to do so and I face it easily, because (2) I think my 'life time' is better used by developing devices that make 'fantasy, technical world' a reality. Maybe I cannot get a Nobel for doing so, but I hope having my existence remembered by something I did to make peoples life better. I have nothing against finance and people who deal with financial activities, I actualy believe that when done in accordance with peoples needs, financial agreements make life easier for many. What I disagree with is the thinking that engineers live in a fantasy, technical world. Engineers develop many devices and machinery, like bulldozers, airplanes, construction tools, computers and calculators to be used in the field so real world looks as it is.

I guess that those who live in a fantasy world are the ones that cannot see this.

Luiz (Brazil, Electrical engineer)

Hmmm. Most of the engineers where I work have to spend a lotsa time cleaning up the messes created by the "marketing oriented" MBA types. I've seen lotsa chips intially spec'd out w/all sorts of conflicting features by the sales and marketing types. One MBA/EE wanted 2GigaOps of DSP work for a digital camera to be performed on a 70MHz ARM.

And, dear sir, if you were high enough on the corporate ladder you've so assiduously scaled, I doubt you'd have time for EBay-ing.

in response to message #1 by K

While I cannot speak for Coburlin, I can easily speak for myself. If my wife flat out said my hobby was over and if I want to continue it had better be as a business, I would operate just LIKE Coburlin. And he probably sells some of his equipment. The wife would be happy, I would be pretty happy (except, in a similiar way to the Warren Beatty movie, Heaven can wait, ie Where the owner of the team sold to Warren Beatty for 3X the value and was ticked off).

While I may be giving Coburlin the benefit of the doubt, I would operate my business just like him. I just can't seem to sell these calculators.

I even hate trading anymore, but I am just to cheap to pay the high prices (today, anyway, in a month or a year or if I start to make a LOT MORE $$$$, my budget may grow). And I don't feel all that comfortable selling my stuff either. I don't think many of the older calculators should be selling for $100's of dollars. They just aren't worth it (but I have paid it, as many of us)! But we are not typical and while pocket calculators have actually regressed, more calculational power is available to the average user than ever before. As elitests we may want the best, but adequate is readily available for $20 retail. RPN (in the Hp33s) is also fairly easy to acquire for $50. While I am not a big fan of the Hp33s, it is the cheapest an RPN calculator has ever been. And it is a fairly powerful calculator, certainly nothing out there today matches up.

So we make our own beds.

Not quite true...

*Message #21 Posted by **John** on 14 Mar 2005, 9:46 a.m.,*
in response to message #20 by Ron Ross

"And it is a fairly powerful calculator, certainly nothing out there today matches up."

This is not quite true. It is the cheapest RPN calculator out there, but there are some casio models that have more functionality such as derivatives and more for under $20.

Re: Not quite true...

*Message #22 Posted by **Ron Ross** on 14 Mar 2005, 11:20 a.m.,*
in response to message #21 by John

No, the Casio still doesn't measure up. But it may certainly provide a better price to performance ratio. I don't have all the Casio's but I do have a few (well not the 995 or some such series, not sold in the US). But I admit, Casio's do make a good calculator, and if you don't need or WANT RPN, they are always a good buy.

True in many ways. Links to two $15 calculators with integration and derivatives included

*Message #23 Posted by **John** on 14 Mar 2005, 11:42 a.m.,*
in response to message #22 by Ron Ross

I guess my point was that other than RPN, there are $20 casios that give more functionality than the 33S.

For example, for $15, the Casio FX-115MS Plus Scientific Calculator will do integration and

derivatives. You must pay 333% more to get a HP33S.More functionality in most ways and much cheaper.

http://www.amazon.com/exec/obidos/tg/detail/-/B00004TVDO/

Or, try this Sharp model with integration and derivaties for $15:

http://www.amazon.com/exec/obidos/tg/detail/-/B00027RVVW/

$15 buys a lot of calculator, and in quite a few ways, much more of a calculator than the HP33S.

Re: True in many ways. Links to two $15 calculators with integration and derivatives included

*Message #24 Posted by **Arnaud Amiel** on 14 Mar 2005, 12:05 p.m.,*
in response to message #23 by John

Funny how the link to the Sharp showed me a special offer to buy the sharp together with a 33s. I can't figure out why would anyone want to buy them both!

Arnaud

*Message #25 Posted by **Raymond Del Tondo** on 14 Mar 2005, 12:48 p.m.,*
in response to message #24 by Arnaud Amiel

With the 33S, you could easily calculate RPN-style
how many times more expensive than the Sharp it was;-)

Raymond

Or a graphing calc for the price of a 33S

*Message #26 Posted by **Norris** on 14 Mar 2005, 2:10 p.m.,*
in response to message #23 by John

The 33S gives you programmability, which the cheap Casios and Sharps lack. On the other hand, Casio and Sharp offer inexpensive programmable graphing calculators starting in the $40-50 range, which are obviously competitive with the 33S

in response to message #27 by Arnaud Amiel

Yes, but that could change if you convinced her about all the money there is in this business!!!! Just LIKE cobulin. Of course I would have to sell a couple of calcuators to placate the wife and show her how profitable my hobby was ie sell one calculator a month for $3-500 and buy 20 (OR MORE!!) for whatever I can ("I buying them for investment and later sales Dear", I would tell my wife).

Whether coburlin has that problem or not, His buying and selling methods would probably be mine as well for the reasons I stated above.

*Message #30 Posted by **Frank Boehm** on 15 Mar 2005, 1:34 a.m.,*
in response to message #1 by K

First - it's free market. Skyrocketed prices annoy me as well, but you just have to learn to say "no". If someone is willing to pay this price - so be it. I won't.

Second - I'm not sure about US laws, but here in Germany, he does very likely commit tax fraud; by our laws, if you buy something to sell it with a profit repeatedly, you are considered a dealer and need to register *and* pay a bunch of extra taxes.

Taxes (was Coburlin. he used to be Burlin?).

*Message #31 Posted by **bill platt** on 15 Mar 2005, 10:13 a.m.,*
in response to message #30 by Frank Boehm

In the US, you are required to report income. It does not matter where it comes from; technically, all income must be reported (though some categories are unofficially left alone--except when someone is dragged in for something else--then the IRS goes over you with a fine tooth comb).

Most states also have tax requirements: and here it varies, but many have both an income tax and a "sales" tax. If you buy anything, from anywhere, your state may require (though few ever check up for small stuff) you to pay the 6% or so tax. (I paid it last year, for my calculators). If you sell, you are not required to collect it, unless you are registered as a business and have a sales tax number.

The US federal tax code has different income categories, and one is "hobby" which is what many who dabble in stuff have to claim as. Hobbies are limited in what losses you can offset, whereas businesses may offset all losses against gains. The point of the hobby category is to prevent all citizens from becoming "businesses" just to support their favorite hobbies---if you have a business, and it does not make a profit 2 (3? can't remember) out of every 5 years, then you are forced to report as a hobby.

So, you see, your average U.S. citizen probably pays just as much tax, as a percentage of income, as a European, yet the European is a "socialist" and the american is a "capitalist". Go figure. The Federal budget is about 1/3 of GDP, and yet we are not socialist? Nope.

The only real difference between Europe and the U.S. (regarding taxes) is that in Europe, the Rich pay their fair share, wheras in the U.S., the wealthy pay at a lower rate than the worker (28%) since they only make "investment" income and pay into social security only up to that level paid by a person making $88,000. And they take advantage of the many legal "tax shelters" to get the rate even lower.

When I was married with no children, with two working, family income $40,000, which is at the lowest "marginal" rate, we paid, in total of federal, social security, medicare, state, sales tax, property tax, personal property tax, 45% of our income.

John Forbes Kerry paid about 10% against his gross income last year.

Republicrats and Demopublicans are the same here, too. Neither will actually reduce government (though interestingly the Clinton era was more frugal than either of the Bush years).

So much for truth in government and taxes.

Regards feom the West side of the pond.

Bill

Bill,

re: "if you have a business, and it does not make a profit 2 (3? can't remember) out of every 5 years, then you are forced to report as a hobby."

Actually, you only have to try seriously to make money. Some businesses (witness the airlines recently!) manage to lose money year after year.

Some friends of mine and I ran a single airplane rental business years ago and always managed to lose money (after depreciation was included - that's the only reason you don't actually lose your shirt!). Since we could show a lot of real rental income and the plane was located where at least two of us could not take advantage of the situation (we were all pilots, but I never flew that plane), the IRS never showed concern.

Re: Taxes

*Message #34 Posted by **db (martinez, ca.)** on 16 Mar 2005, 9:38 p.m.,*
in response to message #31 by bill platt

Hi Bill; Regarding your comments on our taxes here in the US: i think we agree, but it may be worse than you stated.

Sometime in the 80's i read a libertarian essay on taxes. It was annotated and had graphs and flow charts which showed that when one factors in the rise in prices passed on to us due to import taxes/duties, inventory taxes, transportation taxes and the like (which are paid by businesses before we get a chance to be taxed on the same merchandise) plus what we property owners shell out for special assessment districts, bond measures and other taxes-by-another-name (then pass on to our renters); we pay more than 70% of our income to the government.

I appreciated your take on the "Republicrats and Demicans".

Re: "coburlin": That's Outrageous!

*Message #35 Posted by **Matthias** on 18 Mar 2005, 12:54 a.m.,*
in response to message #1 by K

We are all smiling, because coburlin has not sold one of his items on ebay. The are all relisted now...

Yes, the three linked items were relisted, but....

*Message #36 Posted by **K** on 18 Mar 2005, 2:10 a.m.,*
in response to message #35 by Matthias

I noted that the "HP-41CX "Scientific Calculator with X Memory Module", originally for $389 was relisted for $349. Unfortunately, the mismatch between the title and the photo was not corrected or even mentioned. The original "auction" turned into a 41C with Quad Memory with an incomplete manual set, selling for $189.99.

The banged-up "HP-16C Computer Scientist Calculator & Manual" is out there again, still for $289 and still dented. The original link has turned into a 95-cent PS/2 Mouse with $14.95 S&H.

The "HP-41C Scientific Calculator Original Box Set" also turned into a 95-cent PS/2 Mouse with $14.95 S&H before the "auction" expired.

Re: Yes, the three linked items were relisted, but....

*Message #37 Posted by **gifron** on 18 Mar 2005, 9:26 a.m.,*
in response to message #36 by K

That would clearly be a fee-avoidance issue, not kindly looked upon by eBay.

normal distribution hp40G

*Message #1 Posted by **Tho Nilewi** on 13 Mar 2005, 11:02 a.m.*

Can someone help me, I have two questions: * Is there a simple way to plot a normal distribution function with given mean (avarage) and standard deviation without entering the whole function prescription with the hp40G? * Where can I find an aplet to fit a discreet histogram with a continuous normal distribution?

Re: hp49g+ and SYSPRL Programming

*Message #2 Posted by **Tim Wessman** on 13 Mar 2005, 2:08 p.m.,*
in response to message #1 by Tho Nilewi

you can easily use the built in plot overlay capabilities to put a normal cdf function on your bar graph. If you don't know how to do that, review the plotting part of the manual. To make it easier, download my statpack which includes a ton of stat stuff you will find usefull. You can use the NCDF function to do it. This is the same thing as doing a UTPN(x,x,x)-UTPN(x,x,x) if i remember correctly.

Reduce a 49g+ to 4 stack?

*Message #1 Posted by **Eric Lundgren** on 12 Mar 2005, 6:12 p.m.*

If the stack could be reduced (by a program or other?) to only four elements (ie 32sii xyzt), I suspect that the missed entry problem would be worked around..

Has anyone an idea to either limit the stack, or even create a font almost double the standard (8)? I just get too many errors as it is.

Also, does anyone else experience this: In RPN mode, I enter:

number, left shift, square

and get this on the display:

number { sq() }

Its very frustrating, but only occasionally happens. Its as if it goes into eq. edit mode, or algebraic?

Best regards, Eric

Re: Reduce a 49g+ to 4 stack?

*Message #2 Posted by **R** on 12 Mar 2005, 8:26 p.m.,*
in response to message #1 by Eric Lundgren

Hi,

have you tried posting to comp.sys.hp48 ,
the newsgroup for the HP-48 and its relatives,
even if they're so far away like the 49g+ ;-)

I think the 49g+ is somewhat too young for a museum...

Apart from that, I doubt that the missed key problem
will go away by reducing the stack levels shown,
because it's only like trying to cure a symtom,
not the cause of the illness.

And for your sq example:
What do you expect from a calc that misses key strokes...

Raymond

ERAMCO SYSTEMS ESCR-RSU-2 SOFT SELECT (The End)

*Message #1 Posted by **Emmanuel, France** on 12 Mar 2005, 1:00 p.m.*

```
Regarding Philippe's ESCR-RSU-2 and mine.
I finally understood how they should work.
This model is a 64K RSU version.
Ordinary Eramco models have 6 outdoor switches.
Those have only 2 indoor switches :
 ----------------------------
|                            |
|                            |
|                            |
 ---------[SW1]-[SW2]--------
|                |
|                |
|                |
 --------------

Disable Writing    <- [SW1] -> Enable Writing
Enable 32K Bank #1 <- [SW2] -> Enable 32K Bank #2

Alas both are out-of-order.
The first one is only 12.5% functional and the other one is dead.
Regarding the first RSU-2, only pages E and F in bank #1 are available.
I used ES-RSU1A/2A (ES-41 Data Base 85), Hepax 1B/1C/1D, David Assembler Rom, Rambox (32), ES-
MLDL OS, MLDL OS, ...
Always the same result... :o(
Thanks in any case for your mails.
I send a message to Philippe.
```

Re: ERAMCO SYSTEMS ESCR-RSU-2 SOFT SELECT (The End)

*Message #2 Posted by **Christoph Klug** on 14 Mar 2005, 5:40 a.m.,*
in response to message #1 by Emmanuel, France

Dear Emmanuel,

one question about the both internal switches of the Eroamco RSU : SW1 would be used for protecting the internal operating system. Is it correct, that SW2 only would needed for loading the internal operating system to bank #1 and bank #2 ? Because when the oerating system is stored to the RSU bankswitching would be realised by software commands...

May be you are able to fix the hardware failures of the RSU, by exchanging the chips with new chips. But I do not know if this special storage chips are available today...

With best regards - Christoph Klug

*Message #4 Posted by **Karl Schneider** on 12 Mar 2005, 5:29 p.m.,*
in response to message #1 by denis

The quick summary of major differences:

1. The 32S has only one shift key, providing access for many functions through one-level menus. The 32SII has two shift keys, providing direct access for more functions.
2. The 32SII supports equations -- editing, evaluating, solving, and integrating.
3. The 32SII supports mathematics with fractions.
4. The 32S was made between 1988-1991, in the USA and Singapore. The 32SII was made in the USA, Singapore, and Indonesia from 1991-2002.

Hi,

Maybe I have become rusty in my grey cells, but what is a "pental"

Thanks

Ronald

Re: Pental

*Message #4 Posted by **John Smitherman** on 11 Mar 2005, 6:19 p.m.,*
in response to message #3 by Ronald

I assume that pental means base 5 whereby decimal 5 would be represented by 10 and decimal 10 would be 20. I've never seen a computer that uses base 5. I've worked on several that use base 2, base 8 and base 16.

John

Re: Pental

*Message #5 Posted by **Mark Hardman** on 11 Mar 2005, 9:23 p.m.,*
in response to message #4 by John Smitherman

I think the most common use of the pental numbering system is by prisoners in institutions of incarceration. Prisoners mark the passage of days by marking on the wall. Days are counted using four vertical strokes for the first four days. The fifth day is marked with a diagonal line across the group of four. After that, a new group of five is started.

Here's an example from a modern pentaltentiary. ;)

in response to message #3 by Ronald

Hi;

based on what I see and teach, the 'number' that describes a 'base number' expresses the quantity that cannot be represented in the 'base number' with a single algarism. You see, octal, base eight, uses eight algarisms and the last one is seven. The decimal quantity 'eight' is represented as '10_8' or '10_o'.

Pental refers to a base number with five algarisms, being them 0, 1, 2, 3 and 4. The decimal quantity 'five' should be expressed '10_5'. Intriguing!

Cheers.

Luiz (Brazil)

Which Casio calculator? The latest Sharps, which include the EL-506W, are the first calculators I've seen with base 5.

ERAMCO SYSTEMS ESCR-RSU-2 SOFT SELECT

*Message #1 Posted by **Emmanuel, France** on 10 Mar 2005, 7:03 p.m.*

Please help ... I got this item from a friend and I was not able to access its 32K (64K or 128K) RAM. I used ES-RSU1A & 2A, Zenrom and Rambox but nothing happened?! The first 8K ROM returned NO RSU PAGE when INIPRGM a page. It seems to need a special software according to its label. No switch available outside. However there's two switches inside with two positions for each. Thanks for help.

in response to message #1 by James Stephens

HP distributed an update to the user's manual, no doubt in response to bugs discussed in this Forum. Here's a wordy description of various identified 33S bugs:

description of bugs

Here's a link to a post announcing the update:

Link to update

For detailed descriptions of the bugs, look for posts from Norris and me about the HP-33S in Archive #14. Someone (Norris, I think) submitted a post that included links to each of the bug discussions, but I can't seem to find it.

O. T. : International Biographical Centre

*Message #1 Posted by **Nenad (Croatia)** on 9 Mar 2005, 8:58 a.m.*

Dear friends,

I apologize for asking this question here, but this is the place to get an answer to beleive in, without hesitation.

From time to time, in almost regular intervals I receive a letter from IBC Cambridge, England. The last one is they are consider to include me in their list of "Leading Educators of the World 2005". All of the titles offered always sound very attractive to someones ego.

However, they never need a list of references, an updated biography, or something like this, just my name and a payment of 200 to 400 USD to their bank account in order to send me a certificate, a medal, whatsoever.

My question is: has this situation already been described in the "Wizzard of Oz", i.e. somebody is just selling certificates and medals around of no practical value. Briefly, is all this a fraud?

In their web page: www.internationalbiographicalcentre.com there is a "Hall of Fame". I am not sure if this is just a list of those who "swallowed the offer"?

Hoping some of you have already had such experience, thanks for your answer(s)

Hi, Nenad:

Have a look at this URL, scroll down the page till you find the "Nerd Scam" section.

Best regards from V.

Re: Nerd Scam

*Message #3 Posted by **Nenad (Croatia)** on 9 Mar 2005, 10:04 a.m.,*
in response to message #2 by Valentin Albillo

Thank you very much, Valentin, you really made my day.

NERD SCAM - what a beautiful expression to describe the IBC offer

However, I do know some people, even from the Faculty I am working for as a part-time-job, that not only filled the form and sent the money (hopefully receiving a their diploma, certificate, platinum medal, etc.), but also recommended others to be added to IBC database. Human ego (and nerd factor) is rather high,

especially within scientific circles.

If IBC knew some important details from my biography, they would have offered me a nice, say, HP97, instead of the medal and I would not hesitate too much paying for it.

This is something that someone out of moHP would call a "double nerd", or a "nerd nerd", but who cares.

Proud to be an oldHP nerd!

Re: Nerd Scam

*Message #4 Posted by **Valentin Albillo** on 9 Mar 2005, 2:42 p.m.,*
in response to message #3 by Nenad (Croatia)

Hi again, Nenad:

Nenad posted:

"Thank you very much, Valentin, you really made my day."

You're welcome. Just for fun, have a look at this thread and also, specially, **this thread**.

They're but two of the many such threads (and web pages) I've found, but the 2nd one is really funny, IMHO. The part that goes ...

"Not bad. I am in the one thousand top [American] business executives. Funny, since I have never done anything administrative in my life, and live in Norway. [...]

I felt very bad for a friend of mine the other day, who strutted with such pride after he had been named one of the top 1000 designers in the world. Yes, he had bought the book. How could I tell him?"

... is priceless. :-)

Best regards from V.

Re: O. T. : International Biographical Centre

*Message #5 Posted by **Dave Shaffer** on 9 Mar 2005, 10:57 a.m.,*
in response to message #1 by Nenad (Croatia)

Nenad,

Don't buy in - as you've already been warned.

I have been solicited a modest number of times to fill in my bio and other info for one of the "Who's Who" series. These folks then publish a book with the info they get. THERE IS NO CHARGE for this. They always offer to sell you a copy of whatever they produce (often at various levels of fanciness, i.e. gold labelling on the cover - for a price!), but unless you want that on your shelf, there is no obligation.

So, wait for some free compilation in which to be famous!

Who's Who

*Message #6 Posted by **Nenad (Croatia)** on 9 Mar 2005, 12:20 p.m.,*

in response to message #5 by Dave Shaffer

Dave,

Thank you for your advice. I have also noticed the real difference between IBC and Who'sWho, not only in terms of having or not having to pay.

Marquis Who'sWho requires real data from their biographee: related to his/hers education, career, published books, papers, fields of interest, hobbies, etc. Their books might sometimes be useful.

On the other hand IBC only sells certificates and medals. A potential victim is anyone their letter reaches. However, I do think that IBC found my name in a Who'sWho publication and persisted to contact me.

HP-12C

*Message #1 Posted by **Mike Willis** on 8 Mar 2005, 5:38 p.m.*

Two questions regarding the HP-12C. 1. How does one find the serial number on an old unit? I have no box. 2. What is the procedure in finding the principal, interest, and future value on a note when the payment is never the same. I posses a note and the payee always pays a different amount on the loan instead of the correct amount. I want to keep up with the amortization schedule but they never pay the same amount. Thanks, Mike Willis

Re: HP-12C

*Message #2 Posted by **Tom Sherman** on 8 Mar 2005, 8:36 p.m.,*
in response to message #1 by Mike Willis

Mike,

1. The serial number should be stamped in the upper right edge of the backside. (A few units are said to have no serial number at all.)

2. Sounds like you will have good use for the 12C, as you will need to recalculate things each time an irregular payment is made. For a given balance and interest rate, the next period requires a certain amount of interest to be paid. If the payment exceeds this interest, the balance is diminished accordingly. If the payment is less than the interest required (not likely, we hope), then the balance must go up by the amount lacking. An amortization schedule does all the calculating for you, so long as the payments are regular in amount and frequency. An irregular payment means that the amount of interest due on the next payment should be recalculated (based on the new balance),and the amortization schedule revised -- you can keep the standard payment the same, but revise the time required to reduce the loan to zero.

Hope this does not muddy the waters. Others on this forum can explain the matter much more clearly.

Cheers, Tom

Nice Explanation, Tom! (nt)

HP29C - DSZ ISZ Question

*Message #1 Posted by **Mike T.** on 8 Mar 2005, 5:19 p.m.*

I have never owned an HP29C (nor given the prices on e-bay am I ever likely to own one either) but would like to know if the operation of the DSZ/ISZ instructions on the HP29C/HP19C is similar to the DSE/ISG functions on the HP11C - obviously in the case of the HP29C/HP19C the test is against a zero value, but did the HP29C use the fractional and integer parts of the I register in the same was as the HP11C (and HP34C) or was it was it altogether simpler?

Thanks.

Mike T.

Re: HP29C - DSZ ISZ Question

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Mar 2005, 6:04 p.m.,*
in response to message #1 by Mike T.

I don't have a 29/19 either, but have used a 29C for a short while many years ago. If I recall correctly (I apologize in advance if I'm wrong), as the test value was zero and as the step was always one, the fractional part is always zero´. For comparison, in the HP41 any register used for ISG/DSE operations has the format: iiiii.fffcc where i is the initial or current value, fff the final value and cc the step.

Re: HP29C - DSZ ISZ Question

*Message #3 Posted by **Bram** on 9 Mar 2005, 2:54 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Small addition: the fractional part doesn't need to be zero. It's just being ignored.

Re: HP29C - DSZ ISZ Question

*Message #4 Posted by **Mike T.** on 11 Mar 2005, 4:10 p.m.,*
in response to message #3 by Bram

To summarize - the fractional part of the value in R0 is ignored (and left unchanged?) while integer part is incremented/decremented and next instruction is skipped if the result is zero. Please correct me if I'm wrong!

Many thanks for the feedback.

Mike T.

Re: HP29C - DSZ ISZ Question

*Message #5 Posted by **Bram** on 14 Mar 2005, 7:16 a.m.,*
in response to message #4 by Mike T.

fractional part is indeed left unchanged and of course the test is done on the integer part only.

Re: HP29C - DSZ ISZ Question

What does the HP20S function "yx" do???

*Message #1 Posted by **Eduardo Abril de Fontcuberta** on 8 Mar 2005, 4:52 p.m.*

I need to know what the "yx" (top roww of keys) do when you press it. Example: You enter a number = 89.25 divide it by 1.03510 press "yx" key and then 4.85

and the result is 75.4995

What have I done with that key????

Thanks Eduardo

Re: What does the HP20S function "yx" do???

*Message #2 Posted by **George Rose** on 8 Mar 2005, 5:34 p.m.,*
in response to message #1 by Eduardo Abril de Fontcuberta

The function "yx" is y to the power of x. An easier example of y=2 and x=3 equals 2 x 2 x 2 = 8. So in your example 1.0351 yx 4.85 = 1.182127 and your first number of 89.25 divided by 1.182127 = 75.4995. Hope this helps. I wish I had the math background of most of the users of this forum to explain more eloquently.

Re: What does the HP20S function "yx" do???

*Message #3 Posted by **Karl Schneider** on 9 Mar 2005, 3:16 a.m.,*
in response to message #1 by Eduardo Abril de Fontcuberta

As George explained below, y^x is the power function, "y**x" in Fortran or "pow(y,x)" in C.

Of course, with the mathematical precedence in the "Algebraic" HP-20S, you calculated

$89.25 / (1.03510^{4.85}) = 75.4995$

Is that what you intended? For,

$(89.25 / 1.03510)^{4.85} = 2{,}442{,}225{,}117.82$

-- KS

Re: What does the HP20S function "yx" do???

*Message #4 Posted by **Julián Miranda (Spain)** on 9 Mar 2005, 12:32 p.m.,*
in response to message #3 by Karl Schneider

Well, it seems the key should be xy not yx. I think this has been commented before.

Re: What does the HP20S function "yx" do???

*Message #5 Posted by **Larry Corrado, USA (Wisc)** on 9 Mar 2005, 1:33 p.m.,*
in response to message #4 by Julián Miranda (Spain)

Julian,

I haven't seen the earlier discussion your refer to, but I think the reason for this "yx" order is the way we say the expression (at least in English.) For example, the expression m^n would be spoken as "m to the n power." The m is the first item mentioned, and then the exponent n.

Calculators are designed to accept the data in this same order, first the m value and then the n value. In an RPN machine, this means that the m gets pushed into the y location in the stack, with the power in x. Hence, yx is the reaonable way to label the key.

I, too, was a bit confused by this notation when I began using a calculator, but I finally saw the reasoning behind it and now perform this calculation without a second thought, simply keying the values in their"natural" order.

Hope this explanation is clear.

Regards, Larry

Re: What does the HP20S function "yx" do???

*Message #6 Posted by **John Limpert** on 9 Mar 2005, 2:41 p.m.,*
in response to message #5 by Larry Corrado, USA (Wisc)

It was x^y on the HP-35. They switched it to y^x on the HP-80, HP's second pocket calculator. Looking at the old desktop RPN calculators, The HP-9100 didn't have x^y or y^x, a strange omission. The HP-9810A had x^y as an option. The HP-9815 had y^x. TI seems to have been consistent in using y^x on all of their early scientific calculators.

Re: What does the HP20S function "yx" do???

*Message #7 Posted by **Bill Wiese** on 9 Mar 2005, 7:10 p.m.,*
in response to message #6 by John Limpert

Y^X - read as "y to the xth power" may not seem intuitive but it truly is - on both HP and TI calculators. For discussion, we can refer to the 'y' value by its real name, 'base', and the 'x' value by its real name, 'exponent'.

In fact, the name has to be 'weird' to have the arguments entered in 'natural' order.

Real HP calcs have a 4-level stack (X,Y,Z, and T registers), and also a LastX register too. So to perform this calc we key in

   [B]base[/B] [ENTER] [B]exponent[/B] [Y^X]

After ENTER is hit, the base value is lifted to the Y register, and the X register receives the exponent.

On TI/AOS calcs, Y^X works similarly but with infix, not postfix notation:

   [B]base[/B] [Y^X] [B]exponent[/B] [=]

On these calcs, the 'held value' - the base - gets stored in a "y" register pending calculation. (That's why you'll also see an [x<>y] (exchange x with y) on many of these calcs.

Bill Wiese San Jose

New DVD/CD Set Version in the works

*Message #1 Posted by **Dave Hicks** on 8 Mar 2005, 11:58 a.m.*

I'm working on a new DVD/CD set.

These manuals are needed

HP-21S

Please contact me if you can provide a 200-300 DPI scan, or are willing to loan a manual to me for scanning.

These MIGHT be needed

HP-17B and HP-19B. I have the "II" versions of each manual scanned. Since these manuals describe RPN mode in appendices, I think that the 17BII and 19BII manuals will be fine for the 17B and 19B owners. Does anyone disagree?

Other Manuals that are needed?

What am I missing? (please see below)

Manuals that have been scanned for the next version

Here's a rough list of items that are scanned for the next set: Some of the non-HP documents won't make it because I can't find the copyright holder to ask permission. Sorry about the lack of any categorization or order. Please use your find/search command to find any specific manual in the list below.

Re: New DVD/CD Set Version in the works

*Message #2 Posted by **Norris** on 8 Mar 2005, 12:28 p.m.,*
in response to message #1 by Dave Hicks

There was apparently an "HP-67 Earth Sciences Solution Book," because a number of programs were ported from it and posted in the HP-41C Software Library here at the Museum. I would like to see the original documentation, but it must be very hard to find. It isn't included on current Museum CDs, and it apparently won't be in the next version either.

If anyone has any suggestions, please let me know.

Re: New DVD/CD Set Version in the works

*Message #3 Posted by **Ron Ross** on 8 Mar 2005, 12:29 p.m.,*
in response to message #1 by Dave Hicks

There is/was a pdf scan of the manual floating around on the web. Let me know if you want or can use it (15 meg). I don't remember who posted it, so I cannot provide any credit or more than the pdf file.

No need to post any info, just ask.

Re: New DVD/CD Set Version in the works

*Message #4 Posted by **Dave Hicks** on 8 Mar 2005, 12:43 p.m.,*
in response to message #3 by Ron Ross

I think you mean the HP-21S. I've seen a version on the web, but I would like to get a better scan and I haven't been able to contact the person who created it for permission and, hopefully, an improved scan. So I'm hoping someone else (or that person if he/she sees this) is willing to scan or loan one.

Re: New DVD/CD Set Version in the works

*Message #5 Posted by **Ron Ross** on 8 Mar 2005, 1:11 p.m.,*
in response to message #4 by Dave Hicks

Yes, I meant the 21S but failed to elaborate. And if I remembered where I got the pdf from I would also make the request for you. Unfortunately, I do not. I will check do a quick check and if I am successful, get them to contact you.

Re: New DVD/CD Set Version in the works

*Message #6 Posted by **Walter B** on 8 Mar 2005, 7:26 p.m.,*
in response to message #5 by Ron Ross

Hi, I've looked for the hp21s manual several months ago and I've got a good scan (15MB) from

another person here. I will check the archives - but if you need it real urgent, you can get it from me.

Hope this helps you in compiling this tremendous documentation - Walter B

*Message #11 Posted by **Mark Hardman** on 8 Mar 2005, 9:22 p.m.,*
in response to message #1 by Dave Hicks

Dave,

Its good to see that the HP75 I/O ROM documentation will be included in this set.

I've searched the existing contents of the DVD and the projected additional content and do not see the HP75 Math Pac Owner's Manual.

So, I've just scanned it into TIFF at 300dpi. The resulting file is about 5.7MB.

What's the best method for getting this into your hands?

Mark Hardman
Houston, TX

Re: New DVD/CD Set Version in the works

*Message #12 Posted by **Karl Schneider** on 8 Mar 2005, 10:36 p.m.,*
in response to message #1 by Dave Hicks

Hi, Dave, and thanks for continuing to improve the DVD/CD set!

I would like the set to include a scan of the user's manuals for the HP-71B Surveying ROM (5061-7238) and the HP-71B Math ROM.

I have the 71B and a Surveying module, but no manual. I would like to obtain a Math ROM.

*Message #13 Posted by **Mark Hardman** on 8 Mar 2005, 11:19 p.m.,*
in response to message #12 by Karl Schneider

The HP71B Math ROM is already available on CD6 of the current set.

As has been pointed out many time before. The HP71B is NOT complete without the Math ROM.

Mark Hardman
Houston, TX

You are right on both counts! [NT]

HP-71B Math ROM (was Re: New DVD/CD Set ...)

*Message #15 Posted by **Valentin Albillo** on 9 Mar 2005, 4:37 a.m.,*
in response to message #13 by Mark Hardman

Hi, Mark:

Mark posted:

"As has been pointed out many time before. The HP71B is NOT complete without the Math ROM."

Amen. I'm one of the most insistent people to point out that fact. And it's been my long-time experience that most every program or application benefits from having the Math ROM installed, not

just math-related ones. If in doubt, check my articles **"HP-71B Math ROM Baker's Dozen Vol.1"** (10 pages, featured in the current V24N1 issue of Datafile) and **"HP-71B Math ROM Baker's Dozen Vol.2"** (8 pages, appearing in the next issue V24N2, due in April). My introduction to Vol.1 says it all:

"Among the many worthwhile plug-in ROMs ever made for the HP-71B1, the Math ROM is one of the very best. Many of its principal functions and capabilities were intended to be part of the System ROMs from the very start, but were sadly left out when it became clear that the total code was going to exceed the allotted 64 Kb of System ROM space. So, it was excised from internal ROMs #0 and #1 and placed instead in external ROM #2, all 32 Kb of highly optimized machine-language code. Yet some leftovers still remain inside the System ROMs, now mostly issuing polls to the Math ROM code, if present, for it to handle a number of operations such as those involving complex numbers (which the mainframe does accept but can't deal with), and IMAGE statements involving complex numbers.

*All in all, the Math ROM is the one essential addition to any HP-71B system, extending the already very powerful BASIC programming environment to its fullest for all things mathematical. As one of its original creators (Steve Abell, father of CALC mode) once posted when talking about the HP-71B system: "It had math and stat software to *die* for.". Indeed. And all later powerful HP models (such as the 42S and the 48/49 series) have inherited and expanded the advanced functionality of this incredible achievement in portable math computing, itself made possible by the previous experience acquired during the development of the HP-85 Matrix ROM, the HP-75 Math ROM, and the HP-15C highly-optimized SOLVE and INTEGRATE functionality (originally developed for the HP-34C !). The best algorithms were extracted and rewritten in Saturn assembly code, including a large number of refinements (just compare complex number handling) and additions (such as maintaining IEEE compliance, the one and only handheld product at the time to offer such).*

*This article (subdivided into two reasonably-sized "volumes" to make life a little easier for our kind Editor and readers) isn't yet another review of the Math ROM capabilities, that has been done a number of times before and to do it justice would probably require a whole issue of Datafile or two. Instead, this article features **13 assorted mini-topics**, each of them discussing some interesting or otherwise novel aspect of choice Math ROM capabilities, from complex numbers to matrices, root finding, numerical integration, and special functions. I hope you'll find at least some of them enjoyable, even intriging, and further, useful to increase your awareness of the incredible portable computing power the Math ROM has to offer even today."*

Best regards from V.

Re: HP-71B Math ROM (was Re: New DVD/CD Set ...)

*Message #16 Posted by **Rodger Rosenbaum** on 9 Mar 2005, 5:38 a.m.,*
in response to message #15 by Valentin Albillo

The way you said this, Valentin:
"The best algorithms were extracted and rewritten in Saturn assembly code, including a large number of refinements (just compare complex number handling) and additions (such as maintaining IEEE compliance, the one and only handheld product at the time to offer such)."
makes me wonder if you know of some other handheld that didn't exist "at the time", but does now, and which is IEEE compliant?

I had always thought that the beloved HP-71 was the one and only handheld to be IEEE compliant.

Re: HP-71B Math ROM (was Re: New DVD/CD Set ...)

*Message #17 Posted by **Valentin Albillo** on 9 Mar 2005, 6:10 a.m.,*
in response to message #16 by Rodger Rosenbaum

Hi, Rodger:

Rodger posted:

"The way you said this [...] makes me wonder if you know of some other handheld that didn't exist "at the time", but does now, and which is IEEE compliant?

I had always thought that the beloved HP-71 was the one and only handheld to be IEEE compliant."

No, I don't know of any other handheld "pocket computer" or computing device that is IEEE compliant right now. I included "at the time" just in case some other such devices had appeared in the last 20+ years, but to the best of my knowledge you're right, our beloved HP-71B is unique in that respect (and in many others as well).

Which makes me wonder if IEEE compliancy was a good thing to include, actually !?

Why ? Because large amounts of effort and, worse, ROM space were necessary to ensure that compliancy. So, valuable ROM space and man-hours which could've been employed to include more features were "wasted" in something that actually wasn't that useful or necessary. Also, the IEEE-compliant functions and statements spend some execution time dealing with the many, many nuances and quirks IEEE-compliancy requires and thus run slower.

I wonder if disregarding IEEE-compliancy would have meant that enough System ROM space would have been available to include the actual Math ROM functionality in the 71B instead, even if just native complex-number handling at the very least. Or, in the case of the Math ROM itself, more functions could've been included (such as the many missing matrix operations, the missing inverse trigonometric and hyperbolic functions for complex arguments, etc).

Seems quite probable to me. I know for sure that IEEE-compliance takes large portions of the Math ROM, and slows down its operation somewhat. So perhaps IEEE compliance wasn't that good and the HP-71B was burdened with a "ground-breaking" feature that, in retrospect, wasn't that useful and prevented other really useful features to actually make it.

Best regards from v.

HP-71B drawback: [Was Re: HP-71B Math ROM]

*Message #18 Posted by **Raymond Del Tondo** on 9 Mar 2005, 8:46 a.m.,*
in response to message #17 by Valentin Albillo

Slightly OT, but...

IMHO the only thing *really* missing in the HP-71B
was a multiline display, maybe at least 4 rows.
It was very hard to keep an 'overview' when writing lengty BASIC programs.
It also led to writing multiple statements and labels into one line.
It was a bit better when using the FORTH, but not really good...
And it was really annoying when editing the sources of LEX and BIN files.

I couldn't afford to buy the expensive video interface back then,
so I had to write it all down, or later, print it with the IL ThinkJet,
of which the ink modules were and are very expensive.

For programmers the HP-71B was an extremely nice machine

regarding it's features, and a real pain regarding the display.

Regards,

Raymond

Re: HP-71B, Math ROM, and JPCROM (was Re: New DVD/CD Set ...)

*Message #19 Posted by **J-F Garnier** on 9 Mar 2005, 7:17 a.m.,*
in response to message #16 by Rodger Rosenbaum

I fully agree about the HP-71B Math ROM. Let me add that the 2nd most important system extension for the HP-71B is the JPCROM, which adds structured programming keywords like LOOP/ENDLOOP, WHILE/ENDWHILE, LEAVE, SELECT/CASE (inspired by the classic HP Basic aka RMB), and many other useful functions.

Rodger,
I guess that you were the author of important bug fixes for this ROM. If yes, please contact me, I would like to know more about it (jeffcalc ... at ... wanadoo ... dot ... fr)

Sadly, it's not one of the downloadable articles ;-(

Re: HP-71B Math ROM (was Re: New DVD/CD Set ...)

*Message #21 Posted by **Valentin Albillo** on 10 Mar 2005, 2:23 p.m.,*
in response to message #20 by Werner

Hi, Werner:

Werner posted:

"Sadly, it's not one of the downloadable articles ;-("

Thanks for your interest in this particular article of mine, but just in case you're also interested in HP-71B-related articles in general, you might want to consider subscribing to Datafile: the cost is negligible and I've submitted no less than *four* HP-71B articles recently, three of which are due to be published in the very next issues (kind Editor permitting), with several more on the way. The subject matters are varied but always brand new, hopefully quite interessting and even useful, and mostly 10-12 pages long.

I understand that people (myself included) don't like having to pay for anything, be it music or films or software or whatever, but the small fee helps Datfile survive; were Datafile to disappear for lack of members, I would simply stop writing publication-quality articles, and interested people who, like yourself, happen to like them would simply be deprived of the one and only source for them. It happened to PPC, it happened to CHHU, it happened to HPX, and we'd better be advised not to let it happen to Datafile.

I'm also finishing several articles for other HP models including the HP-16C, HP42S, HP-15C,

HP-12C, and HP-41CX. Some of them also feature code for similar SHARP models for comparison purposes.

Best regards from V.

Re: New DVD/CD Set Version in the works

*Message #22 Posted by **James M. Prange (Michigan)** on 9 Mar 2005, 6:08 a.m.,*
in response to message #1 by Dave Hicks

Hi Dave,

I'm glad to read this!

I have quite a few manuals (almost all for RPL models) that I don't see on your list or on the current (Version 4.00) DVD. I don't suppose that they're really **needed**, but I'd be glad to contribute; assuming, of course, that you can obtain the required permissions.

What file format would be needed? Some of the covers are in colour; what colour depth would be appropriate? For that matter, for grey-scale illustrations, what depth would be appropriate?

How soon would you need the files? If very soon, perhaps it would be better to scan the thicker ones at my leisure for some future DVD/CD set?

EduCalc Catalogs

*Message #23 Posted by **Palmer O. Hanson, Jr.** on 9 Mar 2005, 11:19 p.m.,*
in response to message #22 by James M. Prange (Michigan)

Dave Hicks' original list includes four EduCalc catalogs: 27, 52, 5 and 54. James Prange's response include three catalogs: 52, 61 and 74.

I have the following EduCal catalogas in my collection:

No. 12 - I can't find a date on it.

No. 41 - September 1988

Nos. 54 through 66 - Winter 1992 through Winter 1995

Nos. 68 through 70 - Summer 1995 through Winter 1996

Are any of these needed?

Thanks everyone!

*Message #24 Posted by **Dave Hicks** on 10 Mar 2005, 6:09 p.m.,*
in response to message #1 by Dave Hicks

I believe I've emailed everyone who has offered manuals here or via email. (If you haven't seen anything, please email me.)

For other manuals that have been requested here but not offered, I'd be happy to scan or include them if someone can loan or scan them soon.

Upgrade for DVD? (Was: New DVD/CD Set Version in the works)

in response to message #24 by Dave Hicks

Thank you, Dave, for the great work you are doing online and here again on media.

I own the DVD of October 2002, I suppose it is v4.00 (is the version mentioned somewhere?).

The only thing I was missing are: hp20S (manual) hp21S (not on DVD, but found "big 15 MB" copy in internet hp12C (manual) the original one, not the hp12Cp from today's hp site

Will the 3 manuals be included in a new version?

Do you plan to offer an upgrade (on CD or DVD) for the owners of the DVD set or full CD set?

Regards, Valentino

Pay with PayPal?

*Message #26 Posted by **Raymond Del Tondo** on 21 Mar 2005, 7:49 p.m.,*
in response to message #24 by Dave Hicks

Hello Dave,

once it's available, can I also purchase
the new DVD set and pay via PayPal?

Regards

Raymond

HP41 half nut internal swap??

*Message #1 Posted by **Chan Tran** on 7 Mar 2005, 2:30 p.m.*

I have a 41CV and a 41CX both are half nut version. Now, the CX is a blank nut. I wonder I can swap the guts of these machines in order to have a standard CX and a blank nut CV? I am not sure I want to do this as the CX blank nut is more valuable than standard version but I like to use the CX and I am don't like the blank key. Although, I remember all the key legends now.

Re: HP41 half nut internal swap??

*Message #2 Posted by **Matthias** on 7 Mar 2005, 3:22 p.m.,*
in response to message #1 by Chan Tran

I remember, we had that posting some month ago, right? As collector I would say sell the CX blanknut and buy a new CX. So you do not have the filigree work with the internals.

Re: HP41 half nut internal swap??

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 7 Mar 2005, 5:10 p.m.,*
in response to message #1 by Chan Tran

Hi, C han Tran;

although I know it is possible to x-change internal guts between full- and half-nuts (I´ve done that and now I own a deffective 41CV halfnut in a 41C fullnut case), I´d second Matthias advice: a CX blanknut is too rare to dismantle just for daily use purpose. If you can, keep it this way and add another CX to your collection... Just an idea!

Cheers.

Luiz (Brazil)

Re: HP41 half nut internal swap??

*Message #4 Posted by **Richard Garner** on 7 Mar 2005, 5:48 p.m.,*
in response to message #1 by Chan Tran

Chan,

Have you thought of using the 41C standard overlay on the blanknut? There is no difference in the actual keyboard between the different 41C models. If you don't have one, I scanned one in to the computer last year and can e-mail it to you if you like. When printed it should be at 1:1 scale without any modifications. All you need to do is cut out for the keys.

Re: HP41 half nut internal swap??

*Message #5 Posted by **Chan Tran** on 8 Mar 2005, 4:17 p.m.,*

in response to message #4 by Richard Garner

Matthias! My earlier post involved a CV full nut and the CX half nut, blank nut. I just now got a like new CV half nut (for a big 50 cents) so the idea came again. Richard! Thanks I have the overlay as well as the membrance overlay, but neither solution work well. Thanks all for the advice. I think I should keep the blank nut intact.

cranky HP95

*Message #1 Posted by **David C. du Four** on 7 Mar 2005, 2:15 p.m.*

I have an HP95 calculator which has lost it. As long as the machine is not asked to perform with the tape in operation everything is fine. The minute the tape is put into operation by sliding the trace switch to the middle or far right position, the display freezes with a negative entry and the tape does not either print or advance.

Can anyone help?

David C. du Four

Re: cranky HP95

*Message #2 Posted by **Tony Duell** on 8 Mar 2005, 6:18 a.m.,*
in response to message #1 by David C. du Four

Do you mean an HP95C? The really rare one?

I have repaired one (I don't own one, I hasten to add), and I have a reverse-engineered schematic (available, as ever, from HPCC).

My hope is that your problem is power-supply related. I assume you have a known-good battery pack in there (The 95C has the same protection circuit as the other topcats, but like other topcats, it only works when the machine is on. The 95C would therefore seem to suffer from the same RAM-killing problem as the 25C and 33C, etc). It might be something as simple as a dried-up capacitor

A worse possibility, of course, is ROM problems (if the printer driver code is screwed up, then the processor could go crazy when it tries to use the printer). The bad news is that these ROMs were only used in the95C, so finding replacements is impossible.

Ipaq problems

*Message #1 Posted by **Jim** on 7 Mar 2005, 12:08 p.m.*

I have broadband with a wireless Ipaq. Since Comcast did a major upgrade, I cannot access my e-mail. The message I get says I need a browser upgrade but I've got the latest IE version available. Comcast says they can't help me because they really don't support routers. My desktop e-mail works fine. Has anyone else with a mobile unit had this problem? If so, can you shed any light?

I have done both a hard and soft reset and reoriented my router. I suspect its some kind of connection problem but I don't have a clue.

Thanks.

Re: Ipaq problems

First: this is a *museum* forum so we do not usually deal with *live beings*, etc. etc. :-)

Given this if all you need is fooling the server into thinking that you use a more recent version of Pocket IE try this: http://www.cewindows.net/applications/regking2003.htm and apply the patch that says:

> Quote:
>
> Makes Pocket IE pretend to be IE 6.0 - Should allow you to access secure websites like banking or brokerage houses. Right now most sites just check the browser's version and if it is less than 4.02 it does not allow you access. PIE by default reports IE 4.01 so you won't get access.

HTH,

Massimo

HP71: Any suggestions to learn FORTH ?

*Message #1 Posted by **Jos** on 7 Mar 2005, 9:53 a.m.*

Title says it all. I am a (relative) inexperienced programmer and want to start to use my HP71's FORTH module language environment to do some basic programming. I have the museum discs, my main problem is that I do not seem to be able to take the first hurdle, some questions: - Where can I get (download) a simple introductory course in FORTH - Overview of programming elements/language structures. - Example programs geared towards the HP71 - etc.

Any help would be very welcome.

Jos

Re: HP71: Any suggestions to learn FORTH ?

*Message #2 Posted by **Raymond Del Tondo** on 7 Mar 2005, 10:14 a.m.,*
in response to message #1 by Jos

How about google ? A quick search for 'FORTH tutorial' returned various links:

http://astro.pas.rochester.edu/Forth/forth.html

http://home.tampabay.rr.com/jforth/C04_Tutorial_Beginning.html

http://www.pmb.net/documents/forth.html

There are many more, but these should get you started;-)

Even the HP-48 programming manual can be of valuable help,
since RPL is *very* similar to FORTH.
These can be downloaded from HP or www.hpcalc.org

Re: HP71: Any suggestions to learn FORTH ?

*Message #3 Posted by **John Pierce** on 7 Mar 2005, 12:44 p.m.,*
in response to message #1 by Jos

I am also attempting to learn this non-intuitive language. The HP Owner's Manual recommends three references, Brodie's Starting FORTH, FORTH-83 Standard, Haydon's An Annotated FORTH Glossary. I downloaded the FORTH-83 standard from the internet; I bought "used" copies of the two books using Barnes & Nobel, and Amazon. Be careful when buying the used books because the prices ranged from $35.00 to $300.00!!! for the same title in similar condition. I bought each for about $45.00. Also the FORTH Interest Group web-site lists many links to tutorials and different versions of FORTH. I downloaded a copy of Pygmy

FORTH for use on my PC. I have been very frustrated while trying to learn FORTH, fortunately I am retired and learning FORTH as a stimulating intellectual exercise. Good Luck !!!

Thanks for your feedback !

*Message #4 Posted by **Jos** on 7 Mar 2005, 12:54 p.m.,*
in response to message #3 by John Pierce

Thanks to you both, I'll start with the online tutorials.

Re: HP71: Any suggestions to learn FORTH ?

*Message #5 Posted by **Garth Wilson** on 7 Mar 2005, 2:57 p.m.,*
in response to message #1 by Jos

Starting Forth, by Leo Brodie, is a great book for beginning in Forth. It's very dated, but still excellent in most ways, and humorous. Unfortunately the only versions I've seen online were where apparently someone just re-keyboarded the whole thing, without the pictures, the bold and italics, etc.. The Forth Webring's address is http://t.webring.com/hub?ring=forth . You'll find a lot of good websites linked in there, including tutorials.

That was the book I started into Forth with, with the HP-71. Unfortunately the situation I ran up against was that the book assumed you had something to practice on, and the HP-71 Forth/Assembler module manual assumed you already had experience in Forth and only needed to know the things that were particular to the HP-71. The two were left pointing at each other. It wasn't ideal. In your process of learning, you're welcome to E-mail me with questions. I haven't done any Forth programming on the 71 in quite awhile so I'll probably have to do some review, but it'll be good for me! The 71's Forth implementation is not nearly as good as its BASIC implementation (especially when you include the user groups' LEX-file and other contributions to the BASIC); but since it's Forth, you can make a lot of improvements yourself, even without assembly.

After you get some beginning experience in Forth, another book that's good is Thinking Forth, again by Leo Brodie. He has relicensed this book under the Creative Commons license. Although unlinked to in the main page, you can get a copy of the Thnking Forth book at the following URL:

http://thinking-forth.sourceforge.net/thinking-forth.pdf

The pictures' quality is not very good, but it's all there, more or less in its original form.

Garth

Re: HP71: Any suggestions to learn FORTH ?

*Message #6 Posted by **Raymond Del Tondo** on 7 Mar 2005, 6:08 p.m.,*
in response to message #5 by Garth Wilson

Hello Garth,

a small addition:

The link
http://thinking-forth.sourceforge.net/thinking-forth.pdf

doesn't work this way.
You'll have to go to
http://thinking-forth.sourceforge.net/
then select a download mirror, and finally download the pdf.

For onscreen viewing, take the 'color' version,
because in this version, you can *see* the hyperlinks;-)

Re: HP71: Any suggestions to learn FORTH ?

*Message #7 Posted by **kim** on 10 Mar 2005, 2:14 a.m.,*
in response to message #6 by Raymond Del Tondo

I have the original hardbound Brodie (amazon helped me)

But I save it from beeing used when I can

Therefore this stream excited me a lot, I could get a print that was not to be considered brittle...

I tried to do the down load from the sourceforge.net site and got diverted to a slew of mirro host.

I ended up in this domain

http://www.mirrorservice.org/sites/download.sourceforge.net/pub/sourceforge/

and I can't seem to find the title under Leo, Brodie, thinking, forth or anything else. I even tried FIG. What do I do wrong here? Any advice?

KimH

Preserving HP-41 Battery Contacts

*Message #1 Posted by **Brian** on 7 Mar 2005, 8:06 a.m.*

I monitor my collection of HP-41's for battery contact corrosion and wipe them with alcohol and cotton swab occasionally. Recently, I noticed a small amount of corrosion forming.

What is a safe and effective neutralizer to use?

Thanks for the advice in advance.

Brian

Re: Preserving HP-41 Battery Contacts

*Message #2 Posted by **David Smith** on 8 Mar 2005, 12:53 p.m.,*
in response to message #1 by Brian

I have been using a product called a Caig Gold Pen. Like a magic marker full of corrosion inhibitor, etc. They also make a product called DeOxit in the same type of pen. It remains to be seen how well these products actually work in the long term.

Re: Preserving HP-41 Battery Contacts

*Message #3 Posted by **Brian** on 11 Mar 2005, 10:08 a.m.,*
in response to message #2 by David Smith

David:

Thank you for your response. I am not aware of the products you mentioned, can you recommend where I might purchase them?

Any thoughts from other parties or is David's suggestion the consensus?

Thanks, Brian

Re: Preserving HP-41 Battery Contacts

*Message #4 Posted by **David Smith** on 11 Mar 2005, 12:21 p.m.,*
in response to message #3 by Brian

I fount it at Fry's. Also see CAIG.COM They recommend De-Oxit for discolored contacts. ProGold for clean contacts.

Re: Preserving HP-41 Battery Contacts

*Message #5 Posted by **James** on 11 Mar 2005, 10:08 p.m.,*
in response to message #3 by Brian

I would also appreciate further recommendations and anecdotes regarding products to deal with battery compartment corrosion.

I am trying a "Staticide Power Pen"

A few months ago, I used it on my 33E battery and charger terminals. I think the single application substantially reduced the corrosion, but not stopped it completely, so I have now applied it again. It doesn't appear to have done any harm, but this isn't a very scientific test.

The packaging says:

```
"Removes and helps prevent performance-reducing corrosion"
"fast acting formulation removes oxidation from old and new battery contact
surfaces."
"Active ingredients: Citrus and Mineral Oil."
"liquid is clear." "Applicator tip may turn dark after use."
"Non-toxic, non-corrosive ingredients"
```

It also says "Keep out of reach of children." and "Caution: Not intended for use on car or zinc air batteries."

http://www.aclstaticide.com/01/info_pages_ind/product_8080.htm

DigiKey part number ST1026, currently $5.88

Series 80: HP 82940A GPIO Manual

*Message #1 Posted by **Vassilis Prevelakis** on 7 Mar 2005, 7:21 a.m.*

The HP 82940A GPIO Manual for the HP Series 80 computers has been added to the www.series80.org web site.

I am happy to say that this manual just about concludes the scanning of my collection. When I started the Series 80 site, the market prices for these computers were quite reasonable, but nowadays prices have increased to the point where I do not think it reasonable to try to enlarge the collection any further.

This means that unless somebody donates manuals or scans, the on-line collection is not likely to increase any further.

Best Regards

**vp

Re: Series 80: HP 82940A GPIO Manual

*Message #2 Posted by **Tony Duell** on 7 Mar 2005, 2:07 p.m.,*
in response to message #1 by Vassilis Prevelakis

You've got the link wrong, I think. The filename should be HP82940A-GPIO.pdf, not HP82940-GPIOA.pdf (which is what you've got).

Interesting design, with those 8243 I/O expanders to drive the GPIO lines...

Free42 for PalmOS now does skins, too

*Message #1 Posted by **Thomas Okken** on 6 Mar 2005, 11:44 p.m.*

Free42 for PalmOS now does skins, too. The latest version, plus a package containing two skins, is here.

There isn't much to look at, yet: the only built-in skin is still the same old 160x160 monochrome Free42 has used since day one, and the current skins package contains a reverse-video version of the 160x160 skin, plus a 320x320 adaptation of the "Standard" skin from the Windows and Linux versions. (Note that high-density skins only work on high-density screens; if you load them onto a low-density Palm, they won't even show up in the Skin menu.)

I have several more skins that others have donated in recent months; I will convert them all to PRC format and add them to the Free42PalmOSSkins.zip package over the next few days.

Note that you can also create your own skins fairly easily; you need a *.gif and *.layout file, just as for the Windows and Linux version; the tools to generate a PRC from these two files are in the palmos directory in the source package. Take a look at the Reverse.prc and StandardHD.prc targets in the Makefiles and tweak them to your needs. (I will provide a README about the process later on, and maybe make the tools a bit user-friendlier.) Also note that generating PalmOS skins requires some flavor of Unix (or Cygwin), a shell, the netpbm package, a C compiler, and the PilRC resource compiler.

- Thomas

maximizing keyboard label contrast

*Message #1 Posted by **Hugh Evans** on 6 Mar 2005, 2:03 p.m.*

Not long ago someone posted in a thread that they had done work developing an algorithm to evaluate the contrast of labels on various HP keyboards over the years. Any information on this topic would be greatly appreciated!

Best Regards, HDE

Re: maximizing keyboard label contrast

*Message #2 Posted by **Gene** on 6 Mar 2005, 9:29 p.m.,*
in response to message #1 by Hugh Evans

Well, I don't know if I'd call it an algorithm.

But, what I did at HHC2004 was to measure the color of the background and the color of the function on the background using the built-in windows paint program, which gave the color a score on RGB of 0-255 for each color.

I then did a variation of the distance between two points by :

SquareRoot of ((R1 - R2)^2 + (G1 - G2)^2 + (B1-B2)^2)

which gives a score of 0 (for the same color) up to about 440 for black and white.

Scores above 200 seem to provide good contrast when shown to people.

There is a link somewhere to my powerpoint presentation from HHC2004, but I dont' have it handy. It would either be at the HHC2004 website or on Jake Schwartz' site.

Re: maximizing keyboard label contrast

*Message #3 Posted by **Hugh Evans** on 7 Mar 2005, 12:42 a.m.,*
in response to message #2 by Gene

Exactly what I was looking for. Thanks!

Re: Luminance...

*Message #4 Posted by **Andrés C. Rodríguez (Argentina)** on 8 Mar 2005, 6:14 p.m.,*
in response to message #3 by Hugh Evans

Just something more to include in your analysis, from the old black-and-white TV days: There is a magnitude called "luminance", usually denoted by the "Y" letter. The luminance has to do with the graytone brightness of a given color, and with the different sensibility of the human eye to different colors. The formula

Y = 0.59 x G + 0.30 x R + 0.11 x B

gives the luminance value for a color specified by RGB values. When choosing different colors in the color space, you may also want to make them different in the luminance value; so they will be different (brighter-darker) even from a grayscale standpoint.

Re: maximizing keyboard label contrast

*Message #5 Posted by **Frank Wales** on 7 Mar 2005, 4:46 p.m.,*
in response to message #1 by Hugh Evans

You might find our colour selector tool useful; it lets you wander around the space of available colours along a number of dimensions, lets you see text in relation to the colour, and lets you generate sets of colours that are maximally distinct in various ways.

It also has links to various other resources, including one on choosing colour schemes that work for colour-blind people.

M essage to Patrick about SOLVE Algorithm

*Message #1 Posted by **Namir** on 6 Mar 2005, 12:40 p.m.*

Hi,

I am looking for Patrick who published the following post on the web site:

~~~~~~

Reverse Engineering HP Solve [long]

Posted by Patrick on 15 Oct 2003, 3:28 a.m.

For the past couple of months I've been engaged in the rather fun intellectual exercise of trying to reverse engineer the HP Solve algorithm, as found on the HP-34C and HP-15C (experiments suggest it is the same). My source material for this effort is primarily the HP Journal article by William H. Kahan on the implementation of Solve for the HP-34C. Very similar discussions appear in other HP literature, such as the HP-15C Advanced Functions Handbook.

...

Sigh.

So, here I am with a plea to the HP calculator community. If anyone is aware of any details regarding the HP Solve algorithm, especially in regards to bending secants, I would be quite grateful for a hint! Dr. Kahan, are you out there? ;-)

~~~~~~

I am planning to give a talk at HHC2005 this September and would cover HP's SOLVE routines. I am interested in Patrick's discovery (to save time). I will give Patrick credit due in my presentation.

Namir

in response to message #6 by John Smitherman

Let's hope there are better candidates AND this administration is able to name one of them. Besides, I agree with Katie completely.

Re: I find it interesting.

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 7 Mar 2005, 11:10 a.m.,*
in response to message #6 by John Smitherman

At least in a financial institution Carly's decisions will deal with money, profit and there's neither engineering nor R&D unprofitable sections to close...

Sometime ago (more than a year) I posted some of what I think of mixing pure profit to development, and I read good related material posted by brainy guys here, too. Now I read this article (thanks, Joan C.). I hope this sort of thinking becomes more and more a consensus and soon we'll have the right people in their right place, all playing their roles accordingly.

I'm not against CEO's or any financial mannagement staff for as long as their decisions do not crucify development and/or peoples lifes. I can't see a damn thing that's justified for the sake of money except making money itself.

Cheers.

Luiz (Brazil)

Sad to find that leaders are putting priorities in the wrong place.

Re: I find it interesting.

*Message #11 Posted by **John L, Shelton** on 7 Mar 2005, 5:50 p.m.,*
in response to message #1 by joan cardenas

While easy to blame Carly, she was symptomatic of societal changes for which she was not responsible. The world has changed. Consumers value price over quality more than they did a generation ago. They want more flashy gadgets, not fewer high quality ones. Businesses that compete on price and efficiency win because they meet the needs of the majority of their customers.

No one could have made HP successful by returning it to its engineering roots of the '60s and '70s. Look at Sony, or AT&T's Western Electric. Or the hi-fi industry. In nearly all industries, high quality has become a small niche market, and 90% of customers have gravitated to low-cost flashy goods.

One could even argue that overall, this is a benefit. 10x as many people can afford decent stuff now compared to a generation ago. The HP-35 was out of reach to most of America, due to price. Today's HP calculators, though inferior products, meet the needs of many, and can be purchase by nearly everyone. Decent audio equipment is available to the masses now. Air travel is affordable. Even cars are a bargain (and better quality to boot.)

A reason why the "wow" factor is missing is that many of the gaps have already been closed. The leap from slide rule to HP-35 was a big one. From HP-35 to HP-65 was a big one. From there on, the improvements were incremental. It would be difficult to make one a quantum leap better. I'm not arguing that everything has been invented already; there is still room for innovation. But with the rollout of electronics over the last 50 years, the low-hanging fruit has been picked. The next Wow invention arena may be nano technology. Consumer electronics is reasonably mature. We can count on occasional leaps from Apple and others, but don't expect the huge leaps we saw in years past.

Re: I find it interesting.

*Message #12 Posted by **Wayne Brown** on 8 Mar 2005, 2:35 p.m.,*
in response to message #11 by John L, Shelton

> Quote:
>
> No one could have made HP successful by returning it to its engineering roots of the '60s and '70s.

That depends on what you mean by "successful." Do you think it would have been possible for HP to *survive* by keeping an emphasis on quality and innovation? I'm not talking about growth, or expansion, or increasing "market share" or any other "bean-counter" concepts. I'm talking about making just enough money to keep the doors open, pay the salaries, and keep the research projects alive, without worrying about whether a dime is left over for any other purpose (like impressing Wall Street). A small company, fanatical about providing a playground for its engineers (and its small, loyal customer base), and spending just enough time and energy on marketing and sales to avoid bankruptcy -- that, in my opinion, would be a *very* "successful" HP.

Re: I find it interesting.

*Message #13 Posted by **Garth Wilson** on 8 Mar 2005, 3:22 p.m.,*
in response to message #12 by Wayne Brown

Unfortunately however, stock market investors are not interested in the product itself except what short-term ROI potential it offers compared to other investment choices. So although I've toyed with the idea of starting my own company, I won't go public. Still, I think the long-term ROI is worth going after. Linear Technology, maker of integrated circuits for analog-to-digital and digital-to-analog conversion, power supply controllers, op amps, etc. spends 19% of their revenue on engineering. They could give the investors a better immediate ROI if they put that money back in their pockets, but it wouldn't work for long. OTOH, I worked for a company in the 80's that proved you can sell garbage if you have a good enough sales strategy and department. Surely they could successfully sell a _good_ product that way if the owner didn't forbid the engineering department to make such a product by the ridiculous limits he placed on manufacturing cost. He didn't even want to pay enough to get the product assembled correctly to begin, thinking somehow you could "test the quality into it" which is how I got into automated test equipment to extensively test every detail of something that should have been fine with just a simple, manual, functional test.

Re: I find it interesting.

*Message #14 Posted by **John L, Shelton** on 8 Mar 2005, 3:31 p.m.,*
in response to message #12 by Wayne Brown

One aspect of the HP Way was to not lay off employees. I recall many years ago when my wife worked at HP. In those days, the founders still sent wedding gifts to employees. (We were so blessed.) The company went through a tough spell, and instead of laying off employees, lowered everyone's salary 10%, cut hours 10% (every other Friday off), and got the state of California to kick in some unemployment compensation to help with the loss.

Returning HP to a small engineering company would require massive layoffs, and violate the HP way. As others have discussed previously, it would be interesting to spin off the calculator division to a small team of interested people. Perhaps HP would consider that as part of their go-forward strategy which may well include breaking up the company.

I have read elsewhere that Agilent, spun off from HP a few years ago, maintains more of the HP Way than HP does. Perhaps they deserve the HP name.

Re: I find it interesting.

I completely agree. Things haven't been perfect at Agilent -- I believe they went through some layoffs, too -- but they're far more loyal to the HP Way than HP itself has been in years. For instance, the head of Agilent has stated publicly that he always considers "What would Bill and Dave do?" when making decisions. Agilent should have gotten the calculator division and the minicomputer division, along with the Hewlett-Packard name, and the divisions that manufacture the PCs and printers and other generic "me-too" junk should have been the ones that got a new name.

Re: I find it interesting.

"The leap from slide rule to HP-35 was a big one. From HP-35 to HP-65 was a big one. From there on, the improvements were incremental"

The 41C was also a quantum leap in numerous respects
The HP-28C was also a quantum leap becuase of the symbolics
After _that_ it has been incremental IMO

Re: 82002A Battery Charger voltages

*Message #1 Posted by **db (martinez, ca.)** on 6 Mar 2005, 12:01 a.m.*

As a check to your values: on my coarse old meter i get 5 and 15 vdc on my 82002C. I'll trust your readings. I just thought i'd let you know they are both ball park. That amount of juice runs my 35 just fine without batteries. Good luck.

82002A Battery Charger voltages

*Message #1 Posted by **Pyerre** on 5 Mar 2005, 10:17 p.m.*

Hello,

My Battery Charger AC Adapter has following output voltages : center pin (-) to the (+) pin : +5.33vdc /center pin (-) to the unmarked pin : +15.75vdc

The HP35 calculator works just fine in standalone with its battery pack. However, it just want to display a row of ... dots when powered by the AC adapter. Any helps would be very appreciated, Many Thanks, Pyerre

Re: 82002A Battery Charger voltages

*Message #2 Posted by **Tony Duell** on 7 Mar 2005, 1:58 p.m.,*
in response to message #1 by Pyerre

I am pretty sure you can download an ascii-art schematic for this type of charger from somewhere on this site. If not, then e-mail me and I'll send it to you.

The 35 should run off the charger even without a battery pack (the 2 outputs from the charger are a constant-voltage supply, supposidly 4.2V, for the logic, and a constant current supply to charge the battery. The battery is disconnected from the logic when you connect the charger).

Most likely the output from your charger has excessive ripple. The voltage looks fine, but you'd not see ripple on a voltmeter. Again most likely the 400uF electrolytic capacitor on the charger PCB has dried up. Try replacing it (a 470uF is fine).

Re: 82002A Battery Charger voltages

*Message #3 Posted by **Pyerre** on 7 Mar 2005, 9:49 p.m.,*
in response to message #2 by Tony Duell

Many thanks for your advices. I'd replaced the filter capacitor, even the old one has the ESR ~0.35, considered as still good, and the charger has no significant ripple at the output. I don't know why, but the display dimmed with a row number of dots. The HP35 still works fine with its own battery pack. /Pyerre

Re: 82002A Battery Charger voltages

*Message #4 Posted by **Tony Duell** on 8 Mar 2005, 6:15 a.m.,*
in response to message #3 by Pyerre

Have you checked the output voltage and ripple when it's connected to the calculator (turned of, of course)?

Have you got the schematics yet?

Re: 82002A Battery Charger voltages

*Message #5 Posted by **Pyerre** on 8 Mar 2005, 10:06 a.m.,*
in response to message #4 by Tony Duell

With the adapter connected, the output voltages at the battery contacts are about +5.0vdc, ripple ~6.0mVac

anh remains unchanged even turn the calculator on.

I've got your (HP82011) schematics here : http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=390

and beleive it's the same for the 82002A.

Many Thanks, /Pyerre

Re: 82002A Battery Charger voltages

*Message #6 Posted by **Tony Duell** on 9 Mar 2005, 6:22 a.m.,*
in response to message #5 by Pyerre

Does it behave in the same way if you plug the charger into the calculator _without a battery pack installed_ (it is quite safe to do this on a 35, I have read the schematics..)

Have you checked the various voltages inside the calculator when the charger is connected? At least Vbsw at the logic-to-keyboard connector and the Vss and Vgg lines on the testpoints?

HP 33S Battery Life

*Message #1 Posted by **Ed Look** on 5 Mar 2005, 3:31 p.m.*

How long are the lithium 3V cells (CR-2032) supposed to last "on average" in a 33S? I've had mine for less than nine months and it began to shut off during use and the battery annunciator was displayed.

After I replaced them, I did check the old cells with a meter- they were depleted. I am just surprised that it did not last over a year.

And, I'd say, mine doesn't see heavy use, rather, just slightly heavier than moderate use... whatever this means.

RAW and PGM files for HP-41

*Message #1 Posted by **Michel Beaulieu** on 4 Mar 2005, 9:25 p.m.*

Hi! I found a HP-IL card and install it on a old computer. I use "TANS41" to work with the card. After some time i finally get use to it. Now i want to transfer files on the HP museum 41 library. I try to transfer RAW files but the program don't like this file format... If i use PGM format file, transfer is great. I also try HEX file format and nothing works either.

Is there an utility to translate RAW files to PGM tans41 file format?

What is the program to use for transfering directly RAW files to the HP-41?

Is it possible to translate text files containing HP-41 program into a "uploadable" format to the HP-41? A lot of files in the HP museum library don't have a RAW or HEX files format.

Is there other format of HP-41 files on the net; where?

Is there other program for transfering files using the card i just found in a scrap box!

As you can see, i'm very interest in this card because now i can access a lot of programs on the net without keying them slowly on the HP-41... :-) Thanks...

Michel

Re: RAW and PGM files for HP-41

*Message #2 Posted by **Raymond Del Tondo** on 5 Mar 2005, 6:41 a.m.,*
in response to message #1 by Michel Beaulieu

Hi,

I'm sure Christoph Klug will answer more precisely,
but nevertheless I'll just mention it:
Search for Emu41 related threads in the forum,
and maybe in the articles forum.

If you have Emu41 from Jean-Francois Garnier,
in combination with your IL-PC card,
you'll never need anything else.

Raymond

Re: RAW and PGM files for HP-41

*Message #3 Posted by **Miki Mihajlovic** on 5 Mar 2005, 3:13 p.m.,*
in response to message #1 by Michel Beaulieu

I use HP41UC (you can download it from here) to convert between the formats and load through HP-IL card and TRANS41. TRANS41 uses LIF format for its database although the files are called hpside1.pak and hpside2.pak. To convert RAW or TXT file use:

```
hp41uc /r=file.raw /l=file.lif
hp41uc /t=file.txt /l=file.lif
```

Rename file.lif into hpside1.pak and you are redy to upload it to HP-41. It is possible to put number of files into one LIF file but you have to put them all in a separate folder due to HP41UC funky requrement (not a big deal). I use:

```
hp41uc /r=.\folder\*.raw /l=file.lif
```

Hope this help.

Re: RAW and PGM files for HP-41

*Message #4 Posted by **Michel Beaulieu** on 6 Mar 2005, 8:54 p.m.,*
in response to message #3 by Miki Mihajlovic

Thanks. I get the translator. But i still get a problem with PGM format. No translator i available. I still cannot take a RAW files ant translate it in a PGM files.

Thanks again,

Michel

Re: RAW and PGM files for HP-41

*Message #5 Posted by **Christoph Klug** on 7 Mar 2005, 3:18 a.m.,*
in response to message #4 by Michel Beaulieu

Dear Michel,

Raymond´s answer is absolutely right : Today TRANS41 makes less sense because EMU41 includes much more features. And EMU41 is compatible to your existing PC interface card :-)

Please refer to the HP-Museum article forum item 311 : HP41/PC gateway & emulator.

Also for working with programm files and ROM images, EMU41 includes nice support. Please refer to the HP-Museum artivle forum item 448 : Uploading ROM´s for HP41 & EMU41

With best wishes from Germany - Christoph

txt2raw.pl: an HP-42S program listing to "raw" conversion script

*Message #1 Posted by **Thomas Okken** on 4 Mar 2005, 1:27 p.m.*

Today, I posted *txt2raw.pl* on the Free42 home page. This is a Perl script that converts HP-42S program listings, like those generated by the PRP and LIST commands, back into Emu42/Free42 compatible "raw" program files.

txt2raw.pl was written by Vini Matangrano, and I'm reproducing it on my web page as a service to all HP-42S emulation fans out there. The script, plus some documentation, and the author's contact info, are all at http://home.planet.nl/~demun000/thomas_projects/free42/txt2raw/txt2raw.html.

- Thomas

Re: txt2raw.pl: an HP-42S program listing to "raw" conversion script

*Message #2 Posted by **Namir** on 5 Mar 2005, 8:10 a.m.,*
in response to message #1 by Thomas Okken

Thanks Thomas! I made a simple test (after installing Perl) and it works. ;-)

I have a question. Can I assume that your Perl script will work with the (basic) HP41C source code?

Namir

Re: txt2raw.pl: an HP-42S program listing to "raw" conversion script

*Message #3 Posted by **Thomas Okken** on 5 Mar 2005, 12:04 p.m.,*
in response to message #2 by Namir

HP-41 source code is a bit different from HP-42S source code: "ST+" vs. "STO+", "FIX 0" vs. "FIX 00", "INT" vs. "IP", "FACT" vs. "N!", etc.
It's probably not all that difficult to modify the script to accept HP-41 source code, but it won't handle such code properly as it is now.

Note that I didn't write the script myself, I just distribute it; you should contact the author about enhancement requests. (My Perl is a bit rusty, anyway. ;-))

- Thomas

Re: txt2raw.pl: an HP-42S program listing to "raw" conversion script

*Message #4 Posted by **Erik Ehrling (Sweden)** on 6 Mar 2005, 4:08 p.m.,*
in response to message #2 by Namir

> Quote:
>
> I have a question. Can I assume that your Perl script will work with the (basic) HP41C source code?

Hi Namir! For HP-41 source code there is a user code utility by Leo Duran that converts BIN->SRC and vice versa...

Regards,
Erik Ehrling (Sweden)

Re: txt2raw.pl: an HP-42S program listing to "raw" conversion script

*Message #5 Posted by **Namir** on 6 Mar 2005, 10:17 p.m.,*
in response to message #4 by Erik Ehrling (Sweden)

Thanks Eric. I have Leo's program installed on my PC. I was just curious if txt2raw.pl can do the same task.

Cheers,

Namir

Compare 48G/GX and 48S/SX

*Message #1 Posted by **Dan Kalish** on 4 Mar 2005, 12:52 p.m.*

Please compare the 48G/GX line and the 48S/SX line. Are they both Saturns? RPL calculators? Does the 48S provide graphing?

I have a 48G and would like a second calculator which isn't too different from it. I don't want to learn how to use another entirely different calculator. The 48S/SXs seem to have a lower price.

TIA,

Dan

Re: Compare 48G/GX and 48S/SX

*Message #2 Posted by **Ron Ross** on 4 Mar 2005, 1:15 p.m.,*
in response to message #1 by Dan Kalish

The 48S and SX are identical to each other aside from an expansion card bay. Both have only 32K RAM and doe have a Saturn processor (at 2 MHz vs 4 MHz on the G series)and program in RPL. The S series also lacks the Equation Library that is included on the G series and have a somewhat different menu system and keyboard.

I suggest another 48G (only $10-20 more than an S ie about $40-50 on ebay) or step up to an Hp48G+ which are about $100 but have 128K ram and equal to a 48GX except for expansion ports.

You may even consider the new HP48 ($90) or Hp49 ($140) calculators. While they are not of the same quality as the older 48G series, they have improved greatly in the last 6 months and have lots of speed and math features not available to the older 48Gx series unless you buy expansion cards ($$$$ option).

Re: Compare 48G/GX and 48S/SX

*Message #3 Posted by **Dan-the-K** on 4 Mar 2005, 4:26 p.m.,*
in response to message #2 by Ron Ross

Thanks for your response, Ron.

Yes, money is a consideration. My research on eBay completed auctions has the 48GX going for about $200. This is based on 5 recently completed auctions.

Back to the drawing board...

Re: Compare 48G/GX and 48S/SX

*Message #4 Posted by **Raymond Del Tondo** on 4 Mar 2005, 8:31 p.m.,*
in response to message #1 by Dan Kalish

Hi Dan,

please take a look into this thread: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=56518

I'd strongly suggest a newer G+ or GX,
as long as they're available...

The 'successors' of the real HP-48 (like hp49g/g+/g-)
still have quality problems after all these years,
see all the related keyboard problem and bug threads.

HTH

Raymond

BTW: Note that the so-called hp48gII actually is a reduced hp49g, better called hp49g- ,
and therefore doesn't count as an HP-48 series machine.

Re: Compare 48G/GX and 48S/SX

*Message #5 Posted by **John Limpert** on 4 Mar 2005, 11:49 p.m.,*
in response to message #1 by Dan Kalish

If you can find a 48S or 48SX at a good price, go for it. I've seen some excellent bargains on these calculators. For many uses, a 48S is just as good as a 48GX.

Re: Compare 48G/GX and 48S/SX

*Message #6 Posted by **Christoph Giesselink** on 5 Mar 2005, 9:49 a.m.,*
in response to message #1 by Dan Kalish

Because you are already working with 48G I would suggest that you're looking for a 2nd one in the 48G Series (G/G+/GX).

The 48S/SX has the same layout and most of base build in functions are equal. Of course there must be a difference because the 48S series has 256KB ROM where the G series has 512KB. There's also a speed difference the G series is ~ 50% faster than the S series.

One of the most important reasons IMHO is the place of the functions in the soft menus. Most of the functions are equal but reside on a different place in the menue structure. Especially when you use the "Pop-Menus" you will have problems, because the S series haven't them. I'm telling this because I'm a user of a 48SX and here I have problems using one of my 48GX.

When you're are using programs from various authors written in SysRPL or assembler you will have compatibility problems. I recognized that in the last 6-8 years more and more programs are only for the G series and the developers don't care about the S series any more. But this is a result that the HP48G is newer, sold for ~10 years (aka ~4 years SX) and in general much cheaper (I payed 1995 for a new HP48GX half of the price as for my 48SX in 1991). SysRPL and assembly program must specially designed to run on all HP48.

Finally some words to eBay (Germany) prices. 48S and 48SX have nearly the same prices, maybe that the S is about $ 5-10 cheaper. A G series costs about 60% more where especially the 48G are overpriced. For a little more bucks you can get a 48GX with 128KB RAM instead of 32KB. 48G+ are quite rare and have nearly the same price than a 48GX. Because of this I have ~ 5 GX but no G or G+. Like on many other products there are seasons with high prices (especially before X-mas) and times with lower ones. I just bought a 32S (after

looking for one over two years) in used and quite good condition at eBay for 45 EUR (~ $60). Two weeks ago a saw a HP48GX with manual sold for 65 EUR (~ $85), that definitely much below the $100 border.

Regards

Christoph

Re: Compare 48G/GX and 48S/SX

*Message #7 Posted by **Marcus von Cube** on 5 Mar 2005, 12:36 p.m.,*
in response to message #6 by Christoph Giesselink

I just picked up a 48G on eBay (Germany) for EUR 75,97 + shipping. (Auction #3877881704). Did I pay too much?

(The unit hasn't arrived at the time of this writing, so I don't have further info.)

Re: Compare 48G/GX and 48S/SX

*Message #8 Posted by **Raymond Del Tondo** on 5 Mar 2005, 4:22 p.m.,*
in response to message #7 by Marcus von Cube

It depends.
The unit seems to be complete, and comes with ConnKit & Box,
so if it's in good condition then the price is ok.

Raymond

Re: Compare 48G/GX and 48S/SX

*Message #9 Posted by **Christoph Giesselink** on 6 Mar 2005, 10:42 a.m.,*
in response to message #7 by Marcus von Cube

That depends on what you want to have. On some calculators the package costs as much as the calculator itself. So when you bought this item for collecting and the calcultor itself is is very good condition than the price maybe ok. The price of a new 48G with the original HP connectivity kit was ~220 DM (today 113 EUR, $ 150) in 1995 (Stuttgart, university store).

If you bought it for using only, you don't need the original package for which you have payed extra. But we are not discussing about retailed prices, when I try to get something over eBay the first question is: "What is the product _worth_ for me?"

This question must everbody ask for his own and depends on many factors. I assume, because you made the bid, that the calculator has this worth for you.

Regards

Christoph

eBay 48G - unit hasn't arrived yet

*Message #10 Posted by **Marcus von Cube** on 7 Mar 2005, 3:00 a.m.,*
in response to message #9 by Christoph Giesselink

Thanks for your answers. I'll tell you more after I've had a chance to open the box and play with the unit.

I'm a collector of working calcs and old computers (some of which I bought new when I was a student in the early 80ies; I could never afford HP calcs then.) Im not interested in boxes but in the way those machines work. So conditions like NIB or MINT aren't too important; good working condition is the key.

I had no idea of the original price for the 48 series when I started bidding. For *me* the price was reasonable (totalling about 80 EUR including shipping.)

Still waiting for the box to arrive...

Marcus

eBay 48G - unit HAS arrived! - Tricky question about vector addition.

*Message #11 Posted by **Marcus von Cube** on 13 Mar 2005, 10:06 a.m.,*
in response to message #10 by Marcus von Cube

Hey!

And it is in perfect shape! Worth every cent I spent on it :-)

I'm now playing around with my new toy and I'm facing the first "problem":

Is there an easy way to solve the following equation:

```
(r < phi) = (r1 < phi1) + (r2 < phi2)
```

?

The summands are vectors (or complex numbers which is the same in that respect) in polar coordinates. The "<"-sign denotes the angle symbol.

It's easy to do the addition if the right hand side of the equation is known: Enter the two vectors in the stack and apply [+].

But what, if one of the values r1, r2, phi1 or phi2 is missing but one value on the left hand side, r or phi, is known instead. The solver refuses to accept the above as an equation. I know I can do all the math myself and write a program but I was hoping that the solver would do the trick for me.

Any ideas?

Re: eBay 48G - unit HAS arrived! - Tricky question about vector addition.

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 13 Mar 2005, 6:11 p.m.,*
in response to message #11 by Marcus von Cube

Hi, Marcus;

try using the constant 'i', defined as sqrt(-1) in the HP48G, and re-enter the equation. Anyway, if I am not wrong, the built-in solver has no way to find the answer, but if you write the complex numbers as '2 + i×A', being A an unknown, you can try to isolate A by using symbolic rules.

Luiz (Brazil)

Re: Tricky question about vector addition.

*Message #13 Posted by **Marcus von Cube** on 14 Mar 2005, 1:48 a.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

Hi Luiz!

I tried with the exponential equivalence:

```
(r < phi) = r*exp(i*phi)
```

The solver accepts the original equition if rewritten in exponential form and presents all the variables (r, phi, r1, phi1, r2, phi2) but it can only solve for one of them not a pair of r/phi values :-(.

To tackle this type of problem, a triangle solver is needed.

Triangle solver

*Message #14 Posted by **Karl Schneider** on 14 Mar 2005, 3:54 a.m.,*
in response to message #13 by Marcus von Cube

Marcus --

RPN-keystroke Triangle Solutions programs were written for the 41C in its Math Pac, and in the User's Manual for the 11C. These could be adapted for RPL-based calc's (and probably have already been, by someone).

These programs provide five "entry points" for entering adjacent known values:

```
ASA  (Angle-Side-Angle)
SAA
SAS
SSA
SSS
```

AAA cannot be included because it would not define the size of the triangle. AAS and ASS are omitted, not only because they sound naughty, but are respectively equivalent to SAA and SSA if the triangle is circumnavigated in the opposite direction.

The 11C program is nifty in that the five entry points match the five single-letter labels it provides, and that the 11C has *just* enough memory for the program.

-- KS

Hello!

Try to solve (you must to write your own solver routine!) this non-linear equation system:

```
r * COS(phi) = r1 * COS(phi1) + r2 * COS(phi2)
r * SIN(phi) = r1 * SIN(phi1) + r2 * SIN(phi2)
```

Is this unreasonable or what?

*Message #1 Posted by **Katie** on 3 Mar 2005, 11:06 p.m.*

HP is selling a surplus 32SII for a $100 starting bid on ebay. Does this seem as unreasonable to you as it does to me?

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58039&item=5756741871&rd=1

Re: Is this unreasonable or what?

*Message #2 Posted by **Ed Look** on 3 Mar 2005, 11:11 p.m.,*
in response to message #1 by Katie

Without knowing more and on the face of what you've said, I'd agree; it doesn't seem right.

I think if they were smart, they'd have held some promotional event for whatever HP product or program they won and craft into it a contest of sorts, with the vaunted 32SII given as a first prize or only prize.

Re: Is this unreasonable or what?

*Message #3 Posted by **John Limpert** on 4 Mar 2005, 5:37 a.m.,*
in response to message #1 by Katie

Somebody is cleaning out their inventory of obsolete replacement parts. What's wrong with selling them at an auction? That's what the U.S. government, and many other companies and organizations, does with excess/surplus parts and equipment.

Re: Is this unreasonable or what?

*Message #4 Posted by **Bernardo Vargas** on 4 Mar 2005, 6:51 a.m.,*
in response to message #1 by Katie

Free market economy. If you don't want to pay for it, then don't do it. I don't see anything wrong about such auction.

Re: Is this unreasonable or what?

*Message #5 Posted by **Chan Tran (USA)** on 4 Mar 2005, 7:17 a.m.,*
in response to message #4 by Bernardo Vargas

I think that it is reasonable as 32SII's have been sold for well over $100. I won't pay $100 for the 32SII but there were enough people who did so it is not unreasonable at all.

Re: Is this unreasonable or what?

*Message #6 Posted by **Katie** on 4 Mar 2005, 9:37 a.m.,*
in response to message #5 by Chan Tran (USA)

What I find unreasonable is that they start almost all their other auctions for surplus calculators at $1 and let the market decide the value of them. Here they're taking something that they (remember this is HP selling this) sold retail for well under $100 and marking it up based on market demand. When companies do that it's called price gouging and it's illegal in many states.

Re: Is this unreasonable or what?

Are you sure this is HP?

http://contact.ebay.com/ws/eBayISAPI.dll?ReturnUserIdHistory&requested=hp_marketplace

They only claim:

> Quote:
>
> HP_Marketplace is the only Hewlett-Packard authorized reseller of HP & Compaq products on eBay.

in response to message #7 by Massimo (Italy)

From what they say, they are the only HP authorized ebay seller and I believe that given their longevity and ebay rating. They also seem to have access to a vast amount of HP's surplus inventory so they are apparently tightly connected to HP if not indirectly owned by them.

Re: Is this unreasonable or what?

Actually my presence on eBay predates theirs and my rating is 100%, if this means anything at all... ;-)

Well, I doubt that HP is directly involved with them, but they surely have access to surplus material.

Anyway, who knows? Everything is possible.

Greetings,

Massimo

Re: Is this unreasonable or what?

*Message #10 Posted by **Hugh Evans** on 4 Mar 2005, 2:16 p.m.,*
in response to message #6 by Katie

HP authorized doesn't sound equivalent to HP, although even if it is HP I highly doubt this would be illegal... In terms of price gouging, the starting price of $100 is well below the current market value of a 32sii. While it is above the original retail price, it's also no longer in production and has become a collector's item.

When production ceased the market value went up. The number of extant 32sii's is now finite and decreasing while market demand is probably similar to when they were still being sold.

Re: Is this unreasonable or what?

*Message #11 Posted by **marais** on 4 Mar 2005, 3:21 p.m.,*
in response to message #10 by Hugh Evans

I completely agree, but doesn't this on the other hand mean that HP realizes very well that their old calcs are held more worthy than their currently produced ones? I mean, if I was able to sell my surplus items at higher prices than my current offering, it would make me think.

Re: Is this unreasonable or what?

*Message #12 Posted by **Frank Boehm** on 4 Mar 2005, 4:18 p.m.,*
in response to message #10 by Hugh Evans

"HP_Marketplace is the Sales Agent only." Sounds like they are selling the stuff for HP, but they are not HP.

Re: Is this unreasonable or what?

*Message #13 Posted by **Dan Kalish** on 4 Mar 2005, 4:49 p.m.,*
in response to message #10 by Hugh Evans

Put me down in the column of people who think this is unreasonable.

I would have no problem with HP (or its agent) selling used calculators on their website or telephone. They have a very solid direct marketing procedure. They are capable of setting a price and providing warranties. I like HP; I have HP calculators, printer, fax machine, tape backup, and computer.

However, turning it over to eBay like this feels like HP is abandoning its customer base. They are treating eBay like a higher authority and turning its customers over to the wolves. If we want one of these calculators we must fight tooth and nail, and then get a calculator "as is."

Many of we individuals who sell on eBay provide more in the way of warranty and guarantee. I generally give my buyers 14 days to evaluate the product and if they're not happy, they can return it, no questions asked.

Dan

Re: Is this unreasonable or what?

*Message #14 Posted by **Chan Tran** on 4 Mar 2005, 8:46 p.m.,*
in response to message #13 by Dan Kalish

May be what I suspected was correct. HP is secretly reintroduces their old calc but only sells thru Ebay at much higher price.

*Message #15 Posted by **Ed Look** on 4 Mar 2005, 9:32 p.m.,*
in response to message #14 by Chan Tran

I haven't heard this one yet! But, it made me laugh! They must have hired an army of retired secret agents to pull this off!

Re: Is this unreasonable or what?

*Message #16 Posted by **Bernardo Vargas** on 7 Mar 2005, 6:35 a.m.,*
in response to message #6 by Katie

@Katie: There's nothing wrong about asking for a price for an item. The rules of E-Bay allow you to do so. It's up to you to buy it or not. If you don't like it, don't buy it, that's all, but don't say there's something wrong or illegal about it.

Re: Is this unreasonable or buy from VP

Re: Is this unreasonable or what?

*Message #18 Posted by **John L, Shelton** on 10 Mar 2005, 3:58 p.m.,*
in response to message #6 by Katie

The term "Price gouging" is pejorative, at best. Any voluntary, non-fraudulent agreement between buyer and seller is ethical. In some cases, state laws influencing selling prices have themselves been found unconstitutional.

As others have said, if you don't like the price, don't pay it. Our system of market pricing ensures that demand is met by supply; if enough people are willing to pay high enough prices, goods get produced and transported. This is a good thing.

Attempts to regulate prices often have unintended consequences, such as driving sales underground or drying up production (or transportation). Strange that we never hear calls for price controls on labor (or single-family homes in hot markets.)

Hooray for free markets! Without them, we wouldn't have gotten the original HP calculators in the first place.

Is this unreasonable or what?

HP 41CV -> HP 41CX halfnut

*Message #1 Posted by **Artur** on 3 Mar 2005, 8:12 p.m.*

Hi

I have one HP 41CV in working conditions and on 41CX not working. Both are halnut models. Will it work to transfer the small PCB that is present in 41CX model (I believe the time circuit) over the CPU to the 41CV?

Has anybody here ever tryed it? Best regards Artur

Re: HP 41CV -> HP 41CX halfnut

*Message #2 Posted by **Peter** on 3 Mar 2005, 10:01 p.m.,*
in response to message #1 by Artur

Hi,

while there are many more knowledgable people out there, I rembered that I had read about this somewhere and a quick search brought back the threads below. It seems that the Giants here would suggest that it does not work, due to different "ROM codes in the display driver" between CV and CX" (though it does work for Fullnuts...)

Here are a few thread that might help you:

Re: HP 41CV -> HP 41CX halfnut

*Message #3 Posted by **Randy** on 3 Mar 2005, 10:25 p.m.,*
in response to message #2 by Peter

The daughter board in a halfnut CX contains the clock and rom. If it is working and you solder it onto a working CV, you'll have the equivalent of a CV with a time module installed, you will not have extended functions and extended memory since this is contained in the LCD driver module in a CX.

It is *very hard* to kill a halfnut 41. Most that have had battery leakage simply have lots of oxidation in the switches which includes the ON switch. If thats the case with yours, it is simply not able to turn on. Cleanliness in a 41 is not an option. It has to be absolutely clean inside. Any corrosion or dirt must be cleaned up.

To test, first, briefly short together the two leads of the largest capacitor to completely reset the unit. Connect the unit to a 5VDC power supply and check the current. Connect the (+) to the anode of the two diodes soldered to the top left side of the board, the (-) to the (-) of the 470uf cap (the largest one). Current should be less than one milliamp. Anything more and it might have a problem. You can try turning it on by using a small pin inserted into the ON switch from the backside, just be sure to touch the side of the plate-thru hole and switch dome at the same time. Many times a halfnut will come back to life with this treatment.

Re: HP 41CV -> HP 41CX halfnut

*Message #4 Posted by **Miki Mihajlovic** on 3 Mar 2005, 11:49 p.m.,*
in response to message #3 by Randy

If I can borrow this tread and ask a similar question (well sort of). I have a CX that I tried to fix for a friend. It has square LCD so I would say it is a fullnut, if this is a sign of a fullnut. It was working when I got it but the display was fading and there were some loose plastic parts in it (broken posts). I fixed the posts and cleaned it but when put together (I just keep the two halves thight in my hand) the LCD immediately lights up the upper half of all the segments and nothing works. This happens without pressing the ON key and the calc doesn't respond to any keypress.

Has anybody had similar problem. Can anybody give me a hint if maybe replacing the PCB or something else would revive the calc.

Re: HP 41CV -> HP 41CX halfnut

*Message #5 Posted by **Tony Duell** on 4 Mar 2005, 6:14 a.m.,*
in response to message #3 by Randy

You're right about the result (adding the daughterboard to a CV will result in a CV with time module but no extended functions), but not quite right about the hardware details.

That daughterboard contains the timer chip, time functions ROM, extended functions ROM and extended memory. The problem is that the system ROM (in the display driver hybrid) is different between the CV and CX models, and the CV version doesn't look for the extended functions ROM in page 3.

However, if you have a CX with a bad extended functions ROM, then replacing the daughterboard should fix it.

Thanks, I'll try and let you know the results!

Series 80 - Prog ROM Module clone update

*Message #1 Posted by **John** on 3 Mar 2005, 4:17 p.m.*

Hi, Sorry for the clumsy title, here is some more information on the clone version of the HP Series 80 (HP-85, HP-86, HP-87, HP-9915) Programmable ROM Module - 82929A.

Here is a picture of the lastest prototype from Bill K the maker:

http://www.vintagecomputers.btinternet.co.uk/hp80/pics/clone_prog_rom_module_prototype.jpg

This has the ability to store multiple ROM images (eg Assembler, Extended Mass Storage, EDISK, I/O, Mass Storage) as well as user programs.

More details once I get my hands on it, still yet to have a plan for general availability.

Regards, John

HP-41CX, HP-IL and HP3468A Multimeter

*Message #1 Posted by **Chris Catotti (Florida)** on 3 Mar 2005, 3:16 a.m.*

I have an HP 3468A Digital Multimeter, an HP-41CV with HP-IL Module, and a lot of other modules. Does anyone have experience using the 3468A with the HP-41CX ?

Do I need to keep the HP-41 HP-IL Development Module or Extended I/O (HP 82183A) Module to use the 3468A ?

Best Wishes,

Chris Catotti

Re: HP-41CX, HP-IL and HP3468A Multimeter

*Message #2 Posted by **Christoph Klug** on 3 Mar 2005, 3:23 a.m.,*
in response to message #1 by Chris Catotti (Florida)

Dear Chris,

please read the actual issue of the HPCC Datafile Journal : There I published an short article about controlling the HP3468 with HP41. This includes AC/DC voltage measurement, voltage level meausrement which includes dB calculation on HP41 side and display control of the HP3468 by HP41. The combination of HP41 & HP3468 is a nice solution for datalogger applications :-)

With best regards from Germany - Christoph Klug

28C ISOL - what's wrong?

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 3 Mar 2005, 3:08 a.m.*

Hello, I tryed to isolate a variable from this simply equation (it was late at night, and my brain was VERY slow), but I waked up in that minute, when answer appeared on 28C's LCD:

```
'S=(VG-VA)/VG'  (definition of slip in pneumatic conveying vg: speed of gas, va: speed of
coveyed material)
'VG'

Then I pressed [ISOL], and the answer was 'S*VG+VA'

Why 'VG' contained in the answer?
```

Thanks for any ideas!

Csaba

Re: 28C ISOL - what's wrong?

*Message #2 Posted by **ned** on 3 Mar 2005, 10:06 a.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

I believe the problem is due to the fact that isol only works for one instance of a variable. In other words, isol will not behave as a 'symbolic solver'. I tried your problem on my 48g+, which results in an error message. Perhaps the 28c, lacking the user interface shell of the 38/48, simply did the best it could, treating the second instance of the variable VG as unique.

-Ned

The 49G handles it...

*Message #3 Posted by **Karl Schneider** on 3 Mar 2005, 10:11 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

This problem produces an error on the 48G, as Ned found out. However, the 49G handled it fine, as I'm sure the 49G+ does (when the keyboard works properly).

Of course, I could have doen that easy algebra problem on paper in the time it took me to have the 49G do it.

Simultaneous Equation Solver HP 33s

*Message #1 Posted by **JJJ** on 2 Mar 2005, 11:44 p.m.*

To me the most important programs are the root finder and simultaneous equation solver (SES). I used the books program for the root finder and I'm low on variables left to creat a program for the SES. Does anyone have a short program version for SES or the root finder? Please help, must have both programs!

Re: Simultaneous Equation Solver HP 33s

*Message #2 Posted by **Eric Lundgren** on 3 Mar 2005, 2:02 a.m.,*
in response to message #1 by JJJ

JJJ,

What magnitude of a matrix do you wish to solve? A 2-eqn / 2-unknown is simple (I posted one in the software for 32sii here in the museum). However, I haven't tried a 3&3, or greater yet. I have an nxn solver that I wrote in 'c', but that does us no good, I fear.

Yep, wish one could create multi-character variables on the 33s... Eric

Re: Simultaneous Equation Solver HP 33s

*Message #3 Posted by **JJJ** on 3 Mar 2005, 9:25 a.m.,*
in response to message #2 by Eric Lundgren

I'm looking for a 3x3 solver. I'm only using it to solve variables for situations when you have three equations with unkown variables for each equation (huge time saver). Thanks for the response and please let me know if you find anything!

Re: Simultaneous Equation Solver HP 33s

*Message #4 Posted by **Ron Ross** on 3 Mar 2005, 9:51 a.m.,*
in response to message #3 by JJJ

A 3x3 is really trivial to implement. However, no matter how you do it, you are going to need 9 variables and more like 12 if you want to make it easier to use and manipulate. 15 if you don't want to destroy your existing variables or data (may need 15 anyway, if you don't make great use of the stack).

I suggest Cramers rule for finding determinets and staying with only using 9 variables (actually 10, you should store the determinet as well, rather than trust the stack). Although somewhat awkward, will only use 9 variables and will allow you to find value for whichever unknown you wish. If you need all three unknowns, you run the program 4 times, if you just need one, you run it twice.

Sadly, this is the limitation of 27 variables.

An Hp32s/32sii/33s just can't compare to a calculator such as the Hp42s. If you had one, it makes it even MORE difficult to use an Hp33s (I don't cry, I am not quite that emotional, but the Hp33s ain't no

big leap. If people were evolving like calculators, we'd all be chimps about now! Hey wait a minute, I resemble that remark! 8o))

Unfortunately, my batteries need changing on my 42s last week and YOU GUESSED IT! I lost several K of programs. Its to bad there was no serial port on the 42s. That, 32K and a units conversion feature like the 48G and I would never need another pocket calculater, nor would I ever look for one! But I guess marketing wins out, because then HP only makes ONE SALE!

Actually the Hp17Bii doesn't suffer from variable limitations, but it Ain't allowed on the NCEES exams either.

Re: Simultaneous Equation Solver HP 33s

*Message #5 Posted by **JJJ** on 3 Mar 2005, 11:15 a.m.,*
in response to message #4 by Ron Ross

I'm only using the HP 33s b/c I'm taking the PE Exam next month. I don't have experience in writing programs. Do you have a 3x3 program (perhaps using Cramers Rule) written that you could share?

Re: Simultaneous Equation Solver HP 33s

*Message #6 Posted by **Ron Ross** on 3 Mar 2005, 11:52 a.m.,*
in response to message #5 by JJJ

Here is a program written by Walter Grey that will work aside from storing into registers, you will store into alpha variables.

http://www.hpmuseum.org/software/253x3det.htm

Any good EE book (That's my introduction to Cramer) will explain the method in more detail, but the program above should work. Post if you have any problems.

I too hope to take the PE this spring, but my credentials are being reviewed since I do not have an Engineering degree. I am under a bit more scrutiney.

Re: Nix above!! Ron Ross

*Message #7 Posted by **Ron Ross** on 3 Mar 2005, 12:09 p.m.,*
in response to message #6 by Ron Ross

I don't know if program above will work as I looked over quickly.

The steps below will work for a 3x3 to make a det

|a b c| |d e f| |g h i|

(axexi + bxfxg + cxdxh) - (axfxh + bxdxi + cxexg)

The final number is the determinant for the matrix.

now include your values of the equations into the row (replace) that you wish to find the unknown (assuming x is first row, y is second, z is third) and crunch out the next determinant.

now you have two determinants. Divide your 2nd determinant by the first one and you will

have the answer to the unknown of whichever row you had substituted for.

The programming is straightforward, just store and recall variable as you crank out the values and let them move on the stack as you would a typical calculation.

The HP-20S has a built-in Cramer's Rule app

*Message #8 Posted by **Karl Schneider** on 3 Mar 2005, 9:58 p.m.,*
in response to message #5 by JJJ

JJJ --

The HP-20S has a 99-line built-in Cramer's Rule solver for 3x3 linear systems, which can also be used for 2x2 systems. The 20S is not approved by NCEES, although it meets standards.

For adapting the routine to the 33S, each numerical storage register and numerical label would have to be replaced by single-letter values. The 20S is algebraic. Adapting the routine for 33S Algebraic mode might be easier.

-- KS

Edited: 3 Mar 2005, 10:21 p.m.

Re: Simultaneous Equation Solver HP 33s

*Message #9 Posted by **Ron Ross** on 4 Mar 2005, 8:09 a.m.,*
in response to message #5 by JJJ

The Hp33s has the programming routine in its manual in chapter 15 pgs 16-17. I believe the RCL x Alpha is wrong and should be RCL Alpha x in the manual. That worked for me, I did not use the program listed in the manual.

Re: Simultaneous Equation Solver HP 33s

*Message #10 Posted by **bill platt** on 4 Mar 2005, 3:30 p.m.,*
in response to message #5 by JJJ

Hi JJJ:

Botht the 11c manual, and the 32sii manual have 3 x 3 matrix programs for solving simultaneous equations. There may be another routine in the 11c "solutions handbook" which I have at home. Actually, I see now that the 11c has tow different programs--a cramers rule method ofr solving equations, as well as a matrix manipulation program.

Go the the HP website and download the manual for the 32sii. As the 33s is a new version of the 32sii, you should be able to take the program almost exactly as it is (just do not pay any attention to the checksums and bytes--the machines use different architecture).

The 11c, while much older, also has programs that are fully compatible on the 33s, excetp that you will change the numbered registers to letter variables.

I would be happy to fax you all of these---I'll send you an e-mail, and you can e-mail me your fax number.

Regards,

Bill

Alternative solution: take 2 calculators

*Message #11 Posted by **Norris** on 3 Mar 2005, 12:22 p.m.,*
in response to message #1 by JJJ

Your state board should allow you to bring two 33S calculators to the PE exam. You could store the root finder program in one and the SES in another.

Alternatively, supplement your 33S with a Casio FX-115MS Plus, which is NCEES-approved for the PE exam and only costs about $15. It is non-programmable, but it has built-in features for solving 2x2 and 3x3 simultaneous equations, as well as roots of quadratic and cubic equations.

Re: Alternative solution: take 2 calculators

*Message #12 Posted by **Ron Ross** on 3 Mar 2005, 12:51 p.m.,*
in response to message #11 by Norris

I didn't know the Casio FX-115MS (which is my planned backup) could handle a 3x3.

Re: Alternative solution: take 2 calculators

*Message #13 Posted by **Norris** on 3 Mar 2005, 4:49 p.m.,*
in response to message #12 by Ron Ross

I don't actually have a Casio FX-115MS or FX-115MS Plus myself, but I looked at the manual, which is online at:

http://ftp.casio.co.jp/pub/world_manual/edu/en/fx115MS_991MS_E.pdf

Simultaneous linear equations with three unknowns are addressed on pages 24-25.

Re: Alternative solution: take 2 calculators

*Message #14 Posted by **Steve A** on 3 Mar 2005, 1:43 p.m.,*
in response to message #11 by Norris

Casio is good, or try Sharp EL506WBBK Solar that has all the features of Casio FX-115MS Plus -- AND four 4x4 matrix, AND four continuous formula memories, AND 52 constants+42 conversions, AND true edit/replay rather than backspace and rekey. It is also $15. It's a pity HP isn't marketing inexpensive machines like it.

Re: AND

*Message #15 Posted by **Ron Ross** on 3 Mar 2005, 2:16 p.m.,*
in response to message #14 by Steve A

And its not listed on the NCEES approved calculator list. Without being approved, it will just be collected by the proctor. It matters not how similiar or feature rich or poor it may be. Only a half dozen calculator models are allowed. Anything else, isn't.

Re: Alternative solution: take 2 calculators

*Message #16 Posted by **John Smitherman** on 3 Mar 2005, 11:12 p.m.,*
in response to message #11 by Norris

Hi Norris. This is an excellent suggestion. The Casio is a decent scientific calculator with dual power, a nice two line display (one LCD segments, the other dots) with , or . separating the 000's and it has the desired 2x2 and 3x3 equation solver. Also, you can use one to check the answers from the other ;-)

Regards,

John

Re: Simultaneous Equation Solver HP 33s

*Message #17 Posted by **Namir** on 3 Mar 2005, 3:32 p.m.,*
in response to message #1 by JJJ

Here is the math for solving a 3x3 system of linear equations. I generated the output using MATLAB.

A= [A11 A12 A13;A21 A22 A32; A31 A32 A33]

B is the solution ccolumn vector B= [B1;B2;B3]

Det = (A11*A33*A22-A33*A21*A12-A31*A13*A22+A31*A12*A32+A32*A21*A13-A11*A32^2)

X(1) = -(-A12*A32*B3+A12*B2*A33-A13*A32*B2+A13*B3*A22-B1*A33*A22+B1*A32^2)/ Det

X(2) = (-A11*A32*B3+A11*B2*A33+A21*A13*B3-B2*A31*A13+A32*A31*B1-A21*B1*A33)/ Det

X(3) = (-A31*B1*A22-A11*A32*B2+A11*B3*A22-B3*A21*A12+A31*A12*B2+A32*A21*B1)/ Det

Hope this helps!

Namir

A replacement 49g+ rec'vd...

*Message #1 Posted by **Eric Lundgren** on 2 Mar 2005, 11:24 p.m.*

Hello all,

Just received a package from HP today containing a replacement 49g+. (very quick service btw)

It came after explaining our symptoms to the calc tech there.

I've noticed that once the stack gets about 3 to 4 objects deep, the keystrokes still hesitate. For example, with a clean stack, rapidly keying 7777 does enter 7777, but not so after a few objects exist.

I noticed that upon installing the batts I was prompted to go thru the "recover memory?" routine...which I do not recall doing the first time on the other one..?

Well..its a shame, the only (ONLY) complaint I have is that when the initial key is duplicated, I miss strokes: 1. 444 yields 44 2. YET: 43333 always gives 43333! Regardless of # objects in stack...

if only that first one could be corrected...!! Help! Eric

Re: A replacement 49g+ rec'vd...

*Message #2 Posted by **John Smitherman** on 3 Mar 2005, 8:25 p.m.,*
in response to message #1 by Eric Lundgren

Hi Eric. What are the date codes on the original and replacement units?

John

41CX serial #'s -- halfnut/fullnut

*Message #1 Posted by **Karl Schneider** on 2 Mar 2005, 11:24 p.m.*

A current eBay auction offers Two 41CX calc's. The displays indicate that one is a fullnut, and the other is a halfnut. The serial numbers given are 2503S41819 and 2617S20215. Obviously, the latter must be the halfnut, since the changeover occurred during 1985.

The MoHPC indicates that the first halfnut 41CV found has a serial # 2511S... (assuming this is not a factory-repaired unit with new innards).

Does anyone have a later halfnut 41CX?

-- KS

Re: 41CX serial #'s -- halfnut/fullnut

*Message #2 Posted by **Raymond Del Tondo** on 3 Mar 2005, 1:54 a.m.,*
in response to message #1 by Karl Schneider

I assume you mean a later fullnut, or an earlier halfnut;-)
I have a fullnut CX w/serial #2506S42734 .

Raymond

SD Card Directories

*Message #1 Posted by **SuperSack** on 2 Mar 2005, 10:09 p.m.*

i just got a 32 mb SD card for my hp49g+. It seems like its a real pain in the butt (is it even possible?) to move stuff around inside a SD card from within the calculator's filer. i was going for inexpensive when i bought the card ($12 at k-mart) so getting myself a 20 dollar card reader would be a little annoying, but i'm not totally opposed to it if i've got to have it. Is there any way to easily create directories and move files between them on the SD card? thanks for your help

-SuperSack

Re: SD Card Directories

*Message #2 Posted by **John** on 2 Mar 2005, 10:49 p.m.,*
in response to message #1 by SuperSack

Short answer? No.

Longer answer? Check HPs site for the training document about using SD cards.

Secant Formula

*Message #1 Posted by **Matt Swanson** on 2 Mar 2005, 7:21 p.m.*

I just bought a 33s how do you do a sec(angle) calculation sec=r/x? Any help from an old pro?

Re: Secant Formula

*Message #2 Posted by **Thomas Okken** on 2 Mar 2005, 7:25 p.m.,*
in response to message #1 by Matt Swanson

sec(x) = 1 / cos(x)
cosec(x) = 1 / sin(x)
cot(x) = 1 / tan(x)

Hope this helps!

- Thomas

Free42 with skins

*Message #1 Posted by **Thomas Okken** on 2 Mar 2005, 4:26 p.m.*

Hi all,

In case you were wondering when the skin support in Free42 would ever get done (and I wouldn't blame you!, I was in a bit of a slump the last month or so), the latest version now has skin support in the Windows and X versions. Skin support for the Palm is still in the design stages but will hopefully arrive in a week or two.
The skin format is not compatible with that of Emu42, but it's pretty simple. The two main limitations at the moment are: the skin bitmaps must be in GIF format, and there's no support for keyboard mapping yet.
Regarding the first limitation: it seems to me that the existing Emu42 skins don't suffer noticeably from the conversion from 24-bit BMP to 8-bit GIF; they don't use a very large range of colors, so as long as you use some tool that does a decent job of palette optimization and color quantization, the result will look pretty good. But, if enough people complain (i.e., more than one ;-)), I'll add support for some 24-bit format -- maybe BMP, maybe PNG, maybe both.
Regarding the second limitation: keyboard mapping is the next item on my to-do list; once that's done, I'll define extensions to the skin layout format to allow users to customize the mapping.

So, what else is missing? One other thing -- true-color skins look pretty bad on 8-bit screens under Windows. The X version handles 8-bit screens pretty well, but the code that takes care of that magic still needs to be adapted and transplanted to the Windows version.
Here's hoping there aren't too many people still using less than 16 bits per pixel under Windows! (If there are, I'm sure I'll hear about it soon enough!)

The latest Free42, plus a separate package containing a few skins, including my adaptation of "ehrling42sl", is now available on the Free42 home page.
NOTE: you don't actually need to get the skins package; Free42 has two skins built in, so installation is just as simple as before: all you need is the executable and you're good to go.

- Thomas

*Message #3 Posted by **Richard Garner** on 2 Mar 2005, 5:05 p.m.,*
in response to message #1 by Thomas Okken

The skins look great! I got a question. Why couldn't the skins go in the same folder as the program? Having one folder for all the files might cut down on any confusion later on. I first copied the skins into the same folder as the program and wondered why they did not show up until I read the read-me file. I then put them in the new folder and they worked. Just curious.

Re: Free42 with skins

*Message #4 Posted by **Thomas Okken** on 2 Mar 2005, 5:24 p.m.,*
in response to message #3 by Richard Garner

Why couldn't the skins go in the same folder as the program?

Good point. My main concern was secure multi-user installations: I wanted to support the scenario where Free42 is installed in one central location for multiple users (and that location may not be writeable for everyone), where any user-specific stuff (state and skins) should be in a user-specific directory (i.e., under My Documents).

But, there's something to be said for looking for skins in a central directory as well. I think I'll add that to the next version -- make it look in "My Documents\Free42" **and** in the directory containing the executable.

