HEPAX Bidding War

*Message #1 Posted by **Howard Owen** on 26 Mar 2006, 3:30 p.m.*

Up to $510.00 as of post time.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=9703515570&ssPageName=STRK:MEWA:IT

Is it about the box?

*Message #2 Posted by **Vassilis Prevelakis** on 26 Mar 2006, 4:10 p.m.,*
in response to message #1 by Howard Owen

I do not recall who hp-collection is, but I think he is participating in this forum, and in any case, anybody with his collection and experience would be aware of the NOVRAM module.

So are they willing to pay $500+ for the box????

zippyanna must be ecstatic

**vp

Edited: 26 Mar 2006, 4:17 p.m.

Question and Answer

*Message #3 Posted by **Howard Owen** on 26 Mar 2006, 4:51 p.m.,*
in response to message #2 by Vassilis Prevelakis

From the auction:

```
Q: Hello, how much $ for a Buy it Now price on this auction? I'll Paypal. Thanks!

    A: There is no Buy It Now price and there is no reserve price. Thank you for your
interest!
```

Sound like someone we know? 8)

Re: Question and Answer

*Message #4 Posted by **Vassilis Prevelakis** on 26 Mar 2006, 5:12 p.m.,*
in response to message #3 by Howard Owen

If I were the seller for this auction I would be thanking my luck for NOT setting a Buy-It-Now price, because it would certainly NOT have been anything like $500.

At this stage I'd consider setting a Buy-It-Now price for smth like $750 because I do not think it would go that high, and it might just get one of the bidders to pay the money to end the suspense.

Having said that, I am surprised that someone with a long eBay record would bid against a bidder with 0 feedback that is so keen to raise the stakes.

```
> Sound like someone we know? 8)
```

Why, do you have someone in mind?

Most eBay auctions are like that (low starting price, no reserve, no Buy-It-Now) and I find that such auctions are more likely to result in a bidding war than auctions with reserve or high starting prices.

**vp

Re: Question and Answer

*Message #5 Posted by **Howard Owen** on 26 Mar 2006, 5:32 p.m.,*
in response to message #4 by Vassilis Prevelakis

A certain eBay seller, often discussed around here, is famous for asking for BIN terms on non-BIN auctions. He thus sometimes succeeds in taking advantage of sellers who are ignorant of the value of the items they are selling.

If we take her statement that she doesn't ".. know much about calculators" to be an indication that she had no idea of what an HEPAX setup was beforehand, then perhaps "zippyanna" was in danger of falling for that sort of thing at one point. Lucky for her, that point is now passed. 8)

"Zippy" indeed!

Regards,
Howard

Re: Question and Answer

*Message #6 Posted by **Eric** on 26 Mar 2006, 7:55 p.m.,*
in response to message #5 by Howard Owen

Not to be ignorant, I'm not familiar with the 41 series...

What is the HEPAX module, and why is it seemingly (from the previous posts) so sought after?

Thanks! Eric (More of a HP48 kind of guy!)

Re: Question and Answer

*Message #7 Posted by **Howard Owen** on 26 Mar 2006, 8:20 p.m.,*
in response to message #6 by Eric

It's a very cool expansion system for the HP-41. It gives you RAM in the calculator's ROM address space, and the tools to manipulate it. That allows you to load any ROM module image you care to into the RAM. So you can run practically any HP-41 module ever made. You can also use the HEPAX to write your own HP-41 modules.

The HEPAX is quite rare. But there are several solutions that let you run the HEPAX code without owning an HEPAX set up. Diego Diaz has his Clonix family of modules. The NovRAM and Nov32 modules will run the HEPAX code. There's also the MLDL2000, by Meindert Kuipers, which also allows you to load the HEPAX code. Also, many of the

simulators of the HP-41, including HP-41X by HrastProgrammer, emu41 by JF Garnier and this, unfortunately unnamable simulator will run the HEPAX code.

So the point is, a technology enthusiast could satisfy the urge to play with the admittedly very cool technology for a lot less money, even for free in the case of some of the simulators. The auction linked to above must have the high price solely due to the rarity of the original HEPAX. One of the participants in the bidding war is a very experienced HP collector, so we can't just chalk the price up to market irrationality.

Regards,
Howard

Re: Is it about the box?

*Message #8 Posted by **Thomas Radtke** on 27 Mar 2006, 2:17 a.m.,*
in response to message #2 by Vassilis Prevelakis

> Quote:

Probably, since *The working condition of this item is unknown*. Am I the only one who finds this statement disturbing?

Thomas

Re: Is it about the box?

*Message #9 Posted by **Howard Owen** on 27 Mar 2006, 2:47 a.m.,*
in response to message #8 by Thomas Radtke

It's probably just because the 41CV she's selling in another auction is non-operational, so she couldn't test the module. But if I were in the market for a HEPAX in order to be able to use it, then I would be disturbed by that disclaimer.

However, for collection purposes it might not matter, depending on what slot I was trying to fill in my collection. But another omission that would matter to me in that case is no mention of a manual.

Regards,
Howard

LX200

*Message #1 Posted by **borgward** on 26 Mar 2006, 12:46 p.m.*

Hi

Is this the correct forum to post HP LX200 Questions

If not where do you suggest

Question is:

Having problem saving memo documents. After following instructions in Help, I get message - Memory error. I think that maybe the instructions are not complete.

Got the LX200 out of trash. Really impressed with its performance.

How do I protect against virus attacts if I go onlin. It's obvious that there is not enough room to install Norton AV.

Has anybody installed Linux on the LX200?

Re: LX200

*Message #2 Posted by **Raymond Del Tondo** on 26 Mar 2006, 4:29 p.m.,*
in response to message #1 by borgward

Hi,

http://www.hplx.net/

and

http://www.palmtop.net/ (currently offline)

are more suitable places for the 200X

HTH

Raymond

Puzzling HP-49G+ SDEV-function

*Message #1 Posted by **Karl-Ludwig Butte** on 26 Mar 2006, 7:03 a.m.*

Hello All,

I have a difficult question about the SDEV function of the HP-49G+ which puzzles me: There are 4 figures for which I would like to calculate the standard deviation: 6.5 12.1 5.4 -10.3

I've read this excercise in a financial mathematic text book and the author is calculating the standard deviation as follows:

SDEV = SQRT(1/4*(SQR(6.5-3.4)+SQR(12.1-3.4)+SQR(5.4-3.4)+SQR(-10.3-3.4))

SDEV = 8.3

When entered into the HP-49G+ and using the formula above the same result is displayed. But using the predefined function Mean and SDEV the 49 displays: Mean: 3.4250 SDEV: 9.6088

First I thought it maybe because in the textbook the 3rd and 4th decimal isn't used so I recalculated with 3.4250 instead of 3.4 but in vain. Tries with an HP-49G, HP-48G and HP-41 the same differences in results were displayed. So it doesn't seem to be a bug of the HP-49G+ Firmware (Version: HP49-B Rev.: 2.01-2).

Has anyone of you a hint where the difference comes from ? Thank you very much in advance.

Has anyone

Re: Puzzling HP-49G+ SDEV-function

*Message #2 Posted by **Arnaud Amiel** on 26 Mar 2006, 8:03 a.m.,*
in response to message #1 by Karl-Ludwig Butte

If your 4 figures are the whole population then 1/4 should be used in your formula.

However, the 49 is assuming you are using a sample of 4 elements to get an estimate of the standard deviation of a total population in which case it correctly uses 1/(n-1) formula.

If you want to use the 1/n SDEV for a whole population you have to use the PSDEV command. See p584 of the PDF user guide for an hint or look a the very good advanced user guide which has better desciptions p248 and p279.

Arnaud

Re: Puzzling HP-49G+ SDEV-function

*Message #3 Posted by **Karl Schneider** on 26 Mar 2006, 8:12 p.m.,*

in response to message #1 by Karl-Ludwig Butte

Karl-Ludwig --

Arnaud is correct. HP has generally favored providing the function for sample standard deviation (SDEV) instead of population standard deviation (PSDEV).

The workaround for models without a PSDEV function is to enter the mean as an additional datum, and recalculate the sample SDEV.

Free42 for Pocket PC released

*Message #1 Posted by **Thomas Okken** on 26 Mar 2006, 6:03 a.m.*

Hi all,

I released version 1.4.6 of Free42, my HP-42S simulator, today. This latest version now runs on the Pocket PC (as well as all the platforms it ran on before, of course).
You can get it at my Free42 home page.

Enjoy,

- Thomas

42s won't turn on

*Message #1 Posted by **Brian D** on 25 Mar 2006, 9:12 p.m.*

I have a 42s that won't come on after I put new batteries into it.

Is there any where to get it fixed?

Re: 42s won't turn on

*Message #2 Posted by **Randy** on 25 Mar 2006, 10:59 p.m.,*
in response to message #1 by Brian D

In all likelyhood, there is nothing wrong with it. It's just stuck in lah-lah land due to the battery change not being fast enough.

If you had any programs in it, kiss them bye-bye, there is no way to save them at this point.

Here's fix #1:

Press and hold the E+ and XEQ keys down. While holding them down, press and release ON then release the E+ and XEQ. You should see Memory Clear and be back to whatever you were doing before you had to key all your programs back in :(

If that doesn't work, here's #2:

Take the batteries out and touch the two terminals in the calculator at the same time with a coin or straighened paper clip. This will remove the residual voltage on the memory back-up capacitor. Put the batteries back in and enjoy.

And #3:

Leave the batteries out overnight. Same result as #2, it just takes longer.

Anyone have any experience of Lygea calculators?

*Message #1 Posted by **Bruce Horrocks** on 25 Mar 2006, 10:10 a.m.*

I found this bunch by chance: http://www.lygea.com/index.htm

Has anyone tried their products? Any good or bad expereiences to report? How accurate are the emulations?

I did a search on the forum archives for Lygea but turned up nothing - I'm surprised that they haven't been mentioned before.

Re: Anyone have any experience of Lygea calculators?

Even More Simultaneous Equation Solutions

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 25 Mar 2006, 3:42 a.m.*

In his submission "Calculator Precision: Sure" of December 21 which started all of this Valentin Albillo proposed an investigation of the set of linear equations

1.3 x1 + 7.2 x2 + 5.7 x3 + 9.4 x4 + 9.0 x5 + 9.2 x6 + 3.5 x7 = 45.3
4.0 x1 + 9.3 x2 + 9.0 x3 + 9.9 x4 + 0.1 x5 + 9.5 x6 + 6.6 x7 = 48.4
4.8 x1 + 9.1 x2 + 7.1 x3 + 4.8 x4 + 9.3 x5 + 3.2 x6 + 6.7 x7 = 45.0
0.7 x1 + 9.3 x2 + 2.9 x3 + 0.2 x4 + 2.4 x5 + 2.4 x6 + 0.7 x7 = 18.6
4.1 x1 + 8.4 x2 + 4.4 x3 + 4.0 x4 + 8.2 x5 + 2.7 x6 + 4.9 x7 = 36.7
0.3 x1 + 7.2 x2 + 0.6 x3 + 3.3 x4 + 9.7 x5 + 3.4 x6 + 0.4 x7 = 24.9
4.3 x1 + 8.2 x2 + 6.6 x3 + 4.3 x4 + 8.3 x5 + 2.9 x6 + 6.1 x7 = 40.7

which has the "unique" solution :

x1 = x2 = x3 = x4 = x5 = x6 = x7 = 1.0

Valentin closed with the challenge

"Now, get your preferred HP calc or computer software and try and solve it using limited accuracy, say just one decimal, then four decimals, then eight decimals. See what results you get and how do they compare with the actual, unique solution, and among themselves as the limited accuracy increases."

I solved the problem with a variety of linear equation solvers in my inventory with mantissas ranging from six to fourteen digits.

"Unique" answers as used here are the same as the "exact" answers which can be obtained with machines such as the HP-49G and TI-89. A "unique" or "exact" answer the one that a "calculated" answer from a sufficiently capable solver will approach but, in general, will not equal. Solvers sometimes get the "unique" solution for the kind of innocuous demonstration problems that typically accompany the user instructions. The "calculated" answer from a capable solver for more difficult problems such as the ones considered here will have characteristics such as (a) the signs of the elements of the "calculated" vector will agree with the signs of the corresponding elements of the "unique" vector, (b) the magnitudes of the elements of the "calculated" vector will agree with the magnitudes of the corresponding elements of the "unique" vector, and (c) at least some of the most significant digits of the elements of the "calculated" vector will agree with the corresponding most significant digits of the elements of the "unique" vector. An example of a solution which does not meet those criteria is the solution from the HP-28S for Valentin's original problem where the elements of the solution vector are a helter-skelter collection of numbers where three of the signs are not even in agreement with the signs of the elements of the "unique" solution vector. A second example which does not meet those criteria is the solution to Valentin's original problem from the ML-02 program in the TI-59 Master Library module where one of the signs is not in agreement and several of the magnitudes are in error by a factor of about 1.6 from the "unique" solution of all ones . An example that meets those criteria is the solution to Valentin's original problem from software by Maurice Swinnen operating on the Model 100 where the element of the solution which is furthest from the "unique" answer of one is 1.00339... . We can assign a single number to summarize those characteristics by calculating the RMS of the relative errors of the calculated vector where the relative error, calculated as the difference between the corresponding elements of the "unique" and

"calculated" vectors divided by the corresponding element of the "unique" vector should be a small fraction.

I recently ran Valentin's original problem on the HP-49G (actually on an emulator) with the following results:

INV A * B	B/A	RREF
-1.076	-0.6472	1.00148007239
0.999786	1.00110019	0.999999813411
0.407	-0.7415	1.00131966086
0.144	0.6554	1.00132720057
0.999124	0.9996398	1.00000091517
0.553	1.1592	0.998672819845
0.61	3.5385	0.997223232158

where for the RREF solution the input is a 7x8 matrix with A augmented by B. One sign is incorrect for the INV A * B solution. Two of the signs are incorrect for the B/A solution. The RREF solution was much closer to the "unique" solution where I note that for the first time in all the calculations that I have reported in the series of threads since Valentin's original challenge a solver has performed better than my old Model 100 using the simultaneous equation program by Swinnen and Thomas..

In subsequent threads Rodger Rosenbaum proposed three modifications to Valentin's problem.:(1) with B(1) changed from 45.3 to 45.4; (2) with B(3) changed from 45.0 to 45.1; and (3) with A(3,7) changed from 6.7 to 6.8, A(7,7) changed from 6.1 to 6.0 and B(3) changed from 45.0 to 45.1 ."Unique" solutions for Rodger's modified problems were found using the exact mode of the HP-49G.

The RMS relative errors for Valentin's original problem and for Rodger's three modifications for seventeen solvers which are available in my inventory are

Solver	Valentin	Rodger 1	Rodger 2	Rodger 3
Sharp PC-1261	18.386	9.823E-01	9.673E-01	1.250E-07
Model 100 Swinnen SP	11.506	1.014	9.996E-01	2.832E-04
HP-28S B/A	3.927	13.417	13.220	1.253E-10
HP-41 "seq"	2.371	1.019	1.004	2.445E-07
HP-49G B/A	1.327	1.065E-03	1.080E-03	5.477E-13
HP-49G INV A * B	9.060E-0	1.094E-03	1.080E-03	1.573E-10
Sharp PC-1261 Swinnen	7.664E-01	1.117	1.101	2.647E-09
TI-59 ML-02	7.367E-01	2.464E-02	2.428E-02	9.433E-11
TI-95 Math Module	3.147E-01	2.955E-03	2.906E-03	3.297E-11
HP-41 Math Pac	3.018E-01	1.027	1.008	2.005E-08
CC-40 Math Module	2.260E-01	1.025E-01	1.010E-01	3.202E-10
Model 100 HCN DP	1.214E-01	2.215E-03	2.182E-03	2.321E-11
TI-85 INV B * A	3.582E-02	9.270E-03	9.155E-03	8.683E-12
CC-40 Swinnen	5.125E-03	8.466E-03	8.342E-03	2.701E-12
TI-85 Simul Equations	4.274E-03	9.292E-03	9.155E-03	4.399E-12
Model 100 Swinnen DP	1.799E-03	3.625E-04	3.572E-04	9.217E-13
HP-49G RREF	1.472E-03	8.281E-05	8.352E-05	0

where the solvers are listed in the order of decreasing RMS relative errors for Valentin's original problem. Obviously missing in a forum dedicated to HP products are solutions from the HP-15C and the Advantage module of the HP-41. I don't have those capabilities in my inventory. Perhaps someone else will provide the missing material.

The RMS relative errors for all solvers are substantailly smaller for Rodger's third modification. That modification seems to have dumbed down Valentin's original problem so that almost any solver can succeed. For example, solvers such as the the B/A solution with the HP-28S and the ML-02 routine with the TI-59 which couldn't even get all the signs correct with Valentin's original problem get rather good results with Rodger's third modification. Even the Model 100 solver operating in the single precision mode with a six digit mantissa gets four digits correct for Rodger's third modification.

On machines such as the TI-85 and HP-49G the results indicate that row reduction type software will outperform matrix inversion software. That observation agrees with my experience with linear equation solutions to other problems. I do not claim to know whether the apparently inferior performance is inherent in the matrix inversion

methodology or whether matrix inversion software just tends to be less carefully written.

NOTES ON THE HARDWARE AND SOFTWARE OF THE SOLVERS

1. B/A software uses built-in matrix routines to divide the vector by the matrix. That idea is discussed on page 66 of the *HP-28S Advanced Scientific Calculator Reference Manual* and is expected to yield somewhat better results than multiplying the inverse of the matrix by the vector. I do not know if the idea applies for other machines.

2. Swinnen software uses a solution adapted from the Simultaneous Equation routine on pages 113 ff of the *Mathematics Library: Application Software for the Sharp EL-5500 and PC-1403 Scientific Computers* by Swinnen and Thomas.

3, The Model 100 Swinnen DP solver uses the Swinnen routine and the default mode of the Radio Shack Model 100 which provides a fourteen digit mantissa.

4. The Model 100 Swinnen SP uses the Swinnen program and single precisiion mode of the Radio Shack Model 100 which provides a six digit mantissa.

5. The CC-40 Swinnen solution uses the Swinnen program instead of the CC-40 Math Module solver.

6. The Model 100 HCN DP solution uses an older program derived from a least squares solver which was on the old Honeywell Computer Network (HCN) of the 1960's. It does not allow zeroes in the diagonal elements.

7.. The Sharp PC-1261 solution uses the program on page 264 of the *Sharp Pocket Computer PC-1260/PC-1261 Instruction Manual.*. The program will not work with A(1,1) = 0 and with certain other combinations of the matrix elements which yield a zero divisor..

8. The Sharp PC-1261 Swinnen solution uses the Swinnen program.

9. The HP-41 "seq" solution uses Valentin Albillo's program from pages 63-64 of the V7N5 (June 1980) issue of the *PPC Calculator Journal*. The program shares the same deficiency as the Sharp PC-1261 solution when A(1,1) = 0 and when other combinations of matrix elements yield a zero divisor. Valentin's program detects the zero divisor and allows a rearrangement of the problem without starting completely over.

A MESSY HP-49G PROGRAM

In his submission "More on ill conditioning and calculator precision" on January 23 Rodger proposed "... let's create a 7x7 perturbation matrix consisting of 49 uniformly distributed random numbers varying from about -.5 ULP to about +.5 ULP, and then add that perturbation matrix to the A (call the perturbed matrix A') matrix of Valentin's original system, and solve the perturbed system...". He explained

"The procedure can be done on the HP49 emulator (or a real HP48G or HP49) easily. Assume that the original A matrix and the original column matrix B are stored in variables of those names. Then this program will generate a perturbation matrix, add it to the A matrix, and solve the system.

<< B A RANM 247.487 / A + / -3 RND >>

This can be executed repeatedly to see results such as I gave above.

The constant 247.487 is to cause the perturbation matrix to have a Frobenius norm of about .1414, which is the same as the norm of perturbation matrix used to create the slightly perturbed matrix I suggested and you used in your previous post; the maximum perturbation of an individual element of the A matrix will be about +- .0404, just slightly less than .5 ULP (.5 ULP would be .05)."

When I found that the RREF solver on the HP-49G consistently yielded "calculated" solutions which were closer to the "unique" solutions than the B/A solver I decided to see if I could modify Rodger's program to replace the B/A

solution with the RREF solution. My plan was to follow his program to generate the perturbed matrix, augment the perturbed matrix with the B vector and solve with the RREF routine. I had difficulty doing that because I couldn't get the AUGMENT command to attach the B vector at the right side of the perturbed matrix yielding the 7x8 matrix needed by the RREF routine. No matter what I tried the AUGMENT command would attach the B vector at the top or bottom of the perturbed matrix rather than at the right of the perturbed matrix. Eventually, I transposed the perturbed matrix, used the AUGMENT command to attach the B vector at the bottom yielding an 8x7 matrix, and transposed the 8x7 matrix back to yield the 7x8 matrix I wanted. My complete routine was.

<< B A RANM 247.487 / A + TRAN B AUGMENT TRN RREF ->COL DROP -3 RND >>

There must be an easier way to do what I wanted to do but I couldn't find it. Maybe if I had a manual .... Maybe someone more familiar with the HP-49G can help.

Re: Even More Simultaneous Equation Solutions

*Message #2 Posted by **John Smitherman** on 25 Mar 2006, 1:09 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi Palmer. How did you define/calculate the RMS?

Thanks,

John

Re: Even More Simultaneous Equation Solutions

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 25 Mar 2006, 8:36 p.m.,*
in response to message #2 by John Smitherman

I calculate the relative error for each of the seven elements of the solution vector and then find the RMS of the seven relative errors.

Re: Even More Simultaneous Equation Solutions

*Message #4 Posted by **Rodger Rosenbaum** on 25 Mar 2006, 10:02 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Palmer says:

I recently ran Valentin's original problem on the HP-49G (actually on an emulator) with the following results:

INV A * B	B/A	RREF
-1.076	-0.6472	1.00148007239
0.999786	1.00110019	0.999999813411
0.407	-0.7415	1.00131966086
0.144	0.6554	1.00132720057
0.999124	0.9996398	1.00000091517
0.553	1.1592	0.998672819845
0.61	3.5385	0.997223232158

I just discovered something that astounds me in the process of doing your examples. I don't get what you get when I do these tests on my HP49. It hasn't been used for some years, and perhaps the version of the firmware in it has known bugs. My HP49 has version 1.05 firmware--what do you get when you type **VERSION** in your emulator, Palmer?

And, if anybody else has an HP49 with up to date firmware, could you try this and report your results?

Anyway, what I get is:

INV A * B	B/A	RREF
1.00018	1.00018	1.00124
1.9043	1.9043	-33231081.9872
1.3779	1.3779	4704.81157655
1.00065	1.00065	4678.11919981
0.7689	0.7689	6770866.25288
0.553	0.553	-46565.78990985
-0.785	-0.785	-2226.81759925

I have done a little checking, with some anomalous results. The HP49 gives -1.00000533622E-7 for the determinant of the A matrix (Valentin's original), but the HP48G and HP49G+ give 9.98918882E-8.

I've triple checked to make sure that I typed in the matrix correctly. Flag 54 is set on all the machines. I created Hilbert matrices of order 7, 8, 9, and 10, and computed the inverses and the determinants of each. I got the same results on the HP49 as on the HP48G and HP49G+. Something peculiar is going on here; in almost every other test I have tried, my HP49 gets the same result as the HP48G and HP49G+.

The RMS relative errors for Valentin's original problem and for Rodger's three modifications for seventeen solvers which are available in my inventory are

Solver	Valentin	Rodger 1	Rodger 2	Rodger 3
Sharp PC-1261	18.386	9.823E-01	9.673E-01	1.250E-07

TI-85 Simul Equations	4.274E-03	9.292E-03	9.155E-03	4.399E-12
Model 100 Swinnen DP	1.799E-03	3.625E-04	3.572E-04	9.217E-13
HP-49G RREF	1.472E-03	8.281E-05	8.352E-05	0

By the way, as I must have mentioned in an earlier posting, the HP48G and HP49G+ solve Valentin's original system exactly using the B/A method. That is, they get [1 1 1 1 1 1 1] for the solution vector.

The RMS relative errors for all solvers are substantailly smaller for Rodger's third modification. That modification seems to have dumbed down Valentin's original problem so that almost any solver can succeed. For example, solvers such as the the B/A solution with the HP-28S and the ML-02 routine with the TI-59 which couldn't even get all the signs correct with Valentin's original problem get rather good results with Rodger's third modification. Even the Model 100 solver operating in the single precision mode with a six digit mantissa gets four digits correct for Rodger's third modification.

Of course, that was the point of that modification; to show that there is a way to solve a badly ill-conditioned system even on a calculator with only a few digits. I got that perturbation by means of the Singular Value Decomposition, and I'll post a note to show how to do it.

When I found that the RREF solver on the HP-49G consistently yielded "calculated" solutions which were closer to the "unique" solutions than the B/A solver I decided to see if I could modify Rodger's program to replace the B/A solution with the RREF solution. My plan was to follow his program to

generate the perturbed matrix, augment the perturbed matrix with the B vector and solve with the RREF routine. I had difficulty doing that because I couldn't get the AUGMENT command to attach the B vector at the right side of the perturbed matrix yielding the 7x8 matrix needed by the RREF routine. No matter what I tried the AUGMENT command would attach the B vector at the top or bottom of the perturbed matrix rather than at the right of the perturbed matrix. Eventually, I transposed the perturbed matrix, used the AUGMENT command to attach the B vector at the bottom yielding an 8x7 matrix, and transposed the 8x7 matrix back to yield the 7x8 matrix I wanted. My complete routine was.

<< B A RANM 247.487 / A + TRAN B AUGMENT TRN RREF ->COL DROP -3 RND >>

There must be an easier way to do what I wanted to do but I couldn't find it. Maybe if I had a manual .... Maybe someone more familiar with the HP-49G can help.

```
  Here's a program to set up and solve using RREF.  Assuming B and A are on the stack (B
in level 2, A in level 1):

<< SWAP { 7 } RDM 8 COL+ RREF >>

  If you want the result to be the solution vector in the form that B/A returns it, then
use:

<< SWAP { 7 } RDM 8 COL+ RREF 8 COL- SWAP DROP { 7 1 } RDM >>

  To get the result of a random perturbation of A, do this (this program assumes that the
A and B matrices are stored in variables of those names):

<<B A RANM 247 .487 / A + SWAP { 7 } RDM 8 COL+ RREF 8 COL- SWAP DROP { 7 1 } RDM >>
```

Re: Even More Simultaneous Equation Solutions

*Message #5 Posted by **Rodger Rosenbaum** on 27 Mar 2006, 5:04 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Palmer said:

I recently ran Valentin's original problem on the HP-49G (actually on an emulator) with the following results:

INV A * B	B/A	RREF
-1.076	-0.6472	1.00148007239
0.999786	1.00110019	0.999999813411
0.407	-0.7415	1.00131966086
0.144	0.6554	1.00132720057
0.999124	0.9996398	1.00000091517
0.553	1.1592	0.998672819845
0.61	3.5385	0.997223232158

I think there is a typo in the 5th entry under RREF; instead of 1.00000091517, it should be 1.00000091577. If you make this change and then premultiply this solution vector (the RREF vector) by the A matrix (using a 12 digit HP calculator such as the HP48G or HP49G+), you will get exactly the B vector. In other words, the RREF solution vector is an "exact" solution, and there is not a unique solution. This can only happen with floating point arithmetic, of course. In infinite precision arithmetic there is only one exact solution, namely {1 1 1 1 1 1 1]. I wonder how many "exact" solutions there are in 12 digit BCD floating point arithmetic using "round to even". The rounding mode will be one factor determining the "exact" floating point solutions.

82164A as a controller?

*Message #1 Posted by **Steve Roberts** on 24 Mar 2006, 10:07 p.m.*

I have an HP3468B multimeter. I want to talk to it from a PC RS232 port. Can I use the 82164A in this "backward" mode, where the 82164A acts as a controller on the loop? Or, is the 82164A designed only to let you add an RS232 device to the HP-IL loop? Thans very much! -Steve

Re: 82164A as a controller?

*Message #2 Posted by **Eric Smith** on 24 Mar 2006, 10:42 p.m.,*
in response to message #1 by Steve Roberts

The 82164A will not act as a loop controller. If you had an IEEE-488 port on the PC, you could use an 82169A HP-IB to HP-IL interface, which is able to act as a loop controller.

Re: 82164A as a controller?

*Message #3 Posted by **Vassilis Prevelakis** on 25 Mar 2006, 6:20 a.m.,*
in response to message #1 by Steve Roberts

As Eric mentioned the 82164A cannot be a loop controller. However, you can transfer values from the multimeter to your PC by having something like an HP-71B read values from the multimeter and tranfer them to the 82164A.

There **may** be another possibility. You can place the 3468 in TALK ONLY mode in which case it sends a value to the HP-IL bus each time it is triggered.

The manual gives an example where you can use the 82162 printer and the 3468 in a loop without a controller. The 3468 is placed in TALK ONLY mode via a switch in the back and the 82162A in LISTEN ONLY mode by pressing both PRINT and ADV while turning it on.

I am not sure however whether the 82164A can be be configured in this way. Unless someone else on this list can help, you will have to look at the manual.

**vp

Re: 82164A as a controller?

*Message #4 Posted by **Christoph Klug** on 27 Mar 2006, 3:19 a.m.,*
in response to message #3 by Vassilis Prevelakis

Hi Steve,

for controlling the IL-Multimeter by PC you can use the HP-IL/PC-Interface-Card plus EMU41 or EMU71 software from Jean-Francois Garnier.

This setup works great, and EMU41 and EMU71 includes transfer (and storage) features from the meausrement data to other software applications like EXCEL.

This solution only have one diasdvantage : Your PC motherboard needs an ISA-slot for the card, but remember most today industrial PC motherboards support the (old) ISA standard...

Best regards - Christoph Klug

HP 45 input voltage requirements

*Message #1 Posted by **Bill Smith** on 24 Mar 2006, 6:17 p.m.*

I have been asked to trouble shoot my friends HP 45, because I have a lot of calculators myself. I don't have much electronic expertise or tools.

The calculator worked for years, operated on the AC adaptor with no battery pack installed. It has quit working, and I thought I might figure out if it would work on batteries alone, by connecting some to approximate the original battery pack. If it worked, then I'd know the adaptor wasn't. The battery contacts don't seem to be marked with regard to polarity. The adaptor does have an input voltage switch and is rated at 0.8W (I think, it is not with me at this moment).

Any suggestions are appreciated.

TIA

Bill

Re: HP 45 input voltage requirements

*Message #2 Posted by **Hal** on 25 Mar 2006, 2:40 a.m.,*
in response to message #1 by Bill Smith

Hi Bill. The ac adapter for the classic series (35,45,65,67,etc) actually puts out two DC signals: a 5.4 v signal to power the machine, and a constant current signal (which will read about 16vdc with no load) to charge the battery pack. This of course means that the AC adaptor contains rectifier circuitry. I've heard that the smoothing capacitors in the rectifier can go out which results in excessive ripple voltage, which can cause erratic operation of the calculator.
The bottom battery contact is positive one. Note that you'll need to have the adaptor disconnected from the calc to power it from the battery contacts. Also be sure that those little spring loaded plates in the adapter recepticle are making contact with the two outside pins, shorting them together (this is how battery power is routed to the calculator when the adapter is not connected).
Hopefully it's just a bad adapter...
Best regards, Hal

Did anyone on this list ever open the HP65 hybrid ?

*Message #1 Posted by **bernhard** on 24 Mar 2006, 6:04 p.m.*

Hi folks,

assuming that there are some defective HP65 out there, where the fault location was in the hybrid, did you ever try to open it ? I'd like to find how many chips are inside and how they are interconnected. Maybe somebody on this list could provide a photo (or a series of photos). Sorry for this curiosity - but all of my attempts to buy a truly defunct HP65 on Ebay have failed, all the electronics were good, and I'm reluctant to kill a perfectly functional HP65 main board just to see what's in the hybrid.

Regards, Bernhard

Re: Did anyone on this list ever open the HP65 hybrid ?

*Message #2 Posted by **Eric Smith** on 24 Mar 2006, 7:06 p.m.,*
in response to message #1 by bernhard

I haven't opened one, but I've seen an xray of it. IIRC it contains six chips. Based on the HP Journal article, these are most probably:

- clock driver
- C&T - control & timing
- A&R - arithmetic & registers
- CRC - card reader control
- program storage circuit (100x6 dynamic shift register)
- data RAM

Outside the hybrid are six additional chips:

- three ROM chips
- card reader analog chip
- anode and cathode drivers for the display

Tony wrote an article on HP-65 internals which gives pinouts etc.

Half of the ROM source code was listed in two US patents. It may not have been the production release.

The operation of the program storage chip is partially described in the patent, but not in enough detail to write a simulation. A lot of experimentation would be necessary, probably by replacing ROM 0 with a ROM emulator and running custom test programs.

HP-97 Card Reader - Only works sometimes

*Message #1 Posted by **jbssm** on 24 Mar 2006, 6:29 a.m.*

Hi all again,

I've cleaned the card reader of my HP-97 from the gummy well and replaced it by O-rings.

Now the card passes ok, but most of the times it says "Error" only about 1 in every 5 times it reads correctly.

How can I solve this? Does this have anything to do with those screws that are holding the golden metal plate inside, how should I proceed?

Best regards and thank you all for this fantastic forum, jbssm

Re: HP-97 Card Reader - Only works sometimes

*Message #2 Posted by **cmj** on 24 Mar 2006, 11:43 a.m.,*
in response to message #1 by jbssm

Hi,

I just received an HP97 today with the card reader defective. So I hope the problem is only the capstan. I will try to repair it very soon, so if I experience problems like you have got, I will let you aware.
I have changed in the past the clock inductance on an HP67 just to speed up the machine about 20%, the card reader was not affected with already written cards.
As far as I remember the aspect of the magnetic surface was very important, I mean it should not be glossy or with finger prints. Let me time to analyse the things.

Regards Christian

in response to message #1 by jbssm

Hi, jbssm;

> Quote:
>
> Does this have anything to do with those screws that are holding the golden metal plate inside, how should I proceed?

Most certainly. Also, you should check if the heads are cleaned. It would bve a better idea to check the heads, firts. If not, go to the adjustments.

When I got the HP97 I have now, it had the following sympton: everytime it was turned on, the card reaedr started working and the message Error was shown in the display. After that, all of the calculator functions

worked except the ones related to the card reader. It could not read from neither write to cards.

All I did was to adjust the screws. Each of the three screw adjust a thin (and very sensitive) metal blade that act as a contact. Each blade is moved by a tiny plastic wheel Their functions are as follows:
detect when a card is inserted (and turn the pulling motor on)
detect it is in position to be read/written and
detect if the card is either protected or 'written-free'.

Without any card inserted in the card-reader, all of these contacts must be in open position, then they might close, each one at a time, when a card is inserted. Tony Duel once post that the suggested adjustment is to turn each screw in at a time till the very moment that the corresponding contact is closed, then turn it back 1/8 of a turn and check if the contact is open. As we have three contacts, there are three screws.

In the same printed board (I have some pictures at home, if needed I post them later) you can see four soldering contacts alined with each other, each one with a different leter closed to it. These are the 'testing points' for the contacts, being the fourth point the common one. You can use an electronic ohmmetter and verify each contact status through these contact points.

Hope this helps for now. If needed, let me know and later I'll post some pictures showing these 'elementes'...

Cheers.

Luiz (Brazil)

Re: HP-97 Card Reader - Only works sometimes

*Message #4 Posted by **David Smith** on 24 Mar 2006, 12:22 p.m.,*
in response to message #1 by jbssm

Most likely you need to clean the head. The best way to clean the head is to disassemble the reader. Or you can use the red cleaning card. If you dont have the cleaning card you can wet a card with 91%+ isopropyl alcohol and feed it through the reader several times (it will probably slip and need to be pulled through manually). Then wait for the alcohol to dry.

Another problem could be a failing tantalum filter capacitor on the power lines to the card reader chip. It is a dipped tantalum cap that is usually blue in color that fails.

HP-41 rubber feet replacements

*Message #1 Posted by **Donald Leonard** on 24 Mar 2006, 4:24 a.m.*

Does anyone know of a source for replacement HP-41 rubber feet? I would like to add them to my new MLDL2000 and don't want to steal them from my Card Reader. If no one knows of a source, I may have to try some thin bicycle inner tube material.

Donald

Re: HP-41 rubber feet replacements

*Message #2 Posted by **Klaus** on 24 Mar 2006, 9:48 a.m.,*
in response to message #1 by Donald Leonard

Someone sells them on eBay, or have a look in the classified section on this site.

If you just need one, and you can't find any other source, I might have a spare one I can give away for free.

Have a nice weekend! Klaus

Re: HP-41 rubber feet replacements

*Message #3 Posted by **Donald Leonard** on 24 Mar 2006, 3:05 p.m.,*
in response to message #2 by Klaus

I checked the ads, and only one poster (a WTB) was listed and unanswered.

One rubber foot would work fine as this is all the Card Reader case needs. And I have a roll of double backed tape. I'll try to contact you by e-mail. If I can't find your e-mail address, please contact me through donald18NOSPAM@sonic.net with the usual removals.

Re: HP-41 rubber feet replacements

*Message #4 Posted by **David Smith** on 24 Mar 2006, 12:24 p.m.,*
in response to message #1 by Donald Leonard

You can use EPDM sheet roofing rubber available at home supply stores (but you may gavce to buy a 1x12 foot piece). Also good hardware stores have rubber sheet gasket material in smaller sizes in the plumbing area.

HP 97 Self Diagnostics

*Message #1 Posted by **Brian Blackwell** on 23 Mar 2006, 9:08 p.m.*

I have an HP 97 which I retired many years ago in working order. Online I recently found and purchased new batteries and awaiting delivery. I would like to test the calculator once the batteries arrive. Does anyone know if there is a self diagnostics built into the calculator and how to activate it. Thank you in advance for any advice.

Re: HP 97 Self Diagnostics

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 23 Mar 2006, 10:22 p.m.,*
in response to message #1 by Brian Blackwell

Hi, Brian;

I have a working HP97 and, for as long as I know, these calculators have no specific buitl in, self-test feature. Anyway, their original Service Manual includes two programs that are used to test their features and locate, if applicable, in which ROM does the problem occur, I mean, if there is any problem with the calculator.

Anyway, if you make sure the batteries are fully charged and you place them correctly, simply turn it on, check if the display showns 0.00, try a few calculations, read/writ a magnetic card, print something and go ahead. (good) Chances are that your 'retired' HP97 becomes active in a heart beat. These small 'beasts' come from a time when daring was not exactly dreamming...

Success!

Luiz (Brazil)

Re: HP 97 Self Diagnostics

*Message #3 Posted by **Klaus** on 24 Mar 2006, 2:23 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz, hi all!

My HP-67 has a magnetic "diagnostic" card, it was in the standard pac. If the card reader does not work, there is the printed program in the standard-pac manual.

Best wishes! Klaus

You're right! (was: HP 97 Self Diagnostics)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 24 Mar 2006, 2:23 p.m.,*
in response to message #3 by Klaus

Hallo, Klaus;

You made me remember about the Diagnostic Card and the program listing, you are right. I forgot

about that. Mainly because mine has none... There is also a specific, 'red label' card for cleaning the card reader head.

BTW: in my name, C stands for Claudio, the Portuguese equivalent to the German Klaus.

Cheers.

Luiz (Brazil)

Re: You're right! (was: HP 97 Self Diagnostics)

*Message #5 Posted by **Trent Moseley** on 24 Mar 2006, 4:24 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Luiz,

I remember someone mentioned at one time that is wasn't a good idea to use that abrasive card for cleaning the recording head. What's your opinion?

tm

Red abrasive card for cleaning the recording head

*Message #6 Posted by **Vassilis Prevelakis** on 24 Mar 2006, 4:46 p.m.,*
in response to message #5 by Trent Moseley

```
 Trent Moseley wrote:

> I remember someone mentioned at one time that is wasn't a good
> idea to use that abrasive card for cleaning the recording head.
```

Why then would HP put it there in the first place?

Its not a good idea to **overuse** the card, because it is abrasive.

Think of it as prune juice, helpful in small quantities, but you should not overdo it :-)

**vp

Re: Red abrasive card for cleaning the recording head

*Message #7 Posted by **Vieira, L. C. (Brazil)** on 24 Mar 2006, 5:05 p.m.,*
in response to message #6 by Vassilis Prevelakis

Hi;

I second Vassilis. The manual states that one should use the abrasive cleanning card only when the card reader shows some specific behavior.

Cheers.

Luiz (Brazil)

Re: Red abrasive card for cleaning the recording head

*Message #8 Posted by **Brian** on 26 Mar 2006, 8:31 p.m.,*
in response to message #7 by Vieira, L. C. (Brazil)

Wow, thank you all for your help. I found my cards and the diagnostic card. I forgot all about that. Thanks.

While online I found good info about the gummy wheel condition. So I ordered the gummy wheel repair kit. Before I test the reader I will do the repair.

The new battery did bring it to life. And seems to work good.

Any comments or advice on the wheel kit process?

Again thanks for the help.

Re: You're right! (was: HP 97 Self Diagnostics)

*Message #9 Posted by **Klaus** on 27 Mar 2006, 2:14 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Luiz,

amazing coincidence with our names. I think americans are joking that every German's name is either 'Klaus' or 'Fritz', although these name are not so common anymore.

About the red label card: I agree that moderate use will not do any harm (the surface of the dard is rather smooth), but I think for experienced users it is better to take the whole thing apart and clean the head manually. This is because not only the head will be dirty, but also the rubber wheel and the contact balls.

Have a nice week! Klaus

How do I open an HP-45?

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 23 Mar 2006, 8:41 p.m.*

I bought an HP-45 at a garage sale for two dollars. I inserted a good battery pack from my inventory and the display wouldn't come on. I connected a charger and the calculator works. I looked in the charger connector and saw that the spring switches that are supposed to connect the left and right terminals when a charger isn't connected aren't making contact. I tried to take the back off the calculator to see if I could repair the spring switches. I removed the screws in the battery compartment and the screws under the feet but can't get the cover off. Something near the center of the calculator seems to be holding the cover to the calculator body How do I do get the cover off?

Another question: Can I damage an HP-45 if I connect a charger without a battery pack in place?

Re: How do I open an HP-45?

*Message #2 Posted by **Gerson W. Barbosa** on 23 Mar 2006, 9:08 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

There are two other screws under the back label. I don't know exactly where but comparing with my HP-35 I'd guess it's close to the the TTs in LOW BATTERY in the upper left corner and above the 'T' in FUNCTION in the upper right corner. Some people detach the back label and other people drill it to access the screws. It appears the first method is better (mine has been drilled which means it was serviced at least once).

About the second question, the answer is no by what I know, but you should wait for other replies.

Best regards,

Gerson.

Oops! and two other screws under the bottom rubber feet.

Edited: 23 Mar 2006, 9:10 p.m.

Re: How do I open an HP-45?

*Message #3 Posted by **Thomas Radtke** on 24 Mar 2006, 3:12 a.m.,*
in response to message #2 by Gerson W. Barbosa

You're right with the positions of the screws. I too think that it is a bad idea to drill through the label as it can be detached from the back cover easily (with some patience). If you warm up the label with a hair dryer, the label can be peeled of. When I did this, I made a bad mistake: I peeled just to the position of the screws but no further. Unfortunately, my screw driver touched the label and bent it a little thus leaving a kink in it:(. Anyway, thats still better than to have holes in it!

I have no answer to the second question. When I got my -45, I already had a self-made replacement

battery pack at hand. They are easy to make if you find two thin brass plates that can be angled like the original contact stripes (I can make a picture of it if you need it).

Thomas

Re: How do I open an HP-45?

*Message #6 Posted by **David Smith** on 24 Mar 2006, 12:28 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

The HP35/45/55/70 can work just fine on the charger alone. This should not be done for the HP65 and is very iffy for the HP67.

Many chargers have a bad main electrolytic filter capacitor. It should be replaced whenever you service a new machine.

Re: How do I open an HP-45?

*Message #7 Posted by **Palmer O. Hanson, jr.** on 24 Mar 2006, 9:03 p.m.,*
in response to message #6 by David Smith

Thanks to all for identifying the screws under the label.

Next question: Has anyone tried to repair the spring switches in the charger connector, say by bending them. My experience with other hardware such as the battery connectors is that once the springs have been improperly bent there is no real chance of returning them to original stiffness.

Re: How do I open an HP-45?

*Message #8 Posted by **David Smith** on 25 Mar 2006, 5:37 p.m.,*
in response to message #7 by Palmer O. Hanson, jr.

Yes, you can bend the charger strap. Try not to overdo it. One thing you should do is clean it well and also the charger pins. Often invisible gunk is the cause of a lot of problems. I use some 2000 grit

sandpaper and tweezers. I also treat the pins and strap with some Caig Gold Pen or Deoxit Pen fluid.

HP41CV/Kern Surveying Instruments

*Message #1 Posted by **William Lafferty** on 23 Mar 2006, 4:45 p.m.*

I am trying to construct a display showing the advancements made by the now defunct Swiss surveying firm Kern with electronic theodolites some time ago. I have an E2 electronic theodolite and EDM, and the DIF41 attachment which enables the theodolite to send data to and receive data from a HP41CV.

I can transfer data from the E2 into the HP41CV registers fine, but I cannot seem to transmit data from the HP41CV to the E2. The instructions in the manuals do not help. They simply refer to a "HP41 program on magnetic card" but to date I have been unable to locate such a program. And the only instructions given seem to be in BASIC language. They are <STX>T172+45.2234<CR><LF><ETX> where STX means start, T1 is the theodolite, 72 is a code number for horizontal circle orientation, 45.2234 the value of the horizontal bearing and LF and ETX are end of transmission protocols.

The manual also says that anything transmitted to the E2 from the HP41 must be in the X register.

If anyone has any knowledge of this, could they please contact me direct on wjlafferty@ozemail.com.au

thanks .....Bill Lafferty

HP 35 adapter 03502A

*Message #1 Posted by **Michael** on 23 Mar 2006, 3:28 p.m.*

I have the old 03502A adapter for the HP 35 calculator. It doesn't work correctly: when connected to the calculator, then after switching the calculator ON the display lights just for a split second and then the display switches off. Does anbody know, how to open this adapter? There are no visible screws.

Thanks

Michael

*Message #2 Posted by **Frank Boehm** on 23 Mar 2006, 4:41 p.m.,*
in response to message #1 by Michael

it's sealed - you can only crack it open (which is btw not easy...)

Re: HP 35 adapter 03502A

*Message #3 Posted by **Ronald** on 23 Mar 2006, 4:56 p.m.,*
in response to message #1 by Michael

Hi Michael,

Did you check if it the problem is not in the wire itself, I think that is a common problem ?

Ronald

Re: HP 35 adapter 03502A

*Message #4 Posted by **Michael** on 23 Mar 2006, 6:10 p.m.,*
in response to message #3 by Ronald

Voltage between the center pin and the left pin is cca 4.2V, the same 4.2V is between the center pin and the right pin.

Re: HP 35 adapter 03502A

*Message #5 Posted by **Frank Boehm** on 24 Mar 2006, 10:05 a.m.,*
in response to message #4 by Michael

That's only the off-load voltage. I'd suggest checking the voltage again with the calculator plugged in - it's probably well below 4.2V, which hints at a defect (capacitor?)

Does the calculator work with another charger?

Re: HP 35 adapter 03502A

*Message #6 Posted by **Michael** on 24 Mar 2006, 2:33 p.m.,*
in response to message #5 by Frank Boehm

One voltage stays ar 4.2V during load, the second drops to cca 3.3V. I mean that the voltage between the center pin and one of the outer pins should be 16V though. The calculator works well with an another adapter.

Re: HP 35 adapter 03502A

*Message #7 Posted by **Dave Shaffer** on 24 Mar 2006, 5:10 p.m.,*
in response to message #6 by Michael

Even though you say the calculator works with another charger, you might want to check the ON/OFF switch.

On my '35, the switch is rather intermittent, and one of the symptoms seems to be that the calculator switches ON but then goes off immediately. Wiggling the switch (i.e. jiggling the slider back and forth a bit in the on position) will confirm a problem: the LEDs will blink on and off. Spraying some electronic contact cleaner into the switch (be careful, don't overdo it!) may help.

HP 41C Display Window Replacement

*Message #1 Posted by **Mitch Sisak** on 23 Mar 2006, 12:39 p.m.*

Hello,

I have an HP 41C fullnut with a damaged plastic display window over the LCD. It is badly crazed and I would like to replace it and was wondering if anyone can offer advice on how best to remove the old window and install a new one. As well, any sources of a replacement window would be appreciated. Window from a parts unit? A piece of suitably machined plexiglas? Thickness?

Thanks in advance for your time,

Mitch

Re: HP 41C Display Window Replacement

*Message #2 Posted by **Artur - Brasil** on 23 Mar 2006, 3:55 p.m.,*
in response to message #1 by Mitch Sisak

Hi,

I believe you could begin removing the display module from calculator. This will give you access to the protective plastic. As replacement, I have used for 11C, 15C a piece cutted from CD cases. For glueing it to the case, I believe you could use small quantities of liquid Epoxi or that glue watchmakers use to glue the watches glasses. Good luck in your services! Artur

in response to message #1 by Mitch Sisak

If its only scratched, can't you polish it? its MUCH easier than replacing it.

**vp

Re: HP 41C Display Window Replacement

*Message #4 Posted by **mitch sisak** on 24 Mar 2006, 9:48 a.m.,*
in response to message #3 by Vassilis Prevelakis

Hi,

Thanks for the responses.

As to polishing, that will not work as the crazing of the window actually seems to be within the plastic. This resulted when I tried to remove some dust from the LCD with "canned air", tipped the can too far over and blew propellant onto the plastic window. The cold blast left the crazing... so, replacement seems to be

the only option. Again, any idea about how best to remove the window which is currently in place?

Thanks,

Mitch

Re: HP 41C Display Window Replacement

*Message #5 Posted by **db (martinez, ca.)** on 24 Mar 2006, 10:31 p.m.,*
in response to message #4 by mitch sisak

You can desolder and remove the screen on the older models. That lets you replace the window out through the back. On the halfnuts you'll have to cut each heat stake and take out the pcb, or bust/cut the top of the case to slip it out in the direction that the roms slip in. Both of the latter sound like fingernails on a blackboard to me. Two years ago, Mike S. Davis (not the pale imitation without the S) had a couple of new windows in his spares box. You can contact him through msdsite.com. Good luck.

Twenty-three year battery life in 15c?

*Message #1 Posted by **S.B.** on 23 Mar 2006, 11:46 a.m.*

I have an HP-15c that I purchased in 1983. To the best of my recollection I have never changed the batteries, and it's still running on its originals. I have a friend who says the same thing about his HP-15c.

Is this at all possible? I've used it very little in the past fifteen years, but I do use it on occasion.

Re: Twenty-three year battery life in 15c?

*Message #2 Posted by **bill platt** on 23 Mar 2006, 11:50 a.m.,*
in response to message #1 by S.B.

Yes it is possible.

My wife has a Sharp Elsi-mate with an aa (aaa?_) cell that is still good after over 20 years.

Re: Twenty-three year battery life in 15c?

*Message #3 Posted by **Richard Garner** on 23 Mar 2006, 12:32 p.m.,*
in response to message #1 by S.B.

Yes, this is very possible. I owned a 15C for 20 year and only changed the batteries once. That was only because the batteries in my 42S were low and I hadn't used the 15C in about 5 years so I swapped the batteries. The 42S ran for another year before replacing them. One thing to note, they were Silver Oxide batteries.

Re: Twenty-three year battery life in 15c?

*Message #4 Posted by **David Smith** on 24 Mar 2006, 12:32 p.m.,*
in response to message #1 by S.B.

You should change them regulalrly even if they are still good. Otherwise you wake up one day with a machine damaged by leaking batteries.

Re: Twenty-three year battery life in 15c?

*Message #5 Posted by **John Smitherman** on 24 Mar 2006, 2:33 p.m.,*
in response to message #4 by David Smith

> Quote:
>
> You should change them regulalrly even if they are still good. Otherwise you wake up one day with a machine damaged by leaking batteries.

You make an important point about routine calculator maintenance. One action that I have taken to address

this issue is to open up the battery compartment of my calculators and other electronic devices yearly to inspect the condition of the batteries. I have a 15c running on 19 year old batteries.

Regards,

John

Re: Twenty-three year battery life in 15c?

*Message #6 Posted by **bill platt** on 24 Mar 2006, 3:09 p.m.,*
in response to message #5 by John Smitherman

Two general questions.

1. Has anybody ever seen a *Silver* cell leak (type 357)?

2. How can my wife's Elsi-mate run on a AAA for 20 years without leaking? Were there non-alk non-carbon AAA cells?

Re: Twenty-three year battery life in 15c?

*Message #7 Posted by **John Limpert** on 24 Mar 2006, 9:41 p.m.,*
in response to message #6 by bill platt

I've never seen a leaking silver oxide cell.

I've used lithium AA cells. According to Google, they also make lithium AAA cells.

Re: Twenty-three year battery life in 15c?

*Message #8 Posted by **David Smith** on 25 Mar 2006, 5:40 p.m.,*
in response to message #7 by John Limpert

ALL cells will eventually leak. ALL seals will eventually fail. Particularly in a mass produced $1 consumer item.

Twenty-three year battery life in my 11c?

*Message #9 Posted by **Palmer O. Hanson, Jr.** on 25 Mar 2006, 8:32 p.m.,*
in response to message #1 by S.B.

I purchased my HP-11C in December 1982. The batteries have never been changed. It still runs properly. I removed the batteries. The no-load output voltage has dropped to 1.4 volts.

Re: Twenty-three year battery life in 15c?

*Message #10 Posted by **John Kercheval** on 26 Mar 2006, 11:24 a.m.,*
in response to message #1 by S.B.

Yes, that is possible. A colleague of mine has a 41CV and has not changed the batteries since 1984.

screen contrast 41cx

*Message #1 Posted by **don** on 23 Mar 2006, 11:37 a.m.*

Is there a way to adjust screen contrast on 41cx? Cannot find any reference in my manuals and ran a search on this forum.

thanks

don

Re: screen contrast 41cx

*Message #2 Posted by **Richard Garner** on 23 Mar 2006, 12:43 p.m.,*
in response to message #1 by don

There is no direct or indirect way to change the contrast on a 41CX Fullnut. The 41CX Halfnut (black band around the display) however has additional coding that can be accessed using M-Code to change the screen contrast, but I have never seen any code that actually did this.

Re: screen contrast 41cx

*Message #3 Posted by **jbssm** on 23 Mar 2006, 12:44 p.m.,*
in response to message #1 by don

Hi Don,

unfortunately it's not possible to adjust contrast on the HP 41C Series.

But in my units it's always pretty good ... perhaps you need new batteries.

Regards, jbssm

Re: screen contrast 41cx

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 23 Mar 2006, 12:46 p.m.,*
in response to message #1 by don

Hi;

there is a way to adjust contrast only in halfnut HP41's, and it is necessary to have at least one ROM module with such feature/function. If I am not wrong, Angel's Toolbox has this feature. There are others I do not know by heart, though.

The main difference between the halfnut and the fullnut may be observed in the shape of the digit segments and in the LCD frame.

This is an image available at the MoHPC:

Hope this helps.

Luiz (Brazil)

Re: screen contrast 41cx

*Message #5 Posted by **don** on 23 Mar 2006, 2:08 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Thanks, all. Mine is the original screen and tried the battery change routine and there are still problems. The alpha-numeric output is very readable and dark enough.....the problem is there is some faint images behind the alpha-numeric output. This faint output is on the bottom line (shift, bat, ect) and also on the line above that. It is intermitent, not constant.

I actually have 2 41cx's so I can compare the two and am quite sure it is a calculator display problem and not a problem with my expectations.

many thanks

don

Re: screen contrast 41cx

*Message #6 Posted by **Miki Mihajlovic** on 23 Mar 2006, 11:56 p.m.,*
in response to message #5 by don

Sandbox (CTRST, CTRST?, CNT+, CNT-) and Hepax (HEPAX 005) are the only two modules that have functions to adjust the contrast of LCD. On halfnut models only, though.

Re: screen contrast 41cx

*Message #7 Posted by **don** on 24 Mar 2006, 4:51 p.m.,*
in response to message #6 by Miki Mihajlovic

thanks Miki, I'll just live with the display as is.

power adaptor/charger

*Message #1 Posted by **richard ask** on 23 Mar 2006, 6:38 a.m.*

what do I need for the "vintage series" HP35,45,55,65 AC or DC output ? Voltage? max current?

(Of course I could buy an original charger on eBay such as the 82002A I guess, but I have almost 20 different chargers for old dead cellphones, so I want to save me that expense.)

Re: power adaptor/charger

*Message #2 Posted by **Tony Duell** on 23 Mar 2006, 6:50 a.m.,*
in response to message #1 by richard ask

The charger for these machines has 2 outputs (with a common -ve connection on the centre pin).

One output is 4.2V regulated, DC. This is used to run the calculator logic when the charger is connected.

The other output is constant _current_, 55mA with an open-circuit voltage of about 15V. Note this is not the same as a 15V adapter, it must be constant current since it's directly connected to the NiCd battery when the charger is connected. This is used, of course, to charge the battery.

On the 65 and 67, the card reader sense amplifier chip is connected to the battery connections. You need to take care not to damage that if you use a non-standard charger. This chip is HP-custom, and the one in the 65 is supposed to be more fragile (electrically) than the one in the 67 and later machines.

There's an ASCII-art schematic of the HP charger over in the Articles Forum. And a hand-drawn one on the HPCC schematics CD-ROM (at the 'back' of every classic-series schematic IIRC). If you want to build something, that would be a good starting point. The transistors are all pretty generic types, nothing critical.

But I doubt any other charger will work without damage!

Ram card on HP48GX

*Message #1 Posted by **sarkiss** on 22 Mar 2006, 6:18 p.m.*

I have a 48GX. I bought a 512KB ram card to expand my memory. Later I stored a library on that card. I put the ram card on slot #1. I can access the library and use the programs in the library, but when I check my available memory it's barly over 90KB. If I take out the ram card and check the memory , it's still 90 KB. Why I don't see the expanded memory. I know that on slot # 1 the calculater sees only the first 128KB and cannot use the rest, but no matter if I put the card on #1 or #2 slot,the memory is always 90KB. One other ? I have is that I get error massege now when I want to add another library to that ram card.

Re: Ram card on HP48GX

*Message #2 Posted by **bill platt** on 22 Mar 2006, 6:40 p.m.,*
in response to message #1 by sarkiss

Look up the manual.

I think you are getting port meory confused with merged memory. But you cannot merge anything more than a 128 kb card, and so the 512 will always be port memory.

Merged memory takes the card and "merges" it with onboard system memory. At that point, it is no longer port memry--and removing the card is like taking part of the brain out.

**If you put your 512 kb card into slot 2* it will show up as port 1, 2, 3, etc. Without the card, you only have port 0.

Putting a card into slot 1 does not automatically merge it. You have to ask for that. This is on purpose--for some configs, a person doesn't need extra system memory--but does need storage. The merge feature enables the user to configure this aspect.

Edited: 22 Mar 2006, 10:04 p.m.

Re: Ram card on HP48GX

*Message #3 Posted by **bill platt** on 22 Mar 2006, 10:06 p.m.,*
in response to message #2 by bill platt

I forgot to mention orginally (editd in now) that you can used the 412 card--but only in slot 2. You do not need to have a card in slot 1 in order to use a card in slot 2. You just don't have the merge1 available.

Re: Ram card on HP48GX

*Message #4 Posted by **sarkiss** on 23 Mar 2006, 1:27 a.m.,*
in response to message #2 by bill platt

> Quote:
>
> Look up the manual.

Thank you for your comment. As you and Han have recommended, I took the 512 ram card from slot 1 and put it

in slot 2. When I turn it on it gives me Warning "Invalid Card Data" but it works after that ,I checked my library on that card, everything is accessable. Now I have downloaded another library from Hpcalc.org, based on instruction i have to put the # of port on stack and install it on that port which is port 2 now, but it gives me STO Error " Bad Argument Type". How can I check on a ram card what available memory is? I personally don't think it's not enough memory on that card, bacause the library sitting on my computer before installation was 80KB. Another question: I have bought a library on a memory card, I don't know what the size of the card is. I can access the card with right shift and Library key, do you think it's OK to leave this one on slot 1?

Edited: 23 Mar 2006, 1:28 a.m.

Re: Ram card on HP48GX

*Message #5 Posted by **Han** on 23 Mar 2006, 2:09 a.m.,*
in response to message #4 by sarkiss

To clarify, allow me to make a few definitions.

Card slot: the physical slots into which a ROM or RAM card is inserted. The HP48GX has two such slots. Card slot 1 can only recognize 128KB of RAM. Inserting a RAM card with a larger capacity could possibly damage the card and/or card slot.

Port: this is an HP48 object, very much like a library or variable or program are all HP48 objects. The HP48GX can have up to 33 ports (0 through 32). Port 0 is the same as user memory. Port 1 is the port associated to card slot 1. Ports 2, 3, 4, ... and higher are associated with card slot 2. Each port has a maximum size of 128KB.

Memory Bank: a subsection of memory. As an example, your 512KB RAM card consists of 4 banks of memory, each of size 128KB. Each recognized bank of RAM creates a port. Card slot 1 only recognizes one bank; card slot 2 recognizes all banks.

Merged Memory: user memory combined with the memory in card slot 1. You can have a maximum of 256KB memory by using the MERGE1 command with a 128KB RAM card inserted into card slot 1. (Remember that card slot 1 only sees 128KB of RAM.) This plus the default 128KB of user memory produces 256KB of merged memory. Card slot 2 cannot be merged.

There are two types of 512KB RAM cards: The 1x512KB type which, when inserted into card slot 2, produces Ports 2, 3, 4, and 5; the 4x128KB type is, practically speaking, four 128KB RAM cards in one. On the 4x128KB card, there is a switch that allows you to manually "change" to one of the four virtual RAM cards.

Re: Ram card on HP48GX

*Message #6 Posted by **Howard Owen** on 23 Mar 2006, 2:45 a.m.,*
in response to message #4 by sarkiss

> Quote:
>
> I took the 512 ram card from slot 1 and put it in slot 2. When I turn it on it gives me Warning "Invalid Card Data" but it works after that

That error is due to the fact that 1 or more of the banks on your card are uninitialized. That makes sense if you were using it in port 1. Run PINIT and that error should go away, and you should also be able to use the rest of your memory in slot 2. (Ports 2, 3, 4 and 5.)

> Quote:

> I checked my library on that card, everything is accessable. Now I have downloaded another library from Hpcalc.org, based on instruction i have to put the # of port on stack and install it on that port which is port 2 now, but it gives me STO Error " Bad Argument Type". How can I check on a ram card what available memory is? I personally don't think it's not enough memory on that card, bacause the library sitting on my computer before installation was 80KB.

The procedure is 1) put the library on the stack, 2) enter the port number, for example 2, 3) Press the STO key. That error implies that the object on the stack is not the correct type. On the stack, the library should look like 'Library nnn abcd..' where 'nnn'is the library number and 'abcde..' is its text description. So you should have that on stack level 2 and the port number in level 1 before pressing 'STO'.

To see what is in a particular port. Put the port number on the stack and execute 'PVARS'. This will return a list of library addresses in level 2 and the free memory in the port on level 1.

> Quote:
>
> Another question: I have bought a library on a memory card, I don't know what the size of the card is. I can access the card with right shift and Library key, do you think it's OK to leave this one on slot 1?

Odds are it is a 128K card that will do just fine in slot 1. What is the card?

Regards,
Howard

Re: Ram card on HP48GX

*Message #7 Posted by **sarkiss** on 23 Mar 2006, 1:38 p.m.,*
in response to message #6 by Howard Owen

> Quote:
>
> Odds are it is a 128K card that will do just fine in slot 1. What is the card?
>
> Regards,
> Howard

Regarding the card in slot 1, it's a collection of land surveying equations programmed into a plug-in library card. When I used the PVARS command following was on stack 2:
:1:995.0000:1:991.000:1:989.000:1:997.000:1:987.000:1:985.000:1:1001.0000:1:993.0000:1:983.0000:1:981
On Stack 1 was showing "ROM". I have a question, I had a library on that 512 card, now I finally managed to add the other library, old one on port 4 and new one on port 2, but when I go to left shift "alfa" and hit CST I only can access the new library. What happend to the old library sitting on port 4? It is still there, because when I check with PVARS on stack 2 I have :4:1013.000 and on stack one I have 48,369.000 which shows there is some memory taken.

Re: Ram card on HP48GX

*Message #8 Posted by **Howard Owen** on 23 Mar 2006, 5:41 p.m.,*
in response to message #7 by sarkiss

OK, so that ROM card is probably quite happy sitting i slot 1.

> Quote:
>
> .. but when I go to left shift "alfa" and hit CST ..

Left-shift-alpha gives you user mode. User mode CST doesn't produce anything on my machine. So someone is defining a custom menu on the CST key for you. (Perhaps more experienced 48G folks can elaborate.) The way you get to libraries generically is to press right-shift-2 (LIBRARY). This brings up a menu with softkeys for each installed library. (Left-shift 2 gets you a menu of useful commands for use with libraries, including PVARS.)

Regards,
Howard

Thanks Howard, Your advise helped me alot. As you said I can access libraries with right shift LIBRARY.

Re: Ram card on HP48GX

*Message #10 Posted by **Han** on 22 Mar 2006, 7:30 p.m.,*
in response to message #1 by sarkiss

In order to expand user memory on an HP48GX, you must use the MERGE1 command with a 128KB RAM card in card slot one. This "merges" the memory in the RAM card with the default 128KB user memory.

I do not recommend using a 512KB RAM card in slot one. While the HP may see one of the banks on the 512KB RAM card, it is not clear that it is always the same bank. In fact, there are various pins in card slot one which correspond to the LCD signals. If these are read as input for the 512KB RAM chip, you may end up corrupting the data on your RAM card. Also, if you merge memory with a 512KB RAM card in slot one, the HP may use the wrong bank the next time you turn on the calculator or re-insert the card.

I recommend re-reading your user's manual and try to abide by the rules set out by HP regarding card slots.

Best of luck, Han

A fine, but pricey HP-12C

*Message #1 Posted by **Karl Schneider** on 22 Mar 2006, 3:23 p.m.*

Here's a link to a recent auction for a first-year (1981) HP-12C in mint condition -- first time I've seen one go for > US$500.

The seller certainly knew which significant points to emphasize...

A fine, but pricey HP-12C

in response to message #1 by Karl Schneider

Now *that* is a nice auction. It pays off to do a good job.

Interesting to note that his 11c got exactly half of the 12c value:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=58039&item=5881343614

Counterintuitive perhaps?

opening Woodstock calculators

*Message #1 Posted by **Matthias Wehrli** on 22 Mar 2006, 11:43 a.m.*

I need some advice (text, pictures, ..) how to open these sort of calculators.. not the simplest thing, but to repair a HP-29C or HP-27A it is worth that time ;)

Matthias

Re: opening Woodstock calculators

*Message #2 Posted by **Bernhard** on 22 Mar 2006, 6:28 p.m.,*
in response to message #1 by Matthias Wehrli

The procedure I use on the HP21...HP29C series:

Remove battery. Pull out the two topmost rubber feets (i.e. using a dentist's hook). Remove the two screws now visible. Gently apply some pressure to the charger contacts until the keyboard comes out of the shell by about 2...3 mm. Now the trick: turn the unit upside down and stick a thumb's fingernail between the keyboard and the shell near the point (*) on the label with "Hewlett * Packard". There should be a snapping sound and the keyboard now is free from the shell. The whole assembly (keyboard + electronics) now is loose and can be removed from the shell (gently, gently, remember those battery contacts that protrude into the battery compartment).

During reassembly, it is important to snap keyboard + electronics plugged together into the shell. If you put in the electronics first and then try to snap the keyboard in, some of the connector spikes most likely will be bent.

(No warranty implied and no liability taken especially for broken fingernails. Note that a metal blade etc. might damage the plastic).

Repair help

*Message #1 Posted by **Julio Ponce** on 21 Mar 2006, 3:17 p.m.*

Hi all: I have a hp-11c and a hp-25, with the 11c once I changed batteries and my calculator was dead. Until yesterday using a small 10 cents coin, sliped the sides of the coin between both sides of the battery spring clips, at the same time with the coin, then reinstalled the batteries (LR-44), and turned it on but I did not see a " Memory Clear ", "Pr Error" or similar message. What I saw is a permanet: - 8,8,8,8,8,8,8,8,8,8 user f g begin grad dmy c progm and it turned off until removed the batteries out.

With the hp-25 I had a battery leakage and never noticed until I changed the batteries, the new radio shack batteries charged but, the calculator doesn´t work; with the battery charger conected, the display turns on all digits, varying the brightnees of the leds continously, but doesn´t works proper. I ask for help to fix these problems.

Thanks a lot .

Re: Repair help

*Message #2 Posted by **George Rose** on 21 Mar 2006, 7:43 p.m.,*
in response to message #1 by Julio Ponce

I'm sure you'll receive lots of help from more informed persons than myself. My guess for the 11C is that with the new batteries the contrast needs to be turned down. I no longer have a Voyager series, but I believe with the calculator on, press and hold the on button and press the minus button several times to keep decreasing the contrast setting to the desired level.

Re: Repair help

*Message #3 Posted by **Gerson W. Barbosa** on 21 Mar 2006, 8:39 p.m.,*
in response to message #2 by George Rose

The ON/- procedure would only clear the memory on a working Voyager. There is no way to adjust the contrast of the display on the Voyagers, but there is no need to as the constrast is always very good.

If I understand that correctly, all LCD display segments and annunciators showed, then you turned it off and

removed the cells?

That display is the conclusion of a successful ON/X self-test. Hitting the backarrow (<-) key should display zero in the chosen or default display format.

Re: Repair help

*Message #5 Posted by **Hal** on 22 Mar 2006, 12:28 a.m.,*
in response to message #1 by Julio Ponce

Hello Julio,
On your hp25, please, please don't try to run it with the AC adapter connected, untill you are sure the battery pack is making good contact. The battery pack also acts as the voltage regulator when the AC adapter is connected, and without it, the calculator IC's may be damaged by excessive voltage.
I would suggest carefully cleaning the calculators battery contacts, the ends of the batteries, and the spring that connects the batteries in the battery pack (I'm assuming since you've replaced the batteries, the soldered on strap is no more). To clean, polish until shiny with a pencil eraser, then gently rub with a q-tip moistened with alchohol. I would then suggest charging the batteries out of the calculator, with a commercial ni-cad/nim-h charger, then trying it again with only the battery pack. Let us know how it works, and best of luck.
Hal

Re: Repair help

*Message #6 Posted by **David Smith** on 22 Mar 2006, 4:41 p.m.,*
in response to message #1 by Julio Ponce

While the batteries ARE installed in the 11C, short across the stack of battery cells with a paper clip for a couple of seconds. This is mentioned in the back of some of the manuals.

Re: Repair help

*Message #7 Posted by **Laurent** on 24 Mar 2006, 5:30 a.m.,*
in response to message #1 by Julio Ponce

As hal said, be very careful when connecting a charger on the HP25. I have one whose battery contacts were so much corroded that I had to solder a small piece of electrical wire to ensure the contact between the two printboard tracks which go from the contact. Again, thoroughly clean up the contacts before connecting the charger.

Ultrasonic cleaning? Any experiences?

*Message #1 Posted by **Jim Creybohm** on 21 Mar 2006, 9:31 a.m.*

Hi all.

I read a note posted by another reader on using an ultrasonic cleaner to clean his HP calcs. I am curious to know from others with more experience in this what kind of cleaning fluid they are using.

Are the calcs dismantled? I would think that cleaning some circuit boards might be OK, but certain mechanical things such as solder connections would or could break down? I can definitely see grime being taken off the keypad, for example thus perhaps eliminating the nasty wipe lines that you often see around the keys.

Are you using deionized water or something more exotic? I would think only water would be preferable?

And last, what calcs have you cleaned using this procedure?

Re: Ultrasonic cleaning? Any experiences?

*Message #2 Posted by **Frank Boehm** on 21 Mar 2006, 2:59 p.m.,*
in response to message #1 by Jim Creybohm

I purchased such a cleaner 15 years ago or so (when they were really expensive <g>) - the results were not too impressive. It's a nice thing for removing dust from small parts. A different story for 30 years old fat (fingerprints plus dirt) on plastics though - you can't use any aggressive solvents. The HPs are made of "good" plastics, still the prints might fade or the plastics might suffer when cleaned with the wrong stuff. I'd suggest to disassemble the calculator; keys (2-shot-molds) are well suited for the cleaner, using some standard detergent. For the case, I'd suggest to use hot (warm) water with dishwashing detergent and a mostly-soft sponge. Don't clean the printed parts this way, only the plastic ("rough") parts... For everything else, I'd suggest using window cleaner (without ammonia and without solvents) and q-tips. Be *very* careful, as you still could easily ruin the surface or printing. Better test this in advance. It's usually not necessary to clean the electronics; window cleaner works well if desired. Be sure to dry the parts before using the calculator again.

So, if you can get your hands on a cheap cleaner - go for it, it might be useful. It's not suited for a whole calculator though - you nede to disassemble it....

> Are the calcs dismantled? I would think that cleaning some circuit boards might be OK, but certain mechanical things such as solder connections would or could break down?

Recently I cleaned a -45 purchased from a heavy smoker. I completely dismantled the machine and applied

the german cleaner 'Sidol Küchenkraft' on all parts, including PCBs. It is not very agressive but as soon as you spray it on the parts, you see the tar running down with the cleaner. After that treatment, I applied lots of warm water (beware, if too hot, some plastic parts may deform!). There was still some dirt under the key contact arcs which I had to remove by hand (with a wooden toothpick thinned to less than 500 microns). I wonder how it could get there since the plastic sheet was still intact.

> Quote:
>
> Are you using deionized water or something more exotic? I would think only water would be preferable?

This 'Sidol' works great, have used it for several calcs, including a TI-66 and a Casio. Unfortunately, no ingredients are given on the bottle:(.

About the ultrasonic bath, I have used them in the lab but never tried to clean something in them. If I got this right, Randy is using this method to not have to dismantle the calcs. In this case, no cleaner should be applied as it would be nearly impossible to get it out afterwards. At least, my 'Sidol' can be quite sticky if not washed away _very_ thoroughly.

Good luck,

Thomas

(Edited: You find a picture of that shiny 45 in the 'how to open 82001A battery pack' thread)

Edited: 22 Mar 2006, 7:30 a.m.

Re: Ultrasonic cleaning? Any experiences?

*Message #4 Posted by **David Smith** on 22 Mar 2006, 4:47 p.m.,*
in response to message #1 by Jim Creybohm

When I have to use ultrasound on a machine, I use three cycles of distilled water, shaking as much as possible out between cycles. I have added some window cleaner in the first cycle and some Kodak PhotoFlo wetting agent in the last one. You can then dry the thing in a LOW oven or hot car.

I had a MINT HP-55 with a bad power switch and some flakey keys. I tossed the whole thing in the ultrasound since I did not want to mess with the rear label. It came out working perfectly. Also has worked wonders on HP42's that were dropped in mud and rivers.

HP-28S Clock Accuracy

*Message #1 Posted by **Juan J** on 21 Mar 2006, 2:00 a.m.*

Although it is not mentioned in the manual, it is possible to set up a clock in the HP-28S using a set of programs.

A while ago I got two 28S and loaded the programs. I do not use a watch, and I always find out what time is it with a check on one of my calculators or PDAs.

Because of some unfortunate events I had to put both 28S in storage two years ago, with batteries. Last weekend I got them out of storage and checked them. Fortunately, the batteries did not leak and the battery compartment was intact. Then I checked the clock. It was fifteen minutes past the current time on one of the calculators, and fourteen minutes before on the other. Other than this, the two 28S were fine and now have new batteries.

I have checked about the accuracy of the program on the documentation I have but there is not much. Does anybody have any experience on this?

Thanks in advance.

Re: HP-28S Clock Accuracy

*Message #2 Posted by **Eric Smith** on 21 Mar 2006, 2:39 a.m.,*
in response to message #1 by Juan J

I am surprised that you would be concerned about it. An error of 15 minutes in 2 years is only 28 parts per million, which is well within spec for an untrimmed 32 KHz crystal oscillator such as the one in an HP-28S. Few pieces of consumer electronics can achieve any better, aside from devices which depend on an external frequency source such as GPS, time broadcast by radio, or power line frequency. Certainly PDAs rarely have better timing accuracy.

Assuming that the storage was not temperature controlled, that's actually quite good. A wristwatch can do better (while on your wrist) only because it is operating at a much more stable temperature than it would in free air.

When you also consider that neither the HP-28C nor the HP-28S were specifically design with timekeeping in mind, and that the documentation on how to access the internal clock was only released as an afterthought, I think you should be quite happy with how well they work.

Eric

Re: HP-28S Clock Accuracy

*Message #3 Posted by **Juan J** on 21 Mar 2006, 9:22 a.m.,*
in response to message #2 by Eric Smith

Hello Eric,

Thank you for your explanation.

Quote:

> When you also consider that neither the HP-28C nor the HP-28S were specifically design with timekeeping in mind, and that the documentation on how to access the internal clock was only released as an afterthought, I think you should be quite happy with how well they work.

Indeed I am happy with the clock application of the HP-28S. It is a testament to the quality of HP. My concern was rather curiosity on how well the clock performed, and it is impressive how well it does. I am amlso surprised by the battery life. According to the manual, alkaline batteries would last 180 days on an HP-41, and about the same time in an HP-28S. I have seen 41s going on the same battery set for three years of sustained use (not including the card reader) and now almost the same time for the 28S. An HP-48GII is expected to drain its batteries in two months, as per specifications; I have no idea of the figure for a 49G+ Again, HP did know how to build fine instruments.

I remember I was concerned about the hinge contacts of the Clamshells when I got the first 28S. Time has proved me wrong.

Quote:

> Assuming that the storage was not temperature controlled, that's actually quite good.

Yes, they were stored in a friend's warehouse without temperature control.

The 28S is powerful and handy when you get used to the keyboard layout. No Alpha toggle to deal with, just typing in the object name. I think it was conceived for use at a flat surface (like a desk or a table) only, and for quick calculations away from it (and folded as the manual suggests for "field use")

Re: HP-28S Clock Accuracy

*Message #4 Posted by **Ed Look** on 21 Mar 2006, 10:40 a.m.,*
in response to message #2 by Eric Smith

This is slightly off topic, but I now wonder about the precision of the clocks in the HP 48G's and HP 49G+.

Re: HP-28S Clock Accuracy

*Message #5 Posted by **Geir Isene** on 21 Mar 2006, 11:55 a.m.,*
in response to message #4 by Ed Look

I ported my UAC to my 48GX and the clock proves useless. Indeed, there is a program to correct this: Adjustment program for the 48 clock.

Re: HP-28S Clock Accuracy

*Message #6 Posted by **Gerson W. Barbosa** on 21 Mar 2006, 7:30 p.m.,*
in response to message #5 by Geir Isene

For the HP-49G/G+, I would suggest Prof. Dr. Wolfgang Rautenberg's Timeman (Timeman.zip).

Re: HP-28S Clock Accuracy

*Message #7 Posted by **Ed Look** on 22 Mar 2006, 12:30 a.m.,*
in response to message #6 by Gerson W. Barbosa

To Messrs. Isene and Barbosa, thank you very much for pointing out to me these programs! I remember going through 48G and 49G+ files, but there are actually so many. Believe it or not, there are few times I actually have had to depend on my 48G/G+ for timekeeping... thank God it wasn't too critical an application.

Re: HP-28S Clock Accuracy

*Message #8 Posted by **John Limpert** on 21 Mar 2006, 2:42 a.m.,*
in response to message #1 by Juan J

Fifteen minutes over two years is well within the frequency tolerance that can be expected from ordinary quartz crystal oscillators.

Updates From OpenRPN

*Message #1 Posted by **Hugh Evans** on 20 Mar 2006, 11:34 p.m.*

First, I would like to appologize for the main site experiencing extended downtime. Our hosting is in transition, but when the dust settles we will have a much more stable site. We will also gain CVS and Subversion servers, which will give our programmers a nice playground at last! There is a lot of unpublished code for the *fix core, which I look forward to making public.

The other piece of news I have to report is that, my cohort, Chad and I have initiated the process of registering an LLC as well as multiple domain names. Indeed, we are preparing for production and distribution.

Thank you to everyone who has followed and supported our project as we approach our second anniversary. Naysayers mean nothing to me... I have a dream and it will be realized.

Re: Updates From OpenRPN

*Message #2 Posted by **.** on 21 Mar 2006, 1:27 a.m.,*
in response to message #1 by Hugh Evans

Hi,

Glad to see the website will finally be stable from now on.

I'm interested in how you are preparing for "production and distribution." The last I heard, you'd gone from making a whole new calculator to a retrofit kit for the HP49g plus. So is the design work almost complete? I'd love to know how your retrofit kit is getting on. I'm confident that you are making real progress.

.

Rechargable AAA cells on HP-71B?

*Message #1 Posted by **Karl Schneider** on 19 Mar 2006, 8:16 p.m.*

Hello, all --

I recently got an 82059D "Battery Charger" and AC Adaptor. Only my HP-71B can use it, but I may acquire other devices that can.

It seems as though the 82059D will not charge the cells in a HP-71B, so there is no particular benefit to installing four expensive rechargable AAA cells in a 71B. ($13 for 4x NiCd @ 300 mAh ; $20 for 4x NiMH @ 700 mAh).

The HP-71 owner's manual states the following on p. 271:

"When connected to a power outlet, the HP-71 uses the batteries as a backup power supply and normally doesn't draw any power from them."

"You won't damage the HP-71 by using the computer without batteries..."

This is quite different from the early HP calculators with rechargables. I'd even doubt that rechargable AAA cells were available in 1984, when the HP-71 was introduced. One certainly wouldn't want the HP-71 to try to recharge the cells, if disposables were installed as originally intended.

I measured about 3.6 Vdc across the battery terminals with no battery installed, and the 82059D connected and energized. That's less than what a dead 4-cell battery would register, and below the minimum operating voltage.

So, does anyone see any value in powering an HP-71B with rechargable AAA cells, besides not having to replace disposables, or possibly dealing with alkaline-cell leakage?

Also, how do the mAh ratings of AAA alkaline disposables compare to those of the rechargables? I've never seen ratings printed on the packages of disposable AAA cells.

Thanks in advance,

-- KS

Re: Rechargable AAA cells on HP-71B? (and others...)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 19 Mar 2006, 10:11 p.m.,*
in response to message #1 by Karl Schneider

Hello, Karl;

since I got the chance to have an HP71B, I use it with rechargeables manily because I thought I'd have to buy disposable batteries too regularly. In fact, I do not use it very often, so I have no comparison base to offer.

The ones I used first were only 250mAh NiCads, and after they were fully charged, the HP71B was able to keep memory contents for about three months without being used. I only checked for battery status in a regular

two-week basis. Six months ago I decided to power it with a pack of four 850mAh NiMH, and although I am using it a bit more for these days, it did not show any 'low battery' sign so far. I also have some 1100mAh NiMH that I use with the 48/49 series, because it seems to me they consume significant more power when communicating.

In fact, except for the HP28S and the HP17BII, I use rechargeables in all my HP's with AAA and N cells, and I have not spent any money with regular alkaline nor regular batteries since then. What I also take into account is that I am not disposing batteries, too...

Cheers.

Luiz (Brazil)

Re: Rechargable AAA cells on HP-71B?

*Message #3 Posted by **Museum** on 20 Mar 2006, 12:40 a.m.,*
in response to message #1 by Karl Schneider

Hi As the HP-71B does not have a recharge function you will not be able to charge rechargeable batteries in it. It is true, that the HP-71B prefers the adapters power 8if plugged in). Then your batteries will not discharge. You have to charge the rechargable AAA´s in an external charger...

Re: Rechargable AAA cells on HP-71B?

*Message #4 Posted by **Garth Wilson** on 20 Mar 2006, 3:06 a.m.,*
in response to message #1 by Karl Schneider

I don't remember for sure, but it seems my 71 went nearly a year on a set of alkalines even when I was using it a lot, in spite of the five extra modules (HPIL, 96KB RAM, 64KB RAM, Forth/Assembler, and Math) and heavy use of HPIL. I fully trust rechargeables not to ever leak when the low-battery indicator is still off and the "Install by..." label on the battery gives a date that is still well into the future.

The reason others have given here for using rechargeables in the 41 was the card reader with its motor and the bar code wand with its light. (Hmmm... I think there was an IR printer-interface module too.) The 71's card reader however has no motor, and no one here has mentioned having a bar code reader that plugs into their 71 so I assume almost none were sold.

Re: Rechargable AAA cells on HP-71B?

*Message #5 Posted by **hugh steers** on 20 Mar 2006, 8:55 a.m.,*
in response to message #1 by Karl Schneider

hi karl,

for some reason, i've been unable to run my 71b at all on rechargables. it must be that these cells don't make the voltage and my 71 is sensitive enough for it to make a difference.

Re: Rechargable AAA cells on HP-71B?

You have probably stated the best reason not to use rechargable AAA cells on the HP-71B. I'm fairly sure that standard ones are 1.2 Vdc. However, I got intermittent "BAT" warnings when powering it up recently, then got a "Memory Lost" after installing the HP-IL.

Each of the "old" cells measured 1.42 Vdc.

So, I can't explain how Luiz has been successful, unless his 71B is more tolerant or his rechargable cells are 1.5 Vdc.

As for the other contributors, I concur with the assessment of non-rechargability by the 71B.

*Message #7 Posted by **Vieira, L. C. (Brazil)** on 20 Mar 2006, 4:50 p.m.,*
in response to message #6 by Karl Schneider

Hi Karl, all;

I'll check the serial # and post about it later (I'm at the University right now, will be back home after 11:30PM today). Maybe my unit belongs to a lote that has a different power supply circuitry. Based on manual contents, the HP71B can use rechargeables, so I did not consider it failling in this case. And the ones I use are indeed in the 1.2Vcc range, but I'll also measure the batteries today later.

Cheers.

Luiz (Brazil)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 20 Mar 2006, 11:51 p.m.,*
in response to message #7 by Vieira, L. C. (Brazil)

Hi all;

After getting back home: serial# is **USA 2711A0****** The unit is complete with extra 2×4KRAM modules, card reader and HPIL unit (I keep the IL unit in off state.). The batteries measured in the range 1.21Vcc to 1.25Vcc. And I thought I kept the NiMH, 1100mAh pack in the unit, but I actually did not. I remember now that a month ago I bought a Sony 'intelligent charger', and I decided to give the litle NiCads 250mAh a last shot. It is now going to the second month, and the BAT annunciator is still off.

Cheers.

HP-71B: versions and info

*Message #9 Posted by **Karl Schneider** on 21 Mar 2006, 4:17 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Hi, Luiz --

> Quote:
>
> serial# is USA 2711A0**** The unit is complete with extra 2×4KRAM modules, card reader and HPIL unit...

The 1987 serial number indicates that it is newer than mine, which lacks a serial-number stamp, but has the September 1983 "1BBBB" ROM, and came with Ver. C manuals printed in April 1984.

Yours is probably the 1985 "2CDCC" ROM; this is revealed by the VER$ command. More info about HP-71B ROM versions is found at http://membres.lycos.fr/jeffcalc/bug71.html

Valentin has ardently claimed that an 71B is not truly "complete" without its Math ROM, and can make a solid case for that, based upon developmental history. Unfortunately, the 71B was sold without them. Mine has one 4 kB RAM (82420A), the Math ROM Ver. 1A (5061-7226), Surveying ROM Ver. A (5061-7238), and HP-IL Ver. 1B (82401A).

I'm missing the manual for the Surveying ROM, and it's not included in the MoHPC scans.

I found one minor curiosity: There is an "AC" annunciator that p. 30 the HP-71 Owner's Manual states is "reserved for future use". It does not display when the AC adaptor (82059D) is plugged in. Does the "AC" show when yours is plugged in?

Does anyone own an "HP-71" (not HP-71B) that was depicted and referenced as such in manuals? Maybe that was a pre-production version that was developed further, prior to commercial release.

One final note about this thread: I misspelled "rechargeable"! It didn't look quite right with the first "e" omitted, but I wasn't sure and didn't look it up. My apologies for the bit of misinformation to those whose first language is not English...

Re: HP-71B: versions and info

*Message #10 Posted by **Vieira, L. C. (Brazil)** on 21 Mar 2006, 12:41 p.m.,*
in response to message #9 by Karl Schneider

Hi Karl, all;

I forgot to check the ROM version, will do it later, O.K.? I remember I have already done that when I got it, and if I am not wrong, it is ´1DDDD´.

Although I have no ROM modules for the HP71B, I must agree with Valentin and you because any additional MATH feature in a computing device is always welcome. But I could only have my own HP71B about a year ago, thanks to a great (and somehow absent)

contributor of the MoHPC. I consider it as a gift, and I also tried to be fair enough with an HP42S as a 'back gift', if there exists such a thing. At the end, it was almost like two friends exchanging gifts. So, that´s the way I got the chance to have this one, and as it also has so many additional stuff, I cannot dare complaining! d8^)

About manuals: I could only print the basic manuals that come with the MoHPC DVD set, no originals with me, too.

About misspelling recharg(e)able: did not even notice till your call... We, non-native English speakers, may learn anytime, right? And missing keystrokes is not an exclusive priviledge of ours...

I have not yet noticed if the AC annunciator 'lits' when the AC adaptor is connected. Will check for it, too.

Cheers.

Re: HP-71B: versions and (updated) info

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 22 Mar 2006, 12:19 a.m.,*
in response to message #10 by Vieira, L. C. (Brazil)

Hi Karl, all;

although the HP71B I have has a serial# that states it is from 1987, the ROM version is '1BBBB' (I confused with the HP75D, that returns a 'ddddd' string to ver$... Sorry!). I also checked the 'AC' annunciatior and, as expected, it does not lit when the AC adaptor is plugged in (I removed one of the batteries and turnned the HP71B on).

So far, no news.

Cheers.

Rechargable AAA cells on HP-48G, -49G?

*Message #12 Posted by **Karl Schneider** on 21 Mar 2006, 11:23 p.m.,*
in response to message #6 by Karl Schneider

Just a followup on my observation on the HP71B:

> Quote:
>
> You have probably stated the best reason not to use rechargable AAA cells on the HP-71B. I'm fairly sure that standard ones are 1.2 Vdc. However, I got intermittent "BAT" warnings when powering it up recently, then got a "Memory Lost" after installing the HP-IL.
>
> Each of the "old" cells measured 1.42 Vdc.

I checked my HP-48G and HP-49G, each of which use three AAA cells. The 49G displayed "Warning:

Low BAT" and did not otherwise function; each cell measured 1.27 V.

I put those into in the 48G, and it worked just fine.

So, it seems that the 48G might work with rechargeables, but there is the slight annoyance of the extra cell. There oughta be a law against devices using three *disposable* cells that are sold only in packages of two or four. That would include the 28-series, the "real" 48-series, and the original 49G, as a minimum...

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 22 Mar 2006, 12:24 a.m.,*
in response to message #12 by Karl Schneider

Hi, Karl;

Interesting; I use rechargeables in all of my 48/49 series, and they've all worked fine with the many NiCAD's and NiMH's I tested. I observed that when charged with the Sony charger (BCG-34HLD), the batteries maintain the calculators working for longer than when I let them charging in regular 'dummy' chargers and follow their charging times.

Just to add this info.

Cheers.

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 22 Mar 2006, 3:53 p.m.,*
in response to message #14 by Andy Morales

Hey, Andy;

my HP48GII uses four 850mAh, NiMH AAA batteries, and they are installed for about three

weeks, now. No Low Battery warnings so far.

I confess I tried to find the brand mark on them, but could not identify any, just a big POWERPACK printed on it and many Portuguese inscriptions. Seems to be some sort of OEM battery with local identification. In fact, now I am a bit worried...

I also have a set of four 1100MaH NiMh's that I use with the two early original HP49G, but they are identified as Panasonic HHR-4UP. These ones are able to power my HP49G's for more than three months with regular use. By regular use I mean at least three times a week, not a daily basis.

Cheers.

*Message #3 Posted by **Eric Smith** on 19 Mar 2006, 4:23 p.m.,*
in response to message #1 by Andy

If we told you the secret keystroke sequency, it wouldn't be secret any more. And we'd lose our membership in the cabal. Sorry.

If you can't find the secret keystroke sequence, the other way to turn it into an RPN calculator is to sell it and buy a 48GII or 49G+.

How many 12c calculators have been produced

*Message #1 Posted by **Kalevipoeg** on 19 Mar 2006, 4:39 a.m.*

I have wondered many times what is the total number of the HP 12c calculators produced during these 25 years.

Today I found a rough estimate from here

http://h20331.www2.hp.com/Hpsub/downloads/hpcalc_sddt_022706.pdf

To date, more than 15 million units have been sold, and it's still going strong.

Pioneer Creaking

*Message #1 Posted by **Neil** on 18 Mar 2006, 4:16 p.m.*

I've built up a collection of pioneer calcs. I've noticed that with a few of them, I can press the 2 case halves slightly closer together with my 2 fingers going around the edges of the calc, at some particular spots, with a consequent creaking sound when I press, or pinch together, and then release. On one of my calcs, there is even creaking when I press on one of the keys nearest the lefthand side, and this is due to the 2 case halves being able to move against each other at that point. I'm just wondering if this could mean that the calcs with this creaking may end up failing earlier than those where the 2 case halves are completely fixed, with no movement? This question is directed at the guys who have experience of opening and repairing pioneers.

Re: Pioneer Creaking

*Message #2 Posted by **Eric Smith** on 18 Mar 2006, 11:44 p.m.,*
in response to message #1 by Neil

Sounds like you're talking about Clamshells rather tha Pioneers? E.g., 18C, 19B, 19BII, 28C, 28S?

Re: Pioneer Creaking

*Message #3 Posted by **Neil** on 19 Mar 2006, 10:31 a.m.,*
in response to message #2 by Eric Smith

Hi Eric,

No, I definitely mean Pioneers eg 17bii, 14b, 27s etc. If you take a look at a pioneer, you can see that there is a seam all the way around the sides. On a few of my calcs, there is some flexing at the seam when trying to pinch both calc halves together, with a consequent creak. On other calcs, there is no flexing at all. They are solid. My guess is that this flexing is nothing, it will never cause any keys to fail prematurely, but I was curious enough to ask the question.

Re: Pioneer Creaking

*Message #4 Posted by **Eric Smith** on 19 Mar 2006, 4:24 p.m.,*
in response to message #3 by Neil

I misinterpreted what you said about pressing together the two case halves. Also, it is common for Clamshells to be a bit creaky.

Re: Pioneer Creaking

*Message #5 Posted by **Karl Schneider** on 19 Mar 2006, 12:34 a.m.,*
in response to message #1 by Neil

Neil --

I have two calc's made in Singapore during 1993 -- an HP-17BII (Pioneer-series) and an HP-48G ("stretch

Pioneer"). Both of them creak in the same fashion, but have yet to cause me any problems.

-- KS

Edited: 19 Mar 2006, 12:35 a.m.

Re: Pioneer Creaking

*Message #6 Posted by **Neil** on 19 Mar 2006, 10:34 a.m.,*
in response to message #5 by Karl Schneider

Hi Karl,

Did you get your calcs in the early 90's (1993) and have you used them regularly ever since? If so, then that's certainly evidence that the creaking and flexing is a non-issue.

Re: Pioneer Creaking

*Message #7 Posted by **Randy** on 19 Mar 2006, 10:52 a.m.,*
in response to message #1 by Neil

The creaking is most likely caused by several locking pins that extend from the front half into the back half. The back case has molded tapered sockets, I suspect the idea mechanically was for the pin to wedge tightly into socket helping to the hold the edges of the case together. In practice, probably due to material shrinkage once molded, its a less than perfect way to join the halves.

With the help of the Museum's 42S photo, the location of the pins are circled in white.

http://fixthatcalc.com/images/42s.jpg

Re: Pioneer Creaking

*Message #8 Posted by **Neil** on 20 Mar 2006, 2:18 p.m.,*
in response to message #7 by Randy

Randy,

Thanks for the detailed info. So does this basically mean that the whole keyboard assembly is not affected in any way by the case halves being slightly loose / creaky?

Re: Pioneer Creaking

*Message #9 Posted by **Randy** on 20 Mar 2006, 4:59 p.m.,*
in response to message #8 by Neil

I see no reason why it would bother the calculator in any way.

Also, FWIW, *very early* Pioneers did not have the pins, they used a scheme like that later used on 48's - bent metal tabs and small plastic tabs that are supposed to interlock. IMO, less than perfect in practice as creaky 48's are pretty common.

HP 97 Printer

*Message #1 Posted by **jbssm** on 18 Mar 2006, 10:10 a.m.*

Hi all,

the printer in my HP 97 doesn't work very well. The symptoms are: - It prints quite well, but the paper doesn't advance like it should. - If I pull the paper then for a while (about 2 lines) it keeps going, advancing correctly, after that it just stops.

I find this very strange, can anybody give me an hint how to fix it? For what I see, the dented wheel are good, can it be the motor?

Regards, jbssm

Re: HP 97 Printer

*Message #2 Posted by **Doug Wilder** on 18 Mar 2006, 10:53 a.m.,*
in response to message #1 by jbssm

Sometimes a drop of machine oil (sewing machine oil) on the paper advance rod will do it. If not used for a long time this becomes dried out. Possibly someone else recommend a different type oil.

Best

Thank you all very much ... it worked :)

Re: HP 97 Printer

*Message #5 Posted by **Randy** on 18 Mar 2006, 12:07 p.m.,*
in response to message #1 by jbssm

It is a very common 97 printer problem. Oil does not help, only makes things worse as it is usually a lack of friction that causes the problem, not the other 'way round. Have a good look at the shaft that is rotated by the

motion of the print head moving back and forth. That shaft has two "tires" at the ends that contact the paper and push it upward when the shaft rotates. Those tires usually have flat spots on it from sitting in one place too long. When those flat spots come around in rotation, the paper doesn't advance.

A very simple solution from the 97 man himself, David Smith, is to hang a large paper clamp on the end of the paper and drape it over the edge of the desk. The extra weight of the clamp will pull the paper through the printer as the tires advance, even over the flat spots. Easy, but maybe not up to your technical standards.

So, if that's not an acceptable solution, you are looking at a complete disassembly of the printer to make it right. If you're not mechanically inclined and handy with small snap rings that like to shoot out your fingers and into parts unknown in the next room, this is not for you... even if you do want to tackle this, depending upon the condition of the of two driving "tires" this may or may not work:

Tear the printer down to get the shaft out - some help can be found in the 97 service manual on the Museum CD set. The worm shaft and the two pin shafts that the head rides on must come out. Once you have the paper advance shaft out, sand the tires round again with 150 grit or so sandpaper. Don't go overboard here, only take off enough to rough up the circumference and make it somewhat more even and the transition to the flat less pronounced. Clean all the accumulated goo off the worm shaft, clean up any thing else sticky and icky and put it all back together and enjoy.

If the tires are really bad or cracking apart, I've been able to make a reasonable repair using rings of vinyl tubing glued in place after cutting away the old urethane. That would be an extreme case and not something to do first time around. You can also canibalize an 82143A printer as they use the same shaft but understand your parts donor may have the same problem. Later 82143A's had black tires instead of the original natural color urethane, those IMO seem to hold up better.

Re: HP 97 Printer

*Message #6 Posted by **Doug Wilder** on 18 Mar 2006, 4:46 p.m.,*
in response to message #5 by Randy

Hmmmm, well just fixed an HP82162A yesterday with a single drop of oil. This one was half line feeding 80% of the time. The HP82143A manual specifies the lube points, one drop of machine oil (HP instructions). The ratchet needs some oil or it don't ratchet, don't hurt the cam either. Sometimes they dry out. Notwithstanding flat tires.

Re: HP 97 Printer

*Message #7 Posted by **David Smith** on 18 Mar 2006, 5:07 p.m.,*
in response to message #5 by Randy

The slipping paper is a combo of flat spots on the drive rollers, hardened drive roller rubber, and modern paper is thinner and slicker than the original stuff.

Besides sanding down the drive rollers, I have been painting them with a thin layer of new urethane. This has worked VERY well. I have also built up complete new rollers with the stuff.

I use a synthetic urethane polybutadiene rubber called HTPB R45-M. It is used as a binder in solid rocket motor propellent. It uses an isocyanate type curative like Isonate 143L, PAPI94 or MM103. A couple percent castor oil in the brew promotes cross linking and more natural goodness. You can get the stuff at FIREFOX-FX.COM Beware the curatives are nasty stuff. Some of them also crystalize out below room temp and need to be heated in a water bath to redisolve. They also have a limited shelf life. I always test my curatives on a small batch before doing any real work with them.

CP Technologies (SPACE-ROCKETS.COM) sells a more user friendly curative called Rubinate. They also

have a thinner R20 resin, but I prefer the thicker R45M or R45HTLO. Aerocon Systems is another source.

After painting the drive rollers, I tape them vertically to the edge of a table to cure for 24 hours.

> the printer in my HP 97 [...] prints quite well, but the paper doesn't advance like
> it should. - If I pull the paper then for a while (about 2 lines) it keeps going,
> advancing correctly, after that it just stops.
```

As the others have suggested the problem is prob. that the two soft wheels on either side of the carriage cannot get enough traction on the paper.

To get a better look at what is happening, remove the transparent cut guard (rectangular piece of plastic that tears the paper when you pull it), and look closely into the mechanism. On the end far away from the print head, you should be able to see the wheel that pulls the paper through the mechanism (thats the left-hand wheel, the right hand is covered by the print head when the head is in its home position).

Looking at the wheel, press the PRINTx or PRINT:SPACE. Does the wheel slip against the paper? If so the problem is with the wheels. If the motion of the print head is sluggish, or it does not quite return to the home position, then you have a problem with print head mechanism (in this case lubricating the mechanism may fix it).

If the problem is with the wheels do not use any oil!!!!!

Assuming its the wheels, you may be able to get them back to life without disassembling the machine.

Get very fine sandpaper and cut a thin strip 3mm wide by about 20mm long. The piece should be wide enough to cover the width of a SINGLE wheel (you will treat each wheel separately).

You do not want to get sand paper in front of the moving print head!!!!

Then you remove the paper and insert the strip so that it sits between one wheel (start with the left hand wheel) and the backing plate. Holding the sandpaper so that it does not move, press the paper advance button on the side. The printer will complain a bit, but it should move the wheel against the sandpaper. Press the ADV button a couple of times (so that the entire circumference of the wheel scrapes against the sandpaper.

Repeat with the right hand wheel being very careful to stay clear of the printhead.

Use ONLY VERY FINE SANDPAPER. You do not want to destroy the wheels, just make their surface rough.

**vp

*Message #9 Posted by **marais** on 19 Mar 2006, 6:26 a.m.,*
in response to message #8 by vp

Would you consider 240 fine enough, or is necessary to use paper like the 600 or 1000 used for car paint repairs?

Andreas

Re: HP 97 Printer

in response to message #9 by marais

I used 600 sandpaper, because that was the finnest I had around.

Re: HP 97 Printer

*Message #11 Posted by **David Smith** on 20 Mar 2006, 12:06 p.m.,*
in response to message #8 by vp

When I prepare a printer cam, I remove it from the machine, touch up the edges of the flat spot manualy, and then roll the cam back and forth on a sheet of fairly coarse sandpaper (like 120 grit). You need to put some sideways tension on the cam to keep the clutch open.

You can then try a methyl salicylate based rubber restorer (GC Chemicals Ruber ReNew) or slot car wheel traction fluid, but I have found it does not last long. That is why I have been coating the rollers with HTPB urethane.

How to open 82001A batterie pack

*Message #1 Posted by **Thomas Radtke** on 18 Mar 2006, 9:20 a.m.*

Hi *,

I have this 82001A from a 1973 HP-45. The batteries started to leak (fortunately, I got this calculator before it was too late) so I would like to replace the cells. My question is, are the two halfes of the case glued or is there a mechanism to open it? I found nothing about that on the museum pages. Sorry if I overlooked something.

Thanks,

Thomas

*Message #2 Posted by **vp** on 18 Mar 2006, 10:03 a.m.,*
in response to message #1 by Thomas Radtke

they are glued

Re: How to open 82001A batterie pack

*Message #3 Posted by **Jeff O.** on 18 Mar 2006, 6:01 p.m.,*
in response to message #1 by Thomas Radtke

Only the end seams are joined. The side seams are not joined. Open the pack by repeatedly slicing along one of the end seams with an exacto or other very sharp knife*. Occasionally try to pry the seam apart. Eventually it will split open. I have found that only one seam need be split, then just pry the two halves apart from that end and take out the old cells.

* - be careful with the knife. not responsible for bleeding.

*Message #5 Posted by **David Smith** on 20 Mar 2006, 12:08 p.m.,*

in response to message #4 by Thomas Radtke

Take the pack to your local Batteries Plus or Batteries Etc store. They will open it, rebuild the cells with proper spot welds, seal it back up, dispose of the innards properly. Should be 20 bucks or so. No fuss, no muss, no blood, no guts, no gore.

*Message #6 Posted by **Thomas Radtke** on 20 Mar 2006, 2:00 p.m.,*
in response to message #5 by David Smith

We germans are so little service oriented that I would never have guessed a service like that exists;). Besides, the whole calc was not much more that 20 european bucks:). It was hidden under a thick layer of tar. I had to completely dismantle it for cleaning and even had to taper a wooden toothpick to make the key contacts functional again. It is a great little workhorse now.

Looking for Free42/PocketPC beta testers

*Message #1 Posted by **Thomas Okken** on 17 Mar 2006, 8:02 p.m.*

Hi all,

I'm currently in the middle of development of a new PocketPC front-end for Free42. Based on my current rate of progress, I expect to have a mostly-functional version in two to three days, which may still be missing the printer emulation; a fully functional version should then follow in another day or two.
I usually try to all do my testing myself, but with the PocketPC version I'm in the unusual situation that the target platform is a machine I don't actually own. I do all testing and debugging on the Pocket PC 2003 Emulator, but that means running x86 code, while the "real" PPC version will of course be compiled for the ARM processor -- so there is a potential for problems.
If you would like to help me with this (or just get a sneak preview ;-)), please contact me; you can use the MoHPC message feature, or contact me directly at the email address listed on my web site and in the "About" boxes of all current Free42 versions.

Thanks!

- Thomas

HP 19BII Versions... Beige Keys and Black Keys?

*Message #1 Posted by **Eric** on 17 Mar 2006, 4:43 p.m.*

I have two brand new in blister package HP 19BIIs.. One has beige keys and one has black keys.

What's the differences between the versions- just the color? Both have the back battery compartment. I'm guessing the black is a newer version?

Is one version more desireable than the other?

Thanks! Eric

Little research among HP-35 owners :-)

*Message #1 Posted by **Michael** on 17 Mar 2006, 8:30 a.m.*

There are many very different opinions about the total number of HP 35 version 1 ("Red Dots") ever produced. A rough estimate could be made from serial numbers. HP 35 calculators have serial numbers 1143A XXXXX, with a few exceptions. AFAIK the lowest S/N of still existing HP 35 calculator is 1143A 00007. More interesting would be both the information about the highest known S/N version 1 and the information about the lowest S/N of HP 35 version 2. I know about a version 1 with the S/N 1143A 0324X. If you would be interested in this topic, you could take part in a little research. If you have HP 35 version 1 with a high S/N or HP 35 version 2 with a low S/N, post it here so we could roughly estimate the threshold S/N between HP 35 version 1 and HP 35 version 2

Re: Little research among HP-35 owners :-)

*Message #4 Posted by **Michael** on 18 Mar 2006, 3:54 a.m.,*
in response to message #3 by Massimo Gnerucci (Italy)

Maybe it was just your HP 35 :-) I have seen that image on the net. I have found another red dot with a higher S/N 1143A 3770. Among many red dot's I've seen in real or pictured there was no one with a higher S/N than 03XXX. Frank writes in a previous message he is sure he have seen an image of one with S/N 22000. It would be interesting to find some existing versions 1 or versions 2 below/above S/N 20000 to confirm/refute the 20000 threshold assumption.

in response to message #4 by Michael

I meant a V2 with ser.# 22000...

Re: Little research among HP-35 owners :-)

*Message #7 Posted by **Michael** on 20 Mar 2006, 5:01 a.m.,*
in response to message #1 by Michael

After an investigation I have found references to 2-4 still existing HP 35 Red Dot calculators in every thousand of serial numbers. But no Red Dot was found from 03770 up. I have found various references on the web, but the total number of known Red Dots I've found is only 14. Therefore there are too few data for an accurate statement, but a question arises whether the total number of ever produced HP 35 Red Dot could be higher than 4000. There are even a few HP 35's, which have Red Dot S/N, but in fact are versions 2 or higher. IMO those calculators changed from Red Dot to version 2 during some service repair. Another interesting fact is that among still existing Red Dots many have not the 2.02 ln e^x bug. More data would be appreciated, but due to the rareness of the version 1 it's a very difficult task.

Re: Little research among HP-35 owners :-)

Re: HP-41 emulator for HP-48 on a cell phone

*Message #4 Posted by **Andreas Terzis** on 19 Mar 2006, 12:07 a.m.,*
in response to message #3 by Karl Schneider

Because I love my 41, dislike the 48 which is the only one emulated on the SE platform, whose portability I also love. Therefore, that would be a good way to have my HP-41 functionality with me most of the time.

HP-85 Lineart Program

*Message #1 Posted by **Vassilis Prevelakis** on 17 Mar 2006, 2:09 a.m.*

The following is a graphics demo from the early 80s. I found the C version of it[1] and converted it to the HP-85.

Initially it precomputes a bunch of values (taking for ever, of course) and then starts creating graphics displays. After each display it beeps and waits 5 seconds, then starts on the next one.

The initial wait is long enough that I added a progress bar to let you know that its working, it prints "*" characters over a horizontal bar. When the bar is covered with (about 12) "*" the program is ready to start drawing.

Enjoy!

If you want to produce such graphs on the HP-41 you'd need the HP-7470A HP-IL plotter and the HP-82184A Plotter Module. I am not sure whether the portable printer can really be used for such graphs (or rather let me rephrase, the 82162A probably can print the actual bitmap, but with the 41C driving it, it will take forever).

in response to message #4 by Marcus von Cube, Germany

```
Marcus von Cube wrote:

> can you explain, in a few words, what the SCALE statement does
```

The scale defines the mininum and maximum values of the X and Y axes.

The format is: SCALE Xmin, Xmax, Ymin, Ymax

In this case, since we are using SIN and COS, we define SCALE to be -1,1,-1,1

```
> what the screen resolution of the HP-85 is?
```

The HP-85 screen is rather small (5in diagonal) and supports a text screen (16 lines x 32 characters) and a graphics screen (192 x 256 pixels). Information can exist on both the text and graphics buffers and you can switch between them with the A/C key (alpha/graphics).

```
> We'll probably see a Sharp or Casio version in the future.
```

Shouldn't be too difficult. Its a very easy program to port. If you want I can send you the TurboC version (for MSDOS).

Re: HP-85 Lineart Program

*Message #6 Posted by **Valentin Albillo** on 17 Mar 2006, 6:24 a.m.,*
in response to message #5 by Vassilis Prevelakis

Hi, Vassilis:

Vassilis posted:

"The HP-85 screen is rather small (5in diagonal) and supports a text screen (16 lines x 32 characters) [...]"

> Actually, the physical text screen is indeed 16 lines x 32 characters, but the logical (buffered) text screen in 4 times larger, i.e., 64 lines x 32 characters, and you can page up and down in a continuous way, and enter, edit, or re-execute lines in any of the 4 pages.

Best regards from V.

Re: HP-85 Lineart Program

*Message #7 Posted by **Vassilis Prevelakis** on 17 Mar 2006, 4:43 a.m.,*
in response to message #1 by Vassilis Prevelakis

I *really* should stop posting after midnight! :-)

Anyway there were a couple of problems with the program (namely it won't run on an HP-85 because of the huge array for the precomputed data). So here is a version that actually runs on an HP-85 and some screendumps to show what you should expect to see.

Some explanation about the program. Normally there are 12 functions, with functions 2,4,6,8 and 12 being the same as 1,3,5,9, and 11 but multiplied by -1. (i.e. if f1 is sin(x), f2 would be -sin(x)).

To avoid storing all twelve functions we calculate only the odd ones and then compute the even ones (by multiplying the corresponding odd value by -1) during the drawing (lines 2100 and 2110).

In the following listing lines starting with # are comments. BASIC lines always start with a line number.

```
#        Number of functions
1000 N0=12
#       Number of lines
1010 N1=343
1020 DIM F0(6,343)
1030 RAD
1040 GCLEAR @ SCALE 0,N0/2,0,10 @ XAXIS 0,1 @ MOVE 0,2 @ LABEL "Please Wait"
1050 FOR M=0 TO N0/2-1
```

```
#       Draw progress bar (series of 6 "*" characters
1055    MOVE M+.4,1 @ LABEL "*"
1060    FOR X=0 TO N1-1
1070      ON M+1 GOTO 1110,1130,1150,1170,1190,1210
1110      F0(M,X)=SIN (2*PI *X/N1) @ GOTO 1300
1130      F0(M,X)=COS (2*PI *X/N1) @ GOTO 1300
1150      F0(M,X)=SIN (4*PI *X/N1) @ GOTO 1300
1170      F0(M,X)=COS (4*PI *X/N1) @ GOTO 1300
1190      F0(M,X)=SIN (6*PI *X/N1) @ GOTO 1300
1210      F0(M,X)=COS (6*PI *X/N1) @ GOTO 1300
1300    NEXT X
1310  NEXT M
1400  ! ---------------
#     Return random number between 0 and N (here 11)
1410  DEF FNR(N) = INT (RND *N)
1500  ! ---------------
#     Return -1 is M odd and 1 if M even
1510  DEF FNS(M)
1520  FNS=-1
1530  IF M MOD 2=0 THEN FNS=1
1540  FN END
2000  ! ---------------
2010  FOR C0=0 TO 100
2020    GCLEAR @ SCALE -1,1,-1,1
2030    I=FNR(N0)
2040    J=FNR(N0)
#       if I=J, get a new number for J
2050    IF I=J THEN 2040
2060    K=FNR(N0)
2070    L=FNR(N0)
#       if K=L get a new number for L
2080    IF K=L THEN 2070
2090    FOR M=0 TO N1-1
2100      MOVE F0(INT (I/2),M)*FNS(I),F0(INT (K/2),M)*FNS(K)
2110      DRAW F0(INT (J/2),M)*FNS(J),F0(INT (L/2),M)*FNS(L)
2120    NEXT M
#       You can put a COPY instruction here to get a screendump
2130    BEEP @ WAIT 5000
2140  NEXT C0
2150  END
```

The smaller array means that less data can be stored initially, so some computation needs to be carried out while drawing (lines 2100, 2110). This slows the drawing phase, but shortens the precompute phase, so you only have to wait for 6 stars (*):

http://www.series80.org/Misc/LineArtWait.gif

Here are some actual screendumps from the HP-85 thermal printer. The images look a bit better on the screen.

http://www.series80.org/Misc/LineArtDemo.gif

Re: HP-85 Lineart Program

*Message #8 Posted by **Valentin Albillo** on 17 Mar 2006, 7:08 a.m.,*
in response to message #7 by Vassilis Prevelakis

Hi again, Vassilis:

> Very nice for you to post this piece of vintage software. I remember seeing and running this in absolute awe when I was young, and made several simple improvements to optimize for much needed running speed, among them:
>
> - at lines 1060-1300, the values 2*PI/N1, 4*PI/N1, 6*PI/N1 are invariant within the FOR X loop, so you can save time by simply assigning them first outside of the loop, say:
>
> ```
> Q1=2*PI/N1 @ Q2=2*Q1 @ Q3=3*Q1
> ```

then using these variables within the loop, say:

```
1110 F0(M,X)=SIN (Q1*X) @ GOTO 1300
 ...
```

and the same for the other two. This can be done in 6 places and saves significant time.

- User-defined function calling is very convenient *but* notoriously slow in HP-85 BASIC (and some other HP BASICs as well, HP-71B BASIC comes to mind) so you can save a lot of time by deleting:

```
1510 DEF FNS(M)
1520 FNS=-1
1530 IF M MOD 2=0 THEN FNS=1
1540 FN END
```

and replace the lines where it's called by this:

```
2100     MOVE F0(INT (I/2),M)*(1-2*(I MOD 2)),F0(INT (K/2),M)*(1-2*(K MOD 2))
2110     DRAW F0(INT (J/2),M)*(1-2*(J MOD 2)),F0(INT (L/2),M)*(1-2*(L MOD 2))
```

now, since I,J,K, and L are invariant within the FOR M loop at lines 2090-2120, you can precompute outside the FOR M loop their several appearances and assign them to variables, like this:

```
I2=INT(I/2) @ I3=1-2*(I MOD 2) @  J2=INT(J/2) @ J3=1-2*(J MOD 2)
K2=INT(K/2) @ K3=1-2*(K MOD 2) @  L2=INT(L/2) @ L3=1-2*(L MOD 2)
```

so that within the FOR M loop you only have:

```
2100     MOVE F0(I2,M)*I3,F0(K2,M)*K3
2110     DRAW F0(J2,M)*J3,F0(L2,M)*L3
```

which is much simpler and thus will run much faster.

- Likewise with FNR, simply delete:

```
1410 DEF FNR(N) = INT (RND *N)
```

and replace the lines where it's called:

```
2030   I=INT(RND*N0)
2040   J=INT(RND*N0)

2060   K=INT(RND*N0)
2070   L=INT(RND*N0)
```

this will also run faster.

- Finally, you can concatenate as many statements as will fit in a line, using the @ concatenator, which will degrade readability but will shorten the program listing, decrease its size in RAM, and make it somewhat faster as well.

The resulting program will be shorter and appreciably faster, as you may see.

Best regards from V.

Re: HP-85 Lineart Program

*Message #9 Posted by **Vassilis Prevelakis** on 17 Mar 2006, 2:28 p.m.,*
in response to message #8 by Valentin Albillo

Thanks Valentin for the enhancements.

I didn't want to mess too much with the code, but I should have observed the loop invariants. First write a slow program and then complain about the speed of the processor? Maybe I was an applied physics researcher in a previous life :-)

**vp

PS I was also thinking that rather than filling the array before I start drawing, I should use it to cache computed values. I.e. fill it with an invalid number (say 2). Then every time you come across an entry that is less than 2 you use it, otherwise, you calculate the correct value and store it in the array and then use it. Eventually the array will be populated and the program will run at full speed. However, it may complicate the inner loop so much that it will make the program slow even when the array is fully populated.

You can even calculate these values once and store them in a file. If the file exists, you load it, otherwise you calculate the values and create the file.

BTW has anybody really noticed how SLOW the HP-85B is compared to the HP-87XM (these are the machines I am currently using, but I would expect this to be true for the A versions of these models as well).

Each drawing in the lineart program takes 3+ minutes on the HP-85B, but less than half (1.10 minutes) on the 87. I thought that the memory management hardware on the 87 where supposed to make it a bit slower.

BTW both machines are running exactly the same program. The earlier version (the one on the top of this pafe) that precomputes all values (and runs only on the 87), is slightly faster even though it does not include any of Vallentine's enhancements.

in response to message #7 by Vassilis Prevelakis

Hello Vassilis,

There was a similar, but simpler program from HP in one demo or game disc for the HP85. I remember I wrote a HP41 version using a Tandy 4 color mini plotter printer (was quite commun at the time). I will post it if I can recover it from my archives.

J-F

Here are the HP41 and Basic versions:

HP-41 on an HP200LX...

*Message #1 Posted by **Andreas Terzis** on 17 Mar 2006, 1:42 a.m.*

Hi there, Does anyone know of an HP-41 or any other RPM emulator for the HP-200LX with a graphical interface (non-DOS)? (OK, I won't dare ask for a System Manager compliant one). I have found a lot of those (even an HP-29C emulator) but with a character-based interface. Thanks, Andreas

Re: HP-41 on an HP200LX

*Message #2 Posted by **Mike (Stgt)** on 17 Mar 2006, 2:45 a.m.,*
in response to message #1 by Andreas Terzis

Sorry, I do not know a "200LX-multitasking-able" (SysMan compliant EXM) of an HP41 emulator. But JF Garnier's work so nice, a must as he offers a special LX version. An RPN demo looks quite nice on the 200LX too. Hope this helps too.

Ciao.....Mike

Re: HP-41 on an HP200LX

*Message #3 Posted by **Andreas Terzis** on 17 Mar 2006, 5:27 a.m.,*
in response to message #2 by Mike (Stgt)

Mike, Thanks for the info. I didn't know about all the emulators. Regards, Andreas

in response to message #1 by Andreas Terzis

Andreas,

have you tried the built-in one, set to RPN mode?

No keystroke programming but it has the algebraic solver, TVM and more.

Marcus

Re: HP-41 on an HP200LX...

*Message #5 Posted by **Andreas Terzis** on 17 Mar 2006, 4:37 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Marcus, I have definitely tried the built-in calculator in RPN mode. Of course, I am looking for something more powerful, with more functions on the keyboard, let alone that a lot of times even simple number entry is unreliable - if you press keys fast they don't always register!!! That is the reason I was looking for an emulator. Thanks for your suggestion though, Andreas

Re: HP-41 on an HP200LX...

*Message #6 Posted by **Mike (Stgt)** on 17 Mar 2006, 5:51 a.m.,*
in response to message #5 by Andreas Terzis

Missing keystrokes? Got an old item, I assume, or do you need a DS upgrade (DS=double speed)?? You know http://www.hp200lx.org??? Otherwise: have a nice WE with it.

Ciao.....Mike

BTW: I still wate for a replacement of the 200LX, as the LX once was a replacement of the HP-41 (for me at least).

Free memory on an HP-41CX...

*Message #1 Posted by **Andreas Terzis** on 16 Mar 2006, 8:21 p.m.*

Most of you would have noticed my multiple posts about those 'nice' sellers on eBay recently. In any event, I purchased an HP-41CX that has a 'SIZE 100' set and shows '.END. REG 169' in 'PROGRAM' mode. My HP-41C with four memory modules shows 219 registers. I turn the CX on and off a few times and then it has 156 registers of program memory!!! What is going on here? Any insights?

Re: Free memory on an HP-41CX...

bad memory

is it a fullnut or a half nut?

**vp

Re: Free memory on an HP-41CX...

*Message #3 Posted by **Andreas Terzis** on 17 Mar 2006, 12:25 a.m.,*
in response to message #2 by Vassilis Prevelakis

It's a Halfnut. I reset it and after that it didn't do it again, after 20 times of turning it on and off. It has an Advantage module plugged in it as well as a 'Dbl Mem' module. Do you know of any diagnostics to try?

Re: Free memory on an HP-41CX...

in response to message #3 by Andreas Terzis

> Quote:
>
> as well as a 'Dbl Mem' module

Is this extended memory or standard memory (which *must* not be installed in a CV or CX!)

Marcus

Re: Free memory on an HP-41CX...

*Message #5 Posted by **Andreas Terzis** on 17 Mar 2006, 5:42 a.m.,*
in response to message #4 by Marcus von Cube, Germany

Marcus, That is extended memory. It shows 600 registers after an EMDIR. It is a custom module that contains 2 X-Memory modules. I turned the machine on, switched to PRGM mode and then the machine turned off. When I turned it on, it had fewer program registers !?@&* And since this is a new day and I haven't said it yet today, 'eBay sellers rock... I love it when they take us for a ride ...' Andreas

Other stories: HP-41's on eBay

in response to message #5 by Andreas Terzis

Hello, Andreas --

> Quote:
>
> And since this is a new day and I haven't said it yet today, 'eBay sellers rock... I love it when they take us for a ride ...' Andreas

I sympathize with your difficulties pertaining to your halfnut 41CX, but it should be noted that many eBay sellers don't really know much about the HP calculators they offer. They may not even be aware of problems they should divulge. A seller's expertise can usually be deduced reasonably well from the auction description. Failure or refusal to answer questions gives even more insight. Some sellers do know about their product, and are also very upstanding. You can expect to pay more to win their auctions, because other buyers recognize it.

My personal experience buying two fullnut 41's through eBay has worked out fairly well, all things considered.

- The first was a cosmetically- and mechanically-excellent 1984 41CX that sometimes worked, but frequently malfunctioned after I received it via US airmail. Since the calc was described in the auction as fully functional, I offered the seller a choice of letting me keep it for for a substantial refund (I really didn't need or want a "parts machine"), or taking it back a nearly-full refund. The seller let me keep it at a very low price, but eight months went by before I discovered Randy's business at "www.fixthatcalc.com". Ultrasonic cleaning and some resoldering made it function perfectly, for a very reasonable price. I was so pleased with the outcome, I then sent supplemental payments to the eBay seller amounting to the $150 eBay auction selling price, less repair costs, in order to pay him what the CX proved to be worth.

- The second was an 1980 41C that had seen heavy use in a lab -- very dusty in the auction pictures, and with velcro pads on the back for wall mounting. It sold for around $50, due to the poor cosmetics. It also malfunctioned upon arrival as the CX did, but had not been described as functionally perfect, so I did not complain. I sent it to Randy, and he performed the same cleaning/resoldering service, inside and out. Now, it's a virtually-perfect unit -- a fine example of the improved 2nd-year US-made HP-41, with no hard-to-read "tall keys" or bugs, a solid feel, and the most legible display.

The moral here is *"caveat emptor"* -- let the buyer beware (and assume some risk of additional expense if things aren't quite perfect).

Regards,

-- KS

Cleaning an Hp41C

*Message #1 Posted by **Xavier LaRue** on 16 Mar 2006, 4:46 p.m.*

Hi there,

I recently buyed a hp41c + Quad mem and X function, but I don't know what hapened but when I received it is has like 1 inch of dust and other thing on it.. I clean it with rubbering alcool + q-tips but under the protective screen there still a lots of dust.. so my question is , how to open it.. also I have one key that don't click anymore and is a little bit harder to get entered correcly, so, do opening the calc will enable me to help this problem too,

So do somone have picture of how to open a FullNut starting with 20 and tips on how to clean the calc...

Thank you all, Xavier LaRue

Re: Cleaning an Hp41C

*Message #2 Posted by **Andreas Terzis** on 16 Mar 2006, 7:32 p.m.,*
in response to message #1 by Xavier LaRue

Xavier,

I have had the same problems in the last couple of months with machines I bought from 'crooks' on eBay (sorry friends - it's the most polite word I can use). In fact I recently bought a 'MINT' HP-41CX only to find it had tons of scratches on the sides, matte (non-shiny) keys probably from overcleaning, and the 'clean without corrosion' battery contacts to be FULL of corrosion!!!

In any event, I have read posts from before where people used 409 cleaner on the keyboard. You can open the machine by taking the four pads on the bottom off and unscrewing the four screws. There are some posts lately to me, suggesting to be very careful with HP-41C and HP-41CV machines, where HP-41CX machines are easier. The colleagues were suggesting to be careful with the former ones as the boards internally need some pressure to stay together. In fact, later machines that were Halfnuts (even HP-41CVs) would not be difficult to open. (Halfnuts are the ones with the rounded edges on the display - you probably don't have one of those).

Once you open the machine you can use distilled water and a Q-tip to clean the circuit boards inside. I would use some 'Dust Off' myself as well. That is the can that has some kind of condensed chemicals (difluoroethane). As far as cleaning the battery contacts, there was some discussion recently that one could use lemon juice or vinegar, and coat them with butter from what I understand. I just used lemon juice and a Q-tip and it cleaned most of the base deposits on the battery contacts of my machines (about 90%). I think the relevant post was called: 'Battery leakage and cleaning' but for some reason I cannot seem to access it, maybe due to the passworded changes to the site that were implemented lately by Dave Hicks; he can comment if that's the case.

I hope that helps a little bit. Good luck, Andreas

Re: Cleaning an Hp41C

*Message #3 Posted by **Klaus** on 17 Mar 2006, 3:01 a.m.,*

in response to message #2 by Andreas Terzis

I think it was me who said something about butter. DO NOT DO THIS! You can do this on a car's battery, but I would not do it on a 41C.

Also do not scrape the battery contacts, they are just thin foil!

Btw, repairing broken keys is not as easy as on the classic model

Edited: 17 Mar 2006, 3:53 a.m.

Re: Cleaning an Hp41C

*Message #4 Posted by **Xavier LaRue** on 17 Mar 2006, 7:09 a.m.,*
in response to message #3 by Klaus

So the point it,

Until it's completly broken.. don't fix it ?

Xavier LaRue

Re: Cleaning an Hp41C

*Message #5 Posted by **Klaus** on 17 Mar 2006, 11:12 a.m.,*
in response to message #4 by Xavier LaRue

Key malfunction due to dirt => fixable

malfunction due to broken domes (the key is lower than other keys) => bad luck

The reason: You do not have access to the keyboard contacts. The whole keyboard assembly is fixed with heat-stakes to the front plate of the case. Maybe professionals can fix broken keys (fixthatcalc.com).

Re: Cleaning an Hp41C

*Message #6 Posted by **jbssm** on 18 Mar 2006, 9:55 a.m.,*
in response to message #1 by Xavier LaRue

Hi,

I also have had some problems with the 41C Series ... my advice is, try to get some pictures of the calcs you are buying on eBay, you can immediately tell the condition of a unit pretty surely by how it looks on a good picture ... and don't forget to ask a picture of the battery contacts.

Anyway, also on the spirit of this topic, does anyone have a good method to access the keyboard on the 41C series? Like a member said the circuits are pinned to the front plate by heat stakes, so does anyone found a good method of removing then and the put all back?

Regards, jbssm

Using Quad memory w/ 41cx

*Message #1 Posted by **Mike Smith** on 16 Mar 2006, 2:37 p.m.*

Is the 41-c series quad memory module compatible (useable) with the 41cx?

Re: Using Quad memory w/ 41cx

*Message #2 Posted by **Eric Smith** on 16 Mar 2006, 2:44 p.m.,*
in response to message #1 by Mike Smith

No. The 41 family can only address one of those, and the 41CV and 41CX have it built in. They already have the maximum "normal user memory". Don't put the Memory or Quad Memory modules in a 41CV or 41CX, as they will not work correctly, and there is a small chance that the modules or the 41 could be damaged by bus contention.

The 41CX has the "Extended Functions Module" (XFM) built in as well; that contains 127 usable registers of Extended Memory. You can add one or two Extended Memory modules in the ports; each one adds 238 usable registers of Extended Memory. Note that there are some restrictions on the arrangement of the XMEM modules in the ports.

Extended memory is accessed by the Extended Functions, so it doesn't work in the same manner as normal user memory. It stores files, so you can think of it as being similar to a ramdisk. You can store programs or data in it, but you can't access it directly (except by complicated synthetic programming tricks).

Re: Using Quad memory w/ 41cx

*Message #3 Posted by **Mike Smith** on 16 Mar 2006, 2:55 p.m.,*
in response to message #2 by Eric Smith

Eric, thank you for your very thorough and very prompt response. I fully understand not to use this module on my 41-cx calculator. this site (and your response) is a great resource - thank you once again!

How to test the printer 821612A

*Message #1 Posted by **Chiu Yiu Wai** on 16 Mar 2006, 9:00 a.m.*

My frined give me hp 821612A printer for gift , do anyone know how to test it , or do it have selftest , if the printer has any problem do anyone can fix or repaair it??

Re: How to test the printer 821612A

*Message #2 Posted by **Eric Smith** on 16 Mar 2006, 4:23 p.m.,*
in response to message #1 by Chiu Yiu Wai

Assuming that you mean an 82162A, I think there's a self-test if you hold down the print button while you turn it on. Or maybe it was the paper advance button. Or maybe I'm confused. But anyhow, it's worth a try.

HP & RPN

*Message #1 Posted by **Antonio Maschio (Italy)** on 16 Mar 2006, 5:11 a.m.*

Hi everybody.

I want to know your opinion about this matter: HP & RPN

In the past years, HP was the leader in the calculators markets, and its machines were quite all RPN-based. If you wanted a calculator featuring RPN, you *had* to buy a HP product. Any other RPN products were hardly seen on the markets. Furthermore, Casio, Sharp and Texas Instruments produced only algebraic calculators, with more or less success, but the leader was HP.

Nowadays HP produces quite only algebraic calculators (of course, "produces" is a strong word, since all the calculators are made-up in China or so), and in its stock there's only one pure RPN calculator: HP 12C, a financial calculator; its follow-on, HP 12C Platinum, features both methods. The last pure scientific RPN based calculator was HP 32SII, and now it's gone; its follow-on, HP 33S, features both methods (and it's worse in quality).

Surely RPN is more difficult to learn than algebraic input, but only for the first, say, 2 days. Then it's faster and easier to use; RPN users get to the point that they cannot use algebraic machines again after they've learned RPN (I'm one of them).

Surely, intelligence is not lowering down, these days. And surely, people of the Seventies and Eighties were not more intelligent than people today (I hope). So I guess that people today *can* use RPN with no problems for their calculations. Do they *really* prefer algebraic machines? Or algebraic machines are their only choice?

And now the questions: 1. If HP once believed so much in RPN, why not today? 2. If HP once sold a lot of calculators and was the leader, why not today? 3. If we suppose HP gave up with calculators as a leading product, but still believing in RPN, HP calculators today should be pure RPN. Or should we suppose that HP gave up with RPN too? 4. Is RPN something that should be suggested/proposed to people, instead of producing calculators that are merely copies of TI or Casio products? I mean, is HP in the position to produce those golden years RPN calculators again, without being affected by "what will people say?" or "people won't buy this: it's too difficult!" ? 5. If today HP sold only RPN calculators, do you think it would sell less?

In other words, is there a link between RPN and HP leadership?

I wait for your opinion.

-- Antonio

P.S. Of course, one could cite the fact that previous calculators were better-designed and more robust (e.g. HP 11C and all the voyager/pioneer series), while today's calculators are probably worse, and not so robust (e.g. I own both HP 33S and HP 49g+: they are very cool, but got half the appeal of the voyager/pioneer ones); is this a consequence of the fact HP quite abandoned calculator markets (and/or that calculators are made up in China)?

Re: HP & RPN

*Message #2 Posted by **Valentin Albillo** on 16 Mar 2006, 6:24 a.m.,*

in response to message #1 by Antonio Maschio (Italy)

Hi, Antonio:

Some comments, as per your request. All that follows, IMO:

"Surely RPN is more difficult to learn than algebraic input, but only for the first, say, 2 days. Then it's faster and easier to use;"

> Strongly disagree. That's a myth, absolutely unfounded nowadays and 10 to 15 years earlier as well. This myth was once true, when algebraic input meant jurassic TI-style, i.e., one-line numeric display, no way to see your expression whole at a time, no way to correct for entry errors, no way to know if your parentheses were matched or not, etc. That was forced by the hardware and prices possible at the time, and RPN was so much better and elegant, not to mention it was the only possible solution for the limited hardware and desired functionality.
>
> Later on algebraics got bigger screens, sometimes much bigger (SHARP PC-1350's 4-line x 24-char display comes to mind), fully alphanumeric, you could see your whole expression at once, you could enter it essentially as written, no danger of losing data because of too many pending operations, you could edit it at leisure before pressing [ENTER] and also *after* computing the result, recalling the whole expression back for edition or trying out alternatives, or continue with new expressions that would chain to it, etc.

"RPN users get to the point that they cannot use algebraic machines again after they've learned RPN (I'm one of them)."

> I'm not. I'm every bit as proficient with RPN as with advanced algebraic models, always have been. The users you mention are the ones that truly believe in the myth, they're actually *blinded* by it, and are unable and unwilling to get out of the RPN grip. They can't objectively evaluate algebraic systems because of their inherent dislike and even despise of them, they associate "algebraic" with "four-banger" and tremble at the mere thought of not having RPN at hand. They've become RNP-fundamentalists, a kind of harmless fanatics, even addicts. A real pity. But harmless. And they tend to self-extinction.

"Surely, intelligence is not lowering down, these days. And surely, people of the Seventies and Eighties were not more intelligent than people today (I hope)."

> You're equating "intelligence" with "using and advocating RPN". Personally, I consider this insulting, unfounded, and unfair; matter of fact, perhaps you should re-evaluate at what side of the line intelligence lies. If being an RPN-addict, unable to even contemplate using any other system but their obsoleted one, is to be considered more "intelligent" than profitably using both RPN and algebraic, or even rationally chosing algebraic outright, then it seems to me that your definition of "intelligence" doesn't agree with mine, by far.

*"So I guess that people today *can* use RPN with no problems for their calculations. Do they *really* prefer algebraic machines?*

> Of course. Only a fool would seriously think that everyone but himself and his tribe are the fools. People, when given the choice of using obsolete, inefficient RPN style calculations (not to mention RPL) or a decent, advanced algebraic do not hesitate in the least. They do use algebraic.
>
> As a test case, my own daughter, Laura, knows how to use both, RPN and algebraic. But whenever she must do some calculation, for her homework for instance, she always grabs her SHARP PC-1350, because she fully realizes this is to her own advantage. She would run rings around you and your RPN calculator of choice for anything remotely non-trivial.

"If HP once believed so much in RPN, why not today?"

> Because it doesn't sell, at all, and HP is not a charity but tries to earn money for its shareholders.

"If HP once sold a lot of calculators and was the leader, why not today?"

> Because formerly engineer and professionals were the biggest market for the very expensive advanced calculators available, as there were no remotely affordable PCs then. Later on, every engineer and professional worth their salt switched to PCs and laptops, so the biggest market for calculators was educational. And there, TI and the rest or firms had already introduced themselves a mile thick, specially to teachers and authorities. Trying to enter that market with obsolete, arcane RPN systems was doomed to failure from the start.

"If we suppose HP gave up with calculators as a leading product, but still believing in RPN, HP calculators today should be pure RPN. Or should we suppose that HP gave up with RPN too?"

> Of course. What makes you think HP (or anybody else) is a fool ? RPN is obsolete, and RPN doesn't sell to the masses or even to minorities. Only to people *forced* to use it for technical exams, or used to its past glory, gone long since. Such diehard old-timers will be eventually gone too, they're a vanishing market.

"4. Is RPN something that should be suggested/proposed to people, instead of producing calculators that are merely copies of TI or Casio products?"

> RPN's only place is in a museum, like this one for instance. Using it dooms you to inefficiency and to plain obsolescence. Using it in class can be your number one headache if you're a student, and can certainly lower your grades and put you at a serious disadvantage if you stick to it long enough.

"5. If today HP sold only RPN calculators, do you think it would sell less?"

> Apart from the RPN HP-12C, popular among business people, and the HP33S, forced for people taking exams, they would sell nothing.

"In other words, is there a link between RPN and HP leadership?"

> I must be specially dense today because I don't even understand your question. HP was never "leader" because of RPN, but because of their overall quality. In the past, RPN was the best possible system given the hardware, a real godsend. Then RPN was quality. Now RPN is nothing, a jurassic system which has outlived its usefulness. Embracing RPN now would be tantamount to irrelevancy and sinking into oblivion even faster.

Best regards from V.

*Message #3 Posted by **Thomas Okken** on 16 Mar 2006, 6:45 a.m.,*
in response to message #2 by Valentin Albillo

RPN is obsolete? RPN belongs in a museum?
Hmmm, well, let's see. Say I just finished some calculation. The result is in the display. Now I want to add 1 and multiply by 4...

```
1 + 4 *
```

How much is 5 over that?

```
5 X<>Y /
```

I could go on, but I expect the point is clear. This kind of interactive playing with numbers is easy and intuitive with RPN. On any algebraic, the same operations always take more keystrokes.
That's what people like about RPN, and the fact that that doesn't sell any more is because nobody knows about it any more. I suppose you could make the point that the only reason why RPN ever did sell is because in the days of yore, you had no choice: if you wanted a powerful, well-built calculator, HP was the only game in town, and HP meant RPN. A whole generation of engineers got RPN shoved down their throats -- and ended up being thankful for it.

"Harmless fanatics", indeed. Give us a bit more credit, pal. :-)

As for me, there is nothing that beats my HP-97 as the standard desktop calculator for my work. And RPN is one of the 5 major resons for that.

I wonder why some get so emotional about this. It's only a calculator ;) (I can see my friends looking surprisingly at me right now).

Yes, I'm serious. I'm happy for all those who have "seen the light" and are now leading happier and more prosperous lives as AOS users, but some of us actually add 1 and multiply by 4 every now and then, and appreciate how easy RPN makes such tasks.

Yes, Valentin, I did read your post carefully, and I'm disagreeing with your contention that RPN is obsolete. Instead of trying to dismiss my remarks by labeling them as "mantras", how about trying to prove me wrong? Let's see you do my examples with fewer keystrokes on an AOS machine, 71B, or whatever.

Hi again, Thomas:

Thomas posted:

"Yes, Valentin, I did read your post carefully, and I'm disagreeing with your contention that RPN is obsolete."

> You may disagree as much as you want. "Eppur" it *is* obsolete".
>
> RPN was good and okay when machines were so *limited* in hardware resources, most specially RAM, that there was no way they would execute some expression as written, just too many pending operations, too many registers needed to hold operands and operators, too difficult and expensive to parse the input into something internally executable and redisplayable afterwards, too difficult and expensive to allow for extensive recall and edition capabilities, not to mention alphanumerics and named variables.
>
> That being so, an elegant and workable solution was found: *to split the work in half*: the machine would actually do the calculations, one at a time, operating with numbers in a stack in a simple manner, and the user would be in charge of reading the expressions, parsing them into the RPN form the machine expected, then entering operands and operators following his/her human-produced RPN parsing. This collaboration saved much ROM and RAM, the final result was impressive in terms of efficiency and overall productivity, and everyone was happy.
>
> But time passes by, and ROM and RAM became cheaper, alphanumerics were

commonplace, processors got faster. Now, having the *person* do the parsing and processing into RPN was no longer justifiable. The machine could read the expression as entered, do the parsing, place the arguments and operators into their proper internal places no matter how many were pending, and execute it all very fast. The machine would also recall the whole input, operands and operators and all for easy editing and reexecution if needed or chaining if desired. No need for the person to do these annoying *chores*, no need for the person to rethink the expression mentally to cater for necessary *reordering* to avoid overloading the stack.

In other words, the machine now does all the work for me. *I don't care at all* where it places the numbers and operators or how does it arrange them internally, nor would I've ever wanted to do it myself were it not for the fact that the old alternatives were far worse. Would you write your programs in assembler, to take care of every little bit, all the time ? Or would you rather let the compiler do the hard work, and let you *concentrate* in what matters, your *work* ? Same here.

Why on earth would I care for whether this or that thing is in Z, or T, just about to get lost or not, or whether I need an X<>Y or ROLLDOWN to place this or that operand at its proper position in the stack, for it all to work ? Wouldn't it be much better if those *internal, low-level chores* get assigned to *low-level brains*, such as the processor's while my higher-level brain is dedicated to the algorithm or *work* I'm trying to do ? Would you prefer to be thinking about currents and circuits or about stack levels ? Think about beams and stress or about LASTX ?

That's why most people nowadays give RPN a miss. Would *they* consider doing part of the work for the machine ? No way.

"Instead of trying to dismiss my remarks by labeling them as "mantras", how about trying to prove me wrong? Let's see you do my examples with fewer keystrokes on an AOS machine, 71B, or whatever."

See, Thomas. I don't know how long have you been frequenting this MoHP forum but this topic has been discussed an incredible number of times, and I've said all I have to say so many times before that I'm *not* for repeating time and again the same arguments. Do you think you're the first one to say what's quoted above to me ? You must be the *one-thousandth* at the very least !

And it's useless. Like religious issues, you can never convert an RPN addict. They only see their mantras: *"fewer keystrokes ... fewer keystrokes ... fewer keystrokes ..."*. It doesn't cross their minds that keystroke-counting might *not* be the most important measure of the capability and/or productiviy and/or ease of use of a computing paradigm. They think they know that "... fewer keystrokes ..." is their system's good point for sure, and *don't ever consider* the possibility that perhaps that's *not true*, or even if true, that *it might not matter that much* compared to other advantages or disadvantages.

Am I going to waste even more of my time trying to convince you (as a thousand others), or giving you examples for the 1000th time ?

Do your own homework. Search the archives. Convince yourself. Or not.

Best regards from V.

If you do not wish to discuss his point or if you think you've already done it elsewhere then please give him/us a short note about it or don't post at all. No one wants to read dismissive remarks on serious contributions.

I certainly do not wish to get a reply to any of my contributions with the subject changed to 'don't make me laugh' or something similar. I won't make this an issue but you really carry this to excess these days. I was interested in this thread and want to follow it. I am interested in your opinion, too. But it makes me sad to see that every thread containing contributions you dislike gets screwed up.

No offense intended, just a plea for a more moderate attitude on your side.

Thomas

It seems to me that that is precisely what you *are* doing.

You state that present-day technology makes AOS much better than it used to be in, say, the TI-59 days. I agree.
You also state that RPN was used in earlier HP calcs because the technology of those days simply didn't support anything significantly better. I think that's probably true, too.

But why criticize people who *continue* to use those older technologies?
The reason why I usually walk to the grocery store, instead of taking the car, is because the grocery store is 100 meters from my front door -- not because I'm unaware of the advantages of the automobile.

> Quote:
>
> Like religious issues, you can never convert an RPN addict.

Like religious issues, you can never reason with an RPN hater? It's fine that *you* don't care about the fact that AOS requires more keystrokes, but you should maybe just learn to accept the fact that there are people who *do* care about that metric, and also accept that those people are not simply too dense to appreciate your point. They have a perfectly valid

point of their own.

The analogy I like is stick shift versus automatic transmission. Try making the following statement in any bar, at about 6:00 PM on Friday night:

> Quote:
>
> *There's absolutely no reason to use a stick shift anymore. Modern automatic transmissions do a far better job of gear selection under any set of conditions you can name.*

And stand back while a furor not unlike the one we have just seen kicked up here gets going.

The statement may (or may not) be factually true. It has little to do with which type of transmission people prefer.

Regards
Howard

Well, you certainly have a high opinion of yourself. Or a pretty low one of me, I'm not sure which.

> Quote:
>
> On the reverse side of the coin, I wonder if you have that much experience using to the fullest modern algebraic systems, knowing their every trick and technique, to the point that you can make a rational and

> knowledgeable evaluation of their merits when compared to RPN.

So, your point is, you've been using calculators for a long, long time, and that must mean you're right and everyone who disagrees with you is wrong.
You are so convinced that your truth is the only one, that from my defending RPN, you immediately jump to the conclusion that I must have little or no knowledge of anything else:

> Quote:
>
> The bottom line is: I find it deeply irrational that many people who just know the one system, and have barely scratched the surface of the other system, if at all, feel nevertheless in possesion of the truth and claim it loud and clear for the world to know while adamantly refusing to make a reality check by getting to know the other system, to see by themselves if their claims hold or not, instead of taking refuge in their comfy beliefs of superiority. That's akin to self-inflicted blindness and seems most irrational to me.

You don't know me at all, and you have no way of knowing what the extent of my knowledge and experience in the calculator field might be. Of course, the strange thing is, that it doesn't even matter. I pointed out that RPN is keystroke-efficient. I claim that there are people who value that property, who find it natural and intuitive to enter numbers first and operators last, and who don't mind that they have to keep track of the order of evaluation themselves.
Whether I have written 10,000 lines of RPN code in my life or 10,000,000 makes no difference as to the validity of that point. I could brag about all the Java and C++ code I have written, for fun and for profit, or about my prize-winning pumpkins, and it would make no difference to the topic we were **actually** talking about.
(I'm kidding about the pumpkins.)

You are, of course, under no obligation to address, acknowledge, or even agree with my defense of RPN. As I said before, if you like AOS better, good for you. But the way you try to sweep my RPN defense off the table by trying to make me look like a clueless, ranting fanatic is just plain rude.

> Quote:
>
> Nevertheless, my apologies if anything I posted did offend you or anyone else, as it certainly wasn't my intention.

That apology would sound a little more sincere if it wasn't accompanied by even more insults, but it will have to do, I guess.
Apology accepted.

Now, back to work on the PocketPC version of Free42. Yes, an RPN calculator simulator, and hey, maybe I can spark off another flame war by mentioning I always write my code using **vi**.

(I'm kidding -- about the flame war, that is. :-))

- Thomas

P.S. Anyone who is interested in beta-testing Free42/PPC, please drop me a line. I have no PocketPC myself, so I have to do all testing on a simulator; I would like to confirm that the new version works on a *real* PocketPC before I put it up on my web site.
Thanks!

RPN & command-line AOS

*Message #13 Posted by **Karl Schneider** on 17 Mar 2006, 1:56 a.m.,*
in response to message #7 by Valentin Albillo

Hello, Valentin --

Taking up the devil's-advocate argument against RPN again, I see! I would question how earnest your statements actually are. After all, if RPN were so primitive or loathsome, the attributes of HP's (former) high quality, robust mathematics, and top-notch documentation couldn't possibly have overcome it. But, I'm game for the "challenge of the argument".

I agree with the Thomases -- RPN will never be obsolete in handheld calculators, which tend to have limited, but easy-to-read displays. RPN beats old-fashioned AOS hands down, as everyone here would agree. However, calculators with command-line algebraic entry (AE) don't truly fulfill their objective.

The AE concept is straightforward: Allow the entry of entire expressions exactly as they appear on a working paper or in a book. When complete, the expression in the calculator's display can be quickly and easily compared to the printed one, then deemed correct, or edited if not. Then, the user evaluates the expression and obtains the final answer. No parsing or organizing by the user is needed. Simple enough?

Unfortunately, the approach doesn't work as well as intended, because *the expression in the display generally doesn't match the expression on the page:*

- The display isn't wide enough to fully accommodate longer expressions without scrolling or wraparound.
- Low dot-matrix resolution produces poor-quality superscripting and no subscripting.
- Parentheses are used in place of the brackets and braces employed to distinguish nested expressions.
- Function names are used in place of "typeset" symbolic representations.

So, the user is looking at the truncated expression in his display -- which might display "COMB(5,3)" or "5C3" in place of parenthesized 5 above 3, as well as groups of unmatched parentheses in place of matched braces and brackets -- and is then expected to ascertain whether it is correct. In an act of faith, he then hits "=", "ENTER", or "EVAL", and obtains a final result that was delivered without ever having paused at the way stations of intermediate results.

This approach hardly engenders my confidence. With RPN, however, I see each result as it is performed. On some alphanumeric models (41C, 42S, 32S, 32SII, 33S), I can even see the name of the operation before it is executed. Also, it is easier to combine the results of previous calculations.

Every AE system I have tried -- the HP-71B, equation editor on the HP-27S and HP-17B/BII, algebraic expressions on the HP-28/48/49, the Casio fx-115MS ("Visually Perfect

Algebraic Method"), as well as the TI-86 and TI-89 -- suffers from one or more of the listed shortcomings. I know that there are other AE calc's from Sharp and Casio, but I also doubt that any of them achieves the ideal. It may be that only the high-end graphical PC software for mathematics -- e.g, Mathematica or Maple -- can meet the standard for elgeant symbolic representation of mathematical expressions.

This brings me to something more fundamental: The slogan "Just like you'd do it on paper" has been used to tout both RPN and AOS calc's. The statement is true for both in a certain sense, but it needs to be clarified:

- AOS mimics how the expression is *written* on paper, letting the user simply keystroke exactly what he sees.
- RPN, however, provides the true approach one would take to actually *compute* the expression on paper.

The distinction is significant. Assume that one is presented with a complicated expression -- such as the Mach number equation -- and is asked to solve it without using any electronic computational devices. Only a slide rule or Curta, trigonometric and logarithm tables, and pencil and paper, are permitted.

What to do? Start on the inside, where the operands are ready for evaluation. Then, work outward on both sides, one operation at a time. This is the RPN approach. The final result can be trusted, because each step was quality-controlled for reasonableness.

In the absence of a validated and debugged equation or program -- or a look-up table -- to provide the answer, this step-by-step method is the soundest approach to such a task.

Of course, the above is not a revelation to any of us, but it explains just why *RPN will never become obsolete*.

So there! :-)

Best regards,

-- KS

Re: HP & RPN

*Message #14 Posted by **Gene** on 16 Mar 2006, 9:15 a.m.,*
in response to message #2 by Valentin Albillo

Wow. We might as well be discussing religion. That would bring up just as heated a set of disagreements for sure! :-)

1) I agree with Valentin that the current "equation" style of entering long expressions in algebraic syntax has rendered some of the RPN/ALG argument moot. If you are solving something already written down, then the extra keypresses required for parentheses in these modes is more than offset by the ability to visually see the exact full expression and know that it contains all the operators, correct numbers, etc. If the calculating device also has a "command stack" ala HP71B style, that allows you to recover previous results, edit them and then re-evaluate them, all the better. The HP71B's CALC mode was also a very useful solving environment that I liked a lot.

2) I do not see why it matters to any of us whether HP produces RPN only machines vs. those that have both modes. Why do I care if HP produces the 33S with RPN and ALG modes? If that leads to more sales than RPN only, then that is a positive thing, IMO. I am certainly not a purist in this regard where I view the inclusion of ALG modes as some sort of betrayal (full disclosure...I am the one who added the algebraic mode examples to the HP12c platinum owners manual...and believe that is one of the better decisions HP has made).

3) If we are talking non-command line, typical AOS style entry vs. RPN, then a) RPN wins in terms of keystroke usage - you can solve a large majority of problems faster with fewer buttons pushed. b) RPN requires the user to preview the problem and evaluate where to start the processing. That's not always a bad thing, but it does require some effort on the user's part. c) Some of the examples the RPN community has used to showcase the wonderful nature of RPN (think of the mach number problem) have exaggerated the benefits of RPN. For example, it is possible to completely solve the mach number problem on a TI-30 from 1978.

d) RPN/ALG machines HP makes: HP12c platinum, HP33S, HP17bII+, HP48gII, HP49g+

e) Personal: what do I reach for when I have to compute something? My HP12c, since my computations are usually financial in nature. Why not use EMU-something? Because given the nature of the company I work for, we are by-and-large an Apple shop and those run on Windows. Otherwise, I might. :-)

So, I certainly feel that Valentin is very on the spot with machines that have a built-in mode such as he describes. However, if the machine only has RPN vs. classic AOS (which still exists on many machines), then I do still feel that RPN wins for speed.

Re: HP & RPN

*Message #15 Posted by **Valentin Albillo** on 16 Mar 2006, 9:43 a.m.,*
in response to message #14 by Gene

Hi, Gene:

Gene posted:

"So, I certainly feel that Valentin is very on the spot with machines that have a built-in mode such as he describes. However, if the machine only has RPN vs. classic AOS (which still exists on many machines), then I do still feel that RPN wins for speed."

> Agreed, I think the same. But since circa 1980 there's been all kinds of powerful and very small (HP-15C size or less) command-line, fully-alphanumeric algebraic machines available, so if we're debating RPN vs algebraic, it's only fair that we compare similarly advanced models, not a 33S vs. a $0.60 four-function banger. Else we could as well use some primitive 3-level RPN models, or some Sinclair RPN calculators, with their weird RPN stacks and terrible stack manipulations, right ?
>
> Comparing an advanced RPN calc versus a four-banger algebraic is like a heavyweight vs. a flyweight, i.e., not fair, not allowed, and doesn't prove anything. Against a proper command-line algebraic, HP-71B-style or so, RPN has little to do.

Best regards from V.

Re: HP & RPN

*Message #16 Posted by **Gene** on 16 Mar 2006, 10:14 a.m.,*

in response to message #15 by Valentin Albillo

True.

Personally, I wish HP had kept the "CALC" mode from the 71B. Joe Horn even once wrote an article in the PPC Journal titled "CALC > RPN" and I think he had many good points.

Now, back to my 12c. :-)

Re: HP & RPN

*Message #17 Posted by **Garth Wilson** on 16 Mar 2006, 12:15 p.m.,*
in response to message #2 by Valentin Albillo

Wow-- someone must have given Valentin yesterday's coffee for breakfast this morning! I'm disappointed. I won't address every point though.

The RPN v. AOS reception seem to have a lot to do with how an individual thinks, and may have partly to do with one's native language. In English, we say "buy food" for example with the verb preceding the object. Not so in Korean, where sentence structure is different and makes RPN seem very natural. I know this affects the reception of Forth, which seems all backwards to English-speakers, but not to Koreans. Although my first language is English (followed by Spanish and finally French), I was glad to find both RPN and Forth and get rid of those piles of parentheses and the pressure to go left to right when I don't think that way! I have both an HP41cx and an HP-71 within easy reach; and although the 71 is far more powerful, I much prefer the 41 as a calculator. The 41 & Advantage module is more clumsy with complex numbers so I usually reach for the 71 there, but it's not because of the algebraic entry. And I can hardly stand the 71's CALC mode!

The comparison I have made to people asking about the different approach is that algebraic shows what equation you're performing, while RPN shows how you get there. Both are valuable, but I usually prefer to put the algebraic form in the comments (if at all) and the RPN in the program.

As far as HP goes, I think they've just succumbed to the modern "instant gratification" mentality-- cheap, cool, no manual-reading, with no concern for tomorrow relating to durability or anything else.

Re: HP & RPN

*Message #18 Posted by **Jan** on 16 Mar 2006, 12:17 p.m.,*
in response to message #2 by Valentin Albillo

Pretty harsh attack on the RPN community. Take a valium, or (even better) a glass of good italian red wine: it's only about calcs you know. Yes, I am an RPN-dinosaur myself and I will continue to be. Or should I say I am an RPN-crocodile, after all crocs "walked" with dinosaurs and still refuse to go extinct today. I deal with AOS (oh folks I am so fit for the 21st century) and RPN in an equally easy way, although I prefer RPN for its flexibility. RPN is just more usefull for the "medium" calculations by hand I would say. No burden with counting parentheses such as when I am writing a computer-code in some (non-forth) programming language. There is also an educational benefit: you learn to read, interpret and understand complex formulas instead of retyping them on an AOS calc or PC. Unless you want to become a secretary it therefore can be very educational for kids at school. RPN obsolete? Come on, (RPN-based) forth is still THE language for embedded systems and will continue to be. Calcs only for school kids? No way, I am a scientist and my device is that if you cannot say at least something about a physical phenomenon with a piece of paper and a handheld calculator you don't have a clue about what is really going on. First write down a simple approximation, the true number crunching comes later.

Re: HP & RPN

*Message #19 Posted by **John Nguyen** on 16 Mar 2006, 2:45 p.m.,*
in response to message #2 by Valentin Albillo

My Jesus is better than your Mohammed.

My Linux OS is better than your Windows OS.

My HP calc is better than your TI calc.

RPN is better than AOS.

What's the best food? Movie? Music?

These are just some of the imponderables we face. However, to "dis" RPN in an HP forum is just madness. :) This can't be the reasonable and dispassionate Valentin Albillo of yore; must be his evil twin.

John

Boxers or Briefs

*Message #20 Posted by **TF** on 17 Mar 2006, 1:27 p.m.,*
in response to message #19 by John Nguyen

RPN or AOS is sort of like Boxers or briefs. For a lot of us, what we wear was determined in a decision that was made a long time ago. And while they both perform their functions just fine, we certainly prefer one over the other. People can argue that one is better than the other with medical studies or other data to support those positions that one is better than the other. While it might be possible to make the switch form one to the other, most folk don't, and don't care to hear from others that they should switch.

On a slightly more serious note, AOS or RPN is a language of math for the calculator. Maybe somewhat analogous to the language we speak. While some folks can speak several languages, one is their native tongue and they are most efficient at speaking that and conveying the ideas they wish to convey. Therefore, for them, it is the best. I've heard that English is difficult to learn and doesn't make sense at times because of its inconsistencies and special conditions. However, even though my ramblings here might not show it, I am most efficient and confident speaking that language over others. That makes English superior in my little world. I would expect the French, German, and Spanish speaking folks to have a similar view of there own language fro similar reasons. However, in a sense, it doesn't really matter because English seems to becoming the universal language regardless if it is the best, most efficient, logical, or easiest to use language. There is hardly a place on the earth that one can go that doesn't have some English signage or where you can't find someone that speaks at least a little English. (In my travels anyway.) I don’t know if the same can be said for the other languages. Does that make English universally superior? Can an idea be conveyed in the most efficient manner with English over another? Can an idea be expressed in fewer words with a language other than English? Someone might be able to try answer those questions, but, as far as I’m concerned, trying to would be as pointless as the argument between AOS and RPN.

For me, it's English since shortly (relatively speaking) after birth and RPN since the late 70's and boxers since the mid nineties.(See, it's not impossible to change.)

*Message #21 Posted by **James M. Prange (Michigan)** on 16 Mar 2006, 6:33 p.m.,*
in response to message #2 by Valentin Albillo

Okay, the last "advanced" algebraic/BASIC calculator that I've seriously used is my Sharp EL-5520, and no doubt advanced algebraic models have improved since then, but I very much doubt that they've improved to the point that I'd find one easier to use than an RPL model.

I found the 28S very easy and intuitive to use; in perhaps five minutes I could see that working through a problem in RPN was much easier (for me) than doing it on any other calculator that I'd ever tried. Learning to use RPL object types, variables, and program structures was a pleasure; at last, a calculator that worked the way I think.

Not having any way except for the keyboard to input anything to the 28S was indeed a disadvantage compared to the Sharp, but not enough to want to go back to the old way. The 48SX fixed that problem.

With the RPL models so easy and intuitive to use, why would I ever want to go back to using an algebraic model for an advanced calculator?

For students, there are reasons for preferring algebraic models. In many cases, that's all that their instructors know how to use, and that's what "everyone else" uses. Except for looking through the documentation or going online, one usually can't hope for much help in using an RPN model.

It may be that for some people, algebraic models match their way of thinking better than RPN models. That's not to say that they're less (or more) intelligent than me, just that we're different. If someone prefers to use an algebraic model or write a BASIC program, that's fine with me; I'll stick to doing things the way that I find easiest.

I agree that algebraic models sell better than HP's Classic RPN and RPL models, but I see that as a failure to market HP's calculators effectively, not as any inherent superiority of algebraic models. I expect that the main reason that most people prefer algebraic models is because that's the system they've already learned and is most easily available.

Besides the 12C and 33S RPN-only models, HP still markets the 48gII and 49g+, and I hope that it's selling some of them. How many users just leave them in the default ALG mode, I wouldn't know.

HP is indeed a "for-profit" corporation, and thus has a duty to its stockholders to try to make a reasonable profit, so including an "ALG" mode on recent models was a rational decision. Switching a 49 series to "RPN" mode turns out to be a trivial matter, so having an ALG mode available doesn't really matter to me, although it was a nasty surprise the first time that I turned on my 49G. On the other hand, if someone actually prefers algebraic mode, why not just buy a "Brand X" calculator?

But I also think that HP (like many other companies) all too often sacrifices long-term gain for short-term profit.

The quality that I'd come to expect from HP just isn't there in the 49 series, but I don't see that that's relevant to a discussion of the advantages of RPN versus AOS, although relevant to a discussion of the advantages of HP products versus other brands. For now, I'll stay with the 48 series when I just want to get some real work done.

With the RPL models, I can enter an algebraic expression (in the 48 an 49 series, in multi-line "textbook" style if I prefer), and let the compiler take care of working out the equivalent RPN sequence. That's great when I have the expression already written out in front of me. More often, I have the data in front of me, and know what I want to do with it, and I find working through it RPN-style more intuitive, faster, and generally just a lot easier than working out the algebraic expression first. Why should I have to go through the extra trouble of composing an algebraic expression for what I want the calculator to do? The calculator would parse it to an RPN sequence for execution anyway.

Given that I can use algebraic expressions just fine in my RPL models, what advantage would an algebraic-only model have?

What's more, with the RPL models I never have to worry about an object getting lost from the top of the stack; it just can't happen. I can easily enough use up all available memory, but that must be true of any calculator.

As for your daughter preferring her Sharp to an RPN model, has she ever learned to use an RPL model? As counter-examples, my grandniece and grandnephew prefer their RPL models to a TI. Granted, Classic RPN does have some advantages over RPL, but for me, the advantages of RPL far outweigh them.

RPN/RPL calculators may indeed eventually go the way of the dinosaurs, but I'd see that as a failure in marketing and product quality, not due do any disadvantages of RPN itself.

Regards,
James

*Message #22 Posted by **Marcus von Cube, Germany** on 17 Mar 2006, 3:53 a.m.,*
in response to message #21 by James M. Prange (Michigan)

Just to add my two (Euro) cents worth.

AOS (TI-59 style) and RPN on a single line numerical display are roughly comparable in nature. They both require you to think about your expression beforehand. AOS is often used in very much the same way as RPN is: work the expression inside out, see intermediate results by pressing [=] or [)], do some postfix operations like trigs, roots, ... You have to keep track of pending operations in AOS as you need to keep track of the stack contents on an RPN single liner.

For many of the calculations I have to to, even a four banger is good enough, though I prefer one of my classic RPN or AOS machines if multiplications and additions are intermixed. If I have to add a column of figures, something with a real (or simulated) roll of paper is even more appropriate.

No lets compare machines with more power and more screen real estate.

If I have to calculate a complicated expression, probably more than once with varying parameters, the bigger screen vastly pays off. You simply don't get lost so easily. The multi line stack display on RPL machines helps very much to avoid confusion about the stack contents. Together with UNDO you can easily avoid and/or correct mistakes. What I'm missing is the history: once you execute a function, part of the former stack contents is lost (except for UNDO). So if the expression is a complicated one or if you want to reuse it, you better start with ['] on an RPL machine. I don't like the equation editor for this task, it's not intuitive for me. It helps in viewing an expression but I keep forgetting which key combinations are neccessary to invoke it on a given object.

On the high end EOS machines (TI-89 family) you have a history which is displayed in textbook form and which can be easily traversed back to modify and reexecute expressions. Editing is done on the command line with a bunch of parantheses. This is equivalent to starting with ['] on an RPL machine.

Differences aren't as clear as is pointed out in this thread more than once. If you compare the right classes of machines you can see (dis)advantages on both sides. In many cases it's just a matter of taste.

Marcus

P.S.: On an AOS programmable you get the equivalent of EOS by writing a program. Just reading the

equation is a little arkward if you have to think in numerical keycodes.

RPN or RPL programs with stack syntax are often "write only" to me. Since the parsing of the expression has been done in the head of the programmer, you just see the results of his thinking. It's a little like understanding disassembled machine language.

Marcus

Where an advanced algebraic model or an RPL algebraic object really does best is when you already have an algebraic expression written out and it's just a matter of keying it in and having the calculator parse and evaluate it.

More often than not I don't already have an expression available, so I'd have to compose one first, deciding where to put parentheses to get the calculator to work the problem in the correct order, or optionally leaving parentheses out if I knew that precedence rules would take care of the order of operations. Working the problem out RPN style saves me the extra bother.

> Quote:
>
> What I'm missing is the history: once you execute a function, part of the former stack contents is lost (except for UNDO).

Or the LASTARG command or the last command lines operation. And of course you can always DUP objects and use the interactive stack operations.

> Quote:
>
> So if the expression is a complicated one or if you want to reuse it, you better start with ['] on an RPL machine.

That's certainly an option, but more often I start the command line with << and enter a program in RPN syntax.

> Quote:
>
> I don't like the equation editor for this task, it's not intuitive for me. It helps in viewing an expression but I keep forgetting which key combinations are neccessary to invoke it on a given object.

Same here. I'm sure I could learn to use it well, but ordinarily I just type in an expression on a single line, although that often requires more parentheses. Perhaps part of my dislike is due to some maddeningly slow operations in the 48SX equation writer, and though they've speeded things up in more recent models, I've gotten used to doing without it and haven't bothered to relearn how to use it.

> Quote:
>

I think that that's true of any programming language. Sometimes even trying to understand a program that I wrote quite a while ago can be a bit of a challenge. But then too, it's not always obvious just how a mathematician got from an original expression to an equivalent expression.

I have to admit that despite some of the sentiments expressed here I prefer RPN. I do find it easier to use than conventional algebraic calculators and find that the stack is particularly convenient as intermediate results can easily be reviewed using round down/round up or exchange X-Y, something that I find convenient in ordinary use, totalling up household bills, working out VAT, checking my tax returns etc.

I am a very ordinary user, and I have never had much use for the high end functions like matrix manipulation, and only limited use for equation solving (which only my HP34 has anyway).

If I really do need to do something that involves a complex formula then I tend to use a spreadsheet.

Using it in class can be your number one headache if you're a student, and can certainly lower your grades and put you at a serious disadvantage if you stick to it long enough.

Heh, funny. I always get results in my Calc class first, using a 41CV, when everyone else has TI84s and up. My grades have also seen an upswing since I got my 41, and used it in place of a TI-89ti.

Since the HP-41 does not do symbolic mathematics of any kind -- algebra or calculus -- this must mean that you are able to obtain answers faster (and learn better) using paper, pancil and *brain*, rather than meticulously entering the expressions to have the calc do the work.

If you use an HP-41 in a calculus class, the Advantage module would be a fine addition. Its numerical SOLVE and INTEGrate functions can allow you to check your answers.

Here's my Articles Forum contribution on SOLVE and INTEG.

Hi, Antonio,

It was entirely predictable that your post would stir up the rancorous (but somehow amusing) RPN vs AOS debate. I'm a devotee of the RPN school of the calculator religion, but I don't want to stir that pot any more vigorously than has already been done. I don't think anyone responded to your actual question, however:

> Quote:
>
> In other words, is there a link between RPN and HP leadership?

And since you solicited opinions (rather than rigorously researched facts, which I'd be hard pressed to present 8) mine is that there is no direct relationship. The apparent connection is an example of *post hoc ergo propter hoc* fallacy: The switch to algebraic occurred before the decline in HP's market share, but didn't cause it, again in my opinion. I believe the detour into RPL, the neglect of the high-school market and the rise of the desktop PC for serious mathematical analysis all combined to knock HP off its perch.

So there. 8)

Regards
Howard

Re: HP & RPN

*Message #28 Posted by **Bill Rice** on 16 Mar 2006, 8:16 p.m.,*
in response to message #1 by Antonio Maschio (Italy)

Here are a few answers:

1. If HP once believed so much in RPN, why not today? RPN was a solution to the problem of how to allow complex expressions using little RAM. RPN pushes the ordering of operations onto the user, and does it in an (almost) intutive way. Today, calculators can have gobs of RAM at little cost, users are used to letting the program do all the work for them. If Microsoft once believed in command-line DOS, why not today?

2. If HP once sold a lot of calculators and was the leader, why not today? Probably a marketing problem. The

market changed from largely professional users to educational, and HP for whatever reason didn't succeed in pushing their products into schools. Maybe price? Schools at all levels are always under pressure to find the lowest cost (initial purchase price) solution.

3. If we suppose HP gave up with calculators as a leading product, but still believing in RPN, HP calculators today should be pure RPN. Or should we suppose that HP gave up with RPN too? -I don't think RPN was a religion at HP, it was a solution to a problem. Things changed, the problem of low RAM went away. Note that their current RPN calculators are very expensive compared to non-RPNs (particularly scientific). Is the Hp33S that much more expensive to make than a $15 Casio or Sharp? Doubtful, since it seems to be mostly a minor update to a model introduced over a decade ago.

4. Is RPN something that should be suggested/proposed to people, instead of producing calculators that are merely copies of TI or Casio products? I mean, is HP in the position to produce those golden years RPN calculators again, without being affected by "what will people say?" or "people won't buy this: it's too difficult!" - They still sell RPN's, at a high price point. They are aimed at "professional" users, who know what they want and are willing to pay for it. Why introduce a mass-market product when your first selling point is to say, "Honest, it's not difficult!".

5. If today HP sold only RPN calculators, do you think it would sell less?

Definately. Someone is buying the cheaper non-RPN scientifics, otherise they would have been discontinued.

You say yourself that, after using RPN for years, you can no loner use algebraic mode. Probably 99% of the population would say the exact opposite. They are no less smart than you, it is just what they are used to.

*Message #29 Posted by **Palmer O. Hanson, Jr.** on 16 Mar 2006, 11:12 p.m.,*
in response to message #28 by Bill Rice

It seems as if the RPN vs AOS debate has always been more of a religious issue than a technical issue. The problem with religions is that they can become corrupt. A book on that subject *When Religion Becomes Evil* by Charles Kimball lists warning signs of corruption in religion where two of the signs are "Absolute Truth Claims" and "Blind Obedience." Doesn't that sound like our long standing debate? To get unbiased viewpoints one has to find some of those users that were once called "bilinguals", meaning that they felt equally competent with either system.

I suggest that for most engineers and scientists the fewer keystrokes that come with the use of RPN really aren't important because they don't sit at their machine pressing keys all day long, or even for a small portion of each work day. There really may be some users who press keys all day long -- in the olden days we had keypunch operators who operated the machines that made the holes in the IBM cards we used for computer access.

As for marketing TI made a conscious decision back in 1990 to concentrate on the education market. They abandoned a newsletter *Programmable Calculator News* which supported the TI-74 and TI-95 and started a newsletter *It's About T.I.M.E. - Technology in Math Education*. They proceeded to pay as much attention to the education market as HP had paid to the engineer/scientist market. The big difference is not whether

one uses RPN or RPL or AOS or EOS but that the education market is so large. TI bet their calculator future on graphing calculators for the education market and time has proved that they made a correct decision. This was from a company which had made some monumental marketing and technical mistakes in the past. Does anyone remember the TI-99/4? Does anyone remember the keyboard for the TI-55II, TI-57LCD, and BA-55?

*Message #30 Posted by **HrastProgrammer** on 17 Mar 2006, 2:28 a.m.,*
in response to message #1 by Antonio Maschio (Italy)

In other words, is there a link between RPN and HP leadership?

I don't think there is a direct connection. It has more to do with other features, old HP quality, customer support, etc, etc.

Regarding this (pointless) RPN (RPL, ...) vs. AOS (EOS, ...) discussion ... From the current (economical, educational, ...) point of view I must agree with Valentin: Why bother with RPN when you have tons of AOS (EOS, ...) calculators out there which are much simpler to use for average user (student, ...)? Why do you have to enter 2 3 * 1 + 5 6 * 4 + * when you can enter (1+2*3)*(4+5*6)?

Disclaimer: I haven't said that AOS (EOS, ...) is better, just that it is widely accepted way of entering expressions on the calculator.

For me (but note that this is only my personal opinion), a stack machine where you can enter and evaluate expressions in both systems is just perfect - and this is RPL. I haven't been paying much attention on RPL for a long time because I have been much more oriented to RPN (HP-41X, HP-42X, HP-1XE) and AOS/BASIC (HP-71X) during the last few years. But, thanks to my current interest in Forth programming language (after almost 15 years of not using it), I tend to appreciate RPL much more. From my point of view, the main problem with RPL is a bad/slow program editor with separation of source from the program while editing, which is not appropriate for the calculator (this is also very memory hungry because the system has to decompile the whole program to character string object, edit it and compile this character string object back to the program) and this kept me away from RPL programming on a calculator. But, this will be solved with my upcoming project which (I hope) will support UserRPL/SystemRPL in a uniform manner directly on the calculator without the need for a separate editor, compiler, assembler, etc. (I am not talking about another set of SysRPL tools like these on HP-49G/G+ which are working in the usual way: edit the source and compile it so you always have to keep the source together with the program during the development).

Why do you have to enter 2 3 * 1 + 5 6 * 4 + * when you can enter (1+2*3)*(4+5*6)?

Well, actually, I'd more likely enter 1 2 3 * + 4 5 6 * + * in place of (1+2*3)*(4+5*6).

But I do see your point. A student is more often presented with an expression than asked to work out a "story problem", and even with a story problem, he's probably expected to compose an expression to work it out.

Personally, I'd think that an RPL model gives the best features of algebraic and RPN syntax, but a math student's instructor and fellow students probably wouldn't be familiar with RPL and not much help if he's having problem with it. I expect that, for most math students, an algebraic model (preferably the same as the instructor uses) is the more reasonable choice.

> Quote:
>
> From my point of view, the main problem with RPL is a bad/slow program editor with separation of source from the program while editing, which is not appropriate for the calculator (this is also very memory hungry because the system has to decompile the whole program to character string object, edit it and compile this character string object back to the program) and this kept me away from RPL programming on a calculator.

Note that in the 49 series, there's a "clipboard" available, with BEGIN, END, COPY, CUT, and PASTE available as right-shifted keys, and additional editing tools, incuding find and replace operations, available by pressing the TOOL key. I don't find it as nice as using my text editor on the PC, but it's not all that bad.

The compiler and decompiler certainly (temporarily) use some system RAM, and sometimes both the compiled object and it's decompiled character string form have to be in RAM. I think that the idea is that the compiled object is smaller than the source code (or decompiled object) character string. Compiling only has to be done for an ENTER (or implicit ENTER) from an editor, when downloading an ASCII file, or for STR\-> or OBJ \->. Decompiling only has to be done for displaying an object, uploading it with an ASCII transfer, printing it, or for \->STR. I expect that, assuming that programs are ordinarily stored in variables, the compile/decompile operations end up saving on memory use.

Compiling also checks the syntax, so you see whether your source code is valid right away.

I think that more of a problem is that compiling discards the programmer's formatting (indents, delimiters, and separators) and comments, and doesn't allow one to save source code with syntax errors for later editing.

A work-around is to write the program within a character string, perhaps the most foolproof way being to start with

```
C$ $
```

as the first line in the editor (before the program itself). This way the source code, including formatting, any comments, and regardless of syntax errors, is compiled as a character string, which can be left on the stack or stored in a variable. When you want to actually compile the character string object to a program object, have it (or a copy of it) on level 1 and do a STR\-> or OBJ\->.

You could even use vectored ENTER (both system flags -62 and -63 set) with a \GaENTER program of

```
\<< DUP STR\-> \>>
```

to have ENTER place the command line on stack as a string and (if valid) execute it. If the command line isn't valid, you end up with two copies of the string on the stack.

Still, if I happen to be at my PC, I prefer to use it to write any but fairly trivial programs for the calculator.

James

*Message #33 Posted by **Thomas Okken** on 18 Mar 2006, 12:27 p.m.,*
in response to message #32 by James M. Prange (Michigan)

I guess that's one issue that fuels the AOS-vs-RPN debate -- it would be better to have an "in which context is which better" debate...

When I'm programming in C or Java, I like being able to write things like

```
    double h = sqrt(x * x + y * y);
```

...and that's simply because of how readable it is.
The HP-42S RPN equivalent

```
    RCL "X" X^2 RCL "Y" X^2 + SQRT STO "H"
```

is easier to enter, but not so easy to parse for the human eye.

Algebraic notation tends to highlight the structure of an equation; RPN is a series of instructions to evaluate it -- both have their uses.

- Thomas

Re: HP & RPN

*Message #34 Posted by **Ed Look** on 18 Mar 2006, 12:50 p.m.,*
in response to message #33 by Thomas Okken

Excellent point, especially for those who are versed in either or both mathematics and programming.

I just want to add one thing, which essentially has been said by other posters on this thread, that, as Mr. Okken said, as the RPN sequence of instructions is not easily decipherable by the human eye, and we are all essentially visually driven, unless trained later in life to be otherwise. Students, at their age are not going to be able to like using RPN... unless shown and then they have to practice it themselves a bit. I first saw a RPN (HP 25) unit in a professor's hands and while he didn't exactly extol its algorithmic virtues, he did say that while a tad tougher to learn at the outset, it becomes easier for the mind to use in the long run.

I took his word and gave it a shot. When my freshman year TI SR-40 (truly an inferior machine) gave out (somewhat shortly after purchase), on the memory of that man and advice of some advanced students, I got the HP 34C. If I could get another one, it'd STILL be my machine of choice, primarily because of its RPN, secondarily because of its rather nice set of features. (But oh, that power consumption, though!)

Re: HP & RPN

*Message #35 Posted by **James M. Prange (Michigan)** on 17 Mar 2006, 9:55 p.m.,*
in response to message #31 by James M. Prange (Michigan)

PS:

Of course, another reason for compiling a command line as soon as ENTER is pressed is execution speed. With objects stored in the compiled form, the system doesn't have to go through the process every time a stored program is evaluated, and presumably most programs will be evaluated more often than they're edited.

James

Re: HP & RPN

*Message #36 Posted by **HrastProgrammer** on 18 Mar 2006, 2:24 a.m.,*
in response to message #31 by James M. Prange (Michigan)

Believe it or not, I know all that ... and that's the reason why I am searching for an alternative and better way (at least for me) of editing a program.

Again:

(*) When you are editing a RPL program, the decompiled source is kept in RAM together with the original program.

(*) During the compile, the source is kept in RAM together with the original program and the program which is currently being built (if I am not missing something here).

For example, you have a program stored in a variable:

(1) Before editing:

Variable: << 0 1 10 FOR I + NEXT >>

(2) After decompile:

Variable: << 0 1 10 FOR I + NEXT >>
Temporary: "0 1 10 FOR I + NEXT"

Now you can eventually PURGE the variable to free the space occupied by the program but this is not my way of working because I want to keep the original.

(3) After editing:

Variable: << 0 1 10 FOR I + NEXT >>
Temporary: "0 1 10 FOR I I + NEXT"

(4) While compiling:

Variable: << 0 1 10 FOR I + NEXT >>
Temporary: "0 1 10 FOR I I + NEXT"
Temporary: << 0 1 10 FOR I ...

(5) After compiling:

Variable: << 0 1 10 FOR I + NEXT >>
Temporary: << 0 1 10 FOR I I + NEXT >>

(6) After storing to a variable:

Variable: << 0 1 10 FOR I I + NEXT >>

You see a problem? At one moment you have to keep 3 objects for the same program in memory.

I would like to avoid this so I am investigating a possibility to directly edit a program without a need for decompiling/compiling the whole program. I like HP-41C/42S or HP-71B type program editing where you are editing the current program line only and I would like to do something similar with RPL. I won't post any details for now ...

BTW, in my opinion, STR\-> is useless for interactive work and compiling a program after editing because, if the program contains a syntax error, it will report 'Syntax Error' but won't show where the error actually is in the source ...

Best regards.

*Message #37 Posted by **Andy Morales** on 17 Mar 2006, 10:37 a.m.,*
in response to message #1 by Antonio Maschio (Italy)

Hello fellow HP users and ex-users. This ole Babyboomer (60 this year) started out with a HP35 in mid-70's while studying Mechanical engineering. Have used the TI/SR 50 and got same results doing the infamous MACH equation in HP manual. Of course RPN felt more natural when performing calculations. AOS gave same answers without use of parenthesis or brackets. I enjoyed using both logic systems until i picked up one of the state of the art latest ALEGRAIC ENTRY calculators ala TI 83, HP 39 series. A look of horror and shock overcame me when i tried to SQARE a negative number in ALGEBRAIC MODE and the answer was a negative. ie -3 squared is a positive 9 not a negative 9 as the following calculators will give (HP 30S, 38G, 39G, TI 83, etc) Then i realized that the user must enclose the negative number in PARENTHESIS to get the correct answer. No biggie. This ole timer will stick to his HP15C and HPGII in RPN mode to solve his equations. Not because i hate algebraic logic, but because i feel more confident in RPN. I think anyone can learn to use any logic if they follow the correct number entry as stated in the Calculator manual. IMHO the latest Graphic scientific calculators be they RPN or Algebraic logic are ASS KICKERS and pack a punch for

doing Science or Math.

Warmest regards to all

Andy Babyboomer who is learning to use and love his new HPGII Graphing calculator in RPN mode

Random thoughts:

For the "how do you add 1, multiply by 4, then divide 5 by result" question, when I used a Casio algebraic as my main calculator, I found that I had to use the ANS[wer] button constantly for such manipulations. Well, even on an algebraic, most let you easily chain together symmetric operations, like the adding 1 and the multiplying by 4. You'd really only have to go to ANS to divide 5 by the result (5 / ANS) ... and even that could be skipped by using the reciprocal feature, then multiplying. However, even if you can skip using ANS so much, you'd still have to hit "equals" a lot.

I suppose now some algebraics have big enough entry lines that you don't have to worry about dividing the problem up and then using chain calculations: You might be able to enter it all at once.

But that probably explains the continued success of the 12C: When you're balancing books, you don't have a formula. You just keep doing an endless string of chain calculations.

One thing RPN has a definite advantage in is solving on the fly simple equations made of functions that have inverses on the calculator, eg,

-15 = 0.00001* (exp(.5/x) -1) - 20

Then it's easy, without having to think about it much, to simply do each operation backwards..

