So finally, this is why the HP30S gets exactly 9.00000000000000000 when running the calculator forensics test. To see the real error, one should subtract the input argument of the test from the final result. That is, do:

arcsin(arcos(arctan(tan(cos(sin(9))))))-9

On the HP30S, the result is 0, leading one to believe that the HP30S is *really* accurate. But redo the test as:

arcsin(arcos(arctan(tan(cos(sin(9.1))))))-9.1

to foil its rounding near integers and see a result: 4.833288903E-11

Not all that great for a calculator that can do 24 digit calculations, eh?

More on ill conditioning and calculator precision

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 21 Jan 2006, 11:40 p.m.*

On January 7 Rodger Rosenbaum initiated the thread "Ill conditioning and calculator precision" to carry forward discussion of an earlier thread initiated by Valentin Albillo. Near the end of the thread Rodger wrote "But, back to the original purpose I had when I started this thread. I noticed that a slightly different perturbation of the column matrix has even greater effect. Change the third element of the column matrix in Valentin's original problem from 45 to 45.1--now the exact solution is:

```
x1 = -2128901625
x2 =      268387
x3 = -1898169427
x4 = -1909014362
x5 =    -1317226
x6 =  1908985003
x7 =  3994038147
```

This is a tremendous change in the solution for an apparently insignificant change in one element."

For reference Valentin's original problem was

```
    1.3 x1 + 7.2 x2 + 5.7 x3 + 9.4 x4 + 9.0 x5 + 9.2 x6 + 3.5 x7 =  45.3
    4.0 x1 + 9.3 x2 + 9.0 x3 + 9.9 x4 + 0.1 x5 + 9.5 x6 + 6.6 x7 =  48.4
    4.8 x1 + 9.1 x2 + 7.1 x3 + 4.8 x4 + 9.3 x5 + 3.2 x6 + 6.7 x7 =  45.0
    0.7 x1 + 9.3 x2 + 2.9 x3 + 0.2 x4 + 2.4 x5 + 2.4 x6 + 0.7 x7 =  18.6
    4.1 x1 + 8.4 x2 + 4.4 x3 + 4.0 x4 + 8.2 x5 + 2.7 x6 + 4.9 x7 =  36.7
    0.3 x1 + 7.2 x2 + 0.6 x3 + 3.3 x4 + 9.7 x5 + 3.4 x6 + 0.4 x7 =  24.9
    4.3 x1 + 8.2 x2 + 6.6 x3 + 4.3 x4 + 8.3 x5 + 2.9 x6 + 6.1 x7 =  40.7
```

where the system has the exact solution:

x1 = x2 = x3 = x4 = x5 = x6 = x7 = 1.0

In the earlier thread I provided solutions to the original problem on several different machines and to a modied problem which changed the B1 value from 45.3 to 45.4 . Solutions to the modified problem with B3 changed from 45.0 to 45.1 follow.

With my HP-28S:

```
              B/A                                  INV A * B

       X                    A*X                     X                    A*X

-30272808391.1              45.04          -30272808407.9             -87.494
     3816428.18496          48.302              3816428.21599        -181.961
-26991815255.9              46.374         -26991815236.6            -162.843
-27146029351.6              18.506         -27146029342.2              -7.895
   -18730860.0936           36.536            -18780860.0977         -144.096
 27145611882.5              24.694          27145611823               -18.702
 56794898378.3              40.67           56794898341.2             -146.409
```

where the signs of the elements of the solution are correct but the magnitudes are off by an order of magnitude yielding relative errors of 14.2 . The calculations of A*X do indicate that there are difficulties with the solution.

My Model 100 and TI-85 yield the following solutions

Model 100		TI-85	
X	A*X	X	A*X
-2128141186.5423	45.3	-2148392852.67	45.3014
268291.13337654	48.399	270844.2167	49.3991
-1897491405.5188	45.1	-1915548178.57	45.1
-1908332466.734	18.5999	-1926492404.72	18.5999
-1316755.4898248	36.698	-1329285.91435	36.6983
1908303118.2216	24.9	1926462776.91	24.90025
3992611486.3345	40.699	4030605692.38	40.7002

where the signs and magnitudes are correct. At least the first three digits of each element of the Model 100 answer are correct yielding relative errors of 3.57e-04. The relative errors for the TI-85 are 9.15e-03.

The MATRIX routine of the HP-41 Math Pac and ML-02 routine of the TI-59 Master Library yield the following results

HP-41		TI-59	
X	A*X	X	A*X
24666733.49	45.3	-2077198547.178	45.32
3108.726	48.4	261868.9227801	48.44
21993331.58	45.1	-1852069973.364	45.11
22118987.39	18.59	-1862651525.312	18.6
15263.2	36.7	-1285235.478686	36.7
-22118645.18	24.84	1862622879.371	24.901
-46277322.87	40.7	3897037862.598	40.71

where the magnitudes and even most of the signs of the result from the HP-41 are wrong. The magnitudes and signs of the result from the TI-59 are correct and of the correct order of magnitude yielding relative errors of 2.4e-2. Curiously, with the HP-41 the product of Matrix A and the solution vector yield the exact values of the elements of vector B. This suggests that comparing the product A*X with B to measure the acceptability of the solution may not be a good idea if the user is interested in a real world solution as opposed to a solution which is of value only in the calculator's world. The determinants for Valentin's Matrix A were

Exact	1.e-07
HP-41	-86.31e-7
HP-28S	0.0703238892937e-07
TI-59	1.024890772918e-07
TI-85	0.990927530944e-07

Rodger also wrote "Try something I described in an earlier post; add .1 to the {3,7} element of the A matrix, and subtract .1 from the {7,7} element. This tiny change reduces the condition number of the A matrix from about 3E12 to about 400, and using this slightly perturbed A matrix with the perturbed column matrix mentioned just above gives a HP48G solution:

```
x1 = 1.20999247798
x2 = 1.01325966115
x3 = 1.26616078717
x4 = 1.29157926088
x5 = .997263593179
x6 = .690061410742
x7 = .499897531935
```

This isn't as close to [1 1 1 1 1 1 1] as we would like, but given what the solution was with just the third element in the column matrix perturbed and using the original A matrix, this inprovement is an astounding result considering that only two tiny perturbations were made to the A matrix.

My purpose here is to show that with proper techniques we can find reasonable solutions to very ill-conditioned systems. Systems as badly conditioned as Valentin's example are unlikely to occur in practice; they must be

artificially constructed. But, if we can handle them, then we can certainly handle the ones we encounter in real life problems.

Palmer, it would be good if you tried solving the system on your various calculators, consisting of the column matrix perturbed in the third element, and the {3,7} and {7,7} elements of the A matrix perturbed as I described. I think you will find that you don't get wildly varying results with these changes. For example, on my HP48S, which uses the same matrix routines as the HP28, I get about 9 or 10 digit agreement with the solution posted above, whether I use the divide key or invert the A matrix and multiply times the column matrix."

My HP-28S yielded

```
              B/A                                  INV A *B

      X               A*X                   X                    A*X

1.20999247808         45.3             1.20999247808         45.2999999988
1.01325466114         48.4             1.01325966123         48.3998999983
1.26616078724         45.1             1.26616078741         45.0999999989
1.29157926094         18.6             1.29157926101         18.6000000005
0.99726359318         36.7             0.997263593181        36.6999999992
0.690061410687        24.9             0.690061410466        24.9000000001
0.499897531784        40.7             0.499897531481        40.6999999991
```

My HP-28S solutions are consistent with Rodger's results from his HP-48S. Note that when using the B/A method the product of matrix A and the solution vector yields exactly the B vector.

The simultaneous equation solution with my TI-85 is

```
1.2099924779883
1.0132596611477
1.2661607871723
1.2915792608817
0.99726359317885
0.69006141074113
0.49989753192964
```

where the product of the A matrix and the solution matrix yields exactly the B matrix.

The solution from my Model 100 is

```
       X                   B - A*X

1.2099924779846           -1e-12
1.0132596611482            2e-12
1.2661607871704            1e-12
1.291579260881             1e-12
0.99726359317867           0
0.69006141074154           0
0.49989753193417           1e-12
```

where in the second column I listed B - A*X rather than A*X to avoid typing in all those zeroes. I wasn't pleased with the TI-85 and Model 100 results. We were hoping to get a solution closer to all ones using the modification to Valentin's problem, but the TI-85 and Model 100 solutions were further away, not closer than with Valentin's original problem. It occurred to me that perhaps the exact solution to the perturbed problem wasn't all ones. I went to my HP-49G emulator and solved the problem in the exact mode with the following results

```
x1 = 9667493448/7989713675  =   1.2099924779845
x2 = 8095654571/7989713675  =   1.013259661148
x3 = 10116362156/7989713675 =   1.2661607871699
x4 = 10319348483/7989713675 =   1.2915792608801
x5 = 7967850568/7989713675  =   0.99726359317876
x6 = 1102678618/1597942735  =   0.6900614107426
x7 = 3994038147/7989713675  =   0.49989753193502
```

which confirmed my suspicions.

The results obtained with the MATRIX routine in the HP-41 Math Pac module and the ML-02 routine in the TI-59 Master Library module:

```
   HP-41                  TI-59

1.209992482          1.209992478108
1.013259663          1.013259661129
1.266160800          1.266160787202
1.291579278          1.29157926087
0.997263593          0.9972635931871
0.690061393          0.6900614107704
0.499897511          0.4998975318243
```

where the differences from the exact answer are only seen in the lower order digits of each machine. The determinants for the modified matrix A are

```
Exact           798.9713675
HP-41           798.9713752
HP-28S          798.971367542
TI-59           798.9713674893
TI-85           798.9713675
```

Some playing with the numbers on my HP-28S:

If I multiply Valentin's original A matrix times the X vector from from the third modification with A(3,7), A(7,7) and B3 changed I get

```
45.3
48.4
45.0500102468
18.6
36.7
24.9
40.7499897532
```

where the RMS relative error with respect to the B vector of the third modification is 2.672e-02. Furthermore, If I multiply the original A matrix by a vector obtained by rounding the X vector to the nearest 0.25, i.e., a vector made up of the elements 1.25, 1, 1.25, 1.25, 1, 0.75, 0.5 I get

```
45.35
48.45
45.025
18.6
36.7
24.9
40.725
```

which has n RMS relative error with respect to the B vector of the third modification of 2.988e-02

As a novice to the idea of perturbing problems to relieve ill-conditioning I am not sure what all of this means.

Finally, Rodger suggested that someone should translate a Fortran program for singular value decomposition (SVD) for use with BASIC. I took a quick look. Someone else will have to do it. I haven't done any Fortran programming since about 1970.

Re: More on ill conditioning and calculator precision

*Message #2 Posted by **Rodger Rosenbaum** on 23 Jan 2006, 9:58 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Let me make some further observations regarding Valentin's original system. It was intended to be an example of a set of measurements one might make in the lab, for example. The entries in the A matrix were recorded as two digit quantities, presumably because they were real measurements which could not be taken to be more accurate than two digits. Consider the first entry in the A matrix, namely 1.3. This might have been measured

with a digital meter giving more than two digits, but rounded and recorded with only two digits. The actual measurement could have been any number x, 1.25 < x < 1.35; it could have been 1.273, or it could have been 1.329, for example. Either of those readings would have been rounded and recorded as 1.3. So each entry in the A matrix could have actually been measured as the recorded value +- .5 ULP.

So, let's create a 7x7 perturbation matrix consisting of 49 uniformly distributed random numbers varying from about -.5 ULP to about +.5 ULP, and then add that perturbation matrix to the A (call the perturbed matrix A') matrix of Valentin's original system, and solve the perturbed system. If we were to round A' to 2 digits, we would get back the original A matrix. This A' matrix could indeed be the matrix of measurements made with the hypothetical digital meter before they were rounded to two digits; we have no way of knowing since we only have the values after they were rounded. In fact, if we create multiple 7x7 perturbation matrices filled with the previously described random numbers and add them to the original A matrix, all of these A' matrices could have been the actual measurements. There's no reason so far to prefer one of them over the others, including Valentin's original. In fact, the original *unperturbed* A matrix would seem to be a somewhat unlikely candidate because that would mean that all 49 measurements had exactly 2 digit precision. And if the measurements were made with some instrument that only gave 2 digit readings, the real value of the measured quantity was still undoubtedly contaminated with noise, and a value somewhere in the range of recorded value +- .5 ULP was the true value.

You can get insight about the behavior of the original system by repeatedly creating a perturbation matrix, A', and adding it to the original A matrix and solving the system. Each of those solutions is just as likely as any other, including the [1 1 1 1 1 1 1] solution. I have done this for 150 repititions and here are some of the results (rounded to 3 digits):

```
[-8.71 1.33 -7.52 -6.28 .804 8.33 18.5]
[.785 .981 .841 .773 1.01 1.22 1.39]
[1.55 .948 1.38 1.23 1.03 .788 .172]
[1.2 .864 .763 .371 1.06 1.69 1.33]
[4.08 1.06 4.08 4.34 .98 -2.4 -5.27]
[5.44 1.1 5.05 5.21 .963 -3.25 -7.51]
[9.18 1.08 7.65 8.17 .911 -6.07 -13.6]
[-20.7 .628 -19.6 -20.6 1.06 23.2 43.5]
[-1 .808 -1.36 -1.72 1.1 3.83 5.65]
```

This procedure can't indicate that any one of these solutions is any more likely than another, or than the [1 1 1 1 1 1 1] solution, to be the "true" solution.

The procedure can be done on the HP49 emulator (or a real HP48G or HP49) easily. Assume that the original A matrix and the original column matrix B are stored in variables of those names. Then this program will generate a perturbation matrix, add it to the A matrix, and solve the system.

<< B A RANM 247.487 / A + / -3 RND >>

This can be executed repeatedly to see results such as I gave above.

The constant 247.487 is to cause the perturbation matrix to have a Frobenius norm of about .1414, which is the same as the norm of perturbation matrix used to create the slightly perturbed matrix I suggested and you used in your previous post; the maximum perturbation of an individual element of the A matrix will be about +- .0404, just slightly less than .5 ULP (.5 ULP would be .05).

Now, in your previous post, you said:

"I wasn't pleased with the TI-85 and Model 100 results. We were hoping to get a solution closer to all ones using the modification to Valentin's problem, but the TI-85 and Model 100 solutions were further away, not closer than with Valentin's original problem. It occurred to me that perhaps the exact solution to the perturbed problem wasn't all ones. I went to my HP-49G emulator and solved the problem in the exact mode..."

My discussion should have indicated that the perturbation I suggested wasn't intended to give a solution of [1 1 1 1 1 1 1], because we don't yet know if that is really the "best", or "true", solution. What I was trying to show is that if you carry out certain procedures (a simple perturbation of the A matrix here), you can reduce the condition number enough that the new system can be solved by almost any calculator to reasonable accuracy. The solution we got, and with respect to which all the calculators you tried gave good results, is undoubtedly much closer to the "true" solution than the exact solution:

```
x1 = -2128901625
x2 =      268387
x3 = -1898169427
x4 = -1909014362
x5 =    -1317226
x6 =  1908985003
x7 =  3994038147
```

In another post I'll talk about using the singular value decomposition to get the "best", or "true", solution.

vintage calc drag races

*Message #1 Posted by **Hal** on 21 Jan 2006, 6:25 p.m.*

Hi everybody, I was messing around with some old machines last night and thought I would see which one ran the fastest. The results were a bit surprising to me. The three machines were a 15c, 34c, and 29c. I put three different types of identical programs into each machine (one that had many calls to subroutines, one that was just a simple counting loop, and one that was just a string of transcendental functions back to back). I was careful to put the programs in the same relative position within program memory in all three machines as well.
Now the (surprizing) results...the 29C outran the other two machines in all three types of programs! I wouldn't have expected the oldest machine to (apparently) run the fastest. Is this because the 29c has a smaller ROM menu, and fewer program lines to search, or does it indeed run faster? Comments please. Thanks, Hal

in response to message #1 by Hal

I was as surprised as yourself when I discovered the HP11C being significantly slower than my HP29C. I've understood by this forum that the Voyager series was designed to last a life time on a set of batteries (at the cost of speed). Perhaps because it was the first series to run on batteries (ignoring the Woodstocks could run on penlights as well), HP might have thought that the user mustn't be bothered with changing expensive batteries within some years after purchase of the calculator. Obviously a matter of choice.

It's somewhat strange that the Spices are slower than Woodstock. I can't think of a reason for that.

hp 41 or hp 49?

*Message #1 Posted by **e. young** on 21 Jan 2006, 12:59 p.m.*

which one of the 2 machines would be better for dayly use by an engineer? I know the 41 series has huge nostalgic appeal, and also that the 49 has had quality issues. Is one easier to program than the other? Is buying a 49 a risky move due to quality and bad design issues that have plagued the most recent calculators from HP (Kinpo)? Thanks.

*Message #2 Posted by **Stephen Easterling** on 21 Jan 2006, 2:12 p.m.,*
in response to message #1 by e. young

I have never been able to adjust to the way the numbers are displayed on the 41 with the LCD segments. Any of the Pioneer displays are much better, IMO. A 42S, 32S, 32SII, or 33S are much better choices, IMO.

The 49G+ is better at almost anything that HP has ever made in a calculator. It's fast, inexpensive (compared to a nice vintage HP calc), has virtually unlimited memory (depending on SD card size), the display contrast is unbeatable, and the ROM can be upgraded. The downside: it's big and bulky and hard to fit in your pocket. Regarding quality, the new models now,... and using at least ROM 2.00, are great. The quality is more than good enough for me and still better than the competition.

I think a 15C is great if you like it's keypad layout and don't mind its speed. The 15C will go easy on batteries, plus I've never heard of a LR44 / 357 battery leaking as easily as others. The 15C is also made strong like a little brick! There's a reason why so many here want to "bring back the 15C." There aren't too many that say "bring back the 41." Again, this is just my opinion.

Of course this is just your opinion, do you allow me to express mine?

While so many (?) shout that they want back the 15C, you can actually buy (right here, right now) brand new enhacements for the 41C (Clonix, NoVram, MLDL2000).

In 2006, for a calculator out of production since 15 years.
Doesn't this ring a bell?

And why do you find the numbers in the display of a 15C much better than those in the 41C?

Greetings,
Massimo

From a casual perusal of comp.sys.hp48, it appears to me that the latest 49G+ ROMs, combined with tweaking of parameters (dealing with keyboard debounce, it seems,) look like they have addressed keyboard issues with recent vintage 49G+ machines.

Otherwise, the two machines truly are like apples and oranges. Both have learning curves, but the 41C is a much simpler machine. This can be an advantage or not depending on whether you need some bell or whistle available on the 49G+ that's not there on the 41. Since the feature list of the 49 is so long, I can't suggest what that might be, except to note that the screen graphing capabilities and symbolic manipulations are missing on the 41. Many people here think those are overkill on a calculator anyway, given that PCs do them so much faster and better, and that numeric calculation is the proper domain of a handheld calculating machine.

Here are some other differences I can think of.

Item	HP41C	HP49G+	HP48GX	PC
Speed	Slow	Faster	Intermediate	Fastest
Ease(Programming)	High	Very Low	Very Low+	Varies
Ease (Use)	Medium	Low	Low	Varies
Software	Lots	Lots	Lots	Lots!
Ease of loading	Hard	Easy	Intermediate	Too easy. 8)
"Power"	Low	Medium	Medium-Low	High

The 49G+ is a 75Mhz ARM that emulates the Saturn CPU found in earlier 48 series machines. So some of its functions are reasonably fast, but others poke along due to the emulation. the 49G and 48G+ both ran a 4Mhz Saturn. In terms of speed, they were OK for their day, but have been eclipsed by 68K TI machines and the ARM based HP models. The 41C CPU ran at 750 Hz, but it was optimized for BCD math, and so performed a bit better than you would expect at that speed. Whether it's too slow for you depends on what exactly you need to calculate, and in what timeframe. If speed is really important, no calculator can beat a modern PC, running any recent processor I know about.

Ease of programming is somewhat subjective. A couple of months ago we engaged in extensive discussion about the relative nerits of RPN keystroke programming, which the 41C implements, and RPL, which is what the 48 and 49 series use. The RPL afficianados claimed that RPN seemed counter-intuitive and difficult for them, whereas most of the RPN enthusiasts said the same about RPL. Obviously, familiarity with one or the other plays a role in perceptions of this quality. But I don't think anyone would seriously argue that RPL wasn't

a *lot* more complicated - and more powerful - than RPN. Having just completed implementing a game on the 48GX, 49G and 49G+, I can say that there was light at the other side of the first inflection point on the learning curve for me. I'm now pretty comfortable with User RPL, but it took a good six months of occasional effort to get there. By way of contrast, it took me something like a month to learn to program the 41C at fairly high proficiency back in the 80s, and that was the first time I'd programmed anything!

Ease of use depends on how easy it is to get to common functions, and how easy it is to get them to work together. Both the 49G+ and the 41C had a lot of though devoted to their respective user interfaces. So the ensemble works pretty well in both cases. However, there are fewer functions on the 41, so there are fewer that you need to spell out in order to get to. The 49G+ has menus, but customizing those is more trouble than assigning a key on the 41C. I give both high points for trying to make themselves usable, but the 41C wins on simplicity, in my opinion.

There's lots of software available for both platforms. Some of it overlaps, but as you might expect, the 41C's lean heavily toward numeric calculation, whereas the 48 amd 49 series have a load of symbolic and graphical apps too. Mostly though, the software for the 41 is as good for what it does as anything available for the 49. And of course neither can hold a candle to the number of high quality apps available for PCs.

There's an issue regarding loading software onto the 41C. If you don't want to key in a program by hand, you need extra hardware. There are lots of choices for this, but they are complicated, and invole hardware as old as the 41C itself.

Partially balancing this is the fact that 41C programs can only get so large before they fill the limited memory on the machine. This, combined with the slow speed of the CPU is why I give the machine a "low" power rating. The 48GX has more memory and a faster CPU. Also, RPL is more complicated, but also more expressive than RPN. I think that the 49G+ is more powerful than the 48GX by virtue of its faster CPU and larger usable memory. But there's also the fact that an assembler and other developer tools are built in to the machine. Once again the PC wins by a long mile over any of these machines. Clusters of Intel (and AMD) architecture machines are among the fastest supercomputers on Earth at the moment. And even desktop PCs run rings around the fastest calc I'm aware of. Combine that with the better software choice, and it's easy to see why the calculator has been supplanted for many functions.

But even a laptop is more trouble to carry than a calculator. That's one other thing the 41C has going for it - portability. It has better battery life and a smaller form factor than the HP49G+. Plus it has a special place in my heart. I use my 41C for everything up to the point where I exceed its capacity, mainly due to this nostalgic love for the machine. What works for you may vary.

Regards
Howard

in response to message #5 by Howard Owen

Thanks for the excellent replies.

I have gotten by with the "low" end hp's (11c, 32sii, 33s) since I first got turned on to RPN. The 33s has gotten me into programming because I can now have many more in it as compared to the 32sii. I do a lot of numeric calcs, I don't often get involved with the higher end stuff, and when I do, I use pc. So far I find RPN keystroke programming to be very and intuitive.

*Message #7 Posted by **Garth Wilson** on 21 Jan 2006, 3:06 p.m.,*
in response to message #1 by e. young

Although most users used the 41 as a calculator, it definitely qualifies as more of a hand-held computer than the 49 "supercalculator" (all one word, if I can coin it) and similar products. I'm not referring to execution speed, or quantity of memory, or graphics; but the 41 was, as far as I know, the first one that could be interfaced to a lot of professional lab equipment, even a whole rack of instruments simultaneously, while its contemporaries only pretended, being limited to maybe a tiny printer and a microcassette storage device. This interfaceability was important in my work in the 1980's; and in an engineering lab where I woked, almost every engineer had his own 41 that took almost no workbench space, went with him to his desk, went home with him every night in a corner of his attache case, and could be programmed anywhere including on a train ride to work. At least at the time, it was much quicker to whip up a control program on the 41 than it was on PCs. Unfortunately, HP dropped the HPIL which was the key to this interfaceability. An IR link doesn't cut it. For more, see my post at http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/memories.cgi?read=224

My work has evolved over the years; and although I do sometimes still use the 41 and 71 for their interfaceability, more of my workbench-interfacing use of computers involves a home-made workbench computer that interfaces directly to circuits I'm working on, without the bus protocols of HPIL, HPIB, USB, etc..

in response to message #7 by Garth Wilson

In regards to the 33s: It is a good tool. My only wish is for any update to handle small matrices. I've said 10x10 in the past (any more and I'd probably input to a pc utility).

The 49g+ is obviously much more capable than the 41. The human/machine interface is the only fault. My copy is very old (obtained in '03) Perhaps the new ones really are better. If the keys were a bit softer and the bounce/skip issue is resolved, then I'd like to purchase one.

Is there a running consensus on the CURRENT batches? ECL

Hi e.young, all;

although many others have already posted many good stuff about this issue, and their opinions/thoughts/considerations are mainly regarding to the functionality and/or use, all I´d add is that I'd rather taking an HP49 instead of an HP41 when leaving home. Main reason: I have no idea of what kind of people will ask to borrow my calculator... (I hope I wrote it correctly)

I have five working HP41´s and three (working?) HP49´s.

Cheers.

Re: hp 41 or hp 49?

*Message #19 Posted by **Donald Ingram** on 22 Jan 2006, 7:40 p.m.,*

in response to message #1 by e. young

In the mid 80's, I had reached a state where my the HP41CX was becoming a bottleneck and I was very excited at the launch of the HP48sx.

I used complex numbers and matrices a lot for microwave circuit analysis - the HP41 stack could not really cope and my fully loaded 41CX never had enough memory. So as a poor recent graduate I had to sell it. Occasionally I read a nostalgic article on the HP41 and write a few lines of code on the emulator, but find the limitations of the 41 too great and switch to the 49.

I now have the HP48sx at home and a horrible blue HP49 at work - both still get used a lot for simple conversions e.g. VSWR - RL, Vpkpk - dBm, Xc etc. but all the large calculations e.g. microstrip impedance, filter design are now on the PC.

However on that PC runs the HP41 emulator for when I loose the HP49 under a pile of paper.

The Hp48/49 series is easier to program and archive than the HP41. (If only HP had make a RS232 module instead of HPIL - the HP41 series could still be in production as a Instrument terminal) .

Today if you need a calculator as a tool - the HP49 series would give you most run for your money. Check http://www.hpcalc.org and you might find code that fits your needs. Also check out the old HP application pacs - I still often refer to HP41 and HP67 codes examples (it's easier to rewrite them using the formulas than decoding old keystrokes).

Re: hp 41 or hp 49?

*Message #20 Posted by **Garth Wilson** on 23 Jan 2006, 2:07 a.m.,*
in response to message #19 by Donald Ingram

> Quote:
>
> If only HP had make a RS232 module instead of HPIL - the HP41 series could still be in production as a Instrument terminal

You should have gotten the HP82164A or FSI164A HPIL-to-RS232 converter. Better (or in addition), you should have gotten the HP82169A HPIL-to-HPIB converter, which would allow you to interface to a whole rack of IEEE-488 equipment all at once. RS-232 takes too much power to implement directly on the 41, you need a separate RS-232 port for every piece of equipment you want to interface to, and most pro lab equipment was available in IEEE-488, not RS-232. We did set up automated testing with the 41 as a controller. That was never possible with the 49.

RS232 would have worked

*Message #21 Posted by **Donald Ingram** on 23 Jan 2006, 8:19 a.m.,*
in response to message #20 by Garth Wilson

I don't buy the RS232 power consumption - The HP41 can suply greater currents - e.g. the card reader and optical reader.

Especially if you limit the data rate to < 19200 baud the Maxim data sheets show less 10mA or 20mA at those rates for RS232 TX. As TX is intermittent and RX level conversion does not really reqiuire anything, the average current would be less than 5mA = lots of hours from a 1000mAh N battery. A HP41 with RS232 is entirely practical.

The HPIL solution, while elegent, was too expensive for many applications (and certainly for me).

Controlling lots of expensive mains powered instruments, the cost of a HP85 would be less significant. I was wanting to control a <$100 worth of electronics.

The HP41 could have ended up as a single instrument RS232 controller/data logger/ terminal working as an industrial (and hobby) process controller. Imagine lego mindstorm type robots with a HP41 controller on board.

In the 90's before laptops really took off, I used a lot of 'craft terminals' single line dumb terminals to configure PDH/Sonet mux equipment. A RS232 HP41 would have done the job with extra functionality and lower cost.

Re: RS232 would have worked

*Message #22 Posted by **Garth Wilson** on 23 Jan 2006, 2:26 p.m.,*
in response to message #21 by Donald Ingram

Ah yes, the cost of the HPIL and Extended I/O modules plus the interface converters was not trivial. In fact, the joke where I've worked (even among those of us who thought it was worth it) was that "HP" stood for "high-priced." A plug-in RS-232 port would have been nice for people in your position.

RS-232 is still a good workhorse and I still use it, although almost never without the hardware handshaking lines (which again add more current). Not everything supports software handshaking, and the 41 is not fast enough to go without some kind of handshaking. Hardware handshaking would just about be mandatory.

Then there's still the limitation that if you want to connect to five things at once, you need five ports, further multiplying the current requirement. HP would have had to derive the negative supply voltage in the module, and kick the positive supply up a little since 4 partly-used-up N cells don't deliver enough to get the minimum needed output voltage after the line driver drops a bit of it. Today there are quite a lot of line driver/receiver ICs that take care of the voltage conversion onboard for you, although increasing the voltage comes at the expense of supply current.

Making another module is something that could still be done if someone wanted to take up that project. (I'm not the person to do that though.) One nice thing I've seen some hand-held RS-232 devices do is to scavenge their power from the incoming lines, such that in some cases they didn't even need a battery. What the 41's module could do is to use it battery power only to fill in what was lacking from incoming lines. Then connecting to a bench instrument would not cut the 41's battery life at all, and yet the 41 could still be connected to another 41.

Another small connector would have to be used, but that should be no problem.

HPIL was a lot faster than the fastest (19,200bps) RS-232 standard speed in the early 80's, but even that doesn't matter since the 41 couldn't operate the HPIL at more than about 3% of its maximum speed.

Clonix Project

*Message #1 Posted by **Phil Green** on 21 Jan 2006, 3:01 a.m.*

Hi,I am in the process of making a Clonix-41 module. I have made the pcb and have taken apart an old module. According to the pcb artwork given in the project details, it appears that the pcb is mounted upside down compared to the pcb which is already in the existing module. Is this correct? I look forward to your comments.

Regards Phil Green

Re: Clonix Project: have you tried...

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 Jan 2006, 8:40 a.m.,*
in response to message #1 by Phil Green

Hi;

have you contacted Diego Díaz? He's the one that can actually help you with that, though. I bought both a NoV32 and a NoVRAM, and after reading some material at www.clonix41.org, it seems that now all modules share the same PCB layout.

> Quote:
>
> The main IC footprint has been conceived to be fully compatible with previous Clonix-41 and NoVRAM designs so that all and every newly manufactured module will use this PCB, which is also ready to accept the four memory chips required for the future NoV-64.

(from NoV-32: The New Hardware.)

The following picture is actually at clonix41.org. You can see the inside of the module, maybe it can help.

http://www.clonix41.org/Projects/Nov32/nov32-tp.jpg

Success!

Luiz (Brazil)

Re: Clonix Project: have you tried...

*Message #3 Posted by **Diego Diaz** on 22 Jan 2006, 5:55 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi,

Luiz, you're becoming an unvaluable help while I'm not on-line, thank you so much for that!!

I'm using the same board to build all the modules, however, for a DIY project it is simpler to use the original Clonix layout.

Phil, you're right, the board is upside down. Also note that the connector's soldering pins must be full-folded and cutted to gain the required room (about 1mm) for the board to fit into the momdule's housing.

Please use extreme care while doing this, as phosfor-bronce is not reknowned by its ductility (I've broken more than I'd like to admit :-(

Success!! and let us know of the results.

Best.

Diego.

Re: Clonix Project: have you tried...

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 22 Jan 2006, 6:31 p.m.,*
in response to message #3 by Diego Diaz

Hey, Diego;

thanks for your comments. My pleasure, believe me.

Once I am not the one who made the wonders, supporting them (both the wonders and those who created them) is also part of the fun. More than being a pleasant activity, suporting guys like you, Meindert, Hrast and other developpers is a priviledge. Besides, developping HW and SW for these calculators is a daring activity by itself, though.

In time: instead of bending the tinny terminals, would that be possible to add a thin PCB cut to solder the contacts? Just came to my mind...

Cheers.

Luiz (Brazil)

Re: Clonix Project: have you tried...

*Message #5 Posted by **Phil Green** on 23 Jan 2006, 1:13 p.m.,*
in response to message #3 by Diego Diaz

Hi, I have just finished the module today. Works fine. Managed to fit pcb without altering the connector pins! I am using a two terminal resonator at 12MHz, module did not work at first, I suspected the oscillator was not operating. I added two 33pF capacitors either side of the resonator connected to ground. This now works. I have not made the programming adaptor yet, I pre-programmed the 18LF252 in an external programmer first. I am using the ClonixLP version of the code. I have modified the Configuration Build Utility under Visual C++ to support the ClonixLP code rather than the Clonix6 code.

I look forward to any new versions of the code. Thanks for your help. Regards Phil Green

Re: Clonix Project: have you tried...

*Message #6 Posted by **Diego Diaz** on 23 Jan 2006, 4:27 p.m.,*

in response to message #5 by Phil Green

Hi,

These are great news Phil, it will also be interesting if you can send some pictures.

Did you reduce the PCB size to fit it without bending the pins? I'm very interested in that.

The resonator is more likely to need the extra caps, I use a quarzt xtal, which runs flawlesly without caps.

Thanks for sharing your experience and best regards.

Diego.

hp41cx line number branching using indirect.

*Message #1 Posted by **Hal** on 20 Jan 2006, 6:33 p.m.*

Hi Folks. With a 41(cx), can you not branch bockwards to a line number using a negative number stored in an indirect register? You can do this with virtually every other programmable HP on the planet (OK, maybe not with a 25). I can't seem to find any reference to it in volume 2 of the owners manual.
I'm trying to branch back 136 lines (from line 137 to line 1) using syntax as follows...
-136 sto 09
gto ind09

Upon execution it returns "nonexistant".
Any help appreciated.

Re: hp41cx line number branching using indirect.

*Message #2 Posted by **Namir** on 20 Jan 2006, 6:53 p.m.,*
in response to message #1 by Hal

Hal,

I ran a short tetst using GTO IND with a register containing -10. It seems that the 41C ignores the sign and look for LBL 10 (in my case).

In your example, the 41C is looking for LBL 136, which of course is outside the range of valid labels.

I suugest using a jump to a label. This approach allows you to insert code without worrying about keeping count of the corrected number of lines to jump.

Namir

Re: hp41cx line number branching using indirect.

*Message #3 Posted by **Eric Smith** on 20 Jan 2006, 8:01 p.m.,*
in response to message #1 by Hal

The HP-41 family does not include any capability of branching to a line number, or the "rapid reverse branching" of some earlier HP models.

However, the HP-41 has less need for such a feature. The main purpose of rapid reverse branching was to speed up loops by avoiding a label search. But the HP-41 compiles GTOs. When program execution first encounters the GTO, it finds the target label, and stores the address in the GTO instruction. On subsequent

executions of that GTO, no label search is required.

Editing the program will decompile it.

I don't think RRB can be implemented by synthetic programming, because the RRB routine would have to read the program memory to determine the lengths of the program lines, and reading the program memory as data would "normalize" it, possibly destroying the program. Anyhow, use of synthetic programming for this would be much slower than the label search.

On the other hand, it's possible to implement either a "GTO line number" funcction or an RRB function by custom microcode. Aside from the time needed to develop the microcode, this would require an MLDL/HEPAX/Clonix type of device to store the microcode.

However, such a microcode function would usually still be slower than using a LBL and compiled GTO, at least for reverse branches, because of the 41's variable length instructions. When the program pointer is at line 42, and you want to get to line 39, the only way to do that is to count forward from the beginning of the program. This is what the non-programmable functions "GTO .nnn" and BST do, and explains why BST is slow on large programs.

Re: hp41cx line number branching using indirect.

*Message #4 Posted by **hal** on 20 Jan 2006, 8:23 p.m.,*
in response to message #3 by Eric Smith

Thank you gentlemen for your help.
I suppose the need for RRB is somewhat negated by the fact there are infinite label names available with a 41. I was just trying to save steps and memory by not having to insert labels.
Anyway, thanks again and best regards, Hal

Re: hp41cx line number branching using indirect.

*Message #5 Posted by **Gene Wright** on 20 Jan 2006, 10:44 p.m.,*
in response to message #3 by Eric Smith

Another option, especially if the branching spans are constant and not variable, is to compute the jump distance, put it in alpha, do a RCL M and then a STO b, or such.

This allows for a direct movement of the program pointer and can really make it difficult to decode a program.

These ideas are described fairly well in the PPC ROM manual.

Timer function for repeated delay?

*Message #1 Posted by **Marcus von Cube, Germany** on 20 Jan 2006, 5:59 p.m.*

I'm looking for a delay timer function for the HP 41CX or any other HP calculator. I want to create a program that does the following:

```
 1) Accept a number of rounds
 2) Accept a delay in seconds
 3) Delay execution for the given delay time
 4) Increment round number
 5) If the requested number of rounds is reached
 6)    sound a long beep
 7)    stop
    else
 8)    sound a short beep
 9)    go to (3)
```

I checked the CX timer functions but couldn't find a match. Can the stopwatch functions be used to implement this?

What is the easiest way to produce different beeps (without synthetics.)?

Re: Timer function for repeated delay?

*Message #2 Posted by **Vassilis Prevelakis** on 21 Jan 2006, 1:14 a.m.,*
in response to message #1 by Marcus von Cube, Germany

First the easy question:

```
> What is the easiest way to produce different beeps (without synthetics.)?
```

TONE accepts an argument 0 through 9, and it produces different beeps according to the argument, giving you 10 different TONEs. With synthetics you can have around 99 different TONEs.

Now for the difficult question:

If I understand correctly, you essentially want a routine which suspends the execution of a program for *n* seconds, where *n* is supplied as a parameter.

In other words something like the Unix *sleep n* command.

If the stopwatch allowed you to call a function when it crossed zero, this would have been trivial to do. Unfortunately to the best of my knowledge, when the stopwatch timer crosses zero, it just makes some noices until you tell it to go away.

So there are two workarounds:

a) use STOPSW 0 SETSW RUNSW to start the stopwatch and have a loop that repeatedly calls RCLSW and tests it against n. I am not really sure whether this will get you the required resolution though (i.e it may be slow by a second or two).

b) set an alarm in the future. For example

```
"^^WAKEUP"
0
DATE
TIME
increment time by n seconds
XYZALM
OFF
LBL "WAKEUP
continue execution
```

This is a simplified algorithm which has a *serious bug*, namely it does not work near midnight when the date changes during the sleep period. In this case the *n* + TIME will be greater than 23.59599 and will be rejected by XYZALM.

Adding enough code to ensure that this works in the general case, will increase execution time by many seconds, affecting resolution.

Not really a big problem (see the Ultimate Alarm Clock how this was solved).

Re: Timer function for repeated delay?

*Message #4 Posted by **Garth Wilson** on 21 Jan 2006, 1:52 a.m.,*
in response to message #1 by Marcus von Cube, Germany

XYZALM allows you to put in the repeat interval, and starting the string in alpha with ^^ makes it a control alarm that will begin execution at the label whose name follows the ^^ in alpha. That program could do your incrementing, comparing, and beeping, and if it has reached the last one you wanted, clear the alarm to stop the repetition. If there is no label name after the ^^ in alpha when you set the alarm, then execution will resume where it had stopped the last time. The 41 does not need to be off for the alarm to work and take control. The first alarm time may need to be calculated. After that they will keep coming at the interval you specified until you (or your program) clear the alarm. This interval will not depend on execution speed, but you will want the execution to be completed before the alarm comes due the next time. IOW, if you want every 30 seconds, and the program takes 3 seconds to execute every time, and then you add more lines and it takes 8 seconds every time, it doesn't matter. The alarm will still come up every 30 seconds as specified, regardless.

User beeps are numbers 0-9 and are all the same length. Synthetic beeps allow different lengths and pitches, and range from 10-129. I might suggest TONE 7 and TONE 87, which are the same pitch but 7 is about three times as long as 87.

Re: Timer function for repeated delay?

*Message #5 Posted by **Vassilis Prevelakis** on 21 Jan 2006, 3:43 a.m.,*
in response to message #4 by Garth Wilson

```
Garth Wilson wrote:
> XYZALM allows you to put in the repeat interval ...
```

You are right. For some reason I thought Marcus required different timeouts depending on the round. Silly of me.

So, Marcus, if you want the reminder to be every *n* seconds, do as Garth suggested.

Note, however, that my warning regarding the date is still valid (i.e. make sure that TIME + *n* <= 23.59599). Luckily this is required only for the first alarm. Repeat alarms will be handled by the Timer Module.

Another issue is how to stop the alarms once the required number of iterations has been reached. On a non-CX with a TIME module, you have to clear the alarm manually. On a 41CX you can use the CLALMA command to clear the alarm.

Finally be careful that the execution time of the program is shorter than the specified time interval. Otherwise the alarm processing routine will be interupted by the next alarm and so on, till you get in a total mess.

**vp

So here is an example program

```
; REPTMR -- Repeat Timer
;        X iterations (i)
;        Y sleep interval in seconds (ss)

01 LBL "REPTMR
02 STO 00       ; store i in R00
03 RDN          ; bring ss to X register
04 1 E4         ; change ss to 0.00ss
05 /
06 "^^RING      ; unconditional alarm function
07 0            ; use 0 to indicate that the alarm is due today
08 TIME
09 RCL Z        ; bring 0.00ss into X-Register
10 +            ; X := TIME + ss seconds
; here you are supposed to check if X > 23.59599 and do smth about it
11 XYZALM       ; set the alarm
12 OFF          ; wait

13 LBL "RING
14 DSE 00
15 GTO 01

16 BEEP         ; final beep
17 CLALMA               ; clear alarm
18 OFF          ; terminate

19 LBL 01       ; repeat beep
20 TONE 3
21 TONE 3
22 OFF          ; wait
```

Re: Timer function for repeated delay?

*Message #6 Posted by **Marcus von Cube, Germany** on 21 Jan 2006, 4:03 a.m.,*
in response to message #5 by Vassilis Prevelakis

Thanks to both of you!

There is an additional difficulty: I want to be able to suspend execution after each beep with a key. Why? The timer is intended to monitor an IQ test with a given number of seconds for each question. Now what if my telephone rings?

I'll probably go for a simpler aproach that requires to hit a key to advance to the next round. This requires to reprogram the timer for each round but is much more flexible for the user. I'll keep you informed - about both the program and my IQ ;-)

Marcus

Re: Timer function for repeated delay?

*Message #7 Posted by **Vassilis Prevelakis** on 21 Jan 2006, 6:08 a.m.,*

```
Marcus von Cube wrote:
> There is an additional difficulty: I want to be able to suspend
> execution after each beep with a key.
```

Why didn't you say so from the beginning??????

It changes the whole program design!

In this case I'd use the GETKEYX command (HP-41CX only) which takes the number of seconds to wait for the key as argument.

So you can use this program

```
; REPTMR -- Repeat Timer
;        X iterations (i)
;        Y sleep interval in seconds (ss)

01 LBL "REPTMR
02 STO 00       ; store i in R00
03 RDN          ; bring ss to X register
04 LBL 00
05 VIEW 00      ; (optional) display countdown value
06 TONE 3       ; beep to let user know start of interval
07 GETKEYX      ; wait for X seconds
08 X<>0?        ; if nothing pressed, skip STOP
09 STOP         ;     freeze program
10 LASTx        ; recover timeout value
11 DSE 00       ; decrement count
12 GTO 00
13 BEEP
14 END
```

If you press a key while it waits, it will stop (line 09). Pressing R/S will cause it to continue

So as friend used to say *tell me what you want to do, not how you think you should do it* :-)

Re: Timer function for repeated delay?

*Message #8 Posted by **Marcus von Cube, Germany** on 21 Jan 2006, 12:57 p.m.,*
in response to message #7 by Vassilis Prevelakis

Hi Vassilis,

I was asking for a delay function in the first place. GETKEYX seems to be what I was asking for. I'll modify your solution slightly because I need to restart the round if it's interrupted. I like this aproach because it leaves the control to the program, not to an external timer.

Thanks again to all who replied.

strange line in HP-42S program

*Message #1 Posted by **Lars Wadso** on 20 Jan 2006, 4:56 p.m.*

I have tried to enter the Digital Dice program for the HP-42S found in the software library of the HP museum. Without manual (it was lost several years ago) I still managed to enter all lines except one...I have no idea how I should enter line 29 |-"?" (vertical line-horizontal line-cite-question mark-cite). The closes I come is writing it like a string "|-"?"" or using the function I-, but...I cannot get it to work as expected... . Can anyone help?

Re: strange line in HP-42S program

*Message #2 Posted by **Richard Garner** on 20 Jan 2006, 5:23 p.m.,*
in response to message #1 by Lars Wadso

Lars

The symbol is the APPEND command for alpha characters. While in alpha mode press the ENTER key and the APPEND symbol will be entered on the program line. Then add the ? as you would any other alpha character then hit the ENTER key to finish.

What the APPEND symbol does is tell the 42S that there is additional alpha characters to add to the display beyond its program line entry length limits and to add these characters at the end of the text aready in the alpha register.

Web site updates and FREE HP-67 Simulator

*Message #1 Posted by **Namir** on 20 Jan 2006, 3:15 p.m.*

Hi All,

I moved my web site to another location:

http://www.lara.on.ca/~nshammas

Lara ISP is my brother's company in Canada. The hosting is ad-free (woohoooo!)) and free for me (double woohoooo!!). Thanks bro!!!!

I am also releasing my HP-67 simulator for Windows as a freeware. I have run it on Winsows 2k and XP. A user has also run it on Windows 98. A few folks have had problems with it, but most were able to install and run it just fine. You can download it from relocated web site. This is the main reason why I moved it to Lara ISP--to do away with download restrictions that the previous site imposed. Please read the documentation when you unzip the downloaded file.

Enjoy!

Namir

HP-42S Files available for HP ME Solutions Book

*Message #1 Posted by **Bill (Smithville, NJ)** on 20 Jan 2006, 10:00 a.m.*

I have entered the programs in the Mechanical Engineering Step-by-Step Solutions book as Published by HP. Book is Number 00042-90022, Edition 1, October 1988.

The programs were entered into the EMU-42 emulator and then saved to RAW files. Erik's 42S2HTML program was used to generate the program listings and binaries.

I though these might be of use to other HP-42S users. Of course, you'll need a copy of the Solutions Book to understand how each program is to be used.

Although I have checked them cafefully, I may have still overlooked something.....

I have sent a copy to Erik so that he could post it on the Hp-42S site. If anyone here would also like a copy, please e-mail be at

bjunk at NOTvpes dot com

Just remove the NOT and reassemble.

Bill

BACK UP

*Message #1 Posted by **Kingsman** on 19 Jan 2006, 8:38 p.m.*

Hi,

I am having a problem here. Can anyone help me with this configuration?

I have a Tape drive on a HP ProLiant ML350 G3 Server. I cannot do any backup. I checked to see if something is wrong. I went to the bios of the server, pressed F8. It can detect HDs, The only Tape Drive, but then says SCI Bios not loaded,Let the machine do the test to the tape drive, good, it is done, then asked me to insert media in. I did. Then it says "!!!!!The Tape is not Tape-DR Compliant!!!!!" Then again it says "!!!!!Tape Drive is Not set in OBDR mode!!!!!

What do I do here, any help??

Kingsman

in response to message #1 by Kingsman

You should have purchased the HP-49G+ instead. Those are easy to backup, and we could have helped you with that.

Re: BACK UP

*Message #3 Posted by **John Noble** on 20 Jan 2006, 1:51 a.m.,*
in response to message #1 by Kingsman

Smart answer: If the tape was RPN I bet it would still work.

Better answer: This is a vintage calculator site, though a lot of us probably use computers professionally.

Speaking from experience, I feel your pain. Tape drives are just about the worst backup devices ever invented, though I had decent luck with Radio Shack cassette players + TRS-80s. Multi-kilobuck DLT drives seem to thrive on a steady diet of shredded polyester and ferric oxide and they grind their heads down to nubbins every three full backups.

Just accept that tape is a write-only medium, and you'll feel a little better about the whole exercise.

Re: BACK UP

*Message #4 Posted by **Howard Owen** on 20 Jan 2006, 2:08 a.m.,*
in response to message #1 by Kingsman

The ol' "HP Forum" in the masthead fools another one.

It's remarkable what people will miss when they know what they are doing. I had a problem logging in to a particular site. It wouldn't take my user ID, which was a long string of numbers. I ended up always having to go to the "recover password" screen, where I could log in using my email address. Since I had a work-around, I never bothered support with the issue. But one day, I guess I was a little bored, and I put in a trouble ticket. Well, it turns out my username wasn't the long string of digits, but a more normal string of letters. Puzzled at how I could have made such an error, I went through the "recover password" screen again. After my successful log in, I got a screen that looked like this:

```
Click here to go get some work done.

Matched User ID: NNNNNNN

Username: xyz

Password: abcdfghi

Make a note of your username and password!
```

I had been hypnotized by the second line! I was looking for the username that I hadn't been able to successfully enter, saw the ID number and stopped thinking. I actually would go to the file where I had the number stored at that point. When I came back, it was so I could compare the number to the stored version. Yup, they match. WTF?

The ID isn't used anywhere else, so why it had so prominent a place in this screen is beyond me. But the real culprit was my shortcut-taking, pattern-matching brain.

Now back to the "HP Forum" already in progress. 8)

> The only Tape Drive, but then says SCI Bios not loaded
```

I think it says **SCSI** Bios not loaded. If so, I assume that there no disks on that SCSI bus, so the adapter's BIOS is not loading (it is used only when you have hard disks connected to the SCSI controller, so that you can boot and run DOS from a SCSI disk).

If you have only non-disk SCSI devices, the BIOS is not loaded. Your operating system should be able to deal with the tape drive.

```
> The Tape is not Tape-DR Compliant
> [...]
> Tape Drive is Not set in OBDR mode
```

no clue about these messages. I'd suggest you check the manual of the tape drive and make sure that you load appropriate drivers for that device. Also make sure that the backup software you use supports that tape drive.

HP33s keyboard

*Message #1 Posted by **Al in Fl** on 19 Jan 2006, 10:50 a.m.*

I'm sure this issue has been discussed here before, but can someone summarize the story with the keyboard on the HP33s?

I have one of the old ones (CN4040 series) with the poor screen, and a newer model (CNA 4420) with the improved screen (big improvement).

The problem with the newer one is the keyboard. The ZERO and ENTER keys repeatedly fail to register, even with a determined click dead center on the button. This is particularly problematic if you are trying to perform multiple operations at a useful speed of entry.

Any comments? Has this been fixed by newer models? If so, is there a CN range to look for (or something definitive to try through the packaging at Wal-Mart?)?

Thanks, Al in Fl

Re: HP33s keyboard

*Message #2 Posted by **Tim** on 19 Jan 2006, 11:08 a.m.,*
in response to message #1 by Al in Fl

That is strange. The 33s keyboard has been the most reliable of all the new models I own. I would send that one back.

John

Re: HP33s keyboard

*Message #4 Posted by **e.young** on 19 Jan 2006, 12:40 p.m.,*
in response to message #3 by John Smitherman

I have a 33s with the serial number CNA 5020xxx that has an enter key that registers no matter how off center you hit it, and it always registers. I have a 33s replacement unit that I got from HP with a serial number of CNA442xxx that has the improved display, but the enter key is also more sensitive to off-center hits. The tactile feel of the CNA 5020 unit is also far superior. It is less rigid or "clicky". It has a definite click, but is much smoother.

I plan on selling my CNA442xxx unit on ebay and getting another CNA5xxx unit or better because of the keyboard feel.

Wouldn't it have been great if HP had resolved these issues before releasing the 33s for sale?

The first 33s that I bought in the summer of '05 was CNA4xxxx and had the horrible display and an unrelaible keyboard. I still see units of that vintage at WalMart. I wonder how much repeat business HP will get from people who purchase one of the older ones on the shelf, especially if these people are not aware that the display and keyboard have been improved. They would be better off getting those bad units of the shelf that never should have been available for sale in the first place. Hopefully they have learned their lesson for the future.

in response to message #1 by Al in Fl

Hi Al,
For what it's worth...my new model 33s had an enter key that would occasionally fail to register, but with use the problem has cleared up.
Best regards, Hal

followup

*Message #6 Posted by **Al in FL** on 19 Jan 2006, 1:42 p.m.,*
in response to message #1 by Al in Fl

an officemate has one (it was still in the package). it's a CNA527 and is much improved (both display and keyboard).

I notice that they started adding a little sticker to the outside of the packaging that shows the number. Very helpful.

I guess there have been 3 (or more) iterations of the display type?

thanks for the help...I'll hunt down a 524 or 527...

Re: HP33s keyboard -- you might try "the wiggle fix"

*Message #8 Posted by **Paul Brogger** on 20 Jan 2006, 1:03 p.m.,*
in response to message #1 by Al in Fl

Some users (including me) of early HP-49G+ units have had success with "the wiggle fix" for those keyboards.

On mine, I just pushed the offending keys (one by one) down firmly, and then wiggled them (while still pressing down) side-to-side, top-to-bottom, round & round, within the travel allowed by the keyboard mechanism.

It actually seemed to help with the 49G+ key problems, and I think the 33S keyboard structure is similar. That said, I've not had much problem with 33S keys, and so haven't tried this fix on that model myself.

So, do so at your own risk. (But *if* you do try it, **do** report your results, if any!)

HP-16C Encryption Algorithm

*Message #1 Posted by **John Williamson** on 18 Jan 2006, 7:56 p.m.*

Here's a slightly unusual HP-16C program -- it's an encryption program based around the shrinking linear feedback register (lfsr) stream cipher (see Wikipedia's article of the SLFSR). The program takes plaintext blocks and a key and encodes (or decodes) a message. This algorithm is particularly suited to the 16c, where variable length registers are easy to deal with, and a bit count instruction is available (the feedback of an lfsr can be computed at bitcount(state&tap)&1).

Running the encryption on the calculator makes it very difficult for a potential adversary to tamper with the device or the program to weaken this system -- it's also very portable (and deniable, for the truly paranoid). Unfortunately, this algorithm is slow, it takes about a minute to encrypt a 64 bit block.

The cipher key should specify the lengths of 2 lfsrs, which should be between about 30 and 64 (max) bits each. The two lsfrs should be different lengths (the periods -- which are [2^(len) - 1] -- should be mutually prime for maximum effectiveness). Each length should be stored, as a 64 bit word, in register C and D respectively. The key should also specify the feedback polynomial to be used. Some example polynomials are given in the table at the end of this message. The two polynomial codes should be stored in register 2 and 9 respectively, with WSIZE set to the width of the appropriate lfsr. The key should finally give the initial state of the lfsr's, and again with WSIZE set to the width of the lfsr, these should be placed in registers 1 and 8.

To ensure security, you should generate two sequences of random digits (one for each lfsr) for each new message transmitted, and xor them with the original lfsr state as specified with the key. These digits must be noted and prepended [unencrypted] to the start of the transmitted message. This ensures that each run will not use identical keys.

Encryption proceeds by storing the first 64 bits of plaintext in register E, and executing GTO 0 then R/S. The output will be stored back in register E. The next 64 bits should be stored in E, and the algorithm repeated until the entire message has been completed. Decryption is identical, using the encoded messages as the plaintext.

Here's an example usage session which should make things clearer (maybe):

Given a key

```
len1 len2 poly 1     poly 2         state 1    state2
0x21 0x29 0x1b7536ba 0x1d56e7fe0fd  0xbb72d45d 0xb1bb10ff
```

imagine we want to encrypt the message HELLO WORLD. Rewriting this as alphabet indices, 31=space, we have

```
8 5 12 12 15 31 23 15 18 12 4
```

We could code this as 5 bit blocks and concatenate (which is more efficient), but I'll just use 8-bit

blocks here, so we have two 64 bit message blocks:

```
08 05 0c 0c 0f 1f 17 0f
18 0c 04 00 00 00 00 00
```

OK, to set up the encryption with this key, execute

```
(1) HEX/40/WSIZE 21 STO C (sets length of lfsr1)
(2) 29 STO D (sets length of lfsr2)

(3) 21/WSIZE/1b7536ba STO 2 (sets tap poly. for lfsr 1)
(4) 10bfea/ENTER        (random digits just made up for this message, note these for later)
(5) bb72d45d/XOR/STO 1 (sets state for lfsr 1)

(6) 29/WSIZE/1d56e7fe0fd STO 9 (sets tap poly. for lfsr 2)
(7) a10786/ENTER (again, randomly chosen for this message, take a note of them for
transmission)
(8) b1bb10ff/XOR/STO 8 (sets state for lfsr 2)
```

Now, the system is set up and we can encrypt messages! So do 40/WSIZE/08050c0c011f170f/STO E (this is the first part of the message we created above) GTO 0/R/S. After some time, we get the encrypted version back. Note this down. Then do 180c040000000000/STO E/GTO 0/R/S to encrypt the next part (and so on, if we had more blocks to do).

The message to transmit is then just the random digits we made up in (7) and (8), plus the outputs after each run. Decryption is identical, just use the initial digits from the start of the message in steps (7) and (8) instead of creating new ones, and put the encoded message in E and run it...

SECURITY NOTE: This is currently thought to be reasonably secure (though there are some existing attacks, none are currently practical, needing large amounts of ciphertext (>4gb) with known poly. tap sequences). This cipher will probably not stop a dedicated government agency, but it will stop most others, for now, and it's the only one I could fit on the 16c! Any comments or suggestions for optimization are most welcome.

```

Re: HP-16C Encryption Algorithm

*Message #2 Posted by **John Noble** on 19 Jan 2006, 1:43 a.m.,*
in response to message #1 by John Williamson

Fascinating! Very nicely presented, too -- some of it may have penetrated my thick skull.

I don't pretend to understand encryption, but the fact that you did such a thing on a machine like a 16C is just too cool.

Hmmm... I wonder if the supposedly simple Rijndael algorithm (AKA AES) could fit on a 16C? There have been ports to, among other things, Atmel AVR micros. If I understand the problem correctly, however, the minimum 128 bit block lengths might chew up too much of a 16C's resources.

Thanks for a great read.

Re: HP-16C Encryption Algorithm

*Message #3 Posted by **Les Bell** on 19 Jan 2006, 3:39 a.m.,*
in response to message #2 by John Noble

John, I suspect that the use of S-boxes (effectively a kind of 2D lookup table) in algorithms like AES, as well as DES et al, rules them out for a limited-memory device like the 16C.

I'd love to be proved wrong, though. ;)

Best,

--- Les

HP-16C Encryption Algorithm

*Message #4 Posted by **John Williamson** on 19 Jan 2006, 5:45 a.m.,*
in response to message #3 by Les Bell

The S-Box is a problem for AES, but the values can be computed for each entry in the table according to a fairly simple set of bit operations, except you need to compute inverses in GF(256). Given an short algorithm to do that, the S-Box entries could be computed on the fly.

In this way, you would probably need 2 or 3 8-bit registers for temporary storage and 12 32-bit registers (4 each for plaintext, key and state), leaving 150 bytes for the code. But the key schedule seems to need 8 32 bit words as a buffer, as far as I can see, which is not possible on the 16c.

The substitute/shiftrow/mixcols/addkey steps are maybe possible, but the key schedule is probably the biggest stumbling block for an 16c implementation.

In Praise of EMU71 Emulator and JPCROM

*Message #1 Posted by **Namir** on 18 Jan 2006, 3:33 p.m.*

I have been translating some BASIC programs from Excel VBA to True BASIC and to HP-71B BASIC. I decided to use the EMU71 emulator since it's easier to copy edited files than to type them in. The EMU71B has the support of the Math ROM and the JPC ROM. The latter supports more structured constructs for decision-making and loops. I found that the JCPROM to be very useful when included, together with the Math ROM, in the EMU71B. Hats off to Garnier and rest of the Parisian group who wrote all that sofwtare. Also hats off for HP for the Math ROM. This ROM makes matrix operations much easier to handle.

Namir

Re: In Praise of EMU71 Emulator and JPCROM

*Message #2 Posted by **Howard Owen** on 18 Jan 2006, 6:32 p.m.,*
in response to message #1 by Namir

Hi, Namir,

Yes, both EMU71 and JPCROM are great, I wish there were a solution like the Clonix available for the 71, though. Writing software using the JPCROM or Math ROM pretty much restricts you to emulators (HP71X by HrastProgrammer also loads the Math ROM and JPCROM by default.) Since there aren't that many 71B users in the world, I avoid using constructs that would require an unobtainable add-on. I stick with the plain vanilla capabilities of the machine.

I love the structured programming and nice listings of the JPCROM, though. Perhaps if enough people were interested, we could convince Diego or Meindert to have a look at ROM emulation for the 71? 8)

Re: In Praise of EMU71 Emulator and JPCROM

*Message #3 Posted by **Namir** on 18 Jan 2006, 10:59 p.m.,*
in response to message #2 by Howard Owen

Is there a physical module for the JCPROM? Has someone produced these modules?

The basic programming features of the HP-17B were ok maybe in 1990. The Math ROM adds powerful matrix commands that shorten programs and allow the HP-17B to implement sophisticated optimization algorithms. Without the Math ROM. THE JCPROM makes the BASIC code look more structured. Of course in the worl of object-oriented classes, all this is history. I am having fun with it, but I feel I need to go nack to OOP applications. I do have a matrix library in VB6 and VB.NET that will support matrices.

Namir

Re: In Praise of EMU71 Emulator and JPCROM

*Message #4 Posted by **Howard Owen** on 19 Jan 2006, 12:02 a.m.,*
in response to message #3 by Namir

Yes, well, I've had to adapt to OOP over the years. But I hit my first real streak of programming success with structured languages, and I doubt my heart will ever forget the thrill and fun of that. The JPCROM does a very nice job of converting the rather clunky 71 BASIC into something my eyes are predisposed to see as beautiful.

I don't know if the JPCROM ever lived in a real ROM or not. The name suggests it did, but of course the routines it contains can be found in various LEX files. And the ROM image can be used in RAM, if there's enough of it. Maybe JF knows more about it?

Regards,
Howard

Re: In Praise of EMU71 Emulator and JPCROM

*Message #5 Posted by **J-F Garnier** on 19 Jan 2006, 7:08 a.m.,*
in response to message #4 by Howard Owen

The JPC ROM lived as a real module, actually in CMT or HHP 32k/64k EPROM modules. It was sold by PPC-Paris in this way, and was even distributed at some time by Educalc in the US.

I was a PPC-Paris member, but a minor contributor to the JPC ROM project (I just wrote a few HP-IL related keywords...), as I don't live in Paris but in Grenoble (France), and communication was no easy at the time without Internet...

FYI, I'm in the process of documenting the JPC ROM project and collecting the complete JPC LEX source files (assembly language) in order to re-build the JPC ROM, and maybe release a new version?

J-F

Re: In Praise of EMU71 Emulator and JPCROM

*Message #6 Posted by **Namir** on 19 Jan 2006, 8:34 a.m.,*
in response to message #5 by J-F Garnier

J-F,

I really enjoy using your EMU71. While I do have several HP-71B machines (two with 64K additional RAM), it's easier for me to edit HP71B listing on the PC and to transfer them to the EMU71 for testing.

I look forward to the documenation when you are finished with it. Please let us know in this forum.

Thank you fo rmaking my life easier!

Namir

*Message #7 Posted by **Gene Wright** on 19 Jan 2006, 10:07 a.m.,*
in response to message #5 by J-F Garnier

Hi JF!

Please make sure you look for the (almost completely) debugged Version X of the JPCROM, which Rodger Rosenbaum had a great deal to do with.

I have that compiled lex file and, I think, it has been made available on the internet previously.

Joe Horn knows a great deal about it...where else did you think I would have ever gotten a copy? :-)

Re: In Praise of EMU71 Emulator and JPCROM

*Message #8 Posted by **J-F Garnier** on 19 Jan 2006, 1:15 p.m.,*
in response to message #7 by Gene Wright

Yes, Rodger was so kind to provide me his "source" file (actually a disassembly of the JPC ROM) that he used to create the version X. So I have a trace of the changes he made.

*Message #10 Posted by **J- F Garnier** on 20 Jan 2006, 6:50 a.m.,*
in response to message #9 by Namir

Namir,

I used Borland C compiler and turbo assembler.

Regarding the Windows version, I have no plan at the moment, but who knows ... I'm quite satisfied with the classic DOS implementation that runs well in Windows Command box, and the text mode is close to the 'look and feel' of the video display used with the HP-71B at the time.

*Message #12 Posted by **Namir** on 20 Jan 2006, 10:34 a.m.,*
in response to message #10 by J- F Garnier

You basically re-wrote HP-71B BASIC. The expression parser and evaluator modules alone are a major task. Then you add modules to manage variables, arrays, matrices, program executions and flow (CALL and GOSUB stacks), and so on.

Impressive!

> I think you got it wrong, Namir. Emu71 is an emulator, not a simulator. If I'm not terribly mistaken, Jean-François didn't have to implement a BASIC interpreter or operating system, he just implemented a Saturn-CPU emulator in C++ or whatever code, plus ancillary routines. Once working, this Saturn CPU emulator will act as a virtual CPU, and then you simply feed it the HP-71B System ROMs images, the HP-IL ROM image, the Math ROM image, the Forth/Assembler ROM image and *voilá*, you've got a piece of software which acts as a real HP-71B, bugs and all, with HP-IL, BASIC, Forth, Assembler, whatever.
>
> Though still lots of work, it's many orders of magnitude simpler than trying to write code to implement all 240 statements and functions of HP-71B BASIC, plus Forth, plus dozens of Matrix ROM statements and functions, etc, etc. I don't think it would be feasible for an unpaid individual with limited free time.

Best regards from V.

Got you!! Isn't Tcl/Tkl (os something like that) commonly used nowadays for emulators for HP calculators???

Re: In Praise of EMU71 Emulator and JPCROM

*Message #15 Posted by **Howard Owen** on 20 Jan 2006, 3:38 p.m.,*
in response to message #14 by Namir

Tcl/Tk is "Tool control language/Toolkit" where the "toolkit" part refers to a GUI toolkit. It's a "glue" language for making different components work together. Being an interpreted language, it's not suitable for CPU emulation, though it could certainly help with graphical display as part of a larger simulator.

How would I put THE JCPROM in the 71B?

Re: In Praise of EMU71 Emulator and JPCROM

*Message #17 Posted by **Valentin Albillo** on 19 Jan 2006, 7:31 a.m.,*
in response to message #1 by Namir

Hi, Namir:

Namir posted: *"Hats off to Garnier and rest of the Parisian group who wrote all that sofwtare. Also hats off for HP for the Math ROM. This ROM makes matrix operations much easier to handle."*

Indeed, we all HP fans must be extremely grateful to Jean-François Garnier for creating such wonderful emulator firstly, then making it publicly available on-line for free, and last but nor least, including with it a most generous provision of ROM images, the Math ROM, JPCROM, and Forth/Assembler ROM among them.

That makes every HP fan a potential HP-71B user, both for fun and for profit. In my own case, I fire it up under Windows XP each and every time I need to make a quick calculation while working: I've found that making the most complex computations with it is unbelievably fast, both while entering the expressions and when executing them. This includes heavy statistical calculations as well as very complicated actuarial formulae, to name a few.

Also, with the incredible capabilities of the included Math ROM, I can solve equations, compute integrals, use complex numbers, or do matrix computations at once, from the command line, in mere seconds. Actually, I can do most anything in the time that others would need just to load their programs or turn on their physical calculators. So, Emu71 has become second nature for me.

As for the Math ROM, it was and still is one of the most powerful pieces of software for handheld computing ever made. Under Emu71 it's become blindingly fast, and with the help of the simulated 80-colum HP-IL display, working with large matrices and long programs is extremely easy.

There's also the fact that the Math ROM's feature set can be put to uses non-mathematical in nature. For instance, I've used matrix operations in such programs as my "Modest Mater" (which solves arbitrary N-move chess mate problems) or "Sudoku Solver" (which of course, solves Sudoku puzzles), both having very little to do with math. Matter of fact, anytime when you need to make a fast temporal copy of a large bunch of data, such statements as MAT A=ZER, MAT A=CON, MAT A=(expression), and MAT A=B are incredible time-savers, even if you never need to do any arithmetic with the data thus saved and retrieved.

Most other functions can be put to nonexpected (or expected) uses, such as complex numbers as coordinate pairs, Fast Fourier transforms to help speed convolutions (for multiprecision computation, for instance, see my "Fantastic FOUR" article/program), etc.

In short, both Emu71 and the Math ROM are unbelievably good software, and both can be used extremely profitably even nowadays, if nothing else as an über-calculator under Windows which runs rings around any other hardware/software device in terms of speed, simplicity, and convenience.

Formerly I did use either HP-41CX or HP42S emulators but after I got the emulated Math ROM I've never used them for on-the-fly calculations anymore, because when I'm at work, inmersed in some complicated actuarial project (as if there were such a thing as a *non-complicated* actuarial project!), even in the client's presence, I've no time at all for RPN or RPL vagaries and cumbersome interfaces, I just need to key in expressions as fast and easily as possible, hit ENDLINE, and *voilá*, perfect results instantly, editable, saveable, copy/paste-able.

And don't you think that "expressions" means a puny combination of numbers and arithmetic operators, I mean using the full Math ROM feature set, named variables, loops, and even defining and calling multi-line user defined functions or subprograms on the fly. Try and do that, or the equivalent, any other way, at full speed. Particularly, try and do that using any RPN/RPL emulator or physical machine. You'll be hardly starting by the time I'm done with the calculation.

So, most sincerley, thanks again to Jean-François for it, he deserves all our support and appreciation for

his disinterested efforts in benefit of the HP community.

Best regards from V.

>
> But that granted, I pay next to no attention to symbolic algebra capabilities in calculators or small machines. I find them tremendously restricted, awkward to use, slow, and inefficient, not just compared to the real thing in larger machines (say Mathematica or Maple) but also for any real-life, non-trivial use.
>
> For me, these capabilities are nothing but a marketing plot, devised to cater for the educational market, and to show off a new model (the HP28C, say) and impress the fans.
>
> Me, I'm not impressed, never was. I do a lot of number-crunching as part of my work but rarely any 'symbolic computation', and if I ever did (or do, at home, as a hobby), I'd rather do it by hand that use that clumsy, meager capability, in an smallish screen and with an inadequate keyboard. Doing it by hand is much faster, easier, and ultimately rewarding. And if I can't do it by hand ... well, time to reach for Mathematica.

Anyway, thanks for your input and

Best regards from V.

Symbolic algebra on calculators

*Message #20 Posted by **Karl Schneider** on 21 Jan 2006, 5:03 p.m.,*

>
> For me, these capabilities are nothing but a marketing plot *(ploy?)*, devised to cater for the educational market, and to show off a new model (the HP28C, say) and impress the fans.

I concur wholeheartedly! Implementation of the symbolic-algebra functions on the RPL-based calc's never made clear philosophical sense to me. Those users who had the skill and inclination to fully exploit a 28/48/49 would certainly be competent at algebra and calculus. A simple problem whould probably be faster on paper; a solution to a difficult symbolic integral would more likely be found in generalized form within a mathematical reference, such as Schaum's Outline.

Moreover, display of the results is often very difficult to read on a 28 or 48 (although that was improved on the 49).

Regards,

-- KS

Re: In Praise of EMU71 Emulator and JPCROM

*Message #21 Posted by **Namir** on 19 Jan 2006, 3:58 p.m.,*
in response to message #17 by Valentin Albillo

Valentin,

I can see why you like the EMU71 so much. I agree with you that it is very quick to setup and has very good performance. I like to use the HP41 and HP42 emulators, but now that you have mentioned the advantages of the EMU71, I am giving things a second thought.

Compiling Nonpareil 0.77 in Linux

*Message #1 Posted by **Eduardo** on 18 Jan 2006, 10:19 a.m.*

Hi,

Has anyone been able to compile Nonpareil 0.77 under Linux? It seems as if there is a missing file (or entire directory). /src/sound.c includes "SDL/SDL_audio.h" but SDL_audio.h is nowhere in the source tree. Compilation obviously quits when trying to make sound.o.

Anything obvious I'm missing?

Thanks,

Eduardo

PS: It seems as if the Nonpareil mailing lists are dead, sorry for posting here.

Re: Compiling Nonpareil 0.77 in Linux

*Message #2 Posted by **Howard Owen** on 18 Jan 2006, 11:55 a.m.,*
in response to message #1 by Eduardo

That file is part of the SDL library, which is external to Nonpareil. On my Fedora Core 4 system:

```
hbo@quirk|1028> rpm -qf /usr/include/SDL/SDL_audio.h
SDL-devel-1.2.8-3.2
```

So you need to install the "SDL-devel" package on your Linux system to get the header files and the libraries you need to link against.

The mailing lists are indeed defunct. This site seems to be the right place to discuss Nonpareil, which may be one reason why the mailing lists aren't working. 8)

Regards,
Howard

Re: Compiling Nonpareil 0.77 in Linux

*Message #3 Posted by **Eduardo** on 18 Jan 2006, 8:54 p.m.,*
in response to message #2 by Howard Owen

Thanks a lot! I followed the suggestion (installed SDL-dev---I use the *64-bit* version of OpenSuSE 10.0) and Nonpareil compiled like a charm. It is awesome!

Eduardo

Re: Compiling Nonpareil 0.77 in Linux

*Message #4 Posted by **chic thomson** on 18 Jan 2006, 3:25 p.m.,*
in response to message #1 by Eduardo

I tried compiling it under Ubuntu linux. It failed on lack of GTK+ 2.0 or better. However that library is installed, but its now called libgtk+ for compatibility reasons. a minor shuffle of the scons file and away it went.

hope this helps, and by the way, nonpareil is wonderful, as is hrastProgrammers Emu41 under windows!

Re: Compiling Nonpareil 0.77 in Linux

*Message #5 Posted by **Eric Smith** on 18 Jan 2006, 4:48 p.m.,*
in response to message #4 by chic thomson

Did you just have to change the string "gtk+-2.0" in the variables state_io_packages and nonpareil_packages? If so, what did you need to change it to? Possibly I can set it up to automatically decide between what Fedora and Ubuntu (and presumably Debian) use.

Were any other changes required?

I expect to have RPM packaging for Fedora in one of the next few releases. I don't know anything about building .deb packages, so if anyone cares to help with that it will be appreciated.

PRGM mode doesn't work on HP-25

*Message #1 Posted by **jbssm** on 18 Jan 2006, 8:38 a.m.*

Hello all,

I have this HP-25 that is in very good cosmetic condition and as all the keys working, but there are some strange problems with it.

1 - The STO and RCL keys work, but I cannot recall what I've saves in the registers, I always get an 0 2 - In PRGM mode, I can write my program, and it shows the steps like it should, but when I try to RUN it ... nothing, I always get an 0

Can anybody help me fixing it?

Regards, Jorge

Re: PRGM mode doesn't work on HP-25

*Message #2 Posted by **Hal** on 18 Jan 2006, 11:24 a.m.,*
in response to message #1 by jbssm

Hi Jorge, I'm assuming you realize that the HP25 is volatile, and if turned off, all registers and program memory are lost.

Otherwise, it sounds like a power continuity problem causing data to be lost, most likely the battery contacts...which need to be scrupulously clean in a woodstock. Also be sure the all contact points within the battery pack are clean also. And be sure not to connect the calculator to the AC adapter unless you're positive you have a good battery pack with good contact installed (this could over-voltage the machine). I personally never connect my machine to an AC adapter, period. With my 29C I sometimes have to "seat" the battery pack by pressing it in the direction as if to remove it, but stopping short of actually removing it. Best Regards, Hal

Re: PRGM mode doesn't work on HP-25

*Message #3 Posted by **jbssm** on 18 Jan 2006, 2:52 p.m.,*
in response to message #2 by Hal

Hello,

Thank you for your answer.

I've tried to clean the contacts and even that way (with the calculator plugged to the AC charger or not). the problems remain.

Re: PRGM mode doesn't work on HP-25

*Message #4 Posted by **Randy** on 18 Jan 2006, 12:47 p.m.,*
in response to message #1 by jbssm

Enter a few program keystrokes. If, upon review the operations change back to 13 00, the RAM IC has failed. Unfortunately, the only replacement source is from another 25.

Re: PRGM mode doesn't work on HP-25

*Message #5 Posted by **jbssm** on 18 Jan 2006, 2:56 p.m.,*
in response to message #4 by Randy

Hello,

yeah, it always keeps showing the 13 00 in program mode no matter whatever I write. So this must be it's problem :(Can I find the replacement part you told about in any other unit? For instance a cheaper HP-21 ?

Woodstock RAM chips (was Re: PRGM mode doesn't work on HP-25)

*Message #6 Posted by **Eric Smith** on 18 Jan 2006, 5:32 p.m.,*
in response to message #5 by jbssm

Unfortunately the HP-25 is generally the least expensive calculator that has the appropriate RAM chip. I have just posted to the articles forum a comparison of Woodstock RAM chips.

Interested finding the value of an expanded HP48G?

*Message #1 Posted by **Han** on 18 Jan 2006, 12:35 a.m.*

A while back, I posted about expanded units and how much they would be worth. So at the suggestion of another forum member, I've placed one on eBay. The auction is here.

I thought some of you might be interested in tracking the prices along with me.

Edited: 18 Jan 2006, 12:54 a.m.

*Message #3 Posted by **Han** on 18 Jan 2006, 3:55 a.m.,*
in response to message #2 by Howard Owen

It's a link. Click on it to view the photos.

Re: Interested finding the value of an expanded HP48G?

*Message #4 Posted by **Thomas Radtke** on 18 Jan 2006, 4:55 a.m.,*
in response to message #1 by Han

Han,

you mention in the auction text that you're interested to learn about the value of your modified 48G's mainly to collectors. I wonder if there is interest in it at all (as a collectable that is). I mean, being of very invasive nature, that modification is one-way.

Btw., I tend to see the moderate memory capacity of the 'G' as a big plus (faster garbage collection, probably longer battery life) and would rather pick up a 'G+' where 128KiB is needed. For more memory, a GX seems to be optimal.

No offense intended, of course!

Peace:) -Thomas

To clarify, I am interested in the value of an expanded unit among collectors. However, I also hope that other HP48 enthusiasts (not necessarily collectors, but people who use the HP48 often) will help determine the value of such a unit.

It is true that the modification is indeed invasive. One might say that there are at least two types of collectors: one who not only knows about the collectibles, but also all the variants, and one who simply collects unmodified units. Having read many of the posts and ads here, I would wager that many HP enthusiasts have a fair, if not exceptionally good, understanding of the steps involved in the modifications. So as far as informed buyers are concerned, these enthusiasts are probably most qualified to determine the price.

You bring up a good point though -- just how much or how little interest is there for a modified unit? I guess this is what the auction will help determine =)

> Quote:
>
> Btw., I tend to see the moderate memory capacity of the 'G' as a big plus (faster garbage collection, probably longer battery life) and would rather pick up a 'G+' where 128KiB is needed. For more memory, a GX seems to be optimal.
>
> No offense intended, of course!
>
> Peace:) -Thomas

None taken =) Regarding the HP48G's default memory -- I find it simply inadequate. It is true that the garbage collection is faster, and the HP48G is generally faster overall than the G+/GX since there are no extra ports to check, among other reasons. Though for me, even the G+ is not enough (from a programmer's point of view -- no absolute address programming for extra speed, as an example).

Regarding battery life, there are many chips out there today that are much power efficient than the ones used back in the production days of the HP48. While an expanded memory may use extra battery power for the extra RAM module, it may still be much less power consumption than an unmodified 48GX using the older memory chips in its main memory and in its expansion cards.

My personal opinion is that the G+ should have been given not only the 128kB main memory, but also an extra 128kB module for port 1. This is a much better middle ground. Give the G 128kB of main memory, G+ 128kB of main memory + 128kB for port 1, and GX leave it as we know it.

And while it is true that the GX is the best option, cost also comes into play. The cost of a GX and a RAM card for port 1 can range from $200 (total package) to even as much as $350.

Opening a 2225B Thinkjet printer

*Message #1 Posted by **Bill Lafferty** on 17 Jan 2006, 6:59 p.m.*

Does anyone know of a way to open the case of a 2225B Thinkjet printer?

Re: Opening a 2225B Thinkjet printer

*Message #2 Posted by **Tony Duell** on 18 Jan 2006, 5:59 a.m.,*
in response to message #1 by Bill Lafferty

Yes, start by removing the battery pack and the print cartridge. I normally also unclip the lever that locks the cartridge in place.

Undo the 4 deeply-recessed TX9 screws on the bottom. Ignore the one that you can easily see the head of, that holds the mechanism in place.

Turn the printer the right way up, then lift off the top case. The paper window thingy will fall out. Unplug the cable from the control panel (in the top case) to the logic PCB (at the latter end).

Assuming you need to go further, next remove the remaining screw on the bottom (the obvious one), and the 2 screws with the 'top hat' washers inside the mechanism. Lift the mechanism up and forwards, unplug the connectors (motors, home swtich, out-of-paper switch, carriage flexiprint) from the PCB. Undo the 2 screws (TX15?) accessible through holes in the battery compartment, then unplug the HPIL connector from the PCB, lift out the rear panel and unplug the battery connector from the PCB.

Is that far enough, or do you need to dismantle the mechanism?

Free "very used" HP48GX's to good home

*Message #1 Posted by **Paul W** on 17 Jan 2006, 1:40 a.m.*

We are having a spring clean here at the office(surveying) and my bottom drawer has 5 hp48gx's which at one time worked but now sadly do not. perhaps if you are a dab hand at repairs you might be able to get the little blighters to work again, i would prefer that they be fixed rather than stuck on a shelf. all 5 machines have been well used (outdoors) there condition ranges from very poor to poor. please leave your email address or phone no. (as i rarely use email and don't have an email address at the moment) if interested.

ps will probably take "offer" that involves least amount of work on my part.

pps i live in sydney Australia.(not too interested in paying to mail them anywhere)

Edited: 17 Jan 2006, 1:49 a.m.

Lost key bounce (Pioneer)

*Message #1 Posted by **Eduardo** on 16 Jan 2006, 6:40 p.m.*

Hi all,

A sad thing just happened to my HP 32SII: I left it abandoned in a box with other stuff for about a year and now the ENTER key has totally lost its bounce. In fact, it takes the gentlest touch for it to register a keypress, and sometimes it gets stuck (remember that in a 32SII the name of a key appears after it's pressed for a half-second or so? Well, sometimes I take my finger off the ENTER key and the display is stuck showing ENTER). Actually, also the keys immediately above an below ENTER, namely STO and XEQ, have lost most of their bounce, but they are still what I'd call usable.

I immediately thought about FixThatCalc.com but their web site warns that key bounce is not generally repairable. Should I declare my 32SII dead? Anybody has experience with this? (or can at least offer emotional support)?

Thanks, Eduardo

Re: Lost key bounce (Pioneer)

*Message #2 Posted by **Randy** on 16 Jan 2006, 10:08 p.m.,*
in response to message #1 by Eduardo

It's a lost cause... the keyboard probably had something heavy pressing against the Enter key for some time and flex dome has collapsed. I've seen it in units get very hot as well - the top plastic dome sheet of the keyboard has been oriented and the heat/constant tension relives the stress that formed the dome. Once flat, there's no going back... sorry.

Edited: 16 Jan 2006, 10:11 p.m.

Re: Lost key bounce (Pioneer)

*Message #3 Posted by **Eduardo** on 16 Jan 2006, 10:58 p.m.,*
in response to message #2 by Randy

May it rest in peace then...

Thanks.

Eduardo

Re: Lost key bounce (Pioneer)

*Message #4 Posted by **Eric Smith** on 17 Jan 2006, 2:25 a.m.,*
in response to message #3 by Eduardo

If you're going to retire it, would you consider selling it inexpensively? I'd like to get one for reverse-engineering purposes (ROM dump), but I'm not willing to pay big bucks for a good one on eBay and then destroy it.

Nonpareil and dead 32Sii's

*Message #5 Posted by **Randy** on 17 Jan 2006, 5:03 p.m.,*
in response to message #4 by Eric Smith

Eric,

I have several dead ones kicking about, they all have broken keyboards. I could mount the LCD in a 10B frame and while the keys wouldn't match up with the functions, it would work. I also have some 10B's and 20S's that I would donate to the effort if you wanted them. Just email me at randy at fixthatcalc dot com

Re: Lost key bounce (Pioneer)

*Message #6 Posted by **Eduardo** on 18 Jan 2006, 10:09 a.m.,*
in response to message #4 by Eric Smith

I think I'll keep it. I do not really use it nowadays, so it is more of a "collection item". Besides, it is borderline usable (more on the "not usable" side). Maybe I'll get one of the older (orange and blue shift key) models, though eBay is outrageous...

Eduardo

Re: Lost key bounce (Pioneer)

*Message #7 Posted by **Paul Brogger** on 17 Jan 2006, 5:30 p.m.,*
in response to message #1 by Eduardo

I've repaired a few Pioneer keyboards.

I disassemble, including the PCB (though I think you may leave the LCD in place). I've shaved off the tops of all the heat stakes hodling the metal backing plate to the front of the calc. Then, either clean the sandwich layers or replace them with parts from a disposable (algebraic, business, etc.) model. On one, with worn contact material in the mylar domes, I re-inked the dots with a conductive ink pen. (I don't have much experience with actually using it, so I don't know how long the ink adheres . . .)

Then I've just pressed the sandwich back together and re-melted the remaining portions of the heat stakes with a very pointy soldering iron. Enough plastic is forced out to restore the attachment.

But again, I don't have any long-term experience with actually using these restored keyboards, so your mileage may vary. But the keyboards did, in fact, work. And with fully-replaced layers, they should be almost as good as new.

HP-41 Poetry

*Message #1 Posted by **Geir Isene** on 16 Jan 2006, 4:47 p.m.*

Now for a different challenge all together: HP-41 Poetry!

Make an HP-41 program that rhymes. In doing this, a healthy amount of artistic license will be needed :)

Here's my first go at this:

```
LBL "FAD"
+
Y=X?
GTO 06
X<0?
0
GRAD
RAD
2
AVIEW
LBL 06
ATOX
1
AON
XTOA
POSA
AOFF
OFF
"|-"
END
```

Opening HP 71B ROM modules

*Message #1 Posted by **gebripe** on 16 Jan 2006, 3:32 p.m.*

Hi

Does anyone know if there's a trick to open HP 71B ROM modules (the edge-shaped modules for the front module ports)? Is it possible without destoying the case?

What do they contain? Any user-servicable (*g*) parts inside? What ICs do they hold? Has anyone experimented with creating (programming and replacing the EPROM with his own) modules? Is there a tutorial anywhere?

Thanks in advance.

Re: Opening HP 71B ROM modules

*Message #2 Posted by **Eric Smith** on 16 Jan 2006, 3:46 p.m.,*
in response to message #1 by gebripe

There's not really a trick. They're ultrasonically welded together, so you have to slice them open. Whether that destroys them depends on what you mean by "destroy", and how careful you are.

There are no user-serviceable parts inside. There are anywhere from one through four actual ROM chips, but they're mounted chip-on-board and covered with epoxy, similar to 41 modules.

EPROM modules were sold by third parties. They used an EPROM in a windowed leadless ceramic chip carrier, and the module package was designed to leave the window exposed. There must have been a Saturn interface chip in the module as well, but I've never taken one apart.

HP had an interface chip to allow the use of bytewide memory chips on the Saturn bus. The third party card reader port memory modules use this chip in a rectangular plastic quad flat pack. The packaged part was too large for a front-port 71B module, but possibly the third-party RAM and EPROM modules may have used the HP chip as a bare die mounted chip-on-board.

Re: Opening HP 71B ROM modules

*Message #3 Posted by **Vassilis Prevelakis** on 17 Jan 2006, 11:30 a.m.,*
in response to message #1 by gebripe

You can force them open using a similar technique to that used to open HP-41 modules (http://www.tla.org/hp41/module.html).

You won't find much inside though, they contain a small PCB with a custom HP ROM chip. Here is a picture from CHHU Chronicles V1N1 (Oct 84).

HP 9825 Simulator needs ROM-dump

*Message #1 Posted by **Klaus** on 16 Jan 2006, 2:26 p.m.*

Hi!

I am trying to simulate the CPUs of the HP 9825 on the PC. So far I have typed in 6000 lines of Microcode from the patent, and it seems to work. Since the microcode in the patent lacks checksums and some links, I need a ROM-dump to continue my work (besides typing in the rest of the microcode would cost me another year).

If someone here can provide a ROM-dump, he or she can decide on the licence unter which the simulator will be published.

Thanks for your interest! Klaus

HP-41 contrast control

*Message #1 Posted by **karl gruber** on 16 Jan 2006, 12:23 p.m.*

Is there a way to control the contrast of the display?

Thanks, Karl

Re: HP-41 contrast control

*Message #2 Posted by **PeterP** on 16 Jan 2006, 3:32 p.m.,*
in response to message #1 by karl gruber

Yes, as far as I know with the help of various moduls, like the HEPAX or the ML-Rom. Rom-images for both can be found on TOS, but you will need a device to load those images onto, like an MLDL, RamBox, Clonix,...

Hope that helps.

Cheers

Peter

Re: HP-41 contrast control

*Message #3 Posted by **Etienne Victoria** on 16 Jan 2006, 3:52 p.m.,*
in response to message #1 by karl gruber

And contrast control is only possible with the halfnut machines (the one with rounded display corners):

MfG from France!

Etienne

HP41 Does on Turn on

*Message #1 Posted by **Kishor Gala** on 16 Jan 2006, 11:57 a.m.*

My HP41 calculator had been off for many years after the batteries ran out. The batteries were removed from the calculator. Recently, I placed new "N" cells in the calculator but it does not turn on (no display). Any idea what the problem may be? Is there another cell in the calculator?

Re: HP41 Does on Turn on

*Message #2 Posted by **Walter B** on 16 Jan 2006, 3:18 p.m.,*
in response to message #1 by Kishor Gala

Do you see corrosion at the battery terminals? If yes, it may have wandered furtheron. Anyway, low resistance shining copper contacts are beneficial.

AFAIK there is no additional nor backup battery inside.

Re: HP41 Does on Turn on

*Message #3 Posted by **Hal** on 16 Jan 2006, 11:33 p.m.,*
in response to message #2 by Walter B

I recently acquired an HP41cx that appeared to have the same problem, that is untill I decided to try a little additional pressure on the "ON" button, which brought it to life. You might carefully try this. Best regards, Hal

Re: HP41 Does on Turn on

*Message #4 Posted by **Kishor Gala** on 17 Jan 2006, 12:01 p.m.,*
in response to message #3 by Hal

No such luck with pressure on the "ON" switch! I was wondering if there is some minimum state of charging of the circuits necessary before the calculator starts working. The circuits would have been fully discharged after a long period of non-use. Just getting in the dangerous zone of guessing....

Re: HP41 Does on Turn on

*Message #5 Posted by **Kishor Gala** on 17 Jan 2006, 11:42 a.m.,*
in response to message #2 by Walter B

The battery contacts are squeaky clean. The old batteries were removed to prevent damage from leakage. Thanks for the reply.

The parallelogram with the "h" and "p" letters inside is all through a 1970 HP catalog I have at home (Electronics for Measurement, Analysis, and Computation), which means the trapeze-shaped logo on the penknife is even older. 1960?

HP-85 bus and clock signals

*Message #1 Posted by **Roberto Bazzano** on 16 Jan 2006, 10:28 a.m.*

Hello. I need to replace a defective system rom on a HP-85A. Due to the fact that's almost impossible to find, I think to make a small board with a microcontroller to replace it. From the service manual, I understood how the bus and LMA,RD,WR lines work. What I don't know is how to relate them to the four system clocks. I mean, how can the rom know when on the bus there is address LSB and MSB? What does the rom do during negative transition of 4 clock signals?

Probably it's the same method used for external roms (with the addition of i/o rom select) but I dind't find any reference.

Could anyone help me?

Thank you very much. Roberto

Converting hp42s programs

*Message #1 Posted by **B Douglas** on 16 Jan 2006, 4:02 a.m.*

I have 42s programs on paper and they pertain to oilfield drilling programs. I have a new 49g+ and want to get these programs on it... how do I get them converted. They are not that large, but I have no experiance in programming.

Re: Converting hp42s programs

*Message #2 Posted by **Howard Owen** on 16 Jan 2006, 12:18 p.m.,*
in response to message #1 by B Douglas

Unfortunately, the only way I'm aware of to do that is to translate the programs from HP-42S RPN to RPL, which means you have to know how to program in both languages. For earlier calculators, 48G and 49G, there is Hrastprogrammer's HP42X emulator of the HP-42S. But he doesn't have a version for the 49G+, according to the referenced site.

Regards,
Howard

Re: Converting hp42s programs

*Message #3 Posted by **B Douglas** on 16 Jan 2006, 6:59 p.m.,*
in response to message #2 by Howard Owen

Is there anyone out there that can program in RPN & RPL that would be interested in helping me create these new programs forthe 49G+ I do not have that many programs and they are not that large.

Any help would be great! Here is an example: 01 LBL "PUMP" 02 INPUT "LINER" 03 INPUT INPUT "STK LNT" 04 INPUT "EFF" 05 INPUT "SPM" 06 RCL "LINER" 07 X^2 08 0.000243 09 X 10 RCL "STH LNT" 11 X 12 RCL "EFF" 13 X 14 0.01 15 X 16 STO "BBL/STK" 17 VIEW "BBL/STK" 18 42 19 X 20 STO "GAL/STK" 21 VIEW "GAL/STK" 22 RCL "SPM" 23 X 24 STO "GAL/MIN" 25 VIEW "GAL/MIN" 26 INPUT "GAL/MIN" 27 RCL "GAL/STK" 28 / 29 VIEW "SPM" 30 END

Edited: 16 Jan 2006, 7:14 p.m.

Re: Converting hp42s programs

*Message #4 Posted by **Howard Owen** on 16 Jan 2006, 9:01 p.m.,*
in response to message #3 by B Douglas

Are these programs freely redistributable?

```
03 INPUT INPUT "STK LNT"
```

I assume that should be:

```
03 INPUT "STK LNT"
```

Regards,
Howard

Re: Converting hp42s programs

*Message #5 Posted by **Howard Owen** on 16 Jan 2006, 9:40 p.m.,*
in response to message #3 by B Douglas

You also have some useless "VIEW" statements there. Those won't cause the program to stop, so they'll just get overwritten by subsequent "VIEW" statements. Only the last one will show.

Did you want to do a 42S-style "variable menu" where each parameter is entered, and/or viewed via a softkey?

Re: Converting hp42s programs

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 16 Jan 2006, 10:27 p.m.,*
in response to message #5 by Howard Owen

Hi, Howard;

just a reminder: if the printer is active (IR output), these values will be printed. Otherwise, as it happens with the HP41, by manipulating flag 21 you can have the program halted in each VIEW/AVIEW. d8^)

Also, it seems to me it was taken from an original HP41 FOCAL listing, by subtituting numeric STO/RCL and related PROMPT/VIEW for newer ALPHA variables. The program style is a hint, don't you agree?

Cheers.

Luiz (Brazil)

Re: Converting hp42s programs

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 16 Jan 2006, 10:25 p.m.,*
in response to message #3 by B Douglas

Hi, B Douglas;

please allow me some comments/questions.

First: would that be possible to add an example on how to use the program? I'm asking this because of the following: (consider this an anlysis of the program lines)

lines #2 to #5 ask for LINEAR, STK LNT (STacK LeNghT?), EFF (efficiency?) and SPM (?);
lines #6 to #16 compute:

$BBL/STK = (LINEAR)^2 \times 2.34^{-4} \times (STK\ LNT) \times (EFF) \times .01$

If so, considering EFF×.01 only converts percent efficiency to absolute per unit value, we may save some bytes and writte:

$BBL/STK = (LINEAR)^2 \times 2.34^{-6} \times (STK\ LNT) \times (EFF)$

At this point, BBL/STK is stored and shown (line #17). Then lines #18 to #21 compute and show:

```
GAL/STK = BBL/STK × 42
```

and lines #22 to #25 compute and show:

```
GAL/MIN = (SPM) × (GAL/STK)
```

Line #27 halts program execution, shows current GAL/MIN and prompts for new value, if current value is not 'good enough'. Whether a new value is keyed in or the current one is kept, pressing [R/S] at this point leads to compute:

```
(? value) = current (GAL/MIN) ÷ (GAL/STK)
```

Although this new value is left in the X-register and in the lower line of the LCD, the upper line shows current (SPM) value.

I'd like to know if this is actually what the program does and if you have a single example to test both the one that's keyed in and a possible RPL equivalent.

Cheers.

Luiz (Brazil)

Re: Converting hp42s programs

*Message #8 Posted by **B Douglas** on 16 Jan 2006, 11:26 p.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Here is an example:

LINER = 5.5 STK LNT = 10 EFF. = .95 SPM = 90

This is for computing gallons per min(GPM):

Your inputs are as Follows: you state what your "liner" size is of the hole(5.5).

then your "STK LNT" stroke length of your pumps (10).

then your "EFF", stands for pump efficiency. ...one can enter (.95) and you would not have to multple by .01 to change 95 into .95)

then the calc asks for what "SPM" your thinking of running (strokes per min).

then the program takes your "liner" and Squares it. 5.5^2=30.25

then multiplies it by (.000243)=.00735075

then takes that and multplies it by your "STK LNT" & "EFF" = .69832125

It stores that number and gives it to you as "BBL/STK" (BBL/STK is .6982125)

Then it takes your "BBL/STK" and multiplies that by 42 = 2.93294925 or 2.93

It stores that number and gives it to you as "GAL/STK" (GAL/STK is 2.93)

then it takes your "SPM" your would like to run and multiplyes that by your "GAL/STK" = 263.96 or 263 GPM

It give you the answer as (Total GPM is 263)

If you need more examples they can be provided

Re: Converting hp42s programs

*Message #9 Posted by **Howard Owen** on 17 Jan 2006, 1:07 a.m.,*
in response to message #8 by B Douglas

Your listing does more than that. At line 26, it prompts for a new Gal/Minute and calculates a new Strokes/Minute, displaying it along with the old Strokes/Minute.

Ignoring that, the following program comes up with similar answers on a 49G+:

```
\<<
    "Enter Liner" ">" INPUT  OBJ\->
    "Enter Stroke Length" ">" INPUT OBJ\->
    "Enter Efficiency" ">" INPUT OBJ\->
    "Enter Strokes/Minute" ">" INPUT OBJ\->
        \-> lin stl eff spm
        \<<
           lin SQ .000243 * stl * eff * .01 *
           DUP "Bbl/Stroke = " SWAP + SWAP
           42 *
            \-> 'gps'
           \<<
                "Gal/Stroke = " gps +
                "Gal/Minute ="
                gps spm * +
                6 DISP
                5 DISP
                4 DISP
                "Press a key to exit"
                9 DISP
                0 WAIT DROP
           \>>
        \>>
\>>
```

I've probably missed a trick or two. If so, you can be sure Luiz will catch it. 8)

HOW DO I ENTER THIS INTO THE CALC....I KEEP GETTING SYNTAX ERRORS. I HAVE NO EXPERIENCE DOING THIS....SORRY FOR THE LACK OF KNOWLEDGE.

AND HOW DO I STORE AND RUN IT ALSO

Re: Converting hp42s programs

*Message #11 Posted by **B Douglas** on 17 Jan 2006, 3:45 a.m.,*
in response to message #9 by Howard Owen

ON THE GAL PER MIN ENTRY IT ASK WHAT GPM DO YOU WANT THEN TAKES THAT # DIV. BY GAL/STK AND IT WILL TELL YOU THE DESIRED STROKES PER

MINUTE TO RUN SPM TO RUN TO ACHEIVE THAT GPM LEVEL.

THERE ARE WIDE VARIATIONS OF THIS PROGRAM AROUND...I AM TRYING TO EXPLAIN IT THE BEST I CAN.

Re: Converting hp42s programs

Message #13 Posted by ***Vieira, Luiz C. (Brazil)*** *on 17 Jan 2006, 9:15 a.m.,*
in response to message #11 by B Douglas

Hi, Brian;

if you are in trouble keying the program in your calculator, given that you already have the listing, maybe one of the best ways is actually to download the existing listing from the computer to the calculator through the connection cable. In some cases, when you are in the need to load the calculator with edited listings, editing in a PC and downloading it to the calculator may also be better and, occasionaly, faster.

I'm sending you an e-mail with some extra info, O.K.?

Best regards.

Luiz (Brazil)

in response to message #13 by Vieira, Luiz C. (Brazil)

I do not have a program to write a calc. program on the computer in order to be able to download to the calc. I have the connectivity software, but I have not seen a way to actually edit or write programs on it to send to the calc.

Brian

Re: Converting hp42s programs

Message #15 Posted by ***Howard Owen*** *on 17 Jan 2006, 1:04 p.m.,*
in response to message #14 by B Douglas

There is an error in that listing that may have prevented you from sending it to the calc. It was also missing the text header. Here's a corrected version:

```
%%HP: T(3)A(D)F(.)
\<<
    "Enter Liner" "" INPUT  OBJ\->
```

```
    "Enter Stroke Length" "" INPUT OBJ\->
    "Enter Efficiency" "" INPUT OBJ\->
    "Enter Strokes/Minute" "" INPUT OBJ\->
        \-> lin stl eff spm
        \<<
           lin SQ .000243 * stl * eff * .01 *
           DUP "Bbl/Stroke = " SWAP + SWAP
           42 *
            \-> gps
           \<<
                "Gal/Stroke = " gps +
                "Gal/Minute ="
                gps spm * +
                6 DISP
                5 DISP
                4 DISP
                "Press a key to exit"
                9 DISP
                0 WAIT DROP
           \>>
        \>>
\>>
```

Cut and paste the above into notepad, and save as "pump.txt" Start the connectivity kit, cable up the calculator, start the xmodem server and connect with the connectivity kit. Check File->Transfer mode. If it is "binary", select it so you are in "text" mode. Drag pump.txt and drop it into the connectivity kit's view of the calculator file system. Select "Disconnect" from the Connectivity Kit menu. You should have a softkey labeled "pump" in the calculator directory you dropped the file on. That should do it.

You might want to have a look at http://www.area48.com, which is a site for HP48 and HP49 beginners. The mother of all HP graphing calculator sites is Eric Rechlin's hpcalc.org. Despite excellent organization, it can be hard to find stuff there because there's just so much. But your time spent browsing will be rewarded with more knowledge about your calculator. I suggest you start with the FAQ, and then have a look at Programming in User RPL (zip file containing a PDF). The essential reference for programming in User RPL on the 49G+ is the Advanced User's Reference Manual (PDF). It's huge, but has a tutorial course in User RPL at the beginning, and contains detailed reference for all the User RPL words.

Finally, the Usenet news group comp.sys.hp48 is a good place to ask programming questions. This site is for older HP calculators, not current ones like the 49G+ The newsgroup is a better place to go with your questions.

Good luck!

in response to message #16 by B Douglas

What happens when you press the softkey labeled "pump"? (Softkeys are the top row keys, under the "soft" labels.)

Re: Converting hp42s programs

*Message #18 Posted by **Howard Owen** on 17 Jan 2006, 1:26 p.m.,*
in response to message #14 by B Douglas

You should also look at Hrast's message below. For $130.00, you could have a 42S emulator on your 49G+. You would have to key the programs by hand, but no translation would be needed.

Re: Converting hp42s programs

*Message #19 Posted by **B Douglas** on 17 Jan 2006, 2:29 p.m.,*
in response to message #18 by Howard Owen

It brings up the program just like it was entered and sent to the calculator.

It does not actually run it.

it has a: 1: and the program is in qoutes.

I notice that there are g's in alot of the lines at the beginning some have 1 g and others have 2 g's.

Butit does noe execute the program.

Re: Converting hp42s programs

*Message #20 Posted by **Howard Owen** on 17 Jan 2006, 3:15 p.m.,*
in response to message #19 by B Douglas

It sounds like the program transferred as a string, not as a program. That could happen if your cut-and-paste added characters, or if you were in binary mode when you transferred the program.

Delete the program off the calculator. (Press r-shift-files, OK, scroll down to the PUMP..." entry, press NEXT, then the PURGE softkey.) Download the binary version here. Save it and reconnect to the calculator. Drag the saved file (PUMP.hp) into the connectivity kit window and proceed as above.

The text/binary mode probably wasn't the problem. I just transferred the text file to my 49G+ with the connectivity kit in binary mode, and the calc recognized it as a program without a problem. It's more likely some garbage was added when you did your cut-and-paste. (You needed to select *just* the program text before pressing ctl-c, for instance.) The binary version linked to above should get around that difficulty.

Re: Converting hp42s programs

*Message #21 Posted by **B Douglas** on 17 Jan 2006, 4:29 p.m.,*
in response to message #20 by Howard Owen

Howard your incredible, The program works great!!!!! I copied and pasted it just like you mentioned and it still transfered as a string. Is there a way to set the connectivity program to binary and I assume that I was to set the calculater to ascii transfer. I might have been doing it all wrong. Still learning!

I have several other programs that I am needing to write in this code. By looking at the way the program was on the 42s I could follow it, but in the new RPL way it is very confusing for me. Any sugestions....most of the other (formula's) just get more complex.

Would you be interested in helping.

If so let me know.

Feel free to contact me by email

bdouglas1011@earthlink.net

Then I could get you my Contact #.

Thanks for your help!

As you've already successfully downloaded the binary version, this is acedemic, but at least part of the problem would be the header. It should be:

```
%%HP: T(3)A(D)F(.);
```

instead of

```
%%HP: T(3)A(D)F(.)
```

Note the semicolon at the end of the ASCII transfer header. Without a valid transfer header, the calculator stores whatever it received as a character string.

> Quote:
>
> I notice that there are g's in alot of the lines at the beginning some have 1 g and others have 2 g's.

That I don't have any good explanation for. I do notice that Howard posted the source code with tab characters where a series of spaces would usually be, but that shouldn't matter, as either tabs or spaces are parsed as separators.

I hope that you saved it as a "plain text" file rather than some sort of "word processing" document. Generally, ASCII (text) source code files are edited with a "text editor" rather than a "word processor", but a word processor should work as long as the file is saved as plain text.

I recommend uploading (in "ASCII" or "text" mode) some programs (and other objects) that you've written and stored on the calculator, to see what the header and source code should look like in a text editor on your PC. Assuming that you're using Conn4x for the transfer, I recommend configuring Conn4x to translate all non-ASCII characters. If using some other method for transfer, use translation mode 3, which can be set by the sequence 3 TRANSIO on the calculator.

> Quote:
>
> Butit does noe execute the program.

Well, what would be "executed" is the character string, which for a "data class" object, means that it would simply be placed on the stack.

As Howard wrote, the newsgroup comp.sys.hp48 seems to be a better place to ask about RPL models.

Regards,
James

Re: Converting hp42s programs

*Message #24 Posted by **Howard Owen** on 23 Jan 2006, 11:05 p.m.,*
in response to message #23 by B Douglas

Oh, heck.

James noticed this before. I left out a semicolon at the end of the header in this program. So

```
%%HP: T(3)A(D)F(.)
```

Should be

```
%%HP: T(3)A(D)F(.);
```

That's why it isn't transferring. In this case, the 49G+ will give a string conversion error, which doesn't tell you a darned thing, and Conn4X will report a transmission error. Very confusing.

Regards,
Howard.

Re: Converting hp42s programs

*Message #25 Posted by **Howard Owen** on 23 Jan 2006, 11:12 p.m.,*
in response to message #23 by B Douglas

An error in the program will also give you a string conversion error, without telling you where exactly the error occurred. What I do in that case is I edit the file, replacing the outer program delimeters (the first \<<and the final \>>) with double quotes. That makes the 49G+ not do any string conversion, but just copy the contents over as text. Once on the calc, I edit the string and replace the quote marks with program delimeters. Then when I press enter, the calculator parses my program, gives me an intelligble error message and points to where the problem is. Much better!

That wouldn't have worked in this case, however, since the problem wasn't in the program but in the text header.

Regards,
Howard

But he doesn't have a version for the 49G+, according to the referenced site.

There are HP-49G+ versions of all my emulators (http://hrastprogrammer.tripod.com/hp49gp.htm), I just haven't updated single emulator pages with this information. They don't have the same functionality as HP-48GX and HP-49G versions due to some HP-49G+ shortcomings and quirks (no RS-232, 128K Port1, some problems with ROM 2.0x, ...).

HP-11C - 25 years on original batteries!

*Message #1 Posted by **Jerry Lockleer** on 15 Jan 2006, 4:04 p.m.*

I received my HP-11C calculator as a gift in 1981 while studying physics at Central Washington University. I used it intensely for my four years at the university, and have used it as my main calculator ever since I graduated. I have never changed the batteries in the last 25 years! Every day I turn it on and wonder if it will be its last day – but it just fires-up and is ready for work. I'm not sure if there are any records for battery longevity, but 25 years seems like an awfully long time. I'm not sure if it's a testament to the 11C or to the batteries; my guess is both can share the credit. If anyone has a similar story for 25+ years on the same batteries, let me know.

Edited: 15 Jan 2006, 4:05 p.m.

*Message #2 Posted by **David Smith** on 15 Jan 2006, 11:21 p.m.,*
in response to message #1 by Jerry Lockleer

You should regularly change the batteries even though they are still good. One day you will wake up and find the battery seals cut loose and spewed battery barf all over the innards of you wonderful pet machine.

Re: HP-11C - 25 years on original batteries!

*Message #3 Posted by **Chris Roccati** on 16 Jan 2006, 5:26 a.m.,*
in response to message #1 by Jerry Lockleer

I changed the batteries on my HP-11C in october. They did last 20 years. They were not actually dead, but the "snowflake" sign has been on since the last year or so.

The change was a "birthday present": according to the serial number, my 11C was built in the last week of october in 1985.

12c "120+ functions"

*Message #1 Posted by **Don Shepherd** on 15 Jan 2006, 1:37 p.m.*

I would be the last person to complain about the venerable 12c. It is the only currently-manufactured HP product that you can both program in RPN and fit easily in your shirt pocket. However, is anyone but me bothered by the fact that it is (and always has been, as far as I know) advertised as having "120+ function"? Has HP ever listed those 120 functions, because I count only about 88.

Hello Don,

It appears you have forgotten to take into account the following, which are not so evident:

```
Show Mantissa (f CLEAR PREFIX)
STO+
STO*
STO-
STO/
FIX (f 0..9)
SCI (f.)
ON/.
ON/*
ON// (?)
ON+ (?)
ON- (?)
```

HP may have considered also these:

```
f
g
ON
OFF
```

Only 104 functions though (107 if we consider Tim's suggestions :-)

Perhaps 12C experts should point us out the missing functions...

Edited: 15 Jan 2006, 4:39 p.m.

Re: only to US!

*Message #4 Posted by **M currie** on 15 Jan 2006, 10:22 p.m.,*
in response to message #3 by Gerson W. Barbosa

How about if you count all the different "fix" settings and separator options as separate functions? Don't forget the self test too.

Re: only to US!

*Message #5 Posted by **Gerson W. Barbosa** on 16 Jan 2006, 8:00 a.m.,*
in response to message #4 by M currie

The manual lists the ON * and ON / self tests, already included. By what I've read, now it is possible to adjust the screen contrast (ON + and ON - ?). If we consider FIX 0 to FIX 9 as distinct functions (actually they are not), and low power indicator and auto shut-off, we have 115+ 'functions'...

TI-57 Emulator for HP-48S/SX/G/G+/GX, HP-49G and HP-49G+ is finished

*Message #1 Posted by **HrastProgrammer** on 15 Jan 2006, 1:50 a.m.*

AFAIK, this is the first time ever that TI machine code can be executed on a HP CPU :-)

This famous vintage calculators is fully emulated because the emulator is based on the real ROM (object code retyped and analyzed by me from the original TI patents).

Features:

(*) Continuous Memory - data and program memory is preserved after exiting the emulator.
(*) Light-sleep mode when waiting for a key is implemented.
(*) Auto power-off is implemented.
(*) Ability to save/save RAM to/from a RM57 variable.
(*) Emulator is much faster than real calculator.
(*) Pause duration is lowered to about 1/2 second.
(*) Advanced LRN functionality: Current instruction is displayed in text form above the regular display in LRN mode.

The first three features in fact turn TI-57E into never released TI-57C calculator.

I won't release TI-57E for Windows because my primary concern are HP-48 and HP-49 calculators. For this reason, I gave the ROM and the emulation code to Eric so he can include TI-57 into Nonpareil as stated in another thread (this code is written in Delphi Pascal so he must translate it into C).

TI-57E is freeware. I uploaded it to http://www.hpcalc.org some ten days ago but it still didn't show and isn't available for download. I don't know the reason for this. Maybe you can suggest me another location for the upload ...

Best regards.

First non-RPN calculator in Nonpareil

*Message #1 Posted by **Eric Smith** on 14 Jan 2006, 8:42 p.m.*

Thanks to a ROM image and code provided by HrastProgrammer, Nonpareil will soon support its first non-RPN calculator, the TI-57.

Since non-RPN calculators (even the HP-01 and HP-10) aren't really consistent with the name Nonpareil, I've decided to put them into an optional "downgrade pack".

I'm not sure whether the TI-57 will make it into the next release, which I'm trying to finish up this month. If not, it will be in the following release.

Re: First non-RPN calculator in Nonpareil

*Message #2 Posted by **mIKE t.** on 15 Jan 2006, 9:59 a.m.,*
in response to message #1 by Eric Smith

I'm looking forward to the next release.

While it is true that I would probably only use the RPN models, I wouldn't necessarily regard the simulation of a non RPN calculator as a 'downgrade'...

Mike T.

Re: First non-RPN calculator in Nonpareil

*Message #3 Posted by **Eric Smith** on 16 Jan 2006, 1:11 a.m.,*
in response to message #2 by mIKE t.

It's a downgrade pack because once you install it, the name "Nonpareil" is technically no longer applicable.

Re: First non-RPN calculator in Nonpareil

*Message #4 Posted by **Thomas Okken** on 16 Jan 2006, 8:47 a.m.,*
in response to message #3 by Eric Smith

> Quote:
>
> the name "Nonpareil" is technically no longer applicable.

OK, I'll bite. :-) What does that name stand for anyway?

Re: First non-RPN calculator in Nonpareil

*Message #5 Posted by **Gerson W. Barbosa** on 16 Jan 2006, 8:53 a.m.,*
in response to message #3 by Eric Smith

Totally agree!

Nonpareil means unique, unmatched, 'sans pair', etc...

It would be kinda heresy including TI calcs simulations in the official Nonpareil package. Nevertheless, a separate package with some TI calculators would be much appreciated as some of us here had one of these (My first programmable calculator was in fact a TI-59. I had also a TI-51-III and an LCD TI-57 - display and chips available for free, if someone is interested).

Regards,

Gerson.

```
---------------------------------------------------------------------
nonpareil [nónpa ráy'l] noun (plural nonpareils)
1.somebody or something unparalleled: somebody who or something
that has no equal
2.PRINTING six-point type: a size of printers' type equivalent to
six point (dated)

adjective
peerless: having no equal

[15th century. From French, literally 'not (having) equal',
 from pareil, 'equal', from popular Latin pariculus, diminutive of
Latin par, 'equal' (see  PAIR).]

Question about using the EMU71

*Message #1 Posted by **Namir** on 14 Jan 2006, 11:26 a.m.*

Hi All,

How can I read BASIC programs that I type with a regular text editor into the EMU71 emulator for the HP-71B?

I really aprpeciate your help.

Namir

Re: Question about using the EMU71

*Message #2 Posted by **Howard Owen** on 14 Jan 2006, 12:57 p.m.,*
in response to message #1 by Namir

I use one of two methods, both depending on a real 71B and an HP-IL ISA card in the PC. I transfer the program to the real 71B, then I write it to a virtual LIF disk under EMU71, or directly into the emulator.

AFAIK, what's lacking is a program to write LIF format files to a LIF disk image. The HP41UC program will do this for 41C data types, but that doesn't include the LIF text format. (What HP41UC does is wrap a LIF header around the given data, and then a LIF disk header around that.) I know that Tony Duell's LIF utilities ifor Linux nclude a program to put a LIF header around a LIF text file so it can be transferred over the serial port (via COPY FROM RS232C: on the 71B) but that doesn't put the disk header on the file. It shouldn't be too hard to do that for just one file. The tricky thing would be to write a LIF image create/add/modify/delete utility generalized for all the 41C/75C/71B/85/86/87/9816 and so forth file types.

I know that Vassilis gave something like that out as an assignment to his students recently. Did you get any good solutions that could be GPL'd, Vassilis? 8)

Re: Question about using the EMU71

*Message #3 Posted by **Namir** on 14 Jan 2006, 4:22 p.m.,*
in response to message #2 by Howard Owen

I am actually translating True BASIC programs to HP-71B Basic. There is some similarity between the two in the types of programs involved. So going from ASCII text to EMU71 format is good.

What seems to have potential is this process:

1. Translating the HP71B ASCII text source code into a special format that WINBATCH (Windows batch file program) can proces. 2. Run a WINBATCH file that reads the translated BASIC source code and sends the characters to EMU71.

WINBATCH's keystroke transmission to another windows app (or DOS box) has to follow special rules. For example, the + character has to be sent as a special character.

Namir

Re: Question about using the EMU71

*Message #4 Posted by **Howard Owen** on 14 Jan 2006, 7:45 p.m.,*
in response to message #3 by Namir

That sounds like a winner! You could probably can the translations you need in a Perl script or True BASIC program.

Re: Question about using the EMU71

*Message #5 Posted by **Namir** on 14 Jan 2006, 9:16 p.m.,*
in response to message #4 by Howard Owen

Howard,

I wrote a short VB.Net program to convert the HP-17B BASIC listing into keystrokes for WINBATCH to feed EMU71 in a DOS box. I tested it and it works. To make sure EMU71 accepts each character, I programmed the WINBATCH script to wait 2 seconds. As long as the WINBATCH script feeds each line to EMU71 correctly things are fine. I can always go back and edit the listing in EMU71 if I need to.

It's slow but it works!!!

I have several BASIC program that I want to prt to the HP71B and then post on my web sites. The next set s one that does best linear and multiple regression for 2 and 3 variables. The next set of programs deal with multivaribale optimization using some heavy duty algorithms.

Namir

Re: Question about using the EMU71

*Message #6 Posted by **Valentin Albillo** on 14 Jan 2006, 10:51 p.m.,*
in response to message #1 by Namir

Hi,

To load a PC text file into Emu71, proceed as follows:

1. Copy your text file, renaming it to "emu_in.dat", to Emu71's home directory.

2. Enter this small program in Emu71 (where MYTEXT is any legal name you want to give your PC text file when stored in the emulated 71B file system) exactly as written and RUN it:

```
10 DIM A$[100]
20 CREATE TEXT "MYTEXT"
30 ASSIGN #1 TO "MYTEXT"
40 ENTER :DOSLINK;A$
50 DISP A$ ! just to follow the process, you can omit it
60 PRINT #1;A$
70 GOTO 40
```

   The program will stop (at ENTER statement) when there are no more lines to ENTER from the PC text file.

3. Now manually close the file by executing from the keyboard:

```
ASSIGN#1 to *
```

and there you are, your text file is now in the emulated HP-71B file system, as a proper 71B TEXT file, and named "MYTEXT", say.

4. If your text file is actually a well formatted, legal HP-71B program written in syntactically correct HP-71B BASIC, with proper line numbers and all, you can now transform it from its text form to a proper BASIC program by executing from the keyboard:

```
TRANSFORM MYTEXT INTO BASIC
```

which will convert it to a real, runnable HP-71B BASIC program.

5. To do the reverse process, that is to list a program in Emu71 into a PC text file, do the following from the keyboard:

```
ENDLINE CHR$(13)&CHR$(10)
PRINTER IS :DOSLINK
PLIST "MYPROGRM"
PRINTER IS * (or PRINTER IS :DISPLAY)
```

and you'll find a PC text file named "emu_out.dat" in Emu71's home directory, which you can process with any Windows or MSDOS program or utility, such as some editor or converter, or rename it and store it in some repository.

That's all. I think you'll find this approach both easy and quite fast. Notice it works for arbitrary text files, not just programs, so you can also enter data files as well.

Best regards from V.

Namir wrote: *"THANK YOU SO VERY MUCH!!!"*

You're welcome. That's one of the main purposes of this unique MoHP Forum: to enjoy worthy discussions with other fellow HP fans, and to help each other by sharing info (and even goodies !) related to our beloved HP calcs. Matter of fact I've found your ingenious Winbatch approach highly interesting.

Best regards from V.

Re: Question about using the EMU71

*Message #10 Posted by **Namir** on 15 Jan 2006, 6:57 p.m.,*
in response to message #9 by Valentin Albillo

I have several numerical optimization programs to translate to the HP-71B BASIC. They are not very short, so I decided to run them on the EMU71 emulator instea of typing them on a physical HP-1B. Being able to transfer the listigs from DOSWindos text file to the EMU71's virtual RAM is a valuable time-saver.

Namir

Permission Requested

Most current HP 33s models

*Message #1 Posted by **Joe Edwards** on 14 Jan 2006, 9:08 a.m.*

Hey folks, I ran across a post somewhere that stated there have been several iterations of the HP 33s calculator. What is the condition of the most current version (bug wise, LCD wise, tiny decimal point wise, etc) and how do I tell which version is which? Thanks for the help in advance.

Joe Edward

Re: Most current HP 33s models

*Message #2 Posted by **John Smitherman** on 14 Jan 2006, 2:13 p.m.,*
in response to message #1 by Joe Edwards

Hi Joe. I believe that if you find a 33s with date code 524 or newer you should get the new and improved model with the bug fixes.

Happy Computing!

Regards,

John

Re: Most current HP 33s models

*Message #3 Posted by **Bob** on 17 Jan 2006, 9:59 a.m.,*
in response to message #2 by John Smitherman

My 33S with 442xxxxx has the poor LCD. My 527xxx unit has the new and (really) improved LCD and no bugs as far as I can tell.

Re: Most current HP 33s models

*Message #4 Posted by **Marcus von Cube, Germany** on 17 Jan 2006, 10:50 a.m.,*
in response to message #3 by Bob

My 51500163 has the improved LCD but retains all the bugs.

Marcus

Re: Most current HP 33s models

*Message #5 Posted by **bill platt** on 17 Jan 2006, 11:33 a.m.,*
in response to message #1 by Joe Edwards

You have to test it by operating it through the blister pack. Difficult but not impossible.

You need to run the H.MS DMS routine (check to see if it mishandles negative values) and the Polar-Rectangle routine (test to see if it gets confused going from 90degrees r=1 to X,y and tehn back---if it gives 270 degrees it hjas the bug.

Re: WARNING: New scam

*Message #2 Posted by **Howard Owen** on 13 Jan 2006, 10:50 p.m.,*
in response to message #1 by Vassilis Prevelakis

I've been getting a lot of these. They usually ask questions such as "what forms of payment do you accept for your item?" Aside from the fact that the reply URL, as you point out, is spoofed, and actually points to some other site than eBay, the mail headers should also show a spoof in the last Received: header listed. The last header listed should be the first one generated. But sometimes the miscreants add phony Received: headers so the first real one isn't the last one listed. Regardless, the first real Received: header usually contains a spoof of the originating system's name. Knowing this can be helpful in identifying malicious mail when other clues are inconclusive.

For example, here's a sample from a virus laden mail that hit my mailbox a couple of weeks back:

```
Received: from vansbro.se (ASt-Lambert-151-1-23-237.w82-120.abo.wanadoo.fr
```

```
[82.120.234.237]) by [...]
```

So this one claimed to be from 'vansbro.se' but actually originated from 'ASt-Lambert-151-1-23-237.w82-120.abo.wanadoo.fr'.

Re: WARNING: New scam

*Message #3 Posted by **Marcus Aurelius** on 15 Jan 2006, 9:16 a.m.,*
in response to message #1 by Vassilis Prevelakis

I've gotten so many of these of different variations that I closed my eBay account. The fun of trading on eBay is not worth exposing yourself, (however they're getting your email off eBay?), to these scam artists.

Re: WARNING: New scam

*Message #4 Posted by **Howard Owen** on 15 Jan 2006, 12:25 p.m.,*
in response to message #3 by Marcus Aurelius

It's doubtful that your membership in eBay or PayPal has anything at all to do with the phishing spam you are getting. Spam is a volume game, and the miscreants who send out that stuff just don't have time to target groups of people. They assume that some percentage of the multiple millions of messages they send will reach people who have eBay accounts, and that some percentage of those will be selling. Since eBay is popular, they are obviously right to think that. But then they also have to get some percentage (of the percentage, of the percentage) of targets who are dumb enough to fall for the (usually) transparently false scam spam spew. As long as you can tell the difference (which you obviously can) then you are safe.

Regards,
Howard

The brazilian Hurricane, Earth Quake and Terrorist Actions!

*Message #1 Posted by **Artur - Brasil** on 13 Jan 2006, 9:20 a.m.*

Although not particulary concerned to calculators, but just to complement an old post by Luiz Vieira, from Brazil too.

I believe we, brazilians citizens, do not need to have earth-quakes, or hurricanes or terrorist actions! We have our Government doing very well this role.

When we import goods, just see what happens in Customs: - take the goods price: lets say an HP calculator at US$100; - add the shipping costs: US$40 => total US$140;

Well, the Federal tax IPI will be 60% over total = 84US$;

But not only the Federal Government is hungry! The State is too! But State is furious with Federal Government! So, it will add to total costs, the Federal Tax, giving another new calculus-basis: 140 + 84 = 224 US$!!! So, you will have to pay a tax over the Federal tax! You must calculate 18% over the new price: 224 * 18% = US$40. This "would" be the State Tax, but I've said "would". Include the US$40 in the new price and calculate it again!!!! 224 + 40 = 264 US$. Now, 264 * 18% = 47 US$

Finally, you have the final product cost:

original product price: 100US$ shipping costs: 40US$

In Brazil: Federal Tax: 84US$ State tax: 47US$

So, your new calculator have a final price of: 311US$

Now you can imagine why we are a so 3rd world country, always called "in development" ... It does not care how we citizens fight to bring some technology, the Brazilian Government works hard to defeat us and keep our country in the list of the worst in the world in many aspects!

This is why I appreciate so much USA actions: at least it seems your Government works for improving and to defent your Country...

Just an opinion of a very desgusted and tired citizen .....

Artur

Hi Artur,

Sounds like you-all need to have a tea party :-)

Re: The brazilian Hurricane, Earth Quake and Terrorist Actions!

*Message #3 Posted by **E. Young** on 13 Jan 2006, 1:16 p.m.,*
in response to message #1 by Artur - Brasil

Big government is usually the problem. Its appetite for your hard earned money is insatiable. When someone on the street robs you it's called a crime. When the government does it to you it's called taxation, and how dare the average citizen have the nerve to want to keep as much of his/her hard earned money as possible.

Hi Arthur, all;

sorry to bring such unfortunate 'old news', but these are facts. Not ot extend the issue more than it deserves, but we here are the ones that face it. And it seems that God knows it well, because in some extent, we do not suffer that much for other external causes; our government does it so well that it´s been enough...

Thanks for your pacience.

Now to add insult to injury, that $100 HP calculator is not only trebled in cost by the taxes, but the average salaries are lower in Brazil. By how much, I don't know. In the U.S., mechanical engineers are paid generally between $35,000 (beginners in inexpensive cities) to $150,000 (15+ years experience, expensive city). I am not including "bosses" "partners" etc but salaried degreed workers.

I wonder what the Brazilian range is?

The net result is that in the U.S. even these "collector" calculator prices are pretty much only pennies against our earnings--but in Brazil, if feels like it felt in the U.S. in 1979--expensive.

Converting hp3468 from 115 to 230V ?

*Message #1 Posted by **Francois** on 12 Jan 2006, 4:36 p.m.*

Hello,

Is it easy to convert an US HP3468 Digital MultiMeter from 115 VAc to 230 VAC for use in France ? (It's quite difficult to find in europe, so before searching in the US I prefer asking if transformation is possible or not)

Is the power supply a transformer or a switching supply ?

Thank you Francois

Re: Converting hp3468 from 115 to 230V ?

*Message #2 Posted by **Ronald** on 12 Jan 2006, 5:07 p.m.,*
in response to message #1 by Francois

Hi,

Yes this is very simple. Drop me a mail when you have aquired one and I will mail you the page from the service manual. It is just soldering one wire at another place on the circuit board.

Ronald

HP-97 card reader repair question

*Message #1 Posted by **David Ramsey** on 12 Jan 2006, 4:20 p.m.*

OK, almost done with Easterling's 97. The keyboard problem was due to the fact that someone had worked on the calc previously and re-installed the white plastic keyboard spacers incorrectly: instead of spacer-gold foil-spacer it had been put back together as gold foil-spacer-spacer. This lifted the contacts another millimeter or so and prevented the "0" key from making good contact when pressed.

The broken battery contact was replaced with a good contact from an HP-82162A printer with a bad print head.

The card reader wouldn't pull cards, so I took it apart. The rubber roller was in the "rock hard stage just before gummy", so I scraped it off and replaced it with standard O-rings. The inside of the reader, including the read/write head, was kinda dirty so I cleaned that up as well (btw, ultrasonic jewely cleaners work great for cleaning those nylon balls).

The reader now pulls cards very well and will write cards my other calcs will read, but reading a card always produces an "ERROR" display. Any ideas? I have another 97 card reader I can use if I have to...

Re: HP-97 card reader repair question

*Message #2 Posted by **Randy** on 12 Jan 2006, 7:32 p.m.,*
in response to message #1 by David Ramsey

Since it writes okay I would start with the 3.3uf bypass cap across the motor. No joy? Next up are the two 22uf caps in series with the head. That usually takes care of it.

in response to message #1 by David Ramsey

Foil, Spacer, Spacer IS THE CORRECT ORDER!!!! I've worked on a couple hundred of the machines and all the ones that worked and had not been futzed with were in that order. The only ones that were not in that order had been obviously klutzed with.

To fix your read problem replace the 6.8 uF (or so) blue dipped tantalum electrolytic cap on the chip power lines.

Weird. It's not that way on my other 97, and redoing it this way sure seemed to fix the keyboard problem. Do you see any disadvantage to leaving it this way?

> Quote:

in response to message #6 by Vassilis Prevelakis

Apparently somewhere along the way HP changed the stamped sheet. I think they did it to get more bend (and spring) to the contacts. They probably changed the order of the spacers to get keep the contact clearance consistent. If the spacers are in the wrong order you either get swicthes that are shorted closed or never make contact. I know what the service manual says. I also know that most of the machines are actually configured differently. When I first noticed that the spacers were in a different order, I tried fixing them like the manual said. I then started having problems with the keyboards. I just got in two machines last week and both had the spacers together.

You mean this one, right? I read that as 6.9uF. Would it be prudent to replace any other while I'm at it?

*Message #9 Posted by **David Smith** on 22 Jan 2006, 1:25 p.m.,*
in response to message #8 by David Ramsey

Bad Booze Rots Our Young Guts But Vodka Goes Well -> Blue, Gray = 6.8

That is probably the one, but the ones that go bad are usually all blue. It is on the power lines to the chip. The exact value is not critical, better too large than small.

The other two caps are in series with the head windings. I have seen some readers with a small extra cap... don't remember where it goes. (looks like yours has it)

Re: HP-97 card reader repair question

*Message #10 Posted by **David Ramsey** on 22 Jan 2006, 2:26 p.m.,*
in response to message #9 by David Smith

There are only four caps on the board, all visible in that photo.

Whether the one I pointed out is on the power lines to the chip or not, I can't say...no schematics.

My last question regards polarity: there are no obvious polarity markings on the cap or the circuit board. How to I discern which way to orient the replacement part?

Re: HP-97 card reader repair question

*Message #11 Posted by **Randy** on 22 Jan 2006, 4:15 p.m.,*
in response to message #10 by David Ramsey

HP convention for polarized 'thangs is that (+) has a square PC pad, the (-) is a standard round pad. Same goes for pin 1 of DIP's.

The 6.8 uf cap is in a motor timing circuit, the 3.3 uf next to it is the Vss bypass cap. Whenever I have a dodgy 97 and the switches have been adjusted, I just replace all four caps and move on. The 22uf's in series with the head tend to give me the most grief. FWIW, never had a problem with the older hermetics in the 67, only the dipped red lollypops that are on your 97.

HP97 service manual is on the museum CDROMS...

Re: HP-97 card reader repair question

*Message #13 Posted by **David Ramsey** on 28 Jan 2006, 7:18 p.m.,*

in response to message #12 by David Smith

Yes, and I will order the Museum manuals any day now, honest!

In the meantime I only need one last check of my profound Capacitor Ignorance. Here's one of the 22uf caps I picked up at Radio Shack:

http://www.neko.com/neko_images/22uf.jpg

Will this be a functional replacement? I don't know the significants of the "35v" marking, although obviously that's much higher than the voltage in the card reader.

Radio Shack did not have separate 6.8uf and 3.3uf caps. The closest I found were in a "Pack 'o 100 capacitors". I don't know if the caps shown below are 6.8uf or 68uf, nor do I know how to tell the polarity:

http://www.neko.com/neko_images/capacitors.jpg

Advice solicited. Surprisingly, I CAN solder.

Re: HP-97 card reader repair question

*Message #14 Posted by **David Smith** on 29 Jan 2006, 7:03 a.m.,*
in response to message #13 by David Ramsey

No, that Radio Schack cap is an aluminium electrolytic (BTW, most RS stores are getting out of the parts business... and would you like a cell phone with that blank stare). It has a much poorer performance in this application than a tantalum capacitor. I have never had any problems with the head winding caps or the smaller electrolytic. The one that fails is the one on the power line to the chip. The blue ones are particularly bad. The cap will test good on most cap checkers, but it develops a high ESR (equivalent series resistance).

Re: HP-97 card reader repair question

*Message #15 Posted by **David Ramsey** on 29 Jan 2006, 12:42 p.m.,*
in response to message #14 by David Smith

Thanks for the info, David. Another forum member has offered to send me all four caps, which (as I noted) beats ordering them from DigiKey.

Yeah, Radio Shack's component selection wasn't too impressive. I remember when they had tube testers in all the stores.

Museum night

*Message #1 Posted by **Matthias** on 12 Jan 2006, 3:43 p.m.*

Hi

Here in Switzerland in my City there is each year a large museum´s night where all museums open until 2 am. This year I was asked by a computer museum if I would present some of the HP calculators and their accessories. What a honour for me, but I can not decide, what I want to present there. As I was informed, I will have some vitrines to present things (but I can not decide what). Secondly I want to show some of the calculators in daily work, so that the people can touch and use them... As I never did this before I please you to help me finding a cool selection of the spirit of HP.....

Yours, Matthias

Re: Museum night

*Message #2 Posted by **Ronald** on 12 Jan 2006, 5:11 p.m.,*
in response to message #1 by Matthias

Hi

I would take HP9100 HP-01 HP 35 Version 1 (showing the "thinking error" of having a red dot that it is switched on and at the same time seeing the Red digits in the display. HP 10 for it the only algebraic at that time and he is just cute to look at.

From the modern ones I would take a 65, a 27 and ofcourse a fully loade HP41CX with quite some things hooked up by the IL loop, maybe drive the 3468 multimeter via the HP41 to measure the charging current to a HP92 ?

Succes

Ronald

Re: Museum night

*Message #3 Posted by **Thomas Radtke** on 12 Jan 2006, 5:26 p.m.,*
in response to message #1 by Matthias

Hmmm, I could imagine two interesting subsets: (1) The calcs which presents relevant innovations (first scientific, first programmable and so on) and (2) visually different models. The latter seems to be the worser choice to HP calc fans at first look. But then I'm sure a lot of visitors would enjoy the varity of styles, especially if they are HP illiterate.

Just my 2 cents,

Thomas

P.S.: Don't foget to take some picture (and post the link here:)!

Re: Museum night

*Message #4 Posted by **bill platt** on 12 Jan 2006, 5:42 p.m.,*
in response to message #3 by Thomas Radtke

Explanatory cards, large print, nicely designed, with no more than 25 words per model, are essential.

"1st Programmable Pocket Calculator" "1st Pocket Calculator with external memory storage"

etc

Just my tuppence

Re: Museum night

*Message #5 Posted by **Dave Shaffer** on 12 Jan 2006, 5:45 p.m.,*
in response to message #1 by Matthias

I agree on the '35 with its LEDs. In addition, if you have a 9100 series, put it next to the '35 - to show the evolution in size, with comparable capabilities, in just a few years. Also, stress (and perhaps even show by opening it up) that the guts of the 9100 had no integrated circuits.

Re: Museum night

*Message #6 Posted by **Peter Geiser** on 12 Jan 2006, 5:55 p.m.,*
in response to message #1 by Matthias

Congratulations! When? Where exactly?

I would suggest major technology break-throughs, and also some special models (the blue one, see-through-models). Comparison charts could be interesting as well (e.g. speed, functions, etc. also compared to PCs.)

What about a small competition?

If it should be educational, peraps something about accuracy of computations.

Best regards Peter

Re: Museum night

*Message #7 Posted by **Walter B** on 12 Jan 2006, 5:59 p.m.,*
in response to message #1 by Matthias

Well, if you'll have "some vitrines", then you can show the different calculator lines (Classics, Woodstocks, etc.). To keep it simple and avoid confusion, you can limit your exhibition to the RPN and RPL models. Other calcs are plenty, but this logic is really something special. So you can prepare some explanatory material and let people play with 2 or 3 HP21 connected to their chargers (providing some kind of locking to keep diffusion rate low).

If your shelf space is very limited, then I propose to show the models 9100 (any), 35, 45, 65, 25C, 34C, 41 (any), 15C, 28C, 42S, 48SX, and 48GX with their dates of production and some very schematic, clear info about their features and/or their relative computing power versus costs.

Just my 0,02 sfr.

Re: Museum night

*Message #8 Posted by **Karl Schneider** on 12 Jan 2006, 10:51 p.m.,*
in response to message #1 by Matthias

> Quote:
>
> Secondly I want to show some of the calculators in daily work, so that the people can touch and use them...

If theft is not a concern (e.g., security cable or housing present), I would recommend the following models to cover the "handheld era":

- HP-35 (any)
- HP-67
- HP-41CX with peripherals
- HP-15C (or -16C) and HP-12C, side-by-side
- HP-42S and HP-17BII, side-by-side
- HP-48SX or HP-48GX
- HP-49G+ (??)

This display would cover the the following:

- LED era from inception to completion
- Revolutionary "PC predecessor" 41
- Both fine RPN lines from the 1980's, scientific and business
- RPL calculator/data collector
- The outsourced present

Intermediate models (such as Spices and ordinary Woodstocks) and ill-conceived models (e.g., HP-28C) need not be displayed, IMO.

Regards,

KS

Re: Museum night

*Message #9 Posted by **Stephen Easterling** on 13 Jan 2006, 8:09 a.m.,*
in response to message #8 by Karl Schneider

When you say "outsourced present," do you mean outsourced from Singapore? I thought that the Singapore factory was the first placed it was outsourced from the USA.

There are a lot of great ideas here on this thread and the opportunity sounds very exciting. In my personal collection, I don't have all of the models, but I'm trying to have all the models that had something special (e.g., the 55 was the first model to have a built-in timer / stopwatch feature). The other Classic I have is the 35. The Woodstocks are special because they got EVEN SMALLER during a time that we didn't think it was possible. Remember, this is one reason why the original 35 became so popular was the progression of techonolgy in a device so small. I have a 22 and 25 (business & scientific), but you may want to display a 25C or 29C to demonstrate size and continuous memory. For the Spice family, you should probably omit it, but instead, display a 19C if you have one, to show the different cosmetics but at the same time the printing capability, which was pretty important back then for many users. You may also want to show a Topcat, but this is optional. Next, your 41 series where HP is getting really serious with the peripherals,

and your Voyagers (like someone else mentioned, 12C, 15C, & 16C to show the diversity of this platform to cater to all professionals). A 17BII and 42S for the Pioneers, anything from the Champions because they're unlike anything HP had done before, and a 48 series (e.g., GX with some cards and your printer). Next, something from China, like the current offerings: 12CP, 33S, 49G+. I forgot to mention, but start with a big iron 9800-series and maybe a sliderule (something pre-calculator era). I would not allow anything to be touched unless you have a backup. Don't set out your only mint condition 67 or 41CX for someone to casually scratch the display, etc. The name, year it was released, and a couple of sentences (no more) to highlight it's uniqueness. Don't forget to list a few links for folk to find more info on HP calculators.

Hi

The museum´s night is on the 27th of january. If you don´t know Basel, then it´s very recommented to come here for this weekend. I will be in a shool where a computer museum is shown. Further informations I can give you, when you really decide to come.

Matthias

Re: Museum night

*Message #14 Posted by **Meindert Kuipers** on 13 Jan 2006, 2:52 a.m.,*
in response to message #1 by Matthias

Good idea. I remember there are some HP's (inclding the 41) at the Science Museum in London. Also show your mechanical calculator and slide rules to show progress in technology.

Meindert

Re: Museum night

*Message #15 Posted by **Bob** on 13 Jan 2006, 7:48 a.m.,*
in response to message #1 by Matthias

How about also having a PC with an internet connection that is set to this website for folks to look around on. It is a computer museum after all.

That way, people can see alot of different models and the vibrant community of people who appreciate this technology in addition to seeing some first hand.

Re: Museum night

*Message #16 Posted by **PeterP** on 13 Jan 2006, 6:39 p.m.,*
in response to message #15 by Bob

IMHO this is a fabulous idea, as it would allow people to get more information on any of the models that MW is willing to share with the broader public. (loved the comment from Massimo btw...)

Cheers

Peter

Re: Museum night

*Message #17 Posted by **Jan** on 13 Jan 2006, 8:35 a.m.,*
in response to message #1 by Matthias

Hi Matthias,

I would exhibit at least the following models with some short explanation

HP-35, 1st version since it is the 1st scientific handheld that started the whole thing.

HP-80 as the 1st financial handheld.

HP-65, being the 1st programmable. Some reference to the apollo-soyoez mission would be interesting as well.

HP-91/97, just as interesting models. The desktop nature of it is hardly seen nowadays.

HP-2X, just as a representative of the woodstock series with emphasis on the small size.

HP-41 (any version(C/CV/CX)) with peripherals. Reference to the space-shuttle program would also add something extra.

HP-34C representing the spice series, innovative due to root finder and numerical integration capabilities.

HP-12C being the most long living model until now (introduced in 1981 and still in production). A monument to HP's craftsmenship.

HP-15C representing the (scientific) voyager models, innovative due to matrix calculation and complex number handling.

HP-28C because of its peculiar book-like design and the large display

HP-42S representing the pioneers series.

HP-48 (any version) as an interesting, long lasting model (an S- and a G-series model would be nice)

Some reference to RPN on a small poster would be illustrative for the special character of the HP calculators throughout the years.

good luck

Don't forget the Fraternal Twins!

*Message #18 Posted by **Paul Brogger** on 13 Jan 2006, 2:02 p.m.,*
in response to message #1 by Matthias

Maybe it's simply because they're the core of my small collection, but I think the fact that one can record a program on a 67, then load & run it on a 97 (& vice-versa) is way-cool geek stuff.

If you expect that magnetic cards might be a part of your demonstrations, then by all means include a group of compatible siblings & show how well they get along.

Re: Don't forget the Fraternal Twins!

*Message #19 Posted by **Massimo Gnerucci (Italy)** on 13 Jan 2006, 11:02 p.m.,*
in response to message #18 by Paul Brogger

Mom and Dad

*Message #1 Posted by **Ron** on 12 Jan 2006, 12:05 a.m.*

So here's the deal - Like my mom, I go snooping around in junk stores on a fairly regular basis. Best HP deal I ever found in one was a 12C for about two bucks.

My dad on the other hand, can't stand those stores, so he seldom enters one. So he called me over the Christmas break, as he was standing in a store waiting for my mom (mom likes to shop), and asked if he should buy this calculator for $.98. It didn't have any batteries, so he couldn't tell if it worked. It was a 15C, so of course I told him to grab it. So he walks down the aisle a few steps, and lo and behold, there was another one! Two 15Cs for a buck a piece! But don't answer yet - Turns out, it was half price day, so he got both of them for a buck. :^) (Yeah, I feel kind of guilty for hoarding.)

He also found a 48GX once for $10 at a different store, also while waiting on my mom.

I hope I can grow up to be like my dad some day ;^)

Where do they shop?! I have never been to any store that would have calcs like that just lying around for sale. Were they in nice condition or for spare parts only?

Re: Mom and Dad

*Message #4 Posted by **Thomas Radtke** on 12 Jan 2006, 5:16 p.m.,*
in response to message #1 by Ron

I know this comes not even close to your luck but let me share it nonetheless: Just got my Sharp PC-1500 that I've 'won' on ebay. Used condition but ok. It was a big surprise that the seller left a 16KB module in it which is usually worth more than the calculator itself:).

custom menu use in HP48GX

*Message #1 Posted by **Don Davis** on 11 Jan 2006, 4:08 p.m.*

I have some programs in a subdirectory which I would like to be able to run from a custom menu in the Home directory. I have no problem maiking the cst variable list in the subdirectory iteself and getting this to work from there. However, I have forgotten how to put the path in the cst for the home directory so that the subdirectory programs will run from home.

I am pretty sure I have done this successfully in the past, but I am not at a place where I can reach my notes or even a HP48 user's guide. Any responses are appreciated.

Thanks, Don

Re: custom menu use in HP48GX

*Message #2 Posted by **Ron Allen** on 11 Jan 2006, 5:56 p.m.,*
in response to message #1 by Don Davis

I am relying on memory myself since I have the 49. If this doesn't work right come back. By that time I might locate my 48 and will have tried it out.

I think that all you need to do is to create your cst list while you are inside the subdirectory it applies to. You may have as many CST menus as you have subdirectories.

Ron

Re: custom menu use in HP48GX

*Message #3 Posted by **Don Davis** on 11 Jan 2006, 6:28 p.m.,*
in response to message #2 by Ron Allen

Ron,

The custom menu does work if I create it and use it while in the subdirectory where the programs it calls are located. I would like a custom menu to reside in the Home directory, but which calls programs in a sub-directory. I know I did this before, but I can't recall how exactly...

Thanks, Don

Re: custom menu use in HP48GX

*Message #4 Posted by **Ron Allen** on 11 Jan 2006, 7:13 p.m.,*
in response to message #3 by Don Davis

Don,

my quick response is to consider the fact that any object you put into the CST variable (or other name

of an object), even icluding a spare list of variables inside a variable on the CST list, at HOME will iniate the same activity as it would otherwise. Therefore you could have any number of program objects taking you to any subdirectory and back. You would then have the choice of going to another custom menu directly and working with it, or automate that trip as well.

In case you forgot how to create subdirectories a trip to "memory" then "new" should get you to familiar ground.

Re: custom menu use in HP48GX

*Message #5 Posted by **Ron Allen** on 11 Jan 2006, 6:32 p.m.,*
in response to message #1 by Don Davis

Don,

I only remembered a little of the CST use in the 48, but I was right about just storing a list representing the variables in your CST. Or you can go to a helper by pressing left shift then the CST button. Press menu twice to get into the control subdirectory and create your custom menu. The simpler way for a bare menu is still to store a list {of the variables} representing your menu into 'CST'

The custom menu can be enhanced in several ways, mostly by using the shift left and right method. This is all detailed in chapter 30 in the user's guide, part number 00048-90126.

Don't know if you can access a download of the manual, but you might can buy one through this forum. In the meantime, detail any additional enhancements for your subdirectories and I might be able to answer them.

Ron

*Message #6 Posted by **Jonathan Purvis (New Zealand)** on 11 Jan 2006, 9:43 p.m.,*
in response to message #1 by Don Davis

To change to a directory and run a program, use its full path, eg:

```
{ HOME dir1 subdir1 program } EVAL
```

To restore the current directory after running, use this:

```
\<< PATH { HOME dir1 subdir1 program } EVAL EVAL \>>
```

Re: custom menu use in HP48GX

*Message #7 Posted by **Don Davis** on 12 Jan 2006, 7:35 a.m.,*
in response to message #1 by Don Davis

Thanks for the helpful replies - with your help (and finding a manual), here is what I settled on:

I three programs in a subdirectory (path is Home->Optics->Cnvrt) which I want to appear in a custom menu in the home directory. When I run them from this custom menu, I want to remain in (or return to) the home directory. The three programs are labeled "->dBm", "->mW", and "l<->f".

My CST variable in the home directory looks like this:

{ { "-dBm" {<< OPTICS CNVRT -dBm HOME>>}} { "-mW" {<< OPTICS CNVRT -mW HOME>>}} { "l-f" {<< OPTICS CNVRT l-f HOME>>}}}

This works fine. It seems inelegant in that it actually switches directories, runs the program, and then switches back. I would prefer to just run the program via a called path from home, but they are really small short conversions, so it is no matter.

Thanks for the advice ..

Best regards, Don

*Message #8 Posted by **Ron Allen** on 12 Jan 2006, 7:27 p.m.,*
in response to message #7 by Don Davis

Looks just like the model code in the manual, glad you found what you need.

I'm curios. The program labels look like you might be into fiber optics? My son-in-law has qualified in optic networks as an employee of QWEST. I understand that to be a not-so-frequent certification.

I have set aside space in my 49G+ for solving multiple equations to verify depth of field and other optics questions to use in my hobby of photography. The 49g+ is 3-4 times as fast as the 48gx in solving the full set of equations for hyperfocal, depth of field, etc. Had not thought before of accessing programs and functions directly from the HOME Menu to make the frequent use of them more efficient. Thanks for the idea,

Ron

*Message #9 Posted by **Don Davis** on 14 Jan 2006, 10:18 a.m.,*
in response to message #8 by Ron Allen

Ron,

Thanks for the help. Yes, I worked in fiber for a long time - from 1986 until 2002. The market for fiber is sort of down right now, so I am in RF for the moment. I keep a few fiber related quick routines in case something comes up. For a while I did work on optical power induced damage in fibers (hence the quick mW to dBm keys) and later in DWDM (hence the wavelength to frequency key for C and L band work). Very simple calculations, but nice to have them on a menu key. Good luck to your son-in-law. Tell him to put in lots of fiber so the market for products picks back up!!

regards, Don

Maybe try using "path names" in the programs, such as:

```
\<< { OPTICS CNVRT dBm } RCL EVAL \>>
```

where "\<<" and "\>>" represent the program delimiters. Substitute your actual directory and variable names.

Effectively, the above is equivalent to saving the current directory (in this case, HOME), switching to the CNVRT directory, recalling the contents of variable dBm, switching back to the original directory, and finally evaluating the contents of the variable.

If you want to be able to use this from somewhere other than the home directory, then make the program:

```
\<< { HOME OPTICS CNVRT dBm } RCL EVAL \>>
```

Your CST variable could be something like:

```
{
  { "\->dBm" \<< { HOME OPTICS CNVRT dBm } RCL EVAL \>> }
  { "\->mW" \<< { HOME OPTICS CNVRT mW } RCL EVAL \>> }
  { "l<->f" \<< { HOME OPTICS CNVRT lf ) RCL EVAL \>> }
}
```

("\->" represents the "right arrow" character.)

Regards,
James

hp 12cp and hp33s

*Message #1 Posted by **E. Young** on 11 Jan 2006, 12:53 p.m.*

Since I'm an engineer I never gave much thought to the HP12c or 12cp. After seeing an image of the 12cp, it seems like its secondary function colors are blue and red/orange.

The red/orange color seems vastly superior to the purple used on the 33s. I think it would be great if HP dropped the purple on the 33s and went with the red/orange color of the 12cp.

Hp, now that you have addressed the bugs in the display and keyboard, please take another look at the design of the 33s. It seems to me that using different (and better) secondary function colors should be relatively easy to do. If you do a successor to the 33s (and I hope you do), please go back to traditional hp colors, give us a large enter key, and forget about styling gimmicks like the angled keys. We are not mouth breathing morons who need to be stimulated by "cool" product styling, but are people who appreciate quality products where form follows function. i doubt that the styling of the 33s would influence anyone's decidion to buy it, because those who would buy a calculator just becuase they think it looks "cool" are probably just going to buy lower end models from TI, Casio, Sharp, etc. If you want to compete at the shallow end of the pool, keep your sytling gimmicks there.

I like this one--I can see an image of a particularly stupid teacher I had once...

Re: hp 12cp and hp33s

*Message #4 Posted by **E. Young** on 11 Jan 2006, 2:29 p.m.,*

in response to message #3 by bill platt

Bill,

Regarding the enter key, a larger key is what I'm used to, and I do think I would calculate better with a large enter key. It's also very appropriate that the enter key be large because the enter key unleashes the power of RPN. It's what helps to separate the RPN users from the users of lesser calculators.

Re: hp 12cp and hp33s

*Message #5 Posted by **bill platt** on 11 Jan 2006, 2:57 p.m.,*
in response to message #4 by E. Young

Hi Modulus,

> Quote:
>
> It's what helps to separate the RPN users from the users of lesser calculators

Be careful here! RPN users =/ superior. Lesser Calculators =/ non-RPN. Superior calculators are HP quality, or some other quality. One might easily argue in favor for SHARP classics for instance. HP made some non-RPN from the *very* beginning and they were superior products in their time. They also made some dud-RPN models(10c).

Regards,

R. Hooke

Re: hp 12cp and hp33s

*Message #6 Posted by **E.Young** on 11 Jan 2006, 3:21 p.m.,*
in response to message #5 by bill platt

Dear Mr. Hooke: Good one!!

I was taking some poetic license. I define a lesser calculator as one that is non-RPN, not one that is non HP. RPN in my opinion is completely superior to algebraic entry. I would take an HP 10c over the best offering from TI, Sharp, etc. any day of the week. The advanced programming capabilites of the high-end TI's (or HP's)mean nothing to me. For basic number crunching, especially when you have lots of chain calculations, you cannot beat RPN.

This is a digression from my original post though. HP, I beg you as one who is addicted to RPN: continue to improve the 33S! Now fix the colors!

Regards

Re: hp 12cp and hp33s

*Message #7 Posted by **Wayne Brown** on 12 Jan 2006, 11:30 a.m.,*
in response to message #3 by bill platt

> Quote:
>
> Are you going to calculate better with a large enter key? What makes it so important, anyway?

If the **ENTER** key had always been the same size as other keys, it wouldn't matter. But the large **ENTER** came to symbolize RPN and served as a banner announcing, "This calculator is *different*!" The size reduction was done in an effort to make HP calcs look more like the competition's so people would be less "intimidated" by something unfamiliar. That's what bothers me so much about it. It's an example of the way HP has "sold out" to the lowest common denominator.

HP's advertising used to imply strongly that they (and their customers) were *better* because they were *different* from everyone else. Now they want to look and be just like everyone else, and the small **ENTER** is just one example of that. My attitude is, if they're ashamed of the big **ENTER** key, then I'm ashamed to be seen with their products.

*Message #8 Posted by **bill platt** on 12 Jan 2006, 11:58 a.m.,*
in response to message #7 by Wayne Brown

HI Wayne,

I thinnk it is much less complicated---

Simply, they get more keys if they make it smaller!

Re: hp 12cp and hp33s

*Message #9 Posted by **Wayne Brown** on 12 Jan 2006, 6:49 p.m.,*
in response to message #8 by bill platt

Maybe, but it only gains them one extra key, which hardly seems worth throwing away a longstanding company tradition. Plus it happened about the same time that other changes in color, keyboard layout, case design and shape, etc. were happening -- changes that made HP calculators look a lot more like other brands (TI in particular). And don't forget how they de-emphasized RPN by adding (in some cases) a *default* algebraic mode. I think it's clear that HP's marketing tactics changed from "Our customers prefer our calcs because they're smarter" to "You don't have to be smarter to use our calcs."

HP's original approach was, "You're part of a small, elite group if you use our products." Their current approach is more like, "We're a modern, mainstream group now and if you use our products you'll fit in with all the other cool people."

Re: hp 12cp and hp33s

> which hardly seems worth throwing away a longstanding company tradition

Traditions are meant to be broken. Else you have stagnation.

How many people do you know who keep up the tradition of switching from a wool hat to a straw hat on memorial day?

Or even better--how many people do you know who make a wreath out of some of a deceased's hair, mingled with hair of his/her progeny?

Obsolete traditions are quaint reminders of the past, not paradigms on which sound business decisions are taken.

Re: hp 12cp and hp33s

*Message #11 Posted by **Ron Ross** on 11 Jan 2006, 2:13 p.m.,*
in response to message #1 by E. Young

Why not modify the Hp17Bii+ into a scientific. That platform might even support the features and functions of an Hp42s+ with only a new keyboard mask and a new software burned into ROM. Add a serial port if you make any hardware modifications and you would sell 2-3 to me RIGHT NOW (I don't know how good the keyboard of the new Hp17Bii+ is compared to the Hp33s, but if its compariable, I would buy 2-3).

This should be a fairly easy release for Hp aside from marketing and this calculator robbing sales from the Hp33s (which Hp wouldn't mind) and the Hp48/49 series (which is why the Hp42s was probably dropped as it either didn't compete well or if it weren't available, people bought the Hp48G before).

But the Hp17Bii+ calculator released in a scientific version ie the Hp42s+ would be a much more stylish and conservative calculator for the professional. Toss in an RS-232 or USB port and you now have sensible back up for the 32K of RAM on board. Also add in the old Hp48G units conversion routine since you have a two line display and sell it for $80-100 and IT WOULD SELL LIKE HOTCAKES.

Make an algebraic mode and Voila, you would now have a real contender even against Ti for a field calculator for the Masses (who don't want to touch an RPN calculator).

Enough of my RANT! Most of you have heard me go off the deep end before!

in response to message #12 by bill platt

In college towns, IHOP is hopping! Open all night, student friendly, free wireless internet, free coffee refills, syrup shots... It just doesn't get any better.

For me though, one of my least favorite places; ever since I was a kid.

Re: hp 12cp and hp33s

*Message #15 Posted by **Stephen Easterling** on 11 Jan 2006, 3:16 p.m.,*
in response to message #11 by Ron Ross

I had two 49G+ calcs, both with keypad problems. But once I downloaded then new ROM 2.00, my keypad problems were solved. I had a new 17BII+, but my keypad problems with it were worse with no way to fix it. Incidentally, I also had keypad problems on two 12CP calcs and decided to wait for the latest upgrade. I hope I like it when I get it. As for the 17BII+, I think it offers incredible potential as a "42S+" or as a "43S." For me, and don't cast stones, I actually love the 33S and prefer its cosmetics over the existing 17BII+. Regarding the chevron-shaped keys and new colors on the 33S, that design change alone probably helped HP to sell orders of magnitude more than the buyers represented on this small (but awesome) forum. I could be wrong, but this is just my opinion. Thanks, HP, for making the 33S and 12CP in the first place and rolling over and for NOT giving up in light of TI's and Casio's success.

Stephen,

I respectfully disagree with you regarding cosmetics, but I too am thankful that HP does make the 33s.

Do you really like the purple though?

Also, do you know if the 33s is selling well?

Re: hp 12cp and hp33s

*Message #17 Posted by **bill platt** on 11 Jan 2006, 3:50 p.m.,*
in response to message #16 by E. Young

I have been following the stock in the local Wallyworld. So far, in 1 month (Dec 11 through Jan 11) there have been zero purchases of their 33sstock (4 units). I live in a small coastal town where there is a distinct lack of representation of the 18-30 year old crowd.

Re: hp 12cp and hp33s

*Message #18 Posted by **E. Young** on 11 Jan 2006, 4:04 p.m.,*
in response to message #17 by bill platt

It might be selling better at college book stores, and then there's internet sales. Way back in the late '80's when I was in school an HP calculator was considered an advanced and highly desired machine, but I don't know if that's still the case.

Re: hp 12cp and hp33s

*Message #19 Posted by **Stephen Easterling** on 11 Jan 2006, 4:16 p.m.,*
in response to message #16 by E. Young

I don't have any inside info regarding 33S sales and at my local Wal-Mart they have not been selling too well, either. I'm not sure if this is indicative of college bookstore sales, though, but I would assume that the opinions on this forum (regarding cosmetics) may not be the best litmus test for a new calc since most here prefer the older traditional styles over anything new. I think HP tried to impress the current college kids, but forgot that most current working science professionals still buy new calcs, too. Yeah, many DO use the same calcs for decades, but many also replace them from being dropped too many times (or too much chalk dust!) or just got lost or stolen. Hey, what do they have to lose! I think maybe HP SHOULD come out with a traditionally-styled calc (and call it the 43S!). As for the 12CP, I prefer its looks over my regular 12C, plus it's also much faster for all the date calcs I have to do.

Re: hp 12cp and hp33s

*Message #20 Posted by **Norris** on 11 Jan 2006, 5:18 p.m.,*
in response to message #19 by Stephen Easterling

Go to amazon.com and search for "33S calculator". When you get to the HP-33S page, you will find a list of associated items that shoppers also looked at when shopping for the 33S. This is a standard amazon.com feature, it's the list entitled:

"Customers who viewed this item also viewed..."

So what else do people shop for when they shop for a 33S ? Four items are listed:

(1) A review guide for the Fundamentals of Engineering exam
(2) A review guide for the Fundamentals of Land Surveying exam
(3) A review guide for the Professional Mechanical Engineering exam
(4) A review guide for the Professional Civil Engineering exam.

The implication is that the 33S sells particularly well to NCEES exam candidates. If this is true, then it further suggests the following points:

(a) Sales of the 33S are probably relatively small. Not many people take NCEES exams; the number of new candidates each year is on the order of a few tens of thousands. And many of them buy other approved NCEES-approved calculators, like Casios or TIs. HP can't be selling more than 10,000-20,000 units to NCEES examinees per year. And if NCEES examinees are their best market, then total 33S sales can't be very large.

(b) If HP overhauled the 33S design, it would probably not improve sales as far as NCEES examinees are concerned. The 33S already enjoys "monopoly" status as the only NCEES-approved model with RPN or programmability. Any candidate that values these features is going to buy a 33S, with or without improvements. The only way that HP could improve sales in the NCEES market would be to lower the price, to better compete with the non-programmable options from Casio and TI.

Seat-of-the-pants Market Research

*Message #21 Posted by **Paul Brogger** on 11 Jan 2006, 5:36 p.m.,*
in response to message #20 by Norris

May I compliment you on a brilliant bit of market research? Nice contribution!

Re: Seat-of-the-pants Market Research

*Message #22 Posted by **Norris** on 12 Jan 2006, 12:21 p.m.,*
in response to message #21 by Paul Brogger

Another indicator of the close association between the 33S and the NCEES exam market is the number of vendors that are currently publishing and distributing 33S NCEES exam software. The list (which may be incomplete) includes:

www.newcalc.com
www.chotkeh.com
www.33ssurveyor.com
www.softwarebydzign.com
www.ppi2pass.com ("Essential Equations" book series)

Note that these are not just different distributors of the same product -- each of these vendors is offering an original product in competition with others.

Re: hp 12cp and hp33s

*Message #23 Posted by **Jan** on 11 Jan 2006, 4:19 p.m.,*
in response to message #11 by Ron Ross

Well Ron, I think you hit a potential jackpot for HP. I have been asking myself why the design of the 17bII+ is restricted to business models only. It would do perfectly for an RPN scientific. Maybe a big ENTER key would be fine as well. For the non RPN users an algebraic entry mode would be nice (User should be able to choose between both modes. Don't misunderstand me: I would stick to RPN anyway). I also like the keys of the 17bII+: rings a bell from a distant past and they offer the possibility of direct keyboard access to many functions (with their sloped edges). Don't know what they are made of in the 17bII+, but soft keys are of course off limits. You could produce a remake of any succesful model this way (a 15cII would be a nice thing as well)

HP here's a chance I would say!

Re: hp 12cp and hp33s

*Message #24 Posted by **Ron Ross** on 11 Jan 2006, 4:38 p.m.,*
in response to message #23 by Jan

I speak from my experience in manufacturing. Making a 43s out of an existing 17Bii+ ONLY involves software and a new keyboard mask. The re-release an Hp42s manual with updates (sorta EXACTLY what Hp did with the Hp33s).

While I miss the large enter key, a new user who doesn't know anything else, would actually find it more awkward (it is, if you look at the enter key in a rational way, the large enter key WAS a MISTAKE!). That we like it is merely our nostalgia and use of a large enter key. And since nothing left in production (aside from the 12c & hey, I say make an Hp15cp too!) has a large enter key, you use what you have (if you want to push another calculator on the market w/o any additional manufacturing costs.

But so many calculators on the market (and all Hp) only rob sales from Hp's other offerings. That is why Hp isn't offering any additional calculators (aside from the cheap King-po algebraic units). Sad, but true.

Re: hp hp33s -- should "boot" to ALG mode

*Message #25 Posted by **Paul Brogger** on 11 Jan 2006, 5:43 p.m.,*
in response to message #24 by Ron Ross

The amazing thing is that H-P chose to have the 33s "boot" to RPN by default.

That's got to be confusing to at least half of the youngsters attracted to its appearance, while defaulting to ALG would be no problem at all for most (all?) RPN buyers. (I wonder how many of Wal-Mart's units are returned because they "don't work right"?)

Thanks, H-P, for the 33s. (You should probably change it to default to ALG.)

> IT WOULD SELL LIKE HOTCAKES.

I doubt that it would. I don't think many today would buy an $80 scientific calculator, when you get a $100 TI Graphing Calculator. Whether or not someone actually uses the graphing features of their calculator, the fact that it graphs makes users think it is more powerful.

I feel that the best thing companies like TI have going for them is their name. In high school, most people would refer to their graphing calculator not as a graphing calculator but as their "TI-89" or "TI-83" or, most often, their "TI." The brand name replaced the actual product (kind of like Kleenex or Xerox... I blow my noise with generic Kleenexes.) When you have this brand recognition, you begin to associate the brand with quality. Then, companies like Casio and HP become "generic" companies. When going to the store, you see 8 TI calculators for every one HP calculator. This is partially due to the fact that TI makes a wider variety of calculators (but only slightly, perhaps?).

Let's consider for the moment this situation. A high school student needs a calculator for a class. His teacher says, "Go buy a calculator." Every other student in the class had a TI-89. His teacher only knows how to use a TI-89. The textbook has special sections about the TI-89. He goes to the store, and he now has a choice. He could buy 8 varieties of a TI graphing calculator, or a Casio graphing calculator, or an HP 49g+. He is going to buy the TI-89, almost certainly. Why would he buy any other calculator?

Well, he begins to use this calculator. He gets used to it, and believes it is the best calculator ever. It is very powerful, and can do almost anything (anything it can't do, he pretends doesn't matter, or says "My TI-89 can't do it, how can you expect me to do it!?!") As he grows older, he goes to college. He has the choice to keep his existing calculator (or buy a calculator similar to it), or get something completely new and different. He chooses to keep his same calculator.

He goes out to work, and uses a calculator. The calculator breaks one day. He goes out and buys the new model of the same calculator. When he has kids, and they need calculators, he buys the same model for them. The cycle continues.

People enjoy being familiar with things, and people enjoy being good at things. If you know English really well, and live in America, is there any reason to learn Russian? Sure. There are some reasons. Maybe your family all speaks Russian, and you would like to have something in common with them. Maybe you are going to get a job in Russia. Maybe you grew up speaking Russian as well as English. Maybe you are curious, and would like to learn something new. Otherwise, probably not. Most people will just happily

continue to speak English.

TI is picking up users when they are in middle school and high school. They feel there is no reason to switch over to buying a more expensive calculator to learn something more "complex." (and perhaps there is no reason... isn't it a matter of preference).

How many of you all would give up what you are familiar with in order to try something new? How many of you all are willing to use Algebraic, instead of RPN? The answers to these questions are evident in posts such as "Bring back the 15c" and "I want a big enter key" and "RPN is the best thing ever."

I bet other calculator users feel the same way about what they know.

Your reasoning is EXACTLY why the Hp42s ceased to exist. It cost about the same as an Hp48G when it was available.

But many Hp42s users still paid that! Why? Because IT WASN'T a graphics calculator!

But I concede that this is probably the reason Marketing at Hp decided to discontinue the Hp42s.

Except that I always used algebraic calculators and never touched an RPN model until the age of 33, when I fell in love with the HP-16C in 1988. I didn't buy my first HP-41 until they'd been out of production for eight or nine years. And I didn't start using a 48GX until the 49G had been around for a year or two. In my case, I didn't choose the older stuff until *after* I had seen how bad the newer junk was.

"complex."

This is true, but the problems for HP calculators run much deeper than that. TI has ***always*** owned the middle school and high school market, even in the 1970s and 1980s, which were the "Good Old Days" as far as most HP calculator enthusiasts are concerned. In those days, people who were pursuing technical careers (in science, engineering, surveying, finance, etc.) typically "discovered" HP calculators in college, or in grad school, or when they started working professionally.

Now things are different -- but it's not because TI has invaded HP's traditional market. It's the PC (which was a rarity in the 1970s and 1980s) that has invaded HP's traditional market. The real competitor for HP calculators is Microsoft Excel, not TI. Most technical professionals now rely on Excel as their primary tool for numerical calculations, not TI or HP calculators.

Someday middle and high school students will be routinely issued laptop PCs. And when that happens, TI's calculator division will suffer the same pains as HP's.

Re: hp 12cp and hp33s

*Message #30 Posted by **Ron Ross** on 12 Jan 2006, 2:55 p.m.,*
in response to message #29 by Norris

I don't think Ti is challenged by the laptop nearly as much as the Hp calculator line is (Hp's customers were more likely geeks in technological settings that made use of PC's when appropriate). I also don't think the PC will replace the calculator anywhere (except the power user, who couldn't bear to do his work with anything less).

Ti's future competetion will be the cheap PDA. The one that can play games and music and still offer an okay graphics calculator. Kids that have no need of anything beyond simple algebra (most of them, Sadly), will buy this great new device as they only need the graphics calculator for 3-4 months of their limited mathematics life and move on. "Hey, my $100- PDA does that! And it plays awesome GAMES AND MUSIC TOO! Ditch that TI JUNK!" (I kinda agree with that very last line) B^)

But for the on the fly designer or casual number cruncher, nothing beats a full featured calculator with buttons. And no PDA advocate can understand that.

*Message #31 Posted by **E. Young** on 12 Jan 2006, 5:24 p.m.,*
in response to message #26 by Ben Salinas

I had always used TI calculators, until my junior year of college. I new that HP used a different entry system, and that some time would be required to become familiar with it. Learning how to do something new in college is not a big deal, it is what you are supposed to be doing anyway.

After spending a very small amount of time "getting used to it", it was plainly apparent just how superior it was. The HP was faster and easier to use. Therefore, it did allow me to calculate better, much better. Comparing learning to use an HP to learning a new language is a bad analogy. I still have that calculator, and it is 18 years old and still functions perfectly. While using TI's, which I had been using up until my junior year in college, I was replacing my calculator all the time because. All through high school I don't remember anyone having an HP. It was all TI, and I never heard of HP until I was in college. Then while in college I saw many engineers who had HP's. Why then make the switch to

HP if most were presumably familiar with non-HP's? Because of the reputation HP had for making a calculator that was powerful and high quality. There was also an ego aspect to it as well because it also showed the distinction between engineers and non-engineers.

The reason that HP has lost market is because in my opinion, they became stagnant in the mid '90s and stopped being as innovative. They also let the build quality slip. The main reason to buy an HP in my opinion is because of RPN. I doubt that many of the current fans of RPN became turned on to it in grade school, but in college. The question then is why are fewer being turned on to HP and RPN in college now than in the past? I don't but the argument that the computer spelled the end of upper-end calculators. Furthermore, back when HP's were more prevalent in college, they were more expensive than they were now, and students had less disposable income than they seem to have now.

Would an advanced scientific calculator sell really well now? Probably not. I think the reason is because HP dropped the ball in the mid to late part of the 90's. As I said before, the strength of an HP is RPN, and always has been. They should try to make the case for RPN instead of surrendering to algebraic. Surely engineering students even today should be able to see the superiority of RPN.

In response to that particular quote by E. Young: I was 6 or 7 years old when I was introduced to RPN by my father who brought a 45 to our home one day from his job in order to do some work in the evening. I could do addition and substraction of one digit numbers by myself already (I was after all in the 1st year of grammar school). And now there was this odd machine that could do the same by pressing a few buttons! I took RPN for granted of course: odd machines should be operated in an odd way. I did not even realise there was another entry system possible: only later I came across the TI's with algebraic entry. However, the true value of RPN became clear to me when I was old enough to do real mathematics, that is when I was 14.

Think about it. If calculators were still valued for complex numerical calculations, then vendors would sell commercial calculator software. They certainly used to -- the Museum, for example, lists 11 "applications pacs" and 40 "solutions books" for the HP67, and 22 "ROM modules" and 32 "solutions books" for the HP41. And today's graphing calculators (both TIs and HPs) have far more memory, speed, programmability, and graphics capability than those older models. So where is the slick commercial software to take advantage of today's powerful TI and HP hardware?

With few exceptions, it doesn't exist. There was a clearly a market for professional calculator software in the 1970s and 1980s, but now it's almost entirely gone. Why? Probably because professionals don't do complex number-crunching on calculators anymore (either HPs or TIs). All serious work is done on PCs.

There are only a few exceptional cases where there is still a market for calculator software: secondary education (where PCs are rare), field surveying (where PCs are impractical) and NCEES licensing exams (where PCs are banned). But these are the exceptions that prove the rule: calculator software only survives when PCs aren't a viable alternative.

> Quote:
>
> Furthermore, back when HP's were more prevalent in college, they were more expensive than they were now, and students had less disposable income than they seem to have now.

Yes, but it was still a lot easier for a student to spend several hundred dollars on an HP than several thousands on a PC -- if PCs were even available when you were in college. Students and professionals were willing to spend big bucks for calculators (and accessories like extra memory, or printers, or software) because PCs weren't a viable alternative. The rules are different now.

> Quote:
>

The TI vs. HP calculator argument has only slightly more relevance to modern engineering students than an argument about Post vs. K&E slide rules.

Re: hp 12cp and hp33s

*Message #35 Posted by **E. Young** on 13 Jan 2006, 9:49 a.m.,*
in response to message #34 by Norris

You seem to be focused on the decreasing relevance of advanced graphing calculators, and I agree. I say that for an upper end scientific, such as a 33s or a 32sII that there is still a potentially large market since these machines are still very relevant even today where there is a pc on every desk.

Computers have not spelled the end of upper end scientific calculators. I define upper end as a high quality scientificsuch as a 32Sii or 33s type of machine, not a graphing model like the 40 series. The 40 series are in competition with pc's and they loose badly. Certainly computers have put a huge dent in the attractivness of the graphing calculators. The majority of average calculations for most engineers in practice are not overly complex. A high quality sceintific calculator is far superior to a computer for average calculations. The complex stuff is properly handled on a pc. In addition, when a pc is used, the answers need to be checked, and to do that you need a calculator. Blind reliance on computer output is an invitation to disaster.

I also disagree with you that it was easier for a student to plop down a large sum of money back in the old days for a high end calculator. The vast majority of engineering students who had HP's that I encountered had machines like the 11c. Only very few had a 41.

The debate is not HP vs. TI. HP is valued mainly because it provides RPN machines. The relevant point is the clear superiority of RPN vs. algebraic. If modern engineering students are being taught in such a way that they can't function without a computer then that is a huge deficiency in modern engineering education. If you need a computer to calculate a simple span bending moment or to check equilibrium for a statically indeterminate structure, then your ability to be a good engineer in practice, not academia has been hamstrung. Your statement about the HP/TI debate being as relevant as argument about Post vs K&E slide rules makes no sense. Almost nobody uses a slide rule anymore, but almost every engineer will have a calculator. RPN is clearly more efficient than algebraic, and this is clearly a point that needs to be made. It would only be irrelevant to someone who does all calculations on a pc, or to someone who does little more than the type of calculations that can be handled by counting your fingers.

To summarize, I do believe that there is only a minor market for an advanced calculator such as HP 48's and 49's because of the availability of the pc. I still say that there is a market for a quality sceintific in the mold of the 32sII or the 33s with RPN and some limited programming ability. The pc is NOT the end of sceintific calculators in the 33s mold-they simply cannot be beat for performing average calculations, which I say comprise the bulk of engineering calulations for most (but not all) engineers. You could take away my pc today and I could still function fine as an engineer. If you took away my 32SII's or my 33S you would seriously hamper my ability as an engineer. I could of course get by with an algebraic from TI, Sharp, etc., but my productivity in performing average calculations would be lowered.

You presumably mean "in the professional market". There is obviously a huge demand for advanced graphing calculators in the education market; TI and Casio sell (literally) millions of them. In 2003, TI issued a press release after selling its 25,000,000th graphing calculator.

> Quote:
>
> I still say that there is a market for a quality sceintific in the mold of the 32sII or the 33s with RPN and some limited programming ability.

Then why is the programmable scientific calculator -- with or without RPN -- virtually extinct? TI, Casio, and Sharp have all marketed such models in the past, and have all dropped them. For a while -- after the 32SII was discontinued and before the 33S was introduced -- there were (literally) zero programmable scientifics being manufactured for the US market.

Now there is the 33S, which is crippled by the limitations of the 32SII design that it inherited. But there is good reason to suspect that the 33S sells largely to NCEES exam candidates. NCEES demands a "crippled" design; they will not approve calculators with features like I/O or text editing. HP has no incentive to produce a better programmable scientific calculator, because any significant improvements would instantly disqualify it from an important market.

*Message #38 Posted by **E. Young** on 13 Jan 2006, 4:23 p.m.,*
in response to message #37 by Norris

There is no such thing as virtually extinct. Either you are or are not. Obviously there is a market for progamable scientific calculators or HP wouldn't be making one-they also would not have re-entered this market after the termination of the 32SII. They make the 33s to make money; if there was no money to be made with the 33s they would not make it despite the vocal outrage of RPN adherents. If you tell me that HP only makes the 33S because of HP's calculator legacy and that it makes no proffit on the 33S, then you have to prove that in a better way than by considering the browsing habbits of people on amazon.com.

You are also incorrect to say that the 33s is crippled. Despite its cosmetic flaws, it is now a fine machine. Not that it doesn't need improvement in some areas. Text editing or I/O would largely be a waste in a programmable scientific. I can think of no time that I have ever wished for these abilities in my calculators. The NCEES is concerned about calculators being able to communicate with eachother, and with people being able to enter test questions into their calculators. It should be possible to better utilize the memory of the 33s and still not run afoul of the NCEES.

The programmable scientific market may only be a niche, but it exists. HP fills this niche because they use RPN. The others don't use RPN, so any programmable scientific by them would therefore be hamstrung from the outset. They would not be able to compete with HP in this niche, and I'm sure they see no need to try.

I don't deny that there is a niche for scientific programmables. I own and use a 33S, and heartily recommend it to NCEES exam candidates, even if they are not accustomed to RPN. I just don't think it's a very big niche -- not big enough for HP, or any other company, to put much investment in.

> Quote:
>
> You are also incorrect to say that the 33s is crippled.

The 33S has a much larger memory than the 32SII, but the same small number of labels and variables. Unfortunately, this greatly limits the effective programmability of the 33S. It's not possible to store more than a few moderately complex programs in a 33S, although its memory is large enough to hold far more. I'm not the first person here to call it "crippled".

> Quote:
>
> Text editing or I/O would largely be a waste in a programmable scientific. I can think of no time that I have ever wished for these abilities in my calculators.

Do you ever wish to edit long equations? If so, you will quickly tire of the primitive "backspace" key on the 33S, which forces you to retype everything that it touches.

Do you ever wish to enter long programs? If so, you will find that it takes hours of tedious one-finger typing to do so on a 33S (one sofware vendor, hp33ssurveyor.com, estimates 3-5 hours to load their product).

Do you ever wish to back up those programs that took hours to load? If so, you can't do it on the 33S.

> Quote:
>

Other manufacturers could sell RPN calculators if they wanted too. Aurora, for example, currently distributes an RPN financial calculator (the FN-1000) which is an unabashed clone of the HP-12C (except for its much lower price). Aurora could just as well clone RPN scientific calculators (and I wish they would)...but they apparently don't think it's worthwhile.

What's there to argue about? K+E rules were clearly superior. (The Versalog was a nice rule, but somebody forgot to give it the A and B scales. I prefer a nice K+E 4081-3 any day!)

HP-97 battery contact replacement

*Message #1 Posted by **David Ramsey** on 10 Jan 2006, 10:31 p.m.*

I'm working on Stephen Easterling's HP-97. His original complaint was that the "0" key did not work.

When I received the calc, the first thing I noticed were the corroded batteries (bad Stephen! You left them in!) One of the battery contacts had previously broken and been crudely soldered back into place. Unfortunately the solder joint broke flush with the plastic of the battery compartment when I removed the original batteries.

Anyone have any suggestions for fabricating a replacement battery contact? I'm thinking of using wire from a small paper clip, held in place on the other side of the battery compartment with a healthy dollop of plastic-friendly epoxy...

Re: HP-97 battery contact replacement

*Message #2 Posted by **Vassilis Prevelakis** on 11 Jan 2006, 7:33 a.m.,*
in response to message #1 by David Ramsey

Many machines use the same battery pack as the HP-97. You can salvage the battery connections from one of these machines.

My favorite is the HP 82143 printer which is often cannibalized to get an HP-41 interface cable.

HP85

*Message #1 Posted by **Gary Abernathy** on 10 Jan 2006, 6:43 p.m.*

I've got an HP 85 in excellent condition with most of everything that could be bought for it. The tape drive has the common problem of the drive wheel has rotted. The tape is fine and will read if tape is held tight against the wheel to provide traction.

I need the part that provides the traction. Any idea where I could find it, or what would work?

Re: HP85

*Message #2 Posted by **David Ramsey** on 10 Jan 2006, 10:28 p.m.,*
in response to message #1 by Gary Abernathy

I've successfully repaired the drive wheels in desktop calc tape readers using heat-shrink tubing.

Take out the drive wheel (or tape drive assembly). Scrape off all the remains of the disintegrating drive wheel rubber. Get the bare metal wheel as CLEAN AS POSSIBLE.

Now hit your local electronics supply or Radio Shack. Find the smallest heat shrink tubing that just fits over the drive wheel. Back home, use a razor blade or very sharp knife to cut a piece just a millimeter or so less wide than the drive wheel. Slip it over the drive wheel and use a match or heat gun to shrink it.

Others have used 2 or 3 rubber O-rings of the proper size. These will probably result in a quieter drive, but the heat shrink tubing is easier to find.

Hi Phil, Philippe!! ;-)

Thanks for your kind words and your interest in my projects. I've received your mail (thanks), but rather prefer answering your questions thru this forum, as others may also be interested.

According to your mail, you can produce the PCB and get the required components to build a Clonix yourself... That's great, so far only a couple of people have already done so (properly)... please do not hesitate in consulting me with any questions you may have.

As for the hardware issues (shells and connectors), I'm affraid I'm not of much help, I get these buying Memory Modules (82106A) mostly at eBay or (occasionally) receiving an unused Module directly from the customer... and this is by far the most difficult part of the Clonix project, as some modules fail to open cleanly thus becoming useless, and some connectors break while twisting the solder wires to match Clonix PCB requirements... as for the technical aspects, the Clonix module is fairly simple to build, provided you have a steady hand, appropriate tools and good SMD soldering experience... these are the main reasons why I don't sell DIY kits. However, you more likely fulfill these requirements according to your webpage... :-))

Furthermore, the new PCB layout requires the PIC microcontroller chip to be physically cutted and such an "operation" is not recommended to the faint hearted!! :-)

In abstract: it's an easy job but not a begginer's job.

Please let us know of your progress if you finally decided to give a go to this project.

A tech note, the limitting resistor in the V+ line is 100 Ohms instead 47 Ohms (as shown in the preliminary

schematic).

Good luck and best wishes.

Diego.

New Web Site

*Message #1 Posted by **Namir** on 10 Jan 2006, 12:28 p.m.*

Hi All. I started my own web site to post programs for different calculators and programming languages. There are some listings for thr HP-71B, 42S, and upcoming ones for the HP41C. I also have some listing for True BASIC.

The link to the web site is here

You can also download my PowerPOint presentation that I gave at the HHC2005. The ZIP file contains two presentations. One is for the root-seeking methods and the other is for HP's SOLVE feature.

This is a labor of love. I update this web site weekly/daily.

I Hope you enjoy it!

Namir

HP-48SX display problem

*Message #1 Posted by **Fabio Albonico** on 9 Jan 2006, 11:59 a.m.*

I have some problem with the display of my HP-48SX. Normally a vertical line of pixel near the middle (a little on the right) doesn't light. Sometimes if I stroke hardly the calculator on the desk (on a paper) then I light on and the display is ok. As anybody similar problem?

Re: HP-48SX display problem

*Message #2 Posted by **Michael Fink** on 10 Jan 2006, 11:55 a.m.,*
in response to message #1 by Fabio Albonico

Ok, I am not suggesting the following as a repair method, but anyway, I got a similar problem with my SX fixed in a quite unexpected way.

Actually, my USA made 48-SX had the opposite symptom: a vertical line of pixels and most of the indicators were permanently on. After the problem persisted for half a year, I made up my mind and ebayed myself another SX, this unit made in Singapore. When I was just about to transfer my programs from the old SX to the new one, I was interrupted and put the two calculators side by side in a drawer.

Two days later, I was surprised that the display problem had magically disappeared, and my old SX has been working perfectly ever since. Despite my strictly rational upbringing, I cannot help wondering if the old SX started to realize that the situation was becoming serious for "him" and stopped acting up. Or maybe it was a little encouragement from a friend from overseas that got it working again. Other theories welcome :-)

in response to message #2 by Michael Fink

I sold an Indonesian 20s to a friend, as his Singapore 20s had a black "spot" in the corner of the display, and he wanted to be sure he had a working unit.

Lo and behold, one day not long thereafter, he turned on the Singapore 20s and the spot was gone!

HP 12c and HP 12 cp at CES

*Message #1 Posted by **Kalevipoeg** on 9 Jan 2006, 11:52 a.m.*

Have you read an interesting story of the HP 12c history at HP Newsroom

Link here

There is also a big image of the newest HP 12c platinum at HP Newsroom

Link to HP Newsroom

Yes, it´s the 25th anniversary of the HP 12c

BTW it´s also the 90th anniversary of "Consul" The Educated Monkey (not a HP calculator :-) but I heard it is still in production)

Online Consul Here

HP 48GX - Low batterie alarm

*Message #1 Posted by **Henk** on 9 Jan 2006, 7:30 a.m.*

For years I own a 48GX. It always worked fine until this morning.... I got a LowBat(s) alarm even after preplacing the batteries. (Yes I checked, these were new and full). I consulted HP Netherlands but it seems they can open the calculator but will not be able to close it again.... (They said it, not me..)

Does anybody know a remedie?

Regards,

Henk

Re: HP 48GX - Low batterie alarm

*Message #2 Posted by **Jan** on 9 Jan 2006, 11:11 a.m.,*
in response to message #1 by Henk

Henk,

Maybe the battery contacts of the calculator are not OK. I would check for corrosion and make sure the contacts are pushed hard enough against the poles of the battery by GENTLY (!) pushing or bending them a little.

good luck

eBay Loses Another Customer

*Message #1 Posted by **Marcus Aurelius** on 8 Jan 2006, 8:48 p.m.*

Thought I'd buy/sell a few calculators on eBay. Almost immediately I started getting multiple scam emails regarding eBay and PayPal, at least one a day. I'm not sure how these crooks do it, sophisticated bots that trawl all transactions, or an inside accomplice with access to users lists. eBay pays only lip service to chasing these down, I forwarded many on to the spoof guys there, but there's no stopping these crooks. Something just isn't right about eBay, and the best way to halt this is to simply stop doing it, which I have now done. Hope the rest of you haven't been as spammed as I was.

Re: eBay Loses Another Customer

*Message #2 Posted by **Howard Owen** on 8 Jan 2006, 11:28 p.m.,*
in response to message #1 by Marcus Aurelius

I get spammed with this stuff all the time. Thing is, it started way before I became active on PayPal or eBay.

I have noticed some scams that seem directly related to my activity on eBay. Since the record of my transactions is partially public, through the concluded auction listings, and through the feedback mechanism, I conclude that this is the source of the information used in the phishing attacks. I've never once seen a come-on that was linked to private information from a specific eBay auction or PayPal transaction. So I conclude that the stuff eBay and PayPal say they keep private, they actually do keep private.

For the record, I have sold a little, and bought a lot on eBay. I've never been ripped off. My record there has been far better than my experience in meatspace has been. The same is true of PayPal. I've been their customer almost from the beginning, with a similar spotless record of trouble free (though sometimes expensive) transactions.

Regards,
Howard

Re: eBay Loses Another Customer

in response to message #1 by Marcus Aurelius

I get Paypal spams and I am not even a seller on ebay, nor have an account with Paypal.

Re: eBay Loses Another Customer

*Message #4 Posted by **John Garza** on 16 Jan 2006, 11:28 p.m.,*
in response to message #1 by Marcus Aurelius

Heck, I even conducted experiments. Over the course of six months or so, I went through three new ISP accounts with different email addresses linked to my ebay account. All seemed ok, no spam, so I tried ebay - a week or two later the spam started coming on that one account. I switch to another spam free account, same thing all over again, like clockwork. I even used an email account ONLY for ebay - everything else went to

other accounts - Spam came and I can only assume it was infiltrated via ebay. Either trolling bots or an inside job, I agree.

Ill conditioning and calculator precision

*Message #1 Posted by **Rodger Rosenbaum** on 7 Jan 2006, 9:54 p.m.*

Valentin Albillo gave an example a while ago of a very ill-conditioned linear system:

"If in doubt, you may want to consider this example I've set up, where the solution of some engineering problem requires solving this small 7x7 system of linear equations, where the coefficients are the result of some measurement, say Volts, with just one decimal of precision:

1.3 x1 + 7.2 x2 + 5.7 x3 + 9.4 x4 + 9.0 x5 + 9.2 x6 + 3.5 x7 = 45.3
4.0 x1 + 9.3 x2 + 9.0 x3 + 9.9 x4 + 0.1 x5 + 9.5 x6 + 6.6 x7 = 48.4
4.8 x1 + 9.1 x2 + 7.1 x3 + 4.8 x4 + 9.3 x5 + 3.2 x6 + 6.7 x7 = 45.0
0.7 x1 + 9.3 x2 + 2.9 x3 + 0.2 x4 + 2.4 x5 + 2.4 x6 + 0.7 x7 = 18.6
4.1 x1 + 8.4 x2 + 4.4 x3 + 4.0 x4 + 8.2 x5 + 2.7 x6 + 4.9 x7 = 36.7
0.3 x1 + 7.2 x2 + 0.6 x3 + 3.3 x4 + 9.7 x5 + 3.4 x6 + 0.4 x7 = 24.9
4.3 x1 + 8.2 x2 + 6.6 x3 + 4.3 x4 + 8.3 x5 + 2.9 x6 + 6.1 x7 = 40.7

which has the quite obvious, unique solution:

x1 = x2 = x3 = x4 = x5 = x6 = x7 = 1.0 (Volts)"

His point is well made, but I haven't seen much posted here about what one should do in a case like this. The HP48G can solve his example system, and gets the right answer. But, let's perturb the first element in the right hand column matrix so its value is 45.4 rather than 45.3; now the exact solution is:

Transpose[71083, -8, 63379, 63741, 45, -63738, -133356]

It doesn't seem reasonable that such a small perturbation should cause such a large change in the solution. This is what ill-conditioning does. What can we do about this? (I'll be rounding numerical results in what follows)

The statisticians have developed methods for dealing with this problem. Let the system to be solved be Ax = b, where A is the design matrix, Valentin's 7x7 matrix and b is the column matrix. The first thing to do is to calculate the correlation matrix of the A matrix; it is:

[1 .481 .77 .274 -.00652 -.033 .951]
[.481 1 .474 -.166 -.698 -.131 .391]
[.77 .474 1 .676 -.339 .526 .909]
[.274 -.166 .676 1 -.125 .924 .533]
[-.00652 -.698 -.339 -.125 1 -.347 -.052]
[-.033 -.131 .526 .924 -.347 1 .252]
[.951 .391 .909 .533 -.0519 .252 1]

We see that column 3 and column 7 are highly correlated, as are row 3 and row 7. I suspect this is a result of Valentin's method of construction.

One of the things a statistician would do is delete a row or column if it's highly correlated with another, and solve the reduced system. In this case if we drop row 7 (which is highly correlated with row 3) from A and b, the system

can be solved as an underdetermined system (can your calculator do this easily?). The result is:

Transpose[1.09 .961, 1.01 .908 1.02 1.11 .964]

This result is much more reasonable and is actually not too (numerically) difficult to solve, because dropping the 7th row from A gave a matrix with a condition number of 189 (using the 2-norm) instead of the 3.17E12 condition number of the original A matrix.

Now for a small challenge. It is possible to perturb only two elements of the original A matrix, adding .1 to one and subtracting .1 from one, giving a result which is only a distance of .1414 (in R[7x7] hyperspace; subtract the two and compute the norm of the difference) away from the original. The perturbed matrix has a condition number of 399. Can you (and your calculator) find the perturbed matrix? If we solve the system with this matrix, get get a result:

Transpose[1.6 .961 1.47 1.37 1.02 .651 -.0000167]

This time we solved a full rank system, not an underdetermined one. The result is more reasonable than the unperturbed system, but we can do better.

Let's find a matrix which is a distance of .1 (in hyperspace) from the original, using at least 6 digits (up to 12, perhaps) to perturb ALL the elements of the original A matrix. The matrix of perturbations should have the minimum size (norm) to generate a new matrix just about .1 (in hyperspace) from the original. This perturbed matrix should have a condition number of about 399, and gives a full rank system which can be easily solved to give:

Transpose[1.09 .961, 1.01 .908 1.02 1.11 .964]

the same result we got when we deleted row 7 and solved the underdetermined system above. Can you and your calculator find the required perturbation matrix?

If we perturb elements of the Valentin's original A matrix and solve the system, we get wildly varying results, the result of the ill-conditioning. And this happens even if the perturbations are .5 LSD or less; this would be within the measurement error of the given numbers.

But if we use the matrix which is .1 away from the original to represent the original, we can perturb the elements by .5 LSD and still get results that are reasonably close to the unperturbed solution. It is backward error analysis championed by Wilkinson that leads us to this technique. A lot of this is explained in the HP15 Advanced Functions handbook.

How easy is this to do on your calculator? Can you guess which manufacturer's calculators make it easy? No, it's not Radio Shack.

Roger,

can you explain, in a few words, what a correleation matrix is and how it can be read. Another term asking for explanation is the matrix condition number. What do these numbers tell?

Marcus

>
> Marcus

In a few words, eh? Most of the later HP calcs had statistical functions which included the "corr" function. If you input a set of x,y pairs of data, the correlation function tells you if the x and y data sets are linearly related. The correlation matrix tells you all at once the same thing, pairwise, for the columns of a data matrix. The maximum absolute value for the correlation coefficient is 1, so looking at the correlation matrix can tell you which pairs (if any) of columns are (nearly) linearly related. If a pair of columns have a correlation coefficient nearly +-1, then the two columns carry nearly the same information, and you can probably delete one of them without changing the system solution much; you will be losing one variable in your model, but it's probably redundant.

The condition number tells you how numerically unstable the solution of the system will be with respect to perturbations in the system design matrix.

Use the search function at: http://mathworld.wolfram.com/
and you can find out more about these things.

Re: Ill conditioning and calculator precision

*Message #4 Posted by **Marcus von Cube, Germany** on 8 Jan 2006, 9:38 a.m.,*
in response to message #3 by Rodger Rosenbaum

Rodger,

I'm still trying to understand your answer fully.

This is the correlation matrix slightly reformatted:

```
[ 1        .481    .77     .274   -.00652 -.033    .951 ]
[ .481    1        .474   -.166   -.698   -.131    .391 ]
[ .77      .474    1       .676   -.339    .526    .909 ]
[ .274   -.166     .676    1      -.125    .924    .533 ]
[-.00652 -.698   -.339   -.125    1      -.347   -.052 ]
[-.033   -.131    .526    .924   -.347    1       .252 ]
[ .951    .391    .909    .533   -.0519   .252    1    ]
```

It is symmetric with respect to the diagonal and has just ones on the latter. This is clear, because each row is correlated perfectly to itself and the correlation shouldn't depend on the sequence of the rows (row 1 is correlated to row 5 in the same way as row 5 to row 1.) I can see, how to read the matrix for the correaltion between rows, but how do I see the correlation between columns? Is there another symmetry which I didn't detect yet?

> Quote:
>
> We see that column 3 and column 7 are highly correlated, as are row 3 and row 7.

Why did you choose rows 3 & 7. Isn't the correlation between rows 1 and 7 even higher? Can I say the same for the columns?

Marcus

I can see, how to read the matrix for the correaltion between rows, but how do I see the correlation between columns? Is there another symmetry which I didn't detect yet?

Actually, the matrix I have shown is for the correlation between columns. That is the convention for correlation matrices; they're always showing the correlation between columns. To see the correlation between rows, you need to transpose the original matrix before computing the correlation matrix. I should have shown another matrix for the row correlations. I did compute it; I just didn't display it. Sorry.

Why did you choose rows 3 & 7. Isn't the correlation between rows 1 and 7 even higher? Can I say the same for the columns?

What is shown *is* the correlation between columns, as I mentioned above. I can't bring myself to type in the whole matrix of row correlations right now, but the row 3 to row 7 value is .999035, the highest of all the row or column correlations. You could type in those two rows as two-variable data in any late model HP calc and then use the "corr" function to see if you get the same value.

Marcus

Re: Ill conditioning and calculator precision

*Message #6 Posted by **Marcus von Cube, Germany** on 8 Jan 2006, 3:17 p.m.,*

You could type in those two rows as two-variable data in any late model HP calc and then use the "corr" function to see if you get the same value.

I tried with the following value pairs:

(4.8, 0.3)
(9.1, 7.2)
(7.1, 0.6)
(4.8, 3.3)
(9.3, 9.7)
(3.2, 3.4)
(6.7, 0.4)

The correlation is about 0.6 so nowhere near 1 as you mentioned. Who is wrong?

Marcus

Re: Ill conditioning and calculator precision

*Message #8 Posted by **Marcus von Cube, Germany** on 9 Jan 2006, 2:35 a.m.,*

in response to message #7 by Rodger Rosenbaum

Rodger, you are right, I can't count rows :-(

Let's try again with the correct data:

(4.8, 4.3)
(9.1, 8.2)
(7.1, 6.6)
(4.8, 4.3)
(9.3, 8.3)
(3.2, 2.9)
(6.7, 6.1)

The correlation is about 0.999. If you add the right hand sides (45.0, 40.7), the correlation jumps to 0.99998. This means, that the equations are *almost* linearly dependent and the system is in fact underdetermined.

Can you elaborate, how underdetermined linear systems can be tackled?

Marcus

Re: Ill conditioning and calculator precision

*Message #9 Posted by **Palmer O. Hanson, Jr.** on 9 Jan 2006, 4:35 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Valentin issued the following challenge "Now, get your preferred HP calculator or computer software and try to solve it ... ... See what results you get and how they compare with the actual, unique solution." In the absence of other responses I decided to see what my stable of machines and software could do.

HP Machines

The only HP machines that I have which can handle this problem are the HP-41 and the HP-28S. I have two programs for the HP-41: the MATRIX routines in the Math Pac and Valentin's "seq" program from from V7N5P64 of the PPC Calculator Journal. The solutions for the two routines are

```
                    MATRIX                                    seq

          X                   A*X                   X
A*X

where even though many of the calculated values of X are quite different from the

exact solution of all ones, and some values of X are even of the wrong sign, the product of the matrix A and the solution vector X yields values which are never in error by more than 3e-8 and half are exact. I like to think of this situation as that the computer solution is correct in the computer's world even though it is far from correct in the mathematical world or in the real world..