(That might be a nice idea for the X version as well, but it's a bit trickier there because Unix programs cannot reliably determine the location of the executable -- and while something like /usr/share/lib/free42 seems a reasonable choice to put a system-wide set of skins, I don't like hard-coding directory names. This will take some thought...)

```

Of course X has its own way of specifying user options, using the Xresources. So you can have an Xresource that tells you where the directory is.

Re: Free42 with skins

*Message #6 Posted by **Eric Lundgren** on 2 Mar 2005, 11:10 p.m.,*
in response to message #1 by Thomas Okken

Hi Thomas,

Could you explain what "KML" files are? _____
Quote: The executable package of Emu42 for Pocket PC 2002 and 2003 v1.01 (ARM platform) without KML files _____

I run pocketPC, and have only been able to try a 15c emulator (pretty nice, btw). But the 42s would really be a treat!

Thanks, Eric Lundgren

Re: Free42 with skins

*Message #7 Posted by **Jeff O.** on 3 Mar 2005, 7:44 a.m.,*
in response to message #6 by Eric Lundgren

KML files are scripts that map keyboard functions to a bitmap for use with the emu family of emulators developed by Christoph Gießelink. Information on all of the emu emulators can be found here and for the 42s specifically can be found here. Some skins for use with emu42 and emu48 can be found here, as well as other places.
Be aware that you need rom images to run the emu emulators. The 42S rom is not publicly available, and is definitely not available at the above links. If you have access to a 42s and a 48G+ or 48GX, you can dump it yourself fairly easily.

Re: Free42 with skins

*Message #8 Posted by **Thomas Okken** on 3 Mar 2005, 8:47 a.m.,*
in response to message #6 by Eric Lundgren

Note that Free42 and Emu42 are completely separate projects.

Emu42 uses skin descriptions in KML format, and skin bitmaps in BMP format; it runs on Windows and Pocket PC; and it emulates the HP-42S at the hardware level, so you need a ROM image to use it; with different ROM images, it can also emulate other HP calculators that are based on the same hardware architecture. Emu42 was written by Christoph Gießelink, not by me; for more information, look at the Emu42 home page.

Free42 uses a different layout format (called, very imaginatively, "layout"), and skin bitmaps in GIF format; it runs on Windows, Unix, and PalmOS (NOT on Pocket PC (yet)). It emulates the HP-42S at the user level, so no ROM images are required (but note that it uses binary math, unlike the real HP-42S and Emu42, so it's not yet 100% compatible).

Hope that clears things up!

- Thomas

Re: Free42 with skins

*Message #9 Posted by **Mike (Stgt)** on 3 Mar 2005, 5:37 a.m.,*
in response to message #1 by Thomas Okken

Great!

I do not regard the use of 8-bit GIF as a limitation. All skins I use for Emu42 and Emu48 are BMPs reduced to 256 colors, two even to 16 only -- but that's for fun only.

I once asked Christoph "why BMPs only" and he replied "feel free to add the code for others". My idea was to use Stefan Peichl's LXPIC with the built-in programmer interface (using 16 bytes of the BIOS data area, see http://hplx.pgdn.de/lxpic.zip) to convert GIFs or JPGs to BMP on the fly. Well, I had a closer look to the source ... and - ah - you know... it would take some time just for the gain of saving some kB.

So using GIFs for Free42 is no limitation (IMHO).

Ciao.....Mike

Re: Free42 with skins

*Message #10 Posted by **Thomas Okken** on 3 Mar 2005, 9:08 a.m.,*
in response to message #9 by Mike (Stgt)

My main reason for supporting only GIF for skin bitmaps initially, is that I wanted to keep the build simple. I already had a GIF encoder/decoder that I had written for another project last summer, and so that was easy to integrate into Free42.

Adding PNG and JPEG support is relatively easy, as well -- there are excellent open-source/LGPL libraries out there, not too difficult to use, and integrating them into Free42 would be no problem, either. BUT it would mean adding third-party code to my project, or making it a multi-part project, or requiring people to download the libs in question separately, etc... I didn't want to deal with those issues just yet.

BMP might actually be the best option, as I suspect it's sufficiently easy to decode that I could just write my own decoder and not worry about third-party code and licensing issues etc. (Anyone have a link to a good, comprehensive, BMP file format spec?)

- Thomas

Re: Free42 with skins

*Message #11 Posted by **Mike (Stgt)** on 4 Mar 2005, 3:22 a.m.,*
in response to message #10 by Thomas Okken

Did you see the disclaimer agreement for LXPIC?

```
LxPic is copyrighted freeware. If you bundle LxPic with your
software or use the internal interface of LxPic, you have to
ask me for permission and you have to mention LxPic and the
copyright somewhere in your product.
...
```

As your Fre42 is freeware too I am quite sure Stefan will aggree to use his little 20kB gem.

Ciao.....Mike

PS: I'll ask him if he may point me to the specs of the graphic formats. M.

Christoph

Re: Free42 with skins

*Message #13 Posted by **Mike (Stgt)** on 17 Mar 2005, 4:51 a.m.,*
in response to message #12 by Christoph Giesselink

Thank you very much for that info. It will give me some work as the compression for BMPs with 16 colors only (4 bit) is quite good (110kB to 20kB for my EMU42Sbeta.bmp), for 8 bit BMPs (256 colors) the ratio is not so good.

Tnx again.....M.

Re: Free42 with skins

*Message #14 Posted by **Christoph Giesselink** on 17 Mar 2005, 4:56 p.m.,*
in response to message #13 by Mike (Stgt)

The compression rate also depends very much on the used encoder. Some sizes for a good compressable bitmap:

Size uncompressed: 130KB

Size RLE4: 4KB (with Paint Shop Pro 5.0)

Size RLE4: 128 Bytes! (with Photoshop 6.0)

The difference between Paint Shop Pro and Photoshop is, that Photoshop use the Delta Escape sequence. The pity is, that in many cases Photoshop 6.0 corrupts the bitmap when saving in RLE4 mode.

Then I replaced the black background with blue. Then Photoshop also need the 4KB from Paint Shop Pro. With palette renaming it would be possible to get still the 128 Bytes from the 1st example with black background.

Cheers

Christoph

Re: Free42 with skins

*Message #15 Posted by **Mike (Stgt)** on 18 Mar 2005, 5:24 a.m.,*
in response to message #14 by Christoph Giesselink

Well, I never went too deep in that business, as with the tools I have at hand (Stefan Peichl's LXpic, XNview, IrfanView, PSP8) I am not sure if a pic's properties are analyzed correctly and if a format change (RLE, uncompressed, etc.) is saved according to the set options. I hope to meet Stefan next week and get some hints about formats.

Ciao.....Mike

Re: Free42 with skins

*Message #16 Posted by **Thomas Okken** on 18 Mar 2005, 7:57 p.m.,*
in response to message #12 by Christoph Giesselink

Do you read the BMP files using CreateDIBSection()?
From what I understand, if you use that, you automagically support all BMP sub-variants.
I guess if that works as easily as I suspect, that would make it very easy to add BMP support to the Windows version of Free42. Of course I'd still be on my own for the Unix version, but of course there's always bmptoppm to use as sample code...

- Thomas

Re: Free42 with skins

*Message #17 Posted by **Christoph Giesselink** on 20 Mar 2005, 1:15 p.m.,*
in response to message #16 by Thomas Okken

There are different methods for loading bitmaps under Win32. The emulators of my Win32 Emu family use CreateDIBitmap() (used in Emu48 sources / Files.c / Function LoadBitmapFile()), a little bit more high level function than CreateDIBSection().

The easiest way to load bitmaps is to use LoadImage(). But the disadvantage of this function is the difficult way to get the palette information necessary for high color bitmaps on 256 color devices.

Some words to CreateDIBSection(), I use this function in the PocketPC emulators because the Win32 function CreateDIBitmap() is missing in the PocketPC 2002 SDK. Furthermore the PocketPC only supports RGB bitmaps, the RLE decoder is missing. Because of this the limitation "Win32" in my previous post. But everything change, so the next versions of my PocketPC emulators (Emu42PPC v1.02 and Emu48PPC v1.02) will also support RLE coded bitmaps (a small addition). My current beta versions use them already especially for the VGA mode KML background bitmaps.

Finally some words to the use of different bitmap formats. RGB bitmaps are the best supported graphic format in windows. Furthermore, the base of Emu48, Win48 is now nearly 10! years old, or better Emu48 base on 10 years old source code. Until now, you can everthing do with bitmaps. So there was never a real need on PC's to have a different graphic format. Discussing bitmap sizes in the times of > 100GB hard disk space is IMHO useless. Also PocketPC devices getting more and more memory. Do we really need several faceplates for the same calculator at the same time? Do we really need more than one emulator on the Pocket PC device at the same time? --- I must confess on my Jornada 565 I have 5 emulators/simulators and on my Axim x50v I have 3 emulators installed.

But I don't agree with you that 256 colors are enough, there are many "real" Emu42 & Emu48 KML bitmaps using high or true color mode. Of course when you limit yourself onto "synthetic" KML scripts using only 16 or 256 colors a 8 bit limited graphic format will be enough.

Regards,

Christoph

Re: Free42 with skins

*Message #18 Posted by **Thomas Okken** on 20 Mar 2005, 1:27 p.m.,*
in response to message #17 by Christoph Giesselink

Thanks for your insights -- I clearly have some reading to do but now I have a better idea where to look!

BTW, I agree that it would be better to support true-color skins; the reason why I decided 256 colors was good enough for now is that all the Emu42 skins that I have look excellent after conversion to 8 bpp... But of course there may well be "rainbow" skins (or "cloudy skies", etc.) that would look really bad in 256 colors. At any rate, nobody has complained *yet*. :-)

- Thomas

Dynamic conversion of various image file formats

*Message #19 Posted by **Cameron Paine** on 18 Mar 2005, 11:31 p.m.,*
in response to message #9 by Mike (Stgt)

Mike (and Christoph),

Micro$oft have an API which might make your job easier. It is only applicable to Wintel platforms. Check out OleLoadPicture() in the docs. If you find the docs too terse, Paul DiLascia wrote a tutorial on its use.

I wrap this function in a class which I use to load both BMP and JPEG skins on my 16C simulation.

This API is apparently emulated by Wine which makes it accessible to linux platforms too. I've been told that my simulation runs under Wine.

Cameron

Improved Keyboard Hp49g+ serial

*Message #1 Posted by **Will** on 2 Mar 2005, 11:31 a.m.*

Dear Friends...Can you tell me the serial number since the keyboard problems were fixed?...i´m going to buy a unit for a friend so i don´t want to make mistakes...

Thanks a lot.....

Re: Improved Keyboard Hp49g+ serial

*Message #2 Posted by **Eric Lundgren** on 2 Mar 2005, 11:14 p.m.,*
in response to message #1 by Will

Hello,

I just (today 3/2/05) received a replacement 49g+ from HP themselves.

My experience is this: 1. Keyboard felt "pre-used" ie kind of loose, not ncsrly bad.

2. Still- no missed keystrokes, until the stack gets about 3 to 4 objects deep..then a 777 becomes 77, etc..

Eric

Re: Improved Keyboard Hp49g+ serial

*Message #3 Posted by **John Smitherman** on 3 Mar 2005, 12:06 a.m.,*
in response to message #1 by Will

Hi Will. I've got a 49G+ with a 428 date code and with the clock display turned off I haven't experienced any problems. Compared to other calculators the keys do require a fair amount of pressure to press.

I hope that this helps and good luck!

John

Re: Improved Keyboard Hp49g+ serial

*Message #4 Posted by **Eric Lundgren** on 3 Mar 2005, 2:05 a.m.,*
in response to message #3 by John Smitherman

John,

Can you tell me how your 49g+ responds to rapid same key entry? Also, have you noticed it is related to the depth of items on the stack?

Eric

Re: Improved Keyboard Hp49g+ serial

*Message #5 Posted by **John Smitherman** on 3 Mar 2005, 6:58 p.m.,*
in response to message #4 by Eric Lundgren

Hi Eric. I'm able to load up the stack and press keys rapidly without loss of input.

By the way, the date code on the 49G+ is not visible through the blister pack however the expiration date on the batteries is visible. At Fry's I looked at all the packages on the shelf to try to find what appeared to the newest batteries and hopefully the newest and best keypad. Maybe my strategy paid off, but only time will tell.

Regards,

John

in response to message #1 by Tizedes Csaba [Hungary]

I wonder if they have a stock and for what price?

your own free humidity calculator!

*Message #3 Posted by **hugh steers** on 2 Mar 2005, 5:32 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

oddly enough, i used the equations of humidity as a test for various calculators. this page details the formulae and some example programs.

this wasnt meant to be a critique of hp vs ti or casio or anything, but the ti got the most marks. it was an experiment. the 71b would have also won if it had a builtin solver (ie the math rom). the test was based on whether my programs worked first time and how easy it was to write them. obviously, this will depend a lot on how familiar i am with various models.

http://www.voidware.com/calcs/quest.htm

note: it is true that some of the hp's involved have interface capabilities that would be extremely valuable in a lab environment and i haven't considered that at all in my criteria.

*Message #3 Posted by **Thomas Okken** on 2 Mar 2005, 9:28 a.m.,*
in response to message #1 by Bob

Turn the calculator off; then press and hold ON, press and release [.], then release ON.

This question sure does come up a lot. Maybe we should have a link to a dot-or-comma FAQ on the main forum page. :-)

UPDATE: Oops, that should have been: turn the calculator off; then press and hold [.], press and release ON, then release [.].
Apologies for the mix-up!

Edited: 2 Mar 2005, 12:26 p.m. after one or more responses were posted

Re: 15C 0,00 ?

*Message #4 Posted by **Bob** on 2 Mar 2005, 11:44 a.m.,*
in response to message #3 by Thomas Okken

Mike- Thanks for nothin' Thomas- Thanks for the response, but that did not seem to work. Any other suggestions ?

Re: 15C 0,00 ?

*Message #5 Posted by **DougT** on 2 Mar 2005, 12:18 p.m.,*
in response to message #4 by Bob

Thomas was close - try:

With the calculator off, press and hold ON, press and hold ".", release ON, THEN release "." This is from the manual, and it just worked for me. This toggles between "." and that funky ",".

Another typical humorous response to this question is, "Your 15C is broken, but I'll be glad to buy it from you for a couple bucks!"

Re: 15C 0,00 ?

*Message #6 Posted by **Bob** on 2 Mar 2005, 12:23 p.m.,*
in response to message #5 by DougT

AWESOME! Thank you DougT!

Re: 15C 0,00 ?

*Message #7 Posted by **Tom Sherman** on 2 Mar 2005, 1:59 p.m.,*
in response to message #6 by Bob

I find it easier to remember the following:

With the calculator off, just press and hold the [.] while turning the calculator on.

There is no need (at least on mine) for the more complicated sequence described by the manual.

Cheers, Tom

"Transparent " display on my 32S

*Message #1 Posted by **Alexandre(Brazil)** on 1 Mar 2005, 9:02 p.m.*

Hi everybody, I have just bought an used HP32S (sn2943B19417) and I can see the LCD descriptions through its display.They are "EPSONLD-B8193A" , "JAPAN" ,"914F" and some spots and marks...besides the contrast of the digits is weak ... I would like to hear from those of you experts if I can fix it.

Thanks

Alexandre (Brazil)

Re: "Transparent " display on my 32S

*Message #2 Posted by **Raymond Del Tondo** on 1 Mar 2005, 10:12 p.m.,*
in response to message #1 by Alexandre(Brazil)

Sounds like the polarisation filter sheet is missing...
or maybe the LCD has bleeded out.
Besides that, I thought the part numbers were printed on the back.
Could you provide pictures?

Raymond

Re: "Transparent " display on my 32S

*Message #3 Posted by **Ed Look** on 1 Mar 2005, 11:56 p.m.,*
in response to message #2 by Raymond Del Tondo

What about trying to control the contrast with ON + or ON - or some such key combination? Perhaps the contrast is just a little too high?

Re: "Transparent " display on my 32S

*Message #4 Posted by **Alexandre** on 2 Mar 2005, 5:13 p.m.,*
in response to message #3 by Ed Look

Hi,I will try to give a better explanation...the descriptions (part number , origin etc) are on the back of the LCD and are mirrored when we look at it and pressing ON + or ON - don´t change the contrast of these descriptions , it works only on the digits.It is like when you pour oil on a written paper...it became transparent... Another point that I would like to clarify is that this 32S shows a "flat" display and I don ´t know if there is a protection between the LCD and the bezel the fact is that there is dust in this area and I would like to know if I can open it and remove this dust. A lot of questions I have ... sorry ... I will try to take a picture. Thanks a lot!!

Alexandre

Re: "Transparent " display on my 32S

*Message #5 Posted by **Ed Look** on 2 Mar 2005, 8:46 p.m.,*
in response to message #4 by Alexandre

I see. You are clear. Unfortunately, so is the back of your LCD screen. Your oil and paper analogy made me think- I hope nothing leaked out or got into your calculator and "wet" the back of the LCD module. But, I am glad it does not affect performance!

Re: "Transparent " display on my 32S

*Message #6 Posted by **Ron** on 7 Mar 2005, 1:58 p.m.,*
in response to message #1 by Alexandre(Brazil)

I came across a 14B like this once. You can see through the display, and through the board, to the printing on the back side of the board. Very uncommon production problem, I think.

in response to message #8 by bill platt

I'd take $38,000 for it! Free overnight shipping!!

Actually, I think I can see her in the background. The price just jumped to $78,000 (shipping is still free). Still a bargain - You can't take your money with you, and who knows how much good a "Mary-in-the-background" calculator might do you in the eternal?!

Re: "Transparent " display on my 32S

*Message #10 Posted by **ned** on 8 Mar 2005, 10:17 a.m.,*
in response to message #1 by Alexandre(Brazil)

I hope the seller made it clear that this problem existed. Unfortunately it seems as though you cannot fix this lcd, and will have to replace it. Probably the marking by Epson was printed or lasered too much into the back. I'm not sure if a 32sii lcd would work, maybe you could find a dead 14b with a good screen. My 32s is s/n 2843A10397, USA made, and has no problem. There is an article on opening pioneers on this website.

Hungry HP42S

*Message #1 Posted by **Marx Pio** on 1 Mar 2005, 6:11 p.m.*

Is it normal? A set of fresh batteries last ondy 2 weeks with normal use?

You masters of capacitors, resistences, diodes and others strange things that are hungry of energy are my only chance of solution of this problem. ;^)

Thanks in advance.

Pio

This is not good...

*Message #2 Posted by **Randy** on 1 Mar 2005, 7:38 p.m.,*
in response to message #1 by Marx Pio

FWIW, a 42S should consume approximately 2 ma with a key down, 300 ua in operation and about 5 to 10 ua in power down.

With daily use, a set of batteries should last several years in a Pioneer. There are two possible explanations for your problem:

1) Internal corrosion causing the high power consumption. 2) A bad processor.

For 1) There is one solution: Clean it.

For 2) There is one solution: The replacement of the logic board due to the construction methods used by HP (tape automated bonding). You can't replace the processor, just get yourself a complete replacement logic board from another 42S. Many times more easily said than done I'm afraid.

Edited: 1 Mar 2005, 7:44 p.m.

Well, _maybe_ not so bad

*Message #3 Posted by **Tony Duell** on 2 Mar 2005, 6:48 a.m.,*
in response to message #2 by Randy

I had a 42S in for repair that flattened batteries overnight, and like you I thought it would be the processor chip. But I (or more exactly) the owner was lucky. There's a 100uF capacitor across the battery (presumably to maintain continous memory when you change the batteries) and it was leaking. Althought it's a surface-mount part, it's not hard to desolder and solder in a new one.

Re: Well, _maybe_ not so bad

*Message #4 Posted by **David Smith** on 3 Mar 2005, 11:52 a.m.,*
in response to message #3 by Tony Duell

Alas, mine had a good cap and a bad processor...

Re: Question for Tony

*Message #5 Posted by **Ron Ross** on 3 Mar 2005, 12:11 p.m.,*
in response to message #3 by Tony Duell

If it is indeed a bad CPU, can the rom chip be moved over to a Hp17Bii to salvage a good ROM onto a lower valued Hp?

Hardware wise they are identical (aside from a timing circuit for a clock).

Re: Question for Tony

*Message #6 Posted by **Randy** on 3 Mar 2005, 1:02 p.m.,*
in response to message #5 by Ron Ross

The ram is external in the 17b/27s/42s, not the rom. Its a masked rom processor chip :(

Re: Question for Tony

*Message #7 Posted by **Tony Duell** on 3 Mar 2005, 2:53 p.m.,*
in response to message #5 by Ron Ross

Alas the ROM and processor are the same IC (which also contains the display and keyboard interfaces). The only other chip in the machine is (standard) RAM chip.

However, there is a way to make the 42S (and therefore, I assume the 17B-II) processor run from external ROM. HP development machines had a socket on the back which held a standard EPROM. From what I remember (and it will take me some time to find out), you tie one pin on the processor chip to one of the power lines to disable the internal ROM, then hang an EPROM off the address and data lines, with one more pin of the processor being the chip-enable line.

HP 32SII

*Message #1 Posted by **Larry** on 1 Mar 2005, 12:00 p.m.*

I have a HP32SII that when on has a small 2 displayed above the Display LEDs. I have cleared all programs from the calculator and this 2 still remains. What is it and how do I get it to go away?

Re: HP 32SII

*Message #2 Posted by **Jeff O.** on 1 Mar 2005, 12:20 p.m.,*
in response to message #1 by Larry

It is an annunciator telling you that Flag 2 is set. Clear by pressing right-shift then the times key, then the LN key (under the "CF" in the display), then "2".

Edited: 1 Mar 2005, 12:26 p.m.

Re: HP 42S keyboard

*Message #3 Posted by **Marx Pio** on 1 Mar 2005, 6:17 p.m.,*
in response to message #2 by Jeff O.

Jeff,

I did the plastic keyboard shape for the HP42S. The only problem is that I did it only with plastic adhesive. It looks like the pda's screen protector.

Can I send you some jpgs of this attempt to your email?

The School of Engineering - University of Auckland BANS HP + Ti calculators

*Message #1 Posted by **Anthony deFen** on 28 Feb 2005, 10:13 p.m.*

Hi,

I am a 3rd year EEE student at the School of Engineering, The University of Auckland, New Zealand. The engineering school has just banned all "fancy" calculators. The most we can use is a casio fx-82... (for those who don't know - a middle school scientific calculator).

This is a link to the offical SoE web-site:

http://www.engineering.auckland.ac.nz/Studentinfo/calculator.htm

This is Political Correctness gone mad... The exams will be made easier so that the same level of pass can be obtained. This effectively dumbs-down the quality of Auckland's Engineering Degree. Aparently since you cannot do complex number calculations on an Fx82... these will not be asked in exams or tests... and probably will not even be taught to us.

If there are any academics or students from other universities in other countries who read this... could you email the Dean of the SoE... and tell him in no uncertain terms what the wider international-academic community think of this...

peter.brothers@auckland.ac.nz

Thank you for your time,

Anthony deFen

Looks like the 15C or such would work!

*Message #2 Posted by **Gene** on 28 Feb 2005, 11:01 p.m.,*
in response to message #1 by Anthony deFen

They just don't want formulae and/or text letters.

The 10C, 11C, 15C would work.

So would the HP9S and HP30S, for that matter.

Gene

Re: Looks like the 15C or such would work!

*Message #3 Posted by **Ed Look** on 1 Mar 2005, 11:29 a.m.,*
in response to message #2 by Gene

This may be stupid wishful thinking, but if HP could "resurrect" an old model, whatever fancy new case or

model number they want to give it, they might appeal to schools or organizations with these concerns.

Namely, I was thinking of the old 25C, 31E, 32E, etc., that have only so many memory registers, the usual complement of scientific functions and not a whit more, and no or very, very limited programming ability.

To those of us who have to use such a machine for work, it won't be nearly enough, but for come schools, such as this gentleman's university, or even middle or junior high or intermediate schools, a calculator with only trig, exponentials, arithmetic operators, inverse, maybe even factorial (gamma function) and continuous memory (I suppose this is a given, these days) will only enhance the learning of basic to advanced mathematics. The only thing it won't really handle would be numerical analysis, and even then, if one has a lot of time...

Not an unreasonable policy, I think...

*Message #4 Posted by **Karl Schneider** on 1 Mar 2005, 12:15 a.m.,*
in response to message #1 by Anthony deFen

Anthony deFen posted,

I can't agree about "Political Correctness gone mad", but I certainly hope that the calculator restrictions would not affect the curriculum.

It's unfortunate that this standard prohibits the 33S/32SII/32S, but the UoA's approach seems to me much more fair and exacting than the one taken by the NCEES organization. Note that UoA prohibited calculators with the full alphabet available (to target true alphanumeric models, as opposed to those having just a few letters -- e.g, HP-11C, HP-15C, Casio fx-115MS). Also note that that students are given the opportunity to get compliant unfamiliar models approved beforehand. Even if "caught" using such a model, the student's calculator is checked afterwards for compliance (after temporary confiscation!).

By contrast, NCEES simply published a short list of acceptable models, which excludes all discontinued models. NCEES prohibits "text-editing capability", rather than alphanumeric capability, without really defining that.

I'll take Gene's point a bit further, though -- the HP-15C might be the only truly-comprehensive calculator that meets UoA's requirements! I used the 15C through three degree programs and the USA's EIT/FE standard exam for engineers, and wish that I'd be able to use it for the Progessional Engineer exam.

Re: The School of Engineering - University of Auckland BANS HP + Ti calculators

*Message #5 Posted by **Jeff O.** on 1 Mar 2005, 7:40 a.m.,*
in response to message #1 by Anthony deFen

It is not political correctness gone mad, it is paranoia about cheating taken to extreme, just like the NCEES calculator ban. The policy does seem to be a little more flexible than the NCEES ban which has the approved

list and that's it, no questions asked. If you showed them the primitive text abilities that the 33S has with the alphabet on the keyboard, perhaps they would approve it. The NCEES doesn't seem to have a problem with the alpha capabilities of the 33S. If they won't approve it and you want an RPN calculator for a reasonable price, pick up an HP-45. You can add and subtract complex numbers in rectangular form using the Sigma+ and Sigma- keys, and it does rectangular to polar conversions.

Re: The School of Engineering - University of Auckland BANS HP + Ti calculators

*Message #6 Posted by **will** on 1 Mar 2005, 11:11 a.m.,*
in response to message #5 by Jeff O.

Simply it´s a stupid politics...i can understand the NCEES idea but in the university it semms to be something stupid...the fx82 is a VERY old model....in the real world even the most powerful calculator have limited utility (PC applications are by FAR better, powerful and faster)...the idea must be use a powerful tool knowing all the subject...one thing do not discard the other one...

If I may... (was: The School of Engineering - University of Auckland BANS HP + Ti calculators)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 1 Mar 2005, 12:16 p.m.,*
in response to message #1 by Anthony deFen

Hi, all;

It is too sad that this sort of things have gone too far. I cannot help quoting:

> Quote:
>
> It is not political correctness gone mad, it is paranoia about cheating taken to extreme(…)

Thanks, Jeff O., yours is a good thinking as I see.

If the educational institutes are aware of what is actually going on inside their classrooms, it is not necessary to take measures against a problem that is easily handled before examinations. I know, I know, it is almost impossible to keep track of each student's activities, but allowing teachers to act at the very moment they're aware of such problems would significantly reduce students 'need' for cheating. When I mention students 'need' for cheating I mean the way some students find to get rid of a low final grade. Well, why not to interfere in this process and somehow 'recover' these students so they can face examination without worrying about it too much? At the very first class, I tell my students that if they come and pay attention to classes, participate, express their doubts and ask for answers, then examinations and their grades are the smallest of their problems. Otherwise I know they will be in trouble and try to cheat. All I ask them is to think of their future: when will cheating define them as good professionals?

Give students real-word responsibilities and you are actually growing pro-active professionals. Hence, using or not using calculators will be no issue in the classroom nor in the examination.

At least this is what I believe on. And I know some of the contributors in this forum do not actually agree with much of what I wrote here. I understand their point of view and I respect them all, believe me.

Cheers.

Luiz (Brazil)

P.S. – Anthony, I'm an Electrical Engineer and I teach at a Brazilian university. I also earn a post –graduation

in Pedagogy and I believe guys like Seymour Papert and Paulo Freire have not waste their time trying to enhance education. If you believe I can make any difference, ask the guys in your university to read this post and, if applicable, contact me: lcvieira at quantica dot com dot br

Re: The School of Engineering - University of Auckland BANS HP + Ti calculators

*Message #8 Posted by **Jonathan Purvis (New Zealand)** on 1 Mar 2005, 2:24 p.m.,*
in response to message #1 by Anthony deFen

Are they even banning the Casio FX-100? That does complex, doesn't it? I'm sure they're just suggesting the FX-82 as that's what everyone has in high school.

I don't think this is a problem though. I was there for the 1st Professional Year in 1995 (before i switched to CompSci) and we had pretty much the same restrictions. We weren't even allowed any calculators in the Engineering Maths exam. Aside from not having to calcuate sines of arbitary numbers, the exam wasn't dumbed down at all. Sometimes calculators just slow you down.

That was the same year i got introduced to the wonderful HP-48G. I never expected it would be allowed in exams.

HP solver has some bugs

*Message #1 Posted by **will** on 28 Feb 2005, 12:41 p.m.*

try to find a root for 25*x-5*ln(x)=0 using the hp49g solver...

Re: HP solver has some bugs

*Message #2 Posted by **Mike (Stgt)** on 28 Feb 2005, 2:12 p.m.,*
in response to message #1 by will

Plot it from x=0 to .5 and tell us what you expect.

Ciao.....Mike

Re: HP solver has some bugs

*Message #3 Posted by **Gene** on 28 Feb 2005, 2:40 p.m.,*
in response to message #2 by Mike (Stgt)

Well, it shouldn't return 0.2 something. :-)

Gene

Your example does not suggest a problem...

*Message #4 Posted by **Karl Schneider** on 1 Mar 2005, 12:41 a.m.,*
in response to message #1 by will

"will" --

My 33S also can't find a real root to your equation. I suspect that neither can my 15C, 28C, 32SII, 34C, 41C*/Advantage, 42S, 48G or 49G.

Mike and Gene might be coy, but I think you really meant,

```
25*x+5*ln(x)=0, for which x = 0.26534
```

-- KS

Edited: 1 Mar 2005, 12:42 a.m.

Re: Your example does not suggest a problem...

*Message #5 Posted by **Axel** on 1 Mar 2005, 9:26 a.m.,*
in response to message #4 by Karl Schneider

y=25*x-5*ln(x) has no real solution, whereas y=25*x+5*ln(x) can be solved by HP Solver (tried on 32sii and 40g, solution is 0.2653449...)

Regards, Axel

World's all solver has a bug - or not???

*Message #6 Posted by **Tizedes Csaba [Hungary]** on 1 Mar 2005, 3:02 a.m.,*
in response to message #1 by will

My favourite, I posted it below, but NOBODY can tell me, what is the problem in the symbolic solvers!!! Heyhooo Mathematica, Maple, etc programmers!!!! Here is the little problem, what can solve an 10 yrs student, but your 10 yrs old symbolic progs CANT!!!!!

Here it is:

```
        1           1
3*x + ----- = 15 + -----
      (x-5)       (x-5)

And the solution is that: "No solution!"

All of softvares gives x=5 that is not root!!!
```

Feed your head!

Csaba

you are right and you are not

*Message #7 Posted by **Mike (Stgt)** on 1 Mar 2005, 4:23 a.m.,*
in response to message #6 by Tizedes Csaba [Hungary]

True, your function at x=5 is _not_ defined. But (!) the root is a "hebbare Lücke" (sorry, I know only the German word; about "repealable or liftable gap") as the values of the function and its derivative at x=5-0 and x=5+0 are the same. But I am quite sure that no CAS cares about adjacence of gaps in a function.

Ciao.....Mike

Re: World's all solver has a bug - or not???

*Message #8 Posted by **will** on 1 Mar 2005, 10:51 a.m.,*
in response to message #6 by Tizedes Csaba [Hungary]

Interesting posts...the bug is that the HP solver shows a false answer around 0.2 something which is not a root...in fact there is not real answer...

about the problem that csba told us is quite important avoid divide by 0.

Re: HP solver has some bugs

*Message #9 Posted by **Cyrille de Brébisson** on 1 Mar 2005, 1:50 p.m.,*
in response to message #1 by will

Hello,

Actually, the solver works perfectly well. the problem is the user interface which returns 0.2 (and some change) but without displaying the appropriate error/information message: "Extremum"

If you try the "OLD" version of the equation solver UI: hold red shift, 7, ROOT '25*X-5*LN(X)' ENTER green shift EQ, SOLVR green shift X, you will get 0.2 and change and the message Extremum saying that the solver found an extremum, but not a solution

Cyrille

Actually...

*Message #10 Posted by **John** on 1 Mar 2005, 7:21 p.m.,*
in response to message #9 by Cyrille de Brébisson

All one has to do on the new solver is press the menu label "INFO" and it will indicate that the 0.2 was found as an Extremum.

This is ALWAYS a good idea and is proper use of the solver. One should never! accept a numerical result from a solver without knowing this type of additional information.

Always press INFO to find out how the result was obtained!

Gene

which version/revision?

*Message #11 Posted by **Mike (Stgt)** on 2 Mar 2005, 9:17 a.m.,*
in response to message #9 by Cyrille de Brébisson

Aha! HP listens to the grapevine -- Bon jour CdB! :)

Could you pls tell us on which ROM version the "old" UI is available? I tried (i) Version HP49-C, Revision #1.18 (no difference between red-shift 7 and hold-red-shift 7), (ii) Version HP49-B, Revision #1.19-6 (same as i), and (iii) Version HP49-C, Revision #1.24 but there I was not able to reproduce your example. Suppose you are on a HP-49G+plus.

BTW, sorry if I ask for info that is described elswhere and I did not find it: what is the meaning of version letters on the HP49G? It seems not to correspond with the revision numbers. B=Beta and C=produCtion?

TIA.....Mike

Edited: 2 Mar 2005, 9:18 a.m.

Re: HP solver has some bugs

*Message #12 Posted by **Bernardo Vargas** on 2 Mar 2005, 5:59 a.m.,*
in response to message #1 by will

The problem is that SOLVE starts with the value x=0, and then returns immediately an error message because of the impossibility of ln(0). In this case the SOLVE program on the MATH-1 module for the HP41 works better, since it asks first for two GUESSES for the solution. This way you can avoid the ln(0) by entering 0.1 or something like that. Then the program runs for some seconds and gives the answer ROOT IS 0.265344933.

The manual of the HP32SII has an interesting appendix telling how SOLVE works, and explains some of its limitations.

And let me remind you that EVERY numerical algorithm has its limitations. So is mathematics, sorry.

lowercase subscript HP 49G

*Message #1 Posted by **Mike** on 28 Feb 2005, 11:40 a.m.*

does anyone know how to enter the correct keystrokes for lowercase subscript for letters and numbers ??

Re: lowercase subscript HP 49G

*Message #2 Posted by **Cyrille de Brébisson** on 1 Mar 2005, 2:04 p.m.,*
in response to message #1 by Mike

Hello,

if by subscript you mean letter displayed slightly bellow the normal letters, you can not directly enter them in the HP49G+ as they are not such letter in the calculator character set and the calculator does not support subscript.

HOWEVER, all is not lost! because the calculator support multi font! so what you can do is extract the current system font (FONT-> command), use a program such as fontman (http://www.hpcalc.org/details.php?id=5452) to edit the font (change the name/id and move all the character down by 1 pixcel) to create a subscript font.

then, store the font in one of the ports, and when you want a subscript character, while editing, press on tool next, next, style, font and choose the font that you want!

regards, cyrille

Re: lowercase subscript HP 49G

*Message #3 Posted by **Ed Look** on 1 Mar 2005, 11:59 p.m.,*
in response to message #2 by Cyrille de Brébisson

Very nice idea, Cyrille, but it does sound like using Microsoft Word, or even WordStar!

HP48 and the Nikon F5 camera

*Message #1 Posted by **Chan Tran (USA)** on 28 Feb 2005, 8:17 a.m.*

I am just wondering if anyone has use a 48 (any version) to communicate with the Nikon F5 camera via its serial port? I am pretty sure that this is possible but I don't know the protocol or command set of the camera. I think I am pushing my luck but well you never know. Any info would be greatly appreciated.

Re: HP48 and the Nikon F5 camera

*Message #2 Posted by **Etienne** on 28 Feb 2005, 9:10 a.m.,*
in response to message #1 by Chan Tran (USA)

Hi, Although I never tried such a communication myself, Some time ago I went through some details about the hardware and software protocol. Can't remember where is was, though :-(

Here's something to start with: (I'll post if I happen to find it again)

http://www.cocoon-creations.com/COCOON-NiCommSoftTALK-Download.shtml

(get especially a look at the ELECSPEC document)

Some info might be available on www.nikonlinks.com too, under the "F5" and "F90x" pages.

Good luck and keep us informed about this project ! :-)

HP 16C serial number

*Message #1 Posted by **Denis** on 28 Feb 2005, 3:33 a.m.*

Hi all. I plan to buy an hp 16C. Is there any special consideration to know about this model ? I think especialy about serial number of these machine because many buyers ask always about serial number, and I don't understand why... ?

Thanks in advance.

Re: HP 16C serial number

*Message #2 Posted by **Karl Schneider** on 28 Feb 2005, 5:08 a.m.,*
in response to message #1 by Denis

Denis --

I assume that you've gone through the material on this website regarding the 16C. You probably shouldn't be concerneed too much about serial #, since all 16C's were made in the USA to high quality specifications. There are no significant variances in functionality or appearance of the 16C through 1982-89, although there were some internal design changes (as documented on the site).

Prices seem to be down lately. Do try to get a nice-looking one with manual, because the manuals are hard to get and expensive (US$30 for staple-bound; more for spiral-bound).

The 16C is a special-purpose scientific calculator that lacks most standard mathematical functions (it has only arithmetic, sqrt, and 1/x). It's also a little slow to enter integers. But, it is uniquely capable for computer science tasks.

> Quote:
>
> ...many buyers ask always about serial number, and I don't understand why...

Buyers ask about the serial number because it tells you where and when the calculator was made. As Karl S. noted, with this particular model there are no worries about quality differences based on where it was made. For some models, this is an issue, and it is always nice to know how old the unit is.

Help with Searching all Archives

*Message #1 Posted by **Peter** on 27 Feb 2005, 9:58 p.m.*

Hi,

Appologies upfront if what I did was not needed in the first place at it can be done easily here directly already...

However, the only method to search all archives for certain keywords that I found was to go archive by archive, which given that there are 13 already was a bit timeconsuming.

So I downloaded all thread-titles into excel and wrote a little macro that searches all the thread-titles in all archives and puts those that contain a certain word into neat colums with links directly to them here on the web.

It is useful for me to e.g. find all articles about the hp-41 or that have "repair" in their title.

If it would be of interest to anyone else, I'd ne happy to mail the xls (as I'm not sure if and how it could be posted directly...)

Again, not sure if that would be of use to anyone and if so, it will definitely not get any points for elegance, beauty, smart coding or anything the like...

(also, please let me know if I'd be doing anything wrong, e.g. downloading the forum-thread titles is not okay, etc)

Cheers

Peter

HP10C 'Bug' ..?

*Message #1 Posted by **Mike T.** on 27 Feb 2005, 7:10 p.m.*

I've just spent a few minutes trying to figure out why a simple PRANG wasn't working on my HP10C. (I needed a set of 'random' values). Usually I would enter the whole program as follows:

```
01-     48 ' .
02-      5 ' 5
03-      2 ' 2
04-      8 ' 8
05-      4 ' 4
06-      1 ' 1
07-      6 ' 6
08-      3 ' 3
09-     31 ' R/S
10-      9 ' 9
11-      9 ' 9
12-      7 ' 7
13-     20 ' *
14-  42 35 ' f FRAC
15-  22 09 ' GTO 09
```

(To get a more random set I usually substitute R/S with ENTER and run the program for a while first...)

To save time on this occasion I just entered the 'seed' value by hand and used the following code instead:

```
01-      9 ' 9
02-      9 ' 9
03-      7 ' 7
04-     20 ' *
05-  42 35 ' f FRAC
06-  22 00 ' GTO 00
```

I keyed in the program, switched to RUN, pressed f Clear PRGM + f Clear REG to reset everything, entered my seed, and pressed SST to single step the code to make sure every thing worked ... was surprised to find that the digits '997' were appended to the seed value already in X which is not what I expected - the first SST had not enabled stack lift!

I compared this behaviour with that of my HP34C and found that the HP34C did enable stack lift as expected...

I'm not sure if this is a bug but it didn't look right to me. Anyway I thought it might interest someone here - incidentally does anyone know how an HP33E/C behaves in the same situation? (Mine broke 12+ years ago so I can't check but I think it behaved the same way as the HP34C).

Mike T.

Re: HP10C 'Bug' ..?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 27 Feb 2005, 8:15 p.m.,*
in response to message #1 by Mike T.

Hi, Mike;

the owner's manual for all Voyagers state that [SST] is a neutral operation, and it does not actually terminate digit entry IF the program step executed with [SST] has a digit-entry key code ([o] to [9], [.], [EEX] and [CHS]). If you press [R/S] to start running a program, [R/S] itself terminates digit entry, while [SST] does not.

I have the HP10C Owner's Handbook, July 1982, Rev. B. The neutral operations are listed at page 101.

It is not a bug...

Cheers.

Luiz (Brazil)

Re: HP10C 'Bug' ..?

*Message #3 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Feb 2005, 6:53 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I think (non verified) that this behaviour changed when the "backspace" key appeared in the HP 41C and from then on. As the Voyagers and Pioneers have a "backspace" key, I would not expect them to behave as Classics, Woodstocks or Spices with regard to digit entry termination.

Re: HP10C 'Bug' ..?

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 28 Feb 2005, 8:49 a.m.,*
in response to message #3 by Andrés C. Rodríguez (Argentina)

Hola, Andrés; como estás?

Have you ever observed the HP25/25C? If I am not wrong, it works the same. All of the program examples for the HP25 that expect a number entry immediately followed by another number already stored in the program have an initial ENTER. It took me some time to verify that that ENTER was necessary for a Single STep execution and had no effect for a straight execution with [R/S].

I guess that the fact of newer calculators (HP41, 42, 32S and ahead) use a single step to store a whole number in programs instead of a discrete sequence of keystrokes is the key difference. All Voyagers kept the discrete number entry in programs.

Cheers.

Luiz (Brazil)

Re: HP10C 'Bug' ..?

*Message #5 Posted by **Mike T.** on 28 Feb 2005, 3:58 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

What I found interesting was that **earlier** models, HP34C (and HP11C) did behave as I expected, it was just the HP10C that was different - all the more intriguing as wording used to describe the neutrality of the SST operation is identical in all three calculators manuals!

Does any one know how the HP33C/E behaves under the same conditions - I don't remember it being 'odd' but is was a long time since mine worked...

Mike T.

Re: HP10C 'Bug' ..?

*Message #6 Posted by **Thomas Okken** on 28 Feb 2005, 8:52 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Have you ever observed the HP25/25C? If I am not wrong, it works the same. All of the program examples for the HP25 that expect a number entry immediately followed by another number already stored in the program have an initial ENTER. It took me some time to verify that that ENTER was necessary for a Single STep execution and had no effect for a straight execution with [R/S].

R/S behaves no differently than SST on the HP-25: if a program starts with a number, and you enter a number and then press R/S, the number in the program gets appended to what you just entered.
IIRC, the big change came with the HP-41C, which treats a number as a single program line. I don't think it has anything to do with the backspace key -- but I'm sure someone will prove me wrong. :-)

- Thomas

Re: HP10C 'Bug' ..?

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 1 Mar 2005, 6:49 a.m.,*
in response to message #6 by Thomas Okken

I don't think it has to do with the "backspace" (<-) key by itself [I mean the arrow key used to correct digit entry mistakes, not the "backstep" (BST) function], but I think that HP had to redesign the digit entry code to allow for the (<-) to work; and that may relate to such behavior differences between models. IIRC, there was a "digit entry flag". I understand that things may be different at a program run beginning, so my ideas may prove wrong indeed.

Re: HP10C 'Bug' ..?

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 1 Mar 2005, 2:21 p.m.,*
in response to message #7 by Andrés C. Rodríguez (Argentina)

Hi Andrés, all;

I checked my HP55 and digit entry works the same for [SST]. If you are entering a number and there's a program positioned in a step with any digit-entry code ([0] to [9], [.], [EEX] or [CHS]) and this step is executed through [SST], the resulting action is added to the number in the display, either new digits or change signal or enter exponent. And the HP55 has no backspace feature.

I understand what you mean about redesigning digit entry to allow backspace, because prior to the HP41 there was only [CLx] available. I agree with Vassilis, I also think that the main reason is the need to not to finish digit entry through program steps while pressing [SST] in calculators where whole numbers must be "spread" through program steps. The HP41, HP42S, HP32SII and HP33S (others?) store one number in one single program step, as Vassilis mentions, so digit entry is resumed after that step is executed, and there's no way to add extra digits.

Just to add that.

Cheers.

Luzi (Brazil)

Re: HP10C 'Bug' ..?

*Message #9 Posted by **Vassilis Prevelakis** on 1 Mar 2005, 11:09 a.m.,*
in response to message #1 by Mike T.

If I understand it correctly you imply that SST should enable stack lift?

SST does not enable stack lift on ALL models that have unmerged numbers in programs. This is because SST does not (cannot) know if you are in the middle of a number sequence.

Look at the program in your posting. Assuming that you entered the seed followed by ENTER and pressed SST on line 000, you get 9 on the display. Then you press SST again.

What do you expect to happen? If the calculator enables stack lift when you press SST then you will never be able to single step through a program with numbers in it.

However, since SST does NOT enable stack lift, you get 99 on the diplay.

On the HP-41 and models that have merged numeric instructions, the entire number is on a single instruction, so having two numbers on subsequent instructions implies an ENTER between them. This is why the behavior of SST on the HP-41 is slighlty different.

Regarding the behavior of R/S I am not sure which behavior is better, although enabling stack lift appears to be the usual behavior (HP-67/97, HP-34C, HP-19C).

**vp

Re: HP10C 'Bug' ..?

*Message #10 Posted by **Mike T.** on 1 Mar 2005, 3:38 p.m.,*
in response to message #9 by Vassilis Prevelakis

It seemed intuitive to me that the **first** time I pressed SST the stack should lift and when on the HP10C it didn't I wondered why.

What I find very interesting is that the general consensus seems to be that the HP10C is behaves perfectly normally which still leaves me wondering why the HP11C and HP34C behave differently as on these models the **first** SST (and only the first SST) **does** enable stack lift - obviously subsequent SSTs do not.

Re: HP10C 'Bug' ..?

*Message #11 Posted by **Vassilis Prevelakis** on 1 Mar 2005, 9:28 p.m.,*
in response to message #10 by Mike T.

```
Mike T. wrote:
> ... the HP11C and HP34C behave differently as on these

> stack lift
```

not on my HP-34C

I do not have an HP-11C to test though

**vp

Re: HP10C 'Bug' ..?

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 2 Mar 2005, 1:47 a.m.,*
in response to message #10 by Mike T.

Hi, Mike;

> Quote:
>
> the **first** SST (and only the first SST) **does** enable stack lift

Yeap! This is a fact **when program memory is positioned on step 000**. Otherwise, if you press [SST] in the HP11C (or HP34C) while you are entering a number **and** current program step is not 000 **and** it contains a number-entry code, this 'action' is added to the number in the display. I tested it in my HP11C right now.

Cheers.

Re: HP10C 'Bug' ..?

*Message #13 Posted by **Mike T.** on 2 Mar 2005, 4:51 a.m.,*
in response to message #12 by Vieira, Luiz C. (Brazil)

I can confirm that the same thing happens on my HP34C (SN:2126S32231), after trying the following tests -

[f] [Clear PRGM] .05284163 **[SST]** displays 9 (as I expected)

[f] [Clear PRGM] [GTO .001] .05284163 **[SST]** displays .052841639

Repeating these tests on my HP10C (SN:2235A07777) displays .052841639 in both cases, which is what started this whole thread in the first place - neither have backspace but as the HP10C came out last in the voyager series I wonder if something was lost, possibly deliberately, when the digit entry code was reworked to remove the code to handle backspace from the HP10Cs firmware, and if so was it ever changed...?

Hopefully I will be able to check how this works on an HP12C some time in the next couple of weeks.

PS. Luiz - Thanks for spotting the obvious for me, I've tried e-mailing you a couple of times but without success - I've almost finished something that might interest you.

Mike T.

Re: HP10C 'Bug' ..?

*Message #14 Posted by **Vassilis Prevelakis** on 2 Mar 2005, 9:30 a.m.,*

in response to message #13 by Mike T.

Oops, I have a program already in my 34C (I actually do use it from time to time after all :-) so I just SSTed down till I found some numeric sequence and did my tests there.

It didn't occur to me that a number placed in location 000 would (or event that it should) behave differently.

My trusted HP-97 does not have this behaviour, i.e. RTN 123 SST SST will produce 12345 (with 001 4 and 002 5). On the other hand 123 RTN R/S produces 45. Different behavior but predictable.

Is the HP34C's behaviour documented ANYWHERE? If it is then its a feature, if not, its a bug.

**vp

Re: HP10C 'Bug' ..?

*Message #15 Posted by **Thomas Okken** on 2 Mar 2005, 9:42 a.m.,*
in response to message #14 by Vassilis Prevelakis

On the other hand 123 RTN R/S produces 45.

Did you mean to write RTN 123 R/S? Because the way you wrote it, it couldn't possibly return 12345 (I'm pretty sure RTN terminates number entry).

I should try this on my HP-67... Time to finally hook up some batteries (I bought that thing on eBay months ago but have been too busy to even try it yet!)

Re: HP10C 'Bug' ..?

*Message #16 Posted by **Vassilis Prevelakis** on 2 Mar 2005, 9:50 p.m.,*
in response to message #15 by Thomas Okken

```
Thomas Okken wrote:
> Did you mean to write RTN 123 R/S?
```

yes, I do not know what I was thinking. The result though is the same in both cases (i.e. both R/S and RTN terminate number entry).

Re: HP10C 'Bug' ..?

*Message #17 Posted by **Vassilis Prevelakis** on 2 Mar 2005, 9:42 a.m.,*
in response to message #13 by Mike T.

More tests

The behavior Mike wrote about (i.e. SST at line 000 causes stack lift) works only on my HP-34C

On my HP-33C and my HP-38C SST at line 000 does not cause stack lift. Strange!

For the record, my HP-67/97 and my HP-19C also behave like the HP-33C

I guess somebody thought it was a good idea at around the 34C timeframe and added this

"feature". Strange though that the HP-38C (which also came out at the same time as the 34C does not have the same "feature").

**vp

Re: HP10C 'Bug' ..?

*Message #18 Posted by **Thomas Okken** on 2 Mar 2005, 9:45 a.m.,*
in response to message #17 by Vassilis Prevelakis

The 38C came out at the same time as the 34C, but I don't think they changed the firmware from the 38E -- just added continuous memory.

Re: HP10C 'Bug' ..?

*Message #19 Posted by **Mike T.** on 3 Mar 2005, 9:23 a.m.,*
in response to message #17 by Vassilis Prevelakis

Vassilis,

Thanks for trying this out on the HP33C, I didn't remember noticing this before but it has been a long long time since I used an HP33C or HP97 (like 18 years too long!).

Are you able to repeat this test on an HP11C? The results I got indicated that the HP11C behaved that in the same way as the HP34C.

Mike T.

Re: HP10C 'Bug' ..?

*Message #20 Posted by **Mike T.** on 8 Mar 2005, 4:47 p.m.,*
in response to message #19 by Mike T.

I now have an HP12C (SN#3451S04459), and the first thing I I tried were the tests I described above...

I obtained the same results as with my HP10C - so I rather think that the correct subject title for this thread should have been as Vassilis suggested 'HP34C feature!'.

It is strange how quickly we accept the familiar as normal behaviour. Despite the fact that the HP34C behaves differently the HP33C, after getting used to the HP34C I found it difficult to believe that my HP33C had ever been any different.

Mike T.

PS. Luiz - Did you get my email.?

my email provider...

I'm fairly sure that this one from the "New Old Stock" that was found in Great Britain several years ago. One of the sellers offered me one for about $70, but I responded with a question to ascertain exactly what was being offered (seemed too good to be true!). Apparently, the seller had a bunch of these, and didn't quite realize the value of them.

In the meantime, the auction price had shot up to > $300 for these units, and I didn't have enough chutzpah to accept the original offer.

Yes, for sure there are some, at least I know one <G>. I collect just for fun, not with the hope that I may have a revenue (revenge? <G>) in the end. As a result my collection is still _not_ complete and will never be (I do *not* hount for HP01 and alikes).

Ciao.....Mike

Well put Mike, of course I was provoking with my initial comment - I too won't part with hundreds of bucks (that I don't have) just for the sake of completing a collection of items.

Best,ÁM

Re: the other kind

*Message #12 Posted by **Mike (Stgt)** on 1 Mar 2005, 9:20 a.m.,*
in response to message #11 by Ángel Martin

My interest even shiftet from HW to emulators, because a) I'd like to still find a way to bed between all HP-boxes, cartons, and calculator manuals and b) today a 995,- EUR laptop is sufficient even to emulate an IBM mainframe (whatercooled - hence "Big Blue"). So a good emulator is like an idea preserved in a seed for future use. Nothing is real, matter is just perchance a special feature of room, knowledge is virtual, philosophy is only an other model, and faked is realy it. Now what could I do better than give an old HP to my children, even if they use it as door stop.

No-no, not true, just kiddin... I keep my collection, but now and then I ask myself: for what?!

Ciao.....Mike

New Trigonometric Functions Program for the HP-12C

*Message #1 Posted by **GWB** on 27 Feb 2005, 7:46 a.m.*

Hi,

I have submitted an article to the Articles Forum (Hyperbolic Approximations for Trigonometric Functions on the HP-12C). The 99-step program uses only the stack, leaving the financial registers and all the seven remaining registers free for the user. The average percent error is 0.05% never being greater than 0.10% all through the valid ranges, which is enough for practical purposes. Running times are about 4 to 5.5 seconds, depending on the function only, not on the arguments. All inputs and outputs are in degrees.

For more details, those of you still interested please take a look at:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=470

Regards,

Gerson W. Barbosa

in response to message #1 by GWB

woot! the code makes good reading. i like the atan and the evalualtion cascade particularly without memories. pity about the ln(x).

i think there are a couple of silly mistakes tho' in your article. some of the expressions are missing a bracket and the arcos expression is missing the arctan. and should the 90- be a 90+ ?

good stuff. i just had to key it in!

Re: New Trigonometric Functions Program for the HP-12C

*Message #3 Posted by **GWB** on 27 Feb 2005, 3:38 p.m.,*
in response to message #2 by hugh steers

Thank you for having pointed me out the mistakes. I have corrected the expressions and double-checked them.

Hugh Steers wrote:

> Quote:
>
> pity about the ln(x).

I didn't like the ln(x) either, but this is the only way I found to recover x from the stack at that point. LN is a time consuming function I wanted to avoid. This causes the result to come out 500 to 600 ms later than it could, and this is a lot of time. That is, this instruction alone is responsible for about 10% of the total running time.

Hugh Steer wrote:

> Quote:
>
> i think there are a couple of silly mistakes tho' in your article. some of the expressions are missing a bracket and the arcos expression is missing the arctan. and should the 90- be a 90+ ?

Actually there were more than a couple of silly mistakes (Having finished writing the article at 3:00 am last Friday might be an excuse). You are right: the 90- should be a 90+. Thanks again.

All expressions may be copied and pasted to an equation plotter to graphically check the accuracy. Examples:

```
a)

Eq. 1: y=cos(pi*x/180)
Eq. 2: y=(4-(exp(x/68.3393)+1/(exp(x/68.3393))))/(2exp(x^2/21813))
x range: -550, 550
y range: -2, 2

b)

Eq. 1: y=(180/pi)atan(x);
Eq. 2: y=1844.6((exp(x)-1/exp(x))/(exp(x)+1/exp(x)))/(32.2-(abs(x))^3)
Eq. 3: y=90+1844.6((exp(-1/x)-1/exp(-1/x))/(exp(-1/x)+1/exp(-1/x)))/(32.2-(abs(-1/x))^3)
x range: -1, 10
y range: -10, 100
```

Regards,

Gerson

*Message #4 Posted by **hugh steers** on 28 Feb 2005, 5:57 a.m.,*
in response to message #3 by GWB

great.

what i liked about your approach is that i'd never thought of approximating trigs with hyperbolics before. this is a good idea when you need to reduce the number of constants in the program (as these take up too many steps).

HP-67 stuck card reader motor

*Message #1 Posted by **Allan** on 27 Feb 2005, 3:56 a.m.*

What can be the problem with a stuck card reader motor. it does not stop running. the only way to stop it is by removing the baterry pack. never had a problem before. All keys work and calculations are OK even when motor is running. The slide switch does not stop it either. i tried slamming, slapping, and bangging...motor doesn't not quit...HELP

Re: HP-67 stuck card reader motor

*Message #2 Posted by **Tony Duell** on 27 Feb 2005, 8:12 a.m.,*
in response to message #1 by Allan

Either you've got a short somewhere on the card reader PCB, or your sense amplifier chip (the one on the card reader PCB) has failed. I think you can take that chip from a 67, 97 or 82104 (HP41 card reader). The one in the HP65 is slightly different, but should work, I think.

Re: HP-67 stuck card reader motor

Datafile V24N1

*Message #1 Posted by **Bruce Horrocks** on 26 Feb 2005, 4:16 p.m.*

Dear All,

This is to announce that the January/February issue of Datafile is out and should now have been received by all members. I'd like to remind you that this is the last issue you will receive if you do not renew. You can renew by post using the form that was included or by completing the on-line form at http://www.hpcc.org/membership/ and posting, faxing or emailing it. The detail are all on the web-page.

New members are always welcome and should use the same form. If you are wondering what you are missing then here are some highlights:

- Joe Horn's "PDQ Unleashed"
- "Rationalize[x,dx]" from Tony Hutchins which does a pretty good job of matching PDQ but on the HP-12C
- the "HHC 2004 Contest Revisited" in which Roger Hill summarises and explains the contest entries and improves upon the winner. These programs were written by some of the best RPL coders so the tricks revealed are invaluable.
- Valentin Albillo provides part one of a "Baker's Dozen" set of tips for getting the most from the HP-71B Math rom.
- Lastly Tony Hutchins revisits a nearly 20-year old problem that takes just 12 lines on an HP-41C but needs 17 commands to do on the stack in RPL.

Coming up in future issues are:

- Part 2 of "Baker's Dozen" - more 71B Math ROM tricks
- An improved Black Scholes Solver Equation for the 17BII/19B/19BII that is 20% smaller than the one published on the HP web site, and 3000 times more accurate. Inspired by the work of Hoene Wronski.
- And perhaps the most amazing 8 line 71B Math ROM program that you have ever seen.

Regards,

Bruce Horrocks
Datafile Editor

Still Keyboard problem with HP49G+?

*Message #1 Posted by **Broesen** on 26 Feb 2005, 4:14 p.m.*

I have bought a HP49G+ which have a problem with the keyboard (sometimes it dosn't record an input). I can see that several user have the same problem. How have HP solved that? (by exchange or repair?) Where is the old HP quality (ex HP32SII and early models)that maded the HP calculator to state of the art?

Peter

Re: Still Keyboard problem with HP49G+?

*Message #2 Posted by **John Smitherman** on 26 Feb 2005, 8:26 p.m.,*
in response to message #1 by Broesen

Hi Peter. What is the date code associated with the serial number on your 49G+? Mine has 428 and I don't have keypad problems. Also, I've got the clock turned off on the display.

Good luck and happy computing!

John

Re: Still Keyboard problem with HP49G+?

*Message #3 Posted by **Eric Lundgren** on 26 Feb 2005, 9:11 p.m.,*
in response to message #2 by John Smitherman

I have experienced the same problem with the 49g+. John is right, turn off the FLAG that displays the clock.

Also, I found that when there are more than 3 objects on the stack, I still get missed keystrokes. So, if you must use the machine, consider clearing the stack often (or write a routine to do it auto?)

Anyway, it does not appear to be a mechanical issue.

I have called hp calc tech sppt (1800hpinvent) and after some verbal diagnostics, I was told that a replacement would be shipped out. I'm currently waiting for it.

However, since I'm taking the FE exam this October, I will probably continue using only the 33s to get fluent on it.

Good luck, Eric

Re: Still Keyboard problem with HP49G+?

*Message #4 Posted by **Broesen** on 27 Feb 2005, 12:36 p.m.,*
in response to message #3 by Eric Lundgren

Hi Erik.

After I posted my mail yesterday I went to HP Homepage. There was an article about the problem. The solution should be to change the keystroke time. Have you tried that?. There was also and software upgrade. Tomorrow at work I will tried both solutions.

Peter

HP 33s programming

*Message #1 Posted by **Alexander Thorp** on 26 Feb 2005, 10:27 a.m.*

I'm having a hard time preparing the HP 33s for the Civil PE exam in April. I'm hoping to get some help...

The PE exam involves perhaps hundreds of possible formulas, maybe not all of which will be used on a given exam, but I'd like to be prepared.

HP's SOLVE feature is fantastic for solving equations, but I have yet found no way to index the equations, i.e. I will have to scroll through a long list of equations until I find the one I want, then press SOLVE and the variable name I'd like to solve for. With hundreds of equations, the scrolling could take a long time, and speed is key at the exam.

So, I've looked into programming an index structure, using one routine (label A) to ask for a "subject" and "equation" number (i.e. an index), and then directing the program using the GTO (label) command to other labeled routines that I would like to contain all the equations for the subject covered by that routine.

But, I'm having a hell of a time finding a way to have more than one equation within a routine AND at the same time solving any one of those equations for any specified variable...

HP's examples in the manual seem to suggest you can have only one equation per program. Any ideas??

Re: HP 33s programming

*Message #2 Posted by **Veli-Pekka Nousiainen** on 26 Feb 2005, 11:40 a.m.,*
in response to message #1 by Alexander Thorp

Hmmm....
Since programs can also keep equations I suggest you do it yourself.
At least you could have them sorted from labels A...Z, which is less scrolling.
I'm sorry I couldn't offer any better help for you.

Re: HP 33s programming

*Message #3 Posted by **Norris** on 26 Feb 2005, 12:20 p.m.,*
in response to message #1 by Alexander Thorp

As a Civil PE candidate that uses the 33S, I question the value of storing hundreds of equations in your calculator. Most Civil PE exam questions do not involve particularly complicated equations. In most cases, I just look up the relevant equations in the reference book or in my notes, and solve them manually on the calculator.

Note that the 33S only allows simple 1-letter variables (A, B, X, etc.), with no Greek letters or subscripts allowed. Even if you do store hundreds of equations, you are going to have to "translate" all of the variables into simple 1-letter form. Will you really be able to remember what variables "D" and "I" represent in Equation 236, or will you have to look up the equation anyway?

I do store some unusually complex equations on the 33S, but I don't expect to have more than a few dozen. Since the 33S has a 2-line display, I use 2 lines for each equation. The first line is a "dummy" equation with a number and a brief title; the actual equation is on the second line. I put a brief description of each equation in my notes, along with the equation number so I can scroll to it easily, and a list of the variables.

Re: HP 33s programming

*Message #4 Posted by **Fubar Vikinghelmet** on 26 Feb 2005, 12:52 p.m.,*
in response to message #3 by Norris

I passed the October 2004 civil PE and used my 33S. I DID NOT program any formulas other than a nifty quadratic equation solver and an interpolation program (labeled "I" - slick, eh?).

Here is my advice: don't worry about programming formulas into the calculator (yes, not enough labels; yes, can't index equations, etc.). Bring Lindberg's Civil Engineering Reference Manual and its quick formula reference guide - as well as the other other references you will use for your specialty in the afternoon. You might want to print out a list of your programs and equations and glue it to the inside cover of the quick reference guide, though, if you have lots of formulas. Alexander's method "I put a brief description of each equation in my notes, along with the equation number so I can scroll to it easily, and a list of the variables." is brilliant, mind you - and I'm going to steal it!

The key to passing the PE exam is to be ready for tricky questions: the answer requested is usually a tiny piece of a bigger problem (like "the safety factor against X is..." and you'll have to go through the entire design problem in order to find the answer). If you have 'em, the old exams sold by ppi and NCEES are what you'll see in April.

Study hard and ace it!

hp 33s programming

*Message #5 Posted by **Alexander Thorp** on 27 Feb 2005, 8:35 a.m.,*
in response to message #4 by Fubar Vikinghelmet

Fubar:

Thanks for the suggestions. Yes, I have the reference materials you suggested and I've been working on studying the material at the same time as this programming option. And, yes, I am considering dropping the whole notion of programming the calculator to solve equations.

Maybe instead of programming, I'll have a list of the most important equations, especially the ones with the multiple variables. That way, I can use the SOLVE key to solve for the needed variable...

Seems to me, in theory, though, if it could be worked out, that programming the equations might be of great use to candidates for the PE exam in general....

Re: hp 33s programming

*Message #6 Posted by **Norris** on 27 Feb 2005, 3:52 p.m.,*
in response to message #5 by Alexander Thorp

<< Seems to me, in theory, though, if it could be worked out, that programming the equations might be of great use to candidates for the PE exam in general.... >>

I don't think it's such a big plus. I speak from experience, having used the HP48GX on both the EIT exam (when it was legal) and on California state-specific Civil PE exams (where it is still legal).

There are obviously a lot of equations on these exams, but the hard part is recognizing which equations and assumptions are appropriate. In most cases, crunching the numbers is the easy part.

This became particularly apparent to me on the California Special Seismic PE exam. This exam is widely dreaded by civil engineers, yet the actual equations rarely involve anything more than multiplication and division of a few variables. It's the concepts that are difficult.

I stored a lot of equations in the 48GX prior to the EIT exam. But they were not as helpful as I had expected (and note that the Multiple Equation Solver of the 48GX is *much* more powerful than the Solver of the 33S). I think the primary benefit was that all the programming and debugging helped to familiarize me with the equations. In effect, it was a form of studying.

I do miss the units capability of the 48GX. Automatic unit conversions was a plus.

Re: hp 33s programming

*Message #7 Posted by **Alexander Thorp** on 1 Mar 2005, 12:11 a.m.,*
in response to message #6 by Norris

Norris:

Of course, you are correct. The vast majority of the problems will not require complex solutions or math.

I was just so enamored with the 33s ability to solve for a particular variable that I thought, HEY, maybe this could make things faster on the exam.

I think what I'll do is enter in some of the most frequently used equations, especially those with multiple variables, and then as you suggest work out the others in my head or on paper...

Thanks for your thoughtful input.

Re: 33s target of PEs / high school?

*Message #8 Posted by **Alexander Thorp** on 27 Feb 2005, 8:29 a.m.,*
in response to message #3 by Norris

Norris:

Thanks for your constructive criticism. Yes, I have been aware of the fact that if I programmed hundreds of equations that I would have to recall whether "G" represented "gamma" or the "gravitational constant".

Generally, what I was thinking was that I WOULD look up the equation in the quick reference, where I would write the equation number, and then maybe program a dummy label which would show me the variables that I chose to use in programming the equation (or, as you suggested, having the variables written down in the quick reference, or on some other piece of paper). The key, for me, would be to have the ability to SOLVE the equation for any one variable, without having to rewrite the equation on paper for the variable I wish to solve for.

In reality, I'm thinking that I won't program 200 equations, but that I'd like to have the ability to program more than 26, or 31, as the case might be - say, 75? of the most important, and especially multiple variable equations...

In your message of APR 4 2004, you suggested a method to program say 10 different programs using only one LABEL. The trick was the "GTO.A0100, followed by R/S" suggestion.

If I used this methodology, do you know whether I could program an "FN=" and "SOLVE" combination within that subset routine?? Or is there another method such as putting the "FN=" at the calling routine...??

Re: 33s target of PEs / high school?

*Message #9 Posted by **Norris** on 27 Feb 2005, 3:30 p.m.,*
in response to message #8 by Alexander Thorp

Your problem, as I understand it, is like this. You want to store lots of equations. You want to (1) be able to jump quickly to a particular equation, and then (2) make it accessible to SOLVE.

There are two ways to store multiple equations on the 33S. Unfortunately, neither one has both of the qualities that you want.

If you store multiple equations in the equation list, then they are accessible to SOLVE. However, there is no way to jump directly to a particular equation; you have to scroll up or down through the list.

If you store multiple equations in programs, then you can jump directly to a particular one using GTO.Axxxx (assuming you know the line number). However, the "selected" equation will not be accessible to SOLVE.

I suspect you are out of luck. The only workarounds that I can see are:

(1) Group related equations together in the equation list (e.g. water resources, geotechnical, etc.). This should minimize the amount of scrolling that you need to do, especially if you keep the total number of equations to a manageable size.

(2) Programs can solve equations in the y=f(x) format, when y is the desired variable, without SOLVE. So enter all possible forms of each equation in this format. For example, the area of a rectangle is A=BxH. You could enter “A=BxH”, and “B=A/H”, and “H=A/B” as separate equations, then use GTO.Axxxx to jump directly to the particular form of the equation needed for the particular variable (A, B, or H) that you want. This should work in theory, but seems impractical.

My best advice is: practice rearranging equations in your head, or on paper if necessary.

RE: HP 33s programming

*Message #10 Posted by **Alexander Thorp** on 28 Feb 2005, 11:58 p.m.,*
in response to message #9 by Norris

You hit the nail on the head in terms of describing what I am after, and maybe I'm out of luck.

However, I'll share what I've been working on. It involves user INPUT in the main routine of "subject number" S, "equation number" E, and "variable number" V, and utilizes the indirect address (i) to call the appropriate subroutine:

A0001 LBL A A0002 INPUT S (pick one of 17 subjects) A0003 INPUT E (choose equation no. - predefined) A0004 RCL S A0005 1 A0006 + A0007 STO i A0008 FN=(i) (defines label within which the SOLVE will occur) A0009 INPUT V (here, V is a number which corresponds to the letter of the variable to be solved for...A=1, B=2, and so on) A0010 STO i A0011 SOLVE(i) A0012 VIEW(i)

The main routine above works great in terms of calling the subroutine and beginning the SOLVE process. If the subject no. 1 subroutine had only one equation (the area of a circle), it might look

like this:

B0001 LBL B B0002 SF 11 B0003 A=(PI)x(R)x(R) B0004 RTN

in which case it would work great with the main routine.

But what I'm trying to do is use variable E defined in the main routine (equation number) to call out one of a series of equations all within the same "label".

I was hoping the format of this might be as simple as:

B0001 LBL B B0002 SF 11 B0003 1 B0004 RCL E B0005 x=y? B0006 A=(PI)x(R)x(R) B0007 2 B0008 RCL E B0009 x=y? B0010 V=4/3x(PI)xRxRxR (volume of a sphere) B0011 3 B0012 RCL E B0013 x=y?

and so on.

EXCEPT that it doesn't seem to work. Apparently, there needs to be an RTN statement after each equation, once solved, to go back to the main routine. But, unfortunately, I can't simply place an RTN statement after each equation, as the program would then never get past equation number 1...I've tried making the RTN statement conditional upon comparing variable E with the equation number following the SOLVE, but it gets botched up...I don't know why, but I can't figure out how to do it.

I'm not sure exactly the syntax involved in the SOLVE routine, but I'm guessing that the result is that it stores the answer in the variable that is solved for. Maybe it also enters this value in the x-register?

Anyway, I think I'm done trying to make this work - I'd better get back to studying instead of getting distracted by this unfruitful programming....unless of course someone could think of a way, and would be willing to share it...

Thanks for all the help, everyone!

Re: 33s target of PEs / high school?

*Message #11 Posted by **Dave Shaffer** on 28 Feb 2005, 4:15 p.m.,*
in response to message #8 by Alexander Thorp

How many HP33s are you allowed to take to the exam? Several folks have already claimed that they would take at least two (one for "backup"), so apparently the number is more than one.

If you are willing to buy a few of them, then you could put equations (different ones!) in each of them, perhaps grouped by subject.

HP 33s programming

in response to message #11 by Dave Shaffer

Hey now there's an interesting idea!

Thanks.

Menu program 32SII/33S

*Message #13 Posted by **Tizedes Csaba [Hungary]** on 28 Feb 2005, 6:27 a.m.,*
in response to message #1 by Alexander Thorp

Hello, I think this is your lifebelt :) The program is expandable, limited by mem, and you can categorized eqs via alphabet, but solve/integrate not working.

The prg is NOT!!! perfectly, but the main IDEA is usable. You've got many time to April ;) to make a perfect routine.

I think this idea is deserve a pdf copy of HP15C Advanced Functions Handbook, isn't it!!??!!?? (YES, YES, YES!!! :))

So, the routine:

```
LBL G
------------------------------------------------
SF 11                          #eq prompt on
0                              #stack_x setup
SF 10                          #eq is text
EQ:"1GRAV 2GAMMA"              #first and second menu items
CF 10                          #eq is equation
1
-
X=0?                           #menu_item_1 selected?
EQ:"M*9.81"                    #yes
PSE                            #no (inperfection here!!!)
1
-
X=0?                           #menu_item_2 selected?
EQ:"x!(X"                      #yes
PSE                            #no (again...)
------------------------------------------------
SF 11                          #like above, just 3 and 4
0
SF 10
EQ:"3GAUSS 4GRAF"
CF 10
3                              #!!! not -1 here, because
-                              #its item_3 and _4 !!!
X=0?
EQ:"EXP(-U^2/2)/2/PI"
PSE
1
-
X=0?
EQ:"SIN(X)/X"
PSE
------------------------------------------------
... and so on ...
```

Menu items: 1:Weight in gravitation, 2:Gamma function, 3:Standardised Gauss distribution, 4:Table for graphing sin(x)/x

The MAIN ERROR: what happen, when the stack_x is equal 0 after calculation?! How it checkable (selection or calculation gives that result)?

The PSEs is importants, but disturbs the reading results on display...

Cheers!

Csaba

*Message #14 Posted by **Alexander Thorp** on 1 Mar 2005, 12:27 a.m.,*
in response to message #13 by Tizedes Csaba [Hungary]

Do you think the solve/integrate function could be brought to life within the structure of what you offer?

Also, I'm not sure where you would place INPUT commands, or did you not really intend to have input?

I realize it's not perfect, and the idea is a good one, but I'm not yet understanding how it would work for me.

Sorry to be so slow...

Re: Menu program 32SII/33S

*Message #15 Posted by **Tizedes Csaba [Hungary]** on 1 Mar 2005, 2:09 a.m.,*
in response to message #14 by Alexander Thorp

I'm not sure where you would place INPUT commands, or did you not really intend to have input? If you SET the Flag_11, the calc will prompting for variables. See the User Manual...

how it would work for me Are you want a program, what categorized equations by alphabet and more eqs/one label. This program CAN do it. Type it and try it. It's works fine, but PSEs disturbs.

Usage: XEQ letter_of_group then when the MENU is appear (1st and 2nd items), simply press the number what you want to use, then R/S. If you want to use another ones, press R/S, then other MENU will appear (3rd and 4th item), and so on...

It's works what like you want it.

My opinion: With this method store the eqs, what you don't want to solve/integrate. The others store in the calc's EQN LIST.

Csaba

Re: Menu program 32SII/33S

*Message #16 Posted by **Alexander Thorp** on 2 Mar 2005, 8:27 p.m.,*
in response to message #15 by Tizedes Csaba [Hungary]

Tizedes Csaba:

Thank you for putting your program on the web for me to view. I typed it in, and I agree that YES the idea is good. But the devil is in the details, as they say.

I've come up with a revision to your program, as follows, which you or others might be interested in:

```
PRGM TOP
A0001 LBL A
SF 10
SF 11
EQN: "ENTER SUBJECT NUMBER"
PSE
INPUT S
x=0?
GTO B
RCL S
1
+
STO i
XEQ(i)
VIEW i
CF 1
A0016 RTN
```

```
B0001 LBL B
EQN: "1 MATHEMATICS"
PSE
RCL S
x=0?                if x=0, displays list of subjects
GTO C               goes to next subject area
-----------------
EQN: "ENTER EQN NO"
PSE
INPUT E
CF 1
CF 10
----------------
1
-
x=0?
SF 1
FS? 1
EQN: "(PI)*R^2"
STO i
FS? 1
RTN
----------------
1
-
x=0?
SF 1
FS? 1
EQN: "SQRT(A/(PI))"
STO i
FS? 1
RTN
----------------
1
-
X=0?
SF 1
FS? 1

and so on for each eqn within subject 1 (label b)....

C0001 LBL C
C0002 EQN: "2 FLUID"
C0003 PSE
C0004 EQN: "STATICS AND"
C0005 PSE
C0006 EQN: "DYNAMICS"
C0007 PSE
RCL S
x=0?
GTO D

and so on for each subject area.  A final return
at the Nth label brings the program back to label A,
where the user can select another subject.
```

Each equation block returns to the main calling routine and displays the answer as "i=(value)"

It works even better than yours. The problem is that it would take lots of time to program the calculator in this way. Far more time than I have right now. Others have suggested that I should be using this time to study the ideas, and not get hung up with this idea of programming the formulas. Because in the end, its not the formulas that are going to take the test. It's me taking the test, and I need to know HOW to use the formulas.

I still might use the program for certain commonly used equations where one variable is the most used answer, area of circle for example. I agree that multiple variable equations that I want to solve would be better handled by the equation solver.

Thanks for the input, and I'd be glad to continue with this more if there are some that are interested.

By the way, is there a way to receive an email if there is a response to this message?

Re: Menu program 32SII/33S

*Message #17 Posted by **Tizedes Csaba [Hungary]** on 4 Mar 2005, 3:14 a.m.,*

Re: Open HP32SII

*Message #3 Posted by **Randy** on 26 Feb 2005, 9:49 p.m.,*
in response to message #2 by Karl Schneider

Yes, be careful. Are you certain it must be opened? Many problems can be solved by resetting the processor. Remove the batteries and touch the two battery connections together with the edge of a coin.

*Message #4 Posted by **Broesen** on 27 Feb 2005, 12:27 p.m.,*
in response to message #3 by Randy

Hi Randy.

Yes, I think I have to open it because all keys (1st row to right) aren't responding any more!!

Peter

Re: Open HP32SII

*Message #5 Posted by **Randy** on 27 Feb 2005, 1:20 p.m.,*

in response to message #4 by Broesen

You should be able to make it work by pressing on the raised part of the bezel above the 1/x key. Many times it will continue work after the pressure was applied. If not, it will need to be opened and the foam pad under the keyboard connection will need to be shimmed to increase the pressure on the connector.

Re: Open HP32SII

*Message #6 Posted by **ned** on 28 Feb 2005, 6:54 p.m.,*
in response to message #1 by Broesen

To permanently repair the problem, it is first necessary to remove the metal keybord cover. This is glued on, but can be pried loose. Starting at a loose part of this cover, perhaps just below the display above the top row of keys, push a thin tool underneath to begin loosening the template. A plastic toothpick from a swiss army knife may work, i use something i made. Working like this, lift the template and loosen successive rows of keys a little at a time until all the glue is quite loose. Don't try to rip the template off once just one corner is loose, or the metal will bend and kink. Removing the keyboard cover reveals the lower 2 plastic rivet holes and also the source of the problem. The problem arises below the display in the middle, where there is an opening. The upper chassis has 2 prongs or teeth inside this opening. These teeth come loose from the inner chassis, at least in the case of my 32s. The keyboard circuitboard connector is directly below this area. When the chassis comes loose, the electrical connection becomes loose and some keys stop working. If great care is taken, and with luck, these teeth can be reconnected to the inner chassis by pushing the upper chassis down onto the inner chassis. This requires one to remove the rear chassis iirc.

I can email photos of the area I have referred to with the keyboard cover removed, if anyone needs them.

-Ned

Re: How not to open an HP32SII

*Message #7 Posted by **Randy** on 28 Feb 2005, 11:06 p.m.,*
in response to message #6 by ned

You do not and should not remove the keyboard bezel to repair this type of problem with a Pioneer. Doing so will only get you a bent faceplate and you'll be no closer to solving the problem. Opening a Pioneer is done from the back, ***NEVER*** from the front. See http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=5 for the proven method to open.

Edited: 28 Feb 2005, 11:07 p.m.

how to correctly fix the problem

*Message #8 Posted by **ned** on 3 Mar 2005, 11:53 a.m.,*
in response to message #7 by Randy

my previous thread regarding this problem: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=64602

also definitely read this: http://www.hpmuseum.org/disasm.htm skip to the end, regarding pioneers (i never tried the hair dryer method but seems good to me!)

somewhere Tony Duell commented on Paul Brogger's pioneer notes, but I forgot where.

regarding the faceplate: yes one may simply snap off the lower heat stakes. How does one re-fasten

these heat stakes or rivet holes, then? If one has only a screwdriver and little patience, and uses the shim method, I guess the problem gets solved. When I drill out the 4 top and 4 bottom rivets holding together a pioneer, I like to fasten the chassis back together with little screws. I've used ones stolen from some electronic gaget such as a portable radio, because it's difficult to find screws that fit at the hardware store. Once *all 8* holes have been reconnected, the chassis is as good as new and does not need glue/friction/hope to hold it together. As for the cause of and solution to the keyboard problem, I think i am the only one who has written about the 2 teeth coming loose below the lcd. I agree that it would suck to bend the faceplate. Once the faceplate is loose though, one is free to do a number of things: -clean the display window (on older models) and the key labels. -clean the junk from underneath the keys (on really dirty calcs) -squeeze the middle of the chasis together until the teeth below the display re-engage, which fixes the keyboard problem with no shimming required. -get 'creative' with parts swapping, repainting, etc (i liked the 42BS idea)

Softening the keyboard template glue with heat would greatly ease removal, and i'll try/suggest that in the future. -Ned

Search & Speed HP41

*Message #1 Posted by **Peter** on 26 Feb 2005, 12:00 a.m.*

As I'm trying to stand on the shoulders of the giants that have contrinuted to this forum over the years I frequently find myself searching each of the 13 archives piece by piece for one subject (e.g. right now: how to do speed ups). So I was wondering if there is a way to search of the fori archives simulatenously?

And if there is a place out there with an article for speed-up, some pictures to locate the right capacitot on all those different boards I'd be very appreciative!

Cheers

Peter

48G scare

*Message #1 Posted by **Ed Look** on 25 Feb 2005, 9:09 p.m.*

I dropped my 48G earlier today, from the height of a tabletop. It was still in its gray nylon case.

Of course, I checked to see if it was damaged. When I first turned it on, there was a blank strip on the LCD screen about two-thirds or three quarters of the way up from the screen bottom. It persisted after power off then power on.

Fortunately, I gently tapped the right edge of the screen and the blue pixels were restored. Ever since I obtained a 48G+, this original 48G began to mean less to me... until I saw that blank stripe across the screen! Even though it has less memory, it still is quite valuable to me.

HP49G+ How do I save text?

*Message #1 Posted by **Kate** on 25 Feb 2005, 9:02 p.m.*

Can someone please get me pointed in the right direction to save several lines of text in my new HP49G+. I can't seem to figure it out from the manual.

Thanks!

Re: HP49G+ How do I save text?

*Message #2 Posted by **Gene** on 25 Feb 2005, 9:36 p.m.,*
in response to message #1 by Kate

Suppose in level 1 of the stack, you have the string:

1: "THIS IS A STRING"

To save it in the global variable named BOB, type in:

'BOB'

and press the STO key. Note the single QUOTE before typing BOB.

To recall the string, press VAR and then press BOB.

Gene

Re: HP49G+ How do I save text?

HP-67 display trouble: Help!

*Message #1 Posted by **Albert** on 25 Feb 2005, 8:49 p.m.*

Hi everybody,

After a successful card reader gummy wheel replacement, sometimes the display shows a very brilliant row of " ----------" (middle segment) when I turn on the machine.

Even if the calculator is off, when I push some keys, a dull red middle segment twinkles (-). ¿How can I do? ¿How can I fix this problem?

Thanks in advance,

Albert

Re: HP-67 display trouble: Help!

*Message #2 Posted by **Tony Duell** on 26 Feb 2005, 5:46 a.m.,*
in response to message #1 by Albert

The 'g' segment (the one in the middle, used for the -ve sign) has a separate current control circuit, which is pair of transistors in the corner of the logic board. That, in turn is controlled by a resistor on the keyboard/display board.

Bad contacts between the keyboard/display and the logic board can cause this. Since you've just taken the machine apart to repair the reader, I would check the pins between the 2 boards carefully.

Re: HP-67 display trouble: Fixed!

*Message #3 Posted by **Albert** on 26 Feb 2005, 7:34 p.m.,*
in response to message #2 by Tony Duell

Many thanks Tony,

There was a bad contact between the power plug-in and the display PCB (the ground wire). Now, the machine works fine.

Albert

Check your batteries!

*Message #1 Posted by **Dave Shaffer** on 25 Feb 2005, 4:27 p.m.*

A word to the wise (or at least, the paranoid!):

I got a low-battery indicator on my '48GX earlier this week. I finally got around to replacing the batteries a few moments ago, and discovered that one of the AAA cells had leaked - fortunately, just a little bit, but there was definite corrosion build-up on the cell and on the battery holder. These were relatively new (put in the calculator last October), name brand (Sanyo/GE) batteries. So, you don't have to let your calculator lie around in a drawer for years in order to have battery corrosion problems. This calculator has never been wet, either. (At least as long as I have had it - and I bought it new less than three years ago.)

By the way, how long should a set of batteries (3 AAA alkaline cells) last in a 48GX that is used less than an hour a day, with no peripherals or any additional memory cards?

Has anybody ever tried sending a vintage calculator with corroded batteries (and corroded calculator) back to a battery manufacturer? Somebody (Everyready?) used to advertise on their packages that if you ever had a product damaged by their batteries you could send it to them for repair or replacement. It's hard to believe that they might now send you a replacement 15C for example!!

Re: Check your batteries!

*Message #2 Posted by **Mike Sebastian (Texas)** on 25 Feb 2005, 8:37 p.m.,*
in response to message #1 by Dave Shaffer

If the item damaged by their batteries is not easy for them to get repaired, they will just send you a check and keep the item. Then you get to try to find a new 48GX or 15C!

Rad vs Deg accuracy

*Message #1 Posted by **Rick May** on 25 Feb 2005, 2:53 p.m.*

I was wondering, I did the asin(acos(atan(tan(cos(sin(9)))))) and got 8.99999864267 of course. If I convert to 9 into Radians and do the same operation in RAD mode and convert the number back to degrees I get 9.00000000009. So the question is, why is the radians mode so much more accurate? Or am I missing something? If it is more accurate, why not just have the calc do all operations in Rad and just convert to and from degrees?

Re: Rad vs Deg accuracy

*Message #2 Posted by **bill platt** on 25 Feb 2005, 3:00 p.m.,*
in response to message #1 by Rick May

Hi Rick,

1st of all, the supposed "accuracy" is a bit of a red herring here. You are effectively "pushing digits off a cliff" as you take these nested sin/cos/tan operations. So, it is not a real-life test of accuracy. In real life, you generally have most of the significant digits of your problem intact.

2nd, again in real life, you have so many sigfigs in the calculator, that it really doesn't matter which mode you choose, if an issue of truncation is occurring, it is at a far decimal place.

If you actually need all those places, then you are in a special league....

Regards,

Bill

Re: Rad vs Deg accuracy

*Message #3 Posted by **hugh steers** on 25 Feb 2005, 7:58 p.m.,*
in response to message #1 by Rick May

its because in deg mode, the machine is treating each of sin, cos and tan as degree arguments and performing deg->rad conversion for *each* one. then in each of atan, acos & asin its performing the opposite each time. whilst in rad mode there are no conversions except the first and final ones manually performed.

Re: Rad vs Deg accuracy

*Message #4 Posted by **Gunnar Degnbol** on 26 Feb 2005, 9:58 a.m.,*
in response to message #1 by Rick May

It is two completely different calculations. sin(9) returns sine of 9 degrees or 9 radians, two very different numbers, and then you go on doing calculations on the result, interpreting angles as degrees or radians.

tan(cos(sin(9))) is meaningless because sin and cos does not return an angle in either degree or radian mode.

I think Valentin Albillo has pointed out that sin 9° = 0.1564, and cos 0.1564° is very close to 1, where all the meaningful digits are much smaller than 1 and get rounded off.

The same pathological case does not happen for the calculation in radians mode, because the numbers are completely different and in radians mode "less than one" is not the same as "very small".

Re: Rad vs Deg accuracy

Message #5 Posted by ***db (martinez, ca.)*** *on 27 Feb 2005, 1:39 p.m.,*

Triangle 32SII - Bill Platt

*Message #1 Posted by **Norm Pageau** on 25 Feb 2005, 11:46 a.m.*

Hi Bill I want to thank you for your help. The triangle program hangs up on INVALID (i) message. There is only one line in the program that has RTN (i) Am I misinterpeting this statement - help me if you can ?? Norm

Re: Triangle 32SII - Bill Platt

*Message #2 Posted by **bill platt** on 25 Feb 2005, 12:56 p.m.,*
in response to message #1 by Norm Pageau

Hi Norm,

The syntax "RTN (i)" is incorrect.

"RTN" is a command with no parameters--it merely returns the program execution pointer to line 000.

"(i)" is a functionparameter which says, 'use the value stored in variable "i" (or "I" as it is called in the 11c) to carry out the requested function.' For instance, RCL (i) will recall the value of a variable (A through Z, or the stats variables, or "i") for which the pointer is stored as a numeric value in "i". So, for this purpose, A=1, B=2, C=3....26=Z, 27="i", 28="n", 29="Sigmax" etc (see page 13-20).

So, if you had "i" holding a value of "1", then RCL (i) would recall the value stored in variable A. (so if you had 2324 stored in A, then RCL (i) would return 2324 to the x register.)

Similarly, if you have XEQ (i) {which would be GSB (i) in the 11c} then your program pointer would go to the subroutine named for whatever variable's pointer is stored in "i", so in this case, you would see the pointer move to LBL A.

A value greater than the absolute value of 33 will cause an "invalid (i)" error.

So, it sounds like somewhere your program is not properly initializing or feeding the variable "i".

Let me know if this helps.

regards,

Bill

hp-SOLVE in the 33s

*Message #1 Posted by **Eric Lundgren** on 25 Feb 2005, 1:40 a.m.*

I am proudly the owner of another (exam redundancy) 33s.

After entering the quadratic form a*sqre(x) + b*x = - c

I am concerned to obtain only one root (and incorrect). Perhaps I need to think about this, yet I have an excel spreadsheet and XEQ on the 33s, both which arrive at same answer...which is likely because the same idiot programmed both..;)

Any thoughts..? Eric

Re: hp-SOLVE in the 33s

*Message #2 Posted by **Namir** on 25 Feb 2005, 5:22 a.m.,*
in response to message #1 by Eric Lundgren

HP's calculator website has 4 learning modules about using the SOLVE feature. I encourage you to look at them and download them.

Re: hp-SOLVE in the 33s

*Message #3 Posted by **bill platt** on 25 Feb 2005, 8:54 a.m.,*
in response to message #1 by Eric Lundgren

Hi Eric,

I think the following posts should be helpful for understanding how to get the 33s solver to work most effectively. Also be sure to read the manual and the guides on the hp website--the solver is a powerful tool, but slightly different from the 32sii in some ways (though just as good if not better) and it is helpful to understand the nuances.

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62608

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61213

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61224

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=61136

Best regards,

Bill

Re: hp-SOLVE in the 33s

>
> I am concerned to obtain only one root (and incorrect).

As Namir and Bill said, there is osme supplemental info available at HP's website. The info describes how the 33S will use a "direct solution" method for equations of certain forms, solving algebraically instead of iteratively. This is not always desirable, because one must then know how to modify the equaiton so that the 33S will find the other roots.

In any case, it should have returned at least one correct answer. What were the coefficients?

-- KS

Re: hp-SOLVE in the 33s

*Message #5 Posted by **eric lundgren** on 26 Feb 2005, 3:24 p.m.,*
in response to message #4 by Karl Schneider

Karl,

For the coefficients A = 30 B = -25 C = 1

SOLVE yields x= 4.84, which by a sanity check is way off.

My short program yields Sol'ns +/- = 0.7912 0.0421

which is correct, any ideas? I'll look into the book to. Eric

Works fine on my 33S....

*Message #6 Posted by **Karl Schneider** on 26 Feb 2005, 6:34 p.m.,*
in response to message #5 by eric lundgren

All I can suggest is to follow the instructions. The equation should look like this:

```
AxSQ(X)+BxX=-C
```

Display the equation in the x-register; press SOLVE; press "2" for X; enter the three coefficient values with "R/S" after each one.

You can find the desired root by defining the search range between two values: Store one value in the variable X; put the other value in the x-register; then do as above.

-- KS

Re: Works fine on my 33S....

*Message #7 Posted by **Eric Lundgren** on 26 Feb 2005, 9:17 p.m.,*
in response to message #6 by Karl Schneider

Karl,

I don't know what to say. I entered the eqn again in place of my original one, but using some parentheses for confidence, and it solved correctly, giving the first correct root.

However, I really believe that I had it entered as you listed. Well, pc's don't lie, so I must have erred in the entry.

Thanks for the help! Eric

in response to message #5 by eric lundgren

0.79120341757 0.0421299157633 are the correct roots
[VPN]

Re: hp-SOLVE in the 33s

*Message #9 Posted by **Barnardo Vargas** on 1 Mar 2005, 6:56 a.m.,*
in response to message #1 by Eric Lundgren

Don't forget that computer programs are not magical black boxes. They are based on algorithms, and all HP SOLVE programs are based on well known mathematical algorithms, such as Newton's, regula falsi, etc., which DO have limitations, i.e., they are not always applicable, they will not always converge to a root; that depends on some conditions the function must fulfill. Even the most powerful computer in the world programmed with the "best" root-finding algorithm can fail to return a correct answer in some cases, and that doesn't mean its programmers are incompetent or that the programs contain bugs. Get used to it.

Triangle program hp32sII

*Message #1 Posted by **Norm Pageau** on 24 Feb 2005, 4:07 p.m.*

I have a HP 11C and a HP 32SII I programmed Trianlges (side angle side) (side side side) (angle side angle) (side angle angle)(side side angle) into my HP 11C and it works great !!!! Can someone send me an e mail or post on message board showing the steps to program the above formulaes into my HP 32SII. Thanks alot !!! Norm nmp@nleng.ca

Edited: 25 Feb 2005, 8:49 a.m. after one or more responses were posted

Re: Triangle program hp32sII

*Message #2 Posted by **bill platt** on 24 Feb 2005, 5:07 p.m.,*
in response to message #1 by Norm Pageau

Hi Norm,

You can directly translate 11c programs to 32sii. Just change the registers from numbers (0 1 2 etc through 0.9) to letters (A B C etc through Z).

If you use the indirection feature of the 11c, the 32sii is compatible there, to, but is named i and (i) instead of I and (i) respectively. 32sii has slightly enhanced indirection capabilities; yet everything that works on the 11c will work (and the same way) on the 32sii.

I hope this helps. If you need more specific help, let me know by a specific example.

Regards,

Bill

Re: Triangle program hp32sII

*Message #3 Posted by **Bernardo Vargas** on 1 Mar 2005, 6:44 a.m.,*
in response to message #1 by Norm Pageau

The HP32SII manual already contains a triangle-solving program. Have you tried it?

HP-41C how to determine if it's halfnut ?

*Message #1 Posted by **Pascal** on 24 Feb 2005, 9:51 a.m.*

I have an HP-41C built in 1980 that has the halfnut display. Is it possible that such an early HP-41C has the halfnut electronics inside ? Is it possible to tell if the electronics inside is the halfnut or fullnut without opening the calculator ?

Re: HP-41C how to determine if it's halfnut ?

*Message #2 Posted by **Mike (Stgt)** on 24 Feb 2005, 10:00 a.m.,*
in response to message #1 by Pascal

My approach is not 100% sure: Use a synthetic tone that leaves the beeper in "buz mode". Halfnuts tend to "buz" louder. But you know the old surgeon saying: "Open it if you want to see clear."

Ciao.....Mike

Perhaps...

*Message #3 Posted by **Gene** on 24 Feb 2005, 10:02 a.m.,*
in response to message #1 by Pascal

1) No HP41 of any sort actually made as early as 1980 was built as a halfnut. That didn't happen for several years afterward. The orignal HP41s from 1980 would all have been fullnuts. There's just no way around this. HP did not change the HP41 manufacturing process that early. Period. :-)

2) If you actually HAVE an HP41C with a 1980 S/N on the back and a halfnut front / display, then it must be the result of either a) some sort of repair by HP where they replaced the front half of the calculator and left the back side of the calculator alone, or b) some sort of swap by a user/owner trying to get a calculator working again.

3) One way to test would be to take the back of the calculator off and take digital pictures to post and let some of us look at it. That would help determine the true inside nature of the beast.

4) Another way to test would be to load up the Sandbox ROM onto a Clonix / No-VRAM module (what? you don't have one of those?) and try out the lowercase display characters.

My feeling is that it is probably a result of one of the things listed in #2 above.

check the weight !!

*Message #4 Posted by **Pascal** on 24 Feb 2005, 1:52 p.m.,*
in response to message #3 by Gene

It's my father's calculator and he never modified it by himself. You're right, it was probably repaired once and they changed the display and the electronic inside. It may be a coincidence, but I have another HP-41C with serial 2013A which is also a halfnut.

Anyway, Raymond del Tondo (many thanks to him) gave me a good advice in order to check if it was a halfnut : He told me that halfnuts were lighter than fullnuts and that 41C and 41CV should weight about the same. By chance I have a fullnut 41CV and its weight is 147g compared to the 125g of the halfnut 41C. So my 41C is definitely a halfnut !

Thanks all for your advice, I will update the description on my auction on ebay (yes, shame on me, I'm selling my father's calculator :o)

Re: check the weight !!

*Message #5 Posted by **Matthias** on 24 Feb 2005, 2:06 p.m.,*
in response to message #4 by Pascal

I don´t think it is that easy. You have to compare two HP-41C, not a CV with a C. A CV has QuadMEM, so there is more electronical stuff in it. So, the weight must be heavier. What do you think?

Matthias

Re: check the weight !!

*Message #7 Posted by **Raymond Del Tondo** on 24 Feb 2005, 2:23 p.m.,*
in response to message #5 by Matthias

Hi Matthias,

the extra mem chips of a CV don't have much weight.
I think even a CY is lighter than a fullnut C;-)

Raymond

Re: check the weight !!

*Message #8 Posted by **Matthias** on 24 Feb 2005, 2:44 p.m.,*
in response to message #7 by Raymond Del Tondo

Raymond, do you have a CY? That would be new to me? Where did you get this from? I always thought, I was in advance...

Re: check the weight !!

*Message #9 Posted by **Pascal** on 24 Feb 2005, 5:05 p.m.,*
in response to message #5 by Matthias

Hello Matthias,

Why not check it for real ? It would be interesting to see the results !

I have weighted my calculators without any port cover, side cover and battery of any kind and I

have :

125g for the HP-41C halfnut

146g for the HP-41CV fullnut

132g for the HP-41CX halfnut

Do you have the weight of the one I'm missing (41C & CX fullnut and CV halfnut) ?

It's easy to tell...

*Message #10 Posted by **Randy** on 24 Feb 2005, 5:32 p.m.,*
in response to message #9 by Pascal

Whats all the fuss? Just look at the display.

If it has rounded corners, it has to be a halfnut internally since the LCD versions are completely different.

The weight of a halfnut C and halfnut CV are the same.

The fullnut C's and CV's will vary in weight due to internal version differences, 25g or more would not be uncommon.

Edited: 24 Feb 2005, 5:46 p.m.

Re: It's easy to tell...

*Message #11 Posted by **Pascal** on 25 Feb 2005, 11:28 a.m.,*
in response to message #10 by Randy

I didn't know that the LCD display was linked to the new eletronics inside. I thought it could be possible to have a coconut eletronics with a halfnut display.

Re: HP-41C how to determine if it's halfnut ?

*Message #12 Posted by **Garth Wilson** on 25 Feb 2005, 2:00 a.m.,*
in response to message #1 by Pascal

According to Richard Nelson's and Jeremy Smith's article entitled "HALFNUT-- AN INTERNALLY IMPROVED HP-41C,CV,CX" in the CHHU Chronicle V2N4 Jul/Aug '85, pages 9-11, HP started the Halfnut project in mid-83. At the time the article was written, it was expected that cv and cx halfnuts would start shipping to dealers in Sep '85, and that the 41c Halfnut would only be used for service of returned 41c's. So If you have a real 41c Halfnut, it would have to be from having been serviced after the older stock (Coconuts) had already been used up. BTW, if a 41 is not a Halfnut, it's a Coconut, not a Fullnut, according to HP's internal project names.

Contact to HHC Australia

*Message #1 Posted by **Matthias** on 24 Feb 2005, 12:51 a.m.*

I need a contact to a superior member of the HHC Club Australia. I want to ask questions about the Melbourne ROM. Who can help me?

Re: Contact to HHC Australia

*Message #2 Posted by **Raymond Del Tondo** on 24 Feb 2005, 1:20 a.m.,*
in response to message #1 by Matthias

Hi Matthias,

did you ask Wlodek?

Raymond

Re: Contact to HHC Australia

*Message #3 Posted by **Matthias** on 24 Feb 2005, 6:34 a.m.,*
in response to message #2 by Raymond Del Tondo

Yes, but nothing happened... sorry Wlodek.

Matthias

Re: Contact to HHC Australia

*Message #4 Posted by **Emmanuel, France** on 26 Feb 2005, 12:27 p.m.,*
in response to message #1 by Matthias

What do you want to know about Melbourne Rom? Yours. Emmanuel

12345

Re: Contact to HHC Australia

*Message #5 Posted by **Matthias** on 26 Feb 2005, 5:40 p.m.,*
in response to message #4 by Emmanuel, France

Mainly: Was this produced as a ROM module, EPROM module, EPROM?

Matthias

Re: Contact to HHC Australia

*Message #6 Posted by **Emmanuel, France** on 27 Feb 2005, 10:34 a.m.,*

in response to message #5 by Matthias

When it was 'produced', the only form known and available was a couple of 2716 and 2732 Eproms.

ROM refers to the fact it had a FAT and took place in a 4K page.

Yours.

HP-16c Manual

*Message #1 Posted by **Jim Hannah** on 23 Feb 2005, 11:33 p.m.*

I am trying to determine if manual I received was really published by Hewlett Packard or is entirely a copy. The contents are obviously copied from a HP-16c Manual, including the original cover and back cover.

The outside front cover is a laminated cardstock with rectangular geometric square patterns in grays and beiges, (not the photographic computer images on the common manual), with a hp Logo and the words HEWLETT PACKARD in the upper right corner, and in the left side of the lower half of the cover the following title: "HP-16C, Computer Scientist, OWNER'S HANDBOOK.

The rear cover is all beige laminated cardstock with the same hp Logo and HEWLETT PACKARD in the upper right corner and the following words and numbers in the lower left corner: Reorder No. or, Manual Part No., 00016-90001-E1187.

Has any seen one of these before and do they know if it is an official manual originally shipped with a HP-16c.

I have heard one suggestion that these were published by Edu-Calc to accompany some found stock of HP-16c's (without original manuals) that were sold by Edu-Calc after HP-16c's were discontinued by the Hewlett Packard Company. Does any body know if this bears any relation to reality.

Finally does any body have an email address for Richard Nelson (Owner of the Edu-Calc Store) so I could communicate with him and verify this one way or the other.

Thanks very much, Jim H

Can you scan it...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 Feb 2005, 11:36 p.m.,*
in response to message #1 by Jim Hannah

... and post the image here? I'd like having the image of this cover. Or, if you think it's easier, can you e-mail me an image? (lcvieira at quantica dot com dot br)

Cheers and thanks.

Luiz (Brazil)

Re: HP-16c Manual

*Message #4 Posted by **Raymond Del Tondo** on 24 Feb 2005, 1:42 a.m.,*
in response to message #1 by Jim Hannah

Hello,

there were several 'reprints' of HP calculator documentation
after the original printed stock was gone.
I also have a 16C manual reprint and an HP-28S manual reprint
which one could buy separately from HP.
They were sold by HP, and actually are medium
to low quality copies of a xeroxed reserve manual.

Better than nothing, but especially in the 16C manual
there are some IEEE related tables,
which are hard to read in my 'reprinted' manual copy.
However, some time ago I got an original printed manual,
multi-colored as it should be,
and now the machine is complete.

Raymond

Re: HP-16c Manual

*Message #5 Posted by **sjthomas** on 24 Feb 2005, 6:58 a.m.,*
in response to message #1 by Jim Hannah

For the record, Richard Nelson was an employee of EduCalc, which was owned -- in part -- by Jim Carter.

Re: HP-16c Manual

*Message #6 Posted by **Jim Hannah** on 24 Feb 2005, 11:23 p.m.,*
in response to message #5 by sjthomas

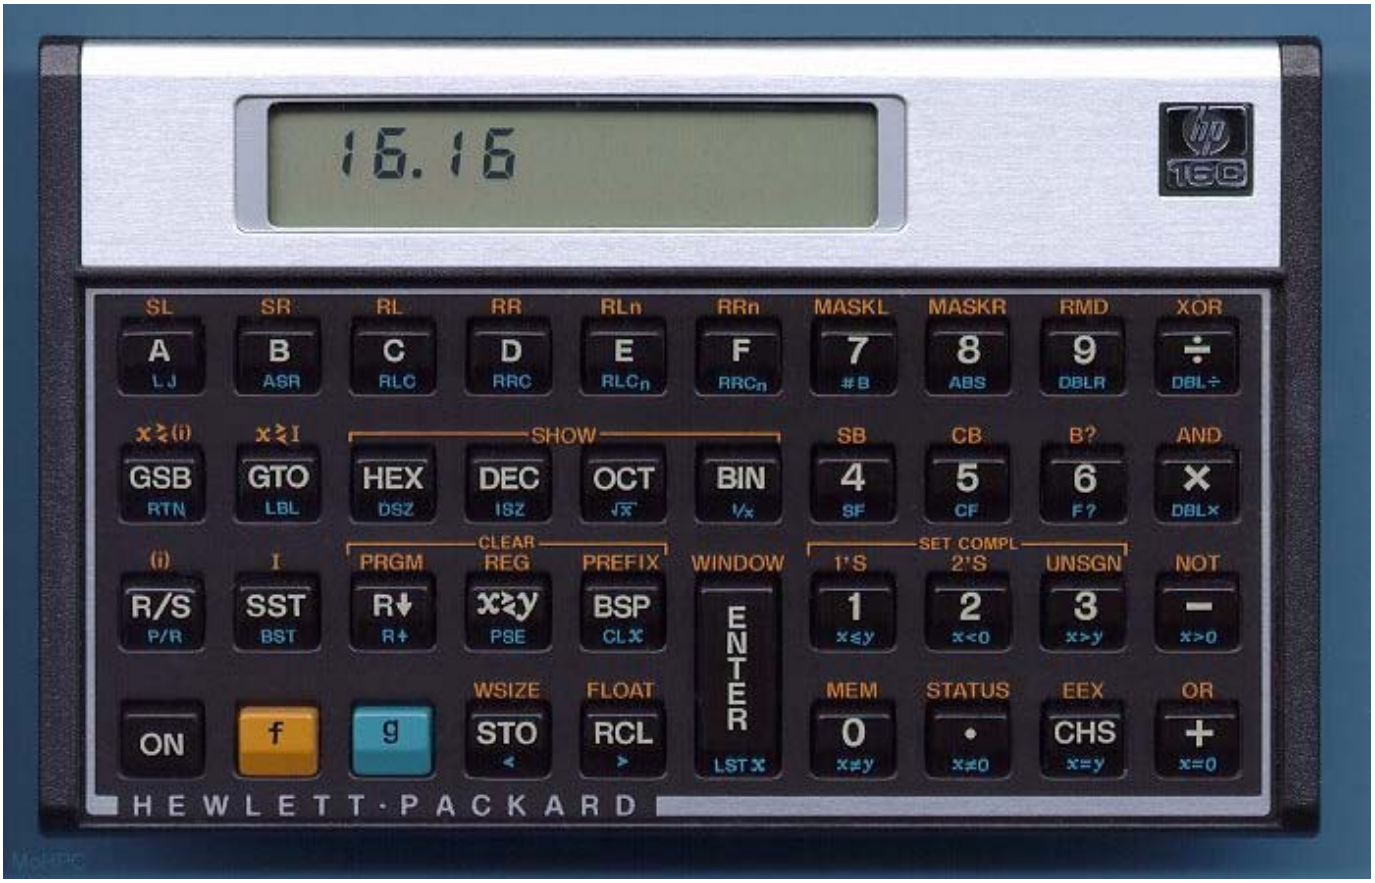
Thanks for the information about Richard Nelson and Jim Carter vis a vis EduCalc. I was going on memory of the catalogs and some other posts over the years and obviously my memory needed to be corrected. I do have a picture from another responder of I think the same manual, however the colors are not quite right. How do I post a picture to this list?

Thanks again for all the responses, Jim

Re: HP-16c Manual

*Message #7 Posted by **Jeff O.** on 25 Feb 2005, 7:25 a.m.,*
in response to message #6 by Jim Hannah

Post a picture here as follows:
Type [img:http://www.full image url]
where "image url" is the web address of the picture. Here's an example, using the
"http://www.hpmuseum.org/16.jpg" picture from this site:



The picture must be available on a web site. If you don't have a place to host it, you can send it to Dave and he will create a directory on this site for your picture(s).
All of the above is fully explained here

Re: HP-16c Manual

*Message #8 Posted by **Cameron Paine** on 26 Feb 2005, 12:11 a.m.,*
in response to message #1 by Jim Hannah

Jim, I am aware of three different HP manual packages for the 16C. The ones that shipped with the first calculators were spiral bound with coloured covers similar to the one on my tribute site. I don't have the dimensions of that book to hand but it was about A5 in size. The text was 2-colour: black and blue.

Caclulators shipped to Europe (or at least that's my assumption) came with a similar, smaller manual that's 170mm x 120mm. The example I have is in German and came with a model from the mid-life period. It is possible that the form factor of this manual shipped with all mid-life calculators. The one I have came with a US-made calculator with a 1987 serial number. It's also possible that my feeble memory has failed and that my original manual was the same size as the German one. ;-)

I have a third manual which I think is similar to the one you describe (it has the same part number). My belief is that this manual shipped with late-life calculators. The one I have came with a US-made calculator from 1988. I don't have the box for that specimen and if the manual did ship in the box, the box must have been made substantially bigger later in life.

Cameron

Re: HP-16c Manual

*Message #9 Posted by **Bruce Horrocks** on 26 Feb 2005, 5:44 p.m.,*
in response to message #1 by Jim Hannah

Quote:

hp49g+ and SYSPRL Programming

*Message #1 Posted by **Eddie Shore** on 23 Feb 2005, 10:38 p.m.*

Out of curiousity, do I have to use an outside computer to edit and compile programs in SysRPL, or may I use the calculator to do this?

I can set the flag to "see" the SysRPL language (-85), but I have not been successful to "imitate" SysRPL language.

i.e. :: x<< ZINT 6 ZINT 3 x+ x>> ; = << 6 3 +>> I can not run it when I type the former code. I have menu 256 attached.

Re: hp49g+ and SYSPRL Programming

*Message #2 Posted by **Raymond Del Tondo** on 24 Feb 2005, 1:23 a.m.,*
in response to message #1 by Eddie Shore

Did you consult the manual (aka RTFM) ?
Or comp.sys.hp48 ?

Maybe www.hpcalc.org will help, too...

Raymond

Re: hp49g+ and SYSPRL Programming

*Message #3 Posted by **Tim Wessman** on 24 Feb 2005, 3:09 a.m.,*
in response to message #1 by Eddie Shore

Yes. There is a built in compiler named MASD. It requires a library named Extable that has the tables of the named pointer. However, the best way to use it is to download and install Emacs. In that package, there is an extable2 (even more stabel romptrs) Sdiag (stack diagrams, help, documents, etc) the emacs library itself(offers autocompletion, searching of memory, templates, macros,etc). Then download a program called Nosy (decompiles and extracts romtrs while editing in emacs) The emacs zip has a nice documentation explaining its advanced features. All are at hpcalc.org

These 4 tools give you everything you need. I actually PREFER programming on the calculator. It is really easy. I program more on the computer now though, since my program is split over 3 libraries--one weighs in at 87K, one at 67K, other at 5K. They are just too big to work on in calculator anymore. However for quick program writing I most often will do it on the calcuator because it is so easy to test.

derivative of a function at a point

*Message #1 Posted by **John LIttlefield** on 23 Feb 2005, 9:37 p.m.*

Here's a homework problem I'm working on and I want to make sure I'm on the right track. Compute the derivative of the function at the specified point using the limit definition of a derivative of a function at a point.
f(x)=2x^2+3x-1 x=-4

here's my work f(x)-f(a)/x-a = f(x)-f(-4)/x+4 = 2x^2+3x-1-(2(-4)^2+3(-4)-1)/x+4 = 2x^2+3x-1-(32-12-1)/x+4 = 2x^2+3x-20 = (2x-5)(x+4)/x+4 = 2x-5 = 2(-4)-5 =-13

Re: derivative of a function at a point

*Message #2 Posted by **Eddie Shore** on 23 Feb 2005, 10:22 p.m.,*
in response to message #1 by John LIttlefield

Interesting approach, but what would happen if you have a polynomial that was not factorable so that you can "eliminate" the denominator?

However, you have the right idea. The defintion of the derivative is:

lim h->0 (f(x + h) - f(x)) ÷ (h)

For a numerical calcuation, choose h that is sufficiently small, but not 0.

Re: derivative of a function at a point

*Message #3 Posted by **John Littlefield** on 23 Feb 2005, 10:41 p.m.,*
in response to message #2 by Eddie Shore

We haven't gotten to the power rule yet, which is where I think my proffessor will show me how to deal with polynomials, but aren't the nicest polynomials constant and therefore wouldn't their derivative be zero?

Re: derivative of a function at a point

*Message #4 Posted by **Eddie Shore** on 24 Feb 2005, 9:20 a.m.,*
in response to message #3 by John Littlefield

You are correct about constants, the derivative of a constant is 0.

Example Let f = pi (3.14159...)

lim h->0 [f(x + h) - f(x)] ÷ h

= lim h -> 0 [pi - pi] ÷ h

= lim h -> 0 0 ÷ h

= lim h -> 0 0

= 0

Re: derivative of a function at a point

*Message #5 Posted by **John Littlefield** on 24 Feb 2005, 12:28 a.m.,*
in response to message #2 by Eddie Shore

Eddie, I asked my calc professor if it was possible to get a polynomial that wouldn't factor and eliminate the denominator and he said "Never (although it can be tricky to factor bigger degree polynomials). Kind >of spooky, eh? In the good way, I mean..." I'm sure I'll be finding out soon. John

Re: derivative of a function at a point

*Message #6 Posted by **Karl Schneider** on 23 Feb 2005, 11:20 p.m.,*
in response to message #1 by John LIttlefield

John --

I'm finding it difficult to read the equations in your post. Please use the "pre ... /pre" formatting described in the Forum's front page.

Eddie is right about the definition of a derivative. You should apply it directly.

You seem a bit confused in your follow-up post. The derivative of a *constant value* is zero.

My $15 Casio fx-115MS does numerical differentiation at suitable points. -13 is indeed the correct answer.

-- KS

May I?

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 23 Feb 2005, 11:33 p.m.,*
in response to message #1 by John LIttlefield

Hi, Karl;

this looks better, you're right:

```
f(x)=2x^2+3x-1  x=-4

here's my work
f(x)-f(a)/x-a = f(x)-f(-4)/x+4
              = 2x^2+3x-1-(2(-4)^2+3(-4)-1)/x+4
              = 2x^2+3x-1-(32-12-1)/x+4
              = 2x^2+3x-20
              = (2x-5)(x+4)/x+4
              = 2x-5
              = 2(-4)-5
              =-13
```

Althought the post is not ours, anyone can edit it, copy and paste parts of it, leave it unchanged and exit edit mode. And when you edit a post, original format (whe typing it in) is kept.

Cheers.

Luiz (Brazil)

Re: May I?

*Message #8 Posted by **John Littlefield** on 24 Feb 2005, 12:09 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Luiz, Thanks for clearing up that mess for me. It is shown in your message as I typed it in, but it posted as that string of junk. You responded to one of my posts earlier in the month on another homework problem I was working on, and your help was greatly appreciated. You were able to set the groundwork for the problem without giving away to much, thus letting me find my own way to the answer. I have a feeling you must be or have been a teacher. Once again thank you for your help and if I get stumped sometime soon I might post the problem in the hopes that you'll be there with a little friendly advice. John Littlefield calc.I student

You're welcome! ;-)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 24 Feb 2005, 12:36 p.m.,*
in response to message #8 by John Littlefield

And yeap! I'm a teacher. I deal with so many subjects, which is common in Brazil, that sometimes I feel as if I have not gone deeply enough in any of them. I read your last post after some of our brainy contributors have already answered, and I saw I had not too much to add... So I just read and learnt a bit more ;-) And be sure that anytime I feel I can help somehow, I'll try to.

I usualy say that I teach almost any subject dealing with numbers, since basic math to hardware design, programming and finacial subjects included. All of them at the university level (engineering, technology, etc.). Now I have a new challenge: A.I. <8-0

Thanks for your kind words and keep doing your best, John.

I wish you success.

Luiz (Brazil)

Evaluating derivatives by limits, and by calc's

*Message #10 Posted by **Karl Schneider** on 24 Feb 2005, 2:18 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Well, the correct answer seems to fall out somehow, but the approach is not what was intended. The thing to evaluate is

```
lim     [f(x+h)-f(x)]/h
h->0
```

which is an exercise in algebra. For numerical evaluation, a very small non-zero value of h must be selected. For greater accuracy,

```
lim     [f(x+ h/2) - f(x- h/2)]/h
h->0
```

can be calculated.

Now (at last!) a connection with HP calculators:

The RPL-based models (HP-28/48/49) will symbolically calculate derivatives of functions. If all variables have entered values, the derivative will be numerically evaluated. Example:

```
'X' [ENTER] [PURGE]
'2*X^2+3*X-1' [ENTER]
'X' [ENTER]
[d/dx] or [d]

(read '2*(2*X)+3' as the result)

-4  [ENTER]
'X' [ENTER][STO]
[->NUM]
(read -13.0 as the result)
```

The Casio fx-115MS is less capable, but simpler:

```
[d/dx] (2X^2+3X-1,-4) =

(read -13 as the result)
```

-- KS

Re: Evaluating derivatives by limits, and by calc's

*Message #11 Posted by **Tom Sherman** on 24 Feb 2005, 3:40 p.m.,*
in response to message #10 by Karl Schneider

Nice to see Karl's reference to the symmetric definition of the derivative as:

lim (h->0) [f(x+h) - f(x-h)]/2h

This is a form which seems to be well known to numerical analysis people, but which is often ignored by calculus textbooks.

From considerations of symmetry, it makes sense that a chord across a curve will better approximate a tangent to a particular point if the x value of that point is in the middle of the chord rather than at one extreme.

This is especially dramatic for the case of y = x^2, where the symmetric representation of the derivative gives:

(limit of): [(x+h)^2 - (x-h)^2]/2h =

[x^2 + 2xh +h^2 - x^2 + 2xh - h^2]/2h =

4xh/2h = 2x

so that for this case we immediately have the correct result for the derivative without proceeding to the limit at all, since h drops out of the expression.

Try y = x^3. The symmetric form will require the limit of 3x^2 + h^2, while the non-symmetric form needs the limit of 3x^2 + 3xh + h^2. Since the symmetric form has h only in the second power, while the non-symmetric form contains the first power as well, the symmetric form approaches the tangent slope faster than the non-symmetric form (i.e., larger values of h can be used to give the same accuracy).

So it worthwhile thinking about the derivative form that Karl has brought to our attention.

Cheers, Tom

Thanks, and a programming example...

*Message #12 Posted by **Karl Schneider** on 25 Feb 2005, 1:10 a.m.,*
in response to message #11 by Tom Sherman

>
> From considerations of symmetry, it makes sense that a chord across a curve will better approximate a tangent to a particular point if the x value of that point is in the middle of the chord rather than at one extreme.

Thank you, Tom. Of course, it goes almost without saying that f(x) must be evaluable and differentiable at the point "x" for the result to be valid. Neither 1/x nor |x| pass both tests at x=0.

Selecting a value of "h" in the ideal range will give the most accurate results. Larger values of "h" can reduce accuracy due to coarseness; too-small values of "h" can reduce accuracy due to roundoff error in the machine used, as significant digits are dropped when "f(x+h)-f(x-h)" is evaluated. HP's introduced prior to the Saturn processor (1984) carry 10 digits; most HP's introduced thereafter carry 12 digits.

Here is a program for the 11C and 15C (and 16C, 33C, and 34C?) to evaluate [f(x+h)-f(x-h)]/(2h) for a user-defined function:

```
LBL A
STO 1    x
RCL 0    h
+
GSB I    f(x+h)
STO 2
RCL 1
RCL 0

GSB I    f(x-h)
RCL 2
x<->y
-
RCL 0
2
*
/        df/dx = [f(x+h)-f(x-h)]/(2h)
RTN
```

1. Program your function f(x) using a label other than "A".
2. Store the numerical identifier of that label in register I.
3. Store the value of "h" in register 0.
4. Put the value of "x" in stack register x.
5. Do "GSB A" and view df/dx evaluated at "x".

For linear and quadratic functions, I expect that the correct answer will result for any value of "h" that does not cause overflow or underflow.

For other functions, note that increasingly larger "h" reduces accuracy, while increasingly smaller "h" reduces accuracy, and eventually produces a result of zero.

*Message #13 Posted by **Tizedes Csaba [Hungary]** on 25 Feb 2005, 6:39 a.m.,*
in response to message #12 by Karl Schneider

When I was buy my first HP, that was an HP32SII - exactly that was the 2nd. the 1st was an HP45 :,(- I was envy the algebraic features of 28x/48xx, so I wrote an numerical derivator for ANY variable. If you interested, the program is in the Program Library in this site. This program don't use the variables A..Z, only statistical registers, and works with SOLVE and INTEGRATE. (Ideal for searching extremums of functions, or maybe calculate deflection of beams with Betty theorem...)

I was posted this forum a HP32SII program, what can to fit quadratic curve without to store data points, and without linear algebraic computations. I hope it's available yet, if you interested...

Csaba

and a simple one for the 71B

*Message #14 Posted by **Tom Sherman** on 25 Feb 2005, 8:50 p.m.,*
in response to message #12 by Karl Schneider

Thanks, Karl, for the nice program and thoughtful comments.

Here's one that I wrote long ago for the HP-71B, using the "symmetric" form of the derivative. I just dusted it off (couldn't even remember that I had written it!), and it seems to work pretty (approximately!) well for simple applications. Certainly it gets John Littlefield's original problem right, as that involves only linear and quadratic terms.