```
-15 [Enter]
20 +
.00001 /
1 +
ln
1/x
.5 *
```

Granted, it's not like that would be all that difficult on an algebraic. It's just easier with RPN. And it would cease to be an advantage for equations where the variable is operated on by several functions, like even

cos(x) + exp(x) - x^2 = 0

Pairing paranthesis can still be a problem with modern algebraics, like the TI-89. If I'm entering something complex, I'll break it up, and then combine the final result by copying and pasting from the history. It works, but using RPN, or an equation writer, could arguably be more elegant.

As for the 33s offering both RPN and algebraic, there is at least one set of circumstances where it's better to use algebraic mode: With complex numbers! I think the 33s's RPN utilization of complex numbers is TERRIBLE! You can only deal with 2 complex numbers at a time, which means you'll either have to do a lot of planning to evaluate anything remotely complicated, or store a lot of intermediate results in registers, or both. And it seems to me that the odds of making a mistake while doing that are high.

On the other hand, in algebraic mode, the 33s's complex handling is decent, and it's fairly easy to work with expressions of almost arbitrary complexity.

Anyway, when it comes to complicated formulas that I might have to use multiple times with different variables, plugging in repeatedly with either RPN or an algebraic would be unbearable. In that case, it'd be better to use a calculator that lets you enter formulas, and then substitute the variables in. By now, many calculators (with RPN or algebraic modes) have this feature.

Chain calc's w/AOS & solving

However, even if you can skip using ANS so much, you'd still have to hit "equals" a lot.

That's just what I found on a $15 Casio fx-115MS (with "S-V.P.A.M.") It has an expression buffer of 80 characters, but closing ")" at the end of an expression can be omitted.

This "inverted L"-shaped expression is somewhat trickier to solve numerically than it would seem! The HP-33S and the HP-17B/17BII/27S can easily find the solution of 0.03810288661 with their algebraic-manipulation direct-solution method. However, the HP-32SII and the Casio had difficulties finding the root unless intelligent guesses were provided (0.04 and 0.05 will do, but 0.05 and 0.06 will not).

A topic I mentioned in my earlier post in this thread titled, "RPN & Command-line AOS"...

Agreed. The complex-number functionality, carried forward from the HP-32SII, seems to have been modeled after the routines in the original HP-41 Math Pac, which were implemented as keystroke programs.

However difficult they are for interactive work, the complex-number routines are quite useful for programming. I used them extensively in the "AC Power Transfer" program in the MoHPC Software Library.

And, of course, the HP-17B/17BII/27S have had that capability since 1988. My only complaints would be the fixation on direct solution to the exclusion of other requested solution values, and the non-support of implicit multiplication.

Best regards,

*Message #40 Posted by **Frank Wales** on 19 Mar 2006, 6:47 p.m.,*
in response to message #1 by Antonio Maschio (Italy)

Having just looked through the replies here, it occurs to me that two messages that I posted elsewhere about 15 years apart represent what I think about these issues:

Message on Psychology of Programming Interest Group discussion list, June 2005

Message in comp.misc, February 1990

Re: HP & RPN

*Message #41 Posted by **Palmer O. Hanson,, Jr.** on 19 Mar 2006, 10:22 p.m.,*
in response to message #40 by Frank Wales

In a discussion extolling the virtues of the HP-28S you wrote:

"... And look in the manual at the section on changing the batteries (it does have one, doesn't it?) to see if they tell you how long you can take to change them *without* losing the memory of the machine; you shouldn't need the dexterity of a plastic surgeon and the limbs of an octopus to do it in time...."

I purchased my 28S at a garage sale for two dollars back in 2001. I expressed surprise at the low price and in return received a lecture on "the worst battery cover design in the world." The owner said that he had so much trouble replacing the batteries and the cover that he lost the memory. He was so exasperated that he just wanted to get the damn thing out of his home. I managed to repair the battery compartment cover and get some batteries installed and have enjoyed playing with the 28S. But, the previous owner is correct about the design of the battery compartment cover. When we talk about the religion involved in calculator design, manufacture and ownership surely we have to recognize that the 28S battery compartment cover design was a sin.

But, in my mind HP's biggest sin was delivering calculators which would be damaged if the user connected the charger without the battery pack in place and making good contact. It has been said that all they needed to do was add a resistor and a diode which shouldn't have been prohibitive in units which were higher priced anyway. I suggest that there is another explanation. In those days it was common knowledge in the electronics industry tha power supply design wasn't held in very high esteem, and as a result the budget for power supply design wasn't very generous.

Other manufacturer's have sinned as well. NSC and National Semiconductor managed to make devices that failed so consistently that it is hard to find a working one. TI did the "multiplication is not commutative trick" on the TI-57, the TI-58/59 and (I think) the SR-52. TI also designed the CC-40 with a 3/4 size QWERTY keyboard and advertised that a user could touch type -- but, they put the ENTER key where the right shift key should be even though they had a blank space to the right of the semicolon key!

And then there is Sharp -- of several hundred calculators in my collection the Sharp's stand out. Whether at garage sales, antique stores, thrift shops or wherever one finds collectibles the Sharp's are the only ones where I fully expect that the device will work.

Pioneer model variations

*Message #1 Posted by **Randy** on 15 Mar 2006, 4:35 p.m.*

I'm almost finished with my complete Pioneer collection (all models, colors and variations) and all that remains to find is one variation of the 22S - the later stepped bezel model. I have several flat bezels with the window in front of the LCD but for the life of me, I've yet to see a step bezel. Dave has one in the Museum - so I know they exist. I'd like to take an informal poll of the community at large:

How many of you out there have a 22S with the later step bezel?

How about the same in the 27S?

Also - I've never seen a 21S in the early flat bezel model - anybody ever see one?

I'd really like to establish the rarity of these these variations in the less popular models. "Less popular" meaning at the time they were sold - as most 27S owners I've encountered are like 42S owners - unwilling to switch at any price.

Re: Pioneer model variations

*Message #2 Posted by **Paul Brogger** on 15 Mar 2006, 5:19 p.m.,*
in response to message #1 by Randy

I *believe* my remaining 22s is a newer, non-window model.

I'll check tonight.

If it's what you want, maybe we can work out a trade. (Goodness knows, you've offered more than your share of free help over the years!)

Ooops! I guess not . . .

*Message #3 Posted by **Paul Brogger** on 16 Mar 2006, 12:07 p.m.,*
in response to message #2 by Paul Brogger

Mine is of the older form. Good luck finding one!

in response to message #1 by Randy

Great job. Maybe you can give us a summery, which model exists in what variation (display, color, serial, ..)

Re: Pioneer model variations

*Message #5 Posted by **Randy** on 15 Mar 2006, 10:53 p.m.,*

in response to message #4 by Museum

Thank you, Paul. I'll just remind and thank you that it all started (at least for me) with your contribution of the "Pioneer Internals" article :)

Here's the list of what I've amassed in almost four years, I can plug in the serial numbers later if it is of any use. I'll be interested to know what I'm missing! Chances are I'll never find them but it will be interesting to compare notes.

Model	Origin	Color	Bezel	
10B	Singapore	Brown	Step	
10B	Indonesia	Brown	Step	
10B	Indonesia	Black	Step	
14B	USA	Brown	Flat	
14B	USA	Brown	Flat	50th Anniversary
17B	USA	Brown	Flat	
17B	Singapore	Brown	Flat	
17Bii	Singapore	Brown	Step	
17Bii	Indonesia	Brown	Step	
17Bii	Indonesia	Black	Step	
20S	USA	Brown	Step	
20S	Singapore	Brown	Step	
20S	Indonesia	Brown	Step	
20S	Indonesia	Black	Step	
21S	USA	Brown	Step	
21S	Singapore	Brown	Step	
22S	USA	Brown	Flat	
22S	Singapore	Brown	Flat	
27S	USA	Brown	Flat	
27S	Singapore	Brown	Step	
32S	USA	Brown	Flat	
32S	USA	Brown	Flat	50th Anniversary
32S	Singapore	Brown	Step	
32Sii	USA	Brown	Step	
32Sii	Singapore	Brown	Step	
32Sii	Indonesia	Brown	Step	
32Sii	Indonesia	Black	Step	
42S	USA	Brown	Flat	
42S	Brazil	Brown	Step	
42S	Singapore	Brown	Step	
42S	Indonesia	Brown	Step

Re: Pioneer model variations

*Message #6 Posted by **Karl Schneider** on 16 Mar 2006, 2:16 a.m.,*
in response to message #5 by Randy

Hello, Randy --

About a month ago, I "completed" my collection of the Pioneer series (one each of the 11 models), amassed over four years mostly through eBay or eBay-inspired prices. I had already "completed" my collection of the HP-41 series and the Voyager series in a similar manner.

Here are the Pioneers I have:

Model	Origin	Color	Bezel	Year	
10B	Singapore	Brown	Step	1993	
14B	USA	Brown	Flat	1989	50th Anniversary
17B	USA	Brown	Flat	1988	
17Bii	Singapore	Brown	Step	1993	
20S	Indonesia	Brown	Step	1997	
21S	USA	Brown	Step	1989	
22S	USA	Brown	Flat	1988	
27S	Singapore	Brown	Flat	1990	
32S	Singapore	Brown	Step	1990	
32Sii	Indonesia	Black	Step	2001	
42S	Singapore	Brown	Flat	1989	

> Quote:
>
> Also - I've never seen a 21S in the early flat bezel model - anybody ever see one?

My 21S is the earliest recessed ("step") bezel model in the list. Maybe it was a pilot project for the redesign.

Note that I have two 1990 Singapore-made units. One is a "step" 32S; the other is a "flat" 27S -- which is not like either of yours.

Just curious: Is your early USA-made 32Sii one with the fraction-calculation bug? If so, can you give an example? I've found the (*sans* bug) fraction-conversion capability of the HP-32II to be quite impressive, and would like to know how it was implemented. Only a massive look-up table in ROM would seem feasible, in order to give quick answers.

Thanks,

-- KS

Hi Randy

Wow, this is a cool list of Pioneers... Maybe more than I have. I will try to add production year and original box (my favorite, yes) to your list. Just give me some time to do this. Also, collect informations of the production year as well. I would like to finally get a full list with time view, which modell was produced in which version during a periode of time. (Do you understand my bad english?)

I have a few extras not in your list (difference is marked with a star):

```
Model  Origin      Color   Bezel
10B    Indonesia   Brown   Flat*
14B    USA         Brown   Step* 50th Anniversary
20S    Indonesia   Brown   Flat*
22S    USA         Brown   Step*
```

I'm very surprised by the 50th Anniversary 14B being different. I wonder if they had both sorts of faceplate in existence and some were done with one batch and others with the other?

HP 35 ROM V2 "exp(ln(2.02) = 2", explanation found

*Message #1 Posted by **Jacques Laporte** on 15 Mar 2006, 11:15 a.m.*

Hi everybody, Peter Monta published (Feb 19 2006) the dump of the HP 35 ROM V2 (with bugs):

http://www.pmonta.com/calculators/hp-35/index.html

A month later, I have found the explanation of the flaw in the exponential algorithm "exp(ln(2.02) = 2". If you are interested in History of Algorithms, please visit my page :

http://www.jacques-laporte.org/HP35 bug.htm

Best regards. Jacques Laporte [url:http://www.jacques-laporte.org/HP35 bug.htm]

Re: HP 35 ROM V2 "exp(ln(2.02) = 2", explanation found

*Message #2 Posted by **Eric Smith** on 15 Mar 2006, 4:38 p.m.,*
in response to message #1 by Jacques Laporte

Nice work.

Note that the HP-35 source code from the Nonpareil package, on which you based the listing on your web site, is Copyright 2004 Eric L. Smith. The copyright notice was unintentionally omitted, which was corrected in later releases of Nonpareil (starting with r120 of the file in the Subversion repository, on 15-Jan-2004). The latest version, r850, can be obtained from ViewVC.

The simulator is GPL'd, so you should make the source code available on your site. Otherwise, to comply with the GPL, you need to accompany the executable (JAR file) with a written offer to provide the source code.

Re: HP 35 ROM V2 "exp(ln(2.02) = 2", explanation found

*Message #3 Posted by **Jacques Laporte** on 16 Mar 2006, 3:42 a.m.,*
in response to message #2 by Eric Smith

Thank you Eric for you comments.

I must underline that this work could not definitely be possible without your work Nonpareil and P. Monta's ROM dump. I couldn't understand the HP35 ROM instruction by instruction, without the help of your simulator. My job is reverse engineering not voodoo magic!

All my work is open source minded. Correction will be made soon to comply with the GPL. For now, I'm going to take a few days off!

Best regards. Jacques.

Re: HP 35 ROM V2 "exp(ln(2.02) = 2", explanation found

*Message #4 Posted by **Eric Smith** on 16 Mar 2006, 4:58 a.m.,*
in response to message #3 by Jacques Laporte

That's fine, no rush. I see that one of the 35 listings on your site had the copyright notice, and the other (the one you modified?) did not.

I've spent more time studying your site since I posted earlier, and the more I look over it, the more impressed I am. You've done a fantastic job of explaining the algorithms.

The algorithms only changed slightly from the 35 through the early Woodstock series (21/22/25/25C). The first big change to the math routines occurred in the late Woodstock era, in the 67/97, 92, 19C/29C, and maybe the 27. An overview of some of the changes is given in the November 1976 HP Journal article "The New Accuracy: Making 2^3=8" by Dennis Harms.

There were some lesser changes in the 30 series, after which the math code remained fairly stable from that point through the 41 and the Voyager series.

I haven't had time to do any thorough analysis of the differences.

AFAIK, all of the Saturn-based calculators use essentially the same floating-point math routines, derived from the HP-71B. Some of the algorithms used are significantly different from the earlier calculators.

Eric

Re: HP 35 ROM V2 "exp(ln(2.02) = 2", explanation found

Hi Etienne, Thank you very much for the warm words. I obviously remember myself the beautiful 70's and my first HP35, Altair, TRS80... My wife could not understand: no furniture in the apartment but so many computers... One day in 1980, I bought in San Francisco a book by James Farvour, “Microsoft Basic decoded & other mysteries”; the guy commented step by step TRS-80's Rom! I remember well - it seems so close - that I said to myself : I must do the same for the HP 35! 25 years after, it is almost done.

HP 35 was -and still is- a so brilliant machine! I personally was using a slide rule when I first put my fingers on it! That’s why I’m very proud to pay tribute to this monumental breakthrough in computer history. All the best to you, Jacques.

Emu28 with increased memory

*Message #1 Posted by **Christoph Giesselink** on 14 Mar 2006, 12:50 p.m.*

Hello together,

I just published a new version of Emu28, the HP28C emulator on http://privat.swol.de/ChristophGiesselink/. Version 1.10 now supports memory upgrades with 4KB, 32KB and 64KB.

Memory upgrades are handled as complete new hardware, so a memory upgrade of existing state files isn't possible. The additional memory is controlled by the Class command in the Global section of the KML file when creating a new state file. Existing state files aren't affected by the Class command.

Be careful with the HP28C versions of MPIG and MBAG or similar programms using the same method of injecting "System Object" data into memory on memory expanded HP28C. They don't work any more. These programs store data at RAM end (on an orginal HP28C at #4FFFF) and don't expect that RAM end has been moved. The ASS program from the CPROMUPL.ZIP archive works like expected. This program is IMHO the best way injecting "System Object" code into calculator memory.

Have fun with it.

Cheers

Christoph

How to detect early HP-41C ROM versions/bugs?

*Message #1 Posted by **Arne Helme** on 14 Mar 2006, 10:06 a.m.*

I have an early version HP-41C with serial number 1939Axxxxx. According to information found on:

http://dan.pfeiffer.net/hp41/hp41info.htm

the calculator contains either a DDE ROM with all the "classic" bugs or a FDE ROM with all bugs except bug #3.

How can I determine whether the calculator has a DDE or FDE ROM? Based on some trials it is evident that the calculator has the #1 bug. However, I am not able to detect either the #2 or #3 bugs. If I understand the information referred to above correctly the calculator should have at least one of these bugs as well, right?

Can someone provice me with the exact steps required to detect the #2 and #3 bugs?

I also have the PPC ROM. Can I use if to read the calculators ROM version?

Regards,

Arne

Re: How to detect early HP-41C ROM versions/bugs?

*Message #2 Posted by **gene** on 14 Mar 2006, 10:31 a.m.,*
in response to message #1 by Arne Helme

Bug 2: Do this: 997 ENTER 1.23 STO IND Y

If it errors out, you do not have bug 2.

If it seems to work, congrat's...you have bug 2.

Bug 3: 49 STO 00. SF IND 00.

If it errors out, you do not have bug 3.

If it seems to work (by turning on the low battery indicator), then you have bug 3.

Much easier/quicker than viewing the ROM versions. :-)

Re: How to detect early HP-41C ROM versions/bugs?

*Message #3 Posted by **Arne Helme** on 14 Mar 2006, 10:37 a.m.,*
in response to message #2 by gene

Thanks for the info! The calculator has the #2 bug but not the #3 bug.

Arne

Pi day

*Message #1 Posted by **unspellable** on 14 Mar 2006, 9:23 a.m.*

Today is offcially Pi Day.

Celebrate by eating a pie.

Start eating your pie at approximately 1:59:26.5 PM.

(How come I learned about this on a gun forum instead of the HP Froum or the Slide Rule Group?)

Re: Pi day

*Message #2 Posted by **tony(nz)** on 14 Mar 2006, 12:11 p.m.,*
in response to message #1 by unspellable

Here we use dd/mm/yyyy and have a more accurate Pi-day: 22/7 :-)

Re: Pi in the nite too

*Message #3 Posted by **Mike (Stgt)** on 15 Mar 2006, 8:20 a.m.,*
in response to message #2 by tony(nz)

More disturbing than Pi day is that I have to get up every 2hrs to Pi in the nite (not funny).

Now to something completely different: There is somebody (reading and contributing this list) who managed to improve this routine (Vieta) in accurancy and register usage (none at all!!). Now guess who is able to improve HP-12C programs?!? I'll publish it soon.

Ciao.....Mike

Re: Pi day

*Message #4 Posted by **Dave Shaffer** on 15 Mar 2006, 5:20 p.m.,*
in response to message #2 by tony(nz)

As my wife pointed out this morning, though, we (Americans) will briefly do better than 22/7 on pi day in 2015.

No you're not, unless I am too:

Someone once stuck a note on my door, "Happy Mole Day".

I thought, "Groundhog day? It's not February anymore, it's the beginning of summer! What's this guy on about??" I couldn't figure it out.

I catch him later and he says that I ought to be ashamed of myself for not knowing. I make him tell me and he says, "Well, today is June 23." He STILL had to spell it out for me a minute later.

You run slow, a whole day?

Re: eDay

*Message #13 Posted by **Ed Look** on 17 Mar 2006, 9:11 p.m.,*
in response to message #12 by Doug Wilder

Aw, you guys are kidding right?

Now, I'm slow, but you all are really bright and quick fellows!

(I know, I didn't get it, so why should anyone else be different?)

Okay, Mole Day has nothing to do with rodents or turncoat spooks or melanin spots.

One mole of objects is 6 x 10^23 objects (well, 6.0223 x 10^23, [Avogadro's number] to be precise, but the calendar doesn't support that unless you "celebrate" it once a century). I know, duh! But hey, someone makes up this stuff...

... and it's found in the HP 33S, 49G+ constants library!

HP-71B/HP-IL with HP82169A, need progr. help

*Message #1 Posted by **Arnold** on 14 Mar 2006, 9:01 a.m.*

Hello, I am reanimating my good HP71B with IL-I/F. Now I got a used 82169A HP-IL/HP-IB Interface and some IB equipment as the relay box HP59306A and the switch/control Unit HP3488A with the relay cards 44470A, 44471A and dig. I/O 44474A.

I would like to command these from the HP-71B, but I am perhaps too old already to understand, because I get nothing out. I have some feeling that perhaps the IL/IB I/F is not working, but perhaps i just do not send the right commands. Can the proper function and life be checked with some program lines on the 71B?

Could somebody give me some help giving some instructions or small program examples to command and read the IB items from my HP71B? I would be very happy about!

Many thanks in advance, greetings,

Arnold

Re: HP-71B/HP-IL with HP82169A, need progr. help

*Message #2 Posted by **J-F Garnier** on 14 Mar 2006, 11:00 a.m.,*
in response to message #1 by Arnold

Hello Arnold,

After connecting the HP82169 to the HP71, try RESTORE IO. If it passes, the HP82169 should be OK.

You have to make sure that the HP82169 is in translator mode (not mailbox), see the settings under the HP82169.

Then you have to know the HPIB address of your equipement. You could try common IEEE-488.2 commands such as *IDN? and get the answer:

```
OUTPUT :addr; "*IDN?"
ENTER :addr; A$ @ DISP A$
(addr= address of your device)
```

ENTER :addr; A$ @ DISP A$
(addr= address of your device)
```

J-F

Hello J-F, many thanks! Something is working! But still not all is clear: 'Restore Io' with no reaction --> ok, OUTPUT :1; "*IDN?" --> no query, seem to be ok as well, ENTER :1; A$ @ DISP A$ gives '1,31,31,31,31,31,31,31,31,31,31,' , which I do not understand.

On the hp3488A I have put the address to 5 (l0l00), but I can put what I want, I do not get any answer back and I cannot see any reaction yet at the 3488, only with addr. 1 I get the numbers as above.

No, on the front panel of this device there is no indicator showing rem or remote.

Trying the same with the simple 59306A 'relay actuator' I experience the same but no reaction (Output 'An' should switch relay n on, 'Bn' then off). thanks again as well to the other respond! regards,

Arnold

PS: unfortunately I do not have (yet) the docu DVD, nor am I familiar with the IB syntax :-((

> experience the same but no reaction (Output 'An' should switch
> relay n on, 'Bn' then off). thanks again as well to
> the other respond! regards,
```

Well if you have an 59306A try the following procedure:

Make sure the 82169A is in TRANSLATOR mode with address 3:

```
  +--+--+--+--+--+--+
1 |  |  |  |  |XX|XX|
0 |XX|XX|XX|XX|  |  |
  +--+--+--+--+--+--+
    M b5 b4 b3 b2 b1
```

Connect ONLY the 59306A to the HP-IB side of the HP82169 and ONLY the HP-71 to the HP-IL side of the HP82169

Strap the HP 59306A for address 6 (dip switch on the back should look something like this:

```
                  A0
```

```
  +--+--+--+--+--+--+
1 |  |  |  |XX|XX|  |
0 |XX|XX|XX|  |  |XX|
  +--+--+--+--+--+--+
```

Now enter the following program

```
10 INPUT M
20 REMOTE :M
30 OUTPUT :M ; "A124B356"
40 GOTO 10
50 END
```

Run it entering 6 at the prompt. If the 59306A does not go into remote and set the relays, you have the address wrong. Try another address at the prompt.

I have just tried this program on my system and I know it works.

With the HP 82169A set for address 3 you can have another HP-IL peripheral on the HP-IL side. You **must**, however, ensure that it is connected **before** the 82169A. I.e. cable from the OUT connector of the 71 to the IN connector of (say) the printer; cable from the OUT connector of the printer to the IN connector of the 82169A; cable from the OUT connector of the 82169A to the IN connector of the 71B.

Re: HP-71B/HP-IL with HP82169A, need progr. help

*Message #5 Posted by **Arnold** on 15 Mar 2006, 7:01 a.m.,*
in response to message #4 by Vassilis Prevelakis

Hello Vassilis, that does work, Thank you very much! The way to explain with the direct example is easy to understand, gives quick positive results! Now I know at least that all devices are working and the appearing problems are on the programming side.

What I have to try is to get working now all that stuff with 'assign io' etc., where I started with.

Question: Using the same setup example, do i have to declare 2 or only one device and how do they know their addresses? It looks like that the 59306A does not give anything back, does not transmit, but the 3488A does. I will try now if I can talk with it getting the state of the relays or other values back. I have the feeling that I have to spend some hours more to understand the logic and to get readable results.

Personally I do learn better with example programs. I find it confusing that the syntax of the 'basic' program is not the same using the hp85, hp75, or hp71 etc.

Unfortunately I do not find anymore any application using the hp71.... Let's go on executing homework and trying, thanks again and regards,

Arnold

Arnold  wrote:
> I find it confusing that the syntax of the 'basic' program is not
> the same using the hp85, hp75, or hp71 etc.
```

Don't get me started :-)

I agree its really annoying. HP was forced to include multiple examples in their literature because of all these inconsistencies.

E.g. in Product Note 3421A-2 (file pr3421.pdf in the MoHPC CDROM) they have example programs for both the HP-71B and the HP-75D, while the manual of the 3421A includes code for both the HP-41 and "Basic" computers.

From the above manual, here is a program that instructs the HP 3421A to take 16 readings of DC voltages on channels 6-9 (4 readings per channel) and print the mean and standard deviation of those 16 readings:

http://www.series80.org/Misc/HP71B-3421A.gif

I hope this example helps with reading values from a device. In your case, of course, line 40 will simply assign the address of the device to variable D (e.g. D=6). Line 80 reads data from the 3421A. As you can see its rather simple.

BTW you are very lucky to have an HP-71B. Other machines with HP-IL interfaces were far more difficult to program (e.g. HP-75C without the IOROM).

HP-32SII strange behavior

*Message #1 Posted by **Alvar Kusma** on 14 Mar 2006, 2:08 a.m.*

Damaged calculator, a bug ,or I am doing something wrong ?

EQN I=U/R (RCL I = RCL U / RCL R ENTER) CK=EFA0 009.0

SOLVE R -> I? 5 R/S -> U? 220 R/S

SOLVING -> DIVIDE BY 0

??????

Hmm... Same equation

SOLVE I -> U? 220 R/S -> R? 44 R/S

SOLVING -> I=5.0000

Again same equation (I=U/R)

SOLVE R -> I? 5 R/S -> U? 220 R/S

SOLVING -> R=44.0000

Why i get "divide by zero" on first attempt to solve R?

```
REPLACE THIS TEXT WITH YOUR LISTING
```

Re: HP-32SII strange behavior

*Message #2 Posted by **Bram** on 14 Mar 2006, 3:58 a.m.,*
in response to message #1 by Alvar Kusma

If I remember correctly it will start computing with whatever value is in the variable to solve. So I think that R contained 0 from anything before (perhaps a Clear Var). After solving for I, R didn't contain 0 anymore, so the equation could be evaluated.

Re: HP-32SII *unexpected* behavior

*Message #3 Posted by **Karl Schneider** on 16 Mar 2006, 12:41 a.m.,*
in response to message #1 by Alvar Kusma

Alvar --

Bram's explanation above to your query:

> Quote:
>
> If I remember correctly it will start computing with whatever value is in the variable to solve. So I think that R contained 0 from anything before (perhaps a Clear Var). After solving for I, R didn't contain 0 anymore, so the equation could be evaluated.

Bram is correct, but I'll take it one step further: The SOLVE routine first executes the function or program using the stored value of the variable to be solved. If that is not a solution, it then uses the value in the stack x-register for the variable to be solved. The results determine whether or not a solution lies within the range defined by the two "guesses".

So, it's also quite likely that a "DIVIDE BY 0" error will result if the stack x-register contains a zero upon executing SOLVE.

One more thing: The algebraic-equation functionality on the HP-32SII was lifted from the algebraic-entry HP-22S, which has $P = I^2R$ and many other simple equations built into a library.

Now, about the equation itself:

I recognize it as Ohm's Law (with "U" denoting voltage or potential difference), with a 5-ampere current and 220 volts.

-- KS

Hourglass and Annunciator won't shut off

*Message #1 Posted by **Rick** on 14 Mar 2006, 12:02 a.m.*

Some time ago, my 4-year-old got ahold of my hp48gx and had a heyday on the buttons. After I took it from him I realized that the hourglass and the annunciator were 'lit' and wouldn't shut off. My son had gotten it into the I/O menu and did something, but I have no idea what.

Now the annunciator and the hourglass characters on the lcd won't shut off and it's driving me crazy. I've tried a halt and a memory reset to no avail. Anybody know how to fix this?

Rick

*Message #4 Posted by **James M. Prange (Michigan)** on 14 Mar 2006, 4:05 p.m.,*
in response to message #3 by Rick

Does it respond to the keyboard at all? If not, you could try to force a warmstart by pushing a straightened paperclip into the small hole labeled "R" found by removing the upper right rubber foot on the back.

Regards,
James

Re: Hourglass and Annunciator won't shut off

*Message #5 Posted by **Paul Marin** on 15 Mar 2006, 12:37 a.m.,*
in response to message #1 by Rick

This happened to my 48G too. I asked about a solution at HP here in Melbourne, but it didn't work. It's still in the cupboard doing the same thing. Lost cause I'm afraid. Sorry I can't help, but if you get a solution, I'm sure it'll cure my problem too. Good luck

Paul

Re: Hourglass and Annunciator won't shut off

*Message #6 Posted by **Rick** on 15 Mar 2006, 12:28 p.m.,*
in response to message #5 by Paul Marin

Mine had been in this state for the better part of a year. The calculator works fine, with the exception of the loss of knowing when it is 'thinking' because the hourglass is on all the time.

Funny thing happened yesterday though...I tried some new things and actually got the characters to finally shut off. This is what I think happened originally: From the I/O menu the (don't know which menu pick) the calculator was set to receive transmission, pretty sure via IR. There it sat waiting to receive a signal. Then it goes thru an apparent timeout, but a flag must have been set somewhere that never really gets cleared, even after reset (I hadn't yet tried a hardware reset under the rubber foot).

Yesterday I again went to the I/O menu, picked "Transfer" -> Port: IR -> Type: Kermit -> Name: 'PPAR' (because it was there) -> then "RECV" on the menu bar. Same result, it waited until I cancelled and the characters are still there. Then I did exactly the same thing except this time I chose "SEND" as the final option. Then cancelled the action and the characters turned off. My '48GX is now back to normal! Must be a bug in their IR RECV routine.

I would like to know if Paul is able to fix his in the same manner.

Rick

Re: Hourglass and Annunciator won't shut off

*Message #7 Posted by **Randy** on 15 Mar 2006, 5:45 p.m.,*
in response to message #6 by Rick

A warmstart is only a partial reset. If you don't care about what's in memory... you can coldstart it and reset everything to factory defaults on a 48 with the three finger salute: With the unit on, press and hold the A and F keys, press and release the ON and finally release the A and F. Press the F key (NO) when presented with the question: Try to recover memory? That should clear all the I/R stuff and put it in a clean state.

In a few rare cases, I've seen a defective LCD cause some or all of the annunciators to stay on. That big thin piece of glass can fracture and/or break in really wierd ways.

Edited: 15 Mar 2006, 5:46 p.m.

I'll try this. Got nothing to lose by it. The unit is buried away and I'm still in mourning. If I can bring it back to life, you will be thanked ten fold.

Paul

Re: Hourglass and Annunciator won't shut off

*Message #9 Posted by **James M. Prange (Michigan)** on 16 Mar 2006, 3:15 a.m.,*
in response to message #6 by Rick

Rick, was it just the busy annunciator (hourglass) on, or was there another one, such as the I/O annunciator (looks like an arrow pointing right)?

Pretty strange in any case, as a CANCEL (ATTN on 48SX/S) operation should abort any I/O, and Kermit and Xmodem transfers ordinarily time-out if not proceeding; I think after about a minute.

The CLOSEIO command might've been worth a try with something going wrong sith I/O, but turning the calculator off should close the I/O port anyway.

For the "Serial I/O" commands XMIT and SRECV (but not Kermit or Xmodem transfers), the STIME command sets the time-out. By default, the time-out is 10 seconds, but it can be set from 0.1 to 25.4 seconds, and 0 STIME disables the time-out entirely; that is, it'll wait "forever", or at least until the batteries go dead, if the command isn't completed or canceled.

An invalid IOPAR reserved variable in the HOME directory should cause an "Invalid IOPAR" error. IOPAR can be safely purged; if it doesn't exist, then the default IOPAR will be created the next time that it's needed.

I don't know of any problem with the RECV command, but earlier ROMs in the 48G series have a problem with the XRECV command. From the HP48 FAQs:

> Quote:
>
> 6.14. Why does XRECV not work sometimes? (GX)
>
> Pre-Rev R. G Series 48's had a bug that would sometimes cause XRECV to fail if there was not twice the amount of room free for the incoming file. FXRECV, a fix for this bug, is available on the Horn 9 disk in the directory \HP as FXRECV. There is more info about this bug there as well. Note that FXRECV is not required for Rom R, and in fact will not run properly on Rom R.

Of course "Horn 9" refers to Joe Horn's Goodies Disk #9, available at http://www.hpcalc.org/hp48/compilations/horn/.

With versions A-D of the 48SX/S there can be a problem if the clock is displayed during an ARCHIVE. From the FAQs:

> Quote:
>
> If the clock is displayed during an ARCHIVE via RS-232, there is a chance (not 100%) that calculator memory will be cleared, after the transfer. The work-around is to turn the clock display off before doing the transfer. Should your memory be cleared, you will have to restore the contents of memory from the archive.

I think that the manuals recommend that the clock display be turned off during I/O anyway.

In the 49 series, XON/XOFF software flow control doesn't work. This doesn't matter with the small packets used in the calculators' implementations of Kermit and Xmodem, but can be a problem with the "Serial I/O" commands.

Of course, SysRPL or assembly language programs or libraries (as well as, presumably, SYSEVAL, LIBEVAL, and FLASHEVAL, and the 49 series menu 256 commands) can change things in system RAM not accessible to ordinary users, including turning annunciators on or off and changing bits that control I/O. In any case, I'd expect the "3-finged salute" (ON&A&F) followed by NO to set things right, preferably after backing up anything that you don't want to lose.

And of course hardware problems are always a possibility.

Regards,
James

Re: Hourglass and Annunciator won't shut off

*Message #10 Posted by **James M. Prange (Michigan)** on 15 Mar 2006, 8:51 p.m.,*
in response to message #1 by Rick

I'm not sure what you mean by "the annunciator"; the little symbols at the top of the display are generally known as "annunciators".

I'm guessing that you mean the "alert" annunciator; it looks sort of like a dot with two pair of parentheses around it. This alert annunciator is turned on by (among other things) an unacknowledged alarm. Try an ACKALL command to turn it off, and while you're at it, delete any alarms that you don't want.

There's a possibility that a repeating alarm has a period too short to give you a chance to delete it. In this case, hold down the ON key and press the key with TIME above it (the 4 key on the 48 series or the 9 key on the 49 series) to prevent the next alarm from executing, and then delete any unwanted alarms.

Regards,
James

First, thanks for the replies & all the suggestions. I had no Idea there were so many possibilities. Second, sorry for the vagueness on the "annunciator". The one I meant was indeed the I/O Annunciator, the little right arrow way to the right of the display -- not the "alert" annunciator.

To answer some previous questions, I did try the "3-finger solute," to no avail. I didn't perform hardware reset with a paper clip under the foot. I had no alarms programmed and I don't believe an alarm to be a factor. I did have the clock displayed and that might have contributed in some way, but how so is beyond me. There have never been any programs downloaded to my 48GX, either. In fact, it's never been connected to a computer or second calculator.

I spent a good amount of time trying to repeat the problem but have not yet been successful.

The little detail that gets me is the fact that the "data transmit" annunciator was on solid. In normal operation, while waiting to connect to something, it is on only intermittently. If it was actually linked to another device I could see it being solid, but such was not the case here.

Oh well, I guess my problem was magically resolved by divine intervention (eegad!). I'd still like to know if Paul got his fixed as well. Thanks again for everybody's friendly expertise.

Rick

HP 33S instructions

*Message #1 Posted by **Antonio Maschio (Italy)** on 13 Mar 2006, 11:34 a.m.*

Hello,

some claimed that HP 33S memory capacity (more than 31000 bytes) is more than 80 times bigger than HP 32SII poor and lonely 384 bytes. It was on a site where this model was sold (don't remember which).

Sadly, HP 32SII had some good features that HP 33S has not:

I) first of all instructions on the 33S take 3 average bytes instead of the 32SII 1.5 bytes; this quite halves the total ratio! II) second, integer numbers in the range 0÷254 (that were optimized in the 32SII to 1.5 bytes instead of the 9.5 of all other numbers) are not more optimized in the 33S; III) any number now takes 15 bytes (integer or not). This reduces again the total ratio, that now is around 25 times.

I think necessity sharpens the brains, and that programming was much more beautiful on my now dead HP 32SII; probably I'll get used with this impersonal machine, and I'll start to love it, some day. But for the moment, I miss my HP 32SII!

Re: HP 33S instructions

*Message #2 Posted by **bill platt** on 13 Mar 2006, 12:22 p.m.,*
in response to message #1 by Antonio Maschio (Italy)

Hi Antonio,

Yes, I figure that in typical usage, the effective memory size is a bout 1/4 of the reported, so around 8 kb.

Take a look at the recent threaad regarding the statistics registers and the abiltiy to enter negative (n) on the pioneers, but not on the 33s.

If you liked using the equation list feature on the 32sii, you will find the 33s is superior, because it has eliminated the inconsistency of the unary minus as parsed in the 32sii.

But you should also pay close attentions to the difference in how "solve" works in some instances. Jordi Hidalgo wrote a goot short article on this in DATAFILE a year or so ago.

Re: HP 33S instructions

*Message #3 Posted by **Gene** on 13 Mar 2006, 12:55 p.m.,*
in response to message #2 by bill platt

Yep, I noted the solve difference when developing one of the 33S learning modules. I was trying to get a

root for X^2-4=0 and it would only get one answer, no matter what guess was supplied. This was the direct solve result.

So, had to modify that example.

Gene

Re: HP 33S instructions

*Message #4 Posted by **Antonio Maschio (Italy)** on 14 Mar 2006, 9:17 a.m.,*
in response to message #3 by Gene

Gene,

I couldn't believe my new HP 33S was bugged, but after your post I tried: your equation X^2-4=0 input in EQN mode gives always 2.0000 as result with SOLVE, no matter what initial estimates you put into X and on TOS! It's a shame!

How can I trust it anymore? Maybe there's a bug even into other routines (integration, for example)! My older and beloved HP 32SII (now broken) gives the right answers (2.0000 and -2.0000) to it!

Luckly, SOLVE seems to work correctly if you input the equation into PRGM mode, as the older HP 32S did. But this makes no difference at all: 33S seems to me a mistaken model the same.

What about it? Is there a way to know what happens and why, and how to override this behaviour?

> How can I trust it anymore?

The 32SII too had a bug in the solver. It has been discovered in 2005 and was discussed right here. I don't remember the details but it had something to do with breaking a solver operation and starting a new one without clearing the stack. Anyone knows better? Sorry to the poster about not remembering his name:(. Anyway, these machines (the software in the first place) have reached a complexity over the years that makes it impossible to test every detail. You have to live with it.

Thomas

Don't make me laugh ...

*Message #7 Posted by **Gene** on 14 Mar 2006, 12:17 p.m.,*
in response to message #6 by Valentin Albillo

And, just for the record, while there are bugs in early versions of the 33s, the direct solve I mentioned is not one of them - it was a conscious design choice, I believe.

And, while it might be a bit too much to expect non-bug-roms for a machine like the 49g+, a machine like the 33s should not ship with bugs.

Of course, the 41c shipped with bugs too. Let's not forget about that. Bug 1 (non-save of LastX when Sigma+) and Bug 4 (or 5? bad SIN for small values of x) were in machines over the first year or so of it's sale.

Most machines ship with bugs...and the more complex the machine, the greater the number of them.

The 15c is truly a marvel and I too am not aware of any bugs.

The 33S should not have had any, IMO.

Valentin, did you see the response on timing of your trig program on the "parentheses 12cp"?

Re: Don't make me laugh ...

*Message #8 Posted by **Valentin Albillo** on 14 Mar 2006, 12:43 p.m.,*

No problem, friend! :-)

*Message #9 Posted by **Gene** on 14 Mar 2006, 12:52 p.m.,*
in response to message #8 by Valentin Albillo

Derogatory comments? Never taken that way. :-)

Like everyone else, I sometimes post when I'm in too "testy" a mood.

I certainly don't want "buggy" products and I want higher quality machines.

Would be interesting to test the new 12cp on one of your "root" problems against other contenders. Perhaps when I have time...

The early 11C's did have a problem

*Message #10 Posted by **Palmer O. Hanson, Jr.** on 15 Mar 2006, 2:19 a.m.,*
in response to message #8 by Valentin Albillo

The "Bugs" section of the Forum contains the following statement:

"Early HP-11Cs had a bug in which if you entered a number in the form 0.0xxx, backspaced over all the digits and then pressed ENTER, 1.00 was entered rather than 0.00. HP allowed users of buggy calculators to swap for fixed units."

I have one of those buggy units (S/N 2217A03623) in my collection. I also have a later, properly operating unit.

Re: The early 11C's did have a problem

*Message #11 Posted by **Valentin Albillo** on 15 Mar 2006, 5:29 a.m.,*
in response to message #10 by Palmer O. Hanson, Jr.

Hi, Palmer O:

Palmer O posted:

"Early HP-11Cs had a bug in which if you entered a number in the form 0.0xxx, backspaced over all the digits and then pressed ENTER, 1.00 was entered rather than 0.00 [...] HP allowed users of buggy calculators to swap for fixed units."

I hope you'll agree with me that:

- Such a 'contrived' bug that only happens when you do some unnatural series of operations, which are non-programmable to boot, whose usefulness is nil, the remedy being as simple as not doing that nonsense to begin with, as is the case with the one "bug" you mention, is in a *vastly* different league than most of the ones reported for the HP33, say, such as the polar-rectangular conversions for instance, and simply can't be compared: plainly saying that they're both "bugs", so that the HP-11C "also has a bug" is *highly* misleading.

- The HP-15C which was the precise model I mentioned never had this "bug". Also, you'll not be able to tell me of any other bug for the HP-11C (10C, 15C, 16C, ...) because none has ever been reported, to the best of my knowledge. I knew about the 11C "bug" you mention but never considered it a proper bug worth worrying or talking about. The fact that HP of old nevertheless replaced machines having this inconsequential and inoffensive "bug" says volumes about HP's former commitment to quality and user satisfaction, i.e., the "HP Way" once more.

Best regards from V.

Early 11C bug vs. HP-33S errors

*Message #13 Posted by **Karl Schneider** on 17 Mar 2006, 2:20 a.m.,*
in response to message #11 by Valentin Albillo

Hi, Valentin --

The original issue:

> Quote:
>
> *"Early HP-11Cs had a bug in which if you entered a number in the form 0.0xxx, backspaced over all the digits and then pressed ENTER, 1.00 was entered rather than 0.00 [...] HP allowed users of buggy calculators to swap for fixed units."*

To which you stated,

> Quote:
>
> Such a 'contrived' bug that only happens when you do some unnatural series of operations, which are non-programmable to boot, whose usefulness is nil, the remedy being as simple as not doing that nonsense to begin with, as is the case with the one "bug" you mention...

I beg to differ about this. If a zero-quantity is present in the display, no matter how it was produced, ENTER should not convert it to 1.00. That is a bug in every cyber-based sense of the the word; HP was justified in fixing it and offering free replacements. In fact, the individual(s) who discovered and reported it may have prevented a similar problem from being introduced into the HP-15C and HP-16C (but not the HP-10C and HP-12C, which had no backspace operation).

> Quote:
>
> ...is in a vastly different league than most of the ones reported for the HP33, say, such as the polar-rectangular conversions for instance, and simply can't be compared: plainly saying that they're both "bugs"...

As one who spelled out the flaws, I absolutely agree with this statement. The first HP-33S had unacceptable shortcomings in representation of arguments (e.g., -0) mathematical algorithms, and validation of output. These problems

were beyond mere "bugs" that would have been unacceptable in real HP's.

Regards,

*Message #14 Posted by **Thomas Radtke** on 14 Mar 2006, 2:25 p.m.,*
in response to message #6 by Valentin Albillo

Valentin,

I'm not aware of a test setup to check a particular calculator for any bugs. Something like that wasn't available when the 15C came out and it is not available today.

Even the HP-35 had bugs.

If I or anyone else chooses to live or to not live with the potential risk of a bug is completely irrelevant. A company might be able to reduce the number of bugs in their products by carefully designing it but it won't be able to guarantee their reliable operation.

I understand your point and appreciate it much but it is not related to what I said.

Re: HP 33S instructions

*Message #15 Posted by **HrastProgrammer** on 15 Mar 2006, 1:55 a.m.,*
in response to message #5 by Thomas Radtke

Anyway, these machines (the software in the first place) have reached a complexity over the years that makes it impossible to test every detail. You have to live with it.

No, I have not. Certainly, almost every HP calculator has a few bugs (including HP-35, HP-41C, HP-71B, HP-42S, HP-48SX, HP-48GX, ...). But the number of bugs in the later HP/ACO/Kinpo/... calculators is just too big for my taste. For example, they are "fixing" bugs in HP-49G+ for the last two years and still haven't fixed all of them. Not to forget that they were fixing HP-49G for a few years before ...

Also for mine. But that was not the point here. Please re-read to post that I replied to.

Thomas

Re: HP 33S instructions

*Message #17 Posted by **HrastProgrammer** on 15 Mar 2006, 4:29 a.m.,*
in response to message #16 by Thomas Radtke

Yes you have.

No, I have not.

As long as you cannot give a prove for a calulator to operate in line with its manual, my statement is true.

In the HP-49G+ manual you will (probably) find that when you press some key the calculator will register it. Well, this is sometimes true and sometimes not. What more do you want?

This thread is about HP-33S so talking about HP-49G+ is off-topic here. But, you said "these machines" so I supposed you were talking about all new HP calculators ...

But that was not the point here. Please re-read to post that I replied to.

I re-read it. It is the same as the last time I read it: *"Anyway, these machines (the software in the first place) have reached a complexity over the years that makes it impossible to test every detail. You have to live with it."*

So, what was the point? That HP isn't capable to produce a "HP quality" calculator anymore and that we "have to live with it"? I would rather say that I can live without it (I mean: without any new HP calc) ...

Edited: 15 Mar 2006, 5:01 a.m.

> In the HP-49G+ manual you will (probably) find that when you press some key the calculator will register it. Well, this is sometimes true and sometimes not. What more do you want?

If thats in the manual, then you have proven that the 49G+ is buggy. The tricky part ist to prove the opposite (i.e., that there are no further undocumented bugs).

Suppose someone asks you whether he can trust a particular calculator or not. He already knows about some bugs, so the question turns into whether there are more bugs that haven't been discovered yet. I said (in other words): It is impossible to test all functions in any situation in reasonable time. Therefore, you cannot trust it. I gave him an example about a calculator that has been in the marked for a long time but only recently revealed a really nasty bug. Was I clear this time?

One is certainly better off using a 15C instead of a 33S (if applicable) but still, he is not on the safe side.

> Quote:
>
> This thread is about HP-33S so talking about HP-49G+ is off-topic here. But, you said "these machines" so I supposed you were talking about all new HP calculators ...

No, I was taking about calculators in general.

> Quote:

Re: HP 33S instructions

*Message #21 Posted by **Gene** on 14 Mar 2006, 11:51 a.m.,*
in response to message #4 by Antonio Maschio (Italy)

Hi Antonio.

These are not new revelations but have been documented even here on the forum.

I also do not believe they are "bugs", but behavior chosen for a purpose.

It works like this:

When an equation has one occurrence of a variable, and only one occurence, the 33S solver will use the direct solver to estimate a root. That is why the X^2-4=0 finds the solution x=2 and only x=2. It does not use an input value as a guess in this instance, since it uses the direct solver.

An equation such as X^2-5x-6 will use input guesses and find more than one root, since X occurs more than once in the equation.

To force the 33S to solve X^2-4=0 and find multiple roots, you must enter the equation as something like this:

X^2-0*X-4=0

This will use input guesses and find more than one root.

This is documented in the 33s learning modules available on HP's site.

You will have no luck claiming this is a bug to HP because this behavior was chosen and is considered the "way it is supposed to work".

So, to get around this behavior, if you have an equation with only one variable that is taken to a power, enter an extra term including 0 multiplied by the variable.

We might disagree with whether this should be the way it ought to operate, but that's the hand of cards we've been dealt.

If you haven't looked over the learning modules on HP's webpage for the 33S, you can find them here:

http://h20331.www2.hp.com/Hpsub/downloads/33s.zip

which will download all the modules in one zip file.

The two specific 33s modules dealing with the solver (which were written by Wlodek!) can be found here:

http://h20331.www2.hp.com/Hpsub/downloads/33sSolver.pdf

http://h20331.www2.hp.com/Hpsub/downloads/33sSolver2.pdf

The second module (33sSolver2.pdf) has a discussion of the "Direct Solve" "feature".

Hope these help!

Gene

A past thread on HP-33S SOLVE

*Message #22 Posted by **Karl Schneider** on 14 Mar 2006, 10:44 p.m.,*
in response to message #4 by Antonio Maschio (Italy)

Antonio (and others who are interested)--

I agree completely with your sentiments.

Here's a link to a thread from September 2004 regarding the direct-method implementation of SOLVE on the HP-33S. It includes some dialogue between Gene and me.

One thing I didn't realize at the time was that the celebrated algebraic solver from the HP-17B/17BII/27S did the same thing -- always providing the direct-solution value whenever possible, even when the initial-guess value of the variable of interest is at or near another valid solution.

unknown (?) error message HP48G

*Message #1 Posted by **Bram** on 13 Mar 2006, 6:38 a.m.*

While trying to get an answer to the S&SMC#14/1 for which I had written an RPL program, my HP48G finally asked *me* a question: "Try to recover memory?"
Of course I replied YES, but it reasked the question, so I couldn't do anything but reply NO and after a while the calc cleared itself and went into virgin status.
I cannot find this message in the manual, but I may have overlooked it. Does anyone have additional information on this behavior?

Re: unknown (?) error message HP48G

*Message #2 Posted by **Marcus von Cube, Germany** on 13 Mar 2006, 8:11 a.m.,*
in response to message #1 by Bram

"Try to recover memory?" indicates a reset condition and should appear if the calculator has reset itself. You probably ran out of memory in a way that the caclulator couldn't recover.

Marcus

Due to a program error I may have filled the stack to its limits. I would have expected the program to just halt with a 'stack full' message, but in extreme cases apparently things don't always go as expected.
I think you're right with your answer. Thank you.

Re: unknown (?) error message HP48G

*Message #4 Posted by **Han** on 13 Mar 2006, 2:10 p.m.,*
in response to message #3 by Bram

When the HP48 uses up all available memory, it will go into a mode that will attempt to free up some of the used memory. In this mode, the calculator will prompt the user if it can delete various parts of memory, beginning with the least important section (e.g. last stack, last arguments, last commands, etc). Once "enough" memory is freed up, the calculator exits this mode. If more memory is required, it will restart and you may possibly have to purge more objects from memory. This is normal, and should never corrupt memory. This is completely different from the "Recover Memory?" mode. Unless your program was written in SysRPL or assembly, memory should always stay in tact.

Is your program written in SysRPL or assembly? Buggy programs in SysRPL or assembly can often result in memory corruption.

> Quote:

> Due to a program error I may have filled the stack to its limits. I would have expected the program to just halt with a 'stack full' message, but in extreme cases apparently things don't always go as expected.

It was just a novice's little program between << and >>. To my knowledge that's neither SysRPL nor assembler and hence should only halt in stead of crash.
I was trying some things and cannot replay the exact program for I don't have it anymore, but it must have something to do with stack growth. I tried to clean it up between calculations, but I must have made an error there.
Anyway, your explanation is clear to me. I'll have to keep track of stack operations carefully (well, anyhow, I guess;-)
Thanks.

Well, nothing done in "pure UserRPL" (excluding SYSEVAL, LIBEVAL, FLASHEVAL, and 49 series "hacker's library" commands, that is) **should** cause a "Try To Recover Memory?" (TTRM), including attempting to make the stack grow beyond available memory. However, there are some bugs (depending on the ROM version) that will cause a TTRM; maybe see the most recent 48 series FAQs at http://www.hpcalc.org/hp48/docs/faq/. Of course, it's also a possibility that you've stumbled upon a previously unreported bug.

Regarding programs or libraries written in SysRPL or assembly language, there's a possibility that a bug won't be immediately apparent, but willl cause memory corruption that will later cause a TTRM during UserRPL operations.

Too bad that the TTRM didn't successfully recover memory; it would be interesting to see what your program did.

Note the "Try" in "Try To Recover Memory"; sometimes it fails or is only partially successful. In particular, Bill Wickes's *Insights* says that a library shouldn't be left in a global variable after it's been copied to a port, as the TTRM will take the library as the start of port 0, thus any global variables or subdirectories following it will be lost.

Of course, if your calculator has anything that you really can't bear to lose, it's wise to have a backup of it on another device, either by transferring selected variables or using the ARCHIVE command.

Regards,
James

Mix and match parts between HP-41CV and HP-41CX

*Message #1 Posted by **Andreas Terzis** on 13 Mar 2006, 3:31 a.m.*

I have an HP-41CV in very good condition. Can I borrow parts from that and replace the ones on the CX with corrosion and possible corrosion of other parts? Both work currently. Should I not bother and wait until the CX fails?

Re: Mix and match parts between HP-41CV and HP-41CX

*Message #2 Posted by **Tony Duell** on 14 Mar 2006, 2:02 p.m.,*
in response to message #1 by Andreas Terzis

This depends on whether the machines are Fullnut or Halfnut.

If one is a fullnut and the other a halfnut, then AFAIK the only common parts are the battery holder and I/O assembly (the flexible PCB on the plastic frame that connects to the battery pack, modules, etc).

If both are fullnuts, then the CPU board is different between a CX and CV. Some of the chips might well be the same, though. The keyboard PCB, display module, all case parts (apart from labels!), I/O assembly, CPU board connector, etc are the same.

If both are halfnuts, then you have less you can interchange. The ROM is different, and that's part of the display hybrid on a halfnut. So unless you want to start dismantling the heat-staked keyboard, the only things you can swap are the back case and I/O assembly. There's a bridge board in the CX only which contains the extended functions ROM, timer ROM, timer chip, extended memory, etc, but if you fit this to a CV all you get is the timer functions. The CV ROM will not detect the extended functions ROM.

Does HP fix L() and G() problem in recent HP 17bii+?

*Message #1 Posted by **Walter Lam** on 12 Mar 2006, 11:17 p.m.*

Hi Guys.

Does anyone purchase a 17bii+ recently? I'd to know whether HP has fixed the unstable performance of L() and G() in 17bii+'s HP SOLVE.

If you have any new comment, please also post it here.

Walter

HP 48G with 512KB RAM

*Message #1 Posted by **Han** on 12 Mar 2006, 9:47 p.m.*

If any of you are curious about my continued efforts in finding the values of (very used) upgraded HP48G calculators, I have another one on eBay (#5879629328). I plan to place a few more units later on as I currently have an overwhelming number (for me, anyway) of HP48G calculators.

HP-41CX damage from battery corrosion...

*Message #1 Posted by **Andreas Terzis** on 12 Mar 2006, 7:25 p.m.*

Hi there, I just picked up an HP-41CX from eBay with the battery contacts of the machine corroded. If I get to keep the machine, is there any way to tell if the battery acid/base might have spread inside? Does anyone know if there is a fairly easy way to open the machine without breaking anything? If the machine works now but the liquid has spread inside, are there significant chances for the machine to die soon? Thanks in advance, Andreas

Re: HP-41CX damage from battery corrosion...

*Message #2 Posted by **Karl Schneider** on 13 Mar 2006, 12:22 a.m.,*
in response to message #1 by Andreas Terzis

Andreas --

If I remember correctly from earlier postings, you bought a halfnut, whose internal components (display, keyboard, CPU and other chips) are integrated onto a single board -- even in the CX, I would assume. Halfnuts are generally more difficult to repair than the (older) fullnuts, although that may not be relevant to this problem.

On any HP-41, separate the case halves by removing each of the four rubber feet, along with their adhesive backing, and the screw underneath. Then, you'll be able to see how far the corrosion has spread.

If it is limited to the battery terminal contacts, one Forum participant has developed and fabricated a replacement "foil" for sale. The individual and the details can be found in Archive #15.

Hi Andreas, and thanks Karl for the reference...

... may this link be of some help too, it's just four threads below:

http://www.clonix41.org/Maintenance/IO_Block/FlexPCB_Replacement.zip

Best of lucks with your CX.

Diego.

Re: HP-41CX damage from battery corrosion...

*Message #4 Posted by **Andreas Terzis** on 13 Mar 2006, 3:29 a.m.,*
in response to message #3 by Diego Diaz

Thanks Karl, Diego. I read somewhere that after I put an HP-41CX back together, if I tighten the screws too much, I'll either destroy it or it won't work!!! I decided to refrain from that for now, and if the machine fails at some point, to take it apart then, or send it in to FixThatCalc. I'll consider the FlexPCB at some point.

Re: HP-41CX damage from battery corrosion...

*Message #5 Posted by **Klaus** on 13 Mar 2006, 4:15 a.m.,*
in response to message #4 by Andreas Terzis

The Halfnut does not have a separate logic board, so it does not need the case's pressure to work. Disassemble it and clean it, it is no big deal! Do not apply force when tightening the screws and it will be easy as 3,14159!

Greetings, Klaus

Re: HP-41CX damage from battery corrosion...

*Message #6 Posted by **Andreas Terzis** on 13 Mar 2006, 5:23 a.m.,*
in response to message #5 by Klaus

Klaus, Thanks for the insight. Do you know if I should use baking soda and water for cleaning? Regards, Andreas

Re: HP-41CX damage from battery corrosion...

*Message #7 Posted by **Klaus** on 13 Mar 2006, 6:03 a.m.,*
in response to message #6 by Andreas Terzis

I do not know whether baking soda is harmful or not. I always use agua demin. (distilled water), and a Q-tip or a piece of cloth.

One more warning: static electricity! I never had any problems with that, but make sure you ground yourself before opening the calc!

Good luck! Klaus

Re: HP-41CX damage from battery corrosion...

Is inflation taken into account When Prices of HP calculators are put in the web-site?

*Message #1 Posted by **Ozzie** on 12 Mar 2006, 7:00 p.m.*

hi all i am doing a project on the calculator industry, and i need to look at the changes in the calculator prices between 1968 and 1968.

i just wanted to make sure that prices that are put on the website are the present values rather than what actually the prices was in those days??? any ideas???

for example in 1968 HP9100 AB was introduced with the price of approx. $5000. is this discounted???

Thanks for commands.

Ozzie

in response to message #1 by Ozzie

I don't think you'll find much of a price fluctuation between 1968 and 1968. =)

More seriously, though, the prices will usually be much less than the introducotry prices, with exception for a few units. I know that in particular the HP48GX had a price of around $250.00 at some retailers, though $200.00 was about average when they were in production. Nowadays, they go for more due to their popularity amongst surveyors and the fact that they are no longer in production.

Regarding the website, you are best off asking the curator of the museum himself.

*Message #3 Posted by **bill platt** on 13 Mar 2006, 9:15 a.m.,*
in response to message #1 by Ozzie

Only Dave can be definitive in an answer (as he compiled the info) but, based on the prices that I paid in 1982, 1995 etc measured against what is listed on the museum, then no, the prices are *not* discounted. The numbers given are the actual prices you would have paid in the dollar of that day.

Yes, $450 1976 dollars is a lot of money! That is why the digital revolution didn't happen over-night :-)

OT: Integral PC Floppy Drive

*Message #1 Posted by **Howard Owen** on 12 Mar 2006, 5:55 p.m.*

I have finally gotten home from an extended business trip, and found the Integral PC I bought on eBay three weeks ago waiting for me. I'm having a blast putting together a system from the disk images at http://www.coho.org/~pete/IPC/ and http://hpmuseum.net/exhibit.php?swc=9 . Although I lack an HP-IB hard drive (which I haven't missed, up to now, with my 80 series and 9816 machines,) I do have two 9122/Ds that give me about 2.4 MB of storage to play with. I would have close to 3MB, but unfortunately, the internal floppy drive appears hosed. Either that, or I'm not operating it correctly. It appears to me that the "up" side of the floppy (with reference to modern PC floppy drives) faces toward the screen. I cannot insert the floppy either way, but if I press the release button at the top-right, I can see the shuttle moving from right to left. When it lines up with the opening, I can insert the disk. The drive access light comes on, and the drive spins away for a bit, but then stops, and HP-UX shows an error to the effect that /dev/A could not be accessed. Things don't work nearly as well if I put the disk in the other way. 8) It sounds to me like a mechanical problem that might yield to some adjustment. I can read up on floppy drive maintanence in my copy of "Upgrading and Repairing PCs" but I thought I'd ask here regarding this specific drive. Does anyone have advice or documentation for the IPC? I'm using modern quad density disks with tape over the hole opposite the write-protect tab.

Thanks,
Howard

Re: OT: Integral PC Floppy Drive

*Message #2 Posted by **Thomas Okken** on 12 Mar 2006, 8:37 p.m.,*
in response to message #1 by Howard Owen

It's a long shot, but you might want to try getting some real double-density floppies. From what I remember from my Macintosh II days, using high-density media in double-density drives was supposedly unreliable -- at least that's what everybody said; I must admit I never tried it myself (and what you're reporting sounds a lot worse than merely "unreliable")...

- Thomas

Re: OT: Integral PC Floppy Drive

*Message #3 Posted by **Howard Owen** on 12 Mar 2006, 9:22 p.m.,*
in response to message #2 by Thomas Okken

I don't have any real DS/DD disks, unfortunately. I do think it's a serious mechanical problem.

I'm in good shape because of the external drives. But I may have a whack at the internal drive, merely as an excuse to open up the machine. 8)

Regards,
Howard

Re: OT: Integral PC Floppy Drive

*Message #4 Posted by **Tony Duell** on 13 Mar 2006, 1:07 p.m.,*
in response to message #3 by Howard Owen

I have an Integral (wonderful machine), I have, as ever, taken it to bits...

There are schematics on the Australian site, but I know there to be errors in them (particularly around the address decoder on the Logic A board). An updated version (including the diagrams for the internal modem) is on the latest version of HPCC CD-ROM.

OK, back to the problem. I can't remember which way the disk goes in an Integral, but the drive mechanism is the same as the one in your 9122 (or 9133, or...), without the front panel and eject button. So the eject button on the front of the Integral should give you the orientation of the drive.

You do have to use DD disks. HD ones will go in, but won't activate the disk inserted sensor (and they're the wrong coercivity). So that's not the problem -- yet -- but it will be a problem later.

Now, there's a well-known problem with these drives. The grease on the eject mechanism goes hard and sticky with age, the levers don't latch up properly. If you're unlucky, the upper head will catch in the slot in the disk when you eject it, and will be ripped from the gimbal spring. At which point you need a new head carriage. Finding one is difficult, fitting it (which involves doing the head alignment) is marginally easier.

But whether that's happened or not, you need to remove the drive to investigate. The Integral is not hard to work on, but you need a set of Torx drivers. Start by removing any expansion cards, then undo the 2 Torx screws on the back. Remove the back cover. Under it is a sheild plate held down by 6 Torx screws. Take that out next and you're looking at the component side of the Logic A board (CPU, memory mapper, ROMs, RAM, HP-HIL).

Disconnect the 2 cables from the back of the floppy drive, then undo the 2 screws in the bottom of the cable well next to the built-in printer, and the single screw on the bottom of the floppy bracket. Slide the bracket and drive out rearwards, remove the eject button and spring before they get lost.

If you want to go further on the main machine, undo the screws holding the vertical chassis plate in place (this has the Logic A board on it). Ease it up, reach under it and unplug the cable from the back of the display. Unplug the cables from the bottom edge of the 2 boards (HP-HIL, Power (one on each board), HPIB, etc), Move the chassis plate so you can unscrew the shield from the logic B board. Unplug the cables going to the Thinkjet mechanism (carriage flexiprint, the 2 motors, home sensor, paper sensor, control panel) and remove the chassis entirely. The logic B board contains I/O circuitry -- the HPIL link to the Thinkjet, the Thinkjet controller, sound, real time clock, disk controller, video controller, HPIB, etc.

The metal box at the bottom contains the PSU and expansion backplane. To get that out (with the chassis out of the way), undo the grounding nut visible through a hole in the expansion backplane. Then remove the 4 Torx screws on the side flanges and slide the whole lot out. To get inside, remove the nuts and torx screws holding it together and ease up the cover. I find it best to unbolt the HPIB connector from the back of this module at this point.

Back to the drive. Undo the 4 screws holding it to the bracket. Take off the cover by removing the single screw at the back. You can now see how the disk holder works. Examine the upper head. If it looks undamaged, or you want to go further, then you can dismantle the drive in the following order :

Remove the 3 screws on the bottom, lift off the foil shield, ease up the PCB and unplug all the cables going to it.

Remove the eject damper (rear left, 1 screw)

Remove the head load solenoid (2 screws, one holds an earth tag. Feed the wires through the chassis). Put clean paper between the heads to prevent them from touching.

The disk holder is held down by 4 screws from underneath.

To remove the spindle motor, remove the E-circlips on the sensor arm posts, lift off the arms and the compression springs. The motor itself is held in by 2 screws.

The head carriage can be removed by undoing the screw on the cover plate under the chassis and freeing the cable there. Undo the screws holding the clamps for the carriage rails, slide out the rails and the carriage. You should be able to refit the same carriage without affecting the alignment, if you fit a replacement, you need to check the radial alignment.

The disk holder comes apart by removing the obvious screw and the E-circlips. Watch out for small, loose spacers on some of the rods.

Re: OT: Integral PC Floppy Drive

*Message #5 Posted by **Howard Owen** on 13 Mar 2006, 11:30 p.m.,*
in response to message #4 by Tony Duell

Thank you for that detailed description, Tony!

Regarding media, the quad density disks work fine in both my 9122s. (Also in my 9121s and 9114s) I'm willing to believe there may be a problem with particular drives, or particuar drive models, though. But the mechanical problem is the first order of business.

Thanks again!
Howard

Re: OT: Integral PC Floppy Drive

*Message #6 Posted by **Tony Duell** on 14 Mar 2006, 6:04 a.m.,*
in response to message #5 by Howard Owen

Odd that you have no problems with HD disks. In the older full-height drives (used in the Integral, 9114A, etc), the disk-inserted sensor lines up with the HD-detect hole, so that the drive doesn't detect that a disk has been inserted if you use an HD type. I am told this was deliberate, the HD disks are the wrong coercivity and will not be reliable.

If you have any more questions on the Integral hardware, feel free to ask.

Re: OT: Integral PC Floppy Drive

*Message #7 Posted by **Howard Owen** on 14 Mar 2006, 10:59 a.m.,*
in response to message #6 by Tony Duell

I cover the HD detect hole with tape, so the drives accept the disks. As far as the coercivity goes, the HD disks can't be out of spec by a huge amount, since they actually do work. I'm sure they are less reliable than the proper media would be, but so far, they have been "good enough." It's probably a testament to conservative engineering in the HP drives. (Perhaps coupled with my not-so-stringent requirements.)

Regards,
Howard

Integral PC Internal Drive Solved

*Message #8 Posted by **Howard Owen** on 18 Mar 2006, 3:37 p.m.,*
in response to message #6 by Tony Duell

It was the media. Hats off to Thomas and Tony.

Thanks for offering to send me a couple to test, Dave, but I decided I needed more than a couple, so I bought 40 DS/DD disks off of eBay. I still have to perform the trick of pressing the eject button until I can insert the disk, but once that's done, I can format, read and write the DS/DD disks just fine in the internal drive. The wrong media still works in the external 9122s, so I figure I'll use them for "scratch" disks, and use the right media for stuff I want to last a while.

Thanks for all your help!

Regards,
Howard

Re: Integral PC Internal Drive Solved

*Message #9 Posted by **Vassilis Prevelakis** on 18 Mar 2006, 7:48 p.m.,*
in response to message #8 by Howard Owen

```
Howard Owen wrote:
> I still have to perform the trick of pressing the eject button
> until I can insert the disk, but once that's done,
```

This should NOT be necessary. If the diskette does not slip into the slot easily, the mechanism that lowers the printheads on the medium may need cleaning and lubrication.

This is NOT optional. You have to do it ASAP, before you destroy one of the heads. Follow Tony's suggestions to remove the floppy and lubricate the mechanism. Use your own judgement on how far you want to disassemble the floppy drive (I admit I was scared to go too far and simply removed the drive from the IPC and cleaned and lubed the parts that were accessible from the outside of the drive mechanism, i.e. I did not disassemble the floppy drive itself).

Do not use the floppy drive until you fix it.

Also take care to save the eject button as you remove the drive. It will prob. fall inside the case because it is not attached to the drive itself or the case. Before removing the floppy drive, you may want to add some sticky tape on the outside of the machine across the button to keep it attached to the case.

This is NOT optional. You have to do it ASAP, before you destroy

---

I will second that. You _WILL_ damage the head if you catch it in the disk shutter because the disk holder doesn't latch up properly. I had to replace the head carriage in the floppy drive of a 9133H because of this. It was not fun. Doing the radial alignment is not easy without the special tool, even if you have the alignment disk and exerciser (I have those).

Quote:

Sometimes I forget that not everyone had a mis-spent childhood dismantling clocks, cameras, computers, etc AND getting them back together again :-)

More seriously, these drives are not hard to work on. Don't touch the screws holding the stepper motor or track 0 sensor PCB, or you will have to do a re-alignment. But everything else can come off and go back without problems. Yes, you do end up with a lot of little parts, but provided you keep them in order, it'll all go back. There are no springs to fly out, or anything like that.

I don't have a digital camera (and won't be buying one until they exceed the quality from my large-format film cameras...) so I can't do what would probably be very useful, namely producing a sequence of pictures showing what to remove in what order.

Quote:

Also take care to save the eject button as you remove the drive. It will prob. fall inside the case because it is not attached to the drive itself or the case. Before removing the floppy drive, you may want to add some sticky tape on the outside of the machine across the button to keep it attached to the case.

I found it best to take out the 3 screws holding the drive bracket in place, then to put the machine screen-side down on my workbench. Lift the drive up (towards the actual back of the machine). Then reach inside and remove the eject button and spring. I don't like putting sticky tape on things, I am worried the adhesive will get somewhere it shouldn't

Halfnut character elements vs. Coconut's

*Message #1 Posted by **Andreas Terzis** on 10 Mar 2006, 11:45 p.m.*

Hi all, I just acquired an HP-41CX (which I might have to return to the seller due to misrepresentation in the ad - business as usual on eBay anyways). It is a Halfnut version and the screen contrast is not as high as on earlier models - the characters are more greyish. Another thing I've noticed is that the character elements are further apart from each other, compared to those on a Coconut machine. Is that the case only on a Halfnut? How are the elements on a Honeynut? What about a Silverbird? I'd dare say that I prefer the display on a Coconut. Are there any other advantages on a Halfnut compared to a Honeynut, apart from the simplified electronics (and probably the lower weight)? Thanks a lot in advance, Andreas

*Message #2 Posted by **Doug Wilder** on 11 Mar 2006, 1:07 a.m.,*
in response to message #1 by Andreas Terzis

Have you tried a greater viewing angle? I notice that my CX is OK when setting on a table but dimmer when viewed at 90 degrees.

Best Regards

HP-41 display units

*Message #3 Posted by **Karl Schneider** on 11 Mar 2006, 1:50 a.m.,*
in response to message #1 by Andreas Terzis

Andreas --

Yes indeed, the displays on the older "Fullnut" HP-41's from 1979-1985 are more legible than the later "Halfnut" units from 1985-1990. In fact, the characters are most "solid" on the earliest US-made HP-41C and HP-41CV models from 1979-80(?), presumably until manufacture shifted to Singapore.

The Singapore-made Fullnuts have characters that are less bold, but taller, and are still pretty good.

The Halfnut display characters, though, are terrible, with wide spaces between segments. I don't know why the changes were made, other than perhaps cost-cutting.

I have one of each (1980 41C; 1984 41CX; 1986 41CV).

If the characters are faint with poor contrast at normal viewing angles, there may be an internal problem. I once saw a Halfnut 41CX with those kind of symptoms. Halfnut display contrast is settable using certain non-HP ROM's, to my understanding.

in response to message #3 by Karl Schneider

Karl thanks. Are there any other advantages on a Halfnut compared to a Honeynut, apart from the simplified electronics (and probably the lower weight)? Would I be OK (displaywise, speedwise or otherwise) if I found a Fullnut CX (that would have a serial starting with a serial # earlier than 2510S or 2510A or even 2501)?

Peace on you Brother Paul,

Thou shallt :

1) Download the Sandbox Rom burn it to the appropriate Rambox (Clonix, NovRAM, MLDL2000) or 41' Emulator.

2) Download the Documentation

3) Learn and use the CTRST & CRST? commands.

4) Pray the Angel with me to have one day a Fullnut version of the Sandbox ;-)

Amen

Etienne

My 32s brooke

*Message #1 Posted by **Jeff Wojtkiewicz** on 10 Mar 2006, 7:29 p.m.*

hi all,

first for background..I'm not a HP "nut" but I've used my HP-32s for 6 years when I first bought it new at my campus bookstore. I actually didn't realize they were discontinued until just last year. Well I figured I was safe.....

Well tragedy has struck. I kept the 32s in my laptop bag for years with no problem. A couple of weeks ago it wouldn't turn on so I figured the batteries were dead. Well today I got new batteries and it won't turn on/do anything. (I kind of suspected something was wrong b/c I never saw the low batt sign) I have no idea what caused this.

Does anyone have any ideas of what I can do? I have it sitting with the batteries out hoping it resets. I've tried pressing C+Ln.

I can't justify buying an ebay for what they are going for since I have to use it every day.

hope someone can help... Thanks Jeff

Re: My 32s brooke

in response to message #1 by Jeff Wojtkiewicz

Subject: "My 32s brooke"

[bad pun]You should have protected it with "shields"[/bad pun]

(Note to international readers: this refers to the American actress Brooke Shields...)

Seriously, if the reset procedures don't work, one regular participant here runs a service at www.fixthatcalc.com. He even fixes Pioneer-series models such as the HP-32S, which weren't really designed to be disassembled and repaired.

HP67 AC adapter logic

*Message #1 Posted by **Hal** on 10 Mar 2006, 6:33 p.m.*

Hi everybody. Can someone enlighten me as to how a 67's AC adapter interfaces with the calculator? Looking down into the plug of the AC adapter (calculator end) with the cord pointing away from me I get 5.2 VDC from the left to center pin, and 16.3 VDC from the right to center pin. The outside pins measure 11VDC right to left. I get no AC readings anywhere. Does the smaller voltage run the machine and one of the bigger voltages charge the battery? Thanks in advance, Hal

Re: HP67 AC adapter logic

*Message #2 Posted by **Bernhard** on 11 Mar 2006, 1:11 p.m.,*
in response to message #1 by Hal

The "bigger" voltage comes from a current source to charge the battery. You may want to measure its current to ground (not the voltage). Expect something around 50 mA, but in any case, less than 100 mA. "Ground" is the middle pin. The smaller voltage runs the calculator. Beware that many of those old chargers have a bad electrolytic capacitor which may cause excess ripple and calculator malfunction. You need an oscilloscope to check that. Ripple under full load should not exceed a few 100 millivolts. Full load can be simulated with a 25 Ohms / 0.5 Watts resistor. Voltage at 144 mA load current should be around 3.6 volts. Beware that the higher voltage from the current source might damage the calculator if no battery is inserted (or the contacts are bad). There was/is a dispute among HP users on the risk level. My own experiments indicate that somehow the HP67 Card Reader IC (which is supposed to get damaged) clamps the voltage to a harmless level but gets quite warm, so prolonged plug-in without battery might cause damage. The HP65 card reader IC didn't have that clamp and the manual explicitely warns about operating it on the charger without battery inserted. If, however, you switch the calculator ON and then insert the charger into the wall outlet, the current source is too weak to develop dangerous voltages (if it is intact). This may be a safe way to operate HP67 without battery from a charger - but never switch it off, just pull the charger from the wall outlet. If you switch it off with the charger still in the outlet, the potentially dangerous higher voltage will appear on the card reader IC.

Re: HP67 AC adapter logic

*Message #3 Posted by **Hal** on 11 Mar 2006, 5:18 p.m.,*
in response to message #2 by Bernhard

Thanks Bernhard for the info. I got to looking at it a bit more last night and noticed the little leaf contact in the receptacle that opens up when the adapter is plugged in and disconnects the battery circuit from the calculator. Are you saying that there is another path from the battery circuit to the card reader IC other than through the leaf contact in the receptacle? Thanks, Hal

HP Advantage Module...

*Message #1 Posted by **Andreas Terzis** on 10 Mar 2006, 4:29 p.m.*

Hi there, Does the HP Advantage module include a Math module in it? Thanks, Andreas

Re: HP Advantage Module...

*Message #2 Posted by **Namir** on 10 Mar 2006, 5:34 p.m.,*
in response to message #1 by Andreas Terzis

The Advantage module does not include the MATH module per se. It does offer other mathematical operations like SOLVE (coded using fast microcode), INTEGRATE, Matrix operations, and oher calculations. The Advantage module brought to the HP-41C/CV/CX features that appeared in the HP-15C which many felt were very importaant.

Namir

Re: HP Advantage Module...

*Message #3 Posted by **Andreas Terzis** on 10 Mar 2006, 8:34 p.m.,*
in response to message #2 by Namir

Thanks Namir, I thought so. But I bought an HP-41CX on eBay where the seller claimed that it would come with a Math pac module and an Advantage module and it didn't. When I challenged that, he said that 'The math module is already in the calculator. It's the HP-41 Advantage'. There are so many crooks out there.

Re: HP Advantage Module...

*Message #4 Posted by **Gerson W. Barbosa** on 10 Mar 2006, 8:19 p.m.,*
in response to message #1 by Andreas Terzis

Hello Andreas,

If you want to hear about the contents of the Advantage Module, in the voice of Richard Nelson (PPC), take a look at this old posting:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=84857#84857

If you have trouble understanting the recording, like I did, here is a transcription (some misunderstood words, many missing, sorry):

```
--------------------------------------------------------------------------------

 12, 12, 12, 12! Richard Nelson --------------  number 12 ---- 1985

 New Product News:
```

Since PPC has preannounced Hewlett-Packard new HP-41 Advantage ROM, here are the details:

All that users (?) are asked: not to contact HP regarding this product. HP cannot answer questions until formal announcement.

The HP-41 Advantage ROM is a 12K collection of the most popular programs from the MATH and STAT ROMs, the HP-IL development ROM, the HP-15C, the HP-12C and CCD ROM. There are under 17 functions in X-ROM 22 and 24 with four headers:

The first is /ADVCONV for Advantage Conversions with 12 functions like BIN, OCT and HEX in NVIEW. Plus only ---- logic like NOT, AND, OR, etc.

The second header is /ADVMTRX for Advantage Matrix with 52 routines, all the three are M-CODE routines based on the CCD ROM.

The third header is /ADVMATH with 47 routines including Solve and Integrate from the HP-15C.

The fourth header is /ADVTVM for Advantage Time Value of Money with 6 user-called routines. These are TVM and PV, PMT, FV and . The bank-switched _____ of the ROM contains a 59 M-CODE routine.

This ROM will be offered free to those who buy --- 41C, CV or CX or HP dealers. The Advantage ROM will otherwise sell for 49 dollars.

In addition to provide a powerful mix of Finance, Math and Stat programs in a single core, the Advantage ROM offers exciting examples of programming for both User-code and M-code programmers. the Finance routines in user code and Solve and Integrate in M-code. The Advantage ROM 25 menus that greatly help the user to function group.

Additional detail in bulletin. Remember that this is _____ information. So please don't bother HP until formal announcement.

CHHU report. CHHU is . The primary project is the largest mailing undertaken in eleven years. All local member who can help should call me. Once this is completed the _____ will be printed. The next three weeks are critical. Until the next bulletin. I need your help.

Gerson.

in response to message #4 by Gerson W. Barbosa

I've made a few additions and corrections to Gerson's transcript. Here it is in its entirety: ----------
---

12, 12, 12, 12! Richard Nelson with your CHUU Bulletin number 12, June 19th, 1985.

New Product News:

Since PPC has preannounced Hewlett-Packard's new HP-41 Advantage ROM, here are the details:

All listeners are asked: not to contact HP regarding this product. HP cannot answer questions until formal announcement.

The HP-41 Advantage ROM is a 12K collection of the most popular programs from the MATH and STAT ROMs, the HP-IL development ROM, the HP-15C, the HP-12C and the CCD ROM. There are 117 functions in X-ROMs 22 and 24 with four headers:

The first is -ADV CONV for Advantage Conversions with 12 functions like BIN, OCT and HEX in NVIEW. Plus Booloean logic like NOT, AND, OR, etc.

The second header is -ADV MTRX for Advantage Matrix with 52 routines; all the three are M-CODE routines based on the CCD ROM.

The third header is -ADV MATH with 47 routines including: Solve and Integrate from the HP-15C.

The fourth header is -ADV TVM for Advantage Time Value of Money with 6 user-called routines. These are TVM, N, PV, PMT, FV and *I. The bank-switched 4K part of the ROM contains the 59 M-CODE routines.

This ROM will be offered free to those who buy an HP-41CV or CX from August 15th to November 15th and send in a promotional coupon obtained from HP or your HP dealer. The Advantage ROM will otherwise sell for 49 dollars.

In addition to providing a powerful mix of Finance, Math and Stat programs in a single port, the Advantage ROM offers exciting examples of programming for both User-code and M-code programmers. Of special interest is the Finance routines in user code and Solve and Integrate in M-code. The Advantage ROM utilizes approximately 25 menus that greatly help the user through eight function groups.

Additional detail in future bulletins. Remember that this is pre-release information. So please don't bother HP until formal announcement.

CHHU report: CHHU is on financial hold. The primary project is the largest mailing undertaken in eleven years. All local members who can help should call me. Once this is complete the March "Chronicle" will be printed. The next three weeks are critical. Until the next bulletin: I need your help. ----------

*Message #7 Posted by **Valentin Albillo** on 10 Mar 2006, 8:39 p.m.,*
in response to message #1 by Andreas Terzis

Hi, Andreas:

You may also want to download and have a look at my 9-page article Long Live the Advantage ROM! in PDF format, which reviews its most important features and includes a sample program utilizing to the fullest some

of them.

It will probably give you a fair idea of what it is, what it can do, and its programming style.

Best regards from V.

Re: HP Advantage Module...

*Message #8 Posted by **Andreas Terzis** on 10 Mar 2006, 9:53 p.m.,*
in response to message #7 by Valentin Albillo

Valentin, Thank you so much. Very nice work on the PDF documentation! I might have to return the machine with the Advantage module though. If I get Clonix would I be able to get the ROM downloaded to it? Also, I have another quick question: when I do an EMDIR on the CX, I only get 124 registers. Is that normal? Shouldn't I get 600? Thanks again, Andreas

Re: HP Advantage Module...

*Message #9 Posted by **Valentin Albillo** on 10 Mar 2006, 11:21 p.m.,*
in response to message #8 by Andreas Terzis

Hi again, Andreas:

Andreas posted:

"I might have to return the machine with the Advantage module though."

A real pity.

"If I get Clonix would I be able to get the ROM downloaded to it?"

I'm no expert in Clonix, there are much more knowledgeable people in this forum. I would think yes, except for the fact that Advantage is a 12 Kb ROM which does use bank switching, and I simply don't know if Clonix allows for this or not, though I'd guess yes. Let's the real experts talk.

"Also, I have another quick question: when I do an EMDIR on the CX, I only get 124 registers. Is that normal? Shouldn't I get 600? Thanks again, Andreas"

It's perfectly normal. To get 600 EMS registers you would need to plug in two EMS modules, each one of them adding 238 EMS registers to the 124 already built-in, for a total of 600.

Best regards from V.

Re: HP Advantage Module...

*Message #10 Posted by **Andreas Terzis** on 10 Mar 2006, 11:32 p.m.,*
in response to message #9 by Valentin Albillo

Valentin, Thanks again. Is it true that those are Extended Memory registers? In other words, the HP-41CX still has four times the memory a regular HP-41C has, right? Regards, Andreas

Re: HP Advantage Module...

*Message #11 Posted by **Valentin Albillo** on 10 Mar 2006, 11:45 p.m.,*
in response to message #10 by Andreas Terzis

Hi, Andreas:

Andreas posted:

"Is it true that those are Extended Memory registers?"

Yes.

"In other words, the HP-41CX still has four times the memory a regular HP-41C has"

Five times, not four: 320- versus 64-, where the "-" means part of the 320th register (64th register) isn't available to the user.

Best regards from V.

Re: HP Advantage Module...

*Message #12 Posted by **Karl Schneider** on 11 Mar 2006, 12:00 a.m.,*
in response to message #8 by Andreas Terzis

Andreas --

Getting an HP-41CX with Advantage Module is pretty good. You might consider keeping the unit, even with the absence of the Math Pac. Math Pac's were widely sold, being the most basic upgrade, and can routinely be obtained on eBay for < $20, complete. Even better is a combined Math/Stat Pac.

The Advantage Pac has much of the the functionality from the Math Pac, but does lack a few items, including triangle solutions, Fourier analyses, and hyperbolics.

The Math Pac contains 4 kB of code, all of it as RPN routines. The Advantage Pac contains 12 kB of code, much of it as sophisticated, faster-running microprocessor code.

On X-memory: 124 registers of X-memory is built into the CX. Two 238-register X-Memory chips are required in order to achieve the maximum 600 registers.

You might find this archived link helpful:

A question from 2003 about PPC and Advantage ROM's

*Message #14 Posted by **Gerson W. Barbosa** on 11 Mar 2006, 11:12 a.m.,*
in response to message #8 by Andreas Terzis

Quote:

> I might have to return the machine with the Advantage module though.

If you didn't like that 41CX, you should consider keeping the Advantage Module if you get it for a reasonable price. Although you can have the Advantage for free using Clonix, I think the power consumption would be somewhat high compared with the original ROM module. On the other hand, people who use Clonix and other peripherals a lot generally rely on rechargeable Ni-Cd cells, so power consumption would not be a problem.

Regards,

Gerson.

Re: HP Advantage Module...

*Message #15 Posted by **Andreas Terzis** on 11 Mar 2006, 4:11 p.m.,*
in response to message #14 by Gerson W. Barbosa

Gerson, Thanks for the reply. Why do people still use Ni-Cds? Can we not use Ni-MH or Lithium cells? (Is there such a thing?) Regards, Andreas

Re: HP Advantage Module...

*Message #16 Posted by **Gerson W. Barbosa** on 11 Mar 2006, 6:59 p.m.,*
in response to message #15 by Andreas Terzis

Hello Andreas,

You may use Ni-MH cells, but they have to be recharged outside the calculator, on a charger specifically designed for them. By what I know, lower capacity Ni-Cd cells are still used because they are compatible with old rechargers. The only lithium cells I know are those button-type 3V batteries. There's a lot a past threads about the subject, the easiest way to find them is doing a google search for, say, *site:www.hpmuseum.org Ni-Cd batteries*.

Regards,

Gerson

Re: HP Advantage Module...

Gerson, Thanks again for all your time and valuable info. Very much appreciated. Do you know how all this info shows up at Google almost immediately by the way? I alos assume it was one of Dave's decision to use whatever method to have all that info posted. Regards, Andreas

Re: HP Advantage Module...

*Message #18 Posted by **Gerson W. Barbosa** on 11 Mar 2006, 11:11 p.m.,*
in response to message #17 by Andreas Terzis

Google just keeps the whole Museum site (and zillions of others) indexed on a regular basis. I don't know how exactly they do this and I think they wouldn't tell us, or would

they? :-)

http://www.google.com/technology/pigeonrank.html

Now, seriously, there's also a search tool in the Museum:

Search/Personalize

But I confess I don't remember how to use it.

Regards,

Gerson.

Avian Influenza...

*Message #19 Posted by **Andreas Terzis** on 12 Mar 2006, 6:19 a.m.,*
in response to message #18 by Gerson W. Barbosa

Being from Europe originally, and still keeping abreast all the news developments, I have been listening to tons of news stories lately about bird flu in different countries there. If the avian flu crosses the Atlantic (with the rate it exists in Europe), I worry that Google's results won't be as accurate any more. Maybe the scattered reports of avian flu lately in the U.S. might be the cause of their stock decline lately!

(I really enjoyed the article...)

Re: HP Advantage Module...

*Message #20 Posted by **Andreas Terzis** on 12 Mar 2006, 6:23 a.m.,*
in response to message #14 by Gerson W. Barbosa

The battery contacts of the CX are corroded. If I get to keep the machine, is there any way to tell if the battery acid/base might have spread inside? Does anyone know if there is a fairly easy way to open the machine without breaking anything? If the machine works now but the liquid has spread inside, are there significant chances for the machine to die soon?

Many of us that live here in the US wonder the same thing. The politicians now seem to be able to do anything they want, and if asked to justify it, all they have to say is "don't you want us to defend you from terrorists?"

Re: Wear an HP-01 watch, not a Casio!

*Message #5 Posted by **e.young** on 10 Mar 2006, 1:47 p.m.,*
in response to message #3 by Frank Boehm

No Mr. Boehm, we haven't gone completely insane. What we have done is go after the organizations that facilitated the attack on 9/11. These people were not detained simply because they wear a Casio watch. Most were captured in batle in Afghanistan. They were fighting on the side of the Taliban and Al Queda,

the people who gave us the attack on 9/11, and are also the people who insist that women wear the burka (spelling?), and also don't believe that women should be educated.

This forum is not the place for political disucssions, discussions about global terrorism, of other such weighty issues. It is for the discussion about HP calculators. However, your comment has made me outraged, and I have to respond. I have driven past the hole in the ground in Manhattan wherer the twin towers once stood. I also happened to see the twin towers in the distance the first time the Islamic terrorists tried to destroy them. I remember seeing the pictures of people jumping out of the twin towers, choosing to die by falling to the ground rather than be burned to death in a jet fuel fire. Have you ever seen these pictures? Have you ever seen the pictures of the people desperatley clinging to the outside of the building? I have, they are still vivid in my mind. We also know that these people are constantly plotting to attack us again, and to cause the maximum number of civilian casualties. Sadly, sooner or later they will probably have another successful attack against us, what will you say then? I'm sure the intended target will be something like a sports stadium, hospital, school, or something similar.

No Mr. Boehm, we are not the insane ones. The ones who are insane are the terrorists. Read the article again. You will see that these people are not detained merely because the happen to have a Casio watch. The ownership of a Casio watch is not the sole piece of evidence, but is stated as being "among" the evidence. The article also goes on to detail instances where these watches have been used as timers in terrorist bombs.

This is the last I will say on this matter to you. I have no desire to engage in a flame war, or to debate this matter with you; this forum is not the place to engage in those activities. You touched on a very sensitive subject. I hope that in the future you will restrict your comments to HP calculators, and not to criticizing my country.

Re: Wear an HP-01 watch, not a Casio!

*Message #6 Posted by **Eric Smith** on 10 Mar 2006, 3:06 p.m.,*
in response to message #5 by e.young

Mr. Young is right; there is no need for foreigners to criticize the US. There are plenty of US citizens, myself included, that are outraged at the ridiculous things the US is doing that are claimed to support the undeclared "war on terror", but are in fact destroying whatever goodwill the US once had with the other nations of the world.

Regardless of the fact that those people were not detained specifically because they happened to be wearing cheap Casio watches, it is still incredibly stupid that the posession of such a watch is considered evidence. That would never fly in the criminal justice system, and it is pure insanity that the rules of criminal justice are not applied to the detainees.

If they had analyzed the watches, AND determined that they had somehow been modified for use as part of a weapon, that would be a reasonable thing to consider evidence. But the mere posession of an unmodified watch is not evidence of terrorist intent any more than my own posession of a boltcutter is evidence that I steal bicycles.

Claiming that the detainees do not have rights under the Geneva Convention does not benefit ANYONE. Torturing detainees does not benefit ANYONE. If we want to fight terrorism, we should do it within the established legal framework; there is no evidence that extra-legal means are actually making us safer, and in fact they may be making us less safe.

I didn't start this thread as a political statement, but I'll also not remain silent when other US citizens who apparently have bought the adminstration's bullshit try to defend it.

Following Mr. Young's lead, I will not post any further on this topic in this forum; anyone who wishes

to discuss it with me is free to do so via email.

IRA & others have used commonly-available West Bend countdown timers for years for bombmaking.

I will add that if I were an investigator/mil int type and saw Abu Akbar wearing a Casio watch I wouldn't think much of it, esp if worn/scratched/dirty band. Now, if Akbar had a box of 5 in his luggage, then I'd think quite a bit differently.

Actually, plastic Casio watch wearers should be arrested simply for poor taste :)

re: "Actually, plastic Casio watch wearers should be arrested simply for poor taste :)"

Well, they may not look so cool, but they have some attributes of HP calculators: (reasonably) well designed, functional, reliable, inexpensive (OK, I threw that one in), batteries last a long time, ...

I have many, and they last virtually forever (unless you break off the little tabs that hold the watch band). Some of mine are more than 15 years old. I don't know of any other $15 watches you can SCUBA dive to 120 feet with.

Also, perhaps like HP calculators, they don't know when to quit "improving" the product. The newer ones have overly fancy displays and look quite garish compared to the classics.

"Fun fact" of the day...

Some of you might wonder why Dave capitalized "SCUBA". After all, "scuba diving" is in our vernacular.

Dave wasn't shouting; it is an acronym meaning "Self-Contained Underwater Breathing Apparatus", if I remember correctly from fourth grade, when the gear was shown and demonstrated to us.

And now you know...

Classic model silver trim repair lesson

*Message #1 Posted by **Gordon** on 9 Mar 2006, 7:11 p.m.*

I have been repairing the worn-down silver trim on a number of the Classic models in my collection, here is what I learned.

A) Where to find the paint for the repair My first visit was a model shop, thinking they would have the best paint selection. They have a good selection with expert advice, but I found them to be no match with craft shops like Hobby Lobby. I heard art supply stores are also a good source.

B) Paint applicator I tried the finest brush, Q-tip squeezed into cone-shape with a sharp point (a model trick), pointed paint pen, and chiseled paint pen. The chiseled paint pen is by far the best method, giving consistent smooth lines.

C) Testors paint I first tried Testors silver enammel paint. I found the silver to be a little dull, and it rubs off even after a day of drying. You need to clear coat it to prevent silver fingers.

D) The best solution I found (so far) I came across a paint pen called "Silver Leafing Pen" by Krylon. It has a chisel point, which makes application extremely easy and even. The paint has a shinier apperance, a better match to the chrome than Testors. Best of all, after a day of drying, it stays on much better. No silver finger, making the clear coat optional. For $5, it is by far the best solution I found so far.

E) Other options I have not tested I also saw chrome paint in a spray bottle, it is supposed to give an even closer match to the original chrome. But you would have to spray it into a small cup, then apply it with an applicator of your choice. Besides, I do not know if it will react with the hard plastic, so I never explored that option.

Hope you find the information useful in restoring your Classic HPs.

Re: Classic model silver trim repair lesson - and a question

*Message #2 Posted by **Jim Creybohm** on 10 Mar 2006, 1:41 p.m.,*
in response to message #1 by Gordon

Excellent information Gordon. I will be trying this on my 67 at some point in the future.

BTW, I have read here in the past, but don't recall any resolution - does anyone know how to restore the coloured letters on my beloved HP's? Is there an easy (read - even a non-handyman type person can do it) way to restore them?

Re: Classic model silver trim repair lesson

in response to message #1 by Gordon

Has anyone tried the silver leaf found a Hobby Lobby, etc..? You prepaint an adhesive to the surface to be finished, and then press the leaf onto the glue. I think this is the process, but I haven't tried it yet. It's the same stuff they use for embossing a name on the cover of a Bible, and that stays forever (so to speak).

SOS - eBay claim. HP appraiser / independent authenticator needed.

*Message #1 Posted by **Andreas Terzis** on 9 Mar 2006, 6:57 p.m.*

Hi fellows, I have just filed a claim against a wonderful seller on eBay that took me for a ride selling an HP-97 in really bad condition, by misrepresenting it in their description and making sound better that it really was. I am looking for an independent authenticator to appraise the machine so that I go on with the claim. Does anyone have any ideas as to who I could use or where, so that I at least collect something back? I live in Los Angeles. Once I am done with all the details and the administrative rif-raf (!?@*), I will post details for saving a bidder or too from bumping onto the same smartie-pants. Thanks, Andreas

Edited: 9 Mar 2006, 7:08 p.m.

in response to message #2 by Paul Marin

Thanks buddy; I appreciate it. I think I'll take your advise. I'll explain what happened after I'm done with all the red tape.

Re: SOS - eBay claim. HP appraiser / independent authenticator needed.

*Message #4 Posted by **Frank Boehm** on 10 Mar 2006, 2:28 a.m.,*
in response to message #1 by Andreas Terzis

Since you will have to send some documents to the ebay buyer protection dept. anyway, I'd take a couple of closeup-pictures of the parts in bad condition. Together with the printout of the auction text, this should be sufficient. If you send the close-ups to the seller as well, he might offer a refund too, since ebay will a) forward the claim to him and b) probably close his account. (this might only help with high-rated sellers..) An authenticator costs money - at least in Germany it would probably cost more than you paid for the machine - and should be the very last option. (useful only when filing a lawsuit).

Re: SOS - eBay claim. HP appraiser / independent authenticator needed.

*Message #5 Posted by **Andreas Terzis** on 10 Mar 2006, 4:26 a.m.,*
in response to message #4 by Frank Boehm

Frank, That's a good idea about the pictures. Unfortunately they require that I take it to an appraiser as a mandatory requirement. This makes it difficult since those machines are not being produced anymore. We'll

see... Regards, Andreas

*Message #6 Posted by **Gonzalo Fernandez (Spain)** on 10 Mar 2006, 3:22 p.m.,*
in response to message #5 by Andreas Terzis

Ebay can be risky, this is why is not advisable to spend high sums of money in calculators, for example, is wise not to spend more than $300 in a new 41CX. All vintage electronics can fail, and calculators advertised in "good condition" are subjected to different things of view between the sellers and the buyers.

Vntage Electronics CAN Fail

*Message #7 Posted by **Namir** on 10 Mar 2006, 5:39 p.m.,*
in response to message #6 by Gonzalo Fernandez (Spain)

Very interesting point that you mentioned about vintage electronics that fail. I have experienced that! For example, selling top notch vintage HP calculators only to arrive with problems. Another example is selling a working HP-41C card reader that develops a problem when it gets to the buyer!!

Namir

> Very interesting point that you mentioned about vintage electronics that fail. I have experienced that! For example, selling top notch vintage HP calculators only to arrive with problems.

I've had three HP calculators I bought on eBay that exhibited some malfunction when I got them via USPS Priority Mail. Two were Fullnut HP-41's, and one was an early-1990's HP-32SII.

The 41's worked sporadically, but sometimes displayed garbage and shut themselves off. These were restored to perfect working order by cleaning and soldering from www.fixthatcalc.com.

The 32SII had a dead column of pixels in one display character. The seller bought it back for full refund, then fixed it and re-listed on eBay.

I wonder if the flight in the unpressurized, unheated cargo hold of a commercial jetliner might have caused old, weakened connections to fail. After repair, the 41's returned across the continent via Priority Mail without a flaw.

Question for all HP-35 red dot owners out there

*Message #1 Posted by **Frank Boehm** on 9 Mar 2006, 4:14 p.m.*

Hello, could you please check your red dot and compare it to the picture I uploaded to flickr?

http://www.flickr.com/photo_zoom.gne?id=110209860&size=l

The print is rather "creme white" and not molten into the surface like on all my other HP-35s. What's your red dot like?

(I received a HP-70 prototype together with this top shell part, so I assume it might be a prototype part as well. Just want to know ;))

Re: Question for all HP-35 red dot owners out there

*Message #2 Posted by **Michael** on 15 Mar 2006, 5:11 p.m.,*
in response to message #1 by Frank Boehm

Hi, I include an image of one HP 35 Red Dot. HP 35 is in mint state, hope this helps.

*Message #3 Posted by **Museum** on 15 Mar 2006, 6:12 p.m.,*
in response to message #1 by Frank Boehm

Finally I had the time to have a look at all my RedDots...

I can attest your discovery:

There is a type with painted legends that is really white shining. A second type is more cremy / ivory-colored. The colour of these legends are molded into the surface. Take a look at the serial: The clear white version seems to be older (mine is very low - 1143A00XXX and belonged to a ex-amager of HP, as it has a special Label with it´s name instead of "HEWLETT*PACKARD"). Maybe these white shells were only produced to special persons.I remember a personal discussion with Wlodek that there might have been a second production run of RedDots to the 5th anniversary of the HP-35, only for higher managers....

New hp device

*Message #1 Posted by **Zaff** on 9 Mar 2006, 10:26 a.m.*

Hi, a new patent from HP a new graphical calculator

http://tinyurl.com/zhqxb

PDF description: http://tinyurl.com/k5jaz

Re: New hp device

*Message #2 Posted by **Vassilis Prevelakis** on 9 Mar 2006, 11:15 a.m.,*
in response to message #1 by Zaff

this is **exactly** what I have been looking for all these years. I hope that the keyboard construction is good (this is usually the biggest problem with similar devices) and that the screen is touch sensitive (like Palm PDAs where you do not *have* to use the stylus)

If this one is like the other recent HP calcs where you can load your own OS, then, I'd simply get rid of all the graphical stuff and load an HP-41 emulator instead 1/2 :-)

Enough of dreaming though. Remember that simply applying for a patent does not mean that HP is even *thinking* about releasing such a product. Look at Xpander, it was killed far far further down the road.

Finally I liked very much the claim that it'll have a one page manual! (what no 900 page AUG on CDROM?)

**vp

Re: New hp device

*Message #3 Posted by **Arnaud Amiel** on 9 Mar 2006, 11:25 a.m.,*
in response to message #2 by Vassilis Prevelakis

Note that this is for a very basic calculator, the hp CYRI would be algebraic, have 8kB RAM and there is no mention of on the calc programmability in the manual. Having 128k storage and maybe a port seem to imply that you could load some programs though. It looks like a perfect calc for high school.

Arnaud

Re: New hp device

*Message #4 Posted by **Wayne Brown** on 9 Mar 2006, 11:41 a.m.,*
in response to message #1 by Zaff

Yuk. Not as ugly as some other recent HP offerings, unless they choose one of their typically horrible color schemes. But it still lacks a double-sized **ENTER** key. And a *one-page* instruction manual?! Those two items alone make it a non-starter as far as I'm concerned.

Re: New hp device

*Message #5 Posted by **Matt Kernal (US)** on 9 Mar 2006, 1:08 p.m.,*
in response to message #1 by Zaff

A new device named "CYRI" and the Inventor named "Cyrille" de Brebisson? What are the chances?!?! The stars must be aligned, if I were him I'd be buying lottery tickets. j/k <8^)

Cyrille really is a great guy. I was lucky enough to meet him and JYA a few years ago at the two HandHeld conferences held up here in the pacific northwest. I got a slightly odd look when we shook hands, as my name sounded almost similar to their own "Meta Kernel" that they had incorporated into the new 49G's operating system. I guess that would have been a good time for me to buy lottery tickets!! :-) As it turned out, all the attendees were given new 49G calculators, complete with firmware version 1.05.

Matt

Re: New hp device

*Message #6 Posted by **Tim Wessman** on 9 Mar 2006, 1:50 p.m.,*
in response to message #1 by Zaff

I am not sure how "new" it is considering th patent is over a year old.

Re: New hp device

*Message #7 Posted by **Richard Garner** on 9 Mar 2006, 2:39 p.m.,*
in response to message #6 by Tim Wessman

I know from several friends that have gone through the patent process, that a patent search can take as long as 5 years to make sure that someone else hasn't already patented the same thing. That is why you see the PATENT PENDING statement on some things.

Re: New hp device

*Message #8 Posted by **Howard Owen** on 9 Mar 2006, 4:59 p.m.,*
in response to message #1 by Zaff

So the "invention" here is a minimalist keyboard and manual, implying radical simplicity in design and use. It's not my cup of tea, complexity junkie that I am, but I must say the idea strikes me as a marketplace winner. I believe that HP surrendered control of the scientific calculator market when they made the switch to RPL. The increased complexity of those models, particularly when compared to the easier to use TIs of the day, condemned them to niche status.

I know I'm, um, over-simplifying a, er, complex issue with this analysis. But I still believe something along the lines of this machine could steal significant share from TI in the high-school market, if not at the universities.

TI hasn't done much innovation in their user interface in quite a while. The complacency of a secure market leader can be the best hope of a would-be usurper. It would also be amusing to see a behemoth like today's HP play the role of the agile upstart, or start-up or something like that. 8)

Regard,
Howard

Re: New hp device

*Message #9 Posted by **Jan** on 10 Mar 2006, 9:38 a.m.,*
in response to message #1 by Zaff

If only it had RPN, at least as an option!

. . . or,

*Message #10 Posted by **Paul Brogger** on 10 Mar 2006, 2:06 p.m.,*
in response to message #9 by Jan

. . . if it's flash-upgradeable and they'll provide an SDK (like the TI graphing calcs have).

THAT would harness The Power of The Geeks(tm). (At least, *some* of the power of *some* of them.)

Edited: 10 Mar 2006, 2:06 p.m.

Re: New hp device

*Message #11 Posted by **John Ioannidis** on 22 Mar 2006, 2:07 p.m.,*
in response to message #1 by Zaff

The patent was filed in August 2003. It has not been granted yet, what you see is an application publication.

If they were intending to release the device, they would already have done so.

Personally, I hope my stash of RPN devices will last me for the rest of my life. There is no need to buy a new device, esp. one that does not have a double-width ENTER^ key.

eBay craze - Not important...

*Message #1 Posted by **Andreas Terzis** on 8 Mar 2006, 10:21 p.m.*

Hi there, Here is another weird bidding pattern on eBay again. I know a lot of you don't have time for postg like this, so you might not read on. In any event, check how high this HP-34C went for. From $79.01 it jumped up to $150 from a bidder with no stars, and then after a war with a bidder with only one star to $405!!! And they are both from Switzerland (second weird coincidence). Any thoughts? Regards, Andreas

Re: eBay craze - Not important...

*Message #2 Posted by **Karl Schneider** on 8 Mar 2006, 10:54 p.m.,*
in response to message #1 by Andreas Terzis

Well, $405 seems a bit high, but there were some extras, and another HP-34C package recently went for $350.

From the description of one you listed:

> Quote:
>
> Included:
>
> --- HP 67 Calculator -- Serial # 2248S30256,
>
> If the winner feels "buyer's remorse", maybe he can claim that he was expecting an HP-67, and ask for the auction to be voided. Except that everything else said "HP-34C", and there are no 67's with that serial number.
>
> However, that serial number indicates a 1982 date of manufacture utilizing the design improvements -- soldered components and better keyboard feel. It should be a reliable 34C.

-- KS

Re: eBay craze - Not important...

*Message #3 Posted by **Andreas Terzis** on 9 Mar 2006, 2:06 a.m.,*
in response to message #2 by Karl Schneider

I brought to the seller's attention that his description was incorrect and he mentioned his auction was for an HP-67 and not an HP-34C as everything else said on the page. Do you happen to know who 'atari-rescue-group' is?

Edited: 9 Mar 2006, 2:10 a.m.

Re: eBay craze - Not important...

*Message #4 Posted by **Dia C. Tran** on 9 Mar 2006, 2:27 p.m.,*

in response to message #3 by Andreas Terzis

I have seen something like this before where 2 bidders (possibly same person) bid it up really high so that nobody is willing to bid any higher. At the last minute the second highest withdraw the bid (in this case can be due to wrong description) and let the highest bidder won with a much lower price.

HP 15C Keyboard

*Message #1 Posted by **Charles** on 8 Mar 2006, 5:19 p.m.*

I have an HP 15C which passes all the tests but the 9 key sometimes doesn't register or puts 2 nines in the display. I'm reluctant to open it up but would consider it. Does anyone have any suggestions ?

Thanks

Re: HP 15C Keyboard

*Message #2 Posted by **Randy** on 8 Mar 2006, 8:12 p.m.,*
in response to message #1 by Charles

If the key clicks okay and has the normal travel, it should be fine.

This is an adaptation from many posts from MoHPC regular David Smith:

"Your most likely problem is a dirty switch contact for the 9 key. These can be cleaned fairly easily if you open up the machine (one screw under each rubber foot).

Beneath each key dome is a tiny hole in the circuit board. Make a tiny wire brush out of three wire brush bristles twised together, mounted in a pin vise, and trimmed square. Place a drop of 91% isopropyl alcohol on the hole, dip the wire brush in more alcohol, and gently "scritch" around in the hole with the brush. In stubborn cases you may have to repeat a few times."

For more on how to open: http://www.hpmuseum.org/disasm.htm

Good luck, post again if you need more help.

eBay fixes a leak

*Message #1 Posted by **Randy** on 8 Mar 2006, 5:10 p.m.*

and sellers who have been abusing the listing insertion fee will have some surprises in their next eBay statement - thanks to a new billing policy. That was the news I got today from an eBay staffer.

It will be interesting to see how long it takes you-know-who to cease and desist with the overpriced but-it-now auctions. Check his auctions - they've all been closing at full fare - with no buyer :) Flame on!

Re: eBay fixes a leak

*Message #2 Posted by **bill platt** on 8 Mar 2006, 5:20 p.m.,*
in response to message #1 by Randy

I don't know why this was a "leak."

It was one good technique to keep the costs down.

The problem is that if you want to sell something expensive on ebay, and it doesn't come up to your minimum, you would like to get on with selling *something* but not get saddled with all that listing fee.

You really haven't done anyone a favor by bringing this "leak" to ebay's attention.

It hurts, rather than helps, me.

Re: eBay fixes a leak

*Message #3 Posted by **Vassilis Prevelakis** on 8 Mar 2006, 5:39 p.m.,*
in response to message #2 by bill platt

Haven't you been following the Coburlin discussions?

This practice (of changing the price and item description at the last minute to save on fees) was abusing the auction model. If that was helping you, well good for you while it lasted.

For the rest of us, it was (a) **annoying** and (b) inflating prices.

I had to change my search patterns to exclude people who did this.

In summary, if I really think that used toothpick costs $500 , then by all means I can set up an auction for this amount. But if (surprise) there are no takers, I get to put my money (eBay fees) where my mouth is.

BTW you can still get away without paying large fees by specifying a high reserve for the auction, and a small initial amount. In this way you will not pay the fee if the item does not sell. **vp

BRAVO! [eBay fixes a leak]

*Message #4 Posted by **Karl Schneider** on 8 Mar 2006, 10:42 p.m.,*
in response to message #3 by Vassilis Prevelakis

Thank you, Randy, if you were the one who successfully lobbied for the policy fix.

And, "Amen!" to Vassilis and Mark.

I've never been an eBay seller, so I'm uninitiated. But, I would hope that the insertion fee would be based upon one of the following:

1. Actual selling price
2. Higher of the Starting Bid or Reserve if unsold
3. BIN if no Starting Bid or Reserve

I also believe that every *bona fide* auction ought to have a Starting bid or Reserve that is no greater than, say, 80% of a BIN price. BIN-only could be relegated to separate categories.

I tend not to participate in Reserve auctions. It seems like a way to extract information about buyers (who bids and how much?) without being upfront about expectations of price.

Re: BRAVO! [eBay fixes a leak]

*Message #5 Posted by **bill platt** on 9 Mar 2006, 9:46 a.m.,*
in response to message #4 by Karl Schneider

The "Final Value Fee" handles the final selling price.

The "insertion fee' is the "ante" that you have to commit in order to use bandwidth.

The basic rationale behind insertion fees is that the higher the starting price, the less likely there will be a final value fee collected--in other words an incomplete sale. The fee for a high start is ebay's way of insuring that they collect something for the bandwitdh--regardless of sales.

Edited: 13 Mar 2006, 8:26 a.m.

Re: BRAVO! [eBay fixes a leak]

*Message #6 Posted by **Randy** on 9 Mar 2006, 12:45 p.m.,*
in response to message #4 by Karl Schneider

It certainly wasn't just me that brought it to their attention - it was probably several thousand other people as well as the practice was certainly not limited to HP calculators. I had given up after several emails with no response more than a year ago.

I simply asked the question today during a conversation that had nothing to do with P.T. Barnum* types when I was asked if there was anything else that eBay could do for me today - so I asked if the practice was in fact in keeping with eBay listing policy. The person said they would get an answer and call me back - which came about five minutes later when she reported the practice was against their listing policy and the technical loophole that had allowed it had been closed several days ago.

> the time.
```

Hi Andrea,

I have no idea who he is. I do not particularly care. For some time he really got on my nerves as I kept seeing these silly auctions for items priced at 2-3 times the prevailing price. Eventually technology saved me (I blacklisted him by including a parameter in my searches that excluded his username from displayed auctions).

```
>Are there private discussions on eBay members; I'd be interested too.
```

I am not aware of any private ones. There were many public discussion in the forum. If you do a Google search on Coburlin (limited to site hpmuseum.org) you will find them all. But they are not really interesting (just people, including me early on, complaining).

Nope. You are incorrect on this point. from ebay:

> Quote:
>
> All Reserve Price Auctions are subject to a Reserve Price Auction Fee that is refunded when you successfully complete your auction on eBay. If your item does not sell, this fee is not refunded.

So, if you use a reserve fee, there is *no* way to recoup it if the item does not sell. With a high starting price, at least you can re-use that insertion fee during the re-list.

Just to put this into perspective:

A $500 or more starting price has an insertion fee of $4.80, whereas a 99cent listing has an insertion

fee of $0.20

I recently listed a violin--and it did not sell--but I was certainly not going to list it for 99 cents! I can re-list it, but it does not look promising. So I'll have to list something else to take its place during the re-list, to try to make that $4.80 useful for something.

I really don't see how this "leak" was "driving up prices." Sure, coburlin might repeatedly *ask* for a ridiculous amount, but that still doesn't mean he'll get it!

Edited: 9 Mar 2006, 9:35 a.m.

Re: eBay fixes a leak

*Message #10 Posted by **Mark Crispin** on 9 Mar 2006, 3:02 p.m.,*
in response to message #9 by bill platt

I have no sympathy for individuals who list items with $500 minimum prices who complain about a $4.80 insertion fee.

I don't think that sellers should get a free re-list either.

Re: eBay fixes a leak

*Message #11 Posted by **bill platt** on 9 Mar 2006, 4:16 p.m.,*
in response to message #10 by Mark Crispin

Mark,

Let me get this straight. You think that ebay should be free and easy for the buyers, but stick it to the sellers? You are kidding, right?

4.80 is not a lot by itself, but it adds up. Why shouldn't the sellers be able to relist? Is there something morally wrong with relisting? Jesus, it is a privately run list! If ebay wants to encourage sellers to "try again" what the hell is wrong with that!

So you think I should have to just eat listing fees left and right? Yeah, great idea. Real friendly idea. Why on earth would anybody even bother with ebay then?

Is this an HP forum, or some populist-socialist anti-business forum?

> The problem is that if you want to sell something expensive on ebay, and it doesn't come up to your minimum, you would like to get on with selling *something* but not get saddled with all that listing fee.

Let's see if I've got this right: You want to use eBay's bandwidth to advertise your $500 listing in hopes of attracting an impulse buyer. Note I didn't say auction, because Buy-it-now is not an auction. Never mind that eBay is an auction site, as you want your minimum price, period. You don't want an auction, you want to sell something a price.

So now when your item hasn't sold, AFTER you've used eBay's bandwidth for 6 days and 11 hours to advertise your $500 for sale item, you change your auction to be a completely different item, valued at a $1.00 so you only have to pay $0.20 for that bandwidth instead of the $4.80 that eBay said they wanted to list your item at the price YOU wanted for it. Does that about sum up the situation?

Bill said:

> Quote:
>
> Is this an HP forum, or some populist-socialist anti-business forum?

Huh? Are you serious? So manipulating a loophole to cheat eBay out of revenue that you agreed to pay when you listed the item is a good, sound capitalistic practice?

Go Randy, go Randy, go Randy. I second that response. I am tired of those hypocritical eBay sellers that think they can rule the world. This is an HP domain...

Re: eBay fixes a leak

*Message #16 Posted by **bill platt** on 10 Mar 2006, 7:55 a.m.,*
in response to message #14 by Randy

Randy, you are really missing the point here. Ebay controls the "loopholes." They aren't loopholes if they work. The fact that changing the auction changed the listing fee is not my fault, nor any other sellers.

As for the "impulse buyer" business, you are just way out of line. If your house cost you $350,000, and it doesn't sell in 10 days, do you think it is unethical to wait longer before lowering the price? Same thing for low-activity "high-value" items. If I have a violin that I know a dealer will buy for $400, and I list it on ebay for $500, where's the crime? Ebay *offers* their bandwidth to me, and they set the rates. It is not my fault, nor any

other sellers', if their software does not work as intended. If I decide that I would rather put something else up in its place--note that I have *paid* the listing fee already--and ebay has offered "relisting" and allows modification to the listing, including changing the listing--what on earth is the crime? Like I said, *ebay* offers relisting, ebay *allows* modification of the listing etc. I sold a viola on ebay for $800 once--with a bottom price of you guessed it--$800. One bidder. So I guess I should have listed it at 99 cents and "taken my chances"? Why would I do that? The buyer needs to do the research with regards to appropriate pricing. You can see from my feedback that the buyer of that viola was *very* happy.

Furthermore, ebay is *not* an auction site. They are a sales listing service. "Buy It Now" is one of *ebay's* services--it isn't an invention of the sellers'. They started out with an *auction" like system (though technically it really is not an auction in the same way that a traditional auction is) but have added these other services in order to increase their revenue. Do you think they would continue to offer BIN etc if it did not make money for them?

You are confusing me with coburlin (which I am not). If you are the Randy that I have known here for all these years, then you know me as well (I bought a 17bii from you, and a case for a voyager--probably 2 years ago). I think you are missing my tone of voice here--I am not trying to flame you! :-)

Re: eBay fixes a leak

*Message #17 Posted by **Randy** on 10 Mar 2006, 9:22 a.m.,*
in response to message #16 by bill platt

I'm the same Randy that's been around here for several years, I just dropped the last name for privacy reasons when I created my MoHPC account. I don't see or sense this a a flame, only a discussion of ethics.

My very simplistic point is and will continue to be that loophole or not, a seller agrees to pay eBay a certain fee when listing an item up front. Their policies are quite clear and straight-forward. Because they had a flaw in their system, people have been cheating them out of revenue by manipulating the entire content of the auction so long as it was 12+ hours before the auction closed.

They fixed the flaw. I post it. You complain, with your reasons for reneging on a promise to pay for a service that was delivered per your terms. No matter what words you use and how you frame it, you'll never convince me it is was okay and justifiable to engage in the practice.

It was not my intent to engage in this kind of dialog when I made my original post. It was only after you made the second reply, (the socialist crack) which, quite honestly surprised me that I felt it necessary to explain the significance of what the one-not-to-be-named seller had been doing that irritated many here, myself included.

Shall we move on to more interesting things?

No, he is not missing the point. You are an self-admitted unethical seller.

Please post your eBay id so we know to avoid doing business with you.

Re: eBay fixes a leak

*Message #19 Posted by **bill platt** on 11 Mar 2006, 6:13 p.m.,*
in response to message #18 by Mark Crispin

I was not an unethical seller. I merely openly used the feature, explicitly allowed by ebay, to modify your listing, if it has no bids. That ebay had a technical flaw is not my fault.

Next thing you will tell us is you used indirect memory operations to access unauthorized registers in your HP-41C... how could you be so unethical ;-) I bet you even turned on the low battery indicator before the batteries ended.

Re: eBay fixes a leak

*Message #21 Posted by **bill platt** on 12 Mar 2006, 12:56 p.m.,*
in response to message #20 by David Smith

(David, I see your wink, but I am still puzzled by the attacks of others, so what follows below is directe more generally).

You know what, there must be some sort of disconnect here. I have *never* done anything will of purposeful to cheat ebay. I have followed there rules to the letter, paid my fees etc.

The fact that either their software was buggy, or their policies were inconsistent is not my fault! I never went in and said, "look, I can cheat ebay!" I merely looed at the policies and decided which mechanism of listing would be most cost-effective.

Where is the crime?

Did I do something unethical by following ebay rules?

Guys, this is crazy.

Can you show me *exactly* what you are describing? I am starting to think that I am defending someting that I never partricipated in--in other words, am I confusing the simple act of modifying a listing before closing, with some other tricky thing? Ebay not only allows mods to a listing; they encourage it!

Please describe the crime in detail before you haul off and say that I am unethical.

It sounds like you've changed from calling it a "feature" to a flaw - correct? You might consider that your current argument is the one commonly made by spyware authors, crackers, spammers, ID thieves and burglars as an argument for their activities. I'm not equating any of them with you, but when you're using their argument, it's time to look for a different one I think. The fact that someone else left a hole, is just way to broad for your purpose.

If it was a technical flaw and is now fixed, then I think we're done.

Randy (Sloyer?) has already rebutted the "philosophy" behind your post, so I won't bother. But here are my short answers:

1. The eBay fees must be paid by *someone*, and it just makes more sense to hold the sellers responsible: They have the funds available after successful sales, and they have a more-extensive business agreement with eBay.

2. Nothing is wrong with re-listing, but there's no reason to presume that repeated re-listings should be free to the seller.

3. If an item is generally desirable, described accurately, priced reasonably, and offered for a sufficient amount of time, there's no reason to believe that it wouldn't sell on the initial listing.

*Message #24 Posted by **bill platt** on 10 Mar 2006, 8:03 a.m.,*
in response to message #23 by Karl Schneider

Hi Karl,

(please see this as a friendly rebuttal:-)

First of all, I have no idea where you get the idea of "repeated relistings"--if there is yet another "loophole" it is one I was not aware of. Only one (1) relisting is possible for any initial listing--ebay software makes that happen automatically.

Your point number 3 is based on assumtptions and is not at all true nor reasonable for evey case. Ebay auctions are 10 days (unless you want to pay extra) and while the exposure is potentially huge, for many items the actual exposure to potentiual buyers is often extremely small. It just so happens that there is a really dynamic and active marketplace for calculators and so one might start to believe that it is *always* like that for *all* products--it is *not*.

Some things are listed to "test the waters." If you cannot find good data--not enough comparables--then being able to re-list with a different item, after you get no bidders, is just good business sense on ebay's part--it encourages sellers to try to sell new things, but without simply throwing money away.

Of course the sellers are paying for the service! 5% off the top, for every sale! (Less percent for big-ticket items). As well as the listing fee. Note that since the listing fee for a 99cent auction is 20cents but that for $500 is essentialy $5.00, ebay believes a couple of things:

1. That they "carrying cost" for their bandwidth is less than 20 cents per 10 days. (OK, I'm not using that term rigorously, but I think it is still essentially true). 2. That in order to encourage listing of expensive items, it is better to rely on final sale fees rather than listing fees.

Regards,

Bill

This is an excellent reason to lobby eBay into abolishing no-cost relisting: there are ethics-challenged individuals who abuse the privilege, and thus create an unfair market biased against the buyers.

Since the privilege is being abused, it needs to be revoked.

Re: eBay fixes a leak

*Message #26 Posted by **bill platt** on 11 Mar 2006, 6:16 p.m.,*
in response to message #25 by Mark Crispin

Mark, you are lost. I think you totally misunderstand me here. Ebay has changed many of their policies over the years. It is confusing to keep track of all of them. As a seller, you have to do your best to use the features they offer to your advantage. Doing so is not unethical; it is part of the bargain ebay makes in order to attract business.

It seems that in your ideal world, the buyers would be in a paradoxical state of perpetual bliss--as there would be no sellers to buy from!

Re: eBay fixes a leak

*Message #27 Posted by **Jim L** on 10 Mar 2006, 11:52 a.m.,*
in response to message #11 by bill platt

I don't see the issue. List it at 99 cents and let the auction find the market price, or set the price above what most people will pay and pay for the privilege of either finding a sucker or not. Your choice.

> Quote:
>
> Is this an HP forum, or some populist-socialist anti-business forum?

This is from the guy who thinks that ebay doesn't deserve to get their cut for helping him maximize his own profit? Ebay wants to make as much money as possible too. Are you in favor of socialism for everyone but you?

Re: eBay fixes a leak

*Message #28 Posted by **Mark Crispin** on 10 Mar 2006, 7:12 p.m.,*

Bill Platt writes:

> Quote:
>
> Let me get this straight. You think that ebay should be free and easy for the buyers, but stick it to the sellers? You are kidding, right?

In case you haven't figured it out the buyers are *the customers*. For this very reason, the market is supposed to be "free and easy" for them.

> Quote:
>
> So you think I should have to just eat listing fees left and right? Yeah, great idea. Real friendly idea. Why on earth would anybody even bother with ebay then?

The listing fees are the lawful and proper fees that a seller pays for entry into the market. All **reputable** sellers pay those fees, with pleasure. They are part of the cost of doing business; they ensure your buyers that the seller is reputable; and ultimately those fees are paid by the buyer in the form of increased market price.

You, sir, by your own admission are not a reputable seller. Please post your eBay user ID here so that I can add you to my blocked seller blocked bidder lists. I do not want to do business with you, ever.

> Quote:
>
> Is this an HP forum, or some populist-socialist anti-business forum?

How dare you! *You* are the one who advocates unethical rip-offs of the market itself.

Hrupmh. Calling me a "socialist." What kind of drugs are you taking, boy?

Re: eBay fixes a leak

*Message #29 Posted by **bill platt** on 11 Mar 2006, 6:19 p.m.,*
in response to message #28 by Mark Crispin

Mark, I have paid every fee that ebay has ever charged me. How is that unethical!!!!

Yes, buyers are the customers of the sellers. But from ebay's perpective, the *sellers* are the customers.

The socialist remark--I make it because you seem to miss the whole supply and demand thing. Gee, if a seller has any chancce of saving money, strike him down!

Re: eBay fixes a leak

*Message #30 Posted by **Mark Crispin** on 8 Mar 2006, 7:18 p.m.,*
in response to message #2 by bill platt

If you really feel that if the item is worth that much, you should be pleased to pay the appropriate listing fees.

If, on the other hand, you set a buy-it-now only (or high-reserve auction) price at a ridiculous level, you deserve what you get if it doesn't sell. You take your chances; either you get the big bucks or you pay for your foolishness.

That's the way that a fair market works; everybody is on a level playing field. What you, Mr. Platt, seem to be saying is that you want the market tilted unfairly to benefit you and hurt your customers.

Re: eBay fixes a leak

*Message #31 Posted by **Andreas Terzis** on 9 Mar 2006, 2:29 a.m.,*

So is Mr. Platt the seller that had all those auctions that we all wanted to bid on, where the reserve wasn't met?!@* Nice sleuth work boys...

Re: eBay fixes a leak

*Message #32 Posted by **bill platt** on 9 Mar 2006, 9:20 a.m.,*
in response to message #31 by Andreas Terzis

No, I am not coburlin.

Every calculator I have ever sold (and that is only a handful) was listed at 99 cents.

There is so much traffic in HP calculators that there is no reason to use a reserve or a high start---the market will take your offering to its fair price--as long as you do a proper job of listing it. In other words:

```
* Full Disclosure
* clear, accurate photos
* plain english
* no excuses like "my brother wanted me to sell this"
* reasonable shipping
```

Let's see...I've sold 3 HP32sii, a broken 48g, a 33s, and maybe one or two others. On the other hand, I've *bought* over $2,000 worth of these crazy things....

Edited: 9 Mar 2006, 9:40 a.m.

Just out of curiosity Bill, did your 33s sell at a good price?

Re: eBay fixes a leak

*Message #36 Posted by **bill platt** on 10 Mar 2006, 1:08 p.m.,*
in response to message #35 by e,young

Yes. I got $55 for it. I bought it for $40 (after rebate). I loaded a bunch of useful stuff with it, and fully described the workarounds for the bugs, had them printed up, and even some cool ALG stuff. I listed it at the right time (some months ahead of the Big Exam). I did not sell mine during the time when they were going for $200--when the Big Exam had made them a requirement, and Walmart had pre-released them and tehn taken them off the shelves. I could have made a lot of money then (but did not).

All of this is so ridiculously little compared to what I actually get *paid* that it really doesn't matter. I could by 10 33s every year and not really notice it...just to put it in perspective...

Edited: 10 Mar 2006, 1:12 p.m.

Re: eBay fixes a leak

*Message #37 Posted by **Andreas Terzis** on 11 Mar 2006, 5:04 a.m.,*
in response to message #32 by bill platt

Yeah, I've bought HP's worth $2000 myself in the last couple of months and returned about half of them due to crooked sellers on eBay. I'm getting tired of this. Statistically I'd say there are about 10% of honest sellers on eBay. And like most of us here, I have a list of them. What is it about taking people for a ride? Does it add excitement to the sellers' lives? Or do they make so much money that they keep deceiving people? Like a few other fellows here, I think from now on I'm gonna be very distrustful of any seller on eBay. Reputable ones don't hide behind their anonymity!

Re: eBay fixes a leak

*Message #38 Posted by **bill platt** on 11 Mar 2006, 6:21 p.m.,*
in response to message #37 by Andreas Terzis

Well, I only got a bad deal * once* in my calculator buying. You have to really do your reasearch. I read *every* feedback (up to 250 of them) for every seller that I bid on. I learned this the hard way fro mthe one that ripped me off.

I have had stuff come in bad--but the sellers have made adjustments and so that is fine with me.

Re: eBay fixes a leak

*Message #39 Posted by **Andreas Terzis** on 11 Mar 2006, 10:21 p.m.,*

No. I'm asking for help with working a calculator that I am unfamiliar with.

Re: Newton's Method

*Message #4 Posted by **Namir** on 8 Mar 2006, 3:41 p.m.,*
in response to message #1 by John Bower

The folloing code assumes that FX stores the function you want to solve:

```
<<
 "TOLERANCE" "1E-8" INPUT OBJ->
 "GUESS" ""  INPUT OBJ-> -> T X
 << 0 0 0 0 -> H D F I
  <<
   DO
    'I' INCR DROP
    X ABS 1 + 0.01 * 'H' STO
    X FX 'F' STO
    X H + FX F - INV H * F * 'D' STO
    X D - 'X' STO
    UNTIL D ABS T < I 55 > OR
   END
   I "ITERS" ->TAG
   X "ROOT" ->TAG
  >>
 >>
>>
```

The program prompts you to enter the root tolerance and a guess for the root. The program displays the number of iterations and the last refined guess for the root. If the iterations exceed 55, the program exits.

Hope this will do the job.

Namir

PS: My consulting fees will be emailed to you. Shoudl email fail, Mr T will show up in person with the invoice. I strongly suggest paying him cash AND without delay!

John

Re: Newton's Method

*Message #6 Posted by **Namir** on 8 Mar 2006, 4:41 p.m.,*
in response to message #5 by John

The code uses the basic Newton algorithm:

X(new) = X - f(X) / f'(X)

The code approximates the derivative f'(X) using:

f'(X) = (f(X+h) - f(X)) / h

where h = 0.01 * (1 + |X|). This expresion insures that h is just above 0.01 when X very small.

So the first equation becomes:

X (new) = X - h * f(X)/(f(X+h) - f(X))

Since f(X) appears twice, it's better to save it to a variable (F in the program).

The term f(X)/f'(X) is the guess refinement, stored in variable D in the program. Iteration stops when the absolute value of this refinement is less than the tolerance value (stored in variable T in the program).

Now here comes your part of the homework. Reconcile the code with the above information.

Re: Newton's Method

*Message #9 Posted by **Valentin Albillo** on 9 Mar 2006, 6:35 a.m.,*
in response to message #7 by Karl Schneider

Hi, Karl:

Karl posted:

""I pity the fool" who must program in RPL! ;-)"

Indeed ! Especially as the algorithm itself is so simple. This would be the no-frills HP-71B version, and I'm sure everyone would agree it's much more understandable (line numbers are arbitrary and comments aren't needed, of course):

```
100  ! Basic Newton's Method:  x1=x0-f(x)/f'(x)
110  !
120  ! Ask for initial guess and tolerance
130  !
140  INPUT "Initial guess=";X0 @ INPUT "Tolerance=";T @ D=.00001
150  !
160  ! Perform up to 50 iterations and output result
170  !
180  FOR I=1 TO 50 @ X1=X0-FNF(X0)/FND(X0)
190      IF ABS(X1-X0)<T THEN PRINT "Root=";X1 @ END ELSE X0=X1
200  NEXT I @ PRINT "No convergence after 50 iterations"
210  !
220  ! Derivative computation: f'(x)
230  !
240  DEF FND(X)=(FNF(X+D)-FNF(X-D))/(2*D)
250  !
260  ! Define your function below: f(x)
270  !
280  DEF FNF(X)=X^3-6*X-2
```

where the equation being solved is $\mathbf{x^3-6x-2=0}$, simply defined at line 230 as FNF(X). For instance, to compute all three distinct roots:

```
>RUN
    Initial guess = 2
    Tolerance = 1E-10

         Root = 2.60167913188

>RUN
    Initial guess = 0
    Tolerance = 1E-10

         Root = -.339876886624

>RUN
    Initial guess = -2
    Tolerance = 1E-10

         Root = -2.26180224527
```

if no convergence occurs within 50 iterations (because the equations has no real roots, for instance), such as when f(x)=$\mathbf{x^2+1}$ = 0, this is what happens:

```
>230 DEF FNF(X)=X^2+1

>RUN
    Initial guess = 2
    Tolerance = 1E-10

         No convergence after 50 iterations
```

An important difference between my HP-71B version and Namir's RPL one is that I compute the derivative using a much more accurate 2nd-order method (error proportional to h^2) instead of the 1st-order method (error proportional to h) he uses. Not that great accuracy is required for Newton's method, mind you, and you need three calls to f(x) instead of only two, but then you have the bonus of being able to compute a fairly accurate derivative right from the keyboard by simply calling FND with your argument.

" Good thing that the 49G+ has equation solving built in."

Oh, if built-in solvers are permitted then the HP-71B version is simply:

```
PRINT FNROOT(0,3,FVAR^3-6*FVAR-2)

