I agree that RPL, as generally employed by the experts, is hard to read. It is also hard to remember what you were doing in a particular fit of impenetrable stack manipulation two weeks after you wrote it. However, I'd like to point out that Arnaud's approach uses at most four levels of the unlimited RPL stack. If you use his translation of OVER as RCL Y and ROT as RCL Z, then you have exactly the same set of manipulations you would have on an RPN stack! Assuming you had an RPN calc that could do symbolic math, a comparison might be as follows:

```
RPL             RPN
=======================
F               F
G               G
-               -
DUP             ENTER^
'X'             'X'
0               0
ROOT            XEQ 'ROOT'
OVER            RCL Y
'X'             'X'
3               3
ROOT            XEQ 'ROOT'
ROT             RCL Z
'X'             'X'
S               XEQ S
```

I naturally lean toward HP-41 syntax in my pseudo-RPN. 8)

My point is that keeping track of stack levels on an RPN calc can be troublesome, too. RPL is inherently worse for three reasons, IMHO. First, going over four stack levels is evil if you want to have any clarity in your code at all. Second, the RPL models have a richer set of program control structures, and frequently more than one of a particular kind. This allows RPL code to be more convoluted, more readily than RPN. Finally, the RPL calcs are more advanced than their RPN progenitors. This means that stuff you store on the stack can have an arbitrary amount of internal structure, further obscuring what a particular operation does. For instance subtraction in the example code composes a symbolic expression of the difference of two functions of X, not a simple

arithmetic difference.

A fourth reason RPL is harder to read is not due to anything inherent in the language. It's the culture of RPL programmers who code it without regard for readibility. You can name your variables in RPL, at the expense of some efficiency, and reduce your dependence on the stack. You can code with comments and nice indentation in a PC file. Unfortunately, both niceties are lost when the text is transferred to the calculator. This would lead me on to a further rant about the usability of the HP-48 as a software development platform, except that I'd rather not root around in that can of worms right now. 8)

Regards,
Howard

Yes, with an RPN model, there are only four stack registers to keep track of, but things can be "pushed off" of the top of the stack, and the content of the t register is propagated downward as things are removed from the bottom (the stack can never be empty). This may seem very intuitive to RPN programmers, but for someone who first learned RPL, these are "gotchas". Of course, in RPN there are also the Last X and storage registers that may be utilized, in which case the user has to keep track of those too, and a GSB may be used to call a subroutine, or a GTO to jump anywhere, so those have to be kept track of.

> Quote:
>
> First, going over four stack levels is evil if you want to have any clarity in your code at all.

Why exactly four stack levels for the maximum? Should we also impose an arbitrary maximum for the number of storage registers or variables to be used? Or how deeply program structures or parentheses can be nested?

It's a matter of how easy it is for the individual programmer to "see" the stack in his head. The high levels can often be regarded as objects that are set aside for a while, until the user gets back to them. Sometimes a large group of objects with a count are treated as a "meta-object", as when a list or array is "exploded" onto the stack, or as preparation in making a list or array.

> Quote:
>
> Second, the RPL models have a richer set of program control structures, and frequently more than one of a particular kind. This allows RPL code to be more convoluted, more readily than RPN.

I don't think that "convoluted" is quite the right word. A program structure can never begin in one program structure clause and continue or end outside of that clause. "Overlapping" structures aren't permitted; any structure has to be entirely within the same clause of any "outer" structure. You can indeed "nest" program structures as deeply as you like (available memory allowing), but you can never "jump" out of a program structure clause early. You can also call programs by name, and a program may even call another instance of itself, and execution of the calling program resumes when the called program is finished. A clause may be skipped over entirely, but execution always has to return to any "outer" clause being executed to finish it up. Well, exceptions being when the structure is within a IFERR clause and an error occurs, in which case, the return stack is discarded back to the IFERR structure's marker, and execution resumes with the IFERR's THEN clause, and when execution is abandoned entirely due to an error. The compilers enforce the rules, returning an "Invalid Syntax" error if you don't stick to the rules.

An RPL subroutine is a quoted procedure already placed on the stack earlier in the program, or a local or global variable, instead of being jumped to with a GOSUB, as in many other languages.

Internally, RPL keeps track of where execution is to resume with a separate return stack. Indeed, the built-in commands (actually special SysRPL programs) use both stacks heavily. Like the data stack, the return stack has variable depth, limited only by available memory. In SysRPL, the programmer has some commands to work with the return stack, but in UserRPL, the user utilizes the return stack with program structures and calls to variables, and may not even be aware of its existence.

Execution can be suspended with the HALT command (or PROMPT or in the debugger, for examples), in which case the "suspended" program is kept in memory, ready to be resumed with the current data stack by CONT or a single-step operation, or abandoned with KILL.

With RPN's GTO, one could develop "spaghetti code". I suppose that RPL's program structures are intended to prevent developers from writing such truly "convoluted" code. Some sort of GOTO or BREAK would indeed be handy in RPL, but offhand, it seems to me that it would have to be restricted to "jumps" within the same structure clause, and perhaps to only "forward" jumps, and a GOTO would require a label or line number, neither of which RPL has. I'm not against GOTO, but it can be used to make very complicated code.

> Quote:

This means that stuff you store on the stack can have an arbitrary amount of internal structure, further obscuring what a particular operation does. For instance subtraction in the example code composes a symbolic expression of the difference of two functions of X, not a simple arithmetic difference.

Well, whether subtraction returns a number or an algebraic object depends on what the arguments were, and the state of system flags for the modes.

But indeed, there are various object types, and a single object may be a list or program (or other composite) which may itself contain any other objects. An algebraic object is very similar to a program object, but is more restricted; it's contents must be logically equivalent to a valid (for the calculator) algebraic expression. Arrays aren't composite, as they don't hold objects complete in themselves, but they might be thought of as containing (among other information) "object bodies".

> Quote:
>
> A fourth reason RPL is harder to read is not due to anything inherent in the language. It's the culture of RPL programmers who code it without regard for readibility.

There's some truth to this. What may be obvious to

the programmer may be very obscure to others, particularly to beginners. A public discussion among "experts" may well be impenetrable to those who don't have the knowledge required to understand it. When answering a question, it may be difficult to guess how much the person asking already knows, and tailor the response appropriately.

Some will just post a compiled program or library on hpcalc.org for example, without bothering to include source code or explain how it works internally. Presumably, these are meant to be "useful" rather then "educational". Of course, others may decompile it back to source code if they know how, and nothing can document the code as accurately as the code itself, although it may indeed be very difficult to understand without comments or at least the original source code.

In "challenges", the object is usually to develop the smallest or fastest program to accomplish a desired objective, so obscure "tricks" are often used without any regard for readability or explanation of just why it works.

> Quote:
>
> You can code with comments and nice indentation in a PC file.

And in the command line editor, for that matter.

> Quote:
>
> Unfortunately, both niceties are lost when the text is transferred to the calculator.

As you probably know, these niceties are discarded because source code is compiled to an object (or objects). Compiling discards all source code delimiters, comments, separators, and indeed even the source code "words" are replaced in most cases. Every object begins with a prologue (actually, a prologue address), a location pointer to the system code (the actual prologue) that tells the system what type of object it is, how to handle it, and how to find its end. That said, as implemented so far, the end of any composite object is delimited with an object pointer to the system's primitive code object SEMI.

RPL source code is largely "free form", except that a Line Feed code (but not other separators) ends any comment (which can also be ended with another "@" character). A comment also functions as a separator. Separators (or series of separators) are otherwise logically equivalent. One could use a separate line for

every "word" or comment, with indenting optional, or could make the entire source code a single line, as long as it doesn't contain a character string with an embedded Line Feed code. Even a Line Feed within a string in a source code file may be written as the character translation sequence \010, as long as translation mode 2 or 3 is used.

Programmers use a variety of styles for their source code. There's no one "right" way to do it; it's rather a matter of what the programmer considers readable. The calculators' command line editor decompilers choose to start an indented new line for every structure word or embedded program, but then continue the line up to the display width and start subsequent lines at the left margin until the next structure word, presumably to fit more information into the calculator's limited display area while still giving some idea of the structure. Sometimes source code is posted online exactly as the calculator decompiles it, or the poster writes it on the PC and doesn't bother formatting it for easy readability.

On a calculator, I mostly follow the decompiler's example, except that I usually put any structure word or program delimiter on its own line, except for putting the index name on the same line as FOR. In a source code file on the PC, I tend to use "multi-line" source code and indent the contents of a clause for the entire clause, but sometimes put a short program structure or subprogram on a single line. I tend to put things that seem to logically go together, such as arguments and the operator, on the same line, if I don't want separate comments for them. Just how I format and comment source code depends on who I intend to have read it. For my own use, I may well consider the source code to be self-documenting with no or very little need for comments. For posting online, I may well go to the trouble of extensive commenting. For projects that seem as if they're going to be complicated, I sometimes write comments as an outline before writing any source code.

If you really want to preserve your nice indentation and comments, you can write the source code within a character string. That way the calculator compiles it to a character string object, preserving the source code as written (or in the case of a "text" transfer, optionally "as translated").

You can't very well have an unescaped " within a quoted-delimited string, but a counted string form may be used for this. NUL marks the end of the command line, so the calculators (mostly) prevent an actual NUL from being used within the command line. For the 49 series, within a quote-delimited string, \00 can be used instead of NUL, \" is used for

", and \\ is used for \. The 49 series still compiles counted strings exactly as the 48 series does, but never decompiles to the counted string form, instead using the new "escaped" forms for decompiling NUL, ", and \. Note that 49G ROM versions prior to 1.19-6 incorrectly compile the \00 to 00 instead of NUL. Within a quote-delimited string, all characters except (on the 49 series) the \00, \", and \\ sequences and \ are treated as literal. Within a counted string, all characters are treated as literal. Note that Conn4x has its own rules for these characters, and can be "confused" by a \ character outside of a quote-delimited string, mistaking it for the beginning of a character translation sequence.

To "execute" the source code string, put it on the stack and execute STR\-> or OBJ\->, which compiles it to an object. If it's a "quoted" object, for example with program delimiters, you'll need to use EVAL to pop it off the stack and actually execute its contents. For convenient viewing on a calculator, you'd probably want to adjust the style to fit the display, without any horizontal scrolling to see a whole line.

So why is source code compiled? I suppose for one thing, the compiled object nearly always uses less memory than the source code. Then too, at run-time, the calculator doesn't have to parse stored code from a form that's easy for a human to read to a form that's easier for the system to execute. For source code in the command line, compiling is a step in the execution sequence. To be sure, the calculator does have to decompile objects for display, \->STR. printing, and text transfers.

The developers also probably expected the users to be writing mostly short programs, and perhaps calling other short programs by name. Having a set of "utility" programs for other programs to call may indeed make sense, but that introduces a dependency tree; purging a program or changing what it uses for arguments or what it returns affects anything else that calls it, directly or indirectly. For an online example, any program that the example depends on has to be included (or at least its inputs and outputs described) for the source code to make sense to others.

RPL is indeed somewhat "different" from classic RPN. It uses a variable depth stack instead of a 4-register stack, execution control is restricted to "program structures" instead of jumping just anywhere with GTO, and they have various other differences.

What I can't see is that RPL is necessarily "complicated" to use.

Regards,
James

Arnaud,

you just proved that you got lost:

> Quote:
>
> Note the this example uses a maximum of 4 stack levels

Here is the Problem:

> Quote:
>
> ```
> OVER              @Stack is 3:'F-G'
> 2:Root1 1:'F-G'
> 'X' 3 ROOT        @Stack is 3:'F-G'
> 2:Root1 1:Root2
> ```

Just before the command ROOT is executed, the stack holds the following items:

```
5:'F-G'
4:Root1
3:'F-G'
2:'X'
1:3
```

It's not a problem of your code because the RPL stack has enough levels, but your reasoning that 4 levels were sufficient is certainly wrong.

Marcus

Oops! That renders my RPN translation invalid too.

I suppose Arnaud can be forgiven for missing a 4-item stack limit. His platform doesn't enforce such a limit. I on the other hand have no such excuse.

On the other hand, missing the stack overflow *doesn't* invalidate my main point, which is that RPN and RPL really are similar at a certain level. Many common RPL stack manipulations have direct RPN equivilants.

Oops!!!

As I said above, I NEVER argued that RPN was straightforward and that quickly keeping stack diagram become necessary. But I also keep stack diagrams in RPN (maybe a bad habit I got from RPL)

Arnaud

in response to message #84 by Karl Schneider

Karl,

> Quote:
>
> Your first indented multi-line RPL program is indeed clearer that the one-liner, in my view. Of course, the Fortran '77 program can also be written using multiple lines (and would have to be, if there were an ELSE clause):
>
> ```
> IF (A .LT. B)  THEN
>   A = A + 360.0
> ENDIF
> ```

And that's clearer to me than the Fortran '77 one-liner.

> Quote:
>
> Now, James, would you care to try my RPL challenge

> from last year, and provide a solution different from those posted by Arnaud Amiel and Raymond Del Tondo? I'd like to see an RPL program that makes sense to non-RPL'ers as to what exactly is taking place. The structure of the HP-71B solution posted by Valentin was evident, I think, even to those who are not familiar with that machine but have learned any high-level data-oriented language.

I thought the examples posted before demonstrated that RPL was easiest to understand, but why not?

First off, the way you described the challenge isn't entirely clear to me. Should the two expression be defined separately, and should they be "user-defined functions"? I chose to combine them into one expression. Also, should there be three separate programs, one that finds the lower limit, one that finds the upper limit, and finally one that calls the other two and finds the area, or should it all be combined into a single program? I chose the single program,

An assumption: It's already known that there's exactly one intersection point between X=0 and X=1, there's exactly one intersection point between X=2 and X=3, and there are no intersection points between these two. This can be verified easily enough by plotting.

My examples are slightly "unfriendly" in that they purge global variables named 'X' and 'IERR' without restoring the originals. I don't like to do that, but in this case, restoring them would be more likely to mislead the user than to be useful.

They are "friendly" in that they follow good practice and restore modes that they may change, and also, they label the results. They also show the "Error of integration", an estimate of how far the result may differ from the true value. Commenting may well be to a ridiculous degree, but that's for the benefit of those who are less familiar with RPL.

In case anyone wants to try them out, copy the source code (starting with the Kermit ASCII transfer headers) to files, and simply transfer the files to any 48/49 series calculator. They should still work on the 49 series if you download them in approximate load, but the results from the BYTES command will be different.

For all models, both programs return the following:

```
In 6 FIX mode:

X lower: 0.343717
X upper: 2.696175
   Area: 3.110575
Err Int: 0.000003

In STD mode:

    X lower: .343717423063
    X upper: 2.69617505788
       Area: 3.11057476957
Err Int: 3.11076465583E-11
```

This first program doesn't use local variables. It uses only a few stack levels, so it's easy to see where everything is.

```

  { X IERR } PURGE               @ Clean up global
variables.
  5 ROLL                         @ Original flags.
  STOF                           @ Restore flags.
\>>                              @ End program.
```

On the 49 series, "3 PICK" could be replaced with "PICK3".

Some approximate timings, in seconds:

```
Model   6 FIX mode      STD mode

48SX    12.72           20.54
48GX     8.84           13.20
49G     15.98           26.45
49g+     6.80           11.52
```

Some interesting things about the timings:

- As should be expected because its processor speed is higher, the 48GX is faster than the 48SX.
- The 49G is even slower than the 48SX. Maybe this is because of the CAS? Well, that's progress.
- The 49g+ is fastest, but not by as much as might be expected; remember that the Saturn processor is emulated (simulated?) in firmware.

This second program doesn't use any stack manipulation commands at all, using local variables instead. But I didn't attempt to restrict the stack use to any particular number of levels, so it wouldn't work

with a 4-level stack.

    f                               @ Original flags
    STOF                            @ Restore flags.
  \>>                               @ Abandon local
environment.
\>>                                 @ End Program.
```

Some approximate timings, in seconds:

Model	6 FIX mode	STD mode
48SX	12.76	20.58
48GX	8.95	13.32
49G	16.04	26.51
49g+	6.81	11.50

This program is slightly slower than the first program in most cases, but actually slightly faster for the 49g+ in STD mode.

Regards,

James

[RPL challenge] Thank you...

in response to message #95 by James M. Prange (Michigan)

...James and Howard for your responses.

James Prange's documented programs and benchmarking were quite an endeavor, and should be recognized. I did find the second one (with minimal stack manipulation) easier to follow.

Howard Owen's program is a bit closer to what I was looking for -- a concise but "followable" method of obtaining the answer.

I'll try both after I figure out what the "\" is representing...

Regards,

-- KS

in response to message #96 by Karl Schneider

That's how the HP-48G renders "special" characters when programs are translated to ASCII. The most common ones are:

```
  ASCII     48G character
-------------------------------------------------
-----------------
  \<<       The "start program" sigil. It looks
like "<<" but it's one character.
  \>>       The "end program" sigil. As above.
  \->       The arrow operator. You see it alone
marking a local variable
            list. It also shows up in things like
"\->LIST",
            (the to list" operator) and "LIST\->"
(the "from list"
            operator.)
```

There are others, Like \=/ is the "not equal" sign, I believe.

I used the escape symbol inconsistently in my example, whereas James was consistent throughout his. Although my solution may have been more succinct, I will look back on his for coding examples!

Regards,
Howard

*Message #98 Posted by **James M. Prange (Michigan)** on 21 Nov 2005, 10:31 a.m.,*
in response to message #96 by Karl Schneider

> Quote:
>
> I'll try both after I figure out what the "\" is representing...

Actually, if you paste the source code, beginning with the

```
%%HP: T(3)A(D)F(.);
```

Kermit ASCII transfer header, to a file and download the file to your calculator, then the calculator (or Conn4x, if you use that) will know what they represent.

The header also specifies the unit for angular values in vectors and complex numbers in CYLIN and SPHERE modes, and how the period and comma characters should be compiled.

As Howard noted, the "\" represents the beginning of a translation sequence for certain "special" characters; more specifically, for non-ASCII characters, and the ASCII character "\" itself would be represented as "\\". These are often referred to as "backslash digraph" or "trigraph" codes. With translation mode 3, the decompiled (source code string) form of an object is "translated" to "pure ASCII" code for transfer to the PC. If you do much writing of calculator source code in text files on the PC, then you'll probably soon memorize the ones that you use frequently.

An alternative is to use an editor that uses a special character set matching the calculator's, and presents you with a pick-table of characters, or even a pick-table of commands, but I find it easiest to just type in the translation sequences.

I suppose that one could memorize how the non-ASCII characters map between the calculator's and text editor's character sets, memorize their numeric values, and type them in with the Alt numeric keypad method. Or one could have the character set tables at hand for reference, instead of memorizing them. I'd rather not even attempt this.

If one were to use non-ASCII characters literally in a source code file, then it would be a problem posting them online, although I've seen this done. It's unlikely that the reader would be using the same character set for these, and MS Windows (or the newsreader or other internet software?) seems to apply some translations of its own. With "pure US ASCII" code, it's a good bet that anyone else will see the same thing.

"\<<" and "\>>" represent the characters for the UserRPL program delimiters, "\->" the "right arrow" character, and "\.S" the character for the integrate command.

I use these, first off, because it's easier for me to type these characters in source code as mode 3 translations, and second, because it makes it easier for others to download the source code to a calculator with no need for "fixing up" these characters.

I believe you have a 48G series? For this model, the character translations are described in the User's Guide; see pages 27-15 and 27-16. For the 48S series, see the single-volume Owner's Manual pages 33-6 and 33-7 or the two-volume Owner's Manual pages 626 and 627. Unless it's in the new AUR, the 49 series documentation seems to lack this information, see http://holyjoe.net/hp/tiotable.png for codes 128-255.

There are 4 translation modes, set with the TRANSIO command or by editing the last element of the reserved variable IOPAR. For the 49 series, note that the numbers in IOPAR and PRTPAR must be "real numbers", not "exact integers". Mode 0 doesn't translate anything. Mode 1 translates Line Feed codes (used as "New Line" codes on the calculator). Mode 2 adds translation of non-ECMA 94 codes 128-159 and \ itself, and for transfers back to the calculator, \nnn codes \000-\159. Mode 3 adds translation of the rest of the non-ASCII codes (160-255), and for transfers back to the calculator, can use all \nnn codes \000-\255.

For generating a character string that shows the translations for non-ASCII characters in the current translation mode on a calculator, you could try one of these UserRPL programs. The "binary" values will be in the current mode, BIN, OCT, DEC, or HEX. "\010" represents a string containing the Line Feed (New Line) character.

Approximate timings, in seconds:

```
48SX: 23.45
48GX: 16.87
49G:  17.26
49g+:  6.25
```

Be sure to choose the right program for your model. The wrong address for SYSEVAL is likely to be disastrous!

\>>
```

If the 48 series was in BIN mode while generating the string, then you'll have to scroll right to see the end of the translation sequence for characters converted to the \nnn form, but nnn will be the same as the decimal value anyway.

Viewing the string in the 48 series' command line editor seems annoyingly slow.

Once generated, the string could be stored in a variable.

Of course, the above programs are optimized for size and speed, not for readability. I used KVIS, which the calculators use for printing "via wire", but I could as well have used KVISLF. which the calculators use for Kermit ASCII transfers. The program goes back to when the 48SX was current, and I really don't recall why I wrote it exactly as I did, but it works.

The documentation is wrong about control code <LF>. <LF> is translated to a <CR><LF> pair, not to a <LF><CR> pair. Here <LF> means Life Feed, ASCII 10 (decimal), and <CR> means Carriage Return, ASCII 13.

What's more, the Kermit translation is buggy for <CR><LF>. Although <LF> is translated to Kermit's canonic <CR><LF> line termination string, a <CR><LF> pair is left as is instead of being translated to <CR><CR><LF>. That is, both <LF> and <CR><LF> are sent to the PC as <CR><LF>, and when sent back to the calculator, both are translated to <LF>. Of course, text editors may change the "end-of-line" codes too. To make these unambiguous in a character string in a text file, you can use \010 for <LF> and \013 for <CR>. This isn't a problem unless you really do, for whatever reason, want a <CR><LF> pair within a character string on the calculator. As far as I've been able to determine, this is the only bug in the Kermit translations.

With Kermit, for transfers to a calculator, a \ that isn't the beginning of a valid translation sequence is left as is. For that matter, anything that isn't a valid translation sequence is left as is.

An additional consideration on the 49 series is that NUL (ASCII control code 0, the "null character"), ", and \ within a character string are decompiled to \00, \", and \\, so after the Kermit translation, show up in the file as \\00, \\", and \\\\. But Conn4x handles these differently; see the Conn4x Help for the differences, and for information on how it translates between global variable names and MS Windows file names.

Also note that with 49G ROM revisions prior to 1.19-6, \00 within a source code character string is incorrectly compiled to 00 instead of to NUL.

The 49 series compiler simply discards a \ within in a character string if it isn't immediately followed by 00, ", or another \.

Conn4x doesn't use the calculators' built-in translation routines, instead doing the translations in the Conn4x application on the PC. It doesn't have Kermit's problem with <CR><LF>, and optionally translates ASCII control codes 0-9, 11-31, and 127 to \nnn sequences, but apparently in attempting to "simplify" the translations of the decompiler's \00, \", and \\, it introduces a new bug. Outside of a quote-

delimited string, Conn4x leaves \ as is, instead of translating it to \\. For transfers back to the calculator, Conn4x may mistake an untranslated \ for the beginning of a valid translation sequence. To work around this bug, change any \ in the file that could be misinterpreted to \092, which Conn4x correctly translate back to \. Note that the 48 series use a counted string form for decompiling strings with an embedded ", and the \ could occur in these, and \ is perfectly valid in a name.

To be sure, these bugs should rarely be a problem, but they've all "bitten" me.

<plug> You could also see my "ASCII on SD" programs for converting between a compiled object and a decompiled (and optionally translated) source code string on a 49 series. Converting a commented source code string returns both a translated but still commented source code string and the compiled object. They're available here. These are intended for the 49g+ specifically, and wouldn't work on the 48 series as written. I prefer to use the card and these programs for the 49g+ instead of using Conn4x. </plug>

Regards,
James

Are you serious ?

*Message #99 Posted by **Valentin Albillo** on 21 Nov 2005, 4:51 a.m.,*
in response to message #95 by James M. Prange (Michigan)

Hi, James:

James posted:

"I thought the examples posted before demonstrated that RPL was easiest to understand, but why not ?"

Are you serious ?

"This first program doesn't use local variables. It uses only a few stack levels, so it's easy to see where everything is.

```
[...] DUP2 [...] 3 PICK  3 PICK [...] DUP2 6 ROLL 6
ROLL
[...] ROT [...] ROT [...] ROT [...] 5 ROLL [...]
"
```

Again, are you serious ?

"This second program doesn't use any stack manipulation commands at all, using local variables instead."

```
<< RCLF 'SIN(X)-((X-1.5)^2-1)'  0   0   0   \->
f  b  l  u   a  <<  RAD  -3 SF  b  'X'  {1 0}  ROOT
'l'
STO   b  'X' {2 3}  ROOT  'u' STO  l  u  b  'X'  \.S
'a' STO  l  "X lower" \->TAG  u  "X upper" \->TAG
a  "Area" \->TAG  IERR  "Err Int" \->TAG  { X IERR }
```

```
PURGE
f   STOF  \>>  \>>
```

So, even without using obfuscating stack manipulations, are you suggesting that that load of gibberish above is clearer than:

```
 10 DEF FNF(X) = SIN(X) - (X-1.5)^2 + 1
 20 PRINT INTEGRAL( FNROOT(0,1, FNF(FVAR)),
FNROOT(2,3, FNF(FVAR)), 1E-5, FNF(IVAR))
```

which essentially is:

```
 Define  f(x) = Sin(x)-(x-1.5)2 +1
 Print   Integral( Root(0,1, f(x)), Root(2,3,
f(x)), precision, f(x))
```

so that your non-stack-based RPL version is equally clear or even clearer to a non-RPL (or even RPL) programmer than the one for the 71B ? (notice that it *doesn't even use variables at all*, local or not, except for the dummy, placeholder variable in the definition of f(x) itself).

If you're stating this and you're serious, then it's clear to me we have significant differences about what "clarity" means, to the point that mutual understanding seems not possible.

Best regards from V.

Edited: 21 Nov 2005, 5:40 a.m.

Re: Are you serious ?

*Message #100 Posted by **James M. Prange (Michigan)** on 21 Nov 2005, 5:06 p.m.,*
in response to message #99 by Valentin Albillo

Yes, I am indeed quite serious. As for why, I suppose first because my examples use postfix notation, which I'm accustomed to using on a calculator, and second, because I'm used to seeing a few stack levels in my mind. I suppose it depends on who's looking at the code, though.

I could simplify them by not restoring modes, returning the limits, labeling results, or cleaning up the global variables.

```
%%HP: T(3)A(D)F(.);
\<<                                  @ Begin Program.
  RAD                                @ Force radians
mode.
  -3 SF                              @ Force numerical
integration.
   6 FIX                             @ Force precision
for integration.
  'SIN(X)-((X-1.5)^2-1)'             @ Expression.
  'X'                                @ Global variable
name.
   DUP2                              @ Make copies.
  {1 0}                              @ Guesses for
lower limit.
  ROOT                               @ Find lower
limit.
  3 PICK                             @ Expression.
  3 PICK                             @ Global variable
name.
  {2 3}                              @ Guesses for
```

```
upper limit.
  ROOT                              @ Find upper
limit.
  4 ROLL                            @ Expression.
  4 ROLL                            @ Global variable
name.
  \.S                               @ Integrate.
\>>                                 @ End program.
```

Or using a local variable for the expression to avoid using any stack manipulations at all:

```
%%HP: T(3)A(D)F(.);
\<<                                 @ Begin program.
  'SIN(X)-((X-1.5)^2-1)'           @ Expression.
  \->                               @ bind local
variables.
  b                                 @ Expression.
  \<<                               @ begin defining
procedure for
                                    @ local
environment,
    RAD                             @ Force radians
mode.
    -3 SF                           @ Force numerical
integration.
    6 FIX                           @ Force precision
for integration.
    b                               @ Expression.
    'X'                             @ Global variable
name.
    {1 0}                           @ Guesses for
lower limit.
    ROOT                            @ Find lower
limit.
    b                               @ Expression.
    'X'                             @ Global variable
name.
    {2 3}                           @ Guesses for
upper limit.
    ROOT                            @ Find upper
limit.
    b                               @ Expression.

name.
    \.S                             @ Integrate.
  \>>                               @ Abandon local
environment.
\>>                                 @ End Program.
```

Consider your BASIC program:

```
10 DEF FNF(X) = SIN(X) - (X-1.5)^2 + 1
20 PRINT INTEGRAL( FNROOT(0,1, FNF(FVAR)),
FNROOT(2,3, FNF(FVAR)), 1E-5, FNF(IVAR))
```

Line 10 defines f(x) clearly enough.

In line 20, we're going to find the integral of something, with the arguments following. But the first argument isn't a number, it's another function,

```
FNROOT(0,1, FNF(FVAR))
```

with the arguments following again, apparently 2 guesses and then a nested function,

```
FNF(FVAR)
```

again with the argument following, What could the arcane-looking FVAR represent? Well, that more or less takes care of the first argument, and the second argument is like the first argument except with different guesses.

The third argument is simply a number for the precision.

The fourth argument looks like another function,

```
FNF(IVAR)
```

again with the argument following. What could IVAR mean, and how does it differ from FVAR?

Okay, now that I've muddled through the arguments, I can recall that they were supposed to be integrated.

Granted, part of my problem with all this is not being familair with the keywords, but are you seriously saying that all those nested parentheses are clearer than straight-forward postfix notation? If I found that clearer, then I'd probably be using the 49 series in ALG mode.

Regards,
James

Hi, James:

James posted:

"Consider your BASIC program: ..."

> Ok, let's.

"What could the arcane-looking FVAR represent?"

> **FNROOT** (FiNd ROOT) can call itself to solve a non-linear system of several unknowns. As such, you need a formal variable to stand for the particular variable you're solving for. You can't name it "X", say, because perhaps you're solving for "Y" or for "E7", say, and perhaps you already do have a local or global variable called "X".
>
> That being so, **FVAR** (Function VARiable) stands for the variable you're solving for.

"What could IVAR mean, and how does it differ from FVAR?"

> **INTEGRAL** (Integral) can call itself to compute a multiple integral over several variables. As such, you need a formal variable to stand for the particular variable you're integrating over. You can't name it "X", say, because perhaps you're integrating over "Y" or over "E7", say, and perhaps you already do have a local or global variable called "X".

That being so, **IVAR** (Integration VARiable) stands for the variable you're integrating over.

As you can Integrate a function being Solved or Solve a function being Integrated, their respective formal variables *must* differ, so that's why one is called FVAR, and the other, consistently enough, is called IVAR, so as not to get confused in an integral being solved, say.

"Granted, part of my problem with all this is not being familair with the keywords, but are you seriously saying that all those nested parentheses are clearer than straight-forward postfix notation?"

There's no such thing as *"straight-forward postfix notation"*, that's actually a contradiction of terms. That's why the vast majority of people find RPL "**R**e**P**e**L**ent" and wouldn't touch it with a ten-feet pole.

That being so in the mind of most people, *yes, I'm serious* when I state that all your code posted above, commented and optimized several times, in several flavors, is much less clearer that my one-and-only, uncommented, never optimized BASIC line, which I wrote down without even thinking about it for a moment, that automatic and straightforward the task at hand is.

Nay, it's too simple to be considered a *program*, I gave it a line number because the original challenge asked for a program, but actually it's an immediate command-line expresion, in the same league as 2+2, say.

And I notice that you refrained from commenting several key features of both solutions, probably because you were on the losing side, namely:

- My 71B BASIC version uses *no* local or global variables at all, so it's that much easier to set up and no chance for variable-related conflicts. No need to change or set up environments, etc.

- I notice in your code that you *"Force precision for integration."*, and that consists in changing the display mode. Now, why on earth should you have to do the wholly unrelated task of changing the display mode just in order to specify some precision for your integration process ? and with the side effect of changing the display mode to the user, no less ?

  If you want to specify a particular precision,

why, just do it, include the desired precision as a parameter to the integration process, which is just what my BASIC version does. Remember, we're talking about someone who's trying to fathom what the code does, and changing display modes instead of explicitly specifying a desired accuracy seems much more obscure, arbitrary, and less clean to me.

Anyway, entering this kind of threads is mostly a waste of time, because there's no way I (or anyone else) can convince *you* with arguments or examples, no matter how obvious or clear. If you, subjectively, find your code or RPL in general clearer, that's the way it's going to be to you, and nothing will change that.

Fine with me, to each his own. But then don't be surprised if you find that the vast majority doesn't agree with your concepts.

(Oh, and by the way, replicating the top register in classic 4-level RPN is **not** a bug or quirkiness or anything like that. It was done on purpose, by design, because thanks to that valuable **feature** *you can evaluate polynomials of arbitrary degree extremely efficiently* (Horner's rule), which you couldn't were it not for it. And, as you know, these advanced RPN calculators were originally designed for engineers by engineers, and at the time, real engineers found themselves evaluating polynomials constantly, and needed to do it fast, simply, and efficiently, even if they had a *non-programmable* model. That's why.)

Best regards from V.

*Message #102 Posted by **James M. Prange (Michigan)** on 23 Nov 2005, 8:33 p.m.,*
in response to message #101 by Valentin Albillo

Hi Valentin,

I really didn't want to get in a flame war over this. I perceived your posts as particularly hostile and responded in kind. I'm sorry that I didn't restrain myself.

I'm not claiming that RPL is perfect, it does have flaws and quirks. Even more so in the 49 series, although they did add some nice features there.

And I rather like BASIC too, but when the argument list has nested parentheses, it looks obfuscated to me.

Quote:

> **FNROOT** (FiNd ROOT) can call itself to solve a non-linear system of several unknowns. As such, you need a formal variable to stand for the particular variable you're solving for.

Agreed.

> Quote:
>
> You can't name it "X", say, because perhaps you're solving for "Y" or for "E7", say, and perhaps you already do have a local or global variable called "X".

Other than the problem of possibly overwriting a variable with the same name, I don't see any reason why whatever name I'm solving for couldn't be used. I've never particularly liked RPL's root-finding methods potentially overwriting a global variable, but it goes back to the RPL solver, where the user sees the variable names in the menu, and knows that they'll be used as global variable names. It has the advantage that the values will be persistent, (until purged or overwritten) and I don't see it as especially harmful.

> Quote:
>
> That being so, **FVAR** (Function VARiable) stands for the variable you're solving for.

I gather that FVAR represents the X in your FNF(X)? Sort of like a reserved variable in RPL?

> Quote:
>
> As you can Integrate a function being Solved or Solve a function being Integrated, their respective formal variables *must* differ, so that's why one is called FVAR, and the other, consistently enough, is called IVAR, so as not to get confused in an integral being solved, say.

You're saying that solving and integrating are occurring at the same time? Yes, I know within the same "outer" function, but in your program for example, I'd think that both limits must be completely solved before integration could proceed.

But whatever your 71B needs is fine with me. In

RPL, ROOT isn't a function, so couldn't be used in an algebraic form of the integral function even if I wanted to do so.

> Quote:

Isn't RPN (mostly) postfix too? How do the vast majority of people find that?

> Quote:

Good for you! I'm glad that you're so familiar with your calculator!

The comments are intended as a courtesy to anyone who doesn't immediately recognize the keywords, know the syntax of the commands, or has trouble picturing the stack. I certainly don't need them for myself.

Since some seem to have trouble seeing a stack of over four levels, I chose to write one program the way I prefer, using just the stack, and another using no stack commands, but local variables instead. Then, of course, you expressed your opinion, so I edited them down to simplified versions just for you.

Karl's "challenge" isn't very clear to me as posted, but I decided to have the program return more than was actually required, since it was already available, and tag the results.

I did have some problems. First off, I seldom integrate anything, so I had to look up the syntax for the integral function. I tried that out on the 48GX, and it worked just fine, I solve for roots and intersections often enough, but I normally use the solver for that, so I also had to look up the syntax for ROOT, and

that too worked fine on the 48GX. Okay, everything seemed clear enough, so I wrote the program in the text editor on the PC, commented it, and transferred it to the 49g+. But it didn't work. It gave me a "Bad Argument Type" error for the integral function. Looking over the program, everything seemed right. Well, sometimes the 49 series doesn't behave the same as the 48 series. Maybe because it was trying symbolic integration? So I stuck in the -3 SF, which didn't help, and I forgot to remove it. Maybe something else about that blasted CAS mucking things up? So I transferred it to the 48GX and tried it there, and it still didn't work. Double-checked the syntax for the integral function and single-stepped the program in the debugger. Sure enough, that's exactly where it failed, although the arguments on the stack sure looked right to me. Fooled around with the integral function by itself, and finally realized that although it works fine with real numbers for the limits, it fails with tagged real numbers there! Now that's really out of the ordinary; I don't think I've ever seen another case where a command didn't work correctly with a tagged argument. It sure seems like a bug to me. Well, that pretty well meant that there was no use tagging the limits until the integration was finished, so back to the text editor to rewrite the source code. This time, it worked perfectly on the first try on all of my 48 and 49 models. So I edited a copy to the version using local variables, and that worked perfectly the first time. When I edited copies down to the "special" versions, they worked the first time.

So are they "optimized several times"? Debugged and edited, yes, definitely, and I did look them over carefully before posting, but didn't see where I could improve them, so I wouldn't say "optimized" at all.

By the way, now that I've thought a bit more about that -3 SF, I tried taking it out and clearing flag -3, and find that it does serve a purpose after all. With the flag clear (Function -> symb), IERR is left as a name instead of its value being returned.

> Quote:
>
> Nay, it's too simple to be considered a *program*, I gave it a line number because the original challenge asked for a program, but actually it's an immediate command-line expression, in the same league as 2+2, say.

Well, my programs aren't quite as simple as 2+2, but interestingly enough, if I edit out the program delimiters, they'll run just fine from the command line too. The one without local variables could be just

keyed in one thing at a time too, but with the local variable, everything from the \-> to the \>> ending the defining procedure would have to be on the command line at the same time.

> Quote:
>
> And I notice that you refrained from commenting several key features of both solutions, probably because you were on the losing side, namely:

Key features? Actually, I didn't think the following were relevant.

> Quote:
>
> My 71B BASIC version uses *no* local or global variables at all, so it's that much easier to set up and no chance for variable-related conflicts. No need to change or set up environments, etc.

My programs do use the global variable X because the ROOT command and integral function on these models require that. I'm not ambitious enough to try to write my own versions of those. Come to think of it, the integral function use the global variable IERR too. So what? My "stack-based" program doesn't use any local variable either. In the program that does use local variables, there's no chance of a conflict because they're local and the defining procedure doesn't try to use anything else with those names.

What kind of variables are your FVAR and IVAR? Do your FNROOT and INTEGRAL functions use any other variables?

True, I do force modes. And as first written, the programs restord the original modes. Again, so what?

> Quote:
>
> I notice in your code that you *"Force precision for integration."*, and that consists in changing the display mode. Remember, we're talking about someone who's trying to fathom what the code does, and changing display modes instead of explicitly specifying a desired accuracy seems much more obscure, arbitrary, and less clean to me.

Now there's a point that I heartily agree with you on! Assuming any association between the current display mode and the desired accuracy is pure nonsense to me.

Interestingly, in the 28 series, the accuracy is a parameter for the integral function, and even the order of the parameters makes more sense to me. What ever possessed them to change this for the 48 series is beyond me.

Probably so.

Thank you for the history lesson; it does help me to understand how that came about. And yes, I do realize that back in those days, calculators were designed for "real world" use, not for students or gamers.

That use of "Horner's rule" rather sparked sparked my interest. These fancy calculators have rather spoiled me, but I do recall it as a method of factoring polynomials such as a+b*x+c*x^2+d*x^3+e*x^4 to the form a+x*(b+x*(c+x*(d+x*e))). That does eliminate all exponentiation, but converted to an RPN sequence is:

```
a x b x c x d x e * + * + * + * +
```

which couldn't even be used with a 4-register stack. Okay, I re-arranged it to (((e*x+d)*x+c)*x+b)*x+a. That's a little better; converted to an RPN sequence, this is:

```
e x * d + x * c + x * b + x * a +
```

so it would need only two registers. But to take advantage of the "replicate downward" feature, I want all of the x'es first. Okay, rearranged it to x*(x*(x*(x*e+d)+c)+b)+a, which converts to the RPN sequence:

```
x x x x e * d + * c + * b + * a +
```

which, with an infinite supply of x values available in the stack, would be considerably easier to key in, especially with a higher-degree polynomial.

I surmise that this, or something quite similar, was what they were using. Very neat, and even on an RPL model, might be easier than keying in the polynomial as an algebraic.

Just for a check, that last RPN sequence, after being executed and COLLECTed on a 49g+ with flag -114 set (Disp x+1 -> 1+x), shows up exactly as the expression that I started out with.

Regards,
James

RPL challenge & Horner's method

*Message #103 Posted by **Karl Schneider** on 24 Nov 2005, 12:56 a.m.,*
in response to message #102 by James M. Prange (Michigan)

Hello, James --

James Prange posted,

> Quote:

> Karl's "challenge" isn't very clear to me as posted...

And yet you were able to provide a working RPL-based solution that met my specifications, as did Arnaud Amiel and Raymond Del Tondo before you, and as did Valentin for HP-71B BASIC. I take some mild umbrage at the suggestion that I didn't describe the task clearly.

However, *lack of specificity in every detail does not equate to lack of clarity.* The task was simply to prepare an RPL-based program that would automatically and correctly calculate three numerical answers: the two limits of integration and the area over those limits. Purposely, no other requirements were imposed; the approach was left to the user's discretion. I even provided working RPN-based code and the correct answers.

>
> *lengthy narrative describing an application of Horner's Method snipped...*

Well, upon re-reading of your narrative, it seems that you did, in fact, understand the point. But, I'd already submitted my write-up:

Horner's Method was described in the HP-15C manual, and probably others that preceded it. The idea is that the polynomial

$f(x) = a_n(x^n) + a_{n-1}(x^{n-1}) + a_{n-2}(x^{n-2}) + ... + a_0$

is to be factored into terms based on addition of each coefficient a_k, and subsequent multiplication by the variable x, in order to avoid use of computationally-slow exponentials.

To do this on an HP RPN-based calculator, arrange the polynomial in descending order of terms, and load the stack with values of x, so that x can be replicated infinitely in the t-register.

For example, to evaluate

$f(x) = 5x^4 + 2x^3 - x^2 + 7$ at x = -2.0:

```
2
[+/-]
[ENTER]
[ENTER]
[ENTER]
5
*           5x
2
+           5x + 2
*           5x^2 + 2x
1
-           5x^2 + 2x - 1
*           5x^3 + 2x^2 - x
*           5x^4 + 2x^3 - x^2
7
+           5x^4 + 2x^3 - x^2 + 7
```

Answer: 67.0

Horner's method is noticeably faster on an older RPN calc. I even employed it for a Fortran mainframe program in the 1980's that required calculation of a low (5th?)-order polynomial at thousands of data points. This might not have *substantially* reduced the computational burden, if the object code for the power function "**" performed a multiplication-loop (instead of

logarithms and e^x) for small positive-integer exponents. However, Horner's Method would still require fewer operations.

Okay, I'm quite willing to take any blame for not immediately understanding exactly what you expected. Perhaps part of my confusion was because you seemed to be asking for the

limits to be returned, yet solutions deemed correct, although they do find the limits for use in finding the integral, do not seem to return the limits used.

> Quote:
>
> Hmm... maybe it was a real challenge after all! :-)

Indeed, more than it should've been.

> Quote:
>
> Well, upon re-reading of your narrative, it seems that you did, in fact, understand the point. But, I'd already submitted my write-up:

Okay, I don't always read posts (or documentation) that don't seem to be relevant to models that I actually own or expect to own in the future.

However, Horner's Method would still require fewer operations.

Indeed, depending on how the power function is implemented in a particular language, I expect that Horner's method can be an advantage.

Some languages, for example, Saturn assembler for the RPL models, don't even provide a power function. In assembler, if I wanted to implement a power funtion, I'd either have to iterate multiplication, or else call an RPL routine. Offhand, if I chose to work with a polynomial in assembler, Horner's method offers a way to avoid using up the limited

number of processor registers.

My conclusion is that when working with polynomials, Horner's method is well worth considering.

*Message #106 Posted by **Valentin Albillo** on 24 Nov 2005, 7:06 a.m.,*
in response to message #102 by James M. Prange (Michigan)

Hi, James:

James wrote:

"I really didn't want to get in a flame war over this. I perceived your posts as particularly hostile and responded in kind."

> Nah, no hostility at all, it's just that my attitude is easily interpreted as 'hostile', while the proper adjective would be 'intense' or perhaps 'passionate'. But don't get me wrong, frequent posters here do know that this is just a problem in understanding my attitude, not a problematic attitude on my part; in other words, I may bark but I mean no harm and usually don't resort to name calling, most specially with polite and educated posters like yourself.

"Other than the problem of possibly overwriting a

variable with the same name, I don't see any reason why whatever name I'm solving for couldn't be used."

> It has to do with nesting. Both FNROOT and INTEGRAL can be nested, i.e., an FNROOT can solve a function which itself calls FNROOT, and INTEGRAL can integrate a function which itself calls INTEGRAL, and further FNROOT can solve INTEGRALs and INTEGRAL can integrate FNROOTs.
>
> That being so, were you to use a normal variable, say "X", that "X" would have different meanings and would hold different values depending on the level of nesting where it was used. That cannot be accomodated with a single, normal user variable, which is a unique location in memory, while FVAR is actually a *keyword* which holds the value of your solved or integrated variable at any and *all* levels of nesting, transparently to the user.
>
> So, if you were to single-step your function while being solved or integrated by a nested call, you'd see that FVAR isn't the same value from one level of nesting to another, while the keyword (i.e.: formal variable in this case) is one and the same to you: FVAR.

"I gather that FVAR represents the X in your FNF(X)? Sort of like a reserved variable in RPL? "

> That's correct, FVAR is the X in FNF(X), the Y in FNF(Y), in other words, the formal variable. But internally it's not a variable but a keyword which holds a set of values, one for each level of nesting. I don't know if that corresponds to a reserved variable in RPL but seems unlikely.

"You're saying that solving and integrating are occurring at the same time?"

> Why, yes. In Karl's particular example, that's *not* the case, you're actually integrating a function which isn't being solved, the solving procedure is only performed twice to compute the limits of integration and it's completely over before the integration process proper starts.

But have a look at this example (already published at this Forum as part of a Test Suite for advanced HP models, search the archives for "Turtle and Hare"), where you're solving for a root of a function that itself is an integral of an implicit function (!), i.e.: you're Solving an Integral whose integrand requires Solve:

```
    Test 7: Solving a definite
integral of an implicit function

                                    /X
                                    |
      Find X in [0,1] such that     |
y(x).dx = 1/3,
                                    |
                                   /0
      where y(x) is the implicit
function defined by:

                y^5 + y = x

       using a precision of 1E-3 for
the integral. HP-71B code:

            FNROOT(0,1, INTEGRAL(0,
FVAR,1E-3, FNROOT(0,1, FVAR^5+FVAR-
IVAR))-1/3)

       gives 0.854136725005
(precision = 1E-3)
          or 0.854138746461
(precision = 1E-6)
```

As you may see, solving and integrating are absolutely intertwined in this example. You can also see that the first FVAR appearing in that expression corresponds to the variable being solved by the outer FNROOT, while the 2nd and 3rd FVAR correspond to the variable being solved by the inner FNROOT. You wouldn't be able to do that using a regular, user variable like 'X', say, because in this case both 'X' would have different meanings. Of cousrse, IVAR is the formal integration variable and you can see as well that it has to be different from FVAR because they refer to wholly unrelated values.

By the way, the above expression is a command-line expression, not a program, and uses no local/global variables at all, flags, modes, or whatever. So, it will work as-is, no need to change modes, be aware of the status of some flags, or keep care that you don't overwrite some variable.

"Isn't RPN (mostly) postfix too? How do the vast majority of people find that?"

> Repelent, of course. The difference is that while most people find RPN repelent except those few that do like it, RPL is found repelent almost universally, even among RPN fans.
>
> As for prefix-postfix, RPN is indeed postfix for all the parts that need to be postfix, namely mathematical operations. Utility operations such as changing flags, modes, or storing/recalling numbers which have no mathematical nature have no reason to be postfix and they aren't.
>
> To make them postfix as well is perverting the original intent of the elegant RPN's postfix notation, cluttering up the stack with all kinds of non-mathematical 'operands' and 'arguments' which are nothing but control parameters which don't belong in the stack to begin with. Doing that, in the name of 'consistency', only results in unnatural, unreadable code, unnecessary and constant growth and shrinking of the stack, and redundant stack manipulations, throwing out the window the innately elegant paradigm so well served by classic RPN.

"Good for you! I'm glad that you're so familiar with your calculator!"

> James, please ... there's no need to be 'so familiar' with my calculator to write down:
>
> ```
>     Print Integrate( FindLimit1, FindLimit2, Precision, Function )
> ```
>
> I can do it in my dreams, and you probably could, too !! Does it actually feel so difficult or unfathomable to you !?

"So are they "optimized several times"? Debugged and edited, yes, definitely, and I did look them over carefully before posting, but didn't see where I could improve them, so I wouldn't say "optimized" at all."

> As you wish. On the other hand, I simply wrote down my expression immediately, never gave it a second thought nor did I have to remember any syntax or whatever as it's so obvious. And of course, it ran first time, no complaints, quirks, special modes, or bugs.

"What kind of variables are your FVAR and IVAR? Do your FNROOT and INTEGRAL

functions use any other variables?"

> That's been fully answered above and no, no other 'variables' are used. As FVAR and IVAR aren't actually variables but keywords that stand for formal variables and transparently take care of the different values at different levels of nesting, the inescapable conclusion is that my version uses no variables, at all.

"True, I do force modes. And as first written, the programs restord the original modes. Again, so what?"

> James, please, be serious. If I point out some illogical and undesirable effect in your proceedings and you come and say "True, but so what ?" you'll merely reinforce my impression that this kind of exchanges are useless and a waste of time, at least for me.

"Now there's a point that I heartily agree with you on! Assuming any association between the current display mode and the desired accuracy is pure nonsense to me."

> That's better, now we're making progress. But then, I now understand your previous "True [...] so what ?" even less.

"Thank you for the history lesson; it does help me to understand how that came about."

> You're welcome.

*"A method of factoring polynomials such as a+b*x+c*x^2+d*x^3+e*x^4 to the form a+x*(b+x*(c+x*(d+x*e))). That does eliminate all exponentiation, but converted to an RPN sequence is:*

*a x b x c x d x e * + * + * + * +*

which couldn't even be used with a 4-register stack."

> You're right, your constant using of RPL has really spoiled you if you can come up with that particularly inefficient, multi-level scheme.

*"Okay, I re-arranged it to (((e*x+d)*x+c)*x+b)*x+a. That's a little better"*

> Wrong, it's much better, because now you can do it using the classic 4-level stack, no

matter how large the degree of the polynomial, and you're reducing significantly the chance of making a mistake. As you now know, the correct sequence is like this example:

```
    Evaluate a5*x^5 + a4*x^4 +
a3*x^3 + a2*x^2 + a1*x + a0

      x
    ENTER
    ENTER
    ENTER
     a5
     *
     a4
     +
     *
     a3
     +
     *
     a2
     +
     *
     a1
     +
     *
     a0
     +
```

where you always begin by ENTER, ENTER, ENTER, no matter the degree of the polynomial, and you can easily detect and correct errors, while never needing more than classic-RPN 4 levels. This procedure is extremely easy do to manually on a non-programmable RPN calc, and can be made into an extremely short program, even the HP-25 included it using 10 steps or less

Best regards from V.

*Message #107 Posted by **James M. Prange (Michigan)** on 5 Dec 2005, 5:17 p.m.,*
in response to message #106 by Valentin Albillo

Hi Valentin,

Quote:

"Other than the problem of possibly overwriting a variable with the same name, I don't see any reason why whatever name I'm solving for couldn't be used."

It has to do with nesting. Both FNROOT and INTEGRAL can be nested, i.e., an FNROOT can solve a function which itself calls FNROOT, and INTEGRAL can

> integrate a function which itself calls INTEGRAL, and further FNROOT can solve INTEGRALs and INTEGRAL can integrate FNROOTs.
>
> That being so, were you to use a normal variable, say "X", that "X" would have different meanings and would hold different values depending on the level of nesting where it was used. That cannot be accomodated with a single, normal user variable, which is a unique location in memory, while FVAR is actually a *keyword* which holds the value of your solved or integrated variable at any and *all* levels of nesting, transparently to the user.
>
> So, if you were to single-step your function while being solved or integrated by a nested call, you'd see that FVAR isn't the same value from one level of nesting to another, while the keyword (i.e.: formal variable in this case) is one and the same to you: FVAR.
>
> *"I gather that FVAR represents the X in your FNF(X)? Sort of like a reserved variable in RPL?"*
>
> That's correct, FVAR is the X in FNF(X), the Y in FNF(Y), in other words, the formal variable. But internally it's not a variable but a keyword which holds a set of values, one for each level of nesting. I don't know if that corresponds to a reserved variable in RPL but seems unlikely.

I had a look at FNROOT and INTEGRAL in the *Math Pak Owner's Manual*, and it looks to me as if FVAR and IVAR are more like RPL's variable of integration and variable for plotting. "Formal variable" does seem like a good name for them. The FVALUE and FGUESS stored by FNROOT, and IVALUE and IBOUND stored by INTEGRAL, are examples of what I'd call "reserved variables" in RPL.

Quote:

"You're saying that solving and integrating are occurring at the same time?"

Why, yes. In Karl's particular example, that's *not* the case, you're actually integrating a function which isn't being solved, the solving procedure is only performed twice to compute the limits of integration and it's completely over before the integration process proper starts.

But have a look at this example (already published at this Forum as part of a Test Suite for advanced HP models, search the archives for "Turtle and Hare"), where you're solving for a root of a function that itself is an integral of an implicit function (!), i.e.: you're Solving an Integral whose integrand requires Solve:

```
    Test 7: Solving a
definite integral of an
implicit function

/X

|
      Find X in [0,1] such
that  | y(x).dx = 1/3,

|

/0
      where y(x) is the
implicit function defined
by:
```

$$y^5 + y = x$$

```
       using a precision of
1E-3 for the integral. HP-
71B code:

           FNROOT(0,1,
INTEGRAL(O, FVAR,1E-3,
FNROOT(0,1, FVAR^5+FVAR-
IVAR))-1/3)

       gives 0.854136725005
(precision = 1E-3)
          or 0.854138746461
(precision = 1E-6)
```

As you may see, solving and integrating are absolutely intertwined in this example. You

> can also see that the first FVAR appearing in that expression corresponds to the variable being solved by the outer FNROOT, while the 2nd and 3rd FVAR correspond to the variable being solved by the inner FNROOT. You wouldn't be able to do that using a regular, user variable like 'X', say, because in this case both 'X' would have different meanings. Of cousrse, IVAR is the formal integration variable and you can see as well that it has to be different from FVAR because they refer to wholly unrelated values.

Actually, it took me a while to see what was going on in that example.

Anyway, in the first program following, I use only two distinct names, and the 48 and 49 series manage to keep track of what they mean. Of course this makes for truly obfuscated code, so normally I use distinct names for distinct variables. Not only does using distinct names make things clearer to me, but it avoids any possible problem with the calculator getting them mixed up.

```
%%HP: T(3)A(D)F(.);
@ Overwrites any 'X' or 'IERR' in
current directory!
@ Takes a number argument to set an
error tolerance;
@ for example, 3 specifies an error
tolerance of 10^-3.
@ Sets display mode to FIX while
running, but normally restores
@ original mode.
@ Results from the BYTES command:
@   48 series checksum: # B2BCh
@   49 series checksum: # B3E6h
@                 Size:     197
\<<
  RCLF SWAP FIX
  'X' PURGE
  \<<
    \-> x
    \<<
      'X^5.+X-x'
      'X'
      { 0. 1. }
      ROOT
    \>>
  \>>
  \-> x
  \<<
    \<<
      0. X
      'x(X)'
      'X'
      \.S
      1. 3. / -
    \>>
    'X'
    { 0. 1. }
```

```
    ROOT
  \>>
  SWAP STOF
\>>
```

With an error tolerance of 10^{-3}, this returns .854136725005, with 3.33478395859E-4 stored as IERR.

With an error tolerance of 10^{-6}, this returns .85413874646, with 3.33369684455E-7 stored as IERR.

In case anyone's interested, here are some approximate timings, in seconds:

```
Error tolerance 10^-3   Error tolerance
10^-6
     48SX: 267              48SX: 548
     48GX: 181              48GX: 376
     49G:  223              49G:  455
     49g+:  81.2            49g+: 166
```

Maybe this next example will look a bit clearer (but maybe not):

```
%%HP: T(3)A(D)F(.);
@ Overwrites any 'X', 'Z', or 'IERR'
in current directory!
@ Takes a number argument to set an
error tolerance;
@ for example, 3 specifies an error
tolerance of 10^-3.
@ Sets display mode to FIX while
running, but normally restores
@ original mode.
@ Results from the BYTES command:
@   48 series checksum: # 2FB6h
@   49 series checksum: # 2EECh
@                 Size:     197
\<<
  RCLF SWAP FIX
  \<<
    \-> a
    \<<
      'Z^5.+Z-a'
      'Z'
      { 0. 1. }
      ROOT
    \>>
  \>>
  \-> f
  \<<
    \<<
      0. X
      'f(Y)'
      'Y'
      \.S
      1. 3. / -
    \>>
    'X'
    { 0. 1. }
    ROOT
  \>>
  SWAP STOF
\>>
```

This returns the same as the previous program, except of course that the "inner" root 'Z' doesn't get overwritten by the "outer" root 'X'.

> Quote:
>
> By the way, the above expression

> is a command-line expression, not a program,

Okay, I wrote mine on the PC, originally as two separate programs, but I decided that I may as well just combine them into one.

Maybe you do this sort of thing frequently, but it strikes me as an unusual case. Ordinarily, I use the solver instead of the ROOT command to find roots and intersections. I don't use integration often, but I've always just typed the arguments into the command line and pressed the integrate key. For this case, it seems especially unfortunate that ROOT isn't a function, because the integrate function on the 48/49 series requires the integrand to be an algebraic.

> Quote:
>
> and uses no local/global variables at all, flags, modes, or whatever. So, it will work as-is, no need to change modes, be aware of the status of some flags, or keep care that you don't overwrite some variable.

I see very little problem with using local variables; they're local to the defining procedure and are abandoned when the procedure finishes. A local variable will definitely never overwrite any other variable. The only thing to be careful of with them is that while a local variable exists, there's no way to access anything else (including a previously bound local variable) with the same name. For example, if you're going to use e or i, or for that matter, SIN, in the procedure, then don't use it for a local name.

Hmm, on second thought, there is another possible problem with local names. Consider the sequence:

```
0 \-> x \<< 'x' \>> [ENTER]
```

That briefly stores 0 in the local variable x, puts the quoted local name 'x' on the stack, and abandons the variable. Any attempt to evaluate this 'x' while no local variable named 'x' is defined results in an "Undefined Local Name" error. Note however, that if I key in another 'x', then this new x is compiled as a global name, so evaluating the new 'x' doesn't

error out.

Although the variable of integration can be either a global or local name, I believe that the system changes it to a new local name to store values with, so any existing variable with the same name is ignored, and is not overwritten by the integration. I suppose that it could be called a "formal variable", rather like your FVAR and IVAR, except that I can use whatever name I choose.

Yes, sometimes global variables are used (and possibly overwritten), as with ROOT and the solver. I typically use one-letter names for these, and have never had any problem with confusing them with the names of variables that I really do want to keep long-term.

"Reserved variables" are global variables such as IERR that the system uses for its own purposes. There are quite a few of these, so there's some danger that the user could inadvertently choose a reserved name for his own variable, but I've never found it to be a problem. Rather like you wouldn't usually store anything with the names FVALUE, FGUESS, IVALUE, or IBOUND, knowing that the system would overwrite them the next time FNROOT and INTEGRAL were used.

Using global variables has a possible advantage that they're saved until overwritten or purged, and of course that there's a name to go with each value. For the solvers, there may be several variables, some with values set by the user, and some solved by the calculator. The solution is placed on the stack, tagged with its name, but having them all stored as global variables with their names displayed in the menu seems useful to me. In the case of the ROOT command, the result is stored in the variable as well as being pushed onto the stack; I suspect that they had the solver in mind when they designed ROOT. For the integrate function, IERR is a supplementary result; it very likely won't be used in subsequent calculations, so there wouldn't be much sense in pushing it onto the stack, but it may be worth checking.

Regarding modes, as long as you don't have any modes that could affect the result, or can safely assume that they're already in the state you need, fine. I'm in the habit of forcing (and restoring, of course) modes when I know they'll make a difference, and even sometimes

when I'm not absolutely sure but suspect that they will. Of course, when I'm not writing a program and I'm reasonably sure that a mode is already the way I need it, there's no need to force it.

Or maybe the difference is that while most people find RPL repellent except for those few who do like it, "Classic RPN" is found repellent almost universally, even among RPL fans?

But I really don't know which of RPL or Classic RPN has more fans. I do expect that there are a lot of 12C users out there.

> Quote:

I think that the idea is that any result should be available as an argument to subsequent operations. For a stack-based system, putting all results on the stack and using all postfix operations strikes me as the most elegant method to achieve this (as long as the stack can be deep enough).

> Quote:
>
> To make them postfix as well is perverting the original intent of the elegant RPN's postfix notation, cluttering up the stack

> with all kinds of non-mathematical 'operands' and 'arguments' which are nothing but control parameters which don't belong in the stack to begin with.

Note that RPL operations can take "symbolic" arguments and return "symbolic" results, which are just RPN sequences of a special type, very similar to SysRPL programs. The start and stop values of FOR loops, for example, often depend on previous calculations. In my program above, I expect the user to have the value for FIX in the command line or on the stack, where FIX in the program can find it, saving the user the slight trouble of switching to alpha mode and keying in FIX. Sure, we could store anything deemed non-mathematical in a named variable (for use with prefix operations) instead of putting it on the stack, but having to do it that way strikes me as a lot of extra bother.

> Quote:
>
> Doing that, in the name of 'consistency', only results in unnatural, unreadable code, unnecessary and constant growth and shrinking of the stack, and redundant stack manipulations, throwing out the window the innately elegant paradigm so well served by classic RPN.

Ah well, I expect that we'll never agree on this. To me, it seems more like it's for functionality, not just for consistency. Is keeping track of a growing and shrinking stack all that difficult? It's true, although to a much lesser extent, of Classic RPN too. What's so hard about using, for example, 3 FIX instead of FIX 3? I put 3 on the stack and it grows one level, but FIX takes the 3 off so it's right back where it was. The consistency helps too; I always know where any operation will take its argument from (though not always which order is needed for multi-argument operations that I seldom use). As long as the hardware to make a very deep stack is available, why not take advantage of it? With RPL, the user is free to choose to take results off of the stack for storage in named variables, leave the results on the stack for as long as they're needed, or whatever mixture of

these he's comfortable with.

>
> I can do it in my dreams, and you probably could, too !! Does it actually feel so difficult or unfathomable to you !?

Well, I suppose that if I were familiar with the keywords and which order the arguments needed to be in, I'd catch on soon enough. It looks as if functions can't be used as postfix commands, and everything is either prefix or algebraic notation. Now that I've glanced at the owners manuals, I wouldn't mind having a 71B to play around with, although I'll stick with the 48 series for "real work". Besides, having a 71B available while I read the *HP-71B Hardware Internal Design Specification* might be handy. But I expect that a 71B would cost more than I could justify to myself.

But it always amazes me that so many seem to find RPL difficult. After playing with a display sample of the 28S in the store for a few minutes, I knew that it was a lot easier for me than switching between "CAL", "PRO", and "RUN" on my Sharp or using short algebraic "keystroke" programs on my little Radio Shack model. To me, RPL has seemed so very intuitive right from day one that it's hard for me to imagine how anyone could find it overly complicated.

But I can understand that if someone has a Classic RPN model that does everything he wants from a calculator and he's quite familiar with it, then getting an RPL model and getting used to the differences would probably be a mistake, except perhaps as a hobby.

Actually, I sometimes get irritated with some of the changes in the 49 series. To be sure, some of the new features are nice, and I can happily ignore a new command when I don't

have the foggiest notion of what it's good for, but when the 49 series return something that looks a lot more complicated to me than what the 48 series returns for the same commands, it makes me wonder what they were thinking of with this new CAS stuff.

Sure; with RPL, I can enter a polynomial as an algebraic. Why would I bother factoring it? Anyway, all I remembered of Horner's method was that it was factoring a polynomial to eliminate all powers; I didn't remember what use it had beyond that, until you pointed it out. Leaving it in ascending order, then factoring it and converting it from an algebraic expression to an RPN sequence was just an exploratory first step in my seeing what else Horner's method would be useful for on an RPN calculator.

Hi James!

You wrote: "But it always amazes me that so many seem to find RPL difficult. ... To me, RPL has seemed so very intuitive right from day one that it's hard for me to imagine how anyone could find it overly complicated."

Gene: I agree. I have never found RPL particularly vexing, and I'm one of the few people here who cut their teeth on an algebraic model (the SR-51A, the SR-56 and the SR-52). I then spent nearly 10 years with the

HP41 getting used to 4-level RPN. RPL has an infinite stack? So what? The HP28S and 48SX weren't really a problem for me.

You wrote: "Actually, I sometimes get irritated with some of the changes in the 49 series. To be sure, some of the new features are nice, and I can happily ignore a new command when I don't have the foggiest notion of what it's good for..."

Gene: Hopefully, now that there is a real AUR out for the 49g+, you won't have to ignore any new commands, since they're documented. :-)

Re: Yes, I'm serious !

Yes, they are documented, but I just don't have the mathematics background to understand, for example, the command CHINREM. To make all of the commands useful to me, the documentation would have to include several volumes on mathematics, which wouldn't be appropriate. For the foreseeable future, I'll ignore any commands relating to mathematics that I don't understand.

Nice exercise in programming.
It is incredible that the 49G+, being praised as a "speed demon", is actually not so much faster than the 48GX ???
That's really disappointing.
On the debate RPN vs RPL, I must stress the fact that the 48/49 screens are too narrow for proper code reading, and the poor editor effectively obfuscate the code by (almost always) improper line breaks and indenting.
On the other hand, I wonder why no one ever issued a BASIC (the real thing), graphical machine (with grapher, scrollable

history or stack... I sure would love this combination.

> That's really disappointing.

Perhaps those who praised the 49g+ as a "speed demon" were comparing it to the 49G?

Other than that, just how fast any model is depends on what it's doing.

> Quote:
>
> On the debate RPN vs RPL, I must stress the fact that the 48/49 screens are too narrow for proper code reading,

Well, it's a calculator; how wide would you expect the screen to be? How much of the code can you see at one time on any calculator?

But it might've been nice to use a "landscape" layout instead of a "portrait" layout,

On the 49 series, you can use the VIEW operation to see the code displayed in a mini-font, so more can be seen at one time, although I don't find it easier to read that way.

> Quote:
>
> and the poor editor effectively obfuscate the code by (almost always) improper line breaks and indenting.

Well, the line breaks may look improper to you or me, but any separator is logically equivalent to any other separator or series of separators to the compiler, and the decompiler simply inserts a Line Feed code instead of a space character wherever it needs to wordwrap a line or start an indented line for a structure word or UserRPL program delimiter.

Maybe it would be more readable to you or me if each "word" were on its own line, but that would mean a lot of vertical scrolling for editing, and we'd see less of the code at one time. I suppose that the decompiler's formatting style for the editor was a compromise between using much of the display area and indenting to indicate structure,

Regards,
James

in response to message #95 by James M. Prange (Michigan)

> Quote:
>
> Some approximate timings, in seconds:
>
> ```
> Model   6 FIX mode   STD mode
> ```

```
48SX    12.72        20.54
48GX     8.84        13.20
49G     15.98        26.45
49g+     6.80        11.52
```

Some interesting things about the timings:

- As should be expected because its processor speed is higher, the 48GX is faster than the 48SX.
- The 49G is even slower than the 48SX. Maybe this is because of the CAS? Well, that's progress.
- The 49g+ is fastest, but not by as much as might be expected; remember that the Saturn processor is emulated (simulated?) in firmware.

I always find it unfair when people simply transfers a program from a 48 to a 49 without modifications.
Do you use numbers? Then make'em REALs.
Just add a fraction mark, dot or comma (as is my case), after each and every number in your program.

My timings, for your first program, on a 49G are:

```
Unmodified: 26,41 sec  (STD)
REAL-ized:  15,50 sec  (STD)
REAL-ized:  10,48 sec  (6 FIX)
```

I am no big fan of RPL but let's use each calc as it is meant to be used.
Still no winner vs a 48GX, maybe I'll make some benchmarks on my hardware if I'll find some spare time.

Greetings,
Massimo

You're right, of course. :-)
The fact is that I began editing the program by changing the integration limits and verified an improvement; what I didn't expect was increasing speed as I went on changing parameters in stack manipulation commands.

Greetings,
Massimo

My RPL and 32/33 solutions to programming challenge

*Message #116 Posted by **Karl Schneider** on 24 Nov 2005, 4:48 p.m.,*
in response to message #84 by Karl Schneider

All --

Based on the solution provided by Howard Owen, and using some enhancements from the other RPL solutions submitted, this would be my "favored" RPL solution for my RPL challenge:

```
'SIN(X)' 'F' STO
'(x-1.5)^2-1' 'G' STO

<< RAD F G - -> d
  << d 'X' { 0 1 } ROOT
'll' STO
d 'X' { 2 3 } ROOT
'ul' STO
ll ul d 'X' {integ} ->NUM
'I' STO
ll ul I
  >>
>>

'CHAL'  STO
execution:
```

```
5 FIX
CHAL  [ENTER]

(10 seconds elapse)

0.34372   (lower limit, also in variable "ll")
2.69618   (upper limit, also in variable "ul")
3.11057   (the area between the curves, also in variable
"I")
```

Here is the solution I developed for the HP-32SII, which should run just fine on the HP-32S and HP-33S. It closely parallels the structure of the solution for the HP-15C and HP-34C.

```
L01  LBL L         F01  LBL F
L02  RAD           F02  RCL X
L03  0             F03  SIN
L04  STO X         F04  RCL X
L05  1             F05  1.5
L06  FN= F         F06  -
L07  SOLVE X       F07  x^2
L08  STO L         F08  1
L09  2             F09  -
L10  STO X         F10  -
L11  3             F11  RTN
L12  SOLVE X
L13  STO U
L14  RCL L
L15  RCL U
L16  {S}FN d X
L17  STO I
L18  RTN

Execution:

FIX 5
XEQ L

(10 seconds elapse)

3.11057    (the area between the curves, also in
register I)
Rdown
0.00001    (estimated solution error, rounded; use SHOW
or ALL)
Rdown
2.69618    (upper limit, also in register U)
Rdown
0.34372    (lower limit, also in register L)
```

Both of these solutions are functionally-equivalent, in that they provide two values guess that bound each SOLVE or ROOT, in order to guarantee the correct solutions. They also store each result into variables or storage registers, and display the results on the stack, as well.

Thanks to all. In keeping with Valentin's recent post regarding nested execution of INTEG and SOLVE, I might release another simple challenge on that topic.

Re: RPN postfix for non-math operations

*Message #119 Posted by **bill platt** on 23 Nov 2005, 10:29 a.m.,*
in response to message #80 by James M. Prange (Michigan)

Hi James,

An important distinction between RPL machines and RPN comes out from this discussion.

RPN allows *only* one datatype on the stack: "real".

RPL has multiple datatypes.

RPL is an operating system and a language--one might in fact even talk about RPL language and RPL operating system differently?

RPN is not a language. It is a parser, or something more low-level.

The language aspect, combined with multiple datatypes and the need for parameter passing with a stack system, leads very logically to the total postfix logic that is RPN.

Ultimately the discussion, viz between Valentin and others regarding

"readablility" is rather unimportant. The fact is that anyone can trip over the syntax of *any* language, if he does not know it.

The value in this dicsussion lies not in finding the "flaw" but rather in illuminating the "paradigms" (what an abused word:) . --From this illumination can come understanding--and the ability to learn the RPL language if one (me for instance, or Karl etc) is an RPN keystroke guy.

Regards,

Bill

If you say so ... but I must confess I know accepted programming languages that are lower level than RPN. My guess is that you won't consider anything a proper language unless it includes structured programming and such. That would exclude programming languages in widespread use before the concept of structured programming made its appearance. Reiventing history, we could say ...

And that would indeed exclude Assemblers, Fortran, various Basics and a host of others. If we don't call those languages, what term should we invent when we want to speak of them as a group?

Re: HP Calc. Promo

*Message #122 Posted by **bill platt** on 23 Nov 2005, 12:21 p.m.,*
in response to message #121 by Geir Isene

Well, glad I got your attention :-)

I guess what I am getting at is that the *RPN* aspect is merely describing the parsing order. The "language" of an hp 67 or 97 or 32sii etc is not the *RPN" part of it. In fact the "programming language" is a steadily evolving set--but it is not the RPN that makes the language. RPN is the operating paradigm under which the language operates.

For example, RPN can essentially be boiled down to the following:

```
Put stuff on the stack
operate on the last one or two things on the stack
put the result back on the stack
```

The "programming language" functions within this paradigm, but includes all sorts of other stuff--control stuff--"verbs" if you will such as DSE, PSE, XEQ, GTO, GSB, RTN, and

uses some of the "direct calculations" verbs as well such as SWAP, ROT, etc.

Notice that the programming "language" of the 20s is not fundamentally different from the 11c except for the RPN aspect and more branching structures--they are both "keystroke" systems that act directly on a "stack" or a "calculator line" and that commands are run from a special logical space called a "program".

RPL is a different situation. What it retained is the stack. What is different is that commands or "verbs" *themselves* can be parsed onto the stack to be executed later. That is the real change in thinking.

Well, I forgot about the alpha (I don't use the 41 very often) but as far as numbers go on the 15c---even though you have "logical" complex numbers, they are in fact "real" *on the stack* when you enter them. They are processed as complex because of the complex mode. Perhaps this is splitting hairs, but it seems quite different to me than the RPL case where putting parens around numbers and putting them on the stack declares to the

parser that they are complex, whereas in the 15c, you have to first tell the parser that you are now in complex mode, then do something, then tell it you are now out of complex mode. In the RPL model, it isn't a "mode change" but a different data type. The matrix business again--each entry is a "real" and it is only by 1st telling the parser that the "reals" you are typing are to be parsed into a matrix, that it ends up that way.

"The matrix business again--each entry is a "real" and it is only by 1st telling the parser that the "reals" you are typing are to be parsed into a matrix, that it ends up that way."

> Bill, I can see you mean well, but seems to me you either have no idea what you're talking about, or else are not very knowledgeable about just how the HP-15C works.

Just to refresh your mind, if you want to add matrix A to matrix B and then subtract matrix C, with the final result stored in A (i.e.: A = A + B - C), you do this in the HP-15C's RPN flavor:

```
RESULT A
RCL MATRIX A
RCL MATRIX B
     +
RCL MATRIX C
     -
```

Does this seem RPN enough to you ? With matrices on the stack, being manipulated as if they were simple numbers, though each one is operated upon as a whole ?

That you can do because, in HP-15C's RPN, the stack registers can hold and operate with whole matrices, including all stack manipulations, ENTER, X<>Y, Roll down & up, STO, RCL, LASTX, the works.

That you can do because each stack register holds a *matrix descriptor*, which is nothing but a *pointer* to where the matrix elements are actually stored, which is no different

from the *pointers* to various objects held by RPL stack registers.

Think about it a little and then re-read your statements and judge if they make sense.

Best regards from V.

Re: RPN postfix for non-math operations

*Message #126 Posted by **bill platt** on 23 Nov 2005, 2:58 p.m.,*
in response to message #125 by Valentin Albillo

[sheepishly...] You're right, Valentin.

[sorry excuse for an explanation...] I was thinking of the "input" side of the matrix operations--essentially loading the stack, one element at a time. I conveniently forgot to think the operating part through.

Actually this 15c matrix functionality really is a huge departure from all the previous keystroke programmables in that sense, it seems to me. Really is a pinnacle in terms of development...but you can see how the input side, and the "reading or viewing the elements" of an array side is so dramatically different from an RPL machine, where you can see the whole matrix at once (well, as long as it ins't really large....)...you can see how the movement to RPL seemed an attractive idea.

Re: RPN postfix for non-math operations

*Message #127 Posted by **Karl Schneider** on 24 Nov 2005, 2:03 a.m.,*
in response to message #126 by bill platt

Hello, Bill --

You posted,

> Quote:
>
> ...the "reading or viewing the elements" of an array side is so dramatically different *(on an HP-15C)* from an RPL machine, where you can see the whole matrix at once (well, as long as it ins't really large....)...you can see how the movement to RPL seemed an attractive idea.

Well, the matrix-editing capabilities on the HP-15C had to be *possible* on its one-line 7-segment LCD, and I think HP did a thorough and thoughtful job.

On models with a free-form dot-matrix display, I

prefer the HP-42S matrix-editing and display to that of RPL-based 28/48/49. On the 42S, one sees only one element at a time, but generally with at least five significant digits for each component if it is complex-valued. One can scroll up or down, left or right, using cursor softkeys.

The 28/48/49 try to display as much as possible, but it's a real mess if the matrix elements are floating-point or complex (as they often are in real-world applications). It helps somewhat to use the matrix editor on the 48 and 49, which eliminates the brackets.

On the other stuff, Valentin expressed my own thoughts, and there's no need to re-hash. You *can* take some consolation in that, strictly speaking, you are correct that the HP-15C does not put complex-valued elements on the dedicated stack. Instead, it borrows five registers from the free pool of user RAM to create a "four level plus LASTx" stack for the imaginary-valued components of complex arguments.

Re: RPN complicated? Well, not really, BUT... (was: programming: RPN vs. RPL vs. hi-level language)

*Message #128 Posted by **Thomas Okken** on 14 Nov 2005, 2:52 p.m.,*
in response to message #71 by James M. Prange (Michigan)

If you're going to compare RPL and RPN programming, it would be fairer to look at the more evolved RPN models. The 16C and 12C were never top programmables; they were just specialized calculators with some limited programmability slapped on.

The HP-41C, and its successor, the HP-42S, have alphanumeric displays so you don't need to decipher key codes; they have label addressing and subroutines, insert/delete of program lines, and ISG/DSE loop counters without the limitations of the silly ISZ/DSZ. They do have four-level stacks, though.

Those two machines are what most RPN enthusiasts are thinking about when comparing RPN to RPL. (Well, I am, anyway. :-))

- Thomas

Re: programming: RPN vs. RPL vs. hi-level language

*Message #129 Posted by **Ed Look** on 23 Nov 2005, 10:33 a.m.,*
in response to message #69 by Karl Schneider

A year or two ago, I was able to write simple programs in RPL on my 48G's to find the average, median, maximum, and minimum of a set of numbers. They work. I'm not a professional programmer, only an occasional one (only 'cuz I gotta), so I cannot attest to their elegance, not even in a wild drunken boast.

But the one I tried for finding the mode still doesn't work and haven't had the time to troubleshoot it.

I wrote one to index a x-ray powder pattern and it does work, but I fear it's a bit clunky and may even be a little bloated.

Incidentally, if anyone wants, I could post that diffraction program to the museum, not because it's such a work of art (a good programmer or even another scientist might laugh), but there aren't too many programs on HP calculators for basic scientific work aside from the usual college freshman chemistry stuff.

Re: programming: RPN vs. RPL vs. hi-level language

*Message #130 Posted by **Arnaud Amiel** on 23 Nov 2005, 2:03 p.m.,*
in response to message #129 by Ed Look

Indexing diffraction patterns was my first evolved sysRPL program! Once it was fully working with graphics and all, I demonstrated it to my classmates and during the IR upload something went terribly wrong and I lost everything. Since then I bought a RAM card (which regularly failed anyway :-() and always backup

Now I am interested in statistics as well and am writing a random numbers generator for different distributions...

But this is on hold due to Valentin new challenge

Arnaud

Re: programming: RPN vs. RPL vs. hi-level language

*Message #131 Posted by **Ed Look** on 23 Nov 2005, 2:38 p.m.,*
in response to message #130 by Arnaud Amiel

Graphics??!!!

Wow!

All mine does is to give the ratios of sums of the Miller indices and you'd still have to use your head to determine the actual Miller indices from these reduced sums! (I mean what's complex for me is simple to most others!)

I did think about some way of doing that using the 48G and 49G+ RPL, but I chickened because it looked like it would take too long. Well, maybe this holiday weekend...

... maybe!

And I'm very sorry to hear that after all that hard work, you lost it. Maybe the first upload should be to a PC, so that you can keep a copy for just that reason... if it doesn't screw up during THAT transmission.

I have one 48G and one 48G+; when I put something I need (a program, some data, etc.) on one, I try to remember (but not always) to beam it to the other, just for safekeeping.

James

Re: RPL *is* complicated. Here are three threads...

*Message #133 Posted by **Howard Owen** on 11 Nov 2005, 10:26 p.m.,*
in response to message #132 by James M. Prange (Michigan)

I like Bill's theory that one's attitude toward RPL and RPN are conditioned mainly by which style one was exposed to first. If there is such a thing as an objective truth about these two, perhaps defined as the opinion of someone who has no opinion, it may be something like "they are *both* ugly and hard."

But I find I can break through surface ugliness to get at a tool, as long as I'm sufficiently motivated. And frequently I find hidden beauty when I do that. When I learned RPN, the motive was to figure out what this "programming" thing was all about. The fact that the 41C was the first machine I ever programmed had a big impact on my later career as a student and as a professional. Today, I'm motivated to learn RPL because it's cool. That has a slightly less urgent edge to it than the motive that drove me to learn the 41C. But I'm getting to the point where I'm having some success in writing code that doesn't strike me as pure gobbledygook when I look at it later. That's a lot of fun. In fact, that sort of thing is 80% of the fun of collecting computing devices, for me.

I still think that RPL is oddball, and that the 48 is very complicated. But I don't seriously hold that against either. 8)

Re: RPL more complicated?

*Message #134 Posted by **James M. Prange (Michigan)** on 10 Nov 2005, 3:38 a.m.,*
in response to message #58 by Howard Owen

Oh, I don't want to start any war. It's just that I keep seeing RPL referred to as "complicated" compared to "Classic RPN", and I just can't see it that way.

To me, it's the "Classic RPN" programming that seems more complicated; sort of like having to write an assembly language program for something that could be accomplished very simply in UserRPL.

Of course, the RPL models are capable of things that the 16C and 12C just aren't capable of, so using them adds complexity, but I mean just the basic things that the more basic models are capable of.

I learned UserRPL first, and it all seemed pretty straight-forward and logical to me. A few different object types, arguments and operators using RPN syntax, a few stack manipulation commands, global and local variables, a few programs structures, name resolution, and realizing that any command line can be the contents of a program (and is made into one by ENTER) and that the contents of any program can be executed from the command line editor. Of course, you don't have to use all of the capabilities of RPL; a lot can be accomplished with a relatively simple program.

I'm beginning to feel that SysRPL is, in some ways, even easier, because the "magic" going on internally isn't quite so hidden behind the "smoke and mirrors" of UserRPL. Of course, with SysRPL, the command set is much larger and there are even more ways to accomplish the same thing, and it doesn't automatically check the arguments to protect the user from his own mistakes. The main advantages of

SysRPL are that the programs are, as a general rule, smaller and much faster. Still, for fast development of "ad hoc" programs, UserRPL has the advantage that it's difficult to get a TTRM with it.

Of course, I suppose that it could be argued that assembly language gives me the penultimate "peek behind the curtain". There are relatively few instructions available, but remembering which operations are possible with which registers is a challenge, and it generally requires what seems like a lot of instructions to accomplish something that seems pretty basic. Note that the emulated (simulated?) Saturn processor on the 49g+ includes a lot of instructions "missing" from the physical Saturn of earlier models, although I haven't experimented with the new ones yet. The advantage of assembly language is that these programs can be amazingly fast.

Now with the 16C and 12C, trying to write any non-trivial program just seems too complicated. Why go to all that trouble when it's so simple to write a UserRPL program?

Regards
James

I have been looking for a UserRPL program (excluding SYSEVAL and LIBEVAL and Dev Library commands) that would TTRM. Any example?

Arnaud

Or in the 49 series, FLASHEVAL.

Of course, this includes calling any program that uses the above commands improperly, or calling buggy SysRPL or assembly language programs or external library commands.

In some cases, the problem may not be immediately apparent, but may corrupt memory so that later perfectly normal operations will end up with a TTRM.

Of course, the [ON]+[A]+[F] operation is supposed to cause a TTRM.

Other than those, any UserRPL operation that causes a TTRM is caused by a bug in the operating system; it's just not supposed to happen. A buggy UserRPL program may well return "unexpected" results or error out, but it should never cause a warmstart or TTRM.

That said, if I recall correctly, it's not that hard to write a "circular reference" program that requires a warmstart to break out of.

Using the filer to rename a global variable to an invalid name (as can also be done with S~N) can cause some problems, but I rather doubt anything that would cause a TTRM.

For some examples, see this search. Some of these may well have been fixed in later ROM revisions.

Overall, it seems to be pretty rare to stumble across an operating system bug that causes a warmstart or TTRM in normal "pure UserRPL" operations, but I wouldn't entirely rule it out.

James

Re: RPL more complicated? A POLL

*Message #137 Posted by **bill platt** on 10 Nov 2005, 9:36 a.m.,*
in response to message #134 by James M. Prange (Michigan)

Hi James,

Point 1: please compare the 15c or 32sii etc to the 48 series. The 12c is a crippled programming environment.

Point 2: as I rather suspected, if someone (and you are an example) is exposed to RPL before RPN keystroke programming, then RPL is "easier".

Perhaps we aught to take a real poll, and ask the questions:

1. Which is easier to use, RPN or RPL programming? 2. Which do you learn first?

Re: RPL more complicated? A POLL

I'd like to, but I don't happen to have one of those, and I'm not likely to get one. I'd love to have a "pocket-sized" RPN calculator, but considering the current prices, I'll "make do" with the RPL models, and struggle with a cheap "Brand X" model on those occasions when I feel a need to carry a calculator in my pocket.

> Quote:
>
> The 12c is a crippled programming environment.

It seems that way to me. How about the 16C? Maybe I should look into what advantages the 15C and 32sII might have.

> Quote:
>
> Point 2: as I rather suspected, if someone (and you are an example) is exposed to RPL before RPN keystroke programming, then RPL is "easier".

I expect that that's very much the usual case. With RPL so easy to use, I personally don't have much incentive to try getting familiar with programming a "True RPN" model.

That's not to say that I have anything particular against "True RPN" models. I can program them, but it just seems like too much bother.

For someone who's already comfortable with programming an RPN model and finds that it suffices for his purposes, there's probably not much incentive to learn to work with RPL.

> Quote:

I expect that in this forum, the usual would be "1: RPN, 2: RPN" with a few "1: RPL, 2:RPL", with just a very few "1: RPN, 2: RPL" and "1: RPL, 2: RPN".

Of course, if asked in comp.sys.hp48, first off, it would require some explanation of what was meant by "RPN" as distinguished from "RPL", and there you'd find relatively few who either peferred RPN or had learnt it first (if at all).

They all three have more programming power than the 12C. As noted previously in this thread, the 16C leaves out a lot of the standard scientific fuctions, replacing them with bit fiddling operations.

The 33S is very similar to the 32SII, and it goes for 50 bucks or so. You want to be sure to get a recent one, as noted in this thread, and elsewhere in the archives. But if you have time and inclination to play, I'd get the Free42 simulator. The consensus here is that the 42S represented the pinnacle of the pure RPN programmable calculator. Free42 will only cost you the time required to set it up. And at least you won't be turned off by arbitrary and silly limits like those the 33S and 32SII suffer under. The other models mentioned also lack alphanumeric capability to a greater or lesser degree, whereas the 42S is fully alphanumeric.

Yes, by cracky, us old uns is gettin' scarce in these latter, decadent days! Why, when I was a youth, I'd walk three miles through snow just to get enough "N" cells to keep my 41C working with the card reader! Nowadays these youngsters have standard batteries. Bah! Them triple-A's is a dime a dozen!

Re: RPL more complicated?

*Message #140 Posted by **James M. Prange (Michigan)** on 12 Nov 2005, 4:09 a.m.,*
in response to message #139 by Howard Owen

The 16C does indeed lack such vital (to me) cababilites as trig and statistical functions, so although it's great for what it's designed for, it doesn't suit my usual needs at all. The 48/49 series doesn't have all of the "binary" capabilites of the 16C built-in, but I'm confident that I could write programs for them if I felt the need; it does seem a bit of a shame that they aren't all built-in.

I've been thinking of the 33S, but it still doesn't look as if it would fit very comfortably in my shirt pocket, and doesn't seem as if I could do anywhere near with it what I can do with the 48SX, so what would be the advantage over the 48 series? $50 is still $50, and I don't want to waste it on something that I have no use for. Now they've come out with the improved version, but since it still has the same model name, it would seem to be a bit difficult to know which version one is buying online. It's not as if I could walk into a store and look at the calculator or its serial number. Of course, that keyboard is about as ugly as I can imagine, although I could live with that if there were a good reason for my owning one.

Maybe I'll look into Free42, but still, what advantage would that have over the 48 series? On the other hand, at least it's free, and might be fun to play around with.

Regarding the N cells, I still need them for the 28 series. To be sure, I don't use the 28S very much since the 48SX came out, but the 28S is still a very useful calculator, with some advantages over the 48/49 series. The thing that really put me off on the 28S was that the first time I got a "low battery" annunciator, I promptly bought a new set, installed them, and pressed ON, only to have the 28S turn back off immediately. It turned out that the "new" N cells were almost completely dead, and the memory had been cleared. Of course, with no way to input anything other than with the keyboard, my only backups were printouts. Since then, I just don't trust the 28 series for storing any object that I really don't want to key in all over again.

By the way, I expect that the "three miles through snow" was "uphill both ways"?

With the 49 series, they might better have used AA instead of AAA cells. The 49g+ in particular goes through them faster than I'd like.

James

*Message #141 Posted by **Ed Look** on 11 Nov 2005, 11:15 p.m.,*
in response to message #137 by bill platt

You know, I learned FORTRAN (my only REAL programming language outside of calculators; never had the gumption to fully learn anything else) before I ever got a RPN machine and of course, I used HP's RPN beauties for a long time before RPL was ever introduced and finally obtained a RPL unit myself.

I find the order of ease to be RPN > FORTRAN > RPL.

But what I didn't say was that due to my own circumstances, I've had more experience programming a scientific programmable (34C, 32SII, 33S) than FORTRAN on any sized machine, and this more than RPL (48G, 48G+, 49G+)

But I think from the experience of the three for me that RPN is MORE INTUITIVE, as essentially, you are helped by the language being laid out right there for you, right on the keyboard you are pressing on! It did not take me long to figure out programming in RPN on a programmable scientific (though that wonderful old HP-34C manual helped greatly) ; RPL I'm still trying to master and FORTRAN... well, I rub the bumps on my head every time I pass by that guy...

... this stupid comment being said now, I would like to state that I wish schools, from the high school level on, would offer as an alternative (at the start, and make it a fixed part of the curriculum years later) programming a 33S (or better, a 34C if they can manage to get any, so there goes THAT idea...) as a "starter language" or "pre-programming" (in the same spirit as "pre-calculus", which is how they seem to be packaging some essential algebra and trigonometry for the kids in many U.S. schools these days).

This is because I think programming in the program space of a RPN machine is *SO* easy to pick up for a teenager starting out. It is easier, really than something even little grade school kids (who are still struggling with the multiplication table) can do- use HTML and create a knockout webpage better than some pros.

RPN is better than HTML because you are not concentrating on cosmetics, but calculations and true math, from basic to (acidic... okay, bad joke...) incredibly advanced (see some of the programs archived here on this very site).

Even though I still do it for my 33S and less now, my 32SII, I still dream wispy-eyed about programming and using my 34C.

Norm Hill, I think, once said to me on this forum that the best thing for an adolescent math student was a HP 33E (no continuous memory means no stored data and thus no... um, less cheating on tests). This is because this rather powerful (and even at the time) affordable calculator had all the basic mathematical functions that anyone in high school to even some scientific research might ever need and is programmable with enough memory for short, useful programs, but not for games or other such waylaying stuff for schoolkids.

* * *

The take home message of this long winded post? RPN is easier. ;)

I think RPN is easier to use, and I learned RPN first. But perhaps I should add that I learned Fortran, BASIC, 6502 assembly, C, Pascal, Forth, COBOL, Natural and Unix shell programming before either RPN or RPL. I still like RPN better even though I think RPL is more like the other languages with which I've worked.

(I also should mention that I needed -- and achieved -- only a minimal amount of proficiency in all but a few of the afore-mentioned languages.)

>
> ...
>
> Now with the 16C and 12C, trying to write any non-trivial program just seems too complicated. Why go to all that trouble when it's so simple to write a UserRPL program?

Yes, and there are those to whom a Rubik's Cube is simple and straightforward, and who can solve it for any initial state in only a few minutes. That's probably not like most people, though...

I agree with Bill Platt: Please use the 15C, 32S/SII, 41S, or 42S as a good example of the RPN programming paradigm. The 12C's programming is primitive; the 16C has a limited set of mathematical operations.

I'll quote several examples from the three earlier threads I linked in a post earlier in this thread. First, my RPL programming challenge, which was to develop a complete program to determine the area between two function curves

```
f(x) = sin(x)  (x in radians)
g(x) = (x-1.5)^2 - 1
```

using SOLVE to find the limits of integration where f(x) = g(x), and then INTEG to compute the area between those limits.

My RPN program for the 15C and 34C:

```
x_lower = 0.343717
x_upper = 2.696175
Area = 3.110575

LBL "A"         LBL "B"         (execution)
0               SIN             RAD
ENTER           X<>Y            FIX 5
1               1               GSB "A"
```

```
SOLVE "B"       .
STO 0           5
2               -
ENTER           X^2
3               1
SOLVE "B"       -
STO 1           -
RCL 0           RTN
X<>Y
INTEG "B"
STO 2
RTN
```

The approach is quite direct:

1. Program the driver routine under label "A" and program the routine to calculate f(x)-g(x) under label "B".
2. SOLVE for x at the first crossing of f(x) and g(x) between 0 and 1 on the stack; store the result in register 0.
3. SOLVE for x at the second crossing of f(x) and g(x) between 2 and 3 on the stack; store the result in register 1.
4. INTEGrate f(x)-g(x) over the two solved limits placed on the stack; store to register 2.

Here are the RPL programs the respondents provided:

```
(store 'SIN(X)' in 'F'; store 'SQ(X-1.5)-1' in 'G')
<< RAD F G - DUP 'X' 0 ROOT OVER 'X' 3 ROOT ROT 'X' (INTEG) >>

(with 'SIN(X)-SQ(X-1.5)-1' on the stack)
<< 'X' DUP2 0 ROOT 3 PICK 3 PICK 3 ROOT 4 ROLL 4 ROLL (INTEG) >NUM >>
```

Good grief! How would the typical, logical engineering/scientific person read and interpret the respective procedures of those programs? They certainly don't make much sense to me.

How about this program statement:

```
"IF (A .LT. B)  A = A + 360.0"             (Fortran '77)
"<< IF A B < THEN A 360 + 'A' STO END >>"  (RPL)
```

To read substantial material regarding RPL, RPN, and BASIC discussed last year at length by Valentin Albillo and Vincent Weber, just follow the link to the "RPN vs. RPL" thread I provided. David Ramsey also had some good, clear insights in the "leisure suit" thread.

Re: RPL more complicated?

*Message #144 Posted by **Howard Owen** on 11 Nov 2005, 1:44 a.m.,*
in response to message #143 by Karl Schneider

I've just put my finger on what I think is the principal problem I have with RPL. I'm continuing to explore the graphics on the 48G, and I just wrote a program to REPL a list of GROBs into a larger GROB so I can make sure I have the dimensions right and so forth. Here's my very rough, not completely correct work in progress:

```
<< # 131d # 64d BLANK @ Create a GROB the size of the display
   'DICE' RCL          @ Get the list of 6 dice images
   1                   @ Starting index into the list
   WHILE DUP 6 <=      @ 6 dice images
   REPEAT
    DUP 1 -
    20 * R->B # 30d    @ Point in large GROB to REPL the small GROB
    2 ->LIST
    3 ROLLD GETI       @ Pick the current die out o the list
    3 ROLLD 5 ROLLD
```

```
    5 ROLLD           @ Set up the stack for the REPL
    REPL
    3 ROLLD           @ Set up the stack for the while loop
   END
>>
```

Now, I could probably be more efficient and logical in my use of the stack. *But why the heck should I have to worry about it?* But here's a second version that's a little more general, and uses named local variables to clarify what is going on:

```
<< # 131d # 64d BLANK @ Create a GROB the size of the display
   'DICE' RCL         @ Get the list of dice images
   DUP SIZE -> big dice top @ names!
   << 1 1 top         @ The first 1 is a dummy for our return val
     FOR idx DROP     @ Index named. DROP the dummy (but not the last time)
      idx 1 -
      20 * R->B # 30d   @ Point in large GROB to REPL the small GROB
      2 ->LIST -> loc   @ name our location.
      <<
        big loc
        dice idx GET
        REPL          @ MUCH better
      >> DUP 'big' STO @ use the same big GROB each time!
                       @ Also, the DUPd value will stay on the stack
                       @ the last time only
     NEXT
  >>
>>
```

This one is actually completely correct, too.

Why do I have to worry about the stack so much, even in this version? I think it's because Prof. Wickes and colleagues were just coming out of an era in which memory constraints were quite painful in handheld devices. I base this of an analysis of why FORTH's stack oriented quality was perceived as a benefit to many in the 80's, and particularly in the 70's. *Stacks are efficient* Stack oriented systems can be designed so that limits on stack size aren't arbitrary. That is, you can get pretty close to the ideal maximum of memory usage with stacks. Microcomputers in the 1980s had one or two letter variable names, and a limited number of these. The hassle of keeping track of deep stacks of variables was part of the price you paid to get to use all the memory as efficiently as possible.

But memory no longer needs to be the limiting factor in what are now called "embedded systems." One of my Zaurii has 64MB of SDRAM, and 128MB of flash built in. I can run a version of Linux on that machine that isn't stripped down. The performance is pretty close to a PII/300 or so. The battery life is suprisingly good for all that.

My point is that there is no necessary virtue in using stacks to the extent they are used on the HP48G[X+]. The HP48SX had only 32K to start, which was a lot for the day. But I'm sure that System RPL allowed for a much more capable machine within the RAM constraints. And I'll bet stack usage was a big part of the story. But the 48GX shipped with 128K standard, and expandibility up to 4MB. Suddenly we were looking over the crest of a hill into the era of abundant RAM. And just as suddenly, the need for a stack oriented machine became less pressing.

And what's the tradeoff? Stack diagrams on paper while you are developing a solution. And these tend to disappear ater the initial development, so you get to come back later and figure it out all over again.

*Message #145 Posted by **James M. Prange (Michigan)** on 11 Nov 2005, 11:54 p.m.,*
in response to message #144 by Howard Owen

I don't see where you're worrying about the stack much in your second version. You use DUP

twice and DROP once, the only stack manipulation commands that I see in the program. Surely anyone who programs in RPN should find those simple enough?

Yes, RPL's unlimited (well, limited only by available memory) variable depth stack does require some complications over a fixed stack size. Such commands as ROLL, ROLLD, PICK, and UNPICK, require an argument for which stack level is to be used, and for DUPN and DROPN how many levels, and there's a need for such commands as DEPTH and CLEAR. In particular, when the stack gets "too deep", it gets hard to keep track of just where things are. Of course, "too deep" varies with the individual user, and for a given user, such matters as how tired he is and what distractions he's dealing with. To make it easier to deal with a deep stack, the stack can be managed by making objects on the stack into a list, or even easier in many cases, by temporarily storing stack objects into named local variables.

Note that dealing with lists in temporary memory (never stored as a global variable, that is) has a disadvantage in that it's difficult to deal with for "garbage collection" (really, "memory packing" describes it better). Any element "extracted" from a list is referenced by a pointer into the still existing (even if it's no longer on the stack) list until the element is either stored into a global variable or a NEWOB is done on it. Now, the size of the list is unknown, so the garbage collection routine has to examine every object in the list to find the end of it, needed for deciding how much of temporary memory needs to be kept (and usually, moved) or can be overwritten. In the case of a large list that's been "exploded" unto the stack, for example, garbage collection can take a very long time.

I expect that there will be objections that it's a hassle to create a new local environment every time you want to store another object into a local variable. But you can "initialize" all of the local variables that you're going to use with a dummy value right at the beginning of a program. For example, by storing the object 0 into each of them, and then using STO to replace the dummy object with the desired object as it becomes available. If you discover that you want another local variable, it's easy enough to edit the program to add another dummy object and name at the beginning. If you decide that you don't need a local variable after all, you can edit out the dummy object and name, or you can just leave them there; they'll do no harm other than using up a little memory.

So why have a stack in the first place? Well, first off, how would you implement an RPN system without one? As long as you already have a stack, why not have the stack manipulation commands available to the user, in case he chooses to use them?

I doubt that using the stack is all that much more memory efficient than using local variables. Either way, the object exists in memory in only one place. Using the stack, it's referenced by a pointer on the stack (having objects "on the stack" is a bit of an illusion by the "smoke and mirrors" of RPL to make things easy for the user). Using a local variable, it's referenced by a name in the local environment.

It seems to me that the advantage (or disadvantage) of keeping objects on the stack and using the stack manipulation commands is mostly a matter of speed. If you have plenty of time to develop a faster program using just the stack, you can do that, but if you need to develop something quickly, or want it to be easy to debug or modify, you can use local variables, with a bit of an execution speed penalty. With both local variables and stack manipulation commands available, it's up to the individual user to choose which method, or, perhaps more likely, mixture of methods, to use. Where would you rather spend extra time, in developing the program, or in running the program? For a fairly complicated program, if you're going to run the program, say, only a few hundred times, it's probably going to be difficult to accumulate enough saved execution time to make up for the extra development time. If you're going to be using the program frequently for the foreseeable future, or intend to distribute it, or are just refining your skills, then it may be worthwhile to spend extra time on development.

Actually, I suspect that having so many ways to accomplish things may be a large part of the

reason so many seem to find RPL overly "complicated". It's difficult to teach how to use RPL because there's no one "right way" to accomplish much of anything in RPL.

Regards,
James

Yes, as I've remarked elsewhere, I'm beginning to find ways to code RPL that scan better for me. The names are the key, of course.

There's one other stack oriented oddity in that second example. The "1" placed on the stack before the range of the FOR statement, only to be immediately DROPped off. As the comment states, that's a place holder for the return value of the inner function.

> Quote:

I prefer the latter. My contention is that large gobs of anonymous data floating on a stack is broken My first attempt shows why I think this is so, not that I hold that up as a prime example of that approach to using an unlimited stack. It's not just an issue of how many things you can juggle in your head via a stack metaphor, either. Source code has a way of creeping away from its author. If someone else ever needs to read that sort of code, the first thing they'll do, once they stop crying, is to start graphing out the anonymous data, assigning temporary names so they can track the stack manipulations on paper. The third thing they'll do is start poking pins in a voodoo doll with your name on it. 8)

Any element "extracted" from a list is referenced by a pointer into the still existing

> (even if it's no longer on the stack) list until the element is either stored into a global variable or a NEWOB is done on it. Now, the size of the list is unknown, so the garbage collection routine has to examine every object in the list to find the end of it, needed for deciding how much of temporary memory needs to be kept (and usually, moved) or can be overwritten. In the case of a large list that's been "exploded" unto the stack, for example, garbage collection can take a very long time.

That's interesting. So there's a reference to the element in the list which is the only one, so it doesn't get cleared until the object it references either gains another reference or is explicitly destroyed. That means that the list also hangs around, meaning a reference is kept somewhere to its storage. And GC has to walk the list to see how many and how large the objects it contains are. Because .. why? Because that information isn't kept anywhere else? Must be it.

So anonymous data on the stack is hard for machines and humans both? 8)

> Quote:
>
> I expect that there will be objections that it's a hassle to create a new local environment every time you want to store another object into a local variable.

Not from me. I find not having the name to be more of a hassle.

> Quote:
>
> So why have a stack in the first place? Well, first off, how would you implement an RPN system without one? As long as you already have a stack, why not have the stack manipulation commands available to the user, in case he chooses to use them?

Anonymous stack data: just say "no!" 8)

C'mon, the unlimited stack isn't just provided, it's a central feature of the machine's architecture.

> Quote:
>
> I doubt that using the stack is all that much more memory efficient than using local variables. Either way, the object exists in memory in only one place. Using the stack, it's referenced by a pointer on the stack (having objects "on the stack" is a bit of an illusion by the "smoke and mirrors" of RPL to make things easy for the user). Using a local variable, it's referenced by a name in the local environment.

The names themselves take up space, even if you are hashing them. An 8 character variable name is nothing on a machine with 128K, or even 32K. But User RPL debuted on the HP-28C, with, what was it, 2K?

But, point taken. The major difference between stack oriented and variable oriented processing on the 48G must be the time it takes to create those local variables.

> Quote:
>
> Actually, I suspect that having so many ways to accomplish things may be a

> large part of the reason so many seem to find RPL overly "complicated". It's difficult to teach how to use RPL because there's no one "right way" to accomplish much of anything in RPL.

I think so too. But there is also the counter-example I offered elsewhere of Perl. Perl can be quite a mess because of the variety of ways in which you can do practically everything in the language. But, as I also stated, Perl offers idioms that match the way I think. I find no such easy idiom in RPL. RPL, like RPN, is *weird* to the rest of the world. I mean, it's an infix world out there, by and large. RPL is even weirder since it carries the postfix notion and stack orientation beyond where the RPN models left off.

To give some idea of what I view as "normal" coding, here's how I would code the GROB example in Perl:

But first, a word about curly braces. ({}). See those nice braces? I can't get them into the [pre] section below. Not only that, but when I type them here, they echo as "|" and "]" in the editor. But they render just fine in the HTML. Have I offended the HP Calculator gods by calling RPN "weird?" Will my calculator collection get up in the middle of the night to give me a good talking to? Let's hope not! 8)

```
open IN, "blank.grob" or die $!; # No native GROBs, of course.
my @grob_data=(<IN>);            # slurp all the data in the file into
(named) memory
for (my $i=1;$i<7;$i++){         # Very "C" like iterator
   open IN, "die$i" or die $!    # no need to close in Perl
   push @dice_images, [(<IN>)]   # semi-anonymous data, Perl style
   # The brackets [] create an anonymous array reference whose
   # content is the lines of the file currently open under the IN
   # file handle. This array ref gets pushed into the @dice_images
   # array, which is a LIFO stack. But in this case there's a name
   # associated with the stack. So the third die image is
   # $dice_images[2] (0 based arrays) and so forth.
}
for (my $i=1;$i<=@dice_images;$i++){ # an array in scalar context returns
its length
  my $x=20*($i-1)+1;
  replace_grob(
               grob_data    => \@grob_data,
               replace_loc  => [$x,30],
               repl_grob    => $dice_images[$i]
  );
}
open OUT ">out.grob" or die $!
print OUT @grob_data;
close OUT;  # This flushes buffers on output, but so does ending the
program.
```

Re: RPL more complicated?

*Message #147 Posted by **Vassilis Prevelakis** on 13 Nov 2005, 7:21 a.m.,*
in response to message #146 by Howard Owen

Before starting let me say that how you do things is a matter of taste, and programming style. No-one can presume to tell you how to do things.

> Quote:
>
> The names themselves take up space, even if you are hashing them.

If you hash the names then you are left with the hash, how are you going to display the name? Also, how will you know you have the correct variable if two names produce the same hash.

Hashing is used to speed up searches not to save memory.

> Quote:
>
> Anonymous stack data: just say "no!" 8)

You are confusing variables with objects. In programming languages you can use variables for temporary values, and they will go away once you exit their scope. In RPL these variables are objects that exist in non-volatile memory until you delete them. This is where the garbage collection issue comes in. Its not the computer that will have to do the GC, its the user.

If the program creates variables and then makes sure they are destroyed, then the programmer is burdened with the GC.

If you use the stack, then the computer does the GC without having you to worry about it. Even if you leave garbage on the stack (bad practice, anyway), the user may have to clear the stack, but he will not have to wonder whether to delete that object or not, anything on the stack is assumed to be temporary.

So, as I said aerlier, its a matter of taste, and programming style. Use whatever style *you* like and feel comfortable with.

> Quote:
>
> There's one other stack oriented oddity in that second example. The "1" placed on the stack before the range of the FOR statement, only to be immediately DROPped off. As the comment states, that's a place holder for the return value of the inner function.

Yes, I do find that rather "odd". My suggestion is to remove that 1, the DROP, and the DUP right after your "inner" program, and insert a "big" (but unquoted) right after your NEXT. Not only does that simplify things and make your program smaller, but there's a speed and run-time memory usage advantage to keeping operations outside of any loop where feasible, so they don't have to be executed in every iteration of the loop.

The "unlimited" stack can indeed be difficult to deal with. Of course, dealing with any program code gets worse if you want to debug or modify code that you wrote quite a while ago, and worse yet if trying to understand someone else's source code. Using local variables can help a lot, as can careful commenting of the source code. Retaining any comments and the source code formatting requires that the source code is within a character string or a file on another device, such as your PC.

On the other hand, even in "True RPN", one has to be careful of where things are on the stack, although with only four stack registers and the LAST X register available, it's arguably less of a chore. But being careful not to try to use more than the available stack can be a bit of a chore too. If storage registers are used, the burden is shifted to keeping track of which storage registers are used, somewhat like keeping track of variables.

The original RPL is what we now call "SysRPL", intended to ease the development of new "operating system" code as calculators became more complicated. Using assembler to develop new ROM code was thought to be too complicated, and apparently none of the existing "higher-level" languages was considered quite right for the calculators, so the new language was developed. UserRPL makes a useful subset of SysRPL available to the ordinary user, with the built-in compilers checking syntax and run-time argument checking of UserRPL operations to protect the user from his own mistakes, as well as checking for a press of the ATTN (or now, CANCEL) key and such details as occasionally checking the battery condition. Perhaps some of the perceived "problems" with UserRPL stem from it being an adaptation of a language not intended for the "ordinary user".

A problem now is that the original developers are no longer available, and HP "rested on its laurels" for a long time, with no development of new calculators or training of new developers. Of course now even most of the developers of the 49G are no longer available "in-house", and the in-house "development team" is very small indeed, with most development (such as the "emulated Saturn processor" and hardware design) presumably out-sourced. I suspect that the developers of the 49G sometimes didn't quite understand the 48GX as a whole, and worked on the areas that they were most interested in, without enough of a look at how changes affected the system as a whole, or due consideration of what "ordinary users" would find most useful. In particular, sometimes the "CAS" causes the 49 series to return results that look far more complicated to me than what the 48 series returns, although they may perhaps make more sense to a "pure mathematician", so may be better for educational mathematics. Sometimes the CAS rather cavalierly uses variables in a "higher-level" directory that it has no business tinkering with, and of course, the CAS routinely fails to restore any modes that it's changed. And now we have such niceties as "styles" (bold, italic, underlined, or inverse) and user-definable fonts, which, while interesting and arguably even useful, may seem a bit out of place on a "calculator". Is it intended to be a calculator with rudimentary character string processing capabilities, or is it supposed to be also a "word processor"? It seems to me that the distinction between "calculator" and "computer" has shifted again. That said, I don't have to use styles or user-defined fonts, but I do pretty well have to put up with the wonderful CAS if I choose to use a 49 series as a "calculator".

But I confess, I actually do use my own custom font, to make ASCII control codes 0-9 and 11-27 distinguishable instead of the same little black square, and make such characters as 0, 7, Z, and z more to my liking. But I consider the user-defined fonts to be a frill, rather than essential to a calculator.

That means that the list also hangs around, meaning a reference is kept somewhere to its storage. And GC has to walk the list to see how many and how large the objects it contains are. Because .. why? Because that information isn't kept anywhere else? Must be it.

It's complicated, at least to me. Mercifully, a good deal of the "magic" of RPL (even SysRPL) is hidden from the user by "smoke and mirrors" (well, perhaps "multiple layers of indirection" would be more technically correct). Most of the time, the details of exactly how memory is managed are important only to assembly language programmers, and perhaps not all that much to them. With the "internal" languages, it's mostly a matter of knowing under what circumstances a GC may occur, and being

careful that a GC isn't going to conflict with the execution of the code. But sometimes, knowing a bit about what really goes on "behind the scenes" can be interesting, and even useful, to even "ordinary" UserRPL programmers.

Although I'm fairly experienced in UserRPL, I'm not qualified to explain the details what goes on what goes on "behind the curtains", particularly where it gets into assembler.

I'm tempted to explain more of what I do understand, but it would be very complicated, very lengthy, and mostly irrelevant in this forum. If you really want to know more about the "internals" of RPL, I suggest looking in the "usual places" such as http://www.hpcalc.org/, http://m.webring.com/hub?ring=hp48, searching the newsgroup archive at http://groups.google.com/group/comp.sys.hp48?, and the information available in the MoHPC CD set/DVD. If you still have a question, ask on the newsgroup.

> Quote:
>
> So anonymous data on the stack is hard for machines and humans both? 8)

I don't understand what you mean by "anonymous" in this context.

Nothing simply appears on the stack without a reason, and every object contains the information to identify which type of object it is.

Anyway, for composites and GC, the problem isn't so much what's on the stack as it is skipping through composites in TEMPOB, although what pointers are on the stack certainly determines whether GC has to do this, and how many times it has to be done.

Notably, don't keep anything that you no longer need on the stack. Among other considerations, a GC has to look at every pointer on the stack.

> Quote:
>
> C'mon, the unlimited stack isn't just provided, it's a central feature of the machine's architecture.

Okay, the operating system does use the stack a lot, but that's mostly hidden from the user. For the user, it may well be convenient to use a few more than the four levels available on a "True RPN" calculator. In some cases, a large meta-object may be used on the stack (and usually, combined into a new composite or array after it's been operated on), but I doubt that many users keep even a dozen objects on the stack as a general rule. A 4-level stack for the user may suffice in many cases, but that's up to the individual user with RPL.

> Quote:
>
> The names themselves take up space, even if you are hashing them.

Huh? Names aren't hashed. And yes, of course they take up space.

> Quote:
>
> An 8 character variable name is nothing on a machine with 128K, or even 32K.

Well, let me see now, an 8-character name takes up 11.5 bytes unquoted, or 16.5 bytes quoted. But for local variables, I usually just use 1-character names, which each use 4.5 bytes unquoted, or 9.5 bytes quoted. After all, it's not likely that I'll be using all that many local variables in a program, so that's enough to tell me what it's for. I do know a SysRPL programmer who would be very happy to find a way to shave 14 nibbles off of his programs, but for me, saving keystrokes is the main reason, although saving bytes helps.

Of course, the code for setting up each local environment uses 7.5 bytes too.

And the local environment must use up some memory too, while it exists, but I don't know how much.

Each stack pointer to an object uses 2.5 bytes. While it exists in TEMPOB, an object takes up an extra 3 bytes beyond its own size. Each stack manipulation command uses 2.5 bytes.

I expect that, at least in most cases, using local variables will indeed use more memory than keeping objects on the stack, but as you note, the extra memory requirements may be considered negligible in all RPL models except the 28C.

> Quote:
>
> But User RPL debuted on the HP-28C, with, what was it, 2K?

Perhaps 2KB, but only about 1700 bytes are actually available to the user, and that's with last command lines, arguments, and stack saves diabled.

I think we can agree that the 28C is rather crippled by it low memory capacity. I guess that releasing it with so little memory could be considered a "marketing experiment".

> Quote:
>
> But, point taken. The major difference between stack oriented and variable oriented processing on the 48G must be the time it takes to create those local variables.

And the time for retrieving or replacing the contents of local variables (these entail a "search by name"), and abandoning the local environment at the end.

And of course, "ease of use" and individual preferences.

But don't assume that stack oriented programs will necessarily be faster. Any operation does take some time. For example, ROLL or ROLLD, particularly with a high stack level and iterated in a loop, take an appreciable time, and accessing a local variable is reasonably fast, as is accessing a global variable at the beginning of the current directory.

Since any local variable requires a "defining procedure" (a program or algebraic, or FOR or START loops with their index local variable) it would be unusual to use one outside of a program, although one can do so from the command line, which is in fact compiled to a secondary (the SysRPL version of a program) by ENTER.

Each style of programming has its advantages and disadvantages. It may well be that the choice of "variable-oriented" or "stack-oriented" programming, or which mixture of styles, is mostly simply a matter of individual preference.

Regards,
James

in response to message #148 by James M. Prange (Michigan)

James,

Thanks again for a thoughtful response.

> Quote:
>
> My suggestion is to remove that 1, the DROP, and the DUP right after your "inner" program, and insert a "big" (but unquoted) right after your NEXT.

Thanks. I'll do that in the current version, which retains the kludge.

> Quote:
>
> *Quote: So anonymous data on the stack is hard for machines and humans both? 8)*
>
> I don't understand what you mean by "anonymous" in this context.

I mean "unnamed," which I believe is the dictionary definition of "anonymous." Data on the stack has no name, but is addressed by the user by its position on the stack.

> Quote:
>
> Each style of programming has its advantages and disadvantages. It may well be that the choice of "variable-oriented" or "stack-oriented" programming, or which mixture of styles, is mostly simply a matter of individual preference.

If you like, hop on over to this thread, where we are discussing what a fusion of RPN and RPL might look like. We could use the perspective of an RPL fan.

Regards,
Howard

Re: RPL more complicated? No, Simpler Than TI-Basic

*Message #150 Posted by **I, Claudius** on 10 Nov 2005, 6:33 a.m.,*
in response to message #58 by Howard Owen

RPL is simpler than TI-Basic. I progam my 49 a lot, also have a TI89. Programs that have the same function are almost always shorter and faster in RPL on the 49 than the 89, neglecting processor speed differences.

TI definitely won the calculator war, but not on programming merits. I've never seen any math/science/engineering professor teaching calculator programming, by the way. Bright kids who are inclined to program will do so on their own, learning from a variety of sources.

The reasons TI dominates the market are: their machines are good quality, easy to use right out of the box, and TI did a great job of selling to educators.

RPL/TIBasic

*Message #151 Posted by **bill platt** on 10 Nov 2005, 9:32 a.m.,*
in response to message #150 by I, Claudius

Or in other words, 99 44/100 % of graphing calculator buyers have no intention of programming anything--the programmability is not in their minds *at all* wit hregards to purchasing.

Re: RPL/TIBasic

*Message #152 Posted by **I, Claudius** on 11 Nov 2005, 8:22 a.m.,*
in response to message #151 by bill platt

I think you're right here. It's another reason why TI calcs are so popular: they're so easy to use and do most everything right out of the box.

TI's are fairly easily programmed in TI-basic, though, and thousands of programs have been written for them from kids to pros. Check out the immensive archive at www.ticalc.org Sad part is half of them seem to be games.

Re: RPL more complicated? Do you want to start a flame war???

in response to message #47 by James M. Prange (Michigan)

Is Linux better than *BSD?

Is Windows superior to Linux?

Is RPL better than RPN?

Come on, stop wasting everybody's time with silly questions like these.

Don't like it don't use. That's my rule.

So anything *anybody* says in this forum is not going to change this.

=> the discussion is pointless

**vp

pointless, or not

*Message #154 Posted by **bill platt** on 11 Nov 2005, 9:05 a.m.,*
in response to message #153 by Vassilis Prevelakis

Hi Vassilis,

I don't think this discussion has been pointless. Rather than arguing "mine's better" or something, we have been making some progress towards understanding *why* we feel one is more difficult.

That may be boring to you (you may have already figured it out!) but not to some of us--me included.

BTW as you are a person with considerable interest in outer space, I thought I'd relay a story I told the other day:

The press go all excited about the X-prize for a little while, and Bert Rutan even started to let it get to his head enough to change his mind and start considering an orbital mission as being within the cards sooner rather than later.

So I took a piece of paper, drew a circle on it, and drew a 60 mile high "prick" on the circle. Then I completed the "orbit" that they made--pretending the earth was not in the way. It is of course a very elliptical orbit--looks like a straight line on a piece of paper.

Then I drew a picture of the 1st Mercury orbit. A big circle more or less, only slightly bigger than the earth.

The reaction was pretty dramatic. The visual nature of the difference in energy is striking. In other words Rutan did something great, but even by his own earlier admission, nowhere near the big leagues yet.

Another method of explanation that I used on somebody who did not really get the picture part: "Throw a ball 50 feet in the air. Dfficult? Not really. Now, throw it 50 feet in the air while also getting it to go 385 feet horizontally. Now how difficult was it?"

The light-bulb came on. It is sort of fun figuring out how to de-mystify some of these problems "for the masses".

To some extent, this discussion about RPN/RPL is a delf-directed group "demystification exersize".

Regards,

Bill

Re: Latest 33s Display is Indeed Improved

*Message #155 Posted by **Dave Bernazzani** on 11 Nov 2005, 3:03 p.m.,*
in response to message #1 by Paul Brogger

As another point of reference, the local Walmart had 3 HP33S units. Two were the older, smaller and harder to read decimal point. They had a serial numbe in the CNA 4xx range. One of the units had a much nicer display - bigger comma and DP and just generally much easier to read. Some of the major bugs seemed to have been fixed (I only tried the cNr and polar conversion but I assume other issues were fixed). This much better 33S had a serial number that started with CNA 532 (which places it mid-2005-ish). Fortunately, HP puts the SN on the back of the blister pack. I never used an older poor-display 33S other than the display model and didn't buy one because of that issue (the bugs were unknown to me at the time). The newer unit seems much improved.

ALG/RPN (and more) in the new Platinum

*Message #1 Posted by **Vieira, L. C. (Brazil)** on 7 Nov 2005, 2:54 p.m.*

Hi, all;

I just grabbed a new HP12C Platinum (with parenthesis, back-arrow and undo) and I realised that, now, neither [f][ALG] nor [f][RPN] clear stack register contents. Also, [f][PRGM] in normal, RUN mode cause the program pointer to return to step 000. Finally, if the calculator is in ALGebraic mode and you enter interest rate through [g][12÷] or number of periods through [g][12×] and immediately after that you try to compute the unknown financial value, you no longer need to press the same key twice.

The IRR issue for small values is also corrected.

If we consider that these were particular characteristics of the previous HP12C Platinum, the new one has its own set. And it is considerably fast, though.

Anything else being observed with the new model?

Cheers.

Luiz (Brazil)

Edited: 7 Nov 2005, 2:56 p.m.

Re: ALG/RPN (and more) in the new Platinum

*Message #2 Posted by **Gene** on 7 Nov 2005, 4:21 p.m.,*
in response to message #1 by Vieira, L. C. (Brazil)

Hi Luiz!

1) ALG/RPN not clearing the stack...that's a feature, not a bug :-)

2) I believe the f PRGM in run mode does what it did on the black/gold 12c now. Don't have that one handy, but I think that's correct.

3) Yep...this is/was a bug fix.

4) Small IRR...yep, that means my friends in Brazil can rest easy. :-)

Other than #1, this is as the black/gold 12c, I think. That's a good thing.

Keep an eye open for a good set of games written for the new 12cp from Tony Hutchins. They will show up in future Datafiles.

How much do 12cp's cost in Brazil?

Hope all is well! Gene

in response to message #2 by Gene

Hi Gene, guys; (I confess I was about to write you an e-mail, but I missed the opportunity...)

The HP12C Platinum costs about R$420,00 in the regular, official market. If main commercial taxes are deducted, it goes to regular R$220,00. In some circumstances (not to be discussed here, though...), you can buy one for about R$270. I am not sure if the new version is already available here, neither in regular nor in alternate commerce.

About the IRR issue: thank you, Gene, for your invaluable help.

Best regards.

Luiz (Brazil)

in response to message #3 by Vieira, L. C. (Brazil)

Well, you (or some friends down in Brazil) found it - I didn't do much of anything! And, I think there are some instructions based on your suggested fix available from HP somewhere online... :-)

What's the equivalent US cost of those 12cp's?

Re: ALG/RPN (and more) in the new Platinum

in response to message #3 by Vieira, L. C. (Brazil)

Hi Luiz,

R$100 tax on R$220? Ouch! Wasn't the Aerospace business supposed to make so much money from exports that taxes like that could be eliminated?

OT: prices of calculators in Brazil (was: ALG/RPN (and more) in the new Platinum)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 8 Nov 2005, 12:14 a.m.,*

in response to message #6 by bill platt

Hi Bill, all;

in fact, but remember we're talking about Brazil. And some things happen in here that, although history may tell us a reason, only history would know this so-called reason. The problem is not exactly when the product leaves USA; in our case, the actual 'problem' resides in its delivery... Brazilian taxes over industrialized products (known here as IPI, or 'Imposto sobre Produto Industrializado') and others are, by themselves, so high that, in some cases, they go close to 50% of the final consumming COST, then we have commerce margin...

The fact is that most of the technology that is 'consummed' in Brazil is of foreign origin. I myself believe that as other countries have their own technology, we more than likely might also have ours, but in a moment in history where many countries were developping their own technology in many 'high-tech' areas, somehow Brazil decided that it would be less expensive to buy their final products instead of investing the same way inside here (reasons 'unknown'). I know other countries have done the same because of their own, very reasons, and that, in some cases, results were differently taken by their people. In our case, consumming foreign technology (no local equivalent, most cases) has its consequences...

(Please, in the following analysis, consider all references to product price as related to the HP12C Platinum) That's why a close to US$80 (US$105 is the MSRP, right?) product is regularly sold in Brazil for about R$450. If the straight current conversion is applied (US$1 ~= R$2.2) we have no more than R$176. The alternate commerce (final price: R$250) gives us a ~42% add-on, including profit and some expenses. The regular commerce (final price: R$450) asks for a ~156% add-on, that might include the regular commerce taxes (Brazil) + expenses + final profit. I know that final profit in terms of regular commerce is, depending on some circumstances, either lower or higher than that practiced in alternate commerce.

This is a very, very raw (and macro) analysis from the point of view of an engineer. Economists would see (and explain) it differently; in fact, terms like 'internal commerce protection' and 'incentive to local developments' would arise, but other considerations like 'extreme profit for those who only see profit' (not commerce, instead those who are interested on this scenario) would be intentionaly omitted. As this is a technology forum (not an economy one), I think that putting things straightly simple would be 'fitting them in'.

Oops! Wrote too much. Sorry! at least I hope it makes sense in all aspects, though. And I hope this elucidates a bit for you, Bill.

Please, forgive any typos (no spell checking).

Cheers.

Luiz (Brazil)

Brazil Tech

*Message #8 Posted by **bill platt** on 8 Nov 2005, 10:15 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Luiz,

It's ironic that in fact Brazil had an HP factory that made 12c calculators.

I have flown on "Embraer" aeroplanes--made in Brazil. How much tax revenue comes from the Ariannespace launching facility?

Must be more of them.

We used to have our own manufacturing in the USA but we don't anymore. But we do have technology. But not for long. But we'll have something else I suppose. Or we will have a more balanced economy at a lower standard of living (most likely outcome--our standard is pretty excessive!).

It sounds like the Politicos in Brazil are doing what Politicos do best everywhere: hoodwinking. By making technology expensive, they dramatically slow growth. Without tools, one cannot build more tools. But someone is getting rich on this policy--just follow the money trail. My bet is Big Landowners-big agrarian?

We have the same sort of hoodwinking here. A recent (this week) proposal to modify a major portion of the federal income tax with regards to deductions of real estate interest payments has led to this huge resistance from the "realtors" and the "experts" who all put their arms up and say how it will "harm" the average american. And yet they quote no figures. When I run the numbers, I see benefits for 90% of the population, and increased taxes for the richest 10%.

The powerful like to pretend they are our friends and protectors. Like Great France--the nanny state par excellence. Too bad they have so many slums. Their (the politicos) motives are impure as is always the case.

But I digress :-)

I use an HP to do all my financial calculations :^)

Without tools, one cannot build more tools. But someone is getting rich on this policy--just follow the money trail. My bet is Big Landowners-big agrarian?

Exactly what I tell my students in order to try showing them that technology ownership goes beyond financial power. About the big landowners, I guess that their way of enhancing their ownership is a little bit different. as you mention, Politicos are the ones to take advantage.

About Embraer: I know some guys that have already worked there, and most of their design is local. Part of the technology happens to be developped here, but I cannot tell the percentage of nacional technology in each airplane.

I'd go a bit ahead about HP fasctories in Brazil. Internal policy and foreign interests moved factories from here to elsewhere. Once we know how to deal with technology, we are able

to go ahead.

Oops! Once again I'm driftting...

Cheers.

Luiz (Brazil)

HP48g - Arithmetic Rounding querry

*Message #1 Posted by **Caribe T** on 7 Nov 2005, 7:40 a.m.*

I am sure there is a reason for this explained somewhere in the manual, but I am hoping that someone knows the answer off the top of their head. As an example,why is it that I get the following - equating: '5/3' (or 3, 'SPC', 5, /) = 1.66666666667 (which gives me '5/3' if i put it back as a fraction.

But if I do '5*(1/3)' (or 5,'SPC', 3, '1/x', x) = 1.66666666666 (which gives me '62500000003/37500000002' as a fraction; which is of course the exact solution of the 1.66...6 solution).

How do I prevent getting the second answer?(other than just by entering the equation in using the first method). Reason that I ask is that during exams I don't want to have to be always worrying about what format I should be entering the problem (so as to not get a large fraction as above.) I am supposing that there is a setting that I may need to change. Can anyone point me in the right direction here? Thanks

Re: HP48g - Arithmetic Rounding querry

*Message #2 Posted by **Arnaud Amiel** on 7 Nov 2005, 8:49 a.m.,*
in response to message #1 by Caribe T

My 48 ran out of batteries but my 49 suggests that using ->QPi (where Pi is the greek letter) should help.

Or if you have a connection cable you should try: QPI from hpcalc.org

Re: HP48g - Arithmetic Rounding querry

*Message #3 Posted by **Chris Dean** on 7 Nov 2005, 11:14 a.m.,*
in response to message #1 by Caribe T

I would hazzard a guess that it is to do with the order that the expression is calculated.

5 * (1 / 3) = 5 * (0.333333333....) = 1.666666666666.....5 and rounded 1.666666666666....6

5 / 3 = 1.6666666666666666666.....6 and rounded 1.6666666666666666...7

You can replicate this problem with any calculator.

Edited: 7 Nov 2005, 11:37 a.m.

Re: HP48g - Arithmetic Rounding querry

*Message #4 Posted by **Tom Steiner** on 7 Nov 2005, 2:13 p.m.,*
in response to message #3 by Chris Dean

That would have been my guess as well. But my 12C Platinum calculates 1.666666667 either way.

Re: HP48g - Arithmetic Rounding PROBLEM?

*Message #5 Posted by **Caribe T** on 7 Nov 2005, 2:57 p.m.,*
in response to message #4 by Tom Steiner

Yeah my Casio gives the me correct fraction regardless of how I enter it.....

What confuses me again is this: '2/3' = 0.666666666667 (which in turn gives me '2/3' as a fraction.

But if I do '2(1/3)' = 0.6666666666666 - this gives me '2/3' as a fraction.

Can anyone figure out the inconsistency from this and the initial problem I mentioned?

Re: HP48g - Arithmetic Rounding querry

*Message #6 Posted by **Gunnar Degnbol** on 7 Nov 2005, 5:30 p.m.,*
in response to message #4 by Tom Steiner

> Quote:
>
> That would have been my guess as well. But my 12C Platinum calculates 1.666666667 either way.

It depends on the rounding. 0.33...333 * 5 is 1.66...665. This is one digit too much, so the final 5 has to be either truncated or rounded. ...665 is right between ...660 and ...670, and there are different methods in use. Half-up always rounds 5 up, and so the result is ...67. Half-even (sometimes called banker's rounding) rounds fives to the nearest even digit, which in this case is 6.

The advantage of half-even rounding is that it gives a better statistical distribution of errors, because 5 really is right between 0 and 10, and always rounding up isn't fair.

This makes interesting reading (includes code)

*Message #7 Posted by **Valentin Albillo** on 8 Nov 2005, 10:55 a.m.,*
in response to message #6 by Gunnar Degnbol

Hi, Gunnar:

This link features an interesting and worthwhile discussion on rounding, and includes simple code to implement most usual rounding strategies.

Best regards from V.

Re: This makes interesting reading (includes code)

*Message #8 Posted by **Gunnar Degnbol** on 8 Nov 2005, 3:09 p.m.,*
in response to message #7 by Valentin Albillo

Thank you, It is very interesting.

I knew about the difference between VBA and Excel, but I was not aware that they had such a

mess across their product line, and I had not noticed that Java had a homebrew not-seen-anywhere-else round() function.

Mike Cowlishaw's General Decimal Arithmetic Specification has a list of all the rounding modes you may need when things are actually designed, and not just happens.

This is a superset of the modes described in the IEEE 854 standard, and implemented in the HP 71B.

He has the following note:

> Quote:
>
> The term ‘round to nearest’ is not used because it is ambiguous. round-half-up is the usual round-to-nearest algorithm used in European countries, in international financial dealings, and in the USA for tax calculations. round-half-even is often used for other applications in the USA, where it is usually called ‘round to nearest’ and is sometimes called ‘banker’s rounding’.

Re: HP48g - Arithmetic Rounding querry

*Message #9 Posted by **J-F Garnier** on 8 Nov 2005, 3:16 p.m.,*
in response to message #6 by Gunnar Degnbol

Another example of half-even rounding (in Saturn-based HP calculators):
1E12 1 - 2 / gives 500000000000 (rounded up from 499999999999.5)
1E12 3 - 2 / gives 499999999998 (rounded down from 499999999998.5)

CalcPro - Buyer Beware!

*Message #1 Posted by **I, Claudius** on 7 Nov 2005, 4:36 a.m.*

I once placed an order with CalcPro, www.calcpro.com, and only received part of it. Attempts to resolve the problem were never responded to, and thus I've never done business with it again.

Now it seems CalcPro has sold pirated books without reimbursing the author, among other complaints:

http://groups.google.com/group/comp.sys.hp48/browse_frm/thread/a4db63204e4e81b7/9c564f6fcc921647?tvc=1#9c564f6fcc921647

It appears this CalcPro may be in the same ethics league as Coburlin, buyer beware!

Re: CalcPro - Buyer Beware!

*Message #2 Posted by **JDH** on 7 Nov 2005, 7:23 a.m.,*
in response to message #1 by I, Claudius

I've ordered off CalcPro in the past without an issue, good reliable service in my case.

Re: CalcPro - Buyer Beware!

*Message #3 Posted by **James F. Chumbley** on 8 Nov 2005, 3:51 a.m.,*
in response to message #1 by I, Claudius

Any details you can post or send me on Coburlin?

Re: CalcPro - Buyer Beware!

*Message #4 Posted by **I, Claudius** on 8 Nov 2005, 7:19 a.m.,*
in response to message #3 by James F. Chumbley

Read threads below. Probably the most interesting comment came from Coburlin himself, who considers his customers "dumb." Ready to give him some business?

Many here want only discussions of technical issues, and don't like postings of business stuff. I and several others feel that pointing out bad business practices and frauds is just as important as hardware and code. If you can't make a good or honest purchase you might as well start manufacturing your own calculators.

Re: CalcPro - Buyer Beware!

*Message #5 Posted by **John Nguyen** on 14 Nov 2005, 11:42 p.m.,*
in response to message #1 by I, Claudius

I just ordered an HP-82241A AC Adapter for the IR printer and an HP 49G Advanced User's Guide from CalcPro with no problem. I didn't expect the AC Adapter to be brand new (it isn't) but it is in excellent shape. The 49G guide came with the shrink wrap still on. Anyway, these aren't exactly big, expensive items.

John

Re: CalcPro - Buyer Beware!

*Message #6 Posted by **I, Claudius** on 16 Nov 2005, 8:30 a.m.,*
in response to message #5 by John Nguyen

The crowd is cheering your good fortune to be one of the few with a completed order...

Re: CalcPro - Buyer Beware!

*Message #7 Posted by **Ed Look** on 16 Nov 2005, 11:36 a.m.,*
in response to message #6 by I, Claudius

To be fully honest, I haven't really had a problem with CalcPro. Stuff might have been some days late, but it did come.

Now, I have received stuff I never ordered, but I always returned it to them.

Re: CalcPro - Buyer Beware!

*Message #8 Posted by **Hal** on 16 Nov 2005, 11:42 a.m.,*
in response to message #7 by Ed Look

According to CalcPro's home page, the 33s is a graphing calculator. ...interesting.

Re: CalcPro - Buyer Beware!

*Message #9 Posted by **Iqbal** on 16 Nov 2005, 8:52 p.m.,*
in response to message #8 by Hal

I like dealing with Calcpro. Never had a problem with any order. Probably just a one off situation.

Re: CalcPro - Buyer Beware!

*Message #10 Posted by **John Nguyen** on 16 Nov 2005, 8:59 p.m.,*
in response to message #6 by I, Claudius

I actually ordered these items before I noticed your original posting (or maybe it was someone else's) warning the buyer. My stomach was in knots until after the package arrived. If CalcPro was a questionable operation, I count myself lucky this time.

HP 34C battery pack

*Message #1 Posted by **Steve from peru** on 6 Nov 2005, 6:06 p.m.*

I just found my old HP 34c and i am trying to get it up and running. The original battery doesnt seem to want to take a charge. Does anyone know the technical specs for these batteries, and how I might find a modern replacement. thanks.

Re: HP 34C battery pack

*Message #2 Posted by **Gerson W. Barbosa** on 6 Nov 2005, 7:09 p.m.,*
in response to message #1 by Steve from peru

Just read the recent thread **Batteries for 41CV or 33E**.

Gerson.

Re: HP 34C battery pack

*Message #3 Posted by **Paul Marin** on 6 Nov 2005, 8:42 p.m.,*
in response to message #1 by Steve from peru

I've been using 2 x AA 1.5v alkalines in my 33E for over 1 year. No problems

This is a quick no fuss fix only. It suits me fine. You can repair the existing pack based on info on this site

Paul

1.5V "AA" will break the battery contacts...

*Message #4 Posted by **Karl Schneider** on 6 Nov 2005, 10:24 p.m.,*
in response to message #3 by Paul Marin

... because they are longer, and depress the curved part of the contacts more. The contacts will fracture along the crease between the riveted flat part and the curved part.

There are two designs of Spice (31/32/33/34/37/38) battery pack; either can be disassembled and rebuilt properly with 1.2V rechargeable flat-top "AA" cells (without posts).

I would eventually like to use Katie Wasserman's procedure to install stronger fabricated contacts, allowing use of either longer 1.5V cells (jumpered by aluminum foil) or a rebuilt pack.

-- KS

Re: 1.5V "AA" will break the battery contacts...

*Message #5 Posted by **Paul Marin** on 7 Nov 2005, 6:15 p.m.,*
in response to message #4 by Karl Schneider

Have had no such problems. Contacts have flattened yes, but remain this way with no other forces on them. The pressure of the batteries is very light. They will fracture if bent backwards and then re-flattened continiously, but if they stay as they are, there is no problem. I don't use the re-built pack therefore I never needed to readjust the contacts, therefore no fracture will occur unless I start fiddling with them. I have had to re adjust contacts in remote controls for eithertv's dvd's or stereo's and I've used pliers to pry them closer to maintain good battery contact and I've never had problems with fractures and some of these remotes are cheap units from China and Taiwan. My 2 cents worth

Paul

Re: 1.5V "AA" will break the battery contacts...

*Message #6 Posted by **Karl Schneider** on 8 Nov 2005, 12:39 a.m.,*
in response to message #5 by Paul Marin

Paul stated,

> Quote:
>
> Contacts have flattened yes, but remain this way with no other forces on them. The pressure of the batteries is very light. They will fracture if bent backwards and then re-flattened continiously, but if they stay as they are, there is no problem.

If the contacts have flattened, then some metal fatigue has already taken place. The force of contact using longer cells is certainly higher than intended by design. Certainly, repeated flexing due to continual removal and re-installation of cells would fatigue the contacts faster. If you are using disposables (as indicated by "1.5V") and are also using the calc regularly, replacement will be required. That's why the HP LED-based models were designed for rechargables.

The two HP-34C's I bought on eBay turned out to have fractured battery terminals. I strongly suspect that this was caused by use of longer 1.5V disposables after the US$12 (in the 1980's!) rechargeable pack gave out. One of them was advertised as having good contacts, but one contact simply broke upon a light touch. It looked fine, but clearly was fatigued and cracked.

-- KS

Re: 1.5V "AA" will break the battery contacts...

*Message #7 Posted by **Paul Marin** on 8 Nov 2005, 5:19 p.m.,*
in response to message #6 by Karl Schneider

Karl, I'm not debating that with constant bending that the contacts wouldnt break. The original rechargable pack flexes the contacts just like any electronic device that uses metal straps to engage the cells. I've just pressed mine flatter to the point where the AA's press lightly enough to make the contact. We are not talking imence pressure exerted here that flex the contacts millimeters each time they are inserted or removed. If mine break in the near future, I'll post a log of how long they lasted. PS The owner of this 33E I own is by coincedent my employer, who happens to be a mechanical Engineer. I did consult his knowledge on what I had done and he believes that the contacts should last once flattened.

HP Ports

*Message #1 Posted by **danny** on 6 Nov 2005, 11:36 a.m.*

I have a survey card in port 1 and a ram card in port two.. once inserted their is a process I go thru to enter into the tripod data system for surveyors... I have just changed the batteries and have reentered the cards, now the calculator will not let my process get entered so I can get back to the program, it keeps telling me no memory, I've never seen it do this, can you help or tell me where to go for help,

Re: HP Ports

*Message #2 Posted by **Randy** on 6 Nov 2005, 12:18 p.m.,*
in response to message #1 by danny

Pulled from the TDS manuals:

1. Turn your HP 48 GX OFF
2. Remove any cards you may have plugged into your 48.
3. Insert your TDS-48 GX Surveying Card into Port 2 of your HP 48 GX. Ports 1 & 2 may be identified by the graphic on the back of the HP 48 GX.
4. Turn the 48 [ON] and clear the system memory by pressing [ON], [A] and [F] simultaneously. A message will appear asking to try to recover memory - select NO.
5. Type, [alpha] [alpha] T D S 4 8 and press [Enter]
6. The following messages will appear on the display as the installation is taking place: Installing Library... Completed.
7. When prompted to insert your RAM Card, turn your HP 48 GX OFF. Move the Survey Card from Port 2 to Port 1 and insert the RAM card in port 2.
8. Turn your 48 [ON] and once again type [alpha] [alpha] T D S 4 8[Enter]

The first time that you install a RAM card, which has not been used previously with TDS-48 GX, the unit will prompt you with the message “Erase all data in port 2? [Y/N].” All data stored on this card will be lost when you press [Y], so be certain that you do not need any data stored on the card. In order for the program to continue you must enter [Y] to this prompt.

If you have installed the RAM card properly and you get a “No RAM card in port 2” error message, you probably have the write protect switch on you RAM card set.

41c 1/2N battery woes

*Message #1 Posted by **Hal** on 6 Nov 2005, 2:32 a.m.*

Does anybody out there rebuild the rechargable battery pack for the 41's? My local Batteries Plus won't order the required 1/2 N's because the manager says he can only order a case of 50, and he doesn't want to be stuck with the remaining 46.

Any help greatly appreciated.
Thanks, Hal

Re: 41c 1/2N battery woes

*Message #2 Posted by **Randy** on 6 Nov 2005, 8:22 a.m.,*
in response to message #1 by Hal

Just use ni-mh 1/3 AAA's and a piece of 1/16" double sided sticky foam to take up the extra volume. Gold Peak has one rated at 160mah which is almost 2.5X more capacity than the original HP 1/2 N cells.

Re: 41c 1/2N battery woes (HP-41 Rechargeable Battery Pack)

*Message #3 Posted by **James F. Chumbley** on 8 Nov 2005, 3:36 a.m.,*
in response to message #1 by Hal

Hi, Hal,

I would recommend that you contact Mark Hoskins (waterhosko@aol.com). I have bought several hand-made rechargeable battery packs--as well as numerous other items--from Mark, and I am almost certain that one of these was a rechargeable battery pack for the HP-41 Calculator. Of all the suppliers from whom I have ever ordered on ebay, the man I would recommend the highest is Mark Hoskins. All product has been ideal, delivery has always been on-time or sooner, and prices have been most reasonable.

Unfortunately, however, Mark is not perfect; he is from Chicago, yet is NOT a White Sox fan. Dante has these people encamped in the seventh circle of hell, If I remember correctly. I am a Brooklyn Dodgers fan, myself.

Oh, by the way, if you mention my name to Mark, I'm sure that he will at least double the price he would normally have been going to charge you.

Regards, Jim Chumbley

to: Hal, hal4635@msn.com cc: Mark Hoskins, waterhosko@aol.com

Angell Martin and SandMath III

*Message #1 Posted by **PeterP** on 6 Nov 2005, 12:47 a.m.*

Hi, Angel if you are around (or if anyone knows how to find Angel) - I'm interested in a docu (at least a QR) for your fabulous Sandmath III mod. Any chance something like that is available anywhere? Cheers Peter

Re: Angell Martin and SandMath III

*Message #2 Posted by **Gene Wright** on 6 Nov 2005, 8:07 a.m.,*
in response to message #1 by PeterP

And QR guides of some sort for your other great modules. :-)

Maybe a listing of commands and what they do?

Gene

Re: Angell Martin and SandMath III

*Message #3 Posted by **Ángel Martin** on 7 Nov 2005, 4:35 a.m.,*
in response to message #2 by Gene Wright

Yes, I'm still around - albeit with little time left for hobbies... but I'd better put some documentation together before even I forget what the module functions do (unforgiving time-passing, amazing how things fade away in our brains).

So let me see, I can prepare a QRG during the next couple of w-ends, hope that's enough to get the basics covered.

Best, ÁM.

Re: Angell Martin and SandMath III

*Message #4 Posted by **Gene** on 7 Nov 2005, 8:19 a.m.,*
in response to message #3 by Ángel Martin

Wonderful! Many thanks for the roms and the upcoming QRG's. ;-)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 10 Nov 2005, 12:13 a.m.,*
in response to message #6 by Ángel Martin

Hi, Angel;

I`m about to finish assembling the MLDL2000 and soon I`ll grab both a NoV32 and a NoVRAM. So, I`ll be loading as many ROM`s as possible. Based on what I (we) saw in your 41Z and what I read in the SandBox manual, the SandMath is something to dare delving into. As I have not been in contact with the ROM itself so far, a QRG will be the best guide, though.

So, if you allow me to:

lcvieiraNOSPAM at quantica dot com dot br

(remove the NOSPAM, please)

Thank you so much.

Luiz (Brazil)

Re: Angell Martin and SandMath III

*Message #10 Posted by **Marcus von Cube, Germany** on 10 Nov 2005, 5:22 p.m.,*
in response to message #6 by Ángel Martin

Ángel,

can you paste the QRG in an article here in the articles forum? This way, everybody has the info. If pasting in an article doesn't work (because of formatting), the curator may allow you to upload the document and create a link somewhere on this site.

Marcus

MLDL - How to convert mod files

*Message #1 Posted by **PeterP** on 5 Nov 2005, 7:49 p.m.*

Hi,

Sorry for the silly question - as probably many of you I have access to .mod files of old HP modules. However the amazing new device making many of us happy and sleepless, the MLDL from Meinder, only uses ROM images. Is there a way to convert the MOD files into ROM files? Thanks!

Peter

Re: MLDL - How to convert mod files

*Message #2 Posted by **Wilson (Bill) Holes** on 5 Nov 2005, 8:31 p.m.,*
in response to message #1 by PeterP

Click on the MOD file utility that comes with the V41 source. Load the appropriate MOD file. Highlight the MOD file. Click on INFO. Exit the MOD file utility and you'll find the .ROM in the same directory as the MOD file. I hope this helps...

Re: MLDL - How to convert mod files

*Message #3 Posted by **PeterP** on 6 Nov 2005, 12:41 a.m.,*
in response to message #2 by Wilson (Bill) Holes

Thanks Bill! The "Extract Rom" did the trick. Now my sleep is definitely gone... Thanks alot!

Cheers

Peter

Re: MLDL - How to convert mod files

*Message #4 Posted by **Meindert Kuipers** on 7 Nov 2005, 2:39 a.m.,*
in response to message #2 by Wilson (Bill) Holes

I will support .MOD files in a later version of the software

Meindert

Re: MLDL - How to convert mod files

*Message #5 Posted by **Matthias Wehrli** on 7 Nov 2005, 5:18 p.m.,*
in response to message #1 by PeterP

Yes, I´ve got it!

If you are as crazy as I am, you have 245 pages (FLASH) full of different images... And I´m still not finished.. I think, I really need a second unit, Meindert.

Re: MLDL - How to convert mod files

*Message #6 Posted by **Meindert Kuipers** on 8 Nov 2005, 4:00 a.m.,*
in response to message #5 by Matthias Wehrli

I really did not think there were more images than would fit in the MLDL2000, but you beat me here. Your 2nd unit is on my list ;)

I really want to know if the modules also work and which modules cause problems, but that may be a bit more work than just downloading ....

Meindert

Re: MLDL - How to convert mod files

*Message #7 Posted by **Matthias Wehrli** on 8 Nov 2005, 6:43 a.m.,*
in response to message #6 by Meindert Kuipers

Hi Meindert

Shure. I guess the top of the "problem-making-module-list" will be ServiceROMs, BankSwitching Modules and Autostart Modules. Unfortuantelly I do not have manuals of many of these modules...

BY the way: My MLDL has double memory, is this correct? If so, I have enough space for the rest of the modules ;)

Yours, Matthias

Re: MLDL - How to convert mod files

*Message #8 Posted by **Meindert Kuipers** on 8 Nov 2005, 7:08 a.m.,*
in response to message #7 by Matthias Wehrli

Service ROM is tested and works, bankswitching needs some more extensive testing, but I do n\know that Advantage works. Autostart would be interesting, but should not really cuase problems. I do know that HEPAX does not work.

So if any on the forum has tested ROM images in the MLDL2000, please let me know!

Your extra memory is all SRAM, so less save from power failures (and not tested ;)

Meindert

Re: MLDL - How to convert mod files

*Message #9 Posted by **Marcus von Cube, Germany** on 8 Nov 2005, 6:45 a.m.,*
in response to message #5 by Matthias Wehrli

Matthias,

crazy you are...

Do you really have 245 different images or did you copy some images to more than one page?

Or do you have different versions of the same module?

Marcus

Re: MLDL - How to convert mod files

*Message #10 Posted by **Matthias Wehrli** on 8 Nov 2005, 10:45 a.m.,*
in response to message #9 by Marcus von Cube, Germany

Hi

Most of the images (not modules!) are different, I think about 235. Shure I added CCD A, CCD B, CCD OS/X and CCD modified as they are all different. Note that each ZEPROM needs 16k = 4 pages, so some modules need a lot of pages (for instance the SMI modules). Maybe there is also a Sandbox-3D 4k and 8k version on my MLDL... I found some EPROMs I finally copied into the MLDL (I was waiting for this for a long time).

Matthias

Re: MLDL - How to convert mod files

*Message #11 Posted by **Vieira, L. C. (Brazil)** on 8 Nov 2005, 2:53 p.m.,*
in response to message #10 by Matthias Wehrli

Hi Matthias, all;

any chance to access these different ROM contents? I'm building my MLDL2000 with connectors instead of direct soldering wires and specific add-ons to hold PCB's inside the card reader shelter, so I believe I'll get it ready till this very weekend. I'm recording each step with pictures and, as soon as it is finished and working, I'm posting the complete sequence.

I hope I have as much ROM images as possible, either in the MLDL memory itself or in a PC I'm building just for HP calculators' related stuff (a Celeron 450MHz, 128MBytesRAM, 20GB HardDisk, all of this already with me) with all possible I/O ports. This way, everything I need will be there and HP41 ROM images are always welcome. I myself have the following actual ROM modules:

Extended IO (dont't know which version)
Financial 1C (there is a 1B, with some different listings)
Navigation (don't remember version right now)

As soon as I have the MLDL2000 working, I'm saving these. Please, let me know if there is a way to access the ROM images you mention above. I intend going ahead trying to develop something, if applicable. Or, if you prefer:

lcvieira@quantica.com.br

Thanks and best regards.

Luiz (Brazil)

Re: MLDL - How to convert mod files

*Message #12 Posted by **Etienne Victoria** on 8 Nov 2005, 6:18 p.m.,*
in response to message #11 by Vieira, L. C. (Brazil)

Hi Luiz, my friend!

Sorry to answer before Matthias but many Rom images are downloadable from TOS!

Am I missing something here?? I confess not having an MLDL but these images seem to me the exact format needed by the MLDL!!

Sorry again to interfer!

I'll delete if inappropriate...of course

All the best!

Etienne

Re: MLDL - How to convert mod files

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 8 Nov 2005, 10:17 p.m.,*
in response to message #12 by Etienne Victoria

Hello, Etienne; thank you for your answer!

I have already been at TOS and found at least one of each of the most well known (or early available) ROM's, but Matthias has many versions of the same ROM. I know many of them were revised and updated. I have a FINANCE 1C and once I had the chance to use a FINANCE 1B. The 1C version has part of the listing for a few functions rewriten when compared to the 1B. I printed all of the 1B contents and still have it, but I am worried about the fact that the blue thermal papper is beginning to fade out (it's been more almost two decades since I printed it...).

About ROM and MOD. It seems to me they are different from each other, hence the need to convert, but as I have no operating RAM box so far, I cant tell anything about this.

Thanks again, Etienne. And be well.

Cheers.

Luiz (Brèsil)

Batteries for 41CV or 33E

*Message #1 Posted by **Stephen Easterling** on 5 Nov 2005, 6:43 p.m.*

I'm looking to add a Spice and a Coconut to my collection. I don't really have any preference as to which model as long as it in excellent - mint condition and works properly. While shopping for these (and BTW, if you have one for sale or trade, let me know), what should I be concerned about regarding batteries? Can I use regular Duracell / Energizer / etc. batteries in them, or do I have to use the rechargable batteries that is supposed to come with the calculator? I don't want to damage the calculator with regular alkaline batteries if I'm supposed to use rechargables. Thanks in advance for your suggestions.

Re: Batteries for 41CV or 33E

*Message #2 Posted by **Les Bell** on 5 Nov 2005, 6:49 p.m.,*
in response to message #1 by Stephen Easterling

Spices were rechargeable, but the 41's came with a battery pack for 4 x N-sized dry cells as standard. The rechargeable battery was an option.

Best,

--- Les
[http://www.lesbell.com.au]

Re: Batteries for 41CV or 33E

*Message #3 Posted by **Stephen Easterling** on 5 Nov 2005, 6:58 p.m.,*
in response to message #2 by Les Bell

So if I buy a 33C, 33E, or 34C I need to make sure I use it only with the rechargable battery pack, right? If they're selling just the calculator and case and I don't want to mess with a battery pack, the I should pass on it, right?

For the 41CV or 41CX, I can always run some Duracel "N" batterie, right? My 28S uses them and I never mind staying on top of the battery situation.

Thanks for helping out!

Re: Batteries for 41CV or 33E

*Message #4 Posted by **Les Bell** on 5 Nov 2005, 10:01 p.m.,*
in response to message #3 by Stephen Easterling

I'm no expert on the Spice series, though I did buy a 32E for my girlfriend years ago. But if you get one with a dead battery pack, it shouldn't be too difficult to replace the batteries with new rechargeables.

The 41's, though, have a choice of N cells or the rechargeable pack, though you'd really only want the latter if you're using the card reader more than occasionally.

Best,

--- Les
[http://www.lesbell.com.au]

Another Look at Alkaline vs. Rechargeable Batteries for HP-41

*Message #5 Posted by **James F. Chumbley** on 8 Nov 2005, 3:59 a.m.,*
in response to message #4 by Les Bell

Gulp, pardon me for intruding, but I would like to comment on the remark about the rechargeable battery pack and the card reader usage.

According to HP's own specifications, the Alkaline batteries have 11 times the capacity of a fully charged rechargeable battery pack. If minimizing the cost of batteries is the object, I suppose that one could make the argument that a rechargeable battery pack would be preferable, but if the reliability of the card write/read function is the most important, as it certainly would be to me, then a person should always opt for installing a brand-new set of Alkaline cells before beginning to write or read a long series of cards with the 82104A reader.

Jim Chumbley

Edited: 8 Nov 2005, 4:01 a.m.

Re: Another Look at Alkaline vs. Rechargeable Batteries for HP-41

*Message #6 Posted by **David Smith** on 8 Nov 2005, 11:40 a.m.,*
in response to message #5 by James F. Chumbley

The alkalines have higher capacity, but the nicads can deliver more peak power. Their discharge curve is more suited to the card reader power requirements than the alkalines. You will probably get more read cycles off of a set of freshly charged nicads than fresh alkalines.

Re: Another Look at Alkaline vs. Rechargeable Batteries for HP-41

*Message #7 Posted by **Garth Wilson** on 8 Nov 2005, 1:26 p.m.,*
in response to message #6 by David Smith

So how much current does the card reader take, anyway? And how many seconds does it take to run a card through? One? According to my old Radio Shack battery guide book, running an ankaline N cell at 300mA (which I expect is considerably more than the card reader takes) for four minutes every hour, eight hours a day, with 16 hours' rest (enough for over 200 cards in those four minutes if I remember about how fast they go through, and if it really took 300mA),it should still last 70 minutes of the card reader motor actually running, or about 4000 card passes. I expect however that the card reader takes less than that amount of current, and that probably even the most dedicated user doesn't do 4000 card passes *in a year*, let alone in the self-discharge time of a rechargeable battery. Since you also can't keep feeding them non-stop for four minutes (or even a tenth of that time), there will be more recovery time between them.

I got the tape drive instead. Generally it was a much better solution, but I didn't like the fact that they made it unable to take regular alkaline batteries so I could leave it logging data remotely and automatically for a whole work day. The NiCads were only good for four hours on a charge if they were in new condition, whereas a set of alkalines could have gone a couple of days.

Re: Batteries for 41CV or 33E

*Message #8 Posted by **Stephen Easterling** on 5 Nov 2005, 10:40 p.m.,*
in response to message #1 by Stephen Easterling

Okay, I've reconsidered this. What if... I just used typical rechargable batteries that I find at Radio Shack, Wal-Mart, etc. in leiu of the original battery pack that was designed for the calculators (including models from the Classics, Topcats, Coconuts, and Spice)? This way I could expand my collection to include some of the older HP families without going nuts of trying to hunt down some hard-to-find battery pack designed to only work in this calcs. I really don't plan to use them for hardcore work but to give them an easy life of just doing the bills and a few logarithms at work (no programs or need for expansions cards). I hear a lot of talk about battery packs for these older units and don't want to put myself in a position where I'm always on the lookout for a special part. I want some degree of convenience and accessibilty when it comes to powering these little machines. Thanks again for the help and direction so I can make good decisions to build my collection.

Re: Batteries for 41CV or 33E

*Message #9 Posted by **Hal** on 6 Nov 2005, 2:21 a.m.,*
in response to message #8 by Stephen Easterling

Hi Steve. You won't be able to find original batteries for any of the Spice, Woodstock, or Classic HP's. The rechargables currently available (at Radio Shack, etc) work just fine though. The original batteries for my 29c were rated at 1.25v, and of course they are long since dead, but the Radio Shack NiMH's I'm using now (which are rated at 1.2v) work just fine. I would shy away from using alkalines, as their voltage rating is 1.5v, and I've measured them at 1.7v, which may be getting a bit high (allthough I did use them for a short period in my 29c, with no apparent ill effects). Good luck expanding your collection. Best regards, Hal

Re: Batteries for 41CV or 33E

*Message #10 Posted by **Stephen Easterling** on 6 Nov 2005, 7:26 a.m.,*
in response to message #9 by Hal

Okay, great! Thanks for the help. I now feel that I can expand my collection of older HPs using the Radio Shack rechargables as long as I keep the voltage at the proper level.

Re: Batteries for 41CV or 33E

*Message #11 Posted by **Randy** on 6 Nov 2005, 8:13 a.m.,*
in response to message #10 by Stephen Easterling

I would not recommend any mass marketed consumer type AA's in a Spice - they're too long and you will most likely break the battery tabs off using them.

You want to purchase any ni-cd or ni-mh cells with flat ends as these are a bit shorter and provide more contact area, they have no pointed tip on the + end as you find with consumer batteries. Any good battery store or Digikey can supply. You also need the welded strap on one end for good contact, the small metal piece in the original Spice pack isn't sufficent.

See Katie's article for numbers: Replacement batteries

Re: New eBay Price Gouging HP Seller

*Message #3 Posted by **I, Claudius** on 5 Nov 2005, 12:56 p.m.,*
in response to message #1 by Howard Owen

If HP was wondering if the "Bring Back the HP15C" idea won't bring in some bucks if it makes a truly decent scientific calculator should look at these aftermarket scalper (probably Samson Cables under a different eBay name) prices. HP could charge $100 plus per unit and still sell boatloads.

Recovering the data from Series80 tapes

*Message #1 Posted by **Vassilis Prevelakis** on 5 Nov 2005, 5:40 a.m.*

The following is a summary of a thread on the classic computer mailing list.

The problem with the old HP 9162-0061 data cartridges is that the magnetic coating peels off from the (transparent) tape causing the machine to stop accessing the tape with an EOT warning. This is actually very good news because it means that the damage is localized (a few mm of tape with scrapped off magnetic coating).

BTW here is a picture of a damaged tape:

http://www.series80.org/Articles/DamagedTape.jpg

Tony Duell suggested that tapes stuck onto themselves and I took apart two old tapes and found the following:

Assuming that the tapes were rewound before storage, there are two stretches of weakened magnetic coating on both tapes I looked at; the first was short while the second longer. These correspond to the length of tape in contact with the drive belt

In

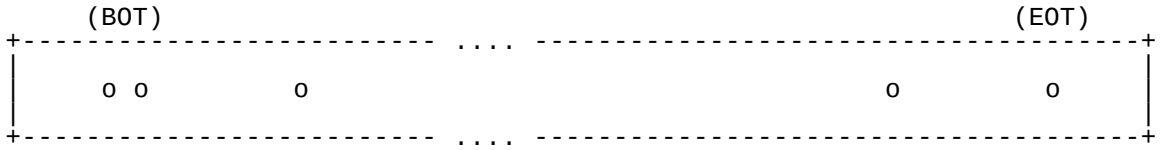
http://www.series80.org/Articles/tape-cartridge-lr.gif

you can see that on the take up reel (left) there is less tape in contact with the drive tensioning belt, while on the right hand reel (which has most of the tape and hence a longer radius) more tape comes in contact with the belt.

Looking closely at the belt, I can see remnants of tape oxide stuck on it (in fact its stuck so well, I could not remove it).

So how come we get an EOT error when using these tapes?

The tape has tiny holes near the beginning and end signifying BOT and EOT.



I assume that the first hole signifies the end of the data region and then if the drive sees one hole its EOT, while if it sees two holes (prob. more than one) its BOT.

So when it sees the blank region, it interprets it as one hole and reports end of tape.

Using a marker to paint (on the back side of the tape) over the region does not work, since the markers I tried allow some light to go through. I stuck a piece of splicing tape and that took care of the hole, but I got a DATA error. I guess the 85 needs some of the info that is missing from the tape.

I have also noticed that the tape does indeed stick onto itself on the right hand reel, but if you unwind it slowly you can get it unstuck without damaging it. I assume that conditioning the tape by warming it up before use may reduce this sticking problem, but I still would not want to fast wind a tape in that condition.

Given the above, I am even more confident about data recovery, as we may be able to use the existing tape mechanism of the 85 to read the data by skipping the regions that appear blank until the tape un-spools and the drive stalls.

Proposal 1

To do this I would need to manually rewind the tape till the BOT sensor, mount it on the tape drive and advance it past the read/write head till I run out of tape (tape unspools from the supply reel).

While this is going on I am recording the output of both heads via the audio in port of my PC sound card (maybe use two separate sound cards to avoid cross talk?).

Data extraction rig:

1) audio connection: what kind of set-up would be required to connect the heads to the audio card. From the schematics I see that there are essentially three connections to each head:

```
Head 0: H0, CT0, and HC
Head 1: H1, CT1, and HC (HC is common to both heads)
```

But I am not sure what these are used for.

2) running the tape at a constant 11ips. There is a circuit that uses the tachometer wheel to control the tape speed, but again I am not sure how to program (?) the tape controller IC (U1) to move the tape. (I may need to disable the BOT/EOT sensors, but that should not be a problem).

I am lucky to have a 9915A as my test bed which allows far easier access to the tape drive mechanism than the HP-85 (and does not have these evil ribbon cables).

Unfortunately I do not have a scope, but I can borrow one for a short period if necessary. I have a logic analyzer.

Proposal 2

Another plan is to get the tape moving at 11 ips and then tap the output of the read/write IC (1820-2418) in the HP-85 tape drive to get the bits from the tape.

This allows the use of existing hardware. But still requires programming the tape controller.

I wish I could understand this infernal assembly language of the 85 so that I could look at the internal routines that access the tape for ideas.

Tony suggested to look at the diagrams of the 9815 and 9825 for clues on the tape drive mechanism and the pre-amp. I have looked at them but I do not have access to a 9815 or 9825.

Do note that the speeds of the various tape drive differ:

```
HP 9825 22ips
HP 9835 22ips
HP 9845 22ips
HP 85   11ips
HP 9815 10ips
```

Any comments, words of advice are always welcome.

Viewing the full mantissa on a 41C

*Message #1 Posted by **Marcus von Cube, Germany** on 5 Nov 2005, 4:38 a.m.*

Hello to all!

On most HP RPN calculators there is a function "clear prefix" which duplicates as a means to view the full mantissa of the value in X while held down.

I couldn't find anything similar on my HP 41CV. My fault or an omission by HP?

Re: Viewing the full mantissa on a 41C

I think the 41 was caught in the midst of a transition from the era where a separate command (DSP) was used to specify the precision to the new way of integrating it with the mode command (FIX/SCI/ENG).

E.g. on the HP-67/97 FIX/SCI/ENG do not take an argument, while on the HP-41 and later models they take the number of digits to display.

On the Spice series (introduced in the same timeframe as the 41) the small display (in the sense that they could display fewer digits than previous models because of the larger digits) the use of the MANT command was imperative.

*Message #3 Posted by **Thomas Okken** on 5 Nov 2005, 9:22 a.m.,*
in response to message #2 by Vassilis Prevelakis

...or to look at it differently, the MANT command became necessary with the Woodstocks, since unlike the Classics before them, they could not display 10 digits in SCI mode.

But, it wasn't until the Spice series that the MANT command actually appeared -- and that's after the introduction of the 41C.

I don't have a 41 any more, but I seem to remember that, in SCI 9 mode, ARCL would recall the full 10-digit mantissa to the alpha register. If that's true, you could use that to create a pseudo-MANT command.

Re: Viewing the full mantissa on a 41C

*Message #4 Posted by **Andrés Rodríguez (Argentina)** on 5 Nov 2005, 10:31 a.m.,*
in response to message #2 by Vassilis Prevelakis

The decision to implement separate DSP and FIX/SCI/ENG instructions has to do with op-code space preservation. The HP 67 (as the HP 25 and others) used just one byte to encode each instruction, hence there are only 256 op-codes available. With a rather rich set of instructions, you need to be careful in order to avoid running out of possible op-codes. The separate option uses just 13 op-codes for all display formats (FIX, SCI, ENG, DSP 0, DSP 1, ... DSP 9), while the unified style requires 30 op-codes (FIX 0, FIX 1, ... FIX 9; SCI 0, ... SCI 9; ENG 0, ... ENG 9), too costly a sacrifice for the HP 67.

As the HP 25 had a not-so-rich instruction set, it could spend more op-code space without too much concern.

The HP 41 introduced multi-byte instructions, so the restriction was avoided.

Of course, op-codes are the manner in which instructions are stored as program steps.

*Message #5 Posted by **Etienne Victoria** on 5 Nov 2005, 10:51 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Hallo Marcus,

The PPC developed a very efficient code for the Mantissa function.

I keep it permanently assigned to my SHIFT ENTER key.

This function, named MT, was built in the PPC ROM Module :

```
01 LBL 'MT'
02 CLA
03 STO [
04 ASTO [
05 INT
06 X<>0?
07 APPEND DIAMOND
08 X=0?
09 APPEND
10 CLX
11 ST+ [
12 X<>[
13 RTN
```

APPEND & DIAMOND: Hex characters in string (refer to combined Hex table).

SOURCE: The PPC ROM USERS MANUAL P. 349

Friendly regards from France.

Etienne

*Message #6 Posted by **Etienne Victoria** on 5 Nov 2005, 11:42 a.m.,*
in response to message #5 by Etienne Victoria

Sorry,

It came to my mind that many people still have an IBM PC compatible and can't get all characters.

Therefore, please find hereunder the "graphical listing" for MT:

http://homepage.mac.com/etienne.victoria/.Pictures/Photo%20Album%20Pictures/2005-11-05%2008.39.46%20-0800/Image-AE70F9204E1A11DA.jpg

[is register M and DIAMOND is hex 00.

Oh yes, and you can LastX the full number after looking at the mantissa!

Thanks.