```
[1 DEF FNC(X)= whatever expression]

10 DESTROY ALL @ DELAY 8 @ STD

20 INPUT "FIND DERIV AT X =";X

30 IF X#0 THEN 60

40 D=.0001

50 GOTO 70

60 D=.0001*ABS(X)

70 F=(FNC(X+D)-FNC(X-D))/(2*D)

80 DISP "DERIV =";F

90 END
```

Line 1 is changed as circumstances require. The rest is kept in program memory.

Cheers, Tom

Re: derivative_the_better_way ;)

in response to message #1 by John LIttlefield

```
Hello,

I think the best way to find derivative function first, then substitue the given 'x'. Your

result is correct, but I think in the way of solute you use some woodoo or something
extraterrestial thing from X-files ;)

So, the best way:

f(x)=2*x^2+3*x-1, and the point is x0=4

      f(x+h)-f(x)
lim ---------------- = this is the definition of derivative function; let's substitue!
h->0       h

     2*(x+h)^2+3*(x+h)-1 - 2*x^2-3*x+1
lim ------------------------------------ = square
h->0                 h

     2*(x^2+2*x*h+h^2)+3*(x+h)-1 - 2*x^2-3*x+1
lim ------------------------------------------- = make multiplication into par.s
h->0                     h

     2*x^2+4*x*h+2*h^2+3*x+3*h-1 - 2*x^2-3*x+1
lim ------------------------------------------- = make collect
h->0                     h

     4*x*h+2*h^2+3*h
lim ------------------ = do the simplication with 'h' It's correct, because 'h' is
h->0         h           NOT equal zero, just goes to zero

lim  4*x+2*h+3 = and make the limit: 2*h->0
h->0

+-----------+
|           |
|   4*x+3   |  Tararaaaa  ;)  Here is the derivative function of f(x)
|           |
+-----------+

And this derivative function at x0=-4:
```

```
f'(x0) = 4*x0+3 = 4*(-4)+3 = -13  This is the correct result!

Cheers!

Csaba
```

...to stand on ceremony...

*Message #16 Posted by **Tizedes Csaba [Hungary]** on 24 Feb 2005, 3:18 a.m.,*
in response to message #15 by Tizedes Csaba [Hungary]

Or, if you want to use it without find the derivative function, the game is same as above:

```
      f(-4+h)-f(-4)
lim ---------------- = this is the definition of derivative function at -4
h->0       h

     2*(-4+h)^2+3*(-4+h)-1 - 2*(-4)^2-3*(-4)+1
lim ------------------------------------------- = square
h->0                     h

     2*(16-8*h+h^2)+3*(-4+h)-1 - 19
lim ------------------------------- = make multiplication into par.s
h->0                h

     32-16*h+2*h^2-12+3*h-20
lim ------------------------- = make collect
h->0             h

     -16*h+2*h^2+3*h
lim ------------------ = do the simplication with 'h' It's correct, because 'h' is
h->0        h            NOT equal zero, just goes to zero

lim  -16+2*h+3 = and make the limit: 2*h->0
h->0

+-----------+
|           |
|    -13    |  Popopopooo  ;)  Here is the derivative of f(x) at x=-4 This is the
correct result!
|           |
+-----------+

Cheers!

Csaba
```

Any recent/newly minted PEs' here?

*Message #1 Posted by **Eric Lundgren** on 22 Feb 2005, 10:56 p.m.*

Just curious,

I will take the EIT next April, and I can not seem to get a confident answer:

1. There is a national NCEES exam which has a list of banned machines, yet there is also a state exam that allows almost any calculator. Which exam are people taking, and why?

2. How does one's choice affect the PE exam prospects?

3. Finally, I have a 32sii, 33s, 48g, 49g, 49g+...would you advise concentrating on fluency with the 33s, or may one expect the NCEES policy to change soon (next april)? (I'd rather use the 32sii or 48g for the keyboard layout)

4. Do people expect the 33s to be discontinued or in short supply any time soon? (the local Fry's electronics (San Diego CA) quickly sold out).

Your input will be appreciated, Eric

Re: Any recent/newly minted PEs' here?

*Message #2 Posted by **Karl Schneider** on 22 Feb 2005, 11:49 p.m.,*
in response to message #1 by Eric Lundgren

1. There is a national NCEES exam which has a list of banned machines, yet there is also a state exam that allows almost any calculator. Which exam are people taking, and why?

I passed the EIT/FE 11 years ago (in California), and I doubt that anything has changed -- the EIT/FE is a general-knowledge national exam. You might be thinking of particular PE subject exams that each state administers.

2. How does one's choice affect the PE exam prospects?

There is no choice -- see #1.

3. Finally, I have a 32sii, 33s, 48g, 49g, 49g+...would you advise concentrating on fluency with the 33s, or may one expect the NCEES policy to change soon (next april)? (I'd rather use the 32sii or 48g for the keyboard layout)

I would concentrate on fluency in the subject matter, ideally by succeeding in collegiate courses in each of the areas. I doubt that the NCEES policy will change. I, and probably others, lobbied for acceptance of good "recent" commonplace RPN models (32SII, 32S, 11C, 15C) as well as the algebraic 20S. However, NCEES went the other way by limiting the list to presently-retailed models. If you gotta have RPN, figure on using the 33S.

4. Do people expect the 33s to be discontinued or in short supply any time soon? (the local Fry's electronics

(San Diego CA) quickly sold out).

I guess that you're asking this because you might want a backup. I see no reason why HP would abruptly discontinue the 33S.

*Message #3 Posted by **Eric Lundgren** on 23 Feb 2005, 12:40 a.m.,*
in response to message #2 by Karl Schneider

Thanks Karl,

Ok for redundancy- Am I correct in the following?

1. FE = Fundamentals of Engr exam = EIT = Engr in Training. 2. The PE (Professional Engineer) exam is completely different, and discipline specific (ME, CE, EE, ...) taken once I have work experience, and may allow the exotic calcs depending on state?

If that's correct, I will shelf my beloved jumbo ENTER kbds for a year and master this 33s. I just found out that I may be ready for the EIT=FE exam this October, instead of next April. (I need the Engineering Thermodynamics course, which builds on the Thermodynamics I'm currently enrolled in).

Well, I'm actually glad, I feel alot of students here relying on the ti-89/Ti's may be up for a surprise when they learn of the news...

Well, back to the exciting world of fluid dynamics! best regards, Eric

Exceptions to NCEES policy

*Message #4 Posted by **Norris** on 23 Feb 2005, 11:48 a.m.,*
in response to message #3 by Eric Lundgren

All FE (or EIT) exams, and the vast majority of PE exams, are developed by NCEES. Anyone taking an NCEES FE or PE exam must abide by the NCEES calculator rules.

Historically, almost any calculator was acceptable on NCEES exams, but they have become much stricter in recent years. For 2005, you must choose from a short list of approved models. If you want programmability or RPN, then currently your only option is the 33S. There is no way to predict future calculator policies for 2006 or beyond, but it is highly unlikely that NCEES will return to their old, flexible policy.

As far as I know, the only PE exams that are exempt from the NCEES calculator rules are certain civil-related exams offered in California. These include the California Traffic, Geotechnical, Structural Seismic, Special Civil Seismic, and Special Civil Surveying exams. These exams were developed by the California Engineering Board (not NCEES), so they can set their own rules. Currently, California continues to allow any non-QWERTY calculator on these exams; for example, my 48GX was allowed on the two Special Civil exams in 2004. California also uses the NCEES Civil PE and Structural II PE exams, but in these cases the NCEES rules do apply.

Certain other states also offer state-specific exams in minor disciplines not addressed by NCEES (e.g. Forest Engineering PE exam in Oregon and Washington, Geological Engineering PE exam in Arizona and Nevada). In theory, the NCEES calculator policy could be waived on these exams as well, but I

don't know if this actually occurs in practice. These states may enforce the NCEES policy for both NCEES and non-NCEES PE exams, because it's obviously simpler to enforce uniform rules.

Bottom Line: The NCEES calculator policy applies to the FE exam and to practically all PE exams; the only exceptions that I know of are certain civil-related PE exams in California. You should review the current policy at ncees.org, and watch for annual changes in the future.

Re: Any recent/newly minted PEs' here?

*Message #6 Posted by **Fubar Vikinghelmet** on 23 Feb 2005, 9:26 a.m.,*
in response to message #1 by Eric Lundgren

"Any recent/newly minted PEs' here?"

Guilty as charged! I took the October 2004 test and passed; got the results last month.

The NCEES policy, dumb as it is, pertains to calculators with communications ability. ANY calculator with ANY port is verbotten. Even if the port is broken, even if you seal the port with epoxy (like I wanted to with my HP-28S), it's still a "no." Also, if the calculator has a QWERTY keyboard it's a no. So those dorks with the TI-92 or whatever that thing is are SOL. They've caught people cheating by either sharing/asking others in the test room via calculator communications.

That's the NCEES calculator policy in a nutshell.

You asking for advice and I will give you mine:

1. The FE/EIT is a nationwide, standardized test. It's the same everywhere.

2. The morning part is general, the afternoon part can be general engineering OR your major (i.e., Civil or Mechanical, etc.). You get to choose which you'll take in the afternoon right then and there.

3. Bring the 32SII and the 33S. Be completely fluent and comfortable with both (I brought two 33S' with me to the test - the proctors did, in fact, visually check them out). If you've studied properly, don't worry about what's on your calculator; they're not going to give you anything that can't be solved in a few minutes, by hand generally. (I can do a 3x3 determinant pretty quickly without a calculator, and that's about how difficult it'll be.) Also, the economics problems can be solved quicker by using the charts provided in the FE/EIT reference book if you don't pre-program your calculator (and with limited labels in the 33S, filling it with engineering economics problems is, IMO, wasteful).

4. Study, study, study. Do lots of problems (which I'm sure you've been doing). Get a lot of sleep; it's an endurance contest, too.

5. I do not expect the 33S to be in short supply nor do I expect them to be discontinued. As far as a run on them prior to the exams and the usual eBay vampires... I don't care. I bought my 33S' right after the April 2004 exams were over - since I figured that there'd be a glut of 'em then. I bought them direct from HP on the web and was happy.

Re: Any recent/newly minted PEs' here?

*Message #7 Posted by **Jeff O.** on 23 Feb 2005, 12:40 p.m.,*
in response to message #6 by Fubar Vikinghelmet

> Quote:
>
> Bring the 32SII and the 33S.

Unfortunately, if you bring the 32SII it will be confiscated. According to this, current policy is as follows:

"The following calculator models will be allowed in the exam room for use during the April 2005 and October 2005 examination administrations. *No other models of calculators will be allowed. Only the models listed below may be used on the examination."*
Hewlett Packard – HP 33s
Hewlett Packard – HP 9s
Casio – FX 115 MS and FX 115 MS Plus (Note: Models with "-SR" designation at end are also allowed.)
Texas Instruments – TI 30X IIS and TI 30X IIB
Texas Instruments – TI 36X Solar

Of course, last year the 32SII was on the approved list. Not sure what happened to get it banned, other than the NCEES wanting to lighten the burden on the proctors.

in response to message #1 by Eric Lundgren

Eric,

You've gotten a lot of great advice about exam formats and permitted calculators, and I'll add one more tidbit:

When it's time for your PE in four years or so, beware of reference overload. Unlike the FE/EIT, it's open book. Spend several months studying and working sample problems, and on exam day bring a select number of books that you absolutely need and are very familiar with (along with your 33S). You simply won't have the

time to wade through dozens of references!

Good luck -

Doug

Re: Any recent/newly minted PEs' here?

*Message #11 Posted by **Eric Lundgren** on 23 Feb 2005, 8:23 p.m.,*
in response to message #10 by DougT

quote: Unlike the FE/EIT, it's open book.

The FE/EIT is open-book in the sense that you are permitted the 'provided' reference manual during the exam, right?

So the PE is actually o p e n book, as in bring what you like? I did not know, but that is great advice, I'll be choosy.

Thanks to all for the great feedback. I'm getting used to the 33s as we speak. Eric

Re: Any recent/newly minted PEs' here?

*Message #12 Posted by **Norris** on 23 Feb 2005, 9:07 p.m.,*
in response to message #11 by Eric Lundgren

The PE is basically "open book", but there are a few restrictions. Some states ban books with solved sample test problems. Many states do not allow loose papers or post-it notes; all material must be bound in some manner (usually binders are OK).

Many states have an unusual rule: any handwritten notes in your reference books must be in ink, and *not* pencil. This rule is supposed to prevent people from copying PE test questions or answers into their reference books during the exam.

The only writing implement that you are allowed to have during the exam is the NCEES mechanical pencil. If your books have notes in ink, then they were presumably made before the exam, and are OK. But if your books have notes in pencil, then those notes could have been made during the exam, and could represent cheating.

It may sound strange, but you should get in the habit of marking potential PE reference books in pen, rather than pencil.

Re: Any recent/newly minted PEs' here?

*Message #13 Posted by **DougT** on 23 Feb 2005, 10:12 p.m.,*
in response to message #11 by Eric Lundgren

Exactly - nowadays the FE/EIT is restricted to the designated reference manual. I took my EIT in Virginia twenty years ago, before this policy was in place (I was able to take in a big honkin' binder), but coworkers who recently passed the test considered the new official manual adequate. Provided you studied beforehand, naturally!

For your future PE exam and its "open book", be sure to check your particular state's current rules as Norris has kindly & thoroughly described. Given the flux in allowed calculators, who knows what will be allowed in 2009...

OT: any opinions on Casio FC-100V ?

*Message #1 Posted by **Iuri Wickert** on 22 Feb 2005, 10:54 p.m.*

Hello

I'm searching for a financial calculator for Financial Math and Actuarial (sp?) Math undergrad classes.

Is this new Casio financial calculator worthwhile? Anyone's been using it? It compares favourably with HP12C/P and TI BAII? I haven't found a link to download its manual...

Best regards

Iuri Wickert

Where have you seen one for sale?

*Message #2 Posted by **Gene** on 22 Feb 2005, 11:12 p.m.,*
in response to message #1 by Iuri Wickert

I'd like to get the 100V and 200V.

If anyone knows where they are available, please let me know.

Gene Wright

Re: Where have you seen one for sale?

*Message #3 Posted by **Iuri Wickert** on 23 Feb 2005, 1:10 a.m.,*
in response to message #2 by Gene

Hi Gene

It's available in Brazil:

http://busca.americanas.com.br/procura.asp?id=10655&raiz=5359&kw=calculadora

Compare the prices... The Aurora can be found at R$190,00. On the "street market" the HP12CP costs about R$300,00; I'll check the Casio price on the street... The TI BAII shown is the old one (the pictures is correct, that's why I'm afraid to buy it). US$1,00 = R$2,60

Anywhere in the US? I'd really like to get a 100V

*Message #4 Posted by **Gene** on 23 Feb 2005, 9:12 a.m.,*
in response to message #3 by Iuri Wickert

Perhaps I'll check the australia location that seems to have them. Wonder what shipping would be? :-)

My HP-27S would not shut off, help!

*Message #1 Posted by **Davin** on 22 Feb 2005, 10:27 p.m.*

Just when I thought I've seen everything there is to my HP-27S calculator in the last 15+ years of ownership, a surprising new feature showed up yesterday. Everytime I turn the power off now, it automatically turns itself on after half a second (sometimes even 15 seconds).

This new auto-power-on feature, as I termed it, follows some bizarre beeping late last night. I was oblivious to the entire incidence as I was soundly asleep, but my wife alerted me in the morning that my calculator was beeping non-stop for hours. The beeping only stopped after I removed the batteries (the whole system froze like Windows). When I put the batteries back, the undesirable feature shows up. Thinking it might be a battery problem, I purchased and put in a new set of batteries to no avail.

I'm hoping there is something I could do to fix it. Much as I love my HP-27S, I hate to have to open the battery compartment and remove the batteries every time to turn it off. Any idea is appreciated (other than installing a power switch :), thanks in advance.

Re: My HP-27S would not shut off, help!

*Message #2 Posted by **Ron Ross** on 23 Feb 2005, 8:17 a.m.,*
in response to message #1 by Davin

Check your appointment alarms. I believe the Hp27s has a clock calander feature with alarms just like the Hp17/19 business calculators.

Re: My HP-27S would not shut off, help!

*Message #3 Posted by **Davin** on 23 Feb 2005, 11:49 a.m.,*
in response to message #2 by Ron Ross

Thanks, I checked again just to make sure and there is definitely no appt set.

Here's an update however. I left the batteries out overnight and put them back in this morning. I turned the calculator on , then off, it remained off for 20-30 seconds before it turned itself on again. I turned it off again and it took about 3 seconds before it turned itself on. After that, everytime I turned it off now, it comes back on in half a second. Other than this auto power-on, everything else works fine still.

Re: My HP-27S would not shut off, help!

*Message #4 Posted by **Bill (Smithville, NJ)** on 23 Feb 2005, 12:20 p.m.,*
in response to message #1 by Davin

Hi Davin,

Have you tried removing the batteries and then shorting out the battery contacts to discharge the internal capacitor? This should reset the calculator. Maybe it'll also reset some data bit that is causing your problem.

Does the 27S have any other resetting mechanism - such as a two or three key combination??

Good luck.

Bill

Re: My HP-27S would not shut off, help!

*Message #5 Posted by **Davin** on 23 Feb 2005, 1:07 p.m.,*
in response to message #4 by Bill (Smithville, NJ)

Yup, I tried shorting the battery terminals before but no luck. There are buttons to reset the machine. I tried those too w/o success.

Re: My HP-27S would not shut off, help!

*Message #6 Posted by **bill platt** on 23 Feb 2005, 12:41 p.m.,*
in response to message #1 by Davin

Hi Davin,

I have looked in my manual for the 27s, and in addition to the removing batteries, then shorting the terminals for a few seconds, there are some other tests and procedures:

*Resetting:

Hold down CLT wehile you press the third menu key from the left. It may be necessary to repeat the reset keystrokes severl times. The HP 27S displays "machine reset" to confirm. This reset will occurr automatically in some circumstances. (memory remains intact).

**Erasing Continuous Memory (delete4s everything you have stored):

Hold down CLR, and press the leftmost and rightmost menu keys simultaneously (all three keys at once). When the keys are released, you should see "MOMRY LOST"

***Self test:

1. Turn calc on. 2. If you have the printer, turn it on, too, 3. If possible, return to the MAIN display (shift main) 4. To start, hold down CLR while you pres the fifth menu key from the left (pressing the 4th menu key starts another meun test used at the factory. If you accidentally do thi one ytou can stop it by holding down the CLR key while you press the third menu key from the left).

Once the self test has begun, do not press any keys until you are ready to halt the test.

5. during the test, the calc beeps periodically, and displays various patterns and characters. Watch for one of two messages that are displayed at the end of each test cycle, before the test automatically repeats:

If it passes, "OK-27S-E"

If it displays FAIL followed by a 5 digit number, then you require service.

If you fail, run it again to be sure you did not cause it to fail by pressing the wrong keys etc.

Best regards,

Bill

Re: My HP-27S would not shut off, help!

*Message #7 Posted by **Davin** on 23 Feb 2005, 1:13 p.m.,*
in response to message #6 by bill platt

Hi Bill,

Yup, I tried all those combinations of keys. All the tests went fine w/o error. I also reset the machine and cleared the memory. In addition, I also did the test where I've to press every single key from top to bottom and left to right to test the keyboard. All checked out okay.

Thanks, Davin

Re: My HP-27S would not shut off, help!

*Message #8 Posted by **Nelson M. Sicuro (Brazil)** on 23 Feb 2005, 1:24 p.m.,*
in response to message #7 by Davin

Isn't the ON button lower than normal? If the button is defective, it may "press" itself on small vibrations due to a bad isolation on the contacts - but this is only a wild guess...

Best regards,

Nelson

*Message #9 Posted by **Davin** on 23 Feb 2005, 1:53 p.m.,*
in response to message #8 by Nelson M. Sicuro (Brazil)

Hi Nelson,

Thanks for your reply but somehow I don't think that's the case because it only powers itself on after it was turned off via the keypad. It would not turn itself on if I were to take the batteries out and put them back in no matter how hard I shake it.

-Davin

HP-32sII after HP-33S

*Message #1 Posted by **Canada** on 22 Feb 2005, 10:14 p.m.*

I bought a HP-33S some months ago even if a lot of negative coments were post here. I finally found that the calculator is a great one but have some problems.

- I don't think the decimal point is too small; i put a comma insted,,,

- Th real problem i can is is one that i didn't read much : pressing keys require too much force. I often use my calc when going to bed and it is difficult to make an easy contact when the calculator is not on a hard surface.

Now, some days ago i received a HP-32sII. Well i'm sure you all think like me : i prefer the size of that one, but i do really prefer the 2 lines display of the 33s.

Wow, what a keyboard : i really like the feeling of the 32sII; easy to push but have a great feedback.

The color scheme is, in my opinion, better with the 32sII; more easy to find keys you don't use too often.

Th V shape of the 33S is not annoying; it is only there to sell more with younger than me so if RPN is alive with this estetics caracteristics, why not!

But even if i find that the 32sII is better calculator i just realize that it cannot be very useful for my use: i just put 4 "small" equations and i don'T have enought memory too solve it! ouf... on my 33S i have 10 times equations than that and no problem with memory.

What can be really nice is a calculator that have the both good side of each calculators + IR printing (or at least a mini USB port for programs transfer)

2 lines display, data transfer, conservative color scheme, great keyboard, good size. If calculators can have child, the kid of the 33 and 32 should be a dream! :-)

Re: HP-32sII after HP-33S

*Message #2 Posted by **Eric Lundgren** on 22 Feb 2005, 10:24 p.m.,*
in response to message #1 by Canada

Yes, the 33s is a nice machine, all things considered.

I just noticed that programming is not identical:

32sii code: INPUT P INPUT + K STO -> X

33s code: INPUT P INPUT K + STO -> X

Well, its minor. I'm very happy with the keys (no misses yet!), but I'd have preferred sq(x) to be the shifted sqrt(x)...Nontheless, you are right, it is RPN & programmable, and small. Eric

Re: HP-32sII after HP-33S

*Message #3 Posted by **Bernardo Vargas** on 23 Feb 2005, 6:50 a.m.,*
in response to message #2 by Eric Lundgren

@Eric: You got a point: the most important features on a calculator are (1) RPN logic, (2) programmability, and (3) small size. I totally agree. I only would add SIMPLICITY.

I'm the happy owner of a 32SII, among others, and I could hardly complaint about it. It shares the above-mentioned features. I had a 48G and dismissed it because of its large size and over-complexity.

Re: HP-32sII after HP-33S

*Message #4 Posted by **Ed Look** on 23 Feb 2005, 4:25 p.m.,*

HP xPander on Ebay

*Message #1 Posted by **speck** on 22 Feb 2005, 7:39 p.m.*

Howdy, all. Been away from the boards for a while, but saw this on ebay, and thought somebody here might be interested.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=50577&item=5753310178&rd=1

Note, I am not the seller, nor do I have any friggin' idea who the seller might be. I merely provide it for those that are fans of HP products. Price seems high for a calc, but probably not for a fairly low volume prototype.

And if I even had an xPander, do you think I'd be selling it? I think not. :-)

HP48gII

*Message #1 Posted by **OzarkMtbr** on 22 Feb 2005, 1:11 p.m.*

Do any of you have the HP 48gII? It seems to be built off the hp49 line. If so, have you had problems with the HP48gII or HP49 keys becoming loose. They rattle and miss many key strokes or in some cases cause a double key stroke. I am on my third one and it is beginning to develop the same problem.

Thanks

Re: HP48gII

*Message #2 Posted by **Ron Ross** on 22 Feb 2005, 1:42 p.m.,*
in response to message #1 by OzarkMtbr

While it may not be built off the SAME EXACT LINE, it is probably built right next to the Hp49G+ with the SAME EXACT manufacturering processes and nearly identical parts.

If you really have to have RPN and a graphics, but don't need the fancy CAS or fast response, you should consider an Hp48G (if you have $$$$, the G+ or GX actually have more RAM than the 48GII), which still sell fairly cheaply on ebay. Nice keyboard, actually easier keyboard layout for general number crunching, built in eq Lib, very close behavior and programming to your Hp48GII.

Cons: Slow, Slow, and no CAS, and limitied memory ie holds one decent program plus 20 (10-20 steps/lines ea.) or so custom small programs (a GX could hold 3-5 decent programs plus 50+ custom programs or even more if you purchase memory cards). I use one at my desk. For general number crunching and its units conversions and eq library make it both a reference and an all purpose tool.

I have a 49G+ and find its speed very easy to get used to. For work though I cannot afford to miss keystrokes, but for fancy coursework, I might give it a chance. But I just don't trust it to hold up at work. Therefore, I don't beat on it nearly as much as my tried and true Hp48G (I actually have a GX at home also, but I find the garbage collection on the GX with its extra memory to take longer and therefore seem even slower than the lower end HP48G). Therefore for general use, the Hp48G actually seems much faster than the Hp48GX.

My advice: Send it back for replacement (actually you might get Hp to replace it with an Hp48G+ if you ask). But the performance of the Hp48G+ may not be acceptable to you either. But you might also consider buying an Hp48G on ebay, typical price is $30-45.

Re: HP48gII

*Message #3 Posted by **OzarkMtbr** on 7 Mar 2005, 12:08 p.m.,*
in response to message #2 by Ron Ross

I do have a HP-48GX. It has served my great for 11 years now. It is my personal calulator and I do not like using it at work. My office bought me a HP-48GII. I am on the fourth one now and each has had a keyboard failure after 3-4 months of use. I talked to an HP tech person and she said that they were all from the same manufacturing batch. The latest one they have sent me has a different serial prefix so hopefully it was just a limited manufacturing problem. You are correct with saying the old HP-G series is a much

better built calulator. I hate to see that model has ended. I guess no one else here has had the keyboard problem. Something I found interesting was when talking with the HP tech support, the support person found it odd that when the replacements were sent that they did not ask for the old ones to be returned. She thought they either ment it was a known issue or that they warranty department did not care about fixing the problems.

Thanks for your response.

hp49g- (was: HP48gII)

*Message #4 Posted by **Raymond Del Tondo** on 22 Feb 2005, 2:41 p.m.,*
in response to message #1 by OzarkMtbr

The '48gII' is a reduced 49g+,
and has nearly nothing to do with a real HP-48.
So the model name 49g- fits exactly.
It's just marketing which could lead you on the wrong track.

Raymond

"Completed Voyager" redux: the HP-10C

*Message #1 Posted by **Karl Schneider** on 22 Feb 2005, 3:39 a.m.*

Several weeks ago, I joined the relative few who own a complete set of HP Voyager-series calculators -- the 10C, 11C, 12C, 15C, and 16C. (The "KinHPo" 12C Platinum is not included in this set, nor do I intend to purchase one.)

The last and most difficult one to obtain, of course, was the 10C. Introduced in 1982 and discontinued in 1984 -- presumably due to poor sales and lowered prices -- the supply of these is quite limited, and high prices are the result. For a functionally-perfect and cosmetically excellent 10C on eBay, I paid the price of a 15C in a similar state. I hadn't seen too many offered on eBay; the opportunity was enticing.

The 10C, I'm sure, was an attempt to fill the price/product niche of the entry-level scientific model, much as the 31E and 32E models did for the Spice series. (One can infer that the 15C was the successor of the 34C, and the 11C similarly replaced the 33C).

Where HP erred with the 10C, I believe, is omitting useful functions in order to provide rudimentary programmability. It's as though HP considered it unthinkable not to fully exploit its Continuous Memory technology by producing a nonprogrammable scientific calculator. Instead, they foisted off a substandard product that only the unknowledgable and the budget-conscious purchased.

The programmability it offered was the simplified paradigm also built into the finance-oriented 12C -- no insert/delete editing, no labels, no subroutines. The most a user could enter was 79 lines of unstructured programming, displayed as numerical keycodes. And yet, in the 10C User's Manual, 40 of the 125 pages are devoted to programming! (By contrast, the 15C User's Manual had 293 pages.)

The 10C, with only one shift key, had a limited number of keyboard positions. Ten of these were allotted to functions pertinent only to programming (GTO, R/S, PSE, SST, BST, P/R, MEM, x<=y, x=0, CLEAR PRGM).

I believe that the HP-10C might have been a viable quality "entry-level" product as a nonprogrammable calc with more mathematical functions -- like a modernized 32E with Continuous Memory and one shift key. I have an idea what it should have been, using the contemporary Voyagers, Spices, and other previous models as guidance. I'll save that for later...

in response to message #2 by Mike (Stgt)

Mike --

I appreciate the greeting, but I can honestly say that I've been a "club member" since November 1983, when I bought my 15C new for US$109. (Still have it, still works great). However, I acquired the other four models only within the past three years -- two from eBay, and two from a local electronics reseller who also appreciates the 1980's HP calculators.

I've always been delighted with the 15C. Like Namir, though, I've learned only recently just how superb it is. (Valentin Albillo's treatises have helped me to "see the light".)

My greeting was for complete your collection of all Voyager.

Ciao.....Mike

Re: "Completed Voyager" redux: the HP-10C

*Message #5 Posted by **Thomas Okken** on 22 Feb 2005, 7:27 a.m.,*
in response to message #1 by Karl Schneider

I bought a 10C when I started going to college... I had a 41CX but I was worried that it might not be allowed for use during tests.
I liked the 10C a lot: it had all the functions I needed and then some, and it was just programmable enough so that you could store a function to make plotting it easier, or to program a basic regula falsi root finder on the fly to check results.
I'm sure the 10C would have sold a lot better if it had been introduced at the same time as the 11C, but as it is, it was always a bit too "low profile", I think. How do you hype a new model if it has *less* of everything than all the existing models in the series?

One reason why I liked it especially, and why I'm really sorry I don't have it any more, was because it was so pretty. The lack of a blue 'g' key made the keyboard look tidy, and the whole machine was just so elegant compared to the other Voyagers.

- Thomas

Re: "Completed Voyager" redux: the HP-10C

*Message #6 Posted by **Namir** on 22 Feb 2005, 11:45 a.m.,*
in response to message #5 by Thomas Okken

I remember buying both the HP10C and the HP11C when they first came out. The programming features of the 10C reminded me of the HP-55 (except the HP11C has more memory steps). I was also using the HP41C since it was launched. This made me prefer label-oriented branching that line-number-oriented branching. I sold the HP10C to a fellow engineer at the office and kept the 11C. Today I have the entire Voyager collection--all bought from eBay.

I have come to appreicate the 15C more now than when it first came out. I feel the same way about the

HP42s.

Namir

Re: "Completed Voyager" redux: the HP-10C

*Message #7 Posted by **Juan J** on 25 Feb 2005, 11:25 p.m.,*
in response to message #6 by Namir

I remember seing a 10C back in the mid-1980s, and it indeed looked tidy, lacking a blue shift key. A minimum RPN, I thought back then.

After quite a while looking for one, I finally got myself a 10C in December 2003. The manual was well-written and a significant part of it was devoted to programming. And while its capabilities are rather limited, it is good for programming a function on the fly or do some repetitive calculations when there is nothing else at hand.

It is interesting to note (have anybody tried this?) that some HP-25 programs can be ported to the 10C without much hassle. An interesting porting (for me during a while) was the Russian Roulette game, about a year ago. I had to visit the doctor frequently, and I found myself using any number as a seed and playing while I waited.

A basic calculator that has RPN, some lexibility of its own and a nice look. My choice for simple calculations instead of a four-banger, and a good companion to ease the tension while you wait for the doctor...

possible explanation for 49g+ missed keystrokes

*Message #1 Posted by **Eric Lundgren** on 22 Feb 2005, 12:18 a.m.*

Just got off the phone with a helpful HP support tech.

He pointed out that displaying the clock would contribute to missed keystrokes,

after fiddling with the machine further, it appears that I never miss keystrokes (pressing four '4's very rapidly generates '4444' on the stack) if the stack is clean.

Once the stack gets 3 levels deep, I begin getting 44 instead of the inteded 444, and so forth. So could 'overclocking' the machine resolve this (as VPN suggested earlier)?

If you read this, VPN, could you please help me understand how to accomplish 'overclocking' it? Also, will it cause damage over time to the hardware?

I can't imagine clearing the stack every few calculations.. Eric

Re: possible explanation for 49g+ missed keystrokes

*Message #2 Posted by **Raymond Del Tondo** on 22 Feb 2005, 2:44 a.m.,*
in response to message #1 by Eric Lundgren

Hi,

I think the only chance to get a somewhat stable entry mode,
is to experiment with ->KEYTIME .
There were several threads discussing this design flaw.

Of course you have an alternative if input reliability is important:
Just use an HP-48, because this machine normally doesn't miss key strokes;-)

Raymond

Re: possible explanation for 49g+ missed keystrokes

*Message #3 Posted by **bob** on 22 Feb 2005, 3:16 a.m.,*
in response to message #2 by Raymond Del Tondo

->KEYTIME has nothing to do with it. Overclocking will not help either. When the user strikes a key, it triggers an ARM interrupt. The ARM emulation layer must then fake a saturn interrupt. The problem is sometimes this takes too long (the OS has several tasks to juggle) and the key is no longer registering by the time the Saturn keyboard handler is called.

It is more complicated then this, but that gives you the general idea.

Re: possible explanation for 49g+ missed keystrokes

*Message #4 Posted by **Raymond Del Tondo** on 22 Feb 2005, 5:42 a.m.,*
in response to message #3 by bob

Yes, I remember a discussion about that,
and that there was a problem recognizing
keys when the ARM is in low power state.

I also think to remember that ->KEYTIME has some
influence to the key registering even on the 49g+,
but I won't search for the articles,
because I don't care about the 49g+.
Thanks god I sold my 49g+ !

After all, there are immanent design flaws,
and the problems won't be resolved.

So my suggestion is still active:
Use an HP-48 instead;-)

Raymond

>
> It is more complicated then this, but that gives you the general idea.

Hm... interesting. I have been running Hrastprogrammer's HP-42X on my HP-49G+ for over a half year now without any missed keystrokes. Maybe the "inner loop" of HP-42X is much lighter than that of the HP-49G itself?

Best regards,
Erik Ehrling (Sweden)

Re: possible explanation for 49g+ missed keystrokes

*Message #6 Posted by **Veli-Pekka Nousiainen** on 23 Feb 2005, 2:28 p.m.,*
in response to message #5 by Erik Ehrling (Sweden)

Maybe that program never allows the calc to go to Slow Mode (12MHz) during key entry or operator hesitating?
I though the problem happens when ARM ramps up to 75MHz and user presses a key and clock updates the LCD all the same tick.
[VPN]

Re: possible explanation for 49g+ missed keystrokes

*Message #7 Posted by **Veli-Pekka Nousiainen** on 22 Feb 2005, 6:41 a.m.,*
in response to message #1 by Eric Lundgren

Actually the 49g+ is underclocked, so overclocking does no damage (sue me:)
ClockSpeed Adjustment Tools - Overclock your 49G+ 2.00:
http://www.hpcalc.org/details.php?id=6081
Try running your calc at a fixed speed all the time
I only overclock for some long programs (and go back at the end)
Just avoid slow mode and displaying the clock

HP-21 trivia

*Message #1 Posted by **Eric Smith** on 21 Feb 2005, 7:22 p.m.*

I haven't used an HP-21 in many years. Now that I have it running in Nonpareil, I noticed something interesting about it. Pressing the shift key (blue) terminates digit entry. I didn't recall seeing that on other HPs, but it turns out that the HP-80 does it as well, though the HP-45 and HP-55 do not.

Re: HP-21 trivia

*Message #2 Posted by **Raymond Del Tondo** on 21 Feb 2005, 8:27 p.m.,*
in response to message #1 by Eric Smith

Similar on the (real) HP-33C:
Pressing one of the shift keys 'terminates' digit entry.
You can't toggle the shift.

Raymond

Re: HP-21 trivia

*Message #3 Posted by **Eric Smith** on 21 Feb 2005, 9:06 p.m.,*
in response to message #2 by Raymond Del Tondo

Actually on the HP-33C pressing the shift does not terminate digit entry. It's the key you press AFTER the shift that does that. But there's an exception to that: you can hit "f CLEAR PREFIX" or "g f CLEAR PREFIX" without terminating digit entry.

The way I originally noticed on the HP-21 is that if you're in he default FIX 2, press "1" then the blue shift, the display changes to "1.00", indicating that digit entry has been terminated. Same on the HP-80. I haven't checked the HP-70 or HP-22, but I don't think any HPs introduced in 1976 or later behave that way.

Re: HP-21 trivia - HP-25

*Message #4 Posted by **Marcus von Cube** on 22 Feb 2005, 2:34 a.m.,*
in response to message #3 by Eric Smith

On an HP-25, neither shift key terminates digit entry but "f clear prefix" does. So once the shift keys are pressed, there is no way back.

Re: Nonpareil not trivia (at least for me)

*Message #6 Posted by **Mike (Stgt)** on 22 Feb 2005, 9:17 a.m.,*
in response to message #1 by Eric Smith

I am not a PC programmer (IBM host only, FORTRAN, REXX, Pipe under VM/ESA) so I just tried Nonpareil 0.44 under Cygwin. And failed. Well, I have not a complete Cygwin, only what is needed to _run_ a well known host emulator and to compile the last HP49-CAS. So what I get is

make: *** No rule to make target `glib.h', needed by `debugger.d'. Stop.

Any hint? TIA.....Mike

Re: Nonpareil not trivia (at least for me)

*Message #7 Posted by **Eric Smith** on 22 Feb 2005, 1:47 p.m.,*
in response to message #6 by Mike (Stgt)

Yes, you need to have the GTK+ toolkit (version 2.x), and the associated GDK and Glib libraries installed, as well as several others they depend on.

Building Nonpareil to run on Windows is quite a hassle. I plan to sell the Windows version in the future, but it's not quite ready yet. There will be a free demo that has only a few calculator models and doesn't save state.

Implementing not saving state is really easy since I don't have any code to save/restore state yet. That's one of the things I need to complete for the version I'll sell.

*Message #8 Posted by **Mike (Stgt)** on 23 Feb 2005, 4:21 a.m.,*
in response to message #7 by Eric Smith

Hello Eric!

First and foremost: let me express my highest esteem for your published work. It makes me a bit envious, how much time you have to care for all those ancient gems. Tonite I read your paper presented at the HHC 2004 conference in San Jose, California on 26-SEP-2004 and was a bit sad it was only 19 pages: this story of success should continue.

Next: I tried to augment my quite incomplete Cygwin (limited just to run an S/390 emulator) with this and that. But still no final success. For Nonpareil I looked for a recipe similar to step 13 in this one. I hope to find some time next weekend to continue with your Nonpareil.

Ciao.....Mike

Re: Nonpareil under Cygwin

*Message #9 Posted by **Eric Smith** on 23 Feb 2005, 12:29 p.m.,*
in response to message #8 by Mike (Stgt)

Sorry I can't offer detailed help with Cygwin. If the Cygwin installer knows about GTK+ 2.x, installing that might get you everything you need.

Re: Nonpareil under Cygwin

*Message #10 Posted by **Eric Smith** on 23 Feb 2005, 12:31 p.m.,*
in response to message #8 by Mike (Stgt)

Forgot to mention that under Cygwin you would have to have the X server installed as well (XFree86 or x.org).

Re: Nonpareil under Cygwin

*Message #11 Posted by **Mike (Stgt)** on 24 Feb 2005, 6:39 a.m.,*
in response to message #10 by Eric Smith

Tnx a lot. I'll try.

Ciao.....Mike

Re: Nonpareil under Cygwin

*Message #12 Posted by **Mike (Stgt)** on 24 Feb 2005, 10:05 a.m.,*
in response to message #10 by Eric Smith

Seems I have to deeper into Cygwin: there is a GTK+ and GTK2, but no GTK+2. Currently I play with "your" Woodstock ROMs in my NutEm.

Ciao.....Mike

Re: Nonpareil under Cygwin

*Message #17 Posted by **Mike (Stgt)** on 11 Mar 2005, 3:21 a.m.,*
in response to message #16 by Mike (Stgt)

"If anything else fails read instructions." This quote helped once more <G>. I may now run Nonpareil (see http://nonpareil.brouhaha.com) on WinXP using

Cygwin. Very impressing! All those elder HP calcs emulated.

Alas I currently can not give a simple recipe what you realy need to install for Cygwin. I used a "brute force" method to make it work and regard it as a stochastical foreordination that MAKE did it. Next I found that Nonpareil expects all files stored in Unix style.

ASAP I'll restart from Zero and log all steps to make Nonpareil work on a windozed PC. IMHO it's worth the effort.

Ciao.....Mike

in response to message #18 by tony

Hello Tony!

Thank you 4 the flowers. I deinstalled Cygwin yesterday to start from zero, if you don't mind I send you a recipe what you need to compile and run Nonpareil. As I am _not_ a Cygwin guru I'd like your confirmation before I put it online (my recipe, not Nonpareil).

Or is there someone else out there who may tell about the do's and dont's of Nonpareil under Cygwin?

Ciao.....Mike

Re: Nonpareil under Cygwin

*Message #20 Posted by **Andrés C. Rodríguez (Argentina)** on 14 Mar 2005, 11:38 a.m.,*
in response to message #19 by Mike (Stgt)

Please post your findings here!! (and thank you in advance for your effort!)

Re: Nonpareil under Cygwin

*Message #21 Posted by **Mike (Stgt)** on 15 Mar 2005, 7:45 a.m.,*
in response to message #20 by Andrés C. Rodríguez (Argentina)

Yes, of cause, but pls let my finding be confirmed. There are still two steps of 15 that are for sure _not_ the canonical way to go.

Ciao.....Mike

I see an and Hp34/45/55 on my screen!!!!!

*Message #22 Posted by **Mike (Stgt)** on 17 Mar 2005, 8:43 a.m.,*
in response to message #21 by Mike (Stgt)

"I see an and Hp34/45/55 on my screen!!!!!"

Tony! Thank you very much for your help.

All others: I have to correct my recipe how to run the classic HP calculators (HP-35, HP-80, HP-45 and so on - those machines that layed the foundations for HP's name for pocket calculators) on a windozed PC using E. Smith's Nonpareil. ASAP I'll shouw you the corrected recipe, I want to restart once again from Zero to count the MBs you need to install - so everybody may decide if it's worth the effort.

Ciao.....Mike

and, and HP-80!

*Message #23 Posted by **Tony (nz)** on 17 Mar 2005, 8:14 p.m.,*
in response to message #22 by Mike (Stgt)

Mike, The HP-80 appears to run perfectly!

I must have downloaded about 60-70 MB in total, but I picked up a little extra by way of source code and also I think I got vim, and I was tempted by a few gnome ganes<G>. On installation that expands to about 230MB here.

Your instructions worked flawlessly here :-) Thanks for your work!

Cheers, Tony

still not perfect

*Message #24 Posted by **Mike (Stgt)** on 18 Mar 2005, 3:55 a.m.,*
in response to message #23 by Tony (nz)

Hi Tony!

I am not convinced of my recipe as last nite I restarted from Zero again and failed. Yes, there are nearly 14,000 files to install that sum up to about 200 MB (the download is much less as it's packed). So to run Nonpareil on a windozed PC is something for the HP-mad.

Anyway - it's great fun to have a working HP-35 on the screen.

Ciao.....Mike

NOW! Here we go...

*Message #25 Posted by **Mike (Stgt)** on 21 Mar 2005, 3:13 a.m.,*
in response to message #24 by Mike (Stgt)

See here for my recipe how to run Nonpareil (at least part of it) under Cygwin on a "windozed" PC.

Ciao.....Mike

HP15C

*Message #1 Posted by **Bernardo Vargas** on 21 Feb 2005, 4:28 p.m.*

Hey folks! I'm sure you all know the page

http://hp15c.org/

Does anyone know if this petition has already been posted to the HP management?

Re: HP15C

*Message #2 Posted by **Namir** on 21 Feb 2005, 5:30 p.m.,*
in response to message #1 by Bernardo Vargas

Having met some of the HP calculator folks at the HHC2004 in San Jose, CA, last September, I got the feeling that the HP calculator division is not what it used to be as far as having resources. It is easy to draw the conclusion that HP will not reproduce models that have been discontinued. And even if they did, the quality of the revived models will be greatly in question. Note the problems many folks have with the last generation of HP calculators produced by a Chinese subcontractor for HP.

Your best best is to buy a nice HP-15C from eBay.

Namir

Re: HP15C

*Message #3 Posted by **Mike T** on 24 Feb 2005, 7:24 a.m.,*
in response to message #1 by Bernardo Vargas

I recently brought an very nice HP11C from www.hpcalcman.com.

I beleive they still have some 15Cs available - a little expensive but if my 11C is anything to go by you should be able to get a nice example from them.

GITS_HP15C

*Message #4 Posted by **Tizedes Csaba [Hungary]** on 24 Feb 2005, 10:29 a.m.,*
in response to message #3 by Mike T

If anybody can to extract the machine code of 15C's ROM, and the hardware's documentation I'm think that is possible to emulate it on a PLC. Plus some electronics :), and HP15C will rebirth in a little girl...

“And where shall I go now? The net is vast and limitless.”

calculators allowed at school

*Message #1 Posted by **Mike (Stgt)** on 21 Feb 2005, 8:48 a.m.*

Anybody here who may point me to the list of magisterially (?) allowed calculators in schools in BW (a county in SW Germany)? The first math teacher ("Fachschaftsvorsitzender") told me, they may only use Casio.

That leads me to a second question: is there somewhere an emulator for Casios with a quality sufficient for educational purose -- with a surface similar to Emu48, Emu42, V41, or VTI?

TIA.....Mike

Re: calculators allowed at school

*Message #2 Posted by **Christoph Klug** on 21 Feb 2005, 9:21 a.m.,*
in response to message #1 by Mike (Stgt)

Dear Mike,

in North Germany (Niedersachen) my son Jonas uses the TI84 - unfortunately no HP :-(

Regards - Christoph

*Message #3 Posted by **Menno** on 21 Feb 2005, 10:12 a.m.,*
in response to message #2 by Christoph Klug

At my "fachhochschule" (NL) was the HP32s the standard calculator. For myself I organised a 42S.

And yes it is true that certain corrupt teachers make certain calculators mantatory, so they can get a profit from a local supplier. Next to the other oldfashioned teachers who prefer the student to learn everything from heart. These also want to reintroduce the slide rule.

Motivation for the fear for advanced calculators is that a student can put the formulas in the calculator.

It makes me very sad to see that it still is a problem.... In the time of internet, WAP, UMTS etc.

Re: calculators allowed at school

*Message #4 Posted by **Menno** on 21 Feb 2005, 10:38 a.m.,*
in response to message #2 by Christoph Klug

At my "Fachhochschule" (NL) the HP32s was the standard calculator. For myself I organised a 42S, and allmost nobody noticed the difference, because there were 32S and 32SII in use. A 48s(x) was not allowed. A year after graduation I showed to a very oldfashioned fossile teacher the capabilities of my HP42S. In the fight that followed he tried desperately to withdraw my degree and failed. All examinations are now, at my old "Fachhochschule" :

1: with everything you want to use, except a connection to the outside world, so all your books and all your notes you can take with you to you exam,

2: the only thing allowed is something to write and nothing else.

And yes, it is true that certain corrupt teachers make certain calculators mandatory, so they can get a profit from a local supplier. Next to the other oldfashioned teachers who prefer the student to learn everything from heart. These also want to reintroduce the slide rule.

Motivation for the fear for advanced calculators is the possibility for a student to put the formulas in the calculator. And to avoid the problem of checking every calculator for "storage capabilities" just one kind of calculator is allowed to use, and the casio is a very simple calculator. I don't know if there is a possibility to put an advanced calculator in the "skin" of a simple casio, as a way of undermining these oldfashioned regulations.

It makes me very sad to see that it still is a problem.... In the time of internet, WAP, UMTS etc.

In the real world you use your books, notes, internet to find the solution to the problem. Only time is the limiting factor.

*Message #8 Posted by **Mike (Stgt)** on 22 Feb 2005, 6:29 a.m.,*
in response to message #7 by Veli-Pekka Nousiainen

The choice of a calculator is not mine as a parent, its the school that has to decide. Currently in BW (south-west Germany) graphing calculators _must_ have no CAS. Only few schools are selected for a test with CAS, but then the arithmetical problems to solve in test are quite different. Interestingly most CAS-testing schools use Maple or TI-92, only one try with HP-49.

About the emulator for Casio calculators: seems there is fallow only. I only found one, but IMHO it's not too useful. And for sure it may not be used in education. So once more *hats off!* for Emu48 and alikes.

"It makes me sad ..."

*Message #11 Posted by **Palmer O. Hanson, Jr.** on 22 Feb 2005, 4:02 a.m.,*
in response to message #4 by Menno

As this old-fashioned fossil engineer (I received my degree in 1950) understands it, some modern students believe that it is acceptable to subvert the intent of instructors to ensure that their students learn some things by heart by hiding formulas in the memory of their calculators. In my school days we would have called that CHEATING.

During a discussion of NCEES calculator limitations last year one correspondent wrote "...Granted, if you brought the 17B you would also need a good scientific, but with its solver and long variable ames, you would be able to load up some pretty good formulas that have a high probability of being on the exam. ..." In my school days we would have called that CHEATING.

Back in my school days we used slide rules. I hadn't even thought that there was a really sneaky way to use my slide rule to bring formulas with me for use in tests. Then last year I was buying a Post 1447 (made in Japan by Sun Hemmi) for my collection at a garage sale. Another shopper observed my purchase and stated that it was his Hemmi that allowed him to get a passing grade in physics class. I asked how that could be. He explained that there were two unused surfaces on his Hemmi on which he could write formulas that he had trouble remembering. One surface was on the frame under the slide.

The second could be made available by bending the tabs which held the celluloid insert in place on the back of the Hemmi such that he could move the insert and store more formulas under the insert. In those days we called that CHEATING.

It made me sad when students in my day used crib sheets and wrote formulas on the palm of their hand. It makes me sad when today's students bring formulas they are expected to know from memory into exams in the memory of their calculators. Find other words to pretty up the process if you must. The bottom line is that it's CHEATING.

Re: "It makes me sad ..."

*Message #12 Posted by **Mike (Stgt)** on 22 Feb 2005, 6:12 a.m.,*

Hi Mike,

> Quote:
>
> No one asks how you get these results -- only how fast

Actually, in my experience this is not true at all. Perhaps even more so than in school, engineering analysis requires a clear record of the assumptions, approach, work, as well as arithmetic.

Or, answers are meaningless unless supported by analysis.

regards,

Bill

Re: "It makes me sad ..."

*Message #14 Posted by **Mike (Stgt)** on 22 Feb 2005, 11:11 a.m.,*
in response to message #13 by bill platt

OK, I probably used the wrong words to describe the difference to school: in industry you do not need to find the solution by heart, you may use all reasonable resources.

But, do you know the quality system of ASME? If you get a signature that your results are achieved according to the standard you may erase all records about how you got that signed paper. Just to prevent evidence in case of error.

Answers are meaningless, at least for the computer that calculated them. In a case of a faulty axle lubrication the responsible engineer wondered: "But the computer calculated it that

way". Would it help if we send him back to school to learn tribological characteristics by heart?

Well, school should prepare for the tasks after school with leading edge methods. We had been told: you may cheat as much as you can - but never get caught cheating.

Ciao.....Mike

Re: "It makes me sad ..."

*Message #15 Posted by **GE (France)** on 22 Feb 2005, 6:27 p.m.,*
in response to message #14 by Mike (Stgt)

Actually, at school you're not solving problems, just being trained to solve them. Rules state you must not use 'reminders', ONLY to train your mental muscles.

If you expect that "the solution" always exists somewhere, ready to replace variables by their current values, be warned : some solutions must be INVENTED (CREATED). And if your brain is just a preprocessor for Google searches, well... maybe you're not very smart, degree or not.

Re: "It makes me sad ..."

Yes, You're A Fossil - Rest In Peace

*Message #17 Posted by **J.C. Randerson** on 22 Feb 2005, 8:50 a.m.,*
in response to message #11 by Palmer O. Hanson, Jr.

When I was a mechanic, no one ever brought a car in and said "fix it but you can't use a certain tool." To tell me to solve engineering problems but then deny the use of the machine of my choice is just that.

Your self description as a fossil is most apt. Your thinking is dead, may it rest in peace.

Keep 'em flying, Mr. Palmer O. Hanson, Jr.!

Cheating = BAD. If you have to cheat, you can't compete.

However, cheating is when one does something against the rules. Writing formulas for physics

on the inside of a slide rule is certainly cheating. BUT: if a test is open book, it isn't. We've all (I'm pretty sure) had open book and closed book tests. Rules are rules (even slide rules!). The PE exam is an open-book test. The FE is partially open-book, as the examinee is provided with a pretty big book full of formulas AND this book is readily available (free download, or you can buy a hard copy) from NCEES a year prior to the exam. If you study properly for the FE, you'll be able to solve all the problems using just their book (except you'd better memorize completing-the-square!). And if you haven't studied properly for the exams, you have a 1-in-4 chance of getting a question right simply by guessing (it's multiple-choice these days).

Regarding calculators, it is NOT programmability, or memory, or built-in functions that's at issue with the NCEES. It is communications ability. That is, any calculators with the ability to communicate with another device is prohibited; thus, you can't share answers with others during the exam and you can't steal the exam by typing in questions (NCEES also prohibts calculators with QWERTY keyboards). Therefore, my HP-28S was prohibited because it has an infrared commo port. My TI-66 is prohibited because it has a printer port that could be configured (I guess, I'm civil, not electrical...) into a commo port, etc. NCEES also probits highlighters and any writing implements other than the ones they provide because some jerk brought in a pen scanner and tried to steal exam questions!

You know, wise asses that waste their intelligence and creativity thinking of lowlife ways to do things like that ought to be similarly dealt with:

They should be apprehended and sentenced to teach math or writing or science in high school... IN THE INNER CITY. Give the guy a boxcutter, kevlar vest, and a HP 6S or some no-name from a 99-cent store just to keep things fair!

Re: "It makes me sad ..."

*Message #23 Posted by **bill platt** on 22 Feb 2005, 9:32 a.m.,*
in response to message #11 by Palmer O. Hanson, Jr.

Hi Palmer,

You are correct about improper use of stored information within an educational framework.

Apparently, some of the responses you have received to your post miss this point. Of course it is OK for a practicing engineer to use a fancy calculator and store formulas in it. But that is not appropriate for a test, where the professor has made a point of limiting your information, for the purpose of testing.

There was, when I was in school, what I would call the 90% rule: 90% of people would cheat if they could, though only 10% of them would actually cheat. Of the 100% of the class, only 10% understood that cheating was in fact a self deceit.

Regards,

Bill

*Message #25 Posted by **J.C. Randerson** on 22 Feb 2005, 2:09 p.m.,*
in response to message #24 by Ed Look

I passed all my engineering math classes jumping through the hoops of the pure mathematicians, no calculator allowed, with flying colors. I've never been thrown out of a class, so you're blowing a pipe dream there. I know when to be diplomatic and when not to be. Bowing obseqiously to authority is just not my style. I can and will continue to be confrontal when I see fit. Just because one may have a degree doesn't mean they're god. I want to see someone do something now, not just rest on past laurels. In short, you're only as good as what you're solving right now.

in response to message #11 by Palmer O. Hanson, Jr.

Mr Palmer Jr (?)

I agree with the fact that cheating is not the way to go. But you will have to agree that a lot of people use every mean to reach their goal. A decade after my graduation I discovered that there are a lot of *** walking around that have no problem at all to make a nice presentation of somebody else his/her work. We call them the "powerpoint specialists"

I am happy to be a engineer, a world in which the "powerpoint specialists" are outnumbered.

On the other hand; I started highschool just in the last year of the sliderule. The discussion was the same: electronic calculator were outbanned by old math-teachers.

Don't stop new developments !

So in education or open book or just a pencil.

Cheating...on an open-book exam?

*Message #27 Posted by **Norris** on 22 Feb 2005, 6:24 p.m.,*
in response to message #11 by Palmer O. Hanson, Jr.

<< During a discussion of NCEES calculator limitations last year one correspondent wrote "...Granted, if you brought the 17B you would also need a good scientific, but with its solver and long variable ames, you would be able to load up some pretty good formulas that have a high probability of being on the exam. ..." In my school days we would have called that CHEATING. >>

Possibly Mr. Hanson is not familiar with the format of NCEES exams. These exams are essentially open-book; extensive memorization of formulas is not expected. For the FE and FLS exams, NCEES supplies all candidates with a detailed Reference Manual. For the PE and PLS exams, candidates may bring in almost any references that they desire. The exams are essentially "open-calculator" as well, although your calculator must be on the current NCEES "approved" list.

Historically, virtually all calculators (except possibly those with QWERTY keyboards) were allowed on NCEES exams, and it was perfectly legal to program them with formulas or equations prior to the exam. The HP41C, 42S, and 48 series were all very popular with exam candidates during the 1980s and 1990s. If programming them yourself was too much trouble, then commercial calculator software for the exams was readily available and advertised.

As of 2004, NCEES has banned graphing calculators, but they still allow the programmable 33S, and there is still a perfectly legal and aboveground trade in commercial 33S exam sofware (e.g. www.chotkeh.com, www.33ssurveyor.com). Chotkeh, in particular, has been around for many years. If NCEES had any problem whatsoever with such vendors, then state engineering boards would shut them down immediately. But obviously they don't.

Believe it or not, it is both legal and ethical to use a pre-programmed calculator on an NCEES exam, and it has been for the past 30 years. It's true that NCEES recently banned graphing calculators, but the ban was not due to their programmability -- it's because NCEES thinks that their alphanumeric or communications capabilities could be used to copy or transmit exam questions.

This may seem strange to you, but NCEES genuinely doesn't care what is in your calculator's

memory when you enter the exam room. You can bring in absolutely any program or equation that you like. But NCEES *does* care (a great deal) about what is in your calculator's memory when you *exit* the exam room. From the NCEES perspective, "cheating" is defined as "using your calculator to copy the exam questions". As long as you only use your calculator to answer the exam questions -- whether through programming or not -- then you're legit.

Well-Stated

*Message #28 Posted by **J.C. Randerson** on 23 Feb 2005, 6:54 a.m.,*
in response to message #27 by Norris

Very well-stated. Problem is that fossils like this Hanson seem to be the current rulers of NCEES. In their mind, using anything but some basic four-banger calc is cheating. If they had the guts to admit it, they just don't like technology. And these guys claim to be engineers? @#$%!!

Re: Well-Stated

*Message #29 Posted by **Norris** on 23 Feb 2005, 2:32 p.m.,*
in response to message #28 by J.C. Randerson

<< Problem is that fossils like this Hanson seem to be the current rulers of NCEES. In their mind, using anything but some basic four-banger calc is cheating. >>

Possibly Mr. Randerson missed the point of my post, which was to emphasize the *differences* between Mr. Hanson and NCEES as regards "cheating".

The intended logic ran as follows: NCEES currently allows programmable calculators and commercial exam software on their open-book exams, and has done so for many years. This indicates that NCEES does not regard the use of such tools as "cheating", in contrast to the opinion originally suggested by Mr. Hanson. Yet Mr. Randerson concludes that NCEES and Mr. Hanson hold similar views, which is exactly the opposite of the point that I tried to make.

Mr. Randerson's posts, in addition to being illogical, also tend to be rude. It is true that people occasionally post misinformed opinions on this board; however, the best way to address such posts is with a polite and well-reasoned response. Mr. Randerson would be well advised to adapt to this style, because it will serve him well in professional practice. Most private and public engineering organizations now make extensive use of e-mail communication. All e-mail messages -- even the poorly composed ones -- become a "permanent record" that colleagues and supervisors can readily refer to.

Re: Well-Stated

*Message #30 Posted by **Ed Look** on 23 Feb 2005, 4:35 p.m.,*
in response to message #29 by Norris

I tried to address this point with Mr. Randerson in a "private" e-mail, but it bounced back; I am guessing either he mistyped his e-mail address or intentionally left a bogus one.

But since another person has made this point, I just want to say that respect, especially for a more experienced and older person (who is also obviously quite intelligent, though this shouldn't even be an issue) is one measure of a man. Even hot, angry topics can be civilly discussed using more calibrated tones, since the notion of engineers and

engineering was mentioned.

Mr. Randerson, your opinions are of course generally welcome; only, well, to quote Mary Poppins, "a little spoonful of sugar makes the medicine go down... "

*Message #33 Posted by **Vieira, Luiz C. (Brazil)** on 23 Feb 2005, 9:27 a.m.,*
in response to message #11 by Palmer O. Hanson, Jr.

... calculators were designed by engineers... right?

I do not feel myself with the right to disagree with you, Mr. Palmer, because I don't know the reality you faced at the time you were at the university. It is somehow different of mine because I was at the university in the 80's.

Now I see PC's running programs for building programs, I mean, even non-programmers can go ahead and program. And some of them call themselves programmers.

I'd be neither against these "program builders", because in some circumstances, top professionals in areas not related to computers or programs are now able to use computer tools and develop highly specialized graphics applications that help other professionals around the world. Think of a program helping plage control writen in C-builder by a plage specialist that cannot program in plain C...

I see computers, calculators and the like as updated tools, math tools, reasoning-aid tools. Using them the best way may be a matter of choice OR knowing how. There is new machinery, designed by engineers, that allows some stuff to be done today that were simply impossible in the past,

without them. It is up to us, teachers, show students the best way to use these tools.

I guess if it would be possible going to space with a slide rule instead of a programmed HP65 or HP41CV. If I'm an astronaut, I'd write down some formulas in the back of my own slide rule... Going to the space is not making an examination, but in this case, you bet I'd cheat!

Cheers.

Luiz (Brazil)

*Message #34 Posted by **Ren** on 23 Feb 2005, 8:51 p.m.,*
in response to message #33 by Vieira, Luiz C. (Brazil)

I'm getting in late (as usual B^)

I haven't taken the NCEES, but I have taken tests B^)

Is "life" an "Open book test"?

I'm being philosophical here. I believe that testing should be in many ways about "real world" circumstances. No, learning to load, shoot and clean a weapon is a lesson that should be received before entering the battlefield. The lessons should teach the student how to identify the problem and apply existing knowledge to build a solution, then a test should present the student with examples they may encounter in real life.

Most Math students hate their test questions to be in essay form. But isn't that how the problem arises in real life?

For example, a person doesn't often encounter in daily life the question:

10% of 23 = ?

But instead, they see a $23 item on sale at 10% off, and they need to know what the item will cost after the discount and with taxes added. And they may buy other items in the same venue, combining various discounted and non-discounted items. They also should have to subtract the total from their existing bank balance, credit card balance or contents of their wallet/purse and make a judgement of whether they can afford the purchase.

In real life, they may have a calculator in their pocket. but they probably won't have a Math book. In real life, a Civil Engineer may be out a remote worksite, with dead cell phone, a calculator, and an Engineer's Pocket Reference (booklet) with formulae and lists of soil properties. But will they know what needs to be formulated? Will they be able to give a "ballpark figure" as to whether construction should be continued without major changes in route, funding, or manpower? Or stopped because of safety concerns?

An algebra teacher I had this past year, used to work for a logging (woodcutting) company. While there he saw large Matrices calculated which included such things as actual number of trees, their heights and diameters, to determine the most profitable and sustainable exploitation. It was a real life problem he 'brought' to the classroom to tell us that matrices will be encountered 'out there in the real world'. He also used the image of a de-barking machine as analogous to mathmatical "function". It didn't matter what type of tree went into the debarker, it

came out debarked. If an oak went in, a (debarked) oak came out. If a pine went in, a pine(debarked) came out... But there wasn't an inverse function for 'debarking'! B^)

HP41C programming

*Message #1 Posted by **Michael Sayers** on 21 Feb 2005, 2:17 a.m.*

I am away from home at present without my instruction manual. Can anyone advise me what I have to do to get my HP41 to pause during a programme for the input of data? I haven't done any work with the calculator for some time and I just cannot remember.

Re: HP41C programming

*Message #2 Posted by **Mike (Stgt)** on 21 Feb 2005, 2:42 a.m.,*
in response to message #1 by Michael Sayers

Try PROMPT, enter your input and R/S to continue.

Ciao.....Mike

Re: HP41C programming

*Message #3 Posted by **Les Bell [Sydney]** on 21 Feb 2005, 3:23 a.m.,*
in response to message #1 by Michael Sayers

I would do the following:

```
"ENTER X: "
[PROMPT]
```

When the program runs, you should see "ENTER X: " in the display. Enter your value for X and press [R/S] and the program will resume.

Best,

--- Les Bell

48gx = 48g +96k ? = 48g+ +32k?

*Message #1 Posted by **Eric Lundgren** on 20 Feb 2005, 8:31 p.m.*

I've been trying to adjust to the constant missed key presses so that I can reap the speed of this 49g+...but alas, I feel that the 33s or 48g may have to work till I graduate.

I have this question- Aside from the expansion port, is this how the 48 series breaks down:?

hp48g 32k hp48g+ 96k hp48gx 128k

Are all the same processor (more to the point, same speed)?

Can one program the 48 series on a laptop and then port via IR?

regards, Eric

Re: 48gx = 48g +96k ? = 48g+ +32k?

*Message #2 Posted by **Aleph Mobius** on 20 Feb 2005, 11:05 p.m.,*
in response to message #1 by Eric Lundgren

Correct me if I am wrong but I believe the break down is this. The S models have a 2mhz CPU and the G models have a 4mhz CPU. X models are expandable. The S models and the 48G have 32K ram and the 48G+ and 48GX have 128K. I remember reading something about a limitation in the hardware so that the 4mhz models don't run twice as fast as the 2mhz models like you might expect. Perhaps someone else can explain the specifics. Hope this helps.

Re: 48gx = 48g +96k ? = 48g+ +32k?

*Message #3 Posted by **James M. Prange (Michigan)** on 21 Feb 2005, 3:44 a.m.,*
in response to message #1 by Eric Lundgren

You can certainly write the programs in a text editor on a laptop, but transferring them via IR is pretty iffy. The 48 series uses "Serial IR", not IrDA. See here for details of the 48 series communications.

The 48 series is RS-232 compatible, so if your laptop has a COM port, then that's the way to go.

Regards,
James

HP28 Commas and Points

*Message #1 Posted by **Steve** on 20 Feb 2005, 7:40 p.m.*

Help! The commas and points are switched on my HP 28S calculator. How do I switch them back?

Re: HP28 Commas and Points

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 20 Feb 2005, 8:26 p.m.,*
in response to message #1 by Steve

Hi;

please, locate [MODE] at the right side of the [SHIFT],wine key. Press:

`[SHIFT][MODE][NEXT]`

now you'll see, over the fifth softkey, left to right, the following menu label:

`[RDX.]`

Press the key and the menu label toggles to:

`[RDX,]`

Do this anytime you want to switch them back.

Cheers.

Luiz (Brazil)

RPN and the HP 38G

*Message #1 Posted by **Charles** on 20 Feb 2005, 5:45 p.m.*

I've seen programs for TI calculators that allow you to use them in an RPN mode. I've wondered if anyone has seen the equivalent for the 38G ?

Re: RPN and the HP 38G

*Message #2 Posted by **Raymond Del Tondo** on 20 Feb 2005, 8:21 p.m.,*
in response to message #1 by Charles

Actually, the HP-38G is an RPL machine internally,
similar to the HP-48, but with some more advanced internal features.

However, the RPL kernel is hidden from the user in the HP-38G.

Have you checked www.hpcalc.org about this topic ?

Raymond

Re: RPN and the HP 38G

*Message #3 Posted by **Mvdn** on 21 Feb 2005, 5:03 a.m.,*
in response to message #1 by Charles

Could you tell us where you did find the programs for the TI equipment ? Sometimes we are forced to use TI machines and if it could be by the RPN entry method it woud be nice. Thanks!

Re: RPN and the HP 38G

*Message #4 Posted by **Charles** on 21 Feb 2005, 5:36 p.m.,*
in response to message #3 by Mvdn

At the risk of being lynched, here are links to another couple of sites

http://www.paxm.org/symbulator/download/rpn.html

http://www.ticalc.org/pub/83plus/flash/programs/

I don't have these calculators so have never tried the programs.

I did have a look at the hpcalc site but couldn't see anything.

typical 33s programs

*Message #1 Posted by **Eric Lundgren** on 20 Feb 2005, 5:24 p.m.*

I will use a program to solve my iterative problems on the 33s, but, any engineers here use the 33s that have some examples of problems that cannot be solved with the EQN list?

For example, one can write a short program to compute Cross Product of 2 vectors, but this would not be so inviting with an EQN.

I'm becoming more confident in the 33s. The ENTER, R/S relocations I can adjust to, but I really wish the X^2 was a shifted root(x). The X^3/cuberoot(X) is simply redundant when you have a XthRoot(Y) and Y^X key...which should also have been inverses of eachother..! My finger instinctively returns to shift x^2 when I want to square things...

Eric

Re: typical 33s programs

*Message #2 Posted by **Namir** on 20 Feb 2005, 7:54 p.m.,*
in response to message #1 by Eric Lundgren

The 48 and 49 series will handle vector and matrix manipulation much more elegently than the 33s. I suggest that you check out a 48 or 49 series machine.

If the 33s is a WWII spitfire airplane then the 48/49 is an F-15 jet fighter.

Namir

Re: typical 33s programs

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 20 Feb 2005, 8:42 p.m.,*
in response to message #1 by Eric Lundgren

Hi, Eric;

not exactly to answer to your request about the cross product of two vectors, instead to give you some other info:

HP 33S Training Modules

If you want to download all of them in one single zipped file, try here. If you already have these... sorry being late!

Best regards.

Luiz (Brazil)

Re: typical 33s programs

*Message #4 Posted by **Les Bell [Sydney]** on 20 Feb 2005, 11:03 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

I will say one thing for the "new" HP - these training module documents are a step in the right direction.

While we tend to focus on the problems of keyboard and general construction quality, perhaps one of the biggest values of the "classic" HP calcs (Classics up to the 41CX, imv) was the accompanying manuals, solutions books, application pacs and the like, which probably reached its peak with the 65/67/41 user-contributed program library, solutions books, etc.

I wish the 48 series had had this kind of support; the 48GX Series User's Guide is nowhere near thick enough, and additional examples would have helped many users up the learning curve.

Best,

--- Les Bell

training manuals

*Message #5 Posted by **bill platt** on 21 Feb 2005, 9:53 a.m.,*
in response to message #4 by Les Bell [Sydney]

Hi Les,

I think you can thank Gene and Wlodek for those manuals---they are the authors I believe.

regards,

Bill

Re: training manuals

*Message #6 Posted by **Les Bell [Sydney]** on 21 Feb 2005, 5:25 p.m.,*
in response to message #5 by bill platt

I believe so, Bill, and they've done great work there. However, the "breakthrough" is the realisation by someone at HP that this would be A Good Thing, and the decision to support it.

I guess there isn't the same need for the Users Library, since independent web sites provide instant availability of programs these days. But good basic documentation is vital, and I'm sure the success of the 48's was hurt by the documentation, which is even typeset in the same font as the turn-of-the-century maths schoolbooks we had back in the sixties.

Back in the eighties, the duty-free stores at Singapore Airport used to sell HP calcs, and I would surprise the sales people there by asking to see, not the calculator, but the *manuals* for the calculators. After all, you'd never guess what lurks beneath the surface of a 41 by looking at the keyboard!

From memory, that's where I picked up my 41CV, 41CX and 16C. And I've been careful to keep their manuals in good condition, in a prime spot on the bookshelf. They're almost as pleasurable to own as the calculators themselves.

Best,

--- Les Bell

in response to message #1 by Eric Lundgren

I have a program to compute positive and negative wind pressures, that's pretty nice. It takes advantage of the two-line display so I don't have to calculate twice.

Hello, this program is interested me, so if it free, please send me it in email! I'm a mechanical engineer, specified for fluid flow and food and chemical processing engineering, and this is seems to me interesting!

Sorry for my English, I'm better in RPN ;)

Thank you!

Csaba

33s target of PEs / high school?

*Message #1 Posted by **Eric Lundgren** on 20 Feb 2005, 4:58 p.m.*

Just thinking about the latest models from hp..

I am very satisfied with my 33s kbd responsiveness. I have still not had a single missed entry, which is very good.

Also, the speed is great for my use, so far. Quadratics and quintics solve within moments on my 33s and 49g+.

I raise these questions: 1. Was the 33s a answer to the mixed question of catering to PE exam users, and highschool environment? That would explain the increased memory, quality key press responsiveness, and the latter for the layout. Seriously, I have never EVER experienced as many missed entries as I have on the new 49g+. Yet, the cheaper 33s is very very reliable!

2. In light of these events: hp DID release new calcs after the freeze in 2000, and CF's recent departure..could one imagine hp releasing a 33s-like machine with normal kbd layout, same storage cap, and perhaps soft menu's?

It seems possible, since, the 33s is essentially a speedy, spacious 32sii?

Thoughts? Eric Lundgren

Re: 33s target of PEs / high school?

*Message #2 Posted by **Fubar Vikinghelmet** on 21 Feb 2005, 11:11 a.m.,*
in response to message #1 by Eric Lundgren

I honestly think that the 33S was released in response to the anal NCEES people concerning "legal" calculators for the FE and PE exams. There was obviously a community, young and older, that liked RPN over AOS, so why not sell them a new calculator?

Re: 33s target of PEs / high school?

*Message #3 Posted by **Norris** on 21 Feb 2005, 9:15 p.m.,*
in response to message #2 by Fubar Vikinghelmet

I doubt very much that HP gave any consideration whatsoever to the NCEES exam market when they developed the 33S. It was designed for high school students and undergraduates, and its success in the NCEES market was probably just a small unexpected bonus.

The NCEES market is simply not big enough for a company like HP to get excited about. There are about 50,000 FE exam candidates per year; however, many of these are repeat takers, so the number of new candidates per year is perhaps 30,000 to 40,000. For comparison, about 3,500,000 students enter the 10th grade in US public schools every year (with more in private schools or home schools). So the high school market is roughly two orders of magnitude larger than the NCEES market. That’s the market that HP wants to reach.

Check the 33S home page at http://www.hp.com/calculators/scientific/33s/index.html. It includes a list of

standardized tests that allow the 33S. But they are all college entrance tests that high school students take (PSAT/NMSQT, SAT, AP, etc). HP doesn't even bother to mention the FE or PE.

Since NCEES banned graphing calculators, the best legal choice for the FE or PE exam has been a programmable scientific. Yet every other major manufacturer (Casio, TI, Sharp) has stopped distributing such calculators in the US, and has left the 33S alone in the market. This suggests that the market is not very important. Casio, for example, could easily compete with the 33S if it wanted to: they currently distribute a competitive programmable scientific, the FX-3650P, in Europe and Asia. It would probably sell very well with NCEES exam candidates (just as the non-programmable Casio FX-115MS Plus currently does), but the market is evidently too small to make it worth the trouble.

Re: 33s target of PEs / high school?

*Message #4 Posted by **Eric Lundgren** on 22 Feb 2005, 12:11 a.m.,*
in response to message #3 by Norris

Good points from all,

Consider this- NCEES cites two reasons for refusing the IR/graph/programmables calcs: 1. transmittal during exam => cheating. 2. exam information being carried out of room.

I have heard of various approaches to eliminate the IR risk, but to protect their other concern (the export of exam problems), one solution which was to clear MEM's upon exit, which was too time consuming acc to NCEES). I suggest this-why not simply confiscate calculators upon exit? Surely a budding PE can afford to lose a $130 machine, what's that compared to all the money people spend on prep mat'ls?

regards, Eric

Re: 33s target of PEs / high school?

*Message #5 Posted by **Norris** on 22 Feb 2005, 5:39 p.m.,*
in response to message #4 by Eric Lundgren

NCEES is seriously considering a proposal to supply calculators to examinees, just as they currently supply mechanical pencils and FE reference handbooks. The NCEES-supplied calculator would be collected after the test, just like the FE handbooks (NCEES does let you keep the exam pencil).

As for sacrificing your own calculator, note the following issues:

(1) Licensed engineers or surveyors typically take two separate tests, the FE/FLS and the PE/PLS. This would double the total cost for sacrificial graphing calculators to around ~$250. That's a minimum; your total cost could easily be $500+ if you had to repeat one or both exams, or if you wanted a replacement calculator after passing the exams. Maybe some people could afford this, but there would be loud protests from those who couldn't.

(2) Some of the banned calcs, like the 48GX or the 49G+, use removable memory cards. NCEES would still perceive a potential security threat even if the calculator was confiscated, because you could remove the memory card first and walk away with it.

*Message #6 Posted by **Alexander Thorp** on 26 Feb 2005, 10:19 a.m.,*
in response to message #3 by Norris

I'm seeking to become a PE and am scheduled to take the April Civil exam. I bought my calculator because it was allowed by NCEES and offered the programmable features.

I don't want to hijack this thread, so I am posting a new one titled HP 33s programming, to which I'm hoping that Norris may reply. I found his response (dated April 4 2004 in the archive) to a similar thread, but wasn't able to respond to it, as I guess it's expired....

Re: AC Adapter for HP 9114B Disk Drive

*Message #4 Posted by **Mutsch** on 20 Feb 2005, 5:42 p.m.,*
in response to message #3 by Emmanuel, France

So what does that mean? Is the AV adaptor to weak for the drive or is the battery required to work properly?

Mutsch

Re: AC Adapter for HP 9114B Disk Drive

*Message #5 Posted by **Diego Diaz** on 20 Feb 2005, 7:32 p.m.,*
in response to message #4 by Mutsch

Hi again,

The (so-called) adapter/charger, is nothing but a simple transformer (8v 3VA nominal secondary specs.)

So you *MUST* have the "Rechargable battery pack" (88014A or B) fully charged to operate the drive.

The 9114 takes its supply from the battery. Transformer (82066B) just re-charge the battery while the drive is not spinning.

Hope this helps.

Diego.

HP-41: The Ultimate Alarm Clock

*Message #1 Posted by **Geir Isene** on 20 Feb 2005, 7:14 a.m.*

Having a HP-41CX (or HP-41C/CV w/time module) can make your nights and mornings better - with The Ultimate Alarm Clock.

It has a bundle of features, including one-button setting of an alarm, snooze, alarm hold and restart and much more. It can give you the current time by beeps :) It will even tell you how much longer before the alarm goes off, again by beeps.

Check it out at http://www.geir.isene.com

Re: HP-41: The Ultimate Alarm Clock

*Message #2 Posted by **Vassilis Prevelakis** on 21 Feb 2005, 12:41 a.m.,*
in response to message #1 by Geir Isene

Hi,

I had an alarm clock at school (a Casio CQ-1)that I liked a lot because I could set up the time quickly (via the keypad) as opposed to most alarm clocks where you have to waste time scrolling through the minutes and hours.

Anyway my poor CQ-1 bit the dust and I turned to my HP-41C (with time module) to wake me up. I created a program that would get my schedule from a file in Ext Mem and make sure I'd wake up at the right time each day (so I could set it up to wake me up at 8 am on Mondays, 10 am on Tuesdays, not to ring at all during weekends etc).

It would support snooze: if you pressed any key other than a specific key combination, it would sleep for 10 minutes and start ringing again.

I used the "phazer fire", a synthetic series of tones from a star-trek game as the alarm ring.

Unfortunately, the 41's volume is not loud enough to wake me up reliably and eventually I switched to a more conventional alarm clock.

**vp

in response to message #2 by Vassilis Prevelakis

Maybe you just got used to the same melody?
randomizing different melodies might help.

Is there anyone here to know how to boost the sound?

[VPN]

Re: HP-41: The Ultimate Alarm Clock/Hardware BOOST?

*Message #4 Posted by **Les Bell [Sydney]** on 21 Feb 2005, 5:31 p.m.,*
in response to message #3 by Veli-Pekka Nousiainen

You could probably place the 41 at the focus of a roughly-parabolic "cone" made of stiff card; that would probably be enough to increase the sound level somewhat.

I still occasionally use my 41CX as an alarm clock, since the one in my wrist-watch isn't loud enough to wake me. And a few weeks ago, I was prescribed two different antibiotics to treat a tummy bug - one to be taken on a six hour schedule, one on an eight-hour schedule. I toyed with the idea of writing a program to remind me, or using one of the programs from the Timer Module Solutions Book, but in the end, I just "winged it", since it was only for a few days.

Best,

--- Les Bell

Update for 49g+ o/s?

*Message #1 Posted by **Eric** on 20 Feb 2005, 3:02 a.m.*

I've been using my old 48g lately, and I just gave the 49g+ a re-try (I had been avoiding it due to my worries about missed key entries) ..and I just realized how FAST it is.

Can one *turn off* the energy saving mode that it goes into when a few minutes of non-use pass by? Perhaps a flag? Or a routine that could run in the background keeping it awake?

Any trick/flag to increase the keyboard sampling rate? (to be able to rapidly enter the same digits, ie: 2.333, or 4440?

Thanks for any insights, Eric

PS. the keys themselves appear and feel pretty good.

Re: Update for 49g+ o/s?

*Message #2 Posted by **Veli-Pekka Nousiainen** on 20 Feb 2005, 8:01 a.m.,*
in response to message #1 by Eric

ClockSpeed Adjustment Tools - Overclock your 49G+ 2.00
http://www.hpcalc.org/details.php?id=6081
STARTOFF is run every time calc powers OFF
<< OFF C34 >> STOred in STARTOFF (at HOME directory)

You could assign STARTOFF to the OFF key
'STARTOFF' 101.3 ASN
'STARTOFF' 101.31 ASN
'STARTOFF' 101.6 ASN
'STARTOFF' 101.61 ASN
So that if you like power it OFF by your self it will still do it "right"

Consider having C124S on program start and C34 at end
[VPN]

Re: Update for 49g+ o/s?

*Message #3 Posted by **EL** on 20 Feb 2005, 4:46 p.m.,*
in response to message #2 by Veli-Pekka Nousiainen

Ok, I'm looking at that clockspeed adjustment. Thanks for the tip, VPN.

For the keyboard issue, I guess there simply is no way to increase the rate of entry?

And, can I also assume that the 48gII keyboard is the same?

Eric

Re: Update for 49g+ o/s?

*Message #4 Posted by **Eddie Shore** on 20 Feb 2005, 1:40 p.m.,*

To remove engineering library from 49g

*Message #1 Posted by **Eric Lundgren** on 20 Feb 2005, 2:51 a.m.*

I have a 49G that came preloaded with "chotkeh's" engineering software, for the PE exam.

How can I flash it clean? Will it speed up? This is the only 49G I've used myself, and it is painfully slow compared to the 49G+..could this huge library have anything to do with that?

regards, Eric

Re: To remove engineering library from 49g

*Message #2 Posted by **Veli-Pekka Nousiainen** on 20 Feb 2005, 7:52 a.m.,*
in response to message #1 by Eric Lundgren

1st I suggest you transfer a backup of the library to your PC
2nd the 49g+ just is 2...4x faster, removing the lib does not help
3rd USER off and keeping the Stack small (<100) helps a bit
[VPN]

Re: To remove engineering library from 49g

*Message #3 Posted by **James M. Prange (Michigan)** on 21 Feb 2005, 3:51 a.m.,*
in response to message #2 by Veli-Pekka Nousiainen

Agreed. I expect that the library is a pretty expensive application, so I'd certainly save a copy to the PC before purging it. I very much doubt that purging the library will speed up the calculator, although it will free up some storage space. If you really want to purge the library, just use the filer to find and purge it.

Regards,
James

A request...(was: To remove engineering library from 49g)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 21 Feb 2005, 7:15 a.m.,*
in response to message #1 by Eric Lundgren

Hi Eric, folks;

I unsuccessfuly tried to locate the library mentioned here in order to know what is it about. Can anyone point me out a link or something? If not, Eric, would you be able to save it and e-mail me a copy of it? (lcvieira at quantica dot com dot br)

Of course, all of my request is based on the possibility of having a copy of it. If it is copyrighted or if it has any sort of restrictions, just let it as it is. Anyway, I'd like at least knowing what does it offer, if possible.

Thanks.

Luiz (Brazil)

Re: A request...(was: To remove engineering library from 49g)

*Message #5 Posted by **Eric Lundgren** on 22 Feb 2005, 12:24 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Luiz,

The software is by a company called "Chotkeh" (www.chotkeh.com). It was not free, and came pre-installed on the 49g for about $300US.

The software is a menu-driven set of equations (very very extensive) for the mechanical engineering PE exam.

1. I am happy to send you a copy, if it is legal (I am not sure, but I doubt it) 2. I have never connected my hp's (I am embarrassed, help me begin!) to my pc yet. I have years of RPN experience, but no hp48/49 programming experience.

Best regards, Eric

Re: A request...(was: To remove engineering library from 49g)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 22 Feb 2005, 6:54 a.m.,*
in response to message #5 by Eric Lundgren

Hi, Eric;

thank you so much for taking the time to check for the library's origin.

As you mentioned, if the library is a US$300 library, **free** copies are most likely to be illegal. I'd like to know what is it capable of, but surely asking for a copy (even by e-mailing you directly) would not be a good "behavior" of mine.

I'd add that, for as long as you can or want to, keep the library as it is in your 49G+. Based on what you read from others, the library itself won't slow your calculator down. And the HP49G+ has plenty of memory to hold it, mostly if you add a SD card.

Thanks again and best regards.

Luiz (Brazil)

hp's and pda's

*Message #1 Posted by **Eric Lundgren** on 19 Feb 2005, 10:30 p.m.*

I'm trying a pocketPC version of the 15c, and its pretty nice.

I wish a 32sii or 42s "upright" emulator was avail, as I'm REALLY trained on these (ie. fast hands). Anyway,

Since compilers are within reach for pda's, I'm just considering, as an engineering student..

1. pocket excel spreadsheets for frequently used routines. 2. e-version of RPN (just HAVE to have rpn) 3. create custom code on my laptop and download to carry around.

It adds up to a tiny (and REPLACEABLE) tool...that I can carry in my back pocket and beat up on...any thoughts?

Re: hp's and pda's

*Message #2 Posted by **Eric** on 20 Feb 2005, 2:53 a.m.,*
in response to message #1 by Eric Lundgren

*Message #4 Posted by **Giancarlo** on 1 Mar 2005, 5:11 p.m.,*
in response to message #3 by Antoine M. Couëtte

I personally tried Organizer 1.1 by Jack Levy and found it really good for my purposes... From the documentation of the software itself: <<Organizer is a library designed to act as a Personal Information Manager, or PIM. The goal is to create a responsive, easy-to-use, complete PIM for the HP48. Organizer provides the following capabilities:

* Calendar * Appointments * Annual Events * Scribe Hooks * Fast assembly display routines for quick scrolling of an unlimited number of appointments * FIND function to search appointments or annual events, either matching case or ignoring it. * Support for any external database, with presets for Scribe, Rolodex, Foneman, and Dbase. * Support for any external editor, with presets for StringWriter, ED, TED, and QED. * Automatic detection and compensation for date and time formats. * Commands for easy backup/restoration/purging of all data. * Stack importing/exporting, configurable starting view, custom full-screen editor, and more.>>

Hope this helps. Regards. GM

Manual -- stat 1 module

*Message #3 Posted by **Karl Schneider** on 20 Feb 2005, 2:07 a.m.,*
in response to message #1 by Earl Calder

I think that you're asking only for the User's Manual, and not schematics or other technical information. This museum's website sells PDF scans of manuals on CD-ROM or DVD-ROM for reasonable prices.

Place an ad in the Classifieds section of this website if you'd like to buy an actual printed manual.

USA Made Hp 12c with "Popping" Keys

*Message #1 Posted by **Neil** on 19 Feb 2005, 5:36 a.m.*

Hi,

I just received a mint condition USA made Hp-12c. I was surprised to notice that quite a few of the keys make a popping sound just like on most of my Indonesian-made pioneer calcs.

I have a couple of other voyagers as well as a quite a few pioneers, and I always thought that the characteristic of the earlier USA, Singapore, Malaysian, Brazil etc. made models was that the keys do not "pop" when you press them. This is true for all my earlier calcs. All my Indonesian-made calcs "pop" except for my HP 32sii.

I've read on the forum that the Indonesian-made calcs tend to be more prone to keyboard problems. So does this mean that for the HP 12c calc I just received, the keyboard quality might not be as good as a "non-popping" voyager? Perhaps due to bad storage conditions leading to deterioration with age, or because it was a factory second? Has anybody else got such a "popping" USA made voyager?

My initial thought when I received this HP-12c was that it could be a Chinese-made HP-12c, but no, it takes the 3 button cells, and it has not been tampered in any way.

Re: USA Made Hp 12c with "Popping" Keys

*Message #2 Posted by **will** on 19 Feb 2005, 6:19 a.m.,*
in response to message #1 by Neil

i´ve got a brand new hp12c (made in usa, in VERY mint condition, box included) with no "poping" keys..in fact its keyboard is as good as it was expected to be...i have other voyager calc (11c bought 10 years ago from a co-worker) with loose keys (since i got it) and used with excelent results. this have worked as well as the first does, in fact i prefer my 11c...

Re: USA Made Hp 12c with "Popping" Keys

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 19 Feb 2005, 10:06 a.m.,*
in response to message #2 by will

If the calculator has a very used keyboard, the rubber membrane below the keys may develop "holes" where the keys press the steel domes. This also let the keys a little lower than normal.

This caused the "rattle" of the keys on one 12C I had.

Anoter cause is in the assembly line when the case isn't well pressed with the "hot tool(?)" that makes the melting of the plastic pins, leaving a very small space between the plastic keys and the steel domes.

Best regards,

Nelson

Re: USA Made Hp 12c with "Popping" Keys

*Message #4 Posted by **Larry Corrado** on 20 Feb 2005, 10:02 a.m.,*
in response to message #1 by Neil

Neil:

I bought a used 12C a few years ago that had a key that sort of popped: it required extra pressure, and then suddenly broke loose. However, I noticed that I only had to "pop" the key once, and then it was ok for that session. If I didn't use the machine for a few days (hours?), I would have to break that key free again with a single press, and then it was fine.

I assumed the problem was due to a sticky substance (eg, a spilled soft drink) getting under the key and then drying out, leaving a dry sticky residue that wouldn't stick unless left for a while. I haven't tried to fix the problem.

Of course, you say your machine is "mint," so maybe this is less likely.

Anyway, a possibility...

Larry

HP 11C R and C oscillator values

*Message #1 Posted by **jean baptiste minazio** on 18 Feb 2005, 7:39 a.m.*

Please can you tell me what are the valuer of the Resistor and Capacitor resonnator value of the HP 11C calculator. The capacitor is broken on mine and would like to solder a new one but I dont know the value. The resistor value is for my confirmation of what I mesured Many thanks Jean Baptiste

Re: HP 11C R and C oscillator values

*Message #2 Posted by **Tony Duell** on 18 Feb 2005, 6:43 p.m.,*
in response to message #1 by jean baptiste minazio

It's an LC (Inductor/Capacitor) circuit, not RC. The values I have (found in both a 12C and a 16C, I guess the 11C is the same) are 180uH for the inductor and 180pF for the capacitor.

71b math rom question

*Message #1 Posted by **hugh steers** on 18 Feb 2005, 7:39 a.m.*

following the hype of the 71b math rom (which i dont have), im interestered to know how to write a function that takes another function parametrically by reference. for example, the math rom will accept something like, integral(0,1,5e-5,cos(1/ivar)) treating the `cos' part as a function definition. how does one define such a `integral' function.

the owners and reference manual for the 71b describes the way to pass variables by reference to subroutines. eg.

```
10 INPUT Y @ CALL FOO(Y) @ PRINT Y
20 SUB FOO(X)
30 X=X+1
40 END SUB
```

where FOO modifies the input variable. but i cant find the way to make it accept a function. is the math rom doing some extra cleverness here, or is there a way?

thanks for any help,

Re: 71b math rom question

*Message #2 Posted by **Eric Smith** on 18 Feb 2005, 1:02 p.m.,*
in response to message #1 by hugh steers

The math ROM is doing extra cleverness by virtue of integral being written in assembly as part of a LEX file (Language EXtension). AFAIK there's no way to do that in HP-71 BASIC using similar syntax.

There might be some other way to do an indirect call to a named subroutine to get a similar effect, but I don't remember.

Re: 71b math rom question

*Message #3 Posted by **Garth Wilson** on 18 Feb 2005, 11:45 p.m.,*
in response to message #1 by hugh steers

I'm not sure I know exactly what you're asking, and I seldom do HP-71 programming anymore so I'm rusty at it; but I'll jump in anyway now.

From your post, I wonder if you're looking for user-defined functions instead of subroutines or subprograms. User-defined function calls take on the form of FNA(...) if you want numeric output, and FNA$(...) if you want a string output. They only give one output, and it's automatic unlike the subprogram which might have several outputs and passes them via the parameter list.

CALL is for subprograms, not subroutines. Subprograms have their own environments, and are even re-entrant, unlike subroutines. A BASIC file can have any number of subprograms in it, and a subprogram does not have to be in the same BASIC file as the program or subprogram that's calling it. If you have more than one subprogram with the same name and the one you want is not in the currently executing file, you'll need to

tell the computer where to find it, either by file name, port name, or something like that. CALL can also be used to call an assembly-language program. An input parameter can be any expression that's valid for the type of variable it goes into in the subprogram; so if one of the input parameters needs to be a real number and V1 was a real variable, it would be perfectly valid to put your COS(1/V1) in the input parameter list (as long as you don't want the output to come through the same parameter-- outputs can't be stored in your expression since it's more than a variable). Parameters are separated by commas, and the parameter list goes in parentheses. You can have a variable or array name be both an input and an output parameter at the same time, which seems to be one of the things you're talking about. For example, even if you only have one parameter in the list, it can be both input and output.

Re: 71b math rom question

*Message #4 Posted by **J-F Garnier** on 19 Feb 2005, 5:46 a.m.,*
in response to message #1 by hugh steers

Hi Hugh,

There are some solutions to your problem. If you want to pass a function, you can pass it as a string, and use the VAL function:

```
SUB FOO(F$)
  Y=VAL(F$)
END SUB
E.g. CALL FOO("SIN(X)"), CALL FOO("FNF(X)")
```

or you can call another SUB indirectly by a variable.