Two solutions are directly available using the keyboard functions on the HP-28S: dividing the vector B by the matrix A, and multiplying the vector B by the calculated inverse of matrix A, where page 66 of the HP-28S Reference Manual states that Matrix B divided by Matrix A "uses 16-digit internal computation precision to provide a more accurate result than obtained by applying INV to A and multiplying the result by B.". The solutions for the two methods are

```
                    B/A
INV A * B

          X                         A*X                              X
A*X

I admit that I may be doing something wrong with my HP-28S. I have checked and rechecked my matrix entries. Also, when I enter X values obtained from some non-HP machines and multiply A times X I get correct results.

Results from Some non-HP Machines

Radio Shack Model 100:

The best results were obtained with my Radio Shack Model 100 using a simultaneous equation solution adapted from the "Mathematics Library: Application Software for the Sharp EL-5500 and PC-1403 Scientific Computers" by Swinnen and Thomas. The best results were obtained using the default double precision mode of the Model 100 which offers fourteen digits. The Model 100 offers an easy way to observe the results which would be obtained with a shorter word length by defining all variables as single precision variables, essentially changing the Model 100 to a six digit computer. The actual results were

```
    14 Digit               6 Digit

0.99819033841188          12.5676
1.0000002281400            0.998543
0.99838647109897          11.3157
0.99837725241896          11.3747
0.99999888029820           1.00717
1.0016227226229          - 9.37452
1.0033951110401          -20.7060
```

For the 14 digit case the product of matrix A with the solution vector yields values

which are within 2e-12 of the values in vector B. For the 6 digit case the product yields values which are within 6e-04 of the values in vector B.

The TI-85:

The simultaneous equation routine of the TI-85, which is also a fourteen digit machine, yields results which are almost as good as the double precision results from the Model 100

0.99570145279720
1.0000005419083
0.99616733305820
0.99614543563180
0.99999734033633
1.0038545050843
1.0080645161290

The matrix routines of the TI-59 and TI-95, thirteen digit machines, yield solutions which are substantially degraded relative to those from the Model 100 and TI-85. For both machines the product of matrix A and the solution vector X yields values which are within 3e-11 of the values in matrix B..

The CC-40 and TI-74:

The CC-40 and TI-74 operate in base 100. As a result they are not truly 14 digit machines since some values will be limited to 13 digits. Even so, I was surprised by the results from the matrix routines in the Mathematics modules of those machines:

```
       X             A*X

     1.45          43.48608
     0.9999        48.21909
     1.16          47.14495
     1             18.51455
     1.0002        38.2778
     0.64          23.90822
     1             42.6484
```

where the differences between the A*X values and the corresponding B values vary between 0.18 and 2.14 (no negative exponents). At least the A*X calculations indicate that the solution isn't acceptable. I kind of remember encountering something like this back when the CC-40 first came out and finding that the solution was obtained by calculating the product of the inverse of matrix A with vector B. Note that the HP-28S results from that technique were also very bad.

With a simultaneous equation program adapted from the "Mathematics Library: Application Software for the Sharp EL-5500 and PC-1403 Scientific Computers" by Swinnen and Thomas the TI-74 and CC-40 obtain a much better solution

0.99484589988833
1.000000649766
0.99540450571417
0.99537824997733
0.99999681097517
1.004621678939
1.009669621273

which is only slightly less accurate than the solutions from the full fourteen digit machines such as the Model 100 and TI-85. The product of matrix A and the solution vector X yields values which are within 4e-12 of the vector B values. Tentative conclusion: for ill-conditioned problems the matrix inversion method of solution is a bad way to go.

Re: Ill conditioning and calculator precision

*Message #10 Posted by **Rodger Rosenbaum** on 9 Jan 2006, 6:58 a.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

"Tentative conclusion: for ill-conditioned problems the matrix inversion method of solution is a bad way to go. "

It would be interesting if you would try my suggestion of adding .1 to the first element of the column matrix, so that it is 45.4 rather than 45.3; I gave the exact solution in my first post.

With such a small perturbation, one would expect the solution to still be [1 1 1 1 1 1 1].

If the matrix inversion method is a bad way to go, how about some other method? Got any ideas?

Some results for the modified system

*Message #11 Posted by **Palmer O. Hanson, Jr.** on 10 Jan 2006, 4:56 a.m.,*
in response to message #10 by Rodger Rosenbaum

Rodger suggested that I redo the problem but with the b(1) value changed from 45.3 to 45.4. Some results follow.

HP-28S

```
                    B/A
INV A * B

        X                    A*X                    X
A*X

```

where the largest difference between the A*X and B values for the the B/A case 5.79e-5. The similarity of results for the solution matrix X by the two methods is more like other results that I recall when testing the 28S, say the 7x7 su-Hilbert with a vector of all ones. I don't recall seeing the lack of similarity between the A*X values, but I 'm not sure I did that calculation. I

will have to search my files.

Again, I am concerned that I may be doing something wrong with my HP-28S.

Radio Shack Model 100:

Again, these results were obtained with my Radio Shack Model 100 using a simultaneous equation solution adapted from the "Mathematics Library: Application Software for the Sharp EL-5500 and PC-1403 Scientific Computers" by Swinnen and Thomas. The actual results were

```
     14 Digit                    6 Digit

 71057.6081486                  45.1833
    -7.9967989123177             0.955531
 63356.360139385                40.3235
 63718.230789577                40.4464
    44.984289163027              1.04639
-62715.23113977                -38.4262
133308.36227832                -81.7585
```

For the 14 digit case the product of matrix A with the solution vector yields values which are within 3e-8 of the values in vector B. For the 6 digit case the product yields values which are within 8e-04 of the values in vector B even though the calculated X values have no obvious relationship to the expected X values..

Other Machines

As with Valentin's original problem the results from the CC-40 were not as good as with the Model 100 for the modified problem.

Results from the remaining machines mentioned in my earlier submission will take a little more time to obtain since for those machines I have to enter the entire problem rather than edit existing files.

No, you're ok. I get exactly the same thing on the HP48SX, except that the value -126.681 in the table above should be -126.4681, an obvious typo

"Radio Shack Model 100:

I think the Radio Shack 100 is running a Microsoft Basic equivalent to the common GWBASIC. I think it is doing 56 bit arithmetic for the high precision calculations, which is equivalent to about 17 digit precision. Would you compute 1000000/7-142857 on the 100 and see what you get? From this we can tell how many equivalent digits are available.

Re: Some results for the modified system

*Message #13 Posted by **Palmer O. Hanson, Jr.** on 11 Jan 2006, 9:48 a.m.,*
in response to message #12 by Rodger Rosenbaum

For 1000000/7142857 I get .1400000028 .

I am not familiar with that test but I presume that the result means that the machine uses 14 digits.

I have tested the Model 100 years ago with a derivative of a Kahan program known as "Little Bits of Paranoia" which reported that it was a fourteen digit, base ten machine with a guard digit. Recently, when I decided to do some of the single precision work I tested in single precision and got six digits, base ten with a guard digit.

I have completed testing of your revised problem with the HP-41 Math Pak and with the TI-85. I should be able to get those results out tonight.

Re: Some results for the modified system

"For 1000000/7142857 I get .1400000028 .

I am not familiar with that test but I presume that the result means that the machine uses 14 digits."

Make that 1000000/7 - 142857

The exact result of 1000000/7 should be:
142857.142857142857142857142857.....

Subtracting off the leading 142857 should leave 14-6 = 8 digits after the decimal point if you have a 14 digit machine, and 17-6 = 11 digits after the decimal point if you have a 17 digit machine.

If it's a 14 digit machine, you should get .14285714; if it's a 17 digit machine, you should get .14285714286, or something close to that.

Re: Some results for the modified system

*Message #15 Posted by **Palmer O. Hanson, Jr.** on 11 Jan 2006, 11:17 p.m.,*
in response to message #14 by Rodger Rosenbaum

Sorry about not seeing the mionus sign.

On the Model 100 1000000/7 - 142857 = .14285714 which says it is a fourteen digit machine. That agrees with my paranoia result.

Some more results

*Message #16 Posted by **Palmer O. Hanson, Jr.** on 12 Jan 2006, 9:24 a.m.,*
in response to message #15 by Palmer O. Hanson, Jr.

In his submission "Calculator Precision: Sure" of December 21 Valentin Albillo proposed the following set of linear equations for investigation of the effects of word length on the accuracy of the solution. His system has the unique solution:

x1 = x2 = x3 = x4 = x5 = x6 = x7 = 1.0

In a response Rodger Rosenbaum proposed examination of a modified set of equations where the only modification was the change of the B1 value from 45.3 to 45.4 The exact solution for the modified set of equations is

```
x1 =        71083
x2 =           -8
x3 =        63379
x4 =        63741
x5 =           45
x6 =       -63738
x7 =      -133356
```

My first response to Rodger's proposal included results obtained with the Radio Shack Model 100 and the HP-28S. Results from additional machines follow.

The HP-41 MATRIX Routine in the Math Pak with the Modified Set of Equations:

```
          X                  A*X

    -822.2517531          45.399997
       1.0649402          48.4
    -733.098423           45.0
    -737.3942465          18.6
       0.50966796         36.699997
     739.402556           24.9000016
    1545.638889           40.699995
```

Many of the calculated values of X are grossly different from the exact solution listed above; however, the product of the matrix A and the solution vector X yields values which are never in error by more than 5e-6 from the vector B values and three are exact.

The CC-40 and TI-74 with the Modified Set of Equations:

The CC-40 and TI-74 operate in base 100. As a result they are not truly 14 digit machines since some values will be limited to 13 digits. With a simultaneous equation program adapted from the "Mathematics Library: Application Software for the Sharp EL-5500 and PC-1403 Scientific Computers" by Swinnen and Thomas the CC-40 yielded the following results

```
x1 =    71675.9882
x2 =       -8.07475664
x3 =    63907.71966
x4 =    64272.7403
x5 =       45.36690284
x6 =   -64269.7322
x7 =  -134468.506
```

which is only slightly less accurate than the solutions from the full fourteen digit machines such as the Model 100 and TI-85. The product of matrix A and the solution vector X yields values which are within 7.9e-7 of the vector B values.

Some Thirteen Digit Results:

The TI-59 and TI-95 are thirteen digit machines. The TI-59 exhibits the famous anomaly in which multiplication is not always commutative, and in addition does not use an add/subtract guard digit. In the TI-95 multiplication is commutative and there is a guard digit. Solutions for Valentin' original problem from the ML-02 program in the Master Library module of the TI-59 and from the matrix routines in the Mathematics module for the TI-95 follow:

TI-59	TI-95
1.740824864135	0.6835858242542
0.9999066058071	1.000039889642
1.660533625121	0.7178790660364
1.664307494855	0.7162672061226
1.000458374646	0.9998042233199
0.3357027223239	1.283728430019
-0.3898635477583	1.593625498008

Both solutions are substantially degraded relative to those from the Model 100 and TI-85. For both machines the product of matrix A and the solution vector X yields values which are within 3e-11 of the values in matrix B.

How Many Exact Answers to Valentin's original problem from the HP-28S (or from any other machine)

Multiply the A matrix by a vector of all ones and it is not surprising that the result will be exactly the B matrix. Multiply the A matrix by a vector which includes the solution from the TI-95 rounded to twelve digits, Voila! The result is exactly the B matrix. I'm suggesting that on any machine there are probably an infinite number of vectors which can be multiplied by the A matrix and yield the exact B matrix.

Re: Some more results

*Message #17 Posted by **Rodger Rosenbaum** on 13 Jan 2006, 7:26 a.m.,*
in response to message #16 by Palmer O. Hanson, Jr.

Palmer said:

"The TI-59 and TI-95 are thirteen digit machines. The TI-59 exhibits the famous anomaly in which multiplication is not always commutative, and in addition does not use an add/subtract guard digit. In the TI-95 multiplication is commutative and there is a guard digit. Solutions for Valentin' original problem from the ML-02 program in the Master Library module of the TI-59 and from the matrix routines in the Mathematics module for the TI-95 follow:

TI-59	TI-95
1.740824864135	0.6835858242542
0.9999066058071	1.000039889642
1.660533625121	0.7178790660364
1.664307494855	0.7162672061226
1.000458374646	0.9998042233199
0.3357027223239	1.283728430019
-0.3898635477583	1.593625498008

Both solutions are substantially degraded relative to those from the Model 100 and TI-85. For both machines the product of matrix A and the solution vector X yields values which are within 3e-11 of the values in matrix B.

How Many Exact Answers to Valentin's original problem from the HP-28S (or from any other machine)

Multiply the A matrix by a vector of all ones and it is not surprising that the result will be exactly the B matrix. Multiply the A matrix by a vector which includes the solution from the TI-95 rounded to twelve digits, Voila! The result is exactly the B matrix. I'm suggesting that on any machine there are probably an infinite number of vectors which can be multiplied by the A matrix and yield the exact B matrix."

Valentin's original problem has, as he says, a unique solution. This is when doing continuous, traditional arithmetic. The discretized arithmetic of calculators spawns the spurious solutions of which you have given an example. Another is:

```
x1 = .220440311016
x2 = 1.00009827737
x3 = .304929663701
x4 = .300958473026
x5 = .999517658758
x6 = 1.6990307756
x7 = 2.46253405849
```

Notice that this one is even further from [1 1 1 1 1 1 1]. I was able to generate lots of them.

The product of A times the X you gave, and the one I

gave, has non-zero digits out to the 15th place, and the loss of these in the rounding process makes it appear that the X is a solution, but only in the discretized arithmetic of the calculator; it's not a true solution.

However, I doubt that there are an infinite number of these false solutions. The HP28, for example, has a 12 digit mantissa; this means that it can represent all possible 12 digit integers, of which there are 10^12 positive and (10^12)-1 negative. The HP28 has 999 possible exponents. Therefore a total of about 2*999*10^12 numbers can be represented on it, somewhat short of infinity. :-)

But, back to the original purpose I had when I started this thread. I noticed that a slightly different perturbation of the column matrix has even greater effect. Change the third element of the column matrix in Valentin's original problem from 45 to 45.1--now the exact solution is:

```
x1 = -2128901625
x2 = 268387
x3 = -1898169427
x4 = -1909014362
x5 = -1317226
x6 = 1908985003
x7 = 3994038147
```

This is a tremendous change in the solution for an apparently insignificant change in one element.

Try something I described in an earlier post; add .1 to the {3,7} element of the A matrix, and subtract .1 from the {7,7} element. This tiny change reduces the condition number of the A matrix from about 3E12 to about 400, and using this slightly perturbed A matrix with the perturbed column matrix mentioned just above gives a HP48G solution:

```
x1 = 1.20999247798
x2 = 1.01325966115
x3 = 1.26616078717
x4 = 1.29157926088
x5 = .997263593179
x6 = .690061410742
x7 = .499897531935
```

This isn't as close to [1 1 1 1 1 1 1] as we would like, but given what the solution was with just the third element in the column matrix perturbed and using the original A matrix, this inprovement is an astounding result considering that only two tiny perturbations were made to the A matrix.

My purpose here is to show that with proper techniques

we can find reasonable solutions to very ill-conditioned systems. Systems as badly conditioned as Valentin's example are unlikely to occur in practice; they must be artificially constructed. But, if we can handle *them*, then we can certainly handle the ones we encounter in real life problems.

Palmer, it would be good if you tried solving the system on your various calculators, consisting of the column matrix perturbed in the third element, and the {3,7} and {7,7} elements of the A matrix perturbed as I described. I think you will find that you don't get wildly varying results with these changes. For example, on my HP48S, which uses the same matrix routines as the HP28, I get about 9 or 10 digit agreement with the solution posted above, whether I use the divide key or invert the A matrix and multiply times the column matrix.

We've seen repeatedly how ill-conditioned systems are not correctly solved (exactly), and the more digits your calculator has, the better the results. This is to be expected. But now we should move on to new pastures and learn how to deal with these ill-conditioned systems, even with calculators that don't do arithmetic with lots of digits.

My favorite way to handle them involves the use of the singular value decomposition. Routines written in Fortran for the SVD can be found at:

http://www.netlib.org/lapack/single/

These could be most easily implemented on a machine that has Basic rather than keystroke programming. Or, you could just get an HP48G which has the SVD and lots more built-in. I find the HP48G very handy for experimenting with advanced matrix algebra.

The book, "Numerical Recipes", has a good section on the use of the SVD for dealing with ill-conditioned systems. I hope I can stir up some interest in this.

>
> Let's try again with the correct data:
>
> (4.8, 4.3)

(9.1, 8.2)
(7.1, 6.6)
(4.8, 4.3)
(9.3, 8.3)
(3.2, 2.9)
(6.7, 6.1)

The correlation is about 0.999. If you add the right hand sides (45.0, 40.7), the correlation jumps to 0.99998. This means, that the equations are *almost* linearly dependent and the system is in fact underdetermined.

The convention is that the terms "overdetermined" and "underdetermined" refer only to whether the system has more equations than unknowns, or fewer equations than unknowns. So Valentin's system is neither. But the fact that system exhibits near linear dependencies (another way to put it is to say that the system is near rank deficient) means that it is ill-conditioned. This can be true even *without* any high correlations, but high correlation can sometimes indicate where linear dependencies lie. In this case, it gave us the clue that dropping row 7 might be a good thing to do.

Can you elaborate, how underdetermined linear systems can be tackled?

To my mind, one of the most elegant methods uses the pseudoinverse. There is some discussion of the pseudoinverse at mathworld.wolfram.com.

But an underdetermined system can still be ill-conditioned, and may need to be attacked by techniques suggested by backward error analysis. What I like to do is to find another matrix only a small distance from the original A, with much smaller condition number and use *it* to solve the system.

The Lawson and Hanson reference at:
http://mathworld.wolfram.com/LeastSquaresFitting.html
is a good place to get detailed discussion of these things.

49G+ SD card

*Message #1 Posted by **Michel Beaulieu** on 7 Jan 2006, 9:30 p.m.*

I just cannot find the information in the manual or guide : what is the specification for the SD card that are compatible with the HP-49G+. Any size? speed? Maker (only HP one?), High speed? etc...

Thanks Michel

Re: 49G+ SD card

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 Jan 2006, 9:54 p.m.,*
in response to message #1 by Michel Beaulieu

Hello, Michel (still owing you an answer about the Cx...);

I have an earlier HP49G+ with a 256MBytes SD card. If I am not wrong, this is the biggest 'memory size' the HP49G+ can handle.

Currently, the one that's installed in the HP49G+ (and working fine) is a SimpleTech PROX High-speed SD Card (STI-PROXSD/256). The one that I also used and worked fine is a FUJIFILM 256 MB SD card, no extra specifications found in the card, neither in the small cardboard that comes with it. It claims to be 'Compatible with all SD Secure Digital Devices'. Now it is in my digital camera.

Nope this helps.

Luiz (Brazil)

(I'll brief you soon about the otehr subject...)

Re: 49G+ SD card

*Message #3 Posted by **Gene Wright** on 7 Jan 2006, 10:09 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi.

There is actually no upper limit on the size of the SD card the HP49g+ can address. 1GB cards have been used sucessfully.

Some of this is explained in the HP learning module on using SD cards with the hp49g+ found on the HP site here:

[url: http://www.hp.com/calculators/docs/learning_modules/49gplus/49gPlusSD.pdf]

Don't worry that it says "for use with ROM 1.22". Nothing significant has changed with ROM upgrades since then.

That said, the best way to format a card for use on the 49g+ is to allow the 49g+ to format the card for you, which is again explained in the link above.

Good luck, gene

Re: 49G+ SD card

*Message #4 Posted by **Gene Wright** on 7 Jan 2006, 10:10 p.m.,*
in response to message #3 by Gene Wright

Oops. Thought I had that link correct. :-)

Typos: show no mercy...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 7 Jan 2006, 10:41 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, all;

first of all, thaks (Gene and Tim) for the extra info. I was not aware of the fact that the HP49G+ could go beyond 256MB through SD card addressing.

Now for the main reason: I wrongly wrote 'Nope' instead of 'Hope' in my previous post... and thanks to the new editing policy, I could not edit it.

Please, forgive me adding an extra post, consumming some (unecessary) bytes and time, but I do not like detected mitakes being left aside...

Cheers.

Re: 49G+ SD card

*Message #6 Posted by **Tim Wessman** on 7 Jan 2006, 10:07 p.m.,*
in response to message #1 by Michel Beaulieu

Any size will work up to 2GB. The super ultra 60x speed ones won't receive any benefit because they require some additional circuitry the 49g+ doesn't have(the same stuff that make SD-wifi card work).

The 32x speed cards do recieve speed benefit, but only when you are storing huge files. I run a 512 Sandisk Ultra2 card in mine, but that is only because I need the high speed for data storage and fast access for some files with a C program I wrote. It isn't 32x, but more like 8x faster write, 2x read.

My recommendation is to just get whatever cheap card you find. All of them should work.

*Message #7 Posted by **Ron Allen** on 8 Jan 2006, 4:50 p.m.,*
in response to message #6 by Tim Wessman

FWIW,

I use a Lexar 128mb SD with no problem.

I am still operating on some old ROM and must be missing some good things like file types, etc. The

change I have been waiting for is the ability of the SD/ G+ combination to support subdirectories.

Does the latest ROM (build 80) substantially improve this support?

Happy new year!

Re: 49G+ SD card

*Message #8 Posted by **John Smitherman** on 8 Jan 2006, 5:08 p.m.,*
in response to message #7 by Ron Allen

Michel, I have used a 64MB Legacy and a 512MB SanDisk both with no problems. With the ubiquitous 1GB SD's you should be able to find 64, 128 and 256MB SD's at dirt cheap prices.

Regards,

John

*Message #9 Posted by **Tim Wessman** on 8 Jan 2006, 11:32 p.m.,*
in response to message #7 by Ron Allen

Support subdirectories? In what way. Since the beginning you have been able to store and recall from subdirectories. Copying in the filer from one SD directory to another isn't possible, but that isn't a huge thing.

Yes I would upgrade to the latest rom found on hpcalc.org 2.05 something if I remember right.

Re: 49G+ SD card

*Message #10 Posted by **Ron Allen** on 9 Jan 2006, 9:28 p.m.,*
in response to message #9 by Tim Wessman

Thanks Tim, I was referring to chapter 26 page 7 of the "User Guide" where it says, "... no subdirectory tree can be built into port 3..." It then states that a future ROM upgrade may address this. I have taken this to mean that I run the risk of eliminating some duplicate named variables now isolated between subdirecoties (or at least prioritized in case of conflicts). Not talking about locals/globals distinction.

I have had my 49g+ since 11/04, which could make a difference if I wanted to back up all of main memory to an SD card. I admit that I could be reading the statement wrong with respect to the 49g+.

Thanks again - I believe the current ROM version is "build 80" with an unsupported "build 83" available to brave hearts.

Re: 49G+ SD card

*Message #13 Posted by **Ron Allen** on 10 Jan 2006, 3:09 p.m.,*
in response to message #11 by ECL

yes, ECL

I posted a question about current level a couple of weeks back and received a response with some information about an unsupported build 83. Among other things, I do recall that it went beyond 80 to address key bounce. Not being interested in testing an unofficial release, I neglected to copy it. I can locate it in archives probably when I get more time.

I just received my connectivity kit zip file which I still haven't been able to unzip as yet.

Instead of key "bounce" I am experiencing what I would call key "wobble." The keys, especially the "enter" seem to be wearing out with no snap to them. My old 48GX still feels solid when I press the keys. I am a little surprised that HP would produce such flimsy switches, but going corporate seems to lower standards just about everywhere. (Too many MBAs in the mix. Optimize for who's benefit?)

Thanks for responding,

Ron

*Message #14 Posted by **David** on 11 Jan 2006, 12:07 a.m.,*
in response to message #13 by Ron Allen

Did you accidentally keep the Enter key depressed while the calculator was in storage? It happened to my 49g+ once, and the Enter key lost the click temporarily. Luckily after a week or two, the Enter key got its click back. Now I have to be cautious to store my 49g+ while not getting anything weighing down on top of the calculator. Also, I don't want to deform the black pouch either.

*Message #15 Posted by **Ron Allen** on 11 Jan 2006, 12:47 a.m.,*
in response to message #14 by David

Wierd, David!

Don't think I accidently pressed enter while in storage, but don't know for sure. Would that affect other keys like the 2 key? Did power remain on during the extended pressing?

I have read about key bounce and such, as well as some varying lack of confidence after the 48GX experience. All in all I have been pleased with HP products and the ability to use such power in the field. Besides, I am hooked on RPN programming.

Thanks for responding!

Ron

Probably an advance fee fraud in which the buyer will offer to pay by a bank (cashier's) cheque he has - for more than your sale price, with you to reimburse the difference, also by bank cheque. His bank cheque is drawn on a foreign bank, and will turn out to be a forgery - by which time, you'll have shipped the goods and a genuine bank cheque.

Only, you won't have, because you know better. . .

Best,

--- Les

I'm on a forum about tandem bicycles, which are a big target of this kind of thing. There have been various things suggested, one of them being that you go ahead and ship an appropriate-sized box; but instead of putting your multi-thousand-dollar tandem in there, you fill it with pieces of wood, wads of newspaper, old shoes, a few Chinese products that don't work, etc.. You might save a dumping fee, and the customer will have to pay a hefty customs fee to pick up their surprise pack.

Re-assembling the 42s

*Message #1 Posted by **Dan L. Cleary** on 7 Jan 2006, 5:51 p.m.*

I want to start by saying thanx to Paul Brogger for describing how to disassemble a pioneer. "THANK YOU".. My calc has had recurring symptoms of quick battery death and vertical lines in the display x 2. After buying the new 33s for the PE exam and as a replacement, I have just not been happy without my trusty 42s. I have tried to send it in for repair to Fix that calc, but they felt it was hopeless. Finally I got the courage to open it up. Turns out that the springs that go been curcuit board and back of housing (possible ground??)were in contact with a slightly green corroded circular pad. My calc had fallen a few times while using in my work vehicle, and I think it got slightly damp. Anyway wanted to pass these symptons on, it works fine now, although it always worked, but ate batteries and had annoying vertical lines. My question is how fasten it securely back together? I did not shave the heat posts, but reheated and straightened. This worked great on the upper four because I heated the tip of a phillips head and after reassembly, I reshaped the posts. But should I use glue on the others?

Re: Re-assembling the 42s

*Message #2 Posted by **Paul Brogger** on 9 Jan 2006, 12:48 p.m.,*
in response to message #1 by Dan L. Cleary

First of all, "You're welcome."

For mine, in shaving the lower heat stakes, I didn't *truncate* them so much as reduce the diameter of the mushroomed heads. Then they could be snapped back through the plastic front and provide a tight (but not completely re-secured) bond.

I would recommend you NOT use any glue -- the stuff could probably wick into the keyboard sandwich and destroy it.

If you really want to re-fasten the lower heat stakes, you'll need to take off the foil overlay, or cut through it. The latter is certainly damaging -- the former seems likely. (As alluded to in the article, I haven't messed with keyboard overlays. I know some do, but it just doesn't seem necessary.)

With regard to the vertical lines -- you might try unseating the PCB and cleaning the PCB-to-LCD contacts, and reassembling. It's yet more invasive, but I should think it's indicated. (I think my earlier article gives some detail on how-to.)

With regard to reduced battery life -- don't I remember someone saying that a bad capacitor somewhere on the board can cause that? Maybe someone will chime in on that, or you could start another thread with that as the subject in hopes of grabbing someone's attention.

Good luck, and keep us posted!

HP 11C 'pr error' message

*Message #1 Posted by **Marc Bailey** on 6 Jan 2006, 3:23 p.m.*

I received an HP 11C as a Christmas gift and do not have a manual with it. When I turn the calculator on sometimes it displays 'pr error' and I have to turn it off and back on to get it to work. I researched and found the self test instructions and keyboard test instructions and it passes both. Does anyone now what this message is? Thanks in advance for your help.

Re: HP 11C 'pr error' message

*Message #2 Posted by **Namir** on 6 Jan 2006, 3:28 p.m.,*
in response to message #1 by Marc Bailey

Marc,

I strongly suggest you get the museum CD/DVD to get the manuals for the HP-11C. I think you will enjoy the machine much more with the docuemntation.

The mesage you got is basically a reset message. The calculator should work fine.

Namir

Edited: 6 Jan 2006, 3:28 p.m.

Re: HP 11C 'pr error' message

*Message #3 Posted by **Randy** on 6 Jan 2006, 5:48 p.m.,*
in response to message #1 by Marc Bailey

The only time you should see Pr Error is when you leave the batteries out for too long and the continuous memory is cleared.

Based on your description, the unit has either a bad battery contact, bad batteries, or worse, the internal memory back-up capacitor is faulty. It's not a common problem so it's a bit hard to tell what could be wrong if it happens when turning on and off as with normal use.

Re: HP 11C 'pr error' message: a small suggestion

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 6 Jan 2006, 11:19 p.m.,*
in response to message #3 by Randy

Hi Randy, Marc, guys;

what about removing the batteries, wait for, say, ten to twenty seconds, then placing them back to the compartment; or simply slightly pushing them away from each other while inside their compartment for just a few seconds.

If the calculator shows 'Pr Error' in these circumstances, then I think that a bad capacitor (or a bad contact with the capacitor terminals) is the best guess. Provided no key is pressed when without batteries, the Voyagers might retain RAM contents for some time, even more than an hour or close to this. In this case, depending on which internal construction it has, resoldering or even replacing the capacitor will not be that hard.

If the calculator passes [ON]/[+] or [ON]/[*] self tests without problems, then I'd guess internals are fine.

Just a suggestion of mine.

Hope you succeed!

Luiz (Brazil)

Equation problem in Hp32II

*Message #1 Posted by **Ravinder Walia** on 6 Jan 2006, 12:09 p.m.*

Hello everyone,

I have a HP32II and stored an equation

D=10xLOG(W/0.001)

If I try solving the equation for D, by pressing EQN and then enter everything is fine.

However I can't get it to work for to solve W. I just got this calculator and don't have a manual. I can use the number crunching fine but this is my first attempt at storing an equation.

Any help greatly appreciated.

Re: Equation problem in Hp32II

*Message #2 Posted by **Antoine M. Couëtte** on 6 Jan 2006, 12:19 p.m.,*
in response to message #1 by Ravinder Walia

Assuming that "LOG" is the Napier Logarithm - if decimal, there is one constant to multiply with - and assuming that I correctly rewrote your equation, did you attempt solving for W with W=1000 EXP (D/10)?
Antoine

Re: Equation problem in Hp32II

*Message #3 Posted by **Ravinder Walia** on 6 Jan 2006, 12:55 p.m.,*
in response to message #2 by Antoine M. Couëtte

I think that the rearranged equation would be

W=0.001xALOG(D/10)

and if I put this in, it works fine to solve for W.

What I wanted to do is enter the first equation which was

D=10xLOG(W/0.001)

And then use this single equation to solve for either W or D. I thought that there was a way to do this, but maybe there isn't.

Re: Equation problem in Hp32II

*Message #4 Posted by **Chris Dean** on 6 Jan 2006, 1:03 p.m.,*
in response to message #3 by Ravinder Walia

When trying to solve for W did you enter a value for D first?

Re: Equation problem in Hp32II

*Message #5 Posted by **Ravinder Walia** on 6 Jan 2006, 1:20 p.m.,*
in response to message #4 by Chris Dean

I entered the equation

D=10xLOG(W/0.001)

Then I did

[LEFT SHIFT]

[STO]

This brings up the equation. Then I pick to solve for W by

[LEFT SHIFT]

[7]

Which then ask me what variable to solve for. To pick W I do

[1]

To give me W. It then asks for a value for D. If I want 12

[12]

It then gives the error LOG(0).

I'm pretty sure I am doing something wrong, but not sure what.

Re: Equation problem in Hp32II

*Message #6 Posted by **Norris** on 6 Jan 2006, 1:52 p.m.,*
in response to message #5 by Ravinder Walia

I tried this equation on a 33S, which should be functionally equivalent to a 32SII as far as equations go, and had no problem solving the equation in question for D=12 (for the record, W=0.158489319246).

I also have a 32SII, but it's at home, so I can't try that until tonight

Re: Equation problem in Hp32II

*Message #7 Posted by **Chris Dean** on 6 Jan 2006, 2:10 p.m.,*
in response to message #6 by Norris

I actually make the answer W=3.3201169223e-3 for D=12. I am sorry but I cannot be of any more assistance as I do not have a 32SII and cannot replicate your problem.

Edited: 6 Jan 2006, 2:13 p.m.

Correction

*Message #8 Posted by **Norris** on 6 Jan 2006, 2:31 p.m.,*
in response to message #7 by Chris Dean

> Quote:
>
> I actually make the answer W=3.3201169223e-3 for D=12

You are using a natural (base-e) logarithm (LN function). But the equation appears to call for a base-10 logarithm (LOG function).

My initial answer also needs correction. For a base-10 logarithm, W=0.0158489319246, not 0.158489319246. I used the SHOW function on the 33S to get all the digits, but I forgot that that the display drops leading zeros. Oops.

Edited: 6 Jan 2006, 2:37 p.m.

Re: Equation problem in Hp32II

*Message #9 Posted by **Katie Wasserman** on 6 Jan 2006, 2:41 p.m.,*
in response to message #5 by Ravinder Walia

You can tell the calculator to look for a solution within a certain range in order to avoid it trying to calculate log(x); where x<=0.

To do this store one limit, say 1 in this case, in W and put the other limit, say .01 in this case, in the x register.

So you would do:

1 STO W .01 ENTER EQN (select your equation) SOLVE W D=12 R/S

I get W=1.58489319 E -2

Re: Equation problem in Hp32II

*Message #10 Posted by **John Smitherman** on 6 Jan 2006, 2:26 p.m.,*
in response to message #1 by Ravinder Walia

Ravinder, here is a link to the 33s manual which provides the same information as the 32sii manual on how to handle equations:

http://h10032.www1.hp.com/ctg/Manual/c00251639.pdf

Regards,

John

Re: Equation problem in Hp32II

*Message #11 Posted by **Ben Salinas** on 6 Jan 2006, 2:48 p.m.,*
in response to message #1 by Ravinder Walia

So, after a bit of fooling around, I think I found the solution. The 32sii uses a numerical approximation (Newton's Method?) to solve equations. It calls for guesses.

The two bounds the 32sii (and consequently, the 33s) use are the number stored in the variable (W, in this case) and the number stored on the top of the stack (the screen). Before, you probably had either 0, or a negative number stored in one of these. Try putting a small number in each. I put 1 in W (5 or 10 should also work fine) and 1E-5 on the stack.

If you limit the interval it has to solve over, then it will solve quicker.

-Ben

Re: Equation problem in Hp32II

*Message #12 Posted by **Norris** on 6 Jan 2006, 3:10 p.m.,*
in response to message #11 by Ben Salinas

I would have expected the 33S to behave in the same manner as the 32SII. Yet I can't duplicate the LOG(0) error on the 33S with the equation D=10xLOG(W/0.001) and D=12.

It doesn't seem to matter what kind of numbers are initially stored in W, or left on the X-register. Positive, negative, or zero, large or small...the 33S responds almost immediately with W=0.0158 regardless.

Needless to say, this is very frustrating. What I am I doing wrong ?? Why won't my calculator give me an error message, instead of the correct answer ?!?

Edited: 6 Jan 2006, 3:17 p.m.

Re: Equation problem in Hp32II

*Message #13 Posted by **Eamonn** on 6 Jan 2006, 6:08 p.m.,*
in response to message #12 by Norris

Hi Norris,

It may be that the HP-33s first attempts to re-arrange the equation so that it can directly solve for a real root. If it cannont do this, then it uses an iterative method (see appendix D of the HP-33s manual).

The HP-32sII, if I recall correctly, always uses an iterative method to solve for the root. I remember some discussion on this site about solving A=SQR(B) on the HP33s and that it could not directly find the negative root of B without some re-shuffling of the equation so that it could not be solved directly. Sorry, I don't have a link to this discussion.

The equation in the original post can be re-arranged and solved directly - I suspect that is why it doesn't matter what initial values are in the X register and the W variable on the HP-33s, but it does matter on the HP-32sII.

Best Regards,

Eamonn.

Re: Equation problem in Hp32II

*Message #14 Posted by **Ravinder Walia** on 6 Jan 2006, 6:13 p.m.,*
in response to message #11 by Ben Salinas

I think that the idea put forward by Ben is correct. I managed to follow his instructions and the equation solves.

I think that for an equation this simple it's not worth it, but at least I understand it a bit better now.

For those that might have been interested in what the equation was, it's a conversion from Watts to dBm, both units of power and used in radio frequency engineering.

Time to go and play some more.

Re: Equation problem in Hp32II (summing it up)

*Message #15 Posted by **Karl Schneider** on 7 Jan 2006, 1:22 a.m.,*
in response to message #14 by Ravinder Walia

A few good points by several people in this thread. I'll try to sum it all up.

To recap, the problem was to solve the equation

```
D = 10 * LOG(W/0.001)
```

for D = 12.0 on an HP-32SII in Equation mode.

Indeed, the HP-32SII solves only iteratively, unlike the HP-33S, which will return an algebraically-derived direct solution if it deems possible.

The 32SII will use the stored value of the variable to be solved, and the value in the x-register as the first guesses for the solution. This is true when solving an equation or a program.

In equation mode, when the user enters 12 as the prompted value of D, that unfortunately is one of the guesses for the solution of W. Pre-storing a positive value for W that is less than, or close enough to the solution W = 0.001*(10^1.2) = 0.015849 will ensure that the algorithm will converge. A larger pre-stored value will cause the algorithm to project the next guess for W from the first two guesses into the undefined non-positive region, causing an error.

Pre-storing a positive value of W that is less than the actual solution will bound it between 12, bringing convergence. Pre-storing W = 0.02 will also work. However, Pre-storing W = 0.1 will fail, as the next projection of W -- based on function values calculated at W = 0.1 and W = 12.0 -- is negative.

One way to get around this problem is to enter the equation as a program, so that two legitimate guesses can be entered.

The methods of the HP-33S are more adroit: It will solve the equation directly.

-- KS

*Message #16 Posted by **Tizedes Csaba [Hungary]** on 9 Jan 2006, 2:31 a.m.,*
in response to message #1 by Ravinder Walia

Hi, try this (I have an HP32SII, but not here, so I can't to try now...):

```
D = 10*LOG(W/0.001)  is equal

D/10 = LOG(W)+3      and SOLVE it --- and you can to substitue L=LOG(W), if it is not
working:

D/10 = L+3           then SOLVE for L and W=10^L
```

Csaba

HP41 - RS232 - PC Interfacing

*Message #1 Posted by **Christoph Klug** on 6 Jan 2006, 4:19 a.m.*

Dear HP41 and PC enthusiasts :

I need detailed information about the wiring between a 9pin PC COM1 serial port and the 25pin port of the HP-IL/RS232 Interface HP82164.

Tony Duell describes a solution for his Linux software tool, but unfortunately his document includes only the wiring between two 25pin connectors.

As I find out some different wiring diagramms exist, describing RS232 inferface connections between 25pin/25pin or 9pin/9pin or 9pin/25pin connections :-(

I am looking for a RS232 solution which works for HP41 and HP71.

Waiting for your help - Christoph Klug

Re: HP41 - RS232 - PC Interfacing

*Message #2 Posted by **Tony Duell** on 6 Jan 2006, 6:20 a.m.,*
in response to message #1 by Christoph Klug

Obviously I use the wiring scheme in my LIF Utilities distribution to link my handhelds to my own PC, which has a DE-9 serial port.

I use a normal PC modem cable -- the same one I use for my modem, actually, plugged into the PC. It has a DE-9 socket on the PC end, a DB25 plug on the 'modem' end, and is wired in the normal way for such cables (I will look up the wirelist if you really can't find the wiring for such a cable). There are no crossovers or the like in the cable.

I then connect that to the 'PC' socket of the adapter I documented in the LIF Utilities distribution, and plug the other end of the adapter into my 82164 with the internal DIP jumper set to the DTE position (this is, IMHO, the only sane way to use the 82164).

Re: HP41 - RS232 - PC Interfacing

*Message #3 Posted by **Christoph Klug** on 6 Jan 2006, 8:59 a.m.,*
in response to message #2 by Tony Duell

Dear Tony,

thanks - that information helps : You use a standart 9pin to 25pin RS232 connection :-)

Best regards - Christoph Klug

Re: HP41 - RS232 - PC Interfacing

*Message #4 Posted by **Garth Wilson** on 6 Jan 2006, 1:21 p.m.,*
in response to message #3 by Christoph Klug

Standard pin usage is as follows:

```
9-pin  desc  dir   25-pin
  1   (DCD)   I      8
  2     RD    1      3
  3     TD    O      2
  4    DTR    O     20
  5    GND           7
  6    DSR    I      6
  7    RTS    O      4
  8    CTS    I      5
  9   (RI)    I     22
```

The "I" and "O" above for "input" and "output" refer to what's connected to the DB-9 end. The DCD and RI are only used for modems, which you're not dealing with right now. All the DB-25 pins are defined except for 9, 10, 18, and 25 which are reserved, but it's rare to see more than the "big 8" actually used. Those are the ones shown above, minus RI. The FSI164A HPIL-RS232 interface converter used the extra pins for more channels. I just got the standard model, so I only have two channels; but there was the option to go up to 8, and they all went through the DB-25. The extra channels only had TD & RD, no handshaking lines.

Wiring for HPILCOM = HP41 / PC Interfacing

*Message #1 Posted by **Christoph Klug** on 6 Jan 2006, 4:08 a.m.*

Dear HP41 & PC enthusiasts :

For using HPILCOM from Hans Brüggemann I need the correct wiring between the 9pin COM1 interface connector of the PC and the 25pin interface connector of the HP-IL/RS232 interface Box.

Please give additional informations about the needed COM1 mode : Hardware interfacing or software interfacing ?

Waiting for your help :-) Christoph Klug

Re: Wiring for HPILCOM = HP41 / PC Interfacing

*Message #2 Posted by **Hans Brueggemann [GER]** on 6 Jan 2006, 5:34 a.m.,*
in response to message #1 by Christoph Klug

christoph, set the COM1 (or, COM2, if you want) to the following mode : 9600 baud, 8 bits, 1 stopbit, no parity and sw flowcontrol. for the cabling, use a simple 25pin male to 9pin female cable. make sure, that your 82164 is in standard DTE configuration. the 9 pin serial connector on the pc has the following pin-out: 1(in)DCD, 2(in)RXD, 3(out)TXD, 4(out)DTR, 5GND, 6(in)DSR, 7(out)RTS, 8(in)CTS, 9(in)RING.

hope, that helps!

hans

Charging Ni-MH batteries

*Message #1 Posted by **Mike T.** on 5 Jan 2006, 9:18 a.m.*

I've rebuilt the power pack for my HP33C using two Ni-MH batteries - Ni-Cd batteries are becoming harder to get hold of easily and have a number of other disadvantages when compared to their Ni-MH counterparts. These appear to work fine in the calculator, however as they are strapped together in the power pack they won't fit into my conventional battery charger.

Given the warnings about charging batteries in the calculator I'd planned to charge them outside the calculator using my reserve power pack (82103A) and AC adapter (62088B) BUT before I try it, does anyone know if this will work as the power pack was obviously only designed to charge Ni-Cd batteries...

I really don't want to damage the reserve power pack (which dispite its name is actually a little battery charger into which you plug the calculator's AC adapter).

Thanks.

Mike T.

Re: Charging Ni-MH batteries

*Message #2 Posted by **Hal** on 6 Jan 2006, 12:11 a.m.,*
in response to message #1 by Mike T.

Hi Mike, From my research, it looks like NiMH's need to be charged in a charger designed specifically for them. The battery voltage, as well as the *battery temperature* needs to be monitored during charging, and the charging rate modulated accordingly. I think it's not so much a matter of damaging your reserve power pack, but of damaging or ruining the expensive NiMH cells if you charge them in a device intended for NiCad's. If you Google Charging a NiMH battery there's lots of info on the subject that you can read.
Best regards, Hal

Re: Charging Ni-MH batteries

> ...it looks like NiMH's need to be charged in a charger designed specifically for them. The battery voltage, as well as the battery temperature needs to be monitored...

I think, that's only true if you want to charge the batteries fast. Trickle charging, as done in the old devices, shouldn't be a problem. You probably don't get the full capacity but you shouldn't be able to kill the cells.

Re: Charging Ni-MH batteries

*Message #4 Posted by **David Smith** on 6 Jan 2006, 11:44 a.m.,*
in response to message #1 by Mike T.

They will charge just fine in the machine or extrnal charger. Multiply the charge time by the ratio of the increased in capacity of the new cells (usually 3-4 times).

in response to message #1 by Tizedes Csaba [Hungary]

The limited resources of the HP calculators division favors the NOT alternaitve!!!

Re: 25th anniversary of 15C's introduction in 2007

*Message #4 Posted by **Hugh Evans** on 6 Jan 2006, 11:23 a.m.,*
in response to message #1 by Tizedes Csaba [Hungary]

Why not force a 25th anniversary edition? Given that nonpareil now supports voyager ROMs, it should be possible to gut a 12c, put in a new board (and perhaps better tactile domes), silkscreen on new labels and sell it. By 2007 OpenRPN will have the facilities to make a conversion kit. Perhaps the threat of unauthorized 15c's would be enough to get HP working on it?

I would propose an ultra low-power MCU, and no I/O. To make the PCB fit properly we can invest in a heat-stake press. If anyone wants to do it, I am willing to supply web space and manufacturing/design help.

Let me know if you want to take on a project like this.

regards, Hugh

Any of the MSP430F4xx would do quite easily: builtin LCD driver for up to 160 segments, up to 60KBytes of in-system programmable flash, 2KBytes of ram, up to 48 bits of programmable i/o (for the keyboard scanner -- you don't even need a multiplexer). All you need is a case, buttons and a 32KHz oscillator...

(OT) Why 'Open Hardware' projects fail

*Message #6 Posted by **Anon** on 7 Jan 2006, 7:38 p.m.,*
in response to message #5 by Chris Roccati

As has been mentioned many, many times before, the electronics is (relatively) easy. It is easier still to make grand plans that never appear all whilst making vague promises.

Sadly designing, building and producing the hardware on a large scale is quite hard. Unlike pure software project it requires many different skills - programmers, engineers (electrical and mechanical), technicians, industrial designers etc. Finding all these people and getting them to work for free is a challenge.

Then you have to consider the money involved. Even though the money required is very small compared to the value of time spent people are still reluctant to invest cash. Production tooling isn't cheap. Almost every single "open hardware" design involving production to date has failed.

Please note that I am not talking about 'IP cores' - designs written in hardware design languages like VHDL / Verilog. These skip the whole mass-production phase. Problems still exist with IP cores as seen here

Re: 25th anniversary of 15C's introduction in 2007

All you need is a case, buttons and a 32KHz oscillator...

I've done several MSP projects, and yes, in principle it is quite easy, really! But, and this is a very important "But": it is one issue to write a hello world program with the provided compiler - there is even a gcc available - and download it via boundary scan pins to the chip - the real challenge then is the final system, the prototyping and the production.

The above is basically unrealistic blurb copied from the data sheet, unfortunately: You almost never run the MSP with a single 32kHz quartz - for calculator purposes this is way too slow; you'll have to add a second one, and then lose those uA power consumption - the MSP will need more current. The 32kHz are realistic for power-down mode mainly.

Also: you either have 160 segments LCD (multiplexed!) or 48 I/O pins, so you'll have to carefully check what display you hook and how you merge it with the keybord scanner. Of course there are also some interdependences between the available pins and features like I2C bus, RS-232, A/D-D/A converters - if you start just straight forward, you'll find yourself blocked eventually with competing requirements - choose among 3 of the 7 requirements that you need; the chip can do all 7 things but only 3 at a time (typical effect).

The MSP chip itself is not easy to handle for a hobbyist, you better look at the TSSOP SMD package in the datasheet to check that you can solder this beast (you can - I learnt it, but if you are accustomed to DIL and std SMD SO packages, the pin distance is a challenge. There are of course adapters and prototype boards from Olimex and Elektronikladen.de, resp., but they are not useful for the product.

The LCD brings up a different question: the HP calcs have numerous special annunciators on their displays (low bat, flags, DEG/RAD mode, function keys) etc. As a hobbyist, you have to use an available LCD; you cannot produce a custom one - too expensive for the experiment. Unfortunately, you either find standard alphanumeric ones, with an own controller and incredible current requirements - you cannot use the MSP's LCD driver feature, or you find just normal 3 1/2, 4 1/2 digit multimeter displays (designed for ICM721x multimeters, which are unusable). You can try to cannibalize an alphanumeric display and control it by the MSP to reduce chip count and current, but the display itself has similar pin distances as the MSP itself, so better find a good PCB layout program and a good PCB producer (Sure there are some - but you'll have to find out the good, the bad, and the ugly yourself).

Of course, besides well-considered system design, you have to program the chip as well. This is no longer MSP specific, but still important. For a calculator, you want to have correct mathematics, so don't just take some multiplication/division routine or some trig functions, etc. from some text book, but invest a minute or two (or some thousands) on optimized and accurate algorithms. This is commonly neglected in almost all hobbyist projects - it was hard to get it compile at all, in all the hacking nights, so "someone else" should add the missing 5% (which turn out to be another missing 95%).

But then, the MSP might be a viable solution for such a project. However, numerous other controllers are then as well - concentrating a project on some single chip which appears attractive is seldomly successful. One better does not start with the chip, but with the design.

Holger

> For a calculator, you want to have correct mathematics, so don't just take some multiplication/division routine or some trig functions, etc. from some text book, but invest a minute or two (or some thousands) on optimized and accurate algorithms. This is commonly neglected in almost all hobbyist projects

That sometimes goes badly wrong even at big companies. One of the first TI LCD calcs, the TI-25 can't calculate 7^8 correctly. It yields 5764800 (exact integer!) instead of 5764801. It looks like the calculation goes IP(8*10^LOG 7).

Marcus

P.S: Are you the XFree OS/2 guy working in Birlinghoven?

IIRC, the TIs were well-known for lousy math for long time. Known problems with TI-52, TI-56, TI-58/59 were reported 20 years ago in the German Funkschau magazine. But HPs, particularly also older ones - no need to talk about Kinpo crap - also have certain artifacts even with or probably particularly because of BCD arithmetics.

> You almost never run the MSP with a single 32kHz quartz - for calculator purposes this is way too slow

With a 32kHz external quartz, you get around 2MHz of MCLK: not a speed demon but still quite fast for the HP15C standards...

> Quote:
>
> you either have 160 segments LCD (multiplexed!) or 48 I/O pins, so you'll have to carefully check what display you hook and how you merge it with the keybord scanner.

With the full 160 segments you still have more than 30 gpio pins available, plus some input only or output only pins. With 16 pins you can control a very large matrix scanned keyboard. This if you don't plan to use an external binary decoder for the column scanner.

> Quote:
>
> The LCD brings up a different question: the HP calcs have numerous special annunciators on their displays (low bat, flags, DEG/RAD mode, function keys) etc.

We're talking about the **hypotetical** possibility of gutting an HP12 here, so the LCD is quite the easiest part...

> Quote:
>
> The MSP chip itself is not easy to handle for a hobbyist, you better look at the TSSOP SMD package in the datasheet to check that you can solder this beast

In fact even the smallest form factor may be TOO BIG for the intended use...

Chargers for HP 25 calculator

*Message #1 Posted by **Bruno Rovito** on 4 Jan 2006, 5:35 p.m.*

I have an HP25 calculator that is in excellent working order. I have misplaced the charger. I need to be able to charge the batteries and I am wondering if I can use a charger for cell phones. I have determined the polarity of the charger connections and have used pieces of bent stainless steel wire inserted into the leads to serve as connection points for clip on leads. What I don't know is what voltage to look for in a cell phone charger? I can easily determine the polarity of the charger and solder on spring loaded clips to the leads of the cell phone charger to attach to the stainless wire clips I have rig up. Does anyone know what voltage I should be looking for in the discarded cell phone chargers that would work. I don't want to arbitrarily use any charger for fear of damaging the calculator. The two rechargeable batteries only need 2.5 to 3.0 volts but the calculator needs more to operate. I have determined this by using an adjustable DC power supply. I understand that the original chargers were unregulated and I am not sure if the cell phone chargers will work. Does anyone have any info that would help me out??

in response to message #1 by Bruno Rovito

Do NOT charge batteries in the calculator. It's too easy to fry the electronics. I remove the center plastic strip in the battery pack and insert (with a bit of force) AA alkalines. Works just fine for my 21,22,25C,and 29C.

-John

in response to message #1 by Bruno Rovito

I have done the same with my 25 - replaced my HP rechageables with AA's. Calculator lasts a very long time as a result - and no charger to worry about.

There is a number of comments about same here at the museum.

http://www.hpmuseum.org/batts/battery.htm

Try this link first. Hopefully it will help you out.

in response to message #1 by Bruno Rovito

I have an extra Woodstock charger I can sell you. I just did inventory and have an extra one. BTW, I thought that several on this forum warned against using AA batteries because their extra length applies too much

pressure against the contacts of your Woodstock and can easily break them. I am considering going to Radio Shack and buying the shorter "AA" rechargeable batteries and stand-alone charger so a charger never needs to be connected to the calculator.

Re: Chargers for HP 25 calculator

*Message #5 Posted by **Randy** on 4 Jan 2006, 7:31 p.m.,*
in response to message #4 by Stephen Easterling

The standard AA cells with the button + end issues are in reference to Spices, not Woodstocks.

Woodstocks don't care so much about length but are incredibly sensitive to both bad connections and batteries when connected to a charger. Woodstock safety tip #0: Never charge the batteries in the calculator using the HP wall wart. Never. To quote the Drink Driving adverts: "You can't afford it".

Re: Chargers for HP 25 calculator

*Message #6 Posted by **Stephen Easterling** on 4 Jan 2006, 10:31 p.m.,*
in response to message #5 by Randy

Thanks for the clarification regarding the use of standard alkaline "AA" batteries in the Woodstocks.

I'm a little confused, then, about how to recharge the battery pack using the HP charger. (Of course, I should just go read my owner's manual!,... but I don't really use mine very much having recently acquired a 22 & 25.) Wouldn't you simply hook up the HP charger with the battery pack in the calc and turned off?

Re: Chargers for HP 25 calculator

*Message #7 Posted by **Hal** on 5 Jan 2006, 10:28 a.m.,*
in response to message #6 by Stephen Easterling

Hi Steve, As I recall, the output of the woodstock AC adapter is on the order of 12vac. It's then rectified in the calculator, and regulated by the battery pack. Hence the danger...if the battery pack develops an open for any reason (bad contact, bad cell, etc.) you will apply overvoltage (around 10-12vdc) to the calc. The only safe way you can use an HP ac adapter is to acquire one of those woodstock external chargers (they look like a miniature calc with no keys or display, and the battery pack goes where the keyboard would be). These external chargers have rectifier circuitry in them, and the ac adapter connects up to them in the same fashion as to a calculator.
In my 29c I just use NiMH rechargables from radio shack, and charge them externally (with a radio shack wall charger). They last a long time and work great. You just have to cut the center rail out of the battery pack to get the cells in and out.
You raise a good point, however, about charging with the HP ac adapter connected to the calculator and just leaving the calculator off. I don't know if this is safe or not.
Can anyone else address this issue...can you protect a woodstock from unsafe voltages from the ac adapter by simply keeping it switched off while the adapter is connected?
Thanks and best regards, Hal

Re: Chargers for HP 25 calculator

*Message #8 Posted by **Stephen Easterling** on 5 Jan 2006, 11:40 a.m.,*
in response to message #7 by Hal

I'll read my Woodstock manual tonight to verify what HP says was the proper way for recharging (back then, at least). However, I'm growing more and more interested in the idea of

just having one or two sets of Radio Shack rechargeable and external charging system. Since most of my HPs are for collecting, I'll just insert the Radio Shack batteries whenever I feel like rotating the calc in/out of rotation for use. How does this sound?

Re: Chargers for HP 25 calculator

*Message #9 Posted by **hal** on 5 Jan 2006, 12:13 p.m.,*
in response to message #8 by Stephen Easterling

The manual will say that the battery pack must be in the calculator when the ac adapter is connected, and that you can use the calc while the battery is charging. This is not the safe way to do it however, twenty years later if you want to maximize the life of your machine. Regards, Hal

Totally OT: (Pana)phone problem

*Message #1 Posted by **Marcus von Cube, Germany** on 4 Jan 2006, 12:04 p.m.*

I apologize! This totally off topic but maybe someone here can help.

A friend of mine has a telephone branded "Panaphone KX-T2838LM". It is working principally but he cannot dial out because the dialling hangs after the first "0", as if the phone waits for a carrier signal. Does any of you have such a beast and can check for me, which of the phone settings can be tweaked? I simply don´t have a manual and cannot find one on the net.

Marcus

in response to message #1 by Marcus von Cube, Germany

I have the model KX-A144EXS. Do you want me to check any thing in particular ?

Re: Totally OT: (Pana)phone problem

*Message #3 Posted by **Marcus von Cube, Germany** on 5 Jan 2006, 2:36 a.m.,*
in response to message #2 by inaki

Thanks for the reply.

I don't have any documentation about the possible settings of the phone which are accessible through the key sequence "set"+digit "1" through "6" (IIRC). The phone has a display which shows cryptic abbreviations for them. I only understand one setting about the length of the hook flash signal. All others are what we call "Böhmische Dörfer" (Villages in Böhmen), so to say, I've no idea what they mean.

Is there a setting which controls "wait for dial tone" or something like "direct connection" versus "connect trough PBX"?

Marcus

Re: Totally OT: (Pana)phone problem

*Message #4 Posted by **Frank Boehm (Germany)** on 5 Jan 2006, 3:53 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Versuche es einmal hier, evtl. koennen sie eine Anleitung als PDF schicken:

http://www.meiyi-hk.com

Wie immer kann man sich nie sicher sein, ob die das Telefon wirklich herstellen (eigentlich wuerde der Name auf einen anderen Hersteller schliessen lassen; die Firmen-Initialen stehen meist am Anfang des

Produktnamens) - ein Versuch ist es aber wert.

Zum Problem: es kann a) durchaus sein, dass das Telefon nicht in D betrieben werden kann oder b) das Telefon war vorher an einer Anlage angeschlossen, die ein dial-prefix "0" benoetigte - das funktioniert natuerlich nicht an einem direkten Anschluss. Vielleicht gibt es die Moeglichkeit, den Puffer-Kondensator / die Pufferbatterie kurzzuschliessen, um die Grundeinstellung zu bekommen...

[this post is *really* off topic, so I didn't bother translating it for your 8)]

HP33 programs?

*Message #1 Posted by **paul c** on 4 Jan 2006, 8:09 a.m.*

I saw an earlier post where someone was going to try to convert their existing programs for use on HP33 if they could find a simulator. Did this ever happen?

I'm in need of EE programs to help me save time on my PE exam this coming April. If anyone has HP33 programs for circuits/electrical engineering, I'd appreciate a link or post of them. The 3x3 solver listed in the HP33 manual--does anyone know if this routine handles complex coefficients?

As a postscript--the original poster seemed to hate the HP33 but was being very generous and kind and had concerns that good programs would lengthen the life of the HP33. I think I fall into the same boat as many--ie. being forced by NCEES to buy this model for use on PE exams because NO other programmable calculators are allowed...otherwise I'd be using my HP48G. So I don't think the HP33 will ever be as popular as HP41 or HP48 models--but until NCEES changes the approved calculator list, we're at their mercy.

If you have progs for HP33 or know where any can be found, I'd greatly appreciate a link or post. I've had very little luck in my searches.

Best regards,

Paul

Re: HP33 programs?

*Message #2 Posted by **Ron Ross** on 4 Jan 2006, 9:04 a.m.,*
in response to message #1 by paul c

Any programs you find for the Hp32s are also good for the Hp33s. This site has quite a few Hp32s programs. Look on the sidebar for programs.

I took the exam just last spring and was limited to the Hp33s also. No, it isn't in the same league as an Hp48g, but the test won't make extensive use of overly complex math. (Yeah, there were a couple of problems that would have been easy with a 48g as compared to difficult with the Hp33s). But everyone was hamstringed by this requirement. After you accept the fact that you won't get every problem right, just get as many right as you possibly can (and hope thats enough).

As far as loading up the caluclator with lots of programs, why bother? The HP33s has a solver (again, not nearly as nice as the 48g's), plug in a couple of known go to programs, punch the rest in as you need.

YOU WILL NOT NEED to solve any 3x3's with complex elements (or at least I didn't). My own advice would be to get the NCEES practice exam for the discipline you plan to take (electrical, isn't it?). Also buy the EIT/FE for the afternoon electrical exam. Many of the problems are quite similar.

And start using your books and resorces (I suggest going in with books you use). One problem, if you have a text book that you wrote in extensively in pencil, either erase or highlight those notes as the NCEES is even more ANAL about pencil marks in books than they are about Calculators (to put it in perspective). I left my

original EE text at home rather than erase or highlight every pencil mark. I bought a similar book used and in much better shape (and never used it either).

I suggest 2-3 handbooks, a couple of Schaums outlines (and you can write all you want in these books, but you must use an INK PEN. I suggest an erasable and write down any extra notes you wish. If you have pencil marks, they are okay, AS LONG as you HIGHLIGHT them with a marker (but again, I suggest INK so as to avoid ANY PROBLEMS).

Hope this information helps.

Re: HP33 programs?

*Message #3 Posted by **paul c** on 4 Jan 2006, 9:29 a.m.,*
in response to message #2 by Ron Ross

Ron,

Thanks for the info.

I didn't realize the issue with pencil marks. I'm glad you told me!

I have bought the NCEES sample exam, as well as one from Camara and the EERM. I've worked through the Camara and am shocked at how much 'theoretical' college type problems are in it as opposed to practical/everyday engineering ones. Is the real exam highly theoretical too? (for example, curls and divergence of E fields)

I'll be taking the EE exam. Which exam depth module did you take? Which Schaum's do you recommend? and which 'known go to programs' for the equation solver would you program?

I take it that you passed the exam first try?

Thanks again for your comments!

Paul

Re: HP33 programs?

*Message #4 Posted by **Ron Ross** on 4 Jan 2006, 10:38 a.m.,*
in response to message #3 by paul c

I took the Power portion as that is what I now practice. I debated long and hard on which I should take. I have a much longer history with controls (but no formal eductation), and a wife who is a Comp Sci weiny and had a fair grasp of the Computer section. I settled on Power because that would lend me the most status in my present position.

You don't have to decide until the exam is passed out and you choose at that time. They give you ALL three exams in the same booklet in the afternoon, you choose the one you like best. Ideally, you have studied for one and just go after that. As for myself, I had decided to concentrate on the Power portion, but I still looked at the other two exams and contemplated a last minute switch (and probably for the best that I did not).

You are NOT going to be presented with any HIGHLY theoretical problems. If you are spending more than 5 minutes getting set up for a problem, you are doing it Wrong! (there may well be a 10 minute problem or two on the exam, but skip them, most are 5 minute problems and no ONE problem counts more than the next). There were 2 or maybe 3 FFT problems (of which I probably missed all three,

though they were concept problems, not hard if you were sharp and know your FFT's) and maybe 2 or 3 EM problems (these were fairly easy).

I found a Schaum's on Power and another on EE, both of which were helpful for study. I also referenced them on a few problems.

Ideally (which isn't likely) you would buzz through the exam, only referencing the NEC code book on the few (3-5) questions on the NEC. However, the exam is so broad (the mornig exam is supposed to be broad, but even the afternoon exam has quite a bit of lateral material covered as well), that you should take an assortment of books. I took about 10. 3 handbooks, 2 or 3 texts, 2 or 3 Schaum's, 1 FE/EIT afternoon Electrical Exam practice book (found at Barnes & Noble), and the NCEES practice exam book (amazingly, it is very similar as they say, and it shows a sample exam of each electrical discipline as well).

As far as programming that miserable Hp33s, I did not bother. I did learn how to use its solver and its numerical integration features, both of which I did use on the exam. But I could have made use of the cheaper Casio Fx-115 just as easily.

While you could stuff a bunch of programs into the Hp33s, its retrieval system is awkward for any large amount of programs and you would best be sereved by learning a few extra new things and reviewing old rusty concepts you may have forgotten. And since you might damage or break the calculator and there being no way to archive or back up short of keying in one key at a time a program into a new calculator should the worst happen, I say forget about it!

Since the book shows how to program a 3x3 (which I feel is also worthless), I didn't bother to put anything in. (I probably had 3-4 equations for the solver).

Good luck! I am sure there are other's on this site who can also give you advice on this exam (there certainly are others far more knowledgable on this site).

Re: HP33 programs?

*Message #5 Posted by **paul c** on 4 Jan 2006, 12:04 p.m.,*
in response to message #4 by Ron Ross

Thanks again Ross for the additional insight.

In working the sample exams, I am working all three depth modules--because I figure regardless of which I take, some of the material is likely to be on the breadth portion anyway.

I will most definitely choose between the computer and electronics modules-- power is out of the question for me. Curious about what the FFT problems were like--if you recall. I've written a few of those so I may be OK on that part at least :).

I've been able to identify a couple of rough areas that I will be trying to bone-up on--transistors and motors/generators. Other than these two areas, most of what I learned 20+ yrs ago is coming back to me ok.

I'll quit worrying about programming the HP33 for now and look forward to getting back to the Hp48 after all is over with the PE exam.

Best regards,

Paul

Re: HP33 programs?

*Message #6 Posted by **brian healy** on 4 Jan 2006, 12:18 p.m.,*
in response to message #2 by Ron Ross

Ron,

What is the deal with pencil marks? I took the structures PE test back in 1997, and don't remember an issue with pencil marks. Just curious.

Way back then, the NCEES didn't have their wonderful calculator policy, so bringing my 32sII was ok, and so was my 11c as a backup. It's interesting that the 33s is ok, but the 32sII is not.

Re: HP33 programs?

*Message #7 Posted by **Ron Ross** on 4 Jan 2006, 12:42 p.m.,*
in response to message #6 by brian healy

The calculator policy and the pencil marks go hand in hand.

The NCEES has become so paranoid about cheating and removing exam questions from the site that they now restrict calculators to single letter variables (AT MOST, hench the upper limit is the Hp33s) and to simplify the adherance to this policy, only six calculator models are allowed. The proctors are given a sheet with pictures of the six calculators allowed, if yours doesn't look like one of the pictured calculators, you are not allowed to continue with the exam.

The pencil policy is such that you are not allowed to bring in a pencil (or any writing instrument). They furnish that. You are only allowed to write on the exam and scratch paper (I'm not sure about the scratch paper, you may be restricted to your test booklet). Either way, they then casually watch for anyone writing anywhere else. If you are found with pencil notes anywhere but in your work book, it is then assumed you wrote a note to take out of the exam ie the pencil marks in an old text. You will be kicked out unless it is obvious that the marks where there before the exam (hench the highlighter option).

Is it fair? Probably not. But the NCEES makes the rules and if you want to play the game, you don't have much choice. Gripe and Bi@%# all you want, but it will not affect their policies as far as I can see. The one concilation is that everyone has the same rules and playing field on today's exam. That earlier engineers had the use of fancier calculators may not be fair to you today, well, life aint always fair, is it?

I admit, I griped and whined too. But I managed to pass, so I suspect anyone with adequit preparation should be able to also.

Re: HP33 programs?

*Message #8 Posted by **Norris** on 4 Jan 2006, 1:14 p.m.,*
in response to message #7 by Ron Ross

There were only six NCEES-approved calculator models in 2005, but there are now nine NCEES-approved models for 2006. The HP-9S, -30S, and 33S are among them. Many other calcs, like the 11C or 32SII, would be acceptable from a security standpoint, but NCEES wants to keep the list of approved models short, to keep it simple for the exam proctors. They don't want to bother with calculator models that were discontinued years ago.

As indicated in another post, the "pencil mark" rule does not come from NCEES, and is not enforced nationally. Some state boards do have this policy, but others do not.

The idea is apparently to prevent examinees from copying down exam questions in reference books. Since you are not allowed to have pens or highlighters in the exam room, any notes in ink were presumably written before the exam, which is OK. But notes in pencil could have been copied during the exam, and are suspect.

Re: HP33 programs?

*Message #9 Posted by **GE** on 5 Jan 2006, 3:59 a.m.,*
in response to message #8 by Norris

This is amazing. Let's try to see if this works :
METHOD 1
step 1 : use your highlighter on blank spaces in your book - OK since nothing is written there
step 2 : use the NCEES-approved pencil to write down exam questions in the aforementioned areas
The result ? You abide by the rules, your writings are supposed to have been there in the first place, and you walk away with exam questions neatly written in your book (better use some form of code anyway).

METHOD 2 :
step 1 : find a dozen friends and assign different numbers to each
step 2 : each member remembers the question by her numbers
step 3 : walk away, and write down questions outside
Does this work ? I would expect NCEES people to brainwash everybody after the exam to fight this. Would be bad if they also erase the knowledge they expect you have of the subject.
While I HATE cheating (any flavor), all this seems to be such a waste of time.

Re: HP33 programs?

*Message #10 Posted by **Ron Ross** on 5 Jan 2006, 9:28 a.m.,*
in response to message #9 by GE

Great minds think alike.

Some Jack ASS in California is responsible for all this paranoia. That is why graphics calculators with I/O are no longer allowed.

The tests are to be taken by Engineers of good character. Cheating of any form is an immediate reason for dismissal. The PE exam is not supposed to be taken until at least four years of experience (both technical and ethical) are gained.

This test is to confirm a minimum competency. And if someone cheats on this exam or helps others to cheat on this exam could lead to drastic consequences in this area of engineering (for the public). The license is granted to the engineer to entrust him/her with public safety. Many engineers work fine without the license, you don’t need this license to be an engineer, unless you practice engineering on your own and for the public.

Therefore a cheat is potentially exposing the public (should he/she ever be in charge of a project that needs a PE seal) to undue hazard (there is always some risk, the PE is deemed competent by the State of licensure to be qualified to assess and minimize design risk and eliminate hazards).

I admit the fine line between competent and incompetent is hard to measure. In 1992 I took an NEC exam and only received a 69 (one point below passing). I hadn't taken the exam as seriously as I should have and immediately changed my methods and re-took the exam as soon as I was able. Was I extremely more competent 6 months later? No, not extremely more competent, but I was more competent and passed with a much higher score. I didn't need a lucky break to pass vs if I had received a 70, I wouldn't have invested that extra effort and corrected some of my own flaws.

My point is, that although the NCEES may be highly overeactive, and so many engineers of good character take this exam, it is a shame that some of lesser character ruin or make reason for these rules.

Re: HP33 programs?

*Message #11 Posted by **Wayne Brown** on 5 Jan 2006, 11:32 a.m.,*
in response to message #9 by GE

Here's what I wish I could do: Get people with photographic memories to take the various exams, have them write down exact copies of all the exams afterward, and post them anonymously on the Internet. That would force the NCEES (at great expense and inconvenience) to throw out all the old test questions and come up with completely new exams. Perhaps that would be a little payback for all the expense and inconvenience of people who've had to replace perfectly good HP calculators with inferior models for these tests.

Re: HP33 programs?

*Message #12 Posted by **Ron Ross** on 5 Jan 2006, 12:04 p.m.,*
in response to message #11 by Wayne Brown

And that great group would go the effort to make a completely new, but equal exam?

Tests (good tests) tend to evolve. That is why these testing agencies try to re-use older exams (although they should damn well change the values, etc). A completely new question may be such that 99% of all applicants either answer it correctly or miss it entirely. Is that a fair question on such a test (if the test group is normal, that is). That is the main reason the NCEES doesn't want to introduce new questions for every exam. Making up a new test is costly, but it may also be statistacly irrevelent if the intended audience cannot achieve the same passing rates as prior testees (or everyone passes, including many who shouldn't).

That is the big gamble you would then introduce into the system should you succeed with your plan.

Re: HP33 programs?

*Message #13 Posted by **brian healy** on 5 Jan 2006, 9:17 a.m.,*
in response to message #7 by Ron Ross

After reading all of the posts in this thread, all I can say is that I'm glad that I took the test (and passed) back in the old days of 1997. Maybe NCEES should ban all calculators and only allow slide rules or an abacus.

Re: HP33 programs?

*Message #14 Posted by **Norris** on 4 Jan 2006, 12:52 p.m.,*
in response to message #1 by paul c

A few comments on the 33S and the PE exam:

(1) You can buy commercial 33S software for the Electrical PE exam at newcalc.com. Cost is $79 for software alone (you provide the 33S and enter everything manually), or $195 for a pre-programmed 33S.

(2) The value of such software on the PE exam may be questioned. In my experience (with the Civil exam), most PE exam problems are not difficult to solve mathematically; the challenge is simply to recognize and apply the appropriate equations. I have put a few programs in my 33S, but they are primarily simple, commonly-used functions for convenience (e.g. area of a circle, coefficient of lateral earth pressure).

(3) The "no pencil mark" rule does exist, but only in certain states; it is not an NCEES rule, and is not required nationally. Some state boards currently have this rule (e.g. Texas), while others do not (e.g. California).

But even if your state allows pencil marks, it's probably best to use ink, because your state board or NCEES could change their policies in the future. I use only ink, even though I am in California, where pencil marks are currently allowed.

OT: but "HP33 programs?" related

*Message #15 Posted by **Ed Look** on 6 Jan 2006, 10:40 a.m.,*
in response to message #14 by Norris

I really have no business in this thread and others like it and I normally just read them as there are intelligent ideas of all kinds.

But I noticed at the newcalc.com site that in their photo of their 33S, an alpha(betic)numeric name/label/message is displayed.

I wasn't aware that can be done with the 33S (a la 48 or 49 series calcs)!

How DOES one enter an alphanumeric string? I'd really appreciate knowing how to do that.

Edited: 6 Jan 2006, 10:41 a.m.

Re: OT: but "HP33 programs?" related

*Message #16 Posted by **bill platt** on 6 Jan 2006, 11:03 a.m.,*
in response to message #15 by Ed Look

Hi Ed,

It is easy to put alphanumerics into not only the 33s, but the 32sii as well. If you are in a program, you set the appropriate flag (10) to treat the equation as a message. You use STO {A...Z} or RCL {A...Z} to put the alpha characters into the equation--the same way that you use when you write an equation for evaluation.

You can also put dummy equations into the equation list--to act as title headings. In this case, there is no flag required. (The example at newcalc appears to be this latter case).

The 32sii had a lot of interesting ideas--this one included--that could never really be taken advantage of because of the pitifully small memory.

The 33s is much better than the 32sii in this respect. Really worth it--if you want to have a machine

that you can program without erasing everything first.

in response to message #16 by bill platt

Hey Bill!

Thanks!

Is this in the 33S manual? I didn't see it, but I'll have to also admit that I did not comb it deeply like I used to when I used the 34C in college.

If this is in the 32SII manual, then I figure I should have seen it there, too, for as it turns out, they are really the same manual, just about. But I did look there when I couldn't find it in the 33S manual.

Maybe I just missed it; I'm definitely going to check it tonight or this weekend!

Re: HP33 programs -- alphanumeric strings in EQNs

*Message #18 Posted by **Paul Brogger** on 6 Jan 2006, 2:32 p.m.,*
in response to message #15 by Ed Look

While programming, enter EQN mode.

To enter a letter, while in EQN mode, type (for example) RCL A (that is, **RCL** key, then **e^x** key).

The equation editor is pretty primitive, but you can get some usable text in this way.

To keep the equations from being evaluated in normal execution, I test Flag 10.

I comment the beginning of all my programs this way. So, for example, my vector cross-product routine starts with:

```
X0001  LBL X
X0002  FS? 10
X0003  VECT X PROD          (eqn)
X0004  ...
```

If Flag 10 is set, the equation is displayed. If clear, the equation is bypassed.

Enjoy.

in response to message #1 by paul c

Paul,
Regarding the thread about converting programs for use on the 33S, the original poster was our friend Valentin Albillo. Sadly, the conclusion seems to have been that the emulator could not be provided to Mr. Albillo, so no programs were converted for use on the 33S.

Regarding the exam itself, I see that Ron and Norris have provided a lot of good advice. The format and process has changed a bit since I went through it *a few* years ago. I had the luxury of taking a 15C, 29C and 45 into the test with me. One thing I'll point out regarding seeking and giving advice, the NCEES (of course) has rules regarding what information a veteran of the test can give to a potential test-taker. For example in this document available at the NCEES web site under the heading **Examination Irregularities**, the following statement is made:

> Quote:
>
> Irregular behavior includes....possessing, reproducing, or **disclosing** exam questions, answers, or **other information** regarding the content of the examination without authorization before, during, or after the exam administration.

Not sure where the line is regarding how much a veteran can say, but based on their calculator policy, my guess would be it might seem pretty restrictive to most people. I don't see how Ron or Norris could have crossed that line with their responses, but it is something to consider.
Best regards and good luck on your exam!
Jeff

I am a veteran of the NCEES FE exam, two California-specific Civil PE supplemental exams, and three California PG (geologist) exams. However, I have not yet taken the NCEES Civil PE exam; I plan to do so in April 2006.

Since I have never taken an NCEES PE exam, I am not in a position to disclose any inappropriate information. My comments are based on my experiences with the publicly-available NCEES Civil PE sample exam and PPI review materials.

Re: HP33 programs?

*Message #21 Posted by **paul c** on 4 Jan 2006, 4:02 p.m.,*
in response to message #19 by Jeff O.

Indeed, lots of good advice and responses here. Thanks to all who took the time.

I didn't see anything about pencil markings on the document you linked to, nor have I seen anything on my state's (AL) website that would suggest it is not allowed. However, better safe than sorry.

Reading their rules--THIS should be the definition of ANAL in the dictionary. I can't see what the big deal is about bringing an eraser or your own pencil--or even a chair! Why on earth they have these crazy restrictions is beyond logic--but like was said above-- gotta play by their rules so b#tching about it is a waste of time.

I'm going to do my darnedest to pass the first time! Any advice that ll help me to that end I APPRECIATE.

Thanks again everyone!

Paul

*Message #22 Posted by **Norris** on 4 Jan 2006, 6:17 p.m.,*
in response to message #21 by paul c

My favorite rule is the California Board's ban on digital watches. You can bring a watch -- and it's a very good idea to do so, because the exam rooms may or may not have visible clocks -- but it absolutely *has* to be analog.

Yet strangely, the California Board is much more relaxed than NCEES about calculators. California still allows any non-QWERTY calculator (HP41C, HP42S, HP48, TI89, etc.) on state-specific (non-NCEES) PE and PLS exams. They only enforce the NCEES calculator rules on NCEES exams. So it is still possible to become a PE in California in certain disciplines (e.g. traffic or geotechnical) with an HP48.

California's casual attitude toward calculators is even more remarkable when you consider that the California Board actually caught an examinee with a graphing calculator that was modified to contain a built-in scanner.

97 key lettering wearing off?

*Message #1 Posted by **Hal** on 3 Jan 2006, 11:57 p.m.*

Hi Folks,
The seller of this 97 says the lettering is starting to wear off of the enter key. I thought these keys were injection moulded, meaning the lettering went all the way through the key.
Comments anyone?
http://cgi.ebay.com/HP-97-Programmable-Calculator-Adapter-Charger-Battery_W0QQitemZ5848417344QQcategoryZ58039QQssPageNameZWDVWQQrdZ1QQcmdZViewItem
Thanks, Hal

Re: 97 key lettering wearing off?

*Message #2 Posted by **David Ramsey** on 4 Jan 2006, 12:10 a.m.,*
in response to message #1 by Hal

You're correct; the key lettering can't wear off. I've seen 97s where the "Enter" key was noticeably worn down in the center from being used so much, and the lettering was clear. I imagine the key is simply dirty.

Re: 97 key lettering wearing off?

*Message #3 Posted by **David Smith** on 4 Jan 2006, 12:56 a.m.,*
in response to message #2 by David Ramsey

Actually, it can wear down... or at least appear to do so. I have had to fix several HP97 keyboards where the white part of the keys (mainly the right hand keys) has deteriorated. I flood the key with a white paint and remove the excess with a cloth and some white gas.

Help with non-functioning HP-9825

*Message #1 Posted by **Bill (Smithville, NJ)** on 3 Jan 2006, 6:06 p.m.*

I just picked up a clean HP-9825 - but of course it doesn't work. The fan runs, the keyboard shift key lights, there are lights in the tape drive slot, but the display remains blank.

I'd appreciate any direction on where I should start. I have the Museum DVD and it has the 9825B service manual - I'll be printing it out later this weekend. But just wondering if there were obvious places I should start with first.

The unit says 9825B on the outside cover and 9825B inside the flip up cover over the printer, but also says it has 61670 bytes of memory. Does that make it a 9825T or just a B with more memory.

It also came with several tapes, but I'm assuming that I would probally need to rebuild the tape drive before attempting to use them (of course only after I get the basic opertion working first before playing around with the tape mechanism.

Thanks for your help. It should make for a fun winter project.

Bill

Re: Help with non-functioning HP-9825

*Message #2 Posted by **Tony Duell** on 4 Jan 2006, 6:18 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

IIRC the HP9825 service manual is a boardswapper guide with no real troubleshooting info. You can get 'my' schematics either on the HPCC CD-ROM or from the Australian Site. I can't remeber exactly which version I covered, but I think all the boards will be included.

I would start by checking the PSU voltages, then check the processor clock (be warned, this circuit is somewhat unconventional, there is 'jitter' on the processor clock to reduce RFI emissions), then look for activity on the processor bus.

Re: Help with non-functioning HP-9825

*Message #3 Posted by **Bill (Smithville, NJ)** on 5 Jan 2006, 7:12 a.m.,*
in response to message #2 by Tony Duell

Hi Tony,

Thanks for the info. I think I do have the HPCC CDROM's somewhere, so I'll look up your schematics.

I'll have to get a friend to help me out with checking the clock. I don't have the test equipment, but he does.

Thanks,

Bill

HP34C Fault

*Message #1 Posted by **Mike T.** on 3 Jan 2006, 4:52 p.m.*

At the start of the Christmas break I took the opportunity to swap cases/boards in my HP33C and HP34C. Fortified with the knowledge I'd gathered from this forum and heedful of the warnings I'd seen I approached this task very carefully and with some trepidation.

In the case of the HP33C I only had the case from my original unit which had died about 20 years ago, it had been of sandwich construction and had become so umrelaiable as to be totally unusable. I did try to solder the chips to the circuit board to rectify things but with no knowledge on how vunerable NMOS was to anti static damage it was almost enevitable that it never worked again. This time I made sure I used an anti-static mat, wrist strap etc!

I'd kept the case in the hope that one day I would be able to obtain another well worn HP33C second hand to be able to use to 'repair' mine. Thanks to the assistance of others on this forum I was able to do so and having swapped the cases I now have a very nice clean unit, which is back where it belongs - in my breifcase.

My HP34C was however rather well worn and had started to look a little sad, and though it still functioned perfectly well I obtained another better looking unit as a spare, just in case. I found that this unit though in very good cosmetic condition was also showing signs of its age and in particular the keyboard action was not quite as crisp or positive as my older unit.

So having successfully swapped the cases of the HP33C I decided to do the same with the HP34C. On opening up the units I discovered that someone had lovingly and very carefully carried out some quite extensive repair and restoration work on the spare unit I had aquired to restore it to working order. I expect this machine though well looked after had been quite heavily used which explains why the key action on some keys didn't feel as positive or as crisp as my other machine - though they are both of the sandwich type construction.

Again I successfully swapped over the cases and how have a very nice HP34C on my desk at home (it is just too complicated, and heavy to carry round with me!).

No problems thus far, however, in the last couple of days the donor machine seems to have developed a faulty contact somewhere that prevents the B, GTO, ENTER, -, +, X and / keys from working.

The affected keys are all obviously all in the the same collumn so I'm proabably looking for just one bad contact somewhere. I know it works as it still passes it's self test - but only if I push the processor chip against the circuit board quite hard.

One thing I did notice was that the donor machine had thin rubber(?) membrane over the key contacts while my original did not. I kept the membrane with that front panel when reassembling the machines and as as a result the donor system is now in my old case without a membrane covering the keyboard contacts. I suspect that this _might_ be the reason why it has stopped working properly.

I have two questions -

Does anyone know what the membrane is made of and how thick it is..?

Where should I look for the faulty contact?

Thank you

Mike T.

Re: HP34C Fault

*Message #2 Posted by **Tony Duell** on 4 Jan 2006, 6:24 a.m.,*
in response to message #1 by Mike T.

As you correctly guessed, those keys are all one column. The keyboard rows and columns go to pins on the 40 pin processor chip, so I would suspect a bad contact there first. If you're _very_ unlucky, it'll be a problem in the keyboard flexible PCB where it's wrapped round the metal plate, but I've never had this.

You might want to get the HPCC schematics CD-ROM (or ask Dave Colver nicely for the appropriate diagrams). This disk contains a reverse-engineered schematic for the 33C. All -C spices have essentially the same schematic (different chips, and different keyboard buttons...), so this will be useful to you in finding just which pin of the processor corresponds to that column.

Re: HP34C Fault

*Message #3 Posted by **Mike T.** on 5 Jan 2006, 8:19 a.m.,*
in response to message #2 by Tony Duell

The processor chip has been soldered on to the circuit board (obviously to overcome the intermittent contact problems that my original HP33C suffered from). Before I risk making things worse by prodding about to see if any if I can find any dry or cracked joints I'd like to know if the problem could be a connection lose between the two layers on the keyboard side...?

Does anyone know how to I get hold of HPCC schematics CD-ROM?

Thanks.

Mike T.

HPCC Schematics CD-ROM

TI-89/Voyage 200: worthy successors to the HP-71B ?

*Message #1 Posted by **Vincent Weber** on 3 Jan 2006, 4:36 a.m.*

Hi all,

I recently got the opportunity to play with a TI-89 and a TI Voyage 200, and especially to have a closer look at TI-basic.

I was pleasantly surprised to see how powerful and simple to use this basic is, and then I had another look at Valentin Albillo's interesting pages on the HP-71B basic/math rom.

Well, the two systems seem to have a lot in commun! And I thought that, for those who legitimately regret the death of the fabulous Titan, buying a TI-89 titanium or a Voyage 200 may be an option worth considering.

TI-basic, just like the basic of the HP-71B, allows user-defined functions which can operate on several data types, seemless integration of matrixes/complex numbers, full recursion, and local variables. I have to admit that it is much simpler to use than UserRPL, and, unlike UserRPL, you do have simple ways to break a loop (Cycle/Return).

Looking at Valentin's pages, it seemed to me that programs could be ported from the HP-71B to the TI-89/Voyage 200 with some adpatation, but not a complete re-writing, like it would be to port them to the 48/49 RPL family.

Compared to the HP-71B:

- You don't have a qwerty keyboard (well, you have in the Voyage 200, even if it is somewhat bulky) with BASIC keywords shortcuts, but you have an efficient menu system to key in BASIC statement fast,

- You don't have module expandability, but plenty of flash memory to download third-party applications,

- You don't have an HP-IL to control a plotter, but you have a graphic screen, which allows easy matrix edition, spreadsheet computation (Cellsheet), and also allows several BASIC lines to be seen at once. One of the major acknwoledged drawback of the HP-71B was the single-line display.

- You don't really have the equivalent of Lex files, but you have access to 68K assembly development, which can expand the calculator functionality greatly.

All in all, I apologize for praising TI on a HP forum, but I found TI-89/Voyage 200 a pleasure to use, with comparable power to the HP-49, but easier to use, especially to those who prefer BASIC to RPL. And they are sold today... The Voyage 200 is bulkier than the HP-71B, but the TI-89 (Titanium) fits in a much smaller package !

My 2 cents,

Vincent

Re: TI-89/Voyage 200: worthy successors to the HP-71B ?

*Message #2 Posted by **Garth Wilson** on 3 Jan 2006, 5:22 a.m.,*
in response to message #1 by Vincent Weber

I see the TI more as a supercalculator (all one word), whereas the HP-71 is more of a hand-held computer. The 71 is not that practical as a calculator. For a calculator, I usually use my 41. I have used both the 41 and 71 however to control a lot of professional laboratory equipment. Without that capability, the TI and most other HPs are just calculators. That's all.

I have never had much use for a graphic LCD, but I do have the 80-column video adapter, and have used the Thinkjet printer with the 71 to print graphs I needed to keep on file.

Re: TI-89/Voyage 200: worthy successors to the HP-71B ?

*Message #3 Posted by **hugh steers** on 3 Jan 2006, 12:01 p.m.,*
in response to message #2 by Garth Wilson

hi guys,

did hp ever consider re-making the 71b into a handheld a bit like they (sort of) remade the 41c into the 42s? 71b basic is indeed very nice, and it makes a good alternative for those not wanting to battle with rpl.

call this the 72s. it would be pioneer form factor but with a 2 line display, 16k ram plus some 71b roms preloaded (eg math rom) and maybe a tad faster. it would have a re-implemented "calc" mode that makes it functional as a regular calculator. the rest would be the same.

this would have been easy and could have been on sale a decade before ti. its almost still worth doing.

any comments?

Re: TI-89/Voyage 200: worthy successors to the HP-71B ?

*Message #4 Posted by **Howard Owen** on 3 Jan 2006, 12:37 p.m.,*
in response to message #3 by hugh steers

I doubt that 71B BASIC, as nice as it was for the time, would be competitive in a modern calculating device. But an updated BASIC upwardly compatible with the 71B would be cool. It's not like there's a huge library of stuff for the 71B, but there are one or two nice things. And some of the ROMs are very nice indeed.

I think it's amusing that everyone has such divergent ideas on what would constitute the "ideal" calculator. It's the strength, as well as the curse of software that it is not fixed in place like physical things. It occupies a partly platonic realm between idea and matter. So people can let their imaginations roam. That's wonderful for coming up with new ideas for this or that, and we've all seen the benefits and drawbacks of that facility. But another downside is that it can be very tough to provide certain products when the users can imagine so many different "ideal" machines.

I somehow can't create an account over at OpenRPN so I can join their discussions, but I'm hoping that the "Open" means you can implement a variety of operating systems on their hardware. I know they are looking at LUA as a systems language. That's very extensible and flexible. It would be nice to have the software platform wide open so others could implement their dream machines on the hardware.

Regards,
Howard

*Message #5 Posted by **Ron Ross** on 3 Jan 2006, 12:47 p.m.,*
in response to message #3 by hugh steers

Hp95lx, Hp100Lx, Hp200Lx and then spiraling downward from there.

These machines lack an Hp-IB interface, but had an RS-232 port and lots of other enhancements that made them an equal (or better) in many ways over the older Hp71B. Especially the step from the Hp95Lx to the Hp100Lx. The Hp100Lx was truly a portable PC with the customability of a small PC. It was DOS based and also had a built in spreadsheet and a built in Hp19B calculator with the spreadsheet tie in.

I feel the quality wasn't quite as good as an Hp71B, but these palmtops were quite capable and still well made.

From a controls aspect I suspect there is a wealth of interface capabilities for the Hp71B, but DOS based controls are also plentiful and RS-232 based hardware is going to be a lot cheaper and easier to acquire.

Although the form factor of my 41 is nice, I was glad for the 2/3 size QUERTY keyboard of the 71. I did an awful lot of typing on it at 30wpm in the 1980's and decided I better take it easy when they discontinued the 71 and wearing out the keyboard would have presented a bad situation. Using a lot of LEX files I was able to write a really nice text editor that was optimized for the small display. An important ingredient was to make it so this tiny window could be moved nimbly around your work.

A keyboard I have no experience with but looks like an ideal, fast, small, one-hand alternative to the QWERTY keyboard is the FrogPad, which you can see at www.frogpad.com . I'd like to see that become somewhat of a standard (although not at FrogPad's high prices). They say that with practice, you can get to 40+ wpm on it.

> Quote:
>
> 16k ram plus some

The 71 came with 17K of RAM, but many owners added many times that much. I have an additional 160KB in mine, and would have gone for more if it fit within my budget at the time.

> Quote:
>
> it would have a re-implemented "calc" mode that makes it functional as a regular calculator.

The 71 did have a calc mode, but I didn't like the way it worked. So the few times I have used the

71 as a calculator, I just left it in BASIC command-line mode.

> Quote:
>
> But an updated BASIC upwardly compatible with the 71B would be cool

That was one of the great things about the 71-- the BASIC could be expanded by the user. I have a load of LEX files adding somewhere near 200 new keywords and features or extending the ones in the "mainframe", but I never did get the module (or LEX file) that gave things like the multi-line CASE statement.

> Quote:
>
> I think it's amusing that everyone has such divergent ideas on what would constitute the "ideal" calculator. It's the strength, as well as the curse of software that it is not fixed in place like physical things.

The 71 did basically allow for this on the software side, although there wasn't much you could do with the display unless you connected an external monitor (which I have but seldom use). I did write routines in Forth to display two lines in the LCD using only four dots' height per line and no space between, but did not do much to integrate it into other parts of the software to make it more practical. I had 2x33 and 2x44, vertically scrolling.

I have HP's Forth/Assembler module and used the Forth quite a bit. The ironic thing is that although the 71's BASIC is the best I've ever seen (IMO much better in some ways than their Rocky Mount BASIC which I also used on bigger HP computers), their Forth is the worst I've ever seen. Fortunately, since it's Forth, I was able to speed up a lot of things and extend it.

> Quote:
>
> From a controls aspect I suspect there is a wealth of interface capabilities for the Hp71B, but DOS based controls are also plentiful and RS-232 based hardware is going to be a lot cheaper and easier to acquire.

The RS-232 lab equipment is a bit cheaper than HPIB, but there's not much available in RS-232. I do use RS-232 on the workbench (and have the FSI dual RS232/HPIL interface), but the major disadvantage with RS-232 is that you need a separate interface for each piece of equipment you want to connect to because there's no loop like HPIL or star connection system like HPIB has. Most HP hand-held users apparently don't realize that with the 82169A HPIL/HPIB interface converter, there are hundreds, if not thousands, of models of professional laboratory equipment that can be connected to an HP-41 or HP-71.

I expect that the ability to display more at once is on everyone's wishlist. With the tape drive, the disc drive, and large 3rd-party memory modules, I'm sure very few people used the 71's card reader. That space would have been better spent on a longer LCD. And speaking of LCDs, virtually all the off-the-shelf intelligent character modules start at 5mm character height. Why so big? Did you ever see a newspaper or magazine use such big characters for their normal text? No. Going to something even slightly smaller would have easily given two lines (and longer ones to boot) in the same amount of space.

Another thing I would have liked in the 71 would be a more mainstream processor. Of course at the time the way HP did it made sense. They wanted to minimize power use while maximizing the floating-point math performance using existing technology.

Although few people filled their 71's memory map, current low memory prices would warrant a much bigger memory-- not for bloated programs, but for data.

I think openRPN mostly has the right idea.

I have a load of LEX files adding somewhere near 200 new keywords and features or extending the ones in the "mainframe", but I never did get the module (or LEX file) that gave things like the multi-line CASE statement.

The JPC ROM adds a multiline SELECT/CASE statement, plus lots of other good stuff. I've only used it in JF Garnier's and HrastProgrammer's emulators, though. It ought to be possible to extract the code from the ROM image into a free-standing LEX file. But the RAM requirements would be steep.

Anyhow, with that ROM, the 71B's BASIC really does start to rival RMB, in my estimation. Otherwise, the lack of long variable names and real control structures takes it a couple of notches below that, again in my opinion. Still, I do have fun coding on the little guy.

> Quote:
>
> I expect that the ability to display more at once is on everyone's wishlist. With the tape drive, the disc drive, and large 3rd-party memory modules, I'm sure very few people used the 71's card reader. That space would have been better spent on a longer LCD.

I have some developer docs for the 71B that carry a cover letter from HP stating that the code documented is now available on cassette tape, since you told us you don't want cards. I think very few of the card readers were sold. They are relatively rare on the market now, and I suspect that's why.

A modern BASIC handheld calculator could choose from a variety of display sizes. The TI92+ (and the Voyager, which I do not own) has a whopping big one, as do the high end graphing from the other manufacturers. Something smaller might be nice for a calculator form factor, though.

But I use my HP-IL ISA card and HP's HPILLINK software when I want to do real work on the 71B. It has its drawbacks, but "LIST" isn't a cruel joke at 80x40. 8) And as nice as the 71's keyboard is, my workstation keyboard is way better.

> Quote:

paper clips & broken Spice battery terminals ....

*Message #1 Posted by **erik** on 2 Jan 2006, 5:02 p.m.*

Hi, all ... once again into the breach, this time regarding the Spice series. I've got nine of them that either have one or both of the battery terminals broken off. I myself am not interested in repairing them, I just want to see if the wee things still work. I'm thinking of getting a two-AA battery holder from Radio Shack, attaching some alligator clips to the leads, poking a paper clip into the rivet hole of the broken terminal, attaching the clips to the paper clip and seeing what happens. Does that sound like a promising idea?

I'm also curious as to what it was with the Spice series that caused these battery terminal problems. Seems to have been a not uncommon occurance with the series.

In other news, I fired up my HP-19C and it came to life brilliantly, with even the printer working and printing with no muss no fuss. OTOH, I have an absolutely pristine HP-10 (sans battery cover, drat) that I can't get an ounce of life out of; I find this very distressing, because something as graceful-looking as the HP-10 should never ever die. Bummer.

Anyway, thanks for any further help anyone might care to offer.

erik

Re: paper clips & broken Spice battery terminals ....

*Message #2 Posted by **db (martinez, ca.)** on 2 Jan 2006, 6:38 p.m.,*
in response to message #1 by erik

Use aluminum foil and regular batteries. Don't reverse the polarity. It was another example of bad design; a springy but corrodable metal that was badly plated with chrome or something. The batteries leak, get into cracks in the plating, and there goes the spring. A stainless clip would have worked better. They needed a real door too.

Folks left the batteries in for 3 reasons:
1) So the battery door wouldn't fall off.
2)So they wouldn't loose the special hp battery pack that they were meaning to rebuild someday.
3)Lazyness.

The "budget" RPN manufactures like Corvus and Privileg had positive doors and used off-the-shelf AA cells so one did not have to leave bad batteries in the unit.

Re: paper clips & broken Spice battery terminals ....

*Message #3 Posted by **Jan** on 3 Jan 2006, 6:55 a.m.,*
in response to message #1 by erik

Hi Erik,

You can also try to weld some new metal springs made of parts of a paperclip to the connection points. I did

that years ago on my HP-34C and it has been working ever since until the present day. The 34C was my first HP calculator (bought in 1983) and I have used it quite intensively during my highschool years and later on at university. One original spring came off after 5 years of rough treatment by a youngster, but this was easily fixed in the way mentioned above here.

regards Jan

*Message #4 Posted by **Doug T.** on 3 Jan 2006, 8:52 p.m.,*
in response to message #1 by erik

Hi Erik,

Although it sounds like you're not up for repairing them yourself, some folks may not be aware of Katie's great fix for busted Spice battery terminals:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv007.cgi?read=14438#14438

I've revived a BUNCH of Spice units this way, and it works great. Which reminds me, I need to order some more of those teeny-weeny screws & nuts from Small Parts.

Regarding your proposed testing procedure, it should work fine - just watch the polarity, naturally. Hopefully the problems with your calcs are limited to broken terminals, and not caused by corroded flex connectors or other nasty, difficult-to-repair internal damage.

Good luck,

Doug

HP-41CX - Clock does not appear!

*Message #1 Posted by **Tom Summer** on 2 Jan 2006, 3:18 p.m.*

I have a problem with my hp-41cx: the clock will not appear after I clicked 'Shift' and 'On'. the hp-41 however obviously is on, because after the next click 'On', I can turn it on again and/or it would accept the 'DELETE' function per '<-'. the clock itself works, which means the command 'TIME' gives the current time into the x-register and all other functions of the Time-module work properly, too. What to do to display the clock permanently? Probably one component on the platinum is defective - only which one? Can anyone help?

Re: HP-41CX - Clock does not appear!

*Message #2 Posted by **Gileno** on 2 Jan 2006, 3:23 p.m.,*
in response to message #1 by Tom Summer

new batteries! ! ! ! :-)

Re: HP-41CX - Clock does not appear!

*Message #3 Posted by **Tom Summer** on 2 Jan 2006, 3:26 p.m.,*
in response to message #2 by Gileno

Just kidding, ehh?? Of course the batteries are new, all functions of the calculator work properly - even the card reader, which has the highest power consumption.

Edited: 2 Jan 2006, 3:26 p.m.

Re: HP-41CX - Clock does not appear!

*Message #4 Posted by **Randy** on 2 Jan 2006, 4:05 p.m.,*
in response to message #3 by Tom Summer

Try reseting it. Warning: This will clear memory.

1. Turn the unit off
2. Press and hold the backspace key
3. Press and release the ON button
4. Release the backspace key

The unit should now be on and display MEMORY LOST

Re: HP-41CX - Clock does not appear!

*Message #5 Posted by **tom summer** on 3 Jan 2006, 6:19 a.m.,*
in response to message #4 by Randy

Hi Randy,

Thank you. I did this already before I posted the problem. MEMORY LOST appears. Unfortunately without further success.

Best wishes, Tom

Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2006, 9:45 p.m.,*
in response to message #1 by Tom Summer

Hi, Tom;

if your answer is "No, I do not allow you a silly question!", please, do not read... It may be considered a silly question, anyway! <8^(

although it seems silly, I cannot help asking it: are you sure it is an HP41CX?

Please, prior to blame me for that question, just let me ask a few others: Is it a newly bought unit, that you have never used before? Did [SHIFT][ON] work properly before? Have you tried [CAT] 2 and checked for the headers-only, CX-style catalog output?

I'm asking these all because it is not hard to hardwire the Time and the X-Functions modules inside a regular HP41CV and 'transplant' its guts to a CX case.

Again, please, if this is not the case, forgive me. I have seen some weird 'hacked' models that called my attention to what can and cannot be done...

Will you forgive me?

Cheers.

Luiz (Brazil)

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #7 Posted by **tom summer** on 3 Jan 2006, 4:34 a.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thank you for your posting. I never would quote it as a silly question, because I did a transplantation from CV to CX and viceversa with other hp-41's, too. But this one is a genuine HP-41CX. [CAT2] shows the CX-ROM Version and the extended CX funktions.

In another post I learned that disconnecting the cardreader without shut off the HP-41 could cause this problem. I bought this one used, so I did not know anything about its 'history'.

Best Regards, Tom

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #8 Posted by **Francois** on 3 Jan 2006, 3:23 p.m.,*
in response to message #7 by tom summer

Hi Tom,

Try the CLOCK function. I think it works like the SHIFT ON.

Best regards

François

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #9 Posted by **tom summer** on 4 Jan 2006, 3:59 a.m.,*
in response to message #8 by Francois

Bonjour François,

I tried this, too. But the command [CLOCK] shows the same effect - same problem.

Thanks, Tom

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #10 Posted by **Chan Tran (USA)** on 4 Jan 2006, 9:29 a.m.,*
in response to message #9 by tom summer

When you xeq the clock function what happened? Just nothing happened or the calculator display "nonexistent"?

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #11 Posted by **tom summer** on 4 Jan 2006, 9:38 a.m.,*
in response to message #10 by Chan Tran (USA)

Hi Chan,

the function [XEQ][CLOCK] causes the same effect as [SHIFT][On]. The display becomes empty: no signs, no characters. Pressing [<-] the display shows the content of the X-Register again.

Thanks, Tom

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #12 Posted by **Michel Beaulieu** on 4 Jan 2006, 8:48 p.m.,*
in response to message #11 by tom summer

I think you will have to open the calculator in order to "celan" the contact between PCB's. In fact, just opening it and moving the two halves of the calculator can fit it! PAY ATTENTION to plastic posts; the yare very fragile so don't screw them in to much...

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #13 Posted by **Tom Summer** on 9 Jan 2006, 3:48 p.m.,*
in response to message #12 by Michel Beaulieu

Hello Michel,

last weekend I opened the calculator again and cleaned the contacts. No success. But another phenomenon became obvious: Once pressed [Shift][On] or [XEQ][CLOCK] the calculator cannot be shut off totally anymore?!? After [Off] any key turns the HP-41CX on and further to that: [<-]+[On] does not lead to 'MEMORY LOST'. To make the calculator working normally, batteries have to be removed for a few seconds. But the above mentioned problems (no clock ...) remain.

Best regards, Tom

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #14 Posted by **Hans-Joerg Gessler** on 11 Jan 2006, 1:21 p.m.,*
in response to message #13 by Tom Summer

My question: Did the "BAT" indicator appear in the display? - With my 41cx it's exactly then that the clock won't be displayed (for avoiding too much power consumption)! In my opinion you possibly & simply should recharge the batteries or replace them by new ones.

Good luck, Hans-Joerg

Re: Allow me a silly question? (was: HP-41CX - Clock does not appear!)

*Message #15 Posted by **Tom Summer** on 14 Jan 2006, 5:58 a.m.,*
in response to message #14 by Hans-Joerg Gessler

Hi Hans-Jörg,

the BAT-Indicator is off. I used new batteries (let's say, they were sold to me as new ones ...). Does it also occur when the BAT-Ind. is off? If so, I'm going to buy new batteries.

Best regards, Tom

Re: HP-41CX - Clock does not appear!

*Message #16 Posted by **David Smith** on 13 Jan 2006, 12:15 p.m.,*
in response to message #1 by Tom Summer

I have seen this when either the clock crystal or the 22 megohm resistors in the clock circuit are bad.

Re: HP-41CX - Clock does not appear!

*Message #17 Posted by **Tom Summer** on 14 Jan 2006, 6:02 a.m.,*
in response to message #16 by David Smith

Hello David,

Thanks for this important information. Due to the fact that the clock itself seems to be ok ([TIME], [SW] e.g. work properly) this could be the reason of the problem. I am going to open the HP-41CX again...

Tom

Re: HP-41CX - Clock does not appear!

*Message #18 Posted by **Tom Summer** on 15 Jan 2006, 11:20 a.m.,*
in response to message #16 by David Smith

Hi David,

Two more attempts to make the HP 100% working:

1. fresh batteries --> no success 2. I replaced the resistor (the old one did have about 26 MegaOhm), the new one has exactly 22.0 MOhm --> no success.

Very frustrating. Do you really think the clock cristal could be bad however [TIME] and [SW] work properly?

Tom

Edited: 15 Jan 2006, 11:21 a.m.

Re: HP-41CX - Clock does not appear!

*Message #19 Posted by **David Smith** on 15 Jan 2006, 11:32 a.m.,*
in response to message #18 by Tom Summer

If TIME and SW are actually working properly, then your problem most likely is the firmware ROM. I know that if the clock crystal has problems, you don't get the clock display.

I had one machine where the clock was very flakey and would not come on from the power switch. It would come on from the keyboard. Apperently it was a bad CPU contact. Pressing the keyboard keys pressed down on the CPU card enough to get contact for a short time, but the clock stopped if you touched the machine.

Re: Homepage Update, OFF TOPIC

*Message #2 Posted by **hugh steers** on 2 Jan 2006, 2:23 p.m.,*
in response to message #1 by HP-Collection

hi matthias, i'm also a toxophilite. i prefer traditional and shoot mongolian. there's no sight or rest. it looks a bit like this,

http://www.arco-iris.com/George/images/mongol_fulldraw.jpg

although that isn't me and i don't wear a silly outfit. although people keep wanting me to wear green which is a terrible colour.

you can see from the guy's hand in the picture, he is using a thumb ring. you hold the string on the ring rather than on the fingers and this gives a more repeatable loose. you can also overdraw the bows which makes them good for clout and also they're a bit smaller and thus easier to carry about than a longbow.

best wishes.

HP 82161A - mini cassette

*Message #1 Posted by **Artur - Brasil** on 2 Jan 2006, 7:34 a.m.*

Hi and happy new year to everybody!

As promised, I return with the results of trying to fix my digital cassetes. I'll use the Diego's message to compare to my experiments:

" (...) Regarding the length of the tape, I used my audio tape recorder timer to count the 8min 44sec. needed for the task. This is the result of calculating how much time a standar tape recorder needs to run 24'384m (80feet) between the holes, plus 2 x 25cm extra tape to reach the leaders at both ends."

Well, I've tryed this and I believe my cassette recorder isn't so accurate. So, I wasted my time and precious tape, because the length wasn't enough to the task.

After many tryings, I decided to measure by hand the HP actual tapes length = 25.08m . So, by hand, I measured the CrO2 tape and cut it. This time it worked well.

"I've also wound the old defective HP tape into a standard audio tape shell... and of course played it!! The saturation is farily high >+8dB!! (I'm sure that my neibourghs' son is still wondering where the hell have I got this amazing new beat!!!! ;-)"

I've done this with another tape I've already replaced with chrome new midia and hadn't worked. I took it from the HP case and filled into a standard cassette. Again, using my cassette recorder, the signal was not so strong. May be incorrect tape type?

"Then conected an oscilloscope to the phones output and took a look... It's a 1'85Khz. (approx.) carrier with phase/amplitude modulation, as stated in the 82161 manual, separated in brusts and silences of 1'16s/0'6s ratio (approx.). "

"Translating this into 82161's read/write speed of 9inches (22'86cm) it results in a 8'9KHz (approx.) carrier. Those are "approx." due to the 82161's constant ANGULAR speed while standard audio tapes runs at 4'75cm. constant LINEAR speed."

"I decided to made my first attempt with a CrO2 TDK tape as I assumed a standard FeOxide tape would have some difficulties in handling the required saturation level and Metal tapes trend to be highly abbrassive."

Using normal tape - FeO2 - the digital cassette even couldn't rewind it. Using 60min chrome tape demonstrated again it is thicker than the HP one. I could find a source for a 60min Metal Tape. It seens to be even thicker than normal tape. Resuming, only the 90min tape could be filled in the HP's case.

"Cutted the tape, made the holes in their corresponding places with a 0'8mm drill bit, taped the leaders, wound it back into the HP Mini Cassette shell and insert it into the drive."

"NEWM 256.... and... IT WORKS!!!!!!!!!! ;-) (...)"

I could restore 5 tapes up to now. One is intermittent. other didn't work any way ... my basis material it's all over

and 90min Crhome tapes are becoming hard to find (at least in my city if someone in Brazil find one, send it to me!). Also, if you don't pay atenction and let the end go into the case, it's very hard to open it without breaking, as the parts are glued togheter. It is not an easy task and the results may not be the expected! (Just forgive my English mistakes!)

Thanks Tony, Diego, Garth, David, Etienne and Dave for precious support!

01/01/2006 - Artur

Re: HP 82161A - mini cassette

*Message #2 Posted by **Diego Diaz** on 3 Jan 2006, 10:07 a.m.,*
in response to message #1 by Artur - Brasil

Hi Artur,

Seems that you've gone thru several troubles while following my experiments.

However, it's not clear for me if you finally succeeded in recovering some of the tapes you've tried... (hope you did :-)

Certainly I didn't mention I used C90 TDK CrO2 tape. Yes, C60 are not suitable as they're much thicker. I haven't tried with Metal tapes (I simply *guess* they are too abrasive for the 82161A head... they should work anyhow)

The tape length didn't was a trouble at all... I measured it with a Technics RS-275M tape deck (a very accurate device, I must say)... The reported saturation level (>8dB) was *measured* using the tape deck Vu-meters (not so accurate indeed) and EQ set to Normal Bias (Type I) FeO2 tape. Values will vary depending on different EQ settings.

Thanks a lot for the feedback and report whichever other info you may get from futher experiments (if any...)

All the best for the new year.

Diego.

Re: HP 82161A - mini cassette

*Message #3 Posted by **Artur - Brasil** on 3 Jan 2006, 2:45 p.m.,*
in response to message #2 by Diego Diaz

Yes, Diego.

Five tapes worked fine and one intermittent. Unfortunatelly, my old Chrome cassettes have gone and 4 HP tapes will have to wait new replacements!

Thanks a lot the help! Artur

Re: HP 82161A - mini cassette

*Message #4 Posted by **Diego Diaz** on 4 Jan 2006, 5:02 a.m.,*
in response to message #3 by Artur - Brasil

Hi all,

Five tapes recovered!! These are great news indeed!! For the remaining "intermitent" one, I suppose

you've followed Tony's advice regarding pressure pad rebuild, double check it otherwise, see "Tony's document" down in this same trhead (Thanks Etienne and credits to Tony for the unvaluable knowledge "database" he shares with us)

It may also be caused by tape wear. Was/is the CrO2 tape used or new??

Can you get more CrO2 tapes to recover the remaining 4 mini-cassettes?

Are you going to give a go to the Metal tape approach?

Congrats on your success and best wishes for your future jobs!!

Diego.

Edited: 4 Jan 2006, 5:14 a.m.

Re: HP 82161A - mini cassette

*Message #5 Posted by **Etienne Victoria** on 3 Jan 2006, 10:36 a.m.,*
in response to message #1 by Artur - Brasil

Hello Artur, Diego, Tony et al,

To complement Diego's useful information, I have Pdf-ed Tony's Tex document on the tape restoration: 49 Kb pdf. You'll need Acrobat Reader 5.0 or later.

I've put it online on the support section of my site: Tony's document

Thank you Tony and best wishes for 2006 to all!

Etienne

49g+ - 48gx infrared transfers

*Message #1 Posted by **Ron Allen** on 1 Jan 2006, 4:57 p.m.*

Am I missing something about exchanging files between the 49g+ and the 48gx? My 49g+ is a year old and I could have sworn that I transferred and modified a couple of old 48gx programs as soon as I received the new unit. Now, I am thinking I must not have because I can't seem to get any kind of transfer in either direction.

I am using the infrared method which works for both if I print.

on the 49: APPS I/O... SELECT VARIABLES (if send)GET OR SEND

on the 48: I/O SELECT VARIABLES (if send) GET OR SEND

Both attempts result in timeouts as if the command has no purpose.

I'm beginning to question my memory. Am I overlooking a flag?

I recognize that without modification some 49 programs will not run on the 48, but the 49 should be mostly backward compatible, right?

Thanks -- Ron

Re: 49g+ - 48gx infrared transfers

*Message #2 Posted by **James M. Prange (Michigan)** on 1 Jan 2006, 7:33 p.m.,*
in response to message #1 by Ron Allen

As far as I've been able to determine, infrared transfers directly between the 49 and 48 series aren't possible. The 48 series infrared transfers use SIR (Serial IR) and the 49g+ and 48gII infrared transfers use IrDA.

"Printing" from the 49g+ and using INPRT (or a variation of it) on the 48 series doesn't work either; I expect that the signal from the 49g+ is just too weak.

To transfer the variables, use your PC as a "go-between", using "ASCII" (or "Text") transfers so that the decompiled code is transferred. "Binary" (compiled object) transfers won't work.

In general, programs written for 48 series should work on the 49 series, exceptions being such things as global names being built-in commands on the 49 series. The 49 series should be in "approximate" mode when receiving programs written for the 48 series if you don't want "real" numbers (type 0) that happen to be integers to be compiled as exact integers (type 28).

For programs written for the 49 series to work on the 48 series, the commands have to be built-in on both models, and in most cases, the object types have to be valid on both models. For example, a "symbolic matrix" (type 29) will result in a syntax error when the 48 series tries to compile it. 49 series "exact integers" (type 28) will be compiled as "real" numbers (type 0) on a 48 series, rounding them if needed.

Regards,

James

Re: 49g+ - 48gx infrared transfers

*Message #3 Posted by **Ron Allen** on 2 Jan 2006, 6:25 p.m.,*
in response to message #2 by James M. Prange (Michigan)

James, you are full of good information and in such detail. Know that I appreciate it very much.

From your response, I would say that my memory of a year ago is wrong. I had programmed a set of multiple equations for calculating photo lens solutions for depth of field, etc. Was attempting to save myself some keystrokes, but it looks like I should just key them into the 49. I do recall now that there was no trouble transferring them from an earlier model 48SX, but then there shouldn't have been.

Thanks again,

Ron

Re: 49g+ - 48gx infrared transfers

*Message #4 Posted by **James M. Prange (Michigan)** on 3 Jan 2006, 4:08 a.m.,*
in response to message #3 by Ron Allen

No need to key it in manually; just transfer (in "ASCII" or Text" mode) everything for your application from the 48GX to your PC, and then from your PC to the 49g+.

Regards,
James

A ? about a few flakey Woodstocks ...

*Message #1 Posted by **erik** on 31 Dec 2005, 6:29 a.m.*

i've got a couple of Woodstocks -- an hp-22, an hp-25 and one other -- that all have the same problem. When hooked up properly -- ie with a battery pack installed and a charger plugged in -- all I get on the screen is an 8 all the way on the right of the screen. The keys have no effect; the 8 remains. Any idea what's going on here? Anything I can do about it? Thanks!

Re: A ? about a few flakey Woodstocks ...

*Message #2 Posted by **Walter B** on 31 Dec 2005, 7:54 a.m.,*
in response to message #1 by erik

Erik, this seems to be a problem covered here earlier several times. Be VERY sure you have good accumulators in the battery pack and they make good contact with the calculator PCB, before you connect the calculator with the mains. Else you may damage (even destroy) your calcs easily. You mentioned in another thread you have suboptimal battery packs, so TAKE CARE !!

Re: A ? about a few flakey Woodstocks ...

*Message #3 Posted by **J.Brabers** on 31 Dec 2005, 8:55 a.m.,*
in response to message #1 by erik

Good battery packs are indeed essential to many elder HP's. I would indeed be very careful with connecting them to the ac-line without inspection of the pack and the contacts related to it. I have no experience with the typical woodstok models but the 67 is based on the same technology and its manual says explicitely that a battery-pack must be installed when running the calculator on the ac adapter. The spice series (30's with LED) require even a battery pack in good condition to run on the ac line. If a spice's pack is not OK the display blimps constantly without any response to the keys.

Re: A ?88 about a few flakey Woodstocks ... uh oh!

*Message #4 Posted by **erik** on 31 Dec 2005, 10:32 a.m.,*
in response to message #3 by J.Brabers

uh oh!

but riddle me this. i'm using the same battery pack and charger to test all my woodstocks. so far about five of them have tested just fine, though of those one or two need some time to warm up, as it were; iow, the charger has to be connected to the calc for a while before it works the way it should. and then there are those three that only respond with an 8. given that some calcs are working fine with the battery, does it still suggest to you that it could be a flakey battery pack problem and not a flakey woodstock problem? is there a way for me to test my battery pack to see if it's okay to use? if not, i suppose i could tear one apart. if you know it off the top of your head, what radio shack battery replacement would do? if you don't, i'll try to find it online.

Re: A ?88 about a few flakey Woodstocks ... uh oh!

*Message #5 Posted by **erik** on 31 Dec 2005, 10:45 a.m.,*
in response to message #4 by erik

from my interpretation of the MoHPC battery page, it would seem that a couple of radio shack 23-191 batteriess might work; they are 1.25V/600mAH Ni-Cd Batteries with Tabs, though i'd need em without tabs. what do you think?

update: well, er, uh -- i did a search and saw an earlier thread where the consensus was that a couple of regular AAs would also work, as long as you got the polarity right and didn't use the charger. So, I opened a battery pack, put a couple of AAs in, put em in one of my flakey HP-25s, turned it on, and up came everything right as rain. for a split second. then the LEDs starting acting all screwy. so i turned the calculator off. took out the battery pack, looked at it dumbly, reinsterted it, turned the poor 25 back on and ... nada, nothing, black screen. maybe i should have gone with the 1.25 nicads instead of the relatively overpowered regular AAs. shewt.

*Message #6 Posted by **db (martinez, ca.)** on 31 Dec 2005, 1:48 p.m.,*
in response to message #5 by erik

Using the charger and having no connection at or between the batteries due to dirt or invisible gunk is the same as no batteries to a woodstock or spice model. You don't get points for meaning well either. It is playing Russian roulette with your calc; you will kill it sooner or later. Due to what people here have posted and one sad personal experience; I have stopped using chargers on those models. I charge NIMH cells outside the calculator or use disposables. I have never heard of a fully charged alkaline damaging the ACT chip but i burn slightly used ones anyway.

It's nice to have the AC adapter as part of the full set, it's just a dangerous practice to use it.

Re: A ?88 about a few flakey Woodstocks okay!

*Message #7 Posted by **erik** on 31 Dec 2005, 5:58 p.m.,*
in response to message #6 by db (martinez, ca.)

thanks all for the sage advice. it was the battery pack after all. i went to radio shack, got some nicad AAs and a charger, charged the batteries up -- bingo bango, woodstocks that were once dead or near so sprung miraculously back to life, no harm done that i can see. bueno. again thanks ...

and i'm sure i'll have more questions like these as i make my way through my collection. please, if you would, bear with me ...

in response to message #5 by erik

Hi Eric,

> Quote:
>
> then the LEDs starting acting all screwy. so i turned the calculator off. took out the

battery pack, looked at it dumbly, reinsterted it, turned the poor 25 back on and ... nada, nothing, black screen.

I get this from time to time with my 29c, which has a rebuilt battery pack. If I slide the battery pack as if to take it out, but stop short, it restores normal operation. It seems to be a battery contact issue. I have not welded a strap across the end of the batteries in my rebuilt battery pack, relying instead on the spring to maitain the contact between the two cells. I'm sure this has a direct bearing on my occasional lack of continuity problem.
I'm in complete agreement with the other posters when they advise not to hook the charger to the calc, but rather charge the batteries externally. That very nifty external battery pack charger that HP made for the woodstocks would be the perfect thing to use (I have one but haven't seen seen it since my last move.)
Best regards, Hal

in response to message #8 by Hal

i went out and bought a radio shack charger yesterday but today, while pawing through my woodstocks, i came upon one of those HP chargers. Very nifty. Only wish I'd known about it yesterday. ah well!

Re: A ? about a few flakey Woodstocks ...

*Message #10 Posted by **David Smith** on 31 Dec 2005, 11:34 a.m.,*
in response to message #1 by erik

The problem is most likely a bad ACT chip. This usually shows up as all 00000000 display, but sometimes you get the (very bright) 8.

It may also be a problem with residual corrosion on the circuit board. I would try standing the board up to the top of the battery contacts in an ultrasonic cleaner with vinegar in it. Run it for a couple of cycles, then repeat with three cycles of fresh clean water. Shake off the excess water and let them dry overnight.

Re: A ? about a few flakey Woodstocks ...

*Message #11 Posted by **jbssm** on 31 Dec 2005, 2:41 p.m.,*
in response to message #10 by David Smith

Is it possible to easily replace this ACT chip? Can we find it in a radio shack shop ?

Re: A ? about a few flakey Woodstocks ...

*Message #12 Posted by **David Smith** on 31 Dec 2005, 11:25 p.m.,*
in response to message #11 by jbssm

The only source is another HP calculator. All the Woodstock series ACT chips are compatible except the HP27 chip is unique.

Card reader clutch repair

*Message #1 Posted by **David Ramsey** on 30 Dec 2005, 8:25 p.m.*

I've got a flakey HP-67 card reader that I think has a clutch problem. I repaired the gummy wheel on this reader a few years back using "O" rings. They look fine, but the reader has real problems pulling a card through-- terrible squeaking noises and jerky card movement. I have tried adjusting the drive wheel offset but it seems to make little difference.

The pitch of the motor jumps higher when the card slows or stops, which I attribute to clutch slippage.

The worm gear slides easily off the motor shaft. Apparently the "clutch" is a rubber or plastic material inside the worm gear shaft that provides a friction fit to the motor shaft.

The obvious solution is a drop of adhesive, but that would eliminate the "clutch" action. On the other hand, unless the reader mechanism jammed solid, would this hurt anything?

Suggestions on a reasonable repair appreciated...

Re: Card reader clutch repair

*Message #2 Posted by **Jon** on 31 Dec 2005, 5:20 a.m.,*
in response to message #1 by David Ramsey

I have got excellent results with small pieces of plastic tube (it´s brand name here in Spain is "Ibersil"). But I think that you can do it also with the plastic isolation of electrical wire.

some words about the so-called clutches...

*Message #3 Posted by **Hans Brueggemann [GER]** on 31 Dec 2005, 8:05 a.m.,*
in response to message #1 by David Ramsey

...of the card readers. following the many posts here in the forum that deal with card readers of 67 and 41 machines, you can find two major opinions about how the worm gear is attached to the drive motor. fact is, that the worm gear is simply pressed onto the motor shaft. the two opinions either state, that the attachment tube of the worm gear serves the extra function of protecting the card drive against too much torque, in case the card movement is blocked somehow. the other opinion is, that there simply isn't any purpose of the attachment tube other than attaching the worm gear to the motor in a fashion, that it can be dismantled and reused in case, say, of a motor fault. i'm of the same opinion. there is *no* protective function designed into the whole drive, other than the weak motor itself. you doubt? try the following: connect the motor to a proper power supply, start it up and try to block it with your bare hands. no bloodshed, though you might have expected that. the generated torque is so low, that there is not the slightest chance to damage anything inside the card reader if the card is blocked. furthermore, you simply won't find *any* card reader, that, with a stuck card, keeps the motor running (until shutdown) and, on the other hand, is able to properly drive a card through the reader. that's why i consider the "safety clutch" nothing more than an "urban legend". it is just an inexpensive means to connect a worm gear to a motor. that's it. just my two cents to the everlasting discussion about "loctite or gelee royal?" cheers, hans

Re: Card reader clutch repair

*Message #4 Posted by **David Smith** on 31 Dec 2005, 11:44 a.m.,*
in response to message #1 by David Ramsey

The motor shaft coupling is definitely NOT a clutch meant to slip. The HP97 service manual talks about reading the motor current with the card stalled by holding it.

The best adhesive that I have found is called IC2000 tire cement. It is a rubbery superglue for gluing tires to RC race cars. Get it at Hobbytown, etc.

Spin the motor shaft. Does it scream? Then oil the bearings with Breakfree CLP and a small paint brush. Wait 30 minutes.

Clean the motor shaft with alcohol and let dry. Paint the inside of the worm gear with a light coating of the glue (I use a small piano wire dipped in the stuff). Press on the worm gear all the way. Let dry for several hours. Reassemble the reader. Enjoy.

Note that if you used too much glue, the worm gear may not fully seat on the shaft. You may need to shim the motor with some thin plastic (pieces of an old mag card?) if the motor binds.

Also sometimes the nylon motor coupling breaks in half. If a small nylon piece somes out with the gear, you should also glue it in place to the gear first. If it crumbled up, use a piece of WD40 spray hose.

Re: Card reader clutch repair

*Message #5 Posted by **David Ramsey** on 31 Dec 2005, 6:17 p.m.,*
in response to message #4 by David Smith

Thanks to all who responded. I cleaned the motor shaft and applied a very tiny amount of cyanoacrylate (super glue). I slid the worm gear over the shaft and let it sit an hour. The card reader now works perfectly!

HP 42s display access

*Message #1 Posted by **Kenn** on 30 Dec 2005, 6:18 p.m.*

I have an HP 42s whose display has a small chunk of what looks like solder sitting on the back of the clear display bezel. Is there an easy way to take the calculator apart and remove it? I've tried the obvious "banging" the calculator in the palm of my hand to see if I can dislodge it, but to no avail. Aside from asthestics, I'm a little concerned that if the thing shakes loose it might short something important out--it's definitely metalic.

If I have to pry the foil off the top of the unit to get it apart, I won't do anything. I certain I'll do more damage trying to pry off that thin foil than is justified by what I'm trying to do.

Ease/Dis-ease of Keystroke Programming

*Message #1 Posted by **Howard Owen** on 30 Dec 2005, 2:00 p.m.*

I know some would say our obsessions with calculators is evidence that our minds are a little "diseased".

That has certainly been true of me for the last couple of weeks. I have been caught and held hostage by a little electronic/mechanical device known as an HP-42S. I have been so enchanted with the little beast, that I have cranked over 1000 lines of calculator language in pursuit of the perfect embodiment of "YATZ," the game I use as a vehicle for learning about programming the old machines in my collection. It's certainly arguable whether I need so many lines to play that stupid (but fun) little dice game. But I want to use the features of each platform to the fullest extent possible. On the 42S, that means graphicl representations of the dice and scorecard, and that means lots of binary data. The initialization routine (*not* run every time) therefore takes over five hundred lines all by itself. The core of the game is currently at 530 lines or so, and will go higher before I'm through.

At that level, I've run into some scalability problems that I thought I'd share with this forum. Before getting into these, I have to praise the ergonomics of the 42S again. Program entry is *very* nice on this machine. The keystroke sequences you need in order to access common programming, matrix manipulation and alphanumeric functions is very regular and logical. It usually takes two to three keystrokes at worst to access the function you need.

The pickboard style of alpha entry is an example of this. Press [SHIFT] [ENTER] to get to alpha mode, or enter it via any function that can use or requires alphanumerics, and you see a menu of the uppercase alphabet spread over six keys. To get an upper case letter, press its menu key, then the key for the letter - two keystrokes. To get lowercase, press shift (orange key) before you press the letter key - that's three keystrokes. Since there are 6 menu keys and at most five letters per alphabet range, there is always a blank key in the letter pick menu. Pressing these always gives you a space. Less common letters are accessed from a secondary menu which you get to by pressing an arrow key at the main pick-board. You still only have three keystrokes on average, but it's not as straightforward and takes a little longer.

That lash up is a little awkward to describe but a breeze to use once you learn it. In fact. I find it to be the easiest system for alpha entry I know of, second to the qwerty keyboard that is burned into my synapses by a lifetime's use. The rest of the functions of the 42S are similarly well thought out, and I find I can crank code on the machine at nearly the speed of (careful, deliberate) thought.

But what I can't do is keep more than about five numeric labels and their meanings in my mind while I'm thinking about how to do some tricky piece of coding. Four labels I can manage, but five blows me out of the water. This is partly because numbers are not names, and partly because I can see at most two lines of code at a time in the calclator's display. "But the 42S has six character named labels!" I hear you protest. Yes. but multicharacter labels (and single character ones after "J") are *global* on the 42S. This means that after a certain point, they clutter up the XEQ and GTO menus to the point where the nice, easy structure is overwhelmed. In a program the size of YATZ42, however, numeric labels just don't cut it. So I've replaced many numeric labels with alpha globals. I may switch them back after I have the whole thing debugged.

A related problem has to do with the limited window on the program provided by the two line display. Often one section of code depends on one or more widely seperated other bits of code. You can't see the two sections side by side in that two line window. These all conspire to make that sort of coding difficult. I've adopted two different strategies for dealing with this. When the program was smaller, I would print it out to an HP 82240B printer. That

was slow, but it worked. Since the program has grown larger, I've tended to print to INPRT running on an HP48GX instead. This is *much* slower, and requires extra transfer and conversion steps to get a listing in a form in which it can be viewed in an editor on the PC screen. Then, as I make changes, the version on the calculator and the one on the PC drift slowly apart, until the work of remembering which changes I've made recently exceeds the inconvenience of generating a new listing.

Finally, there's the fact that data - variables, registers, flags and the stack - are all global on the 42S. This makes it harder to have two significant apps loaded at the same time without collisions. I know the registers are accessible in a matrix called "REGS." and that you can rename and replace this matrix, thus giving you a way to implement local registers. But that doesn't work for named variables or the stack, and what if you bomb having made your local copy of REGS? There's no ON ERROR construct.

So there you have three barriers to scalability of keystroke programs on the HP42S. There are workarounds for some of them, but no outright solutions. Clearly, the machine wasn't designed to scale up very far. The programming model was born on smaller machines, and makes more sense when applied to smaller problems. But that raises an interesting question: is there value in extending keystroke programming to larger environments, meaning ones with a *lot* more memory and processor speed? It seems certain to me that just dropping the 42S environment down in the middle of such resources would be a dismal failure. The language and architecture would, at the very least, have to change to account for the deficiencies outlined above.

What sort of changes do you think might be necessary to acheive success in the larger environment? Here's my list:

1. Real local scopes - local names should be possible, for labels variables, stacks and so forth.
2. Two-way I/O - this to facilitate program editing off the calculator. Bonus points: make program editing on the PC transparent through to the target machine.

That's it. The points, few as they are, beg another question: how can you implement them without screwing up what is nice about keystroke programming? This is really the original question restated: whether keystroke programming *can* be scaled up at all, or *should*,

Regards,
Howard

Re: Ease/Dis-ease of Keystroke Programming

*Message #2 Posted by **hugh steers** on 30 Dec 2005, 8:30 p.m.,*
in response to message #1 by Howard Owen

i agree with your sentiments regarding the scaling of keystroke programming. indeed, it’s a fast way to get results for short and easy to hold in one’s head sort of problems. but as the program gets larger, its gets nastier. as the program gets bigger i am forced to factor it into separate programs. even if this means loss of efficiency simply because otherwise it will go out of my control.

whilst writing large or moderate but tortuous keystroke programs, i have often yearned for some kind of higher level abstraction. i like to make an analogy between keystroke operations and assembler level programming; just like they were the machine instructions of a much larger architecture. it would be nice to have a sort of mini compiler that could take chunks of logic and generate keystroke ops.

when i say a compiler, i don’t mean ‘C’ into 42S or visual basic into 41c, this would be completely inappropriate. i think to some extent hp attempted this idea with the concept of RPL, although it didn’t compile into keystroke ops because really there wasn’t much point. but i don’t think the rpl experiment solved the problem, because pretty much the same difficulties arise when dealing with large rpl programs as do with large keystroke ones, albeit not quite so acute.

rather than a true compiler, i am hankering for some kind of macro processor and code block re-arranger. something that looks after the flow and allocation of real memories and lets me program in virtual ones. that also eliminates superfluous usages and overlaps true memories with virtual ones by scope analysis. i just want to think of each logical variable as a new name and have it allocate them to actual registers in an optimal way.

for block arrangement, i'd like to be able to rearrange blocks of code (ie segments of logic with no jumps out or into) so that i can tidy the program out of an increasingly spaghetti bowl of logic – and if that means reallocating the real vs virtual registers then, so be it!

the other idea would be to program in either a pure stack machine or a pure register machine (eg virtual register again) and have it transform into the ideal mixture of both for a given stack depth (eg 4). the hp keystroke programming paradigm is a strange mix of both. you keep stuff on the stack until you can't, at which point you use registers but as few as you can get away with. then, a bit later, you need to change that bit of code, but all of a sudden, the bit of cleverness you did on the stack won't fit on the stack anymore and you have to find a spare register to accommodate it, often knocking your allocation plan out of kilter. no, all of that should be done for me so i can concentrate on the algorithm itself.

that's what i want anyway :-)

Re: Ease/Dis-ease of Keystroke Programming

*Message #3 Posted by **Ed Look** on 30 Dec 2005, 11:14 p.m.,*
in response to message #2 by hugh steers

Gents, I thought that RPN keystroke programming WAS INTENDED for simple quick programs; I haven't mastered RPL, but have gotten somewhat familiar with it and it seems to be better suited for larger, more complicated programs with more diverse routines.

Besides, RPN scientific programmables (most of our beloved HP vintage calcs) don't have the program memory capacity or data storage capacity for any programs requiring a bit complexity.

I wrote a program that would analyze any number of peaks from a x-ray powder pattern for my 48G series and 49G+ machines. For convenience' sake, I tried my hardest to port it to the 33S without loss of functionality, but because the program really taxed the capabilities of the 33S (four level only stack, twenty-six labels and twenty-six [and a half ;)] registers, I limited the 33S version to only THREE data point inputs (as you said, so I didn't go crazy trying to track all the inputs and results as I wrote it)... plus a bit of revision of the program structure to adapt it to a limited stack depth and limited number of data registers. I think this 33S RPN keystroke version might even be a bit longer and slightly more complex than the original RPL version!!

(Off-Topic Department: as it turns out, the revised 33S version is all I need so far, but I can see easily that I might soon need the less limited version.)

Re: Ease/Dis-ease of Keystroke Programming

*Message #4 Posted by **Howard Owen** on 31 Dec 2005, 12:05 a.m.,*
in response to message #3 by Ed Look

Hi, Ed,

I think there's a bit of context missing. I'm thinking of the OpenRPN project, which has produced this PDF file of what they call a "IQ-43S" (IQ being like HAL in 2001, only backwards, er, forwards.) The "43S" part refers to the idea that this machine will be a succesor to the last great RPN keystroke programmable calculator: the HP-42S. The hardware feature set that project is developing include an

ARM processor running at 80 MHz, 16MB of flash ROM, and 1MB of SRAM. This puts it in the ballpark I was describing in my previous post.

So yes, RPN keystroke programming grew up to solve smaller problems with shorter code. When William Wickes got a look at the problem of scaling it up, he chose instead to jettison the old programming model and helped to create RPL, a revolution in calculator design. A lot of folks feel something was lost in that transition. If you ask the average devotee of RPN keystroke programming, I suspect that simplicity would be high on the list of qualities they would list as lost in the transition to RPL. What I'm interested in is the question of whether this simplicity was solely due to the smaller problems tackled with RPN machines as compared with the RPL family, or if there were inherent simplicities in the older model that went out like the proverbial baby in the bathwater. I actually think that some baby did leave the scene, along with the admittedly murky bathwater.

Regards,
Howard

Re: Ease/Dis-ease of Keystroke Programming

*Message #5 Posted by **Walter B** on 2 Jan 2006, 3:37 a.m.,*
in response to message #4 by Howard Owen

Hi Howard,

so far I didn't know this German proverb also exists in English, so thanks for enlightenment!

Back to your topic: I fully agree on "something" being lost in translation, ummh, transition from RPN to RPL. Remembering the old manuals, programming was always explained in the very beginning as a simple way of storing keystrokes and recalling them later for repeated execution. I do not remember such an approach in the documentation of the 48s or 48g.

The point where RPN programming became awkward to me (pretty early) was with the loop control commands like ISG et.al. This was although I did a lot of (pdp) assembler programming at that time. I found the ISG-syntax difficult to remember and read correctly if not used everyday. In fact, I didn't write real programs on my 25c, 11c and 32s, but coded formulae for frequent use (most times).

Since I also own a 42s, I share your views you stated in your initial post. IMHO, RPN is great even/still today for straightforward automation of calculations, but it falls short in structures. Of course this is less important if you have just 100 steps available, but with 7200 it's a challenge. It reminds me of the FORTRAN (sic!) IV spaghetti code my professor used to write, with GOTOs in either direction - almost unreadable and eventually uncontrollable.

So, besides the 2 way I/O inevitably needed to enjoy comfortable editing in a PC, what about adding some (few!) structure commands like IF...THEN...ELSE, BEGIN...END, FOR...DO and the like (a bit like PASCAL)? To me, there is little to be added to create a new baby capable to win a triathlon. And to baptize it, swimming in the bathwater, I propose to call it RPS (RP Structured) d;-)

Re: Ease/Dis-ease of Keystroke Programming

*Message #6 Posted by **Geir Isene** on 2 Jan 2006, 6:22 a.m.,*
in response to message #5 by Walter B

After months of programming RPL, I went back to pure RPN (41CX) because of what I perceive as a better programming environment. More direct access to the programming features

and better debugging facilities was on top of the list. If only the HP-48 had keystroke programming, I would be in heaven.

As for the scalability, I would rather write a 1000 line program in pure RPN than in RPL. Maybe even more (I have an almost complete gladiator game for the 41 with more than 1800 lines).

For the OpenRPN project I would suggest to go with a combination of keystroke RPN and floating point Forth. That would do the trick for me. Rather than reinventing the wheel, Forth would give what RPL has, only better; Better managability of code through Lego-type building blocks, direct feedback on code execution (even the smallest parts, not just the whole program or a less-than-desirable SST), direct access to assembler coding, build-in editor (this should be improved from what most Forths have to offer) and an array of existing commands and building blocks to start off from.

Just my 2 øre (NOK 0.02)

You know, I thought about this for a while, and my conclusion was: why bother with the calculator? If you've got to use the computer to write and pre-process the program, why not use it to run the program as well?

I think if you're reliant on a computer for writing/editing the program, it rules out use of the calculator for those "exploratory" tasks that are often solved by keystroke programming. It relegates the calculator to programs that are used repetitively, perhaps in the field (not that there's anything wrong with that).

I've been investigating this area for myself, specifically looking at the use of a calculator as an aid to understanding simple physical problems (based on the mass on spring problem [dv/dt = -x] in Chapter 9 of The Feynman Lectures on Physics). Feynman himself takes a numerical approach to the problem, which I had only minimal difficulty in implementing in Perl and on the HP-41, but I haven't yet come up with a numerical solution on the HP-48GX. On the other hand, solving (and graphing) a differential equation is simplicity itself on the 48 - but I think one learns more from the programming exercise.

I'm part-way through writing this up, complete with listings. Just a few more days. . .

Best,

--- Les

in response to message #5 by Walter B

Meanwhile, I found there is some structured control flow for RPN available already. MathU has IF-clauses and loops in its command set. Plus some additional stuff like ELSE and CONTINUE IF. Anyone here knows how they work exactly?

(Maybe it is explained in their documentation, but if you know it by heart you will be faster by far - and I do not have to search and read it all ;-))

Re: Ease/Dis-ease of Keystroke Programming

*Message #9 Posted by **Ed Look** on 2 Jan 2006, 6:41 p.m.,*
in response to message #4 by Howard Owen

Hey, Howard, thanks for the clarification. It stinks to be shooting n the dark!

But in response to one of your questions (rhetorical??) I suspect that in those days, the '70s, the engineers who built the HP RPN calcs and the engineers who used them, along with the scientists, surveyors, programmers, accountants, managers, etc., probably DREAMED of having a simple keying interface yet providing powerful programming capabilities, but were limited by the technology available at the time due to the position of the cutting edge then or due to budgetary constraints.

I mean, how were they going to stuff more labels and registers on a breadboard 2.5" x 5"? Thus, I guess, this imposed natural limits as to the scope of problems it can be programmed to solve.

As to the Open RPN project, I hope I can afford whatever they end up with!

Re: Ease/Dis-ease of Keystroke Programming

*Message #10 Posted by **Howard Owen** on 2 Jan 2006, 8:47 p.m.,*
in response to message #9 by Ed Look

Hi, Ed,

I do think the RPN models did an awful lot with very little. Very little memory, very little processor speed, you name it. I also agree that the keystroke calculation programming model was designed to fit into this limited environment. Perhaps it isn't possible to remedy the scalability problems without erasing the nice things about RPN programming.

There have been several good suggestions, but mine included, they all tend to move the computation away from "nose-to-nose" interaction with the problem. That is to say, they all add abstraction to the model, which is the way to get generality. Add real scope to names, and you get better separation between the solution and the machine. But you have to know the scoping rules, and in particular, how they impact the limited resources a calculator provides.(Presumably without virtual memory! 8) Add real looping structures, and you start to want fancy indenting to reflect them. That means more overhead for the program editor. Program editor? Oh, you mean "program mode!" Well, no, I mean a real editor. More abstraction. At a certain point, I join Les in wondering what the calculator is doing in the mix at all.

So what about this: implement a very fancy, sophisticated programming model for those who

want to do real computer science, functional programming, object oriented or what have you, but include as part of that environment a virtual RPN machine model. Define a flexible way to interface with this virtual machine, probably using an unlimited stack, and call the calculator to solve problems in the traditional RPN way.