Etienne

*Message #7 Posted by **Ángel Martin** on 7 Nov 2005, 4:43 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Hi,

in case this is useful, both the SandBox and the SandMath-III include a VMANT function. M-Code, based on that published in the Ken Emery's book, it shows the mantissa without disturbing X.

Besides, the SandMath-III also has MANT function to replace x with its mantissa.

Best, ÁM

HP 48g - Screen won't turn on -HELP!!!

*Message #1 Posted by **Caribe T** on 4 Nov 2005, 8:34 p.m.*

Right - I may well deserve what I get here. I opened my 48g and put it back together (I am/was planning to upgrade it...that aint been done yet). However, after putting it back together it no longer turns on when I push the 'on' button. When I put the batteries in, the screen does momentarily flash dark and then it stays off. Did I some how kill it? Have I lost all memory (if it does get lost, would this stop the calculatot turning on)? Can anyone help me find out if I have completely fried it? Thanks, Caribe

Edited: 4 Nov 2005, 9:04 p.m.

Re: HP 48g - Screen won't turn on -HELP!!!

*Message #2 Posted by **James M. Prange (Michigan)** on 4 Nov 2005, 9:46 p.m.,*
in response to message #1 by Caribe T

Well, before trying something like opening the calculator, I'd advise archiving anything that you want to save to your PC. But what's done is done.

Are you sure that you're inserting the batteries with the proper polarity? Are you sure that the batteries are good?

It does sound to me like some sort of hardware problem, but strange things could happen if RAM gets corrupted (such as by being without power for too long).

It could be that the calculator really is on, but isn't displaying anything. The following solutions assume that the calculator is on.

Try a warmstart, that is hold down the ON key, press and release C, release ON.

If that doesn't work, try forcing a warmstart with a paper-clip reset. Remove the upper right (as viewed from the back) rubber foot. You'll see a small hole with the letter R next to it. Insert a straightened paper-clip (or something similar) straight in as far as it will go, and release it.

If that doesn't work, and you're willing to lose everything you had stored on the calculator, try clearing all user memory. Hold down ON, hold down A, press and release F, release A, release ON.

Regards,
James

*Message #3 Posted by **Caribe T** on 4 Nov 2005, 10:01 p.m.,*
in response to message #2 by James M. Prange (Michigan)

I tried all that you said and still nothing shows up on the screen. I don't mind losing memory - I just want to get it working again. The batteries are good and they are the right polarity. When I reinsert the batteries,

the screen still momentarily flashes on. I am wondering if I damaged the 'on' button when opening it. If there is a possibility that the 'on' button is damaged, anyone have any info on how to fix them? Any other ideas? I think that I may have pushed the 'on' button without any batteries (thus causing memory loss apparently.) Would this cause the calculator not to turn on? I have tried connecting it to the PC via serial and then tried to grab an image of the screen but nothing happens (which is leading me to thing that it isn't turning on).Thanks

Caribe

*Message #4 Posted by **Caribe T** on 5 Nov 2005, 5:02 a.m.,*
in response to message #1 by Caribe T

I am so rapt at the moment cause I got my wonderful 48g going again! After trying a number of things I just thought that I might as well put the batteries in the opposite way (reverse polarity) and then put them back the correct way (though that I might as well try) - then I heard it beep back to life and it asked if I would like to try and recover the memory. Mate that nearly knocked me off my chair as I was sure it was dead! I don't know what this did electronically to it but what ever it did, it fixed it! Someone out there might be able to explain what happened there. Anyway, maybe this will help someone else some day, who after opening it and putting it back together, seems to have a dead 48g. Thanks James for your help! Caribe

Re: HP 48g - Screen won't turn on -HELP!!!

*Message #5 Posted by **James M. Prange (Michigan)** on 5 Nov 2005, 5:22 a.m.,*
in response to message #4 by Caribe T

Well, I'm glad (and surprised) that that worked.

In general though, inserting the batteries backwards is a very bad idea. One reason is that there's a Zener diode across the batteries, for protection against electro-static discharges. Putting the batteries in reversed is likely to destroy this diode. If it fails "open", the calculator will probably work just fine, but if it fails as a "partial short", you may go through batteries very quickly.

For more on this, see these posts from a hardware designer of the 48 series.

Regards,
James

*Message #6 Posted by **Caribe T** on 5 Nov 2005, 5:51 a.m.,*
in response to message #5 by James M. Prange (Michigan)

James' advice should be followed rather than what I did. I guess I will find out in a few days or so if the zener has failed as a 'partial short'. The calc seems to be working fine at the moment so I am hoping that the battery reversal didn't cause any damage. What would have been another way to fix the problem that I had? Can the zener diode be replaced if it is no good? (Do you think that the battery reversal would have definitely cause some internal damage or could I have got away with it?).

Caribe

Re: HP 48g - Screen won't turn on -HELP!!!

*Message #7 Posted by **James M. Prange (Michigan)** on 5 Nov 2005, 6:28 a.m.,*
in response to message #6 by Caribe T

Simply shorting across the battery terminals might've done the trick. Or removing the batteries and just letting the calculator sit for a few days, to give the capacitor time to discharge.

I suppose that the Zener could be replaced, but I really don't know exactly where it's located on the circuit board. It may well be a "surface-mounted" component, which would require skill with a soldering iron.

It seems to me that a better design would've been two Zeners in series, "head-to-head", that is, always one forward biased and the other reversed biased. If I recall correctly, these are available as discrete components, with both Zeners in one package, that is. I suppose that the designers weren't planning on people putting in the batteries reversed.

If the Zener fails "open", then probably little harm results, although it might not meed the original ESD requirements.

No, it's not certain that the Zener was damaged at all. Particularly if the reversed batteries were connected for only a few seconds, you may have "gotten away with it". My advice is to wait and see if you still get normal battery life.

James

You know of some very handy links thats for sure. I don't seem to find them when I do searches. I did part 8 of point 4.4 in the above link (though I certainly would have tried the previous ones beforehand had I know how damaging it could be) - I did only put them in 'VERY BRIEFLY' so I count my self very lucky that my 48g works (even if it possibly is damaged). Thanks again James - you're worth your weight in gold mate!!!

Re: HP 48g - Speaking of Zeners

*Message #10 Posted by **Randy** on 5 Nov 2005, 7:53 a.m.,*
in response to message #9 by Caribe T

If your 48G serial number begins with the letters "ID", it ** will not ** have a zener installed. They were eliminated in late 1995 to early 1996, depending upon the model (G/GX). All S/SX's have them.

The easiest way to wake up a dead 48 when it's out of it's case is to discharge the 1000uf memory back up cap. Putting the batteries in backwards achieves the same thing but it's a bad idea IMO. If it's not open, leaving the batteries out overnight should work as well.

Of course I'm assuming a good 'ole standard paper clip induced warm-start didn't help...

*Message #11 Posted by **Caribe T** on 5 Nov 2005, 9:14 p.m.,*
in response to message #10 by Randy

I don't have the letters "ID" in the serial number but it was made in the 45th week of 1995 (I must say that it is in great condition for such an old calculator - I had it given to me). So not sure if it would have a zener or not

Re: HP 48g - Speaking of Zeners

*Message #12 Posted by **Randy** on 5 Nov 2005, 9:50 p.m.,*
in response to message #11 by Caribe T

I can't say either as I don't have enough data on date codes in that range :(

What I can tell you is if the unit worked after the reversed polarity batteries and but now eats a set of batteries in a week or less, it has a zener and it has failed as a result of the forward biasing.

More than normal.

> Quote:
>
> (I am not an electrician, but shouldn't I be able to tell how quickly the batteries are draining by comparing the flow that is going through now to what it should be?)

Certainly, provided that your ammeter is capable of registering such low currents.

> Quote:
>
> Anyone know what is the normal current flow when the 48g is off?

If I recall correctly, a fraction of a milliamp with the calculator off. Try some of the posts in this search. I'd trust information from Dave Arnett a bit farther, as in this other search.

I'd recommend checking the current with the calculator off, but also after leaving it off for at least a half hour. Even better, put it into coma mode by holding down ON, pressing and releasing SPC, then releasing ON. In coma mode, even the system clock is stopped, so it's only drawing enough current to maintain static RAM, that is, the CMOS leakage current.

To wake up from coma mode, simply press ON, and of course the clock will need resetting

if you use it. Coma mode will also clear the warmstart log, which you can view in the 48G (and 49) series by executing WSLOG.

Regards,
James

Spice battery connection: images

*Message #1 Posted by **Vieira, L.C. (Brazil)** on 4 Nov 2005, 7:26 p.m.*

Hi, all;

about a month ago I was asked about images and information related to connections in Spice models. I once repaired one HP31E and it worked perfectly fine. I replaced the entire flex circuit for a cut of flat cable (used in computers to connect drivers). The pictures in both links illustrate the 'good' and the 'restored'.

Hope this helps those who need. (In fact, I am not sure if I sent these images to the one who asked me for them... Sorry!)

Cheers.

Luiz (Brazil)

You guys are one bunch of brave men... ... or insanely rich... ... or have a secret cache of old HPs! ;)

Re: Spice battery connection: images

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 5 Nov 2005, 2:05 a.m.,*
in response to message #2 by Ed Look

...or in the desperate need to bring a calculator back to business. qB^(

I forgot to mention that the one that's been restored had a partially destroyed flex circuit (the one that is good remains good, it is unchanged), and after the 'restoration', it worked perfectly (it was, in fact, 'dead').d8^)

I am not sure, but it seems to me you thought I removed a good flex circuit and place a cut of flat cable. q8^O If I had done such a thing, this would be the last place I'd risk (my head) mentioning the fact... That would be insane, you bet! d8^)

Best regards, Ed.

Luiz (Brazil)

Re: Spice decimal separator: images

*Message #4 Posted by **Etienne Victoria** on 5 Nov 2005, 3:48 a.m.,*

in response to message #3 by Vieira, Luiz C. (Brazil)

Bonjour Luiz, all!

And for the fellows who already opened their calc and want to change the decimal separator, here is the picture of the jumper to cut (Europe) or solder (US). It is the LEFT one on the picture:
http://homepage.mac.com/etienne.victoria/.Pictures/Photo%20Album%20Pictures/2005-10-19%2009.14.27%20-0700/Image-9901152E40BA11DA.jpg

and how to get to it: Decimal separator change

Have a nice day!

Etienne

Problem with Spice display (was: Re: Spice decimal separator: images)

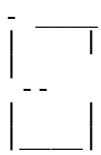
*Message #5 Posted by **Gerson W. Barbosa** on 5 Nov 2005, 11:28 a.m.,*
in response to message #4 by Etienne Victoria

Hello Etienne,

Nice picture! When I opened my 34C to change decimal point to comma, I took some photos too, but none are so clear as yours.

The most difficult thing was separating the case halves. I tried the dental floss trick but it didn't work (perhaps the quality of the dental floss I had at home was not so good). I found a good tip at Hugh Steers's site.

I had to rebuild the battery pack and fix the battery contacts which were broken, but the calculator worked fine until last week, when two segments ('a' and 'g' of the leftmost digit started to faint. Awkwardly only half of these segments remain lit. Now it looks like this:



When I removed the redish lid I noticed signs of battery leakage I hadn't notice before. Is this irreversible? It's very easy to replace the display, the problem is findind a replacement.

Thanks,

Gerson.

P.S.: This should be a separate topic, but since you and Luiz have a good experience with Spices, I thought you might help.

Re: Problem with Spice display (was: Re: Spice decimal separator: images)

*Message #6 Posted by **Etienne Victoria** on 5 Nov 2005, 12:41 p.m.,*
in response to message #5 by Gerson W. Barbosa

Hello Gerson,

If only a **part** of each **segment** does not light, then you should test the display.

Here's what I usually do (Luiz might have a better idea):

1) Take the display out if unsoldered otherwise use your probes.

2) With an ohmeter, check continuity of each display circuit track from pin to end of visible track. If a track is broken, tin it with your iron.

3) With your bench PSU at 1,5V DC (+current limit to 20mA if you can), apply BRIEFLY voltage directly to couples of the display pins.

Powering anode & cathode should (and I hope will) light the corresponding segment for each couple.

Continue till you find an offending segment.

If all segments light this way, then the problem is NOT with the display.

4) If problem is not with the display, repost here for us to go further.

5) If problem is with the display, let's wait for somebody else's idea because I've tried everything including ultrasonic cleaning with no result.

6) If nobody has a better idea, check your mail once again :-)

Best regards from France!

Etienne

PS: Well, I'm getting snobish with my "PSU", a simple 1,5V battery will do ;-)

Re: Problem with Spice display (was: Re: Spice decimal separator: images)

*Message #7 Posted by **Vieira, L.C. (Brazil)** on 5 Nov 2005, 1:15 p.m.,*
in response to message #6 by Etienne Victoria

Hi Etienne, Gerson, guys;

I guess that we can point out other ways, but this one Etienne described seems to be fast, accurate and easy. I`d add that most digital multimeters can briefly lit a LED segment with their own measuring current, when set either to the highest resistence value or to semiconductor (diode symbol). In such circumstances, it is easy to see which terminal goes to each digit, and which terminal is common to each segment (I usually refer to it as `segment matrix` when teaching, as a form of comparison) hence finding the best way to test each segment faster.

About having part of a segment lit: I had problems like this one, too, and I remember that one of them was exactly doe to some sort of dust from battery leakage. I tried to remove with chemical solutions and the display was destroyed for good...d8^(

Sorry not helping too much.

Cheers.

Luiz (Brazil)

*Message #8 Posted by **Gerson W. Barbosa** on 5 Nov 2005, 2:33 p.m.,*
in response to message #7 by Vieira, L.C. (Brazil)

Hello Luiz,

Thanks for your concern. If I cannot fix it, I will send it to you (if I receive the other 34C I am waiting for), along with your book for an autograph :-)

Last year I googled for your book (Da HP41 para a HP48) and find only two left: one in Belém and the other ... in a used books store just three blocks from home! This was in fact new, from an old stock and cost only R$ 17.00 (~$7.50). I read half a dozen pages and learned something I didn't know yet about the 48.

Cheers,

Gerson.

Re: Problem with Spice display (was: Re: Spice decimal separator: images)

*Message #9 Posted by **Vieira, L.C. (Brazil)** on 5 Nov 2005, 3:52 p.m.,*
in response to message #8 by Gerson W. Barbosa

Hey, Gerson, thanks! I appreciate your comments about the book.

In fact, my first one, writen in 1994/1995; took me three months writing, finished in January. I know that there are some `typos` and some stuff is missing, but I was so excited with the idea of having it published that I did not care too much. I remember that the revisor asked me if I did not miss something in the sentence:

"Avaliar é executar a ação associada ao objeto avaliado"
(To evaluate is to perform the action related to the object being evaluated)

He asked me "What is the action to be performed?". I thought I'd need some extra time to explain him, but I decided to ask him please to RTFM, in a polite way, of course, prior to discuss the subject... I hope I was not rude, though.

It will be a pleasure to sign your sample. Please, be my guest sending it and I'll add a few words of mine, too. BTW, have you been told about this subject? The English version exists, but has not yet been disclosed. As the Portuguese version is already available to be downloaded through the HP site, Brazil, I think there is no trouble spreading this news around, though.

About the HP34C and its LED display, I'd be more than happy to try to repair it, thanks. I am running out of free time these days, but in my vacation time I think of going ahead with some interrupted activities (good activities) related to HP calculators, electronics and the like.

Wrote too much, sorry folks.

Best regards and thanks again.

Luiz (Brazil)

*Message #12 Posted by **Etienne Victoria** on 5 Nov 2005, 3:54 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz again!!

Yes, why not confess :-))

For the Spice I kept for my own use (a 31E), I replaced completely the good flex with a cut of IDE disk flat cable and soldered the display once for all.

Since then, I NEVER had to reopen it for repair.

Kind regards from France!

Etienne

9815 standard library tapes?

*Message #1 Posted by **John Ioannidis** on 4 Nov 2005, 4:09 p.m.*

The tapes that came with my 9815 are degraded. Can someone make me copies, or upload them in some form that I could then download?

THanks

/ji

Re: 9815 standard library tapes?

*Message #2 Posted by **Katie** on 4 Nov 2005, 8:07 p.m.,*
in response to message #1 by John Ioannidis

I've tried to make a copy of the "General Utility & Test Routines" tape (09815-10004) before without success. There seem to be some protected programs on that tape that can not be copied -- at least I can't figure out how to do that. If you can tell me how to make a copy of it please do and I'll send one to you.

MLDL2000: something to talk about.

*Message #1 Posted by **Vieira, L.C. (Brazil)** on 4 Nov 2005, 3:52 p.m.*

Hi, all;

after a successful operation, a Meindert's MLDL2000 unit has been delivered today at my Po.Box. I openned it and found 'gold':

http://www.logeng.com.br/images/pic001_mldl_s.jpg http://www.logeng.com.br/images/pic002_mldl_s.jpg
http://www.logeng.com.br/images/pic003_mldl_s.jpg http://www.logeng.com.br/images/pic004_mldl_s.jpg

I'm delving into the documentation and I tell you all that I'm going to fulfill at least two of my oldest dreams as a professional: to know some of the HP41 ROM resources and to learn how to program in MCODE (and to create some of these...). I know, I know, it is ' ancient' technology but, c'mon, it is almost 30 Y.O. technology and we are still using it for our daily activities. The HP41 is already part of the history and thanks to these marvelous, updated development tools (thanks Meindert, Diego, Klug and others), we can go ahead finding some new stuff we can do with it.

Cheers.

Luiz (Brazil)

Re: MLDL2000: something to talk about.

*Message #2 Posted by **Matthias Wehrli** on 4 Nov 2005, 4:15 p.m.,*
in response to message #1 by Vieira, L.C. (Brazil)

Hi

As I told you a week ago I got my MLDL2000 last week. Up to now, I have about 150 images in it. All I can tell you is that this machine is the new spirit for the whole HP-41 scene. The programming is fast, esay and save. There is no risk of loosing your system when the internal backup battery is empty as it is a *real* problem in the ramboxes of W&W or ERAMCO. (Ok, the Profiset is a alternative, but who has a profiset? ;)

The only thing that I miss is a MCODE programm that makes images of a real module that is plugged in a defined port. I have a lot real modules we do not have an image of it.... Maybe someone can programm this "short" command for us/me.

In my mind I have something like this:

1. Give the machine a port (NOT AN HEX ADDRESS!), for instrance "8" 2. XEQ [ALPHA] CLONE [ALPHA] 3. The maching asks you, where to save the image (SRAM number of the MLDL), for instance "10". 4. This should copy the page 8 of the real module directly into the SRAM of the MLDL´s SRAM, number 10.

To prefer would be a command that does not requires to locate/define the memory of the MLDL first (That´s what the "MOVE" command of the ML-ROM needs).

Someone can follow my thoughts?

Matthias

Re: MLDL2000: something to talk about.

*Message #3 Posted by **Marcus von Cube, Germany** on 4 Nov 2005, 6:17 p.m.,*
in response to message #2 by Matthias Wehrli

Matthias,

you can use the ML ROM MOVE command, if your MLDL setup contains a writable RAM page. The MLDL manual (and the original setup) describes the steps as one of the testing scenarios.

For a program which is more flexible (working the way you describe), it will be neccessary to enable one Page as an I/O page (page 4 comes into play here). Then an MCODE program can write to any MLDL RAM address. This is a bit tricky (see the MLDL specification) but can be done. When the module is in MLDL RAM, it can be saved to disk via USB.

I haven't written a single line of MCODE yet, so I'm not the guy to ask.

Re: MLDL2000: something to talk about.

*Message #4 Posted by **Meindert Kuipers** on 7 Nov 2005, 2:44 a.m.,*
in response to message #3 by Marcus von Cube, Germany

This is possible, but as of yet untested and requires mcode programming indeed. It is probably easier to implement this using the I/O features and dump it straight to USB. This requires both mcode (but easier) and software on the PC as well.

Meindert

Self-modifying programs for HP-41

*Message #1 Posted by **Geir Isene** on 4 Nov 2005, 1:49 p.m.*

One of my first real programs on a calculator was a self-modifying program for the TI-59. Even its ancestor, the SR-52 had this capability of self-programming.

I now need the same feature on my HP-41. I am looking at creating a small Petri Net (see http://en.wikipedia.org/wiki/Petri_nets) engine for the 41. Due to speed constraints on the 41 and because I would like to conduct Monte Carlo runs of the Petri Nets, I need the calculator to be able to devise a program from certain user inputs and then run the program a number of times in succession, then give the statistical outputs.

Any suggestions?

Re: Self-modifying programs for HP-41

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 4 Nov 2005, 3:40 p.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

not a solution for your case, I guess, but the AECROM (a custom ROM) has a program generator that builds programs from expressions writen in the ALPHA register. The program asks for the names of the variables that must match the names in the user expression ('formula'), so it creates the PROMPT's, and the resulting value is also labeled accordingly.

Hope this gives you some guidance.

Cheers.

Luiz (Brazil)

Re: Off Topic

*Message #6 Posted by **Howard Owen** on 4 Nov 2005, 11:27 p.m.,*
in response to message #5 by gileno

The 9114B writes 256 byte sectors. PC hardware is capable of doing the same. It works under DOS and Linux on my ancient Compaq, and under Linux on a less ancient low end Dell server. But some combinations of floppy controller/system software seem to have trouble with the format. I do know that your chances of success are increased if you format the disk on the 9114 before trying to write to it from DOS. Also, covering the quad density hole is critical. The PC will try to read and write at that density if you don't, and that will fail to produce disks readable on the 9114 every time.

Re: Off Topic

*Message #7 Posted by **Garth Wilson** on 5 Nov 2005, 1:58 a.m.,*
in response to message #6 by Howard Owen

In my not-so-recent experience, what was written by the high-density drives was not readable by the only-double-density drives. It makes sense, if you think about the narrower head of the high-density drive recording over just the middle of any given track played by the double-density drive, leaving old data at the edges of the track, data which would conflict with the new material. Maybe it would work if you started with a disc that either had never been recorded on or had been erased with a bulk eraser. Someone who knows more about disc drives' insides might have some comments or corrections to offer, but this was my experience at my last place of work when the high-density floppies were just coming in and we had both densities for awhile in the late 1980's.

Re: Off Topic

*Message #8 Posted by **Howard Owen** on 5 Nov 2005, 2:57 a.m.,*
in response to message #7 by Garth Wilson

Except it actually works for me. Not only can I write a DS/DD image on a DS/HD drive, and onto either DS/HD or DS/DD media, I can write SS/DD media as well. It works on one of my systems and not another, as I mentioned, so it may be that differences in the width of the data written are in play. But it could as easily be that the non-working drive has been cursed by the floppy fairy, as far as I can tell. That is, I have no idea why it works in one case and not in another. All I can do is report my results.

Re: Off Topic

*Message #9 Posted by **Howard Owen** on 4 Nov 2005, 5:15 p.m.,*
in response to message #3 by Gileno

If you have Windows or DOS, do the following:

1. Format a disk in your 9114B.
2. If you are using standard PC DS/HD floppy disks, tape over the density select hole. (The one opposite the write protect tab.) before moving the disk over to your PC.
3. Download LIFutil from the museum ftp server.
4. Use it to write DOS files to your 9114B-formatted floppy disc.
5. Done!

This works on one of my PCs (an old Compaq Pentium) and not on another (a Thinkpad A22P) so your mileage may vary. If it doesn't work on your machine, try a friend's.

Re: Off Topic

*Message #10 Posted by **Vieira, L.C. (Brazil)** on 4 Nov 2005, 6:13 p.m.,*
in response to message #3 by Gileno

Hi, Gileno; are you well?

I have an 9114B, one HP71B with IL module, one HP75D and the HPIL for the HP41, but I mainly use the 9114B to store data and programs (in native language) for each of them. I have not worked with LEX files yet, sorry. I'd like to help.

As I see, others have already followed you up.

Success!

Luiz (Brasil)

Re: Self-modifying programs for HP-41

*Message #11 Posted by **Raymond Del Tondo** on 4 Nov 2005, 7:04 p.m.,*
in response to message #1 by Geir Isene

Hi,

for easy and powerful input/output features,
use the CCD ROM.
For easy and powerful user program memory manipulation,
also use the CCD ROM.

As Luiz noted, the AECROM has the unique feature of a program generator,
so maybe that could help, too.

However, if there's a way to avoid self-modifying programs,
I'd go that way.
There are always ways to use parameters as 'modifiers',
without hacking the code itself.
Wouldn't that be a challenge to write your program that way?

In the early HP-48 days, there were some French self-modifying programs,
which caused nothing but trouble to the system integrity,
likely to make the system unstable.

OMHO;-)

Raymond

Synthetic programming (was: Self-modifying programs for HP-41)

*Message #12 Posted by **Vieira, L.C. (Brazil)** on 4 Nov 2005, 10:47 p.m.,*
in response to message #11 by Raymond Del Tondo

Hey Raymond, guys;

I remember quite well that, by using synthetic manipulations, the size of the HP41 could be changed without altering memory contents, i.e., lowest numbered registers with NNN contents would have its contents considered as program instructions after reducing SIZE accordingly. I remember reading Wickes` Synthetic Programming on the HP41 where he mentioned something like `Imagine programs creating programs.`

Although tricky and mind boggler, this can be done. I myself tried a few. It works, no doubts about, but I think that the necessary manipulations may not be worth doing.

Cheers.

Luiz (Brazil)

Re: Self-modifying programs for HP-41

*Message #13 Posted by **Geir Isene** on 5 Nov 2005, 5:48 a.m.,*
in response to message #11 by Raymond Del Tondo

> Quote:
>
> There are always ways to use parameters as 'modifiers', without hacking the code itself. Wouldn't that be a challenge to write your program that way?

I know, this is the way I would usually program in Ruby or Forth. But for the 41, the speed would make this undoable.

I will get the CCD (with the PPC and David's assembler) module from Don soon, and I will look into how I can make a program generator for the 41. The result will be posted, but don't hold your breath :)

Self-modifying programs [a bit OT]

*Message #14 Posted by **Karl Schneider** on 6 Nov 2005, 6:04 p.m.,*
in response to message #1 by Geir Isene

The concept of self-modifying code arose in the 1980's, when I was a programmer on mainframes running Fortran software. We considered the idea frightening, from a standpoint of maintainability...

-- KS

Re: Self-modifying programs [a bit more OT]

*Message #15 Posted by **Marcus von Cube, Germany** on 7 Nov 2005, 2:56 a.m.,*
in response to message #14 by Karl Schneider

Guess were I saw a self modifying piece of Software the first time?

I found it in the BASIC ROM of my Tandy TRS-80 clone from Taiwan. The code implements two I/O commands (INP/OUTP). The Z80 processor has indirect I/O addressing but the BASIC was written for the

8080 which lacks such an operation. So the solution was to write the code sequence to RAM, modify the address byte and call the modified code.

Did I mention who authored the code? It was Microsoft in its early days. It was possibly written by Bill Gates and/or Paul Allen in person...

Re: Self-modifying programs [a bit more OT]

*Message #16 Posted by **Frank Wales** on 8 Nov 2005, 11:29 a.m.,*
in response to message #15 by Marcus von Cube, Germany

Unless I misunderstand the original problem, I don't consider it to be a self-modifying program, but rather a program generator, which is a significantly less hazardous programming technique. (With a self-modifying program, the program alters its own code *as it is running*, and you end up with a different program from the one you started with. There are actually very few legitimate reasons to do this.)

It sounds, instead, as if what is wanted here is a program that can write another program, based on some user input, and then run that generated program repeatedly under controlled conditions. Without knowing more about why this approach is considered the only reasonable one for performance reasons, my approach to the problem as stated would be to write the Petri net engine first, which would also force me to design the corresponding graph data representation in registers. Then I'd re-write the core of the engine in machine code, while leaving the user interface in user code (which, of course, requires you to have some additional hardware for executing your own machine code, which you might not have).

(But really, if performance was going to be that poor, I'd seriously consider switching platforms, if only to a 41 emulator on a PDA or something.)

> Quote:
>
> So the solution was to write the code sequence to RAM, modify the address byte and call the modified code.

This is pretty similar to a technique I (and probably many others) use to implement graceful degradation of Javascript-dependent functionality in web pages. The version of the page that works without Javascript is sent to the browser, but includes a call to a Javascript function that alters appropriate nodes in the web page's in-memory representation to change it into the corresponding Javascript-enhanced version. If Javascript is not available in the browser for any reason, the function call gets ignored and the user sees the non-JS version; if Javascript is available, the user only sees the Javascript-enhanced version. (This also allows more fine-grained feature switching, based on things like platform, screen size, rendering engine and other fiddling details. In general, though, trying to be too smart about this leads to madness at both ends of the network.)

The only real differences with the MS BASIC technique are that the RAM I'm using is in the memory space of the browser on another computer, possibly on another continent, and the instruction sets I'm toggling between are vastly more elaborate and flakey than the old Intel/Zilog operations.

Re: Self-modifying programs [a bit more OT]

*Message #17 Posted by **Geir Isene** on 9 Nov 2005, 8:28 p.m.,*
in response to message #16 by Frank Wales

You are indeed correct. I am not looking to create a _self_modifying_ program for this task, but

rather a program generator from user input.

Exploring av viable self modifying program may be a future challenge...

Loading Excel data onto HP 49g+

*Message #1 Posted by **steve** on 4 Nov 2005, 1:02 p.m.*

Hi I'm looking at writing a simple survey program for the HP 49g+. I need some guidance on the best way to load up this data from Excel on a PC and how it can be setup so that it can be recalled by point number to be manipulated. Upload will be to the backup file port two in order to keep the original data unchanged.

The data is a list of point numbers and levels.

Any tips or links to tutorials that deal with type of data manipulation would be greatly appreciated.

Thanks Steve

Re: Loading Excel data onto HP 49g+

*Message #2 Posted by **John** on 4 Nov 2005, 1:12 p.m.,*
in response to message #1 by steve

Your best bet for this type of question is not here on the museum, but in the comp.sys.hp48 newsgroup.

You can get to it by going to www.groups.google.com

There might be someone there who could help.

Re: Loading Excel data onto HP 49g+

*Message #3 Posted by **Vieira, L.C. (Brazil)** on 4 Nov 2005, 6:51 p.m.,*
in response to message #1 by steve

Hi, Steve;

have you arelady searched www.hpcalc.org ? There are many interesting programs and related stuff for all RPL calculators (HP28, HP48 and HP49). It's worth having a look there.

I tried the Advanced Search for the HP49 with Surveying as search argument and found:

http://www.hpcalc.org/hp49/science/civil/topog.zip

I also tried Data collecting as searching argument and found:

http://www.hpcalc.org/hp49/utils/interface/facil51.zip

The last one is a general data mannager with an easy menu interface (hence the name Menú Fácil, in Spanish).

I hope this helps.

Luiz (Brazil)

(In fact, I agree with John about the place to search for help, but as we have been reading so many off-topic messages here, then anything related to HP calculators is welcome...)

Re: Loading Excel data onto HP 49g+

in response to message #1 by Matthias Wehrli

Does anyone have info on the hP71B HP 82489A AMPI Statistics Pac?? I bought one in an eBay auction, but I don't have any documentation. Your help is GREATLY appreciated!

Re: Website update

*Message #3 Posted by **Namir** on 4 Nov 2005, 11:39 a.m.,*
in response to message #1 by Matthias Wehrli

Thanks for the update!

I recently bought an HP71B Curve Fit Pac and a Math Pac. It seams I missed out on these pacs when they came out originially. I had an HP71B but did not use it much. It's wonderful to discover cool pacs like the one I mentioned. The Math Pac has matrix commands that extend BASIC and are similar to the HP-85A Matrix ROM.

I am glad that the museum DVD has documentations for the 71B Pacs that I mentioned above. Really fun stuff. HP was way ahead of its time back then!!!

AC Adapter for old HP Calculators

*Message #1 Posted by **Bruno** on 4 Nov 2005, 10:53 a.m.*

Hello all,

anybody has got an idea of how to assemble (or if there is something I can purchase in a normal electric store) an AC Adapter for an HP 67 ?

Perhaps a normal AC Adapter with the right output voltage and Amperage will do, but what about the contacts, the ones in the HP 67 are not the normal ones every AC Adaptor has?

Regards, Bruno

Re: AC Adapter for old HP Calculators

*Message #2 Posted by **John Ioannidis** on 4 Nov 2005, 11:01 a.m.,*
in response to message #1 by Bruno

No, there isn't.

Assuming you don't want to buy the real thing on ebay, your best option is to rebuild (if necessary) your battery pac and keep charging it on an external charger. Another option is to get a *regulated* 3.6V power supply capable of sourcing at least 1A and connecting that to the battery contacts (inside the battery compartment, NOT the AC adaptor socket.

Remember that you MUST NOT run the card reader on AC adaptor power only; you need a charged battery in the calculator for that.

Re: AC Adapter for old HP Calculators

*Message #3 Posted by **Bruno** on 4 Nov 2005, 11:08 a.m.,*
in response to message #2 by John Ioannidis

Hi there and thanks for the answer.

I have a battery pac I've bough so Im can try the procedure you described, but isn't there the risk of overcharging it ?

Re: AC Adapter for old HP Calculators

*Message #4 Posted by **bernhard** on 4 Nov 2005, 1:53 p.m.,*
in response to message #3 by Bruno

If you want to build your own charger, the schematics can be found on the MoHPC DVD to be ordered from this website. The three contacts you need to connect to the calculator might be salvaged from connectors you find in the junkyard (or ordered new). Outer diameter of the male part is 2.0 mm. It is not impossible to find a suitable female connector assembly. Cut it open and get the individual contact

elements. Combined with a small printed circuit board they fit perfectly to any Classic HP. Beware to double check the voltage / current / polarity. You may damage your calculator if you make mistakes.

regards, Bernhard

Re: [OT] Who cares?

*Message #3 Posted by **blurdybloop** on 4 Nov 2005, 4:49 p.m.,*
in response to message #2 by .

The answer to the question of "who cares" is "every newbie who was warned by reading about the bubba in this forum." Newbies do come here for information. Being newbies they rely upon those who have greater experience.

Just a few days ago another newbie reported that the messages in this forum warned him.

Think of how you would feel if you join a community, subsequently get ripped off; and then you find out that the rip-off artist is well-known but you never heard because "everybody is tired of hearing about him"?

We've all heard tales of unethical second-hand goods dealers, who snap up bargains at garage sales, deceased estates, etc. Rather than share the good fortune of widows and pensioners, they rip them off.

In the past, their activities have been hidden from view. For once, we get a chance to see a bottom-feeder at work, and it holds a certain fascination.

Best,

in response to message #6 by Coburlin

I haven't done an archive search, so I'm not positive if anyone has brought up the obvious question of whether our "Coburlin" is actually the guy selling all that expensive hardware on eBay. What evidence would you accept to prove that was the case? Personally a line like "Yes, you MoHPC weenies, I really do walk among you" appended to one of the eBay Coburlin's auctions would convince me.

The alternative could be that one of our regulars is having lots of fun pulling some of our chains periodically. The implication of regular posting on the part of "Coburlin" is that he reads the forum regularly, Do you think that the genuine slime-bucket degrader of all that is holy about HP calculators would hang out around here?

Just a thought.

Paper for 9815

*Message #1 Posted by **John Ioannidis** on 3 Nov 2005, 9:58 p.m.*

I recently went in search of paper for my newly-resurrected 9815 printer. I've settled on Staples part number 472872, "9 thermal rolls for gas pump receipt and credit/debit card printers", which seems to work fine and produce nice, crisp output. Here is a pointer:

http://www.staples.com/webapp/wcs/stores/servlet/StaplesProductDisplay?storeId=10001&catalogId=10051&langId=-1&productId=98504&cmArea=SEARCH

There is something profoundly gratifying about suddenly not caring if I waste paper!

/ji

*Message #2 Posted by **tomcee** on 4 Nov 2005, 5:01 p.m.,*
in response to message #1 by John Ioannidis

Very interesting. Thanks for the information. My interest is for the HP82240a/b infrared printers. I've noticed the paper in mine (the HP stuff that came with it, I believe) is just under 2.25 inches wide.

I do recall 'back in the day' that HP specified to use only HP thermal paper. As I recall, it did seem to have a distinctly smoother feeling surface than other brands. I've wondered how critical this really is.

R, TomCee

Re: Paper for 9815

*Message #3 Posted by **TomCee** on 8 Nov 2005, 9:38 p.m.,*
in response to message #1 by John Ioannidis

John:

I've also found that at Staples, they have larger, much less expensive (about half the price!) rolls (Item # 226290 - three rolls of 165feet each). They are likely too large to fit in your printer (they certainly do not fit in my 82240), but the paper seems to work fine. Perhaps a clever method of re-spooling is in order. A bit of a pain, but saves some dollars.

Regards, TomCee

Re: Paper for 9815

Help Lex Files :-(:-(

*Message #1 Posted by **Gileno** on 3 Nov 2005, 9:26 p.m.*

I have several lexfiles (71B) in a diskette (DOS). How do I send them for HP71B using the 82164A HP-IL/RS-232C Interface? The system is already configured and ready to transmit or to receive. Thank's

if you fail once, ...

*Message #2 Posted by **Vassilis Prevelakis** on 4 Nov 2005, 6:45 p.m.,*
in response to message #1 by Gileno

I have already told you how to tranfer your lex files from your DOS/Windows machine to your 71B.

OK you do not like the solution because it probably requires you to do some work, but do you intend to **keep on posting the same question** for ever and ever?

Old calculators are a hobby, you are **supposed** to spend time on your hobby. How are you going to derive any pleasure from your hobby if you have other people do all the work for your.

Its like having a gardening hobby and then asking your neighbor to do your plants.

I know very little about electronics, and I need to ask for advice every now and then, but I still try to do as much as I can on my own.

Take for example the PSU of my 9915B. Tony Duell helped me enormously to repair it, but at the end of the day I learned a lot about how the 9915 PSU works. If he merely told me "replace capacitor C29" I would have fixed it faster, but I would not have learned much.

So take the time to work on your hobby and you will find it enjoyable.

**vp

The one that I asked is very difficult that nobody helped me. I tried of everything and I didn't get. Thank you even so.

Not a straightforward process, ...

*Message #4 Posted by **Etienne Victoria** on 5 Nov 2005, 5:30 a.m.,*
in response to message #3 by gileno

Bonjour Gileno,

1) Before trying to transmit binary, you must at least succeed in transferring ASCII (maybe you did already) : Windows Hyperterminal on the PC side and the HP program XFER will do on the Hp-71B side.

2) Provided you wired correctly your serial cables, don't forget to setup Hardware handshaking on both sides: Tony Duell gives the adequate wiring & Hp-71B program SETRS in his Lifutil distribution.

3) With an hexadecimal editor, check that the binary file you want to send has the 32 bytes LIF header. The Hp-71B COPY command will NOT work without it.

4) Then proceed as said by JF Garnier with the copy command and get prepared for hours of "try & fail" before you get the result.

Good luck.

Etienne

Re: Help Lex Files :-))

*Message #5 Posted by **J-F Garnier** on 5 Nov 2005, 4:43 a.m.,*
in response to message #1 by Gileno

Hi Gileno,

There is no definitive answer, it depends on what you mean by "several lexfiles (71B) in a diskette (DOS)". IF the LEX files include the right LIF header, and IF your RS232 link is correctly configured for raw binary transfer, then the basic method is:
- PC side: send the LEX file to RS232 with a communication tool
- HP-71B side: COPY :HP82164A

If this doesn't work, you will have to investigate more, as Vassilis said:-)

Let us know if it helps...

J-F

Re: Help Lex Files :-))

*Message #6 Posted by **gileno** on 5 Nov 2005, 7:45 a.m.,*
in response to message #5 by J-F Garnier

- PC side: send the LEX file to RS232 with a communication tool.

Which protocol? Ascii?

Would you already have some FTP with the ready lex to be sent?

Thank you

Roll call from CURRENT student HP users:

*Message #1 Posted by **ECL** on 3 Nov 2005, 2:46 a.m.*

If you are CURRENTLY a student of engineering (mechanical, civil, aerospace, structures) would you please share which HP you use?

You don't need to state which school, but it would be interesting to see what countries we are all studying in.

As a side note, I'm beginning to feel that if we should be capable of passing the NCEES (EIT/PE) w/ a 33s, why would we need anything more for our engineering courses?

I'll go first:

Country: USA

Degree: B.S.M.E.

Primary calc: HP 33s (32sii died)

Secondary: HP 48g

Thanks! ECL

Re: Roll call from CURRENT student HP users:

*Message #2 Posted by **I, Claudius** on 3 Nov 2005, 4:56 a.m.,*
in response to message #1 by ECL

"...if we should be capable of passing the NCEES (EIT/PE) w/ a 33s, why would we need anything more for our engineering courses?"

The NCEES has somehow become a law unto itself. Fortunately, it is not necessary to pass their tests with their arbitrary calculator rules to become employed.

As far using a mere 33s for engineering courses, that in itself is so ludicrous I question your motives and your identidy. I suspect you're a shill for the NCEES trying to further their agenda.

I think the NCEES policy is wrong. However, I got through engineering school, got my PE, and currently practice just fine with an HP 11c first, then an HP 32sII. The 33s also is up to the task for me, although it is a far cry from the HP's of old. But that's a different topic.

students and calcs

*Message #6 Posted by **bill platt** on 3 Nov 2005, 11:35 a.m.,*
in response to message #1 by ECL

I can't speak for undergrad (did that in the 80's) but I did do grad engineering just a few years ago, and I can say with certainty that it would have been totally unecessary to have had a "graphing" or "big fancy 48" calculator. The 32sii was just fine--and more powerful than anyone else had.

Grad school just does not put a premium on "number-crunching in a calculator". It puts a premium on thinking. And the big number-crunching that you do do is most definitely on a computer, unless you are mad as a hatter.

I'm not a student, but I will comment as a PE candidate. The short answer to your question: NCEES exam problems aren't necessarily like the problems that you will encounter in your engineering coursework (or for that matter, like the problems that you will encounter in the real world). You shouldn't necessarily assume that the same calculator is ideal for all types of problems.

NCEES exam problems are, in theory, solvable in just 2 minutes (EIT am), 4 minutes (EIT pm) or 6 minutes (PE am/pm). So NCEES exam problems typically do not involve particularly complicated calculations: in most cases, they test your ability to recognize the appropriate equation, rather than your ability to perform the calculation itself. So you don't necessarily need a great calculator to pass NCEES exams. For proof, note that most current NCEES-approved calcs are cheap (<$20) algebraic non-programmable models, such as the HP-9S, Casio FX-115MS, TI-30X II, and TI-36X. Most people who take NCEES exams use such calculators.

Your professors, on the other hand, may very well assign you more complex problems -- problems that could take more than 2 to 6 minutes, and which could involve tricky number-crunching or complex unit conversions. These sorts of problems often arise in the Real World as well. You may find it advantageous to have a more

advanced calculator, such as a 48 or 49, in such situations, although in practice most people now use computers instead.

It seems like a lot of people here went through Engineering.

For any physics graduate students, I would recommend a 49G+ without a moment's hestitation. It will literally save you hours in tedious algebra on every classical electrodynamics problem. I actually did do those problems by hand, and generally a problem would have half a page of physics to get to ball rolling, then about 4 pages (condensed from several times that from what I worked on scrap paper) of algebra that really had nothing to do with physics.

When I took that class, the teacher began by recommending we buy a book of integral tables. The 49G+ mostly makes books like that obsolete.

And the constants library and units are nice, too.

Re: Roll call from CURRENT student HP users:

*Message #11 Posted by **Stephen Easterling** on 3 Nov 2005, 2:57 p.m.,*
in response to message #10 by Crawl

I got my B.S. in Physics (Math minor) and M.S. in Radiological Medical Physics. From the 9th grade through grad school and 9 years of professional use my "main" calculator was a Casio scientific. (I also used a Casio FX7000G in high school for a few problems, but didn't really need it.) However, when I started college as an undergrad, I got a HP28S and used it extensively, but I was still not allowed to use it on exams, so I used it mainly for homework. I had to do all of my math by hand (all calc classes, statistics, linear algebra, ODE, PDE). I wasn't allowed to use a computer until I took partial differential equations and had to solve systems of PDE using Mathematica. My textbook, in fact, was a course on PDE using Mathematica. (One problem took me ten pages doing it by hand!) After I completed much of my math coursework, I heard that my university was starting to use the TI calcs for many of their math classes. I thought that was not a great idea because they were substituting long-hand calcs for the calculator-based problem-solving capability. IMO, this should be left to the student to work out on their own in their dorm

room late at night while burning the midnight oil. BTW, I also had Excel, SigmaPlot, etc. to do other graphing when necessary (plus my Casio FX7000G,... programming this calc was a nightmare!).

After grad school, I used both my smaller, lighter Casio scientific and my bulky 28S, but used the 28S only for running basic programs to make my life easier. Now, I've recently rekindled my love affair with the HPs and established a small collection of about 20-21 different models. I love finding the strengths of each and rotating them in/out of home and professional use. I like the larger calcs only the being able to display more information at once, but enjoy the compact feel of my Voyager or any RPN Pioneers when it comes to actual use. The difference between my 48SX/GX/49G+ and any Voyager/Pioneer is like comparing my big Chevy Silverado diesel truck to my little peppy Chey S10 pickup. One is quicker and easier to get around in for mundane chores, but the other is best to be in when undertaking a really long trip or difficult workload.

If I were back in college again, I'd pick up a 33S and 49G+ and learn to use and program them both really well. Sure the older models are great, but the newer ones are better if don't mind the way they look.

Sorry if I rambled on too long. I felt I needed to get in a few words to represent the physicists out there.

Re: Roll call from CURRENT student HP users:

*Message #12 Posted by **Richard Garner** on 3 Nov 2005, 2:49 p.m.,*
in response to message #1 by ECL

I graduated college with an Associates in Engineering Sciences in 1985. Funding prevented me from going any further on an engineering degree. I work as a Drafter/CAD/GIS Operator for the City of Texarkana Ar. During my first year of college I used a Commodore SR9190R. When I saw I needed programmability I moved to a TI59, because I could get it locally. Then I mail ordered an 41CX to finish up college on. In my last year I bought a 15C to use as backup for the 41CX. I currently use a 42S as my day to day calc. I do own a 48GX, but the only thing I use it for is unit conversions. It makes quick work of converting links, chains, rods or furlongs into decimal feet for CAD/GIS work. For quick and dirty programing, nothing can beat the RPN programing of the 41CX or 42S. For me RPL is too cumbersome to be useful on the fly for programing. It may be more structured, but more structured does not equal easier to use.

Even as a principal engineer at a large semiconductor outfit I never needed more features on a calculator than a HP35 has to offer. Actually, I used a HP15C and after it died, a HP11C because the HP35 does not have the engineering display mode - which is very useful. All the tougher problems are solved on

workstations anyway, using tools like Matlab and Spice. But for quick calculations for the more common daily work, where you need a few squareroots and ln and exp, nothing is more efficient than such a simple scientific calculator.

regards, Bernhard

Pre-loaded EQN in new 33s

*Message #1 Posted by **ECL** on 3 Nov 2005, 2:35 a.m.*

Last Friday I purchased a new (CNA 52707099) 33s. I obtained it from the university bookstore. The package was intact and very fresh (no tell-tale signs of return), yet the EQN listing contained the equation for the volume of a solid cylinder.

Has anyone else noticed this? Its the third new one that I've opened so far, and its the only one to have this.

ECL

Re: Pre-loaded EQN in new 33s

*Message #2 Posted by **Norris** on 3 Nov 2005, 11:28 a.m.,*
in response to message #1 by ECL

The equation in question is used as an example on p. 6-1 of the 33S manual, so that is presumably why it is preloaded. I believe others have reported seeing it as well. Can't remember whether my 33S had it pre-loaded or not.

OT: Casio and Product Liability

*Message #1 Posted by **Howard Owen** on 2 Nov 2005, 7:14 p.m.*

I just got a Casio fx-7000GA graphing calculator. Normally that wouldn't be grist for this particular mill, except for something that caught my eye on the first page of the machine's manual:

```
Note that the manufacturer assumes no responsibility
for any injury or loss incurred while using this manual.
```

So if I read the manual while driving and have an accident, I can't sue them. If I go blind reading the manual in poor light, they won't pay for my glasses. If I read the manual over and over obsessively and lose my job as a result, they won't employ me.

It's a tough world out there for readers. 8)

I got a Casio FX-7000G (new) back in the late 80's in high school. I still have it and manual in mint condition. I used it to do the bills for about 9 years before I retired it and now use something from my HP collection. The 7000G was hard to program but I did find it especially great at statistics and linear regressions. It was pretty good at graphing, too. I think you can buy one now (used, of course) for about $5-10 on Ebay.

Re: OT: Casio and Product Liability

*Message #4 Posted by **Howard Owen** on 3 Nov 2005, 7:43 p.m.,*
in response to message #3 by Stephen Easterling

I paid $20.00 for mine on eBay.

*Message #5 Posted by **David Smith** on 4 Nov 2005, 11:05 a.m.,*
in response to message #1 by Howard Owen

Actually, posting such a warning can actually increase your liability. It shows that you knew the item was dangerous, yet chose to sell it anyway. Much like posting a "Beware of Dog" sign shows that you knew you had a dangerous animal.

49G+-Tracing the work

*Message #1 Posted by **StephenM.** on 2 Nov 2005, 4:10 p.m.*

I read somewhere that you can retrace a problemto see how to work that problem, kind of like a learning thing. How can I do that?

Re: 49G+-Tracing the work

*Message #2 Posted by **John** on 2 Nov 2005, 5:26 p.m.,*
in response to message #1 by StephenM.

The first step is probably to formulate questions concisely and accurately.

Re: 49G+-Tracing the work

*Message #3 Posted by **GE** on 3 Nov 2005, 5:02 a.m.,*
in response to message #2 by John

He is probably talking about the step-by-step feature of the 49. No clue on how to use that *wonderful* machine, however...

Re: 49G+-Tracing the work

*Message #4 Posted by **StepheM** on 3 Nov 2005, 12:57 p.m.,*
in response to message #2 by John

Sorry to be so ignorant John. I guess we can't all have the intelligence you must have. I'll take my business elsewhere.

Re: 49G+-Tracing the work

*Message #5 Posted by **John** on 3 Nov 2005, 1:45 p.m.,*
in response to message #4 by StepheM

At least that was clear.

Seriously, if you want help, spending a little bit of time to clearly frame a question is incredibly important.

Unless you do that, any other places you ask that question will still not know for sure what you are asking.

Re: 49G+-Tracing the work

*Message #6 Posted by **Tim Wessman** on 3 Nov 2005, 2:34 p.m.,*
in response to message #4 by StepheM

Actually, this page is more dedicated to discussing older calculators from more than 10 years ago. Many people on this page don't own any newer calculators.

For help with newer models, it is usally more appropriate to ask on comp.sys.hp48. Use google groups to read/post.

http://groups.google.com/group/comp.sys.hp48

As for your first question, the 49 has step-by-step solving for certain types of problems. These often are not that helpful. Derivatives are actually very helpful (I actually learned derivatives in 9th grade by just playing with the calculator and trying to figure out what it was doing) To turn this on, go into the modes screen, and push CAS, in the next menu, there is a check box for step-by-step.

TW

*Message #7 Posted by **Ed Look** on 3 Nov 2005, 11:36 p.m.,*
in response to message #6 by Tim Wessman

If it's anything like the 48G series machines, you can write a program, and step through it step by step to see exactly how it behaves as a debugging method. If that's what it is, then it is a nice feature and does its job quite well.

Re: 49G+-Tracing the work

*Message #8 Posted by **NA** on 7 Nov 2005, 10:12 p.m.,*
in response to message #6 by Tim Wessman

ooo.. ooo.. I have a 49G!

HP-41 MCode question

*Message #1 Posted by **Jeff D** on 2 Nov 2005, 1:17 p.m.*

I have written the following sequece in MCode
1A0 A=B=C=0
355 ?NC XQ
050 ->14D5
0B8 READ 2(Y)
0AE A<>C ALL
0F8 READ 3(X)
30E ?A<C ALL
017 JC B09A +02
0AE A<>C ALL
070 N=C ALL
10E A=C ALL
135 ?NC XQ
060 ->184D
0E8 WRIT 3(X)
My intention is to find the largest value between the A and C registers and square the value then write it back to the user X register. Unfortunately, when I use a fractional number with no integer value, the program does not produce the correct value.
Any thoughts would be appreciated.
Thanks,
Jeff

Re: HP-41 MCode question

*Message #2 Posted by **Frank Wales** on 2 Nov 2005, 4:20 p.m.,*
in response to message #1 by Jeff D

(Well, it's been about half a billion seconds since I did any 41 machine code programming, but I think I see the problem...)

You need to perform a floating-point comparison between the two values; the ?A<C ALL is doing a 56-bit binary comparison between the normalized forms of the X and Y register values that you pulled into A and C, which won't work for the vast majority of possible values. (Remember, the X and Y registers can also contain alpha values, and could even include non-normalized values.) The Nut CPU basically hasn't a clue about floating-point operations -- the OS does all that. You need to call an appropriate subroutine in the 41 OS that performs something like the guts of the X<Y? user code instruction, and deal with its return value appropriately. I certainly don't know what that would be off the top of my head, but I suspect someone else might.

Hope that helps.

Re: HP-41 MCode question

*Message #4 Posted by **Frank Wales** on 7 Nov 2005, 7:00 p.m.,*
in response to message #3 by ECL

Yeah, about that -- I think I last wrote 41 machine code around about 1989 (and probably machine code of any kind around 1994). I just haven't had a reason to get that close to a machine since (and these days, the platforms I'm programming for are things like browsers, VMs and databases, where the 'machine' is abstracted away from the metal).

Re: HP-41 MCode question

*Message #5 Posted by **Jeff D** on 9 Nov 2005, 7:15 p.m.,*
in response to message #2 by Frank Wales

Thanks for the suggestions. I have tried to use the X<Y? with a X<>Y afterwords. This only yields "NO" whether the larger number is in the X or the Y registers. I understand that when executing these mcode routines from the keyboard will cause only "YES" or "NO" to be displayed, so I ran the routing from a user code program. This eliminated the "YES" or "NO" and left the numbers but still did not execute the X<>Y. I also tried the XX<Y? and still get similar results. My goal is to sort the higher number to a known register. The numbers will be integers with fractional portions.
Any suggestions would be great.
Thanks,
Jeff

Re: HP-41 MCode question

*Message #6 Posted by **Doug** on 13 Nov 2005, 3:40 a.m.,*
in response to message #5 by Jeff D

To compare the size of two floating point numbers; subtract the two and check the sign of the result.

Best

Re: HP-41 MCode question

*Message #7 Posted by **Doug Wilder** on 3 Nov 2005, 12:05 a.m.,*
in response to message #1 by Jeff D

The way the mainframe tackles comparison is to subtract the two FPN's and then test the sign nibble. 1421 does an N=A-N with result also in C. 14D8: check C for Alpha Data Error. 14D5: check both A and C, ends with arguments reversed.

Best Regards

Xpander Connectivity Kit

*Message #1 Posted by **Wilhelm Loidl** on 2 Nov 2005, 7:32 a.m.*

Hello!

Just get my own Xpander!

Nice item, but no Connectivity Cable available ;(

Can someone tell me the correct jack (I assume: 3.5 mm stereo jack like in an mp3-player) and the correct lines between this jack and the 9-pin serial-jack?

Thank you very much!

Wilhelm Loidl

Re: Xpander Connectivity Kit

*Message #2 Posted by **Karl-Ludwig Butte** on 4 Nov 2005, 3:14 a.m.,*
in response to message #1 by Wilhelm Loidl

Hello Wilhelm,

I haven't used my Xpander Connectivity Kit, yet. But to help you I examined the original HP cable, which accompanied my Xpander, with an Ohm-meter. To my surprise it seems defect: Only the most outer layer of the stereo jack is connected to pin 5 of the DB9 connector. Pin 5 is "Signal Ground", so the other 2 segments must be "Receive Data" (Pin 2 of DB9) and "Transmit Data" (Pin 3 of DB9). I'm going to find out which signal is connected to which segment in the near future (yes, time is a big problem). You can try the same or wait until I got the result. I saw your same question at www.xpander.org so I'm going to put the answer there, too.

Hope this helps

Regards

Karl

Re: Xpander Connectivity Kit

*Message #3 Posted by **Wilhelm Loidl** on 4 Nov 2005, 3:42 a.m.,*
in response to message #2 by Karl-Ludwig Butte

Hello Karl!

Thank you for the feedback!

I don't think, your cable is defect - maybe there is inside an optocoupler (hope, you understand my english

interpretation ;)

In the next days, I'll try to connect the Xpander with an modifyed hp-49 serial-cable.

Thank you again

Wilhelm Loidl

Re: Xpander Connectivity Kit

*Message #4 Posted by **Wilhelm Loidl** on 5 Nov 2005, 9:26 a.m.,*
in response to message #3 by Wilhelm Loidl

Hello!

No luck with an hp-49 cable.

No luck with an old Garmin RS232 (with optocoupler) cable.

I testet all possible pin-configurations (Pin 2,3 and 5 on the 9-pin-jack), made before every try an hardware-reset on the Xpander and changed the COM1/COM2 connection with the modifyed cables.

The Connectivity-Software was running on a Windows XP-PC (maybe this is a problem?);

The automatic search withe the original Software for an handshake with the Xpander did nothing find...

Every help is very welcome!

Wilhelm Loidl

Re: Xpander Connectivity Kit

*Message #5 Posted by **Arnaud Amiel** on 5 Nov 2005, 2:53 p.m.,*
in response to message #4 by Wilhelm Loidl

My Xpander connectivity kit works under Windows XP without problem. I am going to have a look with my voltmeter

Here we are: 9 way female D type connector To stereo 3.5mm jack

```
Pin 5 to sleeve (Shield)
Pin 3 to sleeve 5kOhm

A glitch between Pin 4 and ring
```

I guess this doesn't really help but the serial connector is longer than usual so I guess it contains some form of electronics

Arnaud

The connector at xpander.org

Re: Xpander Connectivity Kit

*Message #6 Posted by **Karl-Ludwig Butte** on 6 Nov 2005, 11:59 a.m.,*
in response to message #4 by Wilhelm Loidl

Hello Wilhelm,

as promised I tested my cable with the Connectivity Kit. It seems, your right, it works perfectly. In the manual I found a notice that no other cable should be used 'cause it is designed especially for the Xpander. Alas, there's no way to open the DB9 jack to look inside. Sorry, that I don't have better news for you. If you'd like to discuss the Xpander in more detail you can write me at LKL_Butte@web.de.

Regards

Karl

HP41CV Memory is not expandable?

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 2 Nov 2005, 2:22 a.m.*

Hello,

last weekend was very joyful about calcs: my friend at his workplace find some HP41 accessories for me. I tried to expand my 41CV's memory with two HP82106A Memory Module in port 1 and port 2, but it is not worked. When I try to use other packs (Time Module, Stat I at port 3 and port 4) those are worked perfectly... What was wrong? Any idea acceptable! (I'm very beginner about 41 family...)

Thank you! Csaba

Re: HP41CV Memory is not expandable?

*Message #2 Posted by **Etienne Victoria** on 2 Nov 2005, 2:51 a.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Hello Csaba,

1) With your Hp-41CV, you already have the full possible amount of conventional RAM (ie 319 registers). The other modules you mention are ROM/System modules which map to a different address space.

The 82106 modules cannot be used with the CV and were solely designed to bring a normal Hp-41C up to the capacity of your Hp-41CV.

Your only choices are now either sell them to an Hp-41C owner or donate/trade them with Diego Diaz at Clonix, who uses the shells to manufacture super Rom/Ram modules.

2) That being said, you may extend your Hp-41CV memory by using the Extended Functions/Memory module that will provide you with memory you can save/load your programs from/to.

3) Or better, when you get used and appreciate your 41, have a look to Diego's modules at the link above or Meindert's solution at: MLDL 2000

These 2 solutions are the best I know to extend your Hp-41 possibilities in a flexible and reliable way.

Cheers from France!

Etienne

Desert island calc?

*Message #1 Posted by **Thomas Okken** on 1 Nov 2005, 4:37 p.m.*

Inspired by the recent thread about calculator collections, I have a question for all you forum addicts:

Which one is your single most favorite calculator model?

I suppose I could say that, for me, it would be the HP-42S... But then again, on a desert island, I'll probably not need that much power, and so I'll give the nod to the HP-67, solid and elegant in every way. Truly a classic!

Re: Desert island calc?

*Message #2 Posted by **Namir** on 1 Nov 2005, 4:45 p.m.,*
in response to message #1 by Thomas Okken

My desert island calculator will be the HP41CX. If I am allowed TWO calculators, the second will be the HP42s.

Namir

PS: Shouldn't you be working on a new update for the Free42??? (said with tongue and cheek)

New Free42 version (was Re: Desert island calc?)

*Message #3 Posted by **Thomas Okken** on 2 Nov 2005, 6:43 p.m.,*
in response to message #2 by Namir

> Quote:
>
> PS: Shouldn't you be working on a new update for the Free42??? (said with tongue and cheek)

I just bought a new laptop -- the old one was getting flaky and besides a 233 MHz Pentium MMX with 144 MB RAM doesn't cut it any more with most of the recent software development tools. The reason I mention this is because I needed something that will run Microsoft's PocketPC development tools -- work on the PocketPC port of Free42 is now officially under way. Watch this space for an announcement of a PayPal donation account where Free42 fans can help me by paying for my new laptop. :-)

Re: New Free42 version (was Re: Desert island calc?)

*Message #4 Posted by **Namir** on 2 Nov 2005, 7:47 p.m.,*
in response to message #3 by Thomas Okken

Thomas,

Wonderful! The PayPal donnation is well overdue. You have put in mega hours in this project. I think your labor of love needs some cold hard cash as a "thank you"! I will certainly click that PayPal donnation button.

desert

*Message #5 Posted by **bill platt** on 1 Nov 2005, 5:07 p.m.,*
in response to message #1 by Thomas Okken

Well, the 67 and the 41c are poor choices, because they will run out of power.

I'll go for a 15c. I won't even need to bring a spare set of batteries :-)

Besides, being stuck on a desert island will finally give me the time to figure out how to use all that matrix and complex number stuff to best advantage. What else would I use my calculator for--counting coconuts? 1 coconut <ENTER> 1 cocnut + ... :^)

Edited: 1 Nov 2005, 5:09 p.m.

Re: Desert island calc?

*Message #6 Posted by **Les Bell** on 1 Nov 2005, 5:37 p.m.,*
in response to message #1 by Thomas Okken

Funny - I was thinking about exactly this last night. I just received a copy of "Feynman's Tips on Physics" (the missing lectures from the Feynman Lectures on Physics, plus some problems and additional material), and was intrigued by Michael A. Gottlieb's story of how he took six months out, in rural Costa Rica, to read (and understand) The Lectures.

I'd love to do the same thing. I have the books - it's the six months that's the problem.

But if I got those six months, I'd take my 41CX - I've already used it while reading the books. If it could be *any* calc, then I might consider a 42S, in hopes of better battery life and in view of there being next to no need for peripherals and expansion.

Best,

--- Les
[http://www.lesbell.com.au]

Re: Desert island calc?

*Message #7 Posted by **Walter B** on 1 Nov 2005, 6:17 p.m.,*
in response to message #1 by Thomas Okken

The 67 really is a poor choice, because the sand will destroy your card reader. :-(

I'll choose the 42s, too - but if I may take a 2nd, I'll also take the 15c (it just lists key codes, where the 42s lists commands, and <450 program steps are not too much for plenty of time on an island, but else it's a very nice calc). With the manuals, of course, otherwise I won't have a chance to understand the real stuff.

With the sand, the waves, the coconuts, the sun and the stars above, there will be plenty of applications (and sufficient space to write formulae in the sand). :-)

Formulae in the sand (was Re: Desert island calc?)

*Message #8 Posted by **Thomas Okken** on 2 Nov 2005, 6:50 p.m.,*
in response to message #7 by Walter B

> Quote:
>
> With the sand, the waves, the coconuts, the sun and the stars above, there will be plenty of applications (and sufficient space to write formulae in the sand). :-)

Funny you should say that! It was a time when I was vacationing in the tropics that I found myself pondering the fact that the difference between the length of a summer's day and a winter's day depends on your latitude; I worked out the math but having no calculator at hand I couldn't actually compute any numbers or plot any graphs. This was when I decided I really should never be without an HP-42S, and that's how the Free42 project got started....

Re: Desert island calc?

*Message #9 Posted by **Howard Owen** on 1 Nov 2005, 7:46 p.m.,*
in response to message #1 by Thomas Okken

I'm going to cut against the traditionalist vein here, but before I do, I'm going to impose a condition on my desert island. If I can't have an island with a treadmill run generator connected to a bank of 12 volt batteries, then I'm **not** going. You can't make me. Forget food and water, I must have electricity.

Given that, I'd take my Zaurus CL860 PDA running pdaXrom with Pocket Debian GNU/Linux, and run Nonpareil on it. That will give me many of the Classics, the Voyagers and the HP41. I'll take DOSEMU as well, so I can run JF's EMU41 and EMU71 simulators under simulated DOS. I will bring along the source code to X48 (and to EMU48) and fix the former so it actually works. That will keep me busy for a while. But if I run out of things to do, I'll also bring a couple of 68K simulators and look into a 9816 simulator.

Re: Desert island calc?

*Message #13 Posted by **I, Claudius** on 2 Nov 2005, 7:26 a.m.,*
in response to message #12 by Tim Wessman

First rational response to an inane hypothetical situation.

I remember a calculus professor, who, in banning all calculators, rationalized it by saying "What if you found yourself on a desert island and had to calculate something?" I jumped through his hoop, but have never forgotten how utterly ridiculous the idea was. If one's situation has deteriorated to desert isle status, you're probably going to be more concerned with basic survival, not calculating anything.

So, the moral is, always take two of your favorite machine, whatever it is, wherever you go. And yes, pour a large libation to the calculator God, so you will always have the service of your faithful machine

*Message #17 Posted by **Geir Isene** on 2 Nov 2005, 2:43 a.m.,*
in response to message #1 by Thomas Okken

There's nothing like picking coconuts an hour before sunrise...

So it has to be the 41CX. The calc has to have alarms.

Re: Desert island calc?

*Message #18 Posted by **Etienne Victoria** on 2 Nov 2005, 4:49 a.m.,*
in response to message #17 by Geir Isene

Yes, but to pick coconuts an hour BEFORE the sun rises, you'll need....ahem...light.

So, it HAS to be an Hp-80 with it's beautiful LED display showing 8.88888888 to light your way into the dark!!!

...and you can compute the number of days, you've stayed in the island... ...if you short the battery pack, you may even be able to produce heat and fire :-)) to cook your meals...

Etienne

Re: Desert island calc?

*Message #19 Posted by **Geir Isene** on 2 Nov 2005, 5:25 a.m.,*
in response to message #18 by Etienne Victoria

But HELLO! The alarms! What about the alarms? An HP-80 with a time module. Yes, that would be quite something.

Re: Desert island calc?

*Message #20 Posted by **Etienne Victoria** on 2 Nov 2005, 5:50 a.m.,*
in response to message #19 by Geir Isene

Ok, I surrender...but with an Hp-80...I seldom need to sleep :-)

BTW, your UAC program is a marvel.

Etienne

Re: Desert island calc?

*Message #21 Posted by **Geir Isene** on 2 Nov 2005, 9:54 a.m.,*

in response to message #20 by Etienne Victoria

:)

New version soon comming up. New features include:

Autosnooze Set alarms for each day throughout the week

and some minor stuff.

Re: Desert island calc?

*Message #22 Posted by **Wayne Brown** on 2 Nov 2005, 12:56 p.m.,*
in response to message #18 by Etienne Victoria

But with my Port-X-Light attached to my 41CX I can have a nice, bright light, with several choices of colors. :-)

Re: Desert island calc?

*Message #23 Posted by **Mike T.** on 2 Nov 2005, 5:37 a.m.,*
in response to message #1 by Thomas Okken

I'd have to have some way of recharging the batteries, but my all time favourite is the HP33C (SPICE) - it just felt right, not too complex or too simple, though 49 programming steps were a challenge sometimes.
My second choice would be the HP67...

Mike T.

PS. I really did use my HP33C as a torch to read by under my bedcovers at boarding school - torches were banned...

Re: Desert island calc?

*Message #24 Posted by **Valentin Albillo** on 2 Nov 2005, 6:19 a.m.,*
in response to message #1 by Thomas Okken

Hi, Thomas:

If I can have either electricity or AAA batteries aplenty then I'd take with me a whole HP-71B.

If power's not available, then the HP-15C is the perfect choice, as its batteries will run for 10 years or more.

I think, given adequate care, both would survive in such an environment for a long time. Matter of fact, I did carry an HP-11C with me to a 1-year stay in nearly desertic conditions (heat, dust, etc) and 25 years later it's still mint.

Not that I'd expect to stay that long on a 'desert island' ...

Best regards from V.

in response to message #1 by Thomas Okken

Pack my bags:

```
HP-42s (with the 32k upgrade) & some spare batteries.

My "camper" Swiss Army knife.

A mask, fins, snorkel, spear gun, and 400 gallons of shark repellent.

A box of pencils and a half-ton of sketch paper.

My Ovation S771 and a few dozen sets of strings.

A wide-brimmed hat, some durable shades, and 90 quarts of SPF-45.
```

S.S. Minnow? I'm on it!

in response to message #1 by Thomas Okken

A HP15C modified to run on Solar power if stranded on desert island for 20 years with no electricity.

Re: Desert island calc?

*Message #27 Posted by **db (martinez, ca.)** on 2 Nov 2005, 11:40 p.m.,*
in response to message #1 by Thomas Okken

I had to make that choice in December '96. The desert island was Ecuador, which is neither an island or desert (it more closely resembles a toilet). I chose my 41cx with the math chip, surveyors co op module, and two extended memories.
The difficult decision was "which ten albums?"

Re: Desert island calc?

*Message #28 Posted by **Ron Ross** on 3 Nov 2005, 2:28 p.m.,*
in response to message #1 by Thomas Okken

With no time to think about it or no reference material, I would probably grab an Hp48GX with two memory cards loaded up (or I might even consider a plain 49G as its libraries 1 & 2 are much more reliable). Battery life may be a premium and extra AAA's would also be on my list. Having these is like having a calculator and a couple of reference manuals.

I may opt for a 42s if I had access to other reference material as I actually like the form factor and traveling abilities better.

I chose the Hp49G for its durability as solid number crunching might not be all that practical. Now, if I was at the South pole with weeks and months of spare time and lots of supplies without regard/access to external distractions, I would choose a 42s.

The more I think about it, the more certain I would take the FHB (Frozen Hamster Butt) Blue Hp49G (I chuckle every time I recall that famous color). Sand wouldn't be as destructive to its keyboard as to the typical Hp keyboards and it might actually hold up better to the elements on an island. Of course the Acrilic lens may scratch beyond readability (time for the ice skate method to repair like Tom Hanks used B^O.)

Ebay Seller Gripe!

*Message #1 Posted by **Ron Ross** on 1 Nov 2005, 2:42 p.m.*

I don't have and will not get a Paypal account. I pay by M.O. or cash (I used to pay quite often with Cash, but got burned recently, so MO is my payment of choice). Still, I don't trust Paypal and when an auction says Paypal only, I sadly walk away. I notice that more and more sellers only accept Paypal only. I used to try to contact them, but with Buy it now (Paypal required), I find this not worth the effort to circumvent this trend.

But I am venting on this forum in case any future sellers may want my patronage. (I admit, this is not an overwhelming arguement).

Paypal

*Message #2 Posted by **bill platt** on 1 Nov 2005, 3:06 p.m.,*
in response to message #1 by Ron Ross

Paypal/Ebay is the M$ of e-commerce. You either find a way to deal with it, or become a marginalized member of the alternative universe--in other words a Linux desktop user :^)

Re: Paypal

*Message #3 Posted by **Wayne Brown** on 2 Nov 2005, 12:59 p.m.,*
in response to message #2 by bill platt

But I use both PayPal *and* Linux. :-)

The more people that reject PayPal the better things will get. Check out www.paypalsucks.com

Re: Ebay Seller Gripe!

*Message #5 Posted by **Chris Woodhouse** on 1 Nov 2005, 3:27 p.m.,*
in response to message #1 by Ron Ross

I really can't see what the problem with paypal is. I have used it for many years now, it's fast and easy. I don't have to go to a bank or somewhere else and pay for a money order. I can see why some people don't like ebay though. It is hard to find a good deal on there but they do exist, and if you get screwed by a seller it is unlikely they will do much of anything about it. But paypal just sends money, I've never had any problems with my money getting to the seller and I have got money from a few buyers of some odds and ends I have sold with out any problems. What's the beef?

Chris W

What's the beef?

*Message #6 Posted by **John** on 2 Nov 2005, 5:27 p.m.,*
in response to message #5 by Chris Woodhouse

Read what's at the website posted above and you should see what some of the problems are.

Re: Ebay Seller Gripe!

*Message #7 Posted by **Ron Ross** on 3 Nov 2005, 8:40 a.m.,*
in response to message #5 by Chris Woodhouse

I have no problem with the seller accepting PAYPAL as long as they also allow other options. But many auctions are PAYPAL ONLY. That is my gripe.

Re: Ebay Seller Gripe!

*Message #8 Posted by **Just Another Mike** on 1 Nov 2005, 4:34 p.m.,*
in response to message #1 by Ron Ross

I will only pay with my Bank's Certified Check (BCC). I've never used credit cards, so I will never use PayPal. If I get cheated, and I have (EBAY did nothing), my bank has retrieve my monies from the bank where the BCC was deposited/cashed and filed a fraud complaint.

Re: Ebay Seller Gripe!

*Message #9 Posted by **Stephen Easterling** on 1 Nov 2005, 9:45 p.m.,*
in response to message #1 by Ron Ross

I feel the same as you, Ron. What I do is contact the seller and tell them that I choose not to use PayPal and if I can pay with a US Postal money order. Remind them (in a tactful way) that you, as the buyer, represent a large number of collectors / buyers that don't use Paypal and convince the seller that they'll make more money on the sale if they open it up to money orders, too. If it's an international sale, then you wasting your time. Remember, as the buyer, you can put yourself in the driver's seat. The seller needs the buyer to turn the bucks. More potential buyers, more bucks! If the seller wants convenience, then they sacrifice those bucks! In a kind way, this is the message I convey to those sellers and I'm usually successful.

Re: Ebay Seller Gripe!

*Message #10 Posted by **Howard Owen** on 1 Nov 2005, 10:22 p.m.,*
in response to message #1 by Ron Ross

PayPal is free for buyers, but sellers get charged a percentage of the transaction. So an eBay seller ought to be delighted to take your Postal Money Order. It's cheaper for the seller, and it comes without any buyer protection at all. A personal check ought to be fine too, as long as it's stipulated that it has to clear before shipping.

eBay tries to steer sellers into using PayPal in a variety of ways. Alongside the choices to reject bids by buyers with negative feedback scores, there's a checkbox to reject those that don't have a PayPal account. The implication is that a seller shouldn't trust a buyer without PayPal, of course. Pure self-serving nonsense.

Pressure from eBay notwithstanding, a seller shouldn't arbitrarily limit the ways in which a customer transmits money to the seller. Not only is it a silly idea to put roadblocks in the way of behavior sellers tend to favor, it's a basic issue of customer service.

Re: Ebay Seller Gripe!

*Message #11 Posted by **GE** on 2 Nov 2005, 3:34 a.m.,*
in response to message #10 by Howard Owen

Regarding roadblocks in the way of completely honest buyers, you forgot the major one : many sellers limit their auctions to US-only bidders.
I have talked to many sellers and most agree to deal with "foreign" countries (of course THEY are in the foreign country !!), but it is a pain.
Same arguments as you : more buyers, no real drawback. If you receive the money OK, well, you receive the money, right ??
Nothing to kill for, of course. Funny to see less sought-after items go for a couple of $$ only...

Re: Ebay Seller Gripe!

*Message #12 Posted by **James M. Prange (Michigan)** on 2 Nov 2005, 4:11 a.m.,*
in response to message #11 by GE

I supppose that it's a matter of not being sure of how to handle such things as customs forms, non-domestic shipping, currency conversions and payments, and language differences.

To be sure, restricting the market to US-only buyers may well eliminate a significant part of the potential market, but I suppose that many sellers regard the US market as being "good enough".

Regards.
James

Re: Ebay Seller Gripe!

*Message #13 Posted by **GE** on 3 Nov 2005, 8:47 a.m.,*
in response to message #12 by James M. Prange (Michigan)

Actually there is no problem with non-domestic shipping, you just write an address which happens to have different words on it. As for currency conversions, the seller always get paid in US$, so what ? As for language differences, I believe I am currently writing in English, so again what the hell ?
As for the US market being good enough, I routinely saw items I would pay $30 for, go for $4. That sounds still too much for someone willing to enforce such a silly policy... Also note that items considered common in the US can be rare in other countries. Those who tried to purchase Swedish or Bulgarian machines know that.
Just my point of view, this is a free world (maybe).

Re: Ebay Seller Gripe!

*Message #14 Posted by **Tom Steiner** on 3 Nov 2005, 9:13 a.m.,*
in response to message #13 by GE

The real problem with international transactions is lack of protection for the SELLER! If somebody uses a stolen credit card to PAYPAL some money to the seller, and that transaction is disputed a couple of weeks later, the seller is out the money *and* the goods. Within the US, Paypal offers seller protection, so that if a seller can prove shipment (delivery confirmation, etc.) then he/she is protected against chargebacks.

With respect to shipping outside the US, it's very simple if you use the US Postal Service. But don't try to use FedEx or UPS - they will bury you with forms (commercial invoice, etc.).

Re: Ebay Seller Gripe!

*Message #15 Posted by **James M. Prange (Michigan)** on 2 Nov 2005, 3:59 a.m.,*
in response to message #1 by Ron Ross

I can easily see why a seller wouldn't want to use PayPal, but as a buyer, it seems to me better than the alternative ways of pre-paying for an item that I hope to receive as described. When paying for an item, what's the problem with using PayPal? Of course, there is some risk, but that's also true whenever I use a credit card or personal check, online or not.

Still, restricting the payment method to only PayPal seems counter-productive to me.

Regards,
James

Re: Ebay Seller Gripe!

*Message #16 Posted by **Stephen Easterling** on 2 Nov 2005, 7:53 a.m.,*
in response to message #15 by James M. Prange (Michigan)

The main reason I hear regarding why sellers only use PayPal is that they hate the hassels of having to go to the bank to cash / deposit a check or money order and keep track of what needs to clear. Some sellers that handle a lot of transactions claim they don't need the business of just a few folk wishing to pay with money orders, etc. (or at least this is what their actions are saying). Frequently, they make up for it by opening the auctions to international buyers so they can pay with PayPal (electronically). Shipping internationally is not a pain at all. Making payment internationally CAN BE a pain if you don't do it electronically and if you can't get an international postal money order for that country. I see both sides of the coin. But when I'm the "buyer" and the seller won't accept a postal money order for a calculator I really want, I just try good, clean communication with them and hope they accomodate my payment method. As I mentioned before, most of the time they do because they don't want to exclude someone that might drive their bids up and make a good sale. You see this on collectible but you don't see this on, e.g., imitation purses, colognes, clothing materials, and other fake stuff you come across on Ebay, as well as the other goods that are open to an extremely large market of buyers (like cameras, computer-related parts, etc.). For a collectible, the seller is looking to clear as much as they can, and when they realize the need of more bidders, they usually allow MO payments. (Sorry my response is so long!)

Re: Ebay Seller Gripe!

*Message #17 Posted by **Chan Tran** on 2 Nov 2005, 12:27 p.m.,*
in response to message #16 by Stephen Easterling

The problem with paypal as a buyer is that you can be out of money for much more than your bid amount. Someone could hack your account and get the money. If you lose the money order you lose only the amount in the money order. You're not exposed to any identiy theft either by paying by money order.

Re: Ebay Seller Gripe!

*Message #18 Posted by **unspellable** on 2 Nov 2005, 4:37 p.m.,*
in response to message #17 by Chan Tran

I have to go with Chan Tran on this one. Especially after I caught AT&T double dipping in my checking account. That caused a lot of grief with checks bouncing and what not, and AT&T's "customer service" took over a year to get it ironed out. I must have spent twenty hours on the phone to them plus a number of letters, the first of which they promptly lost.

Paypay wants access to your checking account so that if you reverse the credit card charge they can suck it out of your checking account. Not withstanding you may have reversed the credit card charge for good and sufficient reasons. There is no other reason they would want access to your checking account and no other merchant I pay by credit card demands access to my checking account. Paypal allows you to spend the first $1000 without access to your checking account as the hook. If they want my 1001st dollar they can get it the same way they got the first 1000.

BTW: AT&T is NOT my long distance carrier these days.

Re: Ebay Seller Gripe!

*Message #19 Posted by **James M. Prange (Michigan)** on 2 Nov 2005, 7:12 p.m.,*
in response to message #17 by Chan Tran

Yes, there is a risk that someone could hack my PayPal account. There's also a risk that someone could hack my bank account, credit card account, or various retirement accounts, whether I access them online or not.

Yes, a postal money order is safe. But even "international" postal money orders aren't accepted by all countries. Also, it means a trip to the post office to purchase it, an extra fee, the cost of mailing it, and of course a few extra days for it to go through the mail.

Regards,
James

[OT] Problem with Sperry calculator

*Message #1 Posted by **alfredop** on 1 Nov 2005, 1:20 p.m.*

Hi,

first let me apologize for the off-topic, but maybe someone can give me an hint to solve a little problem on a Sperry Rand Remington 661 calculator that I have. It works well, but sometimes the numbers displayed are confused by the fact that a wrong segment turn on, it is less luminous than the others and it affects all the digits. I tried to dismount the unit and to clean it, but the problem was not solved.

Bye Alfredo

Re: [OT] Problem with Sperry calculator

*Message #2 Posted by **Frank Boehm (Germany)** on 1 Nov 2005, 4:15 p.m.,*
in response to message #1 by alfredop

Do you have fresh batteries installed? That beast is quite power-hungry (I have 0.85W noted). Might as well be the display driver IC T3144 - that one is impossible to find as a part (unless you take apart another early Casio or Sperry). Could be a defective part in the power section as well - again, it's probably cheaper to buy a new one on ebay, since that one is pretty complex too.

Free HP 15C Emulator

*Message #1 Posted by **Bang Bui** on 1 Nov 2005, 8:48 a.m.*

Hi all, Does any know of a free (or cheap shareware) emulator for HP 15C to run on Windows XP? There are lots for Pocket PC but I want it for XP. Thanks

Re: Free HP 15C Emulator

*Message #2 Posted by **Arnaud Amiel** on 1 Nov 2005, 8:53 a.m.,*
in response to message #1 by Bang Bui

Try nonpareil but it will give you more than you asked.

Arnaud

Re: Free HP 15C Emulator

*Message #3 Posted by **Torsten** on 2 Nov 2005, 5:22 a.m.,*
in response to message #1 by Bang Bui

You can try my HP-15C Simulator written in Tcl/Tk. It comes as Windows and Linux executable. Source code should run on any OS supported by Tcl/Tk. Just send me an email.

Torsten

Re: Free HP 15C Emulator

*Message #4 Posted by **Dave Bernazzani** on 2 Nov 2005, 8:48 a.m.,*
in response to message #1 by Bang Bui

Not quite an emulator... but you might have a look at Excalibur 32-bit. This "from-the-ground-up" RPN calculator has a simple layout and small memory footprint and does most everything the 15C does and then some. The 15C was one of four calculators that were the primary inspirations for Excalibur. Though it doesn't attempt to duplicate the look (other than classic Voyager series landscape layout) or exact keystroke sequences, it does capture the elegant feel of a well-made RPN instrument.

It was originally designed for Windows 9X, since it uses standard win32 API calls it will run fine under XP - though I'm working on v2.00 now (with enhanced programming features) that has better XP support. There is no cost to use the program. A search on "Excalibur RPN" will find it for you.

For something much closer to the 15C look-and-feel, I'd also second the recommendation for nonpareil, though the Windows side is still considered in an "alpha" stage.

Re: Excalibur 32-bit

*Message #5 Posted by **Eamonn** on 2 Nov 2005, 7:15 p.m.,*
in response to message #4 by Dave Bernazzani

Dave,

I have been using Excalibur as my Windows calculator for a couple of years now and I would like to thank you for putting together such a great piece of software and making it freely available. I have forwarded it to several colleagues who also use it daily. I use it primarily because of the RPN entry, but also because of all the functionality it provides - scientific, statistics, financial, comp. sci., etc, all seamlessly integrated together.

I have tried several excellent HP sim/emulators (semulators?) on Windows, including Nonpareil, Free 42s, V41, etc. While these are also great products, I find myself using Excalibur on a daily basis. Not sure why - I think it's a user interface issue. I guess I prefer to use the actual physical calculators that these *mulations are based upon, while Excalibur seems easier to use on the Windows desktop.

I also like the fact that Excalibur is programmable, although I haven't written as many programs for it as I have for the programmable handhelds. Since I use Excalibur on a PC, I usually resort to other tools for programming on that platform. I find that programming the handhelds themselves is much more useful since I can use the programs away from the PC.

Thanks again for such a useful tool - I highly recommend it to others.

Eamonn.

Re: Excalibur 32-bit

*Message #6 Posted by **Dave Bernazzani** on 2 Nov 2005, 9:06 p.m.,*
in response to message #5 by Eamonn

Thanks for the kind words Eamonn. Excalibur has been one of the longest running "hobby-projects" I've ever worked on. More than a decade now... When I started the project, I was in school and couldn't afford a good RPN calculator from HP. I drooled over the various models that were out at the time. I was even more interested in classic models which were (even then) somewhat expensive. I wanted a 16C so badly for my programming work! But I wrote Excalibur after using a 16C at work and later a 15C which was borrowed to help me through some exams. At some point after graduation I managed to scrape together enough cash to get a 32SII which I was extremely pleased with (of course it's still up and running almost 10 years later).

Even though I wrote Excalibur to be full featured, I still love handheld calculators and prefer them to computer-based calculator programs. There is something satisfying about holding a well crafted handheld calculating machine. But it's convenient to have one on your desktop - or across multiple desktops so that you always have something familiar and useful to bring up quickly. I've worked hard to give Excalibur it's own comfortable feel - simple but feature packed.

If anyone is interested in trying the latest beta with new functions, better XP support and enhanced programming features, feel free to contact me and I'll forward you a copy (the program continues to be extremely small - about 160kb in compressed form).

HP20s End of Production

*Message #1 Posted by **Walter B** on 1 Nov 2005, 4:26 a.m.*

Certainly someone in this forum knows the end date of HP20s production. Do you also know when the colour scheme was changed from blue/yellow to the HP48g low contrast colours? We had a similar discussion about the HP32sII earlier.

Thanks in advance for your response!

Re: HP20s End of Production

*Message #2 Posted by **Walter B** on 3 Nov 2005, 5:09 a.m.,*
in response to message #1 by Walter B

Sorry, I find no answer neither in hpmuseum.org (HP20s is too new for this site) nor in hpcollection.org (there is just a question mark). But AFAIK these calcs are not produced anymore. So I **assume** they ended together with HP32sii and the change of colors was made together with HP32sii, too. Who **knows** ?

Re: HP20s End of Production

*Message #3 Posted by **Norris** on 4 Nov 2005, 6:54 p.m.,*
in response to message #2 by Walter B

The color change for the 32SII is thought to have occurred in 1999, and the 20S may have changed at that time as well. See the following thread:

HP48G - Popping rivets to open

*Message #1 Posted by **Caribe T** on 31 Oct 2005, 4:36 p.m.*

Hi there, Does anyone have any detailed information about opening the 48g by popping the rivets? 'H.D.'(?) made mention in a forum (back in Semptember) that he/she did it and that they were going to post some information for anyone interested.....not sure if they did or not. Apparently be opening it this way, there is no to very minimal damage done to the calculator. Thanks, Caribe

Re: HP48G - Popping rivets to open

*Message #2 Posted by **H.D.** on 1 Nov 2005, 12:36 a.m.,*
in response to message #1 by Caribe T

It's documented on hpcalc.org (HP48 Openining section). If you need extra help, I don't mind answering questions (I've done it several times with no problems).

in response to message #2 by H.D.

Cheers thanks for that!!! Is this the same way that you opened yours? No problems breaking the rivets or casing?

Re: HP48G - Popping rivets to open

*Message #4 Posted by **H.D.** on 7 Nov 2005, 11:10 p.m.,*
in response to message #3 by Caribe T

The rivets aren't broken per se. You are simply prying them apart. And yes, I've opened several of mine this way. I forgot to leave my email in the last post, but this one contains my email should you have further difficulties opening it.

HP collections

*Message #1 Posted by **Will** on 31 Oct 2005, 2:08 p.m.*

Hi..i just was asking myself about the mean numbers of units held by collectors....how many of them do you currently own?

I first...

28s 17BII all voyagers (except 10c) 48G 48GX

that´s all...

collections

*Message #2 Posted by **bill platt** on 31 Oct 2005, 2:11 p.m.,*
in response to message #1 by Will

about 17 hp's and a few others

update more like 21

```
1       11C
2       12C
2       15C
0       16C

I have a 25, 67, 15C, 42S, and 48G.
Only five, but that means I can love each one a great deal more. :-D

(I used to have a 10C, 16C, 28S, and 41CX (with card reader and printer) as well, but I gave them away after a while. I guess I wasn't ready for the whole display case business. Didn't have room for it, either!)

Yes, I agree. Both of my 12c's are unpowered (I don't find them useful for anything). My 10b is never used in a year. One 30s is unpowered.

70% of my time is between the 32sii, 11c, 33s 10% of my time between 27s and 15c 10% between 32s, 30s, 17bii, 49g, 20s 10% to one of the 48gx. The rest are in need of some work or a re neglected entirely, though I have at times chosen to "rotate" the 17bii, or the 32s, or the 15c, or even the 30s, into daily

service for a change of pace.

The 49g is primarily a travelling alarm clock! (It wakes me up with "ode to joy")

Re: HP collections

*Message #8 Posted by **Howard Owen** on 31 Oct 2005, 3:09 p.m.,*
in response to message #1 by Will

My current count is 38 HP machines:

```
1       11C
1       12C
1       15C
1       16C
1       20S
1       28S
1       41CV "blanknut"
3       41CV
2       41CX
1       45
1       48S
1       48SX
1       48G
1       48G+
1       48GX
1       49G
1       49G+
1       67
4       71B
3       75C
1       75D
1       85A
1       85B
1       87XM
1       95LX
3       97
1      200LX
1     9816S
```

Most of the duplicates were acquired in pursuit of one or another peripheral or other add-on.

Some people might find this interesting. It explains where I am coming from:

1 41CV with maths, circuits, purchased new Feb 1981 for comms engineering student/prof. use. Xfunctions and time module acquired 1984.

(Modified: clock doubled in 82. Repaired a number of times including for "N" nicad gas leak in 86 and keyboard mech. failure in 94. Main use is in electronics (active filters, timing, gain-bandwidth calcs), acoustics (speaker cabinet resonance/standing wavelength calcs) or mechanical (gearbox /diff what ifs, torque, carb. flow rate calcs etc.) Some simple project mngmnt.

1 41C bought (d.o.a.) on Ebay from Louisianna USA (ex coal/petrochemical co.) for testbed use. Badly contaminated. Stripped except LCD and repaired to "as new" for use. 1980 machine.

My collection

(3x) HP-48GX (each with 128K & 2048K RAM cards)
(1x) HP-48G (expanded internally to 768K)
(1x) HP-48G+
(1x) HP-49G
(1x) HP-49G+
(1x) HP-41C (with QUAD/HPIL/DEVIL/EXTIO/AUTODUP/GAMES modules)
(1x) HP-6S
(1x) TI-57
(1x) TI-59
(1x) Sharp PC-1251
(1x) Sharp PC-1403

I also have HP-11C, HP-12C, HP-15C, HP-16C, HP-41C/CV/CX, HP-42S and HP-71B (together with almost all available modules and expanded to the maximum amount possible) installed in the virtual form on my three HP-48GXs and HP-49G :-)

*Message #25 Posted by **Arnaud Amiel** on 1 Nov 2005, 4:27 a.m.,*
in response to message #1 by Will

Looking in my drawer at work I see:

```
1x 35 (+1 on my desk)
2x 45 (why 2? Oh, they are different!)
1x 55
1x 41CV
1x 10C
1x 12C
1x 15c
1x 28s
1x 48gx
1x 49g
1x 32sii
1x 20s
1x 21s
1x 6s
```

There is also a 49g+ in my backpack (and one of the early keyboard at home) and a 33s in my laptop bag. I remember having just fixed a 97 at home and I also have an Xpander at home that I don't really use as it is not so practical. I believe I have a couple more at home that need attending to. This will keep me busy during the long winter nights. And of course I have nonpareil on my PC and still haven't sent a postcard, shame on me...

Arnaud negotiating for a 33e

(So that is about 20)

*Message #28 Posted by **Matthias Wehrli** on 2 Nov 2005, 9:31 a.m.,*

in response to message #27 by PeterP

Hi Peter

As you know, my favorites are accessories, so if I would cout all my calculators and all their accessories in my collection I would perhaps get a balance of 20% to 80%. I´ve specialized myself in accessories, as I have the different models (ok, some specials too).

As I know Raymond very well, I know he will not publish his collection in the internet and I share his point of view very well.

Diego? I wouldn´t say he is a big collector, more a hardware developper and a shining flower in the big autumn field. He gives us the motivation for keeping our goodies.

Re: HP collections

*Message #30 Posted by **brian healy** on 1 Nov 2005, 9:22 a.m.,*
in response to message #1 by Will

my collection pales when compared to the others. I have assembled my fleet of HP's not so much to collect them but to use them. (1) 11c (4) 32sii (one of them is the silver bezel) (3) 33s (bought 2, one sent by HP as a replacement)

Would like to add 15c, another 11c, a 41 series, a 42s, and possibly a 48 series.

My "flagship" is my 32sII from Singapore that has the keys with the molded-in characters. Built in '93, and still going strong. My 11c was my first HP that I bought in college, and while maybe the least capable, I prefer its design.

I am too young to have started with an 11c (5 of my hp calcs are older than me) but however much I like the format of the voyager series, I find them annoyingly slow. Mind you, now that I do most of my work (and play) on the 49g+ I find most of the calculators annoyingly slow. At least the LED calcs are exciting when running programs, not a boring running flashing on the screen.

Arnaud

Yes, they are slow -- HP tried very hard to make them fuel efficient; in the end maybe they tried a bit harder than necessary.
In my college days, when I bought the 10C and 16C, the college bookstore would accelerate voyagers for $30 or thereabouts (they even took over the factory warranty -- pretty sweet deal). There are instructions on the HP Museum site on how to do it yourself, too.
At twice original speed, my 10C felt responsive enough -- still not as fast as the 41CX, but at least not as annoying as the unmodified model.

College Bookstore

*Message #33 Posted by **bill platt** on 1 Nov 2005, 5:12 p.m.,*
in response to message #32 by Thomas Okken

Wow--some bookstore!

Where was it? MIT? Ecole Polytechnique? (just using stereotypes...)

Re: College Bookstore

Delft University of Technology, in the Netherlands.
The book-and-computer store in question is Prins, technically not owned by the university but affiliated.

Disclaimer: I am not affiliated blah blah blah...

2 48GX (one with 128 and 512 cards, other with 128 and 1024 cards)
1 42S
1 41CV (with Adventage module)
1 15C
1 32SII
1 33S (prototype with no serial number)
1 20S

also Casio fx-4000P and fx-6300G

Re: HP collections

*Message #36 Posted by **Ron Ross** on 1 Nov 2005, 1:14 p.m.,*
in response to message #1 by Will

It is easier for me to list what I DON"T HAVE.

Newest models:

Hp9g Hp9s Hp48Gii Hp17Bii+ Hp12cp Hp40GS

later Hp LCD models

Hp16c Hp41CX

Older LED's I do not have (my collection is actually quite weak in Hp LED models, though I do have most of the Ti line):

Hp55 Hp65 Hp67 Hp19c Hp27 Hp29c Hp31e Hp34c

I also don't have the following business models, but I don't make to much effort to get them either (but I wouldn't walk away from a cheap one either)

Hp80 Hp70 Hp10 Hp22

So while I am missing quite a few, it is much easier to list the ones I don't have than to count the ones I do have. I also have multiple samples of many of the ones I do have. I do occasionally horse trade, but would feel guilty if I sold any outright (I horde plain and simple), especially at some of the prices they do go for.

Re: HP collections

*Message #38 Posted by **Jim Creybohm** on 1 Nov 2005, 4:11 p.m.,*
in response to message #1 by Will

Well, lets see, in chronological order:

HP-25 HP-67 HP-41CX Fullnut HP-41CX halfnut w/ printer, numerous pacs, and card reader HP-10C (sold) HP-48GX

I have never been a big fan of the Voyagers, so I did not really enjoy the 10C. I know the form factor made it popular, but after using a 41 I can't go back to non-alpha prompts.

Most of my time is spent between my beloved 41's, and the 48GX. Gee, its too bad when you have to alternate between the best of a couple of eras!

Things to be added might include;

HP-42 HP-32S

And if HP continues along its present path, one or two TIs!

In order of acquisition, my modest collection consists of:

HP-35 (1974…got this from my dad for $100 when he got an HP-45…used it my junior year of high school)
HP-55 (1975…my first new calc, purchased mail-order for $295 from a camera store in NY City…used it my senior of high school and first three years of college…my dad and brother have the only other two I ever saw in use)
HP-34C (1979…bought this at Fresno State for $150 (?) at the start of my senior year of college and used it through my first two years of working as a civil engineer)
HP-41CX (1984…sold my CV+Time+XFun to raise the money ($225?) for this…bought it from Lewis & Lewis in Ventura, CA…I have a modest collection of modules, a card reader, and the 82143 printer…in many ways this is still my favorite)
HP-42S (1987…$105 at the Fresno State bookstore…bought it when I sent my HP-41CX back for repair after removing a speed-up kit and cracking a screw stud…this is still my primary calculator)
HP-48G (bought display unit for $25 from Office Max…on permanent loan to my son)
HP-48G+ (bought new unit for $35 from Office Max when they stopped carrying it…this is my #2 calc)
HP-32Sii (bought for $65 from Office Max when HP announced end of production)
HP-10B (won this a couple of years ago in a contest…a calc dealer in the UK had come across some NIB old stock)

Also, a few years ago my dad gave me his HP-41C. With an HP-28 and HP-48SX, he wasn't using it anymore.

Fred

in response to message #1 by Will

Not an extensive collection but here it is:

1 10C
1 11C
0 12C (I refuse to own a bean couter's calculator)
2 15C
1 16C
1 35
1 45
1 55
1 65
1 67
1 41CV (my first HP from early 80's)
1 41CX fullnut
1 41CX halfnut

13

plus Curta Type I and Curta Type II

Edited: 1 Nov 2005, 10:37 p.m.

Curta calculators

*Message #41 Posted by **Karl Schneider** on 2 Nov 2005, 1:01 a.m.,*
in response to message #40 by Miki Mihajlovic

The Curtas, though the least capable, might be the most valuable:

Recent eBay Curta auction

A fine article about the Curta ran in Scientific American early this year. Production was discontinued in 1972, when inexpensive "four banger" electronic calculators because available.

I'd say that a Curta is to an good electronic calculator as a fine chronometer is to a quartz-crystal chronograph. Both the Curta and the chronometer are masterpieces of mechanical engineering. However, a quality QC watch keeps time even better, and is much more versatile and economical. Only as piece of status-symbol jewelry (and perhaps in exceptional environments and circumstances) could a mechanical chronometer be considered truly "better".

-- KS

Re: Curta calculators

*Message #42 Posted by **Howard Owen** on 2 Nov 2005, 1:30 a.m.,*
in response to message #41 by Karl Schneider

Ah, but the QC watch is mass-produced, so they end up being a "dime a dozen" almost literally. The fine swiss movement in the expensive chronometer is a marvel not only of mechanical engineering, but of manual tweaking and stroking by a master craftsman. Such care doesn't come cheap, and more to the point, is limited. So the supply of the fine swiss movement in the expensive chronometer is limited. Supply and demand take over, and the superior time measuring device is valued less in currency terms than the less accurate device. I know which one I'd rather have with me when seconds really matter, though.

The Curta machines are in limited supply, and are marvelous and ingenious devices. They have also been the objects of collector interest for much longer than our calculators. This probably means that a larger percentage of the available macines are already in collections, compared to the numbers for our hobby interests. Smaller supply and a longer established collector market help explain the high prices.

But I'm pretty sure there never was a Curta watch. 8)

in response to message #41 by Karl Schneider

Two years ago, a surveyor whom I had previously written two surveying programs for free for his CASIO PB-700 offered me a Curta Type II absolutely mint, with case and original manual in Portuguese for about ...$20.00! I told him that was not my preferred kind of calculator, I even told him collectors would pay him more... I even made some additions and subtractions on it, a true mechanical pocket calculator!

Gerson.

Re: HP collections

*Message #45 Posted by **Christoph Klug** on 2 Nov 2005, 2:33 a.m.,*
in response to message #44 by Don Williams

Dear HP handheldcomputer enthusiasts :-)

my own collection is limited to the HP41CX modell. I have some of them including the HP41CY. Furthermore exist some W&W and Eramco RAM-Box systems, Hepax, Zeprom, Clonix, NoVRAM and a collection of the standard plug in modules and Double-X-Memory.

There also exist a collection of HP-IL equipmemt which is compatible to the HP41, including IL-Plotter, IL-Digitalmultimeter, IL-Datalogger and CMT-RAM-Disk.

Main interest are hardware interface applications with HP41 system -most of you know the nice modular I/O-Board and the powerfully IL2000 interface system. For example with the IL2000 system I create an audio measurement system. For any of this systems are manuals and parts available.

The greatest and heaviest hardware device I designed for the HP41 is an HP-IL controlled labor measurement system (power supply + generator + counter + voltmeter).

A key-function for today HP41 applications is PC interfacing, I use the fantastic EMU41 emulator software in combination with the rebuild version of the HP-IL/PC interface card, which is available from me.

Last not least I have a nice collection of HP41 books and manuals, here I only miss the English paper version of the CCD-Module manual :-(

Best wishes - Christoph Klug

*Message #46 Posted by **GE** on 2 Nov 2005, 4:52 a.m.,*
in response to message #45 by Christoph Klug

Most collectors seem to be non HP exclusive (my case too), as there were about 80 different HP calculators made and probably 5000+ from other brands, that is quite understandable. This is probably why there are few or no HP zealots (as opposed to fans) here.

I have about 30 models made by HP, I like more LED types but they are harder to get. On the other hand, later LCD models are not really collectable (past the 41), with exceptions like the 71B.
Another trend is that if I have the 'higher-end' model, I don't need the more limited one, like HP34C compared to HP33C (in that particular case, an HP31E would still be desirable due to rarity of course). The same is true for HP48GX : no need for G, S, G+, etc.
I wonder if it is a sign that you are a 'newcomer' to collecting if you have the complete list of recent models but little on the LED side ? I know I bought most second hand, but some new if they were available at the time I was already biten by "the bug" (and wealthy enough...).
Some have carefully updated databases (that's part of the joy of collecting for sure), I rather rely on 'visual memory' to know if I already have an item.
My current use of HP models is a 6S as a scratch-pad for very low-level calculations I do at work, the 48GX for more involved leisure math, or the 71B for programming (the 48 being write-only IMHO).
Recently I dusted off my 42S, but being stored without batteries it was missing my essential toolbox, and typing all again was too big a task, so I just played a bit.

Re: HP collections

in response to message #45 by Christoph Klug

Hello Chris, You seem to have extinsive knowledge on the HP-IL interface. I have a 2671G thermal printer with HP-IB. The manual has an entire section devoted to HP-IK interfacing but no mention of a model option. Any Ideas here why a section in the manual?

Just amazing...

Re: HP collections

*Message #49 Posted by **James M. Prange (Michigan)** on 2 Nov 2005, 3:36 a.m.,*
in response to message #1 by Will

Ah well, my "collection" is rather limited. I guess that I'm not really very interested in "collecting" just for the sake of collecting, but rather I want "useful" things, and have sentimental feelings for things that I once found very useful, but have been superceded by "better" models.

HP models:

```
12C
16C
28C
28S
48SX
48GX
49G
49g+
82240A printers
82240B printers
Various accessories, such as cards, cords, and adapters for the 48 and 49 series.
```

For the HPs, I'm undecided whether the 48SX or the 48GX is most useful. I think that the 49g+ is even more fun to play around with than the 49G.

I'd love to have a 15C, which may well be the all-around most useful "shirt-pocket-sized" calculator ever made, but my budget is very limited.

Sharp: EL-5520 handheld calculator/BASIC computer, and accessories such as the printer/cassette interface, a genuine Sharp cassette recorder, and level shifters for RS-232 communications. I doubt that I'll ever really "use" them again, but they were marvelous when I got them.

Radio Shack model EC-4004 (rebadged Casio?) keystroke programmable scientific (circa 1990), and Lloyd's model E608 "4-banger" plus square root and percentage keys (circa 1980). The surprising thing about these two is that they're still working with the original batteries.

I just discovered a spare CR 2025 cell for the Radio Shack tucked into the case. I purchased this well over a decade ago, just in case the battery went dead during an ASQC exam.

Various "El Cheapo" models.

I think that I have an electro-mechanical adding machine somewhere in this big old house, or maybe I lent it to my brother. I suppose that I should look for it, one of these days.

Regards,
James

My HP collection (*with pictures!*)

*Message #50 Posted by **Valentin Albillo** on 2 Nov 2005, 6:01 a.m.,*
in response to message #1 by Will

Hi, Will & all:

Just for the record, my 'hardware' HP calcs collection consists of:

```
1 x HP-10C
2 x HP-11C
3 x HP-12C
3 x HP-15C
1 x HP-16C
1 x HP-25
1 x HP-28S
1 x HP-32S
1 x HP-32SII
1 x HP-41CX  + Card Reader + Advantage ROM + PPC ROM
1 x HP-42S
3 x HP-71B + 168 Kb RAM + Card Reader + Math ROM + HP-IL ROM
```

that's 19 machines, all of them with full manuals, cases (inc. leather cases), etc., everything in mint condition.

I also own SHARPs (40 in all, including such superb machines as the SHARP EL-5101, which is allegedly one of *the most beautiful* advanced scientific calculators ever made, and the *20-digit*, BASIC-programmable with microcoded *matrix operations* built-in SHARP PC-1475), TRS (4), Casio (one, the absolutely awesome Casio FX-7500G), and assorted machines of other brands. I also have a Casio PB-2000C on permanent loan. This is a handheld, similar in size to an HP-71B but with a much larger, 4-line display that it's actually *programmable in C* (!!). It also admits plug-in ROMs, including a BASIC ROM.

*Message #51 Posted by **GE** on 3 Nov 2005, 9:11 a.m.,*
in response to message #50 by Valentin Albillo

Hello, the 5101 is nice but how about the 5100, the ORIGINAL machine that started it all. See also the last member of the family, the 5150, much better but quite not so much personality of course.

The PB2000C is nice too, and there was a Prolog module available ("available" being an overstatement as I have never even *heard* of one anywhere). Again, there is the much better fx890P, featuring C, BASIC, CASL *and* assembler out of the box, 64K available to the user... but lots less personality.
I guess our own personal history dictates what we feel is nice, actually.

Hi, GE:

GE posted:

"the 5101 is nice but how about the 5100, the ORIGINAL machine that started it all."

Wish I had one but no such luck yet. Adding insult to injury, I have one good friend of mine which has one in good shape, and I happen to own *two* 5101, also mint. But he won't trade ...

*"The PB2000C is nice too, and there was a Prolog module available ("available" being an overstatement as I have never even *heard* of one anywhere)."*

I've never seen the BASIC module either, but it seems it actually did exist, I've seen the manual.

*Again, there is the much better fx890P, featuring C, BASIC, CASL *and* assembler out of the box, 64K available to the user... but lots less personality."*

Indeed, it's mostly about 'personality'. For instance, I know for sure all RPL models are far more capable than, say, an HP-15C or HP42S. Yet I'd never trade any number of them for a single 15C or 42S. Nor for an HP-25 for that matter.

Best regards from V.

*Message #53 Posted by **bill platt** on 3 Nov 2005, 11:39 a.m.,*
in response to message #52 by Valentin Albillo

The 25 is just *too* cool. Way too cool. Could never trade that if I had one.

http://www.hpmuseum.org/3qs/253q.jpg

The beginning of the ultimate pocked programmable. Got to get one!

Re: 25

*Message #54 Posted by **Thomas Okken** on 3 Nov 2005, 8:00 p.m.,*
in response to message #53 by bill platt

They're not hard to get... I got one on eBay for $33 about a year ago. Works great; still as much fun as in 1977. :-)
Of course you have to be prepared to wade through page after page of outboard engines and inkjet cartridges before you find an actual HP-25 *calculator*!

*Message #57 Posted by **Hal** on 7 Nov 2005, 1:46 a.m.,*
in response to message #53 by bill platt

Ahh yes...my first HP was a 25c, bought new in '76. Shortly thereafter the 29c came out and of course that was a MUST HAVE, so I scraped $195 together and got one (I still have it), and sold the 25c (why!! why!! did I do that!!). One of my classmates who sat behind me had a 67, and I'd hear him running the card reader all the time (he must have been from a rich family, because $450 was a chunk of change back then!!) My envy was assuaged, however, by the fact I had continous memory and he didn't!!
Am still looking to add a 67 to my humble collection, but they cost almost as much now as they did then!!
Regards, Hal

Re: 25

*Message #58 Posted by **Ed Look** on 7 Nov 2005, 11:25 p.m.,*
in response to message #57 by Hal

It's still quite a chunk a change today...

... which is why for all the criticism of models like the 33S and 49G+, the beauty of these is that they do put affordable and really, serviceable RPN models with the reach of many.

*Message #60 Posted by **Tizedes Csaba [Hungary]** on 2 Nov 2005, 9:19 a.m.,*
in response to message #1 by Will

Hi!

My owns are:

```
1   12C
1   15C
1   17BII
1   28C
1   32SII (Blue-Orange)
1   41CV (may I will give an another with printer and tape :P )
1   48SX
```

I sold, or traded:

```
1   10C
2   38G :'( snif, snif... --- OK, I know it's not a big deal,
        but it was a total heart-eclipse (BT rlz)
        and I WANT TO buy a new again (help me, please)!
2   45
1   48G (I hate pop-up windows...)
1   48GX (...and filling-forms... ;) )
```

And the "others":

```
1   CASIO FX-850P with +8K RAM (my first...)
1   CASIO FX-750P
1   CASIO FX-4200P
1   CASIO FX-4500P
1   CASIO FX-50f (a great machine - and what a slim!!!)
2   Texas Instruments TI57LCD (damaged keypad)
1   PSION LZ-64 Organiser
1   PSION Revo 8M Organiser (exploded state)
```

In Hungary may impossible to find old HPs, so I think, I'm very fortunate with this collection...

Csaba

Here we go: (in technologic order, I guess...)

```
1       55
1       97
1       31E
1       34C
1       37E
1       38E
2       38C
2       41C  (fullnut) + 82143A + 82104A + 82153A + Financial ROM
2       41CV (1 full-, 1 halfnut) + MLDL2000 + NoV32 (both to be delivered)
2       41CX (1 full-, 1 halfnut) + HPIL + 82242A + Navigation ROM
1       75D (?)
1       71B (?) + IL + Card Reader
1       10C
1       11C
3       12C
2       12C Platinum (?)
3       15C
3       16C
1       28S
1       42S
1       14B
1       48SX
2       48G+
1       17BII
1       19BII
2       49G
1       10BII
1       33S
1       49G+
1       48GII
2       39G+
```

(HP or not HP...)

```
1       30S
1       9S
2       9G
```

other brands:

```
1       TI55
1       TI57
1       TI58C (bad mem chips)
1       TI59 + PC100C
1       TI82
1       Casio fx7000GA (interesting model, indeed)
```

That´s all, folks. This is almost complete, I am almost sure I missed something. I also have many original HP manuals and a few original boxes.

Re: HP collections

*Message #67 Posted by **Karl Schneider** on 4 Nov 2005, 12:37 a.m.,*
in response to message #1 by Will

The focus of my collection is what I consider the "golden era" of HP calculators -- mature and (mostly) well-engineered and well-documented products introduced between 1979-1993. This era includes the the HP-41, the Spice, Voyager and Pioneer series, all Saturn-processor models, and all the original RPL-based models.

I do also have a few models from outside that period, as well as a few low-end non-HP's.

This is not to imply that the other major manufacturers did not also have some fine products. It's just that HP's "golden era" produced the complete package of excellence in all-American engineering -- design, mechanical quality, mathematical algorithms, and documentation. RPN was an important bonus.

Hewlett-Packard:

Classic (1971-74): 35

Spice (1978-79): 34C (3)

Coconut (1979-83): 41C, 41CV, 41CX

Voyager (1981-82): 10C, 11C (2), 12C (2), 15C, 16C

BASIC computer: 71B (+ Math)

Pioneer (1988-91): 10B, 14B, 17BII, 20S, 21S, 27S, 32S, 32SII, 42S

RPL-based (1986-98): 28C (2), 48G, 49G

Other (ahem) "HP": 33S, 6S

The Others:

Casio fx-3600P, fx-115MS

Texas Instruments TI-36X

Rockwell 18R

then you must have some Woodstocks, mustn't you?

Woodstocks *are* golden....

*Message #69 Posted by **Karl Schneider** on 5 Nov 2005, 1:33 a.m.,*
in response to message #68 by Bram

...after all, their namesake bird from "Peanuts" is indeed yellow in color!

All kidding aside, I don't have any Woodstock-series models (21, 22, 25, 25C, 27, 29C) or 67/97's, which are based on Woodstock internals.

Granted, these models have their fans (take a look at the above posts from Paul and Bill Platt in this thread). As impressive as the 67 was, and as "clean" as the 25/25C was, I can't quite consider any of the LED models as the acme of refinement or practicality. The LCD made further significant advancement possible in those areas.

It's true that the HP-67 was built solidly, and had impressive functionality for its era. I actually wouldn't mind getting one as an example of quite likely the best LED handheld calculator ever made. However:

- It's long and heavy, with both a rechargeable battery and an internal card reader to deal with and maintain.
- Its Application Pac software are RPN routines stored on magnetic cards, instead of machine-coded programs on plug-in modules.
- It has "stiletto-heel" arithmetic keys on the left side, which is wrong for right-handers.
- It has a busy-looking faceplate with ugly brown keys. Many basic functions are shifted.

The HP-25 and -25C have a clean, compact form factor and good construction. But its programming functions make some basic functions shifted; the programming paradigm itself is the crude one from the HP-55. Its keyboard arrangement is very similar to that of the compact HP-34C, which has better programming along with SOLVE and INTEG to make full use of it. (Now, if only the mechanical design weren't so flawed...)

No, I'd say the 1980's and early 1990's was the real "golden age" of HP calc's, when traditional quality converged with unquestioned practicality and affordability.

*Message #70 Posted by **Dave Shaffer** on 5 Nov 2005, 10:13 a.m.,*
in response to message #69 by Karl Schneider

re: "It has "stiletto-heel" arithmetic keys on the left side, which is wrong for right-handers. "

Depends, IMHO.

Perhaps for (right-handed) touch typists, the math keys should be on the right of the numbers, but for us right-handed "hunt and peckers," I prefer those keys to the left of the numbers, where I can see them unblocked by my hand, and where I hit them with my thumb or index finger (which produce a firmer push than my little finger!). Maybe that's why I prefer my 11C and 41CX to my 32S and 42S.

What do the "lefties" out there think about this?

... but you prefer it as you mentioned one post earlier. So there must be another reason ;-)

Re: HP collections

*Message #73 Posted by **Valentin Albillo** on 4 Nov 2005, 10:52 a.m.,*
in response to message #67 by Karl Schneider

Hi, Karl:

Nice collection you have. Mine is complete (i.e., I already own all HP models I care for) except for an HP-34C and an HP-67. May I suggest you should try getting an HP28S. I see you own two HP28C, but the 28S is the much superior model, IMHO.

As for other brands, I would heartily recommend that you get some of these SHARP models:

```
PC-1211/1212: first dot-matrix LCD BASIC handheld, metallic,
              slim, extremely beautiful and capable

PC-1261/1262: ditto, much smaller but 15 times faster, 7 times
              more RAM and with a much better BASIC.

PC-1421:      ditto, specialized financial functions (a la HP-12C)
              but with the power of BASIC language programming

PC-1425:      ditto, specialized statistical functions, again
              perfectly integrated with BASIC programming.

PC-E500/S:    less fancy looks, but 4 lines x 40 char
              alphanumeric & graphic display, and the fastest
              BASIC language handheld of its time: more than
              5 times faster than the HP-71B and faster than
              most other models, including the HP-75, 28S,
              32S, 42S, you name it. It also includes extremely
              useful program libraries built-in in ROM, etc.
```

Of course there are many other worthwhile models, but I humbly suggest that you try and get some of these. They can be had very cheap in eBay Germany, for instance, and if you manage to get a near mint, working one, you're bound to be delighted and awed by their quality of build and performance. I did show some of mine to a number of HP-loving friends and acquaintances, and most of them turned into SHARP 'lovers' as well. Ah, and all of these models *do* have full I/O capabilities.

As for pure programming fun (challenges & all), have a look at what you can do with the very simplest, less capable model listed above, namely the circa 1980 SHARP PC-1211. This 9-liner solves the NxN Chess Queens puzzle for arbitrary N, without recursion (RUN "A"):

```
1 A(Y)=A(Y)+1: IF A(Y)>X LET Y=Y-1: GOTO 1
2 GOTO 5
3 "A" CLEAR: INPUT "N=";X: Y=1: WAIT
4 A(Y)=1
5 IF Y=1 GOTO 8
6 FOR Z=1 TO Y-1: IF (A(Z)=A(Y))+(Y-Z=ABS(A(Z)-A(Y))) LET Z=Y: NEXT Z: GOTO 1
7 NEXT Z
8 Y=Y+1: IF Y<=X GOTO 4
9 USING: FOR W=1 TO X: PRINT "Queen at ";W;A(W): NEXT W: Y=Y-2: GOTO 1
```

I think that a person like you, who loves challenges and math and programming would love to try these machines, either for real or for pure fun.

Best regards from V.

PC-1250

*Message #74 Posted by **bill platt** on 4 Nov 2005, 2:59 p.m.,*
in response to message #73 by Valentin Albillo

Hi Valentin,

I have a PC-1250 which I bought for $4.00 or something like that--no manual but it has its original slipcase. (It belonged to another amateur radio operator---as you know there are a lot of us on this forum!)

It looks very much like the 1261 but is missing the DEG RAD GRAD and a few other "commands" printed on the face--

I have not used it much, but I wonder how much it is "missing" from the 1261?

It looks to have I/O and everything! I suppose there must be some sort of interface and cable -- maybe to write / read from a compact cassette drive?

Nicely made. The buttons aren't HP but they seem to be pretty reliable.

It is the start of my SHARP collection (well, actually my wife started it--with her little elsi-mate that is still going strong since about 1982--with its original battery--amazingly enough it looks to be a single aaa alkaline cell! I still have not replaced it because it just keeps on working...)

Regards,

Bill

Sharp pocket computers (and other topics)

*Message #76 Posted by **Karl Schneider** on 5 Nov 2005, 9:33 p.m.,*
in response to message #73 by Valentin Albillo

Hello, Valentin --

Thank you for the compliment and the links to some of the advanced models of calculators from Sharp. I looked through Archives 13 and 14, revisiting many interesting old threads, in search of this:

POST: Valentin's Sharp calculators

which sprung from an earlier "What's in your calc collection?" thread.

Yes, the machines certainly look impressive, and doubtless offer -- as you described -- certain functionality and capabilities that no HP models had. If the prices are reasonable, I might even get one or two, in order to have an example of a high-end non-HP product.

However, I doubt that I would indulge a hobby of high-end Sharps as you have. My interests lean more toward what I consider the best pure calculators, not the vintage pocket/handheld computers that run BASIC. I do have the HP-71B with the Math ROM and all the manuals, but am barely competent with it. Eventually, I'll learn from those excellent manuals (and your posts!) how to use it properly; that will keep me busy enough when I undertake *that* task.

> Quote:
>
> May I suggest you should try getting an HP28S. I see you own two HP28C, but the 28S is the much superior model, IMHO.

I like the 28 for its advanced unit conversions/definitions and not having an ALPHA mode to remember; I keep one at work.

I once summarized the main differences between the 28C and 28S was the RAM (2 kB vs. 32 kB), directories on the 28S, added functions (e.g., PERM and COMB), and a slightly faster processor. Is that list accurate? If so, then I'd have little need for a 28S, since I already have a 48G and 49G.

> Quote:
>
> ...you're bound to be delighted and awed by their quality of build and performance *(of Sharp pocket computers)*. I did show some of mine to a number of HP-loving friends and acquaintances, and most of them turned into SHARP 'lovers' as well.

Hmm, I dunno. No RPN? Also, I'd be real surprised if the quality of their mechanical engineering and ergononomics matches that of the HP's from the 1980's. Long-term durability and repairability is an issue now, given the age of these devices. And, I'd be absolutely stunned if the documentation measured up to that of the 71B, 71B Math ROM, HP-41, HP-15...

> Quote:
>
> They can be had very cheap in eBay Germany,

But the shipping to the USA might be a hassle, and I'd have to refer occasionally to my German-English dictionary if discussions with the seller were needed... ;-)

> Quote:
>
> I think that a person like you, who loves challenges and math and programming would love to try these machines, either for real or for pure fun.

I'd characterize myself as mainly a pragmatist (although I admit to having engaged in philosophical disputes on the Fourm from time to time). My programming endeavors emphasize my own professional applications, such as this one for my primary workplace calculator:

PROGRAM: AC Power Transfer for HP-32SII

I also have developed a working and more-extensive version of this program for the HP-42S, but it's not yet "ready for prime time". Adequate documentation would be a real chore.

I've also got several useful programs in mind for the HP-16C, once I understand the commands more fully.

My postings on mathematics have focused on fundamental definitions and computational algorithms on HP calculators:

POST: j^j on the 33S

POST: Hyperbolics with Advantage

And here's my discussion and basic technique for using SOLVE and INTEG:

ARTICLE: SOLVE and INTEG on RPN-based HP's

I do enjoy studying and reading your challenges and detailed answers, but generally leave the "doing" to others (some of whom have already accomplished them by the time I read them...)

-- Best regards from Karl S.

*Message #77 Posted by **Valentin Albillo** on 7 Nov 2005, 6:36 a.m.,*
in response to message #76 by Karl Schneider

Hi again, Karl:

Karl posted:

"If the prices are reasonable, I might even get one or two, in order to have an example of a high-end non-HP product."

By all means do, but I'd suggest you get first one of the models I mentioned. They're the more likely to make a positive impression on you, and we all know that first impressions are what counts.

"I once summarized the main differences between the 28C and 28S was the RAM (2 kB vs. 32 kB) [...]"

The ratio is even worse, because 1/4 of those meager 2 Kb were permanently reserved for the operating system, thus leaving no more than 1.5 Kb for the user, which was absolutely insufficient. Mr. Wicked himself said that its RAM resources would compare to a bare bones 41C with no extra RAM at all, and that was insufficient to run most complex HP-67 programs.

"Hmm, I dunno. No RPN? "

You can easily search for my opinion on RPN in the MoHP's Archives so no need to repeat it here. Among my frequent posts, the one discussing HP's "Mach's number example" is the best summarization of my views.

"Also, I'd be real surprised if the quality of their mechanica engineering and ergononomics matches that of the HP's from the 1980's. Long-term durability and repairability is an issue now, given the age of these devices."

Don't be so surprised. SHARP have been pioneers in electronics since old, and theirs are the very first

LCD displays. Their first handheld 'computer', the venerable SHARP PC-1211, was offering a 24-character alphanumeric, dot matrix LCD display and BASIC in ROM in a slim, metallic body, with full I/O to mass storage and printer integrated back in 1980+, at a time where the HP-41C did with a 12-character, segmented LCD display and RPN in a plastic body, with I/O to mass storage and printer requiring expensive accessories with their own external ROMs. Not that I would compare both products or suggest that one is better than the other, they're simply in different leagues, but the SHARP's model hardware and build quality are perfectly comparable or even surpass the HP model.

As for durability and repairability, all my SHARPS do work perfectly, keyboards and all, despite being 15, 20, 25 years old. Still shiny as new, as well. You can open them up by simply unscrewing some perfectly normal screws, you can peek at the insides and even do your own things there, if you want to, such as internally wiring more RAM, etc, as long as you know what you're doing. They mostly use standard components.

"And, I'd be absolutely stunned if the documentation measured up to that of the 71B, 71B Math ROM, HP-41, HP-15... "

The documentation is perfectly good. The SHARP PC-1211, for instance, came with a big User Manual, full of detailed examples, plus another big book with *over a hundred* programs in all cathegories, mainly engineering, maths, statistics, etc, many of them suitably long and well written. After having a look at the dismayingly *bad* and insufficient "Standard Pac" which came with my newly acquired HP-41C, I was more than delighted with the SHARP PC-1211's equivalent, which would run rings around HP's offering both in terms of sheer number of programs featured and their quality and documentation. Not only would you learn from them, you'd actually *use* them (for instance, there was a program to solve linear systems up to 11x11).

You can see the quality and thoroughness of their documentation for yourself by having a look at this, which is the whole manual for one of the models I heartily recommended (SHARP PC-E500, the 'engineering' model) in English language, PDF format (6 Mb approx.):

SHARP PC-E500 Operation Manual

I think you'll agree with me it's perfectly good, adequate and comprehensive documentation for this superb machine.

"I do enjoy studying and reading your challenges and detailed answers, but generally leave the "doing" to others (some of whom have already accomplished them by the time I read them...) "

Well, I suppose doing so has its advantages as well, though you'll miss the fun of confronting an interesting problem and actually finding a solution.

Thanks for your kind opinions and

Best regards from V.

HP-42S with HP-82240B Printer

*Message #1 Posted by **Joe D.** on 31 Oct 2005, 1:21 p.m.*

Hello,

I'm using my HP-42S in combination with the HP-82240B printer for several years now. But there's one big problem about graphics which I never managed to solve and that's why I'm seeking help from you.

Since the calculator's alpha register handles only 44 signs at the same time, any graphic sequence larger than 42 pixels (44 minus the two signs for the escape sequence) has to be splitted into two, three or four parts. So to print for example a 50 pixel wide graphic sequence, I have to enter the following: CLA, 27 XTOA, 50 XTOA followed by 42 times let's say 195 XTOA. To transmit the (still uncomplete) data to the printer I use the PRA-command. At this point the printer doesn't print anything, because he correctly awaits 50 signs, and writes the sequence into the buffer. No problem so far! But when I try to send the remaining 8 signs (CLA, 8 times 195 XTOA, PRA), the printer draws the following sequence:

```
00X0
00X0
XX0X
00XX
00XX
000X
000X
000X
```

before continuing with the correct graphic. In decimal code this means: 4, 4, 27, 252. So it seems that either the printer or the calculator (by means of the PRA-command) adds AUTOMATICALLY two right-stop line-feeds and one "return to normal width"-command. How can I prevent them from doing this?

P.S. To avoid this problem I always used the PRLCD command, but since the display of the HP-42S has only 131 pixels, I could never take advantage of the 35 supplementary pixels of the printer.

MANY THANKS IN ADVANCE!

*Message #2 Posted by **TomC** on 31 Oct 2005, 4:26 p.m.,*
in response to message #1 by Joe D.

Hello Joe: [This may not be an answer, but hopefully it helps.]

In the HP42s Manual, there is a printer plotting program which does not (cannot?) use the full width of the printer paper. I don't believe the HP42s can send hex codes to the printer (as the HP48 does), so you are limited to the width of the LCD display.

Good Luck, TomC

Re: HP-42S with HP-82240B Printer

*Message #3 Posted by **Joe D.** on 31 Oct 2005, 5:25 p.m.,*
in response to message #2 by TomC

Thanks for your answer, Tom!

You're right! I know this program very well. I've even written my own version of it, so that it draws an y-axis too now (I simply couldn't understand why they had forgotten this). But it is obvious that this program CAN'T use the entire paper width because it doesn't directly address the printer. Nor does the enhanced version from the Advanced Programer's Manual (with up to 3 simultaneous functions).

My question however refers only to DIRECT printer adressing. This is undocumented in both HP-42S manuals, but you CAN use the escape sequences via 27 XTOA. So you can change v.g. the character set from ROMAN 8 to ECMA 94 which allows the use of greek letters.

By the way, why does the character code table at the end of the User's Manual show both decimal and hexadecimal codes for each character? Only by convention?

> Quote:
>
> By the way, why does the character code table at the end of the User's Manual show both decimal and hexadecimal codes for each character?

Well, sometimes it's easiest to use the decimal notation, and sometimes it's easiest to use the hexadecimal notation.

> Quote:
>
> Only by convention?

Actually, I suspect that showing both notations is somewhat unconventional. I wish more character tables would do this; it would sometimes save me the trouble of converting.

Re: HP-42S with HP-82240B Printer

*Message #7 Posted by **Thomas Okken** on 1 Nov 2005, 4:42 p.m.,*
in response to message #6 by Joe D.

It's possible to find out what the 42S sends to the printer by using a 48 to capture its output. There is a prgram called INPRT that does this; I've used it myself to work out some details in the Free42 printer emulation.
In case you don't have a 48 yourself, I'd be happy to run some tests for you and send you the results.

Re: HP-42S with HP-82240B Printer

*Message #8 Posted by **James M. Prange (Michigan)** on 1 Nov 2005, 8:35 p.m.,*
in response to message #7 by Thomas Okken

An excellent suggestion! But note that the version of INPRT published by HP remaps many non-ASCII characters from their Roman 8 character set to their modified ECMA 94 character set, which can muddy the issue. However, there are versions available which either skip the remapping or "remap" all non-ASCII characters to themselves; look for one of these versions.

Regards,
James

Re: HP-42S with HP-82240B Printer

*Message #9 Posted by **Christoph Giesselink** on 2 Nov 2005, 12:43 p.m.,*
in response to message #8 by James M. Prange (Michigan)

Instead of the INPRT version you can use the BINPRT program from the Clamshell/Pioneer ROM Upload package at http://privat.swol.de/ChristophGiesselink/Emu28/CPROMUPL.ZIP. This is a recompiled INPRT version without any conversation.

And here we have another possibility, using the PC version of Emu42 with the integrated

debugger.

The IR transmitter routine is at

```
OUTBYT EQU #0318D (HP42S rev. A)
OUTBYT EQU #031D6 (HP42S rev. B/C)
```

and the character to transmit is located in A[B]. So it's easy to set a breakpoint in the debugger and watch the A[B] register.

I made a small test with "ABC" in the alpha register and I got (in HEX) with PRA

1B,FC,41,42,43,04

translated this means

1B,FC = print with normal character width

41,42,43 = ABC

04 = special line feed

This explain the entire behavior I think.

Regards

Christoph

new rpn calcs

*Message #1 Posted by **brian healy** on 31 Oct 2005, 1:20 p.m.*

Is anyone aware if HP is working on a design for a successor to the 33s, or to any of its other currently offered calc's?

Re: new rpn calcs

*Message #2 Posted by **Namir** on 31 Oct 2005, 1:39 p.m.,*
in response to message #1 by brian healy

Having attended the HHC2005 conference in Chicago in September, I asked myself the exact same question. I was hoping something would be shed on successors to the 33s or 49G+. Alas, nothing. Th emain focus in the conference, regarding new stuff from HP, was improving on the current versions of the 33s and 12C Platimum.

This forum has discussed these improvements somewhat recently.

Re: new rpn calcs

*Message #3 Posted by **brian healy** on 1 Nov 2005, 9:08 a.m.,*
in response to message #2 by Namir

Namir, can you elaborate on what the HHC Conference is? I am not familiar with it. I assume HHC stands for hand held computer?

Re: new rpn calcs

in response to message #3 by brian healy

Brian Healy wrote:

> can you elaborate on what the HHC Conference is? I am not familiar with it. I assume HHC stands for hand held computer?

The HP calculator user groups have been holding conferences, almost annually since 1979. The most recent one was held in the Chicago area in September and was called "HHC2005". The web sites for the last three conferences are still up if you want to see them:

HHC2003 is located at http://holyjoe.net/hhc2003/

HHC2004 is located at http://holyjoe.net/hhc2004/

HHC2005 is located at http://holyjoe.net/hhc2005/

The next U.S. conference is tentatively scheduled for September 16th and 17th and various locations

are being discussed, such as San Diego, San Jose and others. Information will be posted here and at comp.sys.hp48 when it is firm - probably by early Summer. For what it's worth, all the conferences going back to 1989 have been videotaped. For info on obtaining copies, check out http://www.pahhc.org/video.htm on the web.

*Message #6 Posted by **John** on 1 Nov 2005, 3:45 p.m.,*
in response to message #5 by Bram

Again, Bram, that series of posts does not say HP will be making a new RPN calculator. All Mary did is say they were getting ready for the anniversary of the 12c.

I think they just want stories to post on a web page you won't be able to find on their website.

I'll eat my hat if HP comes out with anything other than a cosmetically changed 12c for this anniversary. Perhaps they'll do it in one of those lovely shades of plum they seem to like.

*Message #7 Posted by **brian healy** on 2 Nov 2005, 1:00 p.m.,*
in response to message #6 by John

Do we know if Mary is really from HP or just someone pulling our chains?

Mary, Mary quite contrary

*Message #8 Posted by **John** on 2 Nov 2005, 2:49 p.m.,*
in response to message #7 by brian healy

No we don't. I mean anyone could come here and say they work for HP or TI or ? and there would be very little we could do to stop it.

I wish people would quit getting their hopes built up. At best, we'd get a 12c with a different bezel saying something about a 25th anniversary.

So what and big deal.

Re: new rpn calcs

*Message #9 Posted by **Mike H** on 2 Nov 2005, 9:17 p.m.,*
in response to message #7 by brian healy

I do not think she is pulling our chain or an HP employee.

All indications are that Mary works for an ad agency (Source Communications) hired to develop the promotional material for the 12C anniversary edition.

I hope she was able to get some good ideas, but doubt she has any influence on future HP calculator production.

Mike H

What Mary said.

*Message #10 Posted by **John** on 2 Nov 2005, 10:49 p.m.,*
in response to message #9 by Mike H

She never said "12c anniversary edition" that I recall.

She said for the upcoming anniversary.

Hence, the speculation running wild.

Re: new rpn calcs

*Message #11 Posted by **Bram** on 3 Nov 2005, 8:39 a.m.,*
in response to message #6 by John

> Quote:

Connect HP49G+ via IR

*Message #1 Posted by **Daniel CLEMENT** on 31 Oct 2005, 9:49 a.m.*

Hello,

I have tried to connect my 49G+ to my PC.

The cable connection is fine, so I assume the soft is correctly installed.

However, when I try to connect with IR, the connectivity software claims that no calc is connected.

Indeed, from the PC indicator, the IR link is established then broken within seconds, possibly not allowing enough time for the program to get connected.

Maybe someone can point me to detailed instructions, because the documentation is very thin.

Thanks in advance - Daniel Clément

Re: Connect HP49G+ via IR

*Message #2 Posted by **Crawl** on 31 Oct 2005, 10:41 p.m.,*
in response to message #1 by Daniel CLEMENT

????

You do not connect to a PC with IR. IR is only for connecting two calculators to each other. You connect to a PC "by wire".

Re: Connect HP49G+ via IR

*Message #3 Posted by **James M. Prange (Michigan)** on 31 Oct 2005, 11:06 p.m.,*
in response to message #1 by Daniel CLEMENT

Which PC application are you trying to use for the connection with the 49g+?

As Crawl noted, Conn4x (the "Connectivity Kit" designed for the 49g+) isn't designed to work with IrDA. On my system, attempting to "connect" temporarily breaks the already established IrDA connection, and by the time that it's re-established, Conn4x has already timed out. I suggested getting IrDA working to Conn4x's developer, but he didn't seem to think it important enough to bother.

However, using MS Windows 98SE, my RS-232/IrDA converter is seen as a "virtual COM port", and I can use HPComm (the "Connectivity Kit" designed for the 49G) or HyperTerminal to connect with the 49g+.

Note that the 49g+'s IrDA connection is pretty slow (at least with my PC); in terms of bytes per second, the average througput is even slower than a 9600 bits per second connection with the 48 series. That said, I'm not absolutely sure that the "bottleneck" is in the 49g+; I suppose that it could be in something on my PC, including in the RS-232/IrDA converter.

Of course you can use a USB connection with the 49g+ for Conn4x.

Another alternative is to use an SD card or MMC (MultiMediaCard) to transfer objects.

Regards,
James

Re: Connect HP49G+ via IR

*Message #4 Posted by **Daniel CLEMENT** on 1 Nov 2005, 4:46 a.m.,*
in response to message #3 by James M. Prange (Michigan)

Thank you for all these details.

I guess I'm out of luck, for my OS is Win2k-SP4 which does _not_ use the "IRCOMM" thingy to map the IR port to a virtual COM port. So, HPComm would not help me. (The program I use is conn4x)

It's just disappointing... I don't like to play with cables; there are already enough around my PC. It's the 1st time I see 2 IRDA devices not working togethter!

fair price for an HP-45?

*Message #1 Posted by **blurdybloop** on 31 Oct 2005, 1:39 a.m.*

I have an extra HP-45 and manual that I'm planning on getting rid of. This is a version with painted OFF/ON indicator.

It was filthy when I got it, and although it cleaned up nicely I wouldn't feel good in assessing its condition as better than 70%. It works, but it looks like something was spilled inside. The chrome is gone over the OFF/ON switch, there's a nick in the lens over the LEDs, the rubber feet are gone, a pair of holes were punched in the instruction foil to access the screws instead of peeling it back, and there's some sort of ID number scratched into the plastic in the battery compartment.

On the good side: it did clean up, there's no corrosion on the battery or adapter contacts, and it's not badly marred. The manual's in fairly good shape.

If it weren't for the fact that I already had a much nicer HP-45, I would have kept this one. It's suitable as a filler for a collection, and would probably restore well if someone put the effort into it.

It looks like HP-45 calculators are a dime a dozen on eBay, and I don't want to rip anyone off. On the other hand, I don't want to underprice it.

So, what do y'all think that it's worth?

Re: fair price for an HP-45?

*Message #2 Posted by **David Smith** on 31 Oct 2005, 10:46 a.m.,*
in response to message #1 by blurdybloop

A nice HP45 with book, case, and charger can be had for less than $50. An ugly banger is probably 20 bucks.

Mayby list it in the classifieds here. It can be an organ donor and save lots of dying machines. Or keep it, you never know when you will need some parts.

our favorite bubba is selling the same calculator twice!

*Message #1 Posted by **blurdybloop** on 30 Oct 2005, 9:23 p.m.*

He's selling HP-16c s/n 2332A05616 at http://cgi.ebay.com/HP-16C-Computer-Scientist-Calculator-Set_W0QQitemZ5821883492QQcategoryZ58042QQssPageNameZWDVWQQrdZ1QQcmdZViewItem with 18 hours and 56 minutes left, and at http://cgi.ebay.com/Hewlett-Packard-HP-16C-Computer-Scientist-Calculator_W0QQitemZ5824948449QQcategoryZ58039QQssPageNameZWDVWQQrdZ1QQcmdZViewItem with 6 days and 20 hours left.

I'll bet that the first one turns into a cheap mouse real soon now.

Unfortunately, he's currently the only HP-16c seller, so some poor sucker looking for one may actually pay his prices.

He's also discovered how to bid-snipe. He didn't succeed the times that I observed, but he's no longer the bubba who bids low and hopes nobody else bids. He's turned aggressive.

Re: our favorite bubba is selling the same calculator twice!

Nothing like a 1055.28% markup to start your week off right.

If he gets it, do you supposed he'll drop HP equipment and start preying on Windoze users exclusively?

Re: our favorite bubba is selling the same calculator twice!

Doubtful. Most Windows users know better than to buy software on eBay, although he has stung a few victims (one of whom neg'd him).

Note that this particular product is a discontinued product (4 years ago) for ancient (Win98 and NT4) versions of Windows, and was part of Office 2000. The modern replacements are Photo Editor and Visio.

in response to message #2 by Mike DiGirolamo

There's numerous examples of that to be found in his feedback history, although not always with price differentials at greater than an order of magnitude.

It's amusing to watch him describe a ratty condition HP-15c (that he bought for $60 BuyItNow) as "great", and that by adding a CD-ROM containing the owner's manual and advanced function handbook (probably from the MOHPC DVD) he thinks that it's worth $319. That's just half an order of magnitude price increase.

Bingo! It's a USB mouse, with 17 hours 51 minutes to go.

Quite something to see. . .

Best,

--- Les

HP-55

Not a bad one...

Couldn't we stop this constant monitoring?
We all know about him, we all (more or less) use eBay, and his buyers are not here.

Greetings,
Massimo

*Message #8 Posted by **Howard Owen** on 31 Oct 2005, 12:23 a.m.,*
in response to message #7 by Massimo Gnerucci (Italy)

Hi Massimo,

You probably know that this topic is a perennial, as is the point of view you spoke in favor of. I can understand why collectors would be outraged at him. I can also understand why people would get tired of hearing about him on this forum. What I don't really understand is the answer to a question related to the one you raised, That is, why does he hold an enduring fascination for some of us?

I must admit, I'm one of those for whom his activities hold such a fascination. I think my fascination arises from a combination of two things. First, being able to watch part of the inner workings of an "operator's" schemes, which have up to now in the history of the world been largely invisible, strikes me as very interesting. Second, watching others reactions to him as he reduces objects of veneration (perhaps too strong a term) to pure profit and loss teaches me something about how different people value those objects. I'm always interested in learning more about human nature.

Sorry for the use of the indefinite pronoun throughout this post. I figure it's bad luck to speak the devil's name so close to Halloween. 8)

Re: And, while you write...

*Message #9 Posted by **blurdybloop** on 31 Oct 2005, 12:50 a.m.,*
in response to message #8 by Howard Owen

I personally feel that it is very important that there be an ongoing and fresh exposure of coburlin and his activities.

The reason is simple: any individual who does any minimal diligence prior to buying or selling an antique HP calculator will research the MOHPC web page and its forum. If even one person is suitably forewarned, then something good has come of this.

It won't always happen. That poor sap who just sold him that HP-55 knew about the MOHPC web page, but obviously didn't research very thoroughly or he wouldn't have let it go for a piddly $85.

But, sometimes, it does happen. I know this from personal experience. I almost bought from him, but I did my research (his prices seemed a bit high...) first. As a result, I passed on his offering, and got what I wanted for quite a bit less and in much better condition.

It is said that *a fool and his money soon are parted* and those who neglect to do due diligence are coburlin's lawful prey. Nonetheless, as a collector community we should provide the resources for those who attempt diligence.

Re: And, while you write...

*Message #10 Posted by **James M. Prange (Michigan)** on 31 Oct 2005, 2:00 a.m.,*
in response to message #9 by blurdybloop

Well, I suppose some might be forewarned because of reading about him in this forum, but it seems to me that those who sell with a "buy it now" well below the going market price or buy well above it have failed to do their basic research on eBay. If they haven't even bothered to check the typical prices on eBay, then how likely are they to look for advice at MoHPC? A fool and his money (or property) are indeed soon parted. Still, I can't help feeling a bit sorry for the poor suckers who do business with him.

As for the "poor sap" who sold his HP-55 for a "piddly $85", did he actually do much research at MoHPC? In any case, I can't blame the buyer for taking him up on the offer. My guess is that he was simply the first really interested person to spot the bargain.

As for snipers, somehow I can't get excited about them. To be sure, I don't bid very early in an auction, but I make my (usually) one bid the highest I feel willing to pay. Any last-minute bidder will either outbid me or I'll outbid him. If he's willing to pay more than I am, then so be it; it's his money.

It seems to me that sniping is probably mostly effective against (presumably) newbie bidders who want to start out with a low bid and then raise their bid as needed. Sniping may well be very effective in those cases, at least until those who engage in bidding wars learn better.

That's not to say that I like he-who-must-not-be-named's tactics, particularly making private offers (though that is allowable according to eBay) and switching to a different item near the end of his auction. Yes, he is preying on the foolish, but I expect that there are many who do far worse.

Regards,
James

Obviously, the sap didn't do his research. The buyer was the bubba.

There usually isn't a BuyItNow price with the offering. Instead, as soon as the bubba sees a new listing, he sends the seller a message asking for a BuyItNow price. Most people refuse and let the auction run its course.

Every so often, there's a seller doesn't know the value, just wants to get rid of it (probably a fair number are widows or other heirs), and is thrilled to get a response within minutes of posting the item. So the seller closes the auction prematurely with the bubba's bid, and never finds out that there are others who might bid on it.

There's another HP calculator person on eBay who does the same thing, although that person seems to be somewhat less greedy that the bubba. On the other hand, it may just be a "kinder, gentler" sock puppet of the bubba.

The lesson here is to make an inventory of your collections for your heirs, and make a special note what items are of particular value that should not be sold cheaply.

Are you certain of that? My impression is that the BuyItNow option can't be added after an item is listed, but I'm no expert on the matter.

> Quote:
>
> Instead, as soon as the bubba sees a new listing, he sends the seller a message asking for a BuyItNow price.

Yes, he can (and does) ask the seller to end the listing early, but in that case (if the seller complies) the completed listing says something along the lines of "Listing ended early to sell to the highest bidder."

> Quote:
>
> Most people refuse and let the auction run its course.

Quite sensibly, in my opinion. If I were selling and received such a request on the very first day, I'd probably think something like: "Hey, maybe this thing is worth more than I realized."

Regards,
James

*Message #14 Posted by **blurdybloop** on 31 Oct 2005, 1:13 a.m.,*
in response to message #8 by Howard Owen

There is a bit of a warped fascination in observing the operation of someone who is utterly devoid of the most basic notion of morality. People want to believe that other people are basically good, and that

there is no such thing as "evil". It's like a splash of cold water on the face to come to realize that there are, indeed, some truly bad people in the world.

It's also true that the study of how these guys operate is a good way to avoid becoming a victim. Most people have an overly-optimistic assessment of their skill in detecting scams; but aren't going to learn unless/until they witness a "this could have happened to me" scenario.

The bubba is a small fry, and relatively harmless. Nobody's life will be destroyed by dealing with him. There are others in this world who are much worse; people (often at a vulnerable age) have lost their life savings, or even their lives.

Well-stated!

*Message #15 Posted by **I, Claudius** on 31 Oct 2005, 5:56 a.m.,*
in response to message #14 by blurdybloop

Spot on!

Only item I disagree with: that Cobubba is "relatively harmless." Crooks evolve to commit bigger and better crimes when not stopped. As has been observed above, some of his tactics are changing. As stupid as he is, he's learning, and so far has been getting away with his schemes. This will do nothing but encourage him to attempt larger scams, which someday will really hurt someone.

Re: Well-stated!

*Message #16 Posted by **Namir** on 31 Oct 2005, 8:09 a.m.,*
in response to message #15 by I, Claudius

I agree you with. I think Cobubba is venting his anger using eBay. I think the core matter has little to do with calculators. He may well want revenge against someone in his past who used these calculators AND who has victimized him. Some victims evolve into criminals. I had a chance to come across one a week ago --- a childhood friend of my step-son who paid him a visit out of the blue and after many years. The childhood friend ended up stealing my steps-on's pick-up truck!!! The childhood friend (no ex-friend of course) was a victim of abandoment by both parents. So victims do sometimes become criminals and do it in an evolutionary way like you mentioned in your message.

We live in a world today where we are more aware about choices and teh availability of counseling that can help us with all kinds of childhood issues.

> Quote:
>
> I think Cobubba is venting his anger using eBay.

That's falling into the same "all people are fundamentally good" trap, by making Cobubba out to be a victim. The problem with talking about "a soul in pain" is that it assumes that there is a soul there.

A generation ago under the tutilage of B.F. Skinner, psychologists and sociologists had convinced themselves that bad behavior was a product of the environment during one's formative years. Edward O. Wilson thoroughly debunked this notion with the 1975 publication of *The New Synthesis*, which demonstrated that behavior was dictated by genetics, and that (sadly) unsavory behavior could not be eliminated from society through enlightened child-rearing.

Today, Wilson has been vindicated and evolutionary psychology is mainstream. Only the religious Right (ironic, since Wilson's opponents 30 years ago were on the radical Left) seriously questions it.

Cobubba's behavior can't be excused because he had a bad childhood. For all we know, he may have had a wonderful childhood. What's more, the world abounds with individuals who had wretched childhoods, yet still contrived to become decent adults.

Some people turn out good, and others turn out bad. Cobubba is one of the latter. Sympathy is wasted on him; he would consider it to be a sign of idiocy.

in response to message #17 by blurdybloop

Another lap for the do-it-yourself psychologists (or even psychiaters)!

Come on, let people offer what they want as long as it's not criminal. And I can't see a crime in what Cobubba does. It's annoying, for sure, a waste of market space, and may cost inexperienced people some money. I certainly would appreciate if ebay wouldn't be spoiled by such folks. But you find such dealers on every free market (and found them in the past, too). And after all, experience is just the sum of all the errors you make ... and compared to other errors, this has RELATIVELY harmless consequences, I agree.

I have NOOOOOOOO sympathy for cobbuba. In general, victims can often become monsters because they act out their pain an anger in an improper way. Pedaphiles are a typical (and very sad) example.

I am simply saying that psyhcological issues often pick a certain "theater" or "scenario" to act out psychological complexes. These theaters mask out the real problem.

12C Platinum prices around the world

*Message #1 Posted by **Gerson W. Barbosa** on 30 Oct 2005, 7:23 p.m.*

Take a look at this 15C:

http://produto.mercadolivre.com.br/MLB-34288870-calculadora-hp-15c-novinha-_JM

It is selling for R$ 300.00 (about $133), fixed price. Not bad comparing to eBay prices, but somewhat expensive here (Exactly one-month wages of a non-qualified worker). They usually sell for R$ 220.00 here (about $97), when they show up. Apparently the seller doesn't tell his 15C from a 12C Platinum, as he lists the specifications of the latter. Also he says this is his final price because he saw a brand new one selling for R$ 500.00 (~ $221) in a store. Yes, here the 12C Platinum costs this much, at least off Black Market.

I know European prices are generally higher than American prices, though not so high as they are here. Just out of curiosity, what is the official price of HP calculators around the world, say the 12C Platinum? I mean prices on local stores, as prices on the internet stores usually are lower. Thanks!

Re: 12C Platinum prices around the world

*Message #2 Posted by **Joao** on 31 Oct 2005, 12:02 p.m.,*
in response to message #1 by Gerson W. Barbosa

Dear Gerson,

The 12C Platinum costs 89.5 Euros in Lisbon and 119 Euros in France. I bet the price in Lisbon is a typo! What surprised me is that the 17bII+ is more expensive in both countries.

All the best,

Joao

Re: 12C Platinum prices around the world

*Message #3 Posted by **Gerson W. Barbosa** on 31 Oct 2005, 4:07 p.m.,*
in response to message #2 by Joao

Hello João,

Obrigado pelo feedback! (Thanks for the feedback!). About typos in price tags, there's a law here that states that the seller has to sell for the announced price, no matter it's right or wrong. The idea is to prevent sellers from attracting customers to their stores by announcing fake low prices. On the other hand, some months ago, a great supermaket sold at least a dozen LCD monitors for one tenth of the real price until they noticed their mistake (misplacement of the comma) :)

Best regards,

Gerson.

Read the 71devutil.pdf manual in the MoHPC CD-ROM collection, it contains all the info you need for connecting your 71 to a PC using the RS232 interface (p. 9 onwards).

HP25 without or with polar coordinate bug more valuable ?

*Message #1 Posted by **Bernhard** on 30 Oct 2005, 2:43 p.m.*

Hi folks,

maybe some of the collectors lurking on this list could give some opinions which HP25 is more valuable: the one with the polar coordinate bug (original manual with original addendum how to work around the bug) or the one which hasn't the bug.

Would need this advice on which of my two HP25 I might give away. I'm tempted to keep the one with the bug, because I think it's harder to get.

best regards, Bernhard

scientific notation to fixed integer

*Message #1 Posted by **Bill** on 30 Oct 2005, 1:26 a.m.*

I have a HP-15C without a users manual. The display is set for scientific notation and I don't know how to change it to a fixed integer display. Can anyone instruct me? I've ordered the CD, but in the meantime..... Thanks.

Re: scientific notation to fixed integer

*Message #2 Posted by **Richard Garner** on 30 Oct 2005, 3:46 a.m.,*
in response to message #1 by Bill

Bill,

Click the f key then 7 key for fixed then the number of places you want.

For the display to look like this 0.0000 do the following:

f (gold shift key) 7 (fix notation key) 4 (number of decimal places.

Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #1 Posted by **Etienne Victoria** on 29 Oct 2005, 10:23 a.m.*

Hello Tony & al,

I apologize for asking 2 questions in one topic but maybe you can help save my household!!!

Repairing a 9815 & 9825, I've done the usual job (screw posts under PSU, gummy wheel replacement...) on both calcs.

However, before closing the lid, I've got 2 remaining problems :

- The 9815 keeps on printing the error messages and the printer is not especially quiet: I know this is by design but **is it Ok if I insert an additional switch on the printer power supply wires to keep it silent when I want to ???**

- The 9825 fan is producing a tremendous noise even after carefully taking into parts, greasing the axis, inspecting the fan cavity for frictions : the noise seems to come from inside the motor: **does anybody know the specs of this fan for me to replace it with a new one ?? I intend to use the fans sold for today's PCs.**

I surely won't disconnect the fan due to the amount of electronics warming up inside!!

Having read the maintenance manuals for both machines, I found the Hp part numbers but not the specs.

Heeeeelp, my wife doesn't want me to keep noisy calcs anywhere in our parisian flat!!!

Warm (even with the fan :-) greetings to all and thanks in advance!!!

Etienne (still married)

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #2 Posted by **Tony Duell** on 29 Oct 2005, 2:35 p.m.,*
in response to message #1 by Etienne Victoria

Warning : This is based on looking at the schematics, I have not tried any of this.

For the 9815, I see no problem in putting a switch in series with the printer solenoid (connected to the PSU/printer PCB by a 2 pin connector). What I would do is uplug that connector (thus disconnecting the solenoid) and see if the machine behaves as you want it to. If so, add the switch in series with one of the solenoid wires.

I do have to wonder about the HP design that causes a machine to print 'OUT OF PAPER' when it has no paper ;-)

For the 9825, the fan is a 120V AC (50/60Hz) unit. I see no reason why a modern replacement wouldn't work. Note that most PC fans are 12V DC, you can't put one of those directly in place of the existing fan. There is a +12V rail in the 9825 which probably could supply enough current for a modern fan, but I like to keep my

machines as orignial as possible (and 120V fans are not hard to get).

I assume you've looked at said schematics...

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

in response to message #2 by Tony Duell

Good evening Tony,

Thanks galore for your answer!

I'll start with the 9815 and then will go out in the cold to find a 120V fan!

Of course, I'll report back when done.

Thank you also for your 2001 explanation on the printer: 9815 printer overhaul

I received the 9815 with the printer foam spread all around the mechanism and your post did help me to restore it and also the one in my 9825!!!

Have a nice week-end!

Etienne

PS Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #4 Posted by **Etienne Victoria** on 29 Oct 2005, 3:07 p.m.,*
in response to message #2 by Tony Duell

PS : Yes I looked at the schematics on the DVD & found the 12V rail...but not the fan specs: I'll reread then...

I'll try not to consider this rail as a power supply "selfservice" to tune my machine...but I'm tempted :-)

Alea jacta est! (Oops sorry!)

Thanks again.

Etienne

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #5 Posted by **David Smith** on 30 Oct 2005, 10:19 a.m.,*
in response to message #2 by Tony Duell

It is much easier to find a quiet 12V fan than a quiet 120V fan...

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #6 Posted by **Etienne Victoria** on 30 Oct 2005, 10:27 a.m.,*
in response to message #5 by David Smith

I guess you're right and I might go this way.

However, Tony pointed that he prefers to keep his calcs as "authentic" as possible!!

You can be sure I'll take the quietest one because I do appreciate the 9825 and try to learn HPL.

Don't shiver, if I elect to poke the 12V rail, I have a bunch of "tuning options to put in the calc such as "laser blue light" within the fan, retrolighting the keyboard :-)

I'll try to finish the 9825 before Halloween!

Etienne

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #7 Posted by **David Smith** on 31 Oct 2005, 11:07 p.m.,*
in response to message #6 by Etienne Victoria

Put in a quiet 12V fan and use it, keep the old one handy in case you need to restore the machine to its virgin state.

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #8 Posted by **John Ioannidis** on 29 Oct 2005, 7:04 p.m.,*
in response to message #1 by Etienne Victoria

I recently repaired my 9815 printer (Tony Duell's advice was, of course, invaluable! My biggest problem was finding suitable material for replacing the damper rubber foam that had turned to goo. I used thin self-sticking felt pads but they turned out too thin and not particularly impact-dampening: the printer was advancing too much and making almost as much noise as without the felt. Then I tried Dr Scholl's moleskin foam (shaved to remove the fuzzy part!!!), but it was too thick; the printer wouldn't advance. Then I found the closed-cell foam tape that came with my air conditioner, and it turned out to be just right. It's still noisier than I would like it, but it works and I'm not about to disassemble the printer for the hundredth time.

Now, I would advise against just cutting off power to the solenoid; the machine would keep printing without advancing the paper, heating up the printheads. I would assume that the design depends on the moving paper to carry off some of the heat from the printheads, exposing the heads to new, cool paper as the machine is printing. I would fear that if you don't advance the paper you may overheat the heads. I don't have documentary evidence of that, it's just a conjecture, but better sure than sorry.

I do find it annoying that the printer is used to print diagnostic messages even when the printer switch is off. Would it have been too hard to display "Error" and a number to indicate what the error was?

The fan, after a thorough clean-up, is surprisingly quiet. Maybe the ball bearings in yours are defective?

BTW, thanks to Vassilis Prevelakis for fixing the capstan of my tape drive.

/ji

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #9 Posted by **Etienne Victoria** on 29 Oct 2005, 7:23 p.m.,*
in response to message #8 by John Ioannidis

Yassou John!

Thanks for your input! I'll try to find a foam-type similar to yours (air-conditionning is not that widespread in France)

I understand your point on the power cut at the solenoid but remain reluctant to put the switch directly on the printer power lines, fearing that the calc would wait some handover signal from the printer finishing it's job.

That's why, Tony's option looks attractive to me! I'll try to recheck thoroughly the schematics before I jump.

Now on the noise issue, the noisy fan is my **9825T** fan which I completely dismantled and powered directly from my bench PSU : I think it's the motor. On the other hand, the **9815S** fan is really quiet after cleanup and realignment!

Thanks again John!

in response to message #9 by Etienne Victoria

Interesting! Inspired by your thread, I just decided to give it a try and unassembled my 9815. I cleaned the pad from the goo and tried a square-cm of window insulation tape, but it seems to be too thick - the printer doesn't advance, and yet makes a tremendous noise. Emmanuel, if you happen to find a suitable material in France, I'd be happy to receive a mail. The thickness really seems critical for the operation of the printer.

Andreas

*Message #11 Posted by **Etienne Victoria** on 30 Oct 2005, 6:38 a.m.,*
in response to message #10 by marais

Hello Andreas!

By "Emmanuel", I suspect you mean "Etienne" :-)

Of course, I'll keep you posted as soon as I find the proper material.

However, every shop is closed till Nov 2nth and I'm really tempted to try injecting foam (mousse injectable) in the meanwhile.

I'll drop you a mail when my 9815 is definitely silent (I mean works silently!)

Etienne

*Message #12 Posted by **Tony Duell** on 30 Oct 2005, 6:40 a.m.,*
in response to message #10 by marais

There is a back stop adjustment on this printer -- a screw locked by a nut on the right hand side of the front IIRC. If the new damper foam is a little too thick or too thin, you could try adjusting this. The ratchet pawl (inside the platten knob!) should pick up one tooth for each operation of the solenoid.

There is, amazingly, some useful information for this in the official 9825 service manual, including a schematic of the test rig (!).

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

```

Way too thick. Unfortunately I didn't take any pictures when we were repairing ji's 9815S (I did the tape drive, he did the printer), but the piece of foam he inserted was very thin (about 3-4 mm).

The printer still makes quite a clatter, but it now prints OK. We wrote a short program to test the tape drive and listed it before and after saving it onto tape.

Ji promised to take a few pictures before reassembling the 9815.

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #14 Posted by **marais** on 30 Oct 2005, 8:06 a.m.,*
in response to message #13 by Vassilis Prevelakis

Thank you, it worked on my second attempt...I use only a small strip of window isolation tape (I can bring some to Paris, Etienne!), glued to the outer third of the metal plate. I also lengthened the spring a bit, and now the mechanism works fine. I noticed that a working mechanism can be tested manually, by just pressing the plate from behind...if it clicks, it'll also work with the solenoid moving the plate.

Now for the capstan! This forum is fabulous.

Andreas

Andreas, if you want, I have a capstan for you!

It's a spare left after repairing the ones in my 9815 & 9825.

If you prefer machining it yourself, I bought from my plumber the tap joints that I used to rebuild Hp-85, 98x5 and TI SR-52 capstans.

If interested, email me privately.

Cheers from Fourqueux

Etienne

Re: Help!! 9815: Mad at the printer, 9825: Mad at the fan!

*Message #16 Posted by **Tony Duell** on 30 Oct 2005, 6:38 a.m.,*
in response to message #8 by John Ioannidis

The fact that HP allowed the printer to print without paper (e.g. that infamous 'OUT OF PAPER' error) means that it can't be that damaging to the head. As a counterexample, the 7245 printer/plotter (there's one on my bench at the moment..) has a fairly complex out-of-paper circuit, and even detects if the sensor has failed. So presumably something nasty happens to that machine if it's run without paper.

I also don't believe that the platten roller carries that much heat away in the 9815. It's not a metal roller, after all.

Now, I wouldn't disable the solenoid and the out-of-paper sensor and, say, try printing a program listing on the 9815. That might well do damage. But disconnecting the solenoid would leave the out-of-paper sensor working, so what would happen if it tries to print (assuming there's no paper in the machine) would be to print OUT OF PAPER and then stop. I don't think that would do damage.

If you want to leave paper in the machine and shut it down, you might look into forcing an out-of-paper error, e.g. by also disconnecting the LED of the sensor.

No serial number

*Message #1 Posted by **Arnaud Amiel** on 29 Oct 2005, 5:44 a.m.*

I recently acquired a very cheap 6s and noticed that it does not have a serial number but a batch number instead. Are there any other hp calculators (not prototypes) that don't have serial numbers?

Arnaud

serial

*Message #2 Posted by **bill platt** on 29 Oct 2005, 1:00 p.m.,*
in response to message #1 by Arnaud Amiel

Hi Arnaud,

What's the difference between a "batch number" and a cereal number (oops I mean serial---I haven't had breakfast yet! :) ?

Regards,

Bill

Re: serial

*Message #3 Posted by **Arnaud Amiel** on 29 Oct 2005, 1:34 p.m.,*
in response to message #2 by bill platt

There is one serial number per calculators. I would assume that a batch number would be shared between many?

Arnaud

Serial

*Message #4 Posted by **bill platt** on 29 Oct 2005, 2:04 p.m.,*
in response to message #3 by Arnaud Amiel

Yes, but how can you tell that it is a *batch* rather than serial? Can you give example?

Re: Serial

*Message #5 Posted by **Arnaud Amiel** on 29 Oct 2005, 3:19 p.m.,*
in response to message #4 by bill platt

On my 6s, the batch number is CN10020, on my 33s it is CNA11105782. I would believe that there are more 6s than 33s so I assume the batch number is identical for many calcs. Anyone around here with the same batch number as me? Arnaud

serial

*Message #6 Posted by **bill platt** on 29 Oct 2005, 5:16 p.m.,*
in response to message #5 by Arnaud Amiel

Your 33s has one more digit after the "A" than mine (though mine is a CN4 not a CNA4

Re: serial

*Message #7 Posted by **Arnaud Amiel** on 29 Oct 2005, 5:26 p.m.,*
in response to message #6 by bill platt

There was bad lighting, mine is actually CNA41105782, same number of digits though (?)
My 49g+ has the same number of digits CNA51001296

Re: No serial number, Also for 30s

*Message #8 Posted by **I, Claudius** on 30 Oct 2005, 9:00 a.m.,*
in response to message #1 by Arnaud Amiel

The 30s also just has batch numbers.

Re: No serial number, Also for 30s

*Message #9 Posted by **Mark Crispin** on 30 Oct 2005, 11:29 p.m.,*
in response to message #8 by I, Claudius

Are you sure about that?

I have two HP-30s, purchased about a month apart. They both have proper serial numbers in the CNA4060#### range, approximately 2200 apart.

Re: No serial number, Also for 30s

*Message #10 Posted by **I, Claudius** on 31 Oct 2005, 6:05 a.m.,*
in response to message #9 by Mark Crispin

Interesting, they must have changed from early units. The 30s is a junk machine, so it really doesn't matter.

HP is blowing it by trying to produce multiple models as none is good quality. Instead, it should pare back to just three: the eternal 12C, the 32/33 ROM in a classic Voyager 15C case, and a top end 49+, all top quality, with no hardware/software bugs. This fairly simple strategy would go a long way to restore HP's luster in the calculator business.

Edited: 31 Oct 2005, 6:08 a.m.

> The 30s is a junk machine, so it really doesn't matter.

True, although I think that this is more because it is algebraic-only. For $15, it is alright for the purpose to which I put it: one is tossed in the console box of the RV, and the other is on a corner of my desk at work. I usually have a much better calculator with me, but having a 30s on hand means that I have access to a reasonably competant basic calculator in the few cases when I don't.

Since a 30s is a $15 throwaway, I don't need to worry about its long-term welfare. I would not worry about the loss, theft, or destruction of a 30s; I would for a 12c, 15c/16c, and even a 33s (although the 33s is hideously ugly).

> Quote:
>
> [HP] should pare back to just three: the eternal 12C, the 32/33 ROM in a classic Voyager 15C case, and a top end 49+

I wish that I could agree about a 15c redux. Alas, I can't. The display on the 33s is *far* superior, and I don't see any good way that it can fit in the Voyager case.

You could get some vertical space back by moving annunciators to the side; there is sufficient real estate available on each side of the display on the Voyager. But I don't think that that this will provide enough headroom, and the result would certainly have a much "busier" look than the Voyager's elegant cosmetics.

Also, I don't think that a 15c redux could underprice the 33s. That's a fatal flaw; like it or not, the 33s (or a successor, hopefully without that hideous keyboard) is the top-of-the-line scientific calculator . A new 15c, especially if the display is unchanged, would have to fit in at a lower price.

I don't think that a 15c Platinum (ala 12c Platinum) would work as a 33s replacement. There's still the issue of the display.

What may be more likely (and I can hear the shudders going through the community now!) would be an HP-12c Titanium which would have changable face plates that also change the key tops. The face plate also changes the microcode. So you could buy one calculator with three face plates and have a 12c, 15c, and 16c. There would be no software changes, just packaging changes. Whether the microcode is part of the face plate (leaving open the option of other calculators based on the platform), or if it's just a big switchable ROM between 12c/15c/16c is open.

I think that an HP-12c Titanium could be sold at a premium price, since it's effectively three calculators in one.

The catch would be that the PHBs would probably insist that it be based on the 12c Platinum rather than the 12c. As far as I know, the 12c Platinum is a complete reimplementation of the Voyager platform and not itself a Voyager; so you can't just change keytops and microcode and have it become a 15c or 16c.

33s CHECKSUM issue: old/new

*Message #1 Posted by **ECL** on 28 Oct 2005, 6:51 p.m.*

```
Just got a new copy of the 33s and have this problem:

I entered a program from my old 33s and see the same checksum: LN=270, however when I run the
program, I get different answer from my old 33s. Any ideas?

Also, noted these improvements:
1. Spacing between numbers in display is increased (VERY GOOD)
2. Decimal larger (VERY GOOD)

in response to message #1 by ECL

Hi,

Please post your program code so that I may run it on mine.

(I have one of the 1st production series).

regards,

Bill

Re: 33s Checksum Resolved (LONG - code listing)

*Message #3 Posted by **ECL** on 29 Oct 2005, 3:39 p.m.,*
in response to message #2 by bill platt

```
Bill,

I have found the problem. I mistook the meaning of LN=xxx under the -> MEM , PROGRAMS
menu. I thought this was the check sum, but it is not. I suppose it is memory used by
this label. Here is the code anyway, you may already have it, but I have updated it
since I first posted it:

Eric Lundgren April 2005
Rev 2 - August 2005
HP 33s/ Location of Vertical Nuetral Axis, and Ix (Second Moment)for composite cross
section:

Description: For a buildup of n rectangular sections (ibeam, c-channel, sandwich, etc.),
this program computes the location of neutral axis (measured from bottom of section),
and the moment of inertia.
```

```
To use the program-
The program requires that FLAG 1 is set prior to running. I simply keep FLAG 1 set all
the time.
Execute via XEQ I, and you are prompted for number of sections. A basic I-beam would
have 3 sections (web, upper cap and lower cap). B = width of a section, and H = height
of that section.

Both lines of the screen are used for the result:
Upper line is the location of vertical neutral axis (centroid). Lower line is the
second moment of inertia of the plane area defined by the combined rectangular sections.
Note that you can model two plates that have open space between them (perhaps a foam
core that does not contribute to stiffness) by entering the width as zero, and then
height equals the empty space.