```
SUB FOO(F$)
  CALL F$(X,Y)
END SUB
for instance, CALL FOO("MYFUNCT") with
SUB MYFUNCT(X,Y)
  Y=whatever function of X
END SUB
```

Hope it helps...

J-F

Re: 71b math rom question

*Message #5 Posted by **hugh steers** on 20 Feb 2005, 7:32 p.m.,*
in response to message #4 by J-F Garnier

thanks for the replies. i understand now that the math rom must be doing some special cleverness. it just bugged me that there wasn't some special way to accomplish the same using the standard basic implementation.

i think the string method is the most viable alternative in the absence of a special facility.

best regards, -- hugh

Re: 71b math rom question

*Message #6 Posted by **Valentin Albillo** on 20 Feb 2005, 7:33 p.m.,*
in response to message #1 by hugh steers

Hi, Hugh:

Math ROM's keywords FNROOT and INTEGRAL are what HP-71B's original developing team call "funny functions", i.e.: they're functions with non-standard parsing rules, unlike regular functions.

For regular functions, the built-in parser simply evaluates the function's arguments (if passed by value) before pasing them in to the function. That's why you can simply give the number and type of the parameters when coding a new function in Assembler to be included in a LEX file. You don't have to do the parsing yourself, the standard parser will do it on your behalf.

On the other hand, "funny functions" need non-standard parsing, and if coding one in Assembler, you must do it yourself, the standard parser won't do. In the case of FNROOT and INTEGRAL, both accept a function which ultimately uses FVAR or IVAR as the main variable, and the Math ROM's non-standard "funny function" parser can check that FVAR/IVAR are indeed present in the function's definition, allocate space for them, allocate a buffer for the function passed as parameter, and call the expression evaluator upon the contents of this buffer as many times as needed.

Further, as both FNROOT and INTEGRAL can be nested with previous invocations up to 5 levels deep, as many buffers need be created and maintained (they can move around in RAM while FNROOT and INTEGRAL are executing), plus allow for user interruptions while the evaluation is in process, with the possibility of resuming afterwards.

All of this isn't particularly easy, and as stated, needs a very clever, special "funny function" parser, completely ad-hoc for the particular function at hand.

So no help from the mainframe in this respect, and writing one yourself (in Assembler) can get pretty tricky, to say the least.

Best regards from V.

To reassign keys on the 33s

*Message #1 Posted by **Eric Lundgren** on 17 Feb 2005, 11:41 p.m.*

1. I read that someone has done this, swapping the R/S key with the ENTER key... 2. How do you program this? 3. Does one have to launch the program each time you turn on the machine?

Any other directions to 33s tips would be great! (I have searched, but with little fruit)

EL

Re: To reassign keys on the 33s

*Message #2 Posted by **Karl Schneider** on 18 Feb 2005, 12:51 a.m.,*
in response to message #1 by Eric Lundgren

Eric --

Sorry, but there's no way to reassign keys on the 33S. The venerable 41C offered a near-completely reassignable keyboard, and the also-discontinued 42S allowed up to 18 functions or programs to be assigned to slots on user menus.

There are PDF "Learning Modules" on HP's website that might offer the tips you could use. I rarely use my 33S, but dorely on the 33S User's Manual and my familiarity with the 32SII.

Re: To "reassign" <Enter> on the 33s . . .

*Message #4 Posted by **Paul Brogger** on 18 Feb 2005, 12:05 p.m.,*
in response to message #1 by Eric Lundgren

Someone recently did indeed suggest how to "reassign" the <Enter> function to the 33s <R/S> key. I haven't been able to find the original post either. (Maybe that person will chime in?)

In fact, it's not a reassignment of <Enter>, as such, but more a way to give the <R/S> key a "default Enter function". It actually works quite nicely.

The original suggestion was something like:

```
A0001  LBL A
A0002  ENTER
```

```
A0003  STOP
A0004  GTO A
```

With the above program, if you initialize with "XEQ A" the first time you want to <Enter>, then henceforth you may simply press <R/S> to effect an Enter. This works surprisingly well, but not *while* programming, and perhaps not after XEQing another program.

To prevent the last limitation, make sure A is the first program in memory (just below PRGM TOP) because that is the point to which program-ending RTNs return.

I think a cooler approach is:

```
PRGM TOP
00001  ENTER
00002  RTN
```

(This has the advantage that it doesn't tie up a program name.) Final RTNs always return to PRGM TOP, whether from this little program, or upon RTN-termination of any other. To initialize this pseudo-Enter, just do a RTN whenever you turn on the calculator.

But, in fact, there is no genuine key reassignment on the 33s, and this is just a workaround.

Re: To "reassign" <Enter> on the 33s . . .

*Message #5 Posted by **Dave** on 18 Feb 2005, 8:53 p.m.,*
in response to message #4 by Paul Brogger

Thanks Paul for refreshing this task. You made a nice improvement to the program! As another note, if you leave out the ENTER function step then it acts a bit more like an HP48 by not raising the stack, but it loses the ability to fill the stack as a normal ENTER key would.

Re: To "reassign" <Enter> on the 33s . . .

*Message #6 Posted by **Mvdn** on 19 Feb 2005, 6:33 a.m.,*
in response to message #4 by Paul Brogger

This small program works fine on my HP33s (thanks to a post of Dave, see Archive 14 - 'HP 32s & 48gx' posted he 8th of JAN 05 almost last reply 'Re: not so trivial to implement?' posted the 17th of JAN 05).

I'm happy I can use the machine utilizing the better placed R/S keys as the enter key in quick calculations :

HP 33s (enter key assignment to R/S key)

Go into PRGM Mode (Left Green PRGM) LBL A - (Left Green LBL A) You can use any label A-Z R/S ENTER GTO A (Left Green GTO) Exit Prgm mode (Left Green PRGM)

Now any time you want to use the R/S key as the ENTER function just press XEQ A.

You need the XEQ A to assure your R/S as an enter does not start in some undefined program you have loaded.

33s initial impressions

*Message #1 Posted by **Eric Lundgren** on 17 Feb 2005, 11:14 p.m.*

Just bought two HP33s'. It seems like a pretty nice calculator so far.

Compared to the 49g+, I'm very glad that I can fire off strings of numbers w/o missing any. IRT the complaints about how 26 LBLs' won't stretch to 31k, but...I'll use it to organize equation sets, for example:

X-SECT PROP i-beam(wide) i=w*(d^3)/.... circ tube i=pi*(sq(b)-sq.... BEAM DEFLECT pt load at a d=pl^3/(3EI)

and so on.. Also, I was unaware that branching, conditional programming structures were supported. Size of case is ok as well.

Re: 33s initial impressions

*Message #2 Posted by **Karl Schneider** on 18 Feb 2005, 1:15 a.m.,*
in response to message #1 by Eric Lundgren

Yes, the 33S is a capable calculator, based on the 32SII of 1991, which in turn was based on the 32S of 1988. The 31kB of RAM allows the user to retain a library of equations and programs.

Quite frankly, though, I would have been much more pleased with a RPN-only 32SII with 8 kB RAM and complete complex-number functionality.

>
> *Sounds like a 42S... :-)*

Yes, those are two attributes of the 42S, but what I suggested was still quite different:

- No matrix functions
- No named variables
- No character strings
- no numbered registers
- No IR output
- No bit-wise logical operations
- Simpler (but less capable) programming
- One-line (but much more legible) display

*Message #5 Posted by **Fubar Vikinghelmet** on 18 Feb 2005, 9:40 a.m.,*
in response to message #1 by Eric Lundgren

How do you plan to get around the limits of 26 labels?

I've found that, like you, equation sets is the way to go - partly, though organizing them and parsing through the (so far) 80 equations I've kept is tedious.

error message

*Message #1 Posted by **Bobby Tan** on 17 Feb 2005, 8:51 p.m.*

I have a very old Hp LJ 3, I know its very old but very reliable and trying to know if it can be salvage. The error massege is 50 SERVICE. Thank you

Re: error message

*Message #2 Posted by **Richard Garner** on 17 Feb 2005, 11:26 p.m.,*
in response to message #1 by Bobby Tan

Hello Bobby,

The 50 Service error usually means something has happened that requires a trip to a service center to be fixed. The last time that I ran into this message on a LJ 3 and again on a LJ 4si we had to have the fuser and rollers replaced. At the time the LJ 3 was under a repair contract purchase for us by another government agency. The LJ 4si was a $3,000 printer with no service contract and spending $400 to fix it was cheaper than buying another one. Depending on the age of your printer and the volume of printing you do, it might be cheaper to buy something new than to try and repair. The LJ 3 is a very good printer, we still have a couple around the office that keep on printing, but they are starting to show their age (16 years old).

Re: error message

*Message #3 Posted by **Vassilis Prevelakis** on 18 Feb 2005, 12:58 a.m.,*
in response to message #1 by Bobby Tan

This is the wrong forum for this type of question (the LJ III is not a calculator after all).

However, try the following link, they appear to be offering a "fix error 50 kit" for $69.95.

http://www.fixyourownprinter.com/search/center?q=hp+laserjet+III

Note that I haven't tried their service, so I do not know whether their repair kits are for real.

in response to message #3 by Vassilis Prevelakis

Hi Bobby,

I recently fixed my LJ using the repair kit purchased from fixyourownprinter.com. They shipped the kit quickly and the instructions were great. I'll certainly use them again if the need ever arises.

Regards,

Wilson

Re: error message

*Message #5 Posted by **Forrest** on 18 Feb 2005, 1:03 a.m.,*
in response to message #1 by Bobby Tan

Bobby, I agree with what Richard has experienced. We had two LJ3's at work that got the fatal 50, and ended up throwing them in the dumpster. On the other hand I had a personal one at home that got the fatal 50 and was able to recover without repair. It is now at work and runs about a ream every two weeks by my desk.

No one will ever figure out why this one recovered. It was shut off for about two weeks and then when tried for the last time before going into the dumpster, it worked. It remains on all the time now and has not been shut down except for maybe 10-minutes in the last year.

Forrest

Re: error message

*Message #6 Posted by **Tony Duell** on 18 Feb 2005, 3:36 p.m.,*
in response to message #1 by Bobby Tan

IIRC, this is a Canon SX engine. Error 50 means the fuser did not get to the correct temperature (either too hot or too cold).

Common causes include :

The fuser lamp itself, the overheating protection thermostat (check for continuity between the pins of the 2 pin plug on the end of the fuser with the fuser removed, if it's open, then one of those has failed).

The triac Q801 in the AC input block

Capacitors and diodes on the protection PCB (the upper PCB in the AC block).

Occasionally problems on the DC controller board.

[Surely you didn't think I just fixed -- and had info -- on the handhelds :-)]

HP32sii doesn't lie flat.

*Message #1 Posted by **Stephen Walker** on 17 Feb 2005, 3:57 p.m.*

Okay,

I'm the proud new owner of a slightly-used HP32sii. I love the calculator, but the case is slightly bent or twisted, causing it to wobble slightly when operated when being operated on the desktop. Minor problem, I realize, but it's kind-of annoying because it makes it tougher to quickly press keys because the calc is moving and making noise on the tabletop.

So, it seems to me I need to shim on of the rubber feet to make it lie flat. Anyone got any ingenious solutions other than chewing gum? ;)

Thanks,

Steve

Re: HP32sii doesn't lie flat.

*Message #2 Posted by **OzarkMtbr** on 17 Feb 2005, 4:11 p.m.,*
in response to message #1 by Stephen Walker

My HP48gII has the same problem. The case is warped enough to wobble with every key stroke. A easy fix is to get a long rectangular stick on rubber foot (find at hardware store). Stick it on the back near the display end to it tilts more upright. This may interfere with a slide on cover it the 32sii has one.

Re: HP32sii doesn't lie flat.

*Message #3 Posted by **James Stephens** on 17 Feb 2005, 4:54 p.m.,*
in response to message #1 by Stephen Walker

Hi Steve,

In my experience, this is a common problem with hp calculators. My original hp-32s did not lie flat--still doesn't!:) My hp-32sii *does* lie flat, however. An old hp-11 (bought on ebay about a year and a half ago) also has this little flaw, whereas a second one does lie flat. It seems a little funny that high quality products like this should have this problem, but they do, and I just got used to it.

Jim

Re: HP32sii doesn't lie flat.

*Message #4 Posted by **Jeff B** on 17 Feb 2005, 6:13 p.m.,*
in response to message #3 by James Stephens

I've sanded the feet even on a few of mine by sliding the calc across a sheet of sandpaper lying flat on a table. just make sure there's enough foot there to do it.

Lying flat -- 32SII and 11C

*Message #5 Posted by **Karl Schneider** on 18 Feb 2005, 12:34 a.m.,*
in response to message #3 by James Stephens

Re: 11C

My 15C developed the annoying problem of not lying flat, and twisting ("straighening") the case did not solve the problem. Wwondering if some of the four screws underneath the rubber feet had come loose, I disassembled the case halves, re-twisted them flat, then reassembled. Voila!

This might work for your 11C. (Be sure not to lose the small spring that provides chassis grounding.) If you want new rubber feet, I think someone sells them on the MoHPC Classifieds.

Re: 32SII

All Pioneers have a wide rubber foot near the upper end, and four short rubber feet at the lower end. The calc's should lie flat, but they're not as readily disassemblable as the Voyagers (e.g., 11C) are.

Re: Lying flat -- 32SII and 11C

*Message #6 Posted by **Mike T.** on 18 Feb 2005, 8:03 a.m.,*
in response to message #5 by Karl Schneider

I had a similar problem with an HP11C I brought to upgrade my old HP10C recently - I just twisted the case very, very gently to solve the problem ... didn't need to disassemble it (and personally I wouldn't recommend disassembly unless you are comfortable with that sort of thing and have an anti-static mat and wrist strap as the chips in the HP calculators seem to be very susceptible to ESD - as I learnt that the hard way about 15 years ago).

Occasionally I find that a gentle twist is needed to get my older 34C and 32 (Spice) machines to work - but that is (I think) because both of them have the foam sandwich style PCB, and a slight twist has usually fixed any problems caused by poor contacts internally. I found that I can I avoid this sort of problem occurring with these machines by ensuring that I always use them on a horizontal, flat, hard surface - not in my hand or even on a mouse mat. This minimises any movement when using them which seems to help - but it does mean that they don't travel around in my briefcase anymore.

*Message #8 Posted by **GS Leong** on 18 Feb 2005, 9:04 p.m.,*
in response to message #7 by Veli-Pekka Nousiainen

I use a quality Scotch tape (several layres) on the foot that is not making contact. I then use a very sharp knife to cut the tape to fit the foot exactly.

Hope this helps!

Good Luck GS Leong

Re: Lying flat -- 32SII and 11C

*Message #9 Posted by **Neil** on 19 Feb 2005, 5:15 a.m.,*
in response to message #8 by GS Leong

Hi,

I've also got quite a few pioneer calcs that are not flat, as well as some that "creak" when you press some keys or pinch the 2 case halves together, usually on the left side near the display. If you look on the side, you can see that when you press together, the 2 case halves can move ~ 1 mm. All these creaky calcs work fine, but I've always wondered if this means the keyboards could malfunction sooner than in a pioneer that doesn't creak ie. one with the 2 case halves firmly fixed together.

Re: Lying flat -- 32SII and 11C

*Message #10 Posted by **Bernardo Vargas** on 21 Feb 2005, 3:52 p.m.,*
in response to message #8 by GS Leong

A common problem; my 41CV and 12C did so, and I managed to solve it by placing one or two layers of double-sided adhesive tape between the calculator's case and the rubber feet. It works nice.

in response to message #10 by Bernardo Vargas

Hi everybody, I have 9 calculators (2 voyagers and 7 pioneers)and the only one that doesn´t lie flat is a 32SII that I bought new in box a year ago and its serial number is 3450S95580.At first I put 2 rubber feet next to the original one (next to the battery compartment) and removed these feet because the calculator used to slide.The problem is the same already pointed here that is a "curved" , warp , not flat case. I remember now that I used to have a 20S that had the same problem but less curved case.Both of them make a creak when pressing some keys.Both of them made in Singapore that shows the same design as the Brazilian ones but the Brazilian ones don´t have this problem.What i did to solve...as I didn´t intend to sell the 32SII I took a sharp spare blade (like a tiny knife) and ... sorry people of doing so on a marvelous calc (even if it is mine not yours rsss)....CUT....the feet at its middle region....now it lies flat very well ...

Alex(Brazil)

Re: Lying flat -- 32SII and 11C

*Message #12 Posted by **Stephen Walker** on 27 Feb 2005, 11:24 a.m.,*
in response to message #11 by Alexandre Faria

Thanks everyone!

I thought maybe there were others out there that faced the same problem.

For now, I've put several layers of Scotch tape on one of the feet and trimmed it off with a knife so it doesn't look too terribly bad. Maybe i'll try a more permanent solution in the future, but i'm not sure I'm ready to take a sheet of sandpaper to my precious 'classic' calculator! ;)

HP-48gII

*Message #1 Posted by **ozarkmtbr** on 17 Feb 2005, 1:10 p.m.*

Have any of you had problems with the keys on the HP48gII becoming loose. After having it for 3-4 months the keys become loose and will no longer capture all the key presses. The set at an angle now as if their seat has broke. HP has replaced it twice already. Two had the key problem and another just died and will only give a black screen.

I am totally HP all the way and have owned HP-48SX and HP-48GX calculators before. They have lasted years. My GX is 14 years old and still working fine. I am concerned with the quality of the new HP calculators.

I had heard that some of the original HP guys split off and started their own company. Any news on that?

OzarkMtbr

Re: HP-48gII loose keys

*Message #2 Posted by **OzarkMtbr** on 17 Feb 2005, 3:49 p.m.,*
in response to message #1 by ozarkmtbr

The HP49 seems to be of similar build. Has anyone had any issues with the keys on this model either?

HP49+ SD slot - please someone put me out of my misery

*Message #1 Posted by **Steve Dimond** on 17 Feb 2005, 6:28 a.m.*

Does the SD slot on the 49+ come with a "spacer" or dummy insert?

I can't work out whether I've lost mine or I never had one in the first place! I've spent hours looking for something that might never have existed. :)

Steve

Re: HP49+ SD slot - please someone put me out of my misery

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 17 Feb 2005, 6:35 a.m.,*
in response to message #1 by Steve Dimond

Hi, Steve;

I don't recall having such "protective" dummy inseted in the SD slot in my 49G+. If I remember it correctly, I simply inserted the RAM SD card without having to remove anything from my HP49G+' SD slot.

Now that you mentioned, I looked at the SD card small plastic pack and there's nothing there. I usualy save such spacers in the same package that the applicable modules come inside.

Hope this helps.

Luiz (Brazil)

*Message #5 Posted by **Tim Wessman** on 17 Feb 2005, 11:14 a.m.,*
in response to message #3 by Namir

Although if you don't have an SD card inserted in the slot I would consider something missing. It is kind of sily to have the capability and not have anything in there. If ytou don't have one, ask around. I bet someone who has bought a digital camera recently got a 16mb card they'd be happy to give you.

*Message #6 Posted by **John Smitherman** on 17 Feb 2005, 12:13 p.m.,*
in response to message #5 by Tim Wessman

Hi Tim. Is there a recommended or optimum SD card size for the 49G+? Is there a size limit?

Thanks,

John

Re: HP49+ SD slot - please someone put me out of my misery

*Message #7 Posted by **Tim Wessman** on 17 Feb 2005, 2:26 p.m.,*
in response to message #6 by John Smitherman

The size limit is thoeretically 2 GB. I would either find a 16 Mb one from someone, or buy the cheapest you can find unless you plan on sharing it with a camera. I wouldn't reccomend this however as I've had the camera sometimes mess up my card for the calculator and it needed to be reformatted.

*Message #8 Posted by **John Smitherman** on 18 Feb 2005, 7:51 a.m.,*
in response to message #7 by Tim Wessman

Thanks Tim. Do you know if the SD cards reduce battery life significantly?

John

Re: HP49+ SD slot - please someone put me out of my misery

*Message #9 Posted by **Eddie Shore** on 19 Feb 2005, 10:26 a.m.,*
in response to message #8 by John Smitherman

On occasional use of the SD card, battery life remains normal.

Re: HP49+ SD slot - please someone put me out of my misery

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 19 Feb 2005, 11:17 a.m.,*
in response to message #8 by John Smitherman

Hi, John;

I second Eddie's commnets, I'd just add that based on the fact that technology used on SD RAM cards allows data to be retainned without extra battery source, i.e., even when the card is not in the calculator, the additional power consumption is observed only when read/write operations are performed. So, the more often you access the cards contents, the more power you spend on it. My HP49G+ uses a 256MB proX, High-Speed SD card by SimpleTech. The manufacturer claims that, because it is faster (up to 10MBps write speed), it maximizes battery life.

My 2¢.

Luiz (Brazil)

*Message #12 Posted by **LH Chan** on 20 Feb 2005, 12:29 a.m.,*
in response to message #11 by John Smitherman

the ones that came with camera are 8 -32 mb in size, these are just right for use in hp 49g+ (you wont use a 32 mb or smaller card for your camera anyway) .

32-MB SD card size

*Message #13 Posted by **Karl Schneider** on 21 Feb 2005, 3:27 p.m.,*
in response to message #12 by LH Chan

LH Chan said --

> Quote:
>
> (you wont use a 32 mb or smaller card for your camera anyway).

Aw geez, now you tell us! :-)

I just bought my first digital camera yesterday, and a $9.99 32-MB SD card for it. The card holds 26 pictures on a 3 Mpix camera, and one doesn't absolutely need to make use of it (unlike film).

Gosh, the thing's complicated. 3 CD's of suppport software and introductory demo and a fairly-thick manual.

Hp-33S clear stack

*Message #1 Posted by **Michel Beaulieu** on 16 Feb 2005, 6:50 p.m.*

Is there a key to clear the stack instead of entering "0" 4 time?

I cannot find it in the manual.

Thanks ! Michel

Re: Hp-33S clear stack

*Message #2 Posted by **Gene** on 16 Feb 2005, 7:00 p.m.,*
in response to message #1 by Michel Beaulieu

Nope, no Clear Stack.

Reason for this is that there was no such function on the HP32SII and the HP33S is an almost exact duplicate of the HP32SII, with only a few things added.

So, if it wasn't on the HP32SII, it probably isn't on the HP33S. :-)

Don't forget the learning modules on HP's site for the HP33S that are also a source of a lot of information:

http://www.hp.com/calculators/scientific/33s/technical.html

Gene

Re: Hp-33S clear stack

*Message #3 Posted by **Norris** on 16 Feb 2005, 8:32 p.m.,*
in response to message #1 by Michel Beaulieu

There is no key for this function, but it is trivial to program it.

My 33S is programmed for "Clear Stack" by hitting XEQ N:

LBL N
0
ENTER
ENTER
ENTER
RTN

It is also programmed for "Clear Stack, All Variables, and Statistics Registers" by hitting XEQ P:

LBL P
XEQ N

CLVARS
CL-Sigma
RTN

The only problem is that such programs use up the scarce labels on the 33S. If you plan to store a lot of other programs in your 33S, then you may not want to waste labels on simple programs like these.

Re: New page on my website

*Message #8 Posted by **Namir** on 17 Feb 2005, 10:10 a.m.,*
in response to message #7 by Matthias

Hi Matthias,

I remember the summer of 1963 that I spent in Lausanne. I think in August there was a celebration where people walked at night in the streets with candles lit. Was it the feast of the Holy Cross or some Swiss celebration? It was too long ago for me to remember. I went with a Swiss neighbor (my family and I had rented an apartment for the summer that year).

Namir

in response to message #7 by Matthias

yeah, the bridge is super cool, I'd love one of those!

Thanks

Peter

OT: New page on my website

*Message #12 Posted by **Mike (Stgt)** on 18 Feb 2005, 6:14 a.m.,*
in response to message #1 by Matthias

Hi Matthias!

Did you see "Alti Stainlemer" with their 'lamp'. When I saw it my first thought was: Basle has a tradition of humanists! (I hope your Allschwil meeting of HP enthusiasts will make history too.)

For those interested in this OT subject: the carnival organisation "Alti Stainlemer" are known to show topics not too political correct, but it's carnival! This year they pulled with heavy chains a huge, sad looking head of the Statue Of Liberty. Those who pulled had been dressed in bright orange with black bags over the head, escorted by others in field uniforms. Motto: "we are so free".

Ciao.....Mike

HP-41 in Space - World Spaceflight News

*Message #1 Posted by **Bill (Smithville, NJ)** on 16 Feb 2005, 10:57 a.m.*

In trying to find info on HP calculators used in space, I found the following web page - World Spaceflight News:

http://members.aol.com/wsnspace/reports.htm

They list a catalog of training manuals that can be purchased, one of which is the following:

"HP-41 / SHUTTLE PORTABLE ONBOARD COMPUTER (SPOC) Setup of hardware and operation; software descriptions; troubleshooting. 44 pgs. $18.00"

Has anyone ever seen this document? I would order it, but the Web Page is old - catalog last updated August 1998. Most of this site is at least 4 years old.

I've sent an email to the contact - but never received any answer. A scan of the web shows that no one else has had success in contacting them.

This is the first reference I've seen to actual NASA calculator instruction manuals.

So - did anyone buy it back in 1998 when it was available?

Time to do more research, but at least now I know that at one time an instruction manual did exist.

Bill

Re: HP-41 in Space - World Spaceflight News

*Message #2 Posted by **S. Martin** on 16 Feb 2005, 1:20 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Bill,

In case you haven't seen this link yet:

http://www.nasm.si.edu/research/dsh/artifacts/GC-hewlett.htm

A while ago there was some discussion on the board about the programs used in the HP41 by Shuttle astronauts. Someone mentioned that the programs were still around (in someones basement or such) but to my knowledge they have never materialized.

Steve

Re: HP-41 in Space - World Spaceflight News

*Message #3 Posted by **Bill (Smithville, NJ)** on 16 Feb 2005, 2:02 p.m.,*
in response to message #2 by S. Martin

Hi Steve,

Thanks for link - I had run across it some time ago but a re-read brought up several interesting points.

Each program was "Mission" specific and was on Modules with spare modules being carried. Of course, this begs the question - User Step Code or Machine code? Used on total of nine missions, so there may be nine different mission specific modules.

I'll be visiting Washington this spring, so I'll have to check the HP-41 that is on exhibit at the Air & Space Museum. Worder if they are storing it with or without batteries and does it contain the actual modules that were used for the Sally Ride mission. Thinking of batteries, did they use standard off-the-shelf batteries or special batteries for the space environment. Too many questions - few answers :)

No let's see .... if I carry a set of batteries.. and no one is looking ... Nah - I'd never get away with it :)

What has happened to the other calculators and modules?

I had to laugh at the following statement:

"Because of their low cost, NASA was able to buy several calculators and provide them to members of the crew for their personal use."

With the millions being spent, NASA could afford to buy hundreds or thousands instead of just "several".

I have a friend that's involved in designing satilites and maybe he has some contacts that could help me track down some additional info.

Bill

Re: HP-41 in Space - World Spaceflight News

*Message #4 Posted by **S. Martin** on 16 Feb 2005, 3:19 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

Hi again Bill,

Here is some more information that I have come across over the years:

1) My understanding is that the programs were written in FOCAL (i.e. usual programming language on the 41) and did the job (i.e. not very elegant).

2) I have been to the Air & Space museum several times, last time was about a year ago, and the 41CV was still on display. It is behind a glass case, so you cannot handle it. Looking at the top of the 41CV you'll find just module place holders, and no actual custom modules (if there were, I would have made some inquires and tried to get a hold of them to recover the programs). You'll also notice a custom keyboard overlay and a white pouch that was used to store the calc in space. I took some pictures of the display at one time which I posted in this forum some time ago. If you're interested, I can dig them up and re-post them.

Steve

HP15C Advanced Functions Handbook

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 16 Feb 2005, 10:54 a.m.*

Hello!

I found a pdf of HP15C Manual on the Web. Can anybody tell me, where can I found an Advanced Functions Handbook on the Internet or somewhere?

Thanks for your answer!

Csaba

Re: HP15C Advanced Functions Handbook

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 Feb 2005, 11:10 a.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Hi, Tizedes;

you can find the HP15C ADV FCN Handbook in PDF format at the MoHPC CD-ROM set as well. It has lots of extra information. I have the earlier 5-CD pack and I'll upgrade for the new 7-CD or the single DVD ASAP. You'll have many other good stuff, like the HP34C additional literature, the HP11C extra manual as well (a must!), and many others.

I recommend!

Cheers.

Luiz (Brazil)

Re: HP15C Advanced Functions Handbook

*Message #3 Posted by **Namir** on 16 Feb 2005, 12:54 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Vieira,

I agree with you. The MoHPC CDs and DVDs contains a wonderful set of references and calculator documentations. I often use these files to look up formulae, test case, and so on. I highly recommend the museum CDs.

Namir

Re: HP15C Advanced Functions Handbook

*Message #4 Posted by **Karl Schneider** on 16 Feb 2005, 11:38 p.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Tizedes --

Yes, the MoHPC CD/DVD is the best source for scanned HP claculator diocuments. If you want a paper copy of the manual, be prepared to pay up to US$100 on eBay or to Web-based retailers.

HP-11C floating display format

*Message #1 Posted by **Craig Skinner** on 16 Feb 2005, 7:40 a.m.*

Hi,

I have a HP-11C, and it is cuurently set with a fixed number of decimal places format.

How do I unfix the display format so that it displays the number of decimal places as required?

I tried FIX . which works on some other models, but not it seems on the 11C.

Thanks, Craig

Re: HP-11C floating display format (edited)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 Feb 2005, 11:06 a.m.,*
in response to message #1 by Craig Skinner

Hi, Craig;

when you use either [FIX], [ENG] or [SCI] in the HP10C, 11C, 15C and most of the HP calculators, you should specify how many digits you wish to be shown after keying [f][FIX], [f][ENG] or [f][SCI]. For instance, if you want a fixed 5 decimal places, press:

```
[f][FIX] 5
```

It works the same for [ENG] and [SCI]. (both the HP12C and 16C have a different scheme)

Hope this helps.

Luiz (Brazil)

Edited: 16 Feb 2005, 9:09 p.m.

Re: HP-11C floating display format

*Message #3 Posted by **Tom Sherman** on 16 Feb 2005, 11:18 a.m.,*
in response to message #1 by Craig Skinner

Craig,

If I understand what you are seeking, you would like the calculator to display 3/2 as 1.5, but 5/4 as 1.25, and 2/3 as 0.666666666... This is called "standard" display on the HP-48G, and "normal" display on a TI-83. As far as I know, the 11C or 15C will not do this. With [f]FIX followed by a number, you can set the number of decimal places you want to round the answer to, but this will then be used for all results until changed.

Cheers, Tom

Re: HP-11C floating display format

*Message #4 Posted by **Craig Skinner** on 16 Feb 2005, 8:57 p.m.,*
in response to message #3 by Tom Sherman

Thanks Tom,

That is what I was looking for.

At least I now know not to continue trying to work out how to do it. ;)

Thanks, Craig

Re: HP-11C floating display format

*Message #5 Posted by **Bram** on 18 Feb 2005, 4:04 p.m.,*
in response to message #4 by Craig Skinner

You do know that pressing f clear prefix shows all digits for a while (independent on the chosen format), don't you? It's nothing like the ALL format, but it may suit your needs.

"ALL" display format

*Message #6 Posted by **Karl Schneider** on 17 Feb 2005, 12:07 a.m.,*
in response to message #1 by Craig Skinner

Craig --

As Tom said, the Voyager-series models (e.g., 11C and 15C) do not offer an "all digits only as required" display format. This is how the original HP-35 displayed numbers, and is the "Normal" display mode for TI, Casio, and other manufacturers. The "ALL" display format was provided in the Pioneer-series HP calc's (e.g., 20S, 32SII) for 1988.

HP provided "FIX" and "SCI" with the HP-45, successor to the HP-35. It makes more sense for the user to limit the number of digits displayed in routine practice, so as not to clutter the viewed results with insignificant low-order digits. The automatic change of format also gives confirmation that the input number was accepted. Fewer displayed digits saved battery power on the LED-display models, too.

15C auction

*Message #1 Posted by **Chris Woodhouse** on 16 Feb 2005, 2:58 a.m.*

This eBay auction has a 15C, manual and a case for the 48 series calculators. In the auction text they describe it as "Matching nylon Hewlett Packard zippered case". I'm just wondering how clueless you would need to be to think a case for a 48 is a match to a 15C. Just thought it was funny and had to share.

Chris W

Gift Giving Made Easy, Get the gifts you want & give the gifts they want with the help of The Wish Zone

Hi;

I read the auction and I found this:

> Quote:
>
> The owner's manual is stamped Aug. 27th, 1982 and has a serial number which, surprise, matches the serial number on the calculator itself.

I don't recall seeing any serial number in any of the manuals I have... Instead, the order number. Can anyone help me undrstanding this?

Cheers.

Luiz (Brazil)

82180A Ext Func/Mem ver. 1A?

*Message #1 Posted by **Diego Diaz** on 15 Feb 2005, 8:03 p.m.*

Hi all,

I've recently come across an 82180A module that shows "-EXT FCN 1A" in CAT 2.

The functions list is identical to my other "X FUNCTIONS" (ver 1C), and it also shows 124 registers of Extended Memory.

I've checked the most well known lists for HP-41 modules and have found references to the 1B and 1C versions only...

Was the 1A version ever released? Or was it only an HP internal preliminary revision?

Any clue?

Diego.

Re: 82180A Ext Func/Mem ver. 1A?

*Message #2 Posted by **J-F Garnier** on 16 Feb 2005, 2:43 p.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

This may be an early version of the X-function ROM. I'm sure that it will be of great interest for collector. Could you please make the ROM image available for the emulator fans, like me?

In the same way, there were a Time B and a HP-IL Printer 2D modules (as found in some litterature). Common versions are Time C and Printer 2E. I also had a early HP-IL Printer 2C, but I traded it with a "famous european collector"...

J-F

49G+ suddendly died. what to do?

*Message #1 Posted by **Andrea** on 15 Feb 2005, 11:14 a.m.*

Hello, I need help. My 49G+ suddenly died without any apparent reason. It just won't turn on again. I tried to replace both main batteries and backup memories, but it was of no help. What shall I do? It worked fine since I bought it, about 6 months ago. Thank you.

(Case has me needing it for the university on Wednesday :))

Edited: 15 Feb 2005, 11:20 a.m.

Re: 49G+ suddendly died. what to do?

*Message #2 Posted by **Tim Wessman** on 15 Feb 2005, 11:40 a.m.,*
in response to message #1 by Andrea

Perhaps the battery contacts are messed up? Some people have reported the battteries not making contact.

If this doesn't fix it, looks like customer support will have another calculator to ship out.

Buy A TI89

*Message #3 Posted by **J.C. Randerson** on 15 Feb 2005, 2:15 p.m.,*
in response to message #1 by Andrea

HP calculators, as you've now sadly discovered, have serious lack of quality issues. I went through 3 HP49+s with defective keyboards. As they say, the third times the charm, and I'll never buy/use an HP calc again.

Do yourself a favor - just throw the 49+ away, go to the nearest Walmart, Target... and buy a TI89. You'll get a good machine that is very good in function, fit, and finish.

Re: Buy A TI89

*Message #4 Posted by **Andrea** on 15 Feb 2005, 3:53 p.m.,*
in response to message #3 by J.C. Randerson

Hello again, I'm posting to say that I've managed to solve the problem, in case anyone will experience this, too, in the future. I just followed an advice given in this forum but for a different problem: take off the batteries for some hours, then insert them and cross your fingers :)

As for the TI89, I think HP is ok AS LONG AS it works ;)

DON'T buy a TI89 Re: Buy A TI89

*Message #5 Posted by **Fubar Vikinghelmet** on 15 Feb 2005, 4:43 p.m.,*

in response to message #4 by Andrea

Buy an HP-33S if you want a new calculator. Otherwise, keep your old HP. Go away, TI-people, you're stinking up the place (albeit, so is the HP company for the last several years).

DO Buy A TI89 Instead of 49+

*Message #6 Posted by **J.C. Randerson** on 16 Feb 2005, 5:13 a.m.,*
in response to message #5 by Fubar Vikinghelmet

Go away, TI-people - ever hear of free speech? Odds are I was using HP calcs before you were born...

Buy a 33 to replace a 49? What a joke. Idiots like you probably like the V shape of the keys. And what if the original poster wanted a machine with a CAS?

Your own choice of name says all about you: FUBAR

Free speech...

*Message #7 Posted by **John** on 16 Feb 2005, 7:38 a.m.,*
in response to message #6 by J.C. Randerson

has limits. Ever tried yelling "fire" in a theatre?

There is no sense coming to an HP museum site in order to "insult" those who post there.

I'm glad you have finally decided your true colors as a TI man.

Perhaps you should seek www.TImuseum.org if there is such a place. :-)

Re: DO Buy A TI89 Instead of 49+

*Message #9 Posted by **Fubar Vikinghelmet** on 16 Feb 2005, 12:51 p.m.,*
in response to message #8 by Jim the Cowboy

Free speech? You mean I can't voice my opinion, or tell someone to "shut up" (in so many words)? Isn't that infringement of my own free speech rights as an American? Boy, you TI users sure make things confusing...

Next thing you know, HP will be putting ALG keys on their calculators so... Oh, they did that already...

Re: Buy A TI89

*Message #10 Posted by **Namir** on 15 Feb 2005, 4:08 p.m.,*
in response to message #3 by J.C. Randerson

I own TWO TI-200 and one TI89 Titanium. My son owns a TI-89 Titanium and keeps it in his back pack. Both machines work very well. I like the TI-200's icons. The do math like champs!!

Re: 49G+ suddendly died. what to do?

*Message #11 Posted by **Eddie Shore** on 15 Feb 2005, 9:21 p.m.,*
in response to message #1 by Andrea

I'm sorry to hear that. Check the battery compartments, try a warm and a cold reset (I think one way of doing it is ON+F5+F6 but I'm not 100% sure). Try adjusting the contrast ON+plus or minus. Maybe the contrast is too out of whack.

I hope this helps.

Re: 49G+ suddendly died. what to do?

*Message #12 Posted by **Andrea** on 16 Feb 2005, 4:30 a.m.,*
in response to message #11 by Eddie Shore

Hello, thank you very much for your help :) Fortunately, as I wrote some posts ago in this thread, I took off the batteries for a while and then when I reinserted them, it worked. Anyway, could you please explain what "cold reset" and "warm reset" stand for?

Re: 49G+ suddendly died. what to do?

*Message #13 Posted by **Raymond Del Tondo** on 16 Feb 2005, 4:47 a.m.,*
in response to message #12 by Andrea

Hello,

a 'cold reset' (-> Coldstart) performs a complete reset of the machine RAM.
Keys: ON+A+F

A 'soft reset' (-> Warmstart) only clears the current running state.
Keys: ON+C

Be sure to check the manual about this.

Raymond

HP-65 in space with Apollo-Soyuz

*Message #1 Posted by **Bill (Smithville, NJ)** on 15 Feb 2005, 9:03 a.m.*

I've seen the HP ad and read the article where the HP-65 was used in the Apollo-Soyuz mission. See following link:

http://www.hpmuseum.org/adverts/sa65spc.htm

I was wondering - has anyone seen the actual listing of the program that was used? The ad looks like pre-printed cards were used - or maybe they just used standard pre-printed cards for the ad photo.

I would assume NASA would have printed an instruction manual on the use of the program. Anyone ever see a copy?

Anyone here with NASA contacts? It would be great to get some more info on this - I can't image it would be a trade secret or anything that couldn't be disclosed at this point.

Bill

Data Acquisition with HP-41CX

*Message #1 Posted by **CapPs** on 15 Feb 2005, 4:53 a.m.*

I have the following peripherals available to connect to my HP-41CX :

HP3241A Data Acq/Ctrl Unit HPIL Module 82160A HP Extended I/O Module 82183A

9114B Disc Drive 82164A HP-IL/RS-232C Interface 82169A HP-IL/HPIB Interface IBM Thinkpad 365 (Windows 95)

How can I setup a data acquisition system, controlled by the 41CX to capture data at regular intervals. Data is acquired using HP-3241 via HI-IL, and store directly into a 3.5in disk that can be analysed later in Excel?

Can I also stream the data directly into my IBM notebook, using HP-82169?

Re: Data Acquisition with HP-41CX

*Message #2 Posted by **Christoph Klug** on 15 Feb 2005, 5:25 a.m.,*
in response to message #1 by CapPs

Dear CapPs,

the I/O-Board manual contains a software application for HP41CX, which uses time alarms to run a data logger application.

Instead HP3241 I use I/O-Board or IL2000 system, because this includes some more features which are helpfully for data logging applications.

I/0-Board manual contains also a software + hardware modifucation for HP41, for waking up the complete system by an external event.

Alternatively to HP41 you can use EMU41 running on your PC -for controlling the HP3421. Unfortunately (as I know) the alarm functions of EMU41 are limited, therefore starting an data logger application by time alarms would not be possible for EMU41.

But EMU41 is really great for receiving the data from your HP41 and running some post processing routines. For example you are able to transfer NNN´s from HP41 to EMU41, take this feature for compressd data storing of your measurement data. Last not least the transfer of data from EMU41 to EXCEL is easy possible.

With best regards from Germany - Christoph Klug

"Using advanced interface technologies to connect your HP41 System to future " :-)

Re: Data Acquisition with HP-41CX

*Message #3 Posted by **CapPs** on 15 Feb 2005, 6:26 a.m.,*
in response to message #2 by Christoph Klug

Hi Chris

Thanx for you quick response. I'm not entirely familiar with your IL2000 system. Could you please elaborate.

I'm using a HP3214 Data acquisition system because that's what I have on hand.

Incidentally I also have an HP95LX at my disposal too. Its got 512Mb of storage. Would indeed be neat to be able to connect to the system and use of it as data storage.

Re: Data Acquisition with HP-41CX

*Message #4 Posted by **Christoph Klug** on 15 Feb 2005, 7:45 a.m.,*
in response to message #3 by CapPs

Dear CapPs,

for more details - which are helpfully for data logging applications please refer to HP-Museum article forum :

003 : HP41 hardware interface activities

192 : Interfacing IL2000 to analogue world

311 : HP41-PC gateway & emulator

For measurement data storing with HP41 system normally I use X-Memory (CCD module matrix files) or IL-Cass-Drive.

Regards - Christoph Klug

Re: Data Acquisition with HP-41CX

*Message #5 Posted by **Garth Wilson** on 15 Feb 2005, 5:59 p.m.,*
in response to message #1 by CapPs

I believe you mean the HP3421, right? (not 3241) That was part of my entry into automated production test equipment nearly 20 years ago, along with the HP-41cx and other test equipment. (I went through the HPIL-to-HPIB converter though, so all the equipment was on HPIB.) See my "memories" article at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/memories.cgi?read=224 .

As with any complex project, your approach needs to be modular. Learn the 41's alarm functions (especially control alarms), the file functions (both on mass storage and in extended memory), the HPIL and Extended I/O functions, and of course the commands for the 3421, and start piecing things together. Try various commands and watch them work, then write little pieces of code using the commands and watch those pieces work, then use the familiarity you've gained there as you begin writing the final application.

There was an HP-41 module to go with the 3421, but I understand it was really just to give it a "front panel" for someone who didn't want to look up any commands in the manual. I never had or used that module.

Re: Data Acquisition with HP-41CX

*Message #6 Posted by **Christoph Klug** on 16 Feb 2005, 5:01 a.m.,*
in response to message #5 by Garth Wilson

Dear Garth,

thanks for your interesting link - this was the first time I enter the memory section of HP-Museum :-)

Nice to see that some more HP41 enthusiasts using this amazing handheldcomputer also as an advanced system controller.

For the HP3421 exist the DAC-ROM - working as a "front pannel". The rom-images for this module are available at TOS. But for practical work the EXT-I/O does the same job.

Do you own a HP3421 including 8-bit digital I/O option ? Only this additional data lines make possible control functions.

If someone needs more I/O lines plus some different supply voltages - than I/O-Board or IL2000 would be an answer.

For the today work on workbench I prefer the HP3468 digital voltmeter, because this includes a practical user interface.

For anyone who likes the HP41 as a system including HP-IL - and not only as a poor handheld calculator, EMU41 would be an interesting software application - because only EMU41 mirroring much of the system features of HP41 & HP-IL to virtual world....

Dear Garth, may be you want to give the readers of this forum some more details about your HP41 & HP3421 data logger applications, because I think most of the readers do not have an imagination about this funny possibilities...

Regards - Christoph Klug

Dear Thomas,

TOS = the other side, because of the laws of HP-Museum a direct reference is not possible.

Regards - Christoph Klug

TOS illegal? Then please don't mention it.

*Message #9 Posted by **Thomas Okken** on 16 Feb 2005, 4:35 p.m.,*
in response to message #8 by Christoph Klug

TOS = the other side, because of the laws of HP-Museum a direct reference is not possible.

Forgive me for being stupid or whatever, but the laws of the HP Museum seem pretty common-sense to me. Are you saying that this "site that cannot be named" is an illegal one (free and illegal downloads of copyrighted software etc.)?

If that's the case then how about everyone not even talking about that site in the first place? Being cute and saying "TOS" instead of just giving out the URL is just hypocritical, if you ask me. C'mon folks, either stand up for what you believe in, or else just shut up already. Don't let's abuse this wonderful service that David Hicks is providing at hpmuseum.org.

- Thomas

TOS

*Message #10 Posted by **John** on 16 Feb 2005, 5:02 p.m.,*
in response to message #9 by Thomas Okken

The museum software will not allow a post containing the URL for TOS to be posted. It will reject the posting.

This goes back (apparently) to a disagreement between the curator of the museum and the owner of TOS.

TOS hosts ROM images and other materials. The owner of TOS states that he has the proper permissions from HP to do so.

The curator of the museum disagrees (I think that's correct) and does not want the site mentioned here (hence the block if one tries to post the URL).

I've been hopeful the two can somehow work out this disagreement, because it is either OK or not.

The owner of TOS says he has the proper permissions. Seems like that should be easily verified.

Personally, I like both locations.

Usually, the URL for TOS is given by email reference, since it cannot be posted here.

Re: TOS illegal? Then please don't mention it.

*Message #13 Posted by **Diego Diaz** on 19 Feb 2005, 1:11 p.m.,*
in response to message #9 by Thomas Okken

Hi (almost) all,

First, It's me who coined "TOS".

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=62014

It stands for "The Other Site".

If you prefer "That Other Site", it's Ok for me too (I'm not gonna sue you for "Copyright" infringment...)

So, once I've admitted to be the one to blame...

...that leads me to the main question:

Mr Okken:

1st- Definition of what is legal or ilegal is a mere question of time and use.

2nd- You can call me "hypocritical", this won't made a different (worst) person of me, as it didn't made a different (better) person of you either.

3dr- Appart from your taste for judgement and moral advise:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=68940

most of us here are extremely careful when it comes to judge others. Most of us know that it is *really* difficult to tell wrong from right, and it's not a good idea judging without knowing *all* the evidences. It's not a good idea gudging from our living-room or from our keyboards.

You can, of course, have your own opinions, but please, we also have ours so, keep yours with you.

4th- Will you (any of us for that matter) keep on visiting this wonderfull site if you were aware that it contains links to child pornography sites?? Sure not!! But have you ever tried to check if *any* link referenced in *any* post could lead you to such a site, or even if one can place such a link in a post??? Sure not!! Do you consider it a worst behaviour to build a site where "free and illegal downloads of copyrighted software etc." can be found... or a child pornography one?? (Not answer needed)

5th- Copyright is a money matter. That's all about. And, to my mind, there are *really* few things that lead to inmoral behaviour as money does.

6th- Guttemberg would probably be sued by Cistersian monks (if they come back to live nowadays...)

7th- Knowledge is what makes the human being worth living, please, let it spread. The most brilliant brains in History fighted against the stablished powers trying to share their

knowledge. Now he most weak brains ever figth beside the established power to keep knowledge restricted by law... Seems that we haven't learned much since Spanish Inquisition.

8th- If Newton, Einstein, Galileus, DaVinci, Heisenberg... would have kept the copyright of their knowledge and discoveries we simply won't be here.

9th- Mr. Furlow, (curator of TOS) is by no means banned in this forum:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=63848

AFAIK he has not been sued by HP, further more, you can also find a link to this MoHPC at TOS.

10th- Last but not least, you can find a link to TOS on this very site!!!

Of course it is not directly mentioned but it's quite easy to find. It is the case that Warren is the author of the best Windows base HP-41 emulator (freeware). So you can go to the "Calculator Simulations" link:

http://www.hpmuseum.org/simulate/simulate.htm

There you'll find "HP-41C Emulator (Windows)" at the bottom, and this link will lead you to Mr Furlow's site and... to "The Other (illegal?) Site"!!!

Will this change your mind, Mr. Okken, to think that David Hicks is also "Hypocritical" for that "cute" workaround??

Isn't it funny??

Fortunatelly, there are millions of people that can see a huge amount of greytones between black and white.

My best wishes to all of'em.

Diego Diaz, developer of Clonix and NoVRAM modules, none of which could have ever been conceived without the contribution of MoHPC people/info *and* TOS on-line (illegal?) documents.

Edited: 19 Feb 2005, 1:35 p.m.

Re: TOS illegal? Then please don't mention it.

*Message #14 Posted by **Garth Wilson** on 19 Feb 2005, 3:56 p.m.,*
in response to message #13 by Diego Diaz

From working a little with Warren Furlow, I have no doubt that he is completely legal in what he has done on his website. In fact, I think he's a little _too_ careful about some materials that no one would care about anymore. I personally have given him some materials for his website that after many months he still has not put up yet apparently because he has not been able to find whoever he believes he should get permission from. (Maybe a company has gone out of business or something-- I don't even remember anymore what it is that's waiting for permission to be put up on the web.) I'm on another forum and website whose owner has for many years just taken the approach that if he can't find anyone left to get permission from to post old materials, he just goes ahead and posts it with the idea that if anyone complaints, he'll either take it down or

pay them a royalty-- their choice. So far he has not run into any trouble at all. The only company that did complain was one that forgot they already gave him permission. I know Warren has been trying to get permission to post a manual from one company that has no one left in it anymore who even remembers what an HP-41 is. They don't know about their product he wants to post the manual for, but they've asked him not to post any of their materials-- whatever they were-- they can't remember. Maybe if they could remember, they'd give him permission.

Re: TOS illegal? Then please don't mention it.

*Message #15 Posted by **Wilson (Bill) Holes** on 19 Feb 2005, 5:36 p.m.,*
in response to message #14 by Garth Wilson

Hi Garth,

I just wanted to confirm your take on TOS. I too have donated several items and have found Warren to be completely above board when it comes to posting any copyrighted material. My experience has been much like yours in that Warren would not and did not post any of the material I donated until he had a full release in his hands. This was the case with the AECROM, the copyright to which I hold. I am also responsible for donating images and manuals for the NFCROM, Pcoder (ProtoCoder) ROM, ProtoPario ROM, and all associated documentation. Warren posted these as well but only after I obtained and forwarded to him a full release from the author and my good friend Nelson F. Crowle.

In short, it's difficult, no it's impossible, for me to believe or even imagine that Warren would post any illegal materials.

Just my two cents worth in hope that someday both these great sites can resolve their differences.

My Best to all, Wilson (Bill) Holes

Re: TOS illegal? Then please don't mention it.

*Message #16 Posted by **Matthias** on 19 Feb 2005, 7:09 p.m.,*
in response to message #15 by Wilson (Bill) Holes

Just a short, unimportant addition: I agree 100% with you, Wilson. I´m also confident, Warren (who is a good HP friend of mine) only pubishes maerial after getting the authorisation to do so. As you know I do not publish much stuff at the moment (but that is another story). Anyhow Warren asked me for publishing my HP-41 module list, although it is downloadable on my homepage. You see, he does not only asks for commercial products, but also for hobby stuff like my list.

Warren, I realy hopy you find a conclusion with Dave.

What I know about TOS

*Message #17 Posted by **Dave Hicks** on 20 Feb 2005, 12:51 a.m.,*
in response to message #13 by Diego Diaz

A brief chronology as I know it.

Long ago there was a site with an interesting simulator. I linked to it. It became more

popular and was occasionally linked to in this forum.

Sometime later HP told me that the site was hosting ROMs without permission and that I should prevent links to it in the forums. I complied. (I took a look at the site at that time and it said something like: These ROMs are NOMAS so I can place them here, which was surely well-intentioned but legally nonsense I believe.)

Sometime later the site owner told me that he had later received permission so it was OK now. That sounded great, but since it was HP who asked me not to link, I checked with my contacts. They hadn't heard anything about this. I tried more contacts. I tried several people in person. I even tried after beer. I asked other people who were and, still are, trying to get permission to copy ROMs for simulators. No one else I know has heard anything about it. Comments from two HP employees: (quotes from memory) "You would be wise to stay away from this" and "There are many sites with inappropriate HP content but I don't report them to legal for fear that they would take them all out, including the good ones."

Everyone points to Fred Valdez (the GM of the calculator division) as the person who can provide the definitive answer. I asked some time ago and didn't get an answer. I planned to corner him in person at HHC late last year but he had a last minute conflict. At HHC Eric Smith asked if there was any chance of getting some ROMs released for his simulator and Cyrille de Brebisson (Calculator R&D manager) said "I believe that will never happen". (Which tends to imply that he also thinks it never has.)

Later I emailed Fred again and this time I thought I was pretty clever: Instead of asking for confirmation that the site was now operating with HP's blessing, I only asked for permission to remove the link block and for HP to agree to hold me blameless for links to some site I don't control which are added by other people in this forum. That seemed like a simple request that didn't limit HP in any way. I even said I would reinstate the block on their request at any time. An assistant to Fred told me that they were looking into it and it would take some time. That's the last I've heard.

Perhaps the other site owner can ask his contacts to contact Fred. I have no idea whether Fred doesn't know, doesn't agree, or this just gets lost in the shuffle.

Re: What I know about TOS

*Message #18 Posted by **Matthias** on 20 Feb 2005, 5:47 a.m.,*
in response to message #17 by Dave Hicks

Dave, would if solve the conflict if the currator of TOS would publish his permission he got from HP or so? I´m shure, he still has them. Maybe he can also tell you, who gave him the permission and you could ask them back?

Matthias

TOS IS legal, but how do I prove it?!

*Message #19 Posted by **Warren Furlow** on 21 Feb 2005, 8:38 p.m.,*
in response to message #18 by Matthias

Guys, I am deeply gratified that you have said the kind things above!

As I said somewhere before, I could easily believe that one hand of HP does not know what the other is up to.

My initial request was made to Iain Morris who referred it to corporate attorney in Fort Collins. The attorney (who is an HP-41 fan as well) did some checking and eventually sent me a permission letter. It says:

"Dear Mr. Furlow:

In response to your request, Hewlett-Packard Company is pleased to grant permission for you to reproduce HP-41 calculator materials for your [TOS] archive website.

This permission is contingent on you including appropriate HP copyright notices along with reproduced materials. Further you agree to include the following in each copy you make: "

Then it spells out the disclaimer that I have pasted all over the place. That is it. There is no mention of ROMs and I never got an answer to that question. Nevertheless, I believe it is broad enough to include them.

As you probably know, I now distribute only .MOD format files. This format includes the ROM image but also the copyright notice and disclaimer and other information like how to automatically load it into emulators.

It occurs to me that HP may never settle this to our satisfaction.

Thanks & Best Wishes!

Warren

in response to message #17 by Dave Hicks

Thanks for the details. It seems more like people at HP not knowing what has been released in the past rather than inappropriate conduct in the user community. Just my 0.0153005 euros (at today's exchange rate).

Re: What I know about TOS

*Message #21 Posted by **Raymond Del Tondo** on 20 Feb 2005, 2:14 p.m.,*
in response to message #20 by sjthomas

Just a note: Sometimes they do not know yet what they release.
Take for example the manual for the '48gII' which is
for download on the HP-48G/G+/GX pages...
The manual has quite nothing to do with the HP-48,
like the 49g- has nothing to do with the HP-48G

Raymond

Re: TOS illegal? Then please don't mention it.

*Message #22 Posted by **Donald1800** on 20 Feb 2005, 3:03 a.m.,*
in response to message #13 by Diego Diaz

Thank you all who have posted your position about this topic. I too highly respect both site caretakers, believing not only in their honesty and integrity, but also in their belief in their own positions. That is why I am happy to once again see this brought out into the open for further examination.

I personally believe that the core of the 'misunderstanding' lies with the current HP management not knowing about either their prior release or reasonable current position on the subject. After all, HP has no qualms about protecting their commercial/technical intellectual property in court - a simple cease and desist order would suffice - yet nothing has happened for years.

I am pleased that Dave is pursuing a resolution to this unnessary conflict within our community - perhaps a less strict approach would be wise until HP gets it's act together.

I support Warren's claim to release of the NOMAS as do most other HP41 supporters.

Don

*Message #24 Posted by **Garth Wilson** on 16 Feb 2005, 1:17 p.m.,*
in response to message #6 by Christoph Klug

Christoph,

I'm sure this is the longest post I've ever made here.

The 3421 was rented by the company I was working for at the time. I don't own one myself. Yes, we also rented the plug-in output board which had, IIRC, ten relays or something like that, which I connected to some equipment we made in-house. Also on the HPIB were an HP signal generator and a programmable power supply. Other equipment involved that was not computer-controlled included amplifiers, a Bruel & Kjaer reference mic, and a small anechoic chamber. I know I'm forgetting something. Soon after that original set-up, we bought some other equipment and stopped renting. I do remember that we bought an HP3457A digital multimeter, a Wavetek signal generator, and a Cytek relay unit. Later we put in a PC with an HP Viper board (which is a 68K computer with HP BASIC on-board and HPIB built in), but the test speed was not much faster than it was with the HP-41, just because much of the computers' time was spent waiting for filters to settle and readings to come back from the equipment.

I had seen people in the engineering lab at my previous place of work (M/A Com P.H.I.) control network analyzers and other microwave equipment with their personal HP-41's, but the company didn't want to buy any 41's because it would be too easy for someone to steal them.

Since that first ATE setup, I've used a few other pieces of HPIB equipment with my HPIL-to-HPIB

converter, including a digital oscilloscope from which I downloaded sets of 8K points for an FFT on the HP-71 and printed graphs of amplitude and phase versus frequency 15+ years ago.

Do not limit yourself to thinking that there are only a few pieces of equipment the HP-41 can interface to. With the interface converters to HPIB (and to a less extent, RS-232), there are probably thousands of models of equipment you can use. The HPIB fanout is 15 units IIRC, so you can have up to that many pieces of equipment in a rack connected to the HP-41 at the same time, in addition to the HPIL equipment you might have connected. HPIB and HPIL have so much in common that the interface converter is mostly transparent, and from a programming standpoint, equipment on the HPIB side appears to be connected directly on the interface loop.

In later automated test equipment setups, I used the STD industrial computer bus. (STD, by the way, came from "simple to design", not "standard".) Although this took longer to develop that "rack-and-stack" with HPIB equipment, it was more economical to do several identical setups this way because the hardware cost was much lower. The resulting units were also much more compact, suitable for shipping to our Korea and Mexico plants. Still, for quick set-ups that will only be used temporarily, it's very practical to use the HP-41 with HPIB equipment.

*Message #25 Posted by **Christoph Klug** on 17 Feb 2005, 4:40 a.m.,*
in response to message #24 by Garth Wilson

Dear John,

thanks a lot for your helpfully explanations about TOS.

Dear Garth,

thanks for your describtion of your data logger and measurement application. Because your setup included also a microphon and a B&K Preamp, you are testing acoustical equipment ?

Also your details about using the HP-IL/HP-IB converter sound interesting, today in our companie we using some HP-IB measurement equipment - controlled by PC and HT-Basic software.

In the actual HPCC Datafile Journal I published an short article about using the HP3468 Digital Multimeter with HP41 :-)

Best regards - Christoph Klug

*Message #26 Posted by **Garth Wilson** on 17 Feb 2005, 3:38 p.m.,*
in response to message #25 by Christoph Klug

> Because your setup included also a microphon and a B&K Preamp, you are testing acoustical equipment ? <end quote>

Yes. It was not just data logging, but producing various stimuli and checking the resulting responses of the product. There were also some DC tests on the product. The only Bruel & Kjaer component was the reference mic. Two other mics in the setup were calibrated against the reference mic. That was 15-20 years ago. Later automated test set-ups I mentioned performed up to 60 tests on each of several models of other non-acoustical audio electronic equipment

(intercoms for private aircraft) with many inputs and outputs.

Again, some of the equipment is basically output-only; IOW, not for measurement. For example, the only thing to input from a signal generator might be status or error messages. Other than that, you tell it what kind of signal to produce, what frequency, what amplitude, and any sweep or burst instructions you want to give it.

The Cytek relay unit was only a bus listener. It had no way to put any information on the bus. All it would do is take instructions given to it and open or close relays.

The DMM probably did the most "conversation" in the sense that data was frequently going both directions. It took a lot of instructions to set its filters, inputs, modes, etc., and output status and measurement data.

You will generally send instructions to the equipment by forming strings in the HP-41's alpha register, selecting the HPIL address using SELECT (after doing MANIO if you're using the converter to HPIB), and outputting the string with OUTA. INSTAT read the status of an instrument. You will generally use IND to input data (numbers) from an instrument.

25C repair tip

*Message #1 Posted by **Gordon** on 14 Feb 2005, 10:26 p.m.*

History: I have had my 25C since I bought it new back in 1977, the calculator was unused for almost eight years sitting in my drawer. With my recent interest in old HP, I decided to revive it. After replacing the old cells with new NiMH cells, I charged it up, and it worked - a kind of.

Problem description: The storage registers would not reliably store and recall numbers. Program memory was erratic, you could key in a program, after a while, you got a lot of GTO 00 in it. I accidently discovered if the calculator was warm (if it is on charger), then the problem would disappear and everything worked. However, when it cools to room temperature, the problem would return.

Calculator affected: HP 25C

Fix: Thank you David Smith and Luiz for their responses, and especially Katie, for her repair tip on http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=267

This afternoon, I went by the electronics store to pick up the 20K resistor and the zener diode to conduct the EC on my 25C.

After an hour of work, I conclude that Katie's article is absolutely spot on. Although her article did not specifically include the 25C, the procedure she listed for the 25 work beautifully.

I solder a 1/8W 20K resistor across pin 11 and 12 on the ACT chip. I did it on the back side so I don't have to solder over the ACT chip. The 1/8W resistor is preferred, as it is small enough that it barely protrudes above the other pins, and the 25C does not generate nearly enough voltage to overload it.

With that done, the problem is now gone. Both my storage registers and program memory is back in working order, and the Continuous Memory works. Before closing the calculator up, I made another EC by adding the zener diode to protect the fragile electronics.

Observation: The strangest thing is I have never had this problem until now. Everything worked perfectly for 20 years, I only discovered the problem after it came out of an eight year storage. Katie referred to excessive noise on the low frequency clock signal, I began to wonder if the aging of the electronics might have something to do with the noise.

Lesson learned: If you own a 25C, before assuming that register and program memory problems are symptoms of fried memory chips. Try Katie's fix before you give up, you may get a happy ending with a $0.20 part.

Re: 25C repair tip

For Gene - RE TI BA II+ Professional

*Message #1 Posted by **Eddie Shore** on 14 Feb 2005, 10:09 p.m.*

Gene,

Thank you for the $5 rebate coupon. I got last week, and the keys are harder than my first 49g+! The keys are just stiff. I like the display and its functionality though. Good alternative to the 17BII+ (for those who don't want a solver or need more out of the box)

Re: For Gene - RE TI BA II+ Professional

*Message #2 Posted by **Gene** on 15 Feb 2005, 10:55 a.m.,*
in response to message #1 by Eddie Shore

Glad you got it.

I'm also glad TI has come out with a model that does NOT have mushy-keys. Perhaps they are learning something.

Keep in mind, guys, that competition is a GOOD thing for us all.

Gene

Re: For Gene - RE TI BA II+ Professional

*Message #3 Posted by **John Smitherman** on 15 Feb 2005, 6:59 p.m.,*
in response to message #2 by Gene

TI has re-worked the display as well as the colors of the keys on the BA II+ making it more appealing. I don't know if they have worked on the mushy keys. Also, the BA II+ performs the contrived test of asin(acos(atan(tan(cos(sin(x) better than most scientific calculators.

For a peek at the new look go to:

http://education.ti.com/images/products/financial/baiibig.jpg

John

*Message #4 Posted by **Eddie Shore** on 15 Feb 2005, 9:25 p.m.,*
in response to message #3 by John Smitherman

Not bad for a finance calculator, being accurate for 11 digits.

I have always liked the BAII+. This is the first TI I have with hard keys (though I never really had any problems with their keyboards). I like the display, it is clear. It will serve as a good comapnion to my

49g+. (now I wish HP would straighten up about those keyboards so they don't have angry customers!)

HP-67 tantalum capacitor

*Message #1 Posted by **Albert** on 14 Feb 2005, 4:00 p.m.*

Hi everybody,

I need to know what is the value of the tantalum capacitor in the card reader PCB. My HP-67 has not the variable resistor for adjusting the motor speed.

Thanks in advance,

Albert

Re: HP-67 tantalum capacitor

*Message #2 Posted by **David Smith** on 15 Feb 2005, 12:25 p.m.,*
in response to message #1 by Albert

I beleive the original one was 4.7 uF. I have used values from 3.3 to 15 uF. Usually I use 6.8 uF 12V caps. The main problem can be finding one small enough to fit in the space. The models with the cap at then end of the reader chip don't leave much room when the case is closed.

hp 49g key keys not responding inop broken do not work

*Message #1 Posted by **jared hansen** on 14 Feb 2005, 3:58 p.m.*

If your your shift keys stopped working do the following. buy a 49g+ (its worth it I promise). solder through the blue buttons under the battery cover on the old 49g. remove the case portions. remove the black spacer seperating the two portions. I additionally removed the entire heat sync but this may prove to cause issues later. I did not want it to short out anything after having removed the spacer. Now I have 2 calculators.

49g help

*Message #1 Posted by **matt** on 13 Feb 2005, 9:20 p.m.*

does anyone know how put hms functions on the 6 function keys like the 48g?

Re: 49g help

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 14 Feb 2005, 5:47 a.m.,*
in response to message #1 by matt

Hi, Matt;

I'll try to 'brief' the answer, right?

Each directory may contain a 'custom' definition for the six "softkeys". This definiton is actually a list stored in a variable that must be named CST (for CuSTom) and the list must contain as many objects as you want for the keys. Each set of six sequenced definitions compose a "page", and each page is accessed through the [NXT] (next) key. For instance, in your case, you can store the list

```
{ ->HMS HMS-> HMS+ HMS- }
```

in variable

```
CST
```

while your calculator is positioned in the root directory. After that, pressing [CST] will cause these four functions to be assigned to the first four softkeys, left to righ. The other two will be assigned to nothing.

You can follow the same procedure while you position the calculator in other directories, and so having "local" custom definitiosn.

This is the visible part of the iceberg. There's a lot of extra functionality in CuSTom... just let us know if you'd like some more.

Cheers.

Luiz (Brazil)

Try: 94.02 MENU (nt)

41CV doesn´t turn on

*Message #1 Posted by **gonzalo fernandez** on 13 Feb 2005, 5:20 p.m.*

First of all, I want to give my thanks to Tony Duell for his explanation of how to put an HP82106A module inside an HP41CV that shows only 255 registers instead 319 and very specially to Diego Diaz, for supplying me a bare (without enclosure) 82106A module, now my 41CV shows 319 registers! I have the following problem (before I made the upgrade):

When I put batteries on my 41CV, the calculator does turn on, works correctly, and I can turn of correctly, and can turn on again correctly. The problem is that if I leave the calculator powered off (with batteries) for about 5 minutes or more time, it doesn´t turn on again! I have to remove and put again the batteries. It is not a problem of bad connection between the battery contacts and the keyboard or the keyboard with the CPU board (via zebra connector), I have checked this. It seems to me that it is a bad capacitor that doesn´t keep enough charge or a diode. Any suggestions? The calculator is an HP41 Fullnut early version, with the CPU board being initial HP41CV, not HP41C/CV common board or HP41C/CV/CX common board.

Another question, can a HP41 Fullnut display that shows one or more permanently off segments be repaired?

thanks

thanks

Interesting HP41 Wand Repair

*Message #1 Posted by **Meindert Kuipers** on 13 Feb 2005, 11:23 a.m.*

About one year ago I bought a HP41 Wand, which turned out not to work. The led in the tip went on, but nothing showed in CAT 2. There was nothing to be found in the page of the Wand.

Today I plugged in the Wand and copied an image of the Wand ROM in my MLDL2000, and the whole thing worked! It turns out that the Wand ROM image does not have to be in the page that the Wand is plugged in and obviously the Wand controller is totally independent of the ROM. This is confirmed by the Wand Service Manual.

Glad to have my Wand back! I borrewed my original to someone and I have lost track if him.

Meindert

25C needs to be warm for registers to work

*Message #1 Posted by **Gordon** on 13 Feb 2005, 3:18 a.m.*

I am running into a strange problem with my 25C. If the machine is cold, the registers and the program memory will not store or recall data properly.

I found out that by warming up the machine, such as by plugging it into the charger. Then everything will work perfectly, including the Continuous Memory, which indicates that the RAM chips are probably OK. It continues to work even after I disconnected it from the charger, but as the machine cools, the problem returns.

I read the article on "A Common Woodstock Problem and Repair Suggestion." Does the fix for the 25 apply to the 25C? I am hesitant to try it as it says "The 25C and 29C use some CMOS technology and some NMOS, however they seem to have an entirely different set of problems. The following solutions have been found to fix this problem on the 22/25/27 so that the calculator works as it should initially"

Any guidance would be greatly appreciated.

Re: 25C needs to be warm for registers to work

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 13 Feb 2005, 5:06 a.m.,*
in response to message #1 by Gordon

Hi, Gordon;

what I can take from your text is that some "cold soldering" is the cause. When gets warm, all metal (exceptions?) dilates. I'd search for a Vcc (Vdd?) terminal in the RAM IC that's probably wiht a bad contact and, when warmt, extends enough to contact with the board. These are mainly the edge-positioned terminals. I had an HP25 with this problem, ie. no way to keep information in RAM. In my case it was a bad RAM because I resoldered and tested it in another unit.

The HP25C has a single RAM that's continuously fed for as long as the batteries are installed and with enough charge. I saw some units with a provision for another IC, but I never saw an HP25/25C with two RAM IC's.

What bothers me is the fact that the 1Watt resistor (current limit), that's mostly the one that heats up, is in the opposite side of the RAM IC; in fact, it is closer to the second ROM and the ACT. Maybe, just maybe, you have a broken copper trail close to the 1W resistor that connects after getting warm.

Not much of a help, I guess you have figue it all out, but I could not help posting.

Cheers. And success!

Luiz (Brazil)

Re: 25C needs to be warm for registers to work

*Message #3 Posted by **Gordon Lau** on 13 Feb 2005, 10:45 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I did a little more testing last night to see if the "heating" it needs is related to the 1W charging resistor or the battery, or just general heating of the calculator.

By leaving the calculator on top of my DSL modem, which gets slightly warm, the calculator is able to retain its memory and program information overnight without being plugged in.

Is the RAM chip the ones with the gold top? In my case, I have two of them. One to the right, and one above, the ACT chip. It looks identical to the 25C interior picture on the museum website.

Re: 25C needs to be warm for registers to work

*Message #4 Posted by **David Smith** on 13 Feb 2005, 3:54 p.m.,*
in response to message #1 by Gordon

I think the problem lies in the ACT chip. This chip is the same in the 25 and 25C. Katies fix is definitely worth a try.

non-functional calculators wanted for reverse-engineering effort

*Message #1 Posted by **Eric Smith** on 12 Feb 2005, 4:11 a.m.*

I'm looking for non-functional calculators to tear apart for reverse-engineering purposes to further my simulation work (as seen in Nonpareil).

I mostly need LED models, and some Voyagers. It's OK for the display to be broken, and for there to be significant physical damage. The HP-01, HP-10, HP-10C, HP-81, and HP 9805A (all rare) are particularly needed; for the HP-01 and HP-10 I will need to have the ROM chips deencapsulated and photomicrographed to be read optically, as Peter Monta did with the HP-35, because I don't think there's any other practical way to extract the ROM code from those models. For other models, including those I didn't explicitly list, I will try to read the ROMs electrically first, but if they prove to be bad (e.g, the overvoltage problem on Woodstocks), I may need to read them optically as well.

I also hope to get working ACT chips (processors) of various part numbers, and run them in a special test fixture to compare their behavior. There are many different part numbers, and the HP-97 service manual discusses some incompatibilities between certain ACT part numbers and certain ROM revisions. I'd like to find out the detail, as if there were functional changes made to the ACT behavior (as opposed to purely electrical changes), this could very much influence accuracy of simulation.

I am willing to pay some money for these (and postage), but not a huge amount. But you can take comfort in knowing that your old, broken HP is helping to advance the cause of simulation. And you can get your name listed in the acknowledgements in the Nonpareil README file. :-)

Eric

12C for 11C and 15C fanatics

*Message #1 Posted by **Mvdn** on 12 Feb 2005, 4:07 a.m.*

I'm just wondering if their are much 11C and 15C users making use in day to day situations of the still available 12C (voyager series)? (because they like the RPN, the good placed large 'enter' key, programmable, ...)

Re: 12C for 11C and 15C fanatics

*Message #2 Posted by **Don Shepehrd** on 12 Feb 2005, 4:37 p.m.,*
in response to message #1 by Mvdn

For day-to-day use (I'm going back to college to become a middle school math teacher), I just use a $2 4-function calculator. When I want to play around with number theory, though, I use my 12c and also my 11c and 16c sometimes. For serious number theory stuff, I use Mathematica on the PC.

Re: 12C for 11C and 15C fanatics

*Message #3 Posted by **Karl Schneider** on 12 Feb 2005, 5:07 p.m.,*
in response to message #1 by Mvdn

In the 1980's and early 1990's -- before desktop PC's became the standard -- my employer provided HP calculators for their engineers' use. Many got Voyagers (15C's primarily, but also a few 10C's, 11C's, and 16C's). 28C/S, 41CV, and 48SX were also distributed, as well as 20S and 32SII's later (sometimes as replacements).

These calc's are still in regular use (some looking rather rough). Other engineers, who came along after the issued-calculator program ended, use their personal HP calc's at work.

in response to message #1 by Mvdn

Hi Michel. I use both a 12c and a 33s at work. I prefer the landscape layout and display of the 12c over that of the 33s and therefore end up using the 12c quite a bit for simple arithmetic as well as for the occasional financial calculation. The 33s is there for more scientific inquiries. Since both the 12c and 33s are still being sold I have less apprehension about leaving them lying around on my desk. This strategy allows me to leave my more valuable HP museum pieces at home.

I hope that this helps.

Regards,

John

Coming from a 19C, the 41C system, today I use mostly a 32SII for daily duty. For data collection I have a 48SX at the office and mirrored software/data thru PC at home on a (few) 48GX.

The 12C is only used for its great financial interface. I carry the 15C instead of the taller 32SII when I'm "white collar" dressed: The voyagers are heavyer, but they fit better into a white shirt's pocket.

All the other calculators are for math and collector fun (thank to all the community here!)

*Message #8 Posted by **Walter B** on 20 Feb 2005, 8:01 a.m.,*
in response to message #7 by valentino ducati (switzerland)

Wanted to return to use good old calcs in business and took my 11C or my 42S to work several times (always "white collar"). Well, it turned out they were competing with my PDA to occupy the ONE shirt pocket. I have MathU on my PDA plus my calendar plus some other useful stuff. So guess which won?

@Valentino: I tried to verify your result. So far, I did not find any voyager being heavier than a pioneer. What did you compare?

Re: 12C for 11C and 15C fanatics

*Message #9 Posted by **valentino ducati (switzerland)** on 20 Feb 2005, 11:23 a.m.,*
in response to message #8 by Walter B

@Walter B: Maybe I wasn't exact enough in my spelling. I meant that a Voyager feels more like a "brick" in a fine shirt, then the Pioneer formfactor. IMHO. But it looks metallic and it is definitly an eye catcher. More then the plastic only look of a Pioneer.

*Message #11 Posted by **bill platt** on 16 Feb 2005, 9:00 a.m.,*
in response to message #1 by Mvdn

Until a year a go, I never used the 12c, but had been a long-time user of the 11c.

I have not found anything good about the 12c for daily use. It is missing one of the most basic and useful features: a backspace. And its programming method is useless if you are used to a better system like the 11c. And no trig. So, no, I have not found any "general use" for it. (Though its financial stuff is handy).

On the other hand, I like the 17bii quite a lot. Though once I traded for a 27s I was really happy.

The 11c and 32sii are so much more fund and easy to use than the 12c, that I just don't find any reason to use the 12c unless I want to do a financial calc--and then I would rather use the 27s or 17bii anyway.

I sound very critical? And I am a died in the wool classic HP fan? How is this possible?!

Because I had never been exposed to the 12c until after I had been exposed to newer and better machines. (I also find the 41c a bit archaic.....though very cool nonetheless).

regards,

Bill

*Message #21 Posted by **Bernardo Vargas** on 22 Feb 2005, 9:34 a.m.,*
in response to message #20 by valentino ducati (switzerland)

@Valentino: Yes, I find the HP32SII just great for daily use; it's got a lot of useful functions, actually more than the beloved 11C and 15C, it's really FAST, its menu system is not cumbersome, it's very thin and light, and its display is large and clear. I only miss the panorama design.

Actually, as a 41CV ownwer and fan, I must confess that sometimes I run some routines on the 32SII and use these partial results to feed larger programs to run on the 41CV. This is because, as I said, the 32SII runs faster, and works with 12 significant digits. Also, the SOLVE program of the 32SII is superior to that of the 41CV's MATH1 module.

Also agreed, but I should mention that the machine-coded SOLVE and INTEGRATE routines on the HP-41 Advantage Pac module are better than those on the Math Pac module. The two Advantage Pac routines are closely based on the ones in the 15C and 34C, which in turn were enhanced for the 32SII.

HP-21 and HP-25 now working in Nonpareil simulator

*Message #1 Posted by **Eric Smith** on 12 Feb 2005, 4:01 a.m.*

I've now got the HP-21 and HP-25 working **correctly** in my Nonpareil simulator. Previously I didn't have an HP-21 ROM image, and I had typed in the HP-25 code from a paper listing. The HP-25 exponential and logarithmic functions weren't working, and it turns out that this was because the paper listing didn't match either released version of the HP-25 ROMs. It appears that it was an interim development version somewhere between the two released revisions.

It also turns out that the "clear registers" instruction does not clear the F register. The HP-21 stores the display format in the F register, and pressing "g CLR" on the keyboard was setting it to display zero decimal positions.

Anyhow, I've got some more work to do before the next release, but I'll try to get it out soon. I've partially reworked the communication between the GUI and simulator threads, and need to finish that up. There's a report that Nonpareil doesn't do display updates correctly on Suse Linux 9.2, and this might fix it.

I've got some new ideas on in-circuit ROM dumping for Woodstock generation calculators, and if they work out I should have dumps of more models soon. If we're lucky, the HP-27 and HP-29C ROMs should "just work". But it is of course possible that latent simulator bugs will keep them from working correctly, as is currently the case with the HP-34C, HP-38E, and HP-38C.

Remember the 70's National Lampoon photospread, "Games to Play With Your Electronic Calculator"?

*Message #2 Posted by **Paul Brogger** on 11 Feb 2005, 4:56 p.m.,*
in response to message #1 by Marx Pio

(Titled something like that -- late 70's)

Suggested games included billiards (calculators being bashed into one another on a pool table) and my favorite, golf (with a calulator spraying apart in a shower of bits after being whacked with a 7-iron).

The point is, I think there are LOTS of great things to do with the HP-6s. As I reported here once before, when I forcefully and rudely tossed my 6s Solar into the garbage can (some 20 minutes after buying it), I experienced a measure of satisfaction in "using" a new HP calculator that I hadn't felt for some years!

Re: Remember the 70's National Lampoon photospread, "Games to Play With Your Electronic Calculator"?

*Message #3 Posted by **Classic Calculators** on 12 Feb 2005, 2:51 a.m.,*
in response to message #2 by Paul Brogger

We have sold quite a lot of HP 6S units to geologists. When I asked one why it was so popular he told me that the solar cells and battery backup allowed very long complex calculations to be run without the calculator switching off, basically they needed a scientific calculator that was "always on" and would run for hours or days at a time out in the field and apparently there arent any others with this feature.

Also the base conversion funtions are of interest to some users and the ability to do math in various bases.

Personally Ive always liked the 6S, it looks good with its silver metal front, metal case, reasonable quality for a cheap calc and HP logo in the top left and its surprisingly powerful. Its much nicer to use than the 9S in my opinion.

6S Solar as field calculator

*Message #4 Posted by **Norris** on 12 Feb 2005, 1:52 p.m.,*
in response to message #3 by Classic Calculators

Well, what do you know...I'm a geologist, and the 6S Solar is my field calculator.

You know how people in this forum rave about their Voyagers? And how the Voyager form factor and battery life are so great? You've heard it a hundred times: "my 15C is so small, it fits comfortably in my shirt pocket!", or "my 11C uses so little power, I just changed the batteries for the first time in 10 years!"

Well, I have nothing against Voyagers -- my 11C is still going strong in the office. But when it comes to portability and battery life, well, the 6S Solar just blows 'em away. The 11C is like a brick in my pocket compared to the 6S Solar. And if Voyagers have such great battery life, then how come they need an OFF switch?

The 6S Solar is cheap, durable, small, and feather-light; the display is legible in sunlight, and it seems to run forever. What more do you want in an outdoor calculator? OK, RPN and programmability would be nice, but it's still a pretty good package for less than 10 bucks.

Edited: 12 Feb 2005, 2:25 p.m.

Other reason for the 6S to be used

*Message #5 Posted by **Marx Pio** on 13 Feb 2005, 3:42 p.m.,*
in response to message #4 by Norris

There's a perfect reason for using the HP6S outdoors. If the sun fries it, the rain causes a malfunction or you let it fall 30 meters downway, you won't give a damn. I cannot imagine myself using my beloved 41 or 42 on the direct sunlight or in a raining cave. It's more easy to find a new 6S than the home way back from a geological expedition. ;^)

I'm not quite understanding, here. What sort of "very long complex calculations" could a non-programmable calculator be running? If it has few memory registers, why is it important that it be

"always on"?

-- KS

Re: 6S Solar as field calculator

*Message #7 Posted by **Norris** on 15 Feb 2005, 2:20 a.m.,*
in response to message #6 by Karl Schneider

<<What sort of "very long complex calculations" could a non-programmable calculator be running? If it has few memory registers, why is it important that it be "always on"?>>

My 6S Solar calculations are generally pretty basic, mostly data processing. I wouldn't want to use it for anything complex.

The fact that the 6S Solar is "always on" is convenient, because field data are usually collected intermittently, rather than continuously. If you are processing data intermittently, you don't have to keep switching the 6S Solar back on, because it has no auto-off.

The more important advantages of the 6S Solar are (1) it's very small and light, so it's easy to carry around, and (2) it doesn't *ever* seem to run out of power. These are very desirable features if you are working on foot in remote areas.

I can toss the 6S Solar in my clipboard without noticing any extra weight, it's already on whenever I open the clipboard, and I never have to worry about the batteries. I have other HP calculators that I value more highly, but none of them can touch the 6S Solar in these respects.

Re: Solar field calculator

*Message #8 Posted by **Steve A.** on 15 Feb 2005, 9:13 a.m.,*
in response to message #7 by Norris

I wouldn't want to knock my old 11C around in the field either. Evidently other makers see profit in designing new always-on solar/battery calculators at reasonable prices. I found a surprising (and surprisingly cheap) one - although not RPN - on Amazon by searching for EL506W.

Re: Solar field calculator

*Message #9 Posted by **Eddie Shore** on 15 Feb 2005, 9:29 a.m.,*
in response to message #8 by Steve A.

Another good alternative is the Casio FX115. Solar: has a solver, can do numerical derivatives, numerical integration, curve fitting, and base logic. All for about $20.

Re: Solar field calculator

*Message #10 Posted by **Norris** on 15 Feb 2005, 1:28 p.m.,*
in response to message #9 by Eddie Shore

Actually, it is harder than you might think to find a good scientific calculator for field use. You need one that is both compact and solar-powered, preferably without auto-off.

Sharp EL506W ? A possible candidate, but no longer readily available at

Amazon.com, or anywhere else, it seems.

Casio FX-115MS ? Not compact enough; the 2-line display and big cursor button are unnecessary and require too much space. Sure, it has lots of advanced functions, but these are not needed in the field either.

I've heard that the Casio FX-260 Solar ($8.99 from Amazon) is a good geologist's calculator, but I haven't tried it myself. I probably need to get one though, because I can see what's coming: in a few more years my 6S Solar will be so valuable as a collector's item that I won't be able to use it in the field anymore.

Don't laugh. The price of a 6S Solar is already up to 19.69 pounds (or about $37.29) at http://www.calculatorshop.co.uk/acatalog/HP_6S.html

Re: Solar field calculator

*Message #11 Posted by **Ron Ross** on 15 Feb 2005, 2:52 p.m.,*
in response to message #10 by Norris

I have to chip in.

The Hp6s may very well become a collectors item in some ironic twist somewhat akin to the Hp10c.

The Hp6s is a cheap POS that maybe somewhat more durable than the compariable Casio fx250/260. They are compariable though in that both are very compact and offer similiar features. The Casio is plastic and may not take quite as much abuse, but has a better keyboard.

However, if the Hp6s were lacking an Hp logo, it would be worth very little in 10-20 years, but since it DOES have an Hp logo is somewhat sought after. A working one in 10 years may be very tough to find due to the extreme abuse $10 calcuators may have to endure. Time will tell!

My own suggestion for a working pocket calculator is now indeed the Casio fx260 as the Hp is nearly impossible to find retail. And someone had a very good comment about the Casio FX115, it is big, about the size of the new Hp33s, in fact a bit taller in its plastic face protector.

A truly pocket calculator is always nice and the Hp10c series were just at that largest size/ratio. The later Pioneer series is just a bit to tall and that is why my Hp15c is still my favorite calculator over the Hp42s (though, if I do choose, I choose the 42s because of all the extra goodies that it has, do outweight the .5 cm extra length it has).

Just my 0.02 dollars worth.

Re: Solar field calculator

*Message #12 Posted by **Steve A** on 15 Feb 2005, 4:14 p.m.,*
in response to message #10 by Norris

Sorry about that name. The machine I meant is found by searching for EL506W,

but it is called EL506WBBK, a 469-function (so the package says) 2-line machine with 4x4 matrices, solver, 5 base conversions and other fluff; it's as big the FX115MS, but the formula memories and equation memory are not lost when the machine turns off - unlike the Casio. It's also very cheap ($15 shipped) and evidently readily available. Too bad it isn't RPN, though.

in response to message #10 by Norris

Really? The 6S costing $37? It must be a collector's item.

I'll have to hunt one down for collection purposes.

. . . so, the keyboard actually works?

*Message #14 Posted by **Paul Brogger** on 14 Feb 2005, 11:03 a.m.,*
in response to message #3 by Classic Calculators

I guess I must have gotten a lemon. The 6s was my first exposure to "new" H-P keyboards. It had THE most unreliable keyboard I've ever used -- even worse than that of my 49G+.

Hence, my reaction.

But had it exhibited reliable operation, it would probably still be in my calculator box, if not actually in use.

Re: . . . so, the keyboard actually works?

*Message #15 Posted by **Norris** on 14 Feb 2005, 1:31 p.m.,*
in response to message #14 by Paul Brogger

The keyboard on my 6S Solar works reliably, but I have to admit that it feels weird. It is adequate, but definitely not my favorite part of the design.

The buttons on the lower part of the keyboard (digits, basic functions) don't want to go straight down when pushed. Instead, they want to slant downwards to one side. But they are inconsistent: the same button will slant downwards towards the left, right, top, or bottom of the calculator, depending on which part of the button your finger happens to touch. So every keypress feels different, which is weird. This effect is much less noticeable with the smaller keys on the upper part of the keyboard (scientific functions).

Once the button does slant downwards (in whichever direction), something clicks and it registers reliably. So I have no problem with missed keystrokes. The functionality is there, it's just the aesthetics that are lacking. The keyboard simply feels weird.

Speaking of aesthetics, one might also question the need for the six different key colors of the 6S Solar (black, dark grey, light grey, purple, green and red). Surely this a record for HP calculators. However, the labels are all legible, at least on the silver 6S Solar (possibly not on the blue 6S). So again, the functionality is there, even if the aesthetics are lacking.

Question a

*Message #1 Posted by **Namir** on 11 Feb 2005, 2:51 p.m.*

Does anyone have an algorithm, written in some pseudo-code, for one of the HP calculator SOLVER feature? I have read a few articles that were written by folks at HP who worked on the SOLVER feature. Yet I have not seen a pseudo-code or even a source code in a popular language.

I am planning to make a presentation at the next HHC (September of this year) conference. If you provide me with information I will give you credit at the conference.

I have developed an algorithm that handles the following problems with the popular Newton method:

1)Low slope values near the root.

2)Oscillating guess values between asymptotic values/slopes of a function

I appreciate your feedback. You can either post your reply here or email me at nshammasNULLSPAM@aolNULLSPAM.com (of course remove the NULLSPAM to get the actual email address).

Many Thanks!

Namir

Re: Question about SOLVE

*Message #2 Posted by **Thomas Okken** on 11 Feb 2005, 3:42 p.m.,*
in response to message #1 by Namir

I have never seen any documentation about this outside of the HP Journal articles you mentioned. The article on the HP-34C (December 1979) is interesting and gives some good insights, but no complete pseudocode. Many aspects of the algorithm (such as how to find x1 and x2 such that f(x1)*f(x2)<0, in case the initial guesses don't satisfy this condition and the initial secant iteration won't converge) are not discussed at all, which is a pity because there's clearly some very clever code at work there.

I suppose one could try to ask HP nicely if they'd be willing to release that code, but somehow I doubt it -- it seems like a valuable trade secret -- and disassembling a calculator ROM and reverse-engineering the pseudocode from the listing would be copyright infringement (unless you kept the result of that work to yourself, but where's the fun in that?).

Alas! If I had that code I'd use it to make the Free42 solver better... But I guess we're on our own.

- Thomas

Re: Question about SOLVE

*Message #3 Posted by **Namir** on 12 Feb 2005, 7:34 a.m.,*
in response to message #2 by Thomas Okken

Thanks Tom for the info. The hybrid algorithm I developed does not detect and handle the case when the "guess" is in the area of a minimum value (in positive function values) or a maximum value (in negative function values), which I think HP's SOLVE does. The last time I treied my algorithm using f(x) = exp(x) - 3*x^2 + 8, I gave it a guess of 4 and the algorithm found the only root AFTER MANY iterations. My personal standard test function is f(x) = exp(x) - 3*x^2 which has three roots near -,45, 0.91, and 3.7.

RAMBOX and HEPAX manuals

*Message #1 Posted by **Jeff D** on 11 Feb 2005, 12:46 p.m.*

I am looking for a pdf manual for these items in English. Can anyone help me? Jeff

Re: RAMBOX and HEPAX manuals

*Message #2 Posted by **Wilson (Bill) Holes** on 11 Feb 2005, 1:27 p.m.,*
in response to message #1 by Jeff D

I am not aware of any site that has the mentioned documents in PDF form, however I believe both manuals are available on 'TOS' but in PaperPort (.MAX) format. The PaperPort viewer is available for free download at http://support.scansoft.com/downloads/default.asp, I know it has print capabilities. Adobe Acrobat claims to have the ability to convert to PDF from any application that can print. I therefore believe you could create your own PDF files from the .MAX files that are available on 'TOS'... That is provided you have Adobe Acrobat or at least have access to Adobe Acrobat. I hope this helps a bit!!

Edited: 11 Feb 2005, 1:49 p.m.

Solid Black lines

*Message #1 Posted by **Andrew** on 11 Feb 2005, 12:25 p.m.*

I have a HP laserjet 4600 printer that when I print from powerpoint it will print solid black lines randomly. Every 10 pages or so it will put a solid vertical black line down the page. I have tried updating the driver and that didn't work.

Re: Solid Black lines

*Message #2 Posted by **Ron Ross** on 11 Feb 2005, 12:46 p.m.,*
in response to message #1 by Andrew

Clean the toner roller. Be careful and use a very soft tissue. If you are using refurbished rollers or at the end of the life of the toner cartridge, they will fail like this.

You may also consider a real Hp service tech or support center, this is a calculator group of geeks and you will only recieve suggestions such as above, not real support.

HP-42S "No Variables" message

*Message #1 Posted by **Thomas Okken** on 11 Feb 2005, 10:28 a.m.*

I was looking at an HP-42S ROM image today, and in the section with all the messages (starting at byte offset 0x7656 in the rev. C ROM), I noticed the message "No Variables".
Just curious - does anyone know when this message is used? I know about "No Menu Variables", "No Real Variables", "No Complex Variables", and "No Matrix Variables", but I don't recall ever having seen "No Variables".

I also noticed "Global Span", which I'd never seen my 42S utter in anger, either. Took me a moment to figure that one out. :-)

- Thomas

Re: HP-42S "No Variables" message

*Message #2 Posted by **Mike (Stgt)** on 11 Feb 2005, 10:55 a.m.,*

asin(acos(atan(tan(cos(sin(7))))))

*Message #1 Posted by **Valentin Albillo** on 11 Feb 2005, 10:12 a.m.*

Hi, all:

Though this is essentially a commentary to a posting by Ralph, I'm starting a new thread as my commentary isn't directly related to the original thread, "Some 49G+ Limitations".

Ralph posted:

"c)asin(acos(atan(tan(cos(sin(7)))))) [...] HP41CX(6.999519575) worse than HP49G+, HP48G

Lest people would think that the HP-41CX has serious accuracy problems with this particular computation, let's make clear that this lack of accuracy stems from the fact that this example is *very ill-conditioned*, as the cosine function is being evaluated for a *very small argument*, where serious cancellation is taking place. Let's see:

- The Cosine function, COS, is being applied to an argument which itself is a sine function, which will return a value in the range [0-1]. Thus COS' argument will be 1 at most (in this particular example, it is SIN(7º)).
- Further, though not stated by Ralph, all trigonometric functions are being calculated in Degrees, not Radians.
- This means that we're computing the Cosine of a very small angle, between 0º and 1º, namely SIN(7º) in this particular example which is 0.1218+, so we're in fact computing COS(0.1218º), a truly small angle indeed, which, to add insult to injury, is equivalent to 0.00213+ radians, i.e., a really, really small argument.
- And, regrettably, this petite argument causes a large loss of accuracy, because for very small arguments, in radians, we have:

  ```
  COS(X) = approx. equal to 1 - X^2/2
  ```

  and as X is very small to begin with, half its square is much smaller (0.000002262109806), which, when subtracted from 1, effectively *loses half its significant digits*, giving 0.9999977379.

You can see the loss easily, just subtract this result from 1 again, to get 0.0000022621, which is missing its last 5 digits of accuracy (namely ...09806). So, it's no wonder the HP-41CX gives such a seemingly "inaccurate" final result. The loss would be even greater if still smaller arguments were tested, for instance let's try 1 instead of 7:

```
asin(acos(atan(tan(cos(sin(1)))))) = 0.9990167403
```

which loses *7 digits* of accuracy instead of 5-6 in the original example. Now, just to further see that the problem has nothing to do with the HP-41CX's internal algorithms, let's evaluate this second, worse example, but this time in RADians instead of DEGrees:

```
XEQ RAD

asin(acos(atan(tan(cos(sin(1)))))) = 1.000000000
```

which gives a *perfect* result back and clearly shows the true accuracy, once we're no longer dealing with an ill-conditioned problem. Another revealing test, this time in the original DEGrees setting, is to exchange the order of

evaluation of SIN and COS (and also that of ACOS and ASIN as well):

```
XEQ DEG

acos(asin(atan(tan(sin(cos(7)))))) -> 6.999999972
```

and you can see that we have a decent result, with a mere loss of slightly over one significant digit, because this time the argument for COS is 7º, instead of 0.1218º, i.e., almost 60 times greater.

I hope this helps to understand what's happening and why a seemingly poor performance while doing the original test doesn't necessarily mean same poor overall performance, far from it. The original test is a contrived, ill-conditioned case, not to be regarded as a valid measure of general accuracy for the model tested.

Best regards from V.

Edited: 11 Feb 2005, 10:22 a.m.

Re: asin(acos(atan(tan(cos(sin(7))))))

*Message #2 Posted by **Thomas Cox** on 11 Feb 2005, 12:31 p.m.,*
in response to message #1 by Valentin Albillo

Interestingly, the HP-30S gives the answer of 7.000000000 to the problem. I believe it uses many more internal digits in calculation.

I have tried various Sharp, TI, and HP calculators on this example. I know that the TI-30XII, HP-41, HP-6S, HP-39, and HP HP-48X do not give exactly 7 as does the HP-30S.

Valentin,

Excellent short, clear and concise discussion. Thanks!

regards,

Bill

Re: asin(acos(atan(tan(cos(sin(7))))))

*Message #4 Posted by **Katie** on 11 Feb 2005, 11:12 p.m.,*
in response to message #1 by Valentin Albillo

I agree it's not a good test for accuracy, but it is a good test to distinguish the internals of one calculator from another or at least the algorithms used. The same test (with 9 instead of 7) is used here: http://www.rskey.org/~mwsebastian/miscprj/forensics.htm as a means to identify which chip is used in a scientific calculator.

Edited: 12 Feb 2005, 6:05 p.m.

Re: asin(acos(atan(tan(cos(sin(7))))))

*Message #5 Posted by **Garth Wilson** on 12 Feb 2005, 1:43 a.m.,*
in response to message #1 by Valentin Albillo

Thanks for demonstrating this again. It's easy for idealistic students and math enthusiasts to fault a calculator in this way when the same properties make it impossible to keep such tight tolerances on an actual machine or circuit you might try to design to work along the same lines as the posted equation. The inaccuracies in manufacturing or measurement, plus the effects of varying operating temperatures, etc., become hopeless before the calculator's inaccuracy does. IOW, the "problem" becomes irrelevant, and ten digits is far more than most real-life situations need.

Re: asin(acos(atan(tan(cos(sin(7))))))

*Message #6 Posted by **hugh steers** on 12 Feb 2005, 3:45 p.m.,*
in response to message #1 by Valentin Albillo

i have a slightly different take on this problem. i can excuse the 41c but not the 49g+. a top of the range, 21st century calculator should not be caught out by this problem. either it should have more internal precision (like the 30s & 9g) or some form of dynamic precision.

Re: asin(acos(atan(tan(cos(sin(7))))))

*Message #7 Posted by **Ralph** on 14 Feb 2005, 7:04 a.m.,*
in response to message #1 by Valentin Albillo

Hi,

Valentino, thanks for the explanations made over this problem.

Now, although this thread is not directly connected to the one it makes reference, I hope that from what I posted on that other thread, people wouldn't think that the HP41CX has serious accuracy problems, nor indeed that that problem was exposed as a measure of general accuracy for this calculator (I myself have a 41CX which is the one I'm most fond of). We where discussing instead about the HP49G+ and how it handled precisely this extreme or ill-conditioned situation as a means of what Hugh Steers has posted here. In fact, on my response there, I tried to give HP calculators a chance by exposing how the different models have been improving the accuracy of these extreme results through the years, focussing mainly on the internal technology development.

HP41CV

*Message #1 Posted by **Tony Kelly** on 10 Feb 2005, 7:09 p.m.*

I have just recently "lost" one of my surveying programs from my calculator. No reference can be found within the catalogue. When I press and hold the assigned button it displays "XROM 15,12" . Is this some form of error message that is repairable or is my trusty 41 on its wayout. I await any reply. Thanks

Re: HP41CV

*Message #2 Posted by **Raymond Del Tondo** on 10 Feb 2005, 7:29 p.m.,*
in response to message #1 by Tony Kelly

Hello,

it seems your program is/was located in a plug-in module.
This is indicated by the XROM prefix.
XROM 15,12 is in the Petroleum Pac module,
and maybe in some other modules.
Make sure your module is plugged in correctly.
BTW: Which catalogue are you referring to, CAT 1 or CAT 2 ?

HTH

PRx on HP-41CX

*Message #1 Posted by **Michel Beaulieu** on 10 Feb 2005, 5:34 p.m.*

Hi, just a little easy :

Why is there tree stars *** print at the end of the line when executing PRx?

Can i tell the calculator not to print these ***.

It looks like :

15.0000 *** 36.0000 ***

I get this even with HPil printer and even with double wide printing.

Thanks Michel

Re: PRx on HP-41CX

*Message #2 Posted by **Raymond Del Tondo** on 10 Feb 2005, 7:59 p.m.,*
in response to message #1 by Michel Beaulieu

Not sure, but I think it's a relict of older cashier or adding machines...
but maybe the printer manual could clarify this?

Raymond

Try VIEW X instead...

*Message #3 Posted by **HP41USER** on 11 Feb 2005, 5:40 a.m.,*
in response to message #2 by Raymond Del Tondo

NORM or MAN mode, flag 21 accordingly.

12345 to delete

Re: PRx on HP-41CX

*Message #4 Posted by **Thomas Okken** on 11 Feb 2005, 9:28 a.m.,*
in response to message #1 by Michel Beaulieu

*> Why is there tree stars *** print at the end of the line when executing PRx?*

It always prints those stars when printing a **result**, as opposed to a number you just entered: in that case, it prints the command in that position.

For example, when the printer is set to TRACE, and the display mode is set to FIX 2, and you enter 2 ENTER 3 +, the print-out will look like this:

```
2.00  ENTER
3.00     +
5.00    ***
```

> *Can i tell the calculator not to print these ***.*

No, but you can work around it by using code like CLA, ARCL X, PRA (instead of CLA, fill the alpha register with 24 spaces if you want the number to be printed right-justified).

- Thomas

IL and Printer service module

*Message #1 Posted by **Ronald** on 10 Feb 2005, 2:25 p.m.*

Hello,

I am looking for the HP-IL and the printer service module rom IMAGES for the 41 series. Do you have any idea were I can find these in a format I can use in the Clonix module ?

Thank you

Ronald

Re: IL and Printer service module

*Message #2 Posted by **Tony Duell** on 11 Feb 2005, 6:07 a.m.,*
in response to message #1 by Ronald

The service manuals for the HPIL tape drive, video, RS232, GPIO and HPIB interfaces (and maybe the thermal printer, but I don't have that one) contain type-in programs for the HP41.

They need a special module which turns out to be nothing more than the HPIL 'monitor' ROM, which, of course, is basically a DevIL module with some of the command names changed. These programs will run on a 41 with the DevIL ROM (I have done so) if you make the obvious changes.

I have those programs on disk, maybe I should upload them somewhere. Be warned you need the service manuals to make sense of them in some cases (the GPIO one uses _2_ GPIO interfaces liked by a special cable, the wirelist for which is not in the manual, the RS232 one needs a lookback connector, the HPIB one needs 2 HPIB interfaces, one of them with somewhat odd switch settings).

loops

*Message #1 Posted by **VGreen** on 10 Feb 2005, 9:32 a.m.*

Here's the problem:

HP 48GX

(A) I have six values: 1,2,8,6,4, and 9, and I want to subtract 2 from 1, 8 from 2, 6 from 8 etc., and I want to assign (1) to my first answer and (2) to my second answer, i.e., 1=-1; 2=-6; 3=2; etc. I want to be able to enter the six values one after the other and then obtain the result.

(B) I would also like to store all the negative results in one column and all the positives in another and access them later. I would also like to store the sum of the negatives and the sum of the positives in separate columns and access them later.

(C) Finally, I would like to take value 1 and add it to result 1 and store it; value 2 and add it to result 2 and store it in the same column as the previous one, etc., so I can bring up a column of all the results later.

Any assistance would be greatly appreciated.

Re: loops

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 10 Feb 2005, 10:52 p.m.,*
in response to message #1 by VGreen

Hi, VGreen;

two very interesting functions available with the HP48 that might help you a lot are DOLIST (item 3) and DOSUBS (items 1 and 2). If you have the HP48G Advanced Users Reference Manual, see pages 3-91 to 3-93. The related command STREAM may also help.

If you need advice about these commands or any additional help building your program, please post again.

Chhers.

Luiz (Brazil)

Re: loops

*Message #3 Posted by **VGreen** on 11 Feb 2005, 11:52 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks Luiz. I'll try to obtain a copy of the advanced manual and see what I can come up with. But I may later take you up on your offer for more help, as I'm very green at this presently.

Take care.

Re: loops

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 12 Feb 2005, 3:21 a.m.,*
in response to message #3 by VGreen

Hi, VGreen;

just to give you a small sample of what can be done (I read your post again ant took some minutes wondering about but I did not get to a final solution so far, O.K.?)

1 - take a list with your numbers in stack level 1: (consider you have already entered them)

```
{ 1 2 8 6 4 9 }
```

2 - add a program to the stack with a single 'subtraction': (previous list is pushed to level 2)

```
« - »
```

3 - execute DOSUBS and you'll have:

```
{ -1 -6 2 2 5 )
```

In this single form, DOSUBS applies the operation defined in level one (the program) to each pair of elements in the list in level 2, left to right. If you dplicate the list prior to execute DOSUBS, you'll keep a copy of it to perform the other operations.

I'll work on it and let you know what I get. Three questions:

1 - is there any particular way you want to enter the six numbers? There are many ways, by using PROMPT, INPUT and even custom routines;
2 - the output with a sequenced reference: do you need just a visual reference or you actually need to store the resulting values with a sequenced index? Each object in a list has already an index. Fos instance, if you store