```
<<
   fancy-calculator-whoop-dee-doo
   -> [[
         \\stack_size=2  \\stack_grow=fixed
         \\regs=-1  \\result=X
         01 X^2
         02 X<>Y
         03 X^2
         04 SQRT
      ]]
   more-fancy-stuff
>>
```

Or something like that. The wrapping around the virtual RPN calculator would be visible or not as the user chose. In other words, the machine could look like a traditional RPN calculator, with lots of memory and nice support for engineering, scientific and business math, large conversion, constant and formula libraries and so forth. Or it could look like a mega-killer-über-calculator With RPFoS (Reverse Polish FORTH on Steroids). with all those features. *Or it could look like both at the same time!*

This solves the problem of complexity in the traditional geek way: by adding more. 8) Actually, the trick would be in engineering the environments so they were logical and self consistent when used seperately, but also when used together. That *ought* to mean that they'd be as intuitive and simple as possible, too.

Regards,
Howard

I realise that this is a hypothetical example, but if it was intended to be a Pythagorean hypotenutical hypothetical example, shoudn't line 04 be "04 +", then "05 SQRT"? See what happens when all that abstract fancy stuff enters the picture?

;)

Doh! 8)

But finding the error would have been *much* simpler for the dunderhead RPN-prejudiced author. 8)

Re: Ease/Dis-ease of Keystroke Programming

*Message #13 Posted by **Ed Look** on 3 Jan 2006, 12:26 a.m.,*
in response to message #10 by Howard Owen

Nice idea! And, I hope it can get implemented in some new ROM upgrade or compact, downloadable "library" or "aplet" written by one of us fanboys for the 48 and 49 series machines.

But one small aspect of it makes me wince:

it recalls to mind the use of DOSBOX or MO'SLO or some such Rube Goldberg type forced backwards compatibility device to make a Pentium IV or Athlon machine running WinXP able to run some old DOS program (read, most of the the time anyway, game [I do have one old DOS based plotting and fitting program some physicist wrote in-house over a decade ago, which I really liked]<-{--- self exculpation device}).

So, if you guys, or anyone ever does implement this, in itself, rather neat idea, I'd really rather prefer it to be seamless as the default mode, so as not to evoke some inaccurate "legacy" image of RPN keystroke programming, of which obviously I am fond!

Re: Ease/Dis-ease of Keystroke Programming

*Message #14 Posted by **Howard Owen** on 3 Jan 2006, 1:18 a.m.,*
in response to message #13 by Ed Look

Right, that's a bad connotation of "virtual machine." That was probably a bad choice in words not just because of the connection with old, slow legacy environments, but also because you wouldn't need a full-blown VM to do what I have in mind. My idea was to limit the RPN program from seeing more of the calling environment than it was explicitly allowed to. But there are lots of mechanisms for doing that sort of thing that don't involve creating byte code for an idealized processor the way Java does. I'd like the RPN environment to be capable of managing all the calculator's resources, at least to the degree the "whiz-bang" environment was. So one environment could call the other, or relinquish control of the complete machine to the other, with equal ease. There might well be a good reason to stick with one or the other for a particular problem, but it should be at least possible to do anything in either environment. They would have to be compatible, or have compatible glue, at least.

For example, if the "über" environment were RPL, then you would have to deal with the unlimited stack, and with how RPL consumes arguments placed on the stack. My example tried to show how that could work:

```
<< ..
     -> X Y [[ # Two elements from the RPL stack are consumed
                 # and placed on RPN stack levels X and Y
            \\stack_size=2  # "pragma" states only two stack levels
                            #  needed.
            \\stack_grow=fixed # Perhaps this is the default.
            \\result=X         # Single value returned in X. The
                               # glue will put this on the RPL stack
                               # level 1 on exit
            \\regs=-1  # Signifies no registers used. This means no
                       # registers or other memory are visible to this
routine.
            01 .. # Correct Pythagorean thing here .. 8)
```

The \\regs pragma could be a lot more elaborate, mapping data structtures on one side to the other. It could be so elaborate that you might wish to maintain it outside the call preamble, and just refer to it there.

The stack pragmas allow you to have any sized stack, including an unlimited one, in your RPN program. The default for the RPN side would be a classic XYZT and L arrangement. This stack would be *separate* from the RPL stack, and it would have genuine RPN semantics. It would copy the top element down on stack drop, and it would allow you to drop an empty stack position. It could however contain the full bestiary of objects supported by he RPL environment. That's the default, but pragma's could enable lots of alternate stack behaviors in the local environment, according to the needs of the calculation, and/or the taste of the programmer.

Special Module for HP-41CX

*Message #1 Posted by **FABIO ALBONICO** on 30 Dec 2005, 9:53 a.m.*

I want to understand the difference between the special modules made for HP-41 like CCD, ZENROM etc.

Somebody can explain me and tell me how to find these?

Thanks and happy new year

Re: Special Module for HP-41CX

*Message #2 Posted by **Doug Wilder** on 30 Dec 2005, 9:59 p.m.,*
in response to message #1 by FABIO ALBONICO

Hello Fabio,

Guess we could say that the HP41C "Special Modules" are modules not programmed by HP. There are too many for me to list here however, Matthias Wehrli has a .pdf which lists almost all of them along with some data for each module:

http://www.hp-collection.org/modules.html

As far as "find these"; eBay or the Classified Ads here (place a "wanted" ad) are the best bets yet some modules are VERY rare (nearly impossible to find).

The modules that you mention (CCD, ZENROM) are micro-coded roms, whereas many special roms are user-coded roms. The other possibility is using an MLDL device to load module "image". Two such devices are currently being produced: the Clonix/NoVRAM and the MLDL2000. Google is your friend.

Best Regards

hp71B does not get off

*Message #1 Posted by **inaki** on 29 Dec 2005, 7:38 p.m.*

I have a 71B that seems to have a problem when replacing batteries. After I place the new batteries I press ON. The 71B does not start at first time so I must press ON several times and then it goes up. However, if now I press f+ON to put it OFF the 71B does not get OFF but stays in an indefinite situation: the arrow prompt stays in the display, although the machine cannot be used (there is no keyboard answer). I must press ON several times to put the 71B finally OFF. I have tried to INIT from 1 to 3 and have tried to discharge the circuits by pressing ON for 30 seconds with batteries removed, but nothing works. Anyone knows what is hapenning here ?

another ebay seller's question ...

*Message #1 Posted by **erik** on 29 Dec 2005, 6:58 p.m.*

i've got another questions from a seller's perspective ...

how deep do you think the demand is for relatively common HPs on eBay?

For instance, let's say I have 3 or 4 HP-10Cs or HP-35s. Am I going to drive the price down if I put 'em on all at once? I mean, I have 50 or 60 HPs to auction off, spread out unevenly over about 12 different models, and I'd like to get 'em gone as quickly as possible; at the same time, I don't want to drive down the price by flooding the market. But, given the size of eBay, I don't even know if flooding with such a small amount is possible. Suggestions and thoughts?

Re: another ebay seller's question ...

*Message #2 Posted by **Namir** on 29 Dec 2005, 7:08 p.m.,*
in response to message #1 by erik

Erik,

You are on teh right track! You need to determine which is more priority (a) Selling the calculators ASAP, or (b) Maximizing your sales?

I'd recommend taking your time and selling similar items one at a time. Experience shows that this approach keeps prices down. You also need to see who else is selling the same type of item at the same time. Yet another HP12C, for example, will not stirr the passion of collectors to click the BIN button faster than the speed of light!

Also keep in mind, that detailed descriptions of the item and a reasonably good pictures also help. Typical bidders want to know about the functionality of the display (any dead pixels on LCD? All LED segments work?), dents, scratches, beanding, battery-contact corrosion, covers, modules/accessories included, and so on. State these attributes whether present (calculator has dents for example) or not.

Don't rush the auctions and be patient with the whole process. You will find it to be rewarding and something interesting to learn.

Re: another ebay seller's question ...

*Message #3 Posted by **Howard Owen** on 29 Dec 2005, 7:39 p.m.,*
in response to message #1 by erik

10C's are not "relatively common," as you'll find out when you list them. (Did you mean "10B's"?) Remember that the available auction records, which smart buyers and sellers both will search before bidding or selling, only goes back a limited amount of time.That means that a machine that is not uncommon, like a 71B, say, can go for a large premium over the average price, as long as there haven't been many sold recently. We have one

seller everyone loves to hate who relies on this phenomenon. His may be the only 71B selling at any given time, and he asks a whopping multiplier on a price you might think of as reasonable.

So I guess that means you actually could drive down the prices for 71Bs if you sold five or more all at one time. Your market for these luxury items is not all of eBay, but all bidders willing to buy right now. And what they will be willing to pay mainly depends on recent history, if they are smart, or the phase of the moon if they are not. Of course, for common calcs, like the 10B, it would be hard to affect the price, because the market is much larger. And for true rarities, it would also be hard to sell too many, unless the quantities offered made collectors reassess how many of the items were actually in circulation, and thus to recalculate their worth.

But in the middle, you can get a saturation phenomenon. I bid rashly when I started collecting, but I've gotten cagier. I look for oversupply situations as one way to get relative bargains. Choosing when an auction will close can be important. As a seller, you want to close in the evening in the US, since that's the most active time in the biggest marketplace. People bid at work, too, but things really seem to pick up around 5:30 PM Eastern Time. (As a buyer, you want to avoid those times, if you can.)

Good luck!
Howard

Re: another ebay seller's question ...

*Message #4 Posted by **erik** on 29 Dec 2005, 8:10 p.m.,*
in response to message #3 by Howard Owen

thanks for the thoughts!

now, here's a related question. i see that the seller everyone luvs to hate sells onl y by high BIN prices. i don't want to do that. my feeling is i should just open with the same 9.99 i use for just about everything and let the chips fall where they may. am i being foolish doing this? should I follow that *other* sellers lead?

Re: another ebay seller's question ...

*Message #5 Posted by **Howard Owen** on 29 Dec 2005, 8:41 p.m.,*
in response to message #4 by erik

You can get unlucky doing that, which is to say the buyer can get lucky.

I usually set an opening bid amount about 1/2 of the price I think an item will sell for. That usually scares off bottom feeders, which is good. But set it too high, and you will scare off casual bidders, which is bad, since they can turn into serious bidders later. As a buyer, I dislike high "reserve" prices that tend to encourage people to bid higher than they otherwise would, initially. That could be good for a seller, but it's one of the places I personally draw the line to do as I would be done by. 8)

I should make it clear that I don't do an awful lot of eBay selling. But these are the rules I follow when I do, and they have worked well for me.

You Know Who has bid!

*Message #6 Posted by **erik** on 30 Dec 2005, 5:59 a.m.,*
in response to message #5 by Howard Owen

hey, howard: well, i put one of my not-cosmetically great 10Cs up with an opening amount of $24.95 ... and guess who jumped right on it with the first bid? yup, that's right: you know who! i hope he's not going to take me to the cleaners on this one; ie win the auction, turn around, add

some feet to the back of the calc where they're missing, magically make the "U.S. Gov't" etching disappear, and sell it for a ton more. otoh, i guess if he can do all that, more power to him!

Re: You Know Who has bid!

*Message #7 Posted by **Namir** on 30 Dec 2005, 8:50 a.m.,*
in response to message #6 by erik

Erik,

You need not wory about you know who. H is cheap and very easy to outbid.

I noticed that you placed your auction in Vintage Electronics rather than Calculators. I had to do some extra searching to find it.

Re: You Know Who has bid!

*Message #8 Posted by **Erik** on 30 Dec 2005, 8:52 a.m.,*
in response to message #7 by Namir

i didn't even know there was a "calculators" heading. maybe i'll see if i can switch 'em from "vintage electronics".

Dont forget listing fee

*Message #9 Posted by **Mike H** on 30 Dec 2005, 9:20 a.m.,*
in response to message #8 by Erik

eBay propaganda states that listing in two different categories will boost bids by 18%, and increase final sale price by 17% on average, but your listing fees are doubled also. Maybe you could write a program that will calculate the break even point ;-)

Mike

Re: You Know Who has bid!

*Message #10 Posted by **Namir** on 30 Dec 2005, 11:36 a.m.,*
in response to message #8 by Erik

Erik,

To keep your cost down, you might want to leave the current auction in the category listed and have future auctions posted in the Calculators (or any of it's sub-categories) category.

I suggest that you add a classified ad here to point to the URL of the HP-10C auction.

Namir

Edited: 30 Dec 2005, 11:37 a.m.

Re: You Know Who has bid!

*Message #11 Posted by **Howard Owen** on 30 Dec 2005, 11:38 a.m.,*
in response to message #8 by Erik

Looking for "misfiled" listings is another way to get bargains!

I strongly advise you to add "Consumer Electronics > Gadgets & Other Electronics > Calculators > Scientific Calculators > Hewlett-Packard" or "Consumer Electronics > Gadgets & Other Electronics > Calculators > Vintage Calculators" to your listing. Since you have a bid, you can't change the listing category for free, so you'll have to add one of the above. Either one will do to get your listing noticed by folks who would understand what a 10C is. For something like that, a posting to the Classfied section of this website would also get your auction noticed by people who might want to own a 10C.

Regards,
Howard

Re: You Know Who has bid!

*Message #12 Posted by **Chan Tran (USA)** on 30 Dec 2005, 4:32 p.m.,*
in response to message #11 by Howard Owen

If I WERE you I would simply post a classified ad on this site. There are enough of us, HP calculator fans, here to buy all of your stuff. You can sell them for any price you want or any price we would offer you. You will avoid paying ebay fee. You won't part with your calc for price that you don't want to. Coburlin won't bid on your calcs. You won't get as much money as you would on Ebay but you should get a fair amount. After all, doing so would benefit you as well as those of us who buy from you.

Re: You Know Who has bid!

*Message #13 Posted by **karl gruber** on 30 Dec 2005, 9:04 p.m.,*
in response to message #12 by Chan Tran (USA)

Although this site is a great reference it PALES in comparison to EBay. Believe me, I've tried both. I tried to sell some BRAND NEW 41CX's here with no result, even though I thought I'd sell them cheap here to the real affectionatos!

Karl

Finding stuff on ebay ??

*Message #14 Posted by **Dave Shaffer** on 1 Jan 2006, 9:04 p.m.,*
in response to message #7 by Namir

re: "I noticed that you placed your auction in Vintage Electronics rather than Calculators. I had to do some extra searching to find it. "

Does this really make a difference?

When I, as a potential buyer, look for something on ebay, I search "all of ebay". As far as I know, but maybe I am missing something, I've found whatever was available with my search words in the sale title. I guess if you just want to see what's available in "calculators" the seller has to have put it in the correct category.

How does everybody else search?

Re: Finding stuff on ebay ??

*Message #15 Posted by **Howard Owen** on 1 Jan 2006, 9:37 p.m.,*
in response to message #14 by Dave Shaffer

How many hits for outboard motors do you get when you search for "hp" in all of eBay? 8)

Searching the categories is helpful to find stuff you are interested in among appropriately categorized items. Broader searches have to be carefully limited with search term exclusions and inclusions to be effective. Both have their place in my toolkit.

Regards,
Howard

Re: Finding stuff on ebay ??

*Message #16 Posted by **Dave Shaffer** on 2 Jan 2006, 1:52 p.m.,*
in response to message #15 by Howard Owen

"How many hits for outboard motors do you get when you search for "hp" in all of eBay? 8)"

Yeah - I discovered that. And then when you try to be more specific, you find all the 45 hp motors!

So far, "hp calculator" seems to work pretty good.

Part of selling well on ebay is putting as much specific info into your listing title as possible.

HPs on ebay: should I sell overseas?

*Message #1 Posted by **erik** on 29 Dec 2005, 1:46 p.m.*

I'm about to put a whole mess of HPs on eBay and I'm totally undecided about selling overseas. All I can see ahead of me are hassles and paperwork. Does anyone know how to minimize the negatives?

One thing I'm thinking about is only taking Paypal from overseas bidders, since (obviously) payment will be quick and I can use Paypal to pay for global priority mail postage. What's the general feeling here about Paypal only? Sure would make my life easier!

Re: HPs on ebay: should I sell overseas?

*Message #2 Posted by **Ron Ross** on 29 Dec 2005, 2:06 p.m.,*
in response to message #1 by erik

It is the Seller's right to make any terms he please's.

However, I do not bid on Paypal only auctions as I refuse to use Paypal. I may be the only one on this site that doesn't, but I suspect not.

But also, I seldom use Ebay anymore either (occasionally, but nothing like in the past).

It is your best way to clear out you items and recieve top dollar (depending upon your terms and your ebay rating).

I won't buy from anyone with more than a few negatives or low percentage. I do look at the reasons for the negatives and bid (or don't bid) accordingly.

Good luck with your auction.

Re: HPs on ebay: should I sell overseas?

*Message #3 Posted by **erik** on 29 Dec 2005, 2:11 p.m.,*
in response to message #2 by Ron Ross

thanks ron. just so i'm clear, i'm thinking paypal-only for overseas only; here in the u.s., it'd be paypal plus checks and m.o.'s, etc.

also, regarding batteries ...

*Message #4 Posted by **erik** on 29 Dec 2005, 2:09 p.m.,*
in response to message #1 by erik

one other thing:

i've got a number of battery packs for my HPs floating around, all in various states of leakage and other sorts of disrepair. in auctions, do bidders generally like to see batteries included, no matter how worthless they

might be, or does it add relatively little to the auction. i guess i'd have similar questions regarding added-value with regard to cases and chargers as well. thanks!

Re: HPs on ebay: should I sell overseas?

*Message #5 Posted by **Matthias Wehrli** on 29 Dec 2005, 2:59 p.m.,*
in response to message #1 by erik

Yes, you have more work with filling out papers, but you also earn more money because there are some hardcore collectors (as me) who will pay high prices on rare items.... ;)

Matthias www.hp-collection.org

Re: HPs on ebay: should I sell overseas?

*Message #6 Posted by **Daniel Diggelmann** on 29 Dec 2005, 4:07 p.m.,*
in response to message #5 by Matthias Wehrli

Yes I can only double Matthias' words. I've bought and also sold from/to all places in the world. The additional paperwork is reduced to a customs declaration sticker on the package which takes less than one minute. Is this different when sending packages from USA? Of course you're reaching more collectors when selling worldwide. One thing I've also noticed is that only little US bidders buy in Europe. Is there a special cause for this? My use of eBay has become more rare lately. I prefer to trade stuff whith people I know. This usually takes more time but at the end it is more fun. Regards from Switzerland, Daniel

Re: HPs on ebay: should I sell overseas?

*Message #7 Posted by **erik** on 29 Dec 2005, 4:36 p.m.,*
in response to message #6 by Daniel Diggelmann

thanks all for the help so far! it's not filling out paperwork that takes time but standing in the lines at the post office, which can be quite long. if i only ship domestically, i can print the postage out at home and just shove the boxes in the window at the po, no need to stand in line. that said, i think i'm going to do overseas, albiet paypal only.

sadly, nothing i have is too rare, except maybe for an hp-10 and an hp-65 with all the trimmings and a number of calcs with boxes. that's about it.

Re: HPs on ebay: should I sell overseas?

> Quote:
>
> .. One thing I've also noticed is that only little US bidders buy in Europe. Is there a special cause for this? ..

I've bought from all over the world, but mostly I purchase from within the US. Two things conspire to keep my dollars here at home. One is the volume of goods available here. My (unscientific) impression is that there simply are more interesting items (as defined by context) on offer in North America than anywhere else. Europe is a close second. Second, there's shipping cost and time. The cost is usually somewhat higher, and the time is always a good deal longer, if you don't opt for very expensive premium shipping. I always use Paypal for foreign transactions. I will only do a cash transaction with someone who I am familiar with through this forum or other means.

As far as selling overseas, I am glad to do that. The extra paperwork really is minimal, and the walk to the post office gets me away from my computer for a bit. 8) It would seem to be in any seller's best interest to increase the pool of available customers as much as possible, but particularly in an auction environment.

Regards,
Howard

Re: HPs on ebay: should I sell overseas?

*Message #9 Posted by **Raymond Del Tondo** on 29 Dec 2005, 4:01 p.m.,*
in response to message #1 by erik

Hi,

in my experience, the additional paperwork
consists of simply writing some words about
the package contents, a number representing
the content's worth, and a signature .
Ok, I'm from Europe, but judging from the
US parcels I got so far, and the parcels
I sent to the U.S. , it wasn't too
much additional effort for the senders;-)

PayPal, and other forms of non-cash payments,
may all have pros and cons .

I made good experiences with PayPal so far.
It's the fastest way to pay.
Overseas postal money orders are more expensive,
especially to the USA take much longer to arrive,
and force the receiver to go to the postal office
to make it money or put it onto his bank account.

With all online banking or trading methods,
you have to be extra careful regarding your password,
and to avoid opening spam or virus mails which
try to suck your access data.
But that's not a PayPal problem in particular,
but a general problem with all online services.
So these services are as safe as you
handle your personal access data;-)

So to answer in short, IMHO it's not that bad
to at least offer PayPal payments as an option,
because there may be more interested bidders,
especially from non-US locations.

Regards, and have a happy new year!

Raymond

in response to message #9 by Raymond Del Tondo

From a seller viewpoint, paypal has caused some people problems if they happen to sell to dishonest bidders. As I understand it, if a bidder claims they received material substantially different than the auction, paypal refunds $$ to the buyer when they still have the goods...before the goods have been returned to the seller.

That's a rough spot to be in as a seller...you're out the goods and have no $$.

I know several web sites where people were very upset about it. Searching on google should reveal them.

I personally have no idea as to the truthfulness of these reported problems, but they scared me enough for potential bogus buyers that I usually don't take paypal.

One would think that if an ebay buyer had a relatively high, good feedback rating that accepting paypal from them would not be a problem...but often, saying you take paypal will mean you have to accept it from those with 0 or negative feedback too.

For overseas bidders, bidpay.com is another alternative and one that I usually accept.

Just FYI.

Again, for all I know these web pages you will find are made-up nonsense...but I decided not to risk it.

I just saw the following notice at bidpay.com:

Effective December 31, 2005, BidPay.com, Inc. will be discontinuing operations. As a result, BidPay will no longer offer payment services to the online auction industry. We regret any inconvenience to our users and thank them for their loyal patronage. Customer service will remain available at bidpayservice@bidpay.com through the month of February.

Re: HPs on ebay: should I sell overseas?

*Message #12 Posted by **Randy** on 29 Dec 2005, 6:55 p.m.,*
in response to message #1 by erik

My two cents worth:

0) There are very, very few dishonest people in the HP game :)

1) Include batteries even if leaking, package separately.

2) Accept Paypal no matter what, it means higher bids. Dismiss the naysayers as sour grapes. You can have problems no matter what the source of funds. Paypal, like their fees or not, is by far the lowest overhead for a buyer. More buyers = higher bid prices.

3) International shipments and Paypal. Well, there's the rub. Most low cost ways to ship out of the US do not meet Paypal's "seller protection" plans because you do not have tracing. Solution: insist on EMS (Express Mail Service) shipping for any export deals. You can print your postage and customs forms online and have package tracing to most destinations. Just list EMS (only) in the eBay shipping calculator for export and the buyers can see what the cost will be and make their own decision.

IMO, it's a no brainer. eBay and Paypal can work well if you use it wisely. Lots of photos, good, honest descriptions and fair shipping fees work to your advantage.

randy:

i'm going to do pretty much as you suggest. paypal also offers global priority mail and i think that's cheaper than express, so unless i'm wrong i'll use that. thanks for chiming in!

Re: HPs on ebay: should I sell overseas?

*Message #14 Posted by **Randy** on 29 Dec 2005, 7:54 p.m.,*
in response to message #13 by erik

A couple of things about Global Priority:

1) It is very good to most Western European (EU) countries and AUS/NZ. There are many central euro countries for which it is not accepted (Italy being a notable exclusion).

2) There is a four pound weight limitation.

3) There is no package tracability.

4) There is no insurance available.

GPM is a "Youz pays your money, youz takes your chances" situation. Personally, I've never lost a package using GPM with the exception of Mexico (alleged). In general, the postal systems of France and Italy can be slow to deliver. It all comes back to rule (0) in my previous post...

*Message #15 Posted by **Erik** on 29 Dec 2005, 8:42 p.m.,*
in response to message #14 by Randy

thanks, randy, for the postal info. man, is there a lot to know! in any event, i think i'll try global priority and if someone wins in a non-gp country, then i'll suggest express. sheesh! but i do appreciate your help.

Re: HPs on ebay: should I sell overseas?

*Message #16 Posted by **Giuseppe Marullo** on 30 Dec 2005, 2:32 p.m.,*
in response to message #14 by Randy

Italians are VERY aware about the postal problems, and I DO require the seller to ship insured, if tracked even better.

That's my rule when I accept to BUY from an overseas seller from Italy. So far, only very positive experience, kind people ebay or not, paypal or not.

Buon Anno!

Giuseppe Marullo

*Message #17 Posted by **thebullcabinet** on 31 Dec 2005, 2:57 a.m.,*
in response to message #1 by erik

We have sold many items outside the US, usually with no problems. However, there is one issue that regularly comes up - Many foreign buyers ask us to label the item sold as a "gift" on the customs form, in order to avoid paying customs.

Re: HPs on ebay: should I sell overseas?

*Message #18 Posted by **erik** on 31 Dec 2005, 6:24 a.m.,*
in response to message #17 by thebullcabinet

And do you comply?

Re: HPs on ebay: should I sell overseas?

*Message #19 Posted by **Walter B** on 31 Dec 2005, 7:47 a.m.,*
in response to message #18 by erik

So far I *never* had to pay customs for a vintage calc delivered from USA. I live in Germany (= EU) and traded quite a bit with Northern America, using USPS always. The only "extra" I saw on the parcels was a green sticker indicating they contain a "calculator" worth some 10 US$. But there may be other laws in other countries.

Until today, everything arrived safely - no losses even without insurance or tracking. The only drawback IMHO is that USPS is *terribly* slow even with air mail (several weeks). Charles Lindbergh had a faster plane than they use by far! Wonder they still work with biplanes overseas, needing a stop on Greenland ... d;-P

So the typical situation is: when I win an auction, I send the money using PayPal, then I wait weeks until the item arrives - and most sellers will give feedback not earlier than I give. No comment, just experimental facts.

For you as a seller I recommend: Address a bigger market. You will gain.

Re: HPs on ebay: should I sell overseas?

*Message #20 Posted by **thebullcabinet** on 31 Dec 2005, 5:24 p.m.,*
in response to message #18 by erik

No. If it's a 48GX, we put "48GX" in the detailed description field. In the value field, we put the actual selling price (e.g., $250), excluding shipping charges, as this is the documented value of the item. Claiming low or no value on an item that is easily documented to have value (e.g., see eBay for value), is asking for trouble from the postal inspector and customs officials, in the admittedly small chance that your package is selected for inspection.

Favorite quote for the day: "A clear conscience is a bargain at any price." Besides, fighting the feds over something this trivial can ruin your whole day.

Re: HPs on ebay: should I sell overseas?

*Message #21 Posted by **Andrés C. Rodríguez (Argentina)** on 31 Dec 2005, 1:11 p.m.,*
in response to message #17 by thebullcabinet

Usually a "no commercial value" is enough to make clear to customs that items are for personal use and not imported goods to be resold. That may make you more comfortable than the "gift" word.

For instance, an HP25 may be worth U$S 40 for me because of my particular fondness for that model, but for customs purposes is a "non commercial value" good, comparable to U$S 5 current scientific calculators of today.

Customs, however, may be very complex for items over a certain money threshold / allowance.

Re: HPs on ebay: should I sell overseas?

*Message #22 Posted by **Andy** on 10 Jan 2006, 11:58 a.m.,*
in response to message #21 by Andrés C. Rodríguez (Argentina)

I've had good luck so far selling HP's overseas. I use Paypal and Western Union. Both have worked out great. The Collectors in Japan have bid quite high on vintage calculators, ie sold an HP 35 for over $500.00 in Mint condition. I usually indicate GIFT and OFFICE PRODUCTS on Customs' forms to prevent pilferage. Value is usually agreed on between Seller and Buyer. One shipment to Switzerland for a battery pack was lost. Package arrived empty. I use USPS GLOBAL PRIORITY MAIL or US AIR MAIL depending on item.

Good luck

Regards,

Andy

Re: HPs on ebay: should I sell overseas?

*Message #23 Posted by **Joe Edwards** on 24 Jan 2006, 10:05 a.m.,*
in response to message #22 by Andy

You just have to let the people know up front that there is a chance of the item being lost. I only ship overseas with some type of tracking..EMS, FedEX, UPS. The buyer pays the shipping bill, so it really doens't matter what it costs...as long as they are willing. I sold my 71B to a gentleman in Japan for very nice sum and made a friend in the process.

Joe

*Message #2 Posted by **Les Bell** on 29 Dec 2005, 5:34 p.m.,*
in response to message #1 by ECL

I have one of those, and you're right - it's not RPN. On the other hand, it does have some solver-style capabilities for speed/time/distance and similar calculations. I haven't used it for years, though - it's a battery hog and GPS does all the calculations faster with less data entry, while a circular slide-rule "whizz wheel" is most reliable.

Best,

*Message #3 Posted by **Les Bell** on 29 Dec 2005, 5:41 p.m.,*
in response to message #2 by Namir

The mention of "Super visually perfect algebraic mode" is a dead giveaway that it's a Casio under the covers. As a matter of fact, it looks remarkably similar to the Casio that my son's school mandated for his maths class - I hope it has a better manual, but I doubt it. My RPN-leaning brain couldn't work the darned thing.

I noticed that educalc.net is actually based in Singapore. Coincidentally, I think I bought all of my later HP models - 32C, various 41's, 17B and 16C - in Singapore, either while visiting on business or while transitting the airport. The duty free stores there used to have a good selection, but they could never understand why I used to ask to see the manual rather than picking up the calc and pushing buttons at random like the other shoppers. ;)

Best,

--- Les

in response to message #7 by Jan

Lol. When in the good old days did HP ever had a calculator for under $15?

Don't like it? Then don't buy one. :-)

Re: "New" "HP" Calculator

*Message #9 Posted by **Jan** on 30 Dec 2005, 11:27 a.m.,*
in response to message #8 by Gene Wright

You are right Gene: HP never had a calculator under $15 in the good old days. But low end HP models were not that expensive in those days either (HP 21/31/10c for instance). I have nothing against the fact that HP offers the 8s. The fact is that I am just afraid that HP will move more and more to mass-consumption electronics and that it will abandon its old more traditional trade: high quality electronics for professionals. The fact that they offer a casio calculator with an HP label could very

well be consistent with a desire to have a market share also on the low-end market, but since they do not develop their calcs by themselves anymore for some time, I think we could also very well be the whitnesses of the last generation of high quality HP calculators (49 series). I do not exclude the possibility that the 8s will in fact be the first product in a line of mediocre machinery sold (not even produced) by HP, whereas the high-end trade will be left to other manufacturers. That would just be a pitty.

Re: "New" "HP" Calculator

*Message #10 Posted by **Gene Wright** on 30 Dec 2005, 1:15 p.m.,*
in response to message #9 by Jan

Jan wrote: "You are right Gene: HP never had a calculator under $15 in the good old days. But low end HP models were not that expensive in those days either (HP 21/31/10c for instance)."

Gene: Until adjusted for inflation. The HP21 was $125 back in 1975. Today, that's well over $300. The HP10c was $75 or so back in 1983. Today, that's still over $150 at least.

"I have nothing against the fact that HP offers the 8s. The fact is that I am just afraid that HP will move more and more to mass-consumption electronics and that it will abandon its old more traditional trade: high quality electronics for professionals."

Gene: A lot of that business went with Agilent.

"I do not exclude the possibility that the 8s will in fact be the first product in a line of mediocre machinery sold (not even produced) by HP, whereas the high-end trade will be left to other manufacturers. That would just be a pitty."

Gene: Well, the 30S, 9S, and 9G were all OEM products, just as the HP8S seems to be. I don't make any conclusions at all about the low-end products. HP still has quite a hand in their products that aren't low-end. I just wouldn't get too up in arms about a $15 calculator.

Re: "New" "HP" Calculator

*Message #11 Posted by **Bob** on 30 Dec 2005, 9:14 p.m.,*
in response to message #7 by Jan

I just picked up another 33S a week ago and I am impressed with the improvements over the early versions. The display is clearer and it is RPN.

It is no 41CV or 42S, but then it is only $49.

Of course, I don't use a calc the way I did 20 years ago either, so I guess it all balances out.

Re: "New" "HP" Calculator

*Message #12 Posted by **Jan** on 31 Dec 2005, 7:51 a.m.,*
in response to message #11 by Bob

Ok but there is still that keyboard. I simply cannot like it, it makes the calc look like a remote control or something. It's not user friendly either since it is somewhat messy. And that's the pitty because in terms of functionality it is a good calculator I believe (quite similar to the 32SII) and it's an RPN calculator. The latter is perhaps the strangest thing from a marketing point of view, since I don't think that the vast majority of RPN enthousiasts will like the looks of the 33S. They usually want something more down to earth and a more professional appearence. I mean, compare the 33S to the 41-series or even the voyager series: quite a difference in style isn't it. The design of the 33S would be nice for a lower end ALG calculator meant for high-school students but not for a professional calculator. At least, that is what I think.

Re: "New" "HP" Calculator

*Message #13 Posted by **Gene Wright** on 30 Dec 2005, 10:04 a.m.,*

Re: "New" "HP" Calculator

*Message #15 Posted by **Wayne Brown** on 30 Dec 2005, 7:36 p.m.,*
in response to message #13 by Gene Wright

Wow, a new HP that actually *isn't* horrifyingly ugly. If it were RPN and had a big **ENTER** key, I'd be glad to buy at least two or three of them.

Re: "New" "HP" Calculator

*Message #16 Posted by **brian healy** on 1 Jan 2006, 6:02 p.m.,*
in response to message #13 by Gene Wright

Gene,

Any chance that in the future we might get a 33s with revised cosmetics? Say a dark background with blue and gold or orange shifted functions? It would make living with the chevron keyboard and the small enter key a lot easier. The functionality of the 33s is good in my opinion, but the cosmetic design is hard to live with.

Re: "New" "HP" Calculator

*Message #17 Posted by **Jim Creybohm** on 30 Dec 2005, 12:26 p.m.,*
in response to message #1 by Samuel Heddle

If you really need to buy an HP, and it is OK if it is ALG, then why not pick up an HP20S on EBay? I bought a (very) used on a couple of months ago, and it is a great little rig - OK its not a 41 nor a 48, but I am not

nearly as stressed leaving it at work. I paid 10 bux for it.

Programmable, 10 mem, has a large horizontal INPUT key (looks almost like an Enter key) and best of all, a quality feel.

Highly recommended!

I don't need hp; I need RPN

*Message #18 Posted by **db (martinez, ca.)** on 30 Dec 2005, 12:37 p.m.,*
in response to message #17 by Jim Creybohm

Fortunatly, I have a few.

Re: I don't need hp; I need RPN

*Message #19 Posted by **Nenad** on 31 Dec 2005, 5:06 a.m.,*
in response to message #18 by db (martinez, ca.)

Strongly supported!

RPN is really something to be appreciated. IMHO, RPN is preferably related to Hewlett Packard calculators, though there existed other RPN models. HP Invent calculators are something completely different.

IMHO, there is no need to even discuss HP 6s, 8s and simmilar algebraic HP Invent stuff. The reason is obvious: why not discuss then every 5$ (or 32 kuna) kung-fu-drastic-plastic produced calculator available in a supermarket or delivered freely with a 5 kg pack of washing powder.

Happy New Year to all the moHP community. For me, it is very nice to have such a web place where I can read informative, well prepared and polite posts from very competent people. Thank you Dave and thank you all!

Re: I don't need hp; I need RPN

*Message #20 Posted by **Walter B** on 31 Dec 2005, 8:10 a.m.,*
in response to message #19 by Nenad

Fully agree! :-))

IMO, the most elegant algebraic pocket calc HP designed was the 27s. For me as a statistics aficionado also the 21s has some value. But I would love them if they were RPN ...

Re: I don't need hp; I need RPN

*Message #21 Posted by **brian healy** on 1 Jan 2006, 6:13 p.m.,*
in response to message #19 by Nenad

I agree with you 100%. I need RPN. I need a basic RPN calculator similar to the 33s, but without the bad design associated with invisible decimal points, bad keyboards, and a bad color scheme. HP, please no more styling gimmicks. I want something that looks like a prefessional tool, not a toy.

Nicer than 6s, IMHO

*Message #22 Posted by **Andrés C. Rodríguez (Argentina)** on 31 Dec 2005, 1:13 p.m.,*
in response to message #1 by Samuel Heddle

Oh, if only it had RPN...

Re: "New" "HP" Calculator

*Message #23 Posted by **Eddie Shore** on 2 Jan 2006, 10:37 a.m.,*

HP-48SX display problem

*Message #1 Posted by **FABIO ALBONICO** on 28 Dec 2005, 5:42 a.m.*

I have some problem with the display of my HP-48SX. Normally a vertical line of pixel near the middle (a little on the right) doesn't light. Sometimes if I stroke hardly the calculator on the desk (on a paper) then I light on and the display is ok. As anybody similar problem?

TI-57 emulator beta testers needed ... [OT]

*Message #1 Posted by **HrastProgrammer** on 28 Dec 2005, 4:32 a.m.*

As some of you already know, I am investigating a possibility to develop a TI-59 emulator for HP-48GX/49G for some time. While such emulator is still very far away, I just succeeded to make a true TI-57 emulator for Windows (TI-57E). Although I am with HP most of the time, TI-57 was my first (programmable) calculator so it has a special value for me because I learned (calculator) programming on it.

To be honest, TI-57E is more a development and test platform because it is very ugly but it does the job. The development was possible because of the availability of a few TI patents describing TMC1501 CPU and containing TI-57 ROM object code. This object code was obviously manually retyped on a typewriter because it contains a lot of errors. And each patent has different errors so I took 6 of them and compared the whole ROM instruction by instruction (I just had nothing smarter to do during the holydays) trying to figure out which instruction is correct if there is a difference between individual patents. Then I wrote a disassembler and disassembled the ROM and resolved a few more errors by running the emulator and following the instruction traces. Currently there are just a few instructions for which I am not 100% sure but it seems like they are all correct. The additional problem was that this object code is probably not from the final product because it contains a few bugs which aren't present in the production calculators (or, at least, I haven't heard about them): (1) RST instruction breaks a running program and (2) Sigma+/Sigma- corrupt instructions at program steps 48 and 49 (and modify program counter, as well). I corrected these bugs so TI-57E seems to work correctly for all test cases and programs I executed. Even synthetic programming is working so CPU emulation is complete. For example, the famous GTO 2nd 48 LRN Exc SST Lbl 1 GTO 2nd 48 R/S INV STO 3 +/- +/- sequence which in fact turns TI-57 into TI-57C is working (and from the ROM disassembly I can even find why)!

As far as I know, it is the first real emulator of an old TI calculator and TMC CPU ever. The second stage would be to port TI-57E to HP-48/49. But, before I proceed, I need a few beta testers for TI-57E. If you are interested then you can contact me by mail (e-mail address is somewhere on http://hrastprogrammer.tripod.com) ...

Thanks and sorry for OT ...

Re: TI-57 emulator beta testers needed ... [OT]

in response to message #1 by HrastProgrammer

Hi, Hrast;

I still have my TI57 (working fine, and effectively my first calculator...), and I can go ahead trying out whatever you want related to it. I am sure that there are many other owners around here, so, consider me as one of them.

lcvieira (at) quantica (dot) com (dot) br

As you know, I have the HP49G/G+ and the HP48SX/G+/GII And I'd gladly try your emulator out.

Best regards.

Luiz (Brazil)

www.kuipers.to/hp41.htm - Can anyone access it?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 28 Dec 2005, 12:17 a.m.*

Hi all, Meindert (?);

I am trying to access Meindert's home page for a couple of days and did not succeed. Does anyone know if it has been moved or renamed? Meindert?

Maybe it is in maintenance or being rebuilt...

Any news are welcome. Thanks.

Luiz (Brazil)

Re: www.kuipers.to/hp41.htm - Can anyone access it?

*Message #2 Posted by **Howard Owen** on 28 Dec 2005, 3:34 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

No news, but it appears to be a failure in name service:

```
hbo@gate|501> whois kuipers.to
Tonic whoisd V1.0
kuipers ns1.bluedns.nl  213.196.1.192   ns3.bluedns.nl  213.196.31.200
hbo@gate|502> host kuipers.to
Host kuipers.to not found: 3(NXDOMAIN)
hbo@gate|503> host kuipers.to ns1.bluedns.nl
Using domain server:
Name: ns1.bluedns.nl
Address: 213.196.1.192#53
Aliases:

kuipers.to has address 62.221.254.185
```

So its registered name server knows where it is. It's probably a failure in delegation between the .to root and bluedns.nl. Can't say which one is the problem, though.

http://62.221.254.185 returns:

```
Deze website is niet beschikbaar.
```

Which I assume says "This website is not configured." That would mean that the web server is up and running. But it hosts many domains and needs the name in order to serve the right website.

Remember that Meindert said he was moving into a new home? He also mentioned setting up a bunch of computers. I'll bet he's hosting the site at home, and has transferred it to the service provider while he moves, or something like that.

Re: www.kuipers.to/hp41.htm - Can anyone access it?

*Message #3 Posted by **Chris Roccati** on 28 Dec 2005, 3:49 p.m.,*

in response to message #2 by Howard Owen

Apparently there's some problem with the DNS:

The site itself works fine if you put

62.221.254.185 kuipers.to www.kuipers.to

in /etc/hosts (or your OS' equivalent)

Re: www.kuipers.to/hp41.htm - Can anyone access it?

*Message #4 Posted by **Howard Owen** on 28 Dec 2005, 9:41 p.m.,*
in response to message #3 by Chris Roccati

Doh!

Of course that should work. It's a named virtual host on the other end, and it uses whatever name the client browser gives it, regardless of where the browser gets it from. Entering it into /etc/hosts as you suggest works just fine.

The Windows equivalent file is C:\WINDOWS\SYSTEM32\DRIVERS\ETC\HOSTS . That works on Windows 9X and XP. For NT or 2K, replace "WINDOWS" in the path with "WINNT" Syntax is exactly as demonstrated by Chris.

If you do that, be sure to remove it after awhile. Otherwise it will quit working when (if) the host changes its IP address.

Regards,
Howard.

Re: www.kuipers.to/hp41.htm - Can anyone access it?

*Message #5 Posted by **Meindert Kuipers** on 2 Jan 2006, 3:52 a.m.,*
in response to message #2 by Howard Owen

Hi guys,

This is a bad start of the year. I do not yet have broadband access at home myself (I am back at work now) so I have not noticed this. My website is located at a provider (not at home) and I will contact them today about this.

Meindert

Re: www.kuipers.to/hp41.htm - Can anyone access it?

*Message #6 Posted by **Meindert Kuipers** on 2 Jan 2006, 10:43 a.m.,*
in response to message #5 by Meindert Kuipers

My website is offline at the moment, the registration was expired and my provider failed to extend it. This should be corrected now, but will need several hours for the domain to appear again in the DNS.

Meindert

Thanks, Meindert!

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 2 Jan 2006, 9:34 p.m.,*
in response to message #6 by Meindert Kuipers

Hey, Meindert;

although you are facing these problems, it is good to 'read' from you again.

If there is anything we can do from here... Let us know.

Most of all, thank you for allowing us to have access to such information you have at your website.

Best regards.

Luiz (Brazil)

Domain still not available

*Message #8 Posted by **Meindert Kuipers** on 3 Jan 2006, 4:29 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Status is that the domain is still propagating through the DNS. This also involves my email, and its seems that all mails that have been sent to me the last two weeks have disappeared. Through webmail I have answered most on the 25th and 26th of December, but I may have no way of retrieving the emails (and my answers). If there were any urgent messages, please send them again after about 24 hrs from now when the domain is up and running again.

My broadband connection in my new home still does not work either. The problem is now identified and I hope that this is fixed before the end of the week.

Meindert

MLDL2000 website available again.

*Message #9 Posted by **Meindert Kuipers** on 4 Jan 2006, 8:02 a.m.,*
in response to message #8 by Meindert Kuipers

The MLDL2000 Website and email is now working again. The good news is that all my emails that were pending on the server are still there, so nothing seems to be lost (except the messages sent while the domain was down, but those should have resulted in an error message).

Meindert

Looking for the first Field Engineering HP RPN model 15C

*Message #1 Posted by **Nostradamus** on 27 Dec 2005, 10:51 p.m.*

I had used the 15C with either hand without a desk, you can't do that with the 32SII. When will a field calculator be made? One loaded with conversions (my memory is lacking and the pamphlet in the pocket tears and fades), register memory, basic integrals and derivatives simply a semi-NON-programmable model. One with trig, ln, e, pi, i, factorial, the 32SII is semi-close but it's oriented vertically instead of horizontally - and is "tapered" seems the 15c shape was ideal, if not why continue to make a 12C. I can only assume mankind doesn't want to consider: "in the field engineering" What is the modulus of elasticity or thermal growth of whatever... or natural frequency, BTU's, horsepower, joules, blah, blah, blah..... I can only guess HP has had more than one email about it's good old 15C that just didn't have enough customers. What do these antiques retail for on eBay, $180 to $300 ? And they still don't know what 9.8x10E-6 is, so you have to memorize it along with 300 other tidbits, so can you say on the spot if it will hold or break, should you evacuate or stay? I don't know let me go back to the office and program it. Better yet let me use a colloquial equals sign to slow down repetition in the field.

Re: Looking for the first Field Engineering HP RPN model 15C

*Message #2 Posted by **Hugh Evans** on 28 Dec 2005, 2:29 a.m.,*
in response to message #1 by Nostradamus

The designs I have created for OpenRPN are all highly rugged but are constrained to fitting in a shirt pocket. I'm open to making an optional ultra rugged accessory kit (perhaps a more hefty protective boot for example). If you have suggestions or requests I'd love to hear them.

The stock enclosures will feature a rigid core containing all the electronics surrounded by a 0.125" thick black neoprene boot. It will be bordering on overkill for normal usage, but field workers will undoubtedly want more protection.

Either post to this thread or send me an e-mail.

Best Regards, Hugh

in response to message #2 by Hugh Evans

Hugh,

I'm very sorry, but eventually you are going to have to face reality. OpenRPN, like QonoS, is Vaporware . The difference is Hydrix had cash and managed to produce prototypes - something openRPN has not yet done.

> Quote:
>
> The difference is Hydrix had cash and managed to produce prototypes - something openRPN has not yet done.

There's another interesting difference between the two projects. OpenRPN seems thus far to be focusing on developing a cost-effective manufacturing plan (for relatively low volumes without needing a very large investment in tooling), and hasn't yet developed electronics or software.

The Quonos from Hydrix had working electronics and software, but no cost-effective manufacturing plan.

In my not-so-humble opinion, developing the electronics and software is EASY compared to the manufacturing issues. If OpenRPN can successfully tackle the latter, the rest will be a cakewalk.

Re: Looking for the first Field Engineering HP RPN model 15C

*Message #6 Posted by **Nostradamus** on 28 Dec 2005, 4:27 p.m.,*
in response to message #2 by Hugh Evans

Yes. Make it the exact same shape and size as the 12C or 15C. Put a large enter button in the middle like the 15C or 12C. Make the screen exactly like the 12C or 15C perhaps a few decimals longer (easier said than done), maintain all the basic primary button functions like on the 32SII, and majority of secondary functions but, Get rid of the programming ability (aside from complex mode ability), supplant the programming with a library of constants i.e. thermal capacity of sand, thermal growth of steel, stainless, aluminum, copper, glass, yield stresses of steel, stainless, aluminum, density of steel, water, aluminum, concrete, granite, polyethylene, conduction of wood, asbestos, brick, concrete, water, max solar radiation, heat of vaporization of water, of course I know all these things and then on a Tuesday or Thursday I forget one of them! You could display: k sand = 0.44 btu/hr-ft-F (alpha numeric library seems simple enough) Or and I never said this: provide the alphabet "on the keys" to allow us to type in our own. (No external methods please, no extra devices). In this way I'll only have to memorize applicable equations. And I'd say an 1/8 inch protective skin like an iPod would have been fine for the old 15C but, why talk of extraneous things like skin what happened to physical function, look at how your hand grips an object - why is it fact that a calculator laid out horizontally is better than vertical (and now watch everyone say, hum is that right?). The key is simplify. I don't just mean to mention construction, consider canvasing the engine testing world 26,000 rpm mil displacement or production line equipment monitoring decision making "constants" ... When do you apply MC/I or even simpler sigma = F/A or Thrust = PxA but, I can graph y=x**2 + 5 I've said enough, good luck with an on-the-spot engineering calculator.

You must be kidding? There are numerous programs that can apply to 'in the field' work.

If you expect us to respond to your points, please format your statements. You jump around quite alot, and it places the burden on us to extract your intent.

Nixing programmability for more storage space is unecessary. How many megs of text do you anticipate you will need? Perhaps you would find a PDA w/ Excel more suitable. I have created some nice reference files on my PocketPC.

ECL

Re: Looking for the first Field Engineering HP RPN model 15C

*Message #8 Posted by **Howard Owen** on 28 Dec 2005, 6:13 p.m.,*
in response to message #7 by ECL

Perhaps "don't require programming for this laundry list of functions" is a compromise that would work? Or maybe "make the machine easy to use for the non-programmer" would be closer?

With today's memory capacities, I don't think you seriously have to trade off the *capability* of programming with, say, an extensive library of constants. But you could embed programmability to such a degree that the real utility of the machine would only be accessible through programming. I think that ought to be avoided, but I don't think programmability should be jettisoned.

Regards,
Howard

Re: Looking for the first Field Engineering HP RPN model 15C

*Message #9 Posted by **Nostradamus** on 28 Dec 2005, 9:32 p.m.,*
in response to message #7 by ECL

I don't program in the field. What I need is a simple small calculator that is loaded with conversions and constants and functions - simply no need for programming - so why have it in a simple field tool.

Perhaps it should be titled a fast reference field calculator.

Re: Looking for the first Field Engineering HP RPN model 15C

*Message #10 Posted by **Howard Owen** on 28 Dec 2005, 10:02 p.m.,*
in response to message #9 by Nostradamus

Got it. And if folks like you were the only customers, then I would expect OpenRPN to deliver a product more or less in line with your specifications. But I doubt they'll rip out the programmability just to exactly hit your tarets. But there are a couple of points that may not be obvious about that.

1. Ripping out the programming probably won't reduce the price of whatever OpenRPN delivers, like it might if it were HP or TI doing the machine. A lot of the software engineering is probably going to be volunteer work.
2. That also means the software will reflect the interests of the volunteers. (And they are all programmers!)
3. You could benefit from someone else's programming, even if you didn't do any yourself. Perhaps the presentation of the constants would end up not being ideal for you, and a small amount of programming would make a difference.
4. Programmibility shouldn't get in the way of operation of the calculator in normal, non-automated modes.

In an ideal world, your input on how you use a machine should have influence in a community focused project like OpenRPN. I wouldn't expect them to drop the programming, but your overall requirements sound like they could make a heck of a good "use case" in a system design effort. I think it would be useful for them to hear that you don't want a programmable. It should make them think how to ensure the regular operation of the machine doesn't get bogged down in bells and whistles. You should wander over there and put in your 2 cents.

Regards,
Howard.

Re: Looking for the first Field Engineering HP RPN model 15C

*Message #11 Posted by **Walter B** on 29 Dec 2005, 3:40 a.m.,*
in response to message #9 by Nostradamus

@ Nostradamus:

Please take a look to this link.

Therein please take the post of Oct.14th to start with, giving you a comprehensive user interface proposal to look at. You'll see plenty of space reserved for CONSTants and CONVersions already as you requested. And you will have the comfort of a typewriter-style keyboard in this model. The keyboard was developed furtheron with the basic concept kept (follow the thread). If you see a need for more functions than incorporated there please tell me.

Besides, I agree with ECL: *some* formatting would be beneficial in your post. And I would keep the programming capabilities, too: you might come to like them later - and they don't limit you in the beginning.

12C vs 12C Platinum Cash Flows

*Message #1 Posted by **Katie Wasserman** on 27 Dec 2005, 4:09 a.m.*

In looking through the 12C, 12C Platinum and the New 12C Platinum manuals I see that cash flow processing has been increased. The original 12C allows for 21 cash flows, the 12C Platinum allows for 31 cash flows and the New version allows for 81 cash flows.

But the Error section of the manuals for the 12C Platinum say that Error 6 will be returned if you attempt to set N0 (the number of cash flow in the initial cash flow register). This contradicts what an earlier section of the manual implies and is different from the original 12C. I don't have either Platinum calculator to try this out on, but would like to know what the true situation is.

(Why do I care about this? I'm playing around with various sorting and median calculations that make use of the Nj registers and the algorithms need to use N0.)

Re: 12C vs 12C Platinum Cash Flows

*Message #2 Posted by **Don Shepherd** on 27 Dec 2005, 5:35 a.m.,*
in response to message #1 by Katie Wasserman

Katie, they didn't lie! I don't have the "new" 12c platinum, but the "old" platinum does behave that way. You cannot set n(0) to a value between 2 and 99, like you can on the original 12c. Kinpo strikes again!

Re: 12C vs 12C Platinum Cash Flows

*Message #3 Posted by **Gene Wright** on 27 Dec 2005, 10:09 a.m.,*
in response to message #1 by Katie Wasserman

Katie is correct.

The original 12c platinum would not allow for a value input for N0 and the 12c platinum manual was adjusted to tell users to not do this (which was a change from the black/gold 12c).

When the new 12c platinum was coming out (the one with parentheses) and the manual was being edited to put in algebraic examples everywhere, it became apparent that on the newest 12c platinum, the prohibition against having a value for N0 no longer applied. I convinced Cyrille to allow that language in the body of the manual to be changed to its present state.

Sadly, the change needed in the error section notation of the Error 6 slipped past me. :-(That's the first mistake that's been brought to my attention in the manual.)

In summary:

original 12c : N0 can be used original 12cp: N0 cannot be used newest 12cp: N0 can be used again.

So, thanks for finding it and keep looking!

(Interestingly, Tony Hutchins was instrumental in correcting most of the error section of the manual. Many of these had been wrong since the ORIGINAL 12c manual back in 1981. If you compare the error sections of the 12c manual and the newest 12cp manual, you'll see the differences. Where there are differences, it will be the newest 12cp manual that is in almost all cases correct!)

Gene

Gene,

Do you know of any online store that sells the NEW version of the HP-12CP??? It has been very frustrating to find one. All the storesthat carry HP calclators in my area do not carry the 12CP. I know buying online can be tricky in this case. My wife who buys TI/HP/Casio calculators for a local university bookstore was unable to get me a new 12CP. She called her suppliers and they were too lazy to go look for one that is a new version.

in response to message #3 by Gene Wright

Gene, I totally missed that Nj behaviour - till I was writing a little article a month or so ago. Till then I didn't even realise we could have a variable N0 - I was mislead by the formulae in Appendix D for NPV and IRR - the NPV formula there is only valid for all Nj=1, and the IRR formula is only valid for N0=1 - the +CF0 term should be generalised.

You can even have N0=0 - useful if you want NPV and IRR to ignore R0 (a.k.a. CF0).

Katie, thanks for spotting that superfluous last phrase under Error 6! I look forward to your programs. Hope you can find the new 12cpt - I can report that the keyboard is greatly improved. At work I even switch to ALG so visitors to my desk can use it - much easier than explaining about RPN :-)

Cheers, Tony

Re: 12C vs 12C Platinum Cash Flows

*Message #11 Posted by **tony(nz)** on 28 Dec 2005, 10:12 p.m.,*
in response to message #1 by Katie Wasserman

> Quote:
>
> (Why do I care about this? I'm playing around with various sorting and median calculations that make use of the Nj registers and the algorithms need to use N0.)

One undocumented improvement on the new 12cpt is that [g][CFj] does *not* change the associated Nj. This can make correcting cashflows less stressful. I'd often forget about Nj, assuming it would be unchanged, but on the 12C gold it got reset back to 1.

[g][CFo] does however still always reset the Ro to 1.

It never got documented because the examples in the manual don't really touch on this (he says hurriedly re-scanning the manual<G>)- it's only really evident for j>19 as then one cannot just use [STO] to alter a cashflow. On the 12C gold all cashflows can be manually altered without affecting Nj, by using a direct [STO].

CLEAR REG (non-programmable) resets all Nj=1 on the new 12cpt.

Looking forward to your median program :-)

Cheers, Tony

HP-42S Rocks!

*Message #1 Posted by **Howard Owen** on 26 Dec 2005, 11:56 p.m.*

I haven't been able to put this little guy down for very long since I got it two weeks ago. This machine is just great! It fixes lots of things that were limiting and/or awkward of the 41C and adds some very nice extras of its own. In the first column are the full alphanumeric capability, easy access to functions, without typing and nearly ideal form factor. In the latter column are items like named variables, matricies with editor, complex numbers, built in solver and numeric integrator and graphics.

Now for the downside. It's such a pity that the 42S represents the high-water mark of keystroke programmable RPN calculators. The machine is full of promise for the future. The I/O is officially limited to printer output, though clever folks discovered you could dump raw memory, ROM and RAM, through the hidden memory editor, out the infrared port. It's still one way, though. The additional memory compared to the 41C is nice, but its tiny compared to other machines of the day. Once again,clever folks have designed a hardware hack to raise the memory to 32K. But then you have to fill it all up one keystroke at a time! The machine cries out for more RAM, and effective mass storage.

The CPU is slow. Nice new features like the alpha graphics are practically unusable for anything beyond small accents because of the speed. The system software isn't perfect either. The matrices are cool, but they are slow too. In an application I'm writing, I use alpha graphics to draw a screen. The graphics data is stored in a 5X7 matrix. The graphics are slow, but if I dump that data out to registers before I run the display update routine, it runs about twice as fast! So there's room for optimization there.

Some annoying limitations from the HP-41C are retained in the 42S. Registers are 56 bits, just like on the 41C, so they can only contain 6 alphanumeric characters. (6x8 = 48 bits + header byte). This make the alpha register size increase to 44 characters less helpful than it might otherwise be. The RPL machines showed the way to stacks and storage that could contain any type of data.

Taking all that into consideration, the 42S is still an awesome machine, all these many years later. HP has refused to release the 42S ROM into the public domain. I take a faint glimmer of hope from this that they might release a "43S" machine someday, with enhanced RAM and processor. Even if they did that in the same way they did the 33S, without changing the system software very much, it would still be a heck of a product. And perhaps some day something like OpenRPN will succeed to the point where it would be realistic to consider what an advanced keystroke programmable RPN machine based on current hardware technology would look like. When that happens, I hope the designers each have access to an HP-42S, to remind them of what the state of the art looked like at its zenith!

Regards,
Howard

in response to message #1 by Howard Owen

The 32KRAM upgrade makes it sing and dance... Thanks to some of our gurus, here. Open one jump, close

another, change the RAM chip and there it is!

I successfully upgraded at least five (maybe six) units, one of them is my own unit. About keystroke programming, let's see another side of the upgrade: consider inverting a big complex matrix...

Best regards, and welcome to the HP42S fan club!

Cheers.

Luiz (Brazil)

in response to message #3 by Howard Owen

Hi, Howard;

please, have a look at the posts in this thread and you'll find some info about the 32KRAM chips used to upgrade the HP42S.

If you have the skills and the necessary equipments to go ahead with the upgrading AND you still need advice, let us know. There are some pics around (I have at least two, need to search for) with detailled images.

Best regards.

Luiz (Brazil)

Re: HP-42S Rocks! (32K)

*Message #5 Posted by **Paul Brogger** on 6 Jan 2006, 4:36 p.m.,*
in response to message #3 by Howard Owen

If I may be so bold, MoHPC Article # 199 gives many of the essential details. Do ask questions if you have any.

And, I've bought parts by mail from futurlec.com (COMPONENTS tab, Integrated Circuits / Memory / RAMs). You want a 256K bit (32Kx8) low-power CMOS *surface mount* part. In the barely-remembered past, they sold me quantity 1 at reasonable price. Don't know if they're still so accomodating. But make sure you get the *surface mount* part with the proper dimensions.

Good Luck!

Edited: 6 Jan 2006, 4:45 p.m.

Re: HP-42S Rocks! (32K)

*Message #6 Posted by **Howard Owen** on 6 Jan 2006, 6:57 p.m.,*
in response to message #5 by Paul Brogger

Thanks for the reply, Paul and Luiz. I decided that soldering tiny surface mount parts was beyond my meager soldering skills. If it was a throwaway machine, I might risk it. But not on a 42S that has the 2X speed capability!

Re: HP-42S Rocks! (32K)

*Message #7 Posted by **Paul Brogger** on 6 Jan 2006, 7:17 p.m.,*
in response to message #6 by Howard Owen

You're welcome.

There's also the question of whether you'll ever enter more than 8K of programming, anyway? (And, should you get 8k filled up, will you then want to sacrifice it all to upgrade the calc's memory?)

The 32K is probably useful for large, computationally-generated arrays, perhaps? But the lack of speedy, reliable electronic I/O severely hampers the upgraded 42s as a programming platform.

I took the whole 32K upgrade issue as more of a technical challenge than anything else. Having accomplished it, I never used my 42S again. In fact, I love the 33s' programming model for the kind of problems I end up playing with on the calculator anyway. For anything more complicated than the 33s can easily handle, I'm off to Java on a computer.

Someone *really* oughtta implement a one-finger, hunt & peck robotic programming service for the 42s & 33s. It probably wouldn't pay any bills, but it would be a fun challenge and a marvelous contribution to the community!

Re: HP-42S Rocks! (32K)

*Message #8 Posted by **Howard Owen** on 6 Jan 2006, 11:26 p.m.,*
in response to message #7 by Paul Brogger

LOL!

What *I'd* like to see is a beowulf cluster of HP-41s. 8)

And I've nearly filled the memory of the 42S up with a 1500 line program to play Yahtzee, with bells and whistles. I also sacrificed it (but not before saving it with INPRT) in order to download the ROM so I could use it with EMU42. Your points are well taken, though. I'm not using the machine for real work, but as part of my quest to understand how the architectures of HP handheld calculators evolved over the years. I'm positive nobody would want to key my program into a real 42S, memory enhanced or otherwise. People might like to look at it under EMU42 or Free42, however. It does run in both environments.

Regards,

Howard

Re: HP-42S Rocks!

*Message #9 Posted by **Karl Schneider** on 27 Dec 2005, 1:03 a.m.,*
in response to message #1 by Howard Owen

Hi, Howard --

Very astute observations of yours, regarding the HP-42S. I agree with everything you said, save for one item.

I'm sure that I saw one for the first time (long with the HP-32S and/or HP-32SII) in 1991 at a H-P calculator promotion at a college bookstore. However, I was quite pleased with my HP-15C from 1983, and was a very tight-spender at the time, due to circumstances. (It's probably just as well that I didn't buy one, because I would have spent valuable time learning it.)

I rediscovered the HP-42S in 2002 when participating in this forum, and got a 1989 model that summer through eBay from a somewhat-disgruntled former H-P employee. (Note: the ROM version on the 1988-1990 flat-screen models is different from the later ROM versions, allowing the user to run a program that will change settings to double the processing speed, until the "EXIT" button is pressed.)

It is true that only six alphanumeric characters can be stored in the numbered storage registers or stack registers. However, a numbered register dimensioned for real (not complex) values is 8 bytes (64 bits), because that is the size of the binary-coded decimal floating-point numbers used on all Pioneer-series models.

I/O would have been a very nice thing to have. I wonder if the trim form factor and the expensive, limited-capacity 1.5V cells could have supported I/O adequately. My opinion is that I/O would have been a pre-requisite for H-P to install 32kB of RAM, for issues of practicality and not allowing the user to overextend himself. (Consider a large library of keystroked programs lost, due to lack of backup capability...)

There are ways to utilize large RAM for purposes other than storing programs or data -- for example, programs that create large matrices for calculation of sensitivity or statistics. However, no built-in HP-42S functions do these things.

Regards,

-- KS

Re: HP-42S Rocks!

*Message #10 Posted by **Howard Owen** on 27 Dec 2005, 2:16 a.m.,*
in response to message #9 by Karl Schneider

My 42S has a serial number starting with '29' indicating a 1989 manufacture date. What was that magic command to get 2X speed?

Thanks for the correction on the register size. I assumed that since a register could store only 48 bits of text, that the width was actually 56 bits like the 41C. Knowing there are actually 8 more bits makes the limitation even harder to swallow. (Although I'm not sure 7 or even 8 characters would be a huge improvement, practically.)

I agree that full-featured I/O would probably have seriously compromised the very nice form factor and the price. I also agree that 32K would be risky to maintain on battery backup alone. But part of what I meant by saying the machine was "full of promise" was the fact that those things could be provided today within

the form factor and relatively cheaply. Two SD slots could be stacked in the thickness of a 42S, and all you would need would be one to provide huge quantities of storage, and the capability of loading programs and data from a PC.

Regarding the fact that none of the HP-42S built-ins provide features for large matrix applications, I'd expect a modern follow-on to the 42S to have a fairly extensive math library that would include things like that. The RPL machines are the benchmark there, once again. They seem to set a very high standard in breadth and quality for calculation support libraries, though I am by no means expert enough in that area to judge. But along with a modern processor would come a nice, large, modern, flat memory model. That in turn would allow very large quantities of ROM as well as RAM. What to fill the former with ought to be an interesting discussion.

I'm really hoping this will turn out, some day, not to have been merely an exercise in wishful thinking. If you look at what the mechanical engineering people are doing with small, relatively inexpensive prototyping factories, then we could be on the verge of an era of small-scale, low-cost manufacturing. Even without breakthroughs in that area, projects like Open RPN are trying to deliver the goods today. Here's wishing them all the success they can handle! 8)

Regards,
Howard

in response to message #1 by Howard Owen

I cannot agree more. I had a 42s throughout most of college. It handled everything I needed it to for my engineering degree.

The downside: Other people like them too, enough to steal them

Alas, I no longer have one (for over eight years now). But I still remember how much better it was than anything else or since. I also vote for HP to release a new model. Here's hoping they read this forum.

in response to message #2 by Vieira, Luiz C. (Brazil)

Hello Luiz,

Don't you worry about the books. I know you've been busy lately. Anyway, it'll take long before I have the time to read them.

About the post, to be honest, it was not built by hand. I wanted to post a Christmas message using HP-41 characters. I tried to do it by hand but it was harder than I had imagined. Writing a small QBasic program for the task proved to be much easier :-)

At first, I had included only the standard 41 character set. I had trouble designing the lower characters as I haven't been able to find any commercial 14-segment display decoder table with low case letters. These seem to be difficult to implement even on 16-segment displays. When I remembered to take look at your 41 font, I noticed at least sixteen letters matched your set, including 'j', 's', 'z' and 'y'. Now, out of curiosity, how have you come up with the extended set? Have you built it all by yourself or have you received suggestions then?

Best regards,

Gerson.

Re: You're welcome! (was: HP-41 extended char set font)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 26 Dec 2005, 11:17 p.m.,*
in response to message #3 by Gerson W. Barbosa

Hi, Gerson; (Ê nóis no 'thread'...)

First of all, congratulations! I have some knowledge on BASIC, but I'd never be able to go that deep on character handling...

About the HP41 extended character set: when I first announced my fonts here at the MoHPC Forum (late 2001), I had only siv, maybe seven fonts ready. I told the guys I was creating others, then Gordon Dyer (U.K.) sent me an image from one HP-related publication (HPCC, I guess) showing all of the lower-case characters as they are shown in the halfnut LCD when programming accordingly. After that I draw the X-tended character set so users could either use the standard character set or the extended, depending on their application. The other TTF files where created almost in the same period of time.

The first time I actually saw the HP41 LCD lowercase characters was a couple of months ago, when trying some ROM's out with Meindert's MLDL2000. Ángel Martin's Sandbox 3d uses lowercase headers that can only be fully read with a halfnut. A [CAT] 2 in a fullnut with the Sandbox ROM would show

```
[-Sa db   3d ]
```

as the first header instead of

```
[-Sandbox 3d ]
```

normaly read with a halfnut.

Time passes and the HP41 never ceases to amaze us...

Best regards.

Luiz (Brazil)

HP-41 contrast adjustment?

*Message #1 Posted by **Geir Isene** on 26 Dec 2005, 12:54 p.m.*

Seeing the listing from the AlphaRom, it seems to be possible to adjust the contrast of the HP-41, is that so? Is this the only way?

Re: HP-41 contrast adjustment?

*Message #2 Posted by **Howard Owen** on 26 Dec 2005, 1:16 p.m.,*
in response to message #1 by Geir Isene

I think it's only possible with the halfnut models.

Re: HP-41 contrast adjustment?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 26 Dec 2005, 2:31 p.m.,*
in response to message #2 by Howard Owen

HI Howard, guys;

as far as I read about, you are correct. Either full lower-case alphabet or contrast adjustment are only possible with the half-nut units. As an example, Angel's Sandbox ROM has headres that can only be fully read with halfnut units. And if I am not wrong, Angel's Sandbox ROM (would that be the Toolbox?) has a contrast adjustment function.

Best regards.

Luiz (Brazil)

Re: HP-41 contrast adjustment?

*Message #4 Posted by **Geir Isene** on 26 Dec 2005, 3:24 p.m.,*
in response to message #2 by Howard Owen

Is it possible to make a halfnut from a halfnut main board and a fullnut casing?

Re: HP-41 contrast adjustment?

*Message #5 Posted by **Howard Owen** on 26 Dec 2005, 4:04 p.m.,*
in response to message #4 by Geir Isene

If you swap out the daughter card and the mainboard, including LCD, together, I don't see why not.

Re: HP-41 contrast adjustment?

*Message #6 Posted by **PeterP** on 26 Dec 2005, 5:42 p.m.,*
in response to message #5 by Howard Owen

i think there are a few threads on this one here, but I think you are right - bascically one has to change everything. Tony Duell, aside from all the other gurus here, would know all about it I believe...

The one thing I'm not sure about is if the keyboard can stay. Also, changing the LCD - which has the display drivers included. might be a pain to do. ONe migh tbe better of selling the fullnut and purchasing a halvenut. The price-difference, even via ebay, should be somewhere between 0 and 35 USD...

Cheers

Peter

Half+Full nuts?(was: HP-41 contrast adjustment?)

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 27 Dec 2005, 12:12 a.m.,*
in response to message #4 by Geir Isene

Hi, Geir;

I have done such 'transplantation'. I have a halfnut HP41CV with a bad RAM (shows up only 63 registers) inside an original HP41C fullnut case. As mentioned in this thread, all of the inner package must be transplanted, LCD assembly included. Look at the picture below:

http://www.logeng.com.br/images/hn_fn_front_compare.jpg

After removing the entire 'guts' from both calculators, it is necessary to cut out some small posts in the fullnut case (shown as black spots in the picture) prior to settle the halfnut main PCB. This is due to the fact that the halfnut main PCB does not have all small holes available in the fullnut main PCB. Appart from that, evertyhing else fits perfectly fine. The rounded-edge LCD frame is actually in the LCD assy itself, so it goes with the whole package.

Hopes this helps a bit.

Cheers.

Luiz (Brazil)

Re: HP-41 contrast adjustment?

*Message #8 Posted by **Miki Mihajlovic** on 26 Dec 2005, 3:36 p.m.,*
in response to message #1 by Geir Isene

Sandbox (CTRST, CTRST?, CNT+, CNT-) and Hepax (CTRAST or HEPAX 005) are the only two modules to my knowledge that have functions to adjust the contrast of LCD on halfnut models only.

Re: HP-41 contrast adjustment?

*Message #9 Posted by **Geir Isene** on 26 Dec 2005, 5:03 p.m.,*
in response to message #8 by Miki Mihajlovic

When contrast is adjusted, does it stay adjusted after the module is removed?

Re: HP-41 contrast adjustment?

*Message #10 Posted by **PeterP** on 26 Dec 2005, 5:39 p.m.,*
in response to message #9 by Geir Isene

yes.

And... (was: HP-41 contrast adjustment?)

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 27 Dec 2005, 12:20 a.m.,*
in response to message #10 by PeterP

I tested once, and the contrast set is kept even after a [MEMORY LOST] procedure, module(s) inserted or not.

Just to add this bit...

Cheers.

12C Platinum LCD Dust Problem

*Message #1 Posted by **Jeff** on 26 Dec 2005, 10:38 a.m.*

Well, it's kind of annoying. I have one of the newer 12C Platinum units, and have noticed specks of dust that are plainly visible in the display area.

Does anyone have a suggestion? Should I open it up and spray it out with compressed air? Is that a tricky process?

Or should I buy a new one at Office Depot and return this one as defective?

How does dust even get there in the first place?

Many thanks!

Re: 12C Platinum LCD Dust Problem

*Message #2 Posted by **Anthony L. Mach** on 26 Dec 2005, 1:02 p.m.,*
in response to message #1 by Jeff

Hi Jeff,

I bought a new one there recently, too. I also have the dust problem, but mine isn't too bad. It could be manufacturing defects. Office Depot has a very good return policy (I've had to return more than one thing). You could try the canned air, but it didn't work in my case. It's probably best to return for a new one - after all, they're not cheap!

Tony

Prime numbers...

*Message #1 Posted by **Anthony L. Mach** on 26 Dec 2005, 1:19 a.m.*

Hello all,

I always get a ton of good information and programs from the forums. Anyway, here's a present of dubious(?) value to everyone. This is what happens when you have too much time on your hands during the holidays! :) Please check it out:

Check to see if the number you have entered is prime. Program gives a result of "1" if prime, or "0" if not. If the number is not prime, hitting RCL 3 will give you the square root if the number has one, or will give you the lowest factor of the number. It isn't optimized or anything, just plain jane. The original number can be recalled by hitting RCL 1.

Legend:
/ = divide
SQRT = The square root

```
00-
01- STO 1
02- SQRT
03- STO 3
04- FRAC
05- X=0
06- GTO 33
07- RCL 1
08- 2
09- STO 3
10- /
11- FRAC
12- X=0
13- GTO 33
14- 3
15- STO 3
16- RCL 1
17- SQRT
18- INTG
19- STO 2
20- RCL 1
21- RCL 3
22- /
23- FRAC
24- X=0
25- GTO 33
26- RCL 3
27- RCL 2
28- X<=Y
29- GTO 36
30- 2
31- STO +3
32- GTO 20
33- 0
34- ENTER
35- GTO 00
36- 1
37- ENTER
38- GTO 00
```

Enter positive integers only. Enjoy!

Tony, AB9IO

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 26 Dec 2005, 2:07 a.m.,*
in response to message #1 by Anthony L. Mach

Hi, Anthony;

First, congratulations for your program. Looks like being an efficient code (did not run it yet, sorry...).

BTW, to which calculator has it been written? First I thought it was for the HP12C, then it came to my mind it might also fit in the HP10C. Well, based on the INTG code instead of INT, I consider that it is for the HP12C.

Best regards.

Luiz (Brazil)

Re: Prime numbers...

*Message #3 Posted by **alfredop** on 26 Dec 2005, 9:36 a.m.,*
in response to message #1 by Anthony L. Mach

Hi,

unless I made an error in copying the program, it seems that it does not work for the primes 1, 2, and 3.

Ciao Alfredo

Re: Prime numbers...

*Message #4 Posted by **Anthony L. Mach** on 26 Dec 2005, 12:00 p.m.,*
in response to message #3 by alfredop

Hi Alfredo,

You are absolutely correct. The program does not report 2 or 3 as prime. It is an error that I could have easily corrected. Sorry about that. I did write it for the 12c, but it should work for all of the Voyager calcs. It will probably work for others, but [sigh] I don't have any others to work with.

Thanks for the response. I've tested the program with the prime checker at math.com and gotten perfect results. All responses welcome.

Tony

Re: Prime numbers...

*Message #5 Posted by **GE** on 27 Dec 2005, 9:54 a.m.,*
in response to message #4 by Anthony L. Mach

Hello, I would no call prime factorization with trial division efficient, but criticizing is easier than programming, so congratulations on your program. The 12C was probably not intended as a tool for number theory explorations...

Re: Prime numbers...

*Message #6 Posted by **Anthony L. Mach** on 29 Dec 2005, 3:50 a.m.,*
in response to message #5 by GE

Hi GE,

You're not kidding! ;) I sometimes enjoy writing little programs for the 12C to keep my mind agile- and to have a couple of laughs.

Tony

HP41 battery refurbishment

*Message #1 Posted by **Helmut Wabnig** on 25 Dec 2005, 5:29 a.m.*

I have made a PDF file of 1,7 Mbyte which explains how to refurbish the HP41 rechargeable batteries and am looking for a place where I can put it for others to download. Also available as doc file for making a HTML to put on a Homepage.

post here or mail me hwabnig@aon.at

Re: HP41 battery refurbishment

Opening a HP41

*Message #1 Posted by **Roberto FURLAN** on 24 Dec 2005, 10:23 a.m.*

Hello Everybody! After a little battery leakage with corrosion on one of the contacts, my 41 doesn't turn on anymore. Anybody knows how I can open the case to look inside? Thank you very much and Merry Christmas!

Re: Opening a HP41

*Message #2 Posted by **Michel Beaulieu** on 24 Dec 2005, 11:13 a.m.,*
in response to message #1 by Roberto FURLAN

Just remove the 4 rubber feets and under them, remove the 5 screws and it will open like a clam! Pay attention when you will colse the calc; check CPU plastic connectors for allignment and don't FORCE SCREWS to much because you will break plastic post retaining them.

Good luck!

Re: Opening a HP41

*Message #3 Posted by **db (martinez, ca.)** on 24 Dec 2005, 11:46 a.m.,*
in response to message #1 by Roberto FURLAN

If it was only a little leakage then something is probably just not making contact. You could first try cleaning the contacts and springs again with vinnegar on a Q tip. Sometimes you have to wiggle the battery in place (it moves just a little bit). If the metal on the contact is corroded through; you can get metal contact paint, either in a pen (Katie uses this) or a bottle of "Nickel Print" that you brush on. If you want permanence and beauty; Diego Diaz should soon have the replacement flex connectors that he is having made.

HP museum DVD.

*Message #1 Posted by **Michel Beaulieu** on 23 Dec 2005, 4:28 p.m.*

I just received my new DVD from the Museum; what a great job - Thanks to Dave and all "scanners".

I just finish "reading" old EDUCALC catalogs from various years. I was fascinated by the presence of the HP-41 complete SYSTEMS that were available in 1985. Gradually "competition" from other models take place and finally the 41CX discontinuation was annonce on volume 54, 1991 page 56. You could buy a CX for 184$: they need place for the new 48S...

I was too young at the time to have interest in HP 41 systems, but hey, just give me that catalog today and someone that really wait at the other end and i can buy everything. And have you look at the prices for the 15C, 41CX, HP-IL stuff: A lot cheeper brand new than "mint" on eBay today!

After 1991, catalogs were not as fun as before... New technology that, for a lot, has been forgotten...

I think i miss a great era playing with my casio...

Michel

HP-71b ANd IL card

*Message #1 Posted by **Michel Beaulieu** on 23 Dec 2005, 4:09 p.m.*

"I" already communicate with my HP-41 and ISA HP-IL card with various programs.

Is there a way to use the PC card with the HP-71? Where can i find such program?

I have the original HP-IL ISA card on a 386 computer ready to talk with my 71 !

I also have a HP-75C to test. Can it talk to the PC card?

Thanks Michel

Edited: 23 Dec 2005, 4:11 p.m.

Re: HP-71b ANd IL card

*Message #2 Posted by **Howard Owen** on 23 Dec 2005, 7:01 p.m.,*
in response to message #1 by Michel Beaulieu

Yes! You need to get EMU41 or EMU71 from JF Garnier. The €20.00 versions can talk to the real HP-IL card as well as the virtual devices it sets up. I prefer EMU41 for this, because the external machine can be the loop controller.

There's also hpillink and hplink on the museum's FTP server. The first one is a software development enviroment. You have to have one of the FORTH based ROMS, or the KEYBOARD lex file before you can use it to best advantage. But you can transfer text files for sure, and maybe binary. I haven't tried to do that because EMU41 works so well for file transfer. I also haven't used HPLINK, the second one above. It is supposed to emulate a printer or a disk, but only one at a time. Again, EMU41 does such a great job at emulating disks printers and interfaces, I havn't bothered with this one.

Here's a link to JF Garnier's site where you can get EMU41 and EMU71. They both run under Windows, and I even have them working under Linux.

I frequently use HP-75s with EMU41 as well, so those are supported.

Regards,
Howard

Help: HP97 key not working

*Message #1 Posted by **Stephen Easterling** on 23 Dec 2005, 1:48 p.m.*

I just bought and received a mint (and I mean mint!) HP97 with case, manuals, battery pack. The battery pack looks mint. I started performing some basic exponential decay calcs here at work with it and quickly found out that the zero (0) button does not work at all. What can I do. This looks like a keeper but I really want it to work properly. I don't think I can find one as nice as this. I've never opened up an HP, so I don't really feel comfortable trying to fix it, and I only want an honest person that won't mark it up with a screwdriver.

Re: Help: HP97 key not working

*Message #2 Posted by **David Ramsey** on 23 Dec 2005, 8:59 p.m.,*
in response to message #1 by Stephen Easterling

It's probably a very simple fix. The HP-97 keys merely press down on a set of contacts printed on a PC board. I imagine removing the keyboard and cleaning the contacts and the bottom of the key switch would fix it-- it's worked on my 97s.

Re: Help: HP97 key not working

*Message #3 Posted by **db (martinez, ca.)** on 23 Dec 2005, 9:10 p.m.,*
in response to message #1 by Stephen Easterling

The 97 is easy to open. From memory: 6 small phillips screws on the back and 7 to pull the internal frame off. The pcb pulls off a bunch of spreading connector pins with only your fingers as tools. There is no label to peel up. If i can do it then you can. There is a post by waterhosco in the articles forum on the sticky wheel repair and that will get you deep enough to atack the keypad from the back with some cleaner. You might do the sticky wheel fix while you're in there, if it hasn't already been done.

Re: Help: HP97 key not working

*Message #4 Posted by **Stephen Easterling** on 23 Dec 2005, 10:33 p.m.,*
in response to message #3 by db (martinez, ca.)

Thanks, guys! I don't mind sending it to someone competent to fix it and even do a little preventative maintenance. I would gladly pay the person.

Re: Help: HP97 key not working

*Message #5 Posted by **David Ramsey** on 26 Dec 2005, 1:44 a.m.,*
in response to message #4 by Stephen Easterling

Stephen,

If you're still nervous about opening your HP-97 to clean the keyboard contacts, you can send it to me...it takes < 30 minutes if you've done it before.

No guarantees, of course, but it sounds like a simple fix.

Re: Help: HP97 key not working

*Message #6 Posted by **David Smith** on 26 Dec 2005, 12:20 p.m.,*
in response to message #5 by David Ramsey

Of course, the reader will need to be rebuilt.

Also, if the printer was never used the printer drive cam will probably be so screwed up it will need to be replaced also (you can use one from an 82143A). On machines that were never used, the rubber tended to degrade much worse than on machines that were used.

Re: Help: HP97 key not working

*Message #7 Posted by **Tony Duell** on 24 Dec 2005, 5:13 a.m.,*
in response to message #3 by db (martinez, ca.)

Actually, the HP97 (and other Topcat) keyboard is easy to dismantle fully. There are no heatstakes.

Once you've removed the bottom cover and the chassis plate, undo the 2 screws inside, one at each end of the keyboard. Unclip the display window from the top case, then take the whole lot out (it comes out from the outside, not down into the case. Bend the display cable as little as possible, it can be fragile.

Then take off the 7 screws on the back of the keyboard. Lift off the PCB. Don't lose the contacts for the slide switches. Take off the plastic spacer sheets and the gold-plated contact sheets. It's now obvious what to clean -- I use propan-2-ol (isopropanol) for this.

looking for 5x7 display diagrams

*Message #1 Posted by **tommasone** on 23 Dec 2005, 12:51 p.m.*

Hi any one can give me the diagrams of the 5x7 dot matrix display found in hp calculator 9830a? 1990-0345 638

Re: looking for 5x7 display diagrams

*Message #2 Posted by **Tony Duell** on 24 Dec 2005, 5:14 a.m.,*
in response to message #1 by tommasone

What do you mean by 'diagrams'. It's just a matrix of LEDs, no internal logic. You can get 'my' schematics for the 9830 either on the HPCC CD-ROM or from the Australian museum site, I think I included a pinout in there.

Re: looking for 5x7 display diagrams

*Message #3 Posted by **tommasone** on 24 Dec 2005, 3:51 p.m.,*
in response to message #1 by tommasone

ZENROM Manual

*Message #1 Posted by **Tobie** on 23 Dec 2005, 5:15 a.m.*

hi all
i search the manual for the ZENROM module. i dont find it on the hpmuseum dvd (?)

i just like a list with all commands and what they do.

thank you
tobie niggli

Re: ZENROM Manual

*Message #2 Posted by **Raymond Del Tondo** on 23 Dec 2005, 2:56 p.m.,*
in response to message #1 by Tobie

Hi,

did you take a look at TOS (The Other Site)?

Hint: Search the hpmuseum site for the keyword 'Furlow',
without the quotes. There you'll find the link to TOS.

Ok, because it's near Xmas, here's the link to the link:
http://www.hpmuseum.org/software/41uc.htm
Look near the bottom of the page...

Raymond

Re: ZENROM Manual

*Message #3 Posted by **DavidMY** on 23 Dec 2005, 9:45 p.m.,*
in response to message #1 by Tobie

Sorry Tobie --

I'm afraid that the ZENROM is not GPL so it's illegal to post the rom code or manual on the internet. While TOS has quite a few rom's and, in fact, Warren's v41 emulator comes with most, the ZENROM is not on that site.

The only way to get a copy of the manual is probably post a request to buy in the classified here and/or search EBAY.

David

HP34 European decimal change to American

*Message #1 Posted by **Tim P** on 23 Dec 2005, 10:58 a.m.*

Hi, I have a European 34C. Is there any way to change the decimal display from commas to dots ie, now it displays 123.456,2457 (European format) and I'd like to change it to 123,456.2457 (American format)? Or is this hard-coded and not changeable?

Re: HP34 European decimal change to American

OT: PC-100 (A) printers need repair

*Message #1 Posted by **Marcus von Cube, Germany** on 23 Dec 2005, 5:17 a.m.*

Hi,

Sorry for the off topic post from the "dark side", but I'd like to keep some old TI gear working and here are the hardware guys who might be able to help.

I've a couple of PC 100 (A) printers that don't work any longer, due to corrosion (failed batteries had been stored in the units for too long.) I've a working PC 100C but that doesn't support the SR-52 and SR-56 calculators.

Are there any schematics available for these machines?

I also need datasheets for two linear ICs: SN75492 and SN96912. They drive the thermal print head. Both chips seem to be similar. I found one set in one machine and the other in my second printer.

Marcus

P.S.: Happy Holydays!

Re: OT: PC-100 (A) printers need repair

*Message #2 Posted by **Frank Boehm** on 23 Dec 2005, 8:59 a.m.,*
in response to message #1 by Marcus von Cube, Germany

the 75492 is *very* commonly found in early LED calculators, I found the schematics here (if it is broken, a cheap Datamath will provide two of these parts):

Merry Christmas

*Message #1 Posted by **Matthias Wehrli** on 23 Dec 2005, 12:24 a.m.*

Hi you crazy people

Today is the last working day in this year from me. You can not imagine how long I was waiting for it as I had a very, very hard last quarter (maybe as many of you). But now it´s the 23th!

Merry Christmas and a Happy New Year to everyone! Enjoy the holidays, relax and have a smooth start into a happy 2006!

For next year too I will continue my work on presenting you as much HP accessories as I can find on my website. I will also continue my work on the HP-41 module database. I hope you´ll also continue next year so that we can keep alive the sprit of world´s best calculators .

Best wishes to all of you, Matthias Wehrli www.hp-collection.org

Re: Merry Christmas

*Message #2 Posted by **Massimo Gnerucci (Italy)** on 23 Dec 2005, 1:36 a.m.,*
in response to message #1 by Matthias Wehrli

Yeah!
Merry Christmas to you all.
I'll be leaving in a few hours and I won't read anything from you for a couple of weeks.

I wish you all the best.

Massimo

P.S. ...and a **H-P** New Year!! ;-)

Re: Merry Christmas

*Message #3 Posted by **Raymond Del Tondo** on 23 Dec 2005, 1:38 a.m.,*
in response to message #1 by Matthias Wehrli

Merry Christmas and a Happy New Year to all
from another crazy HP fan, too:-)))

Raymond

Re: Merry Christmas

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 23 Dec 2005, 2:27 a.m.,*
in response to message #1 by Matthias Wehrli

Hi, all;

Merry Xmas! And a Happy New Year.

Or, as we say in Portuguese: Feliz Natal, Feliz Ano Novo!

As Massimo say: let's hope for newer HP (actual, please!) calculators for this next year.

Cheers.

Luiz (Brazil)

Re: Merry Christmas

*Message #5 Posted by **Walter B** on 23 Dec 2005, 2:48 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi everybody,

A Merry Xmas and a Peaceful, Happy and Prosperous New Year to All of You!

Or, in my mother tongue: Fröhliche Weihnachten und ein glückliches Neues Jahr!

May the spirit of true H-P-ness rule until the crow turns white and the water runs uphill. May we see at least one running calc emerging from OpenRPN. Or may HP start a calc with a *BIG* ENTER key at the right place... ;-)) Just kidding!

Good luck to everybody!

Edited: 23 Dec 2005, 2:51 p.m.

WHOOPS! Meant to say 49g+ ROM VERSION

*Message #1 Posted by **Ron Allen** on 22 Dec 2005, 11:11 p.m.*

sorry about the error, I was working with the 48 and just had it in my head when I asked for info on current version and build.

I apparently have version 3,54 build 0031. Do I need to upgrade?

THE HP49G+

Thanks!

Re: WHOOPS! Meant to say 49g+ ROM VERSION

*Message #2 Posted by **Tim Wessman** on 23 Dec 2005, 11:02 a.m.,*
in response to message #1 by Ron Allen

Yes--upgrade.

Recently they have started assigning a "build number" in addition to a VERSION number. Type VERSION and you will see a stiring that tells you which rom you have installed. Recently there have been several ROM versions with different build numbers that have slightly different things in them. Version 83 is the most recent. Get it at hpcalc.org http://www.hpcalc.org/details.php?id=6376

Don't worry that it isn't an official release. The only difference between the version 80 and version 83 is a slight change in the keybounce timing. Most people report better keyboard performance with the 83 instead of the 80.

TW

Re: WHOOPS! Meant to say 49g+ ROM VERSION

*Message #3 Posted by **Ron Allen** on 24 Dec 2005, 12:48 a.m.,*
in response to message #2 by Tim Wessman

Thanks, Tim.

From this readout I am way behind (revision 1.23). Don't know why the diagnostic gave so different.

Exact readout to "VERSION" is:

Version HP49-C Revision #1.23

Doesn't sound at all like the "build" numbers I expected. I feel assured that I can get the correct numbers at hpcalc.

Thanks again! MERRY CHRISTMAS

Ron

HP9S facelift?

*Message #1 Posted by **Gene** on 22 Dec 2005, 9:15 p.m.*

HP9S On Ebay

The keyboard background in this auction seems different than the white background on MY HP9S.

?

Re: HP9S facelift?

*Message #2 Posted by **Raymond Del Tondo** on 23 Dec 2005, 1:27 a.m.,*
in response to message #1 by Gene

I think you mean the area surrounding the display;-)
The keyboard area has exchangeable faceplates since the beginning.

Raymond

Re: HP9S facelift?

*Message #3 Posted by **Gene Wright** on 23 Dec 2005, 8:47 a.m.,*
in response to message #2 by Raymond Del Tondo

Hi Raymond.

I know the HP30s had changeable faceplaces, but I didn't think the 9S did. My 9S has a white background with blue shifted functions (which is actually a very GOOD contrast even if somewhat garish).

Do you really have a 9S with changeable faceplates? I dont' think mine came with any.

Cheers! Gene

Re: HP9S facelift?

*Message #4 Posted by **Raymond Del Tondo** on 23 Dec 2005, 10:16 a.m.,*
in response to message #3 by Gene Wright

Hi Gene,

yes, I have some of these (30S, 9S, 9G) units,
and a 'marketing kit' which consists of a
blue cardboard box with one 9G and one 9S each.
You can exchange the faceplates between them,
although it doesn't make too much sense,
since the keyboard legends are not compatible
between the 9G and 9S.

The 9G and 9S basically share the same housing
as the 30S, only the ROM and display are different,
and of course the keyboard legends...
The display of the 9G seems to be the same
as one of my old Casios, a 7400G.

At least for the 30S there's a faceplate kit available.
I don't know if this is the case for the 9G and/or 9S.

Regards

Raymond

Alpha Rom from Angel Martin

*Message #1 Posted by **PeterP** on 22 Dec 2005, 12:14 a.m.*

Hi,

Just wanted to check if anyone of you has done some investigation of the functions of the Alpha-Rom? I have tried to come up with the functions, and got stuck with a few. Anyone has some ideas? (simply could not hold my curiosity until the arrival of a QRG... ;-))

Here is what I have so far (sorry for the bad format...)

Cheers

Peter

```
        XROM    Name    Function
-ALPHA
aView    6.01   Lower Case AVIEW        Displays M&N with lowercases
ACL?     6.02   Is Alpha Clear? Checks if Alpha is Clear. Skip if not true
Aleng?   6.03   Alpha Length    Reports back length of Alpha
AlengX   6.04   Make length of Alpha to x       Deletes n chars from left, to make Alpha as
long as indicated by X-reg
AlengXY  6.05   Make alpha string of y char, x times    create a string in alpha with Char
with code in y, x times repeated
AnumI    6.06   Anum Integer    Gets Integer Number from Alpha into x, -1 if none found
AnumDel  6.07   ANUM and Del    gets the value of the first number from the left into x and
deletes all chars from the left to the end of the number
ArclChr  6.08   ARCL Chars      Append x chars from currently active file
ArclI    6.09   ARCL Integer    Recalls the integer portion of x into Alpha
Arev     6.10   Alpha Reverse   Reverses Alpha to its mirror image
ArotX    6.11   Alpha Rotation by X     Rotates Alpha by X chars
ASCII    6.12   ASCII   Get ASCII code of leftmost char into X
ASHFX    6.13   Alpha Shift by X        Deltes X chars from the left in Alpha
ASTOXX   6.14   Asto in X, x chars      stores x chars from the left into x
ASUB     6.15   Alpha Substitution      Substitutes the Char at pos Y with Char X
ASWAP    6.16           ??? Creates "Private when one goes to PGM mode"
AEXEQ?   6.17   Execute Alpha   Checks if a lable like alpha exists, if so executes it, if not
skips a line
A>RG     6.18   Alpha to Regs   Stores alpha in 4 cons regs, starting at x
A>ST     6.19   Alpha to Stack  Copies reg MNOP to Stack registers
A<>ST    6.20   Alpha Exchange Stack    Exhchanges the context of the alpha regs with the stat
regs
ChrSet   6.21   Char Set        Shows all available characters, scrolling through the screen
ClaC     6.22   Clear Alpha from Comma  Clears Alpha from the Comma to the right
DCNT     6.23   Set Display Contrast    sets display contrast to value in x
DCNT?    6.24   What is Display Contrast?       Retrieves the currently active display contrast
into x
DCNT+    6.25   Increase Disp Contr     Increases the current display contrast by 1
DCNT-    6.26   Decrease Disp Cont      Decreases the current display contrast by 1
Display  6.27   Display the Alpha       Display Alpha reg, maybe some difference with printer
etc…
Dtest    6.28   Display Test    Light up all segments of the display
Ladel    6.29   Left Alpha Del  Deletes the leftmost char
LadelX   6.30   Left Alpha del by x     deltes the x leftmost chars from Alpha
LAtoX    6.31   Left A to X     Deletes leftmost char and puts code in X, just like ATOX from
the X/F mod
Left$    6.32   Left String     Keep x leftmost chars
Low$     6.33   Low String      Replace all upper chars with lower case charts
Mid$     6.34   Mid String      Kepp chars x to y
M<>N     6.35   Switch M and N
M<>O     6.36   Switch M and O
N<>O     6.37   Switch N and O
```

```
PMTA     6.38   Prompt A        Prompt for Text entry
PosAX    6.39   Pos of x in Alpha       Puts the position of the char with the code in X into
X
PostFX   6.40   Post found X    find char in x in alpha, delete all to the left of the found
char
PostSP   6.41           ???
Prefx    6.42   Pre found X     find char in x in alpha, delete all to the right of the found
char
PreSP    6.43           ???
RADel    6.44   Right Alpha Del Deletes the rightmost char, like ABSP
RAtoX    6.45   Right Alpha to X        Seems to not be working. Supposedly takes right alpha
char and puts char code in x
RemZer   6.46   Remove Zeros    Remove leading zeroes from String
Right$   6.47   Right String    Leaves x chars from right in Alpha
RG>A     6.48   Registers to Alpha      copies 4 consec regs starting with x into Alpha
St>A     6.49   Stack to Alpha  Copies Stack regs into Alpha
ToglC    6.50           ???
Upr$     6.51   Alpha Upper     Replace all lower case chars with uppercase chars
ViewA    6.52   View Alpha      Show Alpha, maybe some special treatment of printer
XAtoX    6.53   Alpha to X by X Puts char code of (x+1)th position in x, alpha undisturbed
XtoAI    6.54   X to A Integer  Appends integer of x to Alpha
XToAL    6.55   X to Alpha left puts char with code in x into alpha on left
XToAR    6.56   X to Alpha Right        puts char with code in x into alpha on right
YToAX    6.57           ??? Data Error

-Sound FX
Buzzon   6.59   Buzz On Turns a CPU buzz on
NoBuzz   6.60   Buzz Off        Turns the CPU buzz off
ClaxOn   6.61   Claxon  A new "Beep"
Rasp     6.62   Rasp    Another "Beep"
ToneXY   6.63   Tone by X and Y Y is length (ie number of repetitions) and x is pitch (lower =
higher)
```

Re: Alpha Rom from Angel Martin

*Message #2 Posted by **Howard Owen** on 22 Dec 2005, 12:27 a.m.,*
in response to message #1 by PeterP

Quote:

```
        XROM    Name    Function

..
PostFX   6.40   Post found X    find char in x in alpha, delete all to the left
of the found char
PostSP   6.41           ???
Prefx    6.42   Pre found X     find char in x in alpha, delete all to the right
of the found char
PreSP    6.43           ???
..
```

Given the context and the names, might these find and remove trailing and leading spaces as the case may be?

Re: Alpha Rom from Angel Martin

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 22 Dec 2005, 1:14 a.m.,*
in response to message #1 by PeterP

Hi, Peter;

I tried some of the ALPHA ROM features, but I did not dig too deep as you did. Allow me to congratulate

you!

About YTOAX (Y TO A through X-index), the Extended IO has a function with the very same name. If the ALPHA YTOAX works the same (hopefuly), it places the character defined by the ASCII code in Y to ALPHA, in 'X' position. If X is positive, left-to-right count; if X=0, leftmost character; if X is negative, right-to-left count. So: (using Extended IO YTOAX)

```
                [ABCDEFGHI  ] (ALPHA contents)
79    ENTER                   (ASCII dec code for 'O')
3     YTOAX     [ABCOEFGHI  ] (resulting ALPHA)
[CHS] YTOAX     [ABCOEFOHI  ]
```

Hope this helps.

Cheers.

Luiz (Brazil)

Re: Alpha Rom from Angel Martin

*Message #4 Posted by **PeterP** on 22 Dec 2005, 10:20 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz,

thanks for your kind input. I tried that version (and quite some variations of it) remembering the Ex-IO function. However I only get "Data Error" in the display...

Re: Alpha Rom from Angel Martin

*Message #5 Posted by **Doug Wilder** on 22 Dec 2005, 6:24 a.m.,*
in response to message #1 by PeterP

Hi Peter,

Angel copied several functions from the Bldrom for the AlphaRom. So Bldrom manual will describe these.

For example ALENGX allows plus of minus argument in X for left or right padding of spaces or stripping of characters. Similar for ALENGXY (makes alpha X chars long using char in Y (pads or strips)), ASHFX, ASTOXX (from left if pos right if neg, X in LASTX after). PRESP and POSTSP strip characters after or before the first space character (prefix and postfix parseing). PREFX (prefix) and POSTFX (postfix) using the character specified in X (either decimal, text or NNN). DISPLAY sends the text line that follows to the LCD display using unique LCD setting for each of 256 different bytes and only prints if in NORM or TRACE. A couple of bldrom functions have been renamed (XAI and AXI). You have AXEQ? and ACL? correct!

Best Regards, Doug

HP48G+ ROM VERSION

*Message #1 Posted by **Ron Allen** on 21 Dec 2005, 10:50 p.m.*

Would someone be so kind as to verify my rom version and let me know if it is up-to-date?

I looked into the system using the "hold on-f5" keys and requested the self test to find "VERSION 3,54 BUILD 0031"

Did I search correctly?

Is my version close to current?

How do I get an upgrade if needed? (I have a 128mb SD card for transfer)

I personally have difficulty with the Adobe Reader searching for info. Thank you in advance for assistance!

Ron

Re: HP48G+ ROM VERSION

*Message #2 Posted by **Tim Wessman** on 21 Dec 2005, 11:37 p.m.,*
in response to message #1 by Ron Allen

Do you mean a 49g+? Type VERSION and see what it returns. I am guesing you don't have the latest which reports build 83.

TW

Re: HP48G+ ROM VERSION

*Message #3 Posted by **Ron Allen** on 22 Dec 2005, 11:03 p.m.,*
in response to message #2 by Tim Wessman

whoops! You're right Tim. I was working with the 48 (easier to use on some work than the 49). I did mean to say the 49g+. Guess I better repeat it and put the right model into the heading or will miss some advice.

Thanks for betting on my error and responding anyway. I take it that you believe the version is up==to=date, but the build is way behind current status. Do I just contact tech support for download or do I go to an out source?

thanks again.

Clonix-41 Low Power SW update (Xmas gift... again ;-)

*Message #1 Posted by **Diego Diaz** on 21 Dec 2005, 6:30 p.m.*

Hi all,

Some of you have already tested the new Low Power software version for the Clonix-41 module. So far I have not received any complains... and this is a good symptom. :-))

But, one of the known drawbacks of the Low Power SW *was* that it cannot handle Bank-switched modules, namely, the Advantage, which BTW is one of the most popular "cloned" ROM-Pac's.

After some re-coding, I've finally managed to handle the BS feature into the Low Power version too.

The new version (same name: ClonixLP) is available at:

http://www.clonix41.org/Projects/Clonix-41/clonixlp.zip

Just download and replace the old files.

Enjoy your 41's!!

My very best wishes for this Xmas season.

Diego.

Defective ROM help

*Message #1 Posted by **Roberto Bazzano** on 21 Dec 2005, 5:10 p.m.*

Hello. I'm trying to fix a defective HP-85A. I made some diagnostics using Assembly Level Diagnostic Rom, and it found ROM 2 defective (U6 chip, part number 1MA7-0066). Swapping roms between sockets give always the same error, so probably is really the rom that's defective.

So my question is: do anyone know where to find one in the World? Or do you know if it's possible to replace it with some type of "standard" eprom (what type)? Or is it completely custom so there is no way except to find an original one?

Thank you very much. Roberto

HP-41 Module conflicts or what?

*Message #1 Posted by **Geir Isene** on 21 Dec 2005, 5:00 p.m.*

Sudden erratic behaviour (weird tones beeping, flashing display, funny symbols, locked display, had to take batteries out to unlock the calc, then more erratic behaviour when turned back on etc). Config:

HP-41CX with the following modules installed in the various slots:

X-Memory - Financial I

Math/stat - Navigation

The one I added last that caused erratic behaviour is the Navigation module. I then took the Math/Stat out and moved the Navigation module in its place. Then it's all ok again. Hm...

Any idea why?

Re: HP-41 Module conflicts or what?

*Message #2 Posted by **Howard Owen** on 21 Dec 2005, 6:02 p.m.,*
in response to message #1 by Geir Isene

Can you recreate the fault by putting the modules back where they were?

Re: HP-41 Module conflicts or what?

*Message #3 Posted by **Raymond Del Tondo** on 21 Dec 2005, 8:03 p.m.,*
in response to message #1 by Geir Isene

Check if any of the software modules you use have
either same XROM numbers and/or same function names.
This information can usually be found in the associated manuals.

Additionally, you should place the X-Memory into the lowest numbered slot.
AFAIR the latter is not mandatory, but recommended by HP.

Raymond

Re: HP-41 Module conflicts or what?

*Message #4 Posted by **PeterP** on 21 Dec 2005, 10:24 p.m.,*
in response to message #3 by Raymond Del Tondo

XROM numbers should not be an issue. Math = 1, Stat = 2, Navigation = 14, Finance = 04. Only cuprit I can think of is the Finance mod, if it is a different one (like GMAC or so). To check, plug it in and enter a program using one of its functions and then plug it out and check the program. It will show the XROM number for that function. If it is 1,2 or 14 you have found the issue...

Cheers

Peter

Re: HP-41 Module conflicts or what?

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2005, 11:17 p.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

I had seen some problems related to erratic behavior and, in extreme cases, calculator locked, mainly because of bad contact between the Battery/IO assembly and the keyboard PCB. In some cases, broken/cracked screw posts are the case, and solutions are diverse. Do you have the means to check if the both upper and lower halfcases are firmly together? Just slightly (SLIGHTLY) try to pull them appart, close to the LCD assembly. The simplest feeling of having them moving appart from each other is enough to certify if there is a case problem.

Also: please, don't be mad with me after reading my suggestion, because it is more likely that you'd have done this if you had the means to, but I can't help asking: do you have the means to perform a ROM checksum in these modules?

Hope this gives you some new clues... Let us know how it goes.

Success!

Luiz (Brazil)

Re: HP-41 Module conflicts or what?

*Message #6 Posted by **Geir Isene** on 22 Dec 2005, 4:34 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi guys,

Thanks for the input.

1) Problem can be replicated.

2) The calculator is very firm, not possible to move apart at all.

3) No means of seeing ROM checksum

4) I will try another CX I have. I'll let you know.

Edited: 22 Dec 2005, 4:45 a.m.

Re: HP-41 Module conflicts or what?

*Message #7 Posted by **Wayne Brown** on 28 Dec 2005, 9:41 a.m.,*
in response to message #1 by Geir Isene

> Quote:
>
> Sudden erratic behaviour (weird tones beeping, flashing display, funny symbols, locked display, had to take batteries out to unlock the calc, then more erratic behaviour when turned back on etc).

Sometimes that kind of behavior can be caused by a module that is not inserted fully, or that has loose-fitting or dirty contacts, etc. It may happen more with some module/port combinations than others. For instance, I have a 41CV that behaves that way when my barcode wand is inserted in one port, but it works fine in the other three ports. Other modules work fine in the "bad" port, and the wand works fine in all four ports of my 41CX.

New Datafile articles

*Message #1 Posted by **Valentin Albillo** on 21 Dec 2005, 8:50 a.m.*

Hi, all:

This is to briefly let you know that the just recently published V24N6 Xmas issue of Datafile features two of my articles, namely:

Long Live the HP-16C

> Five-page article commemorating this wonderful, one-of-a-kind HP model belonging to the much celebrated Voyager series. Includes a new program written specifically for the article, which puts to good use some of its distinctive advanced capabilities.

25 Years of Othello

> Eight-page article which commemorates the 25th anniversary of my original Othello program written for the HP-41C back then. As such, it includes a fond, highly-personal remembrance of the circumstances involving its creation and publication, which constitutes a small chronicle of just how golden and how exciting those days were. The article also includes a slightly-revamped version of my original 41C Othello specifically written for the HP-71B.

That's all for now, hope you enjoy them both.

I'll be out for vacation and don't know if I'll be able to read and post to the forum but be as it may, I truly wish you all a Merry Xmas (or Hanukkah, etc ... :-) and very Happy New Year 2006, it's been a pleasure sharing this MoHP forum with all of you.

Best regards from Valentin Albillo

HP75 Internal Design Specifications ?

*Message #1 Posted by **Edouard Lafargue** on 21 Dec 2005, 8:48 a.m.*

I recently received the museum's DVD (awesome work), and browsing throught the list of available documentation, I noticed that the HP75 IDS are not there (you can check this on the web site directly without ordering the DVD, I know :))

Does anyone remember the stories of Roo-Man and Joey that supposedly came from those HP75 internal design specifications, and were published from time to time by Joe Horn on his famous 'Goodies Disks'? Look below for an example...

... and more to the point, does anyone have a copy of these specs? I'd be very curious to have a better look at them, if only to see those small stories in their context.

"Roo-man," Joey looked up with a quizzical plea upon his boyish face. "I can't find any reason why the FOR and NEXT tokens can't follow a THEN statement."

"Well, Joey," Roo-man paused for a moment, his eyes gazing off into some future that could never be. "Well, Joey," he started again, "there is no reason why they can't. There are those who fear what this new found power may be put to. It is a distrust of freedom, much like the bird in a cage, who, when the door is accidentally left open, huddles in a corner in fear of the open air -- his natural inheritance."

Re: HP75 Internal Design Specifications ?

*Message #2 Posted by **Tony Duell** on 21 Dec 2005, 2:14 p.m.,*
in response to message #1 by Edouard Lafargue

They do exist (I have them). There are 2 volumes. One is the commented source code to the HP75C ROM, the other is a commentry/explanation on that source code. I can't remember which volume contains the jokes, maybe some in each.

The bad news is that it's around 1000 A4 pages (!). And as ever I don't own a scanner. This is not the sort of thing I can easily copy and get to you.

Re: HP75 Internal Design Specifications ?

*Message #3 Posted by **Howard Owen** on 21 Dec 2005, 3:34 p.m.,*
in response to message #2 by Tony Duell

Does someone else besides Tony have access to these documents? (The answer to this in the past has been silence.)

Tony, if you are the only one in the current online HP calculator community that has a copy of the 75 NOMAS documents, won't you please consider lending them to someone who can make copies for the benefit of the community? All other things being equal, I imagine someone in Europe would be preferable

to someone elsewhere in the world. I know that Thomas Okken has expressed interest in the past. His HP87 simulator could be more easily adapted to simulate the 75, if he had the benefit of the system source code. Can't we work something out?

Thanks,
Howard.

Re: HP75 Internal Design Specifications ?

*Message #4 Posted by **Eric Smith** on 21 Dec 2005, 4:44 p.m.,*
in response to message #3 by Howard Owen

I've got them.

The only reason I haven't already scanned them is that they're printed 4-up, like volume 3 of the HP-71 Software IDS. My usual very-high-speed scanner only does 400 DPI, which is not adequate for that. It took me a very long time to scan the 71 IDS on a 600 DPI scanner, which was barely adequate. (That's what's on the MoHPC CD/DVD set now.) I have recently obtained a 3200 DPI scanner, so I'll scan them at 800 DPI, which should be fine, but it will take a very long time as this scanner is even slower than my older 600 DPI scanner, and does not have a sheet feeder.

Eric

Re: HP75 Internal Design Specifications ?

*Message #5 Posted by **Jim Rudnick** on 21 Dec 2005, 9:01 p.m.,*
in response to message #4 by Eric Smith

Think about it everyone...these design specifications were printed from a COMPUTER FILE and now with much time and effort the printed results will become a computer file once again! I'll bet the files are still archived by HP somewhere... Merry Christmas everyone Jim

Re: HP75 Internal Design Specifications ?

*Message #6 Posted by **Eric Smith** on 22 Dec 2005, 1:17 a.m.,*
in response to message #5 by Jim Rudnick

Sadly not. I know the last person at HP who had a tape of them, and it's gone. No one at HP wanted the old tapes and discs, so they were destroyed. That's the way things work at big corporations, especially when responsibility for a product line moves to different divisions around the world three times in ten years.

Re: HP75 Internal Design Specifications ?

*Message #7 Posted by **J-F Garnier** on 22 Dec 2005, 6:49 a.m.,*
in response to message #4 by Eric Smith

I'm interested in the HP75 IDS too. If there is a way to share the scan job between different people, I'm ready. But I understand it can be dangerous to send the original document by mail.

J-F

Re: HP75 Internal Design Specifications ?

*Message #8 Posted by **Edouard Lafargue** on 22 Dec 2005, 11:06 a.m.,*
in response to message #4 by Eric Smith

Nice to see that those specs still exist somewhere!

When you say 'printed 4-up', what does this mean in terms of A4/A3/Letter/etc ?

In case the overall format is less than A3 and the pages can be separated somehow, I have access to copy machines that are able to bulk-scan from their sheet feeder, I'd be willing to do the job if someone DHL'ed the specs to my address... I'll return them, of course.

Let me know!

Edouard

Hal is absolutely right! It was one of the first things I got when I joined the HP community just a little while ago - great way to catch up, learn, read, have fun!

Thanks Dave!

Cheers

Peter

Re: HP museum DVD fantastic

*Message #5 Posted by **Namir** on 21 Dec 2005, 12:04 p.m.,*
in response to message #4 by PeterP

I agree. The HP Museum DVD is priceless. Being able to access the old calculator manuals, module books, and solution books is wonderful. I often use them to look up the equations used in the calculations.

34c hard detents

*Message #1 Posted by **Hal** on 21 Dec 2005, 2:08 a.m.*

Hi folks.
Recently acquired my first spice, a nice 34c. In using it, I've noticed that the key detents are quite stiff (to the point that my finger started getting tired!). In fact, a couple keys even emit a sharp snapping sound when depressed (although this sound softens a bit after working the key a few times). The keys all function perfectly though. I guess HP envisioned ham fisted, heavy fingered operators when designing this machine. Is this characteristic of all spice models?
Thanks and best regards, Hal

Re: 34c hard detents

*Message #2 Posted by **Karl Schneider** on 21 Dec 2005, 3:29 a.m.,*
in response to message #1 by Hal

Hal --

I'd surmise that you have the original design (serial # beginning with 22 or lower) with plastic snap-ring detents and the unsoldered keyboard clamped on a steel plate. These snap rings are quite stiff and allow long key travel.

The 1982 redesign featured metal-dome detents on a properly-soldered keyboard without steel backing plate. The calc is lighter; there is less key travel and less effort; and, the circuitry is more reliable.

-- KS

Re: 34c hard detents

*Message #3 Posted by **Hal** on 21 Dec 2005, 4:00 a.m.,*
in response to message #2 by Karl Schneider

Yes indeed, the SN starts with 20 (made in Singapore), and it surely is heavy. Sometimes I lose a segment in the display also, but a slight twist on the case brings it back.
May have to acquire a redesigned unit just to see the difference. Thanks, Hal

Snapping Keys

*Message #4 Posted by **Larry Corrado, USA (Wisc)** on 21 Dec 2005, 8:17 p.m.,*
in response to message #1 by Hal

I have an HP-12C I got three years ago, used (s/n 3215xxxxxx). It works fine, but the "f" key snaps if I haven't used it recently (ie, in the last five seconds.) It seems to be both a tactile (touch) and audible snap.

It seems that the snap gets stronger the longer it (the "f" key") has been unused. My guess is that there is something sticky under the faceplate causing the problem. I haven't had the machine apart.

Have others noticed things like this?

1515C calculator

*Message #1 Posted by **Burhan Ozmat** on 20 Dec 2005, 11:17 p.m.*

My calculator stuck in the USER mode.f+ USER key does not reset the mode back to normal.

I performed all of the tests recomended in te user's manual, including taking out the bateries and shorting battery terminals with batteries in.

They all show that the 15C is working fine.

Do you know if there is a specific sequence of key stroks that would reset it.

Please help.

Thanks

Burhan

Re: 1515C calculator

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2005, 1:09 a.m.,*
in response to message #1 by Burhan Ozmat

Hi, Burhan;

please, forgive me if the question goes above what you have already done, but I am curious about one fact: after shorting the batteries terminals in the calcualtor, did you get the

```
[  Pr Error  ]
```

message in the display? This is important to notice, because this is the (only?) way to be sure the calculator had its (user) memory cleared and all setting are in their default state. If you did not get the

```
[  Pr Error  ]
```

message in the display, chances are your HP15C still maintains prelious contents.

If you saw the Power Error message and you still have the [USER] annunciator lit, have you tested to see if the calculator behaves accordingly?

In any event that you cannot see the solution for this particular issue, at least you have a rare unit in hands. Not a consolation, though, and please, forgive me if it 'sounded' pun; not inteded, believe me. I had two old HP31E (Spices) and one of them had the following peculiarity: after the [STO][ENTER] self test, registers R1, R2 and R3 had their contentes altered to some not-zero value, althought the test itdself finished O.K.:

```
[8,8,8,8,8,8,8,8,8,]
```

As I know that one of the Brazilian contributors at the MoHPC has many calculators and he is a collector, I sent him this particular unit to be taken as a curiosity. And because this is not a common behavior, the unit

itself is a rare one, as seen by collectors...

Please, let us know how it goes. And success!

Luiz (Brazil)

Copies of the hp18c solutions books?

*Message #1 Posted by **John** on 20 Dec 2005, 10:30 p.m.*

Does anyone have electronic copies of the HP made solutions books for the hp18c? I'm remembering a set of books like they made for the hp28c covering a variety of topics. I see that the museum dvd has the 27s technical applications book in pdf form, but I don't see any of the other topics. Can anyone help?

HP 3468A US / German voltage selection

*Message #1 Posted by **gebripe** on 20 Dec 2005, 3:44 p.m.*

Folks,

there's a sticker with multiple supply voltages on the back of the 3468A / B Multimeter (see image below - sorry for the bad scan), with one option being "checked". This indicates that the voltage can somehow be selected...

http://www.24up.de/geb/3468A.gif

Now that these Multimeters are relatively hard to get in Germany, I though about buying one in the US. There's a switch for frequency selection (50Hz/60Hz), but I haven't found anything for the voltage. Usually, one could probably use a power converter, but I don't know in how far the device relies on the supply voltage as a comparator.

So question is: Can the device be reconfigured / rewired / resoldered for use with the German supply voltage of 230V instead of the US 110/120V?

Thanks in advance for your help.

Gunther

Re: HP 3468A US / German voltage selection

*Message #2 Posted by **Daniel Diggelmann** on 20 Dec 2005, 4:13 p.m.,*
in response to message #1 by gebripe

Hi Gunter,

No problems in using a US Model in Germany. After taking off the cover you'll fin a cable on the PCB (printed circuit board) next to the power transformer which can be plugged on the correct voltage selection pin. The voltages to choose from a printed on the PCB. I've bought my HP-3468A in USA and am using it in Switzerland on 230VAC.

Cheers Daniel

Daniel,

you've made my day. Now I have another use for your HP-IL module that is hopefully to arrive in the next few days... :-)

I'll try and get a 3468 asap.

Thanks!

Gunther

Re: HP 3468A US / German voltage selection

*Message #5 Posted by **Etienne Victoria** on 20 Dec 2005, 4:20 p.m.,*
in response to message #1 by gebripe

Hallo Günther,

Yes, you can change the voltage selection on the 3468A/B but, contrary to the frequency, the change must be performed internally.

You have to open the multimeter. inside, you have to solder a jumper (J701) between 2 connections that will provide you with the desired voltage.

The precise scheme to follow is given on page 2.1 figure 2.4 of the 3468A/B service manual.

More precisely on this page:

http://hp41.claughan.com/files/00009/hbhypsfm.gif

After soldering and double-checking your soldering...

Test & enjoy!

MfG aus Frankreich!

Re: HP 3468A US / German voltage selection

*Message #7 Posted by **gebripe** on 6 Jan 2006, 5:02 a.m.,*
in response to message #5 by Etienne Victoria

Just in case anyone else is interested: I just modified a 3468A to 240V by soldering in the correct jumper as described above. You don't even have to lift the PCB, just open the case by the 4 screws on the bottom, solder the existing bridge out and a new one in. Easy thing.

MLDL2000 Conversation

*Message #1 Posted by **Jeff D** on 20 Dec 2005, 1:07 p.m.*

I have not seen any recent conversation on the MLDL2000. I was under the impression that there was going to be a few postings regarding MLDL programming and MCODE. Did this conversation move elswhere?

Re: MLDL2000 Conversation

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2005, 12:52 a.m.,*
in response to message #1 by Jeff D

HI, Jeff;

as I was one of the guys that started some threads about the MLDL2000, I felt like commenting.

As far as I know (or have been told about), it's been a matter of subject only, I mean, no new MLDL2000 related subject to be discussed, though. After some small issues (mainly because of my own actions) and having them all solved with the help of Meindert, Diego and many others, I'm now collecting relevant data and reading many related documentation prior to go ahead (classes are over till February, so I'll have time to get back to some previous issues and to go ahead with new ones, MCODE included). In fact, I saw that MCODE programming and techniques are discussed in at least one publication (MCODE Programming for Beginners, available with the MoHCP CD/DVD set and at TOS, if I am not wrong), as they are the related modules manuals (HEPAX, David Assembler, MLROM, etc.). With these plus the modules contents themselves, we have a vast source of reference. Too bad I had no knowledge about these in the 80's... No complaints, just a bit of sadness.

I want to use HEPAX' DISASM together with the IR module (captured by an HP48G+) and generate my own VASM listings in typset fashion. This is mainly because the available VASM listings (at least the ones I found) are bitmapped images, and I would like to have them in compact, easier to read documentation. And the ones I found are only the C/CV/CX mainframe ROM and the X-Functions plus Time modules. With HEPAX' DISASM it is somehow easier to generate single line, briefly commented VASM listings. As I have two HP41CV fullnut with the possibility to use external batteries, it is just a matter of time and a few try-outs... I'll let you know as I succeed generating usefull documentation.

Any other ideas/suggestions? Let's go ahead with the thread, shall we?

In time: I am trying to get in contact with Meindert and have not 'heard' from him since November; does anybody know any news about him?

Cheers.

Luiz (Brazil)

Re: MLDL2000 Conversation

*Message #3 Posted by **Howard Owen** on 21 Dec 2005, 1:02 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi, Luiz,

"HP41 MCODE for Beginners" is on the museum CD/DVD, but not on TOS. I didn't know it was on the first resource, and I couldn't find it on the second, so I'm grateful for the pointer!

Your documentatiom project sounds very, very interesting. If you'd like someone to transcribe comments found in the NOMAS stuff, I'm willing to help out.

Regards,
Howard

Re: MLDL2000 Conversation

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2005, 7:21 a.m.,*
in response to message #3 by Howard Owen

Hello, Howard;

thank you very much for your offer on helping by adding comments to the typesetting VASM listing. I appreciate that! My initial idea, after seeing what can be done with DISASM (the example program in the HEPAX manual, "DISSST", is a lot helpfull, too.), was actually to read the original VASM and to add such relevant comments to the typesetting, generated VASM listing and let it available to download (plain text, TeX/LaTeX, PDF, others?), so your offer comes in the very best moment! I also believe that a coordinated "task force" would improve final results and generate final documentation in less time; is this too ambitious?

I'll try some listings for these days and let you know.

Best regards and thanks again.

Luiz (Brazil)

Re: MLDL2000 Conversation

*Message #5 Posted by **PeterP** on 21 Dec 2005, 11:29 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

sorry if this is a very dumb thought - couldn't we do the VASM from the PC to a laser or something via one of the simulaters?

One additional resource for the MCODE stuff I would mention are the documented listings from Angel Martin for both his SandBox project and his 41Z project. They have very good documented code (in color!). he also might have good ideas on how to create a similarily well documented VASM listing. Feel that my skills might be far to inferior to participate in such a project, yet I'm interested nonetheless...

BTW, I have collected all MCODE articles I could find in the various magazines from the old days (PPC, Prisma, HPX, etc) and plan on putting them into a pdf document via scanning or something the like. if that idea is useful for others as well, I might change the timetable from "one day" to "soon"...

Cheers

Peter

Re: MLDL2000 Conversation

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2005, 12:50 p.m.,*
in response to message #5 by PeterP

Hi, Peter; thank you for your additional suggestion. For the records, I do NOT consider it dumb at all. d8^)

I briefly considered the possibility of generating a plain text listing from a simulator/emulator so one could change it the best way, I mean, organize in many columns as for a reference, add specific/custom comments, etc. I have two emulators installed in my computer (Nonpareil and Warren's), and I do not know how to generate such plain-text file with a VASM listing through a simulator. Using existing ROM features, like HEPAX DISASM or any other, would generate the same commented list, that's a fact, so the ROM format used by the specific emulator would not be an issue. There is also Hrast's HP41X, where I first tested the DISSST functionality (works perfectly fine, you bet!)

My primary proposal is actually not to print a compact VASM listing, but your idea gives another view. Please, let me know if an output file from an emulator with a plain text is easier to generate, because if so, this is going to be faster and more accurate than what I had in mind.

I see we are going ahead with the MCODE development, and this is a very good point by itself.

Thanks!

Luiz (Brazil)

Re: MLDL2000 Conversation

*Message #7 Posted by **HrastProgrammer** on 21 Dec 2005, 2:35 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Just a note regarding HEPAX DISASM on HP-41X: Although it is perfectly possible to make disassembled ROM listings using HP-41X (especially in the combination with Helios Printer Emulator on PC) don't do this because HP-41X contains highly modified ROMs inside (disassembled using HP-41EPC built-in disassembler then modified according to my needs and reassembled using my own specialized assembler called ASM41) and its "CPU" is 12-bit (I am currently using only 2048 out of 4096 possible instruction codes, many of them are precompiled GOLs/GSUBs to increase execution speed) so you won't get the expected result :-)

Re: MLDL2000 Conversation

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2005, 3:14 p.m.,*
in response to message #7 by HrastProgrammer

Hi, Hrast; thank you for your additional information.

What I did was using the HP41X to write the beginning of the SKWID ROM (example in 'MCODE Programming For Beginners') and disassemble the resulting code, so I saw that the comments added by DISASM are very usefull and help understanding most of what is programmed.

In fact, to do what HP41X does, mostly to access VXMemory (Very eXtended

Memory...8^), I guess you needed to modify the code in some ROM images and in the mainframe core so the emulator can handle the extra memory space. Specific parts of the resulting HP41X disassembled code would not be helpfull in a real HP41, right?

Thanks again.

(BTW, did the mail delivered something for you already??? Please, let me know as it happens.)

Luiz (Brazil)

Re: MLDL2000 Conversation

*Message #9 Posted by **HrastProgrammer** on 22 Dec 2005, 1:42 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

In fact, to do what HP41X does, mostly to access VXMemory (Very eXtended Memory...8^) ...

I would rather call it VLMM (Very Large Main Memory) because it contains 3392 registers of program/data memory so you can easily execute SIZE 1999 and still have .END. REG 1392. Extended Memory is further "extended" to 686 registers.

I guess you needed to modify the code in some ROM images and in the mainframe core so the emulator can handle the extra memory space.

Yes, 4096 registers address space, 16-characters LCD, extended character set, extended XM and many other things required a lot of mainframe (and other modules) changes ...

Specific parts of the resulting HP41X disassembled code would not be helpfull in a real HP41, right?

Yes, the resulting listing would not be "synchronized" with VASM in many places because the code is not equal to the HP-41C ROMs.

BTW, did the mail delivered something for you already??? Please, let me know as it happens.

No, not yet ... I will let you know.

Best regards.
Hrast

Re: MLDL2000 Conversation

*Message #10 Posted by **Howard Owen** on 21 Dec 2005, 12:18 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Luiz,

I'd be delighted to help out. Just let me know when you have a disassembled listing ready for annotation.

You might consider using the disassembler from SDK41. It can produce output from the ROM images on a PC. It can also fill in the names of system entry points, which would save about half the work required to annotate the listings. It can also generate disassembly in one of three different mnemonic systems, including HP's.

Richard Nelson, in his forward to "HP-41 MCODE for Beginners" mentions that Jim De Arras produced an annotated listing of the 41s OS, which probably caused HP to release their source. I wonder if copies of that listing, presumably already in editable text form, still exist? That too could save work in attempting to annotate a disassembly of the ROM OS.

Regards,
Howard

Re: MLDL2000 Conversation

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 21 Dec 2005, 1:13 p.m.,*
in response to message #10 by Howard Owen

Hi, Howard;

thanks again for your support and interest. I completely agree with you when you mention time saving by using existing documentation.

After reading Peter's post, I realised that many other ways exist, and my brief consideration in the beginning of using an emulator meets both Peter's and your idea of going ahead with this line of action. What I thought not being available was the possibility of generating a text file as an output from such emulators.

I was reading David Assembler's documentation (ERAMCO) and found a list of mainframe entry points for many usefull routintes. As other ROM may use these entry points as well, David Assembler with the labels ROM give ways to locate 'where does such calls point to'. As I see, there are so many possibilities that we may disassemble the same ROM with different tools and see what we get. As you added, one can either choose the best mnemonic set for each listing.

I guess we can generate many good documentation this way. I'll try some myself and post as I get results. Meanwhile, I'd like also to try some emulators and see what we can get from them. Which others are available that might generate such VASM listings?

I guess HP would never believe that the HP41 structure and related knowledge base would be in such deep studies as it is today with use here. Although we may be a small group of people, I think that each one of us may find new ways to use and understand such stucture. I saw some PDF's generated from original HP41 documantation that are dated 1978. Almost 28 years ago! What were those guys doing at that time? Go figure ...

Cheers.

Luiz (Brazil)

> Quote:

> As you added, one can either choose the best mnemonic set for each listing.

I think we should stick with the mnemonic set the VASM listings are in - HP's. We should be able to automatically translate between the three types once we have an editable document.

> Quote:
>
> I guess we can generate many good documentation this way. I'll try some myself and post as I get results. Meanwhile, I'd like also to try some emulators and see what we can get from them. Which others are available that might generate such VASM listings?

Warren Furlow has SDK41 over on TOS. It's a set of DOS programs including an emulator, an assembler/linker and a disassembler that work on the PC. One could take the system ROMS from one of the emulators and run them through the disassembler. There are two nice things about this approach. First, the toolkit supports three different mnemonic schemes. The oldest publically known one by Jim De Arras, producd without help from HP through reverse engineering, HP's set, used with the NOMAS VASM listings, and the set used by the Zenrom. The second advantage is the most important. The disassembler runs on the PC and roduces PC compatible text file. So no HP-IL or serial or infrared connection is needed.

> Quote:
>
> I guess HP would never believe that the HP41 structure and related knowledge base would be in such deep studies as it is today with use here. I saw some PDF's generated from original HP41 documantation that are dated 1978. Almost 28 years ago! What were those guys doing at that time? Go figure ...

I was thinking similar thoughts recently. The 41C suprised HP with its popularity. It had a ten year run on HP's price list, which was twice as long as they predicted. Those who worked for the calculator division then must pinch themselves when looking at the current level of interest in the HP-41C. As we have seen, the interest has continued, sustained by a few of the old timers, some of whom post here frequently, and by others that joined in later. It kept the art and science of the 41C alive. As we WWII baby boomers near retirement (I'm a "late boomer" and still have a way to go.) I suspect we will see a continuing upsurge of interest in early computing systems, particlarly ones of such high quality as the HP-41C. We all have those torch-bearers to thank for the fact that so much has been preserved, so that we have this marvelous menu of stuff to play and work with.

Here's my "thank you" and best wishes for the holiday season to all of them, to today's innovators on the old technologies, and to everyone else here. You've made my world a nicer place.

Regards.
Howard

HP41CX OS Sources online at retrocalculator.com

*Message #13 Posted by **Howard Owen** on 22 Dec 2005, 2:46 a.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

It's trivially easy to do with SDK41. The file HP41ROM.TXT gives a roadmap of the ROMs, and the file MANUAL.TXT describes how to run D41.EXE. For the 41-CX ROMs I did the following:

```
D41/P0 XNUT0
D41/P1 XNUT1
D41/P2 XNUT2
D41/P3 CXFUNS0
D41/P5 CXFUNS1
```

This disassembled each of the files, with base page numbers determined by the /P switch. The disassembly was done with the default HP mnemonics. SDK41 contains a map of system entry points, so these have been substituted into the listing automatically. Otherwise the code contains no comments. That gives us *something* to do, anyway. 8)

The five source files are zipped up and available here.

I'm not sure which version of the OS is documented in the VASM listings. The 41C ROMS are also included with SDK41, so I could easily produce that source code too. I'm done for the evening, but I'll take a look at the VASM listings tomorrow to see if I can match up this code with what's there.

Regards,
Howard

in response to message #13 by Howard Owen

Hi, Howard;

thanks for your updated information. I downloaded the .ZIP file now and I'm going to open it later. I agree with you that the task is in the very beginning, and a lot is yet to be done (adding comments and the like). And think of the possibilities we have when considering the even more data we can disassemble. I see Angél's listings (41Z documentation and others) and I think that this is the sort of infomation we should have available... or, in the lack of such information, generate it. Someone has to do that, why not us?

I'll report any news as soon as it happens.

XMas greetings for all.

Luiz (Brazil)

in response to message #2 by Vieira, Luiz C. (Brazil)

I have done initial tests on my MLDL2000 but i am hoping to get some time with it over the holidays. On the vasm listings thing i have a vaque recollection of a HP41 only printer with a stripboard breakout in the cable and a tap going to a PC. The PC (it may have been a 8 bitter like a BBC/B) then decoded the hp41 serial to ascii. By listing the assembler (with ZENROM) to the printer the PC could capture a copy. I guess it could be done nowadays with a PIC chip.
hmm. that might be another little project for 06!

happy merry and a good new to all from bonnie scotland

*Message #16 Posted by **Meindert Kuipers** on 25 Dec 2005, 8:18 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Merry Christmas to all friends in the forum.

I am currently with family to celebrate Christmas and now have internet access for 2 days. In the past two months I have been in temporary housing without Internet access, and did all my HP related communications from my work. Since December 15th I am on vacation to get my new house ready to move into, and we now have less then one week of hard work to do before we actually move. We should then have a 6 mbit ADSL line (if my provider does what they have promised), and my computers should be working again. This is the reason why you have not heard from me for some time.

I have been going through this thread, and ask for a little bit of patience. I plan to improve the software so communication between the MLDL2000 and the PC is much easier. I have compiled a list of things that I plan to do on www.kuipers.to/hp41. Of course my new house also needs attention ...

All the best wishes for 2006!

Meindert

Re: MLDL2000 Conversation: Meindert is back!

in response to message #16 by Meindert Kuipers

Merry Christmas to you Meindert and good luck with your new house, it must be very "interesting" to move over christmas!

All the best and me (and I'm quite certain a lot of other here) are very happy that "you are back" and will ad more goodies to your already fabulous device!

Cheers

Peter

PS: got your email, will try things out and let you know.

Calculator Precision

*Message #1 Posted by **John Limpert** on 20 Dec 2005, 11:09 a.m.*

Most calculators support 8..12 decimal digits of precision. What is the highest precision supported by a desktop or handheld calculator? Some computers support quad precision (128 bit) floating point, which provides about 34 decimal digits for the mantissa.

What's the record for the lowest precision in a desktop or handheld calculator?

Re: Calculator Precision

*Message #2 Posted by **Bill (Smithville, NJ)** on 20 Dec 2005, 11:45 a.m.,*
in response to message #1 by John Limpert

The Sinclair Scientific must come close to being the lowest precision. It displayed only in scientific notation - 5 digit mantissa, 2 digit exponent and was very inaccurate on many of its calculations.

But it was RPN (sort of) and did look good. I had one many years ago - put it together from a kit. Now that I've thinking of it, I think the one I put together was the programable version.

Bill

Re: Calculator Precision

*Message #3 Posted by **Thomas Okken** on 20 Dec 2005, 12:21 p.m.,*
in response to message #2 by Bill (Smithville, NJ)

The Sinclair Scientific actually had a 6-digit mantissa; it just didn't display that 6th digit, but it was there. Of course, since the transcendental functions weren't very accurate, it didn't matter much!

It was still better than a slide rule. I got one in 1976, the ready-to-use version, for about $30, IIRC.

Re: Calculator Precision

*Message #8 Posted by **Eric Smith** on 20 Dec 2005, 5:19 p.m.,*
in response to message #7 by Howard Owen

No, it didn't have a general purpose interface. Just a dedicated printer, not entirely unlike the 82143A.

Re: Calculator Precision

*Message #9 Posted by **Howard Owen** on 20 Dec 2005, 6:22 p.m.,*
in response to message #8 by Eric Smith

That sheds new light on HP's decision to not include a general purpose I/O interface in the 42S! If a printer alone was good enough for Babbage, why then, who at HP could argue with that?

One of my favorite science fiction stories of all time has Babbage perfecting the Analytic Engine in 1812 or so. By 1870, Britain rules the world, having sustained the south in the American Civil War, so that American power is divided and Yankee influence is held in check. France isn't out of the running for world power either, and both powers are engaged in a high-stakes technology race seeing who can develop the fastest steam-powered mechanical computers. And an aged, down and out Lady Ada nearly destroys the French supercomputer with an accidental secret weapon that ..

The title is "The Difference Engine" and William Gibson is one co-author. I think they mention calculators in there somewhere. 8)

in response to message #11 by db (martinez, ca.)

If they hadn't left out a "1" digit, they would have gotten it right. (Then the last digit, which was incorrect, would have dropped off the end.)

It's easy for math enthusiasts to get carried away with precision if they don't have a feel for what it means in the physical world. Although a few functions will make unacceptable error levels accumulate, most calculators have far, far more precision than most real-life situations have any use for. Audio quality much better than that of the finest cassettes can be had with only three digits to the samples. (999 is close to 1023 which is the maximum that 10 bits can represent.) A lot of digital signal processing is even done in 16-bit fixed-point arithmetic. There is no limit to what can be done with numbers, but their relevance to what they measure, control, etc. is another matter. It is difficult or impossible to measure or control pressure, weight, fluid flow, temperature, light intensity, position/displacement, field strength, etc. to precisions anywhere near what common calculators handle. When I need A/D or D/A converters for experiments or development on the workbench, 8-bit is normally enough with the appropriate scaling. Although I'm glad to have some guard digits, I usually use my HP-41 in ENG3 display mode.

in response to message #12 by Garth Wilson

Hi, Garth:

Garth posted:

"It's easy for math enthusiasts to get carried away with precision if they don't have a feel for what it means in the physical world. Although a few functions will make unacceptable error levels accumulate, most calculators have far, far more precision than most real-life situations have any use for."

> I beg to dissent. Your arguments apply only to entering measurements of physical magnitudes as inputs to some computing process, and even then there are plenty of exceptions where high-precision measurements are both possible and required, specially in nuclear physics, astronomy, etc.
>
> But your arguments do not apply at all (and are in fact *misleading*) to the computational processes applied to said inputs, where each and every digit counts, and counts a lot if the resulting outputs are to be meaningful and relevant. There, when subjecting your physical measurements to some complex algorithm, you can't afford to limit the intermediate accuracy to be the same as that of the physical inputs, lest your results will be pure *garbage*. On the contrary, you need *much higher precision*, which usually increases with the size of the problem, notwithstanding the initial accuracy of the physical inputs.
>
> For instance, many architectural and electrical engineering real-world applications require solving large systems of linear equations so in real professional life you'll frequently find yourself working with large matrices which tend to be numerically ill-conditioned more often than not. In these cases, you'll need as much precision to process them as you can get, even if your inputs are measured to just one decimal, that is if you want your results to be accurate to at least one decimal, as the inputs.
>
> Perhaps this will require internally using 10 digits for medium matrices, or 20 digits for large matrices. Your results will still be accurate to one decimal, as the inputs, but *unless you use that much higher internal accuracy throughout the whole solving process, you'll get no usable results*, at all. That's why high accuracy is needed and that's why your arguments are "shortsighted", so to speak.
>
> If in doubt, you may want to consider this example I've set up, where the solution of some engineering problem requires solving this small 7x7 system of linear equations, where the coefficients are the result of some measurement, say Volts, with just one decimal of precision:
>
> $$
> \begin{aligned}
> 1.3\,x_1 + 7.2\,x_2 + 5.7\,x_3 + 9.4\,x_4 + 9.0\,x_5 + 9.2\,x_6 + 3.5\,x_7 &= 45.3\\
> 4.0\,x_1 + 9.3\,x_2 + 9.0\,x_3 + 9.9\,x_4 + 0.1\,x_5 + 9.5\,x_6 + 6.6\,x_7 &= 48.4\\
> 4.8\,x_1 + 9.1\,x_2 + 7.1\,x_3 + 4.8\,x_4 + 9.3\,x_5 + 3.2\,x_6 + 6.7\,x_7 &= 45.0\\
> 0.7\,x_1 + 9.3\,x_2 + 2.9\,x_3 + 0.2\,x_4 + 2.4\,x_5 + 2.4\,x_6 + 0.7\,x_7 &= 18.6\\
> 4.1\,x_1 + 8.4\,x_2 + 4.4\,x_3 + 4.0\,x_4 + 8.2\,x_5 + 2.7\,x_6 + 4.9\,x_7 &= 36.7\\
> 0.3\,x_1 + 7.2\,x_2 + 0.6\,x_3 + 3.3\,x_4 + 9.7\,x_5 + 3.4\,x_6 + 0.4\,x_7 &= 24.9\\
> 4.3\,x_1 + 8.2\,x_2 + 6.6\,x_3 + 4.3\,x_4 + 8.3\,x_5 + 2.9\,x_6 + 6.1\,x_7 &= 40.7
> \end{aligned}
> $$
>
> which has the quite obvious, unique solution:
>
> $$x_1 = x_2 = x_3 = x_4 = x_5 = x_6 = x_7 = 1.0 \text{ (Volts)}$$
>
> Now, get your preferred HP calc or computer software and try and solve it using *limited* accuracy, say just one decimal, then four decimals, then eight decimals. See what results you get and how do they compare with the actual, unique solution, and among themselves as the limited accuracy increases.

Paraphrasing your own opening statement, I'd say that it's easy for physical world 'enthusiasts' to underestimate precision if they don't have a feel for what it means in the computational world.

Best regards from V.

*Message #14 Posted by **bill platt** on 21 Dec 2005, 11:16 a.m.,*
in response to message #13 by Valentin Albillo

In my field, it is Finite Element Analysis where this issue of low *input* precision but high *computational* precision is an outstanding example. In fact FEA is essentially merely a gargantuan matrix problem...and low computational presicion can lead to absolutely wrong results. Of course poor choices in the boundary conditions and boundary geometry also causes outstanding failures.

Any recursive or even step-wise function or procedure can lead to unacceptable loss of precision. Even a "simple" weight-moment computation can lead astray if you do not pay attention to magnitudes vis-a-vis precision.

So low input precision is one thing--computational precision is another.

The example of the slide rule needs to be proerly examined. There was a lot of good engineering carried out on slide rules. This does not mean that the men and women using the slide rules were happy with the low precision! They were astute and often had to find ways to preserve precision--to deal with the limitations of the computational device.

When digital computing became a reality for academics and corporate scientists--on mainframes in the 1960's--there was a lot of excitement: "wow, I can finally tackle that problem--I can get acceptable precision--let's see where it goes!"

Now that we all have computers on our desktops, it is easy to forget, or overlook, the amazing excitement and boost to imagination that the digital computer provided for our predecessors.

Re: Calculator Precision: Sure ?

*Message #15 Posted by **Garth Wilson** on 22 Dec 2005, 2:49 a.m.,*
in response to message #13 by Valentin Albillo

I did say, "a few functions will make unacceptable error levels accumulate." An example I had in mind at the time is that for a bank making amortization calculations, ten digits is nowhere near enough, even if the interest rate is expressed with far fewer digits.

> Quote:
>
> Your arguments apply only to entering measurements of physical magnitudes as inputs.

I did say "outputs" too. I know what you mean; but omitting the outputs-- whether controlling a milling machine's position, a temperature, a motor's torque, or selecting circuit values, etc.-- makes math an end in itself, which it is not. That's part of my point.

2K-point FFTs work fine on 7-bit input data on an 8-bit computer using only 16-bit (less than 5 digits) non-floating-point intermediate and final results. I've often wondered why the HP-71's FFT function went to the overkill of using only full precision when few of us did even 8K-point FFTs (and had to wait 45 minutes for it) and most people who used the function at all had nowhere near enough memory to do that, and the samples usually came from an 8-bit converter.

> Quote:

> many architectural and electrical engineering real-world applications require solving large systems of linear equations so in real professional life you'll frequently find yourself working with large matrices which tend to be numerically ill-conditioned more often than not.

I think that's like saying, "Many people prefer..." when you mean thousands out of the 300,000,000 in the U.S.. Sure there's a significant, valid number, but it's a very small part of the overall set. As an electronics circuit designer, I use matrices so seldom that I have to get the books out every time. But the hardware part of our high-end aircraft communications designs could have been designed entirely with a slide rule if that's all I had to work with. I think I could count on the fingers of one knee the number of times I've needed all the precision the HP-71 offers.

Dave Bernazzani below had a good point about using scaled integers. Contrary to popular belief, there really is life outside the realm of floating-point, and a lot of very useful computing that includes things like trig & log functions. I use scaled-integer quite a bit on the workbench-- mostly 16-bit, often with 32-bit intermediate results. High-precision floating-point is not what I'm against. What I am against is giving the computer the huge overhead of handling everything this way when it's only needed for a small percentage of computing jobs. Although calculators because of their typical usage have a greater need of floating point and high precision, the fact that most of them force *everything* to be handled this way makes them take another hit in speed, an area they're weak in to begin with.

*Message #16 Posted by **brian healy** on 22 Dec 2005, 7:42 a.m.,*
in response to message #13 by Valentin Albillo

High precision in a handheld calculator is not a requirement in the field of architecture and structural engineering for buildings. Computers are used to run FEA software and to perform frame analysis. These things are not done with a calculator. For the overwhelming percentage of calculations, 3 digits after the decimal are more than enough. In the 10 years that I have been a structural engineer, I have never once needed to do a matrix, and none of the many other structural engineers that I have worked with have done one either. It is a common failing of new engineers fresh out of college that they get caught up in carrying way too many decimal places.

I am only debating what you have said about architecture. I do not doubt that other fields do require a high degree of computational precision. Architecture, and the related field of structural engineerng do not require this in a hand held calculator.

Re: Calculator Precision: Sure ?

*Message #17 Posted by **Werner** on 22 Dec 2005, 8:44 a.m.,*
in response to message #13 by Valentin Albillo

```
Hello Valentin.

I'm sorry to say, this is not true at all.
The system you proposed (a variant of your 'Albillo Matrices'?) is
simply badly conditioned. It will lose about 13 digits of precision
in the process of computing a solution. This means that, unless
your inputs carry 14 digits of precision, you can't expect a
meaningful result. Since they have been measured to 2 digits only,
your problem cannot be solved.
If you perturb your matrix elements by 1e-10 (a negligible error,
```

```
right? and as far as our Volt measurements go, the same original
problem), your result will become 100% different.

It is useless to perform calculations with higher precision than
the precision of your input, period. If you do, you implicitly
enhance the precision of your input.

The accuracy of the result of a numerical calculation depends on
three things:
- the precision of the input
- the condition of the problem (condition is a measure of how badly
the output changes as the result of small input changes)
- the stability of the algorithm - a stable algorithm keeps the
errors in the same relative magnitude. If your input precision is
not high enough to overcome the loss of precision due to condition
and stability, you get meaningless answers.

Best Regards,
Werner Huysegoms
```

*Message #18 Posted by **James M. Prange (Michigan)** on 23 Dec 2005, 9:49 p.m.,*
in response to message #13 by Valentin Albillo

Well, I agree with Garth to the extent that I often see results with more significant digits than can be justified by the accuracy of the inputs.

But I also agree with Valentin that often more digits are required during the computational process for the results to have any validity.

Consider, for example, calculators that find the standard deviation by accumulating "running totals" of n, sum(x), and sum(x^2), then find the standard deviation by formulas like squareroot((sum(x^2)-sum(X)^2)/n)/n) for the population and squareroot((sum(x^2)-sum(X)^2)/n)/(n-1)) for the sample. It's all too easy to cause a round-off error in the sum(x^2) value in particular. Other common formulas are squareroot((n*sum(x^2)-sum(x)^2)/n^2) and squareroot((n*sum(x^2)-sum(x)^2)/(n*(n-1))), making a round-off error in n*sum(x^2) even more likely.

Regards,
James

*Message #19 Posted by **Katie Wasserman** on 20 Dec 2005, 11:52 p.m.,*
in response to message #1 by John Limpert

There were several fixed decimal point 6-digit precision calculators. Some of the more popular models were: Commodore MM6, Novus Mathbox, Corvus Checkmate (it only had + and -, but with continuous memory!) I don't know of any 5 or less digit calculators though.

My candidate for the worst accuracy scientific is the Monroe 99. Its precision is 8 digits, but it's accuracy is far less. It returns 6.58003 for ASIN(ACOS(ATAN(TAN(COS(SIN(9)))))) but worse it "thinks" 8^8 = 16777200. Probably because it has a value of 2.7182800 for e.

Re: Calculator Precision

*Message #20 Posted by **Palmer O. Hanson, Jr.** on 21 Dec 2005, 11:12 a.m.,*
in response to message #19 by Katie Wasserman

My nominations for the least capable calculators are the NSC Model 600 and the Novus Mathbox 650 where those devices not only carried few digits but also only handled integers. I discussed that feature in more detail in Article No. 437 "Primitive RPN Calculators". At times the editors of the Journal of the Oughtred Society have proposed a calculating contest between slide rules and calculators. I responded that the only calculators that I knew of which would not totally overwhelm th slide rules were those two devices.

Another six digit calculator

*Message #21 Posted by **Palmer O. Hanson, Jr.** on 21 Dec 2005, 11:28 p.m.,*
in response to message #20 by Palmer O. Hanson, Jr.

The Miida 606 has a six digit display and limits input values to six digits. It does yield answers of more than six digits in some cases:

If you enter 987659 + 987659 = you get 197531 which are the six most significant digits in the display. If you then press C (clear) you get 8 which is the least significant digit in the display. Only the 8 is used in subsequent calculations.

If you enter 98765 x 98765 = you get 975452 which are the six most significant digits in the display. If you then press C you get 5225 which are the four least significant digits in the display. If you enter a problem which has a result exceeding ten digits then some of the more significant results will be correct but some of the less significant digits may be incorrect.

No such luck with divides.

Re: Calculator Precision

*Message #22 Posted by **Dave Bernazzani** on 21 Dec 2005, 11:43 a.m.,*
in response to message #1 by John Limpert

As an aside, there is an important difference between precision vs. accuracy. In the world of desktop computers, the standard single and double precision IEEE floating point representation has made life easier and is very common but at a cost of accuracy. I suspect most calculators use a BCD or other internal representation of a number - meaning that numbers such as 4, .4, 40, etc. can all be represented exactly. The standard 8 byte IEEE floating point representation (approx 15 digits of precision) on a computer does not lend itself to such perfect representations of all numbers as the floating point must be represented by an approximation of binary fractions. For example, with IEEE floats, all numbers are converted to a normalized value plus an exponent. For the mantissa, there is a bit to represent 1/2, one for 1/4, one for 1/8, etc... the more bits you have the more accurately you can represent any given number with this approximation. But it's tricky. For example, the number 4 (or .4, or 40, or 400) cannot be accurately represented in IEEE floating point. The best you can do is 3.99999999999998 (or some variation thereof) and although you can get _very_ close, it does not quite get there with a series of binary fractions. For this reason, you may experience some loss of precision in calculations due to the accuracy of the representation, and some floating point operations may produce unexpected results in chain calculations involving IEEE floats (I haven't looked at the 16 byte floats to see how they are represented - maybe they are better or maybe it just gives larger precision using the same representation scheme). Calculators are generally better in this respect as they seem to have a better internal representation of the numbers. IEEE, however, is extremely convenient since most standard math libraries will work with it and is often optimized in hardware for fast results. There are some PC-based calculators or math algorithms that go out of their way to avoid IEEE floats - using either fixed-point math or BCD math (the GNU bc utility is one such program). Those take longer to code, require user-built trig libraries but are more accurate.

Re: Calculator Precision

*Message #23 Posted by **Thomas Okken** on 21 Dec 2005, 1:23 p.m.,*
in response to message #22 by Dave Bernazzani

In IEEE-754 double precision floating point, which is what most computers use nowadays, the mantissa has 52 bits -- 53 if you count the implied "1" bit at the start. This means you have a relative representational error of about 1e-16.

In the BCD representation used on all the Saturn-based HPs, the mantissa is 12 decimal digits, which leads to a relative representational error of 5e-12.

Both formats use 8 bytes, but the binary format has a relative error that is 50,000 times better than the BCD format (but an exponent with a smaller range: -308..308 instead of -499..499).

From those numbers, I don't think you can call BCD "better"... It just happens to be able to represent certain numbers exactly that binary formats can't, but for numerical computation, that is a useless feature. If you want to keep round-off error in large matrix computations at a minimum, using BCD is just a waste of CPU time (and memory).

Re: Calculator Precision

*Message #24 Posted by **Dave Bernazzani** on 21 Dec 2005, 2:07 p.m.,*
in response to message #23 by Thomas Okken

The problem of IEEE manifests itself in some common ways. First, because some numbers can't be represented properly there is a comparision issue. That is, if you take a value such as 1.2 and divide it by 3 and try to compare that to 0.4 you won't get a match. In one case you get:

0.40000000000000002

In the other:

0.39999999999999997

Exact native compares fail. This is the main reason why in medical embedded software engineering we almost always avoid IEEE floating point in favor of fixed point with a scale factor.

The second problem is with simple chain calculations that should accurately get a value close to a non-representable number but end up a shade too high due to representation issue. In this case, your chain calculation (for example) should be a value just less than 4 but instead gets represented with a value a shade over 4. Using FLOOR/CEIL type functions (often found on better computational devices) will yield the wrong result.

Maybe calling BCD "better" was the wrong term. Certianly there are BCD representations that are better than the representations that are used on the HP calculators (again, bc uses an arbitrary precision BCD for highly accurate results). Maybe I should have said that both have limitations that should be understood before use.

In order to mimimize the above problems, one has to play tricks with the numbers to put them on equal footing (i.e. find ways to compare them within a bracketed range, or convert both of them to a format that can be compared with a certian limit of precision, etc). Again, for most computations it doesn't matter, and with a bit of care you can minimize problems... but all programmers should be extremely cautious when using IEEE floats.

Here is a weak code-snippet for those interested:

```
#include <stdio.h>
```

```
main()
{
   double f1, f2;

   f1 = (double)0.4;
   f2 = (double)1.2 / (double)3.0;  /* This should yield 0.4 */

   printf("f1 = %.17f\n", f1);
   printf("f2 = %.17f\n", f2);

   if (f1 == f2)
   {
       printf("The values match.\n");
   }
   else
   {
       printf("The values do not match.\n");
   }

}
```

*Message #25 Posted by **htom** on 21 Dec 2005, 3:39 p.m.,*
in response to message #24 by Dave Bernazzani

This is really a problem with floating point in general (and fixed + scale doesn't always help.)

You should never compare floating point values for equality, IEEE or not, unless you are explictitly looking for these problems.

To safely do the test a =? b where a and b are floats, use something like

abs (abs(a) - abs(b)) < bound

using whatever value is acceptable as the bound, 1.0e-10 being a starting point.

Re: Calculator Precision

*Message #26 Posted by **Marcus von Cube, Germany** on 22 Dec 2005, 2:52 a.m.,*

>
> abs (abs(a) - abs(b)) < bound

That's a little to much of abs() because it renders -1 equal to +1.

```
abs( a - b ) < bound
```

does the trick better.

Marcus

49G+

*Message #1 Posted by **Chan Tran (USA)** on 20 Dec 2005, 9:30 a.m.*

I think it's time for me to add the 49G+ to my collection. I am wondering how do I find the best version of the 49G+. I understand there are several version of this calculator out there.

Re: 49G+

*Message #2 Posted by **Ron Ross** on 20 Dec 2005, 9:38 a.m.,*
in response to message #1 by Chan Tran (USA)

I bought one from Eric at Hpcalc.org . I have always been happy in my dealings with him. And he is knowledgable.

Or you can sometimes find good deals via web searches or online auctions.

Re: 49G+

*Message #3 Posted by **Stephen Eastering** on 20 Dec 2005, 4:49 p.m.,*
in response to message #1 by Chan Tran (USA)

I think that HPShopper has the most recent, but if not, it's not hard at all to download the latest ROM version onto an SD card and upload it into the 49G+. (No more hardwire connections from calc to computer unless you want to!)

Re: 49G+

*Message #4 Posted by **Chan Tran (USA)** on 21 Dec 2005, 8:20 a.m.,*
in response to message #3 by Stephen Eastering

I heard that some early version of the 49G+ has bad keyboard. I would like to avoid this problem. I know many of the retailers would have very old stock as this particular model does not sell very well I think.

Re: 49G+

*Message #5 Posted by **Stephen Easterling** on 21 Dec 2005, 2:26 p.m.,*
in response to message #4 by Chan Tran (USA)

I had one (two actually) with a keypad that was very insensitive to entries. I had to push pretty hard. After the ROM 2.00 upgrade, the problem was solved.

Re: 49G+

*Message #6 Posted by **Eddie Shore** on 21 Dec 2005, 9:07 p.m.,*
in response to message #1 by Chan Tran (USA)

1. Good choice. 2. Get the newest keyboard possible. Does Joe Horn have any left?

Re: 49G+

*Message #7 Posted by **Dave** on 22 Dec 2005, 9:59 a.m.,*
in response to message #6 by Eddie Shore

Actually it's a little more hit and miss. I've had an older one (2004 from Joe Horn) and a newer one (2005 from Amazon). The older one is actually better quality (print quality on the painted keys, etc.) and less stiff. I think Kinpo initially tried to fix missed keys by making the keyboard stiffer. Later it turned out the most of the keyboard problem was in software. So the stiffer keyboard was unnecessary in the end. With the latest ROM, either should perform fine.

Joe has recently stated he doesn't have any more calculators for sale.

HP 67 keyboard problem

*Message #1 Posted by **Jan** on 20 Dec 2005, 7:45 a.m.*

Hi

I just got a HP-67 from my dad who used it throughout his career at university. The calculator is in working condition except that some keys lost their pleasant, typical "HP-touch" whereas the "A" and the "E" keys do not work at all. Does anybody of you know how to repair this or what the main cause of these problems could be (I can imagine, since the old "classic" has been used quite frequently (also by myself back in the old days when I was still in highschool) that some wear of the contact strips under the keys may be the cause or that the protective plastic sheet between the keys and these strips may have suffered throughout the years. If anyone of you has an idea, please let me know. Furthermore, the card reader is not working properly. The motor is still OK, when a card is inserted the motor starts running but somehow the card is not pulled through, the motor then stops and an error message appears in the display. I think it could be the rubber wheel that normally rolls the card forward. These parts seem to be sensitive to degrading over the years, making it slippy or even brittle. Does anybody of you know about this?

Thanks in advance for your comments and reactions

Re: HP 67 keyboard problem

*Message #2 Posted by **Tony Duell** on 20 Dec 2005, 7:58 a.m.,*
in response to message #1 by Jan

The normal cause of this is that the metal contact strips under the keys crack at one side of the bump. These strips were originally spot-welded to the PCB, and even if you can get spares (e.g. from another old machine), it's difficult to solder them in place and maintain the 'feel'

You can try soldering over the crack. This will make it feel a little better, but it certainly won't be 'right'

HP-71B and PC

*Message #1 Posted by **Fabio Albonico** on 20 Dec 2005, 6:26 a.m.*

Who can help me to connect HP71B with Pentium PC?

Thank you

Re: HP-71B and PC

*Message #2 Posted by **Tony Duell** on 20 Dec 2005, 8:00 a.m.,*
in response to message #1 by Fabio Albonico

What hardware do you have, other than the HP71 and the PC? And what OS do you run on the PC?

One way to do it is to use the HP82164 HPIL-RS232 interface, along with the HPIL module in the HP71. I've written programs for linux to transfer files between a PC and an HP71 with that interface.

Re: HP-71B and PC

*Message #3 Posted by **Christoph Klug** on 20 Dec 2005, 2:29 p.m.,*
in response to message #2 by Tony Duell

A second solution would be using EMU71 in combination with the HP-IL/PC Interface Card. This solution needs a PC motherboard which includes a ISA-Bus...

Regards - Christoph Klug

Re: HP-71B and PC

*Message #4 Posted by **Howard Owen** on 20 Dec 2005, 3:45 p.m.,*
in response to message #3 by Christoph Klug

I actually find EMU41 to be more useful in talking to my 71Bs. EMU71 can't operate as a non-controller. You can still use a real 71B with EMU71, but you have to drive from EMU71. EMU41 on the other hand will stop emulating a 41C on the loop and get out of the way when it sees another controller. That lets you use the 32-column wide EMU41 display as a DISPLAY IS device on the real 71, while accessing all the emulated devices, such as disks and printers.

A better solution if you want a remote terminal on the PC is HPILLINK, available on the museum FTP site. It will talk to your card, Cristoph, or to HP's, and provides both DISPLAY IS and KEYBOARD IS devices. (The latter requires the KEYBOARD lex file, or one of either the Forth/Assembler ROM or the 41C Translator ROM). It also lets you upload and download text files. I use it extensively when doing BASIC development on the 71. It lets you single step BASIC code from the emulated terminal, which is pretty cool. It's useful too because having several lines visible gives single-stepping better context. One annoyance is that the text files it uploads are given a ".TEX" externsion, which xemacs thinks is TeX source. So it highlights the BASIC text in weird ways, trying to interpret it as such. I just rename the file before loading it into the editor to get around that.

My ideal emulation environment for speaking to a real 71 would be EMU71, running as a non-controller, providing keyboard and display emulation as well as the other essential pieces all in one place. I imagine that might be hard to do in DOS, however.

My actual ideal would have all that running natively on Linux. But I shelved my Linux HP-IL device driver months ago when it started getting sticky. But as long as I'm wishing, I wish you could produce a PCI version of the card so the driver would be easier and my choice of systems to run it on less limited. Unfortunately, commodity PC hardware just doesn't have the longevity that these fine old HP machines do. At some point, getting a machine with an ISA slot may become as difficult as getting a rare calculator. 8)

Re: RS232 cabel

*Message #5 Posted by **Christoph Klug** on 20 Dec 2005, 2:33 p.m.,*
in response to message #2 by Tony Duell

Dear Tony,

please give me the wiring details for creating a own RS232 interface cable connection bwetween PC = 9 pin and HP-IL/RS232 interface = 25 pin.

With best regards from Germany - Christoph Klug

Re: RS232 cabel

*Message #6 Posted by **Tony Duell** on 24 Dec 2005, 5:17 a.m.,*
in response to message #5 by Christoph Klug

Ooops, I missed this...

Download the LIF Utilities for Linux from the HPCC web site. The cable wirelists are in there, along with some other hardware stuff. It's in the hardware/ directory of that .tar.gz file, I think.

You might also want to look at some of the comments in the source code. There's a bit of non-obvious HP calculator info there.

HP 65 Card Reader

*Message #1 Posted by **jbssm** on 19 Dec 2005, 10:21 a.m.*

Hi again,

sorry for making so many questions, but I don't find a solution for them anywhere else.

I tried to repair the card reader of an HP-65

I replaced the gummy well, and now the card passes (more or less well) trough the calculator. But as it's passing by it makes a very loud high pitch sound. I tried to re-assemble the reader several times and putting more or less pressure in the screws that hold it together, but it still makes this annoying sound (and the speed is erratic).

Can anybody point me to a solution?

Best regards, Jorge

Re: HP 65 Card Reader

*Message #2 Posted by **David Smith** on 19 Dec 2005, 11:53 a.m.,*
in response to message #1 by jbssm

The bearings in the motor and/or at the tip of the work gear shaft need to be lubricated. I use a gun oil called Break Free CLP. It takes about 30 minutes after applying for it to work. I use a small disposable paint brush to apply the lube to the motor shaft. Be careful not to get it up into the motor/gear coupling or it will slip.

Repairing HP-85's.

*Message #1 Posted by **Barrie Carruthers** on 18 Dec 2005, 10:24 p.m.*

Beleive it or not we are still using some eight odd HP-85's in our work place. One gets pretty slick at trouble shooting and refurbishing these neat little machines after a time but I am reaching the point where I have several otherwise perfectly good units except they requires an I/O ROM or the Video ROM, CPU perhaps and my spares box is starting to look pretty bleak. Any body have any ideas where these can be picked up or has anybody worked out a work around using a standard PROMs and adapters perhaps?

Re: Repairing HP-85's.

*Message #2 Posted by **Vassilis Prevelakis** on 18 Dec 2005, 11:40 p.m.,*
in response to message #1 by Barrie Carruthers

This board allows normal EPROMs to be connected to the HP Series 80 computers. It comes with a number of ROMs already stored in its EPROM, and you can add your own.

http://www.vintagecomputers.btinternet.co.uk/hp85/prm-85_mk1.jpg

It is available from http://www.vintagecomputers.freeserve.co.uk/hp85/prm85user.htm

(and a small plug for my site) a lot of information on the Series80 computers may be found at http://www.series80.org

Re: Repairing HP-85's.

*Message #3 Posted by **Sunny** on 19 Dec 2005, 4:36 p.m.,*
in response to message #2 by Vassilis Prevelakis

What I make out of your response is that its a board that goes into the exapansion slot which is at the back of the machine. If the I/O rom is at fault, will this work?

In another words, does it automatically bypass all the bits viz, the video rom and the CPU? Thanks Sunny

Re: Repairing HP-85's.

*Message #4 Posted by **Barrie Carruthers** on 19 Dec 2005, 11:17 p.m.,*
in response to message #2 by Vassilis Prevelakis

Thanks for your helpful information and referral to your site Vassilis.

Re: Repairing HP-85's.

*Message #5 Posted by **Howard Owen** on 18 Dec 2005, 11:50 p.m.,*
in response to message #1 by Barrie Carruthers

85As amd 85Bs show up on eBay pretty frequently. They go anywhere from $35 to $125 depending on conditions and luck of the draw.

As far as PROMs go, there's a new hobbyist board called the PRM-85 that is an implementation of the EPROM ROM drawer. Only this updated version lets you have up to 8 ROM images in a single EPROM, all online at once. The card ships with a "SuperROM" containing the following:

```
Advanced Programming
Assembler
Service-85
Program Development
Mass Storage
Matrix
Input/Output
Extended Mass Storage
```

These are all the 85 versioms, but an equivilant EPROM for the 86/87 has just been developed.

I can confirm that the device works great. I have it plugged in to my 85B, but I'm checking my mail for the 86/87 SuperROM, which John has sent me from England free of charge! (I am deeply impressed by that. 8)

It's a hobbyist device, which doesn't mean that it's of poor quality, quite the contrary. But there is one guy, the designer, building the boards. So I don't kmow what kind of volume he can handle.

Hope this was helpful
Howard

Re: Repairing HP-85's.

*Message #6 Posted by **john** on 19 Dec 2005, 7:38 p.m.,*
in response to message #5 by Howard Owen

Hi,

The PRM-85 boards are designed and made by Bill Koteska. Volume of boards made so far is around the 10 mark, we have hardly been overwhelmed with enquires so I suspect volume will stay in the 10s for some while yet.

There was a waiting list, but I understand everyone on it has now been supplied with or offered boards. One person on the list has pulled out, so I have one board and am looking for a buyer. The price is $100/€100 or £60 plus postage.

Please e-mail me if you are interested, and I will send further details or if there are more than one reply I'll start a new waiting list!

Regards, John

Re: Repairing HP-85's.

*Message #7 Posted by **Barrie Carruthers** on 19 Dec 2005, 10:47 p.m.,*
in response to message #5 by Howard Owen

Well thanks for this information Howard. Sounds a great concept. Will certainly follow it up. The ROM/Controllers I really need are the Video Controller, the Printer Controller and the I/O Controller - as distinct from the Input/Outout ROM These are the HP IC's Part no's:- 1MA5-0101,1MA9-0101,1MA8-0101.

Yes I do have the option to aquire additional 85's and I may have to do that. Unfiortunately that much harder being out in the sticks down here in New Zealand.

Thanks for your response

Barrie

Re: Repairing HP-85's.

*Message #8 Posted by **Howard Owen** on 18 Dec 2005, 11:54 p.m.,*
in response to message #1 by Barrie Carruthers

I see Vassilis beat me to the punch on the PRM-85. 8) Let me second the plug for his website. It's a great resource for HP-85 tips, software and documentation.

Best Simulaton for 41

*Message #1 Posted by **PeterP** on 18 Dec 2005, 5:44 p.m.*

Hi, what kind of simulation program do you use and why? I've been looking around and it seems that EMU and V41 look both pretty good. For EMU I have trouble locating the bin files (and don't want to go through the trouble of producing them myself for all the fine mods out there. Any tips?), For V41 it seems that one can only program using the mouse with no re-mapping of the 41-keyboard (like XEQ, x^2, sin, etc) to the PC keyboard, so I don't see a real benefit to using it as compared to using the 41 directly.

Thoughts, advice, suggestions?

Cheers

Peter

Re: Best Simulaton for 41

*Message #2 Posted by **Eric Smith** on 18 Dec 2005, 5:55 p.m.,*
in response to message #1 by PeterP

Well, I like Nonpareil, but I might be just the slightest bit biased. :-)

I haven't used "EMU"; in fact I haven't even heard of it. But V41 seems quite nice, and is currently more usable than Nonpareil. In my experience V41 uses the keyboard just fine; in fact I've had requests to change the Nonpareil keyboard mapping to match that of V41.

Re: Best Simulaton for 41

*Message #3 Posted by **Howard Owen** on 18 Dec 2005, 6:16 p.m.,*
in response to message #1 by PeterP

The benefit of an emulator in general is that you can use most of the rare ROM modules without having to pay a fortune for them.

Personally, I use four HP41 emulators in different contexts. I use EMU41 to drive two HPIL boards. One is a real 82973A, and the other is one of Christoph Klug's clones. EMU41 works great with both. I run it under DOSEmu and Linux, so the limitations of DOS aren't bothersome. It's my primary way of exchanging data with my 41s, 75s and 71s. It also is helpful with my 85 and 87, and my 9816. These last three will all write to a 9121 floppy, and a 9114B floppy can read and write the single sided disks, as long as they've been formatted natively. Basic EMU41 is free. A version that speaks to an HPIL card is €20. No source code is available for either version.

The second emulator I use is HP-41X by Hrastprogrammer, on my HP-48GX. In many ways, this is the most successful of all the simulations, because it's implemented on a calculator, not a computer. That means the interface needs less adaptation, and is truer to the original. Add to that the fact that the emulation is good enough to run HEPAX and other advanced 41C modules, and you have a real winner. HP-41X is commercial software, with no source code available.

The third emulator I use is Nonpareil. This is the only one that runs on Linux natively. This is important to me because I like to minimize my use of Microsoft software. The source code is available under the GPL, which means that most questions I have can be answered by looking at the actual implementation in the source. Nonpareil is also unique in its ability to simulate dozens of early HP machines, in addition to the 41C/V/X. It runs on Windows too.

Finally, I have V41 installed on my primary Calc/Windows gateway machine. It's simulation is also very good. I don't use it much because the others fill in most places I want a emulator. But I've been looking at SDK41, which is also by Warren Furlow. It's a suite of mcode development software that runs on DOS. It includes a 41C emulator that is probably a predecessor to V41. The interesting thing about that is it claims to be able to use the HPIL ISA card to communicate with a real 41. It's got me wondering if V41 will do that too. The source code is available under the GPL, so I can find out, whenever my idle curiosity turns into action. 8)

Hope this helps,
Howard

in response to message #1 by PeterP

For EMU I have trouble locating the bin files (and don't want to go through the trouble of producing them myself for all the fine mods out there. Any tips?),

I guess that by EMU you mean Emu41.

You could have a look at this thread where I gave some tips for using ROM with Emu41.

I wouldn't say Emu41 is the best, but it suits my needs (I made it for that) and some people seem to like it, too...

J-F

Re: Best Simulaton for 41

*Message #9 Posted by **Gerson W. Barbosa** on 20 Dec 2005, 9:20 p.m.,*
in response to message #7 by J-F Garnier

Thank you very much, J-F, that's exactly what I wanted to know but was ashamed to ask! Thanks for Emu41LX too.

Now I have a 41CX with the Advantage ROM up and running on the 200LX. It's going to be be nice to play with while I wait for the real things to arrive (my first 41 ever!).

Best regards,

Gerson.

Re: Best Simulaton for 41

*Message #10 Posted by **PeterP** on 20 Dec 2005, 11:20 p.m.,*
in response to message #9 by Gerson W. Barbosa

not knowing and asking is the prerogative of me, the newbie ;-) What 41 are you getting?

Re: Best Simulaton for 41

*Message #11 Posted by **Gerson W. Barbosa** on 21 Dec 2005, 8:02 a.m.,*
in response to message #10 by PeterP

Hi Peter,

Answering your question, a very nice 41CX and an Advantage PAC. The latter is important because I want it to have the advanced functions the 15C (my first HP calc) has.

Now, my time to ask: what accessories do you think I should get? I don't want to key in long programs and I want to have a back-up of my programs. A card reader and a wand? Or a device to link it to the PC?

Regards,

Gerson.

*Message #12 Posted by **PeterP** on 21 Dec 2005, 12:46 p.m.,*
in response to message #11 by Gerson W. Barbosa

In terms of accessories, here is what I use and love:

1) CCD, as it offers lots of matrix functions (albeit some say inferior to the Advantage), alpha functions as well as direct entry of Synthetic instructions. The latter I use a lot for the synthetic registers M, N, O, a as they work faster than normal storage registers like 00, 01 etc. Raymond Del Todo produced a special soft-mod version called OS/X which is halve the size and offers only the direct entry of synthetic indstructions. It is a perfect complement to the Advantage module I'd say, that you have already. However you will need one of the goodies I mention in section 3) to take advantage of that great piece of work.

2) Storage of programs: Here I'm a bit of a snob and use a CMT 512k ramDrive. It is really small, really fast, really portable, really big capacity. And as they are Hp-IL compatible, you could use it for your 71 as well... They are a bit hard to get though, you might want to try the Classified section here. CardReaders are relativly cheap (just make sure you get a repaired one, the non-repaired ones just produce gluey cards... The Classified section as well as eBay might be a good source here), yet they use lots of battery and it might be a lot of cards to store a long program (they store only 16 register per card per side). The upshot is that I like the feel of the 41 with the attached cardreader in the hand a lot, it's much more solid and balanced than without. But that's just me.

3) There are certain modules out there which only exist in software form, that I think are outstanding and really helpful in programming the 41. For normal purposes and math, the Sandbox (generally usefull functions), SandMath (higher math) and the 41Z (complex number module) from Angel Martin come to mind. For MCODE (which might you might want to tackle later on), David Assembler comes to mind (and naturally HEPAX and to a lesser extend IMHO Zenrom, which are available as hard modules as well as soft-roms). To use all this wonderful things (and the CCD I mentioned earlier), one can use either a Clonix/NoVram module from Diego Diaz (160 Euro I think) or the MLDL from Meindert Kuipers (260 Euro), both of which offer lots of great features to load in all those modules as well as connection to the PC (albeit in a bit of an indirect way).

4) For entering programs that others have written, the best way is to get a Wand, as one can produce barcodes. However, I don't do that a lot. I either program myself (that's why we have them in the first place, right?) or just type in the programs. You should be able to buy on either here or on eBay for about 75 USD.

5) Link to PC is as of yet not particularily straight forward IMHO. Christoph Klug has build a great PC board (160 Euro I think), which howerver is only ISA, so you'll need an old PC and the HP-IL module. The connection from the MLDL is via USB, so quite easy, yet by no means offers the same functionality as Christophs board (it basically allows you to use the PC as a RamDisk. it also provides the connectivity to the simulaters around. So you can program on your PC in a simulater, test out your programs using their programming environment and then load them onto your 41 for on the go.

6) There is a great amount of literature out there that is fantastic in learning about your 41. Here are my favorites a) Extend your HP 41, from Mier-Jedrejowicz. It is also called the "the red bible". When you are through with this book and its exercises, you've propelled yourself to the

top quintile of HP 41 users around the world I'd say. b) Keith Jarrets "Synthetic Programming Made Easy", the best introduction into the Synthetic Programming world, which - as a great side-benefit - will teach you a great deal on how the 41 works internally c) MCODE for Beginners, from Ken Emery, the only book I know that was written on MCODE for the 41, for if and when you want to go into MCODE programming.

So what's the bottom line? if you were to get only one thing to your current outfit, I'd get the NoVram from Diego. It will give you access to virtually all available modules, including all the ones I mentioned to use on your HP on a daily basis. And a cardreader for storing programs. The total cost of this is about 200-225 Euro. The other option would be to try to get a MLDL from Meindert (260 Euro if you solder it together, 360 if he does), which will give you far more storage space and a fast connection to the PC to store your PGMS as well (with a little, easy trick), however at a bigger form-factor (it has the size of the CardReader vs NoVram is just a plug in Module. And then get the red bible from Mier-Jedrejowicz and you're set for quite a while...

But that's just me, and close to what I did to get me started on the HP 41. Lets hear the suggestions from others!

Cheers

Peter

Re: Best Simulaton for 41

*Message #13 Posted by **Gerson W. Barbosa** on 21 Dec 2005, 7:01 p.m.,*
in response to message #12 by PeterP

Thanks for your comprehensive suggestions. I had already been advised to get Diego Diaz's CLONIX, but since I was just interested in only one PAC I chose to get that first. I may go for this and other peripherals later, as I need them.

Thanks also for the book recommendations. They'll be needed when I finish reading all manuals. Anyway, I don't want to be any 41 guru. I missed that boat 25 years ago... :-)

Cheers,

Gerson.

Can explain the trick in some more detail? Are you talking about the Hepax file system?

Re: Best Simulaton for 41

*Message #15 Posted by **PeterP** on 22 Dec 2005, 10:39 a.m.,*
in response to message #14 by Marcus von Cube, Germany

I did it using the WW Rambox OS (comes with the V41 emulator in the /mod subdirectory. Just use the extraction tool from Warren to get it in rom form).

Enable a page in the MLDL, without write protection. "INITPG" it with something like "-My41PGMS" (I think it needs 6+ chars to show up in Cat 2). Then save your programs to that page. After you are done, you can "download" that rom in the MLDL Gui on the PC and save it for later use.

Same stuff can be done with a 4k MCODE block. You either program in the MLDL directly (not sure if that works, have not tried yet) or do a "COPYBLCK" operation from the place where you have it into the MLDL (I've transfered my WW Zenprom programing OS that way from a RAMBOX to my PC). Clearly, if you have already a full block in say a Clonix or Rambox filled with programs, the above "COPYROM" procedure works just as fine to save your whole block of user-programs to the MLDL and from there to the PC.

Hope that helps.

Cheers

Peter

RPNglish

*Message #1 Posted by **db (martinez, ca.)** on 18 Dec 2005, 3:21 p.m.*

Y'all seen this? It is a description of a theoretical Last-In-First-Out stack based spoken language. As they would say in Fith; "site interesting the URL the on is" http://www.langmaker.com/lifointro.htm or click RPNglish
The first 2/3 is just an RPN primer. The last third of the page is about the language and there are links for more on Fith grammer. It sounds like a logical and straightforward way to think, till you read that they have a base 144 number system. 12 i could see, but that number is just gross.

Re: RPNglish

HP11C commas & period swapped

*Message #1 Posted by **PJ** on 18 Dec 2005, 2:09 p.m.*

I have had my HP11C for years! It has been the best calculator I have ever owned. Just recently I turned it on and noticed that the comma and the period are swapped. Example, 1111.1111 will display as 1.111,110 - operations perform without errors...it is just the display. I have run the self test (the "ON" and "x" key) and there are no errors. I have also run the keyboard/display test ("ON" and divide key) pressing all keys as stated in the user manual and get the proper display "11" at the end. Does anyone have any experience with this? Is there a cure? Sure hope so! :-) Would love to keep using it, but the display is annoying. Thanks. PJ.

Re: HP11C commas & period swapped

*Message #2 Posted by **Donald** on 18 Dec 2005, 2:20 p.m.,*
in response to message #1 by PJ

Try <ON> <.> at the same time

Re: HP11C commas & period swapped

*Message #3 Posted by **PJ** on 18 Dec 2005, 2:28 p.m.,*
in response to message #2 by Donald

Thanks for the suggestion. Although I had searched the forums here I missed one from "Message #2 Posted by Vieira, Luiz C. (Brazil) on 2 Jan 2005, 4:48 p.m." who responded to another issue but mentioned using the (ON and "-"). He stated this clears the memory. And it worked! If this happens again I'll try the "ON" and "." but the the "ON" and "-" worked!

Thanks Luiz! I would sure have hated to lose the use of this calculator...I've told my friends who kid me about using it that it was the only really useful thing my ex-husband left me with!

HP-75 IL error

*Message #1 Posted by **Michel Beaulieu** on 17 Dec 2005, 10:11 p.m.*

Hi all. I tried to print a program with my thinkjet printer and my HP-75c. I use PRINTER IS ':PR' and after that PLIST and all i get is just a couple of line print on the printer and the display and printer write "TRANSMISSION ERROR"

So i tried my HP-75C on my HP41-IL "brown" printer and this time no problem (but i would like to print WIDER with the thinkjet)

After, i try to print with my HP-41 on my Thinkjet and everything is ok...

Hummm... the printer is ok, the HP-75 is ok but they don't like each other. Is it normal that it just print a couple of line and jump with an Error? Sometime i can get 15 lines, sometime no line at all...

Any idea?

Thanks Michel Canada.

Re: HP-75 IL error

*Message #2 Posted by **Vassilis Prevelakis** on 18 Dec 2005, 11:50 p.m.,*
in response to message #1 by Michel Beaulieu

This looks like a battery problem, are you sure your ThinkJet battery is in good condition. Can you check its voltage during the print operation to see if the voltage level changes?

Another test would be to try to test the ThinkJet electronics to verify that you do not have a memory problem in the IL interface. Try sending data at a very low data rate (e.g. one line every 10 sec) to see if the printer managrs to print more lines. If this works, it may indicate that there is a problem with the printer's buffer (which slowly fills up as the printer mechanism cannot keep up with the incoming data).

Re: HP-75 IL error

*Message #3 Posted by **Michel Beaulieu** on 20 Dec 2005, 8:50 a.m.,*
in response to message #2 by Vassilis Prevelakis

I tried my HP-75C on my disk drive and on cassette drive and i also get a "bad transmission error after a few seconds. I think that my HP-75c is defective; how can it be possible?!

Michel

Re: HP-75 IL error

*Message #4 Posted by **Vassilis Prevelakis** on 1 Jan 2006, 8:15 a.m.,*

in response to message #3 by Michel Beaulieu

check the cables, they may be damaged and make contact intermitently

you can also use a single cable to connect the HP-IL output port to the HP-IL input port on you HP-75 and see if the loop works.

If you get timeouts replace the cable. If you still get timeouts then it is very likely that the HP-75 interface has a problem.

HP 82161A - digital cassette drive

*Message #1 Posted by **Artur - Brasil** on 17 Dec 2005, 8:42 p.m.*

Hi, Does anybody have the electronic schematic of HP82161A or any material about how to service it? Best regards Artur

Re: HP 82161A - digital cassette drive

*Message #2 Posted by **Tony Duell** on 18 Dec 2005, 6:33 a.m.,*
in response to message #1 by Artur - Brasil

I have the HP service manual for the 82161, which includes a schematic.

Unfortunately I have no easy way to get a copy to you, but I can answer any questions about repairing it..

Re: HP 82161A - digital cassette drive

*Message #3 Posted by **Artur - Brasil** on 18 Dec 2005, 5:12 p.m.,*
in response to message #2 by Tony Duell

Hi, Tony

What a pit... is this manual too big?

Well, I would like to know if is there any adjustments like gain, speed, bias, etc. I could see some trimpots inside the drive, but no indication what they are for. Also, how I can measure the signal sent and readen from magnetic head. I believe as the tapes are getting old now, they may are loosing their capacity of recording. So, increasing in some way the signal this could help in improving the reading. Any way to get a simple photocopy and posting it in USPS? Best regards Artur

Re: HP 82161A - digital cassette drive

*Message #4 Posted by **Garth Wilson** on 19 Dec 2005, 1:04 a.m.,*
in response to message #3 by Artur - Brasil

I don't have a service manual for the 82161A, but hopefully this will interest you anyway.

Age alone will not deteriorate the tapes' ability to take new data or hold old data. The characteristics of a head will change somewhat as it wears, possibly requiring an adjustment of the trimmers. I doubt that you've used it that much though. The settings don't change much even for high-end audio equipment until the head is near the end of its life. After the machine is initially aligned correctly, being dirty (especially for the head) is the only real enemy to performance before actual wear-out or damage. Even head demagnetization is a myth. I've done very little tape-recorder design work, but I did service nearly a thousand high-end audio tape recorders in a prior life, over 20 years ago. Bringing a tape recorder back up to new-machine spec.s never involved demagnetizing.

The 82161A records digitally and does not use bias. Its record circuit gives the head about 150% of the

DC current needed to saturate the tape (according to the May 1983 Hewlett-Packard Journal), so even an erase head is not needed.

Re: HP 82161A - digital cassette drive

*Message #5 Posted by **David Smith** on 19 Dec 2005, 11:58 a.m.,*
in response to message #4 by Garth Wilson

The number one cause of tape failures is the backing to the pressure pad rots out. You can replace the pressure pad with either sticky back felt disks used on the bottom of pottery or sticky back nose pads used on eyeglasses. Walgreens sells a brand that is just the right thickness. The pottery felt is a bit coarser than the original stuff, but it seems to work just fine.

Re: HP 82161A - digital cassette drive

*Message #6 Posted by **Artur - Brasil** on 19 Dec 2005, 12:36 p.m.,*
in response to message #5 by David Smith

Thanks to everybody who is helping me. I've already replaced the felts that makes the pressure. I'm still getting or Drive ERR or Midia Invalid (I don't remember the exact message) after initializing them with HP41 command. If the head, even used for a few times, is bad, there would be a replacement? I have worked with tape recorderes only once or twice before. Also, there would be neccessity for cleaning and lubricating the internal motors? Best regards, Artur

Re: HP 82161A - digital cassette drive

*Message #7 Posted by **Diego Diaz** on 20 Dec 2005, 4:17 a.m.,*
in response to message #6 by Artur - Brasil

Hi Artur,

It's a long while since I tried this:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv009.cgi?read=24244#24244

but the tape is still working fine. You may want to give it a go... not much to lose since you can't have the current tape working.

Best wishes.

Re: HP 82161A - digital cassette drive

*Message #8 Posted by **Tony Duell** on 20 Dec 2005, 6:17 a.m.,*
in response to message #7 by Diego Diaz

Incidentally, my offer to make that DataFile (HPCC Journal) article available still stands (I am sure I have it somewhere).

Unfortunately (for most of you), I use LaTeX, and can't produce pdfs, proprietary word processor files, etc. But then LaTeX is a text file with readable commands, so you should be able to understand it. And if you are able to translate it into other formats, that's fine too, just give me credit for the original.

Re: HP 82161A - digital cassette drive

*Message #9 Posted by **Etienne Victoria** on 20 Dec 2005, 7:49 a.m.,*
in response to message #8 by Tony Duell

Hello Tony,

I run TexShop on OS X.

If you email me your LaTex file, I'll try send you back a secured pdf.

Just let me know.

Etienne

Re: HP 82161A - digital cassette drive

*Message #10 Posted by **Tony Duell** on 20 Dec 2005, 7:53 a.m.,*
in response to message #9 by Etienne Victoria

Remind me to send you the LaTeX file... But there's no point in sending me a pdf (secured or otherwise) because it's a lot easier for me to read the original LaTeX. You are welcome to make the pdf available on a suitable web site, though.

Re: HP 82161A - digital cassette drive

*Message #11 Posted by **Etienne Victoria** on 3 Jan 2006, 7:31 a.m.,*
in response to message #8 by Tony Duell

Hello Tony et al,

As promised, I have Pdf-ed Tony's Tex document on the tape restoration: 49 Kb pdf. You'll need Acrobat Reader 5.0 or later.

I've put it online on the support section of my site: Tony's document

Thank you Tony and best wishes for 2006 to all!

Etienne

Re: HP 82161A - rewind using normal tapes

*Message #12 Posted by **Artur - Brasil** on 20 Dec 2005, 1:45 p.m.,*
in response to message #7 by Diego Diaz

Hi, Diego You are always helping us!

Well, last year I tryied to replace the tape using normal midia (but CrO2) found in market. I was surprised, because the 60min tapes are ticker than HP tapes and 90 min seens to work. Any way, I didn't make a precise cutting in the length. I'll try to use your time - 8min 44sec - to get a precise length. I'll let all of you to know the results! I really hope it works!

Best regards,

Artur

Re: HP 82161A - digital cassette drive service manual

*Message #13 Posted by **Etienne Victoria** on 20 Dec 2005, 8:27 a.m.,*

2225B Thinkjet battery pack

*Message #1 Posted by **Bill Lafferty** on 17 Dec 2005, 7:25 p.m.*

I have been unable to get my non functioning 2225B battery pack rebuilt here in Australia. Is there a workshop manual for this, or can anyone give me some information regarding the makeup of the battery. The batteries in my pack are dead, badly corroded, and the motherboard in the pack appears to be damaged.

Re: 2225B Thinkjet battery pack

*Message #2 Posted by **Michel Beaulieu** on 17 Dec 2005, 10:19 p.m.,*
in response to message #1 by Bill Lafferty

Hi. It's fresh in my memory because i just rebuilt my thinkjet! Well, you only need 6 sub-c batteries to rebuilt the pack. For the board, mine was dead too. It is simple to make if the coil is still usable. others parts on the board are commons: 4 rectifiers diodes and a simple resistor. I'm not a EE, can someone tell me the use of that coil in the rectifing circuit - these are very populating in computer switching power supply; is it a "kind" of primitive switching concept in that battery pack?

Michel

Re: 2225B Thinkjet battery pack

*Message #3 Posted by **Tony Duell** on 18 Dec 2005, 6:35 a.m.,*
in response to message #2 by Michel Beaulieu

The coil is simply there to prevent interference (from the Thinkjet's logic circuits) getting out via the charger cable (which could act as an aerial).

I have never had that part fail, though.

Re: 2225B Thinkjet battery pack

*Message #4 Posted by **Etienne Victoria** on 18 Dec 2005, 10:47 a.m.,*
in response to message #1 by Bill Lafferty

Hello Bill,

I've put pictures of the pack on my website to show you my version of the board.

The picofuse is wired between any of the Sub Cs Ni-Cad (polarity is unimportant):

http://homepage.mac.com/etienne.victoria/.Pictures/Photo%20Album%20Pictures/2005-12-18%2007.33.20%20-0800/Image-47207A606FDB11DA.jpg

It is a 5A 25V fuse.

You'll also find detailed pictures of the other components:

http://homepage.mac.com/etienne.victoria/.Pictures/Photo%20Album%20Pictures/2005-12-18%2007.33.20%20-0800/Image-472041276FDB11DA.jpg

There were at least 3 different versions of the motherboard and no component of mine matches exactly the reference you stated in your mail.

I do not know of any paperwork or reference on this battery pack but would be glad to help further if you recognize your broken components on my pics.

Kind regards from Fourqueux (France)

Etienne

Test an HP-97 Card Reader

*Message #1 Posted by **jbssm** on 17 Dec 2005, 2:23 p.m.*

Hello all,

can anybody give me a simple key press to test the card reader of an HP-97 ?

The motor is working great, but every-time I put a card in it (just some random card probably without anything written in it) it just says "ERROR"

I don't know if this means the card has nothing in it, or if the card reader is giving problem, so I need a bit of help.

I don't have manual, so I don't know how to write and read even a very small program for testing, can anybody give me an hand?

Best wishes, Jorge

Re: Test an HP-97 Card Reader

*Message #2 Posted by **Tony Duell** on 18 Dec 2005, 7:44 a.m.,*
in response to message #1 by jbssm

To save a program to card :

Switch to Program Mode (I forget exactly what it's called). Type in the program as usual. While still in program mode, feed a card into the reader. If the program is too long to fit on one track of the card, the machine will prompt with Crd (IIRC), then feed the card in the other end first to record the second track. An HP97 program will always be short enough to fit on one card (2 tracks).

To read the program back in again:

Switch to run mode and feed the card in. Again, if there's a second track, the machine will prompt for it.

To save numeric data to a card:

In run mode type in the data and STOre in the registers. Then press WDATA (I forget the exact name, it's almost certainly a shifted function) and feed in a card. If you have non-zero values in the secondary storage registers, it'll prompt for a second track as above

To read the numeric data back in :

Just pass the card through the reader in run mode.

The user and service manuals for the 97 are on the MoHPC CD-ROM set, BTW.

Re: Test an HP-97 Card Reader

*Message #3 Posted by **David Smith** on 18 Dec 2005, 11:45 a.m.,*
in response to message #2 by Tony Duell

After entering the program, switch to RUN and then enter "GOTO . 0 0 0" then switch back to PRGM mode and insert the card to write it out. This makes sure the program gets written starting at the first instruction.

Then turn the machine OFF than back ON. Insert the card to read the program. This makes sure the program actually got read from the card is not a remnant of the original program.

If you get the message CRD, the program is too long for one card edge. You will need to rotate the card use the other edge.

Re: Test an HP-97 Card Reader

*Message #4 Posted by **Howard Owen** on 18 Dec 2005, 12:20 p.m.,*
in response to message #3 by David Smith

> Quote:
>
> Then turn the machine OFF than back ON. Insert the card to read the program. This makes sure the program actually got read from the card is not a remnant of the original program.

Before inserting the card in this step, switch back to RUN mode. You'll overwrite your card with a blank program, otherwise.

This bit me a couple of times because I'm used to the later models in which cycling power resets the machine to run mode. With the physical mode switch, that's not the case with the 97. 8)

Regards,
Howard.

No. You are thinking of another calculator. The HP-67 and HP-97 **always** record the first 112 steps on the first side of the card and if there are more then 112 steps in the program, prompt for the second side.

The GTO . nnn trick is used when merging programs (so that the beginning of the merged program is loaded starting at address nnn of the already loaded program.

HP 86A/86B/87A/87XM ROM query

*Message #1 Posted by **john** on 16 Dec 2005, 5:43 p.m.*

Hi,

Can someone clarify please which ROMs are built into which of the following machines?

86A

86B

87A - none (only one of these I have)

87XM

I recall (probably incorrectly!) that some of these have the EDISK ROM built in, not sure of any other ROMs.

Thanks, John

Re: HP 86A/86B/87A/87XM ROM query

*Message #2 Posted by **Etienne Victoria** on 17 Dec 2005, 2:36 a.m.,*
in response to message #1 by john

Hi John,

I can answer for mine!

Hp-86B: EDISK ROM, Mass storage ROM, Printer ROM

And that's all!!!

Cheers and thanks!

Etienne

Re: HP 86A/86B/87A/87XM ROM query

Hp-87A and 87XM: Mass storage ROM, Printer ROM

IMHO the only difference between the 87A and the 87XM is that the XM has more memory built in.

**vp

Re: HP 86A/86B/87A/87XM ROM query

*Message #4 Posted by **john** on 19 Dec 2005, 7:47 p.m.,*
in response to message #3 by Vassilis Prevelakis

Hi, Thanks for the responses. Can you clarify please about the HP86/87 Printer ROM? As you know, the 86/87 has a system ROM (address 0) plus an additional ROM (address 1) and I thought this incuded the Printer commands such as

PRINTER IS 10,132

As per your series 80 there is a separate plotter ROM (address 360 octal), but this is not pre-fitted to my HP-87A.

Regards, John

Re: HP 86A/86B/87A/87XM ROM query

*Message #5 Posted by **Etienne Victoria** on 20 Dec 2005, 2:41 a.m.,*
in response to message #4 by john

Hi John,

Sorry but my answer to your post was not accurate enough.

IMHO there is no separate, identified product tagged "Printer Rom" for the 86/87 series.

Printer commands are indeed included in the 86/87 mainframe and by "PRINTER ROM", I was just referring to these included commands.

That's why we just have a separate "Plotter Rom".

Regards

Etienne

Re: HP 86A/86B/87A/87XM ROM query

*Message #6 Posted by **john** on 21 Dec 2005, 5:07 a.m.,*
in response to message #5 by Etienne Victoria

Thanks,

I am updating the PRM-85 userguide for HP-86/87 users, and would like to give some accurate advice on setting the board up. It would cause a clash if the machine had one ROM built in that was the same as one enabled on the PRM-85, so I am trying to avoid this occuring.

Regards,
John

12c: Anyone have a good way to program this? :-)

*Message #1 Posted by **Gene Wright** on 16 Dec 2005, 3:17 p.m.*

http://www.xycoon.com/dispersion.htm

It is the "coefficient of dispersion".

Given that it needs the median, this appears problematic for the HP12c.

I would think it requires:

1) keeping all individual data values, 2) sorting them, 3) finding the median 4) then going through all the data values to compute the C o D.

That seems like a real pain. Any suggestions?

Re: 12c: Anyone have a good way to program this? :-)

*Message #2 Posted by **hugh steers** on 16 Dec 2005, 4:16 p.m.,*
in response to message #1 by Gene Wright

if it must be the median, you have to store (at least) half of the input values. otherwise you can't be sure to have the n/2'th largest.

Re: 12c: Anyone have a good way to program this? :-)

*Message #3 Posted by **Gene Wright** on 16 Dec 2005, 4:46 p.m.,*
in response to message #2 by hugh steers

Yep. That's the problem!

I'm pretty sure that the cash flow registers could be used, but to get the median, some sorting would have to occur, and on the HP12c, that's just painful.

And, the number of data points would be variable, so you can't hard code for 10 of them each time.

Just wondering if anyone saw a way to do this without this much pain/suffering. Gene

Re: 12c: Anyone have a good way to program this? :-)

*Message #4 Posted by **Vieira, L. C. (Brazil)** on 16 Dec 2005, 6:41 p.m.,*
in response to message #1 by Gene Wright

Hi Gene, folks;

maybe I'm wrong, I have once seen it and don´t remember where, but isn´t it numerically equivalent to

```
1/r
```

(inverse of the correlation coefficient)? If so, it is easier to compute through summations and linear regression.

As I said, maybe I'm wrong.

Cheers.

Luiz (Brazil)

Re: 12c: Anyone have a good way to program this? :-)

*Message #5 Posted by **Namir** on 16 Dec 2005, 11:19 p.m.,*
in response to message #1 by Gene Wright

Why not use the ratio between the standard deviation and the mean? That should give you a good feel for the dispersion of data.

As the other posts indicated, getting the median requires the storage and sorting of data. Maybe that's why statisticians use the mean more than the median, since you can accumulate data using a sequence of single observations (storage of ALL the data is not mandatory).

Namir

Re: 12c: Anyone have a good way to program this? :-)

*Message #6 Posted by **Gene Wright** on 17 Dec 2005, 12:34 a.m.,*
in response to message #5 by Namir

Luiz: I'll check on 1/r.

Namir: I know there are plenty of measures of dispersion, but in this case, the individual wants this specific one, the formula for which requires the median.

I just wanted to make sure I wasn't overlooking something. :-)

It's not too bad if you determine the median outside of the 12c and input it separately. But storing individual values and sorting them and then evaluating each of them for a variable number of data points? Yuck!

Re: 12c: Anyone have a good way to program this? :-)

*Message #7 Posted by **Namir** on 17 Dec 2005, 1:25 a.m.,*
in response to message #6 by Gene Wright

Gene,

I suggest using Excel to enter sample data (one or more sets) and then do the following:

1) Sort the column of data 2) Determine the mean value 3) Calculate CD 4) Use Excel built-in functions to calculate the ratio of the standard deviation and the mean. 5) Compare the values of the CD with sd/mean

You can test the above with several sets and see how the two statistics compare with each other.

Re: 12c: Anyone have a good way to program this? :-)

*Message #8 Posted by **Joao** on 17 Dec 2005, 7:00 p.m.,*
in response to message #7 by Namir

Gene,

I guess with a 12c you are in big trouble... You can't escape the median, and doing it on the 12c is not practical at all.

About the previous suggestions:

a) the coefficient of dispersion is not 1/r (sorry Luiz).

b) ratio between the standard deviation and the mean measures the same thing (actually, that is what is generally termed coefficient of dispersion), but it is not robust to outliers in the data. That is the advantage of using the median.

I guess you either have to compute the median outside the machine or upgrade to a 15c!

Sorry for the bad news.

Joao

Re: 12c: Anyone have a good way to program this? :-)

*Message #9 Posted by **tony(nz)** on 20 Dec 2005, 1:12 a.m.,*
in response to message #1 by Gene Wright

Gene, Darn, I missed this. You can use Katie's bubble sort (published here in Oct 2003) for the 12C. Only 21 lines. Adding another 20 or less will give you the median. Maybe 15 more for the average of the absolute deviations - but it's more fun, and more "robust" (when we suspect outliers in an otherwise "normal" data set - see www.rsc.org - they have a technical bulletin on this - a google on "robust mad rsc" brings it up) to actually overwrite the data with their absolute deviations then re-run the bubble sort to find the median (rather than use the average). Should be possible in 57 lines total - leaving room to store 14 data points! Almost useful, but I'm too late, but as always it was a very interesting question. Cheers, Tony

Re: 12c: Anyone have a good way to program this? :-)

*Message #10 Posted by **Valentin Albillo** on 20 Dec 2005, 5:39 a.m.,*
in response to message #1 by Gene Wright

Hi, Gene:

Gene posted:

"I would think it requires: 1) keeping all individual data values, 2) sorting them, 3) finding the median 4) then going through all the data values to compute the C o D. That seems like a real pain.

Any suggestions?"

Yes, two:

1. Sorting provides much more information than is required to find the median, i.e.: there are ways of finding the median without doing a full sort first.

2. Anyway, if you opt for sorting, you don't need to perform a sort on the stored values as a separate process. Matter of fact, you also need to input the values themselves when running this program,

so the best strategy is to mix input and sort, i.e., *to sort the values on the fly* as you're inputting them: after requesting each next element, just simply insert it at its proper place at once. This way, as soon as the last element is entered, they're all already sorted out and finding the median is immediate. A simple final loop finishes the computation.

All of this is perfectly implementable in a few steps, and as the time required for the sort is distributed among the time required to input each element, it would feel faster to the user.

Best regards from V.

Re: 12c: Anyone have a good way to program this? :-)

*Message #11 Posted by **Gene Wright** on 21 Dec 2005, 8:34 a.m.,*
in response to message #10 by Valentin Albillo

Hi Valentin!

I'm certain that I'm not the only one who would really love to see what you can come up with (I already know Tony would too).

You always have a way of finding unique, amazing solutions to problems like this and it would be very helpful/instructive to me (and others I'm sure) to see what you'd do with this problem.

I have seen Tony's approach and it does about what I'd expect (but certainly more optimized than I'd come up with)...it sorts, it uses the CF registers, etc.

But, I have no doubt a non-sorting approach would be very amazing. Please share? :-)

Re: 12c: Anyone have a good way to program this? :-)

*Message #12 Posted by **Katie Wasserman** on 21 Dec 2005, 7:09 p.m.,*
in response to message #11 by Gene Wright

If we're talking about the good old basic 12C, I'm going to go out on a limb and suggest that it's going to be nearly impossible to do better than the bubble sort program that I wrote with picking the middle element after the sort completes.

Insertion sort during input as Valentin suggest is no better than bubble sort as far as overall time is concerned and it might be more annoying to the user to have to wait an increasingly long time between entries.

There are linear-time median algorithms but all require at least O(log(n)) additional memory and a good amount of programming complexity in that you'd have to simulate recursion.

Re: 12c: Anyone have a good way to program this? :-)

*Message #13 Posted by **tony(nz)** on 23 Dec 2005, 5:10 a.m.,*
in response to message #12 by Katie Wasserman

Katie,

For fun, I took your 12C 21 liner below and changed it to do an insertion sort, appended below.

I needed 5 extra lines and 1 extra register. One could say this requires 33/21 (approx pi/2) extra resources :-)

Insertion sorting does seem more efficient, even on the 12C. For example sorting 12 numbers takes about a minute via bubble sort, whether the numbers are already pre-sorted in ascending or descending order. The insertion sort is assymetric in that it takes 12 seconds if the numbers are pre-sorted in ascending order, and the full minute if they are pre-sorted in descending order. It appears that the speed/resource trade-off works in favour of the insertion, even on the 12C.

Personally I still really like your Bubble sort - for me it is a classic 12C program, and really made me see a whole new dimension hidden in the 12C.

Bubble Sort on HP12C

Posted by Katie on 26 Oct 2003, 11:11 p.m.

It's easy to use, just fill up registers 0 - n with your data
and call the program with n in the x register.

Keystrokes	Display	Comments
[f][P/R]		
[f]CLEAR[PRGM]	00-	
[STO][i]	01- 44 12	i = maximum register
1	02- 1	
[STO][n]	03- 44 11	A: n = 1
[RCL][g][CFj]	04- 45,43 14	B: y = A(n)
[RCL][g][CFj]	05- 45,43 14	x = A(n-1)
[g][x<=y]	06- 43 34	if (x <= y)

hp11c calculator

*Message #1 Posted by **F Sievenpiper** on 16 Dec 2005, 2:29 p.m.*

Lost manual,installed new batteries, now I get a user with a 0 above it and 2 zero's on right side. How do I get the calc to work?

Re: hp11c calculator

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 16 Dec 2005, 2:43 p.m.,*
in response to message #1 by F Sievenpiper

Hi, F. Sievenpiper.

It seems to me that your HP11C is displaying number with SCIentific mode, one digit mantissa. To change this, have a look at your calculator and, please:

- locate the [f] (orange, golden) prefix key;
- verify that over the [7], [8] and [9] keys you have [FIX], [SCI] and [ENG] printed in gold, in the keyboard faceplate;
- choose one of these modes (your 11C is already in SCI) and the number of significant digits (from 0 to 9) you want in the mantissa;
- press [f], ([FIX], [SCI] or [ENG]) and the number key corresponding to the number of significant digits you've chosen.

As an example, the default display for the HP11C (and the HP10C and the HP15C) is a fixed, 4-digit, that can be restored with:

```
[f] [FIX] 4
```

To toggle to and from the USER mode, simply press:

```
[f][USER]
```

(please, check the golden inscription over the [RCL] key, in the keyboard faceplate).

Hope this helps for now.

Best regards.

Luiz (Brazil)

Re: hp11c calculator

*Message #5 Posted by **bill platt** on 16 Dec 2005, 2:45 p.m.,*
in response to message #1 by F Sievenpiper

http://www.hpmuseum.org/faq.htm#dsp

The "user" is removed by pressing {f} {user} (on the {RCL} key).

"user" reverses the functionality of buttons A,B,C,D,E so that the {f} shifts are primary, and pressing {f} gets you the main function. (Useful if you have *user* programs stored).

Note that the museum CD/DVD sets have the 11c manual available.

Regards,

Bill

*Message #6 Posted by **Randy** on 16 Dec 2005, 5:33 p.m.,*
in response to message #1 by F Sievenpiper

It is always a *very good* idea to reset a Voyager after a battery exchange, all of the problems you mention should disappear without further fuss. This of course assumes you have no programs installed that need to be held in memory.

1. Turn the unit off
2. Press and hold the "-" key
3. Press and release the ON button
4. Release the "-"
5. You should see "Pr Error"
6. Turn it off and then on again and all the weirdness you've experienced should be gone

Christmas wish for HP 33S

*Message #1 Posted by **brian healy** on 16 Dec 2005, 12:30 p.m.*

Hp, if you are watching this forum, how about giving us an HP33S Bronze edition, where the 33S would have the traditional bronze base with orange and blue secondary functions? I can live with the angled keyboard and small enter key. Just wishing.

Re: Christmas wish for HP 33S

*Message #2 Posted by **ECL** on 16 Dec 2005, 11:48 p.m.,*
in response to message #1 by brian healy

Don't expect that wish filled by x-mas :)

This is a nice way to improve the calc w/o any hardware/OS changes. I like it, and I'd get one. I am currently sweeping through my first half of senior engineering finals with my 33s.

During the pressure of exams (constrained desk space) I have come to miss the stealthy feet of the 32sii. The 33s feet jut out a bit too much for my taste, but functionally, it is a solid calculator.

*Message #3 Posted by **hugh Evans** on 19 Dec 2005, 11:31 a.m.,*
in response to message #1 by brian healy

The blue-purple color selection is wretched to begin with (someone didn't study colors). Putting them on a light color background is catastrophic. HP is more than welcome to use my optimized color scheme if they wish to do so.

As for christmas... That's pushing things a bit. I wouldn't expect anything in under 3 months, possibly 6.

Would it be a big improvement? Yep.

Re: Christmas wish for HP 33S

*Message #4 Posted by **brian healy** on 19 Dec 2005, 2:42 p.m.,*
in response to message #3 by hugh Evans

Agreed, the current color scheme is very bad, but I think that ball was dropped back in the days of the 32SII. In my opinion, the color scheme is worse than the angled keyboard and small enter key. I can live with the green, but the purple is a disaster. I would like to know, why did the color scheme have to change? If I wanted something that looked like a toy I would have bought one of the offerings from TI.

Sticky Keys on HP48GX

*Message #1 Posted by **Stephen Crumley** on 15 Dec 2005, 9:44 p.m.*

Spilled some soda on my HP48. Luckily there was not much left in the can, but enough spilled to make the right 3 keys on the lower 2 rows sticky (everything functions fine, just kind of annoying). Is there a way to clean the keys without resorting to the extreme distilled water submersion method discussed in another post?

Thanks.

Stephen

Re: Sticky Keys on HP48GX

*Message #2 Posted by **Randy** on 16 Dec 2005, 12:15 p.m.,*
in response to message #1 by Stephen Crumley

So long as the batteries are not in the calc, washing them is hardly extreme. It is IMO the only way to get goo out of a keyboard. The only precaution is to allow it to *completely* dry before re-inserting batteries. Twenty four hours in a warm place with a small fan directed at the keyboard is usually enough.

Thanks: Re: Sticky Keys on HP48GX

*Message #3 Posted by **Stephen Crumley** on 16 Dec 2005, 12:43 p.m.,*
in response to message #2 by Randy

Thanks Randy,

Well I'm about to take some time off, so now is the time to try it. I'll have plenty of time to let it dry out before needing it again.

Cheers,

Stephen

Stuck Printer in HP-97

*Message #1 Posted by **Jorge** on 15 Dec 2005, 8:05 p.m.*

Hello all,

I have an HP-97 and in overall is working great, but the printer doesn't work correctly.

The printing head seems to be working cause it moves, but the problem seems that the paper does not advance, that is, the paper is always in the same place.

Can anybody give me a solution to fix this?

Also, I already checked the middle (white) dented well and the problem is not in there since it's in good shape. (This was the only tip I saw about repairing the HP-97 printer)

Regards for all, Jorge

Re: Stuck Printer in HP-97

*Message #2 Posted by **Tony Duell** on 16 Dec 2005, 2:22 p.m.,*
in response to message #1 by Jorge

If the printhead is moving back and forth correctly, then the electronics, the motor, and the gear train on the side of the printer are most likely fine.

The paper advance is operated by the head carriage. The paper feed roller has an internal ratchet mechanism operated by a ridge on part of the roller assembly engaging with the head carriage. As the head moves back and forth, it rocks one part of the ratchet and thus advances the paper.

I would look in the service manual (on the MoHPC CD-ROM set), there's an exploded view of the printer there. I would then strip the printer down (it's not that hard, but then again I have done it a few times) and examine the parts. Most likely the problem is the actual rubber rollers, in which case roughening them up with very fine wet-n-dry paper helps.

Re: Stuck Printer in HP-97

*Message #3 Posted by **jbssm** on 17 Dec 2005, 2:26 p.m.,*
in response to message #2 by Tony Duell

Hi Tony,

thank you for your help.

Well, the rubber rollers seem to be strange, if I press them with my nail, they just seem to be breaking in little pieces.

Perhaps I should replace them for something, do you have any experience in this matter?

Best regards, Jorge

Perhaps one of the techniques to attempt to revive such units found here would do the trick.

Re: HP 41CV

*Message #3 Posted by **Artur - Brasil** on 15 Dec 2005, 1:06 p.m.,*
in response to message #2 by Jeff O.

If none of the steps listed before didn't work, you may have a trouble in the screws bases, on calculator's back. Press the calculator (in the line of upper foot) against a table and try to turn it on.

As these calculators are old, the plastic under screws breaks and the back part can't press the battery/modules contact against the main board.

To really check this, remove the back foot and screws and open very carefully the calculator. Look at the plastic where the screws pass thru.

Good luck! Artur

Stuck HP 28

*Message #1 Posted by **dl** on 15 Dec 2005, 6:21 a.m.*

Hi,

My HP 28S calculator is stuck in an ON state (probably doing an endless loop) for many hours.

How can I stop it?

Thanks.

Re: Stuck HP 28

*Message #2 Posted by **Raymond Del Tondo** on 15 Dec 2005, 10:13 a.m.,*
in response to message #1 by dl

Hi,

you could try resetting it:
Press and hold ON,
then press the 3rd menu key from the left,
then release both.
This should help.
If it doesn't, remove the batteries for a few minutes.

HTH

Raymond

Re: Stuck HP 28

*Message #3 Posted by **dl** on 15 Dec 2005, 11:08 a.m.,*
in response to message #2 by Raymond Del Tondo

What do you mean "3rd menu key"? Which are the menu keys?

Edited: 15 Dec 2005, 11:08 a.m.

Re: Stuck HP 28

*Message #4 Posted by **Thomas Falk** on 15 Dec 2005, 3:56 p.m.,*
in response to message #3 by dl

Hi,

the menu keys are the keys directly below the display.

I wish you success,

Thomas

Re: Stuck HP 28

*Message #5 Posted by **dl** on 18 Dec 2005, 2:19 a.m.,*
in response to message #4 by Thomas Falk

Hi,

Well, I've done it, but unfortunately, it has also reset the memory ("*Memory Lost*"), which is what I was trying to avoid. After all, I could achieve the same result by simply opening the batteries cover.

Meanwhile, I got to see the manual, and this operation you recommended (ON + ^) should really do only a "System Halt", not a "Memory Reset" (i.e. stop the running program, without resetting the memory). So I really don't understand what has happened.

Thanks anyway for your kind help.

HP 97 Printer Advance Switch Color Scheme

*Message #1 Posted by **Marcus von Cube, Germany** on 15 Dec 2005, 3:13 a.m.*

Hi,

my HP 97's paper advance switch doesn't work. No wonder, because it has been totally disconnected: All three wires broke off the switch. Someone must have opened the poor machine before me!

Can someone tell me the color coding of the switch and the wires? Black should be common (middle) but where do red and white go?

Marcus

I found out myself: the red wire is closest to the keyboard, the white one is in the middle and the black one is closest to the back of the calculator. Now I have to make the card reader work again...

Edited: 15 Dec 2005, 8:23 a.m.

Re: HP 97 Printer Advance Switch Color Scheme

*Message #2 Posted by **David Smith** on 15 Dec 2005, 11:43 a.m.,*
in response to message #1 by Marcus von Cube, Germany

On many machines, the colors are noted on the circuit board next to the pins for the switch wires.

*Message #3 Posted by **Marcus von Cube, Germany** on 15 Dec 2005, 12:12 p.m.,*
in response to message #2 by David Smith

David,

> Quote:
>
> On many machines, the colors are noted on the circuit board next to the pins for the switch wires.

On mine, too, but they broke off on the switch side, not on the board.

Marcus

Re: HP 97 Printer Advance Switch Color Scheme

*Message #4 Posted by **Tony Duell** on 16 Dec 2005, 2:18 p.m.,*
in response to message #3 by Marcus von Cube, Germany

I am sure I explained this a couple of months back -- it should be in the archives...

I can't remember the colours (and don't have any of the appropriate schematics in front of me), but I can explain where the 3 switch contacts should be connected :

Common : Ground (this is electrically the -ve terminal of the battery pack)

Normally-closed : To one of the pins going to the printer PCB, and thence to one of the wires to the Out-Of-Paper-Switch (OOPS) contacts.

Normally-open : To one of the flag inputs on the ACT chip (22 pin DIL on the logic board). I think it's either pin 3 or pin 4.

Here's the explanation :

When the switch is not pressed, it grounds one of the OOPS contacts via its normally-closed contact. If there's no paper in the printer, the OOPS contacts are closed, this grounds the forward-drive line to the printer motor driver. If the machine tries to print anything, the motor can't run (because the forward-drive line is held to ground), so the head never moves from the home position. The CPU detects this, and gives an Error.

When the switch is pressed, the flag input to the ACT is grounded. This sets an internal flag, which is detected by the firmware. This then starts the printer motor to advance the paper. Because the normally-closed contact is then open, the OOPS contacts do nothing (one of them is electrically unconnected), so you can use the Advance button to feed paper into an empty printer.

There is one very minor bug (which cost me an hour of tracing a fault that wasn't there). If there is no paper in the printer, the brake circuit can't operate correctly when you release the Advance button. The head 'coasts' to a halt, it doesn't stop dead. This is not a real problem, unless you don't realise it and start trying to figure out why the brake doesn't work.

Re: HP 97 Printer Advance Switch Color Scheme

*Message #5 Posted by **Marcus von Cube, Germany** on 16 Dec 2005, 4:54 p.m.,*
in response to message #4 by Tony Duell

Tony,

thanks for the detailed explanation, worth being put into an article here in the museum!

I did a Google search with "site:www.hpmuseum.org 97 paper advance" which didn't find the proper post. I had something in the back of my mind about a posting here but I couldn't find it that way. Meanwhile I found out by trial and error.

Marcus

Re: HP 97 Printer Advance Switch Color Scheme

*Message #6 Posted by **David Smith** on 17 Dec 2005, 11:40 a.m.,*
in response to message #4 by Tony Duell

HP cheaped out on some later HP-97 machines and did not install the out-of-paper switch.

Need 71B Play Testers

*Message #1 Posted by **Howard Owen** on 15 Dec 2005, 1:15 a.m.*

I have written an implementation of "High Rollers" in BASIC for the 71B, and I need play testers. It works fine for the way I play the game, but I'd like others to pound on it a little before I release it generally. Please respond here or by email (click on my name above to get the address) if you'd like to test it out. The game uses graphics for the dice images, so you'll need either a real 71B or else HP-71X from Hrastprogrammer. As far as I know, that's the only 71B simulation that includes the simulated LCD.

Thanks!

Re: Need 71B Play Testers

*Message #2 Posted by **HrastProgrammer** on 15 Dec 2005, 2:30 a.m.,*
in response to message #1 by Howard Owen

I would like to test it but I don't have much of free time for this :-(

But you can send it to me, just in case (save a program with COPY TO :CARD from HP-71X and send a "card" by mail).

TI forum

*Message #1 Posted by **Michel Beaulieu** on 14 Dec 2005, 7:38 p.m.*

I know it's not officially the good place to make some publicity, but i take a chance because i'm sure some of you secretely (...) have some TI vintage calculators to talk about like on this HP forum.

So i just create a brand new forum about the "dark side" in calculators : a vintage TI forum. I know that i don't have any members yet except me that's why i'm writing here; in order to have nice, mature and experienced users...

The forum is at this adress :

http://vintageti.forumsplace.com/

So if you have an interest in vintage TI like me, you are welcome! comments are welcome too.

Thanks Michel

Edited: 14 Dec 2005, 8:18 p.m.

I wish you success, however (and will put some messages as "needed"). Thks.

Re: TI forum

*Message #6 Posted by **Gene Wright** on 16 Dec 2005, 10:24 a.m.,*
in response to message #5 by GE

What forum exists for TI machines?

Unless Dave goes "bi" brand, discussion of TI issues here (while tolerated to some degree) won't have any real interest.

I think there's an uphill struggle to get people to GO to the TI forum being started, but I'm not sure THIS forum is the proper place for that interest.

?

Re: TI forum

*Message #7 Posted by **Marcus von Cube, Germany** on 16 Dec 2005, 10:47 a.m.,*
in response to message #6 by Gene Wright

Gene,

there is a TI99er forum on the Net discussing to some degree the CC-40 and TI-74 machines, but I'm not aware of a TI calculator forum. ticalc.org is focused solely on the graphics machines. Most sites which have some info about the older machines or almost dead and most don't have a forum.

But I must admit, while the new forum looks much fancier than this one, this place has a better usability (much less clutter.)

Marcus

Re: TI forum

*Message #8 Posted by **Michel Beaulieu** on 16 Dec 2005, 11:26 a.m.,*
in response to message #7 by Marcus von Cube, Germany

You are right about the non existence of VINTAGE TI forum on the net. That's why i create this on that i hope will have quality members as this one.

You are also right about the presentation of the TI forum, but it's the only one i can find without having to create my own website on my own server like this one. Perhaps i will do it if the TI forum is a good experience.

Michel

Re: TI forum

*Message #9 Posted by **John Cadick** on 16 Dec 2005, 2:10 p.m.,*
in response to message #8 by Michel Beaulieu

I've joined. The vintage TI calculators are very interesting. I have more HPs than TIs, but I find the 58/59 family to be a lot of fun. I love the printer attachment for them.

John

Sorry, wrong place to say nice things about TI. <G>

Re: TI forum

*Message #10 Posted by **hugh steers** on 16 Dec 2005, 2:30 p.m.,*
in response to message #1 by Michel Beaulieu

hi michel,

though your intentions are commendable, i feel i should pass on some warnings.

it looks like your forum is (free) hosted for you. scarily, it also looks like its quite an old version of phpBB2 (the bottom page has copyright is 2002). the latest version is 2.0.18 (www.phpbb.com). pretty soon you will be getting spam posted on your forum – in large quantities and also in a few weeks it could be hacked. badly! furthermore they don't let you take away SQL backups which means you cant make a personal backup or re-host it somewhere else should you need to do so.

i run phpbb2 over at voidware. even though my forum is obscure, i've been getting an alarming increasing amount of spam. i got 3 today. to fix it i deleted the spam and applied a mod to insist that guest posters enter human-readable verification. i also have such a thing on registration. quite often now i am hacking the code directly – and i have the latest version with the old loopholes supposedly plugged! when i get a moment, i'm going to physically remove the mass mail feature so that if it gets compromised (again) it wont spam my members.

phpBB2 is so popular that there are robots to hack it. and robots to log in as a new user and post spam. you must enable the human readable verification to register ASAP or you are in trouble.

up until last month i was lazy and not rigorous about keeping up the the latest version. i simply thought that i didn't desperately need any new features. my forum (and many others at the same time out there) was hacked by a turk who changed the front page into a picture of a turk with their national anthem blaring out of the speakers. i had to edit the SQL tables directly to fix it. this came about by exploiting a known loophole in an old version.

my cynical mind wonders if these "free" hosters deliberately court such problems once your site has momentum then require payment to fix it. so watch out!

i do think it's a good idea though!

Re: TI forum

*Message #11 Posted by **Michel Beaulieu** on 17 Dec 2005, 10:12 p.m.,*
in response to message #10 by hugh steers

Thanks you for tips; i jut put Human verification on account creation.

How valuable are upgraded HP48G's?

*Message #1 Posted by **Han** on 14 Dec 2005, 7:12 a.m.*

I have several HP48G calculators which I've upgraded to 256kB memory (and am thinking of adding in port2 in the near future). I did the upgrades without drilling, faceplate removal, or any cuts -- so they look as if they were never tampered with. No PCB was used either (I just stacked two SMD RAM chips on top of each other and placed them where the old 32kB chip used to be). Are the values of these calcs even less than that of a used HP48G because they've been opened up? Or would they be more valuable since they currently have 256kB of memory?

Re: How valuable are upgraded HP48G's?

*Message #2 Posted by **Namir** on 14 Dec 2005, 12:28 p.m.,*
in response to message #1 by Han

Sell it on eBay and see what the demand is!!!

Namir

Re: How valuable are upgraded HP48G's?

*Message #3 Posted by **tomc** on 14 Dec 2005, 11:08 p.m.,*
in response to message #2 by Namir

Han:

I agree; see what the demand is on ebay. I too intend to upgrade a 48 or two, but don't intend to sell them.

I would be curious if you would like to share some of the details of your opening process (is it the method we've seen on the web?).

Not to digress too much, but you might be interested to know that a HP38G has several unique features of interest to us 48 'hacks': 1. It appears to be able to accept a 128k RAM like the 48G. 2. It looks as if it will accept a DIP package 128k RAM. 3. There is another curious 16pin DIP pcb pattern - I intend to figure out what it is someday.

I believe one could drop a 48G ROM in this thing and get it to 'be' a 48G(+). Haven't tried it yet...

Perhaps others have already noticed these things, but I haven't seen it documented very well anywhere.

Regards, TomC

Re: How valuable are upgraded HP48G's?

*Message #4 Posted by **Han** on 15 Dec 2005, 8:36 p.m.,*
in response to message #3 by tomc

Hi Tom,

Well, the suggestion of placing the calculator on eBay sounds like the perfect way to find out. Though, I would rather not sell any of my HP48s =). I am merely curious what collectors think of modified calculators.

As for the method I used to open the HPs, I used a method that I figured out myself -- though it turns out someone else has also done it before. By using just a flat edge, you can open the HP without doing any cosmetic or even structural damage. And it's quite easy. Even when you put everything back together, the calculator feels just as solid as before because the rivets will still pop back into place.

I took many photos which I hope to put together to explain the entire process. I will have some time in January to make further upgrades (adding in port 2), and will put together a zip file containing all the photos and explanations. I've already designed a PCB board that will make use of SMD RAM chips as oppposed to the bulky DIP chips. I learned quite a bit about the HP48, and hope to share what I've found out. If you have any questions, I'd be more than happy to answer them to the best of my ability.

Han

Approximating Integrals on the graphing calculator

*Message #1 Posted by **John Bower** on 13 Dec 2005, 3:07 p.m.*

In my Calculus book today I was taught about approximating integrals with the Ti-83. But I don't have a TI-83; I have an HP 49g+. I know that the hp is better but I don't know how to perform the same functions. On the TI they want me to use the 'fnInt(' option. Is there a corrosponding function on the HP? Thanks

John

Re: Approximating Integrals on the graphing calculator

*Message #2 Posted by **Gene Wright** on 13 Dec 2005, 4:51 p.m.,*
in response to message #1 by John Bower

On the TI, the fnInt function is just a "function integrator".

All (or at least, almost all?) numeric integration on a calculator is an approximation.

You can perform a numeric integration on the hp49g+ by:

1) using the equationwriter (EQW) and then pressing shift and the integral sign. Then fill in the lower and upper limits of the integration followed by the expression to be integrated, then enter the variable of integration in the "d" location (usually dX).

2) using the INTVX function (found in the CALC menu)

and others.

Other resources to help you:

1) The calculator's manual that came with your hp49g+ :-) 2) The extended guide for the calculator that is on the CD that came with your calculator.

3) HP's website has a good number of "learning modules", small PDFs, that show how to do quite a few things with the 49g+. They are found here:

http://www.hp.com/calculators/graphing/49gplus/technical.html

4) The specific learning module that shows how to do numeric integration is found here:

http://www.hp.com/calculators/docs/learning_modules/49gplus/49gPlusNumeric.pdf

Good luck. If you still can't figure it out, post another question here.

Gene

Re: Approximating Integrals on the graphing calculator

*Message #3 Posted by **John Bower** on 14 Dec 2005, 12:45 p.m.,*

something growing inside 48SX bezel

*Message #1 Posted by **Jim Rudnick** on 13 Dec 2005, 10:08 a.m.*

I can't seem to find any threads about opening the calculator. Very faint 'threadlike' impurities on underside of bezel. Hope this is an open and shut case.(after cleaning of course). Help please.

Re: something growing inside 48SX bezel

*Message #2 Posted by **Randy** on 13 Dec 2005, 6:57 p.m.,*
in response to message #1 by Jim Rudnick

If it's on the brown painted area, it's a non-cleanable failure of the finish, nothing you can do as cleaning will only remove the affected paint and leave you with bare aluminum. Voyagers (10/11/12/15/16C) develop this worm tracking as well. Perhaps aluminum oxides reacting with the finish?

Re: something growing inside 48SX bezel

*Message #3 Posted by **Jim Rudnick** on 14 Dec 2005, 10:10 a.m.,*
in response to message #2 by Randy

Thank you for your response. I have something similar on the screen of my Vectra CS portable(clamshell). It looks biological like mold and fans out.

Re: something growing inside 48SX bezel

*Message #4 Posted by **Jeff O.** on 14 Dec 2005, 7:19 a.m.,*
in response to message #1 by Jim Rudnick

Opening an hp48 S/G is challenging but apparently possible. Various instructions can be found here.

Re: something growing inside 48SX bezel

*Message #5 Posted by **Jim Rudnick** on 14 Dec 2005, 10:13 a.m.,*
in response to message #4 by Jeff O.

Thanks for your response. I was hoping for something less destructive. I don't have the dexterity or eyesight I once had.

Re: something growing inside 48SX bezel

*Message #6 Posted by **Han** on 14 Dec 2005, 12:09 p.m.,*
in response to message #5 by Jim Rudnick

There is a way to open the HP48 without causing any cosmetic damage. This allows access to the PCB. However, if you wish to get underneath the bezel, then the only method is to pry it up, causing much bending and whatnot to the faceplate. In my opinion, I would just leave it be -- cleaning with something like "klear screen" (an LCD, laptop, computer cleaner solution to be applied to a cleaning

cloth) is probably the best bet. A few hairlines caused by the worming effect is better than a bent faceplate.

Re: something growing inside 48SX bezel

*Message #7 Posted by **Jim Rudnick** on 18 Dec 2005, 5:08 p.m.,*
in response to message #6 by Han

Thanks and I am leaving it alone. Just so you know the 'worming' effect is on the underside of the LCD screen.

Integration Times "Old" 33s vs "New" 33s

*Message #1 Posted by **John Smitherman** on 12 Dec 2005, 11:26 p.m.*

It appears that HP has improved the speed of the integration function on the latest version of the 33s. Working through a couple of the integration torture tests found at http://www.voidware.com/calcs/torture_integration.htm I recorded the following times for my "old" vs "new" 33s:

1. integral cos(ln(x)) from 0 to 1 radians, fixed at 5 places

Old 33s (s/n 417): 4 min 58 sec

New 33s (s/n 524): 2 min 27 sec

2. integral sqrt(abs(x-1)) from 0 to 2, fixed at 5 places

Old 33s (s/n 417): 10 min 02 sec

New 33s (s/n 524): 5 min 00 sec

Has anyone else seen this type of improvement?

Couple this with an improved display, improved keypad and bug fixes and I am pleased with the 33s.

Thank you HP,

John

Re: Integration Times "Old" 33s vs "New" 33s

*Message #2 Posted by **ECL** on 12 Dec 2005, 11:38 p.m.,*
in response to message #1 by John Smitherman

I have three 33s' (one is the newer revision). The display is significantly improved. I can't speak for old vs. new 33s, but I am very satisfied with the speed over the 32sii.

Yes, thanks, HP, for the 33s!

ECL

Re: Integration Times "Old" 33s vs "New" 33s

*Message #3 Posted by **Marcus von Cube, Germany** on 13 Dec 2005, 3:36 a.m.,*
in response to message #1 by John Smitherman

John,

if you look at the execution times, they seem to be exactly halved, as if the clock speed had been doubled.

Can you check with a simple loop, if the hardware has been made faster?

Marcus

Re: Integration Times "Old" 33s vs "New" 33s

*Message #4 Posted by **John Smitherman** on 13 Dec 2005, 9:39 a.m.,*
in response to message #3 by Marcus von Cube, Germany

Hi Marcus. I wrote a quick program to loop 1000 times and recorded the execution times as follows:

"Old" 33s: 21 seconds

"New" 33s: 10 seconds

So, it appears that the hardware/software is faster for these functions.

Regards,

John

Re: Integration Times "Old" 33s vs "New" 33s

*Message #5 Posted by **Valentin Albillo** on 13 Dec 2005, 4:28 a.m.,*
in response to message #1 by John Smitherman

Hi, John:

If you want a real "integration torture-test", try and compute this simple integral:

```
Integral between 0 and 1 of f(x) = Cos(Ln(x)/x)/x

        =  0.3233674316 7777876139 9370087952 1704466510+
```

(Ln(x) is the natural, base-e logarithm, of course)

and see how many correct digits do you get, in whatever machine, using whatever method. Marcus von Cube passed on this one when I proposed it to him, seems he couldn't make a dent ! :-)

This function isn't made to be numerically integrated!

My TI-84 stops early (less than a minute) with a "Tolerance no met" error (tolerance set to 1E-4).

My Voyage 200 is still trying. Early in the process, a "Questionable accuracy" warning from the trig functions appeared on the status line. I guess it will drain the batteries before it gives up.

The HP 49g+ is still trying (SCI 4). I think it is in the same leage as my Voyage 200.

A newly acquired Sharp EL-5120 quits early with an "ERROR 02", trying to evaluate ln(0).

None of my symbolic calcs was able to find a symbolic solution for the indefinite integral. Does one exist?

Marcus

Hi, Marcus:

Marcus posted:

"This function isn't made to be numerically integrated!"

Don't blame this innocent function. I've seen worse.

"My TI-84 stops early (less than a minute) with a "Tolerance no met" error (tolerance set to 1E-4)."

What would you expect from a Texas Instruments ?

"My Voyage 200 is still trying. Early in the process, a "Questionable accuracy" warning from the trig functions appeared on the status line. I guess it will drain the batteries before it gives up."

They might, indeed. But what would you expect from a Voyage 200 ?

"The HP 49g+ is still trying (SCI 4). I think it is in the same leage as my Voyage 200."

Now you've gone too far. Please don't insult poor Voyage 200.

"A newly acquired Sharp EL-5120 quits early with an "ERROR 02", trying to evaluate ln(0)."

What would you expect from a SHARP? Naw, *this* time I'm joking.

"None of my symbolic calcs was able to find a symbolic solution for the indefinite integral. Does one exist?"

As far as I know, no symbolic solution or closed form does exist. For the record, the HP-71B in "naive" mode produces:

```
>INTEGRAL(0,1,1E-2,COS(LN(IVAR)/IVAR)/IVAR)
 .167473677804

>INTEGRAL(0,1,1E-5,COS(LN(IVAR)/IVAR)/IVAR)
 .169114784125

>INTEGRAL(0,1,1E-12,COS(LN(IVAR)/IVAR)/IVAR)
 .169114784125
```

all of them utterly wrong.

However, thou shalt not give up. Try and conquer this integral by whatever means (variable substitution, expansions, interval subdivision, whatever) or recognize shameful defeat for you and your puny machines ! :-)

(Not for me: using one of several appropriate, "non-naive" approaches, I can get 12 correct digits with an HP-71B very fast, and even an HP-15C can do it relatively fast as well)

Best regards from V.

Hi, Bill:

Bill posted: *"Or in other words, real maths has nothing to do with calculators per se, but with the *brain* "*

Yes, that's more or less correct. Oftentimes, a savvy individual will do with an HP-15C what a less knowledgeable one couldn't, even with a 49G+ or three. This simple integral is probably such a case (and I'm not talking about Marcus von Cube, who undoubtely will soon find the proper way to deal with it).

Best regards from V.

Re: Integration Times "Old" 33s vs "New" 33s

*Message #10 Posted by **Marcus von Cube, Germany** on 14 Dec 2005, 12:04 p.m.,*
in response to message #7 by Valentin Albillo

Hi Valentin,

I've already spent some time on the integral, dusting off areas of my brain which had been in deep sleep over decades!

A simple aproach is to replace the lower boundary by something above zero, e.g. 10^-2 (result: 0.325). Smaller boundaries make things worse!

Variable substitution doesn't seem to get rid of the oscillations and I get an infinite boundary instead. I just had a look into taylor series expansion. That might do the trick.

There are ways to tackle such problems by integrating in the complex plane but that's beyond my powers, at least for now...

Marcus

"Torture" integral solved

*Message #11 Posted by **Valentin Albillo** on 15 Dec 2005, 9:16 a.m.,*
in response to message #10 by Marcus von Cube, Germany

Hi, Marcus:

Marcus posted:

"A simple aproach is to replace the lower boundary by something above zero [...] Smaller boundaries make things worse!"

> Yes, they do. That the result you get with your lower boundary somewhat resembles the correct value is just a coincidence.

"Variable substitution doesn't seem to get rid of the oscillations and I get an infinite boundary instead."

> True, but this is one possible way to deal with this integral. The change:
>
> $t = -\log(x)$
>
> results in:
>
> $$\text{Integral} = \text{Integral}(0,\ \text{Inf},\ \cos(t.e^t)) = \text{Integral}(0,\ \text{Inf},\ \cos(W^{-1}(t)))$$
>
> where W(x) is Lambert's W function. You can then find the integral by subdividing the (0,Inf) original interval in subintervals and thus integrating between the zeros of $\cos(W^{-1}(t))$, thus getting an slowly convergent alternating series that can be accelerated by a number of methods (see my HP-11C Datafile article, for example). This results in an accurate value for the integral but, as you correctly guessed, there's a faster, simpler way:

"There are ways to tackle such problems by integrating in the complex plane"

> That's right. You just need to remember that
>
> $e^{ix} = \cos(x) + i*\sin(x)$
>
> and the original integral becomes:
>
> $$\text{Integral} = \text{Integral}(0,\ 1,\ \text{RealPart}(e^{(i*\log(x)/x)}/x)) = \text{Integral}(0,\ 1,\ \text{RealPart}(x^{i/x-1}))$$

which can readily be integrated by considering it a line integral in the complex plane along some integration path. A simple parabolic path will do:

```
z = t + t*(1-t)*i
```

which takes us far from the oscillations of the real line. Using this path, your faithful HP-71B can compute the integral to full 12-digit precision in a few minutes, as follows:

```
10 DESTROY ALL @ COMPLEX Z @ SFLAG -1 @ DISP INTEGRAL(0,1,1E-
9,FNY(IVAR))
20 DEF FNY(T) @ Z=(T,T-T*T) @ FNY=REPT(Z^((0,1)/Z-1)*(1,1-2*T))

>RUN

   .323367431678
```

which, as stated, is the correct result rounded to the 12 decimal digits shown. The HP-15C solution is a mere verbatim translation of this 2-line 'program'.

This technique of computing difficult real-line integrals by taking them to the complex plane is actually very useful in many situations, and is discussed at length, *with an example*, in the marvelous **HP-15C Advanced Functions Handbook.**

Thanks for your interest and best regards from V.

Hi again, Marcus:

Marcus posted:

"Maybe the complex trick can be ported to other calculators with complex number functions, too. But don't hold your breath!"

I'm sure it'll port easily, at least to the HP42S. Perhaps you'd like to try and create

an RPL version.

"A printout of the HP 15C Adv. Functions Handbook lies on my desk. It just waits to be read..."

It should be a compulsory read for **any** HP-calc math-oriented programmer, regardless of the particular HP model, as it includes such a wealth of truly advanced material (well, ignoring their pathetic 'create a unit matrix' attempt, of course) :-)

Best regards from V.

Re: "Torture" integral *NOT* solved in RPL

*Message #14 Posted by **Marcus von Cube, Germany** on 16 Dec 2005, 4:46 p.m., in response to message #13 by Valentin Albillo*

Hi Valentin,

bad news!

I tried two versions of the complex path solution in RPL on my 49g+ and both failed miserably. The results obtained after several hours of battery draining computation were disastrous: -1.7*10^495 & -1.3*10^495, respectively. I guess, someone else has to have a close look at what I've done:

Defining the complex path

```
'Z(T)=T+(SQ(T)-T)*i'
DEFINE
```

This creates a program P wich takes a parameter T from the stack and outputs a complex result, a point on a parabola in the complex plane. SQ(T) is T^2. *i* can be entered as (0,1) or "left shift"+"TOOL". DEFINE is executed by pressing "left shift"+"2".

Z(0)=0 and Z(1)=1, both on the real axis.

Defining the function to integrate

Version 1:

```
'BAD(Z)=COS(LN(Z)/Z)/Z'
DEFINE
```

Version 2:

```
'BAD2(Z)=Z^(i/Z-1)'
DEFINE
```

Integrate

Note: *INTEG* is the integral symbol "right shift" "TAN". I had to set complex mode by setting flag -103.

```
INTEG(0,1,RE(BAD(Z(X)),X)
```

repectively

```
INTEG(0,1,RE(BAD2(Z(X)),X)
```

Both integrals yield the above mentioned "results."

Can you comment on this?

Marcus

You're right, I didn't read your post thorougly enough! I've added the term to the integral expression inside the RE() part. My calc is still working on it...

I din't change the sign of the complex path because that shouldn't make a difference (hopefully.)

Marcus

P.S.: I'll be back with the results later.

P.P.S.: Last night, my 49g+ failed, while computing, with "low battery" and lost the stack and command history. I've just changed batteries but didn't reenter the integral, yet.

Re: "Torture" integral now solved (not only in RPL)

*Message #17 Posted by **Marcus von Cube, Germany** on 19 Dec 2005, 7:27 a.m.,*
in response to message #15 by Valentin Albillo

Hi Valentin,

to make clear what happens in the complex plane, I played around with the graphing functions of Derive 6 in the PC. Now I know better!

The real part of the original function COS(LN(x)/x)/x oscillates along the real axis as well as along the i-Axis. So no matter what path the integration takes, the numerical results are useless.

The "corrected" function x^(i/x-1) is asymetric with respect to the i-axis: its real part oscillates heavily on the negative i-side (below the real axis) and is smooth above. Therefore, the results depend heavily upon the path taken through the complex plane. I could easily reproduce your results with Derive and on my 49g+ after I had corrected the sign of the imaginary part of the path function.

That was an interesting matter!

>
> execute the integral of cos(ln(x)) in around 2 min 25 sec.
>
> -Greg

Hi Greg. I believe that I've solved the mystery... I replaced the batteries on my old 33s with new batteries and the integral execute times are the same on my old and new 33s.

I tried to execute Valentin's torture test of cos(ln(x)/x)/x and the battery symbol popped up on the display. After 2 or 3 hours the calculator locked up blinking the "memory cleared" message.

I measured the voltages on the old batteries as 2.7 and 2.4 volts. The new replacement batteries measured 3.3 and 3.3 volts.

Strange but true!

Regards,

John

33S vs. 32S/32SII integ times (improvement ??)

*Message #22 Posted by **Karl Schneider** on 14 Dec 2005, 12:04 a.m.,*
in response to message #1 by John Smitherman

> Quote:
>
> integral cos(ln(x)) from 0 to 1 radians, fixed at 5 places
>
> Old 33s (s/n 417): 4 min 58 sec
>
> New 33s (s/n 524): 2 min 27 sec

John --

First, a nitpick. The limits are simply 0 to 1, not 0 to 1 *radians*. Angular measures apply only for trigonometric fucntions, and cosine is taken here on the *output* of the natural logarithm.

Hmm, this is progress? I programmed cos(ln x) as an RPN program on the 32SII and 32S today, using 5 and 6 decimal places. The 32S is a little faster, I've found, and SOLVE/INTEG with RPN functions is faster than SOLVE/INTEG using equations on the 32SII (equations are not available on the 32S).

The correct answer is 0.5 exactly, which can be determined by two applications of integration by parts.

The 32S and 32SII gave the same answers:

```
                  FIX 5         FIX 6

Answer         0.50000696243  0.49999965858
Est. Error     0.00000500000  0.00000050000
Time (32S)     1:06 minutes   4:22 minutes
```

Note that the answer provided under FIX 5 is not within the estimated error of the correct answer. However, FIX 6 does give an answer "within bounds". I had found the same thing with the difficult function integrated between 0 and 1, which is described in the 1980 HP Journal article on the HP-34 SOLVE, repeated in the HP-15C Advanced Functions Handbook and the HP-71B Math ROM manual:

```
        sqrt(x)       1
f(x) =  -------   -   -----
         (x-1)       ln(x)
```

Nonpareil news

*Message #1 Posted by **Eric Smith** on 12 Dec 2005, 8:59 p.m.*

For those of you that are interested in Nonpareil, but don't read my blog, I thought I'd mention some of the recent progress.

I've added additional models to the simulation, including the 22, 27, 29C, and 67 (sans card reader). The 29C and 67 (as well as the 19C and 97) use a highly optimized label search loop for performance, and it depends on some very subtle and undocumented behavior of the ACT chip. I still don't really know exactly how the ACT behaves under these circumstances, but based on analysis of the code, I was able to come up with a hack that makes it work.

The 67 seems fully function with the exception of the card reader and the PSE function. PSE seems to complete immediately rather than delaying, and I'm guessing that this is due to a test for a magnetic card being inserted.

Note that Nonpareil provides continuous storage for all models, and it is possible to keep multiple state save files, so one can effectively save 67 programs and data despite the lack of card reader simulation.

I've fixed a subtle bug in my sound code, so now the 41C TONEs and BEEP work reasonably well on both Linux and Windows.

The KML syntax for specifying keyboard mapping has been improved considerably. Now the GDK Keysms used to name the host keyboard keys can be specified by name rather than obscure numeric values.

Maciej Bartosiak has made a lot of improvements to the rendered images used for the Voyager calculators, as well as developing new ones for the Spice series. I'll be incorporating those, and I'm working on better visual effects for button highlight (when the cursor is over a button but not pressed) and the actual button press.

These improvements will be in the next official release of Nonpareil, which I hope to complete in January.

Eric

in response to message #2 by Gene Wright

Not much to report on that. Richard Ottosen has acquired some ABS stock and is going to try assembling a case out of that. The one I showed at the conference was acrylic.

It seems to be difficult if not impossible to buy sheets of ABS that are smooth on both sides. Normal ABS sheet stock has a texture on one side. But Richard thinks that this may work OK for his assembly technique.

I hope to make a lot of progress on the firmware over the holidays.

Re: Nonpareil news

*Message #4 Posted by **Randy** on 12 Dec 2005, 10:46 p.m.,*
in response to message #3 by Eric Smith

ABS sheet smooth on both sides should not be too hard to source as textured sheet is more costly to produce. What's the desired thickness and color?

Edited: 12 Dec 2005, 10:47 p.m.

Re: Nonpareil news

*Message #5 Posted by **Eric Smith** on 13 Dec 2005, 1:21 a.m.,*
in response to message #4 by Randy

0.63 inch, in 12x24 inch sheets or multiples thereof. (One 12x24 inch sheet is laser cut to make one calculator.) Color isn't important for prototypes, but we expect the most desirable color will be black.

I just did a Google search for "abs sheet", and the very first listing has it in either smooth or one side textured, so I'm not sure why Richard had so much trouble finding it. Maybe it just isn't carried by the retail establishments.

10c...

*Message #10 Posted by **Gene Wright** on 13 Dec 2005, 7:27 p.m.,*
in response to message #9 by Valentin Albillo

I agree with Valentin about the 10c not really stinking all that badly :-)

but it was a shame that HP "crippled" its abilities so much. I think that's probably what people mean by complaints about the 10c.

There are many programs that would not fit on the 10c that ran just find on the old HP25, for example, because of the scarcity of memory on the 10c.

I would really like to know what crazy business case someone at HP made to introduce the 10c anyway.

There just wasn't enough price differential between the 10c and 11c to convince many people to buy it over the slightly more expensive 11c. Hence the relative scarcity of the 10c.

That said, Valentin is quite correct...don't go talking bad about my 10c! :-) Gene

Gene,

I remember buying an HP10C and HP11C whn they came out. I quickly realized that the programming features of the HP10C were ver similar to those of the HP-55 -- that is ... no subroutines, no labels for program branching. That was a let down in the era of King HP41CV.

I found a buyer for the HP10C at the company I was working for and kept the HP11C.

In the last few years I bought two HP10C from eBay to complete the Voyager set.

Namir

in response to message #15 by John Ioannidis

Apologies if this is old ground. I just recently looked at this myself, so it was new to me.

The V41 source includes a utility to go the other way,.mod->.rom, but as far as I know, there's no utility to create a MOD file from one or more roms. It's not a completely automatic process in that direction. If it's your own module, you need to write an info file for it. Here's an excerpt from the info file for the CCD module in the V41 distribution:

```
FILE NAME: C:\Program Files\V41\MOD\Ccd.mod
FILE FORMAT: MOD1
TITLE: CCD Module
VERSION: B
PART NUMBER:
AUTHOR: W&W Software Products GmbH
COPYRIGHT (c) W&W Software Products GmbH
LICENSE: GNU General Public License
COMMENTS:
CATEGORY: Custom peripherals
HARDWARE: None
MEMORY MODULES: 0
EXENDED MEMORY MODULES: 0
ORIGINAL: Yes - unaltered
APPLICATION AUTO UPDATE: No - do not update this file
NUMBER OF PAGES: 2

ROM NAME: CCDL-1B
ROM ID: WW1B
PAGE: May be in more than one location
POSITION: In lower relative to upper page
PAGE GROUP: 1
BANK: 1
BANK GROUP: 0 - not grouped
RAM: No
Write Protected: No or Not Applicable
FAT: Yes
XROM: 9
FCNS: 64
XROM  Addr Function    Type
09,00 754B -W&W CCD B  4K MCODE Programmable
09,01 7764 B?          4K MCODE Programmable
```

And so forth. That file contains a second ROM section for the upper 4K page. Both end up with something like this (taken from the second one in the CCD file.)

```
11,41 169C5             8K MCODE (Not decoded)
INTERRUPT VECTORS:
Pause loop:                      000
```

```
Main running loop:                 000
Deep sleep wake up, no key down:  000
Off:                               000
I/O service:                       3C3
Deep sleep wake up:                2D3
Cold start:                        000
CHECKSUM: 37F (CORRECT)
```

All of that corresponds to how HP-41 roms are organized, which could be generated from the rom itself. But the metadata at the front needs to be filled in by a human being, I think.

Exactly how the info and rom files are glued together in the .MOD is a matter for the source code to tell.

If it isn't your own ROM, the V41 package will likely have what you need. Otherwise the other TOS resources will probably cover it.

Re: Nonpareil news

*Message #17 Posted by **Eric Smith** on 14 Dec 2005, 2:08 a.m.,*
in response to message #15 by John Ioannidis

> Quote:
>
> Is it possible to change the default behavior of "save" so that it doesn't actually create a new image of "nonpareil.exe"?

I've never seen it do any such thing, nor do I have any idea how it could. The save commands writes a state save file with a ".nst" extension.

Re: Nonpareil news

in response to message #15 by John Ioannidis

> Quote:
>
> When emulating an HP41, if I have a rom image, how do I turn it into a .mod file?

Currently Nonpareil only supports hard-addressed ROMs. If you create a .mod file that forces the address (e.g., 8000, A000, C000, or E000 for the base of an 8K ROM), it should work.

Better .mod file support is on my TODO list.

Re: Nonpareil news

*Message #19 Posted by **Mike T.** on 14 Dec 2005, 8:05 p.m.,*
in response to message #1 by Eric Smith

I can't wait - the (potential) new artwork looks stunning, keep up the good work...

Mike T.

Re: Nonpareil news

*Message #20 Posted by **Eric Smith** on 14 Dec 2005, 8:31 p.m.,*

in response to message #19 by Mike T.

Thanks! But all credit for the artwork goes to:

- Maciej Bartosiak - for 41C, Voyager series, and Spice series
- Xavier Théry - 67
- Dave Hicks, MoHPC - for photographs used for other models

My own graphics skills are feeble at best, so it's a good thing that I know how to program. :-)

I'm trying to replace the horrible white box key highlighting that's been used up until now in Nonpareil (which is a side effect of the GTK+ button widget) with a better looking effect.

Christoph Gießelink has sent me his updated NSIS script for Nonpareil, so the next release will have a real installer and uninstaller.

Re: Nonpareil news

*Message #21 Posted by **Howard Owen** on 14 Dec 2005, 11:13 p.m.,*
in response to message #20 by Eric Smith

Speaking of installers, It may be a matter of me using the SVN sources, but 'scons install' seems to miss rom/67.obj.

Other than that, I think the 67 support is "PDC" - Pretty Darned Cool, like the rest of Nonpareil. Thanks!

Re: Nonpareil news

*Message #22 Posted by **Eric Smith** on 14 Dec 2005, 11:23 p.m.,*
in response to message #21 by Howard Owen

Thanks, I just added it to rom/SConscript.

Looks like the cyclic dependency problem with images has come back with the latest release of SCons. Sigh. I suppose I should try to reduce it to as small a test case as possible, and ask about it on the SCons mailing list.

41CV display

*Message #1 Posted by **Stephen Easterling** on 12 Dec 2005, 7:05 p.m.*

I just bought a NOS 41CV (NIB). How long does it take to get used to its display. I was thinking that the 41CV (or CX) was going to be the model that I use the most, you know, my very favorite out of all other calcs I have. BUT, I just opened the box and started doing a few calcs and I'm having a hard time adjusting to the way the numbers are displayed. It's not a contrast issue but rather the way the segments are put together. How long does it take to get used to this? I'd prefer the display of the 20S (large, easy to read segments).

Re: 41CV display

*Message #2 Posted by **Samuel Heddle** on 12 Dec 2005, 7:11 p.m.,*
in response to message #1 by Stephen Easterling

I got used to it after using a 28S display. Personally, I enjoy the contrast of the 41CV display. (Halfnut) The display, IMO, is my favorite of all the HPs, it takes a little getting used to, though.

Re: 41CV display

*Message #3 Posted by **Massimo Gnerucci (Italy)** on 12 Dec 2005, 7:11 p.m.,*
in response to message #1 by Stephen Easterling

Is it a fullnut or an halfnut?
I find the fullnut easier to look at: halfnut segments are too apart, sort of broken digits.
But I must confess that I started with a fullnut 41C... maybe it's just a matter of taste.

Greetings,
Massimo

Re: 41CV display

*Message #4 Posted by **Stephen Easterling** on 12 Dec 2005, 7:21 p.m.,*
in response to message #3 by Massimo Gnerucci (Italy)

How can I tell if it is a full or half nut? My 28S doesn't look anything like this display.

Re: 41CV display

*Message #5 Posted by **Massimo Gnerucci (Italy)** on 12 Dec 2005, 7:32 p.m.,*
in response to message #4 by Stephen Easterling

This is a fullnut: square display corners. If you have round corners then that's an halfnut.
Your 28 uses a dot matrix display, the 41 uses a 14 segment display (plus dot & dot/comma indicators, flags, status, etc.).
When I first got a 28S as a (momentary) substitute for my first, aging, 41C I didn't like that faint display at all.

I'll write it again: matter of taste. :-)

Re: 41CV display

*Message #6 Posted by **Stephen Easterling** on 12 Dec 2005, 7:39 p.m.,*
in response to message #5 by Massimo Gnerucci (Italy)

Well, I just looked it up in my HP Calculator Collector's handbook and according to it, (which agrees with what you stated), I have a Halfnut. I just bought a mint 41CX, though, and when I receive it in a few days, I expect it to be the full nut, so to speak. Maybe its display will be easier to read.

Re: 41CV display

*Message #7 Posted by **Eric Smith** on 12 Dec 2005, 8:40 p.m.,*
in response to message #6 by Stephen Easterling

It's more likely a halfnut, since all product from 1986 through discontinuation in 1991 were halfnuts.

Re: 41CV display

*Message #8 Posted by **Samuel Heddle** on 12 Dec 2005, 8:43 p.m.,*
in response to message #7 by Eric Smith

41CX Fullnuts do exist, though they're not common.

Re: 41CV display

*Message #9 Posted by **Howard Owen** on 12 Dec 2005, 10:39 p.m.,*
in response to message #8 by Samuel Heddle

Roger that. I've got one.

Re: 41CV display

*Message #10 Posted by **David Smith** on 13 Dec 2005, 1:14 a.m.,*
in response to message #8 by Samuel Heddle

Actually, I have found CX fullnuts to be more common than the halfnuts. I seem to have seen 2-3 CX fullnuts for every halfnut... and I've seen a bunch of them.

Re: 41CV display

*Message #11 Posted by **Howard Owen** on 13 Dec 2005, 1:21 a.m.,*
in response to message #10 by David Smith

Dang, shatter a guy's illusions, why don't you Dave? 8)

Well, I've got a halfnut CX too, and *it's* fully functional. (The back arrow key doesn't work on the fullnut CX.)

Re: 41CV display

*Message #12 Posted by **David Smith** on 13 Dec 2005, 12:04 p.m.,*
in response to message #11 by Howard Owen

You can fix the bad key on the CX by opening the case, place a drop of 91%+ isopropyl alcohol on the breather hole under the key, and gently scritch around in the hole with a small wire brush made of three bristles chucked up in a pin vise or knife blade holder, twisted together, and trimmed square. Wet the brush with more alcohol.

While the machine is open, clean all the contacts (including the ones under the CPU board).

Re: 41CV display

*Message #13 Posted by **Stephen Easterling** on 16 Dec 2005, 7:08 p.m.,*
in response to message #1 by Stephen Easterling

I got my 41CX today and it's a Singapore halfnut. It's very nice and clean and everything is included. I'd say mint, for sure! So I now have two halfnuts. Does this make a whole nut?

Edited: 16 Dec 2005, 7:10 p.m.

Re: 41CV display

*Message #14 Posted by **Massimo Gnerucci (Italy)** on 16 Dec 2005, 10:57 p.m.,*
in response to message #13 by Stephen Easterling

> Quote:
>
> So I now have two halfnuts. Does this make a whole nut?

Unfortunately not, as far as display is concerned ;-)
Massimo

P.S. And: 2 halfnut * -> Whole nut
But this is isn't necessarily a **fullnut**; it could be empty...

Edited: 16 Dec 2005, 11:01 p.m.

HP's internal code names for HP-41

*Message #15 Posted by **Garth Wilson** on 17 Dec 2005, 1:20 a.m.,*
in response to message #14 by Massimo Gnerucci (Italy)

An HP-41 made before the Halfnut version was out is **not** a "fullnut". The HP-41 project was internally named "Coconut," probably before they knew what model number they were going to give it. In the summer of 1983, they began investigating the possibility of a version that would be more reliable and easier to manufacture. Originally the idea was to have only half the number of ports, meaning two instead of four, hence the internal name "Halfnut." There were also stories that the name came from ideas to cut the IC count by half, or cut the manufacturing cost by half. I believe HP started shipping the Halfnuts to dealers in September of 1985. In any case, the original HP-41's name is "Coconut," not "Fullnut."

Goin' nuts!

*Message #16 Posted by **Massimo Gnerucci (Italy)** on 17 Dec 2005, 7:22 a.m.,*
in response to message #15 by Garth Wilson

Right Garth,
and there's no *blanknut* either...
However those names are useful when you have to tell one from the other.

Greetings,
Massimo

New HP-15C mini-challenge !

*Message #1 Posted by **Valentin Albillo** on 12 Dec 2005, 6:55 a.m.*

Hi all,

While waiting for the incoming S&SMC#13, those of you fortunate enough to own an HP-15C (physical or emulated/simulated) might want to check any alleged 15C-*guru* abilities with this 15C-specific mini-challenge:

Write a routine as short and fast as possible to find integer solutions (a,b,c) of:

$$a^2 + b^2 = c^N$$

for any given integer exponent N >= 2

Your routine must assume that the stack has been loaded like this upon calling it:

```
Z: some control value
Y: some control value
X: N
```

where the control values are *arbitrary user-supplied integer values* that your routine must use somehow to generate solutions so that, for different control values, different solutions are usually generated, in a repeatable way. Depending on your algorithm, they might be initial ranges for a search, or "seed" values for some computation or whatever, as long as they ensure variety and provide some control on the solutions produced.

Your routine must find out exactly *one* solution (which should depend on the user-supplied control values and N, of course), and must output the resulting integer values (a, b, c). Of course, you should aim to produce non-trivial solutions, at least for the vast majority of control values even if certain combinations do occasionally result in some trivial solution.

A sample run for N=5 would be something like this:

```
p1 [ENTER] p2 [ENTER]
           5 [A]   -> 1121
             [R/S] ->  404
             [R/S] ->   17
```

where p_1 and p_2 are some control values that your algorithm uses to produce the solution (1121, 404, 17). Indeed we have:

$$1121^2 + 404^2 = 1256641 + 163216 = 1419857 = 17^5$$

Specifying different control values, q_1 and q_2 should produce a different solution, say:

$$223191^2 + 119512^2 = 145^5$$

```
i.e.:  49814222481 + 14283118144 = 64097340625
```

Remember that your routine must work for arbitrary integer values of N >= 2, not just 5 (within the HP-15C

accuracy and range limitations, of course). In a few days I'll post my own solution, which is a small, HP-15C-specific **12-step routine** (not counting LBL A or RTN). Let's see yours !

Note: Although both this mini-challenge and my solution are HP-15C-specific, solutions for other models are welcome, of course.

Best regards from V.

Re: New HP-15C mini-challenge !

*Message #2 Posted by **hugh steers** on 13 Dec 2005, 7:05 p.m.,*
in response to message #1 by Valentin Albillo

right, as a logtime fan of the 15c. here's my first stab at 19 steps. i am wasting space adjusting loops and stack which is annoying.

```
LBLA
STO 0
DSE 0
RD
I
ENTER
ABS
X^2
R/S
X<>Y
ENTER
ENTER
ENTER
LBL 1
*
CHS
DSE 0
GTO 1
RTN
```

examples

2 ENTER 3 ENTER 2 ENTER LBL A gives c = 13 R/S to give 5 and (i) 12. Therefore 13^2 = 5^2 + 12^2

3 ENTER 4 ENTER 5 ENTER LBL A gives first c = 25 R/S to give 1875 and (i) 2500 so therefore 25^5 = 1875^2 + 2500^2 (claim).

:-)

Re: New HP-15C mini-challenge !

*Message #3 Posted by **PeterP** on 14 Dec 2005, 12:31 a.m.,*
in response to message #1 by Valentin Albillo

Valentin, you truly have me hooked! Having joined the HP community only very recently I'm right now going through all the historical SSMCs. Just finished #6 (only 5 more to go :-( ) when I saw this mini-challenges and could not resist. My attempt is not for a HP 15C (don't own one, but appreciated the "hint"...), but for my trusty 41, not very short (20 lines without the Lbl) yet relativly fast as it does the (some?) trick in one run without any loops and works with Size 000.

Entry: n, enter, seed1, enter, seed2. Output: C in x, a in y, b in z. with C^n = a^2 + b^2

Here is the listing

```
Lbl ZZ
R-P
Rcl Z
St/Z
```

```
1/x
y^x
P-R
Int
Incx
x<>y
Int
Incx
x<>y
R-P
Sto Z
R/^ (RollUp)
St* Z
y^x
P-R
R/^
x^2
End
```

Edited: 14 Dec 2005, 12:34 a.m.

What is "Incx"? [NT]

hi peter,

intriguing! can you explain Z here. what does that do on a 41? thanks.

Re: New HP-15C mini-challenge !

*Message #7 Posted by **PeterP** on 14 Dec 2005, 9:50 a.m.,*
in response to message #6 by hugh steers

Z is just the stack register Z. 41 has no inate complex abilities (if that's what you thought it might be), unless you use Angel's wonderful rom. Here the P-R's and R-P's do the best they can (actually, I can...) to cope for this shortcoming of the 41 vs the 15.

Cheers

Peter

... which perhaps you'd find interesting, so if you feel like getting it, get ready and sharpen your HP-calc programming skills *and* mathematical ingenuity, you'll need them both.

Thanks for your kind comments and best regards from V.

Re: New HP-15C mini-challenge !

*Message #11 Posted by **Karl Schneider** on 14 Dec 2005, 12:38 a.m.,*
in response to message #1 by Valentin Albillo

Valentin --

Interesting little math problem. I have a few observations:

1. Setting Y and Z as the upper and lower limits of a and b will bound the search range of the solution (sort of like SOLVE).
2. All possible values of c could then be determined from Y and Z.
3. Even values of c require that a and b are both even, or both odd.

4. Odd values of c require exactly one odd value of either a or b.
5. If the loop-counter functions ISG or DSE for a and b are used directly, the maximum value of 999 would preclude your first solution.
6. Your second solution requires 11 significant digits for both terms, outside the display range of the HP-15C. I'm sure there's a workaround.

Without some applicable mathematical theorem that would make the problem simple, I don't have a solution to present...

(But, as I was writing this, Peter apparently did!)

-- KS

Re: New HP-15C mini-challenge !

*Message #12 Posted by **Eamonn** on 14 Dec 2005, 5:51 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

I have to admit that I did not solve the math part of this challenge, so I cheated on this part by looking at the solutions provided by others. After that I understood the basic approach, so I had a go at implementing a program for the HP-15C. Here is a 12 line (not including LBL & RTN) solution for the HP-15C:

```
LBL A
FIX 0
Rv
I
ENTER
ABS
X^2
R/S
X<>Y
R^
Y^X
R/S
Re<>Im
RTN
```

The program displays results using FIX 0 display mode. This is done so that the program always displays an integer. Note that the program can be shortened if the HP-15C is configured for FIX 0 mode before running. The FIX 0 command in the program can be removed, resulting in an 11 step solution.

Additionally, the two R/S commands and the Re<>Im command are included for more user friendly output. If they are omitted, then we get the following eight line program (again, not including the LBL A and RTN lines). The result for 'a' is displayed when the program finishes, 'b' can be displayed by entering Re<>Im and 'c' can be displayed by entering X<>Y.

```
LBL A
Rv
I
ENTER
ABS
X^2
X<>Y
R^
Y^X
RTN
```

Here are some sample results (12 line program)

```
Test run 1
```

```
----------
1 ENTER 4 ENTER 5 fA
---> 17 (=c)
R/S
---> 1121 (=b)
R/S
---> 404 (=a)

ie. 404^2 + 1121^2 = 17^5

Test run 2
----------
8 ENTER 9 ENTER 5 fA
---> 145 (=c)
R/S
---> -119512 (=b)
R/S
---> -223191 (=a)

ie (-223191)^2 + (-119512)^2 = 145^5

Test run 3
----------
1 ENTER 12 ENTER 5 fA
---> 145 (=c)
R/S
---> 102241 (=b)
R/S
---> 231612 (=a)

ie 231612^2 + 102241^2 = 145^5
```

Full credit goes to Hugh and Peter for figuring out what needed to be done to solve the challenge, and of course to Valentin for the mini-challenge itself.

Eamonn.

Re: New HP-15C mini-challenge !

*Message #13 Posted by **hugh steers** on 14 Dec 2005, 9:10 p.m.,*
in response to message #12 by Eamonn

Most Excellent! doh! i completely missed the y^x idea.

so, read this and weep Valentin :-) only 10 steps (not counting LBL A + RTN), all answers positive and not even 15c specific.

```
LBL A
RD
->P
X^2
R/S
SQRT(X)
R^
Y^X
->R
R/S
X<>Y
RTN
```

the idea is based on both Eamonn and Peter plus my own original hacks and in the best of humor.

example 1 ent 7 ent 5 lbl a, gives c=50 then r/s gives 17,500 r/s gives 2,500. therefore 50^5 = 17500^2+2500^2.

happy hacking!

You guys are amazing!

I was thinking of the relationship between nth root in complex space and X^2 + Y^2. However your tricks are way above me. Would you mind to explain old Foolish me what the math behind your tricks is? maybe for 10 lines a line-by-line analysis would not be too long...

Thanks!

Cheers

Peter

Re: New HP-15C mini-challenge !

*Message #15 Posted by **hugh steers** on 15 Dec 2005, 10:18 a.m.,*
in response to message #14 by PeterP

hi peter,

my original idea is based on a plan for generating the solutions by repeated multiplies. the sum of two squares is closed under multiplication;

(a^2+b^2)(c^2+d^2) = (ac – bd)^2 + (ad + bc)^2 ie another sum of two squares.

so it occurred to me that, given any starting a & b, let N = a^2 + b^2 then we must have N^2 = (a^2+b^2)(a^2+b^2) and it must also be the sum of two squares by the above formula and you can keep going to generate any N^m as required in terms of two squares.

i also noticed that the above is the same way complex numbers multiply.

(a+ib)(c+id) = (ac-bd) + i(ad + bc)

except that i was getting negative real parts. i wanted positive ones. so i changed the sign each time and carried on multiplying. it was you that made me realise i didn't need to do this and should keep the negative cases – in which case there was no need for a loop to multiply, just use y^x. the other shocker is that the complex number treatment can also be done in polar coordinates. in (r,theta)^n = (r^n,n*theta). which means the 15c complex mode is not strictly required.

and then i had a very cheeky idea. my original plan of negating the real part of a complex number in polar terms means (r,theta) -> (r, pi – theta). so therefore,

```
(1 times)  (r, theta)
(2 times)  (r^2, 2*theta) -> (r^2, pi – 2*theta)
(3 times)  (r^3, pi – 2*theta + theta) = (r^3, pi – theta) -> (r^3, theta)
```

so the theta remains the same for odd powers! so we can get away with (r,theta)^n = (r^n,theta) when n is odd, but only for the purposes of retaining two squares – not in general.

However, my cheeky idea was too cheeky because even powers went wrong. Eamonn has applied the fixup for them. However, just doubling theta would also fix it. but i cant see a trick for that.

my complex number (re)attempt came out as; LBL A, RD, I, ENT, R^, Y^X, R/S R<>I, R/S, RD, ABS, X^2, RTN

which, when i compare it to Eamonn's original, is really the same! so that's not a new answer. i was hoping to somehow squeeze it down a bit more by not using the complex number mode and using instead a R->P trick.

Re: New HP-15C mini-challenge !

*Message #16 Posted by **PeterP** on 15 Dec 2005, 11:17 a.m.,*
in response to message #15 by hugh steers

Thanks Hugh, that makes sense, very neat indeed!

I was thinking of a thing about the nth power diophant equation X^2 + Y^2 = Z^nth I read once. It states something like the integer solution has to be a nth root of (X+iY), lets call it (a~ + ib~), with integer (a~,b~). So I "foreced" an integer solution by taking the nth root and making the solution intger via "INT" to create a solution (a + ib). C = a^2 + b^2, and X and Y are the coordinates of (a + ib)^n.

I'm wondering if the complex abilities of the 15c combined with your wizardy would maybe yield a shorter than 12 step solution...

```
stack loaded with either seed1/seed2/n or n/seed1/seed2 depending on how the
15c needs it loaded for the nth root calc.

nth root   ------> yielding (a~,b~)
Int
x<>y
Int        ------> yielding integers (a,b)
nth power  ------> yielding X,Y in the real and imaginary parts
LastX C
Abs or Norm -----> yielding C (as a^2 + b^2)
```

(I realize we'll need someway of recouping n after the root operation for the nth power...)

Please accept my appologies if the above is a) wrong b)stupid or c)all of the above. As I stated earlier, you and Eannon (and Valentin) are way above me, just trying to play with the big guys :-)

Cheers

Peter

Re: New HP-15C mini-challenge !

*Message #17 Posted by **Eamonn** on 14 Dec 2005, 10:50 p.m.,*
in response to message #13 by hugh steers

Hi Hugh,

Based on the comments in your post, I'm sure that you realize that your program does not always return integer solutions for a and b. For example, using an example form an earlier post, with p1=2, p2=3 and N=2, your program returns 13 for c, but 10.8167 for a and 7.2111 for b.

However, this can be fixed with the addition of four more program steps, as shown below. This leads to a 14 line solution that will work on many HPs. Testing with the above inputs returns c=13, a=5 and b=12.

Best Regards,

Eamonn.

```
LBL A
RD
->P
X^2
R/S
SQRT(X)
R^
Y^X
X<>Y   <- Here are the additional program steps
LASTx  <-
*      <-
X<>Y   <-
->R
R/S
X<>Y
RTN
```

Re: New HP-15C mini-challenge !

*Message #18 Posted by **hugh steers** on 15 Dec 2005, 9:03 a.m.,*
in response to message #17 by Eamonn

hi eamonn,

yes i knew that some answers were not integers, although i thought it was down to numerical inaccuracy of the machine. non-small input numbers give off-integral results, for example.

looks like its wrong for some small inputs too, which means it can't be called a solution. drat!

thanks for your fixup.

:-)

Edited: 15 Dec 2005, 9:04 a.m.

My original solution and comments

*Message #19 Posted by **Valentin Albillo** on 15 Dec 2005, 4:50 p.m.,*
in response to message #1 by Valentin Albillo

Hi all,

Thanks to all of you who posted solutions or comments to my 15C mini-challenge. Hugh Steers gave an early solution employing the correct approach, and then Eamonn almost nailed my original solution. I'm very happy to see the high level of the contributions posted, and I'm sure they enjoyed a lot discovering and implementing the underlying math necessary for the optimum solution.

As for the math itself, Hugh already explained it in detail so no need to repeat it here. As he said, it all depends on the fact that the product of integers which are the sum of two squares is itself the sum of two squares (closure) and there's an exact correspondence with the product of complex numbers. From this, it's trivial to

demonstrate that positive integer powers of integers representable as the sum of two squares can themselves be represented likewise, and complex exponentiation will produce the required components at once.

This beats any other approach (such as searching) hands down, and results in an extremely short program, which further produces a solution extremely quickly, even if the computed values of a, b, c are such that squaring and adding them would exceed the 10 digits available.

For the record, my original solution was:

```
LBL A
Rdn
 I
ABS
LASTX
Rup
Y^X
R/S
Re<>Im
R/S
CF 8
X<>Y
X^2
RTN
```

which, not counting LBL and RTN, is 12 steps long, as stated in my original post. However, it uses CF 8 to cancel complex mode, which isn´t a requirement, only good housekeeping manners. Removing it brings the solution down to 11 steps, and Hugh Steers came up with virtually the same solution after some editing of his first attempt.

A couple of nice solutions:

$$999^2 + 1432^2 = 145^3$$

$$223191^2 + 119512^2 = 145^5$$

That's all. Hope you enjoyed this mini-challenge, in view of the quality of the contributions I certainly did, so thanks to all of you who posted and/or were interested and

Best regards from V.

Note: the incoming S&SMC#13 won't be such a piece of cake but it will be highly (and unexpectedly) astounding from a mathematical point of view, and further it'll include a prize (well, sort of) for those people who succeed in solving it. Stay tuned.

Re: My original solution and comments

*Message #20 Posted by **PeterP** on 16 Dec 2005, 1:09 a.m.,*
in response to message #19 by Valentin Albillo

Valentin,

thanks for this, I learned a lot. Also from Hugh, Eamonn and the others, many of which I started to appreciate a lot in my ongoing pursuit in solving the old SSMC's (starting at #12 I'm now down to #4...) Unforunately my knowledge and capabilities in math are not advanced enough - Valentin almost always presents like a wizard a solution of the old "as one can easily see" form. And calling this mini-challenge a piece of cake scared me already for SSMC13, I might have to sit that one out...

Anyway, inspired by all the brain here, I loaded the fabulous 41z mod from Angel Martin onto my 41 (I think you Valentin also contributed there a program, right?) and tried a modified version of my original solution.

If one requires integer starting points, not too large, it appears that the problem is solvable in no less than 6(!) steps (not counting the lbl and rtn) using the theorem I mentioned above. The solution below works fine on my 41 and should work with very little translation on a 15c as well.

Limitations: a) for even moderetaly high n it quickly produces large solutions, potentially running into rounding errors. b) it almost always produces negative a, b which still fullfill the initial request, yet are a bit less pretty.

I'm sure you guys can find more limitation, yet I thought I throw it in the mix, given its "length".

```
Input : n enter, intseed1 enter, intseed2 enter
Output: C, R/S then yields a in x, b in y (one could display them together as well with
ZView, yet I find it more convenient to have the solution in x and y)

Lbl aa
Znorm
R/S ------> that is C
RDN
LastZ
RollUp
Z^x
Rtn ------> a in x-reg, b in y-reg
```

Cheers

Peter

PS: a final, but huge, thanks goes to Dave for letting us have so much fun through his forum!

Edited: 16 Dec 2005, 1:12 a.m.

Re: My original solution and comments

*Message #21 Posted by **Ángel Martin** on 16 Dec 2005, 4:44 a.m.,*
in response to message #20 by PeterP

Thanks Peter for the praise. Glad to see that the 41Z is put to work in here! (still one of my favorite modules if not the most).

Regards, ÁM

BTW this alternative listing saves you one step, albeit it's the same size in bytes:

Lbl aa
ZNORM
R/S ------> that is C
LASTZ
RCL Z
Z^X
Rtn ------> a in x-reg, b in y-reg

Edited: 16 Dec 2005, 4:54 a.m.

Re: Wow, down to 5 Steps! [NT]

*Message #22 Posted by **PeterP** on 16 Dec 2005, 8:36 p.m.,*
in response to message #21 by Ángel Martin

Cheers

Peter

PS (I use all of your fabulous modules a lot...)

lcm program on hp 33s

*Message #1 Posted by **kevin** on 11 Dec 2005, 7:03 p.m.*

does anybody know a program for finding the lcm of two numbers on the hp33s (or hp 32s or 32sii)?

Re: lcm program on hp 33s

*Message #2 Posted by **Hal** on 11 Dec 2005, 11:57 p.m.,*
in response to message #1 by kevin

Hi Kevin,
I just banged out this very simple, brute force program for a 33s that seems to work. Enter yor two arguments into the X and Y stack registers and XEQ L. The LCM will show in the display when finished. The bigger the arguments and the higher the LCM, the longer it takes. I put in 5000 and 5002 and it took about a munute to return an lcm of 12505000. 50 and 57 took 3 seconds to return 2850. Best regards, Hal

The program:

```
lblL
x>y?
x<>y
stoA
x<>y
stoB
2
stoC
lblO
rclC
rclB
*
rclA
/
FP (fractional part)
x=0?
gtoQ
1
sto+C
gtoO
lblQ
rclC
rclB
*
rtn
```

Re: lcm program on hp 33s

*Message #3 Posted by **Hal** on 12 Dec 2005, 1:51 a.m.,*
in response to message #2 by Hal

Actually the program I submitted in the posting above was predicated on the assumption that the LCM has to be at least twice the larger argument, which is actaully not true (my bad)...the LCM could be the larger argument itself. Easy fix...just change line seven to 1.

Hal :)

Re: lcm program on hp 33s

*Message #4 Posted by **Katie Wasserman** on 12 Dec 2005, 10:21 a.m.,*
in response to message #1 by kevin

Here are LCM and GCD routines for the 32SII/33S that I came up with. Note that LCM(m,n)= m x n / GCD(m,n) and LCM is computed here using Euclid's method. It's really fast, worst case is on the order of log base 2 of the smaller of m, n.

```
LCM: call with m,n in x,y return with LCM in x
uses: A, B, x,y,z,t

L01 LBL L
L02 STO A
L03 x<>y
L04 STOx A
L05 XEQ G
L06 RCL A
L07 x<>y
L08 /
L09 RTN

GCD: call with m,n in x,y return with GCD in x
uses: B, x,y,z,t

G01 LBL G
G02 x>y?
G03 x<>y
G04 STO B
G05 0                 | these 7 instructions are just
G06 ENTER             | to compute y mod x.  On a 33S
G07 CMPLX+            | You can replace these with
G08 /                 | the single instruction:
G09 IP                | RMDR
G10 x                 |
G11 -                 |
G12 RCL B
G13 x<>y
G14 x>0?
G15 GTO G
G16 RCL B
G17 RTN
```

Re: lcm program on hp 33s

*Message #5 Posted by **Valentin Albillo** on 12 Dec 2005, 11:12 a.m.,*
in response to message #4 by Katie Wasserman

Hi, Katie:

In your 1st routine, namely:

```
L01 LBL L
L02 STO A
L03 x<>y
L04 STOx A
L05 XEQ G
L06 RCL A
L07 x<>y
L08 /
L09 RTN
```

you can save an additional step by replacing the final

```
RCL A, X<>Y, /
```

by the simpler:

```
L06 STO/ A
L07 X<> A
```

which is one step shorter, slightly faster, and leaves the GCD in A and the LCM in X. Or you can simply use

```
L07 RCL A
```

instead of

```
L07 X<> A
```

to get the GCD in Y and the LCM in X, also one step shorter.

Best regards from V.

49G+ buttons

*Message #1 Posted by **Chad Wagner** on 11 Dec 2005, 4:59 p.m.*

Greetings, Has the reliability of the buttons on the 49G+ improved to the point they can be trusted? I pound on the keys pretty hard so it might not be much of an issue for me. I would like to return to the days of buying new machines at an affordable price. I am an old consruction survey layout gradesetter guy. I have owned several of most HP models since 1975. Destroyed them all. I no longer need to hook up to an instrument. At work these days I use GPS (a Trimble Rover Controller)which as a layout tool is really incredible. Rugged too! But as a calculator it really stinks. My company's trainer says Trimbles Survey Pro Rover Controller has too many problems and I won't be getting one of those (mainly because you have to be a rocket scientist to understand the GPS calibration residuals it spits out, I hear)(nothing against the actual rocket scientists who visit this site) So when our model builders are not keeping up I need to make up my own stuff and press on. Plus I truly enjoy shooting holes in the numbers they do give me with my own calculations. I need the alignment calculating ability of the old TDS48 Survey Pro. As I prepare to send my latest handful of 48's and 42's to fixthatcalc.com to get fixed I am considering getting a 49G+ and Ted Kerbers D'Zign Transportation PAC for it. Will it work for an old button masher like me? I would appreciate anyone who knows the current state of these machines giving me a clue. Thanks! CW

Re: 49G+ buttons

*Message #2 Posted by **Frank Boehm (Germany)** on 11 Dec 2005, 5:09 p.m.,*
in response to message #1 by Chad Wagner

I'd suggest building a custom calculator. Just pick the keyboard mechanics of a Panasonic JE-850U or even better Sharp QT-8 and the electronics of the HP. Might be a nice tooling job for the weekends to come ;) (I can promise you: it is impossible to destroy these keys. They are Reed relais based and one key has more metal in it than your whole 48/49. I'd expect them to last for a million keypresses...)

Re: 49G+ buttons

*Message #3 Posted by **Howard Owen** on 11 Dec 2005, 5:38 p.m.,*
in response to message #1 by Chad Wagner

comp.sys.hp48 might be a better place to ask for opinions abount the current state of the 49G+. As far as I can tell, there are complex interactions between hardware and software releases that fix some of the problems for everybody, and all of the problems for somebody. But not all of the problems for everybody. (Odd sense of deja vu there. 8) So I don't think anyone can offer a guarantee that if you go in and plunk down your money for a new 49G+, and load the latest OS, that you're not going to have any problems. Personally, I've had no trouble with my younger the six months 49G+, running the 2.00 release and them the latest one. I have a heavy hand on the keyboard too, so that could partly explain it. However if you go to comp.sys.hp48, you'll hear many, many complaints, and read anecdotal accounts tending the other way.

Good luck!

Edited: 11 Dec 2005, 5:39 p.m.

Re: 49G+ buttons

*Message #4 Posted by **Gene Wright** on 11 Dec 2005, 6:20 p.m.,*
in response to message #1 by Chad Wagner

Another option is to buy a 49g+ from a store where you can return it if you don't find it acceptable.

HP should warranty the unit if you don't like the buttons, but that would involve a return/replacement.

So, best recommendation (if possible) is to determine a store's return policy and if they allow a return because you are dissatisfied, then you have no real risk.

And, I think Ted Kerber's software is very good.

Gene

P.S. I have five 49g+ calculators and only the first (beta) unit ever gave me much of any trouble with the keyboard. It may depend on how you push the buttons, it may be luck of the draw, it may depend on the position of the stars. :-) I'm not sure and if I could figure it out, I'd make lots of money giving exact problem fixes!

*Message #7 Posted by **db (martinez, ca.)** on 12 Dec 2005, 12:45 a.m.,*
in response to message #1 by Chad Wagner

Chad;

A surveyor i know just got a 49g+ and as far as hardware goes; it works flawlessly. That's not saying that you will buy one from the same good lot that his came from so following Gene's advice is a good idea. It is not pleasant as a calculator.

I do the same jobs that you do, so i guess we're both in local 3. I have used D'zign software in the 41, 42, and 48. It was great and i will assume that the 49 version is at least as good. You will have to learn to think like Ted, but you'll be glad you did.

I've used the Trimble SCS 9000 but not the Rover Controller that you use. The only reason i didn't toss it under a D-10 is that they kept saying that we were getting a D-11. If you like your Trimble, you'll want to take a Topcon home for the weekend.

-db

Re: 49G+ buttons

*Message #8 Posted by **Chad Wagner** on 12 Dec 2005, 1:07 a.m.,*
in response to message #7 by db (martinez, ca.)

We have a D-11, THAT is a peice of iron, it is heavy enough to crush the less dense basalt boulders into dust and rubble when it goes over them. and I like my Trimble 5800 Rover Controller enough to keep out of the way of the 11. I used Ted's software on my 48, and still use it on my 42's. Thanks for the feedback fellow Local 3 member.

Have you seen this product?

*Message #9 Posted by **Matt Kernal (US)** on 12 Dec 2005, 11:23 a.m.,*
in response to message #8 by Chad Wagner

Tim Wessman and John Evers will eventually be selling this 49G+-based instrument:
http://www.pssllc.com/

Out of curiosity, what type of repairs did your calculator need?

Han

Re: 49G+ buttons

*Message #12 Posted by **Chad Wagner** on 13 Dec 2005, 12:07 a.m.,*
in response to message #11 by Han

Most of the calculators I have destroyed fall off the hood or tailgate of my pick-up truck or fall off my four wheeler where I forget them because folks keep rudely pestering me to figure out their silly problem and go pound wood sticks in the ground for them so they can keep going. They then get run over usually by some form of heavy equipment, sometimes even by me in my pick-up or four wheeler. Sometimes they last long enough to get all kinds of sand and grit in them, I got tree pitch in one once, that will make your keys stick. Once I leaned over to reach a roll of plans and crushed the screen of a 48GX in an environmental case with my elbow. Some get repaired, some get laughed at and thrown in the backfill. This is not a complete list but sadly, it is true. Fortunately it rarely happens anymore now that I have grown older and no longer care what anyone thinks. I'll get to them as soon as I am ready.

CCD vs PPC

*Message #1 Posted by **Calcfan** on 11 Dec 2005, 4:48 p.m.*

Hello, I have the hp41cx with this setup: 1 double x-memory modules, 1 novram module with ppc rom flashed and 1 advantage module. The question is would you change the ppc flash for ccd modified plus sandbox or other 4k virtual module? so far I like very much the ppc rom, and the manual is awesome, but I heard Raymond's ccd mod and sandbox is the best setup. Also can anyone tell me how many regs should I get with the 16k novram? says 1304 after heproom or hepdir Any oppinions? thank you

Re: CCD vs PPC

*Message #2 Posted by **Howard Owen** on 11 Dec 2005, 5:28 p.m.,*
in response to message #1 by Calcfan

I get 1304 from HEPROOM on my Nov-32 equipped CX. I have CCD OS/X and Toolbox occupying pages A and B on the bank this number comes from, so that is right for 8K (2 pages) of free RAM, which is also what HEPAX 002 shows.

I like the combination of HEPAX + CCD + Sandbox, myself. Since I have the Nov-32, I keep those two modules occupying pages 8-B in one bank, and their abbreviated 4K relatives in pages A and B of the other bank. That lets me use the MLDL features of the HEPAX in that bank, while normally using the 8K variants.

I've had a "real" PPC ROM for some time, and while the manual is instructive and fun to browse, I never had much use for any of the routines. With CCD, I use the extended CAT functions all the time. I haven't settled any of this for myself, though. I've only had the Nov-32 for a few days. 8)

Re: CCD vs PPC

*Message #3 Posted by **PeterP** on 11 Dec 2005, 7:27 p.m.,*
in response to message #2 by Howard Owen

That's pretty much exactely the set-up I have as well [with a rambox, no lucky owner of a NoVram yet:-( ] and love. CCD/OSX + Hepax + SandBox. One could argue for the Full CCD to use Matrix or the Advantage if one needs a lot of other stuff there as well. The CCD/Mod is also cool, yet the functions it has instead of the matrix turn out to be very similar to the SnadBox) Personally I'f use the CCD (either with or without the Matrix, depending on need) And the ToolBox is awesome.

Just 1 cent

Cheers

Peter

Do you miss the 48GX?

*Message #1 Posted by **Massimo Gnerucci (Italy)** on 10 Dec 2005, 1:38 p.m.*

Hurry up!
There's a bargain waiting for you.

And shipping is free if you use BIN (only within USA, alas).
Massimo

Re: Do you miss the 48GX?

*Message #2 Posted by **Ed Look** on 10 Dec 2005, 2:15 p.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

Terrible.

$2000 USD for a HP 48GX calculator.

$300-400 for a HP 32SII calculator.

roughly the same for a HP 42S calculator.

<sigh>

I'd love to own any one of these, but for what they ask, really, I'd rather go out and buy a HP 33S or HP 49G+

Re: Do you miss the 48GX?

*Message #3 Posted by **Stephen Easterling** on 10 Dec 2005, 4:30 p.m.,*

> You should buy a 33S and 49G+. They're better anyway.

Not really, if you consider the hardware quality of at least the '49g+'...
Just take a look at the related threads in comp.sys.hp48

I doubt there will be any 49g+ still working in ten years;-)

Raymond

Re: Do you miss the 48GX?

*Message #5 Posted by **Ed Look** on 10 Dec 2005, 7:07 p.m.,*
in response to message #3 by Stephen Easterling

Oh, I already did, and as Paul Brogger mentioned once, among many others here, the 33S is one I generally reach for the most... at work... and I use the 32SII at home only because I'm so used to it.

But the 33S, cosmetics notwithstanding, has really grown on me to the point I love it as much as the 32SII and 34C; the 49G+, though has yet to displace the 48G or G+ in my hands, and I suspect that is only because of familiarity, not so much their function or power.

And you're right, both really ARE better: you can put in longer programs, so long as you conserve labels, but that was the case with ALL HP scientific programmables. It includes a constants library, equation library, which obviates the need to thumb through books and tables, or my own foggy memory. Again, the old ones really are better only in their cosmetic design.

And, equally as good and as important: you can get it for $40-60 USD, which for a machine of this power is a small bargain.

Re: Do you miss the 48GX?

*Message #6 Posted by **brian healy** on 14 Dec 2005, 11:19 a.m.,*
in response to message #5 by Ed Look

Ignoring the cosmetics of the 33S, it's not surprising that 33s is growing on us because it is based on such a great machine, the 32SII. The 33S just can't be beat for a basic RPN calculator without dropping hundreds of dollars on ebay for an older model that is slower with less memory.

*Message #7 Posted by **Howard Owen** on 10 Dec 2005, 2:27 p.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

As eBay "price pornography" goes, that one's not bad. I'm sure it's the highest price I've seen for a 48GX + Data Collector + RAM csrd. That combo routinely runs around $400-$500, so this auction is "only" asking for a 5X multiple.

Re: Do you miss the 48GX?

*Message #8 Posted by **Gerson W. Barbosa** on 10 Dec 2005, 5:56 p.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

Ciao Massimo,

I have an even more lightly used 48GX (bought it brand new in the year 2000) and a 512K SMI RAM card.

Thinking of selling the whole set for just $1,500.00 and spending the hollidays in Rome... :-)

Regards,

Gerson.

*Message #16 Posted by **Valentin Albillo** on 14 Dec 2005, 6:06 a.m.,*
in response to message #15 by I, Claudius

Hi, I, Claudius:

From the Computer Desktop Encyclopedia:

> *"Trolling"*
>
> *2.Posting derogatory messages about sensitive subjects on newsgroups and chat rooms to bait users into responding.*

Do you like taking the bait ? Do you actually believe for a moment that the troll that's posting under the Coburlin alias is the real Coburlin ?

Your namesake, Claudius, used to be a highly intelligent Roman emperor, as portrayed in the eponymous TV series. If you continue to take the bait and feed the troll, which posts for no other reason than to provoke naive people like yourself and rejoyce at their replies, perhaps yould should consider taking on a new, less paradoxical alias.

My only intention in this matter is to try and avoid yet another cascade of postings by the anonymous troll on one side, and the bait-takers on the other, which serves no purpose except to fill up the forum and the archives with garbage, to the troll's great satisfaction. In other words, I feel "verguenza ajena" when I see people like yourself biting the hook.

Best regards from V.

Point Noted

HP-71B Versions and Bugs

*Message #1 Posted by **J-F Garnier** on 10 Dec 2005, 9:50 a.m.*

Hi HP-71B fans!

I updated my page about versions and bugs of the HP-71B, especially regarding version 1AAAA. I found a lot of informations in the HP IDS (Internal Design Specification) for version 1BBBB. Actually, I didn't review the 3000 pages, but I made a binary comparison between the 1AAAA and 1BBBB ROM. Each time I found a difference, I checked the corresponding IDS pages and very often comments explained the reason of the change.

I don't have the IDS for version 2CCCC (*it exists, let me know if you have it!*), and I was not able up to now to make the same study for 1BBBB-2CCCC differences. However, I checked the fixes of some 1BBBB bugs, and give a description of an interesting bug, still in 2CDCC ROM, related to "funny functions" (Math FNROOT, INTEGRATE for instance) and user-defined functions.

Many thanks to Gordon Dyer, for the lending of his 1AAAA machine some times ago.

J-F

in response to message #1 by J-F Garnier

Hi, Jean-François:

Thank you **very much indeed** for your excellent report on HP-71 bugs, impressive work both illuminating and useful. As for other 71B bugs not mentioned, may I remind you the one I discovered for the Math ROM, details of which can be found in my Datafile article HP-71B: "Math ROM Baker's Dozen (Vol. 1)", namely that trying to find out a real root (or ascertain that none can be found) of $\mathbf{x^2 + 1 = 0}$ by executing:

```
FNROOT(0, 0, FVAR * FVAR + 1)
```

does *not* terminate (at least not this side of geological times) as it should. I've seen this happen in 71B BBBB and CDCC, always with Math 1A (is there any other version ?). It doesn't happen with the HP-15C equivalent SOLVE routine.

Perhaps you would consider interesting to find out what FNROOT is doing in this particular case and why it doesn't exit in a reasonable time. I for one would be very interested to know and would be very obligued if you could shed some light on this subject. Certainly only a Saturn assembler *guru* like yourself can succeed at this endeavour. :-)

Thanks again and best regards from V.

Functions/QRF/Manual for CCD Modified

*Message #1 Posted by **PeterP** on 10 Dec 2005, 2:07 a.m.*

Hi, playing around with all the mods that can be found here and TOS, I come accros the CCD Modified, which has some extra functions (CCD Plus) instead of the array functions. Anyone has a QRF or manual for those functions? One can figure out most of them, yet I'd still like to be sure...

Thanks!

Cheers

Peter

(Still hoping to get a QRF also for the ToolBox from Angel, after he gaves us the great SandMath and SandBox QRF's...)

Hitchhicking: Functions/QRF/Manual for BLDROM?

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 10 Dec 2005, 8:54 a.m.,*
in response to message #1 by PeterP

Hi PeterP, all;

At TOS, there is a link to the BLDROM manual, but the link(s) to the actual file(s) in the page itself is(are) missing. Any chance that someone here has it?

There are a few other ROM module manuals available at the MoHPC DVD/CD set, but this one I have not found (did I search it all?). But I am not quite sure if Dave has ROM images available to download... or you refer only to the manuals?

In time: I prefer the classic CCD. When I read the text file after opening the .MOD file, I felt I'd find extra functionality, but I'd never sacrifice the matrix (array) functions. I like the way CCD deals with them.

Best regards.

Luiz (Brazil)

*Message #3 Posted by **Massimo Gnerucci (Italy)** on 10 Dec 2005, 1:24 p.m.,*
in response to message #2 by Vieira, L. C. (Brazil)

Hi Luiz,
you have mail!

Greetings,
Massimo

Re: Hitchhicking: Functions/QRF/Manual for BLDROM?

*Message #4 Posted by **PeterP** on 10 Dec 2005, 2:17 p.m.,*
in response to message #2 by Vieira, L. C. (Brazil)

Luiz,

I'm trying to optimize what to put into my HP for playing around and programming. Angel's Toolbox has a lot of great stuff, but also takes 8k. So believe it or not, I'm running out of pages to put stuff. As I do not use Matrix that often, I was thinking of using the Modified CCD. Another option is to use the CCD /X from Raymond and the Advantage mod. SO many options, so little time!

Anyway, for the CCD Modified, I'm only looking for the manual, the .rom is at TOS.

Now to something completetly different - what is the BLDROM? Would you mind forwarding me Massimo's email?

Cheers

Peter

What's a BLDROM?

*Message #5 Posted by **Howard Owen** on 10 Dec 2005, 3:46 p.m.,*
in response to message #4 by PeterP

Mirror is here.

From the cover page:

> Quote:
>
> This rom was intended as a plug in module, unfortunately, the author could not muster the $20,000 investment for such a device. I'm told that later ... HP lowered the cost, oh well. It is now being released or your enjoyment. Try out 64 functions in a 4K handcoded XROM 05

Also on the cover appears a summary of the contents:

- Utility Functions
- Single Stepping USer Code Assembler
- Display Functions
- Hexadecimal Tools
- Alpha Functions
- Nibble Process Fnctions
- Complex Number Functions
- Tone Generator
- LIFO Functions
- Key Assignment Functions
- Load Immediate Functions
- User Code Assembler Functions
- Some Examples

Re: Hitchhicking: Functions/QRF/Manual for BLDROM?

*Message #6 Posted by **Howard Owen** on 10 Dec 2005, 3:50 p.m.,*
in response to message #4 by PeterP

Actually, the *Sandbox* ROM takes 8K, but the *Toolbox* ROM only takes 4K. There's no QR or manual, but the latter looks like a subset of the former, which does have a nice manual. Also see the Alpha ROM which contains the alpha manipulation routines from Sandbox, plus quite a few more, also in 4K.

Re: Hitchhicking: Functions/QRF/Manual for BLDROM?

*Message #7 Posted by **Ángel Martin** on 15 Dec 2005, 6:20 a.m.,*
in response to message #6 by Howard Owen

Hello,

You can think of the SandBox as the "condensed" version that spawned these other four:

- 41Z (4k) - Has its own manual

- SandMath (8k but 'separable' in two independent blocks) QRG is available

- ToolBox (4k)

- ALPHA Rom (4k)

The "Modified CCD" is also from me. I always found the Matrix functions of the Advantage more suitable for real operation (and more complete with the high-level stuff), so the obvious "problem" was to remove them from the CCD. Many of the replacement functions are also in some of the roms listed above, think of it as an alternative as well.

Hope this helps to set the record straight.

Best, ÁM.

NSSBWS (Not-So-Short But Weirdly Sweet) HP-33s SLC (Single-Letter Challenge) # 01

*Message #1 Posted by **Paul Brogger** on 9 Dec 2005, 12:00 p.m.*

O.K., we all know the 33s' 33 storage registers and 26.5 program labels would seem to inhibit full utilization of its ~32K memory.

So, how about writing a program that "increases" the number of available registers, while minimizing the use of program labels in the process?

Specifically, using numeric-string manipulation techniques, write a program that stores, maintains and retrieves up to *54* separate values.

These values will necessarily be of lesser precision and/or range than what is available natively in the 33s' registers. How about positive and negative reals with 5 digits of precision, and exponents in the range 10^-99 -- 10^+99?

And how about doing it using only a *single* program label?

I'll share my solution on Monday.

Re: NSSBWS (Not-So-Short But Weirdly Sweet) HP-33s SLC (Single-Letter Challenge) # 01

*Message #2 Posted by **Gene Wright** on 9 Dec 2005, 12:16 p.m.,*
in response to message #1 by Paul Brogger

How about some more introductory information?

Such as...

routine inputs?

To store a number, what? Number in Y and "location" in X?

To retrieve a number, what? "Location" in X?

Does it keep or discard the arguments?

Etc. :-)

I'm very interested in this type of routine, since it might help address one of the basic short-comings of the 33S.

More: NSSBWS HP-33s SLC # 01

*Message #3 Posted by **Paul Brogger** on 9 Dec 2005, 12:43 p.m.,*
in response to message #2 by Gene Wright

Right -- sorry for being incomplete. I'd edit the original post, but that feature has been disabled (for, I think, good reason), so here's more:

I use label "D" (for "Double Memory") for mine.

To store a value, I put the value itself in stack y, and the storage location (1 <= x <= 54) in stack x, and "XEQ D". The routine stores the value, and returns the value as stored (normalized to 5 digits) in stack x.

To recover a value, I put the negated storage location in stack x (-1 >= x >= -54) and "XEQ D". The routine returns the specified value in stack x.

After a "store" call, stack z is returned in y; for recall, stack y & z are maintained in place. As written, the routine uses flags 3 & 4, but it could probably use other, more obscure flags & leave 3 & 4 to the calling programs.

My solution starts mapping pseudo-registers to actual storage way up in the 6 statistics regs (half-register locations 1-12), and proceeds down to register A (half-registers 53 & 54). So if the calling routine needs a few regs, it can keep its storage low in the alphabet, and limit the range of pseudo-index values employed.

My solution utilizes registers V-Z, and restores the original contents of i before returning.

Potentially, similar techniques could be used to store reals of greater precision but reduced range (6 digits & 10^-9 -- 10^+9), 7-digit integers, or even more, smaller integers (perhaps as many as 81 4-digit values?)

Breaking it apart to utilize several labels would make it shorter overall, faster, and easier to understand & maintain. But I was going for the extremes.

And, I won't feel quite so pathologically geek-ish if *someone* finds it useful!

Edited: 9 Dec 2005, 2:34 p.m.

Re: More: NSSBWS HP-33s SLC # 01

*Message #4 Posted by **ECL** on 11 Dec 2005, 5:59 p.m.,*
in response to message #3 by Paul Brogger

Paul,

I think I may be hip to what you're suggesting. Or I'm waaay off :)

Are you proposing something like this?

1. Have two values, 34.555 and 80977.

2. Convert both to similar format: 3.4555E01 and 8.0997E01

3. Multiply the second by a factor, say 10E5, and add it to the first, and subsequently store in one variable? (Kinda like the method of creating values for i? ie. xxxii.eeee?

I'm interested, in other words. ECL

Re: More: NSSBWS HP-33s SLC # 01

*Message #5 Posted by **ECL** on 11 Dec 2005, 6:30 p.m.,*
in response to message #4 by ECL

Sorry,

there were some errors.

I should have said that the second value would be divided by a sufficiently large number (1E+0X). Then the two would be added to equal 34.5550080997 which would be STO'd in 1 variable?

Interesting approach, if this is at all what you're thinking of :P

ECL

Re: More: NSSBWS HP-33s SLC # 01

*Message #6 Posted by **Paul Brogger** on 12 Dec 2005, 12:32 a.m.,*
in response to message #5 by ECL

That's essentially what I'm doing.

Keep playing around. There are more than a few twists.

I'd like to see how someone else would approach the problem.

Re: More: NSSBWS HP-33s SLC # 01

*Message #7 Posted by **Ed Look** on 12 Dec 2005, 1:12 p.m.,*
in response to message #6 by Paul Brogger

It sounds like you guys might be onto some form of a data compression algorithm!

Re: More: NSSBWS HP-33s SLC # 01

*Message #8 Posted by **Paul Brogger** on 12 Dec 2005, 2:01 p.m.,*
in response to message #7 by Ed Look

Not exactly "data compression" -- more like "data re-purposing" (if that makes sense).

I'm taking the twelve decmial digits of precision, 2.5 digits of exponent, and two signs (value and exponent) available for each HP-33s register, and encoding two "half-registers" in each, with a total of 10 digits of precision, four digits for exponents, and four signs (two value, and two exponent signs).

Over the weekend I rescued two more registers, so the routine can reliably encode and recall 58 different reduced-precision values.

(I've been spending WAY too much time playing with my calculator of late . . .)

I'll post the program listing tonight.

Re: NSSBWS (Not-So-Short But Weirdly Sweet) HP-33s SLC (Single-Letter Challenge) # 01

*Message #9 Posted by **Ed Look** on 10 Dec 2005, 8:59 p.m.,*
in response to message #1 by Paul Brogger

I'm not sure I can meaningfully contribute to this thread, but I can nitpick: do the XYZT stack registers count too?

If so, the HP 33S has 37 registers...

... ;P

Re: NSSBWS HP-33s SLC # 01

*Message #10 Posted by **Paul Brogger** on 10 Dec 2005, 11:38 p.m.,*
in response to message #9 by Ed Look

One nit-pick deserves another:

Thirty-*eight*, if we include LAST*x*.

;-}

A Solution: NSSBWS HP-33s SLC # 01

*Message #11 Posted by **Paul Brogger** on 12 Dec 2005, 7:01 p.m.,*
in response to message #1 by Paul Brogger

My solution to the single-letter challenge is posted as Article # 570.

Let me know if you've got any questions, corrections or optimizations.

(And BTW, I found the Forum note from March of 2004 where I first outlined this scheme.)

Battery for CMT 64k Module for HP-71B

*Message #1 Posted by **T. Bergemann** on 9 Dec 2005, 10:54 a.m.*

It's unbelievable but the Battery in the old 64k Module for my HP-71B still shows 2.99V. (I think I bought the RAM module in 1989).

What kind of battery is it? Who sells replacement cells - just in case it dies over the cours of the next 25 years?

Thanks for your help.

See a picture here.

http://www.bergemann.com/HP71B-CMT64k-Battery.jpg

I appreciate your mail to

tom (a t) bergemann.com

Regards, t

Re: Battery for CMT 64k Module for HP-71B

*Message #2 Posted by **Garth Wilson** on 9 Dec 2005, 1:35 p.m.,*
in response to message #1 by T. Bergemann

It's good to know it still measures out to be new after all these years, because I have the same thing. I contacted CMT a couple of years ago, and there was no longer anyone there who even knew what an HP-71 [i]was[/i]. What a shame. Since I never remove mine and I keep good batteries in the computer all the time, that thin shiny battery in the module may never have gotten used. My main concern was just that it not start leaking. But if it's acting new in your case, I suppose it should be fine.

Edited: 9 Dec 2005, 1:36 p.m.

Re: Battery for CMT 64k Module for HP-71B

*Message #3 Posted by **T. Bergemann** on 10 Dec 2005, 8:43 a.m.,*
in response to message #2 by Garth Wilson

Garth,

Thanks for your kind reply. Good to know, that your module battery is healthy as well.

Imagine asking such a question in a shop: "Can I expect the backup to last as long as in my HP-71B?"

;-)

Regards T

A pretty complete table can be found at

http://mathworld.wolfram.com/LargeNumber.html

John

Re: after decillion

*Message #3 Posted by **Matt Kernal (US)** on 9 Dec 2005, 4:46 p.m.,*
in response to message #2 by John Cadick

The Wolfram table skips over "googol".

Where: 1 googol = 1.0×10^{100}

Example: "I'll sell you my HP 42S for 1 googol dollars".

Factoid: The "Google" search engine name came from the number "googol". While still in college, the soon to be founders of Google both used the number as an answer on an exam.

Matt

Re: after decillion

*Message #4 Posted by **Ed Look** on 9 Dec 2005, 11:52 a.m.,*
in response to message #1 by anna marie

This numerical nomenclature is based on Latin. In Latin languages extant today, numbers like 11 or 24 are still spoken as "ten and one, or twenty and four", much like the four and twenty blackbirds of the nursery rhyme.

So, for such systems, after "10"-illion would be "11"-illion, so after decillion would come undecillion, dodecillion, trisdecillion, etc.

Trisdecaphobia, anyone? After all, you're all calc folks!

Re: after decillion

Actually, they have special words for 11 and 12 (e.g. "onze" in French, not "dix-un"). Probably a legacy from the times when humans still had six fingers on each hand.

(Of course French must be the weirdest language for counting -- who the heck came up with the idea of pronouncing 95 as "four twenties fifteen"? Good thing the names of those large numbers are not based on that...)

Re: after decillion

*Message #6 Posted by **Valentin Albillo** on 9 Dec 2005, 12:26 p.m.,*

in response to message #6 by Valentin Albillo

Hi Thomas, Valentin,

Agreed!!

And this way of using "scores" (English) or "vingt" or "fiche" (irish according to my wife) reminds us that we've been using our hands and feets "fingers" to count & compute for a long time before RPN was invented.

All the best from France!

Etienne

*Message #8 Posted by **Crawl** on 9 Dec 2005, 1:01 p.m.,*
in response to message #6 by Valentin Albillo

Lincoln was trying to be poetic (some might say pretentious) due to the occasion. No English speaker would ever say "fourscore" for eighty under normal circumstances.

That's why the Belgians and the Acadians simplified it: septante, huitante, neuvante etc --I can't remember exactly the constructions--mine are a little off but this is the basic idea in both cases :-)

Dozen and douze and onze and eleven and twelve are interesting.

Onze is clearly using the root for the word "un"

Douze is clearly using the root for "deux" as is trez, quatourze etc and so in this sense in french it is a consitent system...Jus that the "teens" don't start until seventeen (dix-sept).

(please forgive my spelling--it has been awhile...)

Compared to deutche is interesting, where

elf zwelf

are followed by dreizien (sp?) fierzien etc. and so is just like english in this respect. where the "zien" is "teen".

All three languages bifurcate the nomenclature of numbers in the set 11-19 into two sets linguistically--why they broke at different places is a good question.

Re: after decillion

*Message #10 Posted by **Peter Geiser** on 9 Dec 2005, 4:40 p.m.,*
in response to message #9 by bill platt

English also has special words for eleven and twelve. They are etymologically even stranger than French:

Eleven comes from old English endleofan, meaning "one left over", and twelve is "two left over".

In German: elf, zwölf (zwoelf), dreizehn, vierzehn, ... (zehn being the equivalent to ten).

In this regards, Chinese is very logical, where you have shiyi (ten one), shier (ten two), shisan (ten three), etc.

Best regards
Peter

Actually, there's nothing special in French words for 11 and 12, *onze* and *douze*: they come from Latin *undecim* (one and ten) and *duodecim* (two and ten).

...latin

Roman (Latin) numbers

*Message #15 Posted by **Marcus von Cube, Germany** on 10 Dec 2005, 5:25 a.m.,*
in response to message #11 by Gerson W. Barbosa

IIRC, Latin starts more consistent (in our modern eyes) than it ends:

```
11 - undecim, one and ten
...
17 - sedecim, seven and ten
```

but

```
18 - duodeviginti, two before twenty (!)
19 - unodeviginti, one before twenty.
```

The last two arne't too strange, given the fact that the Romans wrote their numbers in a similar way: IIXX and IXX.

Marcus

Re: Roman (Latin) numbers

*Message #16 Posted by **Gerson W. Barbosa** on 10 Dec 2005, 7:48 p.m.,*
in response to message #15 by Marcus von Cube, Germany

Hello Marcus,

If you think numbers in Latin are awkward, what about fractions?

Excerpt from Ars poetica (by Horace):

http://tabula.rutgers.edu/spectator/text/june1711/ars_poetica.html

```
"Romani pueris longis rationibus assem discunt in partis centum diducere.
'dicat filius Albini: si de quincunce remota est uncia, quid superat? Poteras
dixisse.'
'triens!'
'eu! rem poteris servare tuam. Redit uncia, quid fit?'
'semis!'"

"Through long calculations, Roman children learn to divide the
as (the unity) in hundredths.
'Tell me, son of Albinus, if an uncia (1/12) is removed from a quincunx
(5/12), what remains? Can you tell me?
'triens! (1/3)'
'Very good! You'll be able to manage your things. Were an uncia (1/12) added,
what would you have?'
'A semis! (1/2)'

5/12 - 1/12 = 4/12 = 1/3
5/12 + 1/12 = 6/12 = 1/2
```

I think they'd learn this by heart as we do with multiplication tables. For everyday calculations they would use abbaci. Too bad the traditional abbacus maker at the time, Hector Paccatus, sold his skillful greek servants in order to reduce costs and imported less expensive slaves from the East. As a result, in the new abbacci the beads would not slide so smoothly on the rods as before and people started complaining... :-)

Re: Roman (Latin) numbers

*Message #17 Posted by **Richard Anderson (in Athens)** on 12 Dec 2005, 7:00 a.m.,*
in response to message #16 by Gerson W. Barbosa

Hello from where those Greek slaves might have come from!

I thought it was worth mentioning, since Roman numerals and abaci have been mentioned, that those numerals (that everyone points out are so clumsy) are a system of abacus notation. They tell you how to set the beads on an abacus with 4 beads + 1 bead on each bar. I & V on the first bar, X & L on the second, C & D on the third, etc. I suppose that the "subtractions" IV instead of IIII are tricks to save "keystrokes".

A skilled abacus user can outperform any old mechanical calculating machine...and maybe not actually need the abacus. It always annoys me when people say the Romans were deficient with numbers.

Kali Dynami (Good Strength),

Richard

in response to message #17 by Richard Anderson (in Athens)

> Quote:
>
> Hello from where those Greek slaves might have come from!

Hello Richard,

I may have used the word 'servants' wrongly, instead of 'workers' or 'employees'. I don't have the foggiest notion what an abacus factory looked like. In fact it appears there were no abacus factories at all, these calculating devices being made by skillful artisans, most likely not from Greece, in low quantities. By what I know the Greek played an important role in ancient Rome as educators.

> Quote:
>
> I suppose that the "subtractions" IV instead of IIII are tricks to save "keystrokes"

If am not wrong, these later notation appeared in the Middle Ages as a way to save space in manuscripts.

Kal imera! (Good-day!),

Gerson

Re: Roman (Latin) numbers

*Message #19 Posted by **Richard in Athens** on 15 Dec 2005, 10:00 a.m.,*
in response to message #18 by Gerson W. Barbosa

Hello Gerson,

I'm sure there's a good abacus book or two out there. When I was a kid I learned how to use a "modern" Japanese abacus with 4 & 1 bead per bar rather than the Chinese 5 & 2 kind. I never learned what the Chinese do with those extra beads, nor do I know what kind of abacus the Romans typically used.

Both would be pretty easy to find out.

I typed "slaves" without thinking and then saw that you had said "servants" to begin with. I decided to leave it because slavery was so much a part of the Greek and Roman world.

Greek learning was much esteemed by the Romans. Many Romans sent their sons to be educated in the "Philosphical Schools" of Athens. An English friend of mine suggested that the Romans viewed a Greek education much as Americans think of Oxford or Cambridge. Athens, of course, wasn't the only place to get a Greek education. Alexandria was famous for its library and Euclid is thought to have studied in Athens but "taught and founded a school in Alexandria". (Heath)

Geometric tools are the compass and straight edge. I guess the abacus was the original "number-cruncher" but they went out when Arabic numerals came in. A good abacus cost much more than some scraps of papyrus...probably relatively more than those "dream-come-true" early 70's HPs. As a poverty-stricken archaeological surveyor I just dreamed of owning one of those but eventually jumped on the 42s. A wise jump and luckily I jumped more than once because one of my 42s's seems to have "walked" from my office last week. Nobody steals your old scraps of papyrus.

Richard (this posting counts as "general information")

Re: Roman (Latin) numbers

*Message #20 Posted by **unspellable** on 15 Dec 2005, 3:53 p.m.,*
in response to message #19 by Richard in Athens

The Japanese style abacus is called a soriban. I have one, complete with English instructions although I have never gotten around to learning how to drive it.

But it is to be noted that the Roman number systemn relate to the abcus in the same way that binary numbers relate to the computer.

If you know the history behind the various nymbering systems, and oddities like a dozen, score, pence, shillings, and pounds, etc. they make a good deal more sense.

LA Times Article on HP

*Message #1 Posted by **Katie Wasserman** on 9 Dec 2005, 9:32 a.m.*

This was posted on the HPLX list but is just as relevant to this forum:

==========

Los Angeles Times, December 8, 2005

by Michael Hiltzik: Golden State Restoring HP to Its Original Condition

Stumbling corporations trying to regain their footing often turn to their past: They invite a retired chairman to resume the reins, reissue a vintage product or christen a factory after a revered founder.

Something like that is undoubtedly behind Hewlett-Packard Co.'s renovation of the rented Palo Alto garage in which its founders, William R. Hewlett and David Packard, assembled HP's first product, an audio oscillator, in 1939.

HP purchased the legendary property at 367 Addison Ave. in 2000 and launched a project to restore it to its 1939 condition last year. On Tuesday, the company held a ribbon-cutting ceremony to mark its completion. The corporate archivist, Anna Mancini, has been giving interviews on the rehab for several months, and a documentary video is posted on the HP website. Except for a few tours this weekend, however, the property won't be open to the public. (It's on a residential street.)

For HP, this project is loaded with subtext. Although the renovation began under former Chairwoman and Chief Executive Carly Fiorina, it's hard to avoid feeling that Tuesday's ceremony was designed partially to leave behind the Fiorina era, which began with great fanfare in 1999 and ended with her ignominious ouster in February, and to certify the succession as CEO of the rather less exhaustingly glamorous Mark Hurd.

Under Fiorina, HP's very survival came into question, as did its devotion to the core principles codified by Packard in his 1995 memoirs as "the HP Way." In a nutshell, the HP Way exalted teamwork, individual initiative and employee dignity. Its corollaries included rock-ribbed integrity, corporate social responsibility and a reliance on innovative engineering.

The company's diverse product lines started with industrial instrumentation and included such inventions as the first hand-held scientific calculator, the HP-35, which rendered the slide rule obsolete overnight. It entered the computer business with only equivocal success, but it's made a mint in printers and imaging.

That success in printers, however, is a mixed blessing.

The category, which includes consumables like ink and toner, has accounted for less than one-third of HP's sales in recent years but nearly 70% of its operating earnings.

Yet the market's growth is slowing, even as lower-priced competitors flood the supply chain.

Meanwhile, third-party suppliers are hacking away at HP's franchise in ink cartridges.

As for the PC, it's a commodity product in which innovation today comes mainly from software — not one of HP's traditional strengths.

Nevertheless, Fiorina doubled down on the PC bet through her controversial, polarizing and ultimately pointless 2002 acquisition of Compaq Computer Corp.

Fiorina was the antithesis of HP's self-effacing, pragmatic founders. She paid lip service to the HP Way, but employees came to doubt that she truly internalized it.

She expanded the corporate jet fleet and seemed to trail clouds of consultants wherever she went.

Her predecessors believed in precise measurement and rigorous financial accuracy; she delivered wildly optimistic growth forecasts that wrecked HP's reputation on Wall Street.

By the time she was forced to lay off more than 10,000 workers in the teeth of the 2000 high-tech crash, she had lost credibility with the rank and file, too.

Yet the founders had never ruled out harsh prescriptions for corporate survival like layoffs, wage cuts or divestitures.

It's part of HP lore that the founders averted a 10% layoff during a 1970 downturn by asking every employee to work nine days out of 10 for six months; but it's generally overlooked that, as Packard observed in his book, this short-term tactic didn't mean HP was committed to "providing absolute tenure for our people." Indeed, in the early '90s HP stringently downsized, mostly through buyouts and early retirements similar to those imposed at other corporations.

Fiorina's layoffs, while certainly larger and possibly harsher than those that came before, were a response to a dramatically changed marketplace and perhaps weren't as much of a violation of the HP Way as her detractors suggested. (Packard died in 1996 and Hewlett in 2001.)

Hurd, a former CEO of NCR Corp., has now inherited the task of setting the company firmly back on the HP Way. He began his tenure with a record round of 15,300 layoffs, but paired that with bonuses for the survivors to shore up morale. He also sheltered the company's $3.5-billion research and development operation from the cuts.

Financial results are looking up. Profits improved across the board in the fourth quarter ended Oct. 31, with even the long-suffering personal computer segment showing an improved operating margin of 2.8%. (Printing and imaging was still the margin champ, at 13.2%.) Under Hurd, HP shares, which lost roughly half their value under Fiorina, have advanced nearly 50% from the trough.

Watching this company's progress is sure to be a fascinating exercise. HP operates in several businesses where differentiating oneself is difficult and margins are narrowing.

But the company is one of high tech's sterling names and retains a reputation for quality; as I've written before, my house is filled with HP products, including a 12-year-old laser printer that churns out flawless prints for less than a penny per page.

If renovating an ancient garage signals the company's modern revitalization, that can only be a good thing.

in response to message #1 by Katie Wasserman

Here's a very interesting article (with pics) about HP, History and the garage that was recently in the New York Times:

http://www.nytimes.com/2005/12/04/national/04garage.html

Maybe a future Hand Held conference location?

TomC

Re: LA Times Article on HP

*Message #3 Posted by **I, Claudius** on 9 Dec 2005, 6:15 p.m.,*
in response to message #1 by Katie Wasserman

Highly interesting, but it's going to take a bit more than rebuilding the old garage workshop (the symbolism is good publicity) to bring HP around. If the current state of HP calculators can used as a general indicator, HP remains in a slow death spiral. Remember, they have to make sure Carly gets every cent of that $43M golden parachute...

Re: LA Times Article on HP

*Message #4 Posted by **db (martinez, ca.)** on 9 Dec 2005, 9:17 p.m.,*
in response to message #3 by I, Claudius

Sadly, i agree but ..... what do you think of the 49g+ ? Really. I'm asking because a fellow surveyor left his with me from yesterday afternoon till this morning and for the hour i played with it, it was moderatly ok. To me, it's not real user friendly as a calculator (!!!) but to a lesser extent, neither was the 48. The screen and keyboard of his are quite good and it is customizeable. God knows it's expandable and it uses a standard interface. If i didn't have everything i need in my 41, i'd buy one with the d'zign survey program and probably be pretty happy.

Don't tell anyone but i'm only 99% happy with my cx.

Re: LA Times Article on HP

*Message #5 Posted by **I, Claudius** on 10 Dec 2005, 6:41 a.m.,*
in response to message #4 by db (martinez, ca.)

The 49+ is cursed with multiple flaws that have not been adequately addressed. I've had several that had defective keys, and I'll probably never buy another one. For some now the other HP newsgroup, Google group comp.sys.hp48, has threads on several types of keypad and memory problems.

As for usage, it takes a lot of time to get used to the 49 interface if you're used to using a basic RPN machine. However, it is quite powerful, once you know its secrets. Professor Gilberto Urroz wrote a two-volume series on using it for engineering work. Those books are now out of print and hard to find, but if you search consistently copies pop up now and again. Professor Renee deGraeve wrote a great command by command description of the computer algebra system, invaluable if you use advanced functions.

As for survey work - I have an uncle who is a surveyor. He told me he has about twenty 48GXs, ranging from beat up to unopened packages. There will be no other machine for him. - Happy Holidays!

Re: LA Times Article on HP

*Message #9 Posted by **unspellable** on 9 Dec 2005, 6:16 p.m.,*
in response to message #1 by Katie Wasserman

The only problem with this is that everything that came out of that garage went with the other half of the company when the split came. Today's HP has next to nothing to do with that garage or anyhting that came out of it. Always maintained the name and the calculators went with the wrong half when they split.

Size of magnetic cards for cardreader

*Message #1 Posted by **Robert Graulich** on 9 Dec 2005, 7:28 a.m.*

Hi!

The manual of the cardreader of the HP41 says that I can save 2*16 registers on a card. Are there longer cards available? 32 registers is not that much.

Robert

Re: Size of magnetic cards for cardreader

*Message #2 Posted by **Chan Tran (USA)** on 9 Dec 2005, 8:38 a.m.,*
in response to message #1 by Robert Graulich

There is no longer card for the 41 card reader. No the card doesn't hold much but then in the HP41 time it was reasonable.

Re: Size of magnetic cards for cardreader

*Message #3 Posted by **Robert Graulich** on 9 Dec 2005, 8:52 a.m.,*
in response to message #2 by Chan Tran (USA)

That's a pity. Using the cardreader would be nice. Did somebody try to hack the OS to squeeze more on a card? Like we did on the C-64 with these "turbo" routines for reading and writing files on tape? Robert

Re: Size of magnetic cards for cardreader

*Message #4 Posted by **Namir** on 9 Dec 2005, 9:16 a.m.,*
in response to message #3 by Robert Graulich

After launching the HP41, HP launched the HP-IL loop and it's perpherals, including the digital tae recorder. That device made the card-reader obsolete for serious data collectors. I remember writing and selling a database program for the HP41C that used the digital tape.

Namir

Re: Size of magnetic cards for cardreader

*Message #5 Posted by **Robert Graulich** on 9 Dec 2005, 9:30 a.m.,*
in response to message #4 by Namir

Well, I understand. So I will ignore all cardreaders on eBay. ;-)

Thank you for your answers, Robert

Re: Size of magnetic cards for cardreader

*Message #6 Posted by **Etienne Victoria** on 9 Dec 2005, 9:32 a.m.,*
in response to message #1 by Robert Graulich

Of course there are :-)))

A long insightful article was published by Vassilis here:

Long magnetic cards

Easy to implement, this technology was a giant leap forward to increase the Hp-41C card reader usability :-))

New heights have been reached recently by packing the MLDL2000 in the card reader which finally made it useful.

Please note the :-))) at the end of the sentences.

Etienne

Re: Size of magnetic cards for cardreader

*Message #7 Posted by **Robert Graulich** on 9 Dec 2005, 9:40 a.m.,*
in response to message #6 by Etienne Victoria

That's a nice one! Due to your smilies it was easy to spot the deal. So I'm already asking Meindert to get an MLDL 2000. Seems to make much more sense to me after looking at the other options.

Robert

My HP 48GX don't turn on! help me...

*Message #1 Posted by **Edgar Moraes** on 9 Dec 2005, 6:42 a.m.*

Dear friends

My HP 48GX don't turn on. I retained its for 2 years, without the battery. When I try turn on now, nothing. Please, if somebody can help me...

Re: My HP 48GX don't turn on! help me...

*Message #2 Posted by **Raymond Del Tondo** on 9 Dec 2005, 7:46 a.m.,*
in response to message #1 by Edgar Moraes

Dear Edgar,

make sure you have fesh batteries,
make also sure you put them in with the correct polarity.
Never put them in with wrong polarity,
regardless of what some people might say,
unless you can drop them the bill for a new HP-48;-)

If that doesn't help, you could try the ON+C reset first.
For this you press and hold the ON key,
then press the third white menu key from the left,
then release both. If the calc starts, you're done:-)
If that won't do either, you can try the hard (pin hole) reset.
For this pry out the rubber foot on the back which is next to
the word 'ONLY' of '128K ONLY'. You'll see a small hole,
and lightly visible a small letter 'R' left to it.
Straighten an end of a paper clip and carefully insert it into the hole,
until you feel kinda resistance. Hold it there for a second or two.
Then remove the paper clip end, and press the ON key.
The calc should now turn on.

If it still doesn't turn on, there may be a hardware defect,
like a shrunken contact pad between the display and the main pcb.

BTW it's a good idea to remove any extension cards
before trying the above procedures.

Regards

Raymond

i lost my program on my 41cx

*Message #1 Posted by **ross denys** on 8 Dec 2005, 4:10 p.m.*

i lost a valuable program on my 41cx whan i left it too long without charging the battery. is there anyone who knows how to get it back or is it lost forever. boo hoo it was a very trusty sun shot program for surveyors navigation.

Re: i lost my program on my 41cx

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 8 Dec 2005, 6:21 p.m.,*
in response to message #1 by ross denys

HI;

if you get something like

```
[MEMORY LOST]
```

you certainly lost it for good. There is no way to recover it from the calculator´s memory once it is cleared. Is there any chance that yo have a listing with the program contents? If so, chances are you can key it back in.

Let us know.

Best regards.

Luiz (Brazil)

*Message #3 Posted by **Ron** on 9 Dec 2005, 12:06 a.m.,*
in response to message #2 by Vieira, L.C. (Brazil)

http://collab.mathsoft.com/~Mathcad2000/login

Try this forum, maybe you will be able to inquire as a guest. Membership is open I think.

Anyway, there is a section on Astronomy and navigation which might have a member with your program or one in another language you might easily transform into your own 41cx. There are other sections in various applied math which might interest you.

Good luck,

Ron

Re: i lost my program on my 41cx

*Message #4 Posted by **Garth Wilson** on 9 Dec 2005, 12:58 a.m.,*
in response to message #1 by ross denys

I expect that even the "Memory lost" message indicates only that the calculator couldn't make sense of the file chain, and only re-initialized it but did not write over everything. One way to find out would be to use the RAM editor in the Zenrom module. It would be kind of a big job to make sense of what you find though, even if significant parts of the program are still intact.

Re: i lost my program on my 41cx

*Message #5 Posted by **Eric Smith** on 9 Dec 2005, 4:36 a.m.,*
in response to message #4 by Garth Wilson

When it says "MEMORY LOST", it has zeroed all of main memory. It's a defensive measure; if the memory doesn't look valid it could contain any random junk that could cause a crash later.

The code that does this is at label "coldst" at line 809 of cn0b.asm. In fact, it looks like the code will zero extended memory too. Sigh.

That's amazing that they would do that. It's totally unnecessary. I haven't gotten into HP-41 Mcode and other internals (except for a small level of synthetic programming), but I've designed and used file chains in RAM on small embedded computers based on what I understood to be happening in the HP handhelds. Instead of using a FAT, I had a header at the beginning of each file, and the header included information on how long the file is so the OS can link to the beginning of the next file to find it, and so on. The location pointed to by the last link should equal the address pointed to by a system variable telling where the .END. byte is, and that address should contain the .END. byte value. Every file except the first one should be immediately preceded by the END byte of the previous file. There is a system variable telling how many files there are, so the OS can check and see if it finds that many, all ending with an END byte, before reaching the .END. byte. The file-length record in the header may be changed and the rest of the chain was scooted up or back and the expected address of the .END. byte changed as necessary when you edit the file. It worked great. Beyond this info, the embedded computer's routine that checked the file chain integrity didn't care what was in a file, so long as it could make sense of the chain and find the right number of files with all their END bytes, and finally the .END. byte at the expected location. This constitutes several safeguards to be sure the file chain is good even if there could be a problem in one file that does not affect any others and should not be a cause to wipe them all out. If there was a file chain problem (which in the final product only resulted from removing the batteries for too long), it would just reset the number of files to 0, and store the .END. byte where the first file would start. The rest of the memory was untouched, and its contents didn't matter to the computer. This worked out well during debugging in the development since I was able to quickly pick through and reconstruct the file chain and recover the information. (We're definitely not talking about tens of thousands of files like you get on a desktop computer.)

Re: i lost my program on my 41cx

*Message #7 Posted by **Eric Smith** on 10 Dec 2005, 2:36 a.m.,*
in response to message #6 by Garth Wilson

That would be a lot of work for no real gain. Writing microcode for the Nut processor is painful,

and you don't write any more of it than you have to.

The "file chain" doesn't get corrupted all by itself, so what's the point in having a lot of microcode designed to recover from problems? Writing fancy recovery code would have taken longer to write, and much longer to test thoroughly - you'd have to ensure that for every possible corruption case the recovery code either successfully recovers (so the RAM contents afterward are fully valid), or that it clears memory. It wouldn't be acceptable to have any cases for which the recovery code thought it had recovered successfully, but in fact left any invalid code in memory.

And that's not easy, because it's difficult to fully validate 41 user code. There are many byte sequences that could appear in a program that will cause a crash. It was a non-negotiable requirement of the product design that after a cold start, there can't be any leftover junk in memory that might cause problems.

As it is, they overlooked the effects of possible corruption on one of the warm-start processes, and that made it possible to get an unrecoverable hang from an invalid buffer chain. It would have been better if they'd erred even further on the side of caution, as it would have saved people a lot of time with batteries removed and waiting for the capacitor to discharge. (They solved this by adding a hard reset feature in later versions of the Nut processor.)

I've been an embedded software developer for many years, and I think if I'd been one of the 41C designers I'd have had a hard time selling my manager on spending an extra several weeks to write and even more time to test fancier recovery code for conditions that aren't even supposed to happen. After all, users were supposed to store their programs and data on cards.

Re: i lost my program on my 41cx

*Message #8 Posted by **Garth Wilson** on 10 Dec 2005, 5:12 a.m.,*
in response to message #7 by Eric Smith

I never wrote any recovery code. I picked through the headers by hand a couple of times only in the debugging, which didn't take more than a few minutes when there were probably less than six files there. The computer only looked at header bytes and the end-of-file and end-of-chain bytes, plus the two variables telling how many files it should find and what the address of the .END. should be; and this was only to determine the integrity of the chain. It took about 40 lines of assembly code. If something there didn't make sense there, it re-initialized the chain by writing into the one variable that there were no files, and into the other variable that the address of the .END. byte would be where the first file will start, and it wrote the .END. byte there. This all took 8 lines of assembly code. It did not do anything else to any other memory locations, and it didn't care what was in the old file space. It's like deleting files on a disc and just marking the space available instead of completely re-initializing every sector that a file had used before being deleted. There's simply no reason to write over those sectors unless you're trying to keep enemies from getting some data off a computer they've captured.

Re: i lost my program on my 41cx

*Message #9 Posted by **Eric Smith** on 10 Dec 2005, 7:11 p.m.,*
in response to message #8 by Garth Wilson

Sure, but you only get to the MEMORY LOST code if it has detected a serious problem. So at that point it can't be assumed that any of the memory contents are valid. Aside from clearing all memory (which is what they do), the only way to guarantee that memory doesn't contain nasty stuff that can cause a serious crash later would be to do some sort of validation process on *everything*, not just the END chain.

That validation of everything is what I am claiming would require much work to write, and even more to debug.

What is the ans. of sin(32 pi) in rad mode

*Message #1 Posted by **cre** on 8 Dec 2005, 4:06 a.m.*

My question in my test was "what is the ans. of sin(32 pi) in rad mode. I put -3286476925x10E-12. But the model ans. is 0. Why? I just input directly to my HP38g.

Anything wrong?

>
> Anything wrong?

The sin(x) function is periodic, with period 2*Pi. This means that sin(x) = sin(x + 2*Pi) = sin(x + 4*Pi) = ... = sin(x + 32*Pi). Since sin(0) = 0, then sin(0 + 32*Pi) = 0.

If you truly entered sin(32*Pi), you _SHOULD_ have obtained 1.26616369195E-10 as your answer (which is extremely close to 0, the real answer). The reason it's not exactly 0 is because the HP first calculates 32*Pi, which is approximately 100.530964915. Then it takes the sine of this approximate value, which returns 1.26616369195E-10 (approximately 0).

I'm not sure how you managed to obtain -3286476925x10E-12. For one, this is not a typical way of displaying numbers on a calculator. Secondly, -3286476925x10E-12 = -0.003286476925, which on your calculator should appear as either -0.003286476925 or -3.286476925E-2.

Check that your modes are correct. [SHIFT-KEY] + [HOME] and examine that your modes are Radian and Standard.

> If I have the same question again on my test, should I write "0" or the number with the notation which display on my calculator?

Well, mathematicians always accept the exact answer -- in this case it is '0'. If your question specifically says to use your calculator for computations, however, then I would write down what shows up on the calculator.

Re: What is the ans. of sin(32 pi) in rad mode

*Message #5 Posted by **unspellable** on 8 Dec 2005, 4:12 p.m.,*
in response to message #4 by Han

If the test asks for the answer provide by the calculator, which in this case it appears to do, since it specifies the mode, I would put down the residual error dipslayed on the calculator rather than zero. In this case that WOULD be the exact answer, and hopefully the instructor is looking for an understanding of calculator operation.

On the other hand, if I were an instructor looking for an understading of the underlying math and not the peculiarities of calculator operation I might expect to see zero regardless of what the calculator displays.

I have seen much controversy about calculators in tests and whether muscle calculators are an unfair advantage or whether they should be banned. In my engineering classes the test questions were always made up in such a way that it made no difference what sort of calculator you had from very basic non-programmable scientific with no memory on up. In fact I had one math instructor who would send the exam home with you for the week end. (In which case you could kiss the week end goodby.)

Re: What is the ans. of sin(32 pi) in rad mode

*Message #6 Posted by **Ed Look** on 10 Dec 2005, 7:17 p.m.,*
in response to message #5 by unspellable

THIS is the best comment (if not explanation) so far!

Please, Cre, memorize your basic trigonometric values first and review on a set of x and y axes why this is true drawing the triangle which hypotenuse radiates from the origin using the definitions of sine, cosine, tangent, etc.

Remember, sin A = 0 for A = 0, 180, 360, etc., and, = 1 for A = 90; = -1 for 270, etc. and all the other special values for sin 30, 45, 60, etc., and similarly for cos A. These have either exact or easily remembered values.

This might save you a lot of time on a test rather than the calculator answer. The calculator is really for us old folks whose brains have worn out since college... or high school for some! ;)

Re: What is the ans. of sin(32 pi) in rad mode (edited...)

*Message #7 Posted by **Vieira, L. C. (Brazil)** on 8 Dec 2005, 1:17 p.m.,*
in response to message #3 by cre

Hi, Cre;

I agree with Han. Sin (2n*PI), being "n" an integer, is always zero. The simplification he shows might also be used to demonstrate your answer in the test. If you write Sin (2n*(3.1415...)), you'd need to compute it with as many digits as the system accepts and handles.

I am not sure about the HP38G, but you can find at least two possible answers in some advanced calculators. If the calculator is set to compute exact answers, then SIN(2n*PI)=0 (n=integer). Otherwise, in approximation mode, SIN(2n*PI) returns the best approximation, given internal accuracy.

As a teacher, I'd ask the student to explain the answer.

Hope this helps a bit.

Best regars.

Luiz (Brazil)

Re: What is the ans. of sin(32 pi) in rad mode

*Message #8 Posted by **Garth Wilson** on 8 Dec 2005, 1:37 p.m.,*
in response to message #2 by Han

About the "-3286476925x10E-12"-- I've seen this mistake with students before. I don't have that calculator model to know exactly what you got, but I suspect it might have been "-3.286476925 -12", with the decimal point after the first digit if it was in scientific notation, or possibly after the second or third digit if you have the calculator set for engineering notation.

The "-12" at the end however means E-12, or "times ten to the minus twelfth power," which is *not* the same thing as "x10E-12". The "E" already means "x10^__" If you put "x10" in there yet again, you'll be off by a power of ten. "x10E-12" is the same as "E-11". To visualize more easily, consider "10E0", which means "ten, times ten to the zero power," = 10x1 = 10, not 1 or 100. "x10E0" means "times ten"; but if the calculator says "E0" or just "00" in the exponent area at the right end, it means "times one". It seems to be common for students to misinterpret this and be off by a factor of ten.

Re: What is the ans. of sin(32 pi) in rad mode

*Message #9 Posted by **Crawl** on 8 Dec 2005, 5:52 p.m.,*
in response to message #1 by cre

A few extra comments:

Usually, with really good calculators, sin("pi") <> 0 has nothing to do with calculator error. The error is in pi, which is an irrational number being represented as a rational.

It turns out that you can use sin(pi) as a quick way of getting a more accurate pi.

If x is very small, then

sin(pi + x) ~ -x

However, pi on the calculator has an error, because it is only stored to so many digits. That error is the negative of the sine of the stored pi, so adding them subtracts the error from the stored pi.

On of my calculators, "pi" = 3.14159265359

sin("pi") = -2.067615374e-13

Of course, you can't combine the two, because all the extra digits will be pushed off.

You can split pi in half, though.

The first half, say, could be

3.141592653

and the second would be 0.00000000059.

Add *that* to the sin of "pi" and you get

0.000000000589793238 46...

Put both halves of pi together to get

3.14159265358979323846

which is correct to pi for 21 digits.

Another note: It's not a good idea in almost any test to give all 10 (or more) digits from a calculator as an answer.

Simple: Pi to 24 digits on later HP calc's

*Message #10 Posted by **Karl Schneider** on 9 Dec 2005, 2:19 a.m.,*
in response to message #9 by Crawl

Utilizing the identity

```
sin(A - B) = sin(A)*cos(B) - cos(A)*sin(B),
```

the result

```
sin(pi - x) = sin(pi)*cos(x) - cos(pi)*sin(x)

            = sin(x)
```

is easily obtained.

Let "x" represent the entire string of missing digits when the value of pi is truncated (not rounded) to a certain number of decimal places.

sin(x) ~= x for small x, and the approximation improves toward perfection as x approaches zero.

Therefore, entering the first "n" digits of pi and taking its sine in radians mode should accurately yield a string of immediately-subsequent digits.

Best results for this simple procedure are obtained using an HP calculator with a Saturn microprocessor. These offer 12 significant digits and a faster processing speed that enables the functions to be computed more accurately.

In radians mode on a HP-20S,

```
sin (3.14159265358) = 0.000000000000979323846264

and pi = 3.14159265358979323846264, correct to 24 digits.
```

The difference between x and sin(x) for this very small value of x is guranteed to be less than (1/3)*x^3 (the next term of the Taylor series for sine), which is much smaller than x.

(I assume that one could probably use "EXACT" mode on an HP-49 to obtain more digits of pi.)

On a 10-digit pre-Saturn HP calc, the 11th through 20th digits of pi cannot be obtained by this procedure. The algorithms apparently don't carry out the series for sine to as many terms, probably owing to lack of processor speed. Alas, tradeoffs had to be made...

In radians mode on a HP-15C or 41C,

```
sin (3.141592653) = 0.00000000059

and pi = 3.14159265359, rounded to 12 digits.
```

Re: Simple: Pi to 24 digits on later HP calc's

*Message #11 Posted by **Marcus von Cube, Germany** on 9 Dec 2005, 3:02 a.m.,*
in response to message #10 by Karl Schneider

Karl,

I tried this on 2 of my TIs (an old TI-36 solar with 12 digit accuracy and a more modern Voyage 200.) None of them produced any more digits as had already been stored in the numerical constant PI.

Does this mean, that these calcs dont't use Taylor series approximation but CORDIC instead? As I understand, the latter algorithm produces consecutive digits of a transcendental function based on a series of precomputed constants in ROM.

Marcus

Accuracy and methods for sine (and cosine)

*Message #12 Posted by **Karl Schneider** on 9 Dec 2005, 3:48 a.m.,*
in response to message #11 by Marcus von Cube, Germany

Marcus --

I'm not sure exactly what methods the respective calculators use for sine and cosine, but it is quite likely that something other than Taylor series are used. I have heard of CORDIC.

Note that I didn't explicitly state that the Saturn-based HP's used Taylor series:

> Quote:
>
> sin (3.14159265358) = 0.000000000000979323846264 and pi = 3.14159265358979323846264, correct to 24 digits.

> The difference between x and sin(x) for this very small value of x is guranteed to be less than (1/3)*x^3 (the next term of the Taylor series for sine), which is much smaller than x.

This implies only that, if this 12-significant-digit result for sin(x) returned by the HP-20S (and other Saturn-based models), is correct and accurate, it must differ from x by less than (1/3)*x^3, as guaranteed by the convergent alternating Taylor series of monotonically-decreasing terms.

I got the following results:

- 11th and 12th digits "59" on the HP-6S;
- 11th through 20th digits on the HP-30S;
- no additional digits on the Le World scientific;
- (My TI-36X Solar is at the workplace.)

*Message #13 Posted by **Ron** on 9 Dec 2005, 3:30 p.m.,*
in response to message #12 by Karl Schneider

FWIW:

My HP49g+ yields 0 for sin(32*pi) in exact mode (approximate not checked) and the same deviation as yours when approximate is checked or if in algebraic mode. It appears to respond with zero only if the calculator is in EXACT AND RPN.

All methods to display pi: (1*pi, pi..) otherwise result in pi rounded to 12 digits .....59, regardless of exact or algebraic modes.

New solution for the corrosion of HP-41 I/O block.

*Message #1 Posted by **Diego Diaz** on 7 Dec 2005, 4:57 p.m.*

Hi all,

I've managed to built a suitable solution for those bad damaged I/O blocks we've all seen into lots of HP-41's battery compartment.

Please take a look at:

http://www.clonix41.org/Maintenance/IO_Block/IO_Block.htm

Your comments are certainly welcomed.

Diego.

in response to message #1 by Diego Diaz

Hi Diego.

Let me be among the first to say thank you for the development of this item. I have long waited for a solution such as this, and just two weeks ago I lost my fave 41 to this disease.

How to order? How much?

Congrats again.

Re: New solution for the corrosion of HP-41 I/O block.

*Message #5 Posted by **Randy** on 7 Dec 2005, 5:48 p.m.,*
in response to message #1 by Diego Diaz

Positively brilliant. The VHB adhesive does the job very well I'm sure without the need for screws or rivets.

Do you have any quantity pricing?

Re: New solution for the corrosion of HP-41 I/O block.

*Message #6 Posted by **James MacPhail** on 7 Dec 2005, 6:19 p.m.,*
in response to message #1 by Diego Diaz

I am eager to order some of these as well.

However, I am wondering if the VHB adhesive is too strong and will make future repairs impossible... after the new circuit is attached, how difficult is it to remove it?

If it is difficult, perhaps using less than 100% coverage of adhesive would be appropriate? (Or perhaps it is already that way?)

Thanks!

Re: New solution for the corrosion of HP-41 I/O block.

*Message #7 Posted by **Diego Diaz** on 8 Dec 2005, 9:46 a.m.,*
in response to message #6 by James MacPhail

Hi James,

3M VHB is AFAIK the strongest double sided adhesive tape available. However, it can be removed. I've done this in one of the samples (in the keyboard PCB contact area) with a smal drop of oil... and a nice amount of patience...

Should the case of a later replacement arises, it will be possible to get the I/O Block plastic cleaned to receive a new Flex PCB.

Greetings.

Diego.

Did the tape help you to withstand the powers of the recent tropical storm on the Canaries?

Marcus

Re: Adhesive tape on the Canries ;-)

*Message #9 Posted by **Diego Diaz** on 8 Dec 2005, 11:38 a.m.,*
in response to message #8 by Marcus von Cube, Germany

Hi Marcus,

Good point indeed! :-)

But unfortunatelly, we haven't got enough tape to securely bond every antenna... and power line tower... more than 200,000 people sunk into darkness, rotten foods, closed highways, no phone lines and almost out of tap water for four days. A real mess. The worst part of all that happened in the Teneriffe island, here at Gran Canaria, where I live, there were almost no significative damages affecting people's normal life. There were severe damages to the harvests though.

This was by no means comparable to Rita's or Katrina's destruction path thru the States, but this was the first time something like this happened in the Canaries and we were not ready at all, so we've paid a very high price for joining the "Hurricane Club".

I sincerely hope we've all learned that first lesson and next time (if ever) we'll be more prepared to face Nature's power.

Best wishes.

Diego.

in response to message #1 by Diego Diaz

Brilliant work I agree.... Thanks for your work again Diego.

I´m currious about the ebay deals with dead HP-41 calculators... ;) Matthias

Re: New solution for the corrosion of HP-41 I/O block.

*Message #19 Posted by **Diego Diaz** on 8 Dec 2005, 9:13 a.m.,*
in response to message #18 by Matthias Wehrli

Hi again and a very big thanks to all of you for your kind comments... (Seems you were rigth Bill ;-)

I'd like to clarify that these units are not in production yet. If this was the case I'd have placed a FS ad instead.

These are samples I ordered a few weeks ago and received yesterday for testing. Tests have gone really well. I was the first one to be impressed for the outstanding quality of the board and the accuracy of the tooling job (this was my real concern as tolerances for the I/O interfece are very tight)

The aim of this thread is making myself a clearer idea about the "reasonable" number of units to order mass production. Obviously the final price will depend on that number... the higher the number, the lower the price (ok, you knew that already :-) import taxes will also affect the definitive figures.

The expected range for the final price tag is set between 35 and 45 Eur. As you can see they're not cheap, (more than $1000 just for processing and tooling... three samples!!) that's probably why no-one had decided re-manufacturing them before... that, and the difficulties in find a high quality manufacturer willing to accept so small a run orders... most HI-Tech manufacturers of Flex-PCB's do not accept orders below the thousand units.

Regarding availablity, they can be ready to ship by early Feb. I'll place the corresponding FS ad with the usual info in this site as I got them on hand.

Again thanks for your interest and best wishes for this Xmas season from the (now sunny :-) Canary Islands.

Diego

in response to message #19 by Diego Diaz

Diego: Here, here!

I've also a "dead" 41C. Well, not really dead, but with corroded contacts. If I could change them, I could give it a second life!

Count me in, I too I'm looking forward to your offer.

Have a nice Xmas.

Valentino

*Message #21 Posted by **Andreas Müller** on 12 Dec 2005, 9:41 a.m.,*
in response to message #19 by Diego Diaz

Hi Diego,

Congrats to this superb job. If I can help to decrease the cost: I need five!

Best wishes, Andreas

P.S. How many top secret "little surprises" do you still have in your drawer?

Re: New solution for the corrosion of HP-41 I/O block.

*Message #22 Posted by **David Smith** on 9 Dec 2005, 12:08 p.m.,*
in response to message #1 by Diego Diaz

The picture of the contacts on the installed one looks different than the flat one. They appear much too thin. Did you have two versions made?

BTW, I have a box of 24+ HP41 machines: all working, but with repaired corroded contacts and many with minor engravings, etc. It may be worth fixing them up with new contacts.

Now, tool up some port and battery covers...

Re: New solution for the corrosion of HP-41 I/O block.

*Message #23 Posted by **Diego Diaz** on 10 Dec 2005, 10:52 a.m.,*
in response to message #22 by David Smith

Hi David,

You've certainly got a sharp eye man!!

The flat Flex in the picture is indeed thicker than the mounted one. This is due to the liner (protective paper coating) attached to its back. This liner must be removed during instalation to expose 3M VHB adhesive, thus the final thickness is actually thinner, but there is just one version of this Flex PCB.

If you're seriously planning a *mass* recovery of your (+24) units, chances are that this helps to get a "thinner" final price for all of us too. ;-)

Best wishes.

Diego.

Re: New solution for the corrosion of HP-41 I/O block.

*Message #24 Posted by **David Smith** on 10 Dec 2005, 11:09 a.m.,*
in response to message #23 by Diego Diaz

Well, I was referring to the width of the traces where the modules make contact. On the photo of the mounted one, they appear to be rather thin. On the photo of the flat one they seem to be more like the width of the original HP ones.

Re: New solution for the corrosion of HP-41 I/O block.

*Message #25 Posted by **Diego Diaz** on 10 Dec 2005, 12:48 p.m.,*
in response to message #24 by David Smith

Hi David,

Thanks for the clarification, I had been wondering how have you got such a sharp perception to appreciate the difference in the PCB's thickness... (and was seriously considering a visit to the optician!! :-)

Back to the tracks widthness issue, the difference you can see in the picture is just caused mainly due to illumination incident angle when the pictures were taken, but both PCB's are identical and have been designed to match (or exceed) the original specs.

Cheers.

Diego.

Creating .ROM files for HP41 ?

*Message #1 Posted by **Francois** on 7 Dec 2005, 3:15 p.m.*

Hello,

Further to advices found on the forum for creating my own .rom files, I've started working with EMU41 which works great but I'm unable to solve the following problems. 1) I've downloaded the machine code for hp41cx (5 * 8k rom files) but I'm unable to merge these files into one .ROM file and then convert it with CLBIN41.EXE Can I use directly .ROM files in EMU41 ? 2) I've not find the necessary rambox.bin file. Where can I find it or create it ? 3) Can I load .ROM files directly in V41R8 or does it accept only .MOD files In this case, how can I convert .ROM to .MOD files ? Thank you by advance for advices, I'm very new in this domain. I own my 41cx since 1984 but don't know anything about machine langage.

Francois (loooking for a charging port cover ...) France

Re: Creating .ROM files for HP41 ?

*Message #2 Posted by **J-F Garnier** on 8 Dec 2005, 6:46 a.m.,*
in response to message #1 by Francois

Bonjour Francois,

I can answer the questions relative to Emu41:

*1) I've downloaded the machine code for hp41cx (5 * 8k rom files) but I'm unable to merge these files into one .ROM file and then convert it with CLBIN41.EXE Can I use directly .ROM files in EMU41 ?*

ROM files are compatible with Emu41, you can load them directly without merging or converting them. Just pay attention that Emu41, as a DOS application, doesn't accept long filenames so you have to shorten some ROM filenames to 8 characters (e.g. xfuns3-2d.rom).
The only exception are bank-switched ROMs, that you *have* to merge into a single file so Emu41 can recognize the bank switching scheme. To merge files, you can do at Windows Command Box level:
copy time-2c.rom /b + xfuns5-2D.rom /b cxtime.rom
Finally, the Emu41.ini file for CX machine becomes:

```
0 4 nut0-N.rom
1 4 nut1-F.rom
2 4 nut2-L.rom
3 4 xfuns-2d.rom
5 8 cxtime.rom   the only ROMs that *need* to be merged
```

The other ROM that need to be merged are: the Advantage ROM (merge the 3 4k-blocs) and the Hepax (merge the 4 4k-blocs)

2) I've not find the necessary rambox.bin file. Where can I find it or create it ?

The Rambox code is part of the Rambox and is included in the ramboxii.dat file (both banks of page 8).

J-F

Re: Creating .ROM files for HP41 ?

*Message #3 Posted by **Francois** on 8 Dec 2005, 3:54 p.m.,*
in response to message #2 by J-F Garnier

Merci Jean Francois et félicitations pour EMU41, I've succeded in declaring the rom files for 41 cx and merging the xfuns rom files into one. It works great and I find all the modules in cat 2. For the rambox, I've declared 10 64 ramboxii.dat it's ok. After, I've created a user code software rom using INITPG LDPGM XQ>XR SUMPG ENDPG All works great. I can list my programs in the RAMBOX 64a module and they are stored in the mldlram.dat file. After, the problems begin. I copy the mldlram.dat in emu41in.dat file and execute LOWER and UPPER. Then rename emu41out.dat in module.bin and convert it in module.rom. But I'm unable to declare and see my module in cat 2 either declaring module.bin or module.rom I think I miss a little detail somewhere but I'm unable to find where. If someone could help me .... Thank you again Francois

Re: Creating .ROM files for HP41 ?

*Message #4 Posted by **J-F Garnier** on 9 Dec 2005, 7:14 a.m.,*
in response to message #3 by Francois

For the rambox, I've declared 10 64 ramboxii.dat it's ok

The 64k rambox *must* be declared as:
8 64 ramboxii.dat (starting from page 8, up to page 15)

I understand that your goal is to create a custom ROM module. It's a good idea to use the mldlram.dat file. You just have to override 2 free pages of the rambox, by adding *after* the rambox declaration:
10 8 mldlram.dat for instance

After, the problems begin. I copy the mldlram.dat in emu41in.dat file and execute LOWER and UPPER. Then rename emu41out.dat in module.bin and convert it in module.rom.

You are refering to the LOWER and UPPER utilities described in Christoph Klug's document. I advise to include a CLRDEV function (X-I/O module) after the SELECT function and at the end of each utility, to be sure to reset input file pointer and then close the output file (flush any data in internal/system file buffer).

Tell me if this helps !

J-F

Re: Creating .ROM files for HP41 ?

*Message #5 Posted by **Francois** on 9 Dec 2005, 4:36 p.m.,*
in response to message #4 by J-F Garnier

Thank you Jean Francois

I've looked rapidely at my problem. I'm able to create .BIN files with my code inside but when I

declare it in EMU41, it doesn't appear in any cat but can be exectuted.

Best regards François

HP48GX -- 2 years not in use -- cant get it run

*Message #1 Posted by **Pelusa** on 7 Dec 2005, 3:17 a.m.*

Hi, I have a big problem with my HP48GX. I read already in the archiv that of the RAM is without battery for a too long time strange things might happen.

Well my problem right now is, that when putting new batteries in, I just see first these fast running horizontal lines going from the upper part of the display to the lower. I thought perhaps the HP is recovering. But it is now on for more than 2 hours, the lines have changed however. Now its just one thick line that is going downwards, but still no response to any keyboard entry.

Hopefully I get my HP to work again .... I thought I am asking first perhaps I have to wait longer to recover all memory, before i am trying to reset or delete what was on my memory (if this did not yet happen already ...)

Thanks for your help Pelusa

Re: HP48GX -- 2 years not in use -- cant get it run

*Message #2 Posted by **Namir** on 7 Dec 2005, 3:55 a.m.,*
in response to message #1 by Pelusa

With the batteries out of the alculator, use a piece of metal to connect the batterie contacrs. Ths acion should discharge any possible static charge. Insert the batteries and see f it turns on.

Namir

Re: HP48GX -- 2 years not in use -- cant get it run

*Message #3 Posted by **Han** on 7 Dec 2005, 12:17 p.m.,*
in response to message #2 by Namir

Here are some fixes you can try:

1. Check that your batteries are inserted in the correct position. If so, then remove the batteries and re-insert them. Does the HP turn on correctly?

2. If not, keep the batteries in there and leave your HP on. Turn it over so that you see the four rubber feet. Remove the top right rubber foot. You will see a hole where the rubber foot used to be. Take a paper clip and press it gently into that hole. Take a look at your HP's screen now. It should be off. Now turn your HP back on again, and chances are your HP is back to working order (with a "Recover Memory?" screen).

Theodolites and calculators

*Message #1 Posted by **Matthias Wehrli** on 7 Dec 2005, 12:43 a.m.*

Can someone tell me a bit more about attaching a theodolite to a HP calculator (HP-41 Serie, HP-71B, HP48GX, ...). What theodolite is needed for what system? There are so many different systems. For the HP48GX there is a SMI and a Topcon software, so I think there is at least one Topcon theodolite for this, but which one? What do I need else? For the HP-71B and for the HP-41 Serie there extists also Surveing software. For the HP-41 I have a DIF41. This is the interface to attach a Kern Swiss Theodolite E1/E2 (so at least here I know what I need). Maybe someoe can sell me usable configurations as Calculator, Software and Theodolite. With what systems do you operate?

Yours, Matthias

Re: Theodolites and calculators

*Message #2 Posted by **db (martinez, ca.)** on 7 Dec 2005, 11:30 a.m.,*
in response to message #1 by Matthias Wehrli

attaching: It's not just the software. Except for Topcon and Leitz they all use different plugs, or at least different pinouts. The oldest 2 Topcons also used their (don't ask me how) power input socket to transfer data but they only output distances. Older Geodimeters also had the problem of only transfering distance, at least to TDS. Of course, the HP platforms all use their own plugs on that end, with the exception of one TDS 41 configuration, which uses a standard 9 pin. D'zign's great 48 series programs were never marketed with data collection capability because each gun (dozens) needs it's own routine and Ted said it was just too much trouble back then. However, he would give users the program he wrote for his own Topcon 3B. Allen Precision Istruments caries a lot of the cables.

sell: If you want to have an instrument to trigger from your calculator just to have; i'd suggest looking for one of the older Topcons, they go cheap. The HP 3810b sometimes gets sold for a couple of hundred bucks. No one with a functioning Kern is going to sell it for what you will want to pay. They had sweet glass. You may someday, as they say, pry it from his cold dead hands. This is an *IF*: If Airbus uses Kern in the airframe division they will sell off working units after they have had the guts turned out of them. This happens with Boeing and their used Wild equipment. Good luck.

How to open the HP28

*Message #1 Posted by **inaki** on 6 Dec 2005, 7:59 a.m.*

Anyone has opened the HP28 calculator ? Does it have hidden screws or is it assembled by presure/click only ?

Re: How to open the HP28

*Message #2 Posted by **Gerson W. Barbosa** on 6 Dec 2005, 10:33 a.m.,*
in response to message #1 by inaki

Take a look at this older thread:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv006.cgi?read=9873

I got a nice 28S recently. Too bad there are two columns in the alpha keyboard that are not working, those starting at 'B' and 'F'. Do you want to open yours because of a similar problem?

Regards,

Gerson.

Re: How to open the HP28

*Message #3 Posted by **Bo B(Sweden)** on 6 Dec 2005, 10:49 a.m.,*
in response to message #2 by Gerson W. Barbosa

Yes, the method suggested in the link in Gersons' post above do work. I've used it for several 28S with broken keyboards. It's somewhat difficult to glue it together again and one should not expect the calculator to feel as solid as before (one could of course argue that this calculator didn't have a solid feel in the first place... :))

Bo

Re: How to open the HP28

*Message #4 Posted by **Gerson W. Barbosa** on 6 Dec 2005, 11:52 a.m.,*
in response to message #3 by Bo B(Sweden)

Hello Bo,

Before I attempt to open it up, how may I be sure the failure is due to a bad contact or a broken trail in the flex printed circuit? Given the columns that are not working, what keyboard overlays should I peel off, both?

Thanks,

Gerson.

Re: How to open the HP28

*Message #5 Posted by **Bo B(Sweden)** on 6 Dec 2005, 4:14 p.m.,*
in response to message #4 by Gerson W. Barbosa

Hi Gerson,

First of all, you may want to practice the disassembly procedure with throw-away unit (I did). Remember the Clamshells are often stated as "not repairable" - for a VERY good reason. I agree with Howards' post below, but with a great deal of patience and a little luck it might be worth a try.

With the 3 28S I've disassembled, I haven't experienced the type of column failure you describe. In all cases, individual keys have failed due to bad contact so a simple cleaning with isopropyl alcohol was sufficient. However, in your case a broken trail seems more probable. I don't know how to possibly diagnose and/or repair a broken trail, but perhaps some other on this forum knows?

And about the overlays: it's always a good advice to take the calculator apart as little as possible (even though the overlay removal is the easy part). Try first the side with the failing columns and see if it helps. The left overlay is most easily peeled off starting from the top (the A row), while the right overlay can be peeled off from either side.

Hope this is of any help! Let us know.

Bo

Re: How to open the HP28

*Message #6 Posted by **Howard Owen** on 6 Dec 2005, 12:06 p.m.,*
in response to message #3 by Bo B(Sweden)

But the main advice in the referenced thread is still good: given the difficulty of surgery on the clamshell models, and the low value they command on eBay, buying a used one there is almost a no-brainer.

Re: How to open the HP28

*Message #7 Posted by **Etienne Victoria** on 6 Dec 2005, 4:56 p.m.,*
in response to message #1 by inaki

Good evening Gerson, Inaki et al

Opening an Hp-28 can be done with some chances to restore the calculator in working order but very few chances to restore the original cosmetics.

I did it to add an interface in a friend's 28 using the following directions:

For english only speakers:

Dismantling the Hp-28. [source Joris Ballet]

For fellow french lovers :-) :

The excellent book from Sébastien Lalande. [source: courbis/Lalande]

The first link provides a tested procedure to disassemble/reassemble the calc.

The second link provides a much more detailed procedure and...all the rest.

I would advise to check them before X-actoing savagely your calc.

Best regards from France.

Etienne

Edited: 6 Dec 2005, 4:57 p.m.

Re: How to open the HP28

*Message #8 Posted by **Gerson W. Barbosa** on 6 Dec 2005, 9:15 p.m.,*
in response to message #7 by Etienne Victoria

Thanks Etienne, Bo and Howard,

Since I feel I am not exactly skillful in removing the overlays and putting them back in place again, I think I won't try it on that 28S because it looks so nice and I might ruin it. Besides, the menus in the defective columns can be accessed via MENU, which in turn can be accessed via CATALOG. Perhaps I can find out workarounds for the missing keys (using CHR, ->STR, etc.) If it only had a two-way infrared interface... Anyway, I'll try to introduce a complete program despite the missing keys.

Howard's suggestion is good, the problem is most 28S calculators I have seen at eBay would not be shipped abroad.

> Quote:
>
> For fellow french lovers :-) :
>
> The excellent book from Sébastien Lalande. [source: courbis/Lalande]

I'll take a look at it, *je pense que je peux comprendre quelque chose* :-)

Best regards,

Gerson

HP25 Memory

*Message #1 Posted by **Grahame Sutherland(Scotland)** on 6 Dec 2005, 6:29 a.m.*

Is there any data/specification for the HP25 memory ic type 1820-1564. Mine seems to be faulty, unable to store programs & memories.

cheers

Grahame

Re: HP25 Memory

*Message #2 Posted by **Stephen Easterling** on 6 Dec 2005, 7:15 a.m.,*
in response to message #1 by Grahame Sutherland(Scotland)

I thought that was the difference between the 25 and 25C: the "C" stood for continuous memory so that it would retain the program once you turned it off. I would not expect a non-C series 25 to retain memory after turning off.

Re: HP25 Memory

*Message #3 Posted by **Tony Duell** on 6 Dec 2005, 7:55 a.m.,*
in response to message #1 by Grahame Sutherland(Scotland)

Alas all the chips in the HP25 (and, in fact, most of the chips in all HP handheld calculators) are HP custom devices. There are no data sheets available, and the only source of spares is other old HP calculators.

FWIW, The HPCC schematics CD-ROM contains reverse-engineered schematics for the 25 and 25C (and IIRC all other Woodstocks).

Re: HP25 Memory

*Message #4 Posted by **Grahame Sutherland(Scotland)** on 6 Dec 2005, 8:29 a.m.,*
in response to message #3 by Tony Duell

It's a pity there's no info, although having a look at the HP25 diagram might shed some light on the operation of the chip. I may be re-tracing old steps here but it seems a shame I can't use my calc fully.

thanks anyway

Grahame

Re: HP25 Memory

*Message #5 Posted by **db (martinez, ca.)** on 6 Dec 2005, 11:03 a.m.,*
in response to message #4 by Grahame Sutherland(Scotland)

Somone posted something like this a couple of years ago. A reply stated that it probably was one particular chip due to the pattern of what still worked and what didn't.
If you repost with 1)if it is a 25 or 25c 2)when, if at all programs can be stored 3)what can be entered and rolled around in the stack 4)if the memories work 5)does the last x function- then some people here can take a good guess as to what is burned out.
A lot of these go south because of a bad battery connection durring recharging. For some reason; the problem can be worse if the calc is OFF while the charging problem is happening. Sadly; you don't know it happened till the dammage is done and theres no fix for a fried chip.
Good luck. May the RPN deities by with you.

Re: HP25 Memory

*Message #6 Posted by **Grahame Sutherland(Scotland)** on 7 Dec 2005, 5:00 a.m.,*
in response to message #5 by db (martinez, ca.)

*** 1)if it is a 25 or 25c 2)when, if at all programs can be stored 3)what can be entered and rolled around in the stack 4)if the memories work 5)does the last x function ***

1) HP25

2) Unable to store programs '13 00' for all entries

3) Stack seems to be OK

4) Memory contents always zero

5) LASTx always zero

Grahame

Re: HP25 Memory

*Message #7 Posted by **Tony Duell** on 6 Dec 2005, 2:44 p.m.,*
in response to message #4 by Grahame Sutherland(Scotland)

Here's a little background. Some of this comes from what I know about the HP41 series (NUT CPU), I believe the Woodstocks (ACT CPU) are similar, but hopefully Eric Smith will correct any serious errors.

The bus in these machines is bit serial. There's a 2 phase clock generated by the ACT which is routed to all the chips, there are 56 clock cycles per machine cycle. The ACT also generates a SYNC signal during a particular set of clock states of _most_ machine cycles (yes I believe I know the reason for this, but I don't want to confuse you too much).

Another bus line is ISA (Instruction and Address). During the first part of a machine cycle, the ACT outputs a ROM instruction address bit-serially on this line. During a later part of the cycle -- actually the states where SYNC is asserted, the ROM outputs the instruction, again bit-serially, and it's read by the processor _and by other chips in the machine_.

The last bus line you need to consider is the DATA line. This is normally an output from the ACT, and carries the 56 bits (one bit per clock cycle) from one of the internal registers of the ACT.

The RAM chip connects to all those bus lines and very little else. There is, for example, no traditional Read/Write line or address bus to the RAM.

To store something in RAM, the ROM chip contains a write-to-RAM instruction. To the ACT processor this is essentially a NOP. But the RAM also decodes it, and on the next machine cycle stores the bits from the DATA line into one of the 56 bit RAM 'registers'.

To load something from RAM, the ROM outputs a read-from-RAM instruction. Now the processor makes the DATA line an input, and stores the 56 bits presented on it during the next cycle into the appropriate register. Meanwhile the RAM also decodes that instruction and outputs the selected 56 bit 'register' onto the DATA line.

From this you can see that the RAM chip in an HP25 is a lot more than just RAM. It includes circuitry to decode some of the machine code instructions and do the appropriate things.

Re: HP25 Memory

*Message #8 Posted by **Grahame Sutherland(Scotland)** on 6 Dec 2005, 6:41 p.m.,*
in response to message #7 by Tony Duell

A wee bit clearer now, it sound a bit like an early I2C type device! This may be a bit simplistic, but might it be possible to program a Pic to decode these instructions and either read or write the 56bit data to the Pic's internal ram? It would depend on the clock speed of course but if sync and other timing pulses are available ;)

A worthwhile project?

regards

Grahame

Re: HP25 Memory

*Message #9 Posted by **Eric Smith** on 6 Dec 2005, 6:53 p.m.,*
in response to message #8 by Grahame Sutherland(Scotland)

Yes, programming a PIC to replace a Woodstock-series RAM chip is definitely possible. You'd need level shifters on the two-phase clock inputs, because they have a -12.5 to +6.5V swing (IIRC). Most of the PIC chips don't have an operating voltage range extending to +6.5V, but you can probably get away with that on any of them that are spec'd with an absolute maximum rating of +7V. Or you could use a PIC16HV series part.

Re: HP25 Memory

*Message #10 Posted by **Eric Smith** on 6 Dec 2005, 6:49 p.m.,*
in response to message #7 by Tony Duell

Tony's description is correct. There's a little bit of additional complication, in that there are actually 16 instructions that read the RAM, 17 that write it, and one that clears a block of 16 registers:

```
opcode
(octal)   function
-------   ------------------------------------------------------
1160      select register (and selects the block of 16)
0070      read selected register
xx70      (xx != 00) read register xx from selected block of 16
1360      write selected register
xx50      write register xx to selected block of 16
1260      clear block of 16 registers
```

The "clear block" instruction disappeared from later RAM chips. The 1820-1564 has it, and the

1820-1843 probably does as well. Both of those are 16-register chips. I'm not sure whether the 32-register chips (1820-1886, and the CMOS 5061-0469) have the clear instruction.

There are also combined RAM/ROM chips, used in the 67, 92, 97, 19C, 29C, 27, and Spice (series 30).

*Message #11 Posted by **Gordon from Chicago HP Calc Club** on 6 Dec 2005, 11:09 p.m.,*
in response to message #1 by Grahame Sutherland(Scotland)

Grahame,

Before you start replacing chips, please take a look at this link from Katie: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=267

I am the original owner of a 25C from 1977. It went into storage for 15 years, when I revived it, it no longer stored data properly. RCL yielded random results in all 8 registers, and so did the program memory, as well as the statistical functions (which used the registers).

I accidently discovered that if I left it connected to a charger overnight, it would work perfectly after the charging resistor heat up the calculator. When it cooled, the problem returned.

I followed the directions on the link, guess what, it worked beautifully ever after. Thank you Katie! I also added the zener diode to protect the calculator while I had the case opened and soldering iron out.

If your memory chips weren't fried by the charger, you may want to try out this repair and keep the original chips.

Good luck.

*Message #13 Posted by **Bernhard** on 7 Dec 2005, 4:31 p.m.,*
in response to message #12 by Grahame Sutherland(Scotland)

Dear Graham,

if you need a replacement RAM chip you might salvage one from a HP25C. These are more common and they have the same functionality, but a different pinout, so they don't fit into the socket of the HP25 RAM. I'd love to try such kind of surgery or assist in it. If you see no way out, please contact me by email.

regards, Bernhard

Re: HP25 Memory

*Message #14 Posted by **Grahame Sutherland(Scotland)** on 8 Dec 2005, 11:09 a.m.,*
in response to message #13 by Bernhard

Rewiring a different pin-out ic should be possible, there is a reasonable amount of space around the chip and not all pins are used. I'm keeping an eye out for any 25/25c's on Ebay, unless you have any;)

I read with interest the post for a new flexible connector for the 41c, that would breath some more life into mine.

thanks

Grahame

Re: HP25 Memory

*Message #15 Posted by **Bernhard** on 8 Dec 2005, 6:10 p.m.,*
in response to message #14 by Grahame Sutherland(Scotland)

Dear Graham,

one hint for hunting "transplant donor" HP25/25C on Ebay: the RAM chip of them is very close to the battery contacts and if the calc was killed by a leaky battery, then the RAM chip might be corroded, too.

The best way to mount a HP25C RAM chip into a HP25 probably is to bend the pins 90 degrees or snip them off, solder thin isolated wires to those which are needed, and the other side of the wires to the PCB, and then glue the RAM chip to the old place an upside down position.

I think if you add the few discrete components of the HP25C circuit which relate to the continous memory you might succeed in getting a HP25 with continous memory just like the HP25C.

But if the donor HP25C PCB is good (except for a few bad chips) it might be better to replace the bad chips with good ones from your HP25. This of course assumes that at least the RAM chip of the donor is still good. According to my experience with HP25Cs which were killed by attempting to run them on a charger without battery inserted almost all of them had a dead 1818-0154 ROM (the chip on the right lower side) while all other chips were still good (especially the 1818-0168 anode driver always was good, somehow the display seems to protect it from overvoltage). Second place in fatalities was the ACT. All these chips can be interchanged between HP25 and HP25C. ACT 1820-1523 and 1820-1741 also fit the same socket (can be interchanged in the HP25, HP25C)

BTW, I have a few 5061-0469 RAM chips (25C/29C) and would swap / trade against a 1818-0154 and/ or a 1818-0431 which I am looking for.

Regards, Bernhard

Re: HP25 Memory

*Message #16 Posted by **Grahame Sutherland(Scotland)** on 9 Dec 2005, 5:02 a.m.,*
in response to message #15 by Bernhard

As I only have the one 25 at the moment I'll keep looking for a doner machine but I agree

with your idea of mounting the chip upside-down and wiring the pins out to the board. I still think it would be a good project to emulate the ram chip within a PIC, a bit more research into the workings of the HP ram chip first though.

many thanks

Grahame

HP41 Beep sound in a .WAV format file

*Message #1 Posted by **Andrés C. Rodríguez (Argentina)** on 5 Dec 2005, 10:04 p.m.*

I am looking for an acceptable-quality WAV sound file containing a recording of the HP41 BEEP. I think it may be used in some emulators/simulators, but I haven't found such file.

I suppose there are no copyright issues for this case :-)

If someone has this kind of file, please send it to

andres dot c dot rodriguez at gmail dot com

Thank you in advance,

PS: Just in case you are curious about this, it will be the startup sound of my new digital still camera.

Value of Champion case

*Message #1 Posted by **Samuel Heddle** on 5 Dec 2005, 9:33 p.m.*

How much can I be expected to get in return for a Champion leather case on an online trade? I'm just wondering, as I'm looking to get some modules for my new toy, a slightly battered 41-CV.

Re: Value of Champion case

*Message #2 Posted by **Stephen Easterling** on 5 Dec 2005, 11:39 p.m.,*
in response to message #1 by Samuel Heddle

$35 - $70, depending on if some bidders get into bidding wars on Ebay. I'm so glad I finally found one for my 28S (my first calc 15+ yrs ago). I would have gladly paid $50 for the case just to make it complete and cozy. Those nice leather cases for the Champions just never turn up on Ebay, and when they do, they are being auctioned off with the calc and manuals. I say run an auction for $45 or $50.

Clonix-41 update (Xmas gift... ;-)

*Message #1 Posted by **Diego Diaz** on 5 Dec 2005, 3:32 p.m.*

Hi all,

It's Xmas season and most of us are seeking for appropriate gifts...

Indeed it's a hard job to find the right gift for every person, but I'm pretty sure I've got a (sort-of-a) gift that will make many (all?) Clonix users very happy: some miliamps!!

Yes, if you take a look at http://www.clonix41.org/Projects/Clonix-41/clonixlp.zip you'll find a brand new version of the code for your Clonix-41 (of course it can also be used with NoV's)

Tha main difference with previous version is that the power consupmtion has been reduced by some 60%... yes, sixty!

There are some drawbacks though:

- You cannot use the 512 RAM words option.

- No bank-switching (this only affects Advantage emulation)

- It cannot be used with 2x speeded up HP-41's

For now this is *experimental* as it has not been possible to test it with the whole HP-41 clock range (340 thru 380KHz) but I've tested it within the 351 - 371KHz range and worked flawlessly.

Hope you enjoy it as much as I've enjoyed developing the code!! ;-))

Best whishes from the Canary Islands.

Diego.

I consider myself visited, Santa!

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 5 Dec 2005, 6:30 p.m.,*
in response to message #1 by Diego Diaz

Hey, Diego;

I'm still waiting for the package, but it is not yet delayed; my bet is that it will be here prior to the end of the week. I'll let you know.

And by all means, I consider myself alredy visited.

Thanks!

Luiz (Brazil)

Re: Clonix-41 update (Xmas gift... ;-)

For those who ordered a 49G+ from Joe Horn...

*Message #1 Posted by **Wayne Brown** on 5 Dec 2005, 12:04 p.m.*

...a bit of news has surfaced.

Several people have mentioned over the last few months that they ordered 49G+ calculators from Joe Horn's web site but never received them. I believe it's been about a year since those orders were placed, and people have (understandably) been concerned and/or upset about the situation. The most worrying part is that there has been little or no information available about the reasons for it. There were a few bits of information indicating that Joe had been dealing with some serious health issues, but no explanation for why no one was at least attempting to answer questions about the calculators. Although I didn't order one of these calcs myself, I found all this troubling because I've always known Joe to be a stand-up guy and found it hard to believe that he would behave in a dishonest manner, so the whole mess seemed inexplicable.

However, it looks like the situation is on its way to being resolved, and I'm happy to say that the problems up to now appear to have been, as expected, beyond Joe's control. There's been a thread in comp.sys.hp48 recently discussing this issue, and Joe responded to it yesterday. I'm going to reporduce his reply here, for the benefit of those who don't read comp.sys.hp48.

```
Joe Horn <joehorn@holyjoe.net> wrote:

Is this an authentic HP product?

*Message #1 Posted by **Han** on 5 Dec 2005, 11:19 a.m.*

HP48 AUR on eBay

Did HP ever produce such a version of the AUR? It looks like someone may have just printed the HP48 AUR that exists as a PDF file and placed it into a 3-ring binder...

Re: Is this an authentic HP product?

*Message #2 Posted by **Ed Look** on 5 Dec 2005, 11:47 a.m.,*
in response to message #1 by Han

Yes, there IS an authentic HP-published HP 48G series AUR. You can still find copies from some sources, like Samson Cables or maybe CalcPro.

Re: Is this an authentic HP product?

*Message #3 Posted by **Han** on 5 Dec 2005, 11:55 a.m.,*
in response to message #2 by Ed Look

Perhaps I should clarify. I understand that HP did produce a AUR for the HP48G series. The version I know of resembles the User's Guide (softbound cover). However, the eBay auction shows a 3-ring binder version of the AUR. So, did HP ever produce a 3-ring binder form of the AUR?

Re: Is this an authentic HP product?

*Message #4 Posted by **Ed Look** on 5 Dec 2005, 12:00 p.m.,*
in response to message #3 by Han

Not to my knowledge; notice on that picture on eBay that there is an extended gray region on the binder cover. I don't recall there being such a huge gray region like that on the original book version. It was more of a thinner sliver. I think it's a (homemade) copy put in a binder with a nice cover jacket.

I'm not sure it's legal, even if it's dirt cheap...

Re: Is this an authentic HP product?

*Message #5 Posted by **Norris** on 5 Dec 2005, 12:30 p.m.,*
in response to message #3 by Han

I bought an HP48GX, interface cable, and AUR from a mail-order electronics distributor in 1999 (possibly 1998). It was from either "Wholesale Products" or "Wholesale Advantage" (can't remember which -- they are both still listed in the "Calculator Buying Guide" at hpcalc.org).

Anyway, my AUR appears to be exactly like the one shown in the eBay auction. I have always assumed that it was an authentic HP product; in fact, I didn't realize that the AUR came in any other

formats besides the 3-ring binder.

I doubt that these are "homemade" copies. It's hard to see the scale in the eBay photos, but on my AUR the binder and paper are non-standard sizes: the paper is 5.5" x 8.5" (half size), and the binder is an unusual 10" x 8.8" size. Someone who wanted to print out the AUR from a CD would probably use standard 8.5" x 11" paper and a regular binder.

My guess would be that HP ran out of softbound AURs by 1999, needed more, and decided that it would be cheaper to reprint the AUR in binder format than in softbound format.

The binder version may be better than the softbound version in terms of functionality. It's bulky, and takes up a lot of shelf space, but it easily lies flat on your desk and stays open at any page.

Re: Is this an authentic HP product?

*Message #6 Posted by **Norris** on 5 Dec 2005, 12:44 p.m.,*
in response to message #5 by Norris

To clarify a bit more, the printed pages in my AUR binder are almost exactly the same size as the pages in my softbound HP48G "User's Guide". They are not standard 8.5" x 11" pages.

It appears to me that the eBay AUR is identical, but since there is no scale in the photos, it's hard to see the dimensions.

Re: Is this an authentic HP product?

*Message #7 Posted by **Ed Look** on 5 Dec 2005, 1:08 p.m.,*
in response to message #5 by Norris

Well, Wholesale Advantage or Wholesale Products appears to be no longer in existence, as a few years back, its link on one of the calculator site pages was nonfunctional and I cannot even find a website for it anymore.

If you know differently, please post!

If it is legal, then this is not a bad deal, to get a physical copy of the (really, rather large) AUR without having to photocopy it yourself!

Re: Is this an authentic HP product?

*Message #8 Posted by **Norris** on 5 Dec 2005, 2:36 p.m.,*
in response to message #5 by Norris

If you go to this link, you will find some archived messages regarding the HP48G from December 1998 and January 1999. They include some discussion of the availability of the Advanced User's Reference, including the following:

> Quote:
>
> Jim Lawson is at Handi-Calc, and can be reached at 732-928-9528. the URL for Handi-Calc is http://www.waterw.com/~jake-s/handyclc.htm
>
> I got my AUR from Jim, fair price, good shipping rate, and timely. I highly recommend him.
>
> Glenn Capone

> BTW, regarding the discussion about the bound vs. loose leaf style AUR, I got the loose leaf and like it very much. The binder allows it to lay flat when open, at the sacrifice of having to tote a larger book.

This suggests that other people also got binder-style AURs during the 1998-1999 time frame, and that they got them from other distributors (not just the one that I used). So most likely the binder-style AUR was an authentic HP product. In any case, it is quite professionally done, and is probably better for desktop use than the softbound style, although it is less portable.

Re: Is this an authentic HP product?

*Message #9 Posted by **Norris** on 5 Dec 2005, 2:52 p.m.,*
in response to message #5 by Norris

I did a search on Google groups for "AUR binder hp48". Got the following messages from 1998 on comp.sys.hp48:

> Quote:
>
> I ordered an AUR from the US recently, and it also took a while to arrive (a few weeks after my GX did). When I queried the delay, I was told it was on back-order with HP.
>
> It just arrived this morning, and is a ring binder with the manual in loose-leaf form. This kinda ties in with the other recent thread where someone tried to sell an AUR in this form.
>
> From this I can only surmise:
>
> 1) HP isn't making a properly bound AUR any more (which might need lead to more speculation in itself :)
>
> 2) HP has run out (or there is a shortage), and is shipping the ring-binder version until more of the properly bound version are printed/available.

> Quote:
>
> I just checked the university bookstore... They got a whole shipment of AUR manuals that are ALL in this loose-leaf form. It looks pretty big. Not something I would want to carry around.
>
> Oh ya, they sell them for $24.95

> Quote:
>
> another reason for wanting a used [AUR] over a new one is that the new ones are bound in a three-ring binder, instead of the same type of book that the user's manual is. I am pretty sure that is the only way to get them now.

HP-21 keybord malfunction

*Message #1 Posted by **Mike (Stgt)** on 5 Dec 2005, 7:42 a.m.*

I got a used HP-21 where the 4 key almost results in 7 or nothing or sets the system in a obstructed state. It's quite impossible to enter 4444. Is there a chance to repair it? For schlemiel ones like me too??

TIA.....M.

BTW: All who waited for mail from me the last 6 month -- sorry! I had/still have to care for my health.

Re: HP-21 keybord malfunction

*Message #2 Posted by **hugh steers** on 5 Dec 2005, 10:12 a.m.,*
in response to message #1 by Mike (Stgt)

hi mike,

try this, it has worked for me on several woodstocks. take the machine apart and separate the circit boards. you don't need to dismantle the keyboard. the idea is co tony duell.

find a fine wire brush and poke it into the holes in the back of the keyboard circuit. if you look closely you might see some green inside the holes. ive seen this on several and its small amounts of corroded copper and possibly the problem.

try pressing the key at the same time as working the brush. this squeezes the contact against it and can help as long as you're not too violent.

hope this helps,

Edited: 5 Dec 2005, 10:16 a.m.

82143 Printer Cable for HP41 for I/O

*Message #1 Posted by **Philip** on 4 Dec 2005, 4:45 p.m.*

Does anyone have specs on the cable and connector for the 82143 printer for the HP41? There is a chapter in "Controlling the World with HPIL" which discusses using this connector when disconnected from the printer for other I/O. The article is simply using the connector and the cable but none of the signals. I'm just curious if anyone has done anything to use that interface for something other than the printer.

THanks

Re: 82143 Printer Cable for HP41 for I/O

*Message #2 Posted by **Eric Smith** on 4 Dec 2005, 5:10 p.m.,*
in response to message #1 by Philip

I hacked up something to montitor the signals over that cable and output the data bytes on an EIA-232 serial port. It depended on the printer still being attached and handshaking properly with the module electronics. It would be more difficult to replace the printer entirely.

But unless you have a source of lots of 82143A printer modules (sans printers), what's the point? Designing a one-off interface usinng the 82143A module would be quite a lot of work. It's much easier to just get an 82160A HP-IL interface and an HP-IL converter (serial, GPIO, or HPIB) and use that to connect things.

The closest thing to specs for the signals on that cable that has been seen outside HP would be the documentation on the NPIC chip, which can be found on TOS. It's a clocked synchronous protocol.

Re: 82143 Printer Cable for HP41 for I/O

*Message #3 Posted by **Philip** on 4 Dec 2005, 6:12 p.m.,*
in response to message #2 by Eric Smith

My interest is purely curiosity. I have several 82143's that don't work and I have all the IL gear. I'm just curious if there have been any other implementations or technical details that would allow me to tinker.

HP-67 Write Problem

*Message #1 Posted by **Henning** on 3 Dec 2005, 5:42 p.m.*

Hello,

First i hope my English is not to well...

I got a HP-67 for a time and it had the Wheel Problem. I repaired it with the two o-rings. I can read cards now but everytime i try to write to a blanc card i got a error message. everybody have a hint for me for that problem?

All the best, Henning

Re: HP-67 Write Problem

*Message #2 Posted by **David Smith** on 3 Dec 2005, 10:30 p.m.,*
in response to message #1 by Henning

The problem is almost certainly the adjustment of the write protect leaf switch since you get an error on writing. Errors reading a just written card could be the adjustment of the head enable switch.

Sorry David...

*Message #3 Posted by **Klaus** on 5 Dec 2005, 10:25 a.m.,*
in response to message #2 by David Smith

...when writing my response I was in a hurry and didn't read your response carefully. So it happened that I repeated your arguments.

I didn't mean to be rude!

Greetings, Klaus

Re: HP-67 Write Problem

*Message #4 Posted by **Klaus** on 4 Dec 2005, 4:30 a.m.,*
in response to message #1 by Henning

Is the card write-protected (corner removed)? Maybe the contact that detects write-protection is out of shape.

Re: HP-67 Write Problem

*Message #5 Posted by **Henning** on 4 Dec 2005, 5:25 p.m.,*
in response to message #4 by Klaus

Hello,

Thanks for the reply! I take a look at the write protect leaf switch. I hope that this is the problem.

All the best, Henning

Re: HP-67 Write Problem

*Message #6 Posted by **Randy** on 4 Dec 2005, 5:33 p.m.,*
in response to message #5 by Henning

If you haven't seen it, be sure to check Tony Duells excellent article on the 67. Look for the signal WPS - that's the one of interest.

Increase HP48GX processor speed

*Message #1 Posted by **George Rose** on 3 Dec 2005, 4:52 p.m.*

I thought I read either here or at the hpcalc.org site that the processor speed of an HP48GX can be increased at the expense of battery life and incorrect clock time. But now that I have need to do it, I can't find how to do it again. I use my 48GX as a surveying data collector to control a Topcon robotic total station. I really like the 48GX & SMI software, but I really could use the speed increase. Can anyone point me in the right direction?

Re: Increase HP48GX processor speed

*Message #2 Posted by **Raymond Del Tondo** on 3 Dec 2005, 8:56 p.m.,*
in response to message #1 by George Rose

Hi,

there were some companies offering speed upgrades for the HP-48,
one of them is Dynatach (www.dynatech.de),
maybe Cynox (www.cynox.de) offered the upgrade, too.
These upgrades were mostly made by Mr. Kemper (www.miketech.de),
so you could ask him directly.

However if you mainly need the speed increase because the input forms,
choose boxes, and alike are too slow, I have another suggestion:
There exists a software speed upgrade for these user interface elements.
It's called SpeedUI and can be found on www.hpcalc.org .

I have a speed & mem upgraded HP-4G+ from Dynatech,
but with the SpeedUI, the forms are fast enough even in
normal processor speed.

Ok, this is kinda advertizing SpeedUI,
but hey, it's downloadable for free;-)

Charger 82002A HP 80 parts

*Message #1 Posted by **Gerardo Rincon** on 3 Dec 2005, 12:28 p.m.*

I need to replace the three prong female connector of my HP 80 charger. Where can I buy this female connector?

Thanks, Gerardo

Re: Charger 82002A HP 80 parts

*Message #2 Posted by **Randy** on 3 Dec 2005, 1:20 p.m.,*
in response to message #1 by Gerardo Rincon

Attached to another 82002A... They don't exist otherwise as it is a custom molded HP part.

The most common problem is fractured wires were it enters the connector. One solution would be to carefully slice it open, shorten the cable and solder the wires to the pins. It can be done in such a way as to be almost invisible.

Total replacement is another possibility.

Re: Charger 82002A HP 80 parts

*Message #3 Posted by **db (martinez, ca.)** on 3 Dec 2005, 1:47 p.m.,*
in response to message #2 by Randy

Randy; I was going to post that he should send it to fixthatcalc.com, and there you go giving away the store.

Creating your own keyboard overlay...

*Message #1 Posted by **Han** on 3 Dec 2005, 1:30 a.m.*

... is it easy ? I have tried (perhaps in vain) to search for HP48 accessories -- in particular the keyboard overlays. One of my HP48GX's is slowly showing a little bit of wear on the keyboard (nothing bad, just that it no longer is shiny and new looking =)

Has anyone tried making their own keyboard overlay? Or could someone owning one give us dimensions / measurements so we could attempt such a project?

Han

Re: Creating your own keyboard overlay...

*Message #2 Posted by **tomc** on 3 Dec 2005, 2:03 p.m.,*
in response to message #1 by Han

I was lucky enough to have purchased a few from HP back when they were available.

There is someone out there (in Hawaii)that is making blank ones. Not quite to the quality of the HP ones, but very usable and reasonably priced. I found him either here or in the newsgroup. Let me know if you can't track him down and I'll get the info up here.

TomC

32s2 for 48gx

*Message #1 Posted by **david bowers** on 2 Dec 2005, 11:11 p.m.*

i have 2 32s basically mint and hardly used, maybe a few hours each from singapore, and 2 x 48g plus the beat up 42s and a hp48 gx for surveying i would be interested in getting a 48 gx with survey pro card as a back up for my other work gx, if anybody would want to do a deal for one of the 32s and they have a gx for sale let me know, i placed an add in the wanted section but got two identical emails from china, but with different names saying they had some in a wharehouse, maybe a scam. anyway if anyone has a gx in australia they wouls sell thanks david

Re: 32s2 for 48gx

*Message #2 Posted by **Han** on 3 Dec 2005, 1:27 a.m.,*
in response to message #1 by david bowers

So are you looking for an HP48GX only? Or did you want a complete package (HP48GX + Survey card)?

Han

Re: 32s2 for 48gx

*Message #3 Posted by **david bowers** on 3 Dec 2005, 10:51 a.m.,*
in response to message #2 by Han

hi i would like the gx and a survey pro card and cables etc, i have tds survey, but the pro is better, its a gamble i guess, somebody said even the cards crash fatally, but a tds ranger for constructions sites only is out of my range of dollars, does anyone know if the ranger has an rpn calculator built in, i may be off to jamaica after taiwan, or iraq, hmm no i hope not cheers david

Re: 32s2 for 48gx

*Message #4 Posted by **Han** on 3 Dec 2005, 9:07 p.m.,*
in response to message #3 by david bowers

If I recall, TDS had a trade-in period for the Survey Pro cards for about $400. It was part of some promotional thing they did to help surveyors transition from the (then) soon-to-be discontinued HP48GX. With this in mind, it may be that there are even fewer Pro versions out there, and that you may be paying top dollar for them. Is the Ranger that much more expensive?

Re: 32s2 for 48gx

*Message #5 Posted by **Tim Wessman** on 3 Dec 2005, 9:38 p.m.,*
in response to message #4 by Han

Rangers can run 4-8 thousand depending on which software and upgrades you run.

That is one of the reasons our DC49 will clean up when it is released.