    2.60167913189
```

where you can even omit the PRINT. I don't know why, but I strongly suspect that the 49G+ built-in equation solving process is still more *complicated* than that. As some clever contributor told me recently in a private communication:

> *"I have to admit that RPL makes you focus more on the technicalities of the stack (DUP, DUP2, ROLL, ROLLD, OVER, PICK, etc...) rather than on your algorithms ..."*

I couldn't have said it better.

Best regards from V.

HP27S battery?

*Message #1 Posted by **Christine Rousselle** on 7 Mar 2006, 3:38 p.m.*

I'm trying to find the type of battery for my HP27s-can anyone help me out? Thanks, Christine

Re: HP27S battery?

*Message #2 Posted by **bill platt** on 7 Mar 2006, 4:35 p.m.,*
in response to message #1 by Christine Rousselle

357. Y ou will need three of them. But not a 357 magnum--that's a bullet:-)

The 357 is silver oxide. You can also use an LR-44 alkaline pile. The latter is not much cheaper, but lasts no where near as long as the silveroxide. However the downside of the 357 (siver oxide) is that when it does start to lose juice, it happens much faster and more suddenly than with the alkaline. If you have a lot of programs loaded, and you want to be able to ignore the low battery indicator for 15 more minutes, tehn better to get the LR-44.

BTW where did you buy your 27s? Are you the original owner? Is this the first battery change? If you are the original owner, would you mind telling your "story"? the 27s, being an Algebraic hp, we would love to know how the original buyers came to choose it. Most HP people are RPN addicts--your take on the world is apt to be insightful....

Regards,

Bill

Re: HP27S battery?

*Message #3 Posted by **Christine Rousselle** on 7 Mar 2006, 6:37 p.m.,*
in response to message #2 by bill platt

I'm the original owner. I bought it when I was an undergrad studying for my EE degree. I had it in storage with no batteries, so I wasn't sure what to replace them with. Thanks for the info! I am sure I have the owner's manual somewhere, but I figured the info might be faster to find on this forum.

Sounds like there are a lot of die-hard 27s fans out there!

Re: HP27S battery?

*Message #4 Posted by **Christine Rousselle** on 7 Mar 2006, 6:47 p.m.,*
in response to message #2 by bill platt

You also asked how I chose the 27s. It has been awhile, but I chose it due to the recommendation of another EE student and its programming ability. At this point, I never need much more than basic

functionality though.

Re: HP27S battery?

*Message #5 Posted by **bill platt** on 8 Mar 2006, 8:32 a.m.,*
in response to message #4 by Christine Rousselle

Hi Christine,

Thanks for your reply. It is very interesting to here that the 27S had a following not only among engineers, but specifically among EE's.

Best regards,

Bill

Cells for Pioneer & Voyager series (HP-27S)

*Message #6 Posted by **Karl Schneider** on 7 Mar 2006, 9:19 p.m.,*
in response to message #1 by Christine Rousselle

Christine --

As Bill mentioned, the 357- and 44-series 1.5V button cells will work for the HP-27S. I'll note that there are *four* types of cells that are compatible for all Pioneer and Voyager series calc's (except late 12C's and the 12C Platinum): 13, 44, 76, and 357.

I don't know the reason for the proliferation of identifiers for interchangable cells. I also don't know if there is any difference in the specifications. It would seem as though some consolidation would be in order.

HP-41 Cold Shock

*Message #1 Posted by **Geir Isene** on 7 Mar 2006, 2:50 p.m.*

Could the HP-41 get problems during cold weather? Maybe that was a reason why one of my CXs died the other day. Another one apparently died today but I managed to revive it with only minor strange behaviour (a few previously unassigned keys were suddenly assigned some XROM functions in the 07 series).

Is it a sudden spell of cold shock? Is this possible?

Background info: I am living in Norway. It is early March. It's damn cold outside. A fireplace and a hot chocolate is the way to go.

Re: HP-41 Cold Shock

*Message #2 Posted by **Garth Wilson** on 7 Mar 2006, 3:35 p.m.,*
in response to message #1 by Geir Isene

My 41cx manual says the minimum operation and storage temperature is 0 deg C. Then it goes on to say that if the batteries are removed, or if clock accuracy is not a concern, then the storage temperature can go down to -20 deg C. I can't think of anything in there that should experience any damage until you get down at least to -20, and then maybe you could damage the LCD. I did test a wide-temperature-range LCD here for my work a few years ago, and although they said anything below -40 could damage it (from freezing the liquid), I took it down to -55, even while operating. Although it was not readable down there, it was fine when brought back up to normal temperature.

Trig functions on any of the business calculators?

*Message #1 Posted by **MikeS** on 7 Mar 2006, 11:48 a.m.*

Hi all, does anyone know if there are trig functions on any of the RPN business calculators. I've checked HP's website but I can't seem to find an answer. I'd like to get a 12C platinum but was wondering about trig. thanks, Mike

Re: Trig functions on any of the business calculators?

*Message #2 Posted by **bill platt** on 7 Mar 2006, 11:59 a.m.,*
in response to message #1 by MikeS

Not ona any current models.

The 19bii was the only modern business *RPN* models with trigonometric functions.

The 27s and the 19b had trigonometry, but were not RPN.

Re: Trig functions on any of the business calculators?

*Message #3 Posted by **Jeff O.** on 7 Mar 2006, 12:50 p.m.,*
in response to message #1 by MikeS

Check the Forum archives for past discussions of programs and routines to add trig functions to the 12C, 17Bii.

Re: Trig functions on any of the business calculators?

*Message #4 Posted by **bill platt** on 7 Mar 2006, 1:21 p.m.,*
in response to message #3 by Jeff O.

The 12c trig is cute and clever but no substitute for having trig functions built-in. The 17bii trig is even more clever, but still no substitute, but it does work nicely inside the solver. Neither are particularly accurate--like 4 decimal places, which is ok for routine work but not for recursive stuff.

Re: Trig functions on any of the business calculators?

*Message #5 Posted by **Gene** on 7 Mar 2006, 5:53 p.m.,*
in response to message #4 by bill platt

While I agree they are no substitute for having the functions built-in, Valentin's 12c trigonometry is accurate to 9-10 significant digits.

It's much better than 4 digits. I checked the write-up here:

http://membres.lycos.fr/albillo/calc/pdf/DatafileVA003.pdf

The latest 12cp

*Message #10 Posted by **Gene** on 8 Mar 2006, 12:14 p.m.,*
in response to message #9 by Valentin Albillo

Hi Valentin...

1) The 12cp can use all 400 program steps. No problems.

2) I have a 12cp with your trig program in it (which is a jewel!), a lunar lander game (Thanks Tony!) and a bagels game (Thanks Tony!) and a Jive Turkey high/low game. All working in 400 steps.

One could have a 12cp with Valentin's trig program, the Black/Scholes options program, and even a game or two.

I do agree with your comments when compared to older 12c's.

Gene

Re: The latest 12cp

Hi Gene,

Gene wrote:

"I have a 12cp with your trig program in it (which is a jewel!)"

> Thanks a lot, you're always so kind to my humble productions. Good to know that the 400 steps are finally fully usable, GTO's and all.
>
> I have a further curiosity: what are the times for my trigonometric functions when run in the latest HP12CP version, specially as compared to the ones I gave in my original article for the regular HP-12C ? And what about accuracy ? Is it maintained or even increased ? Or do all the examples come out with the identical results ?
>
> I remember reading somewhere that the HP12CP took much, much longer to run some HP-12C programs, for instance the high-degree equation in one of my examples featured in my "HP-12C Serendipitous Solver" article. Has this been corrected, so that times are at least equal, preferably faster ?

Thanks again and best regards from V.

Re: The latest 12cp

*Message #12 Posted by **gene** on 8 Mar 2006, 2:07 p.m.,*
in response to message #11 by Valentin Albillo

Yes, the i-solving routine is much faster.

Trig function results on the 12cp:

For an argument of "1"

COS: 0.5403023059 SIN: 0.8414709848

Time: 6 seconds vs. 9 in your paper.

With an argument of "1"

ArcSIN: 1.570796327

Time: Just under 7 seconds vs. 15 in your paper.

Not bad! If one can live with not having 1985 style keys. :-(

Re: Trig functions on any of the business calculators?

*Message #13 Posted by **Gene** on 7 Mar 2006, 11:56 a.m.,*
in response to message #1 by MikeS

Only on the now discontinued HP19bII calculator.

No other business calculator from HP had trig functions (well, unless you go back to 1976 or so with the VERY discontinued HP-27).

However, there are several nice programs for the HP12c and HP12c platinum that give trigonometric functions without much effort. Valentin is the master at implementing these functions on the HP12c. His program is (I think?) in the articles list.

So, short answer: No currently made HP business calculator has trig functions built in.

Re: Trig functions on any of the business calculators?

*Message #14 Posted by **gene** on 7 Mar 2006, 11:58 a.m.,*
in response to message #1 by MikeS

Short answer: No currently made HP business calculator has trig functions.

Although the $30 TI BAII Plus does. Go figure.

However, you do have some options if you are so inclined:

The now discontinued HP19bII (still found on ebay anywhere from $40 to $80 or so) did include trig functions.

The HP12c and HP12c platinum can be programmed to solve the basic trig functions. The best program (IMO) is one written by Valentin, a frequent contributor to this forum. I think his program is in the articles section (if not, it should be).

Hope this helps.

Re: Trig functions on any of the business calculators?

*Message #15 Posted by **Vieira, L. C. (Brazil)** on 7 Mar 2006, 1:48 p.m.,*
in response to message #1 by MikeS

Hi, Mike;

as for standard RPN models, the HP27 (Woodstock) and the HP19BII were the only financial ones offered with trigonometrics (the HP19BII had no GRADs mode, though).

HP27 The HP19B was only algebraic capability, and the newer HP17BII+ has PI as a constant, but has no trigonometric resources <8^O

If a user program is a solution, then there are many alernatives for the HP12C, some of them are well known by: Viktor Toth, Valentin Albillo and Gerson Barbosa. If I am not wrong, Viktor´s is the smallest one of them. Valentin Albillo has the PDF files for his trigonometrics programs availble through his homepage, already mentioned here. The other ones for the HP17BII were created by W. B. McGuire II and by Michael Blankenship.

Hope this helps a bit more.

Thanks everyone for responding. I think I'll give programming the 12cp a try. Mike

Re: Trig functions on any of the business calculators?

*Message #23 Posted by **Gerson W. Barbosa** on 7 Mar 2006, 7:00 p.m.,*
in response to message #22 by MikeS

If you have the newer Platinum, you can try this:

http://www.geocities.com/gwbarbosa/prgms_1.html

I haven't tested it myself, but Luiz has. According to him, the program returns 9.000148569 for asin(acos(atan(tan(cos(sen(9)))))), (9 R/S GTO 094 R/S GTO 104 R/S GTO 157 R/S GTO 141 R/S GTO 123 R/S, on the calculator).

Regards,

Gerson.

Re: Trig functions on any of the business calculators?

*Message #24 Posted by **John Smitherman** on 8 Mar 2006, 10:37 p.m.,*
in response to message #1 by MikeS

Hi Mike. One possibility to add trig functions to the 12cp would be to use the yellow shift key and the right half of the keyboard. In addition to the trig functions other functions could be added as well as plenty of keys are available. The new model could be called the 12cp+. This might attract some new buyers.

Regards,

John

Anomaly with the HP 33s

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 7 Mar 2006, 10:25 a.m.*

I was getting acquainted with my new hp 33s when I stumbled on a difference from many earlier scientific calculators manufactured by H-P. Machines such as the HP-45, HP-27, HP-67, HP-41, HP-11C, HP-12C, HP-15C and HP-32S will all accept a SUM - command immediately after a CLEAR SUM command, return a -1 to the display, and store negative values in the statistics registers relative to those which would have been stored if a SUM + command had been used. The hp 33s will NOT accept a SUM - command immediately after a CLEAR SUM command.

Furthermore, if with those earlier machines the user enters a CLEAR SUM command, stores a positive fractional value in n, and then enters a SUM - command the machines will return one minus the fractional value to the display, store one minus the fractional value in n and store negative values in the remaining statistics registers relative to those which would have been stored if a SUM + had been used. The hp 33s will not accept a SUM - command if the existing value stored in n is less than one.

Interesting!

HP 33S -- validation of n for STAT

*Message #2 Posted by **Karl Schneider** on 8 Mar 2006, 12:00 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi, Palmer --

Hmm, interesting discovery. I compared my 33S (a "bad display with bugs" unit from 2004) with my 32SII from 2001.

The 32SII seems to do no validation whatsoever of the summation value **n** in register 28 (accessed indirectly). So, any operation is permitted, including calculation of standard deviations and mean averages, as long as "SQRT(NEG)" is not attempted.

The 33S seems to include some validation of **n**:

- Sigma- is rejected *without informational message* whenever **n** is not a positive integer, but *Sigma+ is always accepted*.
- Calculation of standard deviations is rejected when **n** is not a positive integer, but *calculation of mean averages is not*.

The reason for this apparently-inconsistent approach to validation may be that the summation functions can be used for purposes other than statistics. Also, the statistical-summation registers could be used as scratch registers, accessed indirectly.

For example, integrals and estimated error of subintervals of an integrand can be respectively summed using Sigma+ as they are calculated. Requirement of positive-integer **n** could needlessly interfere with that. (The integration-by-subinterval technique is is fully described in the HP-34C manual and HP-15C Advanced Functions Handbook.)

Division by a non-integer **n** in a mean average can be useful, also.

Still, a message should be displayed when Sigma- is rejected.

-- KS

Edited: 8 Mar 2006, 1:50 a.m.

Error indications, etc.

*Message #3 Posted by **Palmer O. anson, Jr.** on 8 Mar 2006, 11:44 a.m.,*
in response to message #2 by Karl Schneider

Once I had rebuilt a battery pack I was able to see that my HP-33C and HP-38C operated in the same manner as most of the other machines.

I did find that my HP-28S will not accept a SUM - immediately after a CLEAR SUM. Instead, it beeps and displays the message “Nonexistent SUM DAT”. That is consistent with your idea that a machine should provide an indication if it does not perform a command. Of course, the hp 33s does provide an indication that something is amiss if you try to do a SUM - immediately after a CLR SUM since it does not return a -1 to the display.

I found the following statement under the paragraph “Value Limits” on page 204 of the *HP-27 Owner’s Handbook*:

“You cannot have a negative number of entries for statistical problems. That is, you cannot key three inputs into SUM +, then subtract out four with SUM -. “

That didn’t agree with the tests I had run earlier so I cleared the statistics registers and did two SUM - commands with 2 in the Y register and 3 in the display register. Then I pressed the meanx key and saw +3.00 in the display. I pressed x<>y and saw +2.00 in the display. This seems to make sense since n = -2. I stored +2 in register 4 which sets n to +2. I pressed the mean x key and saw -3.00 in the display. I pressed x<>y and saw -2 in the display. Again, that makes sense. I got the same results with my HP-22.

HP 33S -- validation of n for STAT ("Error indications")

*Message #4 Posted by **Karl Schneider** on 10 Mar 2006, 12:41 a.m.,*
in response to message #3 by Palmer O. anson, Jr.

Palmer stated,

> Quote:
>
> I did find that my HP-28S will not accept a SUM - immediately after a CLEAR SUM. Instead, it beeps and displays the message “Nonexistent SUM DAT”. That is consistent with your idea that a machine should provide an indication if it does not perform a command.
>
> Of course, the hp 33s does provide an indication that something is amiss if you try to do a SUM - immediately after a CLR SUM since it does not return a -1 to the display.

Statistical calculations offered by RPL-based HP-28/48/49 models and by the HP-17B/17BII/27S are different from most other models. The 17/27/28/48/49 store each datum as it is entered -- unlike the other models, which only accumulate six summation values as each datum is entered.

Thus, it is quite logical for the 17/27/28/48/49 to refuse a SIGMA- operation if there are no stored data. However, refusing an operation without an explicit message (as the HP-33S can do for SIGMA-) is not a very good "indication".

KinHPo's attempt in the HP-33S to perform some validation of the summation value **n** before accepting SIGMA- or standard deviation operations is perhaps commendable, but of questionable practical value. Use of only CLEAR SIGMA, SIGMA+, and SIGMA- will yield integer values of **n**, which can be modified only by indirect access of register 28. There's not much reason to alter the value of **n**, but the user may have had a specific purpose for doing so.

A reason to change n and use SUM- after CL SUM

*Message #5 Posted by **Palmer O. Hanson, Jr.** on 10 Mar 2006, 10:20 p.m.,*
in response to message #4 by Karl Schneider

This will explain why I was interested in the different way that my hp 33s responds to a SUM - command which appears after a CL SUM command but before a SUM + command has occurred. It will also show an application where it makes sense to change the value of n other than with SUM + and SUM - commands.

A quadratic solver which appears on pages 208-211 of the *HP-15C Advanced Functions Handbook* uses a so-called "tricky property of the SUM + and SUM - commands" in a way that is equivalent to carrying twenty significant digits in the calculation of the discrimiinant. As I was working my way through the *hp 33s user's guide* I found the following statement on page 1-19: "... During some complicated internal calculations, the calculator uses 15-digit precision for immediate results. ..." That sounded a lot like the "tricky properties". I did some tests that convinced me that the "tricky properties" were available in the hp 33s. I then decided to try to translate the HP-15C program for use with the hp 33s. Steps 011 through 025 of the HP-15C program are

```
011 CLEAR SUM
012 RCL 8
013 STO 7
014 RCL / I
015 RND
016 RCL I
017 SUM -
018 RCL 9
019 x <> 7
020 x <> y
021 RCL 8
022 SUM -
023 R Down
024 SUM -
025 RCL 7
```

and so on where there is an additional SUM - at step 052 and there are no SUM + commands in the loop. That means that the HP-15C is able to accept inputs to the statistics registers which would cause the number of entries (n) to become negative. The statistics routines in the HP-41, the HP-32S and several other HP machines can also do that. The statistics routine in the hp 33s cannot. After a little thought it occurred to me that hp 33s routine may not care how the value for the

number of entries (n) had been accumulated in register 28. To prove that I did a CL SUM and followed it by three SUM + commands where 2 was in the y register and 3 was in the x register. I recalled the means and saw the values 3 and 2 as expected. Then I stored 28 (the number of the statistics register which holds the value of n) in I, entered a 3 in the display, and did a STO+ (i). I recalled the means and saw the values 1.5 and 1.0 . To make a long story short I was able to successfully translate the HP-15C program for use on the hp 33s by storing a four for n in statistics register 28 after the CL SUM command and before the SUM - commands.

The resulting program for the hp 33s with test cases appears in the Articles section as "A Cadillac Quadratic Solver for the hp 33s."

SIGMA- on the HP-33S and your quadratic solver

*Message #6 Posted by **Karl Schneider** on 11 Mar 2006, 1:18 a.m.,*
in response to message #5 by Palmer O. Hanson, Jr.

Palmer --

So that was the motivation! Congratulations are in order for a successful porting of some of the fine work in the HP-15C AFH.

I suspect that the "tricky property" involves some internal numerical techniques to carry out products for the quadratic summations (X^2, Y^2, and XY) with minimal loss of accuracy.

Also, I believe that the AFH program -- and your adaptation of it -- is a perfect illustration of the point I made earlier: Specifically, that the added "validation" of **n** for SUM- and standard deviation in the HP-33S was a misguided "enhancement".

When the statistical-summation registers are employed only in their intended manner, using only CLEAR SUM, SUM+, and SUM-, **n** will be an integer. If the user never "deletes" more data than had been previously entered, **n** will remain non-negative. The value of **n** can be modified to an "invalid" value only by indirectly accessing register 28.

As for disallowing SUM- for **n** not a positive integer: That won't prevent "improper use" of SUM-, whose purpose is to allow removal of erroneous or selected data from the summations. What if the user first enters the data 5, 3, and 7 using SUM+, then "deletes" the datum 8 using SUM-? That wouldn't be valid, yet the HP-33S would allow it.

The HP calculators that were developed in-house do not impose misguided and ineffective restrictions on the summation functions. This allows users to fully exploit the functions as needed. Cases in point are the AFH program and summation of numerical integation over successive intervals.

Re: Anomaly with the HP 33s

*Message #8 Posted by **Palmer . Hanson, Jr.** on 8 Mar 2006, 2:18 p.m.,*
in response to message #7 by Antonio Maschio

Are you sure that anything is really happening in your machine? My hp 33s is S/N 53200443 presumably a later unit than yours. When I try to do the Sum - after the CLR SUM I get a zero returned to the display and no error indication. But, if I recall the statistics registers 28 through 33 I don't find that anything has been entered.

Re: Anomaly with the HP 33s

*Message #9 Posted by **John Smitherman** on 9 Mar 2006, 7:40 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Interesting find Palmer. I'm not sure that I have ever used the Sum - command immediately after the Clear Sum but it is good to know about this difference. It would be interesting to compare this behavior with other Kinpo and non-Kinpo calculators.

In the 80's I worked between a 15c, 34c, 41cv and a 97. Some of those machines also issued a Clear x or Clear Stack when Clear Sum was used. I don't remember the details any longer but I had to be careful when moving around them.

Regards,

John

I just tested my 34c and it does not clear the stack after a Clear Sum.

John

Clearing stack with CLEAR SIGMA

*Message #12 Posted by **Karl Schneider** on 10 Mar 2006, 1:12 a.m.,*
in response to message #9 by John Smitherman

John Smitherman posted,

> Quote:

> In the 80's I worked between a 15c, 34c, 41cv and a 97. Some of those machines also issued a Clear x or Clear Stack when Clear Sum was used.

As Bill Platt said, the HP-11C and HP-15C clear the stack when CLEAR SIGMA is performed. The HP-10C and HP-12C do, also.

However, the HP-32S, HP-32SII, and HP-33S do not. Also, the HP-41C* and HP-42S do not.

Why is this? Here's the answer:

The Voyagers (10, 11, 12, 15) and many earlier models have no "clear stack" function, and they calculate sample standard deviation on both the X- and Y-data when the **"s"** function is performed. So, if "debris" is entered from the y-register into Y-data when only X-data is explicitly entered, the standard deviation function may fail entirely due to SQRT(NEG) caused by the bogus Y-datum. Automatically clearing the stack when clearing summation registers for entry of data will help prevent erroneous results. (A user complained about failed standard deviation in the Forum several archives ago, when he did a calculation that placed results on the stack in the midst of data entry. The fix is to zero out the registers containing the contaminated and unneeded summations involving Y-data.)

The HP-32S, HP-32SII, and HP-33S calculate standard deviation separately for X-data and Y-data using distinct functions, so these models are not affected by the potential error.

The HP-41C* and HP-42S calculate sample standard deviation on both the X- and Y-data, as the Voyagers do. However, they also provide a function "CLST" to clear the stack in a separate operation.

So, there's a usually a valid reason for everything you see on these calculators...

11C/15C keyboard layout and functions

*Message #14 Posted by **Karl Schneider** on 11 Mar 2006, 5:21 p.m.,*
in response to message #13 by Valentin Albillo

Hi, Valentin --

Yes, indeed the layout and organization of the HP-15C keyboard (based, of course, on that of the HP-11C) is an absolute marvel of coherent thought and organization. Even after adding a substantial amount of functionality for the 15C, the grouping of functions on the keyboard was actually improved somewhat over the 11C. Note the following improvements on the 15C over the 11C:

- All statistical functions (except CLEAR SIGMA) are on the bottom row
- All three conversion functions are side-by-side
- Pi and its shift key are closer together
- x<>(i) and x<>I were replaced by a more-versatile "x<> "

Another bit of good thinking was to place SOLVE above the "divide" key, which is used for solving an exactly-determined linear system of equations.

So, if one could revisit 1981-1982 to improve the HP-15C (as well as other Voyagers, respectively), how could that have been done *without changing its hardware or paradigm in any way?* Fixed specifications include the following: Voyager packaging; 7-segment, 10-digit display; RAM; ROM space; microprocessor; and battery.

We've discussed this before, a few archives ago, with the question framed a bit differently. I can think of only the following improvements to the HP-15C within the limitations I have specified:

- Place LN and e^x on keys 12 and 13, rather than e^x and 10^x

This was implemented on the successor Pioneer-series models. Perhaps there was a pleasing symmetry with e^x, 10^x, and y^x side-by-side. Also, keycodes 11, 12, 13, 22, 23, 24, and 25 all had blue-shifted inverses of transcedental functions (maybe *that* was the reason!). However, LN is just more useful than 10^x.

- Show A, B, C, D, and E in program keycodes where appropriate (for labels and matrix identifiers), rather than the corresponding positional keycodes 11, 12, 13, 14, and 15.

This was implemented on the Pioneer-series HP-20S, but might have run into issues of development time and ROM space for the HP-15C.

- Move CLx above the backarrow as a yellow-shifted function, put "SHOW" or "MANT" as the blue-shifted function, and perform "CLEAR PREFIX" as on the HP-41 and the Pioneer-series models: by re-pressing the shift key.

Clearing a prefix key by performing a "no op" or "display mantissa" function was probably carried over from the LED-display Spice models such as the HP-34C, which had no annunciator for a shift key. I believe that considerable 34C microcode was ported to the 11C, which in turn was used in the 15C.

That's about it. *For what the HP-15C was*, those are about the only feasible improvements I can think of -- absolute perfection was nearly achieved. Certainly, a few other functions would have been useful, such x-estimator (present on the HP-10C and HP-12C), $y^{1/x}$, x^2, and "ALL" display

format. However, there just wan't available space, at least without resorting to key combinations that were arcane, unintuitive, or inconvenient.

BTW: What are the seven uses of the [+] operation? I can identify four, six, or eight, depending on how one is counting:

> Two real scalars
> Two complex scalars
> Two matrices
> One matrix and one real scalar (in either order)
> STO + (real scalar to numbered register or matrix element)
> RCL + (real scalar from numbered register or matrix element)

Best regards,

-- KS

Re: 11C/15C keyboard layout and functions

*Message #15 Posted by **Palmer O. Hanson, Jr.** on 11 Mar 2006, 9:37 p.m.,*
in response to message #14 by Karl Schneider

I don't have an HP-15C and as a result don't have a manual. I purchased the *HP-15C Advanced Functions Handbook* after I saw it mentioned in Kahan's paper "Mathematics Written in Sand". When I decided to translate the quadratic solvers I ran into a problem -- commands such as g TEST 2 didn't help me understand what was happening. I had to analyze the programs and look other places in the book in order to decipher what was happening. So my question is, why did they do it that way? It seems to me that it would be possible to put the actual commands in the display, just like the 32S and 33s.

Re: 11C/15C keyboard layout and functions

*Message #16 Posted by **Valentin Albillo** on 11 Mar 2006, 9:55 p.m.,*
in response to message #15 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer posted:

" So my question is, why did they do it that way? It seems to me that it would be possible to put the actual commands in the display, just like the 32S and 33s.""

> As it has been commented a number of times, they did it that way because, as you know, the HP-15C doesn't have alphanumeric capabilities, so there's no way to execute a function by spelling its name, you must press the assigned key, which means 12 key locations would be needed to make available the 12 implemented logical tests.
>
> Due to the many distinct functions available in the HP-15C and the small, fixed number of keys, wasting 12 key locations wasn't an option and instead the two commonest tests were asigned to individual locations, while the 10 remaining ones where assigned to the TEST prefix, thus saving as much as 9 key locations for other functions. This explains why they weren't put on the keyboard.

> As for why they weren't put "in the display, just like the 32S and 33S" it might have to do with the simple fact that, as stated, the HP-15C does not have alphanumeric capabilities, plus it only has a 7-segment LCD display. It's just too hard (physically impossible some might say ...) to display "X less than or equal to Y ?" under such constraints, don't you think ?

Best regards from V.

Hi, Valentin --

Thanks for the response. Just a few clarifications:

> Quote:
>
> It *(single letters in keycodes)* was also implemented in a Voyager as well, the HP-16C, which showed A,B,C,D,E, and F instead of the numeric keycode.

Indeed, but the HP-16C always shows A, B, C, D, E, or F -- even for the functions that do not involve the label or hexadecimal digit. This is because, no doubt, that the letters are prominently double-shot molded on the keys, making a more visible identifier (like 0 through 9) than the two-digit code. The HP-20S and HP-21S, however, make the functional distinction in the displayed keycodes.

> Quote:
>
> The HP-15C *does* have the x^2 function, look under "square root".

Oops, an incomplete statement on my part. I meant, "x^2 *as an unshifted function.*" Practically all HP calc's after the HP-35 had x^2, but few until the HP-33S included it as unshifted. It is used so frequently...

> Quote:
>
> The six you mention, plus [ON]-[+] initiates a self-test operation.

I considered that one, but that's not really an addition operation, *per se.*

Regarding the HP-16C: How might that one have been improved prior to release in 1982? I'm not an expert on required computer-science function set, but it would have been nice if it had the same RAM as the HP-15C, for purposes of programming. The calc is very useful for conversion of data formats, but custom programs are required. It is my understanding (from an Eric Smith post?) that the 15C had two chips for user RAM, whereas the other Voyagers had only one. I'm not sure if the microcode for 16C's automatic memory reallocation (similar to that of the HP-11C and HP-34C) would have complicated the addition of more RAM.

Best regards,

Short & Sweet Math Challenge #14: Cooking Conjectures !

*Message #1 Posted by **Valentin Albillo** on 7 Mar 2006, 8:52 a.m.*

Hi all,

A month has elapsed, and March, 7th is a pretty good day for another S&SMC, this time **S&SMC#14, Cooking Conjectures !**

Preamble

Number Theory is a fascinating branch of Mathematics, where we mostly deal with such basic, fundamental entities as integer numbers. Despite the apparent simplicity, experience shows that it's actually very easy to make integer-related conjectures that seem extremely simple on the outside, yet are nearly *intractable*. A good example would be the infamous Fermat Last Theorem (FLT), which remained a conjecture for several centuries despite the strongest, most strenuous attempts at proving it.

FLT was at long last proved, thus leaving its *conjecture* status (despite its name) to actually become a *theorem* proper, but many other important conjectures are still awaiting for either some clever demonstration, which will break new barriers and advance knowledge, or else a counterexample which proves them false, which doesn't usually advance knowledge an inch but at least gives peace of mind and conclusively stops further costly, time-wasting attempts to try and prove them. When such a counterexample is found, we say that the conjecture is ***cooked***, i.e., unsound, false. For this very S&SMC#14, put on your chef's hat and let's try and cook some nice conjectures for dinner !

The Challenge

For each of these three *plausible* conjectures, you must find a *cook*, i.e., the lowest counterexample that falsifies them. In all cases you are done if you manage to find but *one* counterexample, within the stated ranges. Optimizing for maximum speed will be first priority, then for program size and simplicity. These are the conjectures to cook:

Conjecture 1: Well-done

Some famous mathematician of old noted the fact that, apparently, you could find any number of integer solutions to the equations:

$a^2 + b^2 = c^2$ (e.g.: $3^2 + 4^2 = 5^2$)
$a^3 + b^3 + c^3 = d^3$ (e.g.: $3^3 + 4^3 + 5^3 = 6^3$)
...

where the number of terms added up is the *same* as the power, but he was able to prove that there were no non-trivial integer solutions to:

$a^3 + b^3 = c^3$

where the number of terms added up was *less* than the power. He thus conjectured that such equations as:

$$a^4 + b^4 + c^4 = d^4$$
$$a^5 + b^5 + c^5 + d^5 = e^5$$
...

etc., would also have no non-trivial solutions at all. Now, *you must prove him wrong by finding a counterexample for the 5th-power case*, i.e., write a program that finds one solution of:

$$\mathbf{a^5 + b^5 + c^5 + d^5 = e^5}$$

for non-zero, positive integer values **a**, **b**, **c**, **d**, **e** less than 150. Such a solution eluded mathematicians for two centuries till it was found in 1966 using tremendous computing power for the time. Just duplicate the feat using your small HP handheld calculator and your programming ingenuity.

Conjecture 2: Medium

Another less well-known mathematician stated the following conjecture:

"Every positive integer greater than 5 is the sum of a *prime* and a *power*"

For instance:

```
...
1234 = 991 +  3^5
1235 =  79 + 34^2
1236 =  11 + 35^2
1237 = 337 + 30^2
1238 =  13 + 35^2
...
```

etc. *You must find the smallest counterexample N which cannot be expressed as the sum of a prime and a power*, limiting your search to the range from N = 6 to 2000. Of course the prime numbers are 2,3,5,... (so 1 is *not* considered to be a prime), and the powers are $1^1 = 1$, $2^2 = 4$, $2^3 = 8$, $3^2 = 9$, $2^4 = 16$, ..., (so 0 is *not* considered to be a power for the purposes of decomposition into the sum of a prime and a power, but 1 *is*).

Conjecture 3: Rare

Finally, a more recent and amusing conjecture is that all positive integer numbers can be made into a palindromic number (i.e., one which reads the same from right or from left, such as 123474321) by reversing their digits and adding the result to the original number, then repeating these steps until you get a palindromic number. For instance, 78 gets palindromic in 4 cycles:

```
cycle 1:    78 +   87 =  165
cycle 2:   165 +  561 =  726
cycle 3:   726 +  627 = 1353
cycle 4:  1353 + 3531 = 4884, palindromic
```

You must find the smallest alleged counterexample N, for N up to 200, which fails to produce a palindromic result after M cycles, where M should go up to 200 cycles minimum, preferably up to 1000 cycles. Any number N which fails to produce a palindromic result after M cycles, for suitably large M (say 200, 500, or 1000) will be considered a counterexample for the purposes of this challenge.

Your program must ask for the maximum number of cycles to perform, M, and must output *any and all values* of N up to 200 which do not produce a palindromic result. Be aware that the numbers involved will get *very big* very soon. Your program must cater for this, without ever producing overflow or losing significant digits.

Caveat Emptor

The usual caveats apply, namely:

1. Do *not* post just solutions, actual code is *mandatory*. If you won't post code to accompany your alleged solutions at the time of posting them, then do not post the solutions, period. Wait till you can post both.

2. Code must be for an HP calculator preferably, but other vintage handhelds are acceptable as well. Posting code written in Visual Basic, Java, FORTRAN, or any other PC language will be considered unpolite and disrespectful.

3. Try to achieve a proper balance between you manually doing most of the work and having a "PRINT (solution)" program which does nothing of interest, and you contributing no enlightening ideas of your own and having instead a dumb, brute-force program which delivers the goods but takes ages to run. The ideal is to use some clever ingenuity to significantly speed up the program while still letting it do the hard work as it should. Remember the old computerese proverb:

   "The Program was made for man, not man for the Program"

   Anyway, you'll need some reasonable algorithmic and programming ingenuity if you don't want to kill your batteries in one go.

I'll post my own original solutions next Monday, which will be *three simple programs 7-, 8-, and 9-lines long for the HP-71B*. Though far from being the last word in state-of-the-art programming, they're didactically simple and they're fast and they get the work done reasonably quickly. I'll post background and relevant comments as well.

Let's see yours.

Best regards from V.

*Message #3 Posted by **Bram** on 9 Mar 2006, 6:35 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

Nice challenges and nicely formulated. I immediately started thinking about them, but, unpleasantly enough, I can't think of any other solution than to scan possibilities, which is disapproved in the first place. So for the moment no contributions from my side.
Still, as I was anxious to know the answer, I did write a brute-force program for my 32SII for the first challenge to see how fast it would run. Well, fast enough, but the amount of computations will take a few days to complete, despite the fact that I don't examine combinations that I already have computed but in different order.
Obviously this #14 is not my cup of tea, but I like reading it and I'm looking forward to your approaches. As always.

groeten,
Bram

Hi, Bram:

Bram posted:

"Obviously this #14 is not my cup of tea, but I like reading it and I'm looking forward to your approaches. As always."

> Thanks for your interest and kind words but don't despair so soon. Even if Conjecture 1 would seem hard, it actually isn't that much, and you still have Conjectures 2 & 3 which are easier to cook.
>
> However, the HP32SII is probably not the ideal calc for this #14, because of its extremely limited amount of RAM. After you've entered some clever programming you'll be left with too few bytes for necessary variables, and even the program itself can't be much more refined than a pure brute-force search in that little RAM.
>
> If you can, I suggest you try instead one of these models: HP41CV/CX, HP42S, HP-71B, HP48/49 series. Even if you don't have any of these models available, you can always get Emu71 or other free emulators from the net, and try your might with that.
>
> Don't give up, I know you can succeed ! :-) You might also consider that if all interested people simply get the lazy bug and decide to just wait and see whatever solutions I will eventually post, I might consider the response a total failure and stop altogether posting any further challenges ... in other words, if I do work hard to produce them in the first place, then interested people are expected to work as well trying to solve them for good, else no deal.
>
> This isn't intended as a showcase of my abilities but an interaction between all of us who care for this, where we'll get to see some fun math and interesting programming techniques for a variety of models, and hopefully enjoy it all and learn something valuable in the process.

Best regards from V.

Hello!

Thank you for this nice challenge, really something worth thinking about whike driving to work and back...

> Quote:
>
> Bram: Nice challenges and nicely formulated. I immediately started thinking about them, but, unpleasantly enough, I can't think of any other solution than to scan possibilities, which is disapproved in the first place. So for the moment no contributions from my side.

The same for me, I'm afraid. Nevertheless (I'm an engineer, not a mathematician ;-)), I tried a brute force "attack" on challenge no.1 with a little C-programme on my PowerBook (I wish I had this Casio pocket

calculator with "C" programming language, that would make my attempt a valid entry...) and it took 18 seconds (*) to find the result(s) (**). Which means: definitely no answer within my remaining lifetime on any vintage programmable calculator!

The only alternatives that come to mind would be an iterative approach or an optimisation (simplex method?) approach, but both would not fit into any of my programmable calculators.
Looking forward to see the real smart solutions!

Greetings, Max

(*) and 27 Minutes, if searching up to 300 instead of 150 ... which probably tranlates to a millenium on the hp-41
(**) my very first real brute-brute-brute approach would have taken several hours, so at least *some* thinking had to go into it.

Hi, Maximilian:

Maximilian posted:

"Thank you for this nice challenge, really something worth thinking about whike driving to work and back... "

> You're welcome, glad you find it interesting.

"I tried a brute force "attack" on challenge no.1 [...] and it took 18 seconds [...] which means: definitely no answer within my remaining lifetime on any vintage programmable calculator!"

> Believe me, it's not as hard as it seems. Obviously launching a pure brute-force search with the equivalent of four or five for-next loops is certain to take ages, as I mentioned in my original posting. But some clever refinements plus careful reading of the given conditions can make all the difference in the world, to the point where a vintage handheld, and certainly such models as the modern 48/49 series, can solve it in a few hours at most, if not mere minutes.

"Looking forward to see the real smart solutions! "

> I think you're overestimating the real difficulty. That's usually the way with my challenges: most people find them extremely difficult at first, till they realize that they're actually quite manageable, even easy given the right approach. Else, I wouldn't post them, it's no fun to ask solutions to challenges that would forcibly require the use of a fast, full-fledged computer.

Go ahead and if you don't manage to cope with Conjecture 1, try Conjectures 2 & 3 instead, they're probably easier (that's why I labelled them "Well-done" (hardest), "Medimum" (so-so hard) and "Rare" (easiest) :-)

Thanks for your interest and best regards from V.

Hi,

Any chance that you could put your C solution online? I'd be happy to port it to the HP49 series and make it a valid entry (yes, you can use C with these, and the result is *very* fast).

I have uploaded it here: http://www.bombie.de/tmp/hochfuenf.c

Greetings, Max

Hi Max,

a PB-2000C version is in your mailbox.

Marcus

I *do* have a PB-2000C and I was able to drain a set of expensive batteries with the program without ever coming near a solution...

So I tried to do something about it and I shortened the loops as good as I could. Here is the program:

```
/*
  Short&Sweet Math Challenges No.14 http://www.hpmuseum.org/
```

```
  Version for Casio PB-2000C

*/

/* IMIN: starting point */
#define IMIN 150

/* IMAX: highest number to search */
#define IMAX 150

/* There is no command line in Casio C */
main()
{
  double a5     = 0.0;
  double b5     = 0.0;
  double c5     = 0.0;
  double d5     = 0.0;
  double e5     = 0.0;
  double sum    = 0.0;
  double sumc   = 0.0;
  double sumd   = 0.0;
  double diff   = 0.0;
  double z      = 0.0;
  double vsmall = 1.0E-10;
  int    imin   = 0;
  int    imax   = 0;
  int    i      = 0;
  int    ia     = 0;
  int    ib     = 0;
  int    ic     = 0;
  int    id     = 0;
  int    ie     = 0;
  double *powtab = NULL;
  int    lpowtab = 0;
  int    output  = 0;

  /* get the parameters */
  printf( "imin=" );
  scanf( "%d", &imin );
  if ( imin == 0 ) imin = IMIN;

  printf( "imax=" );
  scanf( "%d", &imax );
  if ( imax == 0 ) imax = IMAX;

  printf( "output=" );
  scanf( "%d", &output );

  printf("SSMC #14.1: Searching up to %d\n", imax);

  /* power table to save multiplictions */
  lpowtab = imax + 1;
  powtab  = (double *) malloc(lpowtab * sizeof(powtab[0]));

  if (powtab == NULL) {
    printf("*** ERROR ***\nMemory allocation failed.\n");
    return;
  }

  for (i = 1 ; i < imin ; i++) {
    z = (double) i;
    powtab[i] = z * z * z * z * z;
  }

  /* outermost loop for "e" */
  for (ie = imin ; ie <= imax ; ie++) {
    z = (double) ie;
```

```
    e5 = powtab[ie] = z * z * z * z * z;
    if (output) {
      clrscr();
    }
    printf("e=%-4d e^5=%-15.0f\n", ie, e5);

    /* compute lower bound of "d" loop */
    z = e5 - 3 * powtab[ie-1];
    id = z <= 2 ? 1 : (int) pow( z, 0.2 );
    if (output) {
      gotoxy(12,1);
      printf("%-3d",id);
    }
    for (; id < ie; id++) {
      d5 = powtab[id];
      if (output) {
        gotoxy(12,1);
        printf("%-3d",id);
        gotoxy(16,1);
        printf("%-15.0f",d5);
      }

      /* compute lower bound of "c" loop */
      z = e5 - 3 * d5;
      ic = z <= 2 ? 1 : (int) pow( z, 0.2 );
      if (output) {
        gotoxy(0,1);
        printf("         %-3d",ic);
      }
      for (; ic <= id; ic++) {
        c5 = powtab[ic];
        sumc = d5 + c5;
        if (output) {
          gotoxy(8,1);
          printf("%-3d",ic);
          gotoxy(16,1);
          printf("%-15.0f",sumc);
        }
        /* check if c^5 + d^5 exeeds e^5 */
        if ( sumc > e5 ) break;

        /* compute lower bound of "b" loop */
        z = e5 - d5 - 2 * c5;
        ib = z <= 2 ? 1 : (int) pow( z, 0.2 );
        if (output) {
          gotoxy(0,1);
          printf("     %-3d",ib);
        }

        for (; ib <= ic; ib++) {
          b5 = powtab[ib];
          sumd = sumc + b5;
          if (output) {
            gotoxy(4,1);
            printf("%-3d",ib);
            gotoxy(16,1);
            printf("%-15.0f",sumd);
          }
          /* check if b^5 + c^5 + d^5 exeeds e^5 */
          if ( sumd > e5 ) break;

          /* compute lower bound of "a" loop */
          z = e5 - sumd;
          ia = z <= 2 ? 1 : (int) pow( z, 0.2 );
          if (output) {
            gotoxy(0,1);
            printf("%-3d",ia);
          }
          for (; ia <= ib; ia++) {
            a5 = powtab[ia];
            sum = sumd + a5;
            diff = sum - e5;

            if (-vsmall < diff && diff < vsmall) {
```

```
              if (output) clrscr();
              printf("SOLUTION: a=%4d b=%4d c=%4d\n          d=%4d e=%4d\n",
                     ia, ib, ic, id, ie);
              beep(1);
              if (output) getchar();
            }
            else if ( sum > e5 ) {
              /* a^5 + b^5 + c^5 + d^5 exeeds e^5 */
              break;
            }
            else {
              if (output) {
                gotoxy(0,1);
                printf("%-3d",ia);
                gotoxy(16,1);
                printf("%-15.0f",sum);
              }
            }
          }
        }
      }
    }
  }

  free(powtab);
  powtab = NULL;

  printf("\nFinished\n");
}
```

I'm relucant to post the result, because I've only tested the program above with time consuming screen output enabled and even after giving it a whole night it didn't reach more than e=70. At the time of this writing, the software is running again, this time with a restricted set of values for e to check ;-). I hope that it will come to a solution before Sunday.

To provide a solution for an HP calculator of old, I ported it back to DOS Borland C and let it run on my venerable HP 200lx. The machine seems to be much faster than the Casio, having reached e=65 after about 15 or 20 minutes. The Casio runs interpreted code (just like BASIC) while the HP runs a compiled DOS program.

I strongly believe that the search algorithm must be improved greatly to have a chance on a slow calculator.

Marcus

*Message #11 Posted by **Marcus von Cube, Germany** on 11 Mar 2006, 6:25 p.m.,*
in response to message #10 by Marcus von Cube, Germany

After a few hours of hard computational work, the HP 200lx was finally able to deliver:

27^5+84^5+110^5+133^5=144^5

My poor Casio has at least arrived at showing the same result after being told to start with e=144...

Re: S&SMC#14 Part 3 - BASIC solution

*Message #12 Posted by **Marcus von Cube, Germany** on 9 Mar 2006, 8:23 a.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

this time I had some spare time to try to solve at least one of your challenges. Here is a BASIC program for the third conjecture.

The program

(Indentation and empty lines added later in the listing)

```
100 REM S&SMC 14, Problem 3
110 INPUT "Number of cycles=";NC
120 INPUT "From=";N1,"To=";N2
130 DIM D(1,199):REM digits

140 FOR N=N1 TO N2
160  REM Split N in digits
170  ID=0:L=0
180  T=N
190  D(ID,L)=T-10*INT(T/10)
200  T=INT(T/10)
210  L=L+1
220  IF T<>0 THEN 190
225  L=L-1

230  REM Cycle loop
240  FOR C=1 TO NC
250   GOSUB 1000:REM display
260   REM Add and Test
270   F=-1:CY=0

280   FOR I=0 TO L
290    D1=D(ID,I):D2=D(ID,L-I)
300    F=F AND (D1=D2)
310    IF F AND (I>=L-I)THEN I=L:C=NC:GOTO 350:REM Palindromic
320    S=D1+D2+CY:CY=0
330    IF S>9 THEN S=S-10:CY=1
340    D(1-ID,I)=S
350   NEXT I

360   ID=1-ID:REM swap source&dest
365   IF CY=1 THEN L=L+1:D(ID,L)=1
370  NEXT C

380  IF F=0 THEN 410
390 NEXT N
400 END

1000 REM display
1005 PRINT N;C;":";
1010 FOR II=0 TO L
1020  PRINT CHR$(48+D(ID,II));
1030 NEXT II
1040 PRINT
1050 RETURN
```

I wrote the program on a TI-74 with bare 8K RAM. The BASIC used here is pretty standard and I assume that a HP-71 could run the same software with minor changes (: -> @).

How is it done?

I didn't make the attempt to handle the sums as integers or real numbers because the number of digits available (10 to 14) wouldn't be enough. Splitting an array of 10 digit numbers in individual digits seemed to be too time consuming. So I traded memory for speed in this first attempt. Each individual digit is stored as a number in an array.

The array is defined with DIM D(1,199). TI-Basic does not support single precision or integer variables so this is a real waste of memory. The array caters for two numbers with up to 200 digits. A posible modification could be to use two character strings (with a maximum length of 255 in most BASICs) or to PEEK/POKE directly into memory.

The first dimension is used to switch between the source and the destination number. There is only one source number, read from left to right for the first summand and from right to left for the second. The other number is the sum. After each cycle, the roles are changed (see line 360).

While adding, two things happen. A comparison is made between the two digits added (line 300) and the result of the comparison is ANDed into a flag (F). If the flag is still set after half of the digits are processed, the number is a palindrome and the rest of the two inner loops are skipped (line 310.)

Secondly, a carry (CY) is set whenever the sum is greater than 9. This carry is than added in the next step of the digit loop (lines 320-340.)

The results

The program took about half an hour to find the result 196 with 200 cycles. The size of the array should be enough for more than 400 cycles (the longest number I got has 88 digits). The following output was created with a modified version of the software that can PRINT to a datafile on the PC (via the PC interface).

Re: Short & Sweet Math Challenge #14: Cooking Conjectures !

*Message #13 Posted by **Eamonn** on 10 Mar 2006, 12:05 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

Thanks you for another S&SMC. I always find them fun to try, but lately it's been an even tougher challenge to find time to work on them.

I wrote a program in HP-71B Basic to find a solution for the first part of the challenge. I was going to write it in Sharp Basic, but the Sharp handhelds I have only support 10 significant digits and the program needs to be able to handle integers with 11 digits.

I don't have an actual HP-71B, so I used emu71. This was the first time I used this emulator and I agree that it is a great piece of software.

Here is my program. There are some small optimizations to reduce the number of cases that are tested (including starting the outer loop at 150 and working backward - thanks for the hint). However, it still took about 10 minutes to find the answer, even when running with emu71.

```
10 FOR E=150 TO 5 STEP -1 @ E5=E^5 @ FOR D=E-1 TO 4 STEP -1 @ D5=D^5 @ C1=INT ((E5-D5)^.2)
15 IF C1>D THEN D=0 @ GOTO 70
20 FOR C=C1 TO 3 STEP -1 @ C5=C^5 @ B1=INT((E5-D5-C5)^.2) @ IF B1>C THEN C=0 @ GOTO 60
30 FOR B=B1 TO 2 STEP -1 @ B5=B^5 @ A=INT((E5-D5-C5-B5)^.2) @ IF A>B THEN B=0 @ GOTO 50
40 IF A^5+B5+C5+D5=E5 THEN 100
50 NEXT B
60 NEXT C
```

```
70 NEXT D
80 NEXT E
90 STOP
100 PRINT A;" ";B;" ";C;" ";D
110 PRINT E
```

It finds the solution 27^5 + 84^5 + 110^5 + 133^5 = 144^5.

I'll see if I can make time to try the other parts of the challenge this weekend.

Best Regards,

Eamonn

Re: Short & Sweet Math Challenge #14: Cooking Conjectures !

*Message #14 Posted by **Gerson W. Barbosa** on 12 Mar 2006, 1:28 p.m.,*
in response to message #1 by Valentin Albillo

Hello Valentin,

Here is my attempt to cook conjecture #1. Ok, it's in QBASIC, but the conversion to HP-71B basic should be straightfoward. So, not to be completely off the rules, I tested it on the HP-200LX. After 26 minutes and 15 seconds the answer was found:

144 133 110 84 27

The program could be ported to the HP-42S but it would take even longer to run. Perhaps the 49G+ gets the same result in less than 10 minutes. Though the algorithm finds the right answer, it may still have flaws, which everybody is welcome to point me out. Of course, it is easier when we know the answer. If I hadn't seen Eamonn's and other people's solutions, I might not have even tried. Thanks all of you!

As always, I am looking forward to your solutions.

```
5  CLS
10 DEFDBL A-H, O-Z
15 DEFINT I-N
25 DIM Q(150)
30 FOR I = 2 TO 150
35   T = I * I
40   Q(I) = T * T * I
45 NEXT
50 FOR I = 150 TO 6 STEP -1
55    E5 = Q(I)
60    LOCATE 1, 1: PRINT I
65    FOR J = I - 1 TO 5 STEP -1
80      FOR K = J - 1 TO 4 STEP -1
85        FOR L = K - 1 TO 3 STEP -1
87          IF Q(J) + Q(K) > E5 THEN 110
90          FOR M = L - 1 TO 2 STEP -1
91            IF Q(J) + Q(K) + Q(L) > E5 THEN 105
92            S = Q(J) + Q(K) + Q(L) + Q(M)
94            IF S < E5 THEN 110
98            IF S = E5 THEN 130
100         NEXT M
105       NEXT L
110     NEXT K
115   NEXT J
120 NEXT I
130 CLS: PRINT I, J; K; L; M

-----------------------------------------
```

Edited to include Emu71 version:

```
25 STD @ DIM Q(150)
30 FOR I=2 TO 150 @ Q(I)=I^5 @ NEXT I
50 FOR I=150 TO 6 STEP -1
55 E5=Q(I) @ DISP I
65 FOR J=I-1 TO 5 STEP -1
80 FOR K=J-1 TO 4 STEP -1
85 FOR L=K-1 TO 3 STEP -1
87 IF Q(J)+Q(K)>E5 THEN 110
90 FOR M=L-1 TO 2 STEP -1
91 IF Q(J)+Q(K)+Q(L)>E5 THEN 105
92 S=Q(J)+Q(K)+Q(L)+Q(M)
94 IF S<E5 THEN 110 ELSE IF S=E5 THEN 130
100 NEXT M
105 NEXT L
110 NEXT K
115 NEXT J
120 NEXT I
130 PRINT I,J;K;L;M
```

Since this takes roughly one hour to find the answer (Emu71 @ 500MHz), I think my previous estimation of running time on the 49G+ is wrong: I'd say *less than 10 hours* instead of *less than 10 minutes* :-(

A question about conjecture #1

*Message #15 Posted by **Gerson W. Barbosa** on 12 Mar 2006, 5:36 p.m.,*
in response to message #14 by Gerson W. Barbosa

In order to test the algorithm, I made a slight modification in the QBasic program. So beginning with 580, the following results were obtained in about 5 minutes (Pentium III @ 500 MHz, QBX - Compiled QBASIC):

```
 576           532  440  336  108
 432           399  330  252   81
 288           266  220  168   54
 144           133  110   84   27
```

Exactly as expected, since (n*a)^5+(n*b)^5+(n*c)^5+(n*d)^5=(n*e)^5. Now, a question arises: besides {133, 110, 84, 24} and their multiples, are there any other four-number sets (and their multiples) that 'cook' the conjecture? Or is this set unique?

I've just found the answer to this question. According to this paper, NEW RESULTS IN EQUAL SUMS OF LIKE POWERS, the set is unique. Perhaps I should attend to an introductory course on Number Theory :-)

Re: A question about conjecture #1

*Message #16 Posted by **Gerson W. Barbosa** on 15 Mar 2006, 8:57 p.m.,*
in response to message #15 by Gerson W. Barbosa

I think I had better stick to my first idea:

$85359^5 = 85282^5 + 28969^5 + 3183^5 + 55^5$ was found by J. Frye (J.-C. Meyrignac, pers. comm., Sep. 9, 2004):

http://mathworld.wolfram.com/DiophantineEquation5thPowers.html

What will come next?

Gerson.

This is even beyond the accuracy of my double precision Sharp PC-E500. The sum has 25 digits while the Sharp can handle 20 digit precision. You need at least 83 bits (unsigned binary) to store a number of that size.

Marcus

Re: A question about conjecture #1

*Message #18 Posted by **James M. Prange (Michigan)** on 16 Mar 2006, 3:24 a.m.,*
in response to message #17 by Marcus von Cube, Germany

But verified on the 49 series, in "exact" mode.

*Message #19 Posted by **Marcus von Cube, Germany** on 16 Mar 2006, 7:28 a.m.,*
in response to message #18 by James M. Prange (Michigan)

James,

I simply forgot about the CAS machines which come with arbitrary precision integer arithmetic. The TI Voyage 200 can calculate the sum as well.

Marcus

Re: SSMC #14/2 in RPL

*Message #20 Posted by **Marcus von Cube, Germany** on 12 Mar 2006, 5:09 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin,

here is my attempt at the second problem in RPL on an HP49g+.

First Step: Computing Prime Numbers

The following program, named MKPR, computes a list of primes. The upper limit is given on the stack:

```
%%HP: T(3)A(R)F(.);
\<< { 2. } 'PRIME' STO 3. SWAP
  FOR i 1. \-> j
    \<<
      DO i PRIME j GET
        IF DUP2 SQ \>=
        THEN
          IF / FP
          THEN j 1. + 'j' STO 0.
          ELSE 1.
          END
        ELSE DROP2 PRIME i + 'PRIME' STO 1.
        END
      UNTIL
      END
    \>> 2.
  STEP
\>>
```

It computes the following list if 2000 is entered on the stack:

{ 2. 3. 5. 7. 11. 13. 17. 19. 23. 29. 31. 37. 41. 43. 47. 53. 59. 61. 67. 71. 73. 79. 83. 89. 97. 101. 103. 107. 109. 113. 127. 131. 137. 139. 149. 151. 157. 163. 167. 173. 179. 181. 191. 193. 197. 199. 211. 223. 227. 229. 233. 239. 241. 251. 257. 263. 269. 271. 277. 281. 283. 293. 307. 311. 313. 317. 331. 337. 347. 349. 353. 359. 367. 373. 379. 383. 389. 397. 401. 409. 419. 421. 431. 433. 439. 443. 449. 457. 461. 463. 467. 479. 487. 491. 499. 503. 509. 521. 523. 541. 547. 557. 563. 569. 571. 577. 587. 593. 599. 601. 607. 613. 617. 619. 631. 641. 643. 647. 653. 659. 661. 673. 677. 683. 691. 701. 709. 719. 727. 733. 739. 743. 751. 757. 761. 769. 773. 787. 797. 809. 811. 821. 823. 827. 829. 839. 853. 857. 859. 863. 877. 881. 883. 887. 907. 911. 919. 929. 937. 941. 947. 953. 967. 971. 977. 983. 991. 997. 1009. 1013. 1019. 1021. 1031. 1033. 1039. 1049. 1051. 1061. 1063. 1069. 1087. 1091. 1093. 1097. 1103. 1109. 1117. 1123. 1129. 1151. 1153. 1163. 1171. 1181. 1187. 1193. 1201. 1213. 1217. 1223. 1229. 1231. 1237. 1249. 1259. 1277. 1279. 1283. 1289. 1291. 1297. 1301. 1303. 1307. 1319. 1321. 1327. 1361. 1367. 1373. 1381. 1399. 1409. 1423. 1427. 1429. 1433. 1439. 1447. 1451. 1453. 1459. 1471. 1481. 1483. 1487. 1489. 1493. 1499. 1511. 1523. 1531. 1543. 1549. 1553. 1559. 1567. 1571. 1579. 1583. 1597. 1601. 1607. 1609. 1613. 1619. 1621. 1627. 1637. 1657. 1663. 1667. 1669. 1693. 1697. 1699. 1709. 1721. 1723. 1733. 1741. 1747. 1753. 1759. 1777. 1783. 1787. 1789. 1801. 1811. 1823. 1831. 1847. 1861. 1867. 1871. 1873. 1877. 1879. 1889. 1901. 1907. 1913. 1931. 1933. 1949. 1951. 1973. 1979. 1987. 1993. 1997. 1999. }

You should set numeric and approximate mode before creating the list. The list is hopefully correct; if not, please complain!

Second Step: Computing Powers

The next RPL program, named MKPOW, creates a list of powers as indicated in the challenge. The upper limit is entered on the stack:

```
%%HP: T(3)A(R)F(.);
\<< { 1. } 'POWR' STO \-> n
  \<< 2. n LN 2. LN /
    FOR p 2. n p XROOT
      FOR i POWR i p ^
        IF DUP2 POS
        THEN DROP2
        ELSE + 'POWR' STO
        END
      NEXT
    NEXT
  \>> POWR SORT 'POWR' STO
\>>
```

Here is the result:

{ 1. 4. 8. 9. 16. 25. 27. 32. 36. 49. 64. 81. 100. 121. 125. 128. 144. 169. 196. 216. 225. 243. 256. 289. 324. 343.

361. 400. 441. 484. 512. 529. 576. 625. 676. 729. 784. 841. 900. 961. 1000. 1024. 1089. 1156. 1225. 1296. 1331. 1369. 1444. 1521. 1600. 1681. 1728. 1764. 1849. 1936. }

If anything is wrong with my list, post a comment, please!

Final Step: Search for Sums

Here is my attempt, named SSMC14, to find a number which cannot be represented as a sum of elements taken from each of the lists:

```
%%HP: T(3)A(R)F(.);
\<< 6. SWAP
  FOR n
    n 3 DISP
    0. \-> p
    \<<
      DO p 1. + 'p' STO n POWR p GET -
        IF DUP 0. >
        THEN PRIME SWAP POS
        ELSE n HALT 1.
        END
      UNTIL
      END
    \>>
  NEXT
\>>
```

If it finds a solution, it hits a breakpoint. The prgramm must be killed manually or can be continued to search for more solutions. The upper limit is entered on the stack. Both lists must be created beforehand.

Here is my result:

1549

Marcus

in response to message #21 by Valentin Albillo

> Quote:
>
> Your result is correct. Timing ?

Wow!

Creating the lists is a matter minutes (PRIME, 2:10) or Seconds (POWR, 0:04). The search itself took

25 minutes. All measurements were done on a 49g+

Marcus

Re: SSMC #14/2 in RPL

*Message #23 Posted by **Arnaud Amiel** on 13 Mar 2006, 3:53 a.m.,*
in response to message #20 by Marcus von Cube, Germany

Unfortunately I haven't had time to look at the SSMC but I would have used the NEXTPRIME command on the 49.

It works correctly up to a few millions.

Arnaud

Re: SSMC #14/2 in RPL

*Message #24 Posted by **Marcus von Cube, Germany** on 13 Mar 2006, 4:42 a.m.,*
in response to message #23 by Arnaud Amiel

Arnaud,

NEXTPRIME might be worth a try to speed up building the PRIME list but we cannot gain more than about 2 minutes here. On the other hand, the programs posted should work on the lower end machines, too.

The 48S cannot sort the power list but the roles of the two lists in program SSMC14 can be reversed and the prime list is always sorted. This results in a performance penalty because the userRPL code must operate on the longer of the two lists and the built-in operation POS works on the shorter. The 48G has SORT and can use a sorted POWR list.

I'll probably do some tests on my 48 series machines, too.

Marcus

Re: SSMC #14/2 in RPL - Revised

*Message #25 Posted by **Marcus von Cube, Germany** on 13 Mar 2006, 5:53 a.m.,*
in response to message #20 by Marcus von Cube, Germany

I revised the above solution slightly and added a controlling program to get some timing information.

MKPOW

```
%%HP: T(3)A(R)F(.);
\<< { 1. } 'POWR' STO
  \-> n
  \<<
    2
    n LN 2 LN /           @ log2 n as upper limit
    FOR p
      2
      n p XROOT           @ n^1/p as upper limit
      FOR i
        POWR i p ^
        IF DUP2 POS       @ check if already in list
        THEN DROP2
        ELSE + 'POWR' STO @ add to list
        END
      NEXT
```

```
    NEXT
  \>>
  POWR SORT 'POWR' STO    @ sort list (only on 48G and up)
\>>
```

MKPR

```
%%HP: T(3)A(R)F(.);
\<<
  { 2. 3. } 'PRIME' STO   @ set up list with first elements
  5 SWAP                  @ loop from 5 to limit on stack
  FOR i
    2 \-> j               @ j indexes into the list for divisors
    \<<
      DO
        i                 @ number to test
        PRIME j GET       @ get divisor from list
        IF DUP2 SQ \>=    @ check if beyond reasonable limit
        THEN
          IF / FP         @ check if divisible
          THEN
            'j' INCR DROP @ not divisible, try next divisor
            0             @ continue with DO-UNTIL
          ELSE
            1             @ leave DO-UNTIL loop
          END
        ELSE
          DROP2           @ drop i and divisor
          PRIME i +
          'PRIME' STO     @ add new prime to list
          1               @ leave DO-UNTIL loop
        END
      UNTIL               @ flag is already on the stack
      END
    \>>

Re: Short & Sweet Math Challenge #14: Cooking Conjectures !

*Message #26 Posted by **Gerson W. Barbosa** on 12 Mar 2006, 10:34 p.m.,*
in response to message #1 by Valentin Albillo

Here is my Emu71 version for problem #1 slightly modified to avoid some unnecessary additions. Now it is about 50% faster:

```
>LIST
25 STD @ DIM Q(150) @ FOR I=2 TO 150 @ Q(I)=I^5 @ NEXT I
50 FOR I=150 TO 6 STEP -1 @ E5=Q(I) @ DISP I
65 FOR J=I-1 TO 5 STEP -1 @ FOR K=J-1 TO 4 STEP -1 @ FOR L=K-1 TO 3 STEP -1
70 S1=Q(J)+Q(K) @ IF S1>E5 THEN 110
80 FOR M=L-1 TO 2 STEP -1 @ S2=S1+Q(L) @ IF S2>E5 THEN 105
90 S3=S2+Q(M) @ IF S3<E5 THEN 110 ELSE IF S3=E5 THEN 130
100 NEXT M
105 NEXT L
110 NEXT K @ NEXT J
120 NEXT I
130 PRINT I,J;K;L;M
>
>RUN
 150
 149
 148
 147
 146
 145
 144
```

```
144                  133  110  84  27
```

Running time: 47 min 21 sec @ 500MHz (previously 1 hour 10 min 36 sec).

Regards,

Gerson.

S&SMC#14: My Original Solutions and Comments [LONG]

*Message #27 Posted by **Valentin Albillo** on 13 Mar 2006, 6:13 a.m.,*
in response to message #1 by Valentin Albillo

Hi all:

Thanks to all of you who were interested in this S&SMC#14, and most specially to the outstanding ones (Marcus von Cube, Eamonn, Gerson W. Barbosa, Mr. Hohmann) who actually cared to take the time to develop and post their very clever solutions, I really hope you enjoyed it and consider the afforded time well spent. These are my original solutions, with comments.

Conjecture 1: Well-done

This is a particular case of a plausible conjecture issued by **Euler** in 1769, which resisted every effort to prove or disprove it for almost *two centuries* until it was finally disproved in 1966 when the first counterexample was found by Lander and Parkin, using a then quite powerful CDC 6600 computer.

Now, we're asked to duplicate that feat, namely finding a non-trivial solution to $\mathbf{A^5+B^5+C^5+D^5=E^5}$ in non-zero integers, using our favorite handhelds. A straightforward, dumb brute-force search would require *excessive* running times (flattening several sets of batteries in the process), but a few refinements here and there will cut down the task by *several orders of magnitude*. However, these refinements need a significant amount of RAM to implement, which means only advanced models like the HP-41CX, HP42S, HP-71B, and HP48/49 can be profitably used.

Here's my original 7-line, 251-byte solution for the HP-71B

```
1 DESTROY ALL @ OPTION BASE 0 @ K=150 @ DIM P(K)
2 FOR I=0 TO K @ P(I)=I*I*I*I*I @ NEXT I @ R=.2 @ L=2^R @ M=3^R @ N=4^R
3 FOR E=K TO 1 STEP -1 @ T=P(E) @ DISP E
4 FOR D=E-1 TO E/N STEP -1 @ F=T-P(D) @ U=F^R
5 FOR C=INT(U) TO U/M STEP -1 @ G=F-P(C) @ V=G^R @ FOR B=INT(V) TO V/L STEP -1
6 IF NOT FP((G-P(B))^R) THEN A=(G-P(B))^R @ DISP A;B;C;D;E @ END
7 NEXT B @ NEXT C @ NEXT D @ NEXT E
```

upon running, it eventually outputs:

```
>RUN

    27  84  110  133  144
```

which is the sought-for *counterexample*, as indeed

$$\mathbf{27^5 + 84^5 + 110^5 + 133^5 = 61917364224 = 144^5}$$

The running time is a short 90 min. in an actual, physical HP-71B, and only 13 seconds under Emu71 in my IBM laptop. To achieve such short times the following techniques are used to speed the search, they key of which is to iteratively reduce the problem to a similar yet easier one:

- first of all, a table of 5^{th}-powers for integer arguments from 0 to 150 is *precomputed*, so that during the search the extremely frequent need of raising values to the 5^{th} power is reduced to indexing an array element, which is significantly *faster*.

- some other needed constants are precomputed as well, which saves additional time when they're used inside the search's nested loops, namely 1/5, $2^{1/5}$, $3^{1/5}$, $4^{1/5}$

- the outer loop traverses all possible values for E in *reverse order*, from the largest possible value to the smallest.

- for earch value of E, we must try to decompose E^5 as the sum of four 5^{th}-powers. Assuming D is the *largest* one, we must search for a decomposition of E^5-D^5 in *three* 5^{th}-powers where, as D is the largest element by definition, we only need to search for values of D in the limited range:

  $(E^5/4)^{1/5} <= D < (E^5)^{1/5}$ i.e. $E/4^{1/5} <= D < E$

  which we traverse in reverse order as well. For each value of D, we must now try to decompose E^5-D^5 as the sum of *three* 5^{th}-powers, so *we've reduced our problem to a similar but simpler one*, and the same argument is repeated till a single summand is left, which we simply check to ascertain whether it is a 5^{th}-power or not (i.e.: the fractional part of its fifth root equals 0). When this condition is met, we've found a counterexample so the program outputs it and stops.

Conjecture 2: Medium

We're asked for the smallest integer number from 6 to 2000 that can't be decomposed as the sum of a prime and a non-zero power.

A brute-force search would again require excessive running time, but *we can trade RAM for speed* once more. This is my original 9-line, 259-byte solution for the HP-71:

```
1 DESTROY ALL @ OPTION BASE 1 @ M=2000 @ D=LOG(M) @ N=INT(SQR(M))
2 INTEGER P(M),Q(310) @ FOR B=2 TO N
3 FOR E=2 TO INT(D/LOG(B)) @ P(B^E)=1 @ NEXT E @ NEXT B @ P(1)=1 @ Q(1)=2 @ I=2
4 FOR N=3 TO M-1 STEP 2 @ FOR D=3 TO INT(SQR(N)) STEP 2 @ IF MOD(N,D)=0 THEN 6
5 NEXT D @ Q(I)=N @ I=I+1
6 NEXT N @ T=I-1 @ FOR N=6 TO M
7 FOR D=1 TO T @ E=N-Q(D) @ IF E<=0 THEN DISP N @ END ELSE IF P(E) THEN 9
8 NEXT D @ DISP N @ END
9 NEXT N
```

upon running, it outputs:

```
>RUN

    1549
```

which is the *smallest counterexample*. The running time is a fast 30 min. in a physical HP-71B, and only 6 seconds under Emu71 in my IBM laptop, thanks to these simple yet efficient techniques:

- first of all, this challenge's actually far easier than it seems at first. Actually, for the search to proceed fast and smoothly, we need but two things: (1) to have all relevant prime numbers instantly at hand, and (2) to be able to test *extremely quickly* whether a given integer is a perfect power or not. This is achieved as follows:

- all primes up to 2000 are *precomputed and stored* in an array so that they can be retrieved very fast during the search

- in order to quickly check whether a given integer is a perfect power or not, we stablish a 2000-element *'flag'* array where each element has the value 1 or 0 depending on whether the index is a perfect power or not, i.e., P(7)=0, P(8)=1 (as $8=2^3$), etc. This could be achieved using much less RAM by packing eight such 'flags' per byte in a string, for instance, but here speed is our top priority so we simply define an integer array and let each individual element act as a 'flag'.

- with primes and very fast power-detection available, the main search just traverses all possible values from 6 to 2000, in ascending order. For each, every prime is subtracted in turn and the result is checked to see if it is a perfect power, skipping to the next value if it is. When no prime subtracted will result in a perfect power remaining, the corresponding value is output as a valid *counterexample*.

- by the way, the prime array is dimensioned to have 310 elements because there are some 300+ prime numbers in the range from 2 to 2000 (actually, 303). If you've got INTEGRATE capabilities in your HP model, you can very quickly compute an *approximate* value for the required number of elements as follows:

```
approx. #primes up to M = INT(INTEGRAL(2,M,1,1/LN(IVAR))
```

  so that the line:

```
2 INTEGER P(M),Q(310) @ ...
```

  becomes:

```
2 INTEGER P(M),Q(INTEGRAL(2,M,1,1/LN(IVAR))) @ ...
```

  and this allows you to expand the search to numbers greater than 2000 by simply changing the value assigned to M at line 1, without having to consult tables for the proper size of array Q. As the integration's *uncertainty* is specified as 1, (i.e: FIX 0 or SCI 0 for models that use the display setting instead), the integral is computed *very quickly*.

  Now, you'll agree with me that a line which dimensions an array with a size *defined by a non-elementary integral* isn't that frequent a sight.

Conjecture 3: Rare

This is a well-known conjecture *as yet unproved or disproved*, though everybody and his uncle feels that **196** is a true counterexample, as it has failed to produce a palindrome after hundreds and hundreds of millions of cycles. For instance, after 670,000,000 cycles you're dealing with numbers *280,000,000-digit long*(!!), yet no palindrome in sight ...

In order to implement this challenge, *multiprecision addition* is mandatory, which can be done with arrays or else with strings, which is the technique I've used in my original 8-line, 364-byte solution for the HP-71B:

```
1 DIM M$[500],N$[500] @ INPUT "#Cmax=";M @ FOR I=0 TO 200 @ N$=STR$(I) @ K=0
2 CALL MADD(N$,M$,K) @ IF M$=REV$(M$) THEN 4 ELSE IF K<M THEN N$=M$ @ GOTO 2
3 DISP I;"fails (";M$;" after";M;"cycles)"
4 NEXT I @ DISP "OK" @ END

5 SUB MADD(A$,C$,K) @ DIM B$[500] @ L=LEN(A$) @ E=10^11 @ C$="" @ C=0
6 B$=REV$(A$) @ FOR I=L TO 1 STEP -11 @ C=VAL(A$[I-10,I])+VAL(B$[I-10,I])+C
7 D$=STR$(MOD(C,E)) @ C$=RPT$("0",11-LEN(D$))&D$&C$ @ C=C DIV E @ NEXT I
8 C$=LTRIM$(STR$(C)&C$,"0") @ K=K+1 @ END SUB
```

The algorithm is completely straightforward and no special techniques are needed, though both for speed and to avoid obscuring the inner works with trivial utility routines, I've made use of several string-handling keywords (REV$, RPT$, LTRIM$) which are available in a number of very common LEX files and ROMs (STRNGLEX, REVLEX, RPTLEX, JPC ROM, etc). The program works as follows:

- the multiprecision results will be stored in strings (which in the case of the HP-71B would allow us to handle *up to 65000-digit numbers!*), initially dimensioned to hold up to 500-digit numbers, more than enough for up to 1000 cycles.

- to perform the multiprecision addition of a number and its mirror image, a call to the MADD subprogram is made. This subprogram takes the number as one of its string arguments pased by value, and returns the result of the addition as another string argument passed by reference. For instance:

```
>CALL MADD("78",M$,0) @ M$

  165

>>CALL MADD("8263485213753244473212",M$,0) @ M$

  10387229637326370316840
```

  because 78+87 = 165 and 8263485213753244473212+21237444235731258436 28 = 10387229637326370316840. Actually, the subprogram's code could be inserted directly in the main program proper, so we could get rid of the subprogram altogether and get a slightly faster, shorter program (7 lines instead of 8) but 'outsourcing' particular tasks to subprograms encourages modular programming and makes for clearer, cleaner code and provides additional functionality as well.

  After calling the subprogram, the main program just checks if the new result is *palindromic*, or if we've exhausted the number of cycles, and iterates as needed.

Upon running, it produces the following, for assorted maximum number of cycles (10, 20, 40, 100, 200, 1000):

```
>RUN

#Cmax=10

  89 fails (8872688 after 10 cycles)
  98 fails (8872688 after 10 cycles)
 167 fails (17050517 after 10 cycles)
 177 fails (17794887 after 10 cycles)
 187 fails (17735476 after 10 cycles)
 196 fails (18211171 after 10 cycles)

OK

>RUN

#Cmax=20

  89 fails (93445163438 after 20 cycles)
  98 fails (93445163438 after 20 cycles)
 187 fails (176881317877 after 20 cycles)
 196 fails (70446464506 after 20 cycles)

OK

>RUN

#Cmax=40
```

```
 196 fails (13305261530450734933 after 40 cycles)

OK

>RUN

#Cmax=100

 196 fails (44757771534490515617290699271561508443627774644 after 100 cycles)

OK

>RUN

#Cmax=200

            21032358265631979728035565670376460540 08 after 200 cycles)

OK

>RUN

#Cmax=1000

  196 fails (35346644392413689785837714402912114362859098083
             41408344020861450405992918328457190349563871687
             95800463971545914548326676428378028814710683108
             50549641273388365259932008237493462055424091251
             57901200166876923521977766210101074152201325440
             26439582289914006246477437313605494900387117318
             73088382467552483640965506947400858697069355944
             18174493380829951504425811945379423290791058264
             41012030342772858788740429334664452 after 1000 cycles)

OK
```

So it's clear that **196** is a very firm *candidate* for a counterexample. Of course, it's not the only one, other candidates include (up to N=2000): 295, 394, 493, 592, 689, 691, 788, 790, 879, 887, 978, 986, 1495, 1497, 1585, 1587, 1675, 1677, 1765, 1767, 1855, 1857, 1945, 1947, and 1997.

That's all. Thanks again and

Best regards from V.

Hello Valentin,

Unfortunatly, I had little time for your challenge, but the first part looked especially interesting for me, trying to reproduce a proof made on 1966 on a large computer with a small handheld of the '80s.

And your solution is so simple, as usual ...

Do you have a reference to the original paper from Lander and Parkin? I would like to know more on how they proceeded.

J-F

Hi, Jean-François:

Jean-François posted:

"Unfortunatly, I had little time for your challenge, but the first part looked especially interesting for me, trying to reproduce a proof made on 1966 on a large computer with a small handheld of the '80s."

> Yes, I missed your usual top-quality contributions to my challenges, it's a real pity you couldn't give it a try. And I agree on the fun factor of having a quite petite handheld doing essentially the same as an original mainframe computer which used to fill a whole room:
>
> The awesome CDC 6600 mainframe computer
>
> This CDC 6600 was designed by Seymour Cray himself, of Cray supercomputers fame, and had a 60-bit processor capable of 4.58 Mflops, impressive for its time indeed.

"And your solution is so simple, as usual ..."

> Thanks, J-F, but I insist, my challenges *are* simple, that's why I call them "Short & Sweet". They never require more than a few lines of code, and simple code at that.

"Do you have a reference to the original paper from Lander and Parkin? I would like to know more on how they proceeded."

> Reference, yes:
>
> *"Lander, L. J. and Parkin, T. R. "A Counterexample to Euler's Sum of Powers Conjecture." Math. Comput. 21, 101-103, 1967."*
>
> Unfortunately, the paper itself, no. It seems to be available only from non-free subscription services. As far as I know, their procedure was similar to mine, only more ambitious because they also attacked more general equations, involving powers up to the 6^{th}. It's quite possible for they to have made use of congruences (i.e. particular remainders when using specific divisors, etc) to discard ranges of tentative values for the inner loops.
>
> I did try a few congruences but the program got more complicated and worse, no speed was actually gained. In a CDC 6600 assembly-language program or compiled code, using just integer operations, congruences would be very effective. But for the floating point HP-71B environment, no gains are made in this case.
>
> Thanks for your interest, and please don't miss my next challenge, come next April 1st.

Thank you for an interesting challenge.
I was disappointed to see that no actual math trick could be used here, that was rather a programmer's challenge.
Please accept my apologies for posting a solution without code, I was just thrilled to 'know' the solution of one of the challenges.
Actually I tried Challenge 1 on my 1BBBB, and it ran about the same as solutions showed her, but with no optimizations and I felt it was too slow and ridiculous to be posted here.
To make for my inappropriate post, here is a small challenge for you : solve 28^x = 19^y + 87^z for x, y and z integers.
There IS some math trickery possible...
See you on the 1st of April.

41CV Battery Life

*Message #1 Posted by **Francois Fornier** on 7 Mar 2006, 8:16 a.m.*

Hello all,

I'm new to the forum, but have been following it for a few months and rejoined the fray quite recentky when I acquired a 41CV with Time Module, X-Functions Module & Quad Module (like many other, my dream machine of the 80s).

For a very short background, the first calc worth mentioning I ever played with, on which I did my first stints at programming, was a 67 borrowed from a friend. That was too expensive, so I moved to TI57 (lost), then 32C (NOK) and finally Sharp PC1500 (still working fine!).

I know the Quad module is useless with it, but in the absence of evidence that it is really incompatible, I've left it in the calc for fear of losing it.

I also added a NoVRAM module (an incredible package, thanks Diego).

Modules are arranges as follows: Slot 1: Time Slot 2: NoVRAM Slot 3: Quad Mem Slot 4: X-Funcs

The first time around, I found the battery life was a bit short, so I recorded the date I last changed it: jan 17 06

Today, when I switched it on the BAT indicator lit up. After 7 weeks!

So my question is: what's the typical battery life for a CV like mine (I thought it was something like a year rather than weeks)?

Any idea what could be the cause for such drain? Quad mem? Internal problem?

Thanks in advance for any suggestion that would help me get to the bottom of this.

cheers, François

in response to message #1 by Francois Fornier

Hi Francois,

First, I won't recommend you to keep the QUAD RAM plugged in... this will surely conficts with the resident RAM chips.

Under normal circumstances a NoVRAM/NoV-32 requires some 13-17mA while running (that means "just" while you're pressing keys or a program/function is running/performing) the rest of the time it "sleeps", draining some uAmps (mostly like if it was not present at all...)

Chances are that some ill code into NoVRAM's RAM memory iterupst the polling point for the HP-41 to tunrn off thus keeping itself in running mode while you still think your calc has been switched off...

Also, (I know it's my fault but I'm *REALLY* busy lately) the auto off feature was misimplemented inthe last NoVRAM code version, and it could lead to a similar situation, due to the fact that you're also using a TIMER module.

There ser several other reasos that can also produce such behavior and are not related to NoVRAM module:

Your TIMER mofule is *hungry* or it has some unwanted alarms/auto-run programmed that make the calc turns on unadvertedly.

To easily determine which module is involved (if any) I'd recommend you to unplug NoVRAM while not in use (you won't lose a bit by doing so)...

Hope this helps.

Diego.

*Message #3 Posted by **Francois Fornier** on 7 Mar 2006, 4:57 p.m.,*
in response to message #2 by Diego Diaz

Hi Diego,

thanks for the detailed explainations. You have at least convinced me to drop the Quad Mem in my drawer.

You may be right about the NoVRAM...

I removed it along with the Quad Mem and the BAT indicator went off! So I put it back in and it went on again.

I'll leave it like that for a while to see if there is a difference, but would really like to be able to keepp it in at all times. When do you think you can update your code?

Also, I have no alarms running in the Time module. I mostly use it as a watch/stopwatch.

Is there an easy way to measure the consumption of a given module?

best, François

> Also, I have no alarms running in the Time module. I mostly use it as a watch/stopwatch.

I don't know about the 41cv with plug-in time module, but I use the alarms regularly on my 41cx (as an alarm clock) and a set of batteries still lasts me a couple of years.

Re: 41CV Battery Life

*Message #5 Posted by **Diego Diaz** on 8 Mar 2006, 8:39 a.m.,*
in response to message #4 by Garth Wilson

Hi,

You're right regarding TIMER, Garth. It "shouldn't" make any difference in a regular use...

The trouble could arise if some unwanted auto-run alarm sets the calc into ON state repeatedly (if such can occur... I've never done or even try)... mostly besause the NoVRAM will draw current during the whole wake-up cycle.

In any case, this is a fairly unprobable situation, the more likely is that some garbage reached the polling area of the NoVRAM's RAM preventing it from going into sleep mode as it should. If this is the case, clearing the RAM is highly advisable.

If my work (yes, the one I do for a living... ;-) allows me, some more spare time in the next few weeks I will port the "Auto-OFF" bug solution code from NoV-32... not a heavy task but time requiring...

On the best case, any NoVRAM/NoV-32 will reduce your average battery life by a factor of 2 (light use) to 5 (heavy use), it should still last some months though.

Regards.

Diego.

Re: 41CV Battery Life

*Message #6 Posted by **Francois Fornier** on 8 Mar 2006, 6:52 p.m.,*
in response to message #5 by Diego Diaz

OK, so my best bet now, assuming garbage in NoVRAM RAM is the culprit, is to clear it. But how do I go about it? Simply reprogram it with the utility?

best, François

Re: 41CV Battery Life

*Message #7 Posted by **Etienne Victoria** on 9 Mar 2006, 1:46 a.m.,*
in response to message #6 by Francois Fornier

François,

Pour effacer la section RAM de ton NoVRAM, tu dois y graver le fichier NovClear.HEX contenu dans le NovRam documentation zip du site de Diego.

Ceci remettra la RAM à 0 sans toucher à la configuration ROM que tu aurais gravée par ailleurs.

Cordialement.

Etienne

To clear the NovRam RAM, you have to use the NovClear.Hex file contained in Diego's NovRam documentation zip package.

Burning this file on your chip will zero the RAM, preserving your ROM configuration.

Best regards.

Etienne

Re: 41CV Battery Life

*Message #8 Posted by **Diego Diaz** on 9 Mar 2006, 4:45 a.m.,*
in response to message #6 by Francois Fornier

Hi all,

Although this method effectively erases RAM contents, it also kills Flash ROM requiring two reprogramming phases (one for the ClearRAM, and another one to recover original -HEPAX- emulation) and thus it is somewhat cumbersome... It is necessary in case of "severe" RAM illness though, and that's why it is included.

As far as you've depicted your calculator's behavior, it seem that you still have full functionality, so try this HEPAX based procedure to clean your the RAM memory.

- Write "OK" into Alpha register.

- Assign "CLRAM" to a key of your choice, and set USER mode (just for your convenience)

- place 11 into "X" register. (this points to page #B)

- execute "CLRAM"

- repeat for "X" = 10, 9 and 8... and you're done...

Power cycle your calc for HEPAX to rebuild its FILESYS.

Hope this helps.

Regards from the Canaries

Diego.

*Message #9 Posted by **Francois Fornier** on 9 Mar 2006, 8:45 a.m.,*
in response to message #8 by Diego Diaz

Thanks Diego,

will try this tonight. And check that BAT indicator stays off this time...

Thanks also for _not_ RTFMing me on this, even though I now feel I deserved it... ;-)

And lastly thanks to Etienne for chipping in with the NovClear procedure.

Enough thanks for today!

best, Francois

*Message #10 Posted by **Francois Fornier** on 9 Mar 2006, 6:29 p.m.,*
in response to message #9 by Francois Fornier

Bad news...

Nothing changed. I have tried all methods, and the result is the same... BAT indicator stays on.

I also tried a Clonix6P config with the same result.

Any ideas?

Re: 41CV Battery Life

*Message #11 Posted by **Diego Diaz** on 10 Mar 2006, 3:46 p.m.,*
in response to message #10 by Francois Fornier

Hi,

The BAT indicator will lit up if you're using the same set of batteries... even with ClonixLP.

That's because your battery are in the very low end of its useful life, so a tiny 5mA *extra* current at power up (with Clonix plugged in) makes the voltage drop below the BAT threshold.

It should be ok if you place a new set...

Best regards.

Diego

Re: 41CV Battery Life

*Message #12 Posted by **Francois Fornier** on 10 Mar 2006, 5:17 p.m.,*
in response to message #11 by Diego Diaz

Hi Diego,

yes, I understand that now, it's just that when it went off after removing the NoVRAM, I thought I could use it as an indicator of the problem...

So, what I'd need to find out is a way to verify that the power drain remains acceptable with the configuration I want to use. Because the problem may well be with the calc itself, but the only way to know right now is to get fresh batteries and leave your module out...

François

Ooops sorry!...and another little question

*Message #13 Posted by **Etienne Victoria** on 9 Mar 2006, 12:40 p.m.,*
in response to message #8 by Diego Diaz

Oooops.....sorry!

And thanks Diego for stating the correct procedure.

May I ask a small question ?

I have both a Clonix (programmed with the low-power code) and a NovRam and use them fine in a normal 41.

However, I wish I could the Clonix in :

- a 41 CV that I've sped up myself - or a Blanknut Cx which seems to be factory sped-up. (I'm the 2nd owner and the first one sweared he never opened it).

Diego would you advise me to speed down the CV or is there any other way ?

I do need the Clonix to program a 44468 ROM to control instruments.

Thank you very much for these jewels!

Etienne

Re: Ooops sorry!...and another little question

*Message #14 Posted by **Diego Diaz** on 10 Mar 2006, 3:59 p.m.,*
in response to message #13 by Etienne Victoria

Hi Etienne,

Speed down an HP-41 is indeed as easy as speed it up... these are the good news.

The bad news are that neither NoVRAM code nor ClonixLP can be used in a sepeeded up 41...

In order to get your CV back to nominal speed (360Khz) just replace the cap between pins 9 & 10 of the the nut processor with a 150pF one... Cahnces are that the speede up procedure was simply placing a second cap in series qith said capacitor, so you'll only need to remove the "alien" capacitor.

Mail me if you have find it difficult to locate such capacitor.

Best wishes.

Diego.

Speed down...

*Message #15 Posted by **Etienne Victoria** on 10 Mar 2006, 6:46 p.m.,*
in response to message #14 by Diego Diaz

Hi Diego,

Thank you for your answer!!

As I did the speed up myself on the CV, I'll speed it down easily! I'll also solder completely the board as I did with my 41Cs.

As for the Blanknut Cx, I'll open it, follow your advice and report back.

If this works, I think I'll solder the Clonix directly in the Blanknut.

Thanks again and friendly regards from France!

Etienne

Re: Speed down...

*Message #16 Posted by **Diego Diaz** on 10 Mar 2006, 11:19 p.m.,*
in response to message #15 by Etienne Victoria

Hi Etienne,

It's ok if you want to permanenetly attach the Clonix module into your 41 shell, just remember you more likely be unable to reprogram it afterwards!

In any case please let me know of your pregress... some pics will be very welcomed too... ;-)

Regards.

Diego.

Re: Speed down...

*Message #17 Posted by **Etienne Victoria** on 11 Mar 2006, 3:18 a.m.,*
in response to message #16 by Diego Diaz

Diego,

Many thanks for everything!

In my config (all fullnuts):

1) The NoVRAM acts as a backup module with the HEPAX filesystem + 2 ROMS and I move it from calc to calc all the time.

2) The Clonix is already *in* an old battered 41 which is a) my Hp-3468 front-end: taking, recording and printing measures with the 44468 ROM.

b) the heart of my IL system with 44468 Data Acq., Ext-IO (Thanks Hans for HpILCOM), Sandbox (Thanks Ángel! If only we could have a fullnut version!!), CCD-OSX (Thanks Raymond!),

As soon as I have the CV or Cx working, I'll gladly report here with pictures!

Friendly regards from France!

Etienne

12c TVM

*Message #1 Posted by **lary** on 7 Mar 2006, 2:06 a.m.*

Try this example taken from Hp Journal (oct. 77) :

n=111.1111111 i=2.222222222 PV=333.3333333 PMT=4.444444444

and solve for FV

Results

HP92 : -5931.82294 (source HP Journal)

HP37E : -5931.82294

HP38E/C : -5931.82294

HP12C : -5926.306294 ???

HP10B : -5931.82294

HP17BII : -5931.82294

HP10B : -5931.82294

HP48G : -5931.82294

All but the 12C give the correct mathematical result (-5931.82294) but only the 12C gives the correct financial result(-5926.306294). In case of noninteger n, the 12c use the fractional part as a odd first period (cf hp 12c user's manual pp.50-51). With others calculators you'll have to do it yourselve (cf hp17BII owner's manual p.160).

Does anyone knows why the 12c is the only calculating with odd period ?

Re: 12c TVM

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 7 Mar 2006, 9:20 p.m.,*
in response to message #1 by lary

Hi, Lary;

in fact, you can even control how the HP12C TVM features deal with the odd 'n' (with fractional portion

different of zero).

If you press [STO][EEX] you will toggle the small $_C$ annunciator status. If the $_C$ is visible, then the fractional portion of 'n' is considered as part of the compound interest calculation. Otherwise, if the $_C$ is not visible, the fractional portion of 'n' is used seaparately, and the equivalent amount of interest due to it is computed as single interest and added to the final interest amount. In fact, as we are dealing with compound interest and a fractional period of time, the final amount of compound interest is smaller than the amount of single interest.

I am not sure if the other calculators have this sort of control.

I hope this post's contents are related to what you are asking about.

Cheers.

Luiz (Brazil)

*Message #3 Posted by **Karl Schneider** on 10 Mar 2006, 2:36 a.m.,*
in response to message #1 by lary

"Lary" --

The odd-period handling looks like a practical, real-world enhancement, designed to handle, in one step, the interest-accruing partial period after which a loan is initiated to the start date of the first regular period. The two examples of loans on pp. 59-61 (as well as my own new-car loan in the 1980's) were set up like this.

The example from the 1977 HP Journal article (JOURNALS\77OCTAC.PDF from CD #6 of the MoHPC CD-ROM set) was for the desktop HP-92, which did not have this partial-period feature. It may have been an enhancement for the HP-12C.

And why didn't the Pioneer-series financial calc's (HP-10B, HP-14B, HP-17B/17BII) retain this feature? Maybe a desire for consistency of algorithm and results between the models. Only the 17B/17BII had the built-in calendar functions (present in the HP-12C and HP-92) for calculating the number-of-days length of the partial period. Without the "delta-days" function, handling the partial period is more of a manual exercise, anyway.

PS: The "C" annunciator that Luiz talked about for this problem represents some cleverness in the Voyager platform, which included five models sharing the same display unit. C stands for "compunding" on the financial HP-12C; "complex mode" on the scientific HP-15C; and "carry bit" on the computer-science HP-16C.

*Message #5 Posted by **tony(nz)** on 10 Mar 2006, 6:50 a.m.,*
in response to message #1 by lary

I think you could get FV= -5931.822944 on the 12C by using a PV and FV adjustment of 200=4.44.../.0222... (perpetuity equivalent). First use PMT=0,PV=333.33...+200=533.33... then solve for FV and add the 200 again. n=111.11... and i=2.22... and have the "c" showing. I know you didn't want to know this<G>

Cheers, Tony

Gummy Wheel Fix

*Message #1 Posted by **Peter Hendy** on 6 Mar 2006, 11:28 p.m.*

I have downloaded details of how to replace the drive wheel on an old HP67 but no details on the correct O Rings to use. Size must be critical. Can anyone help with the O Ring specification or type ?

Re: Gummy Wheel Fix

*Message #2 Posted by **Jan** on 7 Mar 2006, 8:05 a.m.,*
in response to message #1 by Peter Hendy

You can also use a piece of a rubber fuel- or oil-tube. I repaired my 41 card-reader with a piece of a rubber tube used (I guess for brake fluid or fuel) in a small motorcycle. When you have opened the card reader you can usually estimate what the outer diameter must be by inspecting the remains of the old rubber wheel or the distance from the wheel-axis centre to the card. Exact fits with an accuracy of 1/10 of a milimeter are not really necessary as long as the rubber gets in touch with the card: after all it is flexible and will give way to the card even when it is (slightly!) too large in diameter.

Gummy Wheel Fix

*Message #3 Posted by **Peter Hendy** on 7 Mar 2006, 8:24 p.m.,*
in response to message #2 by Jan

Thanks to all for the prompt answers and suggestions. Suppose I should open the thing up and have a look before I go any further or ask anymore questions....Thank You.

Re: Gummy Wheel Fix

*Message #4 Posted by **Jan** on 7 Mar 2006, 8:14 a.m.,*
in response to message #1 by Peter Hendy

The inner diameter is crucial. You can check it by measuring or estimating the diameter of the axis. The wheel should fit tightly enough to the axis so that there is no slipping during operation. The outer diameter can be estimated from the remains of the old rubber wheel or by estimating the distance between the centre of the wheel axis and the card surface. The outer diameter is allowed to be a little too large since the rubber is flexible enough to give way and be pushed aside, but one should not overdo this of course.

Re: Gummy Wheel Fix

*Message #5 Posted by **David Smith** on 7 Mar 2006, 10:23 a.m.,*
in response to message #1 by Peter Hendy

If you MUST use o-rings you need size 005. These are 1/64" smaller than what almost every place stocks (size 006). Silicone ruber fuel line works much better. One problem can be finding it that has the inner and outer diameters well centered.

> I am having SERIOUS problems running some libraries I got from hpcalc.org (e.g. ChemDat49). I'm a TOTAL rookie, and I don't seem to get a clear set of steps to follow.

I'm not familiar with that particular library, but for some general information, see: http://www.hpcalc.org/install.php and http://www.hpcalc.org/hp49/docs/faq/.

Note that libraries developed for the 49G may run on the 49g+, but that's not guaranteed.

> Quote:
>
> Please, if someone can clear out some of my existential intrigues:

> # What is the difference between saving a library in : 0: IRAM 1: ERAM 2: FLASH

0:IRAM is volatile static RAM shared with "System RAM", that is, your HOME directory and it's subdirectories, a "temporary object" area, the user stack, and so on. When you store something in port 0, it decreases the free memory available for other uses. Note that port 0 is cleared by a memory clear operation. 1:ERAM is also static RAM, but it's not shared with "system RAM", and is not cleared by a memory clear operation. If I'm not mistaken, objects in ports other than 0 have to be copied to the temporary object area in system RAM when you want to run them, so using a library from port 0 should be faster. A few libraries and SysRPL programs may have to be run from port 0 only. Both port 0 and port 1 objects will eventually be lost or corrupted if the calculator is left without batteries. 2:FLASH is non-volatile flash memory, so it's probably a "safer" place to store things, but it's also slower than static RAM. On the 49g+, you can use an SD Card (or MultiMediaCard), in which case you'll also have a 3:SD branch in the filer. These cards are also flash memory. The 49g+ stores objects on the card as binary-transferred files, just like binary-transferred files stored on a PC. Libraries may be stored on a card, but port 3 libraries can't be ATTACHed.

> Quote:
>
> # How do I 1. Install and 2. Run the libraries?

1: First, read any documentation that accompanies the library. Unless it's stated otherwise, move the library to port 0, 1, or 2, and then invoke a warmstart by pressing and releasing the C key while holding down the ON key. Most libraries are auto-attaching, so the warmstart will run their configuration programs and ATTACH them. For some libraries, you may have to run the ATTACH command to attach them to the current directory.

2: Press RightShift LIB (over the 3 key) to see the libraries in the menus. Press the menu key for your library, after which you'll see the library's commands in the menus.

> Quote:
>
> I have no problems in copying files to the HP, but I can't get them to work! :S # I want to purge a library I saved in 0: IRAM, but a message appears: "Library in use". How can I solve that?

Try the DETACH command.

> Quote:
>
> Besides, I can see no visual evidence of that library running.

Well, "installing" a library doesn't usually "run" it, it just makes the library's commands available.

> Quote:
>
> Please be considerate with your answers... I'm just new at this.

Understood, but it's difficult to know which information a "newbie" will find useful.

> Quote:
>
> If you prefer you can answer to my email, not to jam this forum with many posts.
> patto17@hotmail.com Thanks a lot! Patricio

I hope that others in this forum may find responses useful, so I'm answering here. Note that the usenet group comp.sys.hp48 may be more helpful for questions on the RPL models; see http://groups.google.com/group/comp.sys.hp48? if you're not familiar with it.

Regards,
James

HP71 memory module question

*Message #1 Posted by **Christoph Giesselink** on 6 Mar 2006, 3:55 p.m.*

I know that the integrated soft configurated RAM of a 1LP2 Centipede chip has 2K nibbles (#800). Configure this RAM not on a size boundary (#800) is failing (for example try to config at #4FC00 instead of #4F800). Fail mean, the module will be configured on the next lower address matching with the size boundary, in the case of our example #4F800.

The HP28C has the possibilty to add additional RAM (RAM module chips from the HP71B) at #50000 (soft configured). I also expected that the configure address must also be boundary of it's size. So HP71B chips with 4KB and 32KB will work, because #50000 is a size boundary of 4KB and 32KB. But not a 64KB chip. But I found an old article about upgrading the HP28C to 64KB.

IMHO this will only work when

- the HP71B RAM module hasn't the boundary limitation (Saturn bus)

or

- a HP71B 64KB RAM module is build internally by 4KB or 32KB modules linked together

Any ideas?

TNX

Christoph

Re: HP71 memory module question

*Message #2 Posted by **Eric Smith** on 6 Mar 2006, 4:22 p.m.,*
in response to message #1 by Christoph Giesselink

The front-port 64K RAM modules for the 71B are configured as though they are two 32KB (64Knibble) chips, so the size of each chip is #10000 hex. They should work OK on the 28C since one will be configured at #50000 and the other at #60000.

The card-reader-port modules work similarly; the 32KB, 64KB, 96KB, and 128KB modules look to the 71B as one, two, three, or four 32KB chips, respectively.

I vaguely recall seeing a writeup somewhere stating that this was done due to the 71B firmware being able to handle ROMs of 64KB, but RAMs only up to 32KB. Or something like that.

Re: HP71 memory module question

*Message #3 Posted by **J-F Garnier** on 7 Mar 2006, 7:07 a.m.,*
in response to message #2 by Eric Smith

Hi Eric,

Do the 64Kb to 128kb (or even the 160kb) modules have one interface IC per 32k RAM, or only one that manages all the RAM chips?

J-F

Re: HP71 memory module question

*Message #4 Posted by **Eric Smith** on 7 Mar 2006, 4:36 p.m.,*
in response to message #3 by J-F Garnier

In the card-reader-port RAM modules, they use one interface chip per 32KB of RAM. I'm not sure about the front-port 64KB module, as I only have one and am not inclined to disassemble it.

Re: HP71 memory module question

*Message #5 Posted by **Christoph Giesselink** on 7 Mar 2006, 12:49 p.m.,*
in response to message #2 by Eric Smith

Many TNX for the information.

Background: I recently had another look at the French "VOYAGE AU CENTRE DE LA HP48c/s". I don't understand any French word ;(, but there nice pictures inside. :) On page 16 there's a picture about memory configuration, explicitly naming a 6KB and a 34KB HP28C version.

I know a lot more about this machine now then on my first "reading". So my interest on the "obscure" 6KB model was waked up. After some tries I found the subroutine at #00F11 (ROM 1CC) allocating the additional memory. With Eric's information that every module has max. 32KB everthing works fine. The HP28C firmware request memory with C=ID until it get C=0. So an upgraded HP28C with 66KB has two additional seperated 32KB modules inside with no conflict with the size boundaries.

For a real emulation inside Emu28 I have to spend a dataset for every additional memory module with it's state and base address. Currently I only emulate/simulate one memory module with a maximum size of 128KB (max size specified in the HP71 HDS) with the extention that this module can be placed on every 32KB boundary. This is only a simulation because a real HP28C with 66KB has two 32KB modules which can be unconfigured seperately.

At the moment I'm a little bit undecided. In general I try to simulate the calculator hardware as close as possible (here the necessary for four datasets to hold the information of four RAM modules (4*32=128)) on the other side the current implementation with one big module is much simpler and has the same effect, getting the requested RAM available for the OS. But everybody with my actual knowledge level know, that this is impossible with the real hardware! On on side I claim to publish an emulator (I don't want to worm up the discussion about emulator and simulator definition here), on the other side the easier implementation is just a functional simulation of the extented RAM > 32KB.

Especially Eric and JFG as developers of similar software, what's your opinion about the topic above?

Regards

Christoph

Re: HP71 memory module question

*Message #6 Posted by **J-F Garnier** on 7 Mar 2006, 4:03 p.m.,*

in response to message #5 by Christoph Giesselink

Hi Christoph and Eric,

On my Emu71, I definitively took the easiest way: implement the memory with big 32k or 64k chips, without trying the reproduce the low-level details. For instance, Emu71 uses a single 32kb "chip" for the main memory, instead of the 4x4kb modules- each 4kb module being in turn made of 4x1kb 1LG8 chips - of the real hardware.

In the same way, keyboard and display are not simulated at low level in Emu71, but only at intermediate level (memory buffers). On the other hand, I think that it's very important to simulate the I/O environment, namely the HPIL devices, which are integral parts of the system.

This is my way of thinking calculator emulator/simulator: the exact internals don't matter, as long as no realistic user program (i.e. program that a user can key in, this includes I/O access and of course machine code) can make the difference, so any previous written software can be run on the emulator/simulator.

My Emu41/Emu71 don't even try to reproduce the look of the HP41/HP71, but they run most known software or modules (not all, for instance service modules only partially run - but they are not what I consider as realistic program).

Kind regards to both.

J-F

Re: HP71 memory module question

*Message #7 Posted by **Eric Smith** on 7 Mar 2006, 4:39 p.m.,*
in response to message #5 by Christoph Giesselink

I think either approach is reasonable. If you make it less like the real hardware (for the sake of efficiency or simplicity), it might be worthwhile to describe the differences in the documentation.

*Message #8 Posted by **Mike (Stgt)** on 8 Mar 2006, 9:22 a.m.,*
in response to message #5 by Christoph Giesselink

Hi Christoph!

Just ask if there could exist a user or a program that is able to detect that this is "only" an emulation (or a fake) and not the real HW. Then - I assume your statement "what runs on my emulators will do so on real HW too" still holds true - how many routines that work on real HW will fail on your EMUs??? IMHO an emulation does the same as one distinct layer of a real thing, the question is which stratum at what cost and for what gain. And I regard a robust firmware-interpreter as a good emulator.

Ciao.....Mike

Re: HP71 memory module question

*Message #9 Posted by **Christoph Giesselink** on 8 Mar 2006, 4:26 p.m.,*
in response to message #8 by Mike (Stgt)

The phrase "functional simulation" describe not everything. When you only look onto the memory with it's address area and size the program will not see any difference. It exactly behave like on the real machine. The main difference is on configuration and unconfiguration of memory modules > 32KB or multiple 4K modules. The HP28C OS see no difference with it's implementation, so it's working. But there's a difference when the user program try to unconfigure only one memory module, which doesn't work like expected.

We can of course say, nobody (also the HP28C OS) will unconfigure the extended memory modules, there's just no need for it. Furthermore I don't know anybody who's programming the HP28C in assembly, the 30 or 40 ROM entry-points I published for the 28C 1CC ROM aren't for sure not enough for serious assembler programming. Finally, hi HP calculator enthusiasts, is there somebody out there, having a memory upgraded HP28C?

The memory extension implementation in Emu28 is something like when you ask a hill climber why he's climbing onto top of a hill: "Because it's there!"

But to end the discussion, I yesterday changed implementation by adding two memory controllers which behave hopefully exactly like in the original calculator. On the next version of Emu28 creating a new document will support 4, 32 and 64KB additional RAM. These are exactly the combinations which have been sold end of 80-ties. The combinations of 4+4=8KB or 32+4=36KB are possible by the hardware emulation (with a modified state file) but not enabled in the frontend.

Regards

Christoph

Re: HP71 memory module question

*Message #10 Posted by **Mike (Stgt)** on 9 Mar 2006, 6:11 a.m.,*
in response to message #9 by Christoph Giesselink

Your approach "as close as possible to the real HW" results in 'high-quality'-emulators, just an other HW-platform for existing OS' and possibly future enhancements. In contrast, my NutEm is **only** a firmware interpreter and **does not** emulate the errors of the Nut chip. I do not know if other HP41-emulators do so.

Ciao.....Mike

no fraction mark in the output of an hp49G+

*Message #1 Posted by **Benny Vanrutten** on 6 Mar 2006, 11:01 a.m.*

On the hp49G+ I like to convert a binary to real:

11111000b B->R then I got 248, I like to have there 248 without ",". I allready changed flag 105, set the mode to std and tried many other flags. Who can help?

Thanks a lot.

Benny

Re: no fraction mark in the output of an hp49G+

*Message #2 Posted by **Tim Wessman** on 6 Mar 2006, 11:13 a.m.,*
in response to message #1 by Benny Vanrutten

Do you want "256." or "256," or "256" ?

If you want "256.", clear flag 51. Set flag 51 for "256,". If you want "256" then that is an integer not a real. Run R->I to get a zint.

TW

Re: no fraction mark in the output of an hp49G+

*Message #3 Posted by **benny vanrutten** on 6 Mar 2006, 12:11 p.m.,*
in response to message #2 by Tim Wessman

Thanks Tim,

I need 248

The R->I does the job. The funniest thing is that I loaded the same flags (with RCLF and STOF) from my HP4GX into my HP49G+ and I do not have the problem on that(hp48GX) machine.

Kind regards, Benny

Re: no fraction mark in the output of an hp49G+

*Message #4 Posted by **Thomas Okken** on 6 Mar 2006, 12:29 p.m.,*
in response to message #3 by benny vanrutten

The HP-48 does not distinguish between "real" and "integer" -- I assume the convention of showing reals like "248," even when their fractional part is zero, is something that was added in the 49.

- Thomas

Re: no fraction mark in the output of an hp49G+

*Message #5 Posted by **benny vanrutten** on 6 Mar 2006, 2:26 p.m.,*
in response to message #4 by Thomas Okken

Hi Thomas,

The HP48GX gives the answer I need, but giving the same command to the HP49G+ responds in the value followed by the unwanted fraction mark. The HP48G advanced users guide however describes the B->R command as Binary to REAL, the result is affected by the mode FIX or STD.

Kind regards,

Benny

Re: no fraction mark in the output of an hp49G+

*Message #6 Posted by **Crawl** on 6 Mar 2006, 4:07 p.m.,*
in response to message #5 by benny vanrutten

The difference between 248 and 248. is important on the 49G+.

248 is the exact number, "Two hundred Forty Eight".

248. is the decimal approximation.

While the mode (exact vs. approximate) is important, the difference can be illustrated by

1 divided by 3 = 1/3, the exact fraction.

1. divided by 3 = 0.3333333333, the decimal approximation.

Re: no fraction mark in the output of an hp49G+

*Message #7 Posted by **James M. Prange (Michigan)** on 6 Mar 2006, 6:19 p.m.,*
in response to message #3 by benny vanrutten

The 48 series has system flags -1 through -64 and user flags 1 through 64. The 49 series has system flags -1 through -128 and user flags 1 through 128.

"Exact" versus "approximate" modes are controlled by system flag -105; within a program, clear it for exact mode, or set it for appoximate mode. For interactive use, hold down the RightShift key while pressing the ENTER key to toggle between exact and approximate modes.

Regards,
James

Re: no fraction mark in the output of an hp49G+

*Message #8 Posted by **James M. Prange (Michigan)** on 6 Mar 2006, 6:33 p.m.,*
in response to message #3 by benny vanrutten

The 49 series lacks built-in B->I and I->B UserRPL commands, so converting between these object types are 2-step processes. You could write your own programs:

```
B->I
<< B->R R->I >>

I->B
<< I->R R->B >>
```

Calculus vs calculation

*Message #1 Posted by **Antonio Maschio** on 6 Mar 2006, 5:43 a.m.*

Hi, sorry if this not the right place to post such question, but I'm Italian, and I want to know from English-speaking people:

What's the difference between calculus and calculation? What's the right plural for both?

I ask this because two dictionaries I consulted give different definitions and different plurals!

"Ask the source, so."

Thanks in advance.

Antonio Maschio

Re: Calculus vs calculation

*Message #2 Posted by **Marcus von Cube, Germany** on 6 Mar 2006, 7:24 a.m.,*
in response to message #1 by Antonio Maschio

Hi Antonio,

I'm not a native speaker either but let me explain what I believe is correct.

Calculation

[pl. calculations]

A calculation deals with numbers, they are summed, multiplied, etc. A calculator is a tool to do such operations. In business terms, a calculation is done in advance to know if a businiss will be profitable, or afterwards, to check if it was. The TVM formulas built into the business calculators are typical applications for calculations.

Calculus

[no plural]

Calculus and Algebra are two main areas of math. Both deal with formulas more than with numbers. Calculus deals with the properties of functions, their derivatives and integrals. A central term is the limit of some term where one of the parameters goes towards infinity or zero. Two simple examples follow.

$$\lim_{x \to \infty} \frac{1}{x} \qquad (A)$$

$$2$$

```
      x
lim  ---
x->0  x        (B)
```

(A) The more you increase x, the smaller the quotient 1/x will be. But how big the value for x may be, the result of 1/x is never zero. Calculus now deals with the case that x is actually bigger than any number and defines the limit to be zero.

(B) If you divide x^2 by x the result is always x, isn't it? The answer is no, because x can be any real value, including zero. The problem: $0^2/0$ cannot be computed that way! The term is undefined for x=0 but calculus can still deal with it. As long as x is not equal to zero, x^2/ x can be simplified to just the term x. Now make x as small as you like. The limit is zero.

Marcus

Re: Calculus vs calculation

*Message #4 Posted by **Ed Look** on 6 Mar 2006, 10:22 a.m.,*
in response to message #2 by Marcus von Cube, Germany

These two definitions are totally correct. However, there are two further definitions for "calculus". It also can be loosely used to mean "calculation", and most often, if used, in the sense of a plan, or scheme, or plot: "all the events that came about fitted well with his devious calculus on this operation"... come to think of it, "calculation" sometimes also has this meaning!

But it ultimately derives from its original Latin meaning of a stone or rock, which was used in ancient times to help one in... calculating! I believe some medical people might sometimes still refer to a hard mass as a calculus.

Re: Calculus vs calculation

*Message #5 Posted by **Antonio Maschio** on 6 Mar 2006, 11:09 a.m.,*
in response to message #4 by Ed Look

Right, calculus has this meaning too (hard mass in the medical sense) even in Italian.

But do you think I can use both term equivalently, in the sense of "series of operation with numbers of variables, formulas or whatever"?

-- Antonio

Re: Calculus vs calculation

*Message #6 Posted by **bill platt** on 6 Mar 2006, 11:20 a.m.,*
in response to message #5 by Antonio Maschio

No, they are not equivalent. It depends on what you are trying to say. There are connotative layers of meaning as well as what is in the dictionary.

And don't forget the word "compute" as opposed to "calculate." These words are close and often interchangeable; yet one might be better suited than the other in certain circumstances.

Re: Calculus vs calculation

*Message #7 Posted by **Ed Look** on 6 Mar 2006, 1:57 p.m.,*
in response to message #6 by bill platt

Yeah, no one ever got complimented or reprimanded over dirty or illegal computations, but for their "cold calculation" or "shifty calculus" (although that could mean keying in an integral or differential equation on your HP calculator)!

Re: Calculus vs calculation

*Message #8 Posted by **Walter B** on 6 Mar 2006, 4:37 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Don't be a native English speaker either, but IMO "calculus" corresponds to "Analysis" in German, at least to the part dealing with differentiation and integration. There is also an English word "analysis". It seems "calculus" is a part of mathematical "analysis" in English, too.

Re: Calculus vs calculation

*Message #9 Posted by **bill platt** on 6 Mar 2006, 5:11 p.m.,*
in response to message #8 by Walter B

for an american child, his or her first exposure to that word, "Calculus" is likely to be some time in middle school when he learns that after he learns Algebra and geometry, he will then have to take a course in analytical geometry (sometimes called trigonometry), and then "calculus." Most students regard this transition with trepidation. Introductions to calculus have been made to him in physics or analytical geometry: the concepts of asymtote and infinity was strange enough, but now he will have to understand the concepts of "infinetesimal" and "limit". And so "calculus" has a certain connotation in american language of transcendance, (and not merely of the transcendentals either ;-)and higher learning. It certainly has analysis as a part of it, but it is by no means a synonym. Sometimes the word "calculus" is used in literary contexts to get at the idea of a reasoned and difficult or rather non-apparetn thought process.

"Calculation" on the other hand is a word that one is exposed to vbery early, as in "something that a calculator does." It has a connotation of "mechanical" or uniform, straightforward, work with numbers, yet even "calculation" has an air of the intellectual or brainy about it, in some circumstances.

Here are some sentences that this native speadker of american english has produced on the fly:

[pre]"When the onboard computer failed, astronaut J.S. Bach calculated his trajectory by hand."

Note that it would have worked essentially the same had I said:

[pre]"When the onboard computer failed, astronaut J.S. Bach computed his trajectory by hand."

Edited: 6 Mar 2006, 5:13 p.m.

Re: Calculus vs calculation

*Message #10 Posted by **Ben Salinas** on 7 Mar 2006, 3:23 p.m.,*
in response to message #8 by Walter B

Yes, analysis is another branch of mathematics. Basically, (as far as I understand it), analysis is the math of formally proving calculus. So rather than taking integrals, you prove limits, and directly apply definitions of calculus to yield theoretical results. Analysis is mainly theory, while calculus is plugging and chugging, so to speak.

Re: Calculus vs calculation

*Message #11 Posted by **bill platt** on 7 Mar 2006, 4:44 p.m.,*
in response to message #10 by Ben Salinas

Hi Ben! I hear you are in beantown! Hope you like it there...we are not so far from there.

Have you figured out all the nuances of the veritable 15c yet?

Bill

Re: Calculus vs calculation

*Message #12 Posted by **Karl Schneider** on 6 Mar 2006, 10:03 p.m.,*
in response to message #1 by Antonio Maschio

Antonio --

There have been some good responses to your question, but I'll "chime in", anyhow...

Calculation is the process of performing mathematical computations using known quantities. It is what calculators do.

The *Calculus* are special analytical methods of symbolic mathematics, developed primarily by Newton and Leibniz, to determine the solutions to many kinds of computational problems. These methods involve use of infinitesimal quantities known as *differentials*.

Represented graphically, these problems include the slope at any point of a curved line (differential calculus), and the area over some interval between a straight axis and a curved line (integral calculus).

Of course, these two problems are inter-related by the Fundamental Theorem of Calculus.

Limit analysis is an area of symbolic mathematics that utilizes algebra and techniques of calculus (e.g., L'Hopital's Rule).

Wikipedia has some informative entries in English, Italian, and other languages, as well.

Re: Calculus vs calculation

*Message #13 Posted by **Marcus von Cube, Germany** on 7 Mar 2006, 7:06 a.m.,*
in response to message #12 by Karl Schneider

Karl,

the reason why I used the limit calculation as a calculus example is my own experience at school. In the physics class we were dealing with speed and acceleration before the topic of differentials had been discussed in the math class. So the physics teacher chimed in and explained what it means to compute the speed of a moving object in a moment of time by letting the time interval become infinitely small.

Marcus

in response to message #15 by Antonio Maschio

Hee hee hee (evil laugh).

I gave my son (teenager) a HP-39G; you know, the one with IR transmission capability. I can try to amplify its transmitter power and if you have one, too, so that on his next Italian test, you can beam over the answers. I think that calculator also has alphanumeric capability as well. Unfortunately, it may not have all the grammatical marks necessary for Italian! ;)

(I guess I fully understand why Europe only sells the HP-40G, which has a nice CAS, but has a disabled IR function.)

HP-35

*Message #1 Posted by **David** on 5 Mar 2006, 7:14 p.m.*

Hello all,

I just picked up an HP-35 calculator from a guy that was emptying out his garage and preparing to leave the state. I got it for free (along with some other items). I thought it was interesting, but worthless. Before I threw it in the trash, I decided to check out e-bay and I saw that they are collectible. That's when I stumbled across this informative forum. So.....

I believe it is a "Version 2". It is ser. no. 1143a 3****. It has the raised dot on the 5. It appears to be in good working order and it pretty good condition. It has the original grey case, as well as the charger and the owners manual. Also the leather case. The owners manual also has the accessory order card and the service card, in the back.

Is there anything else that i should check for to see if this unit is special? (I know it's not a "red dot". And the serial number is inside the battery compartment instead of between the feet.) What is the approximate value? (Although I don't think I want to sell it) This is all so interesting.

Maybe I have found myself a new hobby.

Dave

Re: HP-35

*Message #2 Posted by **Karl Schneider** on 6 Mar 2006, 12:54 a.m.,*
in response to message #1 by David

David --

Glad to see another person who appreciates the technological history!

My HP-35 has a serial #1143A2nnnn, and is a 2nd version. It says only "HEWLETT-PACKARD" on the bottom edge, not "HEWLETT-PACKARD 35", because it was HP's only calculator model at the time. My unit has the serial number between the feet, however.

The only models that are really "distinctive" to collectors are the early "red dot" units, some of which have a computational bug, where $e^{\ln 2.02}$ is calculated as 2.00.

I think that the 4th version is much better aesthetically -- previous versions look almost like prototypes.

Is the section about the HP-35 at this website's homepage helpful?

-- KS

Re: HP-35

*Message #3 Posted by **Jeff O.** on 6 Mar 2006, 8:46 a.m.,*
in response to message #1 by David

> Quote:
>
> Is there anything else that i should check for to see if this unit is special?

It is an HP-35, the world's first handheld calculator with transcendental functions. It is quite special! Granted, it might be a little more special if it were a red-dot, but it is a version 2, and has the earliest possible serial number prefix. Following-up on something Karl mentioned, early units had a few "bugs" where they did not provide absolutely correct answers to some very specific arguments in some of the functions. As Karl mentioned, taking the natural logarithm of 2.02 and then the antilog of the result returned 2., rather than 2.02. There was also a bug in the trigonometric functions for certain inputs. Some examples were:

```
Function                Buggy                    Correct
ARC SIN 0.0002          5.729577893 x 10E-3      0.01145916
ARC COS 0.0002          89.99427042              89.98854
ARC TAN 0.0002          5.729577893 x 10E-3      0.01145916
ARC TAN 1.00020002      45                        45.00573
```

So checking for the above anomalies will tell you if your unit was sent back to HP for repair. If it has the bugs, you have an original, pristine, untouched unit with its “quirks” still intact. If not, you have a unit that the owner went to the trouble to send back, and HP repaired a problem that in the present day would be ignored. Either way, it is special.
Approximate value based on eBay sales would be $40 to $100 (assuming it is not essentially "mint-in-box"). Unless you really need $40 to $100, you should by all means keep it.

> Quote:
>
> Maybe I have found myself a new hobby.

If so, be prepared for quizzical looks from friends and family. Also, beware the slippery slope from hobby to, ...obsession. You will obviously need a version 2 with or without bugs as required to complement the unit you have. Versions 3 and 4 are also a necessity, and a version 1 would be really, really nice. One each of the 45, 55, 65, 70 and 80 to fill out the classic series would also be nice. But wait, the 45 comes in at least three versions, so you’ll need one of each of those.....

Should these be the 25 magnetic cards?

Cheers.

Luiz (Brazil)

Re: 41CX Turbo !!!!

*Message #3 Posted by **Raymond Del Tondo** on 5 Mar 2006, 9:10 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi,

no, I doubt the TURBO was made by HP.
I think it was made by the dealer where he bought the unit.
Aside from that, the turbo switch implementation in the W&W HP-41CY Turbo looks much nicer, and you still can use the wall charger.

On the unit on sale, there also seems to be a small chip on the bottom of the separator plastic, but this could be a glitch of the cheap digicam;-)

About the mag cards: I also understand that there are 25 cards included.

However, another US eBay dealer sold a similar CX Turbo (NOT CY!)
for big money a while ago, so this unit could be a good deal,
taking into account the various included accessories...

Maybe I should announce my HP-41CV Turbo, too;-)

Regards

Raymond

HP are running a competition around the 12C

*Message #1 Posted by **Bruce Horrocks** on 5 Mar 2006, 5:54 p.m.*

Dear All,

In case you haven't spotted this, HP are asking for amazing HP-12C success stories to accompany the 25th anniversary celebrations for this model. If anyone wants to enter then go here:
http://h30248.www3.hp.com/offers/12c/index.html

Re: HP are running a competition around the 12C

*Message #2 Posted by **Antonio Maschio** on 6 Mar 2006, 4:18 a.m.,*
in response to message #1 by Bruce Horrocks

Yes, but I wonder why the 12C is still being sold, while 11C and 15C are not. Do you think there wouldn't be no buyers, today, for those wonderful scientific machines? And why such marvelous models like 32S and 32SII are now out of the way? Maybe because they are RPN? 12C is, and has never been discontinued.

Bah!

Antonio

After HP48sx

*Message #1 Posted by **Walter B** on 5 Mar 2006, 5:03 p.m.*

This museum ends with this model in 1986. Later calcs are described very shortly here, but without pictures, feature sets etc. Are there any other places where I can find this information? Right now I'm looking for the features of 19BII, but that's just one example.

Thanks in advance for some source(s).

Re: After HP48sx

*Message #2 Posted by **Marcus von Cube, Germany** on 6 Mar 2006, 2:08 a.m.,*
in response to message #1 by Walter B

Look at Viktor Toth's great site: http://www.rskey.org/detail.asp?manufacturer=Hewlett-Packard&model=HP-19BII

Marcus

Re: After HP48sx

*Message #3 Posted by **Walter B** on 7 Mar 2006, 5:25 p.m.,*
in response to message #2 by Marcus von Cube, Germany

Marcus,

thanks for recalling this link I forgot! However, the information contained in MoHPC is far more reliable. IMO the only disadvantage is it ends in 1986.

For example, I learned at MoHPC the 19bii offers RPN - can't find this feature in Victor's site.

Is there no site containing HP calc teens (out of production) in equivalent depth as MoHPC?? I'm looking for features and high res photos.

Re: After HP48sx

Re: After HP48sx

*Message #5 Posted by **GE** on 8 Mar 2006, 10:09 a.m.,*
in response to message #3 by Walter B

V.Thoth's site is a must.
In rare cases is information actually not exact, and it goes in much less detail than the MoHPC, but I like the very visual layout. Calculators are easy to browse by maker or other criteria, and it is a godsend for collectors interested in many brands.
My only regret is that there is no "Updates" page. I find myself browsing for new material the hard way from time to time.

Re: After HP48sx -- Thank you

*Message #6 Posted by **Walter B** on 9 Mar 2006, 4:45 p.m.,*
in response to message #5 by GE

Thanks for your infos - these are sites I have in my link list. So apparently that's all what's available. A lot of data ... my favourite place will stay here at this museum. Thanks, Dave, for this site!

19c

*Message #1 Posted by **Walter B** on 5 Mar 2006, 4:45 p.m.*

Some time ago, I found an hp19c. I tested and it is fully functional when connected to 6VDC :) Even managed to get some thermo printer paper for a reasonable prize. Just what's missing is the battery pack. Has anybody here an idea where to get it from? Or is it an easy DIY job to build one? Any hints are appreciated! Thanks in advance!

Edited: 5 Mar 2006, 4:47 p.m.

Re: 19c

*Message #2 Posted by **Vassilis Prevelakis** on 5 Mar 2006, 5:11 p.m.,*
in response to message #1 by Walter B

if you do not use the battery pack, make sure the DC supply you are using is fully regulated, otherwise you are running the risk of damaging the CMOS RAM in your HP19C.

You did not mention whether you have the door to the battery compartment. If you do have it, things are much easier.

**vp

Re: 19c

*Message #3 Posted by **Walter B** on 6 Mar 2006, 3:37 a.m.,*

> Quote:
>
> You did not mention whether you have the door to the battery compartment.

I have this door and it's functional. I just don't have any part at all of the battery pack (neither plastic nor metal).

Re: 19c

*Message #4 Posted by **Vassilis Prevelakis** on 6 Mar 2006, 9:23 p.m.,*
in response to message #3 by Walter B

If yo have the door, then the pack itself is very simple to build. It consists of 4 AA NiCd rechargable cells arranged in the obvious manner. The cells connect to the two OUTSIDE tabs in the battery compartments. The inner tabs are to keep the pack in place and also show the polarity of the OUTSIDE tabs. AFAIK the inner tabs are not connected to anything inside the 19C.

On the far end of the pack you need springs to push the pack towards the tabs and make contact.

**vp

19C Oddity . . .

*Message #5 Posted by **Mark Lynch** on 6 Mar 2006, 10:43 a.m.,*
in response to message #1 by Walter B

Can't help with the battery pack, sorry, but do have a favorite piece of 19C trivia: Examine the decimal point (any) in the display with a magnifying glass. There is a very tiny hp logo in each one.

Best ROMs for 41

*Message #1 Posted by **Geir Isene** on 5 Mar 2006, 2:41 p.m.*

I'm about to get a Clonix and would like some advice as to which modules would be the best fit and why. I am a 41 programmer and use my 41 for as much as I can in life; It's my PDA, my alarm clock, my quick note taker, my experimantal programming environment, my statistics evaluator and ... my calculator (financial and scientific). I would also like to get into m-code programming.

I am considering the following:

PPC
CCD OS/X
Sandbox
Zenrom
Alpha Rom
Advantage
David Assembler + Labels
Extended I/O
HP-IL Devel
AEC Rom

Any other?

Re: Best ROMs for 41

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 5 Mar 2006, 4:59 p.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

although I use my HP41's since the 80's, I was only able to go deeper after being in contact with the MoHPC contributors/gurus. The last improvement I heard about the HP41 prior to buy an HP42S and an HP28S (and got caught by RPL...) was the Advantage ROM. I was neither aware of the fact that specific, third-part modules were developed to allow users to create their own applications with M-CODE.

Well, now I have an MLDL2000, a NoVRAM and a NoV32. For now, the NoVRAM is programmed to work as a Clonix, but I'll probably change that.

Because the MLDL2000 was my, say, 'first` acquisition, I've been using it extensively and also because it allows easily configuration changing (3 microswitches allow selecting one amongst eight user-defined configurations), I tested many combinations with it. In time: does anybody know about a big chart where all possible conflicts may occur? I mean, not only the duplicate XROM numbers, also the functions/programs names. I am compiling a list myself, but there are so many sources that I could not put them all togheter. Also, there are some rare modules that are not available to us, poor mortals...

Because I am an electrical engineer and I like designing, one of the modules that recently called my attention was the AECROM. It has almost everything I wish I had in a calculator to either study or practice

Engineering. The lack of matrix and complex number arithmetic might be easily spressed with the Advantage ROM.

The functionalities added by the CCD ROM are amazing, mostly when dealing with catalogs and ALPHA entry. I also like very much the CCD's matrix data handling, but I have to accept that the Advantage ROM resources do that better.

If M-CODE and program development are the subject, please add the HEPAX to your list. Unless Diego tell me I'm wrong, in this case I think that the NoVRAM or the NoV32 will be better choices than the Clonix, because you'll have 16KAM (NoVRAM) or 32KRAM (NoV32) to store whatever you want with HEPAX extended functionality. One of the configutrations I use with MLDL2000 (and soon with the NoV32) is exactly that: HEPAX in port# 5, all ports from 8 to 15 (Fh) addressed to RAM pages. Either case, it is plenty of memory to dare almost 7 times with NoVRAM or about 15 times with NoV32 of the main HP41 memory that can be instantly recovered, without the need of using external devices. And if you have an HP41CX, you can still have the full Extended Memory range (with two X-Memory Modules) and define the HEPAX in the 7th. port. If, by any reason, you need to use an HPIL with your HP41CX, just reconfigure your module and set HEPAX in the 8th. port. Yeap, unfortunately you'll loose 4KRAM, but you'll still have at least 12KRAM (NoVRAM) or 28KRAM (NoV32). And remember, you can use any of these 4KRAM blocks to develop M-CODE with either the HEPAX or the David Assembler + Labels.

From your list, the modules I did not use so far:

PPC
ALPHA ROM
HPIL Development ROM

I uploaded the surprinzing TOOLBOX and SANDBOX and tested a few functions of them, and also got some moments with the 41Z ROM, all of them by Angel Martin. But these modules need respectfull attention, not only a simple `trial and error` keystroke fooling. I must read about them prior to go ahead with, and all information about them is already available.

Well, I wrote too much, but remember : these words could only be written after having these modules, meanning a few months ago. I'm far from being the expert guiding you, I'm only trying to tell that experimenting is also a good way to find your best approach.

Good luck and best regards.

Luiz (Brazil)

New 49G+

*Message #1 Posted by **John Smitherman** on 5 Mar 2006, 1:19 p.m.*

I purchased a new 49G+ this week from HP's web site. I wanted to comment to the forum that the feel of the keyboard of this new s/n 534 is much improved over my older s/n 428. The 534 keys require much less effort to push and are much quieter than compared to the 428 which required more effort to push and produced a somewhat loud and irratating "thumping" sound.

The only other noticeable difference is that the yellow ink used for the alpha keys on the 534 appears to me to be brighter than on the 428. I believe that this is also an improvement for my tired eyes.

Let's hope that with what appears to be an improved key design coupled with the return of keytime in recent ROM updates that the 49G+'s keyboard issues have been eliminated. Time will tell.

Regards,

John

Re: New 49G+

*Message #2 Posted by **e,young** on 6 Mar 2006, 8:11 a.m.,*
in response to message #1 by John Smitherman

The 33s has had improvements made to its keyboard too, so it seems that HP is addressing the design flaws that were present in 49G+ and the 33s. Too bad they didn't get these issues resolved before they released these machines. A lot of bad blood has been generated.

Re: New 49G+

*Message #3 Posted by **John Smitherman** on 6 Mar 2006, 9:38 a.m.,*
in response to message #2 by e,young

Yes, 2005 was a good year for improvements to the 49G+, 33s and 12cp. Maybe we will see more in 2006.

Regards,

John

Re: New 49G+

*Message #4 Posted by **Gene** on 6 Mar 2006, 10:17 a.m.,*
in response to message #3 by John Smitherman

What? HP improve things? you must be joking! :-)

Seriously, I think they have improved things quite a bit, but there are still many things to do even better. And, no excuses for how they got into that mess to begin with.

But, what would you do if you found yourself in a very bad rut? Give up? Go home. Or, incrementally climb back out of the hole?

Reminds me of the guy who was very upset that HP dared be giving training sessions on how to use their financial calculators when he was still having problems with his 49g+ keyboard.

Without understanding, of course, that the person overseeing the training sessions could not possibly help with the problem.

Re: New 49G+

*Message #5 Posted by **e.young** on 6 Mar 2006, 12:01 p.m.,*
in response to message #4 by Gene

The 64,000 dollar question is, have they learned from their mistakes? If they ever introduce any new models (43S?) I wonder if the initial offerings will be plagued by bad keyboards and displays. I also wonder if they will abandon styling gimmicks like the chevron keyboard of the 33s and the horrible color scheme.

Question about lifespan of refurbished card readers

*Message #1 Posted by **Namir** on 5 Mar 2006, 10:52 a.m.*

Hi all,

I want to ask the folks that fix card readers. What is the expected lifespan of these refurbished card readers:

1. HP-65 card reader 2. HP67 card reader 3. HP-97 card reader 4. HP-41C card reader

All your feedback is appreciated.

Namir

Re: Question about lifespan of refurbished card readers

*Message #2 Posted by **Katie Wasserman** on 5 Mar 2006, 11:03 a.m.,*
in response to message #1 by Namir

I have repaired all 4 readers that you mention (using silicon tubing from Small Parts - part # 210005) about 5-6 years ago and they're all still working fine.

Re: Question about lifespan of refurbished card readers

*Message #3 Posted by **Namir** on 5 Mar 2006, 11:48 a.m.,*
in response to message #2 by Katie Wasserman

That sounds impressive! Thanks Katie for your reply.

Re: Question about lifespan of refurbished card readers

*Message #4 Posted by **David Smith** on 5 Mar 2006, 11:54 a.m.,*
in response to message #3 by Namir

I know of satellite in orbit for over 20 years with an off the shelf silicone rubber drive (yep, medical grade fuel line) on an instrument shutter. It was only needed to work a few months. It is exposed to the vacuum of space, atomic oxygen, nasty temperature swings etc and is still functioning. Another reason not to use o-rings in your rebuild jobs.

Re: Question about lifespan of refurbished card readers

*Message #5 Posted by **Walter B** on 5 Mar 2006, 12:40 p.m.,*
in response to message #4 by David Smith

AFAIK there are silicone rubber o-rings, too. They were used in high vacuum applications.

Edited: 5 Mar 2006, 12:59 p.m.

Re: Question about lifespan of refurbished card readers

*Message #6 Posted by **Bernhard** on 6 Mar 2006, 11:49 a.m.,*
in response to message #5 by Walter B

I use silicon rubber tubes, too. Same kind of tube is on my desoldering station now for 20 years with no signs of wear or decomposition despite of the desoldering fumes. I expect card readers repaired with such tubes to last until the motor or gears themselves give up.

How can I make my PC print to HP82240B?

*Message #1 Posted by **Danny Elfman** on 5 Mar 2006, 10:39 a.m.*

I got an infrared adaptor, a program to emulate a serial port for the adapter and I installed some printer drivers try to print, but the printer didn't respond at all. Anyone know if it's possible to print files from a PC to the 82240B?

Re: How can I make my PC print to HP82240B?

*Message #2 Posted by **Bill** on 5 Mar 2006, 2:37 p.m.,*
in response to message #1 by Danny Elfman

Are you, by any chance, the musical composer?

Re: How can I make my PC print to HP82240B?

*Message #3 Posted by **Eric Smith** on 5 Mar 2006, 4:36 p.m.,*
in response to message #1 by Danny Elfman

The 82440 printers don't use IRDA protocol, so in general a PC can't talk to them.

Re: How can I make my PC print to HP82240B?

*Message #4 Posted by **James M. Prange (Michigan)** on 5 Mar 2006, 4:44 p.m.,*
in response to message #1 by Danny Elfman

I wouldn't entirely rule it out, but the 82240 printers (and perhaps earlier infrared models?) use a special character encoding, including four error-correction bits with each (8-bit) data byte. See: http://www.hpcalc.org/search.php?query=82240B+technical for the details.

Regards,
James

Re: How can I make my PC print to HP82240B?

*Message #5 Posted by **Eric Smith** on 5 Mar 2006, 5:46 p.m.,*
in response to message #4 by James M. Prange (Michigan)

While it's obviously **possible** to somehow interface a PC to an 82440, there is no **easy** way to do it. Standard PC infrared ports and infrared adapters speak IRDA protocol, which cannot by any stretch of the imagination work with the 82440.

Some built-in PC infrared ports (mostly in laptops) have a "consumer IR" mode that is intended to let them act as a remote control for consumer electronics. In principle those could send to the 82440, but as far as I know, no software to do that has ever been published.

Re: How can I make my PC print to HP82240B?

*Message #6 Posted by **James M. Prange (Michigan)** on 5 Mar 2006, 6:55 p.m.,*
in response to message #5 by Eric Smith

Agreed; I don't know of any "easy" way to do it. Perhaps the least painful way would be to connect a calculator to the PC, and with the calculator in server mode, send it data and tell it to print it via IR. In other words, use the calculator as an RS-232/"RedEye" IR adapter.

I've heard of relatively simple RS-232/"Serial IR" (SIR) converters that can be used for communicating with the 48 series for transfers via IR, but I have my doubts about the feasibility of getting them to send in the RedEye encoding for the 82240 printers. Certainly it would be possible to make the hardware/software to do it, but it wouldn't be an "off the shelf" solution.

Regards,
James

Re: How can I make my PC print to HP82240B?

*Message #7 Posted by **Gerson W. Barbosa** on 5 Mar 2006, 8:48 p.m.,*
in response to message #5 by Eric Smith

At least for the HP-95LX/100LX (and 200LX), it has been published a shareware that prints text or data from the palmtop to the HP 82240B (IR-Print/SM):

http://www.rundel.net/palmtop/hp200/shareware.htm

There is also a DOS freeware version at the site, IR-Print/DOS, but this may run only on those early HP palmtops.

Re: How can I make my PC print to HP82240B?

*Message #8 Posted by **Christoph Giesselink** on 7 Mar 2006, 3:27 p.m.,*
in response to message #7 by Gerson W. Barbosa

I only know it for the 95LX, but this model has some special I/O registers generating the necessary pulse packets with the correct timing. These registers are missing on a normal PC.

I don't know a method with standard PC components using the HP82240B printer. My solution in this case would be a self programmed microcontroller converting the data from serial to the HP secific redeye format.

Cheers

Christoph

is this normal in a repaired 41CX?

*Message #1 Posted by **Gonzalo Fernandez (Spain)** on 4 Mar 2006, 5:04 p.m.*

I have an HP41CX fullnut I repaired (changed bad memory chip, only 255 registers instead 319 registers) Now the repaired 41CX has 319 registers and 124 extended registers, the time clock works OK. The problem is after not using the calculator for 1-2 days (without batteries), when I put batteries, the screen shows all characters @, "@@@@@@@@@@@@", twelve @ characters. After this, pressing the backspace keys, the calculator powers off. From this point, I can turn on the calculator (ON key, the screen shows 0.0000) but I cannot do a reset (ON + backspace), only after 1-2 minutes I can do a reset (ON + backspace) and the calculator works perfectly.

What is due the initial showing (twelve @ characters) when I put batteries after not using the calculator for 2 days and stored without batteries? I´m sure that is not due to a bad contact between the two halves of the calculator.

Re: is this normal in a repaired 41CX?

*Message #2 Posted by **Klaus** on 6 Mar 2006, 7:01 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

Hola Gonzalo!

I once got a 41CX fullnut for repair, with the display showing '@@@@@@@@@@' and I think the buzzer hummed a bit when switching on. I measured the signal lines and I think two of them had very low signal (about 200 mV if I recall correctly), and much noise on them. Since I did not have any replacements (As the lines connect CPU,RAM and ROM, any of the chips could have had a defect), I gave it back to the owner and he wanted to sell it on ebay.

I was also sure it weren't the contacts, as I opened the case an clamped the boards together with a 'monkey wrench?' (<= correct word???).

Perhaps you bad memory chip shorted some signal to ground and thereby damaged another chip? I think you should check your signals if you have access to a scope.

Good luck!

Re: is this normal in a repaired 41CX?

Shortcut to toggle between standard and fix?

*Message #1 Posted by **J.C. Boco** on 4 Mar 2006, 4:33 p.m.*

Is tehre a way to toggle between standard display and fix (say 3 digits) display?

I have this output and it's hard to read. I use the DET determinate function on

ii j k 3 4 3 5 2 4

The result (I'm making it up) is say

1.235335653ii + 1.and then it runs off the screen. I want to see the j value and the k value.

I figure if I can set it to 3 digit FIX, there is room to see everything. but it's a pain to do that, and almost equally painful to just enter edit mode and scroll to the right.

Re: Shortcut to toggle between standard and fix?

*Message #2 Posted by **J.C. Bocio** on 4 Mar 2006, 4:34 p.m.,*
in response to message #1 by J.C. Boco

the determent is

ii.....j.....k 5.....4.....3 5.....3.....19

just as an example

Re: Shortcut to toggle between standard and fix?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 5 Mar 2006, 8:24 p.m.,*
in response to message #1 by J.C. Boco

Hi;

can you tell us which HP calculator you are using?

Cheers.

Re: Shortcut to toggle between standard and fix?

in response to message #3 by Vieira, Luiz C. (Brazil)

I'm sorry that took so long.

and sorry for leaving out the most basic of imformation.

HP49g+

Re: Shortcut to toggle between standard and fix?

*Message #5 Posted by **Marcus von Cube, Germany** on 9 Mar 2006, 2:23 a.m.,*
in response to message #4 by J.C.Boco

A simple approach could be a custom menu:

```
{{"FIX3" << 3 FIX >>} STD} 'CST' STO>
```

Pressing [left shift][mode] (custom) results in the display of two functions: [FIX3] and [STD] which activate two different display formats when pressed.

Marcus

Re: Shortcut to toggle between standard and fix?

*Message #6 Posted by **James M. Prange (Michigan)** on 9 Mar 2006, 7:14 p.m.,*
in response to message #5 by Marcus von Cube, Germany

Or a program like the following could be used to toggle between display modes.

```
\<<
  IF -49. FS?
  THEN STD
  ELSE 3. FIX
  END
\>>
```

From FIX or ENG mode, this switches to STD mode, and from STD or ENG mode, it switches to 3 FIX mode.

Use it in a custom menu, assign it to a user key, or just store it in a variable.

Regards,
James

eBayers continue to confuse me

*Message #1 Posted by **Han** on 3 Mar 2006, 2:46 p.m.*

Check out this non-operating HP48G from eBay. It sold for about $40.00. The description is:

> Quote:
>
> HP-48G Calculator, I can't get it to do anything being sold as is. 5.00 shipping in the US

No manuals, no case... just a supposedly non-working HP48G. Now, mint units often go for $50, with case and manuals included. Sometimes people go wild and bid up to the $90 range, but these oftentimes include extras like a screen guard, or the complete package (box, accessories guide, nameplate, etc). Why spend $40 for a unit that is not guaranteed to work when you can spend about that much for one that does, and comes with a case and manuals?

I made a bid of $15.00. But this was under the assumption that no one would bid anywhere near that much for a non-operating unit -- even for parts.

in response to message #1 by Han

Excuse me, why do you assume that everybody dealing on eBay is sane?

In developed countries, the growth of the internet allows everybody and I mean *everybody* access to eBay. So its not surprising that you get crazy or stupid or naive people spending their cash on useless items [1].

This is Coburlin's business model, pick a crazy price out of a hat and wait for the sucker to come to you.

**vp

[1] speaking about buying useless items, I am not sure whether my behavior is sane either :-)

OT: Casio Fx-750P

*Message #1 Posted by **Marcus von Cube, Germany** on 3 Mar 2006, 2:41 p.m.*

Hi!

another off topic post from me, I hope you can stand this ;-)

I've just got a Casio FX-750P off eBay. It came with its cassette/printer accessory FA-20 but without documention. No problem, just find a PDF on the Net! My problem: There isn't any usable info in the wild. I assume very much that the machine wasn't actively marketed outside Japan (it has Japanese characters but no lower case!)

If anybody wants to discuss the machine with me or has some information, just send a mail!

Marcus

P.S: The machine is a close cousin of the PB-700 (no mode key, two enter keys). You can send BASIC files from one machine to the other. Problems arise if you send programs with commands that one machine understands but the other doesn't. String constants with lower case characters are nasty because you can't edit the lines on the FX-750P. :-(

What Calculator to buy

*Message #1 Posted by **Paul Hoffman** on 3 Mar 2006, 1:53 p.m.*

Hi all,

My 41C just dropped some pixels on it's LCD - OH well!

So what do I buy? I am a retired engineer, but still do some engineering. I don't use the fancy features often enough to remember them. I like all the bells and whistles, but if you can't remember how to use them - it's a pain to go back and relearn how to use them again.

I don't like trying to use a small calculator keyboard like a computer - 'ALPHA' this and 'ALPHA' that etc. - UGH!

The 28S has a better keyboard - it's not as cluttered as the later models.

Give me some ideas.

Thanks - Paul

in response to message #1 by Paul Hoffman

Hi,

I would try to buy a good (used) 41 unit again. It's a good calculator as you can probably confirm, it has everything you apparently need, good looks, RPN, and you know it already. They are offered frequently on e-bay and similar sites. However, despite their age the good units are not cheap (100USD+). If buying on e-bay is too much a hassle for you, then the only RPN-scientific alternative presently for sale from HP is the 33S. However, I do not know the details but it suffers occasionally from quality problems.

Re: What Calculator to buy

*Message #3 Posted by **Paul Brogger** on 3 Mar 2006, 2:51 p.m.,*
in response to message #1 by Paul Hoffman

If you can get past the appearance and keyboard layout (some people just can't), the 33s is readily available and I'm guessing has most all the features you need.

It's ~$50.00 at Wal-Mart. Make sure the serial # (usually copied on the outside of the package) starts with CNA53... or greater.

(This doesn't necessarily preclude chasing down another 41 -- it's nice to have a backup unit available.)

Re: What Calculator to buy

*Message #4 Posted by **Stephen Easterling** on 3 Mar 2006, 3:01 p.m.,*
in response to message #1 by Paul Hoffman

The 28S seems like a great idea as long as you use it on a desk or something. It gets clumsy when you try to use it standing up or on the fly. As mentioned already, any good condition 41 series on Ebay would suffice and I doubt it needs to be a pricey 41CX unless you like the stopwatch. If you prefer the layout of the -+x/ buttons on the left of the keypay, try a nice 55 or 65 (LED) unless you prefer LCD. You can usually pick up a 32S (not 32SII) for much less than the cost of the 32SII. I love the 32S. It has only one orange shift key and a relatively uncluttered keyboard. The 33S is not bad, either.

justice to the 28

Marias --

I, too, like the dedicated Alpha keyboard of the HP-28C/S. One can't avoid spelling out function names in RPL, so it's nice not to mess with "ALPHA" mode. I have two 28C's, keeping one at work.

I also like the comprehensive unit-definition library and conversion utility that handles compound units and checks for consistency. One can't append units to values as on the HP-48/49, but the functionality is still quite useful.

As for its ultimate legacy, the original HP-28C was a flawed product: it had an insufficient 2 kB of RAM for its advanced functionality (e.g., symbolic algebra), ans was missing some mathematical functions (e.g., COMB and PERM) and directory structure. The HP-28S fixed those things, but the small graphical screen and lack of full I/O and expandability remained as shortcomings. These issues, of course, were addressed by the HP-48S/SX.

Regards,

-- KS

Does anyone else think it's ironic that the 28 has both one of the most uncluttered keyboards, and, other than the other clamshells, has the most keys of any model?

justice to the 28

*Message #8 Posted by **marais** on 8 Mar 2006, 2:14 p.m.,*
in response to message #7 by Samuel Heddle

That's weird, isn't it? My explanation at the time was that it just takes that many keys, and a thoughtful separation into primary and secondary ones. That's why the 48 failed to become my most used calc, even though it's technically superior.

Andreas

Hardly ironic... Compare the HP-67 and HP-97: one has 35 keys, the other has 56, and both have the exact same function set.
Guess which one is more cluttered? ;-)

Since it's an HP-41C, it is in all likelihood an older "fullnut" design (from 1979-1985), and may be repairable. Randy Sloyer at www.FixThatCalc.com has already repaired two of my fullnut 41's to perfect working order -- a 41C and a 41CX.

As others have stated earlier, it's also easy to find a nice used HP-41 on eBay. If you get the top-of-the-line HP-41CX, expect to pay substantially more. Those made from 1983 to "early" 1985 will be of the fullnut design, with better displays, key-feel, and construction. The rest from "late" 1985 to 1990 will be of the more-reliable halfnut design.

> I don't like trying to use a small calculator keyboard like a computer - 'ALPHA' this and 'ALPHA' that etc. - UGH!
>
> The 28S has a better keyboard - it's not as cluttered as the later models.

But the 41 has an alpha mode button! :-)

Yes, I also like the dedicated alpha keyboard of the HP-28C/S (I have two 28C's). But you won't be pleased with the 28C/S as a replacement for a 41C -- its "RPL" mode of operation is significantly different in many respects, especially for programming. Also, it is non-expandable, with no I/O except for the 82240A/B infrared printer.

Other ideas:

The HP-42S was discontinued in 1995. Its programming, command set, and RPN operating paradigm is quite compatible with the HP-41, but you'll have to enter programs via the keyboard. The display isn't very easy to read, which may be of concern to you. They are available via eBay, but not cheaply.

The HP-32SII or HP-32S is also based on traditional RPN, and was discontinued in 2002. I believe that you would be quite pleased with it as a pure calculator (I have one), but they aren't cheap on eBay either.

As others have stated, the HP-33S (developed from the HP-32SII) is the least-cost new RPN calculator to replace an HP-41. However, there is much not to like about its aesthetics. That's why the HP-32SII is expensive on eBay.

Regards,

-- KS

Re: What Calculator to buy

*Message #11 Posted by **Walter B** on 4 Mar 2006, 11:58 a.m.,*
in response to message #1 by Paul Hoffman

Hi Paul,

as others told you already, 41c-type calcs are often seen at eBay. So, if you have some plug in modules, then you may continue to use them.

The 42s was meant to become a replacement for the 41cv - it turned out to have far more power, but NO I/O besides the IR connection to the printer. Anyway, you'll find a similar keyboard layout, compatible progrmming code, and a 2-line dot matrix LCD. It is the most powerful RPN calc ever built. Just look at the museum.

In comparison, the 32s (and 32sii) has very limited space for your programs. But you may like it if you just want a staightforward calc. Choose between the clean keyboard of the 32s with 1 shift key and more menus - and the 32sii with 2 shift keys, less menus and more functions printed on the keyboard plate. The LCD of the 32 has higher contrast than the one of the 42s.

Prices vary. At some strange times you may be lucky. You may improve your chances if you also look at eBay.de and other locations.

Good luck! Walter

> I don't like trying to use a small calculator keyboard like a computer - 'ALPHA' this and 'ALPHA' that etc. - UGH!
>
> The 28S has a better keyboard - it's not as cluttered as the later models.
>
> Give me some ideas.

The 19BII might be just right for you. Has the same form factor as the 28C/S so a separate alpha keypad for easy entry. Has trigs, logs, hyperbolics and unit conversions -- as well as the business stuff (TVM, bond yields etc.) that you can safely ignore if you want.

Has a built-in clock and appointment reminders - really useful for those ad-hoc things like: "there's a programme on the telly that I really don't want to miss so I'll just put a reminider in now in case I get carried away working on this maths/programming/whatever problem." And the alpha keypad makes this *so* much easier that it's worth doing.

Everything is easy to do from the menu - so great for features that you don't use often and can't quite remember in what order things are done.

Still readily available. Relatively expensive but at least there's no scarcity/insanity eBay markup being applied.

Has an RPN option but only on the "HP19BII Business Consultant II" model. Do not confuse this with the "HP19BII Business Consultant" model. ;-)

Downsides: stats are limited to list stats, only programmable through the solver (but which is very powerful). Batteries are a pain to change (but IIRC that they re-designed the battery compartment on recent models - can someone confirm?)

Otherwise, your only option for a decent calc with a real-alpha keyboard is the second-hand market: the 28 series as you suggested or the 95/100/200LX range. If you only want the calculator then an old 95 can be picked up quite cheaply and they have an excellent calc.

The perfect calculator

*Message #13 Posted by **Bruce Horrocks** on 5 Mar 2006, 8:44 a.m.,*
in response to message #12 by Bruce Horrocks

Boot note: Of course, if HP were to release a version of the 19BII with a flash-able ROM then we could get an openRPN sub-project going to turn it into a scientific/engineer's calculator. (It's perfect for this because the keyboard labels don't need changing.)

I think that an HP-97 would be the best calculator for you. It has a large keyboard with excellent feel, large display that can be read even from a distance, and a built it printer.

Although not strictly speaking handheld, you can easily carry it around. I find that the built-in rechargable pack lasts forever and I have a second pack that can be charged in the external cahrge cradle as soon as the low-bat warning comes on my HP-97 display. This allows me not to have the A/C charger attached to my HP-97 all the time (its bad for the battery and limits portability).

All in all an excellent combination.

**vp

PS I also have an HP-41CX around because of it has the TIME module and I can set reminders and alarms. But I use the 97 for most calculations.

in response to message #1 by Paul Hoffman

Hi Paul. You did not mention what kinds of things that you did with your 41 so we can only speculate what needs you might have.

If you want to buy something new I would recommend either the 33s or the 49G+. The simpler of the two is the 33s and may meet your needs. The most recent versions of the two dated 52x or newer have been improved.

Regards,

John

tablet calculators :-)

*Message #1 Posted by **Alain** on 2 Mar 2006, 11:17 p.m.*

All,

It seems the wireless tablet computer is the next big thing: Nokia 770, Microsoft Origami, Intel, etc. These machines are kinda between a PDA and a small laptop computer.

Which means that calculator emulators on these machines would be great: 640x480 tactile screen if not more..

What does that say for the future of calculators and calculator emulators?

-- alain.

Re: tablet calculators :-)

*Message #2 Posted by **Thomas Radtke** on 3 Mar 2006, 1:54 a.m.,*
in response to message #1 by Alain

Most calculators are used in school. Here, you need a small and robust device with moderate power consumption. A real keyboard is always welcome on these tools, too;). I cannot see PDAs et al. being a challenge for the classic calculator.

Thomas

in response to message #1 by Alain

Tablet computers are not a new idea, but in the past, they seem to have been successful only in industrial applications -- the attraction being that you can use them while holding them with one hand and writing on them with the other.
For anyone else, it's just a laptop with no keyboard...

Re: tablet calculators :-)

*Message #4 Posted by **Vieira, L. C. (Brazil)** on 3 Mar 2006, 6:36 a.m.,*
in response to message #1 by Alain

Hi, Alain; allow me some comments?

> Quote:
>
> (...)640x480 tactile screen if not more

These might be good for low-res graphics, though. I myself feel comfortable with alphanumeric capacity, 12-

digit mantissa, 3-digit exponent of ten, as many digits as possible and necessary for internal numbers, graphics welcome, too. About tactile screen: I prefer keys. Yeap, there is the key bouncing issue and related production costs, but tactile screen depends on keyboard emulation software as well.

> Quote:
>
> (...)the future of calculators and calculator emulators?

This is the sort of subject that we can discuss for too long, or simply wait to see. I have my own perspectives, based on historic events. Once math became a tool and this tool found itself inserted on many other sciences, allowing it to be efficient and precise would consequently allow all 'related' sciences to be efficient and precise as well. Trigs and log tables were written, slide rules were created and some mechanical devices that could perform basic calculations were designed and built. Large electromechanical and electronic computers were designed and built as well, so were desktop, powerful calculators. Pocket size versions became a reality after the memorable HP35.

What comes after?

As we can see, existing tools were replaced by newer ones, more efficient, resourceful and reliable. I see no new replacement after the calculator, only different versions of the same concept. What about a neural interactive device that returns suitably coded resulting values once a number-based question is captured in the neural cortex? That would, indeed, be a replacement: no keys to bounce, no screen to be read in bad light conditions, no batteries to replace, only organic-based nanocells that would harmless be implanted in the base of the backbone.

Wow! With such a NIC (Neural-Interfaced Calculator), who needs a standard, keyboard driven calculator?

O.K., let the flames and blames come!

Sorry, folks, but I actually see no current replacement for a calculator, just some guys showing it in a different package and look and claiming that the calculator has its glorious days in the count. I do not see this coming so soon.

My opinion, again.

Cheers.

*Message #7 Posted by **Garth Wilson** on 3 Mar 2006, 3:09 p.m.,*
in response to message #4 by Vieira, L. C. (Brazil)

It reminds me of when the Apple Newton came out, the little keyboardless computer which was supposed to recognize handwriting. The first thing I thought was, "Wow, that is some impressive technology!" but the next thing I thought was, "How dumb-- someone has forgotten that the reason we used to use typewriters before we had computers was that typing was faster than writing-- *a lot* faster!" The banks' ATMs now all seem to have touch screens. I don't like the paralax, the lack of feel, and looking through the grime left behind by fingers. At stores that use the glass pad to sign on when we use a credit card, I can't make my signature look real because of the paralax and because of the delay in response of the pad to show where I've written.

For typing with one hand while holding the computer in the other, I'd rather see something like the Frogpad become standard. Although a bit complicated to learn initially, it is said that with some practice you can type 40wpm on this one-hand QWERTY keyboard replacement.

As for bounce, there's no excuse for it in modern computers or calculators. It does not take much computing power or very many lines of code to do the de-bouncing in software. I've done it many times in the products I've designed.

> What does that say for the future of calculators and calculator emulators?

Probably nothing. This calculator is the only way to go:

http://i5.ebayimg.com/03/i/06/43/cb/03_1.JPG

In fact, it does have many more features than stated; it easily solves integrals, works even *without* electrical power.

Re: tablet calculators :-)

*Message #9 Posted by **Steve S** on 4 Mar 2006, 8:37 p.m.,*
in response to message #1 by Alain

I'm surprised that none of you seem to be aware of xThink's xCal and MathJournal applications. See:

www.xThink.com

Both products were designed for the tabletPC platform. They are each capable of solving hand-written math expressions. xCalc handles arithmatic, including trig and some specialized math, while MathJournal will solve expressions up to and including entry level calculus (providing, in some cases, symbolic solutions.

The ability to interprete hand-written math is MUCH faster than keyboard entry (as, for example, the -48) which, in this context is both awkward and unnatural.

MathJournal 2.0 is about to enter beta trials. Version 2 will add matrix hath, linear algebra and numerous other expanded capabilities. Before you declare that the calculator is the only future for math manipulation, I suggest

that you take another look around...

Re: tablet calculators :-)

*Message #10 Posted by **GE** on 6 Mar 2006, 9:56 a.m.,*
in response to message #9 by Steve S

Let's see what the future of math in the hand is.
Say the following function is defined on integers like :
u(1)= 44
and
u(2*n) = u(n) and
u(2*n+1)=u(n) .
Tell me what this function is.
For many this function is a constant and has value 44.
For no calculator in the world, is this calculable.
So I say that the future of calculators may be calculators as they are now, but my real brain power. See what one can do with hypergeometric functions. I'm looking forward to better tools.

12C Platinum Dust Problem

*Message #1 Posted by **Jeff** on 2 Mar 2006, 9:45 p.m.*

I have had several of the new and improved 12C Platinums, and they all develop dust inside the display. It's not a huge deal, but is kind of annoying.

Is it just poor design? Can it be blown out.

I'm tired of taking them back to Office Depot.

Many thanks.

Re: 12C Platinum Dust Problem

*Message #3 Posted by **e.young** on 3 Mar 2006, 8:53 a.m.,*
in response to message #2 by j.brabers@chello.nl

I don't think the fact that something is made in China means that it is inherently inferior. If HP wanted calculators with its name on them to equal the quality of the golden years, they would design accordingly and require their Chinese manufacturers to have better quality control.

I think the culprit is ultimately HP. They are ultimately responsible for the quality of the products that bears their name, even if they are not the ones manufacturing it. If issues like dust in the display were unacceptable to HP, they would then require the manufacturer to have better quality control, or they would have to review their design to see if there was a design problem resulting in dust getting in the display.

[OT] Chinese quality

That's hilarious!! Yes, it sounds like an apology.

Re: 12C Platinum Dust Problem

*Message #6 Posted by **Dave Shaffer** on 3 Mar 2006, 12:51 p.m.,*
in response to message #1 by Jeff

You say they "develop" dust. Does this mean they come clean from the store, but get dusty later (as you use it)?

This has been an HP problem for a long time! My '41CX slowly accumulates dust in the display as time goes by. Others have commented on this as well. The display is just not hermetically sealed. Some (clean!) compressed air may help - although it can also just blow the dust farther into the unit.

Re: 12C Platinum Dust Problem

*Message #7 Posted by **Jeff** on 3 Mar 2006, 3:48 p.m.,*
in response to message #6 by Dave Shaffer

Thanks. No, the dust accumulates over time. Very annoying!

help with an HP 48s

*Message #1 Posted by **e.young** on 2 Mar 2006, 12:26 p.m.*

Greetings to all.

I recently aquired an extremely used HP48s in a non-working condidition. Even though it doesn't work, I picked it up in hopes that I might be able to fix it.

This thing had the batteries leak, so there is corrosion in the battery compartment. That I think I can deal with, but the entire unit is filthy, to the point that I don't like to touch it. I wonder if maybe it came out of a wet lab.

Does anyone have any advise on how this might be cleaned? The amount of dirt is way more than just a cosmetic problem-this thing is nasty. Based on other threads that I have read, I am considering soaking it in distilled water for a while. Any comments or sugestions will be greatly appreciated. Thanks.

in response to message #1 by e.young

Hi,

I would not soak it in destilled water either. The point is, since there was battery-leakage, some (salty) remains of this are probably still present in the battery compartment and the rest of the unit. When these salts dissolve in destilled water, the water can no longer be considered as of "distilled" quality and becomes conductive. Moisture is very difficult to get out from a closed compartment (such as a calc). So unless you open it soon after you treated it with water and dry it very thoroughly there is a serious risk of short circuiting parts of the units electronics, with unknown consequences. Furthermore, salt water enhances corrosion. Concluding I would say: don't touch it with lots of water but try a gentle cleaning procedure with a (slightly) wet cloth. Wash your hand after it as well, you don't know what the thing has been in contact with.

regards Jan

in response to message #2 by Jan

If the batteries are out, and you run distilled water through it in copious amounts, I see more good than harm. The distilled water will have a thermodynamic interest in taking on all that battery detritus into solution, and by running fresh distilled water trough it, you will get it all out.

After doing an initial 5 rinses in a short time period, I'd let it soak for 24 hours, and rinse it again.

in response to message #3 by bill platt

Cleaning will not help...

I don't like to be a wet blanket here but my recommendation would be "don't bother" - it's not repairable. 99.9% of the 48's I've seen with a battery leak that no longer turn on cannot be repaired due to keyboard damage. The two battery contact areas are open into the calculator, the negative terminal is open into in the case right above the ON button traces. The electrolyte gets into the keyboard circuit and opens the ON trace. End of calculator. Sorry.

PS: Many times it kills the entire bottom row: ON 0 SPC +

Some other points about other topic above:

1) It's safe to immerse/wash HP's so long as the batteries are out of them and you do not reinsert batteries for at least two days after a wet event. You can shake all the excess water out a 48 and dry in a warm place with no problems what so ever. It takes about 24 hours. Most all electronics that are soldered together get washed somewhere along the manufacturing process. No big deal.

2) Never soak an HP for an extended period of time, especially a Pioneer or 48. The keyboard conductors are printed carbon and they can be damaged and even dissolved given the right conditions. The darker plastics used on cases also have a nasty habit of developing splotchy white areas when left in contact with liquids too long.

Edited: 2 Mar 2006, 5:14 p.m.

*Message #6 Posted by **Han** on 2 Mar 2006, 6:52 p.m.,*
in response to message #1 by e.young

I would first test whether or not the caclulator does not turn on due to the battery corrosion. If you clean the contacts, and a fresh set of batteries do not turn the calculator on, there may be a few other reasons.

In two used HP48Gs of mine (bought from eBay), the blue inductor (I think that's what it is; it's just above the postive battery terminal) broke at the point where its legs were bent; only one of the leg was broken. By broken, I mean it was rusted (? not sure, but it looked like rust) to the point of breaking!

In the HP48S/SX calculators, the contact point of the keyboard circuitry with the PCB oftentimes would not make proper contact. So keypresses do not get registered (e.g. the ON key).

why should I want a 48 series? (having already bought a 49g)

*Message #1 Posted by **Chris** on 2 Mar 2006, 11:54 a.m.*

I recently won a brand new 49g on Ebay. I know it's not as old school as the 48 series, but I like the thing alot, don't know all that much about it currently. I've been offered a 48G for $50. Any thought on why I'd want to own one? I do have a question about my 49G too. I plugged in the batteries that came with it, and used it for several months (here and there). Well, the original Energizers went dead, and all I had on hand were these cheap Panasonics (the kind you get at the dollar store, 4/$1). When I turn it on, it seems to take it's time, whereas before, it would "snap" on, and often display some garbage for a fraction of a second. Are/were either of my batteries doing the unit harm? These were sitting around for a while, so possibly they're not at full capacity (I could try a fresh dollar store batch I guess lol). Should I use a particlar type of battery? Does anyone bother with rechargeables in their calc?

Re: why should I want a 48 series? (having already bought a 49g)

*Message #2 Posted by **Ron Ross** on 2 Mar 2006, 12:36 p.m.,*
in response to message #1 by Chris

The 48G has a lot less memory and No real CAS in comparision. But it has real Hp quality buttons and is actually just as fast (or even somewhat faster, I am talking about the 48G w/32K RAM only). It also has a built in equation Library, which I have on several occasions made good use of.

If I had to choose between a 49G and a 48G for a calculator to use for general use, I would, without hesitation, grab the Hp48G.

Which do I have in a desk drawer at work? Well, I have a 49G, because I have quite a few special programs and these programs would overfill/overload the RAM on a 48G. And I have another Hp to actually crunch numbers on. The Rubber keyboard on the Hp49G just doesn't compare to a real Hp keyboard.

Now if you really meant that you have the NEW Hp49G+, you probably would not appreciate an Hp48G nearly as much (unless you have a 49G+ that has a bad keyboard/ older ROM). The Hp48G is Slooooow in comparision, and Hp has re-included the eq library in the 49G+.

My quick comments:

48G well built, nice layout, somewhat slow 49G Still well built but offered with Rubber??? keyboard, still slow 49G+ Not so well built, FAST!, returned to plastic keyboard, but went cheap on the keyboard construction (the heart and soul of every calculator). But it is also less than one half the cost of the original Hp48 series, so you get what you pay for.

I'd say snag the 48G if you want a quality calculator. $50 at Walmart will buy you a new Hp33s. Which is the better buy?

Of course if you are an engineering student, you should buy an Hp33s to use for a future EIT or PE exam.

Long live Sharp ! :-)

*Message #1 Posted by **Vincent Weber** on 2 Mar 2006, 11:31 a.m.*

Hi all,

Just to say that Valentin is not the only one to support Sharp's past glory - I now got converted ! :-)

I purchased from Ebay various Sharp Basic machines. I especially fell in love for the PC-1262. Why? It is not a super-powerful machine, but it has the best ratio power/volume (or weight) that I have ever seen, and is soooo cute. Its characteristics are quite amazing:

-Beautiful, shiny metal, horizontal design, with very small yet useable keys (full qwerty keyboard). They don't do things like this anymore! Nothing to envy to the design of the HP-15C, and ever more compact. To me this makes this device the most relevant today: we tend to prefer a laptop to a bulky pocket device, but a *truly* pocket device is still most valuable.

-Full I/O with a comprehensive docking station, a printer and inexpensive tape to load/save programs. Out of the tens of pocket machines HP released, very few had full I/O, i.e. the ability to enter programs in another way than your fingers: namely, the 65, the 67, the 41 series, the 71B, the 48 and 49 series and the 95/100/200LX palmtops. That's all folks! And none of these machine even comes close to the PC-1262 in terms of pocketability. The 15C and 42S would come closer, but do not have this I/O functionality.

-10Kb of memory, with an efficient way of tokenizing keywords. That is to say, more than *any* pre-RPL HP calc... Enough to store faily large programs, all the more that you got I/O for 'mass' storage.

-2-line display of 24 characters. Enough to review programs comfortably.

-A nice equation feature, with long variable names. Regretably not integrated with a solver feature a la 27S, which would be really great, but still quite useful.

-Comprehensive help menus.