```
{ 1 2 8 6 4 9 }
```

with the number 'LST01', then 'LST01(1)' EVAL returns 1, 'LST01(3)' EVAL returns 8, etc.
3 - the columns with positive and negative numbers: do you want a separate object for each or it can be a [n × 2] matrix with all elements on it? If so, [SIGMA+] with statistic functions are the best set of tools in this case.

Cheers.

Luiz (Brazil)

Cleaning HP-15C aluminum bezel - how to?

*Message #1 Posted by **GWB** on 10 Feb 2005, 9:29 a.m.*

Hi,

I got my original 15C back after 18 years (SN 2343B75099). It is in excellent shape for its ager, my brother has taken very good care of it all these years. However there are some small stains on the aluminum bezel, apparently caused by a glueish material released by the vynil case, which is very parched. I've replaced the case with a 12C one. The back lable is quite unreadable, but this should improve after cleaning, I think. I thought of using cotton swab soaked in kerosone to remove the greasy stains. Is this safe or should I use some milder chemical instead? And how could I clean the back lable without removing the black paint?

Thank you very much,

Gerson.

Re: Cleaning HP-15C aluminum bezel - how to?

*Message #2 Posted by **David Smith** on 10 Feb 2005, 5:42 p.m.,*
in response to message #1 by GWB

I have used white gas (camping fuel or cigarette lighter fluid) on these machines. Works very well for adhesive residue, etc. Does not affect the plastic case or display window. Best to keep it off the keyboard area as it can leave "water" marks. I would also recommend trying it in a small inconspicuous area first... your gas may not be the same as my gas.

Re: Cleaning HP-15C aluminum bezel - how to?

*Message #3 Posted by **GWB** on 10 Feb 2005, 7:04 p.m.,*
in response to message #2 by David Smith

I was told there's a protective lacquer layer on the aluminum plate that should not be removed. I'll try (carefully) cigarette lighter fluid. Thanks a lot.

Re: Cleaning HP-15C aluminum bezel - how to?

*Message #4 Posted by **Randy** on 10 Feb 2005, 8:24 p.m.,*
in response to message #3 by GWB

Lighter fluid is not white gas - beware. http://www.msrcorp.com/stoves/fuels_int.htm

Very early Voyagers had a lacquer coating on the aluminum that was easily damaged with any solvent. Later coatings were much better and should be okay with non-aggressive solvents.

There is also an anti-reflective coating on the clear plastic LCD window which tends to flake off once

scratched.

Overall, I would be *very* careful with any petroleum based solvents on calculators. Isopropyl alcohol works well for most goo and gunk removal and should be relatively safe.

The Devil you Know vs the Devil you Don't

*Message #1 Posted by **Ron Ross** on 10 Feb 2005, 8:57 a.m.*

I was always a critic of Carly and hate, HATE to say any kind words about her.

Unfortunately, she isn't Hp's only problem. And she had noble ideas. She was pretty good at company politic's and corperate manuvering. For us, she released some new calculators recently and did not abandon the Calculator market (she scared us though).

However, LOOK who is now in charge. A bean counter and a loyal sidekick. Look at their backgrounds. No, I suspect that these two just might shame Carly in Dilbert pointy haired department. Tech wizards didn't run Carly out of town, but a small Coup of even more dispicable clowns are now at the top.

http://www.hp.com/hpinfo/execteam/

Robert Wayman is the bean counter. Debra Dunn is 2nd banana.

It doesn't smell like roses to me.

If someone wants to defend these two and know something I don't, by all means post and correct my blather.

Re: The Devil you Know vs the Devil you Don't

*Message #2 Posted by **Jim Creybohm** on 10 Feb 2005, 9:53 a.m.,*
in response to message #1 by Ron Ross

I won't defend the new selection of CEO, but I will say that reading on the 'net about her resignation, I read that there was "dancing in the aisles" upon word of her leaving (and her 21 million dollar severance).

You know, it just occurred to me; under Carly, HP lost $7B and she got a $21M severance. If they had hired me, I could have lost HP only $2B, and I would have taken $10M for severance. Thus by hiring me HP would be in a stronger fiscal position, and I would not have disembowelled the scientific equipment side.

Personally, I think Carly got too far away from the science, and too deeply involved in the consumer/mass distribution market. This never has been HP's forte, and unfortunately Carly was not a deep enough thinker to try to understand where HP's traditional strengths lay. I won't even go into the merger of Compaq and the mis-handling of the DEC line. Her management direction did appear to be an extrapolation of previous HP management decisions - by way of example, she never decided if she was a DELL or not. You can't be a fence sitter in today's marketplace. Either in or out.

How much worse can HP get? I submit (IMHO) that HP is at the bottom. (*sigh*) Maybe I'll go watch "The Right Stuff" again.

HP 10C problems

*Message #1 Posted by **Artur - Brasil** on 10 Feb 2005, 6:22 a.m.*

Hi,

Yesterday I got my HP 10C and could see it was any more turning on. Well, last time (2~3 weeks ago) it was working fine, so I replaced the batteries. Nothing. I oppened the case and was pleasured to see a two parts calculator (I think very old one) and noted the flex cable at right of display. There was some oxidation. I cleaned it carefully and tryed turn it on again. It turned on but with unrecognizable information in display. Now, it does not work at all ... very bad.

I'm wondering to replace the small condutive zebra rubber for thin wires soldered over the flexible circuit (I'm very afraid to burn it) link the keyboard to the LCD board.

Well, first I would like to see if the circuit, taked apart and powered by a regulated 4.5 VDC suplly is still working.

Does anybody know what happen when we press the ON key? Are we grounding some pin of contacts or putting a positive pulse?

I would appreciate any help!

Artur

HP48G+ screen flickers

*Message #1 Posted by **Larry** on 9 Feb 2005, 9:51 p.m.*

The screen flickers a whole lot. When it powers up sometimes it comes on really dark them settles down to normal after a second. Is something wrong? I normally turn down the contrast and it otherwise works fine.

Mine are the same...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 10 Feb 2005, 5:52 a.m.,*
in response to message #1 by Larry

Hi, Larry;

I own two HP48G+ and one HP48SX. The newer HP48G+ (btw, the HP49G+ too) shows the same flickering you mention. Sometimes a set of vertical bars (Never horizontal bars), sometimes a full black screen, all in a flash. It seems to me that the newer LCD are more efficient, low-power devices. If you consider them as a bunch of small, tiny capacitors (one for each pixel), everytime you turn the calculator ON these capacitors re briefly charged. As they are more sensitive, as a consequence of the supposed better efficiency, they'll flicker easily than the earlier ones. That's why I actaully don't care too much for the flickering...

Just a guess, based on possible facts.

Cheers.

Luiz (Brazil)

stop the Carly-bashing

*Message #1 Posted by **Don Shepherd** on 9 Feb 2005, 8:49 p.m.*

Come on, guys, why all the Carly-bashing? This forum overflows with criticism of her, and HP in general, for not building the great calculators we all are used to from the 80's. Face it, we are probably never going to see the likes of the HP-15c or HP-16c again, from HP or any other company, so let's just enjoy the antique machines we have and be happy creating new and clever programs for them.

START the Carly-bashing !!!!!

*Message #4 Posted by **Mr X** on 10 Feb 2005, 3:05 a.m.,*
in response to message #1 by Don Shepherd

Because rather then admit it is simply not economical to build super high quality calculators, they'd rather have a scapegoat.

Re: stop the Carly-bashing

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 10 Feb 2005, 3:07 a.m.,*
in response to message #1 by Don Shepherd

Hi, Don;

I agree with you that we'll not see something like the HP15C or the HP16C again, neither from HP nor another company. They actualy do not fit todays needs, todays market. I remember programming the HP16C to test some digital implementations. I do that, today, by using some graphics software (Eagle, TKGate, and a few others), mosty for my own or a few, very few professional activities. I also remember using the HP15C for "crunching" AC circuits, like load flow: the complex stack, the integrate and SOLVER, matrices... All-in-one! Beautifull! Today we have softwares that do that all instantly.

I like using them all, I'd buy (if I can afford) any new implementation from our friends, reserches in this forum. If it is a kit, beter yet! A DIY RPN calculator!

I remember that when I started with Electronics (I was 8 YO, first half 1970) I was never known about copmputers as they are, I was not aware of what they were supposed to do. I was 13 YO when I saw an HP21 and I was not aware of what SIN, COS, TAN, P->R and R->P were for. But the calculator was as beauty!

Professional needs for these days are different, for those who want to survive and be active there's a need for keeping 'up to date', otherwise we're not gonna be inside the market.

While many guys use the topmost portables, PDA's and the like (even pagers already belong to the past), using a calculator may seem "antique". I barely use mine outside home and, most of the time, I use them to find a solution to a problem or develop programs to post here.

I don't complain, I simply accept that Don is right about many things. I'd also add that all new achievemnts had their followers at the same time those wanting to keep existing ones were against the new. I want to keep calculators running because they were the best I had in my time, and I cannot see better stuff now. I think of those using slide rules and against calculators. The advantages of calculators against slide rules are tremendous for those who like calculators, but the advantages of slide rules against calculators are also imperative for those using slide rules.

Who's right?

Carly left HP because her fights against the board were biger than herself. That's a fact. I wonder: would HP, as a company, do what it has been done if Carly were not there? How powerfull was she to define everything without any opposition? I guess all of the final decisons, the "big ones", were taken by the board with her, and I gues not all of the things she wanted to be done were effectively done (maybe for the best of HP they were not...)

I'll wait to see. Fast changes in big companies are like route changes in bigger ships: they cannot be done unless you use extreme power. And if so, you may spend a lot of energy for nothing because when you achieve the maximum changing hability, all extra energy is completlely lost. If current board starts to announce astonishing changes and decide to apply them fast, I guess HP will be in trouble. Again.

Cheers.

Luiz (Brazil)

Re: stop the Carly-bashing

*Message #6 Posted by **Klaus** on 10 Feb 2005, 5:18 a.m.,*
in response to message #1 by Don Shepherd

Yes, leave Carly alone!

It's all about abstraction layers: On a very basic layer, Carly is a bunch of cells. If you get to higher layers, you see her as a human that lives an interacts. You cant't criticise her actions unless you are sure that there are no higher layers. I don't know if there are higher layers, but because I am not sure about it, I don't dare to judge

her.

Examples: Once there was the industrial revolution. People were fired and replaced by machines. In there eyes, machines were evil, but today, we see the industial revolution as a process that led us to new inventions like calculators. Today we see the whole thing!

Moral relativism (OT)

*Message #7 Posted by **Thomas Okken** on 10 Feb 2005, 6:50 a.m.,*
in response to message #6 by Klaus

> Quote:
>
> Yes, leave Carly alone!
>
> It's all about abstraction layers: On a very basic layer, Carly is a bunch of cells. [...] I don't dare to judge her.

What's wrong with judging? If a convicted murderer goes to prison for 10 years, that's judgment, too. You disagree with that, too, then?
Then again, I'm not so sure Carly *deserves* the criticism. She didn't invent this system whereby CEOs get paid fortunes, and receive astronomical bonuses whether they achieve their objectives or not; she simply took advantage of it, all above board.

Buying Compaq may have seemed a good idea at the time, and in the long run, maybe time will prove her right and those who forced her out of HP will get to eat their words.

But as far as calculators are concerned, the days of yore are *over*. To speak from my own personal experience: I cut my programming teeth with the HP-25, HP-19C, and HP-41C. They were all great little machines, and I loved them -- but if I had been able to afford it, I would have bought a Commodore PET instead, no question. Handhelds were just more affordable.

These days, computing power is cheap. I do most software development on a used laptop I bought for $175 on eBay. It's a slow machine by PC standards, but it runs circles around any hand-held, and it's good enough for me.

Who needs major power in a hand-held anyway? Students are the only demographic that comes to mind, apart from a few niche markets like surveyors or civil engineers -- and *they* will eventually all switch to PDAs, I'm sure.

> Quote:
>
> Examples: Once there was the industrial revolution. People were fired and replaced by machines. In there eyes, machines were evil, but today, we see the industial revolution as a process that led us to new inventions like calculators. Today we see the whole thing!

Well, I'm sure that anyone who died of malnutrition or disease, back then, as a result of having lost their job (in those glorious days before social security) would have been so much happier if they had seen the "big picture", like we do now! "Hey, kids, we're starving, but it'll all work out GREAT in 100 years or so!" "Yaaaaay, dad!!!"

Re: stop the Carly-bashing

*Message #8 Posted by **Jeff** on 10 Feb 2005, 10:50 a.m.,*

Today, young men on acid realize that all matter is merely energy condensed to a slow vibration....that we are all one conciousness experimenting ourselves subjectively, and that there is no such thing as death, life is only a dream and we are just an imagination of ourselves.

Now here's Bob with the weather.

Re: stop the Carly-bashing

*Message #9 Posted by **Ed Look** on 10 Feb 2005, 11:26 a.m.,*
in response to message #6 by Klaus

Klaus, on a basic level you are quite correct and morally right. You are a humble man, and this is a compliment, for you are a rarity among us modern people.

I agree. Let's not bash her anymore; she's gone from the scene. It was okay to critique her decisions while she was at the job, but now may she find better things.

And I wish better times for HP, too. And as someone said, it is no longer feasible for anyone in the world to manufacture like they did twenty to thirty years ago.

I appreciate your sentiments.

Re: stop the Carly-bashing

*Message #10 Posted by **Klaus** on 10 Feb 2005, 3:01 p.m.,*
in response to message #9 by Ed Look

Thank you!

I think well all experienced unjustified criticism form somebody that did not understand our reasons. That is why I think we shouldn't criticise Carly---she can't explain her reasons in this forum.

Re: stop the Carly-bashing

*Message #11 Posted by **John Limpert** on 10 Feb 2005, 5:33 a.m.,*
in response to message #1 by Don Shepherd

It's sad to see a great company like HP destroyed by bad management. Carly was a major part of that. She seemed determined to wipe out all of the things that made HP unique.

I could live with HP getting out of the calculator business if they thought that there was no market for the kind of products HP excels at producing.

HP is not going to enjoy long-term success if management is only interested in quarterly reports, outsourcing and gutting in-house research and development, like many other American corporations.

I don't work for HP. I wouldn't want to work for them. The current company is a dim reflection of the "old HP", which I greatly admired.

HP Quality ...

*Message #12 Posted by **Artur - Brasil** on 10 Feb 2005, 6:09 a.m.,*
in response to message #11 by John Limpert

Well,

I don't know Ms. Carly but I can see the results of her (and all her staff) in my hands.

This night, I was dismantling my HP-41CX. There was a serious problem with liquids and I had to dismantling it completely. Starting by the case, very well done and engineered. Remove the small PCB soldered over the main plate. A piece o work and, I believe, very well done for that time.

Removed the plastic rivets (this is the bad part) and get appart the main PCB. So, you can see how every key is so very well done. They are molded in two parts: one gray and other black, in the backs. A piece of art! And in four sizes! Each key independent of other. You must count the yellow key too!

The front case is very well done too. It is plenty of cavities, where the keys are put in.

So, remove the plastic and each steel contacts.

Well, to remove the glue left by the plastic, it tooks almost 1 hour, so good it is, even after 15-20 years - and using heavy chemical products.

When mounting everythng back again, I was wondering: "man, I would like to have access to these very goot things HP used: glues, tapes, varnishes, paints, etc."

When I see the 49G+ pictures, it is very desgusting to see the wires, sticks and other very poor quality work. I recently would have acquired one HP Pocket PC, but, analyzing its qualiy in calculators, I decided to get one Toshiba.

Other people have asked my opinion about buying one calculator and I enphasize the CAS system of 49G+, but I alert them about the poor quality in project at all. So, my last words are always: "give a look at Texas calculators too ..."

Only to reduce my ignorance about Carly administration: laboratory, medical and test equipments are any more produced by HP or is Agilent an HP subsidiary?

Best regards and desire best wishes for my HP41CX come back to live again after such surgery!

Artur

in response to message #13 by Mr X

I must agree with you!

Re: I don't agree...

*Message #15 Posted by **valentino ducati (switzerland)** on 22 Feb 2005, 5:15 a.m.,*
in response to message #14 by Artur - Brasil

I don't agree the price comparison (yesterday's 41CX costs, today's 49G+ costs).

Yesterday (middle of 80ies) I had a choice: I could buy the high end 41CV/X, with many of high priced, but well constructed accessories. Then I got a sophisticated and exepnsive machine with *ALSO EXPENSIVE qualitative FEELING*. But I could also buy a cheap and crappy noname calculator with the basic functions I rellay needed.

Today we live in a different world: We have only the choice between a crappy simple noname for a few bucks or a crappy constructed HP for a few bucks more. The 49G+ comes with more functions I ever thought to have on a 41. But not with the same qualitative look and feel I would expect from the function list! Even if I'm willing to pay for a qualitative product, I don't get it on the market!

So, you don't compare same things together. The formula (total_math_functions * total_MBytes_external_Memory / price) is too simple and forgets the quality factor.

Where is *THIS* factor today?

Quality is not the problem, it's the lack of open standards

*Message #16 Posted by **Thomas Okken** on 22 Feb 2005, 6:09 a.m.,*
in response to message #15 by valentino ducati (switzerland)

People just keep complaining about the lack of quality of recent HP calculators. Come on, folks, do the math: building a quality calculator is expensive. Building a cheap calculator that you simply replace when it breaks is more economical.

It is not evil bean-counters at HP or elsewhere that make the decision to focus on cheap products, it is the lack of consumers who are willing to pay extra for a solid product. The few hundred long-time HP calculator fans that haunt hpmuseum.org and TOS etc. do not constitute enough of a market, unless they'd be willing to pay hundreds of dollars per machine, and pay more to get such a machine repaired than it would cost to buy a comparable "disposable" machine today (HP-49G+, TI-89, whatever).

Speaking for myself, I don't have a problem with the quality of today's HP calculators; what bothers me is investing in a proprietary platform, and getting left stranded if and when HP decides to abandon it. (And they do abandon even their best products - like the 41 and the 42S.) OK, and they should fix the 49G keyboard problem, but from what I hear that may require moving the keyboard handling code from the Saturn layer to the native layer, which may be hard for them to do now that they've lost so much Saturn expertise!

I think if high-end calculators are going to survive in the long term, the same kind of standardization has to happen as has happened in the computer arena. As long as all computer manufacturers had their own proprietary OS etc., investing in an information system meant gambling that your computer vendor would stick around -- which they often didn't. Today, if your computer vendor goes under, or starts releasing inferior products or providing bad service, you switch to a different supplier, and simply port all your code -- porting from one flavor of Unix to another is easy; that's the whole *point* of Unix.
All we need is a standardized calculator hardware platform, and then it's only a matter of time before things like the HP-49G+ and TI-89 are re-implemented as portable, Open Source or GPL code, and then people *other* than geeks like us will be able to invest in a high-end calculator *without* worrying about their investment going down the drain a few

years later.

My money would be on a Pocket PC with a smaller screen and a 40-key keyboard. Now I'm going to hold my breath until someone starts making one! :-)

- Thomas

The Qonos looks nice, but how standards-compliant will it be?
I'd rather see someone build a Pocket PC or a Palm with a keyboard. That would have a much better chance of becoming a standard than a maverick product like the Qonos, I think -- not least because there would be a slew of existing PDA-type apps you could run on it right away.

The Pocket PC platform is going to be around for a long time, and PalmOS doesn't look like it's dying yet either; there's a lot of good stuff there and I think a whole new platform would reinvent the wheel. I can't see people going for it. But the surveyors, engineers, etc., who need a high-end hand-held calculator would probably feel much better about investing in a platform that looked set to stay around for a while (after having discovered what can happen to proprietary platforms like the HP-48).

On the software side, the Qonos looks nice, and being able to run Linux on it is nice, but if Qonos folds, then what?

And companies would profit from this how exactly...?

Well, gosh, um, let me think, that's a tough one.
Hey! I got it! Maybe they could try **selling** them! If they sold them for more than the cost of manufacture plus distribution, you could make a profit!
I think I should patent that idea, no? ;-)

I mean Texas Instruments would not be interested. They have the education market already. No incentive to change at all. I really can't see TI products "going down the drain" any time in the next ten years.

So, for the sake of the argument lets suppose Sharp, Casio, HP etc invest in a standard platform. How will that help them win sales?

"All we need is a standardized calculator hardware platform, and then it's only a matter of time before things like the HP-49G+ and TI-89 are re-implemented as portable, Open Source or GPL code, and then people *other* than geeks like us will be able to invest in a high-end calculator *without* worrying about their investment going down the drain a few years later."

Why would "people other then geeks" care if their supplier quit making calculators? Money isn't going down the drain as they still own the device.

Re: Quality is not the problem, it's the lack of open standards

*Message #22 Posted by **Thomas Okken** on 22 Feb 2005, 2:42 p.m.,*
in response to message #21 by Mr X

I agree that the current calculator makers probably won't be interested in making a PDA-with-keyboard (except for Sharp, they're already doing just that; unfortunately the Zaurus it's neither Palm nor PPC-compatible).
The current PDA makers would be a much better bet; they would be entering a new market segment instead of competing with their own products.
PDA makers are also the obvious people to make such a device because it would appeal to (part of) the market they're servicing already. I, personally, would love a PDA with a keyboard; using a pen is sort of OK most of the time, but when I am entering even a two-paragraph memo, I find myself wishing for a keyboard very quickly. Doesn't have to be full-size of QWERTY or anything, either; something with 30 or 40 keys would be fine, AND would allow very nice calculator emulators as a bonus.

Why would "people other then geeks" care if their supplier quit making calculators? Money isn't going down the drain as they still own the device.

Consider a person who uses HP-41s with HP-IL to contol lab equipment. If anything breaks, where do you get repairs or replacements? Purchasing from eBay should never be part of any long-term business plan.
Or consider surveyors or engineers who don't just use the device, but who also invest considerable time and/or money in a software library tailored to their needs. Once their platform of choice is no longer supported by the

manufacturer, they'll have to switch -- maybe not right away, maybe not ever (if they're lucky) -- but most professionals will prefer working with something they KNOW they can replace, without putting up with the unpredictability of eBay.

Re: HP Quality ...

*Message #23 Posted by **Garth Wilson** on 22 Feb 2005, 11:18 a.m.,*
in response to message #13 by Mr X

> What did your HP41 cost when new, in todays dollars?

That question is not relevant, partly because even the same high quality plus a hundred times as much memory and speed would be less expensive to produce with today's technology. The old $450 digital tape drive and pile of $10 cassettes can be replaced with a $19 MMC or other small memory cards with much greater speeds and capacities. If I really need a tiny printer like the HP82162A, I can get an industrial-strength (not disposable consumer stuff) graphic dot-matrix impact printer for half the old HP price from someplace like Weightronix, and the paper won't fade either.

The feel of the keys is one thing I keep seeing over and over on this forum. Let me give you an idea of how cheap the rubber keypads are. We're not just talking about a $5 keyboard compared to a $20 keyboard in a $400 product. At my last place of work we had a rubber keypad made for a product. The tool-up was a couple of grand, and then each keypad after that was twenty-five cents. That was with smaller quantities than we see in today's HP calculators, and 15 years ago before China entered the picture too. HP's calculator keyboards today might cost them less than that hard-to-open slightly flexible clear plastic package the calculator comes in. Don't tell me there's no market for a calculator that puts a little more into the keyboard.

> It's sad to see a great company like HP destroyed by bad management.

Another example was what Jack Tramiel did to his company, Commodore.

Re: HP Quality ...

*Message #24 Posted by **Artur** on 24 Feb 2005, 6:54 a.m.,*
in response to message #23 by Garth Wilson

Hi, Back again to this matter. It seens you have been reading an old answer to a post I've done...

Well, I see two kinds of products: - good quality ones with accordingly prices; - poor quality ones with very low prices;

At the time HP produced high quality products, their prices were high, compared to the similar poor quality products that always were in the market place.

I believe HP and other companies had their territory well delimited. Now, HP has jointed to them and the mess is done. HP products are comparable to others. So, why buy HP? If HP had manteined its quality products, their clients would be paying higher prices until today.

Look at another good example: you have the quartz watches. They have very good looking, precision and are robust and, best of all: are cheap! Well, how to explain somebody todays still pay thousand of dollars for a mechanical one, inprecise, weak and hard to give maintenance?

Simple question of stillish, quality, history...

Well, I think the world comports space for well planed and worked products and place for the rest. I would like to be in the first group, not in "the rest".

Well, about production costs, I agree with you too. Today thecnologies make good processors, memories for a fraction of the pioneers HP products.

People believe professionals don't use anymore calculators because computers.

My thoughts: computers ares expensive, heavy, expensive, need a considerable power source, are not confident (at least with some OS). If you are in the field, a computer can prejudice more than help. PDA devices are not the complete answer. They don't have a decent OS and are hungry on power source.

Even in the case we, professionals, do not any more use calculators for work, I believe students still want them. So, make calculators for students - in all levels! The success of 41 system was achieved because it was a system: peripherals like multimeters, frequency counters, wand, printers and a lot of other very nice options, simple to give the students a way to put their hands in equipments that would cost a fortune if not launched with this intention - make a system for a calculator.

Well, that's what I think ...

Best wishes! Artur

>
> Simple question of stillish *(stylish)*, quality, history...

I think that your views agree with the majority of us here.

Regarding wristwatches, I believe that a top-grade mechanical chronometer (e.g., Rolex) is typically viewed as "status jewelry" as well as an enduring object of admiration by its owner. Personally, I would not want to wear a watch costing thousands of US$, risking loss,

theft, or robbery -- particularly when such watches might not even do their basic job as well as an inexpensive one with modern technology. I also think that many luxury chronometers are rather garish and "busy".

A mechanical chronometer and a Curta mechanical calculator might be very impressive as accomplishments of engineering, but, I doubt that anyone here would prefer to use Curta instead of a quality HP.

Quartz watches also don't have to be cheaply made. I'm still wearing a 1981 Seiko quartz analog/digital Duodisplay with clean design, easy legibility, intuitive and hassle-free operation, and high quality. I recently paid $100 for a new display crystal and other service by Seiko, and I'd do it again instead of buy a new watch. The newer ones aren't as well-made inside, as a professional repairman informed me...

I have been using the same Seiko analog/digital watches for many years. Actually, I think the newer ones are better than the older ones. My first one cost over $200, lasted about 2 years, then died. Its replacement lasted about four years. The next one six years. The later ones have never died, but I am very hard on crystals and wind up replacing the watch every few years. The latest ones, I buy on Ebay for around $5-$20.

Agilent is an independent company that kept many of the businesses that made up the old HP, like test equipment. The new HP kept computers, printers, PDAs, calculators, and the surviving bits of DEC, COMPAQ and other computer companies.

stop the Carly-bashing - WHY?

*Message #29 Posted by **Tom (UK)** on 10 Feb 2005, 7:44 a.m.,*
in response to message #1 by Don Shepherd

HP's calculator design went to sleep in the 90's, this was before Carly.

But Carly was head when the cuts finished off the Australian calculator design house and all their good designs for calculators and PDA's.

Carly was in charge when all the design and manufacture was shipped out to south east asia and China. HP calculator quality and function has gone down during her stay.

The Compaq takeover was pushed through by Carly against some of her fellow directors. This policy does not seem to have paid off, it's probably cost loads of money just to delay the inevitable - PC's don't make good returns.

If CEO's want to take the credit when things go well then they have to take the blame (and bashing) when things go badly.

GOOD design?

Re: GOOD design?

*Message #31 Posted by **Les Bell [Sydney]** on 10 Feb 2005, 5:49 p.m.,*
in response to message #30 by ene

In all fairness to the ACO, the rubber keys are probably the result of HP having no injection-moulding and other manufacturing capabilities of its own. Manufacturing has been outsourced to S.E. Asian companies whose production lines seem to alternate between mobile phones for Nokia et al and calculators for HP.

Nor does the new HP have the industrial engineers who could design a key mechanism.

The ACO seems to have been mostly a software development operation. They did have some very interesting and innovative products in the works, though.

But the colour schemes? Yeah, you got them bang to rights on that one. . .

Best,

--- Les Bell

in response to message #29 by Tom (UK)

Interested folks might care to gander at this week's Cringely.

The links page points you to (among other things) his September, 2001 column, which appears substantially correct re: the Compaq merger.

I'm no longer emotionally invested -- I suspect the Board is the real problem, and that isn't likely to change. There's probably a lot more down-slope sliding in store for H-P from this point.

it's well deserved...

*Message #33 Posted by **Kirk** on 11 Feb 2005, 4:16 p.m.,*
in response to message #1 by Don Shepherd

The reason Carley gets bashed is because she is the prototype of what happens when businesses stop being run by engineers, and technical people, and start being run by business and marketing people. In short, they suck.

Carley had no idea who her target market was, no surprise there, she doesn't exactly hang out with folks that find any virtue in math, science, technology or things of that sort. She has never once had to solve for a derivative of a function, a 3 x 3 matrix or even find a square root. She wouldn't understand the first principal about what makes that slick private jet she fly's around in actually work. She, like most business and marketing people was/is a simple minded creature, adept at creating catchy buzz words, cute phrases and slick marketing campaigns. Oh and she looked good.

Prior to Carley, HP survived and thrived by making insanely good stuff that marketed itself. It didn't need focus groups or market surveys or any of the crap that businesses think they need to sell a product. I discovered my first HP calculator simply by asking other practicing engineers what they recommended. There was no alternative that even came close, there still isn't.

I wish I could be more positive but the damage is done. HP joins the ranks of companies selling second rate electronic gadgets to glutted consumers who have no idea what they are missing. It's not because there is no demand for better, but because the people at the top of those companies have no idea that there is actually a market for such things, and further, wouldn't know how to tap into those markets if they tried.

Kirk

Re: it's well deserved...

*Message #34 Posted by **GE (France)** on 11 Feb 2005, 7:16 p.m.,*
in response to message #33 by Kirk

100% agreed. Carly gets very well-deserved criticism. If you don't bash bean counters, prepare for more to come.

More and more products today are of low quality, break easily, are not repairable, are 'fashionable'. I find myself liking more and more old stuff.

My bets are that HP has still lots of years of going down. Will probably cease to exist at some point, but not to worry since "HP" is gone already.

Re: it's well deserved...

*Message #35 Posted by **Eddie Shore** on 12 Feb 2005, 5:03 p.m.,*
in response to message #34 by GE (France)

Agree. I am out to get calculators (and other office machines) that last.

Do not get me wrong, I really enjoy using my 49g+, and I use it daily. I wouldn't be in the HP world if wasn't for the 49g+ (I starting using HP calculators in 2000 with a very hard to find 48GX, which I lost) But I had to go through three of them to find a keyboard I can live with. (The first one I sent back, the second, I'll probably adorn on my wall as an art object).

I feel that customers would be more loyal if products were built to last at least 8-10 years instead of having to buy a replacement every three years.

Thermal Printers for 41 series

*Message #1 Posted by **GS Leong** on 9 Feb 2005, 6:19 p.m.*

I was in the 41 section of the museum and ran upon pictures of printers. The museum has a pic of the 82162A by itself then a picture of an 82143a with a digital casset drive.

Is there a difference in 81143a vs 82162a printers?

Please help me I am looking to purchase a printer for my 41cx. I also have a cv which i would like to use it with as well.

Thank you GS Leong

Re: Thermal Printers for 41 series

*Message #2 Posted by **David Ramsey** on 9 Feb 2005, 6:49 p.m.,*
in response to message #1 by GS Leong

The actual printer mechanisms are the same-- it's the interface that is different.

The 82143 plugs directly into one of the expansion ports on the rear of the 41C.

The 82162 is an HP-IL device. You must have an HP-IL module installed in one of the expansion ports to use it.

Re: Thermal Printers for 41 series

*Message #3 Posted by **Thomas Okken** on 10 Feb 2005, 7:09 a.m.,*
in response to message #2 by David Ramsey

Apart from HP-IL, there are a few other (minor) differences between the 82143 and 82162. The 82162 has a larger buffer, which means you can do more in terms of graphics (on the 82143, the buffer is too small to hold an entire line's worth of graphics escape codes, although it is sufficient for lots of other cool stuff like high-resolution function plotting).

Also, if I remember correctly, the 82162 lets you control the amount by which the paper advances, so you can create graphics without any gap between lines. You can't do that with the 82143.

Lastly, the 82162 has a low-power standby mode, from which it can be woken up by the calculator. Good feature to have if you want to run it off batteries, while doing lengthy calculations on the 41 where it only prints a few lines every now and then.

BTW, you might also want to look at the HP-82242 module: that's an infrared interface which lets you use a HP-82240 printer. The module supports almost all the functionality of the 82143 and 82162, so most printing programs for the 41 should work with it with little or no modification.

Good luck, and enjoy your 41CX!

- Thomas

Re: Thermal Printers for 41 series

*Message #4 Posted by **valentino ducati (switzerland)** on 16 Feb 2005, 4:25 a.m.,*
in response to message #3 by Thomas Okken

And - talking of replacing parts - you can also replace the few 82240A and B printers with a new clone of it:

Martel MCP8800 (see at http://www.martelinstruments.com/index2.html?ref=8800.html)

Slightly off topic: Now we need only a clone manufacturer of the calculators up to the 48 series and we can leave today's hp managers where they wann be...

Re: Thermal Printers for 41 series

*Message #5 Posted by **David Smith** on 10 Feb 2005, 5:45 p.m.,*
in response to message #2 by David Ramsey

Actually there is a very good chance the '143A and the HPIL printer have different printer mechanisims. There were two types used. One had the timing wheel on the motor side of the machanism and is in most '143A units. The other had it on the far side and is found in most HP-IL units.

41 cx time

*Message #1 Posted by **GS Leong** on 9 Feb 2005, 5:40 p.m.*

My 41cx has lost time over a 24 hour span about 9 mins, this seems very excessive. Is there any way to calibrate the timer? I have a halfnut.

Thank You GS Leong

Re: 41 cx time

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 Feb 2005, 6:05 p.m.,*
in response to message #1 by GS Leong

Hi, Leong;

there are two ways to "calibrate" the CX clock.

first one - enter the actaul time in the X-register and execute CORRECT at the exact moment this time is reached. CORRECT computes the difference between the internal clock and the value in the X-register, and uses the difference to balance the internal "ticks"

second one - use SETAF (set accurace factor). This function uses the value in X-register to force a "stable drift" and adjust any unaccuraces.

If you have the HP41CX Owner's Manual, Vol. 2, please check pages 238 and 376. If you don't have it, post again and we'll add more info.

Best regards.

Luiz (Brazil)

Re: 41 cx time

*Message #4 Posted by **Thomas (CH)** on 10 Feb 2005, 12:55 p.m.,*
in response to message #1 by GS Leong

Hi GS Leong,

I am sorry but 9 mins per 24 hours can't be corrected by the functions CORRECT or SETAF. SETAF can correct 84.375 seconds per day with the value SETAF = 0.1

The function CORRECT has the same range as SETAF.

Regards, Thomas

Re: 41 cx time

*Message #5 Posted by **GS Leong** on 10 Feb 2005, 2:31 p.m.,*
in response to message #4 by Thomas (CH)

Were all the cx's bad about accuracy or is this one just way off?

Thanks GS Leong

Re: 41 cx time

*Message #6 Posted by **Thomas Okken** on 10 Feb 2005, 3:10 p.m.,*
in response to message #5 by GS Leong

I bought one in 1984 (fullnut, Singapore made) and it was fine.
Not as accurate as my wristwatch, but by twiddling the accuracy factor, I could get it to within a few seconds per day.

Yours probably has a bad crystal?

Re: 41 cx time

*Message #7 Posted by **Garth Wilson** on 10 Feb 2005, 9:15 p.m.,*
in response to message #5 by GS Leong

>Were all the cx's bad about accuracy or is this one just way off?

My 41cx halfnut's clock is off by a couple of minutes per year with no correction factor. I only set it when we go on or off daylight savings time. Actually, I usually do 1 or -1 T+X.

Re: 41 cx time

*Message #8 Posted by **Thomas (CH)** on 11 Feb 2005, 3:38 p.m.,*
in response to message #5 by GS Leong

Hi GS Leong,

my 41 CX looses 1.07 s per day without correction. With correction it is better than 0.03 s per day.

I make notes about the drift and I use the formula on page 377 (HP 41 CX German handbook) to calculate an improved AF (accuracy factor).

Kind regards, Thomas

Money makes the world go round...

*Message #7 Posted by **Mike (Stgt)** on 9 Feb 2005, 1:46 p.m.,*
in response to message #4 by Juergen (CH)

There are a few other songs you may sing too. First: what was Carly mission? Making money or making history with everlasting calculators?? (The $$$ on her own account look not so bad, I would be glad to be her gardener...)

Second: Is there such a dictatorship in bussines that you may blame _one_ person for all ups and downs of a company?

Next (back to quality issues): look around, where do you still get goods that last for a decade or longer? After 18 yrs I had to buy a new washing machine only because a spare electro motor would be more expensive as completely new machine. What makes me even more angry: the seller told me that none of the new machines will last that long any more.

That's only an OT example, but it shows the trend: quality is history.

Ciao.....Mike

Quality, reliability,durability

*Message #8 Posted by **Palmer O. Hanson, Jr/** on 9 Feb 2005, 11:34 p.m.,*
in response to message #7 by Mike (Stgt)

Here's some more anecdotal evidence of better quality, reliability and durability in the good, old days.

I purchased a Maytag washing machine for $450 in May 1981. I replaced it with another Maytag for $406 in December 2004 which had more features but doesn't seem as solidly built. I had kept the first machine running with belt replacements, siphon break repairs and hose replacements. I had also replaced the timer mechanism three times. In the process I identified a failure mode in the timer which was not known to the manufacturer. I had to give up on the machiine when the main seal failed. While shopping for a replacement at a Sears store a salesman told me that he hoped that I did not expect that a replacement machine would last as long. The consumer price index has more than doubled since 1981. I'm not sure whether or not I could have obtained the same feel of quality and durability if had been willing to pay $900.00 for a replacement machine.

I purchased a Craftsman gas-powered edger for $72 in December 1970. Those were the days when people bought Craftsman tools expecting them to last for a lifetime. Thirty-four years later it still works. I have replaced several belts and blades. When the edger stopped working recently I found that there was a cracked diaphragm in the carburetor. Remarkably, the Sears repair center still provides a carburetor repair kit which includes the diaphragm for about five dollars plus about another five dollars for shipping and handling. I obtained a replacement diaphragm for $1.20 from a local mower repair shop. The edger is now running as well as when it was new. The consumer price index has increased by about a factor of four since 1970.

Those two anecdotes illustrate the quality, durability and maintainability of appliances manuactured 20 to 30 years ago. That was the same time period when calculators such as the HP-35, HP-67 and HP-41 came on the market. Those machines are among the ones which had the "solid feel" and heft which are so much admired by those who love to dwell on the "good old days". There is little doubt that the calculators coming on the market today do not have the same feel. But consider price and capability. Would anyone today really pay two to three times the 1970's price of an HP-67 for the same capability? I doubt it, and so does Hewlett-Packard.

Finally, I note the glee which the departure of Ms. Fiorino has generated in the participants in the forum. I am reminded of the old anecdote in which someone supposedly said "Cheer up. Things could be worse". So I cheered up, and sure enough, things did get worse.

Re: Quality, reliability,durability

*Message #9 Posted by **Hugh Evans** on 10 Feb 2005, 12:41 a.m.,*
in response to message #8 by Palmer O. Hanson, Jr/

I think a better example would be a modern scientific programmable calc such as the 33s. $50 range. The profit margins for such machines are astronomical, but HP (like the majority of manufacturers today) will sacrifice quality of build to gain every extra fraction of a cent they can squeeze out of each unit. Reducing parts count, minimizing materials, etc. accomplish that economic goal. Quality, consistency, and reliability are what create customer loyalty.

As usual I'm reiterating my strong belief that people are more than willing to pay for quality. It is highly unlikely that HP will ever pose a serious threat to TI in the education market. It is equally unlikely that a popular TI scientific calculator will sell on ebay for 3 or 4 times its' original retail value after being discontinued.

Has this community ever attempted a massive mailing campaign directed at the HP CEO? Perhaps when the next one is chosen it would be worth a shot to launch a massive letter-writing campaign appealing to her/him to either offer a couple of high-end "professional" models or to drop their current direction (I liken their current line to the new coke) in favor of their old niche.

Just my $2E-2... I think it's worth a shot.

Best Regards, HDE

Re: Quality, reliability,durability -- in the 1980's!

*Message #10 Posted by **Karl Schneider** on 11 Feb 2005, 4:05 a.m.,*
in response to message #8 by Palmer O. Hanson, Jr/

Palmer said,

> Quote:
>
> Here's some more anecdotal evidence of better quality, reliability and durability in the good, old days.

Valentin also made a similar post regarding his early '80s Sony CD portable player, and I couldn't agree more.

I think that the 1980's and early 1990's were a "golden era" of consumer products. Granted, certain technological products were immature or unavailable (e.g., PC's and cellular telephones). However, most other commonplace products were well-built with sensible design and styling.

Today, however, gaudiness prevails over soundness in a market of low prices but razor-thin profit margins. It is as though manufacturers are compelled to grab consumers' attention with bizarre stylization in order to gain that critical bit of market share for profitability.

The development of capable and cheap electronics, as well as access to very inexpensive labor in mainland China and Mexico (via NAFTA) has drasitially reduced the price of consumer goods. However, the newer products are often not well-engineered or durable because low price and rapid obsolecence makes that a losing proposition.

Here are some of my everyday "things", which I still use on a regular basis. Many of these I bought new.

1. Cars: 1986 VW and 1989 BMW. Well-built, straightforwardly engineered, cleanly styled. *Many of today's cars are stylized and gimmicky, and I would refuse to own one, depite the technological improvements.*

2. Wristwatch: 1981 Seiko duodisplay. After 24 years, I just had the crystal replaced and minor repairs made at their national Service Center. Still works great and keeps good time. *I'm told that the newer ones aren't made as well inside.*

3. Television: 1988 Zenith 19". $329 new. Doesn't have superimposed graphics or RGB input for DVD player, but does have sharp NTSC picture and displays the channel below the screen. Remote control is easy to hold and use.

4. Shaver: 1989 Braun AC. Simple, clean, and straightforward. Not cordless, no fancy cleaning system, no LED displays.

5. Vacuum cleaner: 1985 Eureka canister with solid metal case. *Have you seen the colorful plastic stylized monstrosities in the stores? Maybe they have HEPA filters, but I just can't stand them.*

6. Calculators: I own and use most of the HP calcs based on models orginally released

during the period 1979-1988. The ones designed later (48G, 33S) just don't measure up in ease of use.

My thoughts went to the song in the Wizard of OZ.

Ding Dong the witch is dead.

It will be interesting to see if Robert Wayman the new interim CEO tries to change anything or will wait until a new CEO is found before things change. Robert Wayman although being the head of the Finance Department has been with the company for 35 years. So he should know what the HP Way is and how the company was run in the past.

Major corporations know that their products need to sell and they know that their company needs to make a profit. Fiorina was dumped because she was doing neither. She was a power monger - holding three titles at the top of a major company. But, the Peter Principle kicked in and out she went. The needs of the many outweigh the needs of the one.

However, those of you hoping for a new 15C, pull youself out of the 70's. Unless the permanent CEO has a woody for old calcs or was an ex-engineer, we're likely to see much of the same in the calc area. HP's main source of income is the printer and PC market, not calcs.

Though, since the Big F's free ride is over, there is always hope, I guess.

From that USA Today story: "H-P board members said they fired Fiorina because she failed to execute a planned strategy of slashing costs and boosting revenue as quickly as directors had hoped. Many on Wall Street hope the company will spin off its printing division, which delivers most of H-P's profit."

What the hell is wrong with this company? They want to spin off the printers? That's the division that makes money! I guess they're going to let Epson take the lead... and if you don't have a profitable business, well, you don't have a business.

Every thing I've read about HP over the recent years indicates that the company is run by stupid people who just happen to be good at high-finance bullying. Even the esteemed Messrs. Hewlitt and Packard went insane (i.e., worrying too much about overpopulation like Ted Turner). I hope the Monterrey Aquarium won't suffer.

Hey, maybe they'll "spin off" the entire calculator line to Radio Shack or something.

I noted that Ms. Fiorna got more in severance pay than the value of the Calculator Division. It is hard for me to imagine that HP would put major resources into calculators as the chief demand is for schools and TI pretty much has that market locked up.

However, as a long-time purchaser and user of HP calculators, I would buy a HP-49G+ or a HP-42 with I/O if it was up to HP's old quality standards.

I still hope that HP will produce quality calculators. I would not even mind if they were Algebraic rather than RPN.

in response to message #20 by Luis

Come on! Martha Stewart is much, much hotter!

Has anyone (else) here read "Perfect Enough: Carly Fiorina and the Reinvention of Hewlett-Packard"? Firstly, Carly's a dog and doesn't even know how to use a calculator, any brand. Secondly, from what I read, I am really not all that surprised that HP went down the tubes. H and P were brilliant, and they had brilliant kids - or so it seemed... In actuality, they're all insane. The fight for this soulless company is pretty well detailed in the book, though it is a love letter to Carly.

What I also gathered from the book is this: did they actually know they had such a devout calculator following? If so, why didn't they follow Apple's model and be extremely happy with a solic less-than-ten percent of the market share? Did they actually care about their consumer customers?

*Message #22 Posted by **Manuel Sanchez** on 11 Feb 2005, 1:59 p.m.,*
in response to message #1 by Mutsch

Problem is that we are not talking about only of calculators. We are talking about the percepction of a company no devoted any more to build quality products. When I thought in the past about HP(only using their calculators), i was really sure that any other product could be excellent. Today, I prefer to buy an Apple notebook or IBM thinkpad instead an HP, because I have concerns about HP's quality reputation

HP25-C

*Message #1 Posted by **Louis** on 9 Feb 2005, 4:59 a.m.*

Last year (July 16th) mr. David Smith give the solution for my HP25-C. Broken C-MOS type 7626 HP indication(1820-1630).

Where can I obtain the C-MOS ?? Are there replacements ? For me it is a challenge to repair the HP25-C myself. Louis.

Re: HP25-C

*Message #2 Posted by **David Smith** on 9 Feb 2005, 4:01 p.m.,*
in response to message #1 by Louis

The only source of the chips is another machine. You can find compatible chips in the HP25C or HP29C. The 25C had two types... a two RAM chip version or a single RAM (double capacity) chip version. Since the 29C has much more memory than the 25C, it used two of the double capacity chips.

Now the tricky part... there is a slight difference in using the two types of chips. There is a 100K pull-up resistor on one of the RAM chip pins (sorry, I don't remember which version uses the resistor and which does not). If you change RAM chip types in your machine you will need to either add or remove the resistor.

Some 49G+ Limitations

*Message #1 Posted by **John Smitherman** on 9 Feb 2005, 12:06 a.m.*

Being a new 49G+ owner I have been trying some of the functions to see how well it handle "extremes". Needless to say, I am disappointed with what I have found thus far:

o 1000! = 1e500 with no overflow warning.

o 1.5! = 1.329 but in my opinion should give an improper (non-integer) input warning.

o Comb(2000,1000) = 1e500 with no overflow warning.

o asin(acos(atan(tan(cos(sin(7) = 7.000003185 which is no better than the 32sii and not up to TI 89 accuracy.

Is anyone aware of a list of other 49G+ limitations, bugs, etc.?

Regards,

John

Re: Some 49G+ Limitations

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 Feb 2005, 1:21 a.m.,*
in response to message #1 by John Smitherman

Hi, John;

let's see:

> Quote:
>
> o 1000! = 1e500 with no overflow warning.

Please, try:

```
[MODE][FLAGS][down-arrow] 6 times and [|/CHK]
```

You'll see that, now, overflow returns an error message. BTW, flag 20, underflow, may be checked for error as well. To maintain this setting, confirm with [OK] twice.

> Quote:
>
> o 1.5! = 1.329 but in my opinion should give an improper (non-integer) input warning.

This is because the [!] function (and also FACT) computes GAMMA(x-1) when the argument is not an integer.

> Quote:
>
> o Comb(2000,1000) = 1e500 with no overflow warning.

Same as first quote.

> Quote:
>
> o asin(acos(atan(tan(cos(sin(7) = 7.000003185 which is no better than the 32sii and not up to TI 89 accuracy.

The actual value is 7.00000318497 (STD mode set). What is the value obtained with the TI89?

Hope this gives you some new info.

Best regards.

Luiz (Brazil)

Re: Some 49G+ Limitations

*Message #5 Posted by **Mike (Stgt)** on 9 Feb 2005, 1:21 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Many complain about their appearance but no one about his brain. IMHO, talking about limitations of a HP49G+ is like blaming the sharp knife when you bleed. But its good habit to know the limits.

I "grew up" (mathematically) with an HP-41 which has not too much math by factory default. What I needed I had to program on my own or buy a plug-in module (if I only had the $ as student back

in those days). Thoday an HP-49 comes packed with nearly all math you may dream of. So it demands a high knowledge in math from the user about all ifs and buts. That leads me to an idea: how about a bare calculator (with a screen as big as an HP200LX or a Sharp Zaurus) with an simple programming language (or two) to do your own solutions and enough storage to download ready to use application packs. That way this calculator will grow with your demands/tasks. In the end you'll have a very personal tool that fits _exactly_ *your* needs.

Ciao.....Mike (sorry for the subject drift)

That would be nice ;-) (was: Some 49G+ Limitations)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 9 Feb 2005, 5:56 p.m.,*
in response to message #5 by Mike (Stgt)

Hi, Mike;

I agree with you. You see, I take the HP49G as the closest scheme for this "custom" calculator. As you say, the HP49G already has all math tools you can dream of. If adding any particular procedure to the existing OS is an easy matter, then it is already one possible, not too expensive solution. The upgradable OS has been the major reason I bought two of them.

Cheers.

Luiz (Brazil)(somehow driffting the subject as well)

The best users work with limitations and with pluses.

*Message #7 Posted by **Eddie Shore** on 9 Feb 2005, 9:15 p.m.,*
in response to message #5 by Mike (Stgt)

No calcualtor will ever be perfect and every machine has its quirks.

"That leads me to an idea: how about a bare calculator (with a screen as big as an HP200LX or a Sharp Zaurus) with an simple programming language (or two) to do your own solutions and enough storage to download ready to use application packs. That way this calculator will grow with your demands/tasks. In the end you'll have a very personal tool that fits _exactly_ *your* needs."

That is why I love programming. Making the calculator (and Excel, Word, the VCR) fit the user's needs. Having memory is more important that too many extras.

*Message #9 Posted by **Ralph** on 10 Feb 2005, 2:33 p.m.,*
in response to message #8 by John Smitherman

After reading all these discursions about how calculators handle 'extremes' these are the results for the following functions on a HP65, HP41CX and HP48G:

a)1000!

HP65(9.999999999E99) wich is interpreted as an overflow

HP41CX(OUT OF RANGE)

HP48G the same as stated for the HP49G+

b)1.5!

HP65 -display blinks

HP41CX (DATA ERROR)

HP48G the same as stated for the HP49G+

c)asin(acos(atan(tan(cos(sin(7))))))

HP65(7.003719916) worse than HP49G+, HP48G and HP41CX

HP41CX(6.999519575) worse than HP49G+, HP48G

HP48G the same as stated for the HP49G+

Certainly the results improve with the newer models, but a strange thing for case c), HP41CX gives a result that aproaches from under the correct value, instead of all others.

less frustration

*Message #12 Posted by **Mike (Stgt)** on 11 Feb 2005, 6:04 a.m.,*

in response to message #8 by John Smitherman

Nice to see my append was helpful. But I am a bit frustrated: An HP-49 or TI-89 has more math built in than I am ever able to understand. That's not a problem of those calculators, it's just an issue of capabilities: I will not in my lifetime understand such papers (alas PostScript only). No calculator may help me to see all coherencies that make up our world.

But what I miss on machines like the HP-49 is a system that calculates with errors, internal errors too. So the answer of asin(acos(atan(tan(cos(sin(7)))))) would be 7 +/- 0.00xy% or an interval [7-e; 7+e]. There is (was?) a FORTRAN lib for that (cant remember neither its name nor source). I once had a system on the HP-41 to calculate with errors (no-no, not with internal errors of cause, and not with intervals). It was for estimating errors when calculating with measured values. I just had to program the formula, the derivation for each variable was done with the PPC-ROM.

Ciao.....Mike (not having a full imagination of this world does not stop me dreaming...)

Beep problem hp 41 repair

*Message #1 Posted by **Peter** on 8 Feb 2005, 11:16 p.m.*

Hi, I read through all the repair messages that this very knowledgable group has assembled but I can't find anything on this recent problem: I bought a couple of HP 41 and they seemed to do fine. Curious as I am I opened them, also to clean some corrosion. However when I put them back together, they either have a little high pitch beep right when I put in the batteries, or when I press the on button. One works afterwards fine, the other one shows funny characters and does not. Does anyone has any tips or ideas what the source of the problem is? How I can fix it? Thanks a mil in advance. Cheers

Re: Beep problem hp 41 repair

*Message #2 Posted by **Raymond Del Tondo** on 9 Feb 2005, 12:59 a.m.,*
in response to message #1 by Peter

Hi, the short beep after inserting batts after a while
seems to be normal for some older units.
If you hear a beep after every keystroke,
this indicates that the OUT or Tone register
hasn't been reset properly.

Just perform a BEEP, then it should disappear.

For the machine(s) which show weird stuff on the display:
Usually this means a bad contct between the CPU board
and the keyboard pcd, and/or the contact between
the keyboard pcb and the battery contact block.
Be sure not to fasten the screws to tightly,
as the posts tend to break.

HTH

Raymond

Re: Beep problem hp 41 repair

*Message #3 Posted by **Peter** on 9 Feb 2005, 11:17 p.m.,*
in response to message #2 by Raymond Del Tondo

Raymond, Thanks for your reply, it must have scared at least one of the HP-41's - it stopped beeping!

I checked the other one for contact between cpu and keyboard and - Voila - there was corrosion on the connector (i think it is called the zebra connector, right?) I tried to clean and fix it, yet to no avail. Got once a steady "Memory Lost" display with no keys working. Than I turned the zebra around to see if that changes anything, nope. I read in the 'Repair of a HP41 CX" article how the cpu can be hardwired to the keyboard, it just sounds like a lot of work... Any idea how to clean/repair the zebra?

On a different note: One of the beeping ones seems to have been subject to a speed up and I wonder if the capacitor is broken (it looks pretty bad...). It is on the left side of the board (facing down, display on top side), where there is a second lengthy, slivery capacitor mounted on top of a first similar looking one. That second one is connected with a blue capacitor which is with a wire soldered to a spot on the top side of the board. Can I just remove the two extra capacitors and the wire?

Thanks so much for your help to a repair newbie...

Peter

Re: Beep problem hp 41 repair

*Message #4 Posted by **Peter** on 10 Feb 2005, 12:25 a.m.,*
in response to message #2 by Raymond Del Tondo

I just found some PPC article with respect to speed up and so I did take out the extra 2 capacitors with the cord. It then had the beeping problem that I resolved following your sage advice of "BEEP". it now works fine.

Thanks a lot yet I'm sure more questions will arise once I try to revive the last of the batch, maybe I do do the hardwiring of the cpu-board... any other/better ideas, please send them forward!

Cheers

domain of a function

*Message #1 Posted by **John Littlefield** on 8 Feb 2005, 1:09 p.m.*

I need help finding the domain of the function f(x)=1/1-ln(9-sqrrt(x^2-9))

Re: domain of a function

Message #2 Posted by on 8 Feb 2005, 7:23 p.m.,
in response to message #1 by John Littlefield

x < 3sqrt(10) && x != sqrt(90-18e-e^2) ??

Re: domain of a function

*Message #3 Posted by **Hugh Evans** on 8 Feb 2005, 7:33 p.m.,*
in response to message #1 by John Littlefield

I assume you're just solving this by hand and not asking how to do this with a 49G+/other graphing model.

Remember that the domain of a function is simply the set of x values for which the function is defined. To find where the function is not defined in this case you must find solutions that result in 1/0. If you set the denominator equal to 0 and solve for x you will find the domain. To get you started:

1-ln(9-sqrt(x^2-9))=0

Some relatively basic algebra will give you the answer. Keep the properties of the squared term in mind. Good luck!

Re: domain of a function

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 8 Feb 2005, 8:34 p.m.,*
in response to message #1 by John Littlefield

Hi, John;

Hugh is correct, one of the first restrictions is the one he pointed out. Now, let me add some guidance that I hope will help you a bit. When defining/checking domain, discontinuities, poles and, if applicable, undefined points must be found so you can set all conditions that define your domain. For each particular function you'll have a series of restrictions. I guess that you may find your way to get the answer yourself, just take some guidelines for this particular case:

1 - denominator different of zero, meaning:

```
1-ln(9-sqrrt(x^2-9)) =! 0 ,hence
ln(9-sqrt(x^2-9))  =! 1
9-sqrt(x^2-9)  =! e (2.7183...)
sqrt(x^2-9) =! 9-e (now you isolate x... your turn!)
```

2 - because it is a ln operand:

```
9-sqrt(x^2-9) > 0  , hence:
sqrt(x^2-9)  >  9
```

3 - sqrt parameter should be greater than zero as well:

```
x^2-9  >  0  , hence
x^2  >  9   and
|x|  >  3
```

Can you put all of these conditions together in one only? If so, you'll have your domain.

(at least I hope this is correct; have someone found anythng wrong here, please add corrections)

Cheers.

Luiz (Brazil)

Re: domain of a function

*Message #5 Posted by **Hugh Evans** on 8 Feb 2005, 11:21 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Well put, Luiz. I was somewhat hesitant to elucidate since this looks to be a homework problem. You did an excellent job of laying the logical groundwork and demonstrating optimal technique to determine the solution without giving much away.

Regards, HDE

Re: domain of a function

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 8 Feb 2005, 11:35 p.m.,*
in response to message #5 by Hugh Evans

Hi, Hugh; thanks for your comments.

You see, that's the technique I always try to use when teaching: "teasing" to an answer. Not always possible, depends on the problem itself and the subject, but when applicable, it is rewarding for both teacher and students. I, as a teacher, must "feel" where to stop (sometimes going further, sometimes stopping earlier), and the students, in their turn, must feel confident going ahead by their own.

I don't remember attending classes like the ones I propose to my students today, but I guess we must all evolve, enhance. Your comments show me I'm on the right path. I neither blame my teachers for their classes, I am confident they were doing the best they could. You see, I tell my students that **when the job is done by both teacher and students**, learning is a consequence of teaching and examination is just a matter of bureaucratic evidence. If students search for knowledge and do not feel satisfied until their doubts are gone, (good) teaching is always effective.

Thanks!

Luiz (Brazil)

hp 11c

*Message #1 Posted by **john littlefield** on 8 Feb 2005, 7:27 a.m.*

The decimal point on my HP 11C has been replaced by a comma. Any ideas what I did, and how to change it back?

Re: hp 11c

*Message #2 Posted by **Mvdn** on 8 Feb 2005, 7:37 a.m.,*
in response to message #1 by john littlefield

Turn off the calculator. Hold down the decimal point. Continue to hold the decimal point key, while turning on the calculator. The comma should change back to a decimal point.

Re: hp 11c

*Message #3 Posted by **john littlefield** on 8 Feb 2005, 7:42 a.m.,*
in response to message #2 by Mvdn

Thank you so much, it was driving me crazy.

Trouble integrating on 49g+

*Message #1 Posted by **JaSon** on 7 Feb 2005, 12:13 p.m.*

If I try to integrate the expression c/(x^n) the calc is unable to integrate it. If I change the n to a number it has no trouble integrating. I have tried changing the flag 105 for exact mode and that doesn't help. Any ideas on what I can do to make the calc integrate with a variable there instead of a number?

Re: Trouble integrating on 49g+

*Message #2 Posted by **Eddie Shore** on 7 Feb 2005, 3:15 p.m.,*
in response to message #1 by JaSon

Interesting, I get the same result using c/(x^n) and c*x^-n: both giving c * integral(1/(e^(n*ln x) dx) where the answer should be

c*-n*x^(-n-1)

Re: Trouble integrating on 49g+

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 7 Feb 2005, 7:34 p.m.,*
in response to message #2 by Eddie Shore

Hi Jason, Eddie, folks;

I did not actualy tried what I'm posting here, but I guess it's worth a try.

As I see, 'n' in 'c/(x^n)' is a number, right? The HP49G+ does not know it is a number unless you tell it. If I am not wrong (from the excelent HP48G documentation), the recognizable constants are:

```
N1, N2, N3...
```

What about trying 'c/(x^N1)' instead of 'c/(x^n)'? Based on the answer you obtained, Eddie (c*integral(1/(e^(n*ln x)dx), 'n' has been considered as a general variable, that can contain a function.

I may also be copletely out of my mind...

Cheers.

Luiz (Brazil)

nope tried that too

Re: What about n1 instead of N1? (NT)
*Message #7 Posted by **Eddie Shore** on 8 Feb 2005, 11:00 p.m.,*
in response to message #6 by JaSon

I tried making N a complex number and it returned 'C*INT(1/EXP(0,3))*LN(Xt)),Xt,X)'

Trying IBP (Intergration by parts) gives 'X*N*C*X^N/(X*X^(N*2))'

The RISCH function gives 'C*INT(1/EXP(N*LN(Xt)),Xt,X)'

This may be a disadvantage of look up tables(?).

Just for curiousity, the HP-39 (not G+) returned the same expression.

Re: Trouble integrating on 49g+
*Message #8 Posted by **J-F Garnier** on 10 Feb 2005, 3:25 a.m.,*
in response to message #2 by Eddie Shore

If I remember well, integral(c/(x^n)) is -c/(n-1)/x^(n-1) ONLY IF n<>1, otherwise integral is c*ln(x) or maybe c*ln(abs(x)).

I'm not expert if HP-49G CAS, but maybe there is a way to add the condition n<>1.

Alg48, running on my 48GX, gives:-(C/(N-1)*X^(-N+1))

Re: Trouble integrating on 49g+
*Message #10 Posted by **JaSon** on 10 Feb 2005, 12:14 p.m.,*
in response to message #9 by Raul L

I haven't use alg48 on a 48 before can you think of any specific settings that are set on your calc?

Re: Trouble integrating on 49g+

*Message #11 Posted by **Raul L** on 10 Feb 2005, 12:44 p.m.,*
in response to message #10 by JaSon

Alg48 only needs "exact" arguments. In this case, f(x) is on level 2, the variable X, on level 1, and then INTGR.

(If you are interested, Erable -mother of the 49 CAS- is unable to integrate this problem)

HP-48G "Invalid card data"

*Message #1 Posted by **Jan (CH)** on 7 Feb 2005, 8:49 a.m.*

Some times ago I had the 48-G memory expanded from 32 K RAM to 256 K. It worked well.

I have not used the calc for a while and removed the batteries. Now I want to use it again and get "Invalid card data" message, which is related to the RAM expansion.

There was an init-procedure to get rid of it, but unfortunately I cannot figure out how that worked. Can anybody help?

Thanks

Jan (Switzerland)

Re: HP-48G "Invalid card data"

*Message #2 Posted by **Daniel Diggelmann** on 7 Feb 2005, 8:59 a.m.,*
in response to message #1 by Jan (CH)

Hi Jan, There's a function PINIT which you will find in LEFT-SHIFT-LIBRARY then type NXT. Do this once and the memory expansion will be correctly recognised. Cheers from Switzerland Daniel

HP49G

*Message #1 Posted by **David Youse** on 6 Feb 2005, 9:39 p.m.*

I've developed a problem I haven't been able to figure out. I just got a used HP49G and am trying to learn its in and outs. When I first got it, everything worked as the manual said it should. I could enter any formula or calculation and I'd get the expected answer. Hovever, a few days ago, it started doing something different.

Now, anytime I enter Anything with an unknown in it, I get an error message: "ERROR: Undefined name"

At its simplest, if I put in 2 * 2 I get the answer - 4. But if I put in 2 * X, I get the error message.

I've tried resetting everything and clearing out all the memories but there's no change.

What am I doing wrong???

Re: HP49G

*Message #2 Posted by **Michael Elzinga** on 7 Feb 2005, 12:02 a.m.,*
in response to message #1 by David Youse

Go to the modes menu and uncheck the approximate mode. Also, you can go the the flags list and uncheck flags 1,2, and 3.

Re: HP49G

*Message #3 Posted by **David Youse** on 7 Feb 2005, 12:53 a.m.,*
in response to message #2 by Michael Elzinga

Thanks Michel, that did the trick. The approximate chioce and flag 3 were checked, although I can't imagine how either of them got that way. When I got the calculator I didn't have the problem. It only developed after I had it several days. Oh well, thanks again.

David

Just a guess... (was:HP49G)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 7 Feb 2005, 2:44 a.m.,*
in response to message #3 by David Youse

Hi, David;

I was wondering about the weird setting without any attempt to set it and I thought that you may possibly had chosen Approximate in orther to perform any of the examples available in the manual so you could see the effect of this. If not you, maybe someone else that access your calculator without problems (do you have kids?).

It happen something like this to me from time to time. The last one was creating, in the root directory,

a variable named 'X' (HP48G+).

What happens next? Anytime you key in X without quotes cause the variable X to be evaluated. Even if the calculator is positioned in a different directory... The OS serches for the X in all directories 'above' the one you are worling now, so any variable stored in the root directory echoes its contents in any other directory if its name is written without quotes.

Learning and learning evryday...

Cheers.

Luiz (Brazil)

Aren't there some math operations that change the settings of the flags automatically? I know Erable does this with some of the flags, and the 49G software is based partly on Erable. It's possible that David performed some operation that changed the flags without his knowledge. However, I don't remember if the "Approximate" flag is one of the flags that changes automatically or not.

Re: Just a guess... (was:HP49G)

*Message #6 Posted by **David Youse** on 7 Feb 2005, 2:37 p.m.,*
in response to message #5 by Wayne Brown

Thinking about it and the above responses makes me think that I must have created the problem by following the examples in the manual. I started on page one and more or less just went through the whole thing one page at a time, trying everything there.

BTW, re: the manual - it's just an average guide, at best. As a teaching tool, it sucks. Is there a comprehensive book available? I've been able to deduce several things not specifically shown in the manual but I have to think I'm missing a lot, given the obvious capabilities of the machine.

David

Re: Just a guess... (was:HP49G)

*Message #7 Posted by **Michael Elzinga** on 7 Feb 2005, 6:33 p.m.,*
in response to message #6 by David Youse

David

I seem to recall some examples that set the approximate mode. It may have been one of the

numerical integration examples or perhaps one of the root finding examples.

I agree that the manual is bad. If you can get your hands on the manuals for the HP48GX (I have a 48GX and all its manuals, and prefer using it to the 49G for most things), you will find that most (obviously not all) of the information for operating the 49G is available in the 48G manuals. What will be missing will be the stuff on CAS. With CAS you have to be aware of the additional types of objects and how they are handled by the 49G. The manuals for the 49G+ would also have much that applies to the 49G. I was able to download these from one of the HP afficionados websites, but at the moment I can't remember which one. I'll try to get the info and get back to you.

Mike

Re: Just a guess... (was:HP49G)

*Message #8 Posted by **Michael Elzinga** on 7 Feb 2005, 6:53 p.m.,*
in response to message #6 by David Youse

I'm back already. Actually you can get CD's from this website. Follow the links to Other Calculators and the 48 series. You will find links to how to get the CD's.

The other website is www.hpcalc.org. There are all kinds of things there.

Mike

Re: Just a guess... (was:HP49G)

*Message #9 Posted by **Michael Elzinga** on 7 Feb 2005, 7:01 p.m.,*
in response to message #8 by Michael Elzinga

Oh, and DUH!, http://www.hp.com/calculators/ click on the 49G+ and look for product manuals. They are both there.

Mike

Re: Just a guess... (was:HP49G)

*Message #10 Posted by **David Youse** on 8 Feb 2005, 1:07 a.m.,*
in response to message #9 by Michael Elzinga

Thanks Michael

I've now downloaded and printed several humdred (!!!) pages here. I've found a couple of other sites that have enough other information to keep me busy for the rest of the winter.

David

Re: Just a guess... (was:HP49G)

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 8 Feb 2005, 6:20 a.m.,*
in response to message #5 by Wayne Brown

Hi Wayne, folks;

I read your post again and I'd like to know one thing: was Erable originally writen for the

HP48G? If so you're right, i.e., the "approximate" flag was surely not changed because the HP48G has no such definition, right?

Just to add this.

Cheers.

Luiz (Brazil)

Re: Just a guess... (was:HP49G)

*Message #12 Posted by **Wayne Brown** on 8 Feb 2005, 10:47 a.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

You're right, Erable was written for the HP48. It uses some of the user flags for keeping track of various settings that determine Erable's behavior. I don't know whether it uses one as an "approximate" flag or not, but it does operate in both an exact and an approximate mode, which can be set by the user and which sometimes switches automatically. Here's an excerpt from the Erable 3.2 documentation:

> Quote:
>
> Most of the time, you will use Erable in exact mode, where no approximations are made. But sometimes, exact solutions can not be computed on the HP48 (e.g. if you want to factor $x^5 + x + 1$), and Erable will switch to the numeric approximation mode where e.g. SQR(2) is handled as 1.414235...

How to connect a plotter HP9862A with HP9815?

*Message #1 Posted by **Thomas Falk** on 6 Feb 2005, 4:46 p.m.*

Hi,

I have a plotter HP9862A and a calculator HP9815. Unfortunately I don't have any cables to connect them, only the BCD I/O module for the calculator.

The manual for the plotter is on the museums CD, but does not give any hints, maybe because it was written in the time of the HP9810, the precursor of the 9815.

Who knows what kind of interface the plotter does have?

Thanks,

Thomas

Re: How to connect a plotter HP9862A with HP9815?

*Message #2 Posted by **Juergen (CH)** on 7 Feb 2005, 5:10 a.m.,*
in response to message #1 by Thomas Falk

Perhaps this helps a little bit:

HP9815 with HP9862 plotter I/F query

Regards, Juergen

Re: How to connect a plotter HP9862A with HP9815?

*Message #3 Posted by **Thomas Falk** on 7 Feb 2005, 4:29 p.m.,*
in response to message #2 by Juergen (CH)

Thanks for the hint. Now I have only to find a 98132A cable. Looks like an easy task. ;-)

A posting in the classified area looking for the cable resulted after a short time in the following email:

Hello, I'm smith,i got your advertised HP98132A plotter cable (WTB) and just wondering if it is still for sale,kindly get back to me if you areb still selling it.Terms of payment is with a certified check or money order,do not worry about the shipping aspect i will get intouch with a shipping company to handle that as soon as the deal is sealed ok. Regards, Smith

---

Very strange indeed.

Thomas

Re: How to connect a plotter HP9862A with HP9815?

*Message #4 Posted by **peter** on 8 Feb 2005, 3:36 p.m.,*
in response to message #3 by Thomas Falk

Hello Thomas,

I sold my 9815A with a 7225A Plotter some days ago, and the plotter had an interface labeled with "98132A, 9862A Plotter". The Plotter itself had a 17600A Interface in it. Don't know if You need the 17600A for the 9862 Plotter, but You need the 98132A. It was a complete system, and there was no extra ROM, so I assume it will work without one. But I think there was a tape for the plotter.

-Peter

3x3 matrix operations for the HP-12C

*Message #1 Posted by **Kalevipoeg** on 6 Feb 2005, 7:18 a.m.*

There has been a lot of messages concerning trig. functions for the HP-12C.
Here is a new math theme for the HP-12C fans:

3x3 MATRIX OPERATIONS FOR THE HP-12C

I wrote this program some times ago. I just wanted to see if it is possible to program any 3x3 matrix operations for the HP-12C.
And it was possible...
This program uses Cramer's rule to solve systems of linear equations with 3 unknowns.
In matrix form AX=B.

PROGRAM LISTING

*Message #5 Posted by **GWB** on 6 Feb 2005, 1:38 p.m.,*
in response to message #1 by Kalevipoeg

Very nice!

What will come next? Numerical integration?

I wonder why HP did not include more scientific functions in the new Platinum model. Are they affraid that would scare potential buyers? If so, they are underestimating business people. Or have they just lost the know-how?.

Don't you think it is time to realese a 15C Platinum, or at least a 15C Tin? Oops, I'm getting off-topic. Sorry.

Regards,

Gerson

Re: 3x3 matrix operations for the HP-12C

*Message #6 Posted by **Mike T** on 11 Feb 2005, 3:44 p.m.,*
in response to message #1 by Kalevipoeg

I just know I'm missing something here - but I'm I know that the HP11C doesn't have STO PV or RCL PV so I was wondering what the HP11C equivalents are in this case ?

Thanks

Re: 3x3 matrix operations for the HP-12C

*Message #7 Posted by **GWB** on 11 Feb 2005, 8:33 p.m.,*
in response to message #6 by Mike T

Hi,

n, i, PV, PMT and FV are special financial register of the 12C. You can use the remanaing registers instead. The author has used some of those because he ran out of ordinary registers as his program grew, I think.

Regards,

Gerson.

batteries for 48G+, 49G+, 48GII

*Message #1 Posted by **Eduardo Costa** on 6 Feb 2005, 12:05 a.m.*

Hi, people. I tried to buy batteries for Classpad 300, HP 49G+, HP 48GII, and HP 48G+ calculators. People told me that the best option would be Compit AAA rechargeable batteries KR 11 / 45 · R 03, 1000 mAh, with an ultra fast recharger. The fact is that there is no such a brand in the town where I lived. I also searched Amazon, and they do not work with Compit batteries. In Walmart, I found Rayovac IC3 rechargeable batteries, with ultra fast charger (15 minutes), but they are 800 mAh models. Is this a good replacement for the Compit? Is 800 mAh enough to drive the foresaid calculators? Amazon has Accupower AP1000-5, that seems to be almost as good as Compit. Should I buy IC3 batteries from Walmart? Or order Accupower batteries from Amazon? Or try really hard to get Compit batteries? By the way, I bought 4 IC3 batteries just to test. They seem to be working quite well. Therefore, can I conclude that 800 mAh is enough?

re: batteries

*Message #2 Posted by **Tim Wessman** on 6 Feb 2005, 1:32 p.m.,*
in response to message #1 by Eduardo Costa

The mAh rating is a measure of the capacity of the battery, not the voltage. I imagine your batteries are 1.2v. The higher the mAh is, the greater the capacity is on the battery.

I had 750mAh rechargables in my calculators. In another I have 4-1950 mAh AAs. They work just fine. Just keep an extra set with you at all points as they tend to run out sooner.

Re: batteries for 48G+, 49G+, 48GII

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 6 Feb 2005, 2:03 p.m.,*
in response to message #1 by Eduardo Costa

Hi, Eduardo;

I wrote an additional post to this thread but somehow it was not added... I forgot to add my name in the proper field and the text was wiped out. No matter.

As Tim mentioned, I also use three 750mAh NiMH (SONY®, Cyber-shot 'STAMINA' DI HR 11/45) in my HP49G+. Considering the average of half an hour a day (I guess this is too much, but I actually powered it up with the purpose of testing batteries) the fully charged pack lasts for about one month. I also used the USB port some times, and this is a power-consumming operation. I did not upgrade the OS with the rechargeable batteries so far.

I also use the same type of NiMH in my HP49G (earlier model) and it lasts about two months. I use a pack of four NiCAD AAA, 650mAh, in my HP71B. These last more than two months, too.

Hope this adds a bit more.

Re: batteries for 48G+, 49G+, 48GII

*Message #4 Posted by **Eduardo Costa** on 6 Feb 2005, 7:36 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi, Vieira. Aren't these new NiMH batteries supposed to last even longer than Alkaline batteries? Besides recharging in less than 15 minutes, of course. At least this is what the manufacturer claims. For instance, the manufacturer of IC3 says that it lasts more than 4 times longer than alkaline batteries. Another manufacturer even presents plots to the effect that his brand has the same low battery behavior as alkaline batteries.

Re: batteries for 48G+, 49G+, 48GII

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 7 Feb 2005, 12:04 a.m.,*
in response to message #4 by Eduardo Costa

Hi, Eduardo;

first of all, forgive me: I added a wrong information in my last post. Actually the 650mAh rechargeable batteries I use in the HP71B are NiMH, too. About discharging time, let me first compare the HP71B and the HP49g+:

1 - the HP71B uses four AAA instead of the three ones used in the HP49G+;
2 - I actually use the HP71B less than I use the HP49G+;
3 - the HP49G+ "eats" batteries; it has higher speed (internal clock) and this is, by itself, one of the reasons.

About the fact the NiMH rechargeable batteries live longer than Alkaline, I always took this based on their actual life, not each charging cycle. In fact, everytime I used alkalines instead of the rechargeables I know and use, their "life time" was a lot of times longer that a single discharge of the rechargeables.

I have not used the new NiMH ones yet; for example, I don't know the specs for this IC3 unit. Based on what you say, the newer NiMH are something to try out. I'm impressed!

Thanks for your information.

Best regards.

Luiz (Brazil)

Re: batteries for 48G+, 49G+, 48GII

*Message #6 Posted by **Francesc Casanellas** on 7 Feb 2005, 3:40 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

A standard AAA 1.5 V battery has a capacity of about 540 mAh. An alkaline-Mn AAA battery has a capacity of about 1200 mAh. A rechargeable NiMH metal hydride battery has normally a capacity of 750 - 800 mAh at 1.2 V, so will last less than an alkaline battery and more than a carbon-Zn battery.

Be carefull with super-fast chargers: Your battery will be dammaged in less charge cycles than if you charge it slowly.

*Message #7 Posted by **Thomas Okken** on 7 Feb 2005, 7:09 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

I recently bought half a dozen cheap NiMH cells (AA) with a cheap slow-charger; HEMA brand (that's a Dutch low-budget department store chain), spent about 25 euros for the whole set.

The batteries are 1900 mAh -- I charged two for 14 hours and put them in my HP-25. OK, I don't use the 25 a lot, I have it purely for nostalgia reasons, but even so, those batteries seem to last *forever*. Two months later, I'm still waiting for them to run down! Even without actual measurement, I can already tell they last several times longer than the original NiCd cells ever did, and maybe even as long as alkalines. And the price is right, too!

(With that kind of life, who needs a fast charger anyway? Even at 14 hours, they charge faster than the 25 can run them down. I bet with the 49 the situation is no worse.)

48G+ or not for calculus

*Message #1 Posted by **Jeff F.** on 5 Feb 2005, 7:38 p.m.*

I am getting ready to begin my first calculus class soon. I am not a 'natural whiz' mathematically speaking. My thinking has been I want to use my 48G+ for the class so that I don't become dependant on the CAS that my 49G+ and TI 89 have (in other words I want to learn the math not just the calculator). Does anyone think I will be disadvantaging myself or will it be beneficial in the long run to use the 48. Seems like it didn't hurt a lot of the older HP generation who didn't have a CAS.

Re: 48G+ or not for calculus

*Message #2 Posted by **.** on 5 Feb 2005, 8:27 p.m.,*
in response to message #1 by Jeff F.

In my opinion, a CAS calculator can help a lot - as long as you have the self control to learn the theory before relying on a calculator. Seeing you posted this question, I'll bet that you do.

"Seems like it didn't hurt a lot of the older HP generation who didn't have a CAS."

Yes, but they weren't competing with classmates who did have CAS machines.

Re: 48G+ or not for calculus

*Message #3 Posted by **J.C. Randerson** on 6 Feb 2005, 1:07 a.m.,*
in response to message #1 by Jeff F.

Use your TI89 to help you learn calculus, as well as any solutions manual to your text, and individual help you professor can give you. As your abilities progress, you will discover just how limited the 48 is in doing many things symbolically. That's why the 49 was produced, and why the TI89 reigns supreme - it is the best handheld in this field. A true pc based computer algebra system, such as Maple, can also be of great help. I'm so glad I'm long done with all my engineering math classes, they were a lot of work. Best of luck!

If you want to give it a try...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 6 Feb 2005, 6:03 a.m.,*
in response to message #1 by Jeff F.

Hi, Jeff;

this book has many good approaches on using the HP48G as a calculus companion:

MATHEWS, J., EIDSWICK, J.,*An HP48G Calculus Companion*. New York, NY. 1994, HarperCollins College Publishers. 320p.

As it is mainly dedicated to the HP48G, no CAS features are explored (none at the time it was printed, I guess), but you'll see many ways of dealing with calculus by using the HP48G 'power'.

I'm a teacher (local university, Brazilian citty) and I saw many different reactions on using a calculator or not in classroom. In your case, I guess that I'd quote 'dot's' words:

> Quote:
>
> In my opinion, a CAS calculator can help a lot - as long as you have the self control to learn the theory before relying on a calculator. Seeing you posted this question, I'll bet that you do.

Success!

*Message #5 Posted by **Fubar Vikinghelmet** on 6 Feb 2005, 2:26 p.m.,*
in response to message #1 by Jeff F.

I think I used my calculator just a couple of times in calculus class. You probably won't need it, either, unless you want to see graphs of volumes or something like that. The best, least frustrating way to learn calculus is to do every problem in the book. THEN whip out the caclulator and harness the magic...

Re: 48G+ or not for calculus

*Message #6 Posted by **David Youse** on 6 Feb 2005, 9:51 p.m.,*
in response to message #1 by Jeff F.

If, as you say, you want "to learn the math, not just the calculator" then do yourself a favor and leave the calculator at home.

Exercise your mind, not your fingers.

Been there, done that, 20 years before 4-function calculators were invented.

David

Re: 48G+ or not for calculus

*Message #7 Posted by **.** on 7 Feb 2005, 3:36 a.m.,*
in response to message #6 by David Youse

"If, as you say, you want "to learn the math, not just the calculator" then do yourself a favor and leave the calculator at home."

The problem is Jeff K said "I am getting ready to begin my first calculus class soon. "

That he wants to learn is admirable. However leaving all calculators at home will give him a huge disadvantage compared to his peers. They will probably have at least some form of calculator; perhaps a CAS machine like a TI89. His teacher will almost certainly expect him to have some form of calculating device.

Not even having a '4-banger' will slow Jeff down and get him bogged down in arithmetic. For someone who is not a "'natural whiz' mathematically speaking." this would be torture.

Beaating a Dead Horse

*Message #8 Posted by **David Youse** on 7 Feb 2005, 3:00 p.m.,*
in response to message #7 by .

My advice stands. If you want to learn calculus then go to class, read the textbook and learn the fundamentals. Then, after you know why and how things produce results, you might use the calculator to speed things up. Knowing how and why determinants work, or how integration produces an answer, or why differentation does what it does is far different from simply pressing keys and reading a final result.

Once you learn how to do something, then you can use tools to make it easier.

As far as being disadvantaged compared with your peers, I think the opposite will be true. You will get the same results but will have a greater basic knowledge, knowing how you got there.

BTW, when I first attended Carnegie Tech (now CMU) the only tools I had were a slide rule and a pencil. I learned how to manually do everything this calculator can do and it wasn't really so time consuming. Granted, we used a lot more paper, but paper is cheap. How many of you can compute square and cube roots with only pencil and paper, and not using approximation methods?

I suspect that most readers of this forum are far to young to remember, know or care that the fastest plane in the world - the SR-71 - and the rockets that put Americans on the moon, were designed and built using slide rules, pencils and paper, not hand held calculators or computors.

Exercise your minds, not your fingers.

*Message #9 Posted by **bill platt** on 7 Feb 2005, 4:05 p.m.,*
in response to message #8 by David Youse

Hi david,

I have told this story before, but here it is:

In 1983, I was the only one in my whole high school with an HP (11c). One day, it fell off the desk (in health class--why I don't know) and broke the display.

I was in physics class, and had an exam to take, and my teacher had a big Pickett slide rule above the chalk board. I asked him if I could borrow a small one for the test. He looked at me sideways--expecting this to be a prank but he gave me one, a cheap Sterling, anyway. I still have it.

I aced the exam. I didn't get my calculator back for months. The slide rule was more than a match for the calculator for general work--it even has a built in memory for chain calculations;-).

I also had a friend and ally on the faculty for life!

SO, some of us youngsters do know how to use slide rules.

But the point is that the calculator is far less useful than you think---it is convenient, yes. But earth-shattering important? No. The real work is always in the head. And slide rules aren't slow at all for general number-crunching. Calculators only begin to really shine with programs (of course you have to compare proficient users).

Regards,

Bill

Re: Beating a Dead Horse

*Message #10 Posted by **Garth** on 7 Feb 2005, 10:13 p.m.,*
in response to message #9 by bill platt

> > "Seems like it didn't hurt a lot of the older HP generation who didn't have a CAS."

> Yes, but they weren't competing with classmates who did have CAS machines.

In my first physics class I was the only one to still be using a slide rule. I always finished tests first and was the only one to get perfect scores.

One of our sons recently had a math class in high school where the students were supposedly required to have a certain TI graphing calculator. I doubted that it was really necessary, so we just went from week to week without getting him one, checking his progress. The little difficulty he did have was not related to any lack of a graphing calculator. He finished the year just fine without one. He said the students who had them mostly used them for playing games in class while trying to keep the teacher from knowing. I never could see the logic behind the idea that you could learn to do the work by having something relieve you of it (even for my own calculus classes 25+ years ago, if such a calculator had been available).

Re: Beating a Dead Horse

*Message #11 Posted by **Eddie Shore** on 8 Feb 2005, 11:03 p.m.,*
in response to message #10 by Garth

I will concur with David, Bill, and Garth. The calculator is a tool (even though I love collecting them), but the tool is much more useful if you know the calculation yourself. It does the student the best to do the problem on pencil/pen and paper (or chalkboard, etc) first before resorting to the calculator.

By the way, during high school, CAS calcualtors were not even around (1991-1995).

Re: Beaating a Dead Horse

*Message #12 Posted by **Dave Shaffer** on 7 Feb 2005, 11:05 p.m.,*
in response to message #8 by David Youse

David,

When were you at Carnegie Tech? I graduated from there (BS, Physics) the year they changed the name to CMU: 1968.

We got along fine in physics courses with just our (three digit accuracy) slide rules, and I never even THOUGHT of needing it for calculus (and of course, even 4-bangers weren't available until a few years later).

Dave

Re: Beaating a Dead Horse

*Message #13 Posted by **David Youse** on 8 Feb 2005, 12:57 a.m.,*
in response to message #12 by Dave Shaffer

Dave,

I was there from 1957 to 1960. Thinking about the last couple of postings here, I'm thinking that if I had had access to the IBM (560 model, I think) at CIT when I was there, I probably would have taken advantage of it and forsaken the K&E. That said, maybe I shouldn't be so hard on those using their HPs in class. But I still think that learning the theory completely is better than jumping in with a short cut.

I could be wrong (again) but it seems to me that more people are too willimg to take any shortcut available, just to get by. Anyway, if someone is taking a class they have no interest in just for the credit, then go for it. Use the calculator, get the grade and feel good about yourself. On the other hand, if you're taking the class because it's necessary for your future career, then save the calculator for when you get the job.

Just my opinion and I apologize for any toes I've stepped on or hard feelings I've caused.

David

Thanks for the insights.

Re: 48G+ or not for calculus

*Message #16 Posted by **Eric Lundgren** on 18 Feb 2005, 2:09 a.m.,*
in response to message #1 by Jeff F.

As my calc prof told me- "learn math now, and secretarial skills when you have begun working."

It was good advice. Depending on your major, engineering? mathematics? physics? ...I feel that you'd still benefit from learning the calculus using a pencil and paper. Or use it as a tool to experiment once you can do it longhand.

After all, you can actually generate the integral tables found in text books using.....!! Calculus! The machine will be useful later when you have to crunch numbers, but the struggle now will pay off.

Eric

Basic trig functions for the HP-12C

*Message #1 Posted by **GWB** on 5 Feb 2005, 5:14 p.m.*

```
Basic Trig Functions for the HP-12C

01 57.29577951    ; 180/pi: degree to radian conversion factor
12 /
13 STO 0
14 STO 1
15 1
16 STO 3          ; n:=1
17 9              ; steps 17 to 23 provide automatic accuracy
18 1/x            ; according to the current number of decimal
19 ENTER          ; places in the display
20 RND            ;
21 -              ;
22 12x            ; intended to multiply by 10, used the built-in
23 STO 4          ; 12x instead in order to save two steps.
24 RCL 3
25 2 * 1 +
29 ENTER ENTER
31 RCL 0
32 x<>y
33 y^x
34 x<>y
35 n!
36 /
37 ENTER
38 1 CHS
40 RCL 3
41 y^x *
43 STO + 1
44 1
45 STO + 3        ; n:=n+1
46 ROLLDN         ;
47 ENTER * SQRT   ; these are equivalent to ABS
50 RCL 4
51 x=<y
52 GTO 24
53 1
54 RCL 1          ; sin(x)
55 ENTER
56 * - SQRT       ; cos(x)
59 STO 2
60 RCL 1

Usage:

Enter angle in degrees, 0 =< x <= 180 (prefer however the
range of 0 to +/-90 degrees for greater speed and accuracy). This
range is for sine only. The range for cosine is 0 to 90 degrees.

R/S  => sin(x)

x<>y => cos(x)

  /  => tan(x)

Registers:
```

```
R0: angle converted to radians
R1: sin(x)
R2: cos(x)
R3: number of iterations minus 1
R4: accuracy

Running time will depend upon the number of selected decimal places:

Ex.:         sin(30.0)=0.5         (0.4996741794, 1 iteration,   5.5 s)
           sin(30.000)=0.500       (0.5000021326, 2 iterations,  8.5 s)
         sin(30.0000)=0.5000      (0.4999999919, 3 iterations, 11.5 s)
      sin(30.00000000)=0.50000000 (0.5000000001, 4 iterations, 14.5 s)

Reference:

sin(x) = x + SUM{n=1, inf, [(-1)^n . x^(2n+1)]/(2n+1)!}; 0 =< x =< pi

cos(x) = SQRT[1 - sin^2(x)];

tan(x) = sin(x)/cos(x)

http://www.rskey.org/gene/calcgene/38trig.htm (got the sine expansion there, which I had
already forgotten).
```

Olá, Gerson; (Hello)

There is an excellent part of this site named Articles Forum where contributors add important information. One of these is from Viktor Toth and explore the same theme. I'm sure you will appreciate having a look at it here. Also, Valentin Albillo proposed another great solution, but I failled finding the link for it. It's an e-paper (a PDF) available at HPCC.

Your version is closer to Valentin's because both use [n!] and [y^x]. Viktor Toth uses a sequence of multiplications in the loop, so it also computes both n! and y^x without using the 'native' HP12C functions themselves. The idea was so interesting for me that I actually used Viktor's scheme to produce this one my own for the HP16C. I'm still in debt with the inverses...

It's always good to see new versions of classical problems. I once wrote a program to compute sin(x) for the HP38C, but I lost it. What I cannot forget is the big smille in the beautifull face of the HP38C's owner...

Good to see your listings here, 'cumpádi' (fella).

Cheers.

Luiz (Brazil)

Re: Basic trig functions for the HP-12C

*Message #3 Posted by **GWB** on 5 Feb 2005, 8:47 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Olá Luiz,

Thanks for your remarks. Machine limitations is always an invite to creativeness. I have not submit anything to the Articles Forum just because I don't have anything realling important. I'll take a closer look to your program, it should run faster, since it avoids both y^x and n!. Well, I bought the 12C this morning, while they are still avaible, and wrote this program in the afternoon (too much to learn to creating something really innovative). By the way, I googled for you book and found it available only in two stores, one happens to be just for blocks away from where I live (I haven't bought it, a brand new book, because I want to pay R$ 15,00 and the bookseller wants R$ 17,00 for it - sometimes my Minas blood I inherited from my father shows :), sometimes not - I paid about USD 160.00 for my brand new 12C at WalMart).

See you,

Gerson.

Re: Basic trig functions for the HP-12C

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 6 Feb 2005, 6:18 a.m.,*
in response to message #3 by GWB

Hi, Gerson;

Hey, thanks for telling me that my book is still available... I was not sure it was.

About the HP12C: is it a Platinum or a plain HP12C? You see, I have both, and I like the additional features available with the HP12Cp. I don't use the algebraic mode unless it is strictly necessary (students with doubts, for exemple), but the extra memory allows for new, bold 'adventures'.

I agree with you when you say: '*Machine limitations is always an invite to creativeness.*' The 'taste of victory' when reducing the number of steps or the quantity of bytes in a program is unique. Sometimes we, the 'creators', are the only ones to understand the meaning of this, but what to do? Today we have so much memory available with computers and portable devices that just a few 'entrepreneurs' go ahead with the job...

About the articles forum: I guess your version of the trig functions for the HP12C deserves a place in there (I see I did not even suggested this fact in my last post... Sorry!). It is original, so it has different approaches.

Best regards.

Luiz

Here is the link to the PDF :-)

in response to message #6 by deleted

Hi, Gerson;

just wondering about the HP38C program...

The HP12C programming features are exactly the same found in the HP38E/C (I own one of each). They both have GTO nn, being nn the number of the step you want it to jump to. Except for bonds, depreciation and computing [n] (the HP12C gives only integer values when computing [n], while the HP38E/C may return non-integer values), all of the rest is the same. Also, the HP38E/C have a switch for selecting both BEG/END and D.MY/M.DY modes simultaneously and they have no [ON]&[key] self tests, only [STO][ENTER].

I tried to find the TRIG program for the HP38C and did not succeed. Do you still have the link OR the listing itself? I'd like to take a look at it. Reference purposes...

Best regards.

Luiz

38c trig program

in response to message #7 by Vieira, Luiz C. (Brazil)

...came from an old PPC Journal.

Can be found at www.rskey.org/gene

Just scroll down a bit on the page.

Gene

Link has additional (weird) characters...(was: 38c trig program)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 7 Feb 2005, 12:35 p.m.,*
in response to message #8 by Gene

Hi, Gene;

thanks for the additional info.

I tried to jump through the link you post but it failed. If you use it directly you'll have:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/www.rskey.org/gene

and it generates an error. I used "copy and paste" and changed it to what you wrote:

http://www.rskey.org/gene

and it worked fine. It jumped to your own page, right?

Thanks. I'll reach the artiocle, now.

Best regards.

Luiz.

I saw the trig program...

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 7 Feb 2005, 12:45 p.m.,*
in response to message #9 by Vieira, Luiz C. (Brazil)

Hi Gene, Gerson, folks;

the trig program mentioned there (earlier at HPCC) uses a fixed number of therms (four) in the sin(x) and cos(x) series. It has no loop for error control/reduction.

Made me "remember the days of the old school yard" (Cat Stevens, right?), at the university, when we had to compute sin(x), cos(x) and the like, and the intermediate therms might be written down on paper (three, sometimes four) so the teacher could "see" what we had done.

Wow! Some 'nostalgic' moments...

Cheers and thanks again, Gene! It's always good to see how things actualy work.

Best regards.

Luiz (Brazil)

Hey, Gerson;

you bet... at least about me. I'm having fun at home, dealing with my stuff. Each one has his own way to get inner satisfaction with outer activities. I like usefull activities in general. Of course, I'm talking about doing things by my own...

I include posting and reading messages here as pleasant and rewarding. We always read or write something usefull.

Even this off-topic words of mine...

Best regards and thanks. I did not notice the link you added to your post... Sorry!

Cheers.

Luiz.

Hi, Gerson:

Gerson posted:

"Thanks for the link. I had been looking for it, but all I could find was (good) references to it."

You're welcome. Should you want any of my past Datafile articles in PDF format, just ask. Besides the trigonometrics one I've explored several other interesting aspects of HP-12C programming in these two articles as well:

- Long Live the HP-12C !

  6-page article, includes a game program.

- HP-12C's Serendipitous Solver

  8-page article, includes a 37-step program to find real roots of polynomial equations up to 1,480th degree.

"I'd rather have a 15C because of the way it handles complex numbers and performs matrix operations. Too bad they are not available any more."

Oh, but they are. At eBay ... Besides complex numbers and matrix operations (which includes solving systems of linear equations), it also does numerical integration and root finding, gamma, hyperbolics, linear regression, permutations, combinations, random number generation, etc, etc. A *passable* machine, methinks ! ;-)

"I think HP could have included some basic scientific functions in their new 12C Platinum."

Other brands did *much* better. SHARP, for instance, had a number of "Business/Financial Pocket Computers", like this SHARP PC-1421 model, a slim, all-metallic, dot-matrix alphanumeric display, large RAM, *fast* machine which featured a *full set* of financial functions (including NPV, IRR, etc) **plus** a full-featured BASIC-language programming environment which of course included 2-dimensional dinamic arrays, strings, *and* all the usual mathematical functions, *trigonometrics included*. Needless to say, you could use the financial functions as keywords in your BASIC programs, which meant incredible computing power for financial applications.

By the way, contrary to what most people believe, trigonometric functions are indeed used in advanced financial applications, just have a look at this paper published in the **Journal of Financial Economics**:

Spanning and Derivative-Security Valuation

These kind of applications *can* be programmed in a SHARP PC-1421, not so in *any* of HP's financial models.

Best regards from V.

Hi, Gerson:

Gerson posted:

"I've taken a look at your papers. Really impressive work! Are you a mathematicien? (You are acquainted with heavy subjects like quintics)."

Just an amateur. Quintics have always been a pet topic of mine since I was 15 or so, I'm fairly acquainted with them by now. As for heavy subjects, just have a look at fractional calculus for a change. Or if you want to do a little I+D, try your hand at writing a program to compute the permanent of an NxN square matrix in polynomial (not exponential) time, you'll get instant recognition.

"I had one 15C in 1984 but I sold it to my youngest brother two years later. I also gave to another brother an 11C, for his Agriculture studies. Both have their calculators flawlessly working till today."

Perhaps a little arm-twisting would be in order to get them back. Make them an offer they can't refuse ... but don't forget to make it look like an accident :-)

"It is quite a challenge. I wonder if I ever will take it."

You're welcome to try, under the same specifications of functionality, range, and accuracy, of course.

Thanks for your posts and best regards from V.

Bad Valentin, bad Valentin... Made me remember Adams' books. BTW, I'm reading them and comparing the original text to the translated one. I got into two conclusions:

1- the translator is a hell-of-a writer; he wrote a damn good piece of good stuff. He uses Portuguese terms common in Brazilian speech that make the translated text completely hilarious;
2 - getting to this conclusion, I'm now taking double seriously your suggestion "to polish my English skills" so I'll take the original text in another perspective.

You see, I laugh a lot when reading the original Hitchhiker's Guide, but in some descriptive passages, the translator used non-conventional terms that made the translation hilarious as well. Now I have two good readings!

Best regards.

Hi again, Gerson:

Gerson posted:

*"By what he told me he used mostly +, -, *, /, %, D%, 1/x, no SIN, COS, etc, so I think he'll do well with the 12C."*

Good. I'm glad if my "arm-twisting" suggestion played a part, however small, in your getting the HP-15C back where it belongs.

"By the way, I enjoyed your time travel adventure with Sir Isaac Newton. Just think you shoud have taken the 15C along."

No, that would've been a *terrible* mistake, as the one fundamental precaution you must adhere to whenever time travel is involved, as in Time Voyager, is that you must *avoid changing history at all costs*. The HP-15C boasts root finding using (precisely!) Newton's own method, which he hadn't "invented" at the time of the rendezvous ! He was to use the machine to help him discover it, not *reverse-engineer* it ! :-)

Also, the HP-15C includes matrix operations, and matrix algebra was unknown to Newton, since he died in 1727 and it wasn't until 1850 when Silvester and Cailey formulated the concept of matrices, so exposing him to their concept and uses well ahead of their proper time would probably result in major *disturbances* to the timeline, and that would be a *big* no-no.

An HP48/49 is also out of the question.

Thanks for your interest and best regards from V.

HP75 Battery

*Message #1 Posted by **Daryl Cheshire** on 5 Feb 2005, 4:21 a.m.*

After doing nothing about it for years, I finally replaced the battery in my HP75C.

I ended up getting one of those cordless phone NiCds which was shrink wrapped in white plastic and contains 3 AA batteries.

I cut the plug off the wires and soldered them to the gold contacts. I noted the battery website which explained the polarities. I also connected the extra tab to the black wire which I think charges the battery. (I still have the charger).

The main problem apart from being rusty in soldering, was that I couldn't get the battery cover back on.

Eventally I slit the shrink wrap because the original battery had deep grooves for the gold contacts (and some blobs of solder) which were not now recessed on the new battery because of the shrink wrap.

I also had to shave some of the ribs inside the cover as they were stopping the cover from sliding on.

Now it's all working except the battery came fully charged and I now have to wait for it to discharge before I charge it. I will also remove the cover when charging so I can check the battery temperature in case I wired it up wrong.

I don't think so because the charging tab lined up with the negative groove on the battery.

Daryl, Melbourne, Australia

*Message #2 Posted by **Vassilis Prevelakis** on 5 Feb 2005, 8:12 a.m.,*
in response to message #1 by Daryl Cheshire

If you wired the battery incorrectly, then your 75C would not work.

Not to mention that it is a bit too late to wonder about whether you have wired the battery correctly after you have installed it in you classic computer.

HP OmniGo 100

*Message #1 Posted by **Adam** on 4 Feb 2005, 7:32 p.m.*

Hello,

I changed both the back up and main batteries of my HP OmniGo 100 and now the unit is not functioning properly. When turned on the screen just displays the OmniGo logo. Does anyone know how to fix my problem??

Thank you, Adam

amor3y@yahoo.com

Re: HP OmniGo 100

*Message #2 Posted by **Raymond Del Tondo** on 4 Feb 2005, 10:11 p.m.,*
in response to message #1 by Adam

Hello,

It could be possible that you changed the batts
while the machine OS wasn't shut down.

You could try a soft reset, or if that doesn't work,
a hard reset using the reset pin hole.

Raymond

Re: HP OmniGo 100 - How do i reset?

*Message #3 Posted by **Adam** on 4 Feb 2005, 11:04 p.m.,*
in response to message #2 by Raymond Del Tondo

How do i soft or hard reset??

Re: HP OmniGo 100 - How do i reset?

*Message #4 Posted by **Raymond Del Tondo** on 5 Feb 2005, 7:02 a.m.,*
in response to message #3 by Adam

Soft Reset: SHIFT+ON+PgDn

System Reset: Immediately after turning on the machine
press and hold the 'C' key for a second.
You'll be asked to initialize the RAM.
Press 'Y' to initiate a Hard Reset,
which erases all data in RAM.
If you press 'N' instead the machine

will try to do a normal restart.

This procedure was taken from the OmniGo 100 user manual;-)

HTH

*Message #5 Posted by **Jeff D** on 5 Feb 2005, 2:33 p.m.,*
in response to message #1 by Adam

How can you bypass the GEOS system on this unit and get right down to the DOS shell? Can anyone help? Thanks, Jeff

Re: HP OmniGo 100

*Message #6 Posted by **Raymond Del Tondo** on 5 Feb 2005, 8:43 p.m.,*
in response to message #5 by Jeff D

IIRC, you can edit the config files,
and REM out the loader call.
Then a simple restart should do the job.
Alternatively, there should be kinda DOS-Box
either on the desktop or inside an application.

Sucessful repair of HP32SII

*Message #1 Posted by **Ara Knaian** on 4 Feb 2005, 5:24 p.m.*

My trusty 32SII developed a display problem; instead of digits, the LCD would show rectangular blocks instead. I figured I would buy a new one, so I went to my local office supply store and was amazed that they no longer carried it; I was even more amazed to look on the web and see that it was discontinued! One poster on amazon.com got it right when he/she called it "The Cadillac of Calculators."

So, I repaired it, as follows:

1. Open case.

A. Apply slow, even pressure with a flat head screwdriver around the side seam, gently trying to pry the case apart. There are several plastic pin-in-socket ultrasonic welds all over the bottom of the case, and most of them will yeild without damaging the pin or socket given gentle and slowly-increasing presssure.

B. Pull hard on the four snap fittings at the top (under the battery door) to undo them.

2. Using a pair of needle-nose pliers, un-twist the metal tabs sticking out from under the circuit board.

3. Remove the circuit board.

4. Using tweezers, remove the two rubbery connecting pieces from the top and bottom of the display. (These are anisotropic conductors: if you tilt the display under the light with them removed, you can see the connecting pads on the LCD.)

5. Clean the rubber pieces, the display, and the circuit board pads using shop air at low pressure.

6. Replace the rubber pads.

7. Replace the circuit board.

8. Re-twist the metal tabs to firmly compress the rubber pieces.

9. Put batteries in the calculator and check to make sure the display problem is solved.

10. Try fitting the case back together. If any of the plastic pins don't fit in the slots, cut them off (if only a few) or shave them down (if many) until they fit.

11. Put the case on, forcing all the remaining pins into the slots, and re-do the snap fittings under the battery case.

You now have a working HP 32SII. The pressure-fit of the pins into the sockets is tight enough that there is no need for any glue: once you shave or cut off any offending pins, the case fits right back together and stays closed by pressure fit.

Now, time to get to that thermo homework...

Ara

Re: Sucessful repair of HP32SII

*Message #2 Posted by **Randy** on 4 Feb 2005, 5:45 p.m.,*
in response to message #1 by Ara Knaian

You sure went to a lot of trouble since all you needed to do was to hold down the sqrt and E+ keys, then press C. You would have seen MEMORY CLEAR and you would have been done. It's in the back of manual under "Testing calculator operation".

BTW, if you really need to open one, there is a safer and better way to do so already in the Museum:

Anybody Looked at "gumstix"?

*Message #1 Posted by **Paul Brogger** on 4 Feb 2005, 11:22 a.m.*

Reading Cringely's column, I came across gumstix, a line of very small computers.

Now, the last time I messed with reengineering a *REAL* RPN calculator, I cross-wired a HP-41C keyboard and my TI-83+SE . I figured the 41's case and quality keypad might serve as a good starting point -- I just needed programmable guts and a display. Alas, the TI's innards, while flash-programmable and well supported, won't *quite* fit within the 41's case (PCB width being the the kicker).

I still think that basic approach deserves hobbyist attention, and I'll be taking another look -- this time with gumstix. (In my "spare time", of course.)

Re: Anybody Looked at "gumstix"?

*Message #2 Posted by **CapPs** on 4 Feb 2005, 3:37 p.m.,*
in response to message #1 by Paul Brogger

I like to get the functionality and screen of a HP49G+ into a body of a "traditional" HP calc, like a HP48G. Hmmm...

Anyone out there with a rapid prototyping facility for low volume plastic production?

CapPs

Re: Anybody Looked at "gumstix"?

*Message #3 Posted by **Paul Brogger** on 4 Feb 2005, 7:36 p.m.,*
in response to message #2 by CapPs

I guess my point was, if you choose a readily accessible HP carcass, the most desirable and durable parts (case, keyboard) are already fabricated. As one example, broken 41's are easily acquired, and they're not necessarily plagued by broken keyboards.

The only stuff needing upgrade is the electronic innards and display, which should have more-powerful-than-ever substitutes readily available. (The gumstix models with Bluetooth might promise newer-yet ways to use an old 41.)

So, rather than get carried away trying to duplicate the legendary look, feel & durability, why not concentrate on functionality while finding new uses for (some of) those rock-solid exteriors we've come to appreciate?

Re: Anybody Looked at "gumstix"?

*Message #4 Posted by **Giuseppe Marullo** on 6 Feb 2005, 6:11 p.m.,*
in response to message #3 by Paul Brogger

Paul, it is under the eye of robot builders, specially now that gmustix has bluetooth connectivity. I was tempted too, but in the end I used an Epia for my robot. I don't think you can use it to build a calculator simply because of power consumption, anyway great stuff.

Giuseppe Marullo

Last Clonix/NoVRAM units shipped.

*Message #1 Posted by **Diego Diaz** on 4 Feb 2005, 8:29 a.m.*

Hi all,

First, this is to thank you all, and mainly those who have decided to include a Clonix and/or NoVRAM module into their collections.

Finally my last 10 modules have been built.

As a special consideration to these last customers we, at Clonix Incorporated, have developed a new s&h procedure and hope you all feel as happy with it as we are:

Your Modules have been gently taken from our Clonix Inc. shelves with sterilized contamination-free gloves and placed onto a satin pillow.

A team of 50 employees inspected your Modules and polished them to make sure they were in the best possible condition before mailing.

Our packing specialist from Japan lit a candle and a hush fell over the crowd as he put your Modules into the finest gold-lined box that money can buy.

We all had a wonderful celebration afterwards and the whole party marched down the street to the post office where the entire town of Las Palmas waved 'Bon Voyage!' to your package, on its way to you, in our private Clonix Inc. jet on that glorious day.

I hope you all had a wonderful time shopping at Clonix Inc. We sure did. Your pictures are on our wall as "Customers of the Year". We're all exhausted but can't wait for you to come back to Clonix Inc.!!

Some day, every HP-41 Module will be shipped and handled like this... ;-))

Thank you once again,

This "procedure" has been stolen from "http://www.cdbaby.com" with which I have no connection at all.

Edited: 4 Feb 2005, 1:35 p.m. after one or more responses were posted

Re: Last Clonix/NoVRAM units shipped.

*Message #2 Posted by **Ronald** on 4 Feb 2005, 10:06 a.m.,*
in response to message #1 by Diego Diaz

Hi Diego,

You only told halve the Story.

Two days ago a brassband marched up our street and played for 30 minutes at my doorstep. To my big suprise the major of our city came out of the brassband and congratulated me on something I still not understood. T

Then I got my present out of the hands the mayor:

A CLONIX and NoVRAM module were lying oh so peacefully on a blue velvet pillow looking up with their beutifull gold bladed contact to their new master. TGhe sun just poped out after a cloud shedding a ray of gold on the two gems.

It was an exiting day.

Thank you for making this day to be one of the most memorable days in my life.

Could you send me the picture you have from us on the wall, then I will send you my pictures which were in the Newspaper of this Yesterday of the event.

Kind regards.

Ronald

HP48 diagram/tree for function location

*Message #1 Posted by **Angel** on 3 Feb 2005, 4:44 p.m.*

Pardon me,

I have a 48SX and somehow I can't find the manual as I have moved several times since the purchase of the calculator (1992). I have tried to search on the internet about a brief description of all the functions of the calculator as well as some sort of tree or diagram of all the functions and how to locate the specific funtions via menu/dir and sub-dir.

For Example: If I needed to put units to a number I would have to press left/gold arrow, then press units and choose the type of units I want from the top menu.

Does any one know of such diagram or document? Respectfully, Angel

Re: HP48 diagram/tree for function location

*Message #2 Posted by **Raymond Del Tondo** on 3 Feb 2005, 9:14 p.m.,*
in response to message #1 by Angel

www.hpcalc.org is likely to have it;-)

There are zillions of HP-48 related documents,
amongst them the user manuals, and MUCH more.

HPIL Video Interface 82163A vs. B

*Message #1 Posted by **Mutsch** on 3 Feb 2005, 12:26 p.m.*

Hi,

I know there are two versions of the HP-IL Video Interface 82163, a US version (A) and a EUROPE version (B). What is the difference between the two? Or in other words can I use a US version on a european TV set that can deal with NTSC? Of course the power adapters are different, but that's not an issue i guess.

Regards Mutsch

Re: HPIL Video Interface 82163A vs. B

*Message #2 Posted by **Bill Wiese** on 3 Feb 2005, 3:20 p.m.,*
in response to message #1 by Mutsch

Well I'd bet that the only differences would be NTSC vs. PAL, and probably a different power adapter (IIRC, these HP boxes used external adapters and didn't have internal power supplies).

(BTW Don't some European countries use SECAM? Can PAL sets display SECAM or vice versa??)

Bill Wiese
San Jose,CA USA

Re: HPIL Video Interface 82163A vs. B

*Message #3 Posted by **Wilson (Bill) Holes** on 3 Feb 2005, 3:38 p.m.,*
in response to message #2 by Bill Wiese

See http://www.alkenmrs.com/video/wwstandards1.html for in-depth information on global video standards currently in use. Click on 'World Standards' to find the standard in any particular country. I hope this helps a bit.

Best, Wilson

Re: HPIL Video Interface 82163A vs. B

*Message #4 Posted by **Tony Duell** on 3 Feb 2005, 3:44 p.m.,*
in response to message #1 by Mutsch

IIRC the internal differences are :

1) The position of an internal link connected to the (custom) video controller chip that selects 525 or 625 line standards

2) The frequency of one of the crystals

3) Some of the components in the RF modulator circuit.

(3) is irrelevant unless you're feeding into the aerial (antenna) socket of a TV. The other 2 don't matter if you're using a monitor that will work with the appropriate standard.

In other words, you can use a 82163A in Europe if you have a monitor that will display a US TV signal (525 lines).

OK, yes the AC adapter is different too. The 82163 takes in the 8V AC and converts it to 5V DC internally. So provided you use the appropriate adapter for your mains there's no problem there either.

Re: HPIL Video Interface 82163A vs. B

*Message #5 Posted by **Mutsch** on 3 Feb 2005, 4:23 p.m.,*
in response to message #4 by Tony Duell

Thanks guys.

For the AC adapter: is it the one that is used with other devices like for instance the thermo printer? That whould solve that problem.

Mutsch

Re: HPIL Video Interface 82163A vs. B

*Message #6 Posted by **Tony Duell** on 3 Feb 2005, 5:05 p.m.,*
in response to message #5 by Mutsch

It's the normal 8V AC adapter. The one that's used with the topcats (90-series calculators), the 82143 HP41 printer, 82161 tape drive, 82162 HPIL thermal printer, 82163,82164,82165,82169 HPIL interfaces, 9114 disk drive, HP71B, HP75, 2225B Thinkjet, etc, etc, etc.

HP were fairly sensible back then. If the plug is obviously designed to fit, then it'll work.

Re: HPIL Video Interface 82163A vs. B

*Message #7 Posted by **Garth Wilson** on 4 Feb 2005, 12:06 a.m.,*
in response to message #6 by Tony Duell

That's not true of the HP92198 HPIL 80-column video interface though. That one takes 9VAC from a DC-10 jack, not the rectangular plug that so much other HP equipment used.

Re: HPIL Video Interface 82163A vs. B

*Message #8 Posted by **Tony Duell** on 4 Feb 2005, 7:14 a.m.,*
in response to message #7 by Garth Wilson

Yes, but the 80 column video interface is not an HP design. It came from a company called 'Mountain Computer Products' or something like that.

Incidentally, that one can be set in software to do either US or European video. The power-on default is US. I've considered looking at the firmware EPROM to see if I can work out the patch to make it default to European video...

Re: HPIL Video Interface - need Tony´s help

*Message #9 Posted by **Christoph Klug** on 4 Feb 2005, 3:31 a.m.,*
in response to message #4 by Tony Duell

Dear Tony,

thanks for your details about hardware differences of model A and B. Would it be possible to convert model B to model A by changing less hardware components ?

This question is absolutely interesting - because I want to use the vidio interface in combination with a small LCD display. For this I feed the Monitor output signal from the video interface to the LCD monitor input.

Actual the monitor runs in European PAL mode - and I get a screen response. The LCD monitor includes both NTSC or PAL mode - unfortunately in PAL mode some pixel lines are removed - and from this some incomplete charkters result. Therefore most of the displayed text lines are showed correctly, but less text lines are displayed wrong.

Now I hope, that from using the NTSC mode a perfectly display will result. For testing this I need the modell A or better a solution for converting the existing modell B to modell A.

Please Tony give me a solution for this :-)))

With best regards - Christoph Klug

*Message #10 Posted by **Tony Duell** on 4 Feb 2005, 7:52 p.m.,*
in response to message #9 by Christoph Klug

OK, I've got the service manual in front of me.... You need to find 2 components on the PCB -- Y2 (a crystal) and R6 (a 10k resistor) Start from the video output socket. Above it are 2 coils, above that is a crystal. That's Y2. Now there's a 40- pin chip 1LF4-0001, the video controller, not far from the video output socket. Between it and the socket is a 14 pin chip (HP's number is 1826-0903, I am pretty sure it's an LM1372 or something). Below that chip is a 10k resistor, axis parallel to the short edge of the PCB. And alongside that are 2 solder pads, spaced as for a resistor. OK, the changes. For PAL, R6 is between the 2 pads closest to the video socket, for NTSC it's between the 2 pads closest to the 40 pin chip Y2 is a 3.24MHz crystakl for PAL, a 3.29MHz crystal for NTSC. Good luck finding those! I can't find any changes to the RF modulator components, but I suspect the modulator should strictly be re-aligned. If you're not using the RF output, don't bother, though.

Re: HPIL Video Interface - need Tony´s help

*Message #11 Posted by **Christoph Klug** on 7 Feb 2005, 5:28 a.m.,*
in response to message #10 by Tony Duell

Dear Tony,

thanks a lot for your detailled describtion. But the problem would be to find an exotic 3,29MHz crystal oszillator :-(

Best regards - Christoph

Re: HPIL Video Interface - need Tony´s help

*Message #12 Posted by **Christoph Klug** on 7 Feb 2005, 9:03 a.m.,*

in response to message #11 by Christoph Klug

Dear Tony,

as I found out, HP uses an own video chip design inside the video interface - therefore the belonging 3,29MHz crystal oscillator is an absolutely exotic part and not available for common use....

Regards - Christoph

Re: HPIL Video Interface - need Tony´s help

*Message #13 Posted by **Tony Duell** on 7 Feb 2005, 2:07 p.m.,*
in response to message #11 by Christoph Klug

One minor point, which may be due to English/German translations :

You want a crystal, not a crystal oscillator. The latter is normally a 4-terminal component about the size of an 8 or 14 pin IC, and contains the crystal together with the other components needed to make it oscillate and output a TTL-level square wave.

There are companies who will make custom crystals (radio amateurs often know about them, since they need odd crystals to put commercial-band radios onto amateur bands). If you're prepared to wait for several months, it's not too expensive...

Have you tried moving R6 and leaving the crystal? The result would be 625-line video with non-standard timings, but your monitor might lock to it. Worth a try, I think.

Re: HPIL Video Interface - thanks Tony´s help

*Message #14 Posted by **Christoph Klug** on 8 Feb 2005, 9:04 a.m.,*
in response to message #13 by Tony Duell

Dear Tony,

thanks a lot for your assistance. Now I set the 10K resistor to NTSC position. The crystal (in German Quarz) is unchanged. Now it seems that the small LCD Monitor is abel to syncronize correctly - and I get a screen response without missing pixel lines :-)

Best regards - Christoph

HP 45 Serial Number

*Message #1 Posted by **Charlie** on 3 Feb 2005, 11:29 a.m.*

I can't find a serial number on my 45. Was it on a sticker?

Re: HP 45 Serial Number

*Message #2 Posted by **Jeff O.** on 3 Feb 2005, 12:41 p.m.,*
in response to message #1 by Charlie

Yes, it was on a sticker. The sticker was located in the battery compartment (between the two battery contact fingers) on all HP-45s, I believe. It would be fairly easy to remove, so a missing one is no surprise.

Re: HP 45 Serial Number

*Message #3 Posted by **Charlie** on 3 Feb 2005, 12:54 p.m.,*
in response to message #2 by Jeff O.

Yep. Appears like a small amount of adhesive residue remains. Can't imagine why it was removed. The sticker on the door is intact.

Thanks for the info. Maybe this could be included on the serial number page?

42's Keyboard layout drawing

*Message #1 Posted by **Marx Pio** on 2 Feb 2005, 9:54 p.m.*

Hi all you HP calcs fans..

Does anybody here has the drawing in *.cdr(CorelDraw) or *.dwg(AutoCAD) format of the HP42's keyboard layout? Need this to make a face plate made with plastic transparency film in roland blade cut plotter. I think it is a better way to avoid contact between finger sweat and the 42's faceplate. BTW, I got my second 42 for 50 bucks. Really mint^2 condition. Should I use it or keep in a box inside a safe?

Thanks in advance.

Pio

in response to message #1 by Marx Pio

> Quote:
>
> Should I use it or keep in a box inside a safe?

Use it by all means - you will definitely get the most value out of it by using it!

By the way, would you ever contemplate over not using another electronic device worth $200 (e.g. a PDA, Stereo, Computer, TV etc) because its too valuable!? :-)

Best regards,
Erik Ehrling (Sweden)

The real world

*Message #3 Posted by **Marx Pio** on 3 Feb 2005, 9:45 a.m.,*
in response to message #2 by Erik Ehrling (Sweden)

Erick,

You really really right!. I drive a Fiat car in a town that has the worse traffic in the world (Manaus) and it cost to me many, many thousands bucks, why keep an HP42S in a safe for just 50 bucks? ;-)

Thanks for to keep me in the real world. :-))

Greetings from Brazil!

Marx Pio

*Message #4 Posted by **Valentin Albillo** on 3 Feb 2005, 10:59 a.m.,*
in response to message #2 by Erik Ehrling (Sweden)

Hi, Erik:

Erik posted:

"By the way, would you ever contemplate over not using another electronic device worth $200 (e.g. a PDA, Stereo, Computer, TV etc) because its too valuable!? :-)"

While I agree with your statement that it's best to use the calculator than to indefinitely keep it in a safe, there's a problem with your "example", namely the fact that you can easily go to the nearest store and buy another "valuable device", say another PDA, or another computer, or another TV, ...

Now try and get an HP42S (HP-15C, HP-29C) just as easily ...

Even better, do your very best (even eBay) and try and get a SHARP PC-1425 Statistics (or a PC-1440 CAP-X, or a PC-1445 CASE) Pocket Computer, price notwithstanding ...

Should you ruin your TV, you can get another in less than 24 hours, give or take 20 hours. Should you ruin (or lose) your HP42S, it can take a number of days or weeks (and some risks) to get another. If it's an HP-29C, it may take a number of months or years. And in the case of the aforementioned SHARP machines, it might take you even longer, if ever.

Price's not the problem. The problem is availability.

Best regards from V.

HP48G+

*Message #1 Posted by **Eduardo Costa** on 2 Feb 2005, 4:15 p.m.*

Since I like RPN, and owned a HP 41 a long time ago, I decided to buy an HP 49G+ for my son. I was appalled by the low quality of the product. The case is ugly and looks cheap, since it is painted with a metallic yellowish color. The keys do not have good finishing, fail to register when pressed, which does not happen very often, but it is annoying when it happens, and are not consistent; for instance, in programming mode, the quote key may register one ", or two "", depending on the context. After reading in one of Amazon reviews that HP 48GII is slightly better, I bought also a HP 48GII shortly after buying the HP 49G+. I noticed the same problem with the keys: they look cheap, feel cheap, and work cheap; the metallic paiting also look cheap, although it is not yellowish. Then, somebody told me that I should look for a HP 48G+; he also said that I could still find a new one left over from old stocks. My friend told me that HP 48G+ is slow, but that does not seem to be a problem, because when I need speed, I write a program in Clean, using a PC computer. In fact, I found a new HP 48+ in Amazon; I ordered it. From the pictures, it seems to have a good keyboard, and a HP look, if you understand what I am telling. I did not received my calculator yet; thus, I have a few questions to the members of this forum:

1- How battery life of HP 48G+ compares with HP 49G+? In my HP48 G+, batteries last about 120 hours of continuous use. 2- How is the keyboard of HP 48G+? Is it as good as it looks in pictures? 3- How about keyboard consistency? Do HP 48G+ keys always register the same thing? 4- A good thing in HP 49G+ is an optional algebraic mode. Does HP 48G+ has an algebraic mode?

Thanx for the answears.

Re: HP48G+

*Message #2 Posted by **GWB** on 2 Feb 2005, 7:58 p.m.,*
in response to message #1 by Eduardo Costa

Hi Eduardo,

1)Under normal use (one hour a day, 5 to 6 days a week) a 3 AAA alkaline battery set should last about 8 to 9 months, as far as I can rememeber (Don't use my 48GX on a daily basis since long). Heavy PC-calculator file transfers causes battery life to decrease considerably.

2)The 48G series keyboard is very good. Its look and feel is comparable to those of HP calculators you were used to.

3)In my opinion there's nothing wrong with it. The 48 is much more powerful than the 41, uses RPL programming language, etc. It may take a little time to get used to it.

4)No, but there's a way to enter algebraic expressions. Just take a look at page 2-6 of the User's Guide when you receive the 48G+.

PS.: If you can, you shoud buy a spare 48G+ as they have been discontinued. Nowadays it appears that HP makes only disposable calculators. If every unpleased customer returned their calculators, things might change.

Regards,

Gerson.

Re: HP48G+

*Message #3 Posted by **Raymond Del Tondo** on 2 Feb 2005, 11:17 p.m.,*
in response to message #2 by GWB

One small addition:
Try to get a new 48G+ unit,
because the latest production units
have the best display contrast.
Ok, the keyboard legends are painted on these units,
instead of molded like on the older units,
but they're still much better than the keyboards of the
'disposable successors' of the real HP-48 machines...

Check the link below and look at the pictures,
and you'll see what I mean with display contrast.

Re: HP48G+

*Message #4 Posted by **Eduardo Costa** on 3 Feb 2005, 10:26 p.m.,*
in response to message #3 by Raymond Del Tondo

Hi, Raymond. I hope to get the new one, with the better display. However, the vendor had only one piece mint in the box, and I did not want to buy an used one. Therefore, I did not have much of a choice. I suppose mine is the new one, because it is unlikely that the store would still have the old model in stock. Thanx for the answer.

Re: HP48G+

*Message #5 Posted by **Eduardo Costa** on 3 Feb 2005, 10:09 p.m.,*
in response to message #2 by GWB

Hi, Gerson. Thanx for the answer. I really would like to buy a spare HP48+, but I could find only one piece new in the box. It seems that everybody and his brother wants a spare one (-:). In any case, I will follow your advice. If I find another one mint in the box, I certainly will buy it. As for the RPL, I think that I will get used to easily, since I am a Lisp/ML/Clean programmer.

Re: HP48G+

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 4 Feb 2005, 10:42 p.m.,*
in response to message #5 by Eduardo Costa

Hi, Costa;

maybe this is a big coincidence, but ... why not?

I know a teacher named Eduardo Costa that is in USA and deals with LISP/ML/Clean; he also teaches, amongst others, AI at UFU, Brazil. Is that you?

Just curious.

Cheers.

Luiz (Brazil)

Re: HP48G+

*Message #7 Posted by **Eduardo Costa** on 5 Feb 2005, 1:17 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Dear Luiz. Eduardo Costa is a very common name. Costa is abreviation of Constantinus, a popular Roman emperor. There is another Eduardo Costa who lives in the same building where I live, and I even received his heating bill, and paid it! I also suppose that every one who works with Mathematics knows Lisp, ML, Clean, and Haskell. Thanx once more for being so helpful with the HP. By the way, I have another question. If I erase the variables of CASDIR, is it possible to recover them? I am talking about the HP 49G+ and HP 48GII. Can I reset the calculator to factory Defaults, after messing up the CASDIR?

Re: HP48G+

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 5 Feb 2005, 3:08 a.m.,*
in response to message #7 by Eduardo Costa

Hi, Costa;

thanks for your answer and for your comments; I appreciate. I agree with you that Eduardo Costa, as many others (in Brazil, Luiz Cláudio can be found every where...) is somehow a common name. I just suspected that I was reading my professor's posts... So, now I can tell: cheers! Nice having you here!

About CAS variables: everytime I reset my HP49G, all CAS variables are set to their default value:

```
MODULO     13
REALASSUME {X Y t S1 S2}
PERIOD     2×pi
VX         'X'
EPS        .00000001
```

You can also cause the same effect, meaning set all CAS variables to their default, with