TW

Re: 32s2 for 48gx

*Message #6 Posted by **Raymond Del Tondo** on 3 Dec 2005, 10:12 p.m.,*
in response to message #3 by david bowers

Hi,

there's an Ebay auction featuring what you are looking for.
Item number: 5835392496 .
Ok, it's a complete set, but it contains at least
three valuable items: the GX, the Survey Pro card,
and the 1MB mem card.
The TDS card alone may be worth more than $400,
much more than even a NIB 32SII,
so the remaining items included in the auction
could be considered as cheap add-ons;-)

Regards

Raymond

Re: 32s2 for 48gx

*Message #7 Posted by **david bowers** on 4 Dec 2005, 8:25 a.m.,*
in response to message #6 by Raymond Del Tondo

hi i wasnt asking for an equal swap, but as part payment if anyone had a gx they didnt use much, i would trust people from here more than e bay to buy, the ranger base unit is 2700usd and about the same for survey pro, if i can get the company to for out for the programme i may get the ranger but the gx is a great unit, someone writes about a 49g invention, i saw the site of an hp cacl shoved in a plastic box, doesnt look too professtional, i thought he gx wasnt stable, anyway i will keep looking thanks to all david

OT: PRM-85 Goodness

*Message #1 Posted by **Howard Owen** on 2 Dec 2005, 6:22 p.m.*

Just got my PRM-85 programmable ROM card for the HP Series 80. THe "SuperROM85" that comes with it is a 27512 EPROM containing the following:

```
Advanced Programming
Assembler
Service-85
Program Development
Mass Storage
Matrix
Input/Output
Extended Mass Storage
```

To get the card working in my HP-85B, I had to remove the jumpers for the Mass Storage and Input/Output ROMS, as these are built-in on that model. But once I did that, I was able to access an HP 9122 double sided disk from the 85B! Now I get to start learning about all those other ROMS. 8)

Next I also get to figure out what it will take to get an EPROM burner set up so I can create a SuperROM for my 87XM. What a hassle, I have to learn how to do all this cool stuff. 8) 8)

Thanks to John Shadbolt for turning me on to this great device, and of course to Bill Kostaka for the design and production!

Regards,
Howard

Re: OT: PRM-85 Goodness

*Message #2 Posted by **Jack Rubin** on 3 Dec 2005, 1:19 a.m.,*
in response to message #1 by Howard Owen

Got mine on Wednesday but only got to my 85B today - really nothing to add to Howard's review. A slick piece of work that delivers as advertised. Thanks to John and Bill.

Now I'm looking for a case to mount the card in - anybody have a blown 128K memory card or interface module? I just need the shell - the PRM-85 has the same form factor as the "long" HP modules (vs the "short" 16K case).

Great stuff - get one!

Re: OT: PRM-85 Goodness

*Message #3 Posted by **john** on 9 Dec 2005, 2:57 p.m.,*
in response to message #1 by Howard Owen

Howard,

I am working on a HP-86 SuperROM with the following built in:

Advanced Programming Assembler Advanced Programming 2 (*) Matrix 2 (*) Plotter (*) Matrix I/O Extended Mass Storage

(*) - Due to the design of the PRM-85 (version 1), only 2 of these ROMs can be enabled at any time.

I'll send you one next week with instructions, Regards, John

Re: OT: PRM-85 Goodness

*Message #4 Posted by **Howard Owen** on 9 Dec 2005, 3:01 p.m.,*
in response to message #3 by john

Great, John! Would you like me to send you a blank EPROM in return? Anything else? (Postcard? 8)

Re: OT: PRM-85 Goodness

*Message #5 Posted by **Jack** on 12 Dec 2005, 11:02 a.m.,*
in response to message #3 by john

John,

I'd be interested in the 86/87 superROM as well - please send details.

Thanks!

Re: OT: PRM-85 Goodness

*Message #6 Posted by **john** on 16 Dec 2005, 5:46 p.m.,*
in response to message #5 by Jack

Hi,

SuperROM for your HP-86/87s are now in the post. Details on installation being worked on now,

Regards, John

Re: OT: PRM-85 Goodness

*Message #7 Posted by **Howard Owen** on 16 Dec 2005, 7:13 p.m.,*
in response to message #6 by john

Wow, thank you, John!

Re: OT: PRM-85 Goodness

*Message #8 Posted by **marais** on 17 Dec 2005, 3:27 a.m.,*
in response to message #7 by Howard Owen

I can confirm reception of my board, and I must say, I am really impressed with the build quality. Thank you John! I will now look out for an empty housing to protect the board.

Andreas

Re: OT: PRM-85 Goodness

*Message #9 Posted by **john** on 17 Dec 2005, 5:12 p.m.,*
in response to message #6 by john

Hi,

I have updated the PRM-85 user guide at:

http://www.vintagecomputers.freeserve.co.uk/hp85/prm85user.htm
Note the change with the new boards, in that the black DIL switches are the opposite as described previously, so that ON is now '0' and OFF is '1'.
I have also described how to use the HP-87 SuperROM, and made it available for download.
Regards,
John

MLDL2000 and HP41X: HEPAX issue solved.

*Message #1 Posted by **Vieira, L. C. (Brazil)** on 2 Dec 2005, 1:45 p.m.*

Hi, all;

After having the MLDL2059 working ‘tunned’, I decided to go ahead and compare it to the HP41X, one of the many Hrast’s masterpieces (Thanks, Hrast! HP41X rocks!!!).

Because of the weird entries shown with HEPDIR when I tried configuring SRAM in my MLDL2000, I used HEXEDIT in HP41X to compare memory contents and I actually found a different value at #XFE9h (X=8, 9, etc). In all HEPAX addressed memory blocks with HP41X, this address is filled with 091h, so I did the same in MLDL SRAM blocks addressed by HEPAX and voilá! For the first time I saw

```
H:DIR EMPTY
```

instead of the many entries (C2 C3 etc). I'd guess 091 is sort of an 'end of field' marker.

Thought I should share with you all.

Best regards.

Luiz

Re: MLDL2000 and HP41X: HEPAX issue solved.

*Message #7 Posted by **Vieira, L. C. (Brazil)** on 3 Dec 2005, 8:00 a.m.,*
in response to message #4 by HrastProgrammer

Hello, Hrast;

This is ONLY ONE of the many, many circumstances I found HP41X to be more than a powerfull emulator. I got in contact with some of the most important HP41 external ROM (modules) features through HP41X. I had not yet got into MCODE before because (my thoughts, O.K.?) I wanted a chance to do MCODE in the actual HP41. So, the HP41X as an emulator would be a development plataform and necessary support. Now with Meindert´s MLDL2000 all I need is already here.

When I think that a 26YO+ handheld, pocket size calculator is the center of this 'working gear', I come to realize I have no idea of what was going on inside Hewlett-Packard's R&D clusters...

BTW, Hrast, would you, please, drop me a mail? I have not found yours in my e-box (after so many cleanups because of virus attacks, I guess I wipped out too many information) and I'd like to contact you.

lcvieira at quantica dot com dot br

Best regards.

Luiz (Brazil)

42s - It doesn't need the optional sugar-coating..(A rant)

*Message #1 Posted by **ECL** on 2 Dec 2005, 12:46 a.m.*

I know that we pick at the ebay peddlers quite often, but I usually refrain. I'm venting over the snow-job wording in this B.S. ad for a 42s:

> Quote:
>
> Fully Tested - Guaranteed to Work Correctly !

It will never work INCORRECTLY! This is important, as computers are notorious for working incorrectly.

> Quote:
>
> The English manual as a bit of use in the outside and inside it's perfect.

Its never been used on the INSIDE! Only the outside has been used.

> Quote:
>
> The unit passes perfectly the self-test.

While most calcs receive only mediocre scores on their self-tests, this one passed PERFECTLY! What has led to the proliferation of adjectives and adverbs nowadays?

And why do the online STORES keep selling the same calculator "which I bought during my last year of college and never used."??

I am becoming increasingly weary of marketing. PBS, and listener-supported Jazz stations are havens...

Liberal Arts students should be required to take some engineering courses as their 'breadth' requirements. Any takers on this one? Then again..that would mean we'd get more exposure to them...

ECL

in response to message #1 by ECL

Beware of the dogs... There's at least one guy that doesn't care telling he dislikes us, engineers. And he'd actually said that out loud in this forum many times! A clue: if he had a sales representative net, it should be called... COBweb ?!?!?

Take care.

(A Rant) is a good description

*Message #4 Posted by **db (martinez, ca.)** on 2 Dec 2005, 12:22 p.m.,*
in response to message #1 by ECL

I bothered to look at the auction. It is from Portugal and probably by someone who does 99.9% of his thinking in Portuguese. I caught three common Latin to English errors. They were small ones. Can you do better in his language?

You were complaining mostly about his adverb usage and to native English speakers that is a matter of style. I agree that to us; his did border on gushing. To him, in his language; it is probably expected. I don't speak Portuguese but I've tried to decipher Brazilian "tele-novellas". While they may not be representative of the language, they are also over descriptive to my ears.

Someone thought it works *perfectly* and *correctly* enough to lay down 250 bones for it.

This is American website and unless you identify yourself otherwise you are perceived to be the same. Running down foreigners for how they talk American helps brand us as more arrogant than the stereotype already says we are. If you want to complain about how someone speaks English; take on the Brits. They deserve it.

Re: (A Rant) is a good description

*Message #6 Posted by **ECL** on 3 Dec 2005, 7:52 p.m.,*
in response to message #5 by I, Claudius

Claudius, DB, and rest,

English is a second language for me as well. Yet, I seem to have mastered it well enough. Don't put me on trial.

> Quote:
>
> Estoy de acuerdo. Este chico siempre habla demasiado sobre nada.

Why do you sneak around and say it in Spanish? Porque no hablas en Ingles? Eres timido, Claudius? Don't be arrogant. What is the significance of YOUR postings?

Recall that to the mainstream, we here ALL discuss useless things (HP calculators). But WE cherish them. Please refrain from lashing out at our own here.

My post was written with an element of HUMOR. This is the one social skill that we engineers DO posess. DO NOT twist my posting into an ESL attack. Observe that I am picking on the GENERAL embelished sentence structure used nowadays, and my disenchantment with marketing.

Furthermore, consider this statement by DB:

> Quote:
>
> If you want to complain about how someone speaks English; take on the Brits. They deserve it.

And exactly WHY do the Brits *deserve it*? Does their accent trouble you? DB, you are selective in your criticisms. Let's acknowledge that YOU introduced the element of ethnicity to this situation. Is it ok to pick on someone's grammar as long as they are not the terribly innocent Spanish speakers? THAT IS B.S. Don't be a *FILTERED SHELTER*, DB.

You are tempting me to PURGE this forum from my MEM.

ECL

in response to message #6 by ECL

ECL;

You were running someone down for the way he wrote in english. I called you on it, not Claudius or "the rest". If you badmouth someone in a small community you ought to expect a response.

If you can work on not ridiculing other RPN users, I'll read whatever pop psychology book that "FILTERED SHELTER" crawled out of.

BTW: We and the Brits have been snipping at each other about English for probably 200 years. It's a hoot. It gives us something to talk about over beers (they have their's warm). "Two great peoples separated by a common language" and all that.

Re: (A Rant) was a good description >> Switch to HP 33s

*Message #8 Posted by **ECL** on 4 Dec 2005, 7:38 p.m.,*
in response to message #7 by db (martinez, ca.)

Yes, let's end it, but please note-

Main point: The post was NOT targeted at foreigner's misuse of English. I am simply fed up with embellished advertising. All you need to show is the screen with pass/fail. If asks for US$300, he has a target for the sale(us), and thus no extensive verbage (nor complete copy/pasted feature listing) is necessary.

I exit the issue here. Back to HP.

To that end, I have been working fitting some root finding algorithms on the 33s, and some non-linear interpolation tools (Lagrange Polynomials). Also, I'm using the Gauss-Seidel method for simultaneous equations, despite its conditional convergence. Anyone else have thoughts to

contribute?

ECL

Re: (A Rant) was a good description >> Switch to HP 33s

*Message #9 Posted by **Ed Look** on 5 Dec 2005, 12:38 a.m.,*
in response to message #8 by ECL

I am not nearly at all the mathematical expert that any of you are, but I did try first on a HP 32SII, as a test, Newton's method to find the square root of a number. If the the algorithm did not converge, i.e., the results come back farther and farther away instead of closer, then, after x iterations, it was terminated. It took at least overnight for the 32SII.

I tried a similar algorithm to find the convergence of a simple series, also on that calculator and it also took about as long.

I tried these on the HP 33S and each only took from a little over one to a few hours. So, I warn you, even with the improved speed of the 33S, it's kind of slow.

I haven't tried it on the HP 48G, G+, nor HP 49G+, but I suppose it should be a bit faster on those... maybe.

Thank God that the short, amateurish programs I write and run on either the 48G/49G+ series or 32SII/33S don't normally require too many real calculational steps or iterations!

in response to message #7 by db (martinez, ca.)

The post left by ECL was humorous, in the context of modern advertisments. - and that is what he seems to have meant. I think some of you took unintended offense. I don't speak spanish, but apparently ECL does, and he seems to have been put on the defensive by I,Claudius' comment.

ECL clearly stated in both his original post and responses that it was not intended as a jab at the individual's grammar as a foreign citizen, but rather at the general methods advertisers use in their hooks.

Besides, does this Ebay merchant count as an RPN user? Particularly when letting go of such a nice machine? :P

You'll never pry my 42s' from me!

Synthetic Programming on the HP-9815A/S

*Message #1 Posted by **John Ioannidis** on 1 Dec 2005, 10:37 p.m.*

Before there was Synthetic Programming on the HP41 (and even the 67/97), there could have been SP on the 9815. To wit:

The HP-IB interface for the 9815 has some commands that allow you to manipulate individual bytes in storage registers and then transfer them to program memory! (The reason for this was to allow character strings to be sent to and from the HPIB interface under program control). Some interesting facts so far:

* Most instructions occupy one byte; some are two bytes, with a prefix and an argument. Storage register operations and GOTO/GOSUBs are examples of the two-byte instructions.

* There are several one-byte instructions that are undocumented.

- One instruction appears to be a NOP, except it doesn't print onthe printer. There does not seem to be a way to enter it from the keyboard.

- CALL A through CALL E can actually be typed on the keyboard, but they make no sense; CALL A tries to access the cartridge drive, but it's unclear what it's doing (it reports "WRONG FILE TYPE"). CALL B through CALL D appear to be no-ops, and CALL E must be trying to access some I/O device unsuccessfully.

* Some 2-byte instructions have interesting properties

- FIX n, SCI n, and SCI3 n (they hadn't invented the term Engineering Notation yet) with n not in the range 0-9 just set the mode to FIX, SCI, and SCI3 without changing the number of visible digits, thus behaving like the HP-67/97 FIX, SCI, and ENG.

- LBL xx, GOTO L xx and GOSUB L xx are prefixes that take the actual label number (00 through 99) as an argument. With SP you can set the argument to any number between 0 and 255, so in effect you have 256 labels, rather than "only" 99. It's also amusing how these print on the printer.

- For some weird reason, the argument for the register operations is only 7 bits; there are separate prefixes for RCL Rxx and RCL R+128xx. The high bit of the argument appears to be ignored.

- The prefix for STO I A through STO I J can be used with arguments other than A through J (101-110). I'm still trying to decipher the results.

I'm in the process of formatting properly a complete "byte table", which I'll post here. Let's see if we can uncover some more secrets :)

/ji

*Message #2 Posted by **Howard Owen** on 2 Dec 2005, 12:19 a.m.,*
in response to message #1 by John Ioannidis

Congratulations, John! Great job of paleocybernetics there. 8) I suppose the relative cost of the 9815 and the HP-41 explains why more hacking was done on the latter than the former.

Re: Synthetic Programming on the HP-9815A/S

*Message #3 Posted by **Tony Duell** on 2 Dec 2005, 6:38 a.m.,*
in response to message #1 by John Ioannidis

Something else that I've not had time to fully investigate yet :

The 9815A has 7 off 2K ROM chips on the CPU board and a space for an eighth. The 9815S has 2 off 8K ROM chips (and more RAM). The address decoder circuit only enables a total of 14K of the ROM, same as for the 9815A.

If you solder in a link on the CPU board it enables all 16K of ROM (this is obvious from the schematics). The extra 2K of ROM has the correct headers for being an I/O device ROM, and in fact seems to contain meaningful names.

One day I am going to sit down with a 6800 disassembler and figure out just what those extra functions do.

Re: Synthetic Programming on the HP-9815A/S

*Message #4 Posted by **Eric Smith** on 2 Dec 2005, 1:05 p.m.,*
in response to message #3 by Tony Duell

Can you make ROM dumps available?

Re: Synthetic Programming on the HP-9815A/S

*Message #5 Posted by **John Ioannidis** on 2 Dec 2005, 3:34 p.m.,*
in response to message #3 by Tony Duell

Have you actually tried soldering the jumper? If the upper 2K looks like an I/O rom, then [CALL] [n] [A-J] would probably be the way to access its functions.

Were there any patents filed for the insides of the 9815?

/ji

US Patent 4,089,059: Programmable calculator employing a read-write memory having a movable boundary between program and data storage sections thereof

Re: Synthetic Programming on the HP-9815A/S

*Message #7 Posted by **Tony Duell** on 3 Dec 2005, 5:56 a.m.,*
in response to message #5 by John Ioannidis

Yes, I've soldered the jumper in my 9815S.

From what I remember CALL 7 A, etc produce names that print out sensibly on the built-in printer, but I haven't worked out what they do yet.

I guess I have an upgraded 9815A after all

*Message #8 Posted by **John Ioannidis** on 3 Dec 2005, 4:53 p.m.,*
in response to message #7 by Tony Duell

My case says "9815 A" in the front, and has a "9815S" sticker inside the paper well. I opened the beastie again, and sure enough it only has 7 ROMs with space for an 8th, but it has eight 2114 RAM chips (so 4K of RAM) and no edge connector for an extension RAM board.

I wonder if this is an early-run 9815S board?

Re: I guess I have an upgraded 9815A after all

*Message #9 Posted by **db (martinez, ca.)** on 3 Dec 2005, 11:32 p.m.,*
in response to message #8 by John Ioannidis

John; Or possibly a repaired unit. Did hp ever do factory upgrades? It would have made sense to want more memory if you were using the plotter.

Re: I guess I have an upgraded 9815A after all

*Message #10 Posted by **John Ioannidis** on 4 Dec 2005, 2:00 a.m.,*
in response to message #9 by db (martinez, ca.)

yes, HP did factory upgrades, hence the 9815S sticker inside the printer well. A repaired A would just have received a regular A board, with the 2111 RAM chips.

According to a prior post by Tony Duell, the S had the eight 2114 chips and two 8K ROMs. I would guess that configuration must have been a later-model version, when 8K ROMs had become cheaper. HP would change the innards of their machines during the machine's lifetime, so that doesn't surprise me.

Is this rare?

*Message #1 Posted by **Samuel Heddle** on 1 Dec 2005, 9:25 p.m.*

This 41-CV has a "turbo speed" upgrade, and a red switch on the side. Only 90 Euros, anyone know if it's a wise buy? Link

Re: Is this rare?

*Message #2 Posted by **Howard Owen** on 1 Dec 2005, 10:19 p.m.,*
in response to message #1 by Samuel Heddle

It's described as non-functional. And you can see corrosion on the battery contacts even the oblique photo provided.

So yes, the turbo speed upgrade is somewhat rare, although I believe that there are plans, or at least instructions, on how to do the mod in the old PPC issues. But the corrosion means you have an unknown amount of damage to the bridge connector, and possibly the main PCB. I've had mixed results bringing machines with that sort of damage back to life. Perhaps some of the more experienced calculator techs have had better luck?

Re: Is this rare?

*Message #3 Posted by **Garth Wilson** on 2 Dec 2005, 2:34 a.m.,*
in response to message #1 by Samuel Heddle

I ordered the speed upgrade kit for my 41cx from Educalc back in the heyday. Being careful to read the whole "manual" before attempting installation, I came across something that said you shouldn't use it if you have the HPIL, merged modules, or something else-- maybe extended memory-- I don't remember. In any case, I had all three of the things on the list of potential incompatibilities, and was using them all regularly, so I sent it back.

Re: Is this rare?

*Message #4 Posted by **Raymond Del Tondo** on 2 Dec 2005, 3:48 a.m.,*
in response to message #3 by Garth Wilson

Hi,

AFAIK the X-Memory works fine with the 1.7x speed,
and most other 'passive' ROM modules do.

At least my CY Turbo has no problems with any modules,
only the Wand, card reader, and HPIL should be operated
at normal speed.

Raymond

MLDL 2000 question

*Message #1 Posted by **Miki Mihajlovic** on 1 Dec 2005, 11:57 a.m.*

Can anyone of you new proud owners of MLDL 2000 tell me about some of the results of test that Meindert suggests on page 11 of User Manual.

Namely, steps (5),(6) say that after you cleared page $9 and moved M2K ROM from $8 to $9 you should see two times -M2K entry on CAT 2.

Step (7) says that disabling ROM in FLASH and enabling it in SRAM puts it in page $F and after executing XCAT 21 should show ROM entries as $Fxxx.

Can anybody confirm that this is the way you had it, since I was not able to see two entries of M2K at (6) and at (7) I still get ROM entries showing as $8xxx and not $Fxxx. Dip switches are of course in correct position as per manual.

Miki

Re: MLDL 2000 question

*Message #2 Posted by **Matthias Wehrli** on 1 Dec 2005, 2:44 p.m.,*
in response to message #1 by Miki Mihajlovic

I do have a MLDL from Meindert but as he tested the unit allready I didn´t. Maybe you should load a CCD ROM into you HP-41. WHith CAT8-F you can test, where the K2K Rom is.

Matthias

Re: MLDL 2000 question

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 1 Dec 2005, 3:45 p.m.,*
in response to message #1 by Miki Mihajlovic

Hi, Miki;

I'm one of the named 'happy owners' and I also did not succeed seing the espected results. Meindert mentions in his site (www.kuipers.to/hp41.htm , go to DOWNLOAD) that it may happen.

See, when you change both SW3 and SW4, you select one of the four possible Setting Rgister configuration (SR0, SR1, SR2 or SR3) available in the kind of memory you choose through SW2 (SRAM or FLASH). Each SR# allows any page in the HP41 bus (P#0 to P#F, four banks each), so each SR# stores the address of up to 64 memory positions inside MLDL2000. BUT if you choose FLASH Setting Register, it does not mean the SR 'per se' must point to a FLASH position, instead it can point to any valid FLASH or SRAM position.

Meindert pre-configures each MLDL2000 to leave with M2K ROM image in FLASH #0000 and the four FLASH SR configurations ready to follow the examples. So, when you place SW2 in OFF, you are dealing with THe setting registers in FLASH memory, so the configuration is kept for as long as it takes till you use it.

If SW2, SW3 and SW4 are set to OFF, then MLDL2000 is instructed to use FLASH SR0 contents, which allow the HP41 to 'see' only the M2K ROM image recorded in FLASH memory through page 8 (lower port 1). As you choose SR1 (SW3=OFF, SW4=ON), SR2 (SW3=ON, SW4=OFF), the related configuration should activate one valid address in SRAM so -M2K ROM image can be copied, listed and used/erased. When you finally choose SR3 (SW3=SW4=ON), the HP41 'sees' only the copy of -M2K ROM, now in SRAM, through page #9 (upper port 1). Keep in mind that what the HP41 sees is not the SR#, instead what each SR# contents 'tell it to see'. e.g., by changing SR0 contents the HP41 may see whatever you load in whatever valid SRAM or FLASH address.

What seems to happen is that Meindert may have not programmed the FLASH SR with the suitable contents in some units, mine included. I'd suggest to go ahead with other experiments if you actually see

-M2K ROM

after CAT 2. It is most likely that your unit is perfectly fine. After loading your PC with the MLDL2000 manager and the necessary USB driver, things will get clearer, believe me.

Hope this helps.

Cheers.

Re: MLDL 2000 question

*Message #4 Posted by **Miki Mihajlovic** on 1 Dec 2005, 4:46 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thanks for the detailed low-down. After some initial troubles with IO PCB that Meindert resolved for me I have put the unit together a few days ago and it looks really great. By the way, your pictures were a great help since I studied them closely for the housing cutouts - great job Luiz. My unit was working OK with mentioned 'problems' of M2K ROM showing in $8xxx but now it totally kills all of my calcs to the point of no return except reversing battery polarity for a few minutes. Interesting thing is that the software control from PC through USB works flawlessly, all the tests, copying, moving, editing, up-downloading goes fine, external battery keeps SRAM alive etc. but as soon as I move any of the switches from OFF that's it, calc winds up somewhere deep in the NUT OS code and it is bye, bye. I am kind of suspicious that I have some wires shorting inside the housing since it is pretty tight in there. I will dismantle it this weekend and see how it works.

Miki

Re: MLDL 2000 question

*Message #5 Posted by **Meindert Kuipers** on 2 Dec 2005, 3:08 a.m.,*
in response to message #4 by Miki Mihajlovic

Miki,

Please verify current consumption of the unit when it crashes you machine. While debugging I have seen some problems that cause the HP41 to go into very high current consumption even after the MLDL2000 disconnected. This was caused by a completely wrong configuration of ROMs in the

MLDL2000. Please doublecheck all connections and verify the Settings Registers and ROM contents if these point to something sensible.

Meindert

Re: MLDL 2000 question

*Message #6 Posted by **Miki Mihajlovic** on 2 Dec 2005, 3:53 p.m.,*
in response to message #5 by Meindert Kuipers

I have checked the SRs and in SRAM they are all $3FF. In FLASH I got $000 for Page 8, Bank 0, the rest of them are $3FF. Dip switches are all OFF. When I try to clear them all and upload SR configuration to FLASH I got SR did not verify at $FFF20.

Any ideas?

Edited: 2 Dec 2005, 3:54 p.m.

Re: MLDL 2000 question (edited for errors)

*Message #7 Posted by **Vieira, L. C. (Brazil)** on 2 Dec 2005, 5:34 p.m.,*
in response to message #6 by Miki Mihajlovic

Hi, Miki;

one thing I learned after having to reset the entire FLASH memory contents twice (because of my own mistakes) is: whenever updating FLASH SR, i.e., from your computer to MLDL, always erase entire sector 34 contents to default (ROM/SR handler already has the erasing feature).

Now I test all SR in SRAM first (to be sure it works) prior to load SR FLASH. Meindert calls our attention to this fact when suggesting to use FLASH SR to permanent (or hardly changing) configurations, and SRAM SR to configurations that may need future changing.

My way now is to save each SR (from SR0 to SR3) in separate files. This way, I test all four SR configurations in SRAM, save each in separate files (e.g.: FL_SR0_xxx.sr, and SR_SR0_xxx.sr, where FL refers to flash, SR refers to SRAM and xxx is a particular reference; I choose sequencial counting) and then I go to Erase FLASH feature, erase entire FLASH sector #34 then I load each valid SR in FLASH. If I have to change at least one single configuration, I go to all steps again. Well, changing a single "1" to "0" is harmless, but after having to erase the entire FLASH contents after insisting on uploading a SR set priot to erase sector 34 made me be more carefull and actually do what must be done. Please note: all because of my own fault.

As all FLASH SR are in the range #FFF00 to #FFFFF, your verifying error matches. In time: have you tried [Reset Flash] already? It is intended to prepare FLASH to be recorder again. Why not?

Hope this helps.

Success!

Luiz (Brazil)

Edited: 2 Dec 2005, 6:28 p.m.

Re: MLDL 2000 question

*Message #8 Posted by **Vieira, L. C. (Brazil)** on 2 Dec 2005, 6:14 a.m.,*
in response to message #4 by Miki Mihajlovic

Hi, Miki;

I faced something close to what you describe, but I was entirely responsible, in my case. You see, I did not get the very MLDL2000 operation way at that time, so I tried to use SRx in SRAM (SW2=ON)prior to configure the corresponding SR. Only after I set all SRAM SRx to their default state I could use any SR confioguration, either SRAM or FLASH. I knew that EPROM's have all of its bits back to '1' after being erased, and FLASH behaves the same, so the default FLASH contents matches the default SR (all bits = '1'), but SRAM default contents are random, so if you set any SRx in SRAM prior to program it, who knows where does it point the HP41 to... No wonder why mine was completely lost, poor thing.

Cheers.

Hp-85/9815/9825 tape capstan creation & 9815 installation procedure.

*Message #1 Posted by **Etienne Victoria** on 1 Dec 2005, 11:25 a.m.*

Hi all,

This is just to report on successful tape capstan repairs if it can help somebody.

I've put on my ugly "site" 2 step-by-step procedures:

- How to rebuild a new tape capstan for the Hp 85/9815/9825 from a tap joint.

- How to change your 9815 A/S Tape capstan.

Next step will be "Silencing your 9815 printer on demand".

As soon as I understand how to include pictures in articles, I'll post an article on the forum.

Critics & suggestions are welcome!

Etienne

Re: Hp-85/9815/9825 tape capstan creation & 9815 installation procedure.

*Message #2 Posted by **Tony Duell** on 2 Dec 2005, 6:43 a.m.,*
in response to message #1 by Etienne Victoria

I've not tried any of this, but a few ideas...

Once you've dismantled the machine as far as you did, it's very easy to go a bit further and take the tape drive out. On a 99815 (any model), undo the 2 screws on the tape drive PCB, free the left side panel from the base, then unplug the tape drive PCB from the edge connector on the PSU/printer PCB and take the lot out. IIRC 2 more screws hold the tape drive to the side panel.

Once it's out, the motor is electrically isolated from everything else (the motor drive amplifier is on the PSU/printer PCB). You could then connect a DC bench supply to the motor and get it to spin so you could use the X-acto blade to scrape off the remains of the old rubber.

Re: Hp-85/9815/9825 tape capstan creation & 9815 installation procedure.

*Message #3 Posted by **Etienne Victoria** on 2 Dec 2005, 9:55 a.m.,*
in response to message #2 by Tony Duell

Thanks for the feedback Tony!

You're right, getting the whole tape subassembly out is much better than merely fixing it in place!

I did remove all screws but didn't succeed in unplugging the tape drive PCB...and was reluctant to exert force.

You may see the unscrewed assembly here:

http://homepage.mac.com/etienne.victoria/.cv/etienne.victoria/Sites/.Pictures/Photo%20Album%20Pictures/2005-12-01%2007.53.27%20-0800/Image-E320BD8A627511DA.jpg-thumb_140_105.jpg

I'll update the procedure at my next maintenance operation (ie Shut-upping the printer on demand).

Thanks again!

Etienne

Re: Hp-85/9815/9825 tape capstan creation & 9815 installation procedure.

*Message #4 Posted by **vassilis Prevelakis** on 2 Dec 2005, 8:11 p.m.,*
in response to message #2 by Tony Duell

If you do decide to remove the motor assembly from the tape drive, note the connections to the speed sensor. I got them wrong and the machine unspooled my test tape.

Not fatal (ji repsooled the tape), but still best avoided because it means you have to take the tape drive out to fix the connection.

OpenRPN Hardware Specifications

*Message #1 Posted by **Hugh Evans** on 30 Nov 2005, 11:10 p.m.*

I have created a set of hardware specifications that I would like to present to this community for feedback. I will be passing these specifications on to an embedded hardware designer to prepare a DIMM-sized development board which will eventually become the mainboard for both of our calculator models.

Sharp LH7A400 (ARM9TDMI) *USB Device *RS232 *IrDA 16MB Flash ROM 512KB SRAM CompactFlash 4xAAA (2250mAh@3V)

Here are a few pages from the OpenRPN documentation site, which include more detail and links. I'm only looking for feedback on the core electronics (don't comment on LCD resolution, keyboard layouts, etc.)

General Hardware Specifications Landscape Feature Set Portrait Feature Set

Best Regards, Hugh

Re: OpenRPN Hardware Specifications

*Message #2 Posted by **Howard Owen** on 1 Dec 2005, 12:07 a.m.,*
in response to message #1 by Hugh Evans

Nice choice! I like the I/O selections. Did I misread the LH7A400 docs to say it has a color LCD controller, or is that just an option? I note you are specifying greyscale LCD.

The MMU means you could run Linux or WinCE on this thing, given more RAM. 8) I assume that is "no value add" for this project.

Edited: 1 Dec 2005, 12:07 a.m.

Re: OpenRPN Hardware Specifications

*Message #3 Posted by **Hugh Evans** on 1 Dec 2005, 12:44 a.m.,*
in response to message #2 by Howard Owen

The I/O seems to be the right mix to satisfy everyone. Indeed, the onboard LCD controller can do 15 grayshades or up to 64k color at a maximum resolution of 1024x768. Grayscale will be used extensively to simulate antialiasing characters.

Another reason for putting the mainboard on a DIMM is that virtually every feature on the CPU can be accessed from the 144 edge connections making it an excellent development kit for the LH7A400 (alternative market). While we won't be using SDRAM, color LCDs, running Linux or Windows CE, our mainboard could be adapted to use all of them. Theoretically, one could probably pull a DIY qonos with it!

Yes, that's a very cool form factor. I had read about it before, somewhere. I guess it may allow some economy in packaging, using COTS parts for stuff that might otherwise be custom?

Shifting gears to software, have you read the recent threads that talk about the sad, neglected state of RPN calculator development? I thought they might provide ideas, when the time comes to think about system software. 8)

I don't know allot about electronics and how you can package it in a small enough area to make it work. Reading over the specs, I see that you are specifying using 4xAAA batteries. I thought the idea around this project was to make calculators that would fit in the shirt pocket. I equate shirt pocket with the use of button type batteries like the 15C or 42S used or the quarter size batteries like the 33S uses. Once you move away from these types of batteries you loose the ability to carry a calculator in the shirt pocket. Am I wrong?

Re: OpenRPN Hardware Specifications

in response to message #5 by Richard Garner

The machines are 0.625" thick, nearly identical to a voyager. We could have used button or coin cells, but by using 4xAAA you can go for at least a year between changes. To answer your question: Both models will fit in your pocket.

I am curious about what level of usage you are assuming when you say that the batteries will

last a year. If a AAA has 900mAHr capacity, that allows you 102uA average current drain over a year.

With this device, just keeping the RTC alive will use half of that capacity.

Monte

> With this device, just keeping the RTC alive will use half of that capacity.

Maxim/Dallas' new DS3232 consumes <4uA in battery back-up mode. They claim +/-1 minute per year accuracy and tout integrated crystal, temperature sensor (to keep it accurate over the temperature range), power management, and 256 bytes of RAM, for $2.70 in 1K-pc qty. They have quite a long line-up of integrated RTC products.

Re: OpenRPN Hardware Specifications

*Message #11 Posted by **Monte Dalrymple** on 1 Dec 2005, 3:24 p.m.,*
in response to message #10 by Garth Wilson

I know the Maxim devices. The openRPN hardware spec doesn't say anything about an external RTC, but it touts the one internal to the LH7A400. That one draws 45uA typical. Of course, you can completely power down the device (and lose the time-keeping capability) to save the 45uA. But than you have to deal with the 2 second startup time, which I would consider unacceptable for a calculator.

The point I was trying to make was that batteries aren't going to last anywhere near a year in this thing.

Monte

Re: OpenRPN Hardware Specifications

*Message #12 Posted by **Hugh Evans** on 1 Dec 2005, 7:35 p.m.,*
in response to message #11 by Monte Dalrymple

There was some limited discussion on this topic once. The LH7A400 RTC isn't very well suited to functioning as a timepiece/calendar. If that is a desired feature I would opt to add a separate chip dedicated to that purpose. As a side note, the RTC only consumes 5uA.

The power consumption figure I quoted is achievable thanks to fully static operation. Only a handful of ARM9 devices feature it. In fact the S3C2410 used in the 49g+ is the only other viable choice for our application. Unfortunately it has terrible availability outside of southeast asia. Back to topic: Current draw is somewhere in the neighborhood of 0.675mA/MHz. The MCU has much more processing power than we need, but it is also highly efficient, so by throttling it back to 66MHz or so during execution gets us up to ~45mA for a few ms at a time. During entry very little clock speed is needed at all. Assuming 2 hours of use per day, with execution making up perhaps 5% of that time you can start to see how small the power consumption really is.

Another very useful feature for many of us is the ability to run off an external power supply, temporarily bypassing the batteries and further prolonging their life.

Hopefully that clears things up for you a bit more.

So is a good clock/calendar something that most people here would like to have? That's a very cheap thing to add and I have no qualms with adding one.

in response to message #15 by John Ioannidis

I'm not seriously proposing it run Linux. I was looking at the feature set and noticing it had an MMU, which seems like overkill for a calculator.

On the other hand, who knows what will seem like overkill for any partcular device five years from now? Moore's law continues, though they can't easily crank up the clock with current materials and fabs. Maybe a calculator of 2011 will crack public keys with quantum computations, or create ciphertexts impervious to such attacks with related techniques.

So what I really want to know is, what would a QMMU(tm) look like? 8)

Quantum encryption devices will be banned!

> Maybe a calculator of 2011 will crack public keys with quantum computations, or create ciphertexts impervious to such attacks with related techniques.

I'm pretty sure that such a device would be banned not only from exams but from general usage. Intelligence agencies around the world will neither want everybody to be able to crack any encryption nor to encrypt their private data in an indestructible way.

I like the idea of being able to transfers to/from a computer, but don't some of the other specs such as an ARM processor, 16mb flash rom and a compact flash port seem like overkill for a scientific? I understand the importance of using the same board in a graphing model later, but I don't think that the thought of using 4 AAA batteries which last "at least a year" in a scientific will attract much interest.

Re: OpenRPN Hardware Specifications

*Message #20 Posted by **Hugh Evans** on 1 Dec 2005, 8:10 p.m.,*

There are enough graphing machines on the market right now that I don't even have one on my long-term to-do list. My personal hope is that Hydrix will pull off getting qonos to market. In fact, I won't even consider doing a graphing machine unless they declare qonos dead.

As far as the ARM goes, what do you have against it? It's the most reasonable way to impliment 96-bit BCD, which is what we're using. One of my personal rules in designing these machines is: If it seems like a little bit of overkill, go with it. The compactflash port will be internal. I'll be using mine strictly as a USB mass-storage device to carry around my files.

Also, the lithium AAA batteries I have selected weigh less than standard alkalines (11.5g ea) and have a shelf life of 15 years. My question is, what's the problem using AAAs?

I suspect some users will see battery life of up to 5 years.

Re: OpenRPN Hardware Specifications

*Message #21 Posted by **Eric Smith** on 1 Dec 2005, 10:37 p.m.,*

> Quote:
>
> I suspect some users will see battery life of up to 5 years.

AAA lithium cells are rated at about 1250 mAh. Assuming that you use a pulse-skipping buck converter to produce 3.3V, and that you get 80% average efficiency, that's effectively 2045 mAh at 3.3V.

Your calculator is likely to draw at least 75 uA in standby, which results in a battery life of 3.1 years only if you never turn on the calculator at all.

The calculator will draw about 250 times more current when on but idle, and about 1000 times more current when active. Assuming that the calculator is used for 30 minutes a day, with an actual running duty cycle of 10%, the battery life would be just shy of three months.

What voltage range with the processor and other ICs handle? If they're all 3V parts, it might be better to go with a couple of AA's and forgo the switching (or any) regulator between the batteries and the circuit. The reason is that a switcher is only efficient for a comparatively narrow range of current, and the actual time the processor spends thinking (the high-current time) will be a small percentage of the total "on" time. You might need to turn the processor speed down a little to keep it working reliably down to 1.8V when the two AA cells are just about dead, but you'll still have plenty of processing power for a calc. Since most of the time would be spent at a current much too low for the switching regulator to pay for itself in terms of battery life, and you can't justify keeping the voltage at max all the time since you don't need maximum processing speed, I'd just leave the switcher out.

Re: OpenRPN Hardware Specifications

*Message #24 Posted by **Hugh Evans** on 2 Dec 2005, 6:33 a.m.,*

in response to message #23 by Garth Wilson

Our embedded HW designer has mentioned planning to use 3V throughout. The only part I know of that drops out below 3V is USB, but since the machine will be using external juice in that mode it's a non-issue. I don't even remember mentioning a switcher outside of it being mentioned during a discusion once.

I'm still inclined to use 4xAAA due to size. I can't get a AA into the current enclosure unless I increase the thickness to 3/4" or so. If lithium polymer ever becomes standardized I will be inclined to retrofit a pack in, 3-5Ah should be possible in the same space!

VARTA EasyPack. 3.7V, 500, 750, 1000, and 2000 mAh. Available from Mouser, not too expensive. TI (Benchmarq) chips can be used to control charging. Reference design kit costs $259 and includes one of each pack.

The 750, 1000, and 2000 mAh are all 64.5 by 36.3 mm, but vary in thickness, 5.2, 6.4, and 11.4 mm.

For my own purposes, I wish they had a pack with 2000 mAh or greater capacity, but that was wider and/or longer rather than being thicker.

> I don't even remember mentioning a switcher outside of it being mentioned during a discusion once.

If you use 4xAAA, and don't use a switcher, you'll be wasting a third of the available battery capacity. A 3.3V linear regulator (or LDO) will take your 4-6V in, and give you 3.3V out, but the voltage difference is being converted to heat. So if the batteries are 1250 mAh at 6V, you get 1250 mAh at 3.3V out.

Some buck-mode switchers that use burst mode or pulse skipping have efficiency above 80% even for low (negligible) loads. With one of those, you get 1818 mAh at 3.3V out.

With a 3.6V lithiun-ion or lithium-polymer rechargeable cell (pack), it makes sense to use an LDO. But then you also need a "fuel guage" chip in order to have a reliable indication of low battery status for the user.

I can't say I've looked into ultra-low-power switching regulator use much, but does that include the I(Q)? I have to doubt it. In any case, using more than two AAA's will still require a linear regulator as well to supply the RAM and clock in power-down mode, unless a tap is taken off the first or second battery (which would only give about 1.6V or 3.2V when alkaline cells are brand new). One thing I tried almost 20 years ago for getting the few microamps needed to keep RAM and RTC alive during powerdown is to use a JFET for regulation, with the only I(Q) being what gets through the 2M trimmer used for the voltage divider at the gate. The minor problem with that proved to be that the JFET's pinch-off voltage varied quite a lot across the temperature range. In order to avoid losing data at the cold end, the voltage at the hot end had to be close to the regular operating voltage. I suppose a very high value of thermistor could fix that, if they exist. (I haven't looked.)

If no switcher is used, then four AAA's to end up with 3V would give no real benefit over three AAA's. The energy from the fourth would just go into heating up the linear regulator. Its space might as well be given to something else.

As far as having **both** USB **and** RS-232, I'm all for it. While USB is good for connecting to a PC, RS-232 is much, much easier to cobble together projects to control or take data from things on the workbench.

No, everything runs on the switcher (though extra stuff like the EIA-232 level shifter might be turned off by a FET). In "power off" mode, everything still gets 3.3V, but the main oscillator is stopped so only the RTC and its oscillator are drawing power. The quiescent current of a modern switcher is around 20 uA.

For example, look at the data sheet for the Linear Technology LTC3405, and particularly at the graph of "power lost vs. load current" on page 10.

Re: OpenRPN Hardware Specifications

*Message #29 Posted by **hugh steers** on 2 Dec 2005, 12:36 p.m.,*
in response to message #1 by Hugh Evans

it looks sensible to me. i have a couple of ideas to add in,

have you got a rough cost estimate of the parts. also the display.

do you need rs232 as well as IrDa as well as USB? i know sometimes interfaces are already in the package, in which case it makes sense to use them. otherwise is more cost justified?

is the ROM memory mapped or do you have to copy into RAM to use it? otherwise you might need more RAM. you might consider adding some DRAM and have less SRAM. the idea being that the DRAM is lost when it sleeps, but it can be used for workspace and to hold stuff copied from ROM if that is necessary.

why compact flash and not SD? this might be a question of cost or availability again.

personally, i agree with the battery choice. it means it can run on regular batteries and also on rechargeable ones. otherwise you have to ship a charger. years ago i had an old handspring palm pilot, it worked fine on rechargeable batteries, but one charge didn't last all that long (by then standards), and when travelling, i used regular batteries since i didn't have to carry a charger. sadly, they are all built-in Li ones now.

on standby you should manage a very low current draw. with dry cells, you ought to have good life expectancy (due to their shelf life and low self-drain).

could it run on 3 AAA cells? if 4 fits comfortably in the package then have 4 as it means it will last longer, but i've seen a lot of home gadgets with 3 (eg cordless phones). some even have 2 now. so i guess they must have some voltage multiplier in them. i'm just wondering about the fitting with 4 and the CF and other connects?

nevertheless a good choice. i think you will actually need the 200Mhz. i know this sounds like madness when compared to calculators of old and their respective speeds, but it will make for a much nicer experience. of course, the unit will sleep when not actually calculating to save power.

just recently i've been playing with the lygea 12c emulator (http://www.lygea.com/pocket12cdetail.htm) i've been running some IIR calculations for cashflows. the real device can take minutes but the emulator is there virtually instantly. for these sorts of thing, i've actually started using it over the real machine despite the fact that it has no real keyboard – which is usually the reason to not use a PDA.

good luck and happy hacking!

A few comments...

Probably overkill for 90+% of calc applications - hope you aren't trying to do another 48/49.

- Don't try to do an HP48/49 calc. Those are available and there's a ton on the used market. (I've given away two myself. To me, they're better as wheel-chocks than calculators.) Plus this is a bigger project. Do a smaller more achievable calc to get something right early.

- A moderately fast HP41/42S-style true RPN calc can do perfectly well using a capable 8 or 16 bit microcontroller, esp if CPU has a built-in basic LCD driver. This includes emulation of original HP 'microcode'.

- Emulation of an orig HP calc w/uncopyrighted ROMs can be very very helpful to getting something "right", early. The emulator can have traps in it to break out into real-code world for ease of implementing

new functions or for overall system management. More important than calc operation routines are the actual quality math routines. We'd be hard pressed here to create transcendental functions that match the quality of HP's on even Spice or 11C/12C/15C calcs - let alone that of Solve & Integrate.

- Avoid USB. Expense, etc. Don't use the calc as a USB memory stick, that's a dud application as these sticks are $20 items that fit on keychains and smaller ones are even being given away as promotional items even...

Most PCs can read/write to many types of memory cards (SD/MMC, CF, xD, etc) either directly (or thru a $10 USB dongle) so do the write or read on the card at the PC and move the card to the calc. Less firmware, less grief, no one's bothered.

- Use SD instead of CF cards (and avoid xD!!). CF connectors are more expensive and the speed advantage of CF devices (esp as inplemented in MicroDrives) is not terribly relevant here. Free FAT12/16/32 filesystem open source is available - search SourceForge for EFSL (Embedded FileSystem Library), just write a low level SPI driver to fetch/write n*512 bytes to card sector address...

- Hugh Steers' question/comment about copying ROM to RAM is an important one. In the devices using embedded ARMs, generally attached RAM is faster than ROM, so it behooves one to copy to RAM at boot.

However, I see this as a system integrity issue. Without elaborate realtime continious memory image checks, the paranoid amongst us prefer code in ROM. Wild pointers don't overwrite it, etc. Your car's engine control software and pacemaker software all run directly out of ROM, often uncached.

- Attack power management at very low level. Power mgmt routines should be programmable and configurable for keystroke operation vs running programs at various speeds.

*Message #31 Posted by **Hugh Evans** on 2 Dec 2005, 10:35 p.m.,*
in response to message #29 by hugh steers

The MCU has USB 2.0 full-speed, IrDA, and RS232. USB is well suited to interfacing with PCs, IrDA is ideal for wireless communications, and RS232 will make life much easier for those who like to tinker.

An internal CF II slot would allow support for everything from microdrives to expansion devices (since it is really just a mini-pcmcia controller). It may be going a bit overboard, though. There is also a MMC controller on board and if a bit of extra storage space is all anyone wants we can certainly go that route.

I don't have an answer for you on the ROM. We sorely need more hardware design help, if anyone reading this thread would like to lend their talent please send me an email. 512KBytes of SRAM should be more than enough. If for some reason we need more I would lean towards using PSRAM at $10 for 16MB.

As far as batteries go, the more we can stuff in the better. Since the MCU has a battery monitor interface, I believe we should use it.

Execution speed is a big can of worms. I don't think we can make any decisions until the development boards become available. What we can be sure of is that plenty of control will be necessary.

Re: OpenRPN Hardware Specifications

*Message #32 Posted by **Eric Smith** on 3 Dec 2005, 2:00 p.m.,*
in response to message #31 by Hugh Evans

PSRAM has higher standby current consumption than SRAM. I think you really want low-power SRAM.

I don't know about other people, but I'm not looking for 16 MB of RAM in a 15C/42S replacement. If it has an SD slot, I'll plug in a 2GB SD card if I for some reason need to store lots of programs or data.

And I *much* prefer SD/MMC over CF. The SD/MMC slot can easily be made accessible from the outside. The cards take up much less room, so I can carry several of them around more easily.

Re: OpenRPN Hardware Specifications

*Message #33 Posted by **Howard Owen** on 3 Dec 2005, 3:43 p.m.,*
in response to message #32 by Eric Smith

CF is a generic peripheral bus, but it's arguable whether you need the flexibility in a machine like this. My dream calculator would have WiFi, desktop-equivilant RAM and storage and the fastest processor available. Oh, and it would be solar powered and never need recharging under constant use. Essentially, I want a calculator sized package with a calculator keyboard and power consumption, but a fast grid's computing power and a game machine's graphic performance. But a real calculator doesn't need real-time network connectivity, as long as it has some way of reaching the outside world. It shouldn't need a huge anount of storage, but SD/MMC is there with a smaller form factor and lower power than CF in case it does. And while the fastest possible computation speed would be nice, the trade-off for power consumption is always present.

On the other hand, it makes sense to choose a platform that will scale for other projects beyond the initial two machines. Perhaps something approaching my dream machine, or someone else's, will be feasible in the future. It would be nice not to have to throw out all the hardware and software design work to get to a better platform. Besides saving effort in development, sticking with the same hardware platform could make it possible to have the newer system upward compatible with the older. So I say don't design the CF slot out unless it will cost an awful lot to leave it in.

Regards,
Howard

*Message #34 Posted by **Hugh Evans** on 3 Dec 2005, 5:01 p.m.,*
in response to message #33 by Howard Owen

I believe the second generation of openrpn machines will be the ultimate dream calculators. Several ultra-low power technologies should be available within the next 5-10 years such as: bistable displays (e-ink), non-volatile memory (NRAM, MRAM, FeRAM), and ever more energy-efficient PLDs. However, I don't want to worry about any of that until our first generation devleopment is finished!

No one seems to be clamoring for CF, and the general concensus is clearly in favor of MMC/SD. However, if we can make them both fit we'll use them! This is another good example of why I want to build the mainboard on a DIMM. If all else fails we have 144 pins for easy access to unused goodies in the MCU.

I don't plan to use the same mainboard for the second generation, but I would like to make an upgrade that consists of a simple board swap.

Seconded. I always thought it's a big plus of the HP-48G and its relatives that it can run off standard batteries. You can use disposables when travelling, or dirt-cheap rechargeables otherwise, plus you can recharge them outside the calc.

OT: I, too, mourn the disappearance of AAA-powered PDAs... I ended up settling for a Palm Zire 21: also a non-replaceable built-in Li battery, but the machine uses very little power (no backlight and other such frills) so it will actually run quite a while before it needs recharging.

This may have been discussed before, but it cannot be overstressed. The two most important features of a calculator are its display and its keyboard:

* Use the HIGHEST contrast display you can find. The main reason i have my 48SX is the low-contrast display. Also, remember that many of us owned HP calculators when they were coming out, and that can tell you something about the state of our eyes :) An option to have a single line of large characters as opposed to two lines of smaller characters `a la HP42 would be nice. The 32SII got it right there.

* While you probably don't have much of a choice on the hardware of the keyboard, you still have much choice on the color scheme. Think HIGH CONTRAST. I suspect someone at HP did a lot of usability research before they settled on the orange ("gold") and blue scheme. It's not perfect, and the choice of colors should depend on the color of the bezel and calculator keys, but the pastel colors in the 48GX and the later 32SII for example were a disaster.

Thanks, and good work!

48GX computing delay

*Message #1 Posted by **Steve Jirsa** on 30 Nov 2005, 6:58 p.m.*

I have a 48GX which often has a several second delay when performing basic arithmetic. Has anyone else experienced this and is there anything that can be done?

Re: 48GX computing delay

*Message #2 Posted by **Han** on 30 Nov 2005, 11:00 p.m.,*
in response to message #1 by Steve Jirsa

I have a 48GX (several actually), a 48G (again several) and 48G+ (just one). I also have several 48SX models. I would be willing to test out your calculations on these models and time them for you for comparison. Could you give us some details as to what it is you are calculating?

Han

Re: 48GX computing delay

*Message #3 Posted by **steve jirsa** on 1 Dec 2005, 11:43 a.m.,*
in response to message #2 by Han

It's usually just basic multiplication or division and it seems to happen pretty randomly.

Re: 48GX computing delay

*Message #4 Posted by **Arnaud Amiel** on 1 Dec 2005, 12:06 p.m.,*
in response to message #3 by steve jirsa

Wouldn't it be garbage collection? It would especially happen if you don't have much in memory.

Arnaud

Re: 48GX computing delay

*Message #5 Posted by **Han** on 1 Dec 2005, 4:59 p.m.,*
in response to message #4 by Arnaud Amiel

I believe you are correct. During garbage collection, the calculator will be seemingly slower. The goal of garbage collection is to get rid of temporary objects in memory which are no longer referenced. If you are low on memory, then the HP 48 will try to garbage collect often in an attempt to get more working memory. Is this the case? Do you have very little free memory?

Re: 48GX computing delay

*Message #6 Posted by **Arnaud Amiel** on 2 Dec 2005, 4:51 a.m.,*
in response to message #5 by Han

If you have little memory, the garbage collection will be quite fast as it does not need to tidy much. However, if you have lots of free memory, it will not happen so often but will take much longer.

Basically, it works like this, the hp leaves all its temporary calculation, objects, rubbish in memory until it feels the memory is too full. It then cleans everything and starts again. If less space (memory) is available, it will have to clean more often but will have less work to do each time and you would not notice it.

When the 49 was introduced with 256 K of free RAM there was lots of people complaining about the garbage collection delay. The solution was to store a huge string in memory to have only say 64K left and adjust the size of this string to your memory requirements. Garbage collection was later improved to cope with the 256K.

Arnaud

Re: 48GX computing delay

*Message #7 Posted by **Han** on 2 Dec 2005, 4:27 p.m.,*
in response to message #6 by Arnaud Amiel

Ahh... I truly blundered then. I had assumed that with such little memory, gargabe collection would occur so often that the frequency of gargabe collection was what was noticable. It makes more sense the way you described it.

Just out of curiosity: how did they make the fix for the 256kB of memory?

Edited: 2 Dec 2005, 4:27 p.m.

Re: 48GX computing delay

*Message #8 Posted by **Arnaud Amiel** on 2 Dec 2005, 5:45 p.m.,*
in response to message #7 by Han

I believe that the Garbage collector of the 49G was rewritten completely in a ROM update. It still happens but it is much fatser. On the 49g+ I believe it was directly implemented in ARM

OT: Sharp PC-1600 documentation in english

*Message #1 Posted by **Gileno - Brazil** on 30 Nov 2005, 4:20 p.m.*

Please i need Sharp PC-1600 documentation in english (PDF) Thank you

Re: OT: Sharp PC-1600 documentation in english

*Message #2 Posted by **Marcus von Cube, Germany** on 30 Nov 2005, 4:53 p.m.,*
in response to message #1 by Gileno - Brazil

The German version can be found on http://esupport.sharp.de.

http://www.manuals-in-pdf.com sells a PDF copy.

Both sites have a working search feature.

Marcus

Craig Finseth's site is a must-read!

*Message #1 Posted by **bill platt** on 30 Nov 2005, 2:33 p.m.*

I've been over there many time--but I just had to mention it. For all of you who are insuffereably interested or even obsessed with knowing what all the models were and especially how they differed or bugs, Craig's list is a great asset--as is the museum here. Where the museum has in-depth discussion of great interest and fun to read, Craig has what is approaching a comprehensive database.

A good example, extracted from his discussion of solvers:

> Quote:
>
> Algebraic:
>
> This solver is similar to TVM5, except that it has been generalized to handle any equation.
>
> <name> stores the value in the variable STO <name> stores the value in the variable <name> (2nd in a row), solves for the variable RCL <name> recalls a value from the variable
>
> The solvers on the 17BII, 19B, 19BII, and -27S also have L(et) and G(et) functions.
>
> The solvers on the -17B, 17BII, -18C, 19B, and 19BII do algebraic simplification: this feature was removed from the -27S in order to save space.
>
> The solver on the 17BII / 19B / 19BII is the best one of the set.

Note that there *is* a small difference between the 27s and the 17bii solver--algebraic simplification!

Indeed!!! (N.T.)

For what it is worth...

*Message #1 Posted by **Jordi Hidalgo** on 30 Nov 2005, 1:47 p.m.*

... my HP39G CAS enabler aplet is downloadable from Eric's site.

Re: For what it is worth??? Are you kidding?

*Message #2 Posted by **Ron Ross** on 30 Nov 2005, 2:03 p.m.,*
in response to message #1 by Jordi Hidalgo

It made the Hp39G worth owning. Without this nice app, the Hp39G is merely a copycat Ti-83. It effectively gave the Hp39G an equation writer (which it lacked). That alone was worth having.

Thanks for that contribution (and I know you have made other contributions as well). Thanks.

I thought the Hp39G should have come standard with CAS as it might as well be loaded up with all sorts of extras and goodies so that the discerning customer would have an edge over his fellow (sheep) students that bought Ti's (add credulence to the Hp marketing slogan, THE HP ADVANTAGE or as I like to say THE HP UNFAIR ADVANTAGE).

If Hp had released the Hp39G with CAS and an RPN mode, they may have made more sales. That it would rob sales from the Hp48/49 was true, but it is much easier to use in algebraic mode (no damn plethoria of flags) than the 48/49 series.

I understand your CAS will not work on the newer Hp39G+ though. I also suspect you cannot confirm nor deny either.

Re: For what it is worth??? Are you kidding?

*Message #3 Posted by **Tim Wessman** on 30 Nov 2005, 2:22 p.m.,*
in response to message #2 by Ron Ross

It won't. They learned any physicaly removed the CAS code from the 39g+. The new 40GS appears to have it back.

I still think it was very dumb to not have the EQW active though. That is a huge feature people love.

TW

in response to message #3 by Tim Wessman

What IS this HP 40GS? Obviously it is not sold in the 'States. But I can't even find an informational page on it on the Internet!

Re: For what it is worth??? Are you kidding?

*Message #5 Posted by **Ron Ross** on 1 Dec 2005, 10:48 a.m.,*
in response to message #4 by Ed Look

hpcalc.org has a small photo of it on the main page (shown with the Hp39G section) and may have a larger jpg somewhere on its site. I have seen it for sale (though not yet available, ie pre-sale) at some German calculator site.

It seems that it will only be available to the European market (if it is ever sold), within the next few weeks (or now, I haven't followed up). It is basically an Hp39G+ in a different (and nicer looking) skin with CAS (at the expense of IR, which I don't value all that much, as long as Hp also supplies a cable).

Re: For what it is worth??? Are you kidding?

*Message #6 Posted by **Gene Wright** on 1 Dec 2005, 11:34 a.m.,*
in response to message #4 by Ed Look

Best bet for these types of questions is to google it.

That brings up three pages with "hp40gs" as the search term, including the hpcalc.org page that has a picture.

:-)

OT: Sharp PC-1425 documentation

*Message #1 Posted by **Juergen Keller** on 30 Nov 2005, 9:59 a.m.*

I recently aquired a Sharp PC-1425 statistics calculator. Unfortunately, it didn't come with a manual. I know that some of you are not only addicted to HP calculators. So probably, there is anybody out there you can provide me information/documentation about this calulator. Didn't found much on the Web. Any help highly appreciated!

Thank you, Juergen

Me too !! Re: OT: Sharp PC-1425 documentation

*Message #2 Posted by **Valentin Albillo** on 30 Nov 2005, 10:10 a.m.,*
in response to message #1 by Juergen Keller

Me too !! :-)

I've also been unable to get hold of any kind of manuals or instructions for this particular model, even after posting in several forum's classified sections, extensively searching the web, and keeping watch at eBay.

So if someone can offer any instructions or manuals, be they for free or for money, I'd be very glad to hear. It's terribly frustrating owning such fine handheld and not being able to exploit its wonders to the fullest due to an absolute lack of docs.

Best regards from V.

Rare calculator?

*Message #3 Posted by **Juergen Keller** on 30 Nov 2005, 10:24 a.m.,*
in response to message #2 by Valentin Albillo

What do you think is the reason that it is so difficult to find any documentation about this model? Whas the manual so bad that everybody got rid of it, or is this a rare calculator?

Do you know if the various Sharp models use (more ore less) the same BASIC dialect? Is there any documentation about Sharp BASIC?

Valentin, hope we are lucky and find someone who can make us happy again ;-)

Best Regards, Juergen

Re: Rare calculator?

*Message #4 Posted by **Valentin Albillo** on 30 Nov 2005, 11:01 a.m.,*
in response to message #3 by Juergen Keller

Hi, Juergen:

Juergen posted:

"What do you think is the reason that it is so difficult to find any documentation about this model? Whas the manual so bad that everybody got rid of it, or is this a rare calculator?"

> It's an extremely rare calculator. I've only seen it offered for sale three times or so. Got mine in eBay for 44 euros (about US$ 50 at the time).

"Do you know if the various Sharp models use (more ore less) the same BASIC dialect?"

> Yes, pretty much the same with obvious extensions for the dedicated models. So, your SHARP PC-1425 does have the same BASIC "level 2" with statistic functions added, the financial SHARP PC-1421 does have the same BASIC "level 2" with financial BASIC statements added (such as IRR, NPV, etc), ...
>
> There are mainly two flavors of vintage SHARP BASIC. Level 1 is the dialect that came with the original SHARP PC-1211 and several other models. Level 2 is the advanced dialect that came with the newer models, such as the SHARP PC-1350, your PC-1425, etc. This advanced BASIC upgrades the older version with two dimensional arrays, multi-character variable names, and many, many extensions,
>
> Programs written in Level 1 can be keyed in and even read from tape by Level 2 machines with few or no modifications. The reverse isn't true, logically. But the bottom line is there are essentially only two versions of vintage SHARP BASIC and they are upwards compatible.

"Is there any documentation about Sharp BASIC?"

> Yes, tons ! You'll find tons of original SHARP manuals scanned and converted to PDF documents freely downloadable from here, both in German and in English. Regrettably, the one for the PC-1425 is missing, but you can download the German manual for the PC-1421 instead, which will include tutorials and reference for all the functionality of your PC-1425, plus business functions (not present in your machine, of course) and minus the statistical functions (not present in the PC-1421, obviously).

"Valentin, hope we are lucky and find someone who can make us happy again ;-)"

> Let's hope. And if you do before I do, please let me know, and vice versa.

Best regards from V.

*Message #13 Posted by **Marcus von Cube, Germany** on 30 Nov 2005, 1:52 p.m.,*
in response to message #10 by Valentin Albillo

Valentin,

can you go to their home page and enter the search term "Sharp PC-1425"? Or does it fail in the same way?

Marcus

Re: Me too !! Re: OT: Sharp PC-1425 documentation

*Message #14 Posted by **Dave Shaffer** on 30 Nov 2005, 3:17 p.m.,*
in response to message #10 by Valentin Albillo

Valentin,

What browser are you using? That might be your problem.

I prefer Netscape 7.1 to MS Internet Explorer, and I occasionally find that a web site will not load properly unless I use IE.

(Another example of MS domination!)

I haven't yet tried Firefox or Opera.

Re: Me too !! Re: OT: Sharp PC-1425 documentation

*Message #15 Posted by **Antoine M. Couëtte** on 30 Nov 2005, 4:21 p.m.,*
in response to message #10 by Valentin Albillo

Nov 30, 2005

Valentin,

I recently happend to be in a similar case : a friend could easily access a web site, while I could not. It turned out that he was using Internet Explorer (MS registered software and name)while I was using an early version of OPERA (egistered software too). When I subsequently searched this site with I.E. everything worked just fine.

Maybe this could explain your difficulties in attemting to acces a site which various other peole - including myself a few minutes ago - can easily access !

Just my one (Euro)cent opinion !!!

Best Regards

Antoine

*Message #21 Posted by **Howard Owen** on 30 Nov 2005, 5:02 p.m.,*
in response to message #20 by Etienne Victoria

It's the musical prompts. Not my fault. 8)

Thanks for your kind words!

Re: OT: Sharp PC-1425 documentation

*Message #22 Posted by **Peter Geiser** on 2 Dec 2005, 3:13 p.m.,*
in response to message #19 by Howard Owen

Howard

The PC1500A and PC1500 are basically the same model in the same package, with the exception of memory: PC1500 has only 2k, while the PC1500A has 8k of user memory.

In terms of chips used, the A version has four 2k chips from Toshiba (if I remember correctly, they were TC5517).

If anyone needs more details, let me know.

Best regards

Peter

Jürgen,

Die Sharp PC-1425 Anleitungen findest Du auch im Deutschland!! auf dieser Seite inklusiv Bedienungsanleitung auf Deutsch und Service Manual (Englisch). EUR 10,59 je Buch.

PC-1425 im "Modell" eingeben

MfG

Etienne

---------- Translation----------

Valentin, Howard, all,

You may also find here the PC-1425 user manual in german and the service manual in English for EUR 10,59 per manual.

Type PC-1425 in the Modell field (and don't try to use the english pages).

Sincerely

Etienne

Edited: 30 Nov 2005, 5:40 p.m.

Thanks to all of you ! (Re: Valentin, Jürgen: Sharp PC-1425 documentation (sorry Dave))

*Message #26 Posted by **Valentin Albillo** on 1 Dec 2005, 4:31 a.m.,*
in response to message #25 by Etienne Victoria

Hi, Etienne:

Yes, that link does work for me and I can see the two manuals offered for the SHARP PC-1425.

Unfortunately, the one I'm interested in, namely the "Owner's Handbook" is only available in German, which regrettably I can't read or translate. As it probably is a PDF consisting in scanned images (thus not in textual form), it seems it will be impossible to use an automatic translator and the prospect of manually typing pages of convoluted German text to have it approximately translated seems impractical.

Well, perhaps at some time in the future I'll get the English manual from eBay or such. Another try would be to offer some valuable HP or SHARP as a trade-in for this manual, but I'm less inclined to follow that way. Meanwhile, my beautiful SHARP PC-1425 will remain safely stored, waiting for better times ...

Best regards from V.

HP48GX crash problems

*Message #1 Posted by **Jeff** on 30 Nov 2005, 9:07 a.m.*

I read this forum when time permits for me. Since I have a problem that I have not seen discussed, I thought it would be a good discussion topic. My HP48GX (manufactured in 2002 with a version R ROM) crashes on occasion during calculations. It acts abnormally slow during some multiplication and trig functions. (BTW, I am gauging the actions against my 48G+.) When the calculator crashes, the following can occur: 1) pixels are randomly generated on the display (this prompts me to remove the batteries and let the calculator reset) or; 2) the display is cleared and the memory is dumped.

I would rather keep this machine running than turning it into a paperweight. Any ideas? I'm fresh out. Thanks for any suggestions.

Jeff

Re: HP48GX crash problems

*Message #2 Posted by **Ron Ross** on 30 Nov 2005, 9:16 a.m.,*
in response to message #1 by Jeff

After a reset, do you use PINIT to re-initialize you memory cards (if you have any). Memory cards (and garbage collection) are what make the GX much slower than a lower end plain 48G. The G+ only has 128K of RAM to worry about and falls somewhere in between (I don't have a G+ version to compare).

Do you load up your GX with certain types of programs (Utilities or memory managers?). Some of these work well, when they work, but when they don't, well you see exactly what you experience.

Re: HP48GX crash problems

*Message #3 Posted by **Jeff** on 30 Nov 2005, 2:07 p.m.,*
in response to message #2 by Ron Ross

I do not use any memory cards for my GX. The math operations I have don't require them. The machine has crashed when the stack had a few numbers on it but I didn't have that problem with the 48G+. BTW, the GX I keep at the office while the G+ goes with me to class.

Re: HP48GX crash problems

*Message #4 Posted by **Han** on 30 Nov 2005, 11:04 p.m.,*
in response to message #1 by Jeff

How replicable is this crashing? Can you cause it to crash doing the exact same caclulations? Or is it more intermittent? If you can force the crash, could you tell us what the computations are? I'm very curious about this and would like to test this on my own set of HP48G/G+/GX calculators.

Re: HP48GX crash problems

*Message #5 Posted by **Jeff** on 1 Dec 2005, 8:07 a.m.,*
in response to message #4 by Han

It is an intermittent problem. I tried to force a crash by loading up the stack then running trig calculations (as it has in similar circumstances). It did not crash....this morning.

Re: HP48GX crash problems

*Message #6 Posted by **Han** on 1 Dec 2005, 5:05 p.m.,*
in response to message #5 by Jeff

Is there anything running in the background, such as say Eqstack? If you are not running any downloaded software, and use only the built-in commands, then you should not be experiencing these crashes. The fact that your screen is garbled means something is trying to write to random areas in memory, including the memory containing the content of the display area. Can you be more specific about the conditions leading up to the crash?

E.g. commands you used, programs you ran, memory conditions (low ram available, etc), where you run the program (from var, port0, port1, or higher ports) etc...

Re: HP48GX crash problems

*Message #7 Posted by **Jeff** on 6 Dec 2005, 10:13 a.m.,*
in response to message #6 by Han

Sorry for the delay in responding.

The only thing running in the background is the clock. I am using the built-in commands in the machine. No memory or equation cards are inserted into the ports. When the crashes occur, the machine is solving a addition or a mutliplication of a number. There were no low memory prompts. The only area that would have some memory usage would be the stack. I would have approximately 20 to 30 lines of numbers in the stack.

As of this moment, I have not been able to replicate the crash. As always, it will crash when I least need it to.

Re: HP48GX crash problems

*Message #8 Posted by **Alberto Acevedo** on 7 Dec 2005, 9:17 p.m.,*
in response to message #1 by Jeff

hi!

when i tried to turn off the calculator it can't turn off. also when i used the 48 gx as a field book or data collector it freezz or crash.

tell me what i can do for resolve this situations.

thanks!

alberto

Revisit of "Can't we give HP some credit"

*Message #1 Posted by **ECL** on 30 Nov 2005, 12:57 a.m.*

To HP calc team: I am an engineering student. The 33s is much appreciated!

New display is sharp and easy to read. TI machines will eventually see stiff competition from PDA's as they try to market themselves as the "EVERY COURSE" machine - check their website.(HP makes PDAs...)

Some comments for future 32/33/42 series machines:

1. When time comes for redesign, consider a traditional case/keyboard layout. However, the ENTER key is not a deal-breaker anymore ;)

2. Some "style" can be tolerated, as not every customer is the late 70s purist-engineer (although I am).

3. Basic soft-menu system, short, but multi-char variables, and minimum of 10x10 matrix support.

4. ...Any hope for a 42s anniversary-esque machine?

If these were implemented, the machine would be a *show-stopper*! Laptops do my heavy work, but you still need to carry something small and light in the field.

After browsing that earlier thread, I'd like to make these comments:

The 33s, to me, is a very reliable and useful tool. If RPN is a condition, the $50 33s *really* is very reasonable. I was one of the people in 2002 that LAMENTED not having scooped up some extra 32sii copies.

I have essentially been on a 42s/32sii quest since then. I am limited by student finances, and thus am so happy to walk into my university store and see a WALL of 33s' on display. Otherwise, I'd be using a Ti one-liner, as not *every* couse permits graphing machines.

I *cleaned house* on a recent exam in my numerical methods course, using my 33s. I walked out with over 95% of the people scrambling to perform matrix row manipulations *by hand*. My 33s zipped me through by virtue of two simple programs. Another example is having to compute % approx error 10 times on an exam. A program scoops the two values from the stack, and returns the error. How many keystrokes are saved...

Its a combination of these 'on the fly' time savings, and the ability to develop a few more involved algorithms that make the 1-2 liner RPN/keystroke prog machines such a pleasure to use.

ECL

*Message #2 Posted by **brian healy** on 30 Nov 2005, 9:51 a.m.,*
in response to message #1 by ECL

ECL, I agree with you 100%

To the HP calc team: I am a practicing consulting engineer, and the 33s is also greatly appreciated by me. I echo many of the comments by ECL. For future machines, please make sure they get a full QC so that issues with invisible decimal points and poor keyboards are not repeated. Never abandon RPN. RPN results in a calculator for an engineer that is a tool, not a toy, as I consider machines that are purely algebraic. Also, I don't believe that laptops and PDA's will eliminate the need for a good basic RPN calculator. Each have their places.

*Message #3 Posted by **Arnaud Amiel** on 30 Nov 2005, 10:08 a.m.,*
in response to message #2 by brian healy

The main advantage of a calculator over a PDA is the dedicated tactile keyboard. I have an Xpander and even that is far from perfect as accessing any function requires the stylus so I don't really use the Xpander.

The main differentiator being the keyboard, I believe that if hp or anyone else want to continue making high-end calculator, they have to focus on the keyboard which does not seem to have been the case at the release of the 49g+ (although mine is perfect)

HP-71B HP9114

*Message #1 Posted by **Justin Stubbs** on 29 Nov 2005, 4:45 p.m.*

I have a bunch of disks that were written with the HP9114. The drives we had are shot, but theres a bunch of information on those disks. Does anyone know of anyway to get at that data?

Re: HP-71B HP9114

*Message #2 Posted by **Howard Owen** on 29 Nov 2005, 5:36 p.m.,*
in response to message #1 by Justin Stubbs

There's a DOS program called LIFUTIL, available here in the museum FTP site. (LIFARC.EXE is a self extracting executable.) I've been able to get this to run under MS-DOS, and it's supposed to work under Windows 9X, too. The 9114 writes double sided *double* density (not quad density as modern) disks with 256 byte sectors. Modern PC BIOS sometimes have difficulty with this format, but sometimes not. You may have to actually load Win9X or MS-DOS onto a machine to get it to work.

Another alternative is the one I use. I bought an HP=IL ISA card from Cristoph Klug. I use JF Garnier's EMU41 and EMU71 DOS emulators to drive the card. It lets me read and write file to and from a 9114B and LIF images on the DOS drive. These I can read using several utilities available here and elsewhere. This appeals to me because I can make it work under DOSEMU on Linux. It is more complicated, and perhaps more expensive if you have an old PC lying around. But it's just the ticket for a hobbyist.

Regards,
Howard

Replacing AC + Battery with DC + Capacitor

*Message #1 Posted by **Howard Owen** on 29 Nov 2005, 3:45 p.m.*

I have a 9122B that was modified by Personalized Software to run on AC. They replaced the battery in its shell with a 100 uF capacitor. The input is from an AC/DC transformer with output of 2A at 6V. This is cool, because I don't plan to use the device where batteres are needed.

Now the one working battery pack I had for my Thinkjet 2223B has gone to electrolyte heaven. I disassembled the pack (and another, non working one I have) and figured out that the bateries were 6 "C" sized NiCads wired in series, with a resistor soldered between two of the cells. A rectifier was included on a PCB to produce the required charging current. A quick Google revealed a source for replacement batteries, but not the packs, for $49.95. I'd rather do something like was done for the 9114B, and replace the battery and rectifier with a transformer and a capacitor.

I am mostly ignorant of basic electronics, being a software guy and all. How can I figure the right value for the dummy load capacitor, given the nominal output voltage of the battery pack?

6S Question

*Message #1 Posted by **Ron** on 29 Nov 2005, 3:29 p.m.*

Please, no tomatoes for a 6S question.

Is the 6S suposed to shut down after no activity for a few minutes in the dark, or does it just stay on until the battery is dead? A friend's seems determined to stay on, even in the dark.

Edited: 29 Nov 2005, 3:30 p.m.

Re: 6S Question

*Message #2 Posted by **Greg Whitfield** on 29 Nov 2005, 5:27 p.m.,*
in response to message #1 by Ron

Are you referring to the HP 6S or the HP 6S Solar?

I have an HP 6S Solar, and it will not turn off. I read some threads here that seem to indicate that being an "always-on" calculator is an advantage. However, I had to replace the battery on mine when I first received it so that it would work in low light.

Cheers, Greg

Re: 6S Question

*Message #3 Posted by **Raymond Del Tondo** on 29 Nov 2005, 5:37 p.m.,*
in response to message #1 by Ron

Hi,

From my experience the unit stays on even in the dark,
maybe until the backup battery is empty.

I got a 6S Solar as a present many years ago,
punched in a few numbers, and these are still in
the calc's display memory after all those years.

After all, it's a throw-away calc,
so if the batteries are empty,
it's cheaper to buy a new 6S (aka Texet ALBERT)
than to replace the batts.

HTH

Raymond

Re: 6S Question

Just a quesion : how do you know that an LCD calc is on **in the dark** ??
Probably NOT because the number on display is still there after a period in the dark, otherwise my 42S has been on for the last few years. So ?

The 6S Solar has a little solar panel in the corner. You can easily cover up the solar panel, which should have the exact same effect as putting the calc in the dark. If the display stays on regardless -- and I think you will find that it does -- then you can assume that it will stay on in the dark as well.

Can I transform a 33S into a 17BII?

*Message #1 Posted by **Tom Steiner** on 29 Nov 2005, 9:05 a.m.*

Made you look with my subject line, didn't I? No, seriously, I have been using a 17BII (not the plus one) for several years. I love the SOLVER functionality and use (only) about half a dozen of the built-in financial functions. Now that my 17BII is slowly getting old, I am wondering what I should do:

(a) Buy 2-3 of the 17BII off ebay, or (b) Buy a brand new 33S (with the new display, etc.), and try to program the few financial functions I need into the 33S. Is this feasible? Usable?

I am also interested in a scientific calculator, because I appear to be using more and more trigonometry functions. So currently I end up either searching for a 15-year old Casio or firing up Excel. With the 33S I would avoid all of this.

PS: I hate the 17BII+ (Plus), 12C, and 12CP (new version) - returned all of them after 1 day.

Re: Can I transform a 33S into a 17BII?

*Message #2 Posted by **Mike H** on 29 Nov 2005, 9:28 a.m.,*
in response to message #1 by Tom Steiner

The 33s can handle most of the common business and financial calculations. There are specific learning modules for:

House payments
Property appreciation
Affordable payments
Required down payment
Average sales price
Sinking funds
Present values
Bond prices
Trend line analysis
Cost estimation using linear regression
Percentage and percentage change calculations

Download here: Learning Modules (all of them) or visit hp.com to download just the ones you want.
The 33s Solver is not as intuitive as the 17BII or 27S because it lacks the soft keys, but I find it works pretty well.

Mike

Re: Can I transform a 33S into a 17BII?

*Message #3 Posted by **bill platt** on 29 Nov 2005, 10:30 a.m.,*
in response to message #1 by Tom Steiner

I agree with Mike.

I have both the 33s and the 17bii. The 17bii solver is so cool that I got a 27s so that I could have that solver on a scientific! (but beware, the 27s is old-fashioned algebraic for its regular interface, not RPN.)

However, the combination of the solver and the keystroke programming of the 33s makes the 33s even more powerful. You can program the 33s to do *any* financial function and unlike its predecessor the 32sii, it won't run out of memory.

You can program the 33s in such a way that it prompts you for each variable--and it will show you the existing value, so if it is good, you hit R/S and move on to the next one.

For some financial stuff, you can put it into the "equation list" but for others, you are better off taking advantage of the keystroke programming.

But the solver interface of the 17bii and 27s is just too cool, no doubt!

A little OT: Guidebook Nonsense (TI BA II Plus)

*Message #1 Posted by **Marcus von Cube, Germany** on 29 Nov 2005, 4:40 a.m.*

I found the following information in the guidebook for the TI BA II PLUS Professional:

> Quote:
>
> ### Universal Power [y^x]
>
> Press [y^x] to raise the displayed positive number to any power (for example, 2^-5 or 2^(1/3)).
>
> **Note:** Because the reciprocal of an even number (such as, 1/2, 1/4, 1/6) is a complex number, you can only raise a negative number to an integer power or the reciprocal of an odd number.

The note is plain wrong. I found the text first in the German translation and already complained to TI; I was assuming a translation error but the translation is perfectly correct: just the same nonsense.

I'm not a native speaker: Is it possible/advisable to place the word "only" in the last sentence after "negative number" instead of before "raise"? In German that would make at least the last sentence correct.

To become a little more on topic: Have you seen similar mistakes in HP manuals?

Edited: 29 Nov 2005, 4:44 a.m.

Guidebook Nonsense (TI BA II Plus)

*Message #2 Posted by **Karl Schneider** on 29 Nov 2005, 6:17 a.m.,*
in response to message #1 by Marcus von Cube, Germany

Marcus --

I'd write the note as follows:

Note: Because the TI BA II Plus does not support complex-valued numbers, it allows a negative number to be raised only to a power that is an integer or is the reciprocal of an odd integer.

Yes, the word "only" is misplaced in the TI documentation. It's a common mistake among our native speakers.

HP manuals from 1978-1985 were outstanding -- highly detailed, well-written, and virtually error-free. Before that period, there wasn't as much to write about (if the HP-35 manual is any indication); after that period, quality started to slide as costs were cut.

*Message #4 Posted by **Gunnar Degnbol** on 29 Nov 2005, 9:54 a.m.,*
in response to message #3 by Marcus von Cube, Germany

> Quote:
>
> Note: Because the TI BA II Plus does not support complex-valued numbers, it allows a negative number to be raised only to a power that is an integer or is the reciprocal of an odd integer.

Does it allow 0.33333333... (whatever the precision is)? Because it can't do that without cheating. Perhaps "the exact reciprocal" would be better.

Re: Guidebook Nonsense (TI BA II Plus)

*Message #5 Posted by **Marcus von Cube, Germany** on 29 Nov 2005, 10:41 a.m.,*
in response to message #4 by Gunnar Degnbol

Gunnar,

> Quote:

Blanknuts

*Message #1 Posted by **gifron** on 29 Nov 2005, 1:35 a.m.*

Okay, I haven't used my 41CV on a regular basis for years, and can't remember much. I've recently acquired a halfnut blanknut. What's the easy way to tell if it's a C, a CV, or a CX? It has no HP label, no back label (says, "MADE IN SINGAPORE"), and a 2823S SN. Thanks!

Re: Blanknuts

*Message #2 Posted by **Etienne Victoria** on 29 Nov 2005, 2:00 a.m.,*
in response to message #1 by gifron

Hello,

After a memory lost with

```
ON BACK ARROW
```

1) To check if it's a Cx, Type

```
XEQ CLOCK
```

If you don't get NON EXISTENT, then it's a Cx.
If you get NON EXISTENT, then it's a C or CV, proceed to step 2)

2) Type

```
XEQ SIZE 319
```

If you get TRY AGAIN or ARE YOU JOKING? then it's a C.
If your command is accepted and you get back to the number display, then it's a CV

Best regards from France!

Etienne

Edited: 29 Nov 2005, 2:40 a.m.

Re: Blanknuts

*Message #3 Posted by **Howard Owen** on 29 Nov 2005, 2:47 a.m.,*
in response to message #2 by Etienne Victoria

> Quote:
>
> If you get TRY AGAIN or ARE YOU JOKING? then it's a C.

Interesting easter egg there, Etienne. I don't think I've read about that one. 8)

You must be joking, of course. 8)

Re: Blanknuts

*Message #4 Posted by **Etienne Victoria** on 29 Nov 2005, 8:08 a.m.,*
in response to message #3 by Howard Owen

Yes Howard, It was just a little joke :-)

But I think it's harmless to the whole testing procedure.

I just hate the "TRY AGAIN" message which was put there as if just another try could help solve the problem...

Maybe "PAY AGAIN"(for more mem modules), "DELETE MORE" (useless programs that clutter memory) or even "SQUEEZE CALC" (to re-establish the 41 electrical contacts) would have been more appropriate.

All the best :-))

Etienne

Re: Blanknuts

*Message #5 Posted by **gifron** on 29 Nov 2005, 1:43 p.m.,*
in response to message #2 by Etienne Victoria

Thanks, Etienne. It is a CV.

49g+ DROP Error (humor)

*Message #1 Posted by **ECL** on 28 Nov 2005, 11:38 p.m.*

My 49g+ fell off my book, and onto the floor. *I know this is coincidental, but therein lies the humor:*

When I picked it up, the display read: **DROP Error**

The machine was on, and likely had an empty stack. It must have struck the <- key. Incidentally, it split the case open, and there are rattling sounds from within. This was a 2.25 foot drop onto linoleum flooring.

This reminds me of an HP ad for the first notebook (HP 100?) which showed it being dropped onto asphalt. Has anyone dropped a 48g? Damage?

ECL

Re: 49g+ DROP Error (humor)

*Message #2 Posted by **Han** on 28 Nov 2005, 11:47 p.m.,*
in response to message #1 by ECL

I've dropped a 48G and 48GX (both were inside their nylon cases) from about where my biceps are (they were sitting atop some books I was carrying). No damage was done. The case to the HP48G had a paint scratch on the zipper. The calculators even bounced on the cement. The 48GX had some RAM cards; neither were nudged out of their slots.

Re: 49g+ DROP Error (humor)

*Message #3 Posted by **Ed Look** on 29 Nov 2005, 12:05 a.m.,*
in response to message #1 by ECL

Actually, I DID suffer minor display damage on my 48G that I use at work. It was still in its gray nylon (soft and man IS it soft!) case and impacted on its upper left corner with the asbestos tiled floor.

That is not such a hard flooring material and it was still in its case. Yet, now, I have a think blank line across my display on the third stack level.

It goes away only if I continuously apply pressure the top end of the calculator shell (squeeze the halves together a bit) and reappears as soon as I let go.

So now, a thick rubber band straddles the top right under the HP logo and I get my full display back.

Moral: the 48G's (G, G+, GX) ARE FRAGILE!! Beware!

Re: 49g+ DROP Error (humor)

*Message #4 Posted by **Han** on 29 Nov 2005, 4:00 p.m.,*
in response to message #3 by Ed Look

The missing pixels can be restored. All that has happened is the contacts on the PCB have be jostled slightly off its original location.

You could try this repair guide.

Re: 49g+ DROP Error (humor)

*Message #5 Posted by **Ed Look** on 29 Nov 2005, 4:43 p.m.,*
in response to message #4 by Han

Why, thank you!

I will most certainly look at it and consider it...

... but I will admit when it comes to opening HP calcs these days, I am faint of heart.

I used to open and try to restore my old 34C, which turned out to be a losing cause, but nowadays, I am quite afraid of accidentally breaking or destroying another part due to static, etc.

But I will consider it!

Re: 49g+ DROP Error (humor)

*Message #6 Posted by **Howard Owen** on 29 Nov 2005, 1:44 a.m.,*
in response to message #1 by ECL

I'm glad you can find something to laugh about in all that! Ouch!

Re: 49g+ DROP Error (humor)

*Message #7 Posted by **unspellable** on 29 Nov 2005, 11:43 a.m.,*
in response to message #6 by Howard Owen

In a previous life I had a Sharp calculator, what passed for a muscle calculator in those days. It had a metal case and a hard plastic slip case so designed that falling out of the slip case was a natural. It got bounced off the pavement many times and had plenty of dings in the metal case but never skipped a beat in operation.

I once layed it down, forgot it, and when I returned it was gone. I then got a fairly powerful sharp scientific which lasted until one day I saw an HP28S. The rest is history.

Stiffness of newer kbds (49g+)?

*Message #1 Posted by **ECL** on 28 Nov 2005, 11:22 p.m.*

In the recent discussions regarding the later (newer) revisions of the 49g+ and build 80 of the ROM, I haven't read much regarding the stiffness of the keys.

My remaining 49g+ is the earlier (CN40600229) and the keys are fairly hard to depress.

When the keybounce issue is resolved, if the keys are more like the 33s and 48g series in resistance, the 49g+ will be attractive.

ECL

Re: Stiffness of newer kbds (49g+)?

*Message #2 Posted by **Marcus von Cube, Germany** on 29 Nov 2005, 2:40 a.m.,*
in response to message #1 by ECL

My CNA 50201686, ROM 2.00, is stiffer than my other HPs (including the 33s) but the keys are working without problems: no bounces, no missed entries. The red shift key rattles slightly but that doesn't affect its function.

My main issue with the keyboard is the layout: since I only use the 49g+ occasionally I keep looking for basic functions. "What were the shifted/shift hold functions of the arrows?" It's mostly a matter of trial and error to find out.

Marcus

in response to message #1 by Michel Beaulieu

Michel --

I have a program written by Tom Sherman in 1986, which he sent to me within the past several years. It requires an HP-41 Navigation Pac and a 41CX or 41C/CV with Time Module. (A 41C will also require a Memory Module or Quad Memory Module.)

Given the latitude and longitude of a location, plus the date and time from the clock, it will calculate the angles of altitude and azimuth for the sun, the moon, four visible planets, and many navigational stars.

I'd like to make a few refinements to the program, but have not yet done so. I have written the program to magnetic cards.

I know it may seem redundant, however one must be extremely careful when viewing the sun. You MUST have a solar filter that is compatable with your telescope!

*Message #4 Posted by **Dave Shaffer** on 28 Nov 2005, 11:44 p.m.,*
in response to message #1 by Michel Beaulieu

Here is a BASIC program which will give the RA and DEC of the Sun to very high accuracy (a few seconds

of arc) given year, date, and time (hours and minutes) as input. (Note, there are some extra variables printed in this version - helpful for debugging and generally checking what's happening). Note that the parallax of the Sun (which can be up to almost 10 arcseconds) is ignored. The RA, DEC are with respect to the center of the Earth. RA and DEC are in fractional hours and degrees - I'm not sure what your telescope wants.

```
10 DEFDBL A-H,J-Z
20 PI = 3.14159265#: TWOPI = 2# * PI: CONV = TWOPI / 360#
30 YEAR = 2000: MONTH = 8: DAY = 22: HOUR = 2: MIN = 0

     get the time & date from the calculator instead

40 UTC = (TWOPI * (60# * HOUR + MIN)) / 1440#
50 DIM NDAY(12)
60 DATA 0,31,59,90,120,151,181,212,243,273,304,334
70 FOR I = 1 TO 12
80 READ NDAY(I)
90 NEXT I
100 YEARM = YEAR - 1900#
110 KDAY = INT((YEARM - 1#) / 4#)
120 JULDAY = 2415019.5# + YEARM*365# + KDAY
130 JULDAY = JULDAY + NDAY(MONTH) + DAY
140 IF(YEARM/4# - INT(YEARM/4#)) > .2 THEN GOTO 160
150 IF(MONTH > 2) THEN JULDAY = JULDAY + 1#
160 CENTURY = ( JULDAY - 2451545# ) / 36525#
170 STM = 24110.55# + CENTURY* (8640184.812866# + .093104#*CENTURY)
180 STM = STM/86400# - INT(STM/86400#)
190 STM = 2# * PI * STM: PRINT JULDAY,STM*12/PI
200 DAYS = JULDAY - 2451545# + (UTC/TWOPI)
210 SOLLON = 280.46# + .9856474# * DAYS
220 SOLLON = SOLLON - 360# * SGN(SOLLON)*INT(SOLLON/360#)
230 IF(SOLLON < 0) THEN SOLLON = SOLLON + 360#
240 SOLANOM = 357.528# + .9856003# * DAYS
250 SOLANOM = SOLANOM * CONV
260 SOLANOM = SOLANOM + TWOPI * SGN(SOLANOM)*INT(SOLANOM/TWOPI)
270 IF(SOLANOM < 0) THEN SOLANOM = SOLANOM + TWOPI
280 ECLLON = SOLLON + 1.915# * SIN(SOLANOM) + .02# * SIN(2#*SOLANOM)
290 ECLLON = ECLLON * CONV
300 ECLLON = ECLLON + TWOPI * SGN(ECLLON)*INT(ECLLON/TWOPI)
310 QUADRANT = ECLLON / (PI/2)
320 IQUAD = 1 + INT(QUADRANT)
325 PRINT ECLLON,QUADRANT,IQUAD
330 OBLIQ = 23.439# - .0000004# * DAYS
340 OBLIQ = OBLIQ * CONV
350 RA = ATN( COS(OBLIQ) * TAN(ECLLON) )
360 IF IQUAD=2 THEN RA = RA + PI
370 IF IQUAD=3 THEN RA = RA + PI
380 IF IQUAD=4 THEN RA = RA + TWOPI
390 ARG = SIN(OBLIQ) * SIN(ECLLON)
400 DEC = ATN(ARG/SQR(1-ARG*ARG)): PRINT RA*12/PI,DEC/CONV
```

I wrote this as part of the SUNMOON program which was published with my article on calibrating antennas by observing the Sun or Moon in the ARRL UHF/VHF Handbook. It uses a formula from the "American Ephemeris and Nautical Almanac" (published by the US Navy).

If you have questions, you can e-mail me directly.

*Message #5 Posted by **Meindert Kuipers** on 29 Nov 2005, 3:23 a.m.,*
in response to message #1 by Michel Beaulieu

I have a Meade ETX90 and the SUN is not in the controller either, and safety is the main reason for that. The trick I know that has been used is to define a planetary object (if that is possible) that has the same orbit as the earth, but exactly opposite of the sun.

Be very very careful with solar watching. Use a good solar filter!

in response to message #1 by Michel Beaulieu

The Sokkia company, a manufacturer of surveying equipment, publishes an annual pocket-sized "Celestial Observation Handbook & Ephemeris" for surveyors. It traditionally included professional-grade HP calculator programs for the 41, 42 and 48 series. I haven't seen the latest editions and don't know if the programs are still there; they were in the 2003 edition.

You can find this at surveying supply stores or www.forestry-suppliers.com if interested. It costs about $8.50.

The Sokkia book and programs were written by Elgin, Knowles & Senne, at http://www.rollanet.org/~eksi/softprod.htm . They apparently still offer the "Astro*Card" for HP48GX.

HP-41 Display and bar code fonts and LaTeX, anyone?

*Message #1 Posted by **Arne Helme** on 28 Nov 2005, 9:54 a.m.*

Anyone out there who have used the HP-41 Display (LCD4.ttf) and bar code TrueType fonts posted earlier on this forum with the LaTeX document processing system? Drop me a note if you have some experience to share.

Arne (at ArneHelme.com)

Re: HP-41 Display and bar code fonts and LaTeX, anyone?

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 28 Nov 2005, 11:47 a.m.,*
in response to message #1 by Arne Helme

Hello, Arne;

one of our contributors sent me a sample (a captured screen) from a McIntosh with some custom fonts, but I m,ust confess (forgive me, please!) I forgot who's the one.

I am actually looking for some ttf to some sort of Metafont-compatible converter. I've been told it exists, and if so, using LaTeX with such converted fonts would be a lot easier.

There is a TexFDP or other environment that allows TeX documents to use TTF ources to generate PDF documents, but I have not yet found this.

It takes me more than one year since the last time I used LINUX as for daily activities (please, do not curse me...) and I feel a little 'rusty' about basic LINUX procedures. Anyway, LaTeX coding is completely possible under MSW® environment. I still have an earlier MikTeX installed in one W98 computer somewhere here...

BTW, do you know about these? I'm just asking because you mentioned LCD4.TTF, that comes with a very well known emulator, and I was not sure if you knew them.

If I have something new I'll surely let you know.

Best regards

Luiz (Brazil)

HP 15C Survey Program

*Message #1 Posted by **F Farner** on 28 Nov 2005, 5:39 a.m.*

I got a land survey program when I bought my 15C, around twenty years ago. The program is still in the 15C. I just cannot find the directions any more!

Does anyone have a land survey program to share? OR - does anybody know how I can copy the program out of the 15C? If I could just see it, I think I could run it.

Fred F.

Not an easy task, but....

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 28 Nov 2005, 8:42 a.m.,*
in response to message #1 by F Farner

Hi, F Farmer;

you can actualy see the keycodes and take note of them for later decoding and bringing back the keystroke sequences that generated your program.

Some precautions: while in PROGRam mode, NEVER press [f]CLEAR[PRGM], because this is just going to clear all programs from meomory; also, NEVER press any other keys but [g][P/R] (to get in and out of program mode), [SST] (to go forward a Single STep) and [g][BST] (to go to the previous step; Back STep).

After turning your HP15C ON, locate the [R/S] key right over the [ON] key, and you'll see the [P/R] inscription on it (slanted front face). Press [g][RTN] (beside the [R/S] key) to bring program counter to step 000 in a safer way, then press [g][P/R], so the display shows:

```
[ 000-          ]
```

and the little PRGM indicator becomes active (your HP15C is in PROGRam mode; rememeber the only keys you shoud press, now...)

Press [SST] one time and it should show:

```
[ 001-xx xx xx]
```

The xx xx xx indicates some number code related to the keys that were pressed in the beginning of the program. Chances are you have something like:

```
[ 001-42,21,11]
```

meaning the first program step is:

```
[f]   (4th. line, 2nd. row in the keyboard)
[LBL] (2nd. line, 1st. row in the keyboard)
[A]   (1st. line, 1st. row in the kwyboard)
```

If you take note of all keycodes you see after pressing [SST], you can rebuild the program. If it is a survey

program, I'd expect something less-than or close to 100 steps, maybe some more, depending on which features it shows and how does it handle data.

If you need more advice or extra help translating the program, let us know.

And aways beware of using any other keys but the ones mentioned while in PRGM mode.

Success!

Luiz (Brazil)

in response to message #2 by Vieira, L. C. (Brazil)

Apart from the numbers, there can be a 'small U' showing, for User STO / RCL, this must also be taken care of.
Just off the top of my head so please correct if needed.

Re: Not an easy task, but....

*Message #4 Posted by **Vieira, L. C. (Brazil)** on 29 Nov 2005, 6:07 a.m.,*
in response to message #3 by GE

You are perfectly correct, GE. I missed that, and because of the Survey subject, matrices and surely complex numbers are desirable.

Thanks.

Re: HP 15C Survey Program

*Message #5 Posted by **db (martinez, ca.)** on 29 Nov 2005, 10:47 a.m.,*
in response to message #1 by F Farner

Was the program you're talking about> Harvey's Field Angle Traverse - Radiation (sic) Layout? The store i got my 11c from gave me a copy of that and it would of course have worked in the 15c. One part is 25 steps and the other is 109. It pretty basic but let's one work in azimuth OR field angles. If that's it i can send you the instructions.

As an aside; this program had a version for the TI57.

Uncertainty and accuracy for numerical integration

*Message #1 Posted by **Karl Schneider** on 28 Nov 2005, 3:52 a.m.*

A recent thread involved a *redux* of my "Area between two curves" challenge for RPL. James Prange posted an HP-48 solution in which the uncertainty of the input function was specified by setting the display mode. Valentin Albillo questioned the clarity of this, as opposed to the syntax of "INTEG" on the HP-71B Math ROM:

> Quote:
>
> If you want to specify a particular precision, why, just do it, include the desired precision as a parameter to the integration process, which is just what my BASIC version does. Remember, we're talking about someone who's trying to fathom what the code does, and changing display modes instead of explicitly specifying a desired accuracy seems much more obscure, arbitrary, and less clean to me.

To which James responded,

> Quote:
>
> Now there's a point that I heartily agree with you on! Assuming any association between the current display mode and the desired accuracy is pure nonsense to me.
>
> Interestingly, in the 28 series, the accuracy is a parameter for the integral function, and even the order of the parameters makes more sense to me. What ever possessed them to change this for the 48 series is beyond me.

A bit of background: The method of setting the display mode to specify the *uncertainty of the input function* to be integrated, was introduced on the original implementation of INTEG on the HP-34C, and carried over to other RPN implementations of the INTEG function: the HP-15C, HP-41C Advantage Pac, HP-32S. Although not entirely logical, it was expedient and saved a stack argument or setting function.

This prompted me to consult the respective manuals to see how the input-function uncertainty for INTEG is specified on various models:

34C, 15C, 41C* Advantage Pac, 32S, 32SII, 33S, 48*, 49*:

Use FIX to specify uncertainty in a particular *decimal* digit; use SCI or ENG to specify uncertainty in a particular *significant* digit.

28C, 28S:

Specify uncertainty in a particular *decimal* digit as a numerical parameter to the INTEG function.

42S, 71B Math ROM:

Specify a *relative* uncertainty as a per-unit fraction of the function-value magnitude, as a numerical parameter to

the INTEG function.

The latter (42S, 71B) approach seems to be the ideal one: flexible and scalable, without the possible discontinuities inherent to using SCI for relative uncertainty. Calculation of the estimated error is a bit more complicated.

Excellent and detailed technical documentation on this topic is found in the HP-34C Owner's Handbook (Section 9 and Appendix B). The same material is essentially repeated in the HP-15C Owner's Handbook (Section 14 and Appendix E).

The HP-15C Advanced Functions Handbook (Section 2) contains further in-depth discussions of pitfalls and techniques for numerical integration.

This material makes one appreciate the diligent effort and high quality of HP's product documentation in the late 1970's to mid-1980's. The same topics are not covered or written as well in the HP-28C and HP-42S manuals that followed shortly thereafter.

Re: Uncertainty and accuracy for numerical integration

*Message #2 Posted by **Valentin Albillo** on 28 Nov 2005, 6:03 a.m.,*
in response to message #1 by Karl Schneider

Hi, Karl:

Karl posted:

"Although not entirely logical, it was expedient and saved a stack argument or setting function."

> Yes, but using a stack argument or setting function (i.e: STO UNC, say, similar to STO RAN#) would've been preferable in the HP-15C (and absolutely *mandatory* in all RPL models) to the utter preposterousness of having to set a display mode to specify the uncertainty in your integration, with the side effect of arbitrarily changing the user's display setting, which perhaps you *can't* determine in advance in order to restore it later, thus changing it for good, whether the user wanted it or not.
>
> That's called a *side effect* though I'd call it collateral damage instead. Also, some people might be tempted to excuse this unacceptable behavior by saying that, by doing this, you'll be seeing your results in the proper display setting to look only at truly significant digits, so that SCI 5 would have you looking at a result more or less exact to the 5 digits after the decimal point you're seeing displayed.
>
> But adding insult to injury the HP-15C, for example, allows you to specify a *negative* number of digits for SCI, down to and including **-6** (!!), which will affect the uncertainty you get. Now try and argue how the "SCI -6" mode you've just set up affects the display of the results you're seeing, and how that correlates with the number of guaranteed correct digits in the result you're just looking at. How many correct digits do you get with SCI -1 ? And with SCI -6 ? How many correct digits do appear in the displayed results in said "modes" ?
>
> Nonsense. INTEGRAL(a, b, uncertainty, f(x)) or the equivalent in RPN or RPL is the way it should've been from the start, and certainly this abomination should never have been carried on to much more capable models.

Best regards from V.

Re: Uncertainty and accuracy for numerical integration

*Message #3 Posted by **hugh steers** on 28 Nov 2005, 3:20 p.m.,*
in response to message #2 by Valentin Albillo

it should be mentioned that the supplied uncertainty is an error measure and is not guaranteed. that's assuming the quadrature is implemented as some form of sampling – which most numerical ones are.

in fact, there should really be two parameters, an error measure and a confidence eg. the relative error or number of digits and the number of standard deviations for which this error applies.

the excitement of numerical quadrature on the 34c lead the manual to make this mistake in its claim of an upper error bound. this slip-up was later corrected in the 15c manual which states the error bound is only highly probable.

Uncertainty for INTEG on 34C & 15C

*Message #4 Posted by **Karl Schneider** on 28 Nov 2005, 11:29 p.m.,*

The ultimate purpose of the user-supplied uncertainty/accuracy/tolerance/error (call it what you will) is to provide a quantifiable measure that indicates to the calculator how extensively it should perform its quadrature. The more samples it takes, the more accurate the estimate of the integral can become. However, if the incremental change in the integral result after additional intelligent sampling is well within the estimated error based upon the "accuracy" of the input function, then there's not much purpose in continuing the quadrature process further.

On the 34C, 15C, 32S, 32SII, (and 33S), the input-function accuracy is indeed represented as an uncertainty. The user specifies the decimal digit (FIX) or significant digit (SCI/ENG) that is to be treated as *uncertain*. This means that the rounded value of the function displayed in that format is the closest possible to the "actual" value, but that the uncertain digit could actually be up to "half a digit" larger or smaller. An upper bound of the estimated error is calculated accordingly, as described on pp. 245-248 in the HP-15C manual, and pp. 244-247 in the HP-34C manual.

On the 42S and 71B Math ROM, the user specifies an error or tolerance of the input function as a per-unit fractional value. This is probably the ideal solution.

> Quote:
>
> in fact, there should really be two parameters, an error measure and a confidence eg. the relative error or number of digits and the number of standard deviations for which this error applies.

Looks like three "error" parameters to me! :-)

Well, remember that the function being integrated might be an exact mathematical function that has no inherent measurement error or uncertainty. Moreover, to introduce sophisticated statistical analysis into the INTEG function would seem like overkill to me (and probably to most users).

> Quote:
>
> the excitement of numerical quadrature on the 34c lead the manual to make this mistake in its claim of an upper error bound. this slip-up was later corrected in the 15c manual which states the error bound is only highly probable.

Could you specify the page numbers in the respective manuals that contain the verbiage in question? Most likely, it was a case of HP's correcting imprecise verbiage, rather than retreating from unfounded claims.

Only if the integral is calculated intelligently, with samples taken in the right places, can the estimate of the integral be accurate. There is a good example of this on pp. 257-267 of the HP-34C manual, treating $f(x) = xe^{-x}$, as well as a technique (subdivision of the integral) describing how to compute it properly. The same example is given in the HP-15C manual, starting on p. 250, but the "computing technique" was exported to the Advanced Functions Handbook (AFH).

My favorite example is that of integrating

```
f(x) = sqrt(x)/(x-1) - 1/ln(x)
```

between 0 and 1.

It was originally presented in the HP Journal article from 1980 describing the INTEG function on the HP-34C. The example was later presented in the HP-15C AFH, the HP-71B Math ROM manual, and probably others...

Best regards,

Some results for different calcs

*Message #5 Posted by **Marcus von Cube, Germany** on 29 Nov 2005, 8:26 a.m.,*
in response to message #4 by Karl Schneider

Hi Karl,

this is an interesting Task!

> Quote:
>
> My favorite example is that of integrating
>
> ```
> f(x) = sqrt(x)/(x-1) - 1/ln(x)
> ```
>
> between 0 and 1.

I tried it on several calcs I own:

The **Simvalley GRC-1000** is a Chinese calc which is obviously a Casio design (but not available from them.) The GRC-1000 fails on the boundary values so that I had to restrict the area to [1E-6,1-1E-6]. The integration function accepts an input parameter N which subdivides the interval in 2^N steps. So it's up to the user to guess the accuracy. There is a default for N but it is not given in the manual. "Accuracy" is awful (never better than 2 digits). Moving the boudaries closer to [0,1] quickly produces "MA Error".

The **Sharp EL-9200** has similar problems, I had to reduce the boundaries to [1E-9,1-1E-9] and the accuracy, even with 512 intervals, is just 2 digits.

My **TI-84 Plus** performs better. It does not stumble over the boundary values and has a separate argument for the tolerance with a default of 1E-5. The manual does not tell anything about the algorithm and what the tolerance exactly means. The TI is fast, even with a tolerance of 1E-8!

The **TI Voyage 200** (and its siblings) has no means of selecting the desired accuracy, the manual tells us that 6 significant digits are the target. The boundaries [0,1] pose no problems. Calculation time depends on whether *nInt* or the integration symbol is used (even in approximate mode.) The TI falls back to numerical integration in either case.

Both the **HP 33s** and **HP 49g+** in approximate mode perform in a similar fashion; they probably share some code. They have no trouble with the boundaries and return the same results. The 49g is much faster than the 33s but still slower than the TI. A display setting of SCI 5 seems to produce the same results as a tolerance of 1E-6 for the TI. If I change the display setting to SCI 8, the 49g+ takes minutes to find a result.

In exact mode the **HP 49g+** returns minus infinity.

Marcus

Re: Some results for different calcs

*Message #6 Posted by **Valentin Albillo** on 29 Nov 2005, 8:53 a.m.,*
in response to message #5 by Marcus von Cube, Germany

Hi, Marcus:

Nice results. Do any of the machines tested come up with the correct 12-digit solution, namely **0.0364899739786+** ?

By the way, though this particular integral is nice and such, Mr. Kahan did not try the hardest examples at all. One of the hardest I know of would be this one:

```
Integral between 0 and 1 of f(x) = Cos(Ln(x)/x)/x

    =  0.3233674316 7777876139 9370087952 1704466510+
```

if in doubt, just try and see how many correct digits do you get.

Best regards from V.

*Message #7 Posted by **Marcus von Cube, Germany** on 30 Nov 2005, 1:42 p.m.,*
in response to message #6 by Valentin Albillo

Hi Valentin,

> Quote:
>
> Do any of the machines tested come up with the correct 12-digit solution, namely 0.0364899739786+

I had an answer prepared but must have managed to *not* post it correctly :-(

Here are some results:

Model	Tolerance	Result
TI-84 Plus	1E-13	0.03648997398
TI-86	1E-13	0.0364899739787
TI Voyage 200	N/A	0.036489973974202
HP 48G / 49g+	SCI 12	0.0364899739831
HP 33s	SCI 9	0.036489974001

Italic digits are correct if rounding is taken into account.

The TIs are much, much faster than the HP models (about an hour for the 48G!). The Manual for the Voyage 200 (which is essentially identical to the TI-89 and TI-92Plus) claims a target accuracy of 6 digits. The results are better than that.

The Casio and Sharp models weren't better than 2 significant digits. They all failed on the boundary values. This holds for the Sharp PC-E500S with its "engineering software", too.

Marcus

Re: Some results for different calcs

*Message #8 Posted by **Karl Schneider** on 29 Nov 2005, 6:42 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Marcus --

The ones that took 2^n or 512 steps (and failed at the endpoints) are probably implementing Simpson's Rule. That's what my old Casio fx-3600P does. Evaluation at endpoints is required by the rule, but is often problematic in practical applications.

I had benchmarked a few HP calculators for this problem, several years ago.

- The less-advanced models (e.g., 15C, 34C, 32SII, 41C Advantage) give an answer outside the estimated solution error at FIX 5, but an answer within bounds for FIX 6.
- The more-advanced models (42S, 28/48/49) give an answer within bounds for the equivalent or approximation of FIX 5, and a slightly more-precise answer for "FIX 6".

I did not have a 71B Math ROM at the time.

Re: Uncertainty for INTEG on 34C & 15C

*Message #9 Posted by **hugh steers** on 29 Nov 2005, 10:06 a.m.,*
in response to message #4 by Karl Schneider

hi karl,

i am not interested in the debate of how the uncertainty is input to the machine, but if you think that setting FIX will be sure to give you the same number of accurate digits you are wrong. because it's a sampling problem, and this is what i'm trying to point out in my comments.

i don't like to use the word "certainty" or "uncertainty". i prefer to refer to a measure of error and a measure of confidence. the problem with the word "certainty" is that it is sometimes interpreted as an error and sometimes as a confidence. really, there are three values at work here for the calculators response; its approximation, its estimate of the error and its confidence. i'm saying to have full control over the approximation, you need to have input both an error measure as a tolerance and also a confidence.

let me give you an example, consider the polynomial,

f(x) = [(256x-11)(256x-81)(256x-175)(256x-245)(32x-5)(32x-27)(2x-1)]^2

now, integral(f(x), 0, 1) = 762676910510443067+2224/4095

however, put this into an hp15c and select FIX 9 and integrate between 0 and 1, and you get 0.000000000 with an "error" of 0.000000001. this is clearly wrong. in fact its completely wrong. what went wrong here?? the problem was that there is no means to input confidence and the calculator got itself pretty confident when it figured the function was zero at all sample points and stopped. remember i've already input the error tolerance as FIX 9. if i could enter a confidence as well, maybe i could persuade it to perform a few more samples after which it would find some non-zeros and start the job proper.

also fyi, here are the references you asked for, the hp34c owners handbook, p209 (footnote)

> Quote:
>
> ...the algorithm in your hp34c computes an "upper bound" on this difference, which is the uncertainty of the approximation. bla bla… This means that while we don't know the exact difference between the actual integral and its approximation, we do know that the difference is no bigger than 0.0001

but later in the 15c owner's handbook, p201 (similar footnote)

> Quote:
>
> … But the algorithm in the hp15c estimates an "upper bound" on this difference, which is the uncertainty of the approximation. bla bla... This means that while we don't know the exact difference between the actual integral and its approximation, we do know that it is highly unlikely that the difference is bigger than 0.0001

happy hacking.

Uncertainty, coonfidence.. for INTEG

*Message #10 Posted by **Karl Schneider** on 29 Nov 2005, 6:29 p.m.,*

hi hugh

do you have a shift key on your keyboard?? there's not enough effort in your typing, or formulation of your thoughts.

> Quote:
>
> i am not interested in the debate of how the uncertainty is input to the machine, but if you think that setting FIX will be sure to give you the same number of accurate digits you are wrong.

When did I say that (whatever it means)?

> Quote:
>
> i don't like to use the word "certainty" or "uncertainty". i prefer to refer to a measure of error and a measure of confidence. the problem with the word "certainty" is that it is sometimes interpreted as an error and sometimes as a confidence. really, there are three values at work here for the calculators response; its approximation, its estimate of the error and its confidence.

These sound like three *output* values.

> Quote:
>
> i'm saying to have full control over the approximation, you need to have input both an error measure as a tolerance and also a confidence.

If applied to the input function, it sounds like "fuzziness", e.g., "The actual value of function will be within 0.7% of the calculated value, but I'm only 35% confident of that..." What is the calculator supposed to do with that?

> Quote:
>
> `f(x) = [(256x-11)(256x-81)(256x-175)(256x-245)(32x-5)(32x-27)(2x-1)]^2`

> however, put this into an hp15c and select FIX 9 and integrate between 0 and 1, and you get 0.000000000 with an "error" of 0.000000001. this is clearly wrong. in fact its completely wrong. what went wrong here??

Well, I evaluated the function, but didn't try to integrate it. The function values f(x) routinely exceed 10^{10} (and even 10^{12}) over most the region of integration, with roots f(x)=0 scattered at points in between. I couldn't expect what result would be obtained.

> Quote:
>
> the problem was that there is no means to input confidence and the calculator got itself pretty confident

I guess the calc came equipped with a lifetime supply of confidence, built right in! :-)

> Quote:
>

>
> *... the algorithm in the hp15c **estimates** an "upper bound" on this difference, ... we do know that **it is highly unlikely that** the difference is bigger than 0.0001*

The statement in the 15C manual is more precise: it acknowledges that the upper-bound estimate of integral error is contingent upon the ability to evaluate the integral intelligently. They knew full well that poor selection of limits by the user could preclude that, as evidenced by the example of integral ($f(x) = xe^{-x}$ from 0 to 1).

*Message #11 Posted by **hugh steers** on 29 Nov 2005, 8:13 p.m.,*
in response to message #10 by Karl Schneider

hello again,

perhaps i'm not being clear enough. i'm suggesting that any meaningful measure of the error in a sampling problem like numerical quadrature requires a measure of the confidence. to be clear, there are two other numbers than the resultant approximation. these are an estimate of the error and the measure of confidence.

now depending on your implementation, these two values can be either input, output or both. in the case of hp you have only an input of the error tolerance by indirect means and you couldn't specify the confidence. consequently, this can lead to bogus results (eg. previous example).

alternatively, the confidence could be an output value. for example, my polynomial is zero at the first 7 sample points chosen by the hp algorithm. that's not really much confidence in the function being zero everywhere. thus its statement of the error as 10^-9 is highly uncertain – but it doesn't tell you this.

for my example, if you dont like the large numbers, you could simply scale the coefficients down by dividing them all by 100 or something like that to bring it into line.

i'd like to restate my main thesis for clarity;

the upper bound estimate given by the hp algorithm is not just contingent on the ability to evaluate the integrand but is MATHEMATICALLY MEANINGLESS without reference to a properly defined statistical confidence which is absent in their analysis.

in the hp qualification of their error estimate, what precisely does the phrase "highly unlikely" actually mean. in point of fact, you are never assured the accuracy of *any* of the resultant digits irrespective of the given error estimate.

happy hacking.

Well, I think that you'd better choose whether confidence should be an input or an output. If it is an input, the user is virtually compelled to be a statistician just to compute a numerical definite integral. This would not be what H-P had in mind.

> Quote:
>
> in the case of hp you have only an input of the error tolerance by indirect means and you couldn’t specify the confidence.

The HP-42S and HP-71B Math ROM let the user specify a numerical value of calculated input-function tolerance as a per-unit fraction. The "actual" value of the input function is assumed with 100% confidence to be within this margin.

> Quote:
>
> my polynomial is zero at the first 7 sample points chosen by the hp algorithm. that’s not really much confidence in the function being zero everywhere. thus its statement of the error as 10^-9 is highly uncertain – but it doesn’t tell you this.

So that's where it came from! A contrived function that deliberately deceives the algorithm. Based on only seven samples of zero, what else would or could the algorithm tell you?

This illustrates why the Nyquist minimum-sampling rate for correct reconstruction of a waveform is more than twice the highest frequency component. What if a pure sinusoidal waveform were sampled exactly at each zero crossing? The calculated rms value and frequency content would be zero -- a clearly erroneous result.

> Quote:

Well, gosh. Is a correct answer -- which INTEG will give reliably -- generated by a reasonable and methodical process ever "mathematically meaningless"?

The HP-34C manual that you have contains much discussion about user responsiblities in posing the integration problem. If the function is flaky, the user should structure the problem so that the calculator can handle it properly.

What answer do you get if you integrate the function in sections, between each of its root values of zero? (Use SCI or ENG).

I got $2.80456*10^{17}$ with estimated error $6.61428*10^{11}$ for the first interval of 0 to 11/256 (= 0.0429688), using SCI 5.

That seems reasonable to me. Maybe you could do the other seven intervals...

*Message #13 Posted by **hugh steers** on 2 Dec 2005, 11:55 a.m.,*
in response to message #12 by Karl Schneider

hi karl,

you are right. the example is contrived to be exactly zero at the 7 sample points. if you break it up at all, even into two arbitrary halves, say, you will then get the correct answer from the calculator. this is what you have shown.

Re: Uncertainty for INTEG on the HP-15C?

*Message #14 Posted by **Karl Schneider** on 28 Nov 2005, 5:30 p.m.,*
in response to message #2 by Valentin Albillo

Hello again, Valentin --

You stated,

> Quote:
>
> Yes, but using a stack argument or setting function (i.e: STO UNC, say, similar to STO RAN#) would've been preferable in the HP-15C (and absolutely *mandatory* in all RPL models) to the utter preposterousness of having to set a display mode to specify the uncertainty in your integration, with the side effect of arbitrarily changing the user's display setting, which perhaps you *can't* determine in advance in order to restore it later, thus changing it for good, whether

> the user wanted it or not.

Certainly, from the standpoint of mathematical "directness", it is not ideal to equivalence a display mode to the uncertainty/tolerance/accuracy/error (call it what you will) of an input function. "Utter preposterousness", though, seems rather harsh.

Consider the practical implications of adding a third numerical input to a function on a calculator having a fixed 4-level stack and no menus. The argument would have to be placed and recalled from its own storage register, or on the stack, as you correctly stated.

- If the argument were placed in its own storage register, a place on the keyboard would be needed for it. There just weren't any spare locations on the 34C or 15C keyboard. Moreover, what if the calculator did not prompt for the uncertainty value, or require it in order to complete the INTEG command? (Consider INTEG in a program.) The user would then run the risk of unwittingly running INTEG with a poorly-matched uncertainty value, thus obtaining inaccurate results, and being none the wiser.

- If the argument were placed on the stack, that would make *three* input stack arguments, which would violate what might have been an HP 4-level RPN design principle -- "no function shall require more than two input arguments from the stack, or shall place more than two results onto the stack." Users may find it difficult to remember where the third argument should go -- in the z-level or x-level. Getting it wrong would cause incorrect results -- after waiting up to several minutes for them. Moreover, the third argument could not be preserved on the stack (as the two limits of integration are). FIX/SCI/ENG give a visible indication of input-function uncertainty, and the mode is static.

The "special storage register" approach would have one subsequently-developed analogy -- the "FN=" command on the 32S and 32SII. I admit to having solved or integrated (or attempted to) the wrong program after not having specified the correct one with "FN=". ("FN=" was necessary on the 32S/32SII when the identifier completing SOLVE or INTEG became the *variable*, not the *program label*, as on the 34C and 15C.)

I can think of only one exception to the "two stack inputs, two stack outputs max" rule on RPN models -- "STO g {matrix ID}" on the HP-15C, which has three stack inputs. I admit to having re-consulted the manual to use that one correctly...

Finally, if one numerical argument for input-function uncertainty were to be input, it ought to be the "ACC" value of the 42S, or the error tolerance of the 71B Math ROM. Since the 42S has a named and menu-displayed variable "ACC" for it, and the 71B uses argument-list checking, this input argument is handled well on those models.

The point of my short essay was that HP *thought through the details and practical implications* of doing things a certain way on their calculators, considering how the typical user would utilize them. They didn't make very many mistakes, and -- all things considered -- I don't think they made one here, either.

> Quote:
>
> But adding insult to injury the HP-15C, for example, allows you to specify a negative number of digits for SCI, down to and including -6 (!!), which will affect the uncertainty you get. Now try and argue how the "SCI -6" mode you've just set up affects the display of the results you're seeing, and how that correlates with the number of guaranteed correct digits in the result you're just looking at. How many correct digits do you get with SCI -1 ? And with SCI -6 ? How many correct digits do appear in the displayed results in said "modes" ?

I don't quite follow this. I see no mention of negative arguments to FIX/SCI/ENG in my HP-15C manuals.

The user cannot successfully enter [SCI][CHS][6] or [SCI][6][CHS], and [SCI][I] with a negative value in the I-register seems to yield the equivalent of [SCI][0].

> Quote:
>
> ...INTEGRAL(a, b, uncertainty, f(x)) or the equivalent in RPN or RPL is the way it should've been from the start, ...

Well, I disagree, for the reasons stated above. (This applies only for the models without static menus or alphanumerics -- 34C, 15C, 32S, 32SII). Practical considerations must trump ultra-orthodox mathematical purity, in my book, as long as computational accuracy is not compromised. It's good to do things the "right and rigorous way" and to give users maximum flexibility wherever possible, but the tool must have the necessary capabilities in place first.

> Quote:
>
> ...and certainly this abomination should never have been carried on to much more capable models.

On the 42S, it wasn't. But, the 42S had the named variables, static menus, and more computing power to incorporate "ACC" properly. I agree with you (and James Prange) that the 48/49 should have had "ACC" (or equivalent) as a stack argument for INTEG.

Best regards,

-- KS

Re: Uncertainty for INTEG on the HP-15C?

*Message #15 Posted by **Valentin Albillo** on 29 Nov 2005, 6:17 a.m.,*
in response to message #14 by Karl Schneider

Hi, Karl:

Karl posted:

""Utter preposterousness", though, seems rather harsh."

> Not to me. Having a display mode control a parameter for numerical integration is utterly preposterous. Specially if you're using software not written by yourself that all of a sudden changes your display format for its own purposes and then doesn't restore it to the setting you preferred (because it can't). What a nuisance !

"If the argument were placed in its own storage register, a place on the keyboard would be needed for it. There just weren't any spare locations on the 34C or 15C keyboard.

> Yes they were. In the case of the HP-15C, for instance, you could have STO INTEG, similar to STO #RAN, say. The combination STO INTEG wasn't used for anything, so it was free for this purpose. I'm sure this same sequence could be used for the HP-34C as well. Further, RCL INTEG would recall to the X-register the uncertainty. This would be even better when using INTEG programmatically, as you would be able to manipulate the uncertainty as a *value* with any arithmetic or mathematical functions, such as:

```
X<=0?          enough accuracy ?
GTO C          yes, go on
RCL INTEG      no, recall uncertainty
  2
  /            halve it
STO INTEG      specify new uncertainty
GTO B          recalculate the integral
```

Just try and do the same with 'display modes' and then tell me what you think it's the logical, natural way and what's the preposterous way.

"Moreover, what if the calculator did not prompt for the uncertainty value, or require it in order to complete the INTEG command? (Consider INTEG in a program.) The user would then run the risk of unwittingly running INTEG with a poorly-matched uncertainty value, thus obtaining inaccurate results, and being none the wiser."

Karl, please, we're talking about *HP* calculators of the past, which were bought mainly by knowledgeable engineers and very bright people in general, what with those prices ! So, some brains on the part of the user were taken for granted. Your argument applies equally well to any and all functions requiring some inputs on the stack, and none of them prompted the user as far as I know. Say, for instance, rectangular <-> polar conversions. What if you forgot to include the theta value in Y ? Well, you wouldn't get your results, that's what, and you'd learn how to do it properly, and that's all. Frankly, I can't see what's difficult to remember about the stack sequence:

```
T:  uncertainty
Y:  b
X:  a
```

being set up before pressing INTEG. Or any other other you deem more natural.

"If the argument were placed on the stack, that would make three input stack arguments, which would violate what might have been an HP 4-level RPN design principle -- "no function shall require more than two input arguments from the stack, or shall place more than two results onto the stack."

Your research is incomplete or your memory is faulty, there are quite a number of exceptions, including the one you mention later. Want another very obvious one? That would be the results of SOLVE, if you care to have a look at the manuals: upon termination, SOLVE places the computed root in X, the previous estimate in Y, and the computed value of your function at the computed root in Z. That's *three* results for you.

Also, what's the point in not using three levels for inputs to INTEG on the HP-34C or HP-15C ? Because none of the stack contents makes it alive to your f(x), matter of fact INTEG and SOLVE fill up all 4 stack levels with the current value of X, for your f(x) to act upon it. So all previous contents are utterly lost. And it goes without saying than upon termination, the initial stack contents before calling SOLVE/INTEG can't be saved at all, not even one level, because your f(x) computation would be likely to use them all, right ?

In other words, once you call INTEG/SOLVE, your original stack is absolutely obliterated, so you can use two registers for parameters, or three, or all four, it makes no difference, none will survive when your f(x) is called, not to mention when the process terminates.

"Users may find it difficult to remember where the third argument should go -- in the z-level or x-level. Getting it wrong would cause incorrect results"

I can paraphrase your statement word for word using SOLVE instead and a lot of other stack-using commands. In the world of stack-based RPN, there are a number of things you should remember, and you eventually do, we're talking engineers and power users here. And after all, why do you think HP included the "stack-syntax" of a number of commands (such as polar <-> rectangular) in the back labels ? Having the uncertainty in the stack would be consistent with this

as well.

"They didn't make very many mistakes, and -- all things considered -- I don't think they made one here, either."

I fully disagree, they did. And they did carry this nonsense to INTEG in advanced RPL models ! Unbelievable !

" I don't quite follow this. I see no mention of negative arguments to FIX/SCI/ENG in my HP-15C manuals."

Another example of either faulty memory or incomplete research. Have a look at the big footnote on the subject, which is at page 247 in the HP-15C's Owner's Handbook, at least it is in my Rev. G manual.

"It's good to do things the "right and rigorous way" and to give users maximum flexibility wherever possible, but the tool must have the necessary capabilities in place first."

If by "the tool" you mean the HP-15C or HP-34C, they certainly had the necessary capabilities, namely a 4-level stack, which could easily accommodate three parameters for INTEG, and/or a prefix-capable keyboard, which could accommodate STO INTEG and RCL INTEG easily. And if you're referring to RPL models, with unlimited stack levels, it goes without saying that they could (and should!) too.

Best regards from V.

RPN-based INTEG, and "intuitiveness"

*Message #20 Posted by **Karl Schneider** on 29 Nov 2005, 5:31 p.m.,*
in response to message #15 by Valentin Albillo

Hi, Valentin --

I see your points, but remain unswayed in my convictions regarding this subject. I'll continue to discuss the specific points, but first, there's a more general point I'd like to make:

You and I both agree that the HP-15C was an utterly remarkable achievement of engineering design -- an extremely sophisticated tool that was nonetheless very accessible and straightforward to use. This was achieved, I believe, because the machine was so well organized, logical, and intuitive. You have emphasized the importance of intuitiveness in previous posts, and I heartily concur.

Even though the manual was extensive, once a user familiarized himself, it was seldom needed thereafter -- even for the advanced functions. The rare items that are not very intuitive on the HP-15C are the ones that get the most questions from users in this Forum, i.e.: "How do I get out of Complex Mode?" [g CF 8]; "How do I change the comma to a decimal point?" [ON/.]

That being said, there's always a *clever* way to do things, and sometimes these must be employed when the more-direct way isn't quite possible. However, doing things "cleverly" but not intuitively may lead users astray, and leave them frustrated or dismayed.

Keeping that theme in mind, here are my responses:

> Quote:
>
> Having a display mode control a parameter for numerical integration is utterly preposterous. ... What a nuisance !

That's a better term, I think: "nuisance", or "annoyance". Display mode is of interest for interactive work, and the user can reset it if needed. It's nice when this is a 3-keystroke combination (e.g., HP-15C) instead of 4 (HP-32SII) or 5 (HP-42S). I use FIX/SCI/ENG frequently.

> Quote:
>
> In the case of the HP-15C, for instance, you could have STO INTEG, similar to STO #RAN, say. The combination STO INTEG wasn't used for anything, so it was free for this purpose.

OK, here's where "intuitiveness versus cleverness" comes into play.

- STO RAN # is intuitive: "Store x-register value as the seed for next random number".
- STO RESULT is intuitive: "Store matrix defined by descriptor in x-register to the designated 'result' matrix."
- STO n, STO I, STO (i), STO MATRIX {}, etc. are all intuitive.

Now, STO S_y^x ("INTEG") would be, what -- "Store the calculated integral"? (Probably wouldn't want to unwittingly use *that* stored value as the input-function error for the next integral.) What if the user mistakenly hit [STO][INTEG], then wondered why subsequent calculated integrals were so coarse?

Sure, STO INTEG would have been a clever way to provide a storage location for a parameter, but it would also provide a potential pitfall for users, even the knowledgeable and very bright ones.

How about placing the tolerance/accuracy on the stack? Well, some users may not be particular about specifying the value, preferring to use a reasonable default. That approach won't work if the value is taken from the stack, because its omission will almost certainly cause garbage results.

However, a FIX/SCI/ENG display setting is <u>always</u> in effect, and is plainly visible in interactive ("RUN") mode. Settings favored by most users will yield a reasonably accurate estimation of the integral, when interpreted as an input-function uncertainty. (For example, FIX 5 says that the uncertainty of f(x) is less than 0.000005 at all points.)

> Quote:
>
> Say, for instance, rectangular <-> polar conversions. What if you forgot to include the theta value in Y ? Well, you wouldn't get your results, that's what, and you'd learn how to do it properly, and that's all.

Again, *intuitiveness*: Any competent user of R->P or P->R conversions knows that they require two inputs and provide two outputs. A diagram and stack table is provided on the back plate to help users get the order correct. The tables also provide references for multi-output functions that are not entirely intuitive.

About those tables on the back plate: Wouldn't it make more sense for "L.R." to also return the correlation coefficient "r" (instead of "y-hat, r" doing so? But that would return three results for a function that required no stack inputs, pushing more of the user's data off the stack. And, notice that no function requires three stack inputs or produces three stack outputs. A *design principle*, maybe?

> Quote:
>
> Frankly, I can't see what's difficult to remember about the stack sequence:
>
> T: uncertainty
> Y: b
> X: a
>
> ...
>
> Also, what's the point in not using three levels for inputs to INTEG on the HP-34C or HP-15C ? Because none of the stack contents makes it alive to your f(x), matter of fact INTEG and SOLVE fill up all 4 stack levels with the current value of X, for your f(x) to act upon it. So all previous contents are utterly lost. And it goes without saying than upon termination, the initial stack contents before calling SOLVE/INTEG can't be saved at all, not even one level, because your f(x) computation would be likely to use them all, right ?

The above is not entirely correct. The *intuitive* user procedure that was implemented (and printed on the keyboard face as S_y^x) is as follows:

lower limit (a)
[ENTER]
upper limit (b)
[INTEG] {user-fcn label}

yielding stack contents of

```
level   input   output
t         --      a
z         --      b
y         a       integ. error
x         b       integral
```

Although the INTEG and SOLVE functions do overwrite a and b on the stack, INTEG restores them upon completion. This is handy for reference, and for proceeding to the next part of a subdivided integral. There's no room to retain the user-function accuracy on the stack.

> Quote:
>
> SOLVE places the computed root in X, the previous estimate in Y, and the computed value of your function at the computed root in Z. That's *three* results for you.

OK, there's an example I'd forgotten about. The "extra" values in Y and Z are useful for evaluating the quality of the solution in X. Since SOLVE is an advanced function that overwrites the input stack, it is not an issue to return three arguments, and it needs only two input arguments, in either order. "Two input/output agruments max" was an apparent *principle*, not a *rule*, and I'm sure there are other exceptions. I didn't scour the manuals to find them.

> Quote:

> Have a look at the big footnote on the subject *(regarding negative arguments to SCI and ENG)*, which is at page 247 in the HP-15C's Owner's Handbook, at least it is in my Rev. G manual.

Ah-ha! I looked right over it earlier, but there it is on p. 247 in my Rev. C and Rev. G manuals. "Big footnote"? That's fine print, man! :-)

There may be unconventional applications for the capability of negative-valued indirect arguments to SCI and ENG for purposes that have no application for display format, but I think it's completely counterintuitive and minimally useful, and should have been omitted.

> Quote:
>
> If by "the tool" you mean the HP-15C or HP-34C, they certainly had the necessary capabilities, namely a 4-level stack, which could easily accommodate three parameters for INTEG, and/or a prefix-capable keyboard, which could accommodate STO INTEG and RCL INTEG easily.

I did, but I firmly believe in this colloquial expression, which is probably universal:

"Just because you *can*, doesn't mean you *should*."

Due to potential pitfalls of implementation that I described, for those models (as well as for the 32S and 32SII), the numerical "accuracy" parameter would not have been a sound idea.

> Quote:
>
> And if you're referring to RPL models, with unlimited stack levels, it goes without saying that they could (and should!)...

I agree on that point. Different story for the RPL-based models, the HP-71B Math ROM, and the HP-42S, which had better-suited operating paradigms for that purpose.

Best regards,

Re: RPN-based INTEG, and "intuitiveness"

*Message #21 Posted by **Valentin Albillo** on 30 Nov 2005, 5:27 a.m.,*
in response to message #20 by Karl Schneider

Hi again, Karl:

Just a few comments, as it seems we agree to (politely) disagree:

Karl posted:

"I see your points, but remain unswayed in my convictions regarding this subject."

> The bad thing about personal convictions is that they aren't necessarily backed up by

> rational, objective facts and can't be used as arguments in any rational discussion.

"Even though the manual was extensive, once a user familiarized himself, it was seldom needed thereafter -- even for the advanced functions."

> I disagree. I find myself having to reach for it continuously to find out whether a particular matrix operation leaves its results in the result matrix or not and if so, if said result matrix can be one of the operands or not and if so, if the allowed operand is the matrix in X or the matrix in Y or both. Not to mention the effect of such convoluted matrix operations as the ones invocated by Cy,x and Py,x, which perform matrix manipulations intended to help when dealing with complex matrices. Also, STO and RCL by row/col are usually difficult to remember, etc, etc.
>
> Trust me on this, Karl, I can issue 15 questions about HP-15C operations right now, and you'd need to have a look at the manual to answer most of them, despite the 15C's alleged "intuitiveness".

"The rare items that are not very intuitive on the HP-15C are the ones that get the most questions from users in this Forum, i.e.: "How do I get out of Complex Mode?" [g CF 8]; "How do I change the comma to a decimal point?" [ON/.]"

> Nonsense. These are the kind of questions that absolutely newbies to the HP-15C (or Voyagers in general) would ask. The real difficult questions never arise because these newbies can never think of them in the first place, and expert users actually do RTFM instead of asking them online.

"Now, STO Syx ("INTEG") would be, what -- "Store the calculated integral"?"

> I'm more in favor of placing the uncertainty in the stack, not to specify it with a STO INTEG command. I only mentioned this as a refutation of your statement that there were no free locations in the keyboard for such a function, remember ? You were wrong, right ?
>
> Nevertheless, an hypothetic STO INTEG command would be much more intuitive than, say, Cy,x or Py,x applied to matrices, to name a few non-intuitive matrix key sequences.

"Ah-ha! I looked right over it earlier, but there it is on p. 247 in my Rev. C and Rev. G manuals. "Big footnote"? That's fine print, man! :-) "

> Who's talking about font size ? A **five line** footnote is a **big** footnote by every standard.

"There may be unconventional applications for the capability of negative-valued indirect arguments to SCI and ENG for purposes that have no application for display format, but I think it's completely counterintuitive and minimally useful, and should have been omitted."

> But they're there, and it adds a good measure of counterintuitiveness, unexpected side effects, and sheer "WTF?" to the whole business of specifying uncertainty by setting display modes. I'm sorry if this spoils a little your point but that's the way it is implemented and there's no point trying to dismiss reality when it doesn't fit with one's convictions.

That said, it's been an interesting thread and I appreciate your point of view, of course.

Thanks and best regards from V.

The last word about INTEG?...

*Message #22 Posted by **Karl Schneider** on 2 Dec 2005, 2:30 a.m.,*
in response to message #21 by Valentin Albillo

... but I have sound counterpoints/rebuttals for every one of your points in the last post! :-)

OK, as you wish -- no further discussion about it. I still support H-P's approach for input-function tolerance to INTEG in the 34C/15C/41C Advantage as a practical and adequate approach, given the limitations of those devices.

Best regards from Karl

Re: Uncertainty and accuracy for numerical integration

*Message #23 Posted by **James M. Prange (Michigan)** on 6 Dec 2005, 3:28 a.m.,*
in response to message #1 by Karl Schneider

With Classic RPN's four-register stack, an extra parameter for the integration command would be a problem, so checking the display mode to set an error tolerance has some excuse.

But what about the RPL models? They can have a very deep stack, so it seeems to me that there should be no real problem with making the error tolerance a parameter for the integration command. A complication here is that with RPL, integration can be either numeric or symbolic, and with symbolic integration, no error tolerance is needed. But any RPL command needs the same number of arguments, regardless of how it's being used, and the development team chose to use just one command for both numeric and symbolic integration.

I looked in Bill Wickes's *Insights* books for some clues about why things are the way they are.

In the 28 series, for symbolic integration,the arguments are as follows:

```
3:             integrand (an algebraic)
2:         variable name (a name)
1                 degree (a real integer)
```

But for numerical integration, the arguments are like this:

```
3:             integrand (a procedure, algebraic or program)
2:   { name lower upper} (a list)
1:       accuracy factor (a real number)
```

Or as a variation of numeric integration:

```
3:             integrand (a program)
2:         {lower upper} (a list)
1:       accuracy factor (a real number)
```

In that last example, instead of looking for a name for the variable of integration, the values are kept in stack level 1, so it's faster.

Note that integration in the 28 series always takes three arguments, although the arguments vary, depending on what you're doing.

For the 48 (and 49) series, this was changed. The arguments are always the same, and the integrand can only be an algebraic; it can't be a program, and instead of supplying the accuracy factor as a parameter in the arguments, the current display mode is checked. The arguments are as follows:

```
4:                 lower (a real number)
3:                 upper (a real number)
2:             integrand (an algebraic)
1:         variable name (a name)
```

Personally, I prefer the way it's done on the 28 series.

Regarding the error tolerance, quoting Bill Wickes from *HP 48 Insights Part II: Problem-Solving Resources*:

> Quote:
>
> The numerical evaluation of [integral symbol] produces a series of increasingly accurate estimates of the integral, derived from sampling intervals that are halved at each iteration. The process terminates when three successive iterations differ by an amount less than an error tolerance that you specify, or after a maximum of sixteen iterations have produced no apparent convergance (at this point the integrand has been evaluated 65535 times). The error tolerance is determined by the current real number display setting: *n* FIX (or SCI or ENG) specifies an error tolerance of [Epsilon] = 10^{-n}. This in turn relates to the probable error in the numerical integral:
>
> *error [less than or equal] [Epsilon][integral]|f(x)|dx.*

> Quote:
>
> If the integration results have not converged after sixteen iterations, the number -1 is stored in IERR. The value returned to the stack is the last estimation of the integral.

I presume that when numerical integration is successful, the value stored in IERR is based on how the estimates of the integral are converging, but I don't know the algorithm used for this.

I think it worth noting that having three successive iterations differ by an amount less than the specified error tolerance doesn't guarantee that the last estimate differs from the actual value of the integral by less than the specified error tolerance.

By the way, scans of the *Insights* books, as well as *HP 41/HP 48 Transitions* are available on the latest MoHPC CD set / DVD. For anyone who wants a deeper look into why RPL is the way it is and how to use it effectively, I highly recommend the *Insights* books. Having never used a 41 series, I haven't read *Transitions*, but presumably it's written for those accustomed to Classic RPN who want to learn RPL.

Regards,
James

Integration on RPL machines

*Message #24 Posted by **Karl Schneider** on 7 Dec 2005, 2:34 a.m.,*
in response to message #23 by James M. Prange (Michigan)

James --

Thank you for the informative response regarding integration tolerance, and for clearing some things up about numerical integration on RPL-based machines. Your response would have been helpful for my first RPL "challenge" in late 2003, when I didn't know how to integrate a function defined as a program (rather than as an expression) on an HP-48G. I got only one uninformative reply.

You say that it is possible on the HP-28C/S, but not on the 48/49.

> Quote:
>
> With Classic RPN's four-register stack, an extra parameter for the integration command would

> be a problem, so checking the display mode to set an error tolerance has some excuse.

There is room on the classic 4-level RPN stack for an input accuracy argument, and it wouldn't matter even if all four stack levels were filled with input variables. This is because INTEG fills the stack with the present value of the input variable to the user-defined program, which might use all four stack levels.

However, I believe that to include the function accuracy on the RPN stack as an input would have been unsound, due to potential pitfalls to the user. (Valentin disagreed with me, but I am unconvinced. You may read the posts in this same thread for this discussion.)

The fundamental difference between the RPL stack and the RPN stack (besides depth) is that the RPL stack objects have specific object types, which the calc can check. Thus, if the user omits the function tolerance on the lowest HP-28 stack level as input to INTEG, the calc knows to return an error (or alternatively to use a default tolerance). INTEG on the RPN-based 34/15/41/32/33 models, however, take only floating-point inputs from the stack. If the tolerance is not placed on the stack, unrelated stack contents would be used as input arguments, and possibly the stack contents would be used for the wrong input variables.

I also prefer the HP-28 stack-argument syntax for INTEG; menus are better to use interactively on the 48/49 models.

-- KS

Re: Integration on RPL machines

*Message #25 Posted by **James M. Prange (Michigan)** on 18 Dec 2005, 6:54 a.m.,*
in response to message #24 by Karl Schneider

Hi Karl,

> Quote:
>

I guess that I thought that Veli-Pekka's response was informative and helpful; he was referring to "user-defined functions". Or maybe I didn't notice your question, or maybe I noticed but didn't find the time to reply.

> Quote:
>
> You say that it is possible on the HP-28C/S, but not on the 48/49.

Unfortunately (in my opinion), that seems to be the case, at least for numerical integration. The 49 series adds a few more commands for integration, but I think for symbolic integration only. Although the integrand can't be a program on the 48/49, this can be worked around. Let me review some things

about UserRPL.

Things that an RPL model can do can be called "operations". Examples of operations include disabling last stack saves, the ROOT command, and the SIN function. Disabling last stack saves can be done from menu 69 (so it is an operation), but can't be done from within a UserRPL program, so it's not a "command" (or a "function"). ROOT can be used (with postfix notation) in a program, so it's a "command" (as well as an "operation"), but it can't be used in an algebraic object, so it's not a "function". SIN can be used in an algebraic with the prefix syntax SIN(X), so it's a "function", and it can also be used in a program using the postfix syntax X SIN , so it's also a "command" (as well as an "operation"). All functions can also be used as postfix commands, although the documentation calls them functions. Some functions require the prefix syntax, such as SIN(X), when used in an algebraic, others require an infix notation, such as A+B, when used in an algebraic.

But what to do when an algebraic is wanted, or even required (such as for the integrand argument for integration), but a command that we'd like to use in the algebraic isn't a function? We can work around the limitation by making our own UDF (user-defined function), that we can use with prefix syntax, such as F(x,y,z), within an algebraic, or for that matter, with postfix syntax such as x y z F.

When used as a postfix command, a UDF takes it's arguments from the stack and binds the values as named local variables that can be used in the "defining procedure", which is either an algebraic or a program. When used within an algebraic, a UDF take it's arguments from a comma-separated (or period-separated, if the "fraction mark" is a comma) or semicolon-separated, parenthetical argument list instead of from the stack.

The following assumes that the "fraction mark" is a period.

Suppose that I want the (3-dimensional) distance between points [x1 y1 z1] and [x2 y2 z2]. I can write a UDF using an algebraic procedure as follows:

```
%%HP: T(3)A(D)F(.);
\<<
  \-> x1 y1 z1 x2 y2 z2
  '\v/(SQ(x2-x1)+SQ(y2-y1)+SQ(z2-z1))'
\>>
'F3DISTA' STO
```

Now, either 'F3DISTA(0,0,0,3,4,12)' EVAL
or the sequence 0 0 0 3 4 12 F3DISTA
returns 13.

I could do much the same using a program for the defining procedure:

```
%%HP: T(3)A(D)F(.);
\<<
  \-> x1 y1 z1 x2 y2 z2
  \<<
    x2 x1 - SQ y2 y1 - SQ + z2 z1 - SQ + \v/
  \>>
\>>
'F3DISTP' STO
```

Suppose that I want to sum the cubes of the numbers within a range. I can write a UDF as follows:

```
%%HP: T(3)A(D)F(.);
\<<
  \-> l h
  \<<
    0.
    l h
    FOR n
      n 3. ^ +
    NEXT
  \>>
\>>
```

```
'FSCUBES' STO
```

Now 'FSCUBES(2,5)' EVAL returns 224. Of course the sequence 2 5 FSCUBES also returns 224.

Here's a UDF that takes the square root of a number less than 1, and squares a number equal to or greater than 1, although I don't know why anyone would want to do that.

```
%%HP: T(3)A(D)F(.);
\<<
  \-> x
  \<<
    x
    DUP 1.
    IF
      <
    THEN
      \v/
    ELSE
      SQ
    END
  \>>
\>>
'FSQSQR' STO
```

Now 'FSQSQR(.25)' EVAL returns .5, and 'FSQSQR(5)' EVAL returns 25.

ROOT seem to be a particularly difficult case. The arguments for ROOT can be any of the following:

```
3: procedure (program or algebraic)
2: global name
1: guess or guesses. (1 number or a list of 1, 2, or 3 numbers)
```

At first glance, it looks as if we could simply define an function, named say, 'FROOT', that we could use in an algebraic using the syntax FROOT(procedure,global name,guess). The first complication is that a prefix function argument list can't include a program, so the first argument will have to be an algebraic (we may have to make another user-defined function for the first argument). The next is that a prefix function argument list can't include a quoted name, so we have to be sure that the name doesn't already exist (otherwise the contents instead of the name of the variable would be used). Finally, the last argument can be 1, 2, or 3 guesses, and list delimiters can't be used within a prefix function argument list.

To work around that last argument, I'll make three separate UDFs:

```
%%HP: T(3)A(D)F(.);
\<<
  \-> p n g
  \<<
    p n g
    ROOT
  \>>
\>>
'F1ROOT' STO

%%HP: T(3)A(D)F(.);
\<<
  \-> p n g1 g2
  \<<
    p n
    g1 g2 2. \->LIST
    ROOT
  \>>
\>>
'F2ROOT' STO

%%HP: T(3)A(D)F(.);
\<<
  \-> p n g1 g2 g3
  \<<
    p n
```

```
    g1 g2 g3 3. \->LIST
    ROOT
  \>>
\>>
'F3ROOT' STO
```

Now, suppose that I want to find the root near 3 of the function SIN(X), in RAD mode. I can do any of the following:

```
RAD HOME 'X' PURGE 'F1ROOT(SIN(X),X,3)' EVAL

RAD HOME 'X' PURGE 'F2ROOT(SIN(X),X,3,4)' EVAL

RAD HOME 'X' PURGE 'F3ROOT(SIN(X),X,2,3,4)' EVAL
```

Any of the above will return 3.14159265359. Of course, if the calculator is already in Radians mode, then RAD can be omitted, and if I know that 'X' won't be found on the current path, I can omit the HOME 'X' PURGE part of the sequence. Note that a new 'X' will be stored in the home directory.

In the above, I stored the UDFs as global variables, but note that I can also store them as local variables. For example:

```
%%HP: T(3)A(D)F(.);
\<<
  RCLF PATH
  RAD HOME
  'X' PURGE
  \<<
    \-> p n g1 g2 g3
    \<<
      p n
      g1 g2 g3 3. \->LIST
      ROOT
    \>>
  \>>
  \-> f3root
  \<<
    'f3root(SIN(X),X,2,3,4)' EVAL
  \>>
  EVAL
  STOF
\>>
'F3LROOT' STO
```

Here, the UDF is f3root, and F3LROOT will return 3.14159265359, and overwrite any variable 'X' in the home directory. It also restores the original directory and angular unit mode.

In the 49 series, at least with recent ROMs, the PUSH and POP commands can be used to save and restore the current flags and directory.

Of course, I don't have to store all of the arguments to a command in the UDF as local variables, although at least one argument has to be a local variable for the program to be a UDF. For example:

```
%%HP: T(3)A(D)F(.);
\<<
  \-> g
  \<<
    'SIN(X)' 'X' g
    ROOT
  \>>
\>>
'F1SINROOT' STO
```

Now, 'F1SINROOT(3)' EVAL returns 3.14159265359,
'F1SINROOT(6)' EVAL returns 6.28318530718,
'F1SINROOT(9)' EVAL returns 9.42477796077,
and so on. All of these overwrite any variable 'X' in the current directory. Since I can quote X in the

program, the 'X' PURGE isn't needed.

I hope that helps.

I wrote above that disabling last stack saves isn't a command, but on the 49 series, the KEYEVAL command offers a way to make many operations programmable. Exceptions are operations that require holding down the ON key while pressing another key. I've sometimes wished for KEYEVAL on the 28 and 48 series.

Of course, SysRPL makes possible many things, and SysRPL entry points can be called from UserRPL with the commands SYSEVAL, LIBEVAL, and FLASHEVAL. But use these with care, as it's easy to cause a memory clear by improper use.

> Quote:
>
> There is room on the classic 4-level RPN stack for an input accuracy argument, and it wouldn't matter even if all four stack levels were filled with input variables. This is because INTEG fills the stack with the present value of the input variable to the user-defined program, which might use all four stack levels.
>
> However, I believe that to include the function accuracy on the RPN stack as an input would have been unsound, due to potential pitfalls to the user. (Valentin disagreed with me, but I am unconvinced. You may read the posts in this same thread for this discussion.)

Okay; my 12C and 16C don't seem to include integration and I really don't care to read all of the documentation for other Classic RPN models, so I shouldn't've even commented on that issue.

> Quote:
>
> The fundamental difference between the RPL stack and the RPN stack (besides depth) is that the RPL stack objects have specific object types, which the calc can check.

And in fact, every built-in UserRPL command that requires any argument checks that the number of arguments required is available, then checks the types of these arguments and proceeds appropriately. If arguments that it can use aren't available, then it will error out.

> Quote:
>
> Thus, if the user omits the function tolerance on the lowest HP-28 stack level as input to INTEG, the calc knows to return an error (or alternatively to use a default tolerance). INTEG on the RPN-based 34/15/41/32/33 models, however, take only floating-point inputs from the stack. If the tolerance is not placed on the stack, unrelated stack contents would be used as input arguments, and possibly the stack contents would be used for the wrong input variables.

Which brings up another difference. With Classic RPN, all of the stack registers are always available; even after clearing, they're zero-filled. On an RPL model, after clearing the stack, the stack levels simply don't exist, and attempting to use a non-existent level will cause an error.

Another difference is that typically, more stack levels are displayed on the RPL models. As far as I know, the Classic RPN models display at most two registers, so what's in the other registers isn't so obvious.

Regards,
James

One, count it, one 67/97/41C mag card

*Message #1 Posted by **Howard Owen** on 28 Nov 2005, 2:48 a.m.*

Only one buck, plus another for postage. If someone doesn't outbid you, that is. 8)

eBay auction for one mag card

I gave about 40 of them away, yesterday!

*Message #2 Posted by **Marcus von Cube, Germany** on 28 Nov 2005, 7:13 a.m.,*
in response to message #1 by Howard Owen

Klaus just helped me to get my HP 41 card reader working again (BTW, it was a nice afternoon!) I gave him about 40 of those cards as a reward.

Did I overpay him? I could have sold all these in eBay auctions (perhaps as a power seller with a quantity in one auction, BuyItNow $10 each?)

Marcus ;-)

Re: I gave about 40 of them away, yesterday!

*Message #3 Posted by **Howard Owen** on 28 Nov 2005, 12:55 p.m.,*
in response to message #2 by Marcus von Cube, Germany

You certainly are missing a trick there, Marcus!

We, the members of the Coburlin Admiration and Philatelist Society have an even better plan: cut the cards in half! Charge only fifty cents, but leave the postage at one dollar. 150% profits! Charge in euros for even greater exploitaton!

RARE!! 1/2 HP Card Reader Card, only 50c! L00K!!!!

Cleaning card for $5.99 + $2.00 shipping!!

*Message #4 Posted by **Howard Owen** on 28 Nov 2005, 4:01 p.m.,*
in response to message #1 by Howard Owen

Don't know how I missed this one:

Cleaning card on eBay for $5.99 + $2.00 shipping!!

So, half of one of *those* sold for $4.99 plus $2.00 shipping would yield very juicy profits! Oh boy! Coby will be jealous!

Edited: 28 Nov 2005, 4:02 p.m.

One, count it, one 67/97/41C mag card

48G(X) serial number vs. ROM version

*Message #1 Posted by **Bo B(Sweden)** on 27 Nov 2005, 6:00 p.m.*

Hi, Is the mapping between serial number and ROM version documented somewhere? I'm most interested in when the change from ROM-P to ROM-R happened. The only thing I've found is an old post by Dave Arnett over at comp.sys.hp48 which says "...I released Rev R to production in late 1993". So, presumably the change happened late -93 or early -94 but does anyone know for shure?

Re: 48G(X) serial number vs. ROM version

*Message #2 Posted by **Gerson W. Barbosa** on 27 Nov 2005, 7:59 p.m.,*
in response to message #1 by Bo B(Sweden)

You may find this info in one more recent comp.sys.hp48 FAQ you can get at:

http://www.hpcalc.org/hp48/docs/faq/

I remember my first 48GX (Made in Singapore), purchased brand new in Aug/93, still had the Rev P ROM.

Regards,

Gerson.

Re: 48G(X) serial number vs. ROM version

*Message #3 Posted by **Bo B(Sweden)** on 28 Nov 2005, 6:39 a.m.,*
in response to message #2 by Gerson W. Barbosa

Thanks for the reply! But no, I can't find the answer in the comp.sys.hp48 FAQ (the latest version seems to be v4.62, 14 April 2000). One could put the question a little different, like this: what is the highest known serial number with ROM version P (or the lowest known number with ROM version R)?

Thanks,

Bo

Re: 48G(X) serial number vs. ROM version

*Message #4 Posted by **tomcee** on 28 Nov 2005, 1:49 p.m.,*
in response to message #3 by Bo B(Sweden)

I too am curious about the mapping of Serial Number to OS Version number and Display type (at least two types were used in the HP48G series). Also, when were double-shot injected keys done away with?

TomC

Re: 48G(X) serial number vs. ROM version

*Message #5 Posted by **Bo B(Sweden)** on 28 Nov 2005, 3:58 p.m.,*
in response to message #4 by tomcee

Some information about the display change (green to black) can be found here:

HP-48GX of black character

And about the keys: to the best of my knowledge all Singapore made HP-48 have double-shot injected keys, while the Indonesian made have painted keys. So the timeline regarding these issues is something like this:

```
1994-xx-yy - Change from ROM version P to R
1997-xx-yy - Manufacture moved from Singapore to Indonesia
2001-xx-yy - New "black" LCD introduced
```

But it really would be nice to have these dates more precise.

Bo

14B Calculator - change # of decial places

*Message #1 Posted by **T.Ulch** on 27 Nov 2005, 3:13 p.m.*

Does anyone know how to increse the number of decimal places on a 14B Business Caluculator. I'm using the HP caluculator that I had in high school for business school now and can't figure out how to increase the decimal points. THANKS!

Re: 14B Calculator - change # of decial places

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 27 Nov 2005, 5:05 p.m.,*
in response to message #1 by T.Ulch

Hi, T. Ulch;

please, locate the "close paenthesis" key [)] in your calculator and you'll see [DISP] printed in orange (gold?) over the key, in the keyboard faceplate. To access the DISP menu, press the shift key, wiht a small orange (golden?) square printed on it, over the ON/[C] key; you'll see that a menu with four options apper:

```
[FIX  ALL  .  ,]
```

If you press [PV] key, the calculator will show all significant digits of the mantissa of the number in the display till the last non-zero to the right side of the fraction part. You can check:

```
2  [SHIFT]1/x   ->   [ 0.5         ]
8  [SHIFT]1/x   ->   [ 0.125       ]
[C]             ->   [ 0           ]
```

If you choose a fixed number of decimal places, [SHIFT][)] again and [FIX]; then you´ll see:

```
[ FIX _         ]
```

so you can specify how many digits you want, frm 0 (only integer part) to maximum of 11. Rounding occurs according to the last not-shown digt: if less than 5, last visible digit remains; if greather than of equal to 5, last visible digit is increased one unit. To specify a number of digits of the fraction part, simply press any number key from [0] to [9] after seeing

```
[ FIX_        ]
```

If you want 10 or eleven fixed digits, press [.] (dot) key to change from

```
[ FIX _       ]
```

to

```
[ FIX 1_      ]
```

then [0] or [1]. Try this:

```
[SHIFT][DISP][N][4] ->   [ 0.0000     ]
2  [SHIFT]1/x       ->   [ 0.5000     ]
8  [SHIFT]1/x       ->   [ 0.1250     ]
[C]                 ->   [ 0.0000     ]
```

Hope this helps.

Cheers.

Luiz (Brazil)

HP-38G Emulator for the HP-48GX ?

*Message #1 Posted by **Joe D.** on 27 Nov 2005, 10:03 a.m.*

Hello,

do you know of any 38G emulator for the 48GX (I mean for the real calculator, not Emu48)? At hpcalc.org I've found an emulator for the 39G, but it's only for the 49G.

Or do you have some other ideas to run some aplets on an 48GX?

Many thanks in advance!

Re: HP-38G Emulator for the HP-48GX ?

*Message #2 Posted by **Mike H** on 28 Nov 2005, 9:20 a.m.,*
in response to message #1 by Joe D.

I am not aware of any 38G emulators for the 48GX, but for the price, why not just get a new 38G. They can be found on ebay for under $20.

Mike

Analysis of Coburlin

*Message #1 Posted by **Bill (Smithville, NJ)** on 26 Nov 2005, 12:39 p.m.*

I have generally reframed from replying to any of the comments that have been made concerning Coburlin and his E-bay practices. But I have been wondering about his success ratio. So I decided to do a totally unscientific analysis using the past deals as reflected in his existing Feedback.

I found the results very interesting.

The period covers Feedback from Sept 29 thru Nov 25. During this period, he bought 50 items for $1925 plus shipping. He also sold 13 items for $2900. Not a bad profit you might say. He still has 37 more items to sell at a highly marked up price.

What is the most interesting is the following:

Of the items bought, 17 were true Buy It Now, 9 were sold early BIN, and 24 were full period bids of 5 to 10 days in length.

The True Buy It Now included:

Three Hp-200LX for $50 each.

HP-41CV W/Survey Module for $60.

HP-41CX for $100

HP-15C for $60.

Each of these Items were available for a short time for ANY ONE OF US to purchase at these prices. He just did it before we did. That's the way it works.

The items that went for the full period included the following:

HP-15C for $61.25 (10 Days)

HP-35 for $13.83 (7 Days)

HP-41CV for $95 (5 Days)

HP-41C X-Func Module for $4.99 (7 Days)

HP-15C for $100.88 (7 Days)

HP-35 for $52 (5 Days)

HP-15C for $86 (7 Days)

Again, ANY ONE OF US could have also bid on any of these items and probally bought them for a faily resonable

price.

I realize there are many here that do not like the fact that he will attempt (and the key word is attempt) to re-sell these items at a very high mark-up. And the fact that he is also quicker to purchase low BIN offers, but any BIN is available for any of us also.

I have to admit that I have bought items extremely cheap at yard sales, flea markets and then re-sold them or traded them at the higher going rate. I'd be willing to bet that most of us here have done that also. But isn't that how most of us fund our hobby? I have picked up items cheaply at flea markets, etc, that I really didn't want just for the purpose of trading or selling it for something I really want. I think most hobbies work this way. I guess the phase "going rate" might make a difference, but I did re-sell or trade at a profit. Of course there are those many items I have bought over the years that I ended up giving away because I was the only person who thought it was a bargain at the time I bought them.

The main difference is that Coburlin does all his buying and selling in a very public way and the mark-ups seem extremely high to most of us and that irritates us.

I guess my main reason for writting this is to try to put some perspective on it. Any one of us could have also bought a fairly cheap HP-15C, 41CV, 41CX or 200LX if we had been quicker. I'm sure that many of us HAVE bought items using BIN that has also irritated Coburin when we were quicker than he was.

Several years ago, I was at a Ham Radio Ham Fest (Flea Market) and the table I was at had several TI calculators on it for sale. I wasn't interested in the TI's, but the person behind me was astute enough to ask the dealer if he had any other calculators for sale that he hadn't put out on the table. Turned out the dealer had 15 HP-41CV's with cases, modules, and other accessories. The person who had asked, ended up buying the lot for $5 each ($75 total) while I could only look on in envy. I learned a valuable lesson that day.

Time to Quit Rambling. I'm not trying to stir anyone up, so please no flames.

Thanks, Bill 12345

*Message #2 Posted by **I, Claudius** on 26 Nov 2005, 1:40 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

A very poor analysis, because it misses the whole point of what ticks people off about this Coburlin. No one here has ever said Coburlin can't buy and sell to make a profit. What has been said is Coburlin's attitude towards his own customers is atrocious. He feels they're a bunch of dumb nerds who deserve to be taken. He even said at one point his customers were stupid. Ready to buy?

How many aucions where bought back by Cobubba (through other accounts) so he could drive the price of calculators up????

Edited: 26 Nov 2005, 2:22 p.m.

Re: Analysis of Coburlin

*Message #4 Posted by **Bill (Smithville, NJ)** on 26 Nov 2005, 3:49 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Just re-read my post and realize the last sentence might be mis-understood:

"Time to Quit Rambling. I'm not trying to stir anyone up, so please no flames."

The phase "Time to Quit Rambling" was made to myself, not to anyone else. I felt I had started to ramble in my post so I wrote a direction to myself. I should Ihave type "Time for me to stop rambling".

Bill 12345

Re: Analysis of Coburlin

*Message #5 Posted by **Don Shepherd** on 26 Nov 2005, 6:17 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Bill, excellent analysis. You are right, any of us could do what he does. He may be obnoxious, so what. If I see a calc I really want on Ebay, I know that serious bidders will raise the price and he will dropout. I'll bid up to my max, and that's it. Coburlin is no different than lots of professional Ebayers who have software that scans for new items and gobbles up low BINs. Que sera sera.

Re: Analysis of Coburlin

*Message #6 Posted by **Peter Geiser** on 27 Nov 2005, 5:03 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Bill

Great analysis! Thank you very much. This shows a bit about the "market" for used calculators.

> Quote:
>
> The period covers Feedback from Sept 29 thru Nov 25. During this period, he bought 50 items for $1925 plus shipping. He also sold 13 items for $2900. Not a bad profit you might say. He still has 37 more items to sell at a highly marked up price.

I think this is a very low profit for the time spent.

Assuming that shipping would take away another USD 300 - 600, net profit is around USD 400 to 700. And this is defintely low for two months. Also, storage is not yet taken into account.

Let's assume that each buy and sell takes about 1 hour. This would result in a "salary" of USD 6 - 12 per hour. Not exactly thrilling. Varying the assumptions might result in an hourly rate of up to USD 30, which still is low for self-employment.

In addition, there is always the risk associated with collector's markets. Items may go out of fashion, and you may end up with a lot of "dead capital".

What we can learn here is that buying and selling old calculators, even HPs, is not really profitable. From an economic point, there are definitely better opportunities (well, this probably depends on your level of expectation.)

In my opinion, old calculators are a matter of the heart, not an economically sound and profitable business.

Best regards
Peter

HP-41 Ultimate Alarm Clock v.0.6

*Message #1 Posted by **Geir Isene** on 26 Nov 2005, 12:21 p.m.*

Finally, after a massive storm of users marching in the streets for a few months and shouting "We want a new release!", we have gathered the forces of Good and accommodated our beloved users.

New release: Change log:

Added support for the WKA (WeeK Alarms) module to get daily alarms throughout the week (separate program).
Added autosnooze/double-alarms.
Switched Lbl A/a and B/b for less keypress errors in the dark.
Improved sound-feedbacks for some functions.
Added way of hearing time since alarm went off.
Several minor improvements.

Documentation and program listings are available here:

Home page: http://www.isene.com/artweb.cgi?article=009-hp41alm.txt
Project page: http://sourceforge.net/projects/hp41uac/

Re: HP-41 Ultimate Alarm Clock v.0.6

*Message #2 Posted by **Namir** on 26 Nov 2005, 2:10 p.m.,*
in response to message #1 by Geir Isene

Is there a link to download the .raw version of the 41C code?

Re: HP-41 Ultimate Alarm Clock v.0.6

*Message #3 Posted by **Geir Isene** on 26 Nov 2005, 3:28 p.m.,*
in response to message #2 by Namir

Nope.

Would you supply the .raw-files so I can put them up on the site?

*Message #4 Posted by **Namir** on 26 Nov 2005, 3:52 p.m.,*
in response to message #3 by Geir Isene

Give me a few days. I will try to convert the source file into a .raw file.

Re: HP-41 Ultimate Alarm Clock v.0.6

*Message #5 Posted by **Howard Owen** on 26 Nov 2005, 9:01 p.m.,*
in response to message #2 by Namir

UAC.RAW
UAC.txt
WKA.RAW
WKA.txt

The ".txt" files are the text I created the .RAW files from. I created those from the original sources by making the following edits:

- Strip line numbers and leading spaces.
- Strip asterisks from the beginning of LBLs
- Add space between "LBL" and "'blah" (Also in "GTO'blah")
- Close quotes as appropriate around alpha labels and strings
- Add space between "X<>" and "01" in "X<>01"

These changes made the source suitable for feeding to Leo Duran's 41C User Code Utility, which did the translation to .raw format.

I haven't tried to ensure that no errors crept in during the translation, so it wold be good to check that yourself before you rely on these files.

Regards,
Howard

VAT calculations with RPN-calculator

*Message #1 Posted by **Kalevipoeg** on 26 Nov 2005, 4:51 a.m.*

I like to tell you how I became more familiar with % function of the HP12c.

VAT = Value Added Tax (in the European Union)

```
NET = GROSS/(1+(VAT RATE/100))
VAT = NET*(VAT RATE/100)
```

I wanted to write a short program which a) calculates NET amount into Y register and b) calculates VAT into X register. In this case VAT RATE is stored in R0-register. Usage: Key in the GROSS amount and press [R/S].

First I wrote the following program (16 steps)

```
01  RCL 0
02  1
03  0
04  0
05  /
06  1
07  +
08  /
09  ENTER
10  ENTER
11  RCL  0
12  1
13  0
14  0
15  /
16  *
```

Then I realized my calculator has a % function and I wrote my program again (now 7 steps)

```
01  1
02  RCL 0
03  %
04  +
05  /
06  RCL 0
07  %
```

The % function of the RPN-calculators is more useful function than I believed!

% vs. delta-%

*Message #2 Posted by **Karl Schneider** on 27 Nov 2005, 1:55 a.m.,*
in response to message #1 by Kalevipoeg

Kalevipoeg --

Good thinking! Of course, "per cent" *means* "per 100", so those are logical simplifications.

Among Voyagers, only the HP-12C and HP-10C have a "%" key as an unshifted function. I believe that "%" is much more useful in business than in science and engineering, in which "delta-%" is more useful. It makes

sense to me that the 12C would have "%" unshifted.

However, the basic scientific 10C *omitted* "delta-%", while providing "%" unshifted. Not good thinking...

Re: VAT calculations with RPN-calculator

in response to message #1 by Kalevipoeg

Hello Kalevipoeg. Nice to see you again.

Today I learned from Wikipedia that you must be the son of Kalev :-)

Indeed it can be very handy the way % preserves Y. I once had fun using i,PV and FV (with n=1 and PMT=0) to do all shopkeeper markup/markdown calculations, which parallel VAT/normal_tax(eg income tax) calculations. The markdown and income tax percentages need to be entered as negative. It takes a bit of getting used to as PV and FV have opposite signs, but we usually know which is the larger. And then PV+FV gives the amount of the tax for example. Yes, I remember now, last year in Datafile V23N2P14/15, I wrote about this - also showing how to calculate markup given markdown, and vice-versa.

So you could set FV=GROSS, i=VAT RATE. Then solving for PV gives -NET. You can input any two, and solve for the third - not that this is very useful, except if you are a tax consultant or a shopkeeper :-) But it is fun to try and do many calculations, actually seen in daily life, with one equation: PV*(1+i/100)+FV=0.

BTW I have submitted some 12C games to HPCC Datafile and I mention your name in bold when presenting lunar lander, referring folk to your Moon Landing Simulator as published here early last month. I hope you don't mind - I never thought to ask!

Cheers, Tony

Thank you Tony. I'm happy you mentioned my name. Thanks.

About VAT calculations

Why did I want to calculate NET amount into Y register and VAT into X register?

Answer: Now I can use Sigma+ to calculate totals if necessary.

HP Codes for other countries

*Message #1 Posted by **Bill Lafferty** on 26 Nov 2005, 12:13 a.m.*

On reading the manual for my HP 82240B infrared printer, it says to use a HP 82241Ax AC adapter "where x is a letter designating various models for other countries."

Does anyone know what the letter for our Australian 240 V AC power supply is? I think it is "G", but would like to confirm this. Is there some sort of table available listing all the letters used by HP for other countries? Thanks.

New root-seeking algorithm

*Message #1 Posted by **Namir** on 25 Nov 2005, 11:21 p.m.*

I presented this new root-seeking algorithm (I call it the Quartile algorithm) at the HHC2005 conference It isa root-bracketing method that improves on the Bsection method:

```
Given: Root bracketing guesses A and B
       Tolerance Tolr

P-Code:

Let alpha = 0.25
Let FA = F(A)
Let FB= F(B)
Do
  If ABS(FA) < ABS(B) Then
    Xm = A + alpha * (B - A)
  Else
    Xm = A + (1 - alpha)*(B - A)
  End

  Let Fm = F(Xm)
  If Fm * FA > 0 Then
    A = Xm
    FA = Fm
   Else
     B = Xm
     FB = Fm
   End
 Loop Until Abs(A - B) < Tolr
 Root = (A + B) / 2
```

J. P. Moreau has implemeted the Quartile algorithm in BASIC, C++, and other languages. The BASIC code is found here

Re: New root-seeking algorithm

*Message #2 Posted by **Marcus von Cube, Germany** on 26 Nov 2005, 5:05 a.m.,*
in response to message #1 by Namir

Namir,

> Quote:
>
> ```
> Do
>   If ABS(FA) < ABS(B) Then
> ```

I assume you mean:

```
Do
  If ABS(FA) < ABS(FB) Then
```

Can you elaboreate a little about the heuristics behind the algorithm?

Marcus

Re: New root-seeking algorithm

*Message #3 Posted by **Namir** on 26 Nov 2005, 7:22 a.m.,*
in response to message #2 by Marcus von Cube, Germany

You are correct. Here is the correced p-code:

P-Code:

```
P-Code:

Let alpha = 0.25
Let FA= F(A)
Let FB= F(B)
Do
  If ABS(FA) < ABS(FB) Then
    Xm = A + alpha * (B - A)
  Else
    Xm = A + (1 - alpha)*(B - A)
  End

  Let Fm = F(Xm)
  If Fm * FA > 0 Then
    A = Xm
    FA = Fm
  Else
    B = Xm
    FB = Fm
  End
Loop Until Abs(A - B) < Tolr
Root = (A + B) / 2
```

Re: New root-seeking algorithm

*Message #4 Posted by **Namir** on 26 Nov 2005, 2:08 p.m.,*
in response to message #3 by Namir

The most common two root-braketing methods are:

1. The Bisection method.This method compares the sign of function values.
2. he Reguli alse method uses the function values are weights to determine the new guess.

The Quartile method compares the absolute funcion values to determine the next guess. Thus, its approach lies somewhere in between the above two methods. If you look at the p-code an change alpha to 0.5, you get the Bisection method.

Thus, the Bisection method is a special case of the Quartile method, where the new guess is systematically taken as the middle of the root-bracketing interval.

Edited: 26 Nov 2005, 2:09 p.m.

Re: New root-seeking algorithm

*Message #5 Posted by **Patrick** on 3 Dec 2005, 10:59 p.m.,*
in response to message #4 by Namir

Sorry, Namir, I don't mean to be impolite, but so what?

It is relatively simple to develop umpteen variations on a theme, the question is whether or not one

of these variations is actually better in some way.

Are there any analyses which motivates the choice of alpha = 0.25? In what categories of problems does this algorithm work better than others? How much better? Does it converge more frequently than others? Is it faster?

Re: New root-seeking algorithm

*Message #6 Posted by **Namir** on 10 Dec 2005, 9:24 a.m.,*
in response to message #5 by Patrick

The Bisection method is a reliable method despite it's slowness. Often, complex root-seeking implementation use a combination of Newton (or similar/better methods) with he Bisection as a backup plan in case Newtons method yield guesses that stray away.

The Quartile method is a root-bracketing method that is better than the Bisection. The value for alpha can be in the range of 0.25 and 0.3. Th Quartile algorithm uses a slightly different approach--compares the absolute values of the functions at interval [A. B]. The Quartile methd is not a variant of Bisection. Te Bisection is a special case of the Quartile method (setting alpha to 0.5).

The method of False-Position is the next higherup root-bracketing method that uses the function values as weights. This algorithm does not systematically shrink the interval containing the root. To stop iterating, you compare the current new guess with the last new guess.

If you are going to resort to the Bisection method as the main or backup method, then you can replace it with the Quartile method to have fewer iterations. The reduction in iterations depends on the function and the initial root-bracketing interval.

Newtons method is popular in root solving. It uses calls to teh functio and it's first derivative. The Haily method is generally better than Newton's. It calls the function and its first two derivatives. The Householder method is even faster, but calls n he fucntion and it's first three derivatives! By using function calls to approximate the derivatives, I found that Haily's method is in general the optimum method (considering iterations and function calls).

Parick, I welcome your suggstions for root-seeking algorithms (both variants of other methods or original algorithms). I think the subject is fascinating and I am interested in all sugegstions.

Namir

Re: New root-seeking algorithm

*Message #7 Posted by **ECL** on 10 Dec 2005, 10:26 p.m.,*
in response to message #6 by Namir

Namir,

I too am interested in root methods. I am not familiar w/ Householder method.

I am dealing with simple methods (modified false position, newton-raphson..). I prefer non-symbolic derivative evaluation due to using primarily the 33s. Although this can be overcome with use of divided difference approach.

Re: New root-seeking algorithm

*Message #8 Posted by **Namir** on 10 Dec 2005, 10:39 p.m.,*
in response to message #7 by ECL

```
Th Householder method is relatively new. Like Newton's and Haily's
methods it is based on te Tayler's expansion. The Householder methods
includes up to the third derivative.

Atributes of method:

+ Very fast convergence rate
+ Requires first, second, and third function derivatives!
+ Using derivative approximation methods results in five function calls
per iteration
+ Compared to other methods, this method has fewer iterations but a high
number of function calls
+ Basic Householder iteration uses:

X = X - f(X){[f'(X)^2 - f(X) f''(X) / 2]/[f'(X)^3 - f(X) f'(X) f''(X) -
f'''(X) f(X)^2 / 6]}

where f(x) is target function (f(x) = 0)
f'(x) is the first derivative
f''(x) is the second derivative
f'''(x) is the third derivative

Pseudo-code:

Obtain initial guess x and Tolerance
Obtain or set value to MaxIterations
Clear Diverge flag
Set IterCount = 0
Loop
        Increment IterCount
        If IterCount > MaxIterations Then Set Diverge flag and exit loop
        h = 0.01 * [1 + |x|]
        f0 = f(x)
        fp1 = f(x+h)
        fp2 = f(x+2h)
        fm1 = f(x-h)
        fm2 = f(x-2h)
        D1 = (fp - fm) / (2h)
        D2 = (fp - 2f0 + fm) / (h*h)
        D3 = (fp2 - 2 * fp1 + 2 * fm1 - fm2) / 2 / h ^ 3
        diff = f0 * ((f0^2 - f0 * D1 / 2)/(f0^3 - f0 * D1 * D2 - D3 *
f0^2 / 6]}
        x = x - diff
Until |diff| < Tolerance

Return root as x and Diverge flag
```

Escape the NCEES grip via Aero?

*Message #1 Posted by **ECL** on 25 Nov 2005, 11:09 p.m.*

With regards to NCEES and the calc policy, it appears that aerospace engineers are exempt from licensing.

As much as I like the 33s for its daily utility, I am partly employing it to remain unspoiled when it comes time for the EIT exam. My work experience as a student has been entirely aerospace/structures related. I intend to remain in this area, but my BS is in mechanical engr.

I find it interesting that the PE is required to contract in most cases even in aerospace. I can't help but envy my aero-colleagues...no EIT -> no HP ban.

Then again, our applicability as MEs' is broader. ECL

Re: Escape the NCEES grip via Aero?

*Message #2 Posted by **Norris** on 26 Nov 2005, 1:24 a.m.,*
in response to message #1 by ECL

NCEES currently offers PE exams in 16 engineering disciplines, plus the PS exam for surveyors. Individual states may offer any or all of these NCEES exams. In addition, some states develop their own PE exams in disciplines not addressed by NCEES.

However, NCEES does not offer a PE exam in aerospace engineering, and I don't think that any state has one either. Aerospace engineers would typically work under the "industrial exemption", and would therefore not need to be licensed. An aerospace engineer that did pursue licensure would most likely take the ME PE exam.

For most US engineers -- with the exception of civils -- licensure exams and NCEES calculator rules are optional. Only about 20% of US engineers will ultimately become licensed, and the majority of those will be civils. For non-civils, the percentage of licensed engineers would be even lower, probably less than 10%.

Re: Escape the NCEES grip via Aero?

> With regards to NCEES and the calc policy, it appears that aerospace engineers are exempt from licensing.

I beleive that Aeros are exempt from licensing only if they work for a company under the industrial exemption.

If an aero plans on starting a business offering their services to the public or working as a consultant while holding themselves out as an engineer, I am pretty sure that they will need the P.E.

49g+ Costco deal

*Message #1 Posted by **Bobby** on 25 Nov 2005, 8:15 p.m.*

I saw this deal on Costco.com, the Hewlett Packard 49G+ Graphing Calculator & **free** 512MB SD Memory Card bundle Item # 801548 for ~$115. It think it only runs from the 25-27th. Note: I don't work for Costco etc... appologies if this is mistaken for a shameless plug.http://www.costco.com/images/content/misc/PDF/801548.pdf

Re: 49g+ Costco deal: The 49+ Still Has Reported Problems

*Message #2 Posted by **I, Claudius** on 25 Nov 2005, 9:23 p.m.,*
in response to message #1 by Bobby

Google group comp.sys.hp48 still has reports of key problems even with the latest hardware and ROM:

http://groups.google.com/group/comp.sys.hp48/browse_frm/thread/72ae5af6c53b4a68/c82861c133a201a8#c82861c133a201a8

I wouldn't touch another 49+ until these problems are completely cured.

Re: 49g+ Costco deal: The 49+ Still Has Reported Problems

*Message #3 Posted by **ECL** on 25 Nov 2005, 11:14 p.m.,*
in response to message #2 by I, Claudius

I Claudius,

I have the recently posted ROM upgrade installed on my 49g+.

My initial complaint was the 'missed keystroke' issue.

Now, my problem appears to be some form of key bounce. I have set KEYTIME at 4097 (appears to be the max), yet I can still frequently get too many hits on just one stroke.

My machine is the earlier one, however:

CN40600229

Just some cents.

I'd love to get involved with this machine, but its got a little bit further to go before I give a new one a shot. ECL

Re: 49g+ Costco deal: The 49+ Still Has Reported Problems

*Message #4 Posted by **Arnaud Amiel** on 26 Nov 2005, 3:47 a.m.,*
in response to message #3 by ECL

The KEYTIME does not have any effect (is not implemented) on the 49g+.

Arnaud

Latest hardware has problems? Show us please.

*Message #5 Posted by **Matt Kernal (US)** on 26 Nov 2005, 1:37 p.m.,*
in response to message #2 by I, Claudius

Hi,

I must be missing something. Per "I, Claudius"'s previous link, I don't see any posts referring to problems with the new hardware. If anything, I read that missing keystrokes have been fixed, but duplicate keystrokes may now be a issue with ROM >= 2.00. I'm sorry, but I don't see any reference to the new hardware having problems. I've read, and re-read the thread. I don't see it.

Here is another thread that refers to a new plastic material being used in the keyboard construction:

[link:http://groups.google.com/group/comp.sys.hp48/tree/browse_frm/thread/10226908ccc3edb7/6b55da5033219860?rnum=1&q=plastic+cyrille&_done=%2Fgroup%2Fcomp.sys.hp48%2Fbrowse_frm%2Fthread%2F10226908ccc3edb7%2Fd943ce9ff42d9de9%3Fq%3Dplastic+cyrille%26rnum%3D2%26#doc_3085126a7372fbd9]Link[/link]

This is good news. The firmware can be addressed.

Bye, Matt

The Resultant Product Has Still Has Problems

*Message #6 Posted by **I, Claudius** on 26 Nov 2005, 1:51 p.m.,*
in response to message #5 by Matt Kernal (US)

It has never been completely determined if the keyboard problems were hardware, software, or a combination of both. KinHPo's approach has been somewhat shotgun, hit 'em both. If there are continuing keyboard problems, they may be hardware related. Ultimately, the resultant product still has problems, and no one should have to pay money to be a KinHPo guinea pig, which is really my point.

Re: The Resultant Product Has Still Has Problems

*Message #7 Posted by **John Limpert** on 27 Nov 2005, 12:27 p.m.,*
in response to message #6 by I, Claudius

I'm on my second HP-49G+, a warranty replacement for an early production model with a flakey keyboard, with the latest ROM, and it still has keyboard problems. I don't trust it and I rarely use it.

The Original 49 Is Better

*Message #8 Posted by **I, Claudius** on 27 Nov 2005, 5:02 p.m.,*
in response to message #7 by John Limpert

How interesting! It won't bother a bit if I never get another 49+.

I've come to really like the original HP49, so well in fact I've bought several new in box old stock units off eBay. The rubber keys, while a bit goofy, work just fine. The redundant upper screen is easily removed and replaced with a piece of wallboard insulation cut out with an exacto blade. Paste on some HP decals, and it looks quite good. Store a copy of all your files/programs in Port 2 and you have a crash proof calc. It has more built-in, out of the box commands than a TI89. The CAS, while not perfect, is darn good for a handheld. The equation and matrix writers are outstanding. Since it's basically a 48 with rewritten software and more memory, battery life is excellent. Any engineer is well-armed with one.

Original 49 Is Better?

*Message #9 Posted by **Howard Owen** on 27 Nov 2005, 6:31 p.m.,*
in response to message #8 by I, Claudius

I'm on my first and only 49G+. With ROM 2.0, it works great. The serial number is CNA 51000... I didn't have the 1.X ROM on it long enough to know whether there was a problem there or not.

It seems some machines do well, while others don't. I can sympathize with someone thinking about buying one, given the uncertainty. I bought mine in blissful ignorance, and got away with it. I don't know if I'd take the plunge now, if I hadn't then, since I use these machines for fun.

But while I think my 49G looks nicer, with a more pleasing color scheme, I have to say it isn't very legible when compared to the 49G+ The color scheme on the + may be lacking in designer flair, but it is certainly easier to read. The larger display is a nice ergonomic touch, too. The nice speedup in some (but not all) functions is welcome as well. I also like USB file transfer, or SD card sneaker net as compared to the 48G's slow kermit at 96K. All of these things are easy to appreciate - if you have a working machine.