-program labelling (18 choices, with overlay), a bit similar to the 41 series 'user mode', with the ability to assign any character string to a key. This is somehow more elegant that the Casio way of doing things (10 independant program spaces, with no naming), even though it can be cumbersome to have a global numbering space for BASIC lines. Best would be to have the ability to define new functions into the system. The HP-71B does this well, but with single-letter names only, and is bulky with a ridiculously small screen. The best machines to do that, if you want BASIC, are actually... The TI-89 and the TI Voyage 200 ! Maybe I will do another 'long live TI' topic :))

-Fast and powerful BASIC otherwise, and entry recall convenience.

In short, a wonderful little machine.

I also purchased a PC-1360, with a nice 4-line graphical display. I thought that Casio invented the graphic calculator in 1985, but I was wrong. The very first machine with graphical capabilities was indeed the PC-1350 (my 1360's little brother) as early as 1984!

HP still has a major strength, though. If you look at the Sharp PC-1475 with matrix capabilities, you will see that this functionality is only available in interactive mode, not as a 'toolkit' to use in your own programs; how unlike the HP-41 with Advantage Pac, the HP-15C, the HP-42S, the HP-71B with Math rom, and the 48 & 49 series, which all feature seamless integration of matrices in the programming system, with the ability to define new functions...

But overall, Sharp produced wonderful machines, especially the PC-1262 which can fit in the smallest programmable casio (fx-400Op) case, and yet deliver such power.

Sharp is dead today, as far as nice machines are concerned - but let's honor its past glory...

Cheers,

Vincent

*Message #2 Posted by **Marcus von Cube, Germany** on 2 Mar 2006, 12:28 p.m.,*
in response to message #1 by Vincent Weber

I bought the predecessor of the PC-1262, the PC-1260 with less RAM (4KB), when it was still in the shops. The main reasons were the luxury display and the small size.

But there is a drawback to pocketability: You need tiny fingers for the alpha keys which measure just 3.5mm x 3.5mm with 4.5mm spacing between them. You really do not want to edit large programs on the machine.

Performance is in the same league as the Casio pocket computers of the same era, but less then the home computers existing at the time.

With some recent developments you can even interface a PC to these little cuties, just connect the cassette interface to the sound card and use software from The Pocket Computer Museum. I've recently made some additions to wav2bin to make it read data files, too (not yet on the museum pages but you can ask me directly.) What's still missing is a BASIC tokenizer to create wave files from ASCII program text.

in response to message #1 by Vincent Weber

Hello Vincent,
just to say that we must have similar taste... :-)

I, too, recently bought a couple of 1262 and, some months back, a 1360. These machines are amazing: well built, quite fast and really pocketable (at least the 1262).
As Marcus wrote the 1360 is a better choice when typing and reviewing programs.
I'm glad you posted your impressions.
Greetings,
Massimo

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 2 Mar 2006, 6:17 p.m.,*
in response to message #1 by Vincent Weber

I love my PC-1260 too, and I "upgraded" it from it's 4KB SRAM to 10KB (actually 16KB) SRAM (a 32K chip, what a waste...). If I can find my hand written annotations of how I did the modification I could post... I used the same original CMOS glue-logic chip, besides the new 32K chip, added some tiny wiring and some tracks cut... Now I can program it in assembler on the "extra" 6KB! A very nice machine, indeed!

Best regards,

Nelson

P.S. My PC-1260 (with cassete/printer CE125) came from Germany, Berlin - what a long trip to Brazil, about 3 months!!

*Message #5 Posted by **Bill (Smithville, NJ)** on 3 Mar 2006, 6:00 a.m.,*
in response to message #1 by Vincent Weber

Hi Vincent,

I totally agree with you. The Sharp Pocket computers are really amazing for their size, power and capabilities. My second PC was a Sharp 1500 with the 4-pen color plotter/printer (My first PC was the TRS-80 Model I). It's quite a bit bigger than the small Sharps that you have, but had a lot of power.

I have just started collecting a few of the 1500A this year, mainly because several came up on e-bay that had HVAC Loads/sales/economics modules. I am now the proud owner of the Lennox Logic Residential Savings and Loads modules plus a module by Rheem. I just this last weekend obtained some working pens and had the great joy to see and hear the little plotter in action. Love that clickty-clack sound.

Does anybody know how to revive dried-out plotter pens?

Also, does anybody know how to do a dump of the modules? They seem to be protected so I can't list them out. When I hit the break key, I get the standard message Break in Line XXXX, so I'm assuming that the modules are programed in Basic - so they sould be listable.

Thanks,

Bill

Re: Long live Sharp ! :-)

*Message #6 Posted by **Klaus** on 3 Mar 2006, 7:44 a.m.,*
in response to message #5 by Bill (Smithville, NJ)

Hi Bill,

to refill the pens, I drill a small hole in the back (0.8 mm or smaller) and use an injection+needle to fill it with standard ink. Close the hole with some adhesive. Dried pens are harder to revive, but it's not imposible. I also have a PC-1500A with a 20k? memory module (total amount: 28K). I am looking forware to aquire a working PC-1600 with plotter in the future, mostly because of the analog input and the big plotter.

BTW. refill the pens over the kitchen sink. It can make a lot of mess. I also made some gears for the plotter, because mine did not transport the paper (broken gear).

Have fun! Klaus

Re: Long live Sharp ! :-)

*Message #7 Posted by **Bill (Smithville, NJ)** on 3 Mar 2006, 10:43 p.m.,*
in response to message #6 by Klaus

Hi Klaus,

I would've never thought of trying to refill them. I'll have tro give it a try. I guess a standard inkjet cartridge refill kit could be used. I think some of them are syringe/needle style.

I don't think I'll use the sink. Don't think the wife would appreciate the mess. But an old bucket would do fine.

I'm thinking of trying a ink removable soution to see if the dried out pens can be revived.

Marcus - thanks for the contact on the Pens. I've enterend in my book for future reference. I just received a package today - another PC-1500A from e-bay that came with three sets of color pens and two sets of black pens - all still sealed in original packaging. Tested one set out and they work great. So I'm stocked up on pens at the present. Unit also came with a very interesting 16K CE-161 memory module. It's battery backed up (battery is dead) but has a switch so that it can become read only once it's programmed. In it's standard configuration, adds 16K to the base memory of the unit.

Bill

You can even buy new pens in Germany. A small company, dealing with medical equipment, has replacement pens. These plotters seem to be used in some expensive devices, so it does pay off.

Here is the contact:

Name: Peter Laß Email: christiane.lass@t-online.de

in response to message #8 by Marcus von Cube, Germany

There's a guy in Italy who sells replacement pens for Sharp. He advertises on eBay all the time. Search for his ads for color pens. They're $13.00 USD but if you're ordering from Europe, he can probably give you a better deal.

Re: Long live Sharp ! :-)

*Message #10 Posted by **Bill (Smithville, NJ)** on 8 Mar 2006, 7:05 a.m.,*
in response to message #9 by Tom Lake

Hi Tom,

I just received yesterday two sets of pens from the gentleman in Italy. While not in the original Sharp Packaging, they are in the standard plastic tube and work fine. They were sent by regular certified Italian Mail and took three weeks to get.

I had already ordered the two sets from him before I was successful on obtaining several sets off e-bay. So I am now well stocked up on both color and black pens.

Bill

Hi, Vincent:

Vincent posted:

" Just to say that Valentin is not the only one to support Sharp's past glory - I now got converted ! :-)"

> Congratulations for your recent acquisitions and thanks for posting your first impressions. I have a hunch that many people who love classical, vintage HP calcs do also love vintage SHARP handhelds, and even more, many more HP-calc lovers would also love SHARPs if only they would get to know them.
>
> Why do I say this ? First of all, most times I've posted something mentioning SHARP models, a number of people stated that they also had and loved them or would like to get them.
>
> Secondly, whenever I've shown some of my SHARPs to HP-lover and -collector friends and friends of friends, they've been impressed with their quality to the point of starting their own collections in many cases.

"I especially fell in love for the PC-1262 [...]Its characteristics are quite amazing: [...] In short, a wonderful little machine."

> Indeed, the SHARP PC-1262 is one of the very best small handhelds existing, very powerful and nice to use, a real collectable and a hacker's dream too, what with machine language accessible (PEEK, POKE, CALL) and full I/O !

"HP still has a major strength, though. If you look at the Sharp PC-1475 with matrix capabilities, you will see that this functionality is only available in interactive mode, not as a 'toolkit' to use in your own programs;"

> It's far simpler for most users. Not everyone is a 'power user' which feels comfortable writing programs for its machine, and the full-fledged, stand-alone program or operation is much easier to use than the toolkit, keyword approach, which mostly requires you to write some program using the provided keywords to get the work done.
>
> Even myself, at times, find it less tiring to simply use the convenient and comfortable prompting applications provided than to, say, having to manually specify the option base (OPTION BASE 1),

dimension the matrices (DIM A(10,10),B(10,10),C(10,10), input the data (MAT INPUT A,B), and then solve the systems (MAT C=SYS(A,B)) and output the results (ENG 5 @ DELAY 1,1 @ MAT DISP C). Not to mention you must remember proper syntax and try and interpret any error messages you might get ! :-)

Also, the SHARP PC-1475 matrix capabilities are *fully machine-language programs*, not BASIC code in ROM. This means they work extremely fast and reliably, using internal extended precision. The corresponding applications in, say, the original HP-41C Math ROM were user-code, RPN programs, not machine language. The Advantage ROM provided both user-code RPN programs for normal users, as well as 'toolkit' machine language keywords to be used by power users in their own user-code RPN programs.

Thanks (and congratulations) again and

Best regards from V.

Speaking of Sharp calculators (computers?) and assembly language, has anyone tried to program an RPN "operating system" on them? My PC-1260 has a "spare" 6KB (6800h~7FFFh) after I made the modifications on its memory module, and I need some help on doing that. Volunteers?

Best regards to all,

Nelson

Re: Long live Sharp ! :-)

*Message #13 Posted by **HrastProgrammer** on 4 Mar 2006, 1:44 a.m.,*
in response to message #12 by Nelson M. Sicuro (Brazil)

I have done this on PC-1251 (very simple version) and PC-1403 (advanced version with ALPHA, comparable to HP-41C).

These are (names are based on the year I developed them):

HP-87C for PC-1251
HP-88C for PC-1403 (like HP-87C but for PC-1403)
HP-91C for PC-1403

HP-91C has ALPHA mode, multiple programs ability, ASN keyboard assignments, 126 flags, 208 bytes free for programs/data (with SIZE), 27 separate ALPHA-addressed registers (A..Z) and many advanced instructions like FOR, TO, STEP, NEXT, START, LOOP, SKIP, READ, DATA, RETRY, PULL (?!?), CLR, INC, DEC, DSTO, DRCL, DEXC, ... Its size is about 6.5K and it uses almost all PC-1403 memory leaving just 100-200 bytes free for a simple BASIC program. It was developed and entered using POKE.

HP-87C/88C source code exists only on paper but I think I have the HP-91C source code somewhere in my archive ...

I also manually disassembled the whole PC-1251 24K ROM (8K internal CPU ROM + 16K external ROM): a little BASIC program displays the 8 successive bytes and I disassembled them by hand (two

weeks of work if I remember correctly). I had all SC-61860A instruction codes in my head these days (I even remember a few of them today) ...

Hi!

Good to hear that, it appears to be very interesting. I have a spare 6KB to play with! I know the 61860 asm a little and I have some descriptions of the opcodes and Sharp internals. Can you share this programs? This is really a very good add-on to these little marvel machines... Did you made any keyboard overlay?

Best regards,

Nelson

Re: Sharp RPN (was: Long live Sharp ! :-)

*Message #15 Posted by **HrastProgrammer** on 5 Mar 2006, 1:55 a.m.,*
in response to message #14 by Nelson M. Sicuro (Brazil)

Hi Nelson,

Yes, I can send a source and hex dump of the program to you but there are a few problems:

(*) I don't have any other docs about HP-91C program in electronic form - I documented it on paper only. I haven't had a computer these days so everything had to be done on paper, in head and directly on the calculator using PEEK/POKE/CALL. I have a lot of info about these calcs in paper form but I really don't have time to retype it.

(*) The source code is not commented. It is disassembled using standard SC mnemonics of these days with the inclusion of a few instructions which I discovered by myself (CASE, TABLE, ELSE, ...). A few years ago I found these instructions documented on some Web page (with different names, of course) but they didn't exist in the SC docs I had in the end of '80s.

(*) I am not sure if this source is 100% correct. It was disassembled after I got my first 286 PC and wrote a SC disassembler for it. As I didn't own an interface I had to retype the hex dump from the calculator into PC and there is a chance for errors. That was in '91 and then I called it HP-91C although it was developed in 1989.

(*) If you want to use it on PC-126x then you will have a lot of problems because I used PC-1403 ROM calls very much in order to save space. And giving the fact that PC-1403 has bank-switched external (outside CPU) ROMs (4x 16K banks) it makes it even more complicated.

So, if this is OK then send me a mail and I will send a source to you. BTW, I haven't made any overlays because I got used to it and I knew the keyboard layout in my head. This is the case with all my emulators, as well :-)

Best regards.

> Quote:
>
> My PC-1260 has a "spare" 6KB (6800h~7FFFh) after I made the modifications on its memory module

Is there any kind of documentation regarding this modification?

I'm sure I read about that and about a similar modification involving a 32Kbytes chip covering all the available memory space including the "hole" inside the video ram (2080h~27ff)...

Re: Long live Sharp ! :-)

*Message #17 Posted by **Nelson M. Sicuro (Brazil)** on 6 Mar 2006, 1:08 p.m.,*
in response to message #16 by Chris Roccati

I have some hand written boolean equations I have used to convert the addressing of the original SRAM chips to the 32KB chip (using only 16KB) - and they can't use the "hole" in the display RAM, it requires an internal modification - I only modified the SRAM/ROM card of the PC-126x.

I'll search my documentation and I'll post for shure when I find it, but it is "buried" on my paper piles... this can take a while...

The original PC-126x internal memory card addresses SRAM from $4000 to $67FF, a "hole" from $6800 to $7FFF, and ROM from $8000 to $FFFF. My adaptation enabled the SRAM from $4000 to $7FFF, but the BASIC only "see" up to $6800, using only 10KB. I have scanned pictures of this modification. The last 6KB can be used in assembler programs.

Best regards,

Nelson

*Message #18 Posted by **Nenad (Croatia)** on 3 Mar 2006, 3:51 p.m.,*
in response to message #1 by Vincent Weber

Fully agree, Vincent!

Just to add a little bit of information about SHARP PC-1262, with respect to its PC connection. A year ago I obtained Transfile PC Plus (DOS application) with an interface cable to connect a SHARP to the parallel port on the PC. It came just as an addition to my SHARP 1403H (that I always wanted to have).

Now, in addition to connecting a SHARP to PC by a CE-124 interface via PC sound card, Transfile performs data transfer in ASCII form without any conversion to WAV format. You just select your SHARP computer type and select upload/download. It works perfectly for 1401, 1403H and for 1262! I have not tried it yet for a SHARP PC-E500, though it might work (at least it can be connected)!

Next issue: the manual in English. I have never found one in a downloadable form, but the one for PC-1251 can be used without a problem. As I understand, the basic (maybe the only) practical difference between the

1251 and 1262 (neglecting the amount of RAM) is a single vs. two-line dsplay.

Yes, the form factor of 1262 is very convenient. I would have never noticed this, unless Valentin (big thanks) have pointed this out, before I grabbed one on German eBay. They are still rather inexpensive there.

The issue that I do not like wrt 1262 is that you have to type: eg. <S><I><N><4><5> instead of <SIN><4><5> on a 1401/1403H. In addition to this it does not separate thousands eg. 1234556.27 instead of 1.234.556,27 - but who cares.

All in all it is a very nice machine. I find it very useful. When my son chalenged me how to print out a series of Fibonacci numbers, before he shows off with his program in C++ (he is sixteen), I grabbed 1262 and did it in exactly three simple lines of code. Yes, yes, Fibonaccy numbers are not a big issue at all, but my 1262 is in my shirt pocket and his C++ works on his 3,5 kg notebook PC-this is the difference.

Sorry Dave, to write this much about Sharps, but they are just beautiful

Proposal: Registration Must be Mandatory

*Message #1 Posted by **Valentin Albillo** on 2 Mar 2006, 9:19 a.m.*

Hi, all:

I've been frequenting this forum for several years now, and I'm frankly absolutely disgusted and upset with the increasing rate of 'unpolite people' (for lack of a stronger term) which hide behind anonymity to post all kinds of attacks, disrespectful remarks, and such.

Besides, there's the fact that a number of otherwise intelligent contributors cannot resist the bait, and usually do reply to that kind of posts, to the utter delight of the moronic trolls, whose only purpose is to waste precious bandwith and time, as well as filling the forum (and eventually the archives themselves) with any number of threads, most of them repeating *ad nauseam* the usually insulting "Subject:" of the original poster.

I think this is **unacceptable**, and further, I am even against hiding one's identity from the rest of the contributors, even if not insulting anyone. It's unpolite, it's unrespectful, and I for once wouldn't accept any opinion from anyone at all if talking to me or trying to argue with me without properly introducing themselves.

That being so, I'm not for suffering that improper behaviour here as well, so I firmly make a proposal and two statements.

- The proposal: that to be able to post to this Forum, registration with a valid e-mail address and other data shall be **absolutely mandatory**.
- The first statement: Personally, I won't reply, nor read, nor communicate in any way with anyone who hides themselves under any kind of obvious alias, fake name, or whatever that I might detect, and strongly suggest that the rest of you do likewise. If noone will read nor reply to the obviously anonymous posters, no matter the content of their messages, perhaps they will learn and use a proper identity. Else they will be absolutely ostracised and will probably leave. Good riddance !
- The second statement: Mr. David Hicks is perfectly entitled to do whatever he wishes with his forum, and to stablish or enforce any policies he wants to. But I'm equally free to stop visiting and contributing to this forum if I don't like them, and if nothing is done to stop dead on its tracks this constant posting by anonymous non-persons, I for once might consider leaving as well if I feel I can't stand it anymore.

Your opinions welcome and thanks for them.

Best regards from V.

You got my vote!

in response to message #2 by Massimo Gnerucci (Italy)

You also have my vote, even if I'm here since not a long time...

Re: You got my vote!

*Message #4 Posted by **Wayne Brown** on 2 Mar 2006, 10:20 a.m.,*
in response to message #2 by Massimo Gnerucci (Italy)

I agree. If someone has a legitimate need or desire to use an alias or nickname, I don't see a problem, as long as it is used *consistently* and Dave knows who it really is. Requiring registration would make that possible. But being able to use a different alias for every message and not having a record that points to an actual person makes it too easy for the sort of cowardly sniping we've seen here lately.

It's a shame it's come to this, as the majority of the people here are mature enough to behave properly without needing a babysitter. But as in many other situations, it only takes one person who feels "above the rules" to make things unpleasant for everyone.

I differ

*Message #5 Posted by **Klaus** on 2 Mar 2006, 10:28 a.m.,*
in response to message #1 by Valentin Albillo

I do not think you can stop by a mandatory registration the trolling. There are many "sign up for free" eMail accounts, and it is impossible to have a list of all and exclude them. On the other hand, you cannot make a list of "valid" eMail providers to allow only these. So any troll can register, and continue trolling.

I don not think trolls come here for fun, it seems to be kind of revenge for harsh comments. With regards to OpenRPN: I too wanted to support the project at the beginning but soon became frustrated , mostly by the organization of the project. I know of others having experienced the same, and maybe this lead to comments about OpenRPN. Some newbies show up on this forum and often cause controverse discussions, which also create frustration on both sides and may cause the trolling.

We all visit this place for fun, so let's treat each other positively and let's control ourselves.

Just my opinion!

Cheers, Klaus

How about a "Registered Users filter"?

*Message #6 Posted by **Paul Brogger** on 2 Mar 2006, 10:49 a.m.,*
in response to message #1 by Valentin Albillo

How about a new Forum feature whereby the chosen view (Daily, Full, Archive, and Search) could be optionally filtered to include only messages posted by registered participants? (I'd be surprised if this proposal is at all novel -- no doubt it has been mentioned before.) Technical difficulties aside, it might offer the best of both worlds.

Filtering, etc: Four Plausible Options

*Message #7 Posted by **Valentin Albillo** on 3 Mar 2006, 8:15 a.m.,*
in response to message #6 by Paul Brogger

Hi, Paul:

Paul posted:

"How about a new Forum feature whereby the chosen view (Daily, Full, Archive, and Search) could be optionally filtered to include only messages posted by registered participants?"

Yes, it's certainly one of the best options. It seems to me that **there are 5 main options** to deal with this alleged problem, in order:

1. **Registration with valid data is mandatory for posting**, so that only registered users can post to the Forum, though anyone at all can *read* messages in the forum without registration being required.

   This is the usual accepted practice in most if not all professional forums dealing with software, hardware, and most other serious disciplines. Professionals do not have the slightest desire to deal with spammers, trolls, and other unpolite species, nor can they afford to lose any time dealing with them. While I understand this is not a 'professionals' forum, I don't quite see why we have to resign ourselves to lower standards.

2. **No registering, all messages by unregistered users aren't posted immediately but they're sent for moderation instead**. They'll only get published if they pass the moderating process.

   However, this will mean more work for Mr. Hicks and/or other appointed moderators, and can bring issues about uneven moderation policies, etc.

3. **No registering or moderation, but visitors can either see all messages or filter out the ones submitted by unregistered users.**

   This would mean little, one-time work for Mr. Hicks, and it's quite similar to the Adds/Adds Without Auctions already in use.

4. **No registering or moderation, but each visitor can filter out messages from any users they don't want to see** (PLONK!), so that messages from the users included in that list will not appear.

   This means keeping a filter list per user, but this is not too much work and the list can be stored as cookies with the rest of the Preferences in each user's own PC. This makes the filtering process absolutely individual, but messages from new spammers/trolls/morons won't get filtered out the first time, so we all will still get to see them and this doesn't actually solve the problem.

5. **Doing nothing about it**.

   This is an option, but I don't honestly think it's the best one, specially in the long run. Spammers/Trolls/Morons will only increase in time, and sooner or later something will have to be done about it. That being the case, 'Sooner' would be more sensible.

Personally, **I would vote for option 3 above**, but whatever is done (or not done) I'll firmly stick to my two statements, the first one in particular: *I won't communicate at all with anyone whose identity I don't know, whatever they might have to say or ask.*

I've been long enough in professional circles to suffer unprofessional behaviour and I'm certainly not used

to anyone talking to me in person or calling me by phone to say something to me or ask something from me, without previously introducing themselves properly. I'd be surprised if you are.

Best regards from V.

I do not think this is a proven fact.

I differ too.

*Message #9 Posted by **Etienne Victoria** on 2 Mar 2006, 10:56 a.m.,*
in response to message #1 by Valentin Albillo

Hello Valentin, all.

I also differ for the same reasons as Klaus' even if I'm also fed up with the moronic posts.

As I remember an anonymous contributor who posted VERY interesting contributions a few years ago, I wouldn't like him to be censored/excluded just because he wanted to stay anonymous.

Valentin, maybe you remember his pseudo : "Ex-PPC Member"

Best regards from France.

Etienne

Re: I differ too.

*Message #10 Posted by **GE** on 3 Mar 2006, 4:54 a.m.,*
in response to message #9 by Etienne Victoria

Hello,
Mandatory registration will not solve the problem, but will block welcome newcomers.
Being able to post somewhat freely is a great thing in these times of more and more limited citizen rights.
You know what I mean, not only in remote countries but in the US too (from what I hear from my place).
Freedom doesn't come for free, it must be fought for every day like the founding fathers said (from what I know). Fear gives power on your life to others.
The general tone of the posts here just make it hard to behave badly.
Of course, I can stand this position because I'm not the one who does the clean up - so it is all in Dave's hands.

Regarding the possibility to edit a post, I don't care as I re-read anything to be posted here at least once.
Mistakes are part of life, who would criticize you for an error made in good faith ?

Re: Proposal: Registration Must be Mandatory

*Message #11 Posted by **Dave Hicks** on 2 Mar 2006, 12:54 p.m.,*

in response to message #1 by Valentin Albillo

I've been resisting this for a long time because most of the abusive posts over the last years have been by a single person. However, it's becoming clear that he needs a little more help than just the occasional deletion of his worst efforts.

The new forum software that I rolled out last year has a number of features to at least slow down abusive posts. So far, they've been turned off, but I'm probably going to turn one or more of them on for a while. I can set it up so people must register, but I can also set it up so unregistered posts must be approved before they appear. I'll probably try the latter first. I'm going to continue to go slow because I don't want to make it too hard for newbies to ask a question due to one person.

I would also like to remind registered users about the "Report Post" link on each message. Sometimes I get busy and abusive posts slip under my radar. The "Dave Hicks doesn't like free speech" post has already been reported this way but I'm leaving it for now. I'd rather have him attacking me on my forum than his usual targets. In 2006, the "report post" feature has only been used 4 times - and the first time was just a few days ago. (And all reports were about the same person.) I want to encourage people to report early and often. There's no need to wait until you're boiling mad. I may not take action on every report but I won't penalize anyone who reports a post either.

Re: Proposal: Registration Must be Mandatory

*Message #12 Posted by **Massimo Gnerucci (Italy)** on 2 Mar 2006, 1:12 p.m.,*
in response to message #11 by Dave Hicks

Thanks Dave,
I think that your approach could be the right one, at least for now.

That said I don't see why anonimity should be a must and registration felt like an imposition: you don't want to appear under your real name? Fine: choose an alias and stick with it. It's the ever changing impersonation of different *characters* that makes me mad.

I, for one, like to build my *e-vision* of the friends I knew here. Not knowing who is writing what simply destroys these *e-images*.

Greetings,
Massimo

*Message #13 Posted by **bill platt** on 2 Mar 2006, 1:28 p.m.,*
in response to message #11 by Dave Hicks

On the topic of newbies: I have seen plenty of newbie questions. Of course the most common one is the 12c comma-decimal format one. Luiz and I and others all "compete" in a friendly way to help those posts.

I don't have statistics, but I think you might find that there are a good number of newbies showing up from time to time. Not all of them become regulars. But I think they pretty much all go away smiling.

I know I was smiling when I first discovered this site :-)

Hi Bill, guys;

Just to thank you, Bill, for mentioning my name this very considerable way. I appreciate.

This is one of the main reasons I read the subjects everyday: guys like Bill that are here to tell us we make a difference.

And that politeness is aways welcome d8^D

Cheers.

Luiz (Brazil)

Thank you, Dave, but I have one minor request..

*Message #15 Posted by **Karl Schneider** on 2 Mar 2006, 11:38 p.m.,*
in response to message #11 by Dave Hicks

... could you please restore the ability to edit posts after a reply is posted? The restriction was imposed after minimal "voting", in response to the, um, "DW" stuff a few months ago.

Most of us want the ability to correct things after-the-fact, and would not embarrass anyone by changing the meaning of a post after a response.

And, once again, I offer a sincere thanks for the service you continue to provide us.

Best regards,

Karl Schnneider

OTOH, a question not worth going through the registration process for it is likely a question not worth being answered.

Thomas

I'd vote for massime disregarding the unwanted visitors

*Message #17 Posted by **Vieira, L. C. (Brazil)** on 2 Mar 2006, 1:12 p.m.,*
in response to message #1 by Valentin Albillo

Hi Valentin, all;

thank you for inviting us all to post our opinion about your suggestion.

I know it is actually unpleasant to 'see' such a place being invaded by unpolite people. But I'd not interfere in

Dave Hicks´ main interests, which are based on a place free for users with the same interest.

I for one read and contribute only with the subjects that are of common interest, but this selection is based on my onw judgment and I may fail, too. Some (not all) of the issues that I do not see as for common interest are:

1 - e-bay policy;
2 - auctions and related 'actors' in general;
3 - other-brand equipment than Hewlett-Packard´s.

By no means reading about these subjects is annoying for me, and I'd never complain. I just mention here that they do not seem to completely fit in a Hewlett-Packard dedicated site, but this is just my opinion. Also, some (not all) issues that are not related to the main subject of this e-museum but I like to read and contribute with (when I'm not the one calling them myself):

1 - Hewlett-Packard technology in general;
2 - Scientific, Math and cultural related issues and subjects.

I confess I have added a few comments, mainly funny stuff, without using my personal ID when the subject (or the poster himself) was not serious, like some Coburlin related posts. I also did not like the last policy that does not allow us to edit posts after at least one answer is added, because if I have to change or correct something I wrote, that would be because whatever I wrote is my responsibility, so I should have the right to step back and retreat. And the guy that started the discussion that ended up in this particular policy was a new visitor/contributor at the time, and it seems to me he is no longer posting. If he is reading, I cannot say.

But I think these decisions are up to our host, Dave Hicks. He 'owns' the place, I am a guest. I for one do not participate in any other e-forum but the MoHPC Forum because of so many reasons that I may not even remember them all (I read some posts in a few of them and I did not identify myself with them). And although this particular, above mentioned last policy looks to me as not exactly MoHPC Forum related because of the main profile of the regular visitors, I'm still posting and will be posting for as long as I make a difference.

If Dave Hicks agrees with these suggestions and they do take place, I'll accept them and will do whatever needed to fit in. It´s worth doing, for the sake of keeping the good relations and spirit.

If we all are conscious about our actions, none of these would be needed; neither would we be talking about this. I confess I feel uncomfortable when I'm told to do what I am already doing, and that what I have never done and will never do is forbidden, and that it is mandatory and that I'll be watched to make sure I'll keep this way.

But these are my opinions.

Cheers.

Luiz (Brazil)

*Message #20 Posted by **Bob** on 2 Mar 2006, 3:11 p.m.,*
in response to message #1 by Valentin Albillo

I try to make it my personal policy to not register for any board, chat group, or message system if at all possible. So, if this board goes that way, I will likely just drop off from posting. I don't usually make inflammatory posts, I just don't feel it is necessary.

This is for fun, and it should stay that way.

One way that Dave might handle it is to empower a certain number of "Moderators" who frequent this board in such a way as to cover the times when he is busy in other activities. I have seen this work in other areas.

...certainly the choice of moderators would have to be made carefully to ensure a consistent standard of adherence to the board "rules of conduct".

Re: Proposal: Registration Must be Mandatory

*Message #21 Posted by **Garth Wilson** on 2 Mar 2006, 3:51 p.m.,*
in response to message #1 by Valentin Albillo

I'm on a microprocessor list serve on Yahoo that people have to register on in order to post, but the requirements apparently are too easy and the forum was mostly destroyed by spammers a couple of years ago. It's still there, but there's no activity because the spammers left such a bad taste in everyone's mouth.

I'm on another related forum that's on a website using phpBB. People sometimes sign up just so they can post spam; but since it's not a list serve, the spam gets deleted before most members get around to checking for new posts every day. Spammers are shown the door when their spam is deleted. There's nothing to keep them from signing up again, but it would be too time-consuming to keep doing it over and over for their advertisements that almost no one will see.

A microprocessor design list serve I'm on required quite a stringent sign-up procedure. I felt like I had to apply, present a resumÃ©, and write an essay on the subject to prove I wasn't there to post spam. I didn't really mind, but as you can imagine, there's hardly anyone on that forum and it goes for long periods of time with no activity at all. That's definitely not the way to do it on the other ones if you want to encourage new enthusiasts to ask their questions and get some help.

None of these forums require actual names, but it doesn't really matter since posters' "handles" are shown automatically with every post. Most people give their names anyway, even if their chosen handle is their amateur radio licence call letters or whatever else. I don't remember any insulting or outright hostile posts on any of these, although one of the most knowledgeable and helpful people on one of the forums does have an

abrasive way about him sometimes. He knows it and he's improving though. Seeing others always respond graciously and being given credit when appropriate has an effect on one.

I hope this is found to be relevant and helpful.

Re: Proposal: Registration Must be Mandatory

*Message #24 Posted by **Bill (Smithville, NJ)** on 2 Mar 2006, 7:13 p.m.,*
in response to message #1 by Valentin Albillo

I guess I might be included as one of those "anonymous" posters, although I always include the (Smithville, NJ) in my Name and have included my e-mail address at various times in my messages. So, hopefully most of you know who I am.

I have mixed feeling on requiring a Registration in order to post. I would probally register, if it was absoultely required, but at the same time would probally resent it. At present, I have over 50 different accounts at various web sites. Some are forums such as here, others are web sites required for my work. It gets over wheming to try to remember my login's, passwords, etc. I have actively taken the approach to NOT register unless I absoutely have to. The Web site has to provide some direct benefit to me in order to get my registration. Obviously, the HP Museum site would qualify.

As to the posts that we all feel are inappropriate due to either content, those trolling for an argument, those posting just to get a rise out of us, etc....

Well, if we each just exercised a little restraint by NOT responding to them or rising to the obvious bait, then most would just go away. I have seen several instances where the original poster was "looking for an argument" and what do we do - we rise to the bate by responding. There's nothing like no respose to cool most inapproprate posts.

Of course, this is just my opinion.

If Dave wishes to impose a manditory registeration, I will register. Otherwise, I'd perfer to continue as I do now.

Bill

> It gets overwheming to try to remember my logins, passwords, etc.

I feel your pain, but that's just the way it is these days. It's something I had to learn to cope with while working for a certain major U.S. telecommunications company, where at one point I had about a dozen different logins within the company alone... Add things like Amazon.com, my bank, several airlines, etc., to the picture, and there's just *way* too much to remember.

I solved the problem by buying some software that lets me store passwords, encrypted!, on my PDA. That way, the only password I have to remember is the one that lets me into that software.

Don't get me wrong, I'm not trying to push anyone into buying a PDA and software just to cope with trolls. But, the days when the Internet was a civilized place are pretty much over... It's just like a formerly pleasant neighborhood gradually going bad. If you can afford to move to a nicer neighborhood, by all means do, but otherwise, invest in some good locks.

in response to message #1 by Valentin Albillo

The one thing that experience of Usenet groups and web sites like this has taught me is that the strength of the community is what prevents the problem of trolls and spammers getting out of hand, just as in the real world, the strength of a community is key in dealing with other forms of anti-social behaviour. This community is strong and will easily overcome its occasional problems.

I'm always cautious about the use of technological solutions (registration and/or moderation) to address what are actually social problems.

Re: Proposal: Registration Must be Mandatory

*Message #28 Posted by **Stephen Easterling** on 3 Mar 2006, 9:09 a.m.,*

Not only do I agree, but I also believe that each user should be required to register in the "Biography" section.

Re: The necessary condition for registration...

*Message #29 Posted by **Nenad (Croatia)** on 3 Mar 2006, 4:17 p.m.,*
in response to message #28 by Stephen Easterling

...is to be a formal proof that you have collected at least two thousand HP calculators by the time you register and that you recharge them on a regular basis. You shall deposit a list with their serial numbers in moHP, somewhere in a form that cannot be publicly seen.

Additionally, you should prove your ability to develop an emulator of, say HP97 on a, say, fax machine or a toaster.

This will keep the moHP community clear!

...I just couldn't resist...

Now seriously, I completely share Valentin's and Dave's opinion about registration, though it would prevent me using a young-girl's-newbie-nick-name when I need an extremely fast response to my extremely stupid question.

Re: Dave Hicks Doesn't Like Free Speech

*Message #7 Posted by **Donald Leonard** on 2 Mar 2006, 3:14 p.m.,*
in response to message #6 by Vassilis Prevelakis

Again folks, if you can't say something nice, don't say anything. This works especially well here because reaction is obviously what is being sought. The dead silence will speak volumes. Yet, there always seem to be people who can't resist jumping into agitators traps. This reaction also leaves the impression of eliteism and rudeness when used with visiting newbs asking what are perceived as "dumb" or unsearched questions. Lets just be nice. Either provide friendly help or silence.

is the HP27S a rare model?

*Message #1 Posted by **Gonzalo Fernandez (Spain)** on 1 Mar 2006, 4:59 p.m.*

I have seen in Ebay an HP27S that reached over $390. Is the HP27S a rare model like the HP42S?

Re: is the HP27S a rare model?

*Message #2 Posted by **bill platt** on 1 Mar 2006, 5:04 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

No. Some people get ahead of themselves.

Most of the time, you can nab one for around $60 to $80.

Re: is the HP27S a rare model?

*Message #3 Posted by **David Smith** on 1 Mar 2006, 5:42 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

The 42S is a very common calculator... it's just that those that have them seldom part with them.

Re: is the HP27S a rare model?

*Message #4 Posted by **Stephen Easterling** on 1 Mar 2006, 9:15 p.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

Do a querry on Ebay of "Completed Items" and take the average selling prices of units in good condition and make an inference based on the number you see being sold. Many here that got their 27S calcs got them cheap long ago. I got mine late last year and had to pay as much as my mint 41CX,... and a 27S was harder to find at the time, esp compared to a 41 series or Pioneer. Other high priced models for me included a mint 97, new 48GX, and a mint 42S, but the 27S was the most expensive for me.

Re: is the HP27S a rare model?

*Message #5 Posted by **Karl Schneider** on 2 Mar 2006, 12:22 a.m.,*
in response to message #1 by Gonzalo Fernandez (Spain)

Gonzalo --

Here is a recently-archived post of mine to a similar thread:

HP-27S prices

The HP-27S was an updated version of the LED-based HP-27 of the 1970's. Both were "intermediate" scientific calculators with the financial Time Value of Money (TVM) equation built in. The intended buyer was the Engineering Manager.

The original HP-27 (which is much more rare) was RPN-based; the HP-27S is algebraic.

Re: is the HP27S a rare model?

*Message #6 Posted by **Eric Smith** on 2 Mar 2006, 2:16 a.m.,*
in response to message #5 by Karl Schneider

I wouldn't say that that the 27S was an "updated version of the 27" The only similarity is that both models combine scientific and financial functions in a single calculator. Other than that, they're completely different.

Saying that the 27S is an updated version of the 27 is like saying that a 33S is an updated version of the 25.

Isn't this kind of similarity enough to make such a statement as the one you're referring to? I mean, combining a financial and a scientific calculator is more than remarkably.

> Quote:
>
> Saying that the 27S is an updated version of the 27 is like saying that a 33S is an updated version of the 25.

The 29C would probably be a better choice to compare since the 33S, being the only RPN calculator left, is the top model in this series. I can see a clear line between the 29C, 34C, 32S(II), and 33S.

Thomas

Re: is the HP27S a rare model?

*Message #8 Posted by **Karl Schneider** on 2 Mar 2006, 11:09 p.m.,*
in response to message #6 by Eric Smith

Eric --

Well, yes, my hasty description "updated version" was imprecise. I did describe the the HP-27 as "LED-based", so it's obvious that the two models were quite different in execution, if identical in concept. Examples of real "updates" include the 41CX, 17BII, and 32SII from their original baseline models.

How about "modern re-incarnation"?

Re: is the HP27S a rare model?

*Message #9 Posted by **Jan (CH)** on 2 Mar 2006, 2:28 a.m.,*
in response to message #5 by Karl Schneider

Yes, indeed. 27 S is quite rare and not as popular, maybe because of the lack of UPN. However, its implementation of the solver is excellent; the simplicity of the keyboard with one shift key only (blue) is perfect. When I bought it early nineties, I was very disappointed to figure out, that it had no RPN. After some time I got accustomed to it and started to like its very good algebraic system with better parenthesis implementation than other calcs.

My 27S had been stolen. It took about me almost a year to find a decent replacement and it was quite expensive. However following an advice from this forum, I bought a 19BII and found it a very adequate substitution. The designation "business consultant" is somewhat missleading. It is a general and versatile calc. The solver implemetation has some manor drawbacks, but setting enough parenthesis it does the job very well. And it has some goodies not available on 27S, such as conversions, financial and of course RPN. There are plenty of them around. And even 17BII is adequate and excellent, if you do not need sin/cos/tan functions

Re: is the HP27S a rare model?

*Message #10 Posted by **bill platt** on 2 Mar 2006, 9:22 a.m.,*
in response to message #9 by Jan (CH)

I have both:

I keep the 27s at the office, where it does duty for any equation that I might need to solve a number of times, during a design problem.

I keep the 17bii at home, where it also handles equation solving, as well as tax, investment etc problems. If I'm home and need to solve trig, I pull out my 15c :-) (or my 32s, or my 45, or my.....:-)

The only thing missing on the 27s is a swap key!

Re: is the HP27S a rare model?

*Message #11 Posted by **Gonzalo Fernandez (Spain)** on 2 Mar 2006, 1:14 p.m.,*

awesome responses! This is a really good forum :-) I have all the answers

Re: is the HP27S a rare model?

*Message #12 Posted by **Ron Ross** on 2 Mar 2006, 2:13 p.m.,*
in response to message #10 by bill platt

I firmly believe the Hp27s is Hp's 2nd best calculator ever made. It has built in features that outstrip all other scientifics of the pioneer line. It has a built in clock and date features. And it has the best solver of all the scientifics except for the 48/49G line. And it has a nice TVM program.

It was well made and its only shortcomings (This IS an Hp forum after all!) was its lack of an RPN mode. I would have liked to see matrix support and units conversions tossed in, but it was never meant to really be a design tool that the 42s was.

Many could argue that the Hp41c series was Hp's finest calculator and I cannot argue their points as well as it had superior I/O to the Hp42s or Hp27s family.

I really do not consider graphics calculators, calculators, as they are more like portable math packages and not pocket calcuators.

But these are my opinions only, YMMV.

HP 17BII malfunction: cannot select RPN mode

*Message #1 Posted by **Rafael del Río** on 1 Mar 2006, 3:07 p.m.*

My HP17BII has a malfunction when trying to select RPN mode. When selecting "Modes" it hangs and show a strange display.

During My life I‘ve had an HP 25 for the High school, a 67 for my Chemistry University studies, a 41C used during my military service, a borrowed 38 for studying an MBA, and finally the 17BII.

I bought the 17BII on 1991 BECAUSE it had the RPN mode. some years ago, a friend gave me his HP12C because he did not used it. I left the 17BII at home and used it in few occasions.

Unfortunately I lost the 12C at the airport some time ago

I took the 17BII and the batteries were off. I replaced the batteries and when trying to select the RPN by pushing <Shift>, <MODES> it locked.

I remember that the 41C, could be set in "synthetic programming" mode. What my 17B shows in the display looks very similar.

After reading everything related to 17BII in the forum I learnt very much. I knew that my calc was an “international” model, with 2 ROMs and an extended <MODES> menu

I also learnt how to perform the self test. The result was the following: ROM, DRAM, URAM and KBD were OK. Final message was:

_____

| OK-17B II – I |, (so version I for the main ROM) _____

Then, after pushing a key:

_____

| MACHINE RESET | _____

The forum also show me how to get the version of the ROMs, <CLR>& <4th Menu Key>, then <BACKSPACE>, giving the following display

_____

| 021E8:71FC70E81FC73055 | _____

So there is information there about the 2nd ROM

After that, I tried to select RPN, but no result: same hang-up when pushing <Shift>, <MODES> · Also no result when forcing the machine reset via <CLR> & <3rd Menu Key> · Also no result when forcing a “MEMORY

LOST" via <CLR> & <1st Menu Key> & <6th Menu Key> · Also no result when short-circuit the batteries (without and with batteries, on ON and on OFF)

Now I think that the 2nd ROM – the "international" has some problem, despite the test doesn't show any

I just want to have my old friend RPN mode

Any idea to restore it?

Thank you all

Re: HP 17BII malfunction: cannot select RPN mode

*Message #2 Posted by **Gene** on 1 Mar 2006, 3:11 p.m.,*
in response to message #1 by Rafael del Río

Sorry to say, but no idea at all.

Sometimes these old friends just die. Could be a stray gamma ray from far far away.

These pioneers generally are not repairable. Your best bet to find an original pioneer HP17bII is probably ebay. There are almost always a couple for sale at any given time.

Sorry it died on you like that!

Maybe...(was: HP 17BII malfunction: cannot select RPN mode)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 1 Mar 2006, 5:16 p.m.,*
in response to message #1 by Rafael del Río

Hi Rafael, Gene, guys;

chances are that you may have a bad contact (broken solder) in one of the many soldering points in the calculator. It would not be that hard to open it and resolder all of the IC's terminals IF you are an experienced electronics tech.

About the ROM's: most (if not all) of the necessary software of the USA-only 17BII is already built in the main processor chip, as it happens withthe HP42S, that shares the same structure and LCD. What we have outside, in the mainboard, are the placeholders for two IC's: the RAM and the 2nd. ROM (only for the intl. version).

What I am not completely sure is if the MODES menu might have some particular connection with the 2nd. ROM OTHER THAN the language selection. The RPN/ALG selection should not depend on whether the calculator has a 2nd. ROM or if it is USA-addressed.

I'd think of checking for cold soldering... And this leads to open the calculator, though.

Not so much of a help, indeed. I wish you success. And please, keep us informed.

Luiz (Brazil)

Re: Maybe...(was: HP 17BII malfunction: cannot select RPN mode)

*Message #4 Posted by **Rafael del Rio** on 13 Mar 2006, 2:27 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Luiz, Paul, you gave me the key!. I thought that if IT WAS a cold soldering, I just needed the contact for a while. Just to re-establish my dear RPN mode.

I put the calc on my knee. I forced a slight bending wth my hands and tryed the sequence: <shift> + <modes> and IT WAS THERE! the menu was showing [...RPN...]. I selected it... The sensation cannot be described properly without getting Dave Hicks censoring it.

Thanks to all, Gene, Luiz Paul

Re: HP 17BII malfunction: cannot select RPN mode

*Message #5 Posted by **Paul Brogger** on 3 Mar 2006, 2:42 p.m.,*
in response to message #1 by Rafael del Río

If it comes time to open the thing up, you may want to take a look at the Forum Articles # 5 and # 199. Each has some information about how one might take the thing apart safely.

But, if the keyboard checks out during the self-test, the only hope I see is to look for broken traces and solder joints, or perhaps a stray piece of conductive material shorting something out.

I believe Randy Sloyer is still available at www.fixthatcalc.com -- he may be able to help.

Good Luck!

How to read newly compiled lex file from windows into Emu71

*Message #1 Posted by **Alain** on 28 Feb 2006, 9:00 p.m.*

Hello all,

just for the fun of it, I compiled various lex files from sources with Areuh. Everything works fine and I load them to my real HP-71B by making a copy to a floppy from my windows box then read into a ramdisk with my HP-100 then finally move the lex file to my HP-71B.

If I want to make small changes to a lex, I don't want to crash my real HP-71B. So I'd like to use Emu71 instead. Because I still want to compile with Areuh (more confortable with Linux), I'd like to move newly compiled lex files directly to Emu71.

I first looked at LifUtils to update a Lif image assigned to Emu71, but LifPut is not yet available (comment from Tony Duell). DOSLINK doesn't seem to be an option (am I wrong ?).

So, what would be the best solution ? Any idea ?

Thanks !

Alain

Re: How to read newly compiled lex file from windows into Emu71

*Message #2 Posted by **J-F Garnier** on 1 Mar 2006, 6:29 a.m.,*
in response to message #1 by Alain

If I remember well, there was an utility in the Areuh suite that adds the right LIF header to the LEX file, in order to transfer it to the HP71 with COPY (by RS232 link for instance).

To load your LEX into Emu71, you just have to add this header, copy the file to 'emu_in.dat', then do in Emu71:
COPY :DOSLINK

It should work.

HP 32SII repairing

*Message #1 Posted by **Antonio Maschio** on 28 Feb 2006, 4:22 a.m.*

Hi everybody. Two facts:

1) I live in Italy, and you may know what it means, from a HP user point of view;

2) I have a HP 32SII which all of a sudden freezed with a "buzz" sound. Now, every now and then, it still works correctly, but it shows the pressed keys (e.g., if you press 2 3 + <Enter> sometimes it shows the writing "Enter" for an instant when you press Enter, or if you digit 23 5.5 ÷ it shows the character ÷ when you press that key), and you are not sure when it will freeze again (it means the display goes blank and no keys work and no reset can be done). Notice that it has never fallen on the ground and it has never got hit.

The point is I've been told by the local HP center (which deals with HP calculators no more sold by HP) that such calculator is not repairable, because it's a whole body machine, and there's no use in repairing it even if, say, the broken microcomponent could be found and replaced.

I'd want to know if such a problem ever arised to you, and if you could manage it and get your calculator repaired. THe last thing I want for my calculator is considering it gone.

Thanks in advance

-- Antonio Maschio

That's not a bug, that is a feature. If you press and hold a key for a while it shows the name of it and not until you release the key you'll get the result of the keypress. If you hit the key very shortly (half a second or less) your 32SII acts as a normal calculator.

The freezing part makes me think of run out batteries, but that would perhaps be too trivial.

Re: HP 32SII repairing

*Message #5 Posted by **Antonio Maschio** on 1 Mar 2006, 4:08 a.m.,*
in response to message #4 by Bram

I never realized this was a built-in side effect. In any way, I'll put my calculator under heavy testing, using even other advices to this thread, and see what happens.

Thanks

Re: HP 32SII repairing

*Message #7 Posted by **jb** on 28 Feb 2006, 12:11 p.m.,*
in response to message #1 by Antonio Maschio

Antonio,

There is a connection inside that is held together by the two halves of the calculator, sometimes this connection comes loose, to test it you can lightly squeeze the front and back together near the middle of the calculator between the screen and top row of keys.

I've been able to 'fix' a few by stuffing some filler material inside the case and closing it back up. not sure what the 'real' fix for this is.

your milage may vary, best of luck,

jb

Re: HP 32SII repairing

*Message #8 Posted by **Antonio Maschio** on 1 Mar 2006, 4:11 a.m.,*
in response to message #7 by jb

Thanks, but.. what kind of filler material? And is it safe opening a 32SII?

Last: do you really think it is sufficient pulling the two halves together? Does the loosing come after usage or is it a natural ending for such a calculator?

Thanks again

-- Antonio

Re: HP 32SII repairing

*Message #9 Posted by **jb** on 1 Mar 2006, 9:33 p.m.,*
in response to message #8 by Antonio Maschio

Did the display start to work after pressing the two halves together?

I've used a thick piece of paper like a business card and folded it a few times and stuffed inside. I had to experiment a few time and don't recall what thickness worked without expanding the case, it will vary.

To open the case I found some instructions on this site about how to open the pioneer case. I used a small drill (by hand) to cut away part of the heat steaks under the battery cover, then carefully pulled the halves apart just enough to slide the filler in. So far I've been lucky to have the heat stakes hold them together well enough after the 'fix'.

not sure of the reason, the ones i've had have been used hard and not always taken care of.

jb

Re: HP 32SII repairing

*Message #10 Posted by **Antonio Maschio** on 3 Mar 2006, 5:48 a.m.,*
in response to message #9 by jb

Yes.

My calculator has been working for three days, with no errors no freezing. I just pulled together the two halves (a bit of unpleasent liquid on the LCD, but not harming) between the display and the last line of keys. I heard no clicks, but the fact is that it works.

Do you think I should expect a stop or was it just this, the problem?

Thanks for your interest

HP 49G+ Retrofit

*Message #1 Posted by **Hugh Evans** on 27 Feb 2006, 11:11 p.m.*

This news item should be of interest to many of you. Chad and I at OpenRPN have received a donated set of 49G+ internals. We are already in the process of designing a piggyback PCB which will modify the keyboard layout and provide a double width ENTER key in its' traditional location.

From there the electronics will be mounted in an OpenRPN enclosure fabricated from ABS and neoprene. In addition it will be given a new set of tactile domes, double shot key labels, and voyager style keys.

Updates will be posted regularly (openrpn.org is down for maintenance at the moment), and will include plenty of pictures, CAD renderings, and prototypes.

Questions and comments are welcome.

Best Regards, Hugh

Hi Hugh. I have been following the recent discussions regarding openRPN, and I would just like to say more power to you guys. I find it very ironic that the same people who constantly complain and bemoan the fact that the quality of HP calculators has gone down since the 1980's are so quick to criticize you for actually trying to do something about it. Hey, to heck with them! If their glass is half empty, that is their problem. I'm sure many of us are lurking out here, just wanting you guys to succeed. Keep up the good work!

Don Shepherd

Don't tar us all with the same brush. I think HP's quality has turned into pure crap and I have no expectation there ever will be any significant improvement; but I also applaud Hugh and the other OpenRPN folks, and wish them the best of luck in their noble efforts.

Re: HP 49G+ Retrofit

*Message #4 Posted by **Antonio Maschio** on 28 Feb 2006, 2:34 a.m.,*

*Message #7 Posted by **Tell Us When It's Ready** on 2 Mar 2006, 6:52 a.m.,*
in response to message #6 by Hugh Evans

Skip the updates, just do it and tell the world when it's ready. Otherwise, it's just more OpenRPN vaporware,VaporWare,VAPORWARE...

Re: HP 49G+ Retrofit

*Message #8 Posted by **.** on 2 Mar 2006, 6:59 a.m.,*
in response to message #7 by Tell Us When It's Ready

No, please don't skip the updates. I really like the idea of making milestones - as long as the goals are concrete (eg, step 4 is "PCB artwork has been created and sent to be fabbed"). If there is evidence that the project is progressing I think it will shut up the critics.

HP-48SX ROM version

*Message #1 Posted by **George Rose** on 27 Feb 2006, 8:16 p.m.*

I have looked through the Museum but I can't seem to locate what I'm looking for. Can someone tell me how to check which ROM version my 48sx has? Thanks in advance.

Re: HP-48SX ROM version

*Message #2 Posted by **Guest** on 27 Feb 2006, 8:57 p.m.,*
in response to message #1 by George Rose

I'm not sure about the SX, but on the GX and later, typing in VERSION will get you the rom version and the copyright on the stack. On the 49 series, VER will display the CAS version.

Re: HP-48SX ROM version

*Message #3 Posted by **James M. Prange (Michigan)** on 27 Feb 2006, 10:07 p.m.,*
in response to message #1 by George Rose

The 48SX/S doesn't have a VERSION command, but one way to find the version is to press and hold ON, press and release D, and release ON to get to the interactive test screen, then press the backspace key, then press EVAL. This briefly shows you the version. EVAL can be pressed again to see the version again. When you're satisfied, invoke a warmstart by holding down ON, pressing and releasing C, and releasing ON.

Another method is to invoke the SysRPL command VERSTRING. This can be done by executing #30794h SYSEVAL. This will return "HPHP48-x", where "x" represents the version letter. The usual dire warning to check that the binary integer (including the trail h for hex base) are correct apply.

Yet another methocd is to transfer any object, in binary transfer mode, to your PC, and look at the resulting file with a text editor. The first eight characters of the file will be "HPHP48-x", where "x" represents the version letter.

Regards,
James

HP85B & HP87 emulator

*Message #1 Posted by **Olivier De Smet** on 27 Feb 2006, 3:11 p.m.*

Hi,

Finally I managed to emulate enough of an HP85B to make a new release of my emulator. On the following website, you'll find a binary archive for windows and an archive with the sources also for windows.

Link to Website

You are free to play with the source, just try to send back major changes.

Olivier

Re: HP85B & HP87 emulator

*Message #2 Posted by **J-F Garnier** on 1 Mar 2006, 7:45 a.m.,*
in response to message #1 by Olivier De Smet

Bonjour Olivier,

Nice to see that the HP85B is supported now!

But I can't download it, transfer fails...

What about a HP-75D version?

J-F

Re: HP85B & HP87 emulator

*Message #3 Posted by **Olivier De Smet** on 1 Mar 2006, 7:56 a.m.,*
in response to message #2 by J-F Garnier

Bonjour Jean-François,

Strange, I just try to transfert the archives and it works ...

For the 75D or C I have some roms but the I/O of the 75 is very different from the I/O of the 80 series...

So without some documentations, it will take some times (trial and errors ...)

As I add some comments, I give now the sources

Olivier

Re: HP85B & HP87 emulator

*Message #4 Posted by **Vassilis Prevelakis** on 1 Mar 2006, 3:14 p.m.,*
in response to message #2 by J-F Garnier

strange, I managed to download it just fine.

**vp

BTW good work

BTW2: I am not sure whether its my set up, but the HP-85B emulation will not start unless a disk drive is mounted. If not it does not respond to input till you actually mount a volume.

Re: HP85B & HP87 emulator

*Message #5 Posted by **Olivier De Smet** on 2 Mar 2006, 2:06 a.m.,*
in response to message #4 by Vassilis Prevelakis

I don't managed to reproduce this behaviour.

Did you try to press 'reset' ?

Olivier

Re: HP85B & HP87 emulator

*Message #6 Posted by **Vassilis Prevelakis** on 2 Mar 2006, 4:09 a.m.,*
in response to message #5 by Olivier De Smet

yes I tried pressing reset

the OS is Windows-2000 basic configuration. It is my standard windows test environment as it does not have any other application installed (except updates to IE etc).

It runs under VMWARE with the host tools installed. It has a non-persistent disk which means that you can install software, test it and when you shut the virtual machine down, it will ofrget everything and revert to the original state. So you cannot damage your starting configuration.

**vp

Re: HP85B & HP87 emulator

*Message #7 Posted by **Namir** on 1 Mar 2006, 10:29 p.m.,*
in response to message #1 by Olivier De Smet

Is there a link to insstructions that show how to load HP-85/8 binary or BASIC files into the emulator?

Thanks,

Namir

Free42 Decimal released

*Message #1 Posted by **Thomas Okken** on 27 Feb 2006, 3:10 p.m.*

Hi all,

For all of you who think it matters that 1 - 0.2 - 0.2 - 0.2 - 0.2 - 0.2 equals 0, Free42 now comes in a Decimal version.
For those who care more about speed, the Binary version is also still available. :-)
Get the goods at the Free42 home page.

Many thanks to Hugh Steers for providing the BCD code!

Enjoy,

- Thomas

P.S. In view of the recent discussion about guard digits, perhaps I should mention that Free42 Decimal has 13 of them. That's right, thirteen. TI-59 eat your heart out. ;-)

Edited: 27 Feb 2006, 3:25 p.m.

Re: Free42 Decimal released

*Message #2 Posted by **Jonathan Purvis (New Zealand)** on 27 Feb 2006, 4:54 p.m.,*
in response to message #1 by Thomas Okken

How does the speed of the decimal version compare to the binary version on PalmOS, considering that it doesn't have an FPU? Are you using the 68k's BCD instructions?

Re: Free42 Decimal released

*Message #3 Posted by **Thomas Okken** on 27 Feb 2006, 5:31 p.m.,*
in response to message #2 by Jonathan Purvis (New Zealand)

I haven't done any benchmarks yet, so I'm afraid I can't give you any numbers yet.

Free42 Decimal for PalmOS does not use the 68k's BCD instructions; it uses a set of C++ classes that implement base-10000 floating point using binary integer math. There is still some performance optimization left to do -- replacing 32-bit operations by their 16-bit equivalents wherever possible -- and that should help speed things up.

Theoretically, the impact of using Decimal vs. Binary should be less on the Palm than it is on the PC, since even the Binary version has to do all its floating point in software on the Palm (using MathLib). In practice, the Decimal version is still going to be significantly slower than the Binary. Whether or not it is fast enough is something everyone should try for themselves... As I said, I haven't done benchmarks yet, but I expect performance comparable to a real HP-42S on recent Palm models. I'll run some tests and post the results here in a few days.

UPDATE: I ran a couple of quick-and-dirty tests on my Palm Zire 21, and SIN runs at about the same speed as on my real HP-42S; INVRT is about 4 times faster than on the 42S.
SOLVE performs poorly, though -- about 10 to 15 times slower than on the real 42S. I guess I could blame Free42's higher precision for part of that (assuming linear convergence, Free42 will take twice as many iterations to converge than the 42S, because its mantissa has twice the digits) but it probably has to do with the fact that the transcendental functions in Free42 Decimal are only accurate to about 20 digits, which means they behave erratically in the final stages of convergence -- and that can force the solver to do dozens of additional iterations.
I have to look into the SOLVE issue a bit more. The solution may be to make it stop iterating once the 20th digit has settled down (instead of going all the way) -- or to change the transcendentals to be more accurate. Stay tuned!

UPDATE 2: I repeated my SOLVE benchmark (which makes heavy use of trig functions), this time after adding FIX 11 RND at the end of the function. With that modification, Free42's performance was on par with my real 42S (again, running Free42 Decimal on my Palm Zire 21, which has a 126 MHz ARM).
Changing Free42 Decimal's trig functions to be accurate to the full width of the internal representation will probably slow them down by only 20-25% or so, so that looks like the best way to fix this.
Meanwhile, if you find SOLVE to be too slow, I'd recommend adding FIX 11 RND (or SCI 11 RND) at the end of the function to be solved: the RND function rounds a number to the precision at which it is displayed, so FIX 02 RND rounds a number to the nearest one-hundredth, while SCI 02 RND rounds a number to 3 significant digits.

On a 16 MHz 68k Palm (like the m100, for example), performance will probably be about 5 times slower than on the Zire 21 -- at least, that's been the typical slowdown in my previous tests. This means that you're looking at HP-41 performance... Hopefully I can get even those old Palms to perform at 42S performance levels with some performance optimization in the BCD code.

- Thomas

Installing HP-41CX Memory

*Message #1 Posted by **SteveH** on 27 Feb 2006, 2:07 p.m.*

I've picked up a memory module (HP-82106A) for my HP-41CX and have been unable to find any clear instructions on how to install it. My manual from the HP Museum is not searchable and seems to only provide instructions on removing modules. Is it simply the case that new module can be added (in the correct sequence)?

Any other references worth a look?

Thanks for any help.

Steve

Re: Installing HP-41CX Memory

*Message #2 Posted by **Etienne Victoria** on 27 Feb 2006, 2:12 p.m.,*
in response to message #1 by SteveH

Hello Steve,

Your Hp-41Cx already has built-in the maximum possible memory (ie 319 registers).

Therefore, you cannot and must not fit in any complementary 82106 or 82170 modules.

They simply won't work in anything else than a bare old simple 41C.

Best regards from France!

Etienne

Edited: 27 Feb 2006, 2:13 p.m.

Re: Installing HP-41CX Memory

*Message #3 Posted by **Diego Diaz** on 27 Feb 2006, 2:15 p.m.,*
in response to message #1 by SteveH

Hi Steve,

This is a good news, bad news tale...

The bad news are that satndard memory modules (82106A) are only for use in the HP-41C (not CV or CX)

The good news is that your CX is equipped with as much standard memory as it can hold, namely 320 registers.

You may want to increase the Extended memory instead using 82181A Extended Memory modules, you can install up to two of them.

Hope this helps.

Diego.

Re: Installing HP-41CX Memory

*Message #4 Posted by **SteveH** on 27 Feb 2006, 3:42 p.m.,*
in response to message #3 by Diego Diaz

Thanks for the advice. I guess I will probably just put the thing up for sale as it was an impulse buy.

Cheers,

Steve

HP-Basic on HP-85

*Message #1 Posted by **Sydney** on 27 Feb 2006, 8:05 a.m.*

I'm working on an old fiber tester from the beginning of the 80's. This has HPIB interface, and I just bought a GPIB-USB interface. Having some problems translating the HP-Basic code to modern GPIB commands. Do someone know how to send equalent commands with the NI-488.2 software?

RESET 7 OUTPUT 708 USING "#,B"; 72,75 ENTER 708; X,Y,Z

Re: HP-Basic on HP-85

*Message #2 Posted by **Etienne Victoria** on 27 Feb 2006, 12:35 p.m.,*
in response to message #1 by Sydney

Did you run the NI-488 Troubleshooting wizard and did it successfully detect the instrument on HP-IB address 8?

Then you have the choice of:

- either use the Interactive Control Utility to send commands/receive data - or program directly your application.

Then, the correspondence between the NI-488 keywords & Hp-Basic should be:

RESET = ibclr

OUTPUT = ibwrt

ENTER = ibrd

Sorry but as I don't remember the precise syntax, please check the NI-488.2 guide

Or maybe somebody else will help you further.

Etienne

Edited: 27 Feb 2006, 12:59 p.m.

Re: HP-Basic on HP-85

*Message #3 Posted by **Sidney** on 28 Feb 2006, 4:27 a.m.,*
in response to message #2 by Etienne Victoria

Thanks! I'll try that.

Re: HP-Basic on HP-85

*Message #4 Posted by **Etienne Victoria** on 28 Feb 2006, 5:13 a.m.,*

in response to message #3 by Sidney

By the way and if I remember well, there is no equivalent to the "USING" 85' Basic statement in NI 488.2 language.

Therefore, I think you have to make sure your data is correctly formatted before submitting the ibwrt statement.

Good luck.

Etienne

HP41CY - Replacing the internal +3v lithium cell

*Message #1 Posted by **Christoph Klug** on 27 Feb 2006, 4:12 a.m.*

Dear HP41CY enthusiasts,

have a look to the HP-Museum article folder about replacing the internal +3V lithium cell of the HP41CY....

Regards - Christoph Klug

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #2 Posted by **Juergen Keller** on 27 Feb 2006, 2:24 p.m.,*
in response to message #1 by Christoph Klug

Christoph,

thank you much for this great article! Unfortunately, it seems that the OS of my RAMBOX is already damaged; not totally lost, but not working properly anymore. In your article, you say, that reloading the OS is a complex procedure. Can you give us an outline of this process? Which tools are needed?

Thank you, Juergen

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #3 Posted by **Matthias** on 27 Feb 2006, 2:35 p.m.,*
in response to message #2 by Juergen Keller

Maybe the simlest way is to have the RamBox OS in a Clonix module. I think it should be possible to copy it from there to the Rambox without problems (or is the copy protection still working in the Clonix)? I will try this with my next CY with dead OS.

Matthias

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #4 Posted by **Juergen Keller** on 28 Feb 2006, 2:43 a.m.,*
in response to message #3 by Matthias

Hi Matthias,

I will try this as soon as I have my CLONIX programming adaptor. I have a 32K RAMBOX, and your module list shows two different versions. Does anyone know the difference between the 1B and 3M versions? Which one should I use in the case I cannot determine the version of my RAMBOX?

Matthias, can you provide me the ROM images of both 32K RAMBOX versions?

Thank you, Juergen

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #5 Posted by **Christoph Klug** on 28 Feb 2006, 3:31 a.m.,*
in response to message #4 by Juergen Keller

Dear HP41 RAM-Box enthusiasts,

it seems to be easy to reload the operating system of non bankswitched RAM-box systems = 32KByte RAM-Box systems. I done this several times : In this case you are able to install an ERAMCO os to an W&W RAM-Box or a W&W os to an ERAMCO RAM-Box, depending which os you prefer or which os size you like to store inside your RAM-box (4KByte or 8KByte). In any case this solution will work.

First you have to clear the RAM pages of the RAM-box, for example by using the ZENROM. When the HP41 is able to switch on correctly including the RAM-Box, the clear process is finished. For reloading you only need the CCD-D from Raymond, stored inside an ZEPROM or Clonix. Use the commands SAVERAM and GETRAM and store the needed os to IL-CASS-Drive. Than switch the internal protect switch of the RAM-Box to the write position, and save the os to the RAM-Box page. Now place the switch back to the protect position. For W&W RAM-Box solutions place the os to page 8, for ERAMCO RAM-Box solutions place the os to page E + F = 14 + 15.

Much more complex is the os reload process of bankswitched RAM-Box systems which includes 64KByte = two banks (W&W and ERAMCO) or 128KByte = four banks (ERAMCO). For this systems we are looking for a working solution....

Best regards - Christoph Klug

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #6 Posted by **Meindert Kuipers** on 28 Feb 2006, 4:07 a.m.,*
in response to message #5 by Christoph Klug

Has anyone tried to run the RAMBOX funtionality on the MLDL2000? It does support bankswitching, and loading images is not too difficult.

Just curious,

Meindert

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #7 Posted by **Christoph Klug** on 28 Feb 2006, 10:10 a.m.,*
in response to message #6 by Meindert Kuipers

Dear Meindert,

does your MLDL2000 really include the bankswitching mode needed for RAM-Box applications ? A RAM-Box switches between full 32KByte pages (not 4KByte pages).

As I know the bank switching from W&W is different to the bank switching of ERAMCO. Jean-Francois Garnier have knowledge about this, because he implement both RAM-Box solutions to his great EMU41 emulator software...

Regards - Christoph Klug

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #8 Posted by **Meindert Kuipers** on 28 Feb 2006, 3:19 p.m.,*
in response to message #7 by Christoph Klug

This would be interesting. Right now only traditional bankswitching is supported, meaning that a BS instruction switches an 8K page (both upper and lower pages of a module port). If our friend Jean Francois is following this thread, could he explain the RAMBOX switching in some detail?

Thanks,

Meindert

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #9 Posted by **Christoph Klug** on 1 Mar 2006, 3:15 a.m.,*
in response to message #8 by Meindert Kuipers

Dear Meindert,

I think it would be a great extension for your MLDL2000 system to include the bank switching solution needed for RAM-Box applications.

From W&W exist the 64KByte RAM-Box version - that means two 32Kbyte pages are bank switched. From ERAMCO exist 64KByte and 128KByte RSU (RAM Storage Unit) versions - that means two or four 32KByte pages available. Furthermore I heard rumors about a 256KByte RSU version from ERTAMCO (but I never hold this in my hands) - that means eight 32KByte pages are available.

I will close the contact to Jean-Francois Garnier, for transfering some bank switching knowledge from EMU41 to MLDL2000 :-)

Best wishes - Christoph Klug

Re: HP41CY - RAMBOX BS

*Message #10 Posted by **J-F Garnier** on 1 Mar 2006, 6:52 a.m.,*
in response to message #8 by Meindert Kuipers

Hello Meindert,

Just to refresh your memory, you can have a look here :-)

At the request of Christoph, I also implemented the 4x32kb=128kb ERAMCO Rambox (to be available soon in next Emu41 release). The bank switching is even weird, using no ENBANK opcodes at all...

Kind regards.

J-F

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #11 Posted by **PeterP** on 2 Mar 2006, 11:22 p.m.,*
in response to message #6 by Meindert Kuipers

Hi, I actually stored the rambox os from my CY away onto the PC via the MLDL2000 and then was able to load it back onto the calc on another page (so that I had two there, just for checking). I have not tried to use the os on the MLDL on a normal cx without a rambox, but I'm not sure what use it would be, other than looking at modules plugged and the like. Not sure if that was the question, but I tried anyway...

Cheers

Peter

Re: HP41CY - Replacing the internal +3v lithium cell

*Message #12 Posted by **Juergen Keller** on 28 Feb 2006, 5:51 a.m.,*
in response to message #5 by Christoph Klug

Christoph,

thank you much for clarifying the procedure! Having a 32K RAM-Box only seems to have at least one advantage ;-)

I'm still wondering what the difference is between the 1B and the 3M version of the 32K RAM-Box (see Matthias' module list). Is 3M just an update to 1B? Any idea?

Best regards,
Juergen Keller

Comparing the HP41 and HP48 (RPN/RPL subject)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 26 Feb 2006, 9:15 p.m.*

Hi;

I decided to check the PDF file I let available related to the HP41 and HP48 comparison, and I saw that the file was created with the Acrobat Creator V3.0, and I forgot to set the `Save TTF character definitions` option when it was generated. So, some characters do not look as they should. I created it again, but now I used Acrobat Creator 7. Unfortunately, the final version is 650MBytes long... It could be smaller if I redraw all graphics, and I intend doing it later.

Well, here it is, the newer file.

Cheers.

Luiz (Brazil)

Re: Comparing the HP41 and HP48 (RPN/RPL subject)

*Message #2 Posted by **Han** on 27 Feb 2006, 1:03 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

650 megabytes!? Guess I'll have to burn it to a CD before I re-read it =)

By the way, the expression 2^3 appears like 23 to me (very first example). I might be the only one, though...

Edited: 27 Feb 2006, 1:04 a.m.

Oops! Wrong file size...

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 27 Feb 2006, 2:48 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Han, all;

after reading Han's post I realized I keyed in a "M" instead of a "K" (they are closed to each other in the keyboard, but it is not an excuse... My fault). Please, correct it: it is actually 650KBytes. Sorry!

And Han, thanks for your feeedback. I'll correct the file. Maybe there are other typos because I mainly used an OCR and correct it later, with the unvaluable help of a spell checker. Some mistakes might not be detected, though.

Cheers.

Luiz (Brazil)

Re: Comparing the HP41 and HP48 (RPN/RPL subject)

*Message #4 Posted by **Karl Schneider** on 27 Feb 2006, 4:14 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Luiz --

Thanks for the file scan! I'll admit that I was discouraged from even attempting to download a 650-MB file...

Regards,

-- KS

eBay question

*Message #1 Posted by **Vassilis Prevelakis** on 26 Feb 2006, 12:21 p.m.*

look at the following bidding:

http://offer.ebay.com/ws/eBayISAPI.dll?ViewBids&item=8767123326

On Feb-22-06 18:03:27 PST tzeng0831us bids $333.00

a little bit *later*

Feb-22-06 18:03:42 PST mcnuggets4540 makes a bid which brings the winning amount to $333.33

How can that be? Once tzeng0831us placed the bid, mcnuggets4540 should have been forced to bid higher than the bid increment (I guess $5 at that level).

**vp

Re: eBay question

*Message #2 Posted by **Etienne Victoria** on 26 Feb 2006, 1:11 p.m.,*
in response to message #1 by Vassilis Prevelakis

Yassou Vassilis,

Not quite, at the end of an auction, I think the final highest bid takes it all regardless of the bid increment.

Look at this other auction I just won:

Hp Auction

The last bids are separated only by 0.22 which is less than the auction increment.

FYI, my bid was 22.22

Best regards

Etienne

Edited: 26 Feb 2006, 1:11 p.m.

Re: eBay question

*Message #3 Posted by **Howard Owen** on 26 Feb 2006, 2:08 p.m.,*
in response to message #1 by Vassilis Prevelakis

That's right. mcnuggets4540 top bid was $333.33, which was *barely* enough to win.

From http://pages.ebay.com/help/buy/bid-increments.html:

> Quote:
>
> Note: A bidder may be outbid by less than a full increment. This would happen if the winning bidder's maximum bid beats the second highest maximum by an amount less than the full increment.

Regards,
Howard

Re: eBay question

*Message #4 Posted by **Vassilis Prevelakis** on 27 Feb 2006, 2:07 a.m.,*
in response to message #3 by Howard Owen

ho ho I get it. My question was how did he get to place a bid that was less than the current bid plus the increment. But the *current* bid was not $333, it was around $192.

Thanks guys

keybaord graphics fading?

*Message #1 Posted by **Hal** on 26 Feb 2006, 12:44 a.m.*

I display my very modest collection of HP's in a glass front cabinet above my computer monitor. Should I be worried about the keyboard markings fading over time. Direct sunlight never hits them, but sunlight does filter into the room. Does anybody have any experience with this?
Thanks and best regards, Hal

Re: keybaord graphics fading?

*Message #2 Posted by **Eddie Shore** on 26 Feb 2006, 11:19 a.m.,*
in response to message #1 by Hal

Could be a possibility. I find some of my calculators have the paint on the keys faint (not my HPs, of course). But I find it due to the calcualtor being in the pocket or being rubbed against the backpack.

Re: keybaord graphics fading?

*Message #3 Posted by **Dave Shaffer** on 26 Feb 2006, 5:17 p.m.,*
in response to message #1 by Hal

I just dragged out my 30+ year old HP35, and the keyboard looks just fine to me. During its youth, this calculator was left on my desktop all the time, exposed to whatever light was around. It has spent most of the last 15 years or so in a desk drawer, however. My HP11C and HP41CV which I have owned since they were new (and early in the life cycle of these products) also look pretty good to me, and they've not been babied with respect to light exposure.

The usual culprit for fading is ultraviolet light (UV), the photons of which have the highest energy and are most likely to interact with the pigments. Even a simple pane of glass absorbs most UV radiation. I suspect your keyboards behind glass are OK.

Re: keybaord graphics fading?

*Message #4 Posted by **Walter B** on 26 Feb 2006, 6:39 p.m.,*
in response to message #1 by Hal

In my active times as a student (>25 years ago) calculators were sitting everywhere. Also in direct sunlight behind big windows on our desks in the summertime, if we forgot to pull down the shade while we were working in another room. I do not remember any effect on the keys nor do I see any in the calcs I collected (and I have a 97 on my desk at home in direct sunlight since 2000).

As you will never get a tan behind a window, your calcs will not suffer there. Enjoy!

Remark: The white *housings* of Woodstocks and Topcats may turn yellowish - that's the only change I observed. No idea whether that's caused by light or oxidation.

Re: keybaord graphics fading?

in response to message #1 by Hal

the keyboard won't fade - at least I have never seen a yellowed or bleached out one; there do exist some models with overprinted keys (limited only to the 10C?), which might wear... the cases of the 21-27 and 97 will certainly yellow over time and should not be placed in direct sunlight; usual office light shouldn't be a huge problem though

Re: Keyboard graphics fading?

*Message #7 Posted by **Karl Schneider** on 4 Mar 2006, 4:04 p.m.,*
in response to message #1 by Hal

I've noticed on a few of my calc's that the yellow legends above the keys has faded to a kind of tan color, whereas on several other calc's, they remain a bright yellow. Exposure to certain knds of light might be a factor.

HP-41 CX dead overnight

*Message #1 Posted by **Geir Isene** on 25 Feb 2006, 6:26 p.m.*

HP-41CX worked perfectly yesterday. Won't turn on today.

Tried:

1. Repeatedly trying to turn it on
2. Tried master clear
3. Took out all modules
4. Tried master clear
5. Left batteries out for a few hours
6. Still won't turn on
7. Tried to reverse battery polarity
8. Still no go

What now?

Re: HP-41 CX dead overnight

*Message #2 Posted by **Raymond Del Tondo** on 25 Feb 2006, 6:52 p.m.,*
in response to message #1 by Geir Isene

Hi,

the usual indicators for causes of a malfunction are

- corroded battery contacts
- corroded battery springs
- bad contact between case halves

Does any of these indicators apply?

Actually the 'case halves indicator'
just indicates that the unit has fallen
off from somewhere, and possibly one or more of
the screw posts that hold the cases together has broken.
The actual malfunction cause is a bad contact between the pcbs
inside if the case halves aren't held together tightly.

BTW: I'd never reverse batt polarity.
Ok, the HP-41 isn't the HP-48, where this
would likely damage the zener diode,
but I don't recall to have ever heard
that an HP-41 could be revived by
reversing batt polarity;-)

Regards

Raymond

*Message #3 Posted by **Geir Isene** on 25 Feb 2006, 7:11 p.m.,*
in response to message #2 by Raymond Del Tondo

No corrosion. Clean as a whistle. No faulty contacts. Two halves firm and tight together.

I've revived a 41 with reversing the polarity once before after getting that tip from someone.

> I've revived a 41 with reversing the polarity once before after getting that tip from someone.

I've used that trick too with success. The 41C hardware experts will undoubtedly be able to tell us why it works in more detail, but I believe the basic explanation is that there are capacitances in the 41C that can maintain voltages in the CMOS circuitry. Reversing polarity allows these to discharge.

Another bit of 41C lore is that it is sometimes neccessary to leave the batteries out for an extended period - like 24 hours - to revive an unresponsive unit. Have you tried leaving the batteries out for that long?

Regards
Howard

Please do not shoot me for this stupid suggestion, it's just that I have overlooked it once myself (why is this darn remot not working suddenly?!) - did you try new batteries?

Cheers

Peter

HP-41: Quick check for battery connections

*Message #6 Posted by **Vassilis Prevelakis** on 26 Feb 2006, 1:55 a.m.,*
in response to message #2 by Raymond Del Tondo

I find that on full-nut models a quick way of making sure that the battery assembly is making good contact with the backplane is to use the two contacts on the side of calculator next to the hole for the batery pack (the ones that were supposed to be used with the A/C adaptor).

If you have a really old 41 (the one with the gold balls) you can simply measure the voltage across the two contacts. If not, you have to use thin wires to reach all the way to the backplane.

The whole point is to do this with the battery pack in place so that you can tell whether there is any problem with the battery pack itself, but most importatnly with the battery/module assembly and its connection to the backplane.

I do not believe that this method works with half-nut models.

Re: HP-41: Quick check for battery connections

*Message #7 Posted by **Geir Isene** on 26 Feb 2006, 4:24 a.m.,*
in response to message #6 by Vassilis Prevelakis

I get the same voltage from measuring the outer battery contacts as I do reaching down all the way to the backplane.

Re: HP-41: Quick check for battery connections

*Message #8 Posted by **Vassilis Prevelakis** on 26 Feb 2006, 9:25 a.m.,*
in response to message #7 by Geir Isene

OK, now the last check to verify end-to-end operation.

Check inside a module port to see if you get Vcc. (The I/O ports are one way of getting at the Vcc line without opening the 41)

These are the module contact assignments (View into I/O Port):

http://www.series80.org/Misc/HP41-Module.gif

(you may want to check Vbat as well, but it should be OK).

If Vcc exists, then its not a supply problem because it means that power from the batteries cross the backplane, enter the CPU-daughterboard, go through the power supply and exit back into the backplane and then into the I/O port sub-assembly.

If Vcc is missing , then you should looking at a bad connection or a bad PSU.

Assuming there is voltage present at Vcc, the value should tell you whether the CPU is running. Normally Vcc should be 6V (CPU running). If the CPU is sleeping or standby, Vcc should be Vbat-1V and it is not regulated.

While monitoring Vcc, press the ON key to see if anything is happening.

*Message #9 Posted by **Geir Isene** on 26 Feb 2006, 10:00 a.m.,*
in response to message #8 by Vassilis Prevelakis

oh-kay: Now here is a challenge; I have a multimeter in my hands. It and I are not very well aquainted. We do get along well, it's just that we have little experience being partners in matters like these.

So, Vcc? What is that? And how exectly do I measure the voltage there? I take the one thingy from the multimeter and insert it into the I/O port and the other one I put... where?

Excuse my ignorance in this area. I am a programmer of these beauties and are eager to learn more about the hardware.

Re: HP-41: Quick check for battery connections

```
Geir Isene wrote:

> So, Vcc? What is that? And how exectly do I measure the voltage there? I
```

Look at the drawing. On the top row, Vcc is the second connector from the left.

You meassure it against ground which can be the battery (-) or the GND signal to the right of Vcc. They are the same.

```
> I take the one thingy from the multimeter ...
```

Hmmm! Given the above, are you sure you want to do this? Maybe you do not want to learn electronic equipment troubleshooting on your HP-41.

Well, I am ready and willing to try a few non-dangerous recepies here before I send it to a competent doctor for revival.

Re: HP-41: Quick check for battery connections

*Message #12 Posted by **Vassilis Prevelakis** on 27 Feb 2006, 2:23 a.m.,*
in response to message #11 by Geir Isene

OK then.

The problem is that the contacts are *very* difficult to get at because the leading edge of the module interface is insulated. So your voltmeter probes would need to make contact with the exposed surface further back inside the port cavity.

The way I'd do it is to use an old module (e.g. an 82106A) take out the PCB inside (or at least make sure the module contacts are isolated from any ICs on the PCB) and connect Vcc, Vbat and GND contacts to short wires coming out through the back of the module. Then you can plug your "troubleshooting" module in and be able to take measurements.

If you have more advanced instrumentation (e.g. scope or logic analyser) you can do the same thing with the clock signals and see whether there is activity apart from power.

**vp

for a discussion on how to take apart a module see
http://www.tla.org/hp41/module.html

Re: HP-41 CX dead overnight

*Message #13 Posted by **Randy** on 25 Feb 2006, 9:19 p.m.,*
in response to message #1 by Geir Isene

In general, putting batteries in backwards or shorting the terminals in a 41 doesn't clear memory. Of course your mileage may vary.

It depends entirely upon the leakage current of the reverse polarity protection diode(s). HP used some good diodes there and as a result these methods usually meet with little or no success.

If you want to do a little experiment, remove the battery and measure the voltage present on the outer calculator terminals, the two center points are only a jumper. Leftmost is (-), right is (+) with the display at top. If the voltage is 4 to 6 volts, that's good because it means the unit is holding voltage as it should and holding memory . If it is zero-ish volts, that's bad and will require further diagnostics to find out is wrong.

For the purposes of the thread, the game is now to get that 4 to 6 volt memory maintaining level to zero to accomplish a master reset.

Short the terminals for a few seconds, now measure the voltage and see that it doesn't change.

Reverse the batteries, insert for a few seconds, remove and check. See that the level may have dropped a few hundred millivolts. Then watch it rise back up all on it's own. I'll leave it to reader to figure out why that is...

Reinsert the reversed batteries and leave it for awhile. Remove and measure. You'll find the level never goes below about 0.6 volts. Never (*see disclaimer below). It can't because you're dropping the voltage across a silicon diode, the very diode that prevents reverse current flow and the resultant damage. Because of that diode, chances are slim to none that you'll ever clear memory.

* Never disclaimer: Chances are the one unit you test will have a leaky diode and reset just fine when shorted :) Consider yourself unlucky and go buy a lottery ticket since no doubt your luck will change for the better.

** Never Never disclaimer. If that diode is leaky, reversing the polarity of the batteries MIGHT do some damage. Consider yourself sufficiently warned.

Now, back to the chase: Is the unit in question a Fullnut or Halfnut? BIG difference internally...

Re: HP-41 CX dead overnight

*Message #14 Posted by **Geir Isene** on 26 Feb 2006, 4:20 a.m.,*
in response to message #13 by Randy

First of all let me thank you guys for jumping to my (still potential) rescue. This is the HP Forum on its finest.

1. It's one of my fullnuts
2. I have tried new batteries

3. Left it without batteries overnight
4. Still not working.

Now to Randy's path:

> Quote:
>
> If the voltage is 4 to 6 volts, that's good because it means the unit is holding voltage as it should and holding memory . If it is zero-ish volts, that's bad and will require further diagnostics to find out is wrong.

It's 6.1 volts

> Quote:
>
> Short the terminals for a few seconds, now measure the voltage and see that it doesn't change.

It changed to 5.5 volts

> Quote:
>
> Reverse the batteries, insert for a few seconds, remove and check. See that the level may have dropped a few hundred millivolts.

Down to 0.01 volts(!)

> Quote:
>
> Then watch it rise back up all on it's own.

After around 5 minutes, it has climbed to 0.02 volts. After a few hours, its up to 0.12 volts.

Should I then reinsert the reversed batteries for awhile (considering the last two answers here)?

Edited: 26 Feb 2006, 6:38 a.m.

Re: HP-41 CX dead overnight

*Message #15 Posted by **Diego Diaz** on 27 Feb 2006, 6:51 a.m.,*
in response to message #14 by Geir Isene

Hi Geir, all,

I've been reading the whole thread, and so far the advices you've got are of a consistent troubleshooting practice.

Furthermore, the results you've encountered/measured are almost definitive to discard any Battery->I/O-Block->Backplane misconnection.

With this scenario there are still two different points where your 41 can suffer its illness:

- Backplane->Mainboard zebra strip (the more likely)

- Mainboard IC damage (the worst case, quite unprobable but not impossible)

You can still try to place your 41 onto a flat surface and push (hard) both halves together in the frame of the 1 2 3 row. Make sure you do not press any key while pushing!... then try ON again while holding the pressure...

Squeezing a bit (just a bit!!) before you try the above procedure won't hurt either...

If if turns on, then the failure is definitely in the above mentioned zebra strip. If it doesn't come up to life, this does not mean that your Mainboard is gone (not yet at least...) but you'll need to take it apart for further testing/repair... indeed you already need to take it apart whatever the case, but you can get a good feedback of what you'll find after doing this.

If you decided to face the task by yourself and need/want futher advice, do not hesitate in asking fot it... You're in the right place ;-))

Best regards.

Diego

*Message #16 Posted by **David Smith** on 27 Feb 2006, 12:10 p.m.,*
in response to message #1 by Geir Isene

You should open up the machine (four screws under the rubber feet), take out the CPU card, clean all the contacts and pads in the machine and the back of the keyboard with 91%+ isopropyl alcohol. Keep the alcohol off the display window. It will leave a white stain. While the machine is apart, short across the large electrolytic capacitors. Reassemble. Cross fingers. Flame on.

Need gear for HP-97

*Message #1 Posted by **Mike Mander** on 25 Feb 2006, 3:55 p.m.*

Hello,

Does anyone have any idea where I might be able to buy a new nylon gear for the printer mechanism in an HP-97? A photo...

http://mikemander.servehttp.com:8008/hp/gear.jpg

I need the yellow/orange nylon gear - as you can see, it is missing some teeth. I had just bought a new battery pack and an owner's manual off eBay and was planning on opening it to repair the card reader when the printer stopped working too. Stripped gear - bummer...

Does anyone have a junk HP-97 for sale that might still have an intact gear?

Thanks for the help...

Regards, Mike Mander

Re: Need gear for HP-97

*Message #2 Posted by **Randy** on 25 Feb 2006, 4:24 p.m.,*
in response to message #1 by Mike Mander

You've gotta make your own. MoHPC article how-to

IMO, there is no such thing as a junk 97, they're all worth something. Most units have the same gear and they're just as prone to fail as the one you have. A few had a black nylon part that didn't shear so easily but those are a needle in a haystack. Make the aluminum replacement and be done with it.

Re: Need gear for HP-97

*Message #3 Posted by **Mike Mander** on 25 Feb 2006, 5:14 p.m.,*
in response to message #2 by Randy

Thanks for the link! You do have a point about the 97... unless one was thoroughly destroyed, it would always still be worth something for parts!

Should have known there would already be some useful info on this website. Sorry for not searching beforehand. My, as they say, bad. Hopefully the companies mentioned still have these parts and ship to Canada. Will try to contact them next week.

If nothing else, the article gives me the gear's specifications and I can hunt around locally for something similar.

Cheers! Mike Mander

Dear OpenRPN

*Message #1 Posted by **A HopeFull Customer** on 24 Feb 2006, 2:01 p.m.*

Dear OpenRPN:

You obviously have good intentions. But the road to hell is paved with good intentions as the devil is in the details. We know, we're engineers ourselves. The difference between you and us is that we don't announce things until we have produced something. Just produce something, anything. Then you can trumpet to the high heavens. We sincerely wish you the best of luck with your dreams.

Re: Dear OpenRPN

*Message #2 Posted by **bill platt** on 24 Feb 2006, 2:20 p.m.,*
in response to message #1 by A HopeFull Customer

"Produce something."

Hmmm, there is a website with all sorts of specifications, discussions etc.

While that may not be "in your hands" kind of product, it is more of a product than 99% of all the financiers out there produce--and OpenRPN is a volunteer project no less!

Re: Dear OpenRPN

*Message #3 Posted by **Geir Isene** on 24 Feb 2006, 3:54 p.m.,*
in response to message #1 by A HopeFull Customer

An open discussion leading to a good product may create a higher quality product in the long run. Witness free software.

Re: Dear OpenRPN

*Message #4 Posted by **gene** on 24 Feb 2006, 4:36 p.m.,*
in response to message #3 by Geir Isene

While not supporting the anonymous comments made here, I too don't really believe OpenRPN will ever lead to an actual product.

It just takes too much organizing by us bean-counters, etc. to ever create a real product.

Witness the apparent collapse of the Qonos, which won't ever see the light of day. When people first heard about it, excitement ruled the day! Finally, a real calculator for the rest of us, designed by someone who understands what we want! Feature descriptions were created, talked about, etc., but it isn't going to happen.

Why?

Good plan, prototypes, but appears to have needed too much $$ to get off the ground.

OpenRPN is a diversion and while fun, will not lead to a working product at anything resembling a reasonable price, IMO.

And, I know that's my opinion and is worth perhaps less than the next poster's opinion :-), but I just don't see it happening.

How long has OpenRPN been going on now? >2 years?

How much time needs to go by with nothing but fancy drawings and spec sheets before we collectively realize that this is not going to happen.

Gene

P.S. Willing to eat whatever crow is needed should they bring something off (which I will not be upset about!), but not expecting to ever taste it. :-)

Re: Dear OpenRPN

*Message #5 Posted by **All OpenRPN needs** on 24 Feb 2006, 9:16 p.m.,*
in response to message #1 by A HopeFull Customer

All OpenRPN needs to to create a simple project plan, filled with milestones. Then by gradually ticking off these milestones outsiders will see that the project is progressing. Maybe OpenRPN is flying along, but from my point of view it looks like endless talking and changing of specifications.

Here is part of the last 'project update'

"The hardware platform will be developed and produced first to aid in software development, as well as allowing a few reviewers to preview the build quality.

OpenRPN hasn't been attracting much attention lately... Most people won't believe it until they see it, so we're going to deliver the goods.

Within the next few days I will start a thread to gather any final opinions on construction methods and feature sets. The designs will be locked in and set for final development and production."

This was last september. What designs were locked in? None. No hardware has been built. The whole focus of the project has changed too many times to even begin to start.

Why would the word of an "X" mean anything? And no one named "Mr. X" has posted recently so which post are we supposed to believe is not like the others?

As far as I can see there's one guy using a different name each time to pick on OpenRPN. If you want to be distinguished from the "other guy" then maybe you should follow the rules of this forum:

> Quote:
>
> You agree to use a consistent identity on the forums. MoHPC reserves the right to reveal the use of multiple identities when it feels this is necessary. You are not required to use your real name but you should stick with one label.

That way at least we'll be able to tell you from the "other guy".

*Message #12 Posted by **Hugh Evans** on 26 Feb 2006, 6:39 a.m.,*
in response to message #1 by A HopeFull Customer

If you've been reading these forums recently you should already be aware of our current plans. Right now a generously donated 49g+ is on its' way. The OpenRPN modifications should finally convince the community that this feasible. To give you some idea of how easy it can be, the first prototypes will be made from sheet ABS with a router. It will represent what the 49g *should* have been.

Insult me and my project all you want. I'm going to keep at it indefinitely.

in response to message #12 by Hugh Evans

I'm glad that your are continuing with Open RPN despite the doubts and insults. It's the easiest thing to take someone elses designs or plans and find reasons why they won't work. Good luck, I hope that you are successful.

Re: Dear OpenRPN

*Message #14 Posted by **Gene** on 26 Feb 2006, 3:06 p.m.,*
in response to message #13 by e.young

Actually, it's easiest to discuss nothing BUT plans.

If they actually come out with this 49g+ retrofit thing, that will be a good first step.

But that's a long way from ever coming up with a real, working calculator.

And I'm not holdling my breath. :-)

Re: Dear OpenRPN

*Message #15 Posted by **Geir Isene** on 26 Feb 2006, 3:54 p.m.,*
in response to message #14 by Gene

I'd say this discussion about OpenRPN is about as easy as it can ever get - much easier than even

putting up a simple project website.

I suggest the critics come with constructive ideas, concrete plans, how to acquire resources or money, hell even pitch in some hours work themselves.

Tearing down a building is a fair bit easier than bulding one.

Re: Dear OpenRPN

*Message #16 Posted by **Gene** on 26 Feb 2006, 4:03 p.m.,*
in response to message #15 by Geir Isene

Hello Geir!

Oh, I hope they succeed. But I've seen many times where a group or someone comes up with great plans and all that happens is talk, talk, talk.

Jean-Yves' Qonos was to be the ultimate graphical calculator. It would kill the HP49g+ AND the TI-89.

Lots of people talked and talked about it.

Then, it appears to have died.

I make no pretense about any abilities to make/manufacture a new calculator. But I do have experience with how business works and how they at times do not work.

Hence my pessimism.

Personally, the comments a few posts above would do wonders to dismiss the pessimism.

"All OpenRPN needs to to create a simple project plan, filled with milestones. Then by gradually ticking off these milestones outsiders will see that the project is progressing. Maybe OpenRPN is flying along, but from my point of view it looks like endless talking and changing of specifications"

Give us some milestones and then meet some of them.

How long have we gone so far? 2 years? And we have nice drawings. That's not the stuff of which success is usually made.

My 1 cent, Gene

*Message #17 Posted by **GE** on 27 Feb 2006, 4:17 a.m.,*
in response to message #16 by Gene

Hello,
First of all all the best to Hugh as it is easy to criticize while it is hard to DO.

Then, ideas to go forward on this wonderful project : this thing is an assembly of hardware and software. The hardware poses many problems (and can be discussed ad nauseam...), so why bother ? It may be (**no experience here**) possible to use some existing hardware and run the existing software on it. Then you make incremental improvements. The original hardware could be a bare bones PCB in a shoe box with bulky switches as a keyboard, I

would still be interested. The software could be a more or less legal copy of the HP49+'s, I think this would not be an issue for a non-commercial, small-scale project (eevn less if the perpetrator owns an HP49+). This platform would allow the more gifted to recompile the software (a la Linux), with HPGCC the software base could be progressively converted to more portable C code, then modified.
Harware could stay based on an HP49G+, anyone could open her machine and do the soldering work.

If this is still too much, OpenRPN could stay on the software side as an open-source project based on the 49G+.
All this could make the project take off in small, incremental steps. Am I completely dreaming here ?

Re: Dear OpenRPN (as I see it)

*Message #18 Posted by **Ron Ross** on 27 Feb 2006, 10:32 a.m.,*
in response to message #16 by Gene

OpenRPN seems to have started about the time that Hp was being questioned about their continued support of the RPN pocket calculator.

That someone might be able to make a better calculator is not really the point. The real point is whether these new startups can compete and profit with the Hp offerings now made available. The early Hp49G+'s were CRAP! (whether this is a hardware or a software fault, the result was a poorly useable calculator).

Next the Hp33s was made available to the low end RPN crowd.

Whats left? Well, you could offer a super deluxe version ie What JYA wanted to market. But 99.9% of your high end Hp users are fine with a working Hp49G+ (and a new Hp49G+ now makes 98% of those people happy). And really the RPN graphics market is small as it is compared to the sales of Ti and Casio graphics.

So that leaves crumbs for the support of the OpenRPN project.

So Hp's re-emergence onto the RPN market has effectively hosed all other RPN calculator projects aside from some spardic support or the efforts of a few dedicated individuals who want to see something come of their previous work. This will be a long lonely road for these few.

I liked the idea of OpenRPN, but when it became apparent that they were trying to please to big and varied a market, I felt they were off track.

My own desires are for an Hp42s type calculator with RAM and I/O. Form factor is MOST important to me! It has to fit in a normal sized pocket for me to appreciate. I even prefer my Hp15c form factor over the Hp42s, but the extra functions of the 42s make me bear with it. However, if the 42s were even 0.2 cm taller or wider, I wouldn't carry it!

I actually use an Hp48/49G most often, but they stay on my desk. If I travel or work away from my desk, I now use an Hp33s (POS that it is!), but would prefer to use an Hp42s and have the security of the matrix functions if need should arise. Why the Hp48 series over the 42s on my desk you ask? The units conversions and its easier to use solver. The eq writer is sometimes useful also.

So when I hear about the size or diminsions that use more than a two line display or horse

shoeing something into a graphics calculator case, I feel the originator is losing sight of the brass ring as I can already buy an Hp49G+.

A graphics calculator is a cheap math package somewhat comparable to a low end math package you can buy for a PC. But a PC is far more versatile, just a lot less portable. But a graphics isn't pocket friendly either (true, it is far more portable than a PC). So that market isn't really that great either.

Admittedly, another meaningless rant by me!

Re: Dear OpenRPN (as I see it)

*Message #19 Posted by **Hugh Evans** on 27 Feb 2006, 12:40 p.m.,*
in response to message #18 by Ron Ross

I actually started OpenRPN because I saw an unfilled market niche. Voyager and Pioneer model calculators sell for hundreds of dollars on ebay and I doubt more than a few of those are going to collectors. It's easy enough to produce similar, yet updated, machines for about $100... Thus undercutting the ebay market and giving professionals a nice option for daily use.

Everyone here is welcome to speculate as much as they please. I need to get back to working with the guts of this 49g+ for a retrofit.

-Hugh

Re: Dear OpenRPN - in defense of....

*Message #20 Posted by **Jim Creybohm** on 28 Feb 2006, 1:22 p.m.,*
in response to message #19 by Hugh Evans

As hobbyists in this eclectic forum, I should think that we would be pleased that Open RPN is trying to produce a calculator. Yes, I have read and listened to the various arguments, and I have read the market studies.

What surprises me though, is that although we have addressed this from a left brain perspective, has anyone considered that maybe, just maybe they are doing this because they want to? Maybe they won't make any money. Maybe they won't produce a million units. Maybe they won't produce one. Who cares? Has anyone here other than the OpenRPN persons put money into the venture? If, after listening to all the sides, they still keep going then its obviously a labour of love.

I don't deny that there hasn't been roadblocks for them, and stumbles. I too, grow frustrated with waiting and hoping but I recognize that this road leads to cynicism. But, y'know, I gotta say - I'm surprised, and a little disappointed in the responses penned here. Here is where I would have thought some kindred spirits live.

in response to message #20 by Jim Creybohm

> Quote:
>
> maybe, just maybe they are doing this because they want to

That is the main point, I agree.

That is why I will not disparage the movement in the least. I suspect that is also why Hugh takes all of the criticism objectively and indeed has expressed appreciation for some of the more negative though yet thoughtful and insightful comments.

I enjoy the whole development as a wonderful fantasy that may just come true. No loss if it doesn't it is still a good fantasy. Now that is a wonderful thing! :-)

(If I knew something that could be helpful, I'd volunteer some).

Re: Dear OpenRPN - in defense of....

*Message #22 Posted by **Garth Wilson** on 28 Feb 2006, 3:00 p.m.,*
in response to message #20 by Jim Creybohm

> maybe, just maybe they are doing this because they want to

and *that's* why it is inappropriate to compare openRPN to business ventures that tried and failed. openRPN as I understand it has no responsibility to investors who would be in it for the money, and certainly no responsibility to critical potential customers who don't have *anything* invested in it. The people involved have day jobs to support themselves. This makes progress slow, but it means one of the biggest risks of failure is gone.

Interestingly, this thread has made more glass-is-half-full people show up than the critics.

Re: Dear OpenRPN - in defense of....

*Message #24 Posted by **Gene** on 28 Feb 2006, 3:18 p.m.,*
in response to message #22 by Garth Wilson

True, but it does compare very closely to the Qonos attempt.

I hope they pull something off...but people also need some realism sometimes.

That said...good luck, Hugh! I'll be glad to eat lots of crow! :-)

Re: Dear OpenRPN - in defense of....

*Message #25 Posted by **bill platt** on 28 Feb 2006, 3:47 p.m.,*
in response to message #24 by Gene

I don't agree with teh Qonos comparison.

I think a better comparison woould be an ambitious HAM radio project. Say, a moon-bounce station for 420 MHz. Or a 1.2 GHz fast-scan FMTV

network over a 200 mile radius, or a metropolitam linked quad-band repeater system with DTMF user-control of phone patch, HF remote, beam steering, cross-band link etc etc all with microwave relay from tower to tower, emergency back-up power etc. I've seen this sort of thing come together. It is pretty fantastic. A ham club with 500 members giving $35 a year, and their time, can erect 200 foot towers, and do al lthat other stuff.

In other words, a project, done on one's own time, with friends, with significant technical and financial commitments but doable with dedicated amateurs.

I don't see why this project cannot be done, in the same vein.

Right on, Ron! [OpenRPN]

*Message #26 Posted by **Karl Schneider** on 27 Feb 2006, 3:24 p.m.,*
in response to message #18 by Ron Ross

Hi, Ron --

> Quote:
>
> Admittedly, another meaningless rant by me!

Far from it. I think that yours is one of the most insightful short essays to date about this topic in the Forum.

As far as I'm concerned, there are two substantial unfilled niches for RPN-based scientific calculators:

What the HP-33S ought to have been

The HP-33S should have been a "synergistic melding" of the HP-32SII and the HP-15C, with a one-line, easy-to-read dot-matrix display. Other attributes would include increased computational speed, ample RAM, an improved equation editor, and solid integrated functionality for matrix and complex-number calculations.

I think that such a project would have genuine value, but it would not be easy. Much effort went into the development of source code for the HP-15C and HP-42S, and what is still available might no longer be applicable to today's hardware.

What the original HP-48S/SX ought to have been

The HP-48S/SX should have been a "Super 42S", with RPN instead of obfuscated RPL, limited but easy-to-use graphics, and HP-71B BASIC for advanced programming (if necessary).

Nowadays, I would question whether such an ambitious project would be warranted. Advanced programs could be entered via downloadable binaries or plug-in chips. Multi-color LCD's would aid graphics, but that begs the question of, "Why not just use a PDA platform, when they become suitable?".

> Quote:

> My own desires are for an Hp42s type calculator with RAM and I/O.

That is indeed the desire of many. I believe that bidirectional infrared and hardwire I/O should be present -- as it was on the 48S/SX -- before large RAM is supplied to the user. (It would be interesting to know what HP had in mind by making the 42S ROM capable of supporting 32 kB of RAM.) However, I also question whether adding full I/O to the compact Pioneer-series package would have been practical or feasible, given the limitations of space and battery capacity.

> Quote:
>
> I liked the idea of OpenRPN, but when it became apparent that they were trying to please too big and varied a market, I felt they were off track.

As far the OpenRPN effort, I must admit that I haven't visited the site recently. I believe that the most useful efforts would be directed to the development of a thorough functional specification for the model(s) they would like to have developed: That is, list and describe all the functions, and specify in sufficient detail how they are to perform.

The issues of internal hardware and package design are best left to real manufacturers with the resources to deal with them. A functional spec could provide a good road map to KinHPo that would allow them to escape their wilderness of misguided marketing-driven product design.

Any independent product-development effort utilizing KinHPo 49G+ firmware is a lost cause. The proprietary and over-complicated 49G+ is already available, and it's based on that dreadful "Leisure suit" RPL.

HP 15C Memory Allocation

*Message #1 Posted by **Bill Balme** on 24 Feb 2006, 7:53 a.m.*

I'm at my wit's end! Is my beloved 15C finally broken? Everything seems to work fine - but I seem to have lost all memory. I can only store numbers in Registers 0 and 1. I have no programming steps available. If I try 19 f[DIM][(i)] I get Error 10

All the diagnostics [ON]X, [ON]+ and [ON]divide work and show no issue. All the keystroke functions work fine.

I just can't do any programming.

Please email any thoughts/advise...

Thanks,

Bill

Re: HP 15C Memory Allocation

*Message #2 Posted by **Randy** on 24 Feb 2006, 8:22 a.m.,*
in response to message #1 by Bill Balme

You didn't say if you cleared memory: [ON] [-] like the other self tests. That should result in a "Pr Error" display.

That usually takes care of wierd Voyager behavior.

Re: HP 15C Memory Allocation

*Message #3 Posted by **Bill Balme** on 24 Feb 2006, 8:54 a.m.,*
in response to message #2 by Randy

Randy - you are my hero! Memory restored - all with a couple of button pushes. Many thanks.

Bill

Re: HP 15C Memory Allocation

*Message #4 Posted by **Vieira, L. C. (Brazil)** on 24 Feb 2006, 12:09 p.m.,*
in response to message #1 by Bill Balme

Hi Bill, all;

This sort of behavior only happens when

```
0 [f][DIM][(i)]
```

is performed. Registers Ro and R1 in the HP15C are permanent, can never be used with other purposes but

store numbers. In fact, they are used as index to access matrix elements.

Beacause

```
19 [f][DIM][(i)]
```

did not work, I'd suggest two keystroke sequences that might probably solved the problem. The first one would be

```
[f][MATRIX]0
```

that clears all matrix definitions (dimension 0,0) and data, restoring all registers dedicated to matrices to the 'uncommited register segment'. After that, any register that could be used by matrices would be free for use by programs, though. The other one would be considering the existence of programs and clearing program memory with

```
[f]CLEAR[PRGM] (while in program mode)
```

In both cases, Randy´s precise solution works perfectly fine because all memory is cleared and default status is set. I decided to add this brief because sometimes, even when the problem is solved, the cause may be yet obscure. As I am an Engineer, I am always trying to find the cause so it can be avoided in the future...

Cheers.

Luiz (Brazil)

Testing an HP 48GX RAM Card - Question

*Message #1 Posted by **jbssm** on 24 Feb 2006, 5:18 a.m.*

Hello all,

I have this old RAM card for my HP 48GX, but I don't really know the size of it or if it's working really correctly.

Is there a simple test I can run in the 48GX to give me the size of the RAM card and to test it?

Best regards, jbssm

Re: Testing an HP 48GX RAM Card - Question

*Message #2 Posted by **Raymond Del Tondo** on 24 Feb 2006, 5:28 a.m.,*
in response to message #1 by jbssm

Hi,

first make sure the read/write protection switch is in the r/w position.
Then put it into port 1, eventually it'll give you an error,
like 'Invalid card data' or 'Battery P1 low'.
At this point just ignore these messages.

Then type 1 PINIT. After a while, when the the port init is over,
type 1 PVARS. This will return an empty list in level 2,
and the amount of free memory in level 1.

For more details, RTFM;-)

HTH

Raymond

Re: Testing an HP 48GX RAM Card - Question

*Message #3 Posted by **tomcee** on 24 Feb 2006, 11:30 a.m.,*
in response to message #2 by Raymond Del Tondo

This brings up a related issue; Is there any way to test any/all available ports of a HP48GX Ramcard as blocks of RAM, similar to conventional RAM testing, that is, write/read each HW location in the RAM block?

Tomcee

Re: Testing an HP 48GX RAM Card - Question

*Message #4 Posted by **Raymond Del Tondo** on 24 Feb 2006, 1:53 p.m.,*

in response to message #3 by tomcee

Hi,

this may also be a RTFM;-)

The HP-48 has some self-test capabilities,
amongst them some memory checks.

Of course you could write a small ML program
which reads/writes from/to each memory address,
but AFAIK the self-test does exactly that...

To enter the memory test, just press and hold the ON key,
press the forth menu key ('D'), then release both.
Three vertical lines will appear.

Now press the up-arrow key, and the main memory will be checked,
some pixel pattern will apear on the display.
After a while the display will show the starting address
and the size of the RAM.

To revert to normal operation, just press and hold ON,
then press the third menu key, then release both.

HTH

Raymond

Re: Testing an HP 48GX RAM Card - Question

*Message #5 Posted by **tomcee** on 24 Feb 2006, 3:24 p.m.,*
in response to message #4 by Raymond Del Tondo

Thanks for the reply.

What I am referring to is not exactly what is built into the machine or in the manual; what I have in mind is something like specifying a particular address or range of addresses:

{13:00000 13:0ffff 5A}

Where the (proposed) utility would write/read a specific bit pattern (eg: 5A)to that range of adresses (eg: port 13, addresses 00000 to 0fff) and verify.

I do understand that each port does not have exactly 128 available. BTW, what are the unavailable locations used for?

Thanks again, TomCee

Re: Testing an HP 48GX RAM Card - Question

*Message #6 Posted by **James M. Prange (Michigan)** on 24 Feb 2006, 7:29 p.m.,*
in response to message #5 by tomcee

Quote:

> I do understand that each port does not have exactly 128 available. BTW, what are the unavailable locations used for?

PVARS shows all of my cards as having 131072 bytes per (empty) port, which is exactly 128kB, (2^{17} bytes). (I don't have a 32kB card.)

That said, anything other than a library is stored in a port as a "backup object", which is somewhat larger than the object it contains. A "backup object" also contains its own name and a CRC value, for example.

For example, a real number stored as a global variable named 'A' takes 16 bytes of memory, but stored as a backup object named :1:A, it takes 23.5 bytes.

Thank you very much Raymond !

Re: Testing an HP 48GX RAM Card - Question

*Message #8 Posted by **James M. Prange (Michigan)** on 24 Feb 2006, 6:38 p.m.,*
in response to message #1 by jbssm

Does the card has any brand name or other markings on it? I haven't heard of a RAM card the doesn't have the size clearly marked, except for Oliver Klotz's cards.

As Raymond wrote, first set the switch to the r/w position. I suggest putting the card in the 48GX's slot 2 instead of slot 1, but indeed ignore any error message for now. Type in PINIT and press ENTER (PINIT doesn't take any arguments). After the "busy" annunciator turns off, press LeftShift LIBRARY (over the 2 key), then press the PORTS menu key. You'll always see the :0: menu label for port 0, and if a card is in slot 1, you'll also have a :1: for port 1. With the card in slot 2, you should see at least :2:. If you see more port labels, then each one is 128kB. If you see only :2: for the card, then execute 2 PVARS to see whether it's a 32kB card or a 128kB card.

32kB and 128kB cards can be used in either slot 1 or slot 2 of either the 48SX or 48GX, but larger cards should be used only in the 48GX's slot 2. Exceptions to this are some TDS brand multi-bank cards designed for the 48SX, and some of Oliver Klotz's multi-bank cards with the current bank selected by switches on the card, which work in either slot of either model.

Regards,
James

HP48SX Repair

*Message #1 Posted by **Billy Everson** on 23 Feb 2006, 6:50 p.m.*

I have an HP48SX which does not come on. I hadn't used the machine for a couple of months, and so when it failed to start I replaced the batteries (no sign of corrosion). I went through the hold the switch and press the "+" key, hold the on switch and press the "C" key and finally pulled it's little foot off and reset it. No success anywhere. I'd really like to find a repair station, as I'm not ready to give up the machine. Any help or info will be greatly appreciated.

Chinese 12Cs better now?

*Message #1 Posted by **joe locket** on 23 Feb 2006, 4:42 p.m.*

Not meaning to open a can of worms, but I'm wondering if the Chinese-built 12Cs (which are routinely slammed on these boards) are actually improving? Could it be HP has listened to the criticisms and have improved the build quality?

I only say this because I recently bought a vintage 12C made in Brazil in 1990. According to the archives, these are supposed to be just as good as the USA-made calculators -- both of which are supposedly superior to the Chinese models.

Admitted I may have had unrealistic expectations, but I have to say I'm not blown away. Several of the Brazil model's keys are mashed down and the clicks are dull. Some may say that's because the unit is old. Maybe -- but isn't standing the test of time supposed to be the hallmark of the classic 12C? And the unit is no studier than my chinese 12C. Also, when I shake the Brazilian unit, there's some key rattling (a top gripe held against the Chinese model).

This isn't a criticism and I don't have any proof to back it up. I too have seen the early Chinese 12Cs. They were relatively flimsy and the buttons were weak. It might be interesting to compare quality based on serial numbers.

Is it possible the new 12Cs have returned closer to the "good old days" quality of H-P in the early 1980s?

Re: Chinese 12Cs better now?

in response to message #1 by joe locket

16 years old, unknown history. What else can I say?

Re: Chinese 12Cs better now?

*Message #3 Posted by **Randy** on 23 Feb 2006, 8:11 p.m.,*
in response to message #1 by joe locket

Bravo, Bill. I second with:

> Quote:
>
> Could it be HP has listened to the criticisms and have improved the build quality?

Is this a trick question?

> Quote:
>
> I only say this because I recently bought a vintage 12C made in Brazil in 1990.

Vintage, yes, lightly used, no way.

> Quote:
>
> According to the archives, these are supposed to be just as good as the USA-made calculators -- both of which are supposedly superior to the Chinese models.

Yes, they are. Good man, you did your homework.

> Quote:
>
> Several of the Brazil model's keys are mashed down and the clicks are dull. Some may say that's because the unit is old.

Nah, just beaten on for 16 years. You'd be flat too with that treatment.

> Quote:
>
> This isn't a criticism and I don't have any proof to back it up. I too have seen the early Chinese 12Cs. They were relatively flimsy and the buttons were weak. It might be interesting to compare quality based on serial numbers.

There is nothing to compare. They aren't same quality, period.

> Quote:
>
> Is it possible the new 12Cs have returned closer to the "good old days" quality of H-P in the early 1980s?

Is this a trick question?

Sorry, I couldn't resist :)

Seriously, find yourself a neglected USA, Singapore or Brazilian unit and you will not be disappointed.

PS: What's the serial number of yours? I might be willing to do a swap if it has parts I can use.

Edited: 23 Feb 2006, 8:12 p.m.

Re: Chinese 12Cs better now?

*Message #4 Posted by **joe locket** on 24 Feb 2006, 10:59 a.m.,*
in response to message #3 by Randy

Randy,

Thanks for the play-by-play analysis. I'm willing to be convinced.

Also, it's very generous of you to offer a swap. What are you willing to swap for my Brazilian unit? I don't have the serial # on me, but will get it later. Thanks!

Re: Chinese 12Cs better now?

*Message #5 Posted by **Randy** on 25 Feb 2006, 7:46 a.m.,*
in response to message #4 by joe locket

> Quote:
>

A USA or Singapore without the keyboard issues. Cosmetics same or better.

Edited: 25 Feb 2006, 7:47 a.m.

Re: Chinese 12Cs better now?

*Message #6 Posted by **joe locket** on 25 Feb 2006, 1:27 p.m.,*
in response to message #5 by Randy

The serial is 3030Bxxxxx. I'd be very appeciative if you would swap for a USA unit. I'll try to find your e-mail address and e-mail you directly. Thanks!

Re: Chinese 12Cs better now?

*Message #7 Posted by **Stephen Easterling** on 24 Feb 2006, 1:06 p.m.,*
in response to message #3 by Randy

Hmmm! I have a Chinese 12C (SN CNG45207252) and it work flawlessly and feels as strong as a little brick (just like my USA 12C). Compared to the 12CP, my Chinese 12C is much better and I can't tell much difference between it and the USA model. Maybe quality control has improved over time.

Re: Chinese 12Cs better now?

*Message #8 Posted by **joe locket** on 24 Feb 2006, 1:51 p.m.,*
in response to message #7 by Stephen Easterling

Maybe we're on to something. My serial is very close to yours: CNG45009226

48gx Statistics help please!

*Message #1 Posted by **Mario** on 23 Feb 2006, 3:31 p.m.*

Hi, I have a HP 48gx calc and I'm taking a stats class. I need to know how to calculate combinations. Such as, if you toss a coin 10 times, how many different ways can you get 4 heads out of the 10. Or something with the lotto, if there are 52 numbers to choose from, and you can choose 6, how many possible combinations are there. I'm kind of a beginner with this calc, so go easy, haha. Thanks for the help!

Re: 48gx Statistics help please!

*Message #2 Posted by **John Limpert** on 23 Feb 2006, 5:04 p.m.,*
in response to message #1 by Mario

Try MTH, NXT, PROB.

Re: 48gx Statistics help please!

*Message #3 Posted by **Mario** on 24 Feb 2006, 3:54 a.m.,*
in response to message #1 by Mario

I was told to put "COMB(10,4)" into the stack. Where can I find the COMB function? Thanks!

Re: 48gx Statistics help please!

*Message #4 Posted by **Arnaud Amiel** on 24 Feb 2006, 4:33 a.m.,*
in response to message #3 by Mario

On the hp48 you will have to do 10 ENTER 4 ENTER COMB

COMB can be found where indicated above or you can use the alpha key to enter [C][O][M][B]

Re: 48gx Statistics help please!

*Message #5 Posted by **James M. Prange (Michigan)** on 24 Feb 2006, 5:57 p.m.,*
in response to message #4 by Arnaud Amiel

Actually, on the 48 (and 49) series, COMB is a function, so 'COMB(10,4)' EVAL will indeed work, as long as the "fraction mark" is at the default of using the period. If the fraction mark is the comma, then use 'COMB(10.4)' EVAL instead. Either way, 'COMB(10;4)' EVAL works.

But Mario, note that the delimiters for an algebraic object are single-quotation marks, not double-quotation marks; "COMB(10,4)" is a character string. I suggest that you spend at least a little time reading the fine manual. Note that for the RPL models, you're likely to get a better response on the comp.sys.hp48 usenet group; see: http://groups.google.com/group/comp.sys.hp48?. Also see: http://www.hpcalc.org/

As an RPN sequence, 10 4 COMB also works.

On the 28S, COMB isn't a function, so the algebraic syntax won't work, and the 28C doesn't have a built-in COMB command.

Regards,
James

Mashed down buttons on 12c

*Message #1 Posted by **joe locket** on 23 Feb 2006, 10:30 a.m.*

Hello. Wondering if this is normal. Based on the advice on this forun, I bought a used Brazil-made HP 12c (made in 1990) from ebay -- instead of buying a new 12c from the store.

I noticed, though, that several of the buttons (+, -, x, clx) are lower than the others -- almost like they were smashed down. They do work, however. Is that normal?

Re: Mashed down buttons on 12c

*Message #2 Posted by **bill platt** on 23 Feb 2006, 10:35 a.m.,*
in response to message #1 by joe locket

Old calculators can end up with all sorts of wear-related flaws. What you describe is just one of many. It is not "normal" or "typical" but it can and does happen.

Re: Mashed down buttons on 12c

*Message #3 Posted by **Karl Schneider** on 23 Feb 2006, 10:45 p.m.,*
in response to message #1 by joe locket

One of my collegues tends to type very "heavily" -- on a PC keyboard and on his workplace-issued 1987 HP-15C. The calc is beat, with frequently-used keys nearly flush with the faceplate. But it still works perfectly...

DDAYS & co. for HP 33s

*Message #1 Posted by **Gour** on 23 Feb 2006, 3:14 a.m.*

Hi!

I placed order for HP 33s and while waiting for it to arrive I'm looking for some programs I need for regular use, like date arithmetic - DDAYS, DATE+ etc.

Anyone knows for some date-arithmetic package for HP 33s?

Sincerely,
Gour

*Message #4 Posted by **Gerson W. Barbosa** on 24 Feb 2006, 1:40 p.m.,*
in response to message #3 by Gour

Hi Gour,

Thanks for the suggestion. I have already submitted a program for calculating Carnival and Easter

Sundays (for the 42S). Perhaps you should take a look at the calendar functions for the 67, it would not be difficult to convert them to the 33S:

http://www.hpmuseum.org/software/67pacs/67calend.htm

Or at Christoph Giesselink's Date Functions for the HP-42S at www.hp42s.com:

http://www.hp42s.com/programs/date/date.html

It should be easy to adapt them to the 33S.

Best regards,

Gerson.

Hi, Xavier:

Xavier posted:

"In the makelex program I found on the forum I get an error on the line 60 : it dont accept P$=RPT$("-",16)"

> The problem is that MAKELEX, a program to create LEX files from an ascii listing, does commit the *stupid* error of needing a LEX file itself as written, because it uses the RPT$ keyword which is only available in a number of LEX files, STRGNLEX for instance.
>
> This is utterly stupid because requiring some LEX file for a program which precisely intends to be a bootstrap to allow the user to enter LEX files in its HP-71B without having mass storage devices (disk, tape, card reader) is plain stupid, kinda chicken-egg situation.
>
> Besides, as pointed in another post, RPT$ isn't needed at all, because all it does in this case is to assign P$ sixteen repetitions of "-", so a simple P$="----------------" would work, faster, simpler, taking less

RAM (!), and not needing a LEX file at all.

Frankly, it's about the stupidest error, intentional or not, I've ever seen in an otherwise useful program.

Best regards from V.

Re: LEX dump

*Message #4 Posted by **Xavier LaRue** on 23 Feb 2006, 11:20 a.m.,*
in response to message #3 by Valentin Albillo

Hi, the next question is surly how to dump lexfile :)

Do this should works :

Using lif_utils

./lifget -f lexfl1.lif RPNLEX | hexdump

and typing it into the 71B ?

Another question, how do we remove a LEXfile ?

Thank for you help all, Xav

Edited: 23 Feb 2006, 11:47 a.m.

Re: LEX dump

*Message #5 Posted by **Vassilis Prevelakis** on 23 Feb 2006, 4:59 p.m.,*
in response to message #4 by Xavier LaRue

BTW one thing to remember when dealing with the 71B is that in many cases sizes and other quantities are in nibbles (4-bit units, fourtets? :-)

So that when you see 100 it may be 100 (base 10), 256 (base 10) or 128 (base10).

**vp

Re: LEX dump

A friend once suggested 4 bit groups should be known as "kibbles"

On half bytes, nibbles, kibbels, or whatever

*Message #8 Posted by **Marcus von Cube, Germany** on 25 Feb 2006, 4:12 a.m.,*
in response to message #7 by george

> Quote:
>
> A friend once suggested 4 bit groups should be known as "kibbles"

Why not "quibbles?"

Why didn't the Americans invent the 3.5 bit unit?

It's good enough for BCD, since $2^{3.5}$ ~= 11.3 which is more then 10.

And two of them are good enough for 7 bit ASCII. Are there any people which need more bits to write properly in their languages?

What could be a good name for such a unit of information? A "thrivel?"

Marcus

Re: LEX dump

*Message #9 Posted by **Valentin Albillo** on 24 Feb 2006, 4:43 a.m.,*
in response to message #4 by Xavier LaRue

Hi, Xavier:

Xavier posted:

"Hi, the next question is surly how to dump lexfile :) Do this should works : Using lif_utils ./lifget -f lexfl1.lif RPNLEX | hexdump and typing it into the 71B ?"

> Sorry but I'm not familiar with lif_utils so I can't say. Seems probable that it would work, except for the fact that the MAKELEX versions I've seen all of them require to input a checksum at the end of each line of hex digits, which they use to check for input errors. If the 'hexdump' you mention does also output that checksum and it happens to be computed the same way as MAKELEX expects it, then it will work, but I can't say for sure.
>
> The usual way of dumping LEX files in MAKELEX format was with the sister application DUMPLEX, also a BASIC program which would run in a barebones HP-71B, which would output the proper checksum digits as well. You can probably get it from the same source where you found MAKELEX, and it's certainly included in some CHHU issues.

"Another question, how do we remove a LEXfile ?"

> Simply PURGE the lex file (i.e.: PURGE RPNLEX). If the file is secured, you'll need to UNSECURE it first, which you can do if the file is in RAM, but not if it's in ROM. Once purged,

you'll lose all its keywords, polls, messages, etc, and if there are some programs in RAM which used them, they'll no longer work, the original lex function and statements being (temporarily) replaced by XWORD and XFN, respectively.

Best regards from V.

The calc was made in 1989 (for these serial numbers, add the first two digits to 1960 to obtain the year of manufacture).

I can't tell you Brazil's period of production, but the ones made in the USA, Singapore, and Brazil are of better quality than the later-production calc's made in Malaysia, Indonesia, and China.

HP 82163 video interface

*Message #1 Posted by **Bill Lafferty** on 22 Feb 2006, 6:27 p.m.*

I would like to connect my IL loop HP 82163 video interface to a spare office VGA monitor, but the monitor input is through a HD15 plug. I've done a fair bit of google searching, but can't seem to come up with a solution. Is it possible to make such a connection? .....Bill Lafferty in Cooma, Australia

Re: HP 82163 video interface

*Message #2 Posted by **Eric Smith** on 22 Feb 2006, 6:53 p.m.,*
in response to message #1 by Bill Lafferty

The 82163A produces NTSC-rate video (or maybe PAL-rate, if there was a PAL version). This means that it has about 15.75 KHz horizontal sync, while most VGA monitors can't sync to less than about 31 KHz. Some VGA monitors can be damaged by out-of-spec signals; others simply won't work properly.

If you're sure your VGA monitor can handle signals that slow, you may be able to wire an adapter. If the monitor can handle sync-on-green, you can just wire the composite output to the green input of the monitor, and you'll get green text. But if it doesn't do sync on green, then you'll need a sync separator circuit (e.g. LM1881 and a few passives, and a power supply).

Are you sure you can't just find an old video monitor (non-VGA)?

Re: HP 82163 video interface

*Message #3 Posted by **Tony Duell** on 23 Feb 2006, 6:37 a.m.,*
in response to message #2 by Eric Smith

There was a PAL version. From what I remember from the service manual, the changes were to move one link (to select a different division ratio in the ASIC), a different clock crystal, and different components in the RF modulator.

Oh, and you got an adapter from an RCA phono socket to a Belling-Lee coaxial plug (the common TV aerial connector in Europe).

Re: HP 82163 video interface

*Message #4 Posted by **Vassilis Prevelakis** on 22 Feb 2006, 10:03 p.m.,*
in response to message #1 by Bill Lafferty

Look around for a video card with a composite video-in connector (like the ATi All-In-One card). Then you can plug in your HP 82163 to the composite in connector on the All-in-One card and see the picture on your PC screen.

The advantage of such cards is that they can be configured to sync to both PAL and NTSC signals, so you do not need to worry about the type of HP 82163 you have.

Apart from that, if your monitor does not have a composite video input connector (my Dell LCD flatpanel has one), then you are out of luck.

**vp

Re: HP 82163 video interface

*Message #5 Posted by **Bill Lafferty** on 23 Feb 2006, 4:27 a.m.,*
in response to message #1 by Bill Lafferty

Thanks for the input, looks like I've got a problem. Is it any easier to connect to a modern TV? .....Bill Lafferty

Re: HP 82163 video interface

*Message #6 Posted by **Tony Duell** on 23 Feb 2006, 6:38 a.m.,*
in response to message #5 by Bill Lafferty

If your TV (or VCR) has a composite video input (often a yellow-coloured RCA phono socket), you should just link that to the monitor (not RF) socket on the 82163.

Re: HP 82163 video interface

*Message #7 Posted by **Christoph Klug** on 24 Feb 2006, 3:18 a.m.,*
in response to message #6 by Tony Duell

I use the IL-video interface in combination with a small modern 7 inch LCD monitor which includes a composite video input.

For switching between NTSC and PAL you have to change an internal resistance inside the IL-video interface (as Tony Duell describes). Than the LCD monitor lock correctly to the (wrong) frequency - therefore it is not needed to change the internal crystal oszillator of the IL-video interface....

Best regards - Christoph Klug

Re: HP-29C: another faulty calculator through eBay...

*Message #1 Posted by **David Smith** on 22 Feb 2006, 9:59 a.m.*

Dancing and flashing digits is NOT a typical ACT symptom. I've seen many 29C's with this problem. Most likely cause is a bad filter capacitor in the DC-DC converter inside the calculator.

Re: HP-29C: another faulty calculator through eBay...

*Message #2 Posted by **Andreas Terzis** on 22 Feb 2006, 4:38 p.m.,*
in response to message #1 by David Smith

Does anyone have any info about what Bram said below (harming the calc when using regular AA batteries)?

Re: HP-29C: another faulty calculator through eBay...

*Message #3 Posted by **Bram** on 23 Feb 2006, 4:01 a.m.,*
in response to message #2 by Andreas Terzis

It may have been a message in this forum; I cannot remember quite right.
On the other hand, here someone shares my experience that it didn't harm. As long as I haven't read a proof that the voltage difference between NiCds and alkalines (0.6 V) can or cannot harm, I don't take the risk (anymore).
It looks like you shouldn't worry about having applied alkalines though.

Re: HP-29C: another faulty calculator through eBay...

*Message #4 Posted by **Andreas Terzis** on 23 Feb 2006, 4:51 a.m.,*
in response to message #3 by Bram

Bram, I didn't understand. Did the alkalines have to be connected on one end as well? I am not sure how that solution worked. Can you please clarify? Thanks, Andreas

Re: HP-29C: another faulty calculator through eBay...

*Message #5 Posted by **Vassilis Prevelakis** on 23 Feb 2006, 7:06 a.m.,*
in response to message #4 by Andreas Terzis

since we are talking about series 2x calculators, here is a picture of the battery pack of my HP-21:

http://www.series80.org/Misc/HP21-bat-lr.jpg

you can see the two alcaline batteries. They are linked on the rear by the existing springs in the HP-21 pack. I had to remove the plastic strip on the top of the pack to allow easy access to the batteries.

*Message #6 Posted by **Bram** on 23 Feb 2006, 10:49 a.m.,*
in response to message #5 by Vassilis Prevelakis

Thank you, Vassilis. Clear picture.
I did exactly the same thing: remove the middle bar, take out the NiCd cells (little force needed) and put 2 alkalines back in. If you use the calculator often and frequently replace the batteries it may be handy to write big pluses and minuses at all proper places in the compartment, and fix the spring with a little piece of tape with 2 sticky sides ('double fix' as it is called in NL).
I have the impression that alkalines are a bit longer and often have a smaller "head". This may cause more tension to the circuit board, so I always put the pack in the calc very carefully.
But, as said before, I hold on to the safe NiCds nowadays.

New source for programs

*Message #1 Posted by **Artur - Brasil** on 22 Feb 2006, 7:10 a.m.*

Hi!

I would like to present all you the new feature of my small site www.elibertas.com.br : a program's database. It is mostly dedicated to portuguese readers, but I would be very happy to receive programs and comments from everyone.

For giving me the pleasure of your visit, just go to: eLibertas

and click on Programas.

Best regards, Artur

Re: New source for programs

*Message #2 Posted by **Valentin Albillo** on 22 Feb 2006, 7:24 a.m.,*
in response to message #1 by Artur - Brasil

Hi, Artur

Nice idea but if you really want to have a sizable number of visits and inputs to your programs database, you really need to create an English version of your site.

Being a Spanish native, I do understand the texts at your site but frankly doubt that the vast majority of potential contributors would manage or find it comfortable or useful enough.

So I know it's a lot of work but ... English texts, descriptions and instructions would be mandatory. My own, much humbler web site is totally in English, I didn't even consider or care to produce an Spanish version.

Best regards from V.

This is not a bad idea ...

*Message #3 Posted by **Artur - Brasil** on 22 Feb 2006, 9:11 a.m.,*
in response to message #2 by Valentin Albillo

Ok, Valentin,

I have been planning a new site, but as you said, it is a lot of work ...

Best regards! Artur

Re: This is not a bad idea ...

*Message #4 Posted by **Valentin Albillo** on 22 Feb 2006, 9:46 a.m.,*

in response to message #3 by Artur - Brasil

Also, I would suggest you use a more substantial "sample" program for each featured model.

Counting upwards is certainly easy, but perhaps excessively so, plain boring, and doesn't reveal the machine's programming style.

May I suggest something still easy and understandable but, as stated, more substantial, let's say a program to compute and output prime numbers, from 2 or 3 upwards ...

This is still outright easy and makes a far better example.

Best regards from V.

Sample programs

What's the difference? (RPN/RPL)

*Message #1 Posted by **Han** on 22 Feb 2006, 1:43 a.m.*

Hm.. I've only used the HP48(S/SX/G/GX/G+), so bear with me. But what exactly are the differenced between RPN and RPL?

Re: What's the difference? (RPN/RPL)

*Message #2 Posted by **Andreas Terzis** on 22 Feb 2006, 2:16 a.m.,*
in response to message #1 by Han

Han,

If you only have calculators of the HP-48 series then fairly you don't know the difference between RPN and RPL. RPN (Reverse Polish Notation) was used by earlier calculators up to the HP-18C or the HP-28C. RPL (Reverse Polish Lisp) is used in your calculator.

One of their main differences is that RPN uses a four-level stack with a fifth element being the LastX number used for intermediate calculations, when RPL uses a stack that has an depth that is dictated by memory only; in other words you can store multiple elements in the stack, limited only by the available memory, and use them for calculations.

Another difference is that RPN doesn't use a completely postfix notation - where you put the numbers in your stack first and then you perform the calculations (2 ENTER 5 +). In a lot of instances you use a prefix notation for functions, e.g. 7 STO 00, where you store the number 7 in register 00. In RPL you would store everything to the stack first and then perform operations on those objects, so the STO command would appear last. It is kind of a strict postfix notation language.

For more on this, you can check some excellent literature on the HP Museum like:

Link to RPN article, Link to RPL article.

I hope I summarized some of the differences correctly for you here. Andreas

*Message #3 Posted by **Garth Wilson** on 22 Feb 2006, 3:10 a.m.,*
in response to message #2 by Andreas Terzis

As one who has never used or paid much attention to RPL myself, perhaps I can ask further, for the original poster. I understand RPL has strict program structures with no GOTO and, I assume, no labels either; and further, that an RPL program is compiled from text source code instead of being keyed directly in like you would do on an RPN programmable calc. I expect that variables can have names, and that you can probably make different kinds of variables, arrays, and data structures. Is this all correct? Does it compile "words" into a dictionary like Forth does? Perhaps these will bring to mind other things about it to

describe briefly as well.

An RPL program is an object that can reside on the stack or in a named variable. Once there, it can be 'evaluated'. Evaluating a variable is performed by just using its name. In that sense, an RPL program stored in a variable becomes part of the language.

I guess that's very similar to Forth.

Marcus

Except the interactivity of the Forth environment is lost (which IMHO is one of the beauties of Forth and is one of the reasons why RPL is indeed inferior to Forth.)

True, and no GOSUB either, thus indeed no use for labels.

But subprograms can be placed and manipulated on the stack and evaluated by the EVAL command, or stored as global variables and evaluated by name, or stored as local variables and evaluated by name followed by EVAL.

> Quote:
>
> and further, that an RPL program is compiled from text source code instead of being keyed directly in like you would do on an RPN programmable calc.

??? Well, ordinarily, I do key a program directly into the command line, within << and >> UserRPL program delimiters. Of course, you can always write a program (or most other object types) as source code in a text editor and transfer it to the calculator. If I happen to be at my PC, I'm more likely to use the larger screen and QWERTY keyboard to write all but the simplest programs. But for "real work", I'm not likely to be at my PC when I want to write an "ad hoc" program.

There are different ways to get the "words" into the command line editor; some can be placed there simply by pressing a primary or shifted key, most of the rest by pressing a menu key, and you can always just go into ALPHA mode and type out the command name. Personally, unless I know that I'm going to be using several commands from the same one or two menus, I normally just type out the command names instead of navigating through the menus.

In the 28 series, all of the commands are available through the CATALOG operation, and similarly, the 49 series has the CAT operation. These are perhaps best used if you don't remember the exact spelling of a command.

ENTER (or implicit ENTER) parses the command line, and assuming no syntax error, compiles it to a "secondary" (a SysRPL program) containing the object(s), and then executes it. In the case of a UserRPL program, we enclose the program within the << and >> delimiters, so "execution" simply places the UserRPL program on the stack, and it's decompiled for the stack display. To evaluate ("run") the program, you can use the EVAL command. Or with the program and a name on the stack, you can store them as a named global variable, in which case, executing the variable's name evaluates the program.

For that matter, you can write the object's source code, followed by the global name and the STO command, all in the command line, and then press ENTER to have them stored as a global variable without ever seeing them on the stack.

"Vectored ENTER" allows you to take additional actions before and/or after actually executing the command line.

Note that storing objects by name effectively extends the language for that particular calculator, and on all but the 28C, you can store quite a lot.

Note that RPL doesn't have "PROGRAM" and "RUN" modes. Perhaps the closest you can come to those is switching between "immediate", "PRG", "ALG", and "ALG PRG" entry modes, and "quoting" source code with delimiters for delayed execution.

You can write your source code within a character string, thus preserving all of your formatting and comments, and later "execute" the string with the STR\-> command, if you prefer.

> Quote:
>
> I expect that variables can have names,

Of course; an RPL "variable" amounts to a "named object". But there are some restrictions to names. For example, a global name can't duplicate a built-in "key word", or start with a numeric character, can't contain mathematical symbols, such as +, -, *, /, ^, <, and so on, can't contain any delimiter or separator character, and is limited to 127 characters. Note that in the 49 series, some of the restrictions are ignored by the Filer's "RENAME" operation and the S~N command in the "hacker's menu", but the "invalid" names can cause problems. Local names have fewer restrictions; for example, they can indeed duplicate built-in key words.

> Quote:

> and that you can probably make different kinds of variables,

Well, variables are either global or local, stored with a global or local name type object. A stored directory might be considered a sort of global variable, stored with a global name, that may contain other global variables. Global variables are stored until the user purges them. Local variables are stored in a local environment that exists only until the "defining procedure" (a program or algebraic object) is finished.

> Quote:
>
> arrays, and data structures.

There are various types of objects, depending on the model.

In the 28 series, the "user" object types are real number, complex number, character string, real array, complex array, list, global name, local name, program, algebraic object, and (user) binary integer. Of course the 28S can have directories, but you can't put a directory "on the stack" in that model.

The 48 series adds graphic object, tagged object, unit object, XLIB name, directory, library, backup object, built-in function, and built-in command to the "user" objects.

The 49 series adds user types (exact) integer, mini-font, symbolic array, and font.

There are also various "system" object types that the user wouldn't ordinarily see, such as system binary, extended real, extended complex, linked array, character object, code object, library data, and external objects.

Note that SysRPL uses different terminology for the object types.

> Quote:
>
> Is this all correct?

Well, I hope that I'm correcting any misconceptions.

> Quote:
>
> Does it compile "words" into a dictionary like Forth does? Perhaps these will bring to mind other things about it to describe briefly as well.

I'm not familiar with Forth.

RPL compiles "words" (source code) into "objects". Certain "built-in" objects are compiled simply as 5-nibble addresses, other than that, each object starts with a "prologue address" (usually referred to simply as the "prologue"), which is a 5-nibble pointer to the actual prologue, the code responsible for handling the particular type of object. Some object types contain information on the length of the object, or information that can be used to compute the length. Lists, programs, algebraic objects, unit objects, and symbolic matrices use the system object SEMI as a closing delimiter.

Note well that RPL never stores source code as such; the closest you can come to that is to force it to compile it as a character string object. For display, Kermit "ASCII" transfer, printing "via wire", and the \->STR command, objects are decompiled. But note that the object types library, backup object, mini-font, and font can't be decompiled by these methods.

Actually, having an object "on the stack" is a bit of indirection. The stack is really a stack of 5-nibble pointers to objects that exist elsewhere in memory, which are decompiled as needed for display. So the stack manipulation commands don't deal with objects per se, rather simply with 5-nibble pointers.

Note that an "algebraic object" could be regarded as a special kind of program. It's entered in algebraic syntax between single-quotation mark characters as the source code delimiters. It has its own prologue, but other than that it's compiled as an RPN sequence with SEMI as the closing object delimiter. For display and so on, it's decompiled to algebraic syntax. Of course, it can't use all of the "commands", only the "functions". That said, you can often write your own "user-defined functions", which can then be used within algebraic objects. All algebraic objects can be re-written as programs, but not all programs can be re-written as algebraic objects.

Regards,
James

in response to message #6 by James M. Prange (Michigan)

It does take some getting use to without having LBL and GTO commands to work with. The << sub program >> 'TEMPVAR' STO then TEMPVAR EVAL works.

*Message #8 Posted by **James M. Prange (Michigan)** on 27 Feb 2006, 5:10 p.m.,*
in response to message #7 by Eddie Shore

> Quote:
>
> It does take some getting use to without having LBL and GTO commands to work with.

Okay, I accept that for someone who's always had these available, learning to work without them may very well be difficult to get used to.

> Quote:
>
> The << sub program >> 'TEMPVAR' STO then TEMPVAR EVAL works.

Using subprograms in RPL is more like using GOSUBs in other languages, or in the case of named subprograms, rather like a CALL in some other languages. More likely substitutes for GOTOs would be conditional and looping program structures.

Unless a local variable named 'TEMPVAR' already exists,

```
<< sub program >> 'TEMPVAR' STO
```

makes a global variable. This makes sense if the intent is to make a utility program that will be called by various other programs, but isn't so good if the intent is to make a subprogram to be used more than once in a single program. For one thing, resolving a global name generally takes longer than resolving a local name or leaving the subprogram on the stack and using stack manipulation commands, and probably more importantly, the global variable will overwrite any global variable named 'TEMPVAR' in the current directory, and will be stored in the current

directory until the user purges it.

With the subprogram stored in a global variable, executing its unquoted name, TEMPVAR, evaluates whatever's stored in the variable, so the EVAL is probably unneeded, although that depends on what evaluating << sub program >> returns.

We could do something like:

```
<<                      @ Begin program.
  << subprogram >>      @ Place the subprogram on the stack.
  'TEMPVAR'             @ Place the name on the stack.
  STO                   @ Store them as a global variable.
  ...                   @ Do some stuff.
  TEMPVAR               @ Evaluate subprogram.
  ...                   @ Do some more stuff.
  TEMPVAR               @ Evaluate subprogram.
  ...                   @ Do yet more stuff.
  TEMPVAR               @ Evaluate subprogram.
  'TEMPVAR'             @ Place the name on the stack.
  PURGE                 @ Discard the global variable.
  ...                   @ Finish up.
>>                      @ End program.
```

But that leaves the possibility of inadvertently purging an already existing variable named 'TEMPVAR', and of course it assumes that the program doesn't change directories.

We could make a utility program using argument checking and the SysRPL CREATE command as a variation on the UserRPL STO command. Given any object on level 2 and a global name on level 1, CREATE creates a new global variable at the beginning of the current directory, even if a same-named variable already exists in the directory. This would have the advantage of not overwriting anything, and since it would be at the beginning of the current directory, it would be resolved quickly. Of course, this assumes that the program doesn't change directories. As long as the variable exists, any same-named variable in the directory will be inaccessible. The variable will still be stored until the user purges it.

For a subprogram, I suggest using a local variable structure instead, such as:

```
<<                      @ Begin program.
  << subprogram >>      @ Place the subprogram on the stack.
  -> p                  @ Bind it in a local variable.
  <<                    @ Begin the defining procedure.
    ...                 @ Do some stuff.
    p                   @ Place the subprogram on the stack.
    EVAL                @ Evaluate subprogram.
    ...                 @ Do some more stuff.
    p                   @ Place the subprogram on the stack.
    EVAL                @ Evaluate subprogram.
    ...                 @ Do yet more stuff.
    p                   @ Place the subprogram on the stack.
    EVAL                @ Evaluate subprogram.
    ...                 @ Finish up.
  >>                    @ Abandon the local variable.
>>                      @ End program.
```

Of course, while a local variable named 'p' exists, nothing else named 'p' is accessible. Using the local variable has the advantage that creating it won't overwrite any already existing variable, and that it will be automatically discarded when its defining procedure ends.

Another approach is to leave the subprogram on the stack and use the stack manipulation commands, such as the following:

```
<<                      @ Begin program.
  << subprogram >>      @ Place the subprogram on the stack.
  ...                   @ Do some stuff.
  a PICK                @ Copy subprogram from level a to level 1.
    EVAL                @ Evaluate subprogram.
  ...                   @ Do some more stuff.
```

```
  b PICK                  @ Copy subprogram from level b to level 1.
    EVAL                  @ Evaluate subprogram.
  ...                     @ Do yet more stuff.
  c ROLL                  @ Move subprogram from level c to level 1.
    EVAL                  @ Evaluate subprogram.
  ...                     @ Finish up.
>>                        @ End program.
```

In the above, *a* PICK or *b* PICK could be some other command in the PICK family, such as DUP, OVER, or (in the 49 series) PICK3, and *c* ROLL could be some other command in the ROLL family, such as SWAP or ROT. This approach may well be a bit faster and/or smaller, but requires the user to keep track of which level the subprogram is in.

Regards,
James

Literature suggestions (was: What's the difference? (RPN/RPL))

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 23 Feb 2006, 2:48 a.m.,*
in response to message #1 by Han

Hi Han, all;

Bill Wickes' `HP41/HP48 Transitions` is one of the most concise sources of information for this very subject. Also, the single-volume version of the HP48 Owner's Manual (mine is January 1993 print, Edition 3) has an additional appendix comparing the HP48S/SX and the HP41. Sometime ago I digitized and converted it to a typeset PDF, available through this link. It's worth reading, only seven pages long.

Cheers.

Luiz (Brazil)

HP-29C: another faulty calculator through eBay...

*Message #1 Posted by **Andreas Terzis** on 21 Feb 2006, 11:38 p.m.*

I just received another calculator through eBay, HP-29C this time, and it doesn't work. The seller claimed it needs a new battery pack. I instead plugged new alkaline batteries in and I got all sorts of fancy shows from the LED segments. Is it that AA alkalines don't work on the machine or that there are way too many crooks out there?

Re: HP-29C: another faulty calculator through eBay...

*Message #2 Posted by **Han** on 22 Feb 2006, 1:44 a.m.,*
in response to message #1 by Andreas Terzis

Can you not return it?

Re: HP-29C: another faulty calculator through eBay...

*Message #3 Posted by **Andreas Terzis** on 22 Feb 2006, 1:58 a.m.,*
in response to message #2 by Han

I haven't asked the seller yet but he mentioned on his ad that he won't accept returns. He mentioned that the calculator needs a new battery pack, but it should work with regular alkaline AA's, right? Maybe I should use that as my defense since the problem is not the battery pack or the power source.

Re: HP-29C: another faulty calculator through eBay...

*Message #4 Posted by **John Garza (3665)** on 22 Feb 2006, 2:08 a.m.,*
in response to message #1 by Andreas Terzis

Beware the ebay hucksters. When possible, buy from people who actually owned the product and know something about it. There are many businesses / pseudo-businesses on ebay now that are clueless about what they sell. They are usually easy to spot..."when powered, the unit lights up but I don't have the (disk,terminal,speaker,expertise,time,whatever) to test it further". With calcs it's more along the lines of "don't have a battery pack" Yeah, right. Batt packs are cheap to buy (on ebay), and cheaper to build yourself. If the calc owner never bothered with this it should tell you something.

I myself have been using AA batteries in both my HP-21 and HP-29C, but I stopped this habit since I read somewhere that it *might* harm the calc, although in my case it fortunately didn't. Ever since I only apply seperatedly recharged rechargables.

Still I think your device shouldn't react to batteries the way it does.

Sample problems to evaluate RPL vs. RPN "objectively"

*Message #1 Posted by **Gene** on 21 Feb 2006, 5:20 p.m.*

I'd like to ask for input from our community here to see if there are some sample problems we could pose that would allow us to evaluate the effectiveness and efficiency of RPL vs. 4-level stack RPN.

For example, suppose we said one of the problems was to compute the roots to a quadratic equation given a, b, and c in the stack.

I'd like to see the RPN approach and the RPL approach to see if they can be remotely objectively evaluated for clarity, efficiency, and general usefulness to the average (NOTE THAT) user. :-)

I know that this is not a good sample problem given the built in quadratic function on the 49g+, but I'd like to see if any here have ideas for good sample problems.

It might be that we should have a set of problems that are RPN masterpieces vs. those that are easy to do in RPL but not RPN.

Thoughts? Gene

Re: Sample problems to evaluate RPL vs. RPN "objectively"

*Message #3 Posted by **Gerson W. Barbosa** on 21 Feb 2006, 7:54 p.m.,*
in response to message #1 by Gene

Hi Gene,

I fear the example below for the HP-15C is not what you'd expect because an RPN (or RPL) program using only the stack is far from meeting the 'clarify' requirement. Nevertheless, I think it meets the 'efficiency' requirement. Well, it is hard to have both.

Furthermore, the HP-15C is an exceptional calculator. Perhaps I should have written an HP-11C version (or even an HP-12C one!). That's one of the programs that are written in the last blank pages of my HP-15C manual. I wrote it in 1984 when I knew RPN even less than I know today.

The RPL version would be straightforward and quite easy to read.

Regards,

Gerson.

```
001-  f LBL E
002-  g CF 8         ; complex mode off
003-    4
004-    *
005-  g R^
006-    *
007-    CHS
008-    x<>y
009-    ENTER
010-    Rv
011-  g x^2
012-    +
013-  g TEST 2       ; x<0
014-  g SF 8         ; if delta <0 then set complex mode on
015-    SQRT
016-  g R^
017-    +
018-    2
019-    /
020-    x<>y
021-    ENTER
022-    Rv
023-    /
024-    1
025-    CHS
026-    *
027-    ENTER
028-  g R^
029-  g R^
030-    x<>y
031-    /
032-    +
033-    1
034-    CHS
035-    *
036-  g RTN
```

Assuming a, b and c in the stack, after running the program the stack will contain x1 and x2. Steps 24, 26, 33 and 35 are only necessary because CHS in complex mode does not change the sign of the argument (a bug or because of a reason unknown to me?). To achieve this it is necessary to multiply the argument by -1. The user will know the roots are complex because of the 'C' indicator.

Re: Sample problems to evaluate RPL vs. RPN "objectively"

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 21 Feb 2006, 10:52 p.m.,*
in response to message #3 by Gerson W. Barbosa

I think that we need to agree on what "effectivenss" and "efficiency" mean and how we separate out the characteristics of the machine from the characteristics of the algorithm. For example, pages 205ff of the *HP-15C Advanced Functions Handbook* defines the quadratic as c -2bz + + az^2 = 0 which allows some efficiency in calculation at the cost of defining a quadratic in a way which is different from the traditional way. For effectivness the 39 step routine on pages 205-206 of the *HP-15C Advanced Fuynctions Handbook* uses a different algorithm which avoids destructive cancellation for difficult problems.

What if you used the old Mach Number problem?

Re: Sample problems to evaluate RPL vs. RPN "objectively"

*Message #5 Posted by **Gerson W. Barbosa** on 22 Feb 2006, 8:18 a.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

You are right. I remember I saw the quadradic solver on the HP-15C Advanced Functions Handbook mentioned here some time ago and how it handled difficult examples. Too bad at the time the

complementary handbook was not available here, neither was it available in Portuguese I think. I need to remember to have the 15C Advanced Functions on the Museum DVD printed out.

The difference between "effectiveness" and "efficiency" is something I still have to learn. I was asked this at least a couple of times at college but I never remember the subtleties. ('Eficiência' vs. 'Eficácia' - Prof. Vieira?)

*Message #7 Posted by **Gerson W. Barbosa** on 22 Feb 2006, 10:35 a.m.,*
in response to message #6 by Valentin Albillo

Hi Valentin,

Yes, as I have recognized in an earlier post, I should have read the other handbook. But, in this case, the answer seems to be in the standard manual. I have surely read this section already, I just may have forgotten about the content.

Anyway, there's no problem in reminding me this: I always translate **RTFM** as *Read the **Fine** Manual*, which, in the case of HP manuals, is always true! :-)

Best regards,

Gerson.

Re: Sample problems to evaluate RPL vs. RPN "objectively"

*Message #9 Posted by **Les Bell** on 21 Feb 2006, 7:59 p.m.,*
in response to message #1 by Gene

The one that interests me, and I've been trying to find time to write up, is section 9-6 of "The Feynman Lectures on Physics". This is simply a numerical solution of a first-order differential equation (mass on spring) and produces Table 9-1, which lists displacement, velocity and acceleration against time.

I've done it on the 41, and I've done it in Perl. I haven't had time to tackle it on the 48 yet - at least, numerically/programmatically. On the other hand, I was able to enter the equation into the differential equation solver on the 48, and get a nice graph, too.

Which method is better probably depends on why you are solving the problem. The goal might be a numerical solution to the problem, or it might be to develop some intuition as to what is going on in the physical system.

Which approach works better for which goal is left as an exercise for the reader.

;)

Best,

--- Les

James

Re: Sample problems to evaluate RPL vs. RPN "objectively"

*Message #11 Posted by **Gene Wright** on 21 Feb 2006, 10:43 p.m.,*
in response to message #10 by James M. Prange (Michigan)

Well, "average" user is tough to define.

I can write/use 4-level RPN and RPL, but there are times when I'm much happier using a normal RPN machine than an RPL one.

So, I'm just wondering if we can come up with some sample problems that really, really point out the differences between them.

What are some areas where the 4-level stack / classic RPN really shows off?

What are some areas/problems where the RPL system would be very difficult to do in the 4-level stack.

We can argue about it all day, but I'm wondering if we can come up with some good illustrations to help.

Evaluating RPL vs. RPN: Area between two curves

*Message #12 Posted by **Karl Schneider** on 22 Feb 2006, 2:01 a.m.,*
in response to message #1 by Gene

Hello, Gene --

A very illustrative example, IMO, was discussed two years ago:

Area between two curves

This problem was revisited in a stupendously lengthy thread that ran during November 2005 in Archive #15.

> I'd like to ask for input from our community here to see if there are some sample problems we could pose that would allow us to evaluate the effectiveness and efficiency of RPL vs. 4-level stack RPN.

I have a very simple example: Add I% interest of A to A (=A(1+I%)). That is on RPN

A
ENTER
I
%
+

while on RPL, it is required to do something like

A
ENTER
ENTER
I
%
+

See? You save one keypress, that is nearly 17% of the total work. If you do nothing else 8 hours a workday, you save more than one hour per day. Clearly, this shows the superiority of RPN;).

Then I would have the insight that Q=1+I% can easily be calculated in mind and end up with typing

A
ENTER
Q
*

which works on both systems and is not only as much as effective but also highly efficient;P.

(My post was probably not the most serious response to Gene's request, sorry for that:).

*Message #16 Posted by **Han** on 22 Feb 2006, 2:39 p.m.,*
in response to message #13 by Thomas Radtke

I only recently read about the differences between RPN and RPL (and by no stretch am an expert in either). I think that the example below is not quite 'objective' enough. For one, not all calculators have a key dedicated to the % operation. On some implementations of RPL (for example, the HP48 series), there are commands that are accessed via menus.

Taking a look at just the keyboard layout of the 41C (I've never used one myself), I do not see a % operation there. Presumably, this is accessible either by menu or catalog of some sort. Likewise, the DUP command on an HP48 can be accessed via the stack operations menu. Thus A ENTER ENTER I % + could easily be A DUP I % + where DUP is from the menu key. Comparisons in terms of the number of keystrokes (because this will be highly dependent on the keyboard layouts of the implementations of RPN and RPL) might not be the most fair comparison. In fact, comparing RPN on one machine with RPN on a different machine may produce a different number of keystrokes.

Also, when doing routine calculations, we're more likely to write a program to do the repetitive tasks.

In that case, the function key to which % is assigned to becomes functionally a % key, right?

> Quote:

> Likewise, the DUP command on an HP48 can be accessed via the stack operations menu.

That would mean to switch between stack and math/real menus all the time. Effective but not very efficient:).

> Quote:
>
> Also, when doing routine calculations, we're more likely to write a program to do the repetitive tasks.

I dare to say that you can overcome nearly any shortcoming of one of the systems by programming a handy shortcut. But you actually have to do this and you have to take that work into account when estimating something like 'efficiency'.

Re: Sample problems to evaluate RPL vs. RPN "objectively"

*Message #19 Posted by **Valentin Albillo** on 22 Feb 2006, 6:48 a.m.,*
in response to message #1 by Gene

Hi, Gene:

Gene posted:

"I'd like to ask for input from our community here to see if there are some sample problems we could pose that would allow us to evaluate the effectiveness and efficiency of RPL vs. 4-level stack RPN."

> Though interesting, I'd say this is an exercise in futility, because the RPN vs. RPL topic, which has been discussed *ad nauseam*, probably belongs to the same class as politics, religion, nationality, local mores, etc. The ones who idolize one will despise the other no matter how many examples you care to provide or no matter how rationally you want to discuss the subject, and you're certain to make no converts no matter how good your arguments. For each example favorable to one of them, someone will provide an example favorable to the other, and at the end we all will agree to disagree, if at that.

"For example, suppose we said one of the problems was to compute the roots to a quadratic equation given a, b, and c in the stack. I'd like to see the RPN approach and the RPL approach to see if they can be remotely objectively evaluated for clarity, efficiency, and general usefulness to the average (NOTE THAT) user. :-)"

> Actually, irrelevant. The average user would be best served by the simple HP-71B version (or any vintage SHARP handheld for that matter)
>
> ```
> D=SQR(B*B-4*A*C) @ (-B+D)/2/A, (-B-D)/2/A
> ```
>
> which can run rings around any RPN or RPL version in terms of efficiency and simplicity, requires no mental conversion, and requires no programming, just a command-line statement.
>
> Anyway, if you still insist in comparing a once useful but now obsolete system to perform calculations to an aberrant, obfuscated system to do the same, you should focus in programs which show off their differences to the best. For instance, if you want to highlight RPN, you must seek examples which:
>
> - Make good use of automatic stack replication, i.e., T is replicated whenever the stack drops. A great example for this would be arbitrary (and *not* specified in advance!) degree polynomial evaluation.

- Make good use of the fact that the stack is always 4 registers deep so it's *never* 'nonexistent'.
- Make good use of LASTX and register arithmetic and manipulations directly or indirectly upon stack registers (STO+Y, STO-L, RCL Z, RCL IND ST T, X<> IND ST L, XEQ IND ST X, etc). A good example would be performing complex number multiplication directly on the stack, as well as converting numeric values in the ALPHA register to their full equivalent numeric value in X, just using the stack.
- Make good use of numerically addressed registers, specially in combination with register arithmetic and indirection.
- In the case of the HP42S, make good use of the fact that the whole numerically addressable register set can be dealt with *en masse* as a matrix variable, so you can have multiple sets of independent numerically addressable register banks and the possibilities are almost limitless. A good example for this would be to provide recursion in a simple way, as well as working with any number of matrices simultaneously.

etc, etc, etc. I'm glad if any of these comments of mine can be of any help to your quest, but for the reasons mentioned at the beginning, I wouldn't waste much time on this.

Best regards from V.

10B Blue

*Message #1 Posted by **Don** on 21 Feb 2006, 3:19 p.m.*

I just got an HP 10B (not 10B11) off E-Bay. It has the blue shift key and all shift-function lettering is in blue. Serial # is 1D03309585 (made in Indonesia). What is the story on this particualr model? Thought I could figure out manufacture date with serial number, but cannot. Would appreciate any information.

Best wishes

Don

Re: 10B Blue and calculating contrast "scores"

*Message #2 Posted by **gene** on 21 Feb 2006, 4:33 p.m.,*
in response to message #1 by Don

Hi. I believe it's actually a "teal green" rather than a blue as such.

Either way, it is a ghastly horrible color scheme combination that is one of the worst HP ever offered. Who on earth thought this would be a good idea?

It had one of the lowest scores of any contrast scheme HP has ever produced. This was discussed (by me) at the HHC2004 gathering in San Jose.

Link to that presentation:

http://www.pahhc.org/2004/HHC2004/Calculating%20_Contrast.pdf

It was a change made to the 10B color scheme within the last year or so of the original HP10B lifetime. The HP10B was then replaced by the HP10BII.

It's actually somewhat rare.

A similar horrible change was made to the HP32SII around this time as well.

Re: 10B Blue and calculating contrast "scores"

*Message #3 Posted by **Geir Isene** on 21 Feb 2006, 4:55 p.m.,*
in response to message #2 by gene

Wow, Gene.

This is a very impressive presentation. Clear. Concise. Solution oriented. I learned a good deal from this one.

Re: 10B Blue and calculating contrast "scores"

*Message #4 Posted by **gene** on 21 Feb 2006, 5:11 p.m.,*
in response to message #3 by Geir Isene

Well, there was a lot I learned from giving it.

It was just an idea I had - to compare contrast as the distance formula, just using an XYZ (RGB) score for each color and computing the distance. Greater distance = better contrast.

Of course, it's not quite that simple, but it certainly is a good place to start. It certainly appears that ALL bad color choices HP has made in the past fail my ~200 score requirement on this test.

If only they had asked. :-)

/commercial

There are many such presentations made at the annual HHC gatherings. If individuals here can attend an HHC meeting, they will find a great group of people and we all learn something. Sometimes, we even get to see toys from HP before they go public. Even better, sometimes we receive toys from HP just for attending.

The next HHC will be in mid-September 2006. Stay tuned!

/commercial off

*Message #5 Posted by **Don** on 21 Feb 2006, 7:16 p.m.,*
in response to message #2 by gene

Hi Gene;

You are right about the contrast....I have an ordinary 10B and my blue or teal 10B sitting next to each other late in the afternoon and the teal is nearly impossible to read. Actually it is totally impossible to read. Thanks so much for the response. Am glad to know this isn't just another knockoff. Your presentation was very impressive.