```
CASCFG
```

and leave all remaining memory contents unchanged. In either case, any CAS variable that has ben purged is created (back?0. I did not reset my HP49G+ to 'Memory Lost' yet, but I guess their values default to the same set. I don't own an HP48GII, but I'd also suppose the same.

Hope this helps.

Best regards.

Luiz (Brazil)

Re: HP48G+ ***try at least the HP 33s***

*Message #9 Posted by **Mvdn** on 3 Feb 2005, 8:34 a.m.,*
in response to message #1 by Eduardo Costa

My recommondation :

As a HP 41C enthousiast, and advanced user of current 12C's a 48G+ in private and professional environment I also like the HP33S!

Of course it isn't a 41C or 42S or ... . But it does a a lot of things we daily use the equipment for.

A small program giving the R/S key the functionality of the enter key (but at the right place (left above the nummeric key pad) it does the job quite well.

Re: HP48G+ ***try at least the HP 33s***

*Message #10 Posted by **Eduardo Costa** on 3 Feb 2005, 10:33 p.m.,*
in response to message #9 by Mvdn

I am happy to know that at least the HP 33S is a good calculator. I will buy one tomorrow. I thought of buying a 33S even before your message, because it really looks better than the HP 49G+. I only decided against it because it does not provide graphics, ane my son needs graphics; he is in junior high school. I also thought that he could use the experience with RPL when the need arises of migrating to PC with LISP of ML. I had the impression that RPL is quite close to LISP.

Re: HP48G+ : RPL / LISP

*Message #11 Posted by **Raymond Del Tondo** on 3 Feb 2005, 10:58 p.m.,*
in response to message #10 by Eduardo Costa

Hi,

RPL is closer to FORTH, with some features from LISP.
I'd say RPL uses the advantages of LISP,
but not the awful order of arguments and operators,
with all those unnecessary brackets...

Raymond

BTW: Comparing the keyboards of any HP-48 with that of a 33S,
is like comparing apples with oranges...

> You're kidding, right? I can't even begin to imagine how many gates it would take to build a hardwired HP-15C.
>
> All the voyagers other than the 15C have a 6K*10 microcode ROM. The 15C has two of those, for a total of 12K*10 of microcode.

Eric, I think we might have gotten off on a tangent here esp. with varying definitions of 'microcode'.

You are indeed correct that to emulate the HP Nut CPU _and_ the whole calculator firmware as a complete, integral, unpartitioned state machine would be an, um, "prodigious" work and take a huge amount of gates.

But I think Bennett was trying to ask if the HP Nut CPU was really a true microcoded CPU - meaning were Nut CPU instructions in turn encoded by microinstructions in a control store ROM within the CPU? Or was it just a state machine CPU with random logic?

I am pretty sure the Nut instruction set architecture is _not_ microcoded. (Lemme know if you find otherwise. Got any die photos???)

What most HP calc folks, and even HP, call microcode - and this includes the 6Kx10 or 12Kx10 bit ROMs in Voyagers - is what I think really is more properly called just 'firmware'.

I've seen this misused in co's that make mainframe computers: these guys call ROM/EPROM resident code 'microcode' for device controllers (disks, tapes, etc.) with their own CPUs. When a big mainframe CPU disk drive needed a firmware update, it was often called a 'microcode update'.

To me, microcode isn't firmware where a user application program resides (in this case, a calculator application). I think of microcode as what Maurice Wilkes described and envisioned: it's the contents of control-store ROM or PLA(holding a 'microprogram') that defines "macroinstructions" (those viewable by a programmer), banks in or out various CPU subsystems, coordinates system timing if necessary, etc. It can drive a 'microengine', kind of a CPU within the CPU. Oftentimes, esp in later machines, the microinstructions were quite "wide" - on the order of 80 to 160 bits - to achieve parallelism and reduce number of microcycles each instruction required.

For example, the Intel 8088 CPU has (if I recall correctly) used 504 x 21 bit microwords. Some MicroVAXes used 1600x39bits of microcode. And Motorola split its control store into two layers, microcode and nanocode, to save a few kbits of ROM:

> Quote:
>
> 68000 uses 544 17-bit words in its microengine and 336 68-bit words in its nanocode engine. It thus has 32,096 bits of ROM.

Some simple 8bit CPUs directly decode the instruction, bank in or out the relevant CPU sections, etc. and do not need microcoded instruction sets. The 6502 appears to be this way.

Not all microcoded CPUs use microprogram ROMs and often use PLAs instead. (This seemed to be common in Motorola 680x 8-bit CPUs.)

Because many macroinstructions (user instructions) may have common preamble or epilogue microinstructions, there are often many redundant states (or redundant fields within microwords) in the microprogram that can be 'collapsed' or 'folded'. You can think of a PLA (programmed logic array) as a ROM without full address decoding: contents stored at one address may show up in one or more other addresses as well: even though there's only one actual storage element (bit, word, etc.) actually represented it can show up in multiple places. In the past this was important to save chip area, and even increase decode speed of internal microaddress. Minimization/optimization software that chip designers used can turn a ROM array into a PLA.

Some CPUs have microcode control store RAM too to allow new instructions to be defined (or existing ones repaired ;)

True microcoded CPU implementations are disappearing as we evolve into a mostly-RISC world, esp with ARM and MIPS CPUs filling up the embedded systems space. But Intel X86 CPUs are still microcoded for some instructions. And they do have a 'repair facility' in RAM to allow bugfixes on certain instructions (I don't think hardwired nonmicrocoded instructions can be 'fixed' this way however.)

For those interested in a good read about microcoding and its history, check out the book "Microprogramming" (forget author) and any work by Maurice Wilkes. Also, check out "Bit Slice Microprocessor Design" by Mick & Brick - a rather excellent intro by some AMD guys who implemented a standard CPU architecture into a multichip 'bit-slice' CPU.

correlation programs for HP 49

*Message #1 Posted by **Luigi Galletti** on 2 Feb 2005, 12:23 p.m.*

I have quite a lot of correlation programs (curve fitting) for the HP 67 and HP 41 and i wonder if there is anything similar for the HP 49 because i do not like the idea of rewriting everything for the HP 49.

Re: correlation programs for HP 49

*Message #2 Posted by **Ron Ross** on 2 Feb 2005, 1:05 p.m.,*
in response to message #1 by Luigi Galletti

They are already built in. If you have some exotic curve fitting method, you can probably find that or download it from hpcalc.org. Only very rarely would you ever have to program this calculator. When and if you do, it is actually easier to customize and use than an Hp67 or the Hp41 for most straight forward problems.

Re: correlation programs for HP 49

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 2 Feb 2005, 10:11 p.m.,*
in response to message #1 by Luigi Galletti

Hi, Luigi;

if you have the chance to take a look at the HP48G User's Guide (not the HP49G, the HP48G itself), look for Part 4, Section 21, page 21-10 under *To perform a regression for two variables in the current data.* and you'll see that there is already a [Best Fit] approach where the model with the correlation coefficient closer to 1 is set according to data stored.

If you are lucky enough having the HP48G Advanced User's Reference Manual (AUR), try page 3-65 under [CORR], the command that returns the CORRelation coefficient for a given data set.

Hope this helps.

Cheers.

Hp 49g: tranferring files

*Message #1 Posted by **Dennis** on 2 Feb 2005, 10:47 a.m.*

Hi! I have a problem: I want to copy a folder with subdirectories and files saved as equations on another hp 49 g calculator, but during the connection a msg box says that there is an error in one of the equations. Thus, it is impossible to terminate the process. If I erase this equation, the problem isn't solved because the same problem affect almost every file. How is it possible? These equations are written by equation-editor and if I can save theme, it means that they are correct. I think that hp49g checks again files during the connection. How can I avoid it? How can I copy a folder (containing folders and equations) to another calculator without problems?

The equations work poperly on the first calculator.

Dennis

Re: Hp 49g: tranferring files

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Feb 2005, 11:51 a.m.,*
in response to message #1 by Dennis

Hi, Dennis;

chances are that the calcualtors have a different translation 'level', that can be set from 0 to 3, if I am not wrong. In this case, 'non-standard' codes like the one for "different of" is sent as \=/ (three bytes) if translation is set to 2 or 3 (I'm not sure about the exact code), or simply sent as a one-byte character (# 139) if no translation is required (Xlat set to 0). If the translation code is different, the receiver does not understand received data. In time: the translation is considered only in ASCII mode.

I remember having some problems when transfering data from an HP48G+ to an HP49G: errors everywhere. I solved them only after setting ASCII mode and Xlat 0. I also had problems with SysRPL data, but I'm pretty sure this has no solution.

Hope this helps.

Luiz (Brazil)

HP 39G+, your thoughts?

*Message #1 Posted by **Eddie Shore** on 2 Feb 2005, 9:54 a.m.*

I am going back to school to finish my math degree. I have a HP 49G+ and I want to designate a backup in case a CAS calculator is not allowed. I have an original 39G, but would it be worth it to get the 39G+?

Thanks.

Re: HP 39G+, your thoughts?

*Message #2 Posted by **bill platt** on 2 Feb 2005, 10:48 a.m.,*
in response to message #1 by Eddie Shore

Hi Eddie,

I enjoy your posts, but I am confused. What on earth would anyone doing an advanced math degree need a calculator for; can't you do it all in your head?;-)

Seriously though, seems to me that a calculator is nothing but a crippled toy for a mathematician--you will have powerful comPuting power at your disposal when you need that sort of support. And math is, well, more like philosophy at high levels, yes? I am a number cruncher (engineer) so I use these devices. But in college, the math courses I took had absolutely no need for a calculator---

I have heard that the undergrads are using calculators now (we've heard a fair amount about it here) but at the graduate level, I would hope that there would be no need for such a crutch....

Maybe I am just a dinosaur, but I just cannot see the point.

Best regards, BILL

Re: HP 39G+, your thoughts?

*Message #3 Posted by **Eddie Shore** on 2 Feb 2005, 3:19 p.m.,*
in response to message #2 by bill platt

I too am a number cruncher. I will find out if the graduate courses are still calculator-independent. I expect to start school again in the Spring.

Re: HP 39G+, your thoughts?

*Message #4 Posted by **Ron Ross** on 2 Feb 2005, 11:00 a.m.,*
in response to message #1 by Eddie Shore

Well, I speak from the same experience you already possess about the newer Hp's.

If you like the algebraic mode of the HP39G (and I like how the algebraic mode of the 39G works better than the Hp49G's algebraic mode), it may be worth it to buy.

For me, though, I would rather purchase an Hp48G instead. You get a much more capable calculator (although slower) than the algeraic only Hp39G+. If you are using your Hp49G in algebraic mode, you might also consider a Ti-86.

Both the Hp 48G and the Ti-86 offer quit a few extra features that are not available to a bare Hp39G.

Re: HP 39G+, your thoughts?

*Message #5 Posted by **Eddie Shore** on 2 Feb 2005, 3:20 p.m.,*
in response to message #4 by Ron Ross

Having possessing both 48G and a TI-86, I (tentatively) decided to use the 86 as the backup, although I may not need it much. Time will tell. Thank you Ron.

Re: HP 39G+, your thoughts?

*Message #6 Posted by **Ron Ross** on 2 Feb 2005, 3:41 p.m.,*
in response to message #5 by Eddie Shore

I did forget about the Statistics ability of the Hp39G+ as compared to the Hp48G or Ti-86. It is much better, but you can find downloads for either the 48 or 86 to bring both into compariable features of the Hp39G's stat functions.

Re: HP 39G+, your thoughts?

*Message #7 Posted by **Tim Wessman** on 2 Feb 2005, 4:30 p.m.,*
in response to message #6 by Ron Ross

And for the 39g+ you can download my stat pack to increase its capability substantially, and then it is much better than either the TI-83/84 or any other calculator. (minus StatPro49)

"V41" for Mac?

*Message #1 Posted by **Gilles Esposito-Farese** on 2 Feb 2005, 9:42 a.m.*

Would anybody know about a Macintosh port of "V41", Warren Furlow's superb HP-41 emulator for Windows <http://www.furlow.org/>?

Eric Smith's "NSIM" for X window (Unix) <http://www.brouhaha.com/~eric/software/nsim/> is very nice, as well as Maciej Bartosiak's port <http://homepage.mac.com/mba/nsim/> to Mac OS X, but they are less complete than "V41".

Indeed, "V41" provides the full set of ROMs and packages which were developed for the HP-41 C/V/X, including the Time Module, Extended Functions, and the great PPC ROM. It also provides a realistic sound emulation and an impressive "Turbo" mode. The key mapping is also very clever, and it works even on foreign laptop keyboards :-).

Maybe someone could teach "NSIM" how to read the ".MOD" files, or find a straightforward way to translate "V41" to Unix or Mac OS? [If, luckily, there exists a volunteer, I would suggest to build a "Carbon" application, so that old OS 9 Macs can also use it.]

Looking forward to receiving hints or answers; all the best, Gilles Esposito-Farese

Re: "V41" for Mac?

*Message #2 Posted by **Chris Roccati** on 3 Feb 2005, 3:29 p.m.,*
in response to message #1 by Gilles Esposito-Farese

It is very easy to add support for more rom modules to NSIM, as the emulator itself can handle almost everything -- it's just a matter of user interface. I'm downoading the V41 source right now to see what can be done...

batteries for 11c

*Message #1 Posted by **dennis thompson** on 2 Feb 2005, 8:33 a.m.*

I removed the batteries for 16-18 hours while using old batteries for comparasion while buying new batteries.

When I put new batteries in, calculator won't come back on. What to do????

Re: batteries for 11c

*Message #2 Posted by **Palmer O. Hanson, Jr.** on 2 Feb 2005, 9:31 p.m.,*
in response to message #1 by dennis thompson

Page 233 of the manual suggests three steps:

1. Press the y^x and ON keys simultaneously and release them.

2. Remove and reinsert the batteries. Make sure the batteries are properly positioned.

3. Install new batteries.

\->keytime (49g+)

*Message #1 Posted by **Eric Lundgren** on 2 Feb 2005, 1:38 a.m.*

To the fellow who posted the convention for adjusting the keytime: I do not seem to be able to get any response using that on the 49g+...what am I doing wrong? Its a seemingly trivial operation..

I have done it on the 49g, however.

Have you considered...(was: \->keytime (49g+))

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Feb 2005, 2:48 a.m.,*
in response to message #1 by Eric Lundgren

Hi, Eric;

Maybe I'll post about the obvious, but there is no harm trying, right?

Have you considered using higher values? Based on what you mention, \-> KEYTIME gave you no response in the HP49G+, meaning it accepted the command and reacted differently. I did not test yet, but considering that the 49G+ is considerably faster than the 49G, you'd need higher values for KEYTIME return sensitive changes in the scan time.

Hope this helps a bit.

Cheers.

Luiz (Brazil)

Edited: 2 Feb 2005, 2:49 a.m.

Re: \->keytime (49g+)

*Message #3 Posted by **James M. Prange** on 2 Feb 2005, 3:13 a.m.,*
in response to message #1 by Eric Lundgren

It seems to work as expected for me; the same on the 49g+ as on the 49G. But I've now noticed that values greater than 4096 are treated as 4096.

If you do 4096 \->KEYTIME and then KEYTIME\->, then it should return 4096, and a press of the same key again in less than 1/2 second should be ignored.

Of course, I don't recommend leaving it at 4096; probably something around 500 or less, depending on how fast you type. The 49G default of 1365 seems a bit high to me. Of course, if you don't get accidental duplication of keystrokes at all, you could just set it to 0.

Note that like all commands, these are case sensitive, so it should be \->KEYTIME, not \->keytime. Maybe use the RightShift CAT (over thr P key); both \->KEYTIME and KEYTIME\-> are in the catalogue.

\->keytime (49g+)

workhorse calc

*Message #1 Posted by **Eric Lundgren** on 2 Feb 2005, 1:35 a.m.*

Well, after some exposure to the 49g+, I, a lowly engineering undergrad, will regard the readily available 48G as the dispensible workhorse.

Big ENTER key, unquestionable button presses, and unappealing to all my classmates.

My 32sII dove into a 3" puddle of rainwater this weekend, and thus I began wondering what to replace it with...but, I was happy to see it work the next day! Well, it doesn't pass the self-test anymore, but everything seems to function.

Re: workhorse calc

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 Feb 2005, 2:59 a.m.,*
in response to message #1 by Eric Lundgren

Hi, Eric;

about the 32SII: the rainwater has many additional components (salt, etc) that would lead to unexpect 'low' resistence (related to the sky-high resistence found in most MOS-based circuits, like the ones in the HP32SII) between some terminals. So, using clear water (destilled should be better, I guess), dip the calculator in and allow a few minutes (hours?) of immerse "shaking". Then let it dry for a couple of days, provided that you removed as much water as possible.

Others in here might guide you better; I can't find the actual expressions I'd like to to describe the whole process. And try doing it ASAP so the salt (if applicable) will not cause more dammage.

Success! And let us know what happens, then.

Luiz (Brazil)

Re: workhorse calc

*Message #3 Posted by **Randy** on 2 Feb 2005, 7:17 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Failure to remove the batteries in a wet 48 or 32S can result in keyboard damage by electrolysis, it's an non-repairable failure.

Rinse well, shake out all excess water and let it dry for at least two days before putting it back in service.

Re: Where Carly First Failed

*Message #2 Posted by **Karl Schneider** on 2 Feb 2005, 12:48 a.m.,*
in response to message #1 by Les Bell [Sydney]

Les --

Pretty good and insightful "blog commentary". His central point reminds me of a more fundamental one.

Why is it that many people praise CEO's who run their vast enterprises as though they were merely a set of independent companies? This philosophy, associated with Jack Welch (formerly CEO of General Electric) asserts that each division chief is responsible for the profitability of his unit. Unprofitable divisions can then be sold, or at least placed under the stewardship of CEO's with an eye on the bottom line.

This approach ostensibly promotes accountability and delegation of authority. Maybe so, but it also fails to recognize that certain endeavors usually need to be nurtured or revitalized through investment before profitability is even possible. If every division must make money now, where do tomorrow's money-makers come from? A corporation can't expect to simply acquire every productive asset, any more than a pro sports team can expect to build a perennial contender through free agency.

GE has certainly been profitable, but what mainstream mass-market products are they known for today? Not TV's and other consumer appliances anymore -- those markets were ceded long ago. They are still big in the electric-power industry, making turbine-generators, transformers, and other high-voltage equipment. Jet aircraft engines are also a major business, and GE also provides consulting services. The other primary GE businesses that occur to me, however, is GE Capital.

Not everyone is enamored with the Welch approach. Several years ago, a rather uncomplimentary book was written about his tenure at GE.

Please, this is exactly what I think, no pun intended at all: why do people with the kind of thought you expressed here are not actually running enterprises as CEO's? It's so "crystal clear", and it seems some CEO's don't (want to?) see.

I see that many of my students are already finding a way to promote sales while they are studenst. O.K., no problem with the choice, but they are supposed to be graduating as technicians, not salespersons. Please, no priviledge or misregarding, just a matter of choice. The R&D staff must be aware of the fact that whatever they are developping must be taken as part of a final product, either as a component or as an enhancement. But they should not be spending time with computing the profits related to their effort on doing that because they'd be comsumming time on doing something they are not actually supposed to be doing. The same would happen if profits are running low and administrative staff decides to invade R&D labs in search for new discoveries that can be sold, somehow...

I sometimes tell my students that as soon as someone builds something, commerce goes ahead. If everyone decides to run 'profitable businnes' based solely on buying and selling, soon there will be no goods to be sold or bought because there is no one taking care of their production. And if there is a production line and no enhancement, improvement or some brand new "gadget" to be added, we'll be buying and selling the same stuff till mankind exists.

Oops! I think that as an Elect. Engineer I have gonne a bit far.

Blames? Flames? Comments?

Luiz (Brazil)

Exactly. And what is even worse, is that in such a structure, the purpose of the CEO is to act as a figurehead - someone who is able to see deeper than the usual bean-counting MBA approach to management. We expect a CEO (or Chairman of the Board) to be *the* person who can say "No - this area is going to be significant, so let's keep investing in it because we *will* see a return in time", or "Our customers expect high quality products, and shifting production to an outsourced factory in S.E. Asia is going to damage our reputation and subsequently our bottom line".

But in many cases, as you observe, CEO's are not providing that kind of leadership at all. And specifically at HP, I suspect the corporate culture has been replaced by a collection of consolidated spreadsheets.

Best,

--- Les

Thought about quality

*Message #10 Posted by **Artur - Brasil** on 2 Feb 2005, 7:42 a.m.,*
in response to message #1 by Les Bell [Sydney]

I was wondering: is there anybody else beyond the members of this forum who is concerned about quality yet?

As I can see: everything is "Made in China". The prices are very low and the quality, usually, is too.

When you go to a store buy a new gadget, there is always a "this does the same thing (similar)" chinese close by it with a 25% cut off.

I assume that I'm always tempted to buy the chinese one. After all, if it break, I can buy a new, and other, other, other ...

It may be this the thoughts in the CEO's heads. Do not produce nothing (as it is produced in China), sell as many as they can, have high profits, but no care with the employments in their own country.

I know my thoughts are very simple in this confuse world. Artur

Re: Thought about quality

*Message #11 Posted by **bill platt** on 2 Feb 2005, 10:37 a.m.,*
in response to message #10 by Artur - Brasil

Buying cheap, breakable junk is a losing economic model. Good examples:

Hi quality lamp, metal parts, $50 in 1980, still works, will always work.

-vs-

Cheap lamp, plastic parts, $10 2000, broken in 1 month, so 12 of them a year. Which makes better economic sense?

Or,

11c, $120, 1983, lasted until lost in 1995. 30s, closeout, Staples, $4.50, ususally $15, 2004, quit working properly in two months (loses memory if you allow the case to be flexed at all). Same for replacement. So, 12 * $15 for every year.

Tubular bicycle tire, (Tufo) made in Czech republic, $40 current dollars, lasts 1800 miles average, after using 10 of them, no premature blowouts, but one sidewall cut blowout; all others survive until the threads are showing.

Tubular tire, (Vittoria) made in Indonesia, $12, average lifespan, 250 miles, about 1 in 8 blow out the first day.

Hi quality colander, copper plated steel, $50 if would replace in 2004 dollars, lasted 25 years, still going strong, vs

Aluminum colander, $4.99, made cheap, lasts 1 year before feet & handles break off.

And I am sure I can come up with dozens more.

Which ones make better economic sense?

Regards,

Bill

*Message #12 Posted by **Chan Tran** on 2 Feb 2005, 11:31 a.m.,*
in response to message #11 by bill platt

When we started to import stuff from China in the late 80's and early 90's, the quality of these products were very bad and their prices were very low. Today the quality isn't all that bad and the price is up about what it used to cost for the US made stuff. In the future, I believe the quality of these Chinese products will be high and their prices will be extra-ordinary high. In the end all we did was to give away to the Chinese our industries. As the footnote, NO I never felt tempted to buy Chinese made stuff even though they were cheap. Today, I don't want to buy them either even though at least on a number of products their quality while not high is OK. No, I don't want to buy them in any cases but many times that is the only choice.

Yes, thought about quality

*Message #13 Posted by **Artur - Brasil** on 2 Feb 2005, 12:00 p.m.,*
in response to message #12 by Chan Tran

I must agree with all of you. I'm not one that buy things only for their value, but usually I look for some quality in them. So, I'm still an 11C, 15C, 41C lover. About chinese things, I must apologize. After all, many things made there are very cool, as many made here in Brazil. Actually, I have very fine electronic equipment from China and they are perfectly. The point of view is actually the low quality project on new HP calculators. If they take care a bit more on details, such keyboard, painted labels and other small things, certainly the chinese industry could make them as planed. Other point is about work places. I may be wrong, but, making things outside your country doesn't contribute for less employment? Just small feelings...no offense at all, ok? Artur

Re: Thought about quality

*Message #14 Posted by **Ren** on 2 Feb 2005, 7:33 p.m.,*
in response to message #12 by Chan Tran

I too avoid buying from Red China, and find it increasingly difficult.

But I'm also a guilty one. Back in the '80's and early '90's, I enjoyed buying Cheap Chinese Crap. I was young with a small income, and my money seemed to go farther with CCC. I had a double agenda, I believed that buying from China would encourage them to become more capitalistic, less communistic and improve human rights in China. The other side of this agenda, I wanted the overpaid Union workers in the US who made crappy Fords and Dodges and stereos and et cetera to shape up.

But China hasn't changed its human rights record for the better one iota. Now they are building the crappy stuff, and Union workers are out of a job. So now it is harder to find work in my chosen profession because their is so little electronics manufacturing (or repair) in the US.

Yes, the Unions did get a message, too little too late. And now I'm simmering in the pot of stew I helped make.

But I'll buy Sears Craftsman Lifetime Warranteed tools, and often leave the CCC on the shelf.

Re: Thought about quality

*Message #15 Posted by **Valentin Albillo** on 2 Feb 2005, 11:49 a.m.,*
in response to message #11 by bill platt

Hi, Bill:

Bill posted: *"Which ones make better economic sense? "*

It depends to whom you're asking the question or where you ask the question.

Most people will do whatever it takes to save a cent, even if it means a lower quality product and they know it. Very few people bother to do the math you mention to realize that a seemingly present gain is actually a loss in the long run. So, garbage products (such as KinHPo calculators) are the order of the day.

As for further examples, here's one of my own:

A SONY discman player (can't remember the model, probably a D-5) I bought in the early 80's, square, all-metallic, rock-solid feeling. It's been playing at least 1 hour a day since then (many times 4 hours or more, I sleep very little), yet still works, looks and sounds absolutely perfectly (after some 10,000+ hours playing !!); cosmetically it would easily pass for new, and can drive enourmous headphones at incredible volumes with top-quality sound.

Compare that to the latest, "made in China" models, all-plastic, feeble things, made with the cheapest components the manufacturer's money can buy, much noisier in operation, worse sound, will distort if used with said headphones, will typically last a year or two before something breaks or wears.

In short: Quality comes at a premium, but most people would rather buy cheap than wise. There's quite an appropriate Spanish proverb for this kind of folly, which reads like this:

```
"No está hecha la miel para la boca del asno"
```

which literally translates as

```
"Honey wasn't meant for donkeys"
```

and is essentially the same as the English proverb:

```
      "You're casting pearls before swine"
```

Best regards from V.

*Message #16 Posted by **Ron Ross** on 2 Feb 2005, 12:12 p.m.,*
in response to message #15 by Valentin Albillo

I like that Spanish proverb and will remember it well.

While most of us here appreciate a quality calculator, the world in general does not consider a calculator a tool for their profession. It is something to be used on occasion to check their bookwork and any $3-5 calculator will work. They put such low value on these that they are considered disposable. Math is a chore that has to be endured once a month (as if we consider this MATH?) when paying bills.

Therefore, we endure the blank stares of unbelief if we admit our calculator affection or try to justify the purchase of a $50+ or greater purchase for a calculator to people who KNOW you can buy a great little scientific for $10-20.

And a question for anyone with a Casio fx115MS. I am using this as my backup to an Hp33s for the upcoming PE exam. I was checking out its numerical integration and I am probably entering something wrong as it is failing miserably in a simple integral.

integrate SQR(4-x^2) from 0 to 2.

Perhaps I am not inputing the variable or the lower, upper limits in the correct sequence. I have tried in various modes ie Radians vs Degrees etc. Any hints or info. I do not even get consistantly WRONG answers. I have used this before on other integrals and did fine in the past (also simple integrals and quite a bit further back in my memory and time).

"And a question for anyone with a Casio fx115MS. I am using this as my backup to an Hp33s for the upcoming PE exam. I was checking out its numerical integration and I am probably entering something wrong as it is failing miserably in a simple integral."

I advise you to purchase a second HP-33S as your back-up. I bought two of them for that purpose (I took the exam just last October); here's how I worked it (I passed my PE, btw! Yay for me!):

1. I kept one HP-33S at work and used it every chance I had (i.e., all the time).

2. I kept the other at home for studying. I marked each calculator with a Sharpie marker, indicating which was the home one, which was the work one. I memorized which programs I had on which (essentially, both had interpolation programs). I didn't bother putting the same programs on each calculator because most, if not all, of the problems I'd encounted while studying (and on the test!) did not really require "programs" - except maybe for surveying problems (I took the Civil P.E.).

3. I brought, naturally, both with me to the exam - with, naturally, extra batteries. I had both calculators on my table and realized an hour into the exam that I was using them

interchangably. I also felt super confident that if one failed I'd have no problem picking up the other and just continuing if nothing happened.

Re: Thought about quality

*Message #18 Posted by **Ron Ross** on 2 Feb 2005, 1:02 p.m.,*
in response to message #17 by Fubar Vikinghelmet

While I may consider that option, I really don't need an extra Hp33s (it actually irritates me to use it as I would rather take an Hp42s, but since that calculator was specifically banned and I do prefer RPN, I will take at least an Hp33s). But I am also a stubborn mule who is just as apt to take a slide rule, since the NCEES has now made a list of about six calculators that are ONLY allowed. I had planned to just take an older Hp32s and an Hp15c (or maybe a Ti66). IF it weren't such an important TIMED exam, I would take in a four function calculator (which isn't on their list either) and a trig and log table, but the person who would suffer from such arrogance would be ME!

Ron's integration problem -- fx-115MS vs. 15C

*Message #19 Posted by **Karl Schneider** on 3 Feb 2005, 4:15 a.m.,*
in response to message #16 by Ron Ross

Ron --

I agree with your thoughts about quality.

Now, about the integration problem you specified:

INTEG (sqrt(4-x^2) dx between 0 and 2

On the Casio fx-115MS, the user enters the expression to be integrated after the integral sign, followed by (and separated by commas) the lower limit, upper limit, and # of partitions as an integer power of 2. "=" gives the answer.

Some things to remember:

- The variable of integration must be X. All other variables will simply be employed using their current values, which might cause a "Math Error".
- If the integrand is undefined at a limit or interior value, "Math Error" will result, and the user must start over.
- The fs-115MS uses Simpson's Rule (as have all inexpensive Casios over the years). The calc will return only the number of significant digits it deems justifiable, then fills out the selected display precision with zeroes.

So:

```
[Sdx]
[sqrt]
(
4
-
[ALPHA]X
[x²]
)
,
0
,
2
,
```

9
)
=

will give the best answer it can, with 513 function evaluations under Simpson's Rule (2^9 +1) : 3.1416

By contrast, the HP's Romberg method used by the 15C, 33S, and other models gives answers much closer to the exact answer of pi, in much less time. Romberg is much better than Simpson for this problem.

Integration Schemes (was Re: Ron's integration problem)

*Message #20 Posted by **Valentin Albillo** on 3 Feb 2005, 5:09 a.m.,*
in response to message #19 by Karl Schneider

Hi, Karl:

Karl posted:

"[...] will give the best answer it can, with 513 function evaluations under Simpson's Rule (29 +1) : 3.1416. By contrast, the HP's Romberg method used by the 15C, 33S, and other models gives answers much closer to the exact answer of pi, in much less time. Romberg is much better than Simpson for this problem.

The HP-71B Math ROM's keyword **INTEGRAL** uses essentially the same Romberg-based algorithm as the HP-15C, and, right from the keyboard (no program) very quickly produces this:

```
>INTEGRAL(0,2,1E-7,SQR(4-IVAR*IVAR)) , PI

 3.14159265359        3.14159265359
```

accurate to **12 places**, using just **63 function evaluations**, i.e., it produces nearly 3 times as many decimal digits with 8.14 times less evaluations than the much inferior algorithm used in the Casio.

Of course, comparing the ultra high-quality, state-of-the-art math algorithms designed for and implemented in the HP-71B Math ROM versus the ones in any Casio machine is pretty preposterous to begin with, just have a look at my article **"Baker's Dozen"** in the very next Jan-Feb 2005 issue of Datafile, which discusses a number of interesting topics, quirks, and powerful uses of the Math ROM.

P.S.: As for integration methods, I'll take **Gaussian** adaptive methods over Romberg any day. One of the main reasons it isn't used by HP in their calculators is simply because it requires a **large** number of full-precision constants, which is expensive in terms of ROM space. That's why they selected some Romberg's variation though fully aware that Gaussian methods were best (i.e., much less evaluations for any specified accuracy).

Actually, even Gaussian quadrature is becoming obsolete. Cutting-edge numerical math researchers now favor the relatively new **Error Function quadrature** and **Tanh-Sinh quadrature** schemes, which are even faster and more robust than Gaussian quadrature

while remaining reasonably easy to implement.

Best regards from V.

Re: Integration Schemes (was Re: Ron's integration problem)

*Message #21 Posted by **Thanks for the xtra info! Ron Ross** on 3 Feb 2005, 5:13 p.m.,*
in response to message #20 by Valentin Albillo

Thanks for all that interesting extra information.

Above, I did not know that you should only integrate with X on the Casio. My own problem was that I place X in the spot where you place the interation number. And the Casio is sloooow. But it will work as a back up in case the new fangled Hp33s happens to fail. And while I could just buy another Hp33s, I feel confident enough with the Casio as a back up (passing or failing won't (and shouldn't) depend so much on the calculator, but on myself, BUUUT I will blame that POS anyway, should I fail!!!)

*Message #22 Posted by **Karl Schneider** on 4 Feb 2005, 2:26 a.m.,*
in response to message #20 by Valentin Albillo

Hi, Valentin --

Thank you for the informative follow-up to my post. I have to admit that I still haven't gotten a Math ROM for the HP-71B I bought on eBay more than a year ago. The ROM itself seems pretty hard to get -- I've never seen it appear on eBay or the MoHPC Classifieds as an individual item.

Not having yet posted a "WTB" ad, though, I can't really complain. I'm not even sure what a fair price is, but the amount that might be asked would probably be sobering.

As for Casio's methods, I'm only speculating. My fx-3600P from 1981 uses Simpson's, as does the 2004 fx-115MS, so I assume that all their low-end models did.

in response to message #22 by Karl Schneider

Hi, Karl:

Karl posted:

"Thank you for the informative follow-up to my post."

You're welcome. If you want to know more, have a look at this very interesting PDF document discussing all three methods, with pretty challenging examples:

A Comparison of three high-precision quadrature schemes

"I have to admit that I still haven't gotten a Math ROM for the HP-71B I bought on eBay more than a year ago. The ROM itself seems pretty hard to get -- I've never seen it appear on eBay or the MoHPC Classifieds as an individual item."

Yes, it's a real gem, a much valued and sought-after add-on among knowledgeable HP-71B fans. However, it actually isn't that rare, there are tens of thousands of them still in existence, because it was bundled with a very large order of HP-71Bs by a British (IIRC) health care organization, and when the machines were replaced, their Math ROMs went with them. Myself, I have three HP-71B and each one of them came with their own Math ROM included.

Anyway, if you're eager to try it, or the examples I post or some of my articles about it (i.e.: "Baker's Dozen" in the next Datafile issue), just get Emu71 from Jean-François Garnier, it comes complete with the Math ROM image and all, and it's absolutely free, very convenient to use, and runs at awesome speeds (25-30x times the speed of a physical HP-71B), which makes the Math ROM functions all that more powerful.

Or, if you have a 48/49 model, you can get HP-71X from Hrastprogrammer, which will give you full 71B compatibility with the added bonus of portability, at 2x-3x the speed of a physical 71B.

"Not having yet posted a "WTB" ad, though, I can't really complain. I'm not even sure what a fair price is, but the amount that might be asked would probably be sobering."

Can't say. As stated, I just bought the 71B's and the Math ROM was included as well (together with the HP-IL ROM; it was bundled with them, too). I got the machines for prices around $100 (i.e., HP-71B + HP-IL ROM + Math ROM), virtually mint.

"As for Casio's methods, I'm only speculating. My fx-3600P from 1981 uses Simpson's, as does the 2004 fx-115MS, so I assume that all their low-end models did."

I'm convinced that only HP engineers of the golden age actually cared about the quality of their algorithms. I know for sure that both the HP-15C and the HP-71B Math ROM were incredible *tours de force* with engineers, programmers and numerical-algorithms experts racking their brains to the most to achieve the maximum speed, accuracy, range and, of course, functionality in the allotted ROM space. As such, the HP-71B Math ROM is the most optimized, higher quality 32K of Saturn assembler programming ever written, bar none. Everyone of the many incredibly gifted people involved in its creation loved what they they were doing, and it shows.

Best regards from V.

My emu71 returns -2

Re: Integration Schemes (was Re: Ron's integration problem)

*Message #28 Posted by **Thomas Okken** on 6 Feb 2005, 3:06 p.m.,*
in response to message #26 by hugh steers

i get -2 for test# 8.

That's a typo in the document. The integrand is negative over the entire interior of the interval.

also, the author should try sqrt(abs(x-1)) over [0,2]. what does the 71b math rom give? my 15c fails to return an answer after 300 seconds.

The discontinuity in the 1st derivative at x = 1 will make life difficult for most numeric integrators. Trying this example on Free42 took 16,383 evaluations with ACC = 1e-6, i.e. a blink of an eye on a Pentium, but a lot longer on a Voyager with a 4-bit CPU whose clock speed is measured in kHz... (I estimate it will take almost 3 hours on a 15C.)
Splitting the integral into two parts, one over [0, 1], and the other over [1, 2], speeds things up a **lot**.

I agree about quality

*Message #30 Posted by **Eddie Shore** on 2 Feb 2005, 3:26 p.m.,*
in response to message #11 by bill platt

I'd rather pay a higher $$ amount for something that will last a longer than pay cheap only to have to replace it the next day. I also find that I stick with the higher quality products. Case in point: I had to go through two (!) HP49G+s before I found a decent keyboard.

The challenge is that 90% of everything sold in the U.S. is made in China.

Ummm . . for the company that hopes to get an ongoing revenue stream without having to invest significantly in produce design and manufacturing plant, the cheap rubbish is the obvious way to go. Otherwise, there wouldn't be so many of them doing it.

Of course, for the rational consumer, quality is the way to go. Unfortunately, there's a shortage of rational consumers, and increasingly a shortage of quality products.

Best,

Re: Thought about quality

*Message #32 Posted by **Bill Wiese** on 2 Feb 2005, 1:18 p.m.,*
in response to message #10 by Artur - Brasil

I have NEVER seen anything from Red China that has equal quality to equiv. non-Chinese product. Biz model is low quality + thin profits X mass sales. Clearly not 'built to last'; everything seems disposable.

This applies to electronics, clothing, kitchenware, etc.

Electronics made in China isn't as good as that from Taiwan, Indonesia, etc. Board quality, connector quality, power supply quality are often substandard. Shirts from China seem to not last too many wash cycles compared to those from India etc. Plus China has NO idea about clothing in XL or XXL sizes, nor do they take the effort to find out! Cups and saucers break easily, etc. etc.

Totally aside from quality issues, I generally avoid buying any Red Chinese products as many of us in the USA perceive China as an enemy country we just happen, unfortunately, to do business with -- WalMart being the funding agency for Red China's military modernization.

I do carefully look at country of origin of what I buy. I myself try to buy American or European products or real quality made-in-Japan products. Or from neigboring Mexico/Latin America - maybe sending some biz there might help some of our illegal immigration issues, dunno... My goal is to generally purchase from somewhat reputable companies civilized societies, not bottom feeders from countries where starving people and dirty civilian water supply is regarded as 'competetive advantage'.

Sometimes it is hard but you can do it. I, for example, will not buy anymore Durango cowboy boots - all Chinese made now. Same with Levi's jeans - I buy Lee or Wrangler pants marked Made in USA (not all variants are). Quite a few of my dressier pants I buy are made in Indonesia or Bangladesh but at least not Red China. My Philips projection TV set has European and Taiwanese chips but is assembled in USA. My Sony home theatre system is actually made in Japan, not China. Most of my guns are made by Smith&Wesson, Colt or Ruger. Ford makes my truck and has a high Western (USA+Canada+ Mexico) parts content. I buy quality US- or European-made dress shoes and keep care of them+repair them, instead of wearing throwaway Chinese cheapies. Keeps the shoe man in business too (finding a good one skilled in leather work is hard these days!!)

Oh - my underwear and socks are US made too. My PC motherboard is made in Taiwan, with hard disk assembled in Mexico.

Sorry to bore you all with this litany but it is possible to do as little biz with Red China as possible at least on a personal scale. It can vary, and sometimes there's no option. (I couldn't find a US-made Thermos-style vacuum bottle for my coffee.) But I generally think you'll be happier with quality by "going elsewhere". It takes just a bit of effort.

Bill Wiese
San Jose CA USA

Re: Thought about quality

*Message #33 Posted by **Les Bell [Sydney]** on 2 Feb 2005, 5:53 p.m.,*
in response to message #10 by Artur - Brasil

Absolutely agreed.

I remember that, back in early 1976, when I bought my HP-65, I was reading "Zen and the Art of Motorcycle Maintenance", which is entirely about the definition of quality. I even remember reading it on the train while heading out to HP's Canadian office which (IIRC) was out in Mississauga, west of Toronto.

As I debated Pirig's assertion that quality is undefinable, the object that, to me, represented Quality was my HP-45 (and the 65 I would shortly buy). To me, the mechanical construction, the logical design, and the accompanying documentation all represented something that was well above some kind of "minimal scientific calculator".

For a while, I thought quality might be defined as work over and above that required to construct the minimal product, but the problem is that some designers can work hard to reduce the quality of the product by making it too complex or otherwise ill-fitted to the task. In the end I pretty much agreed with Pirsig - I can't define quelity, but I know it when I see it.

And I'm not seeing it in HP's products these days.

Best,

--- Les

Re: Thought about quality

*Message #34 Posted by **Walter B** on 3 Feb 2005, 4:53 a.m.,*
in response to message #33 by Les Bell [Sydney]

Les,

IMHO the best definition is: "Quality is meeting (and possibly exceeding) your customer's expectations." It includes the ambigity you mentioned.

Since nowadays 99.x% of perspective calculator users did never have a chance to experience a rock solid scientific calc anymore (which many in this forum remember very well, or even possess), they simply cannot have an idea of such a device. So they will not expect something like this. This runs in parallel with the low prices mentioned in this thread several times. You can't expect too much quality for this.

The times many of you remember, good calculators used to cost more than some 100 $ or equivalent in other currencies (yeah, they still exist!). I remember to have paid more than 600 DM in 1974 or 75 for my first calc (a TI SR 50, since HP was far out of my budget). Being a university student, this was a fortune at that time! But the calc was faster than a slide rule combined with math tables and eased my studies quite a bit. So guess what I would have done if my precious would have failed after a year or so?! I would have had to save money for quite some time until I could afford a new calc. It took me 3 years and some work as teaching assistant to buy a repaired HP25C. Therefore, those calcs simply had to be rock solid to give you a return on your investment. Nowadays, they are no investment anymore. Such, this closes the cycle ...

Just my 0.01 € (Euro)

Remove lint from HP-41 display

*Message #1 Posted by **Mutsch** on 1 Feb 2005, 2:58 p.m.*

Any idea how to remove lint from an HP-41 display without major disassembly of the device? It is of course captured between the LCD and the screen.

Any advice is welcome.

Mutsch

Edited: 1 Feb 2005, 2:59 p.m.

Re: Remove lint from HP-41 display

*Message #2 Posted by **Randy** on 1 Feb 2005, 4:11 p.m.,*
in response to message #1 by Mutsch

Using a flexible tube, direct a blast of canned air into the two openings where the center trim band ends near the fours port covers. Direct the blast up and toward the LCD. Be careful not to turn the can upside down or you'll freeze your unit with the liquid rather than gas. That's the best you can do without opening the unit.

Later half-nuts can be *very* stubborn to clean.

Re: Remove lint from HP-41 display

*Message #3 Posted by **David Smith** on 3 Feb 2005, 4:03 p.m.,*
in response to message #2 by Randy

For very stubborn dirt that won't budge with canned air, use a thin strip of paper/cardboard (like a strip of an index card). Slip it into the small space between the LCD and the case (can be tricky) and use it to brush off the dirt. You may need to bend the strip so that it's end toches the display window.

The seemingly attentive 49g+...

*Message #1 Posted by **Eric Lundgren** on 1 Feb 2005, 2:41 a.m.*

I've noticed something disturbing about the 49g+: when I complete a calculation, and some time passes (ie: not enough idle time to turn off, but more than a minute..)..then I begin to key in 5.249 (for example)..it only registers .249 !! As if it is in a sleepy standby?

Anyone else notice this? Unfortunately, its not something one would catch during an in-store tryout..

On a + note, the 49g+ seems noticeably faster than the 49g.

Also...HP users still have trig functions as primary keys...while the ti-89 Titanium has both trig and inv trig as shifted operations...!

Re: The seemingly attentive 49g+...

*Message #2 Posted by **Arnaud Amiel** on 1 Feb 2005, 4:17 a.m.,*
in response to message #1 by Eric Lundgren

Your observation is correct. To save battery consumption the 49g+ spends most of its time in low clock frequency mode. When you start inputing again, while it switches to a higher frequency it may miss some keystrokes. One solution is to turn it off when you don't use it.

Arnaud

Verilog or VHDL Emulator for HP 16C?

*Message #1 Posted by **Bennett Smith** on 31 Jan 2005, 6:37 p.m.*

I would like to build a model of an HP 16C using Verilog or VHDL (just learning) and was wondering if anyone could recommend resources to help me learn about the hardware architecture of this calculator?

Thanks

-- Bennett

Re: Verilog or VHDL Emulator for HP 16C - some comments

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 1 Feb 2005, 1:03 a.m.,*
in response to message #1 by Bennett Smith

Hi, Bennett;

just to add that in either case, it's gonna be huge...

BTW, have you succeeded emulating the HP16C with a Verilog or VHDL script (I hope so), is there any chance that a custom IC is produced based on it? Maybe this is your main idea... That would be a "dream comming true", and changing the script so it emulates the other Voyagers would be, then, somehow faster and easier (at least for those who master VeriLog or VHDL).

And what are the chances that you can use the existing OS (provided it is available somehow) and emulate the HW core only? that would lead to an actual customizable IC... An HP16C with 999 program lines... better, with FFF program lines... an HP15C with 256 registers... Oops! My head found the roof...

Can you keep us updated with your achievements?

Best regards and good luck (to as all, in fact)

Luiz (Brazil)

... a team working on the development of RPN calculators, all of the basics plus final design (hardware/software, case, etc.). I tried to find their e-address but I could not find it, it seems I lost it the last "cleanning up" for viruses.

I guess they will soon post here.

Best regards.

Luiz

Resources

*Message #5 Posted by **Klaus** on 1 Feb 2005, 10:43 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

The voyagers use the same cpu as the HP41. Resources for the HP41-CPU are easy to find. TOS might help you!

I wish you success, but keep in mind that emulation is only the beginning of work- hardware like case, keys etc are much harder to obtain unless the OPENRPN helps you!

Re: Resources - CPU easiest, other stuff is harder

*Message #6 Posted by **Bill Wiese** on 2 Feb 2005, 1:24 p.m.,*
in response to message #5 by Klaus

Klaus wrote:

Klaus is absolutely right. CPU selection + firmware is only a small part of making a calculator today. Costs of keyboard/keys, case/shell, etc. - esp nonrecurring setup costs - are the backbreaker. We like calculators and programming, so we naturally look to the chips/firmware first. Just like most carpenters think problems can be solved with hammers & nails ;)

VHDL/Verilog HP CPU is a fun exercise but would require a somewhat expensive EPLD/FPGA to run stuff on. Prob not the most power-efficient idea either for a battery operated calculator. Software emulation in a small 8 bit CPU, when done properly and with 'escape' layers to the non-HP outside world is gonna be way more productive, easier to implement, etc.

Re: Verilog or VHDL Emulator for HP 16C - some comments

*Message #7 Posted by **Bennett Smith** on 1 Feb 2005, 12:14 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks for the pointers everyone. It sounds like I need to start hunting for more information on the HP-41 processor first.

A bit more background on my goals.

I work for a company that builds simulators for debugging hardware designs. I am a software developer and need to build a hardware design using a Verilog like language that I can use as my test base for simulator improvements. I was thinking of the HP 16C since it is such a cool device and I have one on my desk that I use every day.

I had no idea that there was such a following for these older calculators. It sounds like there are people out here hoping that eventually someone can build a "next generation" version of these calculators. That may not be me, but perhaps the hardware design will be a start.

Does anyone know if there is microcode in the Voyager calculators or is all the functionality implemented directly in gates?

Thanks for everyone's help. I will keep you posted on the outcome...

Cheers

-- Bennett

You're kidding, right? I can't even begin to imagine how many gates it would take to build a hardwired HP-15C.

All the voyagers other than the 15C have a 6K*10 microcode ROM. The 15C has two of those, for a total of 12K*10 of microcode.

Re: Verilog or VHDL Emulator for HP 16C - some comments

*Message #9 Posted by **Bennett Smith** on 1 Feb 2005, 6:50 p.m.,*
in response to message #8 by Eric Smith

I'm learning - having never built any piece of hardware before what do I know. This is why I am asking the questions. If I already knew then there would be no reason to ask. :-)

Since posting my original question I have learned about the microcode simulators/emulators you built, have learned about the newt microprocessor project, and more about the history of HP calculators than I ever thought I needed.

My goal is to produce a hardware design that I can use primarily to debug digital logic simulators. I'm not trying to do anything more than that. I figured it would be easier to build a logic design for a calculator than a typical general purpose processor and I was hoping that this would serve as a good, controlled test bench for improving an in-house digital logic simulator.

I really appreciate the help.

Re: Verilog or VHDL Emulator for HP 16C?

*Message #10 Posted by **Monte Dalrymple** on 1 Feb 2005, 12:30 p.m.,*
in response to message #1 by Bennett Smith

The 16C uses the same CPU as the 41C. What makes it a different machine is the software held in ROM. The specification for the CPU is available on the internet if you know where to look. Unfortunately it is not quite complete, so you have to make some intelligent decisions about how the designers implemented a few things.

Unfortunately, a similar specification is not available (at least that I have found) for the display driver chip. If you are ambitious and have the time, you might be able to figure out how it works by disassembling the 16C ROM code. I expect that it would be similar in many ways to the 41C display driver operation, and that spec is available on the internet.

The CPU is actually quite simple, and only requires 19 pages of Verilog HDL code. As Meindert mentioned in another reply, I am working on an enhanced version of this CPU so that I can do a brain transplant on 41Cs. It wraps additional logic around a Nut CPU core to add a number of new features. A preliminary specification for the NEWT microprocessor can be found at

http://www.systemyde.com/pdf/newt.pdf

Unfortunately I haven't had a lot of time to devote to this project since the HHC 2004 conference, but I expect to be able to run my first simulation within the next couple of weeks. Because I will be implementing this in an FPGA the power management will need to be done externally (so that I can power down the FPGA), and I still need to work that out. I intend to make that operation transparent to the user.

The other issue is the different voltage levels involved. The FPGA core runs at 2.5V, the FPGA I/O and memories run at 3.3V, and the 41C bus runs at 6V. I've got the 6V translators designed, but still need to design the power supplies for the remainder of the stuff.

I will post progress reports as I make progress.

Monte Dalrymple

HP 65 program tips

*Message #1 Posted by **Ralph** on 31 Jan 2005, 7:07 a.m.*

Somewhere on the hp65 owner's handbook it stats that when starting program execution from the keyboard pressing [R/S], the first [RTN] is ignored by the calculator and it stops at the second [RTN] found. That's true, but it seems not only the first [RTN] is ignored, also every [g][NOP] instruction found till the second [RTN].

If you try the following program (clear memory first):

LBL A_ 5_ RTN_ 2_ g NOP_ +_ RTN

Pressing [A] will leave the answer 5, pressing [GTO][A] and then [R/S] will leave 7!

If you try this other program (clear memory first):

LBL A_ 1_ RTN

Switch to RUN mode and press [GTO][A] and [R/S]. The calculator passes through A and all following [g][NOP] steps on memory, back to top of memory and stops at [RTN]. If you look the stack contents the number 1 is on both X and Y registers (A has been executed two times).

Supose I'm the LAST one who discovers this...

Was this the "cocked" vs. "uncocked" RTN status?

*Message #2 Posted by **Gene** on 31 Jan 2005, 9:58 a.m.,*
in response to message #1 by Ralph

I think something like this was described back in the 1974/1975 PPC Journal issues.

By the way, if you DON'T have a copy of those from Jake Schwartz on CD, you're really missing a wonderful resource. :-)

Non-operating extended memory in my HP41CX

*Message #1 Posted by **Bartolome Dagdagan** on 31 Jan 2005, 1:33 a.m.*

I hope someone could help me on this problem. I have an HP41CX that somehow I could not create any file in the extended memory. Every time I attempted to create a file, the message "NAME ERR" is displayed. When I execute EMDIR, it displays "FL NOT FOUND". But when I execute EMROOM, it displays 124.00, which is the number of registers in the extended memory. Also, when I access Catalog 4, it also displays "FL NOT FOUND". I also noticed that everytime I tried to compute the number of days between dates using DDAYS, it always displays "OUT OF RANGE". Any assistance on this problems would be greatly appreciated.

Re: Non-operating extended memory in my HP41CX

*Message #2 Posted by **Karl Schneider** on 31 Jan 2005, 3:32 a.m.,*
in response to message #1 by Bartolome Dagdagan

Bart --

I don't consider myself a 41CX "guru", but I do use one recreationally.

EMDIR -> "FL NOT FOUND" and EMROOM -> 124 are certainly consistent with no files stored in Extended Memory.

What command(s) are you using to try to create a file? The 41CX offers the following:

- CRFLAS (for creating an ASCII text file)
- CRFLD (for creating a data file)
- SAVEP (for creating and saving a program file)

Are you following all syntactical and procedural rules when creating the file?

Edited: 31 Jan 2005, 3:44 a.m.

Re: Non-operating extended memory in my HP41CX

*Message #3 Posted by **Bartolome Dagdagan** on 2 Feb 2005, 2:18 p.m.,*
in response to message #2 by Karl Schneider

Karl,

I was using the CRFLAS command to create a text file. In fact, I am following an example in the Owner's Manual Vol. I, page 116. And everytime I execute the CRFLAS command, the NAME ERR message appears on the display. I just purchased this calculator about a month ago from Ebay. I am working through the manuals to see if all the functions of this HP41CX work. But somehow, this Extended memory portion seems not to work. In addition, the DDAYS command seems not to work also, because everytime I try to find the number of days between dates the message OUT OF RANGE appears on the display. I hope you or someone could help me. I truly appreciate your help.

Re: Non-operating extended memory in my HP41CX

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 2 Feb 2005, 7:37 p.m.,*
in response to message #3 by Bartolome Dagdagan

Hi, Bartolome;

I own an HP41CX and when I execute [SHIF][CAT]4 and there is no file in the extended memory, the message is DIR EMPTY instead of FL NOT FOUND. FL NOT FOUND is standard for GETAS and SAVEAS, X-Functions that use HPIL mass storage devives for retrieving and saving ASCII files. I'd suggest a Master Clear procedure: [ON][CLx] and wait for MEMORY LOST in the display. If the problem persists, another possible procedure would be using the ROM (module) with tests to find what is going on. The third option would be www.fixthatcalc.com.

About DDAYS generating OUT OF RANGE error message. The weirdest of all is that OUT OF RANGE applies only to T+X and DATE+ when resulting values are actually out of range. If you set either DMY (execute it with [XEQ][ALPHA] DMY [ALPHA]) or MDY prior to execute any date-related operation and values are not accordingly, DATA ERROR is the related error message, not OUT OF RANGE. This I actually don't understand.

Is there any chance that your HP41CX has been hacked and it has extra functionality? The only explanation I can find (at least in a brief reasoning) for this behavior, considering that the calculator is working properly, is that there are user programs with these very names already stored in memory. In this case, RAM is searched first for any possible executable, which allows custom programs with the same name as functions to be executed first.

Anyway, none of the above explains FL NOT FOUND after CAT 4 with an empty extended memory...

Not so much of help, I now, just additional info.

Let us know what comes next; I hope you succeed fixing your HP41CX.

Cheers.

Luiz (Brazil)

keyscan for 49g ...and g+?

*Message #1 Posted by **Eric L** on 30 Jan 2005, 6:21 p.m.*

Hi all, its been a while. There is a command on the 49g (keyscan, keytime, scantime...??) that will increase the rate of scanning for key presses..I've searched, and not found the thread, any one want to volunteer this info?

I'm busy with engineering classes, and it would help to KNOW that three 3s' and not 2 are entered! Thanks.

Re: keyscan for 49g ...and g+?

*Message #2 Posted by **Raymond Del Tondo** on 30 Jan 2005, 9:38 p.m.,*
in response to message #1 by Eric L

I think you mean ->KEYTIME...

Raymond

Yes, KEYTIME-> ...how to use it?

*Message #3 Posted by **Eric** on 30 Jan 2005, 11:47 p.m.,*
in response to message #2 by Raymond Del Tondo

You are right (I believe), the question remains, how to use it? Also, what is the default scan rate?

I'm hoping it will (should) apply to the 49g+...

Re: Yes, KEYTIME-> ...how to use it?

*Message #4 Posted by **James M. Prange** on 31 Jan 2005, 4:59 a.m.,*
in response to message #3 by Eric

Where "\->" represents the right arrow character (141 decimal) and n represents the time in ticks (1 tick=1/8192 second), KEYTIME\-> returns the current keytime value, and n \->KEYTIME sets a new keytime value. For example, 512 \->KEYTIME sets the value to 512/8192=1/16 second.

It works in both the 49G and the 49g+. For the 49G, the default is 1365 (which seems a bit high for many users), and for the 49g+, the default is 0. Apparently, the 49g+ developers didn't think it was necessary for this model, but perhaps kept it for compatibility, or maybe as a policy of not fixing what isn't broken.

I wouldn't call it a "scanning" rate, but rather a means of ignoring key "bounce" occurrences. If the same key is pressed again in less than n ticks, then the second keystroke is ignored. It has no effect at all on how soon you can press a different key and have it register.

Personally, although I often have missed keystrokes on the 49g+, and occasionally on the 49G, I've yet to experience any key bounce problem (a single keystroke registering more than once) with either, even with the keytime value set to 0, but it wouldn't hurt to set it to a fairly low value to prevent key

bounce problems. Setting the keytime to too high a value will make it difficult to type in the same key repeatedly.

Setting the keytime value has no effect on most missed keystrokes, except that setting it too high may well cause repeated presses of the same key to be missed.

For the missed keystrokes problem, the best I can suggest is the "just press firmly" method; that is, press the key until it definitely bottoms out, not just until you feel the "click".

Something that may help you to detect missed keystrokes is to check the "Key Click" option in the "MODE" input form, which will cause a short beep with each (registered) keystroke as it's removed from the key buffer. But this might not be any help in a noisy environment, and may well annoy others in a quiet environment.

For what it's worth, the information that I have on the 48SX is that it scans the keyboard once every millisecond and generates an interrupt when a keypress is detected. Once the interrupt has been generated, the keyboard handler checks which keys are pressed. Whether this is accurate, and whether it's still accurate for the newer calculators, I don't know. Some contend that at least part of the problem with missed keystrokes on the 49g+ has to do with switching CPU speeds when a keystroke is detected, or perhaps that the Saturn microprocessor is emulated by software running on the ARM microprocessor.

Note that with all of the RPL models, up to 15 keystrokes are stored in a FIFO buffer, so you can press a few keys while the "busy" annunciator is on, and they'll be processed when the system is ready for keyboard input again. If the "Key Click" option (49 series only) is enabled, then the beeps won't occur until the keystrokes are removed from the buffer.

Regards,
James

My 15c has shaky keys

*Message #1 Posted by **James** on 29 Jan 2005, 6:27 p.m.*

I got a used 15c a few weeks ago and realized that the enter key and some of the number keys has kind of SHAKY feels when I press it. It's in a mint condition and it passed all the tests but it still bugs me a lot. Am I just being too sensitive??

Re: My 15c has shaky keys

*Message #2 Posted by **JDH** on 29 Jan 2005, 9:00 p.m.,*
in response to message #1 by James

Some have shaky keys and some don't this being said my 1989 made HP 15C doesn't have this problem. It also could be that it has been openned the the plastic rivits removed and re installed to fix it, in that case there probably isn't enough pressue on the keys to stop them shaking. If it is only minor shaking keys I would say it is just the way it is. If it is major you will probably find it is a rebuild.

in response to message #1 by Ronald

I know about 20 of them which are still alive.... not very much. The oldes is 1143A00357.

Matthias

Re: HP 35 Version Red dot How many still "alive" ?

*Message #3 Posted by **David Smith** on 29 Jan 2005, 3:04 p.m.,*
in response to message #2 by Matthias

Serial number 00007 sold on Ebay a couple years ago... went for less than $500 if I remember correctly.

Re: HP 35 Version Red dot How many still "alive" ?

*Message #4 Posted by **Wlodek Mier-Jedrzejowicz** on 31 Jan 2005, 12:53 a.m.,*
in response to message #1 by Ronald

Ronald asked:

"I was wandering how many Original HP 35, version 1, Red Dot would still be around?

I remember to have read some place 10.000 were produced. Is that correct "

I wrote "about 10,000" in my book "A Guide to HP Handheld Calculators and Computers", having been told this number by one of the people who should have known, at HP Corvallis, when they were still designing and making the calculators there. (Yes, I know the HP-35 was a pre-Corvallis product.) It seems about right, but I can not guarantee this number. The book has further details about the different types of "version 1". As I wrote there, most people who have one are aware that they have something special, so I expect that most are still around.

Ronald specifies "Original HP 35, version 1" - do you know of any "fake version 1" units? Has someone been drilling holes in later versions, extending the ON/OFF switches, and sticking red tape to them? :-) Or maybe you mean "Later HP 35 version 1" units - a few HP-35 units were made from remaining parts and presented to HP-35 team members to celebrate the 5th anniversary of the introduction - a very few of these might have been "red dots" if any "red dot" components were still available 5 years later.

The last time I checked, my red-dots still worked :-)

Enjoy your HP-35, but take care of it!

Wlodek

Actually, I know of someone who did drill a hole!

*Message #5 Posted by **Gene** on 31 Jan 2005, 7:39 a.m.,*
in response to message #4 by Wlodek Mier-Jedrzejowicz

Wlodek wrote: "Has someone been drilling holes in later versions, extending the ON/OFF switches, and sticking red tape to them? :-)"

Gene: I do know of one person who bragged to me that he had figured out how to make a hole in the case with the proper red appearing underneath when turned on. He told me that someone would have to take it apart to tell the difference.

If that sounds dishonest on his part, it was...and the person later turned out to be dishonest generally.

Re: HP 35 Version Red dot How many still "alive" ?

*Message #6 Posted by **Ronald** on 31 Jan 2005, 11:41 a.m.,*
in response to message #4 by Wlodek Mier-Jedrzejowicz

Hello Wlodek

You are right regarding the number, it was in your book it was mentioned (i have the book and it is a absolute must item have I think for collectors).

I was refering to a HP 35 Calc sold January 18 on Ebay which indicated to be a red dot, but the picture was more or less blurred and the serial number looked high (Serial $ 1302A 85817). On my request no additional pictures were send so I skipped this auction.

Both the starting number 1302 looked out of range and 85817 unit's made seemed also more than I remembered, so my, a little bit leading question: How many real ones.

Ronald

Re: HP 35 Version Red dot How many still "alive" ?

*Message #7 Posted by **Frank Boehm** on 31 Jan 2005, 3:00 p.m.,*
in response to message #6 by Ronald

I didn't receive any pictures as well - even though I asked twice. That calc was "fishy" at best.

Actually the molded plastics of post-red-dot calcs had the hole area still visible, so it would be very easy to modify a V2 into a V1. I guess only 1143 USA models with the small serial-number label are genuine; I doubt they made a "5th anniversary model" from spare parts...

Re: HP 35 Version Red dot How many still "alive" ?

*Message #8 Posted by **Wlodek Mier-Jedrzejowicz** on 31 Jan 2005, 8:54 p.m.,*
in response to message #7 by Frank Boehm

Yes, the serial number label is the clincher for a real "red-dot", as it is harder to forge than the hole. I have not seen or heard of any red-dots with date codes above 1143. My guess would be that a little more than half the original 10,000 have survived, say 6,000 - and of 7 I have seen in the past few years, 6 were working, so (again at a very rough guess) we might expect there to be around 5,000 still around _and_ working. Good luck getting a real one!

Re: HP 35 Version Red dot How many still "alive" ?

*Message #9 Posted by **Ronald** on 1 Feb 2005, 2:12 p.m.,*
in response to message #8 by Wlodek Mier-Jedrzejowicz

Hello Wlodek,

Seems like a fair guess, maybe a bit less.

Thank you.

Ronald

Repairing plastic

*Message #1 Posted by **Frank J** on 28 Jan 2005, 9:02 p.m.*

Hi, can someone provide a brand name for a "liquid plastic" suitable for reparing broken posts and similar in calculator housings, i.e. for adding material, not merely gluing together parts.

The material should be able to bind well to the "typical" sorts of plastic used for calculator housings and it should harden to a material having plastic like properties: strong and flexible but not that hard that it cannot be cut to shape with e.g. a knife.

If you know such a material and have good experience using it, please let the Forum know. Thanks.

Re: Repairing plastic

*Message #2 Posted by **Katie** on 29 Jan 2005, 9:52 a.m.,*
in response to message #1 by Frank J

I use this: http://mcm.newark.com/NewarkWebCommerce/mcm/en_US/endecaSearch/partDetail.jsp?SKU=20-1090&N=4. It's not the easiest stuff to work with but it binds extremely well and is excellent for replacing missing material.

Password game for both 32SII and 15C

*Message #1 Posted by **GWB** on 28 Jan 2005, 7:05 p.m.*

Hi,

I've just bought in a shop just three or four blocks away from my place a second HP 32SII, a brown bezel one, Singapore made. It had been lying there for at least one year, the question was to buy or not to buy it. The price had dropped from R$ 250,00 to R$ 200,00 and I bought it for R$ 185,00 (USD 69.89) after making sure it passed the self test. When I removed the PVC film it was wrapped in, I found inside, to my surprise, it was like new: no personal marks, no scratches, totally mint (it lacks manual and case though). Actually it looks like it has never been used. Isn't that amazing?

When I bought my first 32SII new in box, two years ago, for about USD 80.00 and posted a message like this in comp.sys.hp48 someone complained: "rather than telling everybody about the bargain, you should submit a real contribution related to the 32Sii" (not his exact words). Though he had been kind of rude, I posted later an old program for the 15C which I had reconverted for the 32Sii. No one complained then, but no one replied...

Here it is:

```
Password game (HP-32SII):

 E         006.0         A5A3
 F         009.0         C7DF
```

The goal is to guess a 4-digit password, ranging from 1234 to 9876, no repeated digits and

no "0" digits. The program gives you clues in the following format:

R.W

where "R" is the number of digits belonging to the secret password that are in their right positions and "W" is the number of digits that, although belonging to the password, are in wrong positions.

Program usage:

Enter your guessing and press XEQ M, the calculator will give you the first clue; enter your next guessing and press R/S until you get 4.0, meaning that you have found the correct password. Then press R/S again to see the number of tries and reset flag 1. You may also press XEG M between guesses instead of pressing R/S.

Example:

```
1234 XEQ M -> 0.2
5678 R/S   -> 2.0
5612 R/S   -> 0.1
3178 R/S   -> 3.0
4178 R/S   -> 4.0 (correct guess!)
R/S        -> 5   (5 tries)
```

The original version of this game, which used some programming tricks to save memory steps was included in the TI 59 manual, by Texas Instruments. When I switched to HP 15C after my TI 59 was stolen, I soon converted it to run in the new calculator, a straightforward conversion as you can see - then I was not worried about in saving memory. An experienced RPN programmer would have made it shorter, but at the time this was the best I could do.

Password game (HP-15C):

```
001 f LBL A 5 CHS 10^x 4 + STO I STO .2 x<>y
010 f LBL 0 10 ÷ ENTER f FRAC 10 X STO (i)
            x<>y g INT

in response to message #2 by Eddie Shore

You forgot to add an irony smiley, Eddie. Is there one for this?

In fact I have presented this program as a curiosity item, just to show you what calculators games were like back in 1980. I imagine some people who bought their TI58s or TI59s might have typed it in and played it for a while. Anybody here who have?

Anyway, I've been expecting remarks about the first part of my posting. I have an old folder from HP presenting a USD 69.95 price tag for the 32SII. Considering their rarity today I thing it was worth the price. But I am not please yet: I am still in search for a mint 42S (but not willing to pay ebay prices).

Regards,

GWB.

Non-working Wand

*Message #1 Posted by **Juergen (CH)** on 28 Jan 2005, 4:26 p.m.*

I've got a non-working wand for my HP-41. The LED lights up, but it doesn't read any barcode. Turning on the calculator by the wand doesn't work, too. Is there anybody out there who has experience in repairing wands? Any help highly appreciated!

Thank you, Juergen

Re: Non-working Wand

*Message #2 Posted by **Tony Duell** on 28 Jan 2005, 4:32 p.m.,*
in response to message #1 by Juergen (CH)

There's a schematic for the 82153 Wand on the HPCC schematics CD-ROM....

Anyway, there are 3 wires in the cable. IIRC they're black (ground), red (Power) and white (signal). I'd start by connecting a 'scope or logic probe/analyser to the white wire and trying to scan some barcode. If you get transitions on the white wire, then the wand itself is working, the problem is either the HP41 connector or the direct-on-board chips in the module. If the wand itself is the problem, you can open it up (it is glued together, but it can be separated) and look at the PCB. There's a dual op-amp chip and a few standard components there.

in response to message #2 by Tony Duell

Ooops... The schematic isn't on the current version of the CD-ROM (I handed a bit of paper with it on to Dave Colver to stick on the next version, though). I am sure if you ask him nicely he'll find a way to get it to you....

in response to message #3 by Tony Duell

Thank you, Tony, for these hints. I was not aware that the wand service manual is on the TOS DVD. Just started to read it; hope it helps.

But if the chip is faulty I guess there is no big chance to repair it. And to open the wand, you have to crack the body! A rather destructive act. Not as easy as replacing the gummy wheel in a card reader.

Re: Non-working Wand

*Message #5 Posted by **Tony Duell** on 29 Jan 2005, 2:35 p.m.,*
in response to message #4 by Juergen (CH)

If the HP41 module (and therefore the 2 direct-on-board chips inside it) is good, you can probably fix the wand. The chip inside the wand is a standard part. In any case the module can be used with a little add-on circuit to download programs into the 41 (without needing an HPIL interface).

I have opened up wands non-destructively. Yes, you can see they've been taken apart -- slight marks in the plastic -- but they are still very useable. HP service manuals often tell you that case parts need to be replaced when they don't -- HP service centres sent the thing back in as-new condition with no marks, etc....

That sounds interesting. Is there any documentation about this? I guess it requires some software on the PC.

in response to message #8 by Bill (Smithville, NJ)

Get the LIF Utilities for Linux from

http://www.hpcc.org/datafile/hpil/lif_utils.html

The information (ascii-art schematic, PIC source code, etc) to make the interface is in there. So are the linux programs to turn HP41 program and data files into barcodes. You are welcome to port those to other machines.

Re: Non-working Wand

*Message #10 Posted by **Bill (Smithville, NJ)** on 30 Jan 2005, 1:54 p.m.,*
in response to message #9 by Tony Duell

Thanks Tony. I'll take a look at them. Will give me an opportunity to load Linux on one of machines.

Bill

```

Yes! I remember in the early 80s I dissasembled the HP-41 interface of my second wand (won as a reward for contributing programs to the European Program Library -- UPLE), and connected it to the user port of my BBC micro.

Later I found out that I could enter programs by touching the tip of my other (intact) Wand to the CAPS LOCK LED on the BBC keyboard and then pulsing the LED under program control.

Almost 20 years later I found out that I could have burned the sensor on the Wand if the external LED was too bright. Ignorance is bliss :-)

**vp

PS I also connected the Wand (sans HP-41 interface) to the joystick port of my BBC to read barcodes distributed by a UK magazine called (I think) BBC Micro User.

The wand interface is just three wires, +5V, GND and TTL output.

Re: Non-working Wand

*Message #12 Posted by **Tony Duell** on 30 Jan 2005, 8:24 a.m.,*
in response to message #11 by Vassilis Prevelakis

I've fitted an optoisolator chip inside the HP41 module of my Wand, details are in the LIF Utilites for Linux distribution. The LED side of the optoisolator goes to whatever I want to use to send data to my 41...

As regards burning out the wand by shining an LED at the sensor, I've seen that reported in PPC Journal, but honestly I don't see how it could happen. Well, not unless you use a laser or something. I would be interested to know exactly what fails when you do this.

Re: Non-working Wand

*Message #13 Posted by **Ion Abraham (New Mexico USA)** on 28 Jan 2005, 8:23 p.m.,*
in response to message #1 by Juergen (CH)

Dear Juergen,

While I'm sure Tony's suggestions are very good, I would advise you to try some simpler things first.

My experience with the wand is that it is VERY temperamental. If the LED lights up, then you might try scanning bar codes in the only way I found that works, which is with a ruler.

That is, take a nice thick ruler, line it up perpendicular to the barcode, and sweep your wand at about a 30 degree angle smoothly across the barcode.

I'd be interested if it works.

Good luck,

Ion Abraham Albuquerque, New Mexico, USA

Re: Non-working Wand

*Message #14 Posted by **Juergen (CH)** on 29 Jan 2005, 1:00 p.m.,*
in response to message #13 by Ion Abraham (New Mexico USA)

I have another wand which works fine so I know "the beast". I suspect that one of the electronic parts is dead... :(

But I don't like to throw away these fine HP stuff. That's why I try to repair the wand.

Re: Non-working Wand

*Message #15 Posted by **Christoph Klug** on 1 Feb 2005, 4:19 a.m.,*
in response to message #14 by Juergen (CH)

Dear Tony,

your program download application sounds interesting, also your hardware modification - using an opto coupler.

What do you thing about an external keyboard (there exist some nice and small keyboards for notebooks and laptops) for HP41 : Between the keyboard output and the wand module input we need a cpu for generating the TTL level input signals for the wand module. With this hardware application we are able to input alpha text, and some control comands like ALPHA, PRGM, USER and so on to HP41....

Please give a response about this idea...

Regards - Christoph Klug

Re: Non-working Wand

*Message #16 Posted by **Tony Duell** on 1 Feb 2005, 6:37 a.m.,*
in response to message #15 by Christoph Klug

Sounds like an interesting idea. You could use the 'paper keyboard' codes, but of course that would prevent you entering syunthetic program instructions. But I can't (off the top of my head) think of a simple way to get round that.

I think a keyboard with the PC/AT (or PS/2) interface would be a lot easier to use than one with a USB interface. You'd need a microcontroller between that and the wand module. You're welcome to

make use of the code (and schematics) that I used, of course.

I have, somewhere, the notes I made on what the wand output looks like when you scan a row of barcode. If it's not obvious from my source code, I'll look it out.

Re: Non-working Wand

*Message #17 Posted by **Meindert Kuipers** on 1 Feb 2005, 1:32 p.m.,*
in response to message #16 by Tony Duell

Tony,

I have done the USB Interface in my MLDL2000 and I can tell you that is is really very simple to use. The only problem is that you need to build a PCB, but there are some DIP size modules available that should work as well. I use the FT2232C from FTDI, have a look at www.ftdichip.com and it is straigthforward to have one of the I/O's blink a led. BTW, my Wand is broken as well, but the problem seems to be in the ROM as I get no listing in CAT 2. BBTW, I do not mind very much, since having an MLDL2000 will beat any other connection between PC and HP41 ;)

Meindert

Re: Non-working Wand

*Message #18 Posted by **Tony Duell** on 1 Feb 2005, 2:49 p.m.,*
in response to message #17 by Meindert Kuipers

I've not seriously looked at USB (none of the over 200 computers that I own can support it), but I was under the impression that there were 'master' devices like PCs and 'slave' devices like, presumably, keyboards, the MLDL2000, etc. And I was also under the impression that making a slave was a lot easier than making a master. To talk to a USB keyboard, though, presumably you'd have to do the latter.

As regards your wand, if it doesn't show up in cat2, then the HP41 is not detecting the ROM. Since you clearly have an MLDL, I would start by looking at the page where you'd expect to find the wand ROM to see if anything appears. You could also try cleaning the contacts on the wand module and checking the soldering between the connector and the wand module PCB.

Finally, the MLDL is only a solution to linking the HP41 to a PC if your PC supports USB. Mine doesn't....

Faded display on HP15-C

*Message #1 Posted by **Larry** on 28 Jan 2005, 3:52 p.m.*

I dug out my HP-15C the other day (purchased new in 1982!) and turned it on. The batteries are fresh. It turned on fine but the display is faded - many of the LCD segments are not as dark as they should be. The display is still readable but of course not as clear as it should be.

I tried a different set of batteries - same problem

Has anybody seen this problem before? The calculator self tests fine and is usable but it would be nice to have this fixed if it could be

Thanks

Larry

in response to message #1 by Larry

Hi Larry , hi everybody!

This is my first time here and I would like to say that I have just bought an HP15C that shows a "faded" display.The unit is like new and has been kept in a drawer or shelf for 19 years !! (its serial number is 2635B11858).Its display is not as sharp and "black" as my 11C that has 2707B05949 serial number.It is not a real "problem" but I wonder if it gets worse as time passes. I would like to congratulate the people who writes in this so cool forum!!

Faded display on HP15-C

*Message #3 Posted by **Larry** on 28 Jan 2005, 8:11 p.m.,*
in response to message #2 by Alexandre

Hi

Yes my 15C was bought new in 1982! I used it regularly for about 4 years and then it got put into a drawer and brought out every now and then. It always worked fine until about a few months ago I brought it out to show somebody and noticed the display had faded. Not the unit is over 23 years old so I guess something had to go but the display going seems to be a bit unusual

My serial # is 2250A00792

I don't use it at all now since I use the Mathu application for the PalmOS which basically emulates the operations and functions of the unit

But would hate to junk it :-(

Larry

Re: Faded display on HP15-C

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 29 Jan 2005, 6:38 a.m.,*
in response to message #1 by Larry

Hi Larry, falks;

I once repaired an HP15C overseas (it was sent me for repairing procedures from an e-friend in Europe) and the problem was that some segments in some digits 'faded' as the display got filled with digits after the fourth one, right to left . I'm not sure yours has the same problem, maybe the fading is constant. In that case, some digits became almost unreadable after the last posible one was entered.

I soldered all terminals of the threee IC's and it did not solve the problem. In fact, had to completely disassemble the unit, remove the LCD, clean all pads and both polymers and rebuild it all again. It worked perfectly fine after that, and the last news I read from him (about one year later) were good ones.

I'm not sure this procedure will fix your HP15C's problems, mostly because I don't know if the LCD itself is actually faded. I saw some Voyagers with digits not as dark and consequently not as sharp in the edges of their segments as others. I own eight Voyagers: one 11C, two 15C, two 16C and three 12C (I also have two 12C Platinum, but it is not a Voyager in concept... I don't even know if the poor little things have a family name...). The two newer HP12C (with one single 3V, button-type, flat battery) have the worst LCD contrast, and one of the HP16C (the earliest one) either has slightly pale digits.

Maybe, just maybe, your HP15C is good as it is.

Best regards.

Luiz (Brazil)

Yeap! Unfortunately no HP10C!

I'm aware of the difficulties involved on "hunting" one of this, so I sadly accept **not** having **one HP10C amongst** the other ones... Also, prices are somehow high!

Best regards, John!

Faded display on HP15-C

*Message #9 Posted by **Larry** on 30 Jan 2005, 3:17 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

I think my problem sounds more like the one you describe where alll the digits are not as dark as they could be - they lack contrast. Certainly it wasn't like that new (of course) and not even about a year ago when I last looked at it. So it seemed to have faded with no use?

Since I don't use it anymore I guess it's not a huge problem but I feel a certain sadness that such a great calculator is now not so usable and the repair seems to be major

Larry

Out of interest can anybody recommend a place to repair a 15C?

Thanks

Larry --

Randy Sloyer at www.fixthatcalc.com repairs Voyager models and many other HP calcs. He has done fine work on two of my HP-41's, but I've never had to send him a Voyager.

He might be swaped with orders, so don't count on getting instant service...

Hi Larry,

I am curious if there is any voltage conditioning responsible for the phenomenon? What if you just power it up more often, and maybe run the self test ahtt makes the whole display fill up at the end, once a week.

Am I completely crazy to think this could help? (I don't know anything about LCD's).

regards,

Bill

Hi Luiz,

Could you describe in more detail what you did that did make a difference--was it the cleaning of the pads? What do you mean by "polymers"

OT: BTW, my son has another new ocarine--which looks Brazilian to me--tnx again for your very interesting links!

Regards,

Bill

Re: Faded display on HP15-C,

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 3 Feb 2005, 7:36 p.m.,*
in response to message #14 by bill platt

Hi, Bill;

thanks for your info! I hope your sun is having fun and great moments with the study of music instruments. Have you checked Uakti, a brazilian band that builds their own musical instruments? It´s worth checking them out (excuse me, folks... could not help adding these words.)

About the polymers: the LCD itself needs residual current to maintain information. In fact, a small "peak" current is observed when charging/discharging the small capacitors formed by the conductors that alter the pole of the crystals when changing from "black" to transparent and back. In fact, to be more precise, the crystals without the polarizer shield show no black/transparent effect.

Because of the tiny current, there is no need for low resistence conductors to electricaly contact the LCD terminals (a transparent oxide I forget the composition) to the PCB terminals (I called them tabs... is it correct?), so some "zebra" polymers with relative low resistence is used. They are thick stripes pressed between the PCB and the LCD itself (edges), and in all voyagers this is achieved through a metal frame with four tabs on the upper and lower edges (the newer HP12C´s have seven tabs, instead). After removing the frame it is possible to remove and clean all of the surface contacts and the polymers, if needed.

I have some pictures at home (I´m in the University right now) and I´ll add them tonight so you can see it better. If someone else has additional pictures, that would be good, too.

Hope this helps a bit.

Decisions...

*Message #1 Posted by **Fubar Vikinghelmet** on 28 Jan 2005, 12:18 p.m.*

So I put away my beloved HP-28S in favor of two HP-33S calculators that I'd use for prep for the PE exam.

I passed the exam! Yay!

Now, however, I've been so conditioned to using the HP-33S, even with its limited programming capabilities (I like RPL, unlimited labelling, enter key in the "right" place) that it's bittersweet going back to the 28S.

I've looked at the 48SX and I like the form factor. ...and the costs on eBay are pretty good.

Thoughts?

Re: Decisions...

*Message #2 Posted by **Ron Ross** on 28 Jan 2005, 1:12 p.m.,*
in response to message #1 by Fubar Vikinghelmet

The versaltility of the SX is nice for the cost, but you might be happier with a lower end 48G (plain). It will be slightly faster and has the built in equation library that was available as a card for the SX. Of course, if the price is right, just buy it. I like the 48 series better than the 28 series myself.

The SX allows you to expand your RAM to 288K, but you sound like you were happy with the meager 32K available on your 28s. However with PC I/O you might find 32k way to little.

You should also look at Hp's new 48Gii and 49G+. They are not that bad and are really fast. You could buy the 48Gii for less than a $100.

If $ aren't an issue, I would choose between the 48GX or a new 49G+. I like the feel and quality of the older 48GX, but I also love the speed of the newer Hp49G+ (and memory cards are a LOT LESS). But memory really isn't needed either for a general calc user.

The 49G+ is an easy choice as it really isn't that much more than the less capable 48Gii, and a LOT LESS than a 48GX. Why the GX is so expensive is probably its reputation as a quality calculator and the amount of hardware that is GX specific in the Survey field. And field serveyors tend to abuse their equipment and therefore use up their stocks of Hp48GX's and are now looking to purchase ones where ever they can get them.

Re: Decisions...

*Message #3 Posted by **Jeff O.** on 28 Jan 2005, 5:09 p.m.,*
in response to message #1 by Fubar Vikinghelmet

First, congratulations on passing the PE test. In society's eyes, you are now safe to practice your craft. Do you feel any different?
Regarding 28S vs. 48SX vs. etc., based on your "enter key in the "right" place" comment, my guess is you won't like Ron's 48gii or 49g+ suggestions. I personally never cared for the 28C or 28S. Maybe the form

factor, maybe the RPL (with which I have never really become comfortable). While you might get a 48S or 48SX for a reasonable price, I think you would do better with a 48G, G+ or GX. They are newer, and are more widely used. The only advantage that the GX has over the G+ is the ability to install memory and application cards. Since either easily connects to a PC for mass storage, you don't really need memory cards for that purpose, and no one is producing new application cards anymore. For running and storing programs, you would probably do fine with a G+. I haven't been following auction prices for either model lately. I know that GX prices really jumped after it was discontinued, but don't know if the G+ prices are still reasonable.

Re: Decisions...48GX + 49g+

*Message #4 Posted by **Veli-Pekka Nousiainen** on 29 Jan 2005, 10:01 a.m.,*
in response to message #3 by Jeff O.

I think you need the 48GX for dumping the ROM of 28S and 42S for the rmulators. The 49g+ is very fast and can be easily overclocked for lengthy calculations using only software
[VPN]

Re: Decisions...

*Message #5 Posted by **Fubar Vikinghelmet** on 30 Jan 2005, 12:42 p.m.,*
in response to message #3 by Jeff O.

"In society's eyes, you are now safe to practice your craft. Do you feel any different?"

1. It is not possible to describe the relief, though I have been told by every PE I know that they felt the same way.

2. I feel very, very dangerous. I feel sue-able.

3. I am cautious, cautious, cautious.

I like to write little programs on-the-fly; but I also want to be able to save these little programs, organize them, and have them at the ready even if I haven't used one in a while. For example, I have a whole bunch of ASCE 7 wind load (I'm a civil/structural engineer) programs that I want to have at my fingertips all the time. My 28S allows me this luxury... I honestly do not anticipate a need for the application cards, but who knows? At any rate, the prices on eBay for the 48S, 48G and others are pretty non-threatening (i.e., under $100), we'll see how well I do.

Thanks, everyone for the input!

48SX, 48GX, 49G+

*Message #6 Posted by **Eddie Shore** on 30 Jan 2005, 9:43 a.m.,*
in response to message #1 by Fubar Vikinghelmet

The 48SX would make a great collectable item and probably will serve almost any purpose. However, the 48G series is faster. If you plan on buying RAM cards for either, be ready to spend a lot of money.

You may want to consider the 49g+, costing about $130-140, with expendability capabilities via SD (security digital) cards. The cards cost anywhere from $19.99 to $59.99 depending on how much memory you desire. The potential downside is that the ENTER key is one "key" long and at the bottom right.

Re: 48SX, 48GX, 49G+

*Message #7 Posted by **Chan Tran** on 31 Jan 2005, 10:34 a.m.,*

in response to message #6 by Eddie Shore

While I like the SX in many ways. I like its color scheme better than the GX. It has sufficient functionality for me. I don't need the GX function nor its higher speed. But, the display on the SX is very difficult to read.

Re: 48SX, 48GX, 49G+

*Message #8 Posted by **Raymond Del Tondo** on 31 Jan 2005, 4:01 p.m.,*
in response to message #7 by Chan Tran

Hi,

check the link below and look at the pictures,
then you'll never want an SX display again.
Maybe you'll even don't want a 'normal' GX display,
because the G models with the 49g display are
much better to read (IMHO;-)

From today's view, the SX display is nearly the worst,
after the one of the OmniGo 100, OmniGo 120,
and then, after a while, the 42S.

*Message #9 Posted by **Fubar Vikinghelmet** on 31 Jan 2005, 5:40 p.m.,*
in response to message #7 by Chan Tran

As far as hard to read is concerned, the 33S display was really hard to read, though strangely I've gotten used to it. I really, really like the 28S' display, though.

From what I've seen on eBay, the 48 series (S, G, whatever) look pretty good.

Re: 48SX, 48GX, 49G+

*Message #10 Posted by **Ed Look** on 31 Jan 2005, 8:31 p.m.,*
in response to message #9 by Fubar Vikinghelmet

Heh. I did say that that 33S will grow on people. It did on me. After seeing its keyboard kosmetix and reading all the naysayer posts about it, I feared getting one. I did anyway (partly because it was HP and partly because it was RPN) and initially, it was strange, but being RPN, it quickly grew on me and I actually enjoy using it.

Mr. Messed Up Nordic Headgear, you might consider doing what I do: at work, it's a tag team of 33S and 48G(+ or X for you, I guess; I am afraid to bring my G+ in) because I love the facile RPN and decent programmability of the 33S for less demanding stuff and if I need some of my little specialty progs or the database capability of the 48G, I then switch off to it. There are times I have both out and on and running.

HP-41CV Keyboeard Problem

*Message #1 Posted by **Daniel Diggelmann** on 28 Jan 2005, 3:27 a.m.*

Dear HP Enthusiast, i've got a HP-41CV in excellent cosmetic shape and very clicky keyboard that has a signle key which works unreliable. It sometimes works ok end then sometimes has to be pressed very hard to register. I openen the calc and saw the small hole to access the contact. I tried to gently clean it with a thin wire but this doesn't seem to help. Does anybody have a good idea. I don't see anything worng with it. Normally HP-41s have a very good keyboard. Thanks for any help Daniel

Re: HP-41CV Keyboeard Problem

*Message #2 Posted by **David Smith** on 28 Jan 2005, 12:21 p.m.,*
in response to message #1 by Daniel Diggelmann

Try cleaning it again a few times. Place a drop of alcohol on the hole and dip the wire brush in more alcohol. Some keys can be a bit stubborn about being cleaning and need the extra work.

Re: HP-41CV Keyboeard Problem

*Message #3 Posted by **Artur** on 28 Jan 2005, 3:07 p.m.,*
in response to message #2 by David Smith

Hi, After opening some HPs keyboards, I don't believe place a drop of alcohol is a good idea. The contact in 10 and 41 series is a little curved steel plate over the pcb and under a seal plastic. In some cases, may occur some oxidation, and alcohol may increase it, if it is not cleaned from the contact, as water will condense. If the problem becomes serious, I have only one way to fix it: breaking all melting plastics (carefully) that tight the PCB to the case, removing the plastic partially around the key and cleaning it with a small piece of fine sand paper. By the way, clean everything and, after that, put back the plastic and mount the pcb to the case. You really do not have to glue the PCB to the case, because 41 has the screws on the back! Good look! Artur

Re: HP-41CV Keyboeard Problem

*Message #4 Posted by **David Smith** on 28 Jan 2005, 5:55 p.m.,*
in response to message #3 by Artur

Alcohol will work just fine and not cause any problems. I have done this many hundreds of times. It helps to use the 91%+ isopropyl alcohol. Keep it off the display window... it will leave a white stain behind (but this can be polished off).

Cutting apart the keyboard is a recipe for disaster. Getting it back together again so that it feels like new is very difficult.

Re: HP-41CV Keyboeard Problem

*Message #5 Posted by **Daniel Diggelmann** on 28 Jan 2005, 5:57 p.m.,*
in response to message #4 by David Smith

Many thanks for your inputs. I'll try the alcohol way first. and if it doesn't help i'l just drink it ;) I'll let you know my results.

Cheers Daniel

Re: HP-41CV Keyboeard Problem

*Message #6 Posted by **Daniel Diggelmann** on 1 Feb 2005, 4:27 p.m.,*
in response to message #5 by Daniel Diggelmann

Juppie! my HP-41CV is registering every single keystroke after cleaning the contact with isopropyl-alcohol. It was so easy to do and i hope it will continue to work for a good while. Many thanks for your ideas and help. Cheers Daniel

an ebay question

*Message #1 Posted by **db (martinez, ca.)** on 27 Jan 2005, 7:24 p.m.*

If someone knows about ebay theft; please tell me if there is anything i can do.

I bought something other than an rpn calculator almost 3 months ago. I was ripped off. The seller waited till after one month to send it and i didn't report it till it turned up, dissassembled and ruined; so she does not have to answer to paypal because they only go back a month. I have went through 4 of the little pretend ebay remedies and they just send me automated responses and do nothing. She has false contact info listed with ebay and refuses to answer ebay's automated questions to her. Ebay says in an automated response to me to report it to the post office. They won't answer my calls or emails.

I waited to that last day to leave negative feedback, thinking that something would work out. Now ebay's feedback system will not let me leave negative feedback. I have wrote about 15 or 20 statements for ebay and paypal, wrote paper letters to both of them, tried to contact the seller and the post office. No dice.

Is there a way to contact a person in the faceless festering fake "buyer assurance" program of ebay?

This happened to me too ...

*Message #2 Posted by **Artur** on 27 Jan 2005, 8:41 p.m.,*
in response to message #1 by db (martinez, ca.)

With a 4Gb MicroDrive. The seller told it would work in any CF device. But he forgoten to tell it picked it up from an Ipod MP3 Player, and these drives does not work in any other device. After two months, there nothing I could do. Only see 150 go to the trash...

Re: an ebay question

*Message #3 Posted by **Randy** on 27 Jan 2005, 8:41 p.m.,*
in response to message #1 by db (martinez, ca.)

I've never had any luck with eBay or Paypal. Never. They pass the buck back and forth until you give up and move on. Quite the scam if you ask me. What's the point of having a credit card on file as a seller or buyer? They seem totally unresponsive to recovering funds on either side so long as they get paid. Once that happens, you're on your own since all they send are form emails which are total garbage. I had a case of clearly documented non-shipment awhile back and they told me as buyer that they "could not recover my money". What a load of crap since they had a CC on file for the seller. They told me to file a dispute with the CC company which was a further joke, since it was a Paypal Visa card. If you ask me, they do absolutely nothing for the big money they suck off sellers.

The only possible solution based on my experiences: If it was paid for with a credit card, your only recourse is by filing a billing dispute. You'll probably have to send in documentation and spend considerable time with stupid forms and even stupider "customer service" personnel to get your money back. They will want to know in great detail your efforts to resolve the problem with seller before you filled the claim for non-delivery. Your persistence is the only thing that gets you your money back, they count on you giving up first.

Maybe some hope ...

*Message #4 Posted by **Pascal** on 28 Jan 2005, 9:53 a.m.,*
in response to message #1 by db (martinez, ca.)

I had a similar problem with one seller who just didn't ship the item and refused to answer any mails. Fortunately I was able to issue a negative feedback after the 3 months limit. You have to go to click on the "site map" link on ebay.com and you will find a link called "Leave feedback for a single transaction" Use this link to put your feedback here. In my case, the seller suddenly contacted me the day after I filed a negative feedback ...

Concerning paypal, I sent them an email explaining the situation and the refunded my money (it was 4 months after the transaction's end).

Good luck !

Re: an ebay question

*Message #5 Posted by **Paul Johnsn** on 30 Jan 2005, 11:05 a.m.,*
in response to message #1 by db (martinez, ca.)

Always keep in mind that eBay is simply coordinating an agreement between you and someone you've never met, somewhere else in the world. It's no secret that there are crooks out there, so be carefull. 1. I always check out the seller's rating, especially for pricier items. Most reputable sellers have 99%-100% ratings. Sellers with thousands of points may have a couple negatives, but casual sellers should have a perfect score. If you're buying something cheap, it may be worth taking a bigger chance, but remember that you're taking a chance. Also, I rarely bids to sellers with only a few points (or zero points). 2. I don't give a credit card number to someone I don't know. I normally use PayPal or Money Order. 3. You should have communications with the seller/buyer within a couple days. No contact within a week is a very bad sign. 4. Once payent is sent, you should expect notification if shipment within a couple days. No contact within a week is a very bad sign. A month is a dead givaway to a scammer. We 'got burned' in a purchase over the holidays. A book seller did not ship the book, and relisted it a few days later. We attempted further contact, and the seller's account was canceled. Followed the procedure in PayPal, we were credited for the purchase the following day!

Re: an ebay question - beware of money order pitfall

*Message #6 Posted by **David Smith** on 30 Jan 2005, 3:07 p.m.,*
in response to message #5 by Paul Johnsn

I have discovered a very nasty thing about USPS money orders. I had one lost in the mail. After 2 months the post office replaced it after paying the 3-4 dollar search fee. Since the auction was long over and the seller had relisted the item, I cashed my replacement money order. Six months later, the original money order was cashed. The post office then sent ME a bill for the duplicate payment. They claim that they have NO way of stopping payment on a money order that is replaced. My only recourse is to file a mail fraud complaint.

- beware of money order pitfall

*Message #7 Posted by **bill platt** on 31 Jan 2005, 5:43 p.m.,*
in response to message #6 by David Smith

Is it possible that in fact your money order was not lost; rather, your adversary merely claimed it was lost, waited a while, and then cashed it? Seems like an easy way to loophole.

Does the USPS keep the order or its facsimilie, showing the reciever's signature? If so, then mail fraud

is true---then what? small claims court?

It seems to me that certified, with return receipt, is the only safe way to use the money order. That way, there can be no fraud--they either get it, or not!

What dou you think?

Regards,

Bill

Re: an ebay question

*Message #8 Posted by **Tom (UK)** on 1 Feb 2005, 3:55 a.m.,*
in response to message #5 by Paul Johnsn

I am not a lawyer so my comments are just that, comments. With difficult sellers you should be firm and act fast.

Here in the UK there is a class of crime if you know (or should have known) you have assisted a fraud. Ebay may just be introducing people but they should police their system and take action to stop or correct fraud when it is reported to them. But hey ebay are making millions and the people defrauded are not paying ebay's profits and only loosing a small amount so ebay don't care. As long as the fraudulent seller pays ebay then there is little incentive for ebay to do anything.

Trading across international borders puts the buyer in limbo if there is a dispute.

I have stopped buying anything from ebay over about $50, the amount of listings I see (of items I know about) that have so many glaring 'mistakes' that serve to make the item look better than it is I have many doubts about the seller's competence (or is that honesty?) If it's not listed as it should then I stay well clear.

I bid and won a camera, the buyer banked the cheque and then gave endless excuses why the item wasn't sent. I stuck to a date when he had to send me the item or a refund. When that date passed I immediately filed a non send fraud. Ebay (Europe) did eventually refund some of the money - 6 months later. This was about 18 months ago so they may have changed policy since then.

New graphical game for the HP-42S - Okie Dokie!

*Message #1 Posted by **Erik Ehrling (Sweden)** on 27 Jan 2005, 5:31 p.m.*

Hi all!

This is just a short note to tell that I have just finished off a new graphical game for the HP-42S - Okie Dokie - converted from the Atari 2600. As the listing is fairly long, it is mainly suited for users of emulators that can load it as a binary.

Best regards,
Erik Ehrling (Sweden)

Edited: 28 Jan 2005, 3:52 a.m.

Re: New graphical game for the HP-42S - Okie Dokie!

*Message #2 Posted by **Bill (Smithville)** on 28 Jan 2005, 1:40 p.m.,*
in response to message #1 by Erik Ehrling (Sweden)

Hi Erik,

Thanks for the great game. I've already loaded it into emu42 at work and have already wasted away too much time playing with it.

I've never done any graphical programing on the 42, so I'm looking forward to looking over your code to see how it's done.

Now to transfer it to my Dell Axim PPC and then to key it into an actual 42S - probally one that can do fast speed.

Thanks again.

Bill

Thanks - but the credits should really go to Bob Colbert, I just happened to stumble across his game and thought that the idea might work on the HP-42S... :-)

> Quote:
>
> I've never done any graphical programing on the 42, so I'm looking forward to looking over your code to see how it's done.

The graphics capabilities are very rudimentary on the HP-42S. Essentially, all there is to know can be found in the Owner's Manual, chapter 9: Program Input ann Output, Graphics (in my version pages 135-140) and Programming Examples and Techniques, chapter 7: Graphics and Plotting, Plotting Data from a Complex Matrix (in my version pages 214-215).

> Quote:
>
> Now to transfer it to my Dell Axim PPC and then to key it into an actual 42S - probally one that can do fast speed.

I have entered it into my real HP-42S (rev A) and it is a bit slow in normal speed mode, so running it in double speed helps to make it more playable. On my Jornada 568 (I have actually ordered a Dell X50v but I'm still waiting for it to arrive!) I modified the KEYB42S.KMI so that the navigational pad maps to the keys 4,6,8,2.

Original version:

```
---

Scancode 38                     # Up
        Map 38 41
End

Scancode 40                     # Down
        Map 40 51
End
```

Modified version:

```
---

Scancode 38                     # Up
        Map 38 43
End

in response to message #1 by Erik Ehrling (Sweden)

Free42 version 1.1.5 and before had a bug in STOEL that would cause Okie Dokie not to work properly, or even crash the emulator. Version 1.1.6, which has the fix for this problem, is available on my Free42 page as of right now.

Erik Ehrling (Sweden)

Okie Dokie reveals another Free42 bug

*Message #6 Posted by **Thomas Okken** on 29 Jan 2005, 7:49 a.m.,*
in response to message #1 by Erik Ehrling (Sweden)

When playing 8 fields in a row, Okie Dokie starts to act weird in Free42 1.1.6. There turned out to be a really dumb error in the code that handles an overflowing RTN stack. Free42 1.1.7, now playing in a theater near you, fixes this problem, so you can actually spend ALL DAY playing Okie Dokie on Free42, without having to restart it after every 7th game.
Get Free42 1.1.7 at the usual place.

- Thomas

HX4700 & Simulators/Emulators

*Message #1 Posted by **Giuseppe Marullo** on 27 Jan 2005, 4:49 p.m.*

Hi all, just got this Ipaq and wondered what I could run on it apart from HP41, 16C and emu42 emulators.

Your recomendations?

Giuseppe Marullo

Re: HX4700 & Simulators/Emulators

*Message #2 Posted by **Christoph Giesselink** on 27 Jan 2005, 7:24 p.m.,*
in response to message #1 by Giuseppe Marullo

Emu42PPC v1.01 has been recently tested successfully on a Dell Axim X50v.

This is a 624MHz VGA PDA with Windwows Mobile 2003 SE OS. Emu42PPC v1.01 isn't supporting native VGA mode, only QVGA. But the next version v1.02 will do. I posted this picture

http://privat.swol.de/ChristophGiesselink/pict/Emu42VGA.png

of an early v1.02beta version running Emu42PPC in VGA mode using display Zoom factor 3 some days ago.

Regards

Christoph

Re: HX4700 & Simulators/Emulators

*Message #3 Posted by **Vincent Weber** on 28 Jan 2005, 5:21 a.m.,*
in response to message #1 by Giuseppe Marullo

If you are into the Voyager series, try Lygea 15C, 12C (and also 10B/10BII) wonderful simulators: www.lygea.com

If you are into 48/49 series (and 38/39/40), you can try Emu48 by Christoph.

The PocketPC can emulate/simulate almost every interesting machine HP did since the HP41, with the notable exceptions of the 32SII and the 19BII.

Hope this helps.

Cheers, Vincent

Re: HX4700 & Simulators/Emulators

*Message #4 Posted by **Giuseppe Marullo** on 28 Jan 2005, 9:46 p.m.,*
in response to message #3 by Vincent Weber

Christoph and Vincent, nice suggestions, only I don't have the roms (common problem I guess).

The HX4700 has a VERY nice display too (4"), today I was amazed on how well you could peek at a Terminal Server session.

About Lygea, it is a commercial product (I have to admit the price is acceptable), but how good is the simulation/emulation? I don't remember but there should be at least another commercial one (HP-15/HP-16).

Giuseppe Marullo

PS: does emu41 work under a msdos simulator inside a pocketpc? ouch...

Re: HX4700 & Simulators/Emulators

*Message #5 Posted by **Vincent Weber** on 29 Jan 2005, 9:09 a.m.,*
in response to message #4 by Giuseppe Marullo

Emu42 requires the ROMs (42S, 28S, 17B, 17BII, 27S) which are not release in the public domain by HP, unfortunately... If you are desperate for a 42 and do not own one (with the ROM), but can buy a cheap low-end Palm and try the wonderful Free42 simulator.

Emu48 requires ROMs, but those are in the public domain and easily found on the net.

Lygea's simulators are execellent. As far as I know, there are not emulators of Voyagers on any platforms - reason being that they are closed machines with no simple way to transfer the ROM. They are still a few bugs in the simulation (I just reported one), but overall, the programs quality are excellent.

Hope this helps.

Cheers,

Vincent

Re: Emu41 under msdos simulator ...

*Message #6 Posted by **J-F Garnier** on 29 Jan 2005, 11:29 a.m.,*
in response to message #4 by Giuseppe Marullo

> PS: does emu41 work under a msdos simulator inside a pocketpc? ouch...

I tried Emu41 under PocketDOS on my old HP360LX (PalmTop PC, not PocketPC) and it works well!! Although a little bit slowly with a SH3@60MHz.

Do you have any reference of free MSDOS emulator running on PocketPC?

J-F

Re: Emu41 under msdos simulator ...

*Message #7 Posted by **Giuseppe Marullo** on 29 Jan 2005, 7:48 p.m.,*
in response to message #6 by J-F Garnier

Hi J F, no, but with this wonderful display (480x640) I will try to grab one, I would like to see what

can be run. It has a pretty 624MHz, EMU41 should run decently I hope.

Vincent, I am not that desperate about the 42. I have enough other stuff to carry around, it MUST fit a pocketpc.

I will let you know,

Giuseppe Marullo

HP 41CX display failure

*Message #1 Posted by **Jim Stewart** on 27 Jan 2005, 12:56 p.m.*

My fifteen year old 41 CX display began going dark along the upper margin about a year ago.It has gotten gradually worse since,to the extent that the top of the fifth digit is no longer visible.Are replacement displays available?I would appreciate any thoughts.

Re: HP 41CX display failure

*Message #2 Posted by **David Smith** on 27 Jan 2005, 3:39 p.m.,*
in response to message #1 by Jim Stewart

Only source of a replacement display is another machine. Assuming your machine is a "fullnut" model, you can use this display from just about any 41C/CV/CX fullnut. Early 41C machines with the square epoxy blobs over the display chips may not work.

You can consider halfnut machines to not be worth the problems associated with repairing... removing the keyboard usually renders the machines unusable.

ROM's for Clonix and NoVRAM

*Message #1 Posted by **Jeff D** on 26 Jan 2005, 10:06 p.m.*

I have recently purchased one of each of these modules and would like to ask the following. I have the Zenrom, David Assembler, MFRM labels, RAMBOX, 512 words on the Clonix. I was wondering what others might put onto the NoVRAM to complement a complete MCODE package. Please let me know your thoughts. Thanks, Jeff D

Re: ROM's for Clonix and NoVRAM

*Message #2 Posted by **Raymond Del Tondo** on 27 Jan 2005, 5:58 a.m.,*
in response to message #1 by Jeff D

Hi,

my NoVRAM has the following config:
HEPAX, ExtIO, Ext-IL, CCD OS/X (of course;-),
David Assembler, Mainframe Labels ROM .

The HEPAX has the advantage that it uses only one
physical address page, and only one XROM number.

The David assembler, along with the Labels ROM,
simply has the best user interface for walking through ROM,
and writing mcode directly on the machine.

But the most important ROM (for me) is the CCD OS/X for obvious reasons;-)

It has functionality which I use everytime I use the HP-41,
like the extended CAT, and more.

Raymond

Re: ROM's for Clonix and NoVRAM

*Message #3 Posted by **Lawrence** on 27 Jan 2005, 10:11 p.m.,*
in response to message #2 by Raymond Del Tondo

Raymond,

I'm unfamiliar with the Mainframe Labels ROM. What is it?

Lawrence

Re: ROM's for Clonix and NoVRAM

*Message #4 Posted by **Raymond Del Tondo** on 28 Jan 2005, 2:26 a.m.,*
in response to message #3 by Lawrence

Hello Lawrence,

the Labels ROM is an extension to the David Assembler,
which makes the mainframe entry points visible and callable
by name instead of addresses only
?NCXQ 07EF
will be shown as
?NCXQ MESSL

?NCXQ 0952
then displays as
?NCXQ ENCP00

and so on.

The combination of David Assembler and
the Mainframe Labels ROM is simply
unbeatable if you really want to program
in mcode on the HP-41 itself.

For cross-development on a PC,
I'd strongly suggest SDK41.

Raymond

Electronic version of Datafile

*Message #1 Posted by **Bruce Horrocks** on 26 Jan 2005, 7:06 p.m.*

Gene's suggestion of a PDF version of Datafile is very timely as I was about to write an article canvassing members' opinions on that very subject. Let me set out the pros and cons from my point of view as Datafile's editor.

There are few or no technical production issues - Datafile is currently produced in Word, converted to PDF and sent to the printer as a PDF file. The original use of a PDF was simply to improve production quality: prior to that we had been laser printing masters which the printer copied from. This worked well enough but we didn't have an oversize printer capable of putting crop marks on the page so pages were often not centred correctly etc. Since moving to PDF, that kind of physical print quality has improved considerably and is extremely consistent from one issue to the next.

Incidentally, I only use Word because it is familiar software to many people. If I were ill, I know that I could easily hand over the editorship to someone else for one issue with few or no problems. If I were using Scribus, say, instead, then I don't know of anyone else in the Club who could pick up the role nearly so easily.

Distributing the final PDF electronically, does provide some challenges whether it is encrypted or not. Assuming an unencrypted version - i.e. everyone gets the same edition - then it could be downloaded from the web or emailed out by me.

Downloading is a non-starter because we could not control access. I do not want HPCC to get into the game of running a secure download site. There is too much hassle with managing passwords & accounts, dealing with queries etc. Also people are very intolerant of delay when dealing with all things electronic. Just look at the criticism that Joe Horn has received in this forum simply for having the misfortune to fall ill and be unable to communicate that fact. I wouldn't want be on the receiving end of that level of criticism nor create another official "role" within HPCC of "electronic membership secretary" and ask someone else to volunteer for it if they are going to become the target instead.

Emailing poses its own problems. The (letter) postal service is exceptionally reliable. We post 120 or so issues 6 times a year, so roughly 720 issues and over that year we might get one complaint from a member that their issue didn't arrive. Distributing the same number electronically, I would expect perhaps 5 or 10 *per issue* to fail or be rejected in some way - either because the user has changed their email address, has gone on holiday and their mail box has filled up, has an overactive spam filter or any one of many, many more reasons. The worst part from my point of view, is that - from talking to people who do run mailing lists - many bounce messages do not necessarily indicate which address caused the bounce. So I would be left knowing that someone didn't receive their issue but with no way of knowing who it was. Of course, you as the unsuspecting non-recipient have no way of knowing this so you get mad with me.

Some of the above problems can be avoided by distributing a version of Datafile that is individually encrypted to each subscriber. This is useful in that it prevents re-distribution (other than by printing multiple copies) since each copy is traceable to the original owner, but would require distribution of keys to each subscriber, which means a whole new set of headaches dealing with lost keys because of hard-disk failures, upgrading to a new PC etc. etc. Also I would have to buy or write some software to automate the encryption process and be sure that I can make it work for re-running previous issues when, inevitably, someone says "My hard disk crashed, could you just send me all of my issues again please?"

A solution to all of these issues would be to use a 3rd party company to distribute Datafile electronically and let them handle all the problems. There is one big advantage to this approach and that is a subscription need not be for a whole year - people could pay per issue. That would allow those interested in a particular issue to easily buy just that issue. The disadvantages are that more money goes to the 3rd party provider and not HPCC and that these types of provider, if they are to offer the secure, non-copiable documents needed to prevent electronic redistribution, usually require the use of their own proprietary, Windows-only, DRM enforcing software. This would prevent users of non- Windows machines and older, but still perfectly serviceable, machines from accessing Datafile.

Lastly, one practical problem is that Datafile is generated assuming an A4 sized page that is scaled down to A5 when printed. While this means that European subscribers could easily print their own copies, US subscribers using US letter paper would have a funny looking copy with excessive margins and very small text. Producing two versions - one A4 and one Letter is not possible - articles are often tweaked to make them fit the page size neatly and I don't really have time nor the inclination to do it twice over.

From an editorial point of view there are a number of problems with going to an electronic issue, but they are not necessarily insurmountable.

I'm sure you're all well aware that printing has a high fixed cost and very low marginal costs. Because of this it might take only a relatively small number of current subscribers to switch from the print to an electronic subscription to make the whole print edition uneconomic. Therefore, once an electronic version starts there is a very real risk that the print version would soon finish. (I suppose that if there were only a few dozen print subscribers left, I could go down to a copy shop and get them run off each time. It's the half-way house situation that is the problem - too many to print individually but too few to print by a commercial printer.)

Currently, there is a practical limit of 48 (52 at a pinch) pages to an issue. (Any more and it won't fold neatly as a booklet and really needs to be bound properly.) If I have extra material I can always hold it over to the next issue which enables me to smooth things out over the year. If there were a completely electronic issue then there would be pressure from authors to "print" their article in the very next issue, regardless of how big that issue might be and how small the following one might be.

I could always explain that some readers print their copies as booklets and so it can't get too large, but upsetting authors is not a good way to ensure a healthy supply of articles.

If Datafile did go all electronic, could it survive? That's very hard to answer. I like to think that there is a market for considered, researched articles as opposed to the majority of the internet which is instant opinion. However, the museum here has a separate section for "proper" articles but there is nothing like the volume that appears here in the main forum. It is very likely that articles would dry up: why bother writing one for Datafile when I could post it on the forum page instead? The knowledge that it goes down on paper (and copies are lodged with the British Library) for posterity must help a little: not quite like being set in stone but paper may be the next best thing in the digital age.

Also, if Datafile did go all electronic there would be pressure for it to become free - after all there are no printing costs. The trouble is that HPCC has no other sources of income so paying for the (tiny) costs of web-hosting our site (www.hpcc.org), the mail redirection for our email, our domain name even, ultimately become problematic. These might only add up to one penny per issue, but these kinds of micro-payment are not easily collectable over the web in small volumes. Admittedly this is less of a problem for the time-being but still something to think about.

So there you have it, a run down of what might or might not happen. For me the biggest issue is the one of email distribution; if we host on a web page then we might as well make it free and that leads to all sorts of problems.

Regards,

Bruce Horrocks (Datafile Editor)

Re: Electronic version of Datafile

Message #2 Posted by . on 27 Jan 2005, 3:55 a.m.,
in response to message #1 by Bruce Horrocks

"Just look at the criticism that Joe Horn has received in this forum simply for having the misfortune to fall ill and be unable to communicate that fact"

People were concerned because from their point of view, they payed money to someone, and didn't get their goods or hear a thing from Joe for months!

He could have just said "sorry guys, I'm ill, please wait a bit"

HP-IL interface cases

*Message #1 Posted by **Wilson (Bill) Holes** on 26 Jan 2005, 6:22 p.m.*

I have an opportunity to pick up a few new and unused authentic HP-IL interface cases such as HP used for the HP-IL/Video, HP-IL/RS232, HP-IL/GPIO, and HP-IL/IB Interfaces. I believe these cases were also used for the Mountain Computer Eprom Programmer and likely several other HP-41/71 accessories. The plastic cases are new, unused, and in the original packaging with HP labels stating the HP part number, etc. The case bottoms are labeled part number 82163-40007 and the case tops are labeled part number 82163-40008. The label on the bags have the HP logo and name plus the words "Corporate Parts Center". Does anyone out there in MoHPC forum land know what these cases may be valued at?? Many thanks in advance.

Re: HP-IL interface cases

*Message #2 Posted by **Gordon Dyer** on 26 Jan 2005, 8:11 p.m.,*
in response to message #1 by Wilson (Bill) Holes

You will soon find out the real value by selling a few on eBay!

Re: HP-IL interface cases

*Message #3 Posted by **Wilson (Bill) Holes** on 26 Jan 2005, 8:34 p.m.,*
in response to message #2 by Gordon Dyer

Thanks Gordon but my interest is in making the purchase not in selling. If I purchase them they will be used for a project and any collectable value will be lost. If they have collector value I don't want to destroy them as I like to see HP legacy stuff with any collectable value preserved. Hence, I would make the same suggestion as yours to the current seller -> sell them on eBAY. This aside, I do appreciate the input.

Edited: 26 Jan 2005, 8:42 p.m.

Re: HP-IL interface cases

*Message #4 Posted by **Christoph Klug** on 27 Jan 2005, 3:36 a.m.,*
in response to message #3 by Wilson (Bill) Holes

Dear Wilson,

do the cases include terminals like HP-IL teminal or AC power supply terminal ?

May be this parts are helpfully for an advanced mass storage project, which is under development from Pavel Korensky....

Best wishes from Germany - Christoph Klug

Re: HP-IL interface cases

*Message #5 Posted by **Wilson (Bill) Holes** on 27 Jan 2005, 11:42 a.m.,*

in response to message #4 by Christoph Klug

Hello Christoph,

Thanks for responding. The cases are plastic, they have no internals and come in two halves (top & bottom), each in its own packaging. If I buy them I intend to use them to replace the housings of my ProtoEPROM's and ProtoCODER's which are beginning to come apart. I can use other (generic) cases to accomplish this which are fairly inexpensive and readily available at local electronic parts stores. I would use the generic cases if the HP cases have "collectable value". If they are collectables I'd suggest the current owner (a good friend) dispose of them on eBAY in the hope that they would wind up in the hands of someone who has a true interest in preservation of legacy HP-41 items.

Best Wishes, Wilson

Re: HP-IL interface cases

*Message #6 Posted by **Dave** on 28 Jan 2005, 9:40 a.m.,*
in response to message #5 by Wilson (Bill) Holes

Personally, I don't think those cases have any particular collector value. The only value I see is the people on this forum building special interface projects that would want to look like an HP peripheral.

Re: HP-IL interface cases

*Message #7 Posted by **Wilson (Bill) Holes** on 28 Jan 2005, 3:45 p.m.,*
in response to message #6 by Dave

Thanks Dave, I much appreciate the feedback. It's becoming obvious to me that the cases in question have little or no collector value so I'll likely get and use them to re-house my ProtoCODER's and ProtoEPROM's. They should result in pretty nice looking units, at least they will match may Mountain Computer EPROM burner.

Best Wishes & Thanks again, Wilson

HP11C broken resonator

*Message #1 Posted by **Jean Baptiste M** on 26 Jan 2005, 7:56 a.m.*

I opened my hold HP11C and saw that the resonator lead was broken. Which part may / could I solder to replace it ?

Many thanks Jean Baptiste

Re: HP11C broken resonator

*Message #2 Posted by **Tony Duell** on 26 Jan 2005, 8:10 a.m.,*
in response to message #1 by Jean Baptiste M

What resonator? I thought the voyagers (certainly ones as old as the 11C) used an LC 'tank' circuit connected to 2 pins on the NUT chip. I can look up the values of the those if you like.

Re: HP11C broken resonator

*Message #3 Posted by **jean baptiste** on 28 Jan 2005, 3:30 a.m.,*
in response to message #2 by Tony Duell

Yes please if you can provide the value. This is great. So if the resonator is LC what is the component on the top left side (view from back and back chassis removed), close to the electrolytic capacitor ?

Many thanks in advance for your help. JB

Re: HP11C broken resonator

*Message #4 Posted by **Tony Duell** on 28 Jan 2005, 7:57 a.m.,*
in response to message #3 by jean baptiste

Which version of the 11C is this? Is in the type with everything on one PCB, or does it have a removable logic module -- a flexible PCB in a plastic frame fixed to the back of the display

I thought (but will have to check) that the soldered-on components in the 11C and 12C were the 2 chips (NUT and R2D2), the clock inductor, the clock capacitor, and the electrolytic capactitor across the battery connections.

Re: HP11C broken resonator

*Message #5 Posted by **Jean Baptiste** on 31 Jan 2005, 11:39 a.m.,*
in response to message #4 by Tony Duell

In fact the 11C I have is assembled on a single PCB.You are right to say that the Electrolytic capacitor is right accros the battery gap.

Many thanks for your help to try to make it work! Regards

in response to message #1 by Walter

Bob, I believe you once made a reference of the Black-Sholes computation for the HP 200lx. Is it possible for you to refer me to it or to send me as an e-mail.

Thanks for your help.

~frank

Black-Scholes on the 200lx

*Message #5 Posted by **Bob Wang** on 26 Jan 2005, 11:47 a.m.,*
in response to message #4 by Frank

Frank:

The shortest, most accurate implementation of Black-Scholes not using UTPN is courtesy of Tizedes Czaba's suggestion of using a Taylor series. However, it is also the SLOWEST, taking well over a minute on my 17Bs and 19Bs. I would appreciate it if you would try it on your 200lx, and time the execution. IF the speed is acceptable, I would recommend using that instead of the different polynomial methods I have posted on my shabby home page.