Gene: Did you mean here "valid only on new 33s" or ?

I'm not aware of any changes to the checksum determination with any 33s revision, but that doesn't mean it hasn't happened, of course.

If this is from a 32SII to a 33S version, then all bets are off. :-)

does you program allow the consideration of a different width for the web versus the flanges (caps). I'm a structural engineer, I get into reinforcing steel wide flange (ibeams) from the AISC manual, and all of the shapes have webs that are thinner than the caps.

Re: 33s Checksum Resolved (LONG - code listing)

*Message #6 Posted by **ECL** on 31 Oct 2005, 3:33 p.m.,*
in response to message #5 by brian healy

Brian,

A nice point is that it only uses one label. My code is for any cross-sect composed of n rectangular pieces.

I'll illustrate with an example of a basic I-beam, and note that I do not account for the radius at the web/flange intersection. Say you have a beam with:

```
upper flange= 3"x0.33" (width x height)
web = 0.35"x6" (width x height)
lower flange= 4"x0.25" (width x height)

My code would work like this, starting from the bottom surface of the lower
flange:
N = 3 R/S
B = 4 R/S
H = 0.25 R/S
B = 0.35 R/S
H = 6 R/S
B = 3 R/S
H = 0.33 R/S

The output is:
3.25204 = Ybar (vertical coordinate of centroid from bottom. Units: inch)
25.99 = Ix (second moment, or area-moment of inertia. Units: inch^4)
```

Hope this helps. I've run it against some real beams and found very close to the published data. Of course, they account for radius and possible taper of web? ECL

Composite Sections

*Message #7 Posted by **bill platt** on 1 Nov 2005, 12:33 p.m.,*
in response to message #6 by ECL

Hi ECL,

No I remember! We talked about this some months back--and swapped programs. I also have written simple programs for this problem.

I have written programs for this problem a number oftimes--1st on the 11c, then the 32s, then the 41cv---I run the 41cv using Hrastprogrammer's emulator on a 48gx.

I "modularize" so that I run separate routine for each:

a: take rectangle width, height, above baseline (this routine can be run over and to keep adding more components)

b: solve for inertia and section modulus. Takes as input the maximum fiber distance from the baseline.

c: a subrooutine that will add the area, self inertia about centroid, and distance to baseline, of any known shape--all you have to do is enter it's I, its A, and its distance from centroid to baseline.

Routine (c) and (a) can be run in any order--and even after running (b)---in other words you can find intermediate results.

I find these routines very useful for design work, especially if making some strange built-up sections. Also good for checking htat a spreadsheet soulution is working correctly before freezing the cells.

Regards,

Bill

ECL: preformatting your posts?

*Message #8 Posted by **Karl Schneider** on 30 Oct 2005, 2:51 p.m.,*
in response to message #1 by ECL

ECL --

Are you using preformatting ("[pre]" using Forum special formatting), or with an HTML editor?

If so, please don't becuas it really impairs legibility. Preformatting is intended for code listings.

Thanks,

-- KS

format

*Message #9 Posted by **bill platt** on 30 Oct 2005, 3:24 p.m.,*
in response to message #8 by Karl Schneider

I was going to ask the same question.

I am curious if it is his browser rather than the "[pre]" thing

Re: format

*Message #10 Posted by **ECL** on 30 Oct 2005, 5:21 p.m.,*
in response to message #9 by bill platt

Sorry guys,

I thought I was doing everyone a favor by that. I thought carriage returns would not be preserved unless I used the [pre]. Ok, only for code listings from now :)

ECL

Re: format

*Message #11 Posted by **Howard Owen** on 30 Oct 2005, 7:40 p.m.,*
in response to message #10 by ECL

> Quote:
>
> .. I thought carriage returns would not be preserved unless I used the [pre].

Not exactly. Two carriage returns in a row will show up as one line break without [pre], so your paragraphs will break naturally without worrying about them. You can also use [nl] to get the equivilant of an (X)HTML <br/>. But [pre] will preserve every carriage return, won't collapse consecutive white space, and will switch the font to fixed rather than proportional, just as with <pre> in HTML, so it's the right choice for listings.

Re: format

*Message #12 Posted by **James M. Prange (Michigan)** on 30 Oct 2005, 10:43 p.m.,*
in response to message #11 by Howard Owen

Yes, [pre]...[/pre] is perfect for program listings, tables, and so on, but it would be better not to include the ordinary text within the preformat delimiters. That way it wraps to whatever the size of the display box turns out to be, and assuming that no preformatted lines are terribly long, we won't have to scroll right to see the whole message.

Also see the advanced formatting techniques.

Regards,
James

"new" and "old hp33s

*Message #1 Posted by **brian healy** on 28 Oct 2005, 2:15 p.m.*

I was just at my local wal mart and noticed that behind the improved hp33s, there were still the older ones with the horrible decimal point. I will try not to laugh when I type this, but I think that HP should have recalled the older version with the bad display. And if it costs a lot of money, then that's the price for letting a product into the market with an ovious design flaw. I know that I'm not being realistic, but on this website you can read about the bug in the HP35 and Dave Packard's response. HP, learn from your history and do it right.

33s versions

*Message #2 Posted by **bill platt** on 28 Oct 2005, 2:33 p.m.,*
in response to message #1 by brian healy

Hi Brian,

There have been even more versions than old nad new. There was "prototype" (of which I think Gene may have one:-) "early Wal-mart Pre-release (of which I have one) and 1st initial production...and now "improved decimal point".

I would love it if you could put it through its paces, checking to see if any of the known bugs are resolved....There are detailed lists/discussions in the archives.

Best regards, Bill

Edited: 28 Oct 2005, 2:34 p.m.

Re: 33s versions

*Message #3 Posted by **brian healy** on 28 Oct 2005, 2:59 p.m.,*
in response to message #2 by bill platt

I occaisionally use it, as I mostly use my 32sii, which was made in singapore in 1993, and is in mint condition. It is a total pleasure to use. I haven't encountered any of the bugs mentioned, but that is not to say they have been fixed. It's just that in my line of work (structural engineering) that I don't need the functions that are buggy. One nice thing about the 33s is that due to the larger memory, I can have more than the 3 programs and 1 equation that fit into my 32sii. The improved display and keyboard have made what in my opinion was unusable into a calculator that I can use at work. I have a version of the 33s with the bad display and poor keyboard, and I felt that I just couldn't trust it.

Re: 33s versions

*Message #4 Posted by **Crawl** on 28 Oct 2005, 5:00 p.m.,*
in response to message #2 by bill platt

I've tried a newer version, and most of the important glitches have been fixed (ones involving polar conversions, or similar complex math).

The glitch involving the wrong indicators being displayed after a self test is still present.

Re: *any* hp33s?

*Message #5 Posted by **Paul Brogger** on 28 Oct 2005, 7:08 p.m.,*
in response to message #1 by brian healy

Well, I went to my local Wal-Mart, and they don't have *any* HP-33s on display. (The slot is there, but it's empty.)

I think it's curious that this particular model is sold out. I'll be watching to see if it's re-stocked.

(It does appear to be still available via their web site.)

How do you distinguish between the....

in response to message #1 by brian healy

old and new HP 33s if you wanted to order it online?

Re: How do you distinguish between the....

*Message #7 Posted by **Howard Owen** on 28 Oct 2005, 10:54 p.m.,*
in response to message #6 by Al In FL

I believe the answer to that is "you don't."

According to reports on this forum, HP itself won't tell you if the machine you are ordering from them directly is the new model. the only way I can see to be sure is to press the "ON" button through the plastic and squint at the decimal point. So far, I haven't found one in the SF Bay Area, but I've only looked in the Lawrence Expwy Fry's.

Re: How do you distinguish between the....

*Message #8 Posted by **david bowers** on 29 Oct 2005, 10:55 a.m.,*
in response to message #7 by Howard Owen

hi i called hp from taiwan and they said all the shipping ones now are from august 05, the lady put me on hold to query it, anyway they said when you order online there is a space for special instructions and to mention that you want only the latter ones i was about to order online from here, but it wouldnt accept overseas credit cards, so many engineers go home to the states on leave, one guy said, ha no problem, i will get the right one for you, so i shall see. i offered him local currency if he could use his card and have it shipped hassle free to his house to bring back here. one guy on this site did offer to get me one through my cousin, but my cousin lost his email address, thanks again anyway. i just want one to crap around the jobsite, are they as dropable as my old 42. i dont know how to post photos on this site but i can email anyone who does, a photo of my retired 42s that a lot of people said wasnt dropped as i claimed cheers david

I'm not sure how HP could know which 33s you would get

*Message #9 Posted by **John** on 30 Oct 2005, 4:42 p.m.,*
in response to message #7 by Howard Owen

After all, remember that the calculators are not in a closet in San Diego where the HP calculator staff is

located.

They are probably in a big warehouse somewhere in Asia (or perhaps smaller ones in different countries). I'd be very confident that no one associated with ordering, the hp website, or the phone tech support has the ability to go get one off the shelf.

While it is possible that HP in San Diego might be able to get one or two that way, keep remembering how many different products HP actually sells.

In the large corporate scheme of things, calculators are lost in rounding to HP's bottom line, I'm sure.

We are fortunate HP corporate has not decided to write them off entirely. After all, that would mean only TI and Casio (perhaps Sharp) making any new models at all today.

Re: Found a "good" one.....

*Message #10 Posted by **Al In FL** on 29 Oct 2005, 1:04 p.m.,*
in response to message #6 by Al In FL

Decided to check out the local Wal-Mart and if you press hard enough you can hit the C key! AS luck would have it, they have some newer ones....

This "good" or "better" one is definitely an improvement.

Not only is the comma much bigger and the decimal point about, what, 25 to 30% bigger....

The biggest improvement is that the clarity of the display is better. Side by side, you can see that the upper projection layer is not as far apart from the lower...so there is less shadow or separation effect if you're not looking at it head on.

FWIW: The original pre-order WalMart one I got is a CN4040...

The newer off the rack model at WalMart is a CNA 4420...

Al in Fl

33s versions

*Message #11 Posted by **bill platt** on 29 Oct 2005, 1:33 p.m.,*
in response to message #10 by Al In FL

Hi,

My pre-order is CN40402051

The one I got from Amazon right when they 1st got them (the second production batch) was CNA....

The only difference, after extensive testing, had to do with the function of the x<>y feature under "Algebraic" mode (which is descibed in detail under the archives). Everything else was the same---all the bugs were the same, e.g. polar, h.ms, Permutation --- not showing overflow for over-sized args etc etc.

Edited: 29 Oct 2005, 1:34 p.m.

Re: Found a "good" one.....

*Message #12 Posted by **ECL** on 29 Oct 2005, 3:49 p.m.,*
in response to message #10 by Al In FL

Also,

Note that the number spacing has INCREASED. ie, there is more space between each number on the screen. This greatly improves legibility.

My new machine CNA 52707099 does have a bad alignment of the solve and display keys. They rub against the ENG and MODES keys when I depress them.

Also it 'tic-tacs' on the table. This is irritating, but twisting the case seems to ameliorate the condition.

Still, I am very satisfied for now. I'd be even happier to see an 'anniversary ed' of these internals in the 32sii casing.

Gummy wheel repair , Need O=-ring size

*Message #1 Posted by **Frederick Harvie** on 28 Oct 2005, 1:54 p.m.*

In the repairs section there are two excelet articles on repairing the gummy wheel problem of card readers. Both articles mention using o-rings for the repair but they don't give a size for the o-rings needed.

Re: Gummy wheel repair , Need O=-ring size

*Message #2 Posted by **Mike DiGirolamo** on 28 Oct 2005, 2:44 p.m.,*
in response to message #1 by Frederick Harvie

Fred,

I've tried to measure the ones I've been using successfully. Be mindful that these are made of rubber hence, are a bit difficult to measure.

The ID is from 0.1181" (3mm) to 0.125" (1/8"). I suspect a tight fit would be correct to hold snugly on a 1/8" shaft.

The OD is ~0.250" or 1/4".

Sorry I don't have a gear out right now that I could directly measure for you.

Hope this helps,

Mike

PS If you have any problems finding the ones you need, drop me an email.

Re: Gummy wheel repair , Need O=-ring size

*Message #3 Posted by **Brian Gladman** on 28 Oct 2005, 2:57 p.m.,*
in response to message #1 by Frederick Harvie

The ones I used recently are 1/8 inch inside diameter and 1/4 inch outside diameter. In British Standards this O-ring is designated as BS006 (see here).

Brian Gladman

Re: Gummy wheel repair , Need O=-ring size

*Message #4 Posted by **Tony Duell** on 29 Oct 2005, 6:19 a.m.,*
in response to message #3 by Brian Gladman

I've found that '1 size smaller' -- the shop I get them from calls them 005 (so presumably that is BS005) is a better fit. Something like 7/64" ID.

Size 006 is ideal for the rubber O-rings in a 9100 keyboad BTW.

Re: Gummy wheel repair , Need O=-ring size

*Message #5 Posted by **Peter Geiser** on 29 Oct 2005, 9:21 a.m.,*
in response to message #1 by Frederick Harvie

There is two guys on ebay who sell the rings, one in the US, the other in Italy. In the US, they are USD 5 for 10 pairs of rings, I think. Try http://cgi.ebay.com/HP-Calculator-HP67-HP97-Gummy-Wheel-Repair_W0QQitemZ5823642197QQcategoryZ11713QQrdZ1QQcmdZViewItem as an example.

If you are interested in pictures to repair HP41 card reader, I could also offer my guide: HP 41 Card Reader Repair http://www.pmgeiser.ch/calc/index.php?id=HP82104A

Best of luck Regards Peter

Re: Gummy wheel repair , Need O=-ring size

*Message #6 Posted by **Brian Gladman** on 29 Oct 2005, 11:52 a.m.,*
in response to message #5 by Peter Geiser

In the UK I got mine from here, where I got 30 for their minimum order of £5. I bought BS006 O'rings but I am pretty sure they will have the BS005 ones as well.

Unable to transfer data through cables between IBM laptop USB port and HP48 GX Serial Link

*Message #1 Posted by **Antoine M. Couëtte** on 28 Oct 2005, 1:18 p.m.*

Oct 28, 2005

Hello to you all,

I just purchased a "Prolific" (Trade / Registered Mark)USB-Serial Adaptor to attempt transferring data IBM laptop USB port and HP48 GX Serial Link. I am totally unable to make it work in either way through a cable - which cable of course I did check as working properly .

To make things worse, I fail retrieving through the "search" function the quite recent post on this subject which seemed quite optimistic and gave information on how to make it work.

Thank you for your help for indicating me the link of this recent post (published here less than one month ago I think) or for any other kind of help.

Antoine

TI-59 vs HP-41 reviving the old contest

*Message #1 Posted by **Vassilis Prevelakis** on 28 Oct 2005, 8:16 a.m.*

Back in 1982, there were a number of attempts to pit the TI-59 against the HP-41. In the PCC Journal V9 N5 (Aug 1982), p 25 there was an article called "LOTS OF PIE" which included a program for calculating the digits of pi on the TI-59.

Another contest involved calendar printing and (I think) another the calculation of digits of e.

Both e and pi calculations were limited by available registers, because all digits of the number were retained. However, since both the TI-59 and (of course) the HP-41 have output devices, how about a new contest to calculate e or pi by printing the digits calculated on the printer as they are computed.

Any takers?

**vp

*Message #3 Posted by **Gerson W. Barbosa** on 29 Oct 2005, 9:54 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Hi Marcus,

Take a look at this algorithm (Brent-Salamin):

http://mathforum.org/library/drmath/view/58283.html

I tested it on both the 48GX and 49G and it worked great. Of course I used the long float libraries available for these calculators to make the job easier (only a few lines using those libraries). It would have been more interesting the implementation of the required long float operators in RPL though. (Besides '+', '-', '*' and '/' it would be required long float square root).

Regards,

Gerson.

Re: TI-59 vs HP-41 reviving the old contest

*Message #4 Posted by **John Limpert** on 28 Oct 2005, 8:36 a.m.,*
in response to message #1 by Vassilis Prevelakis

See http://www.lacim.uqam.ca/~plouffe/Simon/articlepi.html for an algorithm that allows you to compute individual decimal digits of pi.

Re: TI-59 vs HP-41 reviving the old contest

*Message #5 Posted by **hugh steers** on 29 Oct 2005, 10:53 a.m.,*
in response to message #4 by John Limpert

i tried to port that algorithm to the 41, but its too slow. theoretically, you can continue to calculate pi forever, but in practice it quickly get to a 3-day wait for digits still below 1000.

feel free to improve my program!

http://www.voidware.com/index.php?

forum message deletion feature considered harmful

*Message #1 Posted by **Eric Smith** on 27 Oct 2005, 9:17 p.m.*

I expect some will disagree, but I'd like to see the message deletion feature go away. The ability to delete postings is inconsistent with the purpose of having an open and archived forum. It makes the discussions harder to follow.

Anything that a person doesn't want archived for posterity shouldn't be posted to the forum in the first place.

Message Delete Is A Very Good & Useful Feature

*Message #2 Posted by **I, Claudius** on 27 Oct 2005, 10:25 p.m.,*
in response to message #1 by Eric Smith

The creator and moderator of this forum, in his wisdom has given us a very powerful and useful tool: the ability to delete a message. Sure, under ideal circumstances everyone should measure all they say, but everyone slips sometimes, including me. One night I really ragged on an HP employee. When I read the post the next day, I realized I'd overdone it, and I deleted it. I suppose you're so perfect you've never said anything stupid you'd like to take back? Hey, why don't you try it by deleting your post!

Re: forum message deletion feature considered harmful

*Message #3 Posted by **Howard Owen** on 27 Oct 2005, 11:22 p.m.,*
in response to message #1 by Eric Smith

That's what I'm used to in other forums. It might me useful, but I wonder if folks are more likely to shoot from the hip when they know they can take it back by deleting the post later? Personally, I like the edit feature. I use it to correct speling erurs all the time. I've also used it to amplify or modify a post too. But if it weren't there, I'd just be more careful up front.

Both features are open to abuse. There's a subculture of confrontation on this site that invites revisionist edits. I have a volatile side, so I've been caught up in it myself, mostly to my later regret. If I were less scrupulous, I might yield to the temptation to go back and edit the posts I was ashamed of. A truly viscious user wouldn't delete old posts, instead he'd edit them so they made the exchange look completely different. That wouldn't be possible in all cases, but there's enough ambiguity in language that such mischief could often succeed.

My vote would be to get rid of both the deletion and after-post editing features.

Re: forum message deletion feature considered harmful

*Message #4 Posted by **Valentin Albillo** on 28 Oct 2005, 4:26 a.m.,*
in response to message #3 by Howard Owen

Hi, Howard:

Howard posted: *"My vote would be to get rid of both the deletion and after-post editing features."*

That's nonsense. As a frequent poster that frequently posts program listings and snippets of code, I fully know that no matter how many times you read and proofread the listings, you'll invariably commit one or two mistakes that you'll invariably notice *later*, once the listing is posted for good, so having the ability to edit these typos is kind of ***essential*** to make the posts useful in the first place and avoid leaving either errors or duplicated messages (in order to point out and correct the error) in the archives for posterity.

Just for instance, what would you prefer, reading some post of mine including a listing for the 71B which you know it's guaranteed to be correct ? Or having to search the whole thread to see if I had to point out typos in the listing, perhaps several of them scattered among several different later posts ?

Another instance: in your very post to which I'm replying right now, you have such pearls as "speling erurs", which is obviously an intentional mistake or two, and "It might me useful", which perhaps it's not.

Best regards from V.

Re: forum message deletion feature considered harmful

*Message #5 Posted by **HrastProgrammer** on 28 Oct 2005, 4:54 a.m.,*
in response to message #4 by Valentin Albillo

I agree with Valentin.

The possibility to edit a post is essential for non-english speaking posters because many times I noticed that I spelled some word wrong (possibly in this post, as well) and the ability to correct it was very useful ...

Edited: 28 Oct 2005, 5:31 a.m.

Re: forum message edit feature considered essential

*Message #6 Posted by **Paul Brogger** on 28 Oct 2005, 12:09 p.m.,*
in response to message #5 by HrastProgrammer

Quite apart from whether non-English speakers may find it useful (and I assume they may), I use the edit feature myself. Maybe it's a mild dyslexia, but I seem repeatedly to preview my draft posts, finding they look just fine until I see them actually posted, and then there's the garish misspelling or omission suddenly (somehow) made obvious.

(I suppose, alternatively, that from the perspective of some folks "across the pond", I'm a "non-English speaker", and therefore covered under the above statement of need ... ;-))

And, as another post below demonstrates, the "quote" feature may be used to good effect. However, if either the original or the response is deleted or edited, we're left with the question of whether the quote is indeed an accurate and adequate reflection of what was originally written.

I would be interested in a feature that supports "deletion" and editing, but also provides link access to all posted versions of all messages. That way, the poster may hone his/her message, while the reader would have the option to form a fuller picture of what may have transpired.

But regardless of any minor nits that we may find in the way the site is implemented, the bottom line for most of us, I suspect, continues to be something like: "Thanks, Dave, for providing a place to meet!"

Re: forum message deletion feature considered harmful

*Message #7 Posted by **Upset** on 28 Oct 2005, 6:51 a.m.,*

May I? (was: forum message deletion feature considered harmful)

*Message #8 Posted by **Vieira, L. C. (Brazil)** on 28 Oct 2005, 9:47 a.m.,*
in response to message #1 by Eric Smith

Hi, all;

as it is an open question, I'll risk posting my own thoughts.

Many reasons have been pointed out, but the ones I support in order to keep deletion/editing features are: (I simply cut and paste some from others, as you'll see)

- The possibility to edit a post is essential for non-English speaking posters (I assume others agree with the fact that many contributors are foreigners related to the Forum's origin, I included)
- You'll invariably commit one or two mistakes that you'll invariably notice *later* (even when you are a native English speaker)
- everyone should measure all they say, but everyone slips sometimes, including me.

In a real world, what's said is said, no way to turn such said words back to our mouths and brain. In some particular cases, I´ve seen

(read) true 'dog fighting' here at this forum, involving regular contributors, that were completely whipped out, neither Dave Hicks was aware of that (I asked him later about some facts and he told me he was not aware of them). So, I conclude no back up is generated for such whipped out posts, and no such ' bad legacy' is left.

Considering these facts, the Forum Achieve does not perfectly reflects our Forum's history, so we actually are not aware of such inconvenient facts. My question is: knowing about such bad facts or having them recorded would elucidate current behavior from some contributors? As time passes, some unwanted contributors simply disappeared and most of their bad posts are there at the Archives. One of our regular contributors once decided not to offer his valuable emulators because of some disturbed contributor that is no longer posting for more than two years, though.

I myself don't remember removing my own posts except for one particular event in my very first months writing in here. Since them, I 'sit on my hands' long enough prior to writing, so I only edit my posts for corrections, not exactly to change a point of view.

But this is only me...

As a matter of fact, some regular contributors asked me why I was not participating so regularly at the Forum, and I must confess I've been reading messages that are not exactly of my own interest, but somehow others are interested on them. In other cases, I just read and have nothing to add. This does not mean I'd like such messages to be removed.

I'd vote for keeping editing/deletion. How to use the features is up to those who use them, and the main resource should not be confused for the way it is used.

Luiz (Brazil)

(had to correct for spelling)

deletion feature is Essential

*Message #9 Posted by **bill platt** on 28 Oct 2005, 9:58 a.m.,*
in response to message #8 by Vieira, L. C. (Brazil)

Hi Luiz,

I agree.

Also, we have often used the "Luiz if you get this message can you call me" etc followed by "1234 to delete" which enables us to carry out logistics without cluttering the archive with those logistics.

Re: forum message deletion feature considered harmful

*Message #10 Posted by **Howard Owen** on 28 Oct 2005, 12:02 p.m.,*
in response to message #1 by Eric Smith

My apologies to Eric for partially hijacking this thread by including the edit feature in the discussion. Obviously many folks (myself included) find a lot of value in being able to edit posts after they are first published.

The only argument in favor of the deletion feature I've seen so far is that it makes passing short off topic message easier. With respect, I'd like to point out that email is the right technology for that sort of thing. Given recent abuse of the deletion feature, does the convenience of message passing balance the possible misuse?

(Making use of the editing feature. How about that?)

There has been another argument for the deletion feature brought forward: that it allows people to take back hasty intemperate postings. I'm guessing that this may be the reason the feature was included in the first place. (Perhaps the moderator got asked to delete inflammatory postings too many times?)

In the real world, it is rare that you get the opportunity to really "take back" hasty, harmful speech. Words that leave your lips within hearing of someone else can't be recalled. Once the letter is in the mail carrier's bag, its delivery to the recipient is literally out of your hands. Most of us adjust our speech and writing with this fact of life in mind.

In the online world, it is also rare to be able to "take back" your posts. It's common for a moderator to be able to delete messages, but not for the user to have the same power. Despite this, it seems that intemperate speech is far more likely online than off.

Opinions vary as to why this is, but it seems to be true. But this forum probably has a more mature crowd, on average, than other meeting places online. (If not emotionally, then in years, at least.)

I submit that if the deletion feature were removed, that *most* of the users of this forum would adjust. I predict that would lead to *fewer* abusive postings, not more. I know I would be more careful about what I posted if I knew I couldn't take it back.

Wait! That's not what I meant to say! 8) <-- emoticon indicating ironic humor (I hope)

RE" Forum Messager Deletion considered Harmful

*Message #11 Posted by **bill platt** on 28 Oct 2005, 12:49 p.m.,*
in response to message #10 by Howard Owen

Hi Howard,

I disagree with the premise that "email is the appropriate technology" etc. Many here do not register their e-mails--a basic design concept which Dave allows for a number of very good reasons.

This leaves us with the need to pass messages on occasion.

As for the abuse of delete. Well, if you look at the recent string, it was all a lot of "off-topic arguing" and so what really is the harm?

Edited: 28 Oct 2005, 12:50 p.m.

Re: RE" Forum Messager Deletion considered Harmful

*Message #12 Posted by **Howard Owen** on 28 Oct 2005, 1:10 p.m.,*
in response to message #11 by bill platt

See my edited post above. If speech here were more like the real world, we might see less casual abuse between people with more or less common interests. The premise is that postings that *don't* get deleted nonetheless reflect the atmosphere of an environment in which postings *can* be deleted.

And I didn't deny the convenience of passing notes in class. I questioned its value relative to the bad effects of the deletion feature.

Re: forum message deletion feature considered harmful

*Message #13 Posted by **Eric Smith** on 28 Oct 2005, 1:06 p.m.,*
in response to message #10 by Howard Owen

Actually I'd favor removing the edit feature as well, for the same reason, but I knew that would be even more controversial.

I certainly have used the edit feature many times myself, mostly for very minor corrections to my posts, but occasionally to add things I meant to write but unintentionally omitted. However, if the edit feature were removed, I'd be perfectly happy to simply post a response with corrections. That's how Usenet works, and it worked fine as a global forum for quite a few years. (Whether Usenet still is useful today is somewhat debatable, but the problem isn't the lack of delete and edit capability.)

Re: forum message deletion feature considered harmful

*Message #14 Posted by **Howard Owen** on 28 Oct 2005, 1:17 p.m.,*
in response to message #13 by Eric Smith

Usenet is interesting in this connection. It actually does have a delete feature. But for a couple of reasons it was never very effective. The main reason was the distributed nature of the network. Unix systems would call each other up over phone lines and exchange "net news." It was a "seldom on" type of networking, and very ad hoc. That meant that a lot of systems could miss or ignore a kill command. They would later call other systems and exchange news, including the "deleted" posts. The called systems might have different software that implemented the kill feature differently, or not at all.

The second reason was that users of the network, highly technical as most of them were at the beginning, were either unaware of the kill feature or knew it didn't work very well and didn't bother with it.

Edited: 28 Oct 2005, 1:17 p.m.

usenet

*Message #15 Posted by **bill platt** on 29 Oct 2005, 12:57 p.m.,*
in response to message #13 by Eric Smith

HI Eric,

If you look at this thread:

http://groups.google.com/group/comp.sys.hp48/browse_frm/thread/ead62448f8c83ba5/1b05746a858512c1#1b05746a858512c1

I think it shows that indeed, Usenet is still very useful! That little discussion will be archived and universally accessible for a loong time.

Best,

Bill

Re: HP Calc. Promo

*Message #18 Posted by **bill Not for Archive platt** on 28 Oct 2005, 4:47 p.m.,*
in response to message #17 by Mark Lynch

Well, the only person who could delete your messages would be the moderator---unless you used a password and gave that password out (or used 1111 or 1234).

The coburlin stuff was waaaay OT --not all of it---but a lot of it, and if it was removed from the archive, I don't think it harms any of us.

As far as disparaging hobbyists---well, this happens to be a *hobby* for most people around here. That cobubba is bidding in virtually every auction in this hobby certainly is worth noticing and discussing. But when it gets to a flame war----why should Dave pay $$$ to keep that stuff on the server?

BTW, please delete this when you have read it---it doesn't need to be archived as far as I am concerned :-)

1111

Coburlin?

*Message #19 Posted by **Mark Lynch** on 28 Oct 2005, 4:58 p.m.,*
in response to message #18 by bill Not for Archive platt

> Quote:
>
> Well, the only person who could delete your messages would be the moderator---unless you used a password and gave that password out (or used 1111 or 1234).

Is this correct? I was wondering. Further, when I tried to actually "log in" and post I found my account existed, but could not be accessed. So I either forget the password (although "Mark Lynch" didn't seem to be hooked to the real email account I

use), or it was highjacked.

Huh. Food for thought. Oh well, I certainly mean no harm. If the moderator has the bandwidth and inclination to review and/or delete my messages I am okay with that. It is his forum after all.

M

Re: THE Moderator?

*Message #20 Posted by **Paul Brogger** on 28 Oct 2005, 5:09 p.m.,*
in response to message #19 by Mark Lynch

As I understand it, there may be several people acting as moderators at any time. You shouldn't necessarily assume that, when a post of yours is deleted mysteriously, it is Dave Hicks himself performing the surgery.

Re: THE Moderator?

*Message #21 Posted by **Mark Lynch** on 28 Oct 2005, 5:12 p.m.,*
in response to message #20 by Paul Brogger

I see. So at this point can I conclude definitely that it is *a* moderator deleting/editing my messages and not just another user?

Re: THE Moderator?

*Message #22 Posted by **Paul Brogger** on 28 Oct 2005, 5:17 p.m.,*
in response to message #21 by Mark Lynch

I just tried to delete the post to which I'm now responding. I didn't have the password, so it wouldn't let me delete.

So, I don't think that the typical user may delete someone else's post without the password.

(And no, I'm not *a* moderator -- though I was, once upon a time -- and I didn't edit your other message.)

A Ha!

*Message #23 Posted by **Mark Lynch** on 28 Oct 2005, 5:21 p.m.,*
in response to message #22 by Paul Brogger

Well then that settles it.

Coburlin is secretly a moderator of the forum and filters my messages so as to continue his evil practices unnoticed!

Just as I suspected . . .

Re: A Ha!

*Message #24 Posted by **Paul Brogger** on 28 Oct 2005, 5:24 p.m.,*
in response to message #23 by Mark Lynch

I doubt it. If he was, he'd have already listed his Moderator password on eBay . . .

MINT!!! $480.00 NR!!!!

Edited: 28 Oct 2005, 5:25 p.m.

Fast!

*Message #25 Posted by **Mark Lynch** on 28 Oct 2005, 5:08 p.m.,*
in response to message #18 by bill Not for Archive platt

Wow! The post you read and responded to has already been edited (not deleted), by someone other than me.

If it's the moderator making these changes I must say he's exceedingly efficient. It can't be more than 20 minutes past.

Re: forum message deletion - Let's try this...

*Message #26 Posted by **Dave Hicks** on 28 Oct 2005, 5:46 p.m.,*
in response to message #1 by Eric Smith

Hi everyone,

I haven't had a chance to look at the forum much over the last couple of months. Lately I've had time to do a quick spam/scam check and that's about it. I have received a couple of emails about one person but they weren't very specific about the problem since I think they assumed I was caught-up. I wasn't and I'm still not unfortunately. I also saw a reference to me in a post implying that if I wasn't banning him, then I must be "OK" with whatever has been going on. That's also potentially incorrect due to me being out of the loop.

So, I've done a forum update that allows edits and deletes only up to the point where someone responds to your post. After that, you're stuck with what you've said. I can turn this restriction off at some time in the future if everything seems calm or if people hate it.

We do have several moderators here but I guess everyone else has been busy lately too or may have not been sure exactly where to prune. I've seen some strange threads with a bunch of deleted posts myself and not known what to make of them. Perhaps the other mods were similarly confused. Please take advantage of the "report post" feature if you see something inappropriate. If the mods don't agree, they'll just ignore you. You won't be punished and your report won't be made public.

If there are still problems or a "subculture of confrontation" as Howard called it, please let me know. I probably still won't have time to follow each thread over the next few weeks but I hope to get more active later.

On an unrelated subject/poster:

Yes, I edited the Coburlin post since it would flatter Mark and so as not to derail this thread with off-topic flaming. Mark, out of your 23 posts here so far, I see two that are actually about HP calculators. The rest are about Coburlin, ebay, paypal etc. with your contributions frequently being to call people names and to tell them not to talk about these things. If you want to see less on these topics, I suggest you stir them up less. (I don't think I deleted the earlier one, but looking at the logs, I see a few that would have tempted me.) Posting more signal will make the noise less annoying.

Re: forum message deletion - Let's try this...

*Message #27 Posted by **donald wallace** on 28 Oct 2005, 7:13 p.m.,*
in response to message #26 by Dave Hicks

Hi David,

I am happy to discuss with you PRIVATELY what has been going on (apparently in your absence) from my point of view. When I do post advice in good faith to people who have technical problems I draw a lot of flak from certain people. I beleive I understand their motives, which imho are not benign. Other critics have been much more balanced and their feedback I am sure is welcomed by all the reasonable people here including myself.

The contents of my posts are technically sound as others here have independently shown. I thank those people for their objectivity in sharing their knowledge and findings. That's what it's all about, isn't it? I'm beginning to really wonder...

I have received strong support via e-mail (out-of-band ;-) from professional people which I sincerely appreciate.

Much more disturbing to me is that within a day or two of this "flame war" happening I was advised by email of attempts to set up fraudulent amazon.com account and paypal account in my name. I have an I.P. address supplied to me apparently by paypal which I will have to check out to find out what is really going on. What is being attempted is apparently fraud, which carries stiff penalties and can be prosecuted.

Some time ago in August when I first floated an advert to do repairs two attempts were made to send me a destructive payload via e-mail. Due to the poor technical knowledge of the attacker they failed and were a source of annoyance and amusement rather than alarm. I have my machine configured to do comprehensive FORENSICS within a few minutes of becoming aware of attacks so I don't think it's very wise for anyone on the net to hassle me in this way.

Criticism of technically skilled people like myself who urge caution in specific aspects of d-i-y repairs others want to undertake is imho quite unwarranted. I was only trying to help others from a strong technically sound standpoint, FOR FREE. And I was on topic ;-)

I find this whole ridiculous episode a serious waste of my freely given time.

To my critics, particularly those whom I have given good technical advice I would say with respect that imho you may profit from taking a good look at yourself. I think it IS time a few people cleaned their act up. No individual has a monopoly on this forum or on doing repair work for fee or helping people freely by way of accurate advice.

Bottom line from my point of view would be: this forum needs less politics/partisan behaviour, less juvenile bullying/abuse and more technically sound advice. I don't have to cop ill considered criticism or abuse in silence and more to the point I WON'T. Please be clear on that point, everyone. Please keep your posts civil... and accurate.

Anyone who wants technical advice from me on any hp equipment (not just calculators! ;-)I am familiar with without the potential negative side effects of doing this in forum can write to me:

donwallace63@yahoo.com.au

I have also repaired a lot of other brands, too ;-P

I have not bothered to read the copious thread on deletions. My interest here is in assisting hp41 owners to keep their machines running and extending the capability/utility, not helping owners to unwittingly wreck them or abusing others who offer good advice or on-topic cautions.

Dave, if you don't mind, can you please delete all my posts and those responding negatively (for balance) in about a week or two. Thanks for hosting us all. Despite the drama, I HAVE met some really nice interesting people here, both hobbyist and professional.

Seriously unimpressed...

fwiw,

Don Wallace

P.S. To certain people, Please don't cuss/criticize me in latin... No doubt you would be able to faithfully render into latin the phrase: Get a Life...

Re: forum message deletion - Let's try this...

*Message #28 Posted by **donald wallace** on 28 Oct 2005, 8:26 p.m.,*
in response to message #27 by donald wallace

Hi all,

I have read the thread. I vote for keeping edit and delete and would ditch the quote feature but one can cut and paste anyway. No matter what features you keep or discard a forum will be abused by calculating people no matter what.

I am NOT one of them!

Note (Howard) that the quote feature can be (and has been imho) used maliciously. Your assertions about my deletions are just plain wrong. I consider you a friend of sorts so I am not offended. My motives in self-censorship were good. Others could and perhaps should take my lead...

Editing is neccessary. I posted some non trivial technical comments the other day which were just plain wrong (whoops! there's always a FIRST time, for EVERYONE... ;-) but corrected it within about 30 minutes.

Changing gears for a bit... To clarify: I apologize to all hobbyists who have misinterpreted me (my doing (Mia Culpa!) due to slightly careless use of language). There's nothing wrong with those people. However, when someone, whether hobbyist or supposed "pro" jumps in and criticises good technically sound advice meant to protect others from damaging equipment then I find that a bit strange. When they are backed up by people going off like a bunger comparing apples to oranges (34C to 41 battery-and-connect hardware (Hi, Karl)) it gets bizarre...

I respectfully vote for a general return to sanity here and STILL advise caution in d-i-y repairs in certain areas, that is unless people LIKE (enticing others into...???) making inoperable junk! My technical position has not changed.

There is imho nothing wrong with civility, relevance, technical accuracy and moderate behaviour in a forum. However, when being disparaged or under public attack (from others with ulterior motives who behave in a sneaky and hypocritical manner) it is NATURAL to want to respond. As people have found, when pressed I reluctantly can give as good as I get, in latin if required. I am under a lt of stress in my personal life atm and maybe it rubbed. If so then I AM SINCERELY SORRY!

The two people who imho started this garbage some time ago, Tony and Randy are conspicuously quiet. I suspect not after this post. One can hope at least...

I urge all here to take a careful considered approach not just to writing here, but also to READING the posts...between the lines...

In responding to problems I POST FOR THE BENEFIT OF THE PERSON WITH THE PROBLEM. What others think of me is IRRELEVANT.

Now I have to go fix a PC with a thermal alarm problem for a friend for free so I cannot waffle further.

A saying I like form an old drunk (maths genius lecturer who taught me at U.Q. ages ago): If you can't understand what all the fuss is about then you don't know what the hell is going on!

All freedoms are relative.

Sorry for drawing all this heat Dave! Have fun everybody, and PLAY NICE!

CYA!

Don Wallace

Re: forum message deletion - Let's try this...

I believe you when you say the deletions were not meant to be malicious, Don. I think that you were trying to use them to take back intemperate outbursts that you thought better of later. The trouble with that is, you can't really take stuff like that back after people have read it. There are fragile egos everywhere you go, and this forum is no exception. Given that, it's a good idea generally to restrain your pen when you feel like someone has offended you. Personally, I find that postings I make in anger have a disenheartening way of rebounding on me. Often the rebound has the ironic twist that the thing I thought I was being victimized with is the very thing I myself was guilty of in the response. I really hate it when that happens.

Anyhow, I think that you and I, and the forum generally, could benefit from knowing that what we post would be permanent. I know for certain that I would take more care with the content of my writing in that case, and I expect that others would too.

Regards,

Howard

There goes Don again...

Um, hi, Don.

Some of us didn't agree that your advice regarding the risk of using rechargable batteries on the 41's was as sound -- or at least, as specific -- as it could have been. Do you care to elaborate?

On the 34C vs. 41C battery terminals ("going off like a bunger"): Yes, they are different. The 34C's are flexible and seem to be made of spring steel; the 41C's are fixed, and seem to be copper (maybe I'm wrong on both counts).

Many 41C's have severely corroded terminals. I would surmise that most 41's have been run on alkaline disposables, for many practical reasons.

The 34's rarely have corroded terminals, but often have broken ones. 34's were run on their custom-designed NiCd rechargeables -- at least until their owners balked at paying $12 for a new NiCd pack, inserted the overlength AA disposables, thereby breaking the contacts eventually.

Again, do you care to elaborate?

> Quote:
>
> *There is imho nothing wrong with civility, relevance, technical accuracy and moderate behaviour in a forum...*

I consider it *de rigeur*. (That's French.)

> Quote:
>

Ah yes, the irrational "victimhood" exception, which is then invoked to justify the *incivil* counterattack!

> Quote:
>
> *The two people who imho started this garbage some time ago, Tony and Randy are conspicuously quiet. I suspect not after this post. One can hope at least...*

No, you started it, by suggesting that people who elected to use certain kinds of batteries "HAVE ROCKS IN THEIR HEADS". Remember? As for the two individuals, perhaps they have wisely quit wasting their time on a person who seems to have little control over his thoughts and public communications.

> Quote:
>
> *Sorry for drawing all this heat Dave! Have fun everybody, and PLAY NICE!*

How ironic that last statement was...

Frankly, I like the "edit and delete even after responses" capability, and now they have been indefinitely rescinded largely because of your actions. I have liberally made after-the-fact edits (as Valentin Albillo has done), wanting to improve my contributions whenever possible. I don't edit to make respondents appear foolish, and can't cite a clear case of anyone else doing that.

We can all sympathize with your A.S. condition, Don, but I doubt that most of us can fully comprehend it. However, you mustn't allow yourself to use it as a pretext for inappropriate statements.

If this stuff continues, I'll ask Dave and the surrogate moderators to review your postings and to just delete the "bad" ones as they see fit.

No, that's a *sneer* in any language.

> Quote:
>
> How ironic that last statement was...

Don Wallace doesn't know from irony.

> Quote:
>
> Frankly, I like the "edit and delete even after responses" capability, and now they have been indefinitely rescinded largely because of your actions.

Which completely ignores the context the deletions were made in. I'm not talking about the technical arguments, but the rather viscious and cutting responses to Don's over the top, paranoid reaction to criticism.

> Quote:
>
> We can all sympathize with your A.S. condition, Don, but I doubt that most of us can fully comprehend it. However, you mustn't allow yourself to use it as a pretext for inappropriate statements.

And don't let the fact that Don certainly asked to be criticised keep you from feeling ashamed about piling it on a guy with limited capacity to defend himself coherently. He handed *someone* his head, rhetorically speaking, by questioning Randy's credentials. You chopped it off, apparantly with gusto.

All very high-minded, but....

*Message #32 Posted by **Karl Schneider** on 29 Oct 2005, 3:47 a.m.,*
in response to message #31 by Howard Owen

Howard --

... I must take some issue:

> Quote:
>
> *I consider it de rigeur. (That's French.)*
>
> No, that's a sneer in any language.

Perhaps I should have defined it (and, ahem, spelled it correctly) --

De rigueur: strictly required, as by etiquette, usage, or fashion (1825-35).

This is a reasonably familiar foreign phrase that has long been incorporated into English. Remember that Don used pejorative Australian slang to poke me, after having taken others to task for using Italian and Latin phrases (which admittedly should also have been translated to English).

> Quote:
>
> Don Wallace doesn't know from irony.

I guess we'll have to take his (and your?) word for that, won't we? Of course, it might well be true...

> Quote:
>
> ...but the rather viscious *[sic]* and cutting responses to Don's over the top, paranoid reaction to criticism.

I don't think any of us were particularly vicious (least of all myself), but some of us were justifiably blunt.

I think that Don gets displeased that his repeated counterattacks didn't put an end to the threads, so he tried to "wipe the whole thing out" after the fact. Heck, I don't mind deleting my contributions to those threads, but why should people have their time wasted responding to slurs, only to eventually be asked, "Never mind"?

> Quote:
>
> And don't let the fact that Don certainly asked to be criticised keep you from feeling ashamed about piling it on a guy with limited capacity to defend himself coherently.

Let's not forget that he has initiated and repeated the slurs, and that he is educated and intelligent enough to recognize the likely outcome of initiating disputes, given his acknowledged circumstances.

Nobody should get *carte blanche* (a "blank check" or free pass) to act freely, just because of some identified handicap. If someone cannot function properly in a certain activity, he should make that "extra effort" to avoid it. In this case, Don should just present his information as plainly as possible without argumentative embellishment.

> Quote:
>
> He handed someone his head, rhetorically speaking, by questioning Randy's credentials. You chopped it off, apparantly *[sic]* with gusto.

Well, I'd say that's hyperbole.

But a line must be drawn. I won't stand for further irrational criticism and questioning of competence -- by name, in an archived and "Google-able" forum -- regarding myself and others who I know deserve better.

-- KS

Just for the record

Hi Karl,
since **I** was the one who used latin **once** to express (in a mild manner) my feelings about Don's posts I must also point out that I never used italian on this forum.
I thought, erroneously of course, that some latin phrases were known enough around the world to not include a translation. Who knows? Maybe because I keep on spotting latin "mottos": from your national one *E pluribus unum*, to military corps, universities and so on; the EU motto is *In varietate concordia*, BTW.

This is because latin was a *lingua franca* [a language used beyond its native speakers, in commerce and cultural exchanges] long before english.

When asked for a translation I promptly provided it, though, even if "google-ing" around would easily give the answer.

Just a last nitpicky note: when you quote Howard [and I report it *verbatim* ;-)]

> Quote:
>
> He handed someone his head, rhetorically speaking, by questioning Randy's credentials. You chopped it off, apparantly [sic] with gusto.

Here we find **sic** *latin* and **gusto** *italian*.

Given this I must remember that the lack of a positional notation in Roman numerals prevented us to invent the *calculatrix* [*calculus*: pebble, small stone] which - as we all know - brought us to The Fall Of The Roman Empire... :-)

Greetings,
Massimo

As long as we are picking linguistic nits, **gusto** is actually an *english* word. English is of course a great borrower of vocabulary from (mostly) European languages.

In this case, the word was borrowed from spanish, not italian, according to Merriam-Webster

*Message #35 Posted by **Walter B** on 29 Oct 2005, 2:55 p.m.,*
in response to message #33 by Massimo Gnerucci (Italy)

It's always taken for granted all people in this forum (Latin!) understand English despite a real lot of typos and/or slang and these weird abbreviations some folks use. But if anybody once quotes an old and famous expression in another language, those folks are embarrassed. Hi, there are other languages still on this planet! And history didn't start with the Pilgrim Fathers! And if it's just a matter of majority, then we shall have these discussions in Chinese ...

I just had to tell this once.

Ceterum censeo quam lineam esse delendam! (Furthermore I think this thread should be deleted - completely, because it's off topic and will never return to calculators. A similar sentence was used repeatedly - and effectively in the end - by Cato Maior in the Senatus of Rome, about DIV A.U.C., i.e. CXLIX B.C.) Please, Dave!

Hallo Walter!

If you use the *"ceterum censeo Carthaginem esse delendam"* form then you must be german-educated!

As a french, I knew only the simple form *"Delenda est/quoque Carthago"* and was scolded by my teacher in Mainz!!!

Did you learn Latin in Germany ? Please answer me before this thread is deleted!!!

MfG from France!

Etienne

Sorry Dave :-)

*Message #38 Posted by **Etienne Victoria** on 29 Oct 2005, 7:01 p.m.,*
in response to message #37 by Walter B

Hallo!

YOU got the point :-)

I was an exchange student in Mainz for one year (2 years before the Abitur), practising my german in a normal german Gymnasium.

I love german, did enjoy attending a normal school and adapted quickly except for the latin courses with explanations in german!!!

My otherwise good grades (in France) were here transformed in a complete catastrophe!!

And the latin teacher kept on making fun of my "Latin de cuisine" (ie bad latin) let alone my lack of mastership Accusativus cum Infinitivo forms :-)))

A great experience anyway and the Rheinland Palatinat is a wonderful region!!

Thanks for your answer und freundlichem Grüße aus Frankreich!

Etienne

> Perhaps I should have defined it (and, ahem, spelled it correctly)

No, I understood what it means. It's still a sneer when you imply that the person you address the message to wouldn't know that it was french, or wouldn't know the definition.

> Quote:
>
> *Quote: And don't let the fact that Don certainly asked to be criticised keep you from feeling ashamed about piling it on a guy with limited capacity to defend himself coherently.*
>
> Let's not forget that he has initiated and repeated the slurs, and that he is educated and intelligent enough to recognize the likely outcome of initiating disputes, given his acknowledged circumstances.

I know you are capable of using language carefully. That implies you are also capable of reading carefully. I know that can be hard to do when you are defending yourself in public. But please do try to reread the above exchange. I think you are restating part of my premise, and entirely missing its point.

You might also look at my exchange with Don here in this thread in which I criticise him in a way likely to be heard and acted on. Also notice that he apologized in response. My main point now is that your approach to criticism added fuel to the fire, and that could have been predicted. If what you are after is a good roast, then you are clearly approaching things in the right way.

Questions for Don

*Message #41 Posted by **Randy** on 29 Oct 2005, 4:00 p.m.,*
in response to message #28 by donald wallace

I know this may appear out of place in this thread as it is in direct response to Don's post... but here goes:

> Quote:
>
> The two people who imho started this garbage some time ago, Tony and Randy are conspicuously quiet. I suspect not after this post. One can hope at least...

Don, what is that "One can hope" for? That I'll remain conspicuously quiet? A simple yes or no will do.

Since that was an easy one, here's one that is a bit tougher. Could you please explain what you think my motives are by posting what you have many times said is unsound/bad information on this board? I'm most curious...

Re: Questions for Don

*Message #42 Posted by **donald wallace** on 30 Oct 2005, 12:02 a.m.,*
in response to message #41 by Randy

I really am tired of these threads...

Randy, I do not have to justify myself or explain the motives of others here or anywhere else.

You can explain your motives here...if you like.

You need to justify your statement that NiCd cells don't deteriorate or corrode much and won't wreck equipment in

time if not watched...closely. They are more trouble than they are worth. That fact is borne out by long history. Remember all those old PC motherboards with NiCd cells on board for CMOS config ram backup? How many motherboards died that way? How many Canon printing calculators? Etc..... Ad Nauseum.....

Alkaline cells are really bad but only when they do eventually leak. I never ever had trouble with them in my hp and always use them in fact. NiCds are in practice much more troublesome. The difference in discharge characteristics (disch. slope, knee voltage and "flat-cell" cliff) and cell chemistry means with nicd cells you don't get adequate warning from the low battery indicator of some incremental damage occuring when using tired nicd cells. HP fitted a shield in some models to overcome this, apart from different cell cradles all manufacturers try to solve the problem. Alkalines do not give this trouble because at least you know when they are flat and unlike nicd cells they don't seem to damage equipment until they really are quite flat partly as they are not rechargeable and don't gas. When they do go they ARE terrible. So are NiCads, not quite so much so.

I am not certain of what the 41CX "off state" drain is, someone SAID it's about the same as for a CV and that it didn't matter. Well, I know better. A lot of us may use our calcs intermittently and a higher off drain (my measurements indicate a factor five difference based on the timer running a 10kHz oscillator which is where that extra current goes). Not a big difference but significant. As someone said, I got "called out" on that one but I am still right on that point. A timer in system drops the "shelf life" by a factor of five... 41CV off = 6 uA (varies); 41CV with timer off = 30 uA (varies)

A good many people here (this is not meant as a criticism) are not very technical and not very aware. Repairing a lot of different stuff daily for 20 years you soon learn. So you must then know things others don't and that don't get taught at university. I have met some very knowledgeable engineers and some very impractical ones too. Ditto for programmers.

Tony needs to justify his statement to a newbie d-i-y repairer that one can easily pull down an hp41 display and reassemble it when the success rate for people who do it FOR A LIVING is about 30% and on that basis it's almost never done. He needs to justify to me his strong criticism of my warning which was issued in good faith.

You both need to justify criticism of my offering to do repairs here when you both repair calcs for money and in light of the fact that often others offer a tagline type advert for your repair biz (Randy).

There is nothing wrong with friendly open-handed competition and technically accurate criticism.

Tony needs to justify criticising me for "witholding information" when he himself does just that all the time, but subtley. When someone knows something he doesn't he is strident in wanting to know everything they found. Of course, because there's money in doing good repairs as you well know. The more one knows the more repairs one can successfully perform.

There is a lot wrong with starting a flame war in a forum, whatever that forum may be about. That happens a lot on the net, but I have found exactly the politics displayed here in other forums. There's less of it here because most of the time people are quite genteel. Except when fighting over scraps?... or argueing linguistics or semantics (!)

In some cases (in other forums, particularly some computer forums) some of the moderators get very abusive and "bitchy" when they encounter people (not only or neccessarily myself) who are (somewhat or very) knowledgeable on things like internet networking protocols, network security or firewalls or whatever. When after dishing out repeated "cr*p", their bluff is called, they fall silent, outgunned by hard fact and unmasked by their own bad behaviour. Until they are actually silenced they really try to make you look bad, though...That these people are moderators is what surprises me. I am thinking of a girl called Ursula, btw...

Dave Hicks isn't like that, I guess because he's an engineer who's done it (hp product work); he hasn't anything to prove...

As everyone here by now knows, I do not like people who don't know what they are on about or with ulterior motives jumping on me in public. I really "made a few clams" here though... Big ones... I have been really very tired lately (partner does shift work and the hours are crazy so I need more sleep).

Again: SORRY!

Hmmm...

To Karl: Randy doesn't need your support and you didn't help anyone. You just displayed your personality. Oh and a bunger is a firecracker, btw. Was that the oz lingo you referred to?

To Howard: Thanks mate, but I don't need your support though you and Bill and a few others I find by and large are

from fairly to very clear headed about the politics of all this. I enjoyed reading their posts, too many to mention here...

Although abrasive, I have shown I am (perhaps too) open and honest, albeit intolerant of criticism and a bit quick and definitely too abrasive in responding to it. I am also technically competent, despite dropping out of engineering many years ago (not through lack of academic skill). There's one more fact about myself I have disclosed.

Although it would indeed be good for business, I do not talk up or encourage people to dive in to "repairing" elements in equipment which they won't be able to get back in one piece and running again. I do not see any merit in it whatsoever.

People with ANY elecronics fault in ANY hp equipment are WELCOME to write to me privately. I will help you in any way I can. People who want complex software written for the 41 (optionally in a module) can also write to me. If the application warrants it, I will fully characterise any software or hardware I devise.

sincerely,

DW

in response to message #42 by donald wallace

Hi Don,

> Quote:
>
> ...some of the moderators get very abusive and "bitchy" ...
> Dave Hicks isn't like that, I guess because he's an engineer who's done it (hp product work); he hasn't anything to prove...

Please don't make assumptions about me. I haven't commented because I haven't read your posts before. I can get bitchy if I have to. It's possible that I haven't been bitchy enough lately.

Today I have been looking through the logs and piecing conversations together. This has been made somewhat difficult due to your tendency to delete things so I may have missed some things, but here's what I'm seeing:

Here some of the ways the you have referred to people on this forum:

> Quote:
>
> "hacks and hobbyists"
>
> "Where certain parts of this forum get (imho) quite bizarre at times is where people who do not know what they are talking about berate people who actually DO."
>
> "I have met some really remarkable people here. Maybe you are one too. So far, in your replies, I haven't seen it. Am I missing something? (I doubt it...)"
>
> "Some others (perhaps someone whose been critical of me?) have offered completely impractical repair advice here. I never criticised them. "
>
> "I decided to stay here for now as people may need some protection from the BAD ADVICE of a few others... I am happy to fill that role. "
>
> "Anyone who wants to run rechargeables in his 41 HAS ROCKS IN THEIR HEAD."
>
> "Have I offended anyone? Who cares!"
>
> "Grow up, please."

On the other hand, I've found threads where people have politely stated that they have different opinions and experiences from you and you have responded like:

> Quote:
>
> "When you and Randy continue to abuse me (for reasons related to your thinking your getting some competition?): annoying."
>
> "Please don't criticise my posts and I will continue not to criticise yours. Ditto to Randy if you are reading."

As much as you claim to be abused, I haven't yet been able to find it.

> Quote:
>
> Tony needs to justify his statement to a newbie d-i-y repairer that one can easily pull down an hp41 display and reassemble it when the success rate for people who do it FOR A LIVING is about 30% and on that basis it's almost never done. He needs to justify to me his strong criticism of my warning which was issued in good faith.

That isn't quite what he said. What Tony actually said was:

> Quote:
>
> What is the problem (other than very static-sensitive chips) in dismantling the display module of a fullnut?
> ...
> I will admit I have never taken a fullnut HP41 display, but unless I can find good evidence that taking one apart _will_ ruin it, I would give it a go if other cures failed.
> ...
> After all, the HP manual does give an official procedure for doing this.
> ...
> Which brings me back to my original question. If there is something odd about this display where dismantling it will do serious damage, then I would like to know about it. If there is nothing known like that, I probably will take an old 41CV (the most common 41 in my experience, I have a few with cracked posts, etc) apart and see how I get on. I'll report here anything that I find out.

I see nothing to justify there.

By the way, I just tried Tony's technique on my fading old Fluke and it worked nicely. Of course, that's the example Tony gave so it doesn't prove anything about HP41s but it was useful advice for me. Notice also that Tony starts simply by asking a question. He wants to know if what has worked on a Fluke display might work on an HP. This was a fine chance to educate him or just let him try it and see what the results are. I don't see the problem. I would assume the (alleged) newbie would wait to see what results Tony got before proceeding and would decide whether his skills were comparable to Tony's. I think we also need to understand that some people would rather have ideas that they can try themselves because they have no plan whatsoever to send a calculator off to a professional to repair. Such ideas are better than nothing, even if the chances are slim, because in some cases it's either a free self-repair or toss it and buy a new one.

If you're going to continue contributing to a public group like this, you're going to have to learn to accept differences of opinions and experiences. You're also going to need to learn to treat others more like the way you expect to be treated.

> Quote:
>
> Although abrasive, I have shown I am (perhaps too) open and honest, albeit intolerant of criticism

Yes, please work on the abrasiveness and the intolerance of criticism. We'd love to have you share your knowledge with us but we need a little more friendliness and willingness to accept other points of view. (And a different point of view is not necessarily criticism.)

> Quote:
>
> I have been really very tired lately (partner does shift work and the hours are crazy so I need more

sleep).

Again: SORRY!

I hope you get a good night's sleep tonight.

Re: Questions for Don

*Message #46 Posted by **donald wallace** on 30 Oct 2005, 1:53 a.m.,*
in response to message #43 by Dave Hicks

Hi Dave,

There are other threads in which Tony and Randy jumped on me. I think that is where some confusion lies. So, my fault for kind of cross-posting; I should know better.

If you care to you can find some rather critical off-track stuff about me (Karl's posts etc...) in this thread. If you care to... It's worth your while to check other threads.

The point is I was posting to help someone, I know what I am on about, my comments are by and large technically VERY sound, if badly phrased and I did not start this "bun fight".

Generally I'd like to hear from anyone who actually HAS pulled down a display module, reassembled it and got it going. That WOULD be really interesting. If they do it ten times (on ten different displays) and we get a % success rate then that would be great experience for the forum. I expect the rate to be maybe 10%. My advice to the poster was very sound. I admit I phrase things poorly, though, at times.

I am getting a very clear picture of the relative experience of the posters (regardless of degrees, etc...) in this forum and in that respect these recent threads have been very enlightening to me. Ditto wrt personalities/friendships/loyalties, generally speaking with respect to all concerned.

I do not assume you can't get bitchy :-) I do assume you are WAY MORE knowledgeable and rational than Ursula... and less partisan.

A fluke display is designed to be dismantled and cleaned and is quite rugged. I bought a 2nd hand 75 in 1983. One cannot compare that with the repair of stuff like 41's though. They are not designed to be pulled apart and put back together and are infinitely more fragile.

Lots of people, not just me, make all sorts of assumptions...

All I ask, Dave, if you review the threads is be balanced and do not let a matter of personal friendship cloud your objectivity. It is possible Tony and Randy trade on this sort of thing. There's money in it for them!

I now regret deleting my posts in that the water is now somewhat muddied, not my intention at all.

Dave, I wonder how come I was no longer able to post as Don and had to change my user name? Is anyone

apart from yourself able to fiddle my password? Has anyone changed my password on me?

Just curious.

Now more than ever, I feel I can be of benefit to people who post to the forum with problems. Certainly the benefit and payoff is to them not me.

God I hate politics!!!

DW

Do you? A little while ago you weren't going to discuss Randy's motives. I suggest that you either post the entire story of Randy, Tony, me(?), others(?), "destructive email payloads", Paypal fraud, Amazon etc. now, or just drop all the intrigue and talk about calculators.

Re: Questions for Don

*Message #48 Posted by **Tony Duell** on 30 Oct 2005, 7:09 a.m.,*
in response to message #42 by donald wallace

> Quote:
>
> I really am tired of these threads...
>
> Randy, I do not have to justify myself or explain the motives of others here or anywhere else.

No, but you seem to expect others to justify what they say.

> Quote:
>
> I am not certain of what the 41CX "off state" drain is, someone SAID it's about the same as for a CV and that it didn't matter. Well, I know better. A lot of us may use our calcs intermittently and a higher off drain (my measurements indicate a factor five difference based on the timer running a 10kHz oscillator which is where that extra current goes). A timer in system drops the "shelf life" by a factor of five... 41CV off = 6 uA (varies); 41CV with timer off = 30 uA (varies)

I really quant follow this at all. First you say you don't know what the CX off-state current drain is. And then you

say you know better than 'it's about the same as for a CV and it didn't matter'. Now either you do know the current drain of a CX (that is, you've measured it, or have seen measurements that you trust), or you are talking nonsense.

And AFAIK the real time clock oscillator in the CX (and for that matter the time module) is 32.768kHz, not 10kHz. Not that it makes much difference to the argument.

> Quote:

You have no idea as to my qualifications or experience. Period.

I will say this, though. I've been repairing stuff for a lot longer than 20 years. I've also done a heck of a lot of very successful repairs when others claimed they couldn't be done. Yes, I've had disasters, but that, alas, is part of the learning process. If you claim you've never messed anything up, then quite honestly I won't believe you.

And yes I am most definitely a self-taught hobbyist. I also object to the implication that that means my knowledge is somehow inferior to others. I've met plenty of self-taught people in all fields who really know what they are talking about.

I will also gladly admit that I make mistakes and that I've made errors when posting here. I don't believe anyone can ever claim not to have done either. However, I find it a lot more helpful to post justified corrections to such errors, not just flame me for making them.

> Quote:
>
> Tony needs to justify his statement to a newbie d-i-y repairer that one can easily pull down an hp41 display and reassemble it when the success rate for people who do it FOR A LIVING is about 30% and on that basis it's almost never done. He needs to justify to me his strong criticism of my warning which was issued in good faith.

I do not need to justify that because I've never said it. What I claimed was it was possible to take a 41 display module apart without ruining it. And although I've never done it (I am certainly going to try though), I still don't see what the problem is. This does not mean I think it's a good idea to take apart display modules 'for the fun of it' (it isn't) or that anybody can do it. I do think it's _possible_, and will therefore practice on an otherwise broken machine to see.

I re-ask my original question : If you know something odd about this display that means there is some issue in taking it apart that doesn't apply to other similar displays and isn't mentioned in the HP service manual, then please tell us. If not, then let me get on with possibly wrecking an old display to find out.

> Quote:
>
> You both need to justify criticism of my offering to do repairs here when you both repair calcs for money and in light of the fact that often others offer a tagline type advert for your repair biz (Randy).

Yes, I do repair machines for money occassionally. Quite honestly, I'd rather not have the hassle of so doing, but some people do not feel happy with a soldering iron and logic analyser, so I help them out. I'd much rather help them (and others) to do the job themselves.

> Quote:
>
> There is nothing wrong with friendly open-handed competition and technically accurate criticism.

I agree totally. The problem is that much of your critism does not seem to be based on available facts -- that is things I can read in manuals, on the web, etc.

> Quote:
>
> Tony needs to justify criticising me for "witholding information" when he himself does just that all the time, but subtley. When someone knows something he doesn't he is strident in wanting to know everything they found. Of course, because there's money in doing good repairs as you well know. The more one knows the more repairs one can successfully perform.

Let's get the trivial case out of the way now. If I posted all the information I had on a particular machine every time that machine was mentioned here, I'd not have time to do anything else, and this forum would soon be over-full.

Now I want you to point me to one place where I have deliberately witheld information (so I can make a profit on the repair or otherwise). Yes, there have been times when it would have been a waste of time for me to post the information (the questioner would not have had the skills to make use of it). There have been times when I've taken a discussion to private e-mail, but I've then given permission for the results (and the information I've provided) to be made public.

And who do you think produced repair schematics for just about every HP handheld and most of the desktops. And then gave them away free.

in response to message #49 by donald wallace

Did you check that frequency? The "Timer Chip detailed description" states "32768 Hz". (Available on TOS). I don't say your statement ist wrong, but in theory it should be 32KHz.

On Topic: Time module

*Message #52 Posted by **Klaus** on 1 Nov 2005, 7:58 a.m.,*
in response to message #51 by Klaus

The Phineas specification also states:

I in operation = 1mA

24 uA standby

32768 Hz clock input. Prescaler : 175/57344

"This results in a 100 Hz signal..."

As the specification is for the Time Module, not for the 41cx, the 41cx current may be lower.

in response to message #52 by Klaus

On the other hand...

Don, besides the 32KHz in the Timer chip description, I also found the 10240 Hz in the manual: HP41cx owners manual II, appendix. In the section where the calculation of the accuracy factor ist described, it states the internal cycle is 10240 Hz.

> Quote:
>
> Hi Tony,
>
> 10240 Hz (to get 1/100th secs easily).

Can you please explain to me how you _easily_ get 100Hz from 10240Hz? I can think of several ways it can be done, but none are 'easy', and all would also work starting from 32768Hz. Starting with 12800Hz would make it 'easy' (divide by 2^7).

Every $5 digital watch has a stopwatch mode which reads down to 1/100 s. Every $5 digital watch that I've ever seen has a 32768Hz crystal (I am willing to accept that there are, or have been, digital watches with other crystal frequencies, but they sure are not common).

> Quote:
>
> Why do you guess tech. details? RTFM mate.

Can you please give me the title of any HP manual, or for that matter any other reliable source, that specifies that the time module or 41CX use a 10240Hz crystal? Because I have a couple of references that specify 32768Hz.

> Quote:
>
> Thanks for clueing me in on the source of the error riddent 41 schematic.

Are you implying that I produced a 41 schematic? Check your facts, please. I did not. Why would I? I've got the offical service manual on the shelf.

I said I produced schematics for 'almost all' of the handhelds. That's the ones where there aren't official manuals available -- thus excluding the 97, 41, 71 and 75. Official manuals for those 4 machines are around.

I suggest you learn to read and stop posting defamatory comments. If you do not do the latter, I shall, reluctantly, be forced to take this considerably further

Don,

I'll take your direct lack of response to my two questions as Don once again, doing only what Don wants to do.

So it's okay to make denigrating posts and when asked for justification you say you don't have to? That simple eh? My my, aren't we above it all.

And just for the record, about rechargeables... the original thread was about using modern nimh cells in 41's, not nicads. You said yourself "those are a different kettle of fish".

Let's not talk about computer motherboards, let's stick to 41's shall we? So far, of the seventy four 82120A's that I've rebuilt, only one had any significant corrosion that caused the 41 to need repair, minor at that. That's my experience as it pertains directly to the 41, all that really matters here. I think that is far more relevant than your anecdotal evidence of one nicad pack on your 41 with a timer, mother boards nonwithstanding.

On the topic of 41 displays, my evidence shows that removing and cleaning the elastomers works about 40% of the time. This does not apply to the original Ampleflex interconnects, I find a lower repair rate there, especially when the unit experienced a battery leak. FWIW, my current sample size is 52. The remaining 60% almost evenly divides between bad hybrids and bad lcds. Take out the older gold interconnects and the sample is 39 units.

As further support of this evidence, I'll point you to HP service note 41C-35 under the topic "Testing", paragraph G: "Display fades out/Missing Segments/Strange characters in display". They cite in order of occurance:

1. Check for cold solder joints between display and keyboard.
2. Check display connections (P/N 1251-5400)
3. Replace display driver hybrid
4. Replace display (1PT1-0001)

There you have it, straight from Corvallis.

Is there anything else you want ME to justify? Oh, gee, wait, it's your turn first.

Why don't we just give this up Don? Really. It's a waste of time since there seems to be nothing that you already don't know nor seem to want to learn, especially from us "hobbyists". Or am I just a hack?

Don --

I was quite pleased to see Tony and Randy respond directly and eloquently. They covered quite well the topics they chose to address .

You finally took the opportunity to elaborate specifically upon your assertions. I, like Tony, had difficulty following the the "line of logic" in your explanations. Tony covered the issue of standby- and timer current; I have some comments about the NiCd batteries:

> Quote:
>
> ...NiCds are in practice much more troublesome. The difference in discharge characteristics (disch. slope, knee voltage and "flat-cell" cliff) and cell chemistry means with nicd cells you don't get adequate warning from the low battery indicator of some incremental damage occuring when using tired nicd cells....

This discussion is rather vague, in my estimation. You mention "difference in discharge characteristics ... and cell chemistry" without describing what they are. The last part of that excerpt is rather confusing, because low battery indicators cannot possibly give "adequate warning ... of some incremental damage occuring..." And what does "tired" mean -- near the end of its service life, or merely discharged?

Here's what I think you're trying to state (without my judging if it is correct):

"NiCd cells internally self-discharge, and discharge at a slightly higher rate if a timer is being run. The resultant outgassing can cause corrosion over time. Since NiCd cells tend to maintain high output voltage even when significantly discharged, the low-battery indicator does not activate very early in the discharging process, which could otherwise alert the user of possible damage."

Is my "translation" substantially right? (I'll admit now that I'm not an electronics engineer or technician, or even a chemist, but do have a BSEE & MSEE in the area of power sytems.)

In summary, your explanations do not suggest to me a level of expertise that you have claimed to compare so favorably with that of others.

> Quote:
>
> To Karl: Randy doesn't need your support and you didn't help anyone. You just displayed your personality. Oh and a bunger is a firecracker, btw. Was that the oz lingo you referred to?

I'll stand up for anyone I please, until that person asks me not to. Is that clear, Don? I didn't know if he was monitoring your public smears, but I'm glad that he did -- I wasn't about to let them go unchallenged.

On the issue of personality and people "going off like a firecracker/bunger", many of us -- including the website owner -- have already spoken in this thread. Readers can determine for themselves whose personality could be described as pyrotechnic.

in response to message #27 by donald wallace

I'd watch it responding to those Amazon and PayPal warnings, Don. It sounds like "phishing" to me. That's where email is sent that looks like an official communication from some company you do business with. Your bank, eBay, PayPal or Amazon, for example. The mail tells you there have been attempts to access your account, and that as a result your access has been suspended. There is usually a link in the email that looks like it leads to the official site in question, but it really

lands you at the bad guy's site. There you are asked to enter personal information, including your credit card info.

I don't know if the messages you got match that profile, but if they do, my advice is not to click on anything in the email. Also, I find it hard to believe anyone here would attempt abuse of that nature. Putting aside the violation of simple human decency that would represent, there's also the real possibility that anyone attempting something like that would get caught. So don't read too much into events that may well be unrelated.

Regards,

Howard

typo/overstatement in HP-16c manual?

*Message #1 Posted by **Mark Crispin** on 27 Oct 2005, 4:39 p.m.*

On page 32, the HP-16c manual states:

> Quote:
>
> A current word size smaller than 8 will limit the size of the number you can enter to stipulate a new word size; but you can always enter 0 **f WSIZE** to set a word size of 64.

That seems to be overstating matters. 7 bits is enough in signed mode to enter any valid word size (0-63) and 6 bits is enough in unsigned mode.

I took a doubletake when I first read this, until I realized that they were talking about entering 64 (instead of 0) in signed mode.

Re: typo/overstatement in HP-16c manual?

*Message #2 Posted by **Eric Smith** on 27 Oct 2005, 7:12 p.m.,*
in response to message #1 by Mark Crispin

> Quote:
>
> 7 bits is enough in signed mode to enter any valid word size (0-63)

The valid word sizes are 1 through 64; it is not possible to actually set the word size to zero. Representing 64 as a signed integer requires 8 bits; 7 bits only gives you the range -64..63 (two's complement) or -63..63 (one's complement).

Re: typo/overstatement in HP-16c manual?

*Message #3 Posted by **Mark Crispin** on 27 Oct 2005, 10:48 p.m.,*
in response to message #2 by Eric Smith

> Quote:
>
> The valid word sizes are 1 through 64; it is not possible to actually set the word size to zero.

It is not possible to set the word size to zero bits, but it is certainly possible to do a set word size of 0!

Doing **0 WSIZE** sets the word size to 64; it is exactly equivalent to **64 WSIZE** except that you can do it even if the word size is 1 bit. That's how you can recover from an ill-advised word size setting.

Therefore, you only need the range 0..63 to set all possible word sizes. 7 bits suffices for signed, and 6 bits suffices for unsigned.

As a side note, word size 1 in signed mode means that only 0 and -1 are valid numbers.

Re: typo/overstatement in HP-16c manual?

*Message #4 Posted by **Eric Smith** on 28 Oct 2005, 12:56 a.m.,*
in response to message #3 by Mark Crispin

The argument to WSIZE is the desired word size. Zero is handled as a special case alias for 64. Nevertheless, representing a valid word size requires seven bits (unsigned) or eight bits (signed), which is what the quoted paragraph is describing. Zero is not a valid word size; it is just a valid argument to the WSIZE function.

Re: typo/overstatement in HP-16c manual?

*Message #5 Posted by **Mark Crispin** on 28 Oct 2005, 1:13 p.m.,*
in response to message #4 by Eric Smith

Please turn to page 32 of the HP-16c manual and consider the entire paragraph in question:

> Quote:
>
> A current word size smaller than 8 will limit the size of the number you can enter to stipulate a new word size; but you can always enter **0 f WSIZE** to set a word size of 64. (You can then set any word size.) **Error 2** results if you attempt to specify a word size larger than 64.*

Thus, the manual is talking about the need to use a two-step process to recover from setting the word size smaller than 8: **0 f WSIZE** then ***n* f WSIZE** where *n* is the desired new word size. It is not talking about "representing a valid word size".

This two-step process is completely unnecessary in the case of a current word size of 7, and in the case of a current word size of 6 if the mode is unsigned. There is no need for the additional bit because 0 is treated as equivalent to 64, and works no matter what the word size may be.

You only need to use the two step process if:

```
. signed, current word size 6, desired new word size 32 or greater
. unsigned, current word size 5, desired new word size 32 or greater
. signed, current word size 5, desired new word size 16 or greater
. unsigned, current word size 4, desired new word size 16 or greater
. signed, current word size 4, desired new word size 8 or greater
. unsigned, current word size 3, desired new word size 8 or greater
. signed, current word size 3, desired new word size 4 or greater
. unsigned, current word size 2, desired new word size 4 or greater
. signed, current word size 2, desired new word size 3 or greater
. current word size 1
```

Note: "3 or greater" is not a typo. If the desired word size is 2 you don't need to do anything!

As for whether zero is (or is not) a valid word size, without referring to the microcode (have you?), there is no particular reason to believe that "0 is handled as a special case alias for 64." It is quite possible that 64 is the special case for zero in the microcode. Consider, for example, a 6-bit register which holds the "word size restriction", where zero means "unrestricted".

Regardless of what how the microcode implements it, the effect is the same: the range of values accepted by WSIZE is 0..64, and 0 and 64 are functionally identical.

Go ahead and argue semantics if you wish; the fact is that in terms of keystrokes entered the

manual overstates the need to do the two-step process.

*Message #7 Posted by **Eric Smith** on 29 Oct 2005, 12:35 a.m.,*
in response to message #6 by Mark Crispin

> Quote:
>
> Speaking of HP-16c microcode, does the source exist anywhere?

Unknown, but I suspect not. There have been stories from seemingly reliable sources that the original HP-12C source code was lost, but other seemingly reliable sources state otherwise. Possibly it was lost and later recovered. A lot can be lost when responsibility for a product line shifts between different corporate divisions scattered across the world three times after the product was discontinued.

The survival of HP-16C source code seems less likely than that of HP-12C source code, since the former has not had any commercial value for HP in more than 16 years.

But in any case, if the HP-16C source code still exists, it's relatively unlikely that copies will be made available to the general public. AFAIK, the only HP-16C object code publicly available is the modified version I released with Nonpareil.

Re: typo/overstatement in HP-16c manual?

*Message #8 Posted by **Eric Smith** on 29 Oct 2005, 12:26 a.m.,*
in response to message #5 by Mark Crispin

> Quote:
>
> Go ahead and argue semantics if you wish;

OK, I don't mind killing another five minutes.

Suppose I design a product in which feature X has limitation Y, so I add a subfeature Z that effectively changes the limitation to Y2. I would write in the manual an explanation that in order for the user to circumvent limitation Y, the subfeature Z is provided. It wouldn't make sense to say that in order to circumvent limitation Y2, the subfeature Z is provided, because the limitation Y2 doesn't even exist without subfeature Z.

For the HP-16C:

feature X is user-adjustable word size of 1 to 64 bits by way of the WSIZE function

limitation Y is that a minimum of 8 bits are required (in signed modes) to represent any valid

word size (in signed modes)

subfeature Z is the ability to use the value 0 to specify a word size of 64

limitation Y2 is that a minimum of 7 bits are required (in signed modes) to represent any valid input to the WSIZE function when taking advantage of subfeature Z.

Plugh!

Re: typo/overstatement in HP-16c manual?

*Message #9 Posted by **Mark Crispin** on 29 Oct 2005, 1:03 a.m.,*
in response to message #8 by Eric Smith

Well, the argument would probably be answered by disassembling the 16c microcode. I suspect that if that is done, it will be seen that the WSIZE value is actually between 0 and 63, and 64 is supported by a special hack (both for input and display with status).

0..63 is what makes sense. 64 is what some PHB would have forced the microcoder to do.

Re: typo/overstatement in HP-16c manual?

*Message #10 Posted by **Eric Smith** on 29 Oct 2005, 10:04 p.m.,*
in response to message #9 by Mark Crispin

If the processor were particularly optimized for six-bit operations, you would likely be right. But it's not; it's optimized for operations on multiples of four bits, for obvious reasons. So I suspect that it internally uses the true count of 1..64.

If the WSIZE were internally stored as 0..63, as you suggest, everywhere that loops over the bits would have to special-case 0 and convert it to 64 for the loop counter. And everywhere that multiplies by the WSIZE/4 would have to do likewise.

I haven't yet located the particular code that is responsbile for WSIZE, but I'm working on it. At this point we're both just guessing. I'll post an update here when I find it, but it might not be for a while.

Eric

Re: typo/overstatement in HP-16c manual?

*Message #11 Posted by **Mark Crispin** on 29 Oct 2005, 10:40 p.m.,*
in response to message #10 by Eric Smith

It doesn't have to be optimized for 6-bit operations. Rather, it's a matter of how the WSIZE value is stored. You're probably right that it is stored in two 4-bit nybbles.

However, in the early 1980s memory was still quite expensive, and register memory was particularly expensive. I doubt that they would have wasted two bits like that.

It seems more likely to me that they used six bits for WSIZE and two bits for something else. They could have offset by 1, so 0..63 meant 1-64, which would match your idea of 0 being a special hack, but still not wasted two bits.

My guess is that they had 0 mean 64 (= "don't apply a WSIZE, use the full 64-bits"). Rather than "convert to 64 for the loop counter" as you suggest; suppose that WSIZE was a masking operation, and in the case of WSIZE=0 there was no masking.

One way to check for this would be to do some timing tests of 64 bit vs. other bit sizes. If my guess is correct, we probably would see 64 be faster.

As for the other two bits, a possible use was for the base. You could only set the base to one of four values (2, 8, 10, 16). So, that byte would effectively be the display/input mode.

I'm definitely interested in the result of the microcode analysis.

This also suggests a useful hack for nonpareil -- the ability to patch memory or a register and see what happens. If they really use a full byte for the word size, I wonder what happens if the WSIZE is forcibly set to 72.

Re: typo/overstatement in HP-16c manual?

*Message #12 Posted by **Eric Smith** on 30 Oct 2005, 1:14 p.m.,*
in response to message #11 by Mark Crispin

From the HP-35 through the HP-41C, HP routinely stored internal values using space rounded up to the next multiple of 4 bits. Most of their calculators that had flags stored each flag (1 bit) in its own 4-bit digit, though the 41C did not since it had so many. And most of the models that had two or three display modes (FIX, SCI, ENG) used 4 bits to store that, or in some cases, 8 bits.

Your masking idea is plausible, though 0 still wouldn't be "no masking". It's a 56-bit machine, so they still have to mask the high part. In fact, they go through all sorts of gyrations to deal with the high part of each stack location.

The low 56 bits of X is stored in the CPU's M and/or N registers. The low 56 bits of Y, Z, T, and L are stored in memory locations 0x00 through 0x03. The high 8 bits of all of these are stored together in location 0x07:

```
CSC LL TT ZZ YY 0 XX
```

Where CSC is the Cold Start Constant 0xEAE, and the digit shown as zero might be used for something, but is more likely always zero because it makes extracting and inserting the X extension more efficient, and they obviously have to do that a lot. The Nut processor has a defined field for digits 0 though 2 (the rightmost three) used for dealing with the exponent and sign. To insert and extract the other fields, they have to do rotations and pointer operations.

Re: typo/overstatement in HP-16c manual?

*Message #13 Posted by **Mark Crispin** on 30 Oct 2005, 4:07 p.m.,*
in response to message #12 by Eric Smith

Sheesh, so the 64-bit limitation is complete arbitrary!

At the time the HP-16c came out, 36-bit systems (with 72-bit doublewords) were still very much alive, and there were microcode engines which used word sizes of 80 bits. They could have used another word for extension and supported 72 bits, or just do the simple thing and use a doubleword for each

register (thus up to 112 bits).

Having played with a 16c for a while now, I've concluded that it is most useful in doing 16 and 32 bit hex calculations and conversions to/from decimal. It does that quite well.

In floating point, it is little more than a four function calculator. Ditto for decimal. In octal and especially binary, the small (8-digit) display forces you to use scrolling too much.

That probably explains why sales were poor. Had I looked at it at the time, my first reaction would have been that with all the physical space they had on top it could have had a display with many more digits of precision. Two more precious digits would have been available if hex, oct, bin, and dec were annunciators. With all the need for scrolling, having it be a shift was a drag. etc. etc.

Of course, they were limited by the 10c series form factor and display; and in particular they couldn't change annunciators. IIRC, the series was all the same hardware, with just different paint on the keytops and different microcode, right?

Interestingly, the HP-33s is a 36-bit machine, although it limits the word size to 36 bits. It's interesting to think what kind of programmer's calculator can be done with that platform, given the two-line display and additional keys

HP-16C internal state

*Message #14 Posted by **Eric Smith** on 30 Oct 2005, 3:36 p.m.,*
in response to message #11 by Mark Crispin

Much of the 16C's general state is stored in the register at hardware location 0x06. Thus far I've only seen the leftmost 8 digits of this register have non-zero values. The encoding is:

```
R S D M WW FF 000000
```

R is the radix setting: 0=hex, 2=oct, 4=bin, 8=dec, c=float (the floating point digit setting is stored in the processor's G register, with values 0 through 9 or A for "FLOAT ."

S is the sign mode: 0=unsigned, 1=one's comp, 2=2's comp

WSIZE is stored in the D and M digits.

D is the number of digits unused at the left end of the word M is the mask of the bits used in the leftmost used digit of the word (always f, 7, 3, or 1)

Examples:

WSIZE (decimal)	DM
64	0f
63	07
62	03
61	01
60	1f
59	17

```
56          2f

39          67

 1          f1
```

WW is the window position, as an 8-bit binary number indicating displayed digits shifted to the left. WINDOW 0 through 7 are represented as 00, 08, 10, 18, 20, 28, 30, and 38 (hex). Using the arrow keys, you can get any window position from 00 through ff. (Shortly after I got my first 16C in July 1982, I verified that there are 256 window positions in binary mode, and that the arrow key will wrap from position 255 back to 0. I never tried it in other radix modes.)

FF is the flags, binary xx54 3210

>
> D is the number of digits unused at the left end of the word M is the mask of the bits used in the leftmost used digit of the word (always f, 7, 3, or 1)

That settles it. You're right, then; the word size is 1..64 and 0 is a special hack. My consolation is I guessed that the WSIZE is not stored as 1..64 in an 8-bit value. I agree that the format that it uses makes sense, and it does use all 8 bits.

Thank you for hunting up that information.

It's interesting how the R and S data is stored.

Are you certain that 0=hex instead of 1=hex? That means that instead of testing the 0x1 bit being set, it would have to test the 0xe bits being unset. Or maybe it tests for R being zero?

Even more interesting is c=float; this suggests that it first tests for decimal and then uses the 0x4 (nominally binary) flag to do floating.

What happens if you try various invalid states, e.g. R=1, S=3, etc.?

> Quote:
>
> Are you certain that 0=hex instead of 1=hex?

Yes. I went through about a zillion (technical term) combinations of mode settings, dumping the internal registers after each, and zero definitely is hex. I was rather surprised at the encoding, but it must make sense for some reason that isn't immediately apparent. I think only the display code uses the radix, and I haven't yet studied that code at all.

> Quote:
>
> What happens if you try various invalid states, e.g. R=1, S=3, etc.?

I haven't had time to try any. If you care to try it with Nonpareil, here's what you do:

1. Get the simulated calculator into the state you want base your modifications to
2. Save the state. If you use "Save" it will by default go into the ".nonpareil" directory under your home directory (no leading dot on Windows), with a name like 16C.nst. You can use "Save as" to save the state file anywhere you like.
3. The save file is a gzipped XML file, and the XML is not formatted for human consumption, so you can decompress and format it by a command like "zcat 16C.nst | xmllint --format - >16C.xml"
4. Make your changes to the XML file using either a text editor or an XML editor. For playing with the 16C mode settings, you're looking for a line like:

   ```
   <loc addr="006" data="000f0000000010"/>
   ```

   where the data attribute consists of the 14 hexadecimal digits of internal memory location 0x06.
5. Rename/move the resulting file so that it has a ".nst" extension. It is not necessary to gzip it, as Nonpareil will happily read an uncompressed XML file. Note that the Load command in Nonpareil uses the standard GTK file selection dialog, which will usually not let you select files in hidden directories.

It's a bit cumbersome, but it's a lot easier than trying to do this stuff on the real hardware. Though there's always the danger that the simulator might have bugs and behave differently than the real hardware in subtle ways. However, I think Nonpareil's simulation of the Nut processor used in the 41C and Voyager families is pretty well shaken out, with the exception that I probably haven't matched all of the bugs in the real chips. The programmers at HP generally didn't rely on the bugs, because they new that future hardware revisions could eliminate them.

Re: HP-16C internal state

I think that you're doing the right thing here by not worrying excessively about a bug-for-bug reimplementation.

I don't see much point in reimplementing a processor bug in an emulator unless it is necessary for the correct operation of the software. I agree with the general observation that programmers avoid relying upon processor bugs since future hardware revisions can eliminate them. The main benefit of intentionally using a bug is for code to detect and report a particular hardware revision.

More importantly, if Nonpareil is used as part of a platform to reimplement a physical Voyager family calculator, I think that most of us would prefer one that works as if it were an updated model from HP as opposed to one that slavishly reimplements bugs from the 1980s.

HP 9000 Server for $49 :-)

*Message #1 Posted by **Gileno** on 27 Oct 2005, 3:13 p.m.*

http://cgi.ebay.com/HP-9000-Server-847S-HP-IB-800-Series_W0QQitemZ7549797284QQcategoryZ25402QQrdZ1QQcmdZViewItem

Re: HP 9000 Server for $49 :-)

*Message #2 Posted by **Frank Wales** on 27 Oct 2005, 4:23 p.m.,*
in response to message #1 by Gileno

Unfortunately, it's probably not even worth $49, unless you specifically want, say, the box it comes in as a very heavy drinks cabinet.

Computationally, it's way outclassed by modern desktop PCs, it runs a severely out-of-date version of HP-UX that probably hasn't been upgraded since 2001, and it sucks so much power that it needs multiple mains leads. You'll also be stuck with 1995-class expansion cards, memory and disks, as well as a delightful fifteen minute boot-up with any reasonable amount of RAM.

But don't let me put you off buying it if you feel nostalgic. :-)

My First HP!

*Message #1 Posted by **Samuel Heddle** on 27 Oct 2005, 2:57 p.m.*

I just recieved my first HP calculator, a good condition HP-28S on ebay for just $53, good price considering ebay's other prices. It included the owners manual, a refrence manual, and a probability and statistics book. It also included the leather case.(No word weather it is "rich" or "corinthian")I'm currently learning RPN, and am excited to get into this new style of calculator!

Re: HP Calc. Promo

in response to message #1 by Samuel Heddle

Congratulations! Welcome to the "club". Best of luck. You can find a lot of information here--great stuff.

Re: My First HP!

*Message #3 Posted by **db (martinez, ca.)** on 28 Oct 2005, 12:33 a.m.,*
in response to message #1 by Samuel Heddle

Or maybe "welcome to my nightmare". Welcome in any case. You may have made a good first choice, since your 28 is more an RPL than an RPN and what you learn in programming it will help you directly with the new models.

Re: My First HP!

*Message #4 Posted by **Bram** on 28 Oct 2005, 3:44 a.m.,*
in response to message #3 by db (martinez, ca.)

> Quote:
>
> your 28 is more an RPL than an RPN

True, but let's not confuse Samuel. RPN can be learnt without knowing anything of RPL. RPN is a good start to get to know the calculator. RPL will follow at a later date. No doubt about that.

Re: My First HP!

*Message #5 Posted by **marais** on 28 Oct 2005, 3:55 a.m.,*
in response to message #4 by Bram

Congratulations for acquiring the 28S, which was also my first HP 16 years or so ago. A pleasant machine, and of historical significance. Just be careful with the battery door, about the only flaw of the machine - the forum discussed this at length.

Andreas

A Toast to Samuel!

in response to message #1 by Samuel Heddle

Welcome to the club of proud HP calculator owners, Samuel. Feel free to send any questions if you need help.

Re: My First HP!

*Message #7 Posted by **Stephen Easterling** on 28 Oct 2005, 9:43 a.m.,*
in response to message #1 by Samuel Heddle

So you're the one that outbid me for this calc! I was bidding just for the sake of getting that leather case, which are hard to come by these days and can sell for more than you paid for the entire package. Oh well, no hard feelings, really! My first HP was also a 28S I got about fifteen years ago and I used it quite a bit. I still have it and all the manuals in mint condition. I've retired it now but use other HPs for work and home. Enjoy your 28S, but don't let you batteries run down too low or you'll lose everything in memory. (I lost almost 30k worth of programs in mine when the batteries ran too low!) Preplan how you want to set up your directories to organize them well so you won't have to move too much info around downstream. The 28S is unique and more powerful than most folk give it credit for. Being more of a RPL guy compared to RPN anyway, I'll always have a soft spot for the 28S.

Re: My First HP!

*Message #8 Posted by **GE** on 28 Oct 2005, 10:22 a.m.,*
in response to message #1 by Samuel Heddle

$53 is just small change if you happen to be biten by 'the bug'...
I'm not sure how much this craziness cost me all in all but maybe i could have a (much) bigger car by now were it not for this.
Congratulations on the 28S, it was my second HP after the wonderful 42S, and was a pleasure to use. It scored many firsts, a revolution like the 41 before it : symbolic calculation, curve plotting, directories, RPL (yes, yuck !), large memory, folding... and the infamous battery door.

Re: HP Calc. Promo

*Message #9 Posted by **bill platt** on 28 Oct 2005, 11:42 a.m.,*
in response to message #8 by GE

I put a spreadsheet together to track what I was up to...

I have spent over $2,000 on Calculators and ave over $1,200 in them, after selling off some!

I did not show my wife the sheet....

Re: HP Calc. Promo

*Message #10 Posted by **Stephen Easterling** on 28 Oct 2005, 3:20 p.m.,*
in response to message #9 by bill platt

Don't feel too bad. I have over $4k in my HP calculator collection!... if I include a printer, expansion cards, and cases. I still need two calculators to finish my collection, though.

collection

*Message #11 Posted by **bill platt** on 29 Oct 2005, 1:38 p.m.,*
in response to message #10 by Stephen Easterling

Hi Stephen,

To "complete" your collection....Do you have a comprehensive collectio n, or in otehr words, what defines your collection as complete.

If you have only spent $4k ahd have one from every modle, then I'd say you've done very well indeed!

Calculator collection

*Message #12 Posted by **Stephen Easterling** on 29 Oct 2005, 8:31 p.m.,*
in response to message #11 by bill platt

Prior to collecting, I wanted to set some rules so it didn't get out of hand. One thing in common with all I have is that they are all in mint or new condition with cases and manuals. Also, the only models I picked up that were not in the original plans are a few of the Voyagers. Essentially, I have all of the Pioneers, the 48SX, (just sold a mint 48G), 48G+, 48GX (with infrared printer, 2M card, Math, Statistics, Calculus, Chemistry, & Physics cards), 49G+, 33S, 11C, 12C, 15C, and 28S, which was my first 15 yrs ago. I have many books on the 48 series, too, and even a nice poster and a couple of wonderful calculator collection / documentary books. I rotate each of them in/out of office and home use and stay on top of the battery situation. The three that get the most use right now are the 12C, 33S, and 49G+. Reasons for this are partly because they are currently easily replaced. The others are not easy. I can't say that I didn't have to spend much on Ebay. I think I have about $1500 tied up in the 48GX with books and accessories alone!... but I bought it brand new a couple months ago, too. I'd like to get a 10C and 16C to end the collection, but I have to be honest with myself and say that I don't think I'd ever use the 16C in the way it was meant to be used. As a working physicist, I get use out of all of the others.

Re: My First HP!

*Message #13 Posted by **Samuel Heddle** on 28 Oct 2005, 11:54 a.m.,*
in response to message #8 by GE

Thanks, everyone for the replys! I currently am enjoying my calculator, and am reading the owner's manual cover to cover. I am kinda confused about the FORM command, but hope to get it down in memory. :)

Rechargeable NiMh 1/2 N Cells for Battery Pack Rebuild

*Message #1 Posted by **Brian Gladman** on 27 Oct 2005, 12:14 p.m.*

I have had a response from GP Batteries about the GP23NH 1/2 N size NiMh rechargeable batteries that are needed for rebuilding of the HP41 rechargeable battery packs.

They can supply these cells but only in boxes of 400 at a cost of about $3.50 per cell. If enough people wanted these at this sort of price (plus shipping costs) it might hence be possible to obtain them.

This seems pretty costly to me so my guess is that there probably wouldn't be a lot of interest. But I thought it might be worth mentioning here in case I am wrong about this.

If there was sufficient interest I might be able to coordinate a bulk purchase.

Brian Gladman

Re: Rechargeable NiMh 1/2 N Cells for Battery Pack Rebuild

*Message #2 Posted by **David Smith** on 28 Oct 2005, 12:29 p.m.,*
in response to message #1 by Brian Gladman

Check your part number and quote. I think you want the GP18NH....

Re: Rechargeable NiMh 1/2 N Cells for Battery Pack Rebuild

*Message #3 Posted by **Brian Gladman** on 28 Oct 2005, 2:24 p.m.,*
in response to message #2 by David Smith

I used this Technical Information to find the GP23NH, which is a 1/2 N NiMh cell. Do you believe this information is wrong for some reason?

Brian Gladman

Re: Rechargeable NiMh 1/2 N Cells for Battery Pack Rebuild

*Message #4 Posted by **David Smith** on 29 Oct 2005, 10:40 a.m.,*
in response to message #3 by Brian Gladman

My local battery guy called it a GP18. I have also seen the GP18 number in a couple of other posts somewhere. Must be a GP23 though... the manufacturer is seldom wrong.

Re: Rechargeable NiMh 1/2 N Cells for Battery Pack Rebuild

*Message #5 Posted by **Brian Gladman** on 29 Oct 2005, 11:44 a.m.,*
in response to message #4 by David Smith

GP Batteries have been uprating the capacity of many of their NiMh cells - my guess is that there

used to be a GP18NH (180 mAh) but that this has now been uprated to GP23NH (230 mAh). Sadly the manufacturer will only deal in boxes of 400 though.

Lex Files.

*Message #1 Posted by **Gileno** on 27 Oct 2005, 11:32 a.m.*

I have several lexfiles (71B) in a diskette (DOS). How do I send them for HP71B using the 82164A HP-IL/RS-232C Interface? The system is already configured and ready to transmit or to receive. Thank's

Stay on the same thread!

*Message #2 Posted by **Vassilis Prevelakis** on 28 Oct 2005, 8:02 a.m.,*
in response to message #1 by Gileno

Why are you starting a new thread? We are already discussing the subject of xfering data to your 71 in this thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=80343#80343

If you change thread in the middle of the discussion, new posters cannot easily review what has already been said. For example, on the other thread you have already told us that you have a 41 connected to the same HP-IL as the 71 and you do not want to disconnect it.

Reading-in data from the 71 **depends** on whether the 71 is loop controller!

If you want others to help you, at least try to make their job easier.

**vp

Re: Stay on the same thread!

*Message #3 Posted by **Gileno** on 28 Oct 2005, 2:15 p.m.,*
in response to message #2 by Vassilis Prevelakis

That doubt was already solved (How do I send a string of a 71B for a hp41CX through HP-IL?), now it is another doubt (I have several lexfiles (71B) in a diskette (DOS). How do I send them for HP71B using the 82164A HP-IL/RS-232C Interface?). I hope you help me in this new doubt. :-)

An argument for simple rpn non-graph in university

*Message #1 Posted by **ECL** on 27 Oct 2005, 1:58 a.m.*

I've come to the conclusion that since computers (unix, PC, mac) are abundant at universities, along with code like MATLAB, C, Fortran, VBA languages...why not abandon graphing calculators?

Instead, students could utilize some form of what is offered by the 33s. This is complex enough to allow programming, but not so specialized that you are isolated from mainstream code barriers.

I really do not need the 48G/49G+ machines on exams, in fact, I seem to do better with the simpler 32sii/33s machines. Also, common functions (natural log) are primary keys on these machines.

Thoughts? ECL

Re: An argument for simple rpn non-graph in university

*Message #3 Posted by **Walter B** on 27 Oct 2005, 12:45 p.m.,*
in response to message #2 by Thomas Radtke

You got the point! There are markets for both lines, graphic calcs and pocket calcs, in the technical area at least. As long as you can do, choose according to your requirements and enjoy you have the choice. If you don't have it, think about a change ... ;-)

Re: An argument for simple rpn non-graph in university

*Message #4 Posted by **Namir** on 27 Oct 2005, 8:05 a.m.,*
in response to message #1 by ECL

ECL

You have a very good point. In fact in the last HHC2005 in Chicago there was a brief and informal discussion about the possibility that sophisticated calculators will become extinct. The reasons you mentioned (using software like MATLAB, MAPLE, SPSS, MINITAB, and so on) makes the calculators inferior tools for what I call "big-gun" jobs. I have recently gotten into MATLAB, SPSS, MINITAB, and a few others and am able to do calculations that I had dreamed of in the past!!! As I play with BASIC programming on the HP-71B I realize how limited the old calculators are.

I guess that our attachement to these machines is notalgic. Besides, they are familiar and relatively simple to

use. Their limited resources did challenge our intellegence to squeeze in programs with the calculator's limited memory and programming steps.

Cheers,

Namir

in response to message #4 by Namir

ECL - try 'R' a great free alternative (very extensive) stats language http://www.r-project.org/ syntax is MATLAB like.

At university (ok - a few years ago) all ALPHA capable calculators were banned so my HP41CX was no longer acceptable.

The HP15C was the best substitute available - with complex number handling (rather handy for electrical engineering students). I still regularly use this calculator today as I keept it just incase I ever needed to sit any further exams.

There is a movement calling for a HP15C update from HP http://hp15c.org/ (the first URL returned when googling HP15C).

For non graphic needs, it's almost ideal - unmatched ergonomics and size and 10 year battery life. Check the eBay prices for this calc !!

The only thing that needed improvment was it's inability to store the complex numbers coupled together in memory. This had a knock on effect with complex matrix handling which required a rather primative set of transformations to be done to multiply two partitioned [Re Im] matrices which formed the complex matrices.

Today these problems could easily be overcome and a new variant with more memory produced.

I would buy an upgrade immediately if one were available - those HP49 keys eeeugh! As for the HP33s - what is it with the 'V' shaped keyboard ?

Re: An argument for simple rpn non-graph in university

*Message #6 Posted by **GE** on 27 Oct 2005, 12:12 p.m.,*
in response to message #4 by Namir

It's not obvious that very capable CAS are the way of the future.
It is not common or desirable to handle multiple-page equations, and those packages are used exactly for that. I have heard of published proofs where single equations were spread across more than 10 pages. Most "real" problems are quite simple actually.
On the other hand, it is very easy to state one-line problems that those CAS can't solve. Example : "find the triangle with integer sides and surface, whose perimeter is maximum, and whose surface is less than 100000".
Either you use the grey matter for the most part, or ou write a 'brute force' program, but there is no way to input the problem in a CAS semi-exactly as stated, and get results (to my knowledge).

Couldn't Disagree More

*Message #7 Posted by **I, Claudius** on 27 Oct 2005, 10:15 a.m.,*
in response to message #1 by ECL

If you go to any college where technical subjects are taught, from chemistry to physics to engineering, a fast, accurate, powerful and portable machine is highly prized. And what do you see on study tables, lab benches, in test halls? Most likely it will be a TI89, probably the most useful, powerful hand-held produced so far. Sadly, HPs are seldom seen in US colleges nowadays.

Sales figures back this up: TI has sold over 30 million graphing calculators in the last decade, and growing daily. Do some arithmetic, at an average $100 per unit, no wonder TI's calculator division is one of the most profitable ever. There's even a joke in the electronics industry about TI employees saying "We make other great stuff besides calculators!"

While there is a wealth of great computer programs out there, there is no substitute for something like a TI89 or HP48/49. For there are still situations where you often don't have or can't carry a pc with you, and they don't have the quick interface of a calculator. From a student studying in the library to a surveyor in the field, there is nothing that beats a great calculator.

This is because of the "wow" factor though, not anything practical. Our older son said a lot of students in his math classes had them, and the only thing they used the graphics for was games. Yes, games-- which to me is a total waste of computing power! (I realize some will disagree.) The real class work did not benefit at all from the graphics, even though graphics improve sales. As an electronics engineer, I use my 41cx daily, but virtually never have any desire that it would do graphics, let alone color. I use the PC graphics for printed circuit board CAD and looking at data sheets and product info, jobs that would be quite impractical on a 2" screen.

In my experience, the calculators were bought not for the "wow" factor, but because the "required materials" list included "TI-83/84" graphing calculator. My precalc class actually uses the graphing calculators often, for simple things, such as linear regression, and max/min/inflection. And yes, everyone has games, so much, that the schools' math department circulated a rumor that "MirageOS", which is a popular shell for games, was a virus that destroyed your calculator. It worked.

Re: Couldn't Disagree More

*Message #13 Posted by **Stephen Easterling** on 27 Oct 2005, 4:21 p.m.,*
in response to message #7 by I, Claudius

In my personal experience, it's hard to beat a PC for real-world problems, including graphing. However, compared to a laptop, a new HP 49G+ (wtih ROM 2.00) is very hard to beat (and there is no more keypad problems with this update). I never use mine for graphing anything, but enjoy the larger screen for viewing more information, larger equations, matrices, etc. For those who use it primarily for games, what a waste! They're okay for airport terminals, etc. when you need to pass the time. For anyone interested only in a full-on effecient calculator experience, I believe that it's hard to beat one 49G+ and one 33S (or other Pioneer suited to your work or preference, e.g., 20S, 21S, 22S, 27S, 32S, 42S, etc). The "stretch" Pioneers (48 series) may have been on top for a long time, but I believe the 49G+ will be a better model in the long run due to sheer speed, memory, and better CAS, oh, and not to mention far better screen resolution.

I don't think graphing calculators are meant to replace PCs; their meant to be a portable, durable (droppable) math tool, unlike a laptop, which would be a pain to haul around. I have no experience with the 48s and 49s, (I'm thinking of a 48GII, how is it?) but I do have a TI86 and TI89TI, which are excellent at calculating, assuming you don't mind algabraic. Obviously, something like Mathmatica is going to beat it, but that's like saying an Indycar is better than a pickup truck. They're not meant to compete.

Re: My First HP!

*Message #15 Posted by **Stephen Easterling** on 27 Oct 2005, 7:59 p.m.,*

a "basic" calculator would have been like being in hell; the 48GX saved me more than one time when doing thermodynamics (talking about units) and everything else as well - trying to find some zero values in functions could be a pain - or you could just draw a graph

any student without such a "beast" is either a genius or plain stupid

(I agree you probably won't need it during pure math studies, but as soon as you need "numbers" you can't beat these calcs...)

And: they really fit into a pocket or onto your desk; using a laptop is possible (with Mathematica e.g.) but impractical for quick access.

(Funny sidenote: a simple 4-banger does everything I need now, but, heck, I *could* ;))

*Message #18 Posted by **Ed Look** on 27 Oct 2005, 9:00 p.m.,*
in response to message #17 by Frank Boehm (Germany)

Hee hee hee, Herr Boehm!

We used to do that stuff with the HP-34C; units were science fiction for calculators in those days.

Anyway, I use a combination of the 48G and 33S on the job and at home, where I know they are safe, I use the 48G+ (sometimes the 49G+) and 32SII. The pure scientific programmables I use for quick calculations and even some simpler (I mean VERY simple) programs (cheapie stuff like coverting eV to nm, etc.), but for some more involved things that require a bit more memory, or programming lines (something that might help index a x-ray powder pattern) but not so pressing that I need to go to the PC or mainframe, I use the graphing calculators...

... but I do not graph anything on any calculator! I use them as glorified, bigger, slightly more powerful scientific programmables.

Besides, graphing stuff uses up the batteries faster! ;)

Re: An argument for simple rpn non-graph in university

*Message #19 Posted by **Ben Salinas** on 27 Oct 2005, 11:31 p.m.,*
in response to message #1 by ECL

Personally, I use Matlab and/or Mathematica and/or Maple just about every day, but I still find myself reaching for my 49g+ and very often I find myself wishing for my 33s (or other generic scientific calculator... my 33s is at home:( )

CAS software is nice for doing big things, but it is almost always quicker and easier to do arithmetic and to solve numeric equations involving lots of inputs (I am really loving the numeric equation solver on the 49g+) on a calculator. As straightforward as programming in Matlab, I have been wishing for keystroke programming for some quick stuff from time to time.

I don't think the calculator is ready to die just yet, but it's time will probably come eventually.

What about cost? Even with academic licensing, the bill for the computer and the software can be excessive. If you aren't eligible for academic licensing, the cost can be very high.

*Message #21 Posted by **Chan Tran** on 28 Oct 2005, 11:13 a.m.,*
in response to message #20 by John Limpert

Although the cost of software and computer are quite high, if you can afford to pay tuition and book you should be able to afford computer and software.

Re: An argument for simple rpn non-graph in university

*Message #22 Posted by **I, Claudius** on 28 Oct 2005, 6:49 p.m.,*
in response to message #21 by Chan Tran

Not necessarily. The best argument for this would be a CAD class, where the hardware needed, 2 GB of memory on up, a top flight chipset and graphics card make the computer alone very expensive. The student editions of the two most popular CAD programs aren't cheap, and the professional versions being many thousands of dollars. Here, obviously the student is going to use school computers to complete his assignments, and not buy a $3000 pc, unless he's wealthy.

In the case of most math programs, they will run just fine on lesser and older cheap computers. Unless the machine is a laptop, it's just not portable. And almost every engineering professor I ever knew had a rule: no computers allowed on tests, calculators were OK. Some math professors go so far as to allow no calculator, but that's the pure math hoop we all had to jump through at some point or another.

So what is the first choice of technology purchase for a math / engineering student on a budget? He'll buy a calculator from the cheapest place possible, eBay, Walmart, etc. and use it almost exclusively. And that's just how TI has cashed in big time, by providing good quality high end graphing calculators, which have become the standard. HPs are a true rarity in education now.

Re: An argument for simple rpn non-graph in university

*Message #23 Posted by **Les Bell** on 28 Oct 2005, 8:08 p.m.,*
in response to message #21 by Chan Tran

If you are a student, you can usually obtain an academic licence. And, if the evidence of p2p file-sharing networks is to be believed, most students aren't too fussed about licences anyway.

On the other hand, I occasionally dabble in physics and maths as an intellectual exercise, mainly revisiting things I studied at university thirty years ago. For occasional use, tools like Mathcad and Mathematica are simply too expensive. So I get by with a drawerful of calcs and open-source tools like Octave.

Best,

--- Les

Re: An argument for simple rpn non-graph in university

*Message #24 Posted by **I, Claudius** on 28 Oct 2005, 9:02 p.m.,*
in response to message #23 by Les Bell

I have several math programs. For money spent, the best is Scientific Workplace, from Mackichan Software. They also have a version called Scientific Notebook, which I think is available to anyone for a mere $200, $100 for a student. These programs are terrific for What You See Is What You Get typesetting plus the CAS, MuPad 3.1, isn't Mathematica but is still quite good. By the way, I've tried MathCad, found it to be quite lacking, almost a joke.

Re: An argument for simple rpn non-graph in university

*Message #25 Posted by **Les Bell** on 28 Oct 2005, 11:58 p.m.,*
in response to message #24 by I, Claudius

Hmmm. I almost had a heart attack when I saw Scientific Workplace as $A1240 here, but

Scientific Notebook is only $A345. Still, for the roughly 1 hour a week I get to play with this stuff, I think I'll just stick with my calcs, etc. I'm always wary of people whose tools outclass their abilities (e.g. crap guitarists with expensive stratocasters) and wouldn't want to make my position any worse with regard to mathematical toys. ;)

Best,

71B HP-IL module

*Message #1 Posted by **Tomas Fischer** on 26 Oct 2005, 7:22 p.m.*

Anyone has a tip on how to remove the HP-IL module from 71B without scratching the calculator? I've been fighting with it for an hour now and it moved about 1/32 " :) Thanks for your help.

Re: 71B HP-IL module

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 26 Oct 2005, 9:17 p.m.,*
in response to message #1 by Tomas Fischer

Hi, Tomas;

I have an HP71 with an IL module and it is not that hard to remove. I simply use my thumb and pull it out. Are there any chances that some corrosion in the contact surfaces is making it difficult to remove it?

Just an idea.

Luiz (Brazil)

Re: 71B HP-IL module

*Message #3 Posted by **Howard Owen** on 26 Oct 2005, 10:27 p.m.,*
in response to message #1 by Tomas Fischer

I've had an easy time with some, and a harder time with others. Normally, grasping the computer with both hands and pressing outward on the module with both thumbs is enough to get it started. You can apply significant force that way without marring anything. If that doesn't work, try applying the force at slight angles to "straight out." If the module is slightly out of line in the slides, that could help. One machine I tried to remove an HP-IL module from resisted all such attempts. I finally pried it out, without marring the back, by starting with a thin exacto blade and exerting very little force on the seam farthest from the back of the calculator. I then moved up to a larger knife blade when the space permitted. This one got the module loose to the point I could slide it out all the way. The key to avoiding damage was going slow and applying minimum force.

Hope that helps, and good luck!

Re: 71B HP-IL module

*Message #4 Posted by **Raymond Del Tondo** on 27 Oct 2005, 8:28 a.m.,*
in response to message #1 by Tomas Fischer

Hi,

you could also remove one of the front port covers near the IL module,
then you'll see the other end of the HP-IL module.
Then VERY CAREFULLY apply a thin screwdriver or similar to

push the IL module out of it's position.
If you're careful enough you won't even have a scratch on the module housing.
However it may be safer to remove the batteries first,
since the screwdriver will go very near along the sensitive pcb.

HTH

Raymond

Re: 71B HP-IL module

*Message #5 Posted by **Tomas Fischer** on 27 Oct 2005, 10:33 a.m.,*
in response to message #1 by Tomas Fischer

Thank you all for your help. The module is OUT without any scratches. I use small flat screwdriver to carefully pry the module left and right. This managed to pull it out far enough to fit larger screwdriver between the module and 71B. Then applying fair amount of pressure finally popped the module out.
Thanks again
Tomas

External power for 41C

*Message #1 Posted by **ivan** on 26 Oct 2005, 7:04 p.m.*

I notice that there are 2 little round gold contacts behind a small knockout in the side of the battery compartment.

Did HP make an external power supply that would contect to those contacts?

I have a 41C - with card reader, math pac and 2 memory modules.

Thanks

Re: External power for 41C

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 26 Oct 2005, 9:10 p.m.,*
in response to message #1 by ivan

Hi, Ivan;

I´ve been using these external connections for many years, and for me, they are a very good way to power the HP41 with external batteries. At the time I decided to use it, I cut a small piece of unused PCB and simply removed a small track of copper from the middle, to separate the poles. Then I checked the polarity and built (soldered) a small bar with standard terminals, the same used in computer mainboards. To connect the external battery pack I use a regular connector that is normally used as POWER LED (three connecting points, only two used) in standard IBM_PC compatible computers.

I'll add a picture later with polarity marks.

In time: halfnuts have the small holes, but their keyboard PCB has no matching connection points. To use these connectors in a halfnut it would be necessary to add thin, isolated connecting pads aligned with the holes.

Cheers.

Luiz (Brasil)

If you look at the HP-41C circuit diagram in the service manual (hp41srvc.pdf), pages 4-17/4-18 you will see that the J4 connector (one of the gold ball connectors) is Vbat (the other is GND).

This is not the same as the Vin connection to the +ve contact in the battery assembly.

Vin is connected to Vbat via the CR5 diode, while the J4 connector is sent directly to the Vbat bus line.

What this means is that if you use Vin and get the battery polarity wrong, you will simply lose the contents of the memory, if you use the J4 connector, you can kiss your 41 good bye.

Many years ago I asked a friend at the local HP repair shop about using the J4 - J5 connectors and he told me to stay away from them (giving me the above explanation). He also gave me a photocopy of the service manual so that I could check the schematics. Really nice guy.

*Message #4 Posted by **db (Martinez, Ca.)** on 27 Oct 2005, 12:17 a.m.,*
in response to message #1 by ivan

I read that HP intended to market an adapter to plug into that port but never did. That's why the gold contacts (but not the holes) disappeared on the later models. We will all regret that decision the day that N cells become unavailable. It's a good thing that Luiz has found a fix. That should hold us till "dilithium crystals" come online.

Re: External power for 41C

*Message #5 Posted by **donald wallace** on 27 Oct 2005, 2:22 a.m.,*
in response to message #4 by db (Martinez, Ca.)

Hi all.

This may not interest anyone but...(at least it's on topic...)

Vassilis is indeed correct in that the ext. power connector goes straight to the V+ regulator input. Wrong polarity will kill the calc.

I got a really messed up 41c recently... For experimental purposes I soldered wires direct to the pads on the keyboard pcb after removing the gold balls and springs in my 1980 vintage 41c from Ebay. The wires exit the holes where the springs and balls were. I run the darn thing from a battery pack of four AA cells. I am going to fix the hopelessly destroyed battery connector with conductive silver from a pen applicator when I feel the need. THERE'S a HOT TIP for d-i-y repairers for free...

A switching regulator using a reference zener diode does step-up regulation and one could tweak this diode down a little to ease interfacing to 5 volt logic if one desired. The factory part is a 6.2 volt zener and I should imagine (given the incredibly generous margins in the hardware) that a 5.1 volt diode would be fine.

The BAT annunciator kicks in at about 3.6 volts on the battery buss.

When picking up from ebay/wherever you may occasionally encounter really messed up machines. Suggestion: If you get them, just use a current limited power supply to check them first as that way you won't cook the switching regulator. Some of these machines come with all sorts of highly conductive contamination in addition to the usual corrosion problems.

If running the machine from a low current supply with say a clonix module or very certainly a card reader but even a timer module (remember I have very old c/cv stuff, guys) you will find the ssytem won't boot due to voltage dips on the power buss due to transient current demands in the tens of milliamp range or

hundreds for the card reader. You may get very strange displays from it though...

Anyone interested in more info please feel free to write me.

I don't think the N cells will disappear because they are use for a lot more things than just calculators.

Re: External power for 41C

*Message #8 Posted by **Ricardo Guerreiro** on 27 Oct 2005, 11:48 a.m.,*
in response to message #1 by ivan

Hi:

I am using my hp-41c with 4 aa batteries. I just made an adaptor (using a block of wood), to replace the case of the batteries. So, i took the original case of the batteries, put my adaptor on the back hole , and now I am powering my Hp-41c using the battery contacts, so I am still keeping the protection against incorrect polarity. I create some contacts in my wood adaptor using some small springs and some small pieces of metal. The cables between the adaptor and the 4 aa batteries are going trough the lateral hole of the calculator.

Comparing X with Indirect Y

*Message #1 Posted by **James F. Chumbley** on 26 Oct 2005, 5:47 p.m.*

In the HP-41CX Manual, Volume II, Page 305, under the topic "Comparisons," is given a list of six functions (X < NN?, X<=NN?, X=NN?, [X not= NN?], X>=NN?, X>NN?) which are said to compare the contents of the X register with the contents of the register whose name is contained in the Y register (Y Indirect).

The part I don't understand is this statement of HP's: Place the address from 00 through 319 OR THE SINGLE LETTER X, Y, Z, T, OR L in the Y register.

How do you put either an X, Y, Z, T or L into the Y register?

Thanks, Jim Chumbley

Re: Comparing X with Indirect Y

*Message #2 Posted by **donald wallace** on 26 Oct 2005, 6:06 p.m.,*
in response to message #1 by James F. Chumbley

Hi,

You just put the letter in "alpha" register and execute an "ASTO Y".

e.g. using Z into Y using decimal point as a stack operator signifier:

[ALPHA]Z [ASTO][.]Y {command executes} [ALPHA] {leave ALPHA mode}

DW

Re: Comparing X with Indirect Y

*Message #3 Posted by **James F. Chumbley** on 26 Oct 2005, 6:51 p.m.,*

*Message #5 Posted by **Geir Isene** on 27 Oct 2005, 12:08 a.m.,*
in response to message #2 by donald wallace

Interestingly pointless to put "X" or "Y" in the Y-register...

Re: Comparing X with Indirect Y

*Message #6 Posted by **donald wallace** on 27 Oct 2005, 1:40 a.m.,*
in response to message #5 by Geir Isene

Hi Geir,

How are you doin'?

x<>x is one way to get a time burning "no-op". ;-)

(used in the "old days" to check machine speed or burn up some time in a loop which didn't mess with data...)

Re: Comparing X with Indirect Y

*Message #7 Posted by **Karl Schneider** on 27 Oct 2005, 3:38 a.m.,*
in response to message #1 by James F. Chumbley

Jim --

Your question revealed to me an error in the 41CX Vol. II manual, as well as several insights about the functionality:

Functionality:

- All HP-41 models lack the X>=0? and X>=Y? comparisons, for some strange reason. This deficiency was rectified in the HP-42S. (Even the HP-15C offered X>=Y? as TEST 9.)
- The indirect comparisons you mention on p. 305 are specific to the HP-41CX, listed in the "-CX EXT FCN" catalog. They were not offered in the HP-41C or HP-41CV, and were not carried over to the HP-42S.

Error:

- The five color-coded function names under "Comparing X with Y" on p. 304 of the Vol. II HP-41CX manual (Aug 1983 version) lists the nonexistent X>=Y? in place of the actually-present X/=Y?

-- KS

Re: Comparing X with Indirect Y

*Message #8 Posted by **Doug Wilder** on 28 Oct 2005, 3:17 a.m.,*
in response to message #7 by Karl Schneider

Those missing relational functions can be had by use of another byte in program:

for X>=0? one can use

X<=0? X=0? doiftrueline

and for X>=Y?

X<=Y? X=Y? doiftrueline

Best

>
> and for X>=Y?
>
> X<=Y? X=Y? doiftrueline

Yes -- this is an elegant solution. Maybe the designers of the HP-41 knew about it, and figured that it wasn't a big problem for users to program one additional instruction in order to effect a certain conditional test. However, I'm still a bit surprised that X>=0? and X>=Y? were omitted in the first place, even if lack of ROM space was an issue.

During the same era, the HP-10C and HP-12C had only two of the twelve possible conditional tests; the HP-34C, HP-11C, and HP-16C had eight; only the HP-15C had all twelve. With GOTO-dependent logic, it's a hassle to synthesize conditonal tests in this manner.

Re: Synthesizing X>=0? and X>=Y?

*Message #10 Posted by **Doug Wilder** on 31 Oct 2005, 1:48 a.m.,*
in response to message #9 by Karl Schneider

Hi Karl,

I'm agreeing except i believe the problem was that the byte table was full!

There are five lines for single byte functions, 80 of them, and no extras. Probably this is because the 41 has an Alpha register and needs a few slots to support it (CLA,PROMPT,AVIEW,AON,AOFF,ASHF).

A couple of functions would have had to be left out, SDEV and MEAN possibly? I never use these yet the financial types around here would want E^X-1 and LN1+X left out i suppose.

There are a couple of spares (AF&B0) yet they are in the two byte area of the byte table (would make the mainframe flowchart look all weird).

Best

HP41 battery contacts

*Message #1 Posted by **Bob** on 26 Oct 2005, 3:59 p.m.*

I hesitate to ask this question, but since I am not offering anything for sale, here goes. If I should post it in the classifieds let me know.

Theoretically, if I found several original battery contacts for the 41C series, what are they worth ? Let's say that most are new and a couple look very lightly used.

My question is, someone has asked what I might want for one. (Theirs are shot, like mine was, er, is.) I have no idea, and checked EBay for comparison but did not find anything there.

I thought I would ask here. If someone knows or has a way to find out, please post.

MLDL 2000

*Message #1 Posted by **GE** on 26 Oct 2005, 12:11 p.m.*

Recently Meindert Kuipers sent me a copy of his incredible brainchild, the MLDL 2000. At the risk of wasting bandwidth, I MUST say that this is an incredible achievement. Mine is not assembled yet, but the feature set is impressing, as well as the component quality (everything is screaming "nicely engineered"). Also very impressing is the packaging, very friendly communication with the author, and many surprise goodies included in the package. M.Kuipers is willing to run the extra mile to please us amateurs. This is a work of the brain, and the heart. A big thank you, I'm eager to see this marvel at work.

MLDL2064.

Re: MLDL 2000

*Message #2 Posted by **Matthias Wehrli** on 26 Oct 2005, 3:03 p.m.,*
in response to message #1 by GE

I share GE´s word. My MLDL2001 has arrived today, after 2 days of shipping!!! Although I do not understand all it´s preferences yet, I´m fascinated of the technique and the fast communication with the PC.

Maybe there is also another german speaking user of the MLDL2000 which I can share words.... feel free to contact me.

Matthias

Re: MLDL 2000

*Message #3 Posted by **Vieira, L.C. (Brazil)** on 26 Oct 2005, 4:23 p.m.,*
in response to message #1 by GE

Hi, all;

I'm waiting for my MLDL2000 as well, and I have been reading many stuff about the HP41 guts. I was fortunate enough having the MoHPC DVD and one particular book seems to be the very starting point: **HP41 internals**. There are some very interesting, practical examples there on how to create custom add-ons for the HP41.

to Matthias: verzeihen Sie, bitte; Ich spreche kein Deutsch d8^((but I am studying, be sure...d8^), but I'd greatly appreciate knowing about what others are doing and their developments with Meindert´s MLDL2000. I do not know if it sounds too much enthusiastic for now, but what about a decicated MLDL2000 developers forum? I am not suggesting out of MoHPC boundaries, this could be discussed with Dave Hicks, but I'd like to contribute and read about others achievements with MLDL2000. As an example, we can mention the impressive HP41Z, the complex calculator by Ángel Martin, with the best example of documented ROM code (I do not know if Ángel used an MLDL2000 to develop teh HP41Z, and if he mentioned this fact I honestly do not remember, but this is one of the first custom ROM I'll download and delve into studying). I'd vote for keeping his coding form as a standard coding, unless better suggestions arise. Please, these are just suggestions of mine in order to concentrate this sort of activity in one chunk of space, wherever it could be. Any ideas

about this?

Well, I'm just waiting to have mine in hands. Also, I'm contacting Diego Diaz and I'm definitely going to add a Nov32 to my 41 family soon...

Who, at HP HQ, in his own conscience, would dare dreaming of predicting that in 2005 would exist new designs and final, brand new products for a ~30 Y.O. calculator? Daring and true! I am not sure, but I remember that at the time I had my HP41C, I used to see guys playing with the first Apple Computers, and IBM PC were running D.O.S. 3.3®... Sounds strange, ahn?

Cheers.

Luiz (Brasil)

Edited: 26 Oct 2005, 4:27 p.m.

Wrong reference in my last post (was: MLDL 2000)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 26 Oct 2005, 4:45 p.m.,*
in response to message #3 by Vieira, L.C. (Brazil)

Hi, all;

sorry, I wrongly wrote **HP41 internals** (have no idea where this came from) instead of **HP-41 MCode for Beginners**, by Ken Emmery.

Cheers.

Luiz

Re: MLDL 2000

*Message #5 Posted by **Meindert Kuipers** on 27 Oct 2005, 3:45 a.m.,*
in response to message #3 by Vieira, L.C. (Brazil)

Guys, many thanks for your kind words. I have always wanted to make my own MLDL since I started a professional career and the HP41 was phased out by HP. With todays technology this is now possible and I am more than happy to share the results with all the good friends who like the '41. Being able to edit individual words in an HP41 ROM from my PC is a dream come true .....

I am considering to setup a mailing list for the MLDL2000 users (with google groups for example), but this Forum is a better place. Even those without an MLDL2000 or Clonix/NoVRAM can contribute with their knowledge. Now that most MLDL2000 units are shipped and a new production batch of Diego's tool available we can expect more and more questions (and answers) about mcode and the HP41 internals. It is better to share this with the whole community and make our activities visible rather than create our own little corner on the web.

And Matthias, I do speak German, Skype is a good way to communicate if you want.

Meindert

hp-49G+ better manuals

*Message #1 Posted by **Miguel** on 26 Oct 2005, 8:25 a.m.*

Dear friends,

I´m an old HP calculator user (since 1972) but novice on RPL language. The HP manuals do not explain every function and don't have a good index containing all them.

Do anyone know somewhere I could download explanation for all functions?

Thanks a lot!

Miguel

*Message #6 Posted by **Ed Look** on 26 Oct 2005, 3:40 p.m.,*
in response to message #5 by Miguel

I don't know if they are cheap or easily available anymore, but the 48G series manual and advanced users' guide was pretty good at presenting RPL. Even I learned how to use it. I'm not a programmer or systems guy or engineer.

I think www.calcpro.com might still have them.

Re: hp-49G+ better manuals

*Message #7 Posted by **I, Claudius** on 26 Oct 2005, 9:11 p.m.,*
in response to message #6 by Ed Look

Eric Rechlin, webmaster of the program archive at www.hpcalc.org, has copies of the 48 manual. I don't know offhand where to find an AUR, I guard mine like gold. Supplemental books, which often have lots of programs, are the best way to learn to program. Change the code of a program you like, play with it, have it crash, correct it, and you're on your way.

Re: hp-49G+ better manuals

*Message #8 Posted by **Ed Look** on 27 Oct 2005, 11:04 p.m.,*
in response to message #7 by I, Claudius

You know, if it is totally unavailable new... even used, then it's a safe guess the AUR is completely out of print. While HP might still own the copyrights pertaining to it, it may be allowable to make an online version available, say here, or even on HP's calculator site.

Re: hp-49G+ better manuals

*Message #9 Posted by **James M. Prange (Michigan)** on 27 Oct 2005, 2:34 a.m.,*
in response to message #1 by Miguel

I found Bill Wickes's "Insights" series particularly valuable. Scanned PDFs of them are available on the Museum DVD/CD set. To be sure, they're written for earlier models, but still very helpful.

The newsgroup comp.sys.hp48 is very helpful with any RPL questions; these days, most discussions are about

the 49 series.

thermal printer HP

*Message #1 Posted by **Pierre Dutoit** on 26 Oct 2005, 7:04 a.m.*

Where can I get my HP thermal printer 82162A repaired in Europe? Thanks

Re: thermal printer HP

*Message #2 Posted by **Doug Wilder** on 28 Oct 2005, 3:57 a.m.,*
in response to message #1 by Pierre Dutoit

Never heard of someone fixing these anywhere. I suppose that if someone does it, he will be here.

Recently my 82162A blew it's print head (dropping one element), and because i have a few old 43A's, i used the print head from one of those and it worked!

Only thing about removing the thermal print element: use a cut down credit card to release the connector (slide it in next to it), i distroyed one before figuring that out. The manual (43A) don't explain it; just says "use tool #322393-BF2 to remove the cable".

Best

Re: thermal printer HP

*Message #3 Posted by **Tony Duell** on 29 Oct 2005, 6:25 a.m.,*
in response to message #2 by Doug Wilder

I have taken the 82162 apart (there's a schematic on the HPCC CD-ROM, and on the web IIRC), I've never had to repair one.

To remove those flexiprints (also used in the Topcats), I find a couple of HP41-size magnetic cards slipped under the contacts will do it. The correct tool, I believe, was a thin metal blade, I have thought about trimming down one of the stainless steel plastering tools from the local DIY shop. If I do that, I'll let you know how I get on.

What is the the problem with your printer? I can give you some initial tests to do. I would be happy to look at it if you can get it to an HPCC meeting in London (that is Europe, but probably not a lot of use for you ;-)).

Re: thermal printer HP

*Message #4 Posted by **David Smith** on 29 Oct 2005, 10:44 a.m.,*
in response to message #3 by Tony Duell

I use a piece of thin (10 mil) stainless steel spring stock. A piece of Venitian blind slat also works great. I have it trimmed to that you can do a printhead on one end or a HP97 card reader on the other. Most plastering tools are at least 20 mils thick... too fat for this application.

Re: thermal printer HP

*Message #5 Posted by **Pierre Dutoit** on 31 Oct 2005, 10:32 a.m.,*
in response to message #3 by Tony Duell

Thank you Tony. I got battery pack adapted to the printer from Piscera Salvaore, Italy (4 GP rechargeable NiCd 1.2V 2000 mA). I have a good original HP charger 82066A 220V~ 3VA 8V~. Once the batteries charged, the printer has difficulty to work. Sometimes paper advance works, sometimes not. I live in Montreuil, close to Paris. Pierre

HP35 HP45 battery charger. Random display values.

*Message #1 Posted by **Charles Esson** on 26 Oct 2005, 12:53 a.m.*

People have posted with the problem before but none of the replies deals with the issue properly. I'm posting this in the hope it goes into the archives and the next searcher finds the solution faster than I did.

The problem is cause by the electrolytic capacitor (400uf 15volts) found in the battery charger drying out.

Replace the capacitor and the problem goes away.

Thanks for a great site.

Charles Esson

Re: HP35 HP45 battery charger. Random display values.

*Message #2 Posted by **Arnaud Amiel** on 26 Oct 2005, 3:56 a.m.,*

I have several chargers, does this mean I should make a rota so that they are each used in turn? Does this only affect Classics chargers?

Thanks,

Arnaud

Re: HP35 HP45 battery charger. Random display values.

*Message #3 Posted by **Bernhard** on 26 Oct 2005, 2:19 p.m.,*
in response to message #2 by Arnaud Amiel

Drying out is the fate of every non-hermetically sealed electrolytic capacitor. Some last 20 years, some 30 years, but their death is inevitable.

My experience with Classics chargers is that if they are used, and the seal of the electrolytic capacitor is already a bit deteriorated, then the heat produced by the charger will quickly finish them.

Dying electrolytic capacitors can make quite a mess. Best mode to handle this problem is perhaps to exchange them against new ones as a routine precaution, even if the charger still appears to work.

Woodstock chargers contain only a transformer and no electrolytic capacitors.

Regards, Bernhard

Re: HP35 HP45 battery charger. Random display values.

*Message #4 Posted by **Thomas Radtke** on 26 Oct 2005, 10:13 a.m.,*

in response to message #1 by Charles Esson

Thanks for bringing up this topic. I was asking (at multiple places) a question regarding an old C= calc and irregularities when charging it. Thanks to the good people on the usenet, I was able to resurrect it by exchanging the capacitors.

Thomas

28S Question

*Message #1 Posted by **Samuel Heddle** on 25 Oct 2005, 7:27 p.m.*

Does the presence of any crack or fracture near the battery casing of an HP28S indicate a serious problem in development? Thanks

Re: 28S Question

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 26 Oct 2005, 2:03 a.m.,*
in response to message #1 by Samuel Heddle

Hi, Samuel;

I had an HP28S that was stolen about two years ago. Thanks to a fortunate moment, I was able to buy another one in about a month after acceptin g the fact it was stolen. The one I had was bought new in the box, and I took as much care as possible when changing batteries. The battery door was perfect, no cracks, no visible sign of wearing. The one I have have now seems to be carefully taken as well, but the compartment door seems a little 'flaky', if this is the correct word. I'm affraid it will crack due to the surface aspect.

So, it seems to me that, sometimes, the HP28S battery door suffers from a weak, somehow thin design. I should say that the design itself is not the main issue, instead the material used. I'd go for the newer design seen in the HP19BII, with a big door and a safer interlock.

Cheers.

Luiz (it seems to me I did not answer to your question...)

```

For accessing the diskette drive from the HP-71B, it needs to be the loop controller. Since you cannot have two loop controllers and the software on the 41C assumes that *it* is the loop controller, you have to remove the 41C from the loop. Then you can save files on the 9114B from your 71B. You can then reconnect the 41C and either place the 71B in slave mode or (even better) remove it from the loop.

Read the HP-IL Interface Owner's Manual, file 82401a.pdf in the MoHPC DVD.

Hi, and for saving my programs in the 71B, what should I do, as there is one week I'm trying to do this?

Thanks! Artur

Re: And for save one HP 41CX program into HP71B ?

*Message #7 Posted by **J-F Garnier** on 26 Oct 2005, 3:21 p.m.,*
in response to message #6 by Artur - Brasil

Hi,

You need the X-I/O module and use the INP/OUTP functions. You may have to write a few lines of code on the HP-71B side.

Without X-I/O, you will just be able to print programs (with PRP) to the HP-71B as text files, but not reload them back into the 41C.

J-F

41 vs 67 card reading

*Message #1 Posted by **Jim Creybohm** on 25 Oct 2005, 1:13 p.m.*

Hi all.

I have a 67 that has cards that are original, but may be in need of re-recording due to age related de-gaussing. I don't yet know if this is the case, but we are speaking somewhat hypothetically here. The reason I ask is that my 67 card reader is not quite functioning yet, but my 41 is working perfectly (when the batteries are fresh).

So, my question is:

As long as no non-native(i.e., 41 specific) functions are used, can a 41 card reader **record** the cards so that a 67 can read them? I would think that this would be the reverse to what most users do.

Appreciate any and all responses.

Re: 41 vs 67 card reading

*Message #2 Posted by **Etienne Victoria** on 25 Oct 2005, 2:14 p.m.,*
in response to message #1 by Jim Creybohm

Hi Jim,

Unfortunately : No.

Cards written by an Hp-41C won't be readable neither an Hp-67 nor an Hp-97 even if you only use the 67' compatibility instructions.

The only way to achieve your goal is to read/rewrite them in an 67/97.

Sorry!

Etienne

Re: 41 vs 67 card reading

*Message #3 Posted by **Jim Creybohm** on 25 Oct 2005, 3:30 p.m.,*
in response to message #2 by Etienne Victoria

Thank you Etienne.

I am not sure of what additional header information might get written, but I was afraid that this was the case.

Ah well. Time to get the magnifying glasses and soldering iron out...

Re: 41 vs 67 card reading

*Message #4 Posted by **Etienne Victoria** on 25 Oct 2005, 3:46 p.m.,*
in response to message #3 by Jim Creybohm

... and your wife's hair dryer to remove the calc back sticker properly!

IMNSHO, the 67 is one of the last well constructed calcs of PCE (Pre-Crap Era).

Real screws, soldered components, no petty money saving with "pressure connectors"....

Good luck, I'm sure you'll succeed!! Keep us updated!

Cheers from France!

Etienne

Re: 41 vs 67 card reading

*Message #5 Posted by **Bernhard** on 25 Oct 2005, 4:31 p.m.,*
in response to message #4 by Etienne Victoria

Hi Jim,

I've ***never*** seen a HP65 or HP67 card fail due to "degaussing". Neither I have never seen any diskette fail due to "degaussing".

And believe me - I have a lot. Including 25 year old disks and even older cards. I do even have 30 year old 8" disks that still read OK.

The physics behind this is hysteresis of the magnetic particles. It takes a certain field strength to flip them. And even if one particle is flipped by thermodynamic accident, zillions of other particles still wait for the same strong field to be flipped. The HD (high density) media used in the PC even takes much much higher fields to flip. They are almost impossible to erase of write to in old Apple II disk drives, for instance, because the magnetic flux of those drives is too low to flip them.

The bottom line is, in magnetic media there is no effect like "degaussing" - if this means flipping of magnetic domains just by ageing without strong external magnetic fields.

What really happens is that the softening agents gass out and the magnetic particles start to separate from the plastic carrier. This is not "degaussing" but "drop out".

I do have some HP65 / HP67 cards that won't read anymore, but under magnification, it is possible to see those damage spots where the magnetic particles have gone away.

The only cure is to COPY you old cards to newer cards. But do do try to "refresh" the old cards - it is futile - as long as they read OK and don't fall apart mechanically (as described above) they are good. And if they start to lose magnetic coating, well, the they are finished and no attempt to write on them will fix that.

best regards, Bernhard

Re: 41 vs 67 card reading

*Message #6 Posted by **Crawl** on 25 Oct 2005, 5:45 p.m.,*
in response to message #5 by Bernhard

> Quote:
>
> They are almost impossible to erase of write to in old Apple II disk drives, for instance, because the magnetic flux of those drives is too low to flip them.

I'm confused about what you're saying here. However, in my experience, I have lost data on Apple II floppies. I mistakenly put them on top of the disk drive... The next time I tried them, every one was wiped.

I don't think it was a coincidence. They were fine for years (when stored far from the drive), then they all died at once. And I know of a separate occasion where the same thing happened.

Of course, this was due to the field created by the drive, not by random thermal flipping over time.

Re: 41 vs 67 card reading

*Message #7 Posted by **Jim Creybohm** on 25 Oct 2005, 6:48 p.m.,*
in response to message #6 by Crawl

OK, I inadvertently used the phrase "degaussing", when perhaps it appears I should have said "degassing" or drop out. I had a middle aged moment when I wrote that because I knew it wasn't right, but I knew that someone would correct me on it and then give me an answer - and thanks BTW. This continues to be one of the reasons that I hang around this board.

But, I still don't understand, all I did was hold them on the refridgerator door with little flower magnets.....

(really, truly, honestly, kidding)

Re: 41 vs 67 card reading

*Message #8 Posted by **bernhard** on 25 Oct 2005, 7:43 p.m.,*
in response to message #6 by Crawl

I don't think it was magnetic fields from the Apple II disc drive. It would not work if it own fields would corrupt data in a disk that's inserted. Same reasoning most likely applies to disks placed on top of the drive. Maybe your diskettes catched some field from the degaussing coil of a nearby color monitor, who knows. All Apple II disc drive I know of have a metal case which should shield mag fields anyway. But in any case, none of my properly stored diskettes ever have lost data except those who decompose mechanically (literally). I do have some candidates which I don't dare to read until I have the hardware ready to capture them forever - and of course, the head will only step ONCE through the disc.

Regards, Bernhard

Re: 41 vs 67 card reading

*Message #9 Posted by **David Smith** on 26 Oct 2005, 10:18 a.m.,*
in response to message #8 by bernhard

The sure fire way of erasing an Apple diskette was to put it on the Graphics Tablet.

As the bit densities of modern hard drives has increased we are approaching the limit

where random thermal noise and adjacent bit flux coupling can cause bits to flip. Curses Dr. Boltzman...

HP-49G+ - Where is the "last x" key / function?

*Message #1 Posted by **Miguel** on 25 Oct 2005, 12:49 p.m.*

Dear friends, I´ve just got a new 49G+ and realized it does not have the "last x" key / function. Is it true?

Regards, Miguel

Re: HP-49G+ - Where is the "last x" key / function?

*Message #2 Posted by **Jeff O.** on 25 Oct 2005, 1:09 p.m.,*
in response to message #1 by Miguel

You are correct, there is no "Last X" key or function that replicates or closely mimics that function of the RPN calculators. You have to write a program to mimic the functionality. I have one which I am pretty sure was posted here (or perhaps at comp.sy.hp48) by James M. Prange. If you search the archives, you might find more information. The program I use is as follows:

```
<< DEPTH -> n
  << LASTARG DEPTH n - DUP -> s
    << ROLLD s 1 - DROPN DUP DROP
    >>
  >>
>>
```

Type the above in, and save to a variable named “LAST x”. The program seems to work fine.

Re: HP-49G+ - Where is the "last x" key / function?

*Message #3 Posted by **Miguel** on 25 Oct 2005, 1:20 p.m.,*
in response to message #2 by Jeff O.

Dear Jeff, thank you very much for the program. I´ll try it right now! Regards, Miguel

Re: HP-49G+ - Where is the "last x" key / function?

*Message #4 Posted by **Miguel** on 25 Oct 2005, 1:31 p.m.,*
in response to message #2 by Jeff O.

Dear Jeff, I was thinking a litle more: why not use the "lastarg" function only, assigned to some key?

Regards, Miguel

Re: HP-49G+ - Where is the "last x" key / function?

*Message #5 Posted by **Gene** on 25 Oct 2005, 2:08 p.m.,*
in response to message #4 by Miguel

LastARG returns the last arguments! That may be more than just one.

Example: In approximate mode, 25 ENTER 6 divide.

LASTX would return a "6".

LASTARG returns 25 to the second level of the stack and 6 to the first level of the stack.

Re: HP-49G+ - Where is the "last x" key / function?

*Message #6 Posted by **Miguel** on 25 Oct 2005, 2:21 p.m.,*
in response to message #5 by Gene

Got it! Thank you! The program works, but for "33 alpha 'a1' sto>" , it returns a1.

Regards, Miguel

Re: HP-49G+ - Where is the "last x" key / function?

*Message #7 Posted by **Gene** on 25 Oct 2005, 3:57 p.m.,*
in response to message #6 by Miguel

That's because when you do ... 'a1' STORE the 'a1' is the last argument in the first level of the stack.

It is the "lastx".

Gene

Re: HP-49G+ - Where is the "last x" key / function?

*Message #8 Posted by **James M. Prange (Michigan)** on 25 Oct 2005, 11:00 p.m.,*
in response to message #2 by Jeff O.

Thanks for the credit, Jeff. I may well have posted that program somewhere, sometime, but it's not my preferred version. My only problem with it is in the case of an empty last arguments buffer, it errors out instead of returning 0.

Here are three programs that handle the empty last arguments buffer case better.

Note that in the programs, I'm using exact integers (type 28) for the 49 series. "Real" numbers (type 0) also work, but of course the results from the BYTES command will be different.

This first one both returns 0. (as a real number) to the stack and leaves it in the buffer if the last arguments buffer was empty.

```
%%HP: T(3)A(D)F(.);
@ Download (or enter) in exact mode on 49 series.
@ Results from the BYTES command:
@ 49 series checksum: # 2C67h
@ 49 series size:         69.
@ 48 series checksum: # ECA9h
@ 48 series size:          69
\<<
  DEPTH \-> d
  \<<
    LASTARG DEPTH d -
    IF
      DUP
    THEN
      DUP2 2 + ROLLD DROPN
    END
```

```
    DUP DROP
  \>>
\>>
```

This second one returns 0. (as a real number) to the stack and leaves the buffer empty if the last arguments buffer was empty:

```
%%HP: T(3)A(D)F(.);
@ Download (or enter) in exact mode on 49 series.
@ Results from the BYTES command:
@ 49 series checksum: # B2D2h
@ 49 series size:        90.5
@ 48 series checksum:  # F5Dh
@ 48 series size:        94.5
\<<
  DEPTH \-> d
  \<< LASTARG DEPTH d -
    IF
      DUP
    THEN
      DUP2 2 + ROLLD DROPN DUP DROP
    ELSE
      -55 DUP SF CF
    END
  \>>
\>>
```

This last one doesn't return anything to the stack and leaves the buffer empty if the last arguments buffer was empty.