Best wishes

Don

Re: 10B Blue and calculating contrast "scores"

*Message #6 Posted by **Karl Schneider** on 22 Feb 2006, 2:46 a.m.,*
in response to message #2 by gene

Gene --

That presentation was a good way to help quantify the principles of good, contrasting colors. The centered yellow-on-dark-faceplate and blue-on-beveled-dark-key scheme utilized by the HP-41, the Voyager series, and the HP-71B was perfection that should never have been tampered with. The blue also suited the light-colored keys on the 71B.

Yellow and blue side-by-side on a dark faceplate also worked well for the HP-34C, HP-20S, HP-21S, and HP-32SII -- until those got replaced by goofy "designer" colors.

Regarding color blindness: I've known that I am color-vision deficient -- probably a carryover from my red/blue colorblind grandfather. I've seen those colored-circle charts before, and the only number I see clearly is the "56" in the middle one.

*Message #7 Posted by **John Limpert** on 22 Feb 2006, 11:49 a.m.,*
in response to message #2 by gene

I'd suggest that you take into account the color sensitivity of the human eye. The eye is most sensitive to yellow-green and relatively insensitive to blue. This makes blue legends more difficult to read than might be predicted by models that assume a flat frequency response.

See http://www.amastro.org/at/ot/othcs.html.

Re: 10B Blue and calculating contrast "scores"

*Message #8 Posted by **gene** on 22 Feb 2006, 12:11 p.m.,*
in response to message #7 by John Limpert

yep, those were some of the suggestions made at HHC2004, but this contrast score certainly shows that it would have caught many of the "less than optimal" choices made on some recent calculators.

If any of these efforts at least highlight the problem so that HP notices, it is worthwhile. HP can do the detailed analysis if they are aware of the issue. :-)

Re: 10B Blue and calculating contrast "scores"

*Message #9 Posted by **Jim Creybohm** on 23 Feb 2006, 9:15 a.m.,*
in response to message #2 by gene

Hi Gene.

Read through your presentation and I have to say that I found it er, quite "enlightening". I like the way that you have presented the topic and found also that the "classics" are classics for a reason. I have wondered if it was my old eyes or simply poor contrast selection on HP's part. I'd say I have the answer for the most part.

Good read! Thanks again.

How does the blue-on-white used on the HP-25 and 29C rate? Can't be very good, either.
Then again, it never bothered me -- most of those legends are simply the inverses of the very easy to read yellow-on-black legends above the keys (and before too long I was typing blind on the machine anyway. ;-)).

I guess it helped when HP moved away from those multi-colored keyboards. They were pretty (by comparison, I thought the HP-41 was pretty ugly, although it grew on me eventually) but having the number keys be a different color than the rest of the keyboard doesn't really improve usability.

in response to message #2 by gene

For an even better analysis try using the LAB system. You'll get an even better picture of the contrast using it. The 48s was nearly perfect. Under OpenRPN color standards, I've even made an equally legible purple and green. I am still planning to write an article about the color selection process I went through, some of the most useful information and tools came from NASA.

New Datafile articles

*Message #1 Posted by **Valentin Albillo** on 21 Feb 2006, 8:32 a.m.*

Hi, all:

During the very next weeks I'll upload to my web page a number of my Datafile articles, in PDF format, to complement the ones already available on-line. These will include:

```
HP-71B  Fantastic FOUR                  8 pages
HP-71B  Short & Sweet Sudoku Solver    10 pages
HP-71B  Sudoku Solver Sublime Sequel    9 pages
 (all)  Mean Matrices                  11 pages
HP-71B  Minimax Polynomial Fit         12 pages
```

The following recent ones are only available in the printed Datafile magazine:

```
Long Live the HP-16C!                   5 pages
25 Years of Othello                     8 pages
Long Live the HP-25!                    7 pages
```

As mentioned, my 12 previous PDF articles already on-line can be found at my web site.

If you're interested in any of them, make sure to grab them timely, because I'll eventually need to remove them to reclaim some free space for other materials.

Best regards from V.

Re: New Datafile articles

*Message #2 Posted by **Karl Schneider** on 1 Mar 2006, 11:30 p.m.,*
in response to message #1 by Valentin Albillo

Valentin --

Thank you again for advising us of your Datafile articles. I downloaded most of them (they are compact in storage requirements), and will look for the newly-posted ones.

A very impressive sampling of your "body of work" in this area!

Best,

-- KS

Re: New Datafile articles

*Message #3 Posted by **Valentin Albillo** on 2 Mar 2006, 4:36 a.m.,*
in response to message #2 by Karl Schneider

Hi, Karl:

Thanks a lot for your continued interest and very kind words. I'll do my best to upload the remaining

promised ones as soon as possible, it's simply that I'm having some problems with the ftp server and an interfering proxy, but eventually I'll manage.

The PDF format is usually very compact and convenient, wish that Mr. Hicks would allow PDF submittals in MoHP's Articles section but so far I've been unable to convince him. And of course, such formats as PDF are mandatory to preserve fonts, formatting, images, etc., so that interested readers get a true facsimile of the article as originally published.

Within a few days I'll post my S&SMC#14, hope to see you attacking it with all your considerable might. :-)

Best regards from V.

```

Although I agree with the sentiment, the last thing I'd ever want for my site is to have a tons of people downloading everything at the same time. This will bring my short term bandwidth usage over my monthly maximum and incur additional charges.

Do you get charged only by disk size or do you have a monthly cap on bandwidth?

**vp

Hiding behind a vapor-identity to broadcast ineptitudes is a clear sign of bravery.

I hope your high level contribution will be archived to highlight the quality of all others.

Etienne

Vaporware?!?

*Message #4 Posted by **Hugh Evans** on 23 Feb 2006, 2:44 a.m.,*
in response to message #3 by Etienne Victoria

I'm not sure what vapor identity you think I'm hiding behind. I exist, and go by my true legal name. Thus, I have nothing to hide.

On a side note, what are you trying to accomplish by accusing OpenRPN of being vaporware? Would you rather that I take your advice and give up, or would you like to have high quality calculators on the market again?

To make this perfectly clear, I cannot be deterred from this project. Even if if takes years, it will happen.

Best regards, Hugh Evans

in response to message #4 by Hugh Evans

Hi, Hugh;

please, forgive me posting before Etienne's response, and I appologize for that, but it is clear to me that Etienne refers to the anonymous post that calls OpenRPN `Vaporware`, and not straight to OpenRPN. In fact, I take Etienne's post as defending OpenRPN, not against it. I take my observations based on previous contacts with Etienne by e-mail and one very successfull negociation with him.

I am one of the guys that support OpenRPN, but I cannot see a way to go beyond and actually work with it.

Again, forgive me, guys.

Cheers.

Luiz (Brazil)

*Message #6 Posted by **Garth Wilson** on 23 Feb 2006, 5:07 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

The electronics industry magazines keep talking about the increasing time-to-market pressures and decreasing market windows. They're talking of course about the consumer gadget market, and the things that move very quickly and have short product lives, like cell phones, PDAs, digital cameras, iPods, miniature memory cards, etc.. Editorials in the magazines also periodically lament the fact that products developed under these pressures come out half-baked, with lots of bugs and not even having been given time for a decent manual to be written. Put me down as one who is fed up with this kind of thing myself. Some things take many years to develop, even when they're well funded and have a full-time professional team working on them. I'm not about to pressure openRPN to meet the unrealistic schedules dictated by bean counters or by customers who don't understand what's involved. My own industry is generally not like what I described above; but I do know what it's like to be embarrassed because the small company's impatient president, who doesn't understand engineering, set an unrealistic introduction date and stuck to it, against the advice of his engineers, and showed something at a trade show, or maybe took orders for something we couldn't deliver yet. Give openRPN time. Right from the beginning, I figured they'd probably need several years, considering the time limitations of those involved having day jobs, the custom double-shot keys, maybe a custom LCD, but maybe most of all, a big software job ahead. Now only only three months into the pregnancy, some are saying, "Well, where's the baby?!"

Well, some of us do like to hear about OpenRPN here. We also like to here about "Bring back the 15c!" and numerous other projects. For instance, I don't have a functioning 41c, and I don't follow the MLDL project very closely, but I enjoy seeing that it is going on--even though I usually don't read the thread. I don't often "play" in Valentin's quizzes, but I enjoy seeing them and reading them. Some threads do not interest me in the least. I ignore them.

You should do the same. If this thread does not interest you, ignore it!

Hello Hugh, Luiz,

Yes, my post was specifically referring to the anonymous post just before and of course NOT to the OpenRpn project which I respect and follow with great interest. I'll be on the waiting list to be in the first production batch!

This clearly shows that my command of English still needs improvement but I felt the need to react to this useless attack.

Thank you very much Luiz for making my intentions clear!

Friendly regards to both.

Etienne

TW

Thanks!

*Message #14 Posted by **Hugh Evans** on 23 Feb 2006, 4:08 p.m.,*
in response to message #1 by Hugh Evans

Indeed, this was a confusing thread. I would like to thank everyone for your expressions of support, it's nice to receieve a bit of affirmation from time to time.

Like many of you, I became tired of the current trend of disposable electronics. Given the number of engineers, programmers, and other on this board I realized it was a matter of organizing them and taking care of the production logistics myself. Ultimately Chad and I would like to form a company that will serve as an engineers playground and start making quality high-end products that can outlive their users.

Thanks to Tim Wessman, I now have a 49g+ on the way. Our retrofit kit will be the first OpenRPN product. Now an important question, what to call it? 49gx? 50gx? This could be a fun discussion.

Again, I appologize for any misunderstanding.

Best Regards, Hugh

PS. I have a section ready on our wiki to begin entering a pure 42s based command reference... It's even populated with command names. Please help if you can.

Hmmh, Hugh, are you talking about **this**?

If true, this list looks pretty much the same to me after I appended some proposals for additional commands several weeks ago. What do you need? Do you want us to document the commands? Then IMHO we should agree on the command set first.

Else please tell us what you want and where we shall put it.

Re: Thanks!

I forgot to mention, the link to our old wiki apparently still has yet to be removed. Our new wiki is located at:

doc.openrpn.org/wakka

Thus far we have selected two officially supported programming lanuages: *fix - Our answer to UserRPL, the low leve core of which will be used to write the other languages. Eventually it will function in postfix, infix, and prefix modes. RPN - In its' arguably most mature form adapted from

the 42s.

If you have the time and the inclination please open up your old manuals and fill in what you can in our command reference. For now you don't need to follow the command definition standard. I appreciate the help and will be more than happy to bring everything up to spec.

HP-12C or HP-17BII

*Message #1 Posted by **George Rose** on 20 Feb 2006, 8:16 p.m.*

My son has finally decide to go to college after working for the last two years. He will be taking business management classes. He got hooked on RPN at work (an auto parts store) of all places! My question, since I am only familiar with the scientifics, is which business calculator would you recommend? I think I have narrowed the choices to the 12C and the 17BII. I don't like the clam shell 19 series, unless some can make a case for it. I seem to be partial to the 17BII because it looks to be the brother to my beloved HP-42S. All input will be greatly appreciated.

Re: HP-12C or HP-17BII

*Message #2 Posted by **Stephen Easterling** on 20 Feb 2006, 10:03 p.m.,*
in response to message #1 by George Rose

This may not be the answer you want, but if you can, get both. I own both, use both, and love each of them. Swapping out one for the other on occasions can be fun. If you have to choose, though, I'd say go with the 12C. It's a little smaller and I feel faster with the keys (for me) due to their smaller size and close proximity to each other. I also love the 12C's layout. The two styles are so different that it will ultimately boil down to which layout he likes the most. Both are powerful calcs. There's a reason the 12C has outlasted the 17BII.

I secon Stephen's words (was: HP-12C or HP-17BII)

*Message #3 Posted by **Vieira, L. C. (Brazil)** on 21 Feb 2006, 12:42 a.m.,*
in response to message #2 by Stephen Easterling

Hi;

I also have one of each ('black case' HP17BII, HP17BII+) and some HP12C/12Cp units. Although the HP17BII+ belongs to the newer hybrid family, it is fast and has plenty of memory: 32KBytes against 8KBytes in the HP17BII. My HP17BII+ has a key wit bad contact, the HP17BII works flawlessly.

I am not sure about the reasons ('financial' appeal?), but the HP17BII has a lot more featurs than the HP12C/Cp, and if I have to choose only one, I'd leave the choice to the moment. Can't tell you now which one I'd choose.

Not much of a help... Sorry!

Cheers.

Luiz (Brazil)

Re: HP-12C or HP-17BII

*Message #4 Posted by **John Smitherman** on 20 Feb 2006, 11:24 p.m.,*
in response to message #1 by George Rose

Hi George. I would recommend that you consider the newest 12cp. It is faster and has some enhancements over the 12c and the original 12cp. Also, the keys on my new 12cp have a better feel than my Chinese made 12c. Time will tell if it can hold up to day to day use.

Regards,

John

Re: HP-12C or HP-17BII

*Message #5 Posted by **Karl Schneider** on 21 Feb 2006, 12:33 a.m.,*
in response to message #4 by John Smitherman

George --

I have both models, which are indeed the only business models with LCD readout and RPN.

The HP-17BII is a much faster and more capable calculator; its main disadvantages versus the HP-12C are its poorly legible dot-matrix display (shared with the HP-42S) and its extensive use of menus to organize its functions. I definitely prefer its algebraic equation editor with solver over the HP-12C's inferior keystroke programming capabilities. The HP-17BII's clock and time-calculation functions are very user-friendly. You should be able to get one from eBay for less than US$100.

The HP-12C is an old standard that is annoyingly slow for computationally-intensive functions. Its main advantages include its very legible 7-segment LCD readout and easy accessiblity of functions. The horizontal arrangement is good if the calc is on a desktop, not in your hands. It has no clock; the time-calculation functions are limited and slow. Its TVM equations are implemented on a "per-period" basis, rather than with interest entered as an annual quantity and number of periods per year as a separate setting.

IMO, the enduring popularity of the classic HP-12C is its good looks and form factor: It says, "classy financial accessory", not "dime-a-dozen calculator". It's certainly better-looking than the algebraic-entry HP-10B, -14B, or -17B. The HP-17BII got a new gold bezel and trim along with RPN to compete with the traditional product in those respects.

I don't think that the latest HP-12C Platinum is much of an improvement over the traditional HP-12C except for computational speed. Its looks are definitely a step backward...

Regards,

-- KS

Re: HP-12C or HP-17BII

*Message #6 Posted by **bill platt** on 21 Feb 2006, 7:32 a.m.,*
in response to message #1 by George Rose

I think the 12c is outdated, and the 12CP is a royally stupid design. The 17bii is much more powerful, has a real backspace key, more built-in functions than the 12c and a general purpose solver--not merely the financial solver. And it is faster. And you can buy the new 17bii+ and get the same basic feature set, though I am not sure it supports the Let and Get functions of the 17bii (these enable you to do much more sophisticated programming in the solver. These features are not listed in the manual, but are in the "advanced functions" handbook of the 19bii--which has the same solver.)

A lot of people will tell you that the 12c is a "standard" in finance. While this may be true, it is by no means a must. I have a friend, from high school (we are now 40) who has her own hedge fund. She held many good

positions over the years at Deutche Bank, Credit Suisse, Chase Manhattan etc. She has always preferred a 17bii.

The "programmability" of the 12c is dubious at best. It is not like the 11c or 15c--it is crippled. On the other hand the 17bii has an algebraic solver--very powerful and versatile tool, and for many of those programming tasks that one encounters, this solver is superior.

Re: HP-12C or HP-17BII

*Message #7 Posted by **Matt Kernal (US)** on 21 Feb 2006, 1:48 p.m.,*
in response to message #1 by George Rose

17BII period, exclamation point. The BII+ is a cheap imposter, and the 12CP isn't in the same league. Tell your son not to look back, there's nothing he'll be missing from either of the others.

Your instincts are right about the 17BII and the 42S. You know a good thing when you see it, down to the nice 2-line pixelated display!

More opinion than input,

Matt

Re: HP-12C or HP-17BII

*Message #8 Posted by **George Rose** on 21 Feb 2006, 6:43 p.m.,*
in response to message #7 by Matt Kernal (US)

Thanks for input thus far. I'm not fond of the newer HPs, the 17BII+ and the 12CP. So I think I'll head to eBay to start looking for his 17BII.

Re: HP-12C or HP-17BII

*Message #9 Posted by **Dennis** on 22 Feb 2006, 9:20 p.m.,*
in response to message #1 by George Rose

I own both the 12C and 17BII. If he is going back to school I would recommend the 17BII. It is a lot faster in doing the calculations for TVM/NPV/IRR etc. This would especially be important on a timed exam. Also it is easier to see and edit uneven cash-flows and stat lists.

But if it's possible, I would get both. They both have their strengths. And in an academic situation, one could serve as a backup calc. In real life, I usually carry the 12C because of it's form factor. But the 17BII has the solver that can use the LET/GET statements to do some pretty amazing calculations.

Good luck! Let us know what you decide.

-Dennis

solving equations using HP48G

*Message #1 Posted by **Catherine Green** on 20 Feb 2006, 7:53 p.m.*

I have an equation that I need to find the roots for. The equations looks like this:

x=3.5x(3.5x(1-x)[1-3.5x(1-x)]

Can it be entered into the HP48G? If so, how?

Re: solving equations using HP48G

*Message #2 Posted by **Namir** on 20 Feb 2006, 10:40 p.m.,*
in response to message #1 by Catherine Green

Catherine,

Afer you nvoke the Solver, you enter the followig equation (the Solver provides the single quotes):

'Y=SQ(3.5*X)*(1-X)*(1-3.5*X*(1-X))'

And then select th OK menu. The above equation defines two variables Y and X. The solver will display these variables. Enter 0 for Y and then enter a guess for X, followed by pressing the SOLVE menu command. Th SOLVER will display the solution for Y=0, i.e. the root.

The above equaion has a root of X=1.

Namir

Multiplication must be explicit, and brackets (and braces, for that matter) are **not** the same as parentheses. Try:

```
'x=3.5*x*(3.5*x*(1-x)*(1-3.5*x*(1-x)))'
```

in response to message #3 by James M. Prange (Michigan)

the 48g has a polynomial solve as well. i think its in the solve menu somewhere. you have to enter the coefficients as a vector of numbers but it can find all the roots at once - even the complex ones.

SOS - Batteries exploded in machine

*Message #1 Posted by **Andreas Terzis** on 20 Feb 2006, 7:49 p.m.*

Hi everyone,

I read the responses to the 'Battery leakage and cleaning...' posting, and the last comment about toxicity prompted me to let you know about the following incident that happened to me a couple days ago.

I recently bid and won an HP-34C on eBay which was in good condition. [The HP-34C holds a dear place in my heart and there is a lot of history that goes with it.] The seller included a set of rechargeable alkaline batteries with the machine, and claimed that they worked with it. He had recently bought the machine from someone else who also claimed as well that those worked with the machine. The machine came with a charger that didn't work and the seller sent me a 'good' charger. He e-mailed me some instructions in which he mentioned that the rechargeable batteries needed to be charged about 10hrs in the machine. That seemed a little odd but I thought I would give it a shot!

I installed the rechargeable batteries in the machine, using the indicated polarity [and plugged the charger into the machine]. After about half an hour I heard some loud noise coming from my office (while I was in the living room), checked in there but nothing out of the ordinary had happened. Or so I thought. After about five minutes I heard another noise, which was similar to opening a beer can. I checked again and noticed that the batteries of the HP-34C had leaked all over my desk and some paperwork. The batteries were eminating a 'fuming' sound and they smelled. I immediately grabbed the machine - mistake - and unplugged it from the AC. I tried to take the batteries out with bare hands as quickly as possible but that was hard. (Apparently they were a tad longer than regular AA batteries.) I then used a pen for that, but I had acid all over my hands. I cleaned the machine in and out from the acid (or whatever that liquid was) and plugged a set of new batteries in after a while. I got an 'Fr Error' message, pressed CLX and the calculator seemed to function correctly.

My concern at this point is about the acid that came off on my hands and possible fumes (as well the marks on my desk from the acid, I guess.) The batteries that exploded were Alkaline Rechargeable, made in Korea. The name on them is 'charge.ables' and the brand is LENMAR. The company is based out of Westlake Village, CA.

It looks like either [the charger was bad again, or] the battery contacts were rebuilt incorrectly, or the batteries were bad. Who knows?

Next time, I should either buy from reputable people through the HPMo, or at least ask a lot of questions on the board before I buy. [No HP-34C now. I guess dreams are expensive.] Your thoughts would be greatly appreciated.

Thanks, Andreas

Re: SOS - Batteries exploded in machine

*Message #2 Posted by **Ed Look** on 20 Feb 2006, 9:56 p.m.,*
in response to message #1 by Andreas Terzis

First and foremost, rinse your hands with water... for more than five minutes, in case of any toxic materials. DO NOT use any soap, as it might chemically complicate matters.

Now, if I recall (and I still own a partly working 34C), the batteries were Ni-Cd rechargeable cells. There should be no acid! This battery does not require an electrolyte. It's actually *drier* than the conventional "dry cell".

I suspect you might have been inadvertently or in ignorance given nonrechargeable cells of some kind.

EDIT- You said "alkaline rechargeables"; I am not aware of the existence of such a thing!-*EDIT*

But one necessary ingredient in common disposable batteries is potassium hydroxide, in the "alkaline" batteries. It is an alkali, or base, though it is corrosive as an acid would be, too. But the leakage from either type can be corrosive. I can't speak for the property damage, but if it got on your hands and you washed it off quickly, assuming it's this kind of (nonrechargeable) cell, you *should* be okay (I'm NOT a M.D. and am NOT giving advice; only commenting), but perhaps you should see a doctor just in case.

Now if one tries to recharge nonrechargeable batteries, including these "alkaline" ones, you will cause rather complex electrochemical reactions that do produce gases and if you're lucky, will just leak with a little of the sounds you might have heard. If you are unfortunate, it can explode like a grenade and never mind the mess, you can be severely injured. (If it is one of these types, again, if you rinse off the materials from your skin with a lot of water, there should be no real problem, unless you waited or it got in your eye. In either of these last two cases, GO TO A DOCTOR.)

The conditions you described sounded suspiciously like a nonrechargeable conventional C-Zn or "alkaline" battery attempting to get recharged... and leaking then exploding.

But at least your 34C is working. Get simple rechargeable AA sized Ni-Cd (nickel-cadmium) batteries. Just be sure to short the (-) ends together (but DO check this Museum site's pages for the correct procedure, as my memory is kind of foggy on this).

Re: SOS - Batteries exploded in machine

*Message #3 Posted by **Bill (Smithville, NJ)** on 21 Feb 2006, 4:48 a.m.,*
in response to message #1 by Andreas Terzis

Hi Andreas,

Alkaline Rechargable batteries have been around for about 10 years or so. Rayovac makes them in the U.S. I had tried a couple a few years ago and was not overly impressed with them. I fould the following which describes the leaking or exploding that can occur if the batteries are charged when they are completely drained:

link

I don't remember ever getting any warnings in the literature I had rerceived with the Rayovac.

Glad to hear that the 34C is still working. It's a great calculator.

Bill

Re: SOS - Batteries exploded in machine

*Message #4 Posted by **C. Dehnke** on 21 Feb 2006, 4:44 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

Hi Andreas, pretty clear why this happens. The charger in the calculator is made for NiCad cells. These are a totally different technology than the alkaline rechargebles. I think the exploded cells were recharged in

an external recharger and not inside the HP34C when the seller used them. Regards, Chris

Re: SOS - Batteries exploded in machine

*Message #5 Posted by **Andreas Terzis** on 21 Feb 2006, 5:46 p.m.,*
in response to message #4 by C. Dehnke

Hi there, Thanks everyone. Those comments are very insightful. This is what happened: what Chris said. Unfortunately the eBay seller gave me the wrong directions... And when I mentioned to him what had happened, he wrote that I didn't realize those were not rechargeable batteries but plain alkaline. The batteries said 'Rechargeable Alkaline' on them. Well, I'll take it up with him, be careful next time and ask my HP'ers (sounds like H-peers) first. This community rocks!!! Andreas

Re: SOS - Batteries exploded in machine

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 21 Feb 2006, 10:16 p.m.,*
in response to message #3 by Bill (Smithville, NJ)

I, too, remember that rechargeable alkalines have been around for quite a while. But, I definitely recall cautions about using the wrong charger when the rechargeable alkalines first came out. I went to Wal-Mart and checked out their current display. They carry rechargeable alkalines (NIMH) from Rayovac, Duracell and Energizer. Somewhere in the literature accompanying each of the brands are cautions against using the wrong charger with the possibility of rupture or explosion if you do use the wrong charger. The manufacturers all claim a life with recharging of 3 to 4 times that for ordinary alkalines. I never saw much need for that as opposed to the use of NiCad rechargeables. Obviously someone does as the display of the rechargeable alkalines is quite large.

It's either NiMH (Nickel Metal Hydrite) OR (rechargeable) alkaline. Two different beasts.

Marcus

I'm not sure about the spelling of "hydrite".

> I'm not sure about the spelling of "hydrite".

It's hydride.

I believe they all use a potassium hydroxide electrolyte, so in a sense, they are all alkaline batteries.

Looking for volunteers to test Free42 Decimal

*Message #1 Posted by **Thomas Okken** on 20 Feb 2006, 5:44 p.m.*

Hi all,

Free42 version 1.4, featuring decimal floating point, is coming along quite nicely, and I could probably release it this week.
The change from binary to decimal is pretty tricky, though, and there could easily be subtle bugs lurking in there. The current development version does seem to run my two major compatibility test cases correctly (Erik Ehrling's PRM? program, and the "1110 digits of pi" program for the HP-41 that was published in the PPC journal many years ago), so I have some confidence.
If there's anyone who has legacy 42S code that did not work well on the pre-1.4 Free42, and who is interested in running some tests to verify the new version's compatibility, I'd love to hear from you and I'll send you the latest Windows build. I can be contacted through the MoHPC mail feature.

Thanks!

- Thomas

Re: Looking for volunteers to test Free42 Decimal

in response to message #1 by Thomas Okken

I'd love to try to find some but I doubt I'd find anything you havn't already - I am at a bit of a disadvantage as I'm not at all familiar with the HP42..

Mike T.

Re: Looking for volunteers to test Free42 Decimal

*Message #3 Posted by **Thomas Okken** on 22 Feb 2006, 7:56 p.m.,*
in response to message #2 by Mike T.

If you don't use the 42S to run programs, you're unlikely to ever notice the difference between the "binary" and "decimal" versions of Free42... But, still, if you feel like playing around with it, just drop me a line and I'll send you the latest development build of the decimal version.
If you're curious about HP-42S emulation/simulation in general, please take a peek at my Free42 web page; you can download the current "official" (binary-only) versions of Free42 from there, and I have links to several other important HP-42S related web pages.

Thanks for your interest!

- Thomas

Re: Looking for volunteers to test Free42 Decimal

*Message #4 Posted by **Andreas Terzis** on 23 Feb 2006, 3:18 a.m.,*
in response to message #1 by Thomas Okken

Thomas, I just dug out some older programs I had written for the HP-42S that I could test for you. I am not sure if they all work but I can give them a shot. I have a memo editor, a word processor, a database management system and some others. Please let me know if you are interested. Thanks, Andreas Terzis

Re: Looking for volunteers to test Free42 Decimal

*Message #5 Posted by **Thomas Okken** on 24 Feb 2006, 11:19 a.m.,*
in response to message #4 by Andreas Terzis

Absolutely! I'll contact you via email and send you the latest version. I'm very interested to hear how well it works for you.
Thanks!

- Thomas

hp 42s

*Message #1 Posted by **e.young** on 20 Feb 2006, 4:12 p.m.*

I have never had the pleasure of using an HP 42s, but it seems to be highly prized by its fans. I just noticed one on ebay that is currently at $305 with 6 days left. From the item description it is essentially unused. What is the appeal with the 42s that it consistently goes for such high dollar amounts on ebay?

Re: hp 42S [Overview]

*Message #2 Posted by **Karl Schneider** on 20 Feb 2006, 4:41 p.m.,*
in response to message #1 by e.young

The HP-42S is the most advanced scientific RPN-based calculator that HP produced. Its programming paradigm is shared with the HP-41; it carries over the applicable computational functionality from the 41, but adds MUCH more: complex-number functionality, real- and complex-matrix operations, rootfinding (SOLVE) and numerical integration, as well as hyperbolics. It has 7 kB of RAM, but its firmware will support 32 kB.

It shares the high-res two-line dot-matrix display and IR-printer transmitter with the HP-17B/17BII and HP-27S, but lacks the algebraic equation solver and the clock/time-calculation/alarm functions of those models.

The main criticism of the 42S is that it lacks the I/O and expandability of the 41. In that sense, it was not a fully-adequate replacement. The HP-48SX provided those things, but it was RPL-based -- incompatible with the 41.

In defense of the 42S, its trim-line Pioneer-series package and low-capacity button-cell battery effectively precluded hard-wire I/O and plug-in expandability. If only the 48 had been RPN-based...

I bought my early-version 42S on eBay in 2002 from a somewhat-disgruntled former HP employee. Even then, units in good condition were going for US$200.

Of course, more about the 42S is available on the MoHPC main page.

Regards,

-- KS

Re: hp 42s

*Message #3 Posted by **Thomas Okken** on 20 Feb 2006, 5:33 p.m.,*
in response to message #1 by e.young

In a nutshell, the 42S is the most powerful RPN scientific ever made.

People like it because it has the same easy-to-learn four-level RPN and keystroke programming model as the HP-41 series... But the 42S pushes that model much further, by adding named variables, complex numbers and

matrices that can be manipulated on the stack just like plain real numbers; and it has HP's excellent numeric SOLVE and INTEG applications built in as well. It's perfect for quick-and-dirty programming, and supports even medium-sized applications. And, finally, while it has way too many functions to put on the keyboard, so they had to be hidden away in menus, those menus are much better done than those on any other HP model.

- Thomas

Re: hp 42s

*Message #4 Posted by **Walter B** on 20 Feb 2006, 7:41 p.m.,*
in response to message #1 by e.young

It's the only RPN HP calculator I know allowing you to enter keystroke programs just without any need to care for program space - there will be sufficient space always (for quick-and-dirty programs)!

As mentioned already, it's the RPN model with the highest calculating power. It provides some hundreds of functions. At the same time it has a *very* clean keyboard. If it would feature a better display and a comfortable way of data exchange with PCs, it could compete today still easily. Impressive device!

But alas, this WAS the top model ... so try to get one. IMHO they are particularly expensive in the USA. I got mine for < 130 US$ at eBay two years ago.

Good luck - Walter

Re: hp 42s

*Message #5 Posted by **Valentin Albillo** on 21 Feb 2006, 4:40 a.m.,*
in response to message #1 by e.young

Hi, e.young:

The HP42S is a truly wonderful machine, signaling the exact path RPN calcs should have taken. May I suggest you have a look at this article of mine, Long Live the HP42S !, which is a 14-page PDF document fully describing and discussing the most important HP42S capabilities and outstanding features, plus it includes a large, non-trivial program, which is then thoroughly discussed, pinpointing the special techniques used.

This will surely help give you a clear example of what the machine can do and its powerful programming style.

Best regards from V.

Re: hp 42s

*Message #6 Posted by **e.young** on 21 Feb 2006, 8:38 a.m.,*
in response to message #5 by Valentin Albillo

Thanks to all for your responses.

Most of my experience is with the 11c and 32sII which I did not use for programming, being content with the beauty of RPN. It is actually the 33s that has opened my eyes to the potential of keystroke RPN programming because it has the memory capacity to have more that 2 programs entered into it. From your replies and researching the 42s on MoHPC I wish I could get my hands on one. The prices that it goes for on ebay are a little to high for me though. Actually, the hard part would be convincing my wife about the need to get another HP since I have already obtained several other HP's on ebay.

Re: hp 42s

*Message #7 Posted by **Howard Owen** on 21 Feb 2006, 6:47 p.m.,*
in response to message #6 by e.young

If you have an HP48GX, HrastProgrammer has his HP-42X emulator, which is a binary code simulator of the 42S. The simulation will also run on a 49g or 49g+, with some variation in capability. There are also a pair of very good 42S simulators that run on the PC platform. Christoph Geisslink's EMU42 is a binary code simulator, for which you must supply the ROM. This generally means you need to have a 42S before you can run EMU42. Thomas Okken's Free42, on the other hand, is a reimplementation of the 42S in portable C++. That means that a) you don't need a ROM to run it, and b) you don't need Windows either. Free42 will run on Linux and PalmOS, for example.

Hope this helps.

Regards,
Howard

HP48g function

*Message #1 Posted by **Mark Davies** on 20 Feb 2006, 1:21 p.m.*

I am trying to figure out how to use my HP 48G to solve simultaneous equations using vectors for an electrical circuits. So far I am drawing a blank. It seems that all the schools are set up to use TIs' and no one knows the HPs'. Can anyone tell me how to use my HP to perform mesh analysis for AC circuits. I would be most greatful. Thank you.

Re: HP48g function

*Message #2 Posted by **Jan** on 20 Feb 2006, 2:36 p.m.,*
in response to message #1 by Mark Davies

I guess you calculate currents and voltages in complex notation by using (complex) amplitudes and impedances. The 48 can calculate with matrices in order to solve sets of linear equations (see the math menu and the manual on matrix calculations). I am not sure however if the 48 can handle complex matrices as well.

Re: HP48g function

*Message #3 Posted by **Karl Schneider** on 20 Feb 2006, 2:36 p.m.,*
in response to message #1 by Mark Davies

Mark --

You're in luck! In collecge 15 years ago, I not only solved AC and DC loop circuits using matrix functions on my HP-15C, but also now have a 48G at which I am reasonably competent.

After setting up the exactly-determined system-coefficient matrix and the system-measurement vector (both real-valued for DC systems; both complex-valued for AC systems):

1. Choose "SOLVE" (above "7" key) with the green right-shift key
2. Select "Solve lin systems"
3. Enter the (square) matrix as A. Use brackets to enclose each row vector, with spaces between each coefficient; enclose all vectors within another set of brackets to make it a matrix. Enclose complex-valued numbers inside parentheses, with a comma between parts. Use the angle symbol if needed (green right-shift, "SPC"). Load the values with "ENTER".
4. Enter the measurement-vector values as B, inside one set of brackets. (The same guidance applies for complex-valued numbers.) Load the values with "ENTER".
5. Press the "SOLVE" soft-menu key ("F").
6. The answers will be in X. Use "EDIT" (softmenu key "A") to see the full values.

I used this procedure successfully to solve two examples in the HP-15C manual.

BTW, this question could also have been posed in the Usenet group comp.sys.hp48, but it's not inappropriate here.

Regards,

-- KS

HP 42S

*Message #1 Posted by **Joe Plassmeyer** on 20 Feb 2006, 9:45 a.m.*

Is there a location in this calculator that will convert feet and inches to meters/milimeters? The manual doesn't address the subject. Please let me know if I'm sunk.....thanks.

Re: HP 42S

*Message #2 Posted by **Thomas Okken** on 20 Feb 2006, 10:04 a.m.,*
in response to message #1 by Joe Plassmeyer

The HP-42S does not have built-in unit conversions.
Just remember that 1" = 25.4 mm, and you'll be fine. :-)

- Thomas

Re: HP 42S

*Message #3 Posted by **SteveH** on 20 Feb 2006, 5:05 p.m.,*
in response to message #1 by Joe Plassmeyer

> Quote:
>
> Is there a location in this calculator that will convert feet and inches to meters/milimeters?

This is the sort of thing that you can do really easily with the solver on the HP 42S.

Cheers,

Steve

Re: HP 42S

*Message #4 Posted by **Walter B** on 20 Feb 2006, 8:01 p.m.,*
in response to message #1 by Joe Plassmeyer

Thomas' method is the fastest since the HP45 appeared in 1973.

After this one conversion you need I recommend you to stay with the meters till the end of your calculation(s) - enjoy the benefits of a consistent system of measures. If you really need Olde Imperial Thumbs, convert back just your final result.

After all, unit conversions are history (almost) everywhere today.

in response to message #1 by Pio

Hi,

how about the CLLCD, DISP and FREEZE commands?

Regards

Raymond

Re: Clear the menu bar

*Message #3 Posted by **Marx Pio** on 20 Feb 2006, 9:47 p.m.,*
in response to message #2 by Raymond Del Tondo

Hi Mr. Del Tondo,

Thanks for the help.

First I open a grob GAFIG with

CLLCD {#0d #0d} DUP PVIEW PICT SWAP *GAFIG*REPL 7 FREEZE 0 WAIT CLEAR

After this I run an IFB input box with most list fiels and when I print on screen the results with:

CLLCD "BLA.." 1 DISP ... "BLA" 8 DISP 0 WAIT

And in this screen the menu bar from IFB input is still alive.

Must I 7 FREEZE (Freeze all)before 0 WAIT in the output listings? Is that?

Thanks very much!

Pio

HP71 Cosmetics

*Message #1 Posted by **John Kercheval** on 20 Feb 2006, 8:32 a.m.*

Does anyone know how to take scrapes out of the gold faceplate on the 71B?

Regards,

John

Re: HP71 Cosmetics

*Message #2 Posted by **Jan** on 20 Feb 2006, 9:14 a.m.,*
in response to message #1 by John Kercheval

I guess this will be almost impossible. The only way I see is polishing the entire metal surface with very, very fine (!) sandpaper or some other modestly scraping or polishing material. One should realise however that the texture of the surface will change as well due to such a treatment, resulting in a different optical appearence, which is undesired by you I guess. I would just leave it as it is or provide myself with a replacement of the plate from another unit.

Re: HP71 Cosmetics

*Message #3 Posted by **John W Kercheval** on 20 Feb 2006, 10:15 a.m.,*

Battery leakage and cleaning ...

*Message #1 Posted by **gr8patra** on 20 Feb 2006, 1:37 a.m.*

Hi, I just opened my HP82240B portable infrared printer battery compartment to find one of the batteries had leaked. There is some white residue on the battery contacts but it looks cleanable. I hope there is no residue inside the printer (as it had been sitting on its regular position in a drawer - not upside down). How could I clean the battery contacts? Is there a special solution I should use and any special tools? Thank you, Patra G.

Re: Battery leakage and cleaning ...

*Message #2 Posted by **Vassilis Prevelakis** on 20 Feb 2006, 5:40 a.m.,*
in response to message #1 by gr8patra

Lemon or vinegar will do. Once all the white stuff is gone, use distilled water to clean the area.

Needless to say, only very small quantities should be used.

**vp

Re: Battery leakage and cleaning ... OT cleaning of car battery contacts

*Message #3 Posted by **Klaus** on 20 Feb 2006, 12:06 p.m.,*
in response to message #2 by Vassilis Prevelakis

I have been told some useful tips to clean the contacts of a car's battery: -lemon -thinner -honey -egg -vaseline -butter

Put any of that on the calc contacts and you will never experience any more problems. Even better, you can eat honey, egg or butter from your calc in extreme situation, so you are prepared :-)

(Reminds me of Adam's Hitchhikers.... where you soak your towel with nutrients)

P.S. I would not use any of the above, but distilled water or tequila!

Re: Battery leakage and cleaning ...

*Message #4 Posted by **David Smith** on 20 Feb 2006, 11:48 a.m.,*
in response to message #1 by gr8patra

The white stuff comes off easily with just plain water or isopropyl alcohol, no need for vinegar.

Re: Battery leakage and cleaning ...

*Message #5 Posted by **Ed Look** on 20 Feb 2006, 1:46 p.m.,*
in response to message #1 by gr8patra

Just remember that there is potential toxicity (mimimal from ordinary carbon-zinc, or even "alkaline" batteries,

which are similar) from battery leakage. Do your best not to touch the stuff, and if you do, rinse it off yourself with water.

Re: Battery leakage and cleaning ...

*Message #6 Posted by **David Smith** on 20 Feb 2006, 11:31 p.m.,*
in response to message #5 by Ed Look

The white stuff is potassium carbonate... not much to worry about there. It is formed when the potassium hydroxide electrolyte in the batteries reacts with carbon dioxide in the air. Best not to snort it or gobble it down though. Wash hands after handling. Shower daily. Lather, rinse, repeat.

ROM dump of HP-35 version 2 (with bugs)

*Message #1 Posted by **Peter Monta** on 19 Feb 2006, 5:50 p.m.*

There's a ROM dump of the HP-35 version 2 (the one with bugs) available at my HP-35 page.

Seems to work fine with Nonpareil; Eric, feel free to add it to the distribution if you think that buggy firmware is appropriate to include.

The ROM chips are marked 1818-0006, 1818-0017, and 1818-0020. Here's the errata list from HP---all the described bugs seem to be present.

It will be interesting to analyze the exp() bug---was it an algorithmic error or merely a typo in some constant? The trig bugs also involve arguments with 0.0002 or similar, though, so maybe they're all CORDIC related.

Cheers, Peter Monta

HP-33S Latest Versions at Walmart

*Message #1 Posted by **Thomas Cox** on 19 Feb 2006, 4:22 p.m.*

Recently observed that the latest version of the HP-33S is available at Walmart in the Greenville, SC area. The price has dropped by 10% recently.

in response to message #2 by John Garza

The interesting thing is not that the HP-33S is being sold at Wal-Mart but that in western North Carolina and in the Tampa Bay area of Florida I wasn't able to find the machine offered anywhere else. It wasn't at Office Depot or at Staples even though TI and Casio have substantial displays at those stores. So, where does one purchase an HP-33S if one doesn't purchase it at Wal-Mart?

Hi Bill. The Walmart and Fry's near my house are both sold out of the 33s. Also, Fry's is sold out of the 49G+. A few questions come to mind - Has demand outstipped supply, Is HP getting to

release a new product or is it as you say that HP is moving to an Internet based marketing approach?

By the way, there are many old (2004) 17BII+'s and 48GII's at Fry's that don't seem to move at all.

Regards,

John

Thomas,

What was the serial number on those units? Have they reached CNA6XXXXXXX yet?

The Wal-Mart located in Pea Ridge, Florida (or Pace, Florida, depending on where one sides in the Pea Ridge vs. Pace debate) is having it's Electronics department renovated. I noticed that they now had a wall location and a sticker for the HP-33S, but there are no units in stock. The price was, I believe, $44.97. They now have HP-10BII calculators in stock. Before this, they had no HP calculators at all--only TIs, Casios, and some off-brands.

Cheers,
Greg

in response to message #6 by Greg Whitfield

The Wal-Mart in Largo, Florida has four HP-33S's on the display. One has serial number CNA 53200443. Is that as good as, or better, than CNA524's? Two of the others are CNA429XXXX and the fourth is CNA442XXXX.

What is the significance of CNA6XXX?

Re: HP-33S Latest Versions at Walmart

*Message #8 Posted by **Greg Whitfield** on 20 Feb 2006, 7:59 p.m.,*
in response to message #7 by Palmer O. Hanson, Jr.

HP-33S calculators with serial number CNA6XXXXXXX would have been produced in 2006 (since the first digit after the country and plant code, "CNA", is the last digit of the year). That just seemed significant to me. :)

-Greg

I don't believe that there shouldn't be any difference in the quality of the 532 vs 524. Both are the latest with improved display and keyboard and bug fixes.

However, the 429 and 442 have slightly improved display vs the original but still have the poor keyboard and bugs as the original.

It gets kind of confusing, but I hope this helps.

*Message #10 Posted by **Palmer O. Hanson, jr.** on 21 Feb 2006, 10:24 p.m.,*
in response to message #9 by John Smitherman

Thanks for your help. I bit the bullet and bought the 532.

I noticed one other thing -- the older 33S's were in those anti-theft devices which will sound an alarm if you try to take them out of the store without paying for them. My 532 was not in an anti-theft device. Strange, indeed.

*Message #11 Posted by **Bob** on 24 Feb 2006, 1:39 p.m.,*
in response to message #10 by Palmer O. Hanson, jr.

I have 2 HP33S's, one with 527xxxx as the serial number. Both displays are fine. I use them for daily users and for travelling. Basically, all of the time.

I have used HP's starting with the 41CV over 23 years ago and these 2 give good answers all of the time. I had to return my first one because of a non-entry zero key, but the two I have now are great.

Not quite the same feeling as my old 41CV, but certainly good enough to get the job done. Also, I don't have to worry about someone walking off with it or it falling into something messy and destroying it. <$50 and I have a new one. Not great, but it beats losing a 48GX.

HP28 S ROM

*Message #1 Posted by **Boandl** on 19 Feb 2006, 10:10 a.m.*

Hi there,

I desperately search for a HP-28S (or HP-28C) ROM. My old HP28-S has a damaged battery lid. I also own a HP IPAQ and would like to emulate the HP-28S on the IPAQ.

All searching for a ROM was unsuccessful. Some Methods described in the 'net (http://privat.swol.de/ChristophGiesselink/) are not very helpful, because you need equipment, no one I know owns.

Does anyone a practicable way to get the ROM of a HP-28S or HP28-C for the Pocket PC emulators?

Best regards, Klaus

Re: HP28 S ROM

*Message #2 Posted by **Randy** on 19 Feb 2006, 11:31 a.m.,*
in response to message #1 by Boandl

You can make your damaged 28 work long enough to extract the rom -

Use a piece of aluminum foil across the ends of the batteries to make the connection and place tape over the area of the battery holder to force the batteries into the calculator and hold them in place.

Ugly but it will work...

HP25 problem at revival

*Message #1 Posted by **Alain Delmotte** on 19 Feb 2006, 4:07 a.m.*

Hi!

After many (many) years I decided to put my HP25 (bought 1/12/1975) at work again.

I left it because at the time I was told that it was not possible to find new battery pack.

I only now discovered the MoHPC following the advice of someone.

Now I replaced the batteries by new NiMH batteries.

After charging when running the display shows a full line of 0 and nothing modify this.

Any hope to solve the problem?

Thanks

Re: HP25 problem at revival

in response to message #1 by Alain Delmotte

I'm sure others will know better and I don't own one of these fine cals but here is a reasonable guess: After so many (many;) years capacitors tend to go bad. In my experience, this can cause a lot of nasty failures. If no one else will come up with a better idea, replacing all capacitors is worth trying.

Thomas

Re: HP25 problem at revival

*Message #3 Posted by **Randy** on 19 Feb 2006, 9:52 a.m.,*
in response to message #1 by Alain Delmotte

Most caps in HP handhelds are tantalums... it's rare for them to fail.

The problem is bad ACT chip, it was damaged by the charger being plugged in with a bad battery or no battery in place. The battery is the load for the charging circuit, if the battery is open and presents no load, the voltage inside the calculator rises to 10 volts and damages the integrated circuits.

The only source for the chip is from another 21,22,25,25C,29C or 67. The 27 is not compatible. The ACT is the 22 pin DIP at the bottom of the processor board.

HP25 problem at revival

*Message #4 Posted by **Alain Delmotte** on 19 Feb 2006, 12:00 p.m.,*
in response to message #3 by Randy

Thanks for the information.

So there is no solution, unless I change the circuit.

Now the problem will be to find it.

Yours,

Alain Delmotte

Re: HP25 problem at revival

*Message #5 Posted by **John Garza** on 19 Feb 2006, 9:40 p.m.,*
in response to message #4 by Alain Delmotte

To find one, setup a saved search on ebay (look for a cheap woodstock - like a 21). The search will email you when it finds one. Bid, win, pay, receive, unpack, warm up the soldering iron...

Of couse, you could just get another 25 or a 25C.

Regarding batteries on woodstocks. I NEVER recharge batts in the machines. Use the external charger unit, or make one, or better yet remove the central plastic bar in the batt pack so it can accept AA rechargeables, and when they're low remove them and recharge outside the calculator.

HP-41 Date to Week / Week to Date conversion

*Message #1 Posted by **Geir Isene** on 18 Feb 2006, 6:29 p.m.*

Here's a program that converts a date to the ISO week number and a week number to the starting date of that week (monday as specified by ISO). It takes the date in the normal format. The week number to be converted to the date (monday) can be WW for the current year or WW,YYYY for any year.

D-W obviously converts a date to the ISO week number while W-D naturally does the reverse.

Re: HP-41 Date to Week / Week to Date conversion

*Message #2 Posted by **Karl Schneider** on 18 Feb 2006, 10:18 p.m.,*
in response to message #1 by Geir Isene

Geir --

Thank you for the contribution, but I think it needs some more work before it is ready for the MoHPC HP-41 Software Library.

You should mention that the program requires an HP-41CX or an HP-41C/CV with Time Module.

What is "date in the normal format"? We use MM.DDYYYY in the US, but Europe uses DD.MMYYYY. The Time Module and the HP-41CX support both. (Flag 31 clear = MDY; Flag 31 set = DMY).

Also, several examples would be helpful.

I get -12 as the answer, running "D-W" for MM.DDYYYY = 12.182006. That doesn't seem correct, but the program was entered correctly.

Regards,

-- KS

Program submissions

in response to message #2 by Karl Schneider

I'd encourage people developing programs intended for release to the community to use the old HP program library submission forms.

Look in any "Users's library solutions book" in the MoHPC DVD for the format.

```

> That doesn't seem correct, but the program was entered
correctly.
```

The program assumes dates in the European format (DD.MMYYYY). As Karl suggested, the program should check flag 31 and behave accordingly.

Releasing it here makes it possible to get feedback on it (like the flag 31). Thanks.

```

By all means.

My comment was not about posting here. In fact I think this is the best place to post new programs.

I was talking about the *format* of the submission. Specifically, that by following the HP User Library layout you are helped to provide all the info that users will require.

For example, the forms include a section describing the input, another with examples of use, etc. A lot of the programs in the Solution books were submitted to the program library by the user community.

Best Regards

Re: Program submissions

*Message #6 Posted by **Geir Isene** on 19 Feb 2006, 9:03 a.m.,*
in response to message #5 by Vassilis Prevelakis

Ah, point taken. I do that on more involved programs. Had the idea that this little conversion needed no such "overhead". But at the same time I am a "standardization maniac", so I'll adopt it for all my programs.

Re: HP-41 Date to Week / Week to Date conversion

*Message #7 Posted by **Geir Isene** on 19 Feb 2006, 2:22 p.m.,*
in response to message #2 by Karl Schneider

The program now supports both date conventions. Bear in mind that it does however show the first *monday* of the week when you enter the week number and execute "W-D". This is according to the ISO week number specification.

> Quote:
>
> Also, several examples would be helpful.

Enter (in DMY mode):

```
2,012006
XEQ'D-W
```

and you get:

```
1
```

Enter (in MDY mode):

```
11,2007
XEQ'W-D
```

and you get:

```
3,122007
```

Enter (in MDY mode):

```
11
XEQ'W-D
```

and you get:

```
3,132006
```

> Quote:

HP 65/67/97/41 Mag card template for MS Word

*Message #1 Posted by **John Garza** on 18 Feb 2006, 5:26 p.m.*

All,

If anyone's interested, I just posted this to comp.sys.handhelds

It allows you to make professional looking (ie legible!) mag cards. You can use decal paper, white paper & glue, or just print the label cards themselves a la TI58 and keep your limited supply of cards clean and reusable.

Scissors not included - enjoy!

-John

HP16C manual dated 9/83

*Message #1 Posted by **John Leith** on 18 Feb 2006, 3:19 p.m.*

The original manual for the HP16C (purch. Apr. 1984) is 170 x 117 mm (not counting the spiral binding), their part number "00016-900001 Rev. C English" amd "Printed in U.S.A. 9/83" on the back cover. The calculator has "USA 2417A85315" stamped on one edge. Works fine, never replaced the battery, but it is only lightly used. Not for sale! This relates to some exchanges on the forum from Feb. 2005, but I can't figure out how to link my msg. to that thread.

Edited: 18 Feb 2006, 3:20 p.m.

Re: HP16C manual dated 9/83

*Message #2 Posted by **Karl Schneider** on 18 Feb 2006, 10:30 p.m.,*
in response to message #1 by John Leith

John --

A post from that time has gone to the Archives, and is no longer linkable or "repliable". What you should do is find the original thread in the appropriate HP Forum Archives (#14 or #15), and use the "Link" button below to paste in a link to a specific post in the thread.

P.S. I wish your manual were for sale! A genuine color spiral-bound HP-16C manual is one of the few items I'm missing, but it's rare and expensive on eBay. I do have a correct-size B/W spiral-bound facsimile from the MoHPC scan, prepared by Kinko's for US$40.

Regards,

-- KS

Oooh! Oooh! I have one with no revision letter, and dated April 1982. What do I win?

;)

Looks like I'll have to check the version on the Museum DVD. If there were revisions, that suggests there were corrections of errors.

Best,

*Message #6 Posted by **Vieira, L. C. (Brazil)** on 19 Feb 2006, 9:26 p.m.,*
in response to message #5 by Les Bell

Hi Les Bell, guys;

firts of all, congrats! You have a collectible piece, indeed.

I have some original HP manuals, and I'm glad to say that I have at least one of each Voyager´s: English, Portuguese and one in German (HP11C). The one I think is the most interesting of them is a July 1982, Rev. B HP10C Owner's Handbook. At page #94 it should have a program listing, but it has only the comments and the two big blue arrows indicating how the branching occurs in the edited program. I had to wait for the MoHPC listing prior to see the actual program contents.

Cheers!

An RPN Club

*Message #1 Posted by **Ben Salinas** on 17 Feb 2006, 11:05 p.m.*

The college I attend is 4 years old (www.olin.edu), and we recently realized that we have enough students who use RPN to legitamently start an RPN club. We can get funding from the school, but the question is what would we do?

Any ideas of the purpose of an RPN/HP club. Some ideas we had included spreading the idea of RPN on and off campus.

Re: An RPN Club - umm, why?

*Message #2 Posted by **.** on 18 Feb 2006, 1:46 a.m.,*
in response to message #1 by Ben Salinas

I'm curious. Where does the funding come from? If it's from students, why should fellow students pay for it?

Re: An RPN Club - umm, why?

*Message #3 Posted by **Han** on 22 Feb 2006, 3:27 p.m.,*
in response to message #2 by .

As I understand it, funding often comes from student government (which gets some of its funding from student activity fees). Why should fellow students pay for it? For the same reason every student pays activity fees. It's the same for taxes. You might be retired and not have any children. But you still pay taxes, and some of that money goes to fund education.

> Quote:

Re: An RPN Club

*Message #6 Posted by **Dan M (NM/USA)** on 18 Feb 2006, 9:31 a.m.,*
in response to message #1 by Ben Salinas

I think this is a great idea. A meeting place where students can gather and exchange tips and get help can really boost interest in HP calculators. Some ideas for your charter:[ul]

- Teach programming concepts on RPN/RPL calculators.
- Develop and maintain library of applications useful to students in each major. Imagine the incentive to buy an HP if you knew there was a packgage of programs tailored to the classes you will be taking.
- Publish newsletter/Web page with tips and tricks.
- Run programming competitions. [\ul] From what I've seen on this group, Ben is just the person to organize a viable club. Sure, the students can participate in our dialog, but meeting in person is much more valuable.

For those who don't know, the funding generally comes from student fees and is allocated to any group who have a common interest and wish to organize a group open to all students.

1. Have a great time
2. Do something amazing for rag week
3. Write programs to convert beer from your local measure into other measures e.g. litres, pints, etc. and then do real-world testing to make sure that it is correct
4. Do other stuff that students do
5. Finally, if your maths teachers have student notes that are written for the TI, offer to re-write them for the HP. You (a) get to persuade the teacher to try an HP and (b) the act of doing it will help enormously in your understanding/revision of the work.

I've been doing RPN with my first hp 25c calculator.. 30 years ago. Reverse Polish Notation is best there is...

Recently I got me a 49g+ calculator.. to my surprice... The manual stinks...

So I ask my self.. what can be done?

Well.. you might give simple examples of writing simple programs with diss hp 49g+ / 49gplus.. ?

In programing.. how handle input/ outfiles etc and doing/running programs in hp49g+ ? how to send files to pc/ windows 98/ XP ?

Nice HP-Moments/ Lars Norberg.. Master of Science.

>So I ask my self.. what can be done?

How about go to the calculator web page, look under "Product Manuals" and discover this. . .

http://h10025.www1.hp.com/ewfrf/wc/manualCategory?
product=351775&lc=en&cc=us&dlc=en&dest_page=product&

Oh look! There are three downloads. One is the 175 page booklet that comes with the calcualtor. Ther "user's manual" that comes with the calculator is a short inrtoduction to the calculator. Then there is a "users guide" that has 860 pages of material. Then there is the "Advanced Users Reference" that has about 700 pages of material.

So where is is the stinky manual you are wanting something to be done about?

in response to message #12 by Tim Wessman

Tim,

While I agree with you, I empathize with the previous poster. Does not it seem a bit expensive when, in order to learn how to use a $150 machine, one is required to already own (or perhaps purchase) a computer ($500+) and internet connection ($10-$20 per month)? Even if you printed it out at the library, there's still the paper/ink expenses (10 cents copy?). But let's forget about that. Imagine having to carry around a laptop in order to use your machine. Of course, you could print it... and that would be adding to the cost. I think it's fair to complain if a product does not come with adequate documentation.

Granted, most households will have a computer (though not necessarily an internet connection -- like my parents). I understand you're currently involved in writing data collecting software. I cannot picture you only providing a quick start guide to your software. In fact, I'm sure you'd have a very good set of documents on how to make the most of the software. So why can we not expect the same from a company that operates on a much larger scale?

Hi, Ben;

did you read this post of mine? What about getting in contact with the teachers of the related areas and try getting some calculator-related activities? I guess that as the club is funded with an academic basis, teachers might/should participate.

I think that the main ideas in the post I mentioned here may give the teachers some guidance, though.

Cheers.

Luiz (Brazil)

Re: An RPN Club

> Quote:
>
> What about getting in contact with the teachers of the related areas and try getting some calculator-related activities?

I think that's the best approach. If teachers create or use material oriented towards the TI calculators, then the first order of business should be to "correct" it to use RPN or RPL, so that HP users are not disadvantaged. Students should be able to get to work on a problem and learn about the underlying math, without having to divert their attention to algebraic->RPN translation issues.

Test the material "in-house" at first, then release it to the outside world. I'm sure HP would be more than willing to help polish (pun unintentional) the material and assist with distribution.

Best,

--- Les

Re: An RPN Club (Ben - How is OLIN??)

*Message #18 Posted by **ECL (Eric)** on 19 Feb 2006, 8:30 p.m.,*
in response to message #1 by Ben Salinas

Ben,

We corresponded (through postings) over the topic of Olin before you enrolled. I have read a bit about the philosophy of the school. The try first / study later approach is one that we took in my first mechanical design course. We had an extremely open problem of design/fabricate/deploy a robot that traversed a wall with cargo. Seems simple, yet we had all just come out of first-semester dynamics and had little experience. It was true fun with a bit of frustration for good measure!

I'm in the last leg of my BS in mech engr now, and I intend to pursue an advanced degree. I will investigate Olin (Masters/Doctoral granting?) as I like what I've heard.

How do you like it so far?

Eric (ECL)

Re: An RPN Club (Ben - How is OLIN??)

*Message #19 Posted by **Ben Salinas** on 20 Feb 2006, 10:13 p.m.,*
in response to message #18 by ECL (Eric)

Eric,

Olin is great, but unfortunately we are just undergraduate (as of now, and probably forever). Because of the size (<300 students), everyone is very friendly, and very helpful. The professors are wonderful and dedicated to the students and to teaching the students.

Everyone else,

Clubs at Olin are heavily subsidized so that students will do things other than work. Clubs can easily get money so that way clubs will host events, and students will leave their rooms. It's a great system.

I am thinking we will probably start out by working on advocacy on campus. We will probably then move more off campus (either to other schools in the Boston area, or to other age groups)

Thanks all,

Ben

Repairing Classic Series battery compartment cover

*Message #1 Posted by **Gordon** on 17 Feb 2006, 7:16 p.m.*

The sliding latches on a few of my Classic series are broken. The common problem tends to be the plastic tab in the inside of the battery cover (where the rubber feet would attach to), they are often broken in half.

There is not enough material for crazy glue to grab on to, and since it occurred on three of my Classic series, I presume it is a common problem.

I had thought about replacing the internal plastic piece with a custom machined/drilled thin metallic tab, and attach the plastic feet (on the outside of the battery cover) to it. But that can get quite involved in making it. Does anyone has a better idea?

Re: Repairing Classic Series battery compartment cover

*Message #2 Posted by **John Garza (3665)** on 18 Feb 2006, 5:14 p.m.,*
in response to message #1 by Gordon

Gordon,

I've come across this problem a couple of times. What I do is line up the two pieces of broken plastic, then glue a thin strip of plastic over the joint, see below.

Battery latch ====== ====== New plastic -------

I find old plastic collar stays from dress shirts work great! Just trim to fit.

-John

Somehow, the text in my last message was not wysiwyg...

Lets try it again...

Battery Latch ====== ======

New Plastic ------

Re: Repairing Classic Series battery compartment cover

*Message #4 Posted by **Vassilis Prevelakis** on 18 Feb 2006, 8:00 p.m.,*
in response to message #1 by Gordon

If you have all the pieces from the old latch, you can simply add two metal wires to reinfoce the join. Here is a picture of the latch on my HP-97 (the only difference with the HP-67 latch is the colour).

http://www.series80.org/Misc/HP97-latch.jpg

If the latch is broken you arrange the pieces so that they are in the correct positions relative to each other and also correctly aligned (the tops must be level).

You place thin wires (the ones shown in the picture are wires from a resistor pack) on top. You then gently touch each wire with the tip of a soldering iron and wait till the heat allows the wire to sink into the plastic.

Re: Repairing Classic Series battery compartment cover

*Message #5 Posted by **David Smith** on 18 Feb 2006, 11:42 p.m.,*
in response to message #1 by Gordon

If you have the piece, you can reattach it as good as new with plastic welding solvent (methylene chloride) available at any hobby shop. Lay the pieces of latch on a stone or metal table top. Paint each end of the latch with the solvent and hold them together for around 10 seconds. Let dry overnight. The bond will be as stong as new... something no glue will do.

Thank you for all your great suggestions

*Message #6 Posted by **Gordon** on 20 Feb 2006, 9:02 p.m.,*
in response to message #5 by David Smith

Thank you so much for all your ideas. I think I will try the welding solvent first and see if I have enough pieces to put it together (part of the middle section is quite crumbled). If that does not work, then I will try the metal wires.

Come to think of it, is there enough clearance to put another thin piece of plastic on top, then use the welding solvent to create a new piece. So in the picture below, F stands for the rubber feet, O stands for the old crumbled piece, and N stands for the new piece.

NNNNNNNNNNNNNNNNN OOOOOOOFFFFFOOOOOO

My concern is there may not enough clearance to do that. If it may work, is there any place that I can go and buy that thin piece of backing plastic? Do they sell stuff like that at hobby shops?

Just realize John Garza has the same idea

*Message #7 Posted by **Gordon** on 20 Feb 2006, 9:07 p.m.,*
in response to message #6 by Gordon

John,

After I post my last reply, I realized my second alternative is the same as your suggestion. I will give that a try, I think you are right, the collar tab is just about the right thinkness.

Do you use crazy glue, or the welding solvent? I think most of my collar tabs are plastic-like, but not exactly plastic, as they do not snap when you bend them.

Plastic for latch repair

*Message #8 Posted by **Randy** on 20 Feb 2006, 10:14 p.m.,*
in response to message #6 by Gordon

Collar tabs: They're usually made of polyethylene, very hard if not impossible to bond to. The solvent welders will not work, you need something made of a styrenic material.

Some hobby shops sell styrene plastic in strips, rods, tubes and other shapes. It's used primarily for model railroading and many of the shapes are scaled to real world things like 4x4 timbers. Several of them come in real handy for calculator repair :)

I use strips that are 0.25" x 0.010" for the top cap on the battery latches - it reinforces the tab and doesn't add much in the way of thickness. Evergreen Scale Models is what my local shop carries. If you'd like, send me an email and I'll snail mail you a chunk.

IMO solvent welding is the **only** way to repair anything plastic in an HP handheld - throw the crazy glues away, they only make things worse.

[Slightly O.T.] 256KBx8 SRAM in SOP

*Message #1 Posted by **Han** on 17 Feb 2006, 6:42 p.m.*

I know that there are 2Mb (256KBx8) CMOS SRAM DIP chips. Did anyone ever manufacture them in small outline packages (SOIC)? I seem to come up with nothing via Google -- the hits I get usually point toward Flash RAM. So did any company manufacture these?

Re: [Slightly O.T.] 256KBx8 SRAM in SOP

*Message #2 Posted by **Garth Wilson** on 17 Feb 2006, 8:17 p.m.,*
in response to message #1 by Han

I have never seen a 256Kx8 SRAM in any package. 256Kx16, yes; otherwise 128Kx8 or 512Kx8. These are easily available in SOIC.

Re: [Slightly O.T.] 256KBx8 SRAM in SOP

*Message #3 Posted by **Han** on 17 Feb 2006, 9:13 p.m.,*
in response to message #2 by Garth Wilson

Garth,

Thanks for the response. I tried several distributors -- even searched their out-of-stock lists. I managed to find a few 2Mbit (256KBx8) SRAM chips in DIP form (www.digikey.com) prior to posting my question. However, no one seems to have (ever had) any 2Mbit (256KBx8) in the small outline packages. It's odd that these seem to have never ever existed.

Han

Re: [Slightly O.T.] 256KBx8 SRAM in SOP

*Message #4 Posted by **Garth Wilson** on 17 Feb 2006, 10:50 p.m.,*
in response to message #3 by Han

Same thing with 16Kx8 SRAMs. They went from 8Kx8 to 32Kx8. If you want 16Kx8, you use half a 32Kx8, just tying one of the address lines to ground or Vdd.

Last post here on MoHPC

*Message #1 Posted by **Joe Edwards** on 17 Feb 2006, 4:43 p.m.*

Good evening, As a previous owner of a HP 32s, which I purchased in college back in 1989, I was delighted to find the Museum and, especially, this forum. After almost 15 years I found out that I wasn't the only person who knew how to use this "weird" calculator. In fact, after reading much of the information here at the Museum, I learned that there was an entire community built around the HP calcs. Not only that, but that there was also a deep and rich history regarding these machines.

That was about three (3) years ago. Fast forward to today. A post was made regarding my obviously confrontational additude regarding some of my earlier posts. Not only that, but I have been informed that I have made too many requests for information for someone who is new to this forum.

I didn't grow up in the HP culture like so many of you folks, so all of this is new to me, but nonetheless interesting. So interesting in fact, that I spent a decent chunk of change on a number of HP calcs. Money well spent. The idea of studying and using this older technology seemed like a chance to live the history, more than just read about it. Chalk that up to a bad case of want-to-be nostalgia. :) I guess I figued that it would be possible to play catch up.

After reading that post, it became very apparent that no matter how much I study these fine, old machines, I will never truly be part of the community, since I didn't live through the HP Era that so many of you fine folks did. At best, this makes me a wanna-be and at worst a person playing with old "junk" that will have no real value in my daily life. As has been stated here many times, most folks use computers today to deal with serious work or just use a calc for simple "down-and-dirty" number crunching.

Therefore, this is my last post here at MoHPC forums. I greatly appreciate those who took the time to share their knowledge and insights. I am sorry it took so much time out of so many folks' daily schedules to answer my multiple questions. For those that I accidentally offended, my apologies. For those who were intentionally rude to me, no apologies are given.

I guess I should thank Karl for his comments, no matter how I feel about them. It has clearly shown me that I am not a member of this community and also, that (my epiphany) they are just calculators. So, back to ebay goes my newly started collection. There are many others out there who will have more use for them. The 33s and 49g+ will do me just fine (real HP or no).

Good luck to all of you folks who visit this site. Thanks.

Joe Edwards

Hey Joe! I appreciate your posts here and sad to see you go. As one that has also considered selling my collection (mainly just to get the money back), I respect your decision to sell. But, what are you selling? I need an extra 41CX and maybe some others.

Stephen s_easterling@earthlink.net

Re: Last post here on MoHPC

*Message #3 Posted by **John** on 17 Feb 2006, 5:49 p.m.,*
in response to message #2 by Stephen Easterling

Stephen, you will make a good collector. No misplaced plea for Joe to stay and not leave the forum, just wondering what he's selling. Marvelous!

Personally, it would help if people using the internet would always try google first before posting questions to forums, blogs, whatever. Why waste everyone's time when you won't spend your own time first?

And, a thick skin often helps one get through life. Running away the first time someone disagrees with you, even if it is harsh disagreement, will lead to a long and unrewarding life.

So, Joe, if you can take criticism, whether warranted or not, then stay. Otherwise, asta la vista.

Re: Last post here on MoHPC

*Message #4 Posted by **Matt Kernal (US)** on 17 Feb 2006, 7:31 p.m.,*
in response to message #3 by John

>a thick skin often helps one get through life.

Good advice. Just remember, everyone here comes from all walks of life, culture, education, geographic location, occupation, etc.. All of us have different reasons for coming here. Some may be most interested in efficient programming, others in collecting, others may want to get their HP repaired, and some may want to share a good story or memory of how their HP saved their life (OK, I made up that last part :-).

In whatever category the discussion may be concerned, I often just lurk, hoping to learn a thing or two from the "smarty pants" people ;-). Lord knows, I ain't [sic] one of them brain-cells. When I do ask a question, or make a comment, I want to be aware of who will be reading my words, so I try to be polite, friendly, and respectful. I try to make sure I'm as informed as is reasonably possible, before I put in writing, as I want don't want others to know I'm faking it (insert picture of someone nodding "yes", while hold their chin with one hand and resting their elbow in the other hand).

Finally, just be pleasant and enjoy the ride. Don't be intimidated by this group of people that most likely consist of "above average" intelligence quotients (consider the subject matter: calculators). I've met some of these calculator fanatics (myself included) in person, at coffee shops, and some geniuses (myself not included) at some of the handheld calculator conferences . I left with lots of respect for these folks, but more importantly knowing they were/are just people, just like everyone else around you. OK, maybe just a little quirkier! ;-)

Matt

in response to message #1 by Joe Edwards

Hi, Joe;

I am posting here since the beginning of the milenium. I didn´t have the chance to read 'on line' posts of many people that were just mentioned in past posts, others are no longer here sharing their knowledge, skills, rants... Anyway, many good souls prevail, and I try to 'fit in' for as long as I can... or deserve to.

I deal with HP calculators since 1982. And I found here many others that had gone a lot further than I could even dare dreaming of going. I intend to stay and go ahead with them. I feel home, here.

I respect your decision to leave, but shouldn't you consider your motivations being your own instead of other's? Just a question, please, don't feel compeled to consider if you do not intended to.

If it's worth a try, see yah!

Cheers.

Luiz (Brazil)

*Message #9 Posted by **Ed Look** on 17 Feb 2006, 9:27 p.m.,*

in response to message #1 by Joe Edwards

Joe, how do you know you didn't ALREADY fit in? Wherever you or anyone else will go, there'll be disagreements, even an exchange of hot words; it's human nature.

But in these three years, I'm sure you might have found that on this little bright spot of sanity (or is it insanity, $400 for a 32SII !!!) people generally, in an overwhelming proportion of the time, more than polite; they are positively quite nice.

I mean, look at me- I am not an engineer, surveyor, or mathematician. I often find my posts igno... um, unresponded to. (Being insignificant is worse than being treated somewhat poorly because they HAVE taken notice of you... and I'm kind of only one quarter to one half joking...) But there are many nice folk here and even one of them might have a bad day. And often enough, there are those who may have a thoughtful comment or answer to my posts or queries. And I only have in common with the others here what you have, namely a deep appreciation for HP's finely crafted past calculators and their current fairly well designed ones.

Anyway, for what it was worth, I generally found your posts worth reading... er, even if... um, I may not have responded...

Well, I hope you reconsider and post other thoughts for me to consider.

*Message #10 Posted by **Andreas Terzis** on 18 Feb 2006, 5:07 a.m.,*
in response to message #1 by Joe Edwards

Joe, I had been visiting the HP Museum years ago for a while. After a period of inactivity, I recently got back on the bandwagon and started using my beloved HP-41CV and visiting the site again. In the vast majority of the cases, I find our fellow HP aficionados very nice, unlike on any other boards. Here and there someone will take something the wrong way, but in general this site offers a lot of good advice, fun and entertainment. I have read a lot of your posts and don't see anything wrong with them. I would hate to see you go like that. If you still decide to, good luck to your endeavors and I hope you find another area where you can get good info from. Good luck, Andreas

Re: Last post here on MoHPC

*Message #11 Posted by **Nenad (Croatia)** on 18 Feb 2006, 10:29 a.m.,*
in response to message #1 by Joe Edwards

Joe, why take the MoHPC so seriously, as the "community"? Appreciating everybody posting here, especially Dave Hick's efforts to keep the MoHPC going on, all in all it is nothing more than an Internet site. If someone offends me, when I ask something I do not understand, showing me that everybody knows everything about this except me, who cares. If I still do not understand, I will ask again, taking no care about an offensive post of someone else.

Everybody can rant on me on any Internet forum, hiding behind his/hers computer screen. Nobody would dare to do it in real life, believe me.

So, if you in future need any information about your HP33s and/or HP49g+, or any other HP or nonHP calculator, or any machine, gadget or appliance, you should ask, here, or in any other forum on the Internet, dependent on the subject. People here come and go. I remember Glynn, Norm Hill (aka Captain America), Viktor Toth, my friend Dave Colver, ... - I do not see posting them here any more. Once when they, or anybody else, come back with a question, an opinion, an answer, a proposal, or a procedure, who is the one who should complain about it.

For each of my posts I may also say "this is the last one", until I will be in need of another piece of information, or if I see somebody asking how to solve something I know. In that case I try to prepare an answer, but I already know that Luiz Claudio will be faster;)

In case the "community" ignores me for a reason that in someones opinion I ask too much, there is always another opinion. Just fill the name field with something as "Pamela", "Marina", "Renata" or "Sylvia" and ask: how to add two numbers on my sister's HP19C. I will certainly obtain more than 10 answers and the answer is what I needed. How do I know this? This is just how I behave when I see such an entry in the Name field;)

Please, just relax and do not take any Internet forum, even a very polite one like moHPC, so seriously. At least, we are only discussing "old junk" here, that means nothing to most people around us. Imagine a forum of old washing machines collectors - what you would think when you see them discussing errors in their instruction manuals, undocumented features, big "start" button in the centre of their control plate instead of the small one in its down right corner ...

Best regards from sunny Split, Croatia

*Message #14 Posted by **PeterP** on 18 Feb 2006, 7:55 p.m.,*
in response to message #1 by Joe Edwards

Joe,

Hope all is well. being a newbie myself who loves this forum and the people on it, I was quite surprised by your post. I appologize for my curiosity upfront and none of the below is meant in any other way than sharing my thoughts as well as my own experience with another newbie and HP enthusiast.

I went through the effort to bring up your previous interactions with other people here, using one of Dave's fabulous search features by your name, to learn what could have caused your negative experience, where things went wrong.

(goto here and type in 'Joe Edwards' in the last search field and select it)

I admitt coming away from reading the threads a bit mixed: The search (which could be incomplete and so please accept my appologies if it paints an incomplete picture) brought up a host of threads which most often start with a question from you and a discussion that follows, sometimes however with intermixed harsh back and forth, one could argue started by you.

Being a newbie myself I feel very grateful for the overwhelming support that I have received through the members of this forum, especially the HP geniuses among them. Their advice has always been friendly, plentyful and exhaustive and I feel that all they ever asked for in return (if anything!) is a kind 'thank you!' for their effort and acknowledgement of the help they provided. We are all human and like to be thanked (and once in a while padded on the back) for our efforts.

Being a newbie (like me) means that information flow is naturally a bit one-sided. We ask, they answer. I try to give back whereever I can and share things that I learned, trying my best to give credit to those I learned it from. But I know that for the foreseeable future it is EXTREMELY unlikely that I will ever be able to provide only the slightest bit of information to the Valentins, Diegos, Raymonds, Tonys, Meinderts, Christophs and All-The-Other-Great-Ones of this forum. So all I can do is make this learning and teaching experience a fun and engaging one for them.

So when one of them would write back to me "Come On, you could have found this in Goodle in 1 sec" I might simply say, "Sorry, you are right, will do next time" (as he/she most likely is...)

My profession makes me work in a world of people with large ego's, very often in no proportion to their actual skills. Personally my experience here is quite the opposite - many here have far more skill and patience with stupid questions like the ones I often ask, then they would have to. I have yet to find a forum where a 'noop' is so contunally welcomed and supported by the Old Wise Man & Woman like this one.

And before spilling the baby with the bathwater (or whichever way this saying works in english...), I might take a look in the mirror and check if me being upset with another person or group is solely the groups fault or if there is something on my part that might have caused the friction in the first place and I can change.

If you love learning and discovering HPs I can't think of a better place than this forum that Dave so generously provides for all of us to use. Tongue in cheek, maybe you want to "give the forum another chance" ;-)

In any case, best of luck and lots of fun, whichever way you move forward.

Cheers

Peter

Please don't take it too hard when someone is rude on this forum -- or anywhere on the Internet, for that matter. That kind of behavior is not *right*, but it is not representative of most of the people here.
I guess it would be nice if this forum offered a feature to let users filter out posts from people who have history of being unpleasant...
Until then: I hope you'll continue to visit here; rest assured that most of us *are* civil. The silent majority. :-)

- Thomas

*Message #16 Posted by **Karl Schneider** on 19 Feb 2006, 12:43 a.m.,*
in response to message #1 by Joe Edwards

Joe (if you are still following the Forum) --

Well! Your response to me and your "farewell" post were, um, I'm not sure how to describe it. Maybe more sarcastic or emotional than sincere and rational, with a large dose of "guilt trip" included -- aimed at me in particular and the group by association. I won't bother to address their contents specifically.

I spoke only for myself, and made no pretense otherwise. I never referred to you as a "newbie", but only suggested that someone with limited history of contributions in particular should not appoint himself an active moderator. Even the Curator (David Hicks) intervenes only when necessary.

No one is asking you to leave, Joe, and I think you probably "fit" in better than you might think. If you are 36 years old (having started college in 1987, according to one of your posts) and bought a 32S in 1989, then you know about calculators from "the old HP".

However, I will echo what "John" stated in response to your last post: One shouldn't spend the time and effort of others without first spending one's own. I felt that your response to Vassilis in particular was way out of line, and I spoke out in direct terms.

My post might have overstated things, and could have been more tactful. I was specifically referring to only three of your posts (which I excerpted), among the 70(!) you made between January 23 and February 17, 2006.

Good luck to you in whichever course of action you decide...

Best regards,

-- Karl

For those who might not have followed, here is a chronological summary of Joe's contributions, just for the record:

> Jan 23, 2006: Introduces himself with recent biography; asks for unfocused guidance on HP calc purchases
>
> Jan 24-27: Asks about HP-41 vs. HP-15C and HP-32S; slide rules; 48GII+ and HP-49G+
>
> Jan 29: Mildly reproaches me for a posting of mine
>
> Jan 30-Feb 13: Receives HP-41, Gets in eBay "bidding war" over HP-27S with Forum reader; asks for advice about culling HP calc collection, RPL programming, HP-48 build quality; HP-71B
>
> Feb 15: Admonishes "e.young", who doesn't seem to appreciate it

Feb 15: Five posts about newly-acquired 49G+, then asks what the advantage of RPL over RPN is

Feb 16: Scolds Vassilis Prevelakis; I am prompted to respond

Feb 16: Seven more posts on various topics

Feb 17: "Flames out" with two posts in reponse to my post of previous day

Edited: 26 Feb 2006, 3:55 p.m.

Re: Last post here on MoHPC

*Message #17 Posted by **e.young** on 20 Feb 2006, 4:02 p.m.,*
in response to message #1 by Joe Edwards

I don't think that you should leave or cull your collection. In any situation where a bunch of people come together there are bound to be times where someone will rub someone else the wrong way. If there are some here you don't get along with then just ignore them. Meaning no disrespect to you, if you do find yourself frequently in confrontations then it's a good idea to examine your own posts to see if someone else can be taking them the wrong way. Or maybe sometimes you have misinterpreted someone elses post and taken offense where none was intended. It happens to all people, myself included.

I also don't think that because you didn't grow up with HP's in the 70's or early 80's you are demoted to wanna-be status. Membership in the HP community does not belong to a select few, who used the HP41 or the first or second generation of HP calcs. It belongs to everyone who uses/used an HP of any time period. I got my first HP in 1988, and have only used the 11C, 32SII, and 33s. I am clueless about electronics, programming, and have only soldered plumbing joints. However, I don't believe that makes me any less of a member of the HP community than those members who could probably build an HP from scratch. It just means that I am different.

in response to message #18 by Ed Look

Two observations:

1. My dear old daddy used to say, "Never be afraid to ask a stupid question. They're easier to deal with than stupid mistakes."

2. This and several other forums on other subjects that I am a member of are a little like cooking stew. Every now and then a big bubble rises to the top and causes a little splatter. But that doesn't mean it's not a good stew.

MLDL2000 update

*Message #1 Posted by **Meindert Kuipers** on 17 Feb 2006, 3:45 p.m.*

Time for an update!

While between houses I have been staying in a trailer with my family. We are now settled in our new house (with many boxes still to unpack) and I have finally setup my MLDL2000 assembly line again. Those who have a unit on order and have their serial number assigned back in 2005 can expect some good news within the next two or three weeks.

There have been some additional orders as well. The potential problem is that I am down to my last 5 or 6 units from the initial production run, and some of the PCB's did not pass initial testing. These units have been reworked, but not yet tested and I am not certain if they will work at all.

Unless there is sudden interest for at least 25 units, this means that I will probably have stop accepting orders for the MLDL2000 and no more will be made. Which is also good news, because I need time to expand the functionality of the MLDL2000!

Meindert

HP-9G unit conversions

*Message #1 Posted by **Herman** on 17 Feb 2006, 12:25 p.m.*

The HP-9G seems like a nice little machine, so I checked into its specs at hp.com. Its "up to 24-digit internal calculation accuracy" is definitely way beyond enough for me.

HP's info about the 9G's unit conversion capabilities is here. On page 2 of the above document is a table displaying the units used in the HP-9G CONV menu. The text underneath the table says that "some units are exact (e.g. feet, inch, gallon) while others are provided up to 13 digits of accuracy". Looking at the table, I see that indeed several units (amongst which gallon) are off in their last (13th) digit. However, yard and pound are quite off the mark and only are specified with 8 to 9 digits accuracy.

Now, why can't HP get a yard as 0.9144 m (by definition) built into this calculator, instead offers us 0.9144000009144 m ?

And why can't HP get a pound as 0.45359237 kg (by definition) in it ? The 9G says "1 lb = 0.4535923772575 kg". Using Excel to figure out how many HP-9G correct ounces are in an HP-9G off-the-mark pound, it says "16.00000026"... That's a whopping 8 digits of accuracy, or 'back to the early seventies' !?

At hp.com I filled in an inquiry form about these HP-9G unit conversion inaccuracies, then got an 'email undeliverable' message... That's why I'm posting here and hope to get an answer from a Hewlett Packard expert.

Well in due time I'll probably get one anyway, because it's a handy and quite powerful calculator that you don't have to lock up at night. Meanwhile, I will continue to use my good old [censored] fx-4500P, and keep the correct conversion units in an Excel sheet.

Re: HP-9G unit conversions

*Message #2 Posted by **John** on 17 Feb 2006, 12:33 p.m.,*
in response to message #1 by Herman

First you should realize that the 9g is an OEM product produced by someone other than HP and in addition was not designed by anyone at HP.

Second if 24 digits is too much, why is something off 1 digit in the 13th place too far off?

If you're needing to measure/convert things to that degree of precision then the 9g is a bad choice to begin with.

Re: HP-9G unit conversions

*Message #3 Posted by **Herman** on 17 Feb 2006, 12:52 p.m.,*
in response to message #2 by John

Please do read my questions, I wasn't fussing about the units that have an incorrect 13th digit, rather the units that only have 8 or 9 correct digits, for instance inch is given correctly as 0.0254 m but the 9G yard is off, they'd better use 36 inches than the number that they provide for a yard.

And yes for most practical purposes my old slide rule is also precise enough. I'm not questioning the practical applicability of the 9G.

The point here is the difference between the accuracy claimed and the accuracy provided. If the exact international agreed on conversion unit has for instance 4 digits, that's it (the rest is all zeroes) why does this machine have these nonsensical 10th through 13th digits ?

Edited: 17 Feb 2006, 12:56 p.m.

Re: HP-9G unit conversions

*Message #4 Posted by **Frank Boehm** on 17 Feb 2006, 1:10 p.m.,*
in response to message #1 by Herman

Obviously printing "HP" onto some piece of chinese &%$&%$ didn't improve the quality of the original product :)

That said, Sanyo offered 16 digits in their first pocket calculators, 35 years ago. Though it's tough to offer that on an entry-line scifi calculator, it certainly would be possible. The mentioned "slips" in details wouldn't have happened 20/30 years ago at HP. But then this calc didn't cost you a fortune, so one probably has to accept some tradeoffs. I'm sure, for 5k$ of todays money you'd be able to buy a calc that has correct unit definitions ;)

Re: HP-9G unit conversions

*Message #5 Posted by **Herman** on 17 Feb 2006, 1:27 p.m.,*
in response to message #4 by Frank Boehm

Hm, I was starting to wonder if HP didn't replace their last engineer after he retired...

Is there a table somewhere where I can find which machines are really made by HP (if any) and of a good quality, and which models are OEM (Chinese @!#?@!) ?

PS just now received a second 'undeliverable' trying to contact HP...

Re: HP-9G unit conversions

*Message #6 Posted by **bill platt** on 17 Feb 2006, 1:23 p.m.,*
in response to message #1 by Herman

Herman,

I understand your frustration.

It is maddening beyond belief, when something so straightforward and factual should be wrong, and at the same time glossed over and glitzed up.

Re: HP-9G unit conversions

*Message #7 Posted by **Herman** on 17 Feb 2006, 1:44 p.m.,*
in response to message #6 by bill platt

Well I'm mostly amused - check that table, and you will see that they just told someone "press 1, convert it and fill in the result in this table". So now there are two surprising °F to °C and vice versa "conversion

units" at the "Temperature" section.

Re: HP-9G unit conversions

*Message #8 Posted by **John** on 17 Feb 2006, 1:56 p.m.,*
in response to message #6 by bill platt

But at the same time, give HP credit for not hiding it. The information Herman found came from a document on HP's website.

Confusion reigns!

Re: HP-9G unit conversions

*Message #9 Posted by **Herman** on 17 Feb 2006, 3:59 p.m.,*
in response to message #8 by John

That's definitely right - Casio for instance doesn't have the units for the fx-991 listed anywhere.

Well thank you all for your responses and your moral support, this forum is very active and responsive, unlike HP...

Re: HP-9G (and HP-30S) unit conversions

*Message #10 Posted by **Karl Schneider** on 18 Feb 2006, 2:31 p.m.,*
in response to message #1 by Herman

Herman (if you're still monitoring the thread) --

I poked around an HP-30S, which probably uses similar firmware and computational methods (which do not utilize binary-coded decimal representations, to my understanding).

The pound-kilogram conversions on the 30S seems OK. However, I found the same problems for the yard-meter conversions.

It seems that the root of the problem -- strangely enough -- is that one "yard" on these calculators is not exactly three feet!

The conversions between inches or feet to meters, centimeters, and millimeters all followed the internationally-accepted definitions. However, conversions betwen yards and anything else weren't quite accurate.

One more thing: The HP-30S does not distinguish between the international foot (0.3048 meters) and the survey foot (0.304800609601 meters). Thus, the conversions between acres (one acre is 43560 square survey feet) and any metric unit of area is incorrect. If the HP-9G/9S also has area conversions, that same problem is probably there.

If you want a calculator with an excellent unit library and conversion utility, the HP-28C or HP-28S can be bought on eBay for well under US$100.

Regards,

-- KS

Edited: 19 Feb 2006, 1:36 p.m.

Re: HP-9G (and HP-30S) unit conversions

*Message #11 Posted by **Herman** on 20 Feb 2006, 10:58 a.m.,*
in response to message #10 by Karl Schneider

Yes, I was checking back.

Oh, I'll check my 30S too for the pound/ounces discrepancy of the 9g. The 30S indeed uses binary internal calculations, not BCD. Someone once had a table with test results for a load of calculators, calculating something like arcsin(arccos(arctan(tan(cos(sin(9))))))= 9?. Results usually looked like 9.00023455 or 8.9987654. But the 30S was the first one to return 9 exactly thanks to its internal accuracy (and rounding off for the final result).

The HP-9G has indeed more than 25 squares inches short on a square acre because it uses regular feet for its 'acre'.

And thanks for the tip Karl.

Edited: 20 Feb 2006, 11:48 a.m.

use of calculators in the classroom

*Message #1 Posted by **Don Shepherd** on 16 Feb 2006, 9:06 p.m.*

OK, it is not my intention here to start a flame war, but this is a subject that needs some rational discussion: the place of calculators in the classroom. This is a subject that is dear to my heart, because I spend 7-8 hours a day in a middle school math classroom that includes TI-78 calculators. There are 30 of them, and they hang in little pockets on a blanket attached to one wall, each one numbered (and every student in every class has his/her assigned calculator number).

I am the student teacher, which means I assist the real teacher and teach some classes each day. This is 6th grade, and one group of kids is learning how to add and subtract fractions while the other group is moving into data analysis and probability. Fractions are probably the most complex math topic that a 6th grader faces. Just a simple thing like adding two fractions requires a lot of skills that many 6th graders (in fact, many adults) do not normally have: determining the common denominator; converting mixed numbers to improper fractions and vice versa; creating equivalent fractions with the new denominator; adding the numerators; and simplifying the result (if necessary, and determining when it is necessary). Think about how overwhelming that process can be for a 6th grader who does not have the logical, analytical, and organizational skills that you and I have. So how do we teach it? By going over the basics again and again until most of the kids have it, and then moving on. Do we use calculators in this process? No, not for fraction addition, because we know how important it is for the kids to know how to do it without the calculator.

Let me tell you how we do use the calculator. On a recent test, we said that the national debt of the US is $7,030,125,000,000 and the median income is $14,900, so if each family earned the median income, how many families would it take to eradicate the national debt? So we let kids use the calculators to divide the 7 trillion by 14 thousand, because once a kid has mastered long division (and almost all of these kids have) there is no reason for them not to be able to use technology for problems like these. When they leave school they will enter a world full of technology and they had better be able to use it if they are to compete in the marketplace. And we let kids use computers in the classroom (when it is educative) for the same reason.

OK, I know that many of you guys (and gals) learned math without the benefits of technology. Heck, so did I. There were no calculators back when I was in middle school (then called junior high school) in 1961. And we all learned it OK (or at least most of us did). But if we don't expose kids to the current technology, we are doing them a disservice.

Please understand what I'm saying. A kid has to demonstrate that they can add, subtract, multiply, and divide using pencil and paper before they can use the technology. But once they have that knowledge, let them use technology for the purpose for which it is intended. Face it, guys, no one calculates square roots manually anymore. I learned how to do it in the 60's, but I couldn't do it today. But I know where the square root key is on my calculator.

OK, let's get a discussion going…..

Don Shepherd

Re: use of calculators in the classroom

*Message #2 Posted by **Garth Wilson** on 16 Feb 2006, 10:27 p.m.,*

in response to message #1 by Don Shepherd

> But if we don't expose kids to the current technology, we are doing them a disservice.

That reminds me of a political cartoon that was in our newspaper years ago. It shows a business owner following Clinton around his office with a clipboard trying to get his attention and saying, "We can teach new employees to use the computer in two weeks; but we **can't** teach them to read!"

Bob Pease, highly regarded electronics industry guru, talks about these new guys fresh out of the box that were taught to use the circuit simulation software in school but can make a small error inputting the data and get ridiculous results and not realize it because they couldn't get an idea from mental calculations of what to expect generally. There can also be erroneous outputs resulting from faulty circuit component models in the software. These new graduates generally have no workbench skills to actually try something. Relying on the computer can prove very expensive when errors are not caught early in a design cycle. The problem is when the computer is used as a substitute for thinking instead of as merely a tool.

Calculators in the classrooms are mostly a substitute for thinking. Even after the student has shown they know how to multiply and divide, they still need more practice to make sure the skills will stick. When they don't get that practice, high-school graduate clerks are surprised that I can tell them how much change I'm supposed to get at the cash register before the display even arrives at the total and adds the sales tax. They can't do anything without the computer. Most school math problems are artificial anyway, meaning the answers are usually round numbers that should be calculable in one's head.

Our older son was supposed to get a TI-83 graphing calculator for a high school math class. I held off because I didn't think it was really necessary or even appropriate. He did fine without it. He said what most students used the calculator for was playing video games in class, looking busy.

As for finding a square root-- You should have been able to come up with a way to do it even if you can't remember the neat way taught in school. Being resourceful is part of understanding the math. Take a guess. Divide the original number by the guess. The real square root will be somewhere between the result and the guess, right? Average the two and do it again, until you're satisfied that you're close enough. There are several ways to find a square root. There is one that doesn't even require any multiplying or dividing, although it's not fast at all.

I think one should combine the best of both worlds so to say. In my opinion kids should leave school with enough skills to do even more tedious calculations without a calculator. It simply gives them more feeling for numbers and orders of magnitude, which can be quite convenient on many occasions and in many professional activities, whether it's in science, business, or just during a visit to the local supermarket where the cashier makes a typo and charges you USD 35.50 for a few packs of milk, some bread and a bottle of coke. On the other hand, learning tricks and how to apply them is simply not enough. As a kid I found arithmetics specifically boring at school, which sounds quite strange for a kid that would grow up to have a PhD in physics

and astronomy. The major reason was that, during the lessons, there was no (or hardly no) room for understanding about what is behind all those rules for calculations and tricky manipulations on numbers. Everything came down to practicing the same routine over and over again without any immediate purpose and without knowing what one is actually doing (at least not in detail). All this does not mean that I was not interested in the subject. Some things really puzzled me. For instance that dividing 1 by a number smaller than 1 produced a number larger than 1. If you apply your box of tricks you learned in the lessons about fractions to a specific problem of this kind you just get the result and that's it. But it may look strange to a kid and so I remember being busy with the subject to find some propper explanation and insight myself. It is from this period that computing devices have some appeal to me. One day when I was 6 or maybe 7 years old, my dad brought an HP 45 home from his work and I was fascinated by that marvellous, expensive machine that could do all those dull calculations in an instant (back in 1974 I had never seen a calculator before). Later the real math classes were indeed a revelation on many topics and I am hooked on mathematics and related stuff ever since. It is here however that the calculators could enter the picture. Especially the programmables not only provide a tool to learn kids, almost while playing with it, to think in a structured logical way, but they can also be incorporated in a process of understanding about what arithmetics is actually about. For instance, it is a perfect tool to demonstrate trends in a certain type of calculation upon variation of input parameters. For the lower grades, simple (programmable) calculators will do fine. No need for graphic calculators in this respect (the possibility of gaming in the classroom being an extra con). An extra benefit here is that kids also get at least some idea of what happens in all those computer systems that they encounter every day and which they often use themselves for games or surfing the www. However, dull as it may be, there must also be time for calculations with paper and pencil or even without.

in response to message #1 by Don Shepherd

Sir, it is my opinion that in the sixth (to twelfth) grade classroom, there really is NO ROOM for a calculator.

During those years, a child is supposed to learn mathematical principles and reasoning. How much blunter is his intellect going to be if a black (okay, sometimes gaily colored) plastic and metal box does ALL his drudgery for him? It is in fact in that drudgery that the child learns how to calculate, use mathematical tools as logarithms, exponents, trigonometric functions.

In a college chemistry laboratory once, a student announced that she was going to leave and skip the class, as she had left her calculator and was then going to be unable to perform the requisite calculations to prepare for the experiment, unless she can borrow a departmental calculator.

The technician said for her to wait a moment and disappeared into the stockroom. She waited anxiously and he reappeared after several minutes and handed her some log tables and trig tables. Her eyes popped out and she angrily and incredulously shouted, "I ask for a calculator and you give me sheets of paper??!"

Well, the tech and I shared a huge horselaugh, and the young lady, disgusted, threw the papers down on the desk and stomped out.

Okay, now, after the yuks and the years, I feel that her secondary or even primary schooling let her down. She was clearly a child of the silicon revolution (probably, to drown her sorrows, she probably headed home to play a few rounds of video games on her PC or game machine or whatever) and she could not use age old, time honored, and STILL HIGHLY USEFUL methods to execute simple calculations.

If I could, I'd lobby hard to keep calculators, including our beloved vintage or even new HP RPN beauties, out of the secondary and especially, the primary level classroom.

Now if only I can find my reville bugle...

Thanks for all the thoughtful responses, folks. This forum is great for enabling intelligent discussions of sometimes complex and controversial issues. That, in my opinion, is one of the best features of the Internet. We are all learners.

The issue of using technology in the classroom is very complex. On the one hand, we have to prepare our kids for the world beyond school, and computers and calculators are part of that world. So we have to see if we can use these devices in ways that enhance the learning process. On the other hand, I recognize how these devices may be misused and end up hurting the learning process, and the kids.

I'll be honest with you: teaching 6th graders is tough! We keep spending more millions and billions of dollars on education, and the test results just keep going down. Our schools of education teach us the obvious: that the 6th grader does not have the level of logical ability, maturity, and organizational skills that we adults have. We expect that they come to school ready and able to learn, and that is just not the case in many instances, for many more reasons than I can cite here. And we have many teachers who are burned out and who do much more harm than good. I'm a new teacher, and I am excited about helping these kids learn, but I know it's not going to be easy, and I won't reach every kid. But I do it with the knowledge that I will help most of the kids.

Some uses of technology in the classroom are obviously good, such as using a tablet PC connected to a projector and writing math problems on the tablet screen instead of the whiteboard (which, by the way, leaves your hands dirty all day from the markers and erasers!). And kids love to come forward and write their own problems on the screen. Or keeping your gradebook electronically instead of the old paper book (I am currently convincing my cooperating teacher to do this; it's hard for her to give up the paper book after using it for 26 years).

No matter what we do in the classroom, the bottom line is the same: is it good for the kids? That should always be the principle criteria for what we do.

Ok, I'll be the grinch here. Even Bob Pease, the industry guru I mentioned above, still advocates the overhead projector over PowerPoint, and has solid proof of its greater effectiveness. It definitely puts up a bigger image than a TV screen, it's much cheaper, instant-on, and doens't complain that you don't have the latest software installed. You can put another clear slide over a prepared one and scribble

additional diagrams by hand while talking, etc.. Old-fashioned is not bad.

My wife is a 2nd-grade teacher, and I hear all the time about the problems they've had with electronic grading. Several times over the years, the server or a hard disc fault wiped out all the grades and they had to be re-entered from the paper records (which fortunately, the teachers kept). The GradeQuick software has had a very frustrating, never-ending stream of bugs. Often a parent comes in and asks about a bad grade on the report card, and she looks it up in the computer and finds the one on the report card is not what's in the computer that reported it to the office. In fact, once in the junior high of the same school, our younger son was sent someone else's grades, and another time the grades on his report card didn't seem to go to anyone in the class. Three times in his two years in junior high, they had to re-send report cards because of computer errors.

I'm not against technology. There's no excuse for those bugs. What I'm against is the idea that the new way is always better. Some misapplications of technology need to go the way of the talking car of the early 1980's that drove everyone nuts. "Your door is ajar... Your door is ajar... Your door is.."

If we're really going to teach better thinking and reasoning skills in the classroom with calculators, we should teach programming, not operating an appliance. The latter can be picked up very quickly and does not require classroom time.

Re: use of calculators in the classroom

*Message #8 Posted by **Don Shepherd** on 18 Feb 2006, 10:00 a.m.,*
in response to message #7 by Garth Wilson

Hi Garth. We may agree to disagree. I am not necessarily for all the new technology either. I despise cell phones, but I recognize their potential value in certain situations (NOT in the grocery, "honey, should we get Van Kamps or Del Monte?").

I would love to teach programming to middle school kids who are interested, and I hope I get that opportunity.

When I taught computer science at the local community college, I kept grades via the standard paper grade book. But I only had one or two classes of 20 students each, and it was manageable. Now I have 5 classes of 30 kids, and keeping track of 150 kids with maybe two dozen assignment grades each 6-week period is an enormous administrative task. Electronic grade books don't completely eliminate the task, but they certainly reduce the time required to figure grades, and I am finding that being a teacher requires an enormous amount of time, and anything I can do to give me more time to plan exciting lessons for the kids is worth it. I wasn't a big fan of the "keychain" disk drives either, but now I am (for making quick backups).

Technology. It's a two-edged sword, but how many of us HP fanatics would be willing to go back to this?

*Message #9 Posted by **Ed Look** on 18 Feb 2006, 12:54 p.m.,*
in response to message #8 by Don Shepherd

First, your last question: I might not mind! In fact, if I remember, I'm going to ask an even older fella how to use this slide rule I picked up just for fun.

Second, turn off your cell phone: van de Kamps's battered fish is best and Del Monte anything is pretty good; their old "catsup" might even be better than Heinz' !!

(Okay, no ketchup throwing, hear?)

Slide rules and Addiators

*Message #10 Posted by **Palmer O.Hanson, Jr.** on 18 Feb 2006, 10:26 p.m.,*
in response to message #9 by Ed Look

The important things to remember when people talk about going back to old technology are that

Slide rules can't add and subtract.

Addiators, Addometers and related pocket sized devices can't multiply and divide.

The result is that users couldn't do chain calculations with portable devices using combinations of addition, subtraction, multiplication and division without switching intermediate results back and forth between machines. When the first pocket-sized four-bangers came out some slide rule manufacturers came out with a device which had a slide rule on one side and an addiator on the other. The users still had to switch intermediate results back and forth.

My recollection is that we had desktop devices such as the Fridens wich would do mixed chain calculations. Personally, by the late 1960's I had pretty much switched most of my engineering work to a company-operated telephone network which supported an extended BASIC which offered double precision and matrix manipulation.

I suspect that most of the people who long for the "good old days" when we used slide rules never really used the damn things to do engineering.

Wow, I had forgotten about those. I think I only saw one once. I did use slide rules however until 1981 when I needed programmability, since calculators weren't really any faster, and the slide rule gave a better mental idea of number relations.

I should have mentioned that my wife says grading takes more of her time now with the computers than she took when it was all paper. The only thing about the paper she does not miss is having to press through four layers of NCR paper with a ball-point pen on the report cards. If you know of some grading software that's better than GradeQuick, let me know so I can suggest it to the head administrator. If it runs under Linux instead of Windows, so much the better, since that'll help them get away from Windows and save a ton of money and some headaches too. I used to be on the board of this school.

Grade Book software

*Message #12 Posted by **Don Shepherd** on 19 Feb 2006, 9:21 a.m.,*
in response to message #11 by Garth

Hi Garth. Yes, I still like those old manual "adding machines." To do a "carry," you moved the stylus up and over, advancing the next higher power of 10 by 1. It's interesting becoming a teacher late in life. When I learned subtraction in the 1950's, we "borrowed" one from the next column. Now, we "regroup" since borrowing implies paying back, which we don't do! It turns out that the "new math" isn't really that new at all, it just uses different terms.

I'm certainly no expert on grade book software, but I found a neat teacher webpage (http://people.clarityconnect.com/webpages/terri/terri.html) that recommended GradeKeeper (http://www.gradekeeper.com/), and I used that for a couple of months and liked it. It is simple, cheap ($20), and produces the reports that I seemed to need.

Thanks for the feedback (and everyone else too), I know we all benefit from it.

As a teacher, I support the use of calculators in the classroom

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 18 Feb 2006, 8:18 p.m.,*
in response to message #1 by Don Shepherd

Hi, guys;

It is a known fact that tools where created and developed to enhance human's performance when executing a particular job. When a hammer is used the way it was designed for, related primary tasks are performed faster and more accurate. Depending on the task, there is no replacement for a hammer that could do the same job with the same efficiency.

Based on some personal experience of mine in the classroom, I have observed that in many cases, the need to better understand how to use a tool usually comes from a better understanding of the task that the toll is designed for. The opposed situation has also been observed: a better understanding of the task as a consequence of a better understanding of the tool. And it does not deppend on which tool we are talking about.

If a teacher wishes to improve the way the students learn a particular subject, or the whole context, it is possible to associate the bare instructions on how to use a calculator in order to improve the understanding of the subject itself, and later, how to use the calculator to solve problems related to the same subject. As the use of the calculator *as a tool* eases the learning process, the students go ahead and fetch knowledge by themselves, now that they know how to use a tool that allows them to improve the process of learning.

In both cases, learning the subject and solving related problems, the calculator *as a tool* may be used differently. Also in both cases, the students performance may greatly be enhanced in both ways, either in understanding the subject or when solving related problems. And both facts depend on how the teacher shows the use of calculators in the classroom.

These facts relate to my own experience as both a teacher and a student. Maybe others have a different view, or different experiences, that may conflict with the ones mentioned here.

Cheers.

Thanks Luiz. As always, your input is appreciated.

You are right, a calculator is only a tool, just like a computer or a slide rule. When a student has demonstrated that they can do the 4 arithmetic operations using paper and pencil, letting them use calculators to do that basic math enables us to move into the rest of the curriculum faster, and we have a LOT of curriculum to cover in a short time. And I am a firm believer in letting the students use graphing calculators at the appropriate point in algebra, so they can see and study the graph of y1=3x+4 and play around with variations of it. They learn so much better when they "do it themselves." They own the knowledge.

One thing we teach the kids in fractions, when finding the common denominators, is to list the multiples of each denominator and see where they match. So for 3/4 and 2/3, they list 4:4 8 12 16 and 3:3 6 9 12 15 and so on, and they see that 12 is the common denominator. After they master that, we show them another way to see multiples on their graphing calculator: y1=3x and y2=4x, then look at the table and see the first number shared by both y1 and y2. So now they have two ways to do it, and they have learned something.

Good thread!

My deceased brother used to say, "I'd give my right arm to be ambidextrous."

That's why we have teachers and supreme courts to sort out the balance. What I would have given in college for a tool to get me to the "bottom line" of the masses of data contained within the concepts of statistical analysis. I later returned to the question as a user and would vote without hesitation for use of any available tools as teaching aids.

The question would have been to me as a student, "How do I optimize this issue for my benefit?" The question to my teachers should have been, "How do I optimize this issue for the benefit of my students?"

Re: As a teacher, I support the use of calculators in the classroom

*Message #16 Posted by **Ed Look** on 20 Feb 2006, 12:46 a.m.,*
in response to message #15 by Ron

Ah, but the use of "advanced tools" in college math, engineering, or science classes is different from the same in elementary or secondary classrooms.

In these earlier levels, the student is supposed to be mastering the basics to a level of proficiency so as to be able to maximally benefit from the use of these "advanced tools" later in college... or some equivalent thereof.

From what I've seen of most students entering postsecondary levels, including, unfortunately these days, a few even on the graduate level, having difficulties arithmetically, which does affect their

more advanced mathematical skills. And from my own observations, it appears to be an over-reliance on the use of electronic aids, as calculators, PC software, etc.

I think it is academically safer to keep calculators, and even PCs to a great extent out of the elementary classroom, introducing them right before the secondary level or at the early secondary levels. Then, perhaps by the time they hit the universities and colleges, they are truly using the calculator to enhance their work rather than relying on it to make up for shortcomings.

Re: As a teacher, I support the use of calculators in the classroom

*Message #17 Posted by **Ron** on 20 Feb 2006, 2:52 a.m.,*
in response to message #16 by Ed Look

That's part of what I meant about balance, teachers and supreme court. I addressed the advanced student issue, not the basic 'rithmetic which would fall under learning and appreciating just what the tool is for and how you use it. Otherwise I agree that the elementary student needs to learn basic arithmetic, even some trig, geometry and algebra without a crutch. For the advanced student, there are very few uses more dramatic than watching programmable graphic calculators illustrate the dynamics of sensitivity curves or to show symbolically, even numerically as the case may be, a solution to a system of differential equations.

Frankly, I don't see an either/or issue here, it is a trick question for teachers and the answer is yes, no and sometimes maybe. In other words become ambidextrous without losing one arm.

Re: As a teacher, I support the use of calculators in the classroom

*Message #18 Posted by **Ed Look** on 20 Feb 2006, 2:02 p.m.,*
in response to message #17 by Ron

You bring up an interesting idea: let me say that perhaps the teacher ought to do it on a class-by-class basis. That is, some years/semesters the kids, as a group, may be more receptive to truly learning by using the calculator along with their textbook/workbook/rexogr... uh, Xeroxed sheets/blackboard taken notes. Other groups other times in the same grade may not have the intellectual or emotional maturity to realize that the calculator is to be an aid, an extension of one's brain, not the sum of it, especially those that can hold and execute downloaded... ugh... games.

Re: As a teacher, I support the use of calculators in the classroom

*Message #19 Posted by **Vassilis Prevelakis** on 20 Feb 2006, 5:59 a.m.,*
in response to message #14 by Don Shepherd

I agree, at school you learn the meaning of things, so the teacher needs to be sure that the students actually understand what is going on, rather than punch the buttons and copy the result.

For example consider the following problem (from Andy Tannenbaum's book on Networks): Assuming that a laser beam is used to send data across the street, how much should a laser beam be deflected (in degrees) to miss its target. The distance between the transmitter and the target is 100m and the diameter of the beam and the sensor is 10mm. Assume that *any* overlap between the beam and the sensor is adequate for the transmission.

The point of the exercise is to show that the angle is so small, so you have to be very carefull when aligning the equipment.

You should be able to get the ball park figure without a calculator. Then use the calculator to get a

better figure if this is desired.

But some students got an answer that was an order of magnitude wrong while others got strange numbers because of underflows in their calculations.

So a calculator is dangerous unless you really know what you are doing.

Another trend that I have observed is that students also use arbitrary precision calculators (e.g. Unix's bc) to make sure that their answer is correct again without really bothering to understand what is going on. Using bc for this problem may be OK, but if you wanted to do the calculation many times you have to consider the cost of the very high precision.

*Message #20 Posted by **Ed Look** on 20 Feb 2006, 2:09 p.m.,*
in response to message #19 by Vassilis Prevelakis

Yeah, ha ha!

Tell even an exceptionally advanced high school kid, like Ben Salinas used to be, or a college student to calculate the quantum mechanical wavelength of a pitched baseball and most likely they'll use a calculator, be it TI, Casio, HP, Sharp, or the 99-cent store brands, and they'll get an answer, which is, at least mathematically, correct, including the correct digits down to the ninth to twelfth place after the decimal point.

But it doesn't require the calculator to tell that it isn't a very useful result, as even a rough order of magnitude calculation will show that. In fact in such a (silly?) calculation, what is important is the the order of magnitude and its significance, which really can be and really ought to be done either in your head or on the back of an envelope, preferably the former.

in response to message #19 by Vassilis Prevelakis

In a physics class at school I've learned the following simplification which comes in handy here:

sin alpha ~= tan alpha ~= alpha (in radians), if alpha is sufficently small.

In our case: alpha ~= tan alpha = 0.01m / 100m = 10^{-4}.

No calculator or trig tables neccessary!

The class was held back in the mid seventies. Only very few of us had calculators back than (I was the proud owner of an SR-51A while my teacher only had an SR-50!).

Marcus

*Message #24 Posted by **Dave Shaffer** on 20 Feb 2006, 10:04 p.m.,*
in response to message #22 by Vieira, L. C. (Brazil)

Luiz,

I suspect you know this, but if not .....

The small angle approximations for sin and tan can be derived from the Taylor series approximation (now, perhaps, the question is where did THAT come from?) for sin, and the fact that tan = sin/cos and the approximation for cos, which is very close to 1 for small angles.

I have pointed this out in physics class to students with modest mathematical sophistication who had never heard of it. I then had them calculate sine of 1 degree and compare it with 1 degree converted to radians.

Re: As a teacher, I support the use of calculators in the classroom

*Message #25 Posted by **Vieira, L. C. (Brazil)** on 21 Feb 2006, 12:18 a.m.,*
in response to message #24 by Dave Shaffer

Hi, Dave;

Thank you for pointing this relation out. This is the one I remember, too. In fact, cos(0)=1, sen(0)=0, and if we apply limit to the tangent relation, we get to the close-to-zero relation.

What called my attention was the following sentence:

> Quote:

In our case: alpha ~= tan alpha = 0.01m / 100m = 10^{-4}

Is there a way to get this precision without a number-crunching tool? I was not aware of this figure, believe me, that's why I'm asking for guidance. If there is a way to find this 10^{-4} precision without some computing device, I would like to know how. I thought of going ahead with pencil and paper to compute the series terms, but I still would like to know if there ia another way. The teacher's side of my brain is now acking...

Cheers.

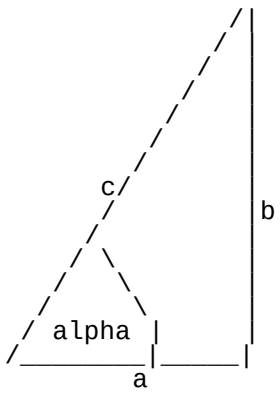
Luiz (Brazil)

Re: As a teacher, I support the use of calculators in the classroom

*Message #26 Posted by **Marcus von Cube, Germany** on 21 Feb 2006, 8:09 a.m.,*
in response to message #25 by Vieira, L. C. (Brazil)

Luiz,

all the trigonometric functions are defined in a rectangular triangle as the ratio of two sides:



sin alpha = b/c
cos alpha = a/c
tan alpha = b/a

This can be simplified if you make c the length 1 (any unit you like):

sin alpha = b
cos alpha = a
tan alpha = b/a

The latter makes it clear why tan = sin/cos.

Do you see, why $\sin^2+\cos^2 = 1$? (Think of good old Phytagoras!)

If you make alpha very small, a will be very close to c=1:

sin alpha = b
cos alpha ~= 1
tan alpha ~= b/1 = sin alpha

The angle (in radians) is nothing more than the length of the arc of a circle with

radius c=1. For very small angles, this arc is very near to the length of b:

sin alpha = b ~= alpha (length of arc)

The trigonometric functions are not just keys on a calculator or function names in some software!

Marcus

Re: As a teacher, I support the use of calculators in the classroom

*Message #27 Posted by **Vieira, L. C. (Brazil)** on 21 Feb 2006, 1:17 p.m.,*
in response to message #26 by Marcus von Cube, Germany

OK, Marcus; so far, so good.

Thank you for your explanation and for taking the time to draw the sketch showing the basic trigonometric and the relations between trigonometric functions. My approach to the students in the classroom when teaching trigonometrics is more 'graphics-based'. At least some of them tell me that this approach makes it easier to understand the subject.

http://www.logeng.com.br/images/rel_trigs_2.GIF

In the above drawing, the triangle relation d/radius = sin/cos is obtained by triangle proportionality. You see, both triangles (sin,cos,r=1) and (d,radius,side) share the same internal angles. By giving ‘d’ the name ‘tangent’ and knowing that ‘radius = r=1’, we have:

```
d/radius = d/1 = tan = sin/cos
```

and:

```
radius^side = cos^r=1 = alpha
```

The issue here is the magnitude of alpha when alpha ~= sin(alpha): 10^{-4}.

Re: As a teacher, I support the use of calculators in the classroom

*Message #28 Posted by **Vassilis Prevelakis** on 21 Feb 2006, 7:44 p.m.,*
in response to message #24 by Dave Shaffer

The easiest way to show that sin(x) = x for small values of x, is to use the Pade approximation:

From http://www.dattalo.com/technical/theory/sinewave.html we get:

http://www.series80.org/Misc/Pade.gif

(x is in **radians**)

You can easily check that this is a fairly good approximation with bc (standard Unix or Linux utility):

```
% bc -l
n1 = -325523.0/2283996.0
n2 = 34911/7613320
n3 = 479249/11511339840
d1 = 18381/761332
d2 = 1261/4567992
d3 = 2623/1644477120

define num(x) {
        return(1 + n1*x^2 + n2*x^4 + n3*x^6)
}
define den(x) {
        return(1 + d1*x^2 + d2*x^4 + d3*x^6)
}
define ss(x){
        print x * num(x)/den(x)
        print "\n"
        print s(x)
}

ss(1)
.84155226541146287688
.84147098480789650650
ss(0.5)
.47942618520237196517
.47942553860420300270
ss(0.3)
.29552022483199108139
.29552020666133957510 0
ss(0.1)
.09983341665515269688
.09983341664682815230 0
ss(0.0001)
.00009999999983333332
.00009999999983333330
```

Now observing the Pade approximation formula you can see that as x gets close to zero the powers of x (x^2, x^4, x^6) will get vanishingly small, hence the formula will end up being

sin(x) = x + epsilon

Hope this helps

**vp

PS to keep this relevant to the MoHPC here is the HP-97 version of the Pade approximation:

http://www.series80.org/Misc/Pade-HP97-lr.gif

*Message #29 Posted by **Gerson W. Barbosa** on 21 Feb 2006, 8:22 p.m.,*
in response to message #28 by Vassilis Prevelakis

What about the limit of the Taylor series for sin(x) when x tends to zero?

```
lim (x - x^3/3! + x^5/5! - x^7/7! + ...) = x
  x->0
```

Regards,

Gerson.

Re: As a teacher, I support the use of calculators in the classroom

*Message #30 Posted by **Vieira, Luiz C. (Brazil)** on 22 Feb 2006, 1:14 a.m.,*
in response to message #28 by Vassilis Prevelakis

Hi, Vassilis;

after seeing this

> Quote:
>
> ```
> ...
> ss(0.0001)
> .00009999999983333332
> .00009999999983333330
> ```

I see the 10^{-4} in both the argument and the (close to 10^{-4}) resulting value. Thanks!

I guess that there is no way to get to this point without some `number crunching` procedure, thought. And a computing device would be of great help, I think.

Cheers.

I think that the whole point is that you do **not** need `number crunching` capabilities.

Consider the problem, you have a right-angle triangle and you know the two sides on either side of the right angle, and want to find the hypotenuse (h). One

side is 100m and the other is 10mm (or 0.010 m).

Normally you'd use Pythagoras' theorem:

h^2 = a^2 + b^2

but a^2 = 10 000 while b^2 = 0.0001

Just looking at the number (h^2 = 10000.0001) tells us that there is no point in calculating the square root if all we want is 4 decimal place accuracy. So, **for the purposes of this problem** h = a + epsilon, but since epsilon is not within the desired accuracy we can ignore it, i.e. h = 100.0000

Same thing about the angle. We **know** its very very small (since we have calculated it as Marcus suggested earlier). This tells us that there is no point in calculating its sine, since we **know** it is equal to the angle.

Thus while you may need `number crunching` capabilities once (to demonstrate what is predicted by theory) you do not need such capabilities to solve this particular problem. No log tables, no trig tables, nothing, just the ability to move decimal points around.

You have to be careful of course, that the dropped digits are not needed later, but you have to be aware of that even if you use a calculator (which also has limited accuracy).

The beauty if this is that if you later use a computer or calculator to get the answer to a gazillion decimal places, knowing roughly what the answer should look like from the quick and dirty calculations will save you from showing up with a number that has 30 digit accuracy, but is wrong by an order of magnitude. :-)

**vp

Re: As a teacher, I support the use of calculators in the classroom

*Message #32 Posted by **Vieira, Luiz C. (Brazil)** on 23 Feb 2006, 12:22 a.m., in response to message #31 by Vassilis Prevelakis*

Hi, Vassilis;

thanks again.

I had to go to the whole thread once again and read all posts, top to botton, to try finding something I missed, and I think I finally saw a connection I didn't explicitly see at the first and second times I read them (I've already read all of the posts two times prior to go ahead...)

Somehow I did not connect Marcus von Cube solution to your specific laser beam proposal (Tannembaum's book) till now that you affirm this connection explicitly. It could save us all the many posts in this thread that were based just in my lack of attention. I appologize you all, Marcus von Cube at first, because I could not see that his answer was to the specific problem, instead I thought it was a general approach to the whole relation between the small-

value angle and its tangent, so I was trying to understand why this relation was valid only when alpha<=10^{-4}. My bad! In fact, about a year ago, I remember this particular relation was explored here by other contributors.

At least I could read some more about programming, math, trigonometry and related stuff. As for a lesson to my own, I'll be more carefull reading posts and trying to figure out a solution prior to turn it into a problem...

Forgive me, please, folks, and thanks.

Luiz (Brazil)

Laser-aiming problem

*Message #33 Posted by **Karl Schneider** on 21 Feb 2006, 2:05 a.m.,*
in response to message #19 by Vassilis Prevelakis

Vasillis posed a laser-aiming problem:

> Quote:
>
> Assuming that a laser beam is used to send data across the street, how much should a laser beam be deflected (in degrees) to miss its target. The distance between the transmitter and the target is 100m and the diameter of the beam and the sensor is 10mm. Assume that *any* overlap between the beam and the sensor is adequate for the transmission.
>
> The point of the exercise is to show that the angle is so small, so you have to be very carefull when aligning the equipment.
>
> ...
>
> But some students got an answer that was an order of magnitude wrong while others got strange numbers because of underflows in their calculations.

Of course, the answer Theta is,

```
Theta = tan-1 (10 mm / 100 m)
      = tan-1 (0.0001)
      = 0.00573 deg

      ~= (180/pi) * 0.0001 deg, since tan (x) ~= x for small x in radians
```

Now, here's my question: What calculators would cause underflow errors for this calculation?

-- KS

Re: Laser-aiming problem

> Quote:
>
> Now, here's my question: What calculators would cause underflow errors for this

> calculation?

Without taking the time for an analysis, I don't expect that any of them would. In embedded systems, I often work with 16-bit fixed-point/scaled-integer cells, which means less than 6 digits (although intermediate results can be 32 bits). In this number system, we divide a circle up into 65,536 (ie, 2^16) pieces. It works out very conveniently in both signed and unsigned arithmetic, as 350° for example is the same as -10°; and 5x90°, although it overflows the full circle, is still 90° as far as the actual angles go. The angle above is very close to one count, and my SIN function is accurate to the last bit in most cases. (Once in awhile it's high by one count, never more, and never low.) It takes the first four terms of the infinite series, except that I tweaked the coefficients slightly. The output of this one, scaled by $7FFF (since you can't have +$8000 in signed 16-bit numbers to represent +1), is 3, which although 8.5% low, is as close as the granulariy allows when you're so close to 0. Calculators, which have the advantage of floating-point and usually at least 10 digits, shouldn't have any problem. BTW, all 10 digits of my HP41cx on this one agree with my HP71 which has the greater precision.

I support the use of calculators in the classroom: add in

*Message #35 Posted by **Vieira, L. C. (Brazil)** on 20 Feb 2006, 1:08 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Hi, guys;

thanks to all of you who added your own opinions and thoughts to my own. It is always a good experience.

What I'd add is that I emphasize the need of focusing the understanding of the problem and the related solution, both with Calculator-Aided support. I remember when teaching Logarithms to my first-semester students (Telecommunication Technology). After showing them all properties and having them seen enough, I asked them to use their calculators and see how calculations could be performed faster. I saw some students teaching others how to use their calculators, others comparing results and some groups asking for extra activities. They were all using only the keys/functions necessary to compute what was asked, I do not remember seeing students 'fooling around' and testing unnecessary keys in that particular class. Because they saw how to use the 'tool' accordingly, in order to accomplish the task, the task itself was the issue, not the 'tool' (calculator). Later on, I was showing them the polynomial series equivalent to trigonometric functions, and I told them that we could compare the values obtained with the series to the ones obtained with the internal functions in their calculators. Once again, a controlled 'brainstorm'...

Just to add these words.

Cheers.

Luiz (Brazil)

Re: I support the use of calculators in the classroom: add in

*Message #36 Posted by **Ed Look** on 20 Feb 2006, 2:13 p.m.,*
in response to message #35 by Vieira, L. C. (Brazil)

In previous eons, the teacher would try to pique our interest by saying it was how we hear volumes and how it related to the big, round volume knob on our stereo receivers. Some of the students didn't hear or understand him because they were listening to their radios (surreptitiously via earphone) and the others were too busy admiring their HP RPN spice or classic powerhouse. Of course this last group

figured it out or did hear a little something! (Perhaps as evidenced by all of you here! ;))

Two simple assignments

*Message #37 Posted by **Marcus von Cube, Germany** on 21 Feb 2006, 8:43 a.m.,*
in response to message #1 by Don Shepherd

Here are two simple assignments which shouldn't require a calculator. All I want as a result are rough estimates. And please don't answer in ounces or pounds, otherwise I'll be completely lost ;-)

1.) What is the weight of thousand steel balls, 1 millimeter in diameter each?

2.) What is the weight of a single ball of cork with a diameter of 2 meters?

Try to guess first and than think a litte further...

Marcus

Edited: 21 Feb 2006, 8:44 a.m.

Re: Two simple assignments

*Message #38 Posted by **bill platt** on 21 Feb 2006, 8:57 a.m.,*
in response to message #37 by Marcus von Cube, Germany

1.)

1000 * 1^3 mm = 1000/1000 grams water * 7.8 = 7.8g. That is assuming a "cube" equal to the diameter. But V = 4/3 r^3 pi. So come closer: 0.5^3 = 0.125 . times pi = 0.4 . times 4/3 =~ 1.6/3.

So, about 4g.

2.)

1 meter = radius, so volume = 1.3333*Pi ~= 4.1 m^3. Density of cork. Hmmmm. I guess 5 lb/ft^3. (that's about 0.08 specific gravity.

4.1 m^3 = 4 .1 metric tonne of water. So, cork = 8% of that, or about 0.32 metric tonne.

No calculator.

Re: Two simple assignments

*Message #39 Posted by **Marcus von Cube, Germany** on 21 Feb 2006, 9:31 a.m.,*
in response to message #38 by bill platt

Hi Bill,

very quick answer.

1.) is perfectly correct. Just to outline a slightly simpler to understand approach:

- Put 10 balls in a row, you'll get a centimeter.
- Put 10 rows together, so you get a square of 1 cm^2
- 10 of these will fit exactly in a cube of 1 cm^3

The specific weight of steel is somewhere between 7 and 8 grams/cm . Since about half of the cube is empty space between the balls, the weight must be somewhere between 3 and 4 grams.

2.) Your estimate for the specific weight of cork is off, its about one fith of that of water. My rough estimate is as follows:

- V = 4/3*pi*r^3 ~= 4*r^3 = 4m^3.
- Weight ~= 0.2t/m^3 * 4m^3 = 800kg.

Most people I've asked tend to think of a few kilos for question (1) because "thousand" sounds like "so much". Likewise many people can't believe that "light" cork can weigh almost a ton if you just get enough of it!

Marcus

Another funny question: What is the linear speed of the moon, circling earth? I tried to calculate it in the top of my head. It kept me busy on a boring road trip.

Re: Two simple assignments

*Message #40 Posted by **Valentin Albillo** on 21 Feb 2006, 10:02 a.m.,*
in response to message #39 by Marcus von Cube, Germany

Marcus posted:

"Another funny question: What is the linear speed of the moon, circling earth?"

About one kilometer per second.

The linear speed equals the distance travelled divided by the time it takes to do it.

The distance, roughly assuming that the moon's orbit is exactly circular, would be 2*Pi*DistanceToTheMoon, which, assuming the distance to the moon is some 400,000 kilometers, would be 2*Pi*400,000 = 6 * 400,000 = 2,400,000 kilometers.

The time is more or less a month, i.e., 30 days, and a day has 24 times 60 times 60 seconds, i.e: 24 x 60 x 60 seconds, which slightly less than 25 x 60 x 60 = 5 x 5 * 60 x 60 = (5 x 60) x (5 x 60) = 300 x 300 = 90,000 seconds, so a month has 30 x 90,000 seconds = 2,700,000 seconds.

So the speed is 2.4 million kilometers / 2.7 million seconds = 2.4/2.7, which equals one kilometer per second, more or less.

Best regards from V.

Re: Two simple assignments

*Message #41 Posted by **Marcus von Cube, Germany** on 21 Feb 2006, 1:58 p.m.,*
in response to message #40 by Valentin Albillo

Valentin,

Your approximation is quite good. If we assume a circular orbit with r=4E5 km, the result given by a calculator is 1.04 km/s.

In such calculations it's totally OK to assume that a day has 25 hours or that the value of Pi is 3.

The result will be of the right magnitude. The many digits of a calculator make the result more exact but does it really affect the idea you get, if the moon runs at exactly 1.04 km/s or slightly more or less? It's not millions of kms per hour and still faster than walking...

Will any of the teachers here use these questions in class?

Marcus

Re: Two simple assignments

*Message #42 Posted by **Dave Shaffer** on 21 Feb 2006, 2:12 p.m.,*
in response to message #41 by Marcus von Cube, Germany

Here's the next thing you should worry about for the moon:

How far does it FALL in one second? You may also be amazed at how small this value is. Remember - as deduced above, it goes forward about 1000 meters every second.

(Remember, an orbiting body is basically "falling" around its parent body at just the right rate. It was this rate of fall that convinced Newton that he understood gravity, when he compared it to how fast bodies fell at the surface of the Earth.)

Re: Two simple assignments

*Message #43 Posted by **Garth Wilson** on 21 Feb 2006, 3:07 p.m.,*
in response to message #40 by Valentin Albillo

Don't forget the earth orbits the moon too; ie, the center of mass of the two is not the center of the earth, but nearly ten times as far from the center of the earth as its surface is. If the earth's mass is approximately six times that of the moon, the resulting radius of the moon's orbit will be, very roughly, 340,000km, not 400,000, and the rest is the earth's orbit around the same center of mass.

Re: Two simple assignments

*Message #44 Posted by **bill platt** on 21 Feb 2006, 3:09 p.m.,*
in response to message #43 by Garth Wilson

Or to simplify, "it is all relative motion" :-)

Re: Two simple assignments

*Message #45 Posted by **Valentin Albillo** on 21 Feb 2006, 6:26 p.m.,*
in response to message #43 by Garth Wilson

Hi, Garth:

"Don't forget the earth orbits the moon too;"

> Nope, the Earth doesn't "orbit the moon", it orbits around the Earth-Moon system's mass center.

"the center of mass of the two is not the center of the earth, but nearly ten times as far from the center of the earth as its surface is."

> Nope, the Earth-Moon system's mass center is only 4,700 km from the Earth's center,

so it is 1,700 km *below* its surface, still *inside* the Earth's body.

"If the earth's mass is approximately six times that of the moon [...]"

Nope, the Earth mass is approximately 81 times that of the Moon.

Nice try but you need to sort out your astronomical data a bit :-)

Best regards from V.

> Nope, the Earth doesn't "orbit the moon", it orbits around the Earth-Moon system's mass center.

That's what I meant; that the earth is not unaffected by the moon's orbit. The two are a system, both orbiting the center of mass of the two.

> Quote:
>
> Nope, the Earth mass is approximately 81 times that of the Moon.

Ok, you caught me. If my memory weren't so good, I would have looked it up. I was specifically taught in grade school that the moon's mass was about 1/6 that of the earth. The fact that the force of gravity on the moon's surface is around 1/6 G despite the smaller diameter by itself should have alerted me to the teacher's mistake. So too should the fact that its diameter is about a quarter of the earth's, which would mean about 1/64 the mass if the average density were the same. I should have known, judging from all the other things I was taught that I knew even at the time were wrong (like that a light bulb's filament got so hot because of all the light coming out of it, a situation where the teacher took my protests to be disrespect for her, the "facts", and authority in general). I regret wasting people's time with errors. Thankyou for the correction.

Re: Non-graphic calculator

*Message #6 Posted by **Walter B** on 16 Feb 2006, 3:53 p.m.,*
in response to message #5 by bill platt

Oh, come on! We're talking about Grade 10, so let him learn this matter first. I agree there is more math (and more fun) to come where a calc is no use, but this will be constructed later on the fundaments layed now.

Re: Non-graphic calculator

*Message #7 Posted by **bill platt** on 16 Feb 2006, 5:15 p.m.,*
in response to message #6 by Walter B

Maybe I am totally lost, be seriously, what on earth would you need a calculator for in a maths class? Really.

It is not like I am ancient or anything. I graduated from University in 1991.

Let's see---algebra, no calculator required. Yo uare unravelling spgetti and shuffling numbers. A bit of simple arithmetic, that's all. Mostly symbolic manipulation. Calculator does not help. Unless one is *allowed* to do some sort of "brute force" estimation instead of rearranging the equations....

Analytical geometry. Oh, I see, let's plot points. I suppose you could use a calculator to make all the points. But isn't it better for the kid to get some arithmetic practice while he's at it?

Calculus. Here I can see absolutely no reason for a calculator. And from following the c.s.hp48 place for a couple of years, I can see that making the CAS stuff useful for learning is spotty at best, and perhaps more dangerous than useful.

So, again, what does he need a number cruncher for in maths?

Re: Non-graphic calculator

*Message #8 Posted by **Joe Edwards** on 16 Feb 2006, 6:21 p.m.,*
in response to message #7 by bill platt

I totally disagree. Being able to quickly see what a function looks like (and then remember it for the future) is very useful in something like an algebra class. Also, using a calc (I mean a symbolic calc) to walk thru steps when working with symbolic math is very useful.

Geometry - all you need is a straight-edge and a divider (compass) and you are set! :) Once again, though, being able to bring up pics of various objects and the formulas that go with them can be quite a teaching TOOL, not to be confused with a crutch.

Calc...hmmm...my instructor never used one in our class, but again, they can be used to walk thru a problem if you are alone and don't have anyone to help you out.

I think we need to clarify WHAT the calculator will be used for in the math class...and which class, before we spout off (for or against) any more opinions.

Re: Non-graphic calculator

*Message #10 Posted by **Ron Ross** on 16 Feb 2006, 9:56 a.m.,*
in response to message #1 by Coby

In the non-graphing catagory, the selection is more limited in many ways than the graphics line.

There are actually 4 entry methods for pocket calcualtors:

Algebraic-no precidence, used by business/finance calculators such as the Hp10B, Hp 17Bii, Ti's BA-ii and Sharps EL 713??? (I don't know ALL the pocket calculators off the top of my head). I wounldn't suggest any of them, unless you are considering a business major. They all are great financial calculators though, but only the Ti has built in trig.

Algebraic - AOS, older algebraic entry with post fix trig functions. Harder to find than the more modern Algabraic, but still offered on some Sharp scientifics and amazingly the Hp33s (this is a selectable OS calculator as it is also RPN, see below). I actually like this algebraic system best.

Algebraic - EOS (Equation entry OS, also called VPAM: Visually Perfect Algebra Method?? by Casio, DAL by Sharp). This is now used by most pocket calculators and nearly ALL graphics calculators. You key in equations exactly as you see them in the text book. Nearly all of todays calculators on the shelf are of this type. This includes Hp's lower end Hp9s and Hp30s as well as all Ti's, Casio's and high end Sharp's (as I stated, the very cheapest Sharp will still be an AOS probably).

RPN - Reverse Polish Notations, clearly the favorite on this board. Only the Hp33s offers this. Also the Hp33s is the only real pocket programmable on the market. That is why it is $50 and everything else is $10-20. If you are a serious engineering/physics/science type student, this is the calculator to buy.

However, if you just need to learn math, the calculator is merely a tool to help and for learning math ie trig, nearly any scientific will do for you.

The TI BAII Plus uses AOS or chain logic

*Message #11 Posted by **Gene** on 16 Feb 2006, 10:17 a.m.,*
in response to message #10 by Ron Ross

It has the option to use precedence or not.

telling my students to change it from "chain" mode (adding machine style logic) to "AOS" is the first thing they do.

Amazing that TI's $30 business calculator knows that 1+2x3 should really equal 7 as written, but none of the HP business calculators do.

Why does HP assume business users never learned "multiplication and division before addition and subraction"?

Gene

I've always wondered about this, too. Must have been some sort of study done---it goes all the way back to their 18c, yes?

Re: The TI BAII Plus uses AOS or chain logic

*Message #13 Posted by **Ron Ross** on 16 Feb 2006, 10:59 a.m.,*
in response to message #12 by bill platt

I suspect it may be a carry over from the early 70's era when electronic calculators became cheap enough to use in businesses. All early electronic calculators (esp desktops, aside from Hp) were offered w/o precidence. Hence to mimick this standard, the business pocket calculator lines were purposely crippled to mimick the older electronic calculators that had become the standard tool in this line of work. When Hp finally entered an AOS business calculator into the market, they followed the rest of the herd.

Only the BA-II offers the choice to abandon this business feature.

Thanks for the info on the Hp9s. I should have remembered that it is an AOS, but I don't have one (yet) to confirm and now that EOS is the supposed standard, I forget that some still offer the older AOS.

I do like the Hp33s for this feature as it allows it to mimick the older Hp20s very closely (aside from its looks). That way, both Hp32s and Hp20s users whose calculators eventually fail, still have a reasonable substitute available for replacement.

Re: The TI BAII Plus uses AOS or chain logic

*Message #14 Posted by **Joe Edwards** on 16 Feb 2006, 6:14 p.m.,*
in response to message #13 by Ron Ross

It would be nice if it mimiced the 22s instead of the 20s. Being able to edit equations would be nice on the 33s. So far all I can seem to do is delete the entire equation and start again.

Am I missing something?

in response to message #10 by Ron Ross

Hp9s is actually the older type, "AOS" as you call it. (Infix for mathematical operators , postfix for trig etc.

Re: Non-graphic calculator

*Message #16 Posted by **bill platt** on 16 Feb 2006, 10:34 a.m.,*
in response to message #10 by Ron Ross

Beware the often cited "enter it just like it is in the textbook" business.

Essentially *every* one of these systems has quirks which make it so that it does not work exaclty as you might think. Frequent errors occurr with differentiation of function between the minus and the change sign "+/-", "unary minus" issues, as in -5^3 does this equal a positive or a negative problem (this was a problem in the HP 32sii equation editor! but has been improved in the 33s)

There are numerous other quirks when going from sharp to casio to hp or even from one sharp to another etc.

RPN has only one *real* advantage: it is totally consistent and the logic is simple and fool-proof. That is why I like it.

But forgo the calculator in maths class :-)

Edited: 16 Feb 2006, 10:41 a.m.

Re: Non-graphic calculator

*Message #17 Posted by **Eamonn** on 16 Feb 2006, 1:42 p.m.,*
in response to message #16 by bill platt

Hi Bill,

-5^3 should return -125, regardless of whether it is treated as (-5)^3, or -(5^3). Now, -5^2 on the other hand could be treated as (-5)^2 which is 25, or -(5^2), which is -25.

Out of curiosity, I flipped my HP-33S over to ALG mode (a rare occurence) and entered -, 5, y^x, 2, Enter. I was pleasantly surprised to see that the upper line displays 0-5^2, with the result -25 on the lower line.

Next I entered 5, +/-, y^x, 2, Enter. Now the upper line displayed (-5)^2, with the result 25 in the lower line. I don't have any Casio or Sharp algebraics on which to try out the same test, but at least the ambiguity seems to be removed in the display line of the HP-33S.

Best Regards,

Eamonn.

Re: Non-graphic calculator

in response to message #17 by Eamonn

Oops, sorry about the cube thing. That was an oops. Glad you were a better reader than I was a proofreader.

Yes, the 33s ALG is pretty cool that way. I remember, when I 1st got my 32sii in the mid '90s, having a crazy problem getting some equation to work. IT was that unary minus bug that was causing all the trouble.

The real important improvement on the 33s is in the equation list. Try it there, too.

in response to message #22 by Coby

A well implemented equation solver is a useful tool, as are statistic functions, and matrices.

Re: Non-graphic calculator

*Message #24 Posted by **John Noble** on 17 Feb 2006, 12:14 a.m.,*
in response to message #1 by Coby

I hate to say this, but you are probably better off without a calculator at all until you have the basics nailed down.

I'm not an Olde Phart like some of the esteemed geezers around here (Class of '85), but I learned everything

(including trig) with pencil and paper plus whatever specialist stuff was needed like trig & log tables, compass & straightedge, etc. That learnin' more or less stuck with me and made me comfortable with numbers. I'm pretty sure a calculator would have been an obstacle to learning rather than a help.

To this day I try to get a first approximation in my head, to within an order of magnitude or better, *before* pulling out a pencil & paper, let alone a calculator. This practice has saved me a lot of grief over the years: if I already know what the answer should look like, I'm less likely to fall victim to, say, fat fingering a number on a calculator or computer keyboard.

Nevertheless, calculators, especially programmable machines, are wonderful labor savers when you have long chains of calculations or when you need high accuracy quickly.

Learning math has nothing to do with this sort of work. Stick to good old pencil & paper. If your math teacher requires you to have a calculator, see what you can do about getting another teacher.

Just my opinion, eh?

Re: Non-graphic calculator

See HP Series 80 Web Site and 1980s Vintage Computers. I think the owners of these web sites can also help you with the printer belts.

Card programmer

*Message #1 Posted by **Han** on 16 Feb 2006, 1:31 a.m.*

Does anyone here own one of those card programmers for the HP48? They were sold by Educalc, if I recall. Can you explain how they work, where you got the cards to be programmed, and if any of this is still available?

Re: Card programmer

*Message #2 Posted by **Raymond Del Tondo** on 16 Feb 2006, 2:56 a.m.,*
in response to message #1 by Han

Hi,

we had these EEPROM card programmers back then at W&W.
It consisted of a card dock/programmer with serial interface,
an HP-48 library for programming control,
and the EEPROM cards, of course;-)

You simply copied the library to the HP-48,
and then you could either copy HP-48 RAM contents
to an EEPROM card, or just copy one card to another.

Nice items!

However the cards cases were made like the other TDS
cards at that time, out of one piece of plastic,
with a metal plate on the back, and no contact protector slider.
Cheap design, you always had to store the card
in an extra non-static case when not in use.

I don't recall if these EEPROM programmers were ever sold in Germany,
maybe due to the price...

And no, I don't have any of these EEPROM programmers here.
However I have an EPROM programmer which is able to
burn EPROM cards (from EPSON) for the HP-48:-)
Unfortunately the suitable EPROM cards are hard to get these days...

Regards

Raymond

Re: Card programmer

*Message #3 Posted by **Han** on 16 Feb 2006, 10:25 p.m.,*
in response to message #2 by Raymond Del Tondo

How much would an EPROM card from Epson cost nowadays? It seems that the software for the HP48GX has become fairly stable in the sense that the programs are not being updated all that much (if at all). It would be nice to be able to do away with battery operated RAM cards and also not worry about having to redownload programs if something bad should happen (e.g. forgetting to write-protect the cards when testing low-level programs).

O.T. and a it long: Bad luck! Definitively, bad luck... (sob)

*Message #1 Posted by **Vieira, L. C. (Brazil)** on 16 Feb 2006, 1:16 a.m.*

Hi, all;

this is more a warnning than just a bad luck story.

I keep four of my computers running with two hard disks, one with system files and programs, the other with ordinary data. All of these four computers compose my home network, so if some data is actually priority data, I keep it in a CD/DVD and in more than one data HD (I had some CD ROM disks unable to be read, so...).

There is a fifth computer, the one I use to access internet, and it is the only exception to the rule: it has one single 6GB hard disk. Yeap, an old device, instead working. All I need to be saved after being downloaded is copied somewhere else in the other computers, but the main mail data (income and outgoing messages) plus some not priority data are kept in the same hard disk. In some circumstances, recently downloaded priority data is kept in this computer for no longer than a day, mainly when the other computers are turnned off at the moment the download happens.

Yesterday (feb. 14th), it took me a few hours to download the HP48G AUG (telephone line, 56Kbits tops...), and as it was late in the night, I simply turned the computer off and let the copy of the HP48G AUG file to be made today morning (feb, 15th). What a surprise seeing the scandisk plane cyan and yellow image after turning the computer on today morning... and automatically running surface scan!

When the surface scan was closed to the last 4% of the surface area, two bad-cluster indication arose and all of the last 15 areas made the surface scan to slow down considerably. Then I heard some different noises and felt worried about what was going on. When the first of the last four small squares was being scanned, the hard disk shriek loudly and then sounded as if something was being scratched. I turnned the computer off, waited for a few seconds and turnned it on again. The noise was then louder, and the harddisk was no longer being detected.

I removed it and tried another computer: same results. I tried some soft taps with the palm of the hand and with a small rubber hammer and did not get better results. Yeap, I know, it is neither scientific nor technical, just a desperate tryout... Yes, you can blame me. Preferably with a small rubber hammer...

Well, let's exhume the corpse and see if we find something. Believe me, I have neve seen something like that: one of the heads was simply unstick from its arm, and part of the surface of the corresponding disk had scratches all over. Total loss.

The bigger losses were definitely the e-mail contents, some kept since October 2004. Most of the other data, unfortunately not all, had a copy somewhere. And, of course, the HP48G AUG file, that took me some hours to download, and was not backed up.

I know that the head being unstick is a hard-to-happen misfortune, but if I had an additional data-only hard disk, I ´d not loose these files and info. After that, when preparing my new hard disks for this computer, I´ll take some time to periodically make a copy of the e-mail files and folders...

This did not happen to a friend of a friend of mine. This happened with me. And I hope it helps you, guys, to consider backing up data more frequently.

Cheers.

Luiz (Brazil)

in response to message #1 by Vieira, L. C. (Brazil)

Hi Luiz,

in Germany we say: Wer zuletzt lacht, hat ein Backup gemacht

(Who has the last laugh, has made a backup)! Last Weekend, I connected a casio docking station (Casio FA-7) to the RS-232 of my notebook. I boted windows an was about to start a terminal program when the computer switched off. And it refused to switch on! I often hope that things regenerate themselves when left alone, so I waited for the next day to try again. I usually make backups of the important things, but at night, I remembered many things I hadn't considered for important, but now seemed to be important for me. The next day, the computer still didn't switch on, and I opened it. By the smell I could locate one bad chip, and looked for the datasheet on the internet. It was some voltage converter for RS232, so I decided to ampute (remove) it. After that, the computer booted, but the display stayed black. It was the background light of the display not working. I used a lamp to see the contents of the display, and managed to copy the data to a USB-stick.

Apparently the casio docking station had generated a voltage peak and therefore destroyed my PC.

Well, bad luck, but now I have more spare time!

Have a nice day! Klaus

Re: O.T. and a it long: Bad luck! Definitively, bad luck... (sob)

*Message #8 Posted by **Eric Smith** on 16 Feb 2006, 12:26 p.m.,*
in response to message #1 by Vieira, L. C. (Brazil)

On all my computers other than my laptop, I use either RAID 1 (mirroring, 2x drives) or RAID 5 (distributed parity, 1 extra drive). This obviously costs more, but then I won't lose data from a single drive failure.

But even with RAID, it is STILL necessary to make backups, because RAI doesn't protect against user stupidity, and I've demonstrated that occasionally I can do very stupid things.

Eric

Re: O.T. and a it long: Bad luck! Definitively, bad luck... (sob)

*Message #9 Posted by **bill platt** on 16 Feb 2006, 12:40 p.m.,*
in response to message #1 by Vieira, L. C. (Brazil)

I mirror my hard drive onto my office hard drive--by physically carrying it in and slaving it every so often.

I used to mirror onto a second on-board hard drive that I kept plugged in, but then I had a power supply blow up in the computer, and it fried my secondary hard drive! I will buy another onboard mirror though; I just won't leave it powered up.

My office work files are backed up to tape, and also archived to CD.

I learned, from those early days on Timex Sinclair, Atari, Commodore, 8088 with 5" floppies, that memory is friable...

I really do not trust any "archiving" that is not refreshed (re-written) to new media every year or so.

But I plugged in my 486 the other day--hasn't been run in 3 years, made in 1994-5? and it still works! All the old files are there!

Interestingly, I had let my Sony digital8 video get pretty old before making analog backups--6 years for the oldest. They all read without any failures. I was getting worried, which is why I made my analog backups (you know--vhs may be low grade, but at least it merely goes snowy with age, rather than blank).

This will work if there is a defective IC that overheats and fails. However the treatment does appear to be a extreme because it will subject the drive *mechanism* to thermal shock when you power it on after you take it out of the freezer.

Many years ago I had a drive that would work a little bit 10-20 minutes and then go off-line. I found that if I raised the PCB to a 30 degree angle (so that the wires at one end would remain in place) and use a fan to blow cool air in the gap, it would allow the drive to continue working. I operated in that configuration for about 18 months at which point I replaced the drive (it did not fail again).

More recently I had the same problem with a Seagate SCSI drive and I managed to extract all data from it by operating it with an ice pack placed on its PCB (ziplock bag filled with ice cubes placed in another ziplock bag).

I then left the drive on my desk for a month or two and when I came back to do the paperwork to get it replaced under warrantee I found out that now the drive worked just fine [1].

**vp

[1] Seagate has a diagnostic CDROM that you boot from and it runs diagnostics on the disk drive. The drive passed the full diagnostic a couple of time. I then installed it inside a PC (so that it would operate on the same temperature conditions as when it failed in the first place) and let it run the diagnostics for a week. It still passed them all without any errors.

@#^%$#%^@$# I do not trust the drive because it failed me once and it does not have the decency to die on me so that I can have it replaced :-(

It would be a shame if something bad happened to the drive while it was sitting on the shelf. The world's a very dangerous place. :-)

Intermittent parts are a major headache. Especially when the repair depot can't find a problem and restocks it as a good replacement part.

HP-12C batteries...

*Message #1 Posted by **gr8patra** on 16 Feb 2006, 12:41 a.m.*

Hi there, I am in the process of buying an HP-12C just as a collecting item. I am a computer scientist/IT developer and I won't use it for anything. (Is this an impulsive purchase?) The seller claims that it takes only one battery. Is that true? I thought it takes three of them. He says that HP started making those with one battery after a while. I asked if he's selling a Platinum edition but he says it's a regular HP-12C. Any ideas on that? Thanks, Patra

Re: HP-12C batteries...

*Message #2 Posted by **Vieira, L. C. (Brazil)** on 16 Feb 2006, 1:21 a.m.,*
in response to message #1 by gr8patra

HI;

the information proceeds. Earlier regular HP12C worked with 3 x 1.5V, LR44-like button cells. Newer units work with a single 3V, flat button cell. Same as the one used with the Platinum series.

Cheers.

Luiz (Brazil)

RPN or RPL

*Message #1 Posted by **Joe Edwards** on 15 Feb 2006, 10:22 p.m.*

I realize most folks here are probably more comfortable with RPN versus RPL (am I wrong?).

RPN seems so simple and the programming style for the 41/42 models seems rather easy to use - not to mention the 32 models and the voyager models as well.

RPL seems so much more, well MORE powerful, but at the same time has a much larger learning curve. I assume (incorrectly?) that RPL can do much more (my programming skills are very much at the novice level) than RPN.

My question is this: what niche does the RPL programming language fit, especially nowadays with the 49g+. With so many more powerful handheld devices, is the RPL in the 49 series just a left-over concept that just works well to power the 49g?

Overall, I just don't see much of a use when compared to a simple RPN calculator. I assume I am not seeing the forest due to all the trees!

Anyone care to enlighten a simple "grasshopper"???

Joe

in response to message #1 by Joe Edwards

The french say that "better" is the enemy of "good".

This is my opinion of RPL. HP took a system that was easy to use/efficient and ruined it.

I agree fully with the statement that RPL is elegant. It is also more complete with fewer exceptions and strange rules (cf discussion on raising the stack which usually takes 1 to 2 pages at the end of every RPN calculator manual).

But is elegant better? In the case of RPN vs RPL my opinion is that it is not. Take a simple job where you want to carry out a bunch of calculations and keep an audit trail. On the HP-97 this is trivial, just switch the printer from MAN to NORM. On the HP-41 ditto. Try the same on the HP28 or later. You have to write a program to do this.

Consider programming. On the HP-41 you just switch to PRGM mode and press the same keystrokes that you would when solving the same problem manually. On the HP-28C or the HP48GX you have to deal with that horrible object editor.

But I won't bore you with any more arguments. I just do not like it.

BTW for a great discussion for and against RPL check the first issue of the HPX Exchange (Jan/Feb 1987

V1N1). Pages 5-9 Bill Wickes presents the then new HP28C, and pages 9-13 has an article called "The HP28C A wonder that wasn't" by Harry Beruccelli.

The scans for this magazine are available from Jake Schwartz's CDROM and may be available from TOS.

Is this the CDROM sold on this website? If not, where would I find Jake Schwartz's CD. I don't know what TOS is either.

You have confirmed how I feel about RPN. I have tried doing the same thing with a 41 and a 49g and it seems so much more complicated for someone as simple as myself. :)

I am still unsure of where RPL fits in these days, other than as an "OS" to run the 49g+/48gII. It really seems that HP would be better off with a 43s model versus trying to compete with TI. A 43s would be a wonderfully useful calculator. The new 49g+ seems to be aimed more at the educational market as opposed to the market(s) that the 48 series was - engineers, scientists, surveyors, etc.

TOS

in response to message #4 by Joe Edwards

TOS is a homepage about the 41C and contains copyrighted material. Therefore its link should not be mentioned in this forum. On the simulation pages of this museum there is a link to http://www.furlow.org/ and this will lead you to TOS

It contains copyrighted material that is there BY PERMISSION OF THE COPYRIGHT OWNERS. Yes, including HP. The gentleman who runs TOS is scrupulous about this.

If someone at HP asked Dave to disallow links to TOS from MoHPC, that's only because HP's left hand doesn't know what the right hand is doing (or has done), which is not too surprising given how big HP is.

About politeness

*Message #11 Posted by **Karl Schneider** on 16 Feb 2006, 11:57 p.m.,*
in response to message #10 by Joe Edwards

Joe, I'm getting a bit tired of the incereasingly-confrontational tenor characterizing some of your own recent posts. You have made many requests here recently for advice, guidance, information, and insights regarding HP calculators, but have rarely acknowledged those (including myself) who have taken considerable time and effort to respond. You have also dished out a fair amount of lecturing, scolding, and imperative statements, which is rather unseemly for someone who is a fairly new participant in the MoHPC Forum:

> Quote:

> We are interested in folks reasons for using the calcs, not bashing them due to their choice. Everyone has their own personal preferences. Let's leave them to enjoy those preferred machines.
>
> Quote:
>
> Why even ask if someone is trying to start a flame war? That question in itself is inflammatory. Just answer the guy's question and if he responds with a reasonable answer, or not at all, you have the answer to your question.
>
> Quote:
>
> How about you COME ON!!! I am trying to engage in conversation here, not play, screw you go google it. You realize it would be a great deal more polite to just answer a question versus playing games.

Frankly, Joe, it would have been much faster for you to do a search for "Jake Schwartz CD-ROM" (without quotes; include the hyphen) under Google, Yahoo, Altavista, etc., than for someone to track down the latest URL of Jake's site and paste it into a titled, clickable link for your convenience.

However, for the benefit of you and others who are interested, I have done exactly that. The search quickly led me to these locations on the first page of listings:

CD-ROM at Jake Schwartz' home page, updated 05 Oct 2005

CD-ROM at Jake Schwartz' home page, updated 10 Feb 2006

In closing, it takes a fair amount of effort to research, develop, edit, and proofread answers to the questions you and others present to us. It's not reasonable to expect a detailed, spoon-fed response to every query that is posed here. I'll add, though, that new enthusiasts for the fine HP calculators and other products of an earlier era are certainly welcome and needed -- I would surmise that the ones who care are mostly the ones who remember, which makes most of us over 40 years old...

Regards,

-- KS

Re: About politeness

*Message #12 Posted by **Joe Edwards** on 17 Feb 2006, 4:19 p.m.,*
in response to message #11 by Karl Schneider

Karl, 1. I have thanked folks for their insight. I am sorry you are upset that I didn't thank you personally. Therefore, Karl, thank you for all your help in the past regarding my questions.

2. It seems that I have misunderstood the concept of this forum. I was under the (mistaken) impression that this was a place where folks could ask for advice, etc. regarding the HP calculator topics. I guess this forum is more of a place for those who are already well-versed in HP calculator lore (and/or have lived through the actual HP age) to share ideas.

Since I fall into neither of these catagories, I will refrain from requesting information from those who visit this site since I have only been visiting the MoHPC forum since 2003.

3. Since my status here is "newbie" it seems I don't have the right to make my opinion known regarding other's confrontational comments. My apologies for speaking up and acting in the manner of a moderator.

4. Frankly Karl, while I did admit to a lack of knowledge regarding the TOS and the Schawart'z CD it wasn't my intention to ask someone to track down the info and post hyperlinks. I was merely engaging in conversation. It seems that I mistook the forum as a place to converse (see point above) with other like-minded individuals.

Your points are well taken.

Re: RPN or RPL

*Message #13 Posted by **Valentin Albillo** on 16 Feb 2006, 4:46 a.m.,*
in response to message #1 by Joe Edwards

Hi, Joe:

Though this isn't an answer to your exact question, let me quote a relevant post from 2001:

> *"And here's what I think about RPL versus RPN: All classic machines, such as the wonderful 15C, 41C and 42S, had a simple but powerful and elegant RPN keystroke programming language, with an efficient 4-level-plus-LAST-X stack, which was easy to understand and easy to visualize while programming. They also had some simple looping controls (decrement and increment), storage arithmetic and indirection, and a fairly useful, uncomplicated filesystem.*
>
> *Now, they've been 'replaced' by these new machines using RPL, which is kinda some "FORTH-with-dressing", which only transforms the intuitive and simple RPN programming paradigm into something so arcane and complicated that matter of fact, a lot of people desist from writing programs in that 'language' not to mention trying to understand them.*
>
> *You need several yellow-pages-sized 'advanced' manuals just to try and grasp the basics and fundamentals of their programming style, the thousands of whimsical functions and their complicated syntax and expected parameters, to the point where you can do almost nothing without such a manual or hefty guide always at hand.*
>
> *Tha sad truth is that the extremely simple, useful and elegant RPN paradigm has been 'improved' to utterly preposterous extremes. The typical RPL program is a nearly unfathomable mess where you actually need paper (lots) and a pen plus the advanced manuals, just to attempt to understand what it's going on. It's kinda some 'obfuscated C' contest, if you know what I mean.*
>
> *Not to mention its efficiency, or lack of it. Where you could do wonders in RPN on a 41C in just 224 bytes, you'll find yourself using more and more kilobytes for the simplest programs. So what ? After all, those RPL machines do have hundreds of Kbytes, even a Mb or two, so who cares anymore for elegant, efficient programming ?*
>
> *[...]*
>
> *To summarize, **RPL is RPN's "Peter's Principle" come true: It's RPN raised to its saddest level of incompetence**. And like it or not, there it will remain forever, no turning back."*

There's also this other post on the subject:

> *"Back then we were waiting for the dream HP calculator for everyone, kinda a super-HP42, i.e., full compatibility with the 41C and all its peripherals, full I/O, large screeen (>= 4 lines), menus, named variables plus registers, matrix operations, complex math, much better alpha capability, much faster, more RAM, the works !*
>
> *Should that have happened, we all would've been in paradise, and would still be there, 20 years later. RPN would've had a natural expansion, users would have had a natural grow path for their skills.*
>
> *What did HP release instead ? The HP-28S ... and RPL, thus creating a schism among loyal HP users that still persists. But we HP lovers were a very tiny minority among people using calculators at the time, what with us having to defend and proselitize RPN, and the *last* thing we needed was a schism among us, much less something that literally required to throw all our carefully developed programming skills and start anew, back to square one. RPN was already too cryptic for the average non-HP users, RPL made it absolutely obfuscated for everyone. While you had a chance to convince some people of RPN's value in normal use and programming, no non-HP users would ever touch RPL with a ten feet pole, or be convinced of its alleged advantages, and many HP users of old thought along the same lines.*
>
> *The result is, RPN never properly developed an upgrade path, the 42S was dismayingly handicapped,*

> *and we got extremely complex, very large, graphing calculators that many of us neither needed nor wanted. Effort, time, and money who could've been spent in RPN were instead focused on the new models. A truly golden opportunity for RPN was absolutely wasted because someone at HP just happened to have other ideas in mind, and practically *killed* RPN from then on."*

I might add now a lot of things related to program editing, traceability, debugging, inconsistent and incoherent program structures, inefficiency, etc, etc. but it's no use, 'nuff said.

Best regards from V.

HP 49g+ just purchased

*Message #14 Posted by **Joe Edwards** on 16 Feb 2006, 8:32 a.m.,*
in response to message #13 by Valentin Albillo

V, Thanks for the ever interesting information. Was HP still a company focusing on engineers, etc. back in the mid/late 80's when RPL was introduced?

At this point, does anyone today really care about what "OS" their graphing calculator runs? It seems few folks at my university would care if they ran embedded linux or whatnot, as long as they can display a graph of a function, or perform other higher maths. While I have played with RPL on my 49g+, it seems to be just as useful without ever really touching the programming aspect of the machine. HP could have hidden the RPL away like on the first machine (18??) and very few folks would really care, I feel IMHO.

Joe

>
> 2. At this point, does anyone today really care about what "OS" their graphing calculator runs?

1. Certainly not, since no engineer can afford to use RPL at work! We (I am one myself) get paid for doing our job quickly and efficiently which is simply not possible using RPL. As a matter of fact, very few of the engineers I work with (mainly aerospace and IT) use pocket calculators at all. Excel (and programs like Mathematica for the more complicated stuff) has won the battle long ago.

2. The same as #1: In industrial/engineering environments no graphing calculators are used at all. The only graphing calculatos I ever see at the office are used by our trainee students for playing games, but even in this role they quicky become phased out in favour of mobile phones...

Greetings, Max

Hi again, Joe:

Joe posted:

"V, Thanks for the ever interesting information."

> You're welcome. Glad you found it interesting.

"Was HP still a company focusing on engineers, etc. back in the mid/late 80's when RPL was introduced?"

> I think HP was then on the verge of a major change (for the worse). On the one side, there were some of the best US engineers ever, assembled at Corvallis, who thought they were still designing the most powerful and state-of-the-art products for the worldwide best engineers out there. So far so good.
>
> But on the other side, as yet unnoticed to them, there were some of the most cretin 'marketeers' and 'bean counters' in the whole US, the kind of people who will take any US company, no matter how great, and quickly reduce it to irrelevancy after getting their pockets full, who were moving fast to take full control of everything designed and produced at HP Corvallis Division, with sales and short-term profits as their main regard and next to perfect disregard for HP's traditional customer base, utmost quality, cutting-edge technology, in short 'the HP way'.
>
> This wasn't that obvious to the people working there at the moment, but became painfully so the moment the 1st Saturn machine was developed and released, namely the HP-71B. Have a look at this revealing and heartfelt post by Steven T. Abell, one of the HP-71B's 'fathers' and see for yourself just how badly he felt with the whole experience. It was just the beginning of HP's unstoppable decline, which continues to this day but not for long ...

Best regards from V.

HP's unstoppable decline? Measured by what?

*Message #17 Posted by **Gene** on 16 Feb 2006, 10:42 a.m.,*
in response to message #16 by Valentin Albillo

Not by stock price.

http://money.cnn.com/quote/quote.html?pg=qu&sid=2385&symb=HPQ&time=all&uf=0

Looking at this graph, there is an obvious spike around 1999/2000, but then, the market fell a good amount in 2001-2003 for a lot of companies.