Regards,
Howard

HP-49G vs. KinHPo 49G+

*Message #10 Posted by **Karl Schneider** on 27 Nov 2005, 7:24 p.m.,*
in response to message #8 by I, Claudius

I bought a new HP-49G at full price from Fry's in 2002, when the rumors on this Forum were that HP would discontinue its calculator product line, with uncertain future plans. I detested the appearance of the 49G, and knew I could get a better deal on eBay. However, I wanted to secure a complete, latest, and fully-functional example of what might have been HP's last-ever calculator model, and to reward one retailer that continued to carry the advanced HP scientifics. (I had also bought one of the last five HP-32SII's they had in stock, not too long prior).

It must be acknowledged that the appearance, speed, and some features of the 49G+ represent a substantial improvement over the 49G. However, a 49 in any flavor is still an over-complicated, user-unfriendly design, with inadequate in-package printed documentation, and which will never be more than a collector's toy to me. I'd never use one at work, or in a collegiate or professional exam (even if the rules allowed me to).

Even though the 49G has some annoying minor bugs (even in the lastest ROM version), it generally works as expected. I would never buy a calculator with an unreliable keyboard, and am disinclined to buy one that is based upon an unsound design.

Re: HP-49G vs. KinHPo 49G+

*Message #11 Posted by **Howard Owen** on 27 Nov 2005, 8:11 p.m.,*

in response to message #10 by Karl Schneider

Well, you know what *I'd* like in a high-end HP calc. But I'm unlikely to get a return of keystroke programming on the high end from HP. So there the 49G+ sits, at the top of HP's line of calculators, just daring the gadget head in me (right around 75% of the total!) to ignore the problems and plunge in. It's a siren's song, and I just can't resist. Perhaps when I get good at SysRPL, some time in the next couple of decades, I'll write what I consider to be the definitive integration of keystroke programming with the existing RPL models. However that turns out, I'll keep playing with the 49G+ for now, if only to keep my hand in for the next high-end machine.

Regards,
Howard.

Re: HP-49G vs. KinHPo 49G+
*Message #12 Posted by **I, Claudius** on 28 Nov 2005, 12:01 p.m.,*
in response to message #10 by Karl Schneider

I went through several 49+s, all bad. A friend of mine was a beta-tester of the original 49, I got to play with it a lot, so I know the machine pretty well. I can understand your not liking it, the case was/is ugly, the documentation was abysmal, and the responses to bug reports from the development team were rude. I can remember threads of nothing but flames between disappointed users and the developers on comp.sys.hp48. Over time most of the bugs were taken care of. Sales were not as expected, some 180,000 total units worldwide, but that is nothing compared to sales of the 12C and 48. By that time HP was disenchanted, fired everyone, and basically dismantled the whole division.

My schooling isn't that distant from your era, but I abandoned basic scientifics when more advanced ones such as the 48 came out. I loved my old 48SX, did a lot with it. But it's now retired too. I always use the best possible tools for whatever task is at hand. Life's too short to go poorly equipped for anything.

Re: HP-49G vs. KinHPo 49G+
*Message #13 Posted by **bill platt** on 28 Nov 2005, 6:15 p.m.,*
in response to message #12 by I, Claudius

> Quote:
>
> Life's too short to go poorly equipped for anything.

which is exactly why spending time to figure out the 48/49 seems a waste..when what it offers above a basic scientific programmable is all better handled on a real computer.

(I have a couple 48gx and a 49 but mostly out of curiosity and a once-strong desire to learn them--a desire which has faded mostly.

The most useful thing about the 48 is that I can emulate a 41 with it thanks to Hrastprogrammer)

Apparently from what I can gather, the 48/49 is still an apex tool for civil engineering type survey work--so I know that for some, it is the *best* possible tool.

in response to message #13 by bill platt

<The most useful thing about the 48 is that I can emulate a 41 with it

The 41 was a fine machine in its time, and many loved it, including my dad. But to use a 48 as an emulator for a 41... do you emulate an Underwood typewriter on your pc?

Re: HP-49G vs. KinHPo 49G+
*Message #15 Posted by **bill platt** on 30 Nov 2005, 12:09 p.m.,*
in response to message #14 by I, Claudius

Well, that's not a fair comparison.

The reason for emulating a 41 is that it has a "language" that I already know (well, I know the voyager "language" which is very close). The keystroke approach is more than adequate for a lot of stuff, and so I don't have to waste my time learning something else that is only a tool. I can put my efforts into learning more important things instead.

In the case of the typewriter, the "language" has not changed--only the hardware.

I already spent too much time trying to learn RPL and I decided it is more efficient for me to "cut and run" on that.

Applications     1                    Unlimited
```

Comparable? Sort of. How about the calculators?

```
                 HP41-CX              HP48-GX
Power            4 "N" cells/AC       3 "AAA" cells
Characters       <128 (ASCII subset)  Multiple 1000s (unicode)
Display          1 line LCD           Multiline LCD
CPU              "Nut" @ 638 KHz      "Saturn" @ 2MHz
OS               HP prop. RPN         HP prop. RPL
Applications     Unlimited            Unlimited (bigger infinity)
```

The 48 comes off well in this comparison. That's because the comparison isn't laughable, like the first one.

Merry Christmas to you as well, Claudius Drusus. 8)

in response to message #10 by Karl Schneider

Karl,

I presume you'd lean toward the 33s if required to use a now-in-production model. The only functional issue as I see it is the inclusion of matrix capabilities. How do you handle this? ECL

HP-33S and matrices

*Message #20 Posted by **Karl Schneider** on 28 Nov 2005, 9:39 p.m.,*
in response to message #19 by ECL

ECL --

I do have an HP-33S (with bugs and bad display). I also have an HP-15C and HP-42S, which I would use for matrix operations. I don't think it's really worth the effort to develop matrix functions for

the 33S, although it could be done.

Nice 71 for sale on Ebay - anyone interested?

*Message #1 Posted by **Jim Creybohm** on 25 Nov 2005, 12:33 p.m.*

No, this is not my 71 for sale. It does look very nice, and it is complete with manuals, etc. I would also like to see the current high bidder not win (corrbubba - or whatever).

I am unable to bid because I live outside the US.

http://cgi.ebay.ca/ws/eBayISAPI.dll?ViewItem&item=5832632881

My apologies in advance if anyone finds this offensive, but there has been a lot of complaining about this person's ethics, etc. I think this might be one way to address said ethos.

Another Great Coburlin Deal

*Message #1 Posted by **I, Claudius** on 24 Nov 2005, 11:06 a.m.*

Buy It Now for $229 and you can be the proud owner of this for parts quality machine:

http://cgi.ebay.com/HP-11C-Scientific-Calculator-with-Case-Manual_W0QQitemZ5831018142QQcategoryZ58039QQrdZ1QQcmdZViewItem

And for just $329 you can have a Buy It Now 15C with a bad key:

http://cgi.ebay.com/HP-15C-Scientific-Calculator-with-Case-Manual_W0QQitemZ5832868211QQcategoryZ58042QQrdZ1QQcmdZViewItem

in response to message #1 by I, Claudius

The question is: is anyone buying these items ? Coburlin is selling at these prices for months so I guess someone is buying.

Edited: 24 Nov 2005, 4:07 p.m.

I'd guess....

*Message #4 Posted by **Vieira, L. C. (Brazil)** on 24 Nov 2005, 4:32 p.m.,*
in response to message #3 by inaki

... that it is easy to do business like this. Find a couple of friends anywhere in the US and have a fair arrangement with them:

(Coduba all the way) "I announce an item and you all go higher and higher bids all along; at the moment a duck gets into the circuit, you all leave the trail and let the duck alone. Otherwise, have any of you won because no duck was in, I'll send you a payment order in the corresponding value, from someone else´s

bank account. Or we can arrange another item so the one amongst you that won the last one will announce this so-called new item and I'll bid back till I reach the previous item´s value. Well, if a duck falls in this time, better for us! He, he, he... All of the ducks around will think: 'If these guys pay so much money for these items, they must be special!' And we will rise their prices till no one else buys them, so we can reduce them a bit so the circle closes on itself. And for as long as we keep doing it smoothly, the closer to reality it will be."

Any other idea?

Cheers.

Luiz (Brazil)

Re: I'd guess....

*Message #5 Posted by **Namir** on 24 Nov 2005, 5:03 p.m.,*
in response to message #4 by Vieira, L. C. (Brazil)

Luiz,

Several years ago I came to realize that my life should revolve around two simple principles--love myself (and others)and respect myself. Part of this principle that applies to this website is enjoying the information about programming that other fine folks post here. Also, it's using that information to develope and improve on algorithms and/or programs in various languages and for various machines and OSs.

Right now, I am having fun (re)learning how to program in RPL and especially for the HP-49G+. I hope to submit some of these programs to Dave Hicks for publishing. I hope that folks on this web site can emjoy them too.

As for Cobubba's rambling about hs auction ... **I COULD NOT CARE LESS!**

So I say let's focus on sharing our love and dedication for algorithms, RPN. RPL, and other development tools. Life is too short to be wasted it on idiots.

Namir

Could not agree more...

*Message #6 Posted by **Vieira, L. C. (Brazil)** on 24 Nov 2005, 10:05 p.m.,*
in response to message #5 by Namir

... and Namir, thanks for calling me back. Sometimes you hear so much noise that you feel compelled to cry out loud as if you need to hear some sound coming out of your own mouth.

Thanks again.

About your programs, I'll surely enjoy reading the listings. You see, programmable 'anything' behaves the way programmers want (when they know how to) without physically changing. This is beautiful, whatever language or paradigm we use ('ll stop here before starting new daughter-threads...)

Cheers.

Luiz (Brazil)

Re: I'd guess....

*Message #7 Posted by **Peter Geiser** on 24 Nov 2005, 5:27 p.m.,*
in response to message #4 by Vieira, L. C. (Brazil)

Well, it's pretty simple.

He just bought a HP80 in good working condition, in original hard case, with manuals etc. for USD 51. Nobody else was willing to buy at that price. Too bad (and yes, I also missed the auction :-(

If you mourn that you didn't buy, you can now buy it from Coburlin for USD 349 adn USD 475, respectively.

It's plain business: Coburlin buys low and sells high. You could have bought the hp80 for USD 60 (or 70, or whatever Coburlin was bidding), and now (try to) sell it for USD 500. It's your free choice.

Whether someone buys or not, that is another question.

As for buying at Coburlin's prices: depending of your goals, it may actually be a very good deal. If you are very short of time, and get paid by the hour as a consultant or a lawyer, it may be worth not spending several hours for an inexpensive machine, but rather shell out the big bucks and get the goods delivered immediately. Again, it's a matter of personal preference (although not mine.)

Best regards
Peter

Re: I'd guess....

*Message #8 Posted by **blurdybloop** on 25 Nov 2005, 2:47 p.m.,*
in response to message #7 by Peter Geiser

It isn't just "buy cheap and sell dear." It's everything else that he does.

He evidentally has considerable social engineering skills to convince people to sell to him without allowing the auction to run its course. It's one thing if the seller was foolish and posted a ridiculously low BuyItNow price; it's quite another when he talks a naive seller into setting such a price or to close the auction early.

He cheats. Many of us have noted how he changes his auctions at the last moment to a cheap mouse in order to avoid paying the listing fees for his overpriced items.

I wouldn't be surprised if he also cheats the IRS and the California Franchise Tax Board. Someone should alert these agencies that he may not be reporting all his profits.

Last (and least) he openly states his contempt for the community.

Pissing into the community well pollutes the water for everybody else. Draining the well of much of its clean water before pissing into it makes the pollution worse. Even if the well renews its water and presently becomes clean again, there is only so much abuse that it can take.

Coburlin is a well-pisser. He undercuts the good will that is necessary for any hobbyist community. I've seen too many hobbyist communities die because of well-pissers; or worse, they react by

becoming closed secret communities with nearly-impossible barriers to entry.

MOHPC is a wonderful resource to defend the well and its water. Nevertheless, I see the bad signs. The moment we stop caring that someone is pissing in our well is the moment we stop caring about newbies.

Hopefully, this particular well-pisser will eventually move on and piss in someone else's well.

Re: Coburlin Reveals Himself Here

*Message #9 Posted by **I, Claudius** on 25 Nov 2005, 9:33 p.m.,*
in response to message #8 by blurdybloop

In reading the ad I found I found one phrase interesting: his description of the item being "worned" shows at least some lack of education. His admitted disdain for engineers and his pricing seems to be almost revenge oriented. Yet, he seems to have enduring interest in old HPs. I think Coburlin is one of those who failed to become an engineer, indeed, probably failed to get any sort of degree. So, he strikes back with an almost bizarre series of eBay sales of overpriced junk. Life is crazy sometimes...

Edited: 25 Nov 2005, 9:34 p.m.

"Coburlin-gua"

*Message #10 Posted by **K** on 25 Nov 2005, 10:27 p.m.,*
in response to message #9 by I, Claudius

> Quote:
>
> In reading the ad I found I found one phrase interesting: his description of the item being "worned" shows at least some lack of education...

Another characteristic of "Coburlin-gua" is the omission of conjunctions: For example, battery contacts are described as "clean shiny" instead of "clean *and* shiny".

Of course, all of his calculators "work great as shown", even though only a static display can be shown in a photo, giving very limited evidence of functionality.

HP41CX halfnut circuit diagram

*Message #1 Posted by **Christoph Klug** on 24 Nov 2005, 3:15 a.m.*

Dear HP41 enthusiasts,

I am looking for the circuit diagram for the HP41CX halfnut version.

Searching an electrolythic condensor which is wired in parallel to the +UBatt terminals. I want to supply the upper housing shell of the halfnut on the workbench - without using the original battery holder

I use this setup for replacing the internal silicium battery cell from a HP41CY (HP41CX halfnut with internal RAM-Box)....

Regards - Christoph Klug

Re: HP41CX halfnut circuit diagram

*Message #2 Posted by **Tony Duell** on 24 Nov 2005, 6:31 a.m.,*
in response to message #1 by Christoph Klug

I certainly have it (I have the full 41 service manual which seems to cover all versions, fullnut and halfnut). I thought it was on TOS.

However, there are no PCB layouts in said manual (component-level repair was not supported by HP), so it's not going to be a lot of help in finding the battery connections. I have powered up a halfnut by connecting wires to the logic PCB, I seem to remember tracing the connections from the contacts for the I/O flexiprint.

It's been a long time since I did this, so check this carefully, but I seem to remember that the -ve battery contact is the -ve side of the largest capacitor on the board, and the +ve side goes to one of the connections to the 2 diodes soldered together near that capacitor.

Re: HP41CX halfnut circuit diagram

*Message #3 Posted by **Christoph Klug** on 24 Nov 2005, 7:43 a.m.,*
in response to message #2 by Tony Duell

Dear Tony,

thanks for your answer - I hoped that I get an input from your side :-)

On which page of the HP41C/CV/CX service manual I will find the wiring diagram for the 41CX halfnut ? Please give me this number - than I am able to download this page from TOS.

Regards - Christoph

Re: HP41CX halfnut circuit diagram

*Message #4 Posted by **Tony Duell** on 24 Nov 2005, 8:05 a.m.,*
in response to message #3 by Christoph Klug

I should learn to check before posting...

While the service manual is on TOS, for some reason the halfnut diagrams are missing. I am sure they are in my paper copy...

Let me check and get back to you...

Hope this helps for now...

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 25 Nov 2005, 12:46 a.m.,*
in response to message #4 by Tony Duell

Hi, Christoff;

I once dismantled an HP41CV halfnutt and powered it with an external battery arrangement. I was able to produce some good images with my scanner (had no digital camera t that time), as you can see:

http://www.logeng.com.br/images/halfnut_mainboard.jpg
http://www.logeng.com.br/images/capacitor_halfnut.jpg

If the big capacitor is the main capacitor, it is identified as a 470uF by 6 dot something volts. The DC wiring is also visible in the upper part of the bigger image (red - positive; black - negative).

I have no other picture for now, just let me know if you need some extra images.

Best regards.

Luiz (Brazil)

Help with charging HP 75D

*Message #1 Posted by **Bill Lafferty** on 23 Nov 2005, 10:35 p.m.*

I've recently acquired a 2nd hand HP-75D - unit only, no accessories. There is nothing in the handbook to stipulate the charger/adapter to plug into an Australian (240 AC) power supply to charge it. Can anyone advise the input/output required, in other words can we use a HP 82068B AC adapter/recharger to charge the HP-75D.

Re: Help with charging HP 75D

*Message #2 Posted by **Howard Owen** on 23 Nov 2005, 11:13 p.m.,*
in response to message #1 by Bill Lafferty

Yes, that's the one. The US equivilant is the 82059B. They used that adapter with a huge number of computers, calculators and peripherals, including the HP-75C/D.

PRM-85 boards for HP-85/87 now shipping

*Message #1 Posted by **john** on 23 Nov 2005, 7:12 p.m.*

Hi,

Thanks to Bill Kotaska the first PRM-85 board (a clone of the Series 80 Programable ROM module) has been sold to an HP-85 user in the UK, and those people who replied first (from the USA and France) will be pleased to know their boards are nearly ready to be shipped. E-mails will go out in a week or so to confirm.

Bill actually plans to have two boards more than the number already reserved, so I am delighted to ask if anyone is interested in buying one for $100 (US) or €100 (Europe) or £60 (UK) please drop me an e-mail to be added to the waiting list. Please note the board comes with a SuperROM with 8 ROM images for the HP-85 as standard, I am also putting together a similar ROM for the HP-87 but this will have slightly fewer ROM images.

Here is my web page describing the PRM-85: http://www.vintagecomputers.freeserve.co.uk/hp85/prm85.htm

Thanks for your interest, Regards, John

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 24 Nov 2005, 10:32 a.m.,*
in response to message #1 by john

Is this unit capable of program the EPROMS or I'll need an EPROM burner?

Best regards,

Nelson Sicuro

Re: PRM-85 boards for HP-85/87 now shipping

*Message #3 Posted by **John** on 25 Nov 2005, 7:41 p.m.,*
in response to message #2 by Nelson M. Sicuro (Brazil)

Hi,

No the PRM-85 does not have the capability to burn EPROMs, neither does the original HP Programmable ROM Module on which the PRM-85 is based.

There are plenty of people on this forum who would be able to help you for the cost of postage, if you have blank EPROMs and have appropriate data files.

Regards, John

Trading calculators

*Message #1 Posted by **Jim Creybohm** on 23 Nov 2005, 6:24 p.m.*

Hi all.

I was wondering; in the museum classifieds there is a section of Buy/Sell/Trade. Well, I know how to Buy/Sell, but I really don't know of anyway to Trade calculators. Has anyone ever done this?

The reason I ask is I am interested in trading one type of (common) older HP for another. There are some variables to consider however; my description vs. theirs, and should disappointment/dishonesty creep in, how does one seek redress? It seems like trading is not an option. An escrow seems like a great idea, but an escrow for calculators?

Looking for thoughts/ideas on this. Maybe its just a pipe dream...

Re: Trading calculators

*Message #2 Posted by **Forrest Switzer** on 23 Nov 2005, 7:15 p.m.,*
in response to message #1 by Jim Creybohm

I have traded one HP-42S for another of equal quality. The purpose was to provide the other person with a specific ROM version. I really didn't care which ROM version I had as long as the calculator was of equal (mint+) quality and one of the older versions.

Re: Trading calculators

*Message #3 Posted by **Stephen Easterling** on 23 Nov 2005, 9:39 p.m.,*
in response to message #1 by Jim Creybohm

I'm a big fan of trading. In fact, I have a new in box 48G+ and some extra cases (for most models) and an extra HP25 I'd like to trade. I'm looking for an excellent-mint 16C for my collection. I think I have everything else I wish to collect at this point.

Re: Trading calculators

*Message #4 Posted by **db (martinez, ca.)** on 23 Nov 2005, 10:40 p.m.,*
in response to message #1 by Jim Creybohm

Trading calculators is great. I've done it a bunch, both for hp and non hp units, to Canada, Germany and the US. All but one (someone who posted here about 5 years ago) was a positive experience for both parties. In fact; with two of them we just send each other stuff. We have different interests and it seems to even out. It's just difficult to find someone that wants what i have and has what i want. The escrow idea would be great, if someone had way too much time and could do that for all of us. Another idea would be to keep two lists somewhere: a bad guy list and a good guy list. The problem there is; who has time to keep that current?

Re: Trading calculators

*Message #5 Posted by **ECL** on 23 Nov 2005, 11:19 p.m.,*

in response to message #4 by db (martinez, ca.)

db,

What, if you don't mind, do you wish to locate, and would you consider posting models that you may be interested in releasing?

ECL

Re: Trading calculators

*Message #6 Posted by **db (martinez, ca.)** on 24 Nov 2005, 11:11 a.m.,*
in response to message #5 by ECL

ECL;
This isn't the right forum to post a trading list on. I've got about a dozen spare HPs. Theres only 3 i want - bet you don't have one. I also want several non hp RPNs. Bet you don't have them either. Email me if you want, so we don't clutter up this space. - d

Re: Trading calculators

*Message #7 Posted by **ECL** on 24 Nov 2005, 4:19 p.m.,*

db,

> Quote:
>
> ...so we don't clutter up this space.

That is fine.

If this forum can tolerate discussions about the newer HP 49g+, recurring rants regarding the infamous "c" fellow, and flame wars over RPN vs RPL, I am a bit surprised at being checked for something relating to OLDER HP's.

You could have used your own advice and emailed me that comment. It would have prevented*further cluttering of this space*.

ECL

Re: Trading calculators

*Message #8 Posted by **db (martinez, ca.)** on 25 Nov 2005, 1:17 a.m.,*
in response to message #7 by ECL

ECL;
I tried to email you by clicking the blue ECL at the top of your post but this came up:
"ECL didn't provide an email address. ECL is not a registered user."
I'm registered and have an email address in the fourm's automated system so i said "Email me if you want".
There have been complaints about both excessive new hp bashing and coburlin rants along with other off topic threads. Most complaints are about postings that should go in the classified ad section, like for-trade lists. It is common to finish off topic or narrow interest conversations by email.

Re: Trading calculators

*Message #10 Posted by **Jim Creybohm** on 24 Nov 2005, 4:04 p.m.,*
in response to message #1 by Jim Creybohm

I appreciate all who have responded, and your input. Thanks! However my next question has to do with the mechanics of the trade. Did you send your calculator away first? Did you use registered mail? What steps did you take to protect yourself? Has anyone ever been disappointed or ripped off? Do you only deal with known entities?

If I were to trade said very common HP, I would not hesitate to trade with any one whose name normally appears on this board - and, because I lurk, I am familiar with most of the people and would not hesitate to trade with them. (except for "corrosion", or whatever his name is)

But I am still very interested in this side of the equation as it seems a very unique aspect of the collecting culture. Normally, one can trade at flea markets, etc. Doing this via the 'net changes things a little bit.

Re: Trading calculators

*Message #11 Posted by **db (martinez, ca.)** on 25 Nov 2005, 1:51 a.m.,*
in response to message #10 by Jim Creybohm

Jim;
If it is a trade then i almost always use insurance or registration. I just sent two boxes of treasures to Germany and Canada uninsured. These are the two people who i have traded so much with that we have kind of lost track of where the ballance point is. I hope that we all came out ahead.
No one is a *known entity* the first time. Your idea of trading with folks who regularly post here is a good one but there is no real "protection" this side of the grave. One guy that i traded with in British Columbia took way over a month to get a calc i sent him insured and signature required. The Canadian Post had delivered it to the wrong address and a woman expecting a package signed for it. It took a month for her to find him. Lucky she is honest. If that had been ebay he would have had to put in negative feedback by 30 days and then we'd have had to pay them $20 bucks to retract it.

Re: Technical manual for 82240B

*Message #5 Posted by **Tony Duell** on 30 Nov 2005, 3:43 p.m.,*
in response to message #3 by tomcee

There should be reverse-engineered schematics for both the 82240A and 82240B on the HPCC CD-ROM. They're pretty simple inside, an 8048 microcontroller, the IR receiver chip, and a driver chip for the printhead/motor.

From what I remember, if you want to take one apart, there are 2 case screws (4 under the feet, 2 in the

battery compartment).

Swap Disk Database Dump

*Message #1 Posted by **Howard Owen** on 23 Nov 2005, 4:39 p.m.*

I've been using a SQL table I made of the contents of the swap disks for some time. I just answered a question using the database, and it occurred to me that others might appreciate having access to it. The swap disk images are available from the Museum site here. My database dump is here. It's in phpMyAdmin dump format, which is basically a set of SQL statements to create the table in an existing MySQL database. It should be readily adaptable to other database types with a little Perl code, or even just hand editing.

Here's a typical query I run against this table. (This is in fact the one I used to answer the recent question.)

```
SELECT * FROM FILES WHERE TYPE LIKE '%71" AND NAME LIKE 'MATH%';
```

This told me that the 71B math rom in a lex file was on the ATCHO swap disk, in the file called "MATHROM'.

Regards,
Howard

New "v.80" 49g+ ROM

*Message #1 Posted by **James M. Prange (Michigan)** on 23 Nov 2005, 3:10 p.m.*

Here.

Regards,
James

Re: New "v.80" 49g+ ROM

*Message #2 Posted by **Howard Owen** on 23 Nov 2005, 3:51 p.m.,*
in response to message #1 by James M. Prange (Michigan)

An odd shift in numbering, isn't it? Version 2.0 to version 0.80 strikes me as strange. Also this version is said to add the equation library, but that came in with 2.0, I believe.

Re: New "v.80" 49g+ ROM

*Message #3 Posted by **Matt Kernal (US)** on 23 Nov 2005, 4:44 p.m.,*
in response to message #2 by Howard Owen

Version 2.00 had build "50". This new ROM is Version 2.01-2 with build "80".

FYI, you can type "VERSION" to see the "2.01-2" version, then press <ON> & <D> to see the build number "80". Press <ON> & <C> to exit the self-test screen.

Matt

*Message #4 Posted by **Howard Owen** on 23 Nov 2005, 4:53 p.m.,*
in response to message #3 by Matt Kernal (US)

Ah, thanks for that explanation. The only thing visible on the download site was the build number.

Re: New "v.80" 49g+ ROM

*Message #5 Posted by **Ed Look** on 23 Nov 2005, 11:55 p.m.,*
in response to message #2 by Howard Owen

What new features or functional improvements came in with this new version?

I took a quick peek at EQLIB and COLIB; it looks kind of the same... no built in periodic table yet. (It's hard to beat Arnold Moy's periodic table available on Eric Reichlin's HP48 site.)

Do any of you think it might be redundant to have an Equation List like on the 33S or 32SII?

evolving attitude towards HP 33S

*Message #1 Posted by **brian healy** on 23 Nov 2005, 12:28 p.m.*

It seems that impressions regarding the 33s are starting to become less negative, perhaps even favorable. That is true for myself. It seems that with the display and keyboard issues addressed, this calc is getting a second chance. Any comments?

I will Eat Crow

Re: more eating crow

*Message #5 Posted by **bill platt** on 28 Nov 2005, 11:36 a.m.,*
in response to message #4 by Valentin Albillo

Hi Valentin,

The great thing about the 33s is that for $50 you can have a piece of equipment that you can take on the road, in the field, down in the bilges, that will funtion in a mostly familiar way (RPN and programmable) and have pretty good tactile feedback and be reliable and able to take the basic abuse of field work, and all for only $50.

I use my "classics" when I am in the home office. But the 33s can take it, in the field.

I tried using some really cheap machines--including the 30s---in the field, but they were unreliable. The 30s has the bad habit of losing its memory if the case gets twisted, even while you are in the middle of a calculation. The 33s, for all its strange design, is a good machine for being out in the field.

Re: more eating crow

*Message #7 Posted by **Ron Ross** on 28 Nov 2005, 12:08 p.m.,*
in response to message #5 by bill platt

I agree. I did not think I would buy the Hp33s, but when I took the NCEES exam earlier this year, the exam had again changed to reducing the allowed calculators down to a select few. Well, I bought the Hp33s feeling that I would use it only for the exam and then dump it in a drawer (well, I have kinda done that, but it sets in a desk drawer at work, where it does see some use).

It is not a bad calculator. And at $50, is not overpriced for what it offers (in comparison to all other offerings, by everyone else). There is no other pocket programmable calculator available by anyone else (there are low end models with solvers, but these only offer one eq solvers, no real memory).

Could it have been better? YES!, could it have been a LOT BETTER? Yes, again. But then it may not have been allowed in the ALL IMPORTANT NCEES EXAMS either. The NCEES

specifically banned the Hp41 and Hp42s along with graphics when they started banning calculators. With that thought in mind, Hp had to immediately reduce its offering to mearly an Hp32s clone or risk having this calculator banned (and embrace all the limitations of the Hp32s as well). But the Hp32s has been enormously popular (ebay auctions often have the HP32s outsell the far more cablable Hp41 and 42s).

My own opinion is that while the Hp32s and now the Hp33s are okay calculators, they are not in the same league as the Hp 41/42s line. But I am a 1% customer and the price/performance ratio and sales of the Hp42s with I/O might need a price of $80-100 and sell only 1 compared to 100 sales of the Hp 33s. Even the less than brilliant marketing group at Hp can make a good case to forget about little old me. And that 1 sale to me would be made anyway, with that fancy Hp49G+ anyway (Yeah, I own one of them too). But I would have rather had a re-vamped Hp43s with 32k (or 1 Meg) and a serial I/O (just provide me with an Hp48G+ w/o graphics and the size of a pioneer and you would have sold one or three to me).

nuff said, I'm sure.

Can the critics give HP at least a *little" credit?

*Message #8 Posted by **Gene Wright** on 24 Nov 2005, 10:54 a.m.,*
in response to message #2 by bill platt

Can we at least hope that the crowd who complain about HP never responding to complaints will be a little less quick to chime in next time? :-)

HP, with much smaller resources than they used to have, have now 1) updated the 12c platinum to have parentheses and a much faster i-solve routine, 2) updated the display of the 33S and fixed some bugs, 3) updated the ROM of the 49g+ to fix all bugs of which I am aware AND addressed the keybounce issues, and 4) issued an up-to-date AUR for the 49g+, and 5) what's next? Who knows?

We can discuss all day long whether these issues should ever have been seen in a shipping product, but the modern corporate world is a difficult place to say "No, we won't ship this yet" to superious. Witness the apparent issues with the new Xbox!

HP listens and HP responds where they can. I hope they listen MORE, but rants may not be the best way to get what we all want. :-0

Gene

P.S. I don't, however, think that we'll ever see a BIG enter key again. That appears to be a non-starter. :-(

Re: Can the critics give HP at least a *little" credit?

> I hope they listen MORE

I hope they'd talk more.

I really appreciate the work that has been going on to update the imperfections and support the latest products. However, I would like to see more interaction with hp, some sort of forums where the user base would be more involved. I am sure some projects to make this calculators better would be

supported by more members of the community; what is missing is leadership. I would have volonteered to help on the AUR if I had been asked. I would volonteer to help developping some useful programs that could be downloaded from hp or hpcalc.org, I just need some guidance as I am not a leader and don't have many ideas or they are too hard for just me. I believe such guidance could easily and cheaply be given by hp. Here and on comp.sys.hp48 lots of able people would be glad to help. If hp was able to create a vibrant community, this would I belive have some positive impact on their sales.

The way I see it these days, hp listen and implement but the user is not really involved.

Arnaud

Re: Can the critics give HP at least a *little" credit?

*Message #10 Posted by **Gene Wright** on 24 Nov 2005, 8:45 p.m.,*
in response to message #9 by Arnaud Amiel

Actually, one of the ways the user community and HP interact is through the user conferences, the latest of which, HHC2005, was held in Chicago in September. HP was there and made a presentation.

Those present this year saw a prototype not yet introduced and the AUR nearly 6 weeks before it was public.

I know for a fact that HP reads this forum, so things said here addressed to HP will be seen. Non-rants will usually be read more thoroughly. :-)

Legal aspects might restrict the ability HP has of offering programs directly on their website. As to the AUR, email me. :-)

Re: Can the critics give HP at least a *little" credit?

*Message #11 Posted by **GE** on 25 Nov 2005, 5:13 a.m.,*
in response to message #10 by Gene Wright

Are those words "saw a prototype not yet introduced" actually blinking in huge letters in that message ?
HP has done some things, and the good news is that they are still in the race. However, why no big ENTER key ? Who forced them into such a bad keyboard design for the 33S ? They could have done it cheaper *and* better to my taste with a more classic design. Recall the function placement on the keyboard is mind boggling.
I just say that they should not take extra steps to make a model less usable. Granted, the work done is nice compared to the small team producing it.

Re: Can the critics give HP at least a *little" credit?

*Message #12 Posted by **Gene Wright** on 25 Nov 2005, 9:38 a.m.,*
in response to message #11 by GE

Well, the "not yet introduced" item has been mentioned already on comp.sys.hp48, so don't get TOO excited.

The small enter key is to make it similar to the TI units, I'm sure. If the true market that buys these things are students, then making sure the unit is familiar to the student appears to be very important.

I would guess someone in marketing either thought the chevron keyboard was a good idea or they had a focus group of young people who thought that.

I remember my first reaction to the 33s (spoken to HP) was "why are the keys shaped this way?" Unfortunately, by then it was too late. :-)

So, I do think given their small resources, they are working very hard to address problems and improve their products. They are learning and trying to improve.

So, we can either encourage or rant. I vote to encourage! :-)

Re: Can the critics give HP at least a *little" credit?

*Message #13 Posted by **Ed Look** on 26 Nov 2005, 1:41 p.m.,*
in response to message #8 by Gene Wright

Mr. Wright, I sincerely support your sentiments regarding giving HP a little credit. Granted it really isn't your professor's old HP (or even yours, with Compaq, DEC, and all that, with Agilent spinning off), but whoever they are, they have, at least to me, bent over backwards to put out a good, solid, ... dare I say it?... superior calculator product.

The 49G+ is a very complex machine as all you electronic and electrical engineers can attest to. These days, how many high-technology products are perfect right out of the box? Most of us have a more flawed out-of-the-box experience. My brother bought one of those Star Trek light-up Christmas tree ornaments, from an old, reputable brand name. The transparent sticker on the deflector dish was annoyingly misaligned. Okay, this is a petty example, but go talk to HP's, Dell's, Gateway's, Sony's, even ABS' or Alienware's customer service departments and if you get a straight answer, there isn't always gaiety among customers. Or, we can talk to Ford, GM, Toyota, Nissan, Volkswagen, etc. How about Airbus or McDonnell Douglas??

Back on the ranch, even their support of the 33S is quite good! They are available, responsive, and generally knowledgeable... and fairly accomodating!

Does anyone know (seriously) if TI, Casio, Sharp, (or worse, the no-names) has good customer support?

At least with their calculator and PC and printer departments, their customer support is very good, in my opinion... and the products at the very least competitive with everyone else's, just to be very laid back about it.

(Edited for grammar, of all things!)

Edited: 26 Nov 2005, 1:43 p.m.

Re: Can the critics give HP at least a *little" credit?

*Message #14 Posted by **Gene Wright** on 26 Nov 2005, 5:26 p.m.,*
in response to message #13 by Ed Look

Thanks, Ed.

Group, please don't get me wrong. I still think HP has room for improvements, perhaps even lots of them!

However, if they really didn't care, there wouldn't be that much of a reason to upgrade the 12cp, the 33s, or produce such a massive volume as the AUR.

I would suggest giving appreciation where appropriate. That's all. :-)

Now, what's next for them to do?

Re: Can the critics give HP at least a *little" credit?

*Message #15 Posted by **Paul Fox** on 27 Nov 2005, 3:15 p.m.,*
in response to message #8 by Gene Wright

No - I can never give them credit again. The HP49+ is a con in every sense of the word. The fact that they took over a year to fix such a deficiency on the classiest calculator in the world? Give us a break.

The HP48GX was a beautiful and brilliant calculator, the HP49+ a pure and unadulterated con. The most expensive calculator beaten in quality control by a $5 highstreet noname brand.

And dont say to compare apples to oranges - they had it right 15 years ago and more, but now they just want to rape their customers.

I will hold them in high esteem when their best calculator lasts more than a few poultry weeks on battery power and/or has signficant usability improvements.

I dont want to detract on the quality of the s/w for the HP, but the hardware sucks badly. So they deserve zero credit after taking my money for a useless paper weight (and a very ugly one at that).

Re: Can the critics give HP at least a *little" credit?

*Message #16 Posted by **Gene Wright** on 27 Nov 2005, 6:21 p.m.,*
in response to message #15 by Paul Fox

What you seem to be unaware of is that:

1) HP had hundreds of people working on calculators when they made the 48gx.

2) None of them are working on calculators now - they have perhaps 30 people total, but certainly not hundreds.

3) And, they had to change the models - the technology had moved on and was no longer available.

Let me ask you a question:

Why didn't YOU fix the problems with the 49g+ in a quicker time?

Let's see...you probably didn't have the time, resources or know-how, did you? :-)

HP calculators are probably in a similar boat.

They could either:

a) Not focus on any other products and fix the 49g+. That probably wouldn't do them any good, since their sales would fall and they could get the axe.

b) work on fixing the 49g+ as they could, while continuing to update their other products. This keeps the sales revenue coming in and puts off the questions from corporate about their ROI and allows them to continue producing calculators.

Alternative a is just a non-starter. All we would have if they did that is the memory of HP calculators with no hope at all for any future ones. I prefer hope and encouragement to HP to improve rather than using language such as you have done. The type of language you use is guaranteed to have HP not take you seriously.

Then again, for individuals such as yourself (and I know there are more than just you), there is a solution.

Keep buying 48gx calculators off ebay at higher prices than a new 49g+. Use them while they last. Take longer to do your calculations.

Sounds a tiny bit like people I know who are still using DOS and won't come to the windows world.

If you are unhappy with your HP product, rather than complaining here, call HP support and tell them. How else will they learn?

Sigh. Gene

Not being an HP insider but being in electronic product development myself (I'm our company's entire engineering department), I'd have to say it's more likely that the older technology's price wasn't falling fast enough to keep up with the new.

> Quote:
>
> 1) HP had hundreds of people working on calculators when they made the 48gx.
>
> 2) None of them are working on calculators now - they have perhaps 30 people total, but certainly not hundreds.

The only way I can imagine it would take 30 people a year to correct problems with a calculator is if the correction required re-writing the software. Otherwise only a few of them would need to put some of their time into it for a couple of months. As for the key-debounce problem correction you mentioned above, that's a very, very minor thing to take care of in software. I always do key debouncing in my embedded software. It's almost trivial. That HP failed in something so basic is inexcusable.

I think people tend to give corporations too much credit *and* too little. On the one hand, corporations, particularly multinationals like HP, are seen by some as either the salvation or the damnation of the world in general. Corporations have power, but so do people, if they will but use it. On the other hand, we expect corporations to act as if they have interests other than making the quarterly numbers, and we excoriate them when it becomes clear that they don't. Even people who work in corporations aren't very comfortable with that one, but it's generally true.

And corporations are made up of human beings. But that doesn't mean that a corporation acts like an ordinary human person, the legal fiction of its personhood notwithstanding. Toeing the bottom line doesn't mean you will always make short-sighted, selfish decisions. Often a corporation's interest coincides with something that is recognizable as "moral" or "community minded" or even "philanthropic" or "noble." More often though, corporate actions are described as "crass" or even "stupid" and "heavy handed." Either way, the labels are misleading, because they tend to make you think of the corporation as a person, rather than a highly organized hive intelligence.

It seems to me that HP, like IBM before it, purged itself of an older culture that valued people inside the corporation over customers outside. The organizations "had" to do this because the competition had made the transition, or else was born with the customer centered focus. In human terms, the transition at HP was famously painful and difficult. A lot of "crass," "stupid" and "heavy handed" decisions got made along the way. One of these, a very small one of these, consigned HP's in-house calculator division to near oblivion.

So that left many of us who loved the old machines, and who admired the old culture that produced them, scratching our heads, wondering where the hell the "customer focus" was in all of that. Well, it's another painful and difficult thing to swallow, but people like us, in our role as calculator enthusiasts, aren't HP's customers, at least in terms of the market research and sales figures.

I'm not saying there aren't good and committed people inside HP working to deliver the best machines they can given realities. I work for a giant corporation too, so I'm not unsympathetic to people who struggle to deliver quality with a human touch in what simply can't avoid being a dehumanizing context. But I do have two criticisms.

The first is aimed at critics of giant corporations. Don't act like the huge hive mind is an individual who has wronged you. It's silly, and more importantly, it's factually wrong.

And the second is directed at individuals within HP's calculator division. If you can't hear criticism like some of the more dramatically stated stuff in this thread, then you really are falling down on your "customer focus." Even if this crowd doesn't represent the target demographic du jour, our sensibilities matter. Our sons and daughters are going to school now, and some of them will be influenced by our opinions about whether or not HP is worth buying.

Regards,
Howard

*Message #19 Posted by **Gene Wright** on 28 Nov 2005, 10:36 a.m.,*
in response to message #18 by Howard Owen

Howard, I don't disagree with much of what you are saying.

However, discourse accusuing HP of "raping" their customers goes beyond the pale, IMO.

That sort of language is not helpful.

I am in no way wishing to discourage ANYONE who has an issue/problem with HP or HP's products from expressing their opinion.

Yet, it often seems that improvements when made, and there have been many, get ignored.

Somewhat like wondering why your 5th grader hasn't received their Ph.D yet when they are showing you a 100 on a spelling test.

Re: Can the critics give HP at least a *little" credit?

*Message #20 Posted by **Ed Look** on 28 Nov 2005, 12:03 p.m.,*
in response to message #19 by Gene Wright

Mr. Wright, to be totally fair, I don't see any language or even allusion of the sort in his post. In fact, it appears that Mr. Owen was largely saying the OPPOSITE of that!

I must say, we ARE a civilized little group! ;)

Re: Can the critics give HP at least a *little" credit?

*Message #24 Posted by **Wayne Brown** on 28 Nov 2005, 12:13 a.m.,*
in response to message #8 by Gene Wright

No. No credit, none at all.

Gene, you (and most others here) seem to think of HP as an old friend who's made a few mistakes but should be encouraged to do better and given the benefit of the doubt. I used to feel that way, but no longer. For the last several years my attitude toward HP has been much like that of a hardened, cynical parole officer toward a repeat offender. It's not a matter of *if* but *when* his parolee will screw up again. He's just waiting for the parolee to make some little slip-up, because it's a case of "perfect behavior or back to jail."

That's just how I look at HP. They would have to make a *lot* of changes (and not just in the calculator division), **and** make a public apology for nearly everything they've done for at least the past decade, **and** be on their best behavior with *no* mistakes for at least the *next* decade before I'd begin to trust them again. Of course, I know they will *never* meet even a portion of my requirements, so I am resigned to never being pleased by HP or wishing them anything but ill, ever again. Nothing they do now or in the future could begin to "make up" for what they've done unless they first go back and undo much of what they've already done.

Re: Can the critics give HP at least a *little" credit?

*Message #25 Posted by **bill platt** on 28 Nov 2005, 10:50 a.m.,*
in response to message #24 by Wayne Brown

Hi Wayne,

You are forgetting that HP is a corporation, not a human being. Your requirement for a corporate "apology" amounts to anthropomorphism.

Corporations change as the people who work for them and run them retire, as market conditions change etc. Asking htem to "apologize" is not meaningful in any real sense.

Basically, if you want or need a calculator with keystoke programming, or one with RPN, or both, or one with a similar set of features to the legacy 32sii, then the 33s, marketed by HP, is the *only* product out there.

That you don't like it is your own opinion--but note that you would not have the luxury of holding that opinion if there were not a large supply of reliable used machines out there.

HP is not a "parolee," it is a corporation.

To me, it's a bit like demanding that Bill Hewlett rise from the grave and personally explain these decisions.

It's certainly something that will never happen.

It also shows (for good or ill) a fantasy-like picture of corporations and the US (and foreign) legal system.

Living in reality as we do, these requirements will never be done.

As I've said many times before, and as you never seem to understand, I don't expect HP to behave like any other corporation. I expect them to behave with a completely different set of rules, motivations, goals and attitudes. I see HP as a sort of pie-in-the-sky engineers' playground and expect it to behave accordingly. So saying "corporations aren't like that" or "corporations don't do that" is about as relevant to my opinions about HP as saying "a piece of caramel-flavored sunshine weighs more than that."

But Wayne,

Why or how do you come to the position that HP was, and forever shall be, an utopic "engineer's playground?" That just does not sound reasonable. Not at all. I just don't quite get that--it's one thing to say that once upon a time, HP *appeared* to be a Utopia; it is an altoghether different thing to expect or demand that a corporation be held to some higher than reasonable or legal standard.

Like, that just becomes an unreasonable position that makes any discussion pointless.

I also have a hard time believing that it was a utopia. People were hired and fired there; products soared or bombed, most of their calculators had bugs or deficiencies of one sort or another. Heck, they had a board of directors!

> Why or how do you come to the position that HP was, and forever shall be, an utopic "engineer's playground?"

While it was never an engineer's Utopia, it used to be a lot closer to that ideal than it is now. I used to know HP employees who delighted in the fact that many product decisions were made more on the basis of "this will impress other engineers" than on how well they would sell. That may not have been the *official* position of the company but it was at least *tolerated* when some of the employees practiced it. But as the rest of corporate America became more and more focused on profits and less on technical excellence, HP went along with the crowd, rather than going further and further in the opposite direction as a reaction against the mainstream. That's primarily how I saw HP -- as a rebel that thumbed its nose at the way the rest of the technology industry did business. I can remember reading the works of business columnists in the '70s and '80s who criticized HP for this very attitude and it was one of the things that most endeared the company to me. But they've swung around in the other direction and fallen into line with the rest of the corporate world, and I'll never forgive them for that.

Re: Can the critics give HP at least a *little" credit?

*Message #30 Posted by **bill platt** on 28 Nov 2005, 6:44 p.m.,*
in response to message #29 by Wayne Brown

Well, the problem with this hindsight is that it tends to gloss over all the deficiencies. Bug in early 32sii fraction implementation; 32sii annoying "unary minus" different from sutraction bug is one that stands out. Look at where the "technical playground" led---straight to hell in a handbasket. Straight to the 48 series--and ultimately to hiring the c.s.hp48 crowd to develop the 49. What a disaster.

Sometimes it takes some business sense to say, "this is crap" or "this will not sell" or " this is cool but not useful".

I work in a technical field--I develop technical solutions--practical technical work--quality is important because that is what your customers want and expect. I understand what qualitiy means, from a technical standpoint. We would not be *in business* if we did not mind our quality. But we would also be out of business if all we thought about was "technical prowess." There never was a conflict between quality and good business decisions. But there were quality problems all along at HP--even in the near-utopia--which is such an important thing to remember.

Why do we like their stuff? Becasue it had higher quality than Ti. But that does not mean that they were as good as they could have been at the price.

Re: Can the critics give HP at least a *little" credit?

*Message #31 Posted by **Howard Owen** on 28 Nov 2005, 7:23 p.m.,*
in response to message #30 by bill platt

This isn't aimed at anyone personally. I'm just stirred up by the idea of living in the past.

To be fair, the world was paying HP's price back then, whereas they were less willing to later. That HP lost the calculator market wasn't enirely HP's fault. There was intense competition from TI, with Casio right on its heels. TI delivered low-cost and simple machines for the burgeoning education market, and marketed them to the hilt. HP kept designing for engineers, when

that segment had moved on to cheap PCs on every desktop, then in every briefcase.

So sad. HP of old lost the calculator market. HP got rid of the "HP Way." The nineties consumed corporations large and small, new and old like a ravening beast. HP survived the 90s to become the tottering giant in PCs it is today. So sad. So completely irrelevant.

How about trying to recreate a human-friendly culture in the corporations of today? How about latching on to the upcoming age of micro-manufacturing to deliver custom hardware to people with nearly the same flexibility that software is delivered today? Talk about room for creativity and engineering "cool!" The future has got a lot to offer. But it won't be possible to transplant yesterday's values directly onto tomorrow. We have to be smart and flexible, if we want to preserve what we think is valuable about the bygone era.

For me, the old HP calculators embody several things that are worth preserving, and even (*gasp*) improving on. In their particulars, these qualities are numerous, but I think they all stem from a deep understanding of and caring for the engineering calculator user. These folks truly were designing for themselves, and they knew their own needs very well indeed. And as long as a significant share of the engineering world looked like them, well they were successful at selling their product.

So what I would preserve is not so much this or that particular feature, although several would make my personal list, but that deep understanding and care for the user. I know that quality is rare in any field of endeavor. I also know it stands out with startling clarity whenever it's present. If we really are moving toward an age of small-scale, decentralized manufacturing, then products are going to proliferate. There will then be an even stronger business need to stand out from the crowd than there is today. Given that the old HP quality embodied an approach that can confer that sort of differentiation, perhaps something of the old style will come back into vogue. Wouldn't *that* be cool? 8)

>
> Well, the problem with this hindsight is that it tends to gloss over all the deficiencies. Bug in early 32sii fraction implementation; 32sii annoying "unary minus" different from sutraction bug is one that stands out.

I never claimed the older products were perfect. But those problems were honest technical mistakes. I think I can guarantee that the fraction bug was not introduced because someone in Marketing thought it would make the 32sii less "intimidating" to non-technical users. I'm sure they didn't add the "unary minus" problem to make it more appealing to people who didn't want to look too "geeky" while using an HP calculator. But what other conceivable reason is there for the chevron keyboard of the 33s, if not to appeal to the

"fashion sense" of the average user? (Whether it succeeds in that respect is immaterial; the *attempt* is what I find offensive.)

I was thinking about this subject on the drive home from the office tonight, and I realized that I could explain my viewpoint on this in fewer words than I used earlier. Essentially, this is it: In the battle between techies and non-techies, the war of geeks and nerds (or as we said in my day, "eggheads") against the rest of the world, I always considered HP to be on "our side." But that's no longer true, and *that* is what makes me so hostile to the "new" HP. They no longer project the image of "pocket protectors are more valuable to us than stock portfolios" that they once had. They've sold out to the "normal" crowd and abandoned those of us who are proud of our "Poindexter" image.

in response to message #27 by Wayne Brown

I think we all understand your position quite well. We just don't agree with it.

The HP of old has been dismanetled and carried away piece by piece. And besides that, it never was as good as our fondest hopes made it seem. I've been offered a stool at the local barbershop where I can spend the rest of my life complaining about how debased the world of today seems; how much better things were back in my youth. The idea turns my stomach! I'm still a part of life *today*. I'm still looking for value and meaning *right now*. Screw the past!

ahem Sorry for the outburst.

Absolutely right. Not only do I think the 33s should be discontinued, but HP should offer a public apology for ever introducing it in the first place. It could have 10,000 times the features and 100,000 times the speed of anything else on the market, and retail for 10 cents, and that keyboard *still* would make it an insult.

Re: evolving attitude towards HP 33S

*Message #39 Posted by **Ed Look** on 23 Nov 2005, 2:23 p.m.,*
in response to message #38 by Rick

Yes, right here in this forum! Here's the thread:

Larry McClellan's post

(Warning: it may load slowly depending on your computer.)

I actually have one now with the new display and it IS MUCH better.

Oops.

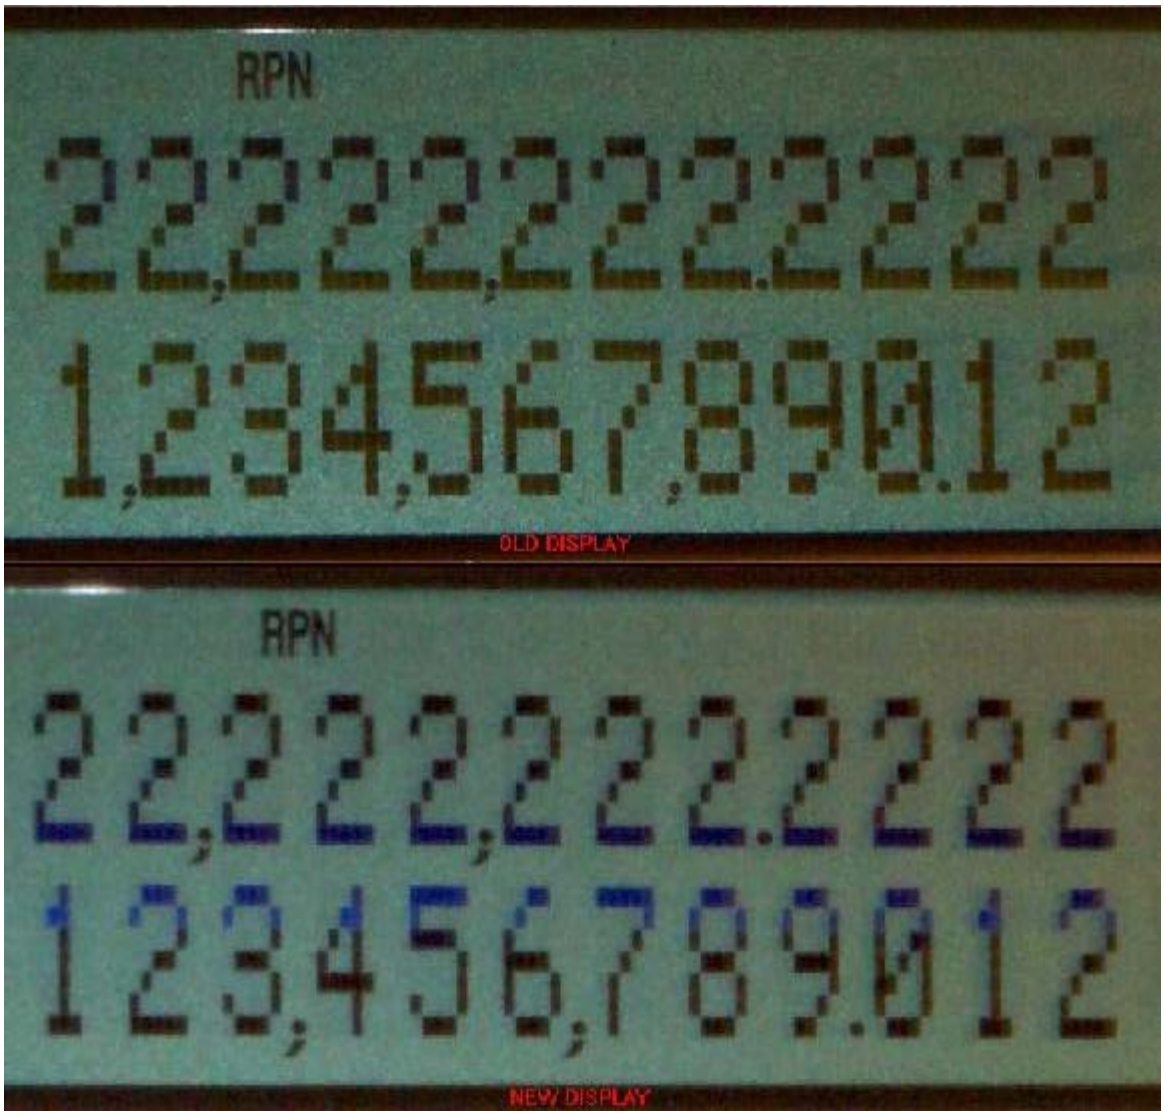
The pic does not exactly show too well how much better the new decimal point is. But I'm sure one day very soon someone will post a comparison.

Edited: 23 Nov 2005, 2:29 p.m.

33S Old vs New Display Picture (was Anyone with a pic of the new display?)

*Message #40 Posted by **Jeff O.** on 23 Nov 2005, 10:37 p.m.,*
in response to message #38 by Rick

Well, yes, just took one today. I was hoping for better quality, but this shows the difference pretty well:



The discoloration in some of the characters in the new display is an artifact of the imaging process. In person, all pixels are nice and dark. As Ed states, the new display is much nicer. The characters seem "crisper", and the background is slightly less green which looks better to me, although this does not really show up in the above image.

Re: 33S Old vs New Display Picture (was Anyone with a pic of the new display?)

*Message #41 Posted by **Ed Look** on 23 Nov 2005, 11:03 p.m.,*
in response to message #40 by Jeff O.

The only other thing I might add is really rather subjective: I sort of preferred the aspect ratio of the original display characters. Alas, their very size and shape contributed to the legibility problems of the decimal point and comma.

But hey, the new display, though featuring "thinner" characters is much easier to read and that ultimately is most preferable.

Re: 33S Old vs New Display Picture (was Anyone with a pic of the new display?)

*Message #42 Posted by **Jeff O.** on 24 Nov 2005, 12:01 a.m.,*

in response to message #41 by Ed Look

Since I failed to reproduce the images at equal scale (the image of the old display needs to be scaled by a factor of approximately 0.97 to be the same scale as the new display image), it may not be immediately obvious that the new characters are the same height as the old. The new are about 15% narrower. Put another way, the height to width aspect ratio of the old is approximately 2.2:1, the new ratio is approximately 2.6:1.

*Message #43 Posted by **Ed Look** on 24 Nov 2005, 12:30 a.m.,*
in response to message #42 by Jeff O.

You did a great job with the pictures, actually! (Well, maybe if you reduced the "zoom" on both so that one doesn't have to scroll... but that's just a nitpicker's nitpick.)

But I don't see the "less greener" side of it. Both backgrounds appear so far to be of the same shade.

LOL!!

I meant between the two 33S models I can physically look at! They both look about as green in their displays.

Yes, there is a big difference in those of the posted pictures. Sorry for the confusion!

Re: 33S Old vs New Display Picture (was Anyone with a pic of the new display?)

*Message #46 Posted by **Jeff O.** on 26 Nov 2005, 1:24 p.m.,*
in response to message #45 by Ed Look

Perhaps the difference in "greenish-ness" differs from unit to unit. On my 2 units, (one of which is an original "Walmart" CN4... unit and the other a CNA532..), the difference in the shade of green of the background is noticeable.
Regarding the size of the image and the need to scroll, I agree, having noted that after I posted it. I considered changing to a reduced size, but I guess I didn't want to have to bother Dave to put a different version in my guest folder here.

Re: 33S Old vs New Display Picture (was Anyone with a pic of the new display?)

*Message #47 Posted by **bill platt** on 1 Dec 2005, 5:16 p.m.,*
in response to message #40 by Jeff O.

I went to Wallyworld last night and confirmed my suspicions:

There are (at least) *two* improved versions.

The older improved display has bigger comma and decimal point, perhaps more space, but the aspect ratio is close to the original

The newest display has more space between numbers, and numbers have a taller aspect ratio.

But *more important* is that the roms are different.

The 1st improved display version has the buggy rom. I only tested the rect-polar bug.

The newer improved display has the polar-rect bug fixed.

Also, the 1st improved display had a "Business 2.0" subscription deal sticker on the packaging, but the newer ones did not.

So, that makes the ROM list look like this (so far):

So far, I have delineated:

```
REV   Description              Screen
beta     ---                    (1)
-     Walmart initial release.  (1)

A     Change Alg swap            (1), (2)

B.   Bugs fixed                   (3)

Notes:
Screen (1) small dec point
Screen (2) large dec and comma, close space standard aspect ratio
Screen (3) large dec and comma, wide space / tall aspect ratio

ROM (B) has "New" as opposed to ROM (A) ALG swap behavior.
ROM (-)and (A) both have same bugs, but ALG swap behavior is different
```

Re: evolving attitude towards HP 33S

*Message #50 Posted by **Norris** on 23 Nov 2005, 9:21 p.m.,*
in response to message #37 by brian healy

One more point about the 33S:

Most of those here are old enough to remember when a trusty calculator, not a PC, was the primary number-crunching tool on a professional's desktop. Those days are gone...except in one respect.

If you need to take professional licensing exams in engineering or surveying, then you are required to turn back the technological clock and kiss your PC goodbye. Your trusty calculator becomes your best friend again, just like in the 1970s or 1980s. And if you want RPN or programmability, then only one model is allowed under current NCEES rules. It is, of course, the 33S.

There are thousands of engineers and surveyors (myself included) that are required to rely on the 33S in a career-critical situation. If the 33S gets me through the rest of the PE exam process next year, then I expect I will hold it in affectionate regard for the rest of my career, just as an old-timer might feel about his old reliable 41C or 42S.

*Message #51 Posted by **ECL** on 23 Nov 2005, 9:31 p.m.,*
in response to message #50 by Norris

Norris,

I am in your camp regarding the 'requirement'. In terms of ergonomics (the engineer's analogy

to...style) I'd say there are a few things that could be improved. Aside from the ENTER key location, and canted kbd, I tend to wish for more acreage between the keys.

Functionally, we will not need to invert a 5x5 matrix on the licensing exam, however not being able to solve such matrices keeps me dragging along my 48g, for those instances.

> The main issues for me are still the "V" shaped keypad and

I didn't think I'd be getting into this one, but I must say the keypad shape is something I cannot get past to give the rest of the unit a fair trial. I don't usually care so much about looks, and I don't care if something is ugly because they didn't put much styling effort into it. But when they try **too** hard and come up with something that looks just plain stupid, I am strongly repelled.

Re: evolving attitude towards HP 33S

*Message #55 Posted by **Howard Owen** on 25 Nov 2005, 5:30 p.m.,*
in response to message #54 by Garth Wilson

This is the sort of thing people will have differing reactions to. If their focus group said the target market would think it was "cool" I can understand that. But neglecting to consider the older audience of 32SII users, and the (on average) even older collector community seems to me to have been a less than optimal decision.

Having said that, I'll repeat that for me, the keyboard shape quickly became a non-issue. It turns out I can key stuff in reasonably quickly, and I can find stuff I'm looking for without too much trouble. I do not conciously register an impression of "cool" or "weird" as I use the 33S. The distinction disappears as I use the machine as a calculator. Before I started using the 33S, I would have predicted, based on experience in adapting to other input mechanisms, that I would eventually get to where the shape wouldn't matter to me. But I was suprised that I got there so quickly in this case.

So I'm willing to cut HP some slack on this one, as far as it goes. My major whine is that "as far as it goes" is barely past the 32SII. I'd like to see a truly updated RPN calculator, with modern CPU,

memory, I/O and software. What the latter would look like is the most interesting question, in my view. There are other threads here that try to provide some answers to that question. (hint, hint 8)

Re: evolving attitude towards HP 33S

*Message #56 Posted by **GE** on 28 Nov 2005, 6:20 a.m.,*
in response to message #55 by Howard Owen

I have a question regarding the outsourcing of fabrication and software. Recall the HP6 was a rebranding of a Kinpo model. Due to the good quality of math on this machine, I believe the math library may have come from HP (anyone ?).
Also recall that no-brand copiies of some Casio low-end graphing calculators are surfacing in the recent years, there are even official re-releases of some of these by Lexibook (here in Europe at least). The 'new' machines sometimes differ with new functions or modification to the general behavior.
So my question is : are we going to see HP machines copied by sub-contractors who have gained the knowledge through current OEM contracts ? I know there are legal issues, but I think asian makers coule build upon the experience and create improved products (not the quality we expect maybe) ?
If I were such a builder with in-house capability to recreate the "functionality" of the 32S (quotes here because I have the 42S...), I would think about issuing something better, different legalese-wise.
Maybe HP and others are laying the foundations for the upcoming takeover of the market by those new makers. Original models by these people tend to be quite buggy, but this may be smoothed with time (a la 49G+...).

Re: evolving attitude towards HP 33S

*Message #57 Posted by **Valentin Albillo** on 28 Nov 2005, 8:16 a.m.,*
in response to message #56 by GE

Hi, GE:

(All that follows, IMHO)

GE asked:

"Recall the HP6 was a rebranding of a Kinpo model. Due to the good quality of math on this machine, I believe the math library may have come from HP (anyone ?)."

> Not a chance.

"So my question is : are we going to see HP machines copied by sub-contractors who have gained the knowledge through current OEM contracts ?" Ditto. *"I know there are legal issues, but I think asian makers coule build upon the experience and create improved products (not the quality we expect maybe) ?"*

> Asian makers, specially Chinese ones, couldn't care less for legal issues, copyrights and such. They'll gladly copy *en masse* anything that seems profitable, and the Chinese government will usually leave them alone. But I rather doubt that "RPN calculators" are deemed 'profitable' enough to bother copying them.

"If I were such a builder with in-house capability to recreate the "functionality" of the 32S (quotes here because I have the 42S...), I would think about issuing something better, different legalese-wise."

> You'd do *nothing* of the sort, because you'd be gambling with your own money, not some fictitious builder's money. And you'd probably come to the conclusion that your money would be best dedicated to some other actually (not imaginarily) profitable endeavours.

"Maybe HP and others are laying the foundations for the upcoming takeover of the market by those new makers."

> If you're referring to the hypothetic RPN market, you'd better wait at some comfortable place. Within a generation, RPN and probably RPL will be lost forever. No "asian" makers are "taking over" the RPN business, actually they're fairly intelligent (if not exactly international-law-abiding in many cases), and want to make money, not lose it. Wait and see.
>
> And, if you're referring to non-RPN, non-RPL HP machines, what's the use in merrily copying an HP product which (like the 6S) is itself a copy of a Citizen-branded product which, in reality, is a no-brand design produced by Kinpo with the 'brand' of any company who cares to pay ? Or did you do for a moment believe the 6S was an HP design ?

Best regards from V.

They'll gladly copy en masse anything that seems profitable, and the Chinese government will usually leave them alone. But I rather doubt that "RPN calculators" are deemed 'profitable' enough to bother copying them.

Aurora, a Taiwanese company, has decided that one RPN calculator, the HP-12C, is worth copying. Their copy, the Aurora FN1000, sells for a fraction of the cost of a 12C (at Fry's, the FN1000 is $24.99, the HP-12C is $69.95, and the HP-12C Platinum is $79.99).

So yes, it's demonstrably feasible for Asian calc manufacturers to clone HPs. If Aurora can copy the 12C, then they could probably copy the 15C as well. However, the market for a 15C clone would surely be much smaller than the market for a 12C clone, given that the 12C must be (by far) the best-selling RPN calc in history. So Aurora is probably not interested.

It would win HANDS DOWN for over $50.

Might win, no matter what.

But Ti has sold a Ti-30 in all types of flavors since 1977 (or therabouts). And sold lots of them. Ti's original Ti-30 might be eclipsed by the Hp12c, but I say, might be eclipsed, because Ti did sell so damn many of the original Ti-30 over a 2-3 year time span. The Hp12c might beat it with its longivity (which would translate into continued sales), but that Ti-30 outsold everything else Ti ever made in its day.

So, while I suspect the Hp12c is the overall top seller, until the two total sales are known, it is speculation.

Yeah, I bought something like six of them. They kept breaking on me. False economy if there ever was one. But I now have a pristine (and rarely touched) TI-30 in my collection because it was the first calculator I used extensively.

That's why I added the qualifier of "over $50.00." I wonder if that can be determined, one way or another?

Re: evolving attitude towards HP 33S

*Message #62 Posted by **brian healy** on 28 Nov 2005, 11:26 a.m.,*
in response to message #1 by brian healy

This thread has certainly wandered a lot. The fact of the matter is, the 33s is more capable than the 32sii by virtue of its larger memory. True, you can't fully take advantage of it, but you can have a library in your calculator that contains more than a couple of programs. I can fit 2 in my 32sii, with one equation, and I have to clear variables every time I use a program.

The weird design of the keyboard, and the color scheme of the 33s are certainly annoying to me, and I don't like them. But what I more care about are results. With the improved display and tactile feel of the keyboard, the 33s does funtion adequately as a basic RPN calculator. I am grateful to HP that they gave us the 33s, because the alernative is to buy an extremely expensive vintage HP on Ebay when the vintage HP that you have been using dies. Therefore, HP, if you are listening, Thank You. The vintage HP's are great, and I love them, but they don't last forever.

My old 32sII's and my 11C are treasures, but I don't use them on a daily basis because my 33s is more capable, even if it doesn't match them in terms of design.

Help with H49G+ Programming

*Message #1 Posted by **Namir** on 23 Nov 2005, 11:28 a.m.*

Where can I find a utility or guidelines that will allow me to key in an HP49G+ program on the PC, transfer it (by SD card) to the calculator, and then compile it into a program object?

I aprpeciate your help in pinpointing me to the right source.

Namir

hp49+ won't power up

*Message #1 Posted by **tom lianza** on 23 Nov 2005, 8:17 a.m.*

My hp49+ just won't power up. I've replaced the AAA cells with fresh ones and it does not power up. Any suggestions would be welcomed.

Re: hp49+ won't power up

*Message #2 Posted by **Ron Ross** on 23 Nov 2005, 9:34 a.m.,*
in response to message #1 by tom lianza

A couple of things to try.

Adjust contrast with on and + button (or on and - button if screen is black).

Next, try a soft reset, press On, F1 and F3 all at the same time. nothing?

Try a complete reset, Press On, F1, and F4 (or F6, hell try both at this stage).

Finally try a hard reset, take a small paper clip and insert in Reset hole in back of calculator.

Still nothing?

Try changing the little 3 V button cell and retry option 1 above (you may have a dead 3 Volt button cell or it is in backwards, though this would be tough to do as it is a shaped compartment).

Nothing? Double check your batteries again. Then it is time to call Hp and complain!

Re: hp49+ won't power up

*Message #3 Posted by **guest** on 23 Nov 2005, 10:53 a.m.,*
in response to message #2 by Ron Ross

A 49g+ will power on without the 3V cell.

Re: hp49+ won't power up

*Message #4 Posted by **James M. Prange (Michigan)** on 23 Nov 2005, 11:50 a.m.,*
in response to message #2 by Ron Ross

Sometimes the button on the + end of a a AAA cell doesn't quite touch one of the contacts, particularly the spiral-shaped contact for the top battery. The battery brand can make the difference.

Also, If you had already stored anything in memory, you'd be better off trying the "paper-clip reset", which just forces a warmstart without clearing memory, before the ON+A+F memory reset.

Regards,

James

Re: hp49+ won't power up

*Message #5 Posted by **Ed Look** on 23 Nov 2005, 2:42 p.m.,*
in response to message #4 by James M. Prange (Michigan)

Oh right! This reply has brought back memories... not good ones.

Before I replaced my 49G+ (the new one is actually quite nice to use... as far as graphing calculators go; I am prejudiced toward scientific models) I did also have a problem with some brands of battery not being long enough to satifactorily touch the contacts.

My homemade solution?

I wadded some household aluminum foil and gently wedged it between the battery terminal and the electrical contact.

If you have one of the older model versions, you may have to do this. It's a slight pain, but it works.

Re: hp49+ won't power up

in response to message #5 by Ed Look

Hi all,

The paper clip reset finally worked. I didn't realize that you had to keep the clip in place for a few seconds. I put it in there and rotated it around for a few seconds and it came back to life...

Thanks,

Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #1 Posted by **Valentin Albillo** on 23 Nov 2005, 6:09 a.m.*

Hi all,

Here you are, the next outing in the S&SMC series, rounding out the first dozen with a simple but quirky math challenge to help you flex your HP-programming muscles. So, enter

The Challenge

Find the *smallest* number N whose square is the sum of more than three *consecutive* cubes, all greater than 1.

- All numbers in your solution must be integer, positive, and greater than 1.
- Your program must find and display the solution as: smallest number (N), first cube (C), last cube (L).

For example, these are **not** solutions:

```
  N    C    L              Sum of cubes                              Comments
-------------------------------------------------------------------------------------------
--
 10    1    4 ->  1^3 + 2^3 + 3^3 + 4^3 = 100 = 10^2          1^3 is not greater than 1

204   23   25 ->  23^3 + 24^3 + 25^3 = 41616 = 204^2         there are only three consecutive cubes
```

Ye Olde Deadline:

Next Monday I'll post my original solutions (plus comments), namely:

- A reference HP-71B solution, which is a 3-line program (129 bytes) which finds the solution in a few minutes (less than 9 seconds running under Emu71 @ 2.4 Ghz). It's written using just standard BASIC, no ROM extensions, so it can be easily converted to any other programming languages, as demonstrated by

- A 54-step RPN program for the HP-15C, which is a direct, optimized conversion of the 71B reference solution. It finds the correct smallest value in under 1 hour 45 min when running on a physical HP-15C.

As a bonus, the almost-automatic conversion process from HP-71B's BASIC to HP-15C's RPN will be discussed in detail as well, statement for statement. Kinda "compiling source code BASIC to RPN", sort of ...

Before I do it, you might want to try your hand at it this next weekend. Solutions for any and all HP calcs are welcome, but you should first read

The Usual Caveat Computat:

- Try to achieve a proper balance between what *you* do and what *your program* does, i.e., the program should work for *you*, not the other way around; remember these challenges are intended for you to try and demonstrate your HP-calc programming abilities.

In one extreme, you give no thought to the problem at all and simply code a pure brute-force search that takes *ages* to run; in the other extreme, you think long and hard about it and come to an analytical solution of your own, then have your program simply print the answer. The ideal is to think *just enough* to help the program *a little*, then concoct a clever program using those simple shortcuts and let it do the hard work for you, as it was meant to be.

- Absolutely refrain from using a PC, laptop, or PDA (unless running some HP calc emulator/simulator) to solve the challenge. A Mathematica, Visual Basic, C++, or Java solution, say, is useless to the intended purposes of this challenge, in fact actually defeats them, *and submitting one is to be considered unpolite behavior*.

Best regards from V.

*Message #2 Posted by **Gerson W. Barbosa** on 23 Nov 2005, 12:00 p.m.,*
in response to message #1 by Valentin Albillo

Hello Valentin,

Sorry for posting just the answer but I am too busy at work to convert the algorithm to RPL or RPN, but I will do it later.

(79 seconds on a 8MHZ 200LX with QBASIC. I have also EMU71 installed on the 200LX. I think the conversion to HP71 Basic should be straightforward, but I am not sure about the efficiency of my algorithm)

```
  N   C   L
312  14  25
```

Best regards,

Gerson.

*Message #3 Posted by **Gerson W. Barbosa** on 23 Nov 2005, 8:12 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

Below is the EMU71B version. Not totally brute force but very far from your optimized solution. It takes less than **9 minutes** running under Emu71 @ 0.5 Ghz, that is, at least 12.5 times slower than the optimum solution. This means it would take more than **9 hours** on the 15C. There's also an RPL version (1h 6m 22s according to the 48GX timer..., perhaps due to bad adaption). Is there a prize for the least efficient program? :-)

I just hope at least the solution is correct.

I am looking forward to yours and other people's solutions.

Best regards,

Gerson.

Re: Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #6 Posted by **Valentin Albillo** on 24 Nov 2005, 8:17 a.m.,*
in response to message #3 by Gerson W. Barbosa

Hi, Gerson:

Gerson posted:

"Below is the EMU71B version. Not totally brute force but very far from your optimized solution."

Thanks for your interest in my S&SMC#12 and your very interesting inputs, but first of all, I've never stated that my original solution is "optimized", far from it. I submitted to my own published "Caveats" and did not use specialized mathematical knowledge, just common 'engineering' sense. A truly optimized version would run much faster than mine, and yet I find your times intriguing:

"It takes less than 9 minutes running under Emu71 @ 0.5 Ghz, that is, at least 12.5 times slower than the optimum solution. This means it would take more than 9 hours on the 15C."

My original solution (again, not 'optimum') runs in 9 seconds under Emu71 @ 2.4 Ghz. Correcting for the clock speed, that means that indeed yours is 12.5 times slower. But my HP-15C version takes 1.75 hours to run so if the same factor applies, yours would take nearly 22 hours to run , not 9 !

" There's also an RPL version (1h 6m 22s according to the 48GX timer..., perhaps due to bad adaption). Is there a prize for the least efficient program? :-)"

Yes, there is, but I doubt yours qualifies. The least efficient ones are the ones not even posted; nay, not even *written*.

"I just hope at least the solution is correct."

You can be rest assured that indeed it is. Congratulations !

"I am looking forward to yours and other people's solutions."

My original (non-optimized) solution will be posted next Monday or sooner if interest in the challenge decays. Thanks again and

Best regards from V.

*Message #7 Posted by **Gerson W. Barbosa** on 26 Nov 2005, 4:31 p.m.,*
in response to message #6 by Valentin Albillo

Hi Valentin,

Thanks for your kind remarks, despite the definitely inefficient algorithm I presented. It was so bad I decided to start over this afternoon, now giving it a little more attention. Since many other excellent solutions have been presented so far, it's possible someone else may have used a similar approach. If such is the case, of course the credit goes to the first poster. I confess I haven't paid attention to the other algorithms as I intended to give it another try. However, I was amazed by the small running time they obtained.

The program below runs in 53 seconds under Emu71 @ 0.5 GHz, but the answer is found in about 11 seconds. There's a weekness in this method though, as the value of K in line 10 is rather arbitrary. Choosing a low K, there'll be no answer at all whereas a higher K will cause the program to take longer than needed. Also, though the solution is evident, it is not presented in the right order.

Best regards,

Gerson.

```
>LIST
10 K=100 @ FOR I=2 TO K-3 @ S=0 @ FOR J=I TO I+2 @ S=S+J*J*J @ NEXT J

Re: Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #8 Posted by **Eamonn** on 23 Nov 2005, 10:20 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

Here is a four line basic program that finds the solution that Gerson posted in 32 seconds on my Sharp PC-1262.

```
10 N=1
20 G=2*((N+5)*N+10)*(2*N+5): FOR X=N TO 2 STEP -1:S= SQR (G): IF S= INT (S) THEN 40
30 G=G+X*X*X: NEXT X:N=N+1: GOTO 20
40 PAUSE S: PAUSE X+1: PAUSE N+4
```

Here is a RPN program for the HP-33s (and HP-32s/sII) that takes about 45 seconds to find the same solution. It should be easy to port to almost any RPN calc. that supports recall arithmetic. Given that it only uses 47 program steps, it may even be possible to fit it into the HP-25 if the user can recall the results from the memory registers.

Best Regards,

Eamonn.

*Message #9 Posted by **Chris Dean** on 24 Nov 2005, 5:35 a.m.,*
in response to message #8 by Eamonn

Eamonn

I am slightly confused by your code

> Quote:
>
> 10 N=1
> 20 G=2*((N+5)*N+10)*(2*N+5): FOR X=N TO 2 STEP -1:S= SQR (G): IF S= INT (S) THEN 40
> 30 G=G+X*X*X: NEXT X:N=N+1: GOTO 20
> 40 PAUSE S: PAUSE X+1: PAUSE N+4

1. It seems as though the setting of G in line 30 is redundant as its value is over written at the start of line 20
2. Does the algorithm use the fact that (1^3 + 2^3 +.... + N^3) = N^2 * (N + 1)^2 / 4?
3. Using S=INT(S) is quite hit and miss, better to use code of the form
IF ABS(S - INT(S + 0.0005)) < 1.0e-6 THEN 40

I hope you are not offended by my comments.

Chris Dean

Edited: 24 Nov 2005, 5:49 a.m.

Re: Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #10 Posted by **Eamonn** on 24 Nov 2005, 1:14 p.m.,*
in response to message #9 by Chris Dean

Hi Chris,

> Quote:
>
> 1. It seems as though the setting of G in line 30 is redundant as its value is over written at the start of line 20

On line 20, G is initialized before the 'FOR' loop. On line 30, the value in G is updated every time through the 'FOR' loop. The program may be a bit confusing because the initialization of G and the 'FOR' are on the same line. However, the initialization of G does not occur each time through the FOR loop.

Perhaps the program is more understandable if break up lines 20 and 30 and write it like this.

(Note that I have also taken the liberty of fixing a bug in the program on line 20. Instead of counting down to 2, the FOR loop now counts down to 1. The original program found the correct answer, but it didn't test all cases. More details below.)

```
10 N=1
20 G=2*((N+5)*N+10)*(2*N+5)
25 FOR X=N TO 2 STEP -1:S= SQR (G): IF S= INT (S) THEN 40
30 G=G+X*X*X: NEXT X:
35 N=N+1: GOTO 20
40 PAUSE S: PAUSE X+1: PAUSE N+4
```

Here, G is initialized on line 20, but the FOR loop starts on line 25. I admit that the original submission was a bit more cryptic than it could have been - perhaps I should have foused on clarity instead of brevity.

> Quote:
>
> 2. Does the algorithm use the fact that (1^3 + 2^3 +.... + N^3) = N^2 * (N + 1)^2 / 4?

Here are some comments on the modified code above, that I hope make it clearer what is going on:

Line 20 calculates (N+4)^3 + (N+3)^3 + (N+2)^3 + (N+1)^3. This is the sum of the four consecutive cubes, from N+1 to N+4. If you multiply out the cubes in longhand and add them together, you will see that they are the same.

Line 25 starts a for loop counting from N down to 2. The square root of G is calculated and checked to see if it is an integer. If it is, then the program has found the solution and branches to line 40.

In line 30, X^3 is added to G. The first time through the loop, this adds N^3 to G, so that G becomes (N+4)^3 + (N+3)^3 + (N+2)^3 + (N+1)^3 + N^3 - ie the sum of five consecutive cubes from N^3 to (N+4)^3. After the NEXT X statement, X will be decremented by 1. Next time through the loop, (N-1)^3 will be added to G. The time after that (N-2)^3 will be added to G, and so on. The last cube to be added to G that is subsequencly tested is 2^3. The last cube to be added is is 1^3, but this value is not tested, because the loop terminates after this is added.

Once the program has tested all sums from (N+4)^3 + ... + 2^3 and not found a solution, it increments N (line 35) and startes testing all the sums for a larger value of N.

On line 40, the results are printed. The challenge dictates that the results should be the square root of the sum (which is S), the smalled value in the series (which is X+1) and the largest value in the series (which is N+4).

> Quote:
>
> 3. Using S=INT(S) is quite hit and miss, better to use code of the form IF ABS(S - INT(S + 0.0005)) < 1.0e-6 THEN 40

Not sure about this. I think that the original test is fine in this case. G is an integer and the test is to see if its square root is also an integer. If the square root is an integer, then the original code should find it

OK.

> Quote:
>
> I hope you are not offended by my comments.

Not in the least. Thanks for the feedback.

Best Regards,

Eamonn.

Thanks for the response. I am enlightened.

HP-25 solution

*Message #12 Posted by **Eamonn** on 25 Nov 2005, 11:37 a.m.,*
in response to message #8 by Eamonn

Here is a solution for the HP-25. It works on the HP-25 simulator available fom this website, but I don't have a real HP-25 to test it on to see how long it takes to run. It requires 39 program steps and 3 registers. This program should be able to run on most RPN programmables with minor modifications.

I have also attached an updated version of my BASIC program that is a bit cleaner than the original one I posted. The HP-25 program uses the same algorithm.

Eamonn.

```
5
STO 0

 RCL 1
 RCL 0
```

Basic program

```
10 N=5
20 G=3*(((N-3)*N+5)*N-3)
30 FOR X=N-3 TO 2 STEP -1:G=G+X*X*X,S= SQR (G): IF S= INT (S) THEN 60
40 NEXT X
50 N=N+1: GOTO 20
60 PAUSE S: PAUSE X: PAUSE N
```

Re: Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #13 Posted by **Thomas Radtke** on 24 Nov 2005, 8:53 a.m.,*
in response to message #1 by Valentin Albillo

Here's my solution for the 48G:

```
<< 1 0 0 0 0 0 0 -> N A B T I R S
<< TICKS 'S' STO
   DO
     -1 1 8 N * + sqrt + 2 / 1 + IP 'A' STO
     N SQ 3 XROOT 1 + IP 'B' STO

     A B FOR I
       I SQ I 1 + SQ * N SQ 4 * - sqrt 4 * 1 + sqrt 1 - 2 / IP 'T' STO
       I SQ I 1 + SQ * T SQ T 1 + SQ * - 'R' STO

       IF R 4 N SQ * - 0 == THEN
         IF A T - 4 >= THEN
           N T 1 +
           TICKS S - B->R 8192 / '1_s' ->UNIT
           KILL
         END
       END
     NEXT

     1 'N' STO+
   UNTIL 0 END
>>
>>
```

Result: 312 14 25, roughly 7'30" used.

I appologize for any bugs, I have no serial cable so had to type in the listing manually:(.

Thomas

Hi Valentin. It is Thanksgiving Day in the US, and I'll take this opportunity to thank you for this challenge. I have just started teaching middle school math to 11- and 12-year olds, so I really should be planning lessons, but I could not resist this challenge.

Below is the code for 12c platinum, using indirect addressing (such as it is) to store the cubes of 2 - 31 so I would not have to recalculate them. It is always a challenge to use indirect on the 12c series (challenge is really not the proper word, but this is a family forum).

The code takes about 4 or 5 minutes to find solutions for n = 323, 312, 204 (which really does not qualify since it is only 3 cubes), and 315.

Thanks for your always stimulating challenges!

Don Shepherd Louisville, Kentucky USA

Re: Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #16 Posted by **Chris Dean** on 24 Nov 2005, 6:28 p.m.,*
in response to message #15 by Don Shepherd

It might be worth noting that the identity

SIGMA(1, N^3) = N^2 x (N + 1)^2 / 4

Therefore

SIGMA(C^3, L^3) = SIGMA(1, L^3) - SIGMA(1, (C - 1)^3)

= L^2 x (L + 1)^2 / 4 - (C - 1)^2 x C^2 / 4

= N^2

which greatly simplifies the sums without assuming that the minimum will have 4 elements. With a test for a minimum value the calculation time taken to solve the problem is drastically reduced. I do not think this detracts too much from the fun of the programming exercise.

I have a solution written in Java but would not dream of posting it as that would not be very polite. I am currently without a HP calculator and will be getting a HP-49G+ at Christmas.

*Message #17 Posted by **Thomas Radtke** on 25 Nov 2005, 2:05 a.m.,*
in response to message #16 by Chris Dean

My solution above uses this identity, plus I make some assumption about one of the boundaries of the series for any N and calculate the second boundary to meet N^2. It bites me that Eamonn has presented a different solution that beats mine hands down in any respect;).

Thomas

Re: Short & Sweet Math Challenge #12: Squaring Cubes on HP 16C!

*Message #19 Posted by **Marcus von Cube, Germany** on 25 Nov 2005, 11:25 a.m.,*
in response to message #16 by Chris Dean

Since my name is part of the challenge I had to participate ;-)

The identity is worth much more than nothing, I used it in my HP 16C solution. The 16C is not the fastest, it takes his time (12'19" to be precise.)

GSB A starts the process from the beginning. After the run, N is shown; press R/S twice to see the values for C and L.

```
LBL A
 DEC
 2
 0
 WSIZE      set it big enough
 5
LBL 0
 STO 2      this is L
 ENTER
 *          no x^2 on the 16C :-(
 RCL 2
```

```
 1
 +
 ENTER
 *          x^2 again
 *          this is 4 times the sum of cubes from 1 to L
 STO 0      intermediate result, used later
 RCL 2
 3
 -
LBL 1
 STO 1      this is C
 1
 -
 ENTER
 *
 RCL 1
 ENTER
 *
 *          this is 4 times the sum of cubes from 1 to C-1
 RCL 0      same for 1 to L (see above)
 x<>y       we want a positive difference
 -          now we have 4 times the sum of cubes from C to L
 SQRT       sets the carry flag if X was not an exact square
 F? 4       query the carry
 GTO 2      next try, because value was not a square
 GTO 9      HEUREKA!
LBL 2
 1          lower bound for C
 RCL 1
 1
 -          new C := C-1
 x!=y       bound not yet reached?
 GTO 1      store new value for C and continue search
 1
 RCL 2      L
 +
 GTO 0      new value for L, continue search
LBL 9
 2
 /          we used 4 times the sum, correct the root
 R/S        show N
 RCL 1
 R/S        show C
 RCL 2
 R/S        show L
```

Re: Short & Sweet Math Challenge #12: Squaring Cubes on HP 16C - Slightly modified

*Message #20 Posted by **Marcus von Cube, Germany** on 26 Nov 2005, 4:09 a.m.,*
in response to message #19 by Marcus von Cube, Germany

I did some optimization on the code and saved steps and execution time (now below 11') by rearranging the expression:

N^2 * (N + 1)^2 ==> (N * (N + 1))^2

The changes are after labels 0 and 1:

```
LBL A
 DEC
 2
 0
 WSIZE      set it big enough
 5
LBL 0
 STO 2      this is L
 ENTER
 ENTER
 1
 +
```

```
 *          L * (L + 1)
 ENTER      no x^2 on the 16C :-(
 *          this is 4 times the sum of cubes from 1 to L
 STO 0      intermediate result, used later
 RCL 2
 3
 -
LBL 1
 STO 1      this is C
 ENTER
 ENTER
 1
 -
 *          (C - 1) * C
 ENTER      no x^2 on the 16C :-(
 *          this is 4 times the sum of cubes from 1 to C-1
 RCL 0      same for 1 to L (see above)
 x<>y       we want a positive difference
 -          now we have 4 times the sum of cubes from C to L
 SQRT       sets the carry flag if X was not an exact square
 F? 4       query the carry
 GTO 2      next try, because value was not a square
 GTO 9      HEUREKA!
LBL 2
 1          lower bound for C
 RCL 1
 1
 -          new C := C-1
 x!=y       bound not yet reached?
 GTO 1      store new value for C and continue search
 1
 RCL 2      L
 +
 GTO 0      new value for L, continue search
LBL 9
 2
 /          we used 4 times the sum, correct the root
 R/S        show N
 RCL 1
 R/S        show C
 RCL 2
 R/S        show L
```

Marcus

Re: Short & Sweet Math Challenge #12: Squaring Cubes in 14 seconds on HP 33s

*Message #21 Posted by **Marcus von Cube, Germany** on 26 Nov 2005, 5:48 a.m.,*
in response to message #20 by Marcus von Cube, Germany

The same solution ported to the 33s takes only 14 seconds to run!

```
LBL A
 5          initial guess for L
LBL L
 STO L
 ENTER
 ENTER
 1
 +
 *
 x²         (L * (L + 1))²
 STO i      intermediate result
 RCL L
 3
 -          initial guess for C
LBL C
 STO C
 ENTER
 ENTER
 1
 -
 *
 x²         ((C - 1) * C)²
```

```
 RCL- i
 +/-         4 times the sum of cubes from C to L
 SQRT
 FP
 x=0?        check if exact square
 GTO Z       HEUREKA!
 1           lower bound for C
 ENTER
 +/-
 RCL+ C      C - 1
 x!=y?
 GTO C       bound not yet reached, store new C and try again
 RCL+ L      L + 1
 GTO L       new L
LBL Z
 LASTx       FP has destroyed the the root, get it back
 2           all values were * 4, correct the root here
 /
 STO N       final result
 VIEW N      show the variables
 VIEW C
 VIEW L
```

Thanks again for the formula, Chris!

Marcus

Re: Short & Sweet Math Challenge #12: Squaring Cubes in 24 seconds on HP 28s (RPL)

*Message #22 Posted by **Marcus von Cube, Germany** on 26 Nov 2005, 8:31 a.m.,*
in response to message #21 by Marcus von Cube, Germany

Here is my RPL attempt. On my 28s it takes 24 seconds:

```
<< 0 0 0 0 0 -> sl c l n done       @ local variables
   << 5                             @ initial guess for L
      WHILE
         'l' STO                    @ store new L
         l 1 + l * SQ               @ 4 * sum of cubes from 1 to L
         'sl' STO                   @ save it somewhere
         l 3 -                      @ inititial guess for C
         WHILE
            'c' STO                 @ store new C
            sl                      @ see above
            c 1 - c * SQ            @ 4 * sum of cubes from 1 to C-1
            -                       @ 4 * sum of cubes from C to L
            SQRT DUP                @ Square root on stack
            'n' STO                 @ and in N (for later display)
            FP 0 ==                 @ check if root is integer
            'done' STO              @ save result of check
            c 2 !=                  @ lower bound not reached
            done NOT AND            @ and no solution yet
         REPEAT
            c 1 -                   @ compute new C
         END
         done NOT                   @ no solution yet
      REPEAT
         l 1 +                      @ compute new L
      END
      n 2 /                         @ display corrected N
      c                             @ display C
      l                             @ display L
   >>
>>
'SMC12' STO                         @ give it a name
```

The program uses the logical variable 'done' to determine if the loops should continue or a solution is found already. The REPEAT keyword marks the spot where the decision about loop terminationis on the stack.

The same program takes about 5.5 seconds on a 49g+.

Marcus

This looks like a nice neat, understandable RPL solution.

Re: Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #24 Posted by **Valentin Albillo** on 25 Nov 2005, 5:57 a.m.,*
in response to message #15 by Don Shepherd

Hi, Don:

Don wrote:

"It is Thanksgiving Day in the US, and I'll take this opportunity to thank you for this challenge."

> Why, thank you ! I'm glad you like it, thanks to you for your interest.

"I have just started teaching middle school math to 11- and 12-year olds, so I really should be planning lessons, but I could not resist this challenge."

> I really do envy you. Among my many main hobbies, teaching is my second vocation, and teaching mathematics would probably qualify as my first. I've always been absolutely upset by the fact that most kids (most people, actually) abhor mathematics and consider it boring and a real chore while, in my humble opinion, this only reflects the fact that mathematics are usually taught in a most boring way, using the most dreadful methodologies. If properly taught, mathematics can be fun, inspiring, enthralling, and one of the greatest intellectual pleasures there are in this world, even artistic if I may say so.

Below is the code for 12c platinum, using indirect addressing [...] The code takes about 4 or 5 minutes to find solutions for n = 323, 312, 204 (which really does not qualify since it is only 3 cubes), and 315.

> Excellent entry, and for the HP-12C no less. Full marks to you for this.

"Thanks for your always stimulating challenges!"

> You're welcome, indeed. Let me say once more that I really appreciate when people tell me, either in this forum or privately, that they do like my challenges, even if they post no solution, because concocting them takes a precious time that I must literally rob from my family time, which always leaves me with a feeling of guilt. So, it's nice to know that at least it isn't wasted and perhaps I might induce some people to be fond of things mathematical.

Now, that's your opportunity with those kids; make sure they consider the math class as one of the funniest around ! There are no boring maths, just boring teachers ! :-)

Best regards from V.

*Message #26 Posted by **Don Shepherd** on 25 Nov 2005, 4:19 p.m.,*
in response to message #24 by Valentin Albillo

Valentin, many thanks for your kind words. I agree, teaching math to kids is probably the best job in the world. It is certainly the hardest job I have ever had. The problem is, of course, that all kids just aren't interested in learning, and that makes it tougher to teach the kids who do want to learn. I've only been teaching for one month, and already I could write a book about it.

thanks again, Don Shepherd

Valentine,

very brute force, yet in a bow in deference to Angel who recently brought to us the QRG to his fabulous SandMathIII, I elected to use some of his functions. And another bow to Meindert, as I use his genial MLDL to load the SandMathIII...

You can choose a starting value for the upper boundary. Using 5 (which is the firts one to fullfill the rules of the challenge) it takes a normal CX roughly 1'34". It has 55 Lines and 94 bytes.

Again, not very pretty, so please no yelling from the more talented crowd. Especially for all the mistakes that I'm sure I have in the code...

Thanks Valentine for those challenges, I love them!

Cheers

Peter

The first version took about 2' and 10" and I had to use some additional "thinking of the programmer" to get it under 2'. For example one can see that the difference between the L sum and the C sum is always an even number. Hence I was able to save the "HalfX" (another handy Angel function) before the "Int, X=Y?", which takes a bit of time out of the loop, yet requires the "2 /" in the end to display the right N. Another time-saver was to calculate X*(X+1) and X*(X-1) out into X^2 +X and X^2-X, which is a tad faster to program on the 41 { [Rcl M, IncX, Rcl M, *] is a bit slower than [Rcl M, X^2, LastX, +]}

Re: Short & Sweet Math Challenge #12: Squaring Cubes !

*Message #29 Posted by **PeterP** on 26 Nov 2005, 10:14 p.m.,*
in response to message #28 by PeterP

...and maybe someone can show me how to format the code as nicely and easily as some of the other HP-lovers. Sorry for the layout mess...

Now that I solved it for myself I went through the other posts. I'm impressed with all the different solutions for all the different calcs! Yet a bit surprised that we do not have another explicit 41 solution (my sole true love). I guess it is a bit too oldfashioned...

Thanks Valentin again!

Cheers

Peter

Formatting

*Message #30 Posted by **Karl Schneider** on 26 Nov 2005, 10:35 p.m.,*
in response to message #29 by PeterP

Peter --

Link to formatting techniques at the HP Forum main page

The bracketed "[]" commands you need at either end of the source code listing are "pre" and "/pre"

If nobody else responds to your first post (and if you gave it a password), you can still edit it to make it look right.

in response to message #29 by PeterP

Hi PeterP,

> Quote:
>
> ...and maybe someone can show me how to format the code as nicely and easily as some of the other HP-lovers.

Just click on the Preformatted button then paste your preformatted listing between the [pre] and [/pre] delimiters. You can also type these delimiters manually:

For instance,

[pre]

```
1st line
2nd line
3rd line
```

[/pre]

will produce this:

```
1st line
2nd line
3rd line
```

rather than the following, if you omit them:

1st line 2nd line 3rd line

Regards,

Gerson.

S&SMC#12: My original solutions and comments

*Message #33 Posted by **Valentin Albillo** on 28 Nov 2005, 7:28 a.m.,*
in response to message #1 by Valentin Albillo

Hi all:

First of all, many thanks for the overwhelming number of excellent solutions you've posted in so many versions for so many different HP models (and the odd SHARP), it's been really great to see so many of you interested in my humble challenge. Also, your kind comments are much appreciated, even by the ones who

couldn't post a solution this time (Hi, Bram!), thank you so much.

Now these are my two original solutions, the reference one for the HP-71B, and the one derived from it for the HP-15C. As I told Mr. Barbosa in an early post, they aren't optimal in any sense, because though I fully knew about the formulae that could compute the sum of N cubes directly, without iteratively adding the cubes up, one at a time, I decided I would provide a solution similar to the one an individual not knowing the existence of said formulae could come up with, by using common engineering sense to speed the search instead of blindly relying in a pure brute force approach.

The HP-71B reference solution

That being so, the reference solution for the HP-71B does not use any formula at all, as seen in the following 3-line, 129 byte, GOTO-less program (arbitrary line numbers):

```
    1 FOR N=15 TO 500 @ S=N*N @ L=INT((S/4)^(1/3)) @ FOR C=L TO 3 STEP -1
    2 S=S-C*C*C @ IF S=0 THEN DISP N;C;L @ END ELSE IF S<0 THEN S=S+L*L*L @ L=L-1
    3 NEXT C @ NEXT N @ DISP "Not found"

>RUN

 312  14  25
```

which takes some 9 seconds under Emu71 @ 2.4 Ghz, and a few minutes in a physical HP-71B. A brief explanation of its workings:

- Since the challenge asks for more than three consecutive cubes, and 1^3 is not legal, we must search from $2^3+3^3+4^3+5^3 = 224 > 14.96^2$ up, so we begin our search at N=15.
- We further arbitrarily restrict our search up to N=500, but this value doesn't affect execution time at all since the search will end as soon as the minimum solution is found, so we could put N=1000000 instead and it would make no difference.
- Since there must be at least 4 consecutive cubes in the solution, we'll start adding cubes from a maximum value depending on N, and go down till either we find a solution, or we reach 1. The maximum value for each cube must be near 1/4th of the value of N, since at least four of them will be added up and they're roughly the same size.
- Then, starting from the greater four cubes, we keep on adding smaller cubes till a solution is found. If our sum exceeds N, we subtract the largest cube and keep on adding smaller ones, and this process is repeated until either we've found a solution or we've reached to 1. In that case, this value of N can't be so expressed and we proceed to the next value for N.

Eventually the solution is found:

$$312^2 = 14^3 + 15^3 + 16^3 + 17^3 + 18^3 + 19^3 + 20^3 + 21^3 + 22^3 + 23^3 + 24^3 + 25^3 = 97344$$

for a total of **12** (S&SMC#**12**) consecutive cubes being added up. As some people discovered, there's a near-solution:

$$315^2 = 25^3 + 26^3 + 27^3 + 28^3 + 29^3 = 99225$$

adding up only 5 cubes. But the requirements were for the *minimum* value of N, and 312 is less than 315.

The HP-15C derived solution

There are two main points in creating a reference solution for the HP-71B, namely:

- Anyone can enter and run it, regardless of they having a physical HP-71B, thanks to the incredible and **free** Emu71, a near-perfect emulator for the HP-71B created by Jean-François Garnier, with the added advantages of much faster execution times and the convenience of full PC keyboard and screen. A solution for other models would only be accessible for people having those physical models or their emulators, possibly non-free, or much more onerous to get and install.

- HP-71B BASIC is extremely easy to understand, most specially for native English speakers, being quite similar to natural language, so it's actually very easy to translate the reference solution to any other programming language such as RPN, RPL, or C#, say. That wouldn't be the case for an RPN and, most specially, RPL solution that by their very nature are extremely cryptic and difficult to convert to non-stack machines.

To demonstrate this, the following HP-15C RPN solution was produced from the above reference solution for the HP-71B:

```
01 LBL A     19 RCL RAN#  33 X=0?     47 GTO 0
02   3       20 Y^X       34 GTO 3    48 LBL 3
03 1/X       21 INT       35 TEST 3   49 RCL 0
04 STO RAN#  22 STO 1     36 GTO 4    50 R/S
05 .003      23 RCL+I     37 RCL 1    51 RCL 3
09 STO I     24 STO 3     38 RCL*1    52 INT
10  15       25 LBL 1     39 RCL*1    53 R/S
12 STO 0     26 RCL 3     40 STO+2    54 RCL 1
13 LBL 0     27 INT       41 DSE 1
14 RCL 0     28 ENTER     42 LBL 4
15 X^2       29 X^2       43 DSE 3
16 STO 2     30  *        44 GTO 1
17  4        31 STO-2     45 ISG 0
18  /        32 RCL 2     46 LBL 0
```

which is 54 steps long and takes 1 h 45 min to find the solution. You can insert a pause statement (PSE) after step 14 RCL 0, in order to see how the search progresses. To run it:

```
RUN -> N
R/S -> C
R/S -> L
```

The conversion process (i.e.: compilation) from reference 71B BASIC to 15C RPN is easy and almost automatic, and goes like this:

- First, let's map the BASIC variables used to RPN registers, like this:

  ```
  0: N
  1: L
  2: S
  3: C
  ```

- Also, we'll optmize for speed by storing a needed constant (the lower limit of the cube search, in RPN's ISG/DSE convention) in register I, and 1/3 (for cube roots) in register #RAN:

  ```
  I   : 0.003
  #RAN: 1/3
  ```

  Now, we'll simple translate statement for statement, like this:

- (required RPN setup)

  ```
  01 LBL A      (entry point)
  02   3
  03 1/X
  04 STO RAN#   (speed optimization, for cube roots)
  05 .003
  09 STO I      (speed optimization, for ISG/DSE)
  ```

- 1 FOR N=15 TO 500

  ```
  10  15
  ```

```
        12 STO 0      (N=15; the upper limit is ignored, search till a solution is
found)
        13 LBL 0      (it's a FOR, so we'll loop to here)
```

- @ S=N*N

```
        14 RCL 0      (N)
        15 X^2
        16 STO 2      (S=N^2)
```

- @ L=INT((S/4)^(1/3))

```
        17  4
        18  /         (S/4)
        19 RCL RAN#   (1/3)
        20 Y^X
        21 INT
        22 STO 1      (L=INT(S/4)^(1/3))
```

- @ FOR C=L TO 3 STEP -1

```
        23 RCL+I      (we construct L.003, for ISG/DSE)
        24 STO 3      (C=L.003)
        25 LBL 1      (it's a FOR so we'll loop to here
```

- 2 S=S-C*C*C

```
        26 RCL 3      (C, with .003 attached)
        27 INT        (C by itself)
        28 ENTER
        29 X^2        (C^2)
        30  *         (C^3)
        31 STO-2      (S=S-C^3)
```

- @ IF S=0 THEN DISP N;C;L @ END

```
        32 RCL 2      (S)
        33 X=0?       (S=0?)
        34 GTO 3      (yes, go deal with that case)
           ...
        48 LBL 3      (here we deal with a solution)
        49 RCL 0      (N)
        50 R/S        (stop for the user to see it)
        51 RCL 3      (C with 0.003 attached)
        52 INT        (C by itself)
        53 R/S        (stop for the user to see it
        54 RCL 1      (L, and last step: end program execution)
```

- ELSE IF S<0 THEN S=S+L*L*L

```
        35 TEST 3     (did we exceed N?)
        36 GTO 4      (not yet, go on)
        37 RCL 1      (yes, recall L)
        38 RCL*1      (L^2)
        39 RCL*1      (L^2)
        40 STO+2      (put it back in the running sum)
```

- @ L=L-1

```
        41 DSE 1      (decrease L by one)
        42 LBL 4      (the search continues here)
```

- 3 NEXT C

```
        43 DSE 3      (decrease C by one and see if we can loop)
        44 GTO 1      (yes, go loop)
```

- @ NEXT N

```
        45 ISG 0      (increment N by one)
        46 LBL 0      (place holder, we'll loop indefinitely)
        47 GTO 0      (go loop for another N)
```

- @ DISP "Not found"

```
                        (no code, it never happens)
```

That's all. Thanks for your interest and

Best regards from V.

Re: S&SMC#12: My original solutions and comments

*Message #34 Posted by **Marcus von Cube, Germany** on 28 Nov 2005, 8:40 a.m.,*
in response to message #33 by Valentin Albillo

Hi Valentin,

the most interesting difference between your solution and mine is the way the search is done.

> Quote:
>
> Find the smallest number N whose square is the sum of more than three consecutive cubes, all greater than 1.

You take the directions literally in that you are building a sequence of squares and try to break each down to a sum of consecutive cubes.

It looks like Gerson and Thomas have used your approach but some of us seem to prefer *reverse* thinking: Build an ascending sequence of sums of cubes that adhere to the rules and check, if the result is an exact square.

The latter aproach seems to be faster, even if the formula that reduces the sum to a simpler term is not used (see Eamonn's solution).

Since your program needs the cube root to estimate L, it is not suitable for the 16C (my "starter" on this challenge). Luckily, the 16C has SQRT, even in integer mode.

What if the solution must be found *without* access to a square root implementation. What would be the quickest way to determine, whether an integer is an exact square? This is kind of a mini challenge...

Marcus

Re: S&SMC#12: My original solutions and comments

*Message #35 Posted by **Valentin Albillo** on 28 Nov 2005, 10:33 a.m.,*
in response to message #34 by Marcus von Cube, Germany

Hi, Marcus:

Marcus posted:

"You take the directions literally in that you are building a sequence of squares and try to break each down to a sum of consecutive cubes."

> Yes, I was trying to come up with the kind of solution that would be obtained when following the instructions 'faithfully'. Doing the opposite and using formulae was optimum but less 'obvious', so to say.

*"What if the solution must be found *without* access to a square root implementation. What would be*

the quickest way to determine, whether an integer is an exact square?"

> You can try a set of prime powers' congruences but, in my experience, the fastest, simplest way is to compute an integer square root by Newton's iteration (i.e: $x_1=(x_0+N/x_0)/2$), which converges quadratically and runs very fast in any hardware's integer mode as the division by 2 is a mere shift), then check the resulting value by squaring it and testing against N.
>
> If the machine can't do integer division either, then a simple Newton iteration can produce reciprocals without division, using just multiplications, and once you've got the (presumably scaled) reciprocal, a final multiplication will give you N/x. Also, there are methods to compute integer square roots directly, by guessing and shifting, similar to long division performed by hand.

Best regards from V.

Writing down the sequence of cubes on paper yesterday I had a glimpse of this approach. But I didn't like my second program because I had to guess the larger cube was below 30 in order to find the solution in less than 10 minutes on my slow 34C. I have to find out what I did wrong. Congratulations for your nicely explained RPL program.

Regards,

Gerson.

Re: S&SMC#12: My original solutions and comments

*Message #37 Posted by **Marcus von Cube, Germany** on 28 Nov 2005, 6:31 p.m.,*
in response to message #36 by Gerson W. Barbosa

Gerson,

the trick is to start with $5^3+4^3+3^3+2^3$ and then start shifting the bounds [L,C] = [5,2]:

1. Step: check, if the sum is a square; exit it true.

2. Step: reduce the lower bound C by 1. If it reaches 1, go to the next step, else go back to 1.

3. Step: increase the upper bound L by 1 and set the lower bound C to L-3; start over with step 1.

The algorithm arrives at the solution but It needs to be proved that the sequence of numbers which are tested in step 1 are really in ascending order so that the solution is the true minimum asked for in the challenge.

(In particular: is SUM(x=2 to L-4,x^3) < L^3 ? The term to the left is removed from the sum when L is increased and C is recalculated.)

Marcus

P.S.: "07734": I really had to type that one into an old calc with 7-segment display and turn it over... :-)

Hepax on eV41 emulator

*Message #1 Posted by **DavidMY** on 22 Nov 2005, 7:50 p.m.*

For anyone who might be using Frank B's eV41 emulator on Pocket PC and wanting to test the Hepax module try this:

First, using Warren F's 41 Emulator for Window (latest version), load the hepax.mod file into it's configuration and run the emulator. Be sure to turn the "calculator" off and on so the Hepax RAM will get initialized. (We need to do this because we won't be able to have Hepax initialize it's RAM in the eV41 emulator)

Next, copy the hepax.mod file to a safe location and using the ModFileWin.exe application split the hepax.mod file into 6 rom files: Hepax 1-4 and Ram 1-2. (We need to do this because eV41 uses the older .rom files only)

Third, copy the 6 files to the PDA into the folder (generally /My Documents/eV41) where the other Rom modules and the autorun.ev41 configuration file is located.

Four, make a copy of your autorun.ev41 configuration and then edit the origional. We need to add the 4 Hexpax ROM's to $Page F 1 Hepax1 Important!! must be page F $page F 2 Hepax2 $page F 3 Hepax3 $page F 4 Hepax4 Edit the Ram roms to: $page 8 RAM1 Again Important!! Hexpax expects its RAM $page 9 RAM2 Starting at slot 8

Fire up the emulator, do a catalog 2 and Hepax 1-D should be listed Do an "XEQ ALPHA HEPDIR ALPHA" and you should see "Dir empty" and when you clear the display the X-reg should have 1340 displayed (i.e the number of hepax ram registers in a standard 8K Hepax)

Most all the commands appear to work including the XF and Hepax multifunctions. Be careful though, I only figured this out about an hour ago and I did have on crash: it appears that returning from a extended page (3 or 4) doesn't always work and the Hepax can go NON-EXISTANT from the directory structure.

Giving credit where it is due: I got the idea from the thread below discussing using the HEPAX in the MLDL2000. Especially Diago's comment that loading the HEPAX to an odd page will suppress it attempting to relocate itself. It also stops the initialization ofHepax RAM which is why we needed to initialize the ram files in v41 first. Again, remember that irrigardless of where the Hepax ROM is located it ALWAYS expects its RAM to start at page 8000hex and be continuous: i.e. an 8K RAM is located at pages 8 & 9 and a 16K RAM is located at pages 8,9,A and B. Help Squeezing some HP67/97 code

*Message #1 Posted by **Howard Owen** on 22 Nov 2005, 12:20 p.m.*

I'm trying to shoehorn YATZ into the HP67/97 I'm doing fine with labels, but I'm running out of program lines. The exercise has convinced me that I can finish the port to the 33S, however, so I've shelved the 97 version for now and am working on the 33S. I'm looking for opportunities to shrink the code size while I do that, however. Below is an algorithm I developed for extracting the nth digit (counting left to right) in a number. It is rather lengthy. Can anyone see a way to shrink it? Is there another approach to this problem anyone is aware of that might be shorter?

```
L0001    *LBL L   ! Extract the Yth digit (counting left to right) from the number in X
L0002    ENTER    ! Copy the number
L0003    LOG      ! Desired order is the opposite of the exponent view of the number
L0004    IP       ! So calculate a complement we can subtract from the input digit position
L0005    2        ! to yield the power of ten digit position plus one. This will scale the
L0006    +        ! number so the desired digit will be in the -1 power of ten position
L0007    x<>y     ! Fiddle the stack for the next calculation

Re: Help Squeezing some HP67/97 code

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 22 Nov 2005, 1:57 p.m.,*
in response to message #1 by Howard Owen

Hi, Howard;

Please, would you try this one?

```
*LBL L   !
ENTER    !
LOG      !
IP       !
2        !
+        !
R^ (rollup)
-        !
10^x     !
/        !
FP       !
10       !
*        !
IP       !
RTN
```

I test it already, and I based my code on previous stack data (if I am not wrong, the program starts with the digit to extract in Y and the number in X). After

```
IP
2
```

you have:

```
         L   X   Y   Z   T
+        v   i   a   n   n
x<>y     v   a   i   n   n
RDN      v   i   n   n   a
x<>y     v   n   i   n   a
-        n   I   n   a   a
x<>y     n   n   I   a   a
RDN      n   I   a   a   n
10^x     I   V   a   a   n
```

With the new code you have:

```
            L   X   Y   Z   T
+       !   v   i   a   n   n
R^ (rollup) v   n   i   a   n
-       !   v   I   a   n   n
10^x    !   I   V   a   n   n
```

where: a - your nunmber
n - digit to extract
I - intermediate index
V - digit position

If you want to preserve a copy of the original number (a), you can use this version (same length):

```
*LBL L  !
ENTER   !
LOG     !
IP      !
2       !
R^ (rollup)
-       !
+       !
10^x    !
/       !
FP      !
10      !
*       !
IP      !
RTN
```

Hope this helps.

Luiz (Brazil)

Re: Help Squeezing some HP67/97 code

*Message #3 Posted by **Howard Owen** on 22 Nov 2005, 4:56 p.m.,*
in response to message #2 by Vieira, L. C. (Brazil)

Very cool, Luiz!

I figured there were better ways to do the stack manipulations, and this fits the bill perfectly. I have quite a ways to go to get it all to fit into 224 steps on the 97, but if I can milk more code for a line here and there, I might just make it. First I'm going to finish with the 33S version, to get a concrete target to shoot at.

Thanks!

Regards,
Howard

Hi, Howard;

I know what you mean, believe me. I'm actually having some good experiences with sqweezing some original TI59 programs to the HP67/97. I had to virtually 'crack the code' in some pieces, but one of the main achievements of mine was a couple of months ago, when I could generate an equivalent HP97 code with 3 parts (three mag cards) from an original TI59 also three-parts program. The fact is that the three HP97 parts together are a bit bigger than one of the three original TI59 parts. And it works perfectly fine...

Success!

Luiz (Brazil)

*Message #5 Posted by **Valentin Albillo** on 23 Nov 2005, 7:09 a.m.,*
in response to message #1 by Howard Owen

Hi, Howard:

If you ever decide to port your YATZ program to the HP-71B, this does the trick:

```
VAL(STR$(N)[P,P])
```

where N is your number and P is the desired digit's position. So, for instance, if N is 3141592654 you would have:

```
VAL(STR$(N)[1,1]) -> 3,  the digit at the 1st position
VAL(STR$(N)[3,3]) -> 4,  the digit at the 3rd position
```

and so on. Also, should you decide to port your game to the HP-15C, these steps will do:

```
STO RAN#
X<>Y
10^X
RCL RAN#
 *
FRAC
10
 *
INT
```

assuming the digit positions are counted this way, for example for 3141592654:

```
digit position   0  1  2  3  4  5  6  7  8  9
orig. number     3  1  4  1  5  9  2  6  5  4
```

so, with the desired position in Y and the orig. number in X, executing the above steps would do the following (say you want the digit at position 6):

```
T:  T                    T:  Z
Z:  Z          ------>   Z:  Z
Y:  6                    Y: 3141592654
```

```
X: 3141592654          X:  2
```

so your original number is preserved intact in Y, the desired digit is of course in X, plus the original contents of Z are preserved as well.

If you want to count digit positions starting at 1 instead of 0, simply subtract 1 from Y after the X<>Y. The routine is quite fast as it uses no LOG instructions, just a single, integer-argument 10^X, and would be even shorter if the HP-15C had either the SIGN or the MOD (or RMD, remainder) functions built-in, which, alas, it doesn't ... nobody's perfect.

BTW, I have no HP-15C at hand right now, but believe the above steps are correct.

Best regards from V.

*Message #8 Posted by **Howard Owen** on 23 Nov 2005, 12:15 p.m.,*
in response to message #6 by Etienne Victoria

Yes, the 71B version was the first one I did. But it doesn't use the same approach to encoding the dice as digits in a five digit number. Since the BASIC has arrays, I just used those. The "grand tour" is a project to implement the Yahtzee dice game on all of the programmable platforms in my collection, or on as many as I can. Each version will try to take advantage of the features, and work within the constraints of the particular platform. The point of the exercise is to familarize (or refamilarize) myself with programming on each of the platforms in question. I also intend to write about each implementation, giving my personal history with the particular machine, as well as any unique challenges or features that interest me. So far I've done the 71B and the 9816, both in BASIC.

The encoding scheme used here comes from the original program, which is not my software. It's a 41C

program that I thought was either here or on TOS, but I can't locate it either place at the moment. I haven't studied the source, but I've played the game quite a bit. It shows the dice as a string of five digits, sorted in ascending order left-to-right. The user enters another number consisting of digit positions in the first string. This works pretty much as in Valentin's diagram, except the first (leftmost) digit is digit "1".

It bothers me that I can't locate the original HP41 program now. I have the program itself, so that's not a concern. But I really do need to attribute the original program as well as I can to the original source.

```
STO RAN#
X<>Y
10^X
RCL RAN#
 *
FRAC
10
 *
INT
```

Devilishly clever! I suppose I shouldn't have expected less from you. 8)

From the HP-15C manual, page 48:

> Quote:
>
> STO f RAN# will store the X-register number (0<=r<1) as a new seed for the random number generator. *(A value for r outside this range will be converted to fit within the range.)*

Italics are mine.

The manual doesn't say how the number is "converted" but testing shows it takes place in the most straightforward way: the number is scaled down to be less than 1 by dividing it appropriately by powers of ten. Thus we have a microcoded operator that replaces the logarithm and division, and some stack manipulaton. Presumably this is much faster, though I haven't timed it.

Since the game needs a "one-base" specifier, the above code needs to add a "1 -" before the "10^X" but that hardly detracts from the suprise nature of the solution!

Thanks, Valentin! I hadn't considered the 15C a suitable platform for this exercise, but with more tricks like that, I may well give it a try!

Regards,
Howard

"Thus we have a microcoded operator that replaces the logarithm and division, and some stack manipulaton. Presumably this is much faster, though I haven't timed it."

> It is, indeed. Virtually instantaneous apart from the time it takes to decode and execute the program step itself (i.e.: it takes almost the same time as a true NOP). I guess that, internally, it just strips the number off from everything but the mantissa proper, thus getting rid of the exponent without divisions or other time-consuming operations.

" Thanks, Valentin! I hadn't considered the 15C a suitable platform for this exercise, but with more tricks like that, I may well give it a try!"

> You should. The HP-15C has many times over the programming capabilities of an HP-67/97, and, apart from the 41C and its synthetic programming, it's HP's most trick-ridden calc ! If in doubt, search the archives for my "HP-15 mini-challenges", to see how its many advanced functions can be cleverly used to optimize programs and routines to astonishing degrees. A YATZ program for it could be made into a work of art, no less.

By the way, I think I own a copy of the original YATZ program from HP User's Library. I'll try and locate it and will tell you the original author, if you still want to know.

Best regards from V.

Well, 338 bytes of memory, assuming most instructions are one byte, together with the ability to have duplicate forward-branch labels, ought to allow me to implement the game of the 15C. Whether it will be a "work of art" remains to be seen. 8)

> Quote:
>
> By the way, I think I own a copy of the original YATZ program from HP User's Library. I'll try and locate it and will tell you the original author, if you still want to know

That rings a bell. But I don't find the game in my collection of User Library programs. There is no 41C program in the swap disks beginning with "Y," other than one named "Y," which isn't the one. So I must have picked it up online somewhere. But I don't see it here or on TOS.

Please do let me know the original author's name and the User Library number, if you get a chance, Valentin. Thanks!

Regards,
Howard

Re: Help Squeezing some HP67/97 code

*Message #12 Posted by **Eamonn** on 23 Nov 2005, 12:13 p.m.,*
in response to message #1 by Howard Owen

Hi Howard,

You would need to see how this suggestion would affect the rest of your program, but if it is possible to change the way you store numbers so that you can end up having to extract the n'th digit counting right to left, instead of from left to right, then you could use the following:

```
L0001 LBL L
L0002 x<>y
L0003 10^x
L0004 /
L0005 FP
L0006 10
L0007 *
L0008 IP
L0009 RTN
```

As an example, if Y contains 3 and X contains 1234567, then this routine will return 5.

Additionally, if it is possible to have the digit to be extracted in the X register and the original number in the Y register, then the x<>y on line 2 can be removed, saving another step in this function. Again, you would have to evaluate how this may or may not impact the rest of your program.

Best Regards,

Eamonn.

Re: Help Squeezing some HP67/97 code

*Message #13 Posted by **Marcus von Cube, Germany** on 25 Nov 2005, 7:53 a.m.,*
in response to message #12 by Eamonn

I understand that the original number has always 5 digits. If that's true, it's a waste to create a routine that can cope with aribtrarily long numbers. If you can't count from right (because it's the user that enters the digit positions and you do not want to change the user interface), just subtract the digit postion from 6.

```
L0001 LBL L
L0002 x<>y
L0003 6
L0004 -
L0005 10^x
L0006 *
L0007 FP
L0008 10
L0009 *
L0010 IP
L0011 RTN
```

Because of the sign change, the step L0006 (was L0004) now is * instead of /.

Marcus

Re: Help Squeezing some HP67/97 code

*Message #14 Posted by **Howard Owen** on 25 Nov 2005, 5:08 p.m.,*
in response to message #13 by Marcus von Cube, Germany

Unfortunately, I need the generality because the user inputs a string of digits representing the "dice" to throw away in the five digit number. For example, if I had "22345" and I wanted to try for the twos, I would enter "354" (or any permutation) to throw away the "345" in the five digit string. If I wanted to try to turn the small straight into a large straight, I would enter "1" or "2" to throw away one of the twos. So the input number can be from 0 to 5 digits (0 is a special case meaning "score now") and it can have the "throwaway" digit positions in any order.

Re: Help Squeezing some HP67/97 code

*Message #15 Posted by **Marcus von Cube, Germany** on 26 Nov 2005, 2:02 a.m.,*
in response to message #14 by Howard Owen

Howard,

in this case, you can simply parse the string from the right. You'll get one digit after the other until the number is zero.

Marcus

Re: Help Squeezing some HP67/97 code

*Message #16 Posted by **Howard Owen** on 26 Nov 2005, 3:06 a.m.,*
in response to message #15 by Marcus von Cube, Germany

Ah, but I want to avoid using a label, too, if I can. Especially on the 33S, where all labels are global. On the 97, I can branch forward to a label that can be repeated elsewhere. But a loop that will process any number of digits, up to five, requires a backward branch. On the 33S, I could unroll the loop, trading labels for lines. I'd have to set a flag and return on that to avoid a forward branch there. But trading lines for labels is not an option on the 97. There I'm already running into the line limit.

So what I need is code that uses few lines and no labels. So far, Luiz has the best code that fits the bill on the 33S, and also the 97. Valentin's trick of using the random seed initialization on the 15C is the overall winner, but it only works on the 15C.

in response to message #6 by Howard Owen

Ah, actually if I never used a 32SII (or 34C for that matter) I think I would actually get fairly attached to using the 33S. Aside from that rather funky keyboard, it IS RPN after all and has all the functionality that a proper scientific calculator should have, including decent programming space.

HP 33s vs HP 32sii

*Message #8 Posted by **Samuel Heddle** on 22 Nov 2005, 6:08 p.m.,*
in response to message #7 by Ed Look

Is there any particular reason for the sky-high 32SII prices on ebay, versus models like the 41-C, and 28-S?

Re: HP 33s vs HP 32sii

*Message #9 Posted by **Howard Owen** on 22 Nov 2005, 6:27 p.m.,*
in response to message #8 by Samuel Heddle

Short term run up by unscrupulous traders?

I bought mine last month for $140.00. It wasn't new, but in excellent shape. There seems to be a cadre of sellers asking the $300+ price. Search completed auctions for a more realistic idea of eBay values.

run-up

*Message #10 Posted by **bill platt** on 23 Nov 2005, 10:03 a.m.,*
in response to message #8 by Samuel Heddle

Simple. Some people really like that machine and are willing to pay for it.

There is nothing unscrupulous about asking for a lot of money. The buyer is free to look elsewhere.

That people pay that much is simply a reflection of what some feel it is worth to *them*.

(Enough with the "unscrupulous" crap. :)

Re: HP 33s vs HP 32sii

*Message #11 Posted by **Howard Owen** on 22 Nov 2005, 6:22 p.m.,*
in response to message #7 by Ed Look

There is a limitation of 26 labels, all global, that can be onerous. If you want more than one

substantial program to reside in the calculator, you have to worry about that resoource long before the memory. It all stems from the fact that the 33S is nearly identical to the 32SII in most important respects. The memory is increased, but can't be used effectively. The keyboard is bizarre, but only in the shapes of the keys, and the downgrading of the enter key. But it adds an improvement in the large buttons at the top for menus and cursor control. The two-line display is better in all respects now that they have fixed the tiny decimal point. The calculator is faster, no doubt. The manual is increased in size, but is mostly a copy of the original.

Bottom line: this is not a new RPN machine. It is a (slight) evolution from the 32SII. Calling it the 33S was misleading in my opinion. It's more of a 32SII+.

But I have got to admit I like this machine quite a bit. It does indeed have all the functions a daily-use scientific calculator needs. The fact that it is sorely lacking in the programming department (my HP97 code ports with only minor changes!) can be looked on as a challenge. Since I'm using it for fun only, I find this acceptable. *But I still want my brand new RPN machine!* And I want it on the high-end, too, with modern I/O and everything. Christmas is coming. Will I be disappointed? Well, yes. But I've learned to live with disappointment from HP.

Regards,
Howard

Re: HP 33s vs HP 32sii

*Message #12 Posted by **ECL** on 22 Nov 2005, 10:19 p.m.,*
in response to message #11 by Howard Owen

I agree, the 33s has some flaws, but if one requires RPN, and is not willing to take a chance on high-priced (and often second-hand) 32sii & 42s machines...then the 33s is attractive.

Last week during a numerical methods exam, I was able to leave nearly 20 min early due to some basic matrix row-manipulation routines I had in my 33s. Its these small things that make it shine, to me.

Here's a thought- I am among a small handfull of RPN users at my university. All else use either a Ti-XX or Casio model. Perhaps this reflects on the declining difficulty in obtaining an engineering degree. Most people are closed-minded and the classic line "I don't like those, they're backward" prevails.

Some fundamental flaws in the Ti-89 Plat/Titanium as I see it:

These apply regardless of RPN entry, and assume practical/daily engineering student needs.

```
1. ALL trig (reg and inverse) are shifted.
2. There are two or three keys that have a variable (ie. X, Y, Z) as the
primary function. One should suffice. Why not make one key LS=X, Primary=Y,
RS=Z ??
3. Text contrast on KBD is sub-HP49g (Big-Blue) in terms of eye-strain.
```

Well, just some thoughts. ECL

Re: HP 33s vs HP 32sii

*Message #13 Posted by **Howard Owen** on 22 Nov 2005, 10:53 p.m.,*
in response to message #12 by ECL

I guess it's a little bit heartening to hear the competition has vulnerabilities that don't relate to something (i.e. lack of RPN) that most of the world sees as a strength. I only find it a

"little bit" heartening, because I'm pretty sure HP won't try to exploit those weaknesses.

But I agree that the 33S is a pleasant machine in many ways. Ergonomic design, in terms of how the machines were used by the technical customers, used to be one hallmark of HP quality. Oddly enough, I find the 33S to have the same kind of usability some of my favorite old machines do. I can *find* things quickly on that weird looking keyboard. If this is due more to the layout of the 32SII, which the 33S did change a bit, then at least the changes haven't screwed things up too badly. And in at least one respect, the large menu and motion keys at the top, the 33S layout is an improvement on the 32SII. I've written elsewhere that the chevron design and the enter key relocation and shrinking became non-issues quicker than I might have guessed, although the latter change took more time to get used to than the former.

But I'm still interested in what a newly minted RPN machine would look like. Thinking about this appeals to me on several levels. First, it's a fun intellectual exercise to see what people in this community think is good about RPN, and what could be improved. It helps me examine and modify my own thinking on the subject. I'm particularly delighted to have engaged an RPL head or two in the discussion. Cross-pollination of ideas always yields interesting hybrids, and sometimes even unique insights. Second, the ideas developed could help me develop calculator software, which I intend to do at some point, after I make the "YATZ grand tour" through my collection. And finally, and most speculatively, maybe HP *is* reading this forum, and maybe one or two of the ideas kicked around here will make it into a real machine someday. That last is unlikely, but the first two points also makes the possibility unnecessary for me to count the activity as worthwhile.

HP 33s vs HP 32sii

> Well, just some thoughts. ECL

Believe it or not, I've been using the X Y and Z buttons more than the trig functions. I'm still looking into a 49G+, though. What I don't like about the Ti89Ti is the difficulty of getting to some functions of the "math" menu, and having only 5 F buttons, when in the main screen, there are 6 tabs. Also, the keyboard is really starting to stick.

Re: Drawbacks of TI-89

*Message #15 Posted by **Marcus von Cube, Germany** on 25 Nov 2005, 6:41 a.m.,*
in response to message #12 by ECL

Hi ECL,

> Quote:

1. ALL trig (reg and inverse) are shifted.

2. There are two or three keys that have a variable (ie. X, Y, Z) as the primary function. One should suffice. Why not make one key LS=X, Primary=Y, RS=Z ??

3. Text contrast on KBD is sub-HP49g (Big-Blue) in terms of eye-strain.

The Voyage 200 fixes most these issues. The only drawback are the relativly small keys. (Keep your fingernails short!) I really like the keybord of my TI-92 Plus.

Re: HP 33s vs HP 32sii

*Message #16 Posted by **Ron Ross** on 23 Nov 2005, 9:58 a.m.,*
in response to message #1 by Larry McClellan

While all that extra RAM is a somewhat dubious improvement and its styling is autrocious to the typical customer, it is less cost than the Hp32s as well. I never saw an Hp32s sell retail for less than $70 (69.95 +tax). And it is also an AOS algebraic (which is probably a marketing mistake, but I personally, like AOS better than EOS). But I am an older calc user who migrated to Hp when AOS was the Algebraic OS of the day. My High Schooler only likes EOS (as of yet).

So it is a big marketing improvement in that area. It provides a market for both the Hp32s and Hp20s for future replacements. There are older calculator users that will certainly detest EOS (I have heard several complaints, and I don't blame them). And it has a fairly decent feeling keyboard. I do wish they would dump the chevron style, but production wouldn't want to expend the $$$$ now and marketing probably cannot afford to admit it wasn't a brilliant idea.

prices

*Message #17 Posted by **bill platt** on 23 Nov 2005, 10:05 a.m.,*
in response to message #16 by Ron Ross

I bought 32sii calculators on three separat eoccasions from a store near Rittenhouse Square in Philadelphia, back in the 90's, for $58 retail.

Re: prices

*Message #18 Posted by **Ed Look** on 23 Nov 2005, 10:24 a.m.,*
in response to message #17 by bill platt

But I'm sure that by the time the 33S reaches the length of a sales run your $58 32SIIs did, it might be cheaper than the 32SII, since the 33S began retailing around at least $10 USD less than the 32SII, if I recall when it was first sold. And note I haven't adjusted for inflation or buying power, etc., so the 33S is effectively cheaper for a calculator that is somewhat more powerful than a 32SII.

From this standpoint, it's not a bad deal at all for such a nice calculator.

heads up to Australia

*Message #1 Posted by **db (martinez, ca.)** on 21 Nov 2005, 5:49 p.m.*

There is a rare non hp rpn programmable on ebay that is located in Oz. It's not mine. Mine is prettier and not for sale. I just thought that someone might want it and no one has found it. Shipping makes it not worthwhile for the rest of us. http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5831974835&ssPageName=ADME:B:SS:US:1

*Message #2 Posted by **Hal** on 21 Nov 2005, 8:22 p.m.,*
in response to message #1 by db (martinez, ca.)

Interesting. I used to have a National Semiconductor RPN calculator, but I've never heard of a Qualitron. Looks pretty rough cosmetically, and I couldn't see an Enter Exponent key...could this be so...a scientific that won't handle really big or really little numbers?

Re: heads up to Australia

*Message #3 Posted by **db (martinez, ca.)** on 21 Nov 2005, 10:09 p.m.,*
in response to message #2 by Hal

It's so. It uses the nat semi / novus mathematician rom that might have been in yours but a slightly clicky keyboard and a typical curvacious qualitron body. Victor toth wrote the definitive description at http://www.rskey.org/detail.asp?manufacturer=Qualitron&model=1421+Programmable+Scientific

Even concidering it's rought shape and limited usefullness i still think that some Ausie ought to rescue it since the shipping would be cheap. Whoever wants it ought to call dibs though. This unit isn't worth winning a feeding frenzy to get.

*Message #4 Posted by **Hal** on 21 Nov 2005, 11:43 p.m.,*
in response to message #3 by db (martinez, ca.)

As I recall my old Novus did have exponential capability but was not programable.
Maybe I'll make a bid on this thing...for old time's sake.....

Re: heads up to Australia

*Message #5 Posted by **Namir** on 22 Nov 2005, 1:55 a.m.,*
in response to message #4 by Hal

I remember buying one in France in 1978. I could not resist the fact that it was a non-HP RPN calculator. Unfortunately it was a half-designed RPN calculator: 3-register stack, 1-mem register, poor accuracy. I had seen non-HP clones of the HP-45 made by several manufacturers, but the

Novus was not one of them.

I bought a few on eBay recently, just to remind myself of the toy-like state of the calculators.

I guess we have a weakness for RPN.

Re: heads up to Australia

*Message #6 Posted by **Hal** on 22 Nov 2005, 12:28 p.m.,*
in response to message #5 by Namir

I bought the Novus in '76 from the college bookstore...to a young freshman (me) it looked like it had lots of buttons and did lots of stuff, and was cheap as well (I think about $39). It's shortcomings soon became obvious, however...lack of memory, poor accuracy, rubber buttons, and worst of all, to use the trig functions, all angles had to be transposed to positive 180 degrees or less!
A few months later, a classmate handed me his HP25 to try out, and suggested I get a real calculator. The Novus was forever relagated to toy status thereafter.
I'll probably pick one up (a Novus) on e-bay just for old times sake...
Hal

Re: Modified HP71B

*Message #3 Posted by **Eric Smith** on 21 Nov 2005, 6:02 p.m.,*
in response to message #1 by Rick Meyerson

Those are aftermarket modfications. There were several people and companies offering such mods commercially, and some 71B owners did the mods themselves.

The speedup is just the typical capacitor value change.

The memory upgrade consists of breaking open memory modules (either HP 4KB modules or CMT 32KB or 64KB modules), and wiring the circut boards into the internal chain.

Re: Modified HP71B

*Message #4 Posted by **Howard Owen** on 21 Nov 2005, 7:12 p.m.,*
in response to message #1 by Rick Meyerson

So what does "full" memory mean? The Saturn could directly address 512 KB, I believe, at least in the HP48

vintage.

Re: Modified HP71B

*Message #5 Posted by **J-F Garnier** on 24 Nov 2005, 7:42 a.m.,*
in response to message #4 by Howard Owen

The maximum theorical RAM is 384k (not including the 1.5k RAM in display ICs), starting from 30000h to EFFFFh. The area F0000-FFFFF is reserved.

Due to the built-in 16k, the maximum practical value is "only" 372k. It could be achieved with a HHP 160k module in card reader, plus 3 CMT 64k front port modules, plus one HP 4k module, without HP-IL. With HP-IL and without the 4k module, we could get 368k.

I never reached this amount of memory on my regular HP-71B, but easily got 320k in Emu71.

Rick, What is your configuration?

J-F

Standard Function Names - Anyone?

*Message #1 Posted by **Mike T.** on 21 Nov 2005, 7:09 a.m.*

Is there a standard (or failing that a generally accepted) way of naming the various RPN functions using just alphanumeric characters?

For many of the functions this seems straight forward enough (though I many have abbreviated things too much in places..?)

```
sin      -> SIN
sin-1    -> ARCSIN
x<>y     -> SWAP   (I'm assuming that SWAP is the same as X<>Y)
+        -> ADD
-        -> SUB
/        -> DIV
etc
```

However, there is rather more scope for interpretation when you try to express some other functions without using 'special' characters - particularly when things get ambiguous...

```
->R      -> ???    (Convert to radians)
RAD      -> ???    (Select radian mode)
->R      -> ???    (Convert polar to rectangular co-ordinates)
R^       -> ???    (Round up)
R        -> ???    (Round down)
r        -> ???    (Correlation coefficient)
->H.MS   -> HMS    (?)
X<=Y     -> ???
Q        -> Q      (A bit to short?)
Q-1      -> INVQ   (?)
(i)      -> ???
I        -> ???
X2       -> SQR    (?)
/X       -> SQRT   (?)
10x      -> INVLOG (?)
etc etc etc
```

Fullnut 41CX problems

*Message #1 Posted by **Klaus** on 21 Nov 2005, 6:52 a.m.*

Hi!

I am trying to repair a Fullnut 41CX for Peter. Apparently, it had contact problems, but Peter said the batteries went hot after switching it on. This 41CX has a logic board similar to the 41Cs, and when I opend the Calculator, this logic board was out of its usual position. This may explain why the Batteries went hot, as it may have sorted some connections.

After cleaning the contacts and fixing the logic board in its normal position, I switched the calc on, but the display just showed "@@@@@@@@@@@@", and the beeper hummed.

I traced some signals with an oscilloscope, an found that the DATA,phi1 and phi2-signals were present though with an amplitude of about 1.7 V. The signals on pin 12 (LCD) was pure noise, so were Pins 6,7 and 8 (LCDC1,LCDC2,LCDC3). Pin 2 (ISA) showed some signals, but also carried a lot of noise.

Did anyone have similar problems or does someone know a cause/solution?

Thank you! Klaus

Need to fix your HP48 LCD or keys?

*Message #1 Posted by **Han** on 21 Nov 2005, 4:52 a.m.*

Every now and then I would read about (or see on Ebay) how someone's HP48 lost some columns/rows of pixels, or the ON key dieing out. I happened to receive such a calculator (HP48SX). This thing had ALL BUT THREE rows of pixels missing! About half of the keys didn't work! I fixed them both! Now I have another HP48SX with a fully working keybaord and all pixels returned to working order.

It seems that most of the keyboard problems, and missing pixel problems can be attributed to a combination of dust and/or being jostled around. The only electronic connection between the top part of the HP48 (LCD and keys) and the PCB are three rows of connectors. Two are for the LCD, and one for the keyboard. The PCB is held onto the top portion by 6 twist-prongs. They are also resonsible for connecting the top part of the HP48 to the PCB. If these are loose there is dust, you get columns of missing pixels and possibly dead keys.

Just a bit of dusting off and adding a little bit of extra solder to the connectors to adjust for any possible gaps that may have formed over the years and your HP48 is back to being functional!

Edited: 21 Nov 2005, 4:53 a.m.

Re: Need to fix your HP48 LCD or keys?

in response to message #1 by Han

I'll write up a guide on how to repair your HP48 if there are enough interested readers. I managed to take some photos, too.

Re: Need to fix your HP48 LCD or keys?

*Message #3 Posted by **valentino ducati (switzerland)** on 21 Nov 2005, 8:50 a.m.,*
in response to message #2 by Han

Han:

That would be really nice! I also have a "spare" 48 with little problems. Maybe with your guide I would risk a repair and have one more fully functional 48.

Thank you in advance.

Valentino

Re: Need to fix your HP48 LCD or keys?

*Message #4 Posted by **Han** on 21 Nov 2005, 4:54 p.m.,*
in response to message #3 by valentino ducati (switzerland)

Here's the link:

Please read through everything first, and examine the photos I've included. The photos are of an HP48G, even though I repaird my HP48SX. However, you'll find that almost everything is the same. I just stupidly forgot to take photos of my HP48SX while I was tinkering with it. Sometimes I get too caught up in the fun of tinkering, and forget that what I'm doing might be useful enough to make note of.

HP48 Repair

There is a maintenance scheduled later this evening so if you can't download it, try later.

Re: Need to fix your HP48 LCD or keys?

*Message #5 Posted by **Han** on 21 Nov 2005, 5:22 p.m.,*
in response to message #4 by Han

I forgot to mention one more thing:

I believe that another cause of these dead keys it the overuse of the card slots. Every time you use a card slot, and press a ROM or RAM card into the connector, you are also pushing the PCB about. I would wager that you see more LCD and dead key problems in the X series than in the non-expandable series.

Han

MLDL2059 (again): completely built!

*Message #1 Posted by **Vieira, Luiz (Brazil)** on 20 Nov 2005, 10:33 p.m.*

Hi, all;

Forgive me bringing back the same subject, but at least, this is the last time I'm posting about my own MLDL2059 assembling procedures (59 is the serial#) .

I actually built the last connector and finished assembling it. Now it is safer to operate and download. Thanks to the additional USB 'holder', I can insert and remove the USB connector without worrying about the possibility of having it loose inside the card reader holder. I am particularly worried about this because I did not use Meindert's suggested USB-B connector (could not find one), so I found myself in the need to hold it in place accordingly.

The new pictures are available at the same old www.logeng.com.br/images/mldl_pics again, and the new ones are easily found (mldl2059_connector_xx.jpg). Hope you like them.

To give you a glimpse, the final image: http://www.logeng.com.br/images/mldl_pics/MLDL2059_FINAL_S.JPG Click to enlargeYeap, Hepax 1D!

The MLDL2059 is working perfectly fine, and I personally consider that the product itself by far exceeds Meindert ´s proposal. Once FLASH/SRAM programming and editing are understood and internal mapping with SR configuration is mastered (just a matter of RTFM), all is heaven!

It is worth the $$$... and also the extra labor to settle the boards accordingly. At least for now, I'll miss all of the fun preparing the case for this unit. Yeap, I said 'at least for now'...

Best regards.

Luiz (Brazil)

Re: MLDL2059 (again): completely built!

*Message #2 Posted by **Marcus von Cube, Germany** on 21 Nov 2005, 2:35 a.m.,*
in response to message #1 by Vieira, Luiz (Brazil)

Luiz,

> Quote:
>
> Yeap, Hepax 1D!

From the docs, Hepax wil *not* work because the bankswitching is special and not (yet) implemented in the MLDL firmware.

Did you try it?

Re: MLDL2059 (again): completely built!

*Message #3 Posted by **Vieira, L. C. (Brazil)** on 21 Nov 2005, 5:07 a.m.,*
in response to message #2 by Marcus von Cube, Germany

Hi, Marcus;

I tried to find bank swithching related documentation, but it seems that each hardware handles the swithching its own way. I tested a set of four HEPAX files, version 1D, named HEPAXH1.ROM to HEPAXH4.ROM in some different configurations, and in some of them I got nothing but garbage from CAT 2. In two of them I read all HEPAX 1D functions and I could program some of them. As I do not know how to use them yet, and some of them refer to HEPAX RAM, I thought it would not be a good idea to test them in run mode. I would like to know which of these files represent lower and upper port, and which sequence should I try. I also would like to know how to rediredt MLDL SRAM pages so the HEPAX functions could "see" them. If bank switching is used in HEPAX RAM pages as well, if it works in MLDL2000 the same and the correct mapping is found, I guess we can expect to use at least 4 MLDL SRAM pages, meaning 16K RAM space for each possible SR setting where HEPAX is configured.

In order to try the configurations I had in mind, I took as a reference the fact that ADVANTAGE ROM images work in MLDL2000 (and I tested it already) when a specific combination of ROM images is used in the four banks in ports 8 and 9:

```
Bank#    Port8    Port9
  0     ADV L1   ADV U1
  1     ADV L1   ADV U2
  2     ADV L1   ADV U2
  3     ADV L1   ADV L2
```

I tried some configurations, and the one that shows all HEPAX functions is:

```
Bank#    Port8    Port9
  0     HEPAXH2  HEPAXH1
  1     HEPAXH2  HEPAXH3
  2     HEPAXH4  HEPAXH3
  3     HEPAXH4  HEPAXH3
```

Maybe this configuration allows only the headers to be seen, because at least their XROM codes are correctly recorded. I'll read the HEPAX manuals and try some functions.

Thak you for your warnings!

Best regards.

Luiz (Brazil)

Edited: 21 Nov 2005, 5:11 a.m.

Re: MLDL2059 (again): completely built!

*Message #4 Posted by **Meindert Kuipers** on 21 Nov 2005, 5:42 a.m.,*
in response to message #3 by Vieira, L. C. (Brazil)

HEPAX should really not be working on the MLDL2000, the special instructions are not implemented at all, certainly HEPAX RAM cannot be supported. I have experimented with HEPAX on an older version of V41, and the virtual HP41 would not start at all. The configuration also seems to be incorrect, but I have not even tested HEPAX myself yet. I am surprised that it shows up in the CAT 2 listing at all.

For the Advantage ROM: I guess Port 9 Bank 3 is a typing error?

However, if HEPAX does work then it would be great, but certainly not by design!

Meindert

Re: MLDL2059 (again): completely built!

*Message #5 Posted by **Vieira, L. C. (Brazil)** on 21 Nov 2005, 7:27 a.m.,*
in response to message #4 by Meindert Kuipers

Hi, Meindert;

you´re correct, I wrongly typed the ADVANTAGE table, sorry! It was supposed to be ADV U2 instead of ADV L2 (no such ADV L2 image...). In time: CCD's CAT' 2 and HP41CX CAT 2 show an interesting user label between '-ADV MTRX' and '-ADV MATH' in the emulated ADVANTAGE ROM ('MATRIX', perhaps, I am not sure). Should it be because of the MLDL2000 particular bank-switching scheme?

About HEPAX configuration, I have no idea if the mapping I use is valid, mainly because I do not know if any of the rom images is low- or up-addressed, their names do not suggest it. I started with some configurations that did not work at all. The one I listed in the previous post produced a valid CAT 2 and program instructions, but I did not go any further, meaning I did not test any of the functions as I do not know how do they work. And as some of them remind the HP original X-Functions/Memory module, they are supposed to access specific RAM memory, and I neither have any idea of how can it be done through the MLDL2000 structure.

In the MLDL2000 User Manual, you actually mention that bank switching is not fully implemented, but based on the ADVANTAGE unique mapping, I supposed it was worth trying to make HEPAX to work as well. Maybe I can think of something later, when deving into MCODE...|B^>

Thanks and best regards.

Luiz (Brazil)

Re: MLDL2059 (again): completely built!

*Message #6 Posted by **Raymond Del Tondo** on 21 Nov 2005, 8:05 a.m.,*
in response to message #4 by Meindert Kuipers

Hi Meindert,

although the HEPAX uses a special sequence to let
the actual HEPAX hardware know how and where to switch to,
AFAIK it also uses the standard mechanics (ENBANKn at the usual locations),
so if the MLDL2K supports these (like in the ADV pac),
then it should work.
The main difference to most other bankswitched modules is
that HEPAX uses all four banks, and BS slots are from xFC3 to xFC9.

Regards

Raymond

Re: MLDL2059 (again): completely built!

*Message #7 Posted by **Meindert Kuipers** on 21 Nov 2005, 8:42 a.m.,*
in response to message #6 by Raymond Del Tondo

Raymond,

You are totally correct, the normal bankswitching should work without problems, except that I am not certain if HEPAX switches only in one page, and not in both (odd and even) pages. The big problem is that when HEPAX starts it tries to relocate itself to another page, and identifies its own RAM pages by using the special Write Protect instruction. This is not yet implemented with the MLDL2000, and will probably cause the HEPAX startup sequence to fail. Both instructions that are special to HEPAX will actually be quite difficult to implement, since it requires modification of the Settings Registers by the MLDL2000 itself. If these are in FLASH it is certainly not possible, only if they are in SRAM. I have some ideas about this, and actually the easiest will be to modify HEPAX itself, so it will start with a fixed configuration, and will not try to relocate itself.

Meindert

Re: MLDL2059 (again): completely built!

*Message #8 Posted by **Diego Diaz** on 21 Nov 2005, 4:54 p.m.,*
in response to message #7 by Meindert Kuipers

Hi all,

First my congrats to Luiz for his neat MLDL2K housing job: Great work Luiz!! :-))

Now, regarding the HEPAX issue, here is what I've been able to learn (based just on experimenting during NoVRAM development, as I'm not one of thoses fortunated *real* HEPAX owners... :-(

Hope this can help others:

- HEPAX certainly uses same *standard* BS scheme than Advantage does. Just extended to four banks as Raymond pointed out.

- HEPAX procedure on Power-ON is as follows:

1st - Allocates itself in the lower page of the port it is plugged in. In doing so, it also temporarily disables its own first RAM page (usually on page #8 assuming HEPAX is plugged in port 1)

2nd - Searches for non used pages starting from page #5 upwards (#6 if it's in a CX). If no page is available it will show [ILL CONFIG] on the display.

3rd - Once a suitable page has been found it relocates itself into such page by means of "ROM BLK" (H'030) instruction and recovers first RAM page (for instance, on page #8)

4th - After relocation is finished it begins idle RAM pages identification by a sequence of READ/WRITE commands.

5th - Once idle RAM pages are identified HEPAX writes its proprietary "FILE SYSTEM" chain in them. (Remember you can have ROM images recorded into RAM pages, these won't be altered by this process)

6th - Last it turns back control to the HP-41 mainframe OS.

From what's stated above, some conclusions can be drawn:

- HEPAX will not perform relocation (nor RAM FILE SYSTEM building) if it's forced to load into an odd page (say #7)

- You can build up the HEPAX FILE SYSTEM by hand (say in pages #8 to #B) so HEPAX will recognize it as its own FS.

- Obviously you won't be able to use RAMTG (page write protection) command so, one must just be disciplined when handling RAM pages.

Theoretically, such a config will work on an MLDL2K, I havent tested it yet, but I'll try to find the time during the week and will let you know of the results.

Cheers from the Canary Islands.

Diego.

Re: MLDL2059 (again): completely built!

*Message #9 Posted by **Vieira, L. C. (Brazil)** on 21 Nov 2005, 6:12 p.m.,*
in response to message #8 by Diego Diaz

Hi, Diego; thank you for your kind (and encouraging) comments. I appreciate it!

Just a few (silly?) questions from someone that is getting into the inner HP41 secrets right now. Some background: I was able to download two sets of HEPAX ROM images, namely versions 1C and 1D, each with four files named HEPAX H1 to HEPAXH4. In both cases, HEPAXH1 and HEPAXH3 had XROM definition (03) and function counting, while both HEPAXH2 and HEPAXH4 had none. One of the sets (don't remember which one, 1C or 1D) also contained two ROM images equivalent to RAM pages, and they are simply two 4K files filled with zeroes (at least I have not seen anything else bute zeroes).

So... questions are: could/should these zero-filled images be loaded in SRAM to mimic HEPAX RAM, so the module (or ROM image) could identify it/them? What could we consider as for lower and upper files for HEPAXH1 to HEPAXH4? Maybe lower or upper image is not even applicable, but what valid mapping should be used to start loading HEPAX? As you have already studied the HEPAX startup, does the module save the startup information somehow, and where should it be?

Thanks for your support and forgive me if the wquestions are not applicable.

Cheers.

Luiz (Brazil)

(in time: Diego, did you receive my last e-mail with the configurations for the modules? Please, let me know)

Edited: 21 Nov 2005, 6:16 p.m.

Re: MLDL2059 (again): completely built!

*Message #10 Posted by **Meindert Kuipers** on 22 Nov 2005, 8:14 a.m.,*

in response to message #8 by Diego Diaz

Diego,

This is really interesting. So it might work after all! I have not done any testing, but looking at the HEPAX code I assumed that HEPAX would identify its RAM pages by doing the write protect, so it would only use its own RAM pages for the HEPAX file system.

My idea was to load HEPAX in the lowest possible page anyway (5 or 6), so relocation should not be required.

If I have time I will also do some testing myself.

Meindert

BTW, I have now a list of ROMs supported by the MLDL2000 on my website. Let me know what ROMs you know to work, so I can add them to the list.

MLDL and HEPAX emulation

*Message #11 Posted by **Vieira, L. C. (Brazil)** on 22 Nov 2005, 3:15 p.m.,*
in response to message #10 by Meindert Kuipers

Hi Meinder, Diego, guys;

After a bit of mind clearing with sacred MoHPC ritual (think RTFM...), I read the little .txt that comes with the HEPAX.MOD and it is explainded there that:

1. HEPAXH1.ROM to HEPAXH4.ROM should occupy banks 0 to 3 (1 to 4 in the original text);
2. it is also stated these ROM images should be in a page with an even # (8, B, D or E);
3. each of the two RAM-image files that come with the HEPAX ROM images are designed to be in the first bank of an odd- or even-numbered page;
4. the HEPAX manual explains that the HEPAX ROM uses one single page, and that each 16K RAM module occupies four pages, or two ports. (This is probably the reason that HEPAX relocates itself to a lower page, so all pages from 8 to F can be used to accomodate the 32K RAM, in 8 pages of 4K each, by using three modules)

So, I loaded all RAM files accordingly, in MLDL SRAM blocks, and set the SR as well (pages A, B, C and D); I also tried the suggested configuration by using page #8 and all of the banks filled accordingly, but I guess that a particular mapping with page #9 should be made, as it happens with Advantage mapping. All HEPAX functions I tried returned error messages, and the HP41 main memory was reduced from the original 319 registers to 273 registers (46 registers are relocated). After testing a few functions to see what messages they generated, the HP41 stuck and pages 8 and 9 became unavailable, even after a series of MEMORY LOST sequencies. I had to remove the MLDL and insert it in another HP41, then I had to insert a different module in port#1, place the MLDL back and then the pages became available again.

After that I tried the same procedure below, with the HEPAX ROM images mapped to page #6 and RAM mapping to pages 8, 9, A and B. Same behavior, no calculator

stuck because I did not insist that much...

I think further studies should be made prior to settle HEPAX to work with the MLDL2000, but although the calculator stuck in a weird way, based on Diego's considerations and Meindert's agreements, I guess it is a matter of a final, working arrangement.

Any additional facts, thoughts, eventual corrections? Please, althought I've been dealing with the HP41 basic hardware and software since the 80's by doing smalll repairs, structure studies and user-code programming, I'm dealing with all of this HP41 internal arrangments for a month only, strictly available time, and I hope all former enthusiasts forgive me if I am like a kid with a new toy... or like a kid with an old toy that found some hidden features.

Cheers.

Luiz (Brazil)

Re: MLDL and HEPAX emulation

*Message #12 Posted by **Diego Diaz** on 22 Nov 2005, 4:20 p.m.,*
in response to message #11 by Vieira, L. C. (Brazil)

Hi all,

Not much time allowed for testing, but here is what I've found:

- Forcing HEPAX to page #7 (CX) or #5 (CV) allows 41 to power up and display the correct CAT 2...

- It's also possible to see RAM on pages #8 & #9 thru [HEXEDIT] and it can be read and written accordingly...

- However, some (most) HEPAX functions return error messages as Luiz has pointed out. Further more, those error messages are *not* consistent with the corresponding function... (?) (for example: [HEPAX 002] returned H:NO FILESYS) So far this is quite a mystery for me...

Now I'm preparing a somewhat weird config SR trying to fool the 41 reagrding HEPAX location in an attempt to gain access to the HEPAX code itself... let's see what we find out... ;-))

Best.

Diego

Re: MLDL and HEPAX emulation (Done!!)

*Message #13 Posted by **Diego Diaz** on 22 Nov 2005, 5:18 p.m.,*
in response to message #12 by Diego Diaz

Hi again,

As usual, things are much clearer when you dig down to the "bit" level... ;-))

First, the cause of the troubles comes from the (dis)order in the so-called *standard* Bank-switching scheme:

100 - Bank 1

180 - Bank 2

140 - Bank 3

1C0 - Bank 4

... as you can see, bits 6 & 7 determine which bank to point to, but banks 2 & 3 are, in some way, *swapped*.

By fooling the 41 (which allows HEPAX editing) I've found out that the BS scheme in the MLDL2000 does not keep the "standard" order, but the bits order instead.

Just place HEPAX images in the "correct" order (i. e. 1, 3, 2 & 4) into the corresponding banks: 1, 2, 3 & 4.

And the whole thing works as expected... well... remember you must write the HEPAX FILE SYTEM by hand... here it is how it looks for 16K on pages #8 to #B.

8000: 00B

8FE7: 000

8FE8: 009

9000: 00C

9FE7: 008

9FE8: 00A

A000: 00D

AFE7: 009

AFE8: 00B

B000: 00E

9FE7: 00A

9FE8: 000

X= Same contents in all four pages

XFED: 090

XFEF: 091

XFF1: 0E5

XFF2: 00F

XFF3: 200

Hope this helps, best wishes from the Canaries!!

Diego.

MLDL and HEPAX emulation (Done!!) - Thanks!

*Message #14 Posted by **Vieira, L. C. (Brazil)** on 22 Nov 2005, 5:37 p.m.,*
in response to message #13 by Diego Diaz

Hi, Diego;

I am amlmost sure I do not speak only for myself when I say "Thanks!"

I'll try it later (now being sure of having a good result) and save the corresponding SRAM contents after modifying them so it will be easier to load them back when needed.

Best regards.

Luiz (Brazil)

(In time (again): did you receive my e-mail with the configuration for the NoVRAM and NoV32? Just let me know, so I can send it again if you didn´t get it)

Re: MLDL and HEPAX emulation (Done!!) - Thanks!

*Message #15 Posted by **Diego Diaz** on 22 Nov 2005, 5:44 p.m.,*
in response to message #14 by Vieira, L. C. (Brazil)

Hi Luiz, all,

Thanks, yes I do receive it, please check your mail, I've sent my reply a minuta ago... ;-)

Best wishes.

Diego.

HEPAX emulation- I tried to edit but, you know...

*Message #16 Posted by **Vieira, L. C. (Brazil)** on 22 Nov 2005, 5:49 p.m.,*
in response to message #14 by Vieira, L. C. (Brazil)

Hi, Diego;

the last post should be updated to contain:

BTW, shouldn't the three last lines be

```
B000: 00E
BFE7: 00A
BFE8: 000
```

instead of

```
B000: 00E
9FE7: 00A
9FE8: 000
```

Maybe you copied and pasted so the last ones were not updated... Also, in case of daring a 32K RAM, would the modifications be reflected the same way, I mean:

```
C000: 00B
CFE7: 000
CFE8: 009
D000: 00C
DFE7: 008
DFE8: 00A
E000: 00D
EFE7: 009
EFE8: 00B
F000: 00E
FFE7: 00A
FFE8: 000
```

or should their contents be different, I mean, do the 8, 9, A, B, C, D and E bytes refer to some address or are fixed data? The other set seems to follow the same pattern, right?

Best regards.

Luiz (Brazil)

Edited: 22 Nov 2005, 5:50 p.m.

Re: HEPAX emulation- I tried to edit but, you know...

*Message #17 Posted by **Diego Diaz** on 22 Nov 2005, 6:35 p.m.,*
in response to message #16 by Vieira, L. C. (Brazil)

Hi Luiz,

You're right about the copy-paste error, regrettably it cannot be edited according to new forum's policy (you know for sure who's the one to "thank" about that..)

Regarding the HEPAX FILE SYSTEM, it's in fact a "chain" so:

X000: Holdl a *unique* fake XROM-ID starting with H'00B, this turns C000: H'00F, D000: H'010, and so on...

XFE7 and XFE8 holds the pointers to the preceding and following pages in the chain respectively, or H'000 for the upper or lower ends of such chain.

Whit this in mind the 32K FILE SYSTEM version will look like this:

```
B000: 00E
BFE7: 00A
BFE8: 00C
C000: 00F
CFE7: 00B
CFE8: 00D
D000: 010
DFE7: 00C
DFE8: 00E
E000: 011
EFE7: 00D
EFE8: 00F
F000: 012
FFE7: 00E
FFE8: 000
```

Hope you find this info useful.

Cheers.

Diego.

It IS usefull, for sure! Thanks! (NT)

...

MLDL HEPAX emulation- Access to SRAM

*Message #19 Posted by **Vieira, L. C. (Brazil)** on 23 Nov 2005, 8:41 a.m.,*
in response to message #17 by Diego Diaz

HI all;

I know Diego is helping the way he can and that Meindert himself had already told that bankswitching is available and has some known limitations in MLDL structure. As a matter of fact, the ADVANTAGE emulation runs perfectly fine, as many other MLDL users may have noticed. The only fact that still calls my attention is that W&W's [CAT'] 2 shows intermetiate labels or function names when the emulated ROM uses more than one page. I have not tested the 41CX's [CAT] 2 to see if it happens the same.

I have read that HEPAX has some tricky operation, and Diego was able to completely emulate it with his Clonix41 or with his NoVRAM/NoV32 running as Clonix41, so Diego has valuable experience studying HEPAX operation.

I prepared all data related to the HEPAX emulation in the MLDL2000 and it now performs all 'memory independant' operations successfuly, and some memory access operation. One of them, HEXEDIT, either reads or writes successfuly in MLDL's SRAM.

But when the HEPAX automatically accesses MLDL SRAM,

it seems that there is something missing or wrong, I cannot say for sure. With all SRAM memory filled with zeroes and the corresponding bytes altered the way Diego sugested (double and trippled checkd, even with HEPAX HEXEDIT), it seems that HEPAX 'sees' some contentes that are not there. HEPDIR returns some entries, about ten, with names like

```
 C2    C3     C4     C5      MC     ??,S     PR,S
```

and so. When the list finishes, the display shows:

```
[           8:]
```

and when HEPROOM is executed, the same

```
[           8:]
```

is shown again. If we activate ALPHA, a weird, right-justified (wait for a little or press any key to see) 2000000 is shown in the ALPHA register; is this what HEPAX sees as free memory? 2.000.000 registers? If so, no wonder why it is behaving like this. I am sure that the last SRAM block contains a 000 as the reference of the last block in the chain.

I am almost sure that I may be doing something wrong, maybe I keyed extra data in or missed some step. Has anyone else tried the HEPAX with MLDL2000 so far? I think that using an actual HEPAX module and emulating RAM with MLDL might also work, OR, Diego, emulating HEPAX with Clonix and SRAM with MLDL (that´s what I actually have in mind) might give us plenty of room to develop and study MCODE. Even if it is for pure fun...

Thanks all and regards.

Luiz (Brazil)

Re: MLDL HEPAX emulation- Access to SRAM

*Message #20 Posted by **J-F Garnier** on 23 Nov 2005, 3:03 p.m.,*
in response to message #19 by Vieira, L. C. (Brazil)

Hi all,

Let me just remind you that Emu41 fully supports the Hepax module (among other things), and can be used as a reference for the (unlucky) ones who don't own the real module...

From my own experience in implementing Hepax operations, there is no need to initialize the RAM with special values.

Regards.

J-F

Re: MLDL HEPAX emulation- Access to SRAM: it really works!

*Message #21 Posted by **Meindert Kuipers** on 24 Nov 2005, 3:01 a.m.,*
in response to message #19 by Vieira, L. C. (Brazil)

Many thanks go to Diego and Luiz for making HEPAX work and finding two design errors in the MLDL2000:

bug 1: Banks 2 and 3 are swapped. This can be easily fixed, but requires the firmware updater to be finished first before the user can do the upgrade himself. I am working hard on this (complicated) piece of addition to the M2kM software.

bug 2: HEPAX works! This is not by design, but rather by fooling HEPAX and setting a special configuration. The only restriction is that it is not (yet) possible to control the Write Protection of SRAM from within HEPAX.

The only thing that need to be added to Luiz' configuration to run HEPAX in the MLDL2000 is that the RAM pages must be in all banks of a port. Why is not really clear to me yet, but with the settings below I have been able to save a program in an SRAM page, and HEPDIR and HEPROOM seems to give the correct results! I will investigate this further, there may be more secrets to bankswitching that still need to be uncovered.

Configuration for a CX:
Page $7, Bank 1: HEPAX1-1D
Bank 2: HEPAX2-1D (in SR this is Bank 3)
Bank 3: HEPAX3-1D (in SR this is Bank 4)
Bank 4: HEPAX4-1D

Page $8, Bank 1 to 4: SRAM Page 1 (identical in SR)
Page $9, Bank 1 to 4: SRAM Page 2 (identical in SR)

I have not tested any other configurations yet, but I think we have proven that HEPAX can work in MLDL2000 if the configuration is right!

To answer to another question with the CCD CAT 2: this is by design. AFAIK a FAT entry starting with a '-' will be seen as an extra header.

Meindert (who was very excited to see HEPAX work in his MLDL2000, I really feel like on old kid with a new toy)

Great; great news! Thanks q8^D. (edited)

*Message #22 Posted by **Vieira, L. C. (Brazil)** on 24 Nov 2005, 7:50 a.m.,*
in response to message #21 by Meindert Kuipers

Hi Meindert, Diego, all;

Thanks for crediting, but I consider that Diego and others that actually know what was going on inside the HP41 'guts' and made good suggestions are the ones to be credited. I am lurking around and, occasionaly, getting into accquaintance with the so many new information. In any case, you all know I am sharing whatever I find out, because I may find something important and do not be (yet) aware of that. Thanks!

In time. Meindert, you wrote in other post:

> Quote:
>
> While testing I discovered another potential problem with a wrong HEPAX configuration: when connected to USB, the CPLD remains powered, and the contents of the Bank Switching Registers (which are in the CPLD) are kept alive. If the current active bank in a port is pointing to the wrong place, switching the HP41 OFF and then ON again, will not solve the problem if USB is still connected. I will investigate this and look for possibilities to reset the BS registers.

I was about to point this out, but with so many stuff being discussed here, I thought I should wait till HEPAX basic configuration was ready prior to go ahead with that. In fact, if this happens, [CAT] 2 lists some stuff but HEPAX functions, and I thought that it was related to bank switching. Anyway, closing all MLDL 2K manager windows and disconnecting the USB cable (HP41 OFF) proved to be enough to bring the HP41 back to normal operation. In only one case that I forgot it connected for too long, it took me a while and a lot of [ON][<-] to bring it back. The LCD was somehow dimm (it is a fullnut, i.e., no contrast available), but it became normal after about 10 to 15 minutes.

Just to add these facts.

Cheers.

Luiz (Brazil)

Edited: 24 Nov 2005, 12:42 p.m.

Re: Great; great news! Thanks q8^D. (edited)

*Message #23 Posted by **Diego Diaz** on 25 Nov 2005, 6:55 a.m.,*
in response to message #22 by Vieira, L. C. (Brazil)

Hi again all,

Undoubtly, the more people try to replycate the "suggested" HEPAX configuration the more feedback info we'll get... However, I think that it will be a good idea to *define* a unique "testing scenario" in order to make all comparative testing (and results) to be consistent.

This is just a proposal for such scenario, feel free to suggest others (or mods to this one):

HEPAX-1D loaded into MLDL FLASH pages 240, 241, 242 & 243 (you may think it's completelly irrelevant where an image is loaded, but it will be easier to share SR files... and, IMHO, *nothing* is completely irrelevant ;-) Point SR (FLASH SR #0 for the sake of precission) to page #5 and use a CV.

RAM pages #8 to #B (start testing just with 16K... I think its a good testing tradition to proceed one step at a time...) pre-programmed with "basic" FILESYSTEM structure (as described in previous posts. Remember BFE8 must be H'000) Loaded into MLDL SRAM pages 0 to 3. (at this point remember to fill all 4 banks of every page with the same descriptor.)

I must say I don't have a battery inside my MLDL, so I keep USB *and* HP-41 connected all the time...

Turn HP-41 ON.

With above described scenario, I've been unable to reproduce the errors Luiz have seen... (?)

After first HEPDIR, (or others FILESYSTEM related commands) HEPAX *actually* build ist FILESYSTEM, shows "H:DIR EMPTY" and (<-) 2.610,0000 (free registers in "X")

You can check at address X092: H'04E and X093: H'00F (X= 9 to B) to verify if FILESYSTEM has

been correctly built. At B092 and following addresses you'll find something like this: 380, 251, 1CA... (on real HEPAX this contents are allocation dependant...)

If things goes as expected then remove the RAM mapping to BANKS 2 to 3 in SR, leave just BANK 1 for RAM pages... Otherwise please post your results as detailed as possible.

I've also tested this, without problems (remember I always have USB plugged in)

Turn 41 OFF.

Then, re-load *all* MLDL SRAM pages 0 to 7 with pre-programmed RAM images according to the *basic* FILESYSTEM for 32K RAM (now BFE8 should be H'00C)

This is required to avoid HEPAX finding a half-built FILESYSTEM (see HEPAX manual to get detailed info on how *strict* is HEPAX in handling its own FILESYSTEM... ;-)

Turn 41 ON, execute HEPDIR, you should get "H:DIR EMPTY" again and 5.222,000 afterwards (<-) in X register...

I know this could seem quite painstaking, but HEPAX is *really* sensitive when it comes to messing into its proprietary FILESYSTEM... and some of the things we've testing are not even cosidered possible those days, back it the good eigthies when this wonder was conceived... so keep in mind taht we're "playing in *other's* yard" ;-))

Once we can cope with HEPAX standalone functionality, will begin with other modules/devices (CCD, Advantage, printer... interoperability).

Your comments and test results are certainly welcome!!

Best wishes.

Diego.

MLDL2000 affairs... (+ rephrasing)

*Message #24 Posted by **Vieira, Luiz C. (Brazil)** on 25 Nov 2005, 10:59 a.m.,*
in response to message #23 by Diego Diaz

Hi Diego, all;

first of all, let me just add that in my previous post I missed some of my own words. I wrote:

> Quote:
>
> (...)I consider that Diego and others that actually know what was going on inside the HP41 'guts' and made good suggestions are the ones to be credited.

and I should have written:

> Quote:
>
> I consider that Diego, the one that actually made HEPAX work properly in MLDL, and others, that also know what was going on inside the HP41 'guts' and made good suggestions, are the ones to be credited.

That said, let's go ahead.

Diego, both the HEPAX ROM images I have, either 1C or 1D, show a checksum error (I did not notice before...). I reproduce the 1D-version report shown after MLDL's Open operation in MLDL ROM/SR Handler:

```
  XROM          : $007  007
  # Functions   : $037  055
  Pause Entry   : $000
  Program Entry : $000
  Sleep Entry   : $000
  OFF Entry     : $243
  Service Entry : $000
  ON Entry      : $213
  MemLost Entry : $000
  ROM Revision  : H1-1D
  Checksum      : $106  CHECKSUM NOT
GOOD, should be $100
```

Is it the same one you use?

This one is just for checking purposes, althought the answer is known. You did not mention the way HEPAX images should be ordered, so we assume it is the 1-3-2-4 bank sequence, right?

About the HEPAX memory modules. I know you mentioned you did not have any HEPAX actual memory modules, but it seems to me you have the actual HEPAX ROM module. If this is true, have you tried to use MLDL's SRAM with

the actual HEPAX module? You know what is still teasing me? If the HEPAX memory modules are RAM modules without backup batteries, shouldn't they be empty (all bits = "0") when firstly inserted in an HP41? If so, HEPAX should build the system files from 'zeroes', and based on what I read, it would identify the existence and location of RAM modules after writing/reading operations. If we can call them this way, the few 10-bit words recorded on these RAM modules are like signalling words, as for the existence and RAM sequence (chain). Is that correct? If my assumptions are correct, would an actual HEPAX ROM module be able to build the HEPAX file system in empty ('zeroed') MLDL SRAM available blocks? If it is not daring too much, may I go somehow further and ask how does Clonix emulation of HEPAX (in NOVRAM programmed with clonix6) handle that?

I have already printed the tentire text and I'll go for your solution in a few minutes from now. I just would like to be confident of the HEPAX image I have here.

Thanks again, Diego (and Meindert, of course). It's been pure brainstorm these last weeks.

Cheers.

Luiz (Brazil)

(a small) Oops!

*Message #25 Posted by **Vieira, Luiz C. (Brazil)** on 25 Nov 2005, 11:07 a.m.,*
in response to message #24 by Vieira, Luiz C. (Brazil)

Hi, Diego, all;

I had not seen Diego's reply to Meindert's post where Diego mentions what he is using to perform tests. Anyway, I'll keep the suggestion to use MLDL2000 SRAM blocks with NoVRAM HEPAX emulation (something I want to do soon...)

Cheers.

Luiz (Brazil)

Edited: 25 Nov 2005, 11:36 a.m.

Re: (a small) Oops!

*Message #26 Posted by **Diego Diaz** on 25 Nov 2005, 12:55 p.m.,*
in response to message #25 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I'll try to make an abstract from the somewhat "disperse" info in my posts above:

- No, regrettably I haven't got any *real* HEPAX, neither the module nor the MEMORIES... :-(

- The Clonix module is not able to emulate HEPAX, this is achieved by NoVRAM and NoV-32. I build an HEPAX file for clonix just for the fun of playing with some of its functions but it cannot handle any FILE SYSTEM related funtionalities.

- HEPAX do in fact lost its memory contents when it's unplugged (one of the [few] things in which NoVRAM emulation surpass the *real* HEPAX specs)

- Consequently, you're right when supposing HEPAX builds its FILE SYSTEM from scratch (all zeroes). This is achieved in two steps:

1st HEPAX writes the "basic" FILE SYSTEM structure, on power up, *after* relocation... thus, due to the imposibility to perform relocation on the MLDL, this step will never be automatically performed. That's why I write it by hand. In fact, the real HEPAX does not write the "chain" (XFE7, XFE8) in this step, these remain zeroed until the 2nd step is performed. Also address XFF3 holds H'100 instead of H'200 at this very stage of the initialization process. However, I've got no difference during tests in doing this way.

2nd once that basic structure is written, you must execute HEPDIR to actually build the FILE SYSTEM structure. At

this point HEPAX writes data at addresses X092 and following, writes the chain at XFE7 and XFE8, and toggles XFF3 from H'100 into H'200.

- NoVRAM could be used to handle MLDL SRAM in an HEPAX-like fashion, but in its current implementation NoVRAM holds 16K (#8 to #B) so MLDL RAM must be set to map at pages #C to #F.

Whichever the case, and prior to begin messing with different/mixed module-MLDL configs I'd like to have a consistent basis just with MLDL and standalone HEPAX emulation.

As I've told before I've got it running in my MLDL but want to make sure this is not a "casual" result... That's why I've posted a basic testing scenario.

Hope this helps others interested in the process.

Best regards.

Diego.

P.S. Regarding HEPAX image checksum... yes it's the same here, but I haven't paid much attention to this point. And the banks order is ok: 1, 3, 2 & 4.

Edited: 25 Nov 2005, 1:04 p.m.

I tested the new procedure, and...

*Message #27 Posted by **Vieira, Luiz C. (Brazil)** on 25 Nov 2005, 3:25 p.m.,*
in response to message #26 by Diego Diaz

Hi Diego, Meindert, all that are following this MLDL adventure.

I followed all Diego's suggestions and actually changed some of my MLDL2000 `preferences`, so I could go ahead with the experiment exactly the same. In time: there is no problem at all rearranging ROM images in the FLASH memory, once you know what you are doing. I sent Diego a copy of what I

have already stored in FLASH memory, and I agreeded with moving four images form where they were in order to locate the HEPAX 1D ROM images in the same address suggested. The four ROM images I had in 240, 241, 242 and 243 were moved to lower addresses. As a matter of easy arrangement, a fifth ROM image was also moved.

All set, 16KRAM available and `preprogrammed`, calculator OFF in all MLDL accesses and changes, after first HEPDIR I saw the same C2, C3, C4 and C5 entries again, and the 2,160.0000 at the end (free registers, O.K.). If HEPAX reports 2.610 free registers, the C2, C3... entries do not occupy space, so there is no trouble for me.

I checked all non-zero words (added/changed) and found:

```
Addr    Dta
8092    048
8093    0B0
8095    01C
809A    047
809B    00F
X092    04E (X= 9, A, B)
X093    00F (X= 9, A, B)
```

I repeated the entire process with a 41CV halfnut and got the same results.

Then I changed SR references and removed the SRAM references from banks 2 and 3 at pages 8, 9, A and B, so I executed HEPDIR again and I received a NONEXISTENT. Then I tried [CAT] 2 and none of the HEPAX 1D functions were there, HEPAX 1D identification neither.

One point: I am counting banks 0, 1, 2 and 3, as they appear in the MLDL2000 Manager windows. Is there a chance that you, Diego, is counting banks 1, 2, 3 and 4? In this case, should I leave intact the references to banks 0 and 1 in a 0, 1, 2 and 3 counting for each SRAM, or should I leave references to banks 1 and 4 in a 1, 2, 3 and 4 counting? Or any other arrangement? In my case, as I am counting as MLDL2000 Manager shows, I left banks 0 and 1 with the original reference SRAM. And as I was

considering other possibilities, I decided to remove all but the first bank reference. So I had only bank 0 of each SR activated and tried again: no HEPAX showing up. I restored previous references to all four banks and tried again. No HEPAX. Then I closed MLDL2000 manager, disconnect the HP41 and tried: there he is, HEPAX functions back again after [CAT] 2.

HEPDIR gives C2, C3, C4 and C5 as the four unique entries yet, each with a right-justified space, and ends with correct 2.610 available registers. I decided to go ahead finished all steps to set 32KRAM the way it is shown here, and after HEPDIR I got:

```
C2
C3
C4
C5
MC
??,S
PR,S
DA,S
5,610.0000
```

These look like ‘ghost entries’, or something like references to the possible file types. You see, when HEPAX cannot identify a file type, it shows the file ID as ??, right? PR refers to Program file, and DA refers to Data, the S meaning Secure file. No Key assignment file references, however, neither ASCII (ALPHA string), nor Write All.. Except for these particular entries in HEPDIR, everything else seems fine. After saving three small programs as for testing purposes, the first `ghost` entry (C2) disappeared, and the reported remaining register was reduced to 5,203 (fair enough to hold the new data). One interesting fact: although these ‘ghost´ entries do not count as used bytes, HEPDIRX ‘sees’ each of them as they appeared: C2 when X=1, C3 when X=2, and so. After loading the three small programs, C3 became entry #1, C4 became entry #2, etc.

And yes, after [HSAVEP], each of the three programs appear in [CAT] 2, after [XFA]. I ordered a MEMORY LOST

and recovered each of them back to main memory. Interesting: I saw [HSAVEP] and [HPURFL], but I did not see [HGETP]. After wondering about how to bring the programs back, I decided to see the functions repertoire in HEPAX to see which of them could be used. Then I saw the three labels showing up as the last entries, and I could understand that they were actually converted to internal XROM calls. I was not known about that... I wonder what else I missed all of these years... After that, [COPY] was enough to bring them back.

I´ll go further using HEPAX functionality to deal with as many possibilities as I can, and I'll report any additional fact.

In time: Meindert and Diego, as Diego mentioned his MLDL2000 is a BETA unit and being my own a regular unit, are there any chances that the CPLD program used in mine is an updated version? If so, that would (at least partially) explain the different behavior. I guess it would be related to WXP version or MLDL2000 manager; maybe the HEPAX version, but it seems to me that Diego is using the same.

I wish I knew more about the HP41 + HEPAX internals to be more technical and deeper when mentioning these facts, sorry.

Thanks again.

in response to message #28 by Vieira, Luiz C. (Brazil)

Please do! I intend to own an MLDL2K one day, and I have a Nov32 on order. Reading this thread has been educational and interesting!

Re: (a small) Oops!-you guys are awesome!!

*Message #30 Posted by **PeterP** on 26 Nov 2005, 12:57 p.m.,*
in response to message #29 by Howard Owen

just a humble "You are guys are simply amazing" from a guy not really worthy reading your stuff. A happy owner of an MLDL as well and in love with the HEPAX I've been following your post here with great excitement. Now it will allow us mere mortals to play with a fantastic HP - MLDLD+CCD+Hepax+lots of memory (as I don't have any hepax-memory modules). Thanks again, you guys (including the one genius who has made the whole thing possible in the first place, Meindert) are awesome! Thanks so much for sharing all this invaluable information, I'm sure I'm not the only bystander who has followed this post with held breath.

Cheers

Peter

Re: MLDL2059 (again): completely built!

*Message #31 Posted by **Diego Diaz** on 23 Nov 2005, 6:08 a.m.,*
in response to message #10 by Meindert Kuipers

Hi again,

I've received an e-mail a minute ago from a user/friend, he pointed me out about one fact that I think requires clarification:

Some of my previous posts in this thread could be *misread* as if I had unveiled some errors or weak design points in the MLDL2000, not AT ALL!!

Please note that MLDL2000 achieves a smooth Bank-switching handling, it uses bits 6 & 7 in the "logical" order, and it's just a matter of ROM images loading organisation which does *not* represents any kind of incorrect function whatsoever.

Meindert, please excuse if any of my explanations could be misunderstood. Sincerely hope this clarifies my opinion about your superb device.

Best regards and enjoy your new toys.

Diego Díaz, honoured MLDL2003 betatester... ;-))

Re: MLDL2059 (again): completely built!

*Message #32 Posted by **Meindert Kuipers** on 24 Nov 2005, 3:49 a.m.,*
in response to message #31 by Diego Diaz

Diego,

I am very glad to hear that there are bugs/mistakes/design issues in the MLDL2000. That is why I have made all the information public to make it better! Did you dive into the VHDL sources?
I have pinpointed the error and have already fixed it, but not tested it yet. For field upgrades this requires a bit of software that I am working on to be finished first to allow reprogramming of the CPLD firmware.
Bankswitching is for me still a bit of black magic. The actual code to implement it is only a few lines of VHDL code, and I have used the bits in the ENBANKx instructions to control the address bits for selecting the active bank, and that is where I went wrong. To implement is was actually very simple, but the mechanism has large consequences. I actually did the coding of BS without any simulation, and it worked the first time I tested it with the Advantage ROM.

While testing I discovered another potential problem with a wrong HEPAX configuration: when connected to USB, the CPLD remains powered, and the contents of the Bank Switching Registers (which are in the CPLD) are kept alive. If the current active bank in a port is pointing to the wrong place, switching the HP41 OFF and then ON again, will not solve the problem if USB is still connected. I will investigate this and look for possibilities to reset the BS registers.

I am still a bit worried about having HEPAX in Page 7 (CX configuration), and something else in Page 6 that also does bankswitching (Page is normally just for the Printer). Since the even and odd ports share the same BS registers they will influence each other. Also, what happens if IL (fixed at Page 7) is plugged in, where do we put HEPAX then?

Again, please report any unexpected or undesired features of the MLDL2000, it only helps to improve it!

Meindert

Re: MLDL2059 (again): completely built!

*Message #33 Posted by **Diego Diaz** on 25 Nov 2005, 7:41 a.m.,*
in response to message #32 by Meindert Kuipers

Hi Meindert,

Thanks for your comments. It was more a question of luck than of knowledge, that I come accross with the swapped organization on banks 2 & 3... (I should'n call it a "bug"... :-)

Regrettably I haven't dig into CPLD code. I've got almost no experience with these devices, so I'm affraid I wouldn't be much of a help in this field... Always willing to learn though!!

In a previous post to Luiz comments I've described some of the test I've performed so far. First I also kept RAM pages in all four banks, but removing them from banks 2, 3 and 4 did not make any difference (at least on my unit) regardless the use of 16K or 32K RAM configurations...

I'm using my own NoVRAM (16K RAM) with HEPAX-1D emulation as a "reference", currently I have no NoV-32 unit due to some domestic trouble... I'm confident I'll have some units ready during this weekend to test 32K configurations (I must say that NoV-32 was not intended to use all 32K with HEPAX FILESYSTEM but this could be achieved though...) It would also be great if users with the *real* HEPAX (and even HEPAX MEM/HEPAX 2MEM) can verify the reported results... Any volunteer?? ;-))

Best wishes.

Diego.

HP-34C repair

*Message #1 Posted by **Stefan K.** on 20 Nov 2005, 2:43 p.m.*

I am finally a proud owner of a 34c. Of course the batteries are dead, and when I put in normal alkalines out of curiosity I unscrewed the two little screws in the battery compartment. Unfortunately I couldn't screw them back in, the little plastic thingies with the thread crumbled away. First I thought it was the corrosion of the screws that busted the plastic, but then I noticed that the batteries put some pressure on the right part of the rear cover (when looked from the back).
My solution was to glue the little parts all together with a fair amount of superglue and then drill a new hole for the screws through the glue.

Hope that helps anybody, and never try to open a calculator if you don't have too!
Stefan

Re: HP-34C repair

*Message #2 Posted by **Art Litka** on 21 Nov 2005, 9:00 a.m.,*
in response to message #1 by Stefan K.

Stefan,

I know how you feel! I have two 34C's, have had them both apart and ran into the screw thread problem as well. I did manage to get one functional by swapping some components from the other. However, the case backing on the functional one is currently scotch taped on until I can devise a more permanent fix. Since the calculator is still somewhat erratic as to when it works or not, I am hesitant about attaching the back more permanently in place yet. Please let us know what you come up with.

Art Litka

Re: HP-34C repair

*Message #3 Posted by **Stefan K.** on 22 Nov 2005, 7:14 a.m.,*
in response to message #2 by Art Litka

Well, as I said: I can now close the back part again and tighten the screws, but I am not sure how much pressure the superglue wil withstand. It's working at the moment, it wasn't exactly a clean job but you won't notice from the outside, and I am hesitant to touch the screws again unless the calculator is broken.

A way to polish aluminium

*Message #1 Posted by **inaki** on 19 Nov 2005, 5:50 p.m.*

I would like to erase those engravings on the aluminium parts of calculators. I have several of them with the name of the former owner on them. Has anyone been successful at erasing those marks from aluminium parts ?

Re: A way to polish aluminium

*Message #2 Posted by **db (martinez, ca.)** on 19 Nov 2005, 9:14 p.m.,*
in response to message #1 by inaki

nothing works completly, but scotch brite rubbed in the direction of the grain may help. if you want to POLISH aluminum, thats a different thing. Try semichrome for that.

Re: A way to polish aluminium

*Message #3 Posted by **Hal** on 20 Nov 2005, 3:04 a.m.,*
in response to message #1 by inaki

Hi Inaki,
If the engravings are deep at all, you may need to use a dremel tool, or dental handpiece with an abrasive rubber wheel.
Best regards, Hal

Re: A way to polish aluminium

*Message #4 Posted by **db (martinez, ca.)** on 20 Nov 2005, 11:47 a.m.,*
in response to message #3 by Hal

Hal;

If your dremel idea doesn't do it, he could go with a 1" cold chisel and a 3 pound hammer. If that doesn't work, an air arc or a jack hammer would probably do the trick. Wait; thats just stupid. Jack hammers are notoriously hard to control. Bosch makes a 9" hand operated grinder that should function well. I know that a longitudinal diamond resurfacer of the type you see gooving roads and freeways will bring the surface evenly down to the bottom of the engraving however the setup fee may be high.

God i love power tools. - d

Re: aluminium resurfacing

in response to message #4 by db (martinez, ca.)

A Red Green show solution:

DB, I think you were on the right track with the grooved roadway... why not duct-tape the plate to the

tire of a car and then make some wheels locked stops? The skidding action on the grooved roadway will provide the desired lengthwise etch lines in the aluminum. The hard part might be locating an older vehicle without anti-lock brakes.

*Message #11 Posted by **Hugh Evans** on 22 Nov 2005, 11:48 p.m.,*
in response to message #1 by inaki

Someone posted a while back about fabricating a new bezel out of brushed stainless steel. Why not draw out the specs yourself and get a few quotes from your local machine shops?

I still think ordering a short production run from emachineshop out of brushed stainless could be a nice way of going.

Re: A way to polish aluminium

*Message #12 Posted by **David Smith** on 24 Nov 2005, 10:42 p.m.,*
in response to message #1 by inaki

The only way to remove an engraving from anything is too remove enough material from the surface until you reach the depth of the engraving. Your best bet would be to remove the bezel (can be hard to do without bending it), The bezel is held down with double sided sticky film. I have used a stong thread soaked in UnDu (heptane).

Next sand the surface down with coarse sand paper. Lay the paper on a hard, smooth surface and work the bezel back and forth. Be careful no to snag and bend the bezel. When you get close, switch to ever finer grit. To get a good final surface you may need to polish it shiny with Flitz, etc then use steel wool or ultragrit sandpaper or a fine wire brush to apply the final brushed aluminium grain pattern.

I bet it will never look right.

41 Help !!! :-)

*Message #1 Posted by **Gileno - Brazil** on 19 Nov 2005, 4:31 p.m.*

```
I have a sequences of letters.
For instance ABCDEFGHIJKLM... (alpha mode, size 21 letters).
How do I do to have only the first 3 letters?
Using the commands of HP41CX, but I don't want to use the xmemory.
```

Re: 41 Help !!! :-)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 Nov 2005, 5:48 p.m.,*
in response to message #1 by Gileno - Brazil

Hi, Gileno;

as you have a CX, you can try this 'Mickey-Mouse' (as simple as it gets):

```
ATOX
ATOX
ATOX
CLA
X<> Z
XTOA
RDN
XTOA
RDN
XTOA
```

It does not use X-memory, only X-functions. Contents of stack registers are lost, only previous X-register contents is kept ((in Y-register). If you need more digits to be handled the same way, maybe other specific ALPHA operations would be more helpfull.

Cheers.

Luiz

Re: 41 Help !!! :-)

*Message #3 Posted by **Raymond Del Tondo** on 19 Nov 2005, 7:05 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi,

another simple solution:

Suppose you have ABCDEFGHI... in Alpha.