```
%%HP: T(3)A(D)F(.);
@ Download (or enter) in exact mode on 49 series.
@ Results from the BYTES command:
@ 49 series checksum: # 8C85h
@ 49 series size:         93.
@ 48 series checksum: # D527h
@ 48 series size:          97
\<<
  DEPTH \-> d
  \<< LASTARG DEPTH d -
    IF
      DUP
    THEN
      DUP2 2 + ROLLD DROPN DUP DROP
    ELSE
      DROP -55 DUP SF CF
    END
  \>>
\>>
```

If system flag -55 is set (No last args), then these programs will error out.

Note that after some commands that don't take any arguments, like CLEAR, DROP, and MEM, these programs don't return what was the last object in level 1.

In the 49 series, LASTARG is invoked by LeftShift ANS (over the ENTER key), at least in RPN mode. I've never used ALG mode, so won't offer any advice for that.

For similar programs for the 28 series, change LASTARG to LAST, and (in the last two programs) change -55 DUP SF CF to 31 DUP CF SF.

Even in the 48 and 49 series, LAST can be used as a synonym for LASTARG, to maintain backwards compatibility.

Personally, I prefer the first program that I've posted here best.

Just out of curiosity, which one do users of "Real RPN" models prefer?

Regards,

James

NiMh 500mah 'N' Cell Source

*Message #1 Posted by **Donald Leonard** on 25 Oct 2005, 12:32 p.m.*

For those of you looking for the highest capacity 'N' cells, here is a source I just found:

[url]http://www.tnccustomproducts.com[/url]

Click on the "Battery" heading on the left. They also have the highest quality 'N' cell to 'AA' battery adapter for charging I have found. I own two different adapter types, and these (my third) are by far the best. They are worth buying even if you already have a set.

These batteries took 3 full hours to charge on my 5 hr. NiMh fast charger that came with my 2300mah 'AA' battery set. I expect that it will take about 1 1./2 - to 2 hrs. with subsequent charges.

PLEASE - no more warnings about corrosion doom from you experts out there. It has been published over and over. I personally don't buy the claim. ALL BATTERIES can cause corrosion - even the highly touted alkaline. NO BATTERIES should be stored in the '41. This 'heads-up' is not for the nay sayers - it is ment for those who ARE trying to find the highest capacity and best quality 'N' cells available. These will do nicely.

Donald

They have all of **one** battery left in stock.

Re: NiMh 500mah 'N' Cell Source

*Message #4 Posted by **Massimo Gnerucci (Italy)** on 26 Oct 2005, 2:23 a.m.,*
in response to message #3 by sjthomas

When I first visited the site I only found **two** batteries available so I wrote to Chris and asked if he

planned to have new cells coming.
He reset the amount to 17 and when I left there were 5 available to the next one... seems like someone came before you.

Sorry,
Massimo

*Message #6 Posted by **Donald Leonard** on 27 Oct 2005, 4:29 a.m.,*
in response to message #5 by sjthomas

As of the moment of this post, he is out of stock. His business is about 5 miles down the road from my home, so I personally visited his machine shop. Chris is a great guy and has a complete machine shop. Part of the reason many of his items are currently out of stock is because he has heavy orders from Japan and other countries, and he has to fill those orders/committments before he has stock for his web site. Currently he has flashlite shipments schedualled for Feb. 2006.

Since his NiMh 'N' cell stock was reduced to two (2) when I picked up my order and many of his other products were 'out of stock', I asked him if he was discontinuing his flashlite and battery line. He assured me that he was not - that he had just placed a rush order for more batteries, that these are still the highest capacity 'N' cells he could find. Nothing bigger is known.

I have been using them only for about 4 days, so my experience with them is limited - but I would not have concerns about their availability. They will be in stock soon.

Donald, since you live near him, you could probably make a few bucks by buying his stock and them re-selling them with reasonable shipping rates.

Re: NiMh 500mah 'N' Cell Source

*Message #10 Posted by **Donald Leonard** on 3 Nov 2005, 2:16 a.m.,*
in response to message #9 by sjthomas

Unfortunately my recent experience with shipping costs have demonstrated that most companies get a volume discount of up to 50% on shipping. As an example, I recently purchased a piece of electronics equipment with a shipping cost to me of $19. I had to pay $38 return shipping with the same shipper to ship the equipment back due to defective operation.

Believe me - I'm better off as an information source than a hardware source.

There are now 17 'N' cells in stock.

Donald

Spice for HP48GX and HP48SX

*Message #1 Posted by **David Houston Thompson** on 24 Oct 2005, 9:43 p.m.*

Hello, I am a novice user of HP's RPL calculators. I was amazed to discover that "cards" are available to perform Spice simulations on the 48GX and 48SX. Has anyone any experience of simulating an electronic circuit on an HP? As a regular user of Spice, I'd love to read how an HP calculator manages to perform such simulations. Best wishes.

Re: Spice for HP48GX and HP48SX

A Worthwhile Strategy?

*Message #1 Posted by **I, Claudius** on 24 Oct 2005, 9:41 p.m.*

This article from CNN's tech page discusses consumers filing a class action lawsuit over defects in the new iPod:

http://www.cnn.com/2005/TECH/ptech/10/24/apple.nano.reut/index.html

On this and other calculator newsgroups, there have been many complaints regarding HP calcs on a variety of issues, from nonfunctioning hardware to buggy software to questionable design.

The question I have is this: if enough people (HP calc users) were so disgusted with the current state of affairs, would it be a worthwhile strategy to consider some sort of class action lawsuit? The idea would not be to try 'break' HP or collect a zillion bucks, but rather to simply get their attention that they need to produce machines that loyal users want and that these machines function as they should.

I'm not a legal type of any kind. Indeed, I personally hate lawyers, especially the new breed of sleazy, ambulance-chasing types who continually broadcast ads starting with "Have you been injured in an accident?" And that's why I've posted this question, those of you who may have legal experience can possibly give some good insight here.

Edited: 24 Oct 2005, 9:43 p.m.

Re: A Worthwhile Strategy?

*Message #2 Posted by **Mike Sebastian** on 24 Oct 2005, 10:53 p.m.,*
in response to message #1 by I, Claudius

I would expect that such a suit would result in the dissolution of the calculator business unit. Many large businesses are very risk adverse when it comes to potential litigation. The only conclusion that HP would arrive at after being threatened by a class action suit surrounding their calculators is that the potential liability is not worth the minuscule income they derive from calculators.

(BTW, there are several attorneys which frequent this forum.)

Re: A Worthwhile Strategy?

*Message #3 Posted by **Howard Owen** on 24 Oct 2005, 11:20 p.m.,*
in response to message #1 by I, Claudius

I doubt a single lawsuit, even a class action, would cause HP to abandon the calculator market. But IANACE (I Am Not A Corporate Executive 8) so what do I know?

But I do think that Apple iPods and HP calculators are different in several respects. iPods are hot sellers that have lifted Apple from the brink of bankruptcy to a solidly profitible company. (Macintoshes? They make computers? 8) Calculators are a niche market for HP. A related point: Apple is a smaller company that has a large share of their success tied up in iPods. HP's got to care about calculators .. a little, at least. Apple's installed base and annual sales in units and dollars probably surpasses similar metrics for HPs's calculators.

Given all that, which company do you suppose will react to a consumer class action lawsuit by actually fixing the problems?

Edited: 25 Oct 2005, 12:22 a.m.

Re: A Worthwhile Strategy?

*Message #4 Posted by **donald wallace** on 25 Oct 2005, 8:49 a.m.,*
in response to message #3 by Howard Owen

Hi all.

Yeah that ipod thing really surprised me. Someone was asleep at the wheel and then tried to bluff it through. I feel that people would want to sue Apple Corps.... donkey ;-)

HP, though... Come on. Poor HP. Great company. Very old and solid. Very hard to continuously adapt in a world with markets that change so fast. In a new field as the product life cycle runs, profit margins start big and end up ephemeral.

Always...

Also, firmware bugs in computing equipment are a real pain but it's really hard to make a computing item totally bug free as we all know (you guys perhaps better than me, I am no programmer). Same with hardware bugs. That was why micros were invented, you could modify the design in firmware rather than at the logic gate level.

I notice a lot of you guys are quite cranky at this or that model but there is also some genuine personal preference stuff in there too, which of course is totally cool. We are all "selfish human beings" who want it just our own way, me included.

I can't help wonder whether the bugs are as bad as you all say. I guess they must be. I am confused about what modern machine I would buy (I'd like a graphing calc to muck around with but don't need one).

I have made my peace that the golden era of Western Civilization is well and truly gone and from now on I'll be happy to dodge the H5N1, fallout from petrol/oil prices going nuts and the odd cyclone...

I for one have much more serious, pressing issues to worry about rather than calculators.

But I sure enjoy seeing people helping each other chewing the fat and poling their resources. What an interesting forum. Thanks guys.

DW

in response to message #4 by donald wallace

Hi Don,

you are right. More important things to do than to put lawsuits on companies that make mediocre and / or faulty products. Pay with peanuts, work with monkeys. Today's silicon technology places zillions of transistors to the fingertips of everyone, for a bargain price, but alas, most of those "everyone" people are VHDL wielding monkeys, and not true adepts of that obscure art of real chip design.

H5N1 is of no concern as it only kills people in close contact with those birds. The dreaded killer

disease which might become the next plague (after politicians and lawyers - and will get them, too) may occur by fusing H5N1 with human flu viruses.

Anyone who is no lawyer nor politician may contact me for my ten cents on which medication might help. Tamiflu most likely won't.

regards, Bernhard

*Message #6 Posted by **Ben Salinas** on 25 Oct 2005, 11:20 a.m.,*
in response to message #1 by I, Claudius

I too would have to say that this would simply knock HP out of the calculator business. Why would HP keep making calculators when they make (relatively) little money on them, and get sued.

The ipod one (might) work because everyone knows about ipods, and everyone expects certain things of them.

I wouldn't bite the hand that feeds me, even if it is feeding me bad food. Especially if it is the only hand I can eat from.

The problem with this is, if the lawsuit won't collect a zillion bucks, then no law firm is going to take it on contigency. That means the class would have to bear the cost of the litigation. And as I think many HP calculator fans would (rightly) avoid suing HP, that would leave a small pool of folks on the hook for .1*Zillion bucks in litigation costs.

41c weak display segments

*Message #1 Posted by **Hal** on 24 Oct 2005, 7:00 p.m.*

Hi folks. Is there a known issue with a 41c which causes display segments to be weak / faint. Mostly the upper segments on the left side. Thanks for any ideas, Hal

*Message #3 Posted by **Tony Duell** on 25 Oct 2005, 6:28 a.m.,*
in response to message #2 by deleted

What is the problem (other than very static-sensitive chips) in dismantling the display module of a fullnut?

You would have to desolder the connections from the keyboard PCB, then unclip the clamps (top and bottom) and seperate the hybrid board from the display. Yes, I've read the service manual, and I know HP say you can't re-use the zebra strips, but having repaired many other similar display modules, I don't understand why you can't (now that replacements are unobtainable) you can't clean everything with propan-2-ol and put it back together.

Weak segments does not sound like the driver mis-initialisation problem. It sounds like a bad contact in the zebra strip, or a defective driver (I have had that on both a halfnut 41 and on a 16C).

I've got half a mind to pull a display from a mangled 41CV apart and put it together just to prove it can be done and see what the real problems (if any) are.

Re: 41c weak display segments

*Message #5 Posted by **Tony Duell** on 25 Oct 2005, 8:02 a.m.,*
in response to message #4 by deleted

I have had a lot of success in repairing missing segments _in other devices_ by cleaning the zebrastrips. One trivial example. I saw a second-hand Fluke 85 multimeter in a second-hand tool shop. When I tried it, some of the segments were weak, but there. _In the shop_ (with the seller's permission, of course), I openied it up, unclipped the display, cleaned the edges of the display on my shirt (!), put it back, and it was fine. I did not attempt to clean the PCB there and then, as I was worried about static damage to the IC. The seller took \pounds 10.00 off the price anyway, since there was a possible fault...

I always intended to clean it properly when it failed again. But it's been fine for well over a year.

I cured one Voyager (original series, with the seperate logic module on the flexible PCB) by taking it apart and cleaning it. Another one did have a defective R2D2 chip, though.

I will admit I have never taken a fullnut HP41 display, but unless I can find good evidence that taking one apart _will_ ruin it, I would give it a go if other cures failed. Yes, I'd power down for a long time first (this is documented in Wlodek's book which every HP41 hacker should have read). Yes, I'd resolder the connections to the keyboard PCB (I've had dry joints there). But I would not assume that taking the unit apart would necessarily ruin it.

After all, the HP manual does give an official procedure for doing this. And my experience of all service manuals is that they err on the side of caution. I've had considerable success with dismantling and repairing modules that the official manuals (HP and others) regarded as not field repairable. On the other hand, there are some things that are almost impossible to repair in the field (hard disk HDAs and dot matrix printheads being examples of things I wouldn't take apart unless there was really no alternative, and with the assumption that I probably wouldn't get them going again).

Which brings me back to my original question. If there is something odd about this display where dismantling it will do serious damage, then I would like to know about it. If there is nothing known like that, I probably will take an old 41CV (the most common 41 in my experience, I have a few with cracked posts, etc) apart and see how I get on. I'll report here anything that I find out.

Re: 41c weak display segments

*Message #6 Posted by **David Smith** on 25 Oct 2005, 10:55 a.m.,*
in response to message #5 by Tony Duell

I would not take apart a 41C display unless I aboslutey had to. It can definitely make things worse. It can also make things better. The Zebra strips can easily be damaged by removing and reinstalling them. I have over a dozen 41C display modules. I'd say it helped 1/3 of the time, made no difference 1/3 of the time, and make things worse 1/3 of the time. If the display module is definitely bad, you have nothing much to lose by opening it, you just don't want to open a good module.

Of the ones that got worse, one failure mode that seems to occur is the zebra strips seem to have a light adhesive on one edge that helps keep them in place. This adhesive does not restick and after a while the replaced strips shift and the contacts flake out again. Cleaning the strips with alcohol can spread the adhesive residue over the contact areas and also lead to intermittent contacts.

As far as weak segments, I'd first try cleaning everything with 91%+ isopropyl alcohol. Start with the back of the LCD and the LCD contacts. Keep it off the display window or it will leave white stains behind (which can be poslished off). Also clean the back of the keyboard and the CPU board and the CPU contacts.

Hi definition images of the HP-19C decimal dot

*Message #1 Posted by **Vassilis Prevelakis** on 24 Oct 2005, 6:48 p.m.*

The HP-19C and HP-10 had a unique feature, the decimal dots in their displays had the HP logo on them. Given the size of the dot and its high contrast wrt the background, taking a good picture of the dot has so far proven to be almost impossible.

Now ji (of http://www.tla.org) has taken some excellent pictures showing the dot, and also revealing that the display had another dot allowing it to display a : (why?)

note that the letters "hp" and the circle appear dark red because of red light reflected from the display window. The actual emitting surface appears pinkish, as it has saturated the sensor.

hp49g+ help with infrared printer

*Message #1 Posted by **Josef** on 24 Oct 2005, 10:43 a.m.*

Can anybody please tell me if it is possible to use the old infrared printer 82240A with the hp49g+? I have tried the PRLCD and PRSTC command which always worked on my hp48s but nothing happened. The manual isn't very comprehensive about this topic. Or is there some trick to enable the infrared port?

PS. Since I have upgraded to the new ROM I haven't had any missed keystrokes or keybounces, so it seems to work at last (My serial No. is CNA 434... in case anybody is interested).

Re: hp49g+ help with infrared printer

*Message #2 Posted by **Arnaud Amiel** on 24 Oct 2005, 10:58 a.m.,*
in response to message #1 by Josef

You need a slightly more modern 82240B which can be had (with a bit of luck)for peanuts on ebay. This would cope with backward compatibility of older calcs. Otherwise, other brands of printer work (even better?) with the 49g+ but I can't find the list now.

Arnaud

Re: hp49g+ help with infrared printer

*Message #3 Posted by **Tom Scott** on 24 Oct 2005, 7:54 p.m.,*
in response to message #2 by Arnaud Amiel

Also, the printer has to be very close to the 49G+ (within 5 cm I think) because the IR range is much less than for the 48.

Tom

Re: hp49g+ help with infrared printer

*Message #4 Posted by **James M. Prange (Michigan)** on 25 Oct 2005, 3:01 a.m.,*
in response to message #2 by Arnaud Amiel

Actually, the 82240A printer does work with the 49g+ (and 48 series), but uses a different character set (Roman 8 only) for the non-ASCII characters. Executing OLDPRT changes the remapping string in the reserved variable PRTPAR so that much of the 48 (and 49) series' (modified) ECMA 94 character set prints correctly with the 82240A's Roman 8 character set. To change back to printing to an 82240B, edit PRTPAR to make an empty remapping string, that is, simply "".

The 82240B has two character sets; Roman 8 is the default, so older calculators work just fine with it. With the 48 series, 49g+, and 48gII, any printing via IR starts out by sending an escape string to switch the printer to using the ECMA 94 character set; this escape sequence is simply ignored by the older 82240A.

As for getting the 49g+ to print to the 82240A or 82240B, make sure system flag -34 is clear (Print via

IR), and, as Tom said, make sure the calculator is very close to the printer.

Also, when transferring or printing via IrDA, don't have the 82240 within range, as some IrDA signals will be misinterpreted by the 82240A/B printer.

Note that for "screen captures" with HPComm or Conn4x, flag -34 must be set (Print via wire).

The flags on the calculator are a little confusing (especially for printing), so here's a table.

flag -33	flag -34	transfer	print
clear (Transfer via wire)	clear (Print via IR)	via wire	via RedEye IR
clear (Transfer via wire)	set (Print via wire)	via wire	via wire
set (Transfer via IR)	clear (Print via IR)	via SIR or IrDA	via RedEye IR
set (Transfer via IR)	set (Print via wire)	via SIR or IrDA	via SIR or IrDA

For the 48 series or 49G, "via wire" means RS-232 compatible signals. For the 48gII, a level shifter (built-in to the cable and powered by a real RS-232 device) is used to make the signal RS-232 compatible. For the 49g+, "via wire" means via USB.

Of course, the 49G doesn't have the IR hardware, so attempting to transfer or print via IR won't work with it.

"RedEye" is for printing to the 82240A/B.

"SIR" (Serial IR) is the format used for transferring via IR between 48 series; not available in the 49 series (including the 48gII). Note that the 48 series can also print in this format.

"IrDA" is used on the 49g+ and 48gII for transfers with or printing to any other IrDA capable device; not available on the 48 series.

Any "via wire" printing (even if it's really SIR or IrDA) respects the character translation mode set in IOPAR, except that LineFeed characters are translated to the line termination string (by default, CarriageReturn LineFeed) set in PRTPAR.

Regards,
James

in response to message #4 by James M. Prange (Michigan)

P.S.

Some printers from Martel Instruments are supposed to work anywhere that the 82240A/B works.

Of course, with the 49g+ and 48gII, any IrDA capable printer **should** work.

Note that although the 49g+ has a USB port, it's a "device" port, not a "host" port, so won't work with any other USB "device", including a USB printer.

Regards,
James

Thank you James and Arnaud for your quick and encyclopedic answer. I think everything has been covered although I haven't understood everything in the first run. But I will make a printout and put it into my manual for further reference.

Anyway it worked at the first try with the combination of the changed flag and the lower distance. So a lot of thanks again to both of you. This has really saved my day.

Josef

HP33S simulator/emulator

*Message #1 Posted by **Valentin Albillo** on 24 Oct 2005, 6:46 a.m.*

Hi all,

I'm thinking of porting a number of my programs of old for such classics as the HP-67/97, HP-34C, and such to the new HP33S, with the idea of making them available in the new, easily affordable HP33S for people who might need them. I'm thinking in such programs as linear systems of up to 7 linear equations in 7 unknowns, tridiagonal systems up to 12x12, matrix operations, complex operations, non-linear systems, etc, etc, in the fields of applied mathematics and engineering, perhaps even including the odd game or two.

This idea crossed my mind after reading the HP33S manual (PDF format) and having a look at HP's pathetic 3x3 system solving example. Imagine, including such a *puny* program for a 32Kb machine, when you could do a 7x7 system in a 224-byte HP-67/97 ! I know it's intended to be an example, but even so ...

Then I thought that it could probably help a number of people interested in those fields if I were to make versions of said programs of mine for the HP33S, which people can take to exams, and while I'm at it, I could also write some articles for publication in Datafile or posting here, maybe even a 'challenge' or two.

The problem is, I do not have an HP33S in my HP collection nor do I intend to get one in the near future. But if any of you would be kind enough to provide me with an HP33S simulator/emulator, that would do, as long as it *faithfully* emulates/simulates the workings of an HP33S, so I could test my programs on it and rest assured that they'd also run in an actual, physical HP33S. I wouldn't want to publish/post untested software, that would be utterly unacceptable to me.

Can anyone help ? :-)

Best regards from V.

I can send you a 33S in the flesh. Emulating it is tricky--there are bugs to be emulated!

Re: HP33S simulator/emulator

*Message #3 Posted by **Valentin Albillo** on 24 Oct 2005, 11:14 a.m.,*
in response to message #2 by bill platt

Hi, Bill:

Bill Posted: *"I can send you a 33S in the flesh. Emulating it is tricky--there are bugs to be emulated! "*

Why, thank you, you're extremely kind. But it's not a matter of money, though the HP33S is more than twice as costly here in Spain than in the US, say.

It's more that I completely disapprove of HP's decisions regarding this product, from its manufacture (KinHPo) to its keyboard to its size to its style to its LCD to its memory management to ... to everything, actually.

So, while I'm perfectly glad to try and help others by making available potentially useful programs for it, I definitely do not want to spend a single cent on it (doing that would be tantamount to me endorsing this HP product, which I absolutely don't), nor would I want other generous people like yourself spending their hard-earned money on my behalf.

Thanks anyway, perhaps some kind MoHP contributor will offer a suitable simulator/emulator.

Best regards from V.

in response to message #3 by Valentin Albillo

Valentin, I believe you should try the 33s. I find it is actually a very useful replacement to the 32sii. The more I use it the more I like it. I wouldn't swap my 33s for a 41C or CV, maybe CX and not sure...

Arnaud

Re: HP33S simulator/emulator

*Message #5 Posted by **Gene** on 24 Oct 2005, 4:07 p.m.,*
in response to message #4 by Arnaud Amiel

Valentin, making your programs available for the 33S would increase its relative value, thereby potentially increasing sales of the machine you so dislike.

Isn't that inconsistent? :-)

(And, unless you did huge amounts of very bad programming, I don't think there is a hope of doing a 7x7 on the 33S...and, wasn't a 5x5 the largest ever done on the HP67/97? anyone know?)

Re: HP33S simulator/emulator

*Message #6 Posted by **Namir** on 24 Oct 2005, 4:40 p.m.,*
in response to message #5 by Gene

Gene,

I agree with you. The number of registers in the HP33s limit the number of linear equations. Systems of 7x7 are not doable on the 33s.

Namir

*Message #8 Posted by **Marcus von Cube, Germany** on 25 Oct 2005, 6:37 a.m.,*
in response to message #7 by Valentin Albillo

Hi Valentin,

> Quote:
>
> Namir wrote in a previous post:
>
> The number of registers in the HP33s limit the number of linear equations. Systems of 7x7 are not doable on the 33s.

A quick look in the manual (page 13-21) reveals what can be indirectly addressed using (i):

```
If i contains:      Then (i) will address:
---------------------------------------
+/- 1               variable A or label A
. . .
+/- 26              variable Z or label Z
+/- 27              variable i
+/- 28              n register
+/- 29              SIGMA x register
+/- 30              SIGMA y register
+/- 31              SIGMA x^2 register
+/- 32              SIGMA y^2 register
+/- 33              SIGMA xy register
<=-34, >=+C34 or 0  error: INVALID (i)
---------------------------------------
```

So there are 32 registers plus the index. That might be enough for a 5x5 system.

*Message #12 Posted by **.** on 25 Oct 2005, 6:39 a.m.,*
in response to message #7 by Valentin Albillo

If it were possible, I'd be very interested in seeing the result.

I have to ask: why would anyone want to solve a 7 by 7 system of equations on a lowly HP33s? This type of task is far more suited to a PC or a graphical calculator. Entering over 50 numbers on a HP33s sounds painful.

Thanks,

.

Re: HP33S simulator/emulator

*Message #13 Posted by **Crawl** on 25 Oct 2005, 11:53 a.m.,*
in response to message #6 by Namir

I just mused over the subject for a couple of seconds, and have thought that you don't really need 49 + 7 registers for a 7x7 equation, IF you solve it in real time as you enter the terms.

This is how I'd sketch it out.

First, you enter the first row (7 + 1 terms). You need to store all of these terms.

Say the first two rows are like this

```
[a1 a2 a3 a4 a5 a6 a7] = [b1]
[c1 c2 c3 c4 c5 c6 c7] = [b2]
```

You would not actually store the numbers c1, c2, etc. Instead, you store c2 -a2/c1, c3 - a3/c1, etc. In the process, you've also saved one register! C1 would not be needed to be stored at all; it has become zero.

So, you could use Gaussian elimination as you go. In each row, you save one additional register.

Ultimately, you'd only need to store 35 terms. And you if reduce the first term of each row to one, by dividing by the first term in each row, you'd only need to store 28 terms.

So, yes, it can be done.

Pivoting would be a tricky issue, I'd guess, without having thought about it much.

*Message #14 Posted by **Valentin Albillo** on 25 Oct 2005, 4:25 a.m.,*
in response to message #5 by Gene

Hi, Gene:

Gene posted: *"Valentin, making your programs available for the 33S would increase its relative value, thereby potentially increasing sales of the machine you so dislike. Isn't that inconsistent? :-)"*

I'm not doing it for the 33S or for HP, I'm doing it for the people. It is my understanding that this 33S is the only RPN model allowed in certain very important US exams, so lots of people use it for that purpose and would welcome having good math & engineering software for it. That's why I wanted to contribute to the community by porting such potentially useful software of mine to this machine. My HP-71B, HP-15C, 41C, 34C, or whatever-C programs will be of no use to people taking said exams, right ?

"(And, unless you did huge amounts of very bad programming, I don't think there is a hope of doing a 7x7 on the 33S..."[and, wasn't a 5x5 the largest ever done on the HP67/97? anyone know?)"

Yes, I know. You're wrong. But who am I to discuss with such geniuses as you and Namir (*"Systems of 7x7 are not doable on the 33s"*) ? ;-)

Thanks for your interest in my plea and

Best regards from V.

I guess you are referring to the NCEES exams. No-one needs to solve a 7 by 7 system of equations on this exam. These type of questions are just not asked. When the new policy was introduced I remember reading *many* comments from test-takers, saying while a HP48 is handy, a normal scientific calculator is all that is required.

While it may be an interesting programming challenge, I doubt such a solver will help anyone.

Re: HP33S simulator/emulator

Hi, .

. posted:*"I guess you are referring to the NCEES exams. No-one needs to solve a 7 by 7 system of equations on this exam."*

C'mon, ., it's just an example of what's available, man ! Would you like me to post a comprehensive list when I can't even get a #@$&!# 33S simulator/emulator to begin with ? :-)

Anyway, perhaps it was a bad idea on my part, noone seems too interested so it may be the case I'm trying to cater for a nonexistent need. Seemed a fair use for good programs written for classic machines at the time, though.

Nah, forget it.

Best regards from V.

Re: HP33S simulator/emulator

Message #17 Posted by **.** *on 25 Oct 2005, 8:22 a.m.,*
in response to message #16 by Valentin Albillo

Hi,

Please don't let me discourage you! I just picked on the the 7x7 equation solver as an example. I'm sure many other old programs could have a new life on the HP33s. I just don't think porting a 7x7 solver is worth the effort :-)

.

Re: Valentin A. - HP33S simulator/emulator

Message #18 Posted by **ECL** *on 25 Oct 2005, 3:19 p.m.,*
in response to message #16 by Valentin Albillo

Valentin,

I support your effort to provide/port useful programs for the 33s. While I agree with you that it should not have been released in the form it was, it is the only RPN calc that you can walk into a store and replace new. More importantly, it is, like you said the only programmable/RPN permitted on the NCEES exams.

Personally, I enjoy the challenge of a programming task that may/may not be possible! :) For example, I found a x-section moment of inertia for composite sections developed for the 49g+. By composite, I mean a cross-section composed of varying rectangular segments (imbalanced I-beam for example).

I really enjoyed writing my own version for my 33s. It provided the same ouput: X-sect I, and Ybar (y-centroid). And it fit in my pocket :)

It is too bad that I can go into Fry's Electronics and still find *NEW* HP 12C AND 12CPlatinum, yet they can't re-release a run of the classic 32sii w/ more memory. Especially after reading the solicitation for a 12C Anniversary wish-list on this board! How many versions of the 12C are required?

I have finally accepted using my 33s after my 32sii expired this summer. I have already suffered on a numerical methods exam due to poorly visible display and hitting the corner of buttons at the same time.

Regards, ECL

Largest matrix program for the 67/97 - Mr. 5x5 from 1978?

*Message #19 Posted by **Gene** on 25 Oct 2005, 4:02 p.m.,*
in response to message #14 by Valentin Albillo

Gene: "[and, wasn't a 5x5 the largest ever done on the HP67/97? anyone know?)"

Valentin: Yes, I know. You're wrong.

Gene again: The program I know of for the HP67/97 that solved the largest matrix work was the "Mr. 5x5" from late 1978 in the PPC Journal.

I do not believe it is possible to solve a problem of higher order on that calculator, unless one puts restrictions on the size of the elements. There are only 26 registers available on the 67/97 and the 5x5 system takes up 25 of them of course.

Valentin, prove me wrong! :-) I'd love to see a link to a 67/97 program allowing the solution of a 7x7 matrix (and, I'll be amazed (once again) if it allows for 7-10 digit values).

Gene

Re: Largest matrix program for the 67/97 - Mr. 5x5 from 1978?

*Message #20 Posted by **Crawl** on 25 Oct 2005, 9:04 p.m.,*
in response to message #19 by Gene

I explained this above. You do not need to store all 7 x 7 elements and use Cramer's rule (by solving with the determinate) once all the terms have been entered. You can store the problem as

```
[1 a1 a2 a3 a4 a5 a6 ] [x1]       [y1]
[0 1  b1 b2 b3 b4 b5 ] [x2]       [y2]
[0 0   1 c1 c2 c3 c4 ] [x3]       [y3]
[0 0   0  1 d1 d2 d3 ] [x4]   =   [y4]
[0 0   0  0  1 e1 e2 ] [x5]       [y5]
[0 0   0  0  0  1 f1 ] [x6]       [y6]
[0 0   0  0  0  0  1 ] [x7]       [y7]
```

(My best attempt to write a matrix expression with text)

This is the Gaussian elimation method, and it actually takes fewer computation steps than Cramer's rule, too. It also can be solved as you go (eg, the third line can be reduced to [0 0 1 c1 c2 c3 c4] before you even enter the fourth line), which saves on registers.

x1, x2, etc. is the solution column and doesn't need to be stored. You could write a program that leaves it up to the user to write those down when they're output. So, if you count, you'll see you only need to store 29 elements.

Depending on how you implement the method exactly, you might need a couple of other variables (eg., loop counters for entering the terms), and you'll have to store the first term in each row until all the terms have been entered and divided by that term.

But the HP33s's 32 registers should be enough wiggle room for that. (Plus, of course, you have the four elements of the stack, too, and towards the end you won't need to store variables - like in the above example, y7 - long before they're output to the user)

With 25 registers, could a 7x7 be done? Without working through the nitty-gritty details, I don't know, but it should be enough to do a 6 x 6 system, which only needs 21 stored terms.

If the code is general enough (if it uses loops and indirect addressing), I'd guess the code for a 6x6 system could be ported to a calculator with more registers to solve a 7x7 (or however large) system.

Re: Largest matrix program for the 67/97 - Mr. 5x5 from 1978?

*Message #21 Posted by **Gene Wright** on 26 Oct 2005, 12:06 a.m.,*
in response to message #20 by Crawl

It would be an interesting test. :-)

As I recall, the "Mr. 5x5" did a determinant and inverse.

And, I'm pretty certain the technique you describe was known to the PPC'ers at the time, so I'm not sure why certain methods were chosen.

Gene

Re: Largest matrix program for the 67/97 - Mr. 5x5 from 1978?

*Message #22 Posted by **Valentin Albillo** on 26 Oct 2005, 4:25 a.m.,*
in response to message #19 by Gene

Hi again, Gene:

Gene posted: *"Prove me wrong"*

Let's make this clear, Gene. I'm stating that I *do* have a 7x7-system solving program for the HP-67, which works, which is a real programming marvel to make it work in 224 bytes/26 registers, and which was written not by me but by my best friend Fernando del Rey, 20 or so years ago. It uses no magnetic card tricks or such, just very clever programming techniques.

So, unless you're plainly stating that I'm lying, I'd expect you to take my word for it, because I'm neither writing down the 200-step listing by hand for you to see, nor can provide a link to it, because web links still do not reach old paper listings.

Further, I'd expect a little more respect from you in the future, as I think I've never done or said anything to you that turned out to be intentionally false or misleading. In other words, if I say that something can be done, you can bet your house that it *can* be done, and more, I've done it or seen it with my very own eyes or else I wouldn't be claiming it's possible.

Thanks for your comments and best regards from V.

Hi, Werner:

Werner posted: *"Now, Valentin - without keying in the 200 lines, you might just lift the tip of the veil and tell us *how* it is done? Curiosity killed the cat, and it's killing me, too."*

There's no mystery at all, Werner, Crawl's post explained the proper way to do it. Fernando had the key idea at the time, which I think it's brilliant indeed, and cleverly managed to make it all work in as little as 224 steps or less for the program itself, and using just 26 registers. He didn't use magnetic cards to store intermediate values but simply diagonalized on the fly.

The whole process was suitably fast and smooth, and amazingly, there were still enough program steps available to include both an output routine and an error correction routine as well ! :-)

This program is ideal for the 33S, because of its extremely reduced number of addressable registers (but still larger than the 26 the HP-67 had), better instruction set (RCL arithmetic, for instance) and vastly superior speed when compared to the HP-67. So I thought it would make a worthwhile contribution to port it to this ungainly machine. But ... :-(Thanks for your interest and

Best regards from V.

*Message #32 Posted by **Ron Ross** on 26 Oct 2005, 11:36 a.m.,*
in response to message #31 by Valentin Albillo

I just took the last NCEES exam offered this spring. And while I would have loved to use my Hp48G as I had earlier when I took the FE exam (mostly for the great units features, solver with long variable names, ease of overall use and for the real horsepower to tackls some of the advanced math ie Fourier analasys), nothing tougher than a 3x3 (or a 4x4 with an obvious reduction eq) was needed for any of the problems with 3 unknowns. If you needed a 4x4 or greater, you were racing away from the real solution.

I think the posters who gave you negative feedback where just trying to save you wasted effort on a needless exercise. That you can do this was not questioned by me if you triangalize the matrix. In reality though a circuit with complex arguements with a 3x3 is probably impossible to handle with the lowly Hp33s (unless you state otherwise B^O).

Since the Hp33s is 3-5 times better than any other calculator allowed to use on these exams, they ain't going to be any super complex number crunching challenges. It just so happens to be my calculator at work (so I can leave my more valuable 42s at home, I suspect you would agree with THAT philosphy).

I appreciated your offer, and I do prefer to crunch my numbers with a calculator over a PC, but when I have to do any complex sophisticated number crunching, I do it with a PC for a record as well as the ease and save the results with the

projects.

*Message #33 Posted by **Valentin Albillo** on 26 Oct 2005, 12:05 p.m.,*
in response to message #32 by Ron Ross

Hi, Ron:

Ron posted:

"I think the posters who gave you negative feedback where just trying to save you wasted effort on a needless exercise."

However, let me insist in that solving 7x7 systems was but an example. The nucleus of the thing is, I have many, many quite decent programs for the HP-67/97, HP-34C, and HP-41C, among others, and I thought it would be a real contribution to port some of these to the 33S, where they'd run perfectly Ok, and which seems to be in need of them.

"In reality though a circuit with complex arguements with a 3x3 is probably impossible to handle with the lowly Hp33s (unless you state otherwise B^O)."

Would you believe that the 0.5 Kb HP-15C can manage circuits requiring a 4x4 complex system (as demonstrated in its HP-supplied manuals) ? It's somewhat laborious but can be done.

"It just so happens to be my calculator at work (so I can leave my more valuable 42s at home, I suspect you would agree with THAT philosphy)."

Certainly, certainly. Though for work I do use a SHARP PC-1350, suitably programmed. It's not that I don't care for it, but rather that I own six or seven, mostly mint, and so I don't mind (carefully) using one of the not-so-mint as a workhorse.

Thanks for your input and

Best regards from V.

*Message #34 Posted by **Valentin Albillo** on 27 Oct 2005, 4:41 a.m.,*
in response to message #30 by Werner

Hi again, Werner:

The 7x7 sytem solution's program for the HP-67/97 is still unpublished, as far as I recall, but it actually was submitted at the time (1980) to PPC Journal, for publication.

However, despite it being a real breakthrough in its genre (only 5x5 program were available at the time, without the recourse to multiple uses of magnetic cards to store intermediate results), Richard Nelson declined to publish it, because he was more keen in articles for the just recently introduced HP41C, which more or less meant the death of interest in 67/97-related materials.

That being so, Fernando and I decided to rewrite it for the new machine, taking advantage of its advanced features such as labeled prompts, multiple registers for indirect addressing and such, but essentially implementing the very same 'diagonalize on the fly' technique used in the 67/97 program.

We submitted the resulting article to PPC Journal and this time it got published, so you can find it there. Details:

```
   Linear Equations - Gaussian Elimination

       by Valentin Albillo (4747) & Fernando del Rey (4995)

   PPC Calculator Journal - V7 N5 Page 63 & 64 - June 1980
```

This 'on the fly' technique allowed for an enormous increase in the size of the systems which could be solved. For instance:

```
    HP-41C + 1 memory module:  up to 14x14
           + 2      id.     :  up to 20x20
           + 4      id.     :  up to 30x30
```

Frankly, being able to solve a 30x30 system of equations on a small, handheld calculator back in 1980 was absolutely amazing, and most people we showed it to wouldn't believe their eyes ! :-)

By the way, the unpublished 67/97 program is exactly 221 steps long, uses all 26 registers and all labels except D and E, and contrary to what I said, it doesn't include an output routine, you simply recall each unknown from its own register (R1-R7). For the record, the instructions look like this:

```
_____________________________________________________________________
         /
|
        /                   7x7 System of linear equations
|
       /
|
       |    Start     Restart
/
       |     row        row          Reset
/
|_____[A]________[B]___________[C]_____________________________________/

Instructions:

Start:  [C]

Enter equations:

a11 [A] a12 [R/S], ..., b1 [R/S]
a21 [A] a22 [R/S], ..., b2 [R/S]
          ...
a71 [A] a72 [R/S], ..., b7 [R/S]

Recall solution:

RCL 1 -> x1
RCL 2 -> x2
   ...
RCL 7 -> x7

Example:
```

```
  x1 +  x2 +  x3 +  x4 +  x5 +  x6 +  x7 = 7
 2x1 - 3x2 +  x3 -  x4 +  x5 -  x6 +  x7 = 0
 5x1 + 5x2 - 4x3 - 6x4 + 2x5 - 3x6 +  x7 = 0
 4x1 + 3x2 + 2x3 +  x4 - 5x5 -  x6 - 4x7 = 0
 3x1              + 3x4 - 3x5 - 2x6 -  x7 = 0
 2x1 - 6x2 -14x3 + 2x4 + 6x5 + 5x6 + 5x7 = 0
  x1 -  x2 -  x3 -  x4 -  x5 -  x6 + 4x7 = 0

Exact solution: x1 = x2 = x3 = x4 = x5 = x6 = x7 = 1

Computed solution:  x1 = 1 +24e
                    x2 = 1 -  e
                    x3 = 1 +10e
                    x4 = 1 + 8e  where e = 1E-9
                    x5 = 1 - 6e
                    x6 = 1 +16e
                    x7 = 1 +  e
```

That's all. Best regards from V.

Re: HP33S simulator/emulator

*Message #35 Posted by **Valentin Albillo** on 25 Oct 2005, 4:16 a.m.,*
in response to message #4 by Arnaud Amiel

Hi, Arnaud:

Arnaud posted: *"Valentin, I believe you should try the 33s. I find it is actually a very useful replacement to the 32sii."*

Thanks for the advice, Arnaud, but I own several HP32S and HP32SII, which offer approximately the same programming paradigm as the 33S, in a far better form factor and ergonomics. And, as for programming power and usability, any of my vintage SHARPs can run rings around the 33S, also with much better ergonomics.

My point is, I see this 33S being used a lot as it's the one RPN model allowed in some important US exams, and having a lot of software potentially useful to such users, which could be converted to this model, I was willing to help and contribute by doing so. But I'm not in the least interested in the machine, I dislike its physical incarnation profoundly (*not* it's programming paradigm, mind you: it's the same as the 32S/32SII, which I like), so that's why I'm aiming for an emulator/simulator.

Thanks again for your interest and

Best regards from V.

You're in luck, there's a 34C simulator that runs on Windows. It's not very polished yet, and there isn't yet a user-friendly installer. (Someone contributed one, but I haven't yet got it merged into the distribution.) Anyhow, you can find it here.

I hope to make a new release available by the end of the year. In addition to the Windows installer, it should look nicer thanks to a lot of work by Maciej Bartiosak, who also had created a port for MacOS.

*Message #38 Posted by **Ed Look** on 28 Oct 2005, 4:10 p.m.,*
in response to message #37 by Eric Smith

Hey Mr. Smith!

Thanks for the tip!

My real 34C is now in a 25C case (don't ask... long story) zipped up and in my drawer. If I have my home PC on, chances are there'll be a 34C on the screen!

Wow. I thought it was just a program that works like a 34C; well it has the skin, too!

But truth to tell, the 32SII and 33S both are "34C-like" enough that I've come to be fond of both, more the former than the latter, but the latter is gaining, mainly because of slightly larger programming space and the inclusion of a constants table. Boy; if the 34C had a constants table back then... it might have saved more program lines and even more time!

Re: HP33S simulator/emulator

*Message #39 Posted by **Ed Look** on 5 Nov 2005, 12:24 a.m.,*
in response to message #38 by Ed Look

Ah, I've installed HP's HP33S simulator/emulator on my PC.

It *DOES* work like a real 33S, except you can use mouse clicks to your keypressing...

... and no, the equation for the volume of a solid cylinder is not preloaded in this emulator! ;)

Now, I don't like using Powerpoint or PC based projections for lectures, but I will, for HP's sake, try to keep the 33S emulator on the computer screen especially when students are wont to come by.

I'll use it when I'm too lazy to actually reach over and whip out the real 33S, which is more often than I had admitted to myself.

Too bad it doesn't have a "right hand rule" preprogrammed key! LOL!!

*Message #40 Posted by **Richard Z.** on 5 Nov 2005, 4:49 p.m.,*
in response to message #39 by Ed Look

I have thought about trying out HP's 33s simulator, but I didn't think I could justify putting it in my syllabus that my students must purchase that specific calculator. Especially when they are being required to purchase a TI-84 for earlier courses, and the local Walmart isn't re-stocking any HPs.

Apparently HP wants to see that syllabus statement before they'll let you have the simulator. How strong of a statement did you have to word?

RZ

Re: HP33S simulator/emulator

*Message #41 Posted by **Ed Look** on 6 Nov 2005, 3:24 p.m.,*
in response to message #40 by Richard Z.

I do not put calculator requirements on my syllabi, especially for advanced courses; for the introductory levels, I just say get *ANY* scientific, not necessarily a programmable calculator.

I merely posted for HP on their site a text copy of the real syllabus which dos not mention a calculator requirement. (At the level of that particular course, if they don't have the common sense to obtain a workable machine... well, there's the first F of the season...) Some of the advanced students may even use Maple, Origin, etc. on a PC.

But as I said here and they did not ask, I do not like using prepared-in-advance Powerpoint files on a laptop with a projector, nor slides with an overhead.

What I do, however, is to let them watch me crank through a calculation with my 33S or sometimes, 48G. If they ask, and some do, I show them and let them try my 33S and try to explain RPN and its glories of elegance and ease (they don't get to touch the 48G). So far, in many years, only a few takers. The world is sold on algebraic TIs. The more budget conscious go for the no-names in drug stores or discount shops (in which places you can get a fairly fully featured scientific, even if not programmable, for around $10 USD).

But the few who have taken an interest in RPN HP calcs are among the better and more serious students.

There you go: RPN makes you smarter!

I'm guessing it's the exceptional student that is curious enough to get the 33s demo. And of of these, only the very exceptional ones who are willing to adopt what seems to most a contrarian approach to calculation. So the choice of RPN may reflect a "think outside the box" type of intellectual curiosity that would map well onto exceptional math ability.

But I'm also guessing you have other exceptional students that don't get bitten by the RPN bug. Otherwise my lead above would not only make a great ad slogan, it would also stand up to FTC scrutiny for truth in advertising!

Ed,

Are you a professor of engineering? I am a senior undergrad M.E., and I've been doing quite well with my 32sii/33s combo (well, just a 33s at this point).

It would be interesting (if you are in engineering) to hear your opinion on the programmable (no graph capability) vs. full-blown 49g+ in the upper-undergrad to grad work curriculum.

I am beginning to run out of variables on my 33s (no shortage of ram though :)). I have been tempted to make an official switch to the 49g+ (I own one, and have done some basic things with it).

The two interests in converting are: backup capability, & multicharacter variables. However, the seemingly infinite opportunities for customization and program development are not so appealing to me as it could be a distraction that would be fun to entertain.

Thoughts? BTW, I do plan to continue with graduate work as well. Thanks, ECL

Re: HP33S simulator/emulator

*Message #45 Posted by **Ed Look** on 6 Nov 2005, 10:13 p.m.,*
in response to message #44 by ECL

You flatter me.

I am a professor of chemistry.

It turns out that the calcs, HP or otherwise, to most chemists are more useful in teaching than research, as the synthetic guys (total potboilers) need only rather basic calculations generally doable on the back of an envelope like G. N. Lewis did and the theorists (complete numbercrunchers) either go the back of the envelope route or rely heavily on PCs or mainframes.

To me, the involvement in actual research calculation has been of the light duty type (quick and dirty short programs in a 33S to convert eV to wavenumber and vice versa, etc.), but the heavier (for us) usage has been in teaching. A bulk of this is in the basic statistical handling of grades, but also in use as a light, small, convenient, and highly portable machine to execute handy programs like ones to help index x-ray patterns, etc. in a classroom or teaching lab. Yes, this is normally done very efficiently in a computer, but in teaching it, not all areas have computer access and some that do don't have the right software.

Now having said all this... and from a chemist's vantage point, I personally DON'T LIKE graphing calculators... well, let me take that back a bit... I don't like the graphing aspect:

I think a student, especially an undergrad, should go through the motions of plotting whatever functions or curves he needs ON PAPER, aided by the output of a trusty HP RPN scientific programmable, to truly get the total feel and significance of the plot.

I have found that, especially for high school aged kids, but still significantly for college students, having the instant gratification of a visual output on a screen on a calculator robs the student of full understanding of the (chemical, physical, biological, statistical) meaning of the curve. Of course, you guys are obviously bright folk and won't have this problem, so for you all, it's probably okay. But for your more average performer, I hate it.

The only time I use my 48G, 48G+, or 49G+ is as a glorified scientific programmable; i.e., more programming capability and bettery equation or constants library (not necessarily faster; I once mimicked some FORTRAN programs that calculated some figures given some chemical or algebraic restrictions for convergence and it took literally overnight). For instance, that homemade powder pattern indexing program I mentioned above just CAN'T be done in a 33S or 32SII or equivalent- there just isn't the program or variable memory space available in them.

But aside from applications that demand more power, I find myself always reaching back most often for my 33S (at work) or 32SII (at home) as they are truly, the most convenient powerful machines (the others are more powerful, but bulkier and thus harder to carry, put on a cluttered surface, etc.)

Ah, look what you made me do... a ten mile long post... :p

Re: HP33S simulator/emulator

*Message #46 Posted by **ECL** on 7 Nov 2005, 2:51 a.m.,*
in response to message #45 by Ed Look

Ed,

Thanks for the response, very nice insights indeed.

I agree on the ease of use / un-clutteredness of the 33/32 series. Also, I noticed today, (obviously) I can access any program via only two keystrokes (XEQ & LABEL), which is certainly not true for deeply hidden progs in an obscure directory on my 49g+ :)

ECL

*Message #48 Posted by **Jeff O.** on 25 Oct 2005, 12:50 p.m.,*
in response to message #1 by Valentin Albillo

To (at least attempt to) answer Valentin's question about the availability of a simulator/emulator for the 33S. As far

as I know, and I would welcome correction, there is no freely available simulator/emulator for the 33S. An emulator (their term) is available directly from HP, but it is not freely available to anyone. It is only available to "educators." Valentin, I don't believe that your occupation is known to this community, but perhaps you may qualify as an educator (your posts to this Forum are certainly educational.) If you do qualify, information is available here.

Hi, HrastProgrammer:

Hrastprogrammer wrote:

"If HP cannot provide an HP-33S emulator to YOU giving all your activities in this forum and further [...] then they are making a terrible mistake [...]"

Thanks a lot for your kind, supportive words but I don't think anybody at HP gives a damn about what I may or may not do in this forum or elsewhere, and if someone actually does, I doubt they can pull the necessary strings to accomplish even such a minor feat as letting me have an HP33 simulator.

Nevertheless, it's probably the case that there's actually not much public interest in my proposal, as I know for sure there are a number of posters in this forum that do have said software, yet noone has said a word to me regarding this matter, either publicly or in private e-mail.

So it's best to forget about it; it would mean a lot of work for me and if there's no interest, I'd rather spend my time and efforts in more worthwhile endeavors.

Thanks again for your support and best regards from V.

Hi, Marcus:

Marcus posted:

"I'd love to read them all. Were are they published? (I assume in Datafile, but I don't know were to find the publication.) I would be glad, if you could point me to a source."

Thanks for your interest in my articles. They are indeed 'premiered' (published) in Datafile, and you can get this publication by following this link.

Once an article's been published in Datafile, I usually let six months or so pass by, then make it available at my web site, and it also usually spreads to other sites as well. After the six-months period has elapsed, you can easily find any available article by using Google, for instance:

Keywords: *"math rom baker dozen"*

immdiately returns a number of links, and the very first of them will already get you a PDF copy of that article.

Thanks again and best regards from V.

> Nevertheless, it's probably the case that there's actually not much public interest in my proposal, as I know for sure there are a number of posters in this forum that do have said software, yet noone has said a word to me regarding this matter, either publicly or in private e-mail.

As the kind of collector who isn't interested in nice looking (probably broken) exhibits behind glass, I recently acquired a brand new 33s. My intend is to understand what are the specifics of this machine. I'm mainly interested in how calculators work and what can be done with them; this includes new machines as well as old ones.

If you were so kind to publish your software, either in their original form or in a revised version for the new calc, I would be delighted to play around with it, just out of curiosity! (I don't really need any of my calculators, for me they are just interesting toys.)

HG48GX cable plug : where can I get it repaired ?

*Message #1 Posted by **Antoine M. Couëtte** on 24 Oct 2005, 4:47 a.m.*

Hello to all !

Problem with one of my HP48GX's : its cable plug (4 pin connector located next to IR transmitter / Receiver) no longer works . It went loose and some of its four pins show a different lenght as usual : one seems (very) short and two are (quite) long . After spending over one half hour on HP site, I have been unable to check whether there is technical support in France or even in Europe (seems there is some in the US) .

What are the options to get it repaired ?

Thanks for your help

Antoine M. Couëtte

antoine.m.couette@club-internet.fr

Re: HG48GX cable plug : where can I get it repaired ?

in response to message #1 by Antoine M. Couëtte

Antoine, what have you done to the poor connector? :-)

Personally, I would try to correct the pins using thin pliers, pincers or something like that (while calculator is turned off, of course).

Best regards.

*Message #3 Posted by **I, Claudius** on 24 Oct 2005, 10:01 a.m.,*
in response to message #1 by Antoine M. Couëtte

Antoine: HP should hire you to test equipment, if it survives your usage, it should work for the general user ;-)

Probably the best solution is simply to order another cable from (since you're in Europe) Cynox:

http://www.cynox.de/eng/index.html?det=48G-Int

Re: HG48GX cable plug : where can I get it repaired ?

*Message #4 Posted by **HrastProgrammer** on 24 Oct 2005, 10:14 a.m.,*
in response to message #3 by I, Claudius

As I understood, the problem is not with the cable but with the connector on HP-48GX ...

Re: HG48GX cable plug : where can I get it repaired ?

*Message #5 Posted by **Antoine M. Couëtte** on 24 Oct 2005, 1:14 p.m.,*
in response to message #4 by HrastProgrammer

Thanks to both of you I, Claudius and Hrastprogrammer for your replies.

As Hrastprogrammer indicates, the problem is not with cables - I have a few which work quite well - but with the HP48GX connector itself.

As it is no longer firmly attached (glued ?) to the HP48GX, the cable connector - should I write cable plug ? - can move around a little but still seems to be (fully ?) connected to the machine itself. I attempted to make the 4 pins look " of reasonable lenght " because with thin pliers I can rather easily make them - one by one - stick out more or less from their support : if I "push" on one, I can insert it more deeply into its support and conversely the other way around . Apart from that the pins do no seem do be bent and I feel nothing different when I attempt connecting a four hole cable .

Still my HP48GX desperately remains "cable deaf". Any other idea ?

Thanks again for your kind attention.

Antoine

Re: HG48GX cable plug : where can I get it repaired ?

*Message #6 Posted by **Tony Duell** on 24 Oct 2005, 2:33 p.m.,*
in response to message #5 by Antoine M. Couëtte

It sounds as though the 4 pin plug has broken away from the PCB. If it's just come unsoldered, then the repair is possible, if you've ripped the PCB pads off as well, it's going to be a lot harder.

Remember that the 48 is not intended to be taken apart. Much has been written here about opening up the later HPs, basically there are heat-stakes under the IR/card cover, and more under the metal overlay on the front. I generally carefully peel off the overlay, then drill off the tops of the heatstakes.

You can then attempt to re-solder the connector to the PCB.

Since these machines are not intended to be taken apart, HP never _repaired_ them. They did offer a replacement service at one point, but I suspect that's long since ended.

Re: HG48GX cable plug : where can I get it repaired ?

*Message #7 Posted by **Antoine M. Couëtte** on 24 Oct 2005, 3:25 p.m.,*
in response to message #6 by Tony Duell

Thanks Tony - we have the same first name :-) - for your very valuable advice and information.

As I feel TOTALLY unable to attempt repairing my HP48GX myself, I am left with 2 options : - either find somebody of confidence who can repair it for me, - or leave it as it is . The IR data transfer works fine, but as I happen to need data transfer in excess of 2 mb, it DOES take time with IR whether it be through XSEND/XRECV or through KERMIT .

Thanks anyway for confirming me - a very important point to me - that HP does not maintain these wonderful machines - actually WONDERFUL to me since I am mostly using them as

super/duper HP41's thanks to the fantastic HP41 X/Y/Z Emulator by Hrastprogrammer - more comments on this later and soon !!!

Best Regards from Antoine (some people keep calling me "Tony" now and then :-))

It's a pity there's no active HP calculator club in France any more, this was the sort of thing that some club members would have at least looked at.

I do do some repairs for HPCC members and their guests _but only if I meet the person face to face at a club meeting_. Sorry about that, but there have been misunderstandings (relating to condition mostly) in the past, maybe my fault, maybe the other chap's (I don't want to start a flamewar), and I don't want it happening again. Actually being able to talk to the person, show him the problem in the machine and discuss the possible repairs helps a lot.

To be honest, SMD repair is not that hard when you've done it a few times. And the pins on this connector are at 2mm spacing, so it's not even that fine a pitch (compared to some of the ICs I've hand soldered). Of course if the pads on the PCB are damaged, it's a lot harder.

If you can find somebody who does SMD rework, it would be literally a few minutes job to re-solder the connector.

If you do decide to open the machine up, of course be aware that the chips are easy to damage by static. Don't touch anything inside when you get the cover off. If you're going to let somebody else do the soldering, then when you've got the machine apart, put the cover back over the board and take the whole lot to him. Do NOT remove the PCB from the keyboard, getting it aligned with the display connections is a nasty job.

I've found the best tool to remove the stakes is a 3.5mm (or sometimes 4mm) twist drill bit held in my fingers. Yes, it's slower than a power tool, or even a hand wheelbrace, but it's a lot more controllable.

in response to message #3 by Gileno

Hi, Gileno;

just to add a suggestion about PRA. What about mentioning that PRA can be found in, at least, three standard HP ROM? Meanning the 82143A standard HP41 printer, the HPIL module (when printer is active through the small mode key) and in the 82242A (IR printer module). These three modules offer PRA.

Cheers.

Luiz (Brazil)

in response to message #4 by Vieira, Luiz C. (Brazil)

In any one of the described manners the use of the instruction PRA it is identical. Send for printer of the content of the alpha register.

Re: 41Notes (New Version - Search)

*Message #6 Posted by **Howard Owen** on 24 Oct 2005, 6:58 p.m.,*
in response to message #5 by Gileno

Your description is correct, as far as it goes. I think the suggestion may have been to include more informaton in the documentation of your program. You could also explain that flag 55 is the "printer existence flag." For the IR printer module and the non-HP-IL pronter, the flag is on if the module is present, regardless of whether the printer is on or in range as the case may be. With the HP-IL module, flag 55 (and flag 21) are set if there is an active loop with a printer or display device on it.

Weird, Unintentional "XEQ" out to PPC ROM (HP-41CX)

*Message #1 Posted by **James F. Chumbley** on 23 Oct 2005, 3:14 a.m.*

OK, It was my fault, and I know what I did to cause it. I pressed XEQ ALPHA CK ALPHA, and the -41CX must have executed a "jump" out to the PPC ROM and begun execution of the "CK" function (clear key assignments). What I really wanted to do was to execute the internal CLKT function, but I pressed the wrong keys by mistake. The problem is that I don't know how to reliably stop execution of the PPC's CK function (the -41CX just kept on running and running and running somehow) and eventually terminated with the "Memory Lost" error message! Well this certainly stopped execution of CK all right, but it seems to me that the program pointer was still pointing to the PPC ROM.

Here's the question: Assuming that I go back in, reload from magnetic card the now-erased program (which was erased as a result of the "Memory Lost" condition), and reassign the also now-erased user key assignment, which was only one function assigned to the "A" or 11 key, when I now press the "A" key in User mode, will the -41CX begin searching for the executable global label from within Main Memory or from within the PPC ROM?

Also, is this documented anywhere in the -41CX's manual set or within the PPC's very extensive manual? I have not quite yet completely memorized all 492 pages of the PPC manual, but I want to assure everyone that I do take it to bed with me every night.

(Sure I do.)

Thanks, Jim Chumbley

Re: Weird, Unintentional "XEQ" out to PPC ROM (HP-41CX)

*Message #2 Posted by **Eric Smith** on 23 Oct 2005, 9:36 p.m.,*
in response to message #1 by James F. Chumbley

If you got a "MEMORY LOST", the program pointer should be left pointing into the (now empty) RAM.

AFAIK, the search order for alpha labels is not different based on whether the program pointer is in ROM or RAM.

The key assignment functions in the PPC ROM are incompatible with any use of time module/41CX alarms. The routines were written before the time module was introduced, and the user community had never seen "buffers" in the 41 memory before that, so it was assumed that the key assignments would always start at address 0xc0, which unfortunately is not true if there are any buffers such as alarms.

HP15C - differences in displays

*Message #1 Posted by **Artur - Brasil** on 22 Oct 2005, 9:51 p.m.*

Hi to everyone!

I was very surprised when I was trying to replace one 15C bad display for an HP12C display and they were not the same.

The 15C has a higher serial number than 12C: 2901B17387 versus 2534B96550.

Note the contacts in both displays and PCBs. The old ones are thin and compared to the newest model.

Old HP-12C

Re: HP15C - differences in displays

*Message #2 Posted by **Eric Smith** on 22 Oct 2005, 10:08 p.m.,*
in response to message #1 by Artur - Brasil

Could you please post the part numbers of the chips in both calculators, as well as the part numbers of the circuit boards (typically 5180-xxxx, 00xxx-600xx, or 00xxx-800xx)? If it's not too much trouble, high-res photos of both sides of both boards would be nice. I'm collecting info for my Voyager internals web page, and would like to link each entry to example photos.

I'm guessing that your 15C has the 1LQ9-0325 processor and uses a 4:1 multiplexed display instead of the older 2:1. The 4:1 mux only needs about 29 contacts (25 segments x 4 backplanes), vs. about 52 for 2:1 mux. The drawback of the higher mux ratio is that the contrast isn't quite as good.

Unfortunately the displays aren't interchangeable, as I's sure you've realized. But it shouldn't be too hard to find a 12C of comparable vintage to the 15C, which should then have the 4:1 muxed display.

Best regards,
Eric

33s - If a wish-list were solicited..

*Message #1 Posted by **ECL** on 22 Oct 2005, 8:51 p.m.*

I'd suggest the following improvements:

1. Multichar variables (even limited to 3 would help) 2. Eqn editing w/out having to backspace (the direction key) 3. GTO for equations lib (jump to any eqn), or basic directories. 4. Ability to call on a stored equation from within a program. 5. Slightly smaller keys (more space between them).

I'd have no need for a bulky graph calc if the aformentioned were incorporated in a future model. ECL

Re: 33s - If a wish-list were solicited..

*Message #2 Posted by **Karl Schneider** on 22 Oct 2005, 10:06 p.m.,*
in response to message #1 by ECL

ECL's HP-33S wish list:

1. *Multichar variables (even limited to 3 would help)*
2. *Eqn editing w/out having to backspace (the direction key)*
3. *GTO for equations lib (jump to any eqn), or basic directories.*
4. *Ability to call on a stored equation from within a program.*
5. *Slightly smaller keys (more space between them).*

Regarding item 1: This would be very useful in certain situations, but would likely require a change of paradigm, and result in some inconsistency how variables are handled. Such things must be thought completely through. (Would one really want to introduce the complexity of the 42S?)

Item 2: Agreed. I would add "support of implicit multiplication" to make equations more compact -- e.g., 2(X+Y) instead of 2*(X+Y).

Items 3 and 4: Also agreed, but this would require the ability to assign an identifier to each stored equation. Maybe an "EQN" command that would work similar to the flexible "MATRIX" on the HP-15C? (e.g., RCL MATRIX A", "MATRIX 9").

Item 5: Not entirely agreed. I would advocate a return to the colors and form factor similar to the original 32SII.

I would also ask for good and complete complex-number mathematical functions, at least as good as those in the 15C and 42S. The functions that are present -- besides being incomplete -- are quite helpful for programming, but are cumbersome for inteactive calculations.

-- KS

Re: 33s - If a wish-list were solicited..

*Message #3 Posted by **Eddie Shore** on 23 Oct 2005, 9:03 a.m.,*
in response to message #1 by ECL

Wish list of 33S:

1. Multivariable names 2. Numerical label numbers, steps are included with each program 3. Classic HP colors, I really like the 48S series color scheme 4. Derivative and summation function (although they can easily be programmed) 5. Input Equation prompt

Re: 33s - If a wish-list were solicited..

*Message #4 Posted by **Wayne Brown** on 23 Oct 2005, 9:44 a.m.,*
in response to message #1 by ECL

Wish list: An HP-41 style keyboard and color scheme.

Re: 33s - If a wish-list were solicited..

*Message #5 Posted by **I, Claudius** on 23 Oct 2005, 9:00 p.m.,*
in response to message #4 by Wayne Brown

Yours is the best wish of all, almost any old HP case and keys would be better than what it currently is.

Re: 33s - If a wish-list were solicited..

*Message #6 Posted by **brian healy** on 24 Oct 2005, 9:39 a.m.,*
in response to message #1 by ECL

Agree with your suggestions, I would also like to see a large enter key again, and a return to the classic colors. I can handle the green secondary functions on the aluminum face plate, but I don't like the purple. Also, to my eyes, the dark purple gets lost on the dark right-shift key. I want rectangular keys again, I think they should abandon the "chevron" layout. I don't like styling gimmicks, so I would prefer something similar to the voyager or pioneer series.

What I hope they keep on future models (hopefully there will be future models) are the 2 line screen, a cursor key, and the separate buttons for solve, modes, and display. And it goes without saying, but I'll say it anyway, KEEP RPN!!! I also like the large memory, though it's hampered by the single character variable names. It allows me to put messages in my programs, however.

** HELP ** Need HP-67 Card Reader Alignment

*Message #1 Posted by **Mike DiGirolamo** on 22 Oct 2005, 4:31 p.m.*

Hi Gang,

I've replaced a few deterioriated "gummy wheels" in the drives of HP-67's, one HP-97 and one in an external drive of an HP-41CX. In all cases of HP-67 replacement's I get a "error" message when feeding a card through after making the wheel fix. Ultimately, upon taking those units apart again and giggling things a bit, the problem has gone away. The giggle fix has always been a mystery to me. Now I'm working on an especially nice one and nothing I do seems to correct the problem. I've checked continuity sequencing for the "leaf contacts," and I don't see any wires that have come loose. Still when I feed the "Diagnostic Card" through, the "error" message presents.

1. Is there something I'm overlooking here? 2. Is there an alignment procedure for the leaf contacts/head? 3. Is there a manual or CD of alignment procedures for the 67/97 series available?

Any and all suggestions are welcomed..

Help please!

Mike DiGirolamo

Re: ** HELP ** Need HP-67 Card Reader Alignment

*Message #2 Posted by **Jon** on 22 Oct 2005, 4:56 p.m.,*
in response to message #1 by Mike DiGirolamo

Hi Mike:

First look at the magnetic head. You should read aprox 50 ohms in the orange-blue wires and also in the red-yellow. If that is not ok you need a replacement part.

Good luck

Jon

Re: ** HELP ** Need HP-67 Card Reader Alignment

*Message #3 Posted by **Mike DiGirolamo** on 22 Oct 2005, 6:02 p.m.,*
in response to message #2 by Jon

Jon,

Thanks for your post.

Is the stated resistance with the head in-line or removed?

Mike

PS Where does one find a replacement head, if needed :(

Re: ** HELP ** Need HP-67 Card Reader Alignment

*Message #4 Posted by **Mike DiGirolamo** on 22 Oct 2005, 6:32 p.m.,*
in response to message #2 by Jon

Jon,

I measure 50 - 58 ohms when head is disconnected.

Any other thoughts? Alignment?

Mike

Re: ** HELP ** Need HP-67 Card Reader Alignment

*Message #5 Posted by **Jon** on 23 Oct 2005, 5:10 a.m.,*
in response to message #4 by Mike DiGirolamo

Next step is the tantalum capacitor. You should replace the one at the top of the card reader´s circuit. 6 to 10uF will work fine. Take care with the polarity. If you send a photograph I will indicate which one must be replaced.

Good luck

Jon

Airforce Modules

*Message #1 Posted by **Matthias Wehrli** on 22 Oct 2005, 12:28 p.m.*

Hi,

Trying to update my HP-41 Module Database I want to look for some manuals of some modules made for the US Airforce. I know there are websites with downloadable manuals of US Army material, but I do not know their URL. Maybe someone can help me (and us) finding manuals of these modules (arrount 8 different modules).

Matthias

David, I have a 524... built 33s with:

o Improved display

o Better keypad

o Bug fixes

I hope that this helps. The 33s is not a bad machine but as we have discussed on this forum it could have been better. One thing is for sure - it's got a face that only a mother could love.

Regards,

John

41CV Back from the Dead

*Message #1 Posted by **Les Bell** on 22 Oct 2005, 1:49 a.m.*

A few days ago, I thanked HrastProgrammer for posting the story of his successful 48G repair; as I mentioned, I like "happy ending" stories.

This motivated me to drag out a 41CV which had been languishing in my desk drawer - it had long ago suffered from corrosion damage, and while I'd screwed in a small piece of bent metal with a soldered connection to the expansion connector block, that fix hadn't "taken" and it subsequently failed again. So, feeling inspired by HrastProgrammer, I dragged it out and disassembled it. There was a small bit of either corrosion damage or wear of some kind where the expansion block contacted the main board, so I cleaned that up, reassembled the calculator, inserted batteries and was rewarded with a "MEMORY LOST" message. A simple fix, really.

I'm left with one, slight, cosmetic problem, though. In peeling off the rubber feet, a couple of them seem to have "delaminated" - in prying up the first foot, it left behind a thinner layer of rubbery plastic which came off separately. Rather than use a sharp knife on the second one, I used a screwdriver to pry it up, but this just "scrunched up" the thin layer in such a way that I couldn't flatten it out again. In the end, I just peeled those two feet apart and threw away the inner layer, so now they are noticeably thinner than the other two (which had peeled off successfully). They're not particularly securely stuck in place now, either.

Has anyone else encountered this? My suggested fix is just to peel apart *all* the feet, and then reattach them to the calculator with some rubber cement - the feet will be a bit thinner, but I can live with that. Any other suggestions?

Best,

--- Les

*Message #2 Posted by **Raymond Del Tondo** on 22 Oct 2005, 2:27 a.m.,*
in response to message #1 by Les Bell

Hi,

the old adhesive tape becomes 'greasy' after years,
you can use a short strip of normal double tape which
you cut suitable pieces for the rubber feet.

HTH

Raymond

ThinkJet 2225B Question

*Message #1 Posted by **Tomas Fischer** on 21 Oct 2005, 7:55 p.m.*

Hi,
I have a ThinkJet 2225B printer and wonder if and where can I get the ink cartridge and does anyone know if it is possible to re-cell the battery? I never used this printer before so it is all new to me.
Any help will be greatly appreciated.
Thank you, Tomas.

Re: ThinkJet 2225B Answer

*Message #2 Posted by **Etienne Victoria** on 22 Oct 2005, 6:24 a.m.,*
in response to message #1 by Tomas Fischer

Hi Tomas,

1) To rebuild the 2225B battery, you will need : 6 Sub Cs Ni-CADs or NiMh, one picofuse if the one in the pack is burned, strength.

Choosing Ni-CADs or NiMh is a matter of use and taste. You'll find reasonable, skilled people or even ayatollahs defending opposite views. See posts and flames about this elsewhere in this Forum.

1a) Open the thing : The case is not welded but snapped, just exert enough pressure with the largest flat screw driver as the innards are tuck with very strong double-sided tape.

NOTE polarity of the existing cells connection alongwith picofuse position!!!

1b) Desolder and dispose/recycle the old cells SAVING the picofuse you'll find between them.

1c) Assemble the new cells in series with the picofuse (picofuse position & polarity not strategic)

1d) Resolder to the pack circuit, respecting polarity, and insert in pack with very strong double-sided tape ON THE BOTTOM.

1e) If you really wish to recreate new problems and stress when opening again, apply same tape to secure the cover.... Otherwise refrain...

1f) Charge outside the Thinkjet, monitoring carefully smells, gassing, funny noise....

1g) Test voltage at 7,2V loaded and use.

2) You may purchase the Thinkjet batteries...just anywhere on the Web or real world. They are still for sale new.

I think they come in black, blue or red.

Being in Europe, I did not test US Webstores but you may try Here (US) or here

Hp is now just a major paper and ink cartridge "manufacturer"/reseller and they incidentally distribute computers and printers to fit on their cartridges.

Cheers from France!

Etienne

Edited: 22 Oct 2005, 4:25 p.m.

Re: ThinkJet 2225B Question

*Message #3 Posted by **Wilson (Bill) Holes** on 22 Oct 2005, 6:19 p.m.,*
in response to message #1 by Tomas Fischer

Ink cartridges for the thinkjet are also available in the US from Carrot Ink (carrotink.com). Quick delivery and usually a bit less expensive.

Re: ThinkJet 2225B Question

*Message #4 Posted by **HANK** on 23 Oct 2005, 12:11 p.m.,*
in response to message #1 by Tomas Fischer

I was able to get new Think Jet ink cartriges from HPshopping. Batteries Plus rebuilt three battery packs for me for a reasonable price.

You will have a problem removing the pack cover because of the double sided "stickey" tape used to keep the pack sealed. Use great care and you should be able to slowly pry the cover off of the pack.

Hank

Re: ThinkJet 2225B Question

*Message #5 Posted by **Tony Duell** on 24 Oct 2005, 2:24 p.m.,*
in response to message #4 by HANK

When dismantling the 2225B battery pack, I found it helped to remove the little catch that locks it into the printer. You can easily flick the 'barb' on that part and then slide it out with the spring.

After releasing the cover on all edges (it's got clips all round), I use a flat blade to prise it from the cells

I also found it was useful to unplug the 2 connectors from the charger PCB, to remove the PCB (it's just pressed onto the pegs, but take care as you can break the pegs off), and unclip the charger plug from the back of the unit. A long, thin, screwdriver inserted through the hole for said plug helps in prising the cells from the base.

Re: ThinkJet 2225B Question

*Message #6 Posted by **Tomas Fischer** on 24 Oct 2005, 8:10 p.m.,*
in response to message #5 by Tony Duell

Thank you all for the helpfull tips. I'll order the Sub C and will try to follow your instructions. Upon completion I will report back :)
Thanks again...Tomas

Re: ThinkJet 2225B Question

*Message #7 Posted by **Garth Wilson** on 25 Oct 2005, 12:09 a.m.,*
in response to message #6 by Tomas Fischer

Many years ago when my Thinkjet's rechargeable battery pack went south, I actually operated it on a little 9V battery for a short time, until I made a power supply for it. The 9V battery would only operate the printer for six full pages before becoming unable to supply enough current, but then it still had most of its life left for other uses. The power supply I made cost me fifty cents. I had everything I needed except one diode, and the diode was fifty cents. The power supply puts out a regulated +7.8V for the printer, plus +5V and an unregulated -12V for other things I might use it for.

Re: ThinkJet 2225B Question

*Message #8 Posted by **Etienne Victoria** on 25 Oct 2005, 5:21 p.m.,*
in response to message #6 by Tomas Fischer

Hi again Tomas, all

Just to let you know that I moved the compiled posts to a small article in the appropriate museum section.

Thanks

Etienne

HP 12C Promo Question

*Message #1 Posted by **Mary** on 21 Oct 2005, 10:39 a.m.*

Hello,a few months ago, I posted a question about the 12c model, asking what you would like to see in terms of a 25th anniversary promotion that we are working on (I work on advertising for HP and we are currently in the process of preparing for the 25th anniversary of the 12C calculator model-HP's longest and best-selling calculator). The responses were wonderful, thank you so much!

We are now looking for your positive comments/experiences you've had using the 12c model. What do you love most about the 12c and do you have any interesting or funny stories to tell? How did the 12c make an impact on your life? thank you! Mary

Re: HP 12C Promo Question

*Message #2 Posted by **blurdybloop** on 21 Oct 2005, 2:10 p.m.,*
in response to message #1 by Mary

One of the secrets of the HP-12c's success, in my opinion, is its cosmetics. It has a "professional" look to it that none of the other current production HP models, including the HP-12c Platinum, have.

Let's face it, the current line of scientific calculators *look* disposable, as do the 10bII and 17bII+. The 12c Platinum isn't as bad, but it looks like an Asian clone instead of "the real thing"....oh wait, that's what it is...

The 12c may be slow and feature-impaired by modern standards; but for the community that it serves, it is fast enough (when what is wanted is the result of a single calculation, there isn't much difference between 1 second and 1.5 seconds...) and has the needed features. Where it falters, of course, is for complex and repetitive calculations; but most of the users don't do either.

Interestingly, for a simple mortgage payment calculation, the HP-12c is *slower* than the HP-70!

I would like to echo the request for a 25th anniversary model that can have its microcode changed to become a 15c or 16c.

Re: HP 12C Promo Question

*Message #3 Posted by **Arnaud Amiel** on 21 Oct 2005, 3:20 p.m.,*
in response to message #1 by Mary

To me, the success of the 12c is of course due to the fact that it looks different and good (though dated). But also it is simple and easy to use! All of its features are directly accessible usually with one or 2 key presses. No complex menus. I have one at work. When I need to make a simple calculation, I get the result faster by taking the 12c from my drawer, then from its slip case and use it, than it takes me time to even start a calculator program on my computer.

Arnaud

Re: HP 12C Promo Question

*Message #4 Posted by **Peter Geiser** on 21 Oct 2005, 6:48 p.m.,*
in response to message #1 by Mary

Hi Mary

The look and feel of the Voyager series (all of them, from 10C to 16C) is unbeaten yet!

The keys have an excellent feeling, and even after dozens of years of wear they still work as on the first day.

The format is also great, fitting into a shirt pocket.

And finally, its use is very simple, and yet it offers a good number of features. I think in those days, an engineer had to think hard of how best to use the limited resources, and create the best possible solution.

Looking forward to a 25 years edition.

Oh: will there be other jubilee editions of calculators? Such as a 30 year anniversary edition of HP67? Or the whole Voyager series re-launched?

Regards
Peter

Re: HP 12C Promo Question

*Message #5 Posted by **Karl Schneider** on 22 Oct 2005, 4:23 p.m.,*
in response to message #1 by Mary

I'd echo the comment of "blurdybloop" that much of the enduring appeal of the original HP-12C is based on its classy appearance.

There's not much time left to develop anything significantly new for a "25th Anniversary Edition", and there's nowhere on the face to put special annotations without cheapening or cluttering the look.

A 25th AE HP-12C should be constructed to the original standards (1981-1995), though the manufacturing facilities probably are no longer in service. It should have the same look, keyboard, and functionality as the original, but run faster and contain more memory (like the latest 12C Platinum).

Perhaps if the latest 12C Platinum hardware and ROM (with ALG mode and other new functions disabled) were placed inside a high-quality "traditional" package?

-- KS

Re: HP 12C Promo Question

*Message #6 Posted by **Woody Larkin** on 22 Oct 2005, 9:14 p.m.,*
in response to message #1 by Mary

The 25th Anniverary model should have: Double Injection Keys; keys with numbers that will never wear out because the numbers are part of the keys, not decals. The keys should have the same tactile feel as the 11C, 15C and original 12C. It should retain the black and gold color scheme; with perhaps deeper and more saturated blue and gold f and g lettering. It should be RPN only. It could have a faster processor and more memory. It should have as clear and contrasty an LCD display as modern technology allows. It could command a premium price (say $129.95) as quality is a much desired quality for a product in a society that will pay $500.00 for a PDA or smartphone. That's my wish list. I'd buy one in an instant.

Re: HP 12C Promo Question

*Message #7 Posted by **Arnaud Amiel** on 23 Oct 2005, 5:06 a.m.,*
in response to message #6 by Woody Larkin

That would be a good wish list but I believe we will see the same 12C that is produced nowadays with a different logo on the top right...

Arnaud

Re: HP 12C Promo Question

*Message #8 Posted by **Peter Geiser** on 23 Oct 2005, 8:15 a.m.,*
in response to message #7 by Arnaud Amiel

... which would not be enough that I would buy one, since it would of inferiour quality than my old (1982) HP12C.

Note that Mary never said a 25th anniversary 12c would be made

*Message #9 Posted by **John** on 23 Oct 2005, 10:29 p.m.,*
in response to message #1 by Mary

All she's wanting is stories about how it made a difference, blah blah blah.

Perhaps she should ask why people still use that instead of thew newer models.

Poorly made.

And Everyone Assumes That "Mary" Is Really From HP

*Message #10 Posted by **I, Claudius** on 24 Oct 2005, 10:05 a.m.,*
in response to message #9 by John

There are valid reasons for wanting to be anonymous, but here it sounds like "Mary" is having a ball tugging at the heartstrings of calc-loving nerds.

Re: And Everyone Assumes That "Mary" Is Really From HP

*Message #11 Posted by **donald wallace** on 24 Oct 2005, 9:54 p.m.,*
in response to message #10 by I, Claudius

I STILL think she may yet turn out to be THE charming Mary from Canoga Park...

(Frank Zappa fans know what I am on about... ;-)

That kinda grrl would definitely end up in sales... ;-)

DW

Re: HP 12C Promo Question

*Message #12 Posted by **will** on 24 Oct 2005, 6:57 a.m.,*
in response to message #1 by Mary

Hi Mary..please tell them (hp guys) than a real "quality" model is the best thing they can do to celbrate this

aniversary (except to change it to remanufacturing a hp 15c like, model). In case they can´t (or don´t want it) a nice "revised" gold darker aniversary model can be OK.

Re: HP 12C Promo Question

*Message #13 Posted by **donald wallace** on 24 Oct 2005, 10:03 p.m.,*
in response to message #12 by will

Hi all.

Mary, the best thing imho is to bring back a slightly re-engineered hp41 with all the (few) mechanical engineering problems ironed out and a fair bit of software incorporated into firmware.

A ten times speed increase at the same power level would be incredibly marvellous and entirely "doable" but not expected.

Cross compatibility with the 11,12,15,16 would be required of course. Very important to all would be exact same apperance, functionality etc... with quirks and "bugs" removed, except perhaps for synthetic functions ;-)

HP would have a BIG HIT...

fwiw...

yours faithfully,

Don Wallace

(I'm too old and practical to be a "nerd"...)

Does anyone know how to open a 38G?

*Message #1 Posted by **Joao** on 21 Oct 2005, 9:41 a.m.*

Dear All,

Following the message posted by HrastProgrammer some days ago, I decided to try to repair my 38g. Does anyone know how I can open it without damaging it? Many thanks for your help.

Joao

Re: Does anyone know how to open a 38G?

*Message #2 Posted by **Randy** on 21 Oct 2005, 9:53 a.m.,*
in response to message #1 by Joao

It's very easy. Peel off the plastic keyboard surround. You'll see six heat stakes that hold the front a back halves together. With an appropriately sized twist drill, by hand, shave down the tops of the posts. Pop the + battery contact off the case tab and seperate the front from the back. It's now open.

Re: Does anyone know how to open a 38G?

*Message #3 Posted by **Ron Ross** on 21 Oct 2005, 10:14 a.m.,*
in response to message #1 by Joao

Since its a 38G, they are cheap on ebay. Just buy another. They usually sell for around $20 plus S&H. Not worth much time unless you want the experience of repair (an experienced repairman would need 20-30 minutes if he had everything ready, many hobbyests would need 1-2 hours, and a complete novice who KNEW what he was doing could spend 2-4 hours and still wind up with a piece of junk). Just a word of warning.

The other fellows advice sounds like it is for the 48G, but there are instructions on how to open a 38G on Colin Crofts website (I don't know the address offhand, but should show up on a websearch)

Actually, you might consider upgrading to an Hp39G+. It has a few more features most importantly, a decent amount of RAM, better stat functions and lots faster (though the 38G wasn't considered slow, like the 48G series). These are often available for $50-60 on ebay also.

For any old timers that don't keep tabs on all the Hp's, the above are algebraic only graphics calculators.

Yes, I know how to aopen a 38G, do you?

*Message #4 Posted by **Randy** on 21 Oct 2005, 10:43 a.m.,*
in response to message #3 by Ron Ross

"The other fellows advice" was what the poster asked for, a 38G. The 48G has an aluminum overlay and ten heat stakes :^)

Re: Yes, I know how to aopen a 38G, do you?

*Message #5 Posted by **Ron Ross** on 21 Oct 2005, 11:01 a.m.,*
in response to message #4 by Randy

No, I confess, I have never opened a 38G as they have always been Cheap (and well made).

Re: Does anyone know how to open a 38G?

*Message #6 Posted by **Joao** on 21 Oct 2005, 11:09 a.m.,*
in response to message #1 by Joao

Hi there,

Thank you very much for your help and advice. I have followed Randy's instructions and found the six heat stakes. I'll now work on them!

Have a nice weekend.

Joao

PS: The reason I want to open this one is to learn how to do it. If it goes wrong, it is not too bad as I have another one and I got this one for free!

Re: Does anyone know how to open a 38G? IT WORKS!

*Message #7 Posted by **Joao** on 21 Oct 2005, 11:52 a.m.,*
in response to message #1 by Joao

Dear All,

You may like to know that my 38G is now safe and back to work! The problem was similar to the one described by HrastProgrammer and I am very proud of the result.

Many thanks, especially to Randy and HrastProgrammer!

Joao

Re: Does anyone know how to open a 38G? IT WORKS!

*Message #8 Posted by **Les Bell** on 21 Oct 2005, 8:08 p.m.,*
in response to message #7 by Joao

OK - I give up! How did you *close* the 38G?

Best,

--- Les
[http://www.lesbell.com.au]

Re: Closing 38G's

*Message #9 Posted by **Randy** on 22 Oct 2005, 8:45 a.m.,*
in response to message #8 by Les Bell

The case halves have snaps at the top and sides, it stays together fairly well without any further help.

You could use small flat-head screws on two the bottom posts as some 48 methods do for additional strength if desired. A piece of tape along the bottom edge works too if you want quick access and don't want to peel the surround off again to get to screws.

The 38G is the most easily opened saturn hack platform there is. That 30 pin standard memory pad screams for a custom rom.

Re: Closing 38G's

*Message #10 Posted by **Les Bell** on 22 Oct 2005, 9:30 p.m.,*
in response to message #9 by Randy

Thanks, Randy - it was the mention of heat-stakes that made me curious. My wife's HP-18C has a dead column of keys on the alpha keyboard, so I was thinking of trying to fix it - only I've heard horror stories of the machines held together with heat-stakes. . .

Best,

--- Les

Re: 19C open/close

*Message #13 Posted by **Eric Smith** on 24 Oct 2005, 2:34 a.m.,*
in response to message #11 by Randy

I'd like to buy 18C, 19B, and 19BII units with failed keyboards, if anyone is willing to sell them cheap. I just want working electronics for the extraction of the ROM code.

I can't afford to spend the money to buy working ones, nor do I want to destroy them if they're perfectly good. But if the keyboard has already failed, they're not much good for anything else.

Also intereseted in the Pioneers for the same reason, though dumping the ROMs from

models other than the 17B, 27S, and 42S will be quite difficult.

Eric

Re: 19C open/close

*Message #15 Posted by **Tony Duell** on 24 Oct 2005, 2:36 p.m.,*
in response to message #11 by Randy

You don't mean that!. The 19C is a Sting series, and is relatively easy to take apart non-destructively -- screws on the bottom, there are 3 PCBs inside, keyboard at the top, then processor/logic, finally PSU/printer in the lower case. After removing the screws, you can seperate the case parts, the PSU/printer PCB is connected to the logic PCB by those spring contacts that HP used in all machines at that time.

The machine that's built like a 28 (Clamshell case) is the 19B (and 19BII).

Re: 19C open/close

*Message #16 Posted by **David Smith** on 25 Oct 2005, 10:59 a.m.,*
in response to message #15 by Tony Duell

But putting back together a 19C can be a little bit of a problem... getting the stake pins together undamaged is always fun.

Re: 19C open/close

*Message #17 Posted by **Tony Duell** on 26 Oct 2005, 2:51 p.m.,*
in response to message #16 by David Smith

But a lot easier than reassembling a 19B (at least if you want the latter to stay together and work).

NiMh 'N' Batteries for the HP-41 Calculator in UK

*Message #1 Posted by **Brian Gladman** on 20 Oct 2005, 11:47 a.m.*

If anyone is looking for rechargeable NiMh 'N' batteries for the HP-41 calculator in the UK, they might like to note the following two sources:

http://cpc.farnell.com

with a search on 'GP36NH'. Another source for the same battery is:

http://www.strikalite.co.uk/

They cost about £1.80 each.

Sadly I have not yet found a source for the 1/2 N GP18NH for use in the rechargeable battery pack (even though GP Batteries lists them as available).

in response to message #1 by Brian Gladman

I have found a very good replacement made with a 1/3AAA NiMH cell (150mAh) which has the same length as the 1/2N but diameter is 10mm instead of 12mm. But I have found a tube that compensates the outer diameter. So you get 1/2N sized cells.

I am offering these in the adempertisemnt section but I can send information to anybody interested on doing it by himself

Re: NiMh 'N' Batteries for the HP-41 Calculator in UK

*Message #3 Posted by **Vassilis Prevelakis** on 20 Oct 2005, 6:15 p.m.,*
in response to message #1 by Brian Gladman

Here we go again.

Unless you want to spend a lot of time using the card reader, the consensus is that its better to use alkaline batteries with the 41C. Rechargeable batteries are a lot of pain for this machine:

a) even when fully charged they are close to the LOW BAT warning level

b) they lose their charge faster than alkalines, meaning that you have to deal with them far more frequently than with alkaline batteries.

c) I have found that the smaller the form factor the more likely the battery will leak or outgas. (Notice that HP-

97 calculators are far less likely to be suffering from corrosion than the HP-67)

d) Back in the early 80s N-size alkalines cost a lot of money, today they are cheap enough that most people can afford to replace them once a year or so.

NiMH cells are great, I use them in all sorts of electronic equipment, its just that they are not really suitable for this *particular* piece of equipment.

Vassilias said it best, here we go again.

> Quote:
>
> Anyone who wants to run rechargeables in his 41 HAS ROCKS IN THEIR HEAD. YOU WILL GET IRREVERSIBLE CORROSION PROBLEMS, particularly if you have a CX.

So a CX is different with respect to battery corrosion? This is absolute nonsense. So the operating current is a bit higher. Big deal, so what? So the standby current might be higher, big deal, so what? You're still talking microamps.

Irreversible corrosion problems? Absolute nonsense. Alkalines destroy 41's when they leak, rechargeable out gassing and the resultant minor corrosion cleans up fine. I'd rather clean up a 41 that had an original 82120A left in it for ten years untouched than a 41 with N alkalines or worse yet old carbon zinc cells.

It is dead easy to rebuild 82120's with modern 1/3AAA nimh cells. They work fine, that's been documented here for several years. If people want to rebuild their rechargables, let them. If people want to use alkalines, let them.

Don, why do you have to shout at people and tell them they have rocks in their heads? Be civil, be

informative. You're just being rude and helping no one.

Re: NiMh 'N' Batteries for the HP-41 Calculator in UK

*Message #6 Posted by **David Smith** on 21 Oct 2005, 10:40 a.m.,*
in response to message #5 by Randy Sloyer

I have measure the "OFF" current of many HP41 calculators. 41CX machines are no different than the others. Yes, they have a clock in them that draws current but the chips in them are built on later technology and tend to draw less currrent. On the whole the standby current is the same for a 41C, CV, or CX. The batteries cannot tell the difference... unless they can read the label on the machine.

A VERY good reason to rebuild the rechargeable pack is because it is all that you have. Many machines no longer have their "N" cell holders. Also a lot of people do use the readers or HP-IL constantly.

That said, use "N" cells if you can. No need to worry about self discharge.

>
> ...
>
> In closing I want to apologise to Dave Hicks for drawing yet more "heat" from a person who may want to rag me rather than help the poster. ... Abrasive cirticism is not warranted in a forum of this generally high quality. I personally couldn't care less at being criticised (by amateurs?) but find I feel acutely embarrassed for the other readers. Sorry to you all, (except my misguided critics).

Wow, that's a lot of petulant, indignant piffle.

FYI: Randy Sloyer has plenty of sound practical experience, and has posted here regularly for at least several years. He has repaired several of my fullnut 41's that arrived "alive" but malfunctioning, and returned them to me in perfect working order. He knows what he's doing, and knows how to fix other models as well.

You can find Randy at www.fixthatcalc.com.

About the battery issue: I would tend to believe Randy (on limited evidence, admittedly) that leaking alkalines will permanently damage the battery contacts, while a leaking NiCd might not.

I've seen damaged HP-41 battery terminals (of which I'd surmise most ran on disposables, once they became available and economical). However, I've seen no terminal corrosion on any of my the three HP-34C's, even though rechargables had been used on all of them at least for a while, and I received sets of dead, "fuzzy" NiCd's with two of them.

Hi,

I normally try to stay out of this kind of discussion, but what the heck.

> Quote:
>
> I am not on any horse, Karl... I get annoyed when I am abused publicly.
>
> Now I understand WHY I drew some flak from Randy et. al. People don't like competition...
>
> Aren't people interesting. I never cared for politics.
>
> I am still happy to participate here, but I won't cop abuse; it is as simple as that.

Perhaps I'm missing something, but I can't see where anyone is really abusing you? Yet in this last post, you seem to be implying that the people disagreeing with you on technical points are only doing so to 'profit from the forum'. Is that correct?

For the record I agree with Karl.

Rather then question Randy's credentials, how about we keep the debate purely on technical terms. I do not believe there is a conspiracy to pass bad technical advice for profit.

Please note that I have zero financial interest in this forum. I have never had anything to do with Randy so there is no conflict of interest.

Thanks,

.

Don Wallace

*Message #21 Posted by **anonymous** on 26 Oct 2005, 9:45 a.m.,*
in response to message #8 by Karl Schneider

Please note that Don Wallace is a self-described *Asperger's* sufferer.

Please note that this syndrome can make a person appear to be highly anti-social and abrasive.

It may be best to simply ignore his annoying comments but respond only to the relevant on topic information.

Common issues with Asperger's (not all are necessarily present):

```
--no friends in school years;
- lack of physical coordination;
- unable to hold a conversation outside of a limited subject matter;
-**NOTE**  Easy to provoke and often lashes out with excessive force or
violence;
-often attempt to dominate social situations;
-often test at genius level for math;
-difficulty smiling;
-strange sense of humor, taking all statements literally--difficulty with
irony and nuance;
```

So, bear these facts in mind. To keep it civil around here, we need to understand each other :-)

Re: Don Wallace

*Message #22 Posted by **donald wallace** on 27 Oct 2005, 11:34 a.m.,*
in response to message #21 by anonymous

Anonymous,

Thanks for your post.

Actually, very few aspergers people are violent. The other points are or "appear to be" pretty accurate. For violence / callous disregard for others welfare you can't go past either pychopaths or politicians. (Think about it...)

We don't set out to dominate social situations, we just lack the subtle devious character of the average human being. Others see we are different and subconsciously resent us. Very strange dynamic that leads to "AS" sufferers being bullied. Their resulting anger can then spiral a bit. We don't like B.S. either and can smell it a mile away!

We "A.S." people have MANY really good features too, such as amazing attention to detail, reliability in relationships and friendships, an extreme degree of honesty, loyalty, reliability at work and a very strong sense of fair play. A very unusual and valuable group of totally misunderstood people often operating at a genius or for a few supergenius level of intellect in NARROW areas. Socially, we are a bit of a TRAINWRECK. Oh well, can't have everything...

We are also very unusual in our total disinterest in social "norms", political behaviour and are disinterested in manipulating others. We cannot read body language, miss social cues and have trouble with verbal sub-text sometimes. This makes us easy prey to setups and manipulation by others.

Once a sufferer learns to live with it, they can learn to behave "normally", much as a child might learn the piano, through a large amount of study and work. I had to actually study body language out of books and then study "live" subjects ;-); now I can read it like a pro and I'm doing it CONSCIOUSLY (hard work!).

Given how "normal" people behave, I would rather be an Aspergers "sufferer", but it's a hard life for many.

I value the people in this forum highly enough to come clean about my "affliction".

We also make GREAT engineers!

All the best, everyone.

Re: Don Wallace

*Message #24 Posted by **James M. Prange (Michigan)** on 27 Oct 2005, 3:25 p.m.,*
in response to message #21 by anonymous

I've read that some "medical archaeologists" think that, among other famous people, Thomas Edison and Albert Einstein may well have been Asperger's syndrome people.

Well, it seems that Edison didn't always "play fair", but he certainly made a difference.

But let's keep in mind that Asperger's covers a wide range of traits, and those who have it should be treated as individuals. For some notes on Asperger's see http://news.bbc.co.uk/1/hi/health/medical_notes/a-b/1166811.stm.

For what it's worth, a student nurse reading about Asperger's told me that she thought it described most of the men she knew.

Written language has subtle nuances that are easily missed, particularly in an international setting such as this, where different dialects of English are used, and for some, English is a second language. A reader should try to "read between the lines", particularly when what he's read seems unreasonable or rude. A good (but probably unobtainable) goal for a writer is to write in a manner that not only can be understood, but can't be misunderstood.

Don, in your case, knowing that you have this condition, perhaps you should make special efforts to avoid being overly sensitive to criticism or seeming rude when you don't really want to be. Practice your empathy; that is, always try to imagine how the other person feels. Maybe write whatever you intend to post in a text file, then save it, take a break, and reread it carefully before pasting it into the Forum's text box, and even then, "preview" it before actually posting. Once posted on the Internet, it can never be totally withdrawn, even if the post is deleted.

Regards,
James

*Message #28 Posted by **Brian Gladman** on 21 Oct 2005, 4:26 a.m.,*
in response to message #3 by Vassilis Prevelakis

I agree that it makes little sense to bother about rechargeables unless a lot of use is being made of the card reader.
But in my case I do use the card reader very extensively so NiMh cells make sense.
I don't yet have the evidence to comment on longer term issues with corrosion but I have not found any problems with low battery warnings since the GP36NH N cells I found are providing for extensive use of the card reader without any early 'low battery' warnings.

Hi Don,

I am pretty happy with the GP36NH cells so far but I will be keeping a watch for any corrosion issues.
The big problem with these cells is that pretty well all commercial chargers are not designed to cope with cells with such small capacities and charging currents. In consequence it is very easy to overcharge these cells and hence break their seals.
To overcome this problem I am using a charging method that allows both cell temperature and cell delta-V to be constantly monitored so that charging can be stopped immediately full capacity is reached irrespective of the initial charge state.

in response to message #34 by Jon

Hi Jon,

My old 41s are both fine thankyou. Why would I send you something I repaired? Certainly there is nothing wrong with the repair. It works and is solid. Your opinion, though in itself valued, is not valid.

I think you have a good sense of humour. Certainly an asset.

I decided to stay here for now as people may need some protection from the BAD ADVICE of a few others... I am happy to fill that role. That would mean maybe I should be more critical? Certainly don't need to get abusive. In any event there is no payoff for me, but a few people with problems will definitely benefit.

No offence meant, but I would be happy to put my ([fine or motor] mechanical or [signal or power]electronics) repair skills against yours, Tony D.'s and Randys any day of the week. I see many errors in the advice these two gents give but I have the coutesy to avoid criticising them. That courtesy is not reciprocated and given their personalities and motives I don't expect it.

To the guy who speaks in latin: of your comments I ask:

Que bono? {you can correct my spelling ;-}

To date no-one in the forum has offered any concrete refutation of my two statements of damage from nicad cells/packs or wrecking displays by disassembly. Some have offered concrete info which in general supports my assertions. Therefore my judgement and advice in this matter is sound. More important, my motives were good.

In future I will not respond to criticism because all the other people who jump on the bandwagon obviously do not know what is really going on and their comments (if on topic) are not technically relevant or accurate. No offence

meant.

I HAVE managed to bootstrap a small repair business for people down here in OZ and for that I am grateful to the forum, to Dave Hicks for hosting us all and to the unnamed software wizard who directed me here in the first place as he thought people here might benefit from my experiences. He doesn't post here anymore btw and given the behaviour of people here I do not wonder why. He's not the only one, either.

Thankyou to the people who have written to me expressing support. A few of you are leaders in your field. It's fun to push that envelope!

To you Tony and Randy I wish you every success in your business / work endeavours. To everyone else, good luck with your d-i-y repairs, may all your problems be little ones, long live hp hardware and roll on BUG SQUASHING in the various add-ons people have devised. I haven't seen any bug reports yet...(nor likely to?). The people I refer to know who they are.

DW

Re: NiMh 'N' Batteries for the HP-41 Calculator in UK

*Message #36 Posted by **anonymous** on 26 Oct 2005, 8:11 p.m.,*
in response to message #35 by donald wallace

Hello Don,

> Quote:
>
> I decided to stay here for now as people may need some protection from the BAD ADVICE of a few others... I am happy to fill that role.

You have now announced that you are 'leaving forever' at least three times now, only to come back within a day or two. Either stay or go, but please make up your mind.

This 'debate' keeps coming back to one issue: You claim others are giving bad technical advice. You have implied multiple times that other regulars on this forum are either incompetent, motivated by greed, or both. You have also stated that others are abusing you purely because you corrected their bad technical advice.

I am having a great deal of trouble finding evidence to support this. You have a habit of deleting your comments. I have searched virtually every message on this forum in the last week and cannot find any message where someone even mildly abused you, where you didn't ask for it first. Someone asked for you evidence of where you were abused, you declined.

From what I've seen, you've constantly insulted people, although subtly. To take the root of this thread as an example

> Quote:

> Anyone who wants to run rechargeables in his 41 HAS ROCKS IN THEIR HEAD. YOU WILL GET IRREVERSIBLE CORROSION PROBLEMS, particularly if you have a CX.

You did not say why this was the case. You were called out on the last "particularly if you have a CX" comment - the current consumption is not an issue. Others replied with positive experiences using rechargables. You then replied several times with fairly angry replies, said you were leaving, then deleted the replies.

Again, it is hard to find evidence of your subtle insults in your old posts, because you've deleted them from the public record. I remember you often replied in an insulting tone.

Questioning people's credentials is an invitation to have yours questioned. To date no one has been impolite enough to question yours.

It's not that technical debates are unwelcome - it's that you're going about it in completely the wrong way.

You clearly have a lot to contribute. It would be great if you could do so without playing the victim and 'lashing out' at invisible enemies.

This forum is otherwise one of the most polite ones I've seen.

> You have a habit of deleting your comments.

Sometimes I wish Dave would remove the capability of deleting messages. I sometimes go several days between visits to the forum, and it's really annoying trying to follow a thread with all those (deleted post)s in the middle. Fortunately, people other than Don almost never delete anything. If I ever feel the need to respond to one of Don's messages, I'll quote the entire thing to ensure the context doesn't "disappear" later.

*Message #38 Posted by **Vieira, Luiz C. (Brazil)** on 26 Oct 2005, 1:50 a.m.,*
in response to message #28 by Brian Gladman

Hi, Brian;

I have some Gama-Power AA-size batteries and I'd like to know if the N-size you mention are also made by Gama Power as well (the GP made me wonder...)

Were I am in Brazil (a small city), it is hard to find either regular, alkaline, NiCad or NiMH N-size batteries, and I had to ask for some local suppliers to try finding some for me. One of them found five

packs with two (Eveready's Energizer) and I bought them all. Not cheap, somehow expensive.

That's the main reason I`d like to try some N-size MiMH. I actually built a pack of four regular D-size batteries with a home made connector so I can power any HP41 with the small, gold coatted ball+spring set (those who deal with the earlier fullnut models know what I mean). I use the D-size battery pack anytime I want to use the card reader, the wand or the 82242A (IR printer module), and the four beasts have been down yet. The last time I measured the voltage in their terminals when using the card reader (VER), I read 5,86 volts. And they are in use for about one year! I must confess that I do not use the HP41's in a daily basis, but the D-size batteries have not even signed they are about to be exhausted... Although I like very much the solution, it is not exactly cosmetic and space-saving. And the handheld use is limitted to the wiring.

I'll add some pictures as soon as I have an acceptable holder for the D-size pack (I simply clampped the plastic halves of the original package together... Shame on me!). Meanwhile I'll try to locate the N-size NiMH, now that I have an identifier.

Thanks and best regards.

*Message #40 Posted by **Vieira, Luiz C. (Brazil)** on 26 Oct 2005, 4:56 p.m.,*
in response to message #39 by Brian Gladman

Hi, Brian;

thank you so much for adding this picture. I downloaded it will print (good image, indeed!) so it is easy to find a 'match'.

As I succeed finding (or not finding), I'm posting again.

Thanks a lot!

Luiz

Re: NiMh 'N' Batteries for the HP-41 Calculator in UK

*Message #41 Posted by **Brian Gladman** on 26 Oct 2005, 5:19 p.m.,*
in response to message #40 by Vieira, Luiz C. (Brazil)

The manufacturer of these batteries is GP Batteries in Hong Kong. They list the GP50NH N cells and the GP23NH 1/2 N cells (for HP41 battery packs rebuilds) here:

http://www.gpbatteries.com.hk/html/techinfo/nimh.asp

where there are data sheets.

I have not yet found anyone who can supply the GP23NH.

Brian

Does the IR module really use so much power?

Re: NiMh 'N' Batteries for the HP-41 Calculator in UK

*Message #43 Posted by **Vieira, Luiz C. (Brazil)** on 26 Oct 2005, 5:01 p.m.,*
in response to message #42 by Gunnar Degnbol

Hi, Gunnar;

I have no figures available (curent consumption), but I use a lot the IR output so I can capture program tracing with an HP48 so debugging is a lot easier. This way, as a program runs, the IR module outputs each step and each new X-register contents. I know that I had a pack of four alkaline N-cells exhausted in less than three months after debugging many programs. I generated a lot of trace output, though, and the HP48G+ was connected to a small laptop so I could trace the HP41 program and see the complete trace listing in the computer screen a few minutes later.

Maybe it is not too much of power consumption, but I use it too often, you see?

Best regards.

HP-41c 'Special Characters'

*Message #1 Posted by **Brian Gladman** on 20 Oct 2005, 11:14 a.m.*

I have been rebuilding my old HP-41c and checking it out by keying in some programs. But entering some special characters is driving me to distraction. I would be most grateful if someone could tell me how to enter the '|-' character (an E without upper and lower horizontals) - I can't find it anywhere on the keyboard and its driving me nuts!

Re: Attaching library on HP48GX

*Message #3 Posted by **Brian** on 27 Oct 2005, 10:05 a.m.,*
in response to message #2 by Arnaud Amiel

Don't know if you are talking about swapping the VAR and 0. I tryed that and got the same error.

Re: Attaching library on HP48GX

*Message #4 Posted by **Ed Look** on 27 Oct 2005, 11:07 p.m.,*
in response to message #1 by Brian

I may be totally wrong, so beware:

I think the library has to be seen by the calculator as an "object", so it may have to be enclosed in the single quote marks, ' ', for example, 'PROG'.

I haven't installed something on my 48G or 48G+ in some time now...

The 9100 and Thomas Osborne

*Message #1 Posted by **Gunnar Englund (Sweden)** on 20 Oct 2005, 2:00 a.m.*

I found this in the archives when I was searching for Thomas Osborne: "What happened to Thomas Osborne after the 9100A? Message #1 Posted by marais on 5 July 2005, 1:56 p.m."

I am extremely happy to inform you that I actually met the man! It happened in the La Posada hotel in Winslow, AZ (a Route 66 landmark). We were sitting at the bar there, I was trying out a Martini and he nurtured his beer. He mentioned Santa Barbara and some other places of significance, so I told him that my heroes (Noyce, Faggin, Hoff and those guys) came from that area. He then said that he used to know most of them. I was very intrigued and dared to ask for his name. It turned out to be Osborne! Thomas Osborne!

As a collector of slide rules and calculators, this was an extreme event to me. There he was -THE MAN! We had dinner together and had lots of fun. He and his wife Paula are travelliing the world in a little yellow plane. A happy man with a great past - and future?

I have his business card and it has a very prominent place in my little collection.

The answer to the subject question is that he approached Bill, telling him that he thought that he could make a pocket calculator after the 9100. He got a team of eight people and the result was the HP 35. Thomas confirmed that the name of the machine reflects the number of keys. Simple as that!

Thomas is now running his independent design firm LOGIC DESIGN in San Francisco when he isn't travelling the world together with his charming wife Paula. I am so glad to have met them both.

Re: The 9100 and Thomas Osborne

*Message #2 Posted by **marais** on 20 Oct 2005, 6:06 p.m.,*
in response to message #1 by Gunnar Englund (Sweden)

Wow, that's amazing, you actually met THE MAN! If I ever met him at a bar, I'd ask him why he did not join HP at the time. He must be a very independent spirit. I envy you for this encounter!

Andreas

Re: The 9100 and Thomas Osborne

*Message #3 Posted by **Gunnar Englund (Sweden)** on 20 Oct 2005, 11:44 p.m.,*
in response to message #2 by marais

Yes, you are right. Should've asked that.

But, you see, I was rather taken by the fact that it was him, so logical questions didn't pop up. We just had a very pleasant evening together. He is in the telephone directory, though.

Re: The 9100 and Thomas Osborne

*Message #4 Posted by **marais** on 22 Oct 2005, 4:56 p.m.,*
in response to message #3 by Gunnar Englund (Sweden)

Well, I wouldn't dare to give him a call. I think his real achievement will be appreciated post-mortem only. It reminds me that I have to call a 9100 my own one day...the design of it is simply stunning, considering that it all happened in the late 60s. I suppose your encounter with the man, as brief as it may have been, will be a tale to tell. Did you talk about his HP days at all?

Andreas

Re: The 9100 and Thomas Osborne

*Message #5 Posted by **Gunnar Englund (Sweden)** on 22 Oct 2005, 6:15 p.m.,*
in response to message #4 by marais

Not much. We were discussing Italian cooking and travelling in foreign countries in general. We had been visiting the Petrified Forest at the same time. Thomas and Paula with their little yellow airplane and we in our little red car. We thought that it was kind of amusing. We remembered seeing that plane in the air above us.

Series 200 software Posted

*Message #1 Posted by **Howard Owen** on 19 Oct 2005, 6:48 p.m.*

From a recent eBay haul, I have posted a dozen or so disk images of old HP series 200 (9816, 9826, 9836) software on retrocalculator.com. The new stuff is listed below. To get to it, click on the "Old Software" link at the above URL.

- HP BASIC 2.0 (RMB) - A complete set including utilities
- IEM FORTRAN 77 for 200 Series
- The Context MBA for 200 Series. Business software on a 9816?
- Terminal Emulator for Series 200. (What, that weird serial port? Yes.)
- System Test for 9816

This stuff joins HP Pascal 2.1 that has been available for some time.

Please let me know about any problems you encounter. I didn't click every link, but I was systematic about creating them so sampling *should* have been enough to test.

Enjoy!

Re: Series 200 software Posted

*Message #2 Posted by **Namir** on 19 Oct 2005, 8:44 p.m.,*
in response to message #1 by Howard Owen

The HP-71B link does not lead to its intended web page.

Re: Series 200 software Posted

*Message #3 Posted by **Howard Owen** on 19 Oct 2005, 9:06 p.m.,*

HP33S - promts for INPUT

*Message #1 Posted by **vq** on 19 Oct 2005, 6:15 p.m.*

I have just started using my new 33s and I'm having problems with using the INPUT command. Well, it works fine, but I can't find any way to define a prompt to show when asking for a value in a program. This way it's quite difficult to memorize what the single-letter prompt means. Is there any way how to specify a prompt to be used in INPUT command? Thanks for any comments VQ

Re: HP33S - promts for INPUT

*Message #2 Posted by **Crawl** on 19 Oct 2005, 9:03 p.m.,*
in response to message #1 by vq

If I understand your question correctly, you don't just want the prompt "V?" but something more descriptive, like "Volume?" or even "Please Enter Volume?"

The manual talks about this, sort of. I don't know if the calculator can do *exactly* what you want, but you should set the calculator so equations are displayed rather than executed (set flag 10, IIRC), then before the input type your prompt with the equation editor (for VOLUME - RCL V, RCL O, RCL L, RCL U, etc.), then put a PSE after it so the user will have time to read it.

As far as I know, that's the best that can be done.

Re: HP33S - promts for INPUT

*Message #3 Posted by **Thomas Radtke** on 20 Oct 2005, 4:15 a.m.,*
in response to message #2 by Crawl

On the 32SII you don't need the PSE. If omitted, the message will stay until you type in your number, i.e.

SF 10
ENTER A (in equation mode)
STO A

does a good job. Probably the same on the 33S?

Thomas

Re: HP33S - promts for INPUT

*Message #4 Posted by **Crawl** on 20 Oct 2005, 10:20 a.m.,*
in response to message #3 by Thomas Radtke

I checked and you are correct; you don't need the pause.

Re: HP33S - promts for INPUT

*Message #5 Posted by **bill platt** on 20 Oct 2005, 11:52 a.m.,*
in response to message #3 by Thomas Radtke

By the way--this is the greatest advantage to the 33s over the 32sii---with all that memory (about equivalent to what 7k would be in 32sii) you can actually use descriptive prompts in your program, without worrying about running out of memory.

In the 32sii, the concept was there, but the tiny memory made it an unuseable feature for any really long programs.

Regards,

Bill

HP33S - promts for INPUT

*Message #6 Posted by **vq** on 25 Oct 2005, 2:57 p.m.,*
in response to message #3 by Thomas Radtke

Thanks for advice. I checked and yes, it helps somewhat. In fact, I like the behaviour of INPUT as it (1) shows the hint on upper line, (2) shows current value on bottom line, (3) accept R/S without a value to keep the original value. Using the recommended technique (hints via EQN after SF10) I can [SF10; RCL A; AS= *(in eqn mode)*; STO A] which does (3) above but I find no way to achieve (1) and (2) which is a pity. It seems there's no way of doing it which is a shame. Or am I wrong? Thanks for any comments vq

Re: HP33S - prompts for INPUT

*Message #7 Posted by **Paul Brogger** on 26 Oct 2005, 1:54 p.m.,*
in response to message #6 by vq

How about something like:

```
-- . . .
-- 5                ; initial value
-- STO X
-- SF 10
-- X = TIME VALUE   ; EQN mode
-- PSE
-- CF 10
-- INPUT X          ; user types R/S to continue
-- . . .
```

It doesn't display the legend *while* the value is being input, but it does let the user know what's coming . . .

Edited: 26 Oct 2005, 1:55 p.m.

HP33S - promts for INPUT

*Message #8 Posted by **vq** on 26 Oct 2005, 4:22 p.m.,*
in response to message #7 by Paul Brogger

Good idea, Paul. Probably the best way - it shows the current value and the A? hint in top row is not too confusing when preceded by the explanatory message shown before the INPUT.

Unfortunately, the problem discussed shows the 33s system is far from being optimised for the nice hardware features (two line display, lots of RAM). Well, for everyday CALCULATION (not COMPUTATION) needs I think 33s is very fine. I had a 48gII and after few months gave

it away - too big for me, problematic stiff keyboard, battery hungry... All larger tasks I do on a PC anyway. Thanks again vq

CP/M autoload

*Message #1 Posted by **Jim Rudnick** on 18 Oct 2005, 9:05 p.m.*

Is it possible to switch drives (1 to 0 and 0 to 1) on a HP-9133D? The CP/M master disk requires 'Autost' to reside on lowest drive and my 9133D floppy is drive 1 and the fixed disk is drive 0. I don't want to install the master files on the hard drive. Internal jumpers maybe?

Re: CP/M autoload

*Message #2 Posted by **Vassilis Prevelakis** on 19 Oct 2005, 2:19 p.m.,*
in response to message #1 by Jim Rudnick

IMHO it depends on the model of your 9133.

Check the manual on bitsavers: http://bitsavers.org/pdf/hp/disc/09134-90032-Aug-1983.pdf

in response to message #1 by Howard Owen

Yes-The programs with the lower case 'g' are binaries for the HP-86,7. The other programs are HP supplied and user supplied. A good find I would say. they need to be copied and freely shared. If you prefer, copy the disc and offer for sale on eBay. Jim

in response to message #2 by Jim Rudnick

I bought them with the intention of making them available (for free). It's only one of 30 or so disks! (Only one for the 80 series, as far as I can tell.)

The disk has errors halfway through. I've copied all the good sectors, along with garbage for the bad ones. Hopefully the damage only cut across 3-5 files.

In your site you mention that the problem was in sectors 32 - 35. Assuming 16 sectors per track (as used by the 9121 drive), that means that sectors 512 till 560 of the medium will have problems.

Now looking at the CAT listing of the diskette:

```
   NAME      START  NBLOCK    TYPE     LENGTH   RECLEN     IMP BYTES
BUILD          16       2    BASIC        276      256     1401 0001

MUNAVL        599      27    BASIC       6845      256     bd1a 0001
MAKE PROG     626       7    BASIC       1672      256     8806 0001
CBIN          633       1    BPGM          61      256     3d00 0001
COUNT         634       2    TEXT         512      256     d901 0001
```

We see that file TERMIN contains the bad blocks (it starts on sector 464 and occupies the next 115 sectors). You will find that this file has problems.

It may be, however, that the drive has "spared" tracks, i.e. spare tracks that have been used instead of the damaged tracks. In this case the file may be recoverable if you copy the original floppy to a known good floppy on the 9121.

Best Regards

No big loss, its just a terminal emulation program. I am really happy that the binary utilities apparently escaped unharmed.

You can still use André Koppel 0x38 rom to identify the keywords of the HP86 binaries (if you have an image of the disk and an S80 emulator)

For more informations, I can still disassemble binaries.

Olivier

Oh, please, there is a command catalog at the beginning of each ROM or binary file. It only takes 40-50 lines of C to pretty-print this info.

in response to message #1 by Howard Owen

Looks like you got the HP-86/87 Binary Utilities package which contains:

```
8291002 - Logical Interchange Format (LIFg)
8291011 - String/Retrieving Programs as Data (GETSAVg)
8291013 - Sorting Groups of Elements of a String (SORTB2g)
8291016 - Enhanced String Manipulation (STRNGBg)
8291018 - Mathematical Functions (MATHBIg)
8291020 - Numeric Array Organization/Initialization (REDGZERg)
8291022 - Programmer Control of CRT/Keyboard (IPBINg)
8291024 - Enhanced CRT, Cursor, Keyboard Control (FORMSBg)
8291030 - FORMS/80
8291033 - Graphical Cursor (GCURSg)
8291035 - Enhanced String Input/Cursor Control (LINCURg)
8291036 - Immediate Execute Keys (KEYONg)
8291003 - Graphics Tablet Display (TRACKg)
```

(the 8291xxx number is the Series 80 Program Library Catalog number).

I have documentation for some of these utilities and summaries for the rest. I will post these as soon as I get home.

Re: Recognize this HP-87 CATalog?

*Message #13 Posted by **Howard Owen** on 19 Oct 2005, 4:54 p.m.,*
in response to message #12 by Vassilis Prevelakis

Thanks Vassilis!

Like I said, there were 3 tracks in the middle of the disk with errors. I haven't gotten to the point of figuring out which files were affected yet.

I'm about to post the major part of my haul on retrocalculator.com. Stay tuned!

HP-86/87 Binary Utilities package

*Message #14 Posted by **Vassilis Prevelakis** on 19 Oct 2005, 11:56 p.m.,*
in response to message #12 by Vassilis Prevelakis

the contents are as follows:

```
8291001 - Logical Interchange Format (LIFG)
8291002 - Logical Interchange Format (LIFg)
        Provides LIF type 1 interchange to allow file transfer to 9826,
```

9642, RTE-7. (Contains both binary and BASIC programs).

8291030 - FORMS/80
FORMS/80 is a data entry/display package created to simplify application programs that require data entry/display, provide a convenient user interface, and provide independence of the CRT Form from the Applications program. Consists of 3 binary programs, two for the creation and modification of a form; the third provides operating system and BASIC language extensions which allow a BASIC program to utilize the form.

8291035 - Enhanced String Input/Cursor Control (LINCURg)
Binary program designed to enhance string input by allowing you to input any character (including the comma and quotation marks) as a string variable and to move the cursor to any location (of the alpha display) on the CRT.

8291036 - Immediate Execute Keys (KEYONg)
Binary program designed to define any key on the keyboard as an immediate-execute key (similar in operation to the special function keys).

8291002 - Graphics Tablet Display (TRACK)
8291003 - Graphics Tablet Display (TRACKg)
binary program designed for use with the 9111A Graphics Tablet. TRACKg uses the CRT as a visual display of the movements of the pen on the tablet. The program can be very useful in generating graphics when used in conjunction with the BREAD function in the Plotter ROM.

8291010 - String/Retrieving Programs as Data (GETSAV)
8291011 - String/Retrieving Programs as Data (GETSAVg)
Normally, Series 80 computers store programs in their own unique internal language. GETSAVg is a binary program designed to enable you to store and retrieve programs as data. When a program is saved as a data file, it can be read, modified or rewritten as string data by other programs.

8291012 - Sorting Groups of Elements of a String (SORTB2)
8291013 - Sorting Groups of Elements of a String (SORTB2g)
SORT2B is a binary program designed to sort groups of elements of a string. Two sort procedures are available. Both produce the same result, however, one of the procedures requires no additional memory to operate.

8291015 - Enhanced String Manipulation (STRNGB)
8291016 - Enhanced String Manipulation (STRNGBg)
STRNGBg is a binary program which contains eight programmable string functions designed to enhance string manipulation. The functions are as follows: 1) highlight, 2) lowercase, 3) repeat, 4) reverse, 5) trim, 6) rotate, 7) search and replace, and 8) number of manipulation.

8291018 - Mathematical Functions (MATHBIg)
MATHBIg is a binary program containing nine programmable mathematical functions including hyperbolics, octal to decimal and decimal to octal conversions and factorial.

8291020 - Numeric Array Organization/Initialization (REDGZERg)
REDZERg is a binary program designed to enhance numeric array manipulation capabilities of the HP86/87. A numeric array can be reorganized (redimentioned) or initialized to zero with use of one of the two statements offered.

8291021 - Programmer Control of CRT/Keyboard (IPBIN)
8291022 - Programmer Control of CRT/Keyboard (IPBINg)
IPBINg is a binary program designed to provide programmer control of the internal CRT and keyboard. Capabilities are intended to make development of a good terminal emulator

```
                possible. Capabilities provided are also intended to be of
                general use in CRT control or special keyboard entry or
                control.

        8291023 - Enhanced CRT, Cursor, Keyboard Control (FORMSB)
        8291024 - Enhanced CRT, Cursor, Keyboard Control (FORMSBg)
                FORMSg is an binary program designed to enhance control of
                the CRT, cursor, and keyboard. The functions or expressions
                offered are: page, cursor, xpos, ypos, home, readchar,
                writechar, key1, key2, key3, setkey, and end key.

        8291032 - Graphical Cursor (GCURS)
        8291033 - Graphical Cursor (GCURSg)
                This is a binary program designed to provide graphics cursor
                capabilities. You should be familiar with the Graphics
                Section of the HP-86/87 Owner's Manual and Programming
                Guide.
```

Re: Recognize this HP-87 CATalog?

*Message #15 Posted by **Vassilis Prevelakis** on 21 Oct 2005, 3:06 a.m.,*
in response to message #1 by Howard Owen

The file COUNT is assembler source:

```
10 !          NAM COUNT
20           DEF RUNTIM
30           DEF ASCIIS
40           DEF PARSE
50           DEF ERMSG
60           DEF INIT
70 PARSE     BYT 0,0
80 RUNTIM    BYT 0,0
90           DEF COUNT.
100           BYT 377,377
110 ASCIIS    BSZ 0
120           ASP "COUNT"
130           BYT 377
140 ERMSG     BSZ 0
150           BYT 377
160 INIT      BSZ 0
170           RTN
180           BYT 0,56
200 COUNT.    BIN
220           LDM R40,=0,0,0,0,0,0,0,0
221           LDM R50,=0,0,0,0,1D,0,0,0
230 LIN1      ADM R40,R50
244           CMM R40,=0,0,0,0,0,0,0,1D
245           JNC LIN1
250           PUMD R40,+R12
260           RTN
265 !ASSEMBLE "CBIN"
266 ONER      DAD 56215
270           FIN
```

I suspect that the BPGM file CBIN is executable version of the above program. This is the hex dump of CBIN:

```
 000000000000    434f554e  54200200    00000000  00000000    *COUNT .........*
 000000000010    00000000  00000000    00002600  2c002400    *..........&.,.$.*
 000000000020    32003300  00000000    3600ffff  434f554e    *2.3.....6...COUN*
 000000000030    d4ffff9e  002e9860    a8010ae4  9e......    *.......`........*
```

Anybody knows what this thing is supposed to be doing?

Hello all,

This BPGM : CBIN is not the binary belonging to that assembler source code.

Your assembler source code for COUNT seems to be a WAIT function of some sort.

Patrice

Re: Recognize this HP-87 CATalog?

*Message #17 Posted by **Valentin Albillo** on 24 Oct 2005, 4:44 a.m.,*
in response to message #15 by Vassilis Prevelakis

Hi, Vassilis:

It's been ages since I last programmed in Series 80 Assembler, but seems to me this assembler source is nothing but a very basic training example.

As far as I can tell, this source simply defines a single keyword, a function named COUNT which takes no parameters and does nothing except increment a counter and test whether it's reached a final value, which is returned. An attempt to comment your source follows:

```
      10 !         NAM COUNT
      20           DEF RUNTIM      define for the runtime table
      30           DEF ASCIIS      define for the ASCII name table
      40           DEF PARSE       define for the parse table
      50           DEF ERMSG       define for the error messages table
      60           DEF INIT        define for initialization
      70 PARSE     BYT 0,0         no parse table
      80 RUNTIM    BYT 0,0         run time table
      90           DEF COUNT.      a single keyword, COUNT
      100           BYT 377,377
      110 ASCIIS    BSZ 0
      120           ASP "COUNT"    function's ASCII name
      130           BYT 377
      140 ERMSG     BSZ 0          no error message table
      150           BYT 377
      160 INIT      BSZ 0          no special initialization
      170           RTN
      180           BYT 0,56       a function, no parameters, returns numeric value
      200 COUNT.    BIN            set binary mode for math
      220           LDM R40,=0,0,0,0,0,0,0,0    load 0 into R40-47
      221           LDM R50,=0,0,0,0,1D,0,0,0   load increment in R50-57
      230 LIN1      ADM R40,R50                  loop: add increment in R50-57 to R40-47
      244           CMM R40,=0,0,0,0,0,0,0,1D   compare multiple: see if R40-47 exceed
fixed final value
      245           JNC LIN1                     logical test: if no carry, then loop
back to label LIN1
      250           PUMD R40,+R12                multi-byte push, returns final value in
R40-47
      260           RTN                          end execution
      265 !ASSEMBLE "CBIN"
      266 ONER      DAD 56215
      270           FIN
```

All of this is purely from memory from several decades ago, so there may be errors in the comments above.

Best regards from V.

HP 48G - PCB for 512K RAM upgrade

*Message #1 Posted by **Caribe T** on 18 Oct 2005, 6:01 p.m.*

I have looked at some of the various RAM upgrade sites on the net. For the addition of a 512K chip, there seems like one needs to put it on to a PCB of some type.....however, I haven't been able to find any information about the PCB (like whether it can be bought ready to use or whether it has to be hand-made). Can anyone give me the story about it? Thanks in advance.

HP 12C

*Message #1 Posted by **Randy** on 18 Oct 2005, 5:49 p.m.*

I have an old 12c and it has a flashing * in the lower left corner of the display. Can anyone tell me what it means and how to get rid of it?

Thanks in advance

Re: HP 12C

*Message #2 Posted by **Tomas Fischer** on 18 Oct 2005, 8:03 p.m.,*
in response to message #1 by Randy

It indicates that the battery is running low. To fix it, replace the batteries :) It takes 2 LR44, SR44, A76, 357 or EXP76. Hope that helps Tomas

Re: HP 12C

*Message #3 Posted by **blurdybloop** on 18 Oct 2005, 8:07 p.m.,*
in response to message #2 by Tomas Fischer

Radio Shack sells SR44s as type 303 silver-oxide batteries, catalog number 23-104.

By the way, new production HP-12c use a different battery, so make sure that you check the battery compartment rather than go by messages posted here.

Re: HP 12C

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 19 Oct 2005, 7:13 a.m.,*
in response to message #3 by blurdybloop

Older HP-12C uses 3 (three) 1.5V button cell battery tipe LR44 or equivalent (alkaline) or SR44 (silver oxide, expensive but lasts longer)

Newer models uses a single lithium 3V coin cell (CR2032? anyone?)

Best regards,

Nelson

(CR2032? anyone?)

Hello Nelson,

You're right, CR2032 by what I can remember and according to HP-12C specs page. By the way, do you know where I can find SR44 cells here in Curitiba? So far, I've only been able to find LR44 cells, mostly Maxell brand.

Best regards,

Gerson.

Re: HP 12C

*Message #6 Posted by **blurdybloop** on 20 Oct 2005, 2:19 a.m.,*
in response to message #5 by Gerson W. Barbosa

I checked my (2005 production) HP-12c and indeed it takes a CR2032.

For older HP 10 series calculators, HP lists any of the following as being suitable:

Eveready (or UCAR) A76 (alkaline), 357 (silver oxide)
RAY-O-VAC RW82 (alkaline), RS76 or RW42 (silver oxide)
National (or Panasonic) LR44 (alkaline)
Duracell MS76 or 10L14 (silver oxide)
Varta 4276 (alkaline), 541 (silver oxide)

I don't know if you have Radio Shack stores in Brazil; they are ubiquitous in North America. Radio Shack catalog number 23-104 is a type 303 silver oxide battery which is listed as a substitute for: Type A, WS14, SB-A9, GS14, 9, 521, EPX77, 8002, 303, 1130SO, SR44, D303, D357, SP303, V303, SR44SW.

The Radio Shack batteries themselves are stamped Energizer and either 303 or 357/303.

Re: HP 12C

*Message #7 Posted by **Gerson W. Barbosa** on 20 Oct 2005, 11:38 a.m.,*
in response to message #6 by blurdybloop

Thanks for the info. I'll take a better look at local photo stores. We don't have Radio Shack stores here (We have Sam's Club and Wall Mart stores though - but the HP-12C is the only HP calc they sell)

Regards,

Gerson.

HP15 User mode

*Message #1 Posted by **Frederick Harvie** on 18 Oct 2005, 3:05 p.m.*

I have a HP15 which is in the user mode and I can't get the user mode to turn of . the calculator passes both the self test and the keyboard test. Any suggestions would be appreciated.

Re: HP15 User mode

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 18 Oct 2005, 4:10 p.m.,*
in response to message #1 by Frederick Harvie

Hi, Frederik;

to get rid of the USER mode, press [f][USER] ([RCL] key) again. The [f][USER] sequence toggles the USER mode On and OFF.

Cheers.

Luiz (Brazil)

Re: HP15 User mode

*Message #3 Posted by **Frederick Harvie** on 18 Oct 2005, 4:53 p.m.,*
in response to message #2 by Vieira, L.C. (Brazil)

The calculator does not respond to pushing "f""rcl" . It seems to be stuck in the user mode and my initial thought was the key was bad but it passes the keyboard check

Re: HP15 User mode

*Message #4 Posted by **Vieira, L.C. (Brazil)** on 18 Oct 2005, 8:46 p.m.,*
in response to message #3 by Frederick Harvie

Hi, Frederick;

if you wanna give it a try, clear all memory with [ON][-]. Try this:

```
turn the calculator off;
presws and hold the [-] key;
while pressing the [-] key, turn the calculator back on;
release the [-] key
```

You should see

```
[ Pr Error ]
```

The USER annunciator should be off, now. But you´d loose all of your data.

Luiz(Brazil)

48's

*Message #1 Posted by **Ron** on 17 Oct 2005, 11:56 p.m.*

I have a 48GX and a 48SX, and I have had a 48G+. Was there ever just a 48, with no letters?

Re: 48's

*Message #2 Posted by **Arnaud Amiel** on 18 Oct 2005, 3:26 a.m.,*
in response to message #1 by Ron

> Quote:
>
> I have a 48GX and a 48SX, and I have had a 48G+. Was there ever just a 48, with no letters?

No but there also was a 48G and a 48S and there still is a 48Gii which has nothing to do with the other 48 series.

Arnaud

Re: 48's

*Message #3 Posted by **Eddie Shore** on 18 Oct 2005, 8:40 a.m.,*
in response to message #2 by Arnaud Amiel

The 48GII is the 49G+ minus the secure card slot and some RAM; and has the black cable connector instead of the USB cord. So the 48GII really belongs in the 49 family.

Re: 48's

*Message #4 Posted by **I, Claudius** on 18 Oct 2005, 9:34 a.m.,*
in response to message #3 by Eddie Shore

Is the 48GII cable similar to the serial type as the ones used for the 48/49?

Re: 48's

*Message #5 Posted by **Tim Wessman** on 18 Oct 2005, 9:48 a.m.,*
in response to message #4 by I, Claudius

Nope. It is a USB connector on the end, and a 9 on the other. The cable has a little circuit board inside of the 9 pin connector that takes power from the 9 pin and does some conversions on the signal in transit. I have not heard of anyone sucessfully using the cable with anything but a computer.

Re: 48's

*Message #6 Posted by **I, Claudius** on 18 Oct 2005, 9:29 p.m.,*
in response to message #5 by Tim Wessman

Thanks. Since you're a 49+ user, do you have one of later serial numbers, or in short, how's your keyboard / general build quality?

Re: 48's

*Message #7 Posted by **Arnaud Amiel** on 19 Oct 2005, 3:26 a.m.,*
in response to message #6 by I, Claudius

I have one of the later ones (2005). The keyboard is as good as on a 48. However the paint job is not very good and the labels look a bit fuzzy. The best would be to try before you buy.

Arnaud

Re: 48's

*Message #8 Posted by **I, Claudius** on 19 Oct 2005, 10:18 a.m.,*
in response to message #7 by Arnaud Amiel

Thanks. I went through several 49+s a while back, a real disappointment.

Your "try before buy" has me laughing, no where I know (around where I live) lets you try a calculator before you buy as they're all in sealed packages. But actually, it's a great idea. If models were out on display for potential buyers to play with, it would help quite bit.

Re: 48's

*Message #9 Posted by **Arnaud Amiel** on 19 Oct 2005, 10:24 a.m.,*
in response to message #8 by I, Claudius

> Quote:

Here in the UK the 49 and 33 and maybe others come in cardboard boxes.

Arnaud

Re: 48's

*Message #10 Posted by **Crawl** on 19 Oct 2005, 2:36 p.m.,*
in response to message #8 by I, Claudius

The Office Depots around here have a lot of calculators out on display so you can play with them before buying. However, they're mostly TI's. The only HP I remember for a fact being out was a 12C.

I played with a 33s at WalMart before buying by pushing the buttons through the plastic (not an idea situation, but it works). That wouldn't work for a 49G+ even if

they were available in stores (but without demo copies), since they're packaged without their batteries connected. I've never seen a 49G+ in any physical store in any shape or form.

Indirect Addressing

*Message #1 Posted by **Eddie Shore** on 17 Oct 2005, 11:51 p.m.*

Is indirect addressing possible on either the 39g+ or 49g+? Thanks.

Re: Indirect Addressing

*Message #2 Posted by **Marcus von Cube, Germany** on 18 Oct 2005, 3:53 a.m.,*
in response to message #1 by Eddie Shore

Eddie,

you can GET from a {list} or a [vector] and you can EVAL any quoted 'name'. In algebraic notation 'L(index)' gets the indexed value from a list (You probably need to EVAL to see a result.)

Re: Indirect Addressing

*Message #3 Posted by **Eddie Shore** on 18 Oct 2005, 8:43 a.m.,*
in response to message #2 by Marcus von Cube, Germany

OK, thank you Marcus. I checked the manuals of both calculators and neither have an "indirection" command. I will probably use a list.

Re: Indirect Addressing

*Message #4 Posted by **Namir** on 18 Oct 2005, 9:23 a.m.,*
in response to message #1 by Eddie Shore

Indect addressing apepared in earlier HP calculator that had numbered registered and labels. Today, the HP33s has indirect addressing that works with the single-letter memory registers and labels. The graphics calculators don't have it since they support named variables. As the other comments pointed out, you can access specific elements in lists in a manner similar to accessing array elements in regular programming languages.

HP11

*Message #1 Posted by **Dave Bleam** on 17 Oct 2005, 8:34 p.m.*

I found an old HP11 (still in working condition), but I forgot how to run the linear regression program on it. Can somebody jog my memory? Dave

Re: HP11

*Message #2 Posted by **Namir** on 17 Oct 2005, 11:27 p.m.,*
in response to message #1 by Dave Bleam

First make sure the stat sum registers are clear by pressing the [f][GSB] keys.

To enter data:

1) Type the value for y 2) Press [Enter] 3) Type value for x 4) Press the [sigma plus] key

To get the linear regression coefficients press [f][sigma +] keys.

To remove data:

1) Type the value for y 2) Press [Enter] 3) Type value for x 4) Press the [g][sigma plus] keys

Re: HP11

*Message #3 Posted by **Dave Bleam** on 18 Oct 2005, 11:07 p.m.,*
in response to message #2 by Namir

Thank you for your help: those steps got my Y intercept point; does this have the capability to calculate the slope also? (using Y=ax+b formula)?

Re: HP11

*Message #4 Posted by **Namir** on 19 Oct 2005, 9:19 a.m.,*
in response to message #3 by Dave Bleam

To see the slope, click the [x<>y] button after you click the [f][sigma +] keys.

I suggest you either buy a copy of the HP-11C user's manual from eBay or get the museum CDs/DVD that contains the two manuals (user's manual and applications manual) for the HP-11C.

HP-11C *back plate*

*Message #5 Posted by **Karl Schneider** on 19 Oct 2005, 9:54 p.m.,*
in response to message #3 by Dave Bleam

Dave posted,

> Quote:
>
> does this have the capability to calculate the slope also? (using Y=ax+b formula)?

Crikey! Didja take a look at the back plate of the HP-11C (assuming it is still there, and readable)? It's got a diagram 'n' everything for the "L.R." linear regression function.

Namir posted,

Re: HP11

*Message #7 Posted by **Ron Ross** on 19 Oct 2005, 10:52 a.m.,*
in response to message #1 by Dave Bleam

You can probably download the Hp12c manual in PDF format from Hp. The Stats and linear regression are either the same or very close in operations. If you can just select chapters, you can be selective.

Re: HP11

*Message #8 Posted by **Namir** on 19 Oct 2005, 11:45 a.m.,*
in response to message #7 by Ron Ross

The HP-12C has linear regression commands that are quite different from the HP-11C. For one, the 12C does not have keys to calculate the slope & intercept and push them into the stack like the 11C does.

Re: HP11

*Message #9 Posted by **Dave Bleam** on 20 Oct 2005, 9:36 p.m.,*
in response to message #8 by Namir

Mine still has a pretty intact back plate; its got some good info. I still like the idea of buying the manual. The backplate doesnt give me enough information to run the LR program. Namir's instructions were right on the money. Incidently, I'm 53; the oldest guy in my Physics class. The calculator is older than some of the students; next week I'll bring in my slide rule.

Upgrade HP 48G 32K RAM chip

*Message #1 Posted by **Caribe T** on 17 Oct 2005, 8:25 p.m.*

I want to upgrade the 32K chip in my 48G. However all the information that I find on the net about doing the upgrades (to 128K, 256K etc) have been done with chips such as the "128K (8bit) static ram chip SMD package (SO32) (HM628128LFP-8 (Hitachi) or KM681000BLG-7L (Samsung))". However it seems that these parts are not readily available - being older model chips, I take it that they have been replaced with newer and larger chips. Can anybody tell me what 'newer' chips I could use that is readily available, that I can just substitute right in place of the chips that are used in the 128K-256K upgrades? Will a "131810 IC,SRAM,628128LP" work (it is 1028K I think). Any help is much appreciated. Thanks

Edited: 17 Oct 2005, 8:29 p.m.

Re: Upgrade HP 48G 32K RAM chip

*Message #2 Posted by **randy** on 17 Oct 2005, 10:08 p.m.,*
in response to message #1 by Caribe T

On the contrary, they're still around as new. 128K x 8 - M5M51008DFP70HIA0-ND from http://digikey.com $4.50 each, in stock.

Edited: 17 Oct 2005, 10:08 p.m.

Re: Upgrade HP 48G 32K RAM chip

*Message #3 Posted by **Caribe T** on 17 Oct 2005, 10:55 p.m.,*
in response to message #2 by randy

Thanks very much for that!! Would you happen to know if any on the larger chips can be substituted. For example, to upgrade to 256K requires piggy backing 2 128Ks.....can you put a single 256K on there (if they make them)? If you can, do you know what chip that is? Thanks again

Re: Upgrade HP 48G 32K RAM chip

*Message #4 Posted by **I, Claudius** on 18 Oct 2005, 9:41 a.m.,*
in response to message #3 by Caribe T

There are a number of sites listed by www.hpcalc.org on how to upgrade your 48g. I did one with a 128K, it came out all right except I could not get the case to close right again. I had a friend who was an expert machinist drill four very small recessed screw holes at the corners of the case so I could reassemble it tightly. Now I can also take it apart again easily should I wish.

Later I bought a 48g that had been upgraded to a 1 MB memory by Cynox from Germany, outstanding. I'm not sure if they're still doing this, you might want to visit their website. Best of luck.

Lead based solder

*Message #1 Posted by **Arnaud Amiel** on 17 Oct 2005, 9:30 a.m.*

From the middle of next year, here in Europe and probably elsewhere in the world, lead based solders will be illegal. Replacement solder usually melt at higher temprature and are not as mechanically strong. How would this affect maintenance of older electronic equipment (calculators). Should I stock large quantities of lead based solder or can anyone recommend an alternative?

Any ideas or clarification welcome.

Arnaud

Re: Lead based solder

*Message #2 Posted by **Ron Ross** on 17 Oct 2005, 9:41 a.m.,*
in response to message #1 by Arnaud Amiel

Stock up? Unless you repair these calculators for profit or have a lot of them, one spool should last you for a long time. (for the older electronics, I certainly would suggest always using the lower temp solder to alieviate (reduce) thermal stress. But unless you repair on a continual basis, a single roll (or two) should last you a long time. But it isn't a prohibitive cost to have a few rolls for a security blanket if you so desire.

Re: Lead based solder

*Message #3 Posted by **Arnaud Amiel** on 17 Oct 2005, 9:51 a.m.,*
in response to message #2 by Ron Ross

I was just thinking of buying 2 rolls instead of one!

Arnaud

Re: Lead based solder

*Message #4 Posted by **Meindert Kuipers** on 17 Oct 2005, 10:39 a.m.,*
in response to message #3 by Arnaud Amiel

Buy enough to last a lifetime. I will certainly stock up myself. You may consider to buy some stock of components as well. Many IC vendors are obsoleting products and this may be your last chance to get some in Europe, unless you can setup a 'grey' channel through the US. Note that the rules are valid for parts of Asia as well (Japan even has more strict rules than Europe), so US manufacturers that build for export will have to comply with the rules.

There are theories that the Roman Empire fell due to the mental state of the leaders being influenced by the lead in the drinking water because of the lead plumbing (only the rich had plumbing, Pb is the chemical symbol of lead). Maybe these RoHS regulations have a good side after all ....

Meindert

Is that why lead acetate is called "sugar of lead"? ;-)

Re: Lead based solder

*Message #7 Posted by **Bernhard** on 17 Oct 2005, 1:18 p.m.,*
in response to message #6 by bill platt

Hi folks,

two years ago, when noticing the legislation against lead-based solder, I went out and bought as much lead-based solder I could carry, 20 kilograms at least.

It is not advisable to use the new lead-free solders to repair our beloved HPs or any other electronics equipment based on leaded solder. Remember the trouble with old Tektronix scopes that needed a special silver-based solder because their electronic components were soldered to ceramic carriers ? Impossible to repair properly without the special solder !

Coming to repairs, the whole leadfree electronics campaign looks like a scam engineered by the consumer electronics industry which presumably might have bribed some corrupt EU politicians to pass such legislation.

Fact is, the new leadfree solders are less ductile and more brittle than lead solder and they won't stand vibrations and / or thermal cycles for a long time before they fail. From my own experience, it is almost impossible to hand-solder them without damaging parts and printed circuit boards by thermal stress, except when working so quick as to risk a cold solder joint.

Be prepared for virtually throwaway (unrepairable) extremely short-lived consumer electronics from TV sets to cars. I will certainly not buy any of those.

Critical systems such as medical electronics, aircraft, military electronics etc. will continue to use the more reliable lead-based solder.

Only the consumers are the fools.

And of course, lead-based solder in any electronics is absolutely no health hazard as long as old equipment is properly disposed of and recycled. All the metals could be regained in the process.

So the remaining reasons for banning lead in solder are greed, corruption, and sheer stupidity.

BTW, when they banned leaded fuel in the 1980's they substituted it with benzene, a potent cancerogen. When the Nazis did the same with their synthetic fuel back in the late 1930s,

the death rate of the pump attendants rose so quickly they had to switch the Reich's filling stations to self - service.

So, folks, be careful, especially when filling your cars... (wear disposable plastic gloves).

regards, Bernhard

I see to remember (it's been over 32 years since my last high school German class) that the German word for "gasoline" is "Benzin".

Re: only to US!

*Message #9 Posted by **M. currie** on 23 Oct 2005, 10:04 a.m.,*
in response to message #8 by Mark Crispin

There is some confusion in terminology, depending a bit on where you live. Benzene with an "e" is the nasty stuff, C6H6, but in American English at least, benzine with an "i" is just another word for naphtha (i.e. lighter fluid, paint thinner, Coleman fuel, or white gas).

I spent two years in Germany, 1989-90. Is benzene the reason the high-octance gasoline smelled different from US formulations? I remeber the "benzene ring" from high-school chemistry, and that it was a toxic, aromatic hydrocarbon.

As for fatal illness from inhaling vapors -- I've noted that the filler-nozzle "vapor capturers" that were introduced in Germany in the late 1980's do make a big difference. They are mandatory in the US urban areas; I see and breathe more vapors when filling up in rural areas without these attachments.

They're not mandatory in *all* US urban areas; or if they are, it's not enforced. Here in Birmingham, Alabama I've seen very few of them; in fact, I can't recall seeing one in the last few months. Most gas nozzles have circular "splash guards" but the vapor-capturing devices are much rarer around here. I frequently have to move to the upwind side of the nozzle to avoid breathing the vapors.

Re: Gasoline additives

*Message #14 Posted by **Bernhard** on 19 Oct 2005, 2:37 p.m.,*
in response to message #13 by Karl Schneider

AFAIK, US legislation limits benzene content of gasoline to 1%. German high octane fuel legally may have up to 5%, actual content varies around 3%. The vapors are most dangerous, but it will also penetrate the uninjured skin and move to the target tissues: fat, bone marrow, brain, where it accumulates. Short term toxic effects are damage to the bone marrow, decrease of blood coagulation capability, and destruction of capillary walls. Long term effects are immune system defects, mutations, and Leukemia. Trouble is, benzene vapors are heavier than air and accumulate towards the ground - especially city kids get their own special dose. Since internal combustion engines do not burn all the fuel, and with cold catalytic converter, cities typically have about 30 micrograms Benzene per cubic meter of air, mean value, which means high-traffic roads and in winter concentration may be much higher. Air at filling stations without the suction devices had 100 times that concentration. Not a very healthy place to work at, or to buy food like butter or icecream there (remember: fat accumulates Benzene like a sponge).

Re: Gasoline additives

*Message #15 Posted by **bill platt** on 19 Oct 2005, 3:32 p.m.,*
in response to message #14 by Bernhard

Hi Bernhard,

Too bad I didn't have you on my side in a heated discussion over on C.S. HP48 regarding environmental legislation some months back. A number of euros were bashing the US in every way and pretending that somehow Great Europe had a monopoly on clean living.

Of course what we all know is that all of our democratic governments are messy things full of good intentions, hidden agendas, outright corruption, greed and power struggles.

So we have crazy inconsistencies in laws in every place.

It is interesting how much more toxic benzene is than any of its close relatives (styrene, toluene, xylene, vinyl toluene etc) though even the relatives have some troubling aspects.

From briefly reading up on the subject, the real hazard of the benzene is that the mechanism of elimination from the body--metablolisis--leaves a number of extremely toxic residues. This also explains why the relatives with side chains are not as bad generally-they metabolize into less dangerous residues.

Lesson from this:

In chemistry, family relations mean little to toxicological specifics.

Never trust adulterated food products. e.g. hydrogenated oil. God Only Knows what that stuff really is and how our bodies deal with it.

Don't sniff your new chinese rubber boots--you might get a nasty headache and leukemia to boot.

I cannot even imagine how many thousands of chinese are probably being harmed by their enormous rubber industry.

Re: Gasoline additives (OT)

*Message #16 Posted by **bernhard** on 20 Oct 2005, 6:30 p.m.,*
in response to message #15 by bill platt

Hi Bill,

you wrote:

"...Great Europe had a monopoly on clean living..."

this would make a good joke - if we weren't the victims. US citizens (total US population 296 Million) can hardly envision what it means to crowd 457 Million EU citizens into 41.6% of the space of the USA.

No wonder we Europeans have to endure more stench and dirt and hence, pretend to be more alert to environmental issues.

With some exceptions (such as LA) I found that US cities I visited had apparently cleaner air than any EU city I know of. From the airplane, a typical US city has a brown dome of air pollution over it and the rest of the sky is blue. Europe has a brown layer of air pollution all over its area and you need to climb a mountain to be above that brown toxic brine and enjoy a truly blue sky. Cities are worse than the countryside, of course.

One of the most evil scientific experiments currently being carried out in Europe is the field test of the effects of nanoparticles on the lungs of 457 Million human guinea pigs. Those who schemed that evil plan have developed a novel automotive diesel engine which produces lots of nanoparticles and they have passed laws which give vehicle tax benefits to cars using that engine, so these cars are everywhere now. Contrary to the stinking black clouds coming from prior art diesel engines which have larger (visible) particles that are filtered out and eliminated by the human's upper airways, the novel engines produce invisible nano-fine particles that pass the natural filters and go directly to the alveoli, where they accumulate any might even pass into the blood (as they are so small). The health hazard of those particles is under severe dispute. Those scientific studies who are paid for by the automotive industry claim no danger, while some critical voices were silenced by threat of lawsuits (or worse).

If the truth ever comes out, the resulting product liability ligitation might drive all of the european car manufacturers which have sold such cars into bankcrupty: some sources claim that in Austria alone (which has only 8.2 Million inhabitants, but the highest percentage of those cars on the road), 8000 children per year die (or get gravely ill)

due to those diesel exhaust fumes. Extrapolate this number to all of Europe and no corporation, regardless of its size, will be able to pay the penalty.

Seems that in the US, you can be happy your gasoline is so cheap that diesel engines for consumer cars never got a significant foothold.

Regards, Bernhard

in response to message #16 by bernhard

In the USA (but not Canada) diesel fuel is much more expensive than gasoline (as much as $.70/gallon). This is because fuel oil is divided here. Oil soldto heat homes is heavily subsidized and dyed, and oil for diesel vehicles is undyed and taxed to pay for the subsidy. One thing that is periodically done to truck drivers is an inspection of their fuel tanks; if there's any dye found the driver is in a *lot* of trouble.

In Canada, diesel is about $.05/liter cheaper than gasoline.

Consequently, in the USA diesel is primarily a fuel for large trucks, buses, and ships. Diesel is considered by many Americans to be bad-smelling and dirty. There are only a few diesel cars, mostly European imports, none of which sold well.

The most common American consumer vehicle with a diesel engine is a motorhome (or RV); but even then, most motorhomes are gasoline powered and only the largest Class A motorhomes use diesel. Class B and Class C motorhomes are almost always gasoline.

The latest fad among the enviro-freaks is something called "biodiesel" which is made from soybeans rather than petroleum. Of course, they overlook the small detail of producing those soybeans...

As evidence that it may be the wrong things getting the attention again, I have a newspaper article here saying that a major cause of particulates in the air we breath in Southern California is-- ready for this?-- brake linings being ground down by all the stop-and-go traffic. So while emissions standards (in grams per mile at constant speeds) keep getting tighter, the problem of the number of miles gets no attention, our roads get more congested, and we end up with other problems.

National Geographic had an article on water several years ago

where they estimated that 80% of the polution of our rivers, lakes, and streams was from urban runoff-- mostly engine oil and radiator and transmission fluid. All IC cars have these, and even hybrids do-- but not electric cars. Yet the auto manufacturers, who don't want to make them, push their FUD (fear, uncertainty, and doubt) agenda about them.

I just pulled out a water quality report on our local ground water. There are apparently 2 parts per billion of lead in it, and the action level is 15 ppb. Leakage from the local landfill with a bunch of electronic waste is *not* one of the suspected contributors, but erosion of natural deposits *is*. Again the RoHS barks up the wrong tree. Maybe I need to get into medical or military electronics after all. Those two fields will be allowed to continue using lead because people's lives depend on the greater reliability lead gives.

Are you suggesting that there is a law banning use of lead solder in any electronics other than military or medical?

It this is true, all I can say is "my god, what has this world come to".

Lots of stupid laws. Just last month, Connecticut *banned* motor scooters (vespas, mopeds etc) as being too "dangerous". Great timing. Rising gasoline prices, so let's ban one of the tools to reduce consumption. 3 guys at work bought 4 cycle mopeds last year. 90 mpg in town riding. Now they will be illegal.

Oh, and by the way, motorcycles are extremely poplar in CT-- and helmets are not required. (But children are required to wear bicycle helments--that's real consistent, huh). No discussion of banning *them*--only banning the "sissy" mopeds.

The diesel thing has always bothered me. I was in London in 1993. The place reaked of diesel all the time. Just a pall of diesel. Of course in Rostock, Germany in 1998, in the evening, it was a strong odor of coal--nothing compared to the soft coal smoke of the "former days" though...

RoHS (often pronounced "ROW-hoss"), the restriction of "hazardous" substances (including lead), goes into effect next July in Europe. Our company will no longer be able to export our products to Europe until we get away from lead and can certify that the product is safe. (If someone else exports it for us, I suppose that's their business. We don't have many customers there anyway.) Soon after that, some of the orient will be onboard. California has a very limited RoHS-like law that goes into effect in 2007. Chicken Little's band is growing.

Indeed. It always amuses me to have Europeans lecture North Americans about environmental stewardship, given what a complete mess they made of their continent. Perhaps they see themselves as civilized missionaries out to warn the ignorant savages. What hubris!

The "ignorant savages" in North America have more forested land today and *much* more wildlife than we had a century ago. Even our modern industrial areas, such as Prudhoe Bay, are places where wildlife thrives.

Whereas every time I go to Europe, I'm struck by how bad the air smells and how sickly the vegetation looks.

I'm sure that the European Union bureaucrats will attempt to ban the import of electronics that use lead solder. Fortunately the WTO should stomp that out.

*Message #27 Posted by **Garth Wilson** on 18 Oct 2005, 3:55 a.m.,*
in response to message #4 by Meindert Kuipers

I grew up in northern Argentina where our water came to us in pure lead pipes. A bunch of us American kids went through a little English boarding school there because our parents were were afraid that otherwise we'd have trouble in school when coming back to the U.S.. An unusually high percentage of the kids went on to become doctors and engineers. The lead pipes certainly did not hurt our mental capabilities one bit.

As for temperature, I believe I read that the new lead-free solders melt at around 250ºC. Does

anyone know if this is correct? 60/40 tin/lead melts at 185. When I worked in applications engineering at a VHF/UHF power transistor manufacturer 20 years ago, I sometimes had to do IR scanning of die surface temperatures with the transistor working under very stressed conditions to simulate a harsh military environment. When there'd be a void in the brazing that was supposed to attach the die to the package, sometimes I'd see temperatures over 350ºC *while the transistor was operating*. This dramatically shortened the life of the transistor (partly from accelerated metal migration), but did not cause catastrophic failure. I believe 500ºC was where it would go poof and fail with a flash, but as it got up there the runaway condition would happen too fast to measure the temperature, at least with the equipment we used at the time.

I understand the soldering temperature limitation on many plastic packages to be due to the fact that the plastic directly contacts the die inside the IC, and can damage it at high temperatures. As long as you're not soldering all the pins at once however, the die will not get that hot. My soldering iron idles at nearly 500ºC, which makes it easier to solder leads very quickly, before much heat has gotten into the part. I find that if I try to solder before the iron is up to temperature, it takes so much longer to transfer enough heat that it becomes much more likely that I can't hold the part with my hand. It gets too hot, ironically because the iron is not hot enough.

Anyway, I'll be stocking up for life with tin/lead solder for the things we don't sell.

in response to message #27 by Garth Wilson

Lead-free soldering in production is best done with a vapour phase setup. The temperature is much better controlled than infra-red reflow. Typically temperatures are between 230-250 degrees C, depending on the exact solder type.

Handsoldering is a different issue of course. I prefer high temperatures of my iron for the sake of speed as well.

The flow rate in the pipes and the water condition have more to do with it.

Boston has a much more serious lead problem in the water, due to the nature of the water

there, which leaches the lead out faster than many other regions.

I think the point Garth is making is really that lead is not always some evil thing, and that it can be safely used--but hte devil is of course in the details.

Re: Lead-based solder

*Message #31 Posted by **unspellable** on 18 Oct 2005, 2:00 p.m.,*
in response to message #29 by I, Claudius

The amount of lead in the water from the plumbing varies greatly depending upon the chemistry of the water, temperature, flow, etc. For example, the pot metal used in today's faucets contains trace amounts of lead. The first glass of water drawn i nthe moring will have the most lead in it from the faucet because the water standing in it overnight has time to leach out the lead.

Modern pewter is pure tin, or as pure as is practical. Antique pewter has perhaps 10% lead alloyed with the tin to make it harder. Actually, 98% of modern "pewter" isn't pewter at all but some sort of pot metal. You have to go out of your way to find real genuine pewter. (Tin isn't all that cheap ya know.)

The bottom line would be the extent of nerve and brain damage, regardless of the mg/dL. FWIW, we were definitely not isolated. We went into town often and knew a lot of people. Dementia, alzheimer's, senility, schitzophrenia, etc. did not seem to be as much of a problem as we see today in modern American society. I can't take the time now to do a web search to try to validate or invalidate that observation.

Interesting, or should I say, muy interasante. I'm glad you and those there apparently suffered no ill effects. I've probably breathed in enough lead solder fumes from my own electronic projects to more than make up for lack of it in my water.

Just the other day on BBC's tech website I read this article:
http://news.bbc.co.uk/2/hi/programmes/click_online/4341494.stm

where the effects of mere mcg/dL were discussed, so I was primed to just spout off a comment.

Re: Lead-based solder

*Message #34 Posted by **bernhard** on 19 Oct 2005, 3:06 p.m.,*

My ten cent about dangers of lead water pipes and soldering:

Depending on the water, the pipe's interior walls may cover with mineral deposits which shield the drinking water from coming in contact with the lead. The older the house, and the thicker the deposits, the better. Usually no danger then. But lead piping used with soft water (especially when the water is slightly acidic) may be a terrific health hazard. In any case, lab analysis will quickly and cheaply show proof whether the drinking water is contaminated or not.

When soldering, always use a device which draws away the toxic fumes. It's not only because of the lead, but also because of the flux agents. Always wash your hands thouroughly after having touched lead-based solder and before touching any food. The real dangers with lead-based solder lurk when working with them and neglecting safety procedures. But once they are in a finished product, they are no danger to the user or consumer, as he will never touch (or is supposed to never touch) the circuit boards.

Other speculation in addition to the lead salts used to sweeten the wine was that pueter (lead and tin) drinking cups were used to drink their wine. Being somewhat acidic, would also help the Roman to get his share of minerals.

The tomato got a bad rap by the Europeans in the middle ages (dark) about being a poisonous fruit, but again this was due to the lead used in their dishes which would react with the acid of the tomato.

AREUH Assembler Document Translation from the French

*Message #1 Posted by **Howard Owen** on 16 Oct 2005, 8:44 p.m.*

I have a new essay up at retrocalculator about my recent activities on the HP-71B. In particular, I've set out to learn Saturn assembler in the context of the 71. In the course of this, I discovered the AREUH assembler, which seems like a nice alternative to the FORTH/Assembler ROM. (There may be better ways, but it is important to me that I use contemporary tools if I can.) The README, and a nice essay by Mike Markov are in English, but the rest of the documentation is in French. I used Google to get a rough literal translation of the main documentation file, then finished things off by hand. The result is here. I'd appreciate it if a French speaker or two could compare my text to the original French text. As I say in my essay, you are welcome to roll on the floor laughing at the translation, but please point out to me what seems funny if you do. 8) Also keep in mind that the translation is not literal. Where possible I have preserved word choices. Otherwise, I've tried to convey the meaning. In a few cases, I have added to the text in order to clarify what I think it means.

Thanks in advance for your *critique*!

Re: AREUH Assembler Document Translation from the French

*Message #2 Posted by **J-F Garnier** on 17 Oct 2005, 8:08 a.m.,*
in response to message #1 by Howard Owen

Hi Howard,

Great attempt to translate the Areuh documentation!

"MACHIN" doesn't mean "MACHINE"! At that time, the Assembler from the Forth ROM wasn't so much appreciated by Pierre and Janick and "MACHIN" has a strong pejorative meaning. You can use the word "THING" instead.

There are a few other obvious mistranslation, I will send my corrections directly to you.

Regards.

J-F

Re: AREUH Assembler Document Translation from the French

*Message #3 Posted by **Howard Owen** on 17 Oct 2005, 12:05 p.m.,*
in response to message #2 by J-F Garnier

Thanks, J-F!

Google translated "MACHIN" as "THING" and I could tell from the context that it referred to the Forth/Assembler ROM, but I didn't know it was a derogatory term. I'll restore Google's original translation.

Problem printing with a HP2225B

*Message #1 Posted by **Ronald** on 16 Oct 2005, 10:21 a.m.*

Hello,

I have a problem with printing on a HP2225B thinkjet printer.

The HP2225B is hooked up with the HP IL interface via IL as only device in the loop.

I have checked flags 21 and 55: Both are set (and verified that they are set). If I start up without the printer hooked up, both are cleared, after connecting both switch to the "set" status.

IL module works (checked with HP82162A printer.

Executed "Autoio"

Did a findid on HP222B and got "1" as response.

Printer detect paper works (yellow blinking Led switches to full on when paper taken out).

Batteries are fully loaded.

Print advance works.

Changing the settings for flag 15 and 16 does not make any difference.

Selftest for printing testpage does **NOT** work.

I used a fully new Printhead.

When I execute the "PRX" command I get "transmit error" I exchanged the PCB board and got exactly the same error. I checked both the IL as the printer manual but not a single reference to this "transmit err".

Based on this it looks like the IL interface is working. The HP 41 is detecting the printer oké and the transmit error comes somewhere from the communication between the CPU on the PCB board and the printhead.

Any suggestions, I am at this moment having a blank in my mind ?

Thank you

Ronald.

*Message #2 Posted by **Tony Duell** on 17 Oct 2005, 3:34 p.m.,*
in response to message #1 by Ronald

Forget the HP41 for the moment...

At power-on (of the 2225B), do you get the 'carriage shuffle'? Does it move away from the left side, and then return to detect the home position?

What exactly happens when you try to print the test page? Do the carriage and paper move and just no ink appears on the paper or what?

FWIW, I have the Thinkjet service manual...

Re: Problem printing with a HP2225B

*Message #3 Posted by **Ronald** on 18 Oct 2005, 8:24 a.m.,*
in response to message #2 by Tony Duell

Hi Tony,

When I swith the printer on the printhead moves all the right and back again.

If I try to pint the testpage nothing happpens.

The flexcable was replaced with a complete new one. I I measure with a DVM om the circuit board with the printhead out it has a vry high resistance between the corner connection and all the other points on the flexcable. When the printhead is mounted, it measures on all pinns between a 130 - 160 ohms. For that reason I think the cable is fine, the printhead makes the right connections.

Does the servicemanual say anything on this IL error ?

Kind regards

Ronald

Re: Problem printing with a HP2225B

*Message #4 Posted by **Tony Duell** on 19 Oct 2005, 6:15 a.m.,*
in response to message #3 by Ronald

You need not worry about the flexible cable or the printhead for the moment. There is no way that the printer's CPU can tell if those are working properly, so if the machine doesn't 'go through the motions' of printing the self-test page, the problem is elsewhere.

I think it sounds like you have a problem with the home sensor. This is a slotted optoswtich mounted on the print mechanism which detects a plastic 'flag' on the carriage. It's got 4 wires going to it, wired to a connector that plugs into the logic board.

I would start by making sure there's nothing in the slot -- bit of paper or whatever. It is connected to an 8 pin chip on the logic board which is a standard voltage comparator -- something like a LM393 (but don't replace it with one of those without me checking the manual first, this is from memory and I've not worked on a Thinkjet for some time). I would then start checking voltages round that chip to find whether the optoswitch itself was OK, etc.

Re: Problem printing with a HP2225B

*Message #5 Posted by **Ronald** on 19 Oct 2005, 10:43 a.m.,*
in response to message #4 by Tony Duell

Hi Tony,

Thank you for the suggestion, I will check this out. The carriage (if this is the correct word) for the printhead does indeed looks a little bit different to the old one, so .... I have hopes again.

Will report later back on the outcome.

Thanks

Ronald.

Re: Problem printing with a HP2225B

*Message #6 Posted by **Ronald** on 23 Oct 2005, 6:57 a.m.,*
in response to message #5 by Ronald

Hi Tony,

CI checked out the end of carriage detector. If I take it out, the carriage will run untill it's mechanical end and after 5 seconds the motor trying to drive him stops. So I assume that is working oké. I then changed the motherboard completely. No change at all. I changed the end of carriage detector and out of paper also from the other printer I had. No change.

If I give a "PWRUP" command with the printer on, IL connector connected, it returns very quick in the HP41 with no error's. If I however switchg the printer of or disconnect the IL connectort at the printer's connector I get after maybe 5 seconds also the "trasmit error" in the display of the HP41.

Any more idea's maybe ? You do have by any means a scanned part of the service manual so I do some circuit level tracing with my osciloscope of DVM ?

Gr.

Ronald

*Message #7 Posted by **Tony Duell** on 24 Oct 2005, 2:29 p.m.,*
in response to message #6 by Ronald

When you said 'removed' the sensor, do you mean you disconnected it from the board as well? I have an idea the LED is used as a voltage reference for the comparator circuit.

Apart from the sensor and the mainboard (both of which you say you've swapped out with good parts, not that I aprove of module-swapping...), the only other things involved are the carriage feed stepper motor and mechanical bits. I can assure you (from the schematics and from experience) that a fault in the paper feed mechanism or in the cartridge/flexiprint will not cause any errors. It just won't work.

Alas I have no scanner, so no way to send copies of bits of the service manual. But if you send me an e-mail (my address is unmangled), I'll talk you through it.

Re: HP-97 Case Yellowing

Re: HP-97 Case Yellowing Eh? Don't you mean the 2225B

*Message #9 Posted by **Tony Duell** on 25 Oct 2005, 6:38 a.m.,*
in response to message #8 by Ronald

I hopefully sent you a long-ish e-mail message last night giving some information I extracted from the service manual.

In particular, the carriage should pass through the home switch _twice_ after power-on. If not, the problem is either the home switch optoswitch, something on the logic PCB, or a mechanical problem (motor, gearing).

Also, what does the yellow LED do? It should blink twice and go out. If it carries on blinking, there is a problem on the logic board (basically, the CPU, ROM or RAM have failed the self-test). If it blinks twice, goes out for a couple of seconds, then starts blinking, the problem is that the carriage did not find the home position (which is what I suspect).

If you are _sure_ the logic board and the home switch sensor are both good, then the problem has to be either the motor (very unlikely as it moves the carriage) or a mechanical problem.

*Message #10 Posted by **Vassilis Prevelakis** on 18 Oct 2005, 5:47 a.m.,*
in response to message #1 by Ronald

If you want to get it working for fun, then excellent, its a fun printer to play with, but if you think you can actually use it, I have bad news for you.

This printer is really bad, probably because it was the first inkjet that HP produced, the ink slowly leaks and can cause a real mess in the print head compartment, the inkjet head nozzles clog up etc.

The interface to the (disposable) printhead is also very fussy and you have to be **really** careful when you clean this up (esp. when cleaning after a leaky printhead) not to damage the little bumps that make contact with the printhead. If this happens, you have to live with the missing dots. I do not think you can repair the flex cable with the contact bumps.

The trick is to use the printer regularly (at least once a week, preferably more frequently), to keep the ink in the printhead and the nozzles clear. Then your ThinkJet will work nicely.

If you plan to store it, make sure the printhead is removed to prevent the inevitable leak from ruining the printer. I usually place the printhead in plastic wrap (used to wrap food) to keep the ink from drying up, some times even this does not work.

Quality is what you'd expect from a 9 pin matrix printer from the 80s, only worse. I get much better printouts from my Epson MX-80 and FX-80 printers (and their HP-IB versions).

I have a stack of ThinkJet printers (mainly HP-IB units) I bought for their HP-IB to HP-IL bridge circuit and they been nothing but a disappointment. The only ThinkJet I try to maintain in some sort of working order is the one that is part of my Integral PC. I wish HP has used a thermal printer for that machine.

Best Regards

**vp

Re: Problem printing with a HP2225B

in response to message #10 by Vassilis Prevelakis

Ho Vassilus,

Reason is pure sentiment journy. We used this printer later for producing the manauals for the Eramco MLDL boxes in the past.

At that time we had the Epson FX80 printer and later this one not making the rattlesnake noise but a nice zoem zoem. It was small, you could take it along easily, battery operated. It was a real gimmick (if that word already existed at time).

I know the ink is awfull, I had it last week by accident on my shirt, it took a chlorine to get it bleached again.....

Kind regards.

Ronald

41c special alpha characters

*Message #1 Posted by **Hal** on 16 Oct 2005, 1:23 a.m.*

Hi guys, Am new to the 41c world, so forgive me if this question is overly elementary.

How to I execute programs that have special characters in their names, with no apparent way to key in those characters while in alpha mode. Specifically, I'm working with the C+ routine in the Math module. The module directions say to press XEQ, then ALPHA, then key in C+, then press ALPHA again to execute. How do I key in a + while in ALPHA mode?? I know I can assign the function to a key in user mode, but according to the module directions, I should be able to key in the function name while in ALPHA mode.

Any help appreciated.

Re: 41c special alpha characters

*Message #2 Posted by **don wallace** on 16 Oct 2005, 2:03 a.m.,*
in response to message #1 by Hal

Hi Hal.

You get "+" by using shift.

DW

[A bit more specifically.. [41c special alpha characters]

*Message #3 Posted by **Karl Schneider** on 16 Oct 2005, 2:49 a.m.,*
in response to message #1 by Hal

Hal --

There is a table on the back of HP-41 models that illustrate the ALPHA mode key assignments. The table indicates that, when the yellow shift key is not used, the characters printed within the key outline are entered. These, invariably, are the ones printed in blue on the keys.

The alpha characters and commands that must be entered by using the shift key are shown above the key outlines on the table. (APPEND is available only in PRGM mode.)

in response to message #3 by Karl Schneider

Ah yes...the shift key...the table on the back...it's all so obvious now. Thanks very much.

While I've got you guys one more question if I may:

Is there any way to execute a function directly from the catalog listing? (I.e. without having to type in the function name or assign it to a user key?) Thanks again, Hal

XEQ from CATalog [was: 41c special alpha characters]

Unfortunately, not with the standard HP-41C/CV/CX. That is an annoying inconvenience that was remedied in the HP-42S.

Hoever, I remember reading once that one of the highly-advanced non-HP ROM's (e.g., PPC ROM, HEPAX, ZENROM) offered the capability of executing the function shown in a directory listing by hitting "XEQ".

Re: XEQ from CATalog [was: 41c special alpha characters]

*Message #6 Posted by **Meindert Kuipers** on 17 Oct 2005, 1:28 p.m.,*
in response to message #5 by Karl Schneider

Just tested it: this works with the CCD ROM. It replaces the normal CAT and can be recognized by the apostophe:
CAT'0: list of IL devices
CAT'1: normal CAT 1
CAT'2: normal CAT 2 with XEQ and assign key by pressing A
CAT'3: normal CAT 3
CAT 4: better version of EMDIR
CAT'5: same as ALMCAT
CAT'6: list of key assignments
CAT'7 to F: CAT 2 of the module in that port

The PPC ROM certainly does not have this feature, I do not know about the other ROMS.

Meindert

Re: XEQ from CATalog [was: 41c special alpha characters]

*Message #7 Posted by **Raymond Del Tondo** on 19 Oct 2005, 5:18 a.m.,*
in response to message #6 by Meindert Kuipers

Hi,

the extended CAT functionality (w/direct XEQ and ASN)
is available in the CCD ROM (and in the CCD OS/X;-) only.

The other ROMs (HEPAX, ZEN) don't have it, the ZenROM
has a similar extended ALPHA mode like the CCD ROM.

Other ROMs are specialized for other tasks, like HEPAX or AECROM,
but IMHO no other HP-41 ROM can compete with the
keyboard/user interface extensions of the CCD ROM.

That's why the only ROM always in my HP-41 is the CCD,
or more precisely the CCD OS/X.

Raymond

*Message #8 Posted by **don wallace** on 16 Oct 2005, 9:57 p.m.,*
in response to message #4 by Hal

Hi Hal.

Only with a user program in ram or a application pack, you can:

do CAT 1 or 2 to get the listing. R/S to stop listing at prgm of interest. press the <- key to exit CAT

Ress R/S to start execution at that label...

hope this helps.

*Message #4 Posted by **Masao Kinoshita** on 16 Oct 2005, 11:09 a.m.,*
in response to message #3 by Raymond Del Tondo

It is actually quite usable since only the "keys" need to be pressed and not the mnemonics on the land area above the "keys" for the shifted functions.

Tip: At work, I use a 4-in-one [(hp)] iPaq stylus pen, so that I don't have to pull out the wristband stylus every time I want to use the touchscreen. :-)

*Message #5 Posted by **Paul Brogger** on 17 Oct 2005, 11:27 a.m.,*
in response to message #4 by Masao Kinoshita

A way to reduce clutter in the display:

Show the shifted functions on the keytops, but only after the related shift key is pressed. That way, the keys could be made bigger, and you don't need to show all the shifted legends until they're actually to be used.

But, way cool! I thought my Armitron four-banger watch was neat ~20 years ago (never had an HP-01), but this is beyond Dick Tracy!

Thanks!

That suggestion has languished in my private to-do list for ages now... I'll try to squeeze it in when I get back to working on Free42 (I am moving at the moment so now is not a good time to do any serious work, but hopefully a couple of weeks from now...).

in response to message #1 by Masao Kinoshita

I've been running Free42 on my Abacus WristPDA (the less exepnsive version of the Fossil) for a while now, but hadn't thought to post a message. Abacus is Fossil's low-end line, and the Abacus WristPDA is functionally nearly identical to the Fossil-branded one, but has a somewhat different case and band. For a while they were available for $80 from TigerDirect; I'm not sure if they still have them.

I mostly use the Abacus as a watch, and only use the PDA features if I forget to carry my Treo 650 (which is also running Free42).

Re: Thomas Okken's HP 42S simulator running on a Fossil wristwatch

*Message #11 Posted by **Eric Smith** on 17 Oct 2005, 6:56 p.m.,*
in response to message #1 by Masao Kinoshita

By the way, if you want a less functional RPN calculator on your PalmOS device, Jonathan Purvis ported my older CSIM simulator for the HP-35/45/55 to the Palm, so I also run that on the Abacus watch and the Treo 650.

There will eventually be a PalmOS port of Nonpareil, but I haven't had time to work on the architectural changes needed to make the simulator core more portable.

Series 80 Programmable ROM module clone (PRM-85) update

*Message #1 Posted by **John** on 15 Oct 2005, 3:47 p.m.*

Hi,

I have updated my web page with further details on the PRM-85 module:

http://www.vintagecomputers.freeserve.co.uk/hp85/prm85.htm

This is a clone of the Series 80 (HP-85/87) Programmable ROM module, which allows EPROM copies of ROMs to be used. This is mainly to allow access to the Assembler and Extended Mass Storage ROMs, and also for the HP-85 Service ROM.

Please take a look, and if interested please e-mail me and I will add your name to the waiting list (currently 5 names long).

I (and others) would be interested if anyone has a Service ROM for either an HP-86 or HP-87. Please get in touch if you would like to help make a copy for use as an EPROM.

Regards, John

49g+ program needs help

*Message #1 Posted by **joshua williams** on 15 Oct 2005, 1:17 p.m.*

Hello all, I have a program that I am trying to get right using HPUserEdit 4.0. The purpose of this equation is to be able to solve for any of the variables that I want. If someone has one out there that I can emulate from that would be great! Maybe if I could enter "X" into the variable I need to know or something like that and then have it solve for X... anyway I hope this question is understood, here it is: « "Henderson-Hasselback" { "pH" "pKa" "Cbase" "Cacid" } { 1 18 } { } { 0 0 1 1 } INFORM IF THEN OBJ DROP pH pKa Cbase Cacid 'pH=pKa+LOG(Cbase/Cacid)' STEQ 30 MENU "Q" TAG END »

Re: 49g+ program needs help

*Message #2 Posted by **I, Claudius** on 15 Oct 2005, 6:17 p.m.,*
in response to message #1 by joshua williams

Considering the power of the HP49, I'm not so sure I would try use the old 48 Multiple Equation Solver for an equation this simple, nor would I bother to write a program for it, it really isn't necessary.

If this is something you'll use often, create a directory, name it say, Chem. Then store the equation as a named variable, say HH. You can then shove the equation onto the stack, solve symbolically for any of the equation variables, use SUBS to assign numeric values and you have your answer.

You can also store the equation and use the solve equation feature which was also in the old 48. This may be the simplest way to go about what you want.

The best way to handle this sort of thing is to use SolveSys, available for free download from www.hpcalc.org which does a marvelous job of solving linear and nonlinear systems of equations. It is fast, bug free, and when fired up, identifies all variables, which can have values assigned or unassigned, as the user wishes. The program comes with complete loading and using documention. As the program can create a lot of variables, depending on just how big or numerous your equations are, it's a good idea to create a directory to store just this one program in, that way the variables don't interfere with others in Home or other directories. Best of luck.

New HP-71B Program - YATZ71

*Message #1 Posted by **Howard Owen** on 15 Oct 2005, 10:08 a.m.*

http://retrocalculator.com/software/yatz71-1.0.tgz

From the README:

YATZ71 is the result of my attempt to reacquaint myself with the joys of programming in BASIC on a memory constrained computer from the 1980s. I never touched an HP-71B back then, let alone programmed one, but there were, nonetheless, strong points of reference between the machines I did use and this cool little handheld BASIC computer. Even though the BASIC on the 71 is much better than Applesoft, to give an example of a language I used an awful lot, the similarities were stronger than the improvements HP's BASIC offered. In a nutshell, BASIC sucks. The line numbers clutter the code visually, and nine times out of ten serve no other purpose than that. Compounding this, the interpreter in both machines renders all keywords and variable names in upper case only, regardless of how you type them in. Then there's the generous provision of two whole characters for variable names themselves. And the second character has to be a number! Yecch! I knew all of this at one time, and blissfully forgot about it as I went on to more capable languages, with their own set of endearing quirks and foibles.

So why do I feel so good about having written this stupid little Yahtzee clone in BASIC? I guess it's the pride of having overcome the visual clutter, the enforced spaghetti, the unhelpful variable names, the slow speed and tiny memory to produce something that actually works. This is a game that I actually play every day. (But I'm easily amused.)

But there's also the fun of the time I spent playing with the cool toy that is the HP-71B while writing this program. It really is a remarkable little machine, considering what its contemporaries were up to. I had to learn how to use HPILLINK, for example, in order to be able to edit the source in an environment where I could search for variable names and so forth.

Re: New HP-71B Program - YATZ71

in response to message #1 by Howard Owen

> Quote:
>
> on a memory-constrained computer from the 1980s

The 71 came with only about 17K of RAM, of which 16K was available to the user. Third-party modules allowed adding a whole lot more. My own 71 has an extra 160KB of RAM in two ports, and, if you wanted to pay enough enough back then, there was a company that would hard-wire 256KB inside so it wouldn't take up any of your ports.

> Quote:
>
> the similarities were stronger than the improvements HP's BASIC offered. In a nutshell, BASIC sucks.

A factor that made HP-71 BASIC potentially so great was the LEX (Language EXtension) file contributions from the user groups which added so many great functions to the BASIC. LEX files are written in assembly and add statements, functions, operators, and program structures that actually become part of the BASIC. They usually come with BASIC programs to get them entered into memory without needing an assembler or text editor. You might be able to get much of that from the CD ROMs offered by this website, hpmuseum.org. I keyed mine in from the CHHU Chronicle, the magazine of the Club of Hewlett-Packard Handheld computer Users in the 1980's.

> Quote:
>
> The line numbers clutter the code visually

I sometimes used my text editor to write a program with no line numbers (using labels to branch to), spacing things the way I want, and then another little program that adds the line numbers and uses TRANSFORM to turn it into a BASIC file. The Forth/Assembler ROM comes with a text editor, but I was able to write a much better one using the user group LEX files. WorkBook 71, by Richard Harvey in Glendale, AZ is a set of programs for spreadsheet, file management, and report generation. He included a full-screen text editor for use with one of the video adapters. Maybe some here knows if WB71 is on the CD ROMs.

Using this text-editor-TRANSFORM process to write a program, you will not get the error-checking every time you enter a line, but you can make your code clearer with meaningful white space (indentation, etc.) so that once you're familiar with the language, the likelihood of entering erroneous lines is diminished. The process lets you start with long variable names if you wish, in both upper- and lower-case, and then use your search-and-replace function at the end to change them to names BASIC likes.

Although the 71 BASIC variable naming method was definitely suboptimal, their system did allow you to run everything together on a line, with no spaces in most cases, and the 71 could figure it all out. I don't think that would be possible with long variable names.

> Quote:
>
> the enforced spaghetti

The Paname module provided other programming structures like a multi-line CASE statement. I never did get that one myself. I don't know if there might be LEX files available that you could key in yourself that might get the same functions.

> Quote:
>
> the slow speed

The 71 is sure slow by today's standards, but was very fast at math for its time. With the math module, you could do complex FFTs twice as fast as a PC running GWBASIC, and a whole lot bigger. It took about 40 minutes for me to do 8K-point FFTs on data downloaded from a digital oscilloscope over the IEEE-488 interface. A 1K-point took about 4 minutes, using 12-digit floating-point (which was overkill).

> Quote:
>
> I had to learn how to use HPILLINK, for example, in order to be able to edit the source in an environment where I could search for variable names and so forth

If you have the program in text form, you can do the search with a text editor. If the program is in BASIC form, there's a variable cross-reference program that lists all the variables used and where they are referenced in the program. You'll find it in the HP-71 Users' Library Solutions, Utilities book, HP number 00071-90066, which again might be available in the CD ROMs available from this website.

I have a 64K CMT module and three HP 4K modules in my work system. That gives me more than a stock Apple][had. The theoretical maximum of 512K, or even the 256K you mention, were huge by contemporary standards. But I stand by the description of the machine as "memory constrained," compared to the 1GB in two of my servers, my laptop and my main workstation, that is. 8)

I can access the swap disks, so I can load all the great LEX files from that source. I agree that's one of the coolest features of the HP-71B, and of the HP-75 before it.

I don't think it is. One of my interests in working with these machines is to conserve old software and documentation. If anyone has a copy of this software lying around, I'd love to hear from you.

That's making a virtue from necessity. The underlying problem was the lack of memory.

As HrastProgrammer notes below, I think you mean the JPC ROM. I've played with this great ROM using emu71, including the nice structured programming elements. It certainly goes a long way toward making me more comfortable with the BASIC. With those mods, the HP-71 basic starts to approach the flexibility and power of Rocky Mountain BASIC, which was the best contemporary BASIC I know of.

There's a problem with relying on a custom ROM though. If you want to distribute software, then you have to assume your users will have the ROM you are using. For example, In my current efforts with the HP-71B, I'm trying to disassemble certain LEX files so I can add to them. One disassembler I've come across is DISASMKW, by Mike Markov. Here are the first two lines of that program:

```
0010 ! DISASMKW - (c) by Michael Markov, 1988/06/13 version 123
0020 ! Needs  TSORTLX9, DISASMLX, EDLEX, JPCROM, HPILROM AND STRINGLX
```

Yikes! Well, I can still use this software, but only under emu71, since I don't have a real JPC ROM at my disposal.

> Quote:
>
> The 71 is sure slow by today's standards, but was very fast at math for its time. With the math module, you could do complex FFTs twice as fast as a PC running GWBASIC, and a whole lot bigger. It took about 40 minutes for me to do 8K-point FFTs on data downloaded from a digital oscilloscope over the IEEE-488 interface. A 1K-point took about 4 minutes, using 12-digit floating-point (which was overkill).

Interesting measure of the performance of this little guy!

In terms of YATZ71, the slowness shows up in the graphics. I first tried to use BINIOR to write a cursor under the dice images. I got this to work, but it was unusably slow. (I could probably get reasonable speed with a custom implementation in assembly.) What I finally ended up doing was toggling the dice images in response to numeric inputs. This is still slow, but borders on being usable.

> Quote:

> If you have the program in text form, you can do the search with a text editor. If the program is in BASIC form, there's a variable cross-reference program that lists all the variables used and where they are referenced in the program. You'll find it in the HP-71 Users' Library Solutions, Utilities book, HP number 00071-90066, which again might be available in the CD ROMs available from this website.

No, it's not there. There is a lack of extant material for the 71B on the Internet today. I want to try to remedy that, as far as I can, by providing a repository of such information at retrocalculator,com (or hp71.org, which I've also registered.) If you have any materials that you would like to donate to this effort, I'd be delighted to hear from you. 8)

That's one I have. My other one is 96K in the card reader port, which was all I could afford at the time even though CMT offered up to 160K in the card reader port. My total is 177K. That quantity would never be necessary except that I like to keep 100 or so files in there all the time and still have room for large data arrays.

> Quote:
>

Hmmm.... that fills up your ports, not leaving room for anything else.

> Quote:
>
> The theoretical maximum of 512K

You can't have 512K of RAM though, because some of the address space is taken by ROM, at least for the OS if not for other modules as well (HPIL, Math, etc.).

> Quote:
>
> But I stand by the description of the machine as "memory constrained," compared to the 1GB in two of my servers, my laptop and my main workstation, that is. 8)

But do consider how efficiently any given computer uses memory. Back before I had Windows on my PC, I had a 32MB HD, but never filled more than about 20MB of if in spite of the many complex multi-layer printed circuit board layouts on it, all the embedded software projects on it, the manuals, endless letters and E-mail (plain text only, which takes one byte per character), the OS and my CAD, assemblers, compilers, and device programmer software and probably a lot of things I'm forgetting now. I had 1MB of RAM and never ran out.

Ah yes, you're probably right. I think it came from the Paris user's group, which is why I said "Paname."

> Quote:

After learning the 71 system well, I used HP's Rocky Mountain BASIC 5.1 at work and absolutely hated it. I expected it to be better than 71 BASIC, but there were all kinds of things it couldn't do that the 71 did with ease, and with a lot less memory. There seemed to be a lot of discontent with HP BASIC in the field, and TransEra took advantage and introduced HTBasic. I never had the oportunity to try that. When we dumped the HP BASIC we went to a completely different hardware platform in our automated production testing.

Yes, it would be nice to get all that stuff in various forms (even paper) so it could be used by anyone with enough RAM, since the modules are basically unavailable now.

Mine is 64K in the card reader port. I also have a 96K homebrew someone made that fits in the CR port. It works, but it sucks down batteries, so I leave it out.

> Quote:
>
> Quote:and three HP 4K modules in my work system.
>
> Hmmm.... that fills up your ports, not leaving room for anything else.

Since my 64K is in the CR port, my port 1 is available for my HP-41 emulator. If I need something else, I'll just pull one or more of the 4K modules.

> Quote:
>
> You can't have 512K of RAM though, because some of the address space is taken by ROM, at least for the OS if not for other modules as well (HPIL, Math, etc.).

Ah, yes. Of course. Well, that's 64K for the OS. HPIL takes 16K, FORTH and HP-41 emulator both take 32K, (It's one or the other; they won't coexist,) JPC is 32K. So if I were to have a setup including JPC and the HP-41 modules, that would leave 344K aboove the built in 24K available. That would be pretty cool. 8)

My emu71 setup has 160K in port 0 plus a 32K IRAM in port 5

> Quote:

> But do consider how efficiently any given computer uses memory.

That's quite true. The 71B can actually get work done in 24K. The explosion in RAM and hard disk sizes have lead to a lot of waste. But not all use of the big memory pool is wasteful, even if it appears to be. I'm an old command line jocky, but GUIs actually do increase productivity for the majority of users. I'm sitting in front of two 20" LCD monitors right now, showing a single desktop on my Linux system. (Actually, the left hand display has an rdp session to my work laptop running Windows 8( ) I actually use all of that real estate. I'd feel severely cramped going back to a single monitor.

Interesting. My comment about 71 BASIC rising to the level of RMB hs to do with the latter's standard REPEAT .. UNTIL, WHILE .. END WHILE and SELECT .. CASE .. END SELECT constructs. When I first used RMB, in 1985, those things just weren't available in most BASICs. They weren't even there with the 71, out of the box. The other thing I liked about RMB was the fast I/O. We were doing hydrographic survey with surface navigation and bathymetry. So we would plot the vessel's surface position and sometimes features on the bottom of the sea. We would also display the ranges to the radio nav stations in real time. The radio navigation used HP-IB and the others a mixture of that and RS-232. Tying this together was a little 9816 running an interpreted BASIC. Coming from an Apple][, I was mighty impressed! There were other "real" language features like named "COM" which were like FORTRAN COMMON blocks. You could build structured, modular software, and let the subs selectively see the global namespace with COM. Anyhow, I was a fan. I've just obtained a 9816 and have it on my list to write some software in RMB. I'll have a better feel of the two languages after I do that.

OT: microchip images

*Message #1 Posted by **Jim Creybohm** on 15 Oct 2005, 9:46 a.m.*

Apologies for the offtopic posting, but I thought most here might enjoy some images and a bit of "e-humor".

Seems HP and DEC enjoyed setting images on their chips of different media images on some older computer equipment. The gallery is quite humourous.

Well worth a read. Anyone notice if HP Calcs have any images on any of the chips? Say, like a coconut?

http://news.com.com/Whats+hiding+on+your+microchip/2100-1006_3-5893374.html

in response to message #1 by Jim Creybohm

Hi Jim, Ettienne.

I really appreciate those pages of yours.

I saw a bit of this in a Discovery channel show on the "microchip".

The only thing in this vein I remember was as a kid of 11 in 1974 I owned an early sheen four function calc. This used the first calc chip by mostek (but of course I didn't know that until a few weeks ago).

Well, it died so I got another one... and sweat unsoldered the metal lid. Under my microscope I found a "1971" date stamp on the part. If anyone is interested in looking at chip dice, you can easily unsolder the lid of say an old 80386 or 80486 using a butane torch. Very old DRAM is interesting in that light can be focused on the die, where cells are thus selectively discharged. The cell addressing can be arranged in such a way that you can get crude CCD type imaging this way. I briefly did this sort of thing as a hobby in 1987.

I have always found microelectronics engineering fascinating.

*Message #4 Posted by **Peter Geiser** on 17 Oct 2005, 4:50 p.m.,*
in response to message #1 by Jim Creybohm

When we made our chip as a student project, my friend and I also "engraved" our names into a small piece of free space. That was about 1989, working with standard cell technology in 1.5 micro meter technology.
Since we were both not gaphically oriented, it didn't occur to us to place small images on the chip. Shame :-(

*Message #5 Posted by **Meindert Kuipers** on 18 Oct 2005, 3:13 a.m.,*
in response to message #4 by Peter Geiser

It is not uncommon at all to have something on the die that can be recognized by humans. This is text (for version identification) and typically a logo. Even today this is done on modern chips, at least on one that I participated in. We had a huge printout of the die hanging on the wall, and the logo and text were there.

Meindert

Re: OT: microchip images

*Message #6 Posted by **bernhard** on 19 Oct 2005, 3:24 p.m.,*
in response to message #5 by Meindert Kuipers

Oh yes, we also had a lot of fun putting images or at least initials on the chips we designed. But three unfortunate developments have put an end to this fun: it became more and more difficult to design images that pass the DRC and LVS verification steps, time pressure on development teams increased and increased and increased ... (still increasing) and the filler structures needed for processes using CMP make it impossible to see images in the lower layers, and the top metal layers usually are too crowded as they must carry the supply currents.

On such modern chips you can see nothing except a morass of really fat metal wiring (mostly supplies) and seas of bricklike blocks in between, and all the chips more or less look the same: boring.

Seems that "chip images art" is an episode which belongs to the past :-(

3468A Help !!!!

*Message #1 Posted by **HP3468A** on 14 Oct 2005, 9:05 p.m.*

When are not the 3468A making any measurement the display is showing several different values, that is normal?

Re: 3468A Help !!!!

*Message #2 Posted by **James MacPhail** on 14 Oct 2005, 10:24 p.m.,*
in response to message #1 by HP3468A

With some older HP Digital Multimeters, it is normal for the reading to fluctuate when: (a) the inputs are floating and (b) the DMM is on a sensitive voltage setting.

If you short the input or connect it to some voltage and the reading is still not stable, then the DMM may be malfunctioning.

HTH,

James

Re: 3468A Help !!!!

*Message #3 Posted by **don wallace** on 15 Oct 2005, 9:53 p.m.,*
in response to message #1 by HP3468A

You may be able to make the instrument work better for you if you put a high value resistor and maybe a bit of capacitance across the inputs.

Say, 4.7 Megohm 1/4 watts (yellow, purple, green, gold bands) and maybe 10 nF 630 volt greencap to settle the instrument.

It's possible that the input op amp has been degraded by some overloads during it's working life and the on-chip input transistors are a bit leaky. Maybe you could replace it?

41c card reader no drive

*Message #1 Posted by **Hal** on 14 Oct 2005, 8:19 p.m.*

Got a good one for y'all.

Just got a card reader for a 41c that pulls cards through when mounted to one calculator, but not when mounted to another one. The card reader functions catalog fine on both calculators. Anybody seen this problem before. I'm thinking I should clean the contacts for expansion bay 4 on the offending calculator with a q-tip and alcohol. Any other ideas appreciated. Thanks, Hal

Re: 41c card reader no drive

*Message #2 Posted by **Tony Duell** on 15 Oct 2005, 6:10 a.m.,*
in response to message #1 by Hal

Again I am working from memory and don't have the schematic in front of me, but from what I remember, the card reader motor is powered straight off the HP41 battery, not from the logic supply line that's used for all the other chips.

If that contact in Port 4 is dirty/corroded, or if there's a bad connection between the HP41 I/O assembly flexiprint and the keyboard PCB inside the HP41, it's possible that the card reader motor will get no power, but the CAT 2 response will be fine.

HP11c

*Message #1 Posted by **Thomas_A** on 14 Oct 2005, 9:41 a.m.*

My HP11c from -86 have a broken LCD. I took it apart and I see its possible to exchange the display of the same type.

I got a 11c for free from -82. It has the original design inside, but it was broken when I got it. I cleaned contacts inside and it works, however, the keyboard is far from perfect. One key (f) needs to be pressed hard and many other keys have a muddy feeling. The keyboard of my previous 11c is perfect.

Now to the question. Is it worth trying to replace the display in my -86 calculator by that one from the -82? Is the LCD between 82- and 86 calculators the same type? I have read somewhere that the driver is different, but how about the display?

T

Re: HP11c

*Message #2 Posted by **Randy** on 14 Oct 2005, 7:36 p.m.,*
in response to message #1 by Thomas_A

The display will work - if you remove the black plastic backing from the original '86 display and attach the '82 display to it . The pink zebra strips from the '86 version must be reused. Centering the lcd on the plastic carrier will be the challenge - and make sure you don't loose track of top/bottom.

The solvent heptane (sold in the USA as UN-DU adhesive remover) will make it much easier to remove safely as it helps the adhesive loose its "stick" and then goes tacky again once the solvent evaporates. Don't pry the lcd once attached or you will crack it, they are very thin and fragile.

OT: C= SR4190R needs repair

*Message #1 Posted by **Thomas Radtke** on 13 Oct 2005, 1:02 p.m.*

Let me first apologize for this OT post. I've seen a few articles about Commodore calculators here in the past so probably someone in this forum can help with my problem. I have already bothered several people with this but it seems no one had an idea.

Ok, here it goes: I recently bought a C= SR4190R. I knew it was defect but it was in a very good used condition so I couldn't resist. It tuned out that the batteries (3xAA rechargables, 600mA NiCad) leaked and burned a trace on the main PCB (ground for the leftmost digits in the display). I replaced the batteries w/ NiMH's at 800mA and soldered a wire to get the LED's back working. A few other traces were concerned too, but I've checked their resistant and they seem to be still conductive. Now two strange things occured.

(1) The batteries don't charge. They got approx. 4.7V but only about 10mA. This doesn't seem right

(2) After several hours on the AC adaptor (only charging, the calc is switched off and the CPU stays cold), I switch the calc on and notice miscalculations with every function that uses more than just x/y registers. The longer the C= is connected to the adaptor, the worser the problem is. After 30min off the AC, the calc runs fine again. It does so even when the CPU gets warm.

There is no RAM on the PCB, all registers are in the CPU. There is a voltage regulator identifying itself as 7735, a working germanium diode and an unknown transistor (the writing could be C1213). Now I have a lot of questions: Does anyone know the 7735 and can identify the specs (to get a replacement, this model seems to be out of production). I suspect this VR to be responsible for the low charging power. Does anyone have an idea what could cause the unreliable operation (defect CPU?/unsufficient current?). Could it be related to the VR? Where does the CPU get its clock signal from? This is another idea on my side, the clock speed might vary over the time and cause malfunctions. How to find out more about this calc?

Again, sorry to bother you with this problem. I would be extremly grateful for any ideas, guesses and pointers.

Thanks for listening,

Thomas

Identifying HP-71B modules

*Message #1 Posted by **Simon Williams** on 13 Oct 2005, 8:24 a.m.*

Hi there

I have an HP-71B which came with three Modules (and a bar code reader). The modules are labelled 'DHSS CPL FS-1' and '01100-01 USA'. I (unwisely) popped off the cover from one of them and found several numbers - 5180 2917, B-2405. The chip on the back is labelled 5061 7134 85402 CC0.

Does anyone have any clues how I can identify them?

Many thanks

Simon

Re: Identifying HP-71B modules

*Message #2 Posted by **Tony Duell** on 15 Oct 2005, 6:14 a.m.,*
in response to message #1 by Simon Williams

DHSS == Department of Health and Social Security.

This is/was a UK Government department who bought a lot of HP71s in the 1980s and ran them with special software in that ROM module. In the early 1990s, the machines were sold off very cheaply. They generally have an HPIL module, maybe the DHSS module, but no case or manuals.

The 71 and IL module are absolutely standard, BTW, no modifications.

I have no idea what the module actually does (I think I have one somewhere), but I don't think it's very useful.

Re: Identifying HP-71B modules

*Message #3 Posted by **Frank Wales** on 16 Oct 2005, 4:07 p.m.,*
in response to message #2 by Tony Duell

The DHSS module turns the HP-71 into a terminal for a one-off file tracking database system that was used to track paperwork within several hundred DHSS offices from about 1985 to about 1992.

Every document had a barcode (type 2 of 5, I think) on it, and possible locations within each DHSS office were also coded. Moving a document required the user to scan the document barcodes, and the destination code, which updated the database. Users could also enter keywords, such as claimant name, on the HP-71 to search the database to find the location of the relevant document. I think a simple messaging system was also included, but I might be misremembering.

The database system was custom-written software on a PC running Concurrent CP/M (or maybe MP/M). The HP-71s were networked via HP-IL, and connected to the PC through an RS-232 interface. Because of technical restrictions, one HP-71 was designated as a master, and dedicated to handling the communication

between the PC and the network. Up to 42 terminals per network were required to be supported, for reasons which later turned out to be related more to Douglas Adams than actual requirements; I think the maximum installation in any one office was about 30.

All the software was custom-written, and used a wholly custom communication protocol and database query language on the RS-232 link. Without the back-end database, RS-232 link, and separate HP-71s running both master and terminal ROM modules, the HP-71 side is basically useless.

How do I know all this? I was one of the developers of this system when I worked at Zengrange, which supplied the HP-71 software and all the barcode wands.

As a piece of trivia, this is the project for which Zengrange developed Zenwand; without the need to somehow have several thousand barcode wands for HP-71s, Zenwand wouldn't have happened. Once we decided to make a wand for the HP-71, we then figured out what additional functionality, beyond that strictly required for the DHSS system, would be useful to end users. Hence the barcode printing software, auto-discriminating barcode scanning, check-digit utility functions and other stuff that's in the wand.

And before you ask: no, I don't have any documentation or other information about the system beyond what I remember from 20 years ago.

> The database system was custom-written software on a PC running Concurrent CP/M (or maybe MP/M).

I used Concurrent CP/M back in 1987 in another UK Government department: an excellent OS that was light years ahead of MS DOS 3.2/3.3 which was current at the time.
Somewhere there's a parallel universe where all is peace and light, war and poverty have been abolished and IBM chose CP/M instead of DOS.
;-)

The Budhha would say that MS-DOS is an illusion.

Re: Identifying HP-71B modules

*Message #6 Posted by **Frank Wales** on 24 Oct 2005, 3:25 p.m.,*
in response to message #4 by Bruce Horrocks

Some more stuff that staggered to mind, in case anyone's still reading...

The only things I remember about the Casepaper Location system database PCs are that they were various shades of brown, and had cheaply-made keyboards (for example, the contacts beneath each key mechanism were just tinned with solder, not plated). Neither Zengrange nor HP specified them; they were purchased from another company as part of a separate technical procurement which flew in parallel with the barcode terminal one. (This split procurement approach is also the reason for the

RS-232 connection between the HP-IL side and the PC -- a lowest-common denominator technical connection to encourage the widest range of submissions on either side.)

And yes, the 'CPL' on the HP-71B module stands for 'Casepaper Location', casepapers being what the DHSS called the individual folders of information about claimants.

Buy me a beer offline, and I might be persuaded to reveal how come Zengrange ended up having to make barcode wands for an HP product, when HP were perfectly capable of it themselves. (Not particularly salacious, just an excuse for someone to buy me a beer.)

> Quote:
>
> Somewhere there's a parallel universe where all is peace and light, war and poverty have been abolished and IBM chose CP/M instead of DOS.

Somewhere else, there is a perpendicular universe where C and Unix didn't get invented, HP decided to release Wozniak's Apple I design as the HP-9400 for only $8,250.00, and I'm currently typing this into Compuserve over a super-fast 1200 baud connection from my illicitly hacked Microsoft TV-Pong system.

So things aren't all that bad, perhaps. :-)

Short & Sweet Math Challenge #11: Who's Next ?

*Message #1 Posted by **Valentin Albillo** on 13 Oct 2005, 7:50 a.m.*

Hi all,

After several months' leave of absence, here you are, a new **S&SMC** challenge to brighten up your HP programming spirit. After challenges #1, #2, ..., #9, and #10, "who's next" ? #11, you say ? And how on earth did you came to that bold conclusion ?

Well, that's exactly the purpose of this S&SMC#11, to substantiate that very conclusion of yours with hard facts ... well, more like 'soft'(ware) facts, actually. Enter

The challenge

Try and write a program for any HP model that will accept a *sequence of numbers*, then produce its prediction for the *next* element of the sequence.

For instance:

- Given the sequence *1,2,3,4,5,6,7,8,9,10*, your program should produce the value ***11***.
- Given the sequence *11,13,15,17,19*, your program should produce the value ***21***.
- Given the sequence *-9,-16,-25,-36*, your program should produce the value ***-49***.

Your program must accept any number of elements (at least 2), then produce the simplest reasonable prediction for the next element. No provisions should be taken to predict further elements, just the next one.

Of course, mathematically speaking there's always a choice in selecting the next element of an arbitrary sequence, as an infinite number of sequences are possible initially having the very same elements. Thus, for instance, the sequence:

```
0, 1
```

might continue like this:

```
0, 1 ->  2, 3, 4, 5, ...
```

or like this:

```
0, 1 ->  0, 1, 0, 1, ...
```

among infinite other possibilities. In this particular example, choosing 2 for the next element is simplest because in the given sequence, going from 0 to 1 entails a (+1) increment and lacking any more information it seems simpler to stay with it than unexpectedly reverse it to (-1) for no apparent reason. So, given the sequence above (0,1), your program is expected to predict **2** as the next element, not **0** or any other value.

Put your program to the test

Use your program to produce the next element for the following 11 test cases:

1. **:** 11, 13, 15, 17, 19, ?
2. **:** -9, -16, -25, -36, ?
3. **:** 8, 27, 64, 125, 216, ?
4. **:** 0, 0.01, 0.32, 2.43, 10.24, 31.25, ?
5. **:** 2, -3, -4, -1, 6, ?
6. **:** *(in radians)* sin(0), sin(0.1), sin(0.2), sin(0.3), sin(0.4), ?
7. **:** Ln(1), Ln(1.1), Ln(1.2), Ln(1.3), Ln(1.4), ?
8. **:** Pieces of pancake (i.e: flat, 2D) obtained by N cuts: 1, 2, 4, 7, 11, ?
9. **:** Maximum number of electrons in layer N: 0, 2, 8, 18, 32, 50, ?
10. **:** Maximum number of pieces of (3D) cake we get with N cuts: 1, 2, 4, 8, 16, ?
11. **:** 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 1, ?

Deadline

Midway next week I'll post my solution (plus comments) for the **HP-71B** (which is a simple, 3-line program) and I'll also provide an **HP-15C** version. You might want to try your hand at it this next weekend.

Caveat computat:

Absolutely refrain from using a PC, laptop, or PDA (unless running some HP calc emulator/simulator) to solve the challenge. A Mathematica, Visual Basic, C++, or Java solution is useless to the intended purposes of this challenge, in fact actually defeats them, and submitting one is to be considered unpolite behavior.

And who knows, you might find using your program a useful training for some outdated *'intelligence tests'* ... :-)

Best regards from V.