The stock is still 4 times higher than it was in the mid-1980s. So since the beginning of HP's unstoppable decline, they have increased value to their shareholders by 400%. How dare they do that!

That's hardly running down the hill to oblivion.

And, with revenues this year estimated at nearly $90 billion, that's a lot of sales.

HP may yet go under, but I would beware premature predictions of doom.

Gene, one of those bean-counters

Re: HP's unstoppable decline? Measured by what?

Re: HP's unstoppable decline? Measured by what?

*Message #19 Posted by **Gene** on 16 Feb 2006, 12:06 p.m.,*
in response to message #18 by Valentin Albillo

No problem on the bean-counter reference...I intended to make the point, which you echo'd that not all bean-counters are the same.

However, it is not obvious to me that a company's success is limited by not growing, by not expanding sales/profits, and catering to a limited market instead of changing to grow.

The company, as a corporation, exists to make money for shareholders. It is their fiduciary responsibility to do so.

A 400% increase in market value is good news for shareholders. That is the only measure of success.

Since sales are much, much larger than they were in the 1980s, obviously the buying public has not minded this change, nor have the owners, the shareholders.

The fact that some of us lament the loss of exquisitely made machinery does not mean that HP should have continued doing that, if the stock had only gone up 10% since the 1980s.

Basic point from Principles of Finance: The corporation exists to make money for the

shareholders. Period.

But, that also means that you don't do that by sticking it to your customers, raping the environment, etc., because SUSTAINED profitability is what the goal is, not short-term profits.

And, a 400% increase over the last 20 years looks quite sustained to me.

Re: HP's unstoppable decline? Measured by what?

*Message #20 Posted by **bill platt** on 16 Feb 2006, 12:26 p.m.,*
in response to message #19 by Gene

400% over 20 years is 7.2% per annum. That sucks, especially considering what the bond market did over the same period.

Re: HP's unstoppable decline? Measured by what?

*Message #21 Posted by **Gene** on 16 Feb 2006, 1:09 p.m.,*
in response to message #20 by bill platt

Well, that 400% is an eyeball estimate of the stock price graph from money.cnn.com over the last 20 years.

It doesn't include dividends which would increase the return.

Over the last 10 years, HP's stock price is up right at the same amount as the S&P 500.

Certainly it is not on some sort of unfailing decline.

Re: HP's unstoppable decline? Measured by what?

*Message #22 Posted by **bill platt** on 16 Feb 2006, 1:22 p.m.,*
in response to message #21 by Gene

yes, since 02 or 03, HP has been a very good investment. Amazing, really, but not so amazing when you compare it to many other "tech" companies.

HP has a lot of desirable qualities, for an investor (no, not for Wayne or Valentin, perhaps):

```
Market Share
Brand Recognition
repeat customer base
```

We noticed the quality of our new printers sliding in the Carly period, though. We've had to retire a number of 2200 laserjets with blown NICs.

And yet, we buy more HP printers. Why? Price to performance, etc works out.

So, yes, HP seems to be a good investment -- but will that stock price continue to climb?

Re: HP's unstoppable decline? Measured by what?

*Message #23 Posted by **Valentin Albillo** on 16 Feb 2006, 12:54 p.m.,*

in response to message #19 by Gene

Hi again, Gene:

Interesting points you raise, and I would like to argue some of them, if you don't mind.

First of all, let me state right front that I know next to nothing about economics or finance so you're the undisputed authority in this particular instance and I abide by what you say, but:

"a 400% increase over the last 20 years looks quite sustained to me."

> The company I work for has sustained a growth of some 2000% in 10 years, so your figure doesn't look that impressive to me, though certainly we weren't as big as HP to begin with. Now the question: that 400% increase over the last 20 years, does it take inflation into account ? What would the real increase be after discounting 20 years of inflation ?

"However, it is not obvious to me that a company's success is limited by not growing, by not expanding sales/profits, and catering to a limited market instead of changing to grow. The company, as a corporation, exists to make money for shareholders. It is their fiduciary responsibility to do so."

> That doesn't sound like "The HP Way" to me. It rather sounds like every run-of-the-mill company's way, i.e., to make money for the shareholders, as much as possible and as soon as possible, and to hell with everything else.
>
> If I'm not wrong, that was not the idea the late Mr. Hewlett and Mr. Packard had about how you should run a successful business and how to keep your customers and your worforce happy, satisfied, and above all, hooked for life to you and your products.
>
> The HP of old was a relatively small company that nonetheless managed to create superb, absolutely state-of-the-art products, mnay times actually pioneers in their field. They were outrageously expensive, but never mind, you felt the quality the moment you saw the *add*, not to mention the product itself.
>
> You would do whatever was necessary to get the money to buy it, you would be extremely proud of owning it, you would be the envy of everyone in your field, and I'm not talking only about calculators but very expensive lab instrumental.
>
> Also, you would be so impressed with the quality and the experience would be so positive that afterwards in life you would always trust in HP for any other lab or computing equipment, based solely on your positive experiences. The keyword here is **fidelization**.
>
> This would result in, for the simple fact of having produced and released a superb calculator, worth $500, say, some very satisfied customer would later purchase goods from HP worth many, many thousands of dollars, both for him and for his company. That's about the best fidelization campaign and the best advertisement campaign you would ever make: "We're the best, you know it, you want us, nothing else will do, we deliver".
>
> Compare *that* with later HP: "The HP way" long abandoned ... crappy products created somewhere else and simply HP-branded ... no outstanding quality

whatsoever ... their engineers disbanded, no research, no pioneering, everything's outsourced ...

So, are you really sure that abandoning the old philosophy has been best for the company and its shareholders ? Short-term, meager-at-best benefits instead of a solid, reputable, the-best-of-the-best company, which people would *die* for, both employees and clients ?

The $250 HP-25 I bought resulted in my buying many, many, many thousands of dollars from HP, and my recommending their products to everyone who would listen, and many *did* listen, with both ears wide open.

Now, I buy *nothing* from HP and recommend their products to noone. And it's not a pathetic revenge for not producing RPN calculators, matter of fact I do prefer SHARP handhelds.

It's just that they're no good value for money anymore.

Best regards from V.

Re: HP's unstoppable decline? Measured by what?

*Message #24 Posted by **Gene** on 16 Feb 2006, 1:14 p.m.,*
in response to message #23 by Valentin Albillo

Certainly, some companies have done better than HP over the last 10 years, 20 years, etc., but you are quite right to note that a % increase in price is much easier if you start lower and smaller.

If HP has abandoned the old "HP way", it certainly does not seem to have affected their sales. The lack of referrals from you (and others) does not seem to have been noticed in their results.

Apparently, those of us (myself included) who really did/do appreciate their products from 20 years ago did not reduce their sales enough when some of us may have taken our business elsewhere.

And, wonder of wonders, HP is up as I write this 8.3% TODAY because of good sales and earnings.

Guess the investors will just cry all the way to the bank.

Re: HP's unstoppable decline? Measured by what?

Hi, Gene:

Gene posted:

"Guess the investors will just cry all the way to the bank. "

More power to them. There are many people that equate money with success, but I'm not one of them. HP could be earning 10 times more and

that wouldn't improve the crappy quality of their outsourced products an iota. I don't quite see why you think that earning more has anything to do towards improving the quality of their products, actually logic dictates that it should be exactly the opposite.

As for the investors running to the bank, it might be the case that they're going there with some of your very own money in their pockets.

Not mine.

Best regards from V.

*Message #26 Posted by **Gene** on 16 Feb 2006, 3:35 p.m.,*
in response to message #25 by Valentin Albillo

Investors, if they are really investors, would of course equate money with success. I assume that if you invest, you prefer to invest in companies that earn a good return on your investment rather than companies that lose your money.

I'm not equating HP's product quality, as it is, with earning more money. But it does appear that our distaste for some of the quality issues with HP's current products is not being shared with the market in total, and that's what counts.

I'm merely pointing out that despite the statements of some here, in a capitalistic economy, companies win when they provide what consumers want (i.e., buy) and are able to sell them for more than what they cost to make.

The investors will run to the bank with whatever $$ is left from the sales prices paid by consumers after deducting HP's cost of goods and other expenses. If I have bought HP products, then yes, some of my money will be in their pockets.

Quality SHOULD matter, but either a) it does not for some reason, or b) consumers in general don't believe HP's quality is low enough to not buy their products.

Another fine "short essay" [HP's unstoppable decline]

*Message #28 Posted by **Valentin Albillo** on 17 Feb 2006, 4:26 a.m.,*
in response to message #27 by Karl Schneider

Hi, Karl:

Why, thank you for your kind compliments but matter of fact these posts of mine are not 'essays', meaning that I write them in the heat of the moment, at full speed, without time to rethink them or polish them a little.

The one you mention, for instance, has at least three or four typos I noticed after the fact, which the utterly inconvenient ruling currently in effect at MoHP prevents me from correcting as I should.

Shame for me, that my 'essays' go into the archives, for posterity, with such demeaning typos ... being a perfectionist at heart, I can barely stand the fact ...

Best regards from V.

Note: Edited to correct a typo which, thanks to the utterly inconvenient ruling currently in effect at MoHP, I could only do because I detected it fast enough that there were no replies yet.

Edited: 17 Feb 2006, 4:40 a.m.

Measured by what? Not Quality

*Message #29 Posted by **Joe Edwards** on 16 Feb 2006, 10:47 a.m.,*
in response to message #17 by Gene

Gene, I think something is wrong with a company when the products are poorly made (compared to past equipment) and the shareholders are pocketing more and more money. Shouldn't some of that profit be used to, once again, make better products instead of disposable electronics?

Joe

And, with revenues this year estimated at nearly $90 billion, that's a lot of sales.

HP may yet go under, but I would beware premature predictions of doom.

Joe wrote: "Gene, I think something is wrong with a company when the products are poorly made (compared to past equipment) and the shareholders are pocketing more and more money. Shouldn't some of that profit be used to, once again, make better products instead of disposable electronics?"

Gene: One cure for that is for customers to buy products somewhere else. If people didn't buy products they consider cheaply or poorly made, the market would be a correcting influence.

Since HP's sales will total nearly $90 billion this year, the market apparently LIKES the products HP makes in total.

Rather difficult to argue with that...it's called capitalism.

The shareholders can force a management change if they feel the company is being poorly run, but since sales are near $90 billion, apparently the shareholders who own the company feel just fine with things the way they are.

How many shareholders would want HP to make fewer, more expensive proudcts with the quality of old? Only those who don't care whether they make money on their investment.

Re: Measured by what? Not Quality

*Message #31 Posted by **Walter B** on 16 Feb 2006, 6:50 p.m.,*
in response to message #30 by Gene

Gene, having read your discussion with Valentin I think there is just one main difference between your points of view:

- You claim that the success of a company is measured in $ and nothing else.
- For Valentin there are more dimensions of sustained success, one of them being quality.

The "HP-way" as outlined in the book, and the mission statement in old HP calculator manuals emphasize this quality dimension. AFAIK the late Mr. Hewlett and Mr. Packard did not burn money, but turned into wealthy men while running HP for 50 years - and many more people shared this profit to some extent. Now we may discuss if this was BECAUSE they've put quality first or ALTHOUGH they did that. Difficult to decide because it is almost impossible to verify scientifically. So you can just BELIEVE in one or the other.

I think a big fraction, maybe the mayority of this forum believes in the first. Let's call it the "technical fraction". It doesn't feel comfortable with the kind of capitalism you explained so well (for which "bean counters" or "marketeers" are just popular labels in this forum). Don't get me wrong, I live in this world and I appreciate its benefits. But IMO something is missing, some "ideas" besides just piling up $$$. HP in earlier days transported the message to have such "ideas" - and it looked consistent. I can't see this today anymore and I miss it. And HP is no singularity - many more companies moved the same way.

The way our system works, changing requirements of customers will sooner or later generate some supplies to fulfill them. If priorities shift and the demand is big enough, it may bring and carry even expensive high quality products. Maybe we're just approaching the end of mass scrap production and the pendulum will swing back. But this is another story, turning really OT, so I'll stop here.

Just my 0,02 Euros.

in response to message #31 by Walter B

The company I worked for from 1985 to 1992 had an owner who was out for the immediate buck. His approach includied making the product as cheaply as possible. This included not only build quality, but good ideas for improving performance were rejected if they would raise the cost of manufacture. I was instructed to set up automated testing, with the idea that somehow we were going to "test the quality into it" after cheap production. As you can imagine, that doesn't work. When the failure rate exceeded certain levels, he would lose his cool and order that the test standards be lowered; IOW, we would "fix" the testing instead of the product. Even of those units that did pass, the reliability was not good. The product's reputation was terrible-- but not to worry, we had an agressing sales team that was always able to find new, unsuspecting customers. Well actually, this could only go on for so long, and gradually it did all catch up to him. The little company went from making money hand over fist to nearly six feet under in a couple of years. Now more than ten years later, they never have recovered. They could have, if the business philosophy had changed.

*Message #38 Posted by **Ron** on 17 Feb 2006, 2:58 a.m.,*
in response to message #14 by Joe Edwards

Good choice if you have a little time to play with it. The User Guide is over 800 pages in a .pdf file. The Advance User Reference is somewhat smaller, and also in a .pdf file, very awkward. If you have a budget and lots of paper,, print both manuals, the AUR first and put them into about 5 inches of binders.

I personally think the hardest thing to learn is how to navigate among the various menus. The unit is almost too powerful to be efficient. The secret there is intelligent menu and subdirectory architecture to get your personal needs close to the surface.

I graduated(?) from my 48gx a little over a year ago and still sneak back to it for some jobs. The 48 averages about one-third the speed of the 49g+ but it is a lot friendlier and with hard copy documentation which I refer to for the basics of the 49 (many of the same functions, etc.)

I had catarac surgery last year and now have problems reading the finer print on the 49, even with cheater glasses.

Good luck in your new adventures/ I changed my whole focus on life, career, family,in my 52nd year and have never been happier.

Ron

*Message #39 Posted by **Thomas Radtke** on 16 Feb 2006, 4:58 a.m.,*
in response to message #1 by Joe Edwards

When programs grow, I quickly get lost in the code. 'Higher level' languages can help keeping the overview. However, I dislike RPL much and recently went over to BASIC again (after so many years) on a Sharp PC-1500. One of the first programs I wrote was a Monte Carlo simulation. I could have done it on the PC in Java much quicker but I sat in the warm kitchen having breakfast and the Sharp brick came in pretty handy:). There are better languages than BASIC, thats for sure but somehow it works great for me.

in response to message #39 by Thomas Radtke

Thomas, I am relearning BASIC now on my HP 71b, hence the questions. I am really suprised at the level of difficulty in programming in simple BASIC versus the RPL. Not impossible, mind you, but RLP seems more arcane.

Re: RPN or RPL

*Message #41 Posted by **GE** on 20 Feb 2006, 11:36 a.m.,*
in response to message #40 by Joe Edwards

The PC1500 is a brick indeed, it is surprising that V. (you know him !) hasn't advised usage of a very small PC1262, or a thin PC1360 instead.
I recently tried again to use RPL and ran into another ***-breaking "feature" of these beasts : you just can't temporarily save a syntactically unfinished program. For example, you can't start a FOR loop without writing the NEXT, and have your program accepted for editing later - right after you have performed that small quick calculation you need (of course it's not just one FOR that was "hanging" when this happened to me).

Not to speak about the lack of early loop termination or GOTO...

And to catch another rabbit with this message, I'd say that whoever believes that success is rated by money first and foremost, cannot have children. This stuff costs LOTS !!! When I go home early (ruining my career in the process) to take them in my arms, the reward is not money. I don't regret this choice however - not one day. And after all, they will soon be new customers for cheap throwable stuff !! (possibly not if they listen to dad).
I really don't envy those who don't have the luck to see their children grow.

> I said nothing at all re the PC-1500, it was Thomas Radtke, not me. And I *do* use a SHARP PC-1350 all the time when I have no laptop at hand. If I do, then Emu71 is the 'calculator' I use. IIf I need absolute portability (i.e., it must fit in a shirt pocket) then an HP-15C is the calc of choice. And once in a while, just for fun, I might grab an HP42S but I quickly tire of the menus, entering programs in this thing is a real chore.

"And to catch another rabbit with this message, I'd say that whoever believes that success is rated by money first and foremost, cannot have children. This stuff costs LOTS !!!"

> You tell me !! I have only the one child, and it's costing me as much money as it took my parents to raise the four of us.

Wow, I'm amazed at the "problems" you guys seem to have with RPL.

> Quote:
>
> you just can't temporarily save a syntactically unfinished program. For example, you can't start a FOR loop without writing the NEXT, and have your program accepted for editing later - right after you have performed that small quick calculation you need (of course it's not just one FOR that was "hanging" when this happened to me).

Although the command line compiler will sometimes add on an END or closing delimiters (although not always where you'd want), it won't fix the syntax for **all** program structures. When it doesn't know how to compile your source code, it gives you an "Invalid Syntax" error and highlights the "word" where it first determined that something must be wrong.

If you want to save your unfinished source code for later editing, then simply insert a " (double quotation mark) as the first character in the command line so that it will be compiled as a character string. That won't always work so well when your source code already contains " chararacters though; perhaps a better method is to insert:

```
C$ $
```

as the first line of the command line; that forces the compiler to treat the rest of the command line as a character string, even if it does already contain a " character. After you think that you've finished editing it, remove the " character or

```
C$ $
```

and try compiling it.

> Quote:
>
> Not to speak about the lack of early loop termination

Haven't we been over this one before? Maybe use a WHILE...REPEAT...END or DO...UNTIL...END loop, or force an early exit from a FOR...NEXT/STEP loop by storing a high (or low) value in the loop index local variable.

> Quote:
>
> or GOTO...

Well, GOTO and labels are fine in languages that need them, but I don't see any need for a GOTO in RPL.

James

Re: RPN or RPL

*Message #44 Posted by **GE** on 21 Feb 2006, 6:07 a.m.,*
in response to message #43 by James M. Prange (Michigan)

You're right on the 3 points (I promise I won't talk about GOTO or loop termination - for some time). On syntax checking before execution, the theoretical reason why RPL behaves this way is obvious. However, it is a real bad thing. On other machines (BASIC included of course), I sometimes type pseudo-code like "GCD(X,Y)->A" or even "W=SOLVE(X*EXP(X)=Z)" when the GCD or SOLVE functions are not available, and then I code 'top-down' going into smaller and smaller parts of the program while keeping complexity manageable.
I want to be allowed to leave parts in an unfinished state and write a FOR while I don't already know what bounds and variable names will be appropriate. Placeholders are not desirable because I will have to determine that they are not the final, correct values.
A real BASIC (with PRINT and INPUT, $ and :) on current graphing calculators is an excellent option (HP71 emulators come to mind). I had this experience with a Sharp organizer of the 8000 series, Sharp made an add-in card that would allow one to program in BASIC with

128K of RAM. The 8000 has one of the largest screen and the best keyboard there is for an organizer, and by adding the card you wold have one of the best, fastest BASIC computers on the market at the time.
Sorry, Olde Phartte mode was on again.

> Quote:
>
> I realize most folks here are probably more comfortable with RPN versus RPL (am I wrong?).

Apparently, most people here are indeed more comfortable with "Classic RPN". Since it's a "Museum" forum, that perhaps shouldn't seem too surprising. For a different viewpoint, browse the comp.sys.hp48 usenet group (http://groups.google.com/group/comp.sys.hp48, if you don't have it in your newsreader).

> Quote:
>
> RPN seems so simple and the programming style for the 41/42 models seems rather easy to use - not to mention the 32 models and the voyager models as well.
>
> RPL seems so much more, well MORE powerful, but at the same time has a much larger learning curve. I assume (incorrectly?) that RPL can do much more (my programming skills are very much at the novice level) than RPN.

Personally, I see RPL as an "enhanced" RPN. I find it pretty simple and very intuitive. If the fine manuals aren't enough for you, see the excellent books by William C. Wickes, available on the Museum CD set / DVD (http://www.hpmuseum.org/cd/cddesc.htm). Also see http://www.hpcalc.org/

I'd think that anyone who can learn to program well in Classic RPN would find RPL easy, but some seem to have some sort of "block" when it come to learning RPL.

> Quote:
>
> My question is this: what niche does the RPL programming language fit, especially nowadays with the 49g+. With so many more powerful handheld devices, is the RPL in the 49 series just a left-over concept that just works well to power the 49g?

Huh? The "niche" for UserRPL is that it's the built-in "fool-proof" language for "ordinary" users of the 28, 48, and 49 series. Well, "fool-proof" in the sense that it's pretty difficult to accidentally get a TTRM ("Try To Recover Memory?") in UserRPL.

Far from being just a "left-over", I see it as being an excellent language for using calculators.

In the case of the 49g+ and 48gII with their ARM processors, I suppose that one could argue that a better RPL could be designed for the particular processor instead of using an emulated (simulated?) Saturn processor with relatively minor changes to the legacy RPL, but that would take time, developers, and money, which HP doesn't seem to be willing (able?) to invest these days.

SysRPL doesn't include the argument checking and dispatching to protect the user from his mistakes, but that makes it faster, and, perhaps even more importantly, it also has a much larger command set. SysRPL is the

underlying language used for developing UserRPL, as well as for various non-RPL models. The 49 series has a built-in compiler for SysRPL, but for other models, you'd need an add-on or a PC application. In general, a well-written SysRPL program is smaller and faster than a UserRPL program to accomplish the same thing, but requires more time and care in development.

Actually. RPL doesn't always seem to work out so well for me on the 49 series. Sometimes the new CAS (Computer Algebra System) seems to get in the way, perhaps due to not knowing what effect the added system flags will have. I often get the feeling that the new development team for the 49 series didn't quite understand the 48 series RPL as a whole, so their "improvements" don't always seem to be very well-integrated.

Being able to upgrade the flash "ROM" on the 49G and 49g+ should be an advantage, but the downside of it is that "beta" quality code can be released as "good enough", with the expectation that bugs can be fixed as needed.

Additionally, the RPL calculators can be programmed in assembly language, and the Classic RPN aficionados could even get to use their beloved GOTOs that way. Like SysRPL tools, assembly language tools are built in to the 49 series, but not the 28 and 48 series. Programs written in assembly language are generally much faster, but larger, and of course require specialized knowledge. Ultimately, SysRPL commands end up using code written in assembly language; I doubt that much (any?) SysRPL code was written in actual "machine language".

The 49g+ and 48gII don't actually have a physical Saturn processor, instead emulating it (plus additional assembly instructions) in code running on the underlying ARM processor. For these models, you could use hpgcc (see: http://hpgcc.org/) to do some programming in C language.

> Quote:
>
> Overall, I just don't see much of a use when compared to a simple RPN calculator. I assume I am not seeing the forest due to all the trees!

Well, I suppose that it depends on what you want to use your calculator for. For many purposes, Classic RPN indeed suffices. To me, the RPL models, although certainly primarily "calculators", often seem rather like simple "computers". Assuming that you have an RPL model, give it a real try and see whether it can do useful things for you.

> Quote:
>
> Anyone care to enlighten a simple "grasshopper"???

"grasshopper"???

HP 49g+ just purchased

*Message #1 Posted by **Joe Edwards** on 15 Feb 2006, 1:43 p.m.*

Hey, I just picked up the most current version of the 49g+, figuring I could just return it if it wasn't worth it. It took a LONG time to decide to buy another one after trying the introductory models in 2003. Overall, I must say that I am very impressed. Sure, it isn't a 48gx, but WOW, everything is so much better on it.

1. No creaking with quite a bit of torque applied to the case. 2. No (with ROM update) missed keys. 3. The keys are SO MUCH quieter than the initial issue.

After some thought, I have decided to "get over" my vintage HP hangup and start using this and the 33s on a daily basis. The 33s was returned earlier due to my dislike of the cluttered keyboard, but after playing with the 49g+, it wasn't that hard to get used to it.

Hey Les, I finally got the Subject marker straightened out. Very odd indeed. Now if only HP would drop the 48gII and expand the line-up to include the oh-so-needed HP 43s...sigh.

I'm looking for a manual for the HP48GX or someone with know how to opperate it. My son lost the manual and needs help in understanding the calculator. HELP please. Anyone in the lower main land with the know how please give us a shout.

Thank-you in advance.

in response to message #1 by Joe Edwards

It was also my intention to use only the 33S and 49G+ on a daily basis, but once I got bitten by the vintage HP bug, I'm having a hard time not using them. Right now I'm starting to fall in love with my 41CX here at work. I've gotten used to the segmentation of the LCD display (I prefer that of the Voyagers!) and I'm reading my user's manuals for the 41CX and loving it. I also love my 55 and many others, so for now, I'm going to keep using my vintage models. Some didn't cost that much to acquire, but others costed me about $300 each due to mint or new condition at time of purchase. So there has been that temptation to sell them all and recoupe some money and stick with just the 33S and 49G+, but I've decided not to do that. Enjoy your two non-vintage HPs. Long live the HP RPN calculator!

I purchased a CNA 41208388 Series number HP 49G+ in may 2005 in Venezuela (my native country so please excuse my English). Then in December it began to present problems with the black numbers' keyboard most of them went loose and almost like coming out of its place. I received this week a CNA 53400181 Series number as a guaranty replacement. I would like to Know your calculator series number and your opinion on this detail, I mean, this "five" first number series is better than the older ones?

Thanks for your atention

> I received this week a CNA 53400181.

That's the newest serial number I've seen or heard of.

"534" means the 34th. week of 2005. That would've been around the middle of June.

It should be a good one. Just update the ROM firmware with the latest revision. Hpcalc.org has the newest (which is newer than than HP's website).

hth, Matt

Mine is CN42502717 updated to Version HP49-B Version #2.05-4

Hp49G+ is probably the most powerful calculator ever made, even if you compare to Voyage200 or T89.

It's hard to imagine how to make it better but I have some suggestions:

QVGA Resolution Color backlight display External or detachebla keyboard(Ir or cable) Touch screen

for sketchs of this dream see:

http://marxpio.multiply.com/photos/album/6

Don't ask me how does it works... ;^)

A minor problem

*Message #12 Posted by **Joe Edwards** on 15 Feb 2006, 10:14 p.m.,*
in response to message #11 by Marx Pio

I like the form factor. Reminds me of a gameboy advance. The problem with the folding calculator is that the flexible cable can, over time, weaken and break. Maybe with better technology we can avoid this. I am just thinking very long term.

I do agree that a better resolution screen at least as good as the TI89, and preferably as nice as

the Voyage 200 (that would be be rather large).

Would HP or TI ever consider a color screen? I just don't think so, but it would be gorgeous!

Well, I would be incredibly happy if the screen resolution were doubled from what it is now. Actually, I would be plenty happier if the screen resolution were oh, say 240x160 pixels, which interestingly enough is the same resolution as the Game Boy Advance. . . ;-)

Seriously though, it would be extreemly easy for HP to double the resolution of the calculator. Simply drop in a higher res LCD and then define the screen controler to appear to the calc OS that it was the same as before. So each "pixel" would be represented by 4 pixels on the new screen. Then using HPGCC you could control the smaller pixels for use with cool programs.

In addition, I bet the demand for the calculator would increase 400% overnight once students discovered they could install game boy roms on their calculator. . . ;-)

TI versus HP

*Message #1 Posted by **Dirk Richter** on 15 Feb 2006, 12:23 p.m.*

Hello:

I used a TI59 (and still do) back at Yale and used to go head-to-head with the HP41 guys all the time. It seemed the TI trumped the HP every time on quality of build, power, convenience and even panache.

Can you tell me what the attraction of the HP line is? It just seems that TI beat them every time esp. in the high end handhelds.

*Message #3 Posted by **e.young** on 15 Feb 2006, 1:07 p.m.,*
in response to message #1 by Dirk Richter

I can't speak for the high end calculators, but I will talk about the non-graphing scientifics. The reason that these are so superior to TI is because of RPN. RPN is vastly superior to the various forms of algebraic entry. RPN is more powerful, quicker, easier, and therefore more reliable.

Before switching to HP, every TI that I ever had lasted at best a couple of years. The numbers wore off the keys, the keys had a lousy tactile response, etc. My first HP is now 19 years old, and still works perfectly. The numbers will never wear off the keys because the numbers are molded in. The tactile response is as good today as when I first purchased it. It's ability to perform long chains of calculations without having to resort to parenthesis or manually storing temporary results is unmatched. The HP is a serious tool in the hands of an engineer, while the TI is more of a toy or a machine for grade school students. In college, it was always the HP that was highly prized by the engineers, not the TI.

Ultimately, this comes down to a matter of opinion as to which is superior. Those who contend that TI is better are welcome to their opinon, but those who frequent this forum are partisans for HP, especially the older ones rather than the newer debased offerings. Are you looking for a dialogue, or just trying to start a flame war?

HP 48gx construction quality question

*Message #4 Posted by **Joe Edwards** on 15 Feb 2006, 1:26 p.m.,*
in response to message #3 by e.young

Why even ask if someone is trying to start a flame war? That question in itself is inflammatory. Just

answer the guy's question and if he responds with a reasonable answer, or not at all, you have the answer to your question.

Re: HP 48gx construction quality question

*Message #5 Posted by **Ron Ross** on 15 Feb 2006, 2:14 p.m.,*
in response to message #4 by Joe Edwards

No, I think it was flame bait. Why? because I own both and there is no way anyone can say with a straight face that the Ti is well built.

Ti's were the cheap calculator solution. You need a CHEAP solution, you buy Ti. The Ti-59 did have lots of horsepower, more so than any LED Hp. But the Hp's were well built and well designed for daily use.

Shortly thereafter Hp released the Hp41c and a bit after that the Hp11c. The Hp41c was so superior to the Ti-59 in EVERY respect. But even the LED Hp's had good to great keyboards, compared with poor to functional for the 1975-83 line of Ti's (nearly a decade of poor keyboards).

On horsepower

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 15 Feb 2006, 10:55 p.m.,*
in response to message #5 by Ron Ross

Back in January 1981 a complimentary article "The HP-41C: A Literate Calculator" appeared in BYTE. The author did comment "... The most fundamental defect in the architecture of the HP-41C, inadequate numerical precision, is a serious flaw indeed. ..."

It still is.

Re: On horsepower

*Message #7 Posted by **gene** on 20 Feb 2006, 5:18 p.m.,*

in response to message #6 by Palmer O. Hanson, Jr.

I agree Palmer. While the HP41c was superior in quite a few respects over the TI59, it was not superior in terms of numeric precision.

A few matrix test routines show that pretty well.

Palmer says:
Back in January 1981 a complimentary article "The HP-41C: A Literate Calculator" appeared in BYTE. The author did comment "... The most fundamental defect in the architecture of the HP-41C, inadequate numerical precision, is a serious flaw indeed. ..."

It still is.

I dug out this old article and re-read it. I found the paragraph where the author makes the quoted comment. He makes another comment that betrays a common misunderstanding about the behavior of calculators.

Imagine that we type the following 10-digit number into an HP41:

1.414213562

Now press the x^2 key. The exact result is a 19 digit number:

1.999999998944727844

But the HP41 can only store and display a 10-digit mantissa, so we would hope it would display the correctly rounded 10-digit result:

1.999999999

which it does. Isn't this what we would want our 10-digit calculator to do? When given a number whose exact square comprises more than 10 digits, wouldn't we want the calculator to return a result correctly rounded to 10 digits?

Now suppose that the number we started with, 1.414213562, wasn't something we typed in, but resulted from typing in the integer 2 and then pressing the SQRT key. This number is, in fact, the correctly rounded 10-digit version of the square root of 2. When we subsequently square it, should we expect to get back exactly 2? If we did, the HP41 would have made an error in its multiplication followed by rounding, even though it might have made us feel better to get a result of exactly 2.

Should the calculator have remembered whether it got the original 1.414213562 as a result of taking the square root of 2, or if it was just typed in? This would be the only way it could return exactly 2 if it was starting from a calculated square root of two, but 1.999999999 if the starting number had been typed in. The calculator would have to have some way of distinguishing the two cases.

We don't want the calculator to return a result in error just to make us feel good, do we? If a

10-digit calculator returns a result of exactly 2 when starting with 2 and pressing SQRT and then x^2, it has made an error. The only way it can happen without an error having been made is if it's really a calculator with more than 10 digits for calculation results, but only displays 10 digits. Or, it is really a 10 digit calculator that has had its display set to display fewer than 10 digits, which the HP41 can do, of course.

One of the other criticisms of the HP41 the author of the Byte magazine article offers is that the HP41 returned 1.999999999 when 2 was entered and then SQRT and x^2 were pressed. This is a misguided complaint, and shows that the author didn't understand what a HP41 calculator should do (or any other 10-digit calculator with a full 10-digit display and no hidden guard digits).

He also says that the HP41 doesn't have any guard digits. The HP41 does in fact have 3 guard digits. Its internal calculations are done with 13 digits and the result rounded to 10 digits. That's how the HP41 guarantees that the result of +, -, / and * are correct to 10 digits. Its just that these extra guard digits are not accessible once the calculation is done, unlike the TI machines, for example.

He complains that after some calculations, the HP41 might lose as many as 2 or 3 digits in its result. He doesn't give a specific example of what he means, so its not possible to give a comment to a particular result. But, it's well known that catastrophic cancellation can occur with subtraction; ANY calculator is subject to this phenomenon, and more digits can certainly help this problem.

As to whether it's a "serious flaw" for a calculator to have only 10 digits, that topic has been beat to death here and elsewhere. 10 digits is WAYYYY more that the slide rules that preceeded it, and more than even 7-place log tables which were the thing you used if you needed a result with lots of significant digits in the days of slide rules.

But, some of this author's comments are just not correct.

Re: On horsepower and guard digits

*Message #9 Posted by **gene** on 21 Feb 2006, 10:31 a.m.,*
in response to message #8 by Rodger Rosenbaum

Rodger wrote: "He also says that the HP41 doesn't have any guard digits. The HP41 does in fact have 3 guard digits. Its just that these extra guard digits are not accessible once the calculation is done, unlike the TI machines, for example"

Gene: And that's probably the rub. On the TI, you have the extra digits hanging around with the number displayed to 10 digits, while on the HP41, those digits are used internally but the result is rounded to 10 digits and those guard digits disappear, which can lead to the results shown when a displayed answer is used as the input for a sequential calculation.

The argument raged for quite some time, IIRC, about the advantages of 10 good rounded digits vs. 13 digits displayed as 10.

IMO, I think the TI method w/guard digits tends to more accurately present a 10 digit result than the HP41 method. The TI method almost always took longer for the result to deteriorate than the HP41 method.

Re: On horsepower and guard digits

*Message #10 Posted by **Dave Shaffer** on 21 Feb 2006, 2:23 p.m.,*
in response to message #9 by gene

If you really need to worry (for, say, science or engineering in the real world) about whether your 10 digits are correct or not, you should think a lot about how those 10 digits were derived!

What real-world cases need this accuracy?

ABout the only thing I can think of are timing and frequency, and associated measurements of length, based on timing and the speed of light.

The speed of light is defined as 299 792 458 meters per second (EXACTLY). A second is defined as some number of cycles (I don't remember it and I don't have a handy reference to look it up) produced by a certain energy level transition in a cesium atom (you even have to use the corret isotope), with comparable precision.

The best atomic time standards (hydrogen masers and other masers) have stabilities that can be measured at the parts in 1e14 or 1e15 level - so here you really can worry about the digits produced by your calculator.

The NASA program I used to help support measures the distances between parts of the world at levels of a few mm out of 10000 km, so we needed high precision calculations, too. This was all based on very precise timing measurements.

Re: On horsepower and guard digits

*Message #11 Posted by **Gene** on 21 Feb 2006, 4:30 p.m.,*
in response to message #10 by Dave Shaffer

The situations in which that much accuracy is needed is an entirely different matter!

Although, sometimes in monetary problems dealing with billions of $$, the rounding can add up.

I just meant to say that IF someone needed such accuracy, IMO the TI59 style guard digits seem to have preserved accuracy longer than the HP41 approach.

Re: On horsepower and guard digits

*Message #12 Posted by **Valentin Albillo** on 22 Feb 2006, 4:39 a.m.,*
in response to message #10 by Dave Shaffer

Hi, Dave:

Dave posted:

"The speed of light is defined as 299 792 458 meters per second (EXACTLY)"

EXACTLY ? ... Exactly the other way around:

```
light           The meter is the length of the path travelled by
                in vacuum during a time interval of 1/299 792 458
```

```
                of a second.
```

The meter is defined from the speed of light, which is a fundamental constant, and a time unit, not the other way around.

You don't 'define' the speed of light, it's just what it is, a universal constant in the broadest sense, and then, arbitrarily, you define the meter from it in any way which suits you best.

In this particular case, and for obvious practical reasons, it's been defined so as to closely agree with the previous definition (the length between two marks on a platinum-iridium rod kept at some place at this or that temperature, etc).

Best regards from V.

Re: On horsepower and guard digits

*Message #13 Posted by **Dave Shaffer** on 22 Feb 2006, 12:35 p.m.,*
in response to message #12 by Valentin Albillo

Valentin,

I'll stick with my original statement about the speed of light being "defined." (Maybe "defined" is too strong - maybe "assigned" is a better term.)

Of course, as you note, it has whatever speed it has, but we then need to assign some value to it.

I defer to the US National Institute of Standards (NIST), at which you can find (http://physics.nist.gov/cgi-bin/cuu/Value?c|search_for=universal_in!) under "Fundamental Physical Constants" that the speed of light has the value I gave and is stated as being "exact."

As you also note, the meter is then defined from that definition plus the value of the second.

Dave

PS Every time I read one of your posts, I tend to say your name mentally, but I'm not sure if the "n" at the end is pronounced or not (i.e. is it nasalized like most final French consonants?).

Re: On horsepower and guard digits

*Message #14 Posted by **Valentin Albillo** on 23 Feb 2006, 5:38 a.m.,*
in response to message #13 by Dave Shaffer

Hi, Dave:

Dave posted:

"I'll stick with my original statement about the speed of light being "defined." (Maybe "defined" is too strong - maybe "assigned" is a better term.)"

> You can do whatever you like, but it's the meter that is defined from the speed of light, not the other way around, as you can easily google out if

you care. And, of course, stating that the speed of light is "defined" as a certain value in meters when the meter itself is defined as the speed of light divided by some value, is what's called a circular reference.

"Of course, as you note, it has whatever speed it has, but we then need to assign some value to it."

Assigning some value to a physical magnitude isn't called "defining" but "measuring". For instance, that your height is, say, 1.80 meters doesn't mean that we're *defining* your height to be that value, but that we've *measured* your height and it comes to that. Similarly, you can *measure* the speed of light in meter per second, but you can't *define* it as a certain number of meters per second.

That the meter's definition has been chosen in such a way that it gives a neat integer value for the speed of light which comes pretty close to the former definition, is nothing but an arbitrary, convenient choice, a "definition". But once that unit (the meter) has been *defined*, the speed of light is just *measured* in terms of these previously defined units.

"I defer to the US National Institute of Standards (NIST), at which you can find (http://physics.nist.gov/cgi-bin/cuu/Value?c|search_for=universal_in!) under "Fundamental Physical Constants" that the speed of light has the value I gave and is stated as being "exact."

I've made the point clear enough by now. By the way, your reference doesn't mention the word "define" or "definition", did you notice ? As stated, that the value is exact is a consequence of the particular definition chosen for the meter.

"PS Every time I read one of your posts, I tend to say your name mentally, but I'm not sure if the "n" at the end is pronounced or not."

Yes it is. In its original Spanish, "Valentin" is pronounced as "va (as in "bar") - len (as in "length") - TIN (as in "tinkle"), with the emphasis on the final syllable.

Best regards from V.

Re: On horsepower

Message #15 Posted by ***Palmer O. Hanson, Jr.*** *on 24 Feb 2006, 11:37 p.m.,*
in response to message #8 by Rodger Rosenbaum

My recollection of the article is that the reviewer didn't seem to understand that while the taking of the square root of two followed by squaring sequence yielded a 2 in the TI-59 display that did not mean that the value in the display register was exactly two. He also did not seem to understand that a similar effect can be obtained with the HP-41 by simply operating in fix 8 mode.

The reviewer's square root of two test was modified by others. In one modification one starts with 2 and repeats the square root square sequence and sees that the HP-41 alternates between 1.999999999 and 1.414213562, while on the TI-59 the sequence the display alternates between 2 and 1.414213562 but the values in the display register are gradually decreasing. Some HP folks suggest that the HP result is preferred but they fail to note how

many iterations would be needed (something like 200 or so as I recall) before the TI-59 errors are as large as the HP-41 errors.

A second modification starts with a small integer in the display and takes five square roots followed by five squares. In this test the end results with the TI-59 is always smaller than the starting values (due to truncation, I think) while the end results for the HP-41 are sometimes smaller and sometimes larger (due to rounding, I think). But the the TI-59 error is always much smaller than that with the HP-41.

If you try to do this test on a Casio fx-7000 or a TI-81 which doesn't have AOS but EOS you need to use parentheses carefully or the machine will essentially remember that you did a square root followed by a square and properly get exactly two. That's sort of akin to the old high school algebra technique of waiting to evaluate until the end of the problem until you can take any cancellations which may be available.

As to what number of digits are needed in the mantissa that clearly depends on the application. I admit that some applications are working with only a few digits. In inertial navigation we were working with at least seven digits as in accelerometer measurements good to a micro-g over a range from a micro-g to ten g's, etc. Slide rules were never good enough for processing that kind of data. In the early sixties we used Friden's a lot. If my memory is right we had eight or ten digits available with the Friden's.

He never mentioned TI calculators in the entire article except to mention that TI used the same size magnetic cards with some of its calculators as the HP41 used. Let me quote from page 136 of the article:

The most fundamental defect in the architecture of the HP-41C, inadequate numerical precision, is a serious flaw indeed. Numbers are represented, both internally and in the display, with 10 decimal digits; there are no guard digits. As a result, inaccuracies are quite often introduced into the least-significant digit. For example, SQRT(2)^2 is evaluated by the calculator as 1.999999999. For operations on some data, the corruption goes still deeper and 2 or 3 digits become suspect. There is something absurd about the world's fanciest calculator not being able to give results accurate to more than seven or eight decimal places.

I already pointed out that he misunderstood some things. In the next paragraph, he says;

Actually, a subsidiary problem is more serious than that. Conditional tests on data are carried out on the full 10-digit representation. Consequently, a test that effectively asks "Is SQRT(2)^2 equal to 2?" will give a false result, wihch can lead a program astray.

Didn't he realize that this sort of problem, due to finite register size, occurs with every calculator that does floating point arithmetic? It is to be expected, and the calculator user must deal with it.

The author of that article wasn't comparing HP calcs to TI calcs specifically.

Palmer says: **As to what number of digits are needed in the mantissa that clearly depends on the application. I admit that some applications are working with only a few digits. In inertial navigation we were working with at least seven digits as in accelerometer measurements good to a micro-g over a range from a micro-g to ten g's, etc. Slide rules were never good enough for processing that kind of data. In the early sixties we used Friden's a lot. If my memory is right we had eight or ten digits available with the Friden's.**

In an earlier post, Ron Ross said:

The Hp41c was so superior to the Ti-59 in EVERY respect.

And you responded:

Back in January 1981 a complimentary article "The HP-41C: A Literate Calculator" appeared in BYTE. The author did comment "... The most fundamental defect in the architecture of the HP-41C, inadequate numerical precision, is a serious flaw indeed. ..."

My aim is to point out that the author of that article had a number of misunderstandings, and to suggest that the phrase "serious flaw indeed" is perhaps overstated. Are we to believe that having only 10 digits is a serious flaw, but that 3 more turn a serious flaw into a non-problem?

The nature of ill-conditioned problems is that you lose a certain number of digits, whether your calc has 10, 12, 13 or 14 digits. Any problem that loses 3 digits of accuracy on the HP-41 will almost certainly lose 3 digits on a TI calc too. Losing 3 digits out of 10, which would happen only rarely, still leaves 7 correct. That's enough for almost all practical problems. Hundreds of thousands of engineers and scientists found the 10 digits of the HP41 more than adequate.

I've said before that, all else being equal, having more digits is a good thing; sometimes, though, all else isn't equal. However, I've noticed that the recent TI calculators have gotten MUCH better with their math.

But comparing the HP41 with the TI59, or comparing the HP49 with the TI86 is like putting a welterweight in the ring with a heavyweight. It's just not fair in some respects and the outcome in those respects is just what you might expect. The TI86, which I own, can give a 14-digit square root; the HP48 can only give a 12-digit result. Just as we would expect. That's why I want to evaluate calculators on another basis--do they do what they should do? I plan to post more on this topic.

Re: On horsepower

*Message #17 Posted by **Werner** on 25 Feb 2006, 4:05 p.m.,*
in response to message #16 by Rodger Rosenbaum

```
I used to have a TI-58 (functionally the same as the '59, but with
only half the memory and no cardreader)
I seem to remember that SIN(45°) was NOT equal to COS(45°).
Now, that is a fundamental flaw - that HP neatly
avoided by rounding the result to 10 digits.
```

```
BTW this exact same 'error' would show on today's 49 calcs, if
they would show their results with the internally used 15 digits:
SIN(45.) = 7.0710678118656E-1
COS(45.) = 7.07106781186545E-1

Cheers, Werner
```

Re: On horsepower

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 26 Feb 2006, 11:09 p.m.,*
in response to message #17 by Werner

Page C-1 of the Persoal Programming manual for the TI-58, TI-58C and TI-59 addresses the problem of sin 45 not equal to cos 45 and states that when doing t register comparisons precautions should be taken to prevent improper evaluation due to the guard digit differences. It notes that the displayed values are equal in FIX 9 mode and suggests the use of the EE-INV-EE sequence to leave only the displayed value for further use. That will work for the 45 degree case. It will not work for the case where the displayed value of sin 39 is 0.6293203910 and the cos 51 is 0.6293203911 . You might think that we can solve the problem by operating in FIX 8 mode but with a little work you can find that the displayed values for sin 32.9999999989 and cos 57.0000000011 will be equal in FIX 9 but not equal in FIX 8.

in response to message #18 by Palmer O. Hanson, Jr.

Common programming sense says that in making equality comparisons of this type, you see if the difference is less than some tolerable amount. Otherwise the critics won't be happy with even a 1000-digit calculator.

Re: On horsepower

*Message #20 Posted by **Palmer O. Hanson, Jr.** on 25 Feb 2006, 9:42 p.m.,*
in response to message #16 by Rodger Rosenbaum

I have no problem with the idea that some applications are less demanding than others. I suppose that is why some people use Casio's, some use Sharp's, some use HP's and some use TI's. I suspect that most don't really look hard before they buy -- certainly not as hard as we looked at the computational capbility of airborne computers before selecting them for navigation and guidance applications.

Some use certain devices because of input and pressures from others whether their professors, their high school teachers, their colleagues, or whatever. These days most high school students use TI graphical calculators, not so much because they are better which they are, but almost certainly because back in the mid 80's someone at TI had an idea about the use of graphic calculators, committed to the idea, marketed the idea to the high school community and delivered the necessary support.

I expect to publish some more results on the Albillo problem and your modifications to it in the near future. The winner to date for machines in my inventory is the RREF routine on the HP-49 which is typically an order of magnitude better than the B/A method.

"exactitude" & the HP-30S (+ HP-16C)

*Message #21 Posted by **Karl Schneider** on 26 Feb 2006, 6:14 p.m.,*
in response to message #16 by Rodger Rosenbaum

Rodger --

Good, thoughtful post on the philosophy of "guard digits" and number of digits maintained.

The topic being discussed is that of $[\text{sqrt}(2)]^2$ equaling 1.999999999 on the HP-41 (and other pre-Saturn calc's,) and 1.99999999999 on Saturn-based calc's.

In an archived post from last month, you also described the performance of the HP-30S for the trigonometric-based "forensic function" that helps reveal roundoff errors in algorithms. You showed some insightful evidence that results of trig calculations on the HP-30S are slightly rounded off to a very-close integer in certain cases.

I would suspect that the philosophy behind these methods are to provide reassurance to novice users that the calc is performing inverse operations correctly. We expect to see exactly 2 as the result of $[\text{sqrt}(2)]^2$; we expect to see exactly 3 as the result of $\cos^{-1}(\cos(3^o))$. "If a result is extremely close to an integer, it probably *should* be that integer, in most cases." Rounding, and the use of many decimal digits, is facilitated by the use of high-precision floating-point representations in the HP-30S.

In Appendix D of the HP-16C Owner's Handbook, there are several programs for converting floating-point values between the calc's native 56-bit binary-coded decimal representation and a hexidecimal display of the IEEE 32-bit single-precision floating-point standard proposed at the time (1981-82).

According to the Wikipedia entry, it seems that the proposed format was adopted as ANSI/IEEE Std 754-1985 (IEC 60559:1989) without further modification.

The format allows integers up to +/- 16,777,216 (2^{24}) to be represented exactly. This is verifiable by running the HP-16C programs (or the converter programs linked in the Wikipedia entry). The IEEE 64-bit double-precision floating-point format can exactly represent integers up to +/- 2^{53} (~= $9.00719925474 \times 10^{15}$).

Regards,

-- KS

Re: TI versus HP

*Message #24 Posted by **Garth Wilson** on 15 Feb 2006, 2:39 p.m.,*
in response to message #1 by Dirk Richter

I have both. I started with the TI-58c because it gave the most for my $100 budget at the time. Next I stepped up to the TI-59 along with the printer and additional modules. I got a lot of use out of those before getting my HP-41cx. The TI-59 did have more digits, and I understand the original HP-41's had quite an inaccuracy in a couple of the trig functions. Those inaccuracies got corrected early on though. To say the TI-59 was better than the HP-41 is like saying that the DC-3 airplane is better than a modern Airbus because the DC-3 gave window seats to a higher percentage of passengers. If you really want a list of things the HP-41 can do that the TI can't, we can put that together for you, but it will be a very long list. There are also issues of speed, battery life, and build quality.

*Message #25 Posted by **Chan Tran (USA)** on 15 Feb 2006, 2:56 p.m.,*
in response to message #24 by Garth Wilson

When I bought my first calculator I didn't know anything about them. I heard of RPN and stuff but I didn't really know why it's better. In 1976 I was deciding between the TI-52 and the HP-25, I chose the HP-25 only because the material, the craftmanship and the look of the 25 was much better than the TI-52. I didn't know squat about what each could do. To say that the TI was better in build quality is beyond me.

Sorry, I really don't know where you got that idea. I had both an HP-67 and a TI-59 around the 1978-79 time frame, and they were like chalk and cheese. The TI-59 died prematurely - it had much lower build quality than the HP-67. The keys didn't feel as positive as the HP's, some required much greater pressure than others, and several went dead within a couple of years.

Don't get me wrong - TI tried hard and did a mostly OK job with the '59. But in build quality, programming model, documentation and design they were obviously trailing HP.

Best,

--- Les

Re: TI versus HP

*Message #27 Posted by **Walter B** on 15 Feb 2006, 6:38 p.m.,*
in response to message #1 by Dirk Richter

My first calc in 75 was a TI SR50. Wealthier students of physics at my university came with programmables soon (TI or HP) - I borrowed them sometimes, so I've experienced both sides. Of course, TI was easier for me to handle - and featurewise, HP and TI were almost equal. Nevertheless, the superior design (logical consistency, keyboard layout) of HP made me to turn to RPN.

In 77, I could pay for a repaired HP25C, and I used this for 5 years and sold it then to buy an HP11C, which disappeared with my bag 9 years later. Both calcs were fully functional when they left me and were looking almost mint (ebay grade ;-)) then. In the same time, I've seen quite some TI calcs worn down or semifunctional. Don't get me wrong, that's just my memory.

You may call this a difference in reliability, i.e. quality. This personal experience is my reason for holding high the flag of (old) HP. However, meanwhile things may have changed.

> I used a TI59 (and still do) back at Yale and used to go head-to-head with the HP41 guys all the time. It seemed the TI trumped the HP every time on quality of build, power, convenience and even panache.

I know this is a recurrant theme in these replies, but it bears repeating in this instance...It's the keyboard.

When I was in school in the 70's, my friend had a TI-52. The keyboard was horrible!! There were two or three keys that he had to stand on to get to register...there was even one key that took about ten seconds to ooze back up after it was pressed. Even the keys that worked normally (for TI) had bad tactile feel because of the floating, non hinged design.

And don't even get me started on panache...My 29c with it's compact, beige colored case, *(as opposed to the boxy black case of the TI)*, wonderful RPN entry *(as opposed to the TI's clumsy algebraic entry (oops, lost count of the parenthisis...I'll have to start over))*, color coded double shifted logical keyboard, with large enter key and slanted keyfaces *(as opposed to the confusing 2nd and INV keys on the TI, with nothing but monotonous square keys)*, had major panache...and still does to this day. And when the guy who sat two seats behind me got out his HP67, the envy was almost palpable... Hal:)

Re: TI versus HP

*Message #29 Posted by **Vassilis Prevelakis** on 16 Feb 2006, 3:15 a.m.,*
in response to message #1 by Dirk Richter

Well with a TI you got what you paid for. The TI-58 was sold for $125 and the TI-59 for $300. Compare this with the $450 that the HP-67 went for or the $750 for the HP-97.

The only calculator that cost less than the TI-58 was the HP-21 ($80) but that one was brain dead (not even LASTx for crying out loud!)

The comparison would be as follows:

TI-59 ($300) vs HP-67 ($450)

TI-58 ($125) vs HP-25 ($125), or HP-29C ($195).

Also, even at a price 1.5 that of the equivalent TI, the HP products had less memory and no ROM packs.

E.g. the HP-29C has 98 steps and 30 registers while the TI-58 had 240 steps with 30 registers.

Similarly the HP-67 had 224 steps and 26 registers versus 720 steps and 30 registers for the TI-59.

Note, of course that the HP machines had merged instructions (e.g. STO 0 was one step vs two steps for the TI-58/59). But even so the larger memory allowed more complex programs to be developed.

In addition, on the TIs being able to jump straight into any ROM program, allowed ROM code to be used as an extension to user programs saving precious program memory.

From the usability perspective, apart from the RPN vs AOS issue (I won't go into this one :-), the TIs design was horrible. Apart from the 2nd and INV constructs that took a while to get used to (e.g. RTN is INV SBR, obvious once you know it, but I remember searching for the RTN key and cursing), there is that OP thing.

It appears that once TI run out of keys they placed all the remaining commands in the OP nn category (which includes printer commands, statistics, memory partitioning, register operations etc.). All in all a nightmare making the quick reference guide a must.

The HP-67 is exquisitely designed with functions selected with a minimum of keystrokes (remember the A-E keys having function shortcuts if no program is loaded) etc.

The quality is also excellent. Just holding an HP-67 in your hand gives you a feel of the quality and solid built of the device.

*Message #30 Posted by **Jan** on 16 Feb 2006, 3:30 p.m.,*
in response to message #1 by Dirk Richter

All I say is this. My 1st calculator was a TI 35 (one of the oldest versions). The keyboard lasted about a year, then the bouncing carnaval started. I already knew HP calculators (my dad used them) so I bought one of the last HP 34C's available. It served me well during the last years of highschool (a tough period for a calculator in those days) and through a major part of my studies at university. I still have it, and more important: it still works the same way as it did when I had just bought it. OK, I had to repair it once (broken battery contact) but at least it could be repaired. I would say the old HP's were much better constructed than the early 80 TI's. I know the TI 59, it is I guess quite robust (a colleague of mine used one for a long time) but it has not the solid feel of the HP 67 that my dad used. In addition, the advantage in memory size the TI59 had was over in 1980 when the HP's 41CV came out.

Off-Topic: Postcards needed (especially International)

*Message #1 Posted by **Mike** on 15 Feb 2006, 11:55 a.m.*

Sorry to post this off-topic post but I have a favor to ask. I hope the moderators don't mind this.

I said "especially international" but would like postcards from U.S. as well.

A friend has a 7 year old son who's class has a project to collect postcards (postmarks), from around the world (U.S. and International). If you have the time and with to help out, please send a post card to the address below. I'm sure Zach would appreciated it.

Ms. Clutts 1st grade class (attn: Zach) Hollister Elementary School 1798 St HWY BB Hollister MO 65672 U.S.A.

I have found many great friends from around the world on the HP Museum site. I hope you don't mind helping out.

Thanks for your help,

Mike Davis

PS: Drop me an email, if you have sent one.

HP 12cp improved in Europe?

*Message #1 Posted by **Gour** on 15 Feb 2006, 11:36 a.m.*

Hi!

I'm an 'old' HP calc user who gave many years ago his HP 15C to his brother. Later I bought HP28s and some time ago a new HP 49g+.

However, soon I'm going to travel and 49g+ is too big to carry around.

I've made a deal with my older brother: he will give me back 15C and I will buy for him a new HP 12C (he anyway needs more business functions, while I need trig/-->HMS etc.)

Luckily I discovered that HP improved HP 12c by adding parentheses, undo & backspace.

I checked with some local dealer, but they still have the old model.

Anyone knows if the new model already hit the European market?

Any url (Austria, Italy...) ?

Sincerely, Gour

please take a look at www.hp42s.com ...

HTH

Raymond

Re: HP42S ROM Dump...

*Message #4 Posted by **Howard Owen** on 15 Feb 2006, 11:55 a.m.,*
in response to message #1 by Andreas Terzis

You need an HP48, but there's a better toolset available at Christoph Giesselink's EMU42 site. It still uses the same basic approach as JF's, with an HP48 receiving the ROM over IR from the 42S. But Christoph's package includes a better server for the HP-48 side, which allows you to download the ROM in one go. That's much better than doing it in small chunks as called for in JF's description.

Regards,
Howard.

HP 32SII

*Message #1 Posted by **Luis** on 15 Feb 2006, 5:38 a.m.*

Hi, I'm new around here and was surprised by the going prices of the 32SII... Well in the range of much more advanced technologically similar devices, like Portable PCs and Palm devices. Is this simply a "collector appeal" issue ??

The 32SII is the calculator I have and eventually use, simply because it's more practical than the 25C I was using before (which I also keep).

What makes these things so valuable and why are some versions apparently more valuable than the others ??
Thanks in advance for your time.

Re: HP 32SII

*Message #2 Posted by **Thomas Radtke** on 15 Feb 2006, 6:29 a.m.,*
in response to message #1 by Luis

> Quote:
>
> Is this simply a "collector appeal" issue ??

I don't think so. There are lots of HP calculators which are more interesting to the collector but go for less. I often quote the 18C, it offered a unique case, lots of firsts, and is quite rare but you can get one in good condition for under 30 EUR. Or have a look at the 35. This is the absolute must have calc and I would think that collectors buy several of them for replacement parts so prices should go up all the time. Nope, I can easily pick one up for 30-40EUR, with a little patience, that is (I'm rigth now looking for one just out of curiosity, condition doesn't matter really:).

> Quote:
>
> The 32SII is the calculator I have and eventually use, simply because it's more practical than the 25C I was using before (which I also keep).

I think you got it. The 32sii is one of very few nearly perfect pocket calculators. I tried to find a replacement for mine but there are simply no competitive models around (I've looked at Casio, Sharp and TI). YMMV but my hypothesis is supported not only by ebay prices but also by the success of the 33S, despite the fact that the keyboard design should distract everyone from buying it as much as several more serious hardware flaws and software bugs.

Re: HP 32SII

*Message #3 Posted by **e.young** on 15 Feb 2006, 11:55 a.m.,*
in response to message #2 by Thomas Radtke

I agree. The prices are high because a lot of people want one for daily use. If you don't need a lot of programing or advanced features, the 32SII is ideal. I needed to replace my original 32SII after it started showing signs of wear. Stacks of books had fallen on it, I carelessly dropped it off drafting tables several times, and once it got speared by an aluminum stick file. Some of the keys got loose, it's gouged and bent, but it still works fine-it's like a tank. I paid a serious amount of money on ebay to get a replacement, because I didn't want to rely on my old one anymore for daily calcs with loose keys. The 33s isn't bad either (assuming you get one with the revised display and keyboard), except cosmetically it is deeply flawed. The old bronze 32SII looked and acted like a serious tool, but the 33s looks like a toy, even if it is useful now.

*Message #4 Posted by **Ed Look** on 15 Feb 2006, 11:57 a.m.,*
in response to message #2 by Thomas Radtke

Well, I think there is *SOME* collector-aimed markup in the prices. If it wasn't so popular for practical use, it's price would still be high, but just not THIS high. I mean, it originally retailed for $70 USD when it was new. What some people ask for now is upwards of FIVE times that!

I agree that there is a 'price offset' for all HP calcs but it is probably insignificant in this case. If the 32SII would not be as useful as it is, it would go for less than a 28C since it is a very common model. Another aspect: A 32SII with the fraction bug is by at least a magnitude more rare than the other models so it should be a collectible. I've never heard that people request one of these faulty calcs. The opposite is true, often new contributors come along this forum and ask for the 'best' 32SII model.

in response to message #5 by Thomas Radtke

Good points.

It it heartening, then, to see hardheaded thinking with respect to machines intended for hardheaded use.

Now, I hope prices on some vintage models decline enough so that I might be able to afford replacing some aging ones or obtain some legendary unit!

in response to message #1 by Luis

I have a pocket PC and find using an RPN (or any other kind) of calculator emulator to be cumbersome. Although the idea is great in theory - that is I have pocket Excel, and more horsepower in my palm than I ever DREAMED of in university - it still falls short for me.

There is too much "stuff" in the way - missed/double digits, itty-bitty keys, etc. I would rather use a calculator to resolve an issue (even if it was a kinpo) than my pocket pc. The tactile feedback serves to reinforce the logic steps for the work I am trying to do. Conversely, my 41 is a lousy text machine for anything other than basic info. (plus the font is, I think, exceptionally ugly). However now my 41 is way too valuable to carry around in the field or leave in the office.

Now if only I could make my 41 play mp3's....

HP48 SMI RAM card on eBay

This went for $350.00 -- which seems reasonable for a retail 2MB RAM card...

...until you realize that there is no way to change the card's battery. Weren't these cards' batteries designed for 10 years? What happens when the batteries die. Will SMI replace them for you? Or are you up the creek without a paddle?

HP 48gx construction quality question

*Message #2 Posted by **Joe Edwards** on 14 Feb 2006, 10:26 p.m.,*
in response to message #1 by Han

I was bidding on it and was suprised to see how much it went for. Of course a nice 15c just went for $610.00 tonight. Of course there were many Zero Feedback folks bidding. Makes you wonder what people are thinking. I hope the seller doesn't get taken.

I thought the battery on thess cards just slid out the top of the card....

SMI 2 MB RAM card

*Message #5 Posted by **Han** on 15 Feb 2006, 1:03 a.m.,*
in response to message #2 by Joe Edwards

As far as the Hewlett Packard cards, and a few other non-HP brand cards are concerned, the battery DOES slide out from the top. However, SMI did not design their 2MB card to have such a feature. There is a battery, but without access to it, it will eventually die out.

You can read more about it via this comp.sys.hp48 post.

Decimal floating point

*Message #1 Posted by **Thomas Okken** on 14 Feb 2006, 5:52 p.m.*

I just started work on adding support for decimal floating point to Free42. I'm getting close to the point where I can hook an actual decimal library into the code, and I'm now on the lookout for the best code to use.

Hugh Steers kindly gave me a copy of the decimal code he wrote for OpenRPN, and I may decide to use that code eventually - it has an unrestrictive license and it's fast, but because of its encoding scheme it is not very memory-efficient, and at present it still lacks a few functions I need (hyperbolics, gamma, ln(1+x), exp(x)-1).

So, does anyone know of any other options? The IBM decNumber code has licensing restrictions I'm not sure I'm prepared to live with... Something that implements IEEE-754R (including "extended", preferably) and comes under a nice BSD-ish license would be perfect, but I guess that may be a bit much to hope for...

(One cute benefit of the Free42 code restructuring is that I'm going to support the use of extra-wide numbers internally (for complex and matrix computations), so on platforms where "long double" really is longer than plain "double", you'll get some pretty decent accuracy when stress testing INVRT with Hilbert matrices and such... Something to keep fans of binary happy. If they're using Linux, anyway -- VC++ 6.0 does not support "long double" so unless I switch to different development software, the 80-bit capability of your PC's FPU will continue to sit idle. And PalmOS (or rather, MathLib) won't do long double, period. Oh, well, enough rambling.)

- Thomas

re: Decimal floating point

*Message #2 Posted by **hugh steers** on 16 Feb 2006, 9:06 a.m.,*
in response to message #1 by Thomas Okken

hi thomas,

for your long doubles, take a look at this: http://www.voidware.com/index.php?option=com_wrapper&page=http://www.voidware.com/dp.htm

its a handy template i wrote that turns your doubles into double-doubles. and you can re-apply it, to turn your double-doubles into double-double-doubles and so on!

you can recompile my BCD library with any N precision. i think, originally i set N to use 24 decimal digits. this was to be pretty confident of 20 digit accurate results. it should be good for sqrt too, but all the trigs are designed to be 20 digit accurate, although in most you could simply increase the number of terms used in the calculations.

a while back i looked at the IBM library, however the license isnt very clear. the thing i did acertain is that it isnt BCD in the usual sense. it works with large binary integers which it converts to decimal on IO. this has the advantage of a smaller representation, but you do need a double sized accumulator eg. for multiply.

incidently, i'm working on a new BCD float library for my "exact" calculator which is variable precision. the fun part is writing the arbrary precision implementations of functions. eg here's the gamma function i've only recently coded:

```
exact -acc 50
Exact! engine (experimental) V1.03
Usage: exact [-max <max-digits>] [-acc <accurate-digits>]
enter expression to evaluate. variables, x=<expr>
`ans' is last result. `clear' erases all variables
`i' is sqrt(-1). blank line to quit. (min accuracy 50, working accuracy 60)
> gamma(20+17i)
= -1.450684303304718374411294862513395039489976225240E14-
4.962621878053675637190965935916024241118840676752 9E13i_
```

best regards,

Re: re: Decimal floating point

*Message #3 Posted by **Thomas Okken** on 17 Feb 2006, 11:31 a.m.,*
in response to message #2 by hugh steers

Hi Hugh,

I've more or less decided to use your code -- nice license, and if I use 12 bytes, I'll get an effective 17 digits, which is good enough for a 42S simulator (and in binary mode, I can use "long double" without changing the memory footprint, and that ought to make fans of ill-conditioned linear systems happy).
I'm still going to need hyperbolics, gamma, log1p, and expm1, but that, at least, is not a show-stopper as these are not too hard to fake.
BTW, do you know of any nice binary<->string routines? The code I wrote for Free42 works fine with "double", but it uses a look-up table that becomes a bit large when using "long double". For the Unix and Windows versions, I'll get around that by using sprintf and sscanf instead, but on PalmOS, that is not an option...

Thanks,

- Thomas

Re: re: Decimal floating point

*Message #4 Posted by **Rodger Rosenbaum** on 17 Feb 2006, 4:10 p.m.,*
in response to message #2 by hugh steers

Hugh says:

**> gamma(20+17i) = -1.450684303304718374411294862513395039489976225240E14-
4.962621878053675637190965935916024241118840676752 9E13i_**

Both Mathematica and Maple say that gamma(20+17i) is about:

-6.65309788E13 + 1.381348614E14 i

You've got a lot of digits, but they all seem to be wrong. Any idea why?

HP41CV Turbo Version- Modified Calcs

*Message #1 Posted by **John Kercheval** on 14 Feb 2006, 2:02 p.m.*

Hello:

While I rarely use it, I did in fact do the double speed modification to my college issue HP41CV. I did not, in point of fact insert an actual turbocharger or intercooler to achieve this.

Anyone else do this?

Anyne else perform non-stock modifications to ANY hp machines?

All stories welcome!

John Kercheval Georgetown University

Re: HP41CV Turbo Version- Modified Calcs

*Message #2 Posted by **Eric G** on 14 Feb 2006, 7:16 p.m.,*
in response to message #1 by John Kercheval

I have a HP 48GX with the 'Digitalis' speedup modification. It supposedly increases the speed of the GX from 4Mhz to 6Mhz.

You can turn the 'turbo' on by keeping the ON key pressed in for 2 seconds when turning it on. Otherwise it acts as a normal GX.

Unfortunately, the speedup also messes up the clock settings because 1 second isn't 1 second anymore!!

Eric

Re: HP41CV Turbo Version- Modified Calcs

*Message #3 Posted by **John Kercheval** on 14 Feb 2006, 7:28 p.m.,*
in response to message #2 by Eric G

Really? Is that true? How can I test that?

After you turn it off, does it slow down again? In other words, do you need to hold down the ON key for 2 seconds EVERY time you start it up?

John

HP-48 Turbo: [Was: Re: HP41CV Turbo Version- Modified Calcs]

*Message #4 Posted by **Raymond Del Tondo** on 15 Feb 2006, 2:52 a.m.,*
in response to message #3 by John Kercheval

At least on my 48G+ with speedup,
you have to hold the ON key for about a second
to signal the calc to switch to turbo mode.
For normal usage, just press the ON key as usual.
When turning off the calc, it will revert to
normal mode automatically.

There are easy ways to determine if turbo mode is active or not:
Just press an empty menu key, or press SWAP (right arrow)
while there's only one or no object on the stack.
The resulting beep will have a much higher frequency
than normal if the calc is in turbo mode.

Most of the time normal mode will be sufficient,
at least for me, since I made my own software speedup,
which also accelerates input forms and choose boxes;-)

HTH

Re: HP41CV Turbo Version- Modified Calcs

*Message #6 Posted by **Klaus** on 15 Feb 2006, 4:23 a.m.,*
in response to message #1 by John Kercheval

I modified one of my 41Cs. I somehow managed it to use the old capacitor, and using a switch to enable another capacitor. The switch sits where the charger plugs in. Unfortunately the switch gets sometimes set when pulling the calc out of its pouch. You can switch back when the calc is on (but idle), but when I switch back during a calculation, I got MEMORY LOST!

The switch selects normal speed or 1.4*normal

Overclocking comes in handy when keying in alpha data and runing programs, and I would recommend overclocking moderately without the possibility of switching to normal speed - as the CPU is mostly sleeping during calculations, the battery life will not be greatly shortened!

Long live the 41C!

Re: HP41CV Turbo Version- Modified Calcs

*Message #7 Posted by **Garth Wilson** on 15 Feb 2006, 4:47 a.m.,*
in response to message #6 by Klaus

Instead of switching another capacitor in or out during operation, it would be better to switch another

resistor in or out of the "R" part of the RC so you don't get the capacitor-charging glitches in the clock circuit. I did this in a product we marketed in the late 1980's. The clock normally ran at 200kHz to save battery power; but if there was a long set of calculations to do, the processor turned on a transistor that was in series with the resistor so the frequency would be bumped up to 1MHz to keep the customer from waiting. When the calculations were done, the transistor was turned off again, so the capacitor took longer to charge and discharge, resulting in a lower frequency. I don't know what's accessible in the 41, but I expect something like this could be done.

Re: HP41CV Turbo Version- Modified Calcs

*Message #8 Posted by **Klaus** on 15 Feb 2006, 6:32 a.m.,*
in response to message #7 by Garth Wilson

You are right, a resistor is definitely a better solution. The logic board of the Fullnut 41Cs offers enough room for a resistor. But since opening and closing the Case breaks out the screwholes, I will leave it as it is. By the way, I have read some old issues of the PPC journal, and at that time, most people were complaining about the build-quality of the 41C and the software bugs. Somehow reminds me of the 33S today.....

HP-16C index register

*Message #1 Posted by **Adam_s** on 14 Feb 2006, 9:02 a.m.*

I remember reading speculations about the wordsize of the index register (68 bits) and what this bits are used for. Since there seem to be firmware emulators available for free, did someone check?

Re: HP-16C index register

*Message #2 Posted by **Anders Persson** on 14 Feb 2006, 5:31 p.m.,*
in response to message #1 by Adam_s

At least Hewlett Packard list it as being 56 bits in the manual. But you are perhaps referring to undocumented extra bits?

Anders

Re: HP-16C index register

*Message #3 Posted by **Vieira, L.C. (Brazil)** on 14 Feb 2006, 7:18 p.m.,*
in response to message #2 by Anders Persson

Hi, Anders;

in the other two Voyagers with index register (HP11C and HP15C), it is described as a 56-bit register. The HP16C also has an index register, but it is described as a fixed-size, 68-bit wide register, and it does not depend on current word size. I wonder if there is a way to check for this fact... Maybe, with WS=64d, perform [0][NOT] [STO][I] and then perform [ISZ] in a running program and see if [I] goes to zero (ISZ returns true) or if it goes to 0100000000000000h (ISZ returns false). Has anyone tried something?

The 68-bit wide Index register in the HP16C is clearly stated in the HP16c Owner´s Manual.

Cheers.

Luiz (Brazil)

in response to message #3 by Vieira, L.C. (Brazil)

Hi!

I read something about this at http://www.finseth.com/hpdata/hp16c.html

But since Nonpareil is available, why not dump the memory and find out? (I must admit I have an old

version installed without voyager support).

Re: HP-16C index register

*Message #5 Posted by **Vieira, L.C. (Brazil)** on 15 Feb 2006, 1:52 p.m.,*
in response to message #4 by Klaus

HI, Klaus;

I´ll try this myself and let you all know here. I own two HP16C units, one is earlier and the other is newer, meaning internals are different. I think the test is simple, but I´d rather have it done in the calculator.

About dumping the ROM contents, it seems to me that it has already been done. I remember that sometime ago I read that one HP16C had one of its IC´s terminal broken after such dumping procedure. Too bad, though! Maybe someone else knowqs more about this.

Hrast has a Voyager emulator for the HP48/49 series, maybe the HP16C code is also available somewhere else.

Cheers.

Luiz (Brazil)

See (6) all way down the page

Greetings,
Massimo

HP-16C index register: definitely not 64 bits wide.

*Message #7 Posted by **Vieira, L.C. (Brazil)** on 16 Feb 2006, 12:30 a.m.,*
in response to message #5 by Vieira, L.C. (Brazil)

Hi, all;

I wrote the following small routines in the HP16C:

```
LBL E
1
DSZ
R/S
CLx
R/S
LBL F
1
ISZ
```

```
R/S
CLx
R/S
```

The basic idea is somehow simple: if I-register contents crosses zero while executing any of the routines, 0 is return. Otherwise, 1 is return. I set the calculator to unsigned mode, HEX base, and WordSize = 64d.

First I tested with the following:

```
keystroke   display
0 [STO][I]   [       0  h ]
[GSB][F]     [       1  h ] as expected;
[GSB][E]     [       0  h ] also expected;
[GSB][E]     [       1  h ]
[RCL][I]     [FFFFFFFF .h ]
[f][WINDOW]1 [FFFFFFFF  h.]
[GSB][F]     [       0  h ] It seems fine... so far.
0 [NOT]      [FFFFFFFF .h ]
[STO][I]     [FFFFFFFF .h ]
[GSB][F]     [       1  h ]
```

Oops! If I is 64-bit long, a zero is expected here.

```
[RCL][I]     [       0  h ]
```

The actual [I] contents are 0100000000000000h, and not 0000000000000000h, so the routine returns '1' instead of '0'.

```
[GSB][F]     [       1  h ]
[RCL][I]     [       1  h ]
[GSB][E]     [       1  h ]
[RCL][I]     [       0  h ]
```

Oops! Again, [I] contents are now 0100000000000000h, so the routine returns '1' instead of '0'.

Do you, guys, agree with the test and conclusions? Any comments?

Cheers.

Luiz (Brazil)

Best regards from V.

Re: HP-16C index register: definitely not 64 bits wide.

*Message #10 Posted by **Vieira, L.C. (Brazil)** on 16 Feb 2006, 1:31 p.m.,*
in response to message #8 by Klaus

Hi, Klaus;

you are right in your concerns, I think I understand. Anyway, I guess that the main fact here is to be aware of these facts and the consequences of using the index register in some applications where its contents might cross 'zero' and they actually don't. If you write a program where it's expected that the [I] register has its contents crossing zero for a given number of bits, mainly the current word size, and you use ISZ or DSZ to detect such occurrence, it is a good idea to check if this is actually going to happen with the full extent of the [I] register.

If you have a device with an internal 32-bit register acting ass a counter and, at a certain point, its contents are FFFFFFFFh and you add one to it, its contents will be 00000000h and, if provided, a carry bit is set. If this register has its contents compared to zero at this point, test returns true. If you simulate the same circumstance in the HP16C and you decide to use the [I] register to do so, ISZ will cause the [I] register to go from FFFFFFFFh to 100000000h, so it returns false and the next step is missed. The same will happen if you are working with any other word size, no matter what.

So, ISZ and DSZ may be tricky in a few circumstances in the HP16C. I am not sure reading about such facts before, so maybe this is too rare to be considered a problem.

Hey, Valentim; thanks for your additional info. BTW, where can we download these masterpiecs of yours from? I remember trying some times when you announced they were available, but I got some error messages and did not succeed downloading. Now that I lost many important documents (every moment I remember something...), I am collecting good material again. Thanks.

Best regards.

Luiz (Brazil)

Re: HP-16C index register: definitely not 64 bits wide.

*Message #11 Posted by **Klaus** on 17 Feb 2006, 8:27 a.m.,*
in response to message #10 by Vieira, L.C. (Brazil)

I tried it yesterday, and apparently GSB(I) exists.

1 STO I GSB (I)

Unfortunately my calculator already has some programs with labels in it, so I couldn't write a test program. Maybe we are talking here again about a feature that has no practical value?

Re: HP-16C index register: definitely not 64 bits wide.

*Message #12 Posted by **Vieira, L. C.** on 17 Feb 2006, 11:24 a.m.,*
in response to message #11 by Klaus

Hi, Klaus;

I think that indexed subroutine call (GSB I) has its particular use when different handling is necessary depending on data value/range. I used this feature in claculators with larger memory, namely the HP41 and the HP15C, but I used it neither in the HP16C nor in the HP11C, although both share the GSB I feature. In the HP15C I remember writting a program (back in the mid 80's) to compute fluid flow in different tubbing, diferent diameter and shape. For each case a number (tubbing type code) was keyed in and the program stored it in [I] register. Then the corresponding subroutine was called with GSB I to adjust an specific index according to tubbing characteristics.

Cheers.

Luiz (Brazil)

Re: HP-16C index register: definitely not 64 bits wide.

*Message #13 Posted by **Klaus** on 17 Feb 2006, 12:30 p.m.,*
in response to message #12 by Vieira, L. C.

Hi Luiz,

I agree that you can do useful things with this indirection (like Polymorphism in C++ or function pointers in C), but I see no chance I will ever use it on the 16C. In fact I have great difficulties programming the voyagers without a manual, as the looping (DSZ,...) won't get into my head. Much less can I remember which value of I does what action (like branching backwards on the 67, referring to the Label "A","B",...)

While most functions on HPs are intuitive, I use hardly more than a fixed set of functions.

Without a manual, I am completely lost on topics like creating bitmasks with the 16C!

Re: HP-16C index register

*Message #14 Posted by **Eric Smith** on 15 Feb 2006, 5:30 p.m.,*

in response to message #1 by Adam_s

I don't know that the high four bits of the 68-bit I register are used for anything whatsoever. It may have simply been easier to implement a 12-bit extension of the native 56-bit word than an 8-bit extenion, and not judged to be worth the trouble of masking off the extra four bits.

The high twelve bits of I are stored in nybbles 3 through 5 of RAM location 0xfe. I don't know if any of the other nybbles of that location are used; I've only observed zeros there. The low 56 bits of I are stored in RAM location 0xfd.

words words words, put them in a rumor-mill and out comes, rumors!

Re: Hp will release a new calculator 43s??

*Message #5 Posted by **Namir** on 14 Feb 2006, 2:18 p.m.,*
in response to message #1 by Chiu Yiu Wai

HP's resources dedicated to calculators are low, perhaps the lowest since HP launched the HP-35 in the 70s. It seems that HP has been focusing on improving the last set of calculators they launched over a year. In a way, that is good, because HP needs to restore some consumer confidence before launching any new calculators.

I would NOT hold my breath for a new calculator to come out very soon.

HP41C/CV/CX Self Test

*Message #1 Posted by **Mike T.** on 14 Feb 2006, 7:45 a.m.*

I suspect that the answer is no but I'm going to ask anyway as there are a lot of heads out there that are much wiser than mine.

I'm considering buying an HP41C/CV or maybe CX - I would like one in a nice clean condition and of course it has to work. Earlier SPICE series machines had a self test, and the later Voyager series had both a self test and a keyboard test. Is there a similar way of testing that an HP41C/CV/CX is working properly...?

Thanks

Mike T.

Re: HP41C/CV/CX Self Test

*Message #2 Posted by **Raymond Del Tondo** on 14 Feb 2006, 8:42 a.m.,*
in response to message #1 by Mike T.

Hi,

the HP-41 doesn't have a similar self-test built-in,
but you can check the most important things very easily.

I'd reset the machine first, clearing it's memory:
While the unit is off, press and hold the backspace key,
then press the ON key, then release both.
The unit should show 'MEMORY LOST'.

Press the bar keys, from left to right.
The first bar key turns the calc on,
the second switches to USER mode,
the third to PRGM mode, and the 4th to ALPHA mode.
If these modes are shown by the associated
annunciators in the display, these keys work.

Then switch back to 'normal' mode by pressing PRGM again.
Press [XEQ] [ALPHA] S I Z E [ALPHA] 0 0 0 , then press [PRGM] again.
On an empty CV or CX unit, the display will show '00 REG 319' .

This way you'll see that the RAM chips are there,
and are likely to work.

To ckeck if the display works, press [ALPHA],
then ABCDEFGHIJKLMNOPQRSTUVWX .
If you hear a beep when entering the X,
you have entered 24 characters. This is ok;-)

Now turn off ALPHA by pressing [ALPHA],
then press [ALPHA] again.

The display should show the string shifting to the left in short intervals.

You can also check if all keys have the same tactile feedback
by pressing them one after the other,
and check basic functionality by doing some calculations.

If nothing unxpected happened so far,
the unit is likely to work.

Of course there are always chances for hidden defects,
like broken screw posts or corrosion,
but this will be visible from the outside;-)

In my experience the above key sequences
show at least that the basic machine works.

There exist some Diagnostic ROM modules for the HP-41,
which had real self-test functions built-in,
but these weren't available to the public,
and thus are next impossible to get.

HTH

Raymond

HP to set up separate portable device business

*Message #1 Posted by **Greg Harris, Sydney Australia** on 14 Feb 2006, 12:42 a.m.*

Interesting news... HP to set up separate portable device business

Re: HP to set up separate portable device business

*Message #2 Posted by **Paul Brogger** on 14 Feb 2006, 8:45 a.m.,*
in response to message #1 by Greg Harris, Sydney Australia

At the risk of stating the obvious, I'll bet that calculators won't be included. They don't share the new product line's essential feature. (That is, a market segment growing 60% per year.)

That would set user flag 72. Assuming that you want to set the system flag, use a negative number, for example:

```
<<...blabla  -72 SF  blabla...>>
```

Regards,
James

Re: HP71B- Main Machine

*Message #6 Posted by **Garth Wilson** on 14 Feb 2006, 2:06 p.m.,*
in response to message #5 by John Kercheval

You can get to the CMT card reader port RAM battery by removing the port cover, and removing a couple of screws holding the back of the RAM unit on. The battery is soldered in. You don't have to remove the RAM from the computer to access the battery.

CMT made these card reader port RAMs up to 160K. There was someone who would hard-wire 256K into the computer for a hefty fee so that you'd still have all your ports available.

HP 41 battery charger and card reader

*Message #1 Posted by **Jan** on 13 Feb 2006, 11:15 a.m.*

Well, I am glad as a little child that just got a new toy. Today my recently purchased mint-state HP 41CV arrived via the mail, including a card reader with cards and a rechargeable battery-pac with a recharger. The calc I always wanted but which I never could afford when it was still in production. All that for 110 Euros. The calculator naturally works fine, even on the rechargeable pack. However, the card reader works as well (motor runs) but seems to suffer from a problem common to the 65 and 67 models. There is a greasy substance on the card after passing and sometimes the card gets even stuck in the card reader. I think it is just one of those damn rubber wheels again, I have the same problem with a 67 that I recently obtained. Could anybody confirm my diagnosis? Then there is something odd about the battery-charger. It is an 82066B, a so called "eurocharger" (that is what can be read on the case). The info on the outer case of the charger also mentions a voltage output of 8VAC. However, when I measure the output voltage directly with an AC voltage meter it gives a voltage of about 14 V (the voltage meter is ok, I did a double check with another meter which also showed the mentioned 14VAC). It seems somewhat strange to me, since it is not plausible that the charger is defect: both calc and accessories were hardly used since the former (1st) owner could not handle the beast very well and soon switched to a Casio. I read in the archives a little about a similar issue. As I understood it can have something to do with the state of the pack and the pack being insufficiently charged. Besides being also an AC/DC transformer, the pac also acts as a voltage regulator in some versions it was said. Does anybody know some more about this? I would not like to blow up the calcs circuits the first day I have it.

thanks in advance

Re: HP 41 battery charger and card reader

*Message #2 Posted by **Klaus_at_work** on 13 Feb 2006, 11:34 a.m.,*
in response to message #1 by Jan

Yes, the problem is the rubber wheel. You have to change it (more about that in the articles forum). Do not use the reader until you have a new wheel, otherwise the dirt from the wheel spreads in the reader and you have to clean everything. The charger output without a load might well be about 14 VAC, I will check this at home!

Greetings, Klaus

Re: HP 41 battery charger and card reader

*Message #3 Posted by **Klaus** on 13 Feb 2006, 1:24 p.m.,*
in response to message #2 by Klaus_at_work

11,7 V says my Voltmeter, depending on the inner Resistance of the Voltmeter, I would say 14 V are OK!

Greetings, Klaus

Re: HP 41 battery charger and card reader

*Message #4 Posted by **Jan** on 13 Feb 2006, 2:08 p.m.,*
in response to message #3 by Klaus

Thanks for your response. Is 14V safe to use though, or are there still some risks?

Regards Jan

Re: HP 41 battery charger and card reader

*Message #5 Posted by **Garth Wilson** on 13 Feb 2006, 3:46 p.m.,*
in response to message #4 by Jan

I don't have a rechargeable pack for my 41, but chargers' voltages are commonly much higher than stated if they're not loaded. I suspect you measured the voltage with no load on it.

Re: HP 41 battery charger and card reader

*Message #6 Posted by **Klaus** on 14 Feb 2006, 1:09 p.m.,*
in response to message #5 by Garth Wilson

14V is safe. An article on TOS about rebuilding the battery pac mentions 14V as output from the charger.

Re: HP 41 battery charger and card reader

You can contact the person that runs www.fixthatcalc.com. I believe his name is Randy.

Joe

Re: hp11c programable calculator

*Message #3 Posted by **Randy** on 12 Feb 2006, 9:58 a.m.,*
in response to message #1 by Frank

The springs have *nothing* to do with your display problem as they are there to connect the front aluminum bezel and rear ledgend plate together to protect the device from electrostatic discharge.

You most likely disturbed the LCD connections to the logic board by bending or otherwise moving the the elastomeric strips or the LCD itself.

Which version of 11C to you have - the early unit with the removable logic module and LCD or is everything mounted to a single PC board which is heat staked in place?

Anti-static springs on Voyagers

*Message #4 Posted by **Karl Schneider** on 12 Feb 2006, 3:11 p.m.,*
in response to message #3 by Randy

Hi, Randy --

You posted,

> Quote:
>
> The springs have *nothing* to do with your display problem as they are there to connect the front aluminum bezel and rear ledgend plate together to protect the device from electrostatic discharge.

I have a 1985 HP-11C that has a rectangular piece of the legend-bearing back plate missing, on the right side, between both rubber feet. This part of the plate covers one of those "spring holes", so one of those spring connectors is missing.

Does that spring provide anything more than redundancy -- i.e., a second, parallel connection between the "front metal" and the "back metal"?

Thanks,

-- KS

Re: Anti-static springs on Voyagers

*Message #5 Posted by **Randy** on 12 Feb 2006, 7:41 p.m.,*
in response to message #4 by Karl Schneider

They are not redundant, the spring nearest the battery connects the brushed finish bezel to the back, the spring nearest the ON button connects the keyboard surround plate to the back.

FWIW, Over the years I've seen at least a dozen beat to death Voyagers with no rear plate and no springs... not a one a with problem other than lots of internal keyboard dirt or broken LCD's. All the chips I've ever replaced were in units with intact plates and springs. Your mileage may of course vary :)

Re: 41cx long continuous memory

*Message #4 Posted by **David Smith** on 12 Feb 2006, 11:51 a.m.,*
in response to message #3 by Randy

It is typical for these machines to last at last two weeks without batteries. I have seen them go well over a month. The CX's tend to hold up longer than the CV and C.

I wonder what they would do with a 1F supercap in them (probably never get it charged, and self discharge would not last much longer than the stock cap... but it would be worth trying).

Re: 41cx long continuous memory

*Message #5 Posted by **S. Heddle** on 13 Feb 2006, 1:22 p.m.,*

HP 48gx construction quality question

*Message #1 Posted by **Joe Edwards** on 11 Feb 2006, 9:19 p.m.*

Folks, Last question for the night. How's everyones' knowledge regarding the construction qualitiy of the various HP 48gx models? I have a model made in Singapore and also a model made in Indonesia, with the black LCD. Should I expect any difference in the two calcs' construction...long term wise? Thanks

Joe

Yes Virgina, there is a difference.

*Message #2 Posted by **Randy** on 12 Feb 2006, 10:13 a.m.,*
in response to message #1 by Joe Edwards

The major difference is a Singapore has double shot molded keys, the Indonesian, printed keys.

IMO keyboard tactile feel in the Singapores is better as well. The same applies to Pioneers since they were manufactured in the same facility. A Singapore 32Sii is head and shoulders above a Indonesian 32Sii for keyboard feel. Indonesian Pioneer keyboards have a nasty habit of making snapping and popping noises when the keys are pressed or released, for some reason the 48's don't have this trait.

We beat this topic to death a couple of years ago when the 32Sii was discontinued, there's thread after thread in the archives.

Re: Yes Virgina, there is a difference.

*Message #3 Posted by **Thomas Radtke** on 12 Feb 2006, 11:39 a.m.,*

You haven't heard my Indonesian 48G yet. Impossible to pass the library security with this calc;). The fact the the housing is half empty amplifies the pop and click noise a lot, I believe.

Thomas

Re: HP 48gx construction quality question

*Message #4 Posted by **Han** on 12 Feb 2006, 4:22 p.m.,*
in response to message #1 by Joe Edwards

Hi Joe,

There are structural differences, in my opinion. Having taken apart a few, I can say that the rivets in the older

models are much better heat-fused to the contact points. In the newer models, the rivets can easily be pried from their contact point with the upper half of the calculator (i.e. the keyboard and LCD section).

As others have already pointed out, the keyboards are also much nicer in the older models.

As for the internals, the older models have a zener diode that helps prevent electrostatic discharges. This component was later removed from the newer models. My guess is that it they did this to prevent the diode from becoming a battery drain. Some owners have reversed the polarity of the batteries as a way of "resetting" their HP48s. Of course, in the older models, the zener diode would prevent this. Unfortunately the diode often becomes resistive, so that when batteries are installed correctly later on, they get drained by the diode.

And lastly, the LCD in the older models had a protective piece of plastic that protected the backside of the LCD. I think this helped prevent the LCD from being bent even slightly.

> And lastly, the LCD in the older models had a protective piece of plastic that protected the backside of the LCD. I think this helped prevent the LCD from being bent even slightly.

The early 48's (both G and S models) up to mid 1994 **did not** have the reinforced LCD. HP had too many warranty claims on broken screens so they added that piece of black plastic stuck to the backside of the LCD to help decrease the breakage rate. Those S and very early G non-reinforced LCD models also tended to be the lower contrast blue which was updated to a darker blue about the same time as the LCD plate was added.

> Quote:
>
> As for the internals, the older models have a zener diode that helps prevent electrostatic discharges

It wasn't there for electrostatic discharge... it was there in case you installed your batteries backwards, in which case the diode was forward biased and clamped the reverse voltage. Only problem was it was too small to handle the current and usually shorted. Since "installing the batteries backwards" trick was one of those urban ledgends that spread like all things bad, it was easier to eliminate the diode. HP did test and found reversed voltage wasn't much of a hazard as originally evisioned and was a better risk than battery eating, shorted zeners. So it was bye-bye zener. They dropped out by early 1996.

Re: HP 48gx construction quality question

in response to message #5 by Randy

Randy,

Thanks for clearing those two bits up. I do have one related question:

How often is it that when an HP48G no longer powers up, the cause is black electrolytic capacitor (next to the ROM chip) being defunct?

I have an older HP48G that no longer powers up, and cannot seem to diagnose the cause of the problem. Do you have any tips on diagnosing the cause of a working calculator simply going kaput?

<1%

Have you tested the logic board on a known good keyboard? On older used units it's most likely not the logic board but a shorted key.

HP 48gx construction quality question

*Message #8 Posted by **Joe Edwards** on 12 Feb 2006, 6:16 p.m.,*
in response to message #1 by Joe Edwards

Okay, thanks for the info. I figured the Indo models might be of lesser build quality after comparing my two calcs. Yes, the Singapore model is very quiet while the Indo model is almost as loud as a 49g+!!!

HP 48gx Advanced User Reference AUR

*Message #1 Posted by **Joe Edwards** on 11 Feb 2006, 8:23 p.m.*

Hey folks, I am looking everywhre for the 48gx AUR. It seems I can download the quick start and User's manual from several locations, but I cannot find the AUR anywhere...and it doesn't seem to be on the MoHPC DVD either. Any advice?

Joe

Ah found it. The search didn't locate the manual, but some sifting through the website was all it took.

I will probably pick up a couple of other books as well.

Thanks all.

Cheers

in response to message #1 by Joe Edwards

Yes, that's what I did.

I was surprised to find I have no PDF version lying around. That probably means that there isn't one in general circulation. There's a user written dictionary of all the keywords in the User RPL vocabulary of the HP48G. That's the bulk of what the AUR is, but the tutorial isn't included. Ibiblio seems to be having a problem at the moment, so hpcalc.org is down. Once it comes back, you can download the reference from the HP48 documentation section, under programming, I believe.

Regards,

Howard

I think it must be - I have one here. The file is called hp48gaur2.zip (but I might have named it that to avoid a name clash with the hp48gaur.zip which contains an HTML reference someone created). Where I got it from, I have no idea - but it can't be hard to find, or I would never have found it.

I know I got the PDF's of the User's Guide from the official HP site.

Best,

in response to message #5 by Les Bell

Google is *so* cool. A search for "hp48gaur -andrew" Gave me lots of hits. (andrew.cmu.edu is the home site for the HTML reference written by a user.) One was from here that pointed to http://www.hpcalc.org/hp48/docs/programming/hp48gaur.zip. I followed that link to find that a) it's the HTML user doc file, and b) it works even though ibiblio's mysql is hosed, so the index documents on hpcalc.org aren't working. The first Google hit was to just such an index page, which I had skipped. But then I remembered the Google cache! Clicking on the cache link for that first hit got me this link to the file you are looking for: http://www.hpcalc.org/hp48/docs/misc/hp48gaur.zip

And it works just fine. Hee hee! 8)

Hi Howard,

I just knew it had to be at the HPcalc.org site, but for some reason when I go it it I get a whole page of following error messages:

Warning: mysql_query(): .....

Not sure why I'm getting that. Maybe I got something turned off or on in my browser? Oh - just re-read your message and you comment on index being messed up - so I'm guessing it's a problem with HPCALC.

Anyway, Joe should now be busy reading the AUG :)

It's the company that hosts hpcalc.org - Ibiblio. The reason I know is that groklaw.org is also down, and also hosted by Ibiblio. Specifically, it's the MySQL database that is hosed, as the above error shows.

*Message #10 Posted by **Howard Owen** on 12 Feb 2006, 11:13 p.m.,*
in response to message #9 by Vassilis Prevelakis

My flight arrived at 5:30 and there was no problem by then. The connecting flight to Pittsburgh was delayed by half an hour - no big deal.

I lucked out in the air, but on the ground, I got lost looking for the shortcut to I-79 that the guy at the Enterprise counter kindly directed me to. So I saw a little bit of snow-

covered Pittsburgh suburb around Moon in the dark. I don't know what all the fuss is about driving in the snow. Piece of cake. 8) But I made it in OK, for all that.

Hi Joe,

I just spent 5 minutes using Google seach for

hp-48gx aur

and second page of searches turned up following link

http://hpcalc.kn.vutbr.cz/hp.php

which has a pdf of the 764 page HP-48G AUR Manual. The picture on the cover is the HP-48GX, so I think this manual covers both 48G and 48GX.

It's about a third of the way down the page and is listed as

HP 48G Series Advanced User's Reference Manual

Link directly to the PDF file is

hp48gaur.zip

Enjoy your reading.

Bill

Reading HP-67 cards...

*Message #1 Posted by **gr8patra** on 11 Feb 2006, 8:18 p.m.*

Hi there, I just purchased an HP-67 and I cannot get it read any cards. It looks like its card reader might not be calibrated correctly. I am not too familiar with the whole process so I would appreciate any input. I set the calculator to RUN mode and slide the card. The card goes through and I don't see 'Crd' on the display so I don't pass the second track through. The display shows '0.00'. I then press any of the top keys 'A'-'E' and the display shows 'Error'. I try the above procedure a few times, and after I also do a 'CL PRGM', but without any luck. I also went in to W/PRGM mode and deleted all '84' instructions from the calculator's memory manually (total newbie??? - sorry). Any thoughts on what might be wrong? Thanks, Gr8Patra

Re: Reading HP-67 cards...

*Message #2 Posted by **Vassilis Prevelakis** on 12 Feb 2006, 1:55 a.m.,*
in response to message #1 by gr8patra

1) get the HP-67 manual, its available on the MoHPC DVD collection

2) your card reader may need repair unless the person you bought it from has already fixed an age related problem. See this link http://www.rskey.org/hp67reader.htm

Re: Reading HP-67 cards...

*Message #3 Posted by **David Smith** on 12 Feb 2006, 11:54 a.m.,*
in response to message #1 by gr8patra

Do you know what program is on the card? Sounds like the reader may be working properly and you are not giving the program the input that it wants.

Re: Reading HP-67 cards...

*Message #4 Posted by **David Ramsey** on 12 Feb 2006, 1:38 p.m.,*
in response to message #1 by gr8patra

As another reply noted, it sounds as if your card reader might be working fine, and you're just using a blank card or a card with a program you don't understand on it.

Try this: enter a small program, record it to the card, then turn the calculator off and on and try to read the program back in. Here's how:

1. Turn calculator off, then on.
2. Slide upper right switch to "W/PGRM" position.
3. Type [f] SST A (that's the yellow "f" key, the key labelled "SST", then the key labelled "A")
4. Type ENTER 2 X R/S (4 keys total).
5. Slide the switch back to "RUN", enter any number, and press the "A" key.

If you've entered the program correctly, pressing the A key will double the number.

Now slide the switch back to "W/PRGM" and feed the card through. This will overwrite any program on the card, by the way!

If no error occurs, turn the calculator off, then back on. Enter a number and press the "A" key and notice that you now get the reciprocal of the number-- this is the default function.

Insert the card into the reader. When it's done, enter a number and press "A". If the number on the display is doubled, congratulation! Your card reader works perfectly.

Re: Reading HP-67 cards...

*Message #5 Posted by **Vassilis Prevelakis** on 12 Feb 2006, 8:06 p.m.,*
in response to message #4 by David Ramsey

```
David Ramsey wrote:

> it sounds as if your card reader might be working fine, and you're just
> using a blank card or a card with a program you don't understand on it.
```

If the card was blank, he'd get an Error. But more importantly if Gr8Patra cannot understand the meaning of the R/S instructions, telling him to "enter a program" is not exactly helpful.

This is why I told him to read the manual. At least this will prevent him for destroying things out of ignorance (e.g. reading a card while in W/PGRM mode and erasing it).

Please this is not intended as a critique on what David said. I just believe that while the HP-67 is a great machine, **but you have to read the manual** if you want to use it.

Its as simple as that.

Now the card reader repair site I added in my earlier posting is also giving info (and pictures) on how to determine if your card reader needs repair. Again this is something important as you can do even more damage to the machine and cards if you try to use a card reader with a degraded roller.

This is all part of the fun of using an antique.

Re: Reading HP-67 cards...

*Message #6 Posted by **gr8patra** on 13 Feb 2006, 8:39 p.m.,*
in response to message #5 by Vassilis Prevelakis

Vassili, This is a good suggestion. I think I'll get Dave's DVD with the manuals. This HP was from an auction I won on eBay and no manual came with it. Unfortunately, I wish I had posted the message earlier. It would have saved me from erasing a few cards in W/PRGM mode!!! But I still get the 'Error' message in RUN mode. It looks like the cards have lost their magnetic charge as they are so old. They are HP cards from official solution pacs but who know where the previous owner had them and how he took care of them. Oh well, that's what happens when one buys HP stuff on eBay. Live and learn. Thanks for your input, Patra

Re: Reading HP-67 cards...

*Message #7 Posted by **Klaus_at_work** on 14 Feb 2006, 2:55 a.m.,*
in response to message #6 by gr8patra

Suerte! The cards from the solution Pacs have the corners removed, therefore they are write-protected. A Card reader with all switches working cannot overwrite those cards! So there is still hope....

Re: Reading HP-67 cards...

*Message #8 Posted by **David Smith** on 14 Feb 2006, 10:52 a.m.,*
in response to message #6 by gr8patra

The cards will NOT erase themselves over time. If they did, all the appliction packs would be bad by now... and they are not.

Re: Reading HP-67 cards...

*Message #9 Posted by **jan** on 12 Feb 2006, 3:17 p.m.,*
in response to message #1 by gr8patra

Hi, The '84' instruction is in fact an R/S instruction which 'occupies' the program steps by default. If you switch on the calculator, put it in W/PRGM mode and press SST repeatedly you see 84 in every (numbered) program line: it simply has no meaning and is not part of some program whatsoever. It is also overwritten automatically when a program is loaded, either via the card reader or via the keyboard. Your problem sounds more like a card problem. Magnetic storage media do not maintain the information stored on them indefinitely. Sooner or later information is lost. Exposure to temperatures higher than room-temperature speeds up this data loss process, (unintended) exposure to magnetic fields (transformers, permanent magnets etc) is sometimes instantly fatal. This has nothing to do (that means not necessarely) with a degradation of the card's materials but rather with a change of the magnetic structure of the actual storage material: the card is probably still writable and (of course) after rewriting also readible. It is possibly just the case that a program-code written on the card in "19 who nows when" has degraded below a level the 67 can handle.

HP48, Battery Drain

*Message #1 Posted by **John Kercheval** on 11 Feb 2006, 8:25 a.m.*

Hello:

I have an hp 48GX with the HP 1MB memory card and the Bringslid Finance Pacx. It SEEMS to be going through batteries pretty quickly. The battery in the 1MB card is fresh, brand new.

Any ideas/comments?

On a related note, had anyone tried using the new AAA Lithium batteries in this thing?

Regards,

John K.

Re: HP48, Battery Drain

*Message #2 Posted by **Raymond Del Tondo** on 11 Feb 2006, 2:09 p.m.,*
in response to message #1 by John Kercheval

Hi,

what do mean with 'quickly' ,
a week, a month, or half a year?
Have you checked if the calc
can be used much longer w/o battery change
if the cards aren't installed?

Another thought:
Do you heavily use software
or data from the RAM card?
Accessing 'covered' ports means
more work for the machine,
and more work means more battery drain;-)

Or do you simply use the calc heavily?

I have a Sparcom 512K GX RAM card in port 2,
and sometimes either an HP 128K card
or an 128K EPROM card in port 1,
and the batteries last for months.

Regards

Raymond

> Not to be confused with the thousand's separator, which isn't supported on the HP-48, at least not out of the box;-)

I'm afraid you're wrong. A soon as you set FIX mode, the thousands are seperated by "," or "." depending on the definition of the decimal point. This is at least true for my 48S. The 28S does not display thousands seperators.

Marcus

HP 12CP program discrepancy

*Message #1 Posted by **C. F. Howlett** on 10 Feb 2006, 9:55 p.m.*

Greetings All:

I'm using the HP 12C Real Estate Applications Handbook and attempted to program the Mortgage Equity Analysis on page 48. This program doesn't directly address any registers, but it does use the STO and RCL functions. Anyway, punched it in and the output numbers wouldn't match up. Repunched with same output. Punched the same program into my 12C and no problem. What's happening here?

Re: HP 12CP program discrepancy

*Message #2 Posted by **Thomas Cox** on 10 Feb 2006, 10:12 p.m.,*
in response to message #1 by C. F. Howlett

Have you confirmed that you are in RPN mode?

Re: HP 12CP program discrepancy

*Message #3 Posted by **C. F. Howlett** on 11 Feb 2006, 1:43 a.m.,*
in response to message #2 by Thomas Cox

I did confirm the RPN mode.

Re: HP 12CP program discrepancy

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 10 Feb 2006, 11:28 p.m.,*
in response to message #1 by C. F. Howlett

Hi, Howlett;

would that be possible to digitize (scan) the program listings and at least one example so I could test it? I tried the MoHPC DVD and did not succeed finding this book there. I also look at the 'HP37E & HP38E/C Real Estate Applications', volumes I and II, and did not find an equivalent example.

If you agree with, please send the images to:

lcvieira (at) quantica (dot) com (dot) br

The (at) and (dot) are @ and . respectively, just a way to avoid scam.

Thanks.

Luiz (Brazil)

Re: HP 12CP program discrepancy

*Message #5 Posted by **tony(nz)** on 11 Feb 2006, 12:50 a.m.,*
in response to message #1 by C. F. Howlett

That prog needs 4 extra lines to run on the newest HP12c platinum. You need RDN after each of:

the FV at line 20, the n at line 22, and the i at line 24.

The PMT at line 25 needs repeating.

The reason is that this prog calculates "p" at line 17 and multiplies it by PMT at line 26 (here PMT is -1/sn).

On the old 12C this "p" is preserved in the Y register while FV and n are updated. The new 12cp does not disable stack lift after values are entered in financial registers, so we need the RDNs above. Or, the program could be re-written in other ways of course.

Hope this helps.

Cheers, Tony

Re: HP 12CP program discrepancy

*Message #6 Posted by **C. F. Howlett** on 11 Feb 2006, 1:55 a.m.,*
in response to message #5 by tony(nz)

Thank you Tony! I mistakenly assumed the only programming adjustment required was to add an extra 0 when directly addressing program line #'s. I'll try your method and update later.

The PDF history of the 12C on the HP site linked to in the article above is interesting. Reading it, you would never know that the 12C was part of a series of calculators. Was it the first of the Voyager models? The production dates on the museum pages for the various Voyager models show that the 15C and 16C were introduced in 1982, followed by the 10C, also in 1982, but that the 11C and 12C began life in 1981. Which came first, the 11C or the 12C?

Regards,
Howard

Hum. In that case, can someone familiar with marketing and The Truth tell me how this PDF can square the two concepts?

I can understand (but resent) that they don't want to mention the less successful bretheren of the 12C on a site devoted to its extraordinary success, but the narrative in the above PDF leaves out any mention of the 11C, even though it came first!? I don't see how they could have gotten away without lying directly, as opposed to indirectly, which is what most marketing material from large companies does. 8(

Regards,
Howard

Re: Contest Entries Should Lie Like This, for Example?

in response to message #4 by Howard Owen

Howard, the sequence I posted above was based on the museum's "next calculator made" function. Meanwhile, I crosschecked and found BOTH calcs were introduced on September 1st, 1981. So, probably both models were developed in parallel, one for the business guys, one for the tech guys. Besides some minor points (e.g. HP80 as direct predecessor of HP12C), the article may tell the truth nevertheless, but then of an Iowa farm boy with a very selective memory - well, after 25 years... ;-)

Re: Contest Entries Should Lie Like This, for Example?

*Message #6 Posted by **Howard Owen** on 11 Feb 2006, 6:16 p.m.,*
in response to message #5 by WalterB

Rereading the PDF just now, the only way I can square it with the idea that there was a scientific calculator released at the same time, and sharing enough design features with the 12C that they are called part of the same model line, is if most of the decisions mentioned were made on behalf of both calculators, and not just the 12C. Perhaps Dennis Harms lead a team responsible for both calculators, instead of being ".. the project manager for the 12C .." as described in the article. Retaining RPN on a business calculator might have been a decision that " .. would cause today's marketing people .. to gasp," but surely not those working for HP then. Every business calculator HP had produced up to then used RPN, as had every other calculator except the HP-01 wristwatch! The decision to add a third battery must have been taken for both machines. My 11C has three batteries, and exactly the same sloping profile as my vintage 12C.

Expurgated histories may be easier for target markets to swallow, but to me they are distinctly unsatisfying - and less interesting. And they just tend to confirm my impression that marketing is the art of half-truth in service of commerce. No, I didn't just discover that. 8(

Project and Product Management

*Message #7 Posted by **WalterB** on 12 Feb 2006, 10:28 a.m.,*
in response to message #6 by Howard Owen

Elsewhere in industry, when you start something like a new product line (let's call it "Voyager" for this post), you begin with elaborating a design to cover everything this line shall include. Suppose HP worked this way, they had all 5 models in mind (11c, 12c, 15c, 16c, 10c) in this early project phase already. These models may have been outlined in a rather coarse, blurred way with not every feature pinned down exactly, but with sufficient data to be sure all will fit into a common "Voyager" frame defined. So, I expect one project manager for "Voyager" (and maybe some deputy managers for the individual models, since many people have "manager" printed on their business cards in USA). Let's assume Dennis was the one (real) mgr. of "Voyager".

The project team started with the 11c and 12c to verify the market demand (some marketing guys may or may not have claimed this demand earlier). They produced the other calcs later.

Maybe not every model was on their project list in the beginning, but the architecture was flexible enough to cover all 5. The last was just the lowest in performance, so no problem with the 10c.

This "history" is just based on published production dates, and derived using logic and common sense - perhaps there are some folks in this forum who KNOW at least some parts of the true story.

So I guess that there's not going to be a 25th anniversary model and that this contest is partially the outcome from those questions that Mary asked here last year. (see: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=80093#80093 and http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=77161#77161) How disappointing.

in response to message #9 by Katie Wasserman

I seem to recall being very skeptical at the time.

Sadly, this is what I would expect.

it should also be a lesson to the dreamers who keep thinking HP will come out with a new version of the 15c.

Wake up, people.

CMT EPROM Programmer?

*Message #1 Posted by **Howard Owen** on 10 Feb 2006, 1:09 p.m.*

I just bought two CMT71-32E EPROM modules. These fit the front ports of the 71, and contain one surface mounted EPROM chip apiece. One of them has '27C256(illegible)' visible on its surface. It appears from this old museum post that CMT sold a special programmer for these modules. Does anyone out there have one of these programmers, or have experience hacking one together for these modules? I so want the JPCROM on one of these. I'm willing to talk trade for the privilege of using your equipment. 8)

Regards,
Howard

Re: CMT EPROM Programmer?

in response to message #1 by Howard Owen

I have one of them, Howard, and I'd be glad to program a PROM for you, assuming the programmer still works!

Email me at r-o-d-g-e-r-o-s@yahoo.com (kill the hyphens)with your own email address.

Re: CMT EPROM Programmer?

*Message #3 Posted by **Jeff D** on 14 Feb 2006, 9:30 p.m.,*
in response to message #2 by Rodger Rosenbaum

Can you also program the HP-75 EPROMS?

Re: CMT EPROM Programmer?

*Message #4 Posted by **Forrest Switzer** on 14 Feb 2006, 11:37 p.m.,*
in response to message #3 by Jeff D

Jeff,

The HP-71B EPROM programmer is specifically for the HP-71B EPROM, and will not accept others. The EPROM being programmed plugs into a contact set that duplicates the front port on the 71.

Forrest

Kitchen computer, true or false?

*Message #1 Posted by **Tom (UK)** on 10 Feb 2006, 9:14 a.m.*

While looking at the following good web site I found:

http://www.old-computers.com/museum/computer.asp?st=1&c=927

Am I being taken in? This can't be true??? I have my doubts (2.5MHz is fast for late 60's and very few details - love the picture and inbuilt chopping board!).

As a spoof it's quite funny, and possibly true - there were some wackey ideas in the 60's - and who knew where computers were going to end up!

Re: Kitchen computer, true or false?

*Message #2 Posted by **Bill (Smithville, NJ)** on 10 Feb 2006, 9:26 a.m.,*
in response to message #1 by Tom (UK)

Hi Tom,

Well - it's apparaently genuine. I just did a search on Honeywell's web site and found following:

Link

At $10,000 each, I wonder if they sold any.

Bill

> At $10,000 each, I wonder if they sold any.

In your Honeywell link, it says: "Not surprisingly, no Kitchen Computers were sold."

But if you do a Google or Wikipedia search, you will find endless references to it

Greetings, Max

Re: Kitchen computer, true or false?

*Message #4 Posted by **Tom (UK)** on 10 Feb 2006, 10:04 a.m.,*
in response to message #3 by Maximilian Hohmann

I clicked on the 'read more' button and there are a few more details including being promoted as a kitchen computer to get free publicity. So not intended for a chopping board! or the kitchen! But not sure of the real intended market.

Re: Kitchen computer, true or false?

RPL programing

*Message #1 Posted by **Joe Edwards** on 9 Feb 2006, 8:50 p.m.*

Hey folks, Where would be a good start to try my hand a BEGINNER's level programming on the 48 series calcs - or basic BASIC (heh) programming on the 71b? Also, has anyone here used a HP 28 model? I see they are cheap on ebay...is this due to poor construction? I kind of wonder about the clamshell kinking/damaging the wiring between the two sides.

Joe

Re: RPL programing

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 9 Feb 2006, 9:31 p.m.,*
in response to message #1 by Joe Edwards

Hi, Joe;

my suggestioin would be theearlier HP48G Advanced User's Reference Guide + HP48G User's Manual. They are concise, well written and specially the AURG explains RPL-based program structures very well.

About the HP28: there are two models, the earlier HP28C (4KBytes RAM) and the later HP28S (32KBytes RAM). I consider the HP28S as having a better interface, with better structured menus.

About the clamshell: there is no wires between them, just a single-piece, multi-layer flex-circuit assy. When the calculator has its case open and 'lined up', as if placed in a plane table, the flex circuit is not bent. When it is closed or tottaly folded, back-to-back fashion, the flex circuit has each half part (one on each shell) 45 degrees twisted in relation the 'hinge' part of the flex circuit. I was never told that this flex circuit has been broken or had a broken track.

Cheers.

Luiz (Brazil)

Re: RPL programing

*Message #3 Posted by **Thomas Okken** on 9 Feb 2006, 10:40 p.m.,*
in response to message #1 by Joe Edwards

I've heard bad things about clamshells in terms of repairability. I'm not sure if the wiring between the two halves is a liability, but from the information I gleaned from the many threads re: repair on this forum, once they do start to get problems in the areas of wiring or bad keys, they're almost impossible to fix.
I bought a 28S when it first came out, and it is an extremely cool machine, but I found the clamshell design to be awkward. As long as it's lying on a flat surface, it's OK, but as a hand-held, it sucks. I can't say anything about how reliable or durable it is, because I only had it for about a year... I sold it once the novelty of RPL and symbolic algebra wore off (and I realized that anything I can't do on the 42S, I'd much rather do on a computer).
If you like RPL, I'd say get a 48G instead. They come a lot cheaper than the 48GX, apparently because surveyors and other power users can't live with the 48G's lack of expandability -- but if you like the 28S, chances are you'll like the 48G even more. Keep in mind that the 28S only has a one-way IR interface, while the 48G has a two-way IR interface *and* a serial port.

I have an 18C, which I use once a week. No problems thus far but the keyboard sucks. The equals key has a notable different feel than the other keys due to it being the key used most (is this still english grammar?;). I guess this is a result from HP being experimenting with cheap plastic domes for the first time AFAIK. However, I have no such problems with pioneer keyboards.

Hi again, Joe:

Joe posted:

"V, Where would I find these out of print books? Are they on the MoHPC DVD (just ordered it)? I cannot seem to find the books on the DVD or your articles in the article section."

Good question ... I had assumed that they would be in the MoHP DVD but alas, they actually aren't :-(

They're probably not on sale anymore, but perhaps can be located at some store specialized in old books. The details for Mr. Horn's book are:

```
Title     :  Hp-71 Basic Made Easy
Author    :  Joseph Horn
ISBN      :  0-9612174-3-X / 096121743X
Publisher :  Educalc Pubns
Edition   :  Softcover
```

and failing that, eBay or an add in the proper section of this forum might help. Also, I you can read French, there's a French-language translation on line, namely:

```
LE HP-71, C'EST FACILE
```

that may be of some help, though it doesn't include some listings at the end of the book.

As for my articles, you can download most of them from my web page, as PDF documents, and failing that, let me know and I'll send the ones you wish to any e-mail address of yours you care to provide, also as PDF files.

The reason they aren't in the Articles' section is because I only want to distribute them in PDF format (so as to keep their exact, facsimile original form, fonts & formatting & images and all), and MoHP only hosts html or text files, it seems. I asked David if he would host them in PDF format, but he apparently wasn't interested as that would be inconvenient for people accessing the articles from some non-PDF capable portable device or such, whatever.

Thanks for your interest in the HP-71B and

Best regards from V.

Learning HP-71 BASIC

*Message #9 Posted by **Garth Wilson** on 10 Feb 2006, 2:59 p.m.,*
in response to message #1 by Joe Edwards

I haven't tried the other books recommended above, but I personally thought HP's manuals for the 71 were great. When I got my 71, I just started at the front of the owner's manual and worked my way through, and at the end, felt like I knew the product-- without ever having gotten to "the hard part." I felt no need at all for another book to "make it easy." Later I added tons of new programming features from the users' groups (through LEX files), but by then I knew the computer they were going into, and there was no difficulty.

Edited: 10 Feb 2006, 3:02 p.m.

Re: RPL programing

*Message #10 Posted by **Stephen Easterling** on 10 Feb 2006, 9:20 p.m.,*
in response to message #1 by Joe Edwards

My first was the 28S back in '89 and I learned a lot on it (reading and applying all the manuals, etc). I kept mine in great condition and never had any problems. However, at one time I had programmed 30k out of the available 32k and let the batteries get low on me. I lost everything in memory! The battery door is not so tough to use once you get used to it, and you have about 30 sec. to swap batteries before you lose memory. It's terrible as a handheld. Back in the day if I could have afforded a 48G (or GX), I would have given my 28S an early retirement. The 48G series is a much better machine (except you have to get used to all the shifts due to fewer keys than the 28S). The 48-series AUR is great. There are also about five (at least) good books on programming the 48 for calculus / differential equations, and is well documented with minimal google searching.

Re: RPL programing

*Message #11 Posted by **John Limpert** on 11 Feb 2006, 2:31 a.m.,*
in response to message #1 by Joe Edwards

I like the 28 series calculators. They are cheap and reliable. I've never had a keyboard or clamshell interconnect problem. I've seen a few with display problems, the sort of thing that often afflicts calculators with LCD graphics displays. The weak point of the design is the battery door. They are a pain in the neck to replace after changing the batteries. They are often cracked or damaged by frustrated users. The display doesn't have the resolution or contrast of the displays on the 48 series calculators, but it is acceptable. The batteries (N cells) are a little hard to find. I've found them at Radio Shack and battery specialty stores on the Internet. The manuals are well written.

If you see one, preferably the 28S, in good condition (check battery door), with the manuals, give it a shot. I've picked them up on eBay for very reasonable prices.

I still have a 28C that I bought when it was introduced. It's never had any problems.

Before you crack open the case, check out www.fixthatcalc.com... From that site...

"I changed my batteries and now my calculator is dead!

Always, always - before changing batteries, back up any programs or solver equations!

The models listed above all share the same battery size and type. The three small coin cell batteries will last a minimum of a year or more, depending upon use. One common problem is after installing new batteries, the calculator appears dead and will not power up. This can be sometimes be fixed by completely resetting the calculator and completely clearing memory. Here's how:

Remove the battery cover and shake the batteries out with a few sharp smacks against the palm of your hand. Now, using a small coin (dimes and pennies work best), slip the sides of the coin between the battery spring clips so that you touch both sides of the battery clips at the same time with the coin. This discharges the internal storage and will clear memory. Now, reinstall the batteries, observing the proper polarity picture shown on the case, slip on the battery cover and turn it on. You should see a "Memory Clear", "Pr Error" or similar message and you're back to calculating."

*Message #3 Posted by **Gonzalo Fernandez (Spain)** on 9 Feb 2006, 1:31 p.m.,*
in response to message #2 by Howard Owen

I doubt he will pay if he wins the auction, he has negative feedback for not paying $9.99 Better for the seller to apply common sense in order to avoid sky prices and then the buyer doesn´t want to pay, for example, ending the auction early, it is only a suggestion, but perhaps the buyer thinks that the auction includes a calculator.

> Considering I can buy four N-type batteries here for $10.00

I just paid $2.29/pair and I thought that was bad. (I guess I'm getting spoiled by AA's dropping to $.40/ea. Fortunately a set of N's lasts a year or two in my 41cx. So lemmee see-- $300 would take me to approximately the year 2100.

I think kahunajumpbig just put in a ridiculously large bid initially, and then some other bidder had to try many times before he could finally get the high bid. The unsuccessful bids don't show up in the bid history, but each time kahunajumpbig's bid is automatically increased (up to his limit) to stay ahead *does* show up.

According to the bid list, seantokuji (10) put in a skyrocket bid at Feb. 6th, then kahunajumpbig (63) stepped up today until he conquered. Usually such many steps are typical for unexperienced bidders.

After all, kahunajumpbig will probably be not completely satisfied with the items he will get for >300 $ -- so he may return them as offered and take the shipping costs as tuition fees. And the winner is ... USPS!

d:-)

> show up.

No this is not how eBay works. Lets look at the bidding:

starting bid was $10

on Feb 5 gwbarbosa bids for $20, the "Current bid" is $10

on Feb 6 seantokuji bids $300, the "Current Bid" is changed to $21

on Feb-8 drsanfranscisco bids $38.89, the "Current bid" is changed to something close to $40 (essentially eBay uses money from seantokuji's max. bid to outbid drsanfranscisco on seantokuji's behalf)

from that moment onwards kahunajumpbig starts bidding up.

Each bid is shown in the bid history and each time the "Current bid" is updated to be a little bit more than kahunajumpbig's bid since it was less than the $300 bid placed by seantokuji.

Finally kahunajumpbig places a bid greater than $300 (prob. smth like $320) and the "Current bid" is changed to $305 with highest bidder kahunajumpbig.

So the bids shown are the actual bids placed by the bidders excpet the last one ($305) which is the lowest possible to outbid seantokuji 's bid. At this stage the bid increments are $5, so we know that kahunajumpbig's bid is >= 305. If the "Current bid" was lower than $305, (e.g. $301) than we would *know* that kahunajumpbig's bid was EQUAL to $301. This is the only case where you can tell the true amount of the highest bid.

My guess is that seantokuji is feeling very releaved at the moment. It may be that he simply put a very high bid to be sure to win without really expecting the price to go *that* high. If kahunajumpbig gave up at $289, then seantokuji would be in for a very bad surprise the next time he/she checked the bidding.

This happened to a friend who bid $100 for the manual of the HP-IL interface for the HP-71B. Someone went as high as $95 and gave up, so my friend had to shell out $100 (+ pp) for a $10 manual.

Folks, never put a very high bid well in advance. Infact never put a bid higher than what you can pay. Sooner or later you *will* regret it.

This is exactly the sort of thing the eBay modified auction encourages. In addition to the dynamics of competitive bidding, which eBay shares with real auctions, there's the fact that the full impact of a high bid is deferred. You bid $300.00, and you see a current auction price of $21.00. The psychological barrier to placing an outrageously high bid is thus lowered. Then there's the fact that you can't retract your bid. This sounds like the normal practice in a real auction that doesn't allow bid retractions, but it is really quite different. There's no such thing as a "maximum" bid in a normal auction, and that's what eBay won't let you take back! Finally there's the element of time. Instead of being over within minutes, eBay auctions take place over a long time period. Since you can't retract you maximum bid, this can only work to the advantage of the seller, allowing maximum time for a silly, inebriated or otherwise impaired buyer (e. g. *me* on a bad day) to top an already outrageously high bid.

Snipe it. That's what I say.

Regards,
Howard.

Couldn't agree more. You see something you like on eBay? Set an alarm to remind you five minutes before the auction ends. If you bid any time before that, you might as well go to a casino and throw your money away in an environment where you can at least watch pretty blinking lights. :-)

I hear there are even sniping services that will automate the process for you. Haven't tried them myself yet, but then again, once I got my nostalgia taken care of by scoring an HP-25 and an HP-67, I haven't really taken a serious look at eBay anyway!

Look a little closer yet. kahunajumpbig was using automated bidding software. There are only 7 to 10 seconds between his bids. He appears to be new and a lot of newbies seem to use that auto bid software.

I expect that he lost control and never imagined that it would go that high. I bet that Walter will be reposting his batteries after kahunajumpbig doesn't pay.

HP20S for over $100... What!?

*Message #1 Posted by **Han** on 8 Feb 2006, 5:35 p.m.*

eBay #5863056474

These normally sell for around $20-$30. Even a brand new one with all its original packaging (unopened, and with brown bezel) was recently sold for under that amount. Why is this one going for such a high price?

Re: HP20S for over $100... What!?

This is the psychological effect of the eBay modified auction at work. Buyers are encouraged to bid high through all sorts of means, and then can't retract the bid when common sense sets in. Personally, I find it takes substantial discipline to buy on eBay without getting goaded into bidding too high. I commonly snipe auctions now, using an outside service. Regardless if I snipe or bid directly, I make my bid, and then I don't look until the auction is over. I frequently lose that way, but when I win, it's for a price I can live with.

Regards,
Howard

I was going to say the same thing. Snipe a max bid at the end and if you bid enough it is yours without adding to the madness leading up to the end of the auction.

Joe

HP-41 ROM image to HP-42S "raw" converter

*Message #1 Posted by **Thomas Okken** on 8 Feb 2006, 3:50 p.m.*

I wrote a little program that reads HP-41 ROM images, extracts the user code from them, and converts it to *.raw files you can import into Free42 or Emu42 (or HP-42X, I expect, or even into any HP-41 emulator).
It converts XROMs that point to user code within the same ROM to corresponding XEQ commands; it converts strings from HP-41 to 42S encoding; it emits warnings about XROMs that point to machine code functions, and about XROMs that are not local to the ROM in question and do not match HP-42S instructions either; and finally, it warns when it finds any synthetic code (most of which won't work on the 42S, at least not the really neat stuff).
The ROM image must be in *.ROM format, meaning: each 10-bit word is encoded by a byte which has bits 9-8 in its bits 1-0, followed by a byte containing bits 7-0. A normal 4k-word ROM thus comes in an 8kbyte file. If you have only *.MOD format images, Warren Furlow has a program called MODFile on his site (TOS) that extracts the *.ROM files from a *.MOD file.
It's called rom2raw and you can download it from my web site. The download is a zip file that includes the source code and a Windows console executable. Enjoy!

- Thomas

Edited: 8 Feb 2006, 5:04 p.m.

Re: HP-41 ROM image to HP-42S "raw" converter

*Message #2 Posted by **Thomas Okken** on 9 Feb 2006, 2:19 p.m.,*
in response to message #1 by Thomas Okken

I posted an updated version, which has an additional command-line option to generate annotated listings of the extracted user code. With those listings, you can easily locate the instructions that an HP-42S would have problems with (unimplemented XROMs, synthetic functions).

*Message #5 Posted by **Thomas Okken** on 14 Feb 2006, 9:47 a.m.,*
in response to message #2 by Thomas Okken

I posted yet another update -- the previous version didn't handle XROM xx,00 properly: it assumed that that entry was always just a dummy used for the ROM name, while in fact there are ROMs that have user code there. This version treats XROM xx,00 like all the others, and it is smarter about recognizing "dummy" entries (it looks for machine code entry points that point right at a Return instruction).

Consider the source (Lew Platt blog item)

*Message #2 Posted by **Karl Schneider** on 10 Feb 2006, 12:04 a.m.,*
in response to message #1 by bill platt

Bill --

Well, that was an easy-to-read, if not particularly insightful, short blog about Lew Platt, former exec at HP and Boeing who died on 8 Sep, 2005.

The entry was dated 11 Sep 2005, making it almost five months old. The author's pseudonym(?) was "irishblogs", perhaps suggesting a non-continental Euro-centric view of things...

The blog entry contained more than a few grammatical errors, causing me some skepticism about the intellectual quality of its content. One assertion that struck me was,

> Quote:
>
> "It’s interesting that Platt died in service while at Boeing, the US aerospace giant which appears to have run out of fresh ideas and is getting it’s ass handed to it by Airbus. Just like HP it’s greatest triumphs are relics of the past...

Apparently the author hadn't heard of the new model 787, revolutionary for its composite-material airframe, as well as many other innovations in passenger ergonomics. Boeing appears also to have surpassed Airbus on new sales, according to figures released after September 2005.

As for "relics of the past", the modern and well-regarded model 777 debuted in 1995, and was the first aircraft to have been designed entirely on CAD. Maybe 11 years is ancient history, according to the blogger.

Well, enough from me about this loosely-related, but off-topic subject.

-- KS

Re: Consider the source (Lew Platt blog item)

*Message #3 Posted by **Vassilis Prevelakis** on 10 Feb 2006, 10:41 a.m.,*
in response to message #2 by Karl Schneider

I agree.

Boeing had a difficult time a couple of years ago, but they managed to get their act together, launch a brand new airplane (the 787) while maintaining their lead in the long range category with the 777-200LR.

I am a bit worried though about Boeing's move at shedding of manufacturing units (e.g. the Wichita plant sold lock-stock-and-barrel to Canada'a Onex Corp.). Boeing is also transfering a lot of technology to sub-contractors so that they can deliver complete aircraft sub-assemblies (i.e. entire sections in flight ready, fully integrated configuration). While this has obvious short term benefits, I am not sure whether this is a particularly bright long term strategy.

```
> Boeing appears also to have surpassed Airbus on new sales,
> according to figures released after September 2005
```

Actually, "*Airbus beat Boeing in the end-of-year tally of net orders, gaining 51% of the marketshare with 1055 versus 1002 aircraft and also surpassed its rival in deliveries, with 378 versus 290 aircraft*" (Aviation Week and SPace Technology, Jan. 23, 2006). I suspect though that because Boeing sold more twin-aisle planes, they may well end with higher $ sales, although this is hard to determine as many deals do not mention actual prices.

*Message #4 Posted by **gifron** on 10 Feb 2006, 5:11 p.m.,*
in response to message #3 by Vassilis Prevelakis

Though I don't remember the "actual estimates," it is widely believed that Boeing handily beat Airbus in terms of $$ - I think it was something along the lines of 60-40 in favor of Boeing. Of course, Airbus is still delivering more planes than Boeing, and that's where the money comes from.

I would much rather cross the pond on a 1960's technology 747, thanks. 777s may be more efficient, but they are also slower than and not as inherently safe as 4-engine 747s.

Those big 777 engines are cool, but maybe they need an afterburner or something -- I don't appreciate the extra hour it takes for a 777 to get from, say, Houston to London.

> say, Houston to London.
```

Are you sure your airline is not trying to save fuel by selecting a lower cruising speed?

The 747-400 typical cruise speed is 0.85 Mach (around 567 mph), while the 777-200ER is 0.84 Mach (around 560 mph).

(all figures from the Boeing web site)

So the 777 is only 7 mph slower than the 747. This means that on a 10 hour journey you will end up only 70 miles behind. This hardly accounts for the 1 hour.

So I'd suspect the airline. I have stopped flying USAir because of this extra time. Notice though that since they pad their timetables (so that they can arrive on time even if they are delayed), you may not be able to determine this behavior until you actually fly a few trips.

**vp

If you think how bad can it get??? I assure you it can get worse, in the UK a low-cost airline Ryan-Air is charging you extra if you check in luggage (BTW you are only allowed 6Kg/13lb as carry on luggage). Needless to say I have blacklisted such loosers.

*Message #8 Posted by **John Noble** on 13 Feb 2006, 3:17 a.m.,*
in response to message #6 by Vassilis Prevelakis

We are waaay off topic now. 333 to delete.

> Quote:
>
> Are you sure your airline is not trying to save fuel by selecting a lower cruising speed?

Possibly. Since fuel and overall economy is the single reason for an airline to buy 777s, I'm sure the airlines maximize both.

Still, 777s can't fly the same transoceanic routes as 747s -- they have to stick closer to airports. 777s can run ETOPS-180 (i.e. not more than 180 minutes from an airport at any time) over the North Atlantic, I think, while 747s have no such restrictions and can simply fly great circle routes.

Re: Consider the source (Lew Platt blog item)

in response to message #8 by John Noble

Is this because it has two engines?

Re: Consider the source (Lew Platt blog item)

*Message #10 Posted by **John Noble** on 14 Feb 2006, 5:55 p.m.,*
in response to message #9 by bill platt

> Quote:
>
> Is this because it has two engines?

Yes. Check out this discussion for some more information. Boeing and the airlines have done a lot of arm twisting to raise ETOPS limits for 777s.

In a parallel post, you said:

> Quote:
>
> My last flight from the West coast was at 530 statute MPH according to the Capitan. It was Continental or Northwest on a 757 or something.

Going west, ground speed could be 50-100 MPH higher than airspeed, depending on jet stream conditions. I've seen ground speeds close to 600 MPH going west ... and c. 450 MPH going east, at which point I begin to wonder if (in Princess Leia's words) it would help if I got out and pushed. :-)

------- 333 to delete.

Re: Consider the source (Lew Platt blog item)

*Message #11 Posted by **Dave Shaffer** on 15 Feb 2006, 1:19 p.m.,*
in response to message #10 by John Noble

I think you've got that backwards.

In the continental United States, the prevailing winds, including the jetstream, are generally FROM west TO east.

Hence, ground speeds will generally be higher when travelling from west to east.

My last flight from the West coast was at 530 statute MPH according to the Capitan. It was Continental or Northwest on a 757 or something.

Re: Consider the source (Lew Platt blog item)

*Message #15 Posted by **Neil** on 16 Feb 2006, 2:22 p.m.,*
in response to message #6 by Vassilis Prevelakis

I've been using Ryanair regularly for the past couple of years, and in fact I'm travelling with them tomorrow. In my experience, they are dirt cheap, punctual, clean, and you get what you pay for. By the way, the actual planes (mostly Boeing 737's) are pretty new. By that I mean they are mostly less than 5 years old.

Unless Ryanair happen to have changed their baggage allowances in the last couple of months, then your statement about having to pay for excess baggage over 6kg is not correct. You are permitted to check in up to 15 kg (33 lbs), and in addition take up to 10 kg (22 lbs) hand baggage, at no extra cost. You can check the details of the baggage allowances here: http://www.ryanair.com/site/EN/faqs.php?sect=bag&quest=baggageallowance

Re: Consider the source (Lew Platt blog item)

*Message #16 Posted by **Vassilis Prevelakis** on 17 Feb 2006, 1:35 p.m.,*
in response to message #15 by Neil

```
Neil wrote:

> take up to 10 kg (22 lbs) hand baggage, at no extra cost. You can check
> the details of the baggage allowances here:
> http://www.ryanair.com/site/EN/faqs.php?sect=bag&quest=baggageallowance
```

I stand corrected.

My statement was based on the following BBC News article of Jan 25, 2006:
http://news.bbc.co.uk/1/hi/business/4647906.stm

"Ryanair planning baggage charge,

Low-cost airline Ryanair is to begin charging passengers extra for checking in their baggage before flights"

I was wrong in thinking that this was the current policy, while as the article suggests it is not

yet in effect (it will start on March 16).

As far as the 6Kg carry-on limit, I was told by another airline (BA) that this was "mandated by EU regulations" Given Ryanair's policy, I am tempeted to believe that BA was simply interpreting EU regulations arbitrarily.

Re: lew platt

*Message #17 Posted by **Bruce Horrocks** on 14 Feb 2006, 6:52 p.m.,*
in response to message #1 by bill platt

Platt was the man who invited Dick Hackborn back to the board and tasked him with coming up with something radical. The result was the spinning off of the test and measurement division into Agilent. Hackborn relied heavily on uber-consultants McKinsey and the split was probably entirely their idea, it being the first leg of a masterplan to turn HP into a services company. Step one goes okay: Agilent spun off, only the employees thoroughly pissed-off so that's all right then. Step 2: beef up HP's consulting arm by acquiring PwC. Oh dear! Large fly in the ointment: PwC partners - being consultants - could see that it was a non-starter and they decided not to let themselves be bought.

So McKinsey then brazenly wheel out plan B: buy Compaq instead. How on earth the HP board swallowed that one beggars belief. PwC and Compaq were chalk and cheese. Such a major re-think of strategy would normally require significant analysis but HP seemed to be committed to following up in ultra-quick time so it went ahead regardless.

Which brings us to the present day, where no one is convinced that the merger worked and HP is still nowhere near to becoming a services company. Because of this fiasco, it seems inevitable that, sooner or later, HP will spin off the printer division while the rump of the company slowly declines into a small player, a la Unisys.

'Platt fell flat' seems to be his legacy.

RPN Simulator for PocketPC

*Message #1 Posted by **John Nelson** on 8 Feb 2006, 12:48 p.m.*

Does anyone know of any good RPN (hopefully HP) simulators for the PocketPC? With using my HP all the time, a regular calculator is a bit hard for me to use and I would rather have a nice RPN calc that I can use on my PocketPC.

Thanks!

Hi John,

The best for the PPC is EMU42. See following link

http://www.hp42s.com

Of course you will also need an actual HP-42S in order to download the ROM image. This is a true emulator since it uses the actual rom image.

There are some other simulators - check www.handango.com for some of the other commercially available HP simulators.

There's probally also some free HP simulatotrs out there also. Maybe someone else here know of some of them.

But EMU42 is the BEST - there's also a PC version.

Bill

HP-49G Vector-Matirx Multiplication

*Message #1 Posted by **William** on 8 Feb 2006, 10:25 a.m.*

Can someone please tell me why my HP-49G will not multiply a vector [nx1] times a matrix [nxn], but it will multiply a matrix [nxn] times a vector [nx1]? Vector-matrix multiplication is a perfectly valid mathematical operation, but the HP-49G gives me an "Invalid Dimension" error. I know that I can overcome this error by placing the vector in the last row of an [nxn] matrix, but I perform this operation many times for my some of my engineering courses and this process becomes cumbersome, especially during an exam.

Re: HP-49G Vector-Matrix Multiplication

*Message #2 Posted by **Marcus von Cube, Germany** on 8 Feb 2006, 10:38 a.m.,*
in response to message #1 by William

William,

you need a "horizontal" vector on the left side of a matrix. To create it, just enclose a vector in another pair of brackets.

```
2:[ [ 1 2 3 ] ]
1:[ [ 1 0 0 ]
    [ 0 1 0 ]
    [ 0 0 1 ] ]
```

This multiplies fine.

Marcus

Edited: 8 Feb 2006, 11:01 a.m.

Re: HP-49G Vector-Matirx Multiplication

*Message #3 Posted by **Namir** on 8 Feb 2006, 2:46 p.m.,*
in response to message #1 by William

When you multiple a vector and a matrix you are really multiplying a row/column matrix with a matrix. Therefore the rule regarding the matrices' dimensions must be obayed.

Namir

Re: HP-49G Vector-Matirx Multiplication

*Message #4 Posted by **Chris Dean** on 8 Feb 2006, 3:54 p.m.,*
in response to message #3 by Namir

```
You can only multiply matrices A and B if the number columns of A is the same as the
number of rows of B.