```
ASTO L  (stores the 6 leftmost chars in L, that is 'ABCDEF')
"XXX"   (replace old Alpha contents by 'XXX')
ARCL L  (appends the 6 chars from L to ALPHA, giving 'XXXABCDEF')
ASTO L  (store again, this time 'XXXABC' )
"YYY"   (replace old Alpha contents by 'YYY')
ARCL L  (append prev stored chars, giving 'YYYXXXABC')
ASHF    (shift 6 leftmost chars out. Here you are: 'ABC' ;-)
```

Seven steps, only uses Alpha and L register.
No X-Functions or CX needed.
Works on any HP-41;-)

Shorter version anyone, using a basic 41?

HTH

Raymond

Power supply for 9114B Disk Drive

*Message #1 Posted by **inaki** on 19 Nov 2005, 3:12 p.m.*

Which is the right power supply for the 9114B Disk Drive ? Is it the same that for other HP peripherals, that is, the 8V one?

Re: Power supply for 9114B Disk Drive

*Message #2 Posted by **Howard Owen** on 19 Nov 2005, 4:05 p.m.,*
in response to message #1 by inaki

Yes, it's the same as for lots of HP products in the late 70s and through the 1980s. In the US, it's the 82059[ABCD] The various revs have all worked well in many HP machines for me:

- HP-97
- HP-41C rechargable battery pack
- HP-41C printer (both dedicated and HP-IL)
- HP9114A/B FDD
- HP-IL Thinkjet printer
- HP-110 portable plus
- HP-IL/Serial interface
- HP-IL/HP-IB interface
- HP-75C/D
- HP-71B

I'm sure there are others that I've forgotten about or never encountered.

HP48GX and Invalid Card Data Error

*Message #1 Posted by **John Kercheval** on 19 Nov 2005, 10:14 a.m.*

Hello:

I have an HP48GX and every time I start it up with the 1MB Memory Pac I get an error:

"Warning: Invalid Card Data."

W/o the card in no problem.

Any ideas?

John

Re: HP48GX and Invalid Card Data Error

*Message #2 Posted by **Han** on 19 Nov 2005, 11:23 a.m.,*
in response to message #1 by John Kercheval

It just means that you have a new card with no data on it. Since the card has not been initialized, you will always have "Invalid Data." As soon as you start using each and every port, the message goes away. Or, you could just use the PINIT (port initialization) command. It will essentially initialize all ports.

Re: HP48GX and Invalid Card Data Error

*Message #3 Posted by **John Kercheval** on 19 Nov 2005, 1:09 p.m.,*
in response to message #2 by Han

Thanks, I tried that. Did nothing. Other ideas?

THANKS!

John

Re: HP48GX and Invalid Card Data Error

*Message #4 Posted by **Raymond Del Tondo** on 19 Nov 2005, 3:17 p.m.,*
in response to message #3 by John Kercheval

Hello,

if it's a new and/or empty card,
PINIT is the way to go.
Be sure to have the write protect switch
in the ReadWrite position.

If the card has some software on it,
it could be that the contents are invalid.
In this case just pull the card out of the calc,
then pull the card's battery for a few minutes,
then reinsert the battery, then the card,
and start over with PINIT.

If that won't work, the card may be defective.

Or is it an older TDS card?

HTH

Raymond

Re: HP48GX and Invalid Card Data Error

*Message #5 Posted by **Stefan K.** on 21 Nov 2005, 3:29 a.m.,*
in response to message #1 by John Kercheval

(Free translation of my German user manual): You have to use at least one port on the card that the error message goes away.

Try using PINIT and then store something on a port. If you still get the error message, it could also be the cell battery. Somehow my memory cards need good cells even if they are plugged into the calculator.

incorrect integral of 1/(sin x)

*Message #1 Posted by **J.C. Boco** on 19 Nov 2005, 8:19 a.m.*

I'm getting an error while integrating 1/(sinx).

the result is -.5 ln (cos(x)+1 +.5 ln (cos(x)-1)

funny, as integral tables give the answer as -ln (cotx cscx).

Is it just a fact of life that since algorithms for integrating are so complex that you just can't expect calculators to do it?

Re: incorrect integral of 1/(sin x)

*Message #2 Posted by **Han** on 19 Nov 2005, 11:30 a.m.,*
in response to message #1 by J.C. Boco

That is a correct integral of 1/(sin x). Just differentiate the expression and you will find that it indeed is correct. When evaluating indefinite integrals, recall that your solution is acutally a family of solutions (due to the "+C"). Since many trig functions also have identities involving other trig functions, it is often the case that you may have seemingly two different antiderivatives.

For example, the antiderivative of (sin x)*(cos x) is both .5*(sin x)^2+C1 as well as -.5*(cos x)^2+C2. The reason: (sin t)^2 + (cos t)^2 = 1. By choosing just the right values for C1 (or C2) you can get from one solution to the other via the trig identity above. (Differentiate either expression and you get back (sin x)*(cos x).)

Re: incorrect integral of 1/(sin x)

*Message #3 Posted by **Crawl** on 19 Nov 2005, 11:30 a.m.,*
in response to message #1 by J.C. Boco

It's not an error.

[applying the ABS]

-0.5 (log (cos(x) + 1) + log (1 - cos(x)))

=

0.5 log((1 - cos(x))/(cos(x) + 1))

=

[multiply top and bottom by 1 - cos(x)]

0.5 log ((cos(x) - 1)^2 / (1 - cos(x)^2))

=

0.5 log ((cos(x) - 1)^2 / sin(x)^2)

=

log ((cos(x) - 1)/ sin(x))

= log(cotangent(x) - cosecant(x))

So, there is no error. It's the exact same function, only written differently.

For the same integral, the TI89 gives another form: log(tan(x/2))

Re: incorrect integral of 1/(sin x)

*Message #4 Posted by **Ed Look** on 19 Nov 2005, 1:37 p.m.,*
in response to message #3 by Crawl

Now, THIS is a good thread, with a good question and some excellent replies!

If this thread was made a chapter in calculus texts, in bold print no less, I think less kids would drop the course! (And some not-so-swift instructors smarten up!)

Oh, and I forgot... it even ties into HP calculators! LOL!!

(P.S. I really shouldn't comment; I usually do integrals and derivatives by hand... else use a computer... except in my old college days, doing a numerical evaluation of a rather simple integral using the SOLVE function on my old HP 34C! I have yet to try out either integrals or derivatives on a 48G+ or 49G+; and on a day I have some nerve, I'll try it on the 33S!)

Re: incorrect integral of 1/(sin x)

*Message #5 Posted by **Marcus von Cube, Germany** on 20 Nov 2005, 10:05 a.m.,*
in response to message #3 by Crawl

> Quote:
>
> For the same integral, the TI89 gives another form: log(tan(x/2))

This is the result that Derive 6 on my PC returns.

My TI Voyage 200 returns: ln(|sin(x)|/|cos(x)+1|) (with AMS 3.1)

Same is true for my TI-89 (AMS 2.09)

I have no idea, why the TI uses || (ABS) on the term cos(x)+1 which can never be negative.

Marcus

Re: incorrect integral of 1/(sin x)

*Message #6 Posted by **I, Claudius** on 19 Nov 2005, 3:00 p.m.,*
in response to message #1 by J.C. Boco

It is correct. There are two good quick ways to check if the antiderivative your 49 has given you is valid:

One is as stated above, take the derivative and see if you get back the function you started with. That is the classic math approach, is absolutely valid, although some algebraic simplification may be needed for complicated functions.

Another method is to use a second computer algebra system, such as Mathematica or Maple. (The 49 was originally programmed using Maple, and it's suprising to see how close the 49 is to Maple (versions 6 thru 8) on many things.) Integrate your function with the other CAS, then plugging in small numbers, such as x=1,2,3... and Pi/(8,4,2) for trig functions, see if the functions are equal. I'm impressed at the accuracy of the 49's antiderivatives. There are a number of errors, but relatively few. The math professor who programmed the 49 did a superb job with indefinite integration, using partial implementation of the Risch algorithm.

The TI89 is often mentioned in comparison to the 49 with regards to integration. The TI89 is generally faster but lacks the Risch methods, instead relying on plug and chug heuristics. There are a number of antiderivatives the TI89 can't do the 49 can, and vice versa. The only area where the 89 outperforms the 49 is with multiple integrals, being much faster. In the final result, though, they are both fairly well matched. An engineer is well armed with either one.

As for integration tables, there is really only one that I use, Gradshteyn and Reyshik's Table Of Integrals, Series and Products. While the table is mostly accurate, there are a number of well-known errors found by programmers when testing the integration powers of Mathematica.

J.C. --

You don't mention what kind of calculator you're using (or even if it's an HP). My HP-48G cannot solve it symbolically, but my HP-49G gives an expression that corresponds to

```
-((LN(COS(x)+1)-LN(COS(x)-1)))/2,   (where x = uppper limit)
```

I'd say that there are editing errors in both the calculator solution and the integral-table solutions you listed.

The Schaum's outline Mathematical Handbook lists the integral of csc (x) [= 1/sin(x)] in equation 14.461 as

```
ln (csc(x) - cot(x)) = ln (tan(x/2))
```

As others have pointed out, all three forms can be equated by trigonometric identities.

Re: incorrect integral of 1/(sin x)

*Message #8 Posted by **I, Claudius** on 19 Nov 2005, 6:21 p.m.,*
in response to message #7 by Karl Schneider

His 49's answer is correct. His table solution is an obvious error.

-((LN(Cos(x)+1)-LN(Cos(x)-1)))/2,LN(Csc(x)-Cot(x)),LN(Tan(x/2)) evaluated at x=2 all approximate to

.443022...

Maple agrees.

Re: incorrect integral of 1/(sin x)

*Message #9 Posted by **Crawl** on 19 Nov 2005, 7:11 p.m.,*
in response to message #8 by I, Claudius

I assumed his table answer of

-ln (cotx cscx)

was a typo and was intended to be

ln (cotx - cscx).

It's the only thing that makes sense, expecially since even if that was the answer, why write it that way? The negative in front of the log would turn cot to tan, and csc to sin, which are the more "normal" trig functions.

Re: incorrect integral of 1/(sin x)

*Message #10 Posted by **Karl Schneider** on 20 Nov 2005, 2:09 a.m.,*
in response to message #8 by I, Claudius

His HP-49(?) answer was missing a right paren after the first term -- unbalanced parentheses.

41c display angle

*Message #1 Posted by **Hal** on 19 Nov 2005, 3:34 a.m.*

Hi Everybody... I have a 41c that i got about a month ago that seemed to have weak, faint upper display elements. That is until I rotated the calc away from me and viewed at a shallower angle (so my line of sight was perpindicular to the slanted face of the keys), and presto...dark, will saturated segments averywhere. Anybody else notice this on a 41c? (More so than on a 41cx halfnut, which doesn't seem to require as shallow an angle for good viewing).

Re: 41c display angle

*Message #2 Posted by **Karl Schneider** on 19 Nov 2005, 2:35 p.m.,*
in response to message #1 by Hal

Well, I have a contradictory example:

One of my co-workers owns a halfnut 41CX whose display is somewhat faint, and seems to run slow, as well.

All in all, though, the fullnet displays are much better than the halfnut displays. The earliest (US-made) 41C/CV's displayed shorter, but bolder and more "solid" characters with less space between the segments. Later fullnuts showed characters that were taller, but less bold. (This may have coincided with the shift of production to Singapore.)

Halfnut displays are bad, IMO. Large gaps between the segments gives a "broken-up" look to the characters.

Re: 41c display angle

*Message #3 Posted by **Miki Mihajlovic** on 19 Nov 2005, 5:56 p.m.,*
in response to message #1 by Hal

HEPAX and SANDBOX modules have function that will alow you to set the contrast on halfnut models. Once set it doesnt change even after the master clear. That will help only if it isn't an LCD problem. From what you said it might be, if only the upper segments are faint.

Re: 41c display angle

*Message #4 Posted by **Hal** on 19 Nov 2005, 7:18 p.m.,*
in response to message #3 by Miki Mihajlovic

Thanks guys for your input.
It looks like said 41c may really have a display problem after all. If I key in 2's across the display, the upper segments are totally gone when using a normal veiwing angle. I can see the upper segments, however, at a *really* shallow angle (almost edge on). I'll try leaving the batteries out overnight and see if that helps.
Hal

in response to message #5 by Question

You're not who? 8)

He blankets HP calculator auctions and occasionally finds a real bargain. He then turns around and offers the bargain for an outrageous premium, which he also sometimes gets. It's "buy low and sell high" with a vengance. In the abstract, I personally see nothing wrong with that, though several folks here would disagree. But emotionally, I just can't stand to see a seller, and then a buyer victimized by a serial capitalist. 8-| It's complicated for me because I'm something of a serial capitalist myself, but not on that scale. I like to sell for a profit, but I also respect the people I do business with, whereas this gentleman seems not to.

(My one and only eBay ID can be gleaned from my email address. I am NOT the guy selling this 71.)

Re: Bargain71 on eBay

*Message #7 Posted by **Stephen Easterling** on 20 Nov 2005, 8:34 p.m.,*
in response to message #6 by Howard Owen

We'd all be silly if we didn't occasionally want to profit off of our sales. Oftentimes we get frustrated when we just want to unload an item and simply want to get our money worth or even take a loss in the name of finding an old calc a nice, new home to another collector. I can see how many here on this forum would be upset (me, too, at times!) with the high prices because the seller we're talking about always seems to have something that we want, but we don't want to spend too money on the (collectible) item. This seller has obviously cornered half the vintage HP calculator market. Honestly, though, his prices should be cut in half unless the item is "new" in box with all essentials.

As for the "bargin" 71B, I don't think calcs like this remain a bargin for long on Ebay! It's at $158.50 now and I predict it'll hit $200 before the auction ends.

Re: Bargain71 on eBay

> Like I already said in an archived post, the HP-71B is a real gem, but it actually isn't that rare, there are tens of thousands of them still in existence because of a very large order (20,000) of HP-71Bs by the British NHS. If I recall correctly, all of them had HP-IL ROMs included and many also had Math ROMs as well. When they were deemed obsolete, they were sold *en-masse* for peanuts, as low as $US 50.00 or less, and at some HPCC meeting they were given *for free* to the attendants, you could chose your own from a large box containing them.

> By the way, I suggest to anyone thinking about getting an HP-71B to also do their utmost best to get hold of its Math ROM. Else you'll have an (HP-71B)/2 instead. And while you do get it, have a look at Emu71 from Jean-François Garnier, which comes complete with the HP-IL ROM and Math ROM images and all, and it's absolutely free, very convenient to use, and runs at awesome speeds (30-50x times the speed of a physical HP-71B), which makes the already incredible Math ROM functions all the more powerful.

Best regards from V.

Must have been wishful thinking; or my mind is totally spoiled by today's memory capacities...

Marcus

Re: Math "ROM" in "RAM"?

*Message #13 Posted by **J-F Garnier** on 23 Nov 2005, 3:10 p.m.,*
in response to message #10 by Marcus von Cube, Germany

Yes, of course!

The Math LEX has been extracted from ROM years ago, and is in one of the Swap Disks on this site.

J-F

Re: Math "ROM" in "RAM"?

*Message #14 Posted by **Howard Owen** on 23 Nov 2005, 4:15 p.m.,*
in response to message #10 by Marcus von Cube, Germany

Specifically, on the 'ATCHO' disk in file 'MATHROM'

Re: Math "ROM" in "RAM"?

*Message #15 Posted by **Marcus von Cube, Germany** on 25 Nov 2005, 8:32 a.m.,*
in response to message #14 by Howard Owen

So in theory I should be able to read the lexfile from emulated mass storage (EMU-71 & Christoph Klug's HP-IL card). I have to find the time to set it all up correctly.

Marcus

Re: Math "ROM" in "RAM"?

*Message #16 Posted by **Howard Owen** on 25 Nov 2005, 11:28 a.m.,*
in response to message #15 by Marcus von Cube, Germany

Yes, that's how I get lex files on to my machines. Only, I use EMU41 to serve the virtual disks because it allows the external computer to be the loop controller. EMU71 must always be the loop controller itself. If you have a real 9114B, you can copy files to it using EMU71, then reconfigure the loop and copy the files onto a real 71.

Edited: 25 Nov 2005, 11:29 a.m.

Re: Math "ROM" in "RAM"?

*Message #17 Posted by **J-F Garnier** on 26 Nov 2005, 4:01 a.m.,*
in response to message #16 by Howard Owen

To download LEX or any file into your HP71 from a LIF disk image using Emu71 (with HPIL support), just do:

```
HP71B side:
  CONTROL OFF (if not already done)
  COPY :LOOP
Emu71 side:
  RESTORE IO (if not already done)
  COPY file:HDRIVE2  (or from any other drive)
  COPY file TO :HP71
```

Could I use the 82164A HP-IL/RS-232C Interface + Emu71 (with HPIL support)?

Re: Math "ROM" in "RAM"?

*Message #19 Posted by **J-F Garnier** on 29 Nov 2005, 7:40 a.m.,*
in response to message #18 by Gileno

At the moment, Emu71 doesn't provide native RS232 support. However, you could copy the LEX file to a DOS/Windows file (through Emu71's :DOSLINK device), it will automaticaly include the right LIF header, then use a communication tool to send this file to the HP-71B through the HP82164A interface.

This is a principle advice only and I can't give more details, I don't use this method (HPIL link is much more easier).

J-F

Re: Math "ROM" in "RAM"? What about in EMU71 ROM?

*Message #20 Posted by **Chris B.** on 29 Nov 2005, 1:56 p.m.,*
in response to message #19 by J-F Garnier

Hi J-F,

This thread has got me thinking about something I've been confused about regarding EMU71 (which by the way is a *fantastic* tool that I plan to upgrade to full HPIL functionality). Is the MathROM actually included with (or is the ROM .BIN file available to load into) EMU71? I've read the instructions on your web site, and it indicates that you must dump the contents from an actual physical ROM (for copyright reasons, which makes complete sense). I've tried this and failed because the MathROM appears to be private and I don't have the alternate PEEK$ LEX file needed to unprivate the ROM. (in fact, I don't know which PEEK$ file is needed -- will the one on JPCROMD work? Apparently, the PEEK$ keyword was removed on JPCROM Ex).

But I've read in this thread and a number of times here in the Forum and in Datafile (Valentin's *superb* HP-71 articles) that the MathROM is *included* in EMU71, which seems to contradict the above.

Since I haven't yet found a MathROM file in the EMU71 download, I'm assuming the instructions on your web site still

apply. But now I'm wondering, if the MathROM code is actually available in a LEX file on one of the swap disks (which I was unaware of until seeing the posts in this thread), doesn't that mean the ROM code is already in the public domain? It looks like I could download the LEX file into EMU71 RAM, but can a binary file be created to include it in ROM on EMU71 (without violating any copyright restrictions)?

Best regards, Chris

Re: Math "ROM" in "RAM"? What about in EMU71 ROM?

*Message #21 Posted by **J-F Garnier** on 29 Nov 2005, 3:03 p.m.,*
in response to message #20 by Chris B.

The Math LEX has been indeed available FOR YEARS on the Swap Disks, with no formal objection from HP, even when the HP-71B and the Math pac were still on the market. So, and at the request of some heavy duty HP-71B Math ROM users, I included the Math ROM in the HP71 ROM package (which is separated from the Emu71 package). Of course, if HP ever objects on this, I will remove them, but when I see the number of HP41 ROM now more or less freely available for (software) emulators or for module (hardware) emulators, I guess that HP definitively doesn't care of it.

And of course it doesn't mean that the Math ROM is public domain, it remains copyright HP.

J-F

Re: Recovering the data from Series80 tapes

*Message #1 Posted by **John** on 18 Nov 2005, 9:10 p.m.*

Hi,

This is a reply to vp's message of November 5 which is now inthe archive.

I also have some damaged HP-85 tapes, my thoughts were to punch some new holes inside of the damaged area (to become the new EOT / BOT markers). This probably is no good in helping to recover data, but would allow the tapes to be re-used.

Experiments so far have not been successful, I think a flat pin and die with sharp edges are needed:

| | | | <- punch +--+ ---------- <- tape ----+ +----- | | <- die | | | |

Regards, John

HP tapes from that era are useless. Apart from recovering data that has survived on them over the years, such tapes are totally unreliable.

On most tapes I have looked at, the tape itself is sticking onto itself and the elastic band that is maintaining tension has deteriorated.

Even if you manage to get the tape working, it will prob. fail after a couple of read/write cycles.

I would strongly recommend leaving such tapes alone in case we can come up with some way of reading their contents.

New HP-33S exam books

*Message #1 Posted by **Norris** on 18 Nov 2005, 4:06 p.m.*

PPI has released two new exam books for the HP-33S:

Essential Equations for the FE Exam Using the HP 33S, by John A. Camara, $29.95

Essential Equations for the Civil PE Exam Using the HP 33S, by David V. Morse, Wane Schneiter, Norman Voigt, and Bruce A. Wolle, $39.95

****

In my experience, most of the equations that you need for the FE and PE exams are not particularly complicated. The hard part is recognizing which equation to use and entering the right values, rather than the actual number-crunching. As a Civil PE candidate, I have loaded only a handful of pre-programmed equations into my 33S (the time-value of money is probably the most important).

So I don't plan to get the book. But it's interesting to see new HP calculator books of any kind. Details at ppi2pass.com

MLDL2059: a few new pics

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 17 Nov 2005, 9:48 p.m.*

Hi all, mainly MLDL2000 'lurkers'...

My unit is just one step far from being concluded and locked inside the custom(ized) card reader holder. The new pictures (from mldl2059_assembly_23.jpg to mldl2059_assembly_32.jpg) show how I added the battery 'backup' and the external DC connector. Please, do not laugh at the ancient technology I used to build the PCB's. The MLDL2059 will demand further studies in the future, because of its unique forward and backward technology inside: HP evolving to Meindert, then getting centuries back with my own...

The 'battery backup', as suggested by Menindert, is actually a .047F/5.5V (half the capacity Meindert suggests, in fact). This one was found in an old Panasonic VCR carcass, and seems to be made to fit in the MLDL holder, as you will see. The tinny 100ohms resistor and the diode were taken from a burned switched power supply (PC). The diode is even smaller than the SMD ones...

Hope you enjoy the pictures. As soon I have the definitive connector between the HP41 interface and the CPLD board, I'll add the final pictures. In fact I know what to do, just miss the continuous hours I'll need to do it.

Cheers.

Luiz (Brazil)

HP 48G upgrade - 4mb info

*Message #1 Posted by **CaribeT** on 17 Nov 2005, 7:41 p.m.*

I was just wondering if anyone has any more info on upgrading the hp 48 to 4mb. I know there is a document in hp.org about it (by Philippe TEUWEN) but it is very short and does not have much details. I was hoping to get some info that basically tells one what to do. If anyone has further info, that would be great. Thanks (Does anyone know of someone who has actually done it?)

Edited: 17 Nov 2005, 8:03 p.m.

Re: HP 48G upgrade - 4mb info

*Message #2 Posted by **I, Claudius** on 18 Nov 2005, 8:06 a.m.,*
in response to message #1 by CaribeT

I did a 128k upgrade myself years ago, had a bit of a problem getting the case back together. I bought a 48g upgraded to 1 MB from Cynox, they did a great job, and it's performed superbly ever since. I don't know if they still do the procedure, but it's worth checking out.

Re: HP 48G upgrade - 4mb info

*Message #3 Posted by **Ron Ross** on 18 Nov 2005, 8:46 a.m.,*
in response to message #1 by CaribeT

I upgraded a 48G to 128k and had planned to add an additional 512K later (never bothered as I then got a 48GX and bought a 128K and 1 meg card from Koltz). Physically the chips I looked at would have to be piggy backed stacked to get me to the RAM I wanted (I wanted 1 meg and only found 512K ram at that time). I suspect you might be in a similar prediciment (only with 1 meg RAM, I don't believe I have ever seen a 4 Meg SRAM of the type needed for the 48 series). It isn't easy for the surface mount variety to extend their pins to piggyback. (of course I am getting older and can't see all that well anymore either).

However, I did consider a 2 meg (I didn't really consider the 4 meg card) card. I still have used less than half of the 1 Meg.

If you do succeed in adding the 4 meg, 256K (and maybe as much as 512K) of it will be on no real use to you. The memory is partitioned out in ports with port 0 and port 1 unavailable to your 4 meg of RAM (thats the first 256K of RAM that the 48G uses). And the 48G uses RAM in 128K increments (so 4 Meg would be 32 ports). That is a lot of ports to keep track of. Koltz uses bank switching and a switch to swap the last two ports for his 4 Meg cards.

I find my 1 Meg is fine for my use and I can understand someone even wanting 2 Meg. 4 Meg on the 48G's memory scheme is probably just for some exotic applications that you are very unlikely to need.

Of course if you can find a way to just land a 1 meg chip on the location of the 128K ram location and get the circuity to work with a few jumpers (you will also need a couple of other components as well) to get the 48G to use anything above 128/256K (may be able to merge the next 128K w/o the extra circuity, but I wouldn't bet on it.

Re: HP 48G upgrade - 4mb info

*Message #4 Posted by **CaribeT** on 18 Nov 2005, 3:12 p.m.,*
in response to message #3 by Ron Ross

I don't really have a need for it at the moment. I just have some spare time on my hands and thought it would be interesting to do. I think that even 1 or 2 meg would be great too - but so far I don't have the info on how to do that either. Are there any takers out there on how to upgrade to 1 or 2 mb? I recently changed the 32k with 128k and will piggy back another 128k on top of that shortly (Opening it was easier than I thought - basically with no damage thanks to some info on hpcalc.org), and am hoping to add another 512 after that (and as I said - even go beyond that.

Re: HP 48G upgrade - 4mb info

*Message #5 Posted by **Ron Ross** on 18 Nov 2005, 3:44 p.m.,*
in response to message #4 by CaribeT

That first 128K is really easy, just remove the 32K and drop on a 128K chip.

Gets more difficult after that. You also need a low power 7400 chip to tie onto one of the pins (there is a spot on the board for it, not supplied on the Hp48G) and a resister.

More and better information is on hpcalc.org and look/search for RAM upgrades. Photo's are also available. Good luck.

One thing I would consider (if I were you). Buy a card slot (the one supplied for the 48GX if you can find one). Solder it on the board, then solder on the 7400(might be a7404, the info you find will be more specific as this was 3-4 years ago for me). Once you have the card slot, you could by a RAM card from Klotz for $40 that you leave in (wrap it so it wont ground/short out). You would have to cut up your back case to make the card fit, but if your 48G ever failed, you could move the same card over to another ready and willing 48G (or if you ever found a 48GX reasonably). Pulling it out would only result in your 48G going back to its onboard RAM.

Re: HP 48G upgrade - 4mb info

*Message #6 Posted by **CaribeT** on 18 Nov 2005, 4:09 p.m.,*
in response to message #5 by Ron Ross

Yeah that does sound like a good idea...just have to keep an eye out for the card slot (maybe on a broken gx??). I wonder if they can be bought as a spare part somewhere? Until then, I'll see how I go with the internal RAM upgrade.

Re: HP 48G upgrade - 4mb info

*Message #7 Posted by **tomc** on 19 Nov 2005, 1:21 a.m.,*
in response to message #6 by CaribeT

Can anyone comment on exactly which 128k memory chips they used? 3.3 or 5v? speed? Power consumption?

thanks, TomC

Re: HP 48G upgrade - 4mb info

in response to message #7 by tomc

I just got 'Hynix HY628100B (LLG-55)' which is made by Hyundai and it works just fine. It was the easiest one for me to get here in Australia (it ultimately shipped from Thailand though) - purchased through futurlec.com. It is very low (LL) power and only 55 ns, which is great. Can download the datasheet for it's specs off any datasheet website.

eigen values and eigen vectors

*Message #1 Posted by **Lorena** on 17 Nov 2005, 1:26 p.m.*

could you please me show how to calculate de eigen values and eigen vectors of a matrix, i found the commands EGV and EGVL but i can not diffirenciate EIGEN VALUES and Eigen vectors. I thank you in advance lorena

eigen values and eigen vectors

*Message #2 Posted by **Thomas Radtke** on 17 Nov 2005, 5:00 p.m.,*
in response to message #1 by Lorena

On a HP48, EGV delivers eigenvectors and eigenvalues, whereas EGVL gives just the eigenvalues.

hth,

Thomas

weird usages of HP 49 (original)

*Message #1 Posted by **Chris** on 17 Nov 2005, 1:15 p.m.*

I was wondering if it was possible, and this would require strange programming, to load an image (jpeg) into the calc's memory and pan on the image (if it was bigger then the screen). If so, would this be very slow? Obviously it would have to be black and white, or at least discernible under those conditions.

Re: weird usages of HP 49 (original)

*Message #2 Posted by **unspellable** on 17 Nov 2005, 2:11 p.m.,*
in response to message #1 by Chris

It doesn't pan, but I have an animated image of a rotating globe of the Earth for my HP48SX. If that can be done, I'd think a panning image could be done. I don't believe a jpg would be the right format though.

Re: weird usages of HP 49 (original)

*Message #3 Posted by **Bill Wiese** on 17 Nov 2005, 5:21 p.m.,*
in response to message #2 by unspellable

Well, you'd first have to decompress the JPEG image into actual pixels. That's a time-consuming process for native Saturn CPU instruction set. Dropping back into the ARM instruction set for the HP49 may be very useful for speed.

If the image is large and the aspect ratio is same/near to that of HP49 screen, and 8X downsampling would work, then the DC coeffecients of the 8x8 DCT blocks could just be used. This avoids the extra crunching to extract all the other pixels - as the DCT's DC coefficient is just the avg value of all the pixels in that 8x8 block.

I have my doubts about viewing a jpeg itself on the calculators, but there are utilities for converting between various image formats and graphicss objects for the calculators. Try some searches at http://www.hpcalc.org/.

And that would be hurtful exactly how? You don't have to read it, *or* answer it.

Gileno, you aren't making the best use of what we have to offer here. I know it's hard to find information in another language, but please do try to find the answer before you ask a question. In this case, lifutil will do what you want. Vassilis pointed it out in the thread he referenced above. If you follow links people give you, and try to learn the tools they lead to, then you will be able to answer questions like this one on your own.

```

a) it decreases the signal to noise ratio of the forum

b) searches in the archives return useless items

c) this approach discourages people from responding (notice that some weeks ago Gileno's postings were ignored and he had to keep posting the question.

d) its actually bad for Gilleno as well, because it may stop people from reading his postings

As far as I am concerned, if this were a newsgroup, I'd just kill-file him and get it over with. This is what I have done with ebay and Coburlin.

However, this is a free forum. If Gileno feels like posting repeatedly questions that have been answered before, I can keep flaming him (another old tradition of newsgroups) !

It depends what you mean by *help*.

Let me give an example, somebody posts a note saying "please help me make spagetti carbonara". How do you help this person? I would simply post the recipe. And this is what I did in your case. The link I posted in my previous posting (http://www.cs.drexel.edu/~vp/CS543/LIF/index.html) is the recipe. It provides definitions, data samples and a discussion on the format to allow undergraduate-level students to write simple programs (500 - 800 lines) to read LIF archives.

However (returning to my analogy), if by "help" you mean to come over and cook the spagetti for you, then let me know and I will not bother with your postings again.

Algorithm used to find Q and Q^-1 on HP32E

*Message #1 Posted by **Mike T.** on 17 Nov 2005, 5:59 a.m.*

Does anyone have the details of the algorithm used to find Q and Q^-1 on the HP32E calculator - it is obviously iterative.

I suspect that it is performing a numerical integration, probably using a Trapezoid or Simpson approximation but I have not idea which or what limits are used. The manual simply states 'The HP-32E computes Q^-1 using a sophisticated iterative algorithm.' and does not give any further clues as to how the answer is calculated.

Thanks, (in advance).

Mike T.

Re: Algorithm used to find Q and Q^-1 on HP32E

*Message #2 Posted by **Namir** on 17 Nov 2005, 6:44 a.m.,*
in response to message #1 by Mike T.

The algorithms use raitonal polynomials.

Re: Algorithm used to find Q and Q^-1 on HP32E

*Message #3 Posted by **bernhard** on 17 Nov 2005, 2:55 p.m.,*
in response to message #2 by Namir

The HP29C program library shows a polynomial approximation used to calculate Q(x). The error term is < 7.5 * 10^-8. The inverted function Q^-1(x) may also be approximated by a polynomial, but the error term is worse (< 4.5 * 10^-4). So it is a good guess the HP32E uses the same (or a similar) poly approximation for Q(x) and for the inverse function Q^-1(x) uses some iterative search (like interval splitting) on the more precise Q(x) approximation to find x.

Algorithm from the manual:

f(x) = exp(-x^2/2) / SQRT(2 * PI);

R(x) = f(x)* (b1*t + b2*t^2 + b3*t^3 + b4*t^4 + b5*t^5) + err(x);

where |err(x)| < 7.5e-8

t = 1 / (1 + r * abs(x));

r = 0.2316419

b1 = 0.319381530

b2 = -0.356563782

b3 = 1.781477937

b4 = -1.821255978

b5 = 1.330274429

Q(x) = [R if (x >= 0)] or [1-R if (x < 0)]

If you want to find out the truth, I'd suggest you try the above math and whether it produces the same results as the 32E does. No warranties implied - maybe you find a typo (I didn't check it).

According to the manual, the primary source is Abramowitz and Stegun, Handbook of Mathematical Functions, National Bureau of Standards, 1970.

If the above algorithm works like the HP32E, please post a reply.. for a long time (~20years) I wanted to know what makes the HP32E Q^-1 lightshow... which is really cool, for a non-programmable calc.

best regards, Bernhard

Re: Algorithm used to find Q and Q^-1 on HP32E

*Message #4 Posted by **Mike T.** on 18 Nov 2005, 5:37 a.m.,*
in response to message #3 by bernhard

Thank you - I'll try this out some time.

I don't suppose you have an HP29C you can try the published program out on...? A 'quick' check of the results produced on an HP29C against the HP32E would give an indication as to the similarity of the algorithms used. Alternatively I could try implementing this on a HP34C...

Mike T.

Re: Algorithm used to find Q and Q^-1 on HP32E

in response to message #3 by bernhard

Good reason to buy the museum disks and look at the vntage calculator manuals and solution pacs. These guides contain the math equations that show the approximations used to calclate various probability distribution functions and their inverse.

You can also find these equations (for Normal, Student-T, Chi, and F) in my book:

"Mathematical Algorithms in Visual Basic for Scietists and Engineers" by Namir C Shammas
This book was published in 1996 by McGraw-Hill.

Some book that must be - the LOWEST price I can find on Amazon is over $1500.00 !! Think I'll have to pass on that..

Is this the book, Namir ?

*Message #7 Posted by **Valentin Albillo** on 22 Nov 2005, 11:41 a.m.,*
in response to message #5 by Namir

Hi, Namir:

Is this the book you're referring to ?

Mathematical Algorithms in Visual Basic for Scientists & Engineers

because the price is absolutely outrageous (more than $3 per page ... what was the 'new' price, then ?) and the reviews seem a little on the negative side, don't they ? Any explanation ? Lots of typographical errors at the printer's or something beyond your control ?

Best regards from V.

Re: Algorithm used to find Q and Q^-1 on HP32E

*Message #8 Posted by **hugh steers** on 18 Nov 2005, 8:37 a.m.,*
in response to message #3 by bernhard

for sure, the 32e doesnt use the Abramowitz and Stegun "Hastings" approximation. at least not the standard one, although i understand there are other hasting approxes. the polynomial you mention is the one use by most programmable libraries include those of casio.

however, it is not 10 digit accurate, but the 32e is. also for inversion (ie inv Q). my guess is that it is, in fact, an iteration, as this would be less storage than the bigger polynomials needed for 10 digit accuracy. Q, erf and gamma are all related and normally require two iterative algorithms, one that converges over 0-1 and the other for x>1.

a while back, i ran some tests on this, here, http://www.voidware.com/index.php?option=com_wrapper&page=http://www.voidware.com/calcs/hp32e.htm

in other news....

the lygea 12c emulator has added N(z) and z. which are exactly Q and inv Q. this is a huge plus for black-scholes on the 12 and why hp couldnt have done this for the 12cp, who knows. AFAIK, the lygea 12c is a true emulator and not a simulator, which means they've suceeded in adding functions to the original code (or bolted them on somehow). so this proves its possible to revise functionality.

it alsp appears to be 10 digit accurate.

http://www.lygea.com/pocket12cdetail.htm

Re: Algorithm used to find Q and Q^-1 on HP32E

*Message #9 Posted by **bernhard** on 18 Nov 2005, 4:15 p.m.,*
in response to message #8 by hugh steers

Well, Gentlemen, I did mention in my post it was only a good guess on how the HP32E might do the calculation, did I ?

To really find out the truth, it might be worthwile to try annotate the disassembled microcode listing of the HP32E microcode.

I think this should be done with all HP calc microcode once Eric's Nonpareil is perfected to a point where there are no ambiguities left as how to the ACT chip works (= all calcs simulated perfectly).

Any volunteers ?

Regards, Bernhard

Prices for classic calculators then and now

*Message #1 Posted by **John Nguyen** on 16 Nov 2005, 9:45 p.m.*

I recently came into possession of a "Users' Library Software Catalog for the HP-41/HP-71/HP-75" from May 1986. I want to share an interesting annnouncement in the "What's New" section of this catalog.

"Announcing Price Reductions for HP-41 Calculators!

"Effective February 1, the prices of four Hewlett-Packard handheld calculators have been reduced by an average of 22 percent. Reduced manufacturing and material costs allow HP to pass the savings on to customers.

"Reductions on the four models are: HP-11C from $75 to $56; HP-15C from $120 to $99; HP-41CV from $225 to $175 and HP-41CX from $325 to $249."

Who would've guessed almost 20 years later, on eBay, an HP-11C goes for $150-$250; an HP-15C $175-$300; an HP-41CX $200-$500.

I still kick myself for passing on a new 48GX back in 2001, on sale at an Office Max for $109. My 48G+ was working great for me at the time so I didn't think I'd need an expandable 48GX as I wasn't going to use those programs on expandable cards anyway. Plus, I thought it was just a matter of time before HP was going to release a killer new calculator to replace the aging 48G series.

I have been known to be wrong.

John

*Message #2 Posted by **Stephen Easterling** on 16 Nov 2005, 10:35 p.m.,*
in response to message #1 by John Nguyen

I felt the same way with the 48GX and 32SII. I was planning on buying them, figuring I had plenty of time. I got busy with work (for several years!), woke up, and when I went to buy them, they were gone!... only to turn up on Ebay for nearly twice their normal prices!

Re: Prices for classic calculators then and now

*Message #3 Posted by **Frank Boehm (Germany)** on 17 Nov 2005, 1:52 a.m.,*
in response to message #2 by Stephen Easterling

> I felt the same way with the 48GX and 32SII. I was planning on buying them, figuring I had plenty of time. I got busy with work (for several years!), woke up, and when I went to buy them, they were gone!... only to turn up on Ebay for nearly twice their normal prices!

Hmm, I paid about 700 Deutsche Mark (that's about 360 EUR or 430 USD) for my 48GX when it was new. (and 444 Deutsche Mark for my first HP - a 28C)

Re: Prices for classic calculators then and now

*Message #4 Posted by **Hugh Evans** on 17 Nov 2005, 3:37 a.m.,*
in response to message #1 by John Nguyen

Adjusted for inflation since 1986:

HP-11C: $56 --> $98 HP-15C: $99 --> $174 HP-41CV: $175 --> $307 HP-41CX: $249 --> $437

The 48gx would have been a nice investment. Since technology tends to depreciate no one could have anticipated anything to the contrary back in '86.

Re: Prices for classic calculators then and now

*Message #5 Posted by **Mike T.** on 17 Nov 2005, 5:14 a.m.,*
in response to message #1 by John Nguyen

Unfortunately prices for UK models were never even close to those in the US - particularly way back in 1979 when I had to work all summer to be able to buy my original HP33C!

Mike T.

Interestingly enough, inflation in 20 years has almost doubled. Peopel earn more and average prices on consumer goods go up. I checked this last year - based on average inflation from 1981 to 2004, a single US dollar in 1981 is roughly equivilent to US$2.08 in 2004. Said in another way, a $100 calculator sold in 1981 would have the same financial impact to a wage earner as a $208 calculator today. So you're actually doing better to buy a $150 HP-11C in 2005 than you would buying it for $75 in 1981. The prices only seem high - but $100 in 1981 was quite large sum once you roll back 20+ years of inflation.

What's more mind boggling to me is that you can buy a $7 calculator that does more than these top-end models of 1981 (though without RPN and without the high quality level).

Voyager line; HP prices in the mid-1980's:

*Message #7 Posted by **Karl Schneider** on 19 Nov 2005, 4:42 p.m.,*
in response to message #1 by John Nguyen

John Nguyen posted:

> Quote:
>

>
> "Reductions on the four models are: HP-11C from $75 to $56; HP-15C from $120 to $99; HP-41CV from $225 to $175 and HP-41CX from $325 to $249."

For context, I bought my HP-15C in November 1983 from a US university bookstore for $109. (I don't know if that was a sale discount.) Mail-order prices also often ran lower than manufacturer's prices.

The large difference in HP's price between the HP-11C and the HP-15C might explain why the 11C was manufactured until 1989, just as the 15C was. The HP-11C was a fine product with excellent documentation. But, let's face it -- the 15C eclipsed the 11C so completely only a year after the latter's introduction, so as to render it superfluous except to occupy a price niche.

The 15C looked virtually identical to the 11C; a trained eye was practically needed to tell 'em apart without the logo. The 15C offered a vastly-expanded repertoire of useful advanced functionality, was no less easy to use, and was a bit better organized, as well. Only a substantial cost savings could justify the purchase of an 11C over a 15C, but it may not have seemed to some would-be 15C buyers that they were actually *getting* more with the 15C.

So, why did the 11C serve as the entry-level model? Because a void was left after the HP-10C was discontinued in 1984.

IMO, it was a good idea for HP to provide a simpler-looking scientific in the Voyager line, with only one shift key and less functionality. However, they probably "missed the mark" on the 10C by making it a crippled and crummy programmable, instead of a fuller-featured non-programmable.

Perhaps HP considered it unthinkable to release a scientific non-programmable, after they had developed and implemented Continuous Memory, LCD's, and low-power circuits. However, the 10C's crude programming paradigm from the HP-55 and small memory (10 registers/70 bytes) rendered progamming nearly useless, even though most of the thin user's manual was devoted to it. The "programming" usurped 10 scarce keyboard positions, which could have been dedicated to useful functions.

So, the 10C -- the original low-end Voyager -- was as poorly-designed as the high-end 15C was excellently developed. If the 10C had been a coherent low-end model, it might have continued to occupy that niche in place of the 11C, which could then have been dicontinued after prices were reduced across the board. That would have left only the *clearly and visibly* more-advanced 15C as the higher-priced alternative for those who wanted programmability and the advanced functionality to exploit it.

Who knows how many sales the 11C "stole" from the 15C, particularly from 1985-1989? I don't know the figures, but this certainly seems like a case in which misguided product design -- perhaps driven by marketing -- had some consequences.

You are definitely an original 15C user, and know the machine well. What is your take on HP making an updated version?

Re: Voyager line; updated 15C

*Message #9 Posted by **Karl Schneider** on 19 Nov 2005, 7:40 p.m.,*
in response to message #8 by I, Claudius

As was discussed extensively in a recent thread, it ain't gonna happen, if for no other reason than lost HP-15C ROM code. Too much work to re-create that, and KinHPo doesn't have the skills or resources to pull it off.

If I were to take any enginnering test that did not require use of a "super-duper" calculator and software, and were allowed to bring and use only one calculator, it would be the 15C. All functions and advanced mathematics directly at your fingertips without menus or spelling of commands, and an easy-to-read display.

However, at work I use the HP-32SII primarily, because I can store and maintain useful programs that run quickly, and that I have a PC with Matlab for heavy stuff.

Today's users would not tolerate not having a useful alphanumeric display for program listings and meaningful error messages. Perhaps the best concept for a new scientific in the traditional HP mold would be based on the 32SII paradigm with a horizontal layout, adding a longer display, and (improved) advanced functionality present in the 15C that "went missing" in the 32S/32SII/33S. Even the HP-42S is too cumbersome in many respects.

The "programming" usurped 10 scarce keyboard positions, which could have been dedicated to useful functions."

> I fully agree. It was surprising that the HP-10C had programming capabilities *inferior* to those of the venerable HP-25, to the point that most 'complex' programs for the HP-25 couldn't be made to fit the HP-10C at all. Though it did have an important advantage over the HP-55 programming capabilities: HP-10C's program steps were *fully merged*, so that STO+5 consumed just *one* step of (unbearably scarce) program memory while it required *three* in the (equally cramped) HP-55.

"Who knows how many sales the 11C "stole" from the 15C, particularly from 1985-1989? I don't know the figures, but this certainly seems like a case in which misguided product design -- perhaps driven by marketing -- had some consequences."

> I think you're absolutely right. Speaking for myself, HP-11C prices were just about affordable (if very high) while HP-15C prices were completely out of reach, at least here in Spain.

Best regards from V.

in response to message #10 by Valentin Albillo

I, too, found the HP-15 priced out of my range and I purchased an HP-11C instead. The up-side: I have one of the early HP-11's with the 0.0xxx bug in my collection as well as an HP-11C without the bug.

My HP-28S is a anniversary model recognizing "AMERICAN MATHEMATICS - 100 YEARS - 1888-1988". I don't know where the start date came from. I got it at a garage sale for a few dollars. The previous owner was so mad at the battery compartment cover that he "just wanted to get rid of the damn thing!"

That model commemorated the 100th anniversary of the American Mathematical Society which was founded in 1888.

But if 15C prices were completely out of reach, how could any other calculator "steal" any sales from it? Suppose the 11C hadn't been available; wouldn't the buyer have just purchased another model, maybe not even an HP? Or would the buyer have saved up until the price of the 15C was in his reach?

But that's not to say that the 11C was necessarily a good marketing decision. Evidently the 15C's price was in reach for at least some, and sales of the 15C would probably have been better if there hadn't been a lower-cost model available.

> But if 15C prices were completely out of reach, how could any other calculator "steal" any sales from it?

Context, context... From what I've read here, prices for HP calc's were and are much higher in Europe than in North America. I paid a very reasonable $US109 in late 1983 for a 15C.

James sated,

> Quote:
>
> But that's not to say that the 11C was necessarily a good marketing decision.

Well, my thesis statement was the following: HP bollixed the entry-level 10C, perhaps causing its early demise, and thereby forcing the fine 11C into the role of price leader, where it may have cannibalized sales of the 15C due to near-indistinguishability despite a large difference in price.

It's more of an indictment of unsound marketing decisions for the 10C, which apparently backfired.

A well-designed 10C, along with the 15C, could have provided buyers a clear choice between two very different models that actually looked different:

- 10C: basic mathematical functions
- 15C: that, plus programmability and advanced functionality

Instead, buyers ended up with an "entry" model (11C) that looked pretty much the same as the premium model (15C).

Back to the 11C: The 11C and its documentation comprised a fine product, but its programmability was merely a simple convenience for most users. It was computationally slow, and -- without I/O and alphanumerics -- ill-suited for maintaining a library of programs. However, the same programmability was *absolutely essential* for the 15C, in order to allow users to define functions for SOLVE and INTEGrate. With complex-number and matrix functions as well, the 15C was a masterpiece built upon the solid foundation of the 11C.

Recently, I acquired a nice HP-11C Solutions Handbook. It contains many application routines that the user can enter by keystroke, to fully utilize the 11C's capabilities. Of course, limited storage essentially restricts the user to one application at a time, and many of these were implemented

better as built-in microcoded programs on the HP-15C, HP-16C, or HP-12C.

Re: Voyager line; HP prices in the mid-1980's:

*Message #15 Posted by **brian heally** on 21 Nov 2005, 12:35 p.m.,*
in response to message #7 by Karl Schneider

In 1987 I bought an HP11c because I couldn't think of affording the 15c, and I also didn't think that I needed its power although I was still in engineering school. I thought the 11C was an excellent product, although I never used the programming capability of it. It's value to me was based on RPN. RPN is the single most important feature to me, I value it way more than programming ability or graphing. It simply can't be beat for plain and simple number crunching, which is what I mostly did (and still do).

I agree with what you are saying. I had been thinking about getting an HP for some time before I could actually afford it, when the 10C was still available. I vaguely remember thinking that although the 11C was pricier, it had some features that I thought that I might want, and that my money was better spent on the 11C. The 11C had some additional non-programable features over the 10C. If the 10C was still around when I finally made my purchase, I probably would have bought it IF it had ALL of the features of the 11C except the programming.

HP-10C v. HP-11C: non-prog features

*Message #16 Posted by **Karl Schneider** on 21 Nov 2005, 9:20 p.m.,*
in response to message #15 by brian heally

Brian posted,

> Quote:
>

And, I believe that you wouldn't have been the only one.

The only non-programming functions "missing" from the 10C that I can find are:

- delta_%
- hyperbolics and inverse hyperbolics
- permutation and combination
- gamma function
- absolute value
- roll up

The last two of these are most useful for programming, but all of them could have been accommodated with room to spare if the weak programming capability were omitted.

BTW, the 10C (and 12C) had a y-estimator function that the 11C and 15C lacked.

Re: HP-10C v. HP-11C: non-prog features

*Message #18 Posted by **Vieira, L. C. (Brazil)** on 21 Nov 2005, 10:45 p.m.,*
in response to message #17 by Katie Wasserman

Hi, Katie;

the HP15C also has a last-minute sequence (if I can say so) that I remember using once when I bought it, and another time here, later, only after Valentin to show how to use it in a very specific way. Both the HP15C and HP11C allow a number to be stored as a random seed through [STO][RAN#], but only the HP15C allows [RCL][RAN#].

My 2 cents.

Cheers.

Luiz (Brazil)

*Message #19 Posted by **Marcus von Cube, Germany** on 23 Nov 2005, 12:44 p.m.,*
in response to message #18 by Vieira, L. C. (Brazil)

Luiz,

> Quote:
>
> ...but only the HP15C allows [RCL][RAN#]

Yes it's allowed, but it does *not* recall the same value that you stored! The decimal point position is lost:

```
123.45
STO
#ran     (press ENTER)
RCL
#ran     (press ENTER)
```

This will return 0.12345

Marcus

Re: HP-10C v. HP-11C: non-prog features

*Message #20 Posted by **Karl Schneider** on 21 Nov 2005, 11:04 p.m.,*
in response to message #16 by Karl Schneider

Katie and Luiz pointed out several specific functions that aren't evident on the keyboard (which was my focus). However, one can add those, as well as

- random number
- clear Sigma

to the list, although the latter isn't much different from "clear reg" on the 10C.

Re: Prices for classic calculators then and now

*Message #21 Posted by **Peter Geiser** on 21 Nov 2005, 9:43 a.m.,*
in response to message #1 by John Nguyen

Interesting idea. If you compare prices for these calculators with prices of actual calculators with the same calculation power, the "values" might be different.

But to add another hypothetical scenario: In 1986, you buy HP shares rather than the calculators. Closing price for the share
15 May 1986: USD 4.21
18 Nov 2005: USD 29.40

This is an increase of 7 times (and it is definitely not the best you could have done).
With this gain you could buy the calculators for the following prices:
HP11C: USD 56 * 7 = USD 392
HP15C: USD 99 * 7 = USD 693
HP41CV: USD 175 * 7 = USD 1225
HP41CX: USD 249 * 7 = USD 1743

It is all a matter of perspective...
Peter

HP 48GX program

*Message #1 Posted by **Mike - uk** on 16 Nov 2005, 5:56 p.m.*

Is it possible to temporarily remove the programming ability of the HP 48GX. I know this may seem strange but as it is programmable, it is not allowed to be used under exam conditions. Hence the question?

Re: HP 48GX program

*Message #2 Posted by **James M. Prange (Michigan)** on 16 Nov 2005, 6:04 p.m.,*
in response to message #1 by Mike - uk

Temporarily remove the batteries. ;-)

Regards,
James

Re: HP 48GX program

*Message #3 Posted by **Ron** on 16 Nov 2005, 6:30 p.m.,*
in response to message #2 by James M. Prange (Michigan)

I could certainly be wrong, but I think James wanted only to disable the programs from use during an exam. Wouldn't removing batteries disable all functional capability? Does on mine

Re: HP 48GX program

*Message #4 Posted by **Howard Owen** on 16 Nov 2005, 7:00 p.m.,*
in response to message #3 by Ron

I think that was the (not quite serious) point.

The fully serious point implied by that is that there is no way to do what the questioner wants, short of making the calculator inoperable.

Re: HP 48GX program

*Message #5 Posted by **James M. Prange (Michigan)** on 16 Nov 2005, 8:02 p.m.,*
in response to message #4 by Howard Owen

Yes, the "wink" emoticon was meant to convey the idea that I was joking.

Seriously, since the compiler creates a SysRPL program every time you press ENTER or an immediate execution key with something in the command line. It's hard to see how you could disable programming and still have the calculator usable at all.

Regards,
James

Re: HP 48GX program

*Message #6 Posted by **Ron** on 17 Nov 2005, 1:09 a.m.,*
in response to message #5 by James M. Prange (Michigan)

LOL James -

Brand new to the forum, not to the product. My rookie week on the forum is full of ignorance, especially about who has been around long enough to "wink" or have tongue in cheek. My experience in other forums like MathCad tells me that such privileges are well earned by special contributors. I look forward to reading your many contributions and learning more programming tricks for the 48 and 49 critters.

My bio with handhelds started with the TI-59 circa 1975 and followed with 15c, 12c, the 48 series and now a Christmas gift the 49g+. I have enjoyed teaching such subjects as queing theory (with learning curve) and reliability calculations in computer maintenance manpower considerations, etc, not to mention some interesting on-site real estate transactions involving random patterns of cashflows. I even programmed some photography equations into the MES system of the 48 to calculate depth of field and other solutions in the field which helped me to appreciate some possible uses by surveyors and other civil engineers.

Forgive me for not taking the time to recognize your "wink." It was a faux pas and won't happen again.

Ron

Re: HP 48GX program

*Message #7 Posted by **Mike -UK** on 17 Nov 2005, 5:10 p.m.,*
in response to message #6 by Ron

Thanks for the response. Perhaps my question was not phrased correctly. In the UK any calculator that is programmable (in that they imply that it has the ability to store user-inputted programs/functions), then it is not permitted in exam conditions. However if you have a calculator that can perform a manor of operations through the main or left shift/right shift keyboard, provided it does not store formulae or programs once turned off, it is allowed in exam conditions. My intention was to remove the ‘user’ programmability off the calculator, temporarily and then replace it afterwards. All other ‘standard’ maths functions would remain as installed in the factory. Regardless I will probably have to purchases a suitably accepted calculator for exams. Thank you again for your comments. Mike

Re: HP 48GX program

*Message #8 Posted by **Arnaud Amiel** on 18 Nov 2005, 2:24 a.m.,*
in response to message #7 by Mike -UK

Although it is not possible to remove the programmability of the calculator, it is possible to wipe out all the content of the memory which means that if you had store anything before your exam and the inspector sees the memory clear, he might just allow you to use it. It is worth checking before end with the inspectors.

Arnaud

Re: HP 48GX program

*Message #9 Posted by **I, Claudius** on 18 Nov 2005, 8:17 a.m.,*
in response to message #7 by Mike -UK

"...any calculator that is programmable... then it is not permitted in exam conditions."

That definitely rules out the 48/49 series, also the 32/33. That leaves you just the 30s and 6s, currently available from HP.

Is this for any exam, including physics/engineering, or just math?

NCEES Approved Calcs for 2006

*Message #1 Posted by **Norris** on 15 Nov 2005, 5:21 p.m.*

NCEES has just released the list of approved calculators for licensing exams in engineering and surveying for 2006. No big changes, just a few additions.

HP: the 9S and 33S remain legal, and the 30S has been added.

Casio: FX 115 MS and FX 115 MS Plus remain legal, and the FX 115 ES has been added.

TI: the 30X IIS, 30X IIB, and 36X Solar remain legal, and the 30XA has been added.

Compared to the announcements for 2004 (HP 41, 42, 48, 49 were suddenly banned) and 2005 (all other HPs, except the 9S and 33S, were suddenly banned), the lack of surprises is welcome.

Re: NCEES Approved Calcs for 2006

*Message #2 Posted by **I, Claudius** on 15 Nov 2005, 6:11 p.m.,*
in response to message #1 by Norris

I have now read from a variety of sources regarding the NCEES policy. Weighing all considerations, the NCEES made a very poor decision. I'm lucky that my professional career will be unaffected by this nonsense, I've gotten very used to the HP48/49 series. To be denied the use of such a wonderful tool for the arbitrary and capricious reasons given by the NCEES is completely asinine. My sympathies are extended to all who are affected by this.

CA-PELS Approved Calcs for 2006

*Message #3 Posted by **Norris** on 15 Nov 2005, 7:29 p.m.,*
in response to message #1 by Norris

Oh, one other point: the California Board for Professional Engineers and Land Surveyors still allows all HP calculators (and other non-QWERTY calculators) on its state-specific (non-NCEES) PE and PLS exams. But this is only relevant if you are taking certain civil-related or survey-related exams in California.

Some other states also offer non-NCEES licensing exams, but as far as I know, they all enforce the NCEES calculator policies, even on non-NCEES exams.

Has the 6S been discontinued? [re: NCEES 2006]

*Message #4 Posted by **Karl Schneider** on 16 Nov 2005, 12:05 a.m.,*
in response to message #1 by Norris

The HP-6S should be perfectly acceptable and adequate, unless it has been discontinued and is no longer available on retail shelves.

BTW, I bought one one eBay, just for fun. It's certainly not a triumph of engineering or good design, but it

isn't ugly, and it has a few functions that even the mighty HP-41C didn't have.

There is no power switch or automatic power-off function. So, as long as an expensive Type 43 button cell is installed and light is inadequate, it will keep discharging that cell. Mine arrived with a dead one, no doubt after spending much time in a dark box.

-- KS

No more 6S or 6S Solar

*Message #5 Posted by **Norris** on 16 Nov 2005, 1:39 a.m.,*
in response to message #4 by Karl Schneider

Sadly, the 6S and 6S Solar have been discontinued. The 9S, 30S, and 33S are the only scientific (non-graphing) calculators currently available at hp.com.

Calculatorsource.com is currently offering "a limited number" of "refurbished" 6S Solars (without case, packaging, or warranty) for $14.95.

I have been using a 6S Solar for a few years, mostly stored in the dark, and the battery isn't dead yet. It's a great field calculator; the combination of light weight, small size, legible display, and low power consumption is hard to beat for outdoor use.

Keys not registering

*Message #1 Posted by **Funnel Bunny** on 15 Nov 2005, 12:54 p.m.*

I have an HP 48G+ and some of the keys are not registering keystrokes. I took the faceplate off and saw there are two small, metal buttons underneath the faceplate that are depressed when the faceplate is attached. Initially, re-adhering the faceplate--ensuring that the metal buttons were depressed--fixed the problem, but now only half the keys register keystrokes. Has anyone encountered this problem before, or is anyone familiar with a remedy?

Re: Keys not registering

*Message #2 Posted by **Randy** on 16 Nov 2005, 6:36 p.m.,*
in response to message #1 by Funnel Bunny

You attacked it from the wrong side. The problem is typically one of lost connection between the keyboard and logic board which can only be accessed by removing the case back and then the logic board. You'll find opening instructions on HP48.ORG.

The two metal tabs you refer to are there to make contact with the aluminum keyboard surround and connect it to the case for electrostatic discharge protection, they have no bearing on the problem you described.

Ultimate keyboard solution

*Message #3 Posted by **Rafael Ramos** on 20 Nov 2005, 4:39 p.m.,*
in response to message #1 by Funnel Bunny

it can be dust or ox between the layers. the easy solution (may be the only?) is:

1 - grab some cofee filters (paper) 2 - cut it into strips that can be inserted between the layers (you should end with a few strips of 7x120mm) 3 - fold them in two (now you have a double 7x60mm sheet) 4 - find a very thin metal sheet, 4x60x.5mm (i found good ones inside celular batery packs) 5 - put it ´inside´ the folded cofee filter strips. 6 - slowly insert it between the plastic layers of the keyboard. the paper must be dry. leave at least 10mm outside. 7 - spray some freon or whaterver you like to use on the paper.wait a few seconds 8 - slowly pull the paper and the metal sheet.

notes: do not use this paper again, neither insert the metal sheet without paper, under risk of damaging the trails or having some paper stuck inside the keyb.

hope this helps

How would you price these calculators?

*Message #1 Posted by **Han** on 15 Nov 2005, 11:54 a.m.*

Hi,

I'm just starting to build upon my humble collection of HP calculators. Since I started with the 48G series, I find myself at a loss as to what most collectors would deem to be a reasonable price for older models. My main interest is to collect each and every one of the Pioneer series, and the HP48 series as they all have my favorite keyboard layout (big ENTER key). Could you seasoned collectors help me by giving what you think are good price ranges for these calculators?

Thanks, Han

Re: How would you price these calculators?

*Message #3 Posted by **Stephen Easterling** on 15 Nov 2005, 6:38 p.m.,*
in response to message #1 by Han

Today I completed my collection. The first thing I did was collect all of the Pioneers. I already had a 28S (my first), but then wanted the 48/49 series. In addition, I have the 33S, some Voyagers (11C, 12C, 15C) and one from each of the other families. Looking back at the $5k I just dropped over the past few months!!, I think I would just collect two calculators from each family (or just one, depending on your budget). At first, I thought the 48GX was the be all - end all of calculators, but it's not. (I'd say the 49G+ is, actually.) So decide what you want to use professionally and what you want to collect. If you need a loaded 48GX to use at work or school, then get one. If you just want to collect, then I'd save the money and get just the 48S and 48G (and 49G+ since it's the latest and greatest). Then pick up one or two from each family. For instance...

Classics: HP35, HP65 Woodstocks: HP25, HP29C Topcats: omit unless you're into the big stuff Spice: HP33E, HP34C Voyagers: HP12C, HP15C, HP16C (get the 15C for sure, but decide between the 16C and 12C) Coconuts: HP41CV, HP41CX Pioneers: 32SII, 42S (the 17BII, 21S, 22S, & 27S are great substitutes, depending on what you're into) Champions: 28S,??? Charlemagnes: 48S, 48G Other: 33S, 49G+

Functionality-wise, there's a great deal of overlap here, but when you throw in a business calc (17BII),

statistics calc (21S), programmers cals (16C), RPL calcs (48G), LED models (34C), and the model that started it all (HP35), then you'll have a well-rounded collection. You may give more consideration to get something that also goes along with your profession (e.g., business, programming, science-only, math-only).

Price-wise, you're in the holiday shopping season, so prices on Ebay may be higher now. Mint versions of any of these older models will go for $250 - $400 on Ebay. Some of the guys here may give you a price break and sell for less if they're Ebay-boycotters, but then again, many selling here also make mention (in their ad) that they are also selling on Ebay, so it does you no good since you're now getting into bidding wars. A mint 29C just sold for about $357 or so on Ebay, and a brand new 15C sold for over $400, but a very nice 15C can be had for $150-$225 usually.

Oh yeah, one more thing. I mentioned I just got all of the Pioneers. That's cool. But looking back, getting one or two from each family is even more cool. All from one family is boring, really. Also, don't feel like you have to get the very best model from each family. They sell for twice as much! You won't use them every day, anyway! Don't be afraid to get the "lesser" models and give them a nice home. For instance, I just passed that beautiful 29C (selling for $357 or so) and got a mint HP25 for only $73. I also got a mint 33E. I found a new 41CV,...didn't need the more popular 41CX. A 48G will do fine,... don't need a 48GX! A 49G+ is far better than the GX anyway.

What you have is a seller making a claim about his product. If you read the copy in that auction it says something like "This thing is new. If you don't agree, I'll give you your money back." There are several things to consider about this claim.

1. Do you trust eBay sellers as a matter of course?
2. Or, do you trust the seller sufficiently after having looked closely at his/her feedback?

3. Do you trust eBay to enforce its rules if you are defrauded?
4. Or, (US only) Do you trust in your credit card company to reverse the charge if you go through the necessary notification steps to comply with federal law?
5. Or, do you trust PayPal's "buyer protection" insurance, if you choose to pay that way, and to pay the insurance fee on top of the auction price?

All of these boil down to one question: do you trust the eBay marketplace? eBay is valued by the U.S. stock market at billions of dollars precisely because a large number of buyers *do* trust them to provide a fair marketplace.

Personally, I try to judge the veracity of a seller's claims by looking at the photos, and reading the claims. I also look at a seller's feedback. Not just at the percentage number, but at two or three recent transactions, and at least one negative feedback, unless these are unavailable. (Most real people who sell on eBay will have at least one or two such feedback entries.) If I were in the market for a pristine 15C, I would view a photograph like the single one included in the referenced auction as inadequate, and I would ask for more. I would decline to bid if I didn't get them, too.

But after all is said and done, I trust the eBay marketplace, in combination with consumer protection laws in the U.S. If I pay with a credit card, I can get a refund for any item for which I have a record of unsatisfactory correspondence with the seller, and proof that I returned the item to the seller. *I have never needed to resort to this for an eBay transaction!* I've been doing a lot of buying on eBay, too. But, I do read the auctions carefully, and I do scrutinize the sellers. And I will frequently pass up a chance to bid if I don't like what I see. For the last several years, that approach has worked well for me.

Hp brought back the HP 15C: Hallelujah!!

in response to message #1 by Luis

Hallelujah!!

Mother Hp has listened to our prayers!!!

She brought back NIB Hp-15C and slowly auctions them one at a time on Ebay making big profit :-)

And next month, a NIB red dot Hp-35 will show up to our delight :-))))

Etienne

In the add it says they it was made in 1988, I've found that a lot of HP 15c & 11c calcultators made through mid 1987 to mid 1988 had painted over HP 12c keys, if it is actually unused I would suspect it will have the painted over HP 12c keys, which would kind of make it inferior. If you are series on bidding you might want to ask that question.

SD card useage - HP49G+

*Message #1 Posted by **RON** on 14 Nov 2005, 3:51 p.m.*

Any word on the possible enhancement ... in a future flash ROM upgrade?"

See page 26-7 under "Storing objects in the SD Card." Has to do with building a subdirectory into port 3, which is basically limited to bulk storage.

Thanks.

Re: SD card useage - HP49G+

*Message #2 Posted by **I, Claudius** on 15 Nov 2005, 7:14 a.m.,*
in response to message #1 by RON

The memory structure of the original HP49 is actually better than that of the 49+, it simply works right out of the box, no card needed. The keys work, too!

Re: SD card useage - HP49G+

*Message #3 Posted by **Arnaud Amiel** on 15 Nov 2005, 7:32 a.m.,*
in response to message #2 by I, Claudius

The 49G+ also works directly out of the box. Its memory structure if you don't bother with the SD card is exactly the same as the 49.

Arnaud

HP41 to PC transfer

*Message #1 Posted by **Francois** on 14 Nov 2005, 2:46 p.m.*

Hello,

I have hp41, hpil loop controler and rs232 interface. I would like to transfer programs and datas from hp41 to pc and reverse. For data, it's possible with instruction OUTA, INA and IND. For programs, it's possible from hp41 to pc with the PRP instruction. Unfortunately, i've not the 82183a extended i/o module. Is there an other possibility to put programs in the hp41 ? Isn't it possible to use the WRTP and READP instruction on the RS232 port ? (when I launch these instructions, the light on the rs232 interface blinks but I've nothing on the serial port) Thank you for your advices Francois North of France

Re: HP41 to PC transfer

*Message #2 Posted by **Doug Wilder** on 14 Nov 2005, 3:51 p.m.,*
in response to message #1 by Francois

Hi Francois,

Unfortunately either the XIO module or an MLDL type device is required to accomplish program transfer between HP41C and PC. A PC ISA HPIL IO card may also implement this transfer, I'm not familiar with these cards.

The WRTP/READP of the IL module is for mass storage device, thus it sends several HPIL commands to the loop, for example to find the file and position the device. The RS232 interface does not understand these HPIL commands. WRTP/READP send literal binary of the 41C program, causing problem when these happen to be control code.

Many people were mad when HP designed the IL module because of its severe restrictions. For example there is no way to remove the loop from remote mode and switch to local mode once REMOTE mode is entered. The LOCAL command does not function because it sends a GTL instead of the required NRE command. LOCAL is essentially an HPIL NOP. This lack can lead to difficulties programming the RS232 interface and any device that implements REMOTE/LOCAL logic.

The XIO module corrects the problems by adding a slew of new and very usefull HPIL functions including full DDL/DDT control. NOTREM fixes the problem mentioned above. OUTP/INP transfer programs via sending an Intel Hex (0-F characters only) dump of the program with attendant checksum.

Best regards

Re: HP41 to PC transfer

*Message #3 Posted by **Francois** on 15 Nov 2005, 1:13 p.m.,*
in response to message #2 by Doug Wilder

Hi Doug,

Thank you very much for your reply. It confirms what I've noticed with the hp41 and the rs232 interface : impossibility to load programs from pc to hp41 and impossibility to return to local mode. For data (X and alpha) it's possible but not for programs. I've developped a small program which permits to upload and download n succesive registers in an excel worksheet. I think I'll look for an extended IO module (82183) rather than a pc isa card which could be difficult to use with our high speed bus on the actual PC computers. Thank you again Francois France

in response to message #3 by Francois

Bonjour François,

Xio modules are dead rare & expensive.

If you intend to use it on a regular basis or wish to use other modules not readily available, you have a very efficient hardware emulator with the Clonix: Voir par ici.

Emulating many modules in one single module enclosure, this marvel will enable you to use nearly any Rom you wish without purchasing one everytime.

I have burnt permanently the Advantage Module & Xio on my Clonix and can use them everyday.

Cordialement

Etienne

Dear Francois,

The HP-IL/PC interface card needs an ISA-Bus. By using EMU41 software the card is compatible to operating systems like DOS, WIN95, WIN98, WINXP, WINNT, WIN2000. I use this solutio also with modern fast PC hardware.

EMU41 includes data and programm transfer. Furthermore EMU41 emulates a printer and two mass storage devices and works as gateway between real HP41 and PC world...

Regards - Christoph Klug

*Message #6 Posted by **francois** on 19 Nov 2005, 2:45 p.m.,*
in response to message #5 by Christoph Klug

Thank you for all your response. Clonix is a nice solution but I know absolutely nothing about M code. If there is a possibility to program the OUTP and INP functions with M code, let me know. For instance, I'll save my programs with the PRP function and type them on the keyboard for entering. And use my excel macro to exchange register data until finding a 82183 ... Regards François

Re: HP41 to PC transfer

*Message #7 Posted by **Howard Owen** on 19 Nov 2005, 4:15 p.m.,*
in response to message #6 by francois

You don't need to write mcode to use a Clonix. You can just load it up with your favorite modules and leave it that way. Diego will load the modules you ask for before he ships it to you. If you want to change the modules later, then you need to know something about the HP-41's memory layout, but you still don't need mcode. (You also need the adapter that Diego will sell you, along with a PIC programmer, in order to change the contents of the Clonix.)

The NovRAM and Nov-32 modules don't strictly require mcode knowledge either, but their purpose is to emulate the HEPAX module. To fully exploit the HEPAX module, you *do* need mcode knowledge.

Regards,
Howard

in response to message #7 by Howard Owen

Hello,

I've looked more closely at all these features and i was wondering if we can only put modules images or is it possible to put user programs in the clonix. In fact is it possible to convert .RAW to .MOD files to put in the clonix ? How can we know if a module is 4k or 8k long ? If a 4k module uses the upper page of a bank, can we put another one in the lower adress space ? If the clonix ram is enabled, how does it appears in the hp41 ? Regards Francois

Re: HP41 to PC transfer

*Message #9 Posted by **Howard Owen** on 23 Nov 2005, 4:27 p.m.,*
in response to message #8 by francois

My Nov32 isn't built yet (hi Diego! 8) so I'm not sure of the answers to some of your questions. I think it is possible to convert user code into .mod format, but which tools to use for that, I have no idea. I'd start my search at TOS, however. The author of V41 is the inventor of the .mod format, I believe. I think you can tell how big a module is from the PC filesize. And I believe that you can indeed load a 4K module into an upper page and another 4K module into the lower page. THe Clonix specific questions I will leave for Diego to answer.

Re: HP41 to PC transfer

*Message #10 Posted by **Doug Wilder** on 23 Nov 2005, 10:46 p.m.,*
in response to message #8 by francois

Hi Francois,

Maybe i can answer some of your questions yet i do not own a clonix. The idea is that if you have an operating system (sic) in a page of rom/ram (mine is in eprom) it will have

a program to transfer user code to rom/ram.

With the old ERAMCO system i use the function is called MMTORAM, and one supplies the user code program name in Alpha and the rom/ram address to load at in X (binary). The function takes care of putting the program in the FAT and is immediately in Cat 2. To read back into ram one uses the COPY function.

Putting user code in rom/ram is one of the best uses of MLDL as you can save very large library of your user code programs in transferable rom/ram pages.

"If the clonix ram is enabled, how does it appears in the hp41"

If the clonix works like most MLDL, it appears as nothing unless an image of microcode and/or user code is in it: then it looks like a module in that page (CAT 2). Usually pages 8-F can be used. The OS will also usually have a function (mine is RAMWR) that allows direct edit of words in rom/ram most usefull for writing mcode functions. Most OS also have mcode disassembler and functions to transfer rom image to/from MASS/PC. OS will also have binary/hex tools like COD/DECOD and a MOVE function to move chunks of code in rom/ram.

Hope this clears up the usage a little bit. Best Regards

*Message #11 Posted by **Hans Brueggemann [GER]** on 15 Nov 2005, 3:18 p.m.,*
in response to message #1 by Francois

hello francois, there is a chance to do hp-41 program transfer via 82164A (with some restrictions, though) simply by using the ina and outa commands.an XF/M module is neccessary to do the trick (or, an hp-41cx, of course). this is truly a bare hands method, digging deeply into synthetic programming. you have to decode your program into bytewise representation (001CC600F500434C584D16141A111911001002A2DE9672B2810000C8032D4F, for example ;o)) and then send it via HPIL to your pc, and vice versa. during coding back to "true bytes" (in our case 10 bits, that is)"simply" put the bytes into proper program storage location et voilá: your are ready to run your program on the 41 again. routines for coding and decoding are ready available (bill wickes did something about it, afaik). please, don't get me wrong here: it is just a theoretical approach to the problem. coding and decoding routines will run for ages, even if your program consists just of a handfull of bytes. well, and programming of all the stuff... truly not for the faint of the heart.

cheers, hans

CNG serial numbers?

*Message #1 Posted by **Scuba Diver** on 14 Nov 2005, 2:23 p.m.*

Hi everyone!

I popped into a local office supply store and took a look at their HP collection. They're selling the 17BII+, the 10BII and the 12C (NOT the platinum). The 10BII and 17BII+ show serial numbers in the CNA520XXXX range, however the 12Cs have serial numbers I've never seen before: CNG516XXXXX. CNG?

Has anyone else seen this before? I assumed the "A" represented the year (since the "5" could be 2005, or (hopefully) 2015...so I thought A5 would represent 2005, B5 2015, etc...)

Perhaps it represents WHERE in China it was manufactured? I'm sure Kinpo operates multiple facilities in China...

Anyhow, I just thought I'd ask.

Scuba

Re: CNG serial numbers?

*Message #2 Posted by **Matt Kernal (US)** on 14 Nov 2005, 7:48 p.m.,*
in response to message #1 by Scuba Diver

> Quote:
>
> I assumed the "A" represented the year ... Perhaps it represents WHERE in China it was manufactured?

From what I remember, when the "A" suffix started showing up (following the original CN country code), it was generally thought to be a second manufacturing plant. If that is the case, then the "G" would be "Plant G".

On the other hand, since they have revised the 12C(P) with some additional keys and some bug fixes, maybe the G means "Good ones".

Re: CNG serial numbers?

*Message #3 Posted by **Mark Crispin** on 14 Nov 2005, 9:03 p.m.,*
in response to message #2 by Matt Kernal (US)

My HP-12c (purchased in September) has s/n CNG507xxxxx. If they're up to CNG516xxxxx in just two months... does that really mean that they sell 450,000 HP-12c calculators each month?

If so, it's no wonder they're still producing it! :-)

Re: CNG serial numbers?

*Message #4 Posted by **Mark Crispin** on 14 Nov 2005, 9:08 p.m.,*

in response to message #3 by Mark Crispin

More seriously, I think that it's more likely that "A", "G", etc. is a factory code. They have probably allocated non-overlapping serial number block ranges, so a particular serial number actually identifies a single calculator within all HP calculators as opposed to one within a particular model.

Re: CNG serial numbers?

*Message #5 Posted by **Matt Kernal (US)** on 15 Nov 2005, 1:03 p.m.,*
in response to message #3 by Mark Crispin

Mark, I think you may be looking at the wrong part of the serial number to conclude that 450,000 units were built in two months. I believe you calculated:

```
51600000
Enter
50700000
2
/
```

450000 <-- answer

If you take a look at Decoding Serial Numbers you'll see that the "5" is the year of manufacture(i.e. 2005) and the next two digits are the week of manufacture within the year (i.e. week 07 and week 16 of year 2005). The last five digits indicate the sequentially-numbered unit produced during that particular week.

You would have to add the final number of units produced for each week from week 07 to week 16 (i.e. a 9 week period), to determine the total number of units produced. Since we don't know the final weekly production numbers, we can't accurately calculate the number of calculators made between your calculator's birthday, and Scuba Diver's calculator's birthday.

L8ter,
Matt :-)

Serial Number format: cc? Y WW

*Message #6 Posted by **Paul Brogger** on 15 Nov 2005, 4:31 p.m.,*
in response to message #5 by Matt Kernal (US)

During my call to HP Support for my 33s replacement, as I read a few serial numbers from my early units, the support person was instantly responding with (for example) "Oh, that was made in January of 2004. There's no way we're gointg to replace that without a receipt."

I took the comments as confirmation of the Serial # pattern, as in each case the interpretation was consistent with the first three digits being a single-digit year code followed by a two-digit week-of-the-year number.

Of course, that doesn't help you with the "G" in "CNGyww..." As an additional quirk, my 33s calculators all start with **CNAyww...**, except the very earliest one, which has just **CN404...**.

(Also, the two earliest have the serial # melted into the back case, while the others each have affixed a silver rectangular label with black printing.)

CNA serial number

*Message #7 Posted by **bill platt** on 15 Nov 2005, 4:48 p.m.,*

in response to message #6 by Paul Brogger

Hi Paul,

I have it from an HP support person (over a year ago) that the "A" refers to a second factory. It is not a date code.

The "A" is noticable when going from what I call the "-" revision to the "A" revision (early Walmart to 1st issue from Amazon)

I had called them with a laundry list--all of the bugs that we had found here.

She was very nice, and she pushed the list into a category that would be looked at seriously (there's some term they use). At the time, she knew about the permutations bug, but not about the H.ms or the rect-polar, or the difference between "-" and "A" with respect to ALG.

It was in this conversation that I learned that the "A" was in fact a second batch and was produced at a different facility. BTW my amazon "A" rev has an "A" in CNA and my early walmart does not (it is CN).

"True" RPN Updated Features?

*Message #1 Posted by **Howard Owen** on 14 Nov 2005, 11:25 a.m.*

What if development of high-end HP Calculators had followed the direction set by the HP-42S?

In the debate between devotees of RPN and RPL calculators, the RPL camp has a distinct advantage in that development of those machines has continued over time, albeit at a slow pace after HP drew in its horns in the calculator market. "True" RPN calculator development seems to have stopped with the HP-32SII and HP-17BII. But the pinnacle of RPN calculator development (neglecting important considerations like I/O) was probably the HP-42S.

So, what if Prof. Wickes hadn't decided to go with the radical and revolutionary architecture first exposed to users in the HP-28C? How would a more evolutionary approach to the revolutionary increases in processor power and memory size have changed high-end HP calculator models? How could some (or all!) of the advantages of the RPL calculators be realized using a more traditional RPN model?

These questions are inspired by this post by James M. Prange, in which he offers up a sharp critique of the Voyager models as programmables from the standpoint of a user/programmer who is used to RPL. Some of his points are due to the differences between RPN and RPL, but many are there because the Voyagers are old, mid-range machines. What if there were an updated RPN machine with a modern processor and memory size *and* an updated RPN OS to take advantage of them?

Re: "True" RPN Updated Features?

*Message #2 Posted by **Ed Look** on 14 Nov 2005, 2:20 p.m.,*
in response to message #1 by Howard Owen

Good post, just as good as James' which inspired yours.

This is a tough question to answer past a certain point, as the needs or preferences of different users would color their perception of the answer. Of course, I suspect the two largest camps are the surveyors and the engineers.

But from a scientific point of view, and not at all comprehensively, and from an idiot's first line of thought, I'd say somehow, merge the power of RPL with the simplicity of keystroke RPN programming (apologies to James Prange, sincerely!) along with a multiline display, for example, the ability to view at least blocks of the program if not in its entirety (tough to do with the usual one or two line display of the usual scientific programmable).

And then, as a personal preference, not necessarily a professional one, I think it'd be best to preserve the keystroke aspect, even to its display in the programming space, for the key itself, be it shifted or not, tells you what it does.

Of course, RPL has the powerful advantage of being able to express a set of instructions (particularly equations) in a more concise way than RPN keystrokes. Perhaps a blend of two, but I don't see how that can be practicably done, given that a RPN machine has only a four level stack. In fact, if a RPN machine can be given the effectively infinite stack of a RPL calculator (plus the attendant RAM increase), I think this in itself

would be a significant improvement.

Finally, I think it would be wonderful to add variables (again, with relatively big RAM) to register storage, just for the flexibility of it.

(Am I dreaming... ?)

I'd love to hear a diversity of opinion about this subject. I figure I'll get my wish around here. 8)

> Quote:

OK, I hear this:

- Preserve the simplicity of keystroke programming.
- A multiline display wih the ability to view some context around the line you are editing.
- This probably means >2 lines.

> Quote:
>
> And then, as a personal preference, not necessarily a professional one, I think it'd be best to preserve the keystroke aspect, even to its display in the programming space, for the key itself, be it shifted or not, tells you what it does.

Can you give an example of what you mean by this?

> Quote:
>

In fact, if a RPN machine can be given the effectively infinite stack of a RPL calculator (plus the attendant RAM increase), I think this in itself would be a significant improvement.

OK, so why not combine the environments in some way? I like this idea. You could have a keystroke RPN mode, or a full RPL programming mode. The calculator would be capable of executing either type of program in any context. They would both share the same stack, variables, registers, and so forth. One type of program could freely call the other type.

> Quote:
>
> Finally, I think it would be wonderful to add variables (again, with relatively big RAM) to register storage, just for the flexibility of it.

Named variables should be able to act as registers in the keystroke/RPN mode. Registers would, in fact, be just predefined (but not preallocated) variables.

> Quote:
>
> (Am I dreaming... ?)

Well, yes you are. But that's what I asked for!

Thanks!
Howard

Oh, by that I simply meant that while writing or viewing the program itself, what is visible is the keystroke that is recorded as a program line. I should add, as it is now done in the HP 33S, unlike the way it was in my old HP 34C, which displayed only the "coordinates" of the key(s) pressed for a given line of program. This to me is very easy or "natural"... I suppose because RPN keystroke recording was my first intro to programming any calculator.

> Quote:
>
> This is a tough question to answer past a certain point, as the needs or preferences of different users would color their perception of the answer. Of course, I suspect the two largest camps are the surveyors and the engineers.

I suppose that surveyors would want I/O, preferably wireless and not line of sight. Maybe Bluetooth? Other than that they'd probably want to be able to store lots of data on the calculator; maybe a low cost memory card like the 49g+, which also makes it very easy to transfer data?

But basic connectivity, such as RS-232 compatible I/O, is important too.

But probably the largest market is students. What would appeal to them? Yes, apparently HP thinks glitzy colours and weird keyboards, but I mean other than that.

I expect that new users are put off by RPN itself, after being indoctrinated in the use of algebraic input models. Maybe release a low-cost very basic "4-banger" model to "catch them young", when they're first getting acquainted with a calculator. It wouldn't have to be immediately very profitable; think of it as an investment in developing a future market, or as an advertising expense.

For that matter, I'd appreciate a shirt-pocket-sized RPN model for myself, even if it didn't include the "scientific" functions or programmability.

> Quote:
>
> But from a scientific point of view, and not at all comprehensively, and from an idiot's first line of thought, I'd say somehow, merge the power of RPL with the simplicity of keystroke RPN programming (apologies to James Prange, sincerely!) along with a multiline display, for example, the ability to view at least blocks of the program if not in its entirety (tough to do with the usual one or two line display of the usual scientific programmable).

No apologies needed; I can see that keystroke programming ought to be very simple.

A multi-line display is useful, but at first thought, as long as the stack is restricted to four registers, it wouldn't seem to make much sense to have more than four lines. But maybe extra status information could be displayed in the run mode and extra code lines in the program mode? Maybe a larger display without the special annunciators would be cheaper? Maybe different font sizes?

> Quote:
>
> And then, as a personal preference, not necessarily a professional one, I think it'd be best to preserve the keystroke aspect, even to its display in the programming space, for the key itself, be it shifted or not, tells you what it does.

But if I understand correctly, the 33S, for example. doesn't always show you which key was pressed, but instead sometimes what you chose from a menu. Surely seeing a command name in the display should tell you what it does?

> Quote:
>
> Of course, RPL has the powerful advantage of being able to express a set of instructions (particularly equations) in a more concise way than RPN keystrokes. Perhaps a blend of two, but I don't see how that can be practicably done, given that a RPN machine has only a four level stack. In fact, if a RPN machine can be given the effectively infinite stack of a RPL calculator (plus the attendant RAM increase), I think this in itself would be a significant improvement.

Of course I prefer a variable stack without the t register replicating downward. But perhaps the user could optionally restrict the stack that he can use to a particular depth, and optionally with the top level replicating downward on stack drops.

Regarding equations, how far would you care to go with various object types? In the RPL models, an algebraic object is internally identical to a SysRPL secondary (program), with the differences being a different prologue, and the algebraic being restricted to RPL sequences that are logically equivalent to a valid algebraic expression. For example, if I key in 'X^2+Y^2=R^2' in the command line, then the compiler changes the order of the elements to:

```
'X' 2 ^ 'Y' 2 ^ + 'R' 2 ^ =
```

for internal use. Converting an algebraic expression to an RPN sequence and back to an algebraic expression is completely deterministic and seems well suited to a machine. But not just anything keyed in as an algebraic is valid; syntax checking is required. And not just any RPN sequence can be converted to a valid algebraic, for that matter. Without going to full-fledged RPL-style "objects", you'd still need a way to keep track of the length of the sequence, perhaps by storing delimiters.

> Quote:
>
> Finally, I think it would be wonderful to add variables (again, with relatively big RAM) to register storage, just for the flexibility of it.

Certainly being able to call an object by an associated name is a big advantage. And so is specifying the scope (global or local to a procedure). In the RPL models, local environments can be "nested", and if a local name in an "inner" procedure happens to match a name in an "outer" procedure (or global, library, or command name in the search path) then only the most recently created local variable with that name can be accessed. Directories in the RPL models (except the 28C) also serve to specify the search path. Unless the path is specified along with the global name, only names in the current and parent, grandparent, etc. directories can be found, and after searching each directory, any associated library is searched for the name.

> Quote:
>
> (Am I dreaming... ?)

Maybe, but it seems to me that the development of the 33S has been mostly getting the 32sII capabilities working on new hardware and trying to get the bugs out. Maybe they'll come out with a 33sII, 33S+, or whatever, that takes more advantage of the capabilities of the hardware.

Regards,
James

in response to message #5 by James M. Prange (Michigan)

James! That was a well thought out, but longish post, so I'll respond maybe tomorrow, but I did read it...

... and guess what I saw skimming over eBay tonight up for bid (I didn't and missed the deadline, but more on that in a second)- an old HP 32E! It is a vintage machine, a Spice series basic nonprogrammable scientific; it had had not a few features and was a rugged unit.

I bring it up because of your post: this unit was a 4 level stack RPN calculator with full scientific functions and several memory registers; something I wouldn't mind sitting on the top of my desk anywhere (provided it was safe ;))! Now, of course it wasn't programmable, but it IS 33S-like in its simplicity, minus the programming capability, BUT NO continuous memory. Now, according to this museum, it listed for $80 USD about forty years ago; (so you might see that I didn't want to top the almost $50 some guy bid on it, for a slightly above basic scientific nonprogrammable, though nostalgia almost made me do it!) which was roughly half the price of a HP 34C, a richly featured, fully programmable scientific with twenty memory registers.

Now the 34Cs were superb to use, but the 32Es were somewhat more affordable and people did happily use the 32E calculators. I'm not saying we're all asking for too much, but consider what we accepted in those days!

Anyhow, goodnight and I'll seriously respond to your thoughtful post as soon as I can, hopefully tomorrow!

Re: "True" RPN Updated Features?

*Message #7 Posted by **Ed Look** on 22 Nov 2005, 5:24 p.m.,*
in response to message #5 by James M. Prange (Michigan)

James,

In addition to that rather rambling response of mine last night, I just want to add that I sort of retracted what I said there about showing the keystroke in program mode. Of course it would be much better to display the actual command or command sequence rather than a simple set of coordinates for a key sequence.

Also, I think your idea of allowing the user to specify stack depth is a very good idea; there are times though I like the "traditional" XYZT stack configuration because that downward replicating T level keeps me from having to use up an extra storage register for a value I may not want to keep longer than for the latest calculational sequence. And then, when one needs to statistically treat a long list of numbers, a four level stack is, without saying, too restrictive. I would love to be able to have a 33S/32SII/34C-ish machine that allows a variable stack, theoretically up to infinity. That would make fast work of calculating averages, medians, and other types of calculations. I once asked someone on the comp.sys.hp48 newsgroup how I could ever get the median, maximum and minimum of a certain bunch of figures. I got an ingenious reply, but it did require, if I recall correctly, a bit of stack register and memory register swapping and essentially "max-ing out" (forgive the pun) the memory register usage. In short, I think I too would love a user-definable variable stack!

in response to message #1 by Howard Owen

I'm a big fan of RPN keystroke programming and not such a big fan of RPL. It seems most natual to me when using a calculator. If I can work the problem out manually, recording my keystrokes to automate that process seems a perfect fit. If I can't work the problem out manually, I'll use a different tool.

RPL always felt like too much of a real programming language... but as a software engineer fluent in a wide variety of mid-to-high level languages (most notably C/C++) and a dozen flavors of assembly language, it seems to come up short - constrained by the interface more than anything else. In the end, if I want to program a complex algorithm I'll do so in a language that I find more flexible and more powerful and run it on a common PC or equiv. When I want to crunch numbers (and I love to crunch numbers with a calculator), I'll do it with manual entry or keystroke programming.

I liken a good calculator to a good hammer. It's a tool. A workhorse. Something that can drive nails and occasionally pull them. I don't want it to drive screws. I don't want it to cut boards. RPL feels like it tries to do too much - which was probably useful back when PCs were expensive and not on every desktop. I want a calculator to calculate - plain and simple automation with keystroke programming sits right at the boundary of simplicity and functionality. It's probably the same reason I'm not fond of graphing calculators, though I'm fine with people that like both RPL and graphing calculators. To each, their own.

In designing Excalibur, I had the opportunity to do design my own custom language (or borrow heavily from existing syntax or lexical parsers) but I stuck with keystroke programming. Simple, clean, effective. If users need more, they can work it out with Excel, Mathcad or Matlab.

*Message #9 Posted by **valentino ducati (switzerland)** on 15 Nov 2005, 2:02 a.m.,*
in response to message #1 by Howard Owen

I second you, Howard.

What never war really discussed here, is also the difference the most evolved RPN calculator has (42S) versus the most evolved RPL has (49G+) regarding the user interface.

Many of the (complicated?) RPL commands in the big command list of a 49 (and even 48) are display related. With the step from a line interface to a graphically oriented UI you have to deliver a big bounch of output and graphic manipulation functions to the user. And having this new GUI now you have also to deal with different font types. This is a terrific PLUS in commands and dependencies to remember and that's probably one of the reasons I still feal unconfortable programming ad hoc my RPL calculators.

Returning to your toughts: IF - after the 41 series, the 42S and the last 32SII - hp invested further in functionality of RPN based systems: What UI would they have?

The 42S started with some graphical capabilities. Would this have been the way to go? Towards a fully graphical RPN calculator? I suppose, the simplicity we are looking for, would have wanished; also still having the RPN paradigma.

Since the 41 series have faded out I also dream - from time to time - of a successor. But when I think of a modern follup, I have to compete with today's state of the art calculators like a TI-89 (or hp49G+). And then I'm really not shure where the journey of a new high end calc should go...

(not yet satisfied, not yet decided...) Valentino

*Message #10 Posted by **GE** on 15 Nov 2005, 8:53 a.m.,*
in response to message #9 by valentino ducati (switzerland)

The HP42S showed the way, IMHO. First, you must stick to the 4-level stack because (as someone stated previously) unlimited stack allows or even naturally leads to complicated states which you must remember.
Then, every stack level / register / variable should be able to hold any type of data, this includes lists of any depth, matrices, variable names, strings / texts (the latter having style maybe). Indirect addressing would be extended to multiple levels or depths : if R00 contains {1 2} and R01 contains { {'A' 33} 47}, RCL IND 00 would return 33.
A big plus of keystroke programming and the fact that you have a program persistant pointer is that you can stop the program, modify it, then resume. I wonder why this is not possible in RPL ??? It is such a strong point for RPN.
I would like also parameter passing and local variables ; however how could this be done ? The 42S has a way to declare variables at the beginning of a program, this should be extended.
Also PLEASE keep GTO and LBL, the possibility to route the processing flow anywhere is just so powerful.
Last idea, operators can be combined in a logical way so there is not a gazillion keywords to remember. For example + can add numbers, integers, matrices, lists, strings, but you can have more : I recall when I used APL, a very powerful "math" oriented language, where you have for example the following rule : The matrix product is calculated like Sum (Product of an element of line... by an element of col...), you would write it like : A<-B+.xC which is "store into A the matrix of the sum (+) of products (x) of terms ... from matrices B and C".
Then you could also write something like : A<-BL.+C which would mean "store into A the matrix of the minimum (L) of sums (+) of terms ... from matrices B and C.
This kind of meta-syntax lets you combine locically building blocks.
I'm not sure this is clear !

It sounds like the "replacement value" of FORTRAN to me!

But you're right about the ability to stop program and resume or resume differently because of the program step pointer in RPN. But I think primarily that was designed in as an editing feature, like the ability to step through a program in a test run showing you the results of each step in RPL.

I think you need to be able to set the stack as you see fit. One man's complexity is another's playground. I find an unlimited stack confusing, but the RPL guys revel in it. Allowing the user to set the stack size as a preference gives us the best of both alternatives.

Of course, if I'm modifying a program someone else has written that uses a deep stack, I'm going to

have as much trouble as ever keeping track. But in my view, it's not worth taking choice away from the user in order to make that sort of thing easier.

> Quote:
>

Good idea! This is a feature of RPL machines that I would also like to see retained in an updated RPN calculator.

> Quote:
>

Intersting This could be done in lots of different ways. For example, a list in R0 used as an indirect address could return a list of all the elements pointed to in the first list, assuming they all resolved either to a register number, a named variable or some other reference. Talk about complexity! Is there anything like this in current RPL machines?

> Quote:
>

I believe this *is* possible on the HP48G. But you have to be in debug mode. You can single step through a program and do anything you like in between steps. Maybe the RPL guys can comment on whether you can also change the program pointer to any point and continue execution or not?

> Quote:
>
> I would like also parameter passing and local variables ; however how could this be done ? The 42S has a way to declare variables at the beginning of a program, this should be extended.

RPL has the "-> var list << .. >>" syntax for creating local variables on the fly. Perhaps that could be adapted into the keystroke programming model?

> Quote:
>
> Also PLEASE keep GTO and LBL, the possibility to route the processing flow anywhere is just so powerful.

I agree with this, on the basis that system designers shouldn't make arbitrary limitations on what users can do if they can help it. RPL lacks a loop "break" statement, which probably reflects the distaste for GOTO that prevailed in the 1980s. "Structured" programming was supposed to make GOTO obsolete. And the construct was (rightfully) blamed for a lot of unmaintainable "spaghetti" code. If there's a danger of exciting a flame war over whether GOTO is needed or not, I'd like to avoid it if possible. So suffice it to say that some users consider GOTO to be useful, so an updated RPN programming model

should retain it.

How does RPL handle this stuff? Are there useful constructs there that we could borrow?

I'm not an RPL user, but I can tell you from plenty of experience in Forth that an unlimited stack does not require any more brain-twisting than a very small one. In fact, an effect of the improved data flow is that you don't need as many variables, and in most cases the need for local variables disappears altogether. Each "word" in Forth concerns itself only with its own small portion of the stack, seldom more than three items. If you have a hundred stack cells under that, it doesn't matter. For each little subroutine, you focus only the stack cells used by that one. It in turn may call others, which may call others, and so on, (even recursively!) but the modularity is part of good programming, and keeps a very complex program manageable. The depth of the stack becomes a non-issue.

> Quote:
>
> A big plus of keystroke programming and the fact that you have a program persistant pointer is that you can stop the program, modify it, then resume. I wonder why this is not possible in RPL ??? It is such a strong point for RPN.

It could be done, but (again, a comment coming again from a Forth programmer and not an experienced RPL man), you may have problems if branch locations stored in program structures get changed by your tinkering after they had already figured out where to go. All the ways I can think of to get around the problem make a big cut in performance.

> Quote:

> I would like also parameter-passing and local variables ; however how could this be done ?

Again, the stack can be used or this. Parameter-passing becomes implicit, natural, very efficient, and in the case of Forth, virtually eliminates syntax requirements. Local variables, if still needed, can be set up on the return stack since they are no longer needed when you exit the subroutine, subprogram, or similar.

> Quote:
>
> Also PLEASE keep GTO and LBL, the possibility to route the processing flow anywhere is just so powerful.

Those are nice and simple for keystroke programming. I don't miss them in Forth, although Forth does allow you to invent your own program control structures if it would help your application. A good set of them makes it much more clear what you're doing, without limiting the possibilities. The words "branch" and "0branch" in Forth are internals, meaning you normally only deal with them if you're writing a program structure. Examples of a few standard ones where the need for internal branching is obvious include DO...LOOP, IF...ELSE...THEN, BEGIN...WHILE...REPEAT, etc.. The same branching words could be used outside structures like these, but such use would usually mean that you're about to lose control of your project! I would not disagree however that GTO and LBL have their place in keystroke programming of small applications.

Re: "True" RPN Updated Features?

*Message #14 Posted by **Howard Owen** on 15 Nov 2005, 5:11 p.m.,*
in response to message #13 by Garth Wilson

Hi, Garth,

Sort of in the same spirit of not wanting to ignite a flame war over GOTO, I'd like to steer away from the debate whether a deep stack or a short one is preferable. I think it's obvious that different programmers have different opinions on this. Your point about avoiding complexity by limiting stack usage is a good one, though.

But since calculator programmers do differ on this point, what I'm most interested in is how to define a programming environment that woud allow for multiple ptogramming models to live side-by-side. It would be a simple enough matter to specify a maximum stack size, or no maximum, either globally, or locally to a particular sequence. You'd think that would get interesting when you wanted to call one model from another. But in most cases I can think of, there would be no problem. The 4-stack level routine wouldn't ever expect more than that many input parameters on the stack. The only difficulty might be when a 6 stack routine, say, wanted to call a routine that returned 7 parameters on the stack. I think that would be rare, though.

Regards.
Howard

Perhaps so, depending on the user, but RPN's GTO could make quite a mess of a program too.

> Quote:
>
> Then, every stack level / register / variable should be able to hold any type of data, this includes lists of any depth, matrices, variable names, strings / texts (the latter having style maybe).

The way RPL accomplishes the stack being "able to hold any type of data" is that the stack is really a stack of pointers. That you see other objects displayed there is a bit of indirection; the system decompiles the pointees for display.

> Quote:
>
> Indirect addressing would be extended to multiple levels or depths : if R00 contains {1 2} and R01 contains { {'A' 33} 47}, RCL IND 00 would return 33.

I don't quite follow that, but in RPL you could certainly store the name B in variable A, the name C in variable B, and the number 123 in variable C, so executing A returns 123.

In RPL, for stored lists, vectors, matrices, and symbolic matrices, you can also use "indexed variables" for the elements. For example, suppose I have the list { "A" B 1 } stored in a variable X. 'X(1)' EVAL returns "A", 'X(2)' EVAL returns 'B', and 'X(3)' EVAL returns 1. To store something new in the list, I could use "C" 'X(2)' STO to replace B with "C". Of course, it's hard to see much advantaage of indexed variables over the GET and PUT commands, and they're mostly neglected, If I recall correctly, they won't work in the 49 series in some situations where they worked in the 28 and 48 series,

> Quote:
>
> A big plus of keystroke programming and the fact that you have a program persistant pointer is that you can stop the program, modify it, then resume. I wonder why this is not possible in RPL ??? It is such a strong point for RPN.

In RPL a copy of the program is placed in the runstream, and I can't modify the program (or what's left of it) there. When debugging or a program is otherwise suspended, assuming that I still have the original, I can modify that, but that won't change anything in the suspended program.

> Quote:
>
> Also PLEASE keep GTO and LBL, the possibility to route the processing flow anywhere is just so powerful.

Of course. Unless you want to go with "program structures" as imolemented in RPL, It would be hard for me to imagine making do without these.

Regards,
James

Yes, GUIs can be complicated. Yes, RPL GUIs *are* complicated! But you can provide the complicated GUI, and also document a path through the complexity for the keystroke programmer. That is, abstract out of the multi-volume user manual a thinner one that shows you how to program in RPN. This simpler mode might include simpler graphics commands, probably built up from the more powerful graphics primitives provided by RPL.

In the desktop and server computer worlds, there are a multitude of such toolkits that seek to simplify access to complicated graphics subsystems. Of course, most of them end up being complicated in themselves. I think that's because they try to be as general as possible, and also because toolkit designers tend to get carried away. 8)

But a GUI toolkit for an RPN calculator wouldn't have to be fully general. The keystroke progamming approach is aimed at relatively short programs that automate a particular mathematical task. For that, the most complicated GUI object you would need would be an equation editor. There's a pretty nice one of those in the HP-49G+. It's not awfully hard to use, either. The 33S has a less capable, but still usable and useful one.

So I say keep the fully general graphic capability, perhaps working to simplify it for its own sake, but provide high level graphic operations that a keystroke program can call to do the hard GUI work. If the user wants a GUI feature that's not in the list, well, there's still RPL and the full generality it provides.

Regards.
Howard

> Quote:
>
> In the debate between devotees of RPN and RPL calculators, the RPL camp has a distinct advantage in that development of those machines has continued over time, albeit at a slow pace after HP drew in its horns in the calculator market.

Huh? More nearly continuous than with RPN models, but far from continuous. I mean UserRPL models, not including models that used SysRPL for development but didn't offer UserRPL.

Development of RPL models temporarily effectively ceased with the release of the 48G series Version R,

apparently in production by April, '94. After that, development started up again with a whole new team at ACO, and the 48G+ was announced 1998-03-30. but the 48G+ took hardly any development; still version R, effectively a 48G with a 128KB RAM instead of a 32KB RAM, and a new label. The next RPL model was the 49G, announced 1999-05-21. The 49G did make significant advances, but is far from being as good as one might expect. But then ACO was disbanded 2001-11-09. I'm not sure when the new team was formed, but it did exist by September 2002, with, as far as I know, one member from the ACO team, and some plans for the future. The first 49g+es started arriving in October, 2003 and I think the 48gII not too long after that. The 49G+ and 48gII are mostly a matter of adapting to new hardware and taking advantage of some of the new hardware's built-in capabilities; notably, they don't add any UserRPL commands not already in the 49G, although there have been some bug fixes and the 49g+ has limited formatting capability for the card. The 49g+ still leaves a lot to be desired.

I can't help wondering what the RPL models would be like today if development of them really had been continuous, with new team members being trained as old team members left. I'd bet that they'd be a whole lot more advanced and usable than the 49g+.

Regards,
James

Well, that's right. Apologies for making it seem like the RPL machines don't suffer from some of the same neglect as the RPN models.

But the fact remains that the RPL machines are more advanced than any RPN machine ever made. I think that at least part of that gap is due to the shift to RPL from RPN by HP, and the consequent neglect of the latter. Well, to be honest, I think *all* of the gap is due to that.

What I'm interested in is whether it is possible to come up with a high-level architecture that allows RPN and RPL to coeexist, and hopefully play off each other's strengths, in an updated machine sporting modern hardware. (Or purely in software, in the alternative.)

Quote:

I can't help wondering what the RPL models would be like today if development of them really had been continuous, with new team members being trained as old team members left. I'd bet that they'd be a whole lot more advanced and usable than the 49g+.

That's really the same question I'm pursuing, but one or two generations down the pike. So, what *do* you think they would have come up with in the way of new or improved features? I see no reason to cut of the discussion of desirable features just because they don't involve RPN. (Although I will undoubtedly try to relate anything you suggest to RPN myself. 8)

Howard

Re: "True" RPN Updated Features?

*Message #19 Posted by **Dave Bernazzani** on 16 Nov 2005, 8:52 a.m.,*
in response to message #18 by Howard Owen

Quote:

But the fact remains that the RPL machines are more advanced than any RPN machine ever made. I think that at least part of that gap is due to the shift to RPL from RPN by HP, and the consequent neglect of the latter. Well, to be honest, I think all of the gap is due to that.

I don't think it's neglect so much as plateau. It's hard to improve on brilliant simplicity. HP wanted more - and rather than try to tweak RPN, they took some of the best features of RPN, extended it and and came up with the LISP-like RPL. What they got, IMO, is something both more powerful... and less so.

In any event, RPN was plenty powerful enough 35 years ago and remains so now. I believe it also remains (by a wide margin) the most elegant way to crunch numbers on a calculator.

Advanced/improved RPN calculators

*Message #20 Posted by **Karl Schneider** on 16 Nov 2005, 2:07 a.m.,*
in response to message #1 by Howard Owen

The intent of Howard's post seems to be how the features of the advanced RPL-based calculators might be adapted to an advanced RPN-based model.

Well, quite frankly, my opinion is that the time for a super-duper handheld calculator may have already passed. Sure, I know that the TI-89, TI-86, and TI-83 are used extensively today in secondary education. However, this is not necessarily a positive development in the instruction of mathematics, what with the emphasis on teaching keystrokes and techniques for specific devices, instead of mathematical fundamentals.

That having been said, the best opportunity for development of a "super RPN" model would have been to design the original 48-series models around RPN, and to simplify the functionality, with emphasis on utility and expandability instead of whiz-bang mathematical functions and computer-like file and data management.

Consider a slightly-downsized 48S/SX based on Classic RPN with the following:

- A user-settable fixed stack
- Easy-to-use I/O
- Time functions and clock
- Easy-to-use 2-dimensional graphing
- High-resolution dot-matrix black LCD screen
- Unsurpassed complex-number functionality
- Matrix functionality improved from that of the 42S

Optional features:

- Plug-in cards for program applications and storage
- HP-71B BASIC with alpha labels instead of line numbers

That's what I think the 48S/SX should have been. It would offer the easy expandability and utility that surveyors and field engineers prize -- just plug in or download advanced programs. Informative and useful graphs appropraite for the machine's capabilities would be and easy to obtain -- no studying the manual to do basic things, and no crude monochrome 3-D rendering.

Comprehensible BASIC, instead of arcane RPL, would provide the programming capability for advanced applications that would be awkward or cumbersome on RPN.

But, it's probably too late for that now. In fact, I think even the 42S would be too advanced a calculator to develop today, now that PDA technology is available.

There is one conceptual non-graphing RPN calculator that I think is worth developing -- one that combines the user paradigm of the 32SII with the (improved) complex-number and matrix functions of the 15C, in a no-nonsense package about the same size as either.

- The display should be one-line, with large characters for legibility.
- The display should be longer, to accommodate equations more fully and to display complex numbers.
- The equation editor should allow insert/delete editing, support implicit multiplication, display sub- and super-scripting, and use more symbols instead of names like "SQRT" and "SQ".
- The stack should be of constant user-settable depth in RPN fashion, with only Rdown, Rup, and x<>y.

Re: Advanced/improved RPN calculators

*Message #21 Posted by **Valentin Albillo** on 16 Nov 2005, 9:54 a.m.,*
in response to message #20 by Karl Schneider

Hi, Karl:

Two brief commentaries to your post:

- In your post you mention, "Unsurpassed complex-number functionality", you say:

  "A few of HP's calculator models have introduced useful capabilities for calculating with complex numbers. These include the 15C, the 28C, the 42S, the 48S/SX, and their direct descendants. [...] Each calculator in the former group has pioneered a good idea:

  15C: Provided complete functionality in the mathematical domain of complex numbers

  28C: Provided straightforward single-line entry and a comprehensive menu of relevant functions

  42S: Provided rectangular or polar modes for entry and calculation, with easy-to-read full display

  48S/SX: Allowed entry of complex numbers in either form while set in either rectangular or polar mode"

  Perhaps due to lack of familiarity with it, you fail to mention HP-71B's Math ROM complex number handling, which as far as I know, pioneered the 'ordered pair' mathematical concept for complex number handling, that is:

  2 + 3i is represented as **(2, 3)**

This format is highly favored in serious mathematics, as it has a number of advantages and, certainly, does away forever with the 'imaginary' stigma that complex numbers have historically been saddled with (still present in "i", short for "imaginary unit"). With this convenient format, you have:

```
(1, 0)  is the real unit
(0, 1)  is the "imaginary" unit
```

and *symmetry* is evident, both real and imaginary parts are treated *the same*, no typographical distinction between them (such as attaching an "i" to the number representing the imaginary part, while nothing at all is attached at the real part). Also, representing complex numbers that way, the 71B's Math ROM allows such expressions as:

```
( 2+5*PI/3, 5-4*PI/3 )
```

which seems more natural and less contrived than:

```
(2+5*PI/3) + (5-4*PI/3)*i
```

and you also have:

```
(1, 2) * (3, 4) = (-5, 10)
```

which is as simple and neat as it can be. Of course, this also works like this with parameters passed to functions and subprograms, results returned, matrices, and evaluating expression from the command line or in CALC mode.

For instance, in DATA statement, you can define complex data like this:

```
10 OPTION BASE 1 @ COMPLEX A(5)
20 READ A
...
90 DATA (1,2), (-3,4), (5,7), (0,13), (23, -27)
```

which reads all complex data in complex vector A at once and, again, is much more neat and elegant than what you would achieve with other constructions.

Finally, the Math ROM also implements ("pioneers") built-in, special IMAGE formats for complex numbers, where you can define each part's format, as well as have it printed with the "i" if you feel like it, etc. I think all of this fully qualifies as 'significant achievement' in complex number handling by HP handhelds.

- Also in your post, you mention:

  "HP-71B BASIC with alpha labels instead of line numbers"

  HP-71B's BASIC *does* support alpha labels, no problem. Of course, it also has line numbers because of ANSI standards compatibility, but you aren't forced to use them if you don't want to. For instance:

```
10 GOSUB "FINDROOT"
20 IF X=7 THEN "FOUND"

...
90 "FINDROOT": X=27 @ y= 28 @ ...
...
120 "FOUND": PRINT X; SQR(X) ...
```

  which is more, you can have labels in mid-line, which means you can branch at the statement level ! For instance:

```
10 ON X GOTO "HERE", "THERE", "HOME"
...
```

```
90 "HERE": (do something) @ "THERE": (do something) @ "HOME": (do something)
```

Best regards from V.

Re: Advanced/improved RPN calculators

*Message #22 Posted by **Karl Schneider** on 17 Nov 2005, 10:22 p.m.,*
in response to message #21 by Valentin Albillo

Hello, Valentin --

Thank you for the thoughtful reply.

I don't fully share your view on several points, though:

> Quote:
>
> Perhaps due to lack of familiarity with it, you fail to mention HP-71B's Math ROM complex number handling, which as far as I know, pioneered the 'ordered pair' mathematical concept for complex number handling, that is:
>
> 2 + 3i is represented as (2, 3)
>
> This format is highly favored in serious mathematics, as it has a number of advantages and, certainly, does away forever with the 'imaginary' stigma that complex numbers have historically been saddled with (still present in "i", short for "imaginary unit").

You are right about my "lack of familiarity": at the time of my original posting, I did not have a Math ROM or manual. Now I have both, but haven't thoroughly delved into it. I'm sure that the HP-71B Math ROM did pioneer some advanced complex-number capabilities that should be recognized.

Perhaps the "parenthesized" representation of complex numbers is favored in high-level math, but I'm not very enamored of it. For one, it could be confused with an ordered pair of coordinates or measured data at a point in time. True, complex numbers are graphically represented on a plane, but not every point on a two-dimensional plane is a complex number.

Also, I was more concerned with *numerical values* of complex numbers, not *expressions* of them. (A typical calculator display line could not hold an entire expression anyway.)

IMO, the HP-42S representation of, e.g.,

```
-3.141593 -i2.718282
```

is cleaner than the RPL-model representation of

```
(-3.141593,-2.718282)
```

This is especially true for complex-valued matrices, which on an RPN-based calc would be littered with parentheses, commas, and brackets.

As for the "stigma" of 'imaginariness', well -- I wouldn't know how to pay someone US$ sqrt(-1)...

In summary, my focus here is still expedient usage for calculators. I still think that my concept of an [+i*] or [i] key, handled like [EEX] or [E] would be ideal:

`[4][.][1][6][5][CHS][i][1][3][.][6][CHS]` would yield `-4.165 -i13.600`

The [i] key could be [g]-shifted to yield an angle symbol for polar-coordinate entry; it could be [f]-shifted to bring up a menu of complex-number functions.

Best regards,

-- KS

Re: Advanced/improved RPN calculators

*Message #23 Posted by **Howard Owen** on 17 Nov 2005, 11:23 p.m.,*
in response to message #22 by Karl Schneider

Here's another area where people differ according to their tastes. My approach to that would be to allow many different representations of complex numbers, but only one (rectangular form) at a time. As long as none were ambiguous, my preference would be to allow *your* preference. 8)

That's nice for the calculator as a personal machine. It gets less nice when you want to work on someone else's program. On the other hand, if I can select a particular form for complex numbers on *my* machine, then *your* program will look just fine to me when I load it there.

Re: Complex # representation

*Message #24 Posted by **Karl Schneider** on 18 Nov 2005, 1:07 a.m.,*
in response to message #23 by Howard Owen

Howard --

> Quote:
>
> My approach to that would be to allow many different representations of complex numbers, but only one (rectangular form) at a time.

This is what the 42S and RPL models already do. However, I disagree with the approach.

Voltage (V) and current (I) on an AC network are sinusoidal phasors that are invariably represented as complex numbers in polar coordinates.

Impedance (Z = R + jX) and admittance (Y = 1/Z = G + jB) are complex-valued non-phasors that are represented in rectangular form.

Complex power (S = P + jQ) is composed of real (active) and reactive power in rectangular coordinates.

Since I = (delta V) / Z, complex I (in polar coordinates) is the quotient of a difference of two complex numbers in polar coordinates, divided by a complex number in rectangular coordinates.

Since S = V * conj(I), complex S (in reactangular coordinates) is the product of two complex numbers in polar coordinates.

This is why, if I enter a complex number in one form, I do not like the calculator to change its representation when a different entry mode is selected. Remember, they are the same value in

either form, just shown differently.

Re: Complex # representation

*Message #25 Posted by **Howard Owen** on 18 Nov 2005, 2:01 a.m.,*
in response to message #24 by Karl Schneider

I could be completely confused, (complex numbers do that to me sometimes,) but do you want to represent two complex numbers in two different *rectangular* styles in the same calculation? I don't know how the calculators do it, but if it were me, I'd allow polar and rectangular forms together, but not more than one style of the latter. I guess multiple rectangular styles would be OK, assuming an unambiguous syntax were preserved. But I'd think "A + Bi" in one place, and "C,D" in another would get pretty confusing.

Re: Complex # representation

*Message #26 Posted by **Karl Schneider** on 18 Nov 2005, 11:11 p.m.,*
in response to message #25 by Howard Owen

Howard --

I see that I may have misunderstood. I agree that complex numbers should be representable in only two ways -- one style in rectangular form, or one style in polar form. I would prefer the HP-42S style:

```
-3.00 -i4.00
5.00 <-126.87   (< = angle symbol)
```

over the HP-48 style:

```
(-3.00,-4.00)
(5.00,<-126.87)   (< = angle symbol)
```

but Valentin might not. ;-) (See other posts in this thread.)

My complaint with the 42S and the 48/49 models is that, when the user changes the entry mode between rectangular and polar, all complex-valued stack elements and register elements are displayed in the selected mode. I would prefer that all complex numbers be displayed in the format in which they were entered. My example showed "mixed-mode" calculations with complex numbers, wherein to change the display format would render values unmeaningful.

I suspect that the designers of the math capabilities did not have backgrounds in electrical power systems.

over the HP-48 style:

```
(-3.00,-4.00)
(5.00,<-126.87)   (< = angle symbol)
```

Got it. That's why I'd let you select your preferred rectangular display style, and Valentin could have his. In a modern machine, the memory and processor power to acheive that flexibility would be available.

Quote:

I suspect that the designers of the math capabilities did not have backgrounds in electrical power systems.

Or perhaps the memory and/or CPU power weren't there to acheive multiple simultaneous representations. The conversion between rectangular and polar coordinates shouldn't have been a limitation in the HP-48, but the display resources might have been. You'd also have to make room in each complex object's storage for "preferred display mode" in order to implement mixed mode representation that tracked a user or (via default) a system preference. All that is doable, of course, but would have involved more overhead.

Regards,
Howard

Re: Advanced/improved RPN calculators

*Message #28 Posted by **Marcus von Cube, Germany** on 18 Nov 2005, 5:29 a.m.,*
in response to message #22 by Karl Schneider

Karl,

Quote:

True, complex numbers are graphically represented on a plane, but not every point on a two-dimensional plane is a complex number.

Are you sure? The set of real numbers *R* is a subset of the set of complex numbers *C* (with the imaginary part being zero.) So the hole plane is a represenation of the complex number set: Just take the x coordinate for the real part and the y coordinate for the imaginary part.

A two dimensional plane is just one way to represent *C*: It can likewise be treated as a vector space with each value represented by a length and an angle. This is what polar coordinates are all about.

Marcus.

Ordered pairs and complex numbers

*Message #29 Posted by **Karl Schneider** on 19 Nov 2005, 12:43 a.m.,*
in response to message #28 by Marcus von Cube, Germany

Marcus von Cube and Valentin Albillo took issue with my admittedly imprecise statement,

> Quote:
>
> True, complex numbers are graphically represented on a plane, but not every point on a two-dimensional plane is a complex number.

What I *meant* by that was, not every ordered pair -- which is typically graphed on an two-dimensional x-y or R-theta plane -- should be interpreted as a complex number.

- For example, calculated or observed points on a time-domain function could be represented as the ordered pair
(t, f(t)).
- Or, two separate characteristics (e.g., height and weight) of each person in a set could be organized as ordered pairs and plotted on an x-y graph to investigate correlation.

However, neither of these examples of ordered-pair data should reasonably be read and treated as a "complex number".

This is why I disfavor the parenthesized ordered-pair representation on the RPL-based calculators. A *bona fide* complex number could easily be confused with an ordered pair of (x,y) data intended for regression analysis, Fourier analysis, or other kind of curve fitting. But, in RPL, everything's gotta be an "object"; hence, the parenthesized ordered-pair.

Valentin also disagreed with several of my other statements, which I'd like to address:

> Quote:
>
> **K:** "(A typical calculator display line could not hold an entire expression anyway.)"
>
> **V:** In the case of the HP-71B, its 22-char display allows the representation of "(a, b)" at once in most practical cases.

Yes, but again, I'm focused on compact calculators. The small-character, two-line, free-format LCD of the HP-42S allows display of the following:

- up to 7 digits (including "E") of each component
- the "." for both
- "i" or "<" (angle symbol)
- one or two "-" if necessary
- a blank space between components

Example:

```
-30.0E102 -i40.0E102
```

That's 20 positions, plus the stack-level annunciator "x:" or "y:".

I favor the large, one-line display from the late HP-32SII. However, it has only 12 characters and a leading negative sign. With its interstitial decimals, such a display (or the 7-segment display from the HP-20S) would require five more positions for displaying an entire complex number with adequate precision in all cases. (And how would "SHOW" work? Hmm...)

> Quote:
>
> **K:**"As for the "stigma" of 'imaginariness', well -- I wouldn't know how to pay someone US$ sqrt(-1)..."
>
> **V:**You also don't know how to father 355/113 childs or -3.1415 childs, I presume, and that doesn't make rational or negative real numbers "imaginary".
>
> "Imaginary" is a stupid label attached to complex numbers for historical reasons, they aren't any less "real" than real numbers, and when you think about them as an ordered pair, the distinction all but vanishes, as (3,0) seems then as "real" as (0,3), don't you agree ?

Not the ideal analogy, I'd say. We live in the world of "real" numbers on the continuous and easily-comprehensible number line. In certain cases (e.g., count of persons), only discrete integers are meaningful. Negative numbers generally represent the polarity or orientation of a value or difference, but they still reside on that infinite line. The domain of negative numbers is like a mirror-image extension of the domain of positive numbers.

(However, it is known that the concepts of zero and negative numbers did cause considerable difficulty to certain ancient societies and mathematicians!)

In the domain of the complex-number plane, both components are equally important. Of course, a so-called "imaginary" number is merely a "real" number multiplied by the imaginary value sqrt(-1) to place it in a new, second dimension. Complex-number mathmatics offer us a powerful mathematical tool for analyzing quantities with two independent components -- especially those with sinusoidal characteristics.

"Imaginary numbers" should more-properly be termed "imaginary-*valued* numbers", if one doesn't believe that "imaginary" is pejorative.

Best regards,

-- KS

Re: Advanced/improved RPN calculators

*Message #30 Posted by **Valentin Albillo** on 18 Nov 2005, 5:33 a.m.,*
in response to message #22 by Karl Schneider

Hi, Karl:

Karl posted:

"For one, it could be confused with an ordered pair of coordinates"

That's the idea, precisely. Remember that this kind of representation is called "an ordered pair", not "a parenthesized representation". How you do typographically represent an ordered pair is up to you, but "(a, b)" is pretty usual. It could be "{a, b}" or "a|b", or whatever.

"complex numbers are graphically represented on a plane, but not every point on a two-dimensional plane is a complex number."

I disagree. There's a one-to-one correspondence between points in a 2-dimensional plane and complex numbers. Any point in a 2D plane is defined by its coordinates (x,y) which are an ordered pair, thus the representation of some complex number.

"(A typical calculator display line could not hold an entire expression anyway.)"

In the case of the HP-71B, its 22-char display allows the representation of "(a, b)" at once in most practical cases.

"IMO, the HP-42S representation of, e.g., -3.141593 -i2.718282 is cleaner than the RPL-model representation of (-3.141593,-2.718282)"

Again, I disagree, but then I'm strongly mathematically oriented, thus I'm myself quite comfortable dealing with this kind of notation. Also, it's mostly a matter of personal taste.

"As for the "stigma" of 'imaginariness', well -- I wouldn't know how to pay someone US$ sqrt(-1)..."

You also don't know how to father 355/113 childs or -3.1415 childs, I presume, and that doesn't make rational or negative real numbers "imaginary".

"Imaginary" is a stupid label attached to complex numbers for historical reasons, they aren't any less "real" than real numbers, and when you think about them as an ordered pair, the distinction all but vanishes, as (3,0) seems then as "real" as (0,3), don't you agree ?

Thanks for your interesting comments, it's always a pleasure to read your posts.

Best regards from V.

Re: Advanced/improved RPN calculators

*Message #31 Posted by **Andrés Rodríguez (Argentina)** on 18 Nov 2005, 7:01 p.m.,*
in response to message #30 by Valentin Albillo

I may add to Valentín's comments that there are some physics concepts (physics are real enough for me) in fields like electric power, radio, audio, airfoil design, etc. that are very difficult to understand or explain without resorting to complex numbers. If you are talking to a complex-aware audience, such concepts are most easy to present and discuss.

Given the very particular economical situations we have lived thru in Argentina some years ago (certainly not a matter of national pride, quite the opposite), I have already posted here a possible approach to explain such facts using a complex currency. For instance, a complex money amount deposited at a complex interest rate may give a negative balance if you are not fortunate enough with your deposit-withdrawal timing. You deposit $ 1000, wait for a certain amount of time and... you have $ -100 (!!). But, if you wait for a couple of extra years, you may have $ 500 again, and you will view such outcome as a winning proposal.

Our brazilian neigbors currency sign is the "REAL", or R$; so if argentinian currency someday becomes the "IMAGINARY", denoted as i$, our newborn common market, the Mercosur, may have a common currency which will be truly "complex" indeed.

in response to message #1 by Ángel Martin

Can you let us knon the difference between the old and the new version? Why didn´t you change the CAT2 outpout to verify the version?

Matthias

Re: New version of SandMath-III

*Message #3 Posted by **Vieira, L.C. (Brazil)** on 14 Nov 2005, 3:54 p.m.,*
in response to message #1 by Ángel Martin

Hi, Ángel;

thank you for the updated version.

Please, forgive me asking this particular question: is it available through TOS? If so, is it just to follow existing SandMath-III link?

In time, I asked for a copy of the QRG and did not receive it (maybe I spelled the wrong e-mail address). Is the QRG available through TOS, too?

If not, would you re-send it, please?

lcvieira (at) quantica (dot) com (dot) br

Thanks you and sorry for the inconvenience... d8^)

(BTW, the 41Z.ROM is a wonderfull achievement, congratulations. Do you think that separating a block of, say, six registers in main memory, like it is done with appointments and assignments, and use these registers to emulate a complete, four-register complex stack would enlarge too much the original 41Z size? I mean, considering that separating a block of registers this way is possible. Just one thought...)

Luiz (Brazil)

Re: New version of SandMath-III

*Message #4 Posted by **Ángel Martin** on 15 Nov 2005, 3:04 a.m.,*
in response to message #3 by Vieira, L.C. (Brazil)

Hi Luiz,

Yes, everything is available at TOS (ROM image, QRG, and blueprints). Just go to the What's new section and there you'll see it.

As per enhancements to the 41Z, yes of course a 4-level complex stack will be a quantum leap (not that it doesn't work fine now, with its 2,5 level). Better yet than reserving a block of registers I thought about a dedicated memory buffer to hold the imaginary parts. Size won't be a problem (the ROM isn't full by far), but afraid time is... will have to wait for a while given my current time-management crunch!

Best, ÁM

Re: New version of SandMath-III (downloaded!)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 15 Nov 2005, 1:31 p.m.,*
in response to message #4 by Ángel Martin

Hi, Ángel;

than you for your guidance. Also, thanks to Matthias, who helpped me as well through e-mail.

About the virtual stack, some facts called my attention. The CCD-ROM allows creating matrices in two ways: one is by 'marking' regular, existing registers, and the other is by creating specific files in X-memory, both ways to hold matrices data. The HP41 itself uses 'uncommited' registers to store either assignments or appointments. Also, the HP15C uses some sort of parallel technic to handle imaginary stack registers. That's why I thought about the 4-level complex stack. And implementing it might lead to a detailed look at how to handle uncommited registers when using complex resources, and mostly how to leave them back to the operating system without disturbing.

Just guesses, I never programmed in MCODE. And thinking of the fact that this is a specific, 26 Y.O. technology, makes me think of the time spent to assimilate it...

Thanks again.

Luiz (Berazil)

Re: New version of SandMath-III (downloaded!)

*Message #6 Posted by **Raymond Del Tondo** on 18 Nov 2005, 8:50 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi,

creating and maintaining a buffer for the complex parts
and some status data wouldn't be a problem.

Just use the least expensive buffer maintaining routine.
The one of the CCD ROM is too complicated for this,
because it has to handle several additional things,

like seeds, matrices, other buffers, etc...
Maybe the one of the Extended IL or the Advantage Pac
should be suitable, using an appriorate buffer number, of course;-)

Raymond

Re: New version of SandMath-III

*Message #8 Posted by **Ángel Martin** on 18 Nov 2005, 3:48 a.m.,*
in response to message #7 by Marcus von Cube, Germany

Marcus,

did you try upgrading to a more current Acrobat version? As far as I know you can get it free from the Adobe site.

I can send you a pdf-3-compatible version of the QRG (not the blueprints though), just let me know your email address.

Best, ÁM

Re: New version of SandMath-III

*Message #9 Posted by **Meindert Kuipers** on 18 Nov 2005, 4:34 a.m.,*
in response to message #8 by Ángel Martin

Angel,

I was wondering how you create the blueprints. Do you use a special tool for this or is it handwork (all the arrows) in Excel or Word?

Meindert

> did you try upgrading to a more current Acrobat version? As far as I know you can get it free from the Adobe site.

...only if you run Windows as your main system; mine is OS/2. I can still read the docs on one of my other computers. I'll probably print them out from my Mac mini.

> Quote:
>

PDF-4 is fine, the QRG opens without problems. What are the reasons to prepare the blueprints in the new PDF format? Any formatting which is not possible with older versions?

Marcus

HP-65 back label replacement

*Message #1 Posted by **Thomas** on 14 Nov 2005, 7:50 a.m.*

Recently I've repaird two HP-65 and for one of them I'd like to replace the back label by a new one. The former owner just pushed a hole into the lable to unsrew the back cover. I remember seeing on eBay someone selling replacement lables some time ago. If someone knows, where to get and maybe can give me some advice if the lables are worth to pay for in case of material and visual appearance. Cheers Thomas

Re: HP-65 back label replacement

*Message #2 Posted by **Gordo** on 16 Nov 2005, 12:55 a.m.,*
in response to message #1 by Thomas

I purchased a replacement label for my 35 from eBay. The label is printed on thick foil with adhesive on one end, and it fit the 35 perfectly.

However, I do notice that the printing on the back does come off easily compared to the original label. I held it once again another HP back to back. And the label was scratched in multiple places in the process. I have not seen similar problem with my other HP Classic series with the original label.

So if you decide to get it, you should be extremely careful with what you rest the calculator on.

Re: HP-65 back label replacement

*Message #3 Posted by **Thomas** on 16 Nov 2005, 2:24 a.m.,*
in response to message #2 by Gordo

Thank's for your coments. I was expecting something like that. Maybe this can be improved by some kind of transparent hard coating afterwards. Do you still have the seller contact information available?

Re: HP-65 back label replacement

*Message #4 Posted by **Etienne Victoria** on 18 Nov 2005, 12:52 a.m.,*
in response to message #3 by Thomas

Yes, his Ebay Id is obh8899

Etienne

Re: HP-65 back label replacement

*Message #5 Posted by **Gordo** on 24 Nov 2005, 9:04 p.m.,*
in response to message #3 by Thomas

Yes, I think the best thing to do is to apply the new label, then put a piece of wide transparent tape over it to protect it. Or those PDA screen protector may work as well (which is less shiny).

HP 71B factory reset

*Message #1 Posted by **inaki** on 14 Nov 2005, 7:42 a.m.*

Is there a way to factory reset the 71B ?

Re: HP 71B factory reset

*Message #2 Posted by **Diego Diaz** on 14 Nov 2005, 1:20 p.m.,*
in response to message #1 by inaki

Hi,

Just press and hold [/] while pressing [ON]

You'll see "INIT: 1" on the display

Press [3] to change it into "INIT: 3" (full reset)

and then [END LINE] to execute.

You'll get "Memory Lost"

Cheers.

Diego.

Re: HP 71B factory reset

*Message #3 Posted by **inaki** on 14 Nov 2005, 7:45 p.m.,*
in response to message #2 by Diego Diaz

Following this sequence I cannot get the intended message 'memory lost'. The calculator locks when I press end-line, after changing INIT:1 to INIT:3.

Thereafter I cannot return back to the starting point! The only thing I can do is entering the same INIT loop again! What happens here ?

Re: HP 71B factory reset

*Message #4 Posted by **Garth Wilson** on 14 Nov 2005, 8:02 p.m.,*
in response to message #3 by inaki

After non-BASIC programming mistakes, there was a time or two I had to remove the batteries, short the terminals together, and hold the ON button down for awhile to get it back on its feet again. I also had to do this after making the mistake of doing something like DIM D$[128](30) (with the maximum string length and the array size in the wrong order) in a text file and then TRANSFORMing to BASIC. There's a serious bug there that causes a crash that even INIT:3 won't always bring it back from.

Weird HP-21S problem

*Message #1 Posted by **bennyboy6** on 13 Nov 2005, 11:16 p.m.*

Hi, I realize this forum is not for ads and I am not trying to use it as such. I ran into a weird issue while listing an HP-21S on eBay. It doesn't work right when I hold it vertically, but works fine when it's placed horizontal on a table.

Have any of you ever heard of a weird orientation issue like this?

A broken connection inside, maybe...

*Message #2 Posted by **Karl Schneider** on 13 Nov 2005, 11:30 p.m.,*
in response to message #1 by bennyboy6

... such that gravity pulls a lead away from its normal point of connection?

If it isn't fixed, you should idntify the calc as non-operational. It may be worth fixing, because the 21S isn't as common as many other models.

-- KS

Re: A broken connection inside, maybe...

*Message #3 Posted by **bennyboy6** on 14 Nov 2005, 8:27 a.m.,*
in response to message #2 by Karl Schneider

When I listed, I discussed this problem of course! Non-operational is a little strong, because it is partially operational. I didn't list it as "untested" like some less scurpulous people do.

> Quote:
>
> Have any of you ever heard of a weird orientation issue like this?

I once read about an even weirder issue involving a mainframe computer. The operator complained that the computer would run flawlessly while he was in the room, but every time he returned from the bathroom he would find the mainframe had crashed while he was gone. It took a while to track down the problem, which was a faulty connection inside one of the mainframe's cabinets. That cabinet was against a wall that the computer room shared with the bathroom. When the toilet was flushed the water pipes in the wall would vibrate; that vibration was transmitted through the wall into the cabinet, causing the intermittent connection to fail and bring down the system.

The same place where I read that story had another weird one. A user reported that her user id and password would work *only* if she was sitting down. If she tried to log in while standing up it would give her an "invalid id or password" error. The tech support guy thought she was nuts, but he watched her logging in, and sure enough she was right. Closer inspection revealed the problem. She was a touch typist, and while sitting down she would type without looking at the keyboard. But when she was standing up she couldn't place her hands on the keyboard in their normal positions, so she would type with one or two fingers while looking at the keys. Sometime in the past someone apparently had dropped the keyboard and a couple of the keycaps had popped off, and they had been switched when they were put back on. As long as she was touch-typing she hit the right keys by habit, but when she looked at the keys she pressed a wrong one because it had the wrong label.

HP 48g+: How do I solve multiple eqns with multiple variables?

*Message #1 Posted by **Tiffany** on 13 Nov 2005, 8:00 p.m.*

I have a hp 48g+ calculator. I need to solve multiple equations (containing complex number) with multiple variables but I do not know how. I was trying to follow the section in the user manual about solving multiple eqns with the Multiple Eqn Solver but I kept getting errors. Can anybody help me with this please? This relates specifically to solving AC circuits using nodal analysis. Thanks! Tiffany

Re: HP 48g+: How do I solve multiple eqns with multiple variables?

*Message #2 Posted by **Gerson W. Barbosa** on 13 Nov 2005, 10:55 p.m.,*
in response to message #1 by Tiffany

Say your equations are:

```
'7*V1 + 11*(V1-V2) = 3'
'5*V2 + 11*(V2-V1) = 2'
```

Your system matrix should be:

```
     A       *   X    =    B

| 18  -11 |   | V1 |     | 3 |
|         | * |    |  =  |   |
| -11  16 |   | V2 |     | 2 |
```

All you have to do is the following:

```
[ [ 3 ] [ 2 ] ]

ENTER

[ [ 18 -11 ]  [ -11 16 ] ]

/
```

(in fact, the actual operation is X=B*[A]^-1, since matrices cannot be divided one by another)

you should obtain

```
[ [ .419161676647 ]
  [ .413173652695 ] ]

Or V1 = 0.419161676647 and
   V2 = 0.413173652695
```

(Of course, you could have complex numbers in your equations, like (3,/_120) or (1.5,2.6) for instance.)

Or just read the manual at page 18-11 (Solving a System of Linear Equations:)

Green arrow SOLVE ^ ^ OK. Perhaps you find this easier.

You can also use the program below and enter your equations exactly as they appear:

```
'7*V1 + 11*(V1-V2) = 3'

ENTER

'5*V2 + 11*(V2-V1) = 2'

ENTER

{ V1 V2 }

SYS
```

You would get a menu with

```
V1 = 70/167

V2 = 68/167

MAT = [ [ 18 -11 3 ]
        [ -11 16 2 ]]

EQS = (a list with the two equations)

For clean-up, use .<- (all objects at left will be purged)
```

Regards,

Gerson.

Program by Francisco Matheus, who has authorized his free use. He was one of my colleagues in Circuit Analyses classes many years ago. At the time, we ran this program on our 28S's. It was useful as we didn't to rework the equations by hand to obtain the system matrix. This saved some time for larger systems (up to 5 x 5). If results in rational form are not needed, use ->NUM or change the program.

```
%%HP: T(2)A(D)F(.);
DIR
  ·\<-
    « VARS 1 OVER
'·\<-' POS 1 - SUB
PURGE
    »
  SYS
    « DUP SIZE \-> l
n
      « n \->LIST
'EQS' STO 0 n
        FOR i 1 n
          FOR j i j
== 1 0 IFTE l j GET
STO
          NEXT 1 n
          FOR j '
EQS(j)' \->NUM
          NEXT n
\->ARRY i
          IF NOT
          THEN NEG
'VET' STO
          ELSE VET
```

```
+ ARRY\-> DROP
          END
        NEXT { n n
} \->ARRY l PURGE TRN
CONJ 'MAT' STO VET
MAT / n 1
        FOR i DUP i
GET \->Q l i GET STO
-1
        STEP DROP
MAT VET n 1 + COL+
'MAT' STO 'VET'
PURGE
      »
    »
END
```

Re: HP 48g+: How do I solve multiple eqns with multiple variables?

*Message #3 Posted by **Tiffany** on 14 Nov 2005, 10:16 a.m.,*
in response to message #2 by Gerson W. Barbosa

Thanks for the information. I wanted to just be able to put the equations in my calculator as is after finding them from the circuit since the problems usually entail at least 4 equations. I know the TI 89 can do this with a function called 'C Solve' which most of my classmates have. On the test I will not have time to simply these kinds of problems.

One of my problems looks like this:

1) V1-V2 = 10Ix

2) V1/j20 + (V1-V3)/20 + V2/10 + (V2-V3)/-j10 = 0

3) V3/j10 + (V3-V2)/-j10 + 2<-45 + (V3-V1)/20 = 0

4) Ix = -V3/j10

where: j is sqrt of -1 all V's and I are phasors 2<-45 is 2 angle -45

And if the HP 48g is not able to do this, do you know if the 49 is able to do so? I have had my calcualtor for about 8 years and I was thinking of upgrading anyways. Thanks again for the help! Tiffany

Re: HP 48g+: How do I solve multiple eqns with multiple variables?

*Message #4 Posted by **Gerson W. Barbosa** on 14 Nov 2005, 12:39 p.m.,*
in response to message #3 by Tiffany

Using the given program, you'd enter the four equations and the list of unknowns on the stack:

```
'V1-V2 = 10*IX'

'V1/(0,20) + (V1-V3)/20 + V2/10 + (V2-V3)/(0,-10) = 0'

'V3/(0,10) + (V3-V2)/(0,-10) + (2,|_-45) + (V3-V1)/20 = 0'

'IX = -V3/(0,10)'

{V1 V2 V3 IX}
```

In the second equation, |_ stands for the angle symbols (right arrow + SPC). Notice that if your calculator is in rectangular mode, as soon as you enter this equation (2,|_-45) will be automatically

converted to rectangular coordinates.

After entering these five objects, just press SYS. The answer will show up in about 15 seconds. It is necessary to press left arrow + EVAL, that is, ->NUM, since the answer will be in a rational form. It will be convenient to identify the section at the end of the program that does this and eliminate it.

If I haven't made any mistake, the answer will be:

```
V1=(-1.886,-24.513)
V2=(-1.886,-5.657)
V3=(-18.856,0.000)
IX=(0.000,-1.886)
```

Change the coordinate mode to polar, if you need the answer this way. You might want to press EQS in the menu, then VIEW, and check if the equations were keyed in correctly.

You should replace IX in the first equation with -V3/(0,10), so that you have to solve a 3x3 system rather than a 4x4 one.

As you can see, there's no need to upgrade your 48G+ just because of this. By the way, I haven't been able to put this program to work in the 49G (perhaps I should also read the manual).

Regards,

Gerson.

P. S.:

You can copy and paste the program to a file named LSYS, for instance, and then transfer it to the 48G+ (ASCII, cksum=3, translate=2). Or create a directory named 'LSYS' and key in both programs.

Just replace

\<- with <- (right arrow + 0)

Save the first program as '.<-' and the second as 'SYS', in this order.

Re: HP 48g+: How do I solve multiple eqns with multiple variables?

in response to message #5 by Tiffany

Hold on to that 48G+!! It's hard to "upgrade" that unless you get a 48GX or... dream of dreams... get a 41CX!

Re: HP 48g+: How do I solve multiple eqns with multiple variables?

*Message #7 Posted by **Gerson W. Barbosa** on 14 Nov 2005, 3:25 p.m.,*

in response to message #5 by Tiffany

You're welcome!

I wrote:

> Quote:
>
> It will be convenient to identify the section at the end of the program that does this and eliminate it.

Just remove \->Q in the 9th line from the last.

Correction: This program won't run on the HP-28S and on the 48 series, because they lack the COL+ instruction . This is due to a slight modification I made later. Matheus's original program ends like this:

```
    FOR i DUP i GET
l i GET STO -1
    STEP VET ARRY\->
DROP {n 1} \->ARRY
'VET' STO DROP
  »
»
```

Regards,

Gerson

Having lost two of those tiny rolling pins during the same card reader repair, I could not imagine trying to turn one out on a lathe! Maybe if I had a micro-CNC machine and an electron microscope.... still, no.

Mike

Re: WOW, that's impressive!

*Message #5 Posted by **Tony Duell** on 15 Nov 2005, 8:08 a.m.,*

in response to message #4 by Mike H

CNC, we don't need no CNC :-)

No, I made it by hand on a Myford 7... Unlike most UK lathe owners, I didn't get this machine to make model steam engines, I got it to make spare parts and special tools for vintage computers, calculators and other electronic/mechanical devices

Special Functions 2 Finished

*Message #1 Posted by **Eddie Shore** on 13 Nov 2005, 12:45 p.m.*

Special Functions 2 expands on the Special Functions library, and contains new functions which include:

* Set Theory (Union, Intersect, Relative Compliment) * Complex Analysis (Derivative [Cauchy-Reimann Equation Test], Gradient) * Stopwatch (that flicks on and off Flag +83) * Expanding the library on special functions (Si, Ci, Li, Ei, GD, Zeta, now with Roman Factorial, Pochhammer Function) * Number Theory (Perfect Integer test, Arithmetic-Geometric Mean, Bernoulli Numbers [5 decimal place approx], and Fibonacci Numbers) * Two week calendar: just give the date and the calculator displays this week and next week * Finance (including net present value, internal rate of return, depreciation, net future value, PITI)

* Includes six One-Minute Marvels [Joseph Horn, Wlodek Mier-Jedrzejowicz and Richard Nelson] ported from the 48 series.

* FHELP - lists the syntax of each command. * FMENU - a choose menu that allows the user to choose the command easily

I will be posting on www.hpcalc.org today, but I will be happy to send the file for anyone interested.

EPROM module for HP71B

*Message #1 Posted by **Thomas Falk** on 13 Nov 2005, 9:16 a.m.*

Hi folks,

I have a HP71b with an EPROM module made by a company called Hand Held Products. It contains a 32KB EPROM with an application for hospitals, which is not very usefull for me.

I found the dump of the JPC-ROM some time ago in the web and would like to use it with this module. Do I have to take care of something when burning the EPROM, or when inserting it in the HP71?

I have tried it, but the HP71 doesn't seem to use the new EPROM.

Any hints?

Thanks,

Thomas

Re: EPROM module for HP71B

*Message #2 Posted by **J-F Garnier** on 13 Nov 2005, 2:37 p.m.,*
in response to message #1 by Thomas Falk

I didn't program an EPROM for the HHP since a long time, but I remember that the content of the EPROM is complemented, i.e. EPROM's 00 bytes are read as FF, and FF bytes are read as OO. I believe it was designed so an empty EPROM (full of FF) behaves like non-exiting memory (returning 0, the RTNSXM opcode).

J-F

Re: EPROM module for HP71B

*Message #3 Posted by **Bill (Smithville, NJ)** on 13 Nov 2005, 7:44 p.m.,*
in response to message #1 by Thomas Falk

Hi Thomas,

If possible, please save copy of eprom file of the Hospital Application. While I have no use for it, there's probally someone here that might want to see it. I don't know how the dump would be done, but I'm sure someone here knows how to do it.

I just hate to see any application disappear.

Bill

Re: EPROM module for HP71B

*Message #4 Posted by **Diego Diaz** on 14 Nov 2005, 1:26 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

Hi Thomas,

In line with Bill's previous post, and if you dont have the time/equipment/skills to perform the EPROM copy, just let me know.

I'll gladly send you a pair of blank ERPOM chips (of the same type) so you can re-program your module without having to erase the original Hospital application.

Diego.

NOTE: Of course, the above offer is ovbiously free of charge.

Edited: 14 Nov 2005, 1:28 p.m.

Re: EPROM module for HP71B

*Message #5 Posted by **Thomas Falk** on 14 Nov 2005, 3:04 p.m.,*
in response to message #4 by Diego Diaz

Hi Bill and Diego,

do not fear!

If I get a new (old) computer, the first thing is to read the EPROMs, just in case.

The application on my HP71 is calling itself STAT-TRAC/RT and made by STAT Systems Inc.. This company still exists, have a look at http://www.statsystems.com/.

Is there a place for storing such EPROM images somewhere in the web?

Hopyfully I will have time to test the tip given by J-F. at the weekend.

Bye,

Thomas

nonpareil HP 41 emulator

*Message #1 Posted by **Guido Ostkamp** on 13 Nov 2005, 8:42 a.m.*

Hello,

I am using the "nonpareil" emulator for HP41 C/CV/CX available at http://nonpareil.brouhaha.com. Unfortunately the mailing lists mentioned at the site don't work, which is why I ask the following question here:

Does somebody know how to address the USER, PRGM, ALPHA, SHIFT(GOLD), SST and R/S keys using the keyboard only?

Every other key works when pressing the usual digit or character for alpha mode.

Regards,

Guido

Re: nonpareil HP 41 emulator

*Message #2 Posted by **Eric Smith** on 13 Nov 2005, 2:30 p.m.,*
in response to message #1 by Guido Ostkamp

There's not currently any standard keyboard mapping for that. You can edit the keyboard mapping in the files 41cv.kml and 41cx.kml. The lines that begin with "scancode" control that. Example:

scancode 105 map 105 24 end # i

is the line that maps the "i" key on the keyboard to row 2 column 4 of the keyboard.

The numbers after "scancode" and "map" have to match. The values that are available may be found in gdkkeysyms.h .

You're welcome to suggest some standard mappings for those keys.

I'm considering F4 for ON, F5 for USER, F6 for PRGM, and F7 for ALPHA, F8 for SST, F9 for R/S, and TAB for shift (gold). If you want to try those, you can use these KML files:

- 41cv.kml
- 41cx.kml

Hi Eric,

Quote:

There's not currently any standard keyboard mapping for that. You can edit the keyboard mapping in the files 41cv.kml and 41cx.kml.

You're welcome to suggest some standard mappings for those keys.

---

thanks for the modified files. I would like to suggest to stay compatible to Warren Furlows windows emulator as closely as possible. I think he uses F1 for help, then F2 for POWER, F3 for USER, F4 PRGM, F5 for ALPHA as well as Shift for Shift as far as I remember.

By the way: I send you email twice now (today and back in October) to the address given on your webpage because of the disfunctional mailing lists, but never got anything back. I hope your email address there works and is read.

Also hope the picture postcard that I sent from my location (Munich, Germany) some weeks ago to honor the QSL idea has reached you.

Best regards,

Guido

Some new photos were added to this listing. Does anyone know when this type of case was produced? I don't ever recall seeing them in the EduCalc catalogues.

*Message #3 Posted by **Bill (Smithville, NJ)** on 13 Nov 2005, 7:52 p.m.,*
in response to message #2 by Han

This is the second case like this I'm seen for sale. The same seller offered one last year on e-bay. I tried to bid on it, but the price went way too high before I even had a chance to bid.

At the time I asked the same question here, but no one seemed to know. The best guess was that it was some sort of presentation case that HP may have used.

With the way it's hinged, I really don't think it would make a good case for daily use. The Astech hard case is much better for that.

But it is a pretty neat case.

Bill

32sii increased availability on Ebay (?)

*Message #1 Posted by **ECL** on 12 Nov 2005, 8:28 p.m.*

Hi all,

I've noticed alot of 32sii's on Ebay lately. Quite a few of the latest silver bezels (NIB) and they always have a BuyItNow price of about $400.

In terms of use-time, the majority of my time was spent on the 32sii until it died this summer. Since, I've been using a few 33s', and currently have the improved radix display with spaced out numbers. I'd say that the only misgiving I can think of is the canted key rows.

I've adjusted well enough to the ENTER key, and find the PLUS pad to be convenient for programming. But seeing so many 32sii's for sale has refired my want for one. The 32sii never caused me any grief, despite its memory deficiency. I even benefitted from that, being forced to get inventive with my programs.

Bullets:

```
1. Is the silver bezel keyboard reliable ($400-worth of reliability)?
2. I am also quite hesitant to fork over 0.4k for a memory-shy unit.
3. Does anyone here wish to sell a spare?

(I'm still in school, which underscores my hesitation to spend a semester's worth of books on
something I can't test for functionality).
```

Thanks, ECL

$400 means its about a buck per byte

:P

Re: 32sii increased availability on Ebay (?)

*Message #3 Posted by **Stephen Easterling** on 13 Nov 2005, 1:57 p.m.,*
in response to message #1 by ECL

I have owned both and would not buy the 32SII with silver bezel. It is not because of functionality. In fact, it looks great and works extremely well. The only problem I had was with the lack of contract between the colors chosen for the shifted keys and funtions. It looks nice to hold in your hand, but when you start using it on a day-to-day basis, the lack of contrast and visibility will aggrivate you very quickly and you'll soon want to get rid of it. I now own both the brown 32SII and the 33S and keep the brown 32SII safe at home and use the 33S at work. If I were you, stick with the 33S. After two days I got used to its chevron-shaped keys and love its speed and display (and looks!).

Re: 32sii increased availability on Ebay (?)

*Message #4 Posted by **Howard Owen** on 13 Nov 2005, 3:05 p.m.,*
in response to message #3 by Stephen Easterling

I agree. It surprised me how fast the weird looking keys on the 33S became a non-issue. The small enter key was harder. Not so much for its size but for its location. But that too became natural after a few hours of use.

Re: 32sii increased availability on Ebay (?)

*Message #5 Posted by **bill platt** on 14 Nov 2005, 12:03 a.m.,*
in response to message #1 by ECL

There is *no* reason to spend US$400 on a 32sii. They just aren't worth that much.

32sii prices have actually come down on bid auctions. Foir a while, they were topping $200. Y oucan now easily get one for between $100 and $130 if you are patient.

But you might as ell switch to the 33s.

Re: 32sii increased availability on Ebay (?)

*Message #6 Posted by **brian heally** on 14 Nov 2005, 12:58 p.m.,*
in response to message #1 by ECL

I agree with the others-don't get the silver bezel 32sii. A few years past I tried to replace my old 32sii because some keys were loosened, probably the result of being dropped several times, and having stacks of books fall on it. Once it got speared by an aluminum stick file. But it still kept on working. This is one of the earlier units from Singapore with the double shot keys. I ordered a new one from HP, and was horrified over what they had done to the 32sii. The choice of green and "lilac" colors is unexcusable, and the quality was way down, with numerals painted on the keys, and many of the keys also make annoying snapping sounds. I then got myself an older version of the 32sii on ebay for about $150, but this was berfore the 33s came out.

Now that HP has dealt with decimal point and keyboard issues, I consider the 33s a usable machine, and it is now my preimary use calculator. I still don't like the color scheme or the slanted keys-bad styling gimmicks. However, I find the green and purple of the revised 32sii to be more distasteful than the color scheme of the 33s, because the 32sii started out as a well designed and quallity machine, and then was taken downhill by degrading quality and design. At least with the 33s, the trend is one of improvement. I compare the choice of HP to change the color scheme and quality of the 32sii to the choice of Coca-Cola to come up with New Coke-a dumb move that almost nobody liked. At least Coke listened and did away with New Coke. On the other hand, I am grateful that HP still makes a basic RPN calculator, and the 33s is way better than nothing at all or getting ripped off on ebay.

41cx on button

*Message #1 Posted by **Hal** on 12 Nov 2005, 7:41 p.m.*

Hi folks,
Does a 41cx On button actuate a discrete micro switch, or is it just part of the keyboard contact matrix.
Thanks, Hal

Re: 41cx on button

*Message #2 Posted by **Diego Diaz** on 12 Nov 2005, 8:01 p.m.,*
in response to message #1 by Hal

Hi Hal,

The CX (all 41 series for that matter) does not have microswiches.

Every key (including [ON]) is handled by the Nut processor keyboard matrix.

Hope this helps.

Diego.

Re: 41cx on button

*Message #3 Posted by **Hal** on 12 Nov 2005, 9:22 p.m.,*
in response to message #2 by Diego Diaz

Thanks Diego for your response.
I was afraid that would be the case with the on switch. My cx requires a bit of excessive pressure on the switch to turn it on or off. Is there a remedy for that?
Hal

Re: 41cx on button

*Message #4 Posted by **Diego Diaz** on 13 Nov 2005, 8:32 a.m.,*
in response to message #3 by Hal

It's a somewhat common problem on used machines.

Mostly due to some dirtiness between the steel key-dome and the KB PCB.

Light cleaning involves taking your 41 apart, turn the upper half (keyboard) upside down, place one drop (means *just* one) of iso-propyl-alcohol thru the small PCB hole under the afected key(s) while repeatedly pressing such key.

This will fix mostly any not-so-bad key contact. For the severe cases (of dirtiness) you should get a very thin and soft paintbrush. Thin enough to pass thru said small hole, and soft enough to bend its

whiskers inside the key dome. DO NOT PUSH, just rotate CW-CCW gently after placing one IPA drop and pay attention not to leave any loose whisker around.

Keyboards with physical damage (not just dirtiness), may require complete disassembling of the KB PCB, which is by no means advisable unless you are a very skilled technician...

Hope this helps.

Diego.

Re: 41cx on button

*Message #5 Posted by **Dave Bernazzani** on 15 Nov 2005, 12:42 p.m.,*
in response to message #4 by Diego Diaz

One more thing to add about cleaning with Isopropyl alcohol: make sure you use the 91% Isopropyl alcohol found in most drug stores or larger shopping centers. The 70% (usually sold right next to it) is a few pennies cheaper but contains mineral oils. This will still clean effectively but will leave the surface coated with mineral oils which will attract dirt and other foreign particles rather quickly. The 91% solution contains 9% inert materials (mostly water). If you don't want such as strong solvent, you might want to dilute this further 50/50 with water (distilled water is best... but not necessary). In any event, stay clear of the 70% "rubbing" alcohol.

HP 41 number display

*Message #1 Posted by **Guido Ostkamp** on 12 Nov 2005, 2:32 p.m.*

Hello,

let me say first that I have been using mostly TI and later Casio calculators as I could not afford an HP at school in the late '70s / early 80's. Now I am trying to get familiar with HP 41 emulators on my PalmOS device and on PC (Windows/Linux) as those are the best programmables available and out of historic interest.

The TI and Casio calculators when running in standard display mode (default), always use a variable size display of number, so e.g. the number 0.125 displays as 0.125 and 0.3 displays as 0.3 etc. - with the number of fraction digits as needed. This kind of display fits my needs best.

However I could not find a way to get the HP-41 into this kind of display mode - it appears the number of digits after the decimal point is always fixed and it starts up with 4 (I am aware how this can be changed to other fixed sizes).

Question:

Am I overlooking something?

Is there a way to get variable digit display with the HP-41 and if yes, how can it be set up?

Thanks for any hints.

Regards,

Guido

>
> Why not try the Hp-35 ;-)

by the way, my name is Guido, not Gileno ;-)

Thanks for your response and sorry to hear this functionality is not available with the HP 41 although I thought it was pretty standard.

May I ask how you deal with the fact that this is not available?

Do you frequently change the fixed number of digits to maximum and back when you see that the last digit displayed is not zero after a calculation?

Or do you simply go with the rounded version?

I have a bad feeling when leaving the setting at maximum fixed digits because then its hard to recognize due to the possibly high number of zeroes.

(It's however clear to me that even if not everything of a number is displayed, it will still internally be used for the following calculations).

Regards,

Guido

Re: HP 41 number display

*Message #4 Posted by **Hal** on 12 Nov 2005, 7:33 p.m.,*
in response to message #3 by Guido Ostkamp

Hello Guido,

I just set the the display to the disered number of decimal places and carry on. Any fractional part of a calculation that falls outside the display format is insignificant anyway. That said, however, I sometimes do set to 9 decimal places and back just to have a look...it's 6 keystrokes and really no big deal.
Best Regards, Hal

Re: HP 41 number display

*Message #5 Posted by **Etienne Victoria** on 13 Nov 2005, 3:11 a.m.,*
in response to message #3 by Guido Ostkamp

Hello **Guido**!

I apologize for the name change (I was alsobtrying to post to another member named Gileno).

Many fellow members have already responded inb this thread about useability of the digit.

For myself, and even if I like Hps, I definitely miss the floating point because fixed decimal is NOT the way I write numbers on the paper myself or even pronounce them when I talk :

- at work, I deal with financial amounts, so Fix 2 is fine, no problem to use nearly all my Hp calcs. - at home, when I want simplicity, I use an Hp-35, an Hp-71B, an SR-50 or SR-51.

I just can't explain to my 8-years old daughter that 5 x 6 = 30,000

and I certainly won't...

Best regards from France!

Etienne

Re: HP 41 number display

*Message #6 Posted by **Andrés Rodríguez (Argentina)** on 12 Nov 2005, 8:08 p.m.,*
in response to message #1 by Guido Ostkamp

Newer HPs have an additional display mode, ALL, which suits your preference. But HP41 hasn't it.

Usually you just choose the number of digits appropriate for your current task, and answers will be so formatted. Internal representation, as you said, is always kept at maximum precision. Once you get familiar with this usage, you like it very much.

Non-zero values will never be shown as zero. In such particular case the display temporarily switches to SCIentific notation and will show something like 1.0000 -05 (instead of 0.0000).

Best regards

Re: HP 41 number display

*Message #7 Posted by **Palmer O. Hanson, Jr.** on 12 Nov 2005, 11:19 p.m.,*
in response to message #6 by Andrés Rodríguez (Argentina)

I won't presume to tell you whether or not the least significant parts of the mantissa are important for the work that you are doing. I will suggest that you can view those least significant digits in the HP-41 in the same way that you viewed the so-called "guard digits" in the TI and Casio machines. Some examples follow. Start with the calculator in Fix 9.

Playing with pi:

1. Place the value of pi in the display; i.e. the ten digit value 3.141592654

2. Divide pi by 4 and see 0.785398164 in the display but you know that the pi value in step 1 divided by 4 should be 0.7853981635 .

3. To see all ten digits of the mantissa simply multiply the displayed value (x register contents) by ten and see 0.7853981635

4. Place pi in the display and see 3.141592654

5. Square the displayed value and see 9.869604404

6. Square the displayed value again and see 97.40909109

7. Take the reciprocal of the displayed value and see 0.010265982; i.e., ten digts but only eight digits of the mantissa.

8. Multiply by 100 and see 1.026598225; i.e., all ten digits of te mantissa.

By now you should be able to see that what was done to see the least significant digits of the mantissa is the same kind of thing that you do with TI and Casio machines to see the guard digits.

Some trigonometry in DEG mode:

1. Enter 45, press sin and see 0.707106781 in the display.

2. Multiply by ten and see 7.071067812; i.e., all ten digits of the mantissa in the display.

3. Again, enter 45, press sin and see 0.707106781 in the display.

4. Enter 45, press cos and see 0.707106781 in the display.

5. Subtract and see 0.000000000 in the display.

Some trigonometry in RAD mode:

1. Enter pi, divide by 4, press sin and see 0.707106781 in the display.

2. Enter pi, divide by 4, press cos and see 0.707106781 in the display.

3. Subtract and see 2.0000000- 10 in the display.

To understand the result in step 3 above:

1. Enter pi, divide by 4, press sin and multiply by ten to see 7.071067813; i.e., all ten digits of the mantissa of the sine of pi/4.

2. Enter pi, divide by 4, press cos and multiply by ten to see 7.07106811; i.e., all ten digits of the mantissa of the cosine of pi/4.

3. Note that the two mantissas are different by two in the least significant place.

4. Why are the sine and cosine of pi/4 slightly different? Because the actual value of pi/4 is 0.78539816339... while the value of pi/4 in the HP-41 is 0.7853981635 slightly higher than the exact value. The sine of an angle slightly higher than pi/4 should yield a value slightly higher than the sine of pi/4. The cosine of an angle slightly higher than pi/4 should yield a value slightly lower than the cosine of pi/4. You can do the arithmetic.

Re: HP 41 number display

*Message #8 Posted by **Garth Wilson** on 13 Nov 2005, 1:45 a.m.,*
in response to message #6 by Andrés Rodríguez (Argentina)

One of the things in my startup routine (automatically executed when I turn the 41 on) is to put the calc in ENG 3 since that's what I usually use. Rarely I'll do ENG 6, and even more rarely, need to view the final digits in something right near 1 (like 1.000000042), so I'll just subtract 1 to see what's out there. My HP71

has STD which is the type of display you're asking about, but I've never missed it on the 41 at all.

Re: HP 41 number display

*Message #9 Posted by **Les Bell** on 13 Nov 2005, 2:00 a.m.,*
in response to message #1 by Guido Ostkamp

I'd have to say that the 41 does it right, as do most of the older HP calcs. I vividly remember one of my university tutors marking me down on a problem for providing more significant digits in the answer than the problem - and the measurement technology implicit in it - warranted.

When I acquired my HP-45 a few months later, I was pleased to notice that it defaulted to FIX 2, although with large values, even that provides the unsophisticated novice with an unjustifiable impression of accuracy.

Lots of digits is something mathematicians might like - but engineers should know better.

;)

Best,

--- Les

Re: HP 41 number display

*Message #10 Posted by **Palmer O. Hanson, Jr.** on 14 Nov 2005, 11:27 p.m.,*
in response to message #9 by Les Bell

I have no problem with the idea that some engineering disciplines do not need the full ten digits available from the HP-41. Some do; e.g, inertial navigation, which was my field of engineering from 1960 through 1990.

The issue of how many digits are enough is not a new one. Back in the early 1980's much of my analysis software was in BASIC on a company-owned time-share computer. A friend suggested that I transfer my programs to an Apple computer since the company was providing Apples as desk-top computers. I converted a program but it wouldn't run my test case satisfactorily. Another friend suggested that I should use Microsoft BASIC rather than Applesoft BASIC. When I did that I got resonable answers to my test case. About that time in the June 1982 issue of *Call Apple* a user asked the Apple Doctor ""I wonder if you could explain why the Apple languages Applesoft, Pascal and Fortran have used only 32-bit floating point numbers which will give only six-seven place accuracy. Microsoft Basic-80 and Fortran used with the Z-80 Softcard offer the additional double precision numbers with 64 bits. ..." Part of the answer in defense of of lesser numerical precision of the Apple software said "It is derned difficult to measure something to nine significant figures ..."

I didn't move away from the time-share computer even though it was S - L - O - W and it was inconvenient to go to the terminal rather than work at my desk. What it offered was an extended BASIC including double precision calculations, matrix arithmetic including calculation of determinants, inverses, transposes, scalar products, vector products, and the like. I had started using the time-share computer in 1967 and was using it regularly when the HP-35, HP-45, HP-65 and HP-67 came on the market. I had no use for any of those devices. They simply didn't offer the calculating power that I had become used to. The TI-59 was the first hand-held capable of doing the work that I needed.

Funny you should mention that, Palmer - I'm currently reading "Feynman's Tips on Physics" (the missing lectures from the Lectures books), in which Chapter 4 (Review Lecture D) is on the topic of "Dynamical Effects and their Applications", covering gyroscopes and accelerometers, and their application to inertial navigation, which was very new in the early sixties. The end of the chapter is a transcript of Feynman's conversation with students as they examine a gyroscope (his mike was left open and the tape recorder running).

As a pilot myself, I've had exposure to the principles; I can still remember learning how a laser ring gyro works and being amazed that we can use light travelling around a fiber in that way.

So I agree with you about the need for precision in some applications, and of course, we need to preserve that precision through intermediate calculations. We also need to understand numerical methods, so we know when precision is being lost. But all in all, I *like* being able to set the display to round to two digits after the point as a reminder that all the digits I'm not seeing are generally not justified.

Best,

--- Les

MLDL2000: ROM images and the like

*Message #1 Posted by **Vieira, L. C. (Brazil)** on 12 Nov 2005, 1:08 p.m.*

Hi MLDL2K owners, all;

I want to know who of you is/are interested on sharing experiences, ROM images and related stuff about the HP41. I myself have only a few ROM modules and peripherals, most of them are already available to be downloaded form other places. Anyway, I have two different card reader versions (F and G), one of them (F) with the weird bug when keying in parameters and using correction key (maybe it is due to hardware instead of software, who knows). I also have an Extended IO module that, surprisingly, returns BAD after ROMCHK. The others are X-Functions (don't remember version), Financial 1C and Navigation 1B. And we can count on the existing ROM of my 82143A peripheral printer, Wand (82153), HPIL and IR Printer Module 82242A.

I want to go ahead with MCODE programming, too.

Maybe some guys think it is some sort of time wasting when dealing with such past-due technology, but what calls my attention to the HP41 is that high-tech, current technology seems to be too close to it that it seems the HP41 is up-to-date technology as well. Seeing Meindert´s boards connected to the HP41 ports and working so tuned with it makes me wonder about what the HP41 represented in its time.

Please, anyone that actually wants to share experiences, I'm 'all ears'. I have never programmed in HP41 MCODE before, and I am yet studying, so I have too much more to read and listen than to talk, but I'd like very much to share whatever I achieve as well.

In time: should MLDL2000 related discussions be posted here with others? Although it agrees with the MoHPC Terms of Use and is related to old HP calculators, I prefer having it as consensual use of the forum space than to have the feeling of being an invader. Just my own thoughts, though.

Best regards and thanks.

Luiz (Brazil) - lcvieira (at) quantica (dot) com (dot) br

*Message #3 Posted by **Etienne Victoria** on 14 Nov 2005, 5:29 a.m.,*

in response to message #1 by Vieira, L. C. (Brazil)

Hi Luiz!

I'd really like to keep the MLDL & Clonix/Novram discussions in this forum!

After all, we're not so numerous to constitute a real nuisance to other users and, for myself, I've learned a lot on the Hp-41C innards even before owning one of these devices!

Maybe, we should check with Dave Hicks that talking about the Rom images doesn't go against his forum/site policy.

I fully intend to respect his options because we're hosted here - even if I've tried to bypass them from time to time...

BTW, thanks for your mail and sorry for not responding yet :-)

Friendly regards from France!

Etienne

in response to message #1 by Vieira, L. C. (Brazil)

Hi Luiz, all...

I'd also prefer a common "meeting point" to discuss about our beloved machines/accesories.

Obviously, it's Dave's last word what really matters as all of you have already stated, and I'll also accept whichever decision he adopts.

Copyright issues have been dicusssed over the time (and will surely be in the future) but I don't think our new devices/modules by themselves make any difference with previous ROM/RAM-Boxes or ZEPROM, CMT, HEPAX... modules. Just new technology and more memory but same functional principles.

Cheers.

Diego.

Re: MLDL2000: discussions here, then!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 15 Nov 2005, 12:26 a.m.,*
in response to message #1 by Vieira, L. C. (Brazil)

Hi Meindert, Etienne, Diego, guys;

I thank you for your comemnts and thoughts. I was just in the need to read(hear) from others, because I`d like that anyone interested on knowing/sharing information about the HP41 new tools from you, guys, could find the MoHPC as the place to do so. And I prefer it as well.

About updates and the like: I read some news from Diego's NoVRAM and have already downloaded the updates. I also visit Meindert's www.kuipers.to/hp41 whenever I have the time to. Should we, users, consider these as the references for updates so far? Also, I see that some updating data is available through TOS, and they are somehow related to your modules' primary activities.

Are there any other places to search for news?

Best regards.

Luiz (Brazil)

Re: MLDL2000: ROM images and the like

*Message #6 Posted by **chic** on 15 Nov 2005, 5:27 a.m.,*
in response to message #1 by Vieira, L. C. (Brazil)

hi all

i'm a fairly regular lurker here (1 or 2 times/week) and would think it would be an obvious place to share experiences, thoughts etc.

chic :MLDL 2074

(status : basic testing done, just trying to pucker up the courage to take a dremel to the cardreader shell! just doesn't seem right somehow!)

Re: MLDL2000: ROM images and the like

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 15 Nov 2005, 7:47 a.m.,*
in response to message #6 by chic

Hi, Chic (AKA 2074... 8^)

Please, have a look at the pictures here (maybe you have probably already seen). Some of them show only the PCB's and connections, others show the cuts. Some are new, added now, and show what I used to cut the upper square little hole.

Hope you find encouragement in these images. Afterall, if by any reason you decide ti use the car reader holder, filling the holes back will be easiear than making them up...

Best regards.

Luiz

Re: MLDL2000: ROM images and the like

*Message #8 Posted by **GE** on 15 Nov 2005, 9:47 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Back in the days there was a form of snobbery by which you "needed" the smallest possible registration number to the various clubs to prove your early commitment and the fact that you were an "old hat" not easily disproven by young fellows. I wonder if there is such a trend here ? GE /2064/
Only kidding !

Re: MLDL2000: ROM images and the like

*Message #9 Posted by **chic** on 16 Nov 2005, 2:50 p.m.,*
in response to message #8 by GE

No offence taken, You still see people rolling off all their serial Nos in sigs too!

I hadn't seen Luiz's pics before, they show a level of care and attention to detail that is wonderful, a real inspiration to be patient, thoughtful and get this construction right, as befits the work that has already gone into the whole MLDL project.

I'll report back when i get some progress

Chic (2074 still in bits!)

That's the spirit! (and thanks 8^)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 16 Nov 2005, 11:06 p.m.,*
in response to message #9 by chic

I added the pictures with the very intention of showing that you can go further. Meindert himself encourages this sort of inspired modifications, even if you want to use a different case.

BTW, GE, I was not known about the common hierararchy (snobbery?) related to the early, smallest numbers... although I agree with the fact that it makes some sense. And yes, I am following the spirit of the 'Only kidding!' as well, so, please, just read this for fun, O.K.? I had no intention at all, mainly when I think that the first unit belongs probably to Meindert and the others close to it are the ones used by the brave Beta-testers. As I am ordering another unit (once you get to it, you can't live without it...), this new one will surely have a bigger serial#, so I can even make a choice... d8^D

Best regards and thanks for your kind words, guys. I appreciate.

I still miss the other MLDL2000 owners and their related paritcipation and experience sharing (just know who are a few of them). This module is a dream come true, at least for me...

Luiz (Brazil)

MLDL serial numbers

*Message #11 Posted by **Meindert Kuipers** on 17 Nov 2005, 3:27 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

About the serial numbers and a bit of history:

There are four units designated as Beta units (#B2001 to #B2004). Two are with myself (one unit for daily use and one working unit on a breadboard for testing). One of the beta's is in the field with a user and number four is damaged after unsoldering the FLASH memory chip.

The regular units start with serial number #2001 (someone is very happy to have this lowest serial number!). All units with serials below #2050 have double capacity SRAM, these have been assigned based on order date. The 2* SRAM is there because at production time there was a shortage in the original size SRAM chips, and I was offered 2* the size at the same cost, so about half the units have 2* SRAM. This capacity is currently not being used nor supported (but it is tested), and for possible future support a handsoldered wire connects the A19 line (which is not connected on the 1* SRAM chips).

Serial numbers >= 2050 have 'just' 512K*16 bits SRAM chips.

The serial number is programmed in the EEPROM on the USB interface, and allows the M2kM software to recognize the unit and show the serial number.

Personally I do not really care aboutserial numbers, since I am a user, nota collector. However, I do care about the kind words you have for the MLDL2000, thanks for that.

Meindert

Re: That's the spirit! (and thanks 8^)

*Message #12 Posted by **James MacPhail** on 17 Nov 2005, 4:50 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

> Quote:
>
> I still miss the other MLDL2000 owners and their related participation and experience sharing (just know who are a few of them).

That sounds like a request for lurkers to reveal themselves...

I feel very fortunate to have an MLDL2000 too (some very high serial number, I'm sure :-), but my experience so far is only to gaze at the pieces in amazement.

I ordered the USB connector just today, but I don't know when I will have the nerve and patience to start the assembly.

Once it is assembled, I will be of little assistance to others as I am an mcode novice and don't have a lot of time to spend with it, but I do share the enthusiasm.

I am certainly paying close attention to the MLDL2000 threads, so please keep up the reports so I may learn! (Great pictures too!)

Thanks again Meindert!

HP-41's NoV-32 SW update.

*Message #1 Posted by **Diego Diaz** on 12 Nov 2005, 8:09 a.m.*

Hi all,

The latest version of NoV-32 programming software is now on-line:

http://www.clonix41.org/Projects/Nov32/NoV-32_SW.zip

This handles overlapped RAM pages as described in the manual.

Thanks and kind regards.

Diego.

Re: HP-41's NoV-32 SW update.

*Message #2 Posted by **Vassilis Prevelakis** on 12 Nov 2005, 4:39 p.m.,*
in response to message #1 by Diego Diaz

Is the NoV-32 module available?

**vp

Ultimate Flame Topic

*Message #1 Posted by **Paul Brogger** on 11 Nov 2005, 6:56 p.m.*

A tongue-in-cheek bumper sticker cries, "Nuke the unborn gay whales!"

For this site, a guaranteed flame topic might be:

"Cobubba should lower the prices on his 15C's so we won't have to use RPL!"

(Anyone care to top that one?)

Enjoy . . .

Re: Ultimate Flame Topic

*Message #2 Posted by **Howard Owen** on 11 Nov 2005, 7:13 p.m.,*
in response to message #1 by Paul Brogger

Hah! Reminds me of the country song about rain, prison, a pickup truck, momma and a train.

Let's see, how about "Coburlin is forcing unsuspecting college freshmen to code in RPL." That's just a refinement on yours. How about "The only way you'll ever get a new calculator like a 15C is with emulation, because anything involving hardware is impractical. Nobody on Earth, including HP will ever build one."

Putting Our Money Where Our Mouth Is

*Message #3 Posted by **Namir** on 11 Nov 2005, 11:19 p.m.,*
in response to message #2 by Howard Owen

We all heard that "If you want to get something done, do it yourself!"

Well, for the folks who want to bring back the HP-15C, I say, If you want the 15C so bad then:

1. Quit your regular jobs 2. Mortgage your houses and get whatever loans you can 3. Start a company that makes calculators 4. Make that HP-15C you always talk about

After step 4 you will realize why HP is soooo wize by not bringing the HP-15C.

You can take my word for it or you can find out for yourselves! It's really your call.

It's what you really do about that matters and NOT what you write on the web. Talk was, is, and will remain cheap!

Re: Putting Our Money Where Our Mouth Is

*Message #4 Posted by **Howard Owen** on 12 Nov 2005, 12:32 a.m.,*
in response to message #3 by Namir

Oops. Got one! 8)

The *joke* was the combination of the "emulators are hardware - no they're software" flame fest with the "15C is impractical - no it isn't" flame fest. The challenge is to find the most provocative such combination you can. Based on your reaction, I'd say I have an early lead. 8)

in response to message #2 by Randy

The best solution for my needs. I thank all.

http://www.hpmuseum.org/software/41hexcon.htm

Re: HEX <-> Decimal

*Message #4 Posted by **Vieira, L.C. (Brazil)** on 11 Nov 2005, 6:33 p.m.,*
in response to message #1 by gileno

Hi, Gileno;

(I was typing it in while Randy was faster... I'll let my answer here, though.)

I have a converting routine that uses X-Functions, would that be a problem? Unfortunatyely I do not have it right now. As soon as I get back home I'll post the listing.

Maybe you already have it, but there is a converting program in the HP41 standard pack. I actually think it is too long and somehow odd, but maybe it can help you.

I'll be back in a couple of hours, O.K.?

Cheers.

Luiz

Re: HEX <-> Decimal

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 11 Nov 2005, 10:58 p.m.,*
in response to message #4 by Vieira, L.C. (Brazil)

Hi, Gileno;

sorry taking too long.

Please, have a look at this set of programs and you'll probably find something usefull. HEX to DEC and DEC to HEX listings are in page 14. You can use only the H-D and D-H listing, that is 73 steps long (it is surely more than 100 bytes long). ALENG, AROT, ATOX and XTOA are from the X-Functions module.

Hope it helps.

Luiz (Brasil)

Re: HEX <-> Decimal

The Advantage module has the base conversions, and work just about as fast as the LCD can respond.

Re: HEX <-> Decimal on the 41C

*Message #7 Posted by **Karl Schneider** on 12 Nov 2005, 2:27 a.m.,*
in response to message #6 by Garth Wilson

Garth posted,

> Quote:
>
> The Advantage module has the base conversions, and work just about as fast as the LCD can respond.

True, but the hexadecimal numbers are limited to unsigned integers up to 32 bits. This differs from most other implementations of integer base conversions on calculators, which assume 2's-complement signed integers of word size 32 bits, 36 bits, or 40 bits.

See my base-conversion thread in the Archives. NOTE: The 41C Advantage module is not covered, because it was not a *built-in* capability.

Wiring of the 97 paper advance switch

*Message #1 Posted by **Arnaud Amiel** on 11 Nov 2005, 4:55 p.m.*

Could anyone tell me in which order I should resolder the red, black and white wires on the 97 paper advance switch. They just broke off while I openned it to show my repairs. I don't have notes on this.

The service manual tell me to check continuity between black and red but I can not find more information.