```

I knew guys like me in college computer lab, in fact, I *was* a guy like me, who would look for the loophole in every computing problem they saw. The problem statement for this challenge is :

> Quote:
>
> "Try and write a program for any HP model that will accept a *sequence of numbers*, then produce its prediction for the *next* element of the sequence.

Then follows a list of sequences to try, ranging from the trivial to the Pretty Tricky(tm). None of that really engaged my "inner prankster," but this line did:

> Quote:
>
> Midway next week I'll post my solution (plus comments) for the HP-71B (which is a simple, 3-line program)

Impossible! Well, not quite. 8)

To belabor the possibly obvious point, the problem statement could have said "Try and write a program for any HP model that will accept *only* a sequence of numbers, then produce its prediction for the next element of the sequence." I would then have had less fun with this example. Also, the word "prediction" in the problem statement is obviously a euphemism. Computers don't make predictions, people do, sometimes based on the output of a computer. Given that ambiguity, I feel my usage in the above program fits the stated problem. 8)

I'll bet I can predict what comes next. haha.

Re: Short & Sweet Math Challenge #11: Who's Next ?

*Message #3 Posted by **Thibaut.be** on 14 Oct 2005, 6:04 a.m.,*
in response to message #2 by Howard Owen

Valentin,

I have a pretty good idea how to do that. There's actually an in built function that solves such issues. May we use any function of the 71B or 15C, or should we concentrate on primary functions ?

May I also kindly suggest you to propsoe solution on, say, 41C or 42S modes, as it is the easiest to transpose to any HP non cumputer calculator ?

Re: Short & Sweet Math Challenge #11: Who's Next ?

*Message #4 Posted by **Valentin Albillo** on 14 Oct 2005, 6:37 a.m.,*
in response to message #3 by Thibaut.be

Hi, Thibaut:

Thibaut posted:

"May we use any function of the 71B or 15C, or should we concentrate on primary functions ?"

You may use whatever functions are available on any HP model, be they built-in or in ROMs or

whatever. If there are different ways of doing it depending on the available functions you're welcome to list them as well. The more, the merrier.

"May I also kindly suggest you to propsoe solution on, say, 41C or 42S modes, as it is the easiest to transpose to any HP non cumputer calculator ?"

If by *"propsoe"* you mean "propose" and by *"modes"* you mean "models", my proposal is for each and every HP model and that of course includes both the 41C and 42S. Perhaps you were mislead by my explicitly mentioning the HP-71B and HP-15C, but I was merely saying that I'll provide solutions for these particular models, not that only these models could be used.

Obviously, I can't provide a solution tailored for each specific model, so I chose these particular ones, the HP-71B because routines written for it are easiest to understand and thus convert to other machines, and the HP-15C as a worthy representation of the RPN programming paradigm. But other contributors are both welcome and expected to provide their solutions for other HP models.

Waiting for your clever inputs,

Best regards from V.

Polynomial Extrapolation in RPL

*Message #7 Posted by **Marcus von Cube, Germany** on 14 Oct 2005, 5:28 p.m.,*
in response to message #1 by Valentin Albillo

Here is a solution in UserRPL, tested on a 49G+ but should work fine on a 28S, too:

I decided to arrange the values as a function f(x) where x are integers ranging from 0 to n-1 for the given values, with f(0) (or f0 for short) being the last given value and f(n-1) the first. The extrapolated value to be computed is therefore f(-1) or fp for short. This an arbitrary decision but it is workable, as you can see.

My solution fits a polynomial of degree n-1 fo n given values:

```
f(x) = a + b*x + c*x^2 + d*x^3 + ...
```

```
f(0) = a
f(1) = a +  b +  c +   d + ...
f(2) = a + 2b + 4c +  8d + ...
f(3) = a + 3b + 9c + 27d + ...
```

This has to solved for [(a = f0) b c d ...] and can be transformed into a matrix equation (here for degree 3, with 4 values given):

```
[ 1  1  1  0 ] [ b  ]   [ f1 - f0 ]
[ 2  4  8  0 ] [ c  ] = [ f2 - f0 ]
[ 3  9 27  0 ] [ d  ]   [ f3 - f0 ]
[ 1 -1  1  1 ] [ fp ]   [ f0      ]
```

This is for the sequence { f3, f2, f1, f0, ? } with ? = fp.

The solution comes in two parts:

MKMAT: Create the matrix

```
<< -> n
   << 1 n 1 -
      FOR r               row counter
        r
        IF n 2 > THEN
          2 n 1 -
          FOR c           column counter
            DUP r *
          NEXT
        END
        0
      NEXT
      1                   last row
      IF n 2 > THEN
        2 n 1 -
        FOR c
          DUP NEG
        NEXT
      END
      1                   very last element of matrix
      { n n } >ARRY       creates matrix
   >>
>>
'MKMAT' STO>
```

SSMC11: Compute the solution.

Input is a {list} of values, like {11 13 15 17 19}. The solution is appended to the list.

```
<< DUP                    make a copy of the list,
   OBJ> -> f0 n           expand to stack and save dimension n
                          and last element f0 in local variables
   << CASE n 2 <          Do nothing if list too short
        THEN n 1 - DROPN
        END
      n 1 - >LIST         convert back to list (without f0)
      -> f                save the list as local variable f
      << n MKMAT INV      create and invert the matrix
         n 1 - 1
         FOR i            backwards loop to reverse the list
           f i GET f0 -   compute f(k)-f0 and leave on stack
         -1 STEP
         f0               last element of right hand side
         { n 1 } >ARRY    create column vector
         *                solve the equation by matrix multiplication
         n GET            pick fp (the predicted value) from result
         +                append to original list (still on stack)
      >>
      END                 end of CASE statement
   >>
>>
'SSMC11' STO>
```

Solutions for test sequences #1 to #6 seem to be accurate.

#6 reveals a value of SIN(0.499989) (I used ASIN to convert back from the numeric value).

I didn' check #7 yet.

#8 reveals 16, #9 reveals 72 but I can't comment on the accuracy.

#10 dosn't work out correctly, the result is 31 instead of 32. The polynomial cannot correctly approximate an exponential function.

#11 reveals 11; obviously the polynomial is heavily oscillating.

Marcus

Hi, Marcus:

Marcus posted:

"Here is a solution in UserRPL, tested on a 49G+ but should work fine on a 28S, too [...] My solution fits a polynomial of degree n-1 fo n given values"

Thanks for your interesting contribution, but that's really overkill ! :-) The goal asked by the challenge, namely to produce the *next* element of the sequence, can be met by a simple 19-step RPN program for the HP-15C or a one-line program for the HP-71B, which, apart from being much shorter and faster than constructing and then solving a whole system of linear equations to find the coefficients of a polynomial which is then evaluated, they also do not use the large amounts of RAM that your approach requires.

"#10 dosn't work out correctly, the result is 31 instead of 32. The polynomial cannot correctly approximate an exponential function."

Here you are, a new challenge just for you: to try and get more than 31 pieces ouf of a 3D-cake with the next cut. You'll find it impossible, 31 is the correct solution and there's no exponential to be seen here.

Thanks again for contributing and

Best regards from V.

Valentin,

I don't get the meaning of "cutting a 3D cake". If you simply look at the numbers, the next number is twice its predecessor. For me, this is just the exponential function 2^(n-1), n=1,2,... Computers don't cut cakes, they just deal with the numbers. For *me*, 31 is wrong and 32 should be the result.

Bram's solution seems to give the same results as mine. He must have looked up the resulting coefficients in a text book. Mathemtically, both solutions should be equivalent. But I must admit that, from a programmers standpoint, solving the equation each time is overkill...

What do you think is the best possible solution for case #11? I would say, a linear approximation (least squares) whould give a much more reasonable result than the polynomial.

Marcus

Re: Polynomial Extrapolation in RPL

*Message #10 Posted by **Valentin Albillo** on 17 Oct 2005, 7:25 a.m.,*
in response to message #9 by Marcus von Cube, Germany

Hi again, Marcus:

Marcus posted: *"I don't get the meaning of "cutting a 3D cake".*

You get a typical cake, any 3D-shape as long as it's convex; a regular, cylindrical one will do. You then get some suitably planar cutting object, say a knife, and give the cake a planar cut along any plane that you like. You'll get 2 pieces. You then proceed to administer the poor cake yet another cut, trying to maximize the number of pieces you get. Lo and behold, you'll get four pieces. And so on ... by the time you've administered five such cuts, you'll be in posession of 31 pieces, not 32. Try it.

"If you simply look at the numbers, the next number is twice its predecessor."

That's a 'fortunate' coincidence and nobody told you to 'simply look at the numbers'. The exact wording of test case #10 is:

```
    10.: Maximum number of pieces of (3D) cake we get with N cuts: 1, 2, 4, 8,
16, ?
```

and it's very clearly stated from the start that said numbers represent maximum number of pieces of 3D cake we get with N cuts. I don't see why you decide to ignore the challenge's terms and decide that you'll simply 'look at the numbers' instead. Of course, you're entitled to do that, if you feel like it, but then you're not entitled to be surprised when you fail to get the correct result.

"For me, this is just the exponential function 2^(n-1), n=1,2,...

For me, as I clearly stated in the problem, this is a case of cake-cutting, which happens to return a polynomial number of pieces, not an exponential one. You ignore the stated conditions at your own peril.

"Computers don't cut cakes, they just deal with the numbers. "

Computers don't 'just deal with numbers', they deal with complex electronic interactions between particles and fields and such. That you decide to interpret them as numbers, text, images, or sounds, is up to you.

*"For *me*, 31 is wrong and 32 should be the result."*

Fine with me. I'm not going to get into a quarrel with you for this, couldn't care less, actually. Your problem is, IMHO, that you don't read and/or understand what I stated in the challenge: there is an infinite number of functions f(x) that happen to include any given sequence of datapoints. Among them, you were asked to select the simplest, and mathematically, polynomials are far simpler than exponential functions.

To further eliminate ambiguities, I specifically stated that said values represented the number of pieces you get when administering planar cuts to a 3D cake. This narrows it all to polynomials, once again.

Of course, it goes without saying that I selected this example to make people intuitively fall for 32, an thus be annoyed that their programs were producing 31 instead. They would search for a bug, find none, search the web or experiment a little, and eventually be pleasantly surprised to discover there was no bug after all and their program was smarter than themselves because in real life, contrary to intuition, you do get 31 pieces of cake, not 32. Seems you haven't reached to that point yet.

(your reply to Bram) It's one way to compute the next number, but who decides what is really meant with the given sequence?"

That would be *me*, because I am the one issuing the original challenge, and I clearly state that these numbers are pieces of cake, etc. So that's the meaning of the given sequence for this particular sequence in this particular challenge that I, in particular, issued. :-)

Stop the weeping at having miserably fallen for #10 and have a look at these URLs: this one and this one, too

"What do you think is the best possible solution for case #11?"

Under the conditions given and clearly stated in the challenge, the best possible solution for case #11 is 11.

Thanks again for your interest and

Best regards from V.

*Message #11 Posted by **J-F Garnier** on 17 Oct 2005, 9:36 a.m.,*
in response to message #10 by Valentin Albillo

Hi Valentin

I appreciated your challenge, as usual!

One question: *To further eliminate ambiguities, I specifically stated that said values represented the number of pieces you get when administering planar cuts to a 3D cake. This narrows it all*

to polynomials, once again.

How do you know (or demonstrate) that the number of pieces is given by a polynomial?

J-F

Re: Polynomial Extrapolation in RPL

*Message #12 Posted by **Valentin Albillo** on 17 Oct 2005, 9:52 a.m.,*
in response to message #11 by J-F Garnier

Hi, Jean-François:

Jean-François posted:

"How do you know (or demonstrate) that the number of pieces is given by a polynomial?"

It's a simple problem of combinatorics. I first read about it decades ago in some Martin Gardner's book about recreational mathematics.

You can find a lot of good references here:

Sequence A000127

Seems you haven't reached to that point yet.

:-)

In the meantime I wasn't searching the internet but busily cutting a spherical "cake" with an imaginary knife in my head and I started to discover what the callenge meant. I had just been "looking at the numbers" before...

All your test cases were deliberately choosen to be represented by polynomials either excatly or with reasonable accuracy (ln, sin); therefore a polynomial fit would always produce the desired result.

Why is my program so overly complicated? I simply didn't remember any suitable formula, so I started from scratch and tried to figure one out for myself. On my 49g+ it just worked the way it was intended. Bram's solution (and yours will be too) is much more elegant, programming wise. From a mathematical standpoint, they are equivalent.

Re: Short & Sweet Math Challenge #11: Who's Next ?

*Message #14 Posted by **Bram** on 17 Oct 2005, 4:06 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

I must admit that I didn't find the mathematical approach myself, but no problem: the challenge is in the programming.
So I wrote a program for my HP-48G:

```
<< DUP OBJ-> 0 -> N S
  << 1 N
    FOR I
      -1 I 1 - ^ N I COMB * * 'S' STO+
    NEXT
    S + >>
>>
```

It reads a list with the series in it from the stack and adds the next element to the tail of this list. So {8 27 64 125 216} becomes {8 27 64 125 216 343}, ready for the next run (that will add 512).

```
The program gives the following answers:
1.      21
2.      -49 (-(7^2))
3.      343 (7^3)
4.      77.76
5.      17
6.      0.479.. (=SIN(0.5))
7.      0.405.. (=LN(1.5))
8.      16
9.      72
10.     31
11.     11
and {0 1} => {0 1 2} as required
```

I wonder. Does #4 have a special "meaning"? I notice that the second decimal is increasing and that after 5 runs the prediction comes out (exactly?) 1000. That's kind of special, isn't it?

By the way, is it a coincidence that you came up with 11 test cases for this S&SMC#11 and that the answer of the 11th case is 11? I guess you did this on purpose ...

groeten,
Bram

in response to message #14 by Bram

Bram,

your results are the same as mine but your solution is way shorter! You admit that you didn't work out the math yourself but can you at least explain what your FOR loop is doing?

Re: Short & Sweet Math Challenge #11: Who's Next ?

*Message #16 Posted by **Bram** on 17 Oct 2005, 6:21 a.m.,*
in response to message #15 by Marcus von Cube, Germany

With pleasure, Marcus,

```
1.      At first I didn't have a clue how to compute the next element.
```

```
        It has something to do with curve fitting was all I could come up with.
2.      Someone posted a link
3.      I read and tried to understand the article
4.      I took formula (4), expanded it to a 4 point situation and
        filled in all x's and y's for the "function" (1,a), (2,b), (3,c) and (4,d)
        that I defined for my list of {a b c d} in order to compute (5,e)
5.      it appears that P(5)=e=-1.a+4.b-6.c+4.d
6.      I happen to spot Pascal's triangle in the "coefficients"
7.      I concluded that the general formula is the sum of (sign . binomial .
element)
8.      sign = (-1)^(I-1), binomial = COMB(N,I), element = element from stack after
OBJ->
9.      I tried the sigma-function on the HP-48G, but I couldn't figure out
        how to get an indexed array or list element into the formula.
        Fortunately the OBJ-> command converts a list into about the ideal format to
process.
        I need to know the length first to enter the FOR loop and
        then one by one the elements are fed into the algorithm.
```

I was very surprised to achieve such a short program.

Re: Short & Sweet Math Challenge #11: Who's Next ?

*Message #17 Posted by **Marcus von Cube, Germany** on 17 Oct 2005, 6:36 a.m.,*
in response to message #16 by Bram

Bram,

your answer has just crossed my response to Valentin where I assumed you had the solution looked up in a text book. But you obviously did a lot of thinking yourself :-)

What I think can be easily proven (haven't it tried yet) is that both solutions are simply the same. Solving the matrix equation for the next element (named fp or f(-1) in my post) symbolically should reveal the very same coefficients.

Your solution is quite elegant! But I'm still not convinced that the polynomial approach is always the best solution. It's one way to compute the next number, but who decides what is really meant with the given sequence? (See me argument with Valentin about cutting a cake.)

Marcus

> (...) But I'm still not convinced that the polynomial approach is always the best solution. It's one way to compute the next number, but who decides what is really meant with the given sequence?

Initially I thought that my program would stock 19 as the next number into the list {21 22 25 27 29}, but polynomically you'll have to opt for 36. Apparently real life doesn't always chooses the simplest solution .... ;-)

Re: Short & Sweet Math Challenge #11: Who's Next ?

*Message #19 Posted by **Valentin Albillo** on 17 Oct 2005, 6:46 a.m.,*
in response to message #14 by Bram

Hi, Bram:

Bram posted: *"I must admit that I didn't find the mathematical approach myself, but no problem: the challenge is in the programming."*

First of all, thanks for your continued interest in my S&SMCs and your kind contributions. I did find the mathematical approach myself, it's actually quite easy, but once you do, the programming is simple and the challenge, at least for me, is to optimize it as much as possible for program size, memory requirements and speed.

"So I wrote a program for my HP-48G:"

My original solutions (a 19-step RPN program for the HP-15C and a one-line program for the HP-71B) are quite similar to yours, except they're even simpler, making no use of the COMB functionality (which the HP-15C has but the HP-71B lacks), and thus can be easily adapted to most any HP model, including the HP-25C, HP-10C, or HP-12C, in 25 steps or so, say, with absolutely minimal memory requirements as no datapoints need be stored.

"The program gives the following answers:"

```
1.      21
2.      -49 (-(7^2))
3.      343 (7^3)
4.      77.76
5.      17
6.      0.479.. (=SIN(0.5))
7.      0.405.. (=LN(1.5))
8.      16
9.      72
10.     31
11.     11
and {0 1} => {0 1 2} as required
```

All of them absolutely correct, of course, except #6 and #7 return approximations to sin(0.5) and ln(1.5), not the exact values. Most people would think that #10 should be 32, but it isn't, you can't get more than 31 pieces by giving that number of planar cuts to a convex 3D-cake, here human intuition guesses 32 and flunks out.

"I wonder. Does #4 have a special "meaning"? I notice that the second decimal is increasing and that after 5 runs the prediction comes out (exactly?) 1000. That's kind of special, isn't it?"

Yes, the values for #4 were generated by y = x^5/100, for x from 0 to 5, so the next value is 6^5/100 = 7776/100 = 77.76, and you eventually get to 10^5/100 = 100000/100 = 1000, exactly. It was an attempt to obfuscate things a little by adding decimals, probably quite successful. Without the decimals (i.e.: 0, 1, 32, 243, 1024, 3125) the generating function is probably easier to guess (y = x^5).

"By the way, is it a coincidence that you came up with 11 test cases for this S&SMC#11 and that the answer of the 11th case is 11? I guess you did this on purpose ..."

Yes, that's no coincidence at all. :-) I thought it would be fun for smart readers like yourself to see S&SMC#11 include a test case #11 which features an 11-element sequence whose next element is precisely 11. :-) The nice touch is to make sure that this 11-element sequence looks interesting and its next element is far from obvious, so it comes as a nice surprise when you realize its value is exactly 11.

Best regards from V.

S&SMC#11: My solutions & comments [LONG]

*Message #20 Posted by **Valentin Albillo** on 18 Oct 2005, 4:31 a.m.,*

in response to message #1 by Valentin Albillo

Hi, all:

Thanks to all of you interested in my S&SMC#11, most specially to those who contributed their own solutions and comments.

S&SMC#11 asked for a program to compute the *next* element of a given sequence. As some of you observed, this could be considered a case of *polynomial fitting*, where we first compute the coefficients of a polynomial which includes all values in the sequence, then we evaluate the polynomial to get the next value.

However, though workable, this is simply *overkill* as we're not interested in making further predictions or interpolations, just getting the *very next element*, so we can do without the complexity, time, and memory resources necessary for a full-fledged polynomial fit. We'll use a much simpler mechanism, based in **finite differences**.

The details are better understood with an example. Imagine we're asked to predict the next element of the sequence which begins (8, 27, 64, 125). We then form the following disposition, where the first row contains the sequence's elements and each number in the rows below is computed as the difference of the two above it, like this:

```
                      n1    n2    n3   n4
                     ---------------------
 original sequence:   8    27    64   125
   1st differences:     19   37    61       (19 = 27- 8, 37 = 64-27, 61 = 125-64)
   2nd differences:        18   24          (18 = 37-19, 24 = 61-37)
   3rd differences:           6             ( 6 = 24-18)
```

where we stop as soon as there's a *single value* in the last row. Now, to predict the next element, lacking futher information we simply assume that the last, Nth differences are constant, and proceed to compute the next entries *adding upwards*, row by row, like this:

```
                      n1     n2    n3   n4      n5
                     -------------------------------
 original sequence:   8     27    64   125 ..  216   (predicted next element = 125 + 91)
   1st differences:     19    37    61 ..   91       (91 = 61 + 30
   2nd differences:        18    24 ..  30           (30 = 24 + 6)
   3rd differences:           6  ..  6               (3rd differences are constant = 6)
```

and so we get **216** as the predicted value for the next element. In this particular case, the original elements were 2^3, 3^3, 4^3 and 5^3, so we would expect 6^3 to be the next element, which it is (6^3 = 216).

Given this simple, finite-difference algorithm, we could write a short program to input the original sequence, then compute the finite differences to form a triangular disposition as seen above, and use it to obtain the predicted next value. But we can proceed more economically by having a closer look at how the predicted value is computed. In the example above, the predicted value (216) is computed like this:

```
216 = 125 + 91
    = 125 + 61 + 30
    = 125 + 61 + 24 + 6
    = 125 + (125-64) + 24 + 6
    = 125 + (125-64) + (125-64)-(64-27) + 6
    = 125 + (125-64) + (125-64)-(64-27) + [(125-64)-(64-27)]-[(64-27)-(27-8)]
    = 125 + 125 - 64 + 125 - 64 - 64 + 27 + 125 - 64 - 64 + 27 - 64 + 27 + 27 -8
    = 125*4 - 64*6 + 27*4 - 8
```

this is, in the notation above:

```
n5 = n4*4 - n3*6 + n2*4 - n1
```

Doing likewise with 5- and 6-point sequences, we similarly get:

```
n6 = n5*5 - n4*10 + n3*10 - n2*5 + n1
```

and

```
n7 = n6*6 - n5*15 + n4*20 - n3*15 + n2*6 - n1
```

and the coefficients which multiply the n's immediately reminds us of **Pascal's triangle**:

```
             1
           1   1
         1   2   1
       1   3   3   1
     1   4   6   4   1
   1   5   10  10  5   1
 1  6   15  20  15  6   1
```

where each number is the *sum* of the two above it. But every element in each row of Pascal's triangle is given by a *binomial coefficient* **C(m,n)** (*number of combinations of m elements taken n at a time*), so, for the last row above we have:

```
n7 = n6*C(6,5) - n5*C(6,4) + n4*C(6,3) - n3*C(6,2) + n2*C(6,1) - n1*C(6,0)
```

and similarly for the general case. This can be readily implemented in any HP model, no matter how small (say HP-10C, HP-12C, HP-25), because:

- no elements need to be stored: each is used only *once*, so they can be input one at a time, interactively, to be immediately used.
- no need to compute each C(m,n) = m!/n!/(m-n)!, because each binomial coefficient can be computed *from the preceding one* by performing just one integer multiplication and one integer division.

Here's the resulting 19-step RPN program for the HP-15C:

```
   LBL A
   STO I     store the number of elements
     1       initialize an auxiliar counter
    CHS
   STO 0
   STO 1     initialize running binomial coefficient
    CLX      initialize running sum
  *LBL 0
    R/S      accept input from the user
   RCL 1     update binomial coefficient
   RCL* I
   RCL/ 0
   STO 1
     *       update running sum
     +
   DSE 0     update auxiliar counter
  *LBL 0
   DSE I     update primary counter
   GTO 0     if not done, go for another input
             done, stop with next element in display
```

which uses no allocatable registers (just the permanent registers R0, R1, RI) and works very fast for any number of elements. The sequence's elements are introduced one at a time, in reverse order (this saves a few extra steps at no cost since you press exactly the same keystrokes as you would if entering them in order). Here's a couple of trial runs:

Sequence 8, 27, 64, 125, ?

```
FIX 2
    4  [A]  125 [R/S]  64 [R/S]  27 [R/S]  8 [R/S] -> 216.00
```

Sequence 0, 0.01, 0.32, 2.43, 10.24, 31.25, ?

```
    6  [A]  31.25 [R/S] 10.24 [R/S]  2.43 [R/S]
             0.32 [R/S]  0.01 [R/S]     0 [R/S] ->  77.76
```

This program can be very easily translated to most any HP model, an HP-25 version or HP-12C version are about 25 steps long. It can also be converted straight away to an **HP-71B** version, namely the following *one-liner* (78 bytes):

```
1 INPUT "N=";I @ A=I+1 @ B=1 @ S=0 @ FOR I=-I TO -1 @ INPUT "X=";X @ B=B*I/(A+I) @ S=S-X*B
@ NEXT I @ DISP S
```

Trial run, test 4: 0, 0.01, 0.32,2.43, 10.24, 31.25, ?

```
>RUN

N=6       [ENTER]

X=31.25   [ENTER]
X=10.24   [ENTER]
X=2.43    [ENTER]
X=0.32    [ENTER]
X=0.01    [ENTER]
X=0       [ENTER]

 77.76
```

That's all. Thanks again for your interest and

Best regards from V.

Re: S&SMC#11: My solutions & comments (edited)

*Message #21 Posted by **Arnaud Amiel** on 18 Oct 2005, 9:13 a.m.,*
in response to message #20 by Valentin Albillo

Thanks, and as usual it all looks so simple now. I will try to find time to get it working on my 55.

However, I have always been reluctant to use interpoling beyond the interval where I have data as it usually produces rubbish (unless you know which "physics" law to follow. Anyone knows of rules validating the use of interpolation beyond the interval?

Thanks,

Arnaud

Re: S&SMC#11: My solutions & comments

*Message #22 Posted by **Bram** on 19 Oct 2005, 5:06 a.m.,*
in response to message #20 by Valentin Albillo

Hi Valentin,

Thank you for your explanations and your programs, which are very compact indeed. The first one runs on my HP-32SII apart from the duplicate label. The 32SII doesn't allow this. As it is a dummy line to ignore a skip of the DSE 0, it can of course be replaced with another label.

All in all it was nice exercising.

S&SMC#11: Flubbing Fibonacci?

*Message #23 Posted by **Karl Schneider** on 19 Oct 2005, 11:53 p.m.,*
in response to message #20 by Valentin Albillo

Valentin --

Thanks for posting a clever and interesting exercise. The method and HP-15C program you provided seems fairly clever; I'll try the HP-71B version when I get more proficient with it.

Curiously, while the program (adapted just slightly for the HP-41C and HP-42S) works as advertised for the examples you provided, it does not give the correct results for the simple Fibonacci sequence:

$a_{n+1} = a_n + a_{n-1}$

0, 1, 1, 2, 3, 5, 8, 13, 21, ...

I get either 0 or twice the correct value as the next term (depending upon how many terms were specified).

I have not analyzed the technique to explain why this is so. Would you have some mathematical insights about this?

Thanks,

-- KS

Re: S&SMC#11: Flubbing Fibonacci?

*Message #24 Posted by **Crawl** on 20 Oct 2005, 12:14 a.m.,*
in response to message #23 by Karl Schneider

The Fibonacci sequence isn't a polynomial sequence.

The nth term can be given in closed form

Fn = ((1 + sqr(5))^n - (1 - sqr(5))^n)/(sqr(5)*2^n)

The program gives 0 as the next term a_{n+1} for odd n > 1; it gives double the correct value of the next term for even n > 1. So, if a_{n+1} represents the correct value of the next term,

$a_{n+1} * [1 + (-1)^n]$ is returned.

It's somewhat correct... ;-)

That was my concern, see message 21 above. However I didn't have time to find an example. I didn't have time to think about the challenge either but I wouldn't have found the answer, exactly because of this.

Arnaud

Re: S&SMC#11: Flubbing Fibonacci?

*Message #27 Posted by **Valentin Albillo** on 20 Oct 2005, 5:44 a.m.,*
in response to message #23 by Karl Schneider

Hi, Karl:

Karl posted:

"Would you have some mathematical insights about this?"

Yes, the finite difference algorithm my solution implements will produce the 'correct' next element (in the sense given) for any sequence generated by evaluating polynomials of any degree at equally spaced data points.

The Fibonacci sequence you give is usually defined as a linear recurrence, in which the Nth term depends on a linear combination of preceding terms. These kind of recurrences usually result in sequences generated by either exponentials or trigonometrics (which are nothing more than exponentials for complex arguments), but not polynomials except in degenerate cases.

Your sequence is 1,1,2,3,5,8,13,21,..., where each term is computed from the preceding ones like this:

$$a_{n+2} = a_{n+1} + a_n$$

i.e., each term is the sum of the two preceding ones. Thus, its nth-term can be expressed as a function of n in this way:

$$a(n) = C_1.x_1^n + C_2.x_2^n$$

where C_1,C_2 are suitable constants and x_1,x_2 are the two roots of the equation associated to the recurrence, namely (notice how closely it mimics the form of the recurrence itself):

$$x^2 = x + 1$$

so x_1 and x_2 are, respectively, (1+sqr(5))/2 and (1-sqr(5))/2, and you can determine C_1,C_2 by making use of the initial conditions:

```
a(1) = 1
a(2) = 1
```

resulting in the values:

```
C1 = 1/sqr(5)
C2 = -1/sqr(5)
```

so you finally get:

```
a(n) = (((1+SQR(5))/2)^n-((1-SQR(5))/2)^n)/SQR(5)
```

which, certainly, it's *not* a polynomial.

If the roots of the associated equation turned out to be complex, then the general term would involve trigonometrics, but the details are fairly similar. Which is more, you can leave everything the same, with exponentials of imaginary values, and if your HP model allows you to compute them, it would work perfectly Ok.

After all, who needs a sin(x) function when you can compute it as (e^(i*x) - e^(-i*x))/(2*i) ? :-)

Best regards from V.

Thank you, Valentin -- an excellent and informative explanation, as usual.

The test case 4 sequence:

0, 0.01, 0.32, 2.43, 10.24, 31.25

I could ask what its definition is, but I expect that I could find out by running your recently-posted HP-71B polynomial curve-fitting routine. Could the HP-41C Stat Pac PC-F routine also find it (maximum order = 3)?

-- KS

Re: Thank you, V [Re: S&SMC#11]

*Message #29 Posted by **Valentin Albillo** on 21 Oct 2005, 4:23 a.m.,*
in response to message #28 by Karl Schneider

Hi, Karl:

Karl posted:

"Thank you, Valentin -- an excellent and informative explanation, as usual."

You're welcome, I'm really fortunate to have such kind, keen, and appreciative 'readers'. :-)

"The test case 4 sequence: 0, 0.01, 0.32, 2.43, 10.24, 31.25 I could ask what its definition is, but I expect that I could find out by running your recently-posted HP-71B polynomial curve-fitting routine. Could the HP-41C Stat Pac PC-F routine also find it (maximum order = 3)?".

It is:

P(x) = (x^5)/100

for x= 0,1,...,5 and yes, any curve-fitting routine worth its salt can find it, provided it copes with degrees up to 5, so perhaps the PC-F routine will be unable to find this one (the best a 3rd-degree polynomial can achieve with these data is to have an absolute maximum error H=0.52, see below). Next element is, of course, (6^5)/100 = 7776/100 = 77.76.

My HP-71B Minimax Polynomial program that you mention can (of course!!) find this, but it's absolutely *overkill* ! We have an idiom in Spanish for this, namely *"Matar moscas a cañonazos"* which literally means *" To kill flies with a canon"* but properly translates in English as *"To crack a nut with a sledgehammer"*. Nevertheless, a sample run of my program goes as follows:

```
>CAT

   MINIMAXP   BASIC  3018 07/09/04 06:14

>RUN

     Verbose ? (Y/N):  N
  [K]bd,[D]ef,[F]ile=  K
           # Points=  6
            #1: X,Y=  0,0
            #2: X,Y=  1,0.01
            #3: X,Y=  2,0.32
            #4: X,Y=  3,2.43
            #5: X,Y=  4,10.24
            #6: X,Y=  5,31.25
            Store in  *
             Degree=
         Max. error=  0

      Degree 1 ... H= 8.16000000000   (max. error for a 1st-degree
polynomial)
      Degree 2 ... H= 2.76666666690   (max. error for a 2nd-degree
polynomial)
      Degree 3 ... H= 0.52000000000   (max. error for a 3rd-degree
polynomial)
      Degree 4 ... H= 0.03750000000   (max. error for a 4th-degree
polynomial)
      Degree 5 ... H= 0.00000000000   (max. error for a 5th-degree
polynomial)

      A0= 0.00000000000
      A1= 0.00000000000
      A2= 0.00000000000
      A3= 0.00000000000
      A4= 0.00000000000
      A5= 0.01000000000
```

Thus, it has found that these datapoints are perfectly represented (absolute maximum error H = 0.00000000000) by the 5th-degree polynomial:

```
      P(x) = A5*x^5 = 0.01*x^5 = (x^5)/100
```

Thanks again for your interest and kind words and

Best regards from V.

41c battery types

*Message #1 Posted by **Hal** on 13 Oct 2005, 12:52 a.m.*

I'm a bit confused about the different types of batteries that can be used in a 41c. I just acquired a 41c, and it's battery pack has the short cells (1/2 N's??) with the rectifier built into the end of the pack. I've seen photo's of 41c battery packs that use cells that run the full length of the pack, with no rectifier (obviously these would have to be externally charged)..are these N cells? Were these full length cell packs an aftermarket item, and can anyone tell me where I can get one? Thanks for any insight into this. Hal

> pack.
```

This sounds like the optional HP-82120A multipurpose rechargeable battery pack. You need a HP-82059B (110 Vac) or HP-82066B (220 Vac) charger for this pack.

```
> I've seen photo's of 41c battery packs that use cells that run
> the full length of the pack, with no rectifier.
```

This is the standard battery pack that was supplied with every HP-41. It is designed to take non-rechargeable cells, so there is no need for a rectifier.

Some people put NiCd or NiMH cells in the standard pack and recharge them on an external (commercially available) charger.

However, there was a discussion on this very point just a few days ago and the consensus was that its not worth the bother. Just put alkaline N-size cells and change them once every 12 to 18 months.

Our favorite bubba has increased his prices

*Message #1 Posted by **blurdybloop** on 12 Oct 2005, 11:53 p.m.*

Now he's asking $449 for his HP-35 with the noisy ON/OFF switch.

http://cgi.ebay.com/HP-35-Scientific-Calculator-Complete-Box-Set_W0QQitemZ5818436919QQcategoryZ58039QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

Gee. I have one of those.

Sadly, it seems that his HP-45 and HP-80 haven't kept their value as much, being only $349. But his HP-16C is $489.

Re: Our favorite bubba has increased his prices

*Message #2 Posted by **Mike DiGirolamo** on 13 Oct 2005, 12:16 a.m.,*
in response to message #1 by blurdybloop

Hi B-bloop,

If you click on "View seller's other items" you'll really get an eyefull of shocking prices! This seller must often be getting their price because most or all of their auctions have only "buy-it-now" pricing. I also recognize this name as one frequently seen bidding on HP items.

Mike

Re: Our favorite bubba has increased his prices

*Message #3 Posted by **Hal** on 13 Oct 2005, 1:09 a.m.,*
in response to message #2 by Mike DiGirolamo

I've also noticed that when "our favorite bubba" bids on an HP item, he drops out when the bidding gets above fifty bucks or so. I've seen him open with bids of less than $10. Incredible.

Re: Our favorite bubba has increased his prices

*Message #4 Posted by **blurdybloop** on 13 Oct 2005, 11:10 a.m.,*
in response to message #3 by Hal

He seems to be interested in HP-16C calculators lately, bidding up to $90.88 (he seems to like that fractional dollar figure) for one with manual.

Since he seems to be located in the land of fruits and nuts, I wonder if he's paying the California inventory tax on his business.

Re: Our favorite bubba has increased his prices

in response to message #4 by blurdybloop

What? Say Hal, how about giving a little credit and respect to us, the Fruits and Nuts at HP. After all, we created those God Damn Calculators!

Re: Our favorite bubba has increased his prices

*Message #6 Posted by **Hal** on 13 Oct 2005, 7:55 p.m.,*
in response to message #5 by Mike3

Hi Mike3, Are you sure you didn't mean for your last rebuttal to be directed at someone else? I never used the term "fruits and nuts" in any of my posts. The inference of my post was that while "our favorite bubba" wants to charge absolute premium prices for his offerings, he wants to acquire HP's for far less that they're worth (sometimes ridiculously so).

If you were at HP making those calculators, then my hat's off to you...you guys made the best products in the world by far. Hal

Re: Our favorite bubba has increased his prices

*Message #7 Posted by **blurdybloop** on 13 Oct 2005, 8:21 p.m.,*
in response to message #6 by Hal

Indeed, no offense intended to the people at HP Palo Alto. Although it has been a long long time since any calculators came from there.

Nevertheless, it's an interesting question as to whether or not the bubba is paying his California inventory tax. He has a demonstrated willingness to cheat his sellers, his buyers, and eBay. He's probably cheating the taxman too.

Re: Our favorite bubba has increased his prices

*Message #8 Posted by **Namir** on 13 Oct 2005, 10:21 p.m.,*
in response to message #7 by blurdybloop

I agree with you about cheating all these entities. I think there may be a problem with jailing cobubba. After 12 hours in his cell he will turn into a mouse (or most likely a rat) and escape home to the sewers (where he has all these calculators stashed).

Can anyone source the 41 xrom 29 contents?

*Message #1 Posted by **donald wallace** on 12 Oct 2005, 9:46 p.m.*

Hi all.

I am hoping someone can source the rom contents for X functions module rom "1D".

Thanks in advance.

DW

Re: Can anyone source the 41 xrom 29 contents?

*Message #2 Posted by **Raymond Del Tondo** on 12 Oct 2005, 11:56 p.m.,*
in response to message #1 by donald wallace

Hi Don,

just disassemble the associated part of the
related *.ROM or *.BIN file for Emu41 or V41.
For disassembly I'd use Warren's SDK41 (see TOS)

HTH

Raymond

Re: Can anyone source the 41 xrom 29 contents?

*Message #3 Posted by **Donald Wallace** on 13 Oct 2005, 12:12 a.m.,*
in response to message #2 by Raymond Del Tondo

Hi Raymond,

Thanks so much for your reply.

My confusion was that I was not sure the existing MOD file contains that actual data... I thought (maybe I am wrong) that it had "1A, 1B and 1C" data pages in there and not "1D", which looking at Mathias great catalogue seems like it's in a later module.

Looking over my listing notes I realise I was mistaken and that call is to an IR printer module, so I was totally off-track...(!)

Thanks again Ray.

HP 49g+ Graphing Help Needed

*Message #1 Posted by **John Bower** on 12 Oct 2005, 3:00 p.m.*

I have a new HP 49g+ and I'm having touble with graphing a certain function. The textbook asked me to graph this function: g(x)=x(x-1)(x+2)(x-3). But when I ty to do it, the calculator gives me an "Error: Invalid User Function." Thanks.

John

Re: HP 49g+ Graphing Help Needed

*Message #2 Posted by **Gene Wright** on 12 Oct 2005, 3:27 p.m.,*
in response to message #1 by John Bower

First guess: You've typed the function in with the implied multiplication. Can't do it that way. You'll have to type X * (x-1)*(x+2)*(x-3) in the EQ section of the plot setup window.

Second guess: You put the g(x) portion of the equation somewhere.

Take a look here for help with the basics of plotting equations:

http://www.hp.com/calculators/docs/learning_modules/49gplus/49gPlusPlotting.pdf

Gene

Re: HP 49g+ Graphing Help Needed

*Message #3 Posted by **Eddie Shore** on 13 Oct 2005, 8:15 a.m.,*
in response to message #1 by John Bower

John,

The 49g+ does not accept implied multiplication. It will be important to actually put the multiplication sign between each factor.

e.g. g(x)=x*(x-1)*(x+2)*(x-3)

Since you want to define the equation as g(x) [instead of y##(x)] you make want to put the equation on stack and executing the STEQ (Store Equation) command. STEQ is only available on the catalog or it is easier to just type the command.

I just fixed my HP-48G+ ...

*Message #1 Posted by **HrastProgrammer** on 12 Oct 2005, 8:03 a.m.*

... and I am so happy that I must share this with the others.

I have one HP-48G+ which suffered a lot of very bad "maintenance" (multiple falling on the floor and some "beating") from one high school student (not from me, of course, otherwise it would be in a perfect condition). Many keys didn't work (especially ones which you need a lot, like ON, +, -, *, /) or, precisely, they work sometimes when you press the calculator hard beneath the display, around C key. So, I decided to see if something can be done regarding this because it would be a shame not to try to fix it these days when HP-48 is no more manufactured and every working unit is precious.

There are a few methods for opening a 48 on http://www.hpcalc.org/hp48/docs/opening as mentioned in another thread and I decided to try one which claimed you can open a calculator without damaging it and using only one tool (http://www.hpcalc.org/hp48/docs/opening/openhp48.zip). In short: if you carefully follow the instructions, you can open a 48 without a need for any drilling or something like that. You don't even have to remove the faceplate! I succeded to open it in about 10 minutes using just a simple kitchen knife. Of course, some patience is needed but if I was able to do it then anyone can do it because I am not known as a very patient man.

The result was a disassembled 48 with the upper part containing keyboard, display and PCB separated from the lower part containing battery compartment. The PCB is fixed in place with six of "something" (I don't know how they are called in english, maybe fasteners or something like that). One of these fasteners was very interesting to me because it is located almost right there where you have to press the calculator to start registering some keys. I thought it could be lose so I tightened it a little bit (just a little bit) and also tightened the others. You must be very careful not to scratch the PCB doing this. And to avoid static electricity, too. Then I partially assembled the calculator, put batteries and pressed ON. It didn't react but I reseted it through a reset hole and it started to work. I didn't believe when I pressed a few keys: they were working! Amazing! Then I assembled the calculator to make some other tests. I used it for about 30 minutes or so and it registered all keys.

Just for practice and curiosity, I decided to open it again. This time I separated the PCB from the upper part to see what is underneath and to clean some contacts if needed. There was some dust around the display connector and I removed it with a soft, dry cloth. After doing this, I fixed the PCB again in place (this is a little tricky) and reassembled the calculator again. If you are reasonably careful then there won't be any scratches on the calculator and you cannot even notice it has been opened. After putting the batteries back, ON+E test displayed OK-48. Then I installed all my HP-1XE series emulators (HP-11E, HP-12E, HP-15E and HP-16E) and used them for more than a hour without any problem. All keys functioned properly.

Of course, I must use the calculator for a few more days to see if this was just a momentary luck or a permanent solution but I am very happy to know that I can (try to) fix some of my three HP-48GXs in case they will ever show similar behavior. Next week my friend and I will try to fix his old HP-48SX with exactly the same problem.

Perhaps this experience will be useful for someone ...

Of course, I am not responsible if someone burns his calculator trying to open it.

Altough my 48SX serial number (3010A*****) is out of this range, the symptom is similar: columns 5 and 7 missing.

OpenRPN Progress

Message #1 Posted by . on 12 Oct 2005, 5:58 a.m.

Hello,

I have not heard any updates about the OpenRPN Project recently. Is it still on track? Will we ever see high quality RPN calculators again?

.

Re: OpenRPN Progress

*Message #2 Posted by **Bill Wiese** on 12 Oct 2005, 2:05 p.m.,*
in response to message #1 by .

> Quote:
>
> I have not heard any updates about the OpenRPN Project recently. Is it still on track? Will we ever see high quality RPN calculators again?

No, unfortunately. It appears folks keep worrying about trivial details like which CPU to use, etc. Furthermore, some folks apparently want HP48-like functionality instead of returning to the prime of the RPN era, the HP15C/41C/42S.

The real issue is manufacturability at a reasonable startup cost - making cases, keys + legends, etc. That's hard work and people would rather keep arguing MSP430 vs PIC vs 80C51 vs 68HC05, when all these CPUs are faster/ more powerful than the Nut chips in the HP calcs and all will serve fine.

Bill Wiese
San Jose, CA USA

Re: OpenRPN Progress (What can we do?)

*Message #3 Posted by **Frank Travis** on 12 Oct 2005, 2:44 p.m.,*
in response to message #2 by Bill Wiese

Bill I remember several months posting a topic about getting the U.S. to compete with overseas labor (mainly China, Mexico, and India). I brought up the fact that over 80% of Sears Craftsman tools are made in the U.S. and carry a lifetime warranty. You commented that Craftsman tools get lots of business from the "Made in the U.S." folks and they don't want to lose it. The tooling/metal quality etc. is better than any schlocky import (excepting quality European imports like Proto). It was a terrific response, but I don't have room here to enter it all. I am glad that I made a printout of your response. What I would like to know is what can I do as an American to safeguard (and in some cases to bring back) quality manufacturing jobs in the U.S. (i.e., contact U.S. Congressman, boycott cheap imports made in sweatshop conditions, etc.)? I attended HHC 2005 in Chicago, IL and gave a presentation on bringing back an enhanced version of the HP 15C. There is a website on this topic http://hp15c.org:8086 There were others at HHC 2005 thinking

along those lines (i.e., bringing back enhanced HP 41 CX, etc.). Cyrille DeB. and Lee Kuan Goh of HP were there and said that HP would have to do their own research to see how much the research and development of new calculators would costs, and how many they could sell to recoup their costs. This was my first HHC attended. I hope to attend more and will gladly pass on feedback to HP persons there. Frank

Re: OpenRPN Progress / Bringing back the 15c and why that will not happen

*Message #4 Posted by **Gene Wright** on 12 Oct 2005, 3:42 p.m.,*
in response to message #3 by Frank Travis

I think greater knowledge and understanding of accounting and business will help to answer why HP has not yet brought back the 15c.

First, there's an assumption that HP's calculator division has more people in it than there really are. Second, there's an assumption that of the people who are in the division, there are a large number of engineers.

It would appear that HP had the 12cp re-engineered from "scratch" a few years ago and when it came out, it had several "problems" that have required time to fix.

The question might arise: "If HP could do that with the 12c, why can't they with the 15c?"

Because it is probably not profitable for them to do so. My guess is that the HP12c and HP12c platinum sell 20-50X more units than the 15c ever did. HP repeatedly came out with newer (better?) financial calculators in what appeared to be an attempt to kill off the 12c in favor of the newer product. Of those, the 12c is still made. The replacements are the ones no longer made.

The 15c did not sell well enough to continue making it. Same thing for my beloved 42s.

Assume a development cost of $10,000,000.

Assume HP gets 10% of the retail price to its bottom line.

Now, convince HP brass that at certain price points, the sales volume estimates in your analysis will prove true, whatever price point you pick.

Scenarios:

(1)

Price $99, sales units per year = 400,000 HP nets $9.90 each x 400,000 = $3,960,000 "profit" each year, taking nearly 3 years to earn back the investment.

This would be laughed out of the room.

(2) Price $299, sales units per year = 50,000 HP nets $29.90 each x 50,000 = $1,495,000 "profit" each year, taking nearly 7 years to earn it back.

This is the picture.

Why a development cost of $10,000,000? If HP works like most other large corporations, each product/project is allocated costs of the enterprise. This may be a cost for each product number in the catalog, it may be an allocation based on some other method.

The time it takes the VERY few HP technical people to spec out the 15c replacement OR to test the one made by an out-sourced vendor is time that/those people are not fixing "bugs" in the 49g+, they

aren't fixing decimal points in the 33S, they aren't improving the "i" solve routine in the HP12c platinum. Etc.

Why are prices so high on ebay for 15c calculators? Because there aren't thousands of them available all the time. If there are a dozen a week, they may well sell for $150-300 each (My last 15c on ebay I got for $80).

It just won't work these days. Not enough people will pay $299 for a new 15c.

So, we can either dream aka waste out time calling for HP to bring it back, or we can try living in the real world of economics. Personally, I enjoy dreaming at times, but then since I have a couple of working 15c calculators, why do I care if HP makes a new one?

Gene

P.S. Other examples of things that haven't worked include JYA's attempt to make a scientific PDA (couldn't raise the $$ it appears) and so far, the Open RPN project. I've been skeptical of the OpenRPN project all along that it would ever really bring anything to fruition and that appears to be it's fate.

P.P.S. Perhaps I should start a new petition drive to Unisys: Bring back the Univac!

Re: OpenRPN Progress / Bringing back the 15c and why that will not happen

*Message #5 Posted by **Namir** on 12 Oct 2005, 5:23 p.m.,*
in response to message #4 by Gene Wright

Well said Gene!!! Sounds like you have given it much thought and expressed it very well. Many folks are clinging to the past and also to the perception that the HP calculator division is basically the same one 20 years ago. Boy are they in for a surprise!!!!

Among all of the projects you mentioned, I see Eric Smith as possibly having a chance to produce something. Even in Eric's case, the cost is STILL paramount.

Ironically, the very same PCs/Laptops we are using to communicate here are essentially the ones who have unseated calculators as the "personal computers" (remember the ads for th HP-65, 67, and 41?).

Namir

Re: OpenRPN Progress / Bringing back the 15c and why that will not happen

*Message #6 Posted by **Gene Wright** on 12 Oct 2005, 5:53 p.m.,*
in response to message #5 by Namir

Gene: Hi again, Namir. I too think Eric may make a go of it, but he's emulating old calculators, not developing a new one. And, he's not a large corporation having to live by lots of rules. Even Eric saw that people won't pay too much $$ for such a "toy". :-)

It's worse than that for me. I want the world to want an HP-41C. That way, companies like HP would be designing and bringing to market *new* calculators that built on the model of the older RPN models. I want a four level stack that I can expand if I want to. I want straight RPN by default, or RPL at my discretion. I want a fairly simple and very robust keyboard and a backlit LCD display. I also want to (rdp|vnc|x11) access to the calculator's innards so I can have a software user interface too. I want the batteries to last as long as the Voyagers to boot. (Chya, right.)

I also want the whole world to sing along in perfect harmony, so none of these weird eastern instruments using non-western scales. (Actually, I kind of like non-western scales, or some of them anyway.)

I *know* I'm not going to get any of that. I've also learned that for me, it is fruitless to not want something by conscious choice. The best I can do is laugh along with my absurd desires, and/or do the next best things I'm capable of, but in any event, not make myself miserable from lack of impossible things.

Gene --

Many good points in your post, but I can't agree with all of them...

> Quote:
>
> It would appear that HP had the 12cp re-engineered from "scratch" a few years ago and when it came out, it had several "problems" that have required time to fix.

Au contraire about "scratch" (but not, alas, the "problems"). KinHPo seems to have developed "new" models (12CP, 17BII+, 33S, 49G+) only from legacy HP-engineered models (12C, 17BII, 32SII, 49G) that were still in production when the efforts were first undertaken. That way, the precious tried-and-true *source code* was available. The problems probably stemmed from porting the old code to the new processors, by whatever means was used (emulation?).

While KinHPo knew what new features they wanted to include in the new models, they didn't really understand or address the functional shortcomings of the legacy HP models (besides limited

RAM, which nowadays is cheap and easy to remedy). Thus:

- The first 12CP was not significantly faster than the slow Voyager-based 12C; it had the same terrible programming paradigm (but with 400 steps!); and it added algebraic-entry without parentheses.
- The 33S retained rudimentary complex-number functions; lacked equation editing; introduced unintuitive algebraic-entry (at least parentheses were already present!); and, introduced unprecendented mathematical bugs.

> Quote:
>
> HP repeatedly came out with newer (better?) financial calculators in what appeared to be an attempt to kill off the 12c in favor of the newer product. Of those, the 12c is still made. The replacements are the ones no longer made.

The 10B, 14B, and 17B, although faster and generally more capable, were all strictly algebraic-entry, and lacked the gold-bezel, horizontal-layout design that looked good and worked well on a desktop. The only true "successor" in appearance and RPN functionality -- the 17BII -- lives on as the 17BII+ (albeit with malfunctioning Let and Get), no doubt thanks to having all of the legacy model fully available.

> Quote:
>
> The 15c did not sell well enough to continue making it. Same thing for my beloved 42s.

I'd suspect that production (as well as sales?) of the 15C were drastically curtailed when the successor Pioneer-based 32S and 42S were introduced around 1988. I have yet to see a 15C later than 1987. While neither the 32S or 42S offered the 15C's combination of functionality and ease of use, the two successors were worthy, all things considered.

I wonder if the 42S and the 48S/48G/48G+ mutually stole sales from each other -- RPN die-hards chose the 42S, while price/feature disciples bought the 48-series models. If that was so, maybe one had to go...

I question whether KinHPo would want to re-introduce the 15C while the 33S is being produced, because few users would want to forego alphanumerics on a high-end, programmable, non-graphing calculator. But the absolute show-stopper (based on the unfortunate history Eric Smith has told us), is the lack of the 15C *documented source code*.

My ideal for such a product would combine the speed, alphanumerics, equations, and fractions of the 32SII with improved-upon complex-number functions and matrix operations of the 15C.

Re: OpenRPN Progress / Bringing back the 15c and why that will not happen

*Message #10 Posted by **Garth Wilson** on 13 Oct 2005, 1:51 a.m.,*
in response to message #4 by Gene Wright

Gene,

Maybe I can change your ideas of the economic realities of developing a product.

I'm sorry to hear that openRPN has been unable to settle on basic things like what processor to use. I have no doubt however that they have the capability to make the new calculator(s). I have not been visiting the site and participating in the forum recently because almost no one shared my interests in a hand-held controller like the 41 and 71. I'm not pouting or faulting anyone of course, just realizing that the majority seem to have different goals which are not as relevant to my own work. That's ok.

As an electronics engineer who has brought many new products to market myself however, I know you don't need ten million dollars to develop a new product-- or even one million. If all of the openRPN contributors are just volunteering their time, I expect that once they settle on what the hardware will consist of, they can get this thing going with possibly not much more than $10,000, in spite of the custom LCD and keyboard which are the highest-development-cost parts that come to mind. If they made a custom injection-molded plastic case (instead of using an off-the-shelf deep-drawn aluminum box or ABS plastic case), that would be several thousand more for the tooling.

Of course HP's engineers won't design a new product without being paid, as if it were just an interest group, but HP's major cost in bringing a new calculator to market would seem to be the software. If what others here have said about all that work going in a dumpster at HP years ago is true, that would be a cryin' shame-- absolutely stupid. But I've witnessed some of their management's bad decisions myself.

I did my most complex production design in 1993, a high-end intercom for private aircraft which, if you order all the options, has nearly a thousand parts on 9 or 11 printed circuit boards, most being 6- or 12-layer. You can see what's inside the main box at http://www.6502.org/users/garth/projects.php?project=2 . I'm the only engineer in our 6-man company, and I did the entire design myself with the exception of the cosmetics on the control panel(s) which you can see at http://www.drecomm.com/symproduct.htm . (Please forgive our website's dire need of updating and maintenance.) We developed the entire product, including software and the installation and user manuals, for about $20,000 (twenty thousand). We have an excellent reputation in the industry. I couldn't do it again now for that price, but maybe for twice as much. The only custom parts we used were the control heads' faceplates (cutting and silkscreening), the cover plate for the main box, and the PC boards.

The next year, I did another intercom design for private aircraft, on a slightly smaller scale. You can see the front panel of the resulting product at http://www.drecomm.com/244eproduct.htm . The annunciators (PILot ISOlate, EXTension, etc) are dead-front, so they don't normally show until the ultrabright green LED behind one or more is lit. (Our president just put a white light behind it so they'd all show for the picture.) The knobs are also pushbuttons to change modes. When fully equipped, the unit has about 500 parts on 5 printed circuit boards in a box hardly bigger than a bar of soap. I wish I could show you the inside. This one was also developed for no more than $20,000. Both of these models are still in our product line today, their last revisions being about seven years ago. Most of the cost was just my own paycheck. Each one took about 8 months while I concurrently spent time on things like technical customer service for other products we were already selling.

Garth, congrat's.

I was talking about BIG corporations, which operate quite differently than smaller shops.

Centralized costs will be allocated.

New Projects must be sure-fire bets to payback their costs very quickly.

And, I just don't see enough demand that would actually materialize for a 15c platinum.

And, remember, I would like to SEE such a calculator, but I'm realistic enough to know it just won't ever happen.

Sad, but ...

There is a way, perhaps, to bring back the 15C, or similar, at low cost...

*Message #13 Posted by **Bruce Horrocks** on 13 Oct 2005, 11:54 a.m.,*
in response to message #4 by Gene Wright

And that is for HP to release a 12C emulator for the PC with only the guts of the ROM - i.e. enough to drive the screen, handle keystrokes etc. The open source people, i.e. us, fill in the rest. The constraints are that the screen and the keyboard layout must remain the same.

There are some very nice calculators out there for PDAs (are you reading this Hugh?) that could cross-compile and we'd need to add programmability, key layout, solver, functionality trade-offs etc. etc. A lot of work to be sure, but able to be done by volunteers.

At the end of it, there will be a "working" calculator that fits the existing 12C hardware. HP can then relatively easily manufacture it. The retooling cost is limited to producing a new ROM, a new set of keys/keycaps and keyboard overlay, case colour etc.

The "US quality manufacturing jobs" portion of Frank's post

*Message #14 Posted by **Gene Wright** on 12 Oct 2005, 3:46 p.m.,*
in response to message #3 by Frank Travis

Frank wrote: "The tooling/metal quality etc. is better than any schlocky import (excepting quality European imports like Proto). It was a terrific response, but I don't have room here to enter it all. I am glad that I made a printout of your response. What I would like to know is what can I do as an American to safeguard (and in some cases to bring back) quality manufacturing jobs in the U.S. (i.e., contact U.S. Congressman, boycott cheap imports made in sweatshop conditions, etc.)?"

Gene: There really isn't much you can do, unless you really want to pay higher prices for things, and

while you and a couple of thousand others do that, the rest of the country will continue buying the cheapest alternative.

Consider...because of overt protectionism in congress, Americans pay 3X the world price for sugar, to help sugar farmers in Louisiana, California and Hawaii. That affects everything we buy that has sugar in it. Is that really what we want with all our goods?

A free market is the best method ever found to maximize the allocation of resources and maximize progress.

ALL attempts to interfere with the market mechanism distort reality and eventually fail, sometimes catastrophically.

A rising tide lifts all boats. Adam Smith still lives.

Gene

*Message #15 Posted by **bill platt** on 12 Oct 2005, 5:22 p.m.,*
in response to message #14 by Gene Wright

Another way to look at this:

We are all saddened that we can no longer find calcuators built to the quality of the 15c.

Now, just think back to 1982. At that time, many were lamenting that "cars aren't built like they used to be" or "boy, those old-fashioned ____ tools were so solidly constructed" etc.

So, we never really "lose" the quality--we just see a shift take place--qualtiy calculators instead of quality whahaveyou.

Similarly, we will, in 20 years time, look at something that was made in 2005 and say, "now *that* was a really well-made ****.

Some products which are really at a state-of-the-art right now:

good canoes (Bell, We-no-nah, others) good kayaks (wilderness systems, others)

These boats are made using a combination of hand-made skill and well-engineered automation, using epoxy, carbon fiber, kevlar. They are extremly light, remarkably durable, fast, stable and able, and beautifully crafted. In a few years, they will no longer be on the market, the tide will shift. But they are made in the USA right now, and they are a relative bargain, and at the top of their art. Soon, the plastic boat revolution will run its course and the market will be saturated.

I just happen to know about these. Someone else can probably comee up with examples from other industry sectors.

We should not lament the loss of production of these gems; rather, we should enjoy our collections--and recollections.

Sometimes I too lament--but today I thought I would show another side...

in response to message #15 by bill platt

Hi all.

Note: contents may meander slightly off-topic (?)

Of course, maybe we shouldn't forget the fact that (we in the) the first world has to a degree which varies a lot over time, lived off the back of the developing world, which often either exploits its poorer social class or cheaper labour again from the third world.

I think the true cost of all this electronics technology was "accurate" in the sixties and very early seventies when most of the components were made in england or the U.S. Remember computing components from Mullard and RCA? Few of us are that old, or have the education of that amount of hindsight.

At first the Japanese, then Korea and now finally China stepped in with "cheap copies", etc. I remember only 10 to 15 years ago in my retailing PCs that people wanted really CHEAP stuff but were concerned about "country of origin". How bizarre?! I remember the blank looks when I asked them if they would pay $10,000 for an Australian computer (assuming we really had the technology!).

I think it's amazing that Electronics Engineering "as Art" is (to me at least) very interesting from a social and historical perspective. That includes politics and geography.

Visitors have turned up so I will cut this post short with a final comment. What happens when the first worlds source of "cheapnis", clean "infinte source, infinte sink" environment, cheap oil and cheap labour, dries up? Grab your calculators and PCs/Macs and brace yourselves for a HARD LANDING, folks...

Military intervention a.k.a theft of natural resources and meddling in other countries politics won't bail us out of THIS one...

A rising tide drowns those who don't have boats, or as in the case of New Orleans, those who don't have a means of transportation to leave.

Re: OpenRPN Progress

*Message #18 Posted by **Hugh Evans** on 13 Oct 2005, 6:48 p.m.,*
in response to message #1 by .

I was planning to post another update here soon. It appears there are many misconceptions floating around here I would like to clear up first:

There are a handful of CPUs capable of doing everything we might ask of them. Figure in fully static operation and the number drops to very few. However, these are minor details since our software is and will be developed in a hardware-independent manor. We also don't want to announce a final decision until the hardware platforms are about to go into production. The bulk of the work right now is out of the public view,

investing in manufacturing equipment and designing processes, tooling, etc. Everything is being held to the highest possible production standards, most of the parts will be produced by a business created in part for OpenRPN. Final assembly, testing, and quality assurance will take place in-house.

Too much focus was being placed on an RPL-like programming language until recently. I proposed and created space on the site to support development of a *pure* RPN environment as well. The command set of the 42s has been adopted, and I anticipate this will spark quite a bit more interest from this community.

Much of the discussion in the OpenRPN forums is outdated and could be misleading. There is a good chance that they will be archived and restarted as a clean slate.

Feel free to contact me via e-mail, or post them as questions in this thread. I want to clear up the obvious confusion as much as possible.

Thanks to everyone for your continued interest. I never said this would be a fast process, but it will be done right.

Best Regards, Hugh

Manual of HP92198A

*Message #1 Posted by **Gonzalo Fernandez (Spain)** on 11 Oct 2005, 9:14 p.m.*

I recently purchased in Ebay an HP92198A HP-IL to 80column video interface made by Mountain company. I would like to know if someone can send by email the scanned manual of the HP92192A. I have both the hpmuseum dvd and the TOS dvd, but the manual is not available. Also, what SF? or CF? command must be input to the HP41 in order to get every key you type appears in the monitor? I don´t remember the SF sequence.

thanks

Flags 15 and 16 control the setting of MAN, NORMAL and TRACE modes.

Following is a list of the various HP-41 flags and their function:

```
flags.txt
00      \
01       |
02       |
03       |
04       |
05        > User Flags
06       |
07       |
08       |
09       |
10      /
11      Auto Execute
12      Double width
13      Lower Case
14      Protection Override
15      Print Control Flag 1 (15 Clear: 16 Clear = MAN, 16 Set = NORM)
16      Print Control Flag 2 (15 Set  : 16 Clear = TRACE, 16 Set = TRACE/STACK)
17      Suppress LF/CR (Record Incomplete)
18      Interrupt Enable (HP-IL Dev Module)
19
20
21      Printer Enable
22      Number Input
23      Alpha Input
24      Range Error Ignore
25      Error Ignore
26      Audio Enable
27      USER Mode
28      Decimal Point
29      Digit Grouping
30      Catalog Flag
31      Date Format (Set=DMY, Clear=MDY)
32      HP-IL Manual I/O Mode
33      IL Lock (HP-IL Dev Module)
34      Auto Address (XIO Module: Set=ADROFF, Clear=ADDRON)
35      Disable Auto Start (Mass Duplication Module)
36      Number of Digits (4)
37      Number of Digits (3)
38      Number of Digits (2)
39      Number of Digits (1)
40      Display Format (Fix)
41      Display Format (Eng)
42      Grad Mode
43      Rad Mode
44      Continuous On
45      System Entry Flag
46      Partial Key Sequence
47      Shift Set Flag
48      Alpha Mode Flag
49      Low Battery Flag
50      Message (PROMPT, VIEW, AVIEW)
51      SST Flag
52      PGRM Flag

in response to message #4 by Vassilis Prevelakis

Thanks for your help! After 30 min. powered on, the plastic case of the Mountain interface gets very hot (due to the power regulator metal dissipator), but the screen remains stable, an almost imperceptible flicker shows up from start (when the interface is cold) and after 30 min. (plastic case hot). It is normal this behaviour? It seems to me that the flicker is due to the monitor (Hantarex 9 inch. monitor) and not the interface.

HP-12C: Corrosion on Negative Terminal

*Message #1 Posted by **Mike Brady** on 11 Oct 2005, 9:13 p.m.*

Does anyone have a solution for preventing copper oxide corrosion from developing at the negative battery terminal (the platted plunger type contact). I'm guessing the copper oxide is caused by cathodic corrosion which is developing between the two different metals of the battery's negative surface and the calculator's non-tinned negative terminal.

Re: HP-12C: Corrosion on Negative Terminal

*Message #2 Posted by **donald wallace** on 11 Oct 2005, 9:27 p.m.,*
in response to message #1 by Mike Brady

Try tinning the copper contact spring near and at where it touches the battery. Solder is less reactive than copper.

HP Xpander Battery Compartment / Changing

*Message #1 Posted by **Eric** on 11 Oct 2005, 7:13 p.m.*

I need some help opening the battery compartment on my HP Xpander.

I've done a search in these forums and can get it started to be opened. I push the clips in and can get it almost opened. I know the rest is held on by double sided tape and takes a firm grip to get off.

I'm scared of breaking it. Does anyone have a picture of the battery compartment door so I know which way to pull- outward (away from the calc) or upward (toward the top of the calc). I'm wondering how the tabs are placed on the back battery compartment door so I don't break them.

Any help or a picture that someone could host would be appreciated.

Eric

Help?

*Message #2 Posted by **Eric** on 22 Oct 2005, 7:25 p.m.,*
in response to message #1 by Eric

Anyone? Help? I want to get those darn batteries out of my Xpander before they leak without breaking anything..!!

Re: Help?

*Message #3 Posted by **Arnaud Amiel** on 23 Oct 2005, 5:03 a.m.,*
in response to message #2 by Eric

I don't have a digital camera but basically, your main problem is the glue. Once you have released the top clips, rotate around the tabs, they are big enough and there is plenty of space behind them so if something breaks it will not be the tabs but whatever is held with the glue: the battery cover itself.

Arnaud

Re: Help?

*Message #4 Posted by **Chris B.** on 23 Oct 2005, 7:30 p.m.,*
in response to message #2 by Eric

Hi Eric,

I have posted photos of the battery compartment and battery door here. There is an adhesive strip about 0.75" square at the lower left of the battery compartment door. The door itself has three tabs on the bottom inside edge. The procedure I used with success was to pry open the two tabs at the top of the door, pivot the top up slightly (just enough to clear the 2 top tabs from the back of the unit), then pull the door slightly forward -- i.e., toward the top of the Xpander -- to clear the bottom tabs a little from their slots. The door

will still be held by the adhesive. Then, you want to work the upper left of the battery door from top to bottom to gradually pry it away from the adhesive, making sure the bottom tabs are free enough that they won't break as you continue to pry the door open. Once you free the door from the adhesive, it will pull off loosely. Hope that helps.

Chris

Re: Help?

*Message #5 Posted by **Eric** on 23 Oct 2005, 8:14 p.m.,*
in response to message #4 by Chris B.

Thanks a bunch- I seriously appreciate it... I was able to get the battery cover off knowing what the cover looked like and knowing where the adhesive was- it wasn't as bad as I expected. I'd just rather be safe than sorry.

I know the Xpanders have a bug where if the battery is totally discharged it won't charge them up at all.

I also understand that you *CAN* replace the rechargeables with some standard AAA's, but not to plug it in or else it will charge the non-rechargeables.. Right?

So, what's the best batteries to run? The batteries in there looked pretty odd- no nipple on the + side of the battery..

Thanks again for all your help! Eric

Re: Help?

*Message #6 Posted by **Chris B.** on 23 Oct 2005, 11:25 p.m.,*
in response to message #5 by Eric

The batteries you need are AA's, not AAA's. I have only used NiMH rechargeables with an external NiMH charger -- I don't know if AA alkalines will fit properly, due to the + terminal nipple which you noted. The following thread in the Archives is the most comprehensive discussion I have seen on this topic:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv013.cgi?read=40096

There is also a discussion forum at http://www.xpander.org, although it doesn't seem to be very active.

Best wishes, Chris

Re: Help?

*Message #7 Posted by **Arnaud Amiel** on 24 Oct 2005, 3:41 a.m.,*
in response to message #6 by Chris B.

The nipple less NiMH batteries are readily available in most electronic shops. However they usually come with a tab attached which I removed. It works fine now althoug I don't use the Xpander much.

48SX ON/OFF button

*Message #1 Posted by **Seb** on 11 Oct 2005, 11:36 a.m.*

My ON/OFF button is defective. It only works some of the time. I'm able to turn it on by pressing the "a" and the "ON" at the same time. Can't turn it off.

Is there a way to clean the contacts or better yet, program other buttons to be ON/OFF.

Thanks for the help

Re: 48SX ON/OFF button

*Message #2 Posted by **Randy** on 11 Oct 2005, 7:46 p.m.,*
in response to message #1 by Seb

The ON/C button is a dedicated function, no other keys can be used to wake up the processor.

The problem is typically the loss of connection between the keyboard and logic board. There are of course other possibilities but if it is the loss of connection, pressing the raised area above the B and C keys simultaneously when pressing the ON button will most times restore normal operation. If the problem persists, the only long term solution is repair which requires opening the unit. There are several methods detailed here: http://www.hpcalc.org/hp48/docs/opening

in response to message #1 by Seb

Although turning the machine ON requires that you press the ON key, you can at least use the command OFF (PRG NXT [RUN] NXT OFF) to turn it off.

hp 41c battery pack replacement

*Message #1 Posted by **Russ Henderson** on 11 Oct 2005, 10:01 a.m.*

I have been using LiPo batteries for my RC hobby and it occurred to me that 2 or 3 very small LiPo packs (3.8mm x 15mm x 33mm) in series coupled with a small BEC (reduce 7.4V/11.1V down to 5.5V) could feasibly fit in the battery compartment. These small LiPo's are 130mAh and with the BEC would yield a major increase in over-all pack capacity. Getting a charger for this would be very easy, however refitting this into the existing battery holder may be the big show stopper.

So, what do you think? Does this sound nuts? Sounds like a major reengineering project to me, but winter is coming...

I appreciate all input.

Re: hp 41c battery pack replacement

*Message #2 Posted by **David Smith** on 11 Oct 2005, 10:43 a.m.,*
in response to message #1 by Russ Henderson

Capacity is not the issue with HP41 batteries (unless you are using the card reader a lot). N cells usually last over a year. Self discharge of most rechargable batteries means you will be charging them monthly. If you have to take your modified pack out of the machine to do so, then you might loose memory,

Re: hp 41c battery pack replacement

*Message #3 Posted by **donald wallace** on 11 Oct 2005, 4:39 p.m.,*
in response to message #1 by Russ Henderson

The main issues for me is leakage, the CX or a C/CV with a timer module draws enough current to slowly flatten nicad bateries to the point where they leak chemicals without even indicating "lowbat". Once this happens you may get some corrosion in the battery compartment.

You can get nicad N cells. Retrofitting something else at a different voltage is possible but I don't see much point in it except to save a few bucks...

?

Where can we get NiCa size N?

Re: hp 41c battery pack replacement

*Message #5 Posted by **donald wallace** on 12 Oct 2005, 2:49 a.m.,*
in response to message #4 by CRT

Hi CRT,

Try an alarms system company, or a battery specialist.

NiCad N size bateries are available.

Re: hp 41c battery pack replacement

*Message #6 Posted by **Garth Wilson** on 12 Oct 2005, 4:22 a.m.,*
in response to message #4 by CRT

Mouser www.mouser.com is one of the big distributors in the U.S. that sends thick paper catalogs (1500+ pages) to everyone in the elctronics industry and a lot of hobbyists every couple of months. They have Sanyo NiCad N cells as catalog number 639-N150N.

My 41cx (which BTW includes timer module, built in) goes a year or two on a set of alkaline batteries. Even when it was getting used all day every day controlling automated production testing almost 20 years ago (plus some other work in the late evenings), a set of alkalines lasted weeks. The low-battery indicator goes on when the batteries are down to about 1.2V, which is almost what you'll get from NiCads when they're fully charged. It wouldn't be worth fooling with them, especially since they have a pretty high self-discharge rate, unless you were constantly using the card reader or the optical wand (or both).

Re: hp 41c battery pack replacement

*Message #7 Posted by **donald wallace** on 12 Oct 2005, 5:01 a.m.,*
in response to message #6 by Garth Wilson

Couldn't agree with you more, Garth.

My Nicads didn't last as long and caused me some grief.

Another idea that is good in theory but fails in practice.

Re: hp 41c battery pack replacement

*Message #8 Posted by **Jon** on 12 Oct 2005, 5:48 a.m.,*
in response to message #7 by donald wallace

I have seen that NiMH cells have a very low self discharge rate. They last a lot. I have battery packs refurbished with 1/3AAA (150mAh) that work fantastic. As I couldn´t find NiMH N sized cells I bought also 2/3AAA NiMH cells (300mAh) which are same lenght as N but 10mm diameter instead of 12mm. I have compensated the diameter with a plastic tube and I am using them in my 41CX. That is the best solution that I have found. I have to charge them outside the calculator but I can do it in 1h with a fast charger. I have two sets of those cells so I don´t lose

the memory.

Re: hp 41c battery pack replacement

*Message #9 Posted by **David Smith** on 13 Oct 2005, 8:57 a.m.,*
in response to message #8 by Jon

Actually NiMH cells tend to have a slighly higher self discharge rate the NiCads...

Do you still need "N" size NiCds ?

*Message #10 Posted by **Roberto** on 14 Oct 2005, 12:39 a.m.,*
in response to message #4 by CRT

Hi !

I have about 100 "N" size NiCd batteries (190 mAh) and I have no use for them, if you or anyone else reading this thread needs a few, just let me know and I will send you some...(shipping is on you).

Please note... I am NOT selling these cells, I have no economic interest in this, I am just trying to help.

Regards;

Roberto

HP 12C keypad - loose keys...nonresponsive buttons...aargh

*Message #1 Posted by **Bubba** on 10 Oct 2005, 11:10 p.m.*

About 2 years ago I purchased a then-brand new HP 12C Platinum. After about a year or so I noticed some of the number keys had become crooked. Some were very loose. Over the last year this has become worse, and to make it more annoying some of the buttons (usually some numbers & operator keys) have become unreliable. Sometimes the keys work, sometimes they dont. I'm pressing some keys harder than I should to be sure they actually register and show the number on the screen. Some buttons dont click anymore, and barely move when I press them. Its like they're pushed in already and you have to press them the right way to get them to respond. This is very annoying. Other than buy a new calculator (I need a 12C for the CFA exams), is there a way to fix it? If not, should I buy a new one, ie 12C instead of 12C Platinum? Thanks.

Re: HP 12C keypad - loose keys...nonresponsive buttons...aargh

*Message #2 Posted by **Stephen Easterling** on 11 Oct 2005, 1:03 a.m.,*
in response to message #1 by Bubba

I had problems with two recently-purchased 12C Platinums (one made Dec04 the other made May05). I ended up getting rid of them and bought the regular 12C. It's much slower, but other than that, it is very reliable and the buttons are true and fast and can keep up with fast fingers without having to worry about not registering the number, etc. So go buy a regular 12C and report back tomorrow.

BTW, a newly revised version of the 12C Platinum is now out IF you can get your hands on one. I'm told the STO and RCL buttons have teh (and) signs on them. I wonder if their keypads will be better.

Re: HP 12C keypad - loose keys...nonresponsive buttons...aargh

*Message #3 Posted by **Bubba** on 11 Oct 2005, 6:10 a.m.,*
in response to message #2 by Stephen Easterling

Just curious...how did you "get rid" of the calculator? Do you toss them out, sell them on ebay, or just leave them in a desk drawer? I paid like $70 for it, other than some of the bad buttons it generally works okay. Seems like a waste to toss it out. Oh well...

Re: HP 12C keypad - loose keys...nonresponsive buttons...aargh

*Message #4 Posted by **Stephen Easterling** on 11 Oct 2005, 7:47 a.m.,*
in response to message #3 by Bubba

By getting rid of I mean returned to seller, assuming the design of the keypad just wasn't for me since I'm more of a fast poker and not a pusher (buttons too hard to "poke" to register a number). Many folk won't have my problem due to the way they "push" the buttons. Since no one else ever complained about this keypad (or the 17BII+), I assumed, and still believe, that I am all along in this world when I say that I had a problem. I would never just throw away a calculator. I ended up getting a regular 12C because at the time I just wanted a working 12C but wanted it right away, and this worked for me. This is the only advice I can give to you (reason for my post).

Re: HP 12C keypad - loose keys...nonresponsive buttons...aargh

*Message #5 Posted by **Bubba** on 20 Oct 2005, 9:23 p.m.,*
in response to message #2 by Stephen Easterling

> Quote:
>
> So go buy a regular 12C and report back tomorrow.

Well I just got a brand new 12C, purchased off of eBay for a pretty good price. It was still in the blister pack. After opening it, I shook the calculator before I even turned it on. I could unfortunately hear some of the buttons rattle a bit. Oh well. At least the buttons are much more responsive to than my Platinum 12C. Anyway only tried a few functions so far, but I like it.

Gotta admit it wasn't an essential purchase. If I push the Platinum buttons hard enough they will usually register. However if the platinum really does break while I'm taking the CFA exam I would probably go on a shooting spree, so I view owning 2 calculators as insurance. There's also something I like about now owning a calculator that is only RPN mode. Makes me feel more like a serious finance guy, just like the big boys at work (investment co), many of whom have the golden 12C on their desks, haha.

HP 34c needs help

*Message #1 Posted by **David Derrer** on 10 Oct 2005, 3:03 p.m.*

This great forum has inspired me to try to repair my 34c, which I have had since new around 1981. So far, thanks to all the helpful posts, I have managed to rebuild the battery, open the case, and repair the lost digit in the display. However, I have made no progress dealing with Pr Error every time it is turned on, and STO ENTER returns Error 9. Clearing Error 9 returns 0.0000. It seems to have no memory at all - I cannot program or use storage registers (the stack does work). This is a solderless unit, and I have double checked chip positions and locations (I'm sure I am the only one to have opened this one). I have twice cleaned all the flex PCB connections. One other oddity - I cannot enter decimal point from the keyboard, although I can enter Pi. It does display decimal points correctly resulting from division of integers.

Thanks to all who have shared their knowledge,

David Derrer

Re: HP 34c needs help

*Message #2 Posted by **Tony Duell** on 11 Oct 2005, 7:01 a.m.,*
in response to message #1 by David Derrer

In the -C spice series, the memory (8 pin) chip closest to the display gets a separate power connection from the other chips -- it gets power all the time to maintain the continuous memory.

I _think_ the power pin is pin 8, I can check this on the schematic.

With the machine switched off (but a battery pack fitted), you should measure a little less than the battery voltage between the power pin of that chip and ground (-ve side of the battery). With the machine on, you should see the same voltage there (or a _little_ less) than on the power pins of the other memory chips.

If either/both of those voltages is incorrect, you have a problem on the flexiprint, or on the power converter PCB (open-circuit diode?). If they're both OK, I would, alas, suspect that memory chip.

Re: HP 34c needs help

*Message #3 Posted by **David Derrer** on 11 Oct 2005, 12:18 p.m.,*
in response to message #2 by Tony Duell

Thanks for the help Tony. I am not reading any voltage between pin 8 for any of the three 8 pin ICs and battery (-). Battery is at 2.68 volts. Yet it turns on, and seems to work fine for ordinary calculations and built-in functions (except decimal point entry). So the CPU must be getting power, and the power PCB must be at least partially working. I wonder if this suggests a problem on the flex, or is the power for the CPU separate on the power PCB from the power for the memory chips?

Thanks again, David

Re: HP 34c needs help

*Message #4 Posted by **Tony Duell** on 12 Oct 2005, 7:41 a.m.,*
in response to message #3 by David Derrer

The most likely explanation is that I've mis-remembered which is the power pin for that IC. I will check tonight (the schematics are at home...)

Re: HP 34c needs help

*Message #5 Posted by **Tony Duell** on 13 Oct 2005, 6:37 a.m.,*
in response to message #4 by Tony Duell

I checked the schematic last night. Pin 8 _is_ the power pin, and pin 7 is ground. If you're not getting any voltage between pin 8 and the -ve side of the battery on any of the memory chips, then I don't see how the thing can possibly work.

Just to check the obvious. There must be a battery pack in the calculator for this test. Pin 8 is the right hand side one nearest the display (to the right of the notch on the IC package). The machine should be turned on to get voltage on the front 2 chips.

Re: HP 34c needs help

*Message #6 Posted by **David Derrer** on 13 Oct 2005, 9:13 p.m.,*
in response to message #5 by Tony Duell

Thanks again Tony. I think I haven't cleaned it adequately. After another round of cleaning, I checked continuity on the flex, and power on the little bit of flex attached to the power PCB (with battery connected). Both were okay. I then reassembled and did your test again on pin 8 (yes, with battery connected and power switch on). While applying a fair amount of pressure to the ICs, I briefly registered voltage (about 6.5v I think) on the number 8 pins. I'm going to try cleaning again, this time I've gotten some deoxIT. I'm also considering increasing the pressure that the plastic backing piece applies to the chips by adding a tiny strip of electrical tape where it lays over the pins. The underlying foam has a pretty good impression after 25 years. I also wonder if the slightly higher voltage of alkaline batteries would make a difference. Regards, David

Re: HP 34c needs help

*Message #7 Posted by **Vassils Prevelakis** on 13 Oct 2005, 5:03 a.m.,*
in response to message #3 by David Derrer

I would suggest that you purchase the HP Calculator Schematics CD-Rom from

http://www.hpcc.org/cdroms

These are schematics that Tony Duell made by tracing the PCBs of the various computers in the collection. He then graciously donated the collection to the HPCC club. The earning from the sale of this CDROM go to HPCC, Tony is not earning a penny from this operation.

So I think purchasing this CDROM is worthwhile to (a) support HPCC and (b) get a better understanding of what is going on with your calculator.

Tony graciously gave me a copy of the 9915 schematics to help me debug by (now working) 9915 computers. Eventually I purchased the CDROM to get access to the other schematics.

improved hp 33s-reason for hope?

*Message #1 Posted by **brian healy** on 10 Oct 2005, 2:14 p.m.*

I recently purchased an HP33s from wal-mart, serial number CNA 50201642, and it has the improved decimal point and also seems to have a better tactile feel to the keyboard. They addressed the decimal point crowding by downsizing the numbers so there is more space for the decimal. While I realize the good old days of HP are behind us, I am optimistic that HP will stay in the RPN calculator business because they have at least expended some effort to address the shortcomings in their (actually kinpo) calculators. By addressing the decimal point, I feel that they have finally made the 33s a usable calculator. Overall, I am satisfied with it, and I hope that they will work on a successor to the 33s.

In terms of quality, my 33s doesn't compare to my 11c or my early 32sii, but I do think it competes in quality with the latter 32sii's that were manufactured in Indonesia. My 32sii's from Indonesia feel cheap, the keys make annoying clicking sounds, etc.

Re: improved hp 33s-reason for hope?

*Message #2 Posted by **John** on 10 Oct 2005, 3:39 p.m.,*
in response to message #1 by brian healy

It certainly shows that HP is not asleep at the wheel, as some have charged. I'm confident at the progress being made by such a small group of HP employees. Keep up the good work.

Re: improved hp 33s-reason for hope?

*Message #3 Posted by **CB** on 10 Oct 2005, 4:34 p.m.,*
in response to message #2 by John

Recent observed units with serial nos. beginning with CNA 527XXXXX (versus the remaining ones with serial nos.435XXXXX) have the LCD modified for readability of the decimal point. Raadix legibility was probably the most serious (and valid) criticism of this . Other criticisms of hp33s include: - Build & feel are not as good as the previous historical units such as 32S, 32SII & 42S - Display readibility (view angle & shadowing) - Unit is larger - Controversial style/design

My assessment is that this calculator is certainly more functionally capable than its predecessor (ie, 32SII) and, in general, represents a reasonable upgrade. True, it is not the build quality of my hp32S, but it is quite useable nevertheless. No doubt HP had to contain costs (as there is not much profit in calculators), and this may turn out to be throwaway due to failure associated with build quality (time will tell). However, after testing it, I certainly would buy a new hp33s rather than bid for a used 32SII on ebay.

Re: improved hp 33s-reason for hope?

*Message #4 Posted by **brian healy** on 10 Oct 2005, 4:37 p.m.,*
in response to message #2 by John

I can understand why some have made that charge. I think they were asleep at the wheel, but have started to wake up a bit. I still can't believe that they let the 33s go to market with the obscured decimal point. I do

really like the 2 line display though. My next wish is for a big enter key and to be able to have multi-character variable names. I'm also not crazy about the styling of it, but it's not so bad when compared to the other offerings out there.

Re: improved hp 33s-reason for hope?

*Message #5 Posted by **John** on 10 Oct 2005, 4:52 p.m.,*
in response to message #4 by brian healy

True. While they may have been asleep, it does not appear they are sleeping now. That is a good thing.

Re: improved hp 33s-reason for hope?

*Message #6 Posted by **Stephen Easterling** on 10 Oct 2005, 7:55 p.m.,*
in response to message #5 by John

I am also optimistic that the current HP calculator division is still working hard on their products. This is definitely true with their new 49G+ with its new ROM upgrade and their new 12C Platinum (and 33S). When I was having problems with my 49G+, someone from the HP calculator division actually called me to see how I was doing and helped me solve my problem. This kind of support keeps a guy like me a customer for life. They (HP) does realize that there is a dedicated group of users that will support them, and they are listening and reading these forums to bennefit their line. Thanks HP! Based on my conversation with the HP guy that called me and his overall concern for our satisfation, I would not be surprised if we saw a 15C Platinum coming soon. I really don't know for sure (and don't have an inside scoop), but predict this to come to fruition within a year. Of course, I could be way off!

Reality check

*Message #7 Posted by **Namir** on 10 Oct 2005, 8:59 p.m.,*
in response to message #6 by Stephen Easterling

I agree that HP is not sleeping behind the wheel. I too am glad to see improvments on the newer calculator models. You should keep in mind that these improvements are quietly introduced to avoid a massive replacement drive by customers. What will HP do with the "earlier" models? What can they do?

While hope is beautiful there is also reality. The HP calculator division (mostly located in San DIego) is about 20 people. Cyril de Brebison (sp?) is, from what I understood, the one-man R&D department in Boise, Idhao. It's Cyril who sets the specs for the new machines and sends them to Kinpo. I'm not clear on who else looks at the specs.

For those who want to see the HP-15C back, I say contact Eric Smith. My guess is that you will have better luck convincing eric to bring back a "version" of the 15C. Of course be prepared (assuming Eric says yes) to pay something like $400, $500, or even a $1000 per unit. If you truly Looooooooooove the 15C, a thousand dollars would be a MINUTE token of your love and devotion to the 15C.

So the ball in Eric's court.

Re: Reality check

```

I am sure this has been discussed before, but since the HP12C form factor and display is identical to that of the HP-15C and the HP-15C code is (I think) available, then by changing the CPU chip in a 12C with one emulating the 15C (or even the 16C) you can have your 15C.

The main problem is (of course) the keyboard. But the current 12C models have painted keycaps, so perhaps they can be painted over with the new assignments. E.g.

Modifying the keyboard is tricky but it can be left as an exercise to the new owner, so the real cost in producing a 15C would be the development of the CPU mod (one off) and the cost of retrofitting it (per unit).Given that retrofitting the 12Cs is probably too labor intensive, the mod will be provided as an upgrade kit installable by the end-user (who may even buy the 12C separately)

Assuming a small production run (about 1k units?), then charging $100 over the cost of a 12C would provide a development and production capital of $100k.

Some kind of agreement with HP would be necessary to ensure that no copyright issues are raised. I am sure that for a 1k production run (i.e. not smth that would create competition with the main HP calculator production, PLUS the fact that it WILL sell HP-12C calculators) there may not be any real problem. If this is dressed up as some kind of publicity stunt (resurrecting the 15C in time for its 2*x*th anniversary) HP may actually provide token support for the project.

**vp

Re: Reality check

*Message #9 Posted by **Eddie Shore** on 13 Oct 2005, 8:22 a.m.,*
in response to message #7 by Namir

I may have never had a 15C before, but I would like to see it come back. I like the landscape of the 12C(P). However, I feel that HP would like to go in a new direction, or build on the 33S and 9G for the lower-end calculators.

Also, let us point out that the 19B were supposed to be part of the released family of 2003. I have yet to see the 19B in the market or on HP's web site.

Re: improved hp 33s-reason for hope?

*Message #10 Posted by **brian healy** on 11 Oct 2005, 6:49 a.m.,*
in response to message #6 by Stephen Easterling

I have never had the pleasure of owning the 15c, I was a user of the 11c which had all the capability that I needed. I do however realy like the design of the voyager series, and would like to see a successor to the 33s that is in the voyager case and has the functionality of the 33s but with improvements. The main improvement that I would like to have is multicharacter variable names in equations. I would like to have larger equation libraries in my 33s (and 32sii) but am limited by single character variables. The equations capability fills a niche that is useful to me in my line of work (structural engineer). Most of my day to day calculations do not need a computer, (nor is a computer always apropriate) and the equations capability improves my productivity, especially when roughing out various alternatives. But I digress.

I hope that HP sees that there is a continuing demand in the market for a basic RPN calculator, and will continue to service it, and to listen to what the sonsumers of its products want.

Minimax Polynomial Fit

*Message #1 Posted by **Valentin Albillo** on 10 Oct 2005, 10:24 a.m.*

Hi all,

Busy as always, just a quick post to let you know that a new article from mine appears published in the latest September-October issue of Datafile (V24 N5), namely:

HP-71B Minimax Polynomial Fit

This is a 12-page article including two programs, namely a *3-liner* to compute the Least-Squares Nth-degree polynomial which best fits a given set of (x,y) datapoints in the least-square sense, and a *50-line* program to compute the minimax Nth-degree polynomial fit to an arbitrary set of datapoints (x,y), which can be entered from the keyboard, automatically generated by evaluating an arbitrary user-provided function, or read/stored from/to a data file.

The user can specify the degree of the polynomial or else specify instead a maximum absolute error and let the program select the lowest degree which will achieve it. Once the coefficients have been computed, the user can *evaluate* the resulting polynomial at any given arguments right from the keyboard (even as part of more complicated expressions), and can also *scan* any given interval for maximum errors in it, at whatever step size desired.

For example, when asked to automatically produce the minimax polynomial of lowest degree which fits **y = Gamma(x)** in the interval [1,2] with maximum absolute error less than 0.00005 (i.e.: 4 correct decimal places), my program produces the 5th-degree minimax polynomial:

```
P(x) = A0 + A1*x + A2*x^2 + ... + A5*x^5
```

with

```
A0 =  3.73459956
A1 = -6.72738793
A2 =  6.54439953
A3 = -3.37095678
A4 =  0.91923039
A5 = -0.09992158
```

Once computed, we can use the automatic scan option to check the [1,2] interval at 0.01 steps to confirm that it has absolute maximum error app. 0.00003812 (<0.00005) at x=1.06

```
>FNE(1, 2, 0.01)

   1.06000000   (x-coordinate where the max. err. occurs)
   0.00003812   (absolute maximum error in [1,2])
```

and can evaluate it for any argument, say Ln(Pi), like this:

```
>FIX 5 @ FNF(LN(PI))

    0.93479     (P(Ln(Pi)) = predicted value of Gamma(Ln(Pi)))
```

while the correct value is

```
GAMMA(LN(PI)) -> 0.93480
```

i.e., we sure got 4 correct decimal places, more nearly five.

Any and all comments are very welcome.

Best regards from V.

Hello Valentin,

Thanks for letting us know of your new article. Just one question: can the user also specify polynomials with odd or even powers only? This would be particularly useful when fitting odd and even functions, as less coefficients would be needed for a given accuracy.

Best regards,

Gerson.

Hi, Gerson:

Gerson posted:

"Can the user also specify polynomials with odd or even powers only? This would be particularly useful when fitting odd and even functions, as less coefficients would be needed for a given accuracy."

First of all, thanks for your interest in my article. As for your question, there's no need of a separate option to achieve that effect. You just simply specify an interval where it shows that the function is odd or even, and the minimax error condition itself will guarantee that only odd or even powers are used.

For instance, let's say that you want to fit a minimax polynomial of lowest possible degree to **y=sin(x)** for values of x not exceeding Pi/2 and using just odd powers of x (as sin(-x) = -sin(x), so sin(x) is an odd function). Also, you want a guaranteed maximum error <= 1E-6.

As I've stated, you only need to specify an interval where the 'oddness' of the functions shows, in this case [-Pi/2, Pi/2] will do. For this particular function, interval, and maximum error, my program returns the following 7th-degree polynomial:

$$\mathbf{P(x) = 0.99999661 * x - 0.16664831 * x^3 + 0.00830636 * x^5 - 0.00018365 * x^7}$$

with guaranteed absolute maximum error less than 1E-6 in [-Pi/2, Pi/2]. As you can see, only odd powers of x were returned, all the remaining coefficients being zero within machine rounding limits so our minimax approximation only requires *four* non-zero coefficients.

Here's a short table of sin(x) vs. P(x):

```
>FIX 7 @ FOR X=-PI/2 TO PI/2 STEP PI/20 @ DISP X,SIN(X),FNF(X),RES-SIN(X) @ NEXT X
```

X	SIN(X)	P(X)	ERROR
-1.5707963	-1.0000000	-0.9999994	0.0000006
-1.4137167	-0.9876883	-0.9876887	-0.0000004
-1.2566371	-0.9510565	-0.9510560	0.0000005
-1.0995574	-0.8910065	-0.8910061	0.0000004
-0.9424778	-0.8090170	-0.8090173	-0.0000003
-0.7853982	-0.7071068	-0.7071074	-0.0000006
-0.6283185	-0.5877853	-0.5877856	-0.0000003
-0.4712389	-0.4539905	-0.4539903	0.0000002
-0.3141593	-0.3090170	-0.3090164	0.0000006
-0.1570796	-0.1564345	-0.1564340	0.0000005
0.0000000	0.0000000	0.0000000	0.0000000
0.1570796	0.1564345	0.1564340	-0.0000005
0.3141593	0.3090170	0.3090164	-0.0000006
0.4712389	0.4539905	0.4539903	-0.0000002
0.6283185	0.5877853	0.5877856	0.0000003
0.7853982	0.7071068	0.7071074	0.0000006
0.9424778	0.8090170	0.8090173	0.0000003
1.0995574	0.8910065	0.8910061	-0.0000004
1.2566371	0.9510565	0.9510560	-0.0000005
1.4137167	0.9876883	0.9876887	0.0000004
1.5707963	1.0000000	0.9999994	-0.0000006

and, as you can see, the absolute error never exceeds 0.0000006 < 1E-6, so the results are accurate to six decimal places plus or minus 1 ulp.

This exact same approach, but specifying the [-Pi/6, Pi/6] interval instead, yields a 7th-degree, odd-powers-only, minimax polynomial which has a guaranteed absolute maximum error e = 3.2E-11 in that interval, while using only four coefficients.

Combined with range reduction, this could form the basis of a simple yet very accurate implementation of trigonometric functions in machines lacking them, as you know. Similar approaches would allow implementing most any specialized function, say Gamma(x), Lambert's W(x), etc.

Best regards from V.

>
> **$P(x) = 0.99999661 * x - 0.16664831 * x^3 + 0.00830636 * x^5 - 0.00018365 * x^7$**

Hi Valentin,

Thanks for your detailed and comprehensive reply. However, I still have another question, if you don't mind: is it possible to force the first coefficient to **1** and then recalculate the other coefficients? Just rounding the first coefficient to **1** would cause the accuracy to decrease, as we can see in the table below:

$$P(x) = x - 0.16664831 * x^3 + 0.00830636 * x^5 - 0.00018365 * x^7$$

X	SIN(X)	P(X)	ERROR
0.0000000	0.0000000	0.0000000	0.0000000
0.1570796	0.1564345	0.1564345	0.0000001
0.3141593	0.3090170	0.3090175	0.0000005
0.4712389	0.4539905	0.4539919	0.0000014
0.6283185	0.5877853	0.5877877	0.0000024
0.7853982	0.7071068	0.7071100	0.0000032
0.9424778	0.8090170	0.8090205	0.0000035
1.0995574	0.8910065	0.8910099	0.0000033
1.2566371	0.9510565	0.9510602	0.0000037
1.4137167	0.9876883	0.9876935	0.0000051
1.5707963	1.0000000	1.0000046	0.0000046

Of course the new polynomial with recalculated coefficients wouldn't be as accurate as the original one, but would be better than this. Setting the first coefficient to **1** is important to reduce the number of steps or registers necessary to implement these polynomials on a RPN calculator.

Best regards,

Gerson.

Re: Minimax Polynomial Fit

*Message #5 Posted by **Valentin Albillo** on 13 Oct 2005, 6:27 a.m.,*
in response to message #4 by Gerson W. Barbosa

Hi again, Gerson:

Gerson wrote: *"is it possible to force the first coefficient to 1 and then recalculate the other coefficients?"*

Yes, there are two ways of doing it:

- Modifying the program itself: as one of the coefficients would be fixed, you'll actually need one equation less to solve, and so one less datapoint in your tuples. A very simple *ad-hoc* modification to the **SPOLMM** subprogram, slightly affecting the part where it is building the matrix of the system to solve, and then including the fixed coefficient in the returned coefficient's array would suffice. This would be faster and most accurate, but requires modifying the program as it is now.

- You can read the reference you give in your own article, which I did, where it is explictily stated how to proceed to achieve exactly what you want, even giving a fully worked example to make it crystal-clear.

To save you the trouble of reading it, basically you transform the problem of finding a *7th-degree* minimax polynomial for y=sin(x) in [0, Pi/4], say, for the related problem of finding a *2nd-degree* polynomial for y=f(x) in [0, (Pi/4)^2], where f(x) is defined thus:

```
f(x) = sin(sqrt(x))/x^(3/2)-1/x
```

this way you get a polynomial which directly translates to your desired special-form one for the original y=sin(x) function in the original [0, Pi/4] interval.

You can achieve that with my program by simply selecting **[D]**efined function, then answering the "f(x)=" prompt like this:

```
f(x) = SIN(SQR(X))/(X*SQR(X))-1/X
```

and specifying the [0, (Pi/4)^2] interval, as stated. You'll get the results you want.

Note: As f(x) is defined, it would generate an error when evaluated at x=0. You can either specify the interval using a small number (1E-6, say) instead of 0, or else include a user-defined function, like this:

```
DEF FNY(X) @ IF X=0 THEN FNY=-1/6 ELSE FNY=SIN(SQR(X))/(X*SQR(X))-1/X
```

then answer the "f(x)=" prompt with f(x)=**FNY(X)**

Best regards from V.

Re: Minimax Polynomial Fit

*Message #6 Posted by **Gerson W. Barbosa** on 16 Oct 2005, 8:53 p.m.,*
in response to message #5 by Valentin Albillo

Hi Valentin,

Thanks for your step by step explanations, they've really helped me. And thanks for reminding me to read my own reference too :-) At the time I didn't give too much importance to these details because I didn't have any minimax tool available. As I said, I used curve fitting and did some minor adjustments by hand to get the best results I could. I got a 9.58E-11 maximum error with the three coefficients I obtained for SIN this way. The coefficients I obtained using a true minimax polynomial yielded a maximum 9.76E-11 error. Not bad! (Of course, my manual solution took much more time and would be impossible to be done for higher degree polynomials).

Using the procedure you showed me, I found the odd power coefficients for a 13th degree polynomial to approximate ATAN (of course, the coefficient indeces refer to the auxiliary 5th degree polynomial):

```
8 DEF FNY(Y) @ IF X=0 THEN FNY=-1/3 ELSE FNY=ATAN(SQR(X))/(X*SQR(X))-1/X
9 END DEF

X1,X2,N=0,3-2*SQR(2),20
.
.
.
H= 0.00000000050
A0=-0.33333333283
A1= 0.19999978075
A2=-0.14284193118
A3= 0.11072111863
A4=-0.08629967887
A5= 0.05061006653
```

Just for a comparison, here are the same coefficients calculated by an expensive mathematical software, using the tecnique shown in the reference:

```
a0=-0.3333333328040560
a1= 0.1999997758846710
a2=-0.1428416640124080
a3= 0.1107161126831530
a4=-0.0862630685349892
a5= 0.0505192312223211
```

The slight difference observed is due, of course, to different machine precisions. Anyway, the maximum absolute errors are 5E-10 and 7E-11, respectively. A remarkable achievement for both programmer and HP-71B! You program is a joy to use, I wish I only had a real 71B!

Best regards,

Gerson.

P.S.: Below are my approximations to ATAN and SIN. Maximum errors observed in a spread sheet were 6.6E-11 and 9.8E-11 respectively, but I am curious to see how they would behave in a HP-12CP. Any simulator available?

```
-----------------------------------------------------------------------

               a = -0.3333333329
               b =  0.1999997763
               c = -0.142841662
               d =  0.1107161
               e = -0.0862632
               f =  0.05052

       atan(x) = x*(1+x^2*(a+x^2*(b+x^2*(c+x^2*(d+x^2*(e+f*x^2)))))),

                                                [0 <= x <= sqrt(2)-1]

       atan(a) = 2*atan(sqr(1/(a^2)+1)-1/a)

-----------------------------------------------------------------------

               a = -0.1666666652
               b =  0.008333217
               c = -0.000197282

       sin(x) = x*(1+x^2*(a+x^2*(b+c*x^2))),        [0 <= x <= pi/6]

       sin(a) = sin(a/3)*(3-4*sin^2(a/3))

-----------------------------------------------------------------------
```

I'm glad you liked my program and found it useful. Owning a physical HP-71 is a real pleasure but certainly this kind of program benefits a lot from being run in an emulator (say Jean-François Garnier's Emu71 or Hrastprogrammer's HP-71X), because it's so math

intensive. This way you get results in seconds and can try different approaches with utmost ease, making the 'fitting experience' rather enjoyable, IMHO.

Also, it's a real testimony to HP-71B/Math capabilities that this kind of functionality, which usually requires advanced software to accomplish, can be implemented in a mere 50 lines of code, and moreover, providing three different input methods (including mass storage) and two modes of output. A basic implementation would surely fit in 30 lines of code or so.

And it's minimaxing, no less ! :-)

Best regards from V.

Impressive! [Re: Minimax Polynomial Fit]

Hi, Karl:

Karl posted:

"I saw no mention of this program needing a Math ROM, but I have one with the manual."

Thanks for your continued interest in my humble productions. Yes, I didn't mention that a Math ROM is needed, but of course it is.

If you've followed my posts since long, you'll know that when I write "HP-71B" it goes without saying that it includes a Math ROM, because if not, it is ***not*** the real HP-71B originally designed by its wise creators, but the maimed thingy they were forced to release when it was clear the System ROMs were going to exceed the allotted 64 Kb of ROM space.

The original HP-71B did include most functionality now present in the Math ROM, including complex numbers definition and functionality, of which some scraps still remain in a bare-bones HP-71B (try to enter the program line: 10 A=(2,3)+SIN((4,5)) and see it being duly accepted, no syntax complaints), and so for me an HP-71B deserves that name *if and only if* it includes a Math ROM.

Else, you should change its name, perhaps "HP-71BL" for "Light" will do, though "HP-71BM" would be better, or even "HP-71BFU" ... ;-)

BTW, don't miss my upcoming **S&SCM #11**, due today ! :-)

Best regards from V.

HP--01 Pen Refills

*Message #1 Posted by **Al Schwarz** on 9 Oct 2005, 9:37 p.m.*

For those of you whose HP-01 pens don't write anymore:

go to http://www.garlandpen.com tab to 'company store' download order form (.pdf)

You can order one or more refill #125 (for dual pens) in medium blue only. Their service is very good, I got mine in about two weeks.

Thought I'd pass this tip along, some folks might not know it.

I hocked two 12C Platinums so I could wait for the "revised" version. How can I get one? If I call to place an order (or go to Office Depot), all they sell are the old stock versions. You can never be guaranteed of getting the latest copy via phone order, even through HPShopping. If you have a source, I'd be happy to order through them.

Re: The NEW Platinum 12C

*Message #4 Posted by **Namir** on 10 Oct 2005, 1:35 a.m.,*
in response to message #3 by Stephen Easterling

Stephen,

To make sure you get the new version of the 12C Platinum you have to go in person to place where the machine is physically availabl. The new version has the open and close parenthesis below the STO and RCL keys. ORDERING ONLINE FROM ANYWHERE DOES NOT GUARANTEE YOU THAT YOU GET THE LATEST VERSION.

I agree in that it would be best to see what I'm buying before I buy. I'll have to look around my community to find the latest revision. I hope that the distributors aren't going to fill standing orders for six months with older models. (Sometimes when a seller gets a "new" shipment, they're getting new old stock.)

I went to Office Depot today (in Indianapolis, IN) to look for the new 12c Platinum. The demo unit was the old model. I pulled the order card and requested one be brought out from stock for me to look at before buying. It was the new model; as reported in earlier posts, the STO and RCL keys have left and right parentheses; the backspace key is on the minus (-) key; the undo is a left downward curving arrow on the divide key. These functions are in blue and are used with the blue (g) key. Overall, I'm impressed with the quality and appearance of the unit. The keyboard has a good tactile feel and the display is clear. I think Office Depot is a good bet to look for one...just don't look at the demo units; they probably have been sitting around quite a while.

I already checked out my local Office Depot and other local stores that would carry it,... none of them have it (yet). You know, I had two 12CP and had terrible keypad problems where the numbers wouldn't register after feeling and hearing the click. Both models were like this. HP told me to just go buy a regular 12C, so I did and it solved the problem. However, I really want a 12CP and want the keypad to work as well as the older, regular 12C models. How do you like the new keypad on the "revised" 12CP?

in response to message #9 by Stephen Easterling

Whoa that's funny! You bought 2 12C platinums and HP told you to just get a regular 12C? Wow so they basically admitted that platinum has quality problems. I wasn't expecting to read that. Maybe I should just buy a regular 12C, too. I'm afraid

one of the buttons on my platinum that semi-works will stop working altogether when I take the CFA exam. Ugh....

Re: The NEW Platinum 12c

*Message #11 Posted by **Stephen Easterling** on 14 Oct 2005, 2:51 p.m.,*
in response to message #10 by Bubba

Sort of. I should say that I owned two 12CP. The story goes like this: I bought a 12CP from Office Depot and I wasn't happy with the keypad, so I called HP Service and they apologized because they'd never heard of problems like that. So they sent me another one. I asked "I'll send you my old one so you can see the problem and make sure the issue isn't reproduced in other calcs." The guy said they didn't need it back. So I got the replacement and it was worse. I called HP Service back and explained my findings. Again, they seemed surprised. I told him I owned many other HP calcs and didn't expect keypads problems like this. I guess he figured I just lightly poked at the keys and I figured the 12CP was just designed for hard pushers, like the new 17BII+. So I just wrote off the new 12CP, figuring that's just the way it is and that my "problem calcs" were not real problems, but just a manifestation of design of the keypad. So I returned the one calc back to Office Depot and sold the other. After I got a new 12C, I was very happy with the keypad, but disappointed with the slow speed. Let me know if you find an acceptable 12CP and I'll buy it (new, of course).

Still ugly and substandard -- the new HP 12c platinum

*Message #14 Posted by **Karl Schneider** on 15 Oct 2005, 12:32 a.m.,*
in response to message #13 by Gene

Well, if the objective is to produce a well-desgned calculator, KinHPo still doesn't "get it":

1. They kept the funky and hard-to-read red and blue shift keys on a metallic background -- not ergonomic like yellow and blue shift keys on a dark brown background.

2. Parentheses have belatedly been added, but they are shifted -- inconvenient.

3. "CLx" (instead of backarrow, which is *essential* for ease of use) is still in its familiar location from the 12C and 10C. Does the shifted backarrow on the "-" key do the same thing as on the 41C, 11C, 15C, and Pioneers?

4. That horrible 10C/12C programming functionality remains, with an ample-but-useless 400 programming steps.

5. Why is "CLEAR PREFIX" still there? Pioneers did away with that by having the user press the shift key again to clear it (like the 41C did), and adding "SHOW" (like "MANT" on the older models) to show the full mantissa.

6. Does "ON" serve as "CLx" as on the Pioneers? If not, why is "OFF" now shifted?

7. Why wasn't "Roll Up" added?

8. How about making "Sx" and "Sy" separate calculations, to prevent perplexing error messages caused by irrelevant-but-corrupted y-data?

9. How about making regression coefficient "r" a separate calculation? It needn't be recalculated each time an x- or y-estimate is performed without new data.

I'd bet that hardly anyone actually *programs* on these low-end financial calculators -- particularly this one, with such a bad programming paradigm. If the 12C Platinum were to be a non-programmable (as the 10C should have been), all of the following could be eliminated:

P/R, R/S, PSE, SST, BST, GTO, CLEAR PRGM, x<=y, x=0, MEM

That would leave plenty of room for making "(" and ")" (or maybe "sqrt" and "x^2") unshifted, and adding things that were left out.

Re: Still ugly and substandard -- the new HP 12c platinum

*Message #15 Posted by **valentino ducati (switzerland)** on 15 Oct 2005, 5:14 a.m.,*
in response to message #14 by Karl Schneider

Hi Karl

I - partly - second you. I suppose there i no discussion about the fact that a 12C(P) is definitly NOT a good programmable calculating device. I think it is ok for keystroke oriented repetitive tasks. But nothing more, compared to the other Voyager or Pioneer models. Or even the few new hp/Kinpo calculators araound.

But it is definitly an improvement.

> Quote:
>
> 1. They kept the funky and hard-to-read red and blue shift keys on a metallic background -- not ergonomic like yellow and blue shift keys on a dark brown background.

Agree! Look at all the hp (and TI) series of calculators since the seventies: gold/blue/white is best on a black plate. I have an original 12C and - beside the well known programming flaws - it looks very luxury (gold finish) but still well readable with its black plate. On silver they should go away from the traditional f=yellow/g=blue matrix.

Quote:

3. "CLx" (instead of backarrow, which is essential for ease of use) is still in its familiar location from the 12C and 10C. Does the shifted backarrow on the "-" key do the same thing as on the 41C, 11C, 15C, and Pioneers?

6. Does "ON" serve as "CLx" as on the Pioneers? If not, why is "OFF" now shifted?

I agree regarding the double functionality of [g]<-- and [CLx]. But the Pioneer you refer to, are also not strightforward. E.g. the 32SII: It has indeed [<--] (Backspace) and above [f] CLEAR. That is the same functionality like 41x. But the [C] key is a mix of an ON, ESC or CANCEL key and again the CLx function, depending on the situation you hit it. And yes, to turn off the 32SII you must key [g] OFF.
With this discussion I will show the venue that not only the hp/Kinpo people have big problem with well designed UI, but also the former hp engineers.

My examples
If you look at a keyboard of a calculator you should be able to inuitive identify the toggle functions and the others. As a designer of the layout you can even preserve more keys using good toggle conventions. Back to the 12CP: This calculator has many toggle functions (with only two states), but only two are realized the good way.
[R/S] is quite intuitive and changes from RUN to STOP and back.
[f] P/R is not 100 % clear but it means PROGRAM mode and RUN mode (should better read calculator mode)

But what about B/E? No, they used one more key to toggle BEGIN and END.
And DM/MDY? They also used one more key to toggle between DMY and MDY date format.
And new for the 12CP, they don't use a toggling key R/A to change from RPN to ALG...

Maybe hp (and other manufacturer) should better look at the proposals of the involved user groups: hundreds of brains can find more and better solution for the same problem then a punch of maybe high qualified engineers.

My 2 EURO-cents

I disagree for a programmable device: If you write a program and want to make sure that the calc is in a certain state, a toggle function is the worst you can encounter, especially if no way is provided to question the current state.

in response to message #14 by Karl Schneider

Before I was a convert to RPN, I used the 10B extensively. The key that I found most useful was the back arrow key. When I converted over to RPN and the 12C, not having the back arrow key was harder to get used to than the new (to me) RPN method. When I heard about the 12CP, my hopes were that they would incorporate a back arrow into the new calculator. My hopes were dashed. When I read in this forum that they had actually incorporated the back arrow key into a newer version of the 12CP, I was ready to buy one. Again, my hopes were dashed. I don't know about everyone else, but I view the back arrow key on a calculator just as I do the backspace key on a keyboard. It's next to impossible to work without it. Try typing your next message in this forum without using the backspace key! Can you imagine the uproar if the computer Gods got rid of the backspace key and put in a clear-all key. I know this is unreasonable, but you get my drift. This half-hearted attempt at the back arrow key just doesn't cut it.

in response to message #13 by Gene

I am utterly baffled by this "upgrade". Between this one, and the 33s, it seems as if HP is so afraid of changing anything from the originals, that they change everything--except that which actually needs to be changed. By this I am referring to the basic logic of the key naming and key placement.

With this upgrade, would it have been difficult to make the clearX key an un-shifted backspace, and put the CLx into another spot?

I have an answer to my own question, which is that because the original design uses keycodes in programming (a thoroughly out-dated method!) they could not "move" a key without destroying 1:1 compatibility with "legacy" user program code.

So, a useless machine merely becomes even more useless...Why on earth is the 12c still popular? Answer: because those who buy it do not write programs for it. (My conjecture).

This begs the question, "so the purpose of the 12cp is....?"

Re: Picture of the new HP 12c platinum

> Quote:
>
> This begs the question, "so the purpose of the 12cp is....?"

Bill:

I got my 12C spring 2005 from a banker; mint condition. I discussed a few minutes with him about the calculator and he told me, he "programmed" **only two** complicated interest formulae into the memory. And **he worked 4 years** with only this two programs. All the other daily work was done with todays broker tools or with the keyboard functions of the 12C.

Let me now answer your question: The purpose of the 12cp is to offer
a good looking white collar pocket calculator
with all the basic functions for daily use in financial environment
and minimum programmability for repetitive tasks
.

If *this was* the purpose, then the 12c(p) matches it.

*Message #21 Posted by **Gene** on 16 Oct 2005, 6:10 p.m.,*
in response to message #19 by bill platt

If this was done, then it wouldn't be an HP12c.

Changing where the keys are located is very bad. HP had to do it for lastX, but I'm sure wanted to minimize them.

Making wholesale changes would not leave you with an HP12c platinum.

Why is this model out there? It is an HP12c with algebraic entry.

And, if you think it is useless, good for you. :-) The millions and millions of finance people using this will just continue to disagree with you.

And, more HP12c's have been sold than any of the measly non-finance machines...perhaps even combined. :-)

Yes, yes, combined--and including all the Sharps and Novus calculators too I suspect...

Still, it seems like lock-in to me. As essentially none of the finance guys actually program it, then why not make it better, rather than a swank but crippled "evolution"? The fact that keys have changed isn't going to bother the finance guys--as they aren't going to have lots of legacy programs to migrate, anyway.

What good is a shifted backspace? That's worse than a shifted parenthesis by far.

Oh well. Anyone still use their betamax machines?

Re: Picture of the new HP 12c platinum

*Message #23 Posted by **Gene** on 17 Oct 2005, 12:46 p.m.,*
in response to message #22 by bill platt

Again, I just don't think you understand what HP has done with this "upgrade".

There is now an HP12c with algebraic mode. Big deal to you? But perhaps not to the great masses in the real estate and finance world who have so far stayed away from the 12c because of RPN (yes, such people exist).

If you "make it better", then you would break all existing programs that are out there for the HP12c. Yes, finance guys program this machine. Take a look at the HP12c platinum solutions book and you'll see lots of programs for it. People in industry and real estate use programs. Start messing around with keycodes much and these will break.

My only guess is that you just speak from a lack of knowledge. Since you appear not to be a finance guy, then you just don't know.

And, if you aren't a finance guy, why would you care what HP did?

They now have an HP12c built on current technology that has RPN and algebraic modes, 4 times the program memory, more space for cash flows, and on this "upgrade" from the original 12c platinum, the algebraic mode has parentheses too.

This appears to be the method to make these changes with the least amount of splash to existing users and the least amount of breaking of existing programs.

A BIG reason the finance people still buy the 12c is because they already know how to use it. If it does what they want, why buy another machine? Why should they buy something that is different even if improved?

Given that HP appears to have tried to kill off the 12c several times in the past, unsuccessully, finance users have spoken. With the HP12c platinum, HP now has a chance to reach people in these industries who would never buy an RPN model.

As to the location of the parentheses and backspace, I can't address that. HP didn't ask my advice. :-)

But, you still don't seem to understand how dominant the 12c is and has been.

It may have outsold ALL other HP calculators combined over its lifetime. Change it to make its usual users learn a new way to use it? Why take that risk? If they want to upgrade, let them buy the 17bII+.

And, your electronic snobbery shows in the betamax comment.

HP will laugh all the way to the bank while you give it a sneer. Who comes out the winner? :-)

Re: Picture of the new HP 12c platinum

*Message #24 Posted by **bill platt** on 17 Oct 2005, 2:42 p.m.,*
in response to message #23 by Gene

Hi Gene,

Sorry--I didn't phrase/punctuate very well---I meant to make my statement "Finance guys don't program these" to be a question. My brother doesn't bother programming his, nor my cousin; both are "finance guys". My hedge fun friend (from high school) has always had a 17bii and could never understand the fascination with the 12c.

I perfectly understand the dominance of the 12c. I have seen it more often than any other hp--in real estate offices, in the president's offiec, in the VP's office, on the stock broker's desk, etc etc. Yes, they are everywhere. I even met a real estate agent who had one with all the paint rubbed off. She had used it for 20 years non-stop. (I have met a lot of real estate agents and seen more 12c thatn any other single calc). (For some reason, the car dealers all use some sort of printing adding machine and some sort of byzantine method of manual calculation--and it takes like 20 minutes to "run the numbers" -- must be a psychological weapon).

I see what you mean about trying to reach the "algebraic" customers. In that respect it is a long-overdue effort. Essentially it looks like people who did not like RPN all ran off to the TI BA. For some reason, the other HP's just did not interest them. Perhaps this platinum, well marketed as an Algebraic Capable machine, just might make a showing.

Oh, as far as betamax goes, I never owned one:-)

*Message #25 Posted by **Bubba** on 17 Oct 2005, 9:18 p.m.,*
in response to message #24 by bill platt

I am studying for the CFA Level I exam. Only 2 types of calculators are allowed the 12c (and the platinum) and one by Texas Instruments. The CFA Institute only allows those 2 calculators becuase its easier include them rather than make a big list of which ones are not allowed. If you add more functions to the 12c then it might become too modern and then it wouldn't be allowed on the exam, because exam takers wouldn't be memorizing the formulas, they'd be using pre-programmed functions instead. I bet HP gets a lot of business from CFA exam candidates.

Help requested to restart a severely crashed HP49G

*Message #1 Posted by **Antoine M. Couëtte** on 9 Oct 2005, 8:59 a.m.*

Oct 09, 2005

Hi to all!

I just loaded 2 HP48GX programs + their 2 associated variables into my HP49G just to see whether they would work in it. Unfortunately I got a very hard crash ,,, to the extent that I can no longer restart my HP 49G , be it through ON+A+F or through inserting a pin in the back hole. A few times it started prompting something like " Restore memory Yes / No ? " , I first choose YES a few times and as nothing happened I subsequently chose NO afterwards. HP49G did not recover even with a memory lost.

Now it no longer reacts to anything I know of .

I also put new batteries in it. No joy , so I removed its 3 batteries for the time being .

CAS is the Beta version released some 2 years ago.

It looks like I might have corrupted its internal system :-((!!!

Any wizard reading me who could help ?

Thanks in advance

Antoine M. Couëtte

The Try To Remember Memory? TTRM crash you experienced was most likely due to a SysRPL program for the 48 you loaded into your 49, where there are different entry points. It is unusual that it should crash the machine to the point you describe. The only thing I can think of is to try to reflash the ROM, if the machine can turn on to connect with your pc. For possible answers with better solutions post this to Google Group comp.sys.hp48

Edited: 9 Oct 2005, 9:32 a.m.

*Message #3 Posted by **Antoine M. Couëtte** on 9 Oct 2005, 9:54 a.m.,*
in response to message #2 by I, Claudius

Thank you "I, Claudius" for your quick reply. Unfortunately, the machine doest not restart at all, so it does not seem possible to reflash the ROM which certainly looks the unavoidable step to get it back in order.

I have been extremely talented to inadvertently crash some machines or some software to the extent that it has been known in my community that if a system works with me , it means that it is fully debugged and it will therefore fully work with anybody else!!!

Antoine

WARMEST THANKS to both SITES Re: Help requested to restart a severely crashed HP49G

Copy Lif disk (disk copy) Help !!!

*Message #1 Posted by **Gileno** on 8 Oct 2005, 5:15 p.m.*

How do I make one copy of safety of my disks (LIF) using the windows 2000? Does some program that makes the diskette copy exist (LIF) for another diskette (disc copy)? Thank's

Re: Copy Lif disk (disk copy) Help !!!

*Message #2 Posted by **Howard Owen** on 8 Oct 2005, 5:37 p.m.,*
in response to message #1 by Gileno

See my response about series 80 disks. It's the same issue.

You can make backups within the LIF environment. Depending on what you are using, it could be easy or more challenging. Wha are you running that accesses LIF disks? What sort of computer, what sort of floppy, and so forth.

9114B 1.44 disk 41CX HP-IL

Re: Copy Lif disk (disk copy) Help !!!

*Message #4 Posted by **Howard Owen** on 8 Oct 2005, 8:33 p.m.,*
in response to message #3 by Gileno

OK. The 41-CX makes it a little tough to do automatically, but what you can do is to write a program to copy a list of files one at a time from disk to memory, then baclk to disk. In the meantime you swap in a new disk, of course.

That is a huge pain, but it will do the trick. Another possiblility, is to read the disk under MS-DOS with TELEDISK.EXE (Available at retrocalculator.com among other places. It will read single sided media, but it won't write to it. But if the "single-sided" disk is really a DS/DD disk, or even an HD floppy like you say you are using, and if you tape over the second hole in the disk (opposite the one with the slider) , and if you further specify to teledisk to only read and write side 0, you might be able to do a disk-to-disk backup that way. Otherwise, you will end up with an image file on your PC's hard disk that will be in TELEDISK's "unique" format. I don't know how to decode this currently. (There is some code to do so in the net, but it doesn't work on the TELEDISK images I have access to.) So a TELEDISK image will only serve as a backup if you can write it back out to floppy at some point in the future.

TELEDISK.EXE will not run under any form of Windows. It does low-level access to the floppy controller that drives Windows insane. It must run under MS-DOS.

*Message #5 Posted by **don wallace** on 8 Oct 2005, 9:48 p.m.,*
in response to message #4 by Howard Owen

Hi Howard.

WARNING ;-P This may be OT...

have you heard of a (very) old DOS utility called alien? file=alien.com It had about 50 odd ss/ds non-dos formats you could pick from to read/write to. Wang, CPM, etc.... circa 1987 (!)

People shuld note that there's a hardware problem writing to old formats due to the thinner heads used in the 1.2MB diskette drives. If anyone has any old (IBM compat.) 360 kB drives, that would probably solve that problem.

DW

Re: Copy Lif disk (disk copy) Help !!!

*Message #6 Posted by **Howard Owen** on 8 Oct 2005, 10:42 p.m.,*
in response to message #5 by don wallace

Hi, Don.

Those are 5-1/4" capacities you are quoting. The 9114 and 9121 are both 3-1/2" drives. Like I say, the problem is twofold. First, LIF disks for both drives have a sector size of 256 bytes, which is half the standard size. Modern BIOS do not include the calls to enable reading from sectors of this size, according to several (more than three) authorities I've run across. TELEDISK is the only utility I've found that will read such disks, at least on my circa 1993 Pentium/75 Presario. I have not exhaustively tested all such utilities, of course. and I've only tried the one system, so I'm unwilling to say firmly that TELEDISK is the only solution.

The second problem has to do with single sided vs double sided disks. Both the 9114 (HP-IL) and 9121 (HP-IB) drives are single sided. Using TELEDISK, I was able to read single sided media for the 9816, which had been written to a 9121 drive. Once again, this is the only utility I have found that can do that. I have also successfully written single sided images to standard HD disks. I had to cover the second hole, opposite the write protect tab in order to then use these disks on a 9121, but it worked. What even TELEDISK can't do is to write to single sided media on my Presario. This sounds like a problem deeper than the BIOS, since TELEDISK can get around the lack of proper BIOS calls for the case of reading the same media it fails to write to.

TELEDISK makes some interesting grinding noises while reading and writing single sided, 256 B/sector media. I suspect this is due to skipping the read or write from/to side 1 of the disk. I guess it could be due to the smaller sector size too. (You'd have to play with the motor speed in the latter case, whereas you'd be advancing the head at an abnormal time in the former.)

Regards,

Howard

Re: Copy Lif disk (disk copy) Help !!!

*Message #7 Posted by **Vassilis Prevelakis** on 9 Oct 2005, 4:42 a.m.,*
in response to message #1 by Gileno

If you have access to an MSDOS environment (i.e. be able to boot into a non-GUI mode) then I would strongly suggest LIFUTIL ftp://ftp.hpmuseum.org/lif/lifutil

If you would rather use your HP-41 for the backups, then you may want to have a look at old PPC journals (Jake Schwartz has a CD collection with all the articles, http://www.waterw.com/~jakes/

I would stay well away from teledisk, I had a chance to look at the format it is using and its very bad for archiving [1].

**vp

[1] teledisk just copies the sectors from the diskette to a computer file and when restoring files reverses the process. The computer file will have the PHYSICAL structure of the diskette, not the logical structure that the OS presents to you. E.g. if the diskette is interleaved, then your sequentially allocated file will be all over the place. Also sometimes teledisk saves both sides of a one-side diskette (I have seen disk images like that in hpmuseum.net), then your diskette image file will contain junk as well as data.

Thus, to be able to use teledisk images you need to connect to your PC the appropriate physical drive (e.g. 5.25 in). This goes counter to my idea of preservation, whereby if you have the floppy image you can simply extract the files without messing with vintage hardware.

For example if I give you a teledisk image of a Series80 5.25 floppy, you have to find a PC, a 5.25 drive and a 5.25 floppy to recreate the original diskette. Then you have to find a 5.25 floppy drive for your series 80 computer to read the files. If you were just given the files themselves, you could xfer them to your Series 80 computer with a technique that is most convient to **you** (e.g. serial link, 3.5 floppy, HP-IL, HP-IB, etc.).

Re: Copy Lif disk (disk copy) Help !!!

Yup, that works under real MS-DOS, I've just determined.

My problem in the past was I wasn't covering the second hole on the disk. I knew you had to do tht before the 9121 would use it, but it is also necessary on DOS if you are writing or reading a single sided image.

What the hell are you talking about? That hole is the Quad Density hole it has NOTHING to do with sides. The behavior should be the same with both DS/DD and SS/DD diskettes.

*Message #10 Posted by **Howard Owen** on 9 Oct 2005, 4:28 p.m.,*
in response to message #9 by Vassilis Prevelakis

You know, Vassilis, you've been very helpful to me, and our interests seem to coincide, but you can be one rude son-of-a-geek sometimes! Please tone down the "you must be an idiot" knob just a notch or two, will you?

I'm sorry if you don't like that result, but if I leave the tape off the quad density tab, writing a single sided image doesn't work on my hardware/OS/software stack. An explanation would be intersting, but it's irrelevant to what I want to do: writing images to floppies that the 9114 and 9121 can read.

Only if you promise to power up your brain before you post messages.

Saying that the QD hole somehow indicates a single-sided diskette is like saying the if your car has no central locking, then it must take leaded gasoline. It may occur (by coincidence) but they are not related!

> My problem in the past was I wasn't covering the second hole on the disk. I knew you had to do tht before the 9121 would use it, but it is also necessary on DOS if you are writing or reading a single sided image.

I stand by that statement 100%. Where does it say that the hole is used to distinguish between anything and anything else?

I said the hole had to be covered to write a single sided image on my system.

I'll bow out of the name calling, Vassilis. But I might suggest you read more carefully, or perhaps think about it longer, before throwing slurs around in public.

I said:

```
> That hole is the Quad Density hole it has NOTHING to do with
> sides. The behavior should be the same with both DS/DD and SS/DD
> diskettes.
```

This is true no matter what kind of noise your drive makes or in fact whether by pure chance your drive happened to work that particular time when you ejected the disk and then placed it back into the drive.

I do not engage in name calling, asking *"what the hell are you talking about"*, is not equivalent to calling you an idiot, it is used to express my frustration at the quality of your statement. If, however, you are so offended by it, I can edit it to remove the rhetorical question and leave just the bit that says you are wrong.

```
>I stand by that statement 100%. Where does it say that the hole is
> used to distinguish between anything and anything else?
```

Exactly, it doesn't. Which is why it is wrong on two counts. (a) if covering the hole somehow worked for single-sided drives, then it should also work for double-sided drives, as *it has nothing to do with the number of sides* (I wonder how many times I have to repeat this). (b) it doesn't work anyway, because the behavior of LIFUTIL when you use a QD disk is not predictable. Mainly it has to do with what junk existed on the disk before you formatted it on the HP-IB drive.

So you can stand by your statement all you want, it won't make it anything other than misleading at best.

Take it easy

It seems to me you've made several wrong assumptions, Vassilis. First, I know the difference between quad vs double density and 2 vs 1 sided media, *and I don't care!*. I'm describing a result I obtained, that's all. That brings me to your second erroneous assumption: because the result seems incredible to you, you assume I tried this once then shot my mouth off. Let me disabuse you of that notion. I was copying from both single sided/double density and double sided/quad density (HD) disks. I had two HD disks that I had written SS?DD data to, one in a 9114 and one in a 9121. The former is a work disk for my HP-71B efforts, and the latter a copy of the HP BASIC 2.0 for 200 series

(RMB) system disk I had made in the 9121 from my 9816. While copying various images to and from these two disks, and various others, I got the following results:

```
Disk      Drive  OS    sw       w/wo cover  result
-----------------------------------------------------------
Work disk 9114  Slack  lifimage without     failure
Work disk 9114  Slack  lifimage with        success
HP BASIC  9121  MS-DOS teledisk without     failure
HP BASIC  9121  MS-DOS teledisk with        success
```

The hardware was identical in both cases. The Compaq Deskpro 575 is an early Pentium machine that actually sports a couple of PCI slots. It has a Compaq custom BIOS that you need a floppy disk to access. The floppy drive is described as "tri-mode" somewhere in the literature I read when I first got the system. I've updated the BIOS to its final release level, circa 1995.

That's two discs I tried this on, running two different OS, and (necessarily) two different image copy programs. Do you detect a pattern in this data? I repeated the test twice for each disc, not because I was trying to be scientific, but because I had a hard time believing it. I don't know why it works like that. I don't *care* why it works. I just now know how to read and write images on this hardware. I couldn't do that before because I was missing this piece. No wonder it was missing! It doesn't make sense to me, but there you are.

So forgive me for interpreting your incredulity for an implication that I am stupid I would be stupid if I had gone about this in the way you seem to think I did.

Re: Copy Lif disk (disk copy) Help !!!

*Message #15 Posted by **Howard Owen** on 9 Oct 2005, 4:45 p.m.,*
in response to message #9 by Vassilis Prevelakis

My guess is that the BIOS on my circa 1993 Compac Deskpro 575 (*not* Presario) uses the existence of the quad density tab to decide what sort of RWTS routines to use. I base this on listening to teledisk trying, then failing to write to the quad density disk with the tab uncovered, versus the sound it makes when it succeeds. The failure case goes "(whisper)shhhk rattlerattle (moderate) bzzzt bzzzt .. (LOUD) brrraaaat brrraaaat.." then failure. The successful case repeats all of that. but then ends up quietly reading from or writing to the disk.

Reverse engineering by ear, as it were. 8)

*Message #16 Posted by **Howard Owen** on 9 Oct 2005, 2:04 p.m.,*
in response to message #7 by Vassilis Prevelakis

Also contrary to what I thought I knew, Tony's lifimage works just fine under Slackware 10. It may be I was making the same error in not covering the second hole on an HD disk masquerading as SS/DD before trying to read it. (The 9114 doesn't care, so it seems. **update:** it does care when you are *initializing* a disk.)

I haven't tried to write with either utility yet. I'll update with details when I do.

update: Tony's lifimage doesn't do image writes.That's done by lifdump (from the same link just given.) That command works with an HD disk (preformatted on a 9114, per the man page) only if the second hole is covered. I'll try with real SS/DD media soon.

update: lifdump, like TELEDISK, won't write to my real SS/DD floppies. This isn't a big drawback since it *will* write to HD media with the second hole covered.

*Message #17 Posted by **Howard Owen** on 9 Oct 2005, 2:10 p.m.,*
in response to message #7 by Vassilis Prevelakis

I agree that TELEDISK is less than optimal, with its physical format images. Not only does it demand that you are tied down to a particular disk drive type, as you note, it would also be really hard to write a single decoder for the format since you'd have to code for all the low-level physical disk format details. But other than translating the good stuff at hpmuseum.net, I can think of one application where TELEDISK would be useful. That would be in using its "disk to disk" mode to make physical disk copies. Assuming your hardware can both read and write the particular format, the problem of variable image format goes away in that situation.

I've heard my name a few times... Wanna play?? ;-))

*Message #1 Posted by **Diego Diaz** on 8 Oct 2005, 4:42 p.m.*

Hi all,

Thanks Gene, Miki, Meindert and others for your kind words ;-))

It's just courious that you both, Gene and Miki, are the only two users that have reported bugs (already fixed) in the Clonix/NoVRAM code so far... I'm pretty sure you squeeze your modules to the limit!! Well done guys!!

I've updated my web page with some info/pics on the new NoV-32 Hardware, hope you find it of some interest.

http://www.clonix41.org/Projects/Nov32/New_HW.htm

Currently I have very little time to write/publish/discuss, in fact I'm just spending the weekend at home, will fight back to Madrid on Tuesday and back home again next Saturday.

In the meantime... I'll propose a game/challenge for those Clonix/NoVRAM users interested in finding out bugs:

During the development of the NoV-32 I found a new bug in the NoVRAM code (HEPAX emulation). It doesn't show up at all except in a very specific (and rarely used) feature of the HEPAX module.

I'll release the new version of NoVRAM-H.asm correcting the bug by the end of October.

Until then you can send me mails with the bugs you discovered in the HEPAX emulation. I'll send a free NoV-32 to the first mail(s) reporting a bug. Ovbiously, should a user report a different undocumented bug will qualify for the prize as well.

Winner(s) and bug(s) will be published at my website.

Hope you enjoy... Best wishes from the middle of the Atlantic Ocean!

Diego.

Hi Diego,

Great job on the PCB's.

I was going to ask you about the 47 ohm resistor in the cloinix circuit but it was obvious what it was for. I note you have explained it on your webpage.

I don't know what went wrong, but I haven't been able to get either the HEPAX or the SERVICE pack HEX code n your website to run in my copy of your original clonix module. I wonder what I am doing wrong?

The symptoms are that my module programmed with these hex files jusy makes the calc not want to turn on and I can't do anything with it. The forth HEX code runs fine. (Now I am figuring out how the code works and what peripherals / extra modules that system expects ;-)

Many thanks to you and to John I for doing such a marvellous design.

Don W

in response to message #1 by Diego Diaz

Deigo,

I have another few questions for you if you don't mind.

What do you think about clocking the clonix PIC a bit more slowly to get the running power consumption down a bit?

I found my module ran fine when I used an eight MHz crystal. What margin do you reckon I have running it at this speed. I ask you this as you and John I. wrote the PIC machine code. I don't have an assembler for the PIC yet and haven't looked at the number of clock cycles the routines take round the loop.

My two 41s are stock from the factory and both run at about the same speed (judging by the tones in the 41 "BEEP" ;-)

Have you found a way to write those new PIC chips yet?

DW

Series 80 Emulator - File transfer

*Message #1 Posted by **Juergen (CH)** on 8 Oct 2005, 4:39 p.m.*

If I develop programs on the Series 80 emulator, how can I transfer these programs to my HP-85 via Floppy disks? In the S80EMU, I can write a LIF file. But I don't know how to transfer this file to the HP-85 (rawrite and fdimage do not work on my Windows PC). Any help appreciated...

Thank you, Juergen

Re: Series 80 Emulator - File transfer

*Message #2 Posted by **Howard Owen** on 8 Oct 2005, 5:04 p.m.,*
in response to message #1 by Juergen (CH)

This is a thorny question. I'm assuming you are using a 9121. The problem is twofold. First, modern PC BIOS have trouble with sector sizes other than 512 bytes. I believe your images need to have 256 bytes/sector to be readable on the HP-85. Second, even a fairly old BIOS has difficulty with single sided media. The 9121 uses single sided, double density disks. (SS/DD).

The second problem is easier to deal with. If your disk imaging software can be told to write to only side 0 of a *double* sided, double density (DS/DD) floppy then that will fool the 9121, as long as the second write enable notch is covered. (Note that these formats are both lower capacity than a standard "HD" floppy disk.) But you still need software that will do that. I don't know of anything running under Windows that will, as a matter of fact. There is a DOS program called TELEDISK.EXE that can do the trick, but it only reads its own peculiar disk image format. Fortunately, quite a lot of HP-85 software is available in that format at hpmuseum.net.

What I do is to beat a long way around the bush. I have an HP-IL card in an ISA slot of my old Pentium/75 system. I use this in conjunction with EMU41 by J.F. Garnier. That is DOS software that I run under Linux. It emulates an HP-41, but also a complete virtual HP-IL loop. If you buy the registered version from JF for 20 Euro, it will use an HP-IL card to talk to real HP-IL hardware. So out there on the real loop, I have a 9114 floppy drive. I use an HP-71B and a BASIC program to copy an HP-85 disk image file-by-file to a real floppy sitting in the 9114. This floppy I can then sneaker net over to the Hp-85 with 9121.

That's a lot of stuff to buy and tinker with just to get a program copied, though. Unless you are addicted to that sort of thing, a more practical approach might be to get an RS232-C interface for the real 85, and use the 87 emulator (if it will do that) or else hyperterm or crt to send the program over as text. It should be considerably easier to do that sort of thing, and cheaper too. Of course, it won't be nearly as much fun. 8)

Good luck!

*Message #3 Posted by **Juergen (CH)** on 8 Oct 2005, 7:08 p.m.,*
in response to message #2 by Howard Owen

Thank you, Owen, for this very interesting informations. I think there must be an other way:
1. From inside Series 80 Emulator, save your programs to a LIF file.

2. From this LIF file, extract the programs (with some tool not yet existing), preceded by a DSF header. I don't know what DSF really is, but it is used by LIFUTIL to preserve file type information. Anybody knows something about DSF?
3. Use LIFUTIL to save programs to a floppy disk preformatted on an HP-85.

Except for the tool mentioned in step 2, everything is working on my system. I'm currently analyzing the DSF header, but I do not understand all the bytes. If anyone could provide me some information about what exactly DSF is, I'm sure, I am able to write the missing tool.

Juergen

*Message #4 Posted by **Howard Owen** on 8 Oct 2005, 8:17 p.m.,*
in response to message #3 by Juergen (CH)

For # 2, you can use Tony Duell's LIF utilities for Linux. There's also a nice tool for DOS and Windows available from this site, but it is tuned for HP-41 files. For #3, I don't know of anything that works on a modern PC under Windows. Someone else here may know different. I'd love to be proven wrong. 8)

Reading this again, I see that you suggest a floppy preformatted (on a 9121?) on the HP-85. If it is single sided media, you will have difficulties. The only way I have been able to write a single sided image to floppy is using real MS-DOS, double sided (DS/DD) media and a utility that knows to only write to side 0 to simulate single sided media. Maybe LIFUTIL will do this, but I thought I had tried that without success.

I have no Linux (shame on me ;-), but perhaps I can compile the utilities under cygwin...

> Quote:
>
> There's also a nice tool for DOS and Windows available from this site, but it is tuned for HP-41 files.

That does not work because HP41UC only handles files with type E080 (41C?) but the HP-85 files have type E020.

> Quote:

On my PC (500 MHz P3) it works perfectly with LIFUTIL. But I had to install an older 3.5"/1.44MB floppy drive.

> Quote:

This is what I do to get stuff from my HP-87 to my Windows or Unix PC. I am using a binary program on my HP-87 that allows diskette sectors to be read/written and then a short Basic program to send the data down the serial card to the PC. More details at http://www.series80.org/Articles/uploading-disk-images.html

If you want to use LIFEXE, read http://www.series80.org/Programs/index.html

*Message #9 Posted by **Juergen (CH)** on 9 Oct 2005, 4:34 p.m.,*
in response to message #8 by Vassilis Prevelakis

I already read the article, and I can transfer files from HP-85 to PC and vice versa. rawrite and fdimage did not work on my PC, but LIFUTIL works perfectly. BTW, thank you much for your excellent web site!

The only thing I cannot do is transferring files from the Series 80 Emulator to my HP-85. I can export S80EMU files to a .LIF file, but how do I get this to the HP-85?

My plan is to extract single programs from the .LIF file (easy), preceed them by a DSF header (need specification!), and transfer this files via LIFUTIL to floppy disk. DSF header is needed to preserve file type information. I have no serial interface, so floppy disks are the only way for me to transfer files.

Does anybody know what this DSF header used by LIFUTIL is?

Re: Series 80 Emulator - File transfer

*Message #10 Posted by **Vassilis Prevelakis** on 9 Oct 2005, 11:05 p.m.,*
in response to message #9 by Juergen (CH)

```
Juergen (CH) wrote:
> Does anybody know what this DSF header used by LIFUTIL is?
```

Its essentially a single file LIF image (http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=24) with significantly reduced directory area. The first block (256 chars) is essentially the same as the first block of a LIF volume (differences: there is always only one file on the volume, and the volume label is always HFSLIF).

The second block contains two directory entries (same as a LIF volume) the first is the entry for your file. The really annoying thing is that the directory entry always has the name WS_FILE instead of the LIF filename (what a wasted opportunity). So you need to specify the filename your self.

The second directory entry is of type 0xffff, end of directory entry.

So you can essentially cut&paste from a LIF volume to create a LIFUTIL DSF file.

Following is some hex dumps with comments:

DSF image of file CH4.BIN (from the HP85 training pack):

          *** SAME ***
```

Directory entry for file CH4

```
 000000000240    43483420  20202020    2020e022  0000006d    *CH4        ."...m*
 000000000250    00000003  00000000    00008001  f0020001    *................*
```

Comparing the two we see that they have only minnor differences (just the filename and the start sector on disk, which is always 2 for the DSF as the file starts on the third sector of the image (which is block 2 if you start counting blocks from 0)

Summary: To create a DSF archive you:

(a) copy the first two blocks (block 0 and 1) from an existing DSF archive.

(b) copy the LIF directory entry of the file (32 bytes) into the beginning of the second block (block 1) of the new DSF archive (absolute DSF file address 0x0100).

(c) Edit the file directory entry in the new DSF archive to change the filename to WS_FILE and the starting block to 0x00000002 (absolute DSF file address 0x010C).

(d) Append file contents to DSF archive starting from the third block (block 2), absolute DSF file address 0x0200.

**vp

HP48GX and Windows XP

*Message #1 Posted by **George Rose** on 8 Oct 2005, 11:14 a.m.*

I have been using Windows 98 and the HPcomm program to transfer data between my 48GX calculator and my old PC with Windows 98. We purchased a newer computer with Windows XP over a year ago. But I have not used it to backup any HP48 files. I use the new computer (originally bought for the kids) more and more and would like to use it to communicate with my 48GX and maybe a 48SX I started using also. HP's web site only has HP48 communications programs for Windows 2000 and earlier versions. But an XP version is available for the 49G+ and 48gii. I have searched hpcalc.org but can't locate what I am looking for. Can anyone PLEASE HELP!!!???

Re: HP48GX and Windows XP

in response to message #1 by George Rose

I use emu48 for connecting my real 48 with a virtual copy of it. This has worked well for years, with several versions of Windows, including XP

in response to message #1 by George Rose

HPComm 3.4, available from hpcalc.org will work just fine on Win XP. I use it every day to transfer files between a Win XP pc to both a 48 and 49 with no problem at all.

*Message #4 Posted by **Iqbal** on 8 Oct 2005, 9:20 p.m.,*
in response to message #3 by I, Claudius

i use hyperterminal without any problems

Re: HP48GX and Windows XP

*Message #5 Posted by **James M. Prange (Michigan)** on 8 Oct 2005, 10:31 p.m.,*
in response to message #1 by George Rose

I think HP just hasn't gotten around to updating their 48G series and 49G pages since Windows XP was released. As far as I know, the HPComm application is the same for MS Windows 95, 98, NT4.0 and 2000. Though undocumented, it's said to work with ME and XP as well.

Similarly, Conn4x (the 49g+ and 48gII application) is the same for all recent versions of Windows. Though Xmodem based, it includes an Xmodem server library that you can install on a 48G series (though not a 48SX/S). It works well with the 48G series for the most part, but some of the character translations differ for "text" mode transfers, and it may have problems with some "text" transfers that include the "counted" forms of characters strings used in the 48 series. In particular, it may get "confused" about the translations when a \

character occurs outside of a quote-delimited character string.

For more information, search the Google archive of the comp.sys.hp48 usenet group. Start from http://groups.google.com/group/comp.sys.hp48/. If you don't find an answer to your question, ask on the newsgroup.

Of course, also see http://www.hpcalc.org/.

Regards,
James

Designing a Logic State Analyzer for calc repairs

*Message #1 Posted by **don wallace** on 8 Oct 2005, 3:23 a.m.*

Hi all.

Some may consider (parts of) this post off topic. To those people I would say respectfully: keep replies constructive and on-topic please (!)

I have a few longer term projects which a few here may find interesting given this is such an active technical community.

The relevant one is a cheap Logic State Analyzer which can be used to debug logic faults and observe the execution of code, on machines from a hp 9810 all the way up to the latest equipment.

These somewhat exotic machines range from expensive to very expensive and hobbyists don't normally have access to one. Some here are fortunate to work for firms where such equipment is accessible, or perhaps they actually own one.

Tony Duell mentioned using one in a recent post. I designed and built one from a scraped arcade video game in '87 when I was 23. Now I'm doing a much improved revamp with modern components.

I had intended to make this thing to do my expansion work on my favourite toy, the 41. In my getting involved in the forum, doing the early calc. dev. work and making my clonix clone etc. other projects and commitments were shelved and now they must have some time devoted to them as well, since I have a copy of Diego D./ John I.s rom emulator running, on which I shall build to "push the envelope" as it were. Some of the code needs work.

Anyone interested can look at my website in a few days to a week where I'll have sketchy details posted (I am re-organising my pages since my allowed 10 MB of space is a bit tight...)

The machine will run under DOS from a parallel printer port and is a general purpose machine for logic hardware / firmware debugging. Many here may find it helpful in exploring the further use and repair of their machines and also in writing machine code for controlling physical devices.

Constructive feedback is welcome. If anyone wants to bitch to or about me they have the option to send abuse to my private e-mail address. That way this forum will not be cluttered with irrelevant venom. Readers don't ask for it.

Reading over a recent thread (everyone knows which one) leaves me feeling a mixture of anger, annoyance, sadness and disgust... except for when I read what my supporters have written; thanks guys! The support from you people and the possibility I can help others are the only reasons why I still bother to post.

"Not impressed"

Don W

donwallace63@yahoo.com.au http://donwallace.customer.netspace.net.au

P.S. To Whom It May Concern: This is NOT a sales pitch, oblique or otherwise.

Re: Designing a Logic State Analyzer for calc repairs

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 8 Oct 2005, 8:20 a.m.,*
in response to message #1 by don wallace

Hi, Don; good reading your posts here.

About the logic analizer: I´ve been doing some research on this subject because I want to have one single, low-budget logic analizer. When I had the need to follow some signals, I borrowed a four-channel scope from a friend of mine and used it. Not the best tool, but it helped me when no more than four lines should be used. In some cases, I used external logic (some AND/OR gates) to combine some lines... at least I could see where I had the final combination, though.

After a while, I thought it would be better in my case having an acquisition gate+memory buffer, either a FIFO, a RAM or even a fast controler to handle data, and a suitable software running in an old Linux-based PC to capture data stored in the above mentioned acquisition gadget and turn it into visible data. Control might be shared with the PC software and the local triggering capabilities of the acquisition gadget in order to enhance capture abilities.

Using an existing PC reduces hardware costs, but demands software development. I was once told by a contributor that some suitable development platform exists that help developping control software. I though of using TK/GTK to write the graphics interface and some small C/C++ routines to capture data trhough I/O connection (USB? RS232? Printer port? Custom IO card?) and build a data file to be read by the TK/GTK to build the instrument viewing window.

I tested just a few experiments my own prior to try some existing capture designs so I could, at least, have a reference, but I did not go too far. I know I have the knowledge and skills to go ahead and get to a final working prototype, but I lack available time. What do you think?

Best regards.

Luiz (Brazil)

Re: Designing a Logic State Analyzer for calc repairs

*Message #3 Posted by **don wallace** on 8 Oct 2005, 6:36 p.m.,*
in response to message #2 by Vieira, L.C. (Brazil)

Hi Luiz,

About the Logic State Analyzer (LSA)

Well it's really great that you are interested in this sort of thing.

I'm pretty out of date with "modern" stuff like USB. Meindert woke me up to FDTI's one chip USB interface (with drivers!) which is exciting and something I will play with and use eventually. Maybe sooner than later!

My opinion is that for me the simplest interface is the printer port. I plan to adapt and extend a very simple design I devised which worked fine using (very old!) 6551 cmos dual port ram. I won't be using dual port RAM in the modern design. In data acquire mode the ram is addressed in sequence with a cmos counter and written to from the circuit nodes under test. In data playback mode you have the PC step the LSA address generator counters through the ram locations and read the bits you are interested in into the PC.

ASIDE: This can also be very simply done in hardware if you have a basic oscilloscope to display the signal. I am a bit torn over whether to bother to also build a very simple LSA which just displays on a 'scope because you can't directly display HEX code easily... just a timing diagram type of display. But for tracing through logic faults like Tony mentioned it would be great for people working in an "advanced hobby" setting where the ultimate (translation of the hex code into assembler mnemonics) isn't required... No mucking around on the PC doing the "acquire/store/display quickstep". Also good for quickly seeing what going on in a design you are doing. ASIDE ENDS:

The only thing you need on the PC software side is to flip bits and write bytes to a few latches (output) in the printer port and read the input latches into some array, it's so simple. CMOS analogue multiplexors are controlled to access different blocks of ram or different bits (you can read five at a time even with very old printer port logic, a byte at a time with any modern EPP port).

This approach is primitive but perfectly adequate, simple to design and can easily be expanded.

My next favourite interface is RS232 as you still have bit mode control of lines.

USB has the advantages/disadvantages of being BLOCK mode and that's why I'm not so interested in using it at this stage. Also, the amount of data we are talking about is quite small.

On a related topic: eramco rambox revisited:

You may already know about it, but there's a new very simple CMOS logic block out which has a serial input and a byte-wide parallel latched output. The 74HC595 is very cheap and fairly fast, fine for some of the interface hardware to the 41 in a modern version of an eramco type rambox. One can easily use two of these to generate latched hp41 address data from the 41's ISA bus. It's only good to about 6.5 volts though so it's unusual CMOS logic. Ok for the 41 which runs it's regulated power bus at 6.2 volts.

A 74HC595 can also be used to convert an incoming serial data stream to byte wide parallel data for writing into conventional memory.

As people can see I am open with this info and only secretive/hesitant about stuff which I can't properly explain yet. Bad information is worse than no information sometimes...

Don W

Re: Designing a Logic State Analyzer for calc repairs

*Message #4 Posted by **Meindert Kuipers** on 9 Oct 2005, 2:32 p.m.,*
in response to message #3 by don wallace

Don and others,

I have created a LSA with a single chip USB interface and a level shifter for the HP41. This was totally painless in hardware with a commercial DIL module of around EUR 30-40 and cost me about 2 evenings in software. No memory, no counters, just send ISA, DATA and SYNC in real time to the PC and dump it in a big file that can be post processed and searched. It gives a full trace of everything happening on the HP41 bus as long as it is in sync with one of the CLK01 or CLK02 lines. Plenty of extra signals for tracing external hardware. At my work we have the DigiView commercial LSA for USB, and I really would not bother making one myself if I needed the datarates. For developing the MLDL2000 I could trace all I wanted with a scope and my 'own' USB LSA. Again I have to credit Eric Smith for the original idea of using the FTDI chip as a LSA. Eric has been able to use this device for dumping almost all HP calculator ROMs.

USB is not really block mode only, it is just more efficient when using blocks, and that is what my

HP41 analyzer uses. A parallel port is limited in speed, and difficult to program on bit level without the right drivers. Besides, I have my PC onder the desk, and a USB hub on the desk, which makes cabling with a USB device much easier (and gets power from it as well). Any bitbanging through USB or a parallel port will seriously suffer from lousy performance. The FT2232C chip from FTDI will give you serial protocols and bitbanging-like functions at very high speed with an easy software interface. I really recommend studying this chip before starting to contemplate the use of 'good old' 40xx CMOS os 74xxxx TTL chips for anything else then level conversion.

A future addition the the MLDL2000 will offer the possibility to do HP41 signal tracing. It is designed to do this in hardware, it is just a matter to implement the firmware and software for it.

I appreciate your opennes. That is how I finally succeeded to build the MLDL2000, with the help of this Forum. It is important to think out of the box, and look at new technologies. To succesfully implement the MLDL2000 I had to learn to write VHDL, program a USB interface and make PCB's for SMD devices. All exciting new stuff!

Good luck with developing your LSA and your RAMBOX!

Meindert

Re: Designing a Logic State Analyzer for calc repairs

*Message #10 Posted by **Bill Wiese** on 9 Oct 2005, 2:40 p.m.,*
in response to message #7 by don wallace

With cheap FPGA/PLDs there's a few cheapie-but-useful logic analyzers on the market. Some of these offer dig scope functionality too...

http://www.tech-tools.com/dv_main.htm http://www.bitscope.com http://www.usbee.com/ http://www.dynoninstruments.com/

The DigiView from TechTools is particularly cool because it offers 'transitional timing'. Many/most logic analyzers just load states into memory as the clock line wiggles - even if there's no change in state. Thus, memory can fill quickly if you're looking for, say, a glitch in a slowly changing environment and could take many capture setups and a closely-constrained test environment.

Transitional timing L.A.s only enter a new state record into memory if there's a state change. If one state lasts thousands or millions of clocks, there's still only one record stored in capture memory. This effectively magnifies the LA capture memory by millions of times and allows extended or repeated test runs that would almost instanly fill capture memory of typical L.A.

[BTW years & years ago I built a capture device to do reverse engineering of automotive engine control firmware. It used 256K x18 of expensive x9 wide fast FIFO chips (having internal dual-port RAM structure), with 2 address range filters (settable with DIP switches, using 74F521? addr comparators) ahead of it. With appropriate filtering and connected to a PC thru a fast parallel port and some DOS software, one could see 'memory movies' of ROM data accesses and/or record data accesses and external measurements to correlate firmware behavior w/outside world. (Those fast dualport FIFOs were REALLY expensive in 1993, esp in single-unit quantities.)]

One could build a nifty capture device these days... maybe 32 bits wide state w/32bit wide timing value per state, so 64 bit records wide. Use a fast PLD for multiple addr range comparisons at the front end. It also monitors change of state - each new 32 bit state resets a counter; when the state changes, the prior state and its clock-count duration are recorded into fast DP RAM or FIFOs. On the other side of this RAM/FIFO bank is a CPU+ USB2.0 or 1394 to squirt it to the PC.

However this may not be worth it as you can get the boxes listed above for around $500, and which will do much of what you want - and that money works out to 6-12 hours of work for avg electronic folks- compare that to your time to design/build/debug/provide software for a design of your own creation.

*Message #11 Posted by **don wallace** on 9 Oct 2005, 5:03 p.m.,*
in response to message #10 by Bill Wiese

Hi Bill,

Well, that post of yours was REALLY interesting...

Transitional triggering is an area I had found frustrating due to the increasing complexity required to do the instrument. But you are right, it's nearly too important not to implement.

Very interesting design you did. It would have been worth it's weight in gold. Like the info in your post.

You and Meindert have certainly got me thinking...!

I try to never build anything that I can buy. I have picked up a few nice logic analyzers on Ebay for real cheap. Not current state of the art, but far more capable than what is needed to hack around a 30 year old calculator.

Re: Designing a Logic State Analyzer for calc repairs

*Message #14 Posted by **Garth Wilson** on 9 Oct 2005, 8:55 p.m.,*
in response to message #1 by don wallace

I have an old HP logic analyzer here, a 1610 I believe, that someone gave me a few years ago. He said it

worked, but I've never used it to even verify. He works at JPL, and it sounds like he got it free from there just because it was so slow compared to the newer ones. I believe it's 10MHz, which would be plenty good for developing HP-41 products. If someone wants it, they're welcome to it. I'm in Whittier, California (about 20 miles east of downtown L.A.). It'll be free if you come pick it up; otherwise the shipping charges for this size and weight will be pretty high. I offered the logic analyzer on another forum and a fellow up in the Sacramento area claimed it, but by the time I found a box for it and was able to pack it up, I couldn't get hold of the man again to tell him how much shipping would be. IIRC, the box was too big for the post office to handle.

Nigerian Scam / 2005 Ig Nobel Prize

*Message #1 Posted by **db (martinez, ca.)** on 8 Oct 2005, 12:55 a.m.*

This has been discussed here, in relation to the classified ads, so i guess it is somewhat "on topic". Of course; real Ig Nobel winners use TIs....

The Ig Nobel Prize for Literature went to the Nigerians who introduced millions of e-mail users to a "cast of rich characters ... each of whom requires just a small amount of expense money so as to obtain access to the great wealth to which they are entitled."

This year's other Ig Nobel winners include:

PHYSICS: Since 1927, researchers at the University of Queensland in Australia have been tracking a glob of congealed black tar as it drips through a funnel — at a rate of one drop every nine years.

PEACE: Two researchers at Newcastle University in England monitored the brain activity of locusts as they watched clips from the movie "Star Wars."

CHEMISTRY: An experiment at the University of Minnesota was designed to prove whether people can swim faster or slower in syrup than in water.

Well deserved!