Bob

Bob Wang Home Page

```
Taylor Series Approximation:
Using L() and G()
Execution time > 1 minute
Character Count = 363
BLK.SCHLS:
IF(S(CALLV):
IF(L(A:ABS(L(C:LN(PS/PE)/S/SQRT(T)+(RF%/100+S^2/2)*T/S/SQRT(T))))>3:0:
0*L(B:ABS(L(D:G(C)-S*SQRT(T))))
+PS*ABS(IF(G(C)<0:-.5:.5)
+SIGMA(N:0:25:1:(-1)^N*G(A)^(2*N+1)/FACT(N)/2^N/(2*N+1))/SQRT(2*PI))
-PE*EXP(-RF%*T/100)*ABS(IF(G(D)<0:-.5:.5)
+SIGMA(N:0:25:1:(-1)^N*G(B)^(2*N+1)/FACT(N)/2^N/(2*N+1))/SQRT(2*PI)))
-CALLV:
-PS+PE*EXP(-RF%*T/100)+0*S+CALLV-PUTV)

HP 45 problem

*Message #1 Posted by **Kevin Kane** on 26 Jan 2005, 12:55 a.m.*

Hello, I just turned on my dad's old hp 45 and the screen flashes zeros across, without coming to stability. What do you think is wrrong ? The rechargeable battery is probably bad, does not work at all without being plugged in. So, what do you think ? thank you, Kevin

Re: HP 45 problem

*Message #2 Posted by **Raymond Del Tondo** on 26 Jan 2005, 2:48 a.m.,*
in response to message #1 by Kevin Kane

Hello,

it's just as you wrote, the battery is dead.
The HP-45, unlike newer models,
can be used without the battery, just on the AC adapter.
If that doesn't work, it's likely to be an internal contact problem.

Regards,

Raymond

Re: HP 45 problem

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 26 Jan 2005, 3:10 a.m.,*
in response to message #1 by Kevin Kane

Hi;

I own an HP55, and it seems to me they are similar (if I am not wrong, all classics use the same AC adapter/charger).

Kevin wrote:

> Quote:
>
> The rechargeable battery is probably bad, does not work at all without being plugged in.

If you do not plug the charger in an AC outlet and connect it to the calculator, the calculator won't work. The charger itself feeds the calculator with properly voltage while charging. If the charger/adapter is not connected to the AC outlet, connecting the cable to the calculator will simply diconnect the batteries terminals.

If possible and you have the proper means, try testing and charging the battery pack externally. Be carefull choosing an adequate charger based on battery characteristics: I'd use a maximum of 50mA to 60mA of charging current, considerign the batteries are not new and are able to supply at least 700mA. In this case,

60mA would charge them in about 12 hours. In my HP55 I use a thirdy-part battery pack, in fact it is three NiCad cells used in one commercial walkie-talkie.

Hope this helps a bit more.

Cheers.

Luiz (Brazil)

Re: HP 45 problem

*Message #4 Posted by **Arnaud Amiel** on 26 Jan 2005, 3:37 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

If you search on ebay for hp45 battery you will find someone selling them. They are good and work out cheaper than rebuilding the pack. I am just a very satisfied customer using my hp45 right now.

Arnaud

Re: HP 45 problem

*Message #5 Posted by **Jeff O.** on 26 Jan 2005, 7:27 a.m.,*
in response to message #1 by Kevin Kane

Quite possibly dirty ON/OFF switch contacts. Very simple to fix. Remove the six screws holding the back on, then remove the 8 screws that hold the keyboard backplate, take everything apart, clean the contacts and the slider, lubricate with silicone lubricant from Radio Shack and reassemble.

Re: HP 45 problem

*Message #6 Posted by **Dave Shaffer** on 26 Jan 2005, 11:03 a.m.,*
in response to message #5 by Jeff O.

I vote for Jeff O's suggestion - at least as the first/easiest thing to try to fix.

My HP-35 often shows the flashing zeroes when I turn it on. Playing with the ON/OFF switch seems to be the fix. I haven't bothered trying to clean the switch yet.

Re: HP 45 problem

*Message #7 Posted by **Tony Duell** on 26 Jan 2005, 8:15 a.m.,*
in response to message #1 by Kevin Kane

The battery is not the problem. The 'classic series' machines without a card reader (35, 45, 55, 70, 80) will work fine from the power unit without a battery in place (and there's no risk of this damaging the calculator).

The fault could be just about anything from bad contacts to a defective (custom) chip. If you are happy doing electronic troubleshooting and have a multimeter and 'scope, then start by downloading the 'HP45 notes' from this site. Take the bottom case off the calculator (6 screws, 2 under the label, 2 under the front feet, 2 in the battery compartment I think) and you'll see the logic PCB. At the right hand side of that board as you look at it are 12 testpoints. The first check should be on the Vss (+6.2V) and Vgg (-12V) supplies. Check them both with a voltmeter _and the 'scope_ to look for ripple/noise.

If that's OK, I can tell you what to expect on the other testpoints, and what the likely chip failure is if one of

them is wrong.

Re: HP 45 problem

*Message #8 Posted by **David Smith** on 26 Jan 2005, 4:40 p.m.,*
in response to message #1 by Kevin Kane

If you get flashing digits when the unit is plugged into the AC adapter, the problem is very likely to be a bad electrolytic filter capacitor in the power plug. The plug is held together with four screws (either Phillips or a small Torx, or even small security Torx). The bad cap is the large 330-470uF one... usually orange.

Re: HP 45 problem

*Message #9 Posted by **kevin Kane** on 27 Jan 2005, 1:29 a.m.,*
in response to message #8 by David Smith

Great information, all of you. I will try the switch fix first, I can handle that, but electronics, well my only experience is college physics and wiring my house. I want to sell it but wondering if I can recoup my repairs and how much it is worth repaired. Thank you all for your help. I will let you know how it comes out. Kevin

Re: HP 45 problem

*Message #10 Posted by **Kevin Kane** on 27 Jan 2005, 1:33 a.m.,*
in response to message #8 by David Smith

Where would I get one of these (330-470uF one... usually orange) for the bad electrolytic filter ? does not sound too tough to put a new one in. thank you, Kevin

Re: HP 45 problem

*Message #11 Posted by **David Smith** on 27 Jan 2005, 3:42 p.m.,*
in response to message #10 by Kevin Kane

Try Radio Shack. Just about any capacitor in that range should work. Voltage rating should be 15V or higher. Just make sure it's physical size is not too big. Since it is an electrolytic cap, it is polarity sensitive. Make sure you get it in the right way.

HP-21 battery drain

*Message #1 Posted by **Michel Beaulieu** on 25 Jan 2005, 4:50 p.m.*

Hi, and thanks in advance for helping me!

My HP-21 have a problem, when i put fresh NI-MH batteries in it, and don't use it, 24 hours after batteries are dead. So the calculator is eatin very fast my batteries when off...

But when on, i estimate batteries last the same time as a "normal HP-21"

I don'T know the story of the calculator, so i don'T know if there was any modifications on it.

The calculator itself works perfectly and is in mint (...) condition...

Michel Beaulieu Canada

Edited: 25 Jan 2005, 4:51 p.m.

Re: HP-21 battery drain

*Message #2 Posted by **Michel Beaulieu** on 25 Jan 2005, 4:53 p.m.,*
in response to message #1 by Michel Beaulieu

I also realize that hte batteries in it are new NiMh batteries that i charge with the normal HP-25c charger

Coud't it be possible that NI-Mh are not well charged in the HP-21?

Thanks,

Michel Beaulieu Canada

Re: HP-21 battery drain

*Message #3 Posted by **db (martinez, ca.)** on 25 Jan 2005, 6:36 p.m.,*
in response to message #2 by Michel Beaulieu

FWIW: I charge my nimh cells outside the calc and they have a long life. I think it's safer that way. You might try that as an experiment once.

HP-21 battery drain

*Message #4 Posted by **Michel Beaulieu** on 25 Jan 2005, 8:02 p.m.,*
in response to message #3 by db (martinez, ca.)

Ok, i'll try your advice. The only drawback i can see is that everytime i remove my battery from the holder i pray for not breaking the central plastic that retain batteries.

Re: HP-21 battery drain

*Message #5 Posted by **Vassilis Prevelakis** on 25 Jan 2005, 9:59 p.m.,*
in response to message #4 by Michel Beaulieu

do you use the HP-21 *that* often?

I seldom use mine and I find that alkaline (non rechargable) cells are much better (they last forever).

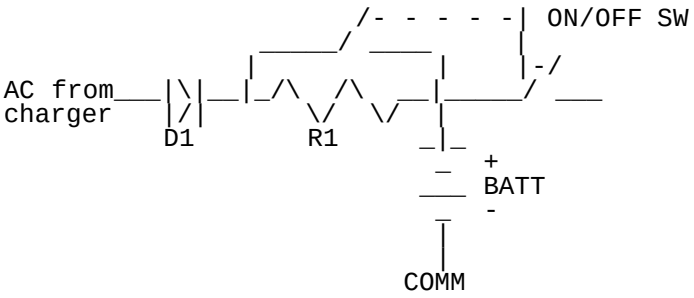
**vp

Re: HP-21 battery drain

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 26 Jan 2005, 12:04 a.m.,*
in response to message #5 by Vassilis Prevelakis

Hi, Michel;

I have the HP21 schematics in hands right now (no, it is not an HP-original, it is a "volunteer" achievement, and there are no credits mentioning the author) and there is nothing but a series resistor connected to the batteries when the calculator is switched to OFF. The circuit ia almost like this:



The series resistor is the only 1W (big guy), 8.2 ohms resistor that is connected to the charger when charging the calculator while it is switched to OFF. When ON, the resistor is bypassed, while the charger is used both for charging batteries and feeding the circuit. So, the only possible problem (if everything else is correct) resides inside the batteries themselves. OR (big OR) a problem with the ON/OFF switch (tabs printed in the keyboard PCB, must remove the plastic rivets).

Yes, I can send you a copy of the complete diagram (I cannot remember where did I downloaded it from), just drop me a line (I lost almost all of my friend's e-mail addresses... Sorry). I also have some news about your 41 MBoard: the equipments I borrowed (a two-trace oscilloscope and an eight-channel capture board with a digital-analyser Software) will be with me at the end of this very week. The "lender" needed them in the first minute after he offered them to me.

Hope this helps for now.

Cheers.

Re: HP-21 battery drain

*Message #7 Posted by **Bill (Smithville, NJ)** on 26 Jan 2005, 7:02 a.m.,*
in response to message #5 by Vassilis Prevelakis

Hi Michel,

VP's suggestion for regular alkaline (non-rechargable) is a good one. Even better is to use the Energizer Photo Lithium AA (non-rechargable) batteries. They last several times as long as alkaline. Just be sure you don't accidently try to recharge them.

I very seldom purchase alkaline AA or AAA batteries anymore - I just pick up several packs of the Lithium when they are on sale and they last forever. Granted, they are a lot more expensive but every now and then Target has them on sale.

Bill

Re: HP-21 battery drain

*Message #8 Posted by **Tony Duell** on 26 Jan 2005, 8:21 a.m.,*
in response to message #1 by Michel Beaulieu

Charge the battery pack (in the calculator, if that's what you normally do), then take it out and leave it for a day or so. If the batteries go flat when you do that, then either they're defective or you're not charging them properly.

Assuming the batteries hold their charge when you do that, then there is some leakage in the calculator. I don't think there's any capacitor across the battery terminals before the on/off switch that could be leaking.

I would open the machine up (2 screws under the feet) and see if anything has been added. It's possible somebody has stuck a capacitor or zener across the battery contacts (in a misguided attempt to prevent damage if the battery goes open-circuit, although only the -C models suffer from this!). You could also connect the battery pack to the machine with a milliammeter in series to see if any current is drawn when the machine is turned off (it shouldn't be!). Maybe there's leakage round the on/off switch (liquid spilt into the keyboard?)

41CV Problems

*Message #1 Posted by **Ron** on 25 Jan 2005, 10:05 a.m.*

With fresh batteries, when I turn it on, there is no visible response. When I push "<-" while turning it on, at the release of the <- key, I get 6 commas, 1234 flags, PRGM, and ALPHA indicators on the right side of the display. This lasts for about 1 sec before turning off. It doesn't fade as in the post below, but goes off instantly. If I hold down a number key while turning it on, the same display stays on until I release the number key. If I hold a function key while turning it on, the function is displayed for a second, and then the commas (etc...) display until I release the key.

Clues, anyone? Thanks, in advance.

Re: 41CV Problems

*Message #2 Posted by **Raymond Del Tondo** on 25 Jan 2005, 11:59 a.m.,*
in response to message #1 by Ron

Seems like a contact problem.
Are the case halves somehow 'squeezeable',
or in other words, do the screws seem to not
hold the halves tightly together?
If this is the case, you could *CAREFULLY* try to fasten the screws.
I wrote 'carefully' because if you screw too hard,
the plastic posts inside are likely to break.

Another idea: Is there any corrosion inside the battery compartment?
If yes, it's still a contact problem.
There's also a chance that the zebra stripes,
which do the contact between the CPU board
and the keyboard pcb, is faulty.
There are several other possibilities for malfunction,
but first try the first option.

HTH

Raymond

Re: 41CV Problems

*Message #3 Posted by **Ron** on 25 Jan 2005, 12:40 p.m.,*
in response to message #2 by Raymond Del Tondo

You know, I had intended to address those items in my first posting, but forgot to. The case seens tight. I know sometimes it can seem tight, but still be loose, so I squeezed it anyway, and it made no difference. There is no battery corrosion.

Re: 41CV Problems

*Message #4 Posted by **Ron** on 25 Jan 2005, 1:08 p.m.,*
in response to message #3 by Ron

Okay...

Eventhough the case seems tight, I took it apart, and yes, the bottom posts are cracked. Without the screws in place, I pressed all the contacts together, and it worked! Put it back together, and it doesn't work, even squeezing it together, but at least we know what the problem is. I trust fixing the posts will do the trick. Thanks for prodding me on, Raymond.

Re: 41CV Problems

*Message #5 Posted by **Jon** on 25 Jan 2005, 1:18 p.m.,*
in response to message #4 by Ron

It is hard to repair the psts. It is much better if you get longer screws. Those coming from halfnut models are perfect.

Re: 41CV Problems

*Message #6 Posted by **Vassilis Prevelakis** on 25 Jan 2005, 10:03 p.m.,*
in response to message #5 by Jon

Also screws coming from the HP67 and other similar calculatoes are quite good replacements.

When I repair HP-67s I usually leave out the screws that go under the label, so I have a small surplus of these screws and use them for my HP-41 repairs.

faulty 41cv memory chip

*Message #1 Posted by **g. fernandez** on 24 Jan 2005, 2:41 p.m.*

Anyone does have a memory chip from a not functioning HP41CV labelled 1LE7-0005 or similar? is for repairing an HP41CV. When I do XEQ SIZE 000, it shows 255 steps only instead 319. Can I put a single memory module (HP82106A) on my HP41CV instead soldering a good memory chip?

thanks

Re: faulty 41cv memory chip

*Message #2 Posted by **Tony Duell** on 24 Jan 2005, 2:55 p.m.,*
in response to message #1 by g. fernandez

IIRC the (user) RAM chips in the 41CV are 64 registers each. You could remove the faulty one and fit a single memory module in the appropriate port (Port 4, here, I think).

Alternatively (and I did this once), you can crack open the memory module and desolder the PCB from the connector. Then wire the PCB's pads to the holes for the original RAM chip, inside the 41. You need to connect the B3 and B4 pads correctly to put the module at the right address (Look at the I/O assembly schematic in the service manual to see what I mean). That way you still have 4 external ports for ROMs or peripherals.

Re: faulty 41cv memory chip

*Message #3 Posted by **g. fernandez** on 24 Jan 2005, 3:53 p.m.,*
in response to message #2 by Tony Duell

B3 and B4 are two metallic connectors of the HP82106A memory module, right? The module has twelve connectors, 6 upper and 6 lower. What pins are B3 and B4? (They must be tied to VCC) Also, what is the difference between a 1LE7-0005 and an 1LE7-0004 chip? Both are memory chips, have the same number of pins, but it seems to me that cannot be exchanged.

Re: faulty 41cv memory chip

*Message #4 Posted by **Tony Duell** on 24 Jan 2005, 4:02 p.m.,*
in response to message #3 by g. fernandez

If you take the memory module apart, you can desolder the connector from the PCB, leaving 12 pads in a line. 2 of those (or equivalently 2 of the pins on the connector) are B3 and B4.

I assume you have an HP41 service manual. The pinout of the port is shown there. B3 and B4 are labelled. If you can't find it, I'll look it up for you.

The memory chips inside the 41 are designed to respond to particular addresses. That's the difference, I think, between the -0004 and -0005 chips. Corresponding pins on the different RAM chips are linked together on the PCB, there is no external chip select logic.

HP42s memory upgrade

*Message #1 Posted by **Michael** on 23 Jan 2005, 4:36 p.m.*

Hi all,

I am wanting to try the memory upgrade on one of my hp42s's and am trying to locate 1 or 2 of the 62256 32K, low power, 28-pin, surface-mount RAM IC's.

The trouble is I am having trouble locating this IC. I'm from Melbourne, Australia so I have tried Farnell's, RS Components and a number of smaller outlets, but no luck.

Is anyone out there able to point me in the right direction??

Thanks

Michael

Re: HP42s memory upgrade

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 Jan 2005, 6:20 p.m.,*
in response to message #1 by Michael

Hi, Michael;

I upgraded a few HP42S (one is still with me) and I used some different sources: dammaged/broken HP48G, one old sound board (it had three IC's) and even one hard-disk main board. I did not use new components in any of the HP42S I upgraded (about six), and their owners were aware of this fact. At least as far as I know, three of them still work perfectly fine.

Just to let you know about these possible sources.

Best regards and success!

Luiz (Brazil)

Thanks for the reply, is there any particular brand of sound card because I just looked at an old Sound Blaster card and it had nothing.

Thanks again,

Michael

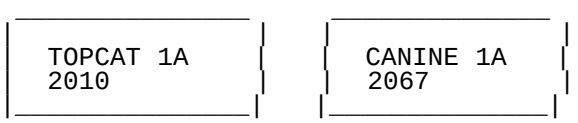
Re: HP42s memory upgrade

*Message #4 Posted by **Vieira, Luiz C. (Berazil)** on 23 Jan 2005, 9:08 p.m.,*
in response to message #3 by Michael

Hello, Michael;

I have the soundboard in my hands right now and I see no particular ID on it. My scanner is disconnected right now, so I can generate an image for you later, if applicable.

There's a paper label on it that reads '96-03-081 4055' and we can see two big PQPF IC's with paper labels as well:



The IC's are, in fact, organized in columns instead of rows, as suggests my "drawing".

The PCB (solder side) has the following inscription: TBSMS05.2 The main signal processor is a Motorola DSP56001AF C27 and the three memory chips used in this board are MT62C256F-70LL (I can't identify the brand; it reads 'MOT', but the 'O' in 'MOT' has crossed lines like tic-tac-toe)

The hard disk is a 341 MBytes Seagate ST3991A. The memory chip on it is a Winbond W24257S-70L.

Based on the fact that the calculators did not show a measurable current consumption (bellow .1mA with my standard multimetter), I guess the 'L' in both IC's after the 70 (access time in micro seconds?) reffers to Low power.

Hope this helps.

Cheers.

Luiz (Brazil)

*Message #10 Posted by **Michael** on 6 Feb 2005, 4:53 p.m.,*
in response to message #1 by Michael

Hi all,

Just like to say thanks for everyone's comments and help and to say I have successfully upgraded the memory in my 42s to 32k. Everything went smoothly, it was easier than I thought it would be, you just have to take your time.

I was also wondering by doing this memory upgrade have I de-valued the 42s at all?

Thanks

Michael

Re: HP42s memory upgrade

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 7 Feb 2005, 12:13 a.m.,*
in response to message #10 by Michael

Hi, Michael;

I thought about this once, when I first upgraded my own. Then I thought: "Who said I want to sale it, now that it has 32KRAM?".

You bet I never thought about that again...

Cheers.

Luiz (Brazil)

(P.S. - I did not answer your question... In fact, I don't know if an upgraded HP42S values less than an original. As a collecting piece, every change reduces the price of the "hacked" unit, agree?)

Re: HP42s memory upgrade

*Message #12 Posted by **Thomas Okken** on 7 Feb 2005, 7:16 a.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

In fact, I don't know if an upgraded HP42S values less than an original. As a collecting piece, every change reduces the price of the "hacked" unit, agree?

That seems to be true in general, but with the HP-42S in particular, there is the suspicion that its value is currently determined not by collectors, but by people who want one to *use*. (I have heard that the situation with the HP-48GX is similar.)
And from the perspective of someone buying a great tool, as opposed to a collectible that they intend to stick in a display case, I'd have to say a 32k unit may well fetch even more than an unmodified one (if the buyer isn't worried about damage caused during the modification, that is (speaking personally, *I* would worry about that, and that's why *my* 42S will stay at 8k)).

Edited: 7 Feb 2005, 7:31 a.m.

<Why?>HP42s memory upgrade

*Message #13 Posted by **Marx Pio(Amazon)** on 8 Feb 2005, 7:13 p.m.,*
in response to message #12 by Thomas Okken

Hi all you HP fans,

Upgrade an HP42S for what reason? Geek fun? We would die before finish to type a 32kbyte program. And if even you have a structural stiffness matrix for inversion I think a PC is more suitable.

A serious upgrade for me is:

1 MB ram minimum SD, MMC or Compact flash slot Support for USB or serial Windows-based SDK for real program typing and debugging More Two or three display lines and all in a HP42 size. Is it possible? :^)

Still dreaming, ZZZZZZzzzz

Pio

in response to message #13 by Marx Pio(Amazon)

Sorry, can't resist...

A serious upgrade for me is:

1 MB ram minimum
SD, MMC or Compact flash slot
Support for USB or serial
Windows-based SDK for real program typing and debugging
More Two or three display lines

and all in a HP42 size. Is it possible? :^)

That's a Palm with Free42 you've just described, Marx. OK, the extra display lines won't be available until later this year, but development on Windows is possible, and will be even easier next week or so when I publish Vini Matangrano's text-to-raw conversion script on the Free42 web site.

If only there were Palms with a decent keyboard... Or any keyboard, for that matter...

Except for the size...

Re: HP42s memory upgrade

*Message #17 Posted by **Valentin Albillo** on 7 Feb 2005, 12:32 p.m.,*
in response to message #10 by Michael

Hi, Michael:

Michael posted:

"I was also wondering by doing this memory upgrade have I de-valued the 42s at all ?"

Other people will surely think differently, but in my own personal opinion, yes, an "upgraded" 42S is *less* valuable than an original, unhacked one.

From a collector's perspective, this should be obvious. The machine is always worthier with its original components and intact cosmetics than it can ever be with replaced chips and the unavoidable cosmetical side effects of the modification.

Plus, from both a collector's and a user's perspective,

> You can never be 100% sure that the modification was properly done and the machine is 100% stable, and what effects it may have on the machine's stability in the long run.
>
> - Perhaps it will develop some bad RAM locations and you'll be getting corrupted results from time to time without even noticing it, or even worse, lose all 32 Kb of painstakingly entered programs without ever knowing if it was the modification or something you did wrong.
>
> - Perhaps you'll notice batteries running down much quicker than before, due to greater power comsumption caused by the newly installed, non-original RAM chip.
>
> - Perhaps you'll notice the machine runs noticeable slower, as the operating system has to move to and fro much larger blocks of RAM than before when editing, for instance, so you'll begin to experience a nasty effect similar to the much dreaded 'garbage collection' ...

In a word, I would never "upgrade" one of my own 42S, and I would never buy an "upgraded" 42S except at a really bargain price (say no more than US$ 50 or so), and then only to be used as an instructional or demo machine, never for real-life, professional use. Any higher a price and I'd rather spend more and buy the real, original, unhacked machine.

It's also the case that I think that 7 Kb are more than enough for such a calculator. Any problem requiring more RAM than this, I would use one of my HP-71B (160 Kb) which has a much better and convenient keyboard (specially for alpha input) and a much higher-level language and instruction set (specially with the Math ROM), not to mention full I/O. That failing, I'd use one of my laptops (768 Mb RAM). For the kind of applications the HP42S is best, 7 Kb are more than enough.

But this is just my opinion, I'm sure lots of people would do or pay whatever was necessary to upgrade and would be perfectly happy to get or buy such a machine, though I'm inclined to think they'd intend it for use, not to collect, and they aren't afraid of relying on it for *professional* practice, where legal *liabilities* are a big concern and a hacked machine which produces wrong results can result in *big* trouble.

Last, there's also the inescapable fact that an unhacked HP42S *retains* the potential to be hacked, if deemed necessary, at a future time, while a hacked 42S can *never* revert to its original, pristine condition, so you've indeed lost something.

Best regards from V.

(edited)Based on my own experience... (was: HP42s memory upgrade)

in response to message #17 by Valentin Albillo

Hi Valentin, folks;

allow me to add a few info to your comments?

> Quote:
>
> Perhaps you'll notice batteries running down much quicker than before, due to greater power comsumption caused by the newly installed, non-original RAM chip.

In fact it may happen, but if you use low-power 32KRAM chips the power consumption is almost the same. In my case, I used a 32KRAM removed from a broken, LCD-less HP48G. I measured the current with an instrument that was able to read up to 199.9mA. The readings with both original 8KRAM and hacked 32KRAM when turned to OFF and later to ON were the same with this instrument. I guess that if the RAM chip is not a low-power type, chances are you'll see the higher

consumption and, consequently, batteries not lasting longer than usual.

> Quote:
>
> Perhaps you'll notice the machine runs noticeable slower, as the operating system has to move to and fro much larger blocks of RAM than before when editing, for instance, so you'll begin to experience a nasty effect similar to the much dreaded 'garbage collection' ...

This is a fact. If a program is large and it constantly accesses data in higher addresses (like the last elements of a 40×40 complex matrix), you'll notice the calculator slows down.

Just my 2¢.

Luiz (Brazil)

(P.S. - maximum square matrices for a hacked, 32KRAM HP42S:

```
SIZE 0000
[62×62 Matrix], 1004 bytes free memory
[44×44 Cpx Matrix], 780 bytes free memory
```

Maximum size, nothing else in RAM: **3,967**!)

Re: Based on my own experience... (was: HP42s memory upgrade)

*Message #19 Posted by **Erik Ehrling (Sweden)** on 8 Feb 2005, 3:50 a.m.,*
in response to message #18 by Vieira, Luiz C. (Brazil)

In reality the theoretical slow-down should not be a problem. The garbage collection, for example, is internally the same as on the HP-28S which has the same CPU and 32K RAM already.

The only slow-down I have experienced in reality is when editing large programs that reside in memory at the same time as memory is full of programs; then entering one program line takes a notifiable long time (haven't measured it, but could be up to a second or so...). This is probably because the HP-42S has to copy all other programs x bytes in memory in order to make room for the new program line.

Best regards,
Erik Ehrling (Sweden)

*Message #20 Posted by **Michael** on 7 Feb 2005, 6:37 p.m.,*
in response to message #17 by Valentin Albillo

Just for the record my upgraded 42s isn't for sale so it doesn't really matter about its value, I just thought I would ask the question. I did use one that had a slight ding below the lcd so it didn't matter so much anyway, and it is one that I use all the time. I wouldn't do it to one of my better units, but I am glad that I did carry out the upgrade.

I used a chip that was kindly donated to me by a complete stranger to me from this site (thanks again) which was removed from an hp48 "W24257S-70LL". I would post a photo if I knew how.

Hi, Michael;

the 32KRAM you mentioned (W24257S-70LL) is a Winbond IC, right? AFAIK, Winbond IC's are reliable.

And congratulations! I think the HP42S itself is something to be seen and used. The hacked 32KRAM allows some 'extravaganza'...

Best regards.

Yes, that 42S eventually sold for US$307.50 - that's a price that recent 42S auctions have only reached for "like new" or NIB units. So, I rest my case, a memory expansion does not reduce the value as long as there are buyers who value the increased usefulness over the decreased authenticity...

BTW, is it just me or is the 42S market on eBay starting to cool off? Hmmm, maybe it's time I bought a second one. :-)

Custom Programming vs. Pre-packaged programming

*Message #1 Posted by **Eddie Shore** on 23 Jan 2005, 1:21 p.m.*

I prefer custom programming since it forces me to learn some mathematical concepts. I also like having to work out the problems and then to acheive a desirable result. I also like doing the research.

If memory serves me correctly, I recall this is an idea of HP users since they can program calculators to any way they want.

I usually don't use pre-programmed stuff because (a) I tend not to use it all and (b) I feel I learn more by doing it myself. Any thoughts?

Re: Custom Programming vs. Pre-packaged programming

*Message #2 Posted by **Arnaud Amiel** on 23 Jan 2005, 1:29 p.m.,*
in response to message #1 by Eddie Shore

It depends on your hp model. But on the 48-49, some of the functionality can only be accessed by using sysRPL or assembly. In this case if you don't have the knowledge, then you are better of using pre-packaged programs. Some programs are also too complicated to write in a reasonable time. For instance, even though I know sysRPL and assembly, I use a prepackaged compiler or compressor (what is more I can then exchange files) because it would be too much work for me to do.

Of course for simpler program I follow the same rule as you, I try to learn a bit more every day.

Arnaud

Re: Custom Programming vs. Pre-packaged programming

Eddie stated,

> Quote:
>
> *I usually don't use pre-programmed stuff because (a) I tend not to use it all and (b) I feel I learn more by doing it myself. Any thoughts?*

Yeah, I've got some thoughts on the matter...

Doesn't this defeat the purpose of the calculator, which is to provide consistently correct calculations over a wide range of inputs with minimal user effort -- in other words, to be a tool that works for you?

The pre-programmed functions in the legacy HP calculators incorporated algorithms developed by mathmeticians, microprocessor coding by skilled programmers, and validation by professional software testers. Can you match that expertise?

The pre-programmed functions will run faster and produce more accurate results than the typical user program. Why would one program Taylor series (or other algorithm) for SIN and COS, when the complete set of trig functions and their inverses is readily available?

In the case of the 15C, for example, where the transcedental math functions are defined for both real- and complex-valued arguments, there's not enough storage for user programs that duplicate that functionality.

You can write your own algorithms and compare accuracy to the pre-programmed functions if you like, but the best use of programming is to develop custom applications for your own needs.

Accurate TVM for HP42S

*Message #1 Posted by **Tommi** on 23 Jan 2005, 10:10 a.m.*

An accurate TVM equation written as a program for the HP42S Solver.

```
n   number of periods
i   interest rate
PMT periodic payment
PV  present value
FV  future value
B/E BEGIN/END

Solve equation:
PMT*(i1-1)*(1/i+p)+PV*i1+FV=0

where (i1-1) = e1^(n*ln1(i))
and i1 = e^(n*ln1(i))
and ln1(x) = ln(1+x)
and e1(x) = e^x-1
p=0 for END, p=1 for BEGIN
```

The use of ln1+x and e^x-1 prevents the loss of significant digits for small values of i. Consider these extreme examples for accuracy checking:
Example 1:

```
n=63
i=0.00000161
PV=0
PMT=-1,000,000
END Mode (set B/E=0 in Solver)
```

Solving for FV:
HP 42S: 63,000,031.4434 (correct is 63,000,031.4433)

Example 2:

```
n=31536000
i=10/n
PV=0
PMT=-0.01
END Mode
```

Solving for FV:
HP 42S: 331,667.006689 (correct is 331,667.006691)

You might compare these results using the "normal" TVM equation, found in many manuals ;)
E.g. using the TVM equation in the 42S manual, we get
62,921,744.4422 and 311,565.594018 respectively.

The program:

```
00 {91-Byte Prgm }
01 LBL "TVM"
02 MVAR "N"
03 MVAR "I%"
04 MVAR "PV"
05 MVAR "PMT"
```

```
06 MVAR "FV"
07 MVAR "B/E"
08 RCL "I%"
09 100
10 /
11 LN1+X
12 RCL* "N"
13 E^X-1
14 RCL* "PMT"
15 RCL "I%"
16 100
17 /
18 1/X
19 RCL+ "B/E"
20 *
21 RCL "PV"
22 RCL "I%"
23 100
24 /
25 LN1+X
26 RCL* "N"
27 E^X
28 *
29 +
30 RCL+ "FV"
31 END
```

Edited: 23 Jan 2005, 12:13 p.m.

*Message #2 Posted by **hugh steers** on 23 Jan 2005, 3:09 p.m.,*
in response to message #1 by Tommi

hi tommi,

yes indeed. that is a good way to tackle the problem. i wrote a page on this problem (also with the same test case)

http://www.voidware.com/tvm.htm

there's some stuff about how to fix it when you dont have the ln1 and exp1 functions (see the 15c case). also solving for `i' is interesting. checkout the references at the end too.

cheers,

Re: Accurate TVM for HP42S

*Message #3 Posted by **Tommi** on 23 Jan 2005, 4:10 p.m.,*
in response to message #2 by hugh steers

Yes, the second test case is well-known. Also known as "A Penny for your Thoughts", see Mathematics Written in Sand
The first test case is from Hewlett-Packard Journal, October 1977.

In fact, while lnx+1 and e^x-1 are useful indeed, even better would be the super accurate ((1+i)^n-1)/i
found in many HP financial calculators. At least in HP-37E, n can also be fractional, while HP-12C only works with INT(n), of much less use. Don't know how other HP financial calculators behave in this respect.

Cheers!

Math Skills

*Message #1 Posted by **gsleong** on 23 Jan 2005, 9:24 a.m.*

I just read an article in our local paper (Louisvile KY Courier Journal) where it stated that 25% of the students tested could not do math at their grade level. I feel this is a function of the way math is taught these days. Kids are taught to rely too much on calculators. Thanks to the marketing blitz of TI in the past where TI would give teachers curiculums to teach from. I feel students today are taught how to perform functions instead of why they work, which if you understand why they work there usually are several possibilities as to how to solve the problem.

Just my $.02

Re: Math Skills (a bit long)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 Jan 2005, 12:27 p.m.,*
in response to message #1 by gsleong

Hi, gs;

I'm a teacher (university) and I include the use of calculators as for checking and comparing results from "hand made" calculations. I agree with you when you mention this:

> Quote:
>
> I feel students today are taught how to perform functions instead of why they work, which if you understand why they work there usually are several possibilities as to how to solve the problem.

To be honest, I'd not give calculators ALL of the responsability for this fact, although I agree with you that missusing a calculator reinforces this. I'd dare telling you I believe that teaching how to fair use a calculator while studying math would enhance their skills. I see that when their attention is slightly deviated to reason about how to use the calculator to solve a problem they are actually trying to solve the problem twice, ONCE they have already master calculator operation. In all subjects I teach where calculator usage is somehow an improvement, I take one or two classes in order to teach students how to use their calculators. It happens that, in some cases, there are lots of different models that operate a bit different of each other. I don't care showing how to use each of them, provided their manuals are in hands. BTW, I take also the chance to show them that having their manuals/user's guide in hands is always handy.

I don't actually tell them what calculator to buy unless they ask me to. It is too bad for a student having a calculator and the teacher telling him to buy another. I preffer teaching him how to use it the best way possible, because it both enhances his productivity as a student and gives him confidence. If the student knows how to use his calculator, he is not gonna spend time pressing the buttons in order to see what happens: this is distractive and not forthcomming. In other hand, if he knows how to use it, he'll not waste time pressing buttons, he will pay attention to your class and, as I mentioned already, he'll think twice on the solution if he wants to use the calculator.

Well, why didn't we, the guys about and more than 35 YO, need this sort of "appealing" in order to use our calculators at the time we had them in our hands? Because at that time they were the appealing tools, they were fresh and neat, and mastering a calculator in the 70's and 80's was "cool" (although cool was not the term , I guess it was "heavy", right?). What is cool to the youngers today? Mastering a mobile, a palm, hacking, "cracking", and other appealing "freak" activities. Oops, maybe we were the freaky younger people at our time...

You see, I'm in Brazil and things here a bit different, our reality is not exactly the same as the one seen in USA. Yes, each country and continent has its own, no way to straight comparisons, but today we have "instant access" to information, and changes spread too fast around all of us. So, I guess that given some particular adjustments for each case/country/reality, what I wrote here applies to many cases.

I gladly accept additional comments, suggestions, corrections, the like.

Cheers.

Re: Math Skills

*Message #5 Posted by **Eddie Shore** on 23 Jan 2005, 1:16 p.m.,*
in response to message #1 by gsleong

Could it be the way math is presented in the classroom (I'm not an expert on this subject)? In society, having math smarts is not looked at as a highly desirable trait (which is sad). While I believe using a calculator is beneficial, I also believe a cirriculum solely on calculators is a bad thing and it misses out on critical thinking (or even creative) thinking skills.

Would it be a good a idea to force the students to do the calculations without a calculator and use it only to check results (and that goes for higher math as well - we all can use highly tuned algebra skills)? I am about to go back to school this year and complete my degree in math and what I do is try the problem on paper first, then use the calculator to verify results.

Re: Math Skills - one example

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 23 Jan 2005, 4:18 p.m.,*
in response to message #5 by Eddie Shore

Hi, Eddie;

just to point out one excellent example: Mathews/Eidswick 'An HP48G Calculus Companion', Harper Collins College Publishers, 1994. An excerpt from 'To The Student' section tittled 'Calculus and your two HPs':

> Quote:
>
> (...)You might even wonder why bother studying calculus if a machine can do it all. Of course, the answer is that you need to know the *ideas* of calculus before you can effectively use the HP48. At the same time, these caclulators provide you an interesting context in which you can learn the ideas of calculus. (...) By combining your two HPs - your HP48 and your Head Power - with what you read in this book, you will find that learning and using calculus is both rewarding and enjoyable.

I consider 'An HP48 Calculus Companion' as the best publication I know (are there others like this?) that actualy "fuses" both learning calculus and using a calculator as a tool to achieve the learning. The 'what if' possibilities are actualy on line.

Cheers.

Re: Math Skills - one example

*Message #7 Posted by **Eddie Shore** on 23 Jan 2005, 11:05 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

I'll have to see if I can get the book at my library (I work, and soon hope to be a student again of Cal Poly Pomona). Thank you for the reference.

One of the best calculator books that I got to learn from are Math On Keys (TI's TI-30 companion book). Published circa 1978, it shows the different applications one can do with the calculator beyond what most calculator companion books do today. I am also impressed with the HP49G+'s User Guide (the one on the CD), the authors go in to calculus and linear algebra theory that compliments the corresponding functions.

in response to message #5 by Eddie Shore

Calculators are very effective for numerical calculations, but not very good for real math problems.

Example : solve y^3=x^2+2. Anyone can find a solution with a calculator. I don't know any calculator which solves this for integer x and y.

There are lots of such examples everywhere. So you can teach using "calc-proof" problems - but, really, that may require too much effort.

Well, that's because there's an infinite number of solutions. But rearrange it into y^3-x^2-2 = 0 and the 48GX will happily solve y for any x or x for any y. And it will graph the function, etc.

I think there's a role for such a calc in the hands of the more inquisitive student, as part of an exploratory learning style. But they have to have the discipline not to bypass the thinking that leads to learning.

Best,

*Message #11 Posted by **Thomas Okken** on 25 Jan 2005, 7:27 p.m.,*
in response to message #10 by Les Bell [Sydney]

But they have to have the discipline not to bypass the thinking that leads to learning.

How about: they have to have the **curiosity** that leads to learning? Textbooks with dumbed-down problems that bear no relationship to real-world applications of algebra and calculus do nothing to fuel that curiosity, they just make you want the quickest and easiest solution (so you can finish the damned test already and leave!).

My maths teachers in high school used examples like position/velocity/acceleration vs. time of a skier going down a slope. That kind of stuff makes immediate sense, and I never saw anyone's eyes glaze over during those classes! (And the fact that I was playing with my HP-41C and figuring out analytical solutions to geometrical problems didn't cause any problems, either -- the teachers didn't mind if I solved problems using my own methods, as long as they were **correct** methods.)

I think a lot of kids fail to see how cool science is because it's never made clear to them what it is all about, both in terms of our deeper understanding of the universe and in terms of us being able to build planes, predict hurricanes, and whatnot. If all they have to go on are the stereotypical "scientists" in Hollywood movies, who can blame them.

(Math zealots only)

Just a small note : there is ONE SINGLE solution to y^3=x^2+2 with x and y BOTH integers. Again, no calculator I know can find it.

Re: Your Equation (was Re: Math Skills)

*Message #13 Posted by **Valentin Albillo** on 27 Jan 2005, 4:56 a.m.,*
in response to message #12 by GE (France)

Hi, GE:

GE posted: *"Just a small note : there is ONE SINGLE solution to y^3=x^2+2 with x and y BOTH integers."*

Wrong. Without actually bothering to find solutions, it's easily seen that since variable **x** appears *squared*, any solution with a integer, positive **x** will also result in another solution with the same **y** but integer, negative **x**.

If you had stated your sentence as *"... with x and y BOTH integers **AND x positive***" you would be right in affirming it would have just "ONE SINGLE" solution. As you omit the "positive x" part, there is actually an *even* number of solutions, namely **TWO** in this particular case.

This kind of equations, asking for solutions in integers, are called Diophantine equations. Your

specific equation is a variant (with **x** and **y** exchanged) of a particular case of the Diophantine equation **y^2 = x^3 + k**, which is known as **Mordell's equation**, and has extensive literature about it and copious on-line info. See for example:

Helmut Richter: Solutions of Mordell's equation y^2 = x^3 + k

"Again, no calculator I know can find it"

I'm not sure what you mean with this statement. Any programmable calculator, however humble, would easily find the solution pair:

```
x=-5 and y=3
x=+5 and y=3
```

If you mean finding them without a program, that's unfeasible in the general case. In fact, it can be demonstrated that there's no general algorithm to solve arbitrary Diophantine equations, or even determining whether they have one solution, several, infinite, or none.

Take for instance **Fermat's Last Theorem**:

```
 "The Diophantine equation  x^n + y^n = z^n  has no integer solutions for n >
2 and x,y,z not zero"
```

Though this hard nut has been proved (recently), you can't realistically expect any calculator or symbolic math package to automatically solve or demonstrate this, nowadays. It's taken several centuries of the combined efforts of the very greatest mathematicians in the world to crack it.

On the other hand, the "converse" theorem:

```
 "The Diophantine equation n^x + n^y = n^z has no integer solutions for n > 2
and positive x,y,z"
```

is more affordable. Matter of fact, I have discovered a truly remarkable proof but this message is already too large to include it ! :-)

Best regards from V.

Damn, you're right : two solutions.

>> "Again, no calculator I know can find it" > I'm not sure what you mean with this statement.

I meant : 'no calculator can prove that there are exactly two solutions', specifically "no more than 2".

> Matter of fact, I have discovered a truly remarkable proof > but this message is already too large to include it ! :-) Hmm I read something like this somewhere... and that last equation looks really easy. Isn't it ?

*Message #15 Posted by **Valentin Albillo** on 4 Feb 2005, 4:58 a.m.,*
in response to message #14 by GE (France)

Hi, GE:

GE posted:

"I meant : 'no calculator can prove that there are exactly two solutions', specifically "no more than 2".

As I said in my posting, "that's unfeasible in the general case. In fact, it can be demonstrated that there's no general algorithm to solve arbitrary Diophantine equations, or even determining whether they have one solution, several, infinite, or none.".

So you see, no calculator can, but also no man and no inhabitant from advanced planet ZYDJ3123, because for the general case it's simply impossible. That said, though, in the case of your specific, particular equation it *might* perhaps be proved, but unlikely. In other words, your expectations are way too unrealistic.

"Hmm I read something like this somewhere... and that last equation looks really easy. Isn't it ? "

Well, just try and find a short, simple demonstration, would you ? :-)

Best regards from V.

Re: Your Equation (was Re: Math Skills)

*Message #16 Posted by **GE (France)** on 11 Feb 2005, 5:57 p.m.,*
in response to message #15 by Valentin Albillo

Hello, Yes some classes of problems don't have general solutions while some problems of these classes do.

On the equation n^x+n^y=n^z, I still think it is not very complex : 1. you can reduce it to x=0 or y=0 or z=0 by dividing by n 2. then 2 cases : 2.a. n^x+n^y=1 not many solutions if n>1 ! 2.b. n^x+1=n^z, rewritten as n^x.(n^(z-x)-1)=1, not many solutions either.

So the equation has not many solutions. Is that correct ?

*Message #17 Posted by **Bram** on 24 Jan 2005, 7:16 a.m.,*
in response to message #1 by gsleong

It happens to have happened only yesterday. A 15 year old had to draw the function $Y=X^2-2X-8$ for X between -5 and 5 to learn about paraboles. Basic approach is computing results for several X values ("use your calculator" it says in the text book) and sketching a curve through the x,y points. His drawing resembled a thirdish powerish plot, so I tried to find out where things went wrong. It quickly appeared to me that he had typed in -5^2-2*-5-8 for the first value and he hadn't the foggiest that -5^2 came out -25. Of course he should have typed (-5)^2 on the darn thing. He obviously has to have an RPN calculator (an HP21 will do). One then cannot possibly make a mistake like this.

Re: Math Skills?

*Message #18 Posted by **Valentin Albillo** on 24 Jan 2005, 9:56 a.m.,*
in response to message #17 by Bram

Hi, Bram:

I'm probably wasting my time but I'll try anyway:

Bram posted: *"It quickly appeared to me that he had typed in -5^2-2*-5-8 for the first value and he hadn't the foggiest that -5^2 came out -25."*

Well, then an explanation of the rules of procedence would suffice. Something like

```
"a power takes precedence over a change of sign, so if
 you type -5^2, the power will be executed first (5^2 =
 25), then the sign will be changed (-25). If you want
 the other way around, simply enclose in parentheses
 what you would want to do first (-5)"
```

Instead of that, which is by no means complicated and that most 15-year old teens will have no problem understanding, specially since it's an universal rule ("whenever you want to force a particular order of operations, simply use parentheses"), you say this:

"Of course he should have typed (-5)^2 on the darn thing."

which immediately begs the question: Why *"darn thing"* ? The mere fact that it does things differently than what you consider "The Holy Bible of Calculating Expressions" is enough to *belittle* it and *insult* it ? Great ! Very rational ! Openmindedness at its best ! But wait, there's more:

"He obviously has to have an RPN calculator (an HP21 will do). One then cannot possibly make a mistake like this. "

Why *"obviously"* ? Because you like it to be so ? What may be so "obvious" to you, many other people can blatantly disagree with. I take it that you firmly believe that *only* RPN calculators can compute the coordinates of a parabolic curve, and "obviously" non-RPN models are grossly *inadequate* for such rocket-science applications !? C'mon !

Perhaps your rationale is that *"One then cannot possibly make a mistake like this"* in an RPN calculator, such as an HP-21. True, operators precedence is not an issue in RPN, the person will not make *that* particular mistake. But he/she can make *many* others.

For instance, the typical sequence to evaluate that expression for X=-5 in your HP-21 would be something like this:

```
5 [CHS][ENTER][X][LASTX][2][X][-][8][-]
```

As stated, there are other possibilities, but the above is typical. And, what's *obvious* about this sequence ? Do you think that having to press [CHS] instead of [-] is obvious ? Or having to use [LASTX] to retrieve back the X value ? Or the *"first enter the values into the stack, then perform the operations upon them"* basic RPN rule itself ?

Of course this is obvious to *you* and to any other *experienced* RPN user, but not to anyone else !! The typical 15-year old, given an algebraic calculator might make the precedence error you mention, but if told the cause, he would understand it right away, and would use parentheses when necessary, or when wanting to make sure.

Same 15-year old, given an RPN calculator would do *mistake after mistake*, and throw the thing in despair, unable to even add two values. I've seen exactly this happen any number of times. And so do most of you.

Unless told how it all works. But the same applies to your "damned thing" and your "obvious" better way. All things are "obvious" once explained and understood, and algebraic calculators are just as able for

computing expression as RPN ones are, even much better in many ways, we must not let RPN addiction to blind us to the objective facts.

Best regards from V.

Re: Math Skills?

*Message #19 Posted by **Bram** on 24 Jan 2005, 5:10 p.m.,*
in response to message #18 by Valentin Albillo

No, no, no, that's definitely NOT what I meant. I obviously cannot express myself in English properly (enough). Apologies.

1. Of course one has to know the precedences. Of course the calculator comes at the final stage and must be operated the right way after having read the manual(s), but it is too simple to type things from the text book. This was only meant as a mere example of how things can go wrong.

2. With "the darn thing" I meant ANY calculator, whichever brand. In the old days when most calculations still were done on slide rules, you could easily tell the rich students: their results contained (always) 8 or more digits, because their calculator (whichever brand) told them so. Some teachers almost became desparate sometimes.

3. My experience with RPN is that it _helps_ you with your calculations by showing intermediate results and I think it would have done so in this particular case as well. I really don't care what one uses for computation, for the right answer is the only thing that counts whichever way you choose to use to get it.

Sorry for making you angry.
Thank you for making me clarify.

Re: Math Skills?

*Message #20 Posted by **Valentin Albillo** on 25 Jan 2005, 4:59 a.m.,*
in response to message #19 by Bram

Hi again, Bram:

Bram posted:

"No, no, no, that's definitely NOT what I meant. I obviously cannot express myself in English properly (enough). Apologies.

Sorry if I misunderstood what you meant, I'm perhaps a little too "computer-like" in that respect: I'm usually quite good at understanding what people *say* (write, post, utter), not so good at what people *meant*. No need to apologize in either case, you're entitled to your own opinion, even if it's derogatory of some *object* (a person would be quite another matter).

"My experience with RPN is that it _helps_ you with your calculations by showing intermediate results and I think it would have done so in this particular case as well."

Quite possible. But when trying to plot a parabolic curve, such as your Y=X^2-2*X-8, you're really *not* interested at all in *losing time* getting to know (or even see) what X^2 amounts to, what 2*X is, what X^2-2*X evaluates to. The *only* thing you want or need is the final result, Y=X^2-2*X-8, but RPN *forces* you to see intermediate results, *whether you want them or not*. And this for every point X you might evaluate. On the other hand, you can use an HP-71B (or any vintage SHARP) like

this:

```
>FOR X=-5 TO 5 STEP 5 @ PRINT X, X^2-2*X-8 @ NEXT X [ENTER]

     -5    27
      0   -8
      5    7
```

which I personally find much *easier*, faster, easy to verify for correctness, and *easier to understand* than arcane juggling acts with RPN, which was best in its prime, back then in the 70's, but it's been *obsolete* for more than two decades as of now.

"Sorry for making you angry. Thank you for making me clarify."

I wasn't angry, excuse me if I gave you that impression. And yes, it's been clarifying indeed, hopefully for you as well.

Best regards from V.

Naaah! This must be "debate-bait", but I'm game...

RPN will never be obsolete. As we all certainly know, on RPN-based H-P calc's made since the latter 1970's:

1. The user could easily program and run the simple expression to avoid seeing the intermediate results. On certain models (e.g., 34C, 15C) the program is ready-made for input to built-in rootfinding (SOLVE) and numerical integration functions.

2. Using a 27S, 17BII, 32SII, or 33S, the user could enter and evaluate the expression nearly as it reads, without seeing intermediate results.

Either is more straightforward than your short 71B BASIC program, which, although certainly not arcane, still incorporates syntactical rules.

One modern non-graphing calc that is ideally suited for this problem is the Casio fx-115MS. Here, the user enters the expression left-to-right exactly as it reads, then evaluate it repeatedly using "CALC". However, this type of basic scholastic problem is about the only thing the fx-115MS is ideally suited for.

Best regards and a belated "welcome back"...

Hi, Karl:

Karl posted: *"Naaah! This must be "debate-bait", but I'm game..."*

That wasn't my intention but I'm game, too ... :-)

"The user could easily program and run the simple expression to avoid seeing the

intermediate results".

Gotcha ! :-) You absolutely **need** to write a program in order not to see the intermediate results, else it's impossible (unless you close your eyes or look aside).

It seems to me you're mistakenly thinking that my HP-71B (or SHARP) example, namely:

```
>FOR X=-5 TO 5 STEP 5 @ PRINT X, X^2-2*X-8 @ NEXT X [ENTER]
```

is a *program*. Well, *it is **not***. Just notice the ">" which is the prompt, and the fact that I simply wrote the expression (without a line number or such) and pressed [ENTER] (not "RUN" or something similar). This is, I'm *not* writing any program and running it, like you're forced to do in RPN to avoid seeing intermediate results, I simply write a command-line, *immediate mode* calculator expression and evaluate it on the fly, without ever storing it in program memory or creating a program file for it or running it. I'm just using its immediate mode expression evaluator. The current program at the time you do this, if any (else the Workfile) is not disturbed or altered in the least by performing this immediate mode calculation.

If you're not familiarized with the HP-71B (or SHARP models) it's understandable that you would think it was a program, but nevertheless it's a mistake on your part.

"Using a 27S, 17BII, 32SII, or 33S, the user could enter and evaluate the expression nearly as it reads, without seeing intermediate results."

But the expression is entered in algebraic or nearly algebraic form, not RPN, right ?

"Either is more straightforward than your short 71B BASIC program"

See ? I repeat once more: it is **not** a program, never was. As for being *"more straightforward"* I fully doubt. What can be more straightforward than:

```
"for X beginning at -5 and incrementing in steps of
 5 display the value of X and X^2-2*X-8, then repeat
 until X exceeds +5."
```

which is the verbose version of what my more terse, immediate command line (not program) is telling the HP-71B to do ?

"Best regards and a belated "welcome back"..."

Thank you very much, it's always a pleasure reading your postings, even if we eventually disagree.

Best regards from V.

*Message #27 Posted by **Garth** on 27 Jan 2005, 3:21 a.m.,*
in response to message #26 by .

As one who has spent a lot of time on my HP-71, I could say that only in a strict theoretical sense could it be considered a program. Many things that would require a formal program status with line numbers, a file, whatever, on other BASICs, can be done on the 71 as a command line, including the FOR-NEXT. The 71 has the CALC mode too which allows you to enter an equation in algebraic notation with the parentheses and all, and still see intermediate results. It's kind of cool that if you backspace after a * or) for example, the last result is undone and you again see the last previous partially calculated equation. When I want a calculator though, I reach for my RPN HP-41, not the 71.

As for theoretical v. practical, I'm not sold on the value of being able to key in the equation exactly as written. That algebraic notation tells you what you end up with. RPN shows how you get there.

From hiring a few fresh-out-of-engineering-school graduates, I have to say that their heads were full of theory and their math skills were better than mine, but they had a hard time making the connection to the reality of what was wrong with their circuit on the workbench. They were just plain lost. I myself am a little like the man the other poster said just resorted to Simpson's rule for integration. On those few occasions when the math gets too heavy (Laplace transforms, for example), I still understand the circuit well enough to write a program to simulate it, and manipulate the coefficients until I get what I want. Results are confirmed valid when I actually build the circuit up.

Years ago I also hired quite a few graduates of these two-year programs that are advertised so much on TV (ITT Tech, DeVry, etc.), and found that they were given a grand tour of the "land of electronics" but were not taught to be a valuable part of it. These who should have been good technicians and problem solvers basically turned

into electronics assembly-line workers with a huge school debt to pay off. They could see that their school had _not_ prepared them nearly as well as they thought. One of them went back to the cabinet-making business to pay off his school loan, since he could make more money there than he could in electronics.

It has been very hard to find the people who really understand the circuits well enought to be creative and come up with solutions to the design challenges that don't have canned answers. I'd be glad to have them even if they occasionally needed math help to solve something. I once had a calculus teacher who would refer to certain things as "very easy-- you just turn the crank," meaning if you just memorize certain forms, you don't have to try to think about or understand what makes them work. That might get you through school but it's not very useful in industry.

Similarly, if all the students have to have the same model of graphing calculator so they can all key things in the same way to be assured of so-called success, I'd say they're not doing much thinking or learning.

GS wrote:

"I feel students today are taught how to perform functions instead of why they work"

Very true. Many years ago when I was in college, I had the opportunity to take two statistics couses that ready drove this home.

The first couse was a Stat corse designed for the business majors. All the equations were given to the students. THe tests would actually have the formulas printed at the top of each page so the student didn't even have to memorize them. The couses stressed the fact that anyone could memorize formulas but the key was to know which one to use for a particular problem. Really simple - read the problem, pick the correct equation, solve the problem with a calculator.

The second couse was for math majors. This couse only dealt with deriving the formulas and proving them. No attempt was made to actually use them in a problem. Here you got to know where the equations came from, but really didn't put them to use. No calculator required.

What a contrast. What made it even more interesting was that the same professor taught both classes and his abilty to adjust the courses to the two quite differnt grounp of students.

Hi Bill,

Your two examples point out that in college education, there are many conflcting requirements.

On the one hand, true scholarship--to the average person, quixotic in appearance;

On the the other hand, practical, "career-minded" "education"

What I have found is that as far as my university time was concerned, only the first aspect provided me with any lasting benefit. When a university attempts to become a trade school, or apply formulaic "practical" approaches to teaching, you end up with students who, unless they take their own initiative, have no foundation for lasting understanding.

In fact, in the trade school I attended, the same rule applied: the fundamentals are what mattered and were remembered; the "practical" stuff was good, but not foremost--it was the theoretical understanding which mattered.

Daily, in my field of work, I find that it is my fundamental understanding of a problem which gets me to the right answer. As far as the "practical", that is easily self-taught--you can go find a reference document--perhaps even on-line----.But if you don't have the reference document, and you cannot derive the solution, then you are stuck.

Only if you truly understand a subject and can derive the solution, can you be truly prepared in life.....

So perhaps there is a sad trend in U.S. universities (and perhaps others) of creating a seeminly beneficial "practical" education, which ultimately is a waste of time.

Regards,

Bill

*Message #30 Posted by **Bill (Smithville, NJ)** on 24 Jan 2005, 3:32 p.m.,*
in response to message #29 by bill platt

Hi Bill,

That's what made my experience unique. I had both worlds - practical & theory. At the time I was majoring in computer science and took the business stat - later I decided to do a dual major in Mathemathics. Hence the theory stat class.

I'm not sure I would be so quick to downplay the usefulness of practical courses. I'm a consulting engineer and spend a lot of time with both theory type persons and practical contruction persons. Quite often, I think a project would never get built if left to theory only. One can get so bogged down in the theory details to a degree that the practically of the project can disappear.

If i have a choice:

Work with someone who can calculate to the n'th degree and still not know what is wrong with the project.

or

Work with someone who can tell me what's wrong, but may not be able to actually calculate it - but just knows from experience..

then I'll take the second person.

But I still like to do the theory :)

*Message #31 Posted by **bill platt** on 24 Jan 2005, 6:09 p.m.,*
in response to message #30 by Bill (Smithville, NJ)

Hi Bill,

You are right about practical project-oriented people being better to work with. But that same person, if he can solve the problem, demonstrates a level of understanding at the "theoretical" level--not neccessarily a computational level--there is a difference. My old professor (not maths) used to say "I don't know how to do integral calculus, I just use simpson's rule." Yet he was being unfair to his abilities. One time, I was having a problem figuring out how to do something, and he steered me to a particular chapter of a particular book--in which the whole explanation was double and triple integrals. I approached him about this and said, "I thought you couldn't do integral calculus." His reply, "I cant. But those squiggly things just amount to a fancy way of saing take the sum of all the little pieces relative to the one with the "d" in front of it...."

My point is that he had perfect theoretical understanding--even without the practical ability to do conventional computations---this was his way of being practical. He could derive the solution--albeit with his own notation--he understood the theoretical underpinnings, and that is the important point.

So to elaborate or clarify my last post, I would say that teaching a method without a theoretical basis is undesirable; yet for a person to develop a practical capacity is a good thing.

I am quite opinionated on this subject and as much as I love and do use my (HP RPN) calculators, I am also of the opinion that the calculator is prematurely introduced in American middle, junior, and senior high schools.

I blame the way our general culture is going for this- we glorify certain professions, of course our brightest and best will head there. We practically demean or devalue the teaching and research professions at all levels, unless it is biomedical, especially teaching, which we researchers do really want much to do with. But we still have a real need to fill these positions in society. We must get somebody, anybody, a warm body to walk in front of the kids in the classroom. Many of these bodies are not really up to their designated tasks, especially in science and mathematics. And then, we have too much of a fascination with gadgets; why look at ourselves, a bunch of CALCULATOR enthusiasts... of a specific kind, even!

They then embrace the calculator as advanced technology and as such they must teach its use to the kids, yet they have not the foresight to see that this will prevent developement of true mathematical and even scientific understanding and insight, nor the bent for hard work to teach the mathematical nuts and bolts without the calculator first. If the teachers really don't get it, how will the kids?

And then they hit college and face better prepared competitors from overseas...

in response to message #33 by Ed Look

Calculators are absolutely introduced too early and are overused in education. I come from the school of thought that calculators are not necessary in learning math/science. Emphasis should be placed on theory, problem solving techniques, and application. Test problems can be designed to have relatively clean intermediates and final answers (which eliminates the argument that the numbers are too difficult to work out by hand). Calculators are indispensible real-world tools, but I believe techniques for their use should be mostly delayed until after solid groundwork in algebra and trig has been established.

Here in the US scientific carreers are viewed as the realm of geeks. In schools, the excitement of scientific achievement and discovery is virtually ignored. We glamorize athletes, movie stars, and TV personalities.

Universities dump a large portion of their resources into athletics. Out of all the collegiate athletics programs in the US, only a dozen or so are profitable... Take away broadcasting deals and merchandizing and the number drops to about 6. Many of these kids pass through with full scholarships (and under-the-table cash incentives), top priority to register for classes, and sub-par GPAs. Meanwhile, they are among the last programs to be dropped when universities are hit with budget cutbacks. How do they cope with budget issues? They cut funding for its' component colleges. My opinion is extremely unpopular, but the economic facts exist to back it up. A business would not hesitate to cut a division with a history of consistent monetary losses despite significant investment.

The bottom line: Our education system in the US needs to encourage science as a lucrative and rewarding path instead of creating the impression that science is laborious, difficult, and only for geeks.

That's my rant. No flames, please! I understand that many people enjoy following college sports, but it is my opinion that they are a generally a waste of resources.

Best Regards, HDE

in response to message #34 by Hugh Evans

Hugh,

I agree with you, calculators are introduced in school too early. My nephew last year upon entering the 7th grade was told that he had to get a graphing calculator by his school and it had to be a TI and the minimum type was the TI-83 Plus. That is entirely too early of an age and grade to be using something that complex and expensive of a calculator.

It has been 23 years sense I was in high school and we were discourage from having calculator until we were in our junior or senior year. That was when you took Chemistry and Physics. At that time as well, we could use whatever calculator we had. It was up to us to know how to use what we had.

At this day and time, I can see having a good scientific calculator in your junior and senior years in high school, of your choice, but not a graphing calculator. In you 3rd and 4th year of college I can see moving to a graphing calculator, again, of your choice not a mandatory this or that brand.

Re: Math Skills

*Message #36 Posted by **Ed Look** on 25 Jan 2005, 9:03 p.m.,*
in response to message #35 by Richard Garner

Actually, personally, I don't think even college students really need a graphing calculator, not for chemistry, physics, nor even calculus. Part of the skill of a chemist, physicist, mathematician (calculator?, calculist??), engineer, is the ability to recognize by eye or within a very short time whether a set of data, a response, a set of numbers, whatever, is exponential, or quadratic, or- our favorite- linear.

A student can't get that by constantly relying on something, someone else to plot your functions. You'll never really know what they look like, never get a feel for them. What if they hear terms like, sinusoidal, sigmoid, hyperbolic, can they spot them from a whole bunch of curves, relatively quickly?

I have a 48G, 48G+, 49G+, and I have yet to use their graphing functions. Seriously, I still grab a pencil and a piece of paper, draw two axes, and off I go... sometimes even without the axes. And we all go to the computer (PC, mini, mainframe) if it gets tougher than that... especially since we now have USB connectivity to PCs.

I sincerely hope today's kids who have graduated and are currently functioning using graphing calculators will realize that they need to get a deeper feel for what those equations mean.

We should consider...

*Message #38 Posted by **Vieira, Luiz C. (Brazil)** on 26 Jan 2005, 4:15 a.m.,*
in response to message #35 by Richard Garner

... that, in most cases, students have access to the www and all of the c..p available on it prior to get in contact with calculators. I guess that we should either consider that calculators today are "restricted" tools and computers, "played" by kids that are 8 YO or less, are "open wide" devices, and by nature, all available OS today are graphics. As they are the 3D games... About these I worry must.

Whatever technology we have at the time we analize facts related to education, it should be taken into account. And to the best use. When calculators were available for the first time, slide rules did not even felt their arrival because they were much more powerfull. And slide rules were neither RPN nor algebraic... ;-)

My .2¢

And advanced slide rules were RPN, because you could select the function once the numbers were aligned.

*Message #40 Posted by **Vieira, Luiz C. (Brazil)** on 26 Jan 2005, 5:35 a.m.,*
in response to message #39 by Veli-Pekka Nousiainen

That's the beauty of them! In some cases, you needed to align the arguments and then you'd select the operation amongst a few valid ones, sort of polish notation "as is"; in other cases, you'd select the operation prior to align the arguments, that should be aligned accordingly, i.e., pure RPN.

*Message #41 Posted by **Palmer O. Hanson, Jr.** on 25 Jan 2005, 11:13 p.m.,*
in response to message #34 by Hugh Evans

When Donna Shalala, who was later in the Clinton cabinet and is presently at the University of Miami, became president of the University of Wisconsin the athletic programs had been through a period of deemphasis. Alumni giving to the Universiy waa also slow across the board. Ms. Shalala studied giving patterns and found that the supporters of successful athletic programs were also substantial givers to other University programs. Conversely, detractors of the athletic programs gave frugally or not at all to any programs. Her response was exactly what one could expect. She re-emphasized athletics!

(Ms. Shalala's experience was reported in the Hew Yorker magazine back in those years -- the late 1980's or early 1990's as best I can remember.)

Re: Math Skills

*Message #42 Posted by **Hugh Evans** on 25 Jan 2005, 11:34 p.m.,*
in response to message #41 by Palmer O. Hanson, Jr.

Very interesting. I've heard figures going both ways in terms of donations. For most universities donations from former athletes or other supporters would be the only significant chance at turning a net profit. I will certainly look into the articles you mentioned. Thanks for the tip.

Re: Math Skills

*Message #43 Posted by **Palmer O. Hanson, Jr.** on 28 Jan 2005, 11:40 p.m.,*
in response to message #42 by Hugh Evans

The article that I mentioned appeared in the April 26, 1993 issue of The New Yorker. The discussion of athletics stated in part:

"... The political-correctness faction was just one of several groups that made demands on

Shalala in Madison. Another one, perhaps even larger, was the football fans. A series of losing seasons had led to a dramatic drop in attendance at Madison's Camp Randall Stadium, from about seventy-four thousand per game in 1984 to fewer than forty-two thousand in 1989. When Shalala took over "the athletic program was a disaster," she told me. "We had no Notre Dame tradition, so we had to build a new tradition." ...

...Shalala's passion for improving the Wisconsin football team was only part of her plan to revive the university, but she never underestimated its importance. ...

... Barry Alvarez, who had been brought in as coach by Shalala, says "I'd been an assistant coach at Notre Dame, which is pretty well known for supporting football, but I had never seen the kind of support Donna gave our football program, ..."

End of quotes. With apologies to Ms. Shalala and to Jeffrey Toobin, the author of the article, I must admit there is no mention in the article of a tie-in between athletic success and giving by alumni as I stated in a previous submission. So far I have been unable to recall another source for that idea but I'll keep searching my files and my memory. At 76 I am starting to have difficulty remembering some things. (I think my read amplifier is going bad!) Hopefully, I have not starting remembering things that didn't happen.

HP 33S help

*Message #1 Posted by **Clay Smith** on 22 Jan 2005, 3:25 p.m.*

Question:

I just bought a HP 33s in preparation for the FE Exam. Upon receiving the calculator, I noticed something does not seem right with the calculator.

When I press a number followed by enter the calculator populates the X and Y stack with that numbers. For example, if I want to press "2" , "enter", "1", "enter". the display would show 1 on both the X (botton) and Y (top) stack.

I have gone through the book to see if I have a setting wrong, but have found nothing. In one of the chapters it talks about populating the stack, and I follow the exact example in the manual, and my calculator will not replicate the example.

Any suggestions? Thanks, Clay

Re: HP 33S help

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Jan 2005, 3:39 p.m.,*
in response to message #1 by Clay Smith

Hi, Clay;

this is completely correct. Everytime you press [ENTER] while in RPN mode, whatever (number) is in the X register is copied in Y register. In fact, the stack contents are "bumpped up" one register, meaning T-contents are lost, Z-contents are pushed up to T, Y-contents are pushed up to Z and X-contents are copied in Y.

If you want to perform any calculation involving a two-number function (+, ×, -, ÷, y^x, and some others) first key in Y-contents, press [ENTER] only once, key in second number and press the key (sequence, if applicable) to perform the desired calculation. If it is a one number function, like square root or reciprocal (1/x), simply key in the number and press the key (sequence, if applicable).

This is probably the main (only?) difficulty found by those wh have not used RPN calculators before: master the [ENTER] key usage. What else is somehow easy.

Remember: you can use the HP33S in algebraic mode as well, and keystrokes must be changed in this case.

Have you found yourself in the need to ask more questions, feel free!

Best regards.

Luiz (Brazil)

HP 33S help

*Message #3 Posted by **Clay Smith** on 22 Jan 2005, 6:24 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks for the quick response.

I might not have explained the problem very well.

With my HP 48GX, if I press:

1 - enter 2 - enter 3 - enter 4 - enter

I have the following in my stack

T-stack = 1 Z-stack = 2 Y-stack = 3 X-stack = 4

If I do the same with my HP 33S

1 - enter 2 - enter 3 - enter 4 - enter

I have the following in my stack

T-stack = 2 Z-stack = 3 Y-stack = 4 X-stack = 4

For some reason, when I put a number into the X stack, it also forces the number into the y stack. So any number I press followed by enter, it goes into my X and Y stack.

Am I explaining myself very well?

Clay

Re: HP 33S help

*Message #4 Posted by **Fred Lusk (CA)** on 22 Jan 2005, 7:03 p.m.,*
in response to message #3 by Clay Smith

Clay…

ENTER works somewhat differently on these two machines.

ENTER on the HP-33S works like it did on traditional RPN calculators dating all the way back to the original HP-35 in the early '70s. On these calculators, numbers are entered directly into the X register, so ENTER duplicates X into Y. Immediately keying in another number overwrites X.

On the HP-48 and similar, the purpose of ENTER is to pop stuff from the edit line into the X register (i.e. Level 1). It takes a second ENTER to copy that number into the Y register (Level 2) and immediately keying in another number does NOT overwrite X.

I hope this helps.

*Message #6 Posted by **Fred Lusk** on 23 Jan 2005, 2:11 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Luiz…

I don't mind at all. Besides, your explanation went further than mine did.

I'm much more comfortable with traditional RPN--30 years of experience will do that--and I'm still a rookie on the 48. In fact, I probably wouldn't have responded had I not been in the middle of writing my first significant RPL program and spending lots of time with the Advanced User's Reference Manual.

I have a simple hydrology (storm runoff) program I wrote several years ago for the 42S. The 42S version is 1211 bytes. The new 48 version (actually two programs--one creates data files for different situations and the other does the calculating--plus one subroutine for building a screen full of results) totals 2066 bytes. Actually, the calculation is pretty trivial. The bulk of both versions is required to make the I/O friendly and handle two sets of parallel calculations (three different storm levels and two different methods of estimating the intensity of the storm). The 48 program works as of about 9:00 p.m. tonight. Now all I have to do is look for ways to streamline it and I want to slightly modify one small feature.

After this venture, I have decided that RPL is very powerful but can be a pain in the rear end.

Fred

Re: HP 33S help

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 23 Jan 2005, 4:04 p.m.,*
in response to message #6 by Fred Lusk

Hi, Fred;

just to add that I felt somehow scared with the HP28S after using an HP41C and an HP15C for about five years. Anyway, I had my first contact with C language a couple of months before seeing an HP28S and I remember thinking that it would be great having a calculator that could be programmed in a structured language. I like RPN and the keystroke programming, but I feel more comfortable with structures than with GoTo and GoSub (or call). You see, an RPN based calculator could also have a structured programming language, but I guess that it would oversize program power. I also believe that the procedural paradigm chosen for RPN clculators might have been the only choice at that time (70's and 80's). I also see no problem on having a program language with GoTo and GoSug, Label and Return in an RPL-based calculator (in fact, their assembly code uses Goto, Gosub and Return), but that would make things difficult.

You see, I take 'programming' and 'keystroke usage' as different aspects. There are

calculators that cannot even be programmed, others that use the same entry system with different program paradigms (mostly algebriac). Till now I did not take some time to force myself using and understanding how to program the HP49G while in algebraic mode. I read the manual and felt myself not comfortable with the ideas. But I must know what algebraic programming in an RPL-based calculator is like prior to have an opinion about this.

Best regards.

Re: HP 33S help

*Message #8 Posted by **valentino ducati (switzerland)** on 24 Jan 2005, 1:46 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

@Fred and Luiz:

Interesting points of view. I have to admit that - after decades of RPN interface and RPN programming - I felt most unconfortable when I bought my first RPL model (48SX).

The strictly postfix and "stack consuming" paradigma used in RPL is a good thing for complex programs. I did realize this after a very short time.

But what is powerful (and maybe better) for greater solution libraries must not be necessarily the best user interface for daily problems!

Coming from the RPN world I really dislike the RPL approach for ad hoc calculations; what I dislike more is that the 48/49 series doesn't give me a switch to RPN mode for daily business.

An exeample: That's not postfix logic, but for my part the better human interface.

function: store the content of X into variable/register A RPN: STO A (not strictly postfix, but like "we speak") RPL: 'A' STO (more keystrokes, and where is my X gone for further calculations?)

Not to mention the daily programming stuff. A little program with 2 subroutines and a loop is keyed in without manuals and big thinking. In RPN. Without manual, because of the simple functions interface.

Back to the initial question, regarding the ENTER/DUP keystroke for ad hoc calculations: RPN: obj ENTER --> obj obj (stack lift off) RPL: inp ENTER --> obj or obj ENTER --> obj obj in RPN you always know what ENTER does in RPL it dipends if you have a hanging input or not.

That's why I carried many years a RPN model for daily use (additionally to the 48)! But in a few week I hope I need it anymore, because I'm writing a userRPL program (RPNcalc) that does exactly what I need: A RPN interface for RPL calculators.

Re: HP 33S help

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 22 Jan 2005, 7:07 p.m.,*
in response to message #3 by Clay Smith

Hi, Clay;

the problem is that you are taking an RPL-based calculator (HP48GGX) and comparing with an RPN-based calculator (HP33S). You see, the HP48GX has an input line (also called command line), where you can key in any user-valid object. Try this in your HP48GX:

```
1 [ENTER]
```

You see that only the number 1 is in the stack level 1, right? Press [ENTER] again and you'll see a copy of it in level 2 as well. OK, OK, you'll tell me that a DUP command is performed when there is no "active" input line and you press [ENTER] in the HP48GX, right? And this is true! Press [ENTER] with nothing in the stack and a DUP error message appears in the HP48GX.

The HP33S has no input line, so pressing ENTER performs the ENTER function, also programmable (there is no [ENTER] command or function in the (user)RPL structure; in the HP48GX, ENTER is an operation and cannot be part of an object). Everythime you key in a number in the HP33S it is already being placed in the X-register. To key in an object in the HP48GX (or any other RPL-based calculator) you should key it in the input line first and then press [ENTER] to 'push it up' into the stack.

That's why a copy of any number already in the X-register is sent to the Y-register when you press [ENTER] in the HP33S. In fact, in an RPN-based calculator, [ENTER] performs three actions:

1 - ends (finishes) number entering (when keyed in by the keyboard)

2 - "pushes" stack contents up and copies X-contents into Y-register
3 - disables stack auto-lift so the next entry (either with the keyboard or with a RCL) overwrites the contents of the X-register

The third action becomes concise when you remember that a 'safe' copy of the X-contents is already available in the Y-register. The only loss is T-contents.

I think this sentence of yours makes sense, now:

> Quote:
>
> For some reason, when I put a number into the X stack, it also forces the number into the y stack. So any number I press followed by enter, it goes into my X and Y stack.

Please, feel free asking again. For now, I'd suggest having a brief with the HP33S User's Manual, chapter 2, pages 2-5 to 2-7. If you think you need a bit more, chapter 2 is only 14 pages long.

Best regards.

Luiz (Brazil)

Got It

*Message #17 Posted by **Clay Smith** on 22 Jan 2005, 8:01 p.m.,*
in response to message #16 by Vieira, Luiz C. (Brazil)

Thanks guys,

I am by far NOT a calculator expert, but I have become pretty comfortable with my HP 48 GX, and although HP 33S is nice, it is defiantly not a 48GX. Yep, I hate change.

Thanks so much for the information. I truly thought my calculator was not functioning properly. After you guys responded, I went back through Chapter 2 and everything worked as you guys suggested. I guess I was assuming that things to work as they did with the 48 model, and miss understood chapter 2 the first time.

Anyway, I am on track now thanks to you guys.

Have a great weekend.

Clay

Re: Got It

*Message #18 Posted by **Dave** on 22 Jan 2005, 10:34 p.m.,*
in response to message #17 by Clay Smith

You can get the 33S to behave a bit more like the 48 series by a program:

LBL A R/S GTO A

Run XEQ A to get into this program and then use the R/S key as a substitute ENTER key. This will avoid the duplication of the X into Y.

Put an ENTER function after the R/S to get the R/S key to behave like the ENTER Key but in a different location

Re: Got It

*Message #19 Posted by **coquirabioso** on 28 Jan 2005, 12:20 p.m.,*
in response to message #17 by Clay Smith

Remember that this is not change but a return to the basic RPN calculators. The change was the 28s and eventualy the 48 and 49. Those idiots in NCEES forced HP to go back to the Old Style calculators in order to take the exams. Soon they will want examines to use slide rules, logarithm tables and measuring tapes.

in response to message #16 by Vieira, Luiz C. (Brazil)

I need help with the polarities of new batteries placement. There are no polarities shown in the battery compartment, nor in the manual. Thanks. rjyak --

Re: HP 38E help with batteries

*Message #21 Posted by **Vieira, Luiz C. (Brazil)** on 30 Jan 2005, 2:00 a.m.,*
in response to message #20 by RJYak

Hi, RJYak;

the polarity of all Spices (HP31E, 32E, 33E/C, 34C, 37E and 38E/C) is as follows.

By facing the back of the calculator, batteries compartment in the upper side, you should see the contact tabs in the left side, OK? The upmost contact is the negative (closer to the AC adapter square hole). The other one is the positive.

When I use standard rechargeable batteries (not the pack supplied with the calculator), I add a small, thin metal stripe in the right side of the compartment when inserting the batteries that must be enough to "close the circuit".

Hope this helps.

HP41CX doesn't turn on

*Message #1 Posted by **Ralph** on 22 Jan 2005, 12:02 p.m.*

Hi

I own a HP41CX I bought three years ago and since then it has always functioned correctly. I haven't used it on the last year so I removed the non-rechargeable batteries to prevent from corrosion and stored the calculator on a safe place. Yesterday I picked it up again and placed the old batteries and turned it on. It showed the MEMORY LOST message for about half a second and then the message faded and the calculator seem to be DEAD! I've replaced the old batteries with new ones, but the same: after placing them I turn it on and it shows the message and then fades and nothing more happens.

Has someone an idea what could be wrong? I hope the calculator is not damaged of being not used!

Thanks for the help Ralph

Re: HP41CX doesn't turn on

*Message #2 Posted by **Ralph** on 22 Jan 2005, 12:24 p.m.,*
in response to message #1 by Ralph

I've been reading a bit on the MoHPC article about batteries and says for the 41CX they must be N cells. I've looked at the ones I bought: The model is VARTA 4001 . LR 1 Alkaline (1.5 V). Now I'm not sure if they are the right ones for the calculator...the size of them is correct, however.

Ralph

Re: HP41CX doesn't turn on

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 Jan 2005, 12:43 p.m.,*
in response to message #1 by Ralph

Hi, Ralph;

I own five working HP41, one of them (HP41C) is with me since it was bought new in the beginning of the 80's. All I can tell you is that I experienced some cases like this, where you insert batteries and they momentarily charge the capacitor built in parallel with them. Because of bad contact (battery holder springs with residual corrosion, batteries main contact set, even contacts between IO/Batt assembly and mainboard...), the batteries do not feed the mainboard circuitry after they are in place, so the remaining charge in the capacitor is enough to power the calculator up time enough for you to see MEMORY LOST message fadding. In all cases, I cleanned each part I mentioned above, same sequence, and tested the calculator. I don't recall any unsuccessful attempt. In two or thee cases I had to reduce the spring pressure by "deforming" them slightly; some springs force the IO/Batt assembly too much when and after the bettries compartment is inserted.

If you need to open the calculator there are some helpfull hints here, but I'd try some "external" cleanning mostly if you have not done this before.

Let us knwo what happens next.

Success!

Luiz (Brazil)

Re: HP41CX doesn't turn on

*Message #4 Posted by **Ralph** on 22 Jan 2005, 1:17 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I have repaired it. I've clean all contacts and have observed the springs that hold the batteries make a great force. So I have put the battery holder in place but just pressing it so that all four batteries made contact. I've then turn the calculator on and it worked fine (nice to see the 0.0000 again). The solution has been deforming the springs a bit so that they don't press with too much force. So easy!!

Thanks very much for the help!

I'm glad you made it! (NT)

Re: HP41CX doesn't turn on

*Message #6 Posted by **Stefan Hauschild** on 23 Jan 2005, 12:16 a.m.,*
in response to message #4 by Ralph

Your battery type is ok - I use the same ones. And I have discovered that the battery holder of older HP41 is somewhat tricky to insert. On my two HP41s I have to adjust it smoothly every time I change batteries. Even after cleaning all contacts with a fiber pencil eraser it has to get the correct pressure on all contacts. It seems to be the same problem with your calculator.

Best regards

Stefan

Re: HP41CX doesn't turn on

*Message #7 Posted by **Ralph** on 23 Jan 2005, 5:40 a.m.,*
in response to message #6 by Stefan Hauschild

Before that I had only changed batteries on my HP-41 once, but now I'm getting familiar with the holder, as you say if it doesn't makes the correct pressure the calculator won't turn on.

Thanks for the counsel.

Ralph

20s manual?

*Message #1 Posted by **Steve M.** on 21 Jan 2005, 11:04 a.m.*

Hi, all,

I've searched here, there, and everywhere for the HP 20S manual, PDF or print. Still not found. Can anyone point me to a copy?

Thanks, - Steve.

Re: 20s manual?

*Message #2 Posted by **Ron Ross** on 21 Jan 2005, 11:23 a.m.,*
in response to message #1 by Steve M.

I believe there is an Hp21s manual available out there in Cyberland. You could easily use that instead. They are very similiar calculators.

20s manual?

*Message #3 Posted by **Steve M.** on 21 Jan 2005, 1:00 p.m.,*
in response to message #2 by Ron Ross

Turns out that http://www.calcpro.com has 'em. Thanks to HP customer service for the tip.

- Steve.

HP41 CCD-Module Matrix files

*Message #1 Posted by **Christoph Klug** on 21 Jan 2005, 3:11 a.m.*

Dear HP41 Enthusiasts,

does anyone know an advanced and fast software solution to transfer CCD-Module Matrix files, stored in X-Memory to an IL-Mass Storage Unit ? But without using main memory !!!

Would it be possible to convert the Matrix file to an ASCII file and using SAVEAS / GETAS commands for transfer to IL Mass Storage Unit ?

Waiting for your solutions :-) With best regards from Germany - Christoph Klug

Re: HP41 CCD-Module Matrix files

*Message #2 Posted by **Raymond Del Tondo** on 21 Jan 2005, 4:56 a.m.,*
in response to message #1 by Christoph Klug

Hi Christoph,

Doesn't Extended IL ROM contain suitable functions?

Best Regards from your neighbourhood,

Raymond

Re: HP41 CCD-Module Matrix files

*Message #3 Posted by **Mike (Stgt)** on 21 Jan 2005, 8:08 a.m.,*
in response to message #1 by Christoph Klug

There exist a program (published in PPC-CJ by ??? from Finland IIRC) that changes the type of XM files. Later there had been MCode functions arround for that. Currently no idea in which ROM.

BTW -- you got the BS Yacht Module running?

Ciao.....Mike

Re: HP41 CCD-Module Matrix files

*Message #4 Posted by **Christoph Klug** on 21 Jan 2005, 8:38 a.m.,*
in response to message #3 by Mike (Stgt)

Dear Raymond, dear Mike,

changing XM file type by altering the file header register is easy possible with CCD-module commands PEEKB and POKEB.

But for creating a correct ASCII file format, also additional field distance bytes are needed, placed between the data bytes. Inserting this bytes in the correct order seems to be much more complex...

Up to now I only get wrong and uncomplete data, when reading them back from ILMass Storage Unit :-(

Yes the BC Module is running (Mike), but what about HC Module (raymond) ?

Best regards - Christoph

*Message #6 Posted by **Mike (Stgt)** on 21 Jan 2005, 12:14 p.m.,*
in response to message #5 by bill platt

Navigation purpose, at least theoretically. I used it on a vessel in rough weather and found the HP41 with it much too dangerous: one wrong entry and you may hit ground. At least that was my impression, so I stored the HP41 away and made my possition from landmarks in sight, w/o calculator.

Ciao.....Mike

HP 15c Sky rocket price

*Message #1 Posted by **Rafael Magallanes Quintanar** on 20 Jan 2005, 7:59 p.m.*

Have you seen the price that somebody has willing to pay for an almost new HP 15c on Ebay?

1986 Hewlett-Packard HP-15C Calculator Item number: 5744641551

Actually when I wrote this message is : $485.01

Please somebody must stop this madness!

Best regards

Rafael Magallanes Quintanar

Re: HP 15c Sky rocket price

*Message #2 Posted by **Nick Nicholas** on 20 Jan 2005, 8:53 p.m.,*
in response to message #1 by Rafael Magallanes Quintanar

That price is not actually surprising. I have seen prices over $500. A HP 10C (NIB) sold for over $600 a few days ago.

How much is a non functional unit worth?

Re: HP 15c Sky rocket price

*Message #3 Posted by **HrastProgrammer** on 21 Jan 2005, 12:05 a.m.,*
in response to message #2 by Nick Nicholas

How much is a non functional unit worth?

Nothing, if you ask me ...

Re: HP 15c Sky rocket price

*Message #4 Posted by **Steve M.** on 22 Jan 2005, 6:27 a.m.,*
in response to message #3 by HrastProgrammer

I dunno about that. Parts are always useful.

Here's one on ebay that has a near-perfect case and a flaky display:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58039&item=5744986872&rd=1

Put that together with a unit with a scratched-up case and perfect electronics and you have a working, cosmetically near perfect unit.

What I can't fathom is why people want to pay astronomical prices for NIB units. Open the box and you devalue them by more than 50%. So you can never use the things!

- Steve.

Re: HP 15c Sky rocket price

*Message #7 Posted by **Valentin Albillo** on 21 Jan 2005, 5:04 a.m.,*
in response to message #1 by Rafael Magallanes Quintanar

Hola, Rafael:

Rafael wrote: *"Actually when I wrote this message is : $485.01. Please somebody must stop this madness!"*

Madness !? I think it's actually quite a reasonable price for what seems to be a complete (box and all), mint, never-used HP-15C. Matter of fact, I think the bids will get even *higher* near the auction's end.

As for stopping it, why ? This is a *free* market, isn't it ? Any seller is entitled to ask as much as he/she wants for their product and any buyer is entitled to pay as much as he/she wish and can afford. What right does anyone have to interfere and "stop it" ? It's not like an HP-15C is any vital product which the masses need to survive.

But come to think of it, no serious and self-respecting HP calculator fan/lover can be without an HP-15C, let alone collectors. There are just this many original HP-15Cs left in the world, there will never be more, and each passing year there are even *less*, a few ones having sadly succumbed to chewing dogs, toddlers and the like. Not having one (or several, as a backup) while you can (and even if you don't) borders on the unthinkable, and even on the irresponsible. :-)

Next week I'll post here one of my Mini-Challenges for it, and maybe even a useful program as well, so you can better appreciate its incredible capabilities. As a pure calculator with useful programming features, it's one of the very best in the world and certainly, the most elegant, rugged, and well-built. My original one has used up just two battery sets in 24+ years, and seems like new. That says a lot. That's now *worth* a lot. Else, take the KinHPo way.

Best regards from V.

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 22 Jan 2005, 1:10 a.m.,*
in response to message #7 by Valentin Albillo

Hi Valentin, all;

first of all, Valentin, forgive me not mentioning 'how good it is to have you back' earlier. My fault and a lack of politeness of mine. I sincerely hope you accept my apologies. d8^)

Now for the news: I borrowed original, English written, single volume 'Six Stories by Douglas Adams' (my younger brother's) and I'm getting my spirit ready to read it. Your indication, remember?

About your "Long Live the HP42S": congratulations. I did not read it YET, but I'm sure it will give me some delightfull moments when reading. You know, I'm a big fan of it and (please, forgive me!) sometimes I am not sure if I like it more than the HP15C or conversely. I worship both, one at a time. Oops! Hope this is not an heresy...

About the HP15C, Valentin wrote:

> Quote:
>
> As a pure calculator with useful programming features, it's one of the very best in the world and certainly, the most elegant, rugged, and well-built.

Just to add: 'Nothing to add!' and 'Very truth!'

Best regards!

Luiz (Brazil)

(PS: yet without a working spell checker; feel free adding corrections, please...)

Answering Luiz (was Re: HP 15c Sky rocket price)

*Message #9 Posted by **Valentin Albillo** on 24 Jan 2005, 6:06 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi, Luiz:

Luiz posted: *"first of all, Valentin, forgive me not mentioning 'how good it is to have you back' earlier. My fault and a lack of politeness of mine. I sincerely hope you accept my apologies."*

Thanks Luiz, but as always, you're being far too kind to my humble person, no need to apologize for anything, of course. I'm also glad to read your always interesting, amiable postings.

"Now for the news: I borrowed original, English written, single volume 'Six Stories by Douglas Adams' (my younger brother's) and I'm getting my spirit ready to read it. Your indication, remember?"

Great ! :-) I'm sure you'll like it a lot, but be warned that it's choke-full with word games, innuendos, obscure references and all kind of dirty verbal tricks, mostly harmless of course but still ... In other words, it might prove slightly difficult to fully understand. Myself, every time I re-read it, I find new things I hadn't noticed before. So, polish up your English and ... enjoy !

"About your "Long Live the HP42S": congratulations. I did not read it YET, but I'm sure it will give me some delightfull moments when reading."

Thanks for your interest and enthusiasm, let's hope they'll get properly rewarded when reading the article.

"You know, I'm a big fan of it and (please, forgive me!) sometimes I am not sure if I like it more than the HP15C or conversely. I worship both, one at a time. Oops! Hope this is not an heresy..."

Not necessarily. I know that the HP42S is the better machine from a features point-of-view, yet the HP-15C is the better machine in terms of robustness, quality of construction and sheer durability. No need to chose, however, just get both.

"(PS: yet without a working spell checker; feel free adding corrections, please...)"

With pleasure. Nothing serious, really; just to name a few:

1. *"forgive me not mentioning"* should be either "forgive my not ..." or "forgive me for not ..."
2. *"delightfull"* has one "l" too many.
3. *"an heresy"* has one "n" too many.
4. *"Very truth"* should be "Very true"

Thanks and best regards from V.

in response to message #9 by Valentin Albillo

I believe that "an heresy" would be correct in jolly old England, while "a heresy" would work on this side of the pond.

[OT] Re: Answering Luiz (was Re: HP 15c Sky rocket price)

*Message #11 Posted by **Valentin Albillo** on 24 Jan 2005, 9:26 a.m.,*
in response to message #10 by db (martinez, ca.)

Hi, db:

Let's see:

*"**an**"*

The form of "a" used before words beginning with a vowel or with an unpronounced h: an elephant; an hour"

And "heresy" has no unpronounced "h", as far as I know. :-)

Thanks and best regards from V.

Re: [OT] Re: Answering Luiz (was Re: HP 15c Sky rocket price)

*Message #12 Posted by **db (martinez, ca.)** on 25 Jan 2005, 6:32 p.m.,*
in response to message #11 by Valentin Albillo

I asked three certified english teachers and it seems you are right. However; the two who agree with you work for the one who thinks that Luiz and I are right. It seems that in proper British english; it is "an h#####" if the stress is on the second syllable and "a h#####" if not. Of course, if it were hard and fast; this rule would make "an hotel" and "an hilarious situation" the correct choice instead of what we know as correct by common usage. English is not math. There is a whole class of people who make their living by making language errors. They are called poets.

For the past few days I have been checking the English version of a Bolivian friend's website. I try to not correct too much because a) It will be read by Norte Americanos, Brits, Canuks, Ausies, Kiwis, folks from Belize and anywhere that they can't read the Spanish or French version. I figure that if it seems like it may be correct someplace then it's good enough. b) He's trying to give information and even if it is a bit verbose or strange sounding to my American ears; if it gets the point across then it's ok. c) It's no fun to hammer or to be hammered and I'd rather be happy than right. It's good to help Luiz though, because he aims for perfection in himself. So lets hammer him.

The best thing about english to me is that it is not pure. We've borrowed words, phrases, and modes of speech from most of the languages on earth. "If you discovered it then we'll use your word for it". So, it's forgiving. It's probably not as forgiving as Japanese, which has an accepted baby version, but it's pretty inclusive. I mean; if i had a buck for every time I could have corrected the speech of a number of a registered professional engineers from India - I could have bought that 15c.

May I? (was: [OT] Answering Luiz...) edited

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 25 Jan 2005, 9:28 p.m.,*
in response to message #12 by db (martinez, ca.)

Hi D.B., Valentin, guys;

Wow! That's amazing, realy! I'm reading these posts, and all I see is that there are many more things about English (and a lot more subjects) that I need to master. At least, get closer to what I want to...

First, based on my own cultural fundation, 'heresy' is writen 'heresia' in Portuguese (maybe the Spanish equivalent is closer to it). Even if it does not start with a vowel, 'heresia' sounds as if, meaning the 'h' is not pronounced. When I wrote 'an heresy' I actualy forgot that the 'h' is pronounced, so I wrote like that. My fault...

Second, I'd like to thank you both: I always learn with your (and others) posts. And Valentin, I took note of the other corrections you pointed out. And I understood them perfectly (I guess...)

Third: you see? I had to look at my old 1977's Merrian-Webster Dictionary to check for a feel spelling of terms I used in this very post. And I'll try keeping this as a regular gesture...

Some mistakes I'll not get corrections by reading a dictionary, like "Very truth" or

"forgive me not mentioning", but I actually got their correct ways for good. Thanks!

For those of you that read this and think the subject is off toppic, I'd say 'I agree', but many contributors in here are from many parts of the globe and I guess many of them took their notes as well. I'm not sure about others, but having Portuguese as my first tongue, I like expressing myself in English: compared to Portuguese structure and grammar rules it's less complicated, but surely demands some time to master particular "nuances". I just need to enhance my knowledge base... Thanks again, Valentin and D.B.

Cheers!

Luiz (Brazil)

Re: [OT] Re: Answering Luiz (was Re: HP 15c Sky rocket price)

*Message #14 Posted by **Garth Wilson** on 31 Jan 2005, 1:29 p.m.,*
in response to message #12 by db (martinez, ca.)

Some of our news stations continually make the mistake of saying "an historical event..." Our dictionary says the correct way (not just the preferred way) is "a historical..."

The error no doubt crept in with the common language in some parts of England dropping the h from the beginning of words. The language professor poked fun at this in My Fair Lady. In The Secret Garden, one of the girls that worked in the palace said "and go around theee 'ouse" (ie, "go around the house"), and her brother said about the lamb, "He's 'ungry!" (ie, "He's hungry!"). The movie Mrs. 'Arris Goes to Paris shows the same thing. Her last name was Harris, but the H was continually dropped.

Still, I'm impressed by how well those on this forum whose first language is not English actually do in English. They seem to keep the "it's" and "its" and other such things straight a lot better than many of the native English speakers on various forums I watch.

English isn't my first language, either, and I never used to confuse "it's" and "its", or "too" and "to", etc.
Then, after having lived in the U.S. for several years, I noticed that such errors were beginning to creep in. I think what happened was that I was getting so fluent in **typing** English, that my brain was starting to skip the word-to-text step, and it started to translate straight from sound to finger movements... And **that's** when the door is opened to homonym errors.
I'm always surprised at the large number of people who write "loose" when they mean "lose", though. That doesn't even **sound** the same!

Luiz writes so much and gives us always so much invaluable information that you should forgive him that minor grammar slip. By the way I've always seen people writing "a HP-15C, a HP-41, etc...": as far as I know the name of the letter H is \ach\, not \hach\ (\a\ pron. as the 'ay' in day). Therefore, they shoud say "an HP-15C, an HP-41", unless there is something I am not aware of. (Once even our teacher of Technical English startled as he found " an LED... " written in the text we were studying. As we Brazilians pronounce \'leji\ it took quite a while for us to realize that the American pronounciation for that acronym was \el-ee-'dee\ - Light-Emitting Diode).

Regards,

GWB

Gerson.

Re: Answering Luiz (was Re: HP 15c Sky rocket price)

*Message #19 Posted by **Rodger Rosenbaum** on 27 Jan 2005, 3:00 a.m.,*
in response to message #9 by Valentin Albillo

Valentin suggests that Luiz makes an error when he says "...forgive me not mentioning..." and proposes that

1."forgive me not mentioning" should be either "forgive my not ..." or "forgive me for not ..."

Actually Luiz's usage is perfectly acceptable English as we see in this segment from the Lord's Prayer:

"...forgive us our debts, as we forgive our debtors."

Good English usage doesn't require "...forgive our debts..." or "...forgive us for our debts..."

No, Valentin is correct [English grammar]

*Message #20 Posted by **Karl Schneider** on 29 Jan 2005, 2:41 a.m.,*
in response to message #19 by Rodger Rosenbaum

Rodger --

"forgive me not mentioning"

could be a request for the second person to forgive the first person on account of his transgression ("forgive me for...") or to pardon his misdemeanor ("forgive my not...").

In the Lord's Prayer, "...forgive us our debts" requests forgiveness (absolution/cancellation) of the debts themselves. It should be interpreted as, "forgive our debts for us", although "forgive our debts" would suffice.

-- KS

Re: Is that your bid?

*Message #23 Posted by **Ron Ross** on 21 Jan 2005, 11:13 a.m.,*
in response to message #22 by Ronald

Are you trying to influence the market?

Its probably not good for any of us to watch these auctions. While many of us begin to think we are sitting on gold mines, many of us are just common folks who used to collect these toys (TOOLs, I tell my wife) before they became valuable to users who had just one, and need another after the demise of their ONLY HP.

New users prefer the EOS algebraics and only a very few of us remaining dinosaurs use RPN (and an even smaller amount of converts). I actually like AOS over EOS, but guess what? Most algebraic users DO NOT. So even the Hp33s will be at a disadvantage in the market to those users.

However, at least an RPN user can avoid the escalation of price gouging buy buying an Hp33s now available. No, it isn't an Hp15c, but for a general RPN user, it is in most ways better. Valentin may not want to soil his hands with it, and its shortcomings would scream out to him every time he would pick it up. However it will work as a general scientific for most.

To a purist, it does have shortcommings, but it is $50 US and does provide a step up from the 11c or Hp32s series in features. Mine seems to be ok aside from the appearance, but it is now my calculator of choice (or more aptly, NCEES's calculator of choice for me, as it is the only RPN calculator now allowed on the National Engineering exam given in the US).

Would I like better, Yes! I would have preferred Hp release an Hp42sx (32K or 128K RAM, 48G type units conversions and a Serial I/O would have made this a great calculator). Sadly, this was all possible 15 years ago, and even more tragic, might not be possible today.

I think HP would be better off to secretly remake their old models and selling them on ebay. What do you think?

Need HP-34C Parts

*Message #1 Posted by **Steve** on 20 Jan 2005, 6:39 p.m.*

Hello, I am in need of a good battery contact board for an HP-34C. If anyone has one or knows of a source, please contact me directly. If anyone knows what is involved in replacing this part, that is also of interest. Thanks, Steve

Re: Need HP-34C Parts

*Message #2 Posted by **Etienne Victoria** on 21 Jan 2005, 4:38 a.m.,*
in response to message #1 by Steve

Bonjour Steve,

You've got mail.

Etienne

Re: Need HP-34C Parts

*Message #3 Posted by **David Smith** on 21 Jan 2005, 4:56 p.m.,*
in response to message #1 by Steve

You can make replacement contacts with beryllium-copper spring stock (from Small Parts, Inc, etc). You will probably also have to replace the battery flex circuit cable with discrete wires.

*Message #5 Posted by **Matthias** on 21 Jan 2005, 9:35 a.m.,*
in response to message #1 by Emmanuel, France

Had a look at your ebook. Realy nice pictures, about the text I can not tell you, because there is nearly nothing in the "demo". I have a software to convert .pdf files to .doc files. So I can easily delete the serial number and key. It does not make sence to put this in your ebook, or you have to iinclude it as a picture, not as a text (but also a picture is easy to edit). By the way, if your ebook is not finished yet: Can I help you with some of my stuff (pictures, modules, ...)?

Matthias

HELP with hobbit

*Message #1 Posted by **john francis** on 20 Jan 2005, 11:34 a.m.*

I thought I just posted this message but my laptop clicked off. I am looking for a game source code in gwbasic called hobbit that is NOT the melbourne game, but is just like the Wizard's Castle, which is a 8x8x8 grid, whereas hobbit is only 9x9. I know the source code exists as I had it years ago. If anyone know where it is, PLEASE send it to me or let me know where. I have looked for days.

Are you sure this is the forum you want? (nt)

changing significant digits on 20s

*Message #1 Posted by **An Tran** on 20 Jan 2005, 11:25 a.m.*

I just got an old HP 20s (i lost my 22s, which is sorely missed, does any body have one they want to sell?). It displays all inputs and answers to 4 signficant decimal places.

In my last 22s, it would just display as many as it cut, and not trucate or add zero's to fill into 4 decimal places.

Can this be changes to be like my old 22s? Where do I find these settings? I don't necessarily want scientific notation, just more data.

Thanks, An

HP 71B to PC Software

*Message #1 Posted by **Nick Nicholas** on 19 Jan 2005, 8:52 p.m.*

I've searched the internet and this forum for software to allow a HP 71B to communicate and transfer files to a PC through a HP IL/RS232 interface.

The only reference I could find regarding such software on this forum is located at:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=45334

It seems this person, Andy Delano, is no longer an active poster on this forum. I sent an email to him but I haven't received a response.

Does anyone have a copy of this software that could email me a copy. My email address is hwxyz at hotmail.com.

Can you identify this?

*Message #1 Posted by **Steve (Australia)** on 19 Jan 2005, 10:30 a.m.*

It's a black box. Approx 9 cm (3.5 in) x 14.5 cm (5.8 in) x 3 cm (1.2 in).

In large embossed letters on one side (top?) it has CMT.

On the other side (bottom?) it has a label reading: CMT Corvallis Microtechnology, inc. Model# RD512-01 Made in USA Serial# 744163 Complies with the limits for Class B...

It has a battery compartment which holds a 9v battery and a lithium cell.

It has a power jack. and an HPIL interface with 30 cm leads (i.e. *not* sockets on the box) on one end.

The other end has a 9 pin male D connector, 2 recessed push buttons (labelled On and Off and 2 LED indicators labelled on (yellow) and Bat (red).

Some things that won't help you identify it, but are kinda interesting include labels:

"Jacquie - New lithium and 9v battery fitted 16/9/94"

"Wilson wheat"

"datrec datdump ldev lsel primemp rpl rsys..."

The unit has 3 *very thin* pc boards with chips mounted both sides of other boards. It has an NEC V20 chip.

It was *probably* used with HP71's.

So what is it?

Re: Can you identify this?

in response to message #1 by Steve (Australia)

Maybe you can give us pictures... This would be much more easier....

Re: Can you identify this?

*Message #3 Posted by **.** on 19 Jan 2005, 1:23 p.m.,*
in response to message #1 by Steve (Australia)

These units were used as temporary mass storage by data collectors

Re: Can you identify this?

*Message #4 Posted by **Steve (Australia)** on 19 Jan 2005, 5:29 p.m.,*

in response to message #3 by .

Yeah, I expected as much. The full kit used by these people appeared to be a 71b (with *lots* of memory), a cassette drive, a printer and one of these.

I really don't know what they used them for, but it was something to do with wheat!

I'd be really interested in further information about this mystery box -- does it have a name for instance? (I don't think they were called Jacquie :-)

I'll try to arrange a picture later today. It may have to come from my scanner though.

Re: Can you identify this?

*Message #5 Posted by **GE (France)** on 19 Jan 2005, 7:12 p.m.,*
in response to message #4 by Steve (Australia)

What do you mean, *lots* of memory ?

Re: Can you identify this?

*Message #6 Posted by **Steve (Australia)** on 20 Jan 2005, 4:23 a.m.,*
in response to message #5 by GE (France)

all were either chokka with 32K ram modules or had a 128K module.

In those days that was a *lot* of memory.

Re: Can you identify this?

*Message #11 Posted by **Lawrence** on 19 Jan 2005, 8:15 p.m.,*
in response to message #1 by Steve (Australia)

The item is a CMT "Ram Disk" which mimics a HP-IL tape drive with NO moving parts. Yours also serves as a RS-232 interface. You have the top-of-the-line unit. Congratulations!!

The RD512 should appear as four separate HP-IL devices as each 128K block of memory would be a separate device. The RS-232 would appear as a different device. There is a way to configure the unit as one contingous 512K block. I'm unfamilar with this.

I have the 128K unit (RD128) without the RS-232 functionality. I use it as I would a tape or disk drive. I've owned mine for about 18 yrs with no problems.

I still have the manual for mine. I could scan some pages for you if you require them. It might take a day or so to find the right box. The manuals for the 82161A tape drive and 82164A RS-232 interface should get you started. All of the mass storage commands associated with the HP-IL, EXT I/O, and the mass storage/duplication ROM work. Commands associated with the DEVL ROM can provide unexpected results.

The required lithium cell (so you don't lose memory when you change batteries) is a CR2325. I get mine here in the US from Radio Shack (part # 23-169)

Lawrence

Re: Can you identify this?

*Message #12 Posted by **Steve (Australia)** on 20 Jan 2005, 4:45 p.m.,*
in response to message #11 by Lawrence

Yeah, I'd be *very* keen to get hold of some documentation.

I suppose the related question is "What happened to CMT and has there been any effort to get them to release to Dave copyright permission to include their documentation in his CDs?"

But Lawence, expect an email soon with my contact details. :-)

Steve

Re: Can you identify this?

*Message #13 Posted by **Wlodek Mier-Jedrzejowicz** on 24 Jan 2005, 1:12 a.m.,*

in response to message #12 by Steve (Australia)

Steve wrote:

I suppose the related question is "What happened to CMT and has there been any effort to get them to release to Dave copyright permission to include their documentation in his CDs?"

They are still going strong, see www.cmtinc.com

They moved from using HP handhelds to making their own (the Marys family), and now they provide solutions using WinCE units and other hand computers.

When I visited a few years ago to talk to the boss he said it was not commercially worth his time to deal with old stuff. Maybe someone in or near Corvallis would like to go ask him specifically for permission to make the manuals available?

Wlodek

Gauss-Jordan Pivot

*Message #1 Posted by **Kevin Havre** on 18 Jan 2005, 4:41 p.m.*

I am taking a Finite Mathmatics class, and we are working with Matrices. The teacher handed out TI programs that let you pick the pivot for solving a system of equations using the Guass-Jordan method, but it only does it one step at a time. You pick the first pivot row and it returns the matrix with a 1 in the left most position of that row and zeros above and below. Then you pick the next row, and it returns the entire matrix with the first non-zero number as 1 in that row, with zeros above and below, and so on...

We are going to have applications later where the row we pick is important, so RREF will not work as he wants us to do one row at a time.

Has anyone seen a program like this? If I give you the TI program can anyone decipher so I can write one for the 48G?

Thanks!

Edited: 20 Jan 2005, 12:18 a.m. after one or more responses were posted

Re: Gauss-Jordan Pivot

*Message #2 Posted by **Veli-Pekka Nousiainen** on 19 Jan 2005, 5:44 a.m.,*
in response to message #1 by Kevin Havre

```
Yes, I have programmed Gauss-Jordan Pivotting for the 49g+
It works really slow compared to RREF, etc.
because it is in UserRPL (instaed of SysRPL+ML)

E-mail to me as a remainder and I send it to you.
My e-mail will later change to have SCI instead of welho
and "fi" insted of "com"
January-February is the X point
Sorry about that
BTW: it was programmed based on a textbook example
where it was done "by hand"

HP-41, 1979-2004 ebook

*Message #1 Posted by **Emmanuel, France** on 18 Jan 2005, 1:03 p.m.*

```
I'm finishing the writing of my book about the 25th anniversary of the HP-41.
More than 300 pages with text, bar codes, screen shots and pictures.
I know that I am late but it should be OK in only one month.
I have not enough space on my website in order to share my acknoledge on the HP-41.
This ebook will be a pdf file on a cdr :
- RPN,
- Synthetic Programming,
- MCode,
- Data Transfer,
- Peripherals,
- Making bar codes,
- Eprom Boxes,
- Programming Eproms,
- Emulation,
- Advanced Using, ...
What do you think about EUR 30 for it?
This price will include the cdr, registered and insured air mail and paypal fees.
Pdf file will be secured with a key for printing.
One key and one serial number for each order.
You can re-sell it as is.
You can now reserve it. The French version will be the first available.
After the first 100 orders, I will put it on ebay.
Please remove 5555 from my email address.
Thanks for interest and please advice.
Kind regards from Normandy.
Emmanuel aka xeq41

Dave Hicks, Warren Furlow and Wlodek Mier-Jedrzejowicz will get a free ebook for evaluation :
#DH000, #WF000 and #WMJ000. Mine is #EC000/100. ;o)
```

Je suis d'accord pour la version francaise, mais j'ai quand meme un doute pour la version anglaise. Je pense que la traduction ne sera pas à la hauteur des attentes.

Re: HP-41, 1979-2004 ebook

*Message #7 Posted by **Garth Wilson** on 20 Jan 2005, 1:57 p.m.,*
in response to message #3 by Jean Dhuicq

> Did you write a 300 page book yet? I don't think so. You certainly don't know what you are talking about !!!

I've written and printed a much smaller book and I know it's an incredible amount of work. But as for the price, a product is only worth what someone is willing to pay for it, regardless of how much work went into it. Very few books make any money for the author. Making money is not the reason most books are written. I want to get this E-book, but I'm going through a temporary very tight financial time so it will probably have to wait. When I do get it, I will probably go all the way and get it printed and put it in a binder. I have to consider that to be part of the price.

Re: HP-41, 1979-2004 ebook

*Message #8 Posted by **Jean Dhuicq** on 20 Jan 2005, 2:23 p.m.,*
in response to message #7 by Garth Wilson

[pre]Emmanuel did not mention it. He has to pay taxes too : income taxes and copyright taxes. French Treasury charges him a lot. That should explain the price. If I understood well, he should get EUR 10 only. We can consider that his work isn't paid for only 100 units.[pre]

Re: HP-41, 1979-2004 ebook

*Message #9 Posted by **Matthias** on 18 Jan 2005, 5:02 p.m.,*
in response to message #1 by Emmanuel, France

Hi Emmanuel

30 Euro is a normal price for a printed book, with ISBN code and a cover. The autor has to pay fees for the printing company, so he perhaps earns half of the price. Is this true for your situation? If you burn your CDs yourself, I would say, the price is some Euros too high, if you have a burning company and we get a booklet it ´s ok...

By the way: I know a lot of "insiders" as Wlodek, Warren and Dave who would also be happy to get a free CDr.. :) I would not publish this to everybody, maybe you could earn some enviousness...

Matthias

Hi Emmanuelle,

When it is French, the price for me is much to high, I can order a good bottle of wine in french, but then it stops in French, so it is probably like an encrypted file (-:) for me mostly.

If it is in English I think it is a reasonable price.

Kind regards

Ronald

```
Dear Matthias,

'30 Euro is a normal price for a printed book, with ISBN code and a cover'.'
You are right when you do not have a little production like mine (only 100 units).

'The autor has to pay fees for the printing company, so he perhaps earns half of the
price.
Is this true for your situation?'
The cost asked by the compagny at Evreux is too high for me. There's only one company.
As mentionned above it's a little production.
For a color printing, covering and wrapping, the Xerox company at Evreux is asking EUR
0.20 per page,
```

```
id est EUR 60.00 per book !!!
For 1000 pages, the price decreases to EUR 0.15 (EUR 45 per book)
and for 5000 pages 'only' to EUR 0.10. (EUR 30 per book).
Those prices do not includes s&h costs.
I'm not a professional, just an ordinary person.

'If you burn your CDs yourself, I would say, the price is some Euros too high,
if you have a burning company and we get a booklet it's ok...'.
I have to burn them myself because at Evreux there's no such company.
But there's an important point you do not consider :
the time left in order to write the book.

'By the way: I know a lot of "insiders" as Wlodek, Warren and Dave who would also be
happy to get a free CDr.. :)
I would not publish this to everybody, maybe you could earn some enviousness...'
Are you jalous? ;o)
Dave, Warren and Wlodek will give their point of view on that book.
```

Dear Emmanuel,

now I am waiting for the English version of your book :-)

I know your price is placed in a fair range. For less it would not be possible to produce a small number of books including printing, binding, and handling costs.

For example my I/O-Board Manual (HP41 hardware interfacing and measurement applications) includes 300 pages, the price for this is 20Euro plus shipping costs. And the IL2000 System manual with 150 pages have a price of 15Euro plus shipping costs.

Best regards from Germany - Christoph Klug

*Message #14 Posted by **Tony Duell** on 19 Jan 2005, 6:36 a.m.,*
in response to message #13 by Christoph Klug

_If_ it was a real, paper, book, then I'd almost certainly buy it (and would pay more than 30 Euros for it).

But I don't like CD-ROMs. I can't easily read them, I certainly can't read them in bed, on the bus/train, and so on. Printing out all 300 pages certainly isn't an option for me either.

HPCC website

*Message #1 Posted by **Matthias** on 17 Jan 2005, 4:12 p.m.*

Have you seen the new outfit of our European club, the HPCC? Mark Power did a brilliant job with a new layout, simpler and no longer spagetti-like.

Some suggestions from a active web designer are allowed:

- There should be a possibility to download old DATAfile articles or even back numbers. Noone will buy a CD-ROM with old articles, because you never read them all, but these articles are a quarry for single informations. - Add some more pictures, mainly from the meetings. I want to know, who is in the club! (Maybe you could add a member´s list as well. - Forget your work with the forum, the last posting is several month old... We all use Dave´s forum. I think it´s better to use one single forum than to read in different.. personal opinion, sorry.

Re: HPCC website

*Message #2 Posted by **Valentin Albillo** on 18 Jan 2005, 6:48 a.m.,*
in response to message #1 by Matthias

Hi, Matthias:

Thanks a lot for your interesting suggestions for the HPCC web site, I agree with most of them but I want to make a couple of remarks:

Matthias wrote: *"Noone will buy a CD-ROM with old articles, because you never read them all"*

On the contrary, quite a number of people have got the ***PPC CD #3 - Handheld and Portable Computer Club's (HPCC) - Twenty-One Years of Datafile 1982 - 2002*** compiled and made available by Jake Schwartz as part of the PPC CD-ROM Set, and it's easy to see why: it makes *fascinating* reading and it's incredibly useful as a *reference* of what's been done and how.

If your remark would hold, all CD-ROMs with the full contents of PPC, CHHU, Australian Technical Notes, HPX, etc, would also fail to hold the interest of HP fans. Fortunately, that's not the case, more like the opposite.

"I want to know, who is in the club! (Maybe you could add a member´s list as well".

Good idea, perhaps such a list will be eventually included at the site. Meanwhile, some members (who I hope wouldn't mind me mentioning their membership here) are Wlodek Mier-Jedrzejowicz, Tony Duell, Bruce Horrocks, Frank Wales, Jordi Hidalgo, Toni Hutchings, Bill Butler, Richard Nelson himself, ..., and yours truly, to name a few. You can get a pretty accurate listing of most active members by simply looking at the Table of Contents of past Datafile issues, here.

Best regards from V.

*Message #3 Posted by **Tony Duell** on 18 Jan 2005, 9:01 a.m.,*
in response to message #2 by Valentin Albillo

Actually, I don't think Richard Nelson is an HPCC member. I don't recall seeing him in the list.

Re: HPCC website

*Message #4 Posted by **Valentin Albillo** on 18 Jan 2005, 10:50 a.m.,*
in response to message #3 by Tony Duell

Hi, Tony:

Tony posted: *"Actually, I don't think Richard Nelson is an HPCC member. I don't recall seeing him in the list. "*

Actually, I was under the impression that he had kind of an "Honorary Membership" but I may be wrong.

In any case, Datafile includes articles by him every so often, the latest issue (V23N6, December 2004) for instance does include his amusing and interesting **"HP Calculator Quiz"** (V23N6P37), and I guess Matthias is more interested in *who* does *contribute* to Datafile with articles, regardless of him/her being a member or not.

Best regards from V.

Re: HPCC website

*Message #5 Posted by **Wlodek Mier-Jedrzejowicz** on 24 Jan 2005, 12:07 a.m.,*
in response to message #3 by Tony Duell

I don't know if anyone is still following this thread, but... There was some discussion of who is or is not a member of HPCC. Well, the list posted by Valentin Albillo contained people whose articles have been published in Datafile - some are members of HPCC at present, others were members but are not now, or were not members but have become members. The British law on privacy of personal information is very strict, so it might even be illegal for us to say who is or is not a member!

If anyone wants to use this as the opening of a new thread on the Data Protection Act and other bureaucratic excesses, relating to our interests, please feel free to do so :-)

Wlodek

Re: HPCC website

*Message #6 Posted by **Tony Duell (HPCC Librarian)** on 18 Jan 2005, 9:00 a.m.,*
in response to message #1 by Matthias

I don't think we have enough web space to put all the articles on-line, and anyway selling the CD-ROMs (and back issues of Datafile) provides income to the club (it does take money to run the club, we have to pay to have Datafile printed, we have to pay postage to send it out to members, we have to pay for the room where we hold the monthly meethings).

As regards people only wanting a few articles, I would point out that Dave Hicks here sells plenty of his CD-ROM collection, even though I can't think anybody wants _all_ the manuals on said disks. Also, you'll often find useful information (to you) in articles that, at first sight, seem to have nothing to do with the information in question. It's better to read everything you can.

I will admit I've not bought that CD-ROM (I personally prefer to read paper), but I have access to every issue of D/F ever published, and have read all of them (!).

I am also pretty sure that the UK Data Protection Act would prevent us making the membership list available to the public. Members get a 'Memberpack' every year which includes a membership list.

More photos of meetings would be a good idea. And I agree with dropping the HPCC forum. I never use it, I come here. It's not as if the HPCC one is private for club members only, or anything like that.

Re: HPCC website

*Message #7 Posted by **Jake Schwartz** on 25 Jan 2005, 9:21 a.m.,*
in response to message #6 by Tony Duell (HPCC Librarian)

Speaking of generating funds for the club, sales of the Datafile CD have passed the 80-copy mark, and have generated U.S. $400. for HPCC since the disk first went on sale. For each copy sold, $5.00 goes back to HPCC.