Thanks for your help.

Arnaud

Re: Wiring of the 97 paper advance switch

*Message #3 Posted by **Arnaud Amiel** on 12 Nov 2005, 2:37 a.m.,*
in response to message #2 by Randy

Thanks for your answer but I am looking for the other end of the wires.

I know that when not pressed I should have close circuit between Red and Black so the white wire has to be soldered to the centre of the switch.

One of the other pins seem to be always open circuit and the other close circuit with the centre one when pressed.

Which one is which????

Thanks,

Arnaud

Edited: 12 Nov 2005, 10:48 a.m.

Re: Wiring of the 97 paper advance switch

*Message #4 Posted by **Tony Duell** on 13 Nov 2005, 6:18 a.m.,*
in response to message #3 by Arnaud Amiel

Yes, the service manual does not properly explain the switch wiring.

I can't remember the colours, but I think I can remember what the 3 switch contacts should connect to. Maybe that will help. It's a changeover switch, there is a common tag, a normally-closed tag and a normally open tag. When the button is not pressed, there's continuity between 'common' and 'normally closed'. When it is pressed, there's continuity between 'common' and 'normally open'.

The common tag is electrically connected to logic ground. The -ve side of the battery is also ground

The normally closed tag is electrically connected to one of the pins to the printer PCB, and via that PCB to one of the out-of-paper contacts in the printer.

The normally open tag is electrically connected to one of the flag inputs on the ACT chip (22 pin). I think it's either pin 3 or 4

A bit of work with a continuity tester should tell you which of the 3 pins on the logic board is which, then you can connect them to the right switch pins.

Re: Wiring of the 97 paper advance switch

*Message #5 Posted by **Arnaud Amiel** on 13 Nov 2005, 6:51 a.m.,*
in response to message #4 by Tony Duell

Thanks a lot, that is exactly what I was looking for. Now just a bit of cleaning and soldering to do.

Just for the Archive, GND is Black normally closed connected to OOPS Red. This is indicated in the service manual. White is ACT normally open connected to GND Black when the switch is pressed.

HP-85 Error 23

*Message #1 Posted by **Juergen (CH)** on 11 Nov 2005, 4:04 p.m.*

I've got another HP-85 which displays ERROR 23 : SELF TEST when turning on. I've entered ERRL {ENDLINE } and got a result of 0. I guess one or more of the RAM IC's are bad. Can anyone confirm that this diagnosis is correct?

Can I cannibalize a 16K memory module to get replacement RAM IC's, or are these IC's different?

Any help is highly appreciated!

Thanks, Juergen

Re: HP-85 Error 23

*Message #2 Posted by **Vassilis Prevelakis** on 12 Nov 2005, 7:44 p.m.,*
in response to message #1 by Juergen (CH)

Have you tried running the diagnostics from the Service ROM?

You can download the service ROM for the HP-85 from http://www.series80.org/Images/index.html a service training course manual from http://www.series80.org/PDFs/HP85-RepairCourse.pdf

while the service manual itself is in the MoHPC DVD collection.

**vp

PS if you do not have the ROM itself you can burn the image from the series80 site on a standard 2764 EPROM and use the 82929A Programmable ROM drawer. If you do not have an 82929A, then check John Shadbolt's site http://www.vintagecomputers.freeserve.co.uk/hp85/prm85.htm for the modern equivalent.

**vp

Re: HP-85 Error 23

*Message #3 Posted by **Juergen (CH)** on 14 Nov 2005, 1:20 p.m.,*
in response to message #2 by Vassilis Prevelakis

Unfortunately, I do not have access to a Service ROM. I have the Service Manual, and there I found the hint to enter ERRL {ENDLINE} after an ERROR 23 : SELF TEST. The result was 0 which indicates bad RAM IC's.

My idea was to replace all RAM IC's by the IC's of a working 16K Memory Module. But I do not know if the IC's are really the same (the labels are different). Has anybody out there ever tried that?

Regards, Juergen

Re: HP-85 Error 23

*Message #4 Posted by **Etienne Victoria** on 14 Nov 2005, 2:13 p.m.,*
in response to message #3 by Juergen (CH)

Hallo Jürgen,

The problem could be with one or more RAM ICs or with a RAM controller.

You normally have 8 RAM ICs on your board. Are they socketed or soldered ?

Could you email me your faulty RAM IC references ?

I will look in my parts (basically a "parts" Hp-86B) to check if I have them.

Grüzi aus Frankreich.

Etienne

Re: HP-85 Error 23

*Message #5 Posted by **Tony Duell** on 14 Nov 2005, 2:23 p.m.,*
in response to message #3 by Juergen (CH)

I thought the RAM ICs used in the 85A were just standard 16K*1 DRAMs, as used in many other computers of the time.

I _think_ (without looking at the service manual) that they are the very common 4116 (or equivalent) chips, they certainly are in the 9915. These need 3 power supply voltages (-5V on pin 1, +12V on pin 8, +5V on pin 9), you could check these with a voltmeter (pin 16 of the RAM chips is ground) to be sure.

Re: HP-85 Error 23

*Message #6 Posted by **Etienne Victoria** on 14 Nov 2005, 2:33 p.m.,*
in response to message #5 by Tony Duell

Hi Tony, Jürgen,

In the Hp-85 service manual, page (pdf) 210, I have only the Hp part numbers :

1MA2-002 RAM Controller

1818-1396 RAM IC

As I have sold my Hp-85, I don't know the correspondence between the Hp part nr & standard ICs.

Jürgen, can you confirm these are standard 4116 ?

http://homepage.mac.com/etienne.victoria/.Pictures/Photo%20Album%20Pictures/2005-11-14%2011.58.03%20-0800/Image-CBD9FAC1554811DA.jpg

Edited: 14 Nov 2005, 3:00 p.m.

Re: HP-85 Error 23

*Message #7 Posted by **Juergen (CH)** on 14 Nov 2005, 4:04 p.m.,*
in response to message #6 by Etienne Victoria

Yes, the IC's are MOSTEK 4116 (MK4116J-3). The IC's in the Memory Module are labeled MB8116E. Somewhere on the Internet I found a hint that MB8116 = MK4116 so I guess it should be possible to cannibalize the Memory Module to replace the IC's in the HP-85. What do you think?

Thank you, Juergen

Re: HP-85 Error 23

*Message #8 Posted by **Etienne Victoria** on 14 Nov 2005, 4:19 p.m.,*
in response to message #7 by Juergen (CH)

So this means Tony is right!

Therefore, it's not necessary to destroy you memory module! These are off the shelf components.

You can purchase 4116 Drams with standard pins readily available in an electronic store.

For example (french sorry): Mostek DRAM 4116

Mostek is just the manufacturer so I guess any standard 8 pins 4116 will do!

Price per IC is roughly 2,5 Euros

Etienne

Edited: 14 Nov 2005, 5:25 p.m.

Re: HP-85 Error 23

*Message #9 Posted by **Etienne Victoria** on 14 Nov 2005, 4:25 p.m.,*
in response to message #7 by Juergen (CH)

BTW, I think you should anyway follow Tony's advice to check voltages on the Chips because there is a possibility for the RAM controller to be faulty and not the Rams themselves.

Etienne

Thank you

*Message #10 Posted by **Juergen (CH)** on 14 Nov 2005, 4:36 p.m.,*
in response to message #9 by Etienne Victoria

Tony & Etienne, thank you much for your advice!

Re: HP-85 Error 23

*Message #11 Posted by **Tony Duell** on 15 Nov 2005, 8:07 a.m.,*
in response to message #9 by Etienne Victoria

The service manual diagram posted a couple of messages back confirms that there are 3 supply rails to the RAMs, as I thought. There was a rarer 16K bit DRAM that used +5V only, I wanted to make sure those were not used in the 85A.

However, you should still check the power supply voltages at the RAM chips. These don't come from the RAM controller IC (which handles the logic signals), they come from the power supply board. If one is missing or incorrect you need to troubleshoot that area.

Of course the RAMs might be good, and the RAM controller IC the problem. That is an HP custom part, alas.

I hate to say this, but you really need to do a lot more tests before replacing chips. I know the 'modern way' is to replace components more or less at random until the fault goes away, but that's never worked for me. I would (at least) check all power supply outputs, the clock signals, the address and data lines to the DRAMs, etc. Only when I had a pretty good idea as to the fault would I change parts.

Announcement: The HP49g+ / HP48gII Advanced Users Reference Manual now available!

*Message #1 Posted by **Gene Wright** on 11 Nov 2005, 12:42 p.m.*

New Advanced Users Reference Manual!

This has been in process for nearly 18 months. Quite a team of people participated in the development of this manual. We hope the user community finds this useful.

Corrections (in particular), suggestions and comments are welcome.

hpcalc.org has a bugzilla system with an entry for the AUR. That will probably be the best place to enter mistakes and corrections.

Enjoy! Gene

Re: Announcement: The HP49g+ / HP48gII Advanced Users Reference Manual now available!

*Message #2 Posted by **Arnaud Amiel** on 11 Nov 2005, 12:59 p.m.,*
in response to message #1 by Gene Wright

Great I am starting now. And I already notice that is assumes RPL mode but I haven't seen where this is explicitely said. I was hoping it would help me learn how to program in ALG mode.

Arnaud

Edited: 11 Nov 2005, 1:14 p.m.

Re: Announcement: The HP49g+ / HP48gII Advanced Users Reference Manual now available!

*Message #3 Posted by **Gene Wright** on 11 Nov 2005, 1:27 p.m.,*
in response to message #2 by Arnaud Amiel

Well, chapter 1 is RPL programming. :-)

For the command reference, the input diagrams show "Level 1 / Argument 1" for any inputs to the commands. The algebraic mode takes arguments in the order shown in these diagrams. So, what's listed will work in both modes.

Programming? anyone program the 49g+ in ALG mode?

Re: Announcement: The HP49g+ / HP48gII Advanced Users Reference Manual now available!

*Message #4 Posted by **Scott** on 11 Nov 2005, 1:24 p.m.,*

in response to message #1 by Gene Wright

Wonderful! Thanks for the effort!

Any word as to when the print version will be available?

Thanks, Scott

in response to message #5 by Namir

Well done! This was an important effort to make the HP-49G+ a valuable tool. Many thanks to all contributors! I like the layout, examples and illustrations. What's next? Will there ever be any additions to the CAS? In my opinion there's still room for bug fixes and improvements. Watch out, on the TI side the development goes on. If HP want to have the best graphing calc they need to invest in development. Of course the manuals will have to kept up to date. I always was a HP fan and I use a HP-49G+ from time to time. I'm actually still waiting for the keyboard to be fixed in order to use it everyday. I'm still hoping...

Regards from Switzerland Daniel

Things to note that are in the new AUR:

*Message #7 Posted by **Gene** on 11 Nov 2005, 2:08 p.m.,*
in response to message #1 by Gene Wright

1) A chapter on the development library. (Chapter 6)

2) A comprehensive (I hope) list of all keyboard shortcuts. This has always been a common complaint that we wanted to rectify.

3) A complete! listing of all error messages.

4) The equation library reference includes a 1-page table of contents that is more a QRG to the equation libary more than anything else.

While doing this, we did find and correct mistakes going back all the way to the HP28S reference manual. It was amazing! Unfortunately, I'm sure there are still lots remaining. :-(

But we have really tried. :-)

Things that I KNOW are really needed:

1) Internal links in the PDF (this was a time constraint...there are thousands of links needed and we really wanted to go ahead and get this released!)

Gene

*Message #10 Posted by **ECL** on 12 Nov 2005, 1:41 a.m.,*
in response to message #7 by Gene

Gene,

This may be inappropriate, but I noticed a heading in the AUR on writing code on the PC and then transferring them to the 49g+, is it fairly simple? I ask because my 49g+ is on loan until next week, and I cannot try til then.

Thanks, Eric

Re: Things to note that are in the new AUR:

*Message #11 Posted by **James M. Prange (Michigan)** on 12 Nov 2005, 2:17 a.m.,*
in response to message #10 by ECL

Very easy. If the code is at all complicated and the PC is available, this is my preferred way of doing things.

Advantages of writing the source code on the PC include:

- More of the code can be seen at one time in my text editor.
- I can use all of my text editor's capabilities.
- I have a qwerty keyboard on the PC; no need to deal with the calculator's alphabetical layout or remember the proper keystrokes for a command or go to the right menu; just type it in.
- I have the original source code, including my formatting and comments, stored on the PC.
- If I care to post my source code in this forum or in the newsgroup, it's already available in a text file. It's just a matter of opening the file, and then copying and pasting.

Regards,
James

Edited: 12 Nov 2005, 2:19 a.m.

Re: Things to note that are in the new AUR:

*Message #12 Posted by **Howard Owen** on 12 Nov 2005, 2:36 a.m.,*
in response to message #10 by ECL

I think all it takes is your HP connectivity software. You transfer the program to the calculator as a text object, and it gets "compiled" when it's EVALuated.

The other way works too, even if the code contains binary objects on the calculator. They get converted to textual forms that are equivilant to the binary form when EVALuated.

Re: HP49g+ / HP48gII AUR -- Available in Hardcopy?

*Message #13 Posted by **Paul Brogger** on 11 Nov 2005, 6:47 p.m.,*
in response to message #1 by Gene Wright

Will this be made available, printed & bound, via HP (or whatever)?

Thanks!

Re: HP49g+ / HP48gII AUR -- Available in Hardcopy?

*Message #14 Posted by **ECL** on 11 Nov 2005, 6:53 p.m.,*
in response to message #13 by Paul Brogger

Yes,

I ditto support for a bound version. Also thanks for the effort in producing the doc!

ECL

Re: HP49g+ / HP48gII AUR -- Available in Hardcopy?

*Message #15 Posted by **RON ALLEN** on 14 Nov 2005, 3:22 p.m.,*
in response to message #14 by ECL

A DEFINITE PROSPECT FOR HARD COPY

Are we talking about the 861-page user manual for the 49G+? I just heard from HP support today on this very question among two others. The response was that a policy decision was made at HP to conserve paper by using the Adobe Reader and the PDF file. FWIW, I use my old 48G series manual for most (probably 90%) of my reference needs.

I haven't downloaded the "Advanced User Manual" for the 49 yet. Is it a more reasonable size?

The other question I posed to HP was about RECURSIVE CALLS in 48-49 programs and functions. I have performed some recursive calls and have often wondered if I might be creating some unstable situations since the stack is being asked to perform at least one additional tracking task, e.g., same-named local variables and stacked recursive calls. Just a little surprised that HP does not address the subject at all.

ANY COMMENTS?

Ron

Re: HP49g+ / HP48gII AUR -- Available in Hardcopy?

*Message #16 Posted by **Gene Wright** on 11 Nov 2005, 7:23 p.m.,*
in response to message #13 by Paul Brogger

Given that this has an official HP part number, I hope so.

That's different from the HP 12c platinum solutions book (also available online in PDF form) which does not have an HP part number.

When I know for certain when and how to get one, I'll post here (unless someone finds out first!)

Re: HP49g+ / HP48gII AUR -- Available in Hardcopy?

*Message #17 Posted by **Ed Look** on 11 Nov 2005, 10:07 p.m.,*
in response to message #13 by Paul Brogger

Let me, too, weigh in in favor a a bound, printed version!

While I love freely downloadable literature, especially quality items like a 49G+ AUR, there's nothing that beats having the book! It's hard to brush up on RPL in bed if you only own a desktop PC.

Many Thanks Gene and Team!

*Message #18 Posted by **Namir** on 11 Nov 2005, 11:14 p.m.,*
in response to message #1 by Gene Wright

Gene,

I would like to express much appreciation for you and the other distnguished writers who contributed to the AUR. As a technical writer myself, I know that putting such a document together is no easy task. It's an elaborate task to organize the document, write and double check the facts, and do the editing.

On behalf of the members of thsweb site, I want to send you and the rest of teh team a warm thak you!

Namir

TEAM is the proper word

*Message #19 Posted by **Gene** on 12 Nov 2005, 12:23 a.m.,*
in response to message #18 by Namir

This was a huge team effort. Please don't mistake this for some sort of solitary work. The team as listed on the inside front page of this book helped out in various ways.

Some of this team are frequent posters here and if they wish to comment on this, great!

Team - (as my former employer used to say) means "Together Everyone Accomplishes More".

*Message #20 Posted by **Eddie Shore** on 13 Nov 2005, 12:33 p.m.,*
in response to message #1 by Gene Wright

Great! Thank you HP people in advance!

Re: Announcement: The HP49g+ / HP48gII Advanced Users Reference Manual now available!

*Message #21 Posted by **Ron Allen** on 17 Nov 2005, 12:22 a.m.,*
in response to message #1 by Gene Wright

Where do we get them? I spoke with tech support only this Monday and they didn't know about them. Is yours a third party source of pubs?

Thamks - anxious to buy

Ron

Re: Announcement: The HP49g+ / HP48gII Advanced Users Reference Manual now available!

*Message #22 Posted by **Gene Wright** on 17 Nov 2005, 6:49 a.m.,*
in response to message #21 by Ron Allen

You get it by going to the link in the original post in this thread and downloading the PDF.

There is not a printed copy available at this time. That's why tech support doesn't know anything about it.

PDF only right now. Hoping for printed later, but not yet.

Re: Announcement: The HP49g+ / HP48gII Advanced Users Reference Manual now available!

*Message #23 Posted by **Ron** on 17 Nov 2005, 3:11 p.m.,*
in response to message #22 by Gene Wright

Thanks for the clarification. I already have one huge .pdf edition of the guide about half copied into a massive volume of 2-sided note paper. From the size of the file it must be about 250 pages. A lot better than the 861 pages of the guide. Can't fault HP policy saving trees, but it kind of spoils the effect of having a powerful field instrument that fits in one's pocket and reference material that is accessed through a full size screen on a pc or a two volume set of 3" notebooks.

Thanks for the work effort, and I will stay tuned for the news,

Ron

MLDL2000 assembly pics

*Message #1 Posted by **Vieira, L.C. (Brazil)** on 11 Nov 2005, 11:28 a.m.*

Hi MLDL2000 owners, all;

After trying many possible solutions, I could not find a suitable connector to be used between the CPDL and the USB boards, so I used a cut of flat cable. This link leads to the pictures of the boards with connectors and their arrangement. The MLDL2000 works perfectly fine the way it is. Main final stages are 1) to build a suitable block of pins to connect the interface board to the CPLD board and 2) to fimrly locate the USB connector so it does not slip when plugging the cable in or out.

The last picture shows my own solution for an external DC input. Although it can be seen, the box has already been cut to hold the USB

These are just intermadiate pictures. As I have it finished and completely assembled I'll post others.

Hope you enjoy. Feedback is welcome.

Cheers.

Luiz (Brazil)

Latitude & Longitude Conversion

*Message #1 Posted by **Robin** on 11 Nov 2005, 7:24 a.m.*

Greetings;

I am using an hp 48gx. Is there any built in function that will allow me to convert latitude and longitude values easily?

By convert I mean from decimal degrees to degrees minutes seconds and back again.

Thanks in advance for any help.

Cheers,

Re: Latitude & Longitude Conversion

*Message #2 Posted by **Vieira, L.C. (Brazil)** on 11 Nov 2005, 7:41 a.m.,*
in response to message #1 by Robin

Hi, Robin;

the HP48 has two converting tools that will surely help:

```
[->HMS] and [HMS->]
```

I'm not with my own HP48 in hands right now, but you could, please, have a look at both TIME menus: [left-shift][TIME] and [right-shift][TIME]. If I am not wrong, in one of the pages you'll find both converting commands.

(PLease, consider that the characters -> are, in fact, a whole right arrow).

Let us know if you found what you want.

Best regards.

Luiz (Brazil)

Re: Latitude & Longitude Conversion

*Message #3 Posted by **Robin** on 11 Nov 2005, 7:57 a.m.,*
in response to message #2 by Vieira, L.C. (Brazil)

Hello Luiz;

You are correct, left shift time on the second page.

I am going to assume [->HMS] is from decimal to hours, minutes, etc. And [HMS->] is from hours, minutes, etc to decimal.

I would like to clarify the formatiing if anyone knows. If I input 55.975056 decimal degrees and use [->HMS] the output is 55.58302016. I believe this translates to 55 degrees 58 minutes 30.2016 seconds. Is this correct? It certainly seems to make sense.

I really appreciate all the help.

Cheers.

Re: Latitude & Longitude Conversion

*Message #4 Posted by **Tim Wessman** on 11 Nov 2005, 8:47 a.m.,*
in response to message #3 by Robin

Yup. That is the correct format. If you want, it is pretty easy to write a little program that will add in o ' " for display purposes should you want to use it in a fancy display.

TW

Re: Latitude & Longitude Conversion

in response to message #2 by Vieira, L.C. (Brazil)

Hi, Luiz, good direction on HMS. (RE: HP49G+ HP 48GX)Do you happen to have either the equations or knowledge of an algorithm to work with surface navigation. Conversion from short distance dead reckoning to great circle, etc,? I use short cut math estimating the distance in nautical miles between longitudes as in the vicinity of cos(latitude). While this is good enough for tracking hurricanes at home, the compounding errors for headings and distance when sailing could lose the race.

I plan to research the internet like in "Ask Dr. Math" for equations, but decided to follow up to see if you happened to have anything all ready to share.

Thanks in advance,

Ron

Ron,

What kind of "formulas" do you want?

Navigation on the surface of the Earth is no more complicated than applications of spherical trigonometry. A book with MORE than you ever will want to know about this stuff is "Textbook on Spherical Astronomy" by Smart.

Basically, if you imagine a triangle drawn on the surface of the Earth, then you can describe the angles between adjacent sides (i.e. where the sides meet) as A, B, and C (other than being on the surface of the sphere, these angles are the same as the interior angles of a plane triangle - i.e. the angles you would measure with a protractor). Opposite each of these interior angles is a portion of a great circle, of arc length respectively a, b, and c (where a, b, and c are opposite the relevant angles, and the angular value is the angle that the portion of the great circle subtends as viewed from the center (inside) of the sphere.

Then, the relations between angles and sides are

sin a sin b sin c ------- = ------- = ------- (the "sine" formulae), sin A sin B sin C

and cos a = (cos b)*(cos c) + (sin b)*(sin c)*(cos A)

(the "cosine" formulae, with appropriate permutations).

Some practice in envisioning and drawing spherical triangles relevant to the problem at hand is necessary. For starters, imagine a spherical triangle defined by the North Pole, a point on the equator at longitude zero, and a point on the equator at longitude 90 degrees. Then, the interior angles will all be 90 degrees and the lengths of the sides will also all be 90 degrees.

For navigation in general, you probably know your current location (in latitude and longitude) and your destination (also in latitude and longitude) and want to know what direction you need to go in order to reach your destination in the quickest possible manner (ignoring windage, current, etc. - i.e. what is the heading of your destination) and how far away is your destination.

The side of the triangle between you and your destination is then the interesting one. Its length (in angular measure, converted to linear measure via the radian formula) and direction (i.e. angle between it and due north) are what you need to calculate.

To do this, draw a spherical triangle with corners at the north pole, your current location, and your destination. Then, the interior angle at the top (A) will be the difference on longitudes of your current location and destination, and two of the sides (b and c) will have angular lengths that are 90 degrees minus the latitudes.

From the cosine formula above, you can then find the length (a) of the third side: you know A and b and c. Convert a from angular measure to linear distance (the distance to your destination) using the radius of the Earth as (approximately!) 6370 km.

Once you know a, you can find your desired heading by finding the angle b (assuming you are now at the point which is the junction of sides a and c.

Be careful when taking inverse trig functions!

These instructions are specifically a bit incomplete in that I hope you will draw some triangles and derive the relevant results!

Note that you can also accomplish much of this with vector products. For instance, the dot product (done with unit vectors) will give you the angle between two points on the Earth: convert your lat, lon (of both current position and destination) to x,y,z coordinates

x = cos(lat) * cos(lon) y = cos(lat) * sin(lon) z = sin(lat)

and take the dot product to get the cosine of the angular separation. use the radius of the Earth, as above, to then get the distance to your destination.

All of this assumes a truly spherical Earth, which ain't quite the case, but close enough unless you are trying to land ballistic missiles on the bad guys a continent away (in which case you may miss by 20-40 kilometers)!!

Re: Latitude & Longitude Conversion (minor corrections!)

*Message #8 Posted by **Dave Shaffer** on 16 Nov 2005, 11:35 p.m.,*
in response to message #7 by Dave Shaffer

I forgot about the formatting conventions!

The "sine" formulas should have

sin a

over

sin A

and similarly for b,B and c,C.

Also, I should have said:

"Once you know a, you can find your desired heading by finding the angle B ..." (angles are capitals!)

in response to message #7 by Dave Shaffer

[quote] Ron,

What kind of "formulas" do you want?

****

Don't recall using the word "formulas" or "formulae." The nearest I recall was equations.

I do appreciate the time you took to expound on what must be your favorite subject, math in general, trig in particular. I continue in my efforts to communicate better the first time, but have a tendency to cut the corners a little close to the line. What I intended to convey when I approached the forum was that I could use an algorithm suitable for use in the 49g+ to quickly calculate heading and distance based on the spherical model of the earth. My experience with forums has been based on something like a barter economy - I exchange a service I can perform to members who contribute to others who borrow from others, etc..... So far I have had tremendous success exchanging ideas and services in photography and math (mathcad). I figured (no pun) that after 30 years making good use of programable calculators, beginning with the TI-59, my experience might contain some trick or treat here or there that just might be the "thing" (formula maybe?) to contribute in exchange for all the favors I am likely to request.

Thanks for your response. I will see if I can reduce it to an algorithm or two. If I perform a

complete analysis of the ballistics problem you offered I would expect the need to solve at least one differential equation to account for drag in the atmosphere, right?

Ron

PS you like oxymorons? I saw a car today with conflicting chrome labels on the trunk "Limited" "Infinity"

Re: Latitude & Longitude Conversion

Re: Latitude & Longitude Conversion

*Message #11 Posted by **Ron** on 18 Nov 2005, 11:25 a.m.,*
in response to message #10 by Les Bell

WOW!

Thank you, Les! Everything I wanted to see plus a whole course in navigation. I'm sure the translations will go smoothly and I can reduce what I want to 48 and 49 g+. Should be fun.

For the benefit of others who might need some of this, the basic file is previewed as 32 pages, but at first glance might expand with several imbedded urls. Looks to me like a complete course, excuse the play on words.

Thanks again, Les

Ron

Re: Latitude & Longitude Conversion

*Message #12 Posted by **Rafael Ramos** on 20 Nov 2005, 8:44 p.m.,*
in response to message #10 by Les Bell

here is a homemade equation to evaluate the distance between two given coordinates

dist=pi*6371*asin(sqrt(sq(6371*sin(lat2-lat1))+sq(6371*cos(lat2-lat1)*sin(lon2-lon1)))/6371)/180

the "6371" is the average earth radius in kilometers. you can change it for miles (make an if() if you wish ;)

can anyone estimate the precision of this equation?

i am working on a formula to consider the diff between the polar and equatorial radius.

Well, in calculus, functions often have limits as they approach infinity... **:-)**

Re: Latitude & Longitude Conversion

*Message #14 Posted by **Ron** on 21 Nov 2005, 2:18 a.m.,*
in response to message #13 by Wayne Brown

the irony of the superior technical/math training in Japan and a "limited" infinity was enjoyable to say the least. Yes, we do have the limits of the errors of our calculus which gives me cause to wonder if the differential doesn't have something to do with "chaos" as it creeps into such things as turbulence and jets. At least most of us seem satisfied with "Close enough for all practical purposes." I still want my jets limited before they approach infinity.

Thanks for the thoughts and chuckles,

Ron

HP Should Really Bring Back The 15C - To Make Money!

*Message #1 Posted by **I, Claudius** on 10 Nov 2005, 7:24 a.m.*

I'm really not passionate about scientific calculators, but many (including most who post here) obviously are. Look at this eBay auction (current bid $300) for a 15C in apparently decent condition:

http://cgi.ebay.com/HP-15C-Scientific-Calculator-with-Manual-More_W0QQitemZ5827219760QQcategoryZ58039QQrdZ1QQcmdZViewItem

If people are willing to shell out $300 up for a years old, used machine, HP should bring back an improved version of the 15C if for any reason to just make money. HP could easily ask $100 up per unit and I'd bet they sell like hot cakes. Good sales would go a long way to help finance the entire calculator division, resulting in hopefully better calculator quality all round.

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #2 Posted by **Stephen Easterling** on 10 Nov 2005, 7:53 a.m.,*
in response to message #1 by I, Claudius

According to a recent auction, Hewlett Packard should bring back the HP67! Did you see that last auction go for just over $400! In all seriousness, I'd love to see some sort of "special" edition (anniversary or not) for a 15C Platinum to go with the 12C Platinum. Imagine, 32k and lots of go-fast parts inside!

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #3 Posted by **Dave Bernazzani** on 10 Nov 2005, 8:56 a.m.,*
in response to message #1 by I, Claudius

I've seen this argument before but it doesn't hold much water, IMO. Something selling for $300 on ebay in small quantity doesn't mean that it can be marketed for anywhere near that nor does it indicate a demand anywhere near large enough to support selling the product in significant quantities. It comes down to basic supply and demand (one of the few things I learned in my non-Engineering classes that has been of immesurable value). In any given week there are, for the sake of example, 10 people selling 15C calculators. There may be 20 people looking to buy said calculators. The price is driven up because there are more willing buyers than sellers. The demand is high. The number of available units for sale is low. The price reflects this ratio.

If HP mass produces the HP-15C (or equiv.) then the market gets saturated quickly - those few that want them can easily get them, demand goes down, supply goes (way!) up and nobody is willing to pay the high price anymore. HP isn't going to sell enough at the ebay-price or by keeping the demand high because they can't survive on handfulls of $300 sales per week. If the HP-15C were to be re-released, a few hundred (or thousand) of us would be happy, and would buy one (or two!). Then the rest would have to compete on the open market with a $15 calculator (admittedly inferior) hat could do everything but clean the kitchen sink. It just doesn't seem viable.

This is a big misconception when people see the prices out of print items fetch. I see this with 'rare' video games as well (my other hobby). In a few cases, companies have been persuaded to re-release a product which

often sells well for a couple weeks for those that have been wanting a copy until the supply/demand ratio changes. Then they are stuck with lots of product that ends up competing poorly.

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #4 Posted by **Frank Travis** on 10 Nov 2005, 9:12 a.m.,*
in response to message #3 by Dave Bernazzani

I see your point about supply and demand. When I was at HHC 2005 in Chicago this year I gave a presentation on bringing back the HP 15C (in an updated version). I used my current HP 12C as an example of the basic layout/mold needed. Lee Kuan-Goh and Cyrille DeB. of HP who were there said that HP would have to do their own marketting survey to see if they could recoup their investment costs and sell enough new version HP 15Cs to bring it back. Lee said they have gotten a lot of hot response on bringing back the HP 15C. The only way of knowing for sure how many new HP 15Cs would sell is for HP to do the marketting survey. In the 1970s the Nissan "Z" sports car was very popular. It is now being re-issued. The Ford Mustang car from the 1960s was re-introduced (with modifications) in the 1970s as Mustang II, and more recently in a newer version. I also made a point at HHC 2005 about the documentation for the original HP 15C already being available (the CD/DVD documentation on www.hpmuseum.org) and whole book form manuals on www.ebay.com HP would not have to redo the who manuals, just make necessary modifications.

some economics classes would help here

*Message #5 Posted by **john** on 10 Nov 2005, 10:13 a.m.,*
in response to message #4 by Frank Travis

Cars like the Mustang II would be bought by people whether or not they ever liked the Mustang I.

there just are not enough people to buy 15c calculators to ever make this worth doing to HP.

I find it humorous that so many people waste their time like this rather than moving on with their lives.

The 15c will not be brough back.

Compare with slide rules

*Message #6 Posted by **Norris** on 10 Nov 2005, 12:54 p.m.,*
in response to message #5 by john

If you check eBay or Sphere Research, you will find that collectors routinely pay $100 to $500 for good slide rules. Does that mean that there is a place for new K&Es or Picketts on the shelves at Office Depot or Staples? Realistically no, not even at a fraction of those prices.

There is an informal association of slide rule enthusiasts, the International Slide Rule Group, that occasionally does commission new slide rules from a Japanese manufacturer. They can round up a few hundred people worldwide for each order. So the community, while passionate, is very small. HP calculator enthusiasts are probably a larger group, but not large enough to represent a significant market, especially for a big company like HP.

in response to message #7 by Chris Dean

The new 'stang is as much an old pony as der neue beetle is the old bug.

Why would anyone seriously wnat to re-create the 15-c? It's ludicrous.

The only reasdon you like it is beacause it is "beautiful" and "pwerful" within the context of its era.

What's wrong with it.

1-line dsplay?

No alpha?

the matrix stuff is great, except it is old-fashioned and anyone is going to say, "what't the point" when you can go to a "graphing" and get much more effective matrix interfaces and manipulation.

can you say slooooow?

RPN? OK, so let's all throw out our windose machines and go LINUX. Never mind that none of the programs we *need* to be productive will *work * on linux. RPN is nice, but it is not viable as a stand-alone approach anymore. It's like apple and linux--great for the "informed" but useless if you actually do something useful in the broader context.

Keycodes? You must be joking if you thing that is a way to program today.

In short, it is just not Worth it to think about bringing it back. Let it live on a a piece of history.

or check out Linspire Linux at www.linspire.com . All the Microsoft stuff is mimicked (without the bugs, virus susceptibility, lousy MS support, etc.) in Linux. For a single, small yearly fee (something like $40), they offer unlimited access to 2000+ software titles, plus Win-to-Lin which allows things that were designed to run under Windows to run under Linspire Linux instead, without Windows. In a few days I expect to be MS-free here.

Edited: 10 Nov 2005, 5:29 p.m.

linux

*Message #11 Posted by **bill platt** on 10 Nov 2005, 5:30 p.m.,*
in response to message #9 by Howard Owen

Don't get me wrong--I love UNIX and I like Linux. And it makes a great server--so far much more secure than windose.

But when it comes to the "front end" no small to medium business can afford to be using equipment that simply will not run the software they need.

I used macintosh back in the day. Much better than early windows.

But I had to buy a DOS machine. I needed the software that was writen for ms-DOS shell, so the hardware and shell had to be DOS.

Some of the IT geeks like to make alot of hay about how Linux is catching up etc.

I won't believe it until I see the programs that I *use* being offered to run native in Linux. At that point, Linux will be the "standard". But it is not there yet. Not even on the radar yet.

Those are the show-stoppers

Micro$oft Access ('m sure I could port my database--would not miss Access for sure!)

The following are used but I don't care who's, as long as they write/read formats perfectly: Wordperfect (current release--a client uses it) Word,Excel,Powerpoint all that sh** Paint, Photoeditor

Re: linux

*Message #14 Posted by **Howard Owen** on 10 Nov 2005, 7:32 p.m.,*
in response to message #13 by bill platt

Codeweavers has a program going until the end of the year in which they will work with you to get *any* Windows app to install on Linux with CrossOver Office. Now, just installing is one thing, and running well is another. But the first has to happen before the last can be acheived. And some Win32 apps will run great under the existing WINE, which is at the heart of CrossOver Office. AutoCAD will, for example, although I don't recognize the others on your list. Microsoft Office, at least through Office XP, runs great. Including Access in the newer releases, I believe. Visio runs well too.

So for basic Office productivity on Linux, you have a choice betweem M$ Office (Or WordPerfect) and some pretty substantial office software from Sun and others. In most cases, it's not the widely deployed apps that stand in the way of Linux desktop deployments. It's the vertical apps, like the ones you mentioned. But I hope I've given you at least a glimmer of an idea that Linux may be "on the radar" after all.

Re: 'stang

*Message #15 Posted by **Thomas Okken** on 11 Nov 2005, 8:24 p.m.,*
in response to message #8 by bill platt

Sorry, getting a wee bit of-topic here, but I couldn't resist...

RPN? OK, so let's all throw out our windose machines and go LINUX.

Why throw anything out? I've been running Windows AND Linux on all my PCs for the last 10 years. Good ol' dual boot.

*Never mind that none of the programs we *need* to be productive will *work * on linux.*

Speak for yourself! All the programs *I* need to be productive are available on Linux, and usually they work better than the Windows equivalents... One thing that's keeping me from ditching Microsoft altogether is that Windows is still the premier *gaming* platform! Not much of a productivity booster, that, but hard to ignore. ;-)

Incidentally, the Windows version of Free42 was developed almost entirely under Linux -- using Win4Lin with Windows 98SE and Microsoft Visual C++ 6.0. No getting around using M$ products if you want to develop software that runs on M$ platforms, but at least I could do it while still having access to all my cool Linux goodies and no need to reboot.

One of the axioms of economics:

Price is set by buyers and sellers. For any class of items for which a large body of items exist, the price is set nty by any "intrinsic" value, but rather by the small percentage of that class that is actually for sale, and the buyers who are buying. This is as true for calculators as it is for real estate.

The great fallacy of your reasoning is caused by you confusing what is actually happening, as compared with the concept of "supply and demand" *as applied to consumables*. Calculators are *durable goods* more akin to real estate, at least over medium time spans. (Obviously over time, they will become scarce--as any collectible will, whereas real estate is fixed).

Note that Pontiac does not go and re-produce the 1969 GTO. Sure, you can spend 50 grand on one, but there aren't that many people out there willing to spend it!

"They Won't"

*Message #20 Posted by **Ron Ross** on 10 Nov 2005, 9:36 a.m.,*
in response to message #1 by I, Claudius

And the reason why: Anything more complex than the Hp33s would then start to rob sales from the Hp49G line. Hp has the history of the Hp42s to refer to for this (falacy maybe, but they should still have the sales data, which I would certainly interpret differently from their brilliant marketing bunch).

The Hp42s was designed to support 32K RAM and a serial I/O had been in the works. As it was, it was priced above the Hp48G AND it STILL SOLD. Every sale was a no SALE for the higher powered Hp48G. "Man, are those DIMWIT ENGINEERS STUPID!" is all Hp marketing could think of. So as to not produce a competing line (as anyone who bought an Hp42s, wouldn't buy anything but Hp, why not reduce their choices ie buy

either an Hp32s or an Hp48G). Most would step up to the Hp48G and those that needed less would buy an Hp32s (with units conversions, and still some programming).

The Hp42s (larger number than 41) was supposed to supercede the 41. Only near the end was it then marketed to replace the Hp15c (after abandoning the serial I/O development, the RAM support was already there).

I could RANT and gripe all day, but at least there is still the Hp33s now available. That it is distinctive is another BIG PLUS (ugly to some, maybe most).

I also feel that is why the Hp20s was NEVER offered as an RPN/algebraic option calculator. That would have ROBBED sales from the Hp32s (retail $70 vs $30 for the Hp20s).

Sometimes Hp marketing stratagies backfire, but hey, they have degrees in these areas, so who are we to argue with their brilliant decisions?

To comment on the intra-product line competition of a beefed up 33/42s style machine and the 49 line-

My university carried a slew of the 49g+ in 2003. They also carried the 48gII. I haven't seen a 49g+ since early 2004, but they do have several stacks of 33s' (the new ones- larger dot,spacing between numbers).

In fact, I can't seem to locate the 49g+ in any store here. I have one of the earlier models with a stiffer keyboard and latest ROM (I'm not looking for one, in other words). Whatever HP may have in the works, I suspect that I will still react with "is THAT the new HP?" They never really live up to the nostalgia-fueled expectations on first impression, although, YES, the 33s is pocketable-RPN for under US50.00, and it works quite well.

My engineering dept is fairly small (300 students), and of the few people I know, 4 people use RPN. We all seem to do very well, too :) Of note is that no one using a Ti grapher seems to have written code, or really used the graph capability. But, what is garbage to me is...

Also, there is a bit of a 'sleeper' component to the 33s (or any non-graphing RPN). And if I sit and program at a cafe, the ladies don't suspect that I'm playing video games :) Lay people at worst assume you are doing math, which is fine, and often the case.

Quote:

The Hp42s was designed to support 32K RAM and a serial I/O had been in the works. As it was, it was priced above the Hp48G AND it STILL SOLD. Every sale was a no SALE for the higher powered Hp48G. "

I'm afaraid that some of this is revisionist history. If you check Craig Finseth's hpdatabase at http://www.finseth.com/hpdata/hp42s.html, it shows that the HP42S was introduced in October of 1988 at a price of $120. and was discontinued in March of 1996. The HP48G was introduced in June of 1993 at a price of $165. and discontinued in mid 1999. From this, it was to be five years after the 42S came out before the 48G was introduced. Did you possibly mean the 48S? It was introduced in April of 1991 (still a year and a half after the 42S) at $250. and was discontinued in June of 1993, right as the 48G came out. Either way, it looks like the price of the 42S was never higher than either the 48G or 48S. I distinctly remember when the 42S was introduced, because I had a 28S at the time and saw no need to revert back to traditional FOCAL language a la hp41 after having just obtained my second (28C, then 28S) RPL machine.

Re: "They Won't"

*Message #24 Posted by **Ron Ross** on 10 Nov 2005, 12:09 p.m.,*
in response to message #23 by Jake Schwartz

I purchased my first Hp42s for $90 (Hp discount) and an Hp48s for $140 (again, an Hp discount). However, shortly there after the Hp48G was introduced at $160 and within a year was down to $100 while the Hp42s was then available for list at $120.

This was now around 93-94 and I had just given my Brother in law my Hp48s and was looking to replace. I was surprised that the Hp42s was priced higher than the newer Hp48G. I then forked out a $100 for a new Hp48G from Educalc. I remember thinking, "Why hasn't Hp reduced the price of the Hp42s? They will never sell any if they are priced more than an Hp48G." Shortly afterwards, the 42s was discontinued. Don't have to be to bright to realize why, it didn't sell. But then it couldn't be expected to sell well in its market niche except to die hard Hp calculator nerds. The typical engineer buys the most he can for what he wants. The Hp48G blows an Hp42s away for features and I/O.

But a 48G aint a pocket calculator either. As a student, I would use a 48G for much of my work, but if I just needed a customizable calculator, I would vote (and buy) an Hp42s. That it was marketed poorly is another matter.

Now I use the newer Hp's because they are fast, fairly reliable and replacable. However, they aren't nearly as well made as the older line.

Re: "They Won't"

*Message #25 Posted by **brian healy** on 10 Nov 2005, 12:46 p.m.,*
in response to message #24 by Ron Ross

Since HP still makes one of the voyagers (12c), why not do a calculator that has the functionality of the 33s (with some improvments) but is in the form of the 12c?

Re: "They Won't"

*Message #26 Posted by **John** on 10 Nov 2005, 12:52 p.m.,*

in response to message #25 by brian healy

That's the whole point of this "Bring back the 15c" stuff.

Problem is that developing a calculator takes a lot more than just a case and keys.

And, these days, corporations won't come out with something that just breaks even. It must compete for scarce capital against other projects with high rates of return.

If you can't show a high net present value, forget it.

Bringing back the 15c would not make HP money. Therefore, they won't do it.

It is simple economics. 10 units a week at ebay may bring $300-500 each.

Making 10,000 units a month of a new 15c and they'd be lucky to command $100 each. Probably more like $60-80 each.

For what? A calculator without alpha capabilities? With programs showing keycodes? Competing against graphing models selling for the same price? competing against casio and sharp models with pretty much the same capabilities selling for $20?

The only reason the 12c survives is that enough people buy them to make it nuts to discontinue it.

If the 15c had sold like the 12c did and still sells, it would still be made.

Not enough people bought it when it was on sale the first time to make it financially smart to keep selling it.

It certainly wouldn't be any different today.

Re: "They Won't"

*Message #27 Posted by **Chan Tran** on 10 Nov 2005, 3:36 p.m.,*
in response to message #26 by John

It won't fly! We all know how much the 42S, 32SII, 48GX go for these days on ebay. Remember HP couldn't sell the 42S at $80, the 32SII at $58 and the 48GX at $100. They only command a high price when they are not available from HP. The 42S was never priced higher than any version of the 48.

Re: "They Won't"

*Message #28 Posted by **brian healy** on 11 Nov 2005, 11:25 a.m.,*
in response to message #26 by John

Then what is the perceived future for the 33s, or a 33s class machine? For a 33s class of calculator, are we then forever going to have the current case and buttons of the 33s? If HP stays in the market, then presumably at some point they will have to change or update the styling of the 33s, as well as add some features, even if only incrementally in nature.

*Message #29 Posted by **hugh steers** on 10 Nov 2005, 5:20 p.m.,*
in response to message #1 by I, Claudius

i'd like to turn this discussion on its head and ask, what people think a viable market price today would be for a calculator, in the spirit of the 15c, but nevertheless totally new.

with:

- high quality buttons & case.
- pocket sized/landscape design,
- fast/large memory (eg 400Mhz/2MB).
- installable software libraries (eg into flash).
- pc interface (eg usb).
- alpha (and indeed greek and other letters).
- bitmap display.
- programmable
- rpn/aos/formula operational modes.
- advanced features (complex, matrices, solve, quadrature etc.)
- financial functions of the 12c.

without:

- expandibility.
- graphing (takes too much actual size).
- decades of battery life.
- exempt from exams/not for education market.

would you pay $200?

turn the 15c on its head

*Message #30 Posted by **bill platt** on 10 Nov 2005, 5:34 p.m.,*
in response to message #29 by hugh steers

Yes. I'd pay $200.

Only becase such a product is way superior to any other current or previous product in it's *size*.

If it didn't have the small size, I'd stick with buying a 49G+ or something.

Note that what you are suggensting is *not* a 15c. It is not a 42S. It is way better!

Re: turn the 15c on its head

*Message #31 Posted by **Walter B** on 10 Nov 2005, 6:18 p.m.,*
in response to message #30 by bill platt

IMHO that's exactly what at least some people in this forum mean when talking about a "new hp15c" or a "new hp42s". So, to avoid ongoing confusion and further wars, let's baptize the baby hugh steers outlined:

Let's call it the **IQ43s**

(for the older audience: remember 2001)

Re: turn the 15c on its head

*Message #32 Posted by **Howard Owen** on 10 Nov 2005, 9:40 p.m.,*
in response to message #31 by Walter B

Wouldn't that be the 'IQ53t' then?

Re: turn the 15c on its head

*Message #33 Posted by **Walter B** on 11 Nov 2005, 11:59 a.m.,*
in response to message #32 by Howard Owen

You are almost right! But "s" stands for "scientific". 8)

Re: turn the 15c on its head

*Message #34 Posted by **Howard Owen** on 11 Nov 2005, 2:34 p.m.,*
in response to message #33 by Walter B

Yeah, but "t" could stand for "terrific!" 8)

Re: turn the 15c on its head

*Message #35 Posted by **Walter B** on 11 Nov 2005, 3:13 p.m.,*
in response to message #34 by Howard Owen

OK, this point is yours! d:^D

Anyway, I like scientific calcs more. The world is full of terrific calcs. You will agree that's reflected in this nice forum quite well.

Hugh, I apologize for having written your name with small letters. The time I realized it, it was too late to correct it.

*Message #36 Posted by **Mike DiGirolamo** on 10 Nov 2005, 8:08 p.m.,*
in response to message #29 by hugh steers

Hi Hugh,

I really LOVE HP stuff. I bought a HP-67 when it first was introduced in the 70's and today I have HP-67's, HP-97's, a HP-12C, HP-15C, a HP-41CX and HP-75C. I especially love working using RPN. BUT, most of the time when I need to work out some calculus or statistics problem, or even an EE problem -- I hate to say this, but I just turn on my TI Voyage 200. It's available all over the place for $150 or less, brand new. Gosh, I wish HP had something equivalent to that Voyage 200 in RPN. That's the competition HP is up against.

This is honest input from tried and true HP lover,

Mike, W4XN

in response to message #41 by Andy

Pro Engineer?! That name is like a profanity to my ears. It's perhaps one of the worst programs in user interface I've seen, overpriced, and the attitude of tech support was surly. Everyone on my team gave up on trying to use it, but I stuck with it. After literally several hundred hours of trial and error, I got to where I could use it. But, the final straw was when it came to transferring the docs to CAM, where it failed miserably. So we started using SolidWorks, which is the industry standard for very good reasons.

Edited: 13 Nov 2005, 7:31 a.m.

Pro/ENGINEER

*Message #43 Posted by **Andy** on 14 Nov 2005, 9:22 a.m.,*
in response to message #42 by I, Claudius

Your Opinion is well noted. I have used AutoCAD (Crayons), ClarisCAD (paint program) and Pro/E since rel 10 (1991) when it was ported for the MAC QUADRA. And also CATIA Ver10. I have also used Solid Words. Created by people who worked for PTC. I have worked in Aerospace since 1990. Main CAD systems being Pro/E, CATIA, UNIGRAPHICS. I thought Ashlar Vellum 3D for the MAC was a most elegant CAD system. Then again just an Opinion.

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #44 Posted by **hugh steers** on 11 Nov 2005, 9:10 a.m.,*
in response to message #38 by Hugh Evans

i wasn't envisaging the same thing as you have here. for one thing, there's no need for all of usb, rs232 and irda simply because it adds cost (and power consumption). a lot of ideas for a new calculator suffer from creeping featuritis and this is a bad thing.

also, copying the form factor of the voyagers is wrong. the display needs to have more lines but not be grossly big as to make the unit large. i completely agree with people that pocket size is crucial. in today's world of pdas & laptops, the biggest reason to buy and carry the machine is convenience.

also the design needs to be smart. if i'm asking people to hand over $200 rather than $20, i don't make the fixings visible. i also make it look cool. think ipod. it needs wow factor rather than nerd factor. the market is small, but bigger than techies. i would aim to include consultants, accountants and business people as well who would currently buy the 12cp, 17bii etc which are both lacklustre in appeal.

there's one other major difference. i'm thinking of a calculator that is in, no way, compatible with hp. although it should have a selectable RPN input mode, it does not have a compatible programming model nor rpl. afaik, this was one of the primary goals for the openrpn design.

Can you say "themeable face plates?"

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #47 Posted by **Hugh Evans** on 12 Nov 2005, 5:05 a.m.,*
in response to message #45 by Wayne Brown

A perfect design should look great to most people, and evoke many wows, without sacrificing any functionality. I think that's what hughsteers meant. In other words you *would* buy it and would appreciate it for both its' function and form.

I certainly haven't been trying to make my designs ugly or for "nerd factor." The exterior shell, for example, is seamless and made from rubber. Why? It helps to create a water barrier, gives it extra grip on surfaces, makes it easier to hold, lends some degree of cushioning when dropped, and it looks cool. Hiding the screws would be easy, but I chose to make them prominent because it makes servicing more convenient and I think it gives the machines a slightly more utilitarian/technical appeal (this is a common feature in aircraft control panels). For every feature of the external design I can explain exactly how it arrived at its' current form.

I find critisism extremely helpful. The fact that my designs have received so little leaves me with a big pile of ambiguity. Tearing them limb for limb on every feature you don't like (especially if you can suggest an alternative) is a big help.

I check my email regularly and anyone can feel free to send me their comments and ideas. Attachments such as CAD files and sketches are no problem.

Best Regards, Hugh

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #48 Posted by **Wayne Brown** on 12 Nov 2005, 11:03 a.m.,*
in response to message #47 by Hugh Evans

Well, I strongly dislike any technical instrument that looks as though some designer spent time on it trying to make it look less intimidating or more "friendly" or more appealing to the average person's "fashion sense." Dark, somber color scheme, chunky, heavy construction, insanely-complicated control panel that looks like you'd need an engineering degree or a mathematics Ph.D. to use it -- *that's* what I find appealing. If it would have looked out of place in a NASA Mission Control Room in the 1960s then I'm not interested.

Having said that, I actually *do* like the design in the drawings you posted in this thread (provided the color scheme matches that of the 15C).

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #49 Posted by **Hugh Evans** on 12 Nov 2005, 11:30 a.m.,*
in response to message #48 by Wayne Brown

The color scheme is similar but not identical. I produced an optimized set of available colors. Yellow/orange and blue are the standard shift colors, green is set for alpha. The purple was made to cover anything else resulting from custom orders. An interesting note is that the purple and green found on HPs would technically work as well as yellow and blue if they had paid attention to luminance!

http://openrpn.org/images/userimages/Colors.jpg

not a 15c -- a 12c Gold!

*Message #50 Posted by **Mark Crispin** on 10 Nov 2005, 9:54 p.m.,*

in response to message #1 by I, Claudius

I agree with those who say that the 15c won't make it on its own. But what about a 12c with expanded switchable microcode that can be switched between 12c, 15c, and 16c modes and changeable faceplates?

The market droids would love the idea (consider the 30s), and they could get away with charging more than a 12c Platinum (even though it would only do the 12c operations); the 12c Platinum is undoubtably cheaper to make. The only real engineering would be to make the changeable faceplates (which would also have to change key tops).

Would you pay $125 for a "three-in-one" calculator?

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #51 Posted by **Eddie Shore** on 10 Nov 2005, 10:03 p.m.,*
in response to message #1 by I, Claudius

Yes, the 15C AND the 42S! :)

Two collector items I'm after. Also, I will probably be in line for the future 50g+.

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #52 Posted by **Andy** on 11 Nov 2005, 8:54 a.m.,*
in response to message #1 by I, Claudius

No need to bring back the 15C, just revise a 12C by adding Scientific functions (ala HP27). Perhaps an overlay. I would pay $200. Also the gold Bezel is more attractive on 12C (non Titanium). Oh leave the Algegraic choice functions for the newer generation.

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #53 Posted by **Namir** on 12 Nov 2005, 10:24 a.m.,*
in response to message #52 by Andy

Andy,

What made the 15C so special are teh following features:

1. Matrix operations 2. Solve 3. Integration

The 15C programming model uses labels and not line numbers to direct jumps and execution subroutines. Speaking of subroutines, the 12C does not support them!

The 15C seem to become more popular now. Back then, the HP41C/CV/CX wereking because of the alphanumeric capabilities. Also th HP41 hd the Advantage ROM that implemented the features of the 15C that were missig in the 41C. HP used microcode to support the 15C-like features.

Namir

Re: HP Should Really Bring Back The 15C - To Make Money!

*Message #54 Posted by **Andy** on 14 Nov 2005, 9:31 a.m.,*
in response to message #53 by Namir

Namir,

I must agree. I purchased an HP 41CV in 1989 from the Hewlitt Packard employee store for $87.50 (Cost to HP to mfr) when someone lifeted my HP15C from my drafing table, then returned a day later to steal the manual. The 15C was a beautiful design, highly functional for fast computation and would not slide off the drafting table when tilted at a 20 deg angle. I thought perhaps the 12C could be revised for Scientific application without losing much of the programming of the 15C

Regards,

Andy

HP49G+

*Message #1 Posted by **Chris Dean** on 10 Nov 2005, 4:30 a.m.*

I noticed in the principal features on the HPCC site that the HP49G series calculators are programmable in HP Basic.

> Quote:
>
> RPL, HP Basic and Assembly language programming

Is this true?

Re: HP49G+

*Message #2 Posted by **Valentin Albillo** on 10 Nov 2005, 5:46 a.m.,*
in response to message #1 by Chris Dean

Hi, Chris:

Chris wrote:

"I noticed in the principal features on the HPCC site that the HP49G series calculators are programmable in HP Basic. [...] Is this true?

If you call code like this "HP BASIC":

```
FOR(i,1,100)
DISP(i,1);
IF I+1-5==50 THEN DISP("Hello World",2) ELSE DISP("I'm off",2) END
STEP(1)
```

then, yes. Else, no.

There are, however, very good emulators available for the 48/49 series that can provide the goods. For instance, HP-71X by Hrastprogrammer does perfectly emulate an HP-71B, and this allows you to program in HP-71B BASIC, which is an advanced version of the usual 'technical' BASIC dialect found in larger, vintage HP computers of old, such as the HP-85, HP-86/87, or HP-75, say. Using this emulator would allow you to write and run code like this:

```
10  DESTROY ALL @ OPTION BASE 1 @ INPUT "#Points, Degree=";N,D
20  DIM X(N),Y(N),A(D+1) @ MAT INPUT X,Y @ CALL LSP(X,Y,A) @ MAT DISP A @ END
30  SUB LSP(X(),Y(),A()) @ N=UBND(X,1) @ D=UBND(A,1) @ DIM U(N,D),V(D)
40  MAT U=CON @ FOR I=1 TO N @ FOR J=2 TO D @ U(I,J)=X(I)^(J-1) @ NEXT J
50  NEXT I @ MAT V=TRN(U)*Y @ MAT U=TRN(U)*U @ MAT A=SYS(U,V) @ END SUB
```

which, by the way, is a little program I wrote to compute the coefficients of the Nth-degree least squares polynomial regression to an arbitrary set of datapoints (X,Y).

Thus, by using HP-71X you can develop/run similar code in this powerful version of HP Technical BASIC on your 48/49.

Best regards from V.

in response to message #4 by Vieira, Luiz C. (Brazil)

Luiz; Please excuse my ignorance but I found hpmuseum just a few days ago. I'm digging for technical information on my 41CX; it was sick but working before I tried "fixing" it. Can you give me the URL for "TOS" assuming it has resources for HP 41 users?

Edited: 10 Nov 2005, 4:08 a.m.

Re: TOS Website - Contents Info. Request

*Message #6 Posted by **Andrés C. Rodríguez (Argentina)** on 10 Nov 2005, 7:29 a.m.,*
in response to message #5 by Dan Taylor

There are some kind of issues (legal, copyright or whatsoever) that prevents the name or URL of "That Other Site" to be posted in the MoHPC site. I am not particularly aware of the issues or about the reasons that support them or not; it is enough for me to know that Dave Hicks, curator of the MoHPC, has stated previously (and repeatedly) that it needs to be that way. If you search previous Forum threads (many months ago) the situation was discussed with different opinions and other details.

If you do a search with Google or other search engine, using "HP 41" as keyword you surely will be able to find TOS by yourself.

Re: TOS Website - Contents Info. Request

*Message #7 Posted by **Jeff O.** on 10 Nov 2005, 7:47 a.m.,*
in response to message #5 by Dan Taylor

Dan,
The story of "TOS" is long and complex. Suggest you review this archive thread and maybe this one for some background.

Re: TOS Website - Contents Info. Request

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 10 Nov 2005, 8:07 a.m.,*
in response to message #5 by Dan Taylor

Hello, Dan;

I think I speak for the others when I say `Welcome!`, although I agree with anyone that mentions the fact that a Brazilian guy welcomes a visitor at an USA-native site is odd... though! d8^)

Andrés has already mentioned much of the TOS issue; anyway, please check your e-mail, at least the one you use to register as a contributor rhere, at the MoHPC (Museum of Hewlett-Packard Calculator).

May I suggest one big source of general, concise, powerful, etc. HP-calculator related information, HP41 mainly included? The MoHPC CD/DVD Set. I saw no one that bought this set and complained. Imagine 10 CD's, or a single DVD with as much information as you can imagine about HP calculators. Please, check the full list of documents and you'll see many HP41 related docs that, by themselves, worth buying the set. In fact, there is so many info that I consider what one pays for the pack as a symbolic contribution...

There are many good additional info at the Articles Forum, that will surely help you in other ways.

Hope you find what you need here, too.

Best regards.

Luiz (Brazil)

Comments, Related Info.

*Message #9 Posted by **Dan Taylor** on 14 Nov 2005, 6:27 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

A., G., J., Luiz, etc.;

I panicked when my reliable (until I tried to program it for sinh) 41CX crashed. I suspect that 1.2 volts per Type N cell should set off the low bat indicator; that's another issue. Then the RPL/RPN thread caught my attention. Apparently no new HP's even use RPN, which I regret. A replacement 41CV is needed.

Yes, I should have read more and looked around more before I ever posted here too. There is a wealth of information to absorb herein, all of which I greatly appreciate. Common courtesy is a related issue which I will observe.

I also found an advertisment for a set of 41CV's. I'll contact them regarding a purchase, but cosmetics are unimportant. Repairs for my 41CX? Another day and time - after final exams. Thanks. dt

Re: Access on TOS?

*Message #10 Posted by **Walter B** on 9 Nov 2005, 5:36 p.m.,*
in response to message #1 by Matthias Wehrli

Accessible from Germany without problems.

Re: Access on TOS?

*Message #11 Posted by **Howard Owen** on 9 Nov 2005, 6:03 p.m.,*
in response to message #1 by Matthias Wehrli

I can traceroute it, but can't get a rise from port 80.

From my hosting company, I can get to the web service. Odd.

Re: Access on TOS?

*Message #12 Posted by **PeterP** on 9 Nov 2005, 9:51 p.m.,*
in response to message #11 by Howard Owen

same here in NYC, no access (it does not even show up in the browser...)

Re: Access on TOS?

*Message #13 Posted by **Howard Owen** on 9 Nov 2005, 10:12 p.m.,*
in response to message #12 by PeterP

Another test: Try "http::*TOS.yeah.right*/footwaddle.cfm", where you literally type things that aren't italicised. I get an error from the web server when I do that.

I've left mail asking what is up.

Work around for a Unix/Linux system that isn't running a webserver:

```
sudo perl -pi -e 's/^127.0.0.1\s+(.*)/127.0.0.1  tos.yeah.right $1/' /etc/hosts

sudo ssh -l mynormalaccount -L80:tos.yeah.right:80 my.webhosting.com
```

Now access as usual from a web browser on the same system. This assumes that "my.webhosting.com" *can* reach TOS.

Re: Access on TOS?

*Message #14 Posted by **Daniel Diggelmann** on 10 Nov 2005, 12:20 a.m.,*
in response to message #13 by Howard Owen

I can access TOS no problems

Cheers Daniel

Re: Access on TOS?

*Message #15 Posted by **Ronald** on 10 Nov 2005, 11:42 a.m.,*
in response to message #14 by Daniel Diggelmann

Working perfect again now

Ronald

48Gx Transfer cable serial to USB modification

*Message #1 Posted by **Will** on 9 Nov 2005, 2:02 p.m.*

Hi Guys...i just want to know if some of you has adapted the standar transfer cable (serial end) to a most update USB conector....Do things like the serial-USB adaptor sold at Radio Shack works or need some electronic (and /or software)changes...I would like to update my transfer cable...

thanks you...

Such adapters carry electronics that translate between the serial protocol, which is just levels on the wire, to USB, which has a good deal more smarts. So your seral/USB adapter contains logic that identifies to a host system as a serial interface, for example.

I've been successfully using a Radio Shack serial/USB adapter on my ThinkPad T40 under SuSE Linux 9.3. It works great for the 48G and for anything else I've thrown at it. I can't imagine the support would be any less on Window$. But you aren't going to get a speedup compared to the serial interface. That's because the 48G is limited in what it can push out its serial port.

As for software, you HP connection kit should handle either USB or serialally connected calculators.

I too use the Radio Shack converter. The accompanying disc comes with Windows drivers, but you can also use the drivers from Prolific (the converter is in fact a Radio Shack branded PL2303).

http://www.prolific.com.tw/eng/Products.asp?ID=59

Under Linux, it uses the usbserial and pl2303 drivers. The adaptor works well under both Windows and Linux.

I should be getting my HP38G cable pretty soon. It too has a serial plug. We'll see how well it works with the convert.

I don't blame him: everybody bids upto what he/she wants.

But if I think that a couple of years back I bought two CX for a similar amount... And yes, they came **with** the battery holder :-)

However, a few days ago, I acquired another 10A **without** battery door: anyone with a spare? :-D

Greetings,
Massimo

A perfect example of the compulsiveness of gambling. I wonder how much this person would pay for that little AC charger cover on the HP-41.

Ebay Must have a new bid policy

*Message #9 Posted by **bill platt** on 9 Nov 2005, 2:29 p.m.,*
in response to message #1 by Massimo Gnerucci (Italy)

I haven't looked at ebay closely in months....

take a look at the bid history. It looks like ebay now disclosed your *maximum* bid! So that auction is down in the $50 range (which is still too high).

When did these policies change? Why?

Re: Ebay Must have a new bid policy

*Message #10 Posted by **Howard Owen** on 9 Nov 2005, 2:46 p.m.,*
in response to message #9 by bill platt

No, the final bid of $91.00 topped a previous bid of $90.00. If you are outbid, then your maximum bid shows in the bid history. It always has, and it makes perfect sense.

Re: Ebay Must have a new bid policy

*Message #11 Posted by **Gonzalo Fernandez (Spain)** on 10 Nov 2005, 5:36 p.m.,*
in response to message #10 by Howard Owen

See Ebay item

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=7193789795&rd=1&sspagename=STRK%3AMEWA%3AIT&rd=1

and Ebay item

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=31534&item=8713899991

(same buyer and seller)

but hurry: soon the item will "transform" into a $15.99 "Brand New USB Black Scroll Mouse Dell" :-)

Re: Ebay Must have a new bid policy

*Message #12 Posted by **Howard Owen** on 10 Nov 2005, 6:15 p.m.,*
in response to message #11 by Gonzalo Fernandez (Spain)

So in the first he's selling it for $99.00 and in the second he bought it for $1.00. How does that relate to "disclosing your maximum bid?"

Or did you just click on the last post in the thread? 8)

How can you blame Coburlin... revisited

The program used to generate the display is shown below:

http://www.series80.org/Pictures/blinken1-pgm-lr.gif

The layout shown here:

http://www.series80.org/Pictures/Blinken2-lr.jpg

shows the light strips (12 of them) connected to two HP 59306A Relay Actuators. Both 59306As are controlled by one of the 9915 computers (the one on the top right, with the LEDs on).

This is a 9915B (brought back to life with the help of Tony Duell) which is running a program from the tape inserted in its drive. By naming the program Autost, the 9915B runs it automatically everytime it is powered up.

I thought of adding some seasonal sound track, but on second thought, I prefer the sounds of the relays.

41CX Needs Serious Help

*Message #1 Posted by **Dan Taylor** on 9 Nov 2005, 8:52 a.m.*

Hi: This reliable calculator is a gift that served me well for over 20 years with the Math 1 and Advantage modules. 4 Type N batteries; Serial No. 2338S42235.

Low Bat indicator never lit. Problem noticed when Ex Alpha Matrix Function used: Prompts order; I enter 2, 3, & 4. Display always ORDER=5\/ TVM Function (compound interest) OK. I lost manuels but have the user guide. Can't set time, date etc. {Later I foolishly tried clearing Reg & Stack. etc} Cat. #3 still showed the apps. "Invalid Entry" was a typical response for all Alpha cmds. Later, unable to store intermediate calc via: STO 00,01,02... Regular Calc. operated OK then.

Removed battery pack to "reset things." Blank display after installing 30 sec later. Cleaned contacts; found cells were 1.2 V each - why no lo bat indicator? Before I get 4 new ones, how messed up is the data structure? I likely made it worse, but had to get Cramer's rule working. Sorry if this is long. Dan. ICT, KS.

Re: 41CX Needs Serious Help

*Message #2 Posted by **David Smith** on 9 Nov 2005, 10:53 a.m.,*
in response to message #1 by Dan Taylor

It can be hard to reset things by removing the batteries. The internal cap can keep the memory alive for over a month. For a well and truly reset machine, you have to open it up and short the two big caps out.

1.2V is a good voltage. It is the standard cell voltage of the NiCad pack The low bat comes on around 1V per cell.

Re: 41CX Needs Caps Discharged

*Message #3 Posted by **Dan Taylor** on 10 Nov 2005, 2:36 a.m.,*
in response to message #2 by David Smith

Discharging the electrolitic capacitors seems reasonable. Given that the unit came with 1.5 V Alkalines, 1.2 V/cell seems low but OK for a NiCad. Are there 4 screws - Allen, Spleen, Torx hiding under the rubber feet? They are not visable, and I don't want to pry on the case just yet. What should I expect after a reset?

Re: 41CX Needs Serious Help

*Message #4 Posted by **Meindert Kuipers** on 9 Nov 2005, 11:12 a.m.,*
in response to message #1 by Dan Taylor

Reverse (all) the batteries and plug the battery holder in for a few seconds, then go back to normal. This will discharge the caps and should normally get your machine running again.

Meindert

41CX Needs Reset (Comments on Usage)

*Message #5 Posted by **Dan Taylor** on 10 Nov 2005, 3:30 a.m.,*
in response to message #4 by Meindert Kuipers

I agree with your concept. My only concern is that there should be reverse biased diodes across a power supply. If so, they would shunt the reversed current to ground and could burn out - to a permanent short. The battery pack is out while I gather info. Thanks.

{For matrix operations, HP's 48g2 is a minimum but no RPN keyboard! Leads me to a 49G+. While a graphing calculator is nice I don't need it. I could learn how to program the 41 CX which I may need to anyway! The trig functions sinh and cosh are abailable using the natural log function repeatedly.} :-(

Re: 41CX Needs Reset (Comments on Usage)

*Message #6 Posted by **Thomas Okken** on 10 Nov 2005, 6:26 a.m.,*
in response to message #5 by Dan Taylor

Sounds like the HP-42S would be the perfect calculator for you (it has the matrix functionality, is not complicated by fancy graphing functionality you don't need, and it's actually easier to program than the 41CX)...
If you don't mind the rather steep prices they tend to fetch on eBay, at least!

41CX & RPN. Is RPN Available in NEW Calc?

*Message #7 Posted by **Dan Taylor** on 14 Nov 2005, 5:38 a.m.,*
in response to message #6 by Thomas Okken

Thomas, Thanks for the information. Both the 42S and the 33S are replacement candidates. RPN operation is for me essential, which it seems is no longer offered by HP - only RPL. When crunching numbers, I simply can't worry about whether or not my keyboard algebra is "still correct". User Programming is required for only a few simple functions. (If sinh and cosh are in the Advantage or Math 1 Application Packs, then the 41CV/X is just fine.) I'll buy a replacement 41CV.

Are there any new HP scientific's that have RPN? Perhaps RPL is also offered for those such as I, who have not written a program for a decade, as well as regular programmers.

Re: 41CX & RPN. Is RPN Available in NEW Calc?

*Message #8 Posted by **Jeff O.** on 14 Nov 2005, 7:43 a.m.,*
in response to message #7 by Dan Taylor

Dan,
The 33S is a true, 4-level stack RPN calculator. (It also has an algebraic mode, but that can be ignored.) It has hyperbolic functions on the keyboard. However, if you don't mind spending at least 3 or 4 times as much, the 42S is one to get. It has hyperbolic functions, although they are not accessible directly from the keyboard. They can be assigned to a custom menu, which can be easily accessed when needed.

HP-85 ROM select I/O?

*Message #1 Posted by **Nelson M. Sicuro (Brazil)** on 9 Nov 2005, 8:38 a.m.*

Hi folks,

I'm developing a "ROM drawer" for my HP-85 using of-the-shelf 74HC logic chips. In the HP-85 service manual I figured out the auto-increment addressing and the logic to send 16 bit adresses to the ROMs.

I only need to know how to select among several ROMs stored on a FLASH device. What is the I/O address (from $FF00 to $FFFF memory mapped I/O?) to select the right ROM image?

My logic acts as a "decoder" from the HP-85 bus to an ordinary 8 bit data/20 bit address bus and /WE and /RD lines to connect with SRAM and/or FLASH devices.

Many thanks in advance, and best regards!

Nelson Sicuro

Edited: 9 Nov 2005, 8:56 a.m.

Re: HP-85 ROM select I/O?

*Message #2 Posted by **Olivier De Smet** on 9 Nov 2005, 10:36 a.m.,*
in response to message #1 by Nelson M. Sicuro (Brazil)

It's 177430 in octal or FF18 in hexa.

Olivier

Re: HP-85 ROM select I/O?

*Message #3 Posted by **Nelson M. Sicuro (Brazil)** on 9 Nov 2005, 3:19 p.m.,*
in response to message #2 by Olivier De Smet

Thanks!

My HP-85(A) need more RAM and ROMS!! Do you know anything about the RAMdisk? Maybe I use a PIC or other microcontroller to add serial download of the RAM/FLASH contents (USB?).

Best regards,

Nelson Sicuro

Re: HP-85 ROM select I/O?

*Message #4 Posted by **Olivier De Smet** on 10 Nov 2005, 2:04 a.m.,*
in response to message #3 by Nelson M. Sicuro (Brazil)

No you need an HP85B to have the Electronic Disk. It use the new EMS from the 86-87 line and allow theoritically up to 16MB of extended RAM.

For the HP 85 you can only use this ram as an electronic disk. So the limit is still 32 KB ram (basic). For the rom there is a hard-coded limit for the number of rom. For an HP86-87 it's 15. For an HP85 I don't know.

Olivier

Re: HP-85 ROM select I/O?

*Message #5 Posted by **Vassilis Prevelakis** on 13 Nov 2005, 1:01 p.m.,*
in response to message #3 by Nelson M. Sicuro (Brazil)

> Quote:
>
> Do you know anything about the RAMdisk? Maybe I use a PIC or other microcontroller to add serial download of the RAM/FLASH contents (USB?).

Since you are going to be building the ROM drawer you can use the same logic to emulate the extended memory controller that is provided by the HP85B.

I assume that with that controller in place you will be able to use the HP-85B EMS ROM to create the RAM DISK.

Note that the extra memory will only work as an electronic disk, you cannot increase the real memory of an 85 (or 85B) beyond 32Kbytes.

HP-85 Thermal Paper and ThinkJet blotter pads

*Message #1 Posted by **Vassilis Prevelakis** on 9 Nov 2005, 6:30 a.m.*

In the good old days when you bought ThinkJet cartridges you got a small blotter pad to attach to the printehad. New cartridges lack this pad. I have found that http://www.chromtech.com actually supplies such pads ($5.00, order code 92661A-01)

They are also selling thermal paper for the HP-85 (order code CTP-3390). $22.25 per pack, IMHO each pack contains two rolls.

Both products are on page 250 of the Chrom Tech catalog (http://www.chromtech.com/Catalog7/PDF_Indvpge/250.pdf)

42s hardcover flip-case

*Message #1 Posted by **ECL** on 9 Nov 2005, 1:53 a.m.*

Does anyone recognize this flip top case for the 42s? Ebay# 5827940433.

It would fit the whole series, I suppose. It seems like a great way to protect the machine. But, having used a 42s, I know that you can best see the display when your line of sight is somewhere around ~40 degrees from the horizontal. Thus I don't know if the increased angle offered by the case would be useful.

I know the 49g / g+ would benefit from a slight angle increase like this. I used two hemisperical stick on feet (r = 0.125) on the battery door, to angle my 49g+ for desktop study use.

ECL

Re: 42s hardcover flip-case

*Message #2 Posted by **Bill (Smithville, NJ)** on 9 Nov 2005, 7:23 a.m.,*
in response to message #1 by ECL

These were hard plastic cases made by Astech Industries many many years ago. I was fortunate enough to get two of them several years ago when a gentleman here was selling his last remaining stock of new ones.

Mine are on two of my HP-42S. They are great cases, especially if you, like me, use your 42s on a daily basis. The overlapping lip on the edges does a good job of sealing out most of the dirt/dust. Since I carry my 42S in my briefcase and out to job sites, the hard case gives it a lot more protection and is quicker to access than using the standard slip case.

The case has a raised tab on each side that matches the grove on the side of the calculator so that the calculator is securely locked into the case. I believe most of the Pioneer models should be able to fit.

As you can tell, I am a great fan of this case. I only wish I had two more. I know, I'm greedy - but aren't we all when it comes to our favorite toys.

Bill

New Trigonometric Functions Program for the New 12C Platinum

*Message #1 Posted by **Gerson W. Barbosa** on 8 Nov 2005, 9:18 p.m.*

Here is a new trigonometric functions program for the new 12C Platinum. Are there another designed specifically for this calculator? This is based on MiniMax Polynomial Approximation (Thanks to Valentin Albillo who's shed some light on the subject) and drastic range reductions ([0..pi/12] for arctangent function). The program is focused on accuracy and easy of use. Arguments are entered in degrees and there is an entry-point for each function. There are neither constants to be previously stored nor initialization routines. Placing the constants directly into the program rather than recalling them from registers slows down program execution but considering the new 12C Platinum is faster, this should not be a problem. Actually **this program has not been tested on the new 12C Platinum**. Instead, it has been tested with a very close version suitable for the 15C. Hopefully, I have made no mistakes in adapting it to the Platinum. I just hope the new Platinum is at least five times faster than the golden 12C so no function takes longer than two to three seconds to run. Cos(x) is calculated as Sin(90-x) for the sake of accuracy. As the program is more than 255 lines long it will not work on the old Platinum unless some modifications are made (such as replacing the last two or three constants in the program for registers recalls).

The accuracy is comparable with that of the HP-35. Cos(x) is calculated as Sin(90-x) for the sake of accuracy. The program gives at least nine significant figures, many times matching the 15C results. Also, the stack register X is always saved. So, the following expression

```
asin(acos(atan(tan(cos(sen(9))))))
```

may be evaluated as:

```
9 R/S GTO 090 R/S GTO 100 R/S GTO 153 R/S GTO 137 R/S GTO 119 R/S
```

The result in the 15C with the equivalent program is 8.999661629

That's all for the while,

Gerson.

Re: New Trigonometric Functions Program for the New 12C Platinum

*Message #2 Posted by **tony** on 11 Nov 2005, 1:13 a.m.,*
in response to message #1 by Gerson W. Barbosa

Hi Gerson, yes it looks like it will indeed run on the new 12c pt. The new one is not 5 times faster than the golden one ;-) But its accuracy may surprise you as it seems to have 12 sig. digits under the hood. 3 [1/x] shows 0.333333333 but then if we remove 6 of the 3s with .333333 [-] and multiply by E6 we see 0.333333000 - another 6 3s. Cheers, Tony

*Message #3 Posted by **Gerson W. Barbosa** on 11 Nov 2005, 11:21 a.m.,*
in response to message #2 by tony

Hi Tony,

Thanks for the good news! When I was adjusting the MiniMax coefficients for the arctangent function (the lowest power coefficients don't require so many significant figures), I considered 1/3 as 0.333333333333 (that's the constant in line 239) in my test spreadsheet. I correctly guessed the 12C Platinum might have some extra guarding digits. By the way, that constant should be 0.333333333089303 or 0.3333333331 to ten places but I wouldn't write it this way just because of a '1' in the leftmost position. So I used 1/3 to 12

places and adjusted the other constants with help of a spreadsheet and a graphics.

Using the constants explicitly in the program have significantly slowed down the execution time as more steps have to be run. The constants could have been stores in registers, but then an initialization routine would have been needed to avoid having to enter them by hand. Anyway, I haven't calculated whether there would have been free registers left since the program uses five registers already. In short, the gain in speed obtained by using only three coefficients in the sine aproximation and only four in the arctangent approximating is lost when the constants are built into the program. But the easy of use may compensate for this. Notice that the constants beginning in lines 54 and 247 are pi/540 and 180/pi, respectively.

Reading again my post, I realized the example I provided was out of context. What I meant is that, calculations like the following are easily done, since the latest computation is saved on the stack:

((sin(60) + tan(30)) * 6/5) ^ 2 :

60 R/S 30 GTO 100 R/S + 6 * 5 / g x^2 => 3.000000001

Thanks again for your remarks.

Cheers,

Gerson.

Correction:

Checking again my test spreadsheet, I discovered I had approximated 1/3 to only 10 significant figures, although I had previously thought of using 12 digits. As a consequence, the '2' in line 236 should be a '3'. Anyway, '2' implies in a maximum absolute error of 5.15E-12 for arguments between 0 and 1, while '3' brings the maximum error down to 4.10E-12.

```
-------------------------------------------------------------
In the tables below, the HP-15C column shows results obtained
with the built-in HP-15 functions, all of them correct to 10
significant figures, whereas the 12C Platinum shows results
obtained with the equivalent program run on the HP-15C. According
to Tony observations, the results on the real Platinum should
vary slightly, hopefully for better. The HP-35 shows the results
obtained on a bugless HP-35 (version 3). Like the program, its
only angular mode was Degrees.

Gummy Case

*Message #1 Posted by **Hal** on 8 Nov 2005, 8:52 p.m.*

Hey folks, I'm going to coin a new phrase here...Gummy Case Disease. I just picked up a nice 34c, but when I took it out of it's stock HP case, it was covered with disintegrated, somewhat gummy feeling foam particles, from the lining of the case. Has this ever happened to anybody else? My woodstock (29c) has a plush beautiful FUR LINED case...I guess the bean counters got to 'em and made them go cheap on the cases after that!!
Regards, Hal

in response to message #1 by Hal

Hello Hal:

Yes, I've experienced the same phenomena with an old 41c case.

TomCee

in response to message #1 by Hal

Throw it (the case - not the calc!) in the washing machine next time you do laundry. Some people turn them inside out. I did mine "warm wash, cold rinse" with detergent in my work clothes, no probs.
I think the breakdown of the foam can be overlooked. Remember: HP didn't think that they were building these things for the ages. They just thought it needed to last, albeit flawlessly, till the next model came out. Then - successive models just got better.

in response to message #3 by db (martinez, ca.)

The washing machine...now I've heard everything. But hey, I'll give it a try.
Thanks much for the tip.
Hal

But DONT use the dryer. Just prop open the case and let it air dry. Comes out looking like new.

Re: Gummy Case

*Message #6 Posted by **Greg Whitfield** on 9 Nov 2005, 12:46 a.m.,*
in response to message #1 by Hal

My oldest HP calculators (a 34C I recently bought on eBay, and the 15C and 16C I bought new) have cases suffering from Gummy Case Disease. I don't have a 29C (although I drool at the thought of having one) to compare it to, but my TI SR-56 (circa 1977) has a plush fur-lined case that shows no degradation.

My first thought was to get those calculators out of the diseased cases. The 34C is currently wrapped in a white handkerchief in its storage box. For the Voyager calculators, I called HP support, figuring that they would still sell replacement cases since they still sold the 12C, but I was wrong! The did refer me to CalcPro and Samson Cables. I called up CalcPro and told them my case needs. They said they would get back to me, but never did. I found a reference in this forum to someone in the UK who sold HP cases, but I decided to find something domestically. I searched on eBay and found Voyager series cases made by Ann at the Corner Store (eBay ID annstcs) and they are really nice! I told her that I needed a case for a Pioneer series calculator that didn't have one. She added those to her slip case product line and sent me one. She's even considering making me a case for my 34C and I just emailed her tonight to tell her that I just received a 35 with no case (I bought "Old Trusty" on eBay).

I'll try washing those cases as suggested. Also, I guess I better check my 41CX case! Does anyone know how to safely clean the keyboards to get the black gummy particles off?

Cheers, Greg

in response to message #6 by Greg Whitfield

A UK store that still sells some "Genuine HP" cases is Classic Calculators.

I bought a hand-made genuine leather case for my 16C from Ann (annstcs) on eBay, and I'm very pleased with it. Note that she sells both genuine leather and (lower cost) felt-lined imitation-leather vinyl cases. If you don't see the style and color you want, I suggest sending her an e-mail asking about it. The last time I checked, she had a couple of ads for her eBay items in the MoHPC classified section.

Regards,
James

*Message #9 Posted by **GE** on 9 Nov 2005, 4:12 a.m.,*
in response to message #8 by James M. Prange (Michigan)

This happened to some Spice here, but never to the 41 cases (or others), these are of better quality. As I am reluctant to put cases in the washing machine, the calculators are put into a clear plastic bag and bask into the case. Maybe the plastic bag can stick to the machine or alter the colors eventually, but this hasn't happened (yet ?). Has anyone experienced such problems ?

Re: Gummy Case

*Message #10 Posted by **Daniel** on 9 Nov 2005, 7:27 a.m.,*
in response to message #9 by GE

I have the same problem with an HP-41 case. Has any one already tried the washing machine solution with these ?

Re: Gummy Case

*Message #11 Posted by **Jeff O.** on 9 Nov 2005, 7:42 a.m.,*
in response to message #10 by Daniel

I have had several "gummy" 41 cases. The washing machine solution worked fine for me.

Re: Gummy Case

*Message #12 Posted by **Massimo Gnerucci (Italy)** on 9 Nov 2005, 9:10 a.m.,*
in response to message #10 by Daniel

I did it with several 41 cases. The goo is gone now.
Greetings,
Massimo

what to do ? 41cx / top or hop

*Message #1 Posted by **Peter Scheller** on 8 Nov 2005, 8:43 p.m.*

hi there !!

last year i bought a 41cx with card reader, looking very nice, with box and all documents, of course used, from a colleague. i inserted new batteries, but said to say, the 41 dos not work. it´s display shows some signs, sometime "memory lost" and the batteries went hot. i want to give the calculator back to my colleague, but instead of that i got my money back and the calculator for nothing. that´s the story, and now my question: what should i do with the calculator ? aa sell it "as is" at ebay bb get it repaired---where ? \--estimated cost ? \-does it make sense ?

i also have the cardreader, but can´t check if it works. still last year the calculator is laying on my desk and i do not know what to do. a lot of memorys with the 41 going through my head, 25 years ago puzzling hours for hours programming, calculating and fun while playing 17+4. but, be honest, i wouldn´t really use it nowadays. so what is your opinion ?

peter

*Message #2 Posted by **Klaus** on 9 Nov 2005, 9:12 a.m.,*
in response to message #1 by Peter Scheller

Hello Peter,

if you want to keep the calc, I can repair it for free, since I don't know any repair service here in Germany. You can contact me: khi1981@web.de

Best regards, Klaus

Can you repair a card reader?

*Message #3 Posted by **Marcus von Cube, Germany** on 10 Nov 2005, 6:11 p.m.,*
in response to message #2 by Klaus

Klaus,

I tried to fix the gummy wheel on my card reader, but it only gives me "card errors" now. I'm stuck.

Do you like to repair it?

Marcus

Re: Can you repair a card reader?

*Message #4 Posted by **Klaus** on 11 Nov 2005, 6:08 a.m.,*
in response to message #3 by Marcus von Cube, Germany

I have repaired several 41Cs and 41CXs, but no 41 card reader. However, I have repaired some HP-67 card readers. I can give it a try, and the forum archives are full of hints how to repair it.

If you want me to repair the card reader, you can eMail me.

Same conditions as for Peter: I'll do it for free, but you would have to pay the postage.

Greetings! Klaus

Question about HP-41C Serial

*Message #1 Posted by **Daniel** on 8 Nov 2005, 4:01 p.m.*

I recently bought a nice 41C which serial number begins with 2043A. The machine has a halfnut display. As far as I can see on hpmuseum pages, early machines had a fullnut display. Though I assume this is an early model, I know little about this issue. Can someone let me know if halfnuts were already marketed on the 2nd year of Hp41 production in the states ?

Re: Question about HP-41C Serial

*Message #2 Posted by **Randy** on 8 Nov 2005, 4:10 p.m.,*
in response to message #1 by Daniel

No, they (half-nuts) did not appear until 1985 or so. What you have is a unit that was returned for repair late in the game, after they stopped fullnut support so HP service just stuck the old back on a new front half of a replacement calculator.

It would be interesting to know if it truly has only 46 free registers or if it is really a CV with a C label on it.

Re: Question about HP-41C Serial

*Message #3 Posted by **Daniel** on 8 Nov 2005, 4:50 p.m.,*
in response to message #2 by Randy

46 reg free. Also, gold-plated ball-bearings are present, which I assume is consistent with the serial #. So I think you got it right, Thanks very much for your help Randy !

Re: Question about HP-41C Serial

*Message #4 Posted by **Howard Owen** on 8 Nov 2005, 5:21 p.m.,*
in response to message #3 by Daniel

Hmm. So either they made some halfnut 41Cs specifically for replacements like this, or else they hacked a 41CV to make it act like a 41C. And what HP hacketh, perhaps ..

Halfnut 41c

*Message #5 Posted by **Gene** on 8 Nov 2005, 5:52 p.m.,*
in response to message #4 by Howard Owen

I believe Wlodek's guide to HP's says that HP made a very small number of halfnut 41c calculators for replacements.

They are quite hard to find and worth $$ to collectors who truly want one of everything.

Re: Halfnut 41c

*Message #6 Posted by **Randy** on 8 Nov 2005, 6:26 p.m.,*
in response to message #5 by Gene

Sorry, forgot to add that since a CV defaults to 46 free, you've got to do an [xeq] [alpha] [size] [alpha] [000] to know for sure. Chances are it is a HP hacked C version of a halfnut CV. Several have been reported here and yes, the gold ball contacts are consistent with an early C case back. Consider yourself lucky, it still remains the only 41 variant I do not own along with many other 41 collectors, marble blue and clear cases non-withstanding.

Re: Halfnut 41c

*Message #7 Posted by **Daniel** on 9 Nov 2005, 11:20 a.m.,*
in response to message #6 by Randy

Thank you all for these informations.
Actually, even when resizing the memory allocation I get 00 reg 63, so I believe it is a 41C.
Is there a way to know if the machine was rebuilt by HP ?
Actually I know little about it and I even don't know if the half-nut/full-nut mask can be (easily or not) separated from the rest of the machine...
However, I understand from your inputs that this may be an HP "re-creation" and that I should keep this one as a collection piece.

Latest 33s Display is Indeed Improved

*Message #1 Posted by **Paul Brogger** on 8 Nov 2005, 11:48 a.m.*

After the previous "improved" display on the HP-33s, I had my doubts.

But (as already reported by others) the latest version I've seen (at Wal-Mart) is very much like what should have been released initially. Each character matrix has been reduced in size, leaving more room between them for the larger decimal point. The contrast appears better too. I'll have to take a closer look to see if the spaces between the pixels have been narrowed.

I do notice that the latest model has embossed on (actually, molded into) its back a garbage can icon with a diagnoal line through it. I'm sure this is meant to suggest that we properly dispose of the batteries and/or circuit board. However, I can't help taking this as an admission that the earlier models *should* be thrown out! ;-)

Re: Latest 33s Display is Indeed Improved

*Message #2 Posted by **Ed Look** on 8 Nov 2005, 11:52 a.m.,*
in response to message #1 by Paul Brogger

Does HP allow trade-ins for the 33S like they did with the 49G+? I forget.

Re: Latest 33s Display is Indeed Improved

*Message #3 Posted by **John** on 8 Nov 2005, 12:30 p.m.,*
in response to message #2 by Ed Look

The only way to know would be to call support and find out.

They may take the line that there is no defect in the earlier 33S units. This is merely an incremental improvement.

But hey, if you are in the US, it is a toll free call.

Re: Latest 33s Display is Indeed Improved

*Message #4 Posted by **brian heally** on 8 Nov 2005, 4:30 p.m.,*
in response to message #2 by Ed Look

I bought a 33s with the older decimal point and bad keyboard, and called up and complained. This calculator didn't always register keystrokes. I told them that I design life-safety elements for a living (which is the truth), and that because the keys didn't always register, and because the decimal point was extremely difficult to distinguish, I couldn't rely on this calculator. The guy on the phone had me reset the thing, which did nothing, and then he said that he would send me a new one, which he did. He also said that he would specify as a special instruction that the replacement unit should have the improved decimal. I received this replacement unit in the mail very quickly, and it did have the improved display. I now use this calculator daily at work, with confidence.

If I was the owner of one of the previous versions of the 33s, I would call them to voice my displeasure over the decimal point issue, and ask if I could be sent a replacement unit with the improved display. You may be surprised, and they may do it. If they hadn't sent me a new one, I would never spend another cent on an HP. However, because they did send me an improved one, I bought another one at Wal Mart to have as a backup.

Re: Well, I Just Tried "1-800-HP Invent" and . . .

*Message #5 Posted by **Paul Brogger** on 8 Nov 2005, 5:23 p.m.,*
in response to message #2 by Ed Look

. . . supposedly a new unit is on the way.

The voice recognition system kept hearing "HP 33S Scientific Calculator" as "Laser Printer", but later it dropped back and started listting product classes. "Handheld" got me to "Calculator" and (FYI) when asked "Home, Home office, or Business", I replied "Business".

From my converstaion with the very helpful attendant, I gather that it helps greatly to have a receipt showing purchase within the last 12-15 months. (Another, even older 33s has a serial # indicating that its replacement is a bit too much to ask, so I'll only be upgrading one of my two original-style units.)

I understand that, should they want my old unit, they'll send a mailing label. If no label, I can do what I want with the old one. ("Throw it out" comes to mind, but I know a high school student who might want it . . .)

So, "Hooray!" for HP calculator support. (And good luck to you all!)

Did you guys note how sometimes the voice would sound "frustrated"??!

LOL!

Re: Well, I Just Tried "1-800-HP Invent" and . . . It Arrived!

*Message #8 Posted by **Paul Brogger** on 14 Nov 2005, 11:37 a.m.,*
in response to message #5 by Paul Brogger

FYI . . .

The replacement showed on Saturday. Calculator only (with batteries installed), wrapped in bubble wrap. Ser # CNA 442nnnnn, with the improved display.

It came with a curious circular beige sticker on the back, printed in black with "MARKETING SAMPLE", and some illegible handwriting.

Though it has the newest display, it seems to have the old (uncorrected) ROM.

```
.1           ten minutes
->HR           as decmial portion of hour  (result:  0.1667)
1            one hour
-            subtract                      (result: -0.8333)
```

```
->HMS        convert                        (result: -0.4920)
```

(My newest unit -- Ser # CNA 532nnnnn -- gives -0.5000 .)

So, beware: there are some "transitional" units with newer displays, but old ROMs.

Curiously, it's got the worst keyboard of my several units -- seems to "miss" on the arithmetic operation keys occasionally. (I hadn't noticed a single problem with 33s keys until this one arrived.) I'll try the "wiggle fix" that seemed to clear up my 49G+ keys so well.

Hey! I'm not complaining! Thanks to H-P for the replacement. I'm just sharing to add to the knowlege base.

My son is using the older unit, in ALG mode, and with no idea yet how to program the thing. He considers it a glitzy upgrade from his previous 20S. And who am I to argue? The two-line display and 26+ variables are indeed steps up.

Edited: 14 Nov 2005, 12:58 p.m.

Re: Well, I Just Tried "1-800-HP Invent" and . . . It Arrived!

*Message #9 Posted by **Ed Look** on 14 Nov 2005, 2:36 p.m.,*
in response to message #8 by Paul Brogger

I called today and the gentleman who responded got my information and set the replacement process underway. I suspect I might just remain a (satisfied) customer...

... funny thing, though, shades of 1984 or the V chip: I asked if he could tell from their records (I did register my calculator, if I recall correctly) where I bought it and in doing so, I mentioned that I have been buying their calculators since I was old enough to afford and buy my own calcs. To this he replied, "Oh, we have an EXTENSIVE record on you!" :P ::(; I guess it must be extensive... for some of us ;) .

It would also be a gas if this fellow happens also to read our forum! (I also hope on their records, I didn't come across as too whiny!!)

Re: Well, I Just Tried "1-800-HP Invent" and . . . It Arrived!

*Message #10 Posted by **Jeff O.** on 15 Nov 2005, 8:23 a.m.,*
in response to message #8 by Paul Brogger

Paul,
Sounds like you have a collector's item. For everybody else, I'd advise buying only units with serial numbers beginning with CNA5xx, or maybe even only CNA532 or later. I finally went to a local Walmart yesterday to see if they had any in stock. I found a hanger with several units hanging on it. I pulled the first one off, pushed the ON button through the blister pack and entered a string of twos. Sure enough, the display seemed much better than my original unit. The serial number on the back was CNA532xxxxx. Curious, I checked the next unit. Its serial number was something like CNA442xxxxx. I pushed its ON button and entered all twos, and saw the old tiny radix. All of the other units were in the same serial number range and had the old display. Needless to say, I put the bad units back and purchased the one good one. So if you want a 33S with the new display, don't buy one that begins CNA4, and your best bet is to actually check before you buy if you can.
Regarding the missing key presses and the need to try the "wiggle-fix", let's hope that is a problem only with your particular prototype (or whatever it is.) (Except for the collector's item aspect, I'd say you would have a right to complain and request yet another replacement.) For what it is worth, the keyboard on my new unit passes the self test, functions flawlessly in use, and feels noticeably better than my first 33S. The feel is a little softer and less "clicky". It is virtually indistinguishable from several pioneers to which I compared it.

Re: Well, I Just Tried "1-800-HP Invent" and . . . It Arrived!

*Message #11 Posted by **brian healy** on 15 Nov 2005, 12:54 p.m.,*
in response to message #10 by Jeff O.

I noticed the same thing at my local Walmart. They a few of the newer machines with the improved display at the front, and towards the back were the older ones with the flawed display. I wonder how much additional bad blood directed against the 33s and HP as a result of people buying the older 33s with the horrible display.

My initial reaction to the 33s was extremely negative. I had spent about $60 for something with an unusable display, and if I hadn't heard in this forum that machines with the improved display were on the way HP would never have seen another dime of my money. After getting a replacement 33s with the improved display and buying another one from Walmart, I have given the 33s another chance, and have to admit that I actually like it. I think it could be in HP's best interest to recall any of the older 33s that are still on the shelves with the flawed display.

33s

*Message #12 Posted by **bill platt** on 15 Nov 2005, 9:31 a.m.,*
in response to message #8 by Paul Brogger

Hi Paul,

Which ALGebraic stack logic does it have?

Is it the parallel stack, or the swap x.,y stack?

Re: 33s

*Message #13 Posted by **Paul Brogger** on 15 Nov 2005, 12:11 p.m.,*
in response to message #12 by bill platt

If you mean the "swap" key function described here,

```
it (# CNA442nnnnn) gives DIVIDE BY 0,
just like my newest unit (# CNA532nnnnn),
while my oldest unit (# CN404nnnnn) gives 0.5 .
```

So it would appear there are at least three ROM versions?

roms 33s

*Message #14 Posted by **bill platt** on 15 Nov 2005, 12:54 p.m.,*
in response to message #13 by Paul Brogger

Yep.

So far, I have delineated:

```
REV   Description
beta  Gene's Calc sample.
-     Walmart initial release.  (just before the EIT exam a few years ago).

A    1st full-time release
B    Bugs fixed for the polar rect and the h.ms
```

Regarding ALG

beta and "-" have the same functionality, viz 24 / 12 SWAP <enter> gives 0.5

"A" and "B" give 24 / 12 SWAP <enter> give div 0. Note that you really need to see my old thread that desribes what is really happening here.

In short, the newer ones maintain two parallel independent algebraic stacks--you can actually run tow independent algebraic chain calculations simultanious ly. SWAP simply moves from one to the other, and so you can also link them.

The earlier ROMS gave the more familiar x<>Y swap which reverses the order--similar to the 20s.

The LCD display appears to be changed indepenedt of the ROM. In otherwords there is not synchronization between the two imporvements.

BETA and "-" may be the same ROM. But the keyboards were different with some of the functions (ask Gene about it! :-)

Edited: 15 Nov 2005, 12:56 p.m.

Re: roms 33s

*Message #15 Posted by **Gene Wright** on 15 Nov 2005, 2:04 p.m.,*
in response to message #14 by bill platt

Nope, all my 33S calculators have the same keyboard layout. :-(

Re: HP Calc. Promo

*Message #16 Posted by **temp (bill)** on 15 Nov 2005, 2:48 p.m.,*
in response to message #15 by Gene Wright

I stand corrected!

Funny though--I distincly remember something about that---was there an early "image" released before actual hardware, that you might have pointed out?

Answer me up-thread--we can kill this one?

I am correcting my post above, and so i will put "1234" here for erasing--then you can erase yours if you like (or has this feature been disabled?)

Re: roms 33s

*Message #17 Posted by **Paul Brogger** on 15 Nov 2005, 2:12 p.m.,*
in response to message #14 by bill platt

Thanks. I'll chase down your older thread on the stack thingie.

Without knowing what's behind the curtain, I was surprised that the older units "behaved better" than the newer with regard to this (SWAP in ALG mode).

But I've assumed it's simply not an issue to an RPN user.

swap

*Message #18 Posted by **bill platt** on 15 Nov 2005, 2:46 p.m.,*
in response to message #17 by Paul Brogger

"better"?

Don't you think it is kind of cool to have two parallel stacks?

(Of course the loss of the inversion capability is sort of vexing...)

Somewhat related, at least as far as ALG goes: the only unpleasant surprise for me, when I finally got a 27s, was that there is no swap command. the 17bii has it--but only because it *has* to because of the RPN mode.

Regards,

Bill

Re: roms 33s

*Message #20 Posted by **Mike H** on 18 Nov 2005, 9:01 a.m.,*
in response to message #19 by Mike T.

Rectangular to Polar Conversion

When performing a rectangular to polar conversion of a number where the X or Y coordinate is equal to zero, the result might be inaccurate.

Workaround : When performing rectangular to polar conversions, if any of the 2 input is 0, take the absolute value of the number before performing the rectangular to polar conversion to yield the correct result.

Example : 10(enter)0(CHS)(ABS)(r-p) will yield the correct result (10, 90) while 10(enter)0(CHS)(r-p) will not (10,270)

There was at one time a workaround posted on the HP website for all the 33S bugs, but I could not find it. The update was dated September 2004, while the newest manual (3rd Ed)is dated November 2004, the updates should have made it into the manual but I didn't check. Email me if you need a copy.

Here's something I've found:

```
                          CNA 442nnnnn                CNA 532nnnnn
... keystroke               display                     display
... 10              x: 10       y:   0.00       x: 10       y:  0.00
... ENTER           x: 10.00    y:  10.00       x: 10.00    y:  10.00
... 0               x: 0        y:  10.00       x: 0        y:  10.00
... ->theta,r       x: 10.00    y:  90.00       x: 10.00    y:  90.00
... ->y,x           x: 0.00     y:  10.00       x: 0        y:  10.00
... ->theta,r       x: 10.00    y:  270.00      x: 10.00    y:  90.00
... ->y,x           x: 0.00     y: -10.00       x: 0        y:  10.00
... ->theta,r       x: 10.00    y: -90.00       x: 10.00    y:  90.00
... ->y,x           x: 0.00     y: -10.00       x: 0        y:  10.00
... ->theta,r       x: 10.00    y: -270.00      x: 10.00    y:  90.00
... ->y,x           x: 0.00     y:  10.00       x: 0        y:  10.00
```

I assume that illustrates the bug?

Re: roms 33s

*Message #22 Posted by **Marcus von Cube, Germany** on 18 Nov 2005, 3:08 p.m.,*
in response to message #21 by Paul Brogger

My CNA 51500163 seems to be a bastard:

1.) The display is perfectly OK; I can't compare to an older machine but I have no trouble reading the decimal point (a comma in my case.)

2.) The P-R bug is present, exactly as shown above.

3.) X<->Y in ALG mode doesn't exchange the last two numbers entered (as to reverse the result of - or /) but seems to use a shadow register that can be used for any purpose. (Very much like the t-Register on older AOS TI machines such as the TI-59)

RE: roms 33s

*Message #23 Posted by **bill platt** on 18 Nov 2005, 3:57 p.m.,*
in response to message #22 by Marcus von Cube, Germany

Marcus,

Do this:

```
clear registers, clear stack in RPN
ALG
1 + 6 <enter>
<x<>Y>
```

If you see "6" then you have the original "pre-release" or rev "-".

If you see "0" then you have the second version of the ROM ("A"). (The third version would have bugs fixed).

Now, continuing from above, assuming you can see "0", then do this:

```
9
x
<x<>y>
{at this point you should be seeing "7" from the 1st calc}
+
<enter>
```

Notice that you have carried on two independent calculations, with their own x,y stacks, and you have tied them together by prefixing an operation (in this example <+>) followed by "swap" (<x<>y>).

The odd thing about this algebraic feature is that it is un-documented...and there was no change in the manual between the 1st and second issues (Rom "-" and rom "a" have edition 1 and edition 2 respectively).

Further, the PDF documents that were written and are available at HP have one spot where they explicitly use the "swap" functionality of rom "-". (A contributor here wrote them--and had that ROM).

So if you have the P-R and the H.ms bug, and the algebraic behavior, and the C.nr overflow bug, and the annunciator but after reset.(asre there more--see archives of Mike's post)...then you have ROM #3 (what I call "B") (as far as we can determine) or in other words, I am inferring from the anecdotes, that there have been three roms:

```
"-" bugs, ALG swap between last stack entry and current command line
      (ealry walmart release--essentially a "pre-release")

"A" bugs, parallel ALG stack (1st full retail release)
"B" no bugs, parallel ALG stack
```

It looks like the new display (and there may be more than one iteration!) happened to some of "A" as well as to "B" ROM machines Let's see if we find more!

(visions of "red-dots" dancing in my head...)

One other thing--does anyone have a rom "A" that does *not* have a CNA (as opposed to CN) serial? In otherwords, I think that rom "A" was instituted at factory "A" and perhaps not at the other? We'll see.

Regards,

Bill

Edited: 18 Nov 2005, 4:03 p.m.

Re: RE: roms 33s

*Message #24 Posted by **Marcus von Cube, Germany** on 19 Nov 2005, 4:54 a.m.,*
in response to message #23 by bill platt

Here are my observations:

```
Keys                Display
---------------------------
1 + 6 <enter>       7.00
<x<>y>              0.00
9                   9_
x                   9.00
<x<>y>              7.00
+                   63.00
<enter>             no change
---------------------------
```

The only thing I can see is that there is a shadow register holding the result of the first addition (7.) after x<>y. This result is then retrieved by the second x<>y and used in the calculation. I can't see any "secondary AOS stack" or whatsoever.

Marcus

*Message #25 Posted by **bill platt** on 20 Nov 2005, 6:37 p.m.,*
in response to message #24 by Marcus von Cube, Germany

Hey Marcus,

You need to "play around" with the ALG more. THe example I gave you is only one very simple starting point. Try this:

```
1 + 6 <enter>       7.00
<x<>y>              0.00
9                   9_
x                   9.00
4                   4_
<enter>             36.00
<x<>y>              7.00
<x<>y>              36.00
<x<>y>              7.00
+                   7.00
4                   4_
<enter>             11.0
+                   11.0
<x<>y>              36.00
<enter>             47.00
+                   47.00
<x<>y>            ......tell me where you take it from here!
```

As you can see, you can carry on parallel work indefinitely and link the work...

Regards,

Bill

in response to message #1 by Paul Brogger

I saw an HP33S in Walmart on Saturday that had a S/N that started with 530xxxx. The display was ALOT better. I could easily see the decimal with two "2's" next to each other from about 2 feet away. The digits looked thinner.

If I didn't already have 2, I might have bought it.

I recently lost my digital camera, or I'd post some today.

I've been film-photographing some stuff for eBay sales, so I'll get comparative views of the 33s displays as well, if no one else does it sooner.

Re: Latest 33s Display is Indeed Improved

*Message #31 Posted by **Howard Owen** on 8 Nov 2005, 12:38 p.m.,*
in response to message #1 by Paul Brogger

I also bought a new 33S from Wal-Mart. (Fry's didn't have the new ones.) I've been staring at the display for quite a while, porting YATZ to the calculator. I know this has been brought up before, but I'm now nose-to-nose with just how limiting 26 variables and 26 labels can be. The other capabilities of this machine are quite nice, but that lack of labels, particularly, leaves most of the ample 32K unused for me. If I were using this calculator professionally, I would be extremely frustrated with this shortcoming. Since there's no way to store and retrieve programs either internally or exernally, it means that all of the ways you might want to program the calculator have to fit into the 26 label limit *at the same time!*

So that leaves a big gap in HP's product line where the HP-41 and HP-42 used to live. Not that there weren't significant differences between those two, but both of those machines were considered the top of the line in their days. Today they would occupy a place midway between the 33S and the 49GX in my opinion. The RPL models are at least one, and possibly two orders of magnitude more complicated to program than the keystroke models. Their power also surpasses the older platforms, but not in the same ratio, again in my opinion. I therefore feel the lack of a nice keystroke programmable machine with higher arbitrary limits in things like the number of labels.

One approach to bringing back this sort of thing would be to add a keystroke mode to the current high-end. I'm not talking about simulators of older machines, such as the fine software by Hrastprogrammer and others, but rather an updated keystroke mode that made a fair percentage of the built in power of the high-end machine available. That could be done in software by the community, I suppose, at the cost of RAM and CPU overhead in running programs. It would be far better to have it implemented natively by the calculator vendor, not only from the (presumably) better integration, but from the standardization that would bring to the new mode if it were deployed on all the machines in a given model.

Re: 26 variables

*Message #32 Posted by **Paul Brogger** on 8 Nov 2005, 12:52 p.m.,*
in response to message #31 by Howard Owen

No doubt about it, there's a limitation. Bummer.

FWIW, the 6 Stat variables are available indirectly, via ***i*** = 28 through 33.

And why they chose to make the ***i*** register available indirectly at ***i*** = 27 is beyond me! Zero would have been much better, leaving the limited available variable space uninterrupted.

Re: 26 variables

*Message #33 Posted by **Thomas Radtke** on 8 Nov 2005, 1:21 p.m.,*
in response to message #32 by Paul Brogger

The should have kicked out the i, introducing an IND statement to indirectly access a few KBs of memory (including A-Z) from any variable A-Z. That would allow multidimensional arrays. My TI/Casio can do this and AFAIK the 41 can do this too, correct?

Thomas

Re: 26 variables

*Message #34 Posted by **Howard Owen** on 8 Nov 2005, 4:32 p.m.,*
in response to message #33 by Thomas Radtke

The 41C can do indirect addressing through any register. It's the only way to access registers above 99. Label indirection is similar, I think.

The limited programming model may have made sense in marketing terms with the 32S and 32SII. Those machines were low-to-midrange, and so either the programming model was deliberately crippled, or else the economics of RAM made it silly to allow more than that. But fast forward 15 years or so and the programming capability looks really lame compared with anything in else in the 33S'x class. This is just a consequence of outsourcing the calculator product development, and then not expecting much innovation from the O.E.M.

You know, just the capability to swap programs in and out of the name space would go a long way toward overcoming the limitation. I can probably avoid using all the labels in any given program, but not in half a dozen or so. If I could have one program, defined as a set of labels grouped by a metalabel, or dare I say it, a *name*, as the 'current" program, then I could be as liberal as I liked in my label usage. It would still suck to not be able to share common routines, but not half as hard as this ridiculously low ceiling does.

Re: 26 variables

*Message #35 Posted by **Gene** on 8 Nov 2005, 5:57 p.m.,*
in response to message #34 by Howard Owen

I'm not so sure about lame outsourcing.

It really probably did cost HP less to drop in the 32K chip than finding one that held only 500 bytes or so.

Perhaps if they had chosen to increase the cost a couple of $$ then they could have dropped in the 500 byte chip and all these comments about "I can't use the ram" wouldn't have come up. :-)

After all, this is essentially a 32SII that was upgraded because of component obsolesence. Nothing more probably intended.

If there are a few new things, ok, but I doubt there was much intent to re-engineer a totally different machine here.

When one understands that the old processors were going away very quickly, HP had to make choices: Make machines as similar as we can to the existing ones with new processors or drop out altogether.

They stayed in and appear to be successful, some isolated problems notwithstanding.

Perhaps, given time, they may come out with totally different machines, but keep in mind...HP calculators are MUCH smaller than they used to be in terms of personnel, so I'm glad with whatever I get.

Re: 26 labels and 33 variables

*Message #36 Posted by **Paul Brogger** on 8 Nov 2005, 6:09 p.m.,*
in response to message #35 by Gene

I agree. On the 32/32s, memory was the overriding limitation, on what otherwise was a VERY simple, straightforward programming model.

Now, the memory limitation has effectively been eliminated. The current limitation is in program labels and variables.

If you want to get 'round those limits, you've got to go "retro" with a 32K 42s, or up to one of the graphical models.

But for a *readily available*, almost-cheap, shirt-pocket RPN programmable, we have a choice analogous to the old Model T's color selection: any H-P calculator, as long as it's the 33s.

Well, I'm not so complacent. For example, the 49G+, with all its warts, is an improvement on the 49G and the 48G. It's got modern I/O , a modern processor and modern storage. If I were starting out with calculators, and I picked up a recent version of that machine, I'd be pretty happy, assuming I wasn't overwhelmed with the complexity or the world's demands that I get a TI.

But if I were starting with the 33S, I'd *definately* be disappointed. The programming restrictions are too onerous. They make the machine practically unusable for a set of programmed tasks. The key thing there is that all programs share a single name space. So it's very difficult (I'd never say "impossible" around *this* place) to get a nice variety of useful programs into the darned thing. That makes the 32k sort of a cruel joke, as you alluded to.

I *understand* that HP lost the calculator wars to TI, and that that meant they faced a choice to either exit the market or drastically curtail their investment in it. I'm glad they chose the latter too. But I'm just not willing to give them a (rhetorical) pass on an obviously bad choice to bring their low end machine forward without addressing the, um, addressing. They did better than that for the high end machine, after all. I'm sure the MBAs crunched the numbers on that choice, but it still sucks in my book.

33s programming

Hi Howard,

I disagree. In fact, the 33s has everything that the 32sii had, and then some. It has more than the 11c. It has more capability than the 67 in terms of variable names and labels. The only pocket calculators that exceed it are the 15c and the 42s--both of which were higher in the chain. (Is the 41 a pocket calculator? Not quite as much).

There were many many extremely useful programs written for the 67, the 11c, the 32s, the 32sii.

Sure, you can't do everything that the 41 or the 42 or the 15c did, but you can do a lot.

In fact, for some things, the 33s can do more than the 15c--if it is memory or lines of code that

is a stumbling block, the 33s has efffectively 7k relative to the 15c.

(The memory structure of the 33s is less efficent and so it really isn't 32k).

When you consider that the 33s has equations as well as RPN, and the ability to use equations as prompts, and real command names rather than keycodes, then you have a much easier interface for programming.

Regards, Bill

Re: 33s programming

in response to message #38 by bill platt

Since I posted this rant, I've become aware that the 33S is better regarded as a programmable than I gave it credit for. You are right about all its advantages relative to the Voyagers and the 67/97. And it does have a much nicer set of capabilities in its built in functions, which of course makes the programming that much more powerful.

I guess I'm really comparing it to the 49G+. The fact that the comparison is unfair is exactly the point! 8)

Re: 26 variables

*Message #40 Posted by **ECL** on 8 Nov 2005, 6:02 p.m.,*
in response to message #34 by Howard Owen

I agree on the limitating nature of a finite number of variables. But, as a student, and knowing that 'heavy' work is frequently done with PC software, it is actually very enjoyable to address the challenges of this machine.

For example, I enjoy being able to solve polynomials and do matrix multiplication, approximate % error, and other "little" stuff that does take some time to do via longhand. And to have the answer as they are just locating the application in their GameBoys' is even more fun.

However, if HP is listening, a 42s style machine (built-in matrices, alpha-num variables, and a sophisticated menu system) would be warmly received :) ECL

Re: 26 variables

*Message #41 Posted by **Howard Owen** on 8 Nov 2005, 6:32 p.m.,*
in response to message #40 by ECL

Interesting. Thanks for that perspective.

As a hobbyist, I enjoy a programming challenge too. But it was my frustration at trying to port a non-trivial game to the 33S that occasioned my fit of pique above. But what really burned my toast was the realization that nobody would ever use the game, once I succeeded in porting it, because it would basically turn the 33S into a one trick pony. And for fifty bucks, you can get a much nicer gaming experience than that nowadays.

Re: 26 variables

*Message #42 Posted by **ECL** on 8 Nov 2005, 9:57 p.m.,*
in response to message #41 by Howard Owen

Howard,

If it can be written off as a pursuit in which you were confronted by a new problem, I say do it!

One of the 33s's pros to me is that I could outgrow it at some point. This may not frame my thoughts properly. Perhaps a better statement is that if I could load a C compiler and all the capabilities of such a language onto my 33s, I would likely try to write "The Complete Student-Engineer's Suite for the HP-33s" which would really derail me from my studies.

I appreciate the 33s for being somewhat limited, but to still be able to 'shirt-pocket' some very useful capabilities. All that said, I still dream of a 'lost' case of 42s' arriving at the local Fry's. Or even better, a new 33s/42s = 43s?? 34s? :) Thanks for the insights, ECL

Re: 26 variables

*Message #43 Posted by **ECL** on 8 Nov 2005, 10:11 p.m.,*
in response to message #41 by Howard Owen

Sorry to saturate the thread here, but I have noticed some elementary ways to get labels to go farther in my case. I have two programs that deal with matrices. One lets me input two rows for manipulation, and the other multiplies two matrices up to 3x3 (this one is brute force, and will be updated).

However, before operating on these rows and matrices, I have to build the matrix. Also, once done, I have to output the new values. I realized that I can have one short program do both. And then both matrix programs can call on the same 'builder/printer' routine. (sorry if this is exceedingly basic)

```
Routine to input and output matrix elements:
LBL A
FS? 1
INPUT (i)
FS? 2
VIEW (i)
ISG i
GTO A
RTN
```

So, if I am building the matrix, the main label will set flag 1 before calling on 'A', and if I am done, and want to output the results, I disable 1, and set flag 2 before calling 'A'. Hey, I think I see how I can fit this into the main label...That's another benefit to these discussions, I see how I could have been more efficient through sharing something :) ECL

Re: 26 variables

*Message #44 Posted by **Howard Owen** on 8 Nov 2005, 10:29 p.m.,*
in response to message #43 by ECL

Yeah, at least half the benefit of explaining what you are doing to other people is the fact you have to explain it to yourself first. 8)

Seriously off-topic: I think that's because when you speak, or even when you frame your thoughts to be spoken aloud, you engage parts of your cortex that aren't in gear when you are thinking to yourself. My intuition says talking aloud to yourself wouldn't have the same benefit. If that's so, then the clarifying power of telling others what you are up to is not due to the motor pathways for speech and hearing being warmed up. It would be interesting to test that experimentally, but I'd have to be working from home before I started talking to myself. 8)

Back on HP calculators. There's an article in the archive that discusses some techniques for optimizing for label usage, specifically for the 33S. It sounds like some of the items you

mentioned are discussed there. But odds are you've had a thought or two that might make good additions.

Re: 26 variables

*Message #46 Posted by **brian healy** on 9 Nov 2005, 11:59 a.m.,*
in response to message #34 by Howard Owen

I agree with you that the ability to name a program would go a long way to increasing the programming capability. I wonder how hard it would be for Kinpo to do this, assuming HP had the desire to look into it. Most of the programs I write are relatively simple, I have minimal subroutines or branches. I have several different programs that use the same same variable but in different equations, and to keep it straight I make a user prompt in equation mode explaining what the required input is. It chews up memory, but the 33s has lots of it.

When I think of the shortcomings of the 33s, I try to remember to be thankful that at least there is still a basic RPN calculator in the market. I "grew up" on the 11c and 32sii, and felt that the higher end models had too many features that I would never use, and were probably too complicated for the day to day calcs that I usually am doing at work. Now that HP has addressed the design flaw of the 33s display, maybe they can address some of the programing limitations of the 33s. A basic RPN calculator like the 33s, but with some enhanced programming features would be totally ideal for me.

To go off on a tangent, does anyone know how successful HP ahs been with sales of the 33s?

RPL more complicated? (was: Latest 33s Display is Indeed Improved)

*Message #47 Posted by **James M. Prange (Michigan)** on 9 Nov 2005, 2:51 a.m.,*
in response to message #31 by Howard Owen

Well, to each his own, but personally, I find the RPL models **much** easier to program than my 12C or 16C.

What's so "complicated" about programming in UserRPL? It's mostly the Reverse Polish Notation that everyone here is so familiar with, along with a few very useful program structures, and **named** local and global variables. What could be simpler to use?

You can simply start the command line with the \<< UserRPL program delimiter, simply press the keys in the same order that you'd use to solve the problem in "immediate" mode, and then press ENTER to put the program on the stack. Doesn't that sound much like "keystroke programming"? Now type in your program name and press STO, and you now have a named program that you can use whenever you want, including calling it by name from another program.

Yes, you can write complicated RPL programs. For example, utilizing local variables, elaborate nested program structures, and recursive programming, but you don't have to utilize all of the power of RPL to write some very useful programs.

Even SysRPL isn't much more complicated than UserRPL, though much less forgiving of mistakes. Assembler language isn't difficult, though perhaps rather tedious to program in. For these two, keep an archive of user

memory on a card, or in the case of the 49 series, in flash memory, while you're programming and testing, and it's easy enough to restore when things go south.

To be sure, there are more commands than almost anyone will ever learn to use, but complaining about that seems much like complaining about your bride being "too beautiful". If you don't know what a command is useful for, then simply don't use it.

I suppose that it largely depends on which model first hooked you on HP calculators.

Regards,
James

My concern with UserRPL is that I forget the keywords and syntax when away from it for some time;). But there is another issue: The missing 'break' statement strikes you especially when writing more complex programs for which keystroke programming wouldn't be suitable anymore. There are some (awkward) ways around it but would it have been much of a problem to implement it?

The keywords are the same used in the menus. Granted, the menu system in the 49 series leaves a lot to be desired, but even there the menus for program structures are straight-forward, and you can use the CAT key to see all of the commands. What is there about the syntax that's easy to forget?

>
> But there is another issue: The missing 'break' statement strikes you especially when writing more complex programs for which keystroke programming wouldn't be suitable anymore. There are some (awkward) ways around it but would it have been much of a problem to implement it?

Maybe you mean something like the HALT command? You can use the DBUG operation to start single-stepping through a program. Or you can start single-stepping at the first HALT command, or CONT to the next HALT command.

in response to message #49 by James M. Prange (Michigan)

I believe he is talking about a kind of EXIT or RTN statement that allows early exit from a subroutine. Though I rarely find the need for them when I do well structure programming. I only really need this kind of functionality when I am looking for the shortest and fastest way to do something. However, now with the speed and memory of the 49g+ it is only required for "challenges"

Re: RPL more complicated?

*Message #51 Posted by **Thomas Radtke** on 9 Nov 2005, 11:17 a.m.,*
in response to message #49 by James M. Prange (Michigan)

I was talking about 'break' as in the C language. I'm often in need to leave a loop somewhere in the middle of the enclosed statements. This might not be the most elegant technique, but it is 'resource friendly' and a standard on several programming languages.

About the forgotten keywords, yes I can look them up but that takes some time. So basically RPL gets my job done but I'm usually faster with keystroke programming. And no, I'm not against RPL, I was just pointing out what I dislike about it. I have used it and will use it in the future, for sure.

Ok, I'm not familiar with C, which explains why I didn't recognize your "break", and got sidetracked to "break point" instead.

> Quote:
>

Which kind of loop?

Somehow, it seems to me that using a WHILE...REPEAT...END or DO...UNTIL...END loop would satisfy your requirements quite nicely.

Of course, you could also nest "conditional" program structures within the loop clauses.

Even with a FOR index...NEXT loop, it's easy enough to force an early stop to looping simply by storing an appropriate value in the 'index' local variable.

Offhand, the only way that occurs to me to force a START...NEXT loop to end early is to force an error (such as 0 DOERR), which of course ends the entire program, unless you have the loop within an error trap.

In the case of a FOR index...STEP or START...STEP loop, one could force an early end by substituting a different value for STEP, sort of forcing a "giant STEP".

Okay, some of those aren't simple methods. I suppose that the simple answer would be that it depends on what you're trying to accomplish.

Yes, but that would mean that you have to go through the rest of the current loop until the condition is queried the next time. A 'break' would leave it immediatley.

> Quote:

I tried that. Can't remember exactly but I think that was possible only once, while I was in need for several 'break's. Probably my fault but at that time I didn't found out how to accomplish that and haven't touched my 48G since then. I'll look at it again.

Well, you want the "break" only if a certain condition is (or isn't) met, right? So you're going to be testing for that condition. How about something like this:

```
1 10                    @ Loop from 1 through 10.
FOR n                   @ Loop index is local variable 'n'.
  @ Code to be executed before break test.
  IF
    @ Test, continue if true, break out if false.
```

```
  THEN
    @ Rest of code to be run in loop.
  ELSE
    @ Optionally record that a break was used.
    10 'n' STO          @ Actually, any value greater than 9
                        @ should work in this case.
  END
NEXT                    @ Increments and tests loop index.
@ Optionally test whether a break was used.
```

You could use a CASE structure to allow for multiple break tests within a loop, for example:

```
1 10                    @ Loop from 1 through 10.
FOR n                   @ Loop index is local variable 'n'.
  CASE
    @ Code to to run before first break test.
    @ Test for first break condition.
    THEN
      @ Optionally save information on reason for breaking.
      10
    END
    @ More code to be run.
    @ Test for second break condition.
    THEN
      @ Optionally save information on reason for breaking.
      10
    END

    @ Etc.

    @ More code to be run.
    @ Test for last break condition.
    THEN
      @ Optionally save information on reason for breaking.
      10
    END
    n                   @ Use existing loop index value if no
                        @ break occurred.
  END
  'n' STO               @ Store value in loop index.
  @ Additional code to be run within loop.
NEXT                    @ Increments and tests loop index.
@ Optionally check reason for breaking.
```

Of course, you could also force a FOR...NEXT loop to run indefinitely, just by storing a value at least 1 lower than the stop value into the index every time.

> Quote:
>

The START loops are problematic to break out of early. The START loops are basically simplified FOR loops, for use where the user doesn't need access to the index. They don't test for whether to loop again, like WHILE and DO loops. Like NEXT loops, they do use a local variable for the index, but START's index local variable is nullnamed, and thus inaccessible from "pure UserRPL". I suppose that one could access it with SYSEVAL, but why bother when FOR loops are available?

Maybe something like the following, but note that pressing CANCEL just once may just cause breaking out of the loop, with a second press required to abandon the program:

```
\<<                     @ Begin program.
  RCLF \-> f            @ Save current flags.
  \<<                   @ Begin local environment defining procedure.
    -55 CF              @ Force Save last args for consistent error
handling.

    @ Code to be run before loop.

    IFERR               @ Start error trap.
      1 10              @ Loop from 1 through 10.
      START             @ Loop index is not accessible by user.
        CASE
          @ Code to be executed before test for first break.
          @ Test for first break condition, break if true.
          THEN
            @ Optionally save information on reason for breaking.
            0 DOERR
          END
          @ More code to be executed.
          @ Test for second break condition.
          THEN
            @ Optionally save information on reason for breaking.
            0 DOERR
          END

          @ etc.

          @ More code to be executed.
          @ Test for last break condition.
          THEN
            @ Optionally save information on reason for breaking.
            0 DOERR
          END
          @ More code to be executed if no breaks occurred.
        END
      NEXT              @ Increments and tests hidden loop index.
    THEN                @ Start error clause.
      IF
        0 ERRN  \=/     @ Was the error unexpected?
      THEN
        @ Optionally any additional error testing and cleanup.
        f STOF          @ Restore original flags.
        ERRN DOERR      @ Execute the error, abandoning program.
      ELSE
        @ Optionally any additional code based on reason for breaking.
      END
    END                 @ End error clause.

    @ Code to be executed after loop.

    f STOF              @ Restore original flags.
  \>>                   @ Abandon local environment.
\>>                     @ End program.
```

But it's easier to just use a FOR loop and use the index local variable to break out, otherwise ignoring it if you have no other use for it. I suppose the main value of this START...NEXT example is to show that "there's more than one way to skin a cat", and some ways are better than others.

Of course, if you want the loop to execute until some condition is met, with a single test for breaking, then very simply use something like:

```
WHILE
  @ Code to be executed before break.
  @ Test for break condition, false to break, true to continue.
REPEAT
  @ Code to run if not breaking.
END
```

Although only the FOR loops have a user-accessible built-in loop index, it's easy enough to add your own loop index to any loop using your own local variable and INCR (or DECR), or for that matter, doing any operation to modify the index value and storing the new value back into the local variable.

For example:

```
\<<
  0 \-> n               @ Initialize loop index.
  \<<
    DO
      @ Code to be looped through.
      'n' INCR DROP     @ Increment loop index value.
    UNTIL
      @ Test whether to loop again, optionally using the value of n.
    END
    @ The loop index value is still in n, even after the loop has
    @ ended.
  \>>
  @ Now the loop index has been abandoned.
\>>
```

Or, for the following, the index is 2 to the power of the loop count.

```
\<<
  1 \-> n               @ Initialize loop index.
  \<<
    DO
      @ Code to be looped through.
      n 2 * 'n' STO     @ Modify loop index value.
    UNTIL
      @ Test whether to loop again, optionally using the value of n.
    END
    @ The loop index value is still in n, even after the loop has
    @ ended.
  \>>
  @ now the loop index has been abandoned.
\>>
```

Note that in a DO...UNTIL...END structure, the UNTIL can actually be anywhere between the DO and the END, as long as it doesn't occur within a nested program structure. The END uses the T/F (zero/non-zero) stack flag, and the DO tells it where to "loop back" to. The UNTIL usually divides the loop into a "loop clause" and a "test clause", but that's only for reasons of program legibility.

But the above doesn't hold for a WHILE...REPEAT...END structure. In this case, REPEAT uses the T/F flag, END tells it where the "loop clause" ends, and WHILE tells it where to "loop back" to for the next "test clause".

A DO loop is always executed at least once, but with a WHILE loop, the "loop clause" may not be executed at all.

Finally, note that what you're trying to do may well be easier in SysRPL.

Regards,
James

Re: RPL more complicated?

*Message #55 Posted by **Thomas Radtke** on 12 Nov 2005, 1:22 p.m.,*
in response to message #54 by James M. Prange (Michigan)

Yes, it is certainly possible to get the job done without 'break' and it might look even better. But compare your first solution

> Quote:
>
> ```
> 1 10                    @ Loop from 1 through 10.
> ```

```
    FOR n                   @ Loop index is local variable 'n'.
      @ Code to be executed before break test.
      IF
        @ Test, continue if true, break out if false.
      THEN
        @ Rest of code to be run in loop.
      ELSE
        @ Optionally record that a break was used.
        10 'n' STO          @ Actually, any value greater than 9
                            @ should work in this case.
      END
    NEXT                    @ Increments and tests loop index.
```

with this one:

```
1 10
FOR n
  @ Code to be executed before break test.
  IF
    @ Condition for a break is met
  THEN
    @ Optionally record that a break was used.
    BREAK
  END
  @ Remaining code
NEXT                    @ Increments and tests loop index.
```

It's slightly shorter (I inserted 'Remaining code' to make clear why 'break' is of advantage here) so you can probably see why I really would appreciate the inclusion of a BREAK keyword.

Thomas

BREAK for loops (was: RPL more complicated?)

*Message #56 Posted by **James M. Prange (Michigan)** on 13 Nov 2005, 8:42 a.m., in response to message #55 by Thomas Radtke*

> Quote:
>
> It's slightly shorter (I inserted 'Remaining code' to make clear why 'break' is of advantage here) so you can probably see why I really would appreciate the inclusion of a BREAK keyword.

Oh, I can easily see where your BREAK would be useful, at least in some cases, but it's just not available. I don't see any pressing need for it though. I don't suppose that it would be all that difficult to develop, and the 49g+ does have upgradeable firmware.

Maybe ask on the comp.sys.hp48 newsgroup; I know that at least one HP employee occasionally posts there. Other than that, someone who programs a lot in SysRPL might be willing to develop it as a add-in.

In the case that there's only one place that you might want to BREAK, and you want an indefinite loop, the WHILE loop seems to me to be suitable.

Regards,
James

RPL Is Just Simply Better

*Message #57 Posted by **I, Claudius** on 9 Nov 2005, 7:41 a.m.,*

in response to message #47 by James M. Prange (Michigan)

RPL beats RPN hands down with programming. For me, writing a User RPL program on an HP48/49 to do darn near anything is almost second nature now.

Indeed, I'm a bit amazed at how people can become excited over an ordinary scientific calculator, as they are in this thread. It's a free country, to each his own...

in response to message #47 by James M. Prange (Michigan)

Well, this is a can of worms, of course. It reminds me of the editor wars between emacs and vi, in fact. People take positions in that conflict and assume that anyone with a different stance is an idiot. Communication between the camps is replete with disclaimers like "to each hos own" and "YMMV" but those are usually preambles to blistering rhetorical attacks on the other side. Not that anyone has reached that level in this particular thread, but it's a danger.

When I look at the relative merits of emacs and vi I see that each editor is useful in different contexts. I spent the earliest 10 years of my career as a systems administrator, so I had to learn both in order to support my users. Though I started out an emacs partisan, I now use both editors in different situations, as I have for the latter 10 years of my career.

I have yet to write a non-trivial program in RPL, so I'm not as qualified to address the differences between it and RPN as I perhaps am the differences in Unix editors. But I'm in the process of tooling up for the exercise of porting YATZ to the HP48G*, and I've been spending lots of time on my 48 machines, learning what I will need for that application, principally the graphics subsystem.

I'm feeling more comfortable on the calculator, but I must say that it has taken me a lot longer to start getting up to speed on the 48/49/49G+. than it has for any other machine in my collection. In fact, it has taken an effort comparable to learning a new operating environment like Python, say, if you are used to Perl, or Java if you know C. This isn't just an RPL issue, but also stems from the very large command set. Yes, that *is* a nice thing to have, but it also, by definition, increases the complexity of the machine. I think partisans of RPL, all of whom presumably have gotten over the steep learning curve of the calculators that implement it, tend to downplay the complexity. This is natural, but it misses an important feature of these machines.

That complexity, in my opinion, contributed to the triumph of TI in the education market. The average teacher didn't have time or interest to learn the rudiments of RPL, when compared to the familar, BASIC-like TI programming model. I *know* it sucks. That's not the point. It's *simpler*. HP must have gotten feedback that RPL was a problem in the marketplace, because they added some TI BASIC like syntax. Of course, nobody uses them in the RPL world because they suck. But that's the opinion of self-selected RPL lovers!

I also don't want to start another HP vs TI flame war. I like HP. TI is devil-spawn. The better calculators lost the calculator wars, a situation not unlike the triumph of Windows over technically superior rivals. I also don't mean to suggest that complexity was the only determinate in that war. I do think that it was an important one, however.

But I'm a hobbyist, so I'm willing to take the time (sandwiched in between fits of work designing grid systems) to learn RPL. I must say, it kind of grows on you. The manuals are essential, basic *and* advanced, since the help systems are a joke. This is somewhat improved on the 49G+. but a basic problem remains: limited screen real estate. Complicated functions require lengthy explanations, and there just isn't room on even a 49G+'s expanded display. There's also an issue of covering your work while you read the instructions. Having the text side-by-side with the work in progress is the only way to go.

In the meantime, I can crank out 41C code at a high rate. I picked up the 33C in about half an hour. This was

not only a function of my familiarity with keystroke programming, but of the fact that there are fewer functions to choose on the 33S. They almost all fit on the keyboard, in fact, with two shift keys and the addition of a few logically laid out menus. Simplicity counts when it comes to learning a new system.

Of course, another consequence of the simplicity of the 33S is less functionality. You can truly do a boatload of interesting stuff on the 48G. I have Hrastprogrammer's 71X simulator loaded in my 48GX, and it rocks. I have his earlier 41E on my 48G+ and it's cool too. There is no question that I will be able to implement YATZ on the 48. That program is non-trivial in BASIC or keystroke models, but I expect it will be a quick knock-off on the 48, once I *learn* enough about the darn thing. (I know there's a Yahtzee clone already available for the 48. Delivering something unique is not the point of my exercise.) I'm probably going to revisit YATZ on the 33S sometime, but it is shelved for now.

So I have an enthusiast's interest in the RPL models. But I still find the keystroke models easier to understand and to program. I believe that's not entirely due to my familiarity with the 41C. I took up 41C after a nearly 20 year hiatus this Spring, after all. I do think that RPL is, by golly, more complicated and difficult to learn. But my hobby is learning about complicated old (or new) systems, so this appeals to me. I also think that the model of keystroke programming hasn't been upddated in those same 20 years. That's a shame. The last 20 years have brought multiple revolutions in software engineering that a keystroke model coould benefit from.

*Message #59 Posted by **Thomas Radtke** on 9 Nov 2005, 11:42 a.m.,*
in response to message #58 by Howard Owen

The war between different systems (or their users) will never stop. I once tried to point out just a few shortcomings of Windows to one over-enthusiastic user and was immediatley labeld a luddite and later accused for not being able to manage my system. I'm at an age where I can laugh at this and leave a discussion without further insiting on my point but a few years earlier the result would have been one of these endless flame wars. The good thing about HP calc users is that they apparently almost always have a working brain between their ears, capable of early stopping a pointless discussion a la 'mine is longer than yours'. A rare species indeed.

The old Usenet adage was to try to "shed more light than heat." I agree that's often a lost cause, and also that it may not be around here.

complexity

*Message #61 Posted by **bill platt** on 9 Nov 2005, 12:23 p.m.,*
in response to message #58 by Howard Owen

Hi Howard,

Very good post and good points.

The key "issue" if there is one appears to be the "learning curve". Essentially, learning RPL is like learning PASCAL or C or some high level language. RPN keystroke is low-level machine code.

The machine code is mostly keystroke stuff, with the addition of some "indirection" and some boolean statements and flags. If you already know these tools, its easy.

What I cannot answer is whether the machine code approach is easier if you haven't been there already. Since I was an RPN programmer at age 14, I cannot answer that.

Of course it also seems to me that the dividends on learning a language such as RPL are greater than learning a machine code such as RPL keystroke.

I think what we get to is, that structured high-level programming can "do more" but takes more initial learning.

What is readily apparent to me is that the keystoke approach is frightful to de-bug if it is large and complex with many subroutines and conditionals between subroutines. Once it gets to be really big in either size or complexity, it is a bear and a nightmare, which is why HP made all those great "pacs" starting with the 55! That way an end-user could get a program on board and running without having to become a machine language expert. I don't think the HP RPN programming would have been the success it was without that.

With the RPL approach, you still have the opportunity to provide "pacs" but you also open up the possibility of meaningful structured programming by an end-user who has "structured high level programming" skills.

Just a thought.

I am personally not proficient with RPL and have not climbed the curve--mostly because I'd rather do other things, and I feel like if I am going to do structured hi-level stuff, I might as well use a language that I already know, i.e. PASCAL.

So that is that.

Hi, Bill,

Thanks for your thoughtful reply.

> Quote:
>
> The key "issue" if there is one appears to be the "learning curve". Essentially, learning RPL is like learning PASCAL or C or some high level language. RPN keystroke is low-level machine code.

I'd generally agree, if we are talking about assembly rather than machine language. But I think the keystroke stuff is just a bit higher level than assembly. Perhaps assembly coding with a very rich library of canned routines would be closer.

> Quote:
>
> What I cannot answer is whether the machine code approach is easier if you haven't been there already. Since I was an RPN programmer at age 14, I cannot answer that.

I can't answer that either, since I learned HP-41C programming before assembler. 6502 and PDP-11

were my first assembly languages. Both were understandable to me immediately, whereas my peers seemed to have trouble. I attribute that to knowing the HP-41, so your general point is well taken.

> Quote:
>

Good points, and ones that keystroke proponents often overlook in their turn.

> Quote:
>

I think it's more than that. I've got a background as a polyglot programmer. My experience in computer languages that I actually did work in, in the order encountered, is HP41, Apple BASIC, 6502 Assembly, VAX BASIC, Pascal and FORTRAN, PDP-11 Assembly on the VAX (in emulation mode), Micro$oft BASIC, HP BASIC 2.0, HP Pascal 2.1, REXX on Amiga, Amiga BASIC (original and MBASIC) C on Amiga, BSD and VMS, DCL, FORTRAN, Pascal and C on VMS, BSD and Ultrix grep/awk/sed/sh, Ultrix Perl 3 and Perl 4, csh on SunOS and Ultrix, SunOS C, gcc on Ultrix and SunOS, Perl 5 on a plethora of platforms, Java on Solaris and Windows, Python on Linux, Javascript all over, PHP, ASP on Windows, C++ on Linux, XSL, SOAP, JSP and other things now being called part of "web services." That's what I remember off the top of my head, I've left many systems out that I came to know but didn't actually use. I'm probably missing one or two.

I'm not presenting that list to ring my own bell, (well, maybe a little,) but to show that I have the background to be able to acquire new computer systems and languages. I also think I'm in a good position to judge complexity in computer systems. I think RPL itself is somewhat complicated, but probably no more than necessary to acheive generality. But combine it with what would be called its standard library set in a big system context, and you have a whoppingly complicated system. That's OK too. You also get functionality for that complexity. I know some would question the utility of that much power in a calculator, but I'm not one of them. I like having it there, even if I'm not using it, yet.

Thanks again for the response!

assembler vs machine

*Message #63 Posted by **bill platt** on 9 Nov 2005, 2:43 p.m.,*
in response to message #62 by Howard Owen

Thanks for correcting me on that.

I am not a programmer and so while I see now exactly what was inaccurate in my statements, I

did not see at the time.

Indeed, when I see actual "machine code" it is gobbledeydgueck. But Assembly language appears to be a human-interpretable item----yes nore like RPN.

I like your description--"assembly with a rich very subroutine library"

And yes, there is something daunting about 48gx & RPL and part of the reason I replied is that I still can't quite put my finger on it...it should be easier than it is, or something----it's all so logical, so then why can't I adapt faster? Is it really merely that there is so much there, or is there a difficulty doing the simple stuff without already understanding the complicated stuff, too? In other words I am looking at the structure of the RPL language from an epistemological standpoint---that it is not modular enough if you see what I mean.

Interestingly the manuals show you three ways to do things--including a stack-based semi RPN keystroke approach--and then say that you really aught to try using the structured approach...but I never really "get there" and get frustrated with syntax and it all comes crumbling down and so I go pick up my fiddle or guitar instead...

OT my cousin used to live in Burlingame. And Sunnyvale, not far from you, has got to be the HAM radio capital of the world (sorry, Dayton, O.!)

It's a common mistake. Strictly speaking, machine language is the binary numbers the machine processes when it runs a program. Assembly, as you note, is the human readable souce code that is closest to machine language of any source system. There is usually a one-for-one correspondence between the mnemonic label, "STO," say, and the binary opcode that it generates in machine language. So the distinction is subtle, but important.

I think it's both things. First, there really is too much detail that needs to be mastered before you can do something useful. Second, there are too many ways to do the same thing. Since there is so much detail, texts that try to teach you RPL tend to start in different places, and be pretty imposing. It's not unlike how mathematics texts differ among themselves. The second feature, the diversity of programming models and constructs, adds to the confusion by letting different authors write code that acts similarly or identically, but looks completely different. (C.F, the lame TI "BASIC" like statements.)

I have mastered another rich language in which There Is More Than One Way To Do It. The capitalization should clue those in the know that I am talking about Perl. Perl is an enormous language with a huge diversity of ways to accomplish things. The difference is that you can bootstrap into the language with very little effort. Tis is in line with another Perl dictum: to make hard things easy and impossible things possible. What do you suppose the following code does?

```
#!/usr/bin/perl
use strict;
my $pattern="^h.*";
while (<>){
  if /$pattern/ then print;
}
```

This searches the input for lines beginning with "h" and prints them. I think it's crystal clear from the code what it does, but I'm really not in a position to tell. What do you think?

The other advantage Perl has going for it is that its creator is a linguist. Larry Wall has attempted to design a computer langage that is conversational in style. But because people have widly varying conversational styles, even when they speak the same language, making Perl "conversational" means different things to different people. So Larry just put all the idioms in there that made sense to him. It really can lead to some horrible looking code that is hard to debug. On the other hand, it is possible to be quite elegant with all that lexical flexibility. The point of that is, it's possible to find a path through the totality of Perl syntax that approximates the way *you* look at the world. That has got to make learning easier, hasn't it? It did for me.

I actually live in San Mateo, just across the line from Burlingame. My mailing address is in Burlingame, however.

RPL *is* complicated. Here are three threads...

*Message #65 Posted by **Karl Schneider** on 10 Nov 2005, 12:13 a.m.,*
in response to message #58 by Howard Owen

Kudos to Howard Owen and Bill Platt *(in proper titlecase)* for their discussion of learning RPL. I would echo practically everything they stated, based on my similar experiences.

I coveted the 41C and experimented with it at stores in 1980-81 as a 17-year-old, but just couldn't afford it. I bought a 15C in late 1983 after taking a liking to the 34C. I got into collecting in 2002 with a 41CV and a 34C, followed initially by the 42S as well as RPL models, including the 28C, 48G, and 49G.

Like Eric, I readily picked up the 41C right where I'd left off 21 years prior. It's only a bit more complicated than the 15C I'd used through three science and engineering programs, in conjunction with

experience in Fortran, C, and similar data-oriented high-level languages.

However, I see little about RPL that is intuitive or practical for myself or for most users. RPL has been discussed quite thoroughly in the last two years by different contributors in at least a few threads, including several that I started:

RPL is like a Leisure Suit

RPL Programming challenge: Area between two curves

RPN vs. RPL discussions

(The last one includes quite a bit of articulate input from Valentin Albillo.)

Re: RPL *is* complicated. Here are three threads...

*Message #66 Posted by **Geir Isene** on 10 Nov 2005, 1:02 a.m.,*
in response to message #65 by Karl Schneider

This has personally been on my mind for a couple of months now: The old RPL vs. RPN problem. I have been trying to decide between my 48GX and my 41CX. Which should be my primary calc?

I used to program the 41 back in the 80's. Then a long period of no calc-programming. Then a couple of years back I picked up the 41 again. However, for more than 6 months I have now been eagerly programming the 48 in UserRPL.

I am now moving back to the 41 and it looks like the 41CX will be my primary calc.

The reason is this: The 41 is for me a better programming environment. It makes it faster to solve simple problems. It's got a superior debug environment.

RPL seems to be cross between RPN and Forth with some grains of Lisp. Had it only been pure Forth, I would probably have settled on the 48. I love Forth. RPL is somewhat cumbersome. RPN is very straight foreward.

41CX OR 49G+

*Message #67 Posted by **Dan Taylor** on 10 Nov 2005, 6:13 a.m.,*
in response to message #66 by Geir Isene

My invaluable 41CX (Math1 & Advantage) helped get my BS and MA degrees a decade past. While writing a function for finding sinh and cosh the machine locked up; it's still sick.

I had thought that its potential replacement was the 49GX2 for all the trig and matrix operations needed. Are the keyboard algebraic operations different too? It seems they are. Right? Learning a new keyboard layout was enough of a change. Graphing? My laptop has Mathcad. Time to find a spare 41CX here or on E-Bay.

Re: RPL *is* complicated. Here are three threads...

*Message #68 Posted by **valentino ducati (switzerland)** on 11 Nov 2005, 5:14 p.m.,*
in response to message #66 by Geir Isene

I have to support both parts here.

Me too am an "old school RPN programmer" and I begun the RPL approach 2004 with a first 48SX (now up to 48GX).

After many approaches to the RPL programming paradigma I still have to say that I am an RPL novice! Not so with RPN, the 41serie in mind.

Well, I have to admit that my higly active PPC years are back in the last century. Maybe I lost some drive to start over again and learn the new RPL approach with all stripes and bells... Maybe other elder mates here have the same problem? ;-)

The 1st step up the RPL stair was understanding that RPL is not well suited for easy going LBL...DSE loops. I begun to look at it like another professional programming language where program entry is only the final step after a well done analysis of the problem and maybe also some structured diagrams for the programming task. And all of this is done on a computer environment with good ASCII programming tools (like ultraedit et al.).

And every few lines there is an explanation block (@...) for later upgrades to the software.

But I still don't have a 49G+ because...
...I'm still waiting for a "RPN pac" for this machine. Not for programming, bevare, but for easy keystroke ad hoc calculating.

With this point of few I finally found my peace regarding the RPN vs. RPL thing. The 32SII or 15C are my favorite RPN everyday calcs. And the 48series are for the serious big RPL programming. And the 41series? Today I like to port a 48/49 RPL solution to a 41 in RPN; but - I suppose you know it already:

RPL is programming, sophisticated, complicated and reliable
but **RPN is real fun!**

Valentino

programming: RPN vs. RPL vs. hi-level language

*Message #69 Posted by **Karl Schneider** on 12 Nov 2005, 3:47 a.m.,*
in response to message #68 by valentino ducati (switzerland)

Valentino Ducati and Ed Look have compared programming in RPN to RPL and Fortran. I generally concur with their assessments, and have similar experience.

RPN-based programming does not utilize a true "language". An RPN-based (or even an AOS-based, as on the HP-20S) keystroke program is essentially a recorded sequence of instructions -- the exact same ones that one would execute interactively, with some extensions to provide structure and control.

These extensions are quite analagous to those in Fortran -- the original high-level number-crunching language, predominant when computers were actually used for computing:

- Numerical ("internal") labels are like statement labels.
- Alphanumeric ("external") labels are like ENTRY and SUBROUTINE.
- GTO and GSB/XEQ are like GOTO and CALL.
- Flags are like logical variables.
- All conditional tests ending with "?" (FS?; x=0?) are like IF.
- DSE/ISG/DSZ/ISZ help automate looping (DO-loop)
- RTN and END are like their Fortran namesakes RETURN and END.

NOTE: There is a distinction between internal and external labels -- as well as the END instruction that partions a block of programming -- only on the HP-41C* and HP-42S. On all

other programmable RPN and AOS calc's by HP, all labels are external.

Any keystroke program is akin to assembly code in that there is only one instruction per line. However, there are no procedural requirements (e.g., declaration of variables), structural rules, or syntactical jargon to obey.

This is certainly not the case with RPL ("Reverse Polish LISP"), which seems to be an unnautral melding of Object-Oriented Programming (OOP) with the spirit of RPN calculating methods. Language constructs are present (e.g., IF/THEN/ELSE, FOR/NEXT), but they are not intuitively arranged, as they are in Fortran, C, or BASIC.

I fail to see how anyone could possibly consider an RPN keystroke program "complicated", unless it implements a lengthy and highly branched-and-looped process, possibly using many variables. In such cases, a user program on a calculator is probably not the best platform for the application, anyway.

Here's a fairly concise chronology of my training in programming tools:

1980-81: Discovered HP-41C; experimented with programming at store counter. Did not experience any confusion.

1982: Passed collegiate course in Fortran '77. Did not experience any confusion. Started work several years later, maintaining Fortran programs on mainframes.

1983: Bought HP-15C and wrote working programs as necessary -- including one to find the value represented by a 36-bit octal floating-point word.

1992: Introduced to Matlab; found it similar to Fortran, but more expedient.

1993: Introduced to MS Visual Basic and wrote successful programs.

1995: Passed collegiate course in C language. Wrote my own recursive program.

1996: Introduced to LISP and CLIPS object-oriented languages. Experienced much confusion.

2002: Bought HP-41CV and successfully entered and modified programs that performed properly.

2003: Bought HP-48G. Saw and entered RPL programs and went, "What the h--- ?" Successfully entered and ran trivial one-line programs, but that's all.

Maybe the real determining factor isn't what one happened to learn first. Maybe it's more how one thinks, and organizes computational tasks. I've had little difficulty with data-oriented languages like Fortran, C, BASIC, and Matlab. However, I find little that is intuitive about the way certain object-oriented languages work, or RPL.

Re: programming: RPN vs. RPL vs. hi-level language

*Message #70 Posted by **Ed Look** on 13 Nov 2005, 12:47 a.m.,*
in response to message #69 by Karl Schneider

You are right on target about the 20S as it too, can be keystroke programmed. And it would be as easy as programming a Spice programmable (all RPN) or a RPN Pioneer programmable.

But I just want to quibble with you in that it really is a language, and while not as fundamental as assembler, it sort of speaks directly to the chip by encoding the keys as commands visible in the LED or LCD display while in its programming space. Obviously, though, it is not a true high level language like FORTH or LISP or FORTRAN (or even BASIC).

And, what you pressed into the program memory is a true program, no matter what!

RPN complicated? Well, not really, BUT... (was: programming: RPN vs. RPL vs. hi-level language)

Okay, maybe "complicated" isn't the correct word. How about the phrase "hard to program"? They're pretty darn nice when used as non-programmable models, but as for programming them....

My first experience with trying to program my 16C went something like this. It doesn't have any I/O, so I don't have the option of writing the program on the PC and simply transferring it to the calculator. Oh well, it's not going to be a very complicated program anyway. I try to program something, and what do I see in the display? A line number, and in most cases, a keycode, but the number or letter where applicable. Oh yeah, these things can display only numbers and a few (sort of) letters. It would've been hard to write on the PC anyway. Oh well, it's sort of like using the keycodes in the 48, except that the shift keys are separate codes instead of planes; I can deal with this, even though it is a nuisance to have to keep track of the row and column to see what I've keyed in. Hmm, no program structures, but it does have GTO, GSB, and RTN, and a few tests, much like assembler or BASIC, so I can implement all of the conditional branching and indefinite loops as easy as pie. Now where was I (imagine, a programmable that displays only one line at a time, but come to think of it, it was designed well before my Sharp was). Maybe I should've written the program out on paper, with line numbers, no less; now that brings back some memories. Hey good, I can even use the "Index register" to implement definite loops, but DSZ and ISZ skip only only at zero, so it's not as nice as a FOR loop. Now let's see, a bunch of these "RPN" commands actually use prefix notation instead of postfix notation; what were they thinking? I'm supposed to memorize which ones work right and which one are bassackwards? Okay, I've finally gotten it entered; now I'll try it out. Doesn't work; better have a look at what I keyed in wrong. Blasted keycodes again, so I'll translate them and write them out on paper. Edit a few mistakes and try again; still doesn't work. Look over the code; that should work. Double-check that that's really what I keyed in. Hey, how can it fail? Single-step through it; hmm, something very strange is going on, but it's hard to put my finger on just what the problem could be. Run through it a few more times. Looks as if the object that I know I put on the stack just plain changed to something else; what the hell? Single-step through it again; sure enough, the object has been changed; how could that happen? Maybe a hardware problem? Oh! These damned things can handle only

4 stack levels, and when my object gets to level 5, it just goes in the bit bucket, without even erroring out or giving me any warning at all. Stranger yet, when I take an object off of the stack, so level 5 (if the damned thing had a level 5) should drop down to level 4, the object that was in level 4 stays there, as well as dropping down to level 3. Hmm, the manual says it's a feature; somehow, I've a hunch that that feature started out as a bug that someone found a use for. Okay, I suppose that it could be useful, now that I know about the !@#$% calculator doing such a &%$^ counterintuitive thing.

The 12C is even worse for programming. Edit a program that I've keyed in? Easy enough if I want to change a line. But inserting a line? Sure, as long as I want to key in every damned thing from that line down all over again. Oh, I can add a line just by overwriting a perfectly good line with a GTO to branch past the end of the program, add my lines there, and GTO back to what should be the next line. Now that makes for some nice, straight-forward code. Why not a GSB and RTN instead of a two GTOs? Oh, you have to be kidding me, it just doesn't have them. Sure, I can get along without them as long as I still have GTO, but they were handy. What about deleting a line? The fine manual doesn't seem to mention this, but I suppose that overwriting it with a GTO the next line is about the best I can expect from this one. And where's DSZ and ISZ? I guess that if I want a definite loop, I have to set up my own loop index and test.

Hey, I could probably write a BASIC program for my Sharp with not too much more difficulty than writing a program for one of these things.

And many RPN users seem to have some sort of problems with RPL models? Hard to understand; I'd have thought that anyone who could learn to like the RPN models would find the RPL models amazingly easy, but apparently not.

Okay, I can program them, but this "True RPN" stuff that so many rave about sure doesn't seem to make things easy for me. And it looks as if only a few programs could fit into memory at any one time anyway, and there's no way to transfer anything into the calculator except for keying it in. I'm going to write a program for one of these only to have to purge it to make room for another program, and then key it back in the next time that I want it? Not likely!

These two are great as non-programmable calculators for the special purposes that they were designed for, once I more or less got used to some of their quirks, and maybe even to hold a very few very carefully written programs more or less permanently.

But switch from the RPL models to any "True RPN" model for my regular programmable scientific? I just can't see that ever happening.

Of course, now I've been told that these two models are poor examples for programming in "True RPN", but my experience with them have put me off the whole idea of using anything but RPL (well, assembler for time critical things such as I/O) for programming calculators. When something works so well, why switch?

Now, if they came out with a low-cost shirt-pocket sized RPN model, even if not "scientific", I'd sure like to have that, even if programming it was too much of a hassle to bother with.

Regards,
James

Difference

*Message #72 Posted by **Howard Owen** on 13 Nov 2005, 4:13 p.m.,*
in response to message #71 by James M. Prange (Michigan)

Wow, this is great! You've really given me a clear sense of what it's like to approach RPN programming from the standpoint of RPL. It's hard to argue with your perceptions. But I do think that many of them boil down to not liking the limitations of the older machines (category "A"), and the rest are direct mirrors of the difficulty of going the other way (category "B".) Both are perfectly understandable.

> Quote:

Category A. The Voyager models were middle tier machines in their day. They incorporated a programming model very similar to the previous generation's high end machines, the HP 67/97. They both showed numeric key codes in program mode. But the HP-97 had a built in printer that would print an alohanumeric version of the program. That made the 97 better for software development. None of the voyager series had this capability, of course. The high end of the time was occupied by the 41C, 71B and later the 42S. The 71B was programmable in BASIC, of course. The other two had alphanumeric capability that made listing programs much nicer. And of course the 41C and 71B both had very nice I/O capability, with standard (for the day) paths to and from a PC.

I'm supposed to memorize which ones work right and which one are bassackwards? ..

One from column "A" and two from column "B".

"Much like assembler or BASIC" indeed! I'd say BASIC is easier, actually. But this is the model many of us were first introduced to, so it seems natural to us. For example, when we look at RPL, we see *everything* being postfix as a jarring change, not the other way around. If you learn a thing one way, however illogical it is intrinsically, you are bound to see it as the "normal" or "sensible" alternative. (Just consider English for instance. I'll bet many of our non-native English speakers could give many, many examples of how illogical it is as a language.)

Okay, I suppose that it could be useful, now that I know about the !@#$% calculator doing such a &%$^ counterintuitive thing.

One from column "A" and two from column "B". I can't speak to why the T register acts the way it does on the RPN models. I can say that it seems natural and normal to me. I occasionally make use of it in the way it's explained in just about every manual for an RPN model I've ever read: a way to store a constant without using a register. That's actually pretty rarely needed, it's true. So I concede the feature is archaic (column A) and "normal" for RPN users (column B). The other column B item is the fact that the unlimited stack of the 28C onward confuses many of us old RPN jockeys. I've articulated what I think is wrong with it elsewhere in this thread. We have been used to using registers (variables by any other name) instead of holding *too many* intermediate results on the stack. This is especially true if you started on the 41C like I did. That machine has plenty of registers on the CV and CX models.

You won't get any argument from me about the brain-dead nature of the 12C's programming model. I suspect you'd be hard pressed to find a defender of that model in the RPN ranks hearabouts. (Who knows, though? We'll see.)

> Quote:
>
> Hey, I could probably write a BASIC program for my Sharp with not too much more difficulty than writing a program for one of these things.

BASIC was my *second* programming language. It seems pretty natural to me too. I have gone on to more modern languages, as I've noted elsewhere. But BASIC probably doesn't seem as outrageously wordy and antiquated to me as it does to you. (But see the rant in this README file for my generally unfavorable impression of BASIC.)

I do think BASIC is easier than RPN - or RPL!

>
> And many RPN users seem to have some sort of problems with RPL models? Hard to understand; I'd have thought that anyone who could learn to like the RPN models would find the RPL models amazingly easy, but apparently not.

I didn't. They are distinctly different, as you can tell trying to go the other way. I think you'd hear the opposite opinion expressed by RPN devotees, that RPN should be easy for RPL coders. It clearly isn't in your case. I don't think either of us is an exception.

I am making an effort, and having some success, at coming up to speed on the 48G. It is a fun machine, after a period of getting to know it better.

> Quote:
>
> Okay, I can program them, but this "True RPN" stuff that so many rave about sure doesn't seem to make things easy for me. And it looks as if only a few programs could fit into memory at any one time anyway, and there's no way to transfer anything into the calculator except for keying it in. I'm going to write a program for one of these only to have to purge it to make room for another program, and then key it back in the next time that I want it? Not likely!

Column B, but mostly column A.

There has been no development of *new* RPN machines since the RPL family took over HP's top of the line. The few programs that fit in a 16C, or even a 41C, reflects the cost of RAM back then. The limited number of labels in the voyager series fits with this limitation. The 33S is the current shipping RPN programmable from HP. It has a programming scheme similar to the voyagers with the addition of alphanumerics. So your listing, as you step through it with *two* lines visible at a time, is more readable. But because HP gave Kinpo the old 32SII code to port to a more modern chip, there are still only 30 or so possible registers and only 26 labels! This makes the 32K of RAM almost useless. If RPN models had been further developed, they would have come up with more elegant ways to use additional memory. But RPL was the king, so it saw the development, not RPN.

So the existing RPN programmables are not as capable as the 48/49 machines. But this is because development essentially stopped in the late 1980s. I've noted elsewhere that there have been numerous successive revolutions in computer architecture and software engineering since then, none of which have been incorporated into an RPN-style machine. It is a pity.

>
> Of course, now I've been told that these two models are poor examples for programming in "True RPN", but my experience with them have put me off the whole idea of using anything but RPL (well, assembler for time critical things such as I/O) for programming calculators. When something works so well, why switch?

No reason at all. I only play with the RPL machines because I'm gadget happy. Come to think, that goes for the RPN machines too! 8)

Re: RPN complicated? Well, not really, BUT... (was: programming: RPN vs. RPL vs. hi-level language)

*Message #73 Posted by **Garth Wilson** on 13 Nov 2005, 8:07 p.m.,*
in response to message #71 by James M. Prange (Michigan)

For the prices these things went for when they were new, it was expected that users would be pretty serious about it. I started with the TI-58c and then the 59, and the key-code recognition very soon became automatic, such that I wrote my programs as columns of key codes on paper, with a few comments to the right. The printer did indeed spell out the function the key was labeled with, but I certainly didn't need that for speed.

Now I often do use the PC with 132 columns (monospaced DOS) and 43 or 60 lines on the screen to write out a program before entering it into the HP-41. That way I can keep a clearer mental picture of the program, have more than one instruction per line, have plenty of room for comments, indent, add diagrams and special usage instructions, etc.. RPL give some of this, but how much can you do with a 2" screen? (I'm not saying anything against RPL, but just cautioning against being too critical of characteristics that were not always a problem, had easy ways to get around, etc..)

Re: RPN complicated? Well, not really, BUT... (was: programming: RPN vs. RPL vs. hi-level language)

*Message #74 Posted by **Ed Look** on 13 Nov 2005, 9:41 p.m.,*
in response to message #71 by James M. Prange (Michigan)

James,

I wished I had a Voyager series machine, but at the time, my 34C was still going very strong and I could not justify at the time spending for even a beautiful unit as the 15C or 16C.

But truly, it ISN'T counterintuitive to program RPN keystrokes on a 34C, 32SII, or 33S. I assume you have a 33S? If not, then this is moot, but the looping controls in these models, while not as powerful as in, say, FORTRAN, they were more than adequate for programs to "automate" things you would repetitively do on a calculator until you got so bored and sick of it that you'd scream.

But, I will admit to the frustration many a time when it came to edit or correct something in the keystroke RPN program. You really just have to scroll through it!

Re: RPN complicated?

*Message #75 Posted by **Karl Schneider** on 14 Nov 2005, 12:23 a.m.,*
in response to message #71 by James M. Prange (Michigan)

James --

I think Howard Owen's response was excellent; there's no need to quote or rehash his post or yours.

Just a few points I'd like to make:

1. Keycodes:

   As Howard pointed out, some of your points seem to confuse RPN with the limitations of mid-level models and early models. The keycodes shown in programs on Voyagers stem from their 7-segment display, not RPN! All the LED-display programmable models had the same limitation (except the HP-97 printer, as Howard mentioned).

   The algebraic-entry HP-20S, and HP-21S also show keycodes due to their *7-segment display*.

   By contrast, the HP-41 with its 14-segment display, and the dot-matrix HP-32S, HP-32SII, the HP-42, and the KinHPo 33S are RPN models that display symbols instead of keycodes.

2. Programming paradigms:

   The Voyagers are and were not the best RPN models for programming, not only due to the 7-segment displays, but also lack of RAM, slow speed, and lack of functions to partition user programs and to manage catalogues of programs. They were really intended for "expedient and disposable programs" only.

   The HP-12C programming paradigm is indeed an abomination that originated with the HP-55 and was unfortunately carried forward to the HP-65, HP-25, and

HP-10C, and maybe others.

The HP-41 and HP-42S were much better suited for "keeper" programs; the HP-32S, HP-32SII are also useful for programming (albeit hampered by lack of RAM).

Please have a look at my AC Power Transfer programs for the 32S/32SII/33S. These programs are quite well-suited to those models, but would be more straightforward if these calcs had more-sophisticated complex-number functions.

3. "t" register on the 4-level stack:

   Since the stack depth is fixed, some value must occupy the top-level register after an operation "pops" a value out. Zero would certainly be logical, but retaining the value in the "t" register can conveniently provide the user an endless supply of that value for calculations -- e.g., a constant term, or an input variable used many times in an equation.

   The 4-level stack was a compromise of required utility with the hardware limitations of the early days. If an all-new RPN calculator were to be designed today, I would suggest a user-settable fixed stack of up to 9 levels (and possibly 19).

One slight quibble with Howard's statement about development of RPN calc's effectively ending in the late 1980's: I'd say that it was actually 1991-92. That's when the HP-32SII replaced the HP-32S with expanded capabilities:

- Equation editor from the HP-22S
- Fractional-math functionality that is really quite useful and impressive (after the bugs in the initial run were fixed)
- Functions and conditional tests omitted from the HP-32S

1991 might also be when the HP-17BII replaced the algebraic-entry HP-17B, adding RPN mode along with with a nicer bezel and trim.

That's what I would have expected if development of RPN models had taken a more evolutionary approach. A settable fixed stack, perhaps with the inclusion of an unlimited stack as a choice, could have been one natural feature incorporated into RPN calcs to help make use of abundant memory.

Thanks for that correction, Karl. That means we've had just about 15 years of neglect of RPN calculator OS software. Like I said, it is a pity.

Re: RPN complicated?

*Message #77 Posted by **James M. Prange (Michigan)** on 15 Nov 2005, 4:47 p.m., in response to message #75 by Karl Schneider*

All good responses everyone.

I do recognize that trying to use more than four stack registers on an RPN model is purely a user error, but one that's easy to commit, at least for someone whose experience is in RPL. In RPL, using "too many" levels may result in an "Insufficient Memory" error or even an "Out of Memory" error, which puts you into a routine of choosing options for freeing up memory so you can use the calculator again, but objects can never be pushed off of the top of the stack.

As for duplicating the T register when the stack drops, the RPL stack can indeed be empty, so what the RPL user expects when he tries to take something from the stack that was never pushed there is a "Too Few Arguments" error, not to use something that was replicated down from a higher level.

I suppose that the small command set reflects the limited number of keys and shifted keys feasible in a calculator, as well as the other hardware limitations.

I've tried to figure out why the RPN models so often put the operator first, followed by the argument, for example, with LBL, GTO, GSB, and STO. The hypothesis that I've come up with is that it's due to the 4-register stack. If the argument came first, it would have to be stored somewhere, presumably on the stack. With the operator coming first, the keystroke can be stored elsewhere until the argument is entered to "complete the command", so the argument never has to be put on stack, thus never using up a precious stack register. Does this make sense?

Yes, many of limitations of the voyager series may be largely due to to the hardware limitations at the time they were designed. Expensive memory, 7-segment

single line displays and so on.

Yes, RPN model development seems to have stopped in the early '90s with the 33s resuming development, but how much does even the 33s improve things over the basics of the Voyagers released in the early '80s? Yes, the 33s has a dot-matrix 2-line display but, that's a relatively minor improvement. It's still limited to a 4-level stack, and still has a limited number of labels. But I gather that the development of the 33s amounts mostly to adapting the 32SII to new hardware? So it's much like asking how much things had been improved by the time the 32SII was released in 1991.

But I see that the 33s actually does have menus after all. Okay now, I suppose that the program doesn't actually record the keystrokes to get to the particular menu, but only the command actually chosen from the menu? In that case, I'd say that it isn't strictly "keystroke programming" after all, but rather "command sequence programming". Somehow, this seems very much like programming the RPL models; the difference being that in the RPN models you have to use a special "program mode" to write a program, and in the RPL models you simply start the command line with the \<< UserRPL program delimiter, type in the rest of the program, press ENTER to put it on the stack, and STO it in a named global variable if you want to save it for later use.

So just what the heck is it that RPN users find so all-fired "complicated" about RPL?

Just for the record, I don't find BASIC to be at all "outrageously wordy and antiquated". Actually, I've always liked BASIC, but preferring the versions that use labels instead of line numbers for GOTOs and GOSUBs. But using line numbers instead of labels isn't that difficult, provided you've left enough unused line numbers that you don't need to renumber your lines. It did get a a bit of a bad reputation because of the "spaghetti code" that one could make with GOTOs all over the program, but I regard that as a matter of poor programming practice, not anything inherently wrong with the language. You could write spaghetti code in RPN or assembler, for example, but that would be the fault of the programmer, not the language. It is rather "old" now, but we all know the "newer" isn't necessarily "better".

James

stack and commands

Does this make sense?

Yes it makes sense.

RPL people like to see this STO LBL GSB GTO stuff as inconsistent. In fact, is is perfectly consistent. You see, STO LBL GSB GTO are not mathematical operators; they are *control commands* and by their very nature have nothing to do with Juskawicz or Infix or Reverse Polish or whatever you want to call it.

So you are correct, it keeps these thing off the stack. But that is not merely to save stack. Think about error checking, argument checking etc. When you press a control function, that is how the machine knows that a control function is to happen "starting from now".

There is a major change in error-checking going from voyager to pioneer.

On an 11c etc, load the stack with say:

```
t   1
z   2
y   3
x   4
```

and then push GSB. the screen will flash, waiting for a label. If you push <X> instead, you will see "12". Or, if you push <backspace> you will see "0".

In other words, classicaly, the *control commands* can be over-ridden by mathematical commands. It's a hierarchy thing.

On Pioneers it is different. IF you push <exq> you will see "exq_" and you cannot push anything but a valid label. If you push <X> you will get a <!> annunciator and you have to push *either* <backpsc> or <C> to get back to the stack view.

I think it is perfectly logical and in fact far more logical than the RPL idea that everything is a stack "argument" which leads to the distracting problem of everything out of order and stupid inane error messages like "too few arguments" etc.

RPN postfix for non-math operations

*Message #79 Posted by **Karl Schneider** on 16 Nov 2005, 12:41 a.m.,*
in response to message #77 by James M. Prange (Michigan)

James --

Regarding your first query about why RPN models use postfix for commands such as STO, RCL, LBL, GSB/XEQ, GTO, FIX/SCI/ENG, etc:

Bill Platt explained it: These are *non-mathematical* operations that have nothing to do with RPN. In fact, I had discussed this in my "RPN is like a Leisure Suit" thread that you claimed to have read. An excerpt, discussing prefix notation, in which arguments must be specified before a command is executed:

> Quote:
>
> This approach -- the essence of RPN -- makes perfect sense for mathematical functions.
>
> However, it is often counterintuitive for device-control functions,

> such as STO/RCL and FIX/SCI/ENG. On the RPN calculators, these functions (as well as LBL/GTO/GSB/XEQ) require an appended identifier, generally numerical, to complete the command. On the RPL units, the input identifier must be specified beforehand, in the interest of uniformity.
>
> Which is easier and more intuitive:
>
> ```
> "FIX 5" or "5 (ENTER) FIX"?
> "25.4 STO 4" or "25.4 (ENTER) 'R4' STO"?
> ```

As for your boldfaced question,

> Quote:
>
> So just what the heck is it that RPN users find so all-fired "complicated" about RPL?

I'll quote another excerpt from my "Leisure Suit" post:

> Quote:
>
> As for RPL programming, compare a sophisticated RPL statement with an equivalent line in C, Basic, Fortran, or any other high-level language:
>
> ```
> "IF (A .LT. B)  A = A + 360.0"              (Fortran
> '77)
> "<< IF A B < THEN A 360 + 'A' STO END >>"  (approximate
> RPL syntax)
> ```

(Much to my surprise, that short RPL program I wrote but didn't test before posting actually did work properly!)

This example underscores my main statement, in that RPL is an ineffective compromise between a high-level language and a keystroke-programming system.

When a series of prefix instructions is listed one at a time (like an RPN program), it essentially looks like an assembly routine. "Jumps" (GTO) are necessary a part of that.

However, when a series of prefix instructions is listed on a single line, it just looks scrambled -- nothing like a line of a high-level-language. Adding IF-THEN-ELSE and other constructs to prefix instructions just doesn't work, in my estimation.

> >
> > Bill Platt explained it: These are non-mathematical operations that have nothing to do with RPN.

I did notice his post.

Yes, of course those are non-mathematical operations. I agree that intrinsically they have nothing to do with RPN; indeed, they're used in many languages. In my opinion, what they have to do with RPN in these discussions is that they are used in a stack-based RPN language.

> > Quote:
> >
> > In fact, I had discussed this in my "RPN is like a Leisure Suit" thread that you claimed to have read. An excerpt, discussing prefix notation, in which arguments must be specified before a command is executed:

In fact, I had read that thread a few times, I read it again a few more times, and now I've read it yet again a few more times. I still disagree with you.

> > Quote:
> >
> > > Quote:
> > >
> > > This approach -- the essence of RPN -- makes perfect sense for mathematical functions.

I agree, although it seems that most of the world disagrees with us on this point.

> > Quote:
> >
> > > Quote:
> > >
> > > However, it is often counterintuitive for device-control functions, such as STO/RCL and FIX/SCI/ENG.

Perhaps seeing them used as postfix commands often seems counterintuitive to you because you've never seen them used that way except in RPL?

Having them prefix seems counterintuitive to me, because although RPN seems so similar to RPL, they're always postfix in RPL.

> > Quote:
> >
> > > Quote:

> > On the RPN calculators, these functions (as well as LBL/GTO/GSB/XEQ) require an appended identifier, generally numerical, to complete the command.

As I figured out for myself, using them that way in a "True RPN" calculator has a major advantage in that it doesn't use up a precious stack level. Now that I've realized what a severe penalty having them postfix on these models would be, I'm quite satisfied that having them prefix is indeed the much better choice.

With the RPL models, there are many more non-mathematical operations, and they take a variety of object types as arguments, often more than one, and sometimes the number of arguments is determined by a number supplied as the first argument. Using up a stack level for each argument is, in some cases, a minor disadvantage of making them postfix operations. Some non-mathematical operations also return results of various object types and numbers of objects, sometimes with a count returned as the last result. What's more, the + operation can be either mathematical or non-mathematical, depending on which types of arguments it finds; should it be postfix or prefix? Perhaps we'd have to have two separate commands instead of loading so much into just that one little command.

> Quote:
>
> > Quote:
> >
> > On the RPL units, the input identifier must be specified beforehand, in the interest of uniformity.

The important reason for specifying the arguments before the non-mathematical operations is functionality, just as it is for mathematical operations.

In RPL, operations may be invoked from the keyboard, along with their arguments. Operations may also be within programs, along with predetermined arguments. If these were the only ways to invoke non-mathematical opeerations, it would make little difference whether they were prefix or postfix.

The arguments could also be objects that were on the stack before the operation or the program containing it was invoked, or input while a program was waiting for input, as with a PROMPT, INPUT, or INFORM. They could be objects stored in a variable and retrieved as needed. They could be objects created by the program that contains the operations. In these cases, as long as the operations are postfix, all the user or programmer has to do is ensure that any arguments are available in the proper locations on the stack before the operations are executed. This is the same as with mathematical operations, and the same methods of ensuring the stack locations are available.

But suppose that an operation is prefix, just because some arbitrary rule says that certain operations shouldn't be postfix. I don't have any way to

move any object from the stack into the runstream. What could be done is to allow prefix operations operations to take name arguments. That way, what I could do is arrange for the program to store the arguments of the prefix operation in a variable, and then place the unquoted variable names immediately after the operations in the program. Dealing with several named variables is a lot of bother, so I'd like to allow prefix operations that require more than one object to take lists instead; but wait, lists are non-mathematical, so operating on them means using a prefix operation, so using lists is out. Well, now I'm back to using multiple variables and names.

It could be done, but it seems to me that all of this handling of named objects is going to take up extra memory both in the program itself and at run-time, and more execution time. In the case that the arguments were already in the right location for using them with postfix operations, the user would still have to go through the trouble of storing them and placing the names after the operations,

Why not just make every operation postfix so it can find its arguments in the most natural place in a stack-based program, right on the stack? It's been done that way in RPL ever since the 28C was released, and hasn't caused any problem yet.

> > ```

To me, very much

```
"5 (ENTER) FIX" and "25.4 (ENTER) 'R4' STO",
```

although I'd key them in as

```
"5 FIX and "25.4 'R4' STO";
```

no sense using an extra keystroke when there's no need for it.

> Quote:
>

```
"IF (A .LT. B)  A = A + 360.0"
(Fortran '77)
"<< IF A B < THEN A 360 + 'A' STO END >>"
(approximate RPL syntax)
```

Both are clear enough, but I'd give a slight edge to

```
"<< IF A B < THEN A 360 + 'A' STO END >>"
```

I did have to think about whether the Fortran '77 example made sense.

It's even clearer to me when formatted as:

```
\<<
  IF
    A B <
  THEN
    A 360 +
    'A' STO
  END
\>>
```

But if you don't like program structures, how's this:

```
\<<
  \<<
    A B <
  \>>
  \<<
    A 360 +
    'A' STO
  \>>
  IFT
\>>
```

You've really lost me in that paragraph. What I take away from all of this is:

- You don't like to see postfix non-mathematical operations because it seems counterintuitive to you.
- I've given myself a good review of just why postfix operations are so important to making a stack-based language easy to use.
- You find RPL program structures hard to read.
- In general, you don't like RPL.

Actually, that last point I figured out a long time ago.

Regards,
James

Re: RPN postfix for non-math operations

in response to message #80 by James M. Prange (Michigan)

So RPL has postfix syntax for every operation for consistency, and for argument passing efficiency's sake. That's why RPL has 'A B > IF', right?

Oh.. wait.. 8)

Re: RPN postfix for non-math operations

*Message #82 Posted by **Geir Isene** on 17 Nov 2005, 2:23 p.m.,*
in response to message #81 by Howard Owen

Forth, on the other hand is rather consistent :)

Re: RPN postfix for non-math operations

in response to message #80 by James M. Prange (Michigan)

James --

Your first indented multi-line RPL program is indeed clearer that the one-liner, in my view. Of course, the Fortran '77 program can also be written using multiple lines (and would *have* to be, if there were an ELSE clause):

```
IF (A .LT. B)  THEN
  A = A + 360.0
ENDIF
```

(360 is written as 360.0 to avoid mixed-mode arithmetic, although that is not absolutely necessary. Fortran will handle mixed-mode calculations properly.)

> Quote:
>
> You've really lost me in that paragraph. What I take away from all of this is:

(Of course, I meant "postfix", not "prefix" in the paragraph you referred to. I'm sure that you understood that. My bad...)

I see some merit, but don't fully concur, on the first two points:

I believe that postfix non-mathematical operations (and RPL itself) is conterintuitive to many people, not just myself.

I do concede that a very complicated and "overloaded" function (i.e., multiple functions for one command) may be best to implement as fully postfix.

Exactly, and "Right on!" about the last two points.

Now, James, would you care to try my RPL challenge from last year, and provide a solution different from those posted by Arnaud Amiel and Raymond Del Tondo? I'd like to see an RPL program that makes sense to non-RPL'ers as to what exactly is taking place. The structure of the HP-71B solution posted by Valentin was evident, I think, even to those who are not familiar with that machine but have learned any high-level data-oriented language.

Regards,

Re: Try my RPL challenge?

*Message #85 Posted by **Howard Owen** on 18 Nov 2005, 2:31 a.m., in response to message #84 by Karl Schneider*

Hi, Karl,

I just happen to be coding my eyes out in RPL right now, and trying to make it easier for me to read. I looked at Arnaud's first two programs in the referenced thread, and I think I can make a version that scans better. I don't know how it will perform relative to the stack based versions however.

Here is some of the setup Arnaud specified:

Quote:

I store SIN(X) in F I store SQ(X-1.5)-1 in G

..

```
<< RAD F G - DUP 'X' 0 ROOT OVER 'X' 3 ROOT
ROT 'X' S >>
```

S being the integral function.

The program is the second one he wrote. It's stack-oriented gibberish to me. I think this is better:

```
<<
  RAD               @ Set Radians mode
  F G -             @ Create the expression  SIN(X) - (X-
1.5)^2 - 1
  \-> d \<<         @ Store it in 'd'
    d 'X' 0 ROOT    @ Solve d(X)=0 with intial guess of
X=0.
    d 'X' 3 ROOT    @ Solve with guess of X=3
    d 'X' S         @ Integrate with respect to X, in the
calculated interval
  >>
>>
```

Regards,
Howard

*Message #86 Posted by **Arnaud Amiel** on 18 Nov 2005, 9:40 a.m.,*
in response to message #85 by Howard Owen

It took me some time to understand it myself but here we are: << RAD F G - DUP 'X' 0 ROOT OVER 'X' 3 ROOT ROT 'X' S >>

or

```
<<
RAD               @Set Radian Mode
F G -             @Level 1 is F-G
DUP 'X' 0         @Stack is 4:'F-G' 3:'F-G' 2:'X' 1:0
ROOT              @Stack is 2:'F-G' 1:Root1
OVER              @Stack is 3:'F-G' 2:Root1 1:'F-G'
'X' 3 ROOT        @Stack is 3:'F-G' 2:Root1 1:Root2
ROT               @Stack is 3:Root1 2:Root2 1:'F-G'
'X' S             @The result
>>
```

I can now find some ways to improve the program but the stack manipulation would be even more complicated.

Anyway, when programming anything slightly involved in RPL, I need to keep stack diagrams as on the comments above. Note the this example uses a maximum of 4 stack levels and would not be very different on an advaced RPN machine: OVER=RCL Y and ROT=RCL Z

Also note that this is really keystroke programming.

But anyway Howard solution is more directly accessible.

Arnaud

Hi, Arnaud:

Arnaud wrote:

"It took me some time to understand it myself [...]"

> **That's the point**, indeed. Even the author of the code himself finds it difficult to understand a few lines of RPL code he wrote after a small amount of time has elapsed.

"... but here we are: << RAD F G - DUP 'X' 0 ROOT OVER 'X' 3 ROOT ROT 'X' S >>"

> without the comments you provide below, this line of code seems absolutely messed up, kind of an entry for the "Obfuscated C" contest (not that it would win, mind you !)

"I can now find some ways to improve the program but the stack manipulation would be even more complicated."

> So less apt to be understandable, even in the least, to someone not familiar with RPL, as Karl's challenge posits.

"when programming anything slightly involved in RPL, I need to keep stack diagrams as on the comments above"

> Once again, that's the point. Anything *slightly* involved in RPL means that you have to keep stack diagrams in order not to get lost and more or less find your way through the mess.

On the other hand, I can assure you that, in my extensive, 30-year experience with RPN, I've never found any need at all to keep or write down "stack diagrams". With just 4 levels, always present, and a few simple commands to deal with them, you can keep where everything is in your head (*"... this is in LASTX now, and this other result is in T, I need to Rup it, then LASTX and +, ..."*) and I've *never* felt "lost" or insecure about where some results are on the stack. And if I did, a simple look at the program steps and some mental tracing would be sufficient to keep my bearings.

That's *not* something you can do with RPL, and certainly *not* if you make extensive use of the stack and avoid named variables. And, if you do resort to using them, dispensing with unfathomable stack manipulations, then BASIC is far, far, far more understandable and easy to use, even to RPN/RPL people, as my BASIC version of the above algorithm clearly demonstrates.

RPL may have its good points, if any, but clarity and understandability are not among them.

Best regards from V.

Re: THAT's THE POINT !! :-) I fully agree

Although I am a strong supporter of RPL, I fully agree with you. Although RPN is not any better.

I have nearly the same problem when I am working with RPN, just instead of keeping stack level in my mind, I need to keep a table of registers. At least, those usually don't move.

When I have a bit more money, I will try to get myself a 71 and play with basic. However, what I like programming in RPL or RPN is exactly the fact that it is not straightforward. You have 2 challenges first find the algorithm, second code efficiently. With basic, step 2 is not very challengeing. I have spent days improveing a few lines of RPL.

Arnaud who sounds like a masochist :-(

keeping stack level in my mind, I need to keep a table of registers. At least, those usually don't move.

Other platforms call them "variables," 8) They leverage this odd human tendency to associate concrete or abstract things with names. (Like our stack diagrams or register tables help us to do.)