Consider C=AxB then if A is MxN and B is NxP then resultant matrix C is MxP.
```

```
Cij=sum(Aik*Bkj) where k = 1 to N
```

Re: HP-49G Vector-Matirx Multiplication

*Message #5 Posted by **Karl Schneider** on 8 Feb 2006, 9:51 p.m.,*
in response to message #1 by William

William --

As others explained previously, the result of matrix multiplication A*B includes the set of all dot products of the rows of A with the columns of B. The matrices must be dimensioned accoringly: the number of columns of A must equal the number of rows of B. A column vector is a matrix with only one column; a row vector is a matrix with only one row.

Also: In general, matrix multiplication is not commutative, even if both orders of multiplication are defined under the rules.

If one wants to left-multiply a column vector by a matrix, the column vector must usually be transposed as a row vector. The result will be dimensioned as a row vector.

There is a built-in function A^TB on the HP-15C for that purpose. In Matlab, it would be A'*B.

A useful theorem: $(A*B)^T = B^T*A^T$

Regards,

-- KS

*Message #6 Posted by **William** on 9 Feb 2006, 2:27 p.m.,*
in response to message #5 by Karl Schneider

Thank you all for your input. I may not have made my problem clear in my previous message. So, I will try again. This is what I am doing.

[1 2 3] <sto> A (1 row x 3 columns)

[[1 2 3] [1 2 3] [1 2 3]] <sto> B (3 rows x 3 columns)

The number of columns in A i equal to the number of rows in B. I am defining these matrices via MTRW. The operation AxB should yield...[6 12 18]...however, my HP-49G says..."Invalid Dimension". The calculator will calculate BxA = [14 14 14]; THIS operation should give me an error message. Isn't this the opposite of what I should be getting? Do I have some obscure flag un-checked?

Thank you, William

Re: HP-49G Vector-Matrix Multiplication

*Message #7 Posted by **Karl Schneider** on 10 Feb 2006, 1:05 a.m.,*
in response to message #6 by William

William --

You're in luck -- I also happen to have an HP-49G, so was able to try your example. (I should point out

that in RPL, it's {data} 'A' STO, not {data} STO 'A'...)

I follow the example -- it looks to me like a row-vector A and a square matrix B. The vector entered with a single set of brackets on one line even looks like a row vector in the Matrix Editor.

But, when multiplying them with 'A' above 'B' in the stack, I get the same dimension error. Marcus von Cube's post has the fix: Make 'A' a true row vector by enclosing it within an extra set of brackets. ("TRAN" will also transpose a matrix or vector on the 49G.) I noticed that, for whatever reason, the transpose made no difference in the vector's layout in Matrix Editor.

$[14\ 14\ 14]^T$ is the product $B*A^T$ -- i.e., the matrix times the column vector.

I struggled to get my 48G to do what I wanted in this example, also.

How counterintuitive! This deepens my appreciation for the HP-15C and HP-42S, both of which I would trust far more than any RPL model to use on an important exam.

Re: HP-49G Vector-Matrix Multiplication

*Message #8 Posted by **Marcus von Cube, Germany** on 10 Feb 2006, 3:17 a.m.,*
in response to message #7 by Karl Schneider

```
[ 1 2 3 ]
```

is a column vector,

while

```
[[ 1 2 3 ]]
```

is a row vector.

The strange thing is that matrix editor doesn't seem to know the difference. Or does he?

Function key F2 toggles the vector mode. I checked it on the 48S, 48G and 49G+, all three have this toggle. The 49G+ uses a single **boldface** pair of brackets in stack display to denote a row vector while the older calculators keep the double pair of brackets.

I assume the RPL designers on the 28C/S wanted the more common vector type (column vector) to have the simpler notation. The matrix editor came into play much later.

Marcus

Website Update

*Message #1 Posted by **Gerson W. Barbosa** on 8 Feb 2006, 8:30 a.m.*

Hi everybody,

My incipient website with a few calculators and a few simple programs has been updated and has moved to:

http://www.geocities.com/gwbarbosa/

Everyone is welcome!

Regards,

Gerson.

Re: Website Update

*Message #2 Posted by **Valentin Albillo** on 8 Feb 2006, 8:57 a.m.,*
in response to message #1 by Gerson W. Barbosa

Hi, Gerson:

Nice site, but if I may suggest something, if I were on your shoes I wouldn't include the whole serial number for each of your calculators.

Something like "2142A01xxx" would be preferable. The idea is to give useful information (which the "2142A" already conveys) but *not* the whole number, just in case some cretin would claim that it was his "stolen" calculator or so. For items obtained via eBay or some other non-easily traceable source, that might be difficult to disprove, and considering the price these models gather today and /or the fact that they are sought for very keenly, this might be a not-so-unlikely scenario.

Not to be paranoid, but nowadays you never know and, as the old proverb says, "better safe than sorry".

Best regards from V.

Re: Website Update

*Message #3 Posted by **Gerson W. Barbosa** on 8 Feb 2006, 9:02 a.m.,*
in response to message #2 by Valentin Albillo

Hello Valentin,

Thanks for the very good advice. Three or four of my calculators I have bought brand new myself, others were bought from allegedly first owners, but I am not sure about two or three. I had already wondered about that and you have made up my mind. Thanks again!

Best regards,

Gerson.

Update:

Done that!

There will be another change as I intend to sell the third 15C, the one with the logo almost worn out (I still need to buy some HP-41 accessories). But I will do this when I get another Voyager (a 12C or 16C) because I have now exactly 14 calculators. If I sold one I would have exactly **13** left! *Yo no creo en brujas, pero que las hay, las hay.* :-)

Thanks, but I don't believe so. The transfer limit is 5MB/h, that's about the total size of the fourteen 800x600 pictures. Anyway, the alternative site should be working.

About your suggestions, I have already number 1, a 41CX (you cannot tell by the pictures, I think, but the caption says so) and number 3, incidentally because of your suggetion in your *Long Live the Advantage ROM* article. Number 2 may arrive in a week or so. For the while, I think number 8 and 9 will do.

> Quote:
>
> Excellent spanish ! :-) Wish my portuguese were as good ... The original galician (galego) proverb reads: "Eu non creo nas meigas pero haberlas hailas"

Well, I must confess my Spanish is not as good as you may have imagined... It just happens that this proverb is well know here and it is usually quoted in Spanish. I didn't know this was originally a galician proverb. As you know, Spanish and Portuguese look so alike (I don't know of two other major languages so mutually understandable) I never took the time to study it seriously, although I recognize I should.

Best regards,

Gerson.

9. CD-R: PPC, CHHU, PPC Technical Notes, Keynotes

plus manuals, mag cards, holders, etc, and you're all set up except for very, very special needs (mcode, etc).

My list of 'desirable' HP41 accessories is rather different :

1. HP41CX or extended functions module (I don't find more extended memory or time functions to be essential)
2. Card Reader (if only for the HP67 compatability functions)
3. HPIL module (HP82160)
4. Disk drive (HP9114A or B). IMHO the only reasons to have a tape drive is either because you want to collect all the HPIL peripherals or because you need to be able to read old tapes.
5. Extended I/O module
6. HPIL Devlopment module (DevIL ROM). The HPIL module is missing a lot of important functions, you need one or other of these 2 ROMs. Unfortunately, the DevIL ROM has the same XROM numbers as the Advantage ROM, so the latter is of little use to me.
7. RS232 interface (HP82164)
8. MLDL RAM box + some ROM to let you load ROM images from disk. With that you don't need a lot of the ROM modules. No, it's not so convenient, but it's probably cheaper and Mcode is interesting anyway
9. ZenROM (if you can find one).
10. MoHPC CD-ROM set
11. Book : Extend your HP41. The best user-level/synthetic reference I've seen
12. Book : PPC ROM manual. You can learn a lot from reading that.
13. Book : HP41 M-code for beginners. I dislike the title, it goes way beyond that level.

If you're a hardware hacker like me, you probably also want to add :

1. Service manuals or schematics for the HP41 and the HPIL peripherals
2. GPIO interface (HP82165 or HP82166)
3. Data acquisition unit (HP3421)
4. HPIB interface (HP82169)
5. Book : Control the world with HPIL

In the U.S., one is innocent until proven guilty. Someone can "claim" the serial number, but it would be left up to the plaintiff to prove it in a court of law.

But in other countries, perhaps it is different.

Nobody goes to court for a $300 calculator.

Just another perspective.

PROOT on 28c/28s

*Message #1 Posted by **hugh steers** on 8 Feb 2006, 4:52 a.m.*

Presumably the core functions of the 28C/28S and later 48 models were lifted from the 71b saturn development including the algorithms of the 71b math rom.

however, on the 28c/28s i can't find the equivalent of the 71b "PROOT" function. This is the function that returns the complete set of roots (real and complex) for any polynomial. its looks like this has been left out. why? lack of rom space maybe? this is a very powerful and useful function.

the feature is back on the 48, built in to a special polynomial solve menu - i assume this is the same logic underneath.

or is it there and i just can't find it?

Re: PROOT on 28c/28s

Hugh,

> Quote:
>
> the feature is back on the 48, built in to a special polynomial solve menu

There is no PROOT function in the 28S and it hasn't apeared in the 48S either! PROOT seems to have surfaced in the RPL world not until the 48G.

I'm just looking into the functional differences between the 48S and the 48G and this is one of them.

HP 32SII double shot keys + bug questions.

*Message #1 Posted by **Ben Rimednac** on 7 Feb 2006, 11:24 p.m.*

Hi all,

I picked up a 32SII on eBay recently for a reasonable amount of money.

I have read in relation to the variants of the 32SII around and the desirable double shot type keys.

I am not entirely sure whether I have one of these models. Here are some details about it that may help identify whether this has the double shot keys or not...

1. Singapore made (CE 91) 2. Serial number: 3316S032xx 3. Brown(ish) bezel. 4. Light blue/pink colouring for shift keys. 5. The manual is 3rd Edition June 1992. 6. The ex key has an e that is larger than the x.

There does seem to be a very fine channel along some edges of the lettering for example on the R/S key the slash has a definite edge.

Can anyone shed any more light on this?

Also what are some tests I can do on it to check if it has the known bugs?

Thank you for your help. Ben

Re: HP 32SII double shot keys + bug questions.

*Message #2 Posted by **Ben Rimednac** on 8 Feb 2006, 12:29 a.m.,*
in response to message #1 by Ben Rimednac

Well a little bit of self help goes a long way.

I've determined that this was made in 1993, 16th week.

I've examined it with a loupe and find little clubbed serifs at the end of the E's and the R in the enter key. To my untrained eye this seems too regular to be paint and I suspect is double shot/moulded.

I've done the self test and it checks out.

I've also done the fraction display checks on Risneth's site and it checks out OK - ie. no bug.

All for $96 US and I had no idea about any of this when I won the auction. Great resource here. I would have been totally ignorant of all this without it.

I'm wondering whether I should use this one at all and not get another less nice one as a user?

I also have a 33S which I could use as a beater; so maybe I could just use it sparingly like I do anyhow. In any case I think the value of these is on the way down because the 33S seems to have really gained some traction in the market.

Regards.

>
> Regards.

No kidding?! That's nice to hear; let's hope it continues. Oh, and congratulations on your bargain of a good find! Use it and your 33S in good health.

In fact, that is what I do, I use my 32SII (brown bezel; I got it new back a few years for $60, at MicroCenter of all places) sparingly at home only. For work, I use my 33S. It has grown on me and might have eclipsed the 32SII except that the feel and look of the 32SII is in my opinion much better.

Re: HP 32SII double shot keys + bug questions.

*Message #4 Posted by **bill platt** on 8 Feb 2006, 2:40 p.m.,*
in response to message #3 by Ed Look

I am opposite.

I use my 32sii at work, because the display and feel are nicer.

But if I leave my 33s at home, then when I run out of memory I wish it was in the office. (Or I pull ot the 48, or the 27s, or the 11c, or the shapr pc-1250 or the hp 59gx....).

Re: HP 32SII double shot keys + bug questions.

*Message #5 Posted by **e. young** on 8 Feb 2006, 9:48 a.m.,*
in response to message #2 by Ben Rimednac

I agree, I think you have one with the double shot keys. Treasure that baby. $96 is a great deal in my opinion. Mine cost me almost $160 about a year ago.

I use a combination of my 32sII and 33s at work. I feel like it would be a shame to have such a well-built machine like a 32sII from 1993 just sitting idle and collecting dust. My 32sII doesn't leave my desk, and I often use it when I don't need to run any programs. I break out the 33s when I do need a program, or when I an calculating away from my desk. The 33s has been growing on me though, since I have a version with the improved display and keyboard. Too bad I consider it so aesthetically challenged.

*Message #7 Posted by **Dave Shaffer** on 8 Feb 2006, 2:03 p.m.,*
in response to message #6 by Trent Moseley

"What's a double shot key?"

The outer part of the key has been molded around the inner number part which began as a separate piece of plastic. The inner part then extends throughout the length of the entire key piece. The advantage is that the number can not wear off. As the key wears down, both the inner and outer parts wear together.

Clearly, more expensive to make, though.

You can see the same effect if you buy a tube of valentine slice and bake cookies at the super market! The red heart is surrounded by the regular dough for the entire length of the cookie tube.

in response to message #1 by Ben Rimednac

Here's what I'd do-

Use the calculator, if you like it. Let's be realistic about the intent of these machines. They are meant to be used!

Second, if you are unsure of the keys being painted or shot, why not simply try to scrape a corner off one of the letters? I tried it with my ENTER key. Guess what? They were painted. Big deal.

Just my opinion.

ECL

Plus, they won't last any longer when not in use. @OP: Have fun with it while it works. The only argument not to use a calculator would be that it's a (worthy) collectible. I'd never dare to use calcs in a condition as

shown at MoHPC.

I guess that makes sense if you plan on selling them for a profit in the future, otherwise they can be considered collectables or just electronic junk.

I agree ECL. Use the things for their intended function. I now have a 15c, 16c, 27s, 42s and 41cx which I use almost every day.

Put them on display when they no longer work or use them for parts, but is seems odd (IMO) to just put a bunch of calculators in a glass case and just looking at them.

It would make more sense for someone to buy up 5 to 10 of their favorite machine...15c, 42s, etc. and use them for the rest of their days (if they want to spend the money).

in response to message #12 by Valentin Albillo

Hello, Valentin!

In response to,

"Put them on display when they no longer work or use them for parts, but is seems odd (IMO) to just put a bunch of calculators in a glass case and just looking at them."

you posted,

> Quote:
>
> > You've never collected valuable stamps, say ? Would you consider odd to just look at them stamps in some album, instead of attaching them to a letter and mail it ? :-) What about valuable coins ? Would you consider best to spend that old silver dollar in some candy ? ;-)
> >
> > The point is, once you realize that vintage HP calculators are valuable collectables (look at eBay if in doubt) then it's pretty normal to handle them as such, glass-case treatment included.

Ah, but the flaw in that analogy is that stamps and coins are intended to be *spent*, whereas calculators are intended to be *kept and used as tools*. If a rare or distinctive stamp or coin is not to be used for its intended purpose, then it makes perfect sense to sheath it in a protective case to allow for viewing enjoyment without further degradation.

A fine calculator that is always handled and stored with care can retain its "mint" appearance, even if directly touched. I bought my HP-10C and HP-16C used on eBay, and both were functionally perfect and cosmetically near-flawless. The owner of the 10C claimed to have used it for his work related to designing a new major airport in the US. My only HP-15C, on the other hand, has not been so fortunate. I bought it new in 1983, lugging it all around campus in a backpack through three degree programs, and (unfortunately) dropping the pack at least twice. Small dents and a deep scratch on the bezel resulted, but no functional problems or damage to the display.

How about rare, classic automobiles? Some people think it is a shame to keep a vintage restored classic car "under wraps", trailered to every show it is entered, or maintained as a static display

in a museum, garage, or warehouse. However, a car cannot be driven on the roadways without suffering mechanical wear and cosmetic damage.

Being a confirmed pragmatist, I've never quite understood the appeal of stamp collecting ("philately"), except in terms of the fundamental reason for almost *any* form of collecting -- to *have* something that few others do. A stamp collection requires little space and maintenance, but what you see is all there is: "a certificate of postage paid, issued in this year by this country for this amount, in this design." Coins often incorporate more historical and political significance, but their intrinsic value beyond metal content is mainly their desirability to other people. As an *objet d'art*, only a "proof" coin can fully show the fine detail and sophistication of the coin's design and manufacture.

By contrast, a quality working calculator is not only useful, but can exhibit an entire package of fine period-specific engineering technology (software, mechanical, and electrical), as well as the specific implementation of mathematical algorithms. Some people (including HP Forum readers) value such things; most, alas, do not.

> Quote:
>
> A reasonably cared HP-11 or HP-15C will last decades, till their internals begin to decompose by age alone. Buying many will be no use, because by the time the 2nd one is also failing, all remaining ones will be the same old age, and thus decaying as well...

If this is true (and it probably is), all the more reason to use them while you can! It might even be that occasional use, to energize the circuits, will help slow the process of degradation.

My oldest is a 1971 HP-35, which still works perfectly. My two early (non-soldered) HP-34C's need service; the two fullnut HP-41's I received were successfully restored to perfect operating condition by cleaning and soldering from www.fixthatcalc.com. All my other HP's are newer and still work great; I hope they will for another several decades...

Regards,

-- KS

*Message #14 Posted by **David Smith** on 12 Feb 2006, 12:01 p.m.,*
in response to message #13 by Karl Schneider

Whenever the post office raises its rates, I use 70 year old 3 cent stamps to make up the postage increase over current stamps. I couple of postal clerks did notice and were shocked that somebody would do such a thing. They can be bought for less than their face value (I got several sheets for free). No all things that are old or collectible are vauable (or will ever be valuable). Besides, the Zepplin on the front was printed upside down ;-)

Transfering HP-85 programs to HP-9915 EPROMs

*Message #1 Posted by **John** on 7 Feb 2006, 7:26 p.m.*

Hi,

I have been working (mainly over the Christmas holidays) on a method to transfer HP-85 Basic programs to an EPROM for the HP-9915. PROM boards are standard on the 9915 unlike tape drives which were an option. The method involves creating a LIF-like directory and breaking down programs into 256 byte records. Also each record has a two-byte checksum value added.

The whole method is on my web page at

http://www.vintagecomputers.btinternet.co.uk/hp85/hp9915_eprom.htm

This method uses LIFUTIL on the PC and HP-85 Basic programs. There are Series 80 binary programs around (and also utilities like SYSEXT on the HP-87) that can read raw sectors, but I wanted to use a basic approach that was easy for me to understand. I hope one day the original HP software pack for the 9915 surfaces, as there must be an easier way!

I would also welcome some help in understanding the CHECKSUM function, it does not seem to match IBM SDLC checksums as claimed in the manual.

BTW I would not be surprised if a similar method could be applied loading programs into EPROMs on the IPC (Integral PC).

Regards,
John

Re: Transfering HP-85 programs to HP-9915 EPROMs

*Message #2 Posted by **Vassilis Prevelakis** on 7 Feb 2006, 8:31 p.m.,*
in response to message #1 by John

Excellent work!

I wonder if anybody can help with that checksum algorithm, the manual says that it uses "the IBM SDLC Frame Check Sequence."

This is supposed to bea 16-bit CCITT polynomial, but no polynomial I have tried gives the same results as the CHECKSUM$ function on the 9915 Development ROM.

Here is a sample of some values calculated with the built-in function:

http://www.series80.org/Misc/HP9915-Checksum.gif

*Message #3 Posted by **John** on 8 Feb 2006, 4:38 a.m.,*
in response to message #2 by Vassilis Prevelakis

Thanks vp,

Can you clarify about your CHECKSUM exmaple, eg when you input the string "0001", surely in hex this is 30 30 30 31?

Also as a postscript I should have mentioned I developed the Basic programs on a PC using the HP-87 emulator, then transfered them to a real HP-85.

Regards, John

Re: Transfering HP-85 programs to HP-9915 EPROMs

*Message #4 Posted by **Olivier De Smet** on 8 Feb 2006, 1:00 p.m.,*
in response to message #3 by John

Hi John,

I hope to finish an alpha version of an HP85 emulator very soon (based on my HP87 emulator). The tape and printer are not working actually and when booting the emulator say 'ERROR 23' :)

But an HP-IB interface and floppy-disc are working :) (electronic disk don't work so it's not an HP85B emulator)

Just for completness, with the service rom, CPU and DISPLAY are ok, only RAM 1 and 6 are OK (don't know why RAM 0,2,3,4,5,7,8 are bad..) and of course, tape, printer, and timers don't pass the tests.

Bye,

Olivier

BTW did someone have an image of the Service rom for HP86/87 ?

I have some manuals about servicing the HP85 and 86, but the diagnosis about the differents errors of the service rom are not enough to implement the missing functionalities.

Is there somewhere a commented listing of thoses roms ?

Re: Transfering HP-85 programs to HP-9915 EPROMs

*Message #5 Posted by **john** on 8 Feb 2006, 5:41 p.m.,*
in response to message #4 by Olivier De Smet

Olivier,

Good to hear you are still working on the HP-85 emulator. I must admit I was a bit rusty on using the HP-87 emulator when I came to use it, so I wrote myself some notes on using disks etc as it was't obvious how to do this, I'll post them to the forum.

If you need any help with debugging your HP-85 emulator, do you want to start a new thread on this forum with any questions? For example, I have an HP-85, Assembler ROM and System Monitor module so (in theory) I can set breakpoints and single step through to see what a real HP-

85 operates.

Also, how about an HP-83 emulator, as this doesn't have a tape drive or printer? I'm sure someone here will be able to dump the system ROM if needed.

Regards
John

Re: Transfering HP-85 programs to HP-9915 EPROMs

*Message #6 Posted by **Olivier De Smet** on 13 Feb 2006, 4:20 a.m.,*
in response to message #5 by john

John,

The new release is ready. I send you a mail about it. I can send it by mail (1,2Mo zip archive).

I still have some problems, perhaps from the roms. There are at least 2 release for the HP85(A) system roms and one for the HP85B. I don't know which release I use...

Olivier

CRC-16-X25

*Message #7 Posted by **Juergen Keller** on 8 Feb 2006, 4:38 a.m.,*
in response to message #2 by Vassilis Prevelakis

Seems to be CRC-16-X25. Please refer to
Crypto - Codes

I've checked it with the
online CRC calculator

I've entered 16 / 1021 / FFFF / FFFF / reverse data bytes. Hope this helps!

Best regards, Juergen Keller

Re: CRC-16-X25

*Message #8 Posted by **John** on 8 Feb 2006, 5:48 p.m.,*
in response to message #7 by Juergen Keller

Thanks Juegen,

Having found the right parameters it should now be easy for someone to write a PC / Linux program to generate 9915 EPROM files straight from the extracted HP-85 Basic program.

Regards,
John

Re: Transfering HP-85 programs to HP-9915 EPROMs

*Message #9 Posted by **Eric Smith** on 8 Feb 2006, 3:49 p.m.,*
in response to message #2 by Vassilis Prevelakis

I wrote a "brute force CRC finder" program when I was trying to identify the ROM check algorithm used

by the HP Spice series calculators, as described in this blog entry.

The actual C code is in the Nonpareil Subversion repository; I can email you a copy if it's of any use to you, but it looks like Juergen Keller has already identified the polynomial.

The general things to try when a CRC polynomial doesn't seem to work right are:

1. reverse byte ordering of data input
2. reverse bit ordering within input bytes
3. initialization value - usually all zeros or all ones
4. bit order or byte order of result

Re: Transfering HP-85 programs to HP-9915 EPROMs

*Message #10 Posted by **Vassilis Prevelakis** on 8 Feb 2006, 8:07 p.m.,*
in response to message #9 by Eric Smith

many thanks everybody -- this was great

**vp

for completeness here is the C function that calculates the CRC of the supplied string:

```
typedef unsigned char   uchar;

// 'POLYNOM' is the CRC polynom without leading '1' bit
#define POLYNOM 0x1021
// 'crcinit' is the initial CRC value belonging to that algorithm
#define CRCINIT 0xffff
// 'CRCXOR' is the final XOR value
#define CRCXOR 0xffff
// 'CRCHIGHBIT' short with most significant bit set to 1
#define CRCHIGHBIT 0x8000

ushort hp85crc(uchar* p, ulong len)
{

        int i, j;
        uchar c;
        ushort bit;
        ushort crc = CRCINIT;

        for (i=0; i<len; i++) {

                c = *p++;

                for (j = 1; j <= 0x80; j<<=1) {

                        bit = crc & CRCHIGHBIT;
                        crc<<= 1;
                        if (c & j) bit^= CRCHIGHBIT;
                        if (bit) crc^= POLYNOM;
                }
        }

        crc^= CRCXOR;

        return(crc);
}
```

and it is called like this:

```
uchar string[] = "1234567890";

printf("crc(%s) = 0x%x\n", string,
        hp85crc(string, strlen(string)));
```

HP16 abruptly quit working

*Message #1 Posted by **Gary Olmstead** on 7 Feb 2006, 1:13 p.m.*

My HP16C,which I bought on the second day they were available, has been working just fine until recently. I had been using it earlier that same day, but when I pushed the ON button.... nothing. As of right now, still nothing.

So, what happened, and how can I fix it? The Windows calculator isn't nearly as handy.

Re: HP16 abruptly quit working

*Message #2 Posted by **Marcus von Cube, Germany** on 7 Feb 2006, 1:21 p.m.,*
in response to message #1 by Gary Olmstead

Gary,

I had some problems with the battery contacts. Some aluminum foil on one end (after some cleaning) might do the trick.

Marcus

BTW, you *know* that the HP 16C runs on batteries and not on good will alone? Since a set of these usually lasts a few decades you might have forgotten about the fact...

:-)

Edited: 7 Feb 2006, 1:22 p.m.

Re: HP16 abruptly quit working

*Message #3 Posted by **Gary Olmstead** on 8 Feb 2006, 12:23 a.m.,*
in response to message #2 by Marcus von Cube, Germany

BTW, you *know* that the HP 16C runs on batteries and not on good will alone?

Well, yes. In theory, there is a low battery indicator, but the only time it has ever gone on was about a year after I got it. I bought batteries, but by then the indicator had gone off, and I forgot to replace the batteries. Some years later, my wife was cleaning out the refrigerator, and asked "What are these batteries for?" The "new" batteries had leaked, and I had to throw them away.

I don't know if I have ever replaced the batteries. I am certain that the low battery indicator was not on the last time it worked.

But I have my DVM here, so... let's see... 1.2V... Looks good.. 0.34V oh-oh... and ummm ... 0.04V Oops. Guess that answers that question. Wonder how long it WAS running on good will alone?

Thanks. Nothing like a little Electronics 101 to counter-act all that high falutin' fancy Dan nonsense I spend my days creating...

Off to the battery store.

Regards Gary

HP 42S vs HP 48,49

*Message #1 Posted by **e. young** on 7 Feb 2006, 12:47 p.m.*

Is it considered a mistake that HP killed the 42s apparently for the sake of the 48 and 49 series? Or rather than killing the 42s and soldiering on with the 32sII, would it have been better if they discontinued the 32sII and the 42s, and replaced them both with a non-graphing RPN model that was somewhere between the 42S and the 32sII in capability? It could have been the HP 37s. Just wondering.

Re: HP 42S vs HP 48,49

*Message #2 Posted by **Namir** on 7 Feb 2006, 1:45 p.m.,*
in response to message #1 by e. young

The HP-42S and HP28C/S came after the HP-41C and ushered an era of more advaced stacks with contents other than simple real numbers. The HP-28S was replaced by the HP-48SX and then eventually by the HP-48GX/G+/G. The HP32S came after the 42s as a low-end RPN calculator and was replaced by the HP-32SII and eventually the HP-33s.

Namir

Re: HP 42S vs HP 48,49

*Message #3 Posted by **Howard Owen** on 7 Feb 2006, 1:54 p.m.,*
in response to message #1 by e. young

Many here do consider it a shame, if not an error, that HP chose the 32SII as the one RPN scientific calculator they would continue with. The 42S was more capable, and an updated version would be very welcome. I've heard speculation that HP didn't update the 42S for fear that it would compete with the 48G at the low end. Whatever the reason, it is a shame.

Regards,
Howard

Re: HP 42S vs HP 48,49

*Message #4 Posted by **e. young** on 7 Feb 2006, 2:53 p.m.,*
in response to message #3 by Howard Owen

If they ever update the 33s, maybe they can add some of the features of the 42s. On the other hand, the 33s/32sII have been around for a long time with minimal enhancements, which is not encouraging. I do not consider the aesthetics of the 33s to be an enhancememt. If they were to give the 33s some of the programming capability of the 42s that would be great, but that's assuming the current group at HP calculator is up to the challenge. It would be a damn shame if the 33s in its current form was the final word in RPN calculators. However, it is better than nothing.

Re: HP 42S vs HP 48,49

*Message #5 Posted by **Howard Owen** on 7 Feb 2006, 3:49 p.m.,*
in response to message #4 by e. young

I agree heartily!

Unfortunately, what seems like a no-brainer from the user's point of view, may be a good deal more complicated from the marketeer/designer/manufacturer's perspective. If the cost of that cycle ever comes down to where niche markets, like us RPN aficionados, are profitable to serve, then we might see something more to our taste.

Perhaps OpenRPN will deliver something, who knows?

Regards,
Howard

> But... the service spares made in Indonesia from 1995 to 2000 can have noisy keys just like the 32Sii's

For the record, the service spares were made at least into 2001, as I have a unit with S/N ID1xxxxxxx. Its keys seem perfectly quiet, although it hasn't seen heavy use. I'll take Randy's word that the keys are double-shot, I have a hard time telling the difference. I *think* I can see the difference between its keys and my 2000 Indonesian made silver bezel 32SII, but that could be because I *think* there is a difference, so I see what I expect to see.

It could have been the HP 37s.

While it was a shame to kill the 42S, it would also have been a shame to produce something with artificially reduced capabilities just to fill a marketing niche. With the (unfortunate) NCEES requirements, the 33S does fill a valid niche. A better solution would be to eliminate the 48gii (which does represent such an artificially crippled product, come to think of it), and fill the slot between the 33S and the 49g+ with a new model, say the 43S. This fantasy machine would add a few enhancements to the 42S (principally more RAM and PC connectivity to upload/download/backup, plus a few other minor things) to become the penultimate **RPN** advanced scientific calculator. It would augment, not compete with the high end **RPL** 49g+. I'm guessing that HP would sell many more of such a machine than the 48gii has sold or ever will sell, at the same price point. Oh well, enough dreaming.

One more thing, a machine numbered "37" would classically be a business model anyway.

Re: HP 42S vs HP 48,49

*Message #14 Posted by **e. young** on 8 Feb 2006, 9:51 a.m.,*
in response to message #13 by Jeff O.

I am not familiar with how HP comes up with model numbers. Why would 37 have been a business machine?

Re: HP 42S vs HP 48,49

*Message #15 Posted by **Jeff O.** on 8 Feb 2006, 12:26 p.m.,*
in response to message #14 by e. young

I don't claim to know any hard-and-fast rules applied by HP for model numbers. I based that conjecture mostly on an analogy with the Spice series and correlating to current models. The HP-32E and HP-33E/C were mid-range scientific models, and the 37E was a low-end business model. When HP came out with the 32S/Sii and 33S, they re-used the numbers for the new models with similar functionality to the old models. So if they came out with a modern model numbered "37", it sort-of follows that it would be a business model.
Model numbering is discussed in several places in *A Guide to HP Handheld Calculators and Computers* by W. A. C. Mier-Jedrzejowicz, Ph.D. The last word seems to be that the current scheme has all business machines beginning with a "1", e.g. 12C/CP, 17B/Bii, 19B. So perhaps there could be a 37S scientific model, although as I stated in my previous post, I believe most would rather see a 43S. Another reference that might provide additional insight is *Codenames of HP Handheld Calculators and PDAs: Facts and Speculations* by M. J. P. Staps. Unfortunately I don't have a copy of that book.

HP-IL, 41CX, and 71B

*Message #1 Posted by **Robert Graulich** on 7 Feb 2006, 8:18 a.m.*

Hi,

just received an HP-IL module for my HP-41CX and want to test it. Up to now, I don't know much about HP-IL.

I connected both machines, entered CONTROL OFF on 71. Switched the 41 on and tried DIR. The result was NO DRIVE. Well, that was to be expected, right?

Does the IL-module of the 71 have a mode to use that machine as a drive to store programs or data from the 41?

What is an easy way to demonstrate that both IL-modules work?

Robert

Re: HP-IL, 41CX, and 71B

*Message #2 Posted by **Raymond Del Tondo** on 7 Feb 2006, 8:55 a.m.,*
in response to message #1 by Robert Graulich

Hi Robert,

you already demonstrated that both IL modules work;-)
Actually, the loop was closed, so at least that part worked.

The manual of the HP-71B HP-IL module may have some info on how to receive data from an HP-41.

For data storage, I'd use a real HP-IL mass media device.

Regards

Raymond

*Message #5 Posted by **Robert Graulich** on 8 Feb 2006, 8:24 a.m.,*
in response to message #4 by J-F Garnier

Thanks. Will try this evening.

BTW, did you receive my order?

Robert

Re: HP-IL, 41CX, and 71B

*Message #6 Posted by **Robert Graulich** on 8 Feb 2006, 12:56 p.m.,*
in response to message #4 by J-F Garnier

YIPIEE! IT WORKS!

But just for data. As I understand the other article, I need the extended I/O module and special software to use the HP-71B as a drive. So I will wait now for the registered version of Emu71.

Robert

Re: HP-IL, 41CX, and 71B

Case cleaning

*Message #1 Posted by **Andreas Terzis** on 7 Feb 2006, 6:07 a.m.*

Hi there, I noticed one of my HP-41 cases had some mildew inside or at lease some black particles that had also filled the yellow foam on the bottom of the inside of the case as well. I cleaned the inside with some isopropyl alcohol and there were tons of particles that came out to the cloth I was using. Is that an OK way to clean the inside of the case? Can I use the case or should I use any other cleaner first? Any ideas? Thanks, Andreas

Re: Case cleaning

*Message #2 Posted by **Jeff O.** on 7 Feb 2006, 7:28 a.m.,*
in response to message #1 by Andreas Terzis

The problem you describe is very common. It seems to be due to the disintegration of the foam rubber layer between the inside liner and outside of the case. Many (myself included) have reported success with turning the case inside out and tossing it in the washing machine with a load of laundry (probably not a hot water load), then let it air dry. Of course, your results may vary, so try at your own risk.

Re: Case cleaning

*Message #3 Posted by **Andreas Terzis** on 7 Feb 2006, 4:41 p.m.,*
in response to message #2 by Jeff O.

I noticed that the removable foam had mildew in it. I assume then that the foam insulation of the whole case (which I didn't know existed) will have mildew too. Is there any way to remove it if I reverse the case (hopefully without tearing it off)? Can you think of anything to cover it after?

Re: Case cleaning

*Message #4 Posted by **David Smith** on 7 Feb 2006, 5:00 p.m.,*
in response to message #3 by Andreas Terzis

Just unzip it and toss the thing into the washing machine. Then prop open the opening and let air dry. It will come out looking and smelling like new.

Re: Case cleaning

*Message #5 Posted by **Howard Owen** on 7 Feb 2006, 5:18 p.m.,*
in response to message #4 by David Smith

This is cool.

I have two 71B cases with the identical symptoms. Thanks for the tip!

Regards,
Howard.

Corbulin !!!

*Message #1 Posted by **gileno** on 6 Feb 2006, 8:24 p.m.*

Ebay link

He will sell for US$ 952252552.98 :-)))))

Re: Corbulin !!!

*Message #2 Posted by **Joe Edwards** on 6 Feb 2006, 8:32 p.m.,*
in response to message #1 by gileno

Well, It is his right, at least here in the States, to buy and sell as he pleases. If folks want to pay his rates, so be it.

Re: Corbulin !!!

*Message #3 Posted by **Museum** on 7 Feb 2006, 6:36 a.m.,*
in response to message #2 by Joe Edwards

Yes, it is his right to do this, but it is not allowed to change the auction style as the seller did. The auction was not a buy-it-now auction at the beginning. Otherwhis this module would have been sold much ealier!

Matthias

Re: Corbulin !!!

*Message #4 Posted by **Joe Edwards** on 7 Feb 2006, 8:29 a.m.,*
in response to message #3 by Museum

I don't wish to disagree, so let me ask this first. Did the auction have any bidders on it? Did the auction have less than 12 hours left on the auction? If the answer is no to those questions, then the seller can change (revise) the auction, as per ebay's current ruleset.

> Quote:
>

HP-71 Module - ID?

*Message #1 Posted by **Howard Owen** on 6 Feb 2006, 5:11 p.m.*

Anyone recognize this module? I just recieved two CMT71-32E modules, each with the following catalog:

```
CAT :PORT(4)
 NAME             S TYPE     LEN
COMM              P BASIC   3654
CALCS             P BASIC   7457
TEST32KE            LEX      111
KEYDEF            P BASIC    822
TXSYS             P BASIC  16571
VERSION           P BASIC   2611
```

This last, when run, gives:

```
Stat Systems Inc.
STAT-TRAC/RT 1.071
```

Looks like I'll need to hit the docs to figure out how to dump a module.

Regards,
Howard

Re: HP-71 Module - ID?

*Message #2 Posted by **Howard Owen** on 6 Feb 2006, 7:41 p.m.,*
in response to message #1 by Howard Owen

Not so oddly, the only reference to that version string on the web is here at the museum. What's also interesting, I bought the modules from a gentleman in Germany. Thomas Falk has a German email address. So perhaps a German hospital recently got rid of a bunch of old 71Bs?

Survey PAC Program

*Message #1 Posted by **Annie** on 6 Feb 2006, 5:11 p.m.*

Posting for customer:

When I turn on last week my HP41C on disply I saw: "BAT. LOST MEMORY". After replacing the batteries, all stored "HP SURVEY PAC" program lost. When I was trying to re-load, for instance:

EXC ALPHA SIZE ALPHA 005 (following Survey Pac)

EXC Alpha Curve Alpha

100 R R/S

I noticed on disply: SIZE 0... or CURVE what is not according to the Survey PAC.

I would greatly appreciate you suggestion and advice. I am unable to dowload any Survey PAC program.The Survey Module is in and before replacing batteries everything was OK.

The Lewis and Lewis is unable to fix up , because the HP 41 C is too old, nor other survey repair companies have any advice.

Thank you for your precious time and consideration.

Dual Stack Design Question

*Message #1 Posted by **Namir** on 6 Feb 2006, 2:27 p.m.*

Hello All,

I am thinking about updating and old HP41-based design of a Windows application for a programmable RPN calculator. My question is this regarding the stack. How do you feel about having a secondary stack to push and pop intermediate results. HP designed the older calculator with a fixed 4-register autmatic stack. We often used it to store intermediate results when calculations allowed this. Otherwise, we store results in memory registers and recall them when we need to. How about a SECONDARY stack (say with 10 registers) to which we push intermediate results and pop them back (to the main stack) when we need them???

Namir

Re: Dual Stack Design Question

*Message #2 Posted by **Eric Smith** on 6 Feb 2006, 2:36 p.m.,*
in response to message #1 by Namir

How about a single stack of arbitrary depth?

Re: Dual Stack Design Question

*Message #3 Posted by **Howard Owen** on 6 Feb 2006, 3:09 p.m.,*
in response to message #2 by Eric Smith

The nice thing about two stacks is that you can seperate them logically. So the main stack is my normal RPN/RPL parameter passing, intermediate result thing, and this other guy is what I say it is. Say that now it's a place to accumulate a list of values (you can do this with a real list in RPL.) and later it's a place to store successive results of an iterative process. I then don't have to juggle parameters as much because they stay undisturbed on the "main" stack. Forth gives you multiple stacks in many implementations.

How about a stack data type? You then allocate or abandon them as needed. Good (perhaps psychic 8) GC would be needed.

Regards,
Howard

Edited: 6 Feb 2006, 3:10 p.m.

Re: Dual Stack Design Question

*Message #4 Posted by **Jan** on 6 Feb 2006, 3:47 p.m.,*
in response to message #1 by Namir

A somewhat longer stack (or virtually infinite, only limited by the total memory-space allocated to it) would do fine. For normal calculations 4 stack positions is fairly enough though, also for temporarely storing results

to be used later.

Re: Dual Stack Design Question

*Message #5 Posted by **Katie Wasserman** on 6 Feb 2006, 4:38 p.m.,*
in response to message #1 by Namir

Sounds like Forth, it has an arbitrarily deep regular stack and a return stack. The return stack normally deals with program flow control but you can use for anything that you'd like.
http://www.forth.org/svfig/Len/softstak.htm I used to do a bunch of programming in a forth-like language of my own design but rarely found the need to use the return stack for intermediate calculation results.

Re: Dual Stack Design Question

*Message #6 Posted by **Vassilis Prevelakis** on 7 Feb 2006, 8:48 p.m.,*
in response to message #1 by Namir

I think we have been through this discussion before.

If you want compatibility with existing programs you cannot change the stack size (will break assumptions of how the stack will look like after RDN, R^ and stack drop).

So how about a pointer into a "large" register bank that tells you where your 4+1 stack is located. You can have a command (say STACK nnn) that sets the stack pointer.

Default is STACK 000. If you want to create a new stack use STACK 005.

OR

You may even have a PUSHST and POPST that "push" and "pop" your entire stack into a stack-of-stacks. But why stop at that? Why not save additional processor state (e.g. flags), program file, etc so that you can push you entire HP41 CPU state into the stack, carry out your task and then pop it. Note that you will need some way of accessing data from that stack so that you can retrieve arguments and return results. In this way you can implement a "native" HP-41 command that retains stack contents, LASTx, ALPHA, flags etc, that is not part of the spec of the command.

**vp

BTW the first technique is used in RISC processors like the MIPS.

Short Battery Life on my HP-41CX

*Message #1 Posted by **Paul Schreck** on 6 Feb 2006, 11:18 a.m.*

My trusty HP-41CX eats batteries like there's no tomorrow! It's been perhaps 20 years or so since it's been used regularly (when I was last in college). However, whenever I need it again and install new N-size batteries, I find it dead when I need it again in a few days or weeks. It's sure not being used heavily when it's on, and I'm always careful to turn it off. I remember the batteries having a somewhat short lifespan (months) in college, but now something seems wrong. My eighth grader is prepping for SATs and I hope to pass down my trusty -41CX.

Any suggestions for this battery problem?

Re: Short Battery Life on my HP-41CX

*Message #2 Posted by **Ron Ross** on 6 Feb 2006, 11:52 a.m.,*
in response to message #1 by Paul Schreck

Since its a CX, do you have any alarms or other background programs running. Perhaps you have a module or other accessory that is also gobbleing up juice while you think it is off.

It could also be something on the inside across some contacts that might be corrected by a good cleaning.

Now, about loaning it to your younger one. Don't. Buy an Hp33s for them instead. It is actually a bit tougher and is easily replacable (and fairly cheap at $50 retail, Walmart). Later you can give them the Hp41Cx after you see how well they treat a $50 calculator.

And it is a dual mode calculator ie both RPN and algebraic.

Another calculator to consider is a graphics such as the Hp48Gii (although it is very complex and everyone in school will be using the Ti-83/84). It is also a dual mode calculator, although as an algebraic, it sucks compared to a Ti-86 which it compares most with (although it has a CAS, which may become a crutch to a younger ueser).

I wouldn't bother to loan an older Hp to your eigth grader and I say this after some experience (old piece of CRAP, why didn't Dad get me something new?!).

Re: Short Battery Life on my HP-41CX

*Message #3 Posted by **Paul Schreck** on 6 Feb 2006, 5:27 p.m.,*
in response to message #2 by Ron Ross

Thanks for the advice; I was checking out the latest versions on hpshopping.com and was considering the -33c. It may be too early to hand him a graphing device. I think those things are not authorized during SAT/ACT as well, but I'm not sure of the current policy but I will be soon!

I've always suspected the clock as the culprit because I've never used any peripherals with my -41CX. The fanciest I ever got were basic engineering equations to save time & keystokes during exams. Is there any way to disable the clock? It's not discussed in the manuals anywhere that I could ever find.

I don't know the current policy, but my son was allowed to use his 48GX on the ACT a few years ago. He had to cover the IR port with tape (to eliminate the possibility of communicating with others during the test), but there was no objection to the calculator itself. They didn't even make him clear the memory or remove his RAM and ROM cards.

Re: Short Battery Life on my HP-41CX

*Message #5 Posted by **John Smitherman** on 8 Feb 2006, 12:56 p.m.,*

Another reason for buying the 33s versus other scientific calculators is the quality of documentation available for the 33s. The 33s comes with a good manual plus there are a set of learning modules available for the 33s on HP's web site. Most other scientific calculators come with brief and sometimes poorly written instructions printed on a single sheet of paper.

Good luck!

John

Re: Short Battery Life on my HP-41CX

*Message #6 Posted by **David Smith** on 6 Feb 2006, 1:01 p.m.,*
in response to message #1 by Paul Schreck

It may be the electrolytic capacitors in the power supply are leaky and neeed to be replaced.

Re: Short Battery Life on my HP-41CX

*Message #7 Posted by **Paul Schreck** on 6 Feb 2006, 5:29 p.m.,*
in response to message #6 by David Smith

Thanks for the reply. Would you have any suggestions for:

1. Troubleshooting techniques to isolate the problem, or 2. Perhaps somewhere I could send it for diagnostics or repair.

Re: Short Battery Life on my HP-41CX

*Message #8 Posted by **Joe Edwards** on 6 Feb 2006, 5:44 p.m.,*
in response to message #7 by Paul Schreck

I have sent a couple of calcs to fixthatcalc.com with good results. He is a bit slow, but that is due to a backlog of work - it is a hobby, not a full time business. But, if you aren't in a hurry, he might be able to help you out.

If I am not supposed to post websites here, feel free to delete my post.

Joe

HP-41C module order

*Message #1 Posted by **Andreas Terzis** on 6 Feb 2006, 6:39 a.m.*

Hi there, I have a couple of questions if you could help me. Here they are:

1. What is a card reader test card? It came with a card reader I purchased, I ran it on both sides and didn't do anything. How can I find out what commands are on it? 2. On a HP-41CV that I have gotten from an older friend there is an infrared module (or so it looks), an 'X-functions' module and a 'dbl Xmem' module. Is there any literature on them? 3. Are those modules compatible with the card reader plugged in? Do they have to be in specific ports? Can I have the 'X-functions' in port 1 and 'dbl Xmem' in port 2 and have the card reader plugged in? I am not sure what is going on with the port order of insertion. Thanks in advance, Andreas

Re: HP-41C module order

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 6 Feb 2006, 1:42 p.m.,*
in response to message #1 by Andreas Terzis

Hi, Andreas;

> Quote:
>
> 1. What is a card reader test card? It came with a card reader I purchased, I ran it on both sides and didn't do anything. How can I find out what commands are on it?

I once had an HP82104A bought new, and I did not see any specific test card. Isn't it a custom card?

> Quote:
>
> 2. On a HP-41CV that I have gotten from an older friend there is an infrared module (or so it looks), an 'X-functions' module and a 'dbl Xmem' module. Is there any literature on them?

Yes. The X-Functions basic resources are fairly described in the HP41CX Owner's Manual, Vol.2, along with the X-Memory Modules (the Double X-Mem module is a custom module with two X-Memory 'chips' built inside as one). If you need the specific X-Functions manual, you can find it with the MoHPC CD/DVD set. Or at TOS (if you are new, please wait for T.O.S. meanning...)

> Quote:
>
> 3. Are those modules compatible with the card reader plugged in? Do they have to be in specific ports? Can I have the 'X-functions' in port 1 and 'dbl Xmem' in port 2 and have the card reader plugged in? I am not sure what is going on with the port order of insertion.

Yes, you can use them the way you mention without problems. You cannot use the Double X-mem with a single X-mem or with two X-mem modules; the double X-Mem Module allows both possible X-Mem to be used in a single port. And they do not interfere with the Card Reader operation.

Cheers.

Luiz (Brazil)

Re: HP-41C module order

*Message #3 Posted by **Howard Owen** on 6 Feb 2006, 2:17 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

> Quote:

> Yes, you can use them the way you mention without problems. You cannot use the Double X-mem with a single X-mem or with two X-mem modules; the double X-Mem Module allows both possible X-Mem to be used in a single port. And they do not interfere with the Card Reader operation.

However, the infrared module sticks out from the back a bit, so it needs to be in port 3 if the card reader is installed.

```
/============================\
| X Functions  | 2X X memory |
|----------------------------|
| Card Reader  | IR Printer  |
\============================/
```

That 2X Xmem module is relatively rare, although instructions exist in the article forum to build one from two regulat X Memory modules.

Regards,
Howard

Howard, Thanks. So this will create no conflicts, right? What is the general rule as far as port precedence is concerned? Andreas

Re: HP-41C module order

*Message #7 Posted by **Jim Creybohm** on 7 Feb 2006, 11:39 a.m.,*
in response to message #6 by Andreas Terzis

If I recall correctly (I don't have my manual in front of me so bear with an old man's memory.....) when you do a Catalog of the modules, the 41 goes through the ports in ascending order. If you are executing a certain XROM program, the 41 will search through the ports 1, 2, 3, 4 until it finds the culprit.

I would not be surprised to learn that the 41 uses the primary XROM number for faster searching, but have never asked this question of any one else here.

You won't have any conflicts with the ROMs that you have listed above. If a conflict occurs in a named (entered) program vs. an XROM, I believe that the named program takes precedence.

Apologies if there are errors, but I am certain that those with more concrete knowledge will correct me.

Re: HP-41C module order

*Message #8 Posted by **Howard Owen** on 7 Feb 2006, 12:32 p.m.,*
in response to message #6 by Andreas Terzis

It's a complicated subject. But as Jim says, there are no conflicts with the modules you have listed there.

The HP-41C ROM address space is 64K, broken into 16 4K pages. The lower eight of these (0-7) are reserved for various OS bits. The upper 32K, pages 8-15, are mapped to the expansion ports like this:

```
Page        Port
8-9          1
10-11        2
12-13        3
14-15        4
```

A module installed in a port may occupy 0, 1 or two of its pages. (Some modules take more than two, but these "page" the upper address space, and sometimes the lower.) The ones that occupy no pages are the so called "system" modules, like the time module and the X-memory module. Ordinary modules won't conflict with one another unless they have a collision in their ROM id. There are a copule of obscure modules that have this problem. I don't have a list handy, but they are rare. Conflicts come up more often with the "advanced" modules like HEPAX. This module plays extensive tricks with the calculator's memory map, and so it has special rules for coexisting with other modules.

Good references for this are the HEPAX module manual, available at TOS and "HP-41 M Code for Beginners" on the museum DVD.

Edited: 7 Feb 2006, 12:33 p.m.

Culling my collectiion and going with a 48gx model

*Message #1 Posted by **Joe Edwards** on 5 Feb 2006, 6:10 p.m.*

Okay, I think it is in my best interest to leave the collecting to the professionals. :) So here I am with several calculators I plan on selling. I am thinking that I should stick with my 27s (and get a 48gx. The emulators of the 10 series, 41 series, and 42s that Hrastprogrammer seem to be of high quality, plus I could just carry them all in one, albiet, large machine.

Since I am not true collector I don't need many machines, do you folks think I am making a mistake? Just a thought.

Would I be better off in the long run just getting a 33s and a 49g+? Sad thought, but this may be the best choice.

> Would I be better off in the long run just getting a 33s and a 49g+? Sad thought, but this may be the best choice.

There are only two reasons I can see for going with older machines. First, the older calculators are generally built better. The 49G+ has issues with keys breaking and labels wearing off with use. I haven't heard any bad reports about the 33S as far as durability goes, but some people just can't stand the weird chevron shape and the bugs. (Most, but not all bugs have been worked out as of the most recent version of the 33S.) The second reason would be affection/enthusiasm for the old machines. That's certainly why I own old HP machines, although the durability is part of the reason I have that affection.

Balancing that are several factors. Both the 49G+ and 33S run a good deal faster than the machines they replaced. They both have more features, too. Both have bigger displays. On the 49G+, the display improvement is huge, when compared to the 49G, and large when stacked aainst the 48G. If you need one or another of these improvements in your work with the calculators, that will of course weigh more heavily.

Hrast's emulators can run on the 49G+, but frequently with less functionality than on the 48GX. Hrast still identifies the 48GX as the best platform to run his emulators on. You will be unable to run any two of the

emulators at the same time, however, or have them installed side-by-side. If you have a large RAM card in port 2, you can store the ones you aren't using there, and switch them in and out as you wish. (Hrast will surely correct me if I don't have that exactly right. Perhaps there are some combinations you can run on the 48GX.) I'm planning to write a program to do the switching on my own main 48GX, with a 4MB RAM card in port 2.

Good luck with your decision!

Regards
Howard

1. True
2. False: I, for one, have all of them installed on a GX: 41X, 42X, 71X, 11E, 12E, 15E and 16E.

Greetings,
Massimo

*Message #5 Posted by **Howard Owen** on 5 Feb 2006, 11:19 p.m.,*
in response to message #4 by Massimo Gnerucci (Italy)

Don't they compete for room in port 1?

If you swap them in and out of port 1, that's what I meant by saying they could be stored in a RAM card in port 2. But they aren't "installed" there, since you can't run them out of port 2+, can you?

Regards,
Howard.

Re: Culling my collectiion and going with a 48gx model

*Message #6 Posted by **HrastProgrammer** on 6 Feb 2006, 1:08 a.m.,*
in response to message #5 by Howard Owen

Howard,

You must read instructions on my pages more carefully :-)

Of course, you can execute all my emulators directly from any port 1..33 without problem on HP-48GX. It is not possible to run them directly from Port2 on HP-49G/G+.

For example, on my own HP-48GX they are installed as follows:

Home: XQ42, XQ71 and XM41 (when needed for HP-41X)
Port 0: XF71 or XR71 (when needed for HP-71X)

Port 1: XM42 for HP-42X or XM71 for HP-71X
Port 2: RAM48X for HP-41X
Port 3: RAM48X for HP-42X (or for HP-71X without XF71/XR71)
Port 4: RAM48X for HP-71X with XF71
Port 5: RAM48X for HP-71X with XR71
Port 6: HP41X
Port 7: HP42X
Port 8: HP71X
Port 9: HP41Z
Port10: XM42
Port11: XM71
Port12: Backup of HP41X (original, disabled with BAK2)
Port13: Backup of HP42X (original)
Port14: Backup of HP71X (original), HPILROM.CRD
Port15: Backup of HP41Z (original, disabled with BAK2)
Port16: HP11E, HP12E, HP15E and HP16E
Port17: Free

Forget about RAM48X and BAK2 for a moment - these are my personal utilities.

This is from HP41X/install.htm:

HP-48GX installation:

The emulator can be executed from Port1 or from a covered port (2..33). In order to use the emulator, you must have at least one 128K (writeable) RAM card in Port1. Before installation, make shure that Port0 and Port1 are empty. If needed, initialize them with PINIT and clear everything from them. Then, use MERGE1 to merge Port1 with the main memory. This is necessary because the size of some librares is nearly 128K. If you want to use HP41Z library (and have second >=128K RAM card) then it must be received from the computer now. Store it to some covered port because there isn't much sense of storing it to Port1 (covered port must be empty, of course). Press ON+C to reboot the calculator. If you don't want to use it or you doesn't have any (free) covered ports then simply skip previous three steps. After doing this, receive the HP41X library from the computer. If you want to install the emulator to Port1 then execute the following instructions: 0 STO { :0: 1052 } FREE1.

If you want to install it to a covered port then simply store it to that port (port must be empty before storing) with something like 2 STO and free Port1 with {} FREE1. It is very important to free Port1 because emulator will not start if Port1 remains merged ('Port Not Available' error will be generated). Press ON+C to (automatically) attach the HP41X library to the HOME directory and the emulator is ready to be started with XQ41 library command.

Best regards.

For day to day use, I'd stick with the HP-48GX. Newer models may be faster and have more features, but the HP-48GX was the last model with a good keyboard, sensible layout of keyboard functions, and a color scheme that doesn't hurt my eyes.

I remember being where you are now and asking the exact same question. To answer it, I have 30 different HP models now. I do have the 49G+ and two 33S calcs (one for work and one for the collection). In the beginning, all I wanted to want (I hope that sounds right) was the 33S and 49G+. However, due to a slight lack of patience with both models for several reasons (all posted on this forum by many users), I decided to try some of the older models. (My first was a 28S over 15 yrs ago.) I fell in love with the older ones for their quality (no keyboard problems that I've experienced with the 33S, 49G+, 12C Platinum, and 17BII+) and overall feel and aesthetics. I learned that I actually prefer the 12C or 11C/15C (Voyager series) as a day-to-day scientific calc despite their relatively slow speed compared to todays newer calcs. I will say, though, that after downloading the new ROM 2.00 into my 49G+, I have not had any problems with its keypad at all. However, I do find it a bit clumsy to use for quick scientific calculations.

Re: Culling my collectiion and going with a 48gx model

*Message #9 Posted by **Les Bell** on 5 Feb 2006, 10:57 p.m.,*
in response to message #1 by Joe Edwards

I'm not a collector, but I certainly couldn't get by with just a 48 or 49. The 41 is much more convenient for back-of-an-envelope stuff, and the 16C is the only way to go for computer-related work.

The 48 is just too cumbersome for daily use, imho. I only use it for maths self-study.

Best,

in response to message #9 by Les Bell

Hi Les,

Not to contradict you or anything (I love the 41 and 16C too, and I agree that the 48 tends to be a bit too awkward for quick-and-dirty work)... But what do you think about the 42S? If you can live without the 41's expandability, and without the 16C's variable word size, the 42S seems like the best of both worlds. Just $0.02 from a majorly biased person. ;-)

- Thomas

Re: Culling my collectiion and going with a 48gx model

*Message #11 Posted by **Les Bell** on 6 Feb 2006, 3:26 a.m.,*
in response to message #10 by Thomas Okken

I'll go along with that, Thomas; I like the 41 because I have a couple with lots of modules, card reader and printer, but the 42S would suit me about as well (I rarely use the printer and have never got around to fixing my card reader - assuming that it *has* a gummy wheel problem, which it certainly ought to).

But the 16C is a bit harder to replace - it's nice having fast keyboard access to all those logical, rotate and bit count functions. . .

Best,

>
> Since I am not true collector I don't need many machines, do you folks think I am making a mistake? Just a thought.

Hello, Joe --

I coveted the HP-41C/CV in 1980-81, but it was too pricey for me at the time. In late 1981 or 1982, I saw an LED-display HP-34C. When I had some money in late 1983, I set out to buy a HP-34C, but the salesman steered me to buy something better: the HP-15C. It served me through three degree programs.

In 2002, I vistited a local used-electronics seller, who had a 34C and several 41's in a drawer. I saw an opportunity to obtain what I had to pass up 20 years prior, and ended up buying the 34C and a near-mint 41CV from the store.

I didn't set out to become a collector, but in the MoHPC Forum, I learned about the fine HP-42S, HP-16C, and other models. I eventually bought these and others on eBay and from the local seller. My collection now includes the LED-based HP-35 and HP-34C, plus all five Voyager-series models, all 11 Pioneer-series models, all three HP-41 models, as well as the HP-71B, HP-48G, and HP-28C.

My focus in collecting has been to keep and preserve the examples from what I consider HP's 1979-1993 "golden era" of calculators: affordable, well-engineered, well-built, and well-documented.

Sure, there were other fine HP calculators from outside that era (e.g., HP-67), and there were others from that era (e.g., HP-75, HP-18C). However, limits should be imposed...

Would it be worth it you in time and money to be one of those who help preserve part of the legacy of an American company, which once was run by engineers and did things right? Only you can answer appropriately for your own situation. A "complete" collection will cost you thousands of dollars at eBay prices.

If you would want to limit such a collection to the *creme de la creme* of HP calculators from that era, I'd recommend the following:

```
Foundation: HP-15C, HP-41CX, HP-32SII, HP-17BII (or HP-27S)
Supplemental:  HP-16C, HP-42S, HP-28C/S, HP-71B, HP-48
```

Of these, however, only the financial HP-17BII and RPL-based HP-28C/S can usually be had for less than $100.

- The HP-15C surpasses the HP-10C and HP-11C.
- The HP-41CX surpasses the HP-41C and HP-41CV.

- The HP-32SII surpasses the HP-32S.
- The HP-17BII surpasses the HP-17B, providing RPN.
- The HP-27S provides the fine equation solver and time/calendar functions of the HP-17BII, but not all the financial functions.
- The HP-16C is a unique computer-science model.
- The HP-42S is the most capable RPN, but is somewhat awkward and limited in certain ways.
- The HP-28C/S offer a nice unit library with conversions.
- The HP-71B is significant, but quite different from calculators.
- The HP-48 (certain models?) will allow you to run the emulators.

I don't yet have the fine emulators that HrastProgrammer, Eric Smith and others have graciously provided to us. Even though the emulators outperform the "real McCoy" physical calculators, I prefer the tactile "actuality" of the original hardware.

Regards,

-- KS

*Message #13 Posted by **Geir Isene** on 6 Feb 2006, 3:28 a.m.,*
in response to message #1 by Joe Edwards

There are of course pros and cons for most every machine. My highlights are as follows:

48GX: A solid math and graphing machine. Big and not a very good programming environment. The clock /drifts/.
42S: A very good calculator. Small and full of features. Lacks I/O to save programs.
41CX: A very good calculator with great I/O. Slow and a bit bulky but with a very good programming environment (IMHO).
Voyagers: Very good LCD, small and well built. No alphanumerics. Slow and maybe horizontal layout is something to get used to.
97: Great calc for your desktop. One shift key. Easy access to all functions. Ok, it's slow, but it's pretty.
67: Good calc for us hobby astronomers with its red LED display.
(I don't have a 49g+ or a 33s.)

Just my 2 øre.

Re: Culling my collectiion and going with a 48gx model

*Message #14 Posted by **Joe Edwards** on 6 Feb 2006, 8:56 a.m.,*
in response to message #1 by Joe Edwards

So far I have decided to keep the following:

HP 33s returned to Fry's. Going to skip buying a 49g+.

I have decided to stick with the following models: HP 21 as a desktop four-banger. The LED's were too much to pass up. HP 27s as my favorite of all HPs. HP 48gx with 41, 42, 16, and 15 emulators.

I thought about going the "Made in USA" route only. This would be the following: HP 21 HP 11c HP 15c HP 16c (maybe a 12c and 10c later on) HP 41c

It seems that the 27s, 42s, and 48 models are all made in Singapore. My 41c is US made, but my 41cx is Singapore made. Are there any CV and CX models made in the USA?

Thanks for the input. Joe

Re: Culling my collectiion and going with a 48gx model

*Message #15 Posted by **Ed Look** on 7 Feb 2006, 11:57 a.m.,*
in response to message #14 by Joe Edwards

Awww, maybe I should have responded sooner.

I truly have found the 33S to be quite useful and handy; it is a slightly expanded version of the 32SII.

In research activities, I find I need a combination of a calc from group 1 [49G+ or 48(G or G+)], and one from group 2 [32SII or 33S]. While I truly enjoy the feel of using the 32SII, I must confess the 33S is a tad bit more USEFUL with the slightly more spacious programming capacity and speed and preprogrammed constants library. Other times, I need my self-stored data or programs I put on the graphing ones from group 1; not that I ever graph any functions, I just need their programmability and memory.

If I teach advanced courses, I often need one of the group 1 machines because I've written and stored programs on it and if an intro course, I use it as a very portable "MS Excel" for quick stats.

In either case, the "smaller" calculators in group 2 are needed actually more often for, as we all call them, quick and dirty, or even somewhat more involved calculations that might require just light programming.

The vintage calcs are sweet and I myself only own one (not totally functional anymore), but these newer and much more maligned HP units are actually more than useful; they are quite handy.

(They really aren't a bad first couple of steps in trying to stake a claim on the calculator market again!)

Ed, The 33s wasn't bad. It seems to me to be a nice zombie mutation of the HP 22s and the HP32sii. Unfortunetly, I don't like the cluttered keyboard of the 32sii anymore than the 33s. I would rather stick with the 32s by itself versus the 33s, given the choice.

Implementing a second alpha register on the 41?

*Message #1 Posted by **Geir Isene** on 5 Feb 2006, 12:14 p.m.*

Has anyone implemented a second alpha register (a scratch register for holding temporary alpha data [for instance while switching between two XM-ascii-files])? I know this can be done with ASTO/ARCL 01-04, but has it been implemnted in MCODE? Also, has anyone implemented moving registers longer than 24 characters from one ascii file to another in an efficient way?

Edited: 5 Feb 2006, 12:47 p.m.

*Message #4 Posted by **PeterP** on 5 Feb 2006, 2:03 p.m.,*
in response to message #1 by Geir Isene

Angel martin (who still owes us some manuals for his wonderful little pieces of works...) has programmed some functions that allow you to move the complete alpha register into a block of 4 registers and back with one line (A>RG and RG>A as well as ST>RG and RG>ST). This way you can quickly move a whole alpha into 4 consecutive regs and back. Works pretty neatly. They are part of the Sandbox as well as the Alpha modules from him. He has even made the MCode available (Fully documented!!!!!)

However, Raymonds suggestion works also for larger thatn 24 chars and serves your purpose potentially much better.

Cheers

Peter

71B Memory Module

*Message #1 Posted by **Xavier LaRue** on 5 Feb 2006, 12:21 a.m.*

Hi there,

A little question, did somone made any memory module for the 71B. I see that for the 41, it has some user made memory module like Clonix / NoVram... But for the 71B, Do that was done ?

Thank for yer info.

Also a last question, if the VER$ outputted string contain HP71:2CDCC HPIL:1B

Do that mean that I have the HPIL interface ?

Thank for all your answer.

Ahh and a last question, do the MoHPC is still availlable, I'm considering the option to buy one.

Thank for all your help, Xavier LaRue

Re: 71B Memory Module

*Message #2 Posted by **Garth Wilson** on 5 Feb 2006, 4:57 a.m.,*
in response to message #1 by Xavier LaRue

I don't know of any recent HP71 memory module offerings, but back in the mid- to late-1980's, CMT offered them in 32KB and 64KB for the front ports, and 32KB, 64KB, 96KB, 128KB, and 160KB for the card-reader port. There was also a company that would hard-wire 256KB internally for you for a hefty fee, so it would not take up any of your ports.

The HPIL module added a pair of connectors next to the power connector. You don't even have to turn the computer on to tell if it has an HPIL module. If you have the pair of connectors there, you have HPIL. If they're not there, you don't. Very simple.

Your last question is not clear. Are you asking whether the MoHPC CD ROMs are still available? They are at http://www.hpmuseum.org/cd/cddesc.htm

HP-12CP Trigonometric functions program still not tested. Anyone?

*Message #1 Posted by **Gerson W. Barbosa** on 4 Feb 2006, 7:27 p.m.*

Hello,

I have a trigonometric functions program that should work on the newer Platinum. However, it remains untested because I don't intend to get a Platinum just because of this, at least for the time being.

The accuracy is comparable to that of the HP-35, I'd say it's even slightly better, and I don't mean the buggy one :-)

I estimate running times to be around 2 seconds for SIN and COS (twice as much for TAN as it is calculated as SIN/COS for the sake of accuracy); and under 3 seconds for ASIN, ACOS and ATAN. It is not as fast as it could be because the constants used by the program are all built-in rather than previously stored in the registers.

Keying in a 274-step untested program is not exactly what one would choose for the weekend, but in case someone wants to try, here it is:

Trigonometric Functions on the HP-12C Platinum (newer one only!)

In an effort to make the task less boring, I have used Luiz's keyset4 font (thanks, Luiz!) in the listings, as you can see. I have doublechecked the listing and I have also provided a working equivalent program for the HP-15C.

Thanks,

Gerson.

Edited: 4 Feb 2006, 7:28 p.m.

HP-12CP Trigonometric functions program tested (single values only)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Feb 2006, 8:02 p.m.,*
in response to message #1 by Gerson W. Barbosa

Hi, Gerson;

first of all, shame on me... (you know why, don't you?)

Second, thanks for using the fonts. I'm suspect to say, but the listing looks good, don't you agree?

I tested the program with the simplest values:

```
45 SIN -> .7071067812 ([STO] 9 for testing)
45 COS -> same as above
[x^2] [RCL]9 [x^2] [+] [f][PREFIX] -> .999999999
45 TAN -> 1.000000000
```

The complementary values were obtained with the value stored in R9.

In time: a few glitches in your listing (just little peebles...). [square-root] and [GTO] are prefixed functions in

the HP12C (they are not in the HP15C, where you wrote the routines, right?) and step #029 is repeated twice in the sequence.

I see it is a .GIF, and you'd have to do it all again. If you actually are going to update it, consider an initial remark with the changes, only.

Congrats! Great program!

Luiz (Brazil)

Re: HP-12CP Trigonometric functions program tested (single values only)

*Message #3 Posted by **Gerson W. Barbosa** on 4 Feb 2006, 9:28 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thank you very much for taking the time to test it. I really didn't expect a so prompt response!

Sorry for having forgotten the prefix keys. I will revise it later, just o matter of editting the text and converting it to .GIF.

About the test, 45 SIN -> .7071067812 is better than .7071067813 on the 15C. But I didn't like the '.999999999'. On the 15, this would result '1.000000000'. A '9' is missing, isn't it?

I didn't use full-accuracy coefficients in the minimax polynomial for sine , to save some steps:

```
-3,2818376137E-08
 5,5539160587E-14
-4,4756602223E-20
 2,0935117545E-26

(max abs error: 8,02E-14)
```

Instead, I used:

```
  -3,28183759E-08
       5,5539E-14
     -4,47304E-20
             2E-26

(max abs error: 1,87E-11)
```

This should have been good enough. Have you seen the comparison table with the 15C and 35? If the displayed result is correct to 10 digits, this should be nice for a financial calculator, it's most of the time set to FIX 2 anyway :-)

Cheers,

Gerson.

PS.:

1) Would you try this:

asin(acos(atan(tan(cos(sen(9))))))

9 R/S GTO 094 R/S GTO 104 R/S GTO 157 R/S GTO 141 R/S GTO 123 R/S

On the 15C the result is 9.000878935

2) The X register is always preserved

3) How about the running time?

Thanks.

You're right. I did not count the '9's, just keyed them in... Sorry! And as you see the last digit, the '2' (12Cp) instead of '3' (15C) leads to a lower result.

> Quote:
>
> 1) Would you try this:
>
> asin(acos(atan(tan(cos(sen(9))))))
>
> 9 R/S GTO 094 R/S GTO 104 R/S GTO 157 R/S GTO 141 R/S GTO 123 R/S

Resulting value is 9.000148569. Closer to the original value. The HP12Cp works with more internal digits... I still believe this is the main cause for the low-value IRR issue in the first Platinum units. And the program runs fast in the HP12Cp. In time: I used a newer model as specified, with parenthesis and back-space/undo features. I think of keying it in one of the earlier units and test it, too. I'll let you know.

Cheers.

Luiz

Additional remark (interesting)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 4 Feb 2006, 10:03 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Gerson, all;

in my previous post, I wrote that the asin(acos(atan(tan(cos(sen(9)))))) resulted in 9.000148569. With this result in the display, I keyed in:

```
9 [-]
```

and I got the following mantissa:

```
1485693900
```

I'm not sure: should the two additional significant digits '3' and '9' be there?

Luiz (Brazil)

Edited: 4 Feb 2006, 10:04 p.m.

Re: Additional remark (interesting)

*Message #6 Posted by **tony(nz)** on 5 Feb 2006, 9:49 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Congrats Luiz, you found the 2 hidden digits :-) 3 [1/x] 1000 [x] [g][FRAC] also shows 0.333333333. On the old 12cp and HP12C we see 0.333333300. So the new 12cp should perhaps be called the 12d, as it has 12 digits under the hood :-)

Best Regards, Tony

I feel like I'm talkn'bout yesterday's news... as if they are just news.

*Message #7 Posted by **Vieira, Luiz C. (Brazil)** on 5 Feb 2006, 10:14 p.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi, guys;

I must confess I've been a bit selective in therms of what to read, mainly because of a lack of time and sometimes because of the huge amount of threads/info that can be found here. My bad...

I remember reading about the (old...) TI58/59 hidden digits that can be shown under certain circumstances, and I also tested a few keystroke sequences to see the HP30S hidden digits as well. I also remember reading about the HP12Cp internal precision due to the specific processor. I know that higher internal precision allows better final resulting values, and it is not necessarily kept in the final result/display.

I was completely unaware of the fact that the newer HP12Cp could handle results with a 12-digit mantissa. This is actually a new design. Not sure if these digits were suppressed in the earlier, bug-filled series or if they are actually added to the new design.

Thanks, guys, for any new data. Also, forgive me if this is a knwon fact and I treated it as new, I'm sort of enthusiastic with unknown facts. If so, can you point me any thread or article that mentions this fact?

Thanks again.

Luiz (Brazil)

Edited: 5 Feb 2006, 10:44 p.m.

Re: I feel like I'm talkn'bout yesterday's news... as if they are just news.

*Message #8 Posted by **Gerson W. Barbosa** on 6 Feb 2006, 7:00 a.m.,*
in response to message #7 by Vieira, Luiz C. (Brazil)

Hi Luiz,

> Quote:
>
> can you point me any thread or article that mentions this fact?

Yes, Tony told me about these two hidden digits almost three months ago:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=81563#81563

By the way, I have updated the listing to include the prefix keys I had missed. Thanks for having warned me about this. Also, line 147 has been changed from **g x^2** to **g LSTx**. This is more effective and doesn't cause a needless decrease in the ACOS accuracy, at least on the 15C. The forensic result (see below) in now 9.000270299. On the Platinum, due to the extra digits, the difference will be less noticeable, if any.

Cheers,

Gerson.

Re: HP-12CP Trigonometric functions program tested (single values only)

*Message #9 Posted by **Gerson W. Barbosa** on 5 Feb 2006, 8:40 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Thanks again.

9.000148569 is a good result, the HP-15C and HP-41 internal functions return 9.000417403. See Mike Sebastien's Calculator Forensics Project. I think it is still possible to adjust the constants to take advantage of the Platinum's features, but I am pleased with the result.

When you subtract 9 from the result the two addition digits come from the extra internal digits in the Platinum.

I don't think the program will work on the older unit because there's a limitation in the number of steps it can handle, just 255 if I am not wrong.

One more question: you said the program ran fast. Is it possible to know exactly how fast? Would you please time 45 TAN? In the 15C version, it takes about 16 seconds! As I said, the program might run even faster if there was a separate initialization routine that stored all the constants in the registers, but then we'd have to run it every time we were not sure about the registers contents. As I know the Platinum is fast, I chose this approach for ease of use.

Cheers,

Gerson.

Update: Thanks to a minor change (see above), the forensic result in the 15C version of the program is now 9.000270299. We should notice the forensic result alone is not a good indicator of the overall accuracy, since the 15C internal function, which are far better, return a worst result: 9.000417403.

*.ROM and *.MOD file format documentation?

*Message #1 Posted by **Thomas Okken** on 4 Feb 2006, 1:49 p.m.*

Hi all,

I'm looking for documentation about the *.ROM and *.MOD file formats (HP-41 ROM image files). Anyone have a link to byte-by-byte explanations of these? Thanks,

- Thomas

Re: *.ROM and *.MOD file format documentation?

*Message #2 Posted by **Howard Owen** on 4 Feb 2006, 2:16 p.m.,*
in response to message #1 by Thomas Okken

The .ROM file format is documented in SDK41 over at TOS.

Re: *.ROM and *.MOD file format documentation?

*Message #3 Posted by **Doug Wilder** on 5 Feb 2006, 8:01 a.m.,*
in response to message #1 by Thomas Okken

The .ROM format is very simple. It is 16 bits for each 10 bit word exactly as they appear in the rom.

The upper 6 bits are set to zero. So a 4Kword rom takes 8KB in a PC .ROM binary file. The largest 16 bit word is 03FF just as the largest 10 bit word is 3FF. Open a .ROM file in a hex editor.

To my knowledge the .MOD format has not been released. The .r41 format (found here: ftp://ftp.math.jyu.fi/pub/hpil/swap/swap09/) is more complex as it packs 4 words into 5 bytes.

Best

Re: *.ROM and *.MOD file format documentation?

*Message #4 Posted by **Thomas Okken** on 5 Feb 2006, 8:11 a.m.,*
in response to message #3 by Doug Wilder

Thanks Doug!
I guess it's not a big problem to only be able to handle ROM files, since it's easy enough to extract the ROM file from a MOD file.
I took a peek at a couple of MOD files (Finance and Securities), and at first I couldn't make sense of what I was seeing, but given that the original ROMs have 10 bit words, now I get it. I'm wondering, though, what this means for user code. If I want to extract user code from a ROM image, is it OK to just ignore bits 8 and 9, or do they have some significance? I notice that they're not all zero, which is what I would expect (given that user code instruction words are just 8 bits).

- Thomas

Re: *.ROM and *.MOD file format documentation?

*Message #5 Posted by **Doug Wilder** on 5 Feb 2006, 12:32 p.m.,*
in response to message #4 by Thomas Okken

Hi Thomas,

I don't work with user code directly in rom much, the reason being that the HP41C COPY function will pull any rom user code into ram and MLDL will write user code to romram. I just develop in ram.

Didn't look it up so this may be wrong/incomplete:

1) Each new line: the first byte has bit 8 set (so it is 1xx).

2) At the .END. bit 9 is set (2xx). I have to look this up.

3) There are two header words before each user code program to implement COPY and PRIVATE.

4) The entry point/s is at a global label.

5) Jumps/executes distances are in words. They are always precompiled (duh, guess i didn't need to say that).Programs run backwards from in ram so the direction bits are switched. The global chain is still intact as it is needed for COPY.

Best

Edited: 5 Feb 2006, 12:51 p.m.

Re: *.ROM and *.MOD file format documentation?

*Message #6 Posted by **Thomas Okken** on 5 Feb 2006, 2:20 p.m.,*
in response to message #5 by Doug Wilder

I stared at a couple of ROM dumps for a couple of hours, and here's what I found. It seems pretty straightforward. I don't care about the "mystery" blocks (Doug mentioned they are for COPY and PRIVATE), and the details of GTO/XEQ offsets and the global chain are not important for what I plan to do either (when Free42 imports HP41/42 user code, it translates it to its own internal format and the specifics of offsets etc. are unceremoniously discarded).

Thanks again for your help -- looks like I'm good to go! :-)

- Thomas

```
0000: (1 word)  ROM number
0001: (1 word)  number of functions + 1
0002: (2 words) Offset to pac name. Points to an E0 byte, which is *preceded*
                by the pac name, with letters in reverse order. The encoding
                looks like ASCII but with the letters of the alphabet moved
                to 01-1A. The last character of the name is flagged by bit 7.
0004:           function directory, one 2-word entry per function. If the
                function is user code, bit 9 of the pointer's first word is
                set; for mcode, bit 9 is clear.
                The directory is followed by two zero words, presumably a
                sentinel.

The remaining words contain the pac's code. User code chunks are always
preceded by a two-word chunk of unknown purpose; both the user code chunks and
the mystery chunks have their final word highlighted by having its bit 9 set.
Inside user code chunks, bit 8 is used to indicate the first word of an
instruction -- to help speed up BST, no doubt.
```

```
So, to extract user code from a ROM image, the following algorithm seems like
it might be adequate:

1) Get the ROM number from word 0000 and the instruction count from word 0001.
2) Get the ROM name by dereferencing the offset at word 0002-0003 (minus one)
and moving backward until a word with bit 7 set is found. Add 0x40 to all words
in the range 00-1F.
3) Copy the table of offsets into temporary storage. Discard all mcode entries;
sort the remaining entries by address.
4) Import user code, starting from the instruction pointed to by the first
entry in the sorted offset table. Keep importing until an END instruction is
found. Then remove all offsets before this END from the offset table.
5) Repeat step 4 until the offset table is empty.
6) During the import process, keep track of the locations of global labels in
the imported code. Build a new XROM->label translation table. Mcode entries
should be set to NULL so Free42's instruction despatcher will know that it has
to display an error message rather than perform a subroutine call.
7) Display a warning when mcode entries were found in the ROM image; display an
even sterner warning if the user code from the ROM image calls these mcode
functions.
```

Hi, Thomas;

part of what you have already observed is described in 'HP41 MCODE For Beginners', availble with the MoHPC DVD/CD Set. And there is more in there, a lot more... It´s fairly worth reading.

Cheers.

Luiz (Brazil)

Re: *.ROM and *.MOD file format documentation?

*Message #8 Posted by **Thomas Okken** on 9 Feb 2006, 2:31 p.m.,*
in response to message #7 by Vieira, L.C. (Brazil)

Thanks for the tip, Luiz -- it hadn't occurred to me to look there, but now that you mention it, machine code and ROM layout are topics that seem to go hand in hand! I don't look at those CDs enough. :-)

- Thomas

Re: *.ROM and *.MOD file format documentation?

*Message #9 Posted by **Doug** on 5 Feb 2006, 10:29 p.m.,*
in response to message #5 by Doug Wilder

Yes, it looks like you have it! Keep in mind however that the first line of a program does not have to be a global.

The 2 word header for user code program, used by COPY:

0000 Number of 7 byte registers required to hold the program.

0001 Number of bytes that go into the first 7 byte register so that all the other 7 byte registers are full. Format is 2b0 (or 3b0 for priv) where 0 < b < 8.

3E0 = RTN, usually used at entry to first function (rom name). Although many times HP don't waste the word as rom name is not supposed to be executed. So it could be anything.

Edited: 5 Feb 2006, 11:19 p.m.

Re: *.ROM and *.MOD file format documentation?

*Message #10 Posted by **Thomas Okken** on 7 Feb 2006, 9:03 p.m.,*
in response to message #9 by Doug

Thanks to all for helping me with this!
I have written a program that extracts the user code from *.ROM files and saves it in a *.raw file that Free42 and Emu42 can use. It still needs some tweaking, but it looks usable... In case anyone is interested, I'll post a message on this forum when it's done, and I'll put it on the Free42 web page for download. Probably by the end of this week.

- Thomas

Re: *.ROM and *.MOD file format documentation?

*Message #11 Posted by **Howard Owen** on 7 Feb 2006, 9:42 p.m.,*
in response to message #10 by Thomas Okken

I wondered what you were up to with the 41C rom images. Sounds really useful!

I imagine these would be loadable into HP-42X with Hrast's RAW42.EXE. Unfortunately, at least one program with 42S specific functions does not work, and actually crashes my 48gx. How similar is the raw fromat for Emu42 and Free42 to the P41 raw format?

Regards,
Howard

Re: *.ROM and *.MOD file format documentation?

*Message #12 Posted by **Thomas Okken** on 8 Feb 2006, 10:59 a.m.,*
in response to message #11 by Howard Owen

Hmm, if you have a raw file with HP-42S code, and it crashes your 48 when you run it under HP42X, it sounds like you need to send Hrast a bug report. BTW, does it work when you load it in Free42 or Emu42?
On the other hand, the problem could be non-HP42S code, that is, XROM instructions that are not valid HP-42S instructions. I don't know how a real 42S (or a hardware-level emulator like HP-42X and Emu42) will react to that kind of thing, or to synthetic instructions. It might crash.
As far as the format is concerned: AFAIK, all raw files are memory images, that is, the same bytes as in the memory of a real calculator, nothing added, nothing removed.

- Thomas

Edited: 8 Feb 2006, 12:00 p.m.

Re: *.ROM and *.MOD file format documentation?

*Message #13 Posted by **J-F Garnier** on 9 Feb 2006, 6:27 a.m.,*
in response to message #12 by Thomas Okken

I don't know how a real 42S (or a hardware-level emulator like HP-42X and Emu42) will react to that kind of thing, or to synthetic instructions. It might crash.

From what I remember from a HP42S ROM code disassembly, an unknown XROM will cause a "Machine Reset". I didn't try, although it would be easy using the built-in memory editor. It may not be the case with HP42X, as Hrast is an expert in ROM code patch :-)

J-F

Re: *.ROM and *.MOD file format documentation?

*Message #14 Posted by **HrastProgrammer** on 9 Feb 2006, 7:41 a.m.,*
in response to message #13 by J-F Garnier

It may not be the case with HP42X, as Hrast is an expert in ROM code patch :-)

Thanks J-F, but it will do "Machine Reset" or something like that because I haven't patched this :-)

Re: *.ROM and *.MOD file format documentation?

*Message #15 Posted by **Tony Duell** on 6 Feb 2006, 1:39 p.m.,*
in response to message #1 by Thomas Okken

I don't know if it's any use, but my LIF Utilities for Linux include programs to look at an HP41 ROM file (as saved on floppy by most MLDL boxes), and to catalogue the functions in a ROM.

I am not sure whether .ROM and .MOD files are anything like these, but if so, you might find the comments in the source code to be of interest.

Slashes in HP48 source code

*Message #1 Posted by **Kieron Abbott** on 3 Feb 2006, 10:47 p.m.*

I'm a new HP48 user who recently inherited my dad's old 48G. I have a question about 48 source code with slashes. In the Advanced User's Guide, there are no slashes in the program listings, but in the source on the Goodies Disks and most places online (i.e. at http://www.hpmuseum.org/software/48vigenc.htm), there are slashes "\" before each << and >>. Can someone clue me in as to what these signify, and whether they are necessary?

Re: Slashes in HP48 source code

*Message #2 Posted by **Gerson W. Barbosa** on 4 Feb 2006, 1:06 a.m.,*
in response to message #1 by Kieron Abbott

Those back-slashes are used to represent the 48G characters with ASCII codes above 127 with characters in the first half of the ASCII table, which is standard for all code pages. For instance, \<< and \>> stand for the program delimiters and \PI stands for the pi symbol.

Refer to the HP 48G User's Guide, page 27-16, for the complete ASCII Characters Translations table.

Re: Slashes in HP48 source code

*Message #3 Posted by **Howard Owen** on 4 Feb 2006, 1:07 a.m.,*
in response to message #1 by Kieron Abbott

Those slashes mark characters that don't have equivalents in ASCII. A 48/49 series calculator will insert them into an RPL program transferred in "text" mode to a PC. So, for example \<< stands for the character with decimal code 171 in the calculator's character set. \>> similarly stands for the character with code 187. If you type these translated codes into a source file on the PC, then transfer it to the calculator in text mode, the kermit server will do the opposite translation, from the backslash escaped codes to the ASCII equivalent. The hp 49g+ & 48gII_advanced user's reference manual (HP link) has a table of these translations in Appendix J. I think they are broadly similar to the 48G translations, though there might be differences in detail.

Regards,
Howard

Re: Slashes in HP48 source code

*Message #4 Posted by **Kieron Abbott** on 4 Feb 2006, 12:50 p.m.,*
in response to message #1 by Kieron Abbott

So, if I was going to type a program directly into my calculator from a source file on my computer, I would simply ignore the replace \<< and \>> with << and >>, and other characters such as \pi with the actual pi symbol? BTW, have you seen Pi: Faith in Chaos? It's good.

Re: Slashes in HP48 source code

*Message #5 Posted by **Howard Owen** on 4 Feb 2006, 2:06 p.m.,*

in response to message #4 by Kieron Abbott

> Quote:
>
> So, if I was going to type a program directly into my calculator from a source file on my computer, I would simply ignore the replace \<< and \>> with << and >>, and other characters such as \pi with the actual pi symbol?

That's right. Most of the escaped symbols are easy to guess, like \>>, \<< and \->. For others you need the tables Gerson and I pointed you to.

> Quote:
>
> BTW, have you seen Pi: Faith in Chaos? It's good.

No. I'm culturally isolated. 8)

Regards,
Howard

Re: cleaning up

*Message #3 Posted by **Randy** on 3 Feb 2006, 9:07 p.m.,*
in response to message #2 by Les Bell

Toss anything more than ten years old in the bin. Except for maybe the one volume of Knuth (why only one?)...

A Win95 resource guide... very useful :-)

Re: cleaning up

*Message #4 Posted by **Les Bell** on 3 Feb 2006, 10:02 p.m.,*
in response to message #3 by Randy

Consider the Win95 and NT resource kits gone, Randy. I've also tossed the books on ancient Slackware and Caldera Linux. But I'm keeping the books on REXX and PL/I for sentimental reasons. ;)

As for Knuth - all three volumes are there - Vol 1 ("Fundamental Algorithms") is in green paperback form and is hidden behind the other two - Volume 3 is slightly obscuring Vol. 2, so that might be why they look like one, but you can *just* make out the two Addison Wesley logos at the bottom of the spines. In any case, your eyesight is excellent!

Best,

--- Les
[http://www.lesbell.com.au]

Re: cleaning up

*Message #5 Posted by **Randy** on 3 Feb 2006, 10:39 p.m.,*
in response to message #4 by Les Bell

I never knew they had been published in paperback. It's absolutely amazing what one can learn when discussing calculators!

PS: Your overloaded shelf caused me to do some cleaning as well. A bunch of Delphi and old VB stuff got the pitch. My three volumes of Knuth, original issue Intel 8008 and 8080 manuals will never go!

So many ebay sellers

*Message #1 Posted by **Paul Marin** on 2 Feb 2006, 5:57 p.m.*

Why is it that we have so many ebay sellers trying to get us to buy from them on ebay. Why dont they come off there and sell direct to those on this site instead like most of us have done or do today??? Just a silly question. I hate ebay

Just my 1 cents worth

Re: So many ebay sellers

*Message #2 Posted by **Namir** on 2 Feb 2006, 6:06 p.m.,*
in response to message #1 by Paul Marin

Paul,

eBay is a free platform for selling and buying items. No one is forcing anyone to buy anything. If you find a deal then go for it. If you think the prices are way too high, then you have the personal power to vote with your wallet. No one is helpless!

As for selling on this site, I have noticed that many of the offers are EVEN MORE EXPENSIVE than eBay. So you do you want to pay MORE for the same item?

This web site is NOT as organized for selling items as eBay is. By that I mean that the site curator does not get involved if a transaction goes sour. There is no feedback system on this site to warn potential buyer.

This site is mainly to share news, techniques, ideas, and so on about HP calculators. It does include a modest for sale part. Again, those folks comfortable with selling and buying here do so, and those who are not don't get involved.

Either eBay or this site, we ALL HAVE A CHOICE. Each system has it's dynamics, advatnatges, and disadvantages. We pick the ones we are comfortable with ... or none at all.

Namir

Re: So many ebay sellers

That choice is your right.

Re: So many ebay sellers

*Message #5 Posted by **Howard Owen** on 2 Feb 2006, 9:53 p.m.,*
in response to message #1 by Paul Marin

Why do sellers use eBay? *Buyers.*

Better to ask why buyers use eBay. I think it's because the general perception is that it is safe. Whether it is or not is certainly arguable. But I think it's true that most buyers see it that way. And other sites on the Internet are unknown quantities to most people, and therefore seen as unsafe, once again whether they are or not.

But when you look at how the psychology of eBay's modified auction works on the seller's behalf, it's amazing so many people keep going there. I "opt out" of the bidding wars, generally. Otherwise I too get goaded into bidding over what I really want to pay.

Regards,
Howard

Re: So many ebay sellers

*Message #6 Posted by **Namir** on 2 Feb 2006, 10:18 p.m.,*
in response to message #5 by Howard Owen

I'd say that eBay is more ORGANIZED and that seems to instill some confidence. Who would want to deal with a here-today-gone-tomorrow web site??? As for safety, I make no illusion about the presence of dishonest or lazy sellers. As a buyer, I have to read between the lines and use experience to get a general feeling about the reliability of the auction info and the seller.

Namir

Re: So many ebay sellers

*Message #7 Posted by **Howard Owen** on 2 Feb 2006, 10:50 p.m.,*
in response to message #6 by Namir

Yes, the stability is part of the safety equation. Also, they work really, really hard to address issues that could undermine trust in the site, generally. Their efforts to educate people about phishing schemes using eBay and PayPal as bait is an example. The warnings and educational links are right up front in "My eBay" most of the time. They have PayPal, which has basically no downside for buyers, offering guarantees, for extra money of course. A user doesn't even have to use the service to get a sense of safety from that. And then there's the reputation system. While it's flawed in the sense that people are reluctant to mark anyone down for fear of retaliation, it actually works pretty well for dissuading outright criminality. (Nobody is reluctant to give negative feedback to a crook.)

So between managing actual site safety and the perceptions of same, eBay keeps the buyers on board. They have to, because *buyers under the influence of the modified auction are eBay's product.*. That product attracts eBay's customers, *the sellers*. Sellers get fees hiked on them every year, and they keep coming back. And eBay keeps on minting money.

But hey, you can get some cool calculators there! 8)

Regards,
Howard

32SII only about $100

*Message #1 Posted by **Han** on 2 Feb 2006, 5:27 p.m.*

This auction (eBay # 5859611553) for an HP32SII ended and the final price was approximately $100. It's also the more desirable unit. How is it that people are charging $300+ for an HP32SII when a collector's unit goes for around $100?

Re: 32SII only about $100

*Message #2 Posted by **Les Bell** on 2 Feb 2006, 5:30 p.m.,*
in response to message #1 by Han

He incorrectly named it "Hewlitt Packard", so those collectors and traders who search on "Hewlett" would have missed it. Also, he offered shipment to US only, which would have eliminated some enthusiastic bidders.

Best,

--- Les

Hp 71B

*Message #1 Posted by **Xavier LaRue** on 2 Feb 2006, 1:12 p.m.*

Hi there,

I just have got a 71B lately and I was asking myself if is possible to program in Assembly without the rom or an HP-IL link. Also, is there a way to make an HP-IL ? As I'm in an Electrical Engeenering I can do the circuit with some microcontroler but, has the protocol been Reverse engeenered ? If so, where can I find the doccument.

Thank your for your info, Xavier LaRue

Re: Hp 71B

*Message #2 Posted by **Howard Owen** on 2 Feb 2006, 1:46 p.m.,*
in response to message #1 by Xavier LaRue

There are several documents on TOS and on the museum's DVD that have detailed specs for HP-IL. These in particular ought to be of interest:

- Hewlett Packard General Purpose HP-IL Interface Integrated Circuit 1LB3-0003 (TOS)
- The HP-IL Interface Specification HP Pub. 82166-90017 (TOS)
- Firmware Design for HP-IL Devices - HP Application Note (Museum)
- The HP-IL System: An Introductory Guide (retrocalculator.com)
- HP-71B HP-IL Internal Design Spec, Volumes 1 and 2 (Museum)

The museum DVD may be purchased here. If you need a pointer to TOS, email me at hbo@egbok.com.

HP made a series of ICs that implemented the HP-IL protocol. You can probably scavange chips from old, non-working hardware. Here's a partial list of devices that had HP-IL, and thus the IC in question, built in:

- Thinkjet HP-2225B
- 9114, 9114B floppy drives
- 3421A Data Acquisition - Control Unit
- 3468A Digital Multimeter
- 82161A Digital Cassette Drive
- 82162A HPIL Printer
- 82163 HPIL Video Interface
- 82164 HPIL-RS232 Interface
- 82165 HPIL-GPIO Interface
- 82166C HPIL Converter Kit
- 82169 HPIL-HPIB Interface
- 82905B Printer
- 82973A HPIL/ISA Interface Card
- FSI164A HPIL RS232 Interface
- HP-110 and Portable+ Laptops
- Add on modules for HP-85 and HP-150 computers

Cristoph Klug makes a reimplementation of the 82973A ISA card. If you were to implement a PCI card, I'd buy one. 8)

Regards,
Howard

in response to message #3 by Howard Owen

Hi there,

Happy to see that somone would be interested into what I'm planning to do.

I'm planning to make a cable to remplace de ISA card using eather RS232 or USB [I'll make it with a microControler]. So I need to find the doccumentation about the protocol and how it works.

I'll need any information that you know on the HP-IL protocol.

Thank you for all your help :) Xavier LaRue

Re: Hp 71B

*Message #5 Posted by **Howard Owen** on 3 Feb 2006, 1:11 a.m.,*
in response to message #4 by Xavier LaRue

Well, all the references I listed above would be helpful.

HP shipped a development kit for HP-IL. It contained four of the 1LB3-003 HP-IL ICs, supporting electronic parts, a couple of HP-IL development modules for the HP-41C, an HP-IL translator, which was some sort of demonstration implementation, plus a lot of documentation. "The HP-IL Interface Kit Technical Guide" contains an overview of the kit. It recommends the following documentation, all of which I listed above: "The HP-IL System" is a book-length tutorial on implementing HP-IL. "The HP-IL Interface Specification HP Pub. 82166-90017" is the most useful document for what you have in mind. It has all the state digrams for the protocol, and exhaustive specs for the logical and electrical properties. Taken together, those two should have enough information for what you want to do. If you decide to take the route of scavanging HP-IL ICs of old hardware, then the "HP-IL Integrated Circuit User's Manual" will also be useful. In might be good to have in any event, just to compare the implementation to the spec. The first book is linked to above. The other two can be found at TOS.

I'm not an EE. I'm a systems software guy with a serious addiction to old computers and networks. I studied the documents listed above with an eye toward writing a Linux driver for Cristoph Klug's ISA card. But I ended up cobbling a solution together with DOSEMU and JF Garnier's EMU41. That got my PCs and my HP-IL gear talking, so the itch got scratched, and I shelved the project.

I'm not sure how much help I'd be to you beyond pointing you at the right documentation. But I'm glad to help out any way I can.

One issue I see is the loop vs the point-to-point nature of serial links. How were you planning to handle that?

Regards,
Howard

Re: Hp 71B

*Message #6 Posted by **Vassilis Prevelakis** on 3 Feb 2006, 6:39 a.m.,*
in response to message #1 by Xavier LaRue

The HP-IL interface generally consists of a controller, two pulse transformers for line isolation and the connectors.

Reverse engineering the controller will be tedious but doable since the specs are out there (see Howard's post above). However finding replacements for the transformers and connectors will be tough.

I'd suggest you forget about HP-IL and think about creating a USB or RS-232 interface for your HP-71B instead. This interface can fit within the HP-IL controller cavity and will be far more useful than the (obsolete) HP-IL interface.

Just my two cents

Maybe I misunderstood, but I was left with the impression that he does not have the **HP-IL interface** fpr his HP-71B and that he is looking to make a new 71B HP-IL interface.

How is *that* going to be of any use to an HP-41 owner?

Another idea would be the card reader port. It provides access to the internal bus so you can hang there a microprocessor with Flash (something like Diego's NOVRAM module). Then you can download programs to the flash and the 71 will find them mapped in its address space.

HPIL is obsolete only in that it is out of production. It's good for only the medium speed of about 5,000 bytes per second plus overhead (even USB 2.0 may not be able to go any faster with an HP71 though), but HPIL has a lot of benefits over other interfaces. It allowed simultaneous interfacing to anywhere from one to *hundreds* of other devices with a single pair of small, inexpensive connectors and no external hubs, was plug-n-play, did auto-addressing and error-checking, every device knew what it was and what it could do, it supported hot-swapping and interrupts, had 1,000-volt isolation between any two adjacently connected devices (by the pulse transformers), and allowed passing control from one controller to another if you had two or more controllers on the loop. There were interface converters to the other major interface types--parallel, RS-232, and HPIB (IEEE-488). Being less expensive and more intelligent than HPIB, it should have become an industry standard, but unfortunately HP marketing killed it like they did the 71. The 71 was made for technical professionals; but not one in ten of them knew it existed; and of those who did know, not one in ten had any idea how much power it had.

USB is the common interface now. It's faster, but it has the *huge* disadvantage that you need an additional

port for each thing you want to connect. (That's a problem when you have limited space for connectors, like on the 71.) Distance is more limited too. Again there are converters to the different interface types though, so a USB port can be connected to RS-232, HPIB, and hubs to more USB ports.

The only other interface I can think of right now that had the isolation like HPIL is MIDI, which uses optoisolators instead of pulse transformers. The optoisolators made it less suitable for low-power hand-held operation, the connectors are bigger, and its fixed speed is slower, at 31.25kbps. It did allow daisy-chaining, but there was no error-checking.

Re: Hp 71B

As the experience of the following thirty-odd years has showed, standard technologies are more likely to succeed than proprietary ones, absent a monopoly. That's because competitors can usually implement the standard on easy terms, often for free. And if there's an installed base already, a company will want to adopt the standard so as to be compatible and familiar to the existing customers. HP-IL was published, but not standardized, remaining an HP-proprietary technology. HP-IB was published *and* standardized, as IEE-488. HP-IB lives on as GPIB, and has been extended several times to keep up with increased data rates and other advances. HP-IL never went beyond the basic implementation of the loop. Controllers were upgraded, from the 41 to the 75 to the 71, and half-heartedly to the HP-85, (the HP-110 and HP-150 weren't intended as instrument controllers,) but HP-IL died a death in obscurity. It's a pity, no doubt.

Re: Hp 71B

*Message #13 Posted by **Eric Smith** on 3 Feb 2006, 1:22 p.m.,*
in response to message #1 by Xavier LaRue

With a bare 71B, you can program in assembly language by using POKE, PEEK, etc. It's quite a hassle though, so I don't especially recommend it. You really should either buy the assembler ROM or the HP-IL interface and an HP-IL to serial converter.

Buildinng your own HP-IL interface for the HP-71 would be a very large undertaking; it's not enough to just build something that emulates the microcontroller and 1LB3 chip in the HP-IL module. In addiion to needing to write a fair amount of firmware for the microcontroller, you would somehow need to have a copy of the HP-IL ROM code that runs on the HP-71.

The protocol has not been reverse-engineered, because HP actually published all the relevant specifications. They're on the MoHPC DVD or CD set.

in response to message #13 by Eric Smith

As Said earlier, I'll see, when I'll get my hand on the documentation, It shoul'nt be to much hard to interface...

We will see, Xavier LaRue

Re: Hp 71B

*Message #15 Posted by **Xavier LaRue** on 3 Feb 2006, 3:21 p.m.,*
in response to message #14 by Xavier LaRue

The point is that I love playing with uC, so, this is only a bus with some protocol. We will see for an RS232 interface but it should not be that hard.

The Assembler Rom and/or the Linking interface cost too much for my budget.. so :)

Anyway, I'll continue my research and see for the Museum CDs.

Thank you all, Xavier LaRue

ps: I still need to receive my hp71B. Its due for the next week :)

Re: Hp 71B

*Message #16 Posted by **Eric Smith** on 4 Feb 2006, 12:47 p.m.,*
in response to message #14 by Xavier LaRue

> Quote:
>
> It shoul'nt be to much hard to interface...

I think you'll find otherwise. I did HP-IL product development for a while, and even WITH all of the HP specifications, it still took months of hard work to develop a microprocessor-based HP-IL device, make sure that all of the necesary state machines work correctly, etc.

This isn't a simple interface like RS-232.

And for what you're talking about doing, you need to interface the the Saturn microprocessor bus too, which is more complex than a typical microprocessor bus of the 1980s.

It's all quite possible, but it's also quite a time sink. So unless you simply have a lot of time on your hands, you're definitely better off buying the interface than engineering your own.

tricky definite integration

*Message #1 Posted by **hugh steers** on 1 Feb 2006, 10:16 p.m.*

Suppose you wanted to evaluate the following definite integral:

$$I = \int_0^1 \cos\left(\frac{1}{x}\right) dx$$

the idea is to try to evaluate it on a calculator. so far, no calculator i've tried will handle the input as stated, so i'm looking for a manipulation or substitution that will break down the problem or transform it into a do-able calculation that will yield over 5 significant figures. a bit like some of the hp manuals treated some difficault cases.

But first: the answer!
We actually know the symbolic answer:

$$I = x\cos\left(\frac{1}{x}\right) + Si(x) + c \qquad \text{where } Si(x) = \int_0^x \frac{\text{Sin}(t)}{t}\, dt$$

therefore $I = \cos(1) + Si(1) - \lim_{x\to\infty} Si(x)$ and $\lim_{x\to\infty} Si(x) = \pi/2$

so I = -0.084410950559573886889

Now suppose we didn't know the above and wanted to evaluate the answer on a calculator and i don't mean using the breakdown of `I' in terms of Si(x) and calculating Si(1) on a calculator because this is cheating.

let's try some substitions:

plan A:

$u = 1/x, \quad \text{gives } I = \int_1^\infty \frac{\cos(u)}{u^2}\, du$

this isn't any good either because of the `inf'. you can try numbers like 1000 for inf and get some of the answer. for example, on a 71b i (eventually) get integral(1,1000,1e-5,cos(ivar)/ivar^2) = -0.0844101253838 which is correct to the 5 figures i asked of it (ie 1e-5), but i didn't prove the remainder of the integral was small enough to ignore and getting more than 5 this way would be very tedious.

plan B:

$u = \tan(y), \text{ gives } I = \int_0^{\pi/2} \frac{\cos(\tan(y))}{2}\, dy$

```
                              /pi/4    sin(y)

now we get finite limits, but still the function oscillates so wildly,
there's insufficient calculator convergence. for instance,
integral(pi/4,pi/2,1e-3,cos(tan(ivar))/sin(ivar)^2) = -0.084561887...
after some time and this is still quite vague.
```

so does anyone have a transform that gets fast enough convergence?

Re: tricky definite integration

*Message #2 Posted by **Marcus von Cube, Germany** on 2 Feb 2006, 3:17 a.m.,*
in response to message #1 by hugh steers

Hugh,

you'll find this thread interesting: Torture Integral. Look for message #5.

This beast is even worse:

Integral between 0 and 1 of f(x) = Cos(Ln(x)/x)/x

The trick is to integrate along a complex path where the trigonometric functions stop oscillating.

Marcus

Re: tricky definite integration

*Message #3 Posted by **GE** on 2 Feb 2006, 3:45 a.m.,*
in response to message #1 by hugh steers

Plan A is not so bad as you think, since we can find an upper bound for the remainer
R=integral(cos(u)/u^2,1000,inf) : abs(R)<integral(1/u^2,1000,inf)=1/1000.
So you get your 4 exact digits.
I wonder if you can take u = cos(1/x), since arccos is relatively well behaved. I have not tried.
Thanks for this mind-streching post.

Re: tricky definite integration

*Message #4 Posted by **Valentin Albillo** on 2 Feb 2006, 7:05 a.m.,*
in response to message #1 by hugh steers

Hi, Hugh:

The HP-71B can compute your integral as is, for instance let's get and display four decimal places:

```
FIX 4 @ INTEGRAL(0,1,1E-4,COS(1/IVAR))

   -0.0844
```

but of course it's rather slow. The optimum way to compute it, exact analytic methods apart, is to do the integration in the complex plane, where your trigonometric function becomes just the real part of some complex exponential, and using a path of integration that mostly avoids the oscillations. A suitable change of variable before performing the complex integration might help as well, if the upper or lower limits are infinite. This is the standard "trick" and it does work.

The integral then becomes much easier and can be computed to 12-digit accuracy in a matter of minutes (or

seconds under Emu71).

Best regards from V.

Re: tricky definite integration - help wanted to relearn

*Message #5 Posted by **Arnaud Amiel** on 3 Feb 2006, 3:37 a.m.,*
in response to message #4 by Valentin Albillo

I am loking to refresh my memory on complex plane integration. Quite a few years ago, it was covered in my university maths course. Unfortunately it was on Friday afternoons so only remember it is very useful for tricky integral and that there are a few pitfalls in the selection of integration path.

Any pointers to go and relearn this would be helpful.

Thanks

Arnaud

Re: tricky definite integration

*Message #6 Posted by **hugh steers** on 3 Feb 2006, 12:13 p.m.,*
in response to message #4 by Valentin Albillo

thanks for your complex contour suggestion,

```
i decided to try out the contour approach. i was hoping to find a really
cunning path that might make the problem really easy. but i can't see one
(anyone?). so here's my attempt:

working now in the complex plane, the problem i have is to start from (0,0)
which is a pole. so what i'm going to do is not start on the pole and instead
start on (eps,0) [eps = epsilon].

my path from (eps,0) to (1,0) has three parts:

part A: quarter circle anticlockwise from (eps, 0) to (0, eps).
part B: line along y, from (0,eps) to (0,1).
part C: clockwise quarter cicle from (0,1) to (1,0).

so my answer, I, is Re(A + B + C), providing i can make eps->0 without
problems (Re = real part).

now, i can say right away that Re(B) = 0, since it is entirely on the
imaginary line. which leaves me with two problems lim eps->0 Re(A) and Re(C).

this is where the calculator can only partly help me. i have to do part A
and maybe it (the 71b in this case) can do part C.

                 1
let  f(z) = cos(-)
                 z

PART A:
                 /pi/2
                 |                                                        it
       A =       | f(z(t)) z'(t) dt   and z(t) = eps(cos(t)+ i sin(t)) = eps e
                 |
                /0
```

$$= i\,\mathrm{eps}\int_0^{\pi/2} \cos\left(\frac{1}{\mathrm{eps}\, e^{i t}}\right) e^{i t}\, dt$$

now, the bit i want is Re(A) whilst eps->0. however this is where i cheat because i can't let eps->0 before integrating and i don't know how to integrate it.

now it turns out that Re(A) = -eps cos(1/eps) - Si(1/eps), where Si(z) is the sine integral as before. knowing this, it's clear than Re(A) lim eps->0
= 0 - si(inf)
= -pi/2

but that was because i knew the original indefinite integral all along. maybe i can put a small eps into the 71b and integrate numerically and guess the answer is pi/2. is there any way to deal with the limit before integrating?? so, by guessing or otherwise i have Re(A) = -pi/2

PART C:

this part i have to manipulate the problem into a form i can feed to the 71b. as in part A, but with no eps, i have:

$$C = -i\int_0^{\pi/2} \cos\left(e^{-(i t)}\right) e^{i t}\, dt$$ [note: minus comes from other direction]

the first idea was to feed this directly to the 71b as a complex numerical integration, like this:
integral(0,pi/2,1e-5,cos(exp((0,-1)*ivar))*exp((0,1)*ivar))

but it doesn't like it. its a pity, i was hoping it could perform its summation with complex numbers. is there a way??

so, i have to do more more work. i can expand C into real and complex parts. if i expand the integrand and take the imaginary part, it will form the real part of the answer when put with the -i outside. so after simplification, i get:

$$\mathrm{Re}(C) = \int_0^{\pi/2} (\sin(t)\cos(\cos(t))\cosh(\sin(t)) + \cos(t)\sin(\cos(t))\sinh(\sin(t)))\, dt$$

and into the 71b (with the additional -pi/2 from part A) as this:

```
10 DEF FNA
20 S=SIN(IVAR) @ C=COS(IVAR)
30 FNA=S*COS(C)COSH(S)+C*SIN(C)*SINH(S)
40 END DEF
50 DISP INTEGRAL(0,PI/2,1E-8,FNA)-PI/2
```

which finally gives the very good (correct) answer:

-0.08441095058.

Re: tricky definite integration

*Message #7 Posted by **Tizedes Csaba [Hungary]** on 6 Feb 2006, 3:08 a.m.,*
in response to message #1 by hugh steers

Hello,

I played with the Taylor-approximation of

```
1/X
```

function on my 48SX. Some results:

```
1/X = 1+SUM(I=1,INFINITY,(1-X)^I) = (1-(1-X)^(N+1))/X (where N is big enough, but not too
;) )
```

I know, this is not an elegant way, but I spend some time to play with it. I want only a fastest result. I wrote few versions of this method, finally the "PRG1" was the integrator with 'COS(INV(X))' intengrand, and "PRG2" was the integrator with 'COS((1-(1-X)^(N+1))/X)'. The big fault is the numerical error when the N is too big!

```
-----------------------------------------------------
N=24  RESULTS                RUNNING TIMES
      PRG1        PRG2       PRG1          PRG2
FIX1  -0.07725   -0.19917       1.2sec     1.9sec
FIX2  -0.083396  -0.084487     37.6sec    14.7sec
FIX3  -0.084375  -0.084487   1193  sec(!) 14.1sec(!)
-----------------------------------------------------
N=49  RESULTS                RUNNING TIMES
      PRG1        PRG2       PRG1          PRG2
FIX1 (AS ABOVE)  -0.06555    (AS ABOVE)    1.9sec
FIX2 (AS ABOVE)  -0.085261   (AS ABOVE)   28.7sec
FIX3 (AS ABOVE)  -0.085261   (AS ABOVE)   28.7sec
-----------------------------------------------------
```

I tried some other way too: changing the boundaries of the interval from [0...1] to [1...H], where H->0, tried to integrate 1+COS(INV(X)), then substract 1 from the result (with this method no change sing on the interval), and so on...

Csaba

Bad 49G+ wanted

*Message #1 Posted by **Hugh Evans** on 1 Feb 2006, 3:53 p.m.*

From discussions around here I have the impression that quite a few replacements were issued by HP for bad 49G+ units. Rather than buy a revised new and potentially good machine I wanted to ask around here for a donor unit that was replaced by HP... In other words a spare that someone might have sitting around.

It will be used to develop an aftermarket enclosure based on OpenRPN designs. Similar to this:

http://openrpn.org/images/userimages/CAD/Portrait-iso-top.jpg

Of course, I will pay for all shipping and handling. And if we decide to a market a retrofit kit, we'll give you the first one free of charge. This will most likely be the first openrpn product to be marketed.

Please respond via email.

Best Regards, Hugh

in response to message #1 by Hugh Evans

OpenRPN sounds very intriguing. How long will it be before you estimate that you will have a product on the market?

Ha ha. ::)

Seriously, one time at church on Sunday, I saw a boy with his big graphing TI-whatever, punching away at the buttons. I thought to myself, "What a studious young man!" So, I went over to see what he might be studying/calculating even on a weekend day like this.

Ever get a small dream deflated?

He was playing games.

Pffphppt!

in response to message #1 by Hugh Evans

Hugh, as far as I know, mainly by my own experience, you have to RETURN the old unit in exchange for the improved one. I suspect none of us may have an extra 49G+, at least not from that transaction.

Sometimes HP doesn't ask for the original calculator back. THAT is how disposable these new machines are! Software seems nice, too bad the build quality is poor. I would pick up a few of them if they had the HP 48S/G/X build quality.

Re: Bad 49G+ wanted

*Message #7 Posted by **Hugh Evans** on 2 Feb 2006, 9:53 a.m.,*
in response to message #6 by Joe Edwards

That's the reason I asked. I recall several posts stating that HP didn't request the faulty unit being returned. This isn't a big deal either way... it would just be nice to avoid cannibalizing a perfectly good unit after shelling out $150 or so when someone around here might have a left over one to spare.

Thanks, Hugh

in response to message #7 by Hugh Evans

I have one. What exactly do you need? It was coverted to use AA batteries, and then later fell out of a pocket while riding my bike. I have the circuitboard/screen whole and intact. The keyboard is scattered in various locations and the case is destroyed from the fall/modifications, but I think the board and screen is still good. Is that all you require?

Re: Bad 49G+ wanted

*Message #9 Posted by **Hugh Evans** on 6 Feb 2006, 2:47 p.m.,*
in response to message #8 by Tim Wessman

Yes, that actually sounds perfect for my needs. I'll send you an email to discuss the shipping details. Thank you very much for your response and contribution.

Once I receive it I expect to have a design ready within a month. My plans include adding a PCB to modify the keyboard layout with a properly sized and placed enter key, as well as an enclosure adapted directly from my OpenRPN designs. The process will also require a new set of tactile domes which should fix keypress registration issues once and for all.

When all is said and done, we'll finally have a worthy successor to the 48gx.

Return of Defective units

*Message #12 Posted by **Paul Brogger** on 3 Feb 2006, 4:57 p.m.,*
in response to message #7 by Hugh Evans

I've got one of each (HP-49G+ and HP-33s) that H-P service decided they didn't need returned after sending me replacements. I think it's a good way for H-P to smooth their customers' ruffled feathers -- they'd just be tossing the faulty units anyway. (In fact, the help desk people did database look-ups on the problems I'd reported, and would have asked for return of a faulty unit had they

wished to examine it, but in neither case was that an issue.)

They took the Serial #'s of the problem units, so those are presumably ineligible for future warranty claims. I was instructed to save the battery cover, recycle the batteries, and dispose of the unit. (I said, "*Will do* . . . ") But there are apparently no guarantees regarding this "free calculator" practice, so your mileage may vary.

Unfortunately, I'm not looking to give away my 49G+. (Sorry!)

Unfortunately also, in the 49G+ the display board is soldered firmly to the main circuit board along two edges. This will likely limit your options in "re-imagining" the overall size and layout of the beast.

I still have a partially-started project to try and fit a TI-83+SE into an HP-41 case. The previous-generation TI's -- 83+ and (I think) 89 -- have the display board linked to the main (keyboard/processor) PCB by a ribbon cable. Potentially, that could be lengthened and folded to reduce the new device's long dimension -- or enabling, possibly, a Voyager-like "landscape" layout? (But that project is sitting in a box -- I really should get back to it some day . . .)

*Message #13 Posted by **Han** on 2 Feb 2006, 5:29 p.m.,*
in response to message #1 by Hugh Evans

This would be fantastic. I recall seeing some pictures of an HP49G (not plus) prototype that used the HP48GX keyboard. Your enclosure design also seems to have a keyboard that looks very much like that of an HP48. Is this the goal? To give the innards of an HP49G+ the beautiful outer shell of an HP48?

factors and primes for 29c

*Message #1 Posted by **Hal** on 31 Jan 2006, 11:28 p.m.*

I would humbly like to submit my program (written for the HP29C) to find the prime factors of a given integer, or find all primes between 2 given integers. This program could be adapted to any machine with >= 98 program lines, conditional branching, and at least 6 storage registers. Note that since the 29C doesn't have flags, I have used register 0 as a pseudo flag.

Instructions: To find prime factors of an integer...put integer in x register and GSB 9. Factors are displayed successively. R/S to see the next factor. 1 is always the final factor displayed. If given integer is prime, factors displayed will be it and 1.

To find primes between two integers, put lower integer into register 6, and upper integer into register 9, and GSB 8. primes will display from lowest to highest. R/S to view next prime. Display will flash one zero, then 10 zeros, then 3 zeros (fix 2) when finished.
Best regards, Hal

Help 75C !!!!

*Message #1 Posted by **gileno** on 31 Jan 2006, 1:26 p.m.*

I have just become two nice hp 75c and 75d. 1. Does anyone know how to access the built in roms in the 75C (Data communications, text formatter, visicalc). What is the syntax for a catalog on these ports? 2. Does anyone have information on how to become the digital wand to work on the 75D?

Thank you for your reply,

Re: Help 75C !!!!

*Message #2 Posted by **J-F Garnier** on 1 Feb 2006, 7:07 a.m.,*
in response to message #1 by gileno

1. Does anyone know how to access the built in roms in the 75C (Data communications, text formatter, visicalc). What is the syntax for a catalog on these ports?

Data communications, text formatter, visicalc ROM are NOT built-in, but are plug-in modules. There is no command to get a catalog of ROMs (built-in or plugged-in): no equivalent of the HP71 CAT :PORT.

2. Does anyone have information on how to become the digital wand to work on the 75D?

AFAIK, the Wand ROM module or the POD extension is needed, even if there is the Wand connector built in the HP-75D, but maybe am I wrong.

J-F

Thank you for the help. She helped me enough. Thank you very much. :-)

Visicalc on the 75C

*Message #6 Posted by **Tom Sherman** on 1 Feb 2006, 12:20 p.m.,*
in response to message #1 by gileno

To access the visicalc program, type vc

To exit the program: shift-attn (as if you were turning the unit off)

For command menu: /

For anything other than historical curiosity, a video interface and monitor would be helpful, as it is pretty hard to follow a spreadsheet with only a one-line display. But it is interesting to see that HP made this spreadsheet program available for the 75C.

Cheers, Tom

how to "see" bmp files on windows

*Message #1 Posted by **how to convert bmp to grob** on 31 Jan 2006, 12:16 p.m.*

Hello,

My problem is: I have some graphics on windows and I want to see them on HP49G+.

So I start looking for something to convert a bmp windows into something HP49G+ could open.

I found bmp2hpgg.exe at hpcalc (God bless Eric...).

Now I can convert to an .gg file, I put it on the stack, but I don't have a clue what to do with it.

Someone can help me;)?

Rui

Off Topic - Question on Sharp PC-1500A Module

*Message #1 Posted by **Bill (Smithville, NJ)** on 31 Jan 2006, 10:48 a.m.*

Sorry for the off topic post, but I know there are several people here that also collect the Sharp pocket computers.

I just received another PC-1500A and it came with two CE-160 program module with battery. THe battery are obviously dead and from what I can learn on the WEB, when the battery dies, the programs on it also disappear.

Two Questions:

1. How do I open the modile to replace the battery?

2. Is the module used as addition memory? Or do I need some special device to program it?

Since this is off-topic, you can reply direct to

bjunk at NOTvpes dot com

Just remove the NOT and reassemble.

Thanks, Bill 12345

I wouldn't mind the same information, if it's not too much trouble. My email is hbo@egbok.com. (Lowlife pondscum spammer filth already have my address for years and years.)

Re: Off Topic - Question on Sharp PC-1500A Module

*Message #3 Posted by **Valentin Albillo** on 31 Jan 2006, 11:43 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

Hi, Bill:

Bill posted:

"Since this is off-topic, you can reply direct to [...]"

I don't agree this is technically off-topic. The MoHP Terms of Use read:

> *"The topics of these forums, include just about anything listed in the Museum pages. These include HP calculators, early HP computers, general math, **calculating machines**, computer history, tips on buying, finding, repairing, or using old HPs etc."*

and your SHARP PC-1500 certainly belongs in the "calculating machine" cathegory, and even in

"computer history" as well. So while I deem reasonable to avoid converting this into a TI or SHARP forum, I think the occasional posting is covered by the above Terms. Matter of fact, I've seen much more off-topic, even bizarre subjects discussed here no questions.

"1. How do I open the modile to replace the battery?"

I do not have a RAM module for your particular SHARP model, but the ones I have for other similar SHARPs, such as the PC-1350, etc, do have a very small screw which you can unscrew with a specialized, 'watchmaker' screwdriver.

"2. Is the module used as addition memory? Or do I need some special device to program it?"

That would depend on the particular module but the ones I've always seen used with this machine are normal RAM modules, which simply add 8 Kb to system memory so, yes, you can use it as additional memory without doing anything special except plug it in.

By the way, if the module's battery is dead, this means you'll lose its contents as soon as you take it out. But as long as it remains plugged in, it'll draw current from the main unit's batteries and won't lose a thing unless they completely discharge as well. This essentially means you can use it ok even if its own battery is dead.

Best regards from V.

Re: Off Topic - Question on Sharp PC-1500A Module

*Message #4 Posted by **Bill (Smithville, NJ)** on 31 Jan 2006, 12:39 p.m.,*
in response to message #3 by Valentin Albillo

Hi Valentin,

Thanks for your reply. I knew you were a big sharp pocket computer fan. My first pocket computer was the 1500A with the neat four color plotter/printer. I now have several of them, but only a couple of pens that still work.

There's no screw on the CE-160 module. I just removed the label on it and checked to see if it was hidden - no luck.

From what I can find so far, it's a 16K memory module with a cr2032 battery. These were not installed in the computer I bought and anyway, the computer ended up with highly corroded battery still install. The unit works, but I think it'll just be a spare parts machine.

It's be great if it is additional memory that could be loaded with programs and then removed without losing them. I did put them in a good computer and they weren't reconized - that's why I figue the battery is dead.

I think the next step is to try the pry apart with a screwdrive or knife.

Thanks,

Bill

You can ask here for new pens: "Peter Lass" <christiane.Lass@t-online.de>

It's a small German enterprise selling medical equipment where these pens seem still to be used.

Marcus

Hi Marcus,

Thanks for the info. It would be great to get some pens and put the plotter to some use.

Bill

Module Is Now Open

*Message #7 Posted by **Bill (Smithville, NJ)** on 31 Jan 2006, 1:23 p.m.,*
in response to message #1 by Bill (Smithville, NJ)

Okay, I bit the bullet and took a dull screwdriver to the module. With carefull prying I was able to get the module to pop apart. Looks like it was tack glued together.

There's a battery soldered directly to the circuit board. The battery shows zero volts. Now I need to get a CR2032 size battery with solder tabs. Anyone know of any souces?

When I get home tonight, I'll take a few digital photos of the module now that it's apart. I can e-mail copies of the photos to anyone who wants them.

Thanks, Bill

Re: Module Is Now Open

in response to message #7 by Bill (Smithville, NJ)

The CR2032 is common and available even at your supermarket. You probably have one in your computer for its clock. The hp 12's use it too.

Re: Module Is Now Open

*Message #9 Posted by **george** on 31 Jan 2006, 2:03 p.m.,*
in response to message #7 by Bill (Smithville, NJ)

Sockets for 2032 batteries should be available from companies like Digikey. Then you can use regular, non-tabbed bateries.

Re: Module Is Now Open

*Message #10 Posted by **GE** on 1 Feb 2006, 6:49 a.m.,*
in response to message #9 by george

On later Sharp machines you have the option of merging the module RAM with the main RAM, or leave it as a separate file system. This is true on the PCE500, PC1600, and I believe the PC1360.
On the PC1500 (even 'A') there is no such thing and RAM should be appended immediately. I think you need to reset the machine by using the usual pointy thing in the hole marked 'P' on the back. It asks you if you want to erase everything, you can dismiss it by pressing [CL]. I'm not sure if this procedure can *really* keep the previous content of your machine, so please don't sue me !!
And yes, those machines are things of beauty. They never stop working if reasonably used, and they have STYLE !!

Re: Module Is Now Open

*Message #11 Posted by **Bill (Smithville, NJ)** on 1 Feb 2006, 8:25 a.m.,*
in response to message #9 by george

I don't think there would be enough room to squeeze a battery holder into the module. There's just barely enough room for the battery. Maybe a smaller or thinner battery with holder could be squeezed in, but I doubt it.

Bill

*Message #12 Posted by **Bill (Smithville, NJ)** on 1 Feb 2006, 8:49 a.m.,*
in response to message #1 by Bill (Smithville, NJ)

I've got good news and bad news.

The good news:

Searching through my box of sharp PC manuals turned up the CE-160 Manual.

The Bad News:

The manual states:

"The CE-160 is a module that can write any program by using the CE-165 exclusive writer. However, no program can be written in CE-160 by using the PC-1500."

"When the CE-160 is connected to the PC-1500, all the programs, data, and the reserved contents previously stored in the PC-1500 cannot be used. Therefore, should be need these, make sure to record them on the tape before connecting the CE-160."

"Any program writen in the CE-160 cannot be either displayed or printed using either the LIST or LLIST instructions. No programs can be recorded on the tape using the CSAVE instruction."

It would appear that even though these are ram modules, they act like pre-loaded rom modules. The big difference is that after 3-5 years, the battery goes dead and all contents are lost. Sort of like self-destructing programs. They say to return module to the orginal place of purchase to have battery replaced and re-program module with the programs.

Has any one ever heard of or seen the CE-165 exclusive writer? Haven't been able to find referece on the web about it.

Very interesting module. Make's me wonder what the thinking was that went into developing it.

Looks like I have a nice display item, but not of much practicl use.

Bill

Loading Forth ROM into Clonix Module

*Message #1 Posted by **Phil Green** on 31 Jan 2006, 8:14 a.m.*

Hi, How do I load the Forth-41.HEX ROM image into the Clonix-41 module? What Page, Bank etc? When I try to load it, nothing appears in the Cat 2 directory. Any suggestions? Regards Phil Green

Re: Loading Forth ROM into Clonix Module

*Message #2 Posted by **Diego Diaz** on 31 Jan 2006, 10:14 a.m.,*
in response to message #1 by Phil Green

Hi Phil,

Please try:

http://www.clonix41.org/Projects/Clonix-41/forth-41.zip

This is the .HEX file to load directly into IC-Prog buffer.

Note that this is compiled with Clonix6P code, therefore, current drain will be higher than the ClonixLP counterpart...

I'll build "LP" .HEX versions for some of these "rare" modules that use pages below #6, namely: Services, Forth, Laitram... it will take a while though. (Really busy nowadays)

Best regards

Diego.

Edited to add: Please remember that Forth ROM as well as any other using page #5 won't work when plugged into 41CX for obvious reasons ;-))

Edited: 31 Jan 2006, 3:33 p.m.

Re: Loading Forth ROM into Clonix Module

*Message #3 Posted by **Phil Green** on 31 Jan 2006, 4:16 p.m.,*
in response to message #2 by Diego Diaz

Hi Diego, Thanks for your advice once again. I should have realised that it was a .HEX file. And yes, I have found I can not use it in my CX! I have just tried it! Can this ROM ever be relocated so that it does not use page #5? Regards Phil Green

Re: Loading Forth ROM into Clonix Module

*Message #4 Posted by **Diego Diaz** on 31 Jan 2006, 5:35 p.m.,*
in response to message #3 by Phil Green

I'm affraid I'm not of much help here... Sorry.

If any of the M-code gurus here read this, they may know if such a relocation is possible.

Best wishes.

Diego.

Re: Loading Forth ROM into Clonix Module

*Message #5 Posted by **Doug Wilder** on 1 Feb 2006, 1:44 a.m.,*
in response to message #3 by Phil Green

Took a quick look. Seems the lower 4K must be at page 4 yet the upper page (the one with the FAT) can go into any page. That is: the local executes are relative (not hard wired to page 5). Worth a try anyway.

Best

Re: Loading Forth ROM into Clonix Module

*Message #6 Posted by **Diego Diaz** on 1 Feb 2006, 10:49 a.m.,*
in response to message #5 by Doug Wilder

Thanks Doug, I'll give a go to a "splitted" Forth-41 version to verify your point... alas I'm not sure how long it will take... as noted before, I'm really busy nowadays.

Cheers

Diego.

Inform Builder 1.8

*Message #1 Posted by **Marx Pio** on 30 Jan 2006, 11:01 p.m.*

Dear friends,

Does anyone has encountered bugs using IFB1.8 optimized for the HP49G+'s new display?

The IFB1.5 works fine on my HP48GX and it's is far the best Inform creator for the HP's ever made. But I could not run as expected on my HP49G+ (ROM revison #2.00)

The problem:

I create a full 2 columns by 4 rows(8 labels and 8 data fields being the last 2 a listfield type) but when I run the compiled code inside a UserRPN program, it doesn't shows the labels in the fourth row. It shows only the data fields(ListFields)in the same 4th row. I noticed that I just get the fourth row labels if I move it up near the 3th row. I had installed twice both extable and IFB1.8 but the problem still remains.

Is it a bug or I missed something?

Thanks in advance,

Marx Pio Manaus-AM

HP 32sII - upgrade memory to 32K?

*Message #1 Posted by * on 30 Jan 2006, 10:50 p.m.*

Hello, I'm pretty happy with my 32sII with one exception... Well, 2 exceptions since I'm still looking for one with the double-shot keys. The memory is so pitiful. As I'm sure you know.

Then I stumbled across this article:

Increasing HP-42s Memory to 32K

Has anyone tried that with their 32sII?

It sounds very delicate and risky. Drilling and cutting. There's no way I could do that myself and my 32sII is brand-new. Still I wish there was some business (like HP!) I could send it to that would do it for me, with some kind of a guarantee if the operation didn't go as planned... Or better, would sell one already upgraded. Don't you agree? I would just buy the 42s but the screen sounds almost painful to read and I love the big, sharp digits on the 32sII.

Re: HP 32sII - upgrade memory to 32K?

*Message #2 Posted by **Thomas Okken** on 31 Jan 2006, 8:40 a.m.,*
*in response to message #1 by **

> Quote:
>
> I would just buy the 42s but the screen sounds almost painful to read

It is true that the HP-42S display has rather poor contrast compared to, say, the 41 and the Voyagers, but I wouldn't go so far as to say it's painful to read. My eyesight is not great but my only issue with the 42S is that the viewing angle is a bit limited; once I adjust the contrast to match my usual viewing angle, I have no problems with it.

Re: HP 32sII - upgrade memory to 32K?

*Message #3 Posted by **Ron Ross** on 31 Jan 2006, 9:02 a.m.,*
*in response to message #1 by **

I don't think the Hp32s has any provision for RAM upgrade. The Hp42s was designed to have 32K RAM, but only sold with 8K for price and marketing reasons (since it has no I/O, 32K isn't needed or used often and a memory clear or reset is very painful to see).

If you want a 32s with 32K, buy an Hp33s. It is a 32sii with 32K RAM (although, not quite as good of quality and certainly not nearly as classic).

Re: HP 32sII - upgrade memory to 32K?

*Message #4 Posted by **Gerson W. Barbosa** on 31 Jan 2006, 9:02 a.m.,*

*in response to message #1 by **

The HP-42S can be upgraded to 32K because its OS can handle this much memory. I fear the 32SII wouldn't accept this large memory upgrade, but I am not the right person to tell.

Anyway, if you're pleased with the 32SII I think you should give the HP-33S a try because:

- it's backward compatible with the 32SII you're used to;

- it has 32K, much more than one will ever need (on the 33S);

- two-line easy-to-read display, but get the newer one with larger dots and commas;

- good keyboard;

- fanciful design.

Ok, to some the latter might be a weakness. I just think it should be slightly smaller, especially in the length. Nevertheless, I'd go for a 43S the same shape if only it were available...

Re: HP 32sII - upgrade memory to 32K?

*Message #5 Posted by **Norris** on 31 Jan 2006, 12:50 p.m.,*
*in response to message #1 by **

Even if you could upgrade the 32SII memory, you would still be in for a major disappointment. Other features of the 32SII wouldn't allow you to take full advantage of the larger memory.

The 32SII offers only a very limited number of labels (A to Z, plus i), which *cannot* be reused between different programs. Every program title, loop, or branch uses one up. This is not normally a limitation with the the 32SII, because you run out of memory before you run out of labels. But if you removed the memory limitation, you would soon run into the label limitation.

The 33S, which is basically a 32SII with a 2-line display and 32K memory, has this problem. Even though the memory is greatly enlarged, it's difficult to load more than a few moderately complex programs into it, because you run out of labels. The "effective" memory capacity for programs is greater than that of the 32SII, but not nearly as much as you would expect. The increased memory of the 33S does allow you to store virtually unlimited numbers of equations, but it does not allow you to store a large number of additional programs.

Re: HP 32sII - upgrade memory to 32K?

*Message #6 Posted by ** on 31 Jan 2006, 11:47 p.m.,*
in response to message #5 by Norris

Thanks for all the responses... This board is great.

That's a good point about the number of labels. I guess I'll have to buy the 42s then. I actually had one about 10 years ago but it was stored at my parent's house and they're not sure what they did with it, "maybe we gave it away" (!!!) I can't remember how difficult the display is to read, maybe it won't be that bad. The 32sII display is definitely nice though.

There's no way I'd buy the 33s with the weird keyboard and cheap construction. And I thought even the new version had tiny periods and commas?

Re: HP 32sII - upgrade memory to 32K?

*Message #7 Posted by **Jeff O.** on 1 Feb 2006, 7:27 a.m.,*
*in response to message #6 by **

> Quote:
>
> I guess I'll have to buy the 42s then....I can't remember how difficult the display is to read, maybe it won't be that bad.

By all means, find your old one or otherwise get another 42S. Yes, the display is somewhat more difficult to read than the 32S/SII or even the 33S. The absolute superiority of the 42S in every other way (in my humble opinion, of course) more than makes up for this shortcoming.

> Quote:
>
> And I thought even the new version had tiny periods and commas?

Check this message and judge for yourself.

Re: HP 32sII - upgrade memory to 32K?

*Message #8 Posted by **e.young** on 1 Feb 2006, 5:17 p.m.,*
*in response to message #6 by **

if you get a 33s with a serial number CNA 5xxxx or later you will have a unit with the improved display and keyboard. There is no more legibility problem with the decimal point, the keyboard has a better tactile feel, and I have yet to have a keystroke fail to enter.

With that being said, just looking at the 33s can be difficult, although it is more functional than the beloved early 32sII. I find myself using the 32sII for tasks that don't require any programs, and I use my 33s for tasks that do. I have about 10 programs in my 33s, and it is a great time saver. These were tasks I used to do on Excel, but I prefer using my HP.

Re: HP 32sII - upgrade memory to 32K?

> The 33S, which is basically a 32SII with a 2-line display and 32K memory, has this problem. Even though the memory is greatly enlarged, it's difficult to load more than a few moderately complex programs into it, because you run out of labels.

It depends on how you write the programs. If you take the traditional approach of doing this:

```
A0001 LBL A
A0002 X>Y?
A0003 GTO Z
.....
Z0001 LBL Z
Z0002 1
Z0003 +
Z0004 2
Z0005 *
Z0006 RTN
```

... it's only nine lines of code, but you'll chew up labels in a hurry.

A far less elegant way to do it that conserves labels is to use a flag and keep testing it:

```
A0001 LBL A
A0002 CF 0
A0003 X>Y?
A0004 SF 0
A0005 FS? 0
A0006 1
A0007 FS? 0
A0008 +
A0009 FS? 0
A0010 2
A0011 FS? 0
A0012 *
A0013 CF 0
.....
```

Thirteen lines, one label.

Either all the flag tests will fail and skip over the stuff in between, or all of them will succeed and the code gets executed.

Inlining subroutines like this feels cheesy and obviously won't work in a lot of situations, but there's RAM to burn and it can save a bunch of labels you'd otherwise have to waste on simple conditionals.

I probably saved 4 or so labels this way in a ~100 line program I wrote recently. The code is ugly as hell, but it computes Julian dates given a Gregorian date (the usual dd.mmyyyy, expected in stack X) and an optional time zone offset from UTC & time (tz.hhmmss, expected in stack Y) with **one** label. Working this way, I think I might actually run out of RAM before I run out of labels.

Re: HP 32sII - upgrade memory to 32K?

*Message #10 Posted by **Howard Owen** on 1 Feb 2006, 1:58 a.m.,*
in response to message #9 by John Noble

I've done this too, and hated myself afterwards. 8)

It's true that there's plenty of memory. But repeating those tests takes cpu, also. It might be interesting to time a 32SII with labels versus a 33S with repeated tests to see how many tests it takes before they cross over.

> be interesting to time a 32SII with labels versus a 33S with repeated tests to see how many tests it takes before they cross over.

It doesn't seem to matter on a 33S. Execution speed of the aforementioned hack is nearly instantaneous. It might matter in a loop with a lot of iterations, but I doubt it would amount to much.

As far as crossover, you could write something like 26 programs of 200 lines each on a 33S if each used one label (assuming 5k lines filled the available 32k). That's a lot more button pushing than *I* want to do, especially with no way to back up the programs. A 32SII would never get close, though you'd be a lot happier about looking at it while entering your programs. :-)

Re: HP 32sII - upgrade memory to 32K?

*Message #12 Posted by **Norris** on 1 Feb 2006, 5:36 p.m.,*
in response to message #9 by John Noble

If you are willing to change your programming style to adapt to the limitations of the 33S, then yes, this technique is ugly but will work.

Incidentally, you can also save labels on the 33S by *not* using them to separate programs. For example, start program 1 at line A0001, program 2 at line A0200, program 3 at line A0300, etc. Fill up any extra lines between programs with RTN statements.

Then you can select and start programs by using "GTO ." to move the program pointer. For example, "GTO . A0200 R/S" will start Program 2. "GTO . A0300 R/S" will start Program 3, etc. Obviously you have to remember the line numbers.

Re: HP 32sII - upgrade memory to 32K?

*Message #13 Posted by **e. young** on 31 Jan 2006, 2:09 p.m.,*
*in response to message #1 by **

If you want a 32SII with double shot keys, look for one made before 1995. I have one made in 1993 in Singapore that has the double shot keys, and a former coworker had one made in 1995 in Singapore that had the painted keys.

If you're looking for one on ebay, ask what the serial number is. This website tells you how to decode the serial number so you can tell what year the calc was manufactured. If you're looking at pictures on ebay, one way to distinguish the double shot keys from the painted keys is that the "e" in the "ex" key is larger with the double shot keys.

Re: HP 32sII - upgrade memory to 32K?

A few months ago I got caught up in the same bidding wars that you're in now over a NIB 27S. I had to pay about $300 for a new one, and it was one of my most expensive calcs and hard to get a nice one now. When more than one is offered, they go for less, but when only one is up for auction, then they're expensive, the 27S is rarely for sale.

Edited: 31 Jan 2006, 2:46 p.m.

*Message #9 Posted by **Joe Edwards** on 31 Jan 2006, 6:35 p.m.,*
in response to message #6 by Vincent Weber

Vincent, Might I ask why you want that particular HP27s versus other models on ebay,past and present? It seems that the bidding war on it has gotten out of hand...and I should know as I am the lamewing guy who was bidding on it! I need another 27s as I acutally use them, but I think the bidding has gotten too much for my blood. I have no clue who the other folks are. Good luck on the auction.

Update...it seems our bidding war has caused temporary inflation on the "percevied" value of the 27s models. Another one just went up for $300.00.

I guess I will wait a month or two.

in response to message #10 by Joe Edwards

I should point out that I have had or have no intention of rabble-rousing regarding that HP 27s. In fact, I was the third to bid on it, while you, Ceasar were the 5th person. Heck, I could say you are bidding on it to piss me off!!! :) -PLEASE UNDERSTAND I AM JUST JOKING WITH YOU. If I have offended you in any way, please let me know as it was unintentional.

Nonetheless, good luck with your collection.

Joe

I had to repost this as I wasn't a member when I made the last post. Sorry for wasting the limited space.

Hi Joe,

So, you are the one who pissed me off :pp I am joking too, no offence, and no prob ! :-) I am very keen on the 27S as 1) it is rare 2) it is one of the most underrated machine here - let me explain:

I own a 19BII, which does almost everything the 27S does (except for base conversion) and much more... but in too bulky a package for a calculator with no I/O. I do prefer my 200LX to it, if you want the drawbacks of a bulky machine, you should at least get the advantages: I/O, large screen, full QWERTY keyboard.

The good thing about the 27S is that it is pocketable. It is the only scientific pocketable calculator with the most elegant and powerful solver ever done. I read the technical applications book and I got amazed that for a so-called 'non programmable' calculator, it can do conditionals, loops, intermediate variables, long variable names, with no need for prompts as all variables appear nicely in the solver automatically. It even has some kind of indirect adressing, at least for reading variables, through the list feature. This is more programmability than most people will ever need on a pocket calculator. If you need more complexity than advanced formulas, you are likely to go for a notebook these days..

I just regret that you cannot define your own functions: imagine that you could do something like DEF F(X,Y)=SIN(X)*COS(Y) and reuse F within other formulas - there we go, this would be a true subroutine feature, that will leave the 27S with very little to be desired compared to let's say a 33S - but so much more user friendly for the commun user!

Too bad the 27S lasted so little time, and is underrated on this forum as it is not RPN.

Yet, it is a beautiful thing! The 27S makes me (almost) agree with Valentin Albillo that RPN is obsolete ! :-) (no flame intended).

Hope you now see why I want to pay so much for this baby.

Cheers,

Vincent

Hi Vincent,

Be patient :-)

I traded an 11-c for my 27s a year or two ago, right here on the MoHPC classifieds! (I already have another 11c).

*Message #14 Posted by **Joe Edwards** on 1 Feb 2006, 1:41 p.m.,*
in response to message #12 by Vincent Weber

Vincent, It might be in the members' best interest is we had some type of "I am bidding on this calc forum!" to avoid pushing the price up in the future. :) Nonetheless, I will back off and not bid again. Can't do anything about anyone else. You are right though about the 27s. If the 27s had RPN/ALG (like the 33s) and the programming capablities of the 42s it would be the only machine I would ever need for hand-held work. The equation support in the 27s is heads above the 33s (and I assume 32s). Yes I bought a 33s to play with and I might keep it (bug free). I wouldn't be so disappointed with the 33s if I hadn't used a 27s and a 42s.

Joe

HP 27S Price?

*Message #15 Posted by **Karl Schneider** on 31 Jan 2006, 11:32 p.m.,*
in response to message #4 by bill platt

I got a pristine HP-27S with manual on eBay within the past year for about $150.

A few months later, someone else got what also looked like a nice 27S, with manual *and* the "HP-27S/19B Technical Applications" book I wanted, for $127. Oh, well...

The HP-27S is a nice calc, intended for engineering manager who perhaps never learned RPN (unlike his cohort from the 1970's, who used the LED-based HP-27). I wanted a 27S for my collection of the 11 models of the Pioneer series, which will be complete after I receive my 22S. All of the 27S functionality is also found in one of its fellow high-end Pioneers: the 17B, 17BII, or 42S. However, the transcedental mathematical functions (e.g., trigonometrics and hyperbolics) can be included in equations on the 27S.

The 27S also has a menu of hyperbolics, which the 42S should have had.

HP philosophy

*Message #1 Posted by **Joe Edwards** on 30 Jan 2006, 9:08 p.m.*

Just a quick comment. I opened up my first HP 41c today and was both impressed and unimpressed. The machine is gorgeous, but wow, it is really limited on features compared to modern calcs. I guess this shouldn't be a suprise.

The suprise came in the way of the manual. My old 32s and 15c manuals are pretty nice, but the manual of the 41c practically spilled over with HP's love and respect for their customers. I haven't seen a manual like that since, well...ever.

Where and when did our companies lose their respect for the customers? I look at the new HP calculator manuals and just shake my head, especially after having read just the first few pages of the HP 41c owner's manual. Was HP just a special case?

After seeing this and reading all of your stories, it really hit home that I was born about 15 years too late. :)

Joe

I'm with you 100% on this one. The biggest problem with low-end calculators today is the lack, and poor quality, of documentation. The 17 pages (excluding TOC and foreign-language stuff) that came with the 6S I bought for my son was an embarrassment. At least it was better than the slip of paper that accompanied the Casio which replaced it.

What's more, I suspect that anyone who attempted to write a good guide for this class of machine would fall foul of the inconsistencies and poor design which characterise them. Those calcs are nearly unlearnable and, for the same reason, nearly udocumentable.

Things for HP seemed to go pear-shaped with the introduction of the 48 series, for a couple of reasons:

a) the manuals have no section which explains the philosophy and underlying principles of the machine. I only "grokked" the 48 after reading a comp.sys.hp48 post by Joe Horn (from memory), which introduced some RPL concepts for the 28S. If that had been in the manual (and some of it was in the 28 manuals) life would have been much easier.

b) the sheer volume of information is much larger. Providing humorous examples and in-depth explanation of the functions in the 48GX - let alone the 49 series - would give rise to a huge (and expensive to develop) manual. Splitting off the AUR was a first step, and PDF's are another step to reducing costs. However, the typographical style of the 48 manuals was an incredible turn-off, reminding me of nothing so much as the maths textbooks used in Scottish schools in the 1960's, and which seemed to date back to the 1890's.

Call me old-fashioned, but I'd much prefer a machine of mid-range capability with an excellent manual, to a machine of indeterminate capability because of poor documentation.

Best,

--- Les

HP did a fantastic job with the manuals of the vintage calculators. They were multicolor and showed the gold and blue shift keys, the red of the LED digits. Also the older manuals included more detailed math, which I often use as a reference. The more calculator produced the less impressive the manuals were. I guess this related to the decreasing calculator costs too.

Re: HP philosophy

*Message #4 Posted by **Howard Owen** on 30 Jan 2006, 10:55 p.m.,*
in response to message #1 by Joe Edwards

The 41C documentation taught me how to program. I had seen an Apple][and a Commodore Pet, but I didn't know the first thing about BASIC. The excellent "Owner's Handbook and Programming Guide" was all I needed to break through from nearly complete ignorance into a fairly good grasp of how computers were programmed. (I actually didn't know what a good grounding it was until later, when assembly programming and FORTH on the Apple came easily to me.)

Documentation, or the lack of it, on the low-end machines notwithstanding, I don't fault HP for trying to produce good documentation for the RPL machines. The 28S manuals are pretty good. But the complexity of the machine had increased to the point where they couldn't give the same kind of general overview. The 48G saw the publication of the AUR, a fine piece of work. It even tries to reproduce that signature HP method of teaching programming through the use of examples. But the language is much, much harder, so the tutotial has to spend most of its time discussing the details rather than how they fit together.

That philosophy that Les says is lacking in the manuals is actually present in "HP-28 Insights" by William Wickes. It gives a designer's eye view of the machine. It's not particularly helpful in learning how to operate the machine, but it does give you an excellent idea of where the principle architect of RPL was coming from. But the HP-48 version of this work was two volumes, so you really ended up needing to read *four volumes* of not-so-easy prose to appreciate the attempt HP made to deliver documentation of a quality similar to the best of what had come before. And in my opinion, the attempt failed, precisely because the job was made so much harder by the explosion in complexity that RPL brought with it.

When I got my 41C, I spent at least six hours every day reading that manual and playing with the calculator. Inside a month, I had a pretty good grasp of what the basic machine was capable of. It's been seven months since I bought an HP-49g+. I haven't concentrated my time on it, or on the 48s I've bought, in the same way as for that first 41, but I've spent plenty of time nonetheless. I am nowhere close to knowing the whole machine the way I knew my first 41. That's not the documentation's fault, however. The new AUR for the 49G+ is built on the old 48 AUR, with lots of additions from the Metakernel manual and other places. There's a terrific little User's Guide by Dr. Gilberto Urroz that gives a methematical introduction to the operation of the machine, and a larger User's manual in PDF form that fleshes the guide out nicely. The documentation is well organized and comprehensive. But the machine is just too darn complicated to grasp in a short time. I keep learning new stuff the longer I play with the 49g+. This is a great delight for me, since I'm doing this as a hobby, i.e. for recreation. But I can certainly see why TI won the educational market with its simpler machines. HP probably got a lock on the mathematics and computer science geek market, but gave up the rest with these powerful, but difficult machines. I'm just glad I'm in the target demographic. 8)

Regards,
Howard

P.S. Don't worry about being born "too late." You get to partake of the best of the past *and* the present. And you have a longer time to try to influence the future. Good luck!

I have tried to model my own product manual-writing after what I found in the manuals for my HP41cx and 71B and some of the supporting products, as much as I've been able. It was amazing when I got those, that I could start at the beginning, read right through, find things clearly laid out and understand them well, and gradually get to the end and feel like I really knew the product, without ever having gotten to the "hard part."

Several years ago when I was at WESCON (an electronics industry convention), I saw a man probably in his late 40's exclaim to an older man, "Aren't you professor so-and-so?" (I don't remember the name.) He had had him in his EE classes in the 60's. Soon into the chat, the older man said, "That was when students knew how to write!" and lamented that young people today don't.

in response to message #6 by Eric Smith

I really didn't think I needed to add a caveat to my post. I am sorry, but I thought the body of my post pretty summed up the fact that I am very impressed with the 41c. Of course it is short on features, it was made in 1980.

My main point had more to do with the difference in the additude between the HP of then and now, based simply on the comparison of the 41 manuals and the current calculator manuals...ie the 33s,etc. Sure the 33s manual isn't difficult to read (isn't it basically the 32sii manual?), but the 41c manual is so much better. Just the introduction expressing how important the customers were appreciated back them almost brought a tear to my eye...almost. :)

I wasn't bashing the 41c. I was quite aware of its liimitations when I bought the thing. No insult intended.

Joe

*Message #8 Posted by **Jan** on 31 Jan 2006, 2:46 p.m.,*
in response to message #1 by Joe Edwards

I never owned a 41 model (I think about buying a 2nd hand though) but to my knowledge the 41 is not that modest when it comes to its features. It may not be a match to let's say a 48, but especially the CX has many functions and features, not to mention enough memory for even more extended software packages. The point is that you can't tell that from the keyboard however: many functions are categorised in catalogs from which the user can select them. They can also, when a function is used very often, be assigned to a specific key. In "user" mode, that specific key then corresponds to the assigned function.

As far as the HP philosophy is concerned, I would say that around the early 90's HP's attitude towards calculators and their buyers has changed gradually. I cannot tell if a similar change in attitude also applies to their other products, but at least the physical appearence of the simple test and measurement equipment (now with agilent) also underwent a negative trend (they looked somewhat cheaper, the tank-like construction gradually made way to a lower- end casing-style and appearence). After the TM equipment division(s) was(were) turned into a separate company under the name of Agilent (the true heir of the old "HP-way" in my point of view), quality matters at HP really went down the drain to my point of view. With China becomming the main "production facility" for electronic equipment in general, I see no signs for improvement in this respect. Not a reason to dislike the chinese but rather the CEO's and shareholders of our western companies that cannot resist outsourcing labour in the far-east for short term profit.

I don't think outsourcing is the problem -- how many beloved Voyagers were made in Singapore? Lots, and I don't think most people question their quality vs. Brazilian or American manufactured calcs.

If you want to blame anyone, go ask the bean counters of that era how hard they squeezed the engineers on the bill of materials and tooling costs.

Then again, it just might be possible that competition and a changing market forced them to squeeze so hard. If the market doesn't want to pay for that kind of quality anymore, then you can either stop production and find other things to do with your capital, keep making the same thing and go bust eventually, or cut costs and keep trying to make a profit with something people *will* pay for.

Blame the "throwaway" consumer culture for caring about cost over all other considerations (except maybe fashion), if you want the real culprit.

*Message #10 Posted by **Dave Shaffer** on 31 Jan 2006, 5:55 p.m.,*
in response to message #9 by John Noble

Some more (overall, general) philosophy tangentially relevant to comments about outsourcing to China:

I think we (the US, at least) are in the process of cutting our own throat in the longer term. Yes, Chinese products may be lower quality at the moment, but I think they will learn to do much better. (They already are: the new Boeing airplane will have significant "made-in-China" content.)

Remember (some of us, at least!) back to the 50's and 60's. "Made in Japan" was synonymous with real junk (much worse than the middle-of-the-road Chinese stuff of today). Nowadays, that Japanese "junk" is on the verge of driving two of the largest, most succesful American enterprises (Ford and GM) right over the cliff. The Japanese learned to make quality products, generally now preferred (Sony, Toyota, Lexus, etc.) over many American "equivalents."

Re: HP philosophy

*Message #11 Posted by **GE** on 1 Feb 2006, 8:56 a.m.,*
in response to message #10 by Dave Shaffer

I have been talking with my brother who is manager of a small R&D team for TV decoders and communicaion devices at some european manufacturer.[nl) He says that production (fabrication or 'fab' for short) has been send way far there a long time ago, with some "abnormal" situations (his words) for a few products still built in Europe. Bean counters are working on this, rest assured.
The point, however, is that there is a tend by which R&D itself is being outsourced in those far away countries, with no more knowledge retained in the original country. This worries me a lot more, as what do we have to sell apart from our supposedly superior research capability ?
The only thing left here is marketing and sales. The only problem is who is going to buy your products ? Your former employees have just been fired and they don't have the cash needed. Their relatives tighten the budget to support the family. Overseas suppliers now know how to produce better products (remember now THEY lead on the R&D side, thanks to us !), and cheaper too (they don't need our brands, as our customers now value more the bottom line past any oher criteria).
Believe me in 10 years I'll be working in a branch which CANNOT be localised overseas (like hair cutting). Others will die. I have children and this doesn't really makes me laugh. Well, not REALLY...
Good luck to you all.

*Message #12 Posted by **bill platt** on 1 Feb 2006, 10:55 a.m.,*
in response to message #11 by GE

Yes, whether Europe or the US, the outsourcing is major. I realized how much this was so, when I woreked in Germany for 2 months in 1998. I was looking forward to buying a pair of Leitz binoculars there. My father had bought many well made optics there in the 1960s. Well, to my astonishment, the camera store did not even stock "made in Germany" equipment!

I have an easier time buying european products here inthe US than I did in europe!

Who will the customers be, in 20 years? The Chinese, naturally! The same as U.S. economic growth up until the 1970's.

*Message #13 Posted by **Jan** on 1 Feb 2006, 11:16 a.m.,*
in response to message #11 by GE

I agree with all reactions to my response, they all address an element of truth in my opinion. I personally think that bean counters and outsourcing cannot be seen as 2 separate things however: they are 2 sides of the same medal so to say. Which of the 2 came first is even hard to tell. Did outsourcing and product influx from the far east raise a demand for bean counting by our domestic industries in order to remain competitive or is outsourcing the culmination of the efforts of the beancounters? Hard to tell. One thing is for sure to me: it is all a direct consequence of the demand for short term profit by the management and shareholders of our companies. Where it will end I don't know but I am not too confident w.r.t. the future of our western economy. The point is that the economic policy of the moment bears some elements in itself that could be called selfdestructive and nothing else. Industries outsource production and development activities in order to raise the profit margins of their sales in western countries and to remain competitive against manufacturers from low-wage countries. However, by the outsourcing of activities jobs are lost in the western world (the replacement of which is difficult), reducing the national income and the amount of money that citizens of western countries can spend. This, in fact, counteracts at least some of the initial objectives behind the outsourcing process: making more money from sales in the western world. In addition to that, the combined trade and budget deficit of some western countries and the way this is being dealt with, is quite alarming. In fact, by lending USD to the west so that we can buy their products, the chinese are financing their own export: a situation that defies all laws and basic principles of economics. I simply refuse to believe that such a situation is sustainable. With respect to R&D I also believe we are not doing enough to stay ahead of wouldbe industrial nations in Asia. We still have a hughe advantage over them but that advantage is not that selfevident anymore. The no longer unthinkable disappearence of R&D activities in the west (including even basic research) is, in my point of view, also a cultural drainage with potentially far reaching (social) consequences. In conclusion: it is time for the western world to wake up!

*Message #15 Posted by **Howard Owen** on 1 Feb 2006, 12:30 p.m.,*
in response to message #14 by bill platt

Please forgive me stirring the pot in an off-topic thread.

Perhaps it would be heretical to mention that along with potent - and soon to be more potent - competitive industries, China and India and the rest of the developing world also bring large markets to the party? I realize they are more or less protected markets at the moment, but that can and will change over time, simply because their domestic industries won't be able to keep up with demand once the ball really gets rolling. Then

there's this other small factor called "innovation." All countries with adequate R&D and industrial capacity have an equal chance at redefining what the world perceives as "valuable." This is particularly true the more economic activity becomes software based. And no country can maintain a monopoly on innovation over the long term. That means both West and East have roughly equal chances at creating, and being the first exploiters of, innovation. As markets open up around the world, that means that demand for brain power will rise everywhere. Finally, the advantage India and China (and Russia, and Ukraine and so forth) have now with respect to labor costs won't last. Already India is seeing competition from Russia in IT outsourcing, for example.

There's no doubt that the rise of economic power in the East, particularly in China, will challenge entrenched economic power in Europe and the US. However, that expansion is a two-edged sword. And refusing to participate in the markets that emerge from the power shift would simply doom an economy to protectionist isolation, and thus to eventual economic irrelevance.

You are correct, and the large players for the most part aready saw that a long time ago, which is why Boeng is there, and GM etc.

But even if we innovate, the empire is still sinking.

The question America has to grapple with is, can we be content to *not* be the superpower? Or will we destroy ourselves in wars while attempting to maintain control?

Pretty much the case in my opinion. If we can accept that fact that we are going to turn into the equivilant of England, Australia, etc then all might be okay, but my concern is that we won't be willing to accept this fate and will destroy ourselves.

By the way, my wife and I have jobs that we will keep (hopefully) for life. She is a clinical (up and growing field) pharmacist/facuilty and I will be teaching math. It might not be grand, but hey...

Q: Hard to fight if they are bigger, richer AND smarter.

True, but observre the "if..."

It is very likely that China / India / etc. won't be able to ever reach the current wealth of the West. Most likely, they will run into the brick wall of depletion of natural resources before they even get close in terms of wealth. Personally, I even doubt the Western investors will ever get a total return of investment from their China endavours. There are huge factories in China, lots of them, built with Western capitalist's money, and they turn out shiploads of low-quality, low-margin products, that will soon end in a landfill. Scarce raw materials being turned into garbage, by the way. Scarce raw materials which could have been turned into high quality, high-margin products. And it is the latter kind of products which build the wealth of nations. Seen from this point of view China is on a road to failure. I think the next big stock market crash will come from there. Anyone who knows the Club of Rome report "Limits of Growth" can conclude that in a world depleted of resources, only those nations will survive which can project military power to those places where the last resources are located, secure their transport, and at the same time transform their society to a post-industrial form where wealth is mainly created by applying human skill and craftmanship instead of wasting resources and energy carriers. It even may be possible to sustain some limited form of a technological society this way. The main difference will be that products will be made to last, will contain a lot of human labour, and less machine labour, and will be very expensive, even those products which are needed for daily life. And they will employ relatively low-tech methods which can be sustained locally. We can only hope the sustainable technological level will be better than the 1960s. Early 1970s maybe. I doubt that

such a society could sustain multi-billion-dollar 90nm wafer fabs (and their equivalent, highly complicated processes, in any other technical field).

Maybe this will bring back the quality of Classic HP pocket calculators, who knows ? A wafer fab for a five micron PMOS metal gate technology possibly could be sustained even under the chaotic but interesting conditions of such a future society which lacks energy, ressources, and capital, but has lots of creative brains who will need to use whatever tools and machines are left over from the industrialized era and can be repaired again and again.

Bernhard

in response to message #21 by GE

The problem with that analysis is the implied idea that those countries wouldn't develop their own R&D if we didn't outsource some of ours to them. China and India will be "up and coming" whether we do R&D here or there. The reasons have to do with increased communication, liberalization of their economies, shrewd policy on the part of their governments and the energy and dedication of their peoples. In addition to wanting to be "on the ground" in the midst of new and emerging markets, US and European R&D is going there to take advantage of those same factors.

Don't exactly understand how all this ECONOMIC DOOMSDAY talk got left on HP's philosophical doorstep, but the REAL contributor to the collapse of the empire will be the pessimistic, failure-oriented scientists and engineers employed to invent and to lead in an optimistic society. No country in the past century has provided the freedom to create the way ours has.

Smarter than us? How is "smart" measured? Not by how well one performs on math tests. Smart is how well and how quickly one innovates and adapts to changing conditions in a "Future Shocked" world, working with the tools and skills available. Granted, there are excessive numbers of bean counters with too much authority to trim away the craftsmanship of high quality products AND too many engineers with the attitude that marketing is equivalent to prostitution.

The strongest organizations in this world long after us will be those that can balance the scales whereby they can truthfully say that they operate under the "Total Marketing Concept." As I recall from reading about the philosophy of "TMC" in graduate studies, the market invented us, not the other way around. Just as freedom

of speech is protected, there is no guarantee of an audience; and our freedom to invent does not CREATE a market. We have the FREEDOM to RESPOND to the market.

SMART!

*Message #27 Posted by **GE** on 2 Feb 2006, 4:17 a.m.,*
in response to message #26 by Howard Owen

Well, if your day work is to actually research, you tend to find more than if your work is to do marketing research or advertising.
Such reasearch work is being destroyed NOW. If it doesn't exist anymore, who is going to innovate? Don't tell me some bright mind can devise devices the complexity of current computers in her free time and budget.

As for the fact that transferring R&D knowledge and skills to others may have no impact on the long term because they could reinvent it anyway, let me tell you a small tale.
In 1859 Bernhard Riemann published an article within which he stated his famous 'Riemann Hypothesis'. When he died, his maid burnt most of his notes, not knowing it could contain valuable material. The only problem is that Riemann had said he had some ideas to prove his Hypothesis, and (contrary to Fermat and his last theorem), it is believed that could be true (When Siegel went to Germany in the 1960 to read the remains of Rieman's notes, he found there a formula to calculate the zeros of the Zeta function that no-one had ever thought of). NO ONE has proved the hypothesis since 1859... So not everything can be invented twice in less than 100 years. So :
1. R&D results have value
2. You can never be sure that you'll invent something big in the next 100 years

Excellent anecdote. I had forgotten about it. The Black Adder had a spoof of this once, if I remember correctly. Though I think it was to do with Johnson's dictionary.

Re: HP philosophy

*Message #29 Posted by **Howard Owen** on 2 Feb 2006, 11:11 a.m.,*

in response to message #27 by GE

You aren't seriously suggesting that secrets along the lines of how to exploit weaknesses in a competitor's product are in the same class as the Riemann Hypothesis?

Certainly there are secrets, then there are secrets. But nobody is going to get a leg up in solving problems in the class of the Riemann Hypothesis through outsourced R&D from a western technology company. As a matter of fact, the odds of someone in China or India solving that conundrum are better than anyone in Europe or the U.S. doing so, simply by virtue of of a larger educated population. (The CIA world fact book doesn't have breakdowns of higher education specialization, but the relative numbers of people with mathematical training can be inferred from the overall number of persons with some education. Here are the numbers for population * literacy rate for China, India and the U.S.: China: 1,187,439,255 India: 642,757,311 U.S 286,862,110)

Re: HP philosophy

*Message #30 Posted by **GE** on 3 Feb 2006, 6:32 a.m.,*
in response to message #29 by Howard Owen

You're right, but it is even worse because you forgot to factor the percentage of people in each case who are doing research.
So :
U.S 286,862,110 & research 'bean-counter-ized' => 0% research, result 286,862,110 x 0% = 0 people
China: 1,187,439,255 & consciousness of the need for R&d => 0.1% research, result 1,187,439,255 x 0.1% = 1,187,439 people

And I don't agree that R&D is always a simple matter. For example, IC fabrication and magnetic storage R&D relies on quantum theory (see IBM's facility in Switzerland), and this is not easy (well, it was not last time I tried !!).

The bigest research activity in the U.S. is the export of research skills and techniques. How? From University graduate science and engineering programs. Most of them are more than 50% foreigners. We do not have a market for american PhD's in engineering, but the chinese and indians do. So our professors teach whoever is willing to pay.

Well, most of the world, engineer or businessman, is near-sighted and provincial.

The smartest or most successful engineers are the ones that understand

business and have business savvy.

There is no value to "engineering for engineering's sake." Engineering is an inherently business-oriented profession. You have to have something economically useful to offer, or there is no point in the exercise.

That some young arrogant punks in bachelor's business school think of engineering in low terms is nothing but sheer ignorance. The smart ones will either already know, or figure out, that engineering is a means to an end, as is a business degree, and that good ideas know no boundaries.

Bingo! The ones that truly rule the roost know that both approaches to reality are required to be successful. In economic terms, a gadget is just a lump of plastic, glass and trace metals without a market. And markets have nothing to trade without the products of human imagination.

But bridging the gap between the two takes even more imagination - the power to put yourself in the shoes of someone who sees the world very differently from you. I find one fact about people helps me stretch my imagination in that way. People almost never think what they are doing is evil or useless. Humans generally have a story they tell themselves about their lives that has them in the center, pursuing noble goals, or at least being well justified in pursuing less-than-noble ones. When confronted with someone whom you may despise, ask yourself this question: "what story is this person telling herself about her life?" The answers may surprise you. They may contain some kernels of truth you have overlooked.

Or else the rest of the world really is populated by complete jerks. Yeah, that's it. 8)

Regards,
Howard

*Message #39 Posted by **Wayne Brown** on 6 Feb 2006, 12:08 a.m.,*
in response to message #34 by bill platt

> Quote:
>
> There is no value to "engineering for engineering's sake."

Well, I'd say that depends on who is making the evaluations. I happen to value "engineering for engineering's sake" very highly indeed. For instance, many years ago I read an article by a business analyst who was criticizing HP's marketing techniques. He said that too many of HP's decisions were made by engineers who were more interested in building and playing with cool toys than with products that would sell well. That article came out before I owned any HP products, and was a key factor in my decision to become an HP customer.

In general, I nearly always value the pursuit of knowledge for its own sake above that which is sought for practical purposes. That's why the mathematician G. H. Hardy is one of my heroes. In his "Mathematician's Apology," he said "...that very little of mathematics is useful practically, and that that little is comparatively dull" and "I have never done anything useful. No discovery of mine has made, or is likely to make, directly or indirectly, for good or ill, the least difference to the amenity of the world." (Much of his work in number theory *did* turn out to be very useful later, but he had no way of knowing that at the time.) Hardy also said, "Here's to pure mathematics. May it never have any use!"

Generally, the more "useful" or "practical" a discovery or invention is, the less it interests me.

HP-IL keyboard for 71B?

*Message #1 Posted by **Arne Helme** on 30 Jan 2006, 3:51 p.m.*

Hi, I am looking for an external keyboard solution for a HP-71B. Which HP-IL keyboards were recommended for the 71B? Any suggestions on where to find one?

Regards,

Arne

Re: HP-IL keyboard for 71B?

*Message #2 Posted by **Howard Owen** on 30 Jan 2006, 4:07 p.m.,*
in response to message #1 by Arne Helme

What I do is to use hpillink with Cristoph Klug's ISA HP-IL card for the PC. That gives me an 80-column by 40 line display, and use of my PC keyboard to control the 71.You can also upload and download files to the handheld, and single-step 71B BASIC programs. It's a very nice package, although it has its quirks. I run it under DOSEMU on Linux, but it should run in a DOS box in Windows.

If you don't have any ISA slots to put an HP-IL interface into, you can get the HP-IL/Serial interface. Then load the KEYBOARD lex file (or either the FORTH or HP-41 emulator ROM) and you can do KEYBOARD IS RS232: and DISPLAY IS RS232: . The trick there is getting the keycode mappings of a typical ANSI or VT100 PC terminal application to work with the ESC codes on the 71B. I got basic communication going with Linux terminal software, but I hadn't cracked the last problem before I found the hpillink solution.

Regards,
Howard

Short & Sweet Math Challenge #13: Adding up to infinity

*Message #1 Posted by **Valentin Albillo** on 30 Jan 2006, 6:39 a.m.*

Hi all,

Just back from Xmas holidays, let's begin the year with a brand new S&SMC, this time lucky number #13, which though not particularly difficult, it's slightly 'busier' than usual so, to compensate for this, it comes with a 'prize' attached for all of you who can deliver, details at the end of this post.

Caveat emptor: since this is S&SMC #**13** you're hereby warned that failure to *at least try* will be considered disrespect to the number 13 and thus you'll suffer *a whole year of pretty bad luck*. You've been warned. :-)

The Challenge

You must write a program for your favorite HP (preferably) calc, which shall do the following:

1. For each one of the 8 infinite sums given below, it must compute *a numerical value S for the sum*. A correct value will be rewarded with 1 point.

2. Then, it must convert this value S to *rational form* and output the numerator N and denominator D of the resulting fraction, N/D, such that this fraction is in lowest terms, and is as simple as possible while correctly evaluating to S, allowing for slight rounding inaccuracies in the computed value S. For instance, if you obtain S = .666666666668, you're expected to produce **2/3**, *not* 166666666667/250000000000. A correct value will be rewarded with another point.

3. You must then state whether your resulting fraction is indeed the *exact* value of the infinite sum, in your opinion, or just an approximation, and in this last case, to how many digits do you think it is correct. If you're right, you'll be rewarded with yet another point.

   Example: Suppose you're asked to compute SUM(N = 1, N -> Inf, f(N)/2^N) where f(N) = N/3.

   First, your program finds that S = .666666666668, approximately. Then, your program converts this value to a fraction as stated, giving S = 2/3 And finally you confirm that, in your opinion, the exact value of S is indeed 2/3. All are correct, so you would get 3 points for this sample case.

Notice that despite there being eight different sums to compute, *they are similar enough that your program will be nearly the same in all cases*, you just need to additionally code the particular function being summed up. Of course, the code to convert to fractional form is the exact very same for all eight cases, and last but not least, your expert judgment about what the exact result should be requires no coding at all, just smarts and/or intuition on your part.

To give an idea of the magnitude of the task ahead, all in all, and supposing you were using an HP-71B for example, you should be able to code the infinite sum calculation in a couple of lines, the particular function being summed up in another two lines at most, and the real-to-fraction routine in some five lines, for a total of 9-10 lines of code for the very first sum, and 2-3 additional lines for each remaining case. Not much, if you know how to do it.

The particular infinite sums to compute for this challenge are the following:

1. **S = SUM(N=1, N -> Inf, f(2^N)/2^N)**

   where f(N) counts the number of *odd digits* (i.e.: 1,3,5,7,9) in N

   for example: f(2048) = 0, f(2718281828) = 3, f(3141592654) = 6

2. **Same as above but f(N) counts instead the number of *even* digits (i.e.: 0,2,4,6,8) in N**

   for example: f(2048) = 4, f(2718281828) = 7, f(3141592654) = 4

3. **Same as above, but f(N) = 1 if N has an *even* number of digits and 0 otherwise.**

   for example: f(2048) = 1, because 2048 has 4 digits and 4 is *even*
   f(777) = 0, because 777 has 3 digits and 3 is *odd*

4. **Same as above, but f(N) counts the number of *odd* digits in *odd* places in the decimal expansion of N**

(the 1st digit is the 1st digit to the left of the decimal point).

For example: f(901) = 2,
f(210) = 0, (the only odd digit, 1, is at an even place (2nd))
f(811) = 1

- **S = SUM(N=1, N-> Inf, f(N)/10^N)**

  where f(N) is the same as in the previous sum above.

- **S = SUM(N=1, N-> Inf, f(N)/2^N)**

  where f(N) = Integer part of (Pi/2 * N)

- **S = (SUM(N=1, N-> Inf, f(N))/5+1/10)^2**

  where f(N) = e^(-N*N/100)

(In this case you must *not* output a fraction but simply the decimal value of S, and must try and guess what the exact value of S is)

- **S = SUM(N=1, N -> Inf, f(N)/ 5^N)**

  where f(N) = Integer part of (N*e^(Pi/3*Sqrt(163)))

That makes a maximum of **23 points** if you correctly compute, convert to fractional form, and guess the exact value of the sum for all 8 cases.

The prize

Everyone whose solutions get **15 points** or more will be entitled to receive by e-mail the following, still *unavailable on-line* Datafile articles of mine, in PDF format, namely:

- **HP-71B Math ROM Baker's Dozen Vol. 2**

  Multidimensional integrals, solving systems of non-linear equations, computing all eigenvalues real and complex of arbitrary square matrices, and more

- **HP-71B Fantastic FOUR**

  Multiplying very large numbers fast by means of Fast Fourier Transforms

- **HP-71B Short & Sweet Sudoku Solver**

  Automatically solves any sudoku puzzle without user's intervention, by using advanced techniques such as recursion, bitboards, and boolean operations.

- **HP-71B Sudoku Solver Sublime Sequel**

Improved version of my Sudoku Solver, incorporating new criteria for much faster results. Includes Test Suite of 15 choice Sudoku puzzles, from the simplest to the most difficult.

- **Mean Matrices**

  Introducing a series of simple and small integer-valued randomly-generated matrices that nevertheless are nearly intractable by conventional means due to their extreme ill-conditioning. Several cases are discussed at length, with (discouraging) results for the 71B and exact results with Mathematica.

- **HP-71B Minimax Polynomial Fit**

  Computes the minimax polynomial fit to a given set of datapoints, a given function in an interval, or a dataset read from a file. The user can specify either the degree of the desired polynomial or else the maximum absolute error over the given dataset or interval and let the program compute the lowest-degree polynomial that meets the requirement.

  The resulting polynomial can be evaluated at any point, scanned for its maximum error over a given interval, and is guaranteed to have an absolute maximum error lower than any other polynomial fit, least-squares included.

The usual caveats apply, namely: (1) Do not post just solutions, actual code is mandatory and (2) Code must be for an HP (preferably) calculator; posting code written in Visual Basic, Java, FORTRAN, or any other PC language will be considered unpolite and disrespectful.

That's all. Hoping you'll like this challenge and waiting for your inputs,

Best regards from V.

*Message #2 Posted by **Mike T.** on 30 Jan 2006, 12:42 p.m.,*
in response to message #1 by Valentin Albillo

OK - I don't think I've got enough space left in my HP33C to actually solve any of these at the same time but when (if) I get round to it I could use the following to convert decimal fractions to rational form.

Unfortunatly I wouldn't get a point every time as I've just found a bug, but I think it is worth posting anyway as I probably won't get round to fixing it! I think it only affects the conversion when the 10th digit in the decimal value is greater than 5 - but it is obvious when it happens, so it is good enough for now. If you can fix it (on an HP33C) post you version here!

```
001 23 3     STO 3
002 15 32    g INT
003 23 2     STO 2
004 24 3     RCL 3
005 15 33    g FRAC
006 23 0     STO 0

*Message #3 Posted by **Antoine M. Couëtte** on 30 Jan 2006, 4:06 p.m.,*
in response to message #1 by Valentin Albillo

Jan 30, 2005

Valentin,

Out of topic information request ... although indirectly related to your Challenge #13 post.

Given its features, I would guess that your "HP-71B Minimax Polynomial Fit" uses Chebyshev Polynomials Approximation (CPA) . CPA needs samples "evenly spaced on a circle", i.e. a more dense sampling at both ends of interval - sometimes a cumbersome constraint - BUT CPA achieves the smallest absolute error for a given degree of polynomial.

On the other hand FFT approximation simply needs evenly spaced samples BUT is generally NOT accurate and may give big (sometimes wildly varying) errors at interval ends.

I need to approximate a function which is known at evenly spaced points. I do not want to use FFT approximation because of its (gross) unreliability and unpredictability at interval ends. Could I easily use your "HP-71B Minimax Polynomial Fit" with evenly spaced samples without the need to (linearly) interpolate function values at the required "evenly spaced on a circle" points?

Thank you for your Kind Attention

Antoine

Hi, Antoine:

Antoine wrote:

"Given its features, I would guess that your "HP-71B Minimax Polynomial Fit" uses Chebyshev Polynomials Approximation (CPA)"

> You'd guess wrong, I don't use CPA. My program computes the *exact* minimax polynomial for the case of a given arbitrary dataset (x_i, y_i), where you can either select the degree of the minimax polynomial beforehand, or else specify a maximum absolute error and let the program select the lowest-degree polynomial that complies.
>
> For the case of some user-specified function f(x) in a given interval (which can be *anything*: a built-in function, an user-defined function, a function in some external ROM, including Math ROM's 'funny functions' Solve and Integrate, etc.), the function itself is firstly used to generate a discrete dataset, then my program fits an exact minimax polynomial to that dataset, which will very closely approximate the true minimax polynomial for the continuous function. Also, you can improve the accuracy of the approximation by simply generating more data points in the interval.

"I need to approximate a function which is known at evenly spaced points [...] Could I easily use your "HP-71B Minimax Polynomial Fit" with evenly spaced samples without the need to (linearly) interpolate function values at the required "evenly spaced on a circle" points?"

> Certainly. As stated, my program doesn't use CPA and it works with any arbitrary dataset as long as the x ordinates are in increasing value and there are no two equal x ordinates. Whether they're evenly spaced or not is irrelevant and, matter of fact, when a user-specified function f(x) is supplied, the program generates *evenly spaced* datapoints from it and fits the polynomial to that.
>
> Also, as discussed in some past posts (search for them in this forum), it's very easy to use my program to compute minimax polynomials having some desired peculiarity, such as only using odd or even powers of x, or forcing the coefficient of x to be exactly 1, say, etc.

Hope this answers your questions. Thanks for your interest, and

Best regards from V.

Re: Short & Sweet Math Challenge #13: Adding up to infinity

*Message #5 Posted by **Antoine M. Couëtte** on 2 Feb 2006, 5:01 a.m.,*
in response to message #4 by Valentin Albillo

Hello Valentin,

Thank you for your kind, courteous and extremely interesting reply.

Given your additionnal detailed information, I would keep thinking that your mathematical approach in your "HP-71B Minimax Polynomial Fit" is probably close in essence to the logic of Chebyshev Polynomials Approximation (CPA). Both methods claim that for a given polynomial degree, their maximum absolute error is the smallest one you can get ...

By the way, do you have a similar program for the HP41? I did write one for the HP41 which works very well for my use, with the constraints of having to interpolate function at specific sampling points "equally spaced on a circle".

I am willing to communicate more on this with you in order to compare my results on HP41X (you have HP41X from Hrast don't you ?) with yours obtained on your "HP-71B Minimax Polynomial Fit". However this forum is not an appropriate place to do so.

Would you be so kind as to send me an e-mail at my e-mail address " antoine.m.couette@club-internet.fr " so that I can give your more details on the function I am studying and on the way I currently represent it with CPA.

Best Regards from

Antoine

Hi again, Antoine:

Antoine wrote:

"Thank you for your kind, courteous and extremely interesting reply."

> You're welcome.

"Given your additionnal detailed information, I would keep thinking that your mathematical approach in your "HP-71B Minimax Polynomial Fit" is probably close in essence to the logic of Chebyshev Polynomials Approximation"

> I don't think so, but anyway, each and every method that deals with the computation of minimax polynomials must address the same issues nevertheless, so they all share similar logics, in essence.
>
> But where CPA deals with an special kind of orthogonal polynomials with some weighting function involved, and then uses their equiripple properties to approximate true minimax, I do nothing of the kind, and I do not find approximate minimax polynomials but exact ones, to the limits imposed by finite accuracy arithmetic.

"By the way, do you have a similar program for the HP41?"

> No, because my approach is very computationally intensive and requires a large amount of RAM, so the HP-71B is about the minimal platform where it would run acceptably. The HP-41C would be far too slow and limited except for low degrees and small datasets.

"I am willing to communicate more on this with you in order to compare my results on HP41X (you have HP41X from Hrast don't you ?) with yours obtained on your "HP-71B Minimax Polynomial Fit".

> I'm willing to obligue but I don't have HP41X because I don't have any 48/49 models, matter of fact I can't stand RPL machines. Not to discourage others from liking or using them, of course, to each his own.

"However this forum is not an appropriate place to do so. Would you be so kind as to send me an e-mail at my e-mail address " antoine.m.couette@club-internet.fr " so that I can give your more details on the function I am studying and on the way I currently represent it with CPA."

I do not concur in this forum not being an appropriate place, as the topic is mathematical in nature ("Terms of Use") and does involve vintage HP machines (HP-41C and HP-71B), so it certainly belongs here and might well be of educational or practical use to others, but if there are any confidentiality matters involved or you aren't comfortable with discussing it here, you can e-mail me at my public e-mail address, which you can find at my web site
http://membres.lycos.fr/albillo/calcmain.htm

Best regards from V.

*Message #7 Posted by **PeterP** on 31 Jan 2006, 11:25 p.m.,*
in response to message #1 by Valentin Albillo

Valentin,

First, thanks for placing to us another challenge that will help us fill our day with more things that are fun and less things that put bread on the table ;-)

Secondly, the first sum is written as Sum(f(2^n)/2^n), for n=1 to infinity) yet then you go on to say f(N) counts the number of odd digits. So I presume - yet might be totally wrong - that you actually mean the first sum to be Sum(f(N)/2^N), for n = 1 to infinity. Not that I would have any better idea how to do this than what is written, just want to make sure I start on the right track...

Cheers

Peter

Hi, PeterP:

PeterP wrote:

"First, thanks for placing to us another challenge that will help us fill our day with more things that are fun and less things that put bread on the table ;-)"

You're welcome. It doesn't help me put bread on my table either, to spend time concocting these challenges ;-)

"Secondly, the first sum is written as Sum(f(2^n)/2^n), for n=1 to infinity) yet then you go on to say f(N) counts the number of odd digits. So I presume - yet might be totally wrong - that you actually mean the first sum to be Sum(f(N)/2^N), for n = 1 to infinity. Not that I would have any better idea how to do this than what is written, just want to make sure I start on the right track..."

Thanks for your interest and you've done the right thing by first clearing out any doubts you had but no, you're indeed *wrong* and the sum is exactly as written, i.e.:

```
 n->oo
-------
 \
  >      f(2^N)/2^N = f(2^1)/2^1 + f(2^2)/2^2 + f(2^3)/2^3 + ...
 /
-------             = f(2)/2 + f(4)/4 + f(8)/8 + f(16)/16 + ...
 n = 1
                    = 0/2 + 0/4 + 0/8 + 1/16 + 1/32 + 0/64 + ...

 as f(N) counts the number of odd digits (i.e.: 1,3,5,7,9) in N,
 so we have:

         f(2)  = 0    ("2" has no odd digits)
         f(4)  = 0    (ditto)
         f(8)  = 0    (ditto)
         f(16) = 1    ("16" has one odd digit, the "1")
         f(32) = 1    ("32" has one odd digit, the "3")
         f(64) = 0    ("64" has no odd digits)
         f(128)= 1    ("128" has one odd digit, the "1")
  etc.
```

I suggest you begin with sums 6, 7, and 8, which are easier, and then, overwhelmed by success, you go on to attack the remaining sums. I might even **increase** the prize by adding two other unavailable articles of mine, so there would be 8 articles for 8 sums.

As for the sums themselves, believe me this is *not* a boring, math-drudgery topic: the results are *awesome*, even surreal, you've never seen anything like this before !

Best regards from V.

*Message #9 Posted by **Chris** on 1 Feb 2006, 7:12 a.m.,*
in response to message #8 by Valentin Albillo

```
Valentin

I have tried the problems with my HP-49G+ using for the main program 'CHALLENGE'
<<
  CLEAR
  'SIGMA(N=1,10000, F(2^N)/2^N)'
  EVAL ->Q
>>
where F(N) defines the function, SIGMA is the summation symbol. This outputs the results as fractions.

A typical F(N), fore example, for  the first problem is shown below and stored in 'F'

<<
  ->STR
  'A' STO
  0 'B' STO
  1 A SIZE 1 - FOR I
    IF A I I SUB NUM 2 MOD 1 == THEN
      1 'B' STO+
    END
  NEXT
  B
>>

The answers I have (some I am a bit dubious about or just do not recognise) are

1. 1
2. 4
3. 0
4. 1
5. 1/9
6. 91720561 / 343614632 = 2.66929133856 (?)
7. 3.14159265837 (PI)
8.200100/1 (?)

Even if the results are not quite correct I have enjoyed the Challenge.

Thank you very much

Chris
```

I only got (3) for now and I get 114/1025 but I am not fully sure. In that case F is << XPON 2 MOD >>

Need to work a bit more now

Arnaud

Re: Your score up to now

*Message #11 Posted by **Valentin Albillo** on 1 Feb 2006, 7:41 a.m.,*

in response to message #9 by Chris

Hi, Chris:

First of all, thanks for your interest in my challenge and your great solutions. Here's some preliminary score for you:

```
1. 1        Wrong value
2. 4        Wrong value
3. 0        Wrong value
4. 1        Wrong value
5. 1/9      Wrong value

6. 91720561 / 343614632 = 2.66929133856 (?)

            Correct value save a few ulps, Wrong fraction
            (remember what I stated about 2/3 vs 166666666667/250000000000)

7. 3.14159265837 (PI)

            Nearly-correct value but you can refine it

8.200100/1 (?)

            Correct value, Correct fraction
            (Your value is integer, so Denominator = 1)
```

You do not clearly state what you think are the correct values for the sum, i.e.: you may have gotten some result but think the real value is some other) so I can't accurately score that.