*Message #2 Posted by **Frank Boehm (Germany)** on 8 Oct 2005, 3:50 a.m.,*
in response to message #1 by db (martinez, ca.)

In my opinoin, the Nobel Prize for Literature is well deserved. Millions of people are able to become millionaires - they just need a computer (and a little cash handy). This is real space age! And (this is much more important, think about world peace), long lost family member appear all over. We have former ministers, sons of former presidents, princes all revealing their true identity through email. I think this is the real breakthrough. (If I only could figure out, why they don't just grab the cash and run. Maybe they are too honest...)

*Message #4 Posted by **John Nguyen** on 12 Oct 2005, 12:43 p.m.,*
in response to message #3 by David Smith

I recently got an offer from the "widow of Mobutu Sese Seko." At first, I was perplexed because if one

were going to "offer" easy money, one could at least use a much nicer character as a subject. But then, I thought about it further: Mobutu was so corrupt, who better to deal with than his family, after his death, when it comes to laundered cash. Now that you've crossed over to the dark side, I could forward you that email. :)

*Message #5 Posted by **donald wallace** on 11 Oct 2005, 9:37 p.m.,*
in response to message #1 by db (martinez, ca.)

The physics department at UQ "experiment" is actually an illustration of "superfluid" behaviour in pitch. Glass behaves the same way. I saw it and although it's boring, it's "interesting" ;-)

Also in the foyer at UQ was a really neat somewhat kitsch display, an early rainbow hologram from the 1960's of a cute (1960's "straight") blonde girl who winked at you as you went past... ;-)

Of much more troubling concern to me at that time (1982) were the bizarre multiple postings in the department halls of expositions on the subject that apparently the speed of light is changing.

Seems some fundamentalist christians couldn't cope with the universe being so very old as it is. Their explanation was the speed of light has sped up recently (since 4007 B.C. the "Time of Creation"). I found this very disturbing that people could actually seriously expound such garbage...

Oh well, it takes all kinds...

dw

Mr. Wallace!

This is, after all, a calculator forum, and a pleasant one at that.

Please be mindful of possible ways your "tone of voice" may be (mis)construed!

I am a research scientist. I am a HP calculator enthusiast and am addicted to RPN over algebraic. I kin do maff and talk ennlish. I am also a fundamentalist Christian.

Don't worry, I don't believe nor teach that the speed of light has sped up, though some report that it may have slowed down (propagation of errors, anyone?). Whatever. The truth is, even with all our current knowledge and technologically improved abilities to inquire and observe, we really still don't know all that much about the universe, especially its origins, as we have to rely on old light transmitted fantastic distances and time through the old ether. Even old HP calculators like my beloved 34C can't help too much with that, seeing how it's kind of electronically decrepit and suffering from the dreaded "2 disease".

Please, though, whatever you believe, don't teach that we have our heads stuck where there is no light, new or old. Besides, not even we unedumakated phun... fon... fundies (that's the ticket!) believe Usher's 4004 terrestrial odessey anymore, just as no one believes the stuff Lamarck and Lysenko taught about heredity, or that TI, Casio and Sharp are the best.

May your HP calcs continue to give you joy and the Lord bless you anyhow.

Re: HP 42s Feet-inch-Fractions

*Message #2 Posted by **Walter B** on 8 Oct 2005, 9:50 a.m.,*
in response to message #1 by Kelley

What do you mean? Shall the program do F-I-F arithmetcs (+ and -)? Shall it display the result in fathoms or yards or miles or mils? Shall it allow for multiplication to reach acres or square feet or square inches? Or shall it just convert F-I-F once into useful units? Then you can do your calculations easily and - if you are not convinced yet - reconvert into F-I-F at the end. Anyway, please specify what you want.

As with the program I found for the 41CX I only need to deal with Feet, inches and fractions of an inch from Decimal format. The program I found on this site under the 41 programs would be great if I could figure out how to get it in my 42s. Thank you.

eg; http://www.hpmuseum.org/software/41/41feet.htm

Re: HP 42s Feet-inch-Fractions

*Message #4 Posted by **Walter B** on 8 Oct 2005, 3:13 p.m.,*
in response to message #3 by Kelley

Because HP42S is code compatible to HP41C, this program should run on both calcs. So just key it in.

While doing so, please think: for at least some 100 years, people use a *system* of units making such calculations obsolete. It is standard worldwide. Worldwide? No, less than 5% of mankind refuse to accept it and spoil the world with strange screws and more. What a waste of resources and time!

The "workarounds" mentioned by Kelley refer to this quote from the program's author (Fred Lusk):

> Quote:
>
> *The program uses several extended functions, including X<>F, XTOA, and REGMOVE, though there are workarounds.*

These three Extended Fucntions were provided on the HP-41CX and the X-Functions module for the HP-41C/CV.

XTOA is available on the HP-42S, but X<>F and REGMOVE are not. So, different means of accomplishing those functions must be used on the HP-42S.

Feet-inch-Fractions: HP-32SII or HP-33S

*Message #6 Posted by **Karl Schneider** on 8 Oct 2005, 4:21 p.m.,*
in response to message #1 by Kelley

Kelley said,

> Quote:
>
> Any help or suggestions would be appreciated. Other than buying yet another calculator.

If you were open to the idea, the HP-32SII and HP-33S have built-in fraction-arithmetic and neares-approximation capabilities that would seem well-suited to Fred Lusk's example problems.

There are also special calculators for construction, sold in hardware stores and big-box home-supply stores, that might handle these calculations conveniently.

Kelley…

I sent you a personal response to your email, but here is the substance of it for the other participants in this thread.

"Kelley…Sorry for the slow reply, but I was completely tied up last week. One of my other hobbies is amateur

astronomy. Last week I got our club calandar ready for the printers (it's a small wall calendar that includes astrophotos by club members, a schedule of club events, moon phases, astronomical events, etc.) and I finished two PowerPoint presentations that I gave at a star party/amateur astronomy seminar this weekend at a lodge near Sequoia National Park (topics: "Beginning Astrophotography" and "A Tour of the Night Sky"). That, and I worked all week. Thank goodness last week is over. If you want to see the calendar part of the calendar, it's at http://www.cvafresno.org/calendar/. We don't post the photos because we sell the calendars.

"Unfortunately, I haven't had time to get back to finishing the rewrite of the program. I'm actually about 75% done with it, but the last several years (yes, years) have been extremely full and I have done almost no programming, except for torturing myself converting a civil engineering program I wrote for the 42S to my 48G+. I like the end product, but I will never do THAT again. Give me keystroke RPN programming any day. However, I need to get F-I-F finished because it's bugging me, and you're not the only person who has asked about the rewrite. I use my 42S more than any other calculator and I need F-I-F on it. Right now, I use F-I-F on a 41CX emulator on my computer.

"A couple of years ago, I sent someone the instructions for converting my 41CX code to the 41C/CV instruction set (which would also work on the 42S), but that was before a hard drive crash and I don't have the email anymore. Most of my notes are boxed up right now, but from I remember, you need to do the following:

"--- Convert [0 X<>F] to [CF 0 CF 1]. The original instruction clears flags 0-7, but because the program uses flags 0 and 1 and not flags 2-7, you really only need to clear flags 0 and 1. I happend to like a clean display, so I clear all of them with this instruction rather than using a different input for X<>F to clear just flags 0 and 1. "--- Convert the various REGMOVE commands. This will take a bit more work, but the concept is straightforward: REGMOVE moves a block of registers from one place to another based on the value in the X register. My 41CX manual isn't handy, but I remember that the parameter in X is defined as follows: aaa.bbbccc, where aaa defines the start of the FROM block of register, bbb defines the TO block of registers, and ccc defines the size of the block. Thus [11.001004 REGMOVE] at steps 47 and 48 will move the four registers starting at register 11 (i.e. R11, R12, R13, and R14) to the four registers starting at register 01 (i.e. R01, R02, R03, and R04). You can duplicate this with [RCL 11 STO 01 RCL 12 STO 02 RCL 13 STO 03 RCL 14 STO 04]. The other REGMOVE commands work in a similar fashion. Please note the constant in step 13 is stored in R09 and reused several times."

Fred

HP-41C battery contacts

*Message #1 Posted by **RicDng** on 7 Oct 2005, 9:28 p.m.*

Hi. I just got a HP-41C. I do not know if it works, and I do not want to buy N (E90) cells just to see if it works. I am planning to power it with some adaptor I will do, but I need to know if central battery contacts are connected to the internal circuits or just to each other.

Bye, Ricardo

Re: HP-41C battery contacts

*Message #2 Posted by **Randy** on 7 Oct 2005, 10:03 p.m.,*
in response to message #1 by RicDng

You can test with any good, clean 4.5 to 5.5 volt dc source. Power consumption is approximately 5 ma in the active state, it varies by model. The center two connections are only a jumper, there is no connection to the 41.

http://fixthatcalc.com/images/41_connection.jpg

Re: HP-41C battery contacts

*Message #3 Posted by **RicDng** on 7 Oct 2005, 10:13 p.m.,*
in response to message #2 by Randy

Thank you, Randy

Re: HP-41C battery contacts

*Message #4 Posted by **don wallace** on 7 Oct 2005, 11:15 p.m.,*
in response to message #1 by RicDng

Hi Ric,

It's just possibly worth your while to current limit the power supply to few hundred millamps or so to test your 41C.

If there is anything along the lines of a short in the interconnections that way you will save the internal power supply regulator.

Second hand machines sure do arrive with some strange faults...

Voyager speedup side effects

*Message #1 Posted by **Gerson W. Barbosa** on 7 Oct 2005, 9:24 p.m.*

Besides some known and obvious side effects of speeding up a Voyager, has anyone experienced new problems?

After speeding up a 15C to 2.49x, I noticed some dots and commas that were not supposed to turn on would do so occasionally. For example, after a calculation the display would show something like

```
123.45 , ..
```

Perhaps that was because of the rather large inductor I used which was pressing the printed circuit board a little. I replaced the 33uH inductor I had previously used with two tiny 180uH inductors (easily found in old 5 1/4" disk drives boards). Instead of warp speed now the 15C runs at sub-warp speed (1.74x), much more suitable for a Voyager :-) At least, now it is almost as fast as a 41...

Regards,

Gerson.

Stat49Pro+ Impressions Please...

*Message #1 Posted by **Scott Guth** on 7 Oct 2005, 8:31 p.m.*

Hello all,

Stat49Pro+ and Stat48Pro+ ver. 3.0 will be available for the HP49G(+) and HP48G(X) calculators soon. In case you are unfamiliar with these products, a description of their capabilities is given below.

What I need is a few people who are familiar with basic and hopefully more advanced methods of inferential statistics who would be willing to try out the product and send suggestions. The HP48G(X) and HP49G(+) versions are both available for this.

If you are interested in previewing the product or seeing a detailed data sheet on the product, please send me an email at guthjun...@charter.net.

Thanks,

Scott Guth Mathematics Dept., Mt. San Antonio College

What's new in Stat49Pro+?

1. Arbitrary regression/least squares applications with inference methods. a. Linear regression with inferences on slope, rho, expected/predicted y values. b. Multivar-linear regression c. Polynomial regression d. Multivar non-linear regression e. Many tests & confidence intervals for these applications

2. Better integration with the Data Manager. The Data Manager can now be invoked from within any inference application - just press the [Data] soft-menu key, and enter your data. Once the data is stored, press the [ImPrt] soft-menu key to import whatever statistics are needed from your data set directly into your input form.

3. More ways to Describe multivariate statistical data (in the Data Manager), including Mean Vector, Variance/Covariance Matrix, and the Correlation Matrix.

4. Better inferential methods for normal-quantile plots.

The following gives an overview of the older features of the product:

Stat49Pro+ is a complete inferential statistics library written in System RPL. Essentially all methods of descriptive and inferencial statistics covered in a college level statistics curriculum are computed by Stat49Pro+. Included is a data manager which stores sample data and sends statistics directly into input forms for the various inference applications. Some non-parametric tests are supported as well, along with normal probability plots and rank sums.

Better Short Median Formula

*Message #3 Posted by **I, Claudius** on 7 Oct 2005, 10:53 p.m.,*
in response to message #2 by Scott

Aha, someone who knows his stats! One of the missing functions in the 48/49 stat menu is a median function. I wrote a User RPL program that uses the short formula of median position = 1/2*(n+1),

<< SORT DUP SIZE 1 + 2 / GET LASTARG FLOOR GET + 2 / >>

but it obviously won't work in all cases. Is there a better short formula for the median I can use?

Edited: 7 Oct 2005, 11:06 p.m.

Re: Better Short Median Formula

*Message #4 Posted by **Scott** on 10 Oct 2005, 12:54 a.m.,*
in response to message #3 by I, Claudius

Well, here's a quick first attempt which handles odd/even list sizes. I thought I had a shorter version, but SigmaLIST doesn't handle a list with one element! Ridiculous!

<< SORT DUP SIZE 1 + 2 / DUP FLOOR SWAP PICK3 SWAP GET UNROT GET + 2 / >>

Someone can do a smaller one, can't they?

-Scott

MLDL2000 information updated, schematics available

*Message #1 Posted by **Meindert Kuipers** on 7 Oct 2005, 7:09 a.m.*

I have updated the MLDL2000 pages at www.kuipers.to/hp41 with a new version of the manual and the specifications, though the changes are minor. I have also posted the schematics and PCB layout (for Eagle CAD) and the source for the CPLD firmware.

The MLDL2000 is shipping now as a kit and assembled units are in the 'production line'. There are still a few available for those who are interested, but as a kit only (cardreader shell is included).

Need help for a 32 e

*Message #1 Posted by **Jürgen Richter** on 7 Oct 2005, 1:06 a.m.*

Hallo!

I have two problems with a 32e-

First is that the thin electrical "cable" between batteries and the calculator is broken in one line, i think because of the defect of batteries in the past.

Is it possible to change or fix this line.

And the other Problem is that is that i have an non soldered version. And i forget to register how the little circuits are placed. because i don't want to take them out. But me daughter decided it was much more excitable to turn this interesting peace of toy, daddy is playing with, upside down. O she was so right, now I am excited.

Did anybody can tell me or probably have a Picture in which direction the circuits have to place?

Thanks for help Juergen

Edited: 7 Oct 2005, 1:07 a.m.

Re: Need help for a 32 e

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2005, 1:37 a.m.,*
in response to message #1 by Jürgen Richter

Hi, Jurgen;

I`d guess you are in no trouble. Since yours is an HP32E, all IC's are lined up by assembling them all pointing the '#1' pin to the LED display. All of them. And there's more: if your HP32E has more than one 8-pin DIP IC (the small ones, as you surely know), keep in mind that they have all pins with the same number connected in parallel with the ones in the other IC's (these are mainly RAM and/or ROM). You can easily check for this fact by inspecting the main PCB.

The main concerns are related to the series with continuous memory (HP33C, 34C and 38C). In these cases, the first position for the small 8-pin DIP IC's, the one closer to the power supply board, must hold the RAM IC so it is always fed for as long as there is a battery maintaining the minimum supply needs to hold its contents.

If you need further advice, please, keep posting.

Best regards from Brazil.

Luiz

HP-97 Printer Idler Gear Replacements Available Here

*Message #1 Posted by **Mike DiGirolamo** on 6 Oct 2005, 10:54 p.m.*

Anyone else with a broken idler gear in their HP-97 printer? I read the fine article by Katie Wasserman ("HP Printer Gear Replacement," 15 Nov 2000)telling how to modify a stock gear to work in the HP-97's. The cost today (considering minimum order charges, etc) comes out to nearly $30.00 for the raw materials of a gear and the nylon sleeve insert. These must be modified before they will work. I got a quote to have the exact gear made in quantities of 12ea and 25ea. The costs were approx $35 each for quan=12 with a price drop to $21 each for quan-25. Are there 12 to 25 folks out there who would like to make a group purchase of the exact gear? Please contact me for details if you are one of them. If I can get enough folks together by 10/15/05, I'll spearhead the project.

Regards,

Mike DiGirolamo, W4XN Charlottesville, VA 22901

Re: HP-97 Printer Idler Gear Replacements Available Here

*Message #16 Posted by **David Smith** on 9 Oct 2005, 5:32 p.m.,*
in response to message #4 by Mike DiGirolamo

I never ordered the gears. I bought 25 stock gears for $4.50 each and milled down the hubs and added a bushing to the hole.

If you are going to have gears made, I would go with the 100 piece run. You will find homes for them. I used about 10 of mine, and the rest went rather quickly without me having to do any advertising.

Re: HP-97 Printer Idler Gear Replacements Available Here

*Message #17 Posted by **Mike DiGirolamo** on 13 Oct 2005, 12:22 a.m.,*
in response to message #16 by David Smith

Hi David,

May I ask, from whom did you order those gears? I'd like to give your source a call if it's different from mine.

Thanks,

Mike

BTW gang, only 2 MORE GEARS ORDERS NEEDED to reach our 12ea pricing -- let me hear from the "other 2" of you..

Re: HP-97 Printer Idler Gear Replacements Available Here

*Message #18 Posted by **David Smith** on 13 Oct 2005, 9:00 a.m.,*
in response to message #17 by Mike DiGirolamo

Stock Drive Products (sdp-si.com) has the stock gear that is easily modifed and also gave me the $9.00 quote for custom gears. Pic Designs also has the stock gear.

solar calculator hack a school calculator

*Message #1 Posted by **bragg g7** on 6 Oct 2005, 4:47 p.m.*

heres a overflow_buffer.dgt for the casio fx-260 solar school

first you type 569874 then = then M+ and then cover the solao panle for 10-13 seconds and then it should say .0.0.0.-.E.-.0. or some thing like that or - - - real--- but the word is broken up in to segments press 8 then it should say -E- in the middle of the screen you have succesfully rewriten the firmware to a lower firmware. it's a possable way to write a type of hombrew I don't know how or what but it could happen I forgot another code which acts a a homebrew supporter I think the code is 2059.076 may be with a 6 at the end.

And yes I made up the code which does work on lower firmwares I have not made any homebrew up but it works

33s and 32sii keyboard issues

*Message #1 Posted by **Stan Fuller** on 6 Oct 2005, 3:51 p.m.*

Has anyone had the keys come loose within the housing of their 33s or 32sii??? I had TWO 32sii's that became unusable because of this. Now, I'm on my second 33s in less than two years and the number "1" key just broke loose. The first one I had replaced under waranty, but this second one is not covered. I LOVE the 32sii and 33s models, but at this point will not buy another one. What about the 48gII and the 49g+? Do these models have similar key construction? I'd hate to abandon HP and go TI...

Re: 33s and 32sii keyboard issues

*Message #2 Posted by **sjthomas** on 6 Oct 2005, 3:55 p.m.,*
in response to message #1 by Stan Fuller

Are you a pusher, or a poker? :-)

Re: 33s and 32sii keyboard issues

*Message #3 Posted by **Ron Ross** on 6 Oct 2005, 4:08 p.m.,*
in response to message #1 by Stan Fuller

If you had two 32sii's fail, you will certainly have no better luck with the newer Hp's. Yes, I believe the Hp48Gii and Hp49G+ have a similar construction to the newer Hp33s (perhaps even less durable).

You will certainly save money by switching over to Ti, but you will also give up features as Ti no longer makes a programmable pocket calculator either.

I suspect (and actually recommend) you will buy a Ti. And their new calculator keyboards are fairly rugged and will probably hold up longer than an Hp for your use.

I also suspect that you will buy another Hp33s in 3-6 months after using the Ti (unless you buy a good graphics), as their pocket calculators are very basic models compared to the features offered on the Hp33s. And the new Hp33s has improved the decimal point in the display.

If you had not mentioned two dead Hp32s's I would blame the new Hp keyboards, but I suspect you punch your keys and cause failures on the Hp style type keyboard. A Ti probably won't fail under the same use, as they use a different construction (no tactile feed back, but no failure either).

OT: TI keyboards

*Message #4 Posted by **bill platt** on 6 Oct 2005, 4:15 p.m.,*
in response to message #3 by Ron Ross

Hi Ron,

When did / how did Ti eliminate teh "Ti-itis" problem that was so endemic on their LED models? I seem to remember some early LCD models having the same problem. How are they made in such a way that

there is no failure from hard keypresses?

Note: I have never taken a Ti apart.

Regards,

Bill

Re: OT: TI keyboards

*Message #5 Posted by **Ron Ross** on 7 Oct 2005, 8:41 a.m.,*
in response to message #4 by bill platt

It took Ti nearly a decade to eliminate their lousy keyboards (and they didn't start out lousy, the SR-50 series was good). Ti's first LCD models had the same crappy keyboards of their earlier Ti-50 line.

Probably Ti wised up after buying and relableing a Toshiba calculator (Ti-66). But I had already switched over to an Hp15c and a friend of mine had purchased the Ti-66. That was in 85 or 86, and I had just abandoned a new Ti-55ii.

In one of my former jobs in R&D in the mid nineties the lab was swamped with Ti-30x's. They held up to all sorts of abuse and yes, we all considered them disposable. But their keyboards never failed due to use (chemical abuse was another problem, some of the chemicals were extremely volatile).

So I would have to say the corrected their problems of poor keyboards in the late 80's or early 90's.

I have never bothered to repair or even disassemble a newer Ti as stated earlier, they are disposable at $10-15. I can understand the original posters dismay, because at $50, you do expect a longer life. I also suspect he does bang hard on the keypad as it is a near statistical impossiblility that he got two BAD Hp32sii's and then a poor Hp33s (that's not quite so hard to imagine).

I did dissemble a Business model due to a bad LCD. It was as stated earlier, a poor connection between the LCD and the zebra strip. And the case was flimsy. Since I had taken it apart to see construction, and it was a business model, I never bothered to reassemble.

I can't agree that TI scientific calculators are rugged, and wouldn't second a recommendation.

I have had two different model TI scientifics die on me, in only about a year of use each. The keyboard died on one. For the other, either the CPU, display, or solar cell got loose. (The calculator would intermittently work if I squeezed the back) I opened it up and was surprised to see that neither the LCD nor the solar cell were physically connected to anything; only the pressure of the back plate kept them in place.

I've used (but don't own) the latest 30IIX model, and wasn't impressed at all. It seems like sometimes keypresses don't register (and I've used an older 49G+, and the problem with the TI is MUCH worse in my opinion and experience). It's dual battery/solar powered, but if you want to change the battery, unscrewing

the calculator isn't enough. It seems like the front and back halves are sealed together, and you'll have to snap them apart. Maybe the calculator was designed to be disposable.

I heard from someone today that his Ti 30IIX stopped working, so I doubt they're any more durable than the TIs I had that died.

Also, it's rather feature poor compared to, say, the Sharp 506w.

The TI36x might seem slightly more solid (but I haven't given it much "rough love"), but it has had some known bugs for quite a while.

As far as I'm concerned, the only TI I think is worth owning is the TI89, but if you just want pure number crunching it might be overkill. I don't know how much I can vouch for the ruggedness of it, but I have dropped one at least a couple of times (when the case was on it, protecting the front), and the battery back came off and the batteries flew everywhere, but it was otherwise unaffected.

in response to message #6 by Crawl

I'll agree that these TIs are not as robust as some say they are. College students destroy them all the time. I suppose that might be one reason as to why there is such a wide market for them...

Re: 33s and 32sii keyboard issues

*Message #8 Posted by **Stephen Easterling** on 6 Oct 2005, 9:07 p.m.,*
in response to message #1 by Stan Fuller

I have both the 32SII and 33S and they work great for me. I consider myself more of a poker. I hit the keys very fast with just one finger and it's more of a fast poke. Maybe you're using a little more force than some folk. Give the new 17BII+ a try. If you don't like it you can always take it back. You'll love the high-quality case it comes in, too. I found the keys on the 17BII+ just a little too hard to push for me and harder than the 33S, but with your style it may be the perfect match. It's is $90-100 at Office Depot, etc. Give it a try and report back. If it doesn't work, take it back. Oh yeah, it's a "business" calc, but it has most of the functions you'll need in a typical scientific.

*Message #9 Posted by **valentino ducati (switzerland)** on 7 Oct 2005, 3:50 p.m.,*
in response to message #1 by Stan Fuller

Hi Stan

It really seems you bang the keys very hard. I have several old Pioneers. I suppose they have the same mechanic regarding the key pad. I never had any keyboard problems.

Same for the Voyagers and 48 series. But my favorite in key response ergonomics remains the 41 series!

Maybe the new 17BII+ (like other posters already noticed here) is the solution for your problem: you can configure it to RPN. I own also a 17BII (intermediate series) and used it daily for many years until I found a 32SII.

Can't remember how to get trig functions to work HP15

*Message #1 Posted by **Pete Dzwonkas** on 6 Oct 2005, 10:23 a.m.*

HP15 and when I try to calculate the Tangent of say 30 degress, I get -6.405 instead of .577. What do I reset? The RADS is not in the display when I do this.

Re: Can't remember how to get trig functions to work HP15

*Message #2 Posted by **Tom Sherman** on 6 Oct 2005, 10:39 a.m.,*
in response to message #1 by Pete Dzwonkas

Pete,

I think that at some point you hit f[TAN] instead of TAN and put your calculator in complex mode. A little c will show on the lower right of the screen if this is the case. In complex mode, the calculator assumes radian mode even though RAD does not show on the screen. To clear the complex mode, hit g[CF]8. Your trig functions should then work as you expect them to.

Cheers, Tom

HP 48G Programming with matrices

*Message #1 Posted by **DBD** on 5 Oct 2005, 6:32 p.m.*

I've been using my HP48 for many years now and unfortunately, I haven't done a lot of programming with it. Some, but not much.

It would be very helpful if I could write a program that would have a 4x4 matrix, with each element being a variable. The 1,1 element would be (cos(theta))^2, 2,1 element (sin(theta))^2, etc. I could have theta as a variable stored in the program's directory or have it as a local variable within the program. The problem is that I can't figure out how to get a matrix full of variables into the program.

If somebody could give me some advice on this, I'd really appreciate it.

DBD

Re: HP 48G Programming with matrices

*Message #2 Posted by **Crawl** on 5 Oct 2005, 10:28 p.m.,*
in response to message #1 by DBD

Does this work the same way as it would on the 49G+?

On that calculator, what I'd do is enter the desired matrix in the matrix writer (maybe using the equation writer within the MW to enter the elements), then enter it onto the stack.

Then I'd select the matrix on the stack and "Copy".

Then I'd go to where I wanted to enter it in the program, and paste it as an algebraic object.

You might need an EVAL after that (depending on how you want to use it).

Re: HP 48G Programming with matrices

*Message #3 Posted by **I, Claudius** on 6 Oct 2005, 9:04 a.m.,*
in response to message #1 by DBD

Perhaps the best is what the second poster suggested, simply use the built-in Matrix Writer to construct your matrix, then use the wealth of 48 matrix commands to do whatever you wish. If you prefer command line entry, another way is to use the ROW-> command, which transforms row vectors into a matrix. There are also a number of element commands which I won't detail here.

Since you're a beginning programmer, there are a number of good books available on programming the 48, which also work on the 49/49+. Probably the best one to start with is "An Easy Course in Using & Programming the 48" by GrapeVine Publications: http://www.read-gpi.com/ If you find you like programming, get a copy of the 48 Series Advanced Users Reference Manual, or AUR. It provides a detailed description of every command available in the 48 ROM.

As I play with my old 48, I find it very slow compared with the 49 series. If possible, experiment with a 49/49+, you may find you like the increased speed as well as a true Computer Algebra System included. If your calculator is a GX in good shape, you will probably be able to sell it on eBay for much more than you'll pay for two 49s! Best of luck.

Edited: 6 Oct 2005, 9:05 a.m.

*Message #4 Posted by **DBD** on 6 Oct 2005, 9:25 a.m.,*
in response to message #3 by I, Claudius

Thanks for both replies. That really helps! DBD

Re: HP 48G Programming with matrices

*Message #5 Posted by **Ron Ross** on 6 Oct 2005, 11:21 a.m.,*
in response to message #3 by I, Claudius

I, Claudius's comment about getting an Hp49G+ holds merit (though I would not suggest you sell your Hp 48GX to get it, keep that until you fall in love with the 49G+ or better, have two loves & don't let them in sight of each other, their infareds would blaze away in jealously! AND that is BAD for battery life!).

While the Hp 48G can work with Some symbolics, its matrix support may not handle anything more complex than simple polynomials (though there is some software on Hpcalc.org that may correct this). No matter, even if there is a solution, your Hp48g will be slow in comparision to everything else if you plan to use symbolics in its matrix functions. Its Matrix routines are optimized for numerical work and it is a great system for numerical number crunching, but its performance is miserable in symbolic manipulation as I, Claudius indicates.

Help with HP-97 Soldering Question

*Message #1 Posted by **Howard Owen** on 5 Oct 2005, 12:09 p.m.*

I'm a software guy who is trying to learn electronic repair. I've had some small success lately thanks in part to the kind help and advice I've received here. I find that I could use some advice now, and I hope someone here can help.

I have a question about soldering a wire on to the electric motor of the card reader I just obtained. I fixed the "gummy wheel" using instructions found in the articles forum. It all went very well up until after I had reassembled the card reader housing and reattached the card reader PCB. I then noticed that the hot lead to the motor had broken off at the motor housing. The article had warned me to take note of the colors and positions of the various wires, so I wasn't suprised that one had broken off. So I started to plan how I would solder this lead back on. There's a picture below that shows the situation. The leads are connected to the terminals on the motor via two "wings" that also allow a cap to be soldered across them. Looking at the ground lead, which is still attached, I see that the end of each wire is connected between the very end of the "wing" which appears to be rolled up around it. (I hope the picture makes this clear.) In the picture, I have pried the wing on the positive side away from the bundle. We are looking more or less straight down on the end of the motor. The broken off end of the positive lead is still pinched between the two sides of the end of the "wing." I don't think I can open this terminal part of the wing:
http://retrocalculator.com/images/CR_motor.jpg
So what I propose to do is to pinch the end of the positive lead (already stripped as can be seen in the picture) between the sides of the "wing I have opened up. Istead of the very end of the wing, the wire will sit in the "v" we are looking down into in the picture. I will then solder it in place.

My questions are these:

1. Is this likely to work? Will I be changing the electrical characteristics of the terminal in a way that would be harmful? (My guess is "no," but I'm a paranoid amatuer. Or maybe that's an amateur paranoid. 8)
2. How hot should I set my temperature controlled iron to perform this soldering? The PCB is on the other side of he housing, with presumably a large heat sink of a motor, and the plastic frame between it and the soldering tip. I'm using standard 60/40 rosin core solder.
3. Any other tips or suggestions?

Thanks in advance for any advice you can offer.

Don't do that, as it will certainly fail and probably even break something. Put a little bit of solder on the lead, heat up the soldered area below the left (in the picture) leg of the condensor, put the lead in place, wait 2

seconds.

> Quote:
>
> Is this likely to work? Will I be changing the electrical characteristics of the terminal in a way that would be harmful? (My guess is "no," but I'm a paranoid amatuer. Or maybe that's an amateur paranoid. 8)

This will work :)

I prefer to solder at highest temperature, but 350 degrees C should be fine. Just take care to work fast enough to not melt any plastics or roast any other part.

> Quote:
>
> Any other tips or suggestions?

Nah, this should work well :) You should consider purchasing some good solder (colophonium core plus parts of silver - or if you can get your hands on it, some good Pb stuff) plus good iron - you might want to check ebay for some used equipment (Weller Magnastat or PACE)

Re: Help with HP-97 Soldering Question

Thanks for the advice!

Let me restate what I think you said to check if I understand. First, tin the stripped end of the red lead. Second, heat the solder pad where the condensor attaches to the positive side of the bridge, wait until heated, apply the tinned lead, wait two seconds then withdraw the iron.

Did I get that right?

Thanks again!

Re: Help with HP-97 Soldering Question

*Message #8 Posted by **Howard Owen** on 7 Oct 2005, 5:24 p.m.,*
in response to message #7 by deleted

I wasn't complaining, Don. 8)

Just saying that I took your advice and it has worked out well for me.

As to the 9816, I was finally able, with Jon Johmston's (of hpmuseum.net) help to get TELEDIK.EXE to work on my old P75. I had to install and boot real MS-DOS before the low-level access to the floppy controller TELEDISK uses succeeded in reading the SS/DD disks I had. But I also proved I could write SS/DD images to one side of a DS/DD dik. That means I can use all the great 9816 software Jon has up on his site. So I'm sitting pretty in the 9816 department.

Loading real MS-DOS also made the NI drivers for my AT-TNT GPIB board work. It almost worked under DOSEMU, but that software doesn't do DMA, other than for the SB emulation. The "TNT" board is a high-speed GPIB card, and it needs DMA to make that work on the PC side. I'm sure I could get a slower HP-IB card to work under Linux/DOSEMU, but not this particular card. The Linux GPIB project drivers are supposed to work with this ISA card on a 2.4 or 2.6 kernel, but I haven't taken the trouble to build the custom kernel yet. I'm not hugely motivated because I'd also have to write a file system driver for Amigo and/or [CS]S80 to talk to any of the various HP-IB drives I have. As usual, data transfer, particularly software transfer is my main interest. There just aren't any

extant drivers with source for these old drives, at least as far as I'm aware. I do know HP maintained drivers for use in HP-UX for many of these devices, but I'm sure they have long since stopped doing that.

Regards,

Howard

HP 42 manual for Free42

*Message #1 Posted by **Alister** on 5 Oct 2005, 7:11 a.m.*

Hi folks,

Do any of you have an electronic version of the HP 42 manual.

I would like to use the Free42, but without a manual I will not be able to do so....

THanks...

Re: HP 42 manual for Free42

*Message #2 Posted by **Jeff O.** on 5 Oct 2005, 7:51 a.m.,*
in response to message #1 by Alister

I am unaware of any source where the manual can simply be downloaded. The Museum DVD/CD set has a scan of the manual, or you can purchase a scan of just the manual itself from the museum curator.
As an alternative, MoHPC Forum contributor José Lauro Strapasson has created an alternate version of the manual, see this message, or go straight to the manual here.

early "OZ" history of hp 41 synthetic programming uncovered!

*Message #1 Posted by **don wallace** on 4 Oct 2005, 10:34 p.m.*

Hi all. I have briefly mentioned this before...

I was looking through my old box (hp41 original) in which are stored my manuals and some old synthetic programming manuals, when I decided to read these.

To my astonishment I found I not only had this manual:

HOW TO:

A Blackbox handbook to synthetic programming techniques with the hp 41C

by Phil Jury (5484) (Armadale Victoria Australia)

1st edition January 1980 (!)

but also THIS ONE:

PPC TECHNICAL NOTES V1N6 February 1981

This is a quite involved manual which runs to 60 pages. And Valentin Abillo is in there too!

If people are interested I may scan these documents and release them to the museum. Maybe others have this sort of stuff anyway, but I thought I would mention their existence.

donwallace63@yahoo.com.au

Karl

Re: early "OZ" history of hp 41 synthetic programming uncovered!

*Message #3 Posted by **Valentin Albillo** on 5 Oct 2005, 4:32 a.m.,*

in response to message #1 by don wallace

Hi, Don:

Don posted:

"HOW TO: A Blackbox handbook to synthetic programming techniques with the hp 41C"

I do have the other one you mention (PPC TN V1N6), but never seen this one so I would be interested for sure.

"This is a quite involved manual which runs to 60 pages. And Valentin Abillo is in there too!"

Ah, those were the days !! :-) ... It's hard to believe that 24 full years have elapsed since then and some of us still remain actively interested in HP calcs and methods of old. Says a lot about the awesome quality of such products, that it would engender so lasting an attachment to them.

Your offer to scan and make them publicly available is much appreciated, thank you very much.

Best regards from V.

Re: early "OZ" history of hp 41 synthetic programming uncovered!

*Message #4 Posted by **don wallace** on 5 Oct 2005, 5:18 a.m.,*
in response to message #3 by Valentin Albillo

Hi all. Hi Valentin.

Yes it sure does. I started to look at the hardware (buss signals)in 1982 but wasn't connected with the PPC so my interest died.

I shudder to think what I would have done if I had been plugged in to all that... (I built a computer out of a video arcade game and wrote my own monitor BY HAND in rom (350 bytes!) in 1984 so I have been quite comfortable with hardware and firmware for a long time...)

My sincere apologies for getting your surname wrong, V.

I will scan this stuff in soon. I am computing on absolute junk (still do more with it than 99% of the population...) and the scanner is second hand with a real resolution of about 150 to 200 dpi so I will just do my best... My friends girlfriend sold it to me THEN told me she hit him over the head with it. I guess that's why the focus is a bit out...

Kind regards from Down Under (in more ways than one...),

Don W

9862+9825

*Message #1 Posted by **Achim (Germany)** on 4 Oct 2005, 5:35 p.m.*

I'm just rebuilding an interface to connect a 9862 plotter to a 9825 calculator. The interface is based on a 98032 16bit-I/O. But I'm still missing some signal connections, which I would have to find out by lengthy experimenting. So does anybody have an original 98032 / option 062 and could send me a sketch or photograph of the internal cable connectors?

Thanks in advance, Achim

X-Memory and HP-IL

*Message #1 Posted by **gileno** on 4 Oct 2005, 2:39 p.m.*

How do I record the information of the x-memory using hp-il? Thanks

Re: X-Memory and HP-IL

*Message #2 Posted by **Vassilis Prevelakis** on 4 Oct 2005, 3:10 p.m.,*
in response to message #1 by gileno

Read section "Transferring Data between Extended Memory and Mass Storage Devices", page 33 of the Extended Functions/Memory Module manual (file 41extfnc.pdf on the MoHPC DVD-ROM).

**vp

Edited: 4 Oct 2005, 3:11 p.m.

Re: X-Memory and HP-IL

*Message #3 Posted by **db (martinez, ca.)** on 5 Oct 2005, 12:11 a.m.,*
in response to message #1 by gileno

You may be disappointed. One may only directly transfer ascii and program files, but not data. For data files you have to write a program to put the data file through the stack into main memory and then into mass storage. This was a major omision on the part of hp imho, because **i** wanted to store data files. I forget if the "store all" function got around that - because using TDS; one could store a full 298 register data file. TDS wrote several functions into their roms, that being one that (again imho) hp should have included.

Re: X-Memory and HP-IL

*Message #4 Posted by **Christoph Klug** on 5 Oct 2005, 4:45 a.m.,*
in response to message #3 by db (martinez, ca.)

For storing X-Memory contents to a HP-IL mass storage device you can use the EXT-IL module (not the EXT-I/O module). This advanced module gives you powerfully commands for controlling big mass storage devices, transfering complete X-Memory, and printing multi column program plots.

With best regards from Germany - Christoph Klug

EXT-IL ????

*Message #5 Posted by **gileno** on 5 Oct 2005, 7:38 a.m.,*
in response to message #4 by Christoph Klug

Which is full name of that module?

Re: EXT-IL from Skwid Ink

*Message #6 Posted by **Christoph Klug** on 5 Oct 2005, 7:58 a.m.,*
in response to message #5 by gileno

The full name is Extended IL Module, created from SKWID INK. Furthermore from SKWID INK exist a module for plotting HP41 barcodes. Virtual ROM images of both module exist for using with EMU41.

With best regards from Germany - Christoph Klug

Re: EXT-IL ????

*Message #7 Posted by **Juergen (CH)** on 5 Oct 2005, 8:15 a.m.,*
in response to message #5 by gileno

Skwid Ink Extended IL ROM (CAT 2 output: EXT IL ROM). Very rare, I think...

Re: EXT-IL ????

*Message #8 Posted by **Gene Wright** on 5 Oct 2005, 9:05 a.m.,*
in response to message #7 by Juergen (CH)

Not rare at all if you have a Clonix module.

Put these into the Clonix today and put another pair in it next week.

One of the best things I ever bought for my 41 machine!

Re: EXT-IL ????

*Message #4 Posted by **John Nguyen** on 5 Oct 2005, 7:58 p.m.,*
in response to message #3 by Stephen Easterling

Hey, good for you, Stephen. I wonder if people are just too lazy to go take a picture or are they somehow being less than honest. If you were going to sell something, you should at least make a little effort to take pictures of the actual item. What a novel idea, huh? I think eBay should disallow stock photos unless you're selling a brand spanking new item.

I tend to steer clear of those kinds of sellers. I know not everyone who does that is dishonest, but I want to have some warm and fuzzy when I buy something.

John

Moon Landing Simulator for HP-12c again

*Message #1 Posted by **Kalevipoeg** on 4 Oct 2005, 12:43 p.m.*

On 24 September Tony (nz) offered a lunar lander program for the HP-12c which follows HP-29c rocket lander program.

I watched Apollo 13 movie yesterday and after that I started to think about this old program again :-)

Here is another moon landing simulator program for the HP-12c. The calculation of crash and landing velocity of this program meets the laws of Newton's Physics better than the original games (HP-67 moon rocket lander, HP-29c moon rocket lander etc.) do. Besides that this program is some shorter and faster.

Rem: Only integer values for fuel burn are allowed.

Re: Moon Landing Simulator for HP-12c again

*Message #2 Posted by **tony (nz)** on 5 Oct 2005, 2:13 a.m.,*
in response to message #1 by Kalevipoeg

Kalevipoeg , thank you! This is brilliant. Lines 12-24 create the VV.0hhh very elegantly. Also I believe you are the first to calculate the correct crash velocity when the first iteration gives a new height as negative - you reverse time and bring us back to the surface with the correct speed!! Please move onto Tic-Tac-toe now:-) Gene's page has an ingenious program that uses 3 by 3 magic square space to facilitate win/block calculations.

Cheers, Tony

Slightly less intense digit,.,EEX, alternatives might be:
5 lines 14-18: RCL1 % % RCL2 X<>Y
12 lines 44-55: ENTER + 5 - STO4 RCL2 X<>Y STO+2 2 / + STO+1
One could even shave 1 line off this, if I count correctly<G>:
STO4 STO+4 5 STO-4 RCL2 RCL4 STO+2 2 / + STO+1
Down to 78 lines and falling<G>. This is fun. From the quality of your code and clarity of exposition I feel I know you from somewhere ;-)

Now I'm onto my third edit. It seems possible to remove more lines by allowing an empty craft to recycle once more. One could have 5 chs sto4 up at line 12. Then we can remove the 5 sto-4, and change the start to STO+4 STO+4 above in my last feeble attempt to shave lines - but that part is now down to 9 where it was 12. Instead we can do the rcl3 x=0? test by "inserting" x=0 gto "67" after the rcl 3 at line 39. Overall this may save us

another 3 lines, but I admit the operation will be slightly different - we get to "see" an empty craft just one more time before the free-fall with R4=-5. Of course we could save another 2 by not testing for R3=0 at all - just keep seeing the free-fall second by second until we go underground at the end :-) But that is too slow ... although one can burn the 60 and see oneself travel out into space before returning. But, too slow to watch. The best place for the R3=0 test is probably after it is displayed - before the burn count-down - then one at least gets to see the final VV.0hhh begore the free-fall. Yup, it seems to work fine here at 75 lines. Good night all. Thanks for the fun :-)

Here it is, in case anyone wants to try/tweak/untweak it. Thanks again to Kalevipoeg - whoever he/she is - maybe an ex-astronaut :-) And also thanks to Gene for these game challenges.

Re: Moon Landing Simulator for HP-12c again

*Message #3 Posted by **Kalevipoeg** on 5 Oct 2005, 10:53 a.m.,*
in response to message #2 by tony (nz)

Tony, thank you for comments and analyses!

For me the lines 39-43 were the biggest challenge of this program. Heureka! There is not always need to use GTO-command after conditional test. This is a good example of it!

Tic-tac-toe isn't my favourite but who knows...

And thanks to you for many additions to this program. Especially "1 CHS RCL 1 % % RCL 2 X<>Y -" is clever.

Edited: 5 Oct 2005, 2:02 p.m.

Re: Moon Landing Simulator for HP-12c again

*Message #4 Posted by **tony (nz)** on 6 Oct 2005, 4:12 a.m.,*
in response to message #3 by Kalevipoeg

Hi Kalevipoeg - I learned something today after looking up your name on google. You must be from Estonia! :-)

I wanted to find a perfect landing fitting for your gem of a program and finally I found one with 14 integer burns! At the end V=h=Fuel=0.00 :-)

```
 VV.0hhh  Fuel 3210  Burn
--------  ----      ----
-50.0500  60        1
-53.0449  59        1  (2)
under 400ft:
-56.0394  58        2
-57.0338  56        3  (5)
under 300ft:
-56.0281  53        3
-55.0226  50        4  (7)
under 200ft:
-52.0172  46        6
```

```
-45.0124  40         6  (12)
under 100ft:
-38.0082  34         7
-29.0049  27         8
-18.0025  19         9
- 5.0014  10         2
- 6.0008   8         3
- 5.0003   5         5  (34)
0 flashing
RCL 1,2,3 all show 0.000000000 :-)
```

I had a few pretty close landings after 10 burns and with some fuel left, but as for the rest I must say you can blame me for a few lunar craters :-)

Has anyone else had a perfect landing?

Cheers, Tony

HP-35 & 32S Calculators

*Message #1 Posted by **Tom Ciborowski** on 4 Oct 2005, 3:29 a.m.*

I have an original (1973) HP-35 calculator. The calculator would still work but the battery charger no longer functions because of a short in the "elbow" that plugs into the calculator. Does anyone know where I can obtain a charger for this calculator? My HP-32S has a problem with "sticking" keys. Can this be repaired? Thanks for taking the time to read this and even more thanks if you respond. I live in Taiwan so its a 12-15 hour time difference with the U.S. Cheers!

Re: HP-35 & 32S Calculators

*Message #2 Posted by **Walter B** on 4 Oct 2005, 4:42 a.m.,*
in response to message #1 by Tom Ciborowski

You can get a working charger for your HP35 from me, IF you tell me the voltage you have in Taiwan AND you pay me a decent price plus the shipping. Please mail your offer to me directly.

Re: HP-35 & 32S Calculators

*Message #3 Posted by **Arnaud Amiel** on 5 Oct 2005, 3:31 a.m.,*
in response to message #2 by Walter B

Taiwan electricity system is identical to the US one, including plugs. So any US charger should work there.

Arnaud

Re: HP-35 & 32S Calculators

*Message #4 Posted by **bill platt** on 4 Oct 2005, 11:57 a.m.,*
in response to message #1 by Tom Ciborowski

Can you elaborate on the "sticking keys" issue? Is it like "TI-itis" where yo upush the button and get seven "9"s or is it more like you have orange juice in between?

In the latter case, taking out the batteries, immersing and soaking the whole calculator in deionized water, drying under ambient temperature with a fan for 3 days or so, will often do the trick.

You can find earlier threads in the archives discussing this--look under "Randy" and you will find posts by the real expert at this sort of thing.

Re: HP-35 & 32S Calculators

*Message #5 Posted by **Jeff O.** on 4 Oct 2005, 12:48 p.m.,*
in response to message #1 by Tom Ciborowski

Regarding the HP-35 battery charger, the "short in the "elbow"" problem is common. It is (at least sometimes) possible to repair this problem by carefully slicing the top of the plug off, exposing the contacts, cutting the

wires back past the short, soldering the wires to the contacts and gluing the top back on. It may not look pretty, but it should do the job.
Regarding your 32S, as Bill stated, your course of action depends on the exact problem. In case it may help, instructions on opening and some repairs to this style of calculator (pioneer) can be found here and here. If you search the Forum Archives for postings by Paul Brogger (author of the linked articles), I believe you will also find reports of successful disassembly and repair of the keyboard itself.
Good luck!

HP 21 replacement cells

*Message #1 Posted by **Bruce G.** on 3 Oct 2005, 1:37 p.m.*

I see that a user has recommended Digi-Key part no P092 as a replacement cell for the hp-21. These are 1000 mah AA size cells rather than the 700mah AA size cells HP used. Will that cause any problems?

I can handle the mechanical part of actually replacing the cells but I do not know much about batteries or their terminology.

Thanks for any help.

Bruce G.

Re: HP 21 replacement cells

*Message #2 Posted by **Bernhard** on 3 Oct 2005, 2:17 p.m.,*
in response to message #1 by Bruce G.

Hi Bruce,

from my experience with HP2X it is possible to use any NiCd or NiMH cells regardless of capacity - those with more mA-hours will run longer, but won't damage the charging circuits nor the calculator. Be careful, though: the original HP cells are 49.0 to 49.5mm long (including the center contact nose). Some cells on the market are significantly longer (such as 53.0 mm) and this might bend and break the contacts in the HP. Do not use those. I have successfully used cells with spot-welded contact strips for solder connection with a total cell length of 48.0 to 49.0mm. The contact strips on the HP's contact side are removed or cut back, and those on the spiral spring side are soldered together. Beware the spiral spring and watch for proper insulation of the cells. If the spiral spring shortens a cell, the heat may melt the battery holder tightly into the HP's case, and it may catch fire. I always put some thin insulation plastic below the contact strips after soldering the cells together to make absolutely sure they nor the spring can't ever touch the outer metal can of the cell.

Regards, Bernhard

Re: HP 21 replacement cells

*Message #3 Posted by **Bruce G.** on 3 Oct 2005, 9:25 p.m.,*
in response to message #2 by Bernhard

Bernhard,

Thanks for the tip, I would have assumed all AA cells were a standard size. I will look for some cells locally, it sounds as though any cell from 700 mah to 1100 mah will be fine. I agree with your notes regarding shorting.

Thanks again.

Bruce

Re: HP 21 replacement cells

*Message #4 Posted by **bernhard** on 4 Oct 2005, 4:35 p.m.,*
in response to message #3 by Bruce G.

Hi Bruce,

any NiCd or NiMH cell with any capacity will do as long as the diameter and length fits the parameters. The spot-welded contact strip variety has the advantage that it indeed was designed to be soldered. If you try to solder cells without such strips, the cells may be damaged and this may cause leaks. One final hint: try your local model aircraft / model car outfit. They should have such cells for solder connection.

regards, Bernhard

Re: HP 21 replacement cells

*Message #5 Posted by **David Smith** on 4 Oct 2005, 5:53 p.m.,*
in response to message #1 by Bruce G.

Any good battery store is able to properly spot weld the two cells together. You want the strap to be such that the cells are loose and can move back and forth a little bit. You do not want them glued together.

How can i open the case of a HP 32s calculator?

*Message #1 Posted by **Martin** on 3 Oct 2005, 12:31 p.m.*

Hello all,

I have an old hp 32s calculator. It has some bugles near by the display frame. The symptoms are that the display shows nearly ever symbol when switching on the calc.

I think that the calc is still ok, but the display contacts have to be repaired.

I think i can handle it when i know how to open the case of the 32s.

Can somebody tell me how to open my HP 32s?

Regards,

Martin.

Don't be too hasty in opening

*Message #3 Posted by **Randy** on 3 Oct 2005, 5:13 p.m.,*
in response to message #1 by Martin

A bent frame would not cause parts of the display to appear when you turn it on. The most likely problem is that the contrast is turned up too far.

Hold down the ON/C button while pressing the "-" key to decrease the contrast. Pressing the "+" while holding down the ON/C button will increase.

> I decline to comment further on how I fixed it since I do (hope one day to) fix these things for money and I am not sure of the exact reasons why my "fix" works [though I have a pretty good idea!]. Suffice it to say there are a few mysteries to these displays which it seems are UNDOCUMENTED. How they actually work and (software) interface to the processor is quite elegant.

I am sorry, but I find the above paragraph and similar comments that you have made in the past to be objectionable, and totally against the spirit of this forum.

I notice you obviosuly read this forum. You, I assume, are quite happy to 'take' from it, but unwilling to 'give' anything back.

Many of us, including myself, sometimes repair HP calculators for money (I don't do it that often, to be honest I'd rather be investigating some machine I've not worked on before than just cleaning the contacts in an HP41 or whatever). The difference is that most of us (and I would like to include myself here) share the information we discover totally freely. Our aim is to keep as many of these fine machines running as possible.

If somebody asks me how to repair something (my speciality is really the desktop machines), then I will give a basic description of how to find the fault. If you feel you have the necessary skills and equipment (it is _hopeless_, for example, to diagnose a processor fault on a 98x0 without a logic analyser!), then I will talk you through the machine at component level, quite likely 'in public'. I will also be happy for you to publish the diagnostic process on your web site provided I get some credit.

If on the other hand you don't feel up to repairing the machine yourself, well then I would consider doing it for you and charging. But note I make the offer of free information first.

When I got seriously into computers some 20+ years ago, a friend offered me a lot of assistance. I jokingly asked him how I should pay him. And I have never forgotten his reply :

"Don't pay back, pay forwards. There is something you can do that somebody else needs help with. Help them. They will go on to help somebody else, and so on. That way we all benefit"

I do not feel the HP calculator community is helped by having information hidden away.

Re: I find this objectionable!

*Message #6 Posted by **Randy** on 5 Oct 2005, 8:13 p.m.,*
in response to message #5 by Tony Duell

Well said Tony, thank you.

Don: I find it annoying that your follow-up posts are not relevant, this thread being a perfect example. Your closing line:

> Quote:
>
> I am not sure but I think I have all the documentation on the 41 available.

The topic was a display problem on a 32S, not about what you did or didn't do to repair a 41.

If you want to repair HP's for a fee, by all means go to it. But as regular reader and poster here I would respectfully ask you to please use the classifieds section for your advertising. You'll see that is the correct place to offer your services rather than trying to weave it into almost every post you make.

I would not say so.(was: I find this objectionable!)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 7 Oct 2005, 12:21 a.m.,*
in response to message #8 by donald wallace

I hope not to extend the subject as much for the boring condition, but let me try keeping it soft and smooth.

Many guys in here know that I`m posting since the year 2000, and I congratulate all of those who have been around here since then. Some well known names have not shown up since long, like Norm (AKA Captain Zenner), others appear to object their names, like 'dot', others like Coburlin (each!) come to try picking some stuff not available here. Many others stay still waiting for the chance to make a difference.

I'm one of them, though.

I'm in Brazil, I play with electronics since I was 12YO, but I actually started to understand digital after being 18YO. I use HP calculators since the beginning of the 80`s and I repaired many units prior to get into the MoHPC world. After that, I could repair some of my own units (two HP41's and an HP25C) and many others from contributors.

I did not charge a dime for any of the repairs I made.

On the other hand, I was given so too many I think I was given too much more than I gave.

I'm forever in debit with the MoHPC community and for as long as I can and I am able to, I'll be posting any information I had access to (unless it is copyright protected, like the MoHPC CD/DVD contents) and I'll repair as many calculators I can without any charge at all. I say that

because I mean that, not because I want others to do the same. And let me tell that this is more than a hobby and less than a profitable activity for me, this is a way for me to be in touch with people I do not know and would like to interact with. Unfortunately Brazilian commercial laws and professional opportunities for R&D guys make it hard for us to go ahead and try doing much more than that what`s been done, but these are facts not to be discussed here.

I would like to have the means to go further and achieve some goals, like cloning the nut processor with some microcontroler+ROM/RAM arrangement, but this demands time and personal resources. Lucky for us some guys in here are delving into these hardware/software mysteries and solutions, and this is something I admire seeing people doing because I`d do the same my own if having the chance and the means.

So much for an off-topic. To those of you reading and thinking 'I'm a dreamer', it seems that I'm not the only one (Forgive, John). A lot of guys in the mid 60's made the technological revolution this way, by sharing without any other reward but seeing things happening. We are the ones in the benefit from their forwarding vision. Maybe other guys share some of my points of view, others will disagree, but I guess I'm not too far from what is intended here. I`d also guess that the feeling of being banned may be connected to a different approach of yours, though.

Sorry writing too much (I did not spell check this text... Please, forgive my 'southern American' accent).

Luiz (Brazil)

Re: A friendly comment

*Message #11 Posted by **Gordon Dyer** on 7 Oct 2005, 7:09 p.m.,*
in response to message #10 by deleted

Don, I have just read this thread and feel sad that a few comments have led you to abandon the forum. All comments and advice in here are freely given and you gave quite a few before being criticised for a comment about hoping to make a little money - and I don't understand what is so wrong with that. Perhaps your mistake was to admit it. I wonder how many people have silently used the information in this forum to fix a calc and sell it as working on eBay (not me, I keep mine!), but I don't see what is wrong with that either.
Please everyone keep it civilised and respect others opinions and aspirations.
Don, why not come back to the forum and share knowledge which you don't feel you have a commercial interest in.
Best wishes...

Accumulated knowledge (was: I find this objectionable!)

*Message #13 Posted by **James M. Prange (Michigan)** on 8 Oct 2005, 11:05 p.m.,*
in response to message #12 by deleted

Of course there already is a lot of information about HP calculators on this Museum site. Don't neglect the "Articles" and "Archives". The CD set/DVD has even more, including documentation that it's not practical to include for download from a Web site; see http://www.hpmuseum.org/cd/cddesc.htm. Yes, I realize the CD set/DVD isn't free, but any "profit" helps support the Museum; I don't think Dave's getting rich from selling it.

Of course you can set up your own site, but also consider contributing to existing sites.

Jake Schartz also sells CD-ROMs at relatively low cost; see http://alaska.magpage.com/~jakes/.

For the RPL models, also see http://www.engr.uvic.ca/~aschoorl/, http://www.hpcalc.org/, http://page.mi.fu-berlin.de/~raut/ http://m.webring.com/hub?ring=hp48, and http://groups.google.com/group/comp.sys.hp48.

Regards,
James

in response to message #14 by deleted

No, I wouldn't consider setting up your own Web page with information on HP calculators to be in any way "subversive".

On the other hand, contributing to existing sites instead of adding a new one tends to keep the information consolidated in fewer places.

For many of us, resources are fairly limited. For example, my own "Personal Web space" is 25MB. To be sure, I don't use it much; occasionally placing a file there that might be difficult to transfer as an attachment to an e-mail.

Dave does indeed have links to other sites on the main Museum page, under "Other

Resources".

Regards,
James

Re: How can i open the case of a HP 32s calculator?

*Message #16 Posted by **don wallace** on 7 Oct 2005, 7:49 p.m.,*
in response to message #1 by Martin

Hi Martin. Having any luck with that 32?

I think there is some mechanical damage to the connections to the display and wrong bias is making the display strange.

If it turns on and off and you can see any other normal activity, (responds to keystrokes, etc., hard to tell with that display, I know) then the buses are okay and it's "just" display connector problems. Does it respond at all to attempts to adjust contrast? Not a fix but one good diagnostic.

Sorry I don't have one or I'd be able to help you.

HP 49G plus, DOMAIN and LIMITS

*Message #1 Posted by **Slobodan Nikolic** on 3 Oct 2005, 4:33 a.m.*

Hello, I have couple of questions that I just can't figure out, so if someone can help me I would appreciate that a lot.

ok, my first question is on the LIMITS, how would I find the limit of a F(x,y) function ? for example lim (x^5+4x^3*y-5xy^2) (x,y)=(5,-2)

I know how to find the limit of normal F(x) function but I can't do this..

and some thing on Domain, i can't do the Domain of f(x,y)..

can someone please help me.

Thank you Slobodan,

Re: HP 49G plus, DOMAIN and LIMITS

*Message #2 Posted by **don wallace** on 3 Oct 2005, 8:49 a.m.,*
in response to message #1 by Slobodan Nikolic

Hi Slobodan,

It's 24 years ago for me since I dropped out of engineering (due to apathy and some stress, not "dumbness" ;-P) so forgive my being rusty. I am not saying I'm not dumb, just that I didn't drop out 'cause I am/was dumb ;-)

Valentin is the maths professor around here (literally, I think...) so I am sure he will correct me where I am wrong. His understanding of maths is really cool and he is really helpful.

I am not too worried about making a fool out of myself as the regulars here will know, , so I will say what little I remember in general terms.

LIMITS: I'm not gonna tell you the nuts and bolts of it because I have forgotten, BUT:

You just need to do some BASIC READING ON "DOUBLE INTEGRATION". It's quite involved maths, sort of.

I would google on that to start with. I think there are some equations of (very) different form which are f(x,y), being D.E.'s That stuff is different, more involved, very useful to engineers, but really made my head spin (memory overload -> "fail" ME201).

Generally the function of one independent variable has a line or curve as a solution or a limit (they're different), but the function of TWO independent variables is a SURFACE in 3-space, so the limit could I think be a surface as well as a curve or line.

So your answer will be often be a non linear equation itself, not neccessarily an easy solutin like a line or an axis.

There are simple cases, though:

Let's take Space and forget about the third dimension (z).

Say you have a (two dimensional) "gravity" function: g = F(x,y) = SQRT(1/(x^2+y^2))

So we will make the third axis (z) plot our output or G force. You would have as an example a black hole with an infinite gravity force "at" the origin (0,0) with z (= g) = infinity. You can correctly say that the Z axis is a kind of limit, called a "pole". That function also has a "ZERO" at infinity, the function decays to nearly zero at very large x and y. I visualize this as a circus tent.

Compare that with the simple hyperbolic function y = f(x) = 1/x, where the x and y axes are asymptotes, i.e. limits of the function.

I know I haven't explained much, but you could google on D.E.'s maybe (it's a bit o.t. given the functions you mentioned) and three dimensional calculus (?) Also google or Wiki on "mathematical poles and zeros".

The function DOMAIN is just the PLANE from x=minus infinity and y=minus infinity to x=plus infinity and y=plus infinity (the "infinite plane")

I am sure Valentin will come to our rescue on this.

Best,

DW

Hi Valentin,

Yes, I realise that but I also realise (I think) Slobodan is new to 3D calculus, otherwise he would have just gone and done it ;-)

A calculator will just crunch the numbers for you...

DW

Try and compute this limit with your Hp48/49

*Message #5 Posted by **Valentin Albillo** on 3 Oct 2005, 12:29 p.m.,*
in response to message #4 by don wallace

Hi again, Don:

Don posted: *"A calculator will just crunch the numbers for you..."*

Indeed. Let's see if you'd do better than your calculator. For a micro-challenge, try and compute this limit with your HP48/49, symbolically and numerically. If a symbolic solution is not an option, see if you can symbolically prove the result yourself:

$$\lim_{n\to\infty}\left(\sum_{i=n^2}^{i=(n+1)^2}\left(\mathrm{Frac}\left(\sqrt{i}\right)\right)\right)$$

where, of course, "Inf" is 'positive infinity', "Frac" is 'fractional part', "Sqrt" is 'square root' and the big Sigma letter means "sum from i=n^2 to i=(n+1)^2".

Try and guess the result before it comes out of the screen !

Best regards from V.

Re: Try and compute this limit with your Hp48/49

*Message #6 Posted by **don wallace** on 3 Oct 2005, 6:49 p.m.,*
in response to message #5 by Valentin Albillo

Hi Valentin,

I only have a 41. And I'm nt working in any area where I need limits, so I'm not motivated to use my head on this too much; real life presents enough (serious) problems to occupy me...

Thanks for the example though.

I WONDER WHAT SLOBODAN THINKS ABOUT MY EXAMPLES?

DW

Re: Try and compute this limit with your Hp48/49

*Message #7 Posted by **Marcus von Cube, Germany** on 3 Oct 2005, 7:21 p.m.,*
in response to message #5 by Valentin Albillo

After some fiddeling with the syntax, I was at least able to enter the function into my 49G+:

```
'VA(N)=FP(sigma(I=N^2,(N+1)^2,sqrt I))'
DEF
```

(substitute sigma and sqrt by the respective symbols). This creates a user function VA which can be evaluted from the VAR menu.

Trying to compute the limit automatically failed: CAS asked for approximate mode and gave up afterwards. But the function VA seems to approximate 1/6 for greater values of N. I'm unable to explain why. Here are some thoughts:

The range of the sum goes over the values between to squared integers, e. g. from 4 to 9 if N=2 or from 100 to 121 if N=10. Since only the fractional part is computed, the first and last summands can be removed from the sum (the square root of a squared integer is an integer.) Therefore, the number of summands is 2*N and the values to be summed up are between sqrt(N^2+1) (>N) and sqrt(N^2+2*N)

(<N+1). None of these values can be an integer so all add to the final fraction.

That's the end of my thoughts. I have no idea how a function like FP can be treated analytically...

HP 49G plus, DOMAIN and LIMITS

*Message #8 Posted by **Slobodan Nikolic** on 4 Oct 2005, 12:23 a.m.,*
in response to message #7 by Marcus von Cube, Germany

First I want to say "Thank you" to all the people who tried to help me on my question...

I am acutally not new to domain and limits, I taken caluculs some two years ago in HS and now I'm in CALC III in my sophmore year at university. On most domain and limits, I can find them. Ones that are in 3D are definetly harder but I'm hanging in there (F(x,y,z))

The reason I asked this question was just so I can figure it out faster when midterm comes (Wendsday), because I realized that my calculator can do those funcions(and many other things that I don't know to work on it). So its ok since many people don't use this calculator, I'll stay up all night tonight and tommorow for the test :) Again, I want to say "thank you" to all the people that responed to my question..

I also have another question, I don't know if I should open a new topic for it ? (I promise this is my last question and I won't boather you guys any more. :), its just that I have a midterm on Wendesday and my scholarship is on the line ehehe :-(I must get 3.5 this semseter :-( ))

ok here it is

I am trying to figure out how to use my HP49+ for "solving system of equations with multiple variables" !? if someone knows how to do it will they please post ?

Thank you, and once again thanks for the help

Valentin, I think I know what's going on here :-)

*Message #9 Posted by **Marcus von Cube, Germany** on 4 Oct 2005, 4:50 a.m.,*
in response to message #7 by Marcus von Cube, Germany

Hi Valentin,

after a few hours of sleep I think I know what's going on with your challenge.

You can look at the sum as an aproximation of the area below a lying parabola y=sqrt x in the interval $[n^2,(n+1)^2]$. To get rid of the integer part, simply subtract the area under the straight line crossing the parabola between the points (n^2,n) and $(n^2+2n+1,n+1)$:

```
'VA2(N) = integral(0, 2*N+1, sqrt(N^2+X)-X/(2*N+1)-N, X)'
DEF
```

The limit n->oo of the original sum should be the same as the limit of the above integral.

The exact solution to this integral is 1/6 for any n and so is the limit for n->oo.

Now back to work (or to bed...)

Re: Valentin, I think I know what's going on here :-)

*Message #10 Posted by **Valentin Albillo** on 4 Oct 2005, 5:27 a.m.,*
in response to message #9 by Marcus von Cube, Germany

Hi, Marcus:

See ? "Calculators just crunch the numbers for you" but it helps if you previously crunch them up yourself a little bit :-)

Thanks for your interest and keen insights and

Best regards from V.

Re: Valentin, I think I know what's going on here :-)

*Message #11 Posted by **GE** on 4 Oct 2005, 8:29 a.m.,*
in response to message #10 by Valentin Albillo

Uh ? I don't see how one is so sure that "the area ABOVE the straight line crossing ..." is less than 1. Hard, dirty direct calculation shows that the sum hac value 2xN^2+3xN+1+1/6+o(1/N^2), as the term in (1/N) vanishes (quite a surprise !). **THEN** the fractional part is **DEMONSTRATED** to reach 1/6 on infinity. Please answer my question. Thanks.

Re: Valentin, I think I know what's going on here :-)

*Message #12 Posted by **Marcus von Cube, Germany** on 4 Oct 2005, 8:58 a.m.,*
in response to message #11 by GE

GE, let me try to explain my thoughts...

At first, I was just subtracting N from the parabola and I got a "stair" of 2n+1 steps with (total) heights between 0 and 1. If you now look at the summands from both ends (first/last, next to first, next to last) they tend to cancel their fractional part if you add them together. If the summands were lying on the straight line between the endpoints, the effect would be exact (the sum would be exactly one for each pair). Since the parabola always stretches slightly above the straight line, there is some fractional part left.

One consequence is that if you subtract the summands on the straight line you only subtract an integer value which does not effect the final result.

The proof isn't perfect, yet. But since the integral itself evaluates to a value below 1 (1/6), I seem to be correct.

Valentin, any real proof?

Re: Valentin, I think I know what's going on here :-)

*Message #13 Posted by **GE** on 5 Oct 2005, 4:53 a.m.,*
in response to message #12 by Marcus von Cube, Germany

Fair enough. I think you found WHY it goes to 1/6, while calculus only shows WHAT it does (ie go to 1/6). My remark came out of frustration for not finding an elegant proof. There is still something missing from yours, however. My method was brute force : taylor series to "sufficient" order of sqrt, then summation on each term, being powers of i for i in [n^2, (n+1)^2]. A no brainer, not elegant. Thank you Valentin for this one, very nice.

As we are quite off topic here and into Math Land, do you know of a method to factor numbers of the form (a + b.sqrt(5)) ? Example : (1+sqrt(5)) = (3-sqrt(5)).(2+sqrt(5)) Thanks.

[OT] Special Factorization

*Message #14 Posted by **Valentin Albillo** on 5 Oct 2005, 6:28 a.m.,*
in response to message #13 by GE

Hi, GE:

GE posted:

"Do you know of a method to factor numbers of the form (a + b.sqrt(5)) ? Example : (1+sqrt(5)) = (3-sqrt(5)).(2+sqrt(5)) Thanks. "

Surely you're aware that the factorization, if possible, is not unique, right ? For example, for the particular case you gave, we have:

```
(1 + sqrt(5)) = (a + b*sqrt(5)) . (c + d*sqrt(5))
```

with a,b,c,d integer, where your factorization corresponds to the case a = 3, b = -1, c = 2, d = 1. But you can factorize 1 + sqrt(5) using factors of the stated form in infinite ways, these are but a few possibilities:

```
   a       b       c       d
 ------------------------------
   2       1       3      -1    (your factorization)
   7       3      -2       1
   9       4     -11       5
  29      13       9      -4
  38      17      47     -21
 123      55     -38      17
 161      72    -199      89
```

so you have, for instance:

```
(161 + 72*sqrt(5)) . (-199 + 89*sqrt(5)) = (1 + sqrt(5))
```

as you may check. The general solution is a simple case of diophantine equations, which, if I'm not wrong, in this particular case reduces to a variation of the generalized Pell's equation. See:

Pell's Equation

I'd like to elaborate but am incredibly busy right now. Nevertheless, for the particular example you gave of factoring (1+sqrt(5)) and for you to check your future, general results, this small HP-71B program will directly compute (no search) and print the first ten set of coefficients (A,B,C,D) such that (A+B*r)*(C+D*r) = (1+r), where r =sqrt(5).

```
100 DISP " A          B           C           D"
110 DISP "-----------------------------------------"
120 DESTROY ALL @ STD @ R=SQR(5) @ FOR N=1 TO 5
130 A=IROUND(((2+R)^N+(2-R)^N)/2)
140 B=IROUND(((2+R)^N-(2-R)^N)/(2*R))
150 DISP A,B,FNC(A,B),FND(A,B)
160 A=IROUND(((1+R)*(2+R)^N+(1-R)*(2-R)^N)/2)
170 B=IROUND(((1+R)*(2+R)^N-(1-R)*(2-R)^N)/(2*R))
180 DISP A,B,FNC(A,B),FND(A,B)
190 NEXT N
200 DEF FNC(A,B)=(5*B-A)/(5*B^2-A^2)
210 DEF FND(A,B)=(B-A)/(5*B^2-A^2)
```

Upon running, it produces:

```
A            B            C            D
-----------------------------------------------
2            1            3           -1
7            3           -2            1
9            4           -11           5
29           13           9           -4
38           17           47          -21
123          55          -38           17
161          72          -199          89
521          233          161         -72
```

```
 682          305          843         -377
 2207         987         -682          305
```

which expands on the results given above.

Best regards from V.

Re: Valentin, I think I know what's going on here :-)

*Message #15 Posted by **Marcus von Cube, Germany** on 4 Oct 2005, 8:29 a.m.,*
in response to message #10 by Valentin Albillo

Hi Valentin,

thank you for the warm words :-)

I must admit that I had my calculators (HP 49G+ and TI Voyage 200) do the 'dirty work' of computing the integral. In the meantime I did it myself with pencil and paper and the result is defintly 1/6, independent of n.

What is your source for these challenges? Is it just the top of your head?

Marcus

Re: Valentin, I think I know what's going on here :-)

*Message #16 Posted by **Valentin Albillo** on 4 Oct 2005, 10:44 a.m.,*
in response to message #15 by Marcus von Cube, Germany

Hi again, Marcus:

Marcus posted:

"thank you for the warm words :-)"

They're well deserved. You've been a regular contributor to my mini- and micro-challenges of all sorts, clearly showing a lot of interest in them and contributing many good ideas.

"Valentin, any real proof? "

Sort of. Using the Euler-Maclaurin formula for sums, we readily get the asymptotic expression:

```
  k=n
 \---          2  3/2   1  1/2    1  -1/2     1   -3/2
  >   sqrt(k) = - n    + - n    + -- n     + ---- n     + ...
 /---          3       2        24         2880
  k=1
```

and, when applied to our particular sum, we get (asymptotically):

```
  k=(n+1)^2
  \---                2         7    1    1       1   3n^2+3n+1
   >    sqrt(k) = 2n  + 3n + - - -- ------ - ---- ---------- + ...
  /---                      6   24 n(n+1)   2880 (n(n+1))^3
  k=n^2
```

and the fractional part of this expression does tend to 1/6 (as numerically found), Q.E.D.

"What is your source for these challenges? Is it just the top of your head?"

Not really. I read a lot of math, be they books, newsgroups or whatever. Everytime I find something interesting, I keep a mental note of it and, when appropriate, it may constitute the 'mother lode' for some mini- or micro-challenge, hoping that like-minded people will also be as amused by it as I was in the first place.

Fortunately, math is a *very* amusing discipline and it's actually quite easy to find fascinating quirks and facts aplenty.

DIRECTIONAL DRILLING PROGRAMS

*Message #1 Posted by **JAMES DAUGHERTY** on 3 Oct 2005, 1:30 a.m.*

NEED HELP FINDING COPY OF DIRECTIONAL DRILLING SURVEY PROGRAM. IF HAVE INFO PLEASE E MAIL THANKS

Re: DIRECTIONAL DRILLING PROGRAMS

*Message #2 Posted by **don wallace** on 3 Oct 2005, 2:36 a.m.,*
in response to message #1 by JAMES DAUGHERTY

I just typed "directional drilling software" into google and got a whole heap of links. The following one was for the 49G:

www.geocities.com/easydrill

You could also e-mail Haliburton or Straightline...

(I fixed the water control and designed a replacement joystick for tram control on a Straightline 2462 once... that was fun!)

Kind regards,

Don W

HP 01 WATCH MODULE REMOVAL

*Message #1 Posted by **RICK ROAT** on 2 Oct 2005, 10:34 p.m.*

ANY HINTS OR EXPERIENCES ARE WELCOMED!

Re: HP 01 WATCH MODULE REMOVAL

*Message #2 Posted by **Eric Smith** on 3 Oct 2005, 4:38 p.m.,*
in response to message #1 by RICK ROAT

I don't know how to do it. But if you're replacing a defective module with a good one from another watch, I'd really like to acquire the defective module for reverse-engineering purposes for Nonpareil.

Re: HP 01 WATCH MODULE REMOVAL

*Message #3 Posted by **Bernhard** on 4 Oct 2005, 4:47 p.m.,*
in response to message #2 by Eric Smith

Oh yeah,

don't throw anything away. I've just bought a brand-new $72 microscope including PC camera (presumably made in the Ukraine of ex-Soviet union fame, the camera possibly made in China), and I'll try to make chip photos of a 1820-2028 for reverse engineering). These are the moments I regret to have resigned from the job in the old company... but this failing countries' socialistic taxes and social security made that $120k/yr job absolutely noneconomical in terms of net income. Now I must do all those neat chip photos myself and pay for the equipment myself...

Bernhard

If you want to make an offer for the module or the complete watch, please let me know.

Thanks,

Rick

Re: HP 01 WATCH MODULE REMOVAL

*Message #5 Posted by **Eric Smith** on 5 Oct 2005, 11:37 p.m.,*
in response to message #4 by RICK ROAT

I'm certainly willing to make an offer, especially if it is non-functional. I want a non-functional module to tear apart for reverse-engineering (photomicrograph the ROM chips), in order to add HP-01

simulation to Nonpareil.

I'd rather not destroy a working watch to do that, and I can't justify paying the price of a working watch.

Re: HP 01 WATCH MODULE REMOVAL

*Message #6 Posted by **RICK ROAT** on 6 Oct 2005, 8:59 p.m.,*
in response to message #5 by Eric Smith

Please let me know if you want to make an offer on this non-working HP 01 Watch.

Thanks, Rick

Anyone want a rambox (made) for the hp 41?

*Message #1 Posted by **don wallace** on 2 Oct 2005, 2:56 p.m.*

Wondering how nay if any would like to experiment with machine language programming on a hp41.

There are some solutions around but they latch up occassionally (not good).

I am interested in building an enhanced copy of the old ERAMCO RAMBOX. I might make a few if anyone wants one.

I am planning to do a little MCODE programming on the 41, so I feel I need one ;-)

Don W

*Message #2 Posted by **Meindert Kuipers** on 3 Oct 2005, 1:15 p.m.,*
in response to message #1 by don wallace

Don,

With all due respect: with Clonix, MLDL2000 and efforts underway by others I do not see why there would be interest in the good old Eramco RAMBOX. Playing with mcode can be done on the simulators as well.

And about lockups: programming mcode is almost a guarantee for locking up your calc!

Meindert

Re: Anyone want a rambox (made) for the hp 41?

*Message #3 Posted by **don wallace** on 3 Oct 2005, 7:05 p.m.,*
in response to message #2 by Meindert Kuipers

Hi Meindert,

Regardless of the cause (hardware glitch or software bug) there is NO PRACTICAL APPLICATION for a system which crashes, (apart from as an example of human fallability).

There are enough examples of human fallability in the real world. The oil crisis (this one is real and permanent) and environmental degradation are the main one I think about.

The answers to your question are:

RELIABILITY and PRICE ;-) An extensible hardware platform and optional HARDWARE FLAGS are an extra bonus. Since when does anyone have to STOP at the point others have reached?

I do want to politely make the point that I am only interested in practical applications for this regretably

ancient machine. If others want to work on extending it I think that is JUST WONDERFUL! that others already have is great.

Thanks to your work Meindert and Diego D. and John I. and many others we have these marvellous gadgets. They are GREAT, but they are not perfect.

I am only coming up to speed fully with all the history of these projects. However I note that these guys didn't have to BUILD THEIR OWN Logic State Analyzers. So maybe I can contribute something to all this?

What would be helpful to the community if painful for the developers is a public bug list so that if/when designs are released the community can work on squashing them.

After all, that's what they did at hp R and D...

Have a nice day.

Don Wallace

Re: Anyone want a rambox (made) for the hp 41?

*Message #9 Posted by **Meindert Kuipers** on 5 Oct 2005, 6:08 a.m.,*
in response to message #8 by Doug Wilder

This is indeed the best starting point, and some other articles in the PPC, explaining the operation of the HP41 interface. Also I recommend the HP41 Service Manuals, which have bits of information that is missing in the PPC articles, especially on the startup- and powerdown behavior. Make certain that you really understand how the WROM instruction works, this can be tricky.
Must reads are:
* Inside the HP41C, article by Kelly McLellan: PPC Calculator Journal V6N7
* HP41 Bus Interfacing, article by Jim De Arras: PPC Calculator Journal V7N3
* HP41 Machine Language Development Lab, article by Lynn A. Wilkins: PPC Calculator Journal V9N3
All this information is available on the various sets of CD's or DVD's that are available at MoHPC or TOS.
Soon I will publish the VHDL source and schematics of the MLDL2000, feel free to use this as a starting point.

Meindert

Need help updating ROM on 49G+

*Message #1 Posted by **Stephen Easterling** on 1 Oct 2005, 11:21 p.m.*

I'm using Windows XP and have been unsuccessful with my USB connectivity software. I'm wondering if the CD that come with the calculator has a version of the connectivity "kit" that is not compatible with Windows XP. Any ideas?

I've tried using the SD card. At the time of purchasing the 49G+, I also got an HP 64 meg SD card. So I hunt down the ROM 2.00, save it, unzip it, and save it to my SD card. Question: Do I need to get a version of the ROM 2.00 that is for a particular FAT? If so, how do I format my SD card for this?

The rest of the instructions on how to update the ROM for the 49G+ seem to be clear.

Thanks very much!

Stephen

PS: Sorry if this topic has been discussed so much.

Re: Need help updating ROM on 49G+

*Message #2 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 3:29 p.m.,*
in response to message #1 by Stephen Easterling

Try the current "connectivity kit" at HP's site. Be sure to properly remove the USB driver for every port that you've tried the 49g+ on, before installing the new driver.

To me, it seems easier to just use the MMC/SD card to upgrade the ROM.

Also, for questions about the RPL models, you might do better searching the Google archive of the comp.sys.hp48 usenet group.

Regards,
James

Re: Need help updating ROM on 49G+

*Message #3 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 4:47 p.m.,*
in response to message #1 by Stephen Easterling

Oh yeah, for the SD card, no, there aren't different ROM versions available for different FAT formats. The "boot loader" built-in to the 49g+ works only with cards formatted FAT16, so that's what you have to have the card formatted to for ROM upgrades. Maybe Windows XP gives you a choice of formats? You may have to use the Windows command line with switches to get the choice. But assuming that you haven't upgraded to ROM 2.00 yet, your 49g+ should format the 64MB card to FAT16 anyway.

The 49g+ ROM revision 1.23 and lower formats 8MB cards to FAT12, and all larger cards to FAT16, and,

except for ROM upgrades, reads either FAT12 or FAT16.

With ROM revision 2.00, 8MB cards are still formatted FAT12, but very unfortunately, it won't read FAT12 cards. It formats 16MB and 32MB cards to FAT16, which can be read and used for ROM upgrades. It formats 64MB and larger cards to FAT32, which it can read, but of course can't be used for ROM upgrades. This was all noted quite a while ago, but we're still waiting for ROM revision 2.01. Of course, we can expect plenty of complaints from those who've already used ROM 2.00 to format their cards FAT32, and find that they can't use them for the next ROM upgrade.

Of course the above card capacity are "nominal"; the available capacities of MMCs will be somewhat less, and of SD cards, even less than MMCs.

Regards,
James

Re: Need help updating ROM on 49G+

*Message #4 Posted by **Stephen Easterling** on 2 Oct 2005, 6:29 p.m.,*
in response to message #3 by James M. Prange (Michigan)

Thanks, James (and everyone) for the help. Late last night I figured it out. I first had to insert the card into the calc and format it BEFORE I could use it. (This, of course, erased the files I had on it.) Afterward the 49G+ formatted it to the FAT16, I went back to the PC and copied the two files needed to do the ROM 2.00 update. It was simple after this. The thing I didn't know or get from the manual was that I needed to take this first formatting step. I have reduced the size of my 64 MB card now, but at least it works. The ROM 2.00 seems to have helped the missed key entries a lot. First the first time I actually want to use this calculator and not throw it against the wall.

I'm still trying to get the connection for Windows XP to work with the CD that came with the calc. It installs and seems to work, but I can only get so far. Oh well, I prefer the SD card now anyway.

Re: Need help updating ROM on 49G+

*Message #5 Posted by **Stephen Easterling** on 2 Oct 2005, 6:30 p.m.,*
in response to message #3 by James M. Prange (Michigan)

Come to think of it, I forgot how I actually used the calc to format the SD card. Do you recall the steps needed to do this? I know I didn't see them written down anywhere. (Thanks!)

Re: Need help updating ROM on 49G+

*Message #6 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 9:18 p.m.,*
in response to message #5 by Stephen Easterling

With ROM 2.00, it's simpler. With the card inserted, press LeftShift FILES, and you should see "FORMA" in the menu over the F3 key. Press F3 and you'll get an "Are you sure?" type warning. OK that and it will format the card. This method doesn't require any warmstart, but sometimes doesn't seem to work if the card doesn't already have a valid format. (I've sometimes used a disk editor to tweak the boot record, and mistakes happen.)

It will format your 64MB card to FAT32 though, so you'd have to reformat it to FAT16 with something else to use it for the next ROM upgrade.

Although FAT32 allows more files than FAT16, and a root directory limited only by the card capacity, it reduces the available storage capacity a bit. Given the capacity of the cards, this shouldn't be much of a problem for "typical" calculator files.

With a card inserted, there's a slight delay before anything visible happens when turning the calculator on. I've surmised that the delay depends on (besides the speed of the card) the size of the FAT. Since for a given card size, FAT32 allows more entries in each FAT, and each entry is larger, this can be annoying with large capacity FAT32 cards. I don't think it would be a problem with a 64MB card, but it can be very annoying with larger cards with small clusters. If you find it to be a problem, try using FAT16, or increase the cluster size, thus decreasing the number of FAT entries. Of course you'd have to use something other than the 49g+ for such "customized" formats. The 49g+ doesn't give you any options as to how it formats a particular card; that depends only on the card's capacity.

You could also use [ON]&[F4] (together) to get to a tests screen, then press [9] (CARD) for a TEST/FORMAT screen, then [2] (FORMAT) for a "last chance to bail out" screen, then [1] to actually start formatting. Note that you'd have to invoke a warmstart [ON]&[F3] or a paperclip warmstart to back out of this method.

Yet another way is to use [ON]&[F6] to get to a different tests screen, then [-] (CARD), then [2] (FORMAT), then [1] to actually start formatting. With this method, after backing out to the tests screen, you can just press [ON] (REBOOT) for the warmstart.

Formatting via the tests screens seems to work with some mis-formatted cards that fail from the filer.

Oh, also note that the 49g+ allows you to store files with names that differ only in case. This is nice as long as you leave the card in the 49g+, but it confuses the heck out of MS Windows (and I suppose maybe other OSes), and it's very easy to trash such files if you try to do anything with them in your PC.

Regards,
James

Re: Need help updating ROM on 49G+

*Message #7 Posted by **James M. Prange (Michigan)** on 4 Oct 2005, 5:48 a.m.,*
in response to message #6 by James M. Prange (Michigan)

By the way, for those still using a ROM revision earlier than 2.00, the procedure above using the [ON]&[F4] keys is the only one available on the calculator.

The 49g+ can use a "MultiMediaCard" (MMC) as well as a "Secure Digital" (SD) card. Differences are that MMC card have a bit more available capacity, lack the "lock" switch and a small notch on the right side, have seven contacts instead of nine, and are 2/3 the thickness.

Of course the MMC also lacks the "security" features of the SD card. These "security" feature are meant to limit the distribution of copyrighted content. I don't know; maybe they could be used by someone selling applications for the 49g+.

The SD card's lock switch position is ignored with ROM revisions earlier than 2.00 (you can indeed write to a "locked" card), but works as expected with 2.00 (attempting to store to a locked card results in a "Disk Protected" error).

An MMC*plus* **should** work, but should function as an ordinary MMC in devices (such as the 49g+) not designed to take advantage of the extra I/O lines. Don't be expecting the dramatic increase in speed from using one.

The smaller size cards are available pretty cheap on eBay, although older cards typically seem to be slower. I expect that even an "8MB" card would be plenty big for typical calculator uses. But note that ROM 2.00 formats 8MB cards to FAT12, which it won't read from or write to.

Regarding my "64MB" capacity MMC, here are some numbers that I've come up with. Note that I'm treating 1MB as 2^20=1048576 Bytes here, although the card manufacturers consider 1MB to be 1000000 Bytes. SD cards will have fewer total sectors available, because some capacity is used for "security" purposes. The FAT16 boot record was tweaked with a disk editor. For FAT16, the root directory can hold up to 512 entries if the filenames all comply with "8.3" all capitals DOS "short" file naming conventions; a "long" filename directory entry is larger, thus fewer can fit in a given directory. "Your mileage may vary."

```
Total sectors (unformatted):
        125440=64225280B=62720KB=61.25MB

Formatted FAT16, 1KB clusters
Reserved sectors:
        2=1024B=1KB~0.0010MB
Sectors per FAT:
  244, allowing up to 62462 entries for clusters.
Sectors used in both FATs:
        488=249856B=244KB~0.2383MB
Sectors used for (nominal) 512 entry root directory:
        32=16384B=16KB~0.0156MB
Total sectors used up for formatting:
        522=267267B=261KB~0.255MB
Sectores left for files (including subdirectories}:
        124918=63958016B=62459KB~60.9951MB
1KB clusters for files (including subdirectories):
        62459

Formatted FAT32, 512B clusters.
Reserved sectors:
        32=16384B=16KB
Sectors per FAT:
        973, allowing up to 124542 entries for clusters.
Sectors used in both FATs:
        1946=996352B=973KB~0.950MB
Sectors used for (initial, 1-cluster) root directory:
        1 sector: 512B=0.5KB~0.0005MB
Total sectors used up for formatting:
        1979=1013248B=989.5KB~0.9963MB
Sectors left for files (including larger root directory and subdirectories):
        123461=63212032B=61730.5KB~60.2837MB
0.5KB clusters for files (including larger root directory and subdirectories):
        123461
```

I expect that it would be a long time before I maxed out this card in terms of either total file sizes plus slack space or maximum number of files, regardless of whether I format it FAT16 or FAT32.

Regarding the connectivity kit and USB driver on the CD-ROM, if it's lower than Version 2.2 Build 2353 with USB driver Version 1.2, then remove them (if already installed) and imstall the current versions instead.

Regards,
James

Re: Need help updating ROM on 49G+

*Message #8 Posted by **James M. Prange (Michigan)** on 4 Oct 2005, 7:05 a.m.,*
in response to message #7 by James M. Prange (Michigan)

After posting, I noticed that the FAT32 format from the 49g+ left a bit to be desired, so I tweaked things to increase the available capacity slightly. Here's what I have on it now.

```
Total sectors (unformatted):
        125440=64225280B=62720KB=61.25MB

Formatted FAT32, 512B clusters.
Reserved sectors:
        32=16384B=16KB
Sectors per FAT:

Re: Need help updating ROM on 49G+

*Message #9 Posted by **I, Claudius** on 2 Oct 2005, 7:01 p.m.,*
in response to message #3 by James M. Prange (Michigan)

I'm trying to follow you here: are you saying a good way to update the ROM is to first format an SD card of 16 MB or greater in the calc under ROM 1.23, then load ROM 2.0 onto the card from the pc, then upgrade the calc from the card?

I'm in no way criticizing, I find this highly interesting. I went through three of the 49+s some time ago and gave up on the machine. Now that word has come out that newer serial numbers with the new ROM are working, it's getting my hopes up again of trying another 49. What is it about these HPs that gets me going? Egad, a nerd addiction...

Re: Need help updating ROM on 49G+

*Message #10 Posted by **Tim Wessman** on 2 Oct 2005, 8:19 p.m.,*
in response to message #9 by I, Claudius

From what I understand, the FAT32 support wouldn't fit in the space allocated for the ROM updater. For this reason, upgrading from the SD card needs fat16. Upgrading via USB does work well once you get the hang of it, but I generally just use the card as it is faster than opening the conn4x program.

In response to...

"I'm trying to follow you here: are you saying a good way to update the ROM is to first format an SD card of 16 MB or greater in the calc under ROM 1.23, then load ROM 2.0 onto the card from the pc, then upgrade the calc from the card?"

... Yes, this is what I did. I tried several times just loading the two files onto the SD card and then inserting it into the 49G+ (then holding teh +/-, resetting, updating ROM,... via SD card, etc) but this never worked after multiple attempts. Then I hit something on the calculator (can't recall what I did!) and formatted it to the calc's FAT16 using its ver 1.23. I felt like I was starting to get somewhere after several hours of trying. A lightbulb appeared over my head and I went back to the PC, copied the ROM 2.00 update files back to the SD card, and tried it again in my 49G+. This time it worked perfectly. A quick test of my keypad indicated it was working much better than before. I won't know until I balance my checkbook tonight and use it at work this if it will be satisfactory, but at least it is much better.

Hey anyone,... how did I format the new SD card in my calc? I can't remember which buttons I pushed!

Yep, you've got it. Of course you could also use some other device to format the card to FAT16, but it has to be FAT16 to use the card for reflashing the ROM.

As Tim mentioned, you can also upgrade the via USB.

Personally, I've gotten in the habit of using the card for all upgrades and file transfers, but USB works fine too, at least with Windows. But don't even bother with trying the "connectivity kit" on the CD-ROM; get the current kit from HP's Web site.

For anyone with a Mac, try Michael Heinz's HPConnect. It's reported to be very good for file transfers, although I don't think it includes anything for ROM upgrades.

For anyone using Linux, ask on the comp.sys.hp48 newsgroup.

Regards,
James

Works with Linux, too. As long as you have a working USB implementation. The newer distros all include kernel 2.6, whcih does a *much* better job with USB. The best software I've found to drive

the connection is hptalx. The same software works great with the HP-48[SG][X+].

Oh, and the copy files to a formatted SD card technique works great in linux too. 8)

HP 48G Directional Force

*Message #1 Posted by **Joshua Bright** on 2 Oct 2005, 10:33 a.m.*

Does anyone know if there a program or native feature that would calculate directional force (Calculus 2 exercise)? The school I go to is only keen to TI calculators. Thanks!

"Directional Force"?

*Message #2 Posted by **Karl Schneider** on 2 Oct 2005, 11:17 p.m.,*
in response to message #1 by Joshua Bright

Joshua --

What exactly do you mean by "directional force" for calculus? Vector dot- and cross-products?

-- KS

Re: HP 48G Directional Force

*Message #3 Posted by **WigglePig** on 3 Oct 2005, 4:40 a.m.,*
in response to message #1 by Joshua Bright

Hmm,

I seem to remember that forces are vector quantities and therefore are directional by default.

Maybe you mean dot and/or cross products, in such things as "resolving" forces in given directions?

Regards

WigglePig

Re: HP 48G Directional Force

*Message #4 Posted by **Joshua Bright** on 4 Oct 2005, 12:07 p.m.,*
in response to message #3 by WigglePig

I made a mistake I'm looking for direction field options jnot directional force for the HP48G.

I asked me professor about it. He said that we would be graphing the derivative, which would include many different possibilites. From those possibilities he would give us different conditions like the interval from a-b. We would then enter those conditions and it would show the correct graph.

This program is associated with Eulers method if that makes sense. Let me know if you have any suggestions. Thanks guys!

Re: HP 48G Directional Force

*Message #5 Posted by **I, Claudius** on 5 Oct 2005, 9:38 a.m.,*
in response to message #4 by Joshua Bright

Your 48G is abysmally slow for drawing direction fields for difeq plots, and they often do not resemble what the plot should look like. The TI89, which does a great job of slope field plots, beats the heck out of HP, and is another example of how TI has been able to lock up 99% of educational calculator sales.

A quick way around this would be to plug in numbers into the equation at selected intervals to directly compute the slope. This is what us old folks did before graphing calculators came along.

Hopefully your school will some sort of computer algebra system available, such as Maple. These programs can quickly and accurately plot these and other more difficult graphs to help you visualize the math.

HP48SX Lack of Laplace transforms

*Message #1 Posted by **David Houston Thompson** on 1 Oct 2005, 9:23 p.m.*

Hello, I am new to using symbolic type HPs. The old 48SX that I bought does not seem to be able to cope with simple Laplace transforms - it cannot fathom the necessary integration. I was surprised at this. I would be most grateful if someone could tell me if I am correct in my assumption that the HP48SX can't manage such an integration. Also, can anyone tell me if a card can be bought to enable the HP48SX to manage such transforms.

Thanks for your consideration of this problem.

Re: HP48SX Lack of Laplace transforms

*Message #2 Posted by **Scott** on 1 Oct 2005, 9:37 p.m.,*
in response to message #1 by David Houston Thompson

Hello,

Erable does Laplace and Inverse Laplace transforms and is available in an SX version... read the instructions carefully for special SX installation steps. I used it quite a lot in the old days.

Click here to download.

Regards, Scott Guth

Re: HP48SX Lack of Laplace transforms

*Message #3 Posted by **I, Claudius** on 2 Oct 2005, 3:51 a.m.,*
in response to message #1 by David Houston Thompson

If you want real symbolic power then get a 49 or 49+. Both have LaPlace/Inverse LaPlace commands. Both machines have a true CAS, quite good for a handheld, unlike your 48, which has sort of a joke CAS. Both machines can be bought cheaply, especially the original 49, going on eBay as new old-stock for $60-$100. The speed of the 49/49+ is much faster than the 48 as well. If your 48SX is in good shape it will sell on eBay to help finance your 49.

As for the Erable program for the 48, it was way overrated. I found it to be so full of bugs and limitations that it was not worth using. It was not until the author of Erable got paid by HP to develop the true CAS of the 49 that it become a good program.

Re: HP48SX Lack of Laplace transforms

*Message #4 Posted by **David Houston Thompson** on 2 Oct 2005, 7:09 a.m.,*
in response to message #3 by I, Claudius

Thanks I Claudius for your help. I was completely underwhelmed by my HP 48SX's symbolic abilities, but as a novice user I was wary of jumping to conclusions before seeking the opinion of more experienced users. So basically what you are saying is that the HP 48SX has a rubbish CAS. When I tried some Laplace

transforms on an old TI-92 it performed well when given the transform as an explicit integration with lower and upper limits of A and B, then I could let A tend to zero and B tend to infinity.

It's a pitty that the HP 48SX could not provide a capable CAS, and it's only saving grace seems to be it's build quality - ah well.

Thanks

*Message #7 Posted by **I, Claudius** on 2 Oct 2005, 9:50 a.m.,*
in response to message #4 by David Houston Thompson

To be quite frank, scrap or sell your 48SX. It's an underpowered dinosaur. I know this is heresy in an HP newsgroup, but I'll admit to owning a TI89, the handheld version of the old brick 92. The 92 has now been superseded by a somewhat smaller thing called the Voyage 200. The CAS in the 89, a version of Derive, is outstanding. If the 89 had an RPN OS and memory structure like the 49 it would be almost perfect. Indeed, if you're worried about build quality of the new 49+, and need a reliable calc with a good CAS, buy a TI89.

There are a number of very good programs available for the 89, an equation writer, and an nth-order difeqs program that also does LaPlace. You can find them and other links at http://www.technicalc.org/

Re: HP48SX Lack of Laplace transforms

*Message #9 Posted by **I, Claudius** on 3 Oct 2005, 8:45 a.m.,*
in response to message #8 by don wallace

Most definitely, the CAS of the 49/49+, while far from perfect, is very good for a handheld. The Erable program for the 48 was quite popular, and the author was a Ph.D mathematician. HP did the smart thing in hiring him to write the 49 CAS. What killed the 49 was its bizarre departure from HP tradition, the ugly "frozen hamster butt" colored case, rubber keys, and stupidly redundant upper screen that scratched with air merely blowing across it. This is probably due to the 49 team being controlled by some very young just graduated engineers, a bad move. There is no doubt in my mind that if HP had simply updated the 48 with the CAS, Flash ROM capability and black screen it would have been a good seller. Then they would have lots of time to get the 49+ or the mythical HP50 right.

Now it's all outsourced to this Kinpo. HP needs to bring all calculator R&D and production back in house, and hire some first rate engineers and programers.

*Message #10 Posted by **don wallace** on 3 Oct 2005, 9:01 a.m.,*
in response to message #9 by I, Claudius

Hi, I Claudius,

So I gather from a casual read of these interesting threads, that the 48 is solid and nice, but sucks a bit computationally and the 49G has the firmware but is built like a kludge? Do I have that right?

I was thinking for tinkering round with some cheap graphing calc. For under $100 U.S. what will I get on Ebay, do you think?

Thanks

Don

Re: HP48SX Lack of Laplace transforms

*Message #11 Posted by **Ron Ross** on 3 Oct 2005, 10:18 a.m.,*
in response to message #10 by don wallace

You could buy an Hp48Gii for under $100, new. It is nearly the same as the Hp49G+.

But you could buy the Hp49G+ for $130 new from Hpcalc.org also. At a bit more than $30 over the cost of the Hp48Gii you get a much more capable calculator in terms of memory and upgradability. Today they are nearly equalivant, but as more software becomes available and the OS evolves the gap between the two can only widen.

If you abandon RPN, you widen up your selection significantly. But for brute force abilities, nothing else matches up to the Hp49G series aside from moving to a PC and math software (ie a

PDA loaded up with software). However you give up a dedicated keyboard, fast boot up time, and the lowcost of a calculator in comparision.

The Ti-89 is a good second choice. But at $150, it is 50% more than your stated price ceiling.

Third in capability (CAS wise) is probably a tie between the Casio FX2.0 and an Hp40GS (available only in Europe). These calculators are a distant third in comparision to the Ti-89 above. I would say the Hp40GS should edge out the Casio, but it isn't yet formally available to confirm.

I personally still use an Hp48G at work. I use and carry a 49G+ for its wealth of features and its speed. But for general number crunching, I like my 48G better (I am slow to trust the keyboard of my 49G+ for desktop use).

If you shop ebay, you should get a 49G+ or an older Ti-89 for less than $100. But with the HP, you would not get your 1 year warrentee. I suspect it is worth the $30 more to have one year of support/trade in for the 49G+ and buy it new.

Re: HP48SX Lack of Laplace transforms

*Message #12 Posted by **I, Claudius** on 3 Oct 2005, 5:36 p.m.,*
in response to message #10 by don wallace

Actually, the first HP49 is the most reliable, whereas you're still taking a gamble with the 49+. The rubber keys take some getting used to, but they do work. There are quite a few new old-stock units available on eBay for $60-100. Get one of those and you won't have forked out megabucks. I have heard good things about newer serial numbered 49+s but not consistently. I'm going to wait a bit longer before trying another 49+. I went through several of the early ones, only to get one bad one after another. My original 49 works quite well. Aside from the case and keys, it is a reworked 48 with a CAS, big memory and file system.

HP 21 display repair

*Message #1 Posted by **Harry (Germany)** on 1 Oct 2005, 5:58 p.m.*

Hi,

did anyone try to repair a 20series display? I got one display with a non working left digit. This seams to be a corrosion problem. A battery leaked into the whole calculator. Then I have another Display from a 20series wich has one faulty segment in the second digit from the right. Now I am wondering how to make one display for my (otherwise very good) 21 that I just bouth. I think there are two options. One is to cut the two display board in half, glue them togather and reconnect the copper lines. The other one is to try and replace the digit on the corroded board with a singel led, as in the 21 this digit is only used for the "-" in negative numbers. Both of those options seam to be very difficult. Any other suggestions? I will probably end up buying another non working 20series for the display :)

Thanks for reading all this nonsense :)

Regards, Harry

Re: HP 21 display repair

*Message #4 Posted by **David Smith** on 2 Oct 2005, 3:27 p.m.,*
in response to message #1 by Harry (Germany)

The display module uses chip-on-board technology where the individual LED chips are attached to the board and wire bonded down This makes the LED module like a big integrated circuit chip. You can pretty much forget sawing the thing in half and patching it back together... unless you have a wire bonder, chip bonder, full

chip doctor setup, etc... but if you had these you probably would not have asked the question. Best to find a machine with a bad ACT or RAM chip, and salvage the display module.

HP 41C Charger lead

*Message #1 Posted by **Chris** on 1 Oct 2005, 9:55 a.m.*

My 82067B charger showed an intermittent fault at the battery connector after accidental crushing underfoot. Dismantling the connector revealed a broken diode(?) embedded in the rubber body.

Is this a Zener or what? Any ideas of characteristics and function?

Grateful for any advice to get 41C operating again: I have had this since new in 1980 and am lost without it!

Re: HP 41C Charger lead

*Message #2 Posted by **David Smith** on 1 Oct 2005, 12:50 p.m.,*
in response to message #1 by Chris

The HP41 nicad battery pack and all the HP41 peripherals ran on the same charger (US model 82059). This charger is a simple AC output transformer with around 8VAC output. There was no diode, etc in the lead.

Re: HP 41C Charger lead

*Message #3 Posted by **Tony Duell** on 2 Oct 2005, 5:42 a.m.,*
in response to message #2 by David Smith

There are components in the charger plug of the topcat/HP41 charger. They're not well-known or documented, but the Portable Plus Technical manual mentions them -- it gives an example circuit for a car charger for that machine, gives a part number for the lead/plug (same cable as for the HP41, etc) and mentions the fact that it contains a pair of zener diodes in inverse series.

I don't know if it's 2 separate diode packages in inverse series or one component that acts like a bidirectional zener. The former would certainly work, though. I seem to remember they're something like 27V each (so they certainly don't do anything in normal use, just suppress transients), I will have to check.

Incidentally, that seems to be the difference between the -A and -B charges for the Woodstock and Spice series. The -B models have the zener diodes. In at least one series they're fitted inside the adapter case, not moulded inside the plug.

Re: HP 41C Charger lead

*Message #4 Posted by **David Smith** on 2 Oct 2005, 3:33 p.m.,*
in response to message #3 by Tony Duell

I once sliced open a bad HP-97 charger plug to fix a broken wire. Did not see any diodes in there, and I did some pretty major hacking on the thing. I eventually wound up cutting the plug off, making a wax mold, and cast a replacement. Looks like not all 82059's have diodes have diodes.

Re: HP 41C Charger lead

*Message #5 Posted by **Chris** on 3 Oct 2005, 9:25 a.m.,*
in response to message #3 by Tony Duell

The broken mystery component was wired across the two leads from the transformer. It probably was about 4 mm long and 1mm diameter, opaque glass casing.

The transformer gives 13 VAC (on my meter), no load. Perhaps two Zener diodes in opposition (or a single bi-directional)could be used to smooth out and reduce this 13VAC to the rated 8 VAC marked on the case. If this is so, what value should they (it) have?

As an experiment I put 1W 7.5V Zener across the lead but it soon overheated and gave 6VAC output!

One of the Forum archive entries (1999?) mentions that the charger built into the battery pack operates from " a 12V rail ".

Finally, what is the Portable Plus manual?

Many thanks for your responses.

Re: HP 41C Charger lead

*Message #6 Posted by **Tony Duell** on 3 Oct 2005, 1:46 p.m.,*
in response to message #5 by Chris

The transformer in this adapter (as in the other HP calculator chargers) has deliberately poor regulation, and appears to the load as having a relatively high (about 10 ohms from what I remember) internal resistance. It may well give 12V+ off-load (or with just a DVM connected), but this will drop when you connect it to a battery pack. A few years ago I connected various load resistors to each type of charger, measured the voltage and plotted the V-I curve. They were all very linear. I still have the data and the calculated values of the open-circuit voltage and internal resistance for various chargers. Let me know if you want this.

I do remember that the zener diodes in this, and in other HP chargers, were a much higher voltage than the transformer would ever give. I remember taking a spare charger lead and connecting it to my bench PSU (0-30V adjustable) with a resistor in series and measuring the zener voltage. I think it was about 27V. The zener therefore has no effect in normal operation, it is there to suppress high voltage transients only.

Finally, the Portable Plus was an HP Laptop computer, an enhanced HP110 (which was called the 'Portable'). It runs MS-DOS from ROM, but is not IBM compatible (neither at the hardware or BIOS level from what I remember). I have a couple, I also have the service manual and technical reference manual for it. It runs off an internal 6V lead-acid battery, but the plug-in charger is the same as the one for the HP41 (and topcats, HPIL peripherals, etc). The techref for that machine certainly mentions the zeners.

Re: HP 41C Charger lead

*Message #7 Posted by **Chris** on 4 Oct 2005, 10:37 a.m.,*
in response to message #6 by Tony Duell

I will try a 27V bi-directional Zener in the cord and see if it will charge the battery pack outwith the calculator.

Thanks for the offer of the VI data but I do not think I would need them at this point. My main aim is to get the 41C back into operation soon.

Again, many thanks for the reponses.

Little memory in my hp 48gII

*Message #1 Posted by **jose goncalves** on 1 Oct 2005, 8:36 a.m.*

Is it possible that the memory of my HP 48gII is much smaller than what the manual says ? Whem I try to see the memory structure with FILES, all I get is 0: IRAM 80 KB Home 80 KB -CASDIR

I cannot see 1: ERAM nor 2: FLASH and the amount of memory available is nothing close to the fugures I see on page 26-1 of the User´s Guide. Where is it hiding memory ?

The serial number is CNA 4360....

Thanks for helping me to recover memory.

Jose

Re: Little memory in my hp 48gII

*Message #2 Posted by **.** on 1 Oct 2005, 8:49 a.m.,*
in response to message #1 by jose goncalves

You have a HP48gii, NOT a HP49g+. The 48gii does not have this extra memory.

.

Re: Little memory in my hp 48gII

*Message #3 Posted by **Gene** on 1 Oct 2005, 10:28 a.m.,*
in response to message #1 by jose goncalves

Jose, the HP48gII only has about 80K of available memory for the user. The other memory you refer to is in the 49g+. Sorry!

Re: Little memory in my hp 48gII

*Message #4 Posted by **jose goncalves** on 1 Oct 2005, 11:10 p.m.,*
in response to message #3 by Gene

Well, it´s quite remarkable, for the manual I´m using is the HP48gII User´s guide, 2003 edition, that I downloaded from somewhere some months ago.

Jose

*Message #5 Posted by **Gene Wright** on 2 Oct 2005, 7:33 a.m.,*
in response to message #4 by jose goncalves

Hi again Jose. Can you give me an exact page reference where it says the "48gII" has that much memory?

I have the manual here and would like to look it up.

thanks, Gene

Re: Little memory in my hp 48gII

*Message #6 Posted by **jose goncalves** on 2 Oct 2005, 12:08 p.m.,*
in response to message #5 by Gene Wright

Well, This information is in two segments of the User´s guide: pages 2-32 to 2-35 and again in the Chapter 26 - Managing memory (the main picture of the display is in page 26-1 and is the same you can see in page 2-35.

I am not familiar with the HP 49G+, so I wonder if it´s so completely compatible with the HP 48gII that all functions and commands are the same. Even if this user guide I have was for the HP 49+, I think there might be some noticeable differences in terms of contents.

All I can learn from this is that the HP 48gII doesn´t even have the same amount amount of memory as the HP 48G does. Is this correct ?

Jose

*Message #7 Posted by **Gene** on 2 Oct 2005, 2:59 p.m.,*
in response to message #6 by jose goncalves

The 48gII and 49g+ are completely compatible with each other. All commands are the same...

other than:

The 49g+ has USB whereas the 48gII has serial. The 49g+ has 1MB of flash ram whereas the 48gII has none. The 49g+ has a larger screen than the 48gII. The 49g+ has an SD card slot but the 48gII does not have one. The 49g+ ROM can be updated but the 48gII cannot.

And, the memory differences you have already noticed (80K on the 48gII).

EVERYTHING else is the same. Any differences are a result of these differences. Example? The default graphing ranges are different on the 48gII vs. the 49g+ with ROM 2.0, since Rom 2.0 is "large screen aware".

For any practical purpose, they are the same with these differences.

in response to message #1 by jose goncalves

The back page of my HP-49G+ manual says:

"512KB RAM plus 2MB flash ROM"

Where is that "512KB RAM"?!? I see 256K of main RAM and 128K of ERAM (Port 1). Of course, I know

that another 128K bank is reserved for the system but, as user, I am only interested in the amount of RAM which is free for me to use and this is 384K.

"2.5MB of total memory lets you take advantage of the most comprehesive library of calculator programs, etc., etc."

What "2.5MB of total memory"?!? There is 384K of RAM and less than 800K of flash memory (as seen from the Filer) free to the user!

*Message #9 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 4:07 p.m.,*
in response to message #8 by HrastProgrammer

I suppose that it's sort of like the amount of usable storage of any magnetic disk, optical disk, or flash memory card.

Ever notice how much is actually available to the user for storing files on a "1.44MB" formatted 3.5" floppy? And if I recall correctly, those floppies were first marketed as having "2MB" (small print: unformatted) capacity.

For an even better example, my PC has 512MB of memory, but I've never had that much available for actual use by applications with the MS Windows (or any other) operating system running. And of course the operating system files take up some space on my hard drive too, so even its "formatted" capacity isn't fully available for my use.

The 48 series also have somewhat less than the specified memory capacity actually available for the user.

Face it, sellers will tell us the best-sounding specs that they can get away with, and either put the less fortunate details somewhere inconspicuous, or neglect mentioning them.

They aren't exactly "lying"; that capacity really is built in to the calculator, although since it isn't all available to the user, it does seem rather "misleading".

Regards,
James

*Message #10 Posted by **HrastProgrammer** on 3 Oct 2005, 1:31 a.m.,*
in response to message #9 by James M. Prange (Michigan)

... my PC has 512MB of memory...
... The 48 series also have somewhat less than the specified memory capacity actually available for the user.

As a beginner, I didn't know that, sorry. I believed that all 131072 bytes in my HP-48GX are free! Of course that some amount of memory is reserved for the system, this is normal. I am not talking about system overhead and I haven't even mentioned that HP-49G+ has 256K RAM of which about 240K (or less) is free to user while 16K (or more) is reserved. But HP is talking about 512K RAM of which 128K is totally invisible to the user (not showing in Filer etc.) and about 2M flash memory (for "the most comprehesive library of calculator programs, ...") of which 1280K is occupied by the system ROM!

And of course the operating system files take up some space on my hard drive too, so even its "formatted" capacity isn't fully available for my use

Obviously, you used it to install the operating system because you had many different operating systems to choose from. What isn't available to you is the system BIOS (flash) ROM. It would be wrong if the manufacturer of your PC wrote that you have 2M of flash memory installed for "the most comprehesive library of computer programs" ...

Re: Little memory in my HP-49G+, as well ...

*Message #11 Posted by **James M. Prange (Michigan)** on 4 Oct 2005, 7:40 p.m.,*
in response to message #10 by HrastProgrammer

It gets worse. With ROM 2.00, libraries 266 and 267 (for the Equation Library) are stored in port 2 (user flash), using up over 66KB more of it.

On the other hand, HP's Web site lists the memory for the 49g+ as 1.13MB, so apparently someone at HP realized that advertising 2.5MB was misleading.

Regarfd,
James.

HP-IL/RS-232-C

*Message #1 Posted by **Gileno** on 30 Sept 2005, 10:18 a.m.*

Which the program that I should use (Win2000) to communicate with HP-IL/RS-232-C Interface?

Thank you

Re: HP-IL/RS-232-C

*Message #2 Posted by **Eric Smith** on 30 Sept 2005, 1:54 p.m.,*
in response to message #1 by Gileno

I have had nothing but trouble with the terminal program supplied with Windows. I use CRT or SecureCRT from Vandyke, and they are *very* good, but they are commercial. You can download them for a time-limited evaluation.

Other than that, a lot of people like PuTTY, which is free (in both senses).

UK HP-41CX why ?

*Message #1 Posted by **HP 41 USER** on 30 Sept 2005, 2:21 a.m.*

Does anyone know anything about the brand new hp-41cx being sold on Ebay. I have seen at least 10 to 20 per month in the last 2 years. They are new old stock and all are UK sellers... what is the story behind them?. Were these units hidden, lost, forgotten .. stolen ?

Re: UK HP-41CX why ?

*Message #2 Posted by **Namir** on 30 Sept 2005, 10:28 a.m.,*
in response to message #1 by HP 41 USER

These units were stored somewhere and basically or practically forgotten. They surfaced recently and were selling on eBay. They are unused and new units.

I've only noticed the UK 41CX sales on eBay recently, but I've only seen 1 or 2 per month, not 10. Maybe the stock is getting low? I'd love to have one of those UK New-In-Box 41CXs, but the going price is outrageous. There was one sold back in June for $651.99. Ouch. See http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=11713&item=5783408911

in response to message #3 by John Nguyen

I bought 2 of these from this seller about a year and a half ago. I paid considerably less than the $600+ USD noted in the previous post. Both arrived in new, old stock condition. I saw one go for about $950 once -- pick your battles on ebay and you'll do OK.

Both appear to operate just fine. I bought one as a backup for my trusty but aging 41CX, and the other I bought, well, as a backup for the backup. My wife took a somewhat dim (but ultimately tolerant) view of

this, but she simply doesn't understand why one cannot be without one's 41CX!

Newbie Question re: HP41CX Card Reader

*Message #1 Posted by **Mike DiGirolamo** on 29 Sept 2005, 10:10 p.m.*

Hi Gang,

Just acquired a HP 41CX (I'm a HP-67 user from way back in the days when it was first introduced). I've loaded in a couple of program tapes from the HP-67/97 Standard Pack and they ran well. Went to load another program and I got the message: "NO ROOM, Try Again." Same message repeats if I load again. I have the X-MEM, STAT and MATH 1 modules plugged into memory slots 1-3 respectively. Is there a command, etc I should run to erase or re-allocate memory, etc? Help please!

Thanks,

Mike

Re: Newbie Question re: HP41CX Card Reader

*Message #2 Posted by **Les Bell** on 29 Sept 2005, 10:44 p.m.,*
in response to message #1 by Mike DiGirolamo

Mike, you want the CLP command. Use CAT 1 to list the programs currently in memory, and note an alpha label of you don't want. Now do:

XEQ ALPHA CLP ALPHA, then ALPHA <label> ALPHA

to delete that program from memory.

Alternatively, use stop CAT 1 with R/S when it's on a label of an unwanted program, and do

XEQ ALPHA CLP ALPHA, then ALPHA ALPHA

to clear the current program.

Best,

--- Les
[http://www.lesbell.com.au]

Re: Newbie Question re: HP41CX Card Reader

*Message #3 Posted by **Howard Owen** on 29 Sept 2005, 11:15 p.m.,*
in response to message #2 by Les Bell

Also, you can allocate memory between storage registers and program lines with the SIZE command:

XEQ (alpha)S I Z E(alpha) NNN

Where XEQ is the key to the right of the gold shift key, (alpha) is the alpha key at the extreme upper right, 'S I ' and so forth denotes spelling out the word with the alpha shifted keyboard, *without* spaces, and NNN are 3 numerals, spelling a number less than or equal to 319, the total number of registers on an HP-41CX.

A 41-CX will come up after a complete "MEMORY LOST" reset with SIZE = 100. That means 100 registers are allocated to data, numbered 0 - 99, and 219 are allocated to program steps. You can tell what your SIZE is on a CX, (or a C or CV with the X Functions module) with the SIZE? command:

XEQ (alpha)S I Z E ?(alpha)

That will return the current SIZE to the X register. If you haven't changed it, it should still be 100. If your programs don't need that many registers, you can choose a smaller SIZE and possibly free up enough to load the extra program.

Of course, with the card reader, you can just load whatever you CLP again later. It does eat batteries though.

Edited: 29 Sept 2005, 11:17 p.m.

Re: Newbie Question re: HP41CX Card Reader

*Message #4 Posted by **Mike DiGirolamo** on 30 Sept 2005, 12:35 a.m.,*
in response to message #2 by Les Bell

Hi Les,

Thanks for your reply. I did as you said.. but, still have problems. I cleared two programs that were shown under the Catalog 1 command. Tried to read a tape afterwards and got the original message "No Room" back again. SST'd through Catalog 1 and got the following: END 121 END 121 .END. REG12 Is this diagnostic in telling you that there is still another step I need to perform? I am trying to understand what you said about memory re-allocation but I'm going to need to do more reading to understand what you were saying to me.

Regards,

Mike

Re: Newbie Question re: HP41CX Card Reader

*Message #5 Posted by **Les Bell** on 30 Sept 2005, 1:19 a.m.,*
in response to message #4 by Mike DiGirolamo

Hi, Mike,

I think the problem is that you are reading HP-67 program cards, which the card reader will translate - but because the 67 had no alpha capabilities, it will simply put a single label in the first line of the translated program: "01 LBL 67".

So there are no alpha labels in memory, and when you run CATALOG 1, it will just show the END statements for each program. If you SST through a CAT 1, and then press R/S, you should then be able to press PRGM, and use SST/BST to get to line 01 of the program. If it's a translated 67 program, you'll see the label I described above. You can then use [XEQ] [ALPHA] C L P [ALPHA] [ALPHA] [ALPHA] to delete the program. You might see the display briefly flash "PACK" after doing this.

You can also get more program memory by executing a SIZE 026, since HP-67 programs, when translated, only use the first 26 registers. Since the default for a 41CX is SIZE 100, this should give

you an extra 74 registers' worth of program storage.

Congrats on having a working 41CX and 82104A, btw - the wheel on mine is probably gummy and I've never gotten around to fixing it (one of these days!).

Best,

--- Les

Re: Newbie Question re: HP41CX Card Reader

*Message #6 Posted by **Mike DiGirolamo** on 30 Sept 2005, 6:55 a.m.,*
in response to message #5 by Les Bell

Hi Les,

The problem in stepping up to this powerful little calculator (from a HP-67) is that I want to get in and start using it immediately. There is much to learn - and, it must be accomplished "one line at a time."

After following your instructions and executing the CLP command, the problem is fixed. I am likely to assign the CLP command to one of my keys under the USER menu. Looks like I'll be using it quite a bit when running different card programs.

Thanks for all your help and,

Best regards,

Mike

Re: Newbie Question re: HP41CX Card Reader

*Message #7 Posted by **Les Bell** on 1 Oct 2005, 7:25 a.m.,*
in response to message #6 by Mike DiGirolamo

Glad it worked, Mike.

I just remembered one other thing: you can avoid the need to keep using CLP by simply positioning the calculator on the previous HP-67 program (rather than after all programs, which would you would do with [GTO] [.] [.]). If the calculator is positioned on a program, then the program you read in will replace that program. See the card reader manual, step 2 at the bottom of page 14, for details.

Best,

--- Les
[http://www.lesbell.com.au]

Re: Newbie Question re: HP41CX Card Reader

*Message #8 Posted by **Les Bell** on 30 Sept 2005, 1:23 a.m.,*
in response to message #4 by Mike DiGirolamo

Oh - one more thought: If you want to keep several of those HP-67 programs in memory for frequent use, you might want to insert a short alpha label at the beginning of them, perhaps replacing the "01

LBL 67" that the card reader inserts. Just go into [PRGM] mode, SST to that label, and then press [LBL] [ALPHA] <your text here> [ALPHA]. You will then be able to see your new label in CATALOG 1, making it easier to find the programs you have loaded.

Best,

--- Les

HP 41CV

*Message #1 Posted by **sdbloom** on 29 Sept 2005, 4:43 p.m.*

The display on my HP41CV goes on only when I hit the shift button. It goes off when I release the shift button. Otherwise it seems to work OK. Any ideas?

Re: HP 41CV

*Message #2 Posted by **David Smith** on 30 Sept 2005, 5:35 p.m.,*
in response to message #1 by sdbloom

This is a rather common problem. Usually caused by old solder flux or other gunk (often invisible) on the display module, connector pins, or the CPU board. Open the machine and clean everything with 91%+ isopropyl alcohol. Keep the alcohol off the display lens or it will leave white spots (that can be polished off).

If this does not fix it, the LCD module is probably bad.

HP-97 Case Yellowing

*Message #1 Posted by **Mike DiGirolamo** on 28 Sept 2005, 5:32 p.m.*

Has anyone been successful in reversing the case yellowing of HP-97 Calculators? I suspect the yellowing is due to a chemical change in the plastic so a possible thought would be to put it in a bag with some (yet to be identified) odoriferous agent that would penetrate and reverse the action. Has anyone explored this or some other approach? All thoughts and ideas will be appreciated -- Mike

in response to message #1 by Mike DiGirolamo

You mean that yellow color is not original? ;-)

Re: HP-97 Case Yellowing

*Message #3 Posted by **Frank Boehm (Germany)** on 29 Sept 2005, 2:33 a.m.,*
in response to message #1 by Mike DiGirolamo

Usually, the process of yellowing (UV rays destroying macro molecules, aka plastic) is not reversible. You could try H2O2 (should be easily obtainable), which has a bleaching effect. Remember that the 97 case was not white though - so a white case is probably not what you want. In short: just leave it untouched :)

Re: HP-97 Case Yellowing

*Message #4 Posted by **John Mosand** on 29 Sept 2005, 5:03 a.m.,*
in response to message #3 by Frank Boehm (Germany)

I have considerable experience with many PVC slide rules (e.g. Aristo and Faber-Castell). Some of them had yellowed. As an experiment, I placed them exposed to UV (sunlight). Voila, the yellowing disappeared! As an architect (retired) I have also watched white PVC facade elements and window frames. After years, no yellowing observed except, in some cases, on the inside! All of which leads me to believe that UV isn't necessarily the cause, possibly only the effect of certain indoor climates or conditions(?)

the Voyagers (11c) seem to be made of polystyrene...

Re: HP-97 Case Yellowing

*Message #8 Posted by **Mike T.** on 29 Sept 2005, 4:26 p.m.,*
in response to message #6 by Nelson M. Sicuro (Brazil)

I remember reading somewhere (the Hp97 manual ?) that the case was made from a high grade ABS plastic of the same type as used in crash helmets. I think the same was true of the SPICE series, and my HP10C and 11C look like they were made of the same stuff..

It is certainly tough enough, I was once careless enough to allow my HP32E to slide off the desk I was working and out of a first (US second) floor window. I survived a 14' fall onto a concrete surface, suffering only a reasonably minor chip to the bottom left hand corner of the case where it hit the ground - in all other respects it didn't seem to be affected at all (I don't think I even lost the contents of the X-Reg!). I think I aged more than it did!

I still use it today, 24 years later.

Mike T.

Re: HP-97 Case Yellowing

*Message #9 Posted by **Ronald** on 3 Oct 2005, 4:53 p.m.,*
in response to message #1 by Mike DiGirolamo

Hi Mike,

I succesfully revert severely yellowed HP97 cases by leaving them for 1 to 2 days in a chlorine solution. Here in Holland we have something for cleaning your toilet based on chlorine (called Glorix Bleek, dikste ooit). The stuff is quit a thick fluid substance (high viscosity) if you know what I mean.

I put 1 1/2 liter (3 bottles) in a stainless steel pan and let it soak.

After 1 day it lookes likes original and has a very "clean smell".

As far as I have seen no impact on structure etc. of the plastic itself.

I do not heat the solution to speed up the proces, for I am afraid the plastic will deform otherwise. With this there is no need anymore to use abbrasive polish etc.

Succes and let me know how it worked for you.

Ronald

Re: HP-97 Case Yellowing

*Message #12 Posted by **Ronald** on 5 Oct 2005, 4:20 p.m.,*
in response to message #11 by Etienne Victoria

Hi,

Hi,

Yes, that is the correct label and ingredients,

Is is basic chlorine stuff used to clean the toilet. Only with some trick to make it a bit more syrup like so it will stream away directly.

The chlorine is the bleaching part.

However be carefull do not overdo do it for it will in that case belach some parts of the plastic almost white and some and the desired colour. I am not sure why that is, maybe that the plastic not fully homogenious ?

Also make sure you submerge it completely otherwise you get some parts more bleached that the others if you do match timng very carefully. (I have to confess I found this out the first time).

Succes

Ronald

Data arithmetic / elapsed days calculation program

*Message #1 Posted by **Stephen Easterling** on 28 Sept 2005, 3:32 p.m.*

Does anyone have a basic program for calculating elapsed days between two given dates? I would like to run this program on a 15C, 33S or any Pioneer series model, and a 48-series.

Re: Data arithmetic / elapsed days calculation program

*Message #2 Posted by **bill platt** on 28 Sept 2005, 3:47 p.m.,*
in response to message #1 by Stephen Easterling

That seems like a "data-intensive" program. Can you make a good alogrythm? Try july31 1947 to april 6, 2004. I guess I would write a supbroutine that 1st figures out the "day number". So you do 31 <enter> 4 <enter> 1947 GSB(x) and calculates days through march---how to store that----a series of if/then could build essentially a "lookup table" so that with "4" it returns 90 days--what about the leap years--a nested if/then for that?

Then you add the days to the month "lookup table reuslt" and that is stored in a register, as is the start year.

Then you run the same thing for the second date. Then the years subtract--oh, we need a leap year figurer for that part, too.

I think this is too much memory for hte 15c, but it would fit in the 33s and the 48g.

I am sure there is a program for (on the 48 and 49) this available at hpcalc.org.

Regards

You're joking, right ? :-)

*Message #3 Posted by **Valentin Albillo** on 29 Sept 2005, 4:18 a.m.,*
in response to message #2 by bill platt

Hi, Bill:

Bill wrote:

"I think this is too much memory for hte 15c, but it would fit in the 33s and the 48g."

You're joking, right ? The HP-15C can do this sort of calculation using 1/10th of its programming resources, at most.

As for the 33s and its 32 Kb of RAM, try and invert an 8x8 matrix using it. The 0.4 Kb HP-15C can do that directly from the keyboard.

Best regards from V.

Re: You're joking, right ? :-)

*Message #4 Posted by **bill platt** on 29 Sept 2005, 8:52 a.m.,*
in response to message #3 by Valentin Albillo

Hi Valentin,

Glad I got your attention; I have not conversed with you in some time :-)

Well, seeing that some here are more clever than me, yes indeed it looks like you can easily fit the problem into a 15c.

I am afraid that my stream-of-consciousness idea of a solution would never fit into the 15c.

Yet another example of how much more effective brains (15c, excellent built-in resources, efficient memory allocation) wins over brawn (33s, gobs of memory, difficulty using most of it) any day.

On this day, I fit into the brawn category :-(

Regards,

Bill

Re: You're joking, right ? :-)

*Message #5 Posted by **Gerson W. Barbosa** on 29 Sept 2005, 9:45 p.m.,*
in response to message #4 by bill platt

Hi Bill, folks,

Valentin is right: a DAYS BETWEEN DATES program does fit in the 15C memory. It even fits in the 11C memory. The following program has 140 lines and includes DAY OF WEEK as well (Of course Valentin would need only half of these, or even less if he manages to concoct a more amazing formula :-) . This is a direct implementation of the formulas used by the Master Library Module of the TI-59 calculator, one of my earliest 15C program, so do not expect anything close to perfection, quite the contrary! (Apparently, at the time I did not know what LSTx was for. I would also sometimes use 2 10^x instead of 100 just to save a step, even though this just makes the program slower, sometimes in the same program I would use simply 100).

```
f LBL 0 x<>y STO 0 x<>y ENTER g INT STO 1 Rv RCL 1 - 2 10^x * ENTER
        g INT STO 2 Rv f FRAC 4 10^x * STO 3 2 ENTER RCL 2 g TEST 7
        GTO 1 RCL 3 ENTER 1 - 100 / 1 + g INT .75 * g INT CHS ENTER RCL 3
        ENTER 1 - 4 / g INT + RCL 2 ENTER 1 - 31 * + RCL 1 + RCL 3
        ENTER 365 * +
        g RTN
f LBL 1 RCL 3 ENTER 365 * RCL 1 + RCL 2 ENTER 1 - 31 * + RCL 2
        ENTER .4 * 2.3 + g INT - RCL 3 ENTER 4 / g INT + RCL 3
        ENTER 100 / 1 + .75 * g INT -
        g RTN
f LBL A GSB 0 RCL 0 GSB 0 RCL 0 - CHS
        g RTN
f LBL B GSB 0 ENTER CHS ENTER 7 / g INT 7 * +
        g RTN
```

f A works just like the DeltaDYS on the 12C, when D.MY format is set.

Unlike the DATE function on the 12C, f B requires only one argument (the date) and returns 0=Sat, 1=Sun, ... 6=Fri. This is quite handy in Portuguese as the days of the week are the corresponding ordinal numbers from Monday (segunda = 2nd) to Friday (sexta = 6th) :-)

Example:

01.012005 ENTER 31.122005 f A => 364

29.092005 f B => 5 'Today is quinta-feira, oops, Thursday!'

Regards,

Gerson.

---------- Notes:

1) The listing is supposed to be ok as I have just keyed it in the 11C and it worked. The program seems to be ok too. Of course g TEST 7 should be replaced by f x>y on the 11C. For speed, occurrences of 2 10^x and 4 10^x should be replaced by 100 and 10000 (or 100 g x^2), respectively.

2) The Brazilian edition of the TI-59/59 Master Library Module Manual has some typos (missing parentheses and brackets). I think the pencil annotation I made is correct:

```
if m < 3 then
  f:=365a + d + 31(m-1) + int ((a-1)/4)-int(3/4(int((a-1)/100)+1))
else
  f:=365a + d + 31(m-1) + int(a/4) - int(3/4(int(a/100) + 1)) - int(0.4m + 2.3)

day of week = f + (int(-f/7)*7)

a=year; m=month; d=day
```

A funny mistranslation in this manual:

The HI-LO GAME (ML-21) was translated as JOGO: Alô? Veja! (GAME: Hello? Look!) which made no sense at all! Apparently, the translator thought LO was short for 'LOOK' and HI was just the interjection 'hi'.

(Edited to correct a couple of typos - I never get rid of them!)

(Edited again to include a missing **g INT** in third line)

To the list of beginner's mistakes in this program, I have to mention at least ten unnecessary ENTERs :-) There's going to be a cleaner version below in the thread.

Re: Data arithmetic / elapsed days calculation program

*Message #6 Posted by **don wallace** on 29 Sept 2005, 6:24 a.m.,*
in response to message #2 by bill platt

Hi all, Hi Bill.

Good question, Stephen. I'm into astronomy, so also into this stuff... (JD etc...)

One thing about the forum, you sure get some REALLY GOOD ANSWERS!

Even if you were on a desert island and had no calculator, it's easy to work out how many days old you are (that is also sobering...we are a bit ephemeral, imho).

You just work out what the leap years are (easy since if they divide into four they are, except for years divisible by 400).

Make a small list of them (a single small look up table). You just then some simple work (30days hath september...) to get from start day/month to end day month (ignoring years). Add to this the 365 x number of years between the dates (if more than 1) and finally, count how many leap years are in between, adding one day for each leap year. There's your answer. Nearly do it in your head...

DW

Re: Data arithmetic / elapsed days calculation program

*Message #7 Posted by **James M. Prange (Michigan)** on 28 Sept 2005, 3:54 p.m.,*
in response to message #1 by Stephen Easterling

For the 48 (and 49) series, you can use the DDAYS command, as long as the dates are from October 15th, 1582 through December 31st, 9999.

With system flag -42 clear, the arguments should be formatted as MM.DDYYYY, and with flag -42 set, the format is DD.MMYYYY.

Regards,
James

HP48 Day-of-week (was: Data arithmetic / elapsed days calculation program)

*Message #8 Posted by **Vieira, L.C. (Brazil)** on 30 Sept 2005, 5:09 p.m.,*
in response to message #7 by James M. Prange (Michigan)

Hi;

the day-of-week (DOW in the HP41CX or HP41 Time Module) in the HP48G may be obtained with TSTR (Time STRing). A brief description of TSTR can also be found here: HP48GII Users´s Guide (chapter 25).

TSTR uses the contents in both Level 2 (time stamp) and Level 1 (date reference) to compose a string (ALGEBRAIC mode demands arguments in the same order),. Given that both contents are valid, the resulting string (Level 1) is added a three-character reference **head** for the day-of-week (MON, TUE, WED...).

Cheers.

Luiz (Brazil)

Re: HP48 Day-of-week (was: Data arithmetic / elapsed days calculation program)

*Message #9 Posted by **Gerson W. Barbosa** on 30 Sept 2005, 6:42 p.m.,*
in response to message #8 by Vieira, L.C. (Brazil)

Quote:

> Given that both contents are valid, the resulting string (Level 1) is added a three-character reference head for the day-of-week (MON, TUE, WED...).

Hi Luiz,

TSTR is very handy, but the output is in English. What about days of the week in languages other than English, like good ol' Portuguese, for instance?

<< "SábDomSegTerQuaQuiSex" 1.012 ROT DDAYS 7 MOD 3 * 1 + DUP 2 + SUB >>

Flag -42 setting is irrelevant! Just enter the date according to the date format on your calculator:

30.092005 => "Sex" (sexta-feira)

Replace "SabDomSegTerQuaQuiSex" with your favorite string:

```
"SamDimLunMarMerJeuVen"
"SabDomLunMarMerGioVen"
"SábDomLunMarMiéJueVie"
"SâmDumLunMarMieJoiVin"
"SatSunMonTueWedThuFri"
"SamSonMonDieMitDonFre"
"ZatZonMaaDinWoeDonVri"
"LörSönManTisOnsTorFre"
"LauSunMaaTiiKesTorPer"
"SobNiePonWtoSroCzwPia"
```

etc...

Cheers,

Gerson.

Re: Data arithmetic / elapsed days calculation program

*Message #10 Posted by **Gunnar Degnbol** on 28 Sept 2005, 5:14 p.m.,*
in response to message #1 by Stephen Easterling

I don't have a calculator program, but it is fairly easy:

1) Move new year to the first of march, so that march is month 0 and february is month 11 of the previous year.

2) Compute the days since some day in january 1 BC as

dn = year DIV 400 - year DIV 100 + year * 1461 DIV 4 + month * 153 DIV 5 + dayofmonth

DIV is integer division, a very useful operation on the HP 33S (but easy to substitute with divide and INTG).

3) Do this for both dates and subtract the results.

If you want the day of week, this can be reduced to

dow = (year DIV 400 - year DIV 100 + year * 5 DIV 4 + month * 13 DIV 5 + dayofmonth) MOD 7

This is called Zeller's congruence.

You can ignore the year DIV 400 - year DIV 100 part if you are only interested in the 20th and 21st centuries.

in response to message #10 by Gunnar Degnbol

Convert each to Julian Day Numbers and subtract.

http://scienceworld.wolfram.com/astronomy/JulianDate.html

Or if you can limit your range, use the Modified Julian Day Numbers (note that these change at midnight, not noon!)

http://scienceworld.wolfram.com/astronomy/ModifiedJulianDate.html

You do know that the HP-12C even has a button to calculate days between dates, don't you?

Re: Data arithmetic / elapsed days calculation program

*Message #14 Posted by **Stephen Easterling** on 29 Sept 2005, 12:23 p.m.,*
in response to message #13 by Bram

Yeah, I have the 12C and love this feature about it. I have several other HPs that calculate elapsed days. For the ones that don't calculate this, I want to write a short program to calculate it. Reason: I'm a medical physicist and frequently I need to calculate elapsed days for a cancer patient's treatment (from start to finish). This is most helpful for the physicians, really, but I have to "QA" every patient's chart weekly. For years I either do it in my head or manually (but using a calc). Now I'm learning to think smarter (or just being lazy!). I think I will first try the Modified Julian Date method since it seems easier. I have over a dozen new HPs added to my collection and trying to rotate them in/out of use (at home and at work) and need them to do what I want them to do. (My first HP was a 28S in '89 and cut my teeth on it.)

Re: Data arithmetic / elapsed days calculation program

*Message #15 Posted by **Gerson W. Barbosa** on 30 Sept 2005, 12:27 p.m.,*
in response to message #14 by Stephen Easterling

Meanwhile, you can use the 15C program above. It is no masterpiece but it works!

In testing it, I can see that today I am exactly 16141 days old, a prime number. And that I got married on a Wednesday (11/11/1987, all prime numbers too... but that was not on purpose), which matches what I can remember.

To use the MM.DDYYYY format you're used to, just replace the first two lines with these:

```
f LBL 0 x<>y STO 0 x<>y ENTER g INT STO 2 Rv RCL 2 - 100 * ENTER
        g INT STO 1 Rv f FRAC 4 10^x * STO 3 2 ENTER RCL 2 g TEST 7
```

Best regards,

Gerson.

*Message #16 Posted by **Andrés C. Rodríguez (Argentina)** on 28 Sept 2005, 7:27 p.m.,*
in response to message #1 by Stephen Easterling

A simple program appears in the HP25 Applications Handbook; a more sophisticated version is published in the HP41 Applications Pac.

The HP25 version is quite simple, due to the limitations of that model (one of my favorites, indeed!). If you would like to understand how it works, and then adapt it to other machines, it may be a very appropriate starting point.

Watch out for Y2K

*Message #23 Posted by **Palmer O. Hanson, Jr.** on 30 Sept 2005, 9:43 p.m.,*
in response to message #22 by R Lion (Spain)

It might be appropriate to be careful about using days beween dates programs from the 1900's since many of those programs did not recognize that the year 2000 would be a leap year (the Y2K problem). If you translate one of those old programs you should check that the number of days between 01/01/2000 and 01/01/2001 is 366. The routine from the TI-59 Master Library mentioned in Gerson Barbosa's submission gets 366.

If you are a dedicated purist, and what RPNer isn't, you might want to check the number of days the routine finds between 01/01/4000 and 01/01/4001. It should be 365. The routine from the TI-59 Master Library gets 366, but everyone knows that AOSers aren't purists.

Re: Watch out for Y2K

*Message #24 Posted by **Gerson W. Barbosa** on 30 Sept 2005, 11:01 p.m.,*
in response to message #23 by Palmer O. Hanson, Jr.

4000 will be a leap year since it is divisible by 400, won't it? Anyway, the program fails for 1700, 1800, 2100, 2200, etc. However I am not sure whether this is due to something wrong in the TI-59 Master Library routine or in the 15C program since I don't have a TI-59. The 12C returns 365 for 01/01/2100-01/01/2101 and 366 for 01/01/4000-01/01/4001.

I have just checked 01/01/2100-01/01/2101 and 01/01/4000-01/01/4001 on Miroslav Nemecek's TI-59 Emulator and the results match those of the 12C. I have to see what is causing the 15C program to return 366 for 01/01/2100-01/01/2101.

Day of Week & Days Between Dates - Lighter version (Was Re: Watch out for Y2K)

*Message #25 Posted by **Gerson W. Barbosa** on 1 Oct 2005, 2:25 a.m.,*
in response to message #24 by Gerson W. Barbosa

There was just a missing **g INT** in the third line. Here is a 15C lighter version after removing a lot of unneeded ENTER's:

```
001:  f LBL 0 x<>y STO 0 x<>y ENTER g INT STO 2 Rv RCL 2 - 100 * ENTER
016:          g INT STO 1 Rv f FRAC 4 10^x * STO 3 2 ENTER RCL 2 g TEST 7
028:          GTO 1 RCL 3 1 - 100 / 1 + g INT .75 * g INT CHS RCL 3
046:          1 - 4 / g INT + RCL 2 1 - 31 * + RCL 1 + RCL 3 365 * +
067:          g RTN
068:  f LBL 1 RCL 3 365 * RCL 1 + RCL 2 1 - 31 * + RCL 2 .4 * 2.3 +
091:          g INT - RCL 3 4 / g INT + RCL 3 100 / 1 + .75 * g INT -
111:          g RTN
112:  f LBL A GSB 0 RCL 0 GSB 0 RCL 0 - CHS
119:          g RTN
120:  f LBL B GSB 0 ENTER CHS 7 / g INT 7 * +
130:          g RTN
```

Date format is MM.DDYYYY

f A: works just like the DeltaDYS on the 12C.

f B: similar to DATE on the 12C, but requires only one argument, the date, and returns 0=Sat, 1=Sun, ... 6=Fri.

On the 11C, **g TEST 7** should be replaced with **f x>y**

Everything appears to be all right now. Sorry for the inconvenience.

When does a calendar week start? (was: Day of Week & Days Between Dates - Lighter version)

*Message #26 Posted by **James M. Prange (Michigan)** on 1 Oct 2005, 3:41 a.m.,*
in response to message #25 by Gerson W. Barbosa

I notice that you have Saturday=0 through Friday=6, but ISO 8601 defines the day of week numbers as Monday=1 through Saturday=7, presumably in accordance with European calendars starting the week on Monday.

Here in the U.S.A., our calendars have stuck with the tradition of the week starting on Sunday, so the ISO numbers seem very strange.

Just out of curiosity, of the cultures represented in this forum, which ones start the week with Sunday, and which start it with Monday (or the equivalents in the local language)?

Does anyone know when European calendars switched to starting the week with Monday?

Or why, for that matter? Was it just to emphasize that secular culture isn't bound by church rules?

Regards,
James

I thought it was quite the contrary, because as least in two European languages, Portuguese and German, the week seems to start on Sunday. The word for Wednesday in German is Mittwoch, which means, I think, "middle of the week". If this is correct, then Wednesday is the fourth day of the week and therefore Sunday is the first day.

In Portuguese, as I have already mentioned, the business days are ordinal numbers: segunda-feira, terça-feira, quarta-feira, quinta-feira and sexta-feira, litteraly "second fair", "third fair",... "sixth-fair" (fair = market place). I think this is because the medieval fairs that were held throughout the week, but I may be wrong (I have heard of another reason, but I don't remember what should it be).

If European calendars now start the week on Monday, you may be right about the reasons. Soon after the French Revolution, for a while they even abandoned the Gregorian calendar.

Regards,

Gerson.

Note that language doesn't always stay in synch with the calendar. For example, our English September, October, November, and December have roots in the Latin for seven, eight, nine, and ten, even though March hasn't been the first month for quite some time.

Before 1976 in Germany Sunday was the first day of the week, since 1976 Monday is the first day according to DIN 1355 (for those who understand German http://de.wikipedia.org/wiki/Woche).

About a later question if calendar weeks are used, I can definitely say "Yes" for Germany. Mostly every working dead line is given as calendar week. In practise this means, when the dead line is for example KW39 (German for Kalenderwoche 39, 09/26/05-10/02/05) you should have it on Monday KW40. ;-)

Finally I want to point to my date conversation routines for the HP-42S which can be found at http://www.hp42s.com/programs/date/date.html working with every date of the Gregorian calendar (October 15/1582 to December 31/9999). Technical notes about implementation can be found at http://www.hp42s.com/programs/date/olddate.html.

Thank you! I was very curious as to when the week changed from starting with Sunday to starting with Monday for part of the world.

Does anyone know of a country that changed earlier?

But really now, a DIN was published and everyone changed their calendars just because of that?

Okay, I realize that it's an ISO standard and ANSI (American National Standards Institute) is a member, but I wouldn't expect our calendars to change in the foreseeable future. Even (or perhaps especially) if the government were to recommend the change, Americans often tend to stick with tradition. For example, our packages for most consumer products usually have SI units on them where applicable, but rarely lack showing the "customary" units as well.

"Weekly planning" pages in business "planners" start with Monday with small

entries at the end for Saturday and Sunday, (a bit annoying for most of us) but the full-month and full-year calendars in them start the week with Sunday.

But the planners do show the ISO 8601 week number on the weekly and daily pages, as well as the day of year and days remaining in year on the daily pages. I suppose they'd be useful if one were ever dealing with someone who used them, but the general consensus around here seems to be that the week numbers don't make any sense at all, so they're simply ignored.

"KW40" is just fine for use within German-speaking countries, but even if you find an American familiar with ISO week dates, he's not likely to recognize that as meaning a week of the year.

Of course an American would understand 10/02/05 or 10-02-05 as meaning October 2nd, 2005 without a second thought, and if even slightly acquainted with German notation, would understand 02.10.05 to be the same date. But written as 02/10/05, 02-10-05, 10.02.05, or 05-10-02, it's probably going to be misinterpreted over here. Personally, I prefer 2005-10-02, particularly for international use, or else October 2nd, 2005. Of course printed forms often indicate that the date should be in MM/DD/YYYY notation.

I doubt that ISO week dates will catch on in the U.S., except perhaps for very limited uses.

First there's the oddity of the week starting with the "wrong" day, and the days being numbered "wrong".

Worse, the first week of the year may lack up to the first 3 days of the year, or may include up to the last 3 days of the previous year, and correspondingly, the last week of the year may include up to the first 3 days of the next year, or lack up to the last 3 days of the year. Okay, for purposes of comparing statistics for the weeks among years, I don't see any way to avoid such problems, at least not without causing even worse problems. But it's difficult for me to imagine ever using such a system for scheduling purposes or recording events.

Regards,
James

Hi James

That's funny, we **all** here are aficionados of artefacts that really does catch with week days: our hp calculators.

Have a look at the serial number coding that hp uses for the calculators.

Here they are - in a big U.S. company. The calendar weeks you call obsolete... :-D

Valentino

Re: When does a calendar week start?

*Message #32 Posted by **James M. Prange (Michigan)** on 12 Oct 2005, 3:26 a.m.,*
in response to message #31 by valentino ducati (switzerland)

First off, the use of a calendar week number in HP serials would be an example of "very limited use". And yes, I was well aware of it. I wonder, does HP's week numbering system follow ISO 8601? There are quite a few other ways one could number the weeks in a year.

I never called it "obsolete", just of limited usefulness.

Regards,
James

Carnival and Easter Days on the HP-42S - no listing! (Re: When does a calendar week start?)

*Message #33 Posted by **Gerson W. Barbosa** on 7 Oct 2005, 1:11 p.m.,*
in response to message #29 by Christoph Giesselink

> Quote:

> Finally I want to point to my date conversation routines for the HP-42S which can be found at http://www.hp42s.com/programs/date/date.html working with every date of the Gregorian calendar (October 15/1582 to December 31/9999)

Very interesting routines! There's even one for calculating the day of the Easter!

About twelve years ago a wrote a 42S program for doing this. No, not for religious purposes, just for planning my vacations. I had to choose my vacations at least six months in advance, and I wouldn't want them to coincide either with Carnival or Easter, since here they are a five-day holiday anyway :-)

By what I can remember, the program is based on a formula by Euler (I simply ported a BASIC program that was published in a local scientific magazine to the HP-42S). It works for any year in the range from 1900 to 2099 (enough for what I had in mind). For example, given 2005 the output will be:

```
Carnival: Feb-06-2005
  Easter: Mar-27-2005
```

The program (361 bytes long) is far from being of general interest. Anyway, I can provide a .RAW file for Emu42 (Thanks, Christoph!) if anyone is interested.

Regards,

Gerson.

> Quote:
>
> Does anyone know when European calendars switched to starting the week with Monday? Or why, for that matter? Was it just to emphasize that secular culture isn't bound by church rules?

I did some googling. It turns out the reason is theological:

1) The third commandment says: Remember thou keep holy the Sabbath day

2) The Christian Sabbath is Sunday

3) The Sabbath is the seventh day

Therefore, Monday is the first day of the week. QED.

Here are some links:

The Days of the Week. Lots of information about weekdays names in different

languages, and this:

> Quote:
>
> The convention, becoming more common, to start calendar weeks on Monday, is a result of the Western European names, especially the German ones, which do not call Saturday the Sabbath -- or do not do so anymore in a recognizable way. Since Christians, especially Protestants, think of Sunday as the "Sabbath," the tendency is to number it as the 7th, rather than as the 1st, day. Familiarity with Greek or Arabic, or several Romance languages, however, would inform one that Saturday remained the Sabbath, as in Hebrew, even for Christians and Muslims.

Sunday:

> Quote:
>
> In ancient Jewish tradition Saturday is the sabbath. Many languages lack separate words for "Saturday" and "sabbath". Eastern Orthodox churches distinguish between the sabbath (Saturday) and the Lord's day (Sunday). Roman Catholics put so little emphasis on that distinction that many among them follow — at least in colloquial language — the Protestant practice of calling Sunday the sabbath.

Sunday is NOT the Sabbath!. This page explains why real protestants keep Saturday holy:

> Quote:
>
> So which authority do you acknowledge, the Word of God that commands seventh day Sabbath worship or the Tradition of the Catholic Church which commands Sunday, first day worship? There is no other choice.

Re: When does a calendar week start?

*Message #35 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 8:35 a.m., in response to message #34 by Gunnar Degnbol*

Granted, the Jewish may use "Remember the Sabbath Day to keep it holy." My understanding is that the Hebrew names for the first six days of the week mean simply first through sixth, and that "Sabbath" comes from the Hebrew word for "rest", not "seventh". Since the Old Testament tells us that God rested on the seventh day, the Jews (and some Christians) quite naturally observe their day of rest (their Sabbath) on the seventh day of the week; surely God's example should be a good thing to follow.

Since the word "remember" is used in the commandment, I surmise that it was an established tradition that was sometimes forgotten or ignored.

Note that the seven-day week wasn't restricted to Jews in pre-Christian times; at least the Romans used it. Where and when it started and how widely it was used, I don't know; I suppose that the obvious answer for "where" would be in the Garden

of Eden, and for "when" would be when God rested after Creation.

If I recall correctly, my catechism said "Remember to keep holy the Lord's Day." Anyway, keep in mind that these commandments are abbreviated (and translated, or perhaps mistranslated) forms of the full text of the Old Testament. Note that Christians generally consider the New Testament as superceding the Old Testament, so old rules could be replaced by new rules. From my reading of the Bible, it seems to me that God changed his policies quite a few times; for anyone who believes that Christ was God incarnate, surely Christ's authority overrides anything in the Old Testament. As the New Testament tells us that Christ's resurrection as well as the Holy Ghost's descent occurred on Sunday, many Christians (particularly Roman Catholics and most Protestants) consider Sunday to be the "Lord's Day", and thus the day of rest (the Sabbath). Surely many early Christians preferred not to honor the Jewish holy day. That doesn't mean that the first day of the week suddenly became the seventh day of the week, but rather that the holy (and rest, or Sabbath) day changed from the seventh day to the first day (for these Christians).

As far as I can determine, the traditional seven-day cycle of the week was unbroken for thousands of years, although of course various cultures used various names for the days of the week, and (many) Christians changed the day of rest from the seventh day to the first day, and for that matter, Muslims changed it to the sixth day, but with Sunday (or the equivalent in the various languages) still considered to be the first day of the week. As far as I can figure out, starting the week on Monday seems to be a relatively recent (20th century?) European innovation.

Anyway, in the U.S.A., calendars still show the week as starting on Sunday. Although in "planners" (such as Franklins), intended primarily for business use, "weekly" pages start with Monday, with smaller entries at the end for Saturday and Sunday, and both the "daily" and "weekly" pages show the ISO 8601 week of year number. That said, even in a Franklin planner, full monthly and yearly calendars show the week as starting on Sunday, and of course, the ISO 8601 week of year and day of week isn't often (ever?) used in the U.S.A.

So where does the week start on your calendar?

For that matter, do you ever use the ISO 8601 week of year and day of week numbers?

By the way, I'm trying to avoid starting any religious-based flame war here; I'm not saying that any particular religion is right or wrong. Still, religions have certainly influenced history, particularly the history of calendars.

James

> As far as I can figure out, starting the week on Monday seems to be

> a relatively recent (20th century?) European innovation

I think that if the reason really was to make Sunday the seventh day of the week to make it fit the Bible, then it sounds more like a 18th or 19th century thing, at the latest. Few 20th century Europeans would bother.

> Quote:
>
> So where does the week start on your calendar?

The week always starts on Monday here. Software that does not allow configuration of the start of the week is broken.

> Quote:
>
> For that matter, do you ever use the ISO 8601 week of year and day of week numbers?

ISO 8601 Week numbers are used a lot, for holiday planning and anything that references a specific week. There is not much reason to number the days in a week (except internally in software), they have names.

My Nokia supports weeks starting on Saturday, Sunday or Monday, and shows ISO week numbers if it starts on Sunday or Monday.

Yes, it is very interesting to discover the logic, to the extent there is any, behind the things we take for granted. It is very often based in religion.

in response to message #23 by Palmer O. Hanson, Jr.

Must be a part of the algorithm I'm unfamiliar with. Why wouldn't 4000 be a leap year, since it's divisible by 400?

Re: Watch out for Y2K

*Message #40 Posted by **James M. Prange (Michigan)** on 1 Oct 2005, 12:58 a.m.,*
in response to message #39 by Howard Owen

In the Gregorian calendar, a year divisible by 4 is a leap year, unless it's also divisable by 100, in which case it's not a leap year, unless it's also divisible by 400, in which case it's a leap year after all.

*Message #42 Posted by **James M. Prange (Michigan)** on 1 Oct 2005, 2:41 a.m.,*
in response to message #41 by Howard Owen

Sorry Howard, I guess that I got mixed up as to whom I meant to reply to.

By the way, I strongly suspect that what Palmer had in mind was a **proposed** additional rule, suggested by the famous astronomer John Herschel, that years divisible by 4000 not be leap years. This would change the average calendar year length from 365 97/400 days to 365 969/4000 days, and would be closer to the observed length of a tropical year, although still a trifle long. However, as far as I know, no church, government, or standards organization has ever officially adopted this rule; it's certainly not part of the Gregorian calendar.

Of course, with the leap seconds, years are (on average) slightly longer, and I suppose that leap seconds will be needed more frequently in the future, which would move the calendar even farther out of synchronization with the seasons, so maybe Herschel's proposed rule wouldn't be enough by the time the year 4000 gets here. But I've read that the U.S. has (unfortunately, IMO) proposed eliminating these adjustments to keep UTC in synch with astronomical time.

I think dealing with the leap seconds is enough for now; changes to the calendar rules can be left for future generations to deal with.

James

According to HP, there are 365.242198781 days per year.

Year length (was: Watch out for Y2K)

*Message #44 Posted by **James M. Prange (Michigan)** on 1 Oct 2005, 5:47 a.m.,*
in response to message #43 by Garth Wilson

Actually, at least in the 48/49 series, the units base for 1 year is 31556925.9747 seconds, but I don't know where they got that value from. Of course they equate 1 day to 86400 seconds, so they don't attempt to take leap seconds into account. So yes, 1_yr converts to 365.242198781_d in these calculators.

Anyway, a Gregorian calendar year, averaged over the 400 year cycle, is 365.2425 days. With Herschel's proposed change, averaged over the resulting 4000 year cycle, it would be 365.24225 days; still a little long.

Of course the Greek Orthodox calendar uses a different set of rules for exceptions to having a leap year every 4th year, which brings them a bit closer to the observed tropical year.

James

*Message #46 Posted by **Palmer O. Hanson, Jr.** on 1 Oct 2005, 9:47 p.m.,*
in response to message #42 by James M. Prange (Michigan)

I was relying on the following quotation from page 619 of Volume 4 of the 1969 version of *Encyclopedia Britannica*:

"... Later, a slight change was made in the Gregorian calendar to bring it still more closely into line with the tropical year. The Gregorian calendar was still in error by one day in 3,323 years and, in consequence, a further rule of intercalation has been adopted that makes the year 4000, 8000, etc., common years, i.e., years without an intercalated day. The calendar is now, therefore, correct to within one day in 20,000 years. ..."

Leap year rules (was: Watch out for Y2K)

*Message #47 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 12:50 a.m.,*
in response to message #46 by Palmer O. Hanson, Jr.

I'm surprised.

At least ISO 8601:2000 section 4.3.2.1 includes:

"The Gregorian calendar distinguishes common years with a duration of 365 calendar days and leap years with a duration of 366 calendar days. A leap year is a year whose year number is divisible by four an integral number of times. However, centennial years are not leap years unless they are divisible by four hundred an integral number of times."

Could it be that the *Encyclopedia Britannica* is mistaken?

That said, I haven't seen a copy of ISO 8601:2004, and don't feel like paying $101 for a copy of it.

James

Re: Leap year rules

*Message #49 Posted by **Howard Owen** on 2 Oct 2005, 2:14 a.m.,*
in response to message #48 by James M. Prange (Michigan)

This is all very interesting and enlightening. I've learned a whole lot more about calendars than I knew before this thread. One thing I did know was that leap-seconds aren't added for the purpose of correcting for the base error in the calendar the way additional leap-year days are. They are there to compensate for the slowing of Earth's rotation, and consequent lengthening of the day.

But what makes us look for an even multiple of 100 to correct an error whose period is 3,323 years? In other words, why not make the year 3323 a leap year, instead of 4000 or even 3200?

Edited: 2 Oct 2005, 2:15 a.m.

Re: Leap year rules

*Message #50 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 5:02 a.m.,*
in response to message #49 by Howard Owen

Yes, seconds are added (or dropped, though that hasn't occurred) to keep the clock very nearly in synch with Earth's varying rotation, not to keep the calendar in synch with the seasons.

However, a leap second does have the additional effect of lengthening the year, thus having a small effect on the discrepancy between the calendar and the seasons. After all, 86400 leap seconds would have the same effect on this as one extra leap year.

How many years will it take for 86400 leap seconds to accumulate? I don't know; I haven't researched that, but since tidal forces are slowing Earth's rotation, it seems reasonable to expect that leap seconds will be needed more frequently in the future. Unless, of course, we actually do stop using leap seconds and just allow astronomical time to drift farther and farther out of synch with clock time.

As for looking for an integer multiple of 100 instead of simply using multiples of 3323 to make additional corrections to the calendar, we'd want to (in addition to our current rules) drop a leap year around that time, not add one, so it would at least have to be a year that would be a leap year by the other rules. Clearly, the year 3323 is out; how about years that are integer multiple of 3324? At first, that seems to work, but how about the year 83100 (25*3324)? That wouldn't be a leap year by the current rules. Even just a multiple of 100 wouldn't suffice, as 3 out of 4 multiples of 100 aren't leap years by current rules. It seems to me that it would be best to use years that are multiples of 400 (always leap years by current rules), such as 3200 or 4000, for

any additional rule.

Of course, by the year 83100 (or even 3323, for that matter), who knows what kind of clock and calendar systems they'll be using? Will they remember an extra rule? (Recall the questions of whether the year 2000 would be a leap year.) How many leap seconds will have accumulated by then? Will they still be using a decimal number system, or will they have changed to, say, an octal or hexadecimal system for everyday counting by then? Will they feel bound by "the dead hand of the past"?

Maybe we'll just wait until the discrepancy between the calendar and the seasons is (averaged over a 400 year cycle) a whole day and then drop a leap year.

By the way, the Gregorian leap year rules are intended to keep the vernal equinox on or near March 21st, as it was at the time of the First Council of Nicea (A.D. 325), which determined that March 21st (regardless of the actual equinox) should be treated as the vernal equinox for Easter calculations, which explains Pope Gregory XIII's interest in the matter. More information on this can be found at http://www.newadvent.org/cathen/03168a.htm.

Of course, even though the calendar reform was for ecclesiastical purposes, keeping the calendar in synch with the seasons also serves a secular purpose.

Regards,
James

in response to message #50 by James M. Prange (Michigan)

Ok, folks, let's strive to reach the year 3323 at all!

Remember oil will be exhausted within the next 50 years. And there is the greenhouse effect leading to some more severe hurricanes and similar stuff.

Oh sorry, I forgot, according to the present administration there is no greenhouse effect! So there is a good (?) chance a well known superpower will start a war on this with the result there is no need for long range calendar corrections anymore.

Good luck! ((;-)

Re: Leap year rules

*Message #52 Posted by **James M. Prange (Michigan)** on 2 Oct 2005, 9:40 a.m.,*
in response to message #51 by Walter B

Hey, I'm pretty certain that I, personally, won't reach the year

3323.

Yes, there are certainly plenty of problems far more urgent than additional leap year reform to be solved. I think we can leave that issue for (hoped-for) generations far in the future to address.

Of course, I do rather wish that the silly ISO 8601 week of year numbers would be dropped; since a Gregorian calendar year never has an integer multiple of 7 days in it, there doesn't seem to be any good way to number the weeks of the year.

And since there seems to be very little chance that those cultures that start the week with Sunday will ever use the ISO day of week numbers starting with Monday as 1, they seem much more likely to cause confusion than to standardize usage

Regrds,
James

Re: Leap year rules

*Message #53 Posted by **don wallace** on 2 Oct 2005, 2:50 p.m., in response to message #51 by Walter B*

Hi all. Interesting thread.

NOTE: The following IS kinda o.t.: (but provided as a community service announcement of sorts)

Actually the permanent oil crisis is here now. Although many still aren't too aware (state of denial) and figures in the tens of years (50,100) are often seen, the data are scary, much closer than 50 years.

The (fatal?) impacts will probably arrive in an irreversible form within TEN years, maybe FIVE. Consider that running out of oil is not the problem, but the END OF CHEAP OIL is. See www.aspo.org

Maybe someone might like to do a quick simulation (on an hp calc of course) to predict economic collapse from incremental rise in oil prices (with resulting flow on effects into EVERY COMMODITY REQUIRING TRANSPORT). The modern economy is in fact very fragile and Bush and Cheney know it. So does John Howard and Tony Blair.

Of course, one (tried and tested) way to avoid collapse is to steal assetts / resources from other countries under a pretext. That action only staves off the end, of course. I saw a documentary called: End of Suburbia and can recommend it. Of course I have read extensively on this problem (only since april 2004). I am amazed how complacent most people still are about this problem.

All the best for the future everyone.

Don W

I think that if we were using a sidereal (star-based) calendar year, based on something like keeping the rising of a particular star near the ecliptic at a certain time on a particular day of the year, you'd have a very good point.

But in fact the Gregorian calendar is designed to keep the observed vernal equinoxes, on average, near March 21st, so

everything that's affected the timing of the vernal equinox is already included, to the extent that the vernal equinox actually does (on average) stay near March 21st.

Perhaps neither TI nor HP expected their products to last until the year 4000 A.C. :-)

Though the calendar is now that accurate, you'll be celebrating Christmas in the Summer, like we do down here, by the year 15,000 A.C. ... Will this be a problem?

Besides your post being enlighting, it helped me spot a mistake in my listing that would prevent the program to work correctly for some years ending in 00. (My hand-written listing on the Master Library was ok though). Thanks.

But, apart from battery problems and capacitors drying: Is the "plastic" body of a classic, woodstock, voyager, pioneer or 41/48/49 still all right in a few 100 years? Or even thousands? And what about the metal parts of the older calculators? And the platin and chips on it? How long could they last?

Anyone here with that material knowledge?

Assuming they are used, the ICs will eventually fail from electromigration of the metal layer. The time period depends on feature size and current density.

My guess is that plastic cases will become a problem. Some plastics become brittle with age. One of the prized items in my collection was a Speedee Add-a-matic (see the section of the museum on old calculators). Last spring I inadvertently knocked it off a table onto a terrazo floor. The plastic case shattered into about twenty pieces. The metal mechanism still works.

By comparison back in the early 1980's I inadvertently knocked my almost new Radio Shack Model 100 off the same table onto the same terrazo floor. There was a small crack in one corner of the case. Some of the keys came off and the batteries came out of the compartment. I put the batteries back in, pressed the keys back in place and the machine was able to complete the calculations that were in process. That machine still works today.

A "shock test" which illustrates how sturdy some of the hand-helds are when they are relatively new is the test of the oscillator described in the service manual for the TI-59. I'm not going to repeat that test today. Sorry about that! Who's going to do a drop test on his HP-35? I do have some old Sharps, Casios, and a number of spare TI-30's at my winter home. When I'm back there I just may have to do some drop tests.

I also have three of the Addometers (again, see the old calculator section) which were all metal and made by a typewrter manufacturer back in the 1920's. Two of the three work well. The third is somewhat rusty and the dials only turn with some difficulty.

A bad choice of metal can be a problem. The early Pickett slide rules used a magnesium alloy (I think) base. They often didn't move smoothly even when new but that problem can be solved these days with a little WD-40. Many of those now have the slide and frame fused together by corrosion. The late aluminum base devices have fewer problems.

"Though the calendar is now that accurate, you'll be celebrating Christmas in the Summer, like we do down here, by the year 15,000 A.C. ... Will this be a problem?"

Nope! It is, in fact, precisely the addition of leap years which KEEPS the seasons where they belong, due to the precession of the equinox. Us northerners will still have spring starting (about) March 21 and Christmas will still be in the winter.

What will happen in 13000 years (half of a precession cycle) is that the stars which you now think of as "winter" stars (again, for us northerners; perhaps better stated as "December" stars) will be instead the summer/June stars. i.e. the constellation Orion will be prominent on June/July evenings in the year 15000, rather then the December/January evenings when we see him now.

Another minor effect will be due to the ellipticity of the Earth's orbit. At this time, the Earth is closest to the Sun in early January. The effect on incoming solar energy is only a few percent, but this means that northern hemisphere winters are now somewhat warmer than they will be in 13000 years, when winter will be occuring when the Earth is farthest from the sun.

Leap seconds (or the alternative now being touted by some folks at the US Naval Observatory - officially charged with keeping track of time for the United States - of changing the rate of atomic time by about 20 parts per billion) keep the rotational position of the Earth aligned with the stars. I have to think a bit about whether the accumulated leap seconds affect leap years. The Earth is not only slowing down overall, but at the level of 10's of microseconds per day speeds up and slows down - somewhat at random but also with seasonal variations that basically relate to the fact that there is more land mass in the northern hemisphere than in the southern hemisphere.

This stuff is all very critical for very accurate (sub-centimeter) global geodesy. For more details on precise earth orientation and timekeeping, go to http://maia.usno.navy.mil .

I always thought the addition of leap years keeps the seasons in place because this makes the year closer to its actual length. But the seasons shifts due to the precession of the equinoxes would not be corrected by this method. Have I misunterstood anything?

Here is an excerpt of Isaac Asimos's "A choice of catastrophes":

"... In 12890 years, the [Earth's] axis shall turn to the opposite direction... ...and the Summers's Solstice [in the northern hemisphere] will be on December 21, and the Winter's Solstice on June 21..." (This is a bad translation back to English. The actual text should be somewhat different, but hopefully I may have kept the right meaning).

Don,

Precession can be viewed as the "sliding" of the celestial reference frame (right ascension and declination - "RA/Dec" in astronomer shorthand) which is tied to the Earth (basically projection of latitude and longitude onto the sky) along the ecliptic (the more-or-less plane of the planetary orbits).

If you think of the position of stars in an ecliptic coordinate system, they will not change with time. In the RA/Dec system, the star positions change continuously.

So yes, the RA/Dec of Orion will change, but Orion will still be in the ecliptic, as will ALL the ecliptic constellations (so beloved of astrologers (gack, I HATE that word!). The path of the Sun, as viewed from the Earth, will continue to circle around the ecliptic once per year.

Also, as I said earlier, leap years REALLY DO take care of the sliding of the seasons. The reason calendar reform was necessary was because the date March 21 was clearly no longer coinciding with the "beginning" of spring (defined as the day of the year on which the declination of the Sun is ZERO (i.e. the Sun was exactly on the celestial equator = Declination of the Sun is 0 degrees)). What was the problem: the length of the year was too short (as noted elsewhere in this discussion) if only 365 days were alloted to a year. So, leap years merely adjust the length of the year to match the actual time that the Earth takes to go around the Sun - with year here defined as the length of time from the beginning of one spring to the next spring. That's what our current calendar is based on - the spring-to-spring year.

If the date of the seasons was going to switch, we would have already seen the effect. This problem has been known, more or less, for several thousand years. That would be enough to switch the beginning of spring by a month (i.e. around a twelfth of the 26000 year precession period) - which has not happened.

So, (as long as we stick to the current calendar or some close approximation) Spring will continue to occur on March 21 for the forseeable future. In particular, for the next 13000 years.

For more on this, try

http://www-istp.gsfc.nasa.gov/stargaze/Sprecess.htm

My attempt to explain the "precession of the equinoxes", Milankovitch cycles, leap years...

But I'm not anastronomer; I wouldn't even consider myself an "amateur astronomer" (I don't even have a telescope). But I do find astronomy, calendars, and time-keeping interesting. Maybe I'm an "armchair astronomer"? Anyway, take the following with a few grains of salt.

First off, we have at least three major definitions of a year based on astronomy, in addition to the various calendar years.

A "tropical" year, the period of the seasons. For example, from vernal equinox to vernal equinox; our Gregorian calendar year is based on this.

A "sidereal" year, the period of the earth's revolution around the sun in relation to the "fixed stars", or equivalently, the apparent position of the sun against the starry background. Of course, the stars, galaxies, quasars, and so on are actually moving, but due to their immense distance from us, except for the nearest stars, any change in their apparent angular relationships as viewed from the earth is negligible. A sidereal year is about 20 minutes longer that a tropical year. Note that even the length of the sidereal year is changing, presumably due to transfers of angular momentum among the bodies of the solar system, "friction" with interplanetary gas and "dust", the affects of the solar wind, and so on. Everything in the universe affects everything else.

An "anomalistic" year, the period from the earth's perihelion (closest approach to the sun in its elliptical orbit) to its next perihelion. An anomalistic year is about 25 minutes longer that a tropical year, or 5 minutes longer than a sidereal year. This precession is due (at least mostly) to perturbations of our orbit from the major planets, particularly Jupiter and Saturn. The period of this precession (in relation to the fixed stars) seems to be about 114000 years. The eccentricity (how nearly a true circle the orbit is) is thought to vary too, with a period of about 95000 years.

The ecliptic is the plane of earth's orbit, so called because an eclipse of the sun or moon occurs when the moon crosses this plane very nearly at the new or full moon. Of course the sun, as viewed from the earth, always appears to be on the ecliptic. The constellations that appear to be on the ecliptic are called the zodiac. The sun, as viewed from the earth, appears to move through the zodiac once per sidereal year. As noted in another post, the ecliptic is very stable (at least in terms of human history), and except perhaps for some relatively nearby stars, so is the zodiac. Of course, when the sun evolves into a red giant, that will effect Earth's orbit, to put it mildly, but no one on Earth will be concerned with that. The moon's orbital plane around the earth is at an angle of about 5.1 degrees to the ecliptic. The orbital planes of the other planets, except Pluto, are near the ecliptic, ranging from about 0.8 degrees from the ecliptic for the orbital plane of Uranus to 7.0 degrees for Mercury's, so the planets also appear to be near the ecliptic. Even Pluto's orbital plane is only about 17.2 degrees from the ecliptic.

The celestial equator is the earth's equator projected into the sky. Of course the plane of the celestial equator is perpendicular to the earth's axis of rotation.

The celestial poles are the earth's axis of rotation projected into the sky. Currently, the north celestial pole is near Polaris (the North Star).

Currently, the planes of the ecliptic and celestial equator are at an angle of about 23.5 degrees, though that's thought to vary a few degrees with a period of about 41000 years.

An equinox occurs when the earth passes through the line of intersection of the planes of the ecliptic and the celestial equator.

Because the earth spins, it has an equatorial bulge. The sun's and moon's gravity pull on this bulge, one might say trying to pull it into alignment with a line from the sun to the moon, in effect, applying a torque to the earth's rotational axis. As anyone who's played with a gyroscope should recognize, the affect is to cause a precession of the earth's axis, causing it to sweep out a (more or less) cone in the sky, relative to the fixed stars. This precession has a period of about 26000 years, relative to the fixed stars. One effect is that Polaris is near the axis only periodically; the stars (as viewed from the northern hemisphere) won't always appear to

revolve around it. The celestial poles move in (more or less) circles in the sky. Since the plane of the celestial equator is perpendicular to the axis, as the axis precesses, this plane "wobbles" (for lack of a better term) in synch with it, and of course, this causes its line of intersection with the ecliptic plane to rotate one full turn for every period of the precession, and thus the equinoxes to move relative to the fixed stars, so the apparent position of the sun at the time of the vernal equinox moves through the zodiac once for every period of precession. Note that there are also smaller. faster, oscillations of the axis, known as nutations.

As noted above, the point of perihelion is precessing, and the combined effect of this precession with the precession of the equinoxes in the opposite direction is that the period of Earth's perihelion coinciding with the vernal equinox is about 21000 years.

Because the earth's orbital speed (like a comet's) is fastest at perihelion (currently about January 3rd) and slowest at aphelion (currently about July 5th) the length of the seasons vary too; currently shortest for (northern hemisphere) winter, with autumn longer, then spring, and summer longest.

We all know that the sun appears to revolve around the earth due to the earth's rotation, but actually, the sun's apparent daily motion across the sky is a combination of both the earth's rotation and its revolution around the sun.

After all, if the earth didn't rotate at all in relation to the fixed stars, the sun would appear to revolve around us once per sidereal year, in the direction opposite to what we're familiar with. As the earth is both closest to the sun and at its highest orbital speed at its perihelion, the sun's apparent motion from the earth's revolution around the sun would be fastest at perihelion.

A sidereal day, the period of Earth's rotation relative to the fixed stars, is about 3 minutes 56 seconds shorter than a mean solar day. The earth really rotates, relative to the stars, about 366-1/4 times per year, but Earth's revolution around the sun makes the sun appear to revolve around the earth only about 365-1/4 times per year, that is, the earth's revolution around the sun slows down the apparent motion of the sun around the earth.

Because the earth's orbital speed is fastest at perihelion, and the distance to the sun is shortest, the sun's overall apparent motion is slowest at perihelion, so a solar day (as from high noon to high noon) is longest near perihelion.

No doubt Earth's actual orbit is much more complicated than I've mentioned, but I think that I've covered the most important points.

The relationships of the above periodic motions are the bases of Milankovitch cycles, which may well have an affect on our climate, though they don't totally account for the apparent

climatological record.

To simplify timekeeping, we use a "mean solar day".

Of course now we no longer define a second as 1/86400 mean solar day, but rather define a second by atomic clocks, and a day as 86400 seconds, adding (or potentially dropping) a second occasionally as needed to keep UTC close to astronomical time.

As noted in another post, earth's rotation varies, and it's difficult to predict exactly how long a solar day will be. Before accurate timekeeping was available, a day was a solar day. Exactly how long was a solar day in Caesar's or Pope Gregory's time? At first glance, that would seem to be a good question for geophysicists, but maybe astronomers can have an important role in this. Because the earth's and moon's orbits are known, astronomers can determine when an eclipse occurred in the past. By looking at records of eclipses, some answers as to the exact date of some events can be found, even though various calendars were used. Astronomy can also tell us where a solar eclipse should have been visible from; comparing this with the historical record could give us information on the rotation of the earth. Of course, an astronomer may well respond "been there, done that".

Regarding leap years, to be pedantic, they're used simply because a tropical year, rather inconveniently, doesn't happen to be a whole number of days long.

Before Julius Caesar's reform, Roman years varied in length, typically with 355 days, with an extra month added to the year as needed to bring the calendar back close to the seasons. Sometimes, as in times of war, they neglected to add the extra month. Besides the rather irregular length of year, exactly when to add the extra month was subject to political/financial pressures, a rather unsatisfactory situation for many.

Of course now we change the dates of the "fiscal year" instead, and Michigan's government is currently shifting the dates of its "property tax year". Of course, they're not increasing the taxes, they're just having the counties collect taxes earlier every year for the next few years. Yeah, right....

Anyway, a fixed-length year would be an obvious solution the Romans' problems with the calendar, but a 366-day calendar year is too long, and a 365-day calendar year is too short. Having a "partial day" in every calendar year would seem rather inconvenient.

Julius Caesar's calendar reform came fairly close. The idea is to keep the average calendar year very nearly the same length as the average tropical year, while also keeping each calendar year a whole number of days long, and varying the length of the calendar year by only 1 day. Three calendar years of 365 days followed by one of 366 days, and repeating this cycle indefinitely, was an

elegant solution.

Unfortunately, with Julius Caesar already dead, his reform was apparently misunderstood to mean a leap year every three years, and this error was finally corrected by Caesar Augustus after 36 years.

Of course it would've been more "elegant" to distribute the days of the months something like the following:

Month number	normal year length	leap year length
1	30	30
2	31	31
3	30	30
4	31	31
5	30	30
6	31	31
7	30	30
8	31	31
9	30	30
10	31	31
11	30	30
12	30	31
total	365	366

and for that matter, start both month #1 and the year on (okay, near) the day of the vernal equinox.

Why the vernal equinox? Well, it's the beginning of spring, a season that seems to me symbolic of renewal (birds, bees, eggs, flowers, bunnies, etc.), and an equinox is fairly easily verifiable by rather simple astronomical observation, and thus a good time to start a new year. On the other hand, the solstices seem to me even more obvious (sunrise and sunset farthest south or north, sun at "high noon" farthest south or north relative to the zenith), so wouldn't be bad choices, although the changes in sunrise/sunset direction and the daily highest point of the sun are smallest near the solstices and greatest near the equinoxes.

Of course the year has actually started on various dates in various cultures.

But the Julian calendar was certainly a huge improvement from the previous Roman system. Besides, February is such a depressing month around here that I'm rather glad that it's the shortest of all.

Notably, under the Julian calendar, the vernal equinox was considered to be on the 21st of March, regardless of the actual astronomical date, and for the purpose of calculating the date of Easter, it still is by most western Christian churches, even with the Gregorian calendar. By Pope Gregory's time, it was evident that the average calendar year was too long, with an all too noticeable accumulated error of about 10 days in the date of the vernal equinox. Rather than totally discarding the existing leap year rules and starting over, they chose to modify them, dropping 3 out of every 100 leap years.

Of course they also dropped 10 calendar days, so 1582 had only 355 days, at least in the Vatican's reckoning.

In my opinion, it might've been simpler to just acknowledge that the vernal equinox was actually on a different date, and settle for the leap year modifications to keep it from drifting much farther. Maybe it would've been easier to get the rest of the world to go along with this? But this still would've changed the date of Easter, giving the Protestant churches yet another reason to condemn the Pope.

Of course other leap year rules, some arguably better, can be (and have been) devised, but for now, most of the world has adopted the Gregorian calendar, at least for most secular purposes.

Regards,
James

But after thinking a little more, I realize that this would've been a big problem for the liturgical calendar. The entire Easter cycle could occur as much as ten days earlier, and without changing the timing of the Christmas cycle, the Easter cycle could begin before the "time after Epiphany" (the last part of the Christmas cycle) had even begun. No wonder they chose to keep the vernal equinox on March 21st.

> Quote:

> Perhaps neither TI nor HP expected their products to last until the year 4000 A.C. :-)

"A.C."?

Indeed, the valid "system time" on the 48/49 series covers only a 100-year range. For the 48SX/S, 1989-01-01 through 2088-12-31, and for the 48G series and 49 series, 1991-01-01 through 2090-12-31. Attempting to set a date outside of these ranges results in an "Invalid Date" error. Setting a date and time just before the maximum and letting it tick up to midnight results in a warmstart, with WSLOG showing a "System time is corrupt" entry, and for the 48 series and 49G, the system time jumps back 100 years, but strangely enough, my 49g+ jumps back only to 2003-01-01. Trying CLKADJ to try adjust it out of range either earlier or later jumps it to these same times, but without causing a warmstart.

I find it interesting that they didn't move the range ahead a bit for the 49 series.

Apparently it's an "artificial" restriction; with the 52-bit clock at 8192 ticks per second, they could've made the range far larger. It turns out that a binary system time (as from TICKS) of #0 would correspond to exactly time 00:00:00 on 0000-01-01 in a proleptic Gregorian calendar, and a binary system time of #FFFFFFFFFFFF would be sometime in late January, 17421.

Maybe they simply chose the range so that TSTR would only have to use 2 digits for the year?

Similarly, the range of 1582-10-15 through 9999-12-31 for date arithmetic seems "artificial". It seems to me that, assuming a proleptic Gregorian calendar, the range could've been 0000-01-01 through 99999999-12-31. I'm not sure how much trouble it would've been to allow negative years, but if it were feasible at all, I suppose that they could've gone back to January 1st, -99999999.

But I doubt that they expected the calculators to still be in use even in 2088. They may well be surprised that the older models, or even the 48SX/S, are still in use even today.

But with the most recent models, I sometimes can't quite help suspecting that they designed in some planned obsolescence.

> Quote:
>
> Though the calendar is now that accurate, you'll be celebrating Christmas in the Summer, like we do down here, by the year 15,000 A.C.

Well, barring some major medical breakthroughs and several other near miraculous circumstances, I won't be around here then.

As others have pointed out, maybe it could be considered miraculous if

humans weren't in a long "dark age" by then, if not extinct.

Anyway, the way I figure, ignoring the effects of leap seconds, and assuming no adjustments other than the current Gregorian calendar rules were made, the seasons would occur only a bit less than 4 days earlier in the calendar year then, and I doubt that leap seconds would accumulate even a day's extra error in that time, so I suppose anyone living around here would be celebrating Christmas about 8 or 9 days after the winter solstice instead of about 4 days after it.

> Quote:
>
> ... Will this be a problem?

I rather doubt that the few days drift would be a problem, unless accusations of heresy for not celebrating Easter at the proper time become fashionable again.

Certainly it would be noticeable to astronomers, but I trust that they'd be able to deal with it.

As for celebrating Christmas in the summer, at least they wouldn't have to put up with freezing rain, sleet, and snow while trying to do last-minute Christmas shopping, and the Christmas decoration lights wouldn't be on for so long, thus saving energy. But the kids would be trying out their new bicycles immediately, instead of their new sleds.

Do Australians include artificial snowflakes, snowmen, and such in their Christmas decorations?

Well, I'm glad that it helped. I confess that I didn't even attempt to follow the programs posted. The only "True RPN" model that I have is thr 16C that I inherited, and though I did work through the examples in the manual and try a few variations, I haven't tried programming it since. The 16C is wonderful for working with binary though.

Regards,
James

Maybe your snowflakes and snowmen make it feel a little cooler? I suppose that many early "settlers" often wished they were back in Britain.

Regarding the pagan origins for Christmas, St. Valentine's day, Easter (at least the eggs and bunny associations), All Saints' Day, Thanksgiving, etc., I suppose that telling the pagans to quit having their festivals would have been a dismal failure; much easier to change them to (more or less) Christian festivals.

Around here, we really **need** something like Christmas to cheer us up around that time of year. Personally, I'd like a better celebration around Groundhog Day (February 2nd).

The kids colour hard-boiled eggs before Easter, so they know where those came from. The usual story is that the Easter Bunny takes them out of the refrigerator and hides them various places around the house the night before Easter, but I don't think any of them actually believe that. They know full well that the Easter candy is from Gramma and Grandpa. Some organizations hold Easter egg hunts for large groups of children, with chocolate eggs hidden outdoors, but I don't think anyone believes any story that the Easter Bunny left them.

Christmas is a different story though. I'm always amazed that most children actually do seem to believe in Santa Claus until they're about 7 years old. I don't remember ever believing in Santa Claus, any more than I believed in Donald Duck or Bugs Bunny. We did exchange presents of course, but no one pretended that Santa Claus was anything other than an amusing myth. Maybe my parents thought that Santa Claus was a bad idea for religious reasons, or maybe they thought that with with three older brothers and an older sister, I'd soon be told otherwise. I expect that their reasons were religious; Christmas and Easter always started with going to Mass, and the somewhat secular aspects were limited to a Christmas tree, lights, decorations, exchanging gifts on Christmas, and more elaborate dinners than usual, most of which had a religious explanation; these were very clearly "holy days" more than "holidays" in our home.

Regards,
James

I should have said AD (Anno Domini). As I know you use the abbreviation BC (Before Christ), I wrongly guessed you'd use also use AC (After Christ) as we do here.

About the dramatic seasons shifting as a consequence of the precession of the equinoxes, I was wrong as Dave Shaffer pointed out. By what I can see, contrary to what I thought, we are doomed to celebrating Christmas in the Summer for ever, a problem only for thousands of southern Santas that have work in Winter clothings under a tropical sun :-)

Regards,

Gerson.

A.C. (After Christ) is new to me, though I'm familiar with C.E. (Christian Era) and B.C.E. (Before Christian Era) for the proleptic Gregorian calendar. Incidentally, this is usually taken to have a year 0000, which is a leap year, so the same leap year rules apply for negative years.

For the Julian calendar, which doesn't have a year 0, A.D. and B.C seem to be the rule, but of course these have also been used for the Gregorian calendar. I suppose that C.E. and B.C.E. might by applied to the julian calendar too. I guess for dates before all western cultures adopted the Gregorian calendar (around 1750?), it's best to be specific about which calendar is meant.

For my niece's genealogical research, I think that "New Style" and "Old Style" dates have caused some apparent anomolies. Which date something occurred on depends on which calendar is used.

Regards,
James

Common Era

*Message #72 Posted by **Eric Smith** on 6 Oct 2005, 8:19 p.m.,*
in response to message #71 by James M. Prange (Michigan)

More generally referred to in non-religious context as Common Era (CE) and Before Common Era (BCE). See the Wikipedia article on the Common Era.

Re: Common Era

*Message #73 Posted by **James M. Prange (Michigan)** on 7 Oct 2005, 3:47 a.m.,*
in response to message #72 by Eric Smith

Okay, now that you mention it, I think I've also seen "Common Era", but the alternative of "Current Era" on that page makes more sense to me.

But if they wanted to get references to Christ out of the date, why didn't they choose some other epoch than the birth of Christ? Using that epoch makes the connection to Christianity extremely obvious.

And of course Gregory was a pope, so shouldn't we stop using the term "Gregorian calendar"? Perhaps ISO 8601 should change all occurences of "Gregorian calendar" to, for examples, "ISO calendar", "common calendar", or "current calendar"?

Like it or not, Christianity has had a real influence on history, including the epoch for our calendar.

Not that I feel that a calendar for secular purposes particularly should have religious references, but since it already does, I don't see any good reason to change that.

James

The problem is that A.D. stands for Anno Domini, "Year of our Lord". For a huge number of people, Jesus isn't "our Lord".

Yes, obviously, but few would seriously doubt that Jesus Christ was a very real historical person. Even

those who might think that the New Testament were completely fictitious wouldn't dispute the historical reality of Christianity, hence my mistake that "C.E." stood for "Christian Era". After all, whoever came up with "C.E." and "B.C.E." didn't choose to base a calendar on a new epoch that had nothing to do with Christianity.

So that they wouldn't have to change the dates of everything.

The epoch of the Gregorian calendar (and the Julian calendar) isn't really the birth of Christ anyhow; scholars seem to think that happened some time around 4 or 5 BCE.

So it seems to me that they weren't really very serious about removing any religious references from the calendar. Obviously, "A.D." (Anno Domini, Year of the Lord), would seem very inappropriate to non-christians, but I don't see why anyone would object to, for example, "Christian Era".

> Quote:

> Christ anyhow; scholars seem to think that happened some time around 4 or 5 BCE.

Yes, there's very good reason to believe that the birth of Jesus of Nazareth actually occurred a few years before our calendar would seem to indicate. However, the particular scholar (Dionysius Exiguus) whose work the epoch is based on, apparently believed that Jesus turned 1 year old in 754 A.U.C., so he established that as the year 1 A.D. How certain he was, I don't know.

> Quote:
>
> By the way, I strongly suspect that what Palmer had in mind was a proposed additional rule, suggested by the famous astronomer John Herschel, that years divisible by 4000 not be leap years.

The current Gregorian calendar is slow by 25.92 seconds/year (much better than the 11 1/2 minutes of the Julian calendar!); the Y4K proposal makes it slow by 4.32 seconds/year. However, that means that there will be a Y20K problem.

Note too that the Eastern Orthodox church in 1923 proposed an alternative rule to correct the leap year problem in the Julian calendar. In their system, century years modulo 900 must have a value of 200 or 600 to be considered a leap year. This first year of divergence is in 2800, where the Gregorian calendar has a leap year but the Orthodox calendar does not until 2900.

The Orthodox calendar is slow by 1.91 seconds/year, so their day of reckoning doesn't happen until Y45K.

An additional problem is that the end of the current interglacial period (*not* "the next ice age" since we're in the middle of an ice age now!) is due around Y25K and may cause further perturbations on the Earth's rotation and revolution.

re: "An additional problem is that the end of the current interglacial period (not "the next ice age" since we're in the middle of an ice age now!) is due around Y25K and may cause further perturbations on the Earth's rotation and revolution."

As I try to make the difference when I teach Astronomy 101, "rotation" is the turning of the Earth on its axis, whereas "revolution" is the orbital motion of the

Earth around the Sun.

So, while a new ice age may well affect the rotation rate of the Earth (due to changes in the moment of inertia of an ice-clad Earth) it WILL NOT affect the revolution (i.e. the orbital period).

Sorry to be so technical, but when among geeks and nerds, we should make sure we have it right!!

Note that I said "the end of the current interglacial period" and not "the return of the glaciers." The latter is one aspect of the former. Consider the possibility that ice ages and interglacial periods are caused by something that also impacts the revolution of the Earth.

That's what I meant when I said "rotation and revolution". Rotation can be affected by the ice, whereas revolution *and* ice could be affected by some common external cause.

This is all speculation, of course.

Re: Watch out for Y2K

*Message #81 Posted by **James M. Prange (Michigan)** on 5 Oct 2005, 10:43 p.m.,*
in response to message #78 by blurdybloop

My impression is that the additional rule was actually adopted by the Greek Orthodox church, and also that for Russia (and I suppose maybe some others), this is the official calendar. I hope that everyone will agree on a uniform civil calendar before the Gregorian and Orthodox calendars get out of synch in 2800.

I wouldn't expect lunar calendars for religious and traditional uses to be abandoned though.

Regarding ice ages, land in many northern (and southern?) regions is still rebounding from the last big melt-off, so mass is being redistributed closer to Earth's axis. I'd expect this "glacial rebound" to tend to speed up the earth's rotation, opposing tidal braking's slowing of it. Then too, glaciers at all latitudes seem to be shrinking currently, which surely has some effect on the distribution of Earth's mass.

What happens if (when?) the ice caps on Greenland and Antarctica melt or slide into the ocean? I suppose for one thing, for most people, whether the vernal equinox falls very near March 21st will be among the least of their problems.

Of course the distribution of inland water varies, largely due to human engineering. Ocean and atmospheric currents (and their portion of the angular momentum) vary, and the distribution of mass in the oceans and atmosphere varies (El Nino and so on).

I've read that Earth's core rotates at a different rate than its crust, and the "slippage" probably varies, thus changing the distribution of angular momentum.

Quite a lot of things affect the distribution of Earth's angular momentum, and the rotation has to change to conserve total angular momentum. Well, of course in the case of tidal braking and the moon moving farther out, it's the angular momentum of the Earth-Moon system that's being conserved. As it seems difficult to predict the exact distribution of angular momentum of, it's also difficult to predict the exact rotation.

But all of the above affects Earth's rotation (its day length), not it's revolution (year length). They would be relevant for leap seconds (or occasionally dropping a second) or redefining a second to make 86400 seconds closer to 1 mean solar day.

To the extent that the average length of a day varies, the number of such days in a year must vary too.

To affect the revolution, we need something outside of the Earth-Moon system, such as perturbations from other planets, or perhaps the solar wind or impact with extra-planetary "dust". My understanding is that it's perturbation from the major planets that causes the precession of Earth's perihelion (no, this isn't the same as the "precession of the equinoxes").

Regards,
James

Hence my reference to the Earth's revolution; as we are not certain what causes ice ages, we need to consider the possibility that it is due to something external to the Earth-Moon system.

Cleaning a HP 48GX: Can I dip it in a solvent to clean?

*Message #1 Posted by **David** on 28 Sept 2005, 12:42 p.m.*

I have a HP 48 GX that I've not used particularly hard. The on key is variable in its function. I blew some air into the key area and have noted improvement with the function of the key...so was wondering if dust could be the culprit...if so...what is the best way to clean below the keys...can I dip the calculator in a solvent...batteries out of course...or does this require only compressed air.

Thanks, David

Re: Cleaning a HP 48GX: Can I dip it in a solvent to clean?

*Message #2 Posted by **I, Claudius** on 29 Sept 2005, 9:37 a.m.,*
in response to message #1 by David

No solvents except distilled water! And that only after you've removed the batteries for at least a week to let the capacitor discharge. You will then have to wait several days for it to dry out. As for using compressed air, those little cans shouldn't hurt, but don't use true shop-type compressor air, it's way too powerful.

Last but not least, the cost of replacing your 48 is going up. eBay prices range about $300-$400, and Samson Cables now wants $999 for new-in-box old stock units. Just before the first HP49 came out, prices for a 48 dipped to about $100 at my old college bookstore...

Re: Cleaning a HP 48GX: Can I dip it in a solvent to clean?

*Message #3 Posted by **David Zane** on 29 Sept 2005, 11:52 a.m.,*
in response to message #2 by I, Claudius

I wonder that I shouldn't just let the calculator discharge...when I whack it on the side in the palm of my hand...the ON button works...so I've considered some kind of static charge...or electrical issue...as well as dust. The ON button is working about 90% of the time after applying compressed air...I can always get it to turn on...it just takes more than one time occassionally.

I have seen a link to fixit.com...but for $78 dollars, I'd chip in the extra $50 to get the newest model...I'm not a collector.

Thanks for your help, David

Re: Cleaning a HP 48GX: Can I dip it in a solvent to clean?

*Message #4 Posted by **I, Claudius** on 30 Sept 2005, 2:53 p.m.,*
in response to message #3 by David Zane

Getting the new machine might be your best bet. The new HP49+ with serial numbers beyond CNA515... with ROM version 2.0 seem to be OK. The software of the 49 is far and away more powerful than the old 48. The computer algebra system, while not Mathematica, is darn good for a handheld. The new CPU seems like lightspeed compared the 48, which was quite slow for certain

operations. If you do get a dud, HP seems to be good at warranty exchanges. Best of luck.

Re: Cleaning a HP 48GX: Can I dip it in a solvent to clean?

*Message #5 Posted by **Hugh Evans** on 29 Sept 2005, 9:19 p.m.,*
in response to message #2 by I, Claudius

Agreed, solvents are not what's needed here. But I could see some advantage to using a mild detergent soak followed by several rinses in DI. Carrying this all out in a sonicator might also help. If you have an oven with a "warm" setting, 90°F or so (verify this with a thermometer), you could let it air out for several hours.

Caps won't cause you any trouble as they will discharge during the process. If you're feeling paranoid you could discharge them with a piece of hookup wire, paperclip, etc.

Best of luck,

HDE

Re: Cleaning a HP 48GX: Can I dip it in a solvent to clean?

*Message #6 Posted by **Brian** on 29 Sept 2005, 11:57 a.m.,*
in response to message #1 by David

A common problem, similar to your description, with the HP 48 has to do with an internal intermittant connection. Try putting some light pressure between the display and the softkey 'C' prior to depressing the 'ON' key. If this improves the situation, I have noticed someone claiming to be able to permanently repair that problem.

Good luck,

Brian

Re: Cleaning a HP 48GX: Can I dip it in a solvent to clean?

*Message #7 Posted by **don wallace** on 3 Oct 2005, 2:47 a.m.,*
in response to message #1 by David

Hi David,

I would (very strongly) advise against a "bath" in anything!

At some risk to the feel of the keys on some hp calcs (e.g. 41) you can use CRC brand "Contact Cleaner" in minimal amounts.

It is very gentle but used on the older hp calcs like the 41 the keys lose their tactile feedback quality when the spray is applied. As the plastic components "dry out" (rapidly!) some of this tactile feedback characteristic recovers. At least the keys then operate! They feel a little spongy, though and don't make a clicking sound. A small price to pay for a functional keyboard.

Never use any detergents at all (!). If you want to run a small *risk and use ultrasonic cleaning in a fluid (I don't have access to such exotic stuff!) the only liquid to use is isopropyl alcohol. Distilled water sounds okay, but metal can be induced to oxidize. At least isopropanol is as inert as you are going to get.

*If liquid permeates between the LCD interconnects to a PCB, then often you will lose the display (connections).

For What Its Worth...

DW

HP-97 Printer Paper Advance

*Message #1 Posted by **Mike DiGirolamo** on 28 Sept 2005, 7:57 a.m.*

When printing, my HP-97 sometimes doesn't fully advance the paper which results in an overlapping of print lines. Can someone tell me what's wrong and how to fix this problem? Is it a clutch, lube or ?? problem?

Thanks - Mike

Re: HP-97 Printer Paper Advance

*Message #2 Posted by **Katie Wasserman** on 28 Sept 2005, 9:24 a.m.,*
in response to message #1 by Mike DiGirolamo

There are several things that can cause this that I've come across:

- The little rubber (soft plastic of some type, actually) drive rollers on the extreme right and left side of the paper advance bar are dirty.

- The springs that push this bar against the paper are week.

- A bad idler gear (the middle of the three drive gears).

- Bad paper -- old paper seems to slip more often for some reason.

- There's excess friction in the paper path -- something else is dirty in there.

Re: HP-97 Printer Paper Advance

*Message #3 Posted by **David Smith** on 28 Sept 2005, 3:38 p.m.,*
in response to message #1 by Mike DiGirolamo

The usual cause is flat spots on the printer rollers. These are caused by not using the printer. The rollers are constantly pushed against the platen rollers which causes a flat spot on the rubber. This shows up as a hiccup every four lines (assuming the paper moves at all). Mint-in-box never used machines are almost always severly affected.

Cures: 1) Clean the rollers and printer mechanism. If you can find it, apply some rubber belt conditioner to the rollers (like slot car tire traction liquid or MG Chemicals sells somthing called Rubber ReNew. These are usually sodium salicylate based solvents that disolve rubber and make it tacky).

2) Clamp a large paper clamp to the end of the roll of paper, hang it over the edge of a table, print some long listings.

3) If this does not get things working you can try removing the printer drive cam and sanding the rollers round again. Removing the drive cam and reinstalling it is not for the mechaincally challenged. You have to remove and reinstall the printhead... klutzes will crack their heads.

4) If this does not work replace the drive cam with one from the HP41 82143A printer.

Re: HP-97 Printer Paper Advance

*Message #4 Posted by **Tony Duell** on 28 Sept 2005, 3:47 p.m.,*
in response to message #3 by David Smith

If the problem is caused by the pressure of the rear rollers against the rubber drive rollers, would it be worth unhooking the 2 little tension springs at the sides of the printer in any machine that you're going to store rather than use? It's easy enough to do, and a Topcat can be opened without disturbing any labels (for those who care about such things).

Re: HP-97 Printer Paper Advance

*Message #5 Posted by **Tony Duell** on 28 Sept 2005, 3:45 p.m.,*
in response to message #1 by Mike DiGirolamo

I've fixed several machines with this problem, and every time it's been a problem with the actual rubber rollers. Unlike the one in the card reader, I've yet to have one turn to goo, thankfully.

The main problem is getting the roller assembly out. I would seriously recomend getting the service manual that's on the MoHPC CD-ROMs. Then :

Take out the battery, take off the bottom cover (6 screws), slide out the printer paper window, take out the 3 screws, washers, and grommets that hold the printer in place. Unplug the printer PCB from the logic PCB and take the whole lot out.

Unplug the 6 single wires from the PCB, noting their positions (2 white -- home position reed swtich, 2 red -- out-of-paper contact, red and black -- motor). It's difficult to unplug the printhead tapewire from the PCB without damaging it -- one trick that helps is to push a couple of old magnetic cards between the tapewire and the socket connects, then pull the wire out. If you're not happy doing that, leave the printhead connected to the PCB.

Undo the 2 screws holding the metal 'tab' clamp that holds the printhead in place. Slide out the printhead (with the PCB still attached if you've not disconnected it). When reassembling, make sure the printhead is properly seated before fitting the clamp, and tighten the screws carefully and evenly. There is a real risk of cracking the ceramic head if you're not careful.

Mark the position of the home switch, take out the screws and take it off. Take out the 3 screws holding the motor in place and remove that. Take off the E-circlip and remove the idler gear.

Take off the E-circlip and the gear on the end of the leadscrew. Turn the leadscrew to move the carriage away from the RHS of the frame, then press on the leadscrew to force out the RH leadscrew bearing. Slide the carriage and leadscrew towards the right, Push the LH leadscrew bearing to the right (into the frame) and remove that too. Then 'unscrew' the leadscrew from the carriage and remove it through the left side of the printer frame.

Remove the 2 E-clips on the carriage rails _inside the frame_. Take out the rails and remove the carriage. Notice how the ridge on the paper feed roller fits into the carriage. The platten strip will probably fall out at this point.

Unhook the tension springs on the sides of the printer that pull the paper feed pressure shaft forwards. You can now push the feed assembly rearwards and unclip it from the slots at the side.

I've found that carefully rubbing the rubber tyres with 1000-grit wet-n-dry paper (used dry) will greatly

improve their grip.

When reassembling, put a smear of plastic grease on the leadscrew, and a bit of dry-film (teflon) lubricant on the carriage rails, the idler gear spindle and the gear teeth.

Another Topcat printer comment

*Message #6 Posted by **Tony Duell** on 28 Sept 2005, 3:54 p.m.,*
in response to message #1 by Mike DiGirolamo

There's a printer feature of topcat models that might cause you to spend a couple of hours looking for a non-existant fault. If you use the printer paper feed button _without paper loaded_, the head will go back and forth as it should do, but it will not be correctly braked when you release the button. It will just coast to a stop, and will not necessarily stop at the right position.

I spent a bit of time looking at the printer schematics and testing transistors (this is made harder by 2 facts, firstly the drive signals go straight from the PIK chip to the bases of transistors, so there's almost no voltage change there to check with a logic analyser, and secondly, the HP schematic doesn't show how the transistors in the 3 quad transistor arrays are allocated. I have my own schematic that does (on the HPCC CD-ROM), but...)

Only after a lot of thought did I realise that the way the out-of-paper circuit works (it grounds the FWD line, preventing the head from moving forward, if printer is out of paper and the feed button is not pressed) would also affect the brake circuit.

Disconnecting one of the red wires from the out-of-paper contact to the printer PCB proved the point. As did putting some paper in the thing.

Why would you want to replace the circuit board (unless it was physically missing)? There are no custom components on it, you can get a schematic on the HPCC CD-ROM.

The most common failure, of course, is the 5A picofuse between the battery and the output socket.

If you have problems getting the right 'block battery', 3 2.5Ah Cyclon cells (2V lead acid) in series fit the case perfectly.

in response to message #1 by Gileno

Hi, Gileno;

I found a "Made in Brazil" lead acid that fits fine in the 9114B battery pack. It is a 6V/2800mAh (yeap, .4Ah +). I'll add pictures later, so you can check the model # and order it, if so. It cost me R$22,00 (Not so expensive, ahn? Not US$, R$).

Best regards.

Luiz

in response to message #5 by Vieira, L. C. (Brazil)

I am waiting. Thank you very much! ! ! !

Small correction (was: HP 9114B Batteries. Help !!!!)

*Message #7 Posted by **Vieira, L. C. (Brazil)** on 27 Sept 2005, 8:21 p.m.,*
in response to message #6 by Gileno

Hi Gileno, guys;

the sealed battery is a UNIPOWER, and it is actually made in China (sorry) and I confused the origin because it has all specs printed in Portuguese.

I´ll add identification and photos later (not home yet).

Cheers.

Luiz (Brazil)

Small correction (was: HP 9114B Batteries. Help !!!!)

*Message #8 Posted by **Gileno** on 27 Sept 2005, 8:59 p.m.,*
in response to message #7 by Vieira, L. C. (Brazil)

Can you supply myself the data of the battery the site or address that you bought?

Replacement batts (was: HP 9114B Batteries. Help !!!!)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 28 Sept 2005, 2:48 a.m.,*
in response to message #1 by Gileno

Hi Gileno, guys;

these are the pictures I got: (click any to enlarge)

http://www.logeng.com.br/images/unipower_02_short.jpg
http://www.logeng.com.br/images/unipower_04_short.jpg
http://www.logeng.com.br/images/unipower_06(stick)short.jpg

Specs are visible and readable, though. Unipower battery ID is UP628. The National LCR6V2.4P is the one that came with the 9114B I have (thanks, D.M.). Physical dimensions for UP628 match LCR6V2.4P except for the largest dimension: UP628 case is about 2mm `taller`. UP628 contacts are also in different orientation and position, so I had to solder another wire for negative terminal. Anyway, it fits fine in original 88014B (battery pack).

Gileno, if you do not find it in local suppliers, let me know. Mine was brought from Sao Paulo, and I do not know the original supplier address, only the local supplier. If you do not succeed finding it, let me know.

Cheers.

Luiz

Off Topic: HP-9816

*Message #1 Posted by **Howard Owen** on 27 Sept 2005, 1:02 p.m.*

Apologies for mentioning the definitely-not-a-calculator 9816. I've recently acquired one, and this community is the closest I could find to ask questions of. I've been unable to find th items below on the web or on USENET.

I'm looking for manuals for my 9816. Specifically, I'm looking for pinouts of the serial connector, or even a source for an adapter to standard RS232. I have RMB 2.0 on two floppies, but no documentation, so I'm looking for pointers to manuals. Finally, I have a nearly complete Pascal 2.1 disk and manual set. I say "nearly complete" because I can't locate the INTERFACE library module needed to reconfigure the system (to compile CTABLE.PAS.)

Hopefully that is brief and to the point. Thank you for tolerating this digression from the normal flow of the forum. 8)

in response to message #2 by Vassilis Prevelakis

Vassilis, you are a digital pack rat after my own heart! Thanks for pulling another obscure piece of documentation out of your archive! There's lots of other useful information in that little manual too. Thanks again!

Don, I try not to think of how old *I* am. I just concentrate on the old machine. What I really love about this hobby are two things. First, there's combining my memory of a machine I used "back in the day" with whatever I (or helpful folks like Vassilis and yourself) can dig up on the Internet or our root cellars, plus whatever I can discover using my lifetime's experience with systems in playing with the actual device today. This crosses so many areas I find pleasurable in my life, that I sometimes don't have time to get to the second thing I really love: making these old machines talk to my modern machines and networks. I have 7 Linux boxes up and running on my home network, not counting laptops, PDA or Windows boxes. This is my laboratory for work, and my primary playground. If I can get my former life talking to my present life why, I'm peculiarly delighted! 8)

Now if only someone could pull a set of RMB 2.0 manuals out of some dark and musty corner.

hp 41c battery pack rebuild

*Message #1 Posted by **Hal** on 27 Sept 2005, 3:09 a.m.*

Hi, I've just acquired a 41c which needs the batery pack rebuilt, and was wondering if someone could share a little of their expertise / experience here in this forum. My questions are as follows: 1. What's the best way to get the battery pack apart...does it snap apart or is it glued?

2. What voltage does a working battery pack supply to the calculator? (looks like 5v to 6v from the configuration)

3. Since the wall adapter output is 8vac, am I correct in assuming that there is a rectifier built into the battery pack?

4. Whats with the center contact in the battery compartment...does it tap off an intermediate voltage or something?

Any and all information very much appreciated. Thanks, Hal

Re: hp 41c battery pack rebuild

*Message #2 Posted by **Etienne Victoria** on 27 Sept 2005, 4:49 a.m.,*
in response to message #1 by Hal

Hi!

1. It is seamed & does not snap apart: I use an Xacto Blade (or cutter for Europeans) to cut it apart cleanly, taking care not to break it.

2. Normal spec is 4x1.2V=4.8V which is enough. Up to 5 or 6V is not a problem as alcalines provide 6V anyway. I get 5V steady with my 4x 1/3 AA rebuit accupack.

3. Yep...with beautiful tiny fragile standard diodes.

4. Nein, it just links the 2 middle batteries. It is useless with a rebuilt rechargeable battery pack.

Small cells like 1/2N are hard to get. Therefore, you can use 1/3AAA for your first try but won't get a great capacity with these. When you get more practise, you can use 4x1/3AA which give you much more capacity but require careful grinding & sanding the accupack inside to give more room.

Friendly regards from France.

Etienne

Thanks very much for the information. I think I can find the little N cells. If I have any problems, I'll post another message. Best regards from Idaho (Northwestern US). Hal

Re: hp 41c battery pack rebuild

*Message #4 Posted by **Etienne Victoria** on 27 Sept 2005, 2:59 p.m.,*
in response to message #3 by Hal

Yes Hal, I'm pretty sure you can find N cells quite easily.

However, those are too big to fit in the rechargeable pack. They can just serve as substitute for the dead-expensive N alcaline batteries in the **non rechargeable** battery container.

To recell the rechargeable pack, you'll want 4x **1/2 N cells** which in my opinion are not found so easily at least here in Europe.

That's why I was advising 1/3 AAA or 1/3 AA+hard work.

Have a nice day!

*Message #7 Posted by **Etienne Victoria** on 28 Sept 2005, 12:46 p.m.,*
in response to message #5 by Jon

Hello Jon & all!

As requested, I propose a few pics of an Hp-41 battery pack recelled with **1/3 AA** :

Hp-41C battery pack recelled with 1/3 AA

Just click "Start slideshow" to get bigger pictures.

Sorry for the lack of aesthetics but it's the 1st one I did...the others are gone to other Hp 41!

In a few days, I'll try to post a step by step description on the recelling when I can get new dead packs.

I intend also to refit an inexpensive **alkaline J-type battery** & will post the pics if I succeed.

The best solution till now for me is indeed the **1/3 AA** cell for it's increased capacity.

Friendly regards from France!

Etienne

Edited: 28 Sept 2005, 12:47 p.m.

Re: hp 41c battery pack rebuild with 1/3AA

*Message #8 Posted by **Jon** on 28 Sept 2005, 4:39 p.m.,*
in response to message #7 by Etienne Victoria

Hi Claudio & Etienne

There isn´t any problem to charge the cells with the standar charger. It works fine. These cells have higher capacity (150mAh) than originals. So it is more difficult to overcharge them. If you take care to wait until the calculator shows BAT to recharge, you won´t have problems. I can send photographs to your email if needed.

The final aesthetic result is very good but capacity of the cells is, of course, lower than Etiennes pack. Etienne, just wondering if the contact is good when you insert the pack or you have to adjust it each time...

I have also succed using 2/3AAA NiMH cells (300mAh) with an standar alcaline holder. I found a plastic 12/10mm pipe that increases the diameter so the final dimensions are the same as N cells (28mm x 12mm). But you have to charge them outside . There are chargers for that (MAHA,...)

Regards

Jon

Re: hp 41c battery pack rebuild with 1/3AA

*Message #9 Posted by **Etienne Victoria** on 28 Sept 2005, 6:39 p.m.,*
in response to message #8 by Jon

Hi Jon,

Thank you for your tips!

On the recelled battery packs, I put the original metal contacts from the Hp pack.

Therefore the look & contact quality are the same, I do not have to reajust anything and the calc looks the same as normal.

The recelled pack is NOT thicker as the original because of the 2 hours spent grinding & sanding the inside.

You cannot see these original contacts on my pictures because....I've lost them when rebuilding my first pack!!!

Sorry, the next recelling "J-type" or 1/3AA will be more beautiful I hope!

Cheers!

Etienne

So Eric, what's with the new hardware?

*Message #1 Posted by **Howard Owen** on 26 Sept 2005, 11:31 p.m.*

Looking over the HHC 2005 conference notes, I see where you demonstrated some hardware running your simulator code. (I will leave the debate over whether this then would constitute an "emulator" or not to others.) I recall threads here discussing using an HP-97 as the "user interface" for a souped-up modern calculator, including the ability to run nonpareil, but I thought it was just theoretical. Now I know you had this project up your sleeve the whole time. 8)

So, when are you going to cut the rest of us in on the details?

Re: So Eric, what's with the new hardware?

*Message #2 Posted by **Howard Owen** on 27 Sept 2005, 1:51 a.m.,*
in response to message #1 by Howard Owen

The photos of a device with key actuators being fitted with an HP-41 faceplate look intriguing. Is that your hardware? Sort of KML in the flesh? Cool!

Re: So Eric, what's with the new hardware?

*Message #3 Posted by **Eric Smith** on 27 Sept 2005, 12:19 p.m.,*
in response to message #1 by Howard Owen

I need to send an updated paper by Richard Ottosen on the hardware to Ron Johnson for the conference CD proceedings, if it's not too late. I'll make the paper available on my web site as well.

The current hardware uses a PIC18F6680 microcontroller. This has 64KB of flash memory and 3328 bytes of RAM. We added a 256KB serial flash chip for storage of application module code, and a 2KB serial FRAM for the user registers. There's also an SD card slot, a serial port, and an LED to drive an IR printer.

The case is made of many layers of thin plexiglass laser-cut and laminated together. There are 39 tact switches (buttons with integrated snap discs) arranged in an HP-41 layout. Rather than using keys to press the switches, there is an overlay which slides into the calculator.

The firmware wasn't working in time to be demonstrated at the conference, so only a simple hardware test program was shown. The real firmware will simulate Woodstock and Spice series calculators as well as the HP-41. The code is hand-written assembly, not Nonpareil.

The HP-41 firmware running on this hardware will be slightly faster than a real HP-41. We were more concerned with battery life than speed.

Re: So Eric, what's with the new hardware?

*Message #4 Posted by **Gene Wright** on 27 Sept 2005, 12:21 p.m.,*
in response to message #3 by Eric Smith

And, I'm still on the list to buy one...good looking case or not.

I'd be hopeful that other calculators could be emulated...like an HP67? ? :-)

Re: So Eric, what's with the new hardware?

*Message #5 Posted by **Eric Smith** on 27 Sept 2005, 1:19 p.m.,*
in response to message #4 by Gene Wright

> Quote:
>
> I'd be hopeful that other calculators could be emulated...like an HP67?

There are two issues with that:

1. Currently I don't understand how a subtlety of pointer wraparound works on the Woodstock CPU, so the 19C, 29C, 67, and 97 get stuck in a loop whenever they search for a label. I need to build a ROM emulator to hook up in place of the HP ROMs to run my own test code.
2. I haven't figured out how the card read instructions work.

Once these problems are solved, it should run fine on the new hardware.

Re: So Eric, what's with the new hardware?

*Message #6 Posted by **Gene Wright** on 27 Sept 2005, 1:24 p.m.,*
in response to message #5 by Eric Smith

And, the card reader instructions (at least, read/write) would be nice to point to files on the SD card. :-)

If we have to sacrifice some of the other uses of card instructions (merge comes to mind), to be able to play with an HP67 in all other ways, I could easily live with that. :-)

Re: So Eric, what's with the new hardware?

*Message #7 Posted by **Bernhard** on 27 Sept 2005, 4:26 p.m.,*
in response to message #5 by Eric Smith

Why don't you ask me to give you the schematics of my ROM emulator ?

regards, Bernhard

Re: So Eric, what's with the new hardware?

*Message #8 Posted by **Howard Owen** on 27 Sept 2005, 12:45 p.m.,*
in response to message #3 by Eric Smith

Coool!

So the photos in Richard Nelson's conference report *are* of the new machine! So the 256K serial FRAM is for modules, there's 2K for registers (291, by my count) and 3328 bytes of RAM for user programs. So what is the SD slot for? I note there are two lines in the LCD. Alpha and X? X and Y? Selectable? What does the serial support look like on the calculator side? Is there a meta OS in the 64K?

This is pretty damned exciting stuff!

Re: So Eric, what's with the new hardware?

*Message #9 Posted by **Eric Smith** on 27 Sept 2005, 1:15 p.m.,*
in response to message #8 by Howard Owen

The 256KB of serial flash is for storage of calculator microcode (though some will be in the PIC's internal flash) and application module (ROM) images.

My previous posting was incorrect; the FRAM is 8KB, which allows for the full addressable register address space of the 41 (1024 registers), though unless I modify the microcode it will have the same effective capacity as the 41CX with two extended memory modules.

Future units may use a 32KB FRAM; we weren't able to obtain any in that capacity when we ordered the components. Modified extended function module microcode might allow for the equivalent of an extra twelve extended memory modules, for a total of 3459 usable registers of extended memory.

The SD slot is for mass storage. The intention is to write a compatible replacement for the mass storage functions of the HP-IL module.

The second line of the 2*16 LCD is used for the annunciators. Because the 41 can actually display up to 24 characters in alpha mode (if every other character is a period, comma, or colon), the alpha mode display can spill over into the second line. I may hack the microcode for alpha display to remove the special-casing of the punctuation, and always display only 12 characters in alpha mode. (Making it use 16 characters would be substantially more work.)

There are not yet any plans for the serial support; it may simply be left for future use.

> Quote:
>
> Is there a meta OS in the 64K?

I'm not sure exactly what you mean, so I guess the answer is no. What would a "meta OS" do for you?

Eric

Re: So Eric, what's with the new hardware?

*Message #10 Posted by **Howard Owen** on 27 Sept 2005, 1:23 p.m.,*
in response to message #9 by Eric Smith

I guess I meant that in connection with the serial port. There being no direct serial support on a real 41C, you'd have to have some "glue," at least, to turn that port into something the calculator would see as HP-IL, for example. The mass storage emulation would also be a piece of OS-like glue.

I called it a "meta-OS" because it would be above the level of the calculator's own OS.

Re: So Eric, what's with the new hardware?

*Message #11 Posted by **HrastProgrammer** on 28 Sept 2005, 1:35 a.m.,*
in response to message #9 by Eric Smith

though unless I modify the microcode it will have the same effective capacity as the 41CX with two extended memory modules.

From my experience: it is possible to address 3392 data/program registers by modifying the

firmware (I have done this 4 years ago). But, you'll have to change a lot of things, not only in HP-41 ROM ...

Modified extended function module microcode might allow for the equivalent of an extra twelve extended memory modules, for a total of 3459 usable registers of extended memory.

I really doubt you can have extra 12 XM modules ... you'll have to completly rewrite XF/XM module and all parts of CCD, Advantage and perhaps some other modules dealing with extended memory. The best I came to (without sacrifying too much of a compatibility) was 686 XM registers. Again, this is from my experience and can, as well, be wrong ...

The SD slot is for mass storage. The intention is to write a compatible replacement for the mass storage functions of the HP-IL module.

Do you plan to rewrite the complete HP-IL ROM or provide the HP-IL hardware emulation and use the existing HP-IL ROM?

I may hack the microcode for alpha display to remove the special-casing of the punctuation, and always display only 12 characters in alpha mode. (Making it use 16 characters would be substantially more work.)

The emulation of display instructions and a lot of things have to be changed in HP-41 ROM (Printer ROM, ...) but it is possible to have 16-characters LCD ...

Hi Eric...

Hmmm. How come Nonpareil emulation wasn't just ported over (of course w/perhaps minor changes for I/O related stuff)? There are C compilers for PIC CPUs. That way you aren't dealing w/a whole new body of code, since Nonpareil is getting good exercise now...

Bill Wiese
San Jose

Re: So Eric, what's with the new hardware?

*Message #16 Posted by **Eric Smith** on 28 Sept 2005, 8:03 p.m.,*
in response to message #15 by Bill Wiese

Would have been lower performance. The PIC18 architecture is somewhat better suited to C code than the older PICs, but it's still not great. Also Nonpareil wasn't written with such a limited-memory device in mind.

Re: So Eric, what's with the new hardware?

*Message #17 Posted by **Howard Owen** on 28 Sept 2005, 9:05 p.m.,*
in response to message #16 by Eric Smith

Score another one for hand-optimized assembly code!

In an era of bloatware, it's somehow reassuring that there is still room for that sort of thing. Of course, it's easy to take that line when I don't actually have to *do* any of it. 8)

41 battery circuit - opinions wanted

*Message #1 Posted by **Jim Creybohm** on 26 Sept 2005, 12:12 p.m.*

I again received an email from the chinese company that does the flex ciruits. I am not an electronics twinky and so I don't really know how to describe the 41's battery tracings. I suspect Don Wallace or someone of his caliber might be better with this than myself. I am interested in pursuing this, however I wonder if these guys are legit and, if this might be a realistic option.

Anyways, the message follows. The only mention of a company however is at the bottom of the text whom I suspect is only a portal like yahoo.

****** message begins **********

Dear sir, Wish you have good health!

We are glad to introduce a printed circuit (FPC ,PCB) factory. We use The latest technology make flex(rigid, rigid-flex) printed circuits for use in any Electronic products.the factory is iso9001:2000 confirmed and IPC Criteria. The main capacity: We can make "ROLL TO ROLL" flexible printed circuits.

We can make very long (250 mm x 100 meter) single sided flexible printed circuits item.

We can make 4 layers ,5 layers,6 layers rigid-flex printed circuits.

We can produce 3 layers,4 layers,5 layers,6 layers flexible printed circuits and double side with min 0.06mm trace width. The square hole of the coverlayer can be min 0.4 mm.

We also can produce 4 layers,6 layers,8 layers,10 layers,12 layers rigid printed circuits board(PCB). and 14 layers,16 layers,18 layers,20 layers HDI rigid printed circuits board.

Our products have exported to USA,Canada,Japan,UK,Germany,France,Australia etc More then 20 countries.

We would welcome you to visit our factory.

Please e-mail your circuit design by gerber file,or auto cad,or protel files and advise us of: Fpc size, and number of layers.

You can get the directly factory price!

We can make samples for your approval.

Thank you for your support!

Best regards!

*Message #2 Posted by **David Smith** on 26 Sept 2005, 2:44 p.m.,*
in response to message #1 by Jim Creybohm

Yes, they are probably legit... but most Chinese compaines only want to do business with you if you want to order a zillion pieces. You can ask them though. There are US companies that will do small lot/prototype orders. Setup charges can be high.

Re: 41 battery circuit - opinions wanted

*Message #3 Posted by **Garth Wilson** on 26 Sept 2005, 3:45 p.m.,*
in response to message #1 by Jim Creybohm

How many do you want to make? If it's only a couple, the setup charges (or having to buy thousands) will be a kiiler, so you might want to get some adhesive-backed copper foil and make (or repair) your own. This kind of material is used for things like connecting top & bottom ground planes on RF stripline or microstrip circuits around the edge of the board-- at least that was my first exposure to it. I got a roll of it for practically nothin' at an electronics swap meet.

Re: 41 battery circuit - opinions wanted

*Message #5 Posted by **Garth Wilson** on 26 Sept 2005, 11:13 p.m.,*
in response to message #4 by deleted

> Quote:
>
> I have not seen the stuff Garth spoke about. Assuming the material was available at reasonable cost, One would have to go to a lot of trouble to actually build a rig to do, say ten, flex PCB's. This is called tooling up. One makes a phtotmask, builds/buys a UV lightbox, makes/buys an ecthing tank, etc.,etc. Once the photomask was made then one could make a hundred, of course. I may consider this if I could get the flexible copper/mylar. Garth, is that stuff etchable (without adhesive failure)?

For just doing one, I would first try to stick the copper foil on the plastic backing and draw the pattern on it and then use an X-Acto knife to make the cuts (being careful not to cut the plastic backing), and peel away the unwanted material. You might have to experiment with different backings to find one that can handle whatever small amount of soldering you need to do. Then I would probably just cover the parts I want insulated with a good transparent packing tape.

I was thinking earlier about whether you could etch this stuff like a PC board. I guess the thing to do would be to experiment. I used to etch my PC boards for home projects (and did many, many of them) but I abandoned that over 20 years ago in favor of off-the-shelf breadboards that are available in different types for different kinds of projects. With the right kind of breadboard, I can usually exceed the density I was getting before (sometimes having to cut a trace here and there), and I no longer have trouble with

corrosion. With the home-made ones, it seemed like no matter how well I washed them after etching, some etchant must still have been held in the pores of the board, and a year or two later a tiny bit of corrosion would start to show at the edges of the traces.

Re: 41 battery circuit - opinions wanted

*Message #6 Posted by **James** on 27 Sept 2005, 4:09 a.m.,*
in response to message #1 by Jim Creybohm

At a 2004 electronics industry trade show in Vancouver, I noticed one rep had samples of flex circuits. When I inquired about ballpark setup charges, minimum quantities, etc. for a single sided design, I was astounded.

The fee was around US$400 for setup, plus $150 per (whatever you could fit on an) 11x17" panel.

This was presuming you provided ready-to-use artwork, and yes, this really was flex... copper on kapton. I didn't ask about masking and gold plating, but I did ask about cutting the outline... it could be arbitrarily complex as they etch the kapton.

Perhaps the reality is different from the ballpark guesstimate, but I think it is worth investigating.

http://www.tech-etch.com/flex/index.html

Since then, I've been pondering the question of how to attach a 41C replacement flex circuit so that it doesn't require the plastic welds... I think this is key to making a successful retrofit. I have some ideas but whomever is going to take this on probably has their own :-)

HTH,

James

in response to message #1 by Jim Creybohm

I have seen people pay over $100 for a replacement battery contact assembly... too much in my opinion. But I suspect if you can get the costs down to around $50 or so to replace a bad one, that you could sell a good amount of them. Setup charges of a a couple of hundred bucks or so would not be too bad spread out over a run of 100 or so pieces.

Where to Find 12C Platinum Programs?

*Message #1 Posted by **Jeff** on 26 Sept 2005, 11:28 a.m.*

I know there are a lot of programs out there for useful applications, but I wasn't able to find such a site. Can anyone suggest one?

Thanks.

Re: Where to Find 12C Platinum Programs?

*Message #2 Posted by **Gene Wright** on 26 Sept 2005, 11:31 a.m.,*
in response to message #1 by Jeff

First, try the HP12c platinum solutions book, available free in PDF form from HP's website. Find it here: http://h10032.www1.hp.com/ctg/Manual/c00367123.pdf

Second, there are a few games listed in the forum here for the 12cp. Seach for listings from Tony.

Third, there are quite a few useful programs for the HP12c platinum found in the back issues of Datafile, the publication of the HPCC club. Some of these were written by a museum contributor Valentin and by the previously mentioned Tony.

Otherwise, I'm not aware of a site dedicated to the HP12c platinum. But, perhaps that is a good idea. :-)

Re: Where to Find 12C Platinum Programs?

*Message #3 Posted by **Jeff** on 26 Sept 2005, 12:45 p.m.,*
in response to message #2 by Gene Wright

Many thanks, Gene. You're the go-to guy here!

Re: Where to Find 12C Platinum Programs?

*Message #4 Posted by **Gene Wright** on 26 Sept 2005, 12:47 p.m.,*
in response to message #3 by Jeff

ha! I can't let that stand! There are lots of people here who have more answers than I would ever dream of having! Just look how poorly my bagels game for the 12cp compared to Tony's. :^)

We're all just trying to help each other. Shame everyone in the world can't take that approach, isn't it?

How to program rich INFORMs on the 49G+

*Message #1 Posted by **Karl-Ludwig Butte** on 26 Sept 2005, 8:32 a.m.*

Hi all,

while doing some programming on an HP 49G+ I wondered how to do an INFORM input form with check- and choose fields as it can be seen in the MODE INFORM. Does anyone could please give me a hint or link how to realize such nice INFORM forms ? Thank you very much in advance.

Re: How to program rich INFORMs on the 49G+

*Message #2 Posted by **Tim Wessman** on 26 Sept 2005, 8:45 a.m.,*
in response to message #1 by Karl-Ludwig Butte

They can only be done in sysRPL. HOWEVER, there is a nice program named Inform Builder that lets you use an interface to add things like checks and stuff. Download it here and then send an email to thank the author if you like it: http://www.hpcalc.org/details.php?id=3258

For even more powerful inform boxes, you can use Debug4x, but that needs a PC and a little more knowledge to use.

Inform boxes tend to be large, but if you compress them the size can usually drop 50% or so.

TW

Unusual Packing Methods & Materials

*Message #1 Posted by **Bill (Smithville, NJ)** on 25 Sept 2005, 1:53 p.m.*

When I got home from work on Friday, I noticed a large box (61.9 oz) of kellogg's Frosted Flakes sitting on the dining room table. I thought it very unusual since my wife and I don't eat cerials and wondered why my wife had bought it.

Turned out that a notepad computer I had bought on ebay had been shipped by UPS in the cerial box. The computer was surounded by styropone and stuffed into a cerial box for shipping. Forturnately the computer was okay.

This got me to wondering what unusual packaging others have received and used.

Here's a HP calculator packing story to start it off:

Last year I had bought an entire collection of 12 calculators. Since it included two HP-42S, a HP-71B, a HP-41CX , a HP-15C, and an assortment of other lesser valuable calculators, I was looking forward to them. When the box arrived, it obviously had a rough trip - one entire seam of the bos was torn open and the box was quite squished.

When I nervously opened the box, I found that each calculator had been placed in a plastic grocery bag and then the bag rolled up around the calculator. Then the shipper had padded the box out with hundreds of plastic grocery bags. No wonder the box was squished - it had no internal structural support. The good news was that all of the calculators were in good condition and nothing was harmed.

There was one other unusal part to this story. The top of the box was completely covered (with only the space for Ship to and ship from not covered) with individual Christmas Stamps. This was well after Christmas and someone had decided to use up their supply of Holiday stamps. It turns out that the local post office had done it - not the shipper. The person at the post office told me that ever so often they take a package and use up all their loose stamps they have cluttering up their desk drawers.

The top was so collorful that I cut it off and plan to frame it to hang on the wall. If anyone interested, I could post a photo of it.

What stories do you have?

Bill 12345

Check out http://www.dau-alarm.de/g_pack.html

(in German, but let the pictures speak for themselves; a couple of pictures are mine...)

Re: That's everyday business

*Message #4 Posted by **Bill (Smithville, NJ)** on 25 Sept 2005, 8:09 p.m.,*
in response to message #3 by Frank Boehm (Germany)

Hi Frank,

Thanks for the link to the pictures. I especially like the care taken with the monitor - just a little foam to protect tube. Great site to make us appreciate when a shipper does it right.

Thanks, Bill 12345

Re: Unusual Packing Methods & Materials

*Message #5 Posted by **Dave Shaffer** on 3 Oct 2005, 2:24 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Not exactly a calculator (or E-bay) shipping story:

I used to be on the scientific staff at the National Radio Astronomy Observatory (1976-1979). The EEs there were responsible for building the very latest in low noise amplifiers, basically from scratch. One day, the latest in solid-state amplifier chips arrived. This was the actual tiny piece of doped silicon (actually, it probably was a GAsFET chip). It was about 1 millimeter square and perhaps 0.1 mm thick. This chip was in a little container which was in a bigger box which was in a bigger bigger box which was ..... The outer box was about the size of a shoe box. I figure the box to product volume ratio must have been at least 10e6!

Perhaps apochryphal, from the same place: the shipping department figured they needed some packing noodles (styrofoam peanuts). How much to order? Well, a few hundred pounds sounds about right. Oops! That's a whole truckload!!

Unknoun 'Hex' Annunciator on HP10b

*Message #1 Posted by **Raul Leslie C.** on 25 Sept 2005, 10:03 a.m.*

I've got an old HP10b (1987) but it has an 'Hex' Annunciator on the display, that I want to turn off.

In the manual I didn't found anything about this message.

Please can someone help me with this problem.

Thanks. RLeslie.

Re: Unknoun 'Hex' Annunciator on HP10b

*Message #2 Posted by **randy** on 25 Sept 2005, 10:26 a.m.,*
in response to message #1 by Raul Leslie C.

Just erase memory and it should remove the hex annunciator. From the manual:

Press and hold down [C], then press and hold down both [N] and [E+]. Memory is cleared and the ALL CLr message is displayed when you release all three keys.

Re: Unknoun 'Hex' Annunciator on HP10b

*Message #3 Posted by **Raul Leslie C.** on 1 Oct 2005, 10:52 a.m.,*
in response to message #2 by randy

Randy,

It worked fine.

Thanks for your help. RLeslie

Re: Unknoun 'Hex' Annunciator on HP10b

*Message #4 Posted by **GE** on 3 Oct 2005, 3:59 a.m.,*
in response to message #3 by Raul Leslie C.

Interesting, what is this indicator supposed to be used for ? Probably nothing on the stock 10B, so was there supposed to be another model on this hardware base with base conversion functions ?

Re: Unknoun 'Hex' Annunciator on HP10b

*Message #5 Posted by **Randy** on 3 Oct 2005, 8:35 a.m.,*
in response to message #4 by GE

The 20S provided HEX/DEC/OCT/BIN functions.

exchanging displays?

*Message #1 Posted by **Bram** on 25 Sept 2005, 5:17 a.m.*

(Seems that 48 is in picture these days.)

Well, I've a question as well. Would it be possible (and feasible) to put the display of an HP 48G in an HP 48GX of which the display is broken?
Technically possible?
Mechanically possible? Case not glued together?

Re: exchanging displays?

*Message #2 Posted by **H.D.** on 25 Sept 2005, 11:37 a.m.,*
in response to message #1 by Bram

It is possible to take apart the HP48 without damage any parts whatsoever. It takes a bit of patience and courage, though. Changing the display, on the other hand, would require lots of techinical skills.

The PCB of the HP48 is held to the top of the calculator by 6 tabs. These tabs are very hard to remove. They look like T's, with the top part of the T twisted (rotated about the vertical axis). You'd have to undo the tabs to get the PCB out.

Only then can you get to the LCD. Check hpcalc.org on how to open the HP48 -- there are even pictures of opened ones to show you what you're up against. Lastly, make sure you read the document on how to open the calculator without damaging it. (It helps to look at ALL the photos of opened ones, first)

If you find that the directions are not as clear, I have some photos I can send you as well as some directions.

Re: exchanging displays?

*Message #3 Posted by **Bram** on 26 Sept 2005, 3:21 p.m.,*
in response to message #2 by H.D.

Thanks for your answer.

I'll study the sources you mentioned. I may give it a try in the future.

HP-48 blank overlays?

*Message #1 Posted by **Geir Isene** on 25 Sept 2005, 4:55 a.m.*

Is it possible to get hold of blank HP-48 overlays? Haven't seen any on ebay the last couple of months (after I started looking for it). Were they even produced? Otherwise it could be an ok substitute with a non-blank and add my user-labels to it.

Re: HP-48 blank overlays?

*Message #2 Posted by **H.D.** on 25 Sept 2005, 10:35 a.m.,*
in response to message #1 by Geir Isene

If you ever find any, please let us know by posting here, as I too would like to buy some.

Re: HP-48 blank overlays?

*Message #3 Posted by **James M. Prange (Michigan)** on 25 Sept 2005, 8:55 p.m.,*
in response to message #1 by Geir Isene

HP did indeed market an "Overlay Kit" for the 48SX/S, part number 82220A, consisting of three very light grey opaque and three "clear" overlays plus one clear with the standard shifted alpha key functions printed on the reverse surface. All are matte finished on the exposed surface, so "clear" might be better called "translucent".

I've rarely seen them on eBay, but who knows what will turn up there?

The possibilities for making them have been discussed here before; try a search of the Museum Forum archives.

Regards,
James

Calculators and Snowboarding

*Message #1 Posted by **Katie Wasserman** on 24 Sept 2005, 1:08 p.m.*

This is OT but you're the only people I could think of to tell...

For the snowboarders among us (I'm going to try it soon!), Ride has a new calculator-art snowboard for 2005/06 - take a look at the middle picture here: http://sportstop.zoovy.com/product/RIDER05023. The artwork is by Mark "Fank" Fankhauser, Ride's art director, the pictures are from my website http://www.wass.net/manuals/index.htm.

It's all Fank's idea and work, I would have suggested using HP calculators of course :)

Edited: 24 Sept 2005, 1:11 p.m.

Voyager emulators

*Message #1 Posted by **Ricardo Lira Matte** on 24 Sept 2005, 12:15 p.m.*

Check the link http://homepage.mac.com/riclira for voyager series hp calculators emulators. There are emulators for the 10c, 11c, 15c, 12c and 12c Platinum.

Re: Voyager emulators

*Message #2 Posted by **Peter Geiser** on 25 Sept 2005, 4:36 a.m.,*
in response to message #1 by Ricardo Lira Matte

If you want the same emulators for free, and most older HP calculators as well, check out Nonpareil by Eric Smith (http://nonpareil.brouhaha.com/)

Re: Voyager emulators

*Message #3 Posted by **Gunnar Degnbol** on 25 Sept 2005, 4:12 p.m.,*
in response to message #2 by Peter Geiser

They are not the same. The "emulators" here are what everybody in the big what-is-an-emulator thread agreed are simulators. They reimplement the functionality of the voyagers at the user level, but adds a lot of functionality and possibly unique bugs. Eric Smith's Nonpareil emu^H^H^Hsimulates the Coconut CPU and executes the original firmware, making them identical to the real calculators, except they don't fit in a pocket.

Re: Voyager emulators

*Message #4 Posted by **Peter Geiser** on 25 Sept 2005, 4:45 p.m.,*
in response to message #3 by Gunnar Degnbol

I see. Yes, they have more memory, etc.
Regards
Peter

Re: Voyager emulators

*Message #5 Posted by **Mike T.** on 6 Oct 2005, 4:07 a.m.,*
in response to message #1 by Ricardo Lira Matte

Ricardo -

Your simulators certainly look the part they have very realistic appearance!

The arithmetic accuracy isn't what I'd expect from an HP calculator though, and you should know that this can (and will) cause problems with a number of programs.

As an example try the following

48 - 47.8 - 0.2

The answer should of course be zero but it isn't and any test for x=0 will fail.

To be a true replacement your simulations need to match the accuracy of the real thing.

Mike T.

Re: Voyager emulators

The $1000 HP48

*Message #1 Posted by **I, Claudius** on 23 Sept 2005, 9:56 p.m.*

The oil companies aren't the only ones price-gouging: Samson Cables now has new old-stock 48GXs for $999.

http://www.samsoncables.com/catalog/prodDetail.cfm?Prod_ID=186&Sku=48GXABA

Re: The $1000 HP48

*Message #2 Posted by **Howard Owen** on 23 Sept 2005, 11:12 p.m.,*
in response to message #1 by I, Claudius

It's strange. Thay have used ones for market prices, at least to judge by the eBay prices. They must either be counting on collector interest for a 3X premium over market, or else they really don't want to sell that one. 8)

Re: The $1000 HP48

*Message #3 Posted by **Howard Owen** on 23 Sept 2005, 11:14 p.m.,*
in response to message #1 by I, Claudius

They normally aren't *that* bad, compared to other brick-and-mortar retailers. They're higher than what you can sometimes get on eBay. I've bought books and calculators there before.

Re: The $1000 HP48

*Message #4 Posted by **Namir** on 23 Sept 2005, 11:16 p.m.,*
in response to message #1 by I, Claudius

If it smells like greed, walks like greed, talks like greed ... IT IS GREED. I am not making any excuses for them.

Re: The $1000 HP48

*Message #5 Posted by **Stephen** on 24 Sept 2005, 11:33 a.m.,*
in response to message #1 by I, Claudius

I bought a new 48GX from them for $400 a month ago. Considering the retail cost when in production and current Ebay prices for a new one, I didn't feel so bad, esp. since they have a return policy. However, $1k for a 48GX! I think they're expecting a collector to buy it, not figuring that most collectors don't go for the graphing calculators as much as for the scientifics, Voyagers, etc. Now $1k for a new old stock LED might interest some collectors.

Re: The $1000 HP48

*Message #6 Posted by **Eddie Shore** on 24 Sept 2005, 12:27 p.m.,*
in response to message #1 by I, Claudius

Outrageous. $1,000 for a calcultor? Let alone for one that was built in the 90s? That is nuts!

Could also explain why they are selling used ones for $249 and $299.

Re: The $1000 HP48

*Message #7 Posted by **Howard Owen** on 24 Sept 2005, 1:57 p.m.,*
in response to message #6 by Eddie Shore

That's pretty much par for HP-48GX on eBay. The people bidding them up aren't collectors, but working surveyors. The 48GX can be interfaced to surveying "total stations" and has ROM addons that will drive them. If an auction includes the right ROM card, it's not unusual to see it go for $500.00 and up.

BTW, I wasn't apologizing for Sampson Cables, but making an observation from my own experience. Normally, their prices are a bit high, but not as ridiculous as this.

Re: The $1000 HP48

*Message #8 Posted by **Stephen** on 24 Sept 2005, 4:26 p.m.,*
in response to message #7 by Howard Owen

Howard is right. They are invaluable for surveyors that use them on the job (with the aftermarket overlays and programs). $1k for a field computer is just a tax right-off and S.C. knows it. For the math or physics student or collector, $1k is crazy, but for the professional, working surveyor relying on it, it may be a bargin.

Re: The $1000 HP48

*Message #9 Posted by **Les Bell** on 24 Sept 2005, 9:30 p.m.,*
in response to message #7 by Howard Owen

You're spot on, Howard. What drives the value of these devices are "network effects" (in marketing terms) such as availability of peripherals, software, related books and manuals, etc. Once someone has invested both money in these things and then time in mastering them, they're loathe to switch to a new type of cheese. ;) Hence demand remains higher than supply, and prices rise.

The same thing has happened with the HP-41 - a large part of its value was the stuff that worked with it: manuals, applicatin pacs, peripherals, and programs from the User Library (now gone, unfortunately). I doubt if HP could afford to recreate it today.

Best,

--- Les

> if market conditions warranted it

Aye, there's the rub - but of course, companies will do *anything* if market conditions warrant it. However, I think the conditions that pertained back then - HP's market dominance, a continuous growth of user base from the HP-35 onwards, a base of RPN routines that had evolved over the same time frame, a User Library that was well established for the -65 and -67/97 - no longer apply today. They'd have to start from scratch, which would be very expensive.

On the positive side of the balance sheet, the market is much larger, and the Internet would make running a User Library operation much lower in cost. The hpcalc.org site is a good example.

My view might be coloured by nostalgia for The Good Old Days of the 41, I'll allow. ;)

Best,

--- Les

> On the positive side of the balance sheet, the market is much larger, and the Internet would make running a User Library operation much lower in cost. The hpcalc.org site is a good example.

I've always viewed the wonderful, quirky spirit of sharing in the old time user groups as the direct predecessors of Free Software. Richard Stallman formed GNU because he thought that software companies were trying to get users to act against their own best interests, and those of other users, by making them swear not to tell what they knew about the software they purchased. It was an extreme form of the concern for the user that PPC and other groups (DECUS and USENIX come to mind) stood for.

Most people read the GPL and think it's about a programmer's right to have source code and make changes. But it's really about the *users* of software having ultimate control over the software they use. If you have the source, you have the leverage, not some other person or entity. Even if you don't use that leverage, it's harder for others to use it against you. This is

why "Free/Libre and Open Source Software" (FLOSS) is such a big hit in business. Businesses are the biggest users of software numerically and in monetary terms, at least in the US. Businesses as software users benefit from lock-in protection when they use software released under a Free/Libre license, even (or especially) when it's the leftmost license of them all, the GPL,

Um, I'll tone down that rant now 8). But I really do see this connection between the old-time spirit of information sharing and mutual assistance that the old calculator and computer clubs had in spades, and the user oriented FLOSS movements of today.

in response to message #12 by Howard Owen

I would like HP release a new high quality calculator (may be HP 50?) As soon as HP releases a good quality calculator, nobody will pay such high prices for the HP48GX and soon all ebay prices will drop

Re: The $1000 HP48

*Message #14 Posted by **Stephen** on 25 Sept 2005, 5:03 p.m.,*
in response to message #13 by Gonzalo Fernandez (Spain)

They have released a "better" calculator called the 49G+; however, it suffers from bugs, keyboard problems, lack of documentation, and lack of aftermarket support to utilize the SD card to cater to the working engineer / surveyor. I'll be the first to admit that I hocked my 49G+ after two weeks of frustration in anticipation of a more mature product. But if they offered something like a 49GX or 49G+ with an "X" to make use of PAC cards, then that would be great. I don't think it would be that difficult to springboard from their current design to do that.

17BII+ keys been fixed??

*Message #1 Posted by **Stephen Easterling** on 23 Sept 2005, 7:14 p.m.*

I recently bought a new 17BII+ and returned it because of the same "missed entries" with the keypad that I had with the 49G+ and my 9-month-old 12C Platinum. Has anyone else experienced this and found resolution to the problem?

Re: 17BII+ keys been fixed??

*Message #2 Posted by **john** on 23 Sept 2005, 10:01 p.m.,*
in response to message #1 by Stephen Easterling

I've had about five 17BII+ calculators and never had a missed keystroke.

You probably just got a bum unit. Certainly haven't seen any reports here or on the newsgroups about any problem with that calculator's keyboard.

Now the solver has been a different thing altogether.

Re: 17BII+ keys been fixed??

*Message #3 Posted by **Stephen** on 24 Sept 2005, 11:39 a.m.,*
in response to message #2 by john

I got it a week ago at a local Office Depot. What is the SN of one of your that works well? Are your fingertips accustomed to using, e.g., a 17BII or other HP scientifics in the past? I was finding that when I would use one HP scientific and then use the 17BII+, I found it difficult to key in an entry. In fact, I would hit the buttons (of the 17BII+) and hear the click sound, but not get the entry to appear on the display unless I pressed even harder. I believe that if you can hear the click, then it should register the number on the display, and I wasn't experiencing that with this model (or with my new 12C Platinum or with a 49G+,... but I do with a new 33S).

HP41 card reader repair / opening

*Message #1 Posted by **Peter** on 23 Sept 2005, 4:53 p.m.*

Hello fellow HP friends

How do I open the HP 82104A magnetic card reader? I just aquired one that shows the first signs of the "gummy wheel problem", and would like to fix this.

Btw, when I do this, I will take photos, and publish a visual repair guide, if sufficient interest is here.

Best regards Peter

*Message #3 Posted by **Peter Geiser** on 24 Sept 2005, 1:34 a.m.,*
in response to message #2 by Randy

Great, thank you! Stupid me didn't find the articles.

So now I have something to do over the weekend ;-)

I'll tell you how it went.

Peter

Re: HP41 card reader repair / opening

*Message #4 Posted by **Howard Owen** on 23 Sept 2005, 7:59 p.m.,*
in response to message #1 by Peter

There are actually two guides in the article archive. But this is such a tricky operation, I don't think a third photo essay would be taken amiss by anyone! 8)

Re: HP41 card reader repair / opening

*Message #5 Posted by **Peter Geiser** on 25 Sept 2005, 1:51 p.m.,*

in response to message #1 by Peter

This afternoon, I repaired the card reader. It works fine now.

As promised, I created a small guide with a few images to document it:
http://www.pmgeiser.ch/calc/index.php?id=HP82104A

Best regards,
Peter

Re: HP41 card reader repair / opening

*Message #6 Posted by **David Smith** on 25 Sept 2005, 3:09 p.m.,*
in response to message #5 by Peter Geiser

Peter, you should add a warning note to your page... Before taking apart the internal mechanism, make a note of the locations of the wires to the read head and motor. They can pop out of the connector pins when you move the motor assembly.

Recognizing HP 41 model (C, CV or CX)

*Message #1 Posted by **Francis** on 23 Sept 2005, 4:33 p.m.*

I have the opportunity to buy a 41 but the buyer as a doubt about the version. The front plate clearly shows 41CX but he's not able to find any time functionalities.

So, what could be a 'simple test' to check the version?

Please keep in mind that I have to explain this to him without having a 41 myself !!!

The serial number of the calculator is 2350S40219.

Regards, Francis

Re: Recognizing HP 41 model (C, CV or CX)

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 23 Sept 2005, 5:04 p.m.,*
in response to message #1 by Francis

Hi;

one of the simplest tests to recognize the existence of the timer module is by pressing [SHIFT][ON] after having the calculator turnned on ([SHIFT] is the golden key, that activates the SHIFT indicator in the display). If it simply turns itself off after the [SHIFT][ON], then it is surely not an HP41CX or it has a bad time module. Also, try [SHIFT][CAT][2]. You should see:

```
[TIME FCN 2_ ] (the underscore represents the version indicator)
[CX TIME FCN ]
[EXT FCN 2_  ]
[CX EXT FCN  ]
```

Any other HP41 (C or CV) will do nothing after CAT 2, unless it has a ROM module plugged in or, if hacked, an internally connected extra ROM.

Hope this helps.

Luiz (Brazil)

Edited: 23 Sept 2005, 5:05 p.m.

Re: Recognizing HP 41 model (C, CV or CX)

*Message #3 Posted by **Garth Wilson** on 23 Sept 2005, 8:58 p.m.,*
in response to message #2 by Vieira, L.C. (Brazil)

There must be many ways to tell a cx from a cv with modules in it, but one extra-quick one should be to try the catalogs above catalog 3. The cx adds catalog 4 for files in extended memory, catalog 5 for alarms, and catalog 6 for key assignments. I think that if you try these on a c or cv, you'll just get catalog 3 (like you do if you try "catalog 7" on a cx).

Re: Recognizing HP 41 model (C, CV or CX)

*Message #4 Posted by **Peter Geiser** on 23 Sept 2005, 5:07 p.m.,*
in response to message #1 by Francis

Catalog 2 (yellow shift - Enter - 2) will show the list of available functions. My CX displays: -TIME 2C -CX TIME -EXT FCN 2D -CX EXT FCN

Best regards Peter

Oops! (was: Recognizing HP 41 model (C, CV or CX))

*Message #5 Posted by **Vieira, L.C. (Brazil)** on 23 Sept 2005, 5:14 p.m.,*
in response to message #4 by Peter Geiser

Hi, Peter;

you are right. I don´t have my CX in hands right now, and the [TIME 2_] plus [CX TIME] are the correct output messages.

Thanks.

Luiz (Brazil)

Re: Recognizing HP 41 model (C, CV or CX)

*Message #6 Posted by **Richard Garner** on 23 Sept 2005, 5:09 p.m.,*
in response to message #1 by Francis

Hi Francis,

One way to find out if the 41 is a CX version is to do a catalog 2.

Shit Key (Gold Key)

Enter Key

2

This will run the system catalog for plugged in modules/devices. The CX funtions will show up as

-CX Time

-CX EXT Fcn

Re: Recognizing HP 41 model (C, CV or CX)

*Message #7 Posted by **Richard Garner** on 23 Sept 2005, 5:15 p.m.,*
in response to message #6 by Richard Garner

Sorry about the misspellings. I hit the post button by mistake while trying to click on something else.

Re: Recognizing HP 41 model (C, CV or CX)

*Message #8 Posted by **don wallace** on 23 Sept 2005, 6:11 p.m.,*

in response to message #1 by Francis

Hi Francis.

You can try to view the CLOCK:

[ON]

[SHIFT] [ON]

Or try to display the current time:

[XEQ][ALPHA]t i m e [ALPHA]

DW

Re: Recognizing HP 41 model (C, CV or CX)

*Message #9 Posted by **Randy** on 23 Sept 2005, 7:59 p.m.,*
in response to message #1 by Francis

You could have him clear the unit back to factory defaults with a simple proceedure.

1. Turn the unit off
2. Press and hold the backspace[clx a]
3. Press and release ON
4. Release the backspace
5. MEMORY LOST appears
6. Turn off and back on again to clear message
7. Press PRGM

A CX will display 219 free registers, a C or CV will display 46 free. Not a conclusive test but sometimes worthwhile.

HP-97 with different problems

*Message #1 Posted by **Johnny Bjoern Rasmussen** on 23 Sept 2005, 4:16 p.m.*

I'm trying to repair a friends HP-97 and need some help. It sympthoms are:

1. Flashing display, specially the left most digits. The right most are still and not flashing. 2. Printer does not return carrige after being in the right most position. I suspect the reed switch or the magnet to switch the reed to be defective. 3. Only a few of the 'function'-keys work, eg. [sin] and [cos].

I have cleaned the pins cnnecting the PCBs and this helped preventing the calculator craching all the time. But I would like to be able to solve the above problems.

Thank you in advance! Johnny Bjoern Rasmussen

Re: HP-97 with different problems

*Message #2 Posted by **Randy** on 23 Sept 2005, 7:30 p.m.,*
in response to message #1 by Johnny Bjoern Rasmussen

The easy stuff: 1) Stripped printer gear. 2) A key stuck down. 3) Printer daughter board not seated.

#1 will usually result in a blank display.

Do you have the service manual? It's on the MoHPC collection.

Re: HP-97 with different problems

*Message #3 Posted by **Katie Wasserman** on 24 Sept 2005, 2:52 a.m.,*
in response to message #1 by Johnny Bjoern Rasmussen

Do you have a good nicad battery in it? If you don't it can run off the AC supply, but the printer won't work nor will the card reader and the left digits may indeed flash.

Re: HP-97 with different problems

*Message #4 Posted by **David Smith** on 24 Sept 2005, 12:55 p.m.,*
in response to message #3 by Katie Wasserman

Katie has nailed it. You need a good battery pack installed.

Plus the printer gear may be stripped causing the printer to not work. Any attempt to use a printer with a stripped gear will result in a locked up machine and you can hear the printer motor quietly running continuously. If the print head is not in the home position, the machine may not even appear to power on.

My 12C Platinum is blue. Also, how about those solar ones they made a few years ago? Wasn't one of those blue?

Re: Blue Calculators

*Message #7 Posted by **Iqbal** on 25 Sept 2005, 10:38 a.m.,*
in response to message #4 by Matthias Wehrli

Hi Matthias, I think I remember seeing a blue 41 somewhere before [maybe ebay]. Do you have any photos of it you would like to share? my email is iqbalNOSPAM@tstt.net.tt [remove NOSPAM] Thanks Iqbal

Re: Blue Calculators

*Message #8 Posted by **Matt Kernal (US)** on 26 Sept 2005, 4:58 p.m.,*
in response to message #3 by Howard Owen

Shortly after the 49G was released, one forum user came up with a name for the Imac-like shade of blue: Frozen hampster butt blue. And the name stuck!

Re: Blue Calculators

*Message #9 Posted by **Howard Owen** on 26 Sept 2005, 5:39 p.m.,*
in response to message #8 by Matt Kernal (US)

ROFL!

I hadn't heard that one. And to think it's been around since 1999 or so. 8)

Re: Blue Calculators -- Sharp

*Message #10 Posted by **Paul Brogger** on 23 Sept 2005, 11:15 a.m.,*
in response to message #1 by Eddie Shore

Sharp has made translucent blue scientifics, and I've seen them at Office Depot, Wal-Mart & etc. of late.

Re: Blue Calculators -- Sharp

*Message #11 Posted by **Howard Owen** on 23 Sept 2005, 4:02 p.m.,*
in response to message #10 by Paul Brogger

Ah, you noticed he didn't qualify "calculators" with "HP". We could probably extend this thread indefinitely if we ran with that. 8)

Edited: 23 Sept 2005, 4:03 p.m.

Re: Blue Calculators -- Sharp

*Message #12 Posted by **Eddie Shore** on 24 Sept 2005, 1:14 a.m.,*
in response to message #11 by Howard Owen

Since I didn't qualify which brand, I would also nominate TI-34 II+, TI-30 XII+ (I think that is correct), TI-82, and TI-83.

I didn't realize blue was a common color in calculators.

Re: Blue Calculators -- Some more...

*Message #13 Posted by **Marcus von Cube, Germany** on 26 Sept 2005, 1:46 p.m.,*
in response to message #10 by Paul Brogger

My HP 720 is blue (Is this a calculator? At least, it's from HP!)

The TI-81 (TI's first graphic) was blue, too.

My ancient TI-36 Solar comes in a blue sleeve (firmly attched to the calc, it opens sideways.) and it has some blue keys. The case itself is aluminum.

The Casio fx-85MS comes in a dark blue/black combination.

Re: Blue Calculators

*Message #14 Posted by **Vieira, L.C. (Brazil)** on 23 Sept 2005, 2:28 p.m.,*
in response to message #1 by Eddie Shore

Hi;

compared to the HP48S/SX series, the HP48G-series have a 'blue-like' case.

Re: Blue Calculators

*Message #15 Posted by **Howard Owen** on 23 Sept 2005, 4:00 p.m.,*
in response to message #14 by Vieira, L.C. (Brazil)

Blue*ish*, I'd say. My subjective analysis: the back and sides are a blue-green that is closer to green than blue, and the keypad background is the same color, but in different material. The frame around the (black on olive green, usually) screen is a lighter blue-green that is slightly closer to blue than green. To top it off, the right-shift button and labels are all turquoise, whuch adds to the overall "bluish" effect.

hp 27s operating manual

*Message #1 Posted by **Nate Whipple** on 22 Sept 2005, 11:47 p.m.*

A coworker of mine pulled out his calculator the other day asking me if I knew how to re-enter some programs that he had. He did not change the batteries in time and lost what he had entered into it.

He no longer has the opperating manual to find the procedures to do this. Where is the best place to find this information, or an operation manual. I think he would like an orriginal but would settle for an electronic version if anyone had scanned one.

would appreciate any feedback at whipmich@isu.edu

thanks

Nate Whipple

Re: hp 27s operating manual

*Message #2 Posted by **bill platt** on 23 Sept 2005, 10:30 a.m.,*
in response to message #1 by Nate Whipple

The 17bii has the same fundamental operating system and most of the menus are the same though labelled differently on the keys.

You can download the 17bii+ manual from HP and I think I have the 17bii manual as PDF somewhere. If I find it I can send it to you. Just send me an email.

Regards,

Bill

Re: hp 27s operating manual

*Message #3 Posted by **Chris Dean** on 23 Sept 2005, 11:38 a.m.,*
in response to message #2 by bill platt

Press the SOLVE button and then NEW. Now enter your code. Press CALC. Enter the required values etc....

Re: hp 27s operating manual

*Message #4 Posted by **bill platt** on 23 Sept 2005, 1:45 p.m.,*
in response to message #2 by bill platt

I have the spanish version of the 17bii manual, the english version of the 17bii+ manual, and the description of Let and Get functions from the 19b manual, all on PDF.

48-series question about downloads from PC

*Message #1 Posted by **Stephen Easterling** on 22 Sept 2005, 8:59 p.m.*

I am jumping the gun asking this because I have not seriously sat down to program my recently-acquired 48GX (having too much fun with some older HPs now), but my question is this:

I would like to dump tables of data into my 48GX from PC. Can this be done using something like WordPad, Word, Excel if I properly delimit that data. Ideally, two - four columns of numbers available to the user at the touch of a button.

Thanks in advance for any advice or direction on this. I originally bought a 49G+ thinking it would be better suited for this, but I hated the keypad and sold it. That's when I went for a 48GX and bought a memory card (and other goodies for it).

Re: 48-series question about downloads from PC

*Message #2 Posted by **James M. Prange (Michigan)** on 23 Sept 2005, 3:23 a.m.,*
in response to message #1 by Stephen Easterling

The files are best written on a "text editor", but a "word processor" will work as long as you save the file as plain text, to avoid having word processor control codes and sequences added to the file. I don't know about Excel.

I suggest first uploading a variable from the calculator to the PC, to see how the transfer header should look.

"ASCII" mode transfers to/from the 48GX can be done with Kermit, but assuming a recent version of MS Windows, the Kermit-based HPComm ("HP PC Connectivity Kit") may be easier.

By installing the Xmodem Server library that's included with the Xmodem-based Conn4x ("hp48gII and hp49g+ PC Connectivity Kit"), you can use Conn4x for "text" transfers, which are very similar to Kermit "ASCII" transfers, and should be faster.

Try some searches of the newsgroup http://groups.google.com/group/comp.sys.hp48?; useful search strings may be "transfer header", "ASCII transfer" and "translation".

Regards,
James

Re: 48-series question about downloads from PC

*Message #3 Posted by **Karl-Ludwig Butte** on 23 Sept 2005, 3:36 a.m.,*
in response to message #1 by Stephen Easterling

Hello,

perhaps an appropiet Excel Add-In is what would serve your needs best. Have a look at http://www.hpcalc.org/hp48/pc/misc/hp48xla.zip. I've tried it myself with a 49G and it worked great.

Have fun

Karl

My Battery Sucking HP-71 Memory

*Message #1 Posted by **Howard Owen** on 22 Sept 2005, 6:20 p.m.*

I related elsewhere that I'd purchased an HP-71B that turned out to have a 96KB memory add-on. I told how the calculator would go through batteries at a very rapid clip with the module installed in the card reader bay. I also had verified that this behavior followed the module into a second 71B. At the time, Don W. suggested I post photos of the beast. So here they are. They were all taken through an illuminated magnifying lamp, so please forgive the image quality.

It's an interesting little monster. You can see that one of the screws is missing, because there's a corner of a chip filling the left-hand gap!

http://retrocalculator.com/images/hp71_mem/one.jpg

The right hand screw hole has a torx head screw too small for any of my tools. I still haven't gotten around to buying an approptiate sized one. But ...

http://retrocalculator.com/images/hp71_mem/two.jpg

You can do this to the module without unduly straining anything. Here we can see that PCBs have been stacked together, with chips soldered on both sides. The chips at the top in this photo are soldered in the same orientation as the chips on the other side of the board. The other assembly moving down and to the right has a single large chip on one side, mated to two smaller ones below.You can't see it in this photo, but there is another PCB with another five chips underneath the two boards visible here. There was some question in my mind if 96K was really the par RAM amount for this module. Seeing three CBs leads me to think that it is. So assuming it's 32K per board, we must have 4 4K chips and one 16K? How else could it break down? People used to dealing with RAM at the chip level in the same vintage can perhaps enlighten me on that.

Another feature you can sort of see in the above photo is the not-so-great soldering job. The following photo, taken with an additional magnifying glass inline with the first, shows this in more detail:

http://retrocalculator.com/images/hp71_mem/three.jpg

It is probable that one or more of these joints, or worse ones hidden from view, are responsible for the excessive current drain.

More when I get the right tool to remove the other screw.

Edited: 22 Sept 2005, 6:46 p.m.

Re: My Battery Sucking HP-71 Memory

*Message #2 Posted by **Gordon Dyer** on 22 Sept 2005, 7:15 p.m.,*
in response to message #1 by Howard Owen

In the early '80s I used to test memory chips for quality and reliability.
If the memory module is fully functional then it is likely that the solder joints are ok, even though they do look

messy, but high battery drain could be caused by leakage between joints, or by a damaged chip, possibly from electrostatic discharge causing internal oxide breakdown and high internal leakage currents. Some chips from the early 80s were very sensitive to static damage as the internal protection circuits were not good.
If you can remove the lid of the module try inspecting between all the joints with a 3x or 4x eye magnifier and look for slivers of solder and flux between the pins. Carefully remove any debris from between any joints with the point of a sewing pin. If any of the chips has been damaged by ESD it would need to be replaced. It may be difficult to find the right chip to replace it and it will be a very tricky soldering job, but I am sure one or two people in this forum could help!
Before you handle the module sit at a conductive, or non-static generating bench, wear only cotton clothes and if possible use a special anti-static wrist strap connected to ground.
Tell me the part codes on the chips and I may be able to tell you what memory size and configuration they are.
Good luck!

Re: My Battery Sucking HP-71 Memory

*Message #3 Posted by **Howard Owen** on 22 Sept 2005, 9:16 p.m.,*
in response to message #2 by Gordon Dyer

Thanks for the advice, Gordon!

I guess I could peer at the labelling on some of the chips now, but I prefer to wait until I have the whole thing open. Got it regarding the static precautions. Good ol' CMOS!

Re: My Battery Sucking HP-71 Memory

*Message #4 Posted by **Eric Smith** on 23 Sept 2005, 3:20 a.m.,*
in response to message #1 by Howard Owen

Each board has four industry-standard 8K*8 SRAMs, and an HP chip that acts as a Saturn-bus-to-bytewide-memory interface. I don't recall the part number of the HP chip, but rumor has it that a datasheet on that part was distributed by some of the user groups.

IIRC, there was some bug in the chip that prevented it from being used for more than 32Kbytes, hence the need for three of them to make a 96K module.

If the module is drawing too much current, yet seems to function correctly, there are several possible problems:

1. dirty PCB - gunk on PCB can be slightly conductive, causing leakage current. This is a big problem with solder with water-soluble fluxes, but I doubt that they were used on these boards. Still, cleaning the boards could help.
2. ESD damage to a RAM chip - fortunately they are common chips that can easily be replaced
3. ESD damage to one of the HP memory interface chips - there is no source of replacements other than cannibalizing them from other similar memory modules, but if you can identify which of the three PCBs is causing the problem, you can remove it and have a better 64K memory module. Be careful to document the interboard connections so that you can rewire it properly; most signals should just be in parallel, but there is a daisy-chained signal used by the soft configuration process.

Re: My Battery Sucking HP-71 Memory

*Message #5 Posted by **Howard Owen** on 23 Sept 2005, 11:17 a.m.,*
in response to message #4 by Eric Smith

Thanks for those details, Eric.

I'm not sure if this should be my first attempt at chip-level electronic repair or not. I might just confine myself to dropping boards out one at a time to see if the problem is associated with one of them, as you suggest. That would probably involve some soldering, but at least not whole chips.

Thanks again!

Re: My Battery Sucking HP-71 Memory

*Message #6 Posted by **David Smith** on 23 Sept 2005, 12:07 p.m.,*
in response to message #4 by Eric Smith

The most infamous way for a CMOS chip to suck huge amounts of power is for an input pin to be left unconnected. This causes both complementary transistors to turn on and effectively short power to ground. Check all solder joints, etc. Clean all solder flux. Repent all sins.

Re: My Battery Sucking HP-71 Memory

*Message #7 Posted by **Howard Owen** on 23 Sept 2005, 12:15 p.m.,*
in response to message #6 by David Smith

All of them??

Sorry, but there are one or two I'm quite happy with. 8)

Inspecting the joints is something I planned to do. I'm just not sure what I'll do if I do find a problem.

Programming the 48GX

*Message #1 Posted by **John Rogers** on 22 Sept 2005, 2:32 p.m.*

I've my 48GX programmed for several years, but never have figured out how to perform a display of the CST menu...you know, like it does when you press the CST key. Is there no programmable equivalent?

Here's what I want to do:

I have a key assigned to << HOME >> which returns to the Home directory. what I'd like it to do is return home & display the CST menu...something like << HOME CST >> (except that doesn't work; it returns home, then recalls the CST to the stack.

Any ideas?

Re: Programming the 48GX

*Message #2 Posted by **Jonathan Purvis (New Zealand)** on 22 Sept 2005, 4:17 p.m.,*
in response to message #1 by John Rogers

<< 1.01 MENU >>

You can get the current menu with the RCLMENU command. 1.01 (or 1) is the first page of the custom menu, 1.02 is the second, etc.

in response to message #2 by Jonathan Purvis (New Zealand)

Thanks...that's exactly what I was looking for.

It's hard to believe I couldn't find it in the great manual that came with the calculator

HP 49G+ Button Fix?

*Message #1 Posted by **Shaun** on 22 Sept 2005, 8:13 a.m.*

Hi,

Does anyone know what the current situation is regarding the keyboard button issue on the 49G+? Is it worth buying yet? What serial numbers are good to buy - if any? etc.....

Regards Shaun

Edited: 22 Sept 2005, 8:16 a.m.

in response to message #1 by Shaun

Supposedly ROM upgrades available via internet are supposed to remedy the problem, but some folk are not experiencing much bennefit from that upgrade. However, some are. It may depend on whether or not your are accustomed to using HP in the past and are used to the better buttons, or if you are new to HP and don't know the quality keypad you are missing from the older ones.

I sold my recently purchased 49G+ for that reason (without installing the new ROM, though). Two weeks ago I also bought a new 12C Platinum and 17BII+ and had the SAME PROBLEM! I returned those without hesitation and plan to never buy another Kinpo / HP calculator until most HP users say the problems have been ironed out. I really want a new 49G+, but I want it to work properly and NOT be a liability to me at home or at work.

*Message #3 Posted by **Shaun** on 22 Sept 2005, 6:52 p.m.,*
in response to message #2 by Stephen

Thanks for your insight Stephen.

I have been a HP user for the last 30 years - my first HP calculator was the HP25. Since then I have had a HP15C : HP42S : HP48GX. I quite fancied moving to a HP49G+ but when I purchased one I couln't believe how poor the construction was. It was immediately returned only to be replaced by a similar quality item. I got a refund and now I await a decent calculator to be released. It is very frustrating to be in possession of a burning desire to buy the latest HP calculator and at the same time, to be confronted with an extremely "poor quality" product.

Hp keypad buttons used to be so good touch - what went wrong?

in response to message #3 by Shaun

Because of a recent revival I have gone through with the HPs, I really wanted to buy a 33S (which I have been quite happy with, BTW) and a 49G+ and be done with it. A month ago I had purchased the latest build of the 49G+ and really loved it. It was fun to "play with" but a nightmare to use seriously. (Just sit down and do the bills with it sometime and you'll end up throwing it against a wall!) I found the same to be true of the 17BII+ and even a Dec04-build HP 12C Platinum. This prompted me to start looking for sibling calculators for my beloved 28S (which is what I cut my teeth on 15 yrs ago and it's still going strong). I've acquired a decent collection now and love finding the strengths of the older calculators. So if only HP would have given us a decent 49G+, I would not have been so tempted to buy used HPs.

If you do buy 49g+, get a 2005 build.

in response to message #7 by I, Claudius

Mine is CNA 50201686. It just arrived from hpcalculators.com.

The keyboard isn't too bad, is this the recent release? How can I check the ROM revision? (I'm still looking for an "about" screen.)

VER returns 4.20031005.

Re: If you do buy 49g+, get a 2005 build.

*Message #10 Posted by **Gene Wright** on 26 Sept 2005, 2:08 p.m.,*
in response to message #9 by Marcus von Cube, Germany

Type VERSION.

VER returns the CAS "version". VERSION tells the ROM version.

Re: If you do buy 49g+, get a 2005 build.

*Message #11 Posted by **Matt Kernal (US)** on 26 Sept 2005, 2:23 p.m.,*
in response to message #9 by Marcus von Cube, Germany

The ROM revision number can be displayed by entering: VERSION. My 49G+ returns "#2.00" (among other things).

VER provides the CAS revision number. Mine displays "4.20050219"

Regards, Matt

p.s. The serial number on the back of mine is: CN40204986

Re: If you do buy 49g+, get a 2005 build.

*Message #12 Posted by **Marcus von Cube, Germany** on 26 Sept 2005, 4:48 p.m.,*
in response to message #11 by Matt Kernal (US)

Thank you both!

My calc is Revision #1.23; I'm going to upgrade the ROM.

Any info about the keyboard mechanics of my CNA 50... system? Is this the new hardware?

Re: HP 49G+ Button Fix?

*Message #15 Posted by **Stephen Easterling** on 29 Sept 2005, 12:44 p.m.,*

in response to message #1 by Shaun

Yesterday I received my second 49G+.

The first one I bought about six weeks ago from HPShopping which had ROM 1.23 and was prone to mis-entries with the keyboard. I would feel the click, hear the click, but not get the entry on the display. I could dance all day on the keyboard with my fingers (just like on any USA / Singapore model) and still not record the entry. I was always looking at the screen to see if the number was displayed (sometimes not), and it was just miserable to use. It was fun to play around with, was fast, overall cool to own, but downright miserable to actually use. Not being a rookie to HP, I hated this! Test yourself: cover the screen, type in 1-9 (enter), 1-9 (enter). After doing this seven times, look at the stack and see how many times you didn't record all the numbers and you'll be amazed. Of course, if you're aware of what you're doing, you hit the keys harder and not have mistakes. But if you do it like you're not aware and you let the feel of the key and the sound of the click be your judge, then you'll see the difference. I hocked this 2-month-old 49G+ to a doctor that enjoys it a toy.

Okay, so now I really want a 49G+ and I want it to work properly. I call up HPShopping and they said that they have the very latest issue of these versions. The man I spoke to was very much aware of the problems I outline above, and assured that HP segregated all of the defective lots, and that if I purchased a new one from him (about five days ago), that it would have no more keypad problems AND have the ROM version 2.00. Yesterday I was excited to receive my new 49G+, but depressed to have the same keypad problems. When I checked the ROM it was still 1.23. I called back today and the lady was surprised the other guy could ensure I would receive ROM 2.00 and have no keypad problems. She said the best HP could do would be to just keep exchanging them for a model that didn't have problems. She had no way of knowing if their distributer could segregate older lots and newer lots, and didn't seem to care about the problem.

My question: What should I do? Should I believe HP when they the current product has been debugged / updated and take my chances, or just forget about the 49G+ and use my 48GX for everything? My serial number is CNA 52302843. I will go ahead and download the ROM 2.00, but according to many out there, this does not correct the keypad problem (although a few report some improvement).

Re: HP 49G+ Button Fix?

*Message #16 Posted by **Howard Owen** on 29 Sept 2005, 1:02 p.m.,*
in response to message #15 by Stephen Easterling

I must just be lucky. Or perhaps my touch on the keyboard is unusually heavy. I loaded the 2.00 ROM on my 49G+, serial #51000586 right after I got it, and I've never had a problem, either with repeated entries or non-responsive entries. My keyboard feels snappy, and operates perfectly. I'd prefer a bigger ENTER key, but other than that, I can't complain. (The printed vs molded keys may or may not ever be an issue with this machine for me.)

This problem is still hit and miss. Some people swear that the ROM 2.0 with a CNA5xxxxxxx is the holy grail, some still experience the problem you mentioned even with the latest S/N model. HP's got some serious issue with the keypad on this calculator which I don't think they even know how to deal with. After trading in 3 HP-49G+, my problem has settled somewhat (though not completely disappeared). My round arrow keys still have issues.

I have a CNA45201473 and ROM 2.0. I use ->KEYTIME (that's the right arrow not the red right-shift key) to set the delay value where if the software senses two key presses within this time interval it will not register, so you won't get the double entry. It won't solve the missing key problem. Use KEYTIME-> to see what your current value is. The unit is in 1/8192 of a second, so I set my delay to something like 1639 (1639/8192 = roughly 200 ms) and this has worked for me. For details, check out the HP web site and search for "49G KEYTIME".

Hope this helps.

John

in response to message #15 by Stephen Easterling

To bring closure to a thread I started regarding the 49G+, I am happy to report that the ROM 2.00 upgrade significantly improved my keypad. My problem has officially been solved, and I honestly didn't think I was going to be happy with it. I am. I also helped a friend out with his new 49G+ and he is also very impressed with how it fixed his keypad problems. Thanks, HP Support, and those of you on this forum that recommended the ROM upgrade as a possible solution. I'm excited to learn and use my new 49G+!

in response to message #1 by Shaun

Shaun,

A week ago I bought a new 49G+ and was very unhappy with the keypad and missed entries. I was ready to throw it against a wall! I contact HP support and they were VERY helpful, even sending me an email and calling me to see how I was doing. (That alone will keep me a customer for life!) At any rate, it was highly recommended that I just install the ROM ver 2.00, so last night I did that. To my surprise, my keypad has improved dramatically. It now passes my own test with flying colors and I am now very happy with this calculator.

New hp12c platinum game developed

*Message #1 Posted by **Gene** on 22 Sept 2005, 7:51 a.m.*

I have now developed an hp12c platinum version of an old game which I hope to type up and post here soon.

It plays 4-digit bagels on the 12c platinum. Program is 258 or so lines long, so it won't run on the black/gold 12c.

Is anyone going to care if I post it to the group or not? :-)

Might as well have a game in the 12cp...after all, who would ever believe someone was playing games on that financial calculator. ;-)

Gene

in response to message #1 by Gene

Hi, Gene:

Gene posted:

"I have now developed an hp12c platinum version of an old game which [...] after all, who would ever believe someone was playing games on that financial calculator. ;-)"

Do post it, please. I don't have an HP-12CP but it's always nice to have a look at HP-12C program code because of its serious limitations as a programming environment.

As for HP-12C games, here's another one I wrote specifically for the HP-12C a while ago.

Best regards from V.

Re: New hp12c platinum game developed

*Message #4 Posted by **Gene Wright** on 22 Sept 2005, 10:05 a.m.,*
in response to message #3 by Valentin Albillo

I'll get it typed up shortly.

And, Valentin, your game is what made me want to write this one. I certainly don't claim that it is elegantly written :-) but I did try a trick or two. Mostly, it's just brute force. Each digit of the secret number is computed separately (no subroutines) and each possible combination of a digit in the guess showing up in the secret number is checked individually. Ugh!

But, with 400 steps and only two conditionals, that's the approach I saw.

What I really would like is a tic-tac-toe game for the 12cp and a lunar lander. Anyone want to try those?

Re: New hp12c platinum game developed

*Message #5 Posted by **Andrés C. Rodríguez (Argentina)** on 22 Sept 2005, 1:16 p.m.,*
in response to message #4 by Gene Wright

Gene:

I'm very busy, so I have not time to put in practice any Lunar Lander migration to the HP12c/cp. I have no 12c either. But a simple lunar lander as featured on the HP25 Applications Handbook, or even a slightly more sophisticated one like the one that came in the HP67 manuals should not be very difficult to port.

The question may be if 12c users will found it interesting/enjoyable; since the combination of a bare numeric display like [-50.0500 00] and Newtonian physics may not suit those users' taste.

Now, for my HP41/42 Space Shuttle Landing Simulator... well, I don't think the HP12c/cp may cut it!

Regards

PS: In real life and business, you can often consider TVM as a "game" (not always for fun, indeed!).

Re: New hp12c platinum game developed

*Message #6 Posted by **Gene Wright** on 22 Sept 2005, 2:45 p.m.,*
in response to message #5 by Andrés C. Rodríguez (Argentina)

Regarding the lunar lander...the version I'd be happy to have would just be the one with a display of -50.0500 as you start your fall to the surface.

The 12cp gives a challenge with only 2 conditionals and no subroutines. :-) That's what makes putting games on it fun.

I hope to post the 4 digit bagels game shortly.

Re: New hp12c platinum game developed

*Message #7 Posted by **Andrés C. Rodríguez (Argentina)** on 24 Sept 2005, 11:00 a.m.,*
in response to message #6 by Gene Wright

The HP25 Lunar Lander version uses some 45 steps, just four registers, and no trigs or logs. It uses conditionals just three times: x<0 for display formatting, x<y for checking if fuel is enough, and x<0 to see if altitude is still positive. With some recoding and eventual use of extra registers and steps, it should be almost line-by-line portable to the 12C. Further, the Applications Handbook gives comments at various steps to clarify things.

The next sophistication level comes with spaceship mass correction as the fuel is used; and you can also use a random number to cause minor variations in altitude or thrust (say 1%), just to make the game not as deterministic. After all, the moon surface is rough, so a little randomness may well be due.

That's the best part ;-)

12c platinum Bagels game listing

*Message #9 Posted by **Gene Wright** on 22 Sept 2005, 4:00 p.m.,*
in response to message #1 by Gene

Here it is...all 258 lines of it. PLEASE feel free to help correct any mistakes or suggest improvements. My goal is not to have any programming pride left :-) but to have a good workable Bagels game for the 12cp.

Couple of notes: 1) the g prefix is not included for the comparison tests, the x^2 and SQRT (square root) functions, and not for the FRAC and INT functions. ROLL DOWN is pretty self explanatory. Line 62 is "gold shift 1" to set the display to 1 decimal point.

The steps which compare each digit of the secret and guessed number work like this: I subtract the digits which will either give me a 0, or -3 through -1 or a 3 through 1. I then take the absolute value by squaring and then square rooting the result. That means I have a 0 (indicating a matched number) or a positive 1, 2, or 3. I then put a 1 on the stack and test this 1 to the previous result (which is either a 0, 1, 2, or 3 in the Y-register). If this 1 is <= the number in Y, I do not have a match and I replace the 1 with a 0. Otherwise, the 1 stays. I then add the number in X (which is a 1 if it was a match or a 0 if it was not a match) to the appropriate counter for guesses (Memory 0 is for correct guesses and 1 is for incorrect).

Memory usage: 0 is the correct digit counter, 1 is the wrong place but in the secret number counter, 2 through 5 hold one digit of the secret number (don't peek!), 6 through 9 hold one digit of the entered guess number, memory .0 holds the seed, memory .1 holds the input guess number as a 4 digit value (which is destroyed as the digits are separated), and memory .2 holds the guess count.

How to use: 1) Key in a decimal seed for each game and press GTO 000 then R/S. The calculator will generate the secret number and stop displaying 0.0. 2) Enter a 4 digit guess and press R/S. 3) The calculator will return a number of the form X.Y, where X is the count of digits in your guess that are in right place in the secret number and Y is the count of digits in your guess that occur in the secret number, but are in the wrong location. 4) Continue entering 4 digit guesses and pressing R/S until you have guessed the secret number. 5) When you guess the number correctly, the display will show 4.0. The number of guesses you took is in the Y-register and can be viewed by pressing X<>Y.

Example game: 1) Seed 0.123456789 GTO 000 R/S --- calculator shows 0.0 in about 3-4 seconds. 2) Guess 1234 R/S --- calculator shows 2.1 in about 5-6 seconds. We have 2 digits correctly guessed and 1 digit right but in the wrong spot. 3) Guess 9134 R/S --- calculator shows 0.3, so we have 3 numbers right but in the wrong spot. 4) Guess 1263 R/S --- calculator shows 3.0, so we have 3 numbers in the right spots. 5) Guess

1293 R/S --- calculator shows 4.0 -- only took 4 guesses. That's good!

For a new game, enter a new seed, press GTO 000 and then R/S.

Note: The game will generate a secret number that may have duplicate digits.

Known issues: Of course, as I typed up the instructions, I noticed a couple of things. 1) If the secret number is 2222 and you guess 2222, the display does not show 4.0, but 5.2 of all things. Why? I'm thinking through that one. 2) If the secret number is 1292 and you guess 1294, you'll get 3.1 shown, since the "2" you guess will be correct for digit 2 and in the wrong place for digit 4 of the secret number. I'm sure this could be fixed (if desired), but at what step expense?

So, there you have it. I'd like for this to be viewed as the start of a few more games for the 12cp. Improvements are welcomed! :-)

in response to message #9 by Gene Wright

Ok, the 5.2 result is finding all 4 digits correct but also counting the other 3 locations as correct number but wrong location. 3 x 4 = 12 (which is 1.2 since it is shown as the tenths place). 4 + 1.2 = 5.2, which is shown if you guess 2222 for a secret number of 2222.

So, how should the program go about that stuff?

Hello Gene,

I remember there was a game like this in the TI-59 owner's manual. However, repeated numbers were not allowed, as well "0". This makes the game easier to play. This game was one of the things I missed when my 59C was stolen, so as soon as I finished reading the manual of the 15C I had bought as a replacement, I ported the game to the new calculator. Actually, this was my first RPN program, so the TI influence may show a little. Of course, the 15C made things quite easier. Even today I wouldn't try it on the 12CP. Congratulations!

Now, just one question: I heard the old Platinum had a bug which didn't allow more than 255 programming lines. I see your program has 258 lines. Is this issue resolved?

Regards,

Gerson.

I have a fix for the 5.2 problem programmed. I'll test it for obvious problems and post an update shortly.

And, the step count is now well above 255 and it works perfectly. :-)

Bilbo Baggins of Bag End burgled not only his precious ring but also a 12C which made him invisible while he programmed it. His BEG key was of course marked BAG, being next to END. While blowing smoke rings he used to think of bagels. After many years he came up with a program for 1 to 6 bagels, with the number being stored in [FV] (Food Value). Then along came Gandalf and showed him how to make room for 7 bagels...but one mustn't input anything past line 92!

4 [FV] sets us up for 4 bagels.

[FV] is preserved, until changed by the user.

Before running the first time a seed should be stored in [i]. For example:

.123456789 [i]

The seed is modified by the program but the latest seed remains in [i], so for subsequent games it is not necessary to re-seed.

All guesses are fractions, which of course appear with an initial bagel before the decimal point.

The source is below. All digits from 0-9 are allowed and digits can be repeated in the hidden target.

To run with [i] and [FV] as above:

```
[f][PRGM][R/S] -> 4.0 (your target)
.123 (read as .1230) R/S -> 1.1 so 2 digits are correct but
one is misplaced.
.4567 R/S -> 0.1
.5813 R/S -> 3.0
.5810 R/S -> 4.0
```

Now try the next random game like this:

```
[f][PRGM][R/S] -> 4.0 (your target)
.0123 R/S -> 0.2
.4567 R/S -> 0.2
.1653 R/S -> 2.2  Yeah we have all digits! 2 need swapping.
.3651 R/S -> 4.0
```

All available 12C resources are used when FV=7.

Show off. :-)

Seriously, this is great. I'd much rather have a smaller program than a bigger one. Good to see use of the cash flow registers to store things.

Now, how about a lunar lander game?

Re: 12c platinum (&12C) Bagels(now Lunar Lander) game listing

LOL! It was a lot of fun.

I'd never tried using/abusing both the CFj and the Nj before. It's easier to keep things constant in the CFj - as soon as one does a [g][CFj] the associated Nj gets set to 1 - it can be preserved of course but takes a few lines more in this case. Maybe someone can knock 10 lines off it though - it's pretty ugly in parts - most of it seems to be housekeeping.

> Quote:
>
> Now, how about a lunar lander game?

Well here is something that may be OK. It's early morning here and I've only been awake for an hour but this does seem to work. If I do nothing I crash like a lunatic<G> going at 90 feet/sec, after about 8-9 sequences!

Follows 29moonld.htm here on www.hpmuseum.org - 92 lines that become 94 on the 12C. The instructions are the same except that [f][PRGM][R/S] restarts instead of GSB 1. Here Regs 1-4 are used instead of 6-9. It's indeed a pretty good little model. I never played it before but I can see how it became so popular, as google attests :-) To burn fuel I press "f" at the end of the countdown :-) Very very tricky to land with zeros flashing.

Re: 12c platinum (&12C) Bagels(now Lunar Lander) game listing

*Message #16 Posted by **Gene** on 24 Sept 2005, 3:27 p.m.,*
in response to message #15 by tony (nz)

Tony, you are the master! :-) I bet you get your name in an hp12c platinum owners manual some day. ;-)

Ok...folks...which OTHER games do we want for the 12cp?

How about:

a) a tic-tac-toe program that uses the keyboard as the playing area?

b) a jive-turkey game (a variation on the high/low game where the calculator "lies" at times).

c) or a basic craps game.

Some samples of these (for the HP25 and HP65) can be found (of course) at:

http://www.rskey.org/gene/hpgene/index.html

Personally, I've always wondered what a full TVM program would look like written on the hp12cp. Why do that? To learn better how to program the 12cp!

Without subroutines, with only 2 comparisons, I think it would be a challenge to fit it all in.

Thanks again Tony!

Perhaps these two are good candidates for a future Datafile article? Gene

Re: 12c platinum (&12C) Jive Turkey game listing

hehe. I do cheat quite a lot - I do the programming on a palmtop and run it through a formatter and usually type it in just once.

There are some really nice touches in that one. I couldn't resist it. Listing below.

Thanks for this great resource Gene! hehe your Jive Turkey really jives - it has a GSB 4 in line 7 but there is no target for that. GSB 1 fits.

Yup the challenge is what makes it worthwhile really. I don't know why they put TWO tests on the 12C - one would have been enough<G>

> Quote:

My pleasure.

> Quote:
>
> Perhaps these two are good candidates for a future Datafile article? Gene

Your idea about doing the games is great. I found an old "Super bagels" for the 67 today - quite impressive.

Jive Turkey for the 12C

Originally by Maurice E.T.Swinnen founder and Editor of TI PPC Notes (1980-1982). Transcribed for HP-67 in PPC Journal Jan 1978 by Terry Mickelson(PPC #1926). The HP-67 has flags and subroutines. Here we use FV as a flag and replicate the 63 line HP-67 version in 66 lines.

'Jive Turkey' was famous. Nowadays Maurice dedicates his free time to ballroom dancing. Still jivin' :-)

```
Setup (no need to clear registers)
-----
1. Seed  (0-199,017) [n]
2. %Truth (0-100)    [i]
3. [R/S]->0 (ready for first guess)
4. Input guess(0-99) [R/S]
5. See +-1 (plus/minus indicates high/low)
```

6. Repeat 4 till you see not +-1 but your total number of guesses. This means you won't know what a +1 means after your first guess. Just re-run with the same guess and if you were right you'll see a 2 :-)

7. To play a second game: [f][PRGM][R/S]

It is not necessary to input a new [n] or [i], unless you want to. [n] automatically has a new seed for each game. They can be changed at any time. Lower [i] if you are getting j[i]ved too much. i=0 is nice and simple :-)

Re: 12c platinum (&12C) Bagels(now Lunar Lander) game listing

*Message #18 Posted by **Kalevipoeg** on 28 Sept 2005, 6:13 a.m.,*
in response to message #15 by tony (nz)

I think there has been a formula error in calculation of crash velocity since 1976 (HP-67 Moon Rocket Lander) and it's here again.

Background:

In this game acceleration a = 2*burn-5

From Physics book:

x = x0 + v0*t + 0.5*a*t^2 and when t = 1 => x = x0 + v0 + 0.5*a
=> x = x0 + v0 + burn - 2.5

v = v0 + a*t and when t =1 => v = v0 + a => v = v0 + 2*burn - 5

But see lines 75-83:

```
75  RCL 3
76  2
77  .
78  5
79  -
80  STO+1
81  2
82  *
83  ST0+2
```

As you see in lines 75-80 a new height x is calculated as x = x0 + burn - 2.5. What happened to v0? This should be x = x0 + v0 + burn - 2.5
Therefore I would like to add two lines 75 and 76:

```
75  RCL 2
76  STO+1
77  RCL 3
78  2
79  .
80  5
81  -
82  STO+1
83  2
84  *
85  STO+2
etc.
```

Do you agree? I'm not a physicist.

Re: 12c platinum (&12C) Bagels(now Lunar Lander) game listing

*Message #19 Posted by **tony (nz)** on 29 Sept 2005, 4:17 a.m.,*
in response to message #18 by Kalevipoeg

I agree :-) The final crash involves 2 steps - the rest of the fuel is burned, and then we have another cycle under the 5 ft/sec/sec acceleration. You're right - the distance has to be fully updated after the burn.

Cheers, Tony

Different results, Tony? :-) Bagels game listing

*Message #20 Posted by **Gene Wright** on 26 Sept 2005, 3:52 p.m.,*
in response to message #13 by tony (nz)

When I run it with the input seed of 0.123456789 i and 4 in FV, I get these results:

0.123 -> 1.2 0.4567 -> 0.0 0.5813 -> 2.0 0.5810 -> 3.0

I've checked my listing and it all appears ok. Typo in the instructions? :-)

Re: Different results, Tony? :-) Bagels game listing

*Message #21 Posted by **tony(nz)** on 26 Sept 2005, 6:20 p.m.,*

in response to message #20 by Gene Wright

Thanks for testing on the new 12c platinum Gene! It converts the .123456789 seed into a guess with one digit different to that produced by the 12C. The platinum has a "2" instead of the 12C "5". The platinum has 2 extra digits - and this has an effect when we are using the 997 * FRAC 10 *.

I see the answer now. The Solutions Handbook "Random Number Generator" uses a 7 digit seed on purpose - the .5284163. If we use .1234567 instead of .123456789 then the 12C and new 12c platinum agree 100% :-)

It only takes a couple of lines to make it run like yours - with no zeros chosen, and with integral input. But then the .123456789 seed it gives 1286 - not the 1293 you got on the new platinum - same issue with the extra 2 digits held in the new one.

Oh I see a great 223 line "Super bagels" in an old 67-97 Games Pac book here. It's like mine (variable secret number length from 1-8 digits, mine is now only 1-6 again) uses integral input and you can specify a maximum digit - yup we can do that too - 99 lines. That is my final version :-) I see other great progs in the book - many suitable for the platinum - the craps game has a .528461 in - we know where that comes from :-)

Cheers, Tony

Re: 12c platinum (&12C) Bagels game listing

*Message #22 Posted by **Eamonn** on 28 Sept 2005, 8:22 p.m.,*
in response to message #13 by tony (nz)

Hi Tony,

I had a look at your program. Nice use of the financial registers - I've learned a lot about how they work from your program. I have a HP-12C, but I had only ever learned how to use the TVM formula, and do some simple programming on it.

Unfortunately, there seems to be a error in your logic for generating the response to the user input for certain secret numbers and corresponding guesses. This can be seen with the number of bagels set to 4 (in FV) and an initial seed of 0.14 (in i). This results in a secret number of .3225. If you enter a guess of .2235, the calculator responds with 2.1 and not the expected 2.2. A guess of .3522 does return 2.2, and a guess of .3225 returns 4.0, as expected. I see where the error in the logic is, but I don't have a fix.

After looking at your program, I have a few of questions about the HP-12C that you or someone else may be able to answer.

- Are the n, i, PV, PMT and FV registers permanently allocated in addition to the other registers?

- Where are the values for the Nj registers stored? I see that they can only be in the range 0 to 99, but I don't see where they are stored. Does the calculator borrow a couple of BCD digits from the corresponding CFj regitser?

Best Regards,

Eamonn.

Re: 12c platinum (&12C) Bagels game listing

*Message #23 Posted by **tony (nz)** on 29 Sept 2005, 4:10 a.m.,*
in response to message #22 by Eamonn

Eamonn - thanks you are of course 100% correct. I always suspected my logic :-) Am sketching a fix as I write. All the big hits need to be completed first. You came up with a brilliant example to show the flaw - many thanks!

later ... lucky the extra little loop was there for accessing ... 7 more lines. Fits but can probably be shrunk. I want to preserve new features making it like the HP-67 "Super Bagels" - variable max digit and plain integer entry instead of the decimal. Interesting logical flaw - almost worth leaving in ;-)

Re your other questions - yes the TVM registers are permanently allocated. FV does double as the very top Cfj though. All I know about the Nj is that every available Cfj has one. Sure looks like they borrow "part of" the corresponding storage register.

Cheers, Tony

HP12c Speedup project

*Message #1 Posted by **Pierre Brial** on 22 Sept 2005, 2:20 a.m.*

Hello,

I've got a 1996 HP12C. The only flaw I find for this calculator is its slowness, so I have been very interested by the recent thread of Karl Schneider about the possibility to increase the speed of these kind of calcs.

The 1996 HP12C is a calculator-on-a-chip. Here is a picture of the CPU :

http://80calcs.web.ool.fr/Images/CPU12c.jpg

There is 2 CMS component linked in parralel with the CPU :

- a dark one with 181J marking
- a smaller grey one with KG2 marking

I supose that the 181J is either the 180 uH inductor or the 180pF capacitor, but I don't know wich one. Any idea ? And what could be the KG2 component ? Is it a resistor ?

Regards

Pierre

Re: HP12c Speedup project

*Message #2 Posted by **Etienne Victoria** on 22 Sept 2005, 6:52 a.m.,*
in response to message #1 by Pierre Brial

Bonjour Pierre,

The 181J is a 180uH INDUCTOR manufactured by TDK (entre autres).

Unfortunately, I have no idea about the KG2 origin.

Cordialement/Best regards.

Etienne

The kg2 part is the cap.

DW

First Experiment

*Message #4 Posted by **Pierre Brial** on 22 Sept 2005, 9:32 a.m.,*
in response to message #3 by don wallace

Thanks, Don & Etienne, for these informations.
As it is easier for me to find capacitors than inductors, I first removed the KG2 capacitor, and try to run the calculator without it. What a surprise ! the calculator works perfectly, but now at warp speed. The ON-X test is completed in 3 seconds instead of 13.5 seconds usually, so a speedup factor of 4.5. I run the ON+ test during 10 mn without trouble, and the ON/ test is OK.
Programs run nearly instantaneously, and financial calculations are very fast (time is money, you know that).
Well, I recognise that it is suspicious that such an easy improvement have not already been made by HP. There will be probably drawback, so I keep watching my calculator during the next weeks.

Regards

Pierre

*Message #5 Posted by **David Smith** on 22 Sept 2005, 5:04 p.m.,*
in response to message #4 by Pierre Brial

You may need some sort of inductance in order to stabilize the oscillator and/or keep the clock waveform decent. Without it the clock could be very susceptible to noise and tiny changes in the environment.

Who moved my cheese?

*Message #1 Posted by **Namir** on 22 Sept 2005, 1:22 a.m.*

A few years ago I read the book "Who Moved My Cheese?" The book contains a simple story that illustrates how some folks react realisticly to change while others adopt denial, insisting that things MUST and SHOULD BE AS THEY WERE!! These latetr folks become indignant at changes.

The book's metaphor hints at ALL kinds of changes .. in jobs, relationships, beleif systems and so on.

"Who Moved My Cheese?" seems to eloquently apply to HP calculators. All of us have enjoyed HP's calculators in the past -- quality, robustness, workmanship, documentation, support, and so on. In terms of the book, we had our cheese (HP calculators in this case) available in a certain way. In the past few years, the source, quality, and type of cheese HAS CHANGED. We can either see the reality of this change and adapt to it ... or BECOME bitter about the absence of the OLD CHEESE, refusing to adapt to the new cheese.

So which kind of cheese consumer are you? Does you attitude extend to other areas of your life?

Something to ponder about!

Re: Who moved my cheese?

*Message #2 Posted by **Howard Owen** on 22 Sept 2005, 1:41 a.m.,*
in response to message #1 by Namir

Good questions!

Ideally, I'd prefer to skip the bitterness. But I still like the way the old cheese tasted. So I'll keep collecting old pieces of cheese .. um, well, I guess the metaphor leads me into some rather unappetizing territory there.. Let's assume, for the sake of all our appetites, that HP had some magic cheese preservative that allows us to taste the cheese in almost the same way we did back then. The differences would mainly be in our taste buds, instead of in the cheese itself..

Oh, hell.

Here's the deal. I like to play with old HP calculators. And I *can*, because they made 'em really well, so they've aged gracefully. I don't expect HP or anyone else to bring back the 15C or the 41C or any other old model that wouldn't fit today's market. Nevertheless, I'll ask them to build a modern 15C when I get the chance, on the 1E7:1 shot that they might do it.

But what I'd *love* to see would be recent advances in embedded systems applied to a machine with a calculator keyboard. I want color! I want speed! I want math on the Internet! I want stuff I haven't thought of! But I would also *love* it if the same spirit that embued the old machines could also inhabit the new ones. That thoroughgoing love of engineering a marvelous example of cutting edge technology, in order to effectively apply it to real human problems.

So, what sort of cheese lover am I? 8)

Infact, the PIC is not the most optimal controller for the project. Not that I want to diminish Diego's and John's work; it was likely an opportunistic decision to use it for the project - the original author knew the PIc and had one. It has been discussed earlier in the forum whether an MSP430 or a Cygnal 8051 would give a more powersaving implementation. Given the NUT CPU runs at 300kHz (likely for power reasons) and the PIC at 12MHz, there has been progress in power consumption over the last 25 years. And, as you also write, consumption can be further reduced by powering-down the system during idle time.

Concerning a PIC for emulation, I think its instruction set is a bit too weak for compact and fast emulation of the NUT, mainly because it'd require too many single instructions to handle the 56bit BCD architecture.

I have ported Eric's nsim to a simpler C and compiled it for the pic16f877. I still have the sourcecode if anyone is interested. I have also built several HP-45 and HP-55 clones with the 16f877, runiing at 4MHz and the speed was like the original calcs. Taking a 18-series PIC, which has a 4 times faster instruction cycle (if I am not wrong?), speed should be no issue!

I like these Hardware projects, but the definitely eat too much time!!!!

Howard,

There is no question about our collective love/interest for the old HP calculators. After all, this web site is all about this interest.

In the 70s and early 80s, the HP calculators (and other advanced ones made by TI, Sharp, Casio, etc) were MORE significant pieces of technology. The advent of PCs with ever ncreasing power and versatility has REALLY made calculators as second-class citizens in the electronic-gadgets world. Using a PC with a math application (Matlab, Mathematica, MINTAB, SPSS, Maple, Excel, and so on) empowers you to do calculations that run circles around the old calculators.

We are not all to ready to toss our old calculators because we have invested a part of ourselves in them. I too "play" with calculators as a mental exercise, but never hope to do anything that my laptop can't do.

Math Software

*Message #9 Posted by **John Limpert** on 22 Sept 2005, 6:48 p.m.,*
in response to message #8 by Namir

The problem with math software is the cost. I nearly had a heart attack when I recently looked at the non-academic price list for Matlab, which is used in many EE courses and textbooks. Many other math software packages have similar pricing. A high-end programmable calculator like the HP-49G+ or TI-89 is affordable to a much larger group of people.

I agree that this is a good read - and the unusual and rather qwerky line is easily, and usefully, remembered even in the middle of the most animated discussion!

However to get back to the question that was asked, I all too often find that my own 'cheese' hasn't so much moved as simply disappeared. As all too often the quality and design seem to be sacrificed in order to minimize cost or production times and increasingly I find that more and more effort is needed to get the product that I like as this trend affects everything and is, it would seem, inevitable.

Fortunately apart from a number of specialist products I find that is possible to find items of a similar type or quality to those I'm used to if I change suppliers. I don't like it, but this is by and large something I've learnt to accept (that is of course the general thrust of the book). Unfortunately the old HP calculators were one product that has to all intents an purposes vanished...

However, to get back to the book, I rather suspect that if you find yourself agreing then, depending on you

fashion sense, you may like me have three or even of four pairs of similar, even identical, pairs of trousers (pants for those American readers among you) and a collection of identical or similar shirts to go with them in you wardrobe. (I used to wear a similar tie most days too, but my wife has taken advantage of a more liberal dress code at work to banish them to some dark corner, and to my surprise my head hasn't fallen off yet...)

When calculators were rare and accuracy and reliability were more important than cost then HP could succeed by producing a limited number of expensive machines. Those of us fortunate enough to be able to afford the early HP calculators valued their quality and became used to their look and feel - it may have quickly become intuitive, but I expect we all had to learn RPN!

These days accuracy is taken for granted (actually a little too much for granted, but that is a different discussion). Calculators and computers have become commodity items where cost is more important than 'quality'. Though of course there have been amazing improvements in some areas like performance and capacity we seem take these for granted.

Modern calculators and computers may no longer be special but as far as I'm concerned it is more important that they have become so widespread and easily accessible.

We can see the same history in the development of just about every thing around us, the difference is that with anything to do with computers the rate of development is so much faster than anything else.

Mike T.

Now where did I leave my cheese...

*Message #16 Posted by **Richard Zajac** on 22 Sept 2005, 9:19 p.m.,*
in response to message #1 by Namir

Occasionally I look at it this way.

Consider for the moment that the latest generation of "HP's" had not been put out by HP. Rather, let's say that HP had gone completely bankrupt several years ago. (Side topic: what's an appropriate cut-off point for the end of the HP of old? Right after the 48G?)

Let's say that the latest generation of calculators had instead been produced by an independent group striking out for the first time, trying to resurrect RPN after HP's demise. I think I would be more prone to see the merit in their valiant attempt, coming as it were, from a new startup. I would praise the noble effort, and encourage them to keep up the development.

[Back to reality] Instead, we look at the new offerings and feel offended because of what HP used to offer us. Can it be that HP's worst enemy is its own past: a tough standard to live up to?

So, what would you think of the new cheese, if it weren't being offered to you by the same party who had given you the previous cheese?

Re: Who moved my cheese?

*Message #17 Posted by **Les Bell** on 22 Sept 2005, 9:46 p.m.,*
in response to message #1 by Namir

Perhaps the problem is that there hasn't been a widely-hyped massive "improvement" in cheese over the last 35 years (or has there?). Although the "lucky" US consumer can get such high-tech delights as Cheez Whiz http://www.kraftfoods.com/cheezwhiz/, those of us who'd rather get something with a little less preservatives

and flavourings can still obtain classic, natural, flavoursome . . droool . . Brie, Camembert, Stilton - all the classics, in fact. If I invite friends over for dinner, I'm certainly not going to finish up a gourmet delight by passing around processed cheese slices with the crackers.

So it is with calculators and other technology. A facile focus on the word "more" by marketing people (more memory, more functions, more "power", more pixels) isn't necessarily the same thing as "better". I read in an article yesterday that Steve Jobs and the management at Apple have realised this with the iPod - they've looked at putting video playing capabilities into the iPod, but concluded that it couldn't be done without messing up the clean interface and design of the machine. Considering the marketing success of the iPod - it completely dominates the market - I'd say they're onto something. All our family have iPods, and the simple and elegant interface is a large part of the appeal.

From where I'm sitting, the same thing has happened with calculators. The 48/49 have *too much functionality*. They're cumbersome and awkward to use by comparison with the simple keystroke programming model of the 41/42.

I think it's time for high-tech industrial designers to get hold of the concept that just because you *can* do something, that doesn't mean it's a good idea. Sometimes, less is more. I think that the "sweet spot" for a hand-held personal *computational* device is somewhere around the 41CX; maybe a bit more RAM wouldn't hurt, but *no more functions and no more buttons!*.

In summary: I'm unimpressed by the latest high-performance, preservative-enhanced, flavour-enhanced, consumer-taste-tested, pre-sliced, conveniently-packaged cheeses. What's more, I suspect that Katrina and Rita might well affect production of those cheeses and drive prices up. ;)

Best,

--- Les

*Message #18 Posted by **Bernhard** on 23 Sept 2005, 12:45 p.m.,*
in response to message #1 by Namir

My standpoint is the third alternative: the first group mourns the old cheese and besides that does nothing to improve the misery, the second group adapts and starts to eat the modern sh*t (burps...) while the third group has some secret stash of conserved old cheese that will last for a lifetime. Unlike food, calculators of real old-day HP quality (read:Classics + HP67 + Topcats) can be preserved for many decades if not for centuries. What I do is to try understanding their technology to a point where I could replace each and every failing chip or mechanical component. I do now have > 25 HPs and most likely won't run out of spare parts anyway.

regards, Bernhard

New 12C Platinum and Poor HP Service

*Message #1 Posted by **Jeff** on 21 Sept 2005, 8:14 p.m.*

I have the "old" 12C Platinum, and just bought the newer version. It's funny, I called HP pre-sales and tech support several times. No one knew about the upgrade. One guy said that the manual was premature! HP doesn't even let their own support people know about their products.

The screen is a little sharper, it does have the contrast control, backspace, and undo key, of course. But it is MUCH faster. It seems like this was the Platinum that they should have released before.

Why don't they do a recall? Should I box up my 9-month old Platinum and return it to the store, pretending that it was the one that I just bought? I don't feel right about that.

When you call HP now, they have that hugely annoying voice recognition system. I make up words just to get to a live person. Of course you get India when you call now.

It seems that HP is on track to become worse and worse.... Sad.

Re: New 12C Platinum and Poor HP Service

*Message #2 Posted by **Gene** on 21 Sept 2005, 9:55 p.m.,*
in response to message #1 by Jeff

Let's see...

HP releases a new product, one that you find you like. Faster, things fixed, etc.

Yet, that gives you cause to say they are going down the tubes.

Odd.

Of course, if you realized just how small the calculator division is compared to the entire HP empire, you might understand how "support" is general HP support, not a dedicated calculator support group.

While support might should be more aware of things, don't go laying that at the calculator group's feet.

*Message #3 Posted by **Jeff** on 21 Sept 2005, 10:55 p.m.,*
in response to message #2 by Gene

Those were two separate, but related, comments. I realize that calculators are a tiny part of HP.

I don't care how HP sets up their support. All I know is when I called support, it was a lousy experience.

It's not big secret that HP is basically just another commodity company. The famed "HP Way," great support, quality products, etc., are long gone.

They're getting their asses kicked by Dell in PCs and servers. Printers are probably the only thing keeping them afloat.

I still think they make the best calculators, and I wish they'd get the company on track.

*Message #5 Posted by **Stephen Easterling** on 22 Sept 2005, 7:07 a.m.,*
in response to message #3 by Jeff

I agree with Jeff's assessment in Message #3, but HP has been losing market share with their calcs since TI got a foothold in the education department.

Since this thread is about the 12C Platinum, I called HP Service a few days ago complaining about the terrible missed entries with my "defective" keypad on my Dec'04 -built 12C Platinum. The HP Service guy said he'll send me a new one. I asked if he needed mine back so they could learn from its problem. He said that HP didn't need it back. I hope the replacement corrects this problem.

Re: New 12C Platinum and Poor HP Service

*Message #6 Posted by **Stephen Easterling** on 26 Sept 2005, 8:04 p.m.,*
in response to message #5 by Stephen Easterling

I got my replacement 12C Platinum today (built May 05) and its keyboard is even worse than my Dec 04-built Platinum. I don't see a backspace key anywhere on either keyboard. I can hit the keys all day long while my finger feels the click / register and my ears hear the click sound, but I don't get any numbers on the display unless I press even harder. This is not efficient and prone to misentry and errors. I'm giving up on the 12C Platinum and going back to an old 12C. Anyone want to buy a 12C Platinum,... cheap?!

Re: New 12C Platinum and Poor HP Service

*Message #7 Posted by **John** on 26 Sept 2005, 8:17 p.m.,*
in response to message #6 by Stephen Easterling

Since the replacement machine was built in May 2005, why would you expect to see a backspace on the keyboard, since only now in September 2005 are people reporting seeing just one or two with such features?

As to the keys, if it's bad, call HP again. How will they learn if you just sell it cheaply.

Re: New 12C Platinum and Poor HP Service

*Message #8 Posted by **Stephen Easterling** on 26 Sept 2005, 10:11 p.m.,*
in response to message #7 by John

I wasn't sure how much lag time there is between build time and purchase time. If a calculator is made in China in Sept 05, I would be surprised to see it in our stores in Sept 05. I guess, though, that is the case indeed. Since I reported a "bad" keyboard to HP a week ago on a Dec04-built Platinum, I would expect them to send me the latest they had (current). So when I got it today and learned that it was made in May 05, I assumed it was their latest build date. I guess not! They sent me something even worse than what I had. He asked me if I was new to HP calcs and I said I was using them for 15 yrs. He asked me which ones, so I said,.... 11C, 12C, 15C, 17B, 17BII, 20S, 21S, 22S, 27S, 28S, 32S, 32SII, 33S, 42S, 48SX, 48G, 48G+, 48GX, 49G+. Then he told me there was nothing he could do to help me and to just return the 12C Platinum to Office Depot (original purchase place) in exchange for a regular 12C made in Singapore. I went there tonight and they were out of stock, so I got some printer ink for my printer instead.

Re: New 12C Platinum and Poor HP Service

*Message #9 Posted by **Stephen Easterling** on 26 Sept 2005, 10:14 p.m.,*
in response to message #7 by John

PS: I comment about selling it cheaply was a joke. I asked the HP guy if he needed my "defective" units back and he said to keep them. I got the feeling that they didn't care about solving the problem if no one else is having it. I'll make the old original Voyagers my mainstay, I guess, and allow more time for the Kinpo / HP product line to mature a bit more.

Re: New 12C Platinum and Poor HP Service

*Message #10 Posted by **Gene** on 22 Sept 2005, 7:48 a.m.,*
in response to message #3 by Jeff

Hi Jeff. Not a problem. I think we would agree based on your additional explanation. It's just that I see people some times who seem to blame the calculator group for things that are fairly out of their control.

I've heard some people call HP support who talk to people who don't even seem AWARE that HP makes calculators!

And, I'd be curious what you think in depth about the new 12cp.

Gene

Re: New 12C Platinum and Poor HP Service

*Message #11 Posted by **don wallace** on 21 Sept 2005, 11:42 p.m.,*
in response to message #2 by Gene

Hi Gene. Agree (fwiw) onall that.

Hi Jeff. Can relate.

I think the drama is that in a changing (profit driven) world when a large corporation like hp has the founders die off and the internal culture then inevitably changes, the whole show is in danger of losing focus (on keeping "everything" nice and shiny). Internal communication is a real challenge and when the magic motivation factor is gone then you see the whole "animal" get a good deal less healthy. It's a real tough nut to crack, actually.

It's happening everywhere of course... c'est la vie... ;-(It's just that with hp, we all came to expect so much more because they used to be so good (for so long). When they are now less "perfect", everyone notices.

All that doesn't help the customer with dead product however.

Anyone want hp 41 to 41 infra-red data transfer?

*Message #1 Posted by **don wallace** on 20 Sept 2005, 7:38 p.m.*

Hi all.

I am developing an infra-red module for the 41 for engineers. Many have expressed their desire for simple low cost data transfer to the PC.

But would anyone want, need or use a system where two 41 machines could transfer data, programs or key assignments from calculator to calculator?

It strikes me this could just be a useful add-on for firms with several machines used by a number of colleagues

DW

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #2 Posted by **Holger Veit** on 21 Sept 2005, 4:19 a.m.,*
in response to message #1 by don wallace

A more useful module might be a replacement of the HP-IL module that does not exchange data with IL devices, but has a direct RS/232 or USB or parallel interface. I do know that there are such gadgets for the IL bus, and I already use the 82166 converter to exchange data with the PC for quite some time, but HP-IL is nowadays exotic. When we are talking about adding hardware modules to the HP-41 - which I consider a great idea - then they should be universally usable and available, which is except occasional auctions at eBay, not really the case for the IL converter, for instance.

For bidirectional infra-red transfer (a sender-only module is available already, the IR-Printer module) with a PC you would need some standard like IRDA, which is strictly a serial protocol, so replacing the IR xmit/rcv diodes with RS232 drivers would be quite easy.

Holger

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #3 Posted by **Christoph Klug** on 21 Sept 2005, 4:52 a.m.,*
in response to message #2 by Holger Veit

Interfacing to PC is possible by using the IL-Module and the HP-IL/PC interface card. For this application some nice software solutions exist, the leading tool is EMU41. By using EMU41 it is also possible to transfer data and programms between two HP-41 handhelds.

Also directly data exchange between two HP41 is possible by using two HP82166 IL-Converters. The powerfully HP82166 IL-Converter (nice to use for any hardware interfacing application) is available from some sources without problems :-)

If I know correctly, there exist infared interfacing solutions from HP-41 to PC which uses the Inrared

Printer Module and an infared eye with special software. This application is undirectional, that means only data / programm upload to PC is possible.

People who like to use the HP-41 also prefer the belonging HP-IL system, because with this the fourty one mutates to an powerfully computer system...

With best regards from Germany - Christoph Klug

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #4 Posted by **Holger Veit** on 21 Sept 2005, 7:24 a.m.,*
in response to message #3 by Christoph Klug

You misunderstood me (probably intentionally). I do use IL converters for interfacing purposes already.

The problem with such solutions is that they add a lot of stuff dangling from the handy HP-41 box. This is similar to the problem of the MAC-mini which is by itself a nice and small system, but if you need any additional component, you'll end up with a desktop full of additional boxes and cables and wall warts to powerup the whole stuff. When the original poster came up with his idea of an IR module, I immediately thought about a bidirectional version of the IR printer module - namely same in size and selfpowered by the HP41 box. The IL converter needs an external supply, hence a wall wart (at least two converters fit onto the busprint and only need a single supply.

Besides, I still consider IL as a proprietary, outdated solution although it was at its time technically interesting. With the documentation from the Kane/Ushijima book, one could rebuild the HPIL state machines in a CPLD, I suppose, and recreate IL converters, but the serious question (besides hobbyism and nostalgia) is why? More interesting might be nowadays an entire replacement of the CPU board in a HP41 box with some powerful CPU that emulates the whole machine at much higher speed.

However, this might be considered as heresy in a collector's forum...

Holger

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #5 Posted by **Christoph Klug** on 21 Sept 2005, 8:52 a.m.,*
in response to message #4 by Holger Veit

Dear Holger,

from the hardware standpoint both, the HP-41 box and the HP-IL system are nostalgic solutions, today we have much better replacement systems. But most of us really like the fourty one system (including HP-IL) not only some exotic collectors :-)

From the technical standpoint your idea about replacing the internal HP-41 box hardware by a fast speed CPU solution (including RAM-Box features and some other advanced features) sounds really good. Than we use the identical operation mode with keyboard and display and handy size, but get much more calculating power...

Yes - the HP-41 is a vintage calculator or computer system - but also the device mixture of nostalgic HP-IL equipment plus modern add ons like I/O-Board, IL2000 or the MLDL2000 from Meindert or Clonix / NoVRAM from Diego make possible new and powerfully applications.

Therefor I think anything is welcome to HP-41 world : Using the old well known system parts same

as new any hardware extension and future system solution. Please design all this new parts hardware compatible to the existing system - only than we are able to create fantastic HP-41 applications :-)

With best regards from Germany - Christoph Klug

Hey Holger!

I agree with you totally, for what it's worth.

I would love a fast hp41! If possible, I'd settle for something which was 16 times faster. Monte D's project if it gets to be reality, will be really great. I think it's an amazing effort. He is aiming for 50 x normal speed.

I am even considering doing something down the track a bit, either at 16 or 64 x normal speed. But what bothers me is the ROM copyright situation, since there is not a lot of point in keeping the serial roms... so one would have to COPY the rom.

The other thing is, is that such a practical idea? We'll have to see what Monte comes up with. I am a little concernied about power consumption in these add-ons / replacements, in general.

*Message #7 Posted by **don wallace** on 21 Sept 2005, 4:26 p.m.,*
in response to message #3 by Christoph Klug

Hi Chris,

HP-IL is a really nice old system. Howver, it is bulky and expensive. Surely now some of the mechanical stuff must be getting unreliable. And though this next factor is not usually a problem, it's also slow.

I am thinking of a fast compact, reliable two way system which is reasonably priced, although it won't be "cheap". Something that can be used in-field which "emulates" ;-) the quality level of the Hewlett Packard equipment itself. And which NEVER crashes the calculator.

If I was going to control instrumentation, I'd go for the modern equivalent of HP-IB. Why muck around with HP-IL at all, except for fun?

> Quote:
>
> And though this next factor is not usually a problem, it's also slow.

The HP-41 was only able to operate the HPIL at about one-thirtieth of HPIL's maximum speed; so the bottleneck was the 41, not HPIL.

> Quote:
>
> And which NEVER crashes the calculator.

HPIL never did. (I know you weren't saying it did-- I just wanted to clarify.) in 19 years of using my 41 daily, much of it with HPIL, the 41 only crashed a couple of times, and that was due to my own errors in synthetic programming. I have not had a MEMORY LOST condition either in over 15 years.

> Quote:
>
> If I was going to control instrumentation, I'd go for the modern equivalent of HP-IB.
> Why muck around with HP-IL at all, except for fun?

Although not as fast as HPIB (IEEE-488), HPIL had some advantages over IEEE-488. These include auto-addressing and no address conflicts, the ability for the controller to find various pieces of equipment regardless of their position in the loop, interfacing to more devices at a time, longer connections possible, less-expensive and lighter cables, and the pulse transformers that allowed the grounds of two consecutive devices in the loop to be up to 1000 volts apart. In the late 1980's when my 41cx was mostly used to control a rack of IEEE-488 equipment, it was nice that IEEE-488 (HPIB) and HPIL were so much alike, because the interface converter was in most ways completely transparent, making it look to the 41 like the IEEE-488 equipment was actually HPIL equipment on the loop. The 41 insisted on being the controller on the HPIL, and did not have HPIL interrupt support; but these were limitations of the HP-41, not HPIL. The HP-71 does not have these limitations. When I've connected the 41 and 71 together, the 41 had to be the controller. For those who have more than one 41, it would be nice to be able to connect them together to transfer files and programs directly.

IR has its place, just not in interfacing to multiple pieces of equipment at once. To add a comment to someone else's about RS-232, Maxim's MAX3100 UART has an IrDA mode.

in response to message #8 by Garth Wilson

Hi Garth.

Thanks for the feedback, very pertinent and much appreciated.

I take your points on HP-IL. Yeah, they would be great features... I hadn't actually considered all those great "selling points"... ;-)

If there was a large market for HP-IL I would be stirred to do something. But I guess most of the non mechanical hardware is still running fine. As for HP-IL on the PC, who cares? Maybe I am a bit closed minded on that one.

I would have really liked to have HP-IL when it came out. I can think of a lot of situations where it would have been rather useful, even in my own limited hobbyist electronics work at

the time. Certainly I would never have used it at work, since my jobs were repairs, not testing and design. And far from high-tech. "We're not in Santa Clara (anymore) Toto!". My working life was mainly a basic drudge involving a multimeter, a soldering iron and a screwdriver (!), but "it's all good" as the young people say now.

I am seriously considering doing some development work towards an analogue voltage data logger in a plug-in ROMPACK. Any thoughts?

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #10 Posted by **Howard Owen** on 21 Sept 2005, 7:14 p.m.,*
in response to message #9 by don wallace

I'm an HP-IL enthusiast, so I'd be using it whether I had a practical application or not. But as of now, HP-IL is the best way I have to move data back and forth between my HP-41s and the rest of the world, what I like to call "the 21st Century" in this context. I realize that you are planning to do a better solution for the 41, and that the MLDL2000 will enable USB for a similar, but not identical purpose. But neither of those solutions are here right now, or, more to the point, were six months ago when I started feeding my old HP equipment habit.

But there are several things I do with HP-IL that no HP-41 based solution will do. Those are a) all the stuff I do with an HP-71B, and b) all the stuff I do with an HP-75. Enthusiasm for the HP-41 doesn't often translate to an equal enthusiasm for the 70 series. That means there are fewer options for a 70 series user today. So HP-IL remains the best solution for transferring data to and from those systems. I may be interested in purchasing any soluion for two way HP-41 data transfer you come up with, but it won't replace my need for HP-IL, let alone my enthusiasm. 8)

But a discussion of HP-IL's merits and demerits is interesting. It obviously failed, or was killed in the marketplace. HP announced the death of HP-IL at the same time they withdrew the HP-71B. Some HP-IL peripherals remained on the price list until the HP-41C reached end-of-life. But HP-IL as a commercial solution for data collection died with the 71B. HP noted then that they had basically no replacement to serve the market niche HP-IL was aimed at. That was low cost, battery operated test equipment. I think that partly this reflected the lowered cost of other interfaces, RS-232 in particular, and the systems that hosted them, such as the IBM PC and its clones. But partly this may have reflected lessened importance of battery powered data collection generally. I don't know if such systems were actually needed less, or if they just didnt grow as fast as other segments. Either way it would have lead to less market share.

Surveying is one place where battery power remained important, and where the HP-41C therefore remained popular. But that soon enough transitioned to specialized systems, and also the combination RS-232 and the HP-48. Today we see the HP-48GX holding on to importance in the surveying world, partly because of excellent custom hardware and software systems to interface to "total stations." I'm not a surveyor, so I don't know for sure why they remain so popular. But I can guess that they are relatively low cost, and low power solutions. That's the niche that HP-IL was designed to fill, oddly enough.

I say the "failure" was that of HP's marketing and management, not the product. The 71 especially was made for technical professionals; yet not one in ten even knew it existed. Of those who did, not one in ten had any idea how much power was there (which was of course partly due to the user groups and third-party suppliers). I can't imagine that HP recovered their development cost on the 71, but that was not the fault of the 71 or its designers. It probably made Susan Wechsler, Nathan Meyers, James Dickie, Thomas Lindberg, Stanley Blascow, James Donnelly, Laurence Grodd, Charles Patton, Robert Miller, and the rest of the design team just sick to hear their creation was being canned!

*Message #12 Posted by **Howard Owen** on 21 Sept 2005, 9:07 p.m.,*
in response to message #11 by Garth Wilson

That must have been particularly tough when measured against the success of the HP-41C. HP really hit the "sweet spot" with that machine. I don't know if it's second in unit sales to the 12C (which surely must hold the top spot) or if some other machine holds that distinction. But if you combine longevity on the price list with enthusiasm for the machine then, and even more remarkably, now, you have got to hand the 4C the crown as HP's most successful calculator ever.

Still, I'm having more fun with the 70 series. The 71B is cool, but the 75C is more of a challenge, since there's less materual extant for it now.

I think I've gained a small insight into this topic over the last couple of days. The HP-IL card for the 80 series is rare. I finally obtained two in one lot. Plugging on in to my HP-87, I tried to get it to talk to my other machines and peripherals. It's probably a stretch to say that the HP-85 implementation of HP-IL is nearly as primitive as the 41C's, but I tend toward that point of view. I'll cover the technical details elsewhere, but lack of a full-function HP-IL implementation in the HP-85 series may have contributed to the failure of HP-IL as a product.

Dear Don,

your idea about creating a analogue voltage data logger plug in rom pack sounds really nice. Helpfully for this system would be a resolution of 12bit or more, also a multiplexer for more than one measurement channel would be nice.

For HP-41 was the CMT-300 digital voltmeter box available, which was designed from Corvallis Micro Technologie. Furthermore exist the HP3468 digital voltmeter which includes the HP-IL interface.

From CMT also the additional CMT-200 digital I/O box was available for HP41. This includes a 8bit digital Input / output ports. In combination with the voltmeter box you get a compete data logger system for HP41. Furthermore from CMT was available the fantastic RAM-Disk (with HP-IL). This includes 128KByte memory up to 512KByte memory plus RS232 interface option.

May be you are able to add some of this features to your analogue voltage data logger plug in rom. That means : Additional digital I/O lines for realising control applications plus RAM memory for storing data.

My own battery powered I/O-Board and the IL2000 System includes some analogue voltage input and output channels (with 8bit and 12bit resolution) plus some digital 16bit input / output ports for control applications.

With best wishes from Germany - Christoph Klug

Interestingly, when you read Kane&Ushijima's book on HP-IL, there is very much in common between HP-IB and HP-IL, so one could in principle call HP-IL something like a serial version of

HP-IB (surely there are differences in topology, in electrical parameters and the device identfication mechanims, but the logic behind both is rather similar).

Concerning control instrumenation, it should be also asked what the benefit of a 8 bit bus technology is nowadays. Serial communication is not slow by itself - see the PCI-Express connection lines in a modern PC. HP-IL took into consideration that the controller itself, i.e. here the HP-41, is not fast enough to feed large amounts of data to the ring. A CPU with a 300kHz clock, and effectively a 1/6kHz cycle time it power-saving, but definitely not fast (for normal calculations, you wouldn't need more anyway, BTW).

When the question were to design a new communication system to replace HP-IB, I'd rather think about some multi-master serial USB type than the conventional parallel HP-IB handshaking. Powerful, ad also fault-tolerant protocols are now easily written in software; HP-IB is a child of the 80s; it could be rather easily "coded" in TTL.

*Message #19 Posted by **Meindert Kuipers** on 22 Sept 2005, 7:27 a.m.,*
in response to message #18 by don wallace

RS-485 multidrop might be nice, but it is not really multi-master. CAN is a totally different bus and requires a specific controller (some PIC's have it nuilt inside), and software may be somewhat complicated.

For easy interfacing with peripherals SPI or I2C could be useful, since there are ADCs, DAC, memories and many other interface IC's that can immediately connect to it. This is also realtively easy to implement in a microcontroller by bitbanging a port (if the controller does not already have I2C or SPI.

On your remarks about current consumption (further down in this thread): any microcontroller will consumer more power than the HP41 if you let it run at several MHz. I considered a microcontroller in my MLDL2000, but decided against it due to the high power consumption. When running, the MLDL2000 consumes about 6-7 mA, on top of the 5 mA that the '41 uses, and it used no extra power if the NUT is not running, apart from some uA's to keep the SRAM alive.

I would strongly advise a (small) CPLD to create an external interface, which could be powered from something outside when it is connected. My MLDL2000 uses USB power when that is connected.

*Message #24 Posted by **Holger Veit** on 23 Sept 2005, 3:27 a.m.,*
in response to message #23 by don wallace

It is probably a two-chip solution; you'd better have level shifters to interface to the HP bus, and maybe a tiny voltage regulator (Z diodes already consume to many mAmps). The MSP is 3.3V, however TTL tolerant at its I/O pins, but the HP41 is not even TTL compatible.

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #25 Posted by **Meindert Kuipers** on 23 Sept 2005, 4:37 a.m.,*
in response to message #24 by Holger Veit

The MSP looks promising, but you will need to buffer the inputs (HP41 I/O is about 6.5V) and drive the outputs (HP41 is CMOS so you will need to reach the full 6.5V to keep power consumption low).

This is in general a problem to connect state-of-the art technology with good old TTL or CMOS hardware.

Meindert

Hi Meindert. Thanks for your thoughts. I agree completely...

Can't be bothered with trying to pack in even more electronics...(!)

What a shame...

(Hand soldering one chip one resistor and a crystal was trying enough ;-)

However, I will try to find a nice CMOS microcontroller which will cope with 6 volts. I think that's why Diego had a 47 ohm resistor in the Vcc rail, to drop a little voltage. Never got around to asking him. Diego? Are you there? (Hi!) The thing is, when the coconut is sleeping (display on) the 41 internal psu is generating 6.2 volts on the rail AND the PIC chip is not drawing any current so it is seeing the full 6.2 volts on it's VCC pin, so I do wonder a bit about the long term reliability of the basic Clonix circuit. I considered using a diode to drop 0.6 volts...

DW

*Message #28 Posted by **Meindert Kuipers** on 21 Sept 2005, 5:03 a.m.,*
in response to message #2 by Holger Veit

This is all possible with the MLDL2000, it has USB. By replacing the USB print it can be used to build an interface to almost everything, that would be a simple hardware expansion by implementing the UART in the CPLD and add the RS232 level shifters in a very simple piece of hardware. The design is completely open and when I have finished the current production run all design files and sources will be published. In addition, the MLDL2000 will hold ALL currently known ROM images.

> What do you feel is the best? USB or universal RS232?

USB is becoming far more common in consumer electronics that get operated as appliances by people who have absolutely no concern for what goes on inside the boxes, but RS-232 is much more friendly to anyone who would want to make their own equipment. I think the maker of MLDL2000 said that making a USB controller gets a lot more complicated and is impractical for the 41.

RS-232 requires a lot more power, but there have been some hand-held terminals made that had no batteries and operated entirely on power scavanged from the RS-232 lines coming from the equipment the terminal was connected to. Of course the power has to come from at least one end, so you couldn't connect two 41's together to transfer data if both ends were expecting the other to supply the power.

I myself do have the FSI164A HPIL-to-dual-RS232 interface converter; but I don't think there's any way to transfer a program over it unless you "print" it to the interface converter. Added funcions like this would be welcome.

Hi Meindert.

Wouldn't the process of backing up your mag cards to your mldl system be very laborious and maybe even wear out the 41 connectors (plugging and unplugging...)?

What if you have a power failure or corruption of the memory in your mldl2000? All that work doing the transfer down the drain...

DW

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #37 Posted by **Meindert Kuipers** on 22 Sept 2005, 3:00 a.m.,*
in response to message #36 by don wallace

Backing up your mag cards is a one-time exercise. Just load as much as possible cards in the '41 or in Extended Memory and then transfer to a ROM image (in the MLDL2000) with existing utilities. This can then be saved on the PC as a main backup. When programmed in Flash the programs will be safe for a long long time, and can be reloaded form the PC backup whenever you want. Some software could be written to make the process much easier and that should not be a very difficult task.

Re: Anyone want hp 41 to 41 infra-red data transfer?

*Message #39 Posted by **don wallace** on 21 Sept 2005, 4:17 p.m.,*
in response to message #2 by Holger Veit

Hi Holger.

I am also planning some sort of wired connection to a PC for the 41. But that is a rather different project. I am hoping that will be a straight RS232C cable which you can simply plug in to the 41 to upload and download either the complete machines memory, or just the user data and / or user program area. That is actually pretty involved, as is anything which connects to the 41.

The difference I see with the projects I am doing is that they must be 100% reliable. That is, they MUST NOT crash the calculator and make it lose it's memory. In other words, full commercial grade peripherals, noy hobbyist experimental equipment. It's a whole different kettle of fish...

Thanks very much for your feedback. It's appreciated.

Do you use your own plug in module hardware solution, or the existing module designs Clonix or NoVRAM from Diego Diaz or the nice Zeprom ?

With best wishes from Germany - Christoph Klug

*Message #4 Posted by **don wallace** on 21 Sept 2005, 6:15 p.m.,*
in response to message #3 by Christoph Klug

Hi Chris.

At present the hardrware is a copy of Diego D.'s (actually almost identical to John I.'s) system.

At present the firmware is Diego's (John's?) old code.

I expect now I have it running reliably, I will alter the PIC code a bit. Although that code is really great, I can see the possibility for some enhancements. Certainly to take the development work foward

into other territory the code and hardware will change quite a bit. This is near the top of my list of prioroties.

I am going to do some audio and digital electronics engineering work too, though, so the projects will run concurrently.

Hi Howard.

(Tongue firmly planted in cheek...) What?! Is that all? You can put a lot of other code in there too.

The other thing Howard, is that given there are no 41 (spare) parts, I can't see a service module being all that useful to you. Also, if the service module works then there's not that much wrong with the calc.

You can test the RAM very easily with a user mode program. Finally, the service module isn't just software. There's some unusual hardware in there too, which code can't emulate.

Still, if you want one, can do! Would be a lot of fun to play with. How about some synthetics? Advantage? Assembler? Get my drift...?

Thanks for your feedback. Always nice to hear from you.

Cheers,

DW

HP41 service rom

I believe that the last time this came up, (in connection with emulating the service module on the MLDL2000,) Eric Smith stated this wasn't actually the case. Subsequent reading (In William Wickes "Synthetic Programming" book, I think) states that the service module takes over the 41 OS by virtue of living at a particular ROM address and implementing specific hooks. In other words, apart from the addressing, there's nothing but software involved. Perhaps Eric can set me straight if I have that wrong.

> Quote:
>
> Still, if you want one, can do! Would be a lot of fun to play with. How about some synthetics? Advantage? Assembler? Get my drift...?

Welll, I *am* on the list to get an assembled MLDL2000. I think I'll wait to see how I do with that before I go hog-wild on copies of already existing modules. I might make an exception for the service module, assuming I remeber Eric's comments correctly.

As far as custom code, that sounds interesting. I need to think about that a bit more.

And to you!

Re: Anyone want custom hp41 rompacks?

*Message #10 Posted by **don wallace** on 21 Sept 2005, 8:59 p.m.,*
in response to message #9 by Howard Owen

Hi Howard,

Oh yes, I forgot you "got spare parts"... ;-)

The thing is, my clonix clone does not latch up or crash. That's gotta be a positive factor vis-a-vis other stuff.

To check up on things w.r.t a service module I suggest a careful read of the original hp documents. You guys can probably prove me wrong; that's cool. I haven't had time to read all of the documentation thoroughly enough to recite it chapter and verse. There's a fair volume of material. (Show me the money...)

With regard to the service module just being software, how then would it be able to calculate processor clock speed? (Think carefully before you answer..., where's the timebase?)

I am not talking about it being at page 4 in the system. That's got nothing to do with anything... And besides, Forth sits at page 4 and 5 and it does not run the cpu all the time, nor is it a program which can't exit back to the original rom os on command ("bye").

I'm not hp, but if I had designed the service rom (maybe I am getting confused with the diagnostics rom?) at that time, I CERTAINLY would have used some logic which was not rom circuitry. Logic is just too useful (to have in a hardware diagnostic package)...

Contrary to what programmers think (and I am not having a go at anyone here, just being frank, honest and speaking from some experience), there is a lot of stuff you can do very differently with hardware or which requires hardware to implement. Turing might not agree, but then he was a mathematician and not an engineer. Babbage was way ahead of his time sadly for him, but his hardware solution to computation is interesting in that it actually works... I'd hate to have to actually compute (anything) on the original Turing machine. Do you see my point? Not all computers are digital machines, either, btw...

Software is great, but it's not the be all and end all. You still need hardware to "run it on".

And most software of the type we are discussing here (as opposed to more specialized stuff) assumes the existence (intact) of all required hardware to run. That's not the case in a defective system under test. Intermittent faults make the situation worse again...

On a different, related subject this quiz might be interesting:

Q. The most complex software in the world is found:

a: In UNIX (/LINUX)

b: In Micro$oft Windows XP / NT4 etc...

c: In the space shuttle take-off / landing Computer

d: In AT&T's 4ESS telephone switching system (or whatever it's called nowadays)

You might just be surprised at the answer...

Q. In the correct answer above the largest proportion of the code is devoted to:

a. Kernel operations (including task switching)

b. mathematical computations (including memory addressing)

c. User interface and human factors (e.g. drawing graphics)

d. Error detection and correction (include software and hardware malfunction detection and recovery in this category)

Again, maybe the answer will surprize you.

DW

P.S. happy coding, guys!

Good question. Seems like you'd need an external reference.

> Quote:
>
> I'm not hp, but if I had designed the service rom (maybe I am getting confused with the diagnostics rom?)

Maybe. Or maybe I'm the one who is confused. I wasn't aware there was a diagnostics ROM as distinct from the service ROM.

> Quote:
>
> Contrary to what programmers think (and I am not having a go at anyone here, just being honest and speaking from some experience),

Oh, yeah. And it's "to-may-toe" I tell ya! 8)

> Quote:
>
> there is a lot of stuff you can do very differently with hardware or which requires hardware to implement. Turing might not agree, but then he was a mathematician and not an engineer.

It's two levels in the abstraction layers we wrap around the mapping of the motion of electrons and photons into informationi processing. There is therefore no necessary disagreement. Alan Turing invented the field of Computer Science in one fell swoop in 1936. His work was pure Mathematics. And while it was revolutionary in scope and impact, it bore no relation to any physical machine doing real computational work. (This was *before* Bletchley Park, remember.)

Real computers have to deal with real electrons traveling through real circuits. Considerations of timing, temperature, conductivity, permissivity, crankiness, colic and gout are paramount. 8) There is plenty of theoretical work underpinning Electrical Engineering too, but the impact of the real physical world makes EE a whole different art form than CS. I say this as one who is untrained in the former and self-taught in the latter. (I have had frequently to make software work for EEs, MEs and Physicists in the past, so I am familiar to some degree with how they think. I've also formed some conclusions about why they think the way they do, which I'm saving for my Magnum Opus: "Everything I Need to Know I Learned by Cleaning Up After Computer Users Too Clever By Half To Clean Up After Themselves". The title is tentative. I may need to flesh it out a little more.)

So it's all well and good to conceive of an abstract machine, and to investigate its properties, thereby founding a new branch of Mathematics. (It's actually damned good, far exceeding anything most of us, or me at least, could even aspire to acheiving.) But it's another trick entirely to go and implement a physical system that embodies the abstract machine. And to expect that physical system (or multi-layerd systems of systems) to behave purely according to the abstract machine model is silly.

> Quote:
>
> Babbage was way ahead of his time sadly for him, but his hardware solution to computation is interesting in that it actually works... I'd hate to have to actually compute on the original Turing machine. Do you see my point?

I think so. 8)

I've heard it said, by the way, that Babbage was too much the Mathematician to design systems

that could realistically be implemented with the available technology. I'm aware that a group in England created an Analytical Engine using machining techniques of the time. But "realistically" includes not only the mechanical engineering, but the financial wherewithall. That's another whole level of abstraction, God help us.

Somewherre I saw a modified ISO model of networks that illustrates this:

```
Religious <-- You are here
Financial
Application
Presentation
Session
Transport
Network
Data Link
Physical
```

>
> You might just be surprised at the answer...

I think it's the phone switching system. It's an enormous, distributed computer. Linux is less complex than the NT code base, to judge by number of lines and tendency to crash. So I'd place Windows and Linux at 2 and 3. The software for landing the space shuttle has to run on some pretty old machines, so I'll put that as the least complex.

I answered that off the top of my head, and will not change it if I got it wrong.

Hey, Howard! Interesting post!

I really enjoy raving on this forum (I just hope I don't bug too many people...) Only bettered by the great replies I get from you and the other knowledgeable people here (*everybody* here in their own way).

So many good points in your post Howard!

The thing is, when you look at it, Maths, CS and EE are just amazing endeavours. The whole idea of developing systems which do symbolic processing at the speed and precision at which the cutting edge operates is amazing to me. A systems approach, with that line between the hardware and software being somewhat arbitrary and certainly movable, really fascinates me.

You wrote:

Religious <-- You are here Financial Application Presentation Session Transport Network Data Link Physical

well, I guess that would also apply to me some of the time...

Congrats on the quiz, you scored 100%

There's a great book which some people here might find interesting called "Fatal Defect" by Ivars Petersen. Although it is not actually 100% correct in every single detail, it covers software glitches in a way I have never read before. It's well written too. Examples are a software glitch in a therapeutic x-ray / electron beam machine which killed a few people in Texas 20 years ago, a bad GUI in the A300 aircraft which has led (it's been argued) to a number of (real aviation) crashes, the famous AT&T phone system crash of 1991 and the aborted launch of the first space shuttle flight in 1981 (when I was "doing time" in the Aussie Air Force as a cadet comms engineer and mucking around with my then-new 41CV doing math for third year students...).

But I am getting into another (+ve) rave again...

I suppose that is what I like about the "old" hp, the engineering involved in the whole package, whether it was an oscilloscope, RF spectrum analyzer or a humble scientific calculator, were simply not bettered. Equalled, maybe, by other firms in particular fields, but not bettered. So hp had a real "class act", back then...

Now they are making bubble jet printers, competing with Canon (whom I once worked for doing repairs on calculators and desktop computers... for $A306 a week before tax).

You also wrote:

Oh, yeah. And it's "to-may-toe" I tell ya! 8)

Absolutely...

I remember now that this was on a t-shirt I bought around 1987, I think. At any rate, it was then when I first got sime insight into how networks were being managed at the large scale. The big fights then were between TCP/IP, the protocol of the Internet or "arpanet" as it was still sometimes called) and other protocols like X.25 and DECNet. The latter was important where I worked, in the Physics department at UCSB. We ran Vaxen with connections to various DECNET based "internets." SPAN, the Space Physics Analysis Network from NASA and HEPnet, the High Energy Physics network were two of those. (Digression: one of our links to the latter was over a 56K line to the Stanford Linear Accellerator. When the Loma Prieta earthquake struck the Bay area in 1989, that line stayed up. That was an early indication for me of just how robust the telephone network really was.) Anyhow, the "Religion" in the diagram was just so appropriate, given how the various groups sniped at each other. The thing about computer networks, then as now, is that they cross organizational lines. But back then that was kind of novel. So there was a lot of groping around for how to deal with groups needing to cooperate in ways they hadn't had to up to then. And the usual outrageous academic politics would flare up in ways that could be amusing - from a distance.

So the "religious" layer could just as well be labeled "political" is the point of all that.

> Quote:
>
> There's a great book which some people here might find interesting called "Fatal Defect" by Ivars Petersen. Sounds like some of the topics that were and are kicked around on the RISKS list. How organizations succeed and fail is very interesting to me. I'm a geek, not a manager, but I just get a kick out of exploring how human beings act in packs.

Possibly apropos of that, I read a very dry sociological work called "The Challenger Launch Decision" several years ago. This was an analysis of that famous disaster undertaken several years after the fact. The author was an academic who was puzzled by the conclusions of the official investigations, the independent commission and two congressional inquiries, insofar as it ascribed basically evil motives to the managers at Morton Thiokol and NASA. The idea was called the "immoral calculator hypothesis," and it asserted that those managers deliberately hid evidence of problems with the SRB seals, in order to keep to the flight schedule. This didn't make sense to the author, so she looked more closely at the actions of the people that were involved, starting from the beginning of the shuttle program forward to the disaster. So there's lots of detail about how the different groups that contributed to the space shuttle's development and management worked over a fairly long period. She concluded that what really happened was that each time something unexpected occurred, like the seals showing more erosion, as they did flight after flight, they would re-baseline their expectations of what was "normal" for the next flight. So they would see 20% burn through of the inner seal, for example, which they would go off and exhustively analyze. They would conclude that it wasn't actually a danger to the mission, since there were two seals in a redundant arrangement. The next time, there would be 40% burn through, and they would go through the same procedure. So they incrementally accepted more and more risk, never taking too big a jump into the unknown. She called this process "normalization of deviance," and made a persuasive case that that was the real reason the fatal decision was eventually taken.

Something similar may have happened with the Columbia and debris from the external tank. They had plenty of evidence that the foam was a problem, but no truly mission threatening damage until the final flight.

> Quote:
>

There's a whole other topic we have beat to death in other threads, about how the rate of change has tended to flush that sort of attention to quality out of commercial electronics and software. I always feel middle aged when I consider it. "Why, when I was a boy, we had REAL computers, not these new-fangled low-quality, fancy-schmancy quantum entaglement thingamajigs.." 8)

> Quote:
>
> Now they are making bubble jet printers, competing with Canon (whom I once worked for doing repairs on calculators and desktop computers... for $A306 a week before tax).

And they continue to beat the pants off Canon and everyone else in that market. Cold comfort, I say.

Just one hook. The mainframe ROM does a CALL 4000 (hex) early on. If there is any ROM there, that gets control. Otherwise, the fetch from 4000 will return an all-zeros word (due to bus precharge). Normally that would be a NOP, but the Nut processor will treat a zero word at the target of a CALL instruction as a RETURN.

The service ROM never returns control to the normal 41 OS; it might call some subroutines in the 41 OS, though I somewhat doubt it. I have not taken the time to disassemble the code.

*Message #16 Posted by **Doug Wilder** on 23 Sept 2005, 10:24 p.m.,*
in response to message #14 by Eric Smith

Hi Eric,

Yes, the call is @ 0180H, early in the sleep wakeup. Interesting that you should call it a RTN

when there is no rom there (or more correctly: a null word at 4000H). What surprized me about your post is that you say it is a RTN instead of a NOP.

This implies that a stack level is used, something i hadn't realised. Other references i have indicates it is a two word NOP, so i never bothered to test the stack contents.

Thanks!

*Message #17 Posted by **don wallace** on 23 Sept 2005, 10:33 p.m.,*
in response to message #16 by Doug Wilder

Hi Eric, Doug.

Does the 41 os do a real CALL or does it first test the data returned from ADDR:4000?

I have not bothered to look at the VASM listing, but if I was designing, I'd test the word first, then do the CALL if the ROM existed... That makes much more sense in a system which is designed to have optional ROM in different locations.

I read something vague in the hp literature whcih said if a null was read then the processor doesn't do a CALL. I imagine the data is tested first... Your thoughts, guys?

Re: Anyone want custom hp41 rompacks?

*Message #18 Posted by **Monte Dalrymple** on 23 Sept 2005, 11:55 p.m.,*
in response to message #17 by don wallace

The JSB (otherwsie known as a CALL) is executed normally. If the first instruction fetched after a JSB is a NOP (all zeros) it is automatically interpreted as a RTN by the CPU. There is a trace of what this looks like on http://www.systemyde.com/hp41. The CPU contains special logic to do this.

This is a very powerfull feature of the NUT processor. Any attempt to execute a

subroutine in a non-existing part of memory would result in an immediate return and saves bytes when coding. This is also used when executing the entry points at the end of a module. I do not recall if the status of the carry is influenced by the result of the jump.

The (image of the) Service Module runs quite well on the MLDL2000, I have verified this about one month ago. There is no strange hardware in the module, but depending on the test you just need the modules being tested and in some cases (see the Service Manual) you could measure voltages of verify signals with a scope.

There is no recovering from the Service Module, apart from removing it from the HP41 or, in case of the MLDL2000, disabling page $4000.

*Message #23 Posted by **Meindert Kuipers** on 24 Sept 2005, 8:38 a.m.,*
in response to message #22 by don wallace

Have a look at the HP41CX Service Manual, page 4-8: a Time Module is required for the clock frequency test on the '41C and '41CV (built inside the CX). I have been able to runs almost all tests, and those I did not run was because I did not bother to plug the hardware in (Cardreader etc).

I have even done a more spectacular test. I have bought a Wand through Ebay, but it did not work (could not see anything in the CAT 2 listing), but the LED would light up. I plugged this Wand in a port, loaded the WAND ROM image in the MLDL2000 and voila (excuse my French) : I have a perfectly working WAND again!

82490A HP-41 Translator Pack - Need Help

*Message #1 Posted by **Howard Owen** on 20 Sept 2005, 4:57 p.m.*

I've just become the lucky winner of a 71B auction on eBay that included the 82490A HP-41 Translator Pack. I've been playing with this pack before now with EMU71 and an image of the ROMs I obtained from JF (Thanks!) In the course of that, I discovered I was missing two critical pieces of BASIC software required for translating and loading HP-41 programs into the HP-41 FORTH environment. These are referred to in the manual as "READ41" and "TRANS41". (The latter not to be confused with the PC software of the same name. I've asked the eBay seller if he has these, and he said no, though he does have the manual.

Does anyone have access to these BASIC programs? Could you make them available to me? I can handle any format you care to use, including cards, 9114 floppy, cassette, LIF image, raw bits or text listing.

Thanks!

*Message #2 Posted by **Etienne Victoria** on 21 Sept 2005, 3:27 a.m.,*
in response to message #1 by Howard Owen

Good morning Howard,

TRANS41 & READ41 Basic programs are INCLUDED in your Hp-41 Translator ROM.

Just type RUN TRANS41 or RUN READ41 on your beloved TITAN.

More detailed explanations in the 82490A HP-41 Translator Pack user manual on the Hpmuseum DVD.

Or if you don't have them just ask more questions.

Friendly regards from France!

Etienne

in response to message #3 by Geir Isene

Perish the thought!

No one could seriously argue that the One True Editor could be compared to something as trite as vi.

8)

Edited: 21 Sept 2005, 11:09 p.m.

Re: VIM: HP-41 syntax and file type plugin

*Message #5 Posted by **Geir Isene** on 22 Sept 2005, 3:25 a.m.,*

VIM is the power of simplicity compared to the bloated mammoth Escape-Meta-Alt-Control-Space ;)

Re: VIM: HP-41 syntax and file type plugin

*Message #6 Posted by **Howard Owen** on 22 Sept 2005, 10:22 a.m.,*
in response to message #5 by Geir Isene

I'm going to stop now. 8)

My background is as a systems administrator. In that role I've had to become proficient at both vi and emacs. I may be somewhat unusual in that I will use one or the other editor depending on what I want to do. So, for example, when I need a quick edit of a text file or script, I use vi. (VIM, elvis, nvi, "real" vi, depending on OS.) If I'm writing a larger Perl or C application, I use xemacs for the perldb and gdb integration. So I actually don't participate in the editor flame wars.

*Message #7 Posted by **Mike T.** on 22 Sept 2005, 7:09 p.m.,*
in response to message #4 by Howard Owen

The 'one true editor' was of course TECO...

Mike T. (Ducking quickly!)

Re: VIM: HP-41 syntax and file type plugin

*Message #8 Posted by **Howard Owen** on 22 Sept 2005, 9:08 p.m.,*
in response to message #7 by Mike T.

Yes, and Gosling wrote an EMACS version in TECO. I used TECO briefly on a VAX at school. I think you are right about the One True Editor appelation being applied to it first. But EMACS is at least the spiritual heir of TECO, since it's an editor you can write as you use it. Nowadays I don't spend my entire online life in EMACS like I used to. USENET, mail, shell, c compiler. debugger, what more could you ask for? But, like I say, I was a sysadmin, so I had to use vi in order to support vi users. And I needed to know ex and ed also, in case I ended up in single user mode on a Sun 3 or BSD|Ultrix VAX. So I got into the habit of using vi for quick edits. It did start up a lot faster than EMACS. I also found the regex implementation more to my taste. But I didn't start to seriously dig into it until it wasn't really vi anymore, but one of several vi clones. Mainly, that was vim. Vim has lots of interesting stuff hidden inside. I like their syntax highlighting in Perl better than the standard emacs scheme. But highlighting the searched for text in obnoxious brown everywhere it appears on the screen is bogus. ":nohl" does away with it, but I haven't discovered how to turn it off entirely, or preferably modify it to be less intrusive.

Oh, gosh, that's a long ramble on Unix editors on an HP calculator site! But there is a calculator angle, besides Geir's worthy vim mode for the HP41. That has to do with another vi clone - elvis. This is the defult vi on Slackware, which I have installed on my old Compaq Pentium 75 box. That's where I have my HP-IL card and where I run EMU41 and EMU71 to interface my various HP-IL capable machines. Elvis has a great hex/ascii mode it turns out, that it invokes by default whenever there is 8-bit content in the file you edit. So I've been using it to study the HP-

75 BASIC file format.

There, the OB calculator reference is accomplished! 8)

HP broken : help!

*Message #1 Posted by **Claudio** on 20 Sept 2005, 12:09 p.m.*

Hello, I need your help because my HP100LX is broken (I know, it isn't a true calculator but please, I really need some help....).
While it was connected to the external power supply it was overheat near the power connector and then it was off. Now with the batteries all it's ok, but with only the external power supply it's all off.

I have opened it and I have found a smd component with a melted plastic case. It's the first component on the line from the power supply connector.
I can read that this component is a "15DM" in a SO23 case, but I don't know what kind of semiconductor it's, and how substitute it (possibly with an original replacement). I suppose that it's a diode to protect the HP by reverse polarity of the supply, but I am not sure.
Is there anyone who knows this component and where I can find it?

I can send you a picture of the pcb of the HP with the broken component.

Thank's very much for any help.
Best wishes,
Claudio

*Message #2 Posted by **don wallace** on 20 Sept 2005, 5:36 p.m.,*
in response to message #1 by Claudio

Hi Claudio. By all means send me your photo.

donwallace63@yahoo.com.au

It's a diode I guess. Nothing special about it, probably but it could be a Schottky diode. Knowing hp they may have used one. Schottky diodes just turn on better (lower voltage drop and more quick turn-on) than regular rectifier diodes.

You can replace it with a IN 4001 rectifier diode or a UF4001 which is the high speed schottky version.

BUT, I'd get a circuit diagram or some help doing all this first. After all your calc is still working, so far. What happened?

Don

Upgrading HP48G

*Message #1 Posted by **H.D.** on 19 Sept 2005, 11:54 p.m.*

It's me again... I've found a few ram chips which have almost all the right specs I need. The problem is that they (all the 128kB x 8 types) come in 1 Mbit modules and that's the smallest I can find from non-minimum-order companies (e.g. futurlec.com or digikey.com -- digikey has a $5.00 charge for orders below $25 which I can handle)

So my question is, would there be problems if I were to use a 1Mb sram module for the initial 128kB upgrade? I wish I could post to comp.sys.hp48 but I currently do not have a news server. Anyway, any help would be truly appreciated.

Re: Upgrading HP48G

*Message #2 Posted by **don wallace** on 20 Sept 2005, 12:59 a.m.,*
in response to message #1 by H.D.

Hi H.D. Can yu tell me what the par number is for the chips you have?

By typing a few (address buss) pins low on the chips you can get the ran to operate happily as a 128 kB device.

BTW, whats the part number for the original chips, too?

DW

Re: Upgrading HP48G

*Message #3 Posted by **H.D.** on 20 Sept 2005, 1:36 a.m.,*
in response to message #2 by don wallace

I ended up buying (from Digi-key):

```
M5M51008DFP70HIA0-ND    IC SRAM 1MBIT 70NS 32SOP
PT100KXCT-ND    RES 100K OHM 1W 5% 2512 SMD
PT47KXCT-ND     RES 47K OHM 1W 5% 2512 SMD
568-1379-1-ND   IC GATE NAND QUAD 2INPUT 14SOIC
296-1195-1-ND   IC HEX D-TYPE FLIP-FLOP 16-SOIC
```

What I was failing to realize was that when these companies list the modules as 1 M or 1 Mb, it stands for a mega-bit, which is equivalant to 1,000,000 bits / 8 ~ 128kB. I, for an incredibly and stupidly long time, kept thinking these were 1MB (as in mega-byte) modules. Anyway, the memory was "LL" but the datasheet did say low active and low idle power; the currents were comparable to one by Sony, listed as CXK581000AM-70LL

I picked up an extra 104 SMD resistor (the 100k ohm one) to upgrade the IR receiver.

As for the original 32kB memory chip on my HP48G, it's Winbond W242575-70LL.

Also, it appears that my PCB board has a number printed on it: NI9803 (printed slightly near the center of

the board). I also see another number: I34 slightly below the CPU. I am hoping someone knows something about how to place the 104 and 143 SMD resistors as according to an upgrade doc I read, their alignments vary depending upon PCB versions.

I've upgraded an HP48G before (only to 128kB user ram) but it was stolen when I was studying abroad in Hungary. I finally bought a new 48G (for $15.00!) and decided to go for port 1 and port 2. This time around, I managed to open the case without any damage whatsoever (e.g. no cutting or removing the keyboard overlay) by popping the rivets (they're not damaged and are reusable) and slowly applying pressure to the latch points. I'll document the process and have plenty of photos in case people are interested.

Re: Upgrading HP48G

*Message #4 Posted by **don wallace** on 20 Sept 2005, 5:38 a.m.,*
in response to message #3 by H.D.

Hi HD.

I can't seem to find data on the ram you bought.

Also, please note that RAM can be electrically organized in a variety of ways, the most common ones being: 1 bit wide, 8 bits wide, 16 bits wide. I have worked with 4 bit wide and 32 bit wide ram as well as the above.

Your safest bet is to get something which is pin for pin compatible and timing compatible. Don't forget voltage too, but this is pretty standard...

DW

HP-67 Card reader woes

*Message #1 Posted by **Jim Creybohm** on 19 Sept 2005, 9:09 p.m.*

Greetings all.

I have a 67 that appears to have some modest issues with the card reader. I spent the weekend trying to get the old girl (fella? seems like a sociology study) working again, and only met with limited success, and so I am hopeful that someone can help me further it along or help me decide if I need to send it off to fixthatcalc to do his magic on.

The problem is that the card is only pulled 1/2 way through, and then "error" is flashed on the display. By pressing Clx, the error message is cleared, and the card is then pulled through the rest of the way - indicating to me at least that the power is adequate for card performance. Thus far, I have examined a couple of other culprits:

1) The golden fingers may be bent too far. This is possible, however I am not sure; i) what they do and, ii) what the amount of bend is that they need.

2) I did not replace the sticky wheel, and I am not sure if this is the problem or not. I thought that the previous owner had done so, and this is why I did not pursue it with greater vigor. This will be the next step.

3) I noted also that the card reader head is very worn. It may be that the large number of cards it has seen may have had some negative impact upon it. Is there a way to tell if the card reader is within specs?

Re: HP-67 Card reader woes

*Message #2 Posted by **Tony Duell** on 20 Sept 2005, 6:14 a.m.,*
in response to message #1 by Jim Creybohm

The symptom of 'Error' after starting to move the card is very often due to problems with that finger contact.

To answer your questions :

1) The finger contact is lifted by plastic (nylon?) balls as the card moves through the reader. The ends of the fingers touch contacts on the back of the keyboard PCB.

There are 3 balls and thus 3 contact fingers. One lifts as the card is inserted to turn on the motor. The next lifts when the card is over the read/write head, and starts read/write. The last detects the cut-off corner of the card (it lifts later if the corner is cut) and is used for write protection.

I believe that if there's bad contact on these 'switches' then you get the 'Error'. In other words if one opens too early, or makes and breaks again due to too little contact pressure or dirt, you get thise problem.

2) You could try disconnecting the motor from the card reader PCB (note the polarity!) and run it from a 3V battery or similar. If that will pull the card through, the roller is probably OK.

3) There are ways of detecting wear in a magnetic head (often you notice the drop in self-inductance of the head winding as the gap gets worn larger), but I have no idea what the 'right' value for a 67 head would be, or how far worn it can be before you have problems.

Over-use of the cleaning card will wear the head (to the extent that I never use this card, I take the machine apart and clean the head by hand). I've never found a head too worn to work, though.

I would start by cleaning (propan-2-ol, and if that doesn't work, a careful rub with an ink eraser) the contacts on the keyboard PCB and the ends of the finger contact. If that doesn't help, look at the fixing screws for the finger contact. The 2 at the end are for fixing it and should be tight. The other 3 are adjustments for each 'switch'. Try screwing them in _slightly_.

Re: HP-67 Card reader woes

*Message #3 Posted by **Klaus** on 20 Sept 2005, 8:32 a.m.,*
in response to message #1 by Jim Creybohm

Forgive me this simple quesion, but do you use a fully charged battery? I have similar problems when using the cardreader with AC adaptor and empty battery pack.

Re: HP-67 Card reader woes

*Message #4 Posted by **David Smith** on 20 Sept 2005, 11:48 a.m.,*
in response to message #1 by Jim Creybohm

If your drive roller has not been replaced, this could easily be your problem. While you have the mechanism apart, clean the head (and any other gunk in the reader) with isopropyl alcohol.

Replacement Voyager Rubber Feet

*Message #1 Posted by **Brian M** on 19 Sept 2005, 5:28 p.m.*

I recently spotted someone selling replacement rubber feet on ebay called Vintage Voyager Rubber Pads (TM). They are advertised as being slightly thicker than the original equipment, thus adding increased clearance and reduced probablilty of scratches on the bottom.

Personally, I have no desire to participate in buying or selling through the world of ebay however, I am interested in aquiring some through more normal channels.

Any information out there good, bad or alternatives? Also, how to contact the manufacturer for further information.

Brian

Re: Replacement Voyager Rubber Feet

*Message #2 Posted by **Stephen Easterling** on 19 Sept 2005, 9:47 p.m.,*
in response to message #1 by Brian M

I don't know about the manufacturer of those Voyager feet (pads), but I have ordered some through that same Ebay seller. I should receive them any day now, and I'll let you know what I think. The seller was very easy to commuvicate with and seemed like an honest person. It is NOT easy finding some of these older calculators anywhere except on Ebay, and many of the sellers are engineers, scientists, or teachers and enjoy the HPs as much as any diehard collector, but feel it's just time to sell. Ebay is the best way for that. Besides, everytime I look on this website for a calc, the seller usually just refers the potential buyer to a link where he/she has already posted it on Ebay. But getting back to the point of your inquiry, I believe the replacement rubber feet should be well worth the money considering what they do for an old Voyager, their accessibility, and esp. their low cost.

Re: Replacement Voyager Rubber Feet

*Message #3 Posted by **Tomas Fischer** on 20 Sept 2005, 12:32 a.m.,*
in response to message #2 by Stephen Easterling

I purchased those pads from the same seller on eBay and they are perfect. Perfect fit and I didn't noticed the thickness. Very nice eBay guy btw. I would recommand buying from this guy. Hope this helps. Tomas

Re: Replacement Voyager Rubber Feet

*Message #4 Posted by **tony (nz)** on 27 Sept 2005, 4:31 a.m.,*
in response to message #2 by Stephen Easterling

I just received some here. Absolutely perfect!

Re: Replacement Voyager Rubber Feet

*Message #5 Posted by **David Smith** on 20 Sept 2005, 11:51 a.m.,*

in response to message #1 by Brian M

The Voyager slip cases are well known for being a very tight fit. Thicker feet may cause problems getting the machine in and out of the case. Many voyagers have lost their logos off the front due to the slip case.

Re: Replacement Voyager Rubber Feet

*Message #6 Posted by **Brian M** on 20 Sept 2005, 12:03 p.m.,*
in response to message #5 by David Smith

Good point on the case fit!

Re: Replacement Voyager Rubber Feet

*Message #7 Posted by **Curtis** on 22 Sept 2005, 5:51 a.m.,*
in response to message #6 by Brian M

Just to allay some of your fears/reservations, please review the feedback from satisfied customers: http://feedback.ebay.com/ws/eBayISAPI.dll?ViewFeedback&userid=pimpmyhp

Personally, I'm a computer scientist who was introduced to the HP Voyager calculators during my college days at Columbia University. Recently, I noticed my 16C had the feet missing and I thought about replacing the calculator until I saw the prices they were being sold for on eBay. That's how I came upon the idea of selling the pads. As the saying goes, although I've never really found out who said this but, "Necessity is the mother of invention."

Cheers,

Curtis

pimpmyhp@gmail.com

Re: Replacement Voyager Rubber Feet

*Message #8 Posted by **Curtis** on 22 Sept 2005, 6:09 a.m.,*
in response to message #5 by David Smith

The tight fit of the slip case was taken into consideration before the rubber feet were fabricated. Consequently, I can guarantee that they will not make your case fit any tighter than it already does. As a matter of fact, the difference in thickness is so slight, that you really have to pay very close attention before you'll notice.

By the way, I do accept checks or money orders directly. So if the concept of doing business through eBay is a deterrent to purchasing the rubber feet, then you can just contact me directly at pimpmyhp@gmail.com, and I'll supply you with a mailing address and "payable to" information.

Best regards,

Curtis

pimpmyhp@gmail.com

Re: Replacement Voyager Rubber Feet

*Message #9 Posted by **Chas** on 2 Oct 2005, 1:04 a.m.,*
in response to message #8 by Curtis

David and Brian,

I just found this string.

I bought 4 sets of feet from Chris last spring. just before he had his ad down pat on eBay and one set was the quantity he offered on an eBay sale. Mailed him a check, and they arrived after he wrote me when he received check and then when he mailed the feet.

Can't ask for a better fit, working great with the HP slip case.

Chris is quite communicative and does what he says that he will. I've never met him, and have no economic interest in his business. I'll buy from him again in the future when I run out.

His Replacement Feet just work well.

static memory chips for HP48 upgrade

*Message #1 Posted by **H.D.** on 19 Sept 2005, 5:28 p.m.*

I can't seem to find these chips: static ram, 128kB (128kB x 8), SO32, low power on idle, 70ns-85ns access time.

Does anyone know how I can buy, say, 3 of them without having to make a minimum order of $100.00 as is required by many distributors who actually have them?

Re: static memory chips for HP48 upgrade

*Message #2 Posted by **Randy** on 19 Sept 2005, 5:59 p.m.,*
in response to message #1 by H.D.

Try M5M51008DFP70HIA0-ND from http://digikey.com $4.50 each, in stock.

I have some older Toshiba TC551001CF's that you may have if you don't mind desoldering them from a board...

Re: static memory chips for HP48 upgrade

*Message #3 Posted by **Paul Brogger** on 19 Sept 2005, 6:09 p.m.,*
in response to message #1 by H.D.

I got mine from **www.futurlec.com** .

(I don't know if I got parts that conform exactly to your specs, but they work.)

At the time I purchased (several years ago!) Futurlec would take a no-minimum order. I'll leave it to interested parties to discover whether that's still true.

I do remember being pleased with their prompt service. (Again, this was several years ago.)

Good luck!

Re: static memory chips for HP48 upgrade

*Message #4 Posted by **don wallace** on 19 Sept 2005, 6:15 p.m.,*
in response to message #1 by H.D.

Hi H.D.

Let me know in a day or two if you still can't source the parts you need.

donwallace63@yahoo.com.au

Best wishes!

Don Wallace

Re: static memory chips for HP48 upgrade

*Message #5 Posted by **H.D.** on 19 Sept 2005, 8:15 p.m.,*
in response to message #1 by H.D.

Oh, I forgot to mention that I need a 128kB chip (the one posted above is a 1MB chip) since I'm upgrading my 48G (starts with 32kB ram). I was hoping to upgrade to 384kB (128kB main ram, 128kB port 1, and 128kB port 2).

So far, futurlec.com has all the _other_ parts I need (74HC00, 74HC174, 104 and 143 SMD thin film resistors) but nothing resembling 128kB (8-bit) static ram chips.

Sadly, no distributor has a search feature that allows descriptive words as opposed to knowing part numbers. Mouser electronics is an exception, but they too do not carry the 128kB sized ram chips.

Re: static memory chips for HP48 upgrade

*Message #6 Posted by **Paul Brogger** on 20 Sept 2005, 9:10 p.m.,*
in response to message #5 by H.D.

www.futurlec.com -- Components -- Integrated Circuits -- Memory -- RAMs

(I couldn't resist.)

Two parts are listed: a "628128" and a "681000", each 128Kx8 CMOS static RAM for $5.90 and $2.90/piece (respectively), in stock. (With a Hitachi data sheet available online for the former.) They're referred to as 1 mega*bit* (not mega*byte*) chips because 128K words x 8 bits ~= 1 million bits. They seem to come in several packages, so make sure they have available (and that you order) the *surface mount, dual inline package*.

I *think* that one of those parts is the same type of which I bought several way back when, and they're working today.

Good luck!

[. . . and I've finally got 'round to reading the other thread, so you already know most of the above. Sorry!]

Successful HP-11C speedup

*Message #1 Posted by **Karl Schneider** on 18 Sept 2005, 10:25 p.m.*

Fans of the HP-1*C "Voyager" models --

I followed the instructions posted in the article "HP Voyager Calculator Speedup" by Ken Sumrall and (later) Eric Smith to accelerate an 11C that I recently bought. The article is available at

http://www.brouhaha.com/~eric/hpcalc/voyager_speedup/

The calculator is a 1985 model (S/N 2508Annnnn) with the older 1LF5 CPU. I soldered a small 33 uH (microhenry) inductor to the same two terminals on the circuit board just below the battery compartment, where the calculator's 180 uF inductor underneath the board is soldered. The additional inductor fits between the case and the circuit board, and is electrically paralleled with the 180 uH inductor.

The modification reduces the inductance of the parallel LC circuit, increasing its resonant frequency and the effective clock speed, as described in the article.

Acceleration of processing is as described in the article -- about 2.5 times as fast as an unmodified 1986 11C (S/N 2624Annnnn), corresponding to the higher clock frequency. I have yet to see any malfunction or incorrect calculation result.

I bought the small 33 uH and 22 uH inductors at Norvac Electronics in Beaverton, Oregon for $0.60 each. (The 47 uH and 28 uH inductors recommended by Ken were not available.) The one Radio Shack store I asked carried only a rather large 100 uH inductor, but not these compact ones of lower inductance.

Speedup would be particularly useful on the 15C (for Solve and Integrate), but is a welcome enhancement for any Voyager. I just hope that there aren't any unwelcome side effects, besides the tolerable ones listed in the article.

The 11C I modified has a piece of the metal backing plate and one of the chassis-grounding springs missing, but the calc exhibits no apparent malfunction. Just curious: Is the second spring needed to connect one part of the board to another, or are two springs used only for redundancy?

Well, one unwelcome side effect will be an increased power consumption, approx. by a factor of 2.5

Andreas

*Message #4 Posted by **Eric Smith** on 20 Sept 2005, 7:27 p.m.,*
in response to message #3 by marais

Only while it's actually computing. When it's not running or processing a keystroke, the CPU goes into a very low power sleep mode, and the oscillator doesn't run.

So with the mod, you get 2.5x the performance for 2.5x the power, thus using the same amount of power for your calculations.

*Message #5 Posted by **Gerson W. Barbosa** on 19 Sept 2005, 9:31 a.m.,*
in response to message #1 by Karl Schneider

Hi Karl,

Congratulations for your success! My newer (or should I say less old?) 15C has the 1LM2 CPU. In theory, it can be speeded up up to 5.3 times. I'll try a 2 or 2.5 speedup. The drawback is that batteries may last only 3 years rather than 6 or 8, under the way I use it. The article says something about a narrower operating temperature range. No problem! According to the manual, the operating range is 0°C to 55°. Here I estimate we have indoor temperatures ranging from 10° to 30° all the year round. There is only one visible capacitor next to the battery compartment. Is this as simple as soldering the inductor in parallel with it?

Thanks,

Gerson.

in response to message #5 by Gerson W. Barbosa

Congrats Karl on your successful mod.

I imagine you will not have any problems at all. At extremes of temperature or at low battery volatge you may possibly have problems with the faster clocking, but these will, if they occur, result in either the calc not turning on, not turning off, or very strange and dramatic malfunctions as the memory or display does not respond to the faster logic operations on the buss. I beleive if this were to ever occur the worst that might happen is that the machine memory will get scrambled and the processor will do the 11C equivalent of a "memory lost" (I only have a 41c and cv). In that case, just increasing the inductor value a bit will slow it down a bit and get you reliable operation again. As you probably know, The 11c uses the same processor as the 41c. If you want any advice on how the processor works, feel free to ask me. I have been doing a bit of tinkering with the coconut... (and a lot of reading... ;-)

I decided against taking pictures because my "simple" digital camera is a hassle and it discharges its batteries. I wanted to make sure the calc worked properly before inconveniencing myself by taking photos.

Of course, I can always open it up again and take them.

I was hoping that the Voyager internal photos at this website would show clearly where the modification was made. Unfortunately, the photo of the 15C (http://www.hpmuseum.org/10cint.jpg) looks different from the 11C I modified. The prominent tubular object with colored bands looks like the 180 uH inductor that is under the circuit board in my 11C.

The article says that the stock 180 pF capacitor and 180 uH inductor form a parallel LC circuit. So, the additional inductor could be soldered in parallel with either one, presumably. I soldered the new inductor in parallel with the existing inductor, because that was straightforward.

I also have an HP-12C made in 1990 that I can try to "enhance".

*Message #8 Posted by **don wallace** on 19 Sept 2005, 11:25 p.m.,*
in response to message #7 by Karl Schneider

Hi Karl.

I think you mean 180 pF capacitor.

For general info for thread readers, inductors in parallel drop the value (desired goal) and for capacitors it's in SERIES to drop the value.

In the 41C series the parts are: 82 uH and 150 pF. The resonant frequency of that is around 1440 kHz. Logic in the processor does a divide by four to get the two system clocks which run at about 360kHz. It interested me to read that the 11 and 12 use the same processor as the 41. But the 41 has a voltage regulator and a 6 volt buss so they (can reliably) clock it faster.

(pF = picofarad, one millionth of a uF, stating the obvious for the casual reader)

Pardon me for sticking my two cents worth in...

DW

Edited: 20 Sept 2005, 1:30 a.m.

Thank you, Don...

>
> Pardon me for sticking my two cents worth in...

Mea culpa! You are right -- no apologies necessary. I failed to notice in Ken's article what was actually there. With 180 uF, the resonant frequency on the 11C is 884.19 Hz, not 884.19 kHz.

Also thanks for posting the helpful precautions. Next time I'll follow them...

Hi Karl and others

I woul dbe glad to get a picture of the HP-11C speedup anyway. Not to verify your work, but to see, how to do. I´m not exactly shure, if I understood the instructions correctly and I do not want to kill a HP-11C... If yo do not want to send the picture to the public, you can also send it to me personaly...

Matthias

Re: Answers: Successful HP-11C speedup

*Message #11 Posted by **don wallace** on 20 Sept 2005, 5:30 p.m.,*
in response to message #10 by Matthias Wehrli

Hi Mathias.

The main thing to be wary of is causing damage due to static electricity (electrostatic damage or esd in trade terms).

The simplest way to avoid this is to touch the soldering iron (plugged into a grounded three pin wall outlet) briefly on an electrical ground point in the calculator electrical system. The copper of a piezoelectric buzzer is a good ground point. Do not apply heat, just make contact.

This brings the calculator electrically to ground in a safe way.

Having done that the next thing is to be sure of the timing capacitor and timing inductor identity and to be careful in not damaging the pcb.

I find it is better to put anther capacitor in series with the timing cap. as you can just cut one wire on the cap itself and put the extra capacitor where the cut was made. I choose capacitors as they are less bulky than inductors.

If you want to choose the inductor, it looks like a fairly large bluish power resistor with colour code bands. And using a multimeter it looks like a short circuit reading very low resistance of say one ohm.

There is a photo somwhere on my site (on the 41).

What if just replacing the capacitor instead of adding another in series? That might be a better option for earlier boards. On newer boards, it may be easier just to solder another inductor in parallel with the existing one. In this case, the terminals should not be overheated as the existing weld may melt under the other side of the board. I have to open up the calculator to see if there's room for another inductor. In the table below (DECIMAL POINT IS COMMA) are listed both options (I am not sure if all capacitors are easily available). Notice that the mutual inductance between inductors have not been taken into account in the calculations. The table quite matches one of Ken's while the other is slightly different, which makes me wonder he may have soldered the new inductor below the existing one in the older board, thus minimizing the influence of the mutual inductance, and side by side on the newer board. Just a guess though. Please correct me if I am wrong.

Gerson.

	L (uH)	C (pF)	f (kHz)*	speedup factor

*Message #13 Posted by **don wallace** on 21 Sept 2005, 5:16 p.m.,*
in response to message #12 by Gerson W. Barbosa

Hi Gerson.

Yes, just replacing the capacitor is fine.

Mutual inductance effect is not a significant factor. The coupling factor would be very low... But at least you are thinking about things, which is good.

There are other factors which limit the top speed of the clock. The active components in the chip itself start to limit things as you go up in speed. So top speed has to be found from experiment. And this figure will vary a bit from calc to calc because they are all individuals... ;-)

Process variations at the factory mean each chip will have slight differences in it's absolute maximum speed ratings.

Successful HP-15C speedup!

*Message #14 Posted by **Gerson W. Barbosa** on 21 Sept 2005, 7:31 p.m.,*
in response to message #13 by don wallace

Hi Don,

I've just done a speedup in one of my 15C's. In this case, it was easier to add an inductor. Using a 33uH inductor I obtained a 2.49x speedup. It ran a benchmark routine in 9.75 s (mean of three measurements). Previously it had taken 24.3 s to run the same test. I will provide 'before' and 'after' pictures somewhere else in the thread later, in case other people are interested.

Cheers,

Gerson.

Successful HP-15C speedup! (Pictures)

*Message #16 Posted by **Gerson W. Barbosa** on 21 Sept 2005, 9:06 p.m.,*
in response to message #1 by Karl Schneider

I have just sped up my 2547B2728 15C (2.49x, using a 33uH inductor - see my reply to Don for other options). Thanks Karl, for having guts to try, thanks Eric for keeping Ken's article and my curiosity (you may remember I noticed Tony's 2-speed 15C among his numerous calculators of his collection).

When I left work at 05:00 PM, instead of going home as usual, I decided to go for the inductors. Unfortunately the ones I could find here were just too large to fit inside the calculator. So, I removed its outer blue cap, as you can see in the picture below. When I opened up the calculator after taking the batteries out I looked for two low-impedance points close to the battery compartment. I measured 6.4 ohm between the first two points I tried, those circled in red. I had to presume it was the LC circuit, because I could not see underneath the board. As the soldering iron I have at home is not grounded, I removed it from the outlet when soldering as a precaution. The green wire in the second picture was soldered to one end of the inductor because it was too short.

Before one decides to try, I would suggest a careful checking in the board as printed circuit board layouts may vary a little. It is advisable to follow all safety recommendations listed throughout this thread. The risk of permanently damaging the calculator while doing this modification should not be overlooked.

Regards,

Gerson.

HP-75 BASIC Tokens. - NOMAS Please!

*Message #1 Posted by **Howard Owen** on 18 Sept 2005, 8:23 p.m.*

I've finished the first draft of numeric constant assignment in my HP-75 BASIC program lister. I'm sure I'm missing some corner cases, but decoding of positive and negative mantissas and exponents, as well as integers works for the small set of test cases I've coded up. Reverse engineering this stuff by looking at the file dumps is interesting, but *slow*.

I'd like to renew my plea for the HP-75 NOMAS material. It contains the token table, among other stuff. The "other stuff" no doubt includes things like nibble or bit packed field decoding where appropriate. I can figure that stuff out by hand, but I'd like to finish this project in the current decade. 8) I'm willing to pay a reasonable amount, if that's necessary. But what I'd really like to do is scan the material and add it back into the public corpus of literature on the 75C, which is where it belongs.

The project? It's my SWAPDEX effort to catalogue all the existing "swap disk" images. I want to be able to describe all the software to the extent possible. For the 41 and the 71, there are emulators into which I can load the software plus any ROM images required. No such emultor exists that is public at this time for the 75C/D. But the first several BASIC programs I tried to load on to real 75 hardware resulted in errors trying to list them. It seems that won't work if a ROM the program relies on is missing. That got me off on decoding the BASIC file format, which led to the current effort.

Thanks for any help you can offer.

So $52.00 for a new HP-12C. That's pretty close to retail, isn't it?

It's quite possble the buyer knew exactly what was what.

Re: Silly people in HP calculator market...

*Message #4 Posted by **Don Shepherd** on 18 Sept 2005, 9:44 p.m.,*
in response to message #3 by Howard Owen

Since I assume that sellers pay a percentage of the final sales price to Ebay as a listing fee (and shipping charges would not be included in this), isn't this seller simply trying to pay less to Ebay and maximize his take? Ebay probably tries to discourage this, but unless someone reports these sellers, they (Ebay) will never know.

Re: Silly people in HP calculator market...

*Message #5 Posted by **Howard Owen** on 18 Sept 2005, 10:10 p.m.,*
in response to message #4 by Don Shepherd

And why would you, as a buyer, want to do that? As long as the fees aren't hidden up front and sprung on you after the auction closes, what's wrong with paying 12 bucks for a calculator and 40 bucks for shipping instead of the other way around? The total's the same, either way.

Unreasonable eBay shipping? Here's what's wrong:

> what's wrong with paying 12 bucks for a calculator and 40 bucks for shipping instead of the other way around?

Depriving eBay of funds for the service it provides would ultimately kill said service.

That unethical seller is fond of saying, "If you don't like my FIXED and NON-NEGOTIABLE S&H fees, don't bid." I would say to him, "If you don't want to pay the agent his cut for the lucre he helps bring to you, don't use his services." There is no free lunch.

Re: Unreasonable eBay shipping? Here's what's wrong:

*Message #7 Posted by **Howard Owen** on 19 Sept 2005, 12:07 a.m.,*
in response to message #6 by Karl Schneider

Chya, right. Have you sold much on eBay? They get you coming, going and hanging around. They are so not in financial trouble, they dropped five *billion-with-a-b* dollars on Skype last week.

But I guess you're right. Why don't you try reporting every seller you see on eBay who's shipping seems too high? How about turning in every mail order outfit that does the same? Impractical? *Yes.* Why? *It's accepted business practice.* Unethical? I don't think so. It's unethical to hide it from your customer. But if the terms of the deal are out in the open, the customer has the right not to enter into a contract to buy, and eBay has the right to slap the poor money grubbing slob of a seller down. They'll never do that because those sellers are their customers, and they already soak them for plenty.

Re: Unreasonable eBay shipping? Here's what's wrong:

*Message #8 Posted by **blurdybloop** on 19 Sept 2005, 11:01 p.m.,*
in response to message #7 by Howard Owen

It's accepted business practice. Unethical? I don't think so.

I can't agree. Regardless of what we may think about eBay, that does not make it acceptable to cheat them.

Another thing to consider: do you really want to do business with a cheat? How do you know that they won't cheat you? How do you know that you are not being sold stolen property? What if there is some other problem; do you think that you'll get a refund of that "shipping and handling"?

It's better to be honest in your own dealings, and only deal with honest people. I haven't sold anything on eBay yet, but cobubba and other dishonest eBay individuals are on my blocked bidder list because I will never do business with them.[italic]It's accepted business practice. Unethical? I don't think so.

Re: Unreasonable eBay shipping? No! Here's why.

*Message #9 Posted by **Howard Owen** on 20 Sept 2005, 2:56 a.m.,*
in response to message #8 by blurdybloop

I try to puzzle through ethical matters with a functional sense of right and wrong, instead of a strictly legalistic one. I try to figure out *why* something is unethical. I use other people's opinions of ethical matters as guideposts, not as holy writ. For me, it usually comes down to actual or potential harm coming to someone who is powerless to stop it from happening. So that's why sexual harrassment at work is immoral, for example. That's why "Thou Shalt Not Kill" as a practical matter is sensible ethics, and the "Shalt Not Covets" too. The latter lead to strain in unequal power arrangements. When those were read to me in my youth, (I'm using examples from my cultural tradition here, I hope it translates OK,) they left me cold, as did most of the proscriptions I was taught. It took some painful bumps and scrapes for me to realize that there was practical sense in all the shalts and shoulds.

For example, in this case, the customer would be harmed if the high shipping fee were imposed by surprise. The seller could reduce or eliminate that harm if adequate notice were given to the buyer. On the other hand, eBay could be harmed if the seller avoids the full auction ending fee. That seems simple, but there are complicating factors.

The balance of power between eBay and the seller is unequal. eBay has enormous power to shape the marketplace it provides. And that marketplace is hugely profitable, to judge by their quartely reports, stock valuation and the $3.5 Billion (plus possible $2 billion additional) they just laid on the barrelhead for Skype. The seller is a small retailer, or medium sized at best. He has limited choice for many of eBay's fees. eBay gets a cut coming, (insertion fees) going (auction closing price percentages and PayPal fees) and hanging around (various services like image hosting and listing aids.) The value proposition it offers in return is access to lots of buyers.

Fair enough, but in retail, margins are typically razor thin. Let's look at the fees a typical seller might pay to list and sell, what, a new HP-12C?

```
Wholesale price of calc       -25.00

Auction Fees
------------------------------------
Bold Listing Fee               -1.00
Buy It Now Listing Fee         -0.25
Gallery Fee                    -0.35
Insertion Fee                  -1.20
Listing Designer Fee           -0.10
Picture Fee                    -0.30
Scheduled Listing Fee          -0.10
Final Value Fee                -0.39
====================================
Total Auction Fees             -3.69

Income
------------------------------------
Final price:                   12.00  (FV fee is 3.9%)
Shipping & Handling            40.00
====================================
Total income                   52.00

Post sale and prep
------------------------------------
PayPal Fee                     -1.56 (.03 * 52.00)
Actual Shipping                -5.00
Labor to set up auction        -7.50 (1/2 hr @ $13/hr)
Actual handling                -3.25 (1/4/hr "" ""   )
```

```
Shipping Materials              -0.50 (Wrap and tape)
==================================
Total pre and post sale       -17.81

Total cost of goods sold      -46.50

Total profit                    5.50
==================================
```

Now, if we reverse the auction price and shipping above, the final value fee becomes $1.31, an increase of $0.98 in the seller's fees. That represents a whopping 17.8% hit to the seller's bottom line. From eBay's perspective, the lost fee is 15.7% of the revenue they should have received.

Now, none of this directly speaks to the ethical issue. What it does do is to supply context to that issue. The seller, like most retailers, is struggling to make a profit. A 17.8% hit to his margin might well be the pebble that sends him underwater. If that happens, eBay loses, because it can't extract fees on a continuing basis from the bankrupt seller. And we the buyers lose, because we don't get to exploit, in the form of prices cheaper than brick and mortar retail, that seller's willingess to work for next to nothing.

So in a functional sense, who is hurt by this guy, the "poor slob of a seller" I called him above, shaving a few more points at the apparent expense of eBay? Assuming, once again, that the charge isn't hidden, and assuming that eBay's reputation system works to protect both the buyer and the seller from fraud, **nobody!** eBay could, without a doubt, institute a policy like "shipping and handling charges will not exceed the actual cost of shipping, and 5% of the item's auction value for handling." Why don't they do that? Once again, because eBay loses if the poor slob, living on a razor thin margin, folds his business. It's a delicate balancing act for them. They need to charge enough to keep the billions flowing in, yet not enough to ruin the retailers. I'm sure this keeps smart folks at eBay on their toes, at least five days a week.

So, "no harm, no foul" in my book.

Re: Unreasonable eBay shipping? No! Here's why.

*Message #10 Posted by **Holger Veit** on 20 Sept 2005, 6:05 a.m.,*
in response to message #9 by Howard Owen

I think your calculation is highly biased in order to minimize the profit. Let us look at the figures for a realistic seller: - The price for a new calc may be infact 25$, no problem here. But why would this seller sell a new item with a starting price of 1$ - he should expect that potential buyers also know the price and won't go bid over the market price? A serious seller would probably offer a starting bid of 25$ with a buy-now option of 25$, to be sure to sell it for at least his costs. He might, for a modest profit, try to establish a price of 30$ - would be okay for me as well, if it is an uncommon item, or even try 50$ for a rare item. Or, if he really wants to sell it through an auction, set the starting bid to an amount that will grant a profit.

- You have artifically bumped up the auction fees with items I have never found useful for my auctions - if I have an interesting item, such as a rare HP calc, I can be sure it will be located by interested buyers, even without gallery, bold, and listing designer options. Besides, it is forbidden by eBay rules to shift these costs to the customer, so here is a first unethical part. It is solely the responsibility of the seller to

choose advertising options - doing so is not unethical per-se, but trying to get that money back from the customer against the official market rules surely is. This is a difference to the common market where a seller certainly imposes his costs (for advertising, shop rent, storage, personal, etc.) on the customer. There are other market rules.

- There is no requirement to allow PayPal for an auction - if you do, then add it to the S&H costs (which this seller obviously did multiple times).

- Also, a serious power seller will not spend half an hour for designing a single auction page. Either he users upload tools, or predefined page templates or other means to reduce the labor. Thus, reducing the potential profit in your calculation by 7,50$, and even 3,50$+0,50$ for handling and shipping material does not look like professional mail-order operations. I'd believe 5,00$ for shipping, and maybe insurance - the postal services are unfortunately high.

To summarize: other sellers, even power sellers, manage to keep their costs below 40$ by far for a simple calculator sent in a booksize case, so he is unbelievable to actually for normal shop costs. People commonly call such practice rip-off.

Finally, it is not unethical of eBay to request all the fees, and surely there is nothing unethical in an unequal balance of power between eBay and the seller. Everything here is an option for the seller: the seller may choose whether to enter the eBay marketplace at all, which option he chooses for advertising, which starting price he requests, etc. He is nowhere forced to go to eBay at all (given your cost calculation, this apparently stupid seller would be even less successful in the real market (or he isn't as stupid).

OTOH, a buyer also has the option of not buying from a seller who wants to rip off customers in such an obvious way. So probably, two idiots have found each other. No need at least for me to join such a circle. This is what is actually meant by "unethical" - it does not match my own opinion of correct trading behaviour.

Holger

*Message #11 Posted by **bill platt** on 20 Sept 2005, 10:01 a.m.,*
in response to message #10 by Holger Veit

It is perfectly ethical for the seller to do what he does. Ebay allows it.

Is it unethical for me to pay the absolute minimum federal income tax, by showing all my itemized decutions and such? What you are saying above would lead us to believe that it is "unethical" to minimize one's tax burden. It is a similar situation. The seller is minimizing his fee burden--and he is working within the system.

The point is, ebay has the discretion and the power to decide where to draw the line on "reasonable" shipping and handling charges. Since they allowed this auction, it is therefore legal.

That is That.

You-all that are trying to trump up the ethics issue are totally losing the point--

that ebay can and will clamp an auction if it fails their criteria.

They did not clamp it, therefore it is legal. Period!

Short and sweet.

Re: Unreasonable eBay shipping? No! Here's why.

*Message #13 Posted by **Howard Owen** on 20 Sept 2005, 1:08 p.m.,*
in response to message #10 by Holger Veit

The numbers I quoted aren't exact. I have no idea what the wholesale price of a 12C is, for example. The fee structure was taken from one of my own auctions, so I'm the "stupid seller." I did assume that the sale was fixed-price buy-it-now, which doesn't seem unreasonable. PayPal is optional in the way lots of things that attract customers is optional. At any rate, neither fee is a huge part of the final cost of goods sold.

But, let me repeat, none of that speaks directly to the ethical issue. It just sets the context. Trying to be as succinct as Bill Platt below, I think that context is "Retail margins are thin, and eBay fees are high." Now, to the meat of the ethical issue, for the last time, the buyer is not harmed under any theory of real damage, and I don't count a sense of outrage as such. eBay might be harmed, or it might actually be more in their interest to allow this sort of thing. In either event, their fee structures encourage this sort of optimization on the part of sellers. Also, either way they could suppress this behavior with policy and/or technology and they don't. They therefore don't appear to think they are being harmed, and they are in the best position to make that determination.

In my functional ethics, no harm == no ethical problem. Q.E.D.

So in a functional sense, who is hurt by this guy, the "poor slob of a seller" I called him above, shaving a few more points at the apparent expense of eBay?

Aren't you overlooking one small detail?

Since the sale price is $12, that's also the refund price if the buyer has to return it for any reason. Suppose it is DOA? Suppose it turns out that he bought it as a gift, and it turned out that he was supposed to get a 12C Platinum (yes, I know that people here would consider a 12C to be inferior, but you know what I meant...).

I don't know if the package was insured; if it was, then if the package is lost or crunched by the postal orifice then $12 is all the buyer gets.

Now, these all may be unlikely; but the fact is that something *is* being taken from the buyer when the sale is formulated in this way. The priced value of the item, which represents value to the buyer, is reduced.

I agree with the comment that one cretin found another; and the one is the other's proper prey.

Re: Unreasonable eBay shipping? No! Here's why.

*Message #15 Posted by **Howard Owen** on 21 Sept 2005, 12:00 a.m.,*
in response to message #14 by blurdybloop

I did overlook that detail. Of course, every eBay seller I have ever returned an item to refunded the shipping (both ways) too. It's a "what if" in this case. If the seller refused to refund that charge, I'd call that unethical.

As to insurance, what the seller charged the buyer for shipping and handling and what the shipment is insured for are two completely separate quantities. UPS automatically insures up to $100.00 in value, for example. The seller would have no reason not to insure for the total charge amount, since paying off in the event of loss wouldn't come out of his pocket. And he'd have less chance of negative feedback if the buyer got a full refund.

In fact, all these hypotheticals ignore the eBay reputation system. If a seller screws enough buyers, their reputation gets shot to hell, and at best they have to start over with a clean slate, for which trick eBay really *will* slap you down if you are caught at it. But assuming the seller successfully starts a new account, he then has to build up a positive rep with that account. That can't be done with phony $.01 auctions alone. (I know I'm not alone in actually reading a seller's feedback and looking at the auctins that generated a sample of the feedbacks.) So that means the seller has to treat a couple hundred customers right before screwing 10 or so and starting over. And then there's the risk of getting caught again. Aren't your suspicions starting to rise at this scenario? Doesn't it strain credulity a little? Isn't it simpler to assume the seller will not screw his customers?

What is it about this guy that really ticks you off? You can try to construe this or that element so some harm comes to the "stupid" buyer, but I haven't heard anything that convinces me that anyone is hurt in the slightest. Is it making a profit from the sale of a calculator that annoys you?

The official word about unreasonable eBay shipping

*Message #16 Posted by **Karl Schneider** on 21 Sept 2005, 12:33 a.m.,*
in response to message #9 by Howard Owen

Notwithstanding Howard's tedious accounting and long-winded essays, here is the excerpted official policy from http://pages.ebay.com/help/policies/listing-circumventing.html:

> Quote:
>
> ***Circumventing Fees***
>
> *Users may not use systems or techniques to circumvent, or avoid, eBay*

fees.

Some Examples

Unreasonable shipping or handling costs - Listings with low prices but unreasonably high shipping or handling costs.

Why does eBay have this policy?

Listings that circumvent (avoid) fees may provide a poor buying experience and always unlevel the playing field by putting sellers who pay all their eBay fees at a disadvantage. Further, these listings undermine the trust and legitimacy of eBay's marketplace.

So there!

Bill Platt stated,

Quote:

The point is, ebay has the discretion and the power to decide where to draw the line on "reasonable" shipping and handling charges.

... ebay can and will clamp an auction if it fails their criteria.

True -- but only if they know about it beforehand.

Quote:

The seller is minimizing his fee burden--and he is working within the system.

Since they allowed this auction, it is therefore legal.

They did not clamp it, therefore it is legal. Period!

False! eBay doesn't have the resources to validate and pre-approve every auction listing. Someone must inform eBay of a listing that violates its policy for them to terminate it. Consider the cancelled eBay auctions for body parts and memorabilia of infamous crimes.

in response to message #17 by Howard Owen

> Quote:
>
> You are pointing to the writing, and ignoring the actual effect of the the actions it proscribes.

Whatever the heck that's supposed to mean, unless the "actual effect" is that eBay receives the revenue to which it is *entitled* according to the *specific policies and fee schedules* by which the sellers *agree* to abide. The sellers, BTW, are not under any duress to participate, and collectively make much more money than eBay.

Ever wonder why almost all eBay sellers of HP calculators charge actual or near-actual shipping costs? Buyers consider it sleazy to do otherwise. If notified, eBay would quite likely have put the kibosh on that auction for its S&H demands, citing breach of agreement. In other words, bad ethics.

> Quote:
>
> I still haven't heard a refutation of any of the points I made about harm to the buyer, or harm to eBay.

There was nothing to hear. Only text that one is asked to read open-mindedly and to understand has been presented.

I'll refute your financial analysis, though: Most sellers of calulators worth $50 did not acquire them at $25 for the sole purpose of flipping them on eBay. They may have bought them long ago for college and no longer use them; they inherited them; they picked them up as surplus for a song. With a wholesale cost of essentially zero, it is not necessary to tack on exorbitant and bogus fee-evading surcharges in order to make a decent profit on the sale.

The same is surely true for other items sold on eBay, even the big-ticket ones that make the majority of the profits -- the wholesale cost was very low, or essentially "sunk".

> Quote:
>
> So, I'm not convinced. But I'm happy to leave you with your interpretation of the situation. Good night.

What other rational interpretation is there?

I just received a 1983 12C from California here in New Zealand, posted in California last week, via usps Global Priority Mail. Postage was eleven dollars!!! Came in an enormous box too - about A4 size and 2 inches deep. I recommend hpgoodies on ebay as a seller. Also have another on the go from the USA but the seller asked for $80 for postage!!! That actually may be a valid rate via DHL as courier or something, but I told the guy Global Priority Mail will do :-)

Any news from HHC2005?

Message #1 Posted by . on 18 Sept 2005, 4:05 a.m.

Please see http://holyjoe.net/hhc2005/DoorPrizeList.htm

I just noticed that HP are providing "hp49g+ calculators, latest version (to be talked about)" as door prizes. Are these cheap junk like the current models, or something better?

.

Re: Any news from HHC2005?

*Message #2 Posted by **Namir** on 18 Sept 2005, 8:28 a.m.,*
in response to message #1 by .

I think that attending the HHC2005 itself is the true prize. I have met Viktor Toth who is the curator of rskey.org and a few other new folks like this site's Tim Wessman. Tim won the HP calculator contest for 2005 and his presentation was his winning design.

Of course seeing old and new friends like Gene Wright, Jake Schwarts, Richard Nelson, Eric Smith, Jeremy Smith, Jack Stout, Brian Walsh, Wiodek Mier-Jedzrejowicz, and many many others is a real pleasure. HP was kind enough to pay for lunch and we aprpeciate that a lot.

Soooo .. I am off for a second day of geeky fun.

Happy Programming

Found an HP 67, what now?

*Message #1 Posted by **blake marnell** on 16 Sept 2005, 3:07 a.m.*

Greetings,

I recently picked up an HP-67 at a garage sale. I had no idea what it might be worth but I was fairly certain it was worth what I paid for it. The calculator came with a soft case, quick ref card, AC power adaptor, & a stand alone battery charger. Unfortunately it did not come with any manuals or blank magnetic strips.

There is a strip with some key functions written on it that is directly above the keyboard. I'm guessing that this is a mag strip that has been inserted into the upper slot after it was at some point in the past passed through the lower slot.

See my absurdly high resolution photos at: http://briefcase.yahoo.com/bc/blakemarnell/lst?&.dir=/HP+67+Calculator&.src=bc&.view=l

So with no blank cards and no instuctions I'm sort of at a loss as to how to tell if my unit is fully functional. Id like to do a test to see if my unit needs the "gummy" wheel repair but I need a card to do that and I can't figure out how to remove the card from the upper slot.

I have read that trying the card reader while on AC power is a bad idea so even if I had a card I'm not sure that I should proceed.

I'm guessing that my best course of action is, A) Buy manual B) Buy battery pack C) Buy mag strips D) Test

Any tips or suggestions would be welcome as would any offers to sell me a single blank magnetic strip. I see that I can get the manual off of this site and will probably do so and the batteries seem to come up now and then on e-bay. However, if anybody has an alternate source on the batteries they could point me to I'd appreciate it.

Any other tips/tricks/pointers would be welcome as well.

BTW, If my unit does need the gummy wheel repair, I may even try it myself given the excellent directions on this site.

thanks for any help or tips,

Blake

Re: Found an HP 67, what now?

*Message #2 Posted by **Tony Duell** on 16 Sept 2005, 6:38 a.m.,*
in response to message #1 by blake marnell

I can't get the URL you've given to work at the moment, so I can't see the pictures.

That said, I can give you some general comments.

There has been some debate here recently as to whether it is safe to plug an HP67 into the mains adapter without a good battery pack in place. The card reader sense amplifier chip _is_ directly connected to the battery terminals and will get a higher voltage than it should if the charger is connected without a battery. Whether this will damage the chip is another matter, but as the chip is HP custom, I don't like to risk it.

There is a guy on E-bay who sells reproduction batteries for these machines (it's the same battery as the 35, 45, 55, 65, 70, 80, 75C, 82168). Probably worth getting one.

I am pretty sure the user manual is on the CD-ROMs avaiable from this site.

It is quite normal to label the 'top row' of keys -- the A--E keys on the magnetic card, and then slide it into the slot above the keyboard after reading it. The card slides in from the right hand side of the machine and should be able to be slid out again towards the right. There are no catches or anything.

Unless your card reader roller has been replaced, it will need repair. In fact I think even if the machine was repaired by HP at the last date that HP repaired these machines, the roller will need replacement by now.

Re: Found an HP 67, what now?

*Message #3 Posted by **Mike T.** on 16 Sept 2005, 4:55 p.m.,*
in response to message #1 by blake marnell

You lucky man!

There is quite a lot of information about the HP67 on this web site, enough to get started anyway, so I'd say a battery was your highest priority...

I hope it 'just works' - have fun!

Mike T.

in response to message #1 by blake marnell

Hi Blake,

I jus happen to have three magnetic cards for the 41. I think they are exactly the same as the 67 uses. Anyone?

If you like I will mail one to you for free.

You can write to me at donwallace63@yahoo.com.au to let me know where to post it.

Re: Found an HP 67, what now?

*Message #5 Posted by **Howard Owen** on 17 Sept 2005, 5:06 p.m.,*
in response to message #4 by don wallace

They are indeed the same, Don.

If he's going to use that 67 much, he'll need several cards at least. It doesn't have continuous memory, so anything you want to save, you have to write to a card. But one will certainly do for testing purposes. 8)

Re: Found an HP 67, what now?

*Message #7 Posted by **Howard Owen** on 18 Sept 2005, 3:39 a.m.,*
in response to message #6 by don wallace

I was going to suggest that he buy an 80 pack of cards, after he's sure the card reader works. Having one to test would seem to be essential though.

Re: Found an HP 67, what now?

*Message #8 Posted by **blake marnell** on 18 Sept 2005, 4:35 a.m.,*
in response to message #4 by don wallace

Don,

Thank you very much for your offer of a free mag card for my HP 67. It never ceases to amaze me how generous people can be with their knowledge and support in forums like this one.

I have sent a message to your e-mail with my address.

Thanks also to all the others who posted replies to my "newbie" thread. I'm really excited about tackling this project and am looking forward to posting the results.

I'm going to order the manual on CD from this site and pick up a battery as soon as I can. Thanks for listing all of the other calculators that share the same battery packn as I'm sure that will help.

About the gummy wheel, apparently its almost a forgone conclusion that it will need replacement. Should I just go ahead and open the unit up to verify the wheel's condition? And if it's bad, I imagine I should go forward with the wheel repair before even testing the mag reader since I'm guessing that the mag reader won't work properly until the wheel is functioning correctly.

Basically I'm wondering if I could make the condition of the calculator worse by testing a mag card before replacing the gummy wheel. The old wheels look really awful in the pics posted on here and I'd hate to spread that gunk around inside if I don't have to.

Thanks again for your help,

Blake

Re: Found an HP 67, what now?

*Message #9 Posted by **blake marnell** on 18 Sept 2005, 5:03 a.m.,*
in response to message #8 by blake marnell

Wow,

I've just been reading a little further on here and it seems that even using the adaptor to power the HP

67 when there is no battey inside can cause damage?

Of course, I knew nothing of this and had already done this a few times so I guess I have to keep my fingers crossed that I didn't fry anything already.

So the revised project order as of now looks like,
1) GET BATTERIES
2) Get manual and read it!
3) Charge batteries in the stand alone charger
4) test non mag card calc functions using battery power only.
5) Crack open unit and inspect gummy wheel
6) Replace wheel if needed (99% chance)
7) test mag card function using battery power.
8) Rejoice/swear at my good/bad fortune.

how does that look?

Re: Found an HP 67, what now?

*Message #10 Posted by **don wallace** on 18 Sept 2005, 3:49 p.m.,*
in response to message #9 by blake marnell

Hi Blake,

You have probably gotten away with powering it up w/o batteries, but obviously it's not wise to push your luck.

I never owned a card reader, but if that decomposed plastic gets on the actual read/write heads then the thing will be history. The recording / playback gap is only 1/10th of a thousandth of an inch (or less) wide so it's really fragile.

While the machine is apart you could clean the head with a kit like they had for manual cassete head cleaning (remember them?). Also, be sure not to bend the microswitch actuators as this causes grief from what I have read here.

I will send you some cards on thursday (payday) by air mail.

Good luck.

Don W

Rebuilding a HP-67 battery pack

*Message #1 Posted by **Albert** on 15 Sept 2005, 10:10 p.m.*

Hi all,

I must rebuild a HP-67 battery pack. Questions: Can I use a NiMH battery type set instead of a classic Ni-Cd type set? Problems, advises, tips? Power consumption suggested: 1600 - 2000 or 2300 mAh? Thanks in advance.

Re: Rebuilding a HP-67 battery pack

*Message #2 Posted by **David Smith** on 16 Sept 2005, 4:57 p.m.,*
in response to message #1 by Albert

NiMH cells work better than the original nicads. No memory effect to worry about discharging batteries before recharging and they will run the machine for very long times. You do have to keep them on the charger for quite a while to fully charge them (like 24-48 hours, depending upon their capacity).

HP-41 PCB's pictures (for the HW guys out there... ;-)

*Message #1 Posted by **Diego Diaz** on 15 Sept 2005, 5:30 p.m.*

Hi

Hope some of the Hardware "maniacs" here enjoy this *almost* complete collection... just for fun, not much real use indeed, but it can be used as a time reference as the PCB's are shown in chronological order.

For the sake of precision, the initial CV shown in the picture is the four layer version PCB, there is a newer two layer verison with identical components footprint (except for the bender soldering pads) but with a more dense track pattern.

http://www.clonix41.org/Maintenance/hp-41_PCBs.htm

Have fun!!

Diego.

P.S. It's some 2Mbyte!!

An HP28S wakes up

*Message #1 Posted by **GE** on 15 Sept 2005, 4:12 a.m.*

Hello fellow calc fans. I recently acquired a nice HP28S and this made some fond memories resurface. It is a very curious experience to face all the quirks in this machine, which lacks many twists of its later siblings. The hardware is truly excellent, apart from the dreaded battery door (undamaged in my copy). Even knowing that putting batteries in would be a challenge, it was still a pain. On my original 28S, the battery door actually broke spontaneously.

I had a funny experience trying to get 'N' batteries ; I went to a store dedicated to selling rare kinds of batteries (the store is actually named "a thousand and one batteries" !). When I asked for 'N' batteries, the guy immediately replied "So you have an HP calculator ?" !! Seems all the world production of this kind goes into elder HP models. Great fun.

While typing some programs, I ran into some problems : - No such thing as a 'continue', once it is HALTed you can't restart the program
- No access to local vars in called programs : if program A has a local variable and calls program B, then B doesn't see the variable. You need to pass it on the stack - hmm.
- STO+ can't do all what + STO can : no STO+ into local variables, and for example {1,2} 'A' STO {3} 'A' STO+ brings an error
- The program editor is horrible, starts in overwrite mode, discards your nice indentation, doesn't go to the next line if you [->] at the last character of the line, etc. Cursor keys being the same as menu keys is also bad.

Other funny behavior includes : - UNITS catalog doesn't have base units such as kg
- 'A+B' 'A' STO A doesn't crash. Then A EVAL gives 'A+B+B'. EVAL again gives 'A+B+B+B' !?
- 'SQRT 5' 2 + SQ EXPAN COLCT gives back a numerical result 17,94... instead of '4*SQRT 5 + 9'(where SQRT is the square root character)

I still like the FORMS editor, it was powerful and a lot faster than the Equation Editor on 48s. 32 kb is nice to use. So I only wish this model would have benefited from all the ideas that surfaced in the following years. However, this one was the real innovation, the 48/49 being IMHO much less of a change in paradigm.

I think this machine deserves some space in the museum.

Re: An HP28S wakes up

*Message #2 Posted by **don wallace** on 15 Sept 2005, 5:06 a.m.,*
in response to message #1 by GE

Hi GE.

Now I remember! Around 1983 (84?, 85?) I saw an HP calc in an electronics store, (while shopping for opamps, dvm chips and some OTA chips).

It really blew me out because the thing would do symbolic (named variables) work, like speed=distance / time.

I really liked that and I was a bit jealous at the time since I own an old HP41CV [as everyone here knows by

now... sorry guys!]

I guess that was the 28S...?

in response to message #2 by don wallace

Aside from my 28S I have several flashlights that use N cells.

Re: An HP28S wakes up

*Message #4 Posted by **marais** on 15 Sept 2005, 3:18 p.m.,*
in response to message #3 by unspellable

I think the community does not do justice to the 28S, which improved over almost all the faults of the admittently premature 28C. But the 28C was such a revolutionary break from the past that even HP couldn't get it perfect the first time. I bought the 28C right after it appeared (in fact even before-I had a friend at HP at the time who gave me his rebate), and was stunned from the very first day. I used to have little programs doing complex number calculations, determinants and matrix inversions - usually either complex numbers OR matrices, since both wouldn't fit into the memory of the FX602 (yes, that's a CASIO) I used at the time - and the 28C did all this and more right from the start, without programming. I found this ability to handle compound data types more impressive than the algebraic operations in fact - the 28C did the simple derivations I could do by hand, and failed at the same ones than me, let alone do symbolic integrations. After a year of heavy use, I hit the memory limit of the 28C, but HP issued the 28S right in time. It is still one of my favourite machines, and I never managed to become equally acquainted to the 48. Long live the 28C/S!

Andreas

Re: An HP28S wakes up

*Message #9 Posted by **James M. Prange (Michigan)** on 16 Sept 2005, 2:40 a.m.,*
in response to message #2 by don wallace

Well, the 28C was introduced in 1987, and the 28S in 1988, so either you're a bit off on your dates, or you're thinking of some other calculator.

Re: An HP28S wakes up

*Message #10 Posted by **James M. Prange (Michigan)** on 15 Sept 2005, 10:38 p.m.,*
in response to message #1 by GE

First off, I recommend that you have a look at the 28 series reference materials, particularly Bill Wickes's "HP-28 Insights", available on the Museum DVD if you don't have a printed copy. http://www.hpcalc.org/ also has a lot of information on this model, and of course the newsgroup comp.sys.hp48 is a good source of information.

I agree that the battery cover is a poor design; I haven't had one break, but that may be a matter of luck as much as a matter of being careful. I have mixed feelings about the hinged design too.

As for N cells, they are used elsewhere, but they're unusual enough that "new" N cells may have been in storage for a very long time. To avoid a "Memory Lost" condition, I recommend that you test the cells before inserting them into your calculator, especially if they don't have a date code.

> Quote:
>
> While typing some programs, I ran into some problems : - No such thing as a 'continue', once it is HALTed you can't restart the program

Sure there is; use CONT, the "shifted" 1 key. Or just type in CONT and press ENTER; it's a built-in command.

> Quote:
>
> - No access to local vars in called programs : if program A has a local variable and calls program B, then B doesn't see the variable. You need to pass it on the stack - hmm.

The compiler compiles a name as a local name only if that local variable currently exists, or is defined as such in the source code. A work-around: Suppose that your program 'A' defines the local variable 'a', and you want the called program 'B' to use 'a'. Run a program like

```
<< "dummy string" -> a << HALT >> >>
```

Now enter (or edit or visit) your program 'B' which uses 'a'; this way 'a' will be compiled as a local name. Finally, do a CONT to finish the suspended program. This technique is easy enough, but it's very easy to forget to use it if you decide to edit program 'B' at some later date. This technique works with the 48 and 49 series too. Starting with the 48G series, any name that begins with a <- (left arrow) character is compiled as a local name, even if it doesn't currently exist.

Of course you can pass the contents of the variable on the stack instead.

> Quote:
>
> - STO+ can't do all what + STO can : no STO+ into local variables, and for example {1,2} 'A' STO {3} 'A' STO+ brings an error

True enough, STO+ requires real or complex numbers or arrays, and a global name, while + can take quite a variety of arguments, and STO works with either a local or global name, but so what? The "storage arithmetic" commands are intended to be rather special purpose; STO+ is not intended to be a "short form" of + STO.

> Quote:
>
> - The program editor is horrible, starts in overwrite mode,

I prefer that editing start in insert mode, but note that overwrite mode seems to be the default for quite a few editors.

> Quote:
>
> discards your nice indentation,

The source code that you type into the command line editor isn't saved; it's compiled, and the resulting object is stored, thus all separator characters (such as SPACE and NEWLINE) and delimiters are discarded. To display an object on the stack, for editing, or printing the object, it's decompiled, using separator characters (and delimiters) as the designers thought appropriate.

If you want to save your source code, then write the program within a character string. When you want to compile it, you can use the STR-> command, or edit out the " delimiting characters around the body of the string.

> Quote:
>
> doesn't go to the next line if you [->] at the last character of the line,

??? So use NEWLINE (shifted SPACE key) when you want to go to the next line.

> Quote:
>
> etc. Cursor keys being the same as menu keys is also bad.

Okay, and the cursor keys being the same as ALPHA keys on the 48 series is a bit of a nuisance too. Design decisions had to be made; no doubt you or I would have decided differently on some things, but I think that the designers made reasonable decisions on the 28S.

> Quote:
>
> Other funny behavior includes : - UNITS catalog doesn't have base units such as kg

I think that this calculator treats g (gram) as the "base unit" for mass. While that doesn't agree with SI, it's easy enough to insert a "k".

> Quote:
>
> - 'A+B' 'A' STO A doesn't crash. Then A EVAL gives 'A+B+B'. EVAL again gives 'A+B+B+B' !?

Well, I'd certainly hope that it wouldn't "crash", but a "Circular Reference" error (as on later models) would be nice. But even the latest models don't catch all non-obvious circular references. In some cases, a warmstart may be needed to stop evaluation of a "circular reference".

> Quote:
>
> - 'SQRT 5' 2 + SQ EXPAN COLCT gives back a numerical result 17,94... instead of '4*SQRT 5 + 9'(where SQRT is the square root character)

True, as documented, COLCT starts out by evaluating numerical subexpressions.

> Quote:
>
> I still like the FORMS editor, it was powerful and a lot faster than the Equation Editor on 48s.

I tend to agree on that.

> Quote:
>
> 32 kb is nice to use. So I only wish this model would have benefited from all the ideas that surfaced in the following years.

Well, that's the nature of the evolution of devices.

> Quote:

> However, this one was the real innovation, the 48/49 being IMHO much less of a change in paradigm.

Actually, I'd say that the 28C was the real innovation; it introduced UserRPL. The changes in the 28S and 48/49 series seem rather minor in comparison.

> Quote:
>
> I think this machine deserves some space in the museum.

Well, it does have some space in the Museum; see http://www.hpmuseum.org/hp28c.htm. But apparently some feel that the RPL models don't belong in the Museum at all.

Regards,
James

in response to message #1 by GE

Nice thread! My first HP was a new 28S my first year of college back in '89. I had four manuals for it and read them all cover-to-cover that Christmas. Although I don't find it very useful at the workplace, it is really at home on a well-lit desk for doing hours of physics or math homework (somewhere it has space to breathe and not be shuffled around). I kept mine (and the manuals) in mint condition all these years and have increased my HP collection. I've hit my 32k memory limit, too, and was really down the day my batteries went south and memory followed (loosing it all!). I'll always have a special place in my heart for the 28S. I only wish I had purchased one of those nice leather covers for it back then! $20 in those days (same as the manuals) and the 28S itself costed me $200!.... back then! Gotta love its RPL, though.

Saxon Calculus and Hp49+

*Message #1 Posted by **Stacey Bower** on 14 Sept 2005, 5:22 p.m.*

Can anyone help? My son who is 15 is trying to learn Calculus at home. Now he also has the challenge of learning to use the HP 49+ graphing calculator. He has used the HP-15 in the past. The book called for TI-83, but we couldn't bear to buy a TI having been an HP RPN family for 30 years.

The problem

Use a graphing calculator to approximate the values of y when x = pi and when x = Square root of 2

Given: y = (square root of x + one) over x

Stacey Bower and John

Re: Saxon Calculus and Hp49+

*Message #2 Posted by **bill platt** on 14 Sept 2005, 6:02 p.m.,*
in response to message #1 by Stacey Bower

It is pretty much like hte 48 series. You write the expression and save it to a variable, and then you can manipulate it. I think the manual should help you to know what buttons to push, but that is the basic gist of it.

Re: Saxon Calculus and Hp49+

*Message #3 Posted by **Osvaldo** on 14 Sept 2005, 6:44 p.m.,*
in response to message #1 by Stacey Bower

Hi: Sorry to say this but go for a TI 89. TI is a LOT more education oriented than HP. I am an HP fan but I recognize that on that subject TI are a lot better than HP

Br,

Re: Saxon Calculus and Hp49+

*Message #4 Posted by **I, Claudius** on 14 Sept 2005, 9:00 p.m.,*
in response to message #1 by Stacey Bower

Congrats on your boy taking calculus at 15, brighter than I was at his age!

There are many ways to do this on the 49/49+. This is one way:

Enter the Equation Writer with the EQW key. You are now in a special screen environment allowing you to write any equation or expression exactly as you would on paper. Type in your function: Y(X)=(square root of X + one) over X. Enter the equation onto the stack, you will see it on level one. Type DEFINE, the level one entry disappears. Hit the VAR key, you will see Y displayed. To see the expression in terms of X, hit the X key, then the F key under the variable Y key. You will now see (square root of X + one) over X displayed. As

a number example, hit 1 then the F key under the variable Y key and you get square root (2). For numeric approximations go RightShift ENTER. When you're through with that definition type 'Y' PURGE to delete it.

Re: Saxon Calculus and Hp49+

*Message #5 Posted by **Stacey Bower** on 15 Sept 2005, 2:18 p.m.,*
in response to message #4 by I, Claudius

Thank you, Claudius for prescribing a way to solve the problem!

We were wondering if you could tell us how after entering the equation we can solve for any number of particular x variables by imputting the x variable value.

Then the calculator will give the corresponding y value and mark it on the graph.

S & J

Re: Saxon Calculus and Hp49+

*Message #6 Posted by **Guest** on 15 Sept 2005, 5:39 p.m.,*
in response to message #5 by Stacey Bower

Speaking as another underage calculus student, I can say the 49g+ is fine for the purpose. TI just has better marketing.

Use the left-shift-hold and F1 keystroke to get to the Y= editor that lets you manage multiple functions. The add softkey will call the equation writer and give you a Y1= blank. From here you type in the function and hit enter. The functions are automatically stored to the proper variables (after you graph them or hit the OK softkey.) Once you have graphed the functions, the f(x) softkey in one of the menus will get you the y value, and leave it on the stack. For multiple values, you can use the table and type in your own values. The same menu with the f(x) button also can show you f' and graph the tangent line where the cursor is.

Re: Saxon Calculus and Hp49+

*Message #7 Posted by **I, Claudius** on 15 Sept 2005, 11:01 p.m.,*
in response to message #5 by Stacey Bower

I think you want to plot or table this function and then get values?

The 48/49/49+ create plot variables when plots are created. A neat way to keep these variables from cluttering up the Home Directory is to create a new directory for your plots. Type Plot then the command CRDIR. You will see a newly created directory named Plot. Press the F key under the Plot name and you enter this new directory. All the variables will be blank at this time. To delete any EQ, PPAR, ZPAR variables, enter them on the stack and type PURGE. To exit this directory use the commands UPDIR or HOME.

There are many ways to create plots, using (hold) Left-Shift (Y= or GRAPH) and the manual does a pretty decent job of describing this. You can also access the old 48 plot menu by typing 81. MENU , if you have the soft menu flag 117 set, -117 SF

You can also easily create a table of values for the function using the (hold) Left Shift TABLE function. This may the best way of getting what you want. I realize I'm not guiding you step by step

and I apologize, I'm just very busy at the moment.

"Use a graphing calculator to approximate the values of y when x = pi and when x = Square root of 2

Given: y = (square root of x + one) over x"

All the responses I've seen so far assume you are trying to find EXACT values of y for those two specific values of x. I think the intent of the problem is to GRAPH the function over a reasonable interval and then DIGITIZE approximate y values from the graph.

--Mark

Re: Saxon Calculus and Hp49+

*Message #9 Posted by **Howard Owen** on 16 Sept 2005, 10:09 p.m.,*
in response to message #8 by Mark A. Ordal

To plot a function on the 49G+, do the following:

1. Go to the "Plot Functions" menu (APPS->enter)
2. Press enter again to select the first item "Equation Entry."
3. Enter the equation as per the example above, but only the right hand side. (i.e. no "y(x)=")
4. Press the DRAW soft key when you are finished entering the equation. This will plot the function using the default axes and tick values.
5. You can now use the arrow keys to move a cursor around the graph.
6. When you are near a point you would like to see the x and y values for, press the "(X,Y)" softkey.
7. Press ON (cancel in this context) twice to return to the stack display

Hope this helps.

```

Does the 49 include the **TRACE** function? On the 48, pressing the **TRACE** softkey and then the **(X,Y)** softkey will keep the cursor locked onto the graphed line. The left and right cursor keys will cause the cursor to follow the line in the -X or +X directions and the X and Y positions of the cursor will be displayed continuously at the bottom as the cursor moves. That makes it simple to move to a particular X value and see the corresponding Y value.

Yes, it works exactly the same in the 49G+ instead of manually moving the cursor around as in my example, you can use the TRACE function as you describe.

I thought there was some requirement to "guesstimate" the values, though.

*Message #12 Posted by **John Bower** on 20 Sept 2005, 2:07 p.m.,*
in response to message #11 by Howard Owen

I am the son currently doing the Calculus. Thanks for the help, but what I really want to know how to do is: After I have graphed the function, can I imput values of x (i.e. pi or square root of 2) and have the calculator plot the matching y value? My textbook tells me how I can do it on a TI-83, but many of the buttons aren't carried over in exactly the same way. Thanks much.

John

*Message #13 Posted by **Ron Ross** on 20 Sept 2005, 3:00 p.m.,*
in response to message #12 by John Bower

If you are having difficulty, you might consider an Hp39G. It is a near Ti-83 clone and can be found on ebay for about $30 (NEW old stock) for the following reasons:

Unconventional Rubber buttons Ti-83 clone ie Algebraic only (very similar keyboard layout and press sequence). Slow (in comparision to a Ti-83).

On the plus side, it is cheap and it has a lot more math, calculus functions and memory over a Ti-83/84.

The newer Hp39G+ is basically an upgraded hardware version similar to your Hp49G+ in feel and speed. About $90 retail.

Or you might find a Ti-83/84 used at a local college or pawn shop.

I would still suggest keeping and learning your Hp49G as it is truly far superior to the Ti-83. But learning how to use and master an Hp49G will take months (and/or years depending upon HOW well you want to know it), not days or weeks, and you probably do not have that luxuary.

Browse ebay... you may find another unit for no that much money.

Re: If do not find anyone in your country ...

*Message #4 Posted by **Adrian Swanson** on 14 Sept 2005, 12:05 p.m.,*
in response to message #3 by Thibaut.be

I did buy one on e-bay for about $130

Thanks to all who responded, I have now have enough information to start the repair my self. Stay tuned.

Re: HP Repair

*Message #5 Posted by **don wallace** on 14 Sept 2005, 5:41 p.m.,*
in response to message #1 by Michael Moore

Hi Mike.

(Hey you aren't THAT Michael Moore, are you?!)

What's wrong with it? Depending on what is wrong, it can vary from being fairly "easy" to an absolute train wreck for someone to fix their 41. Be aware to not static damage the chips and do not muck around with the display at all or you will make it toast...

I have some pictures and contact info at:

http://donwallace.customer.netspace.net.au

Pretty much everything is covered in pictures there. But there are some pitfalls, also.

I repair 41s professionally for a fee. So if Australia isn't too far away for you by all means. Turnaround would be a week or two.

good luck!

*Message #8 Posted by **Paul Marin** on 15 Sept 2005, 7:49 p.m.,*
in response to message #7 by don wallace

Got a 48G that I would like to get working properly. It's either that or buy a TI-83 new in sealed wrapper from a friend of mine for $70.00. So what kind of costs would I be looking at to let you start looking at this unit? With batteries in it turns on, but then at its own discrection, the busy signal and left shift indicator appear and the unit runs to a stand still. Frantically pressing the on button might clear this status but at times it needs the batteries removed for a long period of time and then it still might be in this mode. I've looked on this site and asked advice by others more knowlwdgable than myself on repairs, but I can't bring myself to crack this baby open. Shit-scared i'm going to bust it, if you know whay I mean? Paul

How many engineers etc. out there still using hp41?

*Message #1 Posted by **don wallace** on 13 Sept 2005, 2:43 a.m.*

Wondered how many professionals are still using the HP41 series? Have met a few here and elsewhere, but... maybe there's more. After all, tens of thousands got sold and they can't all be in the trash or behind a glass case.

Looking at developing some real add-ons for everyday professionals. Also at doing reliable repairs as a service for fee (a bit harder than it looks).

Anyone using their machine daily, what do you want in an add-on and what would you pay for it?

Don W

*Message #6 Posted by **Andy** on 13 Sept 2005, 2:38 p.m.,*
in response to message #5 by don wallace

Don,

I assist in design of spacecraft. Custom Overlays/module perhaps with triangle solutions, density calcs and Metric conversions without having to insert different modules or overlays. Similiar to TI 58C/59 program inserts. I know the new ALG/AOS HP Calcs have this. Also the older HP45, 55 and 31E series.

Thanks for your input.

Andy

Re: How many engineers etc. out there still using hp41?

*Message #7 Posted by **don wallace** on 13 Sept 2005, 5:14 p.m.,*
in response to message #6 by Andy

Hi Andy,

That's prety fascinating. I remember reading about the AOS module (program?) in HP keynotes in 1981 as youngster in the Air Force. (Was doing Comms Engineering before I dropped out due to stress).

If you can be even more specific and would be so kind as to dropp me a line at:

donwallace63@yahoo.com.au

we can take this further and I can work out what I can do in what timeframe. I am just working from home but I don't see why I can't put a bit of project management and QA into what I am doing...

I am trying to get to be *really good* at repairing these machines. There are quite a few pitfalls, actually. But when you get all the way under the hood on the 41 machine design it's a really NICE work of Art. Shame about the memory size though, I always thought...

Thank you very much for your comments.

DW

*Message #10 Posted by **Andy** on 15 Sept 2005, 10:52 a.m.,*
in response to message #9 by don wallace

Yes Don, i remember Clockwork Orange, Fail Safe with Henry Fonda and the remake a few years back with Don cheadle. Also read the book. They used film of the B58 Hustlers (Vindicators) taking off. I remember the thunder they made when they took off from Kelly AFB in Texas with full afterburners on while i was in Basic at Lackland. It was the most overwhelming jet noise i have ever heard. I also have Stanley's Nightmarish epic with Slim Pickens riding an H-BOMB. There was a movie (UK) called THREADS made in '80s showing the aftermath of nuclear hallocaust. Had F4S taking off from from UK bases. Phantoms were part of NATO in COLD WAR years and used as primary Nuclear weopons delivery platforms. I also remember the Cuban Missile crises. Almost stopped doing my AlgebraII homework. Figuered world was going to end. Opps, just gave away my age. (59)

Warmest regards,

Andy

Re: How many engineers etc. out there still using hp41?

*Message #11 Posted by **don wallace** on 18 Sept 2005, 10:44 p.m.,*
in response to message #8 by Andy

Hi Andy.

I am posting to advise that my programming jig for the ROM emulator (Diego Diaz's Clonix clone) is running and I am in a position to roll your custom application packs (and write fully tested code for you).

I can also do some limited characterization if required:

Temperature limits testing from -20 degrees Celsius to + 45 deg.C Undervoltage latch up / 41 system crash testing and limited impact testing (2 meters to concrete). I can't characterize for RH but can quote an RH figure at which the tests are run.

Modules will be available hermetically sealed in standard module housing and can be reprogrammed using a jig. All modules would be 100% functionally tested and low voltage tested (for latch-up etc.) prior to dispatch.

Cheers,

Don W

Re: How many engineers etc. out there still using hp41?

*Message #15 Posted by **don wallace** on 15 Sept 2005, 12:24 a.m.,*
in response to message #14 by Andy

Hi Andy,

I should be able to engineer and produce either single or short run manufacture of application packs which will comply with your requirements. The time frame to supply finished product is in the next four to six months including software writing time.

Do you need MCODE in the application packs? Because I'm going to have to network with people or do some reading and creative fast-tracking to do that. I still am quite certain I can do it though. I've looked at coconut (cpu) asm code and it's not too hard; the architecture is nice.

The triangle solution stuff you speak of, is that out if the MATH I pack? Any further info you can provide to me by writing me at:

donwallace63@yahoo.com.au

Just mark it in confidence and encrypt it and bind me with a non -dsiclosure contract if it is sensitive.

Yours faithfully,

Don W

Re: How many engineers etc. out there still using hp41?

*Message #17 Posted by **Namir** on 13 Sept 2005, 6:47 p.m.,*
in response to message #13 by don wallace

Hi Don,

I do analysis of European stocks. I do a lot of regression analysis. I use Excel (make use of VBA macros to automate things as much as possible), MatLab, and MiniTab. I am also looking at other software like Mathematica, SPSS, R, and so on.

My hobbies are statistics (linear and nonlinear regression), optimization, root-seeking algorithms, and time series analysis. I use calculators and computer software to implement various methods and see how I can also use them for my work.

My use of calculators is very limited in my work. I have an HP-41CX near my laptops which I used to do simple calculations.

Namir

Re: How many engineers etc. out there still using hp41?

*Message #18 Posted by **forrestswitzer** on 13 Sept 2005, 3:49 p.m.,*
in response to message #1 by don wallace

Don,

There are two other engineers in our small office of 12-people still using the 41. I am using a couple of 42's, but also have a couple of 41's. We are a civil engineering company, and mostly they are used over the top of drawings for figuring slopes, elevations, horizontal and vertical curves, etc. Many surveyors still have them and use them regularly, even though they may be using a 48 or some of the later data collectors for survey instrument data collection and transfer. If you want to see the level of use by surveyors of HP products (all obsolete) then go on eBay and search for "HP Survey*".

Although we do all of our drawings in CAD, and have a PC at every desk, it is just much easier to grab a calc, lay it on the drawing that is too big to fit beside the PC (or maybe a set of 200 sheets bound together), and do our calcs.

I have specialized programs for the 4 or 5 things I use most, but would use it for adding up lists, or anything where it is faster than creating a spreadsheet.

Most needed in our office would be a means to save and re-load programs and data. An ability to connect to a PC and transfer both directions for about $50 would be a huge help. Whether it is through an IR or USB or whatever. Since the 42 has no way of doing that, or even talking to another, that would be a huge help also.

Forrest

Re: How many engineers etc. out there still using hp41?

*Message #19 Posted by **don wallace** on 13 Sept 2005, 5:28 p.m.,*
in response to message #18 by forrestswitzer

Hi Forrest.

Thank you for the feedback. It aligns perfectly with my initial thoughts. I always wanted (larger capacity) data/program nonvolatile backup. And for all sorts of reasons 2-way IR would be nice and has been planned by mytself from the outset. I just wondered how many other people actually using "in-field" thought the same way.

I am looking closely at doing two way IR with very good lighting immunity at (a slow) 1200 bps because that is what you can do with cheap modulated (light) carrier components.

I also want to do a nice permanent data backup/restore system which fits in a module.

If you want to discuss this further, please write to me at:

donwallace63@yahoo.com.au

I agree totally on the space saving aspects of the calcs. They just "DO STUFF" as younger people are want-to-say today in a smaller package that nothing else does... It was very cool to read your post.

DW

P.S. In 1985 I used to fix desktop computers (a supercalculator with graphics and printer in-board) for Canon Australia in Brisbane. They were used a lot in roofing (truss design), and in a few med labs I think

*Message #20 Posted by **Fred Lusk** on 14 Sept 2005, 8:46 p.m.,*
in response to message #18 by forrestswitzer

Forrest…

Another civil engineer here, class of 1980.

There is one engineer in my office who still uses a 41CV, and one who did until he lost his a year ago. He bought a 48GX, doesn't like it, but got promoted to VP, so it's a moot point. I know of several other engineers in other offices who still use one version or another of the 41. I have a 41CX that I use sometimes, but I mostly use my 42S and once in a while my 48G+. For a 41, I am more likely to use Warren Furlows 41CX emulator. I typically use it to run some older programs that I haven't spruced up yet to use the 42S menus, or simply won't fit into the remaining memory of the 42S.

Since I'm the only one in the office who ever took an interest in writing programs, the guy who still uses the 41CV uses several of my programs.

Fred

Re: How many engineers etc. out there still using hp41?

*Message #21 Posted by **Forrest Switzer** on 15 Sept 2005, 2:28 a.m.,*
in response to message #20 by Fred Lusk

Fred,

I am in a similar situation but am probably much older than you. Maybe because I had some programming experience back in the mid 60's (when I was in the Army) the 41 seems really easy for me to program and when it first came out I wrote a COGO program for it that remembered coordinate points by point number. The survey module makes you type in the coordinates every time and that becomes a bummer real quick. I had a program that would traverse, inverse, and do the BB, DD, and BD intersections allowing you to set and recal points by number. As I recal, besides the program you could hold about 60 points in memory. It was two dimensional so we wern't carrying elevations with the numbers, just the northing and easting. That quickly got converted first to tape storage with a little more room for the program features, then to the disk drive. We had about four survey crews using it. (I wish I had kept a copy, but it looked like the laptop and pc were the future).

I really like the 42. It is light and fast and has that extra line on the screen, etc. I hate that it can't be backed up. You are right. It also needs more memory. I also really like the 71. Its survey module remembered points by point number and did some really slick stuff for that time.

My job is solving peoples problems. Most of them deal with grading in one way or another. Some with property boundary descriptions. Most of them are real problems that are happening now, and someone is really interested in getting them fixed quickly. The current thought process is that if they can fax or e-mail me a problem then I should be able to answer the question in the same time period that it took them to ask the question or pose the problem. Because of the type and variety of problems I deal with, the pc is seldom involved in the solution. It is more a process of fresh ideas from a different viewpoint and the 42S provides the necessary calc support. Once the solution is determined then maybe time spent on the pc in Land Development Desktop or maybe hydrology and hydraulic calcs.

Forrest

Re: How many engineers etc. out there still using hp41?

*Message #22 Posted by **chas** on 13 Sept 2005, 9:59 p.m.,*
in response to message #1 by don wallace

Use a 41CV every day since 1978. The same one. I've rebuilt the posts several times, all prior to using Internet.

It replaced/retired my HP35.

Use many programs that I wrote myself, and many longer ones that I bought from Mr. Horne, during the 80's. (They were such a steal at $6.00 to $12.00 at the time.) I ordered a back-up 41CX the week they quit making them, I already had a back-up card reader.

Since I've found this web site I've repaired both card readers, several voyagers and pioneers. Thanks to eBay, I now have a three repaired 41CV back-ups too.

Really would like some sort of connection to a computer, so I could store/retrieve programs there.

Batteries are not as easy to find as they used to be. If the N-cells disappear, like the half N's we'll all be going to 357 powered devices, and a ratty 42s will go for $500 on eBay.

*Message #23 Posted by **don wallace** on 13 Sept 2005, 11:59 p.m.,*
in response to message #22 by chas

Hi Chas.

I am going to build something simple and fairly cheap that fits in a module. Probably will implement RS232C and maybe over an infra-red link (maybe two way).

What software would you want at the PC end. Would a standard app. like (MS windows)Hyperterminal be preferred? Would a dedicated piece of (program and data load and save)software be expected? What options would you want?

Thanks for your reply Don,

2-way via infared economically would be great. I'd have to go buy an infared mod, but I'd do it if the economics was willing.

Whatever is the least painless with Windows. I haven't tried hyperterminal since Win3.1. For the amount of information going back and forth it should not be a problem, but likely more universal methods exist.

Still use my HP-41 CX. I have several and it is my favorite. I use spreadsheets, etc., but sometimes you just need a good calculator.

I still use my 41cx every day, although not very often anymore for the longer programs and data acquisition and equipment control. My home-made workbench computer and even the HP-71 is much better for that. I mostly use the 41 for quick calculations by hand, number-base conversions (with the Advantage module) for programming, various conversions and medium-short programs, my alarm clock, a Daytimer of sorts, and even keeping some phone numbers in. Most shifted keys are re-assigned.

I have the HPIL-to-RS232 and HPIL-to-HPIB (IEEE488) interface converters, but use them more with the HP-71 than with the 41. I also have the Mountain Computer HPIL 80-column video interface. I have sometimes wished I had bought a double extended-memory module for the 41 (which would fill my four ports with 6 modules since my HPIL and X-I/O are already combined to take only one port), but the need for the additional extended memory seems to be going away, as even without it now I haven't had to hook up either of my HPIL tape drives in years. The one thing I might still wish I had gotten when it was available was the HPIL-to-parallel interface-- the smaller, earlier, more versatile one. I can get the same function though in a

round-about way, going through RS232 to my home-made workbench computer which has far more I/O of various types, timers, and other nice things than I could ever expect to find in an HPIL (or dedicated HP-41) device. Connecting the 41 to a parallel printer this way for example is a little more involved than I'd like, but I've done it when necessary (when my HPIL Thinkjet didn't work anymore).

I would be more likely to buy further accessories for the 41 if I could use them with the 71 as well, which basically means HPIL.

Someone else mentioned difficulty in getting N cells. They're always available at Radio Shack, Sav-On, Home Depot, and all kinds of places, especially drug stores and consumer electronics stores.

Hi Don

I used my 41C on daily basis until I had a severe battery leakage after vacances in 1998.

After that I converted to a 32SII for on-the-fly calculations and short programs.

In 2004 I found a beautyful 41CV. So, after 6 years, I had again an 41.

Today I use it for larger programming tasks, always with printing routines for the IR printer. To make the story short: My daily favorite is the 32SII (smaller), but as soon it goes into programming or repetitive tasks, it comes the time for the 41CV.

My job: IT consulting and project management for solutions in enterprise content management sector.

If **I** could wish I would like some media card (SD, MMC...) external memory storage. Maybe as slot solution, or incorporated into a card reader device hull.

*Message #31 Posted by **Arne Helme** on 14 Sept 2005, 4:57 a.m.,*
in response to message #1 by don wallace

Hi Don,

for 25 years I have been using my 41s almost daily. I got my first one when I was a kid and used it throughout high school and university. Nowadays it is the 17BII that tends to be most used, though, but that's because the financial functions of the 17BII fits better with my current job as consultant/project manager than the standard scientific functions of the 41.

I have always liked the "look and feel" and functionality/programmability of the 41 series. For me there are only three shortcomings 25 years after 41 series was introduced: speed, storage, and communication. I'll pay for products that will improve on the 41s in either of these areas.

Good luck with your project(s)!

Regards,

Arne

*Message #35 Posted by **Vieira, Luiz C (from Brazil)** on 14 Sept 2005, 1:17 p.m.,*
in response to message #1 by don wallace

Hi, Don;

I am almost sure I'll start some discussion, maybe some flames, but I think that as you ask for some feedback, let's try a few thoughts.

When I bought my HP41C in the 80's I used to dream of possibilities and add-ons. I was later known about the 41´s adaptation of the HPIL system, but I could not afford any of those. I remember showing a friend of

mine the HP41 running programs I wrote for 3D and complex arithmetic, and at his turn, he showed me his Apple computer. Even if I could work with a color screen and use the whole bunch of kilobytes plus floppy disks, I'd still prefer my pocket-size, fully portable HP41.

Now I use the HP41's I have from time to time, mainly to run earlier programs prior to store them or to port them to other systems. Most of the programs I wrote for the HP41 are now available as internal functions, routines in newer models, but some of these HP41 programs contain specific procedures or data handling that may be useful somehow. I still use RPN/RPL calculators at the academic level (I'm an electrical engineer and since 1995 I act as a university teacher), but when I find the time and the 'tease', I go for some RPN exercise. A couple of days ago I wrote a small program for a friend that asked me if there was a way to compute NFV (net future value) in an HP12C/Platinum without the need of changing existing TVM data neither use extra storage registers. My final version is a 31-step, fully automated program.

If the HP41 system is still active, in production, or (even better) has compatible, updated replacement components, then I'd go for new add-ons. In fact, I think that the only ones are worth buying today are Meindert Kuiper´s MLDL, Christoph Klug´s HPIL/PC connection card and Diego Diaz´ Clonix. As for what I know, with these add-ons, you can make the HP41 sing and dance.

I myself like to keep track with the new, and I have been dealing with some experiments involving bidirectional IR I/O for the HP48/49 series. Just a few tests with sending and receiving, nothing exceptional so far.

Thanks for your offer, Don. I hope you take these words of mine as my own feedback. And guys, please, don't toast me up…

Cheers.

Luiz (Brazil)

*Message #36 Posted by **don wallace** on 15 Sept 2005, 12:36 a.m.,*
in response to message #35 by Vieira, Luiz C (from Brazil)

Hi Luiz,

Really good to hear from you about your work and your interests in maths. Plus the HP gear you have and use.

I am actually an EE dropout (long story) turned small system tech and defacto EE (contractor). Also into NT4 systems admin and also tinker with LINUX / UNIX when I feel I need to. I have an educated laymans interest in maths. But I failed D.E.s at UNI...(subject called ME201 [maths for 2nd year engineers - differential equations])

Back to the 41: There really is nothing like these old machines. So far as I know the 41 is rather dead in any form of manufacture. I am interested in preserving and repairing the hardware, plus assisting with eliminating the weakness of no cheap connectivity and poor memory / storage, etc.

Modifications and enhancements are for me only a way to increased utility, not really for hacking mcode (though that is fascinating to many people here, including me to an extent).

*Message #37 Posted by **Jim Creybohm** on 14 Sept 2005, 3:42 p.m.,*
in response to message #1 by don wallace

Hi Don.

Tried to lurk only, but had to add my .02Cdn (.0000001 USD). I am a petroleum using mine daily. Not so much technical anymore, but still a daily driver.

1) Two way transfer with the PC. NOT using Hyperterminal, rather a standardized program such as kermit or vt100. $150 w/ cable? USB 1.0/serial/parallel.

2) Extension of the 41 screen/stack through the PC, i.e, trace on the printer. This would also allow editting of programs in your favourite editor. Perhaps printing as well. Why? It would be record of work done, and later could be a replay of your session.

3) An interface into a memory card. 8/16 MB would suffice, but it would be better if I could then put the memory card in to my PDA. Perhaps through the card reader.

4) Replacement battery/module traces! How many 41's have been put into drawers because leaking batteries ate through the traces? I would pay up to 25 USD for a new one. This should be a simple thing to do.

I know that there are some applications out there that do exactly what I am seeking, but I am seeking something simpler. I find it easier to use my PC keyboard, but I prefer using the 41. If I could write a program on my PC, then xfer it to my 41, I would be one happy duck.

Re: How many engineers etc. out there still using hp41?

*Message #39 Posted by **don wallace** on 15 Sept 2005, 12:57 a.m.,*
in response to message #37 by Jim Creybohm

Hi Jim.

Thank you for your comments. Very interesting. I don't like Hyperterminal. I was thinking of a one protocol like kermit or something similar. I always used to use PROCOMM (now here's a blast from the Past...) in the MS DOS days. Was thinking in the price range you mentioned. Serial though, as it has more utility for machine control than USB.

Straight serial would mean a linux/unix link also.

SD memory cards have been mentioned to me before. Has got me seriously thinking. Would one want that amount of ram? Would be very good for storing data sets.... That amount of storage does mean an intelligent peripheral to maintain an indexed library of data for the 41 to access, so i thought people would rather have a laptop do that...?

Tracethrough, well thats a really neat idea, but if you can tell me a bit more about how you want it to work and I might be able to actually build it for you. Anyone else want something like this? If there is enough demand then a good idea can get engineered into reality. Meinderts mldl2000 is a good example of that.

Battery flexstrips. Simple? yes. Cheap? No... I can't see it. Copper on mylar (or whatever it is) can't be cheap in low run quantities because it's low demand/specialized. I am looking at ways to fix this interconnect problem but can't get past hand repair of machines sent to me as yet. Still thinking about it though. I would love to see everybody able get their old 41 machines up and running again. Most units I have seen sold on Ebay have these problems.

I am also looking at a really neat way to repair the stress cracking of the plastic shell mouldings that all old machines suffer from in time. This is a serious "killer" of machines.

Anyway, thanks for the really interesting feedback, Jim. I'll give the solution to those problems you raised serious thought.

I'd recommend MMC instead. MMC uses the same form factor and even the same connector; but you don't have to pay thousands of dollars to the association, plus royalties, to be able to make and sell MMC-compatible equipment like you do with SD. One of the industry magazines predicted that MMC will be gaining more market share against SD because of this. MMC does have an SPI mode too, which makes it really simple to interface.

Re: How many engineers etc. out there still using hp41?

*Message #41 Posted by **don wallace** on 15 Sept 2005, 3:35 a.m.,*
in response to message #40 by Garth Wilson

Hi Garth!

Thanks for the advice (I haven't bothered to check this stuff out in that legal/costs area). For sure MMC would be the deal... and SPI is what I am looking for, because that will dove tail with the IIC buss which I will probably implement the comms to work on.

I am looking at something a little lower power than what Diego has done. With similar general capacities... or better, using a different approach. I wish to get close to truly emulating the old modules themselves, if possible.

Re: How many engineers etc. out there still using hp41?

*Message #42 Posted by **Meindert Kuipers** on 15 Sept 2005, 6:39 a.m.,*
in response to message #39 by don wallace

The MLDL2000 is designed just to be able to do all this. Of course it requires a special program on the PC, but my plan is to ultimately have the PC emulate mass storage, printer and maybe keyboard and display as well (althoug it is then better to use V41 or another emulator). There is no need to modify the hardware for this, all should be possible to do this in the PC software, a special ROM and perhaps some modifications in the CPLD 'firmware'. Communication is through USB, even the upgrading of the CPLD firmware. Note that these features are NOT implemented yet, but will be my next project for the winter evenings. Since the design is completely open, you are all invited to do your own stuff!

Another possibility is to use the HP41 as the input device for V41 with the right modifications to V41 itself.

The MLDL2000 has a ridiculous large amount of storage (that is compared to the HP41 memory itself) and a memory card is not really needed. ROM images can easily be backed up to the PC.

The only think that the user community should do is to make software for the host computer supporting Linux, since I only support Windows myself. Again, with the open design of the MLDL2000 this should not be too difficult.

Meindert

*Message #44 Posted by **Meindert Kuipers** on 18 Sept 2005, 6:38 a.m.,*
in response to message #43 by don wallace

Hi Don,

A lot of questions, most are answered at my website. It is as rugged as you want it, since the unit is shipped as a kit with an empty cardreader shell, and you are the one to assemble it. I do offer an assembly service, and I think it is just as rugged as a normal cardreader. Just do not abouse it (I would never do that with my '41 anyway). Current consumption is about 8 mA extra when the HP41 is running, and virtually none when in standby or off. Current may be a bit higher if a gold cap is installed for battery backup and it needs to be charged by the HP41. And yes, I have seen some crashes in the HP41, but these are mainly due to bad contacts or bad settings. Some I have not been able to fully explain yet.

Meindert

Re: How many engineers etc. out there still using hp41?

*Message #45 Posted by **Jim Creybohm** on 15 Sept 2005, 10:34 a.m.,*
in response to message #39 by don wallace

Hi Don.

1) Straight serial would be great! Serial link and standardized protocol would allow MAC/Linux and PC's to talk to the 41.

2) The SD card would allow transfer of programs from PC to 41 to pocketpc/palm. I want to save my 41 for better things, however I also would like to run prgrams on a pocket pc emulator when I am out in the dirt and don't always have access to my laptop. Pie in the sky stuff, but it seems that the people here can do anything with the 41 (unlike myself who only can dream of programming in mcode).

3) The tracethrough idea is one that I haven't fleshed out yet. Initially, the PC was simply to be a virtual printer for the 41 - ergo any printing could then be reflected on the virtual printer and then a txt save. Ultimately, I was dreaming that if a 41 active playback were used, it would be a simple matter to then create a checksum for programs after a certain number of steps. Thus, program data entry error could be reduced, as well as a transaction record of the session. A playback would not be required, but again I am doing a little dreaming...I am also trying to stimulate a little conversation on something that I think might have some merit.

4) I am very sorry to hear about the flex strips. I guess I should have thought a little bit about the fact that there is a reason no one has done this. Every second week I get a spam email from a chinese vendor offering to do printed circuits and copper traces. I will pay more attention in the future and maybe I can get them to put something together. I see this as the biggest single shortfall of the 41.

I wish you the best of luck in your endeavour to return the 41 to its rightful place at the head of the class. It is a noble venture, and you have some great persons available for resources.

Re: How many engineers etc. out there still using hp41?

*Message #47 Posted by **don wallace** on 15 Sept 2005, 5:28 p.m.,*
in response to message #45 by Jim Creybohm

Hi Jim.

I am thinking that maybe I am able to just fix the flexstrips if people just send me the

BACKSHELL of their machine. That would get the weight down and maybe the cost and would be (only a little) less disastrous if the post goes awry.

The thing is that in a moderate leakage, corrosion or contamination occurs on the gold flashing on the keyboard PCB, so the machines require my attention to repair this. I also permanently fix the problems of failed ports and intermittent crashes caused by corrosion on the interconnect, without soldering wires into the machine (!). So the repairs are solid and restore the machines to original (you can remove the backshell).

I am looking at the best way to reinforce the screw holes which crack over time (this is a very weak design area). Given thats resolved I think these machines could last another ten years, maybe twenty? Does anyone know the life of a well made LCD display?

An Italian friend of mine remarked that it almost unheard of for a calculator (or any small computing product) to last 25 years and he wondered what their lifespan really is... We will see.

As regards the people I have here to help me, yeah you are right they are a great bunch.

DW

P.S. I HIGHLY RECOMMEND Warren Furlows V41. It is very, very nice.

> Does anyone know the life of a well made LCD?

I'm not aware of any limits on the life of an LCD as long as it's not abused. I have seen one that turned dark from being in extreme heat for a long time, and I've read that the worst combination is heat and moisture. The LCDs on my own HP's that are getting close to 20 years old still have bright, silvery backgrounds and really black segments or dots. Ditto for my workbench computer's LCD which is also nearing 20 years of age. I have several other LCD samples from products I've developed, and these are also at least 15 years old and appear and work as new. I have purposely tested LCDs at temperature extremes, but did not leave them at those extremes for more than an hour or so. At super low temperatures, it may even take seconds for a segment or dot to turn off or on before it gets so cold it won't work at all (like -40ºC). At high temperatures, the display may even turn negative-- ie, lighter dots against a dark background and be hard to read. But in all cases, everything went back to normal when the LCD was brought back to a normal operating temperature.

HP-71B - HP-41 Translator Bits?

*Message #1 Posted by **Howard Owen** on 11 Sept 2005, 5:19 p.m.*

I can't find this particular bit pattern anywhere on Usenet or the Internet. Do any of you hard-core HP collectors have the 82490A module? Have you extracted it into a free-standing LIF or other file type? Would you consider letting me make a digital copy of that bit pattern?

Regards,

Howard

FTH41ROM in J.F. Garnier's Lex Files 1 collection.

Found 'em, but now what?

*Message #3 Posted by **Howard Owen** on 12 Sept 2005, 1:33 a.m.,*
in response to message #2 by Howard Owen

That's actually a copy of the lexfl1.gz LIF image available from the museum's FTP site.

The status of the FTH41ROM file is discussed in this museum thread. What I'm trying to do is to run EMU71 with the HP-41 translator. The referenced thread says that the FTH41ROM file is "part of" the 16K soft configured portion of the translator. Is the hardwired E0000 portion the same as the standard FORTH ROM? Also, the lex file is only 890 bytes, far smaller than 16K. WTF, over? 8)

Re: Found 'em, but now what?

*Message #4 Posted by **don wallace** on 12 Sept 2005, 1:46 a.m.,*
in response to message #3 by Howard Owen

Hi Howard! How are you?

Got the FORTH bug I see. I wish I could help you but I don't have a HP-71 to start with... Let me (us all?) know how you get on.

Interesting archive thread you pointed out.

On another subject entirely, I have a few (hardware) photos I just posted to my webpages that might just interest you. I am tinkering with my 41 on a 'scope, preliminary to getting my LSA running. One photo is interesting in that it shows what a difference twisting two short (insulated) wires together can

make... ;-). The difference between crashing a 41C and seeing the data bus in actin is so very fine... In light of your earlier inquiries about HP-IL it might be interesting to you.

Just a thought.

w.r.t. your current endeavours: good luck!

Re: Found 'em, but now what?

*Message #5 Posted by **Meindert Kuipers** on 12 Sept 2005, 8:53 a.m.,*
in response to message #4 by don wallace

Don,

I am surprised that it makes so much difference. The HP41 bus is pretty stable in my experiences. However, since the signals are CMOS, you should avoid loading them. Crashes can occur when pulling a signal too low, but I have used pretty long (non-twisted) wires to my scope or other circuits without any problem at all. Also be aware that the ISA signal is used as a reset by driving it high for a short time.

Meindert

Re: Found 'em, but now what?

*Message #6 Posted by **don wallace** on 12 Sept 2005, 5:09 p.m.,*
in response to message #5 by Meindert Kuipers

Hi Meindert.

Thanks for the info. I have been doing a bit of reading so I know about the coconuts "soft" reset, etc.

I am not loading the buss much at all at the moment. Just a CRO: 1 Mohm || 39 pF.

Yeah, I was a bit surprised at the DATA bus crashes, too. To be exact though, that happened on my 41CV, which is a very old (early) machine from January 1981 production. It wuld have been one of the first to use the then new high capacity (?!) 16 x 56 bit RAM chips. Maybe they switched to internally buffered circuitry or revised the chip design shortly after that?

On my old CV I know the ROM is able to drive the ISA bus more strongly than the RAM can do with the DATA bus. There's a real difference!

Finally, to be fair to my CV it was fitted with a TIME MODULE and two other modules during the "run" where I had the crashes: X functions and a CIRCUITS ROMPACK. So there was a bit of capactive loading contributed by the modules themselves. But yes, I got the system to crash a few times...without trying ;-). The "new" 41C (manufactured September 1980!) was not fitted with any modules, so it "got off lightly", so to speak.

I had been planning to buffer the BUSS before looking further (with a 74HC04 or a CD4069) but found I could get reliable operation just by using the transmission line approach. So I guess we can all learn a thing or two from a simple jig, even if we do use high density chips, SMT and CAD/CAM VHDL software!

Electronics is fascinating. I have been working with CMOS and LSTTL logic for 27 years

(analogue a little longer) and I am still surprised very occasionally. The other day with my CV was another such occasion.

I think you meant the new high-capacity 64 x56 bit "quad" RAM chips; the HP-41CV uses five of those and one of the 16 x 56 chips.

HOW EMBARRASSING!

Yeah, Eric, I was lost in space (tired) when I wrote that...

By the way, I think you said way back when (in a reply to me in another thread) that a USB port for the HP-41 would be good. What's wrong with using an MLDL2000?

Would many people really just want usb alone for the 41? What for? And what else might people want that's practical?

I was thinking a while ago about doing a very few really practical add-ons for the system, which the average engineer would use, rather than people who want a pocketable coconut assembler etc., which is in theory what some of these "power gizmos" (Diego and Meinderts marvellous hardware) would do and I guess what they are aimed at.

My interest lies in another area entirely, real add-ons and reliable repairs for everyday maths / engineering HP41 users.

Any regular (everyday real world) HP41 USERS please feel free to respond... (keep it practical if possible.)

DW

Did I? I suppose I might have said something like that, though I don't recall. I'd personally probably be happier with an EIA-232 serial port (formerly known as RS-232), but these days most people probably prefer USB.

A serial port would be more useful to me in that it would allow the 41 to control instruments as well as upload and download software.

> Quote:
>
> What's wrong with using an MLDL2000?

Nothing, other than that I don't have one, and AFAIK it doesn't allow the 41 to programmatically control data transfers to other devices.

*Message #10 Posted by **Howard Owen** on 13 Sept 2005, 9:11 p.m.,*
in response to message #9 by Eric Smith

A $20.00 USB to serial device gives you the best of both worlds.

Well, a USB port + converter *is* bulkier than a nice built in serial port. But I've gotten an HP-85, HP-48, HP-41, HP-75 and HP-71 talking to my T40 laptop running Linux with one of those things. (The latter three with the HP-IL<->RS-232C converter.)

in response to message #10 by Howard Owen

Hi Howard. Yes you are right it does, MOST of the time... USB has a few serious drawbacks in certain areas though...

I ran across your docs showing your network the other day. Pretty cool, but what do you actually DO with it?

Not being rude, just curious. How's the long HP-IL going?

Re: USB vs 232

*Message #12 Posted by **Howard Owen** on 14 Sept 2005, 12:05 a.m.,*
in response to message #11 by don wallace

Hi, Don.

I now have two of the HP-IL/Cat-5 cables. I use both on a daily basis and they work great.

As to what I actually *do* with all this stuff, I'd first like to point out that getting anything accomplished with a hobby is optional, in theory anyhow.

But truth be told, I am pursuing several goals with all my HP-IL equipment. The main high-level goal is to make as much old software for the HP-41, HP-71 and HP-75 accessible to current enthusiasts as possible. That means developing or reviving systems to connect the old storage media to the 21st century Internet. It also means trying to scrape together documentation for all the old stuff that lacks it. The lack may be due to loss of original hardcopy, or perhaps because the documentation is buried in old PPC or other club journals. In either case I need to load the software onto a real machine or an emulator, figure out what it does, then try to match it up with other information sources. This is an enormous task, which I will never complete on my own. But it's pleasant to pursue at my leisure because it requires playing with the old machines and reading the old journals, which are both activities I enjoy.

In a closely related goal, I'd also like to collect and conserve as much old software and printed matter as I can. I'm standing on the shoulders of giants here, for which fact I am profoundly grateful. But I do occasionally run across old programs that aren't in any online repository I know about. I have several user library programs that fit this description. The user library probably perished in a landfill after the Corvallis division moved to Singapore, according to several threads in the museum archives. It seems to me to be worthwhile to try and reconstruct as much of it as we can from the materials that were distributed by the library over the years.

I'm also interested in writing a Linux HP-IL driver. I got some way down this path before I realized I could run EMU41 and drive Cristoph Klug's ISA card under Linux without a driver. That removed a lot of the incentive to write the native driver. So I've been lazy about that.

And generally, I have fun with systems. The HP-41 is an open system, rather than a closed box. I didn't know that when I bought my first one from tutoring money in Junior College, but that's what it was, and is. The other machine I got introduced to then was the Apple II, another open system. Those two open platforms were products of the accelerating advance of microelectronics that swept through the last third of the 20th century. And they were my entry point into that tide of change and progress. So being able to connect them to the 21st century isn't just a cute trick in my opinion. It's really a profound reflection on the nature of open systems, as well as a personal journey through my own history.

*Message #14 Posted by **don wallace** on 13 Sept 2005, 10:56 p.m.,*
in response to message #9 by Eric Smith

Thanks for the feedback Eric.

Yes, I thought rs232 is better. USB being block sucks a fair bit for control type apps. The data rate is total overkill for the 41.

I will try to roll a nice simple 232 adaptor for the 41. Don't know when but in next month or three...

Do you have an e-mail address where I can ask you about software control of 232 port data lines etc...? If you don't mind down the track I would love to be able to get a few answers from someone who's actually done it, because I would be using the port in a higly non-standard manner... you know what I mean.

DW

Re: "My Bad..." or USB vs RS-232

*Message #15 Posted by **Meindert Kuipers** on 14 Sept 2005, 2:59 a.m.,*
in response to message #9 by Eric Smith

Let me add my comments why I have done USB instead of RS232 in the MLDL2000. I agree that RS232 is better because it is on almost every type of computer. The problem is that a controller or CPU is required on both ends for RS232, andthe latest notebooks do not have RS232 anymore. The USB solution in the MLDL2000 allows a much easier implementation on the MLDL side, and the selected USB device (FT2232C) gives me instant communication with the CPLD by allowing bitbanging from the PC. Eric is totally correct that it does not allow control of devices from the HP41, and indeed, that is not possible with USB, and that was not intended. In order to allow control, microcode or usercode is needed on the HP41 and I wanted a device with no specific microcode requirements. The USB on the MLDL2000 is mainly intended to transfer data between the 41 and the other computer (ROM images and control of settings) and later (still need to make some software for that) to do higher level control, like having the PC emulate mass storage, printer and such stuff.

Meindert

*Message #16 Posted by **don wallace** on 14 Sept 2005, 3:28 a.m.,*
in response to message #15 by Meindert Kuipers

Hi Meindert,

Yes, I understand why you chose usb and did it really well, too.

I have just looked at your manual for the mldl2000 or maybe the specs, not sure?

Man, you have done one class A1 job on that hardware design of yours. It really is a very very nice implementation. When I think of the amount of work you put into that, including the documentation, and the time that it all took I am really quite amazed.

I have done a little real engineering work for clients with say a breadboarded SBC which was hairy as a goat but ran, non optimized, which they wanted a PCB cut for.

Too much detail, way o.t. and boring to most to go into here. But there was a lot more to that story including on-the-fly design corrections to debug their circuit with no possiblility to test the mods, and a very tight design / fabrication schedule. For example, I had to learn PROTEL advanced schematic and PCB in about one month flat... My point being that I have an idea of the work involved in your project.

Very well implemented and documented, Man!

while on subject of erratta. . .

*Message #17 Posted by **don wallace** on 13 Sept 2005, 1:50 a.m.,*
in response to message #7 by Eric Smith

Eric,

errata to your post: 4 x 64by56bit + 1 x 16by56bit (not 5x64x56b + 1x16x56b), [I have one...]

Whose counting? This stuff is so small in capacity that no wonder I got confused. I have always really been annoyed that HP provided so little RAM. The system was very old, but they could have at least furthered the series of RAM to give a factor of (at least) four times the CV memory. Otherwise a really great product.

Re: while on subject of erratta. . .

*Message #18 Posted by **Eric Smith** on 13 Sept 2005, 6:43 p.m.,*
in response to message #17 by don wallace

No, the 41CV definitely has five of the 64x56 and one 16x56. Otherwise how would you get 320 registers (319 as described by HP, due to three bytes consumed by the final .END.)?

Maybe you've overlooked one because it's on the other end of the board with the ROMs.

The original 41C had only five RAM chips, all 16x56. The 41CX has eight; the same six as the 41CV plus two more 64x56 to add the built in extended memory (128 registers, 127 as described by HP due to one being consumed by housekeeping).

Eric

different versions of 12c platinum

*Message #1 Posted by **laskody** on 10 Sept 2005, 9:34 p.m.*

Please help - I am aware of two different versions of the HP 12C Platinum financial calculator: some versions have the "minus" and "divide" keys imprinted with a blue ("G" key) sub-function operation - each are printed with differnet blue arrows on these minus and divide keys - while other 12C Platiunums do not have the printed function. Can anyone explain why? Thank you! Laskody

*Message #3 Posted by **Tomas Fischer** on 15 Sept 2005, 12:01 p.m.,*
in response to message #1 by laskody

It appears that there will be a new revision of the 12c Platinum. Some of the diferrences are: Adjustable display contrast, Backspace key (under minus sign), Undo key (under division sign), Left and right parentheses (STO and RCL).

If you download the manual from HP's 12c platinum page, it will have all those new functions included.

Tomas

Hi laskody, where did you see the new version of 12c platinum? I want to buy one!!

Re: different versions of 12c platinum

*Message #9 Posted by **Jeff** on 20 Sept 2005, 6:44 p.m.,*
in response to message #8 by walter

I called HP's calculator department today, and the doofus that I talked to said that the enhancements were "premature." The manual had them, but they weren't applied to the units yet.

Nonsense.

I bought one today at Office Depot (the wouldn't honor the $15 discount certificate that had expired 3 days ago).

Anyway, the display is greener than the other Platinum that I have. I don't know if I like that or not. It does have the modifed keys as mentioned, but the TVM calculations are MUCH faster than the original unit.

29c battery contacts

*Message #1 Posted by **Hal** on 9 Sept 2005, 2:52 p.m.*

Hello HP fans. I've rebuilt the battery pack in my 29c by cutting out the center bar and replacing the old cells with 1.2v nickel-metal hydrides (which I always charge outside of the calculator). This works fine except that sometimes I need to reposition the battery pack (by pushing it against it's springs slightly) to get it to power up. I did notice that on the original battery pack, the ends of the cells toward the springs were connected with a soldered on strip. Do I need to do something similar with my rebuilt pack to cure this glitch? Any other tricks that might be applicable? All ideas appreciated. Thanks very much, Hal.

Re: 29c battery contacts

*Message #2 Posted by **David Smith** on 10 Sept 2005, 11:11 a.m.,*
in response to message #1 by Hal

The batteries should be strapped together on the end (you should not trust just the spring to connect the cells). Also there needs to be some slack in the strap so that the cells can move freely (they can't be glued together). I also clean the contacts in the calculator by applying a drop of DeOxit contact cleaner, gently polishing them with a wire brush wheel in a Dremel, wipe off the residue, and then use another light drop of DeOxit.

For stuborn machines (and all HP-19C and HP-10's) you may need to place a small wad of aluminium foil on each battery contact.

Re: 29c battery contacts

*Message #3 Posted by **Hal** on 10 Sept 2005, 4:56 p.m.,*
in response to message #2 by David Smith

Thanks for your response David. When I go to put the strap on, I'm assuming I can use a soldering pencil and a little silver solder, is this right? Any other tricks to soldering directly to a battery? Thanks for your help, Hal

Re: 29c battery contacts

*Message #4 Posted by **David Smith** on 11 Sept 2005, 3:02 p.m.,*
in response to message #3 by Hal

You really should have the strap spot welded on. Any battery store can do this (Batteries Plus, Batteries Etc). Heat from a soldering iron can easily damage batteries... but, if you are careful, ...

I have been having a go at this lately. I now have the NoVram module with the HEPAX and have been trying to write some code. Why do you ask? Jeff

Re: Is there anyone writing MCODE for the HP-41?

*Message #7 Posted by **don wallace** on 8 Sept 2005, 7:21 p.m.,*
in response to message #6 by Jeff

Hi Doug, Jeff.

Really cool, Doug... What sort of motorbike do you have? What are you doing on it?

Well Jeff, to be honest I am just curious. I am going to have to write a few simple routines in MCODE to do my IR module and maybe (if it ver sees the light of day) to implement my rom expansion for the 41. I am using a different scheme to the method Diego employed so I need to write my own MCODE for the 41 side of what amounts to an HP41 buss to IIC buss adaptor. I plan to use two PICs (one to implement the 41 microcode) and some flash ram or eeprom. All smt of course. Prototyping with standard DIP parts fairly soon.

DW

Re: Is there anyone writing MCODE for the HP-41?

*Message #8 Posted by **Doug Wilder (CA.)** on 8 Sept 2005, 10:15 p.m.,*
in response to message #7 by don wallace

Hi Don,

Aw, it's an old HD. 1931 VL. Did you know that those old machines literally dump oil on the road? It just goes straight through. Have to fill up the "oil" tank (half the gas tank) every 200 miles or so (hand pump it every 5) ... it just goes by the crankshaft one time .. then on the ground. Not gonna pass ANY envionmental test! The gas/oil tanks are a nightmare when they leak: about 30 pieces and all lead soldered together like a radiator. The chromoly frame is brazed together with cast iron at the joints. The springer front end is all cast iron save the springs, but i have told you more than you want to know.

Any help i can offer with your MCODE, yet i don't know much about the actual signals on ISA due to any particular function, i'm definately software on the 41 only, too clumsy to handle a soldering iron or an smt.

Best Regards, Doug

Re: Is there anyone writing MCODE for the HP-41?

*Message #9 Posted by **don wallace** on 9 Sept 2005, 1:46 a.m.,*
in response to message #8 by Doug Wilder (CA.)

Hi Doug,

Well thanks on the offer of (advice / asisstance with) coding; I might just need your help sometime soon...

W.r.t. the 'cycle... well what can I say? You certainly seem to be a gultton for punishment (love hurts...). I have heard the old Harleys (etc.) want to spew their stomach contents a bit...

I think old motorcycles are a bit like women:

A Great hobby, fun to ride, very lovable but HIGH MAINTAINENCE...(?)

It's cool, I won't call the EPA (or FEMA) on ya, buddy!

Cheers,

Well if you go, you will find out what (if anything) it is about. Perhaps it is a complaint to HP about lack of an AUR. . .

HP Calcs and amatuer Radio

*Message #1 Posted by **Jeff D** on 8 Sept 2005, 1:24 p.m.*

Has any one ever written programs for HP calcs that solve inductance, coil winding or any other topic related to amatuer Radio. My son and I have been building a tube radio and I was curious to see some of the interesting programs written for such items. Thanks,Jeff

Re: HP Calcs and amatuer Radio

*Message #2 Posted by **Bill (Smithville, NJ)** on 8 Sept 2005, 1:50 p.m.,*
in response to message #1 by Jeff D

Hi Jeff,

Great to see that you're doing a father/son project building a tube radio. Should be a fun project.

You might want to try a search on the HPCALC.ORG site. I just did a search on "Inductor", "Capacitor", and "Resistor" and got several interesting hits. Not sure which calculators you're wanting to use.

Found the following HP-33S guide to electrical engineering:

http://www.hp.com/calculators/docs/guides/33sElectrical.pdf

The HPmuseum site has following:

http://www.hpmuseum.org/software/67resist.htm

http://www.hpmuseum.org/software/33/33resist.htm

http://www.hpmuseum.org/software/11serres.htm

Have fun building the radio.

73,

Bill

Quite a bunch for the TI-59. That was before my HP days. Let me know if you're interested anyway. I've maintained my license, but have been inactive for 21 years.

*Message #4 Posted by **don wallace** on 8 Sept 2005, 4:43 p.m.,*
in response to message #1 by Jeff D

Hi Jeff,

Once I wrote a simple program to do inductance based on a standard formula.

I would refer you to ARRL Handbook. Very practical "Bible" for any amateur radio (transciever or reciever) builder. You can get them cheap second hand and maybe someone has scanned one in and released it into the peer-to-peer space (I recommend Limewire, a well configured computer and DUE CAUTION to access the Guntella P2P mesh)...

Once I had a HAM licence (as a young teenager), dropped my licence in my early 20's. (Most amateur radio operators [I know] know distressingly little about electronics and operating regs for that matter, so I had no-one savvy to talk to. At its best an interesting hobby though. Anyone here remember SSTV?)

in response to message #4 by don wallace

I used to be GM4CFM but never bothered getting a licence once I moved to VK-land. Paradoxically, I got diverted into doing stuff with computers (partly due to the fun I was having with my -45 and -65) and ham radio fell by the wayside.

I still have a 1978 ARRL Handbook on the bookshelf, though.

Best,

--- Les [http://www.lesbell.com.au]

Re: HP Calcs and amatuer Radio - who's got the oldest ARRL Handbook?

*Message #6 Posted by **Dave Shaffer** on 9 Sept 2005, 12:17 a.m.,*
in response to message #5 by Les Bell

From Les: "I still have a 1978 ARRL Handbook on the bookshelf, though."

The first one I bought, which I still have, is from 1960, when I got my license, and I have one somewhere from 1946 that was originally my Dad's (and, I just realized, the same age as me). These are sort of like HP calculators - thay can be admired and used even after many years for their continuing utility (although finding some of the components might be a challenge! Do you still have any acorn tubes or selenium rectifiers?!).

"I still have a 1978 ARRL Handbook on the bookshelf, though."

I also have the 1978 book, in fact! My father went out and bought it when I expressed interest back then. He had been active in MARS in the 50's as W3RTR, but let his license slide. We had both a National and a Hallicrafters full MF-HF reciever in the house when I was a kid. And a T-50 transmitter that we wanted to get going again.

in response to message #1 by Jeff D

Hi Jeff,

There are a lot of hams on this frequency :-) Somewhere I scribbled down the ones I know of and there are at least a dozen regulars here who are hams.

I suppose we really aught to set up a 20 meter sked one of these days--that would be fun, and a challenge (especially since I don't have a 20m rig!).

About the only thing I ever programmed to do was antenna calculations. Nothing special--just keystroke saving routines. I loved building makeshift antennas with bicycle wheels and stuff.

HP41 parts for sale - possibly...

*Message #1 Posted by **don wallace** on 8 Sept 2005, 12:31 a.m.*

Hi all.

I bit the big one and bought a dud HP41C on Ebay. Paid top dollar, too. You get that.

But maybe one mans misfortune can be someone elses good fortune?

I am thinking of junking the calc, testing the parts (rather involved...) and selling the following:

Keyboard PCB and front half shell (minus LCD display panel)

LCD display module only single with tag leads

I may also be able to salvage the processor.

The fault is a heavy load on the power buss. Machine obviously does not power up...

I will determine which parts have failed and recycle the rest. Sadly it's only a 41C...

The backshell is mechanically sound but the interconnect is fairly badly corroded...

I have very recently posted some photos of this beasts innards on my webpages, so if you are curious, go have a look.

For mre details, please write...

Best regards everyone!

OT, but I need math help

*Message #1 Posted by **Don Shepherd** on 7 Sept 2005, 9:13 p.m.*

OK, this is off-topic, but I'm stumped and I need some brainy math people to help me find the pattern here. The question is, how is the last number derived from the first two in these four examples? This puzzle was designed to be solved by third graders, so no higher-order math should be required. I wrote the author of the textbook where I found this, but he has not responded yet. Here is the deal:

```
3 * 4 --> 5
4 * 7 --> 1
8 * 4 --> 0
1 * 2 --> 9
```

Any ideas, guys and gals?

Don Shepherd

Gerson.

Re: OT, but I need math help

*Message #3 Posted by **Howard Owen** on 8 Sept 2005, 1:43 p.m.,*
in response to message #2 by Gerson W. Barbosa

An RPN solution. *Very* appropriate. 8)

Re: OT, but I need math help

*Message #4 Posted by **Gerson W. Barbosa** on 8 Sept 2005, 3:47 p.m.,*
in response to message #3 by Howard Owen

But that will not work on the HP-35 unless we add an extra CHS. I should have posted the following, which works for all RPN HP calculators:

```
+
12
-
CHS
```

Sometimes we have trouble trying to solve certain problems, not because they are hard but because they are easy. Once I was given a problem and after an hour trying to solve it, to no avail, I quit. Two

months later, when I opened the drawer where I had kept it, the solution popped up in front of me. I can understand Don's trouble with it.

Regards,

Gerson.

Re: OT, but I need math help

*Message #5 Posted by **Namir** on 8 Sept 2005, 4:38 p.m.,*
in response to message #4 by Gerson W. Barbosa

When I wa sin 5th grade my math teacher gave us an example of two linear equations. I just looked at it, tried in my mind a could of numbers and gave him the solution. He was very impressed. He gave the same question to the other section, but no one solved it. It IS how you perceive the problem that allows the brain to analyze it and then solve it.

Re: OT, but I need math help

*Message #6 Posted by **Don Shepherd** on 8 Sept 2005, 7:29 p.m.,*
in response to message #2 by Gerson W. Barbosa

Thanks Gerson, Howard, and Namir. You are right on! I never noticed that each set of 3 numbers added up to 12. I was actually doing the multiplication and trying to relate the product to the number on the right, with no success.

I think this relates to the math skills that a third-grader has, and I imagine that includes addition and subtraction, but maybe not multiplication. I think it also involves clock arithmetic, where kids solve 3 + 4 by starting at 12 on the clock face and counting "clockwise" to get the answer. If a kid sees the symbol "*" or "X" and does not understand what it really means, that same kid might just start at 12 and go counter-clockwise, and arrive at the number on the right.

Gerson, I tip my hat to you!

Don Shepherd Louisville, KY

Re: OT, but I need math help

*Message #7 Posted by **Gerson W. Barbosa** on 8 Sept 2005, 9:42 p.m.,*
in response to message #6 by Don Shepherd

Thanks, Don. Am I allowed in 4th-grade now? :-)

Relating this problem to a clock makes a lot of sense. But when I read it was a problem for third-graders, the first image that came to my mind was this:

http://www.eggs.ab.ca/news/images/mediathumbs/basic6.jpg

I don't know why I thought of this, perhaps because at the time we solved problems like this: "You have three eggs and get four more. How many more do you need to make up a dozen eggs?". However, this was a problem presented to first or second-graders as far as I can remember (1st-grader in 1968).

Best Regards,

Gerson W. Barbosa

Re: OT, but I need math help

*Message #8 Posted by **Howard Owen** on 8 Sept 2005, 11:20 p.m.,*
in response to message #7 by Gerson W. Barbosa

It occurs to me that the third graders (if they aren't mythical) may well have been given such a lesson just before being asked to answer that question.

Re: OT, but I need math help

*Message #9 Posted by **Ed Look** on 19 Sept 2005, 1:04 a.m.,*
in response to message #8 by Howard Owen

I was confused... LOL!... because I took the "*" to be multiply; for example, I entered 3, then 4, then ENTER then "x" then + then +/- (I was using a 32SII) then + and was totally mystified at first!

I guess one has to be a kid...

Re: OT, but I need math help

*Message #10 Posted by **Howard Owen** on 19 Sept 2005, 10:49 a.m.,*
in response to message #9 by Ed Look

Yes, the asterisk is bound to confuse anyone who codes in a high level language. BASIC, C, C++ FORTRAN, Pascal, Modula, Java, Perl, Python and many others all use the "star" as the multiply operator. A third grader of yesteryear would have been blissfully ignorant of that usage, although I'm not sure about the more recent crops.

29c value

*Message #1 Posted by **Hal** on 7 Sept 2005, 7:04 p.m.*

Hello out there in HP land. Can anyone give any input on the value to collectors of a 29c? The unit has the original box, manuals, softcase, etc, is virtually in mint condition and works fine. I did notice that there are no 29c's on E-Bay...This either means they're very rare, or commonplace to the point of total disinterest. Opinions appreciated. Thanks, Hal

Re: 29c value

*Message #2 Posted by **Gerson W. Barbosa** on 7 Sept 2005, 8:44 p.m.,*
in response to message #1 by Hal

Not very rare, but definitely no commonplace. Take a look at the Prices & Rarity section:

http://www.hpmuseum.org/collect.htm#diff

Regards,

Gerson.

Re: 29c value

*Message #3 Posted by **hugh steers** on 8 Sept 2005, 7:32 a.m.,*
in response to message #2 by Gerson W. Barbosa

out of interest, how often do these figures get updated?

i noticed that in the slide-rule market, they use a robot that collates past sale prices of makes by month.

FYI, http://www.voidware.com/calcs/hp29c.htm cost me about $240 and i'm happy with it.

Re: 29c value

*Message #4 Posted by **Gerson W. Barbosa** on 8 Sept 2005, 10:09 a.m.,*
in response to message #3 by hugh steers

I don't know how often Dave updates these figures or whether he has automated this task. But they seem to be update. For example, I am currently looking for a 34C ($46-$150, $177, $202, $205, according to Dave's list). The most recent 34C's on eBay sold for $49.99 (calculator and case, untested), $87.51 (not so good), $178.50 (complete with manuals, no box - thought it would sell for much more and quit), $207.50 (it appeared to be excellent and the seller told me it passed the self test, I quit when the price went over $200 - still expect to get it for less than $150).

Anyway, Dave's list and the price information you have provided (yours looks excellent) may give Hal a reference price.

Re: 29c value

*Message #5 Posted by **don wallace** on 9 Sept 2005, 6:26 a.m.,*
in response to message #4 by Gerson W. Barbosa

The 34C is a nice machine. I like the FREE LIGHT SHOW you get when you get it to run a program or particularly to do a SOLVE...

A bit slow though...

I had a friend who dismantled one... integrated circuits went everywhere! And in 1979 (?) you couldn't just log onto the internet to find out what went where...

He is now an ELECTRICAL ENGINEER... (Nice guy, though and quite clever [and a bit bent...{Hi Peter! How was Tibet?}]).

DW

34C (Was: Re: 29c value)

*Message #6 Posted by **Gerson W. Barbosa** on 9 Sept 2005, 5:45 p.m.,*
in response to message #5 by don wallace

I've heard a story like that before, a 34C being dismantled and the user not being able to put it together again. That's why I'd like to get an European 34C: DECIMAL POINT IS COMMA (as it should be :-), so I wouldn't have to open it to cut the radix selection jumper.

As of speed, isn't it just slightly slower than the 11C/15C?

Re: 34C (Was: Re: 29c value)

*Message #7 Posted by **don wallace** on 9 Sept 2005, 9:42 p.m.,*
in response to message #6 by Gerson W. Barbosa

Hi Gerson.

Doing a solve or running a program which implments a function (to use solve or integrate on) it runs about 1/4 (maybe 1/3?) as fast as a 41CV.

I'm not bagging it but it IS quite slow. Only a few program steps per second (about four to five?). same or faster from what I can remember than the 33E. Long time ago...

DW

Re: 34C (Was: Re: 29c value)

*Message #8 Posted by **Gerson W. Barbosa** on 9 Sept 2005, 10:57 p.m.,*
in response to message #7 by don wallace

Hello Don!

According to the benchmarks in the link below, let us not discuss whether they are adequate or not, the 41C/CV runs twice as fast as a 34C. Of course, the tasks you have mentioned may be accomplished even faster than this on the 41C/CV depending on the algorithms you use.

http://www.thimet.de/CalcCollection/CalcPerformance.html

What I'd like to point out is that the 34C can be occasionally used even today, the same way we may occasionally use an 11C or a 15C, since they have comparable features. I was pleased to be able to use a red LED display calculator again, when I received my HP-35 early this year, which incidentally came from Australia. My first HP calculator was a 15C (a replacement for a stolen TI-59). For I matter of months, it could have been a 34C... Yes, a long time ago...

Re: 34C (Was: Re: 29c value)

> My first HP calculator was a 15C (a replacement for a stolen TI-59). For I matter of months, it could have been a 34C... Yes, a long time ago...

Hey, me too! I bought the 15C in November 1983, fully intending to buy a 34C, which I had seen several years before. The improved version of the 34C was still for sale, but the young salesman eventually persuaded me to buy the 15C instead. I could see that the 15C was clearly the superior product, but I had to come to terms with the change in paradigm and expectations.

The 15C was my only HP until 2002, when I started a collection with an older 34C and a 41CV from a local used-electronics seller.

> I bought the 15C in November 1983

Hi, Karl!

I am almost sure I bought mine the same year and month. My 15C has serial 2343B75099, that same year I bought one of my brothers an 11C, just before Christmas as a gift (his only calculator until today). Then I had the bad habit of selling my HP calculators in order to buy newer models (15C => 28S => 48GX, trying in between the 32S and 42S). Fortunately that 15C had beed with my youngest brother all these years and has eventually returned to me. I don't remember ever having seen a 34C on the shelves. Anyway, at the time I didn't miss the LED display because the 15C Liquid Crystal Display was impressively excellent, and I never had to look for a seat next to a power outlet again :-)

Re: 29c value

in response to message #1 by Hal

> Quote:
>
> any input

Well, I still own the HP-29C that I bought on November 7, 1977 for ƒ680 (=€300). It matches your description and any reasonable price will be far too low to make me sell.
A 29C and its owner hardly ever part. That may explain the lack of them on eBay.

Which side of the glass case do the Hp's belong on?

*Message #1 Posted by **Richard Zajac** on 6 Sept 2005, 9:01 p.m.*

Having lurked for some time, I have grown curious about how everyone treats the calculators they collect.

Do you keep them under glass, carefully locked in some curio cabinet, lest their aging keys suffer wear from dirty fingers?

Or do you adhere more closely to the TOY STORY philosophy that a toy becomes miserable just sitting on a shelf and must be active?

I myself teach everyday with one of my HP sidekicks wheezing through the smog of chalk right beside me. Perhaps that kind of abuse is sacrilegious to a few of you serious collectors. Somedays I'll even take along the Novus, lest it get bored.

What say you? What's the more proper fate for your noble HP's?

Re: Which side of the glass case do the Hp's belong on?

*Message #2 Posted by **don wallace** on 6 Sept 2005, 9:36 p.m.,*
in response to message #1 by Richard Zajac

Hi Richard.

My HP41CV (early fullnut Sliverbird) is a bit mechanically fragile at the moment so I am handling it carefully until I get time to do some structural repairs on it. But it still runs perfectly and is fully functional after 24 years and five repairs. It gets use doing impedance calculations on capacitors and on timing values for LM555 oscillator circuits which I use for clocking some digital projects I am doing. It has a TIMER module also and so is used to alert me to closing Ebay auctions and I wrote a very simple PROJECT MANAGEMENT program with it to help goad me into putting in the neccesary time to get my longer term projects out the door on time.

If you and others are curious you may like to look at my website:

http://donwallace.customer.netspace.net.au

I have a few photos there of some of my digital electronics projects. The latest one centers on a tool I am builidng (a five channel serial Logic State Analyzer) to assist me in designing and building hardware add-ons for the HP41C series machines among other things...

I think any self-respecting HP engineering calculator would rather "die with it's boots on" in a chalk saturated classroom helping the engineers of tommorrow or end up MIA on a construction site rather than quietly languish in a glass case somewhere. But collectors are also an important part of the "user mix" that constitutes this community of people within the forum. You find a lot of helpful people here and I am delighted to see what others are doing and offer help where I can. The speed and quality of responses to my own questions makes me feel really confident about "hanging out" on the forum and I have met some VERY INTERESTING people here. Some are rather qualified and experienced. All are pleasant and helpful to each other. If RL was

this way there would probably be no war (just a few healthy debates from time to time ;-)

Welcome aboard!

DW

Hello Don,

I just had a look at your really impressive documentation for repairing a 41. What I missed is a closer look at the keyboard-PCB. The "8"-key of my 41C has the problem that you nearly always have to push it twice before the 8 is accepted. Did you had such a keyboard problem once, too ? And could you show me how to repair it ? Thank you for your answer in advance.

Regards

Karl

41C series keybaord repair

*Message #4 Posted by **don wallace** on 7 Sept 2005, 4:07 a.m.,*
in response to message #3 by Karl-Ludwig Butte

Hi Karl.

I did have a serious failure in the keyboard of my 41CV in 1994.

The actuators for the keys are moulded in the keys themselves. I found that the ALPHA and USER plastic spikes broke off.

Others have said the keyboard is not repairable. I would say this is partly true and if you have no great experience with fine soldering on CMOS circuitry your chances aren't that good at all. Experiened people will find it a tedious exercise which involves a total strip down of the calculator. My repair took me about five to six hours. But I don't rush repairs like this.

The most delicate part of the repair is to unsolder the LCD module from the keyboard PCB. Once that's done one can cut away the many plastic heat stakes holding the keyboard onto the front panel to access the key mouldings themselves to repair them.

At this point you have to determine if it's a failed key or the actuator has broken away. This is readily apparent. The key moulding has to be repaired and then the keyboard PCB has to be re-staked to the front panel. The main problem is repairing the key acuator so that the keyboard will function properly with a pretty long life. Due to the limited length of the heat stakes, I believe keyboard repair is a once-only procedure.

Once that is done, re-assembly proceeds with components going back where they came from with due care to avoid static damage.

From what I saw of the keyswitches themselves I believe spray solvent or immersion / ultrasonic cleaning would not work as they are pretty well sealed.

Hope this helps. Happy to repair your 41 if you want. If so, please write to me.

HP41 keyboard contacts

*Message #5 Posted by **Tony Duell** on 7 Sept 2005, 8:03 a.m.,*
in response to message #3 by Karl-Ludwig Butte

It would be worth trying to clean the contacts without dismantling the keyboard.

Take the machine apart (remove the back case, the logic board, and the black 'paper' cover over the keyboard PCB). Now get some fine strands of wire (e.g. from a piece of multi-strand wire) and grip them in a pin chuck. Trim them all to the same length so you have a tiny wire brush. Put it through the via (hole) behind the defective key, and carefully brush the contacts. Maybe drop a _little_ propan-2-ol down there as well. Then put it all back together and try it.

If it doesn't help you've not lost much. If it does, you've saved the problems of re-assembling the heat-staked keyboard.

*Message #7 Posted by **don wallace** on 7 Sept 2005, 9:39 p.m.,*
in response to message #3 by Karl-Ludwig Butte

Hi Karl,

I just rxed a hp41C, very old, totally D.O.A.

In the process of diassempling the machine, I will photograph the keyboard PCB and post my pictures for you.

It appears to me that you are very unlikely to get alcohol into the keyswitches themselves from the back of the keyboard. There are very small "plate through" holes in the PCB, but they are too small to allow alcohol to go through, I think. Capillary action will stop it. The photos will show you what I mean...

*Message #9 Posted by **Karl-Ludwig Butte** on 8 Sept 2005, 7:08 a.m.,*
in response to message #3 by Karl-Ludwig Butte

Hello Don and Tony,

thank you very, very much for your suggestions and the really great photos. As the photos show the 41-keyboard has nothing to do with the simple to repair 35/65/67-keyboard anymore. Well, the "8"-key is still working although one often need 2 presses. And because I just got 41cx for my collection without this problem I'll let this as is. Many thanks for your repair-offer, Don, I may be come back to you at a later date.

Hope one day I can return the favour.

Kind regards

Karl

*Message #12 Posted by **Larry Corrado, USA (WI)** on 6 Sept 2005, 9:41 p.m.,*
in response to message #1 by Richard Zajac

Richard:

I keep most of my HPs on a shelf, some behind glass, in a display case in my dining room, the rest in the basement. However, I don't hesitate to pull one out and turn it on when someone comes over and shows some interest. (besides "Calculator collecting? Why?") Sometimes some of my machines travel to displays in local libraries or schools. (Of course, there they're behind glass in a safe environment.)

I also have a few I keep out to use: a beat up HP 15C next to my computer for miscellaneous calulations, an HP 11C (in pretty good shape) in my desk at work for occasional use, and an HP 33S on my desk at home for balancing my check book.

My HP 16 sometimes comes out when I'm working with number theory.

FWIW... Larry

Bottom Line

*Message #13 Posted by **Garth Wilson** on 7 Sept 2005, 3:26 a.m.,*
in response to message #1 by Richard Zajac

My 41cx is going on 20 years of perfect daily operation with no repairs. There was a time however that it was getting operated in a dusty environment, so I kept it in a clear zip-lock bag, with the HPIL cables (to the IEEE-488 interface converter) coming out a corner and the extra bag plastic folded behind and taped. So in a sense, you could say it was getting heavy daily use "behind the glass."

*Message #15 Posted by **Valentin Albillo** on 7 Sept 2005, 6:34 a.m.,*
in response to message #1 by Richard Zajac

Hi, Richard:

I own more than a hundred vintage calculators, mostly HP and SHARP BASIC handhelds, together with their manuals, accessories, etc.

But for three, all of them are safely stored within an enclosed, humidity-controlled cabinet in a relatively cold place, each particular calculator inside a hermetically thermo-sealed plastic bag. This keeps interaction with light, heat, air, and humidity to a minimum. Before storage, each calculator has been carefully cleaned up, both inside and outside, and of course with no batteries or power cells in them. This guarantees as much as possible that except for time itself, most aging and degrading agents are left out.

As for the three models excepted from this treatment, they are an HP-15C, a full HP-71B, and a SHARP PC-1350. All of them are in very good condition (the 71B being actually mint), and see frequent use. The HP-15C

is further protected by being tightly enclosed in a very clear plastic bag, which prevents any physical contact with its surfaces, thus avoiding stains, fingerprints, dust under the display, moisture, etc., while allowing perfectly comfortable use.

The other two models are not so delicate and do not require such extra protective measures, they're simply treated with care.

Overkill you might think ? Not so. These measures ensure that my valuable calculator collection stays in pristine condition for years to come, so that I can take out any of them some years in the near future and have the extreme pleasure of holding in my hands a, say, pristine, not-a-single-dust-speck, not-the-slightest-blemish, shiny and new HP42S, HP-15C, or HP-41CX, say. Proceeding otherwise I would be denied this exhilariating experience.

Do I not miss having them at hand at all times, using them, etc ? Well, I *do* have an HP-15C, full HP-71B and SHARP PC-1350 available at all times, and they do get used. As for the rest, I did make extremely good quality digital pictures of all of them, and can look at them at will.

And re using them, with such fantastic emulators as V41, Emu42, Emu71, Nonpareil, and SHARP PocketEmu, to name a few, my vintage programming needs are more that fulfilled, and with better facilities to boot (keyboard, mass storage for calculators that had none whatsoever, etc).

Best regards from V.

*Message #16 Posted by **Tony Duell** on 7 Sept 2005, 8:08 a.m.,*
in response to message #1 by Richard Zajac

I've said many times that the _appearance_ of a calculator doesn't matter to me. What interests me is how it works, what it does, the electronic design, the firmware. So I use them, take them apart, probe them with a logic analyser, solder wires to the insides, and similar things

I have little interest in collecting lumps of plastic that I never turn on. Therefore my HPs get used. Well used in some cases. I always have at least 2 41's, a 67, a 71B and several IL peripherals with good batteries and 'ready to go'.

I treat most of my other things like that too. Obviously for optical stuff (cameras, etc) I make darn sure the lenses don't get damaged -- that would affect the performance. But a 'ding' in the paint wouldn't bother me at all.

*Message #17 Posted by **bill platt** on 7 Sept 2005, 9:28 a.m.,*
in response to message #1 by Richard Zajac

Hi Richard,

I have about 20 calculators. None of them are "stored away" though I try to take good care of them.

I keep on top of the battery situation. I am quite certain that use keeps a battery from leaking--at least that appears to be the case! (My wife has a sharp elsi-mate that is 20 years old, and still has the original battery!).

I like to rotate them into use, too. It is fun to go back to an 11c after having been awy from it for a long time.

Or to switch to a 32s 50th anniversary edition from a 32sii--the color scheme is different.

I also find that now that I have a working collection, I think about programming in a different way. I go the "easiest route" and so if I know that the 48gx has a good way to handle something, I pull it out. Sometimes I have three on my desk at once--since each one is already programmed for some particular task.

For travel, I use less valuable machines: I used to take the 20s around, but now I use the 33s. I carry a 49g (not the new G+) when I want to have an RPL machine on the road.

Re: Which side of the glass case do the Hp's belong on?

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 8 Sept 2005, 10:30 p.m.,*
in response to message #17 by bill platt

I have over 500 hand-helds. The great majority are in working condition. I have another 25 desktops, over 100 slide rules, and numerous mechanical calculators including two Fridens. I have carrying cases and documentation for many of the units. Putting all that material under glass or in special packaging isn't possible for me. I keep the calculators in an air-conditioned environment with battery packs removed where possible.

Some of my biggest problems are with devices where circuitry has been damaged by cell leakage and with some of the older hand-helds where the rechargeable NiCad's are hard-wired in. I clean up the residue due to cell leakage as best I can.

I have thirty HP's including three HP-11C's, four HP-12C's and four HP-41's. Only the HP-11C which is one of the early models with the glitch and the HP-41C which has gold balls and exhibits bug 2 qualify for special care.

The easiest to care for are the Sharps which are by far the best built units. When I see a Sharp in a thrift store or at a garage sale I expect that it will work properly. By far the hardest to care for are the NOVUS/National Semicondctor models. When I see one of those I am surprised if it works properly, and units which were once working properly have gone bad on the shelf. The rest of the manufacturers are somewhere in between.

*Message #19 Posted by **Stephen Easterling** on 8 Sept 2005, 10:31 p.m.,*
in response to message #17 by bill platt

Just like the last post, I have at least a dozen models from the 20S up to the 48GX (got rid of my 49G+). Some I have two of, so I don't mind getting more use with the "back-up" model (e.g., 20S, 32SII, 48G, G+, GX). I try to keep them all rotated into use and stay on top of the battery situation, too. The calculators get jealous if one gets more use than another! I take extremely good care of each of them, but know that some day I'll die, and what a regret I'll have if all I did was keep them under glass and not get any use out of them. (Just my opinion, of course.) Mine don't see chalk dust or dirty hands that always want to borrow them, and I use a cheap Casio when I go to the operating room (medical physicist) just in case something happens and a doctor "contaminates" it. So my HPs have an easy life and they "know" they are appreciated and used routinely. My current hobby is trying to make a medical physics PAC for my own personal use at work.

*Message #20 Posted by **GE** on 12 Sept 2005, 6:51 a.m.,*
in response to message #19 by Stephen Easterling

I have quite a number of machines, all brands including HP (!) and also Sharp which are wonderful hardware and software-wise.

They are stored vertically (so keyboards are not pushed onto) in cupboards (no light, no dust) in a bedroom normally heated/ventilated. They are wrapped in foam or in the original pouch, whichever is available, and only a few have batteries. I have never experienced battery leakage.

Few machines get real usage, as I like to work on real problems and only recent machines provide semi-adequate speed. So usually I get a recent machine (HP48, a Sharp, others). Most machines are on a permanent rest, and some talk to me a few times each year. I always fear I can damage my beloves LED models.

Fortunately everybody thinks I'm crazy, so they stay clear of the stuff. Behaving bizarrely is sufficient, and for most of us it must be easy !

As of now, no machine died on the shelf (including the Novus). Actually, he older the machine the better its quality it seems (apart from 'budget' ones like some Radofins or Novus etc).

That would be the E6B. Somewhere I have a smaller, less expensive one for aviation that didn't do as much as the E6B.

Re: circular slide rules for aviation

*Message #25 Posted by **Les Bell** on 13 Sept 2005, 1:20 a.m.,*
in response to message #24 by Garth Wilson

Flight computers - a.k.a. "whizz wheels" - have two sides. One is a fairly conventional circular slide rule which is used for time/speed/distance problems. It often has markings for useful conversion factors (e.g. litres/gallons/lbs/kg) and of course, has a prominent index mark against 60, since most time/distance calculations done in flight involve minutes although speed is expressed in knots.

The back side is unique to navigation devices and usually has a panel which slides up and down behind a rotating perspex wheel; this is used for solving wind triangle problems (e.g. working out the heading to fly in order to maintain the correct track for a given cross-wind and what the resulting groundspeed will be). It's a very simple vector calculation, and the flight computer lays it out graphically.

A few (e.g. Jeppesen CR series) don't have the large rectangular slide, but are completely circular. They (probably) use a slightly more tricky trigonometric technique to solve wind problems, and make it harder for the user to intuit what's going on. However, the smaller ones like the CR-5 can fit in a shirt pocket.

I occasionally pull mine out and check that I can still do things the old-fashioned way. Funnily enough, I've never had to replace the batteries, either . . .

Best,

--- Les

*Message #26 Posted by **don wallace** on 13 Sept 2005, 2:05 a.m.,*
in response to message #25 by Les Bell

Hi Les,

Yeah, the Jeppesen is the one I was thinking of...

About batteries... That reminds me of a joke I coined when I was baby-sitting an SBS server for some guys who (think they?) run a communicatins company:

Q. Whats the difference between a Notebook PC running Windows and a Spirax notepad?

A. A spirax doesn't crash or need batteries.

Comments on slide rules

*Message #27 Posted by **Palmer O. Hanson, Jr.** on 13 Sept 2005, 4:54 a.m.,*
in response to message #26 by don wallace

I have about 170 slide rules in my collection including the K&E Log Log Duplex Decitrig that I purchased while a freshman engineering student in 1947. I also have several of the navigation slide rules.

One of the most unusual slide rules in my collection is a Faber-Castell 67/22R which has a 12.5 cm slide rule on the front and an Addiator (one of the push-down adders) on the back. I think it was an attempt to compete with the early four-bangers.

One of the problems with the circular slide rules is that the scales closer to the axis are shorter. Typically, the C and D scales are on the outside and the K scale is innermost and practically useless.

Some slide rules do deteriorate. Many yellow with age. The slides on the early metal Picketts (made with magnesium, I think)tended to corrode and bind. In the 1940's there wasn't a good solution for that. Now one can make them work as smooth as silk with a little WD-40 on the slide.

Re: Comments on slide rules

*Message #29 Posted by **Palmer O. Hanson, Jr.** on 14 Sept 2005, 9:25 p.m.,*
in response to message #28 by don wallace

I received my BS from the University of Minnesota in 1950. After a year of half-time grad school and half-time teaching freshmen mathematics I entered the Navy in 1951. I left the Navy in 1956 and joined Honeywell. I worked with automatic flight control systems and inertial navigation systems on aircraft such as the F-100, F-101, A-11, YF12, etc., from 1957 through 1989.

My retirement activity has been limited by multiple bouts with cancer.

My favorite computing device by far was and is the Radio Shack Model 100. That device was primarily designed for use by reporters. I found that Microsoft had provided a BASIC with astounding scientific capability. It's default mode was double precision which used 14 digits. I did some

fairly exhaustive testing of the trigonometric functions. The largest errors I found were 5 in the fourteenth place. The display could be used for graphing with a 240 x 64 pixel range although I had to write my own graphing routines. This was is in 1983. Casio would not provide graphing capability until the fx-7000G with 96 x 64 pixels in1985, HP not until the HP-28 with 137 x 32 pixels in 1988 and TI not until the TI-81 with 96 x 64 pixels in 1990. The Model 100 also provided a full size keyboard which was a real advantage to me since I could touch type, something adults can't do on computers with baby sized keyboards. A major deficiency of the device was that the external power supply would not charge the batteries.

I did a lot of work with linear regression and curve fitting, not because I particularly liked it, but because my work required it.

Re: Comments on slide rules

*Message #30 Posted by **don wallace** on 15 Sept 2005, 1:17 a.m.,*
in response to message #29 by Palmer O. Hanson, Jr.

Hi Palmer.

Amazing...

I had an old friend who has since passed on who was quite berzerk over two hardware items: His HP 11C and his TI-99/4A. Don Curry could rattle of a polynomial expression for any trig or trancendental you cared to ask about. Amazing guy, who used to install ground station equiment (including help with the odd dish) for Marconi in the 50's and 60's in South Africa and England, I think.

He shared your interest in accuracy of trigs and in using curve fit and polynomial stuff. He was doing a high accuracy planetary ephemeris in turbo pascal (bcd) and was, like myself, into Astronomy as an amateur. We had trouble with the int function and with cummulative rounding errors. He was very into high accuracy versions of Basic, Pascal and to an extent, Forth. In fact I got him a copy of Power Basic v 1.0 from Bob Zane; it is quite good, in it's way. Way better than anything Microsoft had at the time.

My contact with Pascal, Forth and Mathematics has crossed paths with quite a few people who have similar interests over the years.

Clear Skies, Palmer!

Trigs in Microsoft BASIC interpreters (Was: Re: Comments on slide rules)

*Message #31 Posted by **Gerson W. Barbosa** on 15 Sept 2005, 10:52 a.m.,*
in response to message #29 by Palmer O. Hanson, Jr.

Quote:

> I found that Microsoft had provided a BASIC with astounding scientific capability. It's default mode was double precision which used 14 digits. I did some fairly exhaustive testing of the trigonometric functions. The largest errors I found were 5 in the fourteenth place.

Here's how the MSX, an 8-bit computer with a Microsoft developed BASIC, behaves in this usual trigonometry test:

```
10 K=ATN(1)/45
20 DEF FNASN(X)=ATN(1/SQR(1/(X*X)-1))
30 DEF FNACS(X)=ATN(SQR(1/(X*X)-1))
40 PRINT FNASN(FNACS(ATN(TAN(K*COS(K*SIN(K*9))))/K)/K)/K
Ok
run
 8.9999999954364
Ok
```

According to Mike Sebastian's Calculator Forensics Results, the Radio Shack TRS-80 Model 100 Computer returns 8.9999999956625, which means both interpreters may share the same code. Very likely, since the Zilog Z80 is backward compatible with the Intel 80C85 microprocessor.

That's Microsoft's implementation of trigonometric functions on the MSX computer:

```

in response to message #31 by Gerson W. Barbosa

Hi Gerson,

Correct me if I am wrong but the Intel 8085 and the Zilog "Z80CPU" are contemporary and not 100% op code compatible with each other. They are both op code back compatible with the Intel 8080.

There was a math library (with a few really nasty bugs, most notoriously the INT function code) written in C, which got used a lot through the 1980's... found it's way into quite a few versions of (personal computer) BASICs... [bugs - Yuck!].

Pascal we found was better, but alos had it's limitations. I believe JPL used FORTRAN for the required precision to manage the voyager series spaceprobe flight plans. Interesting.

Anyone heard of PAPC.exe, a variable precision HP calc simulator. Runs user code in MS DOS... Anyone want a copy? PAPC=Programmable Arbitrary Precision Calculator

Re: Trigs in Microsoft BASIC interpreters (Was: Re: Comments on slide rules)

*Message #33 Posted by **Gerson W. Barbosa** on 15 Sept 2005, 9:20 p.m.,*
in response to message #32 by don wallace

Hello Don,

By what I can remember, the Z80 was designed to be

backward compatible with the 8085, at least at software level. I had a course on the 8085 at work, back in 1986, and soon noticed the compatibility when I started to study the Assembly language of the 8-bit Z80-based microcomputer I had then (and still have :-)

As I wrote from memory, I thought the early Microsoft BASIC had been written originally for the 8085 microprocessor. In fact, it was written first in the 8080 Assembly Language and later ported to 8085 and Z80 microprocessors (and not taking fully advantage of the more complete intruction set of the latter), according to my copy of the MSX Red Book in Portuguese (it took me a while to find it).

I had a hint you'd be the first one to reply. Thanks for your remarks,

Gerson.

Re: Trigs in Microsoft BASIC interpreters (Was: Re: Comments on slide rules)

The Z-80 predated the 8085, so it can't be backward-compatible with it.

In fact, the 8085 only added a couple of new instructions over the 8080. The major new features were the use of a single 5V supply (the 8080 also required -5V and +12V), a reorganised pinout (to work with the related RAM/ROM & I/O chips) and the incorporation of some serial I/O (which accounts for the new instructions).

The Z-80, by contrast, provided an alternate register set and a lot of new instructions, though the assembler syntax was completely different. Incidentally, the Z-80 was designed by Federico Faggin, who had earlier designed the 4004 and the 8080 at Intel, but left Intel in 1974 to found Zilog.

Both were designed as a superset of the 8080 architecture, though.

Best,

--- Les

Thanks, Les, for definetely clarifying the matter, and Don for first pointing me out the mistake. I've just found the old 8085 stuff, but that took a little longer... I had written below the 8085 syntax the Z80 correspondence when I began to study the Z80 Assembly: MVI M, byte -> LD (HL),byte; INR -> INC r; XRA A -> XOR A, etc.

Regards,

Gerson.

Good one, Les. I didn't wanna go into painful detail on it all and you saved me the hassle.

Cheers, Man!

DW

IIRC, the 8085 only added two instructions, RIM (Read Interrupt Mask) and SIM (Set Interrupt Mask), which could be used for software-controlled serial I/O.

You have a very good memory, John - I racked my brains over that, and could only remember that there were two new instructions, but not what they were!

Best,

The 8085 actually added about a dozen new instructions. They were deliberately designed in, not the accidental result of partial decode, but Intel management decided to leave them undocumented. A pity, since they were specifically designed to make compiled code more efficient.

Presumably Microsoft did not use them in any of their 8080/8085/Z80 software.

Any links to this? I always thought RIM & SIM were the only new 8085 instructions; I'd heard there were one or two 'practical' hidden ones on NEC 80C85

chips.

There were ten undocumented instructions:

- HL := HL - BC
- DE := HL + imm16
- DE := SP + imm16
- memory [DE] := HL