Jake Schwartz

HPCC - personally, I'd pay for a PDF of the Datafile each month...

*Message #8 Posted by **Gene** on 25 Jan 2005, 2:39 p.m.,*
in response to message #7 by Jake Schwartz

Sure, I know there are quite a few members who want a printed journal each month, but there are probably a lot more of us out there who would pay a smaller amount just to get the PDF version.

That would HAVE to subsidize the printing of the journal, even if a few members changed "status".

Think about it...more members paying somewhat less...but with NO printing cost = excess funds to cover the printing for those that want it.

Cost/volume/profit analysis. Might even use it for my managerial accounting class I'll be teaching.

Give us a PDF membership level! :-)

Re: HPCC - personally, I'd pay for a PDF of the Datafile each month...

*Message #9 Posted by **Tony Duell** on 25 Jan 2005, 3:29 p.m.,*
in response to message #8 by Gene

This idea has been discussed -- many times -- in the past. I seem to remember the main problem was finding a way to prevent the pdf file being copied round all your friends (I am not saying _you'd_ do this, but there are plenty of people who would, alas).

Re: HPCC - personally, I'd pay for a PDF of the Datafile each month...

> I seem to remember the main problem was finding a way to prevent the pdf file being copied round ...

Already some years ago you could encrypt PDF to each individual who was allowed to read the document.

With the newer products you can even encrypt **once** and let download the whole world. Only the customer who received/bought a decryption key is able to read the file. You have also print and copy control, etc...

There are ways to solve completely this problem.

Have a look to the page http://store.adobe.com/security/main.html and related security links.

Re: HPCC - personally, I'd pay for a PDF of the Datafile each month...

in response to message #11 by Raymond Del Tondo

@raimond:

> Quote:
>
> ...the cost for the software would have to be set into account, too...

That's right. But I believe that hundreds of (new) members would buy a pdf version and on the long term the total costs for the club should be far smaller than the costs of a printed edition.

I'm *pro* minded for a PDF version in addition to the paper version, but from my personal point of view I still would pay my fee for the printed version.

The feedback from some HPCC exponent in charge would be interesting.

Actually, PDF tools ARE free...

*Message #13 Posted by **Gene** on 25 Jan 2005, 11:19 p.m.,*
in response to message #12 by valentino ducati (switzerland)

On my Macintosh powerbook I'm using right now, if I go to print, I have the option to "Save as PDF" on the print dialog box. That's built into the mac OSX system.

Of course, that doesn't encrypt! the file, but it does create a PDF.

I just don't believe this is a money loser for HPCC.

They would gain more members (like me) who would pay for a PDF but don't wish to pay for postage.

Anyone else?

Gene

Datafile in PDF format

*Message #15 Posted by **Valentin Albillo** on 26 Jan 2005, 6:59 a.m.,*
in response to message #13 by Gene

Hi, Gene and all following this thread:

Here are my humble opinions and comments on this topic, for what they might be worth:

- Creating the PDF files is essentially free. As far as I know, Datafile people can generate PDF files, encrypted or not, right now, no extra cost involved. Besides, there are a number of free libraries available on-line to that purpose, I routinely generate PDF on the fly as part of the software I develop, with graphics, text, etc., dependent on some inputs and results, i.e., a report. Come to that, I would volunteer to do the conversion myself, if necessary. In other words, it's very easy and that's no problem at all.

- Securing the PDF file so that only subscribers can have access to its contents is far more difficult, or even impossible. There's no encryption method for PDF files that can't be broken, as far as I know, you can always remove the encryption if you have the required knowledge and the right tools, and once it's done, it will spread very quickly.

- Even if encryption is not removed, the encrypted file can nevertheless be distributed as long as you also include the password. The mere fact of having Datafile in a digital format means that you can then process it by digital, automated means, i.e., sooner or later it will get broken.

- Another likely scenario is: you don't break the encryption and you don't distribute the PDF file with password and all, but you do print any number of copies, in plain paper, and distribute that among your friends, local club

members, whatever, thus having a number of people reading and essentially owning a copy of that Datafile issue for free. Unless you forbid printing (which in my opinion should not be done because it's much more convenient and comfortable to read a paper printed copy than the glaring screen), this can't be avoided at all, and is by far the most likely scenario: who can resist the temptation to print a copy for your good friend and HP-calc *innamorato* What E. Ver, so that he/she can enjoy reading it at leisure, at home ?

You can do that right now with your printed copy of Datafile, but passing that one original to a number of people is time consuming and inconvenient. Printing copies for all of them is not.

- Also, having Datafile in digital form, as a PDF file, means that it can eventually become a vehicle for viruses. There are already a small number of PDF viruses, more or less of the 'proof-of-concept' status, but I still remember that one of the very first viruses for MS Word was "Concept", a simple virus which just proved you could write viruses for Word. Needless to say, now there are hundreds of very harmful viruses than can attack and spread via MS Word (Excel, etc) documents. I concede that this is a minor point, but in any case is something that simply cannot happen in its present, printed form.

To summarize, while having Datafile in PDF form might be a good thing, it's an important issue with severe implications for the survival of Datafile itself, and so it's not something that you can take lightly, a careful evaluation of pros and cons by the powers-that-be is definitely needed, lest you risk ruining in one year something that has valiantly survived for nearly 21.

Best regards from V.

Edited: 26 Jan 2005, 7:15 a.m.

Re: Datafile in PDF format

*Message #16 Posted by **Gene** on 26 Jan 2005, 7:18 a.m.,*
in response to message #15 by Valentin Albillo

Perhaps. :-)

I just don't think most of us are waiting on edge to print out copies of Datafile. While I would love to have a PDF format, I do not know of anyone within 500 miles of me who I would print a copy for!

One idea...Datafile could ALWAYS try this and if copies showed up on the 'net, they could discontinue it.

They could stop it if 1/2 of the members dropped out.

They could stop it if the total $$ that came in was less than before.

I just don't see how that would be. :-) I think they would have more $$ than before.

After all, a large number of us here and on comp.sys.hp48 may not get the

paper copy at ~$50 or so per year, but we might do the PDF @ $25/year or so.

It wouldn't take very many new subscribers to make this an attractive option.

:-) Gene

Re: Datafile in PDF format

*Message #17 Posted by **Tony Duell** on 26 Jan 2005, 8:32 a.m.,*
in response to message #15 by Valentin Albillo

A couple of minor points :

1) Datafile is already sent to the printing company electroncially, I assume as a pdf file (although I am not actually involved in this)

2) HPCC has been around for almost 23 years (not 21)! We don't want to do anything that might change that...

As regards the cost of membership, I have probably different views on this because I am a UK member who gets to almost all the monthly meetings. I think of it like this :

I pay \pounds 25.00 per year, which is just over \pounds 2.00 a month. For that I get an interesting afternoon's meeting -- it's less than the cost of going to see a movie or the theatre, and a lot more interesting and educational. Datafile for me is actually a bonus (and if Datafile stopped being produced, I would still remain a member of HPCC, if the meetings stopped, I wouldn't).

Re: HPCC - personally, I'd pay for a PDF of the Datafile each month...

*Message #18 Posted by **Tony Duell** on 26 Jan 2005, 8:26 a.m.,*
in response to message #10 by valentino ducati (switzerland)

Re encypted PDF files :

I know little about this (much prefering to read stuff on paper...) but what is to stop :

1) The decrypted version (or the postscript/pcl/whatever you send to a printer) being distributed

2) The decryption key/password being distributed

3) Somebody printing off a dozen copies for all his friends

Re: HPCC - personally, I'd pay for a PDF of the Datafile each month...

*Message #19 Posted by **Gene** on 26 Jan 2005, 11:22 a.m.,*
in response to message #18 by Tony Duell

I think perhaps this is a fear of something that would probably never happen.

I like HP calculators quite a bit and HPCC (and its members too). But, I don't see a

market for stolen Datafile issues that would be large enough to reduce the # of paying members.

Suppose it did. Imagine:

Now: 100 paying datafile members each paying $50 / year. Total revenue $5000/year.

Add a paid PDF option: Then: 90 paying datafile members (10 change to PDF only): $50/year and 30 new paying datafile members for PDF only @ $30/year. Total revenue $4500 + $900 = $5400.

Gain $400 in total.

Suppose 50 people now see the PDF of the datafile who were not members before and have not joined up now.

There is no loss of revenue.

I guess teaching managerial accounting and cost/volume/profit relationships for so long makes me think through these things differently.

Personally, having more $$ for datafile/HPCC is a good thing. :-)

9821A calculator

*Message #1 Posted by **Gerry** on 17 Jan 2005, 2:16 p.m.*

Anyone interested? I own a HP 9821A calculator (like the 9820, but with built-in cassette drive). It includes a Mathematics ROM and operating manual. I just fired it up and ran one of the roof truss design programs I wrote in the mid 70's - and it works fine, printer and all! How would you suggest I sell this item? What's it worth? Any ideas?

Re: 9821A calculator

*Message #2 Posted by **David Ramsey** on 18 Jan 2005, 12:04 p.m.,*
in response to message #1 by Gerry

You have two main venues for selling your calculator:

1. eBay

2. Classified ads on this forum (Note the link from the home page)

Estimating the worth of these old calcs is hard-- the market ebbs and flows, and individual models may experience sudden huge price spikes depending on demand. The older desktop calculators are less in demand among most collectors than some of the best handhelds like the 15C and 42S, but I've still seen some pretty high prices ($500 and up) for machines like yours over the past couple of years.

I'd be intested in yours, depending on cosmetic condition. Can you post some links to photos?

Disassembling dusty HP27S

*Message #1 Posted by **Erwin** on 17 Jan 2005, 11:52 a.m.*

I bought a very dusty HP27S, where dust came inside and reduces the visibility of the display. In my opinion the one possibility to clean is to open the calculator, but I couldn't find any way without applying brut force. So I gave up.

Is there an easy procedure for opening available.

This was the question sent 14/1/05.

Two tips came up. Once more many thanks therefor. For want of an ultrasonic cleaner I used compressed air that I blast in from all sides, where I could make a little gap between top and bottom side of the case. Many dust came out and also the display is clean now. But unfortunately the calculator does not display anything now. In my opinion the flexible contact sticks between display and board are misplaced. But how to get them in the right position. May be I'm fully wrong with my theory, as I don't know much about the inside of calculators.

In any case help is highly appreciated.

Re: Disassembling dusty HP27S

*Message #2 Posted by **Jeff O.** on 17 Jan 2005, 12:41 p.m.,*
in response to message #1 by Erwin

If you want to open it to attempt repair (at your own risk, of course), instructions can be found here and also discussed here.

Re: Disassembling dusty HP27S

*Message #3 Posted by **Randy** on 17 Jan 2005, 3:45 p.m.,*
in response to message #1 by Erwin

The display zebras cannot be blown out of place.

Try discharging the backup capacitor first. Remove the batteries and touch a wire between the two terminals for a second or two. Reinsert batteries, you should be okay.

Long Live the HP-42S !

*Message #1 Posted by **Valentin Albillo** on 17 Jan 2005, 11:26 a.m.*

Hi all:

HPCC's Datafile has kindly made available on-line my article ***"Long Live the HP-42S!"***, recently published in that magazine.

It's a *14-page* commemorative article which includes an *all-new* 423-line program written specifically for the occasion, in order to demonstrate interesting 42S programming techniques and methodology, from menus and matrices to error handling and *fast* graphics.

If interested, you can download it in all its PDF glory from HPCC's web site:

HPCC - Handheld and Portable Computer Club

You've got no excuse to don't give it a try, even if you don't own an HP42S, as it runs perfectly in the wonderful free HP42S emulator Emu42 (I haven't checked Free42, it would be a *very* good compatibility test indeed if it *can* run this program !).

Hope you'll enjoy it, and

Best regards from V.

in response to message #1 by Valentin Albillo

Hi Valentin!

I can only congratulate you for having written a very nice article indeed! Reading it did actually put me in a very good mood and high spirits!

Best regards,
Erik

Re: Long Live the HP-42S !

*Message #3 Posted by **Valentin Albillo** on 18 Jan 2005, 7:14 a.m.,*
in response to message #2 by Erik Ehrling (Sweden)

Hi, Erik:

Erik posted: *"I can only congratulate you for having written a very nice article indeed! Reading it did actually put me in a very good mood and high spirits! "*

Thank you so much for your encouraging words, I'm *very* glad that it dit have that most positive effect on you, of all persons ! There's probably noone more enthusiastic about the HP42S than yourself.

In this same mood, I think you'll be interested to know I'm writing another *all-new*, (hopefully) interesting and complex program for the HP42S right now, this time with *plenty of real-life applicability*, which will eventually be made into an article to be published in Datafile in the very near future. I'll let you know in advance.

For those of you who haven't seen it yet, have a look at this excellent short essay by Erik, Keep the HP spirit alive!, it's an emotional roller-coaster for those of us who love the HP42S and well worth reading and passing it along.

Best regards from V.

Hi,

Interesting essay Erik (and nice job Valentin).

"this is the year when I have given up hope altogether about Hewlett Packard's calculator division"

Thats a bit sad. I suppose you really like your HP42s. Fair enough, its a fine machine. However, do you really think all of your suggestions make sense for the average user? Playing devils advocate here...

"HP will never put the HP-42S back into production again"

They would overnight, if it really made economic sense. Suppose you could go down to the store and buy one tomorrow, exactly the same as they were years ago. Suppose it was priced roughly at about the same point as the HP49g+.

Honestly: Who would buy it?

I'm sure the readers here would snap them up. But you need many, many more buyers before HP turns a profit. How would you market it compared to say a TI89?

The 42s has no expandability. It has a tiny amount of memory. It is limited to a 4 level stack, which is really annoying if you are used to an RPL machine. Also the electronics are obsolete. The Saturn is dead and is never coming back. To put it back into production would be a complete redesign.

Now, I know I am probably going to get alot of flames about this. Think about the average user, reading websites and comparing features.

4 Level Stack vs Unlimited stack 7k memory vs a megabyte or so, or hundreds of megabytes on SD no PC connection vs USB / IrDA numerical vs numerical + symbolic mathematics

etc, etc. For the price, what do you think the *average* user will choose?

Finally, remember the average user probably has never used RPN at all. By not including an algebraic mode you have scared off a fair number of potential customers (who might otherwise have experimented with RPN and liked it).

What I'd like to see is a slimline, simpler HP49 with perhaps a smaller screen, and built like a tank.

Basically a very powerful calculator that really fits in your pocket.

"HP will never start to include Hrastprogrammer's HP-42X with every sold HP-49G+"

I'm sorry, but I think this is a bad idea. Most people think the HP49g+ is too confusing as is, and the majority have never even heard of the 42s. Of those who had, much fewer still would want to emulate it.

The tiny, tiny minority who would use it can get it easy enough. HP has to consider additional documentation and support costs, as well the chance of possible bugs. Why should they go through the hassle of including it?

best regards, and let the flames begin,

.

With minor updates (I would vote for 32K and I/O being the most important improvements) it would be bought by:
- People traditionally used to RPN calculators (e.g. the HP67 people, the HP-41C(V/X) people, the HP-11C/15C people and of course the HP-42S people). The HP-42S is an ideal small calculator to carry with you and is simple enough so that you never need to look in the manual while in the field.

- New generations (e.g. college students) that want a calculator with an unsurpassed "easy of use vs powerfulness" ratio (i.e. accessibility). And this calculator would in several cases be the only calculator they would need all the way through university. But of course - and this is pointed out by Wlodek Mier-Jedrzejowicz in his report from Copenhagen - someone has to tell this new generation about the superiority of RPN. Currently HP shows very little interest in doing just that.

Remember, the number of features is not necessarily the most important thing here, the accessibility is what counts in the long run. What is the point for a newcomer to have a lot of features in the HP-49G+ that they need to hunt down a copy of the old HP-48 Advanced User's Guide to use? How many new HP-49G+ users would actually end up programming their HP-49G+? I bet a lot of "HP-42S+" users would, just because programming on it is so pure simple. So, it is not the number of features that is important, but what the calculator actually delivers to its user in the end!

> Quote:
>
> The 42s has no expandability. It has a tiny amount of memory. It is limited to a 4 level stack, which is really annoying if you are used to an RPL machine.

- I agree on the first one. An Xmodem server or similar would be absolutely necessary - releasing

the HP-42S without I/O was a big mistake in the first place.
- But I don't agree on the second one - it doesn't have a tiny amount of memory however. It supports 32K (any HP-42S is easily upgradable to 32K) which is a fair amount of memory for RPN programs. (And the HP-42X emulator has 96K so with some tweaking more than enough memory is within reach)
- Neither do I agree on the third one. The Saturn might be dead, but it is excellently emulated on the ARM CPU. The emulation layer is already there on the HP-49G+, reusing this for the "HP-42+" would make perfect sense in reusing this investment.

> Quote:
>
> By not including an algebraic mode you have scared off a fair number of potential customers (who might otherwise have experimented with RPN and liked it).

Of course, if you believe in RPN you should not include an algebraic mode! Including algrebraic modes on the 33S and the 49G+ makes it look as if HP does not believe in what they are doing! (And put the ENTER button in its proper place, please!)

> Quote:
>
> "HP will never start to include Hrastprogrammer's HP-42X with every sold HP-49G+"
>
> I'm sorry, but I think this is a bad idea. Most people think the HP49g+ is too confusing as is, and the majority have never even heard of the 42s. Of those who had, much fewer still would want to emulate it.

I still regard this a good idea. Remember the HP67/41/11C/15C/42S people are among the most important customers to HP nowadays as recruitment of younger users is totally absent. And many of these users (not all, but many) prefer keystroke programming to RPL. Personally, I am hoping for the Qonos project to finish soon - it will be very nice to fire up HP-42X in its emulated HP-48/49 mode!

Best regards,
Erik Ehrling (Sweden)

*Message #6 Posted by **Raymond Del Tondo** on 19 Jan 2005, 4:58 p.m.,*
in response to message #5 by Erik Ehrling (Sweden)

Hi,

only two things to add:

A new (reintroduced) 42S would be worth to buy if it has a
reliable keyboard (and of course the classic kbd layout),
and a display with better contrast than the original one.
It doesn't need to have more pixels, they should only be better readable.

'hp' doesn't even have the need to change the original ROM code,
the dock location for OS extensions should be sufficient
for adding I/O code and the like.
BTW: Any news regarding the latter topic?

Regards,

Raymond

*Message #7 Posted by **Fred Lusk (CA)** on 19 Jan 2005, 9:13 p.m.,*
in response to message #6 by Raymond Del Tondo

Erik and Raymond…

I agree whole-heartedly. I have a 48G+, and it's a phenominal machine, but I prefer my 42S as a ***calculator*** for many of the reasons you state. I use it probably 10x as much as my 48G+. My programming experience follows the path 55-34C-41CV/41CX-42S. I find traditional RPN very easy, and can do quite a bit just in my head (unfortunately, I can't XEQ the program there!). I still struggle with RPL…not because I don't like it, but because I don't have 30 years' experience with it. Plus, I don't like having to keep looking up what each function requires and what each does to the stack.

I would only make one change to the mathematics code in the 42S: fix the power curve prediction bug. I would simplify ALPHA entry by assigning each letter to a key like on the 41 and 48, and I would certainly vote for a better screen. I agree that 32k is enough. I have all the programs I use everyday in about 6k. I also want USB connectivity, with the new and improved 42S showing up as a hard drive. Last, I want an external USB box that will accept HP-41 modules.

I would actually $500+ for an updated 42S. Mine is 18 year's old and has never given me a day of trouble, but…

I would only make one change to the mathematics code in the 42S: fix the power curve prediction bug.

What's this bug you're referring to? I have never actually used the curve fitting functionality of the HP-42S, and I wasn't aware that it even had any bugs in that department...

Thomas…

For a power curve fit FCSTX does not give the correct X estimate. Perhaps a year ago (?) I offered a .pdf of HP's manual update sheet to the MoHPC family and I had about a dozen takers. I can't find the file right now--I may have lost in a hard drive crash last spring--so I will remake the file and email it to you tomorrow.

Also--if anyone else still need a copy, drop me a line.

I got the manual addendum -- thanks Fred! -- but I can't reproduce the FCSTX bug on my HP-42S (rev. C, serial # 3323S<whatever>). I take it this is specific to certain earlier revisions? Or does the bug only bite with certain tricky data sets? I couldn't reproduce the LASTX bug mentioned in the addendum, either. I *could* reproduce an entirely different bug, where summing a matrix in LINSigma mode causes the machine to crash.

Re: Power curve prediction bug?

*Message #14 Posted by **Fred Lusk (CA)** on 21 Jan 2005, 4:33 p.m.,*
in response to message #13 by Thomas Okken

Thomas…

I don't think HP ever updated the ROM, but maybe someone here knows differently. I use linear regression far more than power, log, or exponential and I haven't had to deal with the FCSTX bug in years. However, I remember it being a problem on my machine. Also, I never had a problem with the LASTX bug because I never make mistakes :)

Anyway, I am home for lunch and my calculator is at work. I will play around with it tonight as see what I come up with.

Hi,

Craig Finseth discusses some other bugs at his site:
http://www.finseth.com/hpdata/hp42s.html

Does anyone have a comprehesive list of the bugs of the 42s?

These bugs make you think a bit differently about that machine, yes?

By comparison, the 11c and 15c were so remarkably bug free....

in response to message #15 by bill platt

There may have been bugs found in the 42s after it was released, nothing is ever 100%. But it was and still is a solid machine with a well written manual. Not like what HP has released in the last few years. Everything from the 49G forward, it seems that the customer is the Beta Tester and the ones left to write the manuals. I'll take a 42s with a few bugs over the others any day.

Re: Power curve prediction bug?

*Message #17 Posted by **Thomas Okken** on 21 Jan 2005, 11:00 p.m.,*
in response to message #15 by bill platt

These bugs make you think a bit differently about that machine, yes?

Hmmm, well, I would always prefer a machine **without** bugs, but when it comes to the few bugs I'm aware of in the HP-42S, they are all in areas that are very easy to work around, and that most people will never run into in the first place.
Consider: LINSigma mode is mostly just an HP-41 backward compatibility hack. Nobody actually *needs* it; in ALLSigma mode, it just uses a few more registers.
And about the famous PERM and COMB bugs: I guess they can be annoying if you often enter wrong numbers, but they're hardly show-stoppers.

The bugs I know of in the HP-42S all fall in the "slightly annoying" category. Compared to the bugs in some older models, where some functions would give answers that were just plain wrong, I think the 42S holds up pretty well.
And, not that it's an excuse, but after spending roughly 600 hours rewriting most of the HP-42S, I have gained an awful lot of respect for how well they (HP) did their job! I tried to be thorough, too, but just look at the HISTORY file on the Free42 web page to get an idea of all the little things that can fall between the cracks... So what if I'm just a one-man operation, I *could* have done it better, the problem being that it would have taken years instead of months.

Re: Long Live the HP-42S !

Message #18 Posted by **.** *on 20 Jan 2005, 4:04 a.m.,*
in response to message #5 by Erik Ehrling (Sweden)

"With minor updates (I would vote for 32K and I/O being the most important improvements) "

OK, you are not talking about a 42S, but an enhanced new model based on the 42S. I thought you meant the 42S exactly.

"People traditionally used to RPN calculators (e.g. the HP67 people, the HP-41C(V/X) people, the HP-11C/15C people and of course the HP-42S people)."

How big do you think this target market is? If the volume is small, then the price will be high.

"New generations (e.g. college students) that want a calculator with an unsurpassed "easy of use vs powerfulness" ratio (i.e. accessibility)."

This is a matter of personal opinion only, I'm sure some people will think this, others won't.

A calculator of this nature would most likely only be of interest to those studying engineering and the hard sciences. Of those, it would not attract those who weren't highly technical. Lets face it, most students think RPN is confusing and pointless.

Those who would be intereted are probably after the most computational power they are allowed in an exam. Surely a student using a 43s could be at a disadvantage to a student using even a TI89.

"And this calculator would in several cases be the only calculator they would need all the way

through university."

In some cases, sure. But if I were a student doing an exam with a 43S, and my fellow students all had TI89s with CASes, I'd feel disadvantaged. Symbolic mathematics can be really helpful.

"But of course - and this is pointed out by Wlodek Mier-Jedrzejowicz in his report from Copenhagen - someone has to tell this new generation about the superiority of RPN. Currently HP shows very little interest in doing just that. "

Just a question: How would you demonstrate 'the superiority of RPN' to students, if you were HP? What would you do to make them think "Wow, this leaves my TI89 for dead!"?

Its probably blasphemy on this forum, but I consider 'classic' numerical only RPN, limited to a 4 level stack, to be greatly inferior for exam type problems. I think removing the 4 level limitation would be a great help. I admit that RPL is a very poor programming language.

"Remember the HP67/41/11C/15C/42S people are among the most important customers to HP nowadays as recruitment of younger users is totally absent."

If you were HP, which market would you like to corner? The massive, ever growing student market, or a handful of professionals who remember HP's glory days?

I wish I could say both, but I think thats not feasible.

best regards,

.

Nice article, Valentin. Hope your next article will be available to all of us as well, instead of hpcc members only. But you have missed one trick: the way to make an alphanumeric label start with a digit - you could have called it "8QUEENS". (Press any 'character menu' key first, then the digit - it will be entered as the first *character*, not as the first *digit*)

Hi, Werner:

Werner posted: *"Nice article, Valentin. Hope your next article will be available to all of us as well, instead of hpcc members only."*

Thank you so much for your interest. As for my next articles, it's fully my intention to make them freely available on-line, either as HTML or as PDF documents (or both), albeit a number of months *after* said articles have been published in Datafile.

This particular HP42S-related article has been made available on-line right now, with near to no delay after its publication in Datafile, with full consent by Bruce Horrocks (Datafile's Editor). Matter of fact, it was

him who came up with the idea in the first place, and I couldn't agree more. But this isn't to be construed as a *precedent*, more like an *exception* actually.

Three more articles by me have been submitted to Datafile in these past few days and are due for eventual publication in the very next issues (at Bruce's discretion of course), with three more on their way. One of them is truly, *truly* outstanding, even by my own standards (I was as amazed as anyone can be when it turned out the apparently preposterous idea actually worked!), and the rest gallantly try to follow suit.

"But you have missed one trick: the way to make an alphanumeric label start with a digit - you could have called it "8QUEENS".

Thanks for pointing this out but I didn't miss it, it just happens that I like "EQUEENS" best.

Best regards from V.

Re: Long Live the HP-42S !

*Message #21 Posted by **Vincent Weber** on 18 Jan 2005, 3:24 p.m.,*
in response to message #20 by Valentin Albillo

On top of Valentin's excellent input on the merits of the 42s, I would add than emulation on a PocketPC (with Emu42) or simulation on a Palm (with Free42) remove the major concern with the 42S, which is the lack of I/O: both programs allow you to load programs in .raw format (also V41 compatible !) which gives you mass storage in your pocket! (with no real keys and poor battery life, granted, nothing is perfect).

As for the time module, its need disappears more or less once you choose the emulation/simulation route: A modern PDA is much better than an HP-41CX for time, alarms and memo functions... In 1983 you had nothing else, but today the programming functions are enough to emulate/simulate. Trust your PDA for the PDA stuff!

I can understand though, that you would miss the extended memory functions from the 41, even though file management pushes the 41 to its limits. Synthetics are nice, too, I agree - but the very complete feature set of the 42S reduced the need for hacking (unless you want to use it as a hacking toy).

Well, you can also run a 41 emulator on your pocketPC (ev41) or Palm (P41CX).

My Ipaq 1940 serves me as a 12C, 15C, 16C, 41CX, 42S, 17BII, 27S, 48GX, and 49G ! What else could we want? Only the 32SII and 19BII are unfortunately not "emulable", besides the pre-41 machines (but these are superseeded by the 41CX and the 15C).

Long live emulation/simulation ! :)

Cheers,

Vincent

*Message #22 Posted by **Tony Duell** on 18 Jan 2005, 9:05 a.m.,*
in response to message #1 by Valentin Albillo

I have a perfect excuse for not trying it. I am not going to type in over 1000 lines of program for a problem I am not particularly interested in. And I don't have anything to run those emulators on.

I've said this before, but I regard the HP42S as one of the worst mistakes HP ever made. Take a very nice calculator (the 41 series), take out the good bits (extended functions, I/O, synthetic programming, time module, etc, etc), put in the Advantage Pac (which of all the modules I own is the one I use least). There's no way of backing up the 42S memory to anything else (unlike the 41, where you can use cards, tapes, floppy disks, or another computer system).

I really can't see the atraction of the 42S over the 41.

Re: Long Live the HP-42S !

*Message #23 Posted by **Valentin Albillo** on 18 Jan 2005, 10:01 a.m.,*
in response to message #22 by Tony Duell

Hi, Tony:

Tony posted: *"I have a perfect excuse for not trying it. I am not going to type in over 1000 lines of program for a problem I am not particularly interested in."*

The excuse may be perfect but the counting is *not*: my program is 423 lines long, not "over 1000 lines".

"And I don't have anything to run those emulators on."

That means you don't have any kind of PC (to run Emu42) and you also have no HP-48GX, HP-48SX, HP-49G, HP-49G+ (for HP-42X). I find it very hard to believe, but assuming that's possible, you'll concede such is not exactly frequent among HP fans, specially those contributing to this forum or enjoying an HPCC membership like you do, both.

"I've said this before, but I regard the HP42S as one of the worst mistakes HP ever made."

Let's see ...

"take out the good bits (extended functions, I/O, synthetic programming, time module, etc, etc), put in the Advantage Pac (which of all the modules I own is the one I use least). There's no way of backing up the 42S memory to anything else (unlike the 41, where you can use cards, tapes, floppy disks, or another computer system)"

Comparing calculators meant for different niche markets is like comparing apples and oranges. The HP42S was originally intended as a successor and replacement for the HP-41C, then *redefined* as the same but for the HP-15C instead, which was its *final* redefinition. As such, comparing it to the HP-41C is like comparing the HP-15C vs. the HP-41C: can be done, can be fun, but it's meaningless ultimately.

Nevertheless, let's engage in some 'comparisons'. You've stated at leisure the 'good bits' taken, but of course, you concede *no 'good bits' added* or even acknowledge that it might have some. I'll try and fill up that void in your argument:

1. Less bulky, quite comfortable slim design.
2. More robust, less prone to hardware failures (corrosion, anyone ? discrete components failures ?).
3. Better, more modern low-power electronics, with much larger useful battery life.
4. Wider, 2-line x 22-character dot matrix display with user-accessible variable contrast.
5. Simple but useful graphics capabilities.

6. Over 7 Kb of usable RAM, easily expandable to 32 Kb.
7. Much faster program execution.
8. Greater precision, 12-digit mantissa plus exponents up to +-499, internally extended to 15-digit.
9. Much enhanced, classic RPN 'keystroke language', including menus, named variables, graphic commands, the works.
10. Much larger Alpha register, up to 44 characters long.
11. Incredibly expanded math functionality, with full matrix operations, full handling of complex numbers, solve and integrate, boolean operations, base conversions and arithmetic, all working at full assembler speeds and with extended, 15-digit precision.
12. All new objects (complex numbers, matrices) are seamlessly integrated with classic RPN, and can be stored in a single stack level or named variable, plus most mathematical functions act upon them transparently to the user, so that you can attempt to take the sine of a complex number or a matrix and the function will work and produce a useful result.
13. Ergonomic features, such as the program, variables and functions catalogues, with menus and submenus.

And I could go on and on and on. But, being a highly intelligent individual, you yourself could easily come up with such a list if you were to try, so if you haven't it's just because you're sacrificing your objectivity for reasons only known to you, which can hardly pass for rational arguments.

"I really can't see the atraction of the 42S over the 41."

I know. And you'll probably never will. But that's your prerogative, *"Ye pay yer money, ye take yer choices"* and I'm not the one to discuss them. You don't like the 42S ? Good for you.

Best regards from V.

Re: Long Live the HP-42S !

*Message #24 Posted by **Tony Duell** on 18 Jan 2005, 4:06 p.m.,*
in response to message #23 by Valentin Albillo

To come back on some of your points :

> Less bulky, quite comfortable slim design

I find the 41 much easier to hold, with a much nicer keyboard feel. Having fairly large hands, I don't like things that are too small.

> More robust, less prone to hardware failures (corrosion, anyone ? discrete components failures ?).

But the 41 is much easier to repair when things do go wrong. The case is screwed together, there's proper service documentation, a diagnostic ROM, and so on. I know which I'd rather have on my bench...

> Better, more modern low-power electronics, with much larger useful battery life

And the HP41 can be run off a mains power supply (what, you don't have one with the gold balls).

> Simple but useful graphics capabilities

But the HP41 will drive a real pen plotter....

As regards your other points, if I want an advanced calculator, I'll grab a 48 or 49 of some type (note : With an RS232 port, so I can back it up to one of my other machines). The 41 is used because of the tremendous range of add-ons available for it...

As regards my PC, it is strictly command-line only, and doesn't have a graphical display. Therefore it's not going to be a lot of use for running said emualtors. I suppose I could run the one on my 48 or something....

tough 41s

*Message #1 Posted by **Steve (Australia)** on 17 Jan 2005, 10:25 a.m.*

I just remembered that my collection of calculators was stored briefly in my roof -- about 3 years ago.

Tin roof, temperatures in summer exceed 50C (and then some)

41's still looking good (no display damage).

Yep I left batteries in them, several with nicad packs, the N cells were left out of the calculators.

And guess what -- none of them lost memory! All the programs are intact still!!!

Amazing.

p.s. I promise to give them a better home.

Free42 conduit crash

*Message #1 Posted by **Thomas Okken** on 17 Jan 2005, 8:15 a.m.*

Hi all,

There turned out to be a bug in the version of the Free42 Conduit that I released yesterday, which would cause it to crash (and take down HotSync manager with it).
There's a fixed version on my web site now; install it by first uninstalling the old version, then installing the new version (you can do both steps using the same installer). Or, just drop Free42Conduit.dll into the Palm directory and restart the HotSync manager manually.

My apologies for the inconvenience!

- Thomas

Re: Free42 conduit crash

in response to message #2 by Vincent Weber

Thomas,

Yes for sure I don't think you have to apologize. We all are very happy with the great job.

I have a question !

I presume since I only have installed the .prc file I don't have to install the update, isn't it?

Only people who installed the *.ZIP file have to update. Correct?

Thanks, Michel

Free42 conduit crash

*Message #4 Posted by **Thomas Okken** on 17 Jan 2005, 2:28 p.m.,*
in response to message #3 by mvdn

I presume since I only have installed the .prc file I don't have to install the update, isn't it?

*Only people who installed the *.ZIP file have to update. Correct?*

That is correct.
Note that with version 1.1.1, I'm bundling the PRC and the conduit, but **installing** the conduit is still optional -- and any bug fix that affects only the conduit can be safely ignored by those who only use the PRC.

- Thomas

Re: Free42 conduit crash

*Message #5 Posted by **Thomas Okken** on 17 Jan 2005, 2:46 p.m.,*
in response to message #2 by Vincent Weber

I guess it would cause some technical problems to rename it ? ;)

Actually, I've renamed it before! I first called it Fake42, which is still evident in the 'Fk42' creator ID for the PalmOS version. I renamed it Free42 the day I first released it -- thought it sounded a bit nicer. :-)

Maybe once I have everything from the 1.2 wish list implemented, I'll publish a shareware version... Cheap42? Naw, don't like the sound of that either...

HHC2005 Announcement! 9/17-9/18 2005

*Message #1 Posted by **Gene Wright** on 16 Jan 2005, 4:33 p.m.*

Hello Everyone,

During the post HHC 2004 conference discussion on future conferences a major point was made that people wanted to know ASAP when the next conference will be. I believe that this is the earliest we have made an announcement.

HHC 2005 Announcement

What: HHC 2005 When: September 17 and 18, 2005

Where: Training Facilities at Ace Metal Crafts, 10550 Anderson Place, Franklin Park, IL 60131. This is just a few miles south of O'hare International Airport.

Who: Richard J. Nelson, CA - Conference Talks & Schedule, rjnelson@aemf.org Joseph K. Horn, CA - Web Page, JoeHorn@HolyJoe.Net Paul Hubbert, IL - CHIP Organizer,. PaulnBren@comcast.net Ron Johnson, IL - Registration, rbj.jes@att.net Wlodek Mier-Jedrzejowic, UK - European Coordinator, wlodekmj@yahoo.co.uk. Jake Schwartz, NJ - Videographer, jacob.g.schwartz@lmco.com ? Other(s) ? an odd number is good

Price: The conference will be very low cost. (There's no cost for the meeting place, and no meals are included. All services are within two blocks, hotel, restaurant, meeting facilities, etc.) Payment only accepted on-site, in cash (US Dollars).

AV and Computer Equipment: The facility has a projection screen. It is probable that an Infocus LP130 XGA resolution DLP projector will be available for presentations. A computer will be available, but it might NOT have Powerpoint or other software. So if you wish to give a computer based presentation, you may wish to be self sufficient. We will be able to meet any AV requirements.

Nearby Hotel / Motels: * Super 8 Motel at 3010 N Mannheim is about two blocks away, and is about $55 per night, with a shuttle to O'Hare. 847-288-0600. * There are many other hotels and motels in the area, but a car may be necessary.

Other details to follow...

The CHIP Chapter is the host for the conference. They have been active since the very earliest days and I am sure that they will share some of their history.

It might be nice to come up for a theme for people to be thinking about. Do you have any ideas?

Comments, ideas, suggestions, your commitment to attending are most welcome. Joseph will be setting up a web page and will announce when it is operational.

Re: EUROPE 2005 STaK 20 year anniversary Announcement! 1-3rd, July 2005, Helsinki

*Message #3 Posted by **Veli-Pekka Nousiainen** on 17 Jan 2005, 10:02 a.m.,*
in response to message #2 by Namir

Re: EUROPE 2005 STaK 20 year anniversary Announcement! 1-3rd, July 2005, Helsinki
The main event is held at HP Finland building about 10 miles to west from Helsinki.
The costs will be your Super-Apex Flight for the weekend, your chosen Hotel fee (for students I offer my apartment=flat with two free bedrooms for quest [with free internet access] and a separate toilet=wc for quest.
The local bus transfer costs 2€ in one direction and 3€ for longer transfer like the airport.
The food in McDonals is more expensive than you are used to - be aware!
The entrance fee is optional - pay what you think is fair.
Look at this Forum and the comp.sys.hp48 for durther information.

MLDL2000 all tests OK

*Message #1 Posted by **Meindert Kuipers** on 16 Jan 2005, 1:41 p.m.*

All testing for the MLDL2000 now concluded so far. There were some problems with power consumption but that was fixed with an extra pulldown resistor. All in all only 3 simple hardware modifications are required and that means that no redesign is really neccesary.

All functional requirements are working quite well. Bankswitching is tested using the Advantage ROM and that tested out fine. The next step is to clean up the MLDL2000 Software and build and test the units for the beta testers. In parallel the production will be planned and the documentation will be more or less finished. When the units are at the beta testers the ordering of the final production units can start. I will post a message in the classifieds with the details. As usual news is also available on my own site at www.kuipers.to/hp41. I will assemble a mechanical proto next week and post pictures on my site.

Meindert

Great! Keep us all informed!

*Message #2 Posted by **Gene** on 16 Jan 2005, 2:02 p.m.,*

HP 9810A problems

*Message #1 Posted by **Stefan** on 16 Jan 2005, 1:35 p.m.*

Hi,

I have a HP9810A and it comes on with the leds Status,Float and RUN. Apart from that it doesn't seems to do much. Anybody any idea what the problem might be ? It hasn't been on for a long time so perhaps it just needs some reseating ? How do I open a HP 9810A ?

Thanks!

Stefan.

Re: HP 9810A problems

*Message #2 Posted by **Tony Duell** on 17 Jan 2005, 1:50 p.m.,*
in response to message #1 by Stefan

Let's deal with the easy bit first.

To open the 9810, open the flap on top over the printer paper hole. Then undo the 4 screws you see there. The top cover can then be pulled up by the flap and will come off.

You can now see (from the left) : The memory box, which is held down by 4 screws. If you need to work on that, take out the screws, then eject its backplane from the main backplane (read and purple ejector handles). Take off the side plate from the memory box (4 more screws).

Next, in the main machine, are the 4 processor PCBs.

Then the printer, next to that is the card reader interface.

Then, on the right, are the PSU boards. To get to those, take off the cover (7 screws IIRC). There are no particularly nasty voltages in there -- the mains is fed to a transformer at the back, and only relatively low voltage AC (30-0-30V I think) is fed to the PSU boards.

The keyboard comes off by the 4 screws on the bottom of the machine. It's connected by an edge connector under the printer and a 5 pin connector carrying the mains switch wires. You need to remove it to get to the printer, card reader, card reader controller and display PCBs.

OK, now how to debug it. It's not a trivial machine to work on (I speak from experience here), it's bit-serial, so everything should be changing all the time. To be honest, unless you have a 'scope and/or a logic analyser, you've got a lot of work.

To get something on the display, the CPU, ROM, RAM, memory controller, and display boards all need to be working. That's most of the machine!

I would start by checking the PSU -- all 6 outputs. 5 of them are on testpoints accessible through holes in the

PSU cover. The 5V rail is marked on the display PCB (or just find a handy TTL chip on one of the boards :-)).

If they're all OK, I'd remove the printer, card reader controller, I/O backplane, any memory expansion board (red/blue handles, very top slot of the memory box), I/O backplane (at the back, behind the printer, it just pulls out) and disconnect the keyboard signal edge connector. The machine will run without those, the aim is to get a display.

If that doesn't help (and alas it rarely does), I will talk you through sorting out what the processor is doing. We had a little thread about this a few weeks back here that might be worth reading.

Finally, HPCC has reverse-engineered schematics for this machine, should you need them.

Free42 version 1.1 released

*Message #1 Posted by **Thomas Okken** on 16 Jan 2005, 10:02 a.m.*

Hi all,

I just released version 1.1 of Free42.
The highlights of this version are: the ability to import and export programs to files (Emu42 compatible), and support for printing to GIF and to text files on PalmOS devices without VFS. And, of course, several other minor improvements and bug fixes.

Enjoy!

- Thomas

Re: Free42 version 1.1 released

*Message #2 Posted by **Namir** on 16 Jan 2005, 11:31 a.m.,*
in response to message #1 by Thomas Okken

Cool work Tom!! Thanks for the updates. Do you know of any websites that conatin .raw program files for the HP42s (this site has a few HP42s with downloadable RAW files)?

Many thanks for your much appreciated effort and work with the simulator!

Namir

in response to message #1 by Thomas Okken

Is anyone working on a realistic skin? Perhaps based on a scan of an actual 42S?

Re: Free42 version 1.1 released

*Message #7 Posted by **Thomas Okken** on 17 Jan 2005, 2:40 p.m.,*
in response to message #6 by John C

I'm not a big fan of "realistic" skins, myself, but then again Erik Ehrling's Emu42 skin for 1024x768 looks very nice. With realistic skins, I like it if they look just a bit artificial... Definitely no photographs, they just look weird on a computer desktop, IMHO.
I'm thinking of making a skin using a ray-tracer, but that won't happen today or tomorrow. :-)

Once I do the skin-changing code in Free42 (it's finally made it to the top of my to-do list!), I'll probably compile a realistic-but-artificial skin, plus a very plain one, into the executable. I like the default HP-48G faceplate for Emu48, which I think looks just like an unobtrusive calculator desk accessory should look.

But, heck, tastes differ. I'll definitely support 3rd-party skins. Maybe even Emu42 KML files, but I have to think about that a bit. Don't hold your breath just yet!

- Thomas

Re: Free42 version 1.1 released

*Message #8 Posted by **John C** on 17 Jan 2005, 8:26 p.m.,*
in response to message #7 by Thomas Okken

Thanks for you reply Thomas. You are right, tastes do differ, I kind of like the realistic skins, even the scanned faces.

In any event, you are doing a great job on Free42. Keep up the great work.

John

Skins for Emu42 and Emu48 for Pocket PC

*Message #1 Posted by **Jeff O.** on 15 Jan 2005, 9:33 p.m.*

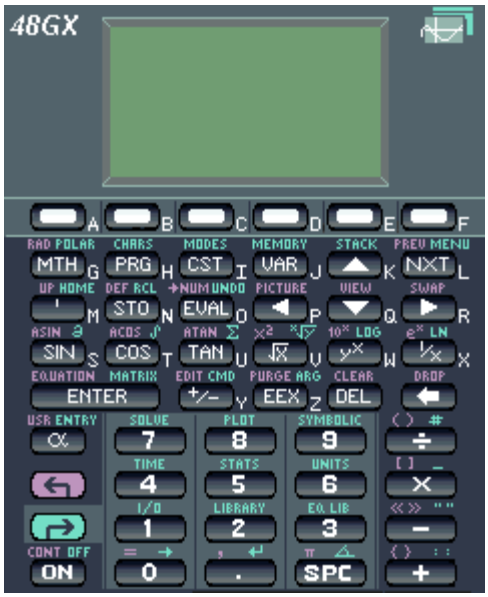
To all users of emu42 and emu48, I have developed a few skins for use with emu42 and emu48 for Pocket PC.
For the sake of the following discussion, I'll use the following definitions:
Portrait format – the skin is viewed and used with the pocket PC device held normally, i.e. with the long dimension vertical.
Landscape format – the skin is viewed and used with the pocket PC device held rotated 90 degrees clockwise from the normal orientation, i.e. with the long dimension horizontal, and the function buttons on left side.

My primary interest was in developing landscape formats to allow a larger display size. The skins are shown below:

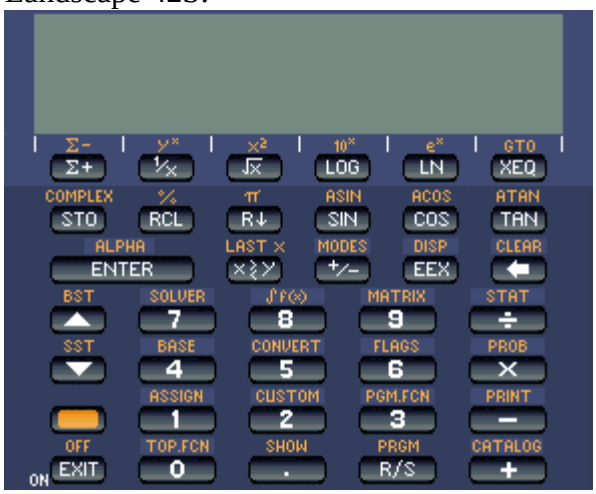
Landscape 48G, with the numeric keys located on the right side of the keyboard:

Landscape 48G, with the numeric keys located on the left side of the keyboard:

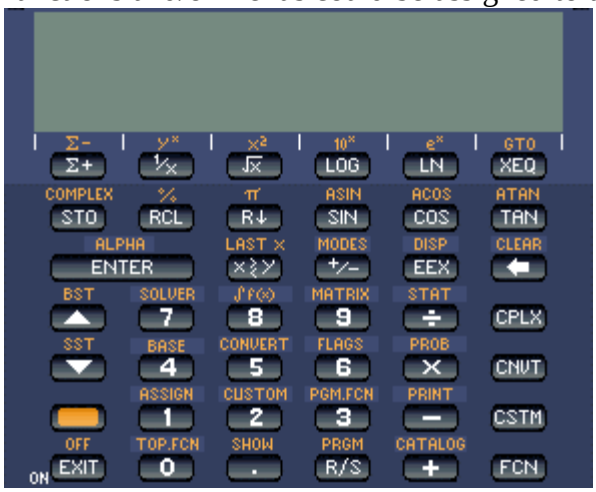
Portrait 48G:



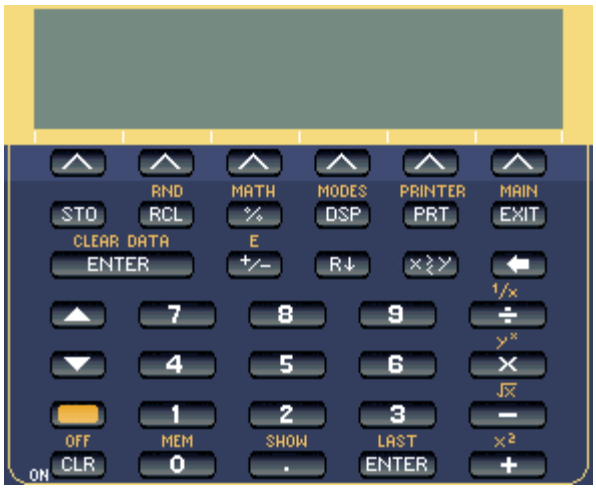
Landscape 42S:



Landscape 42S with extra function keys in rows four through seven. The “COMPLEX” function is assigned to one of these keys, and shortcuts to the “CONVERT”, “CUSTOM”, and “FCN” menus to the other three. Other functions and/or menus could be assigned to these keys:



Landscape 17BII, RPN keyboard:



The HP48 skins are based on and/or adaptations of skins I found at hpcalc.org, principally ones by authors Calculon and Leopoldo Bueno Castillo. The look of the buttons and labels on the HP42S and17BII skins were also inspired by the graphics of those HP48 skins. As indicated above, all landscape versions were developed to enable a larger display size (zoom 2) than is possible with portrait orientation skins. All kml scripts use the “TOPBAR” command in the KML script to suppress the navigation bar at the top of the pocket PC screen.
If you would like the complete images and the associated KML scripts, just click here.
Many thanks to Dave Hicks for hosting the images and the archive with the kml scripts and bitmaps.

Edited: 22 Jan 2005, 9:16 p.m. after one or more responses were posted

Re: Skins for Emu42 and Emu48 for Pocket PC

*Message #2 Posted by **Matthias** on 16 Jan 2005, 5:19 a.m.,*
in response to message #1 by Jeff O.

I use a Jornada 720...Landscape on this large display would nearly be 1:1 size. Who wants to develop such a skin?

Re: Skins for Emu42 and Emu48 for Pocket PC

*Message #3 Posted by **Veli-Pekka Nousiainen** on 17 Jan 2005, 9:41 a.m.,*
in response to message #2 by Matthias

I also have a Jornada 720 (and I'm willing to sell it)
The EMU42S would nicely fit into the 620*240 color screen

VPN

Re: Skins for Emu42 and Emu48 for Pocket PC

*Message #4 Posted by **Christoph Giesselink** on 17 Jan 2005, 1:46 p.m.,*
in response to message #2 by Matthias

Sorry, my Emu42PPC and Emu48PPC version isn't compatible with a Jornada 720. These emulators needs an ARM CPU and Pocket PC 2002 or Windows Mobile 2003 (SE) as operating system.

The next version of Emu42 will best fit on a Pocket PC with VGA resolution. ;-)

This picture

http://privat.swol.de/ChristophGiesselink/pict/Emu42VGA.png

shows Emu42PPC v1.02beta04 running a HP42S with display Zoom factor 3 in VGA mode on a Dell Axim X50v.

Sorry for the poor quality, the background bitmap is a double sized 240x320 mode bitmap, and the display capture tool allows only 240x320 display downloads. On the original machine the HP42S display qualitiy is much better.

Regards,

Christoph

GAMMA on the 17bII+

*Message #1 Posted by **Bob Wang** on 15 Jan 2005, 3:38 p.m.*

OK, here's another in the category of "Why even bother?" Eddie's post on "L, G, and some trig functions" inspired me to implement GAMMA on the 17bII+.

Victor T. Toth's page on "Calculators and the Gamma Function" is an excellent resource, and I've used his listing of the Lanczos approximation.

ONLY valid for POSITIVE values of z. The SIN identity for negative values of z COULD be used IF the 17bII+ had a built-in SIN function. Coding the extra steps to calculate SIN results in the now familiar overflow condition of GAMMA being returned as being 0.

Pretty simple, pretty accurate for positive z, pretty useless ;-)

Bob Wang

```

Omnibook CD Drive - Drivers?

*Message #1 Posted by **mahoobley** on 15 Jan 2005, 12:37 p.m.*

I'm attempting to help fix a friends old Omnibook 800CT, and it was so clogged up with crap (spyware, viruses, diallers etc) that it seemed it would be best to start with a clean slate, so I backed everything important up and formatted the HD.

The Omnibook is quite small (and old) and doesn't have a built in CD Rom drive - but they do have a specific external one which plugs into a proprietary socket at the back. Now its not possible to boot from CD on this computer which didn't suprise me, so I made a boot floppy.

However, now the windows 98 (I also tried a ME boot disk) boot disk CD rom drivers do not see any cd drive being there. Oh dear. I cannot find anything on HPs website. Oh dear.

So, save trying to track down a big set of old (working) Windows 95 or 98 installation floppies - does anyone know how I might install windows from a CD when the windows boot disks don't see the Omnibook CD rom drive?

Re: Omnibook CD Drive - Drivers?

*Message #2 Posted by **Raymond Del Tondo** on 15 Jan 2005, 1:06 p.m.,*
in response to message #1 by mahoobley

Hi,

this site (hpmuseum.org) is not specialized on OmniBooks.
You'll find much more info about OBs on the following site:
http://24.237.160.4/files/omnibook/

That site has drivers and images for all real OmniBooks,
from the 300 up to the 800CT.

There exists a discussion forum with competent members,
which you can reach from the HP site.
Take a look at
http://forums.itrc.hp.com/service/forums/home.do?forumId=2

HTH

Re: Omnibook CD Drive - Drivers?

*Message #3 Posted by **Jim Creybohm** on 15 Jan 2005, 1:12 p.m.,*
in response to message #1 by mahoobley

Hi Mahooey.

This is not technically an HP forum, or rather it is a forum for HP calculators only.

Having said that, the cd drive on this computer is a SYMBIOS SCSI drive. You can try locating a SCSI-2 fast driver on the net. You may also need to update the BIOS.

Try this link for more info:

http://groups.google.ca/groups?

q=omnibook+800ct+external+cd+scsi+drivers+windows&hl=en&selm=78go1a%24p8t%241%40nnrp1.dejanews.com&rnum=1

Good luck!

48SX hangs when ON is pressed

*Message #1 Posted by **JoseCuervo** on 14 Jan 2005, 7:02 p.m.*

Hi guys, let's see if someone can help with this.

I turn on my calc and it shows / too few arguments without touching anything all keys work fine except the ON key... when I press it calc hangs...

I took the vaccuum cleaner and tried to suck some dust it could have....didn't work either

Any ideas before I attempt to open the case and clean it from the inside?

Re: 48SX hangs when ON is pressed

*Message #2 Posted by **Randy** on 15 Jan 2005, 12:07 a.m.,*
in response to message #1 by JoseCuervo

Don't bother to open it, it will not help in any way, you can't clean it from the back. Check all your keys for any loose and wobbly ones, especially the "/" key. If it is loose and wobbles side to side, put the calculator on a shelf and buy a replacement as you will not be repairing it. The divide key has a broken hinge and it has divided one too many arguments on the stack.

If the keys are all nice and tight, take the batteries out and place several drops of isopropyl alcohol around the "/" key so that it seeps down into the keyboard and press the key several times. Repeat with a few more drops. Let it dry for a while, 15 minutes or so. Put the batteries back in a give it a try. If you have the same problem you might well have an SX keyboard that has reached end of life.

If you have access to an ultrasonic cleaner you might give that a chance if the easy method doesn't work.

Disassembling dusty HP27S

*Message #1 Posted by **Erwin** on 14 Jan 2005, 6:23 p.m.*

I bought a very dusty HP27S, where dust came inside and reduces the visibility of the display. In my opinion the one possibility to clean is to open the calculator, but I couldn't find any way without applying brut force. So I gave up.

Is there an easy procedure for opening available.

Erwin

Re: Disassembling dusty HP27S

*Message #2 Posted by **Randy** on 14 Jan 2005, 6:33 p.m.,*
in response to message #1 by Erwin

Opening it will not get you any closer to the display, it's behind the logic board. The best way to clean is a couple of cycles through an ultrasonic cleaner. If that is not available, form a point on the end of the tube on an air blaster can. Stick the point in the case seam and blast away. Work from both sides and you should be able to get most of it out. It can be VERY stubborn.

Don't use any mechanical methods, you'll only scratch the inside of the lcd or polarizer, they are very soft materials.

Re: Disassembling dusty HP27S

*Message #3 Posted by **Matthias** on 14 Jan 2005, 7:52 p.m.,*
in response to message #2 by Randy

Well, I´m a layman in ultrasonic cleaning. As I know, you put the dirty unit in the cleaner and fill it with undistilled water. But what happenes with the electonic parts in the calculator? Does the water damage the electronical parts? What is "allowed", what is "not allowed", because you damage parts?

Matthias

Re: Disassembling dusty HP27S

*Message #4 Posted by **Randy** on 15 Jan 2005, 12:10 a.m.,*
in response to message #3 by Matthias

The water will not damage anything.

So long as you always remove batteries and when cleaning is done you shake out all excess water and dry in a warm place all you will get is a clean calculator.

My Hp33s impressions

*Message #1 Posted by **Ron Ross** on 14 Jan 2005, 11:01 a.m.*

I just got my first new Hp33s and want to input my thoughts to the Hp community.

First I bought from Eric at Hpcalc.org and am always pleased with dealing with him.

The calculator is in a blister pack and always dangerous to open, but that is actually a side note.

It is an okay, above average calculator with the Hp tactile keyclick. I suspect (and expect) it will last 3-5 years with fairly heavy use (I don't expect it will last 10-20 years like the 41, Pioneer, or Voyager series). But I also suspect it is every bit as tough or rugged for field work ie dropping and beating up in a travel bag.

It really isn't as good as an Hp20s or Hp32s for overall quality, but manufacturing costs probably prohibit a return to those types of calculators for price and sale. I feel the upper selection modes keys at the top are going to be the high failure areas of this model (hence the 3-5 year lifetime).

However, I don't disdain it as I imagined I would. I would have liked better and the comments about the decimal point are valid. If you have weak eyes, you won't see it.

It is available and the only RPN calculator now allowed for the EIT or PE exams here in the USA.

Putting things in perspective, I would say it is an okay working RPN calculator. Also note, it is an AOS/RPN selectable (not EOS like everyone else) calculator. I like AOS better, but I suspect most new users won't if they choose algebraic.

If you are really selective in your calculator use, not worried about theft or loss, you can buy an Hp classic at twice or thrice the cost. However, if you use your calculator at work and/or in a high risk environment, the Hp33s will certainly give you a decent RPN calculator to expose to the real world.

Re: My Hp33s impressions - other thoughts

*Message #2 Posted by **Gene** on 14 Jan 2005, 12:02 p.m.,*
in response to message #1 by Ron Ross

1) Be sure to take a look at the learning modules on HP's site for the 33S. Be curious what you think about them. :-)

2) AOS mode actually has some advantages IMO (heresy?) when dealing with complex numbers. Came to that conclusion writing the Complex number module.

I do think the 33S is a demonstration that HP has not given up on RPN. They could have made the model without it.

Re: My Hp33s impressions

*Message #3 Posted by **Norris** on 14 Jan 2005, 12:36 p.m.,*

in response to message #1 by Ron Ross

>>It is available and the only RPN calculator now allowed for the EIT or PE exams here in the USA.<<

The 33S is also the only *programmable* calculator now allowed for the EIT, PE, LSIT, or PLS exams.

>>Putting things in perspective, I would say it is an okay working RPN calculator.<<

Agreed. However, I would also advise all 33S users to be aware of the bugs that affect several 33S functions (HMS conversion, polar conversion, and combinations).

Does your 33S still have these bugs? If so, does HP now include a copy of their "User's Manual Update" in the blister pack?

Re: 33s "User Manual Update" and Work-arounds

*Message #4 Posted by **Paul Brogger** on 14 Jan 2005, 1:38 p.m.,*
in response to message #3 by Norris

My most recent 33s purchase (BTW: ~$40.00, from an Amazon partner) came with the "User's Manual Update" sheet included.

In case you've not tried it, using the comma for the fraction mark can make the decimal location marginally more legible -- two "pixels" rather than one -- but at the expense of the thousands separators' legibility, however.

Adjusting the contrast on the display can reduce the shadowing somewhat. (Lower contrast allows more light to pass through and softens the shadows.)

Major scam on MoHP classified ads

*Message #1 Posted by **Luis** on 13 Jan 2005, 8:33 p.m.*

Help! I put an ad for the sale of a 15C on the MoHP classified ad section, and since then, I have been mailed nothing reliable and only major scam and fraud attempts. The worst one is here below for everybody's info and awareness. I left the typos, punctuation errors, and spelling mistakes as originally received. Is there anything we can do to continue using the reliable ads of these pages??

Sent: Wednesday, January 12, 2005 7:56 PM Subject: PAYMENT AND TERRIBLE MISTAKE. HELP ME OUT

It's my pleasure to mail you that the payment has been sent and the deal is now on ok. but there is a terrible mistake that has been made by my personal secrectry which i believe we can both settle with understanding and the knowledge of God.she was supposed to issue another client of mine a payment of ($1,312) who the name is (HERE IS A NAME CLOSELY SIMILAR)she issued that person ($312) and yours instead of ($312) she has issued you ($1,312) (becaus of the similarity in both names) so, kindly help me out of this problem and she has sent you the payment already. When it gets to you please kindly help me to deposit it till it will clear your bank because, i don't want this to delay our own transaction. I know you must be a GOD fearing person,i will be so glad if you can help me out of this terrible mistake made by my secretary, please do mail me back.I'm very sorry that this is happening this way I hope we can sort this out with God's knowledge may God help us. Let me read from you Ommediatelly concerning this error, Kind regards.

Edited: 13 Jan 2005, 9:02 p.m.

Re: Major scam on MoHP classified ads

*Message #2 Posted by **Ron Ross** on 14 Jan 2005, 8:37 a.m.,*
in response to message #1 by Luis

Since the check is supposedly on its way, now you can refer and possibly implement the following advice I posted earlier.

Just a suggestion. I don't know if it is wise advice either. It is surely a scumbag!!!

I would love to see someone accept the check then contact the bank or firm the check is drawn on, fax them the bogus check (maybe send to them for proof of fraud). Then contact the buyer and say you haven't recieve the check, but would wait until they got their refund from their MO, bank check, whatever and could send you another after stopping in and getting their funds back. It is a check after all, they should have a reciept.

The bank or firm on which the funds are drawn will be (or should be) waiting for them to claim their $5-10 check (who knows, they may be dumb enough to get it, thinking, what the hell, the check might really be lost and they probably make a couple of trips to that bank every week anyway). It is in the banks or MO firms best interest to reduce this type of fraud and perhaps they may do it (I know, it isn't likely).

At the very least they will have an afternoon of hassle, alas probably nothing more.

Re: Major scam on MoHP classified ads

*Message #3 Posted by **Frank Boehm** on 14 Jan 2005, 1:19 p.m.,*
in response to message #2 by Ron Ross

The checks are completely bogus, so they will just send another one. No bank is involved in creating these checks, more like a scanner and a laser printer ;)

Re: Major scam on MoHP classified ads

*Message #4 Posted by **Gordon** on 16 Jan 2005, 7:42 p.m.,*
in response to message #2 by Ron Ross

Any kind of response to the scam is an invitation for more problems. I would advise you ignore it and don't make any contact.

Black-Scholes on 17bII+ using Taylor series VERY ACCURATE!

*Message #1 Posted by **Bob Wang** on 13 Jan 2005, 7:47 p.m.*

Special Thanks to Tizedes Csaba for pointing me to the Taylor series approximation for the normal cumulative distribution.

This implementation of Black-Scholes only works in the region where d1 and d2 are less than 3 in absolute value. If either d1 or d2 is greater than 3, 0 is returned for CALLV. Calculation time is well over a minute, but accuracy is basically to the last displayed decimal place!

Note that the newer 17bII+ ROM has changed order of precedence, i.e. (-1^N) works on the older version, but has to be explicitly written as ((-1)^N) for the newer version.

On a brighter note, the newer ROM is almost an order of magnitude faster at displaying equations, and opening the editing function.

Also, replace * with multiply, and / with divide. Replace SIGMA with the sum operator found under the second screen of MORE Alpha characters. I apologize for the inconvenience, but I can't seem to get these characters to paste correctly.

Bob Wang

```

HP 21S Manual

*Message #1 Posted by **Nick Nicholas** on 13 Jan 2005, 7:15 p.m.*

I didn't realize that the manual for the above calculator is not on the HP Museum DVD/CDROMs. Was a copy of the manual ever available as a pdf download from HP? Does anyone have a scanned copy they are willing to email to me? Thanks.

Re: HP 21S Manual

*Message #2 Posted by **Raymond Del Tondo** on 14 Jan 2005, 1:24 a.m.,*
in response to message #1 by Nick Nicholas

No, the 21S manual is one of the rare birds,
because it wasn't made in the same quantities as the calc,
and the HP-21S calc itself wasn't made in large quantities.

However, at some time someone actually made a scan,
and posted the link to the hpmuseum forum.
It seems the link still works, so grab it while you can.

http://home.comcast.net/~bsmith1776/index.html

But note, the pdf is more than 15 megabytes in size,
so DSL is recommended;-)

HTH

Raymond

Re: HP 21S Manual

*Message #3 Posted by **Nick Nicholas** on 14 Jan 2005, 2:14 a.m.,*
in response to message #2 by Raymond Del Tondo

Thanks for referring me to the url. I thought I was going to end up at a deadend.

Black-Scholes on 17bII+, accurate to 5th decimal place

*Message #1 Posted by **Bob Wang** on 13 Jan 2005, 5:18 p.m.*

Thanks to Tony Hutchins for the idea of using an intermediate variable and nesting divisions.

This Black-Scholes formula relies on a 5th order polynomial approximation. The worst case scenario, given below, is till accurate to 5 decimal places.

Enter PS, PE, RF%, S, T, then "MORE", then "SOLVE", then "CALLV", and if needed, "PUTV"

I had stopped working on this, waiting for the new 17bII+ ROM. But now that we know L() and G() don't work, I decided I should post this for anyone who wants a relatively accurate and fast Black-Scholes.

I'll post another VERY accurate version using Taylor series, as suggested by Tizedes Csaba. But that version is VERY VERY SLOW. Takes over a minute to execute.

```
PS=68
PE=29
Rf%=.5
T=6
S=.2054
Exact Call   = 40.2016616074
Formula      = 40.2016671122
Exact Put    =   .344582080329
Formula      =   .3445875851

Re: Black-Scholes on 17bII+, accurate to 5th decimal place

*Message #2 Posted by **Eddie Shore** on 14 Jan 2005, 9:19 a.m.,*

in response to message #1 by Bob Wang

Thanks, Bob.

I wonder if HP let out L and G, in the first 17 batch so maybe to "match" the solver in the 49 series?

Re: Black-Scholes on 17bII+, accurate to 5th decimal place

*Message #3 Posted by **Dave Shaffer** on 14 Jan 2005, 1:59 p.m.,*
in response to message #1 by Bob Wang

Let me be a bit of an iconoclast:

I'm no expert on Black-Scholes (or any other formulae which purport to calculate the future value of investments), but it seems to me that no matter what you calculate, the actual results of an investment depend on the true-life variability of the market - which can not be modelled all that accurately! I therefore doubt that even 5-digit precision is necessary in such calculations.

It's like my physics students who continually provide 10 digit "answers" (because that's what the calculator reports) to problems with only one or two significant figures!

Re: Black-Scholes on 17bII+, accurate to 5th decimal place

*Message #4 Posted by **Wayne Brown** on 14 Jan 2005, 2:12 p.m.,*
in response to message #3 by Dave Shaffer

> Quote:
>
> It's like my physics students who continually provide 10 digit "answers" (because that's what the calculator reports) to problems with only one or two significant figures!

That's one of the nice things about slide rules; it's pretty hard to learn to use one properly without also learning the importance of significant digits, and the difference between precision and accuracy. It's also pretty hard to come up with a 10-digit answer! (Well, at least without "cheating" and using a book of log tables. :-)

I remember my own physics teacher, back in 1973, giving us the "precision vs. accuracy" lecture when one of those new-fangled calculators had the temerity to show up in her classroom...

Re: Black-Scholes on 17bII+, accurate to 5th decimal place

*Message #5 Posted by **Bob Wang** on 14 Jan 2005, 3:10 p.m.,*
in response to message #3 by Dave Shaffer

Dave:

These formulae are not intended for real world use. Think of them as "proof of concept" exercises. Just as I am amazed by Hutchins, Derenzo and Carr, I hope SOMEBODY, besides myself, finds these formulae interesting ;-)

Bob

P.S. *IF* HP financial calculators had UTPN, Black-Scholes could be implemented to the limit of machine accuracy. However, such an exercise would also be trivial and uninteresting.

Hp48GII

*Message #1 Posted by **Andrea** on 13 Jan 2005, 3:18 p.m.*

We were trying to transfer our Highway Programs from our HP48G+ to a Hp48GII. It would appear that this is not possible. Does anyone have any suggestions of how to get the programs on to the new calculator short of retyping them. Thanks

Re: Hp48GII

*Message #2 Posted by **Jeff O.** on 13 Jan 2005, 4:46 p.m.,*
in response to message #1 by Andrea

I believe that if the programs are User RPL programs, you can transfer them to a PC as ASCII files, then manipulate with one or more programs written by James M. Prange, available at hpcalc.org, then transfer to the 48GII. If they are SysRPL, I think you are out of luck. I'm pretty far outside my area of expertise here. Searching the Forum archives, hpcalc.org, and the comp.sys.hp48 newsgroup will likely yield far more info than I can provide.

Re: Hp48GII

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 13 Jan 2005, 10:10 p.m.,*
in response to message #2 by Jeff O.

Hi Jeff, all;

I successfully tranfered an User RPL program from an HP48G+ to an HP49G+ (the newer one) the way you mention, after storing the original program in a P.C. After that, I transfered it to the HP49G+ by setting ASCII mode and no translation. It ran O.K., without problems, and I did not change its contents. I guess that the HP48GII will work the same because they both, HP49G+ and HP48GII, seem to be internally compatible.

Cheers.

Luiz (Brazil)

hp49g-

*Message #4 Posted by **Raymond Del Tondo** on 14 Jan 2005, 1:40 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz,

AFAIK the 49g+ and the 49g- (48gII) use the same OS.

Regards,

Raymond

Re: hp49g- (what a "nickname"...)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 14 Jan 2005, 8:35 a.m.,*
in response to message #4 by Raymond Del Tondo

Hi, Raymond;

I remember reading some stuff about these two, and I am not sure if they both share equivalent internals, meaning the same processor, etc. Do you have additional info?

About the OS, I have only two doubts (not about the equivalency you mention, instead about the calculators): what sort of changes should the extra LCD lines in the HP49G+ demand in relation to the HP48GII? And the SD card access? The SD card access may exist in the HP48GII and never be used, but the building of the additional lines in the HP49G+ LCD must be suppressed in the HP48GII, right? I remember Hrast mentioned something about this particular fact when he announced that he was testing his emulators in an HP49G+.

As always, curiosity of mine.

Best regards and thanks!

Luiz (Brazil)

48gII

*Message #6 Posted by **Gene** on 14 Jan 2005, 10:18 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

I have one of these and actually like it.

They have the same internals as much as possible.

The processor is slower than the 49g+ (48Mhz vs. 75?), no SD card and a smaller display. Not sure how that gets handled, though.

I particularly like the color scheme. I've thought about placing the internals of my 49g+ into a 48gII case. :-)

Re: 48gII

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 14 Jan 2005, 11:19 p.m.,*
in response to message #6 by Gene

Hi, Gene; are you ewll?

I'm planning to buy an HP48GII, and after what you say, it seems to me it's not a bad idea. In fact, I actually intend buying it not for my own use, instead for, say, "professional" future needs.

And... can I ask you a question? What do you see when the HP48GII is completely empty (no data at all in RAM) after executing MEM? I mean, what is the actual amount of RAM available for the user? If I am not wrong, Iqbal mentioned once that it is smaller than 100KBytes, but I don't recall the correct number. How much is it?

Best regards and thanks.

Luiz (Brazil)

Re: hp49g- (what a "nickname"...)

*Message #10 Posted by **Raymond Del Tondo** on 14 Jan 2005, 2:35 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

i'm not quite sure, because I don't have a 49g+ anymore,
but I think the 49g+ 'simply' uses an additional
DA (Display Area) for the additional lines.
Maybe the OS can check the existence of those lines somehow,
and map the desired contents there.
If I remember correctly, someone (maybe CG) told me
that you could even load the 49g+ OS into the 'blueprint' 49g,
because the OS knew the amount of display lines...

But as always, the people who are more involved in the
HP-48 spinoffs could perhaps clarify this topic.

Best Regards,

Raymond

NB: DA (=Display Area): All stretched Pioneer machines have
three DAs, namely DA1 (Status), DA2A + DA2B (Main), DA3 (Menu)
If the 49g+ has an additional DA, it could be s.t. like DA1B, DA2C, or DA3B.
If it doesn't have an additional DA, the main area and
default number of stack rows coud have been updated.

Maybe at config time, the rowcount is set accordingly.

However, these are all guesses;-)

Re: hp49g- (what a "nickname"...)

*Message #11 Posted by **Raymond Del Tondo** on 14 Jan 2005, 6:06 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

btw the 'nickname' fits nearly
exactly to what the machine is,
namely a reduced hp49g.
No ports, no flash, no upgrade.
As we all know, it's derived from the hp49g,
not the HP-48G(X), so the name 'hp48gII'
goes near to an offense for HP-48 fans.

The only advantages of hp49g-
over the 49g are its color,
its upgraded OS, and its plasic keytops,
despite their questionable quality,
regarding the bouncing/loosing key strokes.

Best Regards,

Raymond

Re: hp49g- (what a "nickname"...)

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 14 Jan 2005, 11:14 p.m.,*
in response to message #11 by Raymond Del Tondo

Hi, Raymond;

just to tell you that I actually liked the nickname.

Cheers and thanks for your comments.

Luiz (Brazil)

Re: Hp48GII

*Message #13 Posted by **James M. Prange** on 14 Jan 2005, 9:37 p.m.,*
in response to message #1 by Andrea

Actually, as long as they're pure UserRPL, exclusive of SYSEVAL and LIBEVAL commands, they probably won't need any "manipulation" at all for a transfer from a 48G+ to a 48gII.

Note that the transfer will have to be in Kermit "ASCII" mode or Conn4x "Text" mode. In general, due to entry point changes, compiled "binary" programs aren't compatible between the 48 series and the 49 series. Note that in spite of the name, the 48gII uses a 49 series ROM, so should be considered to be a 49 series calculator.

Conn4x (XModem based) is faster, but there are a few special cases where the translations go wrong. If the transfer doesn't work with Conn4x, then try HPComm (Kermit based) instead.

The only problem that I know of with Kermit ASCII translations is that, in translation mode 1, 2, or 3, a string with a <CR><LF> sequence will be left as is instead of being translated to <CR><CR><LF> on transfers from a calculator, so on transfers back to a calculator, it's "untranslated" to just <LF> instead of to <CR><LF>. As long as you don't need to view or edit them on the PC, you could use translation mode 0, which is faster too.

The 48gII should be in approximate mode to avoid changing "real" numbers (type 0) that have integer values to exact integers (type 28).

If the programs have (or call) a global name that happens to be a built-in command or reserved varible name on the 48gII, the name will have to be changed.

There are some commands that behave a bit differently. Ask on the comp.sys.hp48 Usenet group if the program doesn't work as expected after you transfer it.

If the program uses SYSEVAL or LIBEVAL, you'll have to check for changed entry points.

Note that libraries, SysRPL programs, and assembly language programs can't be transferred in ASCII mode; you'd need to decompile them and recompile them for the 48gII.

The 48G+ won't supply the power for the level shifter built in to the 48gII's cable, and the 48gII's IrDA won't work with the 48G+'s "Serial IR", so probably the most practical method is to first transfer from the 48G+ to a PC file, and then from the PC to the 48gII.

Regards,
James

in response to message #3 by karl

Indeed, he should have done CF28 or ON/. in his mind...

590€ is quite a lot of money, but the lot, if as advertised, if offered at a common ebay price.

Re: New record prices for HP Calculators

*Message #5 Posted by **Raymond Del Tondo** on 13 Jan 2005, 3:35 p.m.,*
in response to message #2 by Massimo (Italy)

Yes, it means 590 Euros, of course.

That's why Europeans use a decimal comma,
not only a point...it can be seen more easily, except on an hp33S;-)

Summing up the individual item prices seems to lead to a reasonable price,
at least if the units are not worse than described...

HP-48GX + 3 128K RAM cards : 150 - 200 Euros

hp49g : 75 - 100 Euros (ok, to me the 49g is worth nothing, but that's another story...)
hp49g+ : 150 - 170 Euros
HP-32SII : 150 - 250 Euros
HP-20S : 20 - 50 Euros
HP-38G : 20 - 50 Euros

The above are price ranges I saw at online dealers and on eBay.

So you can see that the auction isn't exactly a bargain,
but not too expensive, too.

Raymond

Bringing back the HP 15C - why not

*Message #1 Posted by **mvdn** on 13 Jan 2005, 11:25 a.m.*

Reading the articles on http://hp15c.org/ and the petition to subscribe I thought, why not !

The hardware (in a different colour) is still build (HP 12C) why not bringing back the 15C alive.

Many people will be very happy (including me)

Re: Bringing back the HP 15C - why not

*Message #2 Posted by **Walter B** on 13 Jan 2005, 1:06 p.m.,*
in response to message #1 by mvdn

Hi mvdn,

we had this discussion in this forum several times already. One result is the OpenRPN project, please see http://www.openrpn.org/index.php . According to the opinion of the vast majority of the experts here, HP itself will not bring this calculator back based on the recent number of signers of the petition - sorry. So, the only hope is said project.

Re: Bringing back the HP 15C - why not

*Message #3 Posted by **hugh steers** on 13 Jan 2005, 1:07 p.m.,*
in response to message #1 by mvdn

i have decided, heretically, i don't want to bring back the 15c, even though its my favourite hp calculator!

its a bit like when you think back to all those computer games of the 80's and how cool they were. but when you fire up an emulator and run them, they're just so out of date.

i would, however, like to see an evolution of the 15c. say something like the 15c, but add alpha capability. add an extra line of display, widen the display (keeping the case the same size tho'). much more memory. much, much faster! and a choice of either keystroke programming or something more structured like either an evolved rpl or even some kind of basic (71b basic would be fine). add an ir tranceiver in the corner or an sd card if you really must.

change the batteries from 3 lr44 to 2 AAA to provide the required mAh (faster processor, etc.) keep the keys the same but drop the alphabetic codes under the keys, for which there is ample space. cost wise, it would be around the same as the 49g+, or perhaps a bit more if the keys and case were nice like the originals.

i think that's viable without going overboard.

*Message #4 Posted by **Bill Wiese** on 13 Jan 2005, 2:15 p.m.,*
in response to message #1 by mvdn

Well it's been addressed a few times before, but as a recap:

- HP sells calculators in competition with other co's based on FEATURES. Whether those are really valid features or not, distributors, stores, etc. look at # of features for price. They have different price point 'slots' up and down the scale. HP15C would be perceived by regular folks and marketing droids as going 'backwards' - remember these are standards of the folks filling these channels. They don't understand usability refinements, etc.

Our views simply won't/don't/can't register. We're a small community of fanatics. Selling into our demographic might get 25K calculators sold. Maybe some lucky carryover might get 70K calcs sold. This'd be web-only sales, etc. Prob not at any major store: the 15C could not get on a shelf at any store - unfortunately. The calc market is primarily seen as not "engineering" or even "academic" but "educational", and probably has its peak sales in August/September 'back to school' times (at least in USA).

If they can throw in RPN on a calc for $0 additional ocst, like they did on 33S, they might do it. But that calc is probably not gonna be an RPN-centric calc.

- Cost of a calc is NOT in the electronics. LCD, case, quality KB and battery clips may well cost more than the IC. The 65C02-flavored microcontroller in the 33S might only be $0.40-$0.60 depending if mask ROM, how much RAM, how strong the I/O drive levels, etc. Plus pinning costs.

Packaging, distribution, support, marketing all probably cost MORE than the parts cost of calc.

- Given the above, and the way HP does things, etc. no matter if it was an original 15C, it would cost AT LEAST $1Million, probably more, to reintroduce it - even if they still had and understood the original internal firmware.

HP could not conceive of running 15C internal firmware in an emulation layer on a non-Nut processor, and would start re-coding 15C from scratch on a new CPU. (Which explains the bugs in the 12C-Platinum.)

And there is probably nobody at HP that knows the Nut CPU anymore. There may not even be original source code for 15C anymore - was prob developed on minicomputer/mainframe. Might have a tape backup _somewhere_ and a printout - if they could find it after multiple divisional building moves. ;)

HP65 and HP67/97 factory cards

*Message #1 Posted by **Paul O'Hare** on 13 Jan 2005, 3:34 a.m.*

Hello all, apologies for posting such a simple question but are hp65 factory written magnetic cards (as found in the hp65Pacs)compatible with hp67/97 calculators?

Cheers Paul

Re: HP65 and HP67/97 factory cards

*Message #2 Posted by **Achim** on 13 Jan 2005, 5:52 a.m.,*
in response to message #1 by Paul O'Hare

The cards are physically identical but the opcodes of the HP-65 are different from the HP-67/97. So it makes no sense to read cards from the other calc. If you try to do so, you either get an error or unpredictable results.

Emu42 campaign and Emu4xPPC compatibility to WM 2003 SE devices

*Message #1 Posted by **Christoph Giesselink** on 12 Jan 2005, 7:31 p.m.*

Hallo together,

first of all I want to thank all of them who contributed the Emu42 campaign on http://www.hp42s.com/campaign/. It's now closed. A special thank to Erik Ehrling for all his work.

With the collected money I recently bought a Dell Axim X50v PDA to test Emu42PPC and Emu48PPC on a Windows Mobile 2003 SE device. The Axim X50v has a VGA (640x480) display.

The latest versions of Emu42PPC v1.01 and Emu48PPC v1.00 run without problems on this device. The OS resize the QVGA (320x240) KML scripts automatically to the VGA resolution.

Some good news to the one who have problems with the Vertical KML script for the HP28S where sometimes (most times) the 'Topbar 0' command, to switch off the top line, isn't working. This seem to be a general bug in the WM 2003 series OS. Some combinations for the state argument of the SHFullScreen() function don't work every time. At the moment I'm trying a workaround that seems to work.

The next Emu42PPC version will have native VGA display resolution support.

Best Regards,

Christoph Giesselink

*Message #2 Posted by **hugh steers** on 13 Jan 2005, 12:50 p.m.,*
in response to message #1 by Christoph Giesselink

excellent. i also have the same axim model.

i looked into running this last week, but i don’t have a rom image for the 42. i have a 28s which i could maybe extract the rom from. otherwise i could help out with the vga support. i run my unit in vga all the time now, i've got used to really small buttons but its worth it to get more text on screen. it annoys me when apps don’t work in vga properly.

incidentally, you can now try out my exact! calculator, which is currently still a test version. it will run fine in qvga and true vga. true vga is nice. all my buttons and features are scalable.

http://voidware.com/exact/

cheers,

HP-35 accessories

*Message #1 Posted by **NeilV** on 12 Jan 2005, 6:38 p.m.*

Hello,

A co-worker cleaned out his parent's basement and gave me an HP-35 calculator. This was the calculator I couldn't afford as a student (72-75). Also a great addition to my slide rule collection considering this was the calculator that ended the slide rule era.

Thanks to the repair tips on this site I was able to find the hidden screws, open and remove the gunk from the on-off switch. I should have a replacement battery pack assembled later this evening.

My question is what accessories came with the calculator? I have a gray-blue box, manual and charger. Was the black (leather?) case a separate item? It doesn't look like it would fit in the gray-blue box.

Thanks, Neil

(Looks like I posted this question to the forum. 2X!! Mayber 3X is this attempt fails. Apologies. I hope someone with authority will delete it. Thanks.)

Edited: 12 Jan 2005, 6:40 p.m.

*Message #2 Posted by **Raymond Del Tondo** on 12 Jan 2005, 6:59 p.m.,*
in response to message #1 by NeilV

Hello,

AFAIK the leather case was tightly rolled,
to fit into the space nearby the charger.
Aside from the manual, there was a small
cardboard sheet showing accessories,
the guarantee/warranty card and a sheet
of paper about the batteries.

Raymond

in response to message #2 by Raymond Del Tondo

There were a few applications books with keystroke sequences for various professions. These are the bare bones. You will find some of the same routines from the surveying books, for instance, as the heart of the HP programs for the 65, 67 and 41 You can get scans of all the known books by buying the museum cd/dvd.

Re: HP-35 accessories

*Message #4 Posted by **Palmer O.Hanson, Jr.** on 14 Jan 2005, 11:53 p.m.,*
in response to message #3 by db (martinez, ca.)

There were two hardware accessories which did not come in the package with the HP-35:

The Reserve Power Pack (82004A)provided the capability to have a spare battery pack charging while the calculator was in use.

The Security Cradle was used to prevent the calculator from "walking away". That was not an inconsequential problem in those days. The company where I worked purchased several calculators. They soon disappeared. When replacements were purchased the users were required to use security cradles which provided the capability to lock the calculator in the cradle which was bolted to the user's desk or tied to the desk with a security cable. This had the unhappy effect of turning a portable calculator into a desktop calculator.

The cradle in my collection carries the stock number 82007.

Re: HP-35 accessories

*Message #5 Posted by **NeilV** on 18 Jan 2005, 7:16 p.m.,*
in response to message #4 by Palmer O.Hanson, Jr.

Thanks for all of your responses. I built a replacement battery pack and the calculator is up and running. The main missing accessory seems to be the (leather) case.

-Neil

*Message #6 Posted by **db (martinez, ca.)** on 16 Jan 2005, 1:54 a.m.,*
in response to message #1 by NeilV

HP made a thick black leather field case (along with the glove leather one) that would fit on a military web belt too. I crammed my 41 into one for a while but it was really for the 35/45. I just thought of the 35's applications manuals first because they are such clean keystroke examples, and useful to someone who is finally retiring his slip stick and moving up to a 35 :-)

hp42s rom

*Message #1 Posted by **Paul Andrews** on 12 Jan 2005, 4:27 p.m.*

I have found several emulators for the HP42S, but each indicates that I need to aquire the ROM code. How does one go about this? I have an HP42S calculator, and would like to run it both in windows and on my palm, but I do not have a clue as to how one goes about dumping the ROM.

Re: hp42s rom

*Message #2 Posted by **Raymond Del Tondo** on 12 Jan 2005, 4:59 p.m.,*
in response to message #1 by Paul Andrews

In the links area of the emulator section of this site
should be a link to Christoph Giesselink's page,
(http://privat.swol.de/ChristophGiesselink/)
and there should be a description how to dump the ROM
in a quarter of an hour.

Re: hp42s rom

*Message #3 Posted by **Erik Ehrling (Sweden)** on 13 Jan 2005, 2:08 p.m.,*
in response to message #2 by Raymond Del Tondo

Paul - do not hesitate to attempt doing a ROM dump according to Christoph's instructions, you'll be amazed by how simple it is!

Regards,
Erik

Re: hp42s rom

*Message #4 Posted by **Jeff O.** on 13 Jan 2005, 7:22 a.m.,*
in response to message #1 by Paul Andrews

Be aware that you need an HP48GX (I think a G+ will also work) to do the dumping. If you have one, dumping the rom is not too difficult (actually kind of fun), although piecing together all of the necessary steps takes a little study. If you need any tips, reply here or send an e-mail.

NO60hzSPAMatFORieeedotMEorg (remove NO SPAM FOR ME and change the at and dot.)

Re: hp42s rom

*Message #5 Posted by **Thomas Okken** on 19 Jan 2005, 9:51 p.m.,*
in response to message #1 by Paul Andrews

You might also want to take a peek at Free42; it does **not** require a ROM image, and it runs natively on PalmOS.

Re: hp42s rom

*Message #6 Posted by **Mike (Stgt)** on 21 Jan 2005, 8:27 a.m.,*
in response to message #5 by Thomas Okken

Seems I have to mention your Free42 on [link:http://ourworld.compuserve.com/homepages/nutem/pioneer.htm]my site[/link:] as it is the first simulation I see so close to the original. But - not to downgrade your work - if your routines depend on machine specific characteristics and you do need to migrate to a new platform I would advice to use an emulator. Unless the advantages (speed, control, interfaces, and so on) outweight the need to test most routines on the new platform. That is everybody's own decission.

Ciao.....Mike

HPIL-RS232 interface

*Message #1 Posted by **Jon** on 12 Jan 2005, 4:08 p.m.*

Hi everybody:

I have finally received my HPIL-RS232 interface. Following Emmanuel´s instructions I have connected it to the PC and I have tried HPILCOM. But I have some questions

1) I have been able to send a program to the PC using OUTP. However I see that I send all the programs that I have in the memory, not just the program which label I have in the ALPHA register

2)To get a program from the PC I have to press transmit in HPILCOM and then INP in the calculator(otherwise it doesn´t work and produces a "READ ERR"). Doing this I get the comunication, but all the programs in the calculator are replaced with the transmited information.

Any sugestion?

Thanks in advance

Jon

Re: HPIL-RS232 interface

*Message #2 Posted by **Hans Brueggemann [GER]** on 13 Jan 2005, 1:38 p.m.,*
in response to message #1 by Jon

hi jon, maybe it's not too difficult to fix. 1) OUTP only sends out the program which is specified in the alpha register. OUTP will then send all code from the specified global alpha label to the following END instruction. you should check whether you did a GTO.. after each program you keyed into the calc. if you did not, (i.e., you used STOP at the end of the program), then all programs are "chained" together and cannot be separated by OUTP. if you do a CAT1, you should always see an END between adjacent programs.

2) above said should also fix the second issue. please check the manual for the "GETP" routine, which automates the process of "INP"ing a program. by using "GETP", it is not necessary to do a "TRANSMIT" on HPILCOM. make sure that HPILCOM is not in "DUMB" mode.

plz do also check the documentation of the program for my e-mail address and drop me a line, if you have further questions.

hope, that helps! cheers, hans 1234

More bad news on the 17bII+ (Long)

*Message #1 Posted by **Bob Wang** on 12 Jan 2005, 3:24 p.m.*

Well, since L() and G() won't work on the new 17bII+ ROMs I decided to take a chance on the program size limitation being solved. NO SUCH LUCK! The more accurate 5th order polynomial approximation implementation can calculate the first half correctly, but returns CALLV=0 after about 70 characters into the second half.

This behavior seems similar to the L() and G() problem where G() seems to just return 0, no matter what. The Solver also seems to return 0, instead of an error, when a certain program size is exceeded.

I'm including my Black-Scholes program below for those masochists interested in entering it into their own 17bII+'s as an exercise. If you delete the entire second half, you'll get PS*N(d1) for CALLV, so for HP's example

PS=52 PE=45 RF%= 0.5 T=6 S=.2054

CALLV = 37.713812252994

Bob Wang

Black-Scholes using 5th Order Polynomial Approximation

BLK.SCHLS.5TH: 0×(PS+PE+RF%+T+S)

Black-Scholes for HP-71B (different polynomial)

*Message #2 Posted by **Valentin Albillo** on 13 Jan 2005, 9:18 a.m.,*
in response to message #1 by Bob Wang

Hi, Bob:

Too bad the 17BII+ is giving you such a headache. Implementing Black-Scholes in other HP models can be very easy, like this very simple code of mine for the HP-71B, which uses a different polynomial approximation. Perhaps you can use this polynomial instead of yours, to try and fit the expression in your own machine:

```
>list
10 INPUT " Current price PS= ";P
20 INPUT "Exercise price PE= ";X
30 INPUT "Risk free rate RF= ";R
40 INPUT "Term of option T = ";T
50 INPUT "    Volatility S = ";S
60 PRINT @ R=R/100 @ D1=(LN(P/X)+R*T)/(S*SQR(T))+S*SQR(T)/2 @ D2=D1-S*SQR(T)
70 C=P*FNN(D1)-EXP(-R*T)*X*FNN(D2) @ PRINT "    Call Value CV=";C @ END
80 DEF FNN(D) @ N=.5*(1+.196854*D+.115194*D^2+.000344*D^3+.019527*D^4)^(-4)
90 IF X<0 THEN FNN=N ELSE FNN=1-N
```

Let's run your own example:

```
>RUN
 Current price PS= 52
Exercise price PE= 45
Risk free rate RF= 0.5
Term of option T = 6
    Volatility S = .2054

    Call Value CV= 14.2383025355
```

and the first term is:

```
>P*FNN(D1)
 37.7232626591
```

more or less in accordance with your result. The corresponding program code for most any vintage SHARP handheld (the PC-1350 for example) is:

```
100 "S" CLEAR: INPUT "Current price P=";P
102 INPUT "Risk free rate R=";R
104 INPUT "Volatility S=";S
106 INPUT "Term of option T=";T
108 INPUT "Exercise price X=";X
110 D1=(LN(P/X)+R*T)/(S*SQR(T))+S*SQR(T)/2, D2=D1-S*SQR(T)
120 D=D1: GOSUB "N": N1=N, D=D2: GOSUB "N": N2=N, CV=P*N1-EXP(-R*T)*X*N2
130 PRINT "Call Value=";CV: END
140 "N" N=1-.5*(1+.196854*D+.115194*D^2+.000344*D^3+.019527*D^4)^-4
150 IF X<0 LET N=1-N
160 RETURN
```

Best regards from V.

Re: Black-Scholes for HP-71B (different polynomial)

*Message #3 Posted by **hugh steers** on 13 Jan 2005, 10:15 a.m.,*
in response to message #2 by Valentin Albillo

hey valentin,

bob's program uses hasting approx whose error is bounded by 7.5e-8, but yours is bounded by 2.5e-4. you could get better accuracy (but still less than bob) with a shorter approximation, thus:

UTPN(x) = exp(-x*x/2-4*x/(x/.85+5))/2

error bounded by 9.2e-5.

Re: Black-Scholes for HP-71B (different polynomial)

*Message #4 Posted by **Valentin Albillo** on 13 Jan 2005, 11:34 a.m.,*
in response to message #3 by hugh steers

Thank, Hugh, but come to that I could simply use the INTEGRAL keyword and have a relative error of 1.E-12 or so, i.e., nearly full machine precision.

I refrained from doing so as I guess the 17BII+ doesn't have the INTEGRAL functionality (not to mention the SHARPs or most BASIC dialects). The idea was to provide a shorter (if less accurate) formula that perhaps would do where the longer, more accurate one wouldn't.

Thanks again and best regards from V.

Re: Black-Scholes for HP-71B (different polynomial)

*Message #5 Posted by **hugh steers** on 13 Jan 2005, 12:41 p.m.,*
in response to message #4 by Valentin Albillo

indeed, and this is a peeve i have with hp’s latest models.

these days, if you’re going to market a professional financial model, it should already have black scholes, utpn, erf, and others together with their inverses to full precision. why not?

is the 17bi++ a rom emulation of the old 17bii (if so, why doesn’t l() & g() work properly) or is it a remake like the 12cp?

if a rom emulation, surely you could add new codes that map into new features, if not, then there’s no excuse not to add the new features.

or is it simply, that the model was completely engineered outside hp and the 17bii was given as a “specification” for the new model?

Re: Black-Scholes for HP-71B (different polynomial)

*Message #6 Posted by **Ron Ross** on 13 Jan 2005, 12:58 p.m.,*
in response to message #5 by hugh steers

I shouldn't bother to rant and rave, but I get so fed up with Hp incompetence in their designs and screw ups!

First you have a bunch of whipped puppies left, if you speak out, Carly's henchmen will hunt you down and find a Compaq drone to replace you with. (a side note here, HP bought Compaq, not the other way around, but guess who lost their jobs, except for Carly. This is easily verified, many Hp execs were replaced with their Compaq counterparts.)

Not that Hp marketing was a whole lot better when they were in charge either.

Today, Hp could make the Hp17Bii+ with buried trig functions (or just toss in the Hp42s with a replacable face plate like the Hp30s) and toggle it between modes. Give it a USB or RS 232 port (I prefer RS 232), and sell it for $100 (same price as an Hp48Gii, which is what the Hp17Bii+ actually does sell for).

But a calculator like that would ROB sales from their graphics line (I suspect the thought of robbing sales from Ti's graphics line doesn't even come up).

I stand upon this mountain (I am fanatasizing again) and shout, "HP, YOU ARE A BUNCH OF MORONS!"

I don't think they care, or they may even be laughing at the Hp calculator zealot that I am.

I end another RANT!

Re: Black-Scholes for HP-71B (different polynomial)

*Message #7 Posted by **Valentin Albillo** on 13 Jan 2005, 1:12 p.m.,*
in response to message #5 by hugh steers

Hi again, Hugh:

"these days, if you're going to market a professional financial model, it should already have black scholes, utpn, erf, and others together with their inverses to full precision. why not?"

Indeed. But nobody cares at KinHPo.

"is the 17bi++ a rom emulation of the old 17bii (if so, why doesn't l() & g() work properly) or is it a remake like the 12cp?"

I daresay it's a (bad) remake.

"if a rom emulation, surely you could add new codes that map into new features, if not, then there's no excuse not to add the new features."

Again true. But nobody cares at KinHPo.

"or is it simply, that the model was completely engineered outside hp and the 17bii was given as a "specification" for the new model?"

Most probable. But nobody cares at KinHPo. If someone did, the 33S wouldn't have an antiergonomic key layout, poor display and invisible decimal point, nor would it have nearly 32 Kb of unusable RAM, nor would it fail miserably when doing some essential mathematical operations. The HP-12C Platinum wouldn't have a sub-par, "pessimized" algorithm to compute the IRR, nor would it have the serious GOTO bug which makes it very difficult to use the 400-steps RAM for long programs, nor ...

But who cares ? Who's counting ? Everyone has their own interests and I couldn't be less interested in the latest KinHPo crap. This is a "Museum of HP", so theoretically devoted to the awesome models of old, and as long as I do have a functioning, physical HP-15C, HP-41CX, HP42S, or HP-71B (to name a few, let alone my SHARPs), and a wonderful site dedicated to them such as this, who cares what KinHPo does or doesn't do ? They are NONEXISTENT to me.

Best regards from V.

*Message #8 Posted by **tony** on 13 Jan 2005, 3:48 p.m.,*
in response to message #3 by hugh steers

Hi Hugh,

> Quote:

UTPN(x) = exp(-x*x/2-4*x/(x/.85+5))/2

error bounded by 9.2e-5.

That is indeed a good approximation to UTPN(x) for x>=0.
The absolute error bound is [-9.14e-5, 5.62e-5].
I'm curious if you saw this in an HPCC DataFile article (V23N3p25) about Peter Carr's Black-Scholes program for the HP-12C, or did you find it elsewhere?
Review of Peter Carr's HP-12C Black-Scholes

Tony

Re: Black-Scholes for HP-71B (different polynomial)

*Message #9 Posted by **hugh steers** on 13 Jan 2005, 7:19 p.m.,*
in response to message #8 by tony

yes, i confess. i did get this from datafile.

i remember reading this in issue v23n3 from last june and being impressed by the derenzo formula for Q. in the past, i have played with many approximations to this function, but none of these have ever been interested in making the coefficients shorter (ie for calculator programming) which is why the derenzo formula is so elegant.

i am also intrigued by the hp32e's ability to get full 10 digit accuracy for both is Q and inverse Q functions. i wonder what approximation it uses. whatever it does, its good at it.

Re: Black-Scholes for HP-71B (different polynomial)

*Message #10 Posted by **tony** on 13 Jan 2005, 9:01 p.m.,*
in response to message #9 by hugh steers

Ah I should have guessed - now I see you in the HPCC MemberPack :-). I have Stephen Derenzo's original paper. Brilliant piece of work, and what Peter Carr did with the Q was most ingenious - and stimulated by the challenge of just fitting something reasonable in the HP-12C.

Greetings and more

*Message #1 Posted by **Valentín Albillo** on 12 Jan 2005, 7:49 a.m.*

Hi, all:

Just returned from Xmas vacations, first thing I do is have a look at this Forum and see the regular mail, where I notice the latest issue of Datafile (V23N6) is waiting for me, and lo and behold, my latest article ("Long Live the HP42S!") is included.

Just in case you're interested, and as a kind of past-due Xmas 'present', I'll send copies of my former Datafile articles (**in PDF format**) to anyone requesting them. Briefly, the articles you may request are:

- **HP-11C: Long Live the HP-11C!**

  5-page article, includes an 84-step program which will quickly and accurately find the limit sum of any user-defined infinite alternating series, no matter how slowly it does converge (if at all).

- **HP-12C: Long Live the HP-12C!**

  6-page article, includes a 72-step program which will play a challenging game of Bridge-It! against the user.

- **HP-12C: Tried & Tricky Trigonometrics**

  10-page article, includes a 99-step program which evaluates all six trigonometric functions (sin, cos, tan and their inverses) very quickly and with full accuracy over an extended range of arguments.

- **HP-12C: Serendipitous Solver**

  8-page article, includes a 37-step program which makes use of the built-in machine code solver and a number of financial functions to find a real root of polynomials up to 14th-degree (up to 1480th-degree or more if there are groups of repeated coefficients). The program can also evaluate the polynomial for given arguments. Both root finding and evaluation are implemented using built-in financial functions. without user-code loops or branching.

- **Time Voyager**

  An HP-related short story (11 pages), specifically written to commemorate Sir Isaac Newton.

- **HP-15C: Long Live the HP-15C!**

  6-page article, includes a 64-step program which will compute and store the value of Euler's constant e (=2.71828+) up to 208 decimal digits, using matrix operations.

- **HP-15C: Nth-degree Polynomial Fitting**

  7-page article, includes a 42-step program which will compute explicitly the coefficients of a polynomial of degree N (for 2 <= N <= 6), which exactly fits (passes through) a given set of data points (x,y).

- **HP-41C: Long Live the Advantage ROM!**

  8-page article, includes the 62-step HP-41C/Advantage ROM version of the HP-15C program featured in HP-15C: Nth-degree Polynomial Fitting, extended to handle degrees much higher than 6, limited only by available RAM.

- **HP-71B: Modest Mater**

  12-page article featuring a program that recursively solves arbitrary Mate-in-N chess problems. Fully commented and annotated listing plus examples included.

You can see all of them in HTML format at my web site (except "Modest Mater"), if you wish, but should you want **PDF** copies of them (identical facsimile to the published article) for storage in a binder or CD-R compilation for example, just send me an e-mail specifying which articles do you want to this address:

http://membres.lycos.fr/albillo/calc/pics/MYHPMAIL.GIF

and I'll send them attached to my answer to your e-mail (absolutely free, of course !). Keep in mind that each article is some 100-150Kb in size, so you should make sure that your e-mail account has capacity enough to receive them and further, your e-mail server does not remove PDF attachments. The Subject of your e-mail ***must*** be "HP CALCS: DATAFILE ARTICLES". This offer is valid till next Monday (2005-01-17)

By the way, I've recently submitted a new batch of articles to Datafile, so you can see them published right now in the very next issues, or else when I eventually make them available at my web site as well, within six months or so.

Best regards from V.

do you know if the pc-1475 can do all its scientific functions to 20 digits, out of interest?

thanks.

[OT] Re: Greetings and more

*Message #6 Posted by **Valentin Albillo** on 18 Jan 2005, 12:48 p.m.,*
in response to message #5 by hugh steers

Hi, Hugh:

Excuse me but for whatever the reason I completely missed your post, hence the rather long delay in posting an answer.

Hugh posted: *"do you know if the pc-1475 can do all its scientific functions to 20 digits, out of interest?"*

It's been some time since I used this model, which is now kept sealed and battery-less in my collection, but I do remember perfectly that at least all arithmetic functions and square roots did produce 20-digit results.

I have the less defined idea that I also did trigs and logs and exponentials with it, and all of them also worked with 20-digit accuracy, else I would have noticed it at once, which I don't remember was ever the case, so I am 90% sure that yes, all standard elementary functions do work to 20-digit precision as well.

On the negative side, I also extensively tried the built-in matrix functions, and though they were very fast, accurate, and easy to use, they did *not* work with double precision, 20-digit variables, just 10-digit ones, which is a real pity.

When I take this machine out of its sealed envelope for its periodic check, I'll test all of this much more thoroughly.

Best regards from V.

*Message #7 Posted by **Palmer O. Hanson, Jr.** on 12 Jan 2005, 8:36 p.m.,*
in response to message #1 by Valentín Albillo

Back in July 2004 you wrote that you were writing programs which would solve "7x7 system of linear equations in an HP-67, a 12x12 tridiagonal system of equations, invert a 5x5 matrix in place, or do 4x4 matrix operations within a single program, ...". Are those programs in your latest submission to DATAFILE?

Re: Greetings and more

*Message #8 Posted by **Valentin Albillo** on 13 Jan 2005, 5:04 a.m.,*
in response to message #7 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer posted: *"Back in July 2004 you wrote that you were writing programs which would solve "7x7 system of linear equations in an HP-67, a 12x12 tridiagonal system of equations, invert a 5x5 matrix in place, or do 4x4 matrix operations within a single program, ...". Are those programs in your latest submission to DATAFILE?"*

Matter of fact, no, the three latest articles I've sent are focused on other HP models, not the HP-67, but the ones you mention can indeed be sent for eventual publication in a near future issue.

To set the record straight, I weren't writing those programs back in July 2004, said programs were written, debugged and documented some 20+ years ago, but as far as I recall they haven't been published anywhere, with the possible exception of the 7x7 system which might haven been (though I can't remember where or when). Also, the 7x7 program was written by my friend Fernando del Rey, the 4x4 and 5x5 programs were written by me, and I can't remember who wrote the 12x12 program, whether he or me. Both could be the author, our programming styles are quite similar. :-)

Thanks for your interest and best regards from V.

Palmer would certainly be interested in the 15c PDF articles!

*Message #9 Posted by **Gene** on 13 Jan 2005, 9:02 a.m.,*
in response to message #8 by Valentin Albillo

Palmer has done quite a bit of work with matrix solving routines for accuracy.

So far, it appears that the TI-59 is still quite a bit ahead of most of the competition. :-)

HP 01 calc/ watch repair

*Message #1 Posted by **Sam** on 11 Jan 2005, 8:23 p.m.*

After a list member graciously answered my question about how to setup the time for the HP-01, I found out that keypad is messed up. When I press any digit, I either get 3 (if I press the upper row) or 8 (if I press the lower one). Can someone help me with a place to repair the watch if one exists?

Thanks Sam

Re: HP 01 calc/ watch repair

*Message #3 Posted by **Tony Duell** on 12 Jan 2005, 6:40 a.m.,*
in response to message #2 by Randy

Alas, I have to agree with that. I had a chance to handle the module from an HP01 at the last HPCC meeting. It consists of 2 ceramic 'circuit boards' glued together, the keyboard contacts being on the top one. I believe that inside, there are the bare silicon dice (chips), bonded out (connected) by fine gold wires to traces on the lower 'board'. These chips are not in packages, there's not way to replace them even if you could get spares (and AFAIK they were only used in the HP01). The display, battery contacts, crystal and a couple of passive components are soldered to the back surface of the lower board and could, in theory, be replaced, but they're unlikely to fail anyway.

The 2 boards are connected by a zebra-strip like connector on the right edge, which can be pulled out. This sowuld be worth cleaning if some of the keys are totally dead.

To return to the orignal problem, if this had been a classic-series machine (related architecture), I would have suspected a C&T chip failure, or maybe ROM failure. But there's no way to replace those on the '01

Re: HP 01 calc/ watch repair

*Message #4 Posted by **David Smith** on 12 Jan 2005, 6:46 p.m.,*
in response to message #3 by Tony Duell

One may also try a trip through an ultrasonic cleaner (use three passes with fresh distilled water in each pass). Shake out as much water was possible and then let dry. I use an oven on LOW (<150 degrees F). The high impedence circuitry on the boards is easily messed up by any accumulated gunk.

Where are these units made?

*Message #1 Posted by **Matthias** on 11 Jan 2005, 4:06 p.m.*

I only have sealed units of the following types and I do not want to open the box. Can you tell me if these are all made in China or if there are other place of manufactoring?

HP-12C Platinum HP-17BII+ HP-33S HP-39G+ HP-40G HP-48G+ HP-49GII HP-49G+

Thanks for your support

Re: Where are these units made?

*Message #2 Posted by **karl** on 11 Jan 2005, 4:54 p.m.,*
in response to message #1 by Matthias

I think that Kinpo produces them

Re: Where are these units made?

*Message #3 Posted by **Randy** on 11 Jan 2005, 5:50 p.m.,*
in response to message #1 by Matthias

FWIW, the 48G+ was made in Indonesia only.

Re: Where are these units made?

*Message #4 Posted by **Luis** on 11 Jan 2005, 7:09 p.m.,*
in response to message #1 by Matthias

HP-12C Platinum HP-17BII+ HP-33S are only made in China.

Greetings,

Re: Where are these units made?

*Message #5 Posted by **mvdn** on 12 Jan 2005, 7:54 a.m.,*
in response to message #4 by Luis

Correct!

Most (and all new) are build OEM by Kinpo (www.kinpo.com.tw) for HP so HP is not really involved in de thinking and building.

Re: Where are these units made?

*Message #6 Posted by **Arnaud Amiel** on 13 Jan 2005, 10:39 a.m.,*
in response to message #5 by mvdn

I am not sure kimpo is even involved in the making, I believe just the design. Manufacturing is then subcontracted to PRC

Arnaud

Another HP41 MLDL2000 Update

*Message #1 Posted by **Meindert Kuipers** on 11 Jan 2005, 2:33 p.m.*

Hello all,

It looks like I have bankswitching working! I can sucessfully run the first matrix example of the Advantage ROM, which did not work before I implemented bankswitching. I would like to have some of your suggestions for more tests of the bankswitching mechanism using standard ROM (HEPAX is not supported yet).

There is now one little issue that is bothering me, and that is that the current consumption gets a little too high when I disconnect USB. I am currently trying to fix this with a small hardware modification.

When this is fixed I will prepare the units for the beta testers and quickly after that will start the process of formally offering the production versions of the MLDL2000!

Meindert

Re: Another HP41 MLDL2000 Update

*Message #2 Posted by **Gene** on 11 Jan 2005, 3:02 p.m.,*

in response to message #1 by Meindert Kuipers

Hi Meindert, looks like you´re rounding off the few last rough edges of the design - not only remarkable but also another sign of a thorough job, many thanks.

Can´t wait to take the unit for a spin!

Best, AM

Re: Another HP41 MLDL2000 Update

*Message #4 Posted by **Garth Wilson** on 11 Jan 2005, 9:49 p.m.,*
in response to message #1 by Meindert Kuipers

> and that is that the current consumption gets a little too high when I disconnect USB

How high? Is it high all the time (even when on but inactive), or only when it is being actively accessed?

Re: Another HP41 MLDL2000 Update

*Message #5 Posted by **Meindert Kuipers** on 12 Jan 2005, 9:10 a.m.,*
in response to message #4 by Garth Wilson

We are talking a few milliamps when the HP41 is switched off. The problem is that there is leakage trough the USB interface chip from the I/O ports, so it is still running and supplying power to the CPLD (which it should do to power the MLDL from USB). My goal is only to power the SRAM and to switch everything else off to have a very low standby power. I have a solution that I am testing.

Overall power consumption is only a few milliamps extra when the HP41 is running and using the MLDL2000, but I need to do some more measurements.

Meindert

Re: Another HP41 MLDL2000 Update

*Message #6 Posted by **Sean** on 12 Jan 2005, 12:20 a.m.,*
in response to message #1 by Meindert Kuipers

By production, do you mean you will be selling them? That's a great idea - any idea what you'll be asking for them yet? I sure would be interested in one... Great work!

(delete pw is delete)

Re: Another HP41 MLDL2000 Update

*Message #7 Posted by **Don Leonard** on 12 Jan 2005, 2:32 a.m.,*
in response to message #1 by Meindert Kuipers

Outstanding! You have no idea how long I have waited (many years) to acquire a MLDL that works, let alone one as flexable and with such massive program storage. Don't forget to let me know when they are available.

Don

L() and G() unsupported on NEW HP17BII+ (Long)

*Message #1 Posted by **Bob Wang** on 11 Jan 2005, 2:19 p.m.*

To all current and prospective HP17BII+ owners:

I finally got around to requesting a replacement for my OLD HP17BII+, SN CN33301xxx, which did not support L() and G(). My unit was purchased in March of 2004, and I first inquired about a replacement in October. I was told to wait a month since the procedure to replace old units with units that had L() and G() was not yet in place. I was assured that replacement was not a problem, EVEN if my warranty had expired. I checked back in December, and was asked again to wait.

I called back last week, and the 1(800)HPINVENT menu choices of “Handheld”, then “Calculator” led to a message that HP was experiencing “server problem”. After a few days of getting the same message, I tried the old fashioned “don’t choose an option and wait for a human” approach.

I did reach a human, albeit one with an accent ;-) Said human could not understand 17BII+ as a model number, even after many attempts at spelling it out explicitly. I was even asked if my unit was an iPAQ, and whether I was running Windows XP! Don’t we wish, or maybe NOT ;-)

I finally suggested looking for the group that supports the HP33s. VOILA!

I was transferred to a non-accented person who proceeded to inform me that L() and G() were undocumented functions, so my unit was functioning perfectly as advertised. Therefore, I was NOT entitled to a warranty replacement. HOWEVER, he would replace my unit THIS ONE TIME ONLY as a “nicety”. I wonder if that word is actually in the script ;-)

Anyway, my replacement unit, SN CN41202xxx arrived yesterday. I eagerly entered a test equation into the Solver, and promptly locked up the machine. Repeat testing confirmed that attempting to run ANY equation in the Solver would result in a blank display, or garbage, necessitating a reset.

Reaching calculator support was easier the second time around. Support person was also MUCH more responsive, expediting a replacement, which arrived this morning. IMPRESSIVE!

New unit, SN CNA41806xxx, was not impressive. The first support person WAS RIGHT, L() and G() ARE unsupported functions because THEY DON’T WORK!

L(A:X) + 2*G(A) – B = 0

Entering 5 for X, SHOULD return 10 for B. Actual result is B=5. My Black-Scholes formulas return nonsense values for CALLV and PUTV.

Bottom line: Don’t expect to be able to use L() and G() on the NEW HP17BII+’s.

Bob Wang

Re: L() and G() unsupported on NEW HP17BII+ (Long)

*Message #2 Posted by **hugh steers** on 11 Jan 2005, 4:47 p.m.,*
in response to message #1 by Bob Wang

should be 15?

Re: L() and G() unsupported on NEW HP17BII+ (Long)

*Message #3 Posted by **Nick Nicholas** on 11 Jan 2005, 8:58 p.m.,*
in response to message #1 by Bob Wang

Thanks for posting your experiences with HP. I find it strange that HP is claiming these features are undocumented when the Technical Applications manual clearly explains the use of these features.