You might consider having a second look at it in order to correct/improve the wrong/improvable values and/or fractions, and come to that, specifically state what are the actual values in your opinion. I'm sure you can easily improve your score ! :-) Anyway, thanks a lot for your interest and

Best regards from V.

*Message #12 Posted by **J-F Garnier** on 1 Feb 2006, 3:45 p.m.,*
in response to message #11 by Valentin Albillo

Just a short and fast try to answer question #6 with the HP-71:

```
10 DEF FNF(N)=IP(PI/2*N)/2^N
20 S=0
30 FOR N=100 TO 1 STEP -1
40 S=S+FNF(N)
50 NEXT N
60 DISP S;FRAC$(S)
>
 2.66929133858 339/127
```

FRAC$ comming from the JPC ROM. (If HP48/49 owners can use the ->Q function, I may use the JPC ROM one?)

J-F

Hi, Jean-François !

Jean-François wrote:

"Just a short and fast try to answer question #6 with the HP-71:[...] 2.66929133858 339/127"

> Correct value and correct fraction. Care to state whether you think this fraction is the exact value of the infinite sum ?

"FRAC$ comming from the JPC ROM. (If HP48/49 owners can use the ->Q function, I may use the JPC ROM one?)"

> Of course, and very clever on your part to remember that such a convenient function is included in the JPC ROM. Anyway, I'll provide a conversion routine using only standard keywords as part of my solution, for the benefit of interested users.

Come on, Jean-François, be a sport and post equally clever solutions for the remaining sums ... it's actually pretty easy ! :-)

Thanks for your interest and pretty solution, and

Best regards from V.

Re: Your score up to now

*Message #14 Posted by **Chris Dean** on 1 Feb 2006, 7:37 p.m.,*
in response to message #13 by Valentin Albillo

```
Valentin
I have made a few changes to my code and have had another go. The main program 'CHALLENGE'
<<
  CLEAR
  'SIGMA(N=1,10000, F(N)/2^N)'
  EVAL ->Q
>>
where F(N) defines the function, SIGMA is the summation symbol. This outputs the results as fractions.
A typical F(N), for example, for  the first problem is shown below and stored in 'F'
<< 2 ^
  ->STR
  'A' STO
  0 'B' STO
  1 A SIZE 1 - FOR I
    IF A I I SUB OBJ-> 2 MOD 1 == THEN
      1 'B' STO+
    END
  NEXT
  B
>>

The answers I have now are

1. 4175734221719/556712812325 approx 3 / 4, 0.75
2. 614074 / 1615189 very approx 2 / 5, 0.4
3. 1 /1
4. 1089 / 1629256, 0.000668 approx 8 / 30000
5. 10 / 99
6. 91720561 / 343614632 = 2.66929133856
7. 3.14159265357  slightly better approximation of PI than last time
8. 200100000001 / 1000000 -> 200100

Any better?

Chris
```

Re: Your score up to now

*Message #15 Posted by **Valentin Albillo** on 2 Feb 2006, 6:54 a.m.,*
in response to message #14 by Chris Dean

Hi again, Chris:

Chris posted: *"I have made a few changes to my code and have had another go."*

> I'm truly glad you did and thank you for your continued interest. In view of the scarce number of entries this challenge is getting, I think maybe it's useful to separate mice from men, speaking from a programming-abilities point of view, of course; though I don't get why, it's actually very easy, the novelty lies in the highly unexpected results.

"The answers I have now are 1. 4175734221719/556712812325 approx 3 / 4, 0.75"

> Nope, wrong value.

"2. 614074 / 1615189 very approx 2 / 5, 0.4"

> Wrong value.

"3. 1 /1"

> Wrong value.

"4. 1089 / 1629256, 0.000668 approx 8 / 30000"

> Wrong value.

"5. 10 / 99"

> Correct fraction, thus correct value. Do you think this is the *exact* value of this sum ? Or else, how good an approximation ?

"6. 91720561 / 343614632 = 2.66929133856"

> Correct value within a few ulps, wrong fraction. Once again, remember the 2/3 versus 166666666667/250000000000 I mentioned in the preamble to the challenge, when trying to convert the approximate result 0.666666666668 to fractional form. The long fraction is of course the minimal fraction which will result in a value of 0.666666666668, but this is misleading, since that final "8" is just an artifact of finite precision. Your conversion to fraction must take these small inaccuracies into account and come instead with the simplest fraction that represents your result within a few ulps. That way you'll get the correct 2/3 instead of the artificious 166666666667/250000000000.

"7. 3.14159265357 slightly better approximation of PI than last time"

> Correct value. Do you think that Pi is the *exact* value of this sum ? Or else, how good an approximation ?

"8. 200100000001 / 1000000 -> 200100"

> Correct value, wrong fraction. The same comment as for #6 above applies. If you got S = 200100.000001, your conversion to fraction must consider, taking into account small inaccuracies, the "integer" fraction 200100/1 = 200100 is the lowest possible "fraction", not 200100000001/1000000
>
> And as always, would you say that your fraction (or integer value) is the *exact* value of this infinite sum ? And if not, just how close is it ?

Well, there's been some improvement. But you really need to work your functions definitions and/or your summation method for the first 4 sums because your answers are not even close to the true results. The conversion from (approximate) computed sum to lowest fraction also needs reworking.

Thanks again for your continued efforts, and

Best regards from V.

Re: Your score up to now

*Message #16 Posted by **Chris Dean** on 2 Feb 2006, 7:45 a.m.,*
in response to message #15 by Valentin Albillo

```
Valentin

Thank you for your comments I will re-try 1 to 4. J-F has noticed an error in my program which is possibly the problem
with my results. Also antoher problem I am possibly having is with the Hp-49G+ as it is the first time I have used it in
anger from a programming point of view.
With regards to my fraction values I am using the ->Q function which converts decimal values to the results as a
fraction.

From your comments 1 to 4 I will retry.

For 5 this is the result output from the HG49G+ and I assume is exact (although I have a suspicion that 1 /10 might be
the correct solution!)

For 6 I have 917207561 / 343614632, using a common factor of 2705627 gives me the fraction 339 / 127

For 7 possibly the accuracy is restricted to the accuracy of the HP49G+ but I would have to investigate further.

For 8 Point taken I used 200100 / 1 the first time round!

Thanks for the comments

Chris
```

Using ->QPI sometimes provides "better" fractions.

I will have to try more that (3) and recheck it. Hopefully this weekend

Arnaud

S&SMC #13: Adding up to infinity

*Message #18 Posted by **Valentin Albillo** on 2 Feb 2006, 11:17 a.m.,*
in response to message #17 by Arnaud Amiel

Please do. And thanks a lot for your interest :-)

(By the way, both your value and fraction for #3 *are* correct. Would you state whether you deem the fraction to be the *exact* value for the infinite sum ? Perhaps computing some more extra digits would allow you to decide ? (hint, hint) ;-)

Have a busy and enjoyable weekend, keep up the good work, and

Best regards from V.

Re: S&SMC #13: Adding up to infinity

*Message #19 Posted by **Arnaud Amiel** on 2 Feb 2006, 5:46 p.m.,*
in response to message #18 by Valentin Albillo

A bit more work has been done. I will now try to follow your hint. In the mean time I hope this will help others to improve:

I have had a quick look and decided to use my 49G+.

The advantage of the 49G+ is that it is fast so I could use very inefficient algorithms.

I have up to now only looked at those not involving individual digits. I plan to do those this week end in ML as I believe it is the only way to properly deal with individual digits; and it is fun... so more results a bit later.

Anyway, here I go.

I use a program F to define f(N)
I use a program LOOP to loop infinitely (this is where I use the speed of the 49G+)
I use a LAUNCHER program to catch the error when LOOP underflows
I use the ->QPI function to give me the fraction as I found it usually works better than ->Q for approximate results

```
LAUNCHER
<< IFERR LOOP THEN DEPTH 1 - DROPN END >>
```

This works from an empty stack because LOOP always leave the sum on the top level.

For S3:

```
LOOP
<< 0 0 WHILE 1 REPEAT 1 + 2 OVER ^ DUP F SWAP / ROT + SWAP END >>

F
<< XPON 2 MOD >>
```

I find 0.111219512196 the 49 tells me it is 114/1025 I would however believe it would be 114/1024 because we are looking at sums of 2^N

For S6:

```
LOOP
<< 0 0 WHILE 1 REPEAT 1 + 2 OVER DUP F UNROT ^ / ROT + SWAP END >>

F
<< PI 2 / * IP >>
```

I find 2.66929133856 the 49 tells me it is 339/127 I would however believe it would be 342/128=171/64 because we are looking at sums of 2^N

For S7:

```
LOOP
<< 0 0 WHILE 1 REPEAT 1 + DUP F ROT + SWAP END >>

F
<< SQ neg 100 / EXP >>
```

After dividing by 5, adding .1 and squaring I get 3.14159265357 which the 49 tell me is PI, and which I somehow believe

For S8:

```
LOOP
<< 0 0 WHILE 1 REPEAT 1 + 5 OVER DUP F UNROT ^ / ROT + SWAP END >>

F
<< PI 163 SQRT 3 * / EXP * IP >>
```

I find .31250000512 the 49 tells me it is 3814696/12207027 somehow I don't trust numbers after so many 0s so I would tend to say 5/16.

Anyway, I will try to find the others by using an F written in ML and will look again at calculating or intuiting exact results on the paper a bit better this weekend.

Arnaud

Re: S&SMC #13: Adding up to infinity

*Message #20 Posted by **Valentin Albillo** on 3 Feb 2006, 4:36 a.m.,*
in response to message #19 by Arnaud Amiel

Hi, Arnaud:

Arnaud posted:

"In the mean time I hope this will help others to improve"

> *THAT'S* exactly the idea behind these challenges o'mine: that everyone can enjoy then, and that everyone can learn something useful. Me, I'm enjoying a lot the ideas and code posted here and learning new RPL tricks and techniques all the time. I'm sure many others do too, even if they simply 'lurk' without posting a thing.
>
> Matter of fact, I firmly believe that for every forum visitor who posts something, there are at least ten others that do never post anything, but nevertheless do enjoy the topics under discussion.

"I find 0.111219512196 the 49 tells me it is 114/1025 I would however believe it would be 114/1024 because we are looking at sums of 2^N"

```
Yes, but you have:  computed Sum = 0.111219512196
                    and 114/1025 = 0.111219512195
                    but 114/1024 = 0.11128125000
```

> so it all depends on how much you do trust your computed Sum. If you're certain that 11-12 digits are correct ... Perhaps getting some more digits would help you decide. Are there any multiprecision libraries available for your calculator ? They would probably be useful here.

"I find 2.66929133856 the 49 tells me it is 339/127 I would however believe it would be 342/128=171/64 because we are looking at sums of 2^N"

> Same argument here. It all depends on how much you trust your computed sum.

"For S8 [...] I find .31250000512 the 49 tells me it is 3814696/12207027 somehow I don't trust numbers after so many 0s so I would tend to say 5/16."

Double-check the sum definition and/or your code, because your result is way out.

"Anyway, I will try to find the others by using an F written in ML and will look again at calculating or intuiting exact results on the paper a bit better this weekend.

Great ! Have an enjoyable weekend and please, *do post* your ML code for others to see. It'll be most instructional to all of us, myself included. Thanks for your interest and

Best regards from V.

Re: S&SMC #13: Adding up to infinity

*Message #21 Posted by **Arnaud Amiel** on 3 Feb 2006, 3:59 p.m.,*
in response to message #20 by Valentin Albillo

Quote:

Are there any multiprecision libraries available for your calculator ? They would probably be useful here.

The 49 has the ability to deal with unlimited precision numbers which are built in. It is just a pitty that the functions themselves are not built in. There are however very good libraries to deal with those. I might try weather permitting.

Quote:

Double-check the sum definition and/or your code, because your result is way out.

Of course you are right, I miss read thedefinition of f(N) which should be << PI 3 / 163 SQRT * EXP * IP >> which gives me 200100.000001 which the hp tells me is 200100.

Now I have to work on the other ones

Arnaud

Re: S&SMC #13: Adding up to infinity

*Message #22 Posted by **Arnaud Amiel** on 4 Feb 2006, 5:45 p.m.,*
in response to message #20 by Valentin Albillo

I have had time to play around a little bit with ML. I jus coded the missing F. The other part is the same RPL

as above. I will try to comment enough for people not too familiar with Saturn ASM to understand.

Here we go:

For 1:

```
GOSBVL =POP1%  %We take real from the stack, save the context, put it in register A and set the processor
in BCD

mode
ASL.W          %We shift A left to align the first digit with the S (4 bits) field of the register
C=0.W          %C will be our counter
```

```
P=4             %P is one nibble which we will increase until it carries. There are 12 digits in the
mantissa of

A
{
SB=0            %The sticky bit is set when a shift operation loses a digit.
ASRB.S          %We shift the nibble in S by one bit to the right
?SB=0 { C+1.A }%If the sticky bit is still 0 we skip increasing the counter
ASL.W           %We shift A by one nibble to bring the next digit in the S field
P+1 UPNC        %We increment our counter P and go up to the first bracket if we haven't overflowed yet
}
%Pushing reals is a trouble so on a 49 we push a ZINT. Much easier
A=C.A P=3       %We copy our counter C in A which will be pushed - P holds the number of digits.
SETHEX          %We must always return in HEX mode not BCD
GOVLNG =PUSHzintLoop %We push the ZINT and return
@
```

This gives me .111111111108 which ->QPI tell me is 1/9 and which I believe to be exact.

For 2: First I believed it would be a straightforward copy of the above but it turned out not to be for two reasons.

1) There is no ?SB<>0 test
2) For small numbers the registers are full of zeros which are even digits

So after playing a bit I got this:

```
GOSBVL =POP1%  %Same as before
SETHEX          %We want to calculate how many digits we will look at to load P in HEX
B=0.A           %B will hold the result
B=A.P           %We get the LSD of the exponent of A stored in DCB
ASR.X           %We get the next digit in the P=0 field
?A=0.P { B+10.A } %If it is not 0 we add 10 - I only consider "small" numbers to < 1E13
LC 00F C-B.A P=C 0 %We set our counter initial value in C and move it to P
SETDEC          %We will count the digits in DCB
C=0.A           %As before
ASL.W
{
C+1.A           %As there is no ?SB<>0, we assume even
SB=0 ASRB.S ?SB=0 { C-1.A } %If we were wrong we decrement our counter
ASL.W           %The rest is as before
P+1 UPNC
}
A=C.A P=3
SETHEX
GOVLNG =PUSHzintLoop
@
```

This gives me 1.03160638597 which ->QPI tell me is 3166/3069. I just don't believe that Valentin would have us

looking for this fraction. So either my calculation is not accurate enough or there is something special about

this fraction that I don't know.

For 4 and 5:

By now I had gotten in the mood of writing ML, which I usually only do when Valenin posts his cahllenges. So I

figured out the best method for this one was different. Here we go.

```
GOSBVL =POP1%   %Same as before
LC 101010101010000 %We use a mask to get only the LSB of even placed digits
SB=0 ASRB.X ?SB=0 { CSL.M } %If the exponent is odd we shift the mask
A&C.W            %We AND everything
P=4              %We will go through the whole 12 digits
ASL.W            %We bring the first digit to the end of the register
{
ASLC             %We circularly shift the first digit to the beginning of the register
```

```
C+A.X           %Add it to our counter
A=0.X           %Clean the X field of the A register to avoid adding old digits
P+1 UPNC        %Same as before from here
}
A=C.X P=3
SETHEX
GOVLNG =PUSHzintLoop
@
```

This gives me 1.01010101008E-2 and .10101010101 which the calc tell me are 1/99 and 10/99 respectively which I

believe.

Now I still need to recheck a few of these sums to see if I can come up with something more reasonable. It is

time to recheck the manual for the extended precision libraries.

Hopefully a bit more information tomorrow.

Arnaud

Re: S&SMC #13: Adding up to infinity - Rechecked with more numbers

*Message #23 Posted by **Arnaud Amiel** on 5 Feb 2006, 7:43 a.m.,*
in response to message #22 by Arnaud Amiel

Up to now, I was happy that: S1=1/9
S4=1/99
S5=10/99
S7=PI
S8=200100

For the others, Valentin seemed to imply that getting more digits would help so I used the Longfloat library it is much slower but I got many more digits.

S3 was 0.1112195121951219512195..... so I am happy that S3 is 114/1025

S2 was 10316063859718040101220361779253392004437687402157981960542380195161838125925590758044055067926010 15.E-99 and however hard I try, I can not find a period in there.

S6 is 26692913385826771653543307086614173228346456692913385826771653543306993153860770080720989436591834 97.E-99 and there seem to be a period but it is quite large 669291.... this yields a long fraction: 29658792650918635170603675406824146981627/11111111111111111111111111111111111111111 Somehow it looks nicebut I still can't say that I am happy with it.

So unless a miracle happens before the end of the weekend, I lose 2 points for S2 and S6

And I am still wondering how Valentin got all these sums?

Arnaud

in response to message #23 by Arnaud Amiel

Nice work Arnaud! Seems that between you and J-F, the French own this challenge. I was hoping to learn again something magnificent from Markus or Ernst but they were notably abscence. So were all the other forum-prowling code magicians who write in RPN, I always hope to take a peek and learn some new trick from them...

And - at least from my low vintage point - Valentin is anyway in a different sphere...

However, I hope that he creates some challenges that are not only doable by my little-old-41 (albeit it carres a y in its name) yet also at least carry the change to win something for it as well, rather than those fabulous programs for the 71, which I do not have... How about a Sudoku solver for the 41, Valentin?

Can't wait to have the magician lift the curtain and tell the story about those sums. I bet there is some unifying theme between them, too many 1/9, 1/99, 10/99...

Cheers

Peter

Better than ->Q or ->Qpi

*Message #25 Posted by **Gene** on 2 Feb 2006, 11:29 a.m.,*
in response to message #17 by Arnaud Amiel

would be joe horn's amazing dec->frac routine, if you have that available. I think he's posted the routine to comp.sys.hp48 in the past.

in response to message #25 by Gene

I believe you are talking about PDQ. I was thinking about using it but decided to restrict myself to built in functions. I will give it a try if I have time this weekend.

Re: Your score up to now

*Message #29 Posted by **J-F Garnier** on 2 Feb 2006, 8:11 a.m.,*
in response to message #28 by Valentin Albillo

And why on earth don't you post them, man !? :-)

Ok, ok ... The programming task is quite simple, well maybe not the decimal->fraction conversion, but as we are using "high level" functions like ->Q or FRAC$...

No, the fact is that I'm unable to judge the results, especially for question #1 to #5. Personally, I prefer the questions #6 to #8.

About #7, here is my result and comment:

```
90 DEF FNF7(N)=EXP(-N*N/K)
100 S=0
105 K=100
110 FOR N=100 TO 1 STEP -1
120 S=S+FNF7(N)
130 NEXT N
135 S=(S*2+1)^2/K
140 DISP S
```

Result is: 3.14159265357 close to pi, as already posted.

Note that I rewrote the sum as

```
   S = ( (SUM( N=1, N-> Inf, f(N) ) * 2 + 1 ) ^2 ) / K
   where f(N) = e^(-N*N/K)   and K=100 in Valentin's problem
```

I get the same result (up to 11 digits) for K value from 100 down to 3. But for K=2, I get 3.1415926872. So my guess is that the sums are very good approximations of PI (but are not PI), and the limit when K -> Inf may be actually PI.

About question #8: with a similar program I found : 200100, also already posted. I have some doubt that the exact value is an integer, as it seems related to the famous exp(pi*sqrt(163)) number, which is close to an integer, but is not.

Re: Your score up to now

*Message #30 Posted by **J-F Garnier** on 2 Feb 2006, 12:57 p.m.,*
in response to message #28 by Valentin Albillo

Well, Valentin, here are my results for problems 1 to 5:

```
10  DEF FNF1(N)
20    C=0 @ P=1
30    WHILE N>=1
51      IF MOD(N,2)=1 THEN C=C+1 ! PB#1
52      ! IF MOD(N,2)=0 THEN C=C+1 ! PB#2
53      ! C=C+1 ! PB#3
```

```
54      ! IF MOD(N,2)=1 AND MOD(P,2)=1 THEN C=C+1 ! PB#4,5
60      N=N DIV 10
65      P=P+1
70    END WHILE
81    FNF1=C ! PB #1,2,4,5
83    ! IF MOD(C,2)=0 THEN FNF1=1 ELSE FNF1=0 ! PB#3
90  END DEF
100 S=0
110 FOR N=100 TO 1 STEP -1
120   S=S+FNF1(2^N)/2^N ! PB#1,2,3,4
125   ! S=S+FNF1(N)/10^N ! PB#5
130 NEXT N
140 DISP S;FRAC$(S)

Results:
#1: .11111111111 1/9
#2: 1.03160638645 3166/3069
#3:  .111219512195 114/1025
#4:  .010101010101 1/99
#5:  .10101010101 10/99
```

Results #1,4,5 are beautiful enough to be true, I don't know for #2 and #3...

Waiting for your final comments!

J-F

310   H0=H0*2
320   IF L0>=M0/2 THEN L0=L0-M0/2 @ H0=H0+1
330   L0=L0*2
340   DISP H1;L1
345   IF H0>1.E+12 THEN EXIT N
350 NEXT N

Problem #6:
5   DEF FNF(N)=IP(PI/2*N)
150 S=0
180 H1=0 @ L1=0 ! real result
190 M1=.0000000001 ! 1E-10 limit between H1 and L1
200 FOR N=1 TO 100
210   X=FNF(N)
220   ! calculate X/2^N in dble precison
230   H2=X @ L2=0
240   FOR J=1 TO N
250     H2=H2/2 @ L2=L2/2
260     X=MOD(H2,M1) @ H2=H2-X @ L2=L2+X @ IF L2>=M1 THEN L2=L2-M1 @ H2=H2+M1
270   NEXT J
280   ! add H2,L2 TO H1,L1
290   H1=H1+H2 @ L1=L1+L2 @ IF L1>=M1 THEN L1=L1-M1 @ H1=H1+M1
340   DISP H1;L1
350 NEXT N

Results:
#1: .1111111111  1.11111111128E-11
  Last two digits are supposed to be invalid.
#2: 1.0316063864  4.50961225158E-11
  in line the 3166/3069 fraction, as can be checked with the HP71:
                                      1.0316063864450961225158
  3166/3069                      -> 1.031606386
  (3166-3069*1.03160638)/3069 ->          6.44509612252E-9
#3: .1112195121   9.51219512197E-11
  check:                      .111219512195121951219
  114/1025                  -> .1112195
  (114-1025*0.111219)/1025 ->       5.12195121951E-7
#4: .0101010101  1.01010101013E-12
#5: .101010101  1.0101010101E-11
#6: 2.6692913385  8.26771653543E-11
  check:                    2.6692913385826771653543
  339/127                -> 2.6692913
 (339-2.669291*127)/127  ->        3.38582677165E-7
```

With 20 digits, the fractions represent the sums accurately. Are they the exact values? I don't know. If I was a mathematician, I would write a 100-digit accuracy program (or use a PC Math software) and would consider spending some time on trying to prove it if the results still match. But I'm not a mathematician...

I was a little disapointed, because I expected that at least one result would invalidate the fraction approximation. Valentin insisted too much on getting our comitment on rational results! I'm really intrigued by problem #6, how a combination of the decimals of PI could make a rational number?

Valentin, we need you!

J-F

in response to message #33 by Chris Dean

```
Valentin
Once again more results. You cannot fault me for trying!

1. 1 /9
2. 32 /31
3. 1 / 1. I am having problems with this one as I can also get the answer 0 if I change my program by adding an EVAL
statement after 2^N.
4. 1 / 99
5. 10 / 99 This is the result output from the HG49G+ and I assume is exact.
6. I have 917207561 / 343614632, using a common factor of 2705627 gives me the fraction 339 / 127
7. 3.14159265357 possibly the accuracy is restricted to the accuracy of the HP49G+ but I would have to investigate
further.
8. Point taken, I used 200100 / 1 the first time round!

Thanks for the comments

Chris
```

S&SMC #13: Adding up to infinity

*Message #35 Posted by **Valentin Albillo** on 2 Feb 2006, 11:34 a.m.,*
in response to message #34 by Chris Dean

Hi again, Chris:

Chris posted:

"You cannot fault me for trying!"

Indeed !! :-)

As for your new results:

- #1, #4, #5, #6 (the smaller fraction), #7 and #8 are Ok.
- #2 needs reworking: the fraction you give doesn't result in a value accurate enough.
- #3 is wrong.

Anyway, if you want to remain friends with me, you must abide by the challenge's regulations (see "Caveat emptor" in my original post), this is:

1. You *must* post your code. Posting just solutions won't do, and it's to be considered impolite. Share with your fellow forum visitors so that they can marvel at your code and learn how things are done !
2. For this particular challenge, please state your opinion on the exactness of the final results. Simply accepting some calculator's output without verification and jugdment is terribly bad practice. What would you do if I didn't comment on their correctness ? Would you trust anything important to these results ? You gotta be confident in what you get.

Enough ranting. Have a good weekend, I'll post my solutions next Monday, so you still have time to make it perfect.

Best regards from V.

*Message #36 Posted by **PeterP** on 2 Feb 2006, 12:13 p.m.,*
in response to message #8 by Valentin Albillo

Okay valentin, here are some initial tries, just to see if I am on the right track. Unfortunately I do not own a 71, so a) my code is for a 41, which I hope is still okay.

The main loop is the "Lbl S", where one chooses which function F(N) to use. It right now is set up only for the first few, where we have to divide by 2^n.

Also, I have not written a conversion to fraction routine, dont have a good idea how to do this yet...

Hence I have only the fractions here:

```
1) 0.11111111, 1/9 (I believe exact)
2) 1.031606386
3) 0.11219512
```

here is the code, I will add the other functions piece by piece and add it here if there is any interest.

Re: Short & Sweet Math Challenge #13: Adding up to infinity

*Message #39 Posted by **Chris Dean** on 3 Feb 2006, 1:50 p.m.,*
in response to message #38 by PeterP

Valentin

I apologise for not including code in my previous post. I now have further results for problems 2 and 3 (including code!). For each case I have used the main program shown below

```
<<
  CLEAR
  'SUM(N=1,10000, F(N)/2^N)'    EVAL
  ->Q
>>
```

Where
F(N) defines the function for each problem,
SUM is the HP49G+ summation function
->Q is the HP49G+ quotient function which converts decimal results as fractions.

2. F(N) is defined by

```
<<
  2 SWAP ^ DUP
   ->STR ‘A’ STO
  LOG 1 +  IP ‘B’ STO
  0 ‘C’ STO
  1 B FOR I
    IF A I I SUB OBJ-> 2 MOD 0 == THEN
      1 C = ‘C’ STO
    END
  NEXT
  C
>>
```

This gives a result of 3166 / 3069. I believe this to be accurate for the algorithm I am using yielding the decimal result 1.03160638645.

3. F(N) is defined by

```
<<
```

```
  2 LOG * IP 2 MOD
>>
```

This gives a result of 114688217 / 1031187916 = 0.111219512196. I believe this to be accurate for the decimal result that is produced. The algorithm is dominated in this case by the value of 2^-N which is having little affect on the result as N increases. Running the algorithm over 100 and 10000 iterations yielded the same results as those for 39 iterations. Considering the 44th iteration which is the next even result to be considered after the 39th, this result will add 5.68434188609E-14 to the previous sum. The value does not have any affect on the current sum 0.111219512196 on my calculator. Looking at, say, 114 as the denominator multiply by the result yields 1024.9999999999. It might 'safe' to assume that a reasonable estimate for the result could be 114 / 1025 which gives 0.111219512195. A close result to the previously calculated one but is it a valid?

Regards
Chris

in response to message #1 by Valentin Albillo

Hi Valentin!
Well I want the prize, so I had better participate (and hope I'll pass the exam ;-)
I used the 49, for two reasons:
- Qpi to convert the answer to fractions
- long integer support allows me to run tests twice to see if the infinite sum really converges to the proposed fraction
for that I use the following program that (where possible) adds up the *exact* terms of the sum.

```
In: 2: f
    1: N
Out: 3: SUM(i=1,N,f(i)) (numeric)
     2: approximate fraction
     1: difference between exact and approximate fraction
@ INFS

results
                                  50     100    200    EXACT?
1. 0.111111111111 '1/9'        7e-15  1e-29  2e-59    Y
2. 1.03160638644  '3166/3069' 7e-15  1e-29  1e-32    N
3. 0.111219512196 '114/1025'   8e-16  9e-32  1e-31    N
4. 0.010101010101 '1/99'       3e-15  5e-30  8e-60    Y
5  0.101010101010 '10/99'      1e-51 9e-101 1e-100    N
6. 2.66929133858  '339/127'    7e-14  1e-28  2e-58    Y
7. 3.14159265357   PI                                 ?
8. 200100.         200100                             N

7: no idea. I guess not
8: 200100 is NOT the exact value of the sum.  It would be if exp(pi/3*sqrt(163)) were an integer (640320) but it isn't.
If it were, the infinite sum could be written as
640320*(1/5 + 2/25 + 3/25 + .. N/5^N) = 640320*S
when T = 1/5 + 1/25 + 1/125 then 5*T = 1+T, so T=1/4
Then S = T + T/5 + T/25 + ... = T*(1+T) = 5/16
so 640320*5/16 = 200100
Hope I'll pass!
```

S&SMC #13: My Solutions & Comments [LONG]

*Message #41 Posted by **Valentin Albillo** on 5 Feb 2006, 3:07 p.m.,*
in response to message #1 by Valentin Albillo

Hi, all:

First of all, I'm **absolutely** impressed with the quality & quantity of your posted solutions to this humble challenge of mine, it's been most enjoyable and unexpected.

Frankly, I thought for a while whether I should submit this particular challenge or some other easier one instead, because I feared people would consider it too difficult and too 'busy', what with eight different cases to solve. But then, on the other hand, the subject matter seemed to me irresistibly interesting, because these sums are truly weird, and the results are well-nigh *surreal*, so to say.

Why ? Well, most people knowledgeable in things mathematical have seen infinite sums (Taylor expansions, say) where each term is defined as some combination of

elementary functions, such as trigonometrics, exponentials, or logarithms, mixed up with powers and arithmetic operations. Even other non-elementary functions are sometimes included as well, such as Gamma or Bessel functions, or some integrals, things like that.

But what is one to do with functions such as the one featured in Sum #1, where f(n) *counts* the number of odd digits in its argument ? How can we deal with such a function by analytical means ? Does it have a derivative ? Can it be integrated ? Can it be extended to arbitrary, non-integer arguments, much like the factorial function can ?

Such weird functions, which deal more with their argument's *form* than with their argument's *value*, so to say, seem absolutely *intractable*, and there's no telling what an infinite sum of them could amount to. Math intuition would seem to suggest that it would be some weird no-name irrational value, not related to any well-known mathematical constants. *Yet the first sum comes to 1/9 !* A simple rational !! Exactly !!!

And our amazement can only increase when the second sum, which features the twin function who counts the number of *even* digits in its argument, also seems to evaluate to a rational argument, though this time a not-so-simple fraction, namely 3166/3069.

At the very least, 10-digit and 12-digit results exactly agree with this fraction. Jean-François Garnier took my hint and came up with a 20-digit sum still in perfect agreement with the fraction. Yet, the sum does *not* exactly evaluate to this fraction but comes *incredibly close*. Matter of fact, the sum isn't neither rational nor even irrational, but *transcendental*. An easily-defined, easily-computable transcendental number which is extremely close to the rational 3166/3069. Why this asymmetry between the odd case (sum = 1/9, rational, exactly) and the even case (sum = 3166/3069, extremely close approximation but actually transcendental) ?

Fear not: there's a deep mathematical reason for these unexpected evaluations, these weird counting functions *can* be treated analitically, and sums #6, #7, and #8 also have a suitable and easily understandable explanation, only this is not the place to explain it in detail, of course. Let's go instead for the solutions proper, plus assorted comments.

My Solutions

As usual, I'll give my solutions for the HP-71B, as they're easier to understand and to translate to the programming language of any other HP models, say RPN or RPL.

First of all, we do need some way of converting decimals to fractions. Jean-François Garnier used the FRAC$ function available in the HP-71B's JPC ROM, but that's hardly portable to most other HP machines so here's a 5-line **DEC2FRC** (Decimal-to-fraction) subprogram I wrote for the occasion which will do the conversion:

```
100 SUB DEC2FRC(X,N,D,W) @ IF X=0 THEN N=0 @ D=1 @ END
110 U=0 @ V=1 @ N=1 @ D=0 @ Y=INF @ Z=ABS(X) @ F=SGN(X) @ X=Z @ W=ABS(W)
120 C=INT(X) @ IF FP(X)=0 THEN N=N*F @ END ELSE X=1/FP(X) @ S=N @ T=D
130 N=N*C+U @ U=S @ D=D*C+V @ V=T @ R=N/D @ IF ABS(R/Z-1)<W THEN N=N*F @ END
140 IF R=Y OR MAX(N,D)>1.E+12 THEN N=U*F @ D=V @ END ELSE Y=R @ GOTO 120
```

This subprogram is based on the continued fraction expansion of the given decimal number, and it simply computes the subsequent approximants till the tolerance is met, returning the last one. It works for most any argument within range, regardless of its sign or value.

To use it, you simply call DEC2FRC, passing it the following parameters:

```
 X: passed by value,     is the decimal number to convert to fractional form
 N: passed by reference, is the variable where the numerator will be returned
 D: passed by reference, is the variable where the denominator will be returned
 W: passed by value,     is a tolerance value which lets you control the
                         relative error of the fraction so you can get smaller
                         fractions which still result in acceptable errors;
                         specifying this tolerance as 0 will return the most
                         precise fraction (smallest error) found
```

For example, let's convert -PI to fractional form calling DEC2FRC from the command line:

```
>CALL DEC2FRC(-PI,N,D,0) @ N,D,N/D,PI

   -1146408    364913   -3.14159265359    3.14159265359
```

so our fraction is -1146408/364913, which agrees with PI to 12 digits. Let's suppose that we don't want so close an approximation, but prefer instead a simpler fraction. We'll call DEC2FRC again, but this time we'll specify a tolerance of 0.00001 for the maximum relative error:

```
>CALL DEC2FRC(-PI,N,D,1E-5) @ N,D,N/D,PI
```

```
    -355        113      -3.14159292035    3.14159265359
```

and so this time our fraction is -355/113, which agrees with -PI to nearly 8 digits, far better than our tolerance would have us believe. So our subprogram does work, and you can freely use it in your own programs which require fraction output. As for the sums themselves:

Sum #1:

S = SUM(N = 1, N -> Inf, f(2^n)/2^n)

where f(N) counts the number of *odd* digits (i.e.: 1,3,5,7,9) in N

Our main program will be:

```
10 DESTROY ALL @ STD @ S=0 @ FOR N=1 TO 12/LGT(2) @ X=2^N
20 S=S+FNF(X,"13579")/X @ NEXT N @ CALL DEC2FRC((S),N,D,.000000001)
30 DISP USING "K,Z.10D,K,K,A,K";"Sum = ";S," = ",N,"/";D @ END
```

where FNF is a user-defined function that accept two parameters, the number whose digits will be counted, and a string argument specifying the digits to count. As we want to count the number of odd digits in N, we supply "13579" as the second parameter. Thus, FNF is defined so:

```
50 DEF FNF(X,D$) @ S$=STR$(X) @ C=0 @ FOR I=1 TO LEN(S$)
60 C=C+(POS(D$,S$[I,I])#0) @ NEXT I @ FNF=C @ END DEF
```

which you can test from the keyboard, if desired. This very same function will be re-used for Sum #2. Notice that the main program sums from N=1 to N=12/LGT(2). This is so because we don't want 2^N to be more than 12 digits in length, which is the maximum size for an exact integer argument in the 12-digit HP-71B's BASIC. Else, the count function would return *wrong* results.

Upon running the program we get:

```
>RUN

   Sum = 0.1111111111 = 1/9
```

This is indeed the *exact* result, a nice rational sum.

Sum #2:

S = SUM(N = 1, N -> Inf, f(2^n)/2^n)

where f(N) counts the number of *even* digits (i.e.: 0,2,4,6,8) in N

Our program and user-defined function are exactly the same, except in line 20 the string "13579" should be replaced by "02468".

Upon running it we get:

```
>RUN

   Sum = 1.0316063865 = 3166/3069
```

This result is only *approximate*, but *correct to 31 decimal digits* (!!)

Actually, we have:

```
   Exact value =  1.0316063864450961225154773541870 130310+
     3166/3069 =  1.0316063864450961225154773541870 031606+
```

and you can see that the true sum agrees with our fraction 3166/3069 to 31 decimal digits, but differs afterwards. Thus, the true sum for the even case is a *transcendental*

number, but extremely close to a simple rational. This is in contrast with the sum for the odd case, which is exactly rational.

Sum #3:

S = SUM(N = 1, N -> Inf, f(2^n)/2^n) = 114/1025

where f(N) = 1 is N has an even number of digits, 0 otherwise

Our main program is extremely similar to the one for #1 and #2, and the user-defined function is much simpler:

```
10 DESTROY ALL @ STD @ S=0 @ FOR N=1 TO 12/LGT(2) @ X=2^N
20 S=S+FNF(X)/X @ NEXT N @ CALL DEC2FRC((S),N,D,.000000001)
30 DISP USING "K,Z.10D,K,K,A,K";"Sum = ";S," = ",N,"/";D @ END
40 !
50 DEF FNF(X)=1-MOD(LEN(STR$(X)),2)
```

Upon running it, we get:

```
>RUN

   Sum = 0.1112195122 = 114/1025
```

Once again, this result is only approximate, but *correct to 30 digits* !

In fact, we have:

```
Exact value =  0.11 12195 12195 12195 12195 12195 12204 97+
   114/1025 =  0.11 12195 12195 12195 12195 12195 12195 12+
```

and so the exact sum, which begins mimicking a 5-digit period, actually ceases to agree with the nice fraction after 30 digits. The sum is also transcendental and, again, extremely close to a rational value. Computing to, say, 20 or 25 digit precision would led anyone to think that the 12195 period continued indefinitely, it's hard to believe that, *suddenly*, it *vanishes forever* upon reaching the 30th digit !

Sum #4:

S = SUM(N = 1, N -> Inf, f(2^n)/2^n) = 1/99 (exact)

where f(N) counts the number of *odd* digits in *odd* places in the decimal expansion of N.

In this case, our main program is exactly the same as #1, and the user-defined function is a simple variation of the one in #1:

```
10 DESTROY ALL @ STD @ S=0 @ FOR N=1 TO 12/LGT(2) @ X=2^N
20 S=S+FNF(X,"13579")/X @ NEXT N @ CALL DEC2FRC((S),N,D,.000000001)
30 DISP USING "K,Z.10D,K,K,A,K";"Sum = ";S," = ",N,"/";D @ END
40 !
50 DEF FNF(X,D$) @ S$=STR$(X) @ C=0 @ FOR I=1 TO LEN(S$) @ J=LEN(S$)+I-1
60 C=C+(POS(D$,S$[I,I]) AND MOD(J,2)) @ NEXT I @ FNF=C @ END DEF
```

Upon running it we get:

```
>RUN

   Sum = 0.0101010101 = 1/99
```

which is the *exact* result. This time the sum is, as in #1, exactly rational.

Sum #5:

S = SUM(N = 1, N -> Inf, f(n)/10^n)

where f(x) is the same as in Sum #4.

We only need to change these lines in our main program for #4:

```
10 DESTROY ALL @ STD @ S=0 @ FOR N=1 TO 12/LGT(2)
20 S=S+FNF(N,"13579")/10^N @ NEXT N @ CALL DEC2FRC((S),N,D,.000000001)
```

Upon running, it returns:

```
>RUN

   Sum = 0.1010101010 = 10/99
```

where most unexpectedly, as the function *is the very same* and the sum is very similar, the result is only approximate, but *correct to 99 digits* !!! The true results is, again, transcendental, but this time much closer to a rational value.

Why Sum #4 results in an exact rational (1/99) while the extremely similar Sum #5 results in a transcendental which agrees to 99 digits with 10/99 may seem as mysterious as the odd-even dissimilar results in Sums #1 and #2. Of course, the "10" period dissappears upon reaching the 100th digit, but anyone computing the sum to 10, 20, 30, ..., 70, 80, 90 decimals would be adamantly convinced that it would go on forever.

Sum #6:

S = SUM(N = 1, N -> Inf, f(n)/2^n)

where f(x) = Integer part of (Pi/2 * x)

The main program is a trivial variation, and the user-defined function is also trivial:

```
10 DESTROY ALL @ STD @ S=0 @ FOR N=1 TO 12/LGT(2)
20 S=S+FNF(N)/2^N @ NEXT N @ CALL DEC2FRC((S),N,D,.000000001)
30 DISP USING "K,Z.10D,K,K,A,K";"Sum = ";S," = ",N,"/";D @ END
40 !
50 DEF FNF(X)=INT(PI/2*X)
```

Upon running it we get:

```
>RUN

    Sum = 2.6692913385 = 339/127
```

and, again, this result is only an approximation to the real sum, which is transcendental. However, it's a very close approximation once more, this time *the fraction agrees with the true sum to almost 69 digits* !

```
Exact value = 2.669291338582677165354330708661417322834645669291338582677165354330 69931+
    339/127 = 2.669291338582677165354330708661417322834645669291338582677165354330 70866+
```

Sum #7:

S = ((SUM(N = 1, N -> Inf, e^(-n*n/100))/5+0.1)^2

The main program is very simple, no need to call DEC2FRC, and the user-defined function is trivial, too

```
10 DESTROY ALL @ STD @ S=0 @ FOR N=1 TO 50
20 S=S+FNF(N) @ NEXT N @ S=(S/5+.1)^2
30 DISP "S = ";S @ END
40 DEF FNF(X)=EXP(-X*X/100)
```

Unpon running it, we get

```
>RUN

   S = 3.14159265357
```

which makes us wonder if the exact sum would indeed be Pi. But lo and behold, *it isn't Pi* but another transcendental number which nevertheless *agrees with Pi to 428 decimal places* !! As my 13-year old daughter Laura put it: *"It looks like Pi, it smells like Pi, it tastes like Pi, but it isn't Pi"*

```
Exact value of the sum =

094330572703657595919530921861 17381+
```

Sum 8:

S = SUM(N = 1, N -> Inf, INT(N*e^(Pi*Sqrt(163/9)))/ 5^N)

Again, an extremely simple main program and straightforward user-defined function:

```
10 DESTROY ALL @ STD @ S=0 @ FOR N=1 TO 18
20 S=S+FNF(N)/5^N @ NEXT N
30 DISP "S = ";S @ END
40 DEF FNF(X)=INT(X*EXP(PI*SQRT(163/9)))
```

Upon running it, we get:

```
>RUN

    S =  200100
```

and, as you may suspect by now, this neat integer value is too good to be true and it's only an *approximation* to the exact value of the infinite sum which is *transcendental*. However, there's no typing both values for you to see the difference, *because 200100 agrees with the exact sum to at least 500,000,000,000 (half a billion) decimal digits* !!!!

So it's doubtful you could use your arbitrary precision math package to empirically test this claim. Now, having such a simple sum return a result which *differs from an integer by less than 10^500000000000* is simply mind-boggling !

The Prizes

Everyone who posted their solutions and estimates did extremely well, with special mentions to Arnaud Amiel (who coded some of the functions in Saturn assembly language and later tried multiprecision), Jean-François Garnier (who not only got all solutions Ok but coded special double precision programs to compute results to double accuracy), Werner (who got all results Ok, plus gave some math insight as to why some of them couldn't be exact), Chris (who kept trying once and again till he got the answers), and PeterP (who did his best with his trusty 41C).

All of you, either explicitly mentioned above or not, will receive by e-mail whatever PDF articles you want me to send you, please contact me either via this web site (clicking on my name at the beginning of each post of mine) or else via my e-mail address which you can find at my web page. Please send a valid e-mail address plus a list of the articles you do want, and I'll send them to you at once.

Thanks to all of you posters and lurkers for your interest, and

Best regards from V.

Valentin,

Although I didn't participate, I am once again blown away by this "humble challenge" of yours, and left absolutely breathless (stunned, even) by the mathematical elegance of the results.

Valentin wrote:

> Quote:

> ...there's a deep mathematical reason for these unexpected evaluations, these weird counting functions can be treated analitically, and sums #6, #7, and #8 also have a suitable and easily understandable explanation, only this is not the place to explain it in detail, of course.

I'd love to learn the mathematical reasoning you allude to. If not here, could you at least point me toward a reference that explains this numerical sorcery?

Chris

Re: S&SMC #13: My Solutions & Comments [LONG]

in response to message #41 by Valentin Albillo

Valentin,

Thanks again for your wonderful challenge - seems my 41 did much better than me, getting all the results right yet my intuition being wrong... (about both which ones are accurate and what precision you would want the fractions to be. Was quite happy with my Dec2Frac program though, fast and using a similar method as yours)

Same as Chris I'd love to learn more about the analytical/mathematical way of handling those sums you alluded to in your post.

As for your articles, - I'd love to read your two Sudoku solvers, maybe I can find a way to translate them to the 41. Also the Fantastic Four would be great - still working on the last couple of SSMC's, one of which is the high precision arithmetic package for the 41, as well as the Mean Matrices, as this is something I often have to tackle at work. Would love to learn your insights here. If you'd be so kind and email it to me (click on my name), that'll be wonderful.

As usually you have inspired me (and us I'd say) a lot over the last few days. So my next question should be no surprise to you:

When is the next SSMC coming?

Cheers

Peter

dumbed down

*Message #1 Posted by **e. young** on 29 Jan 2006, 1:57 p.m.*

If RPN is less common in engineering schools these days, is this a reflection of the dumbing down of society? Or maybe they now need, and are required to use a computer for everything. I find both to be sad if true.

Re: dumbed down

*Message #2 Posted by **Howard Owen** on 29 Jan 2006, 2:22 p.m.,*
in response to message #1 by e. young

I think the absence of RPN in general reflects two things. First and foremost, it's a result of the failure of HP in the calculator market. Fewer HP calculators means fewer RPN units in circulation. Second, it's a result of market research in the 1980s showing that RPN was a barrier to calculator sales. I don't know of any such studies specifically, but I infer their existence from two facts. First, that HP became more of a "market driven" as opposed to "engineering driven" company, and second, that they started to introduce algebraic models in the 1980s, gradually phasing out the RPN models. This may reflect the "dumbing down" of society, or it may just reflect the "dumbing down" of HP.

Of course, HP is *still* shipping an RPN calculator, and two models sporting the even more esoteric RPL operating and programming model. So their market research today must show there is a continuing, albeit small, market for smarty-pants calculators. Maybe their marketing department isn't so dumb after all?

Regards,
Howard

RPN v. AOS in '80s HP calcs ("dumbed down")?

*Message #3 Posted by **Karl Schneider** on 29 Jan 2006, 3:09 p.m.,*
in response to message #2 by Howard Owen

Howard posted,

There did seem to be a revised product-design philosophy introduced with the Pioneer series in 1988. All mainstream calculator models preceding them -- even the business models -- were RPN-based. After the non-mainstream HP-71B, HP-75, and HP-28C were introduced, the extensive set of original Pioneer models can be categorized as follows:

```
                    Scientific      Business
```

```
Low-end             20S, 21S        10B

Mid-grade           22S, 32S        14B

High-end            27S, 42S        17B
```

Only the 32S and 42S were RPN-based; all others were AOS-based. Clearly, RPN was now being reserved for only "up-scale" scientific calculators, which had the highest model numbers. AOS-based scientifics had lower model numbers, and business calcs had the lowest model numbers.

RPN capability was restored to business models (by consumer demand?) with the introduction of the HP-17BII. The convenient (but non-RPN) equation editor from the HP-22S was ported to its "classmate" HP-32SII in 1991, making it the undisputed leader of the mid-grades. There was undeniably a "rhyme and reason" to the product design and positioning in that era.

NOTES:

- "low-end" models have 7-segment displays
- "mid-grade" models have low-resolution 1-line dot-matrix displays
- "high-end" models have high-resolution 2-line dot-matrix displays and IR tramsitters

As for "dumbing down", I did notice a decline in the quality of printing and verbiage in the Pioneer-series manuals, as opposed to the manuals for the Voyager series, HP-41, and HP-71B.

Re: dumbed down

*Message #4 Posted by **Palmer O. Hanson, Jr.** on 29 Jan 2006, 11:38 p.m.,*
in response to message #2 by Howard Owen

In 1990 TI made a conscious business decision to pursue the student calculator market with graphing calculators. At the same time they stopped making the TI-74 which used BASIC and the TI-95 which used A.O.S. They mechanized what they dubbed the Equation Operating System (E.O.S.) with the graphing calculators. Educators liked it. I like E.O.S. because although it is a somewhat lower order methodology than BASIC or FORTRAN it is clearly a higher order methodology than A.O.S. or RPN. Some background follows:

As an undergraduate student in aeronautical engineering in the late 1940's I was exposed to the pencil-and-paper equivalent of today's spread sheets. What we did was take manometer measurements at various points of the surface of an airfoil, enter the measurements in the left hand column of a large piece of paper and proceed to process the data by moving to the right as we processed the data by a sequence of mathematical operations listed across the top of the page. We used slide rules for multiplication and division, log-log slide rules if raising to a power was required, and pencil-and-paper for addition and subtraction. One summer one of my friends worked as an intern at one of the large aircaft manufacturing firms. When he returned he told us that they had acres of junior engineers and technicians doing the same thing only they used log tables and mechanical calculators for increased precision. Don't try to tell me that the computerized spread sheet technology isn't a good thing.

After a tour in the Navy I returned to graduate school and took a computer programming course which used a Rem-Rand 1103 which filled a whole building. We programmed in machine language. I left graduate school and worked as a field engineer in inertial navigation systems for seven years. We had miniaturized drum machines for airborne use. We programmed in machine language and did scaling in ones and zeroes. In the late 1960's I moved in-house and took a course in BASIC which allowed me to use

the company computer network and took a course in FORTRAN which allowed me to use a large number-crunching company computer. No more messing around with ones and zeroes, or with octal and hexadecimal representations of machine language commands. I could enter equations just as I wrote them and didn't have to do my own scaling. With apologies to the memory of Martin Luther King, Jr. I found that I was "FREE AT LAST, FREE AT LAST, Thank God in Heaven, I was FREE AT LAST!"

A few years later someone tried to tell me that I needed to get an HP-25 and learn to use it. I looked at the methodology and said "Good God, it's back to machine language! Why would I want to do that?"

My personal experience

*Message #5 Posted by **Artur - Brasil** on 30 Jan 2006, 6:48 a.m.,*
in response to message #4 by Palmer O. Hanson, Jr.

Well, I'm talking from Brazil, where things happen different way. The vast majority of our public secondary schools don't have computers and, where I could see they have these machines, the teachers are not interested or prepared to use them.

About my life with calculators, I've started with one very simple 4 operations, used to help me with those long chemical calculations.

Since them I've been upgrading, but I have the luck to see a cousin of my friend using one HP41. Man, I was impressed with the power of that machine! He told me about cassettes, card readers, printers - a dream machine! So, I spent almost my mother's salary to buy my first HP: HP-11C. I was starting in University, and it took to me less than 4 hours to make my first finite integral program.

Well, the rest of my time I've studying, I used one HP calculator. For me, RPN logic was almost natural, I don't know why. For my coleagues, usally afraid of HP calculators just because the RPN logic, just 15 to 30 minutes and they were proficient HP users.

I must agree with makority posts in this thread: the problem was the HP marketing, or the lack of it.

Also, removing models like 15C and not keeping the HP42S line was two great mistakes. Not I don't like the 48/49 series, but because the portability and quality of those machines.

About using calculators at University, I have to say that there was nothing I couldn't do with HP calculators. When 48 series arrived, so, really nothing! Even litteral calculus!

This bring to me a problem - let's take the Algebra course. I was always interested in the mechanic of things. After that, I implemented a program and, well, the problems were transformed in just typing numbers in the calculator - thanks to my devoted HP 15C or 48GX.

Now, I assume that it would be important to take more care about the principles, the math basis, the theorems around each problem. Even today, a decade after, I'm always interested in making programs and relegate to a second plane the mathematic basis.

When I discovered this gold mine called HPMuseum Forum and was prompted for some ardue mathematics problems proposed on the "challenges", I could see the brilliant brains working on both hands: the mathematics basis and the applied solution unsing 15C, 41C or other machines!

I believe that my choices were wrong: I am actually a programmer (calculator programmer ;>), not a proficient one, neither a mathematician, probably worst than the programmer.

Best ragards and forgive the grammar mistakes...

Artur

Timely observation

*Message #6 Posted by **John Noble** on 29 Jan 2006, 2:56 p.m.,*
in response to message #1 by e. young

Not ten minutes ago my wife and I were talking about this very subject. She is a middle school teacher and something of a math geek and I am sort of a jack-of-all-trades engineer/programmer.

I see some of the same problems with technical professionals my own age (I'm 38) as my wife does with her students: intellectual laziness, coupled with a lack of intimacy with (in this case) numbers. "Math" as taught these days is largely data entry into a TI CAS screen, with the natural effect is that the student/victims never develop that essential intimacy with numbers required to know, at a glance, the answers to most problems within an order of magnitide or less *before* doing any actual calculations.

I know, I know: every generation carps like this about the generations that come after. Caeser tells us in his *Commentaries* that the Gallic Druids frowned on *writing* -- in part because they felt it was in intellectual crutch!

Still, I think anyone who can't function with what was available to the guys who ran the Manhattan Project (slipsticks, tables, pencils, paper) is nearly defenseless against the GIGO principle.

Bah, sorry about the mutilated grammar above. The editing operation was successful, but the patient did not survive.

One thing that just occurred to me is that RPN is very similar to working through problems on paper ... which no one does anymore, hence the unpopularity of RPN.

I know there are a lot of people who would agree with this assessment, and I am not naive enough to believe that it never happens. However, I have been observing in middle school math classrooms for the past two years (and student teaching currently) and my experience is that kids are allowed to use calculators only after they have demonstrated a mastery of the underlying mathematical procedures. That has been true in every math class I have observed, and this includes schools in both rich and poor communities.

Let's not be so quick to write-off the kids and their teachers.

If your observations are true, then you are working in an elightened school district. I hope they continue to actually teach concepts rather than procedures.

> Quote:

Far from it! As I mentioned, my wife is a teacher: BA in Human Development, MA in Special Education, and a growing list of credentials. I'm very proud of her and what she does, but she agrees with my assessment of public education as practiced here in sunny Southern California. It's not like she's in some benighted backwater, either: her school has been frequently presented as an educational technology leader by people like Bill Gates and newspapers like the Wall Street Journal.

As far as I can see, calculators/computers have *no* place in mathematics education, to limit to this one area. One needs nothing more than pencil, paper, a willing mind, and a good teacher to do everything from 2+2 to orbital mechanics. *After* someone has a good grounding in math ... well, computing devices are a godsend.

Good luck with your teaching career -- it really takes a special kind of tenacity and concern for children to be a success in today's school system.

Thanks John. I appreciate your feedback.

I don't know how enlightened the school system here in Louisville is. I have been lucky to have observed in the classrooms of some very sharp math teachers. I know all of them can't be that good. They probably pair us student-teachers up with the cream of the crop so we don't get so discouraged that we quit before we have even started!

I worked in the computer field for 28 years, and based upon how I have seen computers used in the schools so far, I tend to agree with you. I have not seen them used very effectively at all by the students. Some middle schools here even issue laptops (Apple iMacs) to each student, but 99% of the teachers do not even use them in their lessons, the kids just use them to play.

Regarding calculators in the classroom, I don't know. I can see them being of value in high school algebra, where a kid can do a graph of y=3x and see how it appears, then change it to y=.5x and see how the graph changes. But I agree, a kid would have to understand graphs and equations before being allowed to use them that way. I think they could help learning, but they could become a crutch too.

Ah, the challenges of education!

My son is in the accelerated 5th grade math program at his school, and is not allowed to use a calculator, even though they are throwing some pretty tedious numbers at him. Having known nothing else, however, he whips through them with pencil and paper pretty handily. I was going to approach his teacher about when he can start using a calculator to spare him the drudgery of taking 12.369 into 3.587 longhand, but after reading this thread, I'll hold my horses. When that time does come, I'll send an HP rpn machine with him (maybe even a vintage one), and see what kind of reaction that evokes from his classmates. My son's favorite machine is my old 29C, but I DOUBT I'll be sending that to school with him...
Best regards, Hal

*Message #12 Posted by **Howard Owen** on 29 Jan 2006, 3:40 p.m.,*
in response to message #6 by John Noble

Feynman's talks about Los Alamos contain a lot of grist for that mill. His one-sided competition with Hans Bethe over who could get an answer the fastest, Feynman with a Marchant calculator or Bethe in his head. Bethe won about 6 in 7 of these contests. He did it by knowing his logarithms, and by recognizing proportions and relations between various numeric values. Feynman got pretty good at doing the same thing, as he relates later in his talk about a contest with an abacus salseman.

The second point that relates to John's post was the use of IBM machines to do large-scale computations at Los Alamos. Feynman was in charge of a group that took IBM machines that did discrete operations , such as addition, mechanically with punch cards, and ganged them together in an assembly line to do big problems very rapidly. It was a fascinating precursor to the digital computer. But the relevant bit is how Feynman got the job. The fellow who had the brainstorm of using the IBM machines fell victim to what Feynman called "the computer disease." This is probably well known to many on this list. I certainly recognize it. This fellow started designing clever programs to do things with his new "computer," like calculating tables of arctangents. He came up with very clever ways to do this after a lot of intense effort. Unfortunately, they already had completely fine tables of arctangents! He got lost in theoretically fascinating but completely useless activity, and neglected the problems he was supposed to try to solve with the machines.

So those certainly are cautionary tales for today's students. But they aren't the whole story. Doing number crunching on machines actually can free up your mind for higher level reasoning about mathematics, as long as you have obtained an appreciation for what the original meaning of the word "computation" was. Knowing the numeric shortcuts can help you reason about problems in applied math, as well, as it helped Bethe and Feynman think about Physics. But being able to get exact or approximate numeric results very quickly, or revealing symbolic transformations of a complicated expression must also be hugely helpful to that sort of effort too. (I don't do this sort of thing myself, but I watched the impact that Mathematica had on the Physics Department at UCSB where I ran the computing facilities. When Mathematica was released, the theoretical physicists burst into lyrical flights of praise for the software, and I was busy for weeks getting it on all their workstations.)

So computers obviously have great power to advance or retard learning, depending on how they are

applied. Let's not throw the analytical baby out with the computational bathwater!

Regards,
Howard

Well, Bethe was a genius on several levels (his *How a Supernova Explodes* is an amazing piece of science writing), as was Feynman (*Surely You're Joking, Mr. Feynman*, etc. are wonderful). I had Feynman in mind when I made my original post, so I'm pleased you brought him up.

> Quote:
>
> The second point that relates to John's post was the use of IBM machines to do large-scale computations at Los Alamos. ...

I purposely ignored the use of computers at Los Alamos since the real issue is that the computers didn't do any calculations that Oppenheimer & Co. couldn't do backwards & forwards while standing on their heads in their sleep.

> Quote:

Spreadsheets were the original "killer app" for the personal computer, but I wonder if the net effect is positive or not after watching people fiddle them all day. There have been reports that over half of all "siginificant" spreadsheets used in business (i.e. they are used to justify financing or support significant business decisions) have "material" errors in them. I've witnessed a few instances of this, and I can't help but think their authors would be better off with a cocktail napkin and a pencil.

Not a chance: I write software for a living and have been fascinated with computing devices ever since my uncle let me play Moon Lander on his shiny new HP-97.

Thanks for the thoughtful response!

I'm reading "Classic Feynman" which is a new edition by Ralph Leighton combining *Surely You're Joking, Mr. Feynman!* and *What do You Care What Other People Think?*. Most of the stories are transcribed from taped interviews Leighton did with Feynman in the 1980s. But the classic *Los Alamos From Below* is from a talk Feynman gave at UCSB (where I used to work, alas more than ten years later) on the occasion of the 30th anniversary of the Los Alamos bomb. That talk is included with the book on a CD at the back of the volume, and it's a wonderful thing. Both the story of Bethe's facility with mental calculation and the tale of what may be the first "geek tragedy" of the modern era come from that talk. There is also *The Value of Science* in which Feynman propounds his idea that freedom of thought requires "a satisfactory philosophy of ignorance." Looking around now at those who are forcing their beliefs down others throats, some even resorting to murder and torture, all in the name of certainty, I can only add a reverent *amen* to that!

> Quote:
>
> Thanks for the thoughtful response!

You're welcome. Feynman is my hero. I'm only too glad to write about him! 8)

I glanced at this in the bookstore the other day and dismissed it as a reissue of books I already have, which appears to be only partially true. Thanks for the tip!

To the original poster: sorry to have hijacked your thread. I'll desist now. :-)

I have relatives who are math teachers and they comment on how things are being dumbed down in educating students. When I was in school in the '80's, we couldn't have a calculator in math class. Only in physics and chemisty class. I know that some will say, "well that's because they didn't have graphing calculators back then". Well I'm glad they didn't have them because you were forced to do it the hard way. A lot of things may be tedious to do by hand, but they are also an excellent way to learn, and they also develop the muscle that resides between your ears. The automation should come later when you are a competent professional in you field.

I didn't get turned on to HP calculators in college through HP marketing, but by word of mouth. It seems there are fewer mouths spreading the word now. If calculators with RPN are less popular in college now, I question if it is just because HP does a bad job marketing or if it is because there is an over-reliance on software solutions at the college level. It is not my goal to say that software should not be used in college, and that it is always inappropriate. No, not at all. It has a definite place and usefulness. But before you use it you should be able to do things by hand. You have to learn how to walk before you can run.

Being able to handle numbers with a pencil, paper, and calculator is a valuable skill. RPN is just better for this purpose than aos. One day, you might have to go into the field and do some calculating on the spot. I have. If you don't have a laptop, and can only solve problems using software, you are in trouble. Being able to solve a problem by hand, or at least being able to come up with a reasonable approximation by hand should be a pre=requisite for using software. Also, if you are weak in performing calcs by hand, how can you check your output?

My apologies for my spelling errors.

Batteries for HP 12C

*Message #1 Posted by **Peter McKee** on 29 Jan 2006, 12:06 p.m.*

Does anyone know the battery part number and equivalents for a HP12C calculator. Do you know a source of supply?

Re: Batteries for HP 12C

*Message #2 Posted by **Hal** on 29 Jan 2006, 1:09 p.m.,*
in response to message #1 by Peter McKee

I'm using 1.5V 357 watch cells in my 15c and they work just fine. The manual (for the 15c) calls for A76, LR44, or 357 cells. I'm sure all the voyagers use the same batteries.
Best regards, Hal

Re: Batteries for HP 12C

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 29 Jan 2006, 1:27 p.m.,*
in response to message #1 by Peter McKee

Hi;

newer HP12C and all HP12C Platinum use a single 3V or 3.3V button type cell. You can see which is yours by removing the battery cover.

My newer HP12C and 12C Platinum use a Panasonic CR2032.

About suppliers, I guess that you can find them easily, wherever you are. Any electronic components supplier should have these for sale.

Cheers.

Luiz (Brazil)

Re: Batteries for HP 12C

*Message #4 Posted by **Dave Shaffer** on 29 Jan 2006, 7:39 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

The battery model numbers are given by the previous posters. These types of batteries are used in watches - so check the watch counter at your local favorite drug store, Target, Sears, Wallyworld, Radio Shack, etc.

Re: Batteries for HP 12C

How to alphabetically sort an alpha XM-file (HP-41)

*Message #1 Posted by **Geir Isene** on 29 Jan 2006, 8:15 a.m.*

What is the best, most efficient way of alphabetically sorting an ascii exended memory file on the HP-41?

Re: How to alphabetically sort an alpha XM-file (HP-41)

*Message #2 Posted by **Raymond Del Tondo** on 29 Jan 2006, 10:40 a.m.,*
in response to message #1 by Geir Isene

Have you tried the SORTFL function of the CCD module?

Re: How to alphabetically sort an alpha XM-file (HP-41)

*Message #3 Posted by **Geir Isene** on 29 Jan 2006, 10:53 a.m.,*
in response to message #2 by Raymond Del Tondo

Good tip. Don't have the CCD (waiting for it). I would however need a routine that doesn't use functions outside a standard HP-41CX (to make my upcomming PDA program usable for most people).

Re: How to alphabetically sort an alpha XM-file (HP-41)

*Message #4 Posted by **Geir Isene** on 30 Jan 2006, 1:54 a.m.,*
in response to message #2 by Raymond Del Tondo

It seems the SORTFL function only sort data registers in XM.

Re: How to alphabetically sort an alpha XM-file (HP-41)

*Message #5 Posted by **Ángel Martin** on 30 Jan 2006, 7:11 a.m.,*
in response to message #4 by Geir Isene

That's right, SORTFL can only deal w/ data files (or matrix files if you've changed its file type previously). ASCII files are trickier in that each record can have multiple "registers" (7-words each), thus the file type change trick won't work in this case.

No substitute to plain old RPN programming in this case, or so it looks.

Best,

ÁM

Re: How to alphabetically sort an alpha XM-file (HP-41)

*Message #6 Posted by **Geir Isene** on 30 Jan 2006, 7:36 a.m.,*
in response to message #5 by Ángel Martin

Excuse my ignorance: Matrix files, what's that?

Re: How to alphabetically sort an alpha XM-file (HP-41)

*Message #7 Posted by **Valentin Albillo** on 30 Jan 2006, 8:20 a.m.,*
in response to message #6 by Geir Isene

Geir Isene posted: *"Excuse my ignorance: Matrix files, what's that? "*

> They're files created by the Advantage ROM, which can directly create and use matrices stored in extended memory. This way you use no numeric registers at all to store matrices, greatly simplifying most matricial programs.
>
> In some cases your program can run even using no numeric registers at all (and no 'synthetic' registers M,N, etc., either), this is, even with SIZE 000. See my 62-line, SIZE 000 **Nth-degree Polynomial Fit** program featured in my Datafile article Long Live the Advantage ROM !

Best regards from V.

in response to message #1 by Geir Isene

Here we go (sorts only ascii files with records of max 24 characters - that's all I need for the "HP-41: The Reminder"-program):

```
001 *LBL "FLSORT"
002  LBL 01
003  0
004  SEEKPT
005  SF 25
006  GETREC
007  SF 05
008  FC? 25
009  GTO 03
010  SF 25
011  LBL 02
012  ASTO 05
013  GETREC
014  FC? 25
015  GTO 03
016  5
017  ENTER
018  ASTO X
019  X>NN?
020  GTO 02
021  CF 05
022  DELREC
023  RCLPT
024  1
025  -
026  SEEKPT
027  INSREC
028  1
029  +
030  SEEKPT
031  GTO 02
032  LBL 03
033  FC?C 05
034  GTO 01
035  CLA
036  CLST
037  SEEKPT
038  END
```

*Message #5 Posted by **Johnny** on 7 Feb 2006, 5:56 a.m.,*
in response to message #4 by Hugh Evans

Try DRUPAL. I hear it's a great CMS.

Re: [OT]OpenRPN.org hacked, AGAIN

*Message #6 Posted by **bill platt** on 8 Feb 2006, 10:24 a.m.,*
in response to message #1 by .

Maybe I'm just ignorant, but isn't the server supposed to be read-only to the outside world, with the exception of forum posts?

How can it be possible to "hack" a server like this?

Re: [OT]OpenRPN.org hacked, AGAIN

*Message #7 Posted by **Marcus von Cube, Germany** on 8 Feb 2006, 10:54 a.m.,*
in response to message #6 by bill platt

I'm not a specialist in this but I've read something about hacking of database applications on the web.

One possible problem is dynamic SQL: Normally, your posts are enclosed in some SQL statements to put them in to a database:

```
insert into mytable( poster, text ) values( '<poster>', '<text>' )
```

The values in angle brackets come directly from the input form. Now consider a poster named "badguy" enters something like this in the text field:

```
' );
update sometable( colum1, column2 ) values( 'bad value1', 'bad value2
```

Now lets combine the two:

```
insert into mytable( poster, text ) values( 'badguy', '' );
update sometable( colum1, column2 ) values( 'bad value1', 'bad value2' )
```

One can imagine that evil things can be done if the exact database structure is known (as is the case for many such systems.)

Marcus

Preferred TI calculator???

*Message #1 Posted by **Namir** on 28 Jan 2006, 3:15 p.m.*

Ok, so we are HP-calculator nuts! I have two questions regarding TI calculators?

1. Which vintage TI calcultor did you use/own besides your HP beauty and what did you use that TI beast for?

2. Which graphics TI calculator do you use now and what tasks do you use it for?

Happy Programming!

Namir

Re: Preferred TI calculator???

*Message #2 Posted by **philippe** on 28 Jan 2006, 3:26 p.m.,*
in response to message #1 by Namir

Well.....

TI 58 TI 58C TI 59

By the way, who knows how to repair the card reader of the TI 59 I know this is not the correct place here, but I take the opportunity....

Re: Preferred TI calculator???

*Message #3 Posted by **Gene** on 28 Jan 2006, 3:37 p.m.,*
in response to message #2 by philippe

I was actually a TI user until the HP41c was announced.

TI: More memories (TI59 - 100, HP67/97 - 26?) and more program steps (960 vs. 224), which really DID allow for more complicated problems to be programmed at times in the TI machines...and they were so much cheaper for a poor student!

But, programming in AOS was really painful.

Then the HP41c was announced and I was transfixed. Alpha on a calculator! Redefined keys! Forgot TI even made calculators! :-)

The TI's I used until then were: SR-16II (my first), SR-51A, SR-52 (bought second hand for $70 in 1978), TI-58C.

Graphing TI model? Forget it. Have a TI-84plus in case my son has to use that specific model in HS math classes, but otherwise...

Re: Preferred TI calculator???

*Message #4 Posted by **Vassilis Prevelakis** on 28 Jan 2006, 4:16 p.m.,*
in response to message #3 by Gene

```
Gene wrote:
> TI: More memories (TI59 - 100, HP67/97 - 26?) and more program steps (960 vs. 224)
```

not "and". Unlike the HP-67/97 where you had 224 steps AND 26 registers, the TI-58/59 had a movable partition (like the HP-41) so you could change the split between program and registers. The default config was 480 steps and 100 registers, so with 30 registers you had 720 steps which *is* more than the 224 steps on the HP67/97, but the comparison is deceptive as the HP67/97 had more merged instructions (e.g. GTO A would take one step on the HP-67/97 but two steps on the TI-58/59.

All in all I'd say that the TIs could support programs twice as long as the HPs, which was a real advantage.

```
> and they were so much cheaper for a poor student!
```

Indeed, but they were of significantly lower quality. The keyboard in particular was horrible.

```
> But, programming in AOS was really painful.
```

Absolutely!

Though, you forgot to mention the printer (PC-100C). While the HP-97 beats the TI-59 + PC-100C hands down for quality, elegance, usability and looks, the TI approach allowed you to move up to a printing calculator when you could afford to do so while retaining the portability of a handheld calculator. With the HP-67/97 you need to have both of them (at a cost of more than $1000, serious money even nowadays).

For some strange reason, the PC-100C was a quality product. It was well built, solid, and was FAST! Boy was it fast! It had a row of thermal dots so it could print an entire line of dots at one time without moving the head (the paper moved against the print head).

Compared to the PC-100C, printing on an HP-97 gives you the impression that the 97 is doing you a favour :-)

Re: Preferred TI calculator???

*Message #5 Posted by **Gene** on 28 Jan 2006, 6:28 p.m.,*
in response to message #4 by Vassilis Prevelakis

good points...quite true!

Re: Preferred TI calculator???

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 28 Jan 2006, 9:44 p.m.,*
in response to message #5 by Gene

My experience is that the PC-100A was a higher quality product than the PC-100C. The PC-100A was also quieter. To see the ultimate in what could be done with the TI-59/PC-100 combination go to Viktor Toth's site at www.rskey.org/, click on "The Library, click on "Texas Instruments", click on "PPC Notes" and click on "Volume 8 Number 2".

Re: Preferred TI calculator???

*Message #7 Posted by **Geir Isene** on 28 Jan 2006, 3:56 p.m.,*
in response to message #1 by Namir

1. My first calculator: TI-57. Then I borrowed a TI-59 from a friend (with a PC-100C printer). I used the 57 to learn to program and the 59 to perfect it. I used the 59 to create self-modifying/program generating code.

2. None. I was grabbed by the HP-craze after my TI affair :)

Re: Preferred TI calculator???

*Message #8 Posted by **John Noble** on 28 Jan 2006, 4:27 p.m.,*
in response to message #1 by Namir

The best TI calculators:

A) My wife's TI-92+, after it sells on eBay.

B) Any of them at 9.789 m/s^2. As you can see from the equation, the resulting improvement varies as the square of 's'.

Re: Preferred TI calculator???

*Message #9 Posted by **Howard Owen** on 28 Jan 2006, 5:28 p.m.,*
in response to message #1 by Namir

Going back to school in my early twenties, I used a succession of TI-30s and TI-35s for ordinary scientific calculations. They would break, and I'd buy another one - completely disposable. I wanted a TI-59 because one or two other students I knew had them. But before I could get enough money together out of tutoring wages, I saw the 41C in the bookstore. The alpha capability, and the expansion just floored me. I saved a while longer than I might have otherwise and bought the 41, then a couple of memory modules, then a quad memory module, then a card reader. That machine was stolen from me as I slept on the lawn after class one afternoon. (Laziness was ever my downfall) So I saved and bought a 41CV. Any thought of a TI calculator was banished by the 41.

I recently bought a TI-59 + PC-100C printer. The 59 lacks a battery pack or battery cover, or I might play with it more. I also bought a TI-92+ to see what the last generation's top-of-the-line was like. I intend to play with them both some more. However I still have lots of projects lined up on HP machines, so it may be a while until I get around to it.

Regards,
Howard

Re: Preferred TI calculator???

*Message #10 Posted by **Karl Schneider** on 28 Jan 2006, 6:42 p.m.,*
in response to message #1 by Namir

I received a TI-30 (original LED version) for Christmas 1978 (I think) and was quite delighted. I had been intrigued by some Casio models at the time, and had seen expensive HP models before, but the TI met my needs perfectly.

Unfortunately, it had a 9V rechargeable NiCd battery that quickly lost its ability to hold a charge. One had to plug the calc into a nearby wall socket to use it. I started using disposable 9V batteries, until one of those went dead in electronics class in 1980-81. I hooked up the calc to a regulated DC power supply at 9.0 V, but might

have done so backwards, as the display broke up and died.

The TI was replaced in Fall 1981 by a Casio fx-3600P (I hadn't the chutzpah to ask for a US$300+ HP-41C!), which I used until I bought an HP-15C in Fall 1983.

I bought a cheap TI-36X as a disposable for "old times' sake" in 2002 (or so), then got into HP collecting that year.

I'm intrigued by the TI-89, which seems to be an easier-to-use product with better firmware than the HP-49 series. Several of my younger colleages have TI-89's. However, I haven't yet committed to get one.

Re: Preferred TI calculator???

*Message #11 Posted by **Garth Wilson** on 28 Jan 2006, 7:34 p.m.,*
in response to message #1 by Namir

I don't have any experience with any TI's newer than the 59, but I got an awful lot of good use from first the 58c and then the 59 before I had the HP-41cx. I also had the printer and used its alphanumeric capability a lot. I had four modules (the most valuable being the electrical engineering one), and a bunch of applications books, and a pile of users' group publications. My biggest program needed about 1500 bytes, so it would prompt for the appropriate cards if you'd call a part that wasn't in the memory at the time. That would of course mean overwriting another part; so if you needed that again before you were done, it would call for the other cards again. The major weaknesses of the 59 that immediately come to mind were the batteries' lasting less than four hours per charge, the memory's forgetting everything when you turn it off, only being able to hold one program at a time (unless multiple programs were planned around each other so they didn't require the same memory space and labels), only being able to hold one module at a time, the modules' only being able to hold user code, and the resulting slowness. There was no alpha capability without the printer, and the keyboard was cheap, and there were a lot of other less-major weaknesses; but the one thing that really drove me to the HP-41 was the fact that the TI had no I/O that could be interfaced to anything else. Still, the owner of the ti95.com website had the gall to say the TI-59 is the best calculator in the world. Go figure.

Re: Preferred TI calculator???

*Message #12 Posted by **Palmer O. Hanson, Jr** on 28 Jan 2006, 10:22 p.m.,*
in response to message #11 by Garth Wilson

The TI-59 was clearly the most powerful hand-held calculator during the three years from it's introduction in June 1977 until the introduction of the HP-41 in early 1980. It had more user memory than the HP-67, it had the Solid State Software modules which offered a wide range of subroutines which could be accessed by user programs, and it had a printer connection.

I didn't purchase an HP-41 when it came out because I couldn't afford it. When the time came that I could afford it the Radio Shack Model 100 had become available. I bought a Model 100 which offered a fourteen digit mantissa versus the ten digit mantissa in the 41, programming in a higher order language (BASIC) as opposed to the lower order language (RPN) in the 41, a built-in RS-232 connection, a built-in modem and a screen which supported graphics years before Casio offered the first graphing calculator.

Currently, I have a working HP-67, HP-28S, HP-41C, HP-41CV and HP-41CX all of which I purchased at thrift stores and garage sales. I got the CX and a fully functional TI-59 for two dollars each at a thrift store where they were being sold in the same bin with TV remote controls!

Using multiple modules with the TI-59

*Message #13 Posted by **Palmer O. Hanson, Jr.** on 30 Jan 2006, 11:41 p.m.,*
in response to message #11 by Garth Wilson

A company known as American Microproducts sold devices which allowed the user to connect multiple Solid State Sofware modules to the TI-59 calculator. I have one where the user manually switches the modules. I sort of remember that they also sold a unit where the user could switch modules under program control but I haven't found the reference.

*Message #15 Posted by **Gerson W. Barbosa** on 29 Jan 2006, 12:27 a.m.,*
in response to message #1 by Namir

1. In 1983 as a Physics sophomore I used a TI-59, not that this was really needed but because I liked it. I remember I used it to evaluate a series for computing Pi I had 'discovered' using Fourier's series... a very very slowly convergent series first described at least two centuries before by a Fourier's countryman as I found out later... Oh, I used to use it at work too, as a military technician. My colleagues were amazed when I measured the diameter of a copper wire, enterered it on the calculator and it immediately displayed the AWG number :-).

The calculator seemed very powerful then, mostly when I remembered just four years earlier I did my calculations with the help of a logarithm table (calculators were just unaffordable then and slide rules didn't provide the accuracy I needed..., I didn't have one either). Too bad thieves broke into the house I lived with work colleagues then while we were at work and took it away... But then I would not have moved towards HP...

2. None. I just cannot get used to algebraic calculators any more. I always make mistakes when I try. I know there are people here who switch easily from one to another. Perhaps I should try harder... My inability to use the Windows calculator once made me (almost successfully) try to replace it:

My (brave) attempt to replace the Windows calculator

Regards,

Gerson.

Re: Preferred TI calculator???

*Message #17 Posted by **Marcus von Cube, Germany** on 29 Jan 2006, 11:49 a.m.,*
in response to message #1 by Namir

I started with TI calculators at school when I was 16. The only caculator I had ever seen before was the HP 35 (see my Memories). HPs were simply unaffordable back then so I went for an SR-51A. At that time my teacher just had an SR-50 while my classmates were still using logarithm tables and slide rules in the math and physics classes.

Still at school, I switched to my very first programmable, an SR-56, giving my SR-51A to my sister. I added the PC-100A printer (the one that could connect to three different calculators, namely the SR 52, the SR 56 and the TI58/59 series.) This combo was seriously tweaked as my programming workbench but nothing is left from that era.

Later at University, when I had just seperated from my girl friend, I had left some spare money originally saved for a vacation for two. I spent it on a TI-59 (kind of revenge: my former girl friend's new lover just had an SR-52!).

The TI-59 was my main computing device in the first few years at university. I wrote some software for it and even made one listing appear in the German computer magazine "Chip". When the HP 41 appeared it was too late: I soon switched to a "Home Computer" (EACA Video Genie, TRS-80 clone) in 1980 or 81. This made my interest in calculators fade and it was the starting point for my current profession - I'm a professional programmer for over 20 years now.

From time to time I picked up some interesting machines just to play around a little: Casio PB-700, TI CC-40, TI-74 Basicalc, TI-95 Procalc, Sharp PC-1261. I still like them all. My first genuine HP was the HP 200lx, my "brain substitute" for several years, until replaced by a Psion netBook.

Some time ago, eBay provided a chance to get back to all my old calculators which had either failed or were sold or given away since long.

Now I own a bunch of HPs (11C, 12C, 15C, 16C, 25(C), 28S, 33S, 35, 41C/V/X, 42S, 45, 48G, 49G+, 97, 200lx, 720), Casios, Sharps, an Epson HX-20, a TRS-80 Model 100, and, of course, many TIs. I still don't really *use* any of these but I love to play around with them, solving more or less complicated problems mentioned in this forum. (Thanks to Valentin and other contributors who have helpd to awaken my mathematical brain which had slept for so long!)

I have the following working TIs in my collection (in numerical order):

```
TI-25 (early LCD)
TI-30 (original red LED)
```

```
TI-30 (original red LED) transplanted in TI-45 case
TI-36 Solar (LCD)
CC-40 with peripherals (Quick-Disk, RS-232, plotter, 80 column printer) and modules
(Pascal, Math)
SR-50 (first scientific LED, no parentheses)
SR-51A (early LED, statistics, still no parentheses)
SR-51 II (2nd generation LED)
SR-52 (first programmable) with PC-100 (the original TI printer & security cradle!)
TI-56 (LCD)
TI-57 (3rd generation LED)
TI-57 II (LCD)
TI-58C
TI-59 with PC-100C and additional statistics module
TI-66 (LCD), made by Toshiba
TI-74 (S & Basicalc) with peripherals (PC-Interface, small printer) and some modules (math,
statistics, finance, Deutsche Bank Leben)
TI-81 (first graphics)
TI-84 Plus
TI-85
TI-86
TI-89
TI-92 Plus
TI-95 Procalc, sharing the peripherals with the TI-74, and some modules (8k RAM, Math,
Statistics)
Voyage 200
CBL & CBR, Calculator Based Ranger and Calculator Based Laboratory  with some probes for
connection to the graphics calculators.
```

Many of the LED machines have such a bad keyboard that I barely use them. The older machines (50, 51, 52, 56) are better then the later models (30/57/58/59).

From the next generation, I like the TI-95, the last keystroke programmable from TI, and the Basic programmables. Playing around with the old peripherals is pure fun.

On the more modern side, I like the TI-92 Plus. This machine is solid like a brick, has a QUERTY keyboard and a huge display. I mainly use its connection to the CBL and/or CBR. The latter are educational devices, not serious lab equipment, but they provide a well designed link between the calculators and the "real world". You can have the CBL collect temperature and lighting data during 24 hours and have the calculator graph the results the next day. CBL can be operated on external power which saves on batteries.

CBL and CBR work well with most of the other graphics machines (except 81, rexstricted on 85). Software is available for free, mostly written in TI user code (sometimes referred to as "TI-BASIC" which it isn't.)

The Voyage 200 has the same operating system as the TI-92 Plus but more memory in a smaller footprint. I don't like the keys which are a little too tiny. While the TI-89 has the same CAS and is even more pocketable, its keyboard layout isn't very well suited to the vast functionality.

From the non-CAS graphics I prefer the 85/86 series for which production and development has sadly stopped, in favour of the less capable 81/82/83/84 line. The latter have only one-letter variable names and a less capable programming model while the former have long variable names and a more complete programming dialect. I like the 85/86 menu system better then both the systems in the simpler series and the CAS machines.

Marcus

> 1. Which vintage TI calcultor did you use/own besides your HP beauty and what did you use that

TI beast for?

2. Which graphics TI calculator do you use now and what tasks do you use it for?

Happy Programming!

Namir

---

1. None. I gave up on older TI's after purchasing an HP-34c in 1980.

2. Non-graphing: My 12 year old son uses a TI-34II periodically to check his pre-algebra homework. His teacher doesn't allow calculators in the classroom. The 34II is a nice machine and I found it on sale at Office Depot for $2.97.

Graphing: I have a TI-83+ Silver Edition that I use from time to time to graph functions, manipulate matrices and calculate statistics.

Regards,

John

My favorite TI is whichever of the many TI36X solar-powered units that I have picked up at a local flea market.

I have written several times about buying them for $6-7 each when buying several of them at once. They are still selling around here for about $19. I go back to that well every now and then for more.

For that price, I can give them away, drop them, travel with them, or loan them out without worry. Just pull the drawer open, pull out another unit, and open the blister pack.

While the key feedback is not great, they are dependable, have plenty of computing power most of the time, and have a hard case. If I need more power, I pull out one of my 48GX's or turn around to the PC.

*Message #20 Posted by **Ron Ross** on 30 Jan 2006, 2:42 p.m.,*
in response to message #1 by Namir

I used a Ti-55 before switching over to an Hp15c. Ti even exchange my old 55 for a newer Ti-55ii, but its keyboard still sucked! I had purchased an Hp15c when the keyboard of the Ti-55 was shot, then heard about the exchange program that Ti had. Until I got my new Ti-55ii, I was thinking about what a dope I was to buy a $100 calculator so quickly. That thought changed when I got my hands on the new Ti-55ii. Yep! Same Ti keyboard, glad I have an Hp, is what went through my head.

A friend of my bought the new Ti-66 and was really happy with it. Years later, I bought a Ti-66 and can see why (of course the Ti-66 was really made by Tosiba).

I have a good representation of the Ti graphics line, basically one of each family. I really have a dislike of the Ti-83/84 line as it is crippled in so many areas (but that is by design as Ti can sell another graphics, when you out grow this model). It does work as a general purpose graphics calculator. Shamefully, Hp followed suite

with the Hp38/39G family as well.

I myself like the Ti-86, simple, yet powerful, with an easy to read screen. The Ti-89 may be far more powerful, but I find its units conversions awkward to use in comparison to the Ti-86, the screen very difficult to read, and its keyboard layout is awful (second shifting the trig functions).

Re: Preferred TI calculator???

*Message #21 Posted by **Palmer O. Hanson, Jr.** on 30 Jan 2006, 11:27 p.m.,*
in response to message #20 by Ron Ross

One of the real problems with the TI-82 and T-83+ is that there are some instances where the devices fail to calculate determinants properly. I have seen two instances where my TI-82 and TI-83+ calculate the determinant of a matrix as zero but my TI-85 calculates the determinant properly.

The first case appeared last year when I was investigating the ability of various machines to find the determinants of sub-Hilbert matrices from order 7 to 10. The TI-83+ and TI-85 gave identical answers for orders 7 through 9. For order 10 the TI-85 gave the answer 2.207089...E-53 where the decimal equivalent of the exact answer obtained from the HP-49G is 2.164179...E-53 . The TI-83+ gave zero. I did not have a TI-82 at the time.

The second case appeared this year when working with the following linear equation problem proposed by Valentin Albillo:

1.3 x1 + 7.2 x2 + 5.7 x3 + 9.4 x4 + 9.0 x5 + 9.2 x6 + 3.5 x7 = 45.3
4.0 x1 + 9.3 x2 + 9.0 x3 + 9.9 x4 + 0.1 x5 + 9.5 x6 + 6.6 x7 = 48.4
4.8 x1 + 9.1 x2 + 7.1 x3 + 4.8 x4 + 9.3 x5 + 3.2 x6 + 6.7 x7 = 45.0
0.7 x1 + 9.3 x2 + 2.9 x3 + 0.2 x4 + 2.4 x5 + 2.4 x6 + 0.7 x7 = 18.6
4.1 x1 + 8.4 x2 + 4.4 x3 + 4.0 x4 + 8.2 x5 + 2.7 x6 + 4.9 x7 = 36.7
0.3 x1 + 7.2 x2 + 0.6 x3 + 3.3 x4 + 9.7 x5 + 3.4 x6 + 0.4 x7 = 24.9
4.3 x1 + 8.2 x2 + 6.6 x3 + 4.3 x4 + 8.3 x5 + 2.9 x6 + 6.1 x7 = 40.7

where the system has the unique solution:

x1 = x2 = x3 = x4 = x5 = x6 = x7 = 1.0

The exact determinant of the matrix is 1E-07. My TI-85 gave 0.990927530944E-07. Both my TI-82 and TI-83+ gave zero. This is not an easy problem. Determinants yielded by some other machines were

```
HP-41 Math Pac  -86.31E-07
HP-28S            0.0703238892937E-07
TI-59             1.024890772918E-07
TI-95             1.002914557528E-07
```

Rodger Rosenbaum modified Valentin's problem by changing A(3,7) from 6.7 to 6.8, changing A(7,7) from 6.1 to 6.0, and changing B(3) from 45.0 to 45.1. The exact determinant of the matrix becomes 798.9713675. The TI-82, TI-83+ and TI-85 calculate the value 798.97136749978 . Determinants from some other machines were

```
HP-41 Math Pac    798.9713752
HP-28S            798.971367542
TI-59             798.9713674893
TI-95             798.971367499
```

Rodger's changes have essentially dumbed-down the problem so that almost any machine can solve for the determinant and get reasonable answers.

If one goes ahead and solves the linear equations using X = INV A * B then the solutions from the TI-82,

the TI-83+ and TI-85 are exactly the same. If one uses the simultaneous equation function of the TI-95 one get a slightly more accurate solution.

The TI-82, TI-83+ and TI-85 all use a fourteen digit mantissa so it is not surprising that the three machines get the same results when they are asked to do the same thing. I can't explain the occasional improper evaluation of a determinant.

Re: Preferred TI calculator???

*Message #22 Posted by **Valentin Albillo** on 31 Jan 2006, 5:39 a.m.,*
in response to message #21 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer wrote:

"Rodger Rosenbaum modified Valentin's problem by changing A(3,7) from 6.7 to 6.8, changing A(7,7) from 6.1 to 6.0, and changing B(3) from 45.0 to 45.1. The exact determinant of the matrix becomes 798.9713675."

> I fail to see how changing the original problem so that you can then get 798.9713675 as the determinant's value with utmost ease has any relevance at all to finding the original determinant's value which is 0.0000001 instead.

"Rodger's changes have essentially dumbed-down the problem so that almost any machine can solve for the determinant and get reasonable answers."

> This sentence is almost surreal. This is not 'dumbing-down' the problem, this is changing it altogether. Now any machine can solve for the determinant and get a "reasonable answer", namely 798.9713675 when the true answer to the actual problem is 0.0000001 !! Must be a joke, isn't it ? You're not serious, right ?

Speaking of jokes, this whole situation strongly reminds me of this well-known joke:

> "A man who has lost his keys in the dark on one side of the street searches for them under a lamppost on the other side. When asked why he is looking over there, he says, "There's better light here."

This man would do well to search for his keys where he lost them, if he's to find them out.

The moral is clear: if your solving methods or machines can't deal with the original problem, you'd do well to change your methods and/or machines, as solving *another* problem simply won't do. You'll never find your keys that way.

Best regards from V.

P.D: By the way, never mind TI's, my SHARP PC-1475 has no problem at all solving the original problem, what with its 20-digit double-precision math. You see, I changed the computing device, not the problem.

Re: Preferred TI calculator???

*Message #23 Posted by **Palmer O. Hanson, Jr.** on 31 Jan 2006, 2:31 p.m.,*
in response to message #22 by Valentin Albillo

Valentin:

I admit that I don't really comprehend where we are going with all of this. I have been following Rodger's lead trusting that I will learn something in the process.

If you go back and review some of the threads covering Rodger's work with your original problem and with modifications to it you will find that his first two modifications only involved changes to single elements of B. Only fourteen digit machines delivered reasonable results. Other machines delivered X elements which were an order of magnitude in error and of the wrong sign. Rodger's third modification involved the changes mentioned to A(3,7), A(7,7) and B(3) previously mentioned. All machines then got excellent results, even my Model 100 operating in single precision mode which then has a mantissa of only six digits.

In answer to Namir's two questions:

1. Which vintage TI calculator did you use/own besides your HP beauty and what did you use that TI beast for?

My first TI was an SR50. I had wanted the HP35 when they first came out, but $395 for a calculator remained too high a price for me for quite a long time. When TI came out with the SR50, I perceived it as a cheaper, but equally capable, alternative to the HP35. I knew before buying it that it was a lesser quality machine than the HP35, but the SR50 was still a huge advancement over my Casio "Minuteman III" 4-function calculator. I waited for the SR50 to drop to $140 in 1975 (March?) before buying one. (I was first made aware of the SR50 when they sold for $170.)

I was pretty pleased with the SR50 for most of Spring quarter. (It was particularly exhilarating to have it for a Fluid Mechanics course I took that term!) Then it developed charging problems. I made it through final exams with it and then sent the SR50 in for warranty repairs. The charging problem reappeared during the summer. (Later I realized it wasn't a charging problem as such but weak contacts between the calculator and the battery pack---just bending the flat spring contacts out a little further generally made the problem go away, at least for a while.)

In August of 1975, I saw an advertisement for an HP25C in Time magazine. I decided right then to buy one. The idea of programmability in a calculator had always fascinated me, but having to type the program in again every time you turned the machine off made no sense to me! (A Physics Professor of mine had one, so I knew about the HP65 and its little magnetic cards, but $800 for a calculator way beyond anything I could imagine buying at the time.)

My HP25C arrived in the middle October of 1975 and I was very content with it for quite a while.

NOTE: currently, the HP Museum site incorrectly lists the introduction of the HP25C as 1976. (I've emailed David Hicks about this issue.)

I will admit I was tempted by the HP29C when it came out, but I managed to resist the urge to upgrade. My HP25C was my "good" calculator and my TI SR50 was my "loaner" calculator. I knew my two calculators were on borrowed time when I encountered the HP41C in graduate school. I held out until the 41CV came out! After becoming addicted to my 41CV, I sold the 25C to a friend. I threw the SR50 in the garbage!

I later sold the HP41CV to help pay for an HP75C. In the spring of 1984, I traded my "HP-IL to Centronics Parallel" adapter for a new HP41CX. (The adapter was of little interest to me after I purchased the HP-IL version of the HP "Thinkjet" printer.)

For a brief period, I had the habit of buying whatever the newest and most expensive HP scientific calculator was and selling my previous one. That practice started with the HP28C and lasted through the HP28S and HP48SX. (I kept the 41CX all along as my "loaner" calculator.) Later I bought the HP48G, HP49G and the HP49G+.

2. Which graphics TI calculator do you use now and what tasks do you use it for?

I use the TI Voyage-200 for just about everything. Of the graphing calculators I still own (including the TI-85, TI-84 Plus SE, HP48SX, HP48G, HP49G and HP49G+), it is the only one I actually use for graphing. I use it routinely for working out solutions to homework problems for my Physics classes.

I bought a TI-84 Plus SE mainly for working with TI's CBL ("Calculator Based Laboratory") data acquisition device, but I haven't had time yet to do anything with the CBL.

I realize that students need to worry about the QWERTY keyboard of the Voyage-200 (and its predecessors the TI-92/92+) because some standardized tests ban anything with a QWERTY keyboard. So the TI-89 is sometimes allowed while the same calculator with a QWERTY keyboard is not. Others just prefer the TI-89 form factor.

For old eyes, I find the TI-89 and TI-89 Titanium hard to use. Calculations aren't so bad, but just try setting the preferences! The text on the preferences screen is so microscopic that I need to take off my glasses to read it! (I'm very nearsighted so taking off my glasses is almost like using a magnifying glass!)

One further thing to note about the TI-89/92/Voyage-200 models is that they finally allow the user to write their own "functions" (as opposed to "programs"). On these TI models a "function" is a user-written program that can be called by other user written programs or used in a calculation. Being able to call my own program from another of my programs is a capability I just took for granted from my HP experience. Finding that I couldn't do that on the TI-85 was a real disappointment at the time I got that calculator.

Gene: Actually, in this case, you are incorrect. :-) The HP25C was introduced on July 1, 1976.

This was covered in the 1976 issues of the PPC Journal. I guarantee that the 1975 issues of the PPC Journal do not mention the HP25c introduction in that year. It was introduced in 1976.

Link to July 1976 PPC front page in PDF format

(Note: I took this page from TOS)

And, Craig Finseth's excellent dump of HP calculator information also lists the date as 1976.

Craig Finseth's HP25c page

So, very much more likely that somehow you've got the year's mixed up.

in response to message #27 by Gene

The HP Journal indicates, along with other information on this site, that the HP 25 was introduced in 1975. The HP-25C was, in fact, introduced in 1976. Perhaps that is where the confusion or foggy memories come to play.

Re: Preferred TI calculator???

*Message #29 Posted by **GE** on 1 Feb 2006, 11:40 a.m.,*
in response to message #24 by Mark A. Ordal

Interesting thread.

A small remark to begin with : the TI85 and all others can call programs from within programs : just type the target program's name and voilà ! it's called.
Now back to the questions :

1. Which vintage TI calculator did you use/own besides your HP beauty and what did you use that TI beast for?

After a wonderful Radofin 2660 that my dad offered to his amazed son "a few" years ago, I got a TI30, the legendary LED one. It served me faithfully through high school, but those machines were not really mandatory at the time. Math teaching rarely involved long strings of calculations, it was more theoretical. During later studies, my parents offered me (again) a TI58C, because of its powerful function set mixed with the constant memory, a must. At that time funding was extremely low and I knew HP only by name. Honestly I was not impressed : machines 4 times more expensive had to offer 4 times more 'things', and obviously it was not the case. I never had quality problems with my TI, maybe because I knew that the price of my beauty was very high from my point of view, so I was taking *real* care (I wonder if some quality problems on TI57/58/59s are not due to bad care - granted some later TI models were low low quality). I was using this machine for school related subjects, and for programmming the usual fan stuff : multiprecision, tricks, prime factors, special functions...

2. Which graphics TI calculator do you use now and what tasks do you use it for?

The TI I use now is a TI83-family member, because when commuting I can't always take good care of my machine, so these are considered expandable. Also, it seems they are quite easy to program, speed is reasonable and the function set is enough for my stuff.
My interets now are number theory things, like finding how to factor (3+7*sqrt(5)), (quickly) calculating the Mascheroni constant, what is the value of the infinite sum of i^p/i! for a given p, what is the curve limiting the domain of (n,p) for which the Comb(n,p) < 10^500, why the continuous fraction representation of the square root of any integer is periodic, ...
For this kind of problems CAS machines are completely unusable, so I need higher end models only for pure calculating power, and actually the game is to use better algorithms instead of brute force. So low-end machines are OK, provided they are easy to program.
As a mater of fact, no current machine fits that bill :
- HP49G+ : uses RPL... yuck
- TI89 : functions can't access global variables !!!
- ClassPad 300 : functions can only be a single mathematical expression (this one is the most wounded of all)
- other graphical machines : no local variables, can't pass parameters
- vintage Basic machines : some could be good, but we got accustomed to big screens. Granted, I like the HP71B and the TI74 which have real functions / procedures. If the 71B had a 4-lines screen, it would be in my pocket all day.

Re: Preferred TI calculator???

*Message #30 Posted by **Marcus von Cube, Germany** on 2 Feb 2006, 2:49 a.m.,*
in response to message #29 by GE

GE,

> Quote:
>
> - TI89 : functions can't access global variables !!!

From a theoretical (information technology) point of view this is a desirable feature! Why? These functions cannot have side effects, the output is completely defined by the input. If you really need side effects, just write a procedure that acts on global variables.

> Quote:

> If the 71B had a 4-lines screen, it would be in my pocket all day.

That would be equally true for the TI-74. As a student I was looking for such a beast and came across the Casio PB-700. Nice screen, reasonable keyboard but way to slooooooooow.

Another very interesting machine is the Casio PB-2000C which is programmable in a C dialect (pre ANSI, no switch/case).

(All links go to Viktor Thot's excellent RSKEY site: http://www.rskey.org).

Marcus

Re: Preferred TI calculator???

*Message #31 Posted by **GE** on 2 Feb 2006, 4:30 a.m.,*
in response to message #30 by Marcus von Cube, Germany

There are many cases when those side effects are desirable.
For example a function :
1. based on a table of coefficients
2. which returns many results
3. which output trace information
4. which is defined based on itself and can be accelerated by storing the result of previous calls
5. very deeply recursively defined, overflowing the built-in subroutine stack
6. which needs some input at some point (yes, this one is weird)
7. not numeric, but handling the user interface (example CreateWindow()...)

By the way, procedures cannot access the caller's local variables either, and there is NO EXCUSE for this.
TI-ish discussion, so OT.

Functions() and Global Variables

*Message #32 Posted by **Marcus von Cube, Germany** on 2 Feb 2006, 8:55 a.m.,*
in response to message #31 by GE

GE,

It's no at all OT, because this is a general programming question.

Just to keep other readers informed what our discussion is all about:

> Functions (as implemented on certain machines) must not have side effects by modifying global variables or states while programs are allowed to do so but cannot return values easily.
>
> I think it is a good idea to restrict functions in this way but GE complains.

GE, let me answer some of your points:

>> There are many cases when those side effects are desirable.
>> For example a function :

>> 1. based on a table of coefficients

Put them in a { list } and pass them as an argument.

>> 2. which returns many results

Return a { list }.

>> 3. which output trace information

I agree, that's a real problem if you cannot write to the environment outside the function.

>> 4. which is defined based on itself and can be accelerated
>> by storing the result of previous calls

You still need a way to initialize such a function. If you just call it with arbitrary parameters, how do you know the current state?

If you really need state inside a function it is better to write a program instead and have it return a value (you can pass a variablename as a string and store the result into it or you can create some global variables in a special directory an modify these.)

>> 5. very deeply recursively defined, overflowing the built-in subroutine stack.

That can probably be better handled by unrolling the recursion into a loop.

>> 6. which needs some input at some point (yes, this one is weird)

You'll need to rewrite it as a program. It's better to collect al input beforehand and pass the values to the function.

>> 7. not numeric, but handling the user interface (example CreateWindow()...)

Again better suited to a program instead of a function.

>> By the way, procedures cannot access the caller's local variables either,
>> and there is NO EXCUSE for this.

There is an excuse! At least for functions which are called from somewhere but are defined elsewhere. How should these functions ever know about local variables defined in the *calling* function or program? I agree partly in that it is very restrictive that even local programs cannot access the local variables of their defining program.

There is a paradigm called "Functional Programming" (Wikipedia) which relies totally on side effect free coding. Everything is treated as a function!

Marcus wrote:

" hat would be equally true for the TI-74. As a student I was looking for such a beast and came

across the Casio PB-700. Nice screen, reasonable keyboard but way to slooooooooow."

> The SHARP models PC-1350, PC-1360, PC-1600, and PC-E500/E500S, among others, all have 4-line, dot-matrix quality graphical displays. And none of them is 'slow', quite on the contrary the SHARP PC-E500 is among the fastest vintage handhelds you can find. It's really fast, some 4 times faster than an HP-71B.
>
> Nevertheless, as I have as many as four or five SHARP PC-1350 models, all acquired *en-masse* in eBay for peanuts from a seller that was clearing some obsoleted surplus military equipment (which used preprogrammed PC-1350 for artillery computations), I use one of them all the time, as an all-use, scratch machine, and it's as comfortable, easy to use, and powerful programming and calculator environment as it gets.
>
> I did enter several very short programs I specifically wrote to compute integrals (Gauss), solve for roots (enhanced Newton) and do matrix inversion, and I can do with it most anything I want or need, very fast, and still got 12 Kb or so for one-shot programs or variables.
>
> And the extreme usefulness and ease of programming afforded by the 4-line screen can't be stressed enough, a real pleasure. Getting back to the 22-char, 1-line display of the HP-71B feels unbearably cramped in comparison.

"Another very interesting machine is the Casio PB-2000C which is programmable in a C dialect (pre ANSI, no switch/case)"

> I do own a Casio PB-2000C. It features a pretty good, standard C language, with filesystem and all, but unfortunately it always runs interpreted instead of compiled, so if you're used to fast, compiled C programs you'll find it slow in comparison. It also accepts plug-in modules, and one of them does provide BASIC language programming so you get the best of both worlds in a single machine.
>
> Matter of fact, I'd rather prefer HP had issued a **C/Assembler ROM** for the HP-71B instead of the actual FORTH/Assembler ROM. After all, there's also a full FORTH-language system in the 41C Translation ROM, so who needs two incompatible, distinct FORTH implementations ? :-)

Best regards from V.

Preferred TI calculator??? "Does not compute", said the mechanized female voice (known only as "computer") from the original 60's Star Trek episodes. j/k :-)

Matt

ps. OK, I'll admit I had a TI30 in middle school in the seventies. Currently have a TI Programmer (also from the 70's), a TI ProCalc95 w/ printer, a TI92, and a TI Voyage200. Anyone interested in any of these (trades for HP's preferred)?

Your preferences between the 10, 41 and pioneers

*Message #1 Posted by **Joe Edwards** on 27 Jan 2006, 3:05 p.m.*

Hey folks, Sorry to be "hogging" the board this week, but you folks are the only resource I really can find regarding the HP calcs. This question isn't so much about the capabilities, per se, of the calcs, but instead about your preferences between the models.

It seems that the 10 (voyager?) and the pioneers series have a strong following. It seems the 41 series does as well. I am curious about why folks would prefer on over the other - not necessarily based on capabilities alone.

This really isn't research, but just information gathering for my personal interest. Thanks.

Re: Your preferences between the 10, 41 and pioneers

*Message #2 Posted by **Garth Wilson** on 27 Jan 2006, 3:51 p.m.,*
in response to message #1 by Joe Edwards

The one thing that made me move from the TI-59 to the HP41cx was the 41's I/O capability. I wanted a hand-held controller. I already had a calculator-- not that the TI-59 was as good a calculator, but it was acceptable for my work.

Re: Your preferences between the 10, 41 and pioneers

*Message #3 Posted by **Namir** on 27 Jan 2006, 4:12 p.m.,*
in response to message #1 by Joe Edwards

The HP41C/CV/CX is my all time favorite. It was the fit HP calculator to use an LCD display AND support alphanumerics. Writing programs that prompt you for input was a major improvement. Continuous memory was also a big plus.

The HP41 has also 4 ports that allowed connecting the calculator to a variety of devices and plugging in all kinds of HP and custom-made modules.

The RPN programming was very good an flexible. The memory was very good at the time it was introduced. I used the HP-41C as a graduate student and in technical testing labs to process statistical data. The HP41 had an adequate number of registers to store my data and allow me to process it in diferent ways.

So there is my 2 cents worth of answer. I still own a few HP41CX that I bought from eBay. My original HP41CX died a few years ago when I spilled coffe on it in my office.

*Message #5 Posted by **Chan Tran (USA)** on 27 Jan 2006, 4:32 p.m.,*
in response to message #4 by Joao

Between the 3, I prefer the 41. Unlike a lot of people here, I don't care for any of the voyager. The Pioneer's are OK, and unlike a lot of people I don't care for the 42s either. The 32SII is kind of interesting but for real use it's not that hot. I do like the 48 series but I am not sure that they are considered Pioneer.

HP-41 vs. HP-11/15/32 as calculator

*Message #6 Posted by **Karl Schneider** on 28 Jan 2006, 3:39 a.m.,*
in response to message #5 by Chan Tran (USA)

Chan Tran posted,

> Quote:
>
> ...I prefer the 41. Unlike a lot of people here, I don't care for any of the voyager...

I know, I know, "To each his own"... But here are several practical sample problems worked out on a 41 and on a Voyager:

Problem 1:

Show that arcsin (- sin (x + pi radians)) = x, if -90 deg <= x <= 90 deg)

1. Enter an angle in degrees
2. Convert it to radians
3. Set to radians mode
4. Add pi
5. Take the sine
6. Change sign of result
7. Set to degree mode
8. Take the arcsine

The result should be exactly (or almost exactly) the original angle within the specified range.

```
HP-41C/V/X:                    HP-10C/11C/15C:

(set degree mode if necessary:)

[XEQ][ALPHA]D E G[ALPHA]       [DEG]

(enter the angular value)

[XEQ][ALPHA]D - R[ALPHA]       [->RAD]
[XEQ][ALPHA]R A D[ALPHA]       [RAD]
[PI]                           [PI]
+                              +
[SIN]                          [SIN]
```

```
[CHS]                          [CHS]
[XEQ][ALPHA]D E G[ALPHA]       [DEG]
[SIN-1]                         [SIN-1]
```

[bracketed] keywords are keyboard functions; shift keys are not shown. Which is quicker and easier?

Problem 2:

A lottery game requires the player to correctly pick six unique numbers from the set 1 to 40 to win the jackpot. What are his chances of doing so?

Answer: 1 in COMBination (40, 6) = 3,838,380.00

```
HP-41C/V/X:                    HP-11C/15C:

40                             40
[ENTER]                        [ENTER]
[ENTER]                        6
6                              [Cy,x]
-
[LASTx]
[XEQ][ALPHA]F A C T[ALPHA]
[x<>y]
[XEQ][ALPHA]F A C T[ALPHA]
*
[x<>y]
[XEQ][ALPHA]F A C T[ALPHA]
[x<>y]
/
```

(Of course, this HP-41 procedure could be quickened by assigning the FACTorial function to a key. Unfortunately, this procedure will not work if any argument to FACT exceeds 69. A more-robust algorithm will require the user to write a program.)

Which would you rather have at your disposal during a one-hour probability/statistics exam?

> Quote:
>
> The 32SII is kind of interesting but for real use it's not that hot.

Hmm? It's got all those built-in mathematical functions the 41 is lacking, and it's six times as fast. Built-in SOLVE, INTEG, algebraic expressions, and fractional-number support, as well. Also, it's got microcoded versions of the 41's Math ROM complex-number functions. This allows the creation of real-world solution programs like **this one**.

Re: Your preferences between the 10, 41 and pioneers

*Message #7 Posted by **Vassilis Prevelakis** on 27 Jan 2006, 5:01 p.m.,*
in response to message #1 by Joe Edwards

I started with a TI-59 (complete with the PC-100C printer). Neat combination, good specs on paper. But then the 59's keyboard started missing keystrokes and then the card reader had problems, so I got rid of it and switched to an HP-41C (early model with the upright keys and all the bugs). I still have it and it works apart from the 1 key that does not click any more. Throughout the 80s and most of the 90s it was my PDA and alarm clock (then I got a cellphone!).

So I can say that I am an HP-41 fan, but I *really* adore the HP-97. This machine is sooooo beautiful, I have one on my desk right next to my keyboard. This machine has it all.

*Message #9 Posted by **Diego Diaz** on 27 Jan 2006, 5:04 p.m.,*
in response to message #1 by Joe Edwards

Well, what can I say, I'm not a good mathematician, but I love engineering, and from a hardware point of view HP-41 is an "open system" more than a calculator.

This feature allows a whole range of developement choices that goes far beyond its calculator abilities (not short indeed).

No other device in its class can cope with that, many surpass it in speed or math functionality though, but its posibilities are only limited by your imagination and ingenuity, and some people here are certainly very "imaginative"... ;-)

Cheers.

Diego.

*Message #10 Posted by **Geir Isene** on 27 Jan 2006, 5:04 p.m.,*
in response to message #1 by Joe Edwards

For the most types of work I do with a calculator: HP-41CX. It is my PDA, my alarm clock, my statistics analyzer, my note-keeper and my programming environment for all sorts of programs from games and role-playing character creation to equation programs.

For work, I use the HP-97. It is my most sturdy calculator. I use it for statistics, business decisions, quick calculations - it has the convenient built-in printer.

For quick business calculations at work, I use the HP-38E.

Not had much interest in the Voyagers or the Pioneers.

Had high interest for the HP-48, but that sort of faded.

Re: Your preferences between the 10, 41 and pioneers

*Message #11 Posted by **Howard Owen** on 27 Jan 2006, 5:06 p.m.,*
in response to message #1 by Joe Edwards

I don't think anyone here will fault you for asking that we give our opinions about vintage HP calculators. We do it all the time without being asked! 8)

As a calculator enthusiast first, and a collector second, my favorite among the three is the HP-41. This is partly because that was the first machine I learned to program on, partly because it was very advanced for its day, containing lots of computer-like features, and partly because continuing interest in the machine means there are lots of options for obtaining *new* hardware to do cool and interesting things. I'm thinking mainly of the MLDL (Machine Language Development Lab) add-ons like Clonix/NovRAM and MLDL2000. These allow the user to load practically any add-on ROM module ever built for the 41C, provided the bits are available. Most old modules are available as compuer files, so we get to enjoy add-ons that used to be rare and expensive, like HEPAX, CCD, AECROM, PPC ROM and others. And we also get to use *new* ROMs built by other enthusiasts with the MLDL add-ons. There's also the fact that 41C machines and peripherals are plentiful on eBay and elsewhere.

The other two models you mention have their virtues too. For programmability, I prefer the HP42S, which was the top of the line Pioneer scientific. It represents the zenith of the RPN keystroke programming model. I've coded a 1500 line program on that machine, and enjoyed (almost) every minute of it. The Voyager series has the best form factor of any calculator ever made, in my opinion. the 11C, 15C and 16C all have special characteristics that appeal to me.

But the HP-41 still wins. It's my sentimental favorite, and it has a vibrant and productive community behind it right now. For me, the combination is hard to beat.

Regards,
Howard

*Message #12 Posted by **Richard Garner** on 27 Jan 2006, 5:11 p.m.,*
in response to message #1 by Joe Edwards

My first HP was a 41CX, then I got a 15C as a backup if something happened to the 41CX during class. The 15C is a very capable device, but it is not as versital as the 41CX. I later got a 42S and really fell for it. The 42S had program compatability with the 41CX and it fit nicely in the shirt pocket. I have sense gotten a 48GX because of the unit conversion, but my faverates are the 42S first and then the 41CX. If HP made a new version of the 42S with more memory, the 48G unit conversions and a PC interface, I would buy at least 3. 1 for home, 1 for office and 1 always in my pocket.

*Message #13 Posted by **e. young** on 27 Jan 2006, 6:06 p.m.,*
in response to message #1 by Joe Edwards

For me, my favorite has been the 32SII (a Pioneer). I haven't needed a lot of power in my calculator like many of the others here. Mostly I am doing lots of chain calcs with relatively simple terms. I really like the equation capability. I have an equation in it that dierectly calculates the area of steel for reinforced concrete-a huge time saver for me. I also like the solver. I was also a fan of the 11C, but I prefer the 32SII because it is faster. My prefered design is the voyager series, I really like the landscape layout.

My ideal calc would be if you combined a voyager and a pioneer. Give me the form factor of the voyager and the functionality of the pioneer and I will buy MANY.

Re: Your preferences between the 10, 41 and pioneers

*Message #14 Posted by **Jim Creybohm** on 27 Jan 2006, 7:10 p.m.,*
in response to message #1 by Joe Edwards

Like many others posting, I have tried all three types of calculators. Me, I prefer the 41 for many of the same reasons cited. The alphanumeric capability was a BIG help when packing many small programs for field calculations. The addition of I/O and external storage didn't hurt either. Adding the Petroleum Pac and for a petroleum engineer you had much joy. I would have liked more built in math functions, but this could be solved using the Math Pac.

The Voyagers never really appealed to me, primarily because I had trouble getting used to the vertical Enter key and I couldn't program the prompts like the 41. But I did like the form factor, and much preferred the display to the robotic 41.

I used the 32 and really enjoyed its speed. I would say that in order of preference mine was the 41, then the 32S and then the 11/15. Since that time I have also started using the 48, and while it is powerful, it also suffers from a convoluted menuing system (locating the percent key for example is a circus) and a poor display (mine is the blue display - I have been told that the black display is much better).

Re: Your preferences between the 10, 41 and pioneers

*Message #15 Posted by **blurdybloop** on 27 Jan 2006, 9:33 p.m.,*
in response to message #1 by Joe Edwards

I'm gonna be an old fart here. In all fairness, "your mileage *will* vary..."

I feel that perfection was achieved in the HP-35.

The HP-35 did everything that I have ever needed out of a calculator. It had an incredibly clean key layout. It had standard mode display, with a 10 digit mantissa even when there was an exponent. It completely replaced a slide rule.

I disliked the HP-45 from the onset. First and foremost, they took away standard display when they added SCI and FIX. Second, too many things were shifts. I notice that today HP-45 commands a much lower price on eBay than HP-35.

The HP-65 is, of course, special because it's programmable.

In the next series they took away two digits from the mantissa. The current models (HP-30S, HP-33S) give you 10 digit mantissas again, but both have cluttered, poorly-designed key layouts and the HP-30S is algebraic (ugh) and the HP-33S has that hideous chevron.

The Voyagers have a nice form factor, but are still cluttered and have the 8 digit mantissa. I haven't really used an HP-15c enough to judge its capabilities fairly, but the HP-16c has proven useful to me when programming.

Re: Your preferences between the 10, 41 and pioneers

*Message #16 Posted by **Don** on 27 Jan 2006, 9:57 p.m.,*
in response to message #15 by blurdybloop

The 41CX. My first HP programmable was the 41C. My HP41cx, as well as 41C sit on my desk and I use them daily. The thing that sets the 41 series apart for me is how they feel in my hands. They just feel so natural. And I learned to program with the 41....it has the card reader on it but no longer use that. The calculator I use most though is the HP10B. The very best financial calculator for the money and I have lots of other HP financial calculators.

Best wishes

Don

Perfection achieved in the HP-35?

You can't be serious!

OK, let's define the objective as a basic, straightforward, non-programmable scientific calculator. Granted, the HP-35 was a revolutionary product and a very impressive first effort. But, where might it fall short of perfection?

- Most keys are too small, even though plenty of space is available on the faceplate.
- Most (early) keys did not contrast very well with the faceplate.
- No radians or gradients angular mode.
- No % or delta-% functions.
- STO disables stack push unnecessarily.
- x^y may be visually intuitive, but not in usage.

We won't even begrudge its power-hungry LED display and lack of continuous memory, because the technology of the time did not permit better. It had only one memory register, but didn't really need more.

> Quote:
>
> I disliked the HP-45 from the onset. First and foremost, they took away standard display when they added SCI and FIX.

What's wrong with those? They use less battery power, and reduce clutter by showing the user only the meaningful digits. It's nice that FIX and SCI were unshifted -- very convenient.

As for "standard display", that was restored in the Pioneer models as the "ALL" display format.

> Quote:
>
> The HP-65 is, of course, special because it's programmable.

But a poor, impractical programming paradigm (which unfortunately got carried over to the HP-10C and HP-12C). The HP-67's was much better; it was carried over to the Spice and the other three Voyager models.

> Quote:
>
> In the next series they took away two digits from the mantissa...

> The Voyagers have a nice form factor, but are still cluttered and have the 8 digit mantissa.

The full mantissa (without exponent and sign) can be viewed on the HP-34C using "MANT" and on Voyyagers using "CLEAR PREFIX".

I think that the Voyager faceplate/keyboards were quite well organized, even if function-packed with two shift keys. But, if simplicity is synonymous with "uncluttered", the 10C's single shift key made for a clean layout. If only it were nonprogrammable, and had a few more functions...

Re: Perfection achieved in the HP-35?

*Message #18 Posted by **Joe Edwards** on 29 Jan 2006, 9:14 a.m.,*
in response to message #17 by Karl Schneider

While I appreciate your love of your machines, I would hate to see this thread turn to a flame-war due to a misunderstanding. Leave that for some of the lesser forums. :)

We are interested in folks reasons for using the calcs, not bashing them due to their choice. Everyone has their own personal preferences. Let's leave them to enjoy those preferred machines.

HP-35 "perfection": Not my intent...

*Message #19 Posted by **Karl Schneider** on 29 Jan 2006, 3:32 p.m.,*
in response to message #18 by Joe Edwards

Joe --

Sorry if the tone was a bit direct, but some assertions were made that called for challenge, IMO. Nobody is being "bashed" -- and "blurdyploop"'s posts have been pretty good, as I remember.

First efforts rarely achieve perfection, as I think almost all of us would agree. HP had valid and practical reasons for changing "x^y" to "y^x"; for adding FIX, SCI, and ENG; for making keys larger and rectangular; and for retaining stack push on STO.

All those changes improved practical usability, inspired by customer experience and input. It was part of the maturation process of the product.

Regards,

*Message #20 Posted by **Les Bell** on 27 Jan 2006, 9:49 p.m.,*
in response to message #1 by Joe Edwards

The alpha display of program steps on the 41C was the killer leap forward. The form factor isn't as pocketable as the voyager series, but the availability of application modules, solutions books, the software library and of

course the peripherals and I/O much more than compensate.

41, all the way!

Best,

--- Les

Re: Your preferences between the 10, 41 and pioneers

*Message #21 Posted by **Karl Schneider** on 28 Jan 2006, 2:12 a.m.,*
in response to message #1 by Joe Edwards

Hello, Joe --

As a fairly-accomplhished collector of what I consider the "golden era" of HP calc's, I have to weigh in...

> Quote:
>
> It seems that the 10 (voyager?) and the pioneers series have a strong following. It seems the 41 series does as well. I am curious about why folks would prefer on over the other - not necessarily based on capabilities alone.

Voyagers:

I have the complete line, at least one of each model: 10C, 11C, 12C, 15C, 16C. The 12C is a financial model, and the 16C is a special-purpose computer-science model. The 15C is the premier advanced scientific model, eclipsing the 10C and 11C.

Pioneers:

The only RPN scientific models are the 32S, 32SII, and 42S. I have one of each. The 42S is the most capable, and can run most 41C/V/X RPN programs. However, the 32S and 32SII are easier to read and use.

41C/V/X:

I have one of each, perferring the older (1979-85) "fullnut" desing for their sharp displays and crisper keys.

COMPARISONS:

The 41's excel in their plug-in expandability, many supported I/O devices, and the most-advanced RPN programmability (shared with the 42S). As pure calculators, though, they can be somewhat cumbersome.

The 15C beats any 41 hands-down as a pure calculator, and cost considerably less, as well. I bought mine new in 1983, after having coveted the unaffordable 41C several years prior. The 15C features four kinds of built-in, easy-to-use advanced functions:

- matrices and linear-system solution
- complex-number mathematics,
- numerical rootfinding
- numerical integration

Every function is on the keyboard -- no spelling or menus -- and the 7-segment display is large, crisp, and legible. The 10C and 11C have the same attributes, but lack the advanced functions, and have diminished

programming capabilities.

The four kinds of advanced functionality were available on the 41C only by installation of plug-in modules.

The 32S and 32SII excel for their user-friendly programmability and Saturn-processor speed (12x that of a 15C; 6x that of a 41C/V/X). Their alphanumeric dot-matrix displays are nearly as legible as the 7-segment display of the Voyagers. The 42S is amazingly capable, but suffers primarily from a poorly-legible display and extensive menuing of functions.

MY VERDICTS:

The 15C is the best-designed pure scientific calculator of the bunch -- the one I'd want to use during an exam that did not require or allow pre-programmed subject-matter application software.

The 32S and 32SII are the ones I'd want at my desk -- as long as a PC with Matlab was available when needed for matrix and complex-number functions.

The 41C/V/X is the best lab or field calculator, to expand with advanced programs that can be securely archived.

No need for excuses, it's our favourite question!

At home I most often use the 12C and the 97. Although I'm an engineer, I nowadays need financial calculations more often than scientific stuff. The 97 is great for its printer, but I admit that it's also a nice and decorative item to have on ones desk.

At work I need complex arithmetics (I'm an EE), but my 15C has become too precious, so I keep a 28C in my desk drawer. I like its alpha display, and appreciate its programming capability for a couple of small programs I can take everywhere. I also keep the IR printer in my drawer, but I only use it for program listings, which means once a year. I consider the 28C keyboard an improvement over the 41, and also much better than the 32/42's keyboards and all that followed.

I find the 41 clumsy, and never felt the need for a full-fledged controller. Even at the time, I found the Casio FX602P superior to the 41.

Oh yes, and my first HP ever was the 16C, which served me well for many years a long time ago, but now rests idle in a special place.

You see how a reply to such a question always turns into a rant...

Andreas

> It's got all those built-in mathematical functions the 41 is lacking, and it's six times as fast.

You just need the Advantage module. I got my 41cx when they were giving that module out free with it. It's my understanding that they called it that because the 41 was losing the advantage with the 12c having the financial functions, the 15c having the complex-number, matrix, root-finding, and other such functions, and the 16c having things like the base conversions, ANDing and ORing, etc.. So for the 41 to gain back the advantage, they put all this in the Advantage module (although admittedly the 41 is still a little more clumsy at handling complex numbers). I've never had a 15c, but I've read that the 41 with the Advantage module can invert a matrix twice as fast as the 15c. I measured it to be about 25 times as fast as my TI-59 could do it, IIRC. To me, the 41 is generally better as a calculator than the 71 (which does better as a computer), but when I want to do complex-number crunching, I reach for the 71.

41 Advantage ROM vs. Voyager models

*Message #24 Posted by **Karl Schneider** on 28 Jan 2006, 9:46 p.m.,*
in response to message #23 by Garth Wilson

Hello, Garth --

> Quote:
>
> You just need the Advantage module. I got my 41cx when they were giving that module out free with it.

I do, in fact, have one Advantage ROM for my 41C, 41CV, and 41CX (all purchased used since 2002). I also have each of the Voyager models, but only the 15C did I buy new from the store, in 1983.

The Advantage ROM is a 12kB chip with some of its routines as microcoded programs (e.g., SOLVE, INTEG, base conversion functions, and most of the matrix functions), but many others are slow RPN keystroke routines. Still, it is the best HP-made ROM for the 41-series, IMO -- a "must have" for the collector.

SOLVE and INTEG are very well-done, and the library of powerful microcoded matrix routines is impressive. However, the user is still burdened with having to remember the names of the extra routines, and to endure the clumsiness of the RPN routines (e.g., the complex-number functions).

No, "added on" in a handheld calculator is not as good as "built in". Much of the added functionality, moreover, represents only a sample or a limited set of what the respective "dedicated" models offer.

The intuitivity and ease of use of the matrix-math and complex-number functionality on the HP-15C just isn't equaled on the HP-41 Advantage ROM -- trust me. This can be very important on collegiate examinations.

BTW, it's interesting that the Advantage ROM was a "throw in" when you bought your 41CX. One of my colleagues has a 41CX and Advantage Pac from his college days in 1988, but I think he paid for the Pac.

Re: Your preferences between the 10, 41 and pioneers

*Message #25 Posted by **Joe Edwards** on 28 Jan 2006, 10:22 a.m.,*
in response to message #1 by Joe Edwards

Wow, I am overwhelmed at the support for the various machines mentioned in this thread. Since posting this thread, I have started to read the Memoirs section of the Museum (interesting stuff). I greatly appreciate all the information and hope to read more.

From '88 to 2003, I owned the 32s (purchased at the University of Texas at Arlington), but never really used it for more than just an RPN calculator. The programming aspect seemed unnecessary during my time in the military. Hence, my 32s acted as a device to balance my checkbook. :(

In 2003, I found this site and was overwhelmed by the variety and history of the HP machines. Since then I have bought and sold several of the models, trying to get a feel for which ones would be the most useful for my return to university (I don't really "need" a graphing). So far my useage has included the following, 32s, 42s, 41cv, 41cx, 11c, 15c, 16c, 20s and my coveted 27s.

While I realize the construction of (eaiser disassembly too) the Voyager series seems more robust and the LCD is very easy to read, I find the layout a bit difficult to use. Maybe this lies with my first calc being the Pioneer model 32s. The 41c models are a special case in that they just have a special "panache" about them. They are harder to use compared to the voyager set, no doubt. The typing in of the functions can get old fast, but it is still a beautiful (if not clunky) machine.

Strangely enough, the 27s has become my "baby". While is is Algebraic, is has a stack and SO MANY FUNCTIONS. And this is where I become confused. The 27s has a SOLVER that lets you input a formula/equation and solve for any variable. Is this any different than the 15c? I have yet to play with the 15c to any extent (just recently giving it a second chance). The 32s SOLVER seems more like the 27s SOLVER.

So, it comes to progammability. How important is it, when compared to the ability of the 27s. I have compared the 15c, the 32s and 27s and it seems that for standard equations, the 27s is the alpha wolf. So where does the strenght of the programming come into play versus just using the SOLVER on the 27s. I have an idea of the differences, but it would be nice to get more details from those who use them. By the way, does anyone here use the 27s?

Thanks.

Joe

Exploiting the 27S Equation editor and SOLVE history

*Message #26 Posted by **Karl Schneider** on 28 Jan 2006, 6:17 p.m.,*
in response to message #25 by Joe Edwards

Joe --

I think that your main question is how to fully exploit the capbilities of the equation editor on the HP-27S and other models. You should get the "HP-27S/19B Technical Applications" book, scanned on the MoHPC CD #1 or DVD. I wish I had a paper copy...

Regarding SOLVE capabilities, here is some history:

The original numerical-iteration SOLVE function was introduced for programmable RPN calculators on the HP-34C in 1979. It requires the user to program a function f(x) as a labeled RPN keystroke routine that takes a value "x" from the stack x-register and leaves f(x) is the output in the x-register. The user provides two first-guesses x_1 and x_2 in the x- and y-registers to SOLVE, wheich then executes the function

repeatedly to obtain the answer.

The SOLVE function was implemented, apparently unmodified, in the HP-15C in 1982, and was adapted with minor changes for the HP-41 Advantage Pac in 1985. The same mathematical algorithms of SOLVE were later adapted with some changes to operating paradigm for the RPN HP-32S, HP-32SII, and HP-42S.

The algebraic HP-17B, HP-17BII, HP-18C, HP-19B, HP-19BII, and HP-27S do not have keystroke programmability. However, these high-end Pioneer-series models do have high-resolution multi-line dot-matrix displays that provide up to six alphanumerically-legended softkey menu items in the bottom row of the display.

SOLVE on these algebraic models is the same: The user must define the function to be solved as an algebraic expression. SOLVE will validate and parse the expression, and provide a convenient means via the menu for the user to initialize the fixed variables and select the variable to be solved. A direct algebraically-derived (instead of numerically iterated) solution will be returned if the calc deems possible.

The algebraic HP-22S has a coarse one-line dot-matrix display that does not support the alphanumeric legends for menus. However, a less-sophisticated expression-entry capability with SOLVE was provided. This was later ported to the HP-32SII, complementing its RPN-keystroke programming capabilities.

SOLVE on the HP-33S has all the capabilities of the HP-32SII, with the addition of the algebraic direct-solution logic.

Some additional info about SOLVE (primarily for RPN models) is available in **my MoHPC article**.

Regards,

Re: Your preferences between the 10, 41 and pioneers

*Message #28 Posted by **bill platt** on 31 Jan 2006, 10:58 a.m.,*
in response to message #25 by Joe Edwards

I have a 27s and I do use it. I like the solver and large memory along with scientific functions. It is great for anything that can be solved with a solvable equation. But I use the voyagers/pioneers mostly, for their keystroke programming which is useful for keyboard shortcuts and programs that streamline repetetive tasks.

I also have a 17bii which is nearly identical in functionality except that it is RPN and missing the scientifics. The one notable difference in operation between the 17bii and the 27s is that in the 27s, there is no "swap" function. This is unfortunate. It means that you have to store, roll down, recall, instead of swapping. Interestingly, the swap on the 17bii works whether it is in "Alg" or RPN. (of course the Alg on the 17bii is not alg--it is simple infix with no precedence) .

The other great thing on both the 17b(ii), the 19b(ii) and the 27s is the "STAT" (27s) also known as "SUM" (17b) which makes the whole process of going through a checking account while not at a comuter so much easier!

Regards,

Bill

Strange problem with Nov32 / Hepax

*Message #1 Posted by **giastar** on 27 Jan 2006, 7:59 a.m.*

I use my Nov-32 with Hepax to store Focal programs, executing them within Hepax. I've been working in this way for several months without problems.

Last night I allowed the batteries to run down (forgot I'd executed "ON"). This morning the batteries were flat. The Hepax contents were all there thanks to the Nov-32. I cleared the HP41 memory to be safe, and started work...

Now the strange bit: The Focal programs in Hepax cannot be directly executed as before. They have not been corrupted: if I COPY to main memory they run as expected. But when I attempt to run a program in Hepax it returns immediately, without any error message but without executing any of the program. BUT, if I GTO that program and press R/S it runs correctly!

It seems to be only the ability to execute Hepax programs directly that has been affected. This applies both to my original programs and a test program I just created and saved to Hepax. Any ideas, before I resort to reprogramming the Nov32 from scratch?

Re: Strange problem with Nov32 / Hepax

*Message #2 Posted by **giastar** on 27 Jan 2006, 10:33 a.m.,*
in response to message #1 by giastar

More info:

I have tried the Nov32 in a different HP41, with the same results, so the problem appears to be corruption of the Nov32 contents.

If I manually execute a program in Hepax memory using GTO xx followed by R/S then programmable key assignments to labels in that program don't work but show an XROM code, e.g. XROM 63,12.

Re: Strange problem with Nov32 / Hepax

*Message #3 Posted by **Diego Diaz** on 27 Jan 2006, 2:19 p.m.,*
in response to message #2 by giastar

Hi,

Certainly, this is a weird behavior. Not so strange due to the fact that the system has been brought to an unpowered state in very irregular way: i.e. leaving the batteries runnig out overnight.

NoV-32 is not designed to face such situation and, although not harmful to the hardware itself, it may well have led NoV-32's RAM contents to a corrupted state.

With this in mind, I'm affraid that your better choice is to erase NoV-32's RAM pages and reload the programs. Sorry for the bad news.

As you're handling FOCAL programs you could move them to main RAM and use a card reader to avoid re-typing.

Please let us know about the results.

Cheers.

Diego.

Re: Strange problem with Nov32 / Hepax

*Message #4 Posted by **giastar** on 27 Jan 2006, 4:10 p.m.,*
in response to message #3 by Diego Diaz

Thanks, Diego. I'll try this later. No time at the moment as I'm working to a deadline, and fortunately the Focal programs I'm using for this job will fit (just!) in main memory.

This is indirectly related to the fact that Nov32 doesn't like the auto-off function of the HP41. So I normally manually execute "ON" to be safe - this time I forgot to switch off and the charger wasn't plugged in either. Ooops.

Is there any way to support auto-off or is this a fundamental limitation of the HP41's expansion bus?

Peter

Re: Strange problem with Nov32 / Hepax

*Message #5 Posted by **Diego Diaz** on 27 Jan 2006, 4:52 p.m.,*
in response to message #4 by giastar

Hi again,

I'll need a while to check my code database, but I think I fixed the auto OFF bug, both for NoVRAM and NoV-32!! At least I'm positive I did for the NoVRAM code, but I may have forgotten updating the NoV-32 code, oops sorry if this was the case...

For the records, this was not a limitation of the 41 I/O interface whatsoever, on the contrary, PWO and SYNC lines perfectly define the HP-41 power state in any case. However, as NoV's are designed to minimize power drain, I leave PIC processor into sleep as soon as PWO goes low, thus, handling the SYNC line to detect Auto OFF, msut be done via interrupt to allow PIC "wake-up".

It took a nice code compression effort to make enough room for the interrupt handling routine that allows such handling. I finally got the time to rethink the power management and write the appropriate line by '05 3rd quarter, while I was dealing with NoV-32 developement.

In any case, you won't need to execute "ON", should your 41 goes to Auto OFF, just unplug NoV-32, plug it again and turn your calc ON. It won't lose a single bit, granted.

Best wishes.

Diego.

Re: Strange problem with Nov32 / Hepax

*Message #6 Posted by **giastar** on 27 Jan 2006, 5:12 p.m.,*
in response to message #5 by Diego Diaz

> I think I fixed the auto OFF bug, both for NoVRAM and NoV-32!!

That's excellent news! This was the only problem I had with the otherwise excellent Nov32. It's made the HP41 much more useable - no need to mess around with card reader etc except for occasional backups.

Unfortunately the unplug/plug/power-on routine didn't work reliably for me, occasionally resulting in a high-current state in the Nov32 which would pull down the supply and corrupt the HP41 memory. That's why I usually execute ON to be safe. (we discussed this by email a few weeks ago: I'm peter at giastar com.) So support of auto-off is very useful.

I'll download the latest Nov32 firmware before continuing with this. Perhaps you could confirm when/whether the auto-off fix is included in the Nov32 firmware - I don't mind waiting for this, my NOV32 is still working fine as a non-volatile memory, I just have to COPY any stuff I'm using to main memory first.

Peter

Howard

Re: Strange problem with Nov32 / Hepax

*Message #8 Posted by **Diego Diaz** on 28 Jan 2006, 6:57 p.m.,*
in response to message #5 by Diego Diaz

Hi,

I've had to dig a bit into my "old versions" directory to find out what happened to the *Auto-OFF bug free* version of "NoV-32-H.asm".

Finally I manage to re-create the "crime scene" :-)

- I wrote the code for NoV-32 based on NoVRAM (obviously), this code was intended to provide enable/disable features at page (4k) level.

- Then I modified the NoVRAM code to fix Auto-OFF bug.

- Modify the NoV-32 code in the same way

- At this point page enable/disable feature revealed unreliable and I rush to correct that.

- I modified NoV-32 again to allow "block" (16K) swapping... but (here it the point) I did it on

the file that wasn't been modified with the code to fix Auto OFF bug... Ouch!!

Please accept my apologise, I'm confident I can rebuild a bug free version for NoV-32 along next week.

Best regards.

Diego.

HP-92 ac charger

*Message #1 Posted by **Don** on 26 Jan 2006, 8:21 p.m.*

Just got an hp-92 as a gift and it doesn't have the ac charger. The battery pack looks nearly new and there is no corosion inside the battery compartment. Any idea where I can get the ac charger or possibly modify a charger? Any suggestions would be appreciated.

Re: HP-92 ac charger

*Message #2 Posted by **Gene Wright** on 26 Jan 2006, 10:03 p.m.,*
in response to message #1 by Don

the HP92 uses the same charger as the HP97, HP91, HP19C, and the HP peripheral printer, cassette drive and HPIL printer.

These are fairly easy to find, since they were used for so many machines.

Best place might be either the classifieds here or on ebay.

Good luck! Gene

Re: HP-92 ac charger

*Message #3 Posted by **Don** on 26 Jan 2006, 11:22 p.m.,*
in response to message #2 by Gene Wright

Thanks Gene & Eric, will try E-Bay and maybe someone in classifieds will see this and respond.

Best wishes

Well, someone bought the poor thing.

It's odd, the case looks like it's been through hell, but the buttons are clean. And he claims it passes the self tests. Tsk.

Re: Bee-yoo-tee-full 10C on eBay

*Message #10 Posted by **Paul Brogger** on 26 Jan 2006, 12:04 p.m.,*
in response to message #9 by Howard Owen

I'm guessing an extended period of exposure to moisture (high humidity perhaps?) or maybe something caustic. It looks like the aluminum faceplate is extensively oxidized, with loss of ~50% of the black background. Someone has tried to fix that with a marker. (I recognize *that* from my own attempt to hide scratches on the face of the first HP-48 I disassembled -- oooops!)

If that is the case (very punny!), it's not surprising that the keytops look relatively unaffected. (What *is* surprising, however, is that it still works -- if indeed lots of moisture is the culprit.)

What is the newest HP 49g+ model

*Message #1 Posted by **Joe Edwards** on 25 Jan 2006, 10:25 p.m.*

As per the subject, what is the most current iteration of this HP 49g+ calculator? I looked at a couple of units, but I couldn't find any identifying marks. Serial number? Packaging?

How does the HP 48GII compare? The serial port seems to be rather archaic compared to the 49g+'s USB port. The 48GII looks better, but that isn't really important. :)

Thanks in advance.

Joe Edwards

Re: What is the newest HP 49g+ model

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 25 Jan 2006, 11:06 p.m.,*
in response to message #1 by Joe Edwards

Hi, Joe;

I own one of each, and my HP49G+ seems to be from the the first lote or close to it. After uploading the newer, 2.0 OS version, it seems to me it is more stable, more reliable. It used to miss keys frequently, I don't remember having this happening enough times to bother me after the upgrade.

About the HP49G+, what I actually take as big advantages over the HP48GII are:

1 - memory space - more than 1MBytes available, expandable through SD card; the HP48GII reduces the user RAM to about 80KBytes;
2 - upgradable OS;
3 - larger LCD - the HP49G has extra lines (don't recall how many), enough to show 7 stack levels (medium font size) against 5 in the HP48GII.

As you mentioned, the HP49G+ has USB connection against RS232 in the HP48II. If you are using old computers, they all have RS232 and you should add extra hardware plus drivers to add connectivity support for the HP49G+, while it is easier to the HP48GII. Interesting: both share the same connector, meaning you can use ones cable in the other. Not necessary to mention that it does not mean one connecting through the other door...

I also agree with the look.

Others will surely add their impressions.

Cheers.

Luiz (Brazil)

Thank you for some light on this subject. What is the best way to determine the 'generation' of an HP49G+ from the outside (prior to buying) ?

Re: What is the newest HP 49g+ model

*Message #4 Posted by **Joe Edwards** on 26 Jan 2006, 9:39 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

I also appreciate the detailed information, but I'm still at a loss as to determine which interation of the 49g+ is which from the outside blister pack. Thanks.

Joe

*Message #5 Posted by **Tim Wessman** on 26 Jan 2006, 9:48 a.m.,*
in response to message #4 by Joe Edwards

The latest models have a silver sticker on the back with a serial number. Anything without the sticker will be from older stock.

in response to message #1 by Joe Edwards

Quote:

> The serial port seems to be rather archaic compared to the 49g+'s USB port.

In my opinion, other than the *marginally* better looks, the serial port is the only thing the 48GII has going for it.

in response to message #8 by Wayne Brown

I guess I should ask this question to clarify my confusion. The the serial/usb connections on the 48GII and 49g+ hardware specific to the calculator or is the only difference the cable? Also, is it correct that the 49GII isn't firmware upgradeable? Thanks.

Joe

Re: What is the newest HP 49g+ model

*Message #10 Posted by **Gene Wright** on 26 Jan 2006, 10:50 p.m.,*
in response to message #9 by Joe Edwards

1) Different port connectors - so the internals of the calculator are different.

2) The serial port hp48gII is not firmware upgradable.

Thanks for the update, Gene. I am bit confused behind HP's decision to design a (large calc) practical twin of the 49g+ without an upgradeable firmware. If they could foresee a need to upgrade the 49g+, how did they expect to fix the same problems on the 48GII, other than by just fixing the firmware with the next version. Doesn't make any sense.

Re: What is the newest HP 49g+ model

*Message #12 Posted by **Ron Ross** on 27 Jan 2006, 8:58 a.m.,*
in response to message #11 by Joe Edwards

I hate to second guess Hp, but I am going to blame Marketing.

The Hp48Gx was extremely popular and there was still a demand for an RS-232 port. Hence Hp marketing decided that they could still sell such a machine, only problem, Hp didn't still make one. No problem, can the Hp49G+ platform do this while not robbing sales of their great new wonderful high end platform? Why YES! YES, it can!

Now that Hp was going to market such a machine, and yet not rob sales from the 49G+, Hp

marketing, then decided they had to reduce features (never mind that the original intent was to offer an Hp48GX replacement).

If you have any experience with large corporation decisions you can certainly imagine how it went from there.

The final calculator has a crippled RS-232 that can't drive any RS-232 devices, but only hook up to a Pc RS-232 port (heck, that aint any better than the USB aside from an easier transfer routine). The RAM was also reduced to 80K(probably should have been 256K or 512K fixed). Since the ROM isn't flash upgradable, it can't keep current with any software improvements either (such as the new eqw library which is now missing from this 48g line). None of these really cost any more than the existing line, just decisions to avoid overlapping or robbing sales from the Hp49G+. In the end, you end up with another Pink elephant on the shelf.

I end my rant. I am also only speculating on this, it is probably worse.

Re: What is the newest HP 49g+ model

*Message #13 Posted by **Joe Edwards** on 27 Jan 2006, 2:22 p.m.,*
in response to message #12 by Ron Ross

You know I could accept the lesser memory, the serial port (even though I don't see a use since it only hooks to a PC port), and the smaller screen, but the lack of a flashable firmware seems like it would just cost HP money in the long run as folks will just avoid the 48GII and buy the upgradeable 49G+. I don't see the cost savings, but I am not a market "expert". :)

Re: What is the newest HP 49g+ model

*Message #14 Posted by **Ron Ross** on 27 Jan 2006, 3:06 p.m.,*
in response to message #13 by Joe Edwards

That non feature has already cost Hp million$$$ and some extra egg on their faces, though maybe none of you noticed. Bo)

The first Hp48Gii's had Rom 1.22 installed. This contained a major battery Drain bug that resulted in a supposed total recall. Owners of the Hp49G+ simply upgraded their ROM to 1.23 and THAT problem went away.

Re: What is the newest HP 49g+ model

*Message #15 Posted by **Guest** on 28 Jan 2006, 8:39 p.m.,*
in response to message #8 by Wayne Brown

Since it doesn't seem absolutely clear, the communication ports on the 48gii and the 49g+ are the same. Only the cables are different. A 48gii can connect to a pc with a usb cable from an mp3 player.

Re: What is the newest HP 49g+ model

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 28 Jan 2006, 10:58 p.m.,*
in response to message #15 by Guest

Hey, Guest;

I'm confused: I was curious enough to test the HP48GII cable in the HP49G+ and opposedly, and I did

so (should not mention that, though...). I did not succeed connecting them to the computer with the changed cables (and ports...). Using the corresponding cable, both worked perfecty fine in the same computer running the same connectivity software. One thing I actually did not get, though: based on what you mention in your post, should both the HP48GII and HP49G+ communication ports support either USB or RS232 signals and protocol? I am not aware of that.

In time: both the newer HP39G and the HP49G+ share both the same cable and USB hardware/protocol; is there a chance that you confused?

Cheers.

HP 45 Charger

*Message #1 Posted by **Neil J Strickland** on 25 Jan 2006, 10:06 p.m.*

I recently purchased a HP45 with a charger made for the US. I have a charger for the HP67 made for Australia. It says "INPUT: 172 to 254V AC, 50HZ, 5Watts - OUTPUT: 50MA, 4.2V, 4V, 150MA". Does anybody know whether I can safely use this with the HP 45 or am I likely to fry it? Thanks

Re: HP 45 Charger

*Message #2 Posted by **Hal** on 25 Jan 2006, 11:32 p.m.,*
in response to message #1 by Neil J Strickland

Hi Neil,

Both of those machines (67 and 45) use the same battery pack. The chargers should be interchangable. If your Aussie charger will fit the receptacle on the 45, this is further assurance of compatability. However, just to be sure, please wait for confirmation from another one of the fine individuals who posts regularly on this forum, which I'm sure will be forthcoming.
Best regards, Hal

Re: 49g+ DROP Error ([originally] humor) ; retrieved from Archive 15

*Message #1 Posted by **Ed Look** on 25 Jan 2006, 11:34 a.m.*

A bit of good news about my HP48G!

In this thread I just fished out of the archive bin, I had posted that after dropping it on its upper left corner, while still in its soft gray nylon case, on the floor, I had a blank line across the display in the third stack level position. To remedy it, I used a simple kluge: a thick rubber band across the top of the calculator where the logo is.

However, after a couple of months of rubber banding it, I removed it just a few days ago and the display is restored and appears to be staying that way. Of course, this is after some normal use and making sure the 48G does not impact anywhere anymore. I now carry it in a 49G+ case, which appears to be more protecting. Even so, I will be more cautious with it while not in use (or even in use!).

Probably, the rubber band forced the case and LCD module to be in their proper relative positions and the normal daily vibrations due to use and transporting (in my briefcase, generally) caused them to settle in these positions while being held so. I hope it remains this way!

82162A Printer contrast

*Message #1 Posted by **Tom F** on 25 Jan 2006, 9:58 a.m.*

I have an 82143A and 82162A printer. The 82162 printer functions OK but the print quality is not the same as my 82143 printer. The 82143 printer prints very nicely on fresh Office Max thermal paper with very dark printing in the DARK setting. The printing starts to 'bleed out' a bit at that setting so it is too dark and I usually print at about setting 3. The 82162 printer prints much lighter. When set to the highest setting, the print intensity of the 82162 is more equivalent to the #1 setting ,or less, of the 82143 printer. The physical condition of the 82162 is excellent and mechanically operates quite well with no unusual noises. Also, there is not a great deal of difference between any of the settings for intensity on the 82162. In fact, it appears to be the same intensity on settings 1, 3, and 5. It is ever so slightly lighter on settings 2 and 4 which also appear to be about the same between the two. One more thing to note is that the rightmost character position is lighter than the rest.

Is there anything to be done about print intensity of the 82162?

Can I (should I) swap the print head or mechanism form the 82143 into the other as I prefer to use the IL version? Is that terribly difficult/risky?

I searched through the archives and found some info suggesting that the platen backing up the paper might be able to be adjusted to increase the print density of the outermost characters and I was curious if this could be a fix here? I looked at that and it appears to float nicely behind the printhead much like it does on the 82143 but that is all I have to compare to I don't know if it should have more pressure. Does anyone know of any electronic reasons for this difference? Are there any adjustments to the circuitry possible? All the pixels are present and of equal intensity. I haven’t taken anything apart yet to look furhter. I was looking for some sage advice first.

Thanks, Tom

Re: 82162A Printer contrast

*Message #2 Posted by **David Smith** on 25 Jan 2006, 10:37 a.m.,*
in response to message #1 by Tom F

Thre were two types of print mechanisms used in these printers. One type had the timing wheel on the left, the other on the right. The motherboards were different. If both your printers are the same type, you should be able to swap them, but most 163's were one type and 143's the other.

Re: 82162A Printer contrast

*Message #3 Posted by **Eric Smith** on 25 Jan 2006, 12:48 p.m.,*
in response to message #2 by David Smith

Are you certain that there are some 82162A units with the 82143A print mechanism? I didn't think there were any, because part of the reason for the mechanism change was that it was necessary for the improved graphics capability (reduced line spacing) of the 82162A.

*Message #4 Posted by **David Smith** on 26 Jan 2006, 12:10 p.m.,*
in response to message #3 by Eric Smith

I dont know for sire if there are any 163's with 143 printers, but I do know there are 143's with 163 printers.

Re: 82162A Printer contrast

*Message #5 Posted by **Tony Duell** on 26 Jan 2006, 6:13 a.m.,*
in response to message #1 by Tom F

The print intensity control switches resistors in a potential divider circuit that's part of the feedback loop in the printhead power supply.

If it doesn't work properly, you might try removing the PCB and cleaning the contacts, and then getting 'my' schematic either from the Australian Site or on the HPCC CD-ROM, and checking the switch, the connections to RP4, the resistors inside RP4, and so on. Make sure the printhead voltage (VHead on the diagram) increases as you go to higher intensity settings.

Re: 82162A Printer contrast

*Message #6 Posted by **Tom F** on 26 Jan 2006, 10:26 a.m.,*
in response to message #5 by Tony Duell

I was able to look at the sevice manual for the 143 and have deduced from the trouble shooting guides and schematic for that printer that the problem is most likely the print head power supply, assuming the switch and resistors are functioning properly. Of course, this is based on the electronics of the 143. As you have mentioned, VH should be measured to determine for sure. The voltage listed in the 143 manual is a range from 13V to 18V. Assuming the power portion of the schematic between the two are similar, I should be able to measure. However, I do not know exactly where to measure VH on the 162. I have a couple of ideas I'll look into tonight. I did disassemble the 162 and inspected the contacts. They appeared in good condition but I cleaned them anyway with no effect. The question I have now is; If the Print Head Power Supply is the problem, is there a suitable replacement to be found and could the PS from the 143 be used?

Also, can you point me to the Australian site you mention? And is the schematic availible there? OR is it only availible on the CD. I appologize that I am not familiar with all of the choice sites yet as I have just recently revived my interest in HP41 things.

Thank you very much for your help.

Tom

Re: 82162A Printer contrast

*Message #7 Posted by **Tony Duell** on 27 Jan 2006, 6:28 a.m.,*
in response to message #6 by Tom F

I'm not sure if I can mention the URL for the Australian Site here, but to get it, just change the .org in this site to .net .

And yes, there's a reverse-engineered schematic of the 82162 there, along with stuff for a lot of other larger machines.

From what I remember, the power circuitry of the 82162 and 82143 is very similar. The 82162 is more complicated because it has the ability to be turned on/off over the HPIL loop, but once you get past the

power switching, the power converters, etc are much the same.

Re: 82162A Printer contrast

*Message #8 Posted by **Tom F** on 27 Jan 2006, 8:10 a.m.,*
in response to message #7 by Tony Duell

Thanks. I had found the site and your schematics last night as I searched the internet. I find it interesting that the site is not on the Links page for this site.

I measured the VH voltage and it comes up a bit short at 12.8V on settings 1,3, and 5. and right around 12.2V or so on settings 2, and 4. All of which are below the minimum stated in the service manual for the 143 at a range of 13V to 18V. What I am unsure of now is if this is a power supply problem or a problem with the control circuitry feeding into it. Namely, is it being told to be the voltage it is providing, or is it being told to control to the correct V and is unable to comply. I still need to track down the intensity control resistors and check them if possible. I guess I should have paid more attention to my EE for nonbeliever's class while I was getting my ME degree many years ago.

Re: 82162A Printer contrast

*Message #9 Posted by **Vassilis Prevelakis** on 27 Jan 2006, 4:50 p.m.,*
in response to message #8 by Tom F

silly question probably, but it has to be asked

You are using a good batery, right? check the voltage level of the batery during printing to see how low it gets when load is applied to it.

**vp

Re: 82162A Printer contrast

*Message #10 Posted by **Tom F** on 27 Jan 2006, 6:17 p.m.,*
in response to message #9 by Vassilis Prevelakis

That is a reasonable question. Sometimes it's easy to overlook the obvious. I have a newly built battery that I put together for the 143 that I have been using. With the brand new cells, the battery voltage runs just over 5 volts. I should note that there is no difference in the symptoms if the charger is plugged in or not. I also used the same roll of paper in both. Having two printers really helps to trouble shoot that problem. Like I mantioned before, I wish my electronic skills were a bit better. Right now I hope to characterize the thing as best I can and try to determine the best path forward. So far the info I've gotten here has been helpful but I was hoping someone else has had a similar problem as mine that I could build from. I'll post more findings when I complete more measurments.

Re: 82162A Printer contrast

*Message #11 Posted by **David Smith** on 26 Jan 2006, 12:11 p.m.,*
in response to message #1 by Tom F

One thing you might try is removing the print head and gently cleaning it with alcohol.

HP9825 lights and drive wheels

*Message #1 Posted by **Eugene Royer (USA)** on 24 Jan 2006, 9:21 p.m.*

Previously, I have contacted Etienne Victoria with thanks for a method of refurbishing the drive wheel of the tape recorder. Where I work we have a number of HP 9825's and most have the sticky wheel problem. His method is good but with the addition of a Dremel routing table to hold the drill and glueing the sandpaper to a square piece of wood, the necessary sizing can be accomplished. Material to shape can be pressure cones (slip joint washers) for toilet tank water supplies or electrical grommets with almost any size preselected. I used a 932 dremel grinding stone to hold the slip joint (Danco STK no 38805B or 38808B), since the 9825B cleaned wheel was very close to 3/8 of an inch of the stone. A finely divided metal ruler and patience (don't try to rush) in shaping does the job. I don't have a web site yet to post linking pictures (but am willing to send JPGs of what I did, but give me an indication of the resolution you would like). The final dimensions (in inches) are: ID = 0.375 OD = 0.410 and width 0.150. Dremel has other dimensions of stones or a larger one could be dressed down to hold the proper ID. I thought I would have mine well tested by now, but I noticed no light in the tape transport. To make a long story short, I discovered that not all 9825's have a visible light. This one had an infrared diode (part number F5D1) which I thought was an incandescent bulb (with part number F501) when I emailed Etienne Victoria. So be careful, not all nonvisible lights are burnt out. I also found out my digital camera can take a picture of the active diode and shows up pink in the picture. I have not tried yet (discovery was today Jan. 24, 2006) to detect the IR in an assembled 9825. Oh, the 9825Bs with the diode also have an 82 ohm resistor connecting it to the +5 volt supply thereby limiting the current to about 45 milliamps. Tony Duell may want to show this on his schematics if it not sown there already. I have ordered them but they have not yet arrived. If anyone has replaced an incandescent bulb I would be interested to know if the hole size is different than the F5D1 (T0-48 package) made by Fairchild. I also have taken many pictures during the disassembly process.

Eugene Royer

32SII Not Responding to any key strokes

*Message #1 Posted by **Paul Gilles** on 24 Jan 2006, 1:57 p.m.*

Help! I recently bought a 32SII which only displays EQN LIST TOP no matter what you do. I have tried all the reset techniques in the manual, shorted out the battery contacts, left the batteries out for 2 days. When any key or combination is depressed, the ! shows up at the bottom of the display until the key is released, and the display returns to EQN LIST TOP. I think its time for surgery. How do you open up a 32SII? Thanks. prg

Re: 32SII Not Responding to any key strokes

*Message #2 Posted by **jeff** on 24 Jan 2006, 2:08 p.m.,*
in response to message #1 by Paul Gilles

It might be the keyboard contacts, try lightly squeezing the front and back together just below the display and using the keyboard at the same time. carefull not to squeeze too much or it could dent the bezel.

Re: 32SII Not Responding to any key strokes

*Message #3 Posted by **Jeff O.** on 25 Jan 2006, 12:54 p.m.,*
in response to message #1 by Paul Gilles

Info on opening the 32SII (and all pioneers) can be found here and here. It sounds like you have a problem in the keyboard itself. Access and repair to this part of the calculator is not for the faint of heart. That said, I believe that Paul Brogger (author of the two linked articles) has had success with such repairs.
Good luck!

ENTER key on HP 33S

*Message #1 Posted by **e. young** on 24 Jan 2006, 12:26 p.m.*

I think HP has revised the 33s again and is now getting away from using an "ENTER" key. I just bought a backup 33s and it has an "ENTFR" key. That's right, ENTFR. Serial number CNA 524xxx. Quality control appears to be an on-going struggle, but at least the key responds no matter how off-center I hit the key. The typo isn't too big of a deal, since I certainly do not appreciate the 33s for its looks but for its function. Oh well. Bought it at Wal Mart, and there were still lots of older CNA 4xxx units on the shelf with the old bad display.

If it wasn't for this forum, I would never have known that HP had fixed the display on the newer 33S's, and I would have written it and HP off forever after getting my first 33s with the bad display and bad keyboard.

Thank you HP Forum!

Re: ENTER key on HP 33S

*Message #2 Posted by **Namir** on 24 Jan 2006, 1:58 p.m.,*
in response to message #1 by e. young

I have an HP33s wth SN CNA527xxx and the ENTER key **is spelled correclty**. Care to post an image of your HP33s?

*Message #5 Posted by **Stephen Easterling** on 24 Jan 2006, 3:17 p.m.,*
in response to message #1 by e. young

I wonder if this will suddenly make it more of a collector's item!

Re: ENTER key on HP 33S

*Message #6 Posted by **Namir** on 24 Jan 2006, 8:04 p.m.,*
in response to message #5 by Stephen Easterling

I'd really like to see a picture. I do have my doubts about the typo.

Re: ENTER key on HP 33S

*Message #7 Posted by **e. young** on 25 Jan 2006, 8:56 a.m.,*
in response to message #6 by Namir

I assure you that it is spelled ENTFR on my calculator. I'm at work and really can't take a picture and download it because I keep this calculator at home. Please take my word for it that the lower horizontal leg of the E is not present and the result is ENTFR. The word is not blurred or off-center on the key. The other letters look fine.

Re: ENTER key on HP 33S

*Message #8 Posted by **Namir** on 25 Jan 2006, 10:25 a.m.,*
in response to message #7 by e. young

I am asking you to confirm it visually, so I can look for that typo when I visit WAL-Mart and other stores that carry newer versios of the HP-33s.

What you have in your possession sounds like a spcific batch with a typo-error key, since many of the newer HP-33s have ENTER spelled correctly. Kinpo has corrected the dislay to make the decimal more visible.

Namir

Re: ENTER key on HP 33S

*Message #9 Posted by **Jan** on 25 Jan 2006, 7:59 a.m.,*
in response to message #1 by e. young

This is yet another sad example showing that the good old days in personal electronic equipment may be gone and that, in denial of their tradition, HP makes no exception in this respect. The scale and severeness of the problems with the 33S as I got to know them from this forum is truly unprecedented in the history of HP calcs. Although the role of the handheld calculator may be different than, let's say, 20 years ago, this may not be an excuse to bring products on the market that are simply mediocre and sometimes even bad. HP are you listening! I even wonder if the new corporate "philosophy" of HP supports the manufactoring of professional products at all as they did in the old days. Being the true heirs of the old company that Bill Hewlett and Dave Packard founded, maybe Agilent could find itself a market for calculators for the professional. After all, these profs know who and what is behind the brandname Agilent and what this company stands for. They don't need a well known name from a once great company to make up their minds about which product to buy as long as the product is excellent, so from the marketing point of view I see no objections, just benefits.

Re: ENTER key on HP 33S

*Message #10 Posted by **e. young** on 25 Jan 2006, 9:11 a.m.,*
in response to message #9 by Jan

The quality of current HP calc's is no match for the "old days" to be sure. I also think the cosmetics of the 33s are seriously flawed, and the fact that the 33s was released for sale with a horrible display and keyboard is outrageous. However, now that the display and keyboards have been fixed, I am satisfied with the functionality of the 33s. I still don't like the cosmetics though. In its current form (with the fixes) it is an acceptable calculator. Since it's based on the 32sII it almost has to be. I'm not saying that it's perfect by

any means, but I think the quality problems it had with the initial models have poisoned many people against, understandably so. Once I accepted that the HP that we knew and loved is gone for good I was able to appreciate the fixed 33s for the qualities that it does have. It is still the only programable RPN scientific on the market. Hopefully HP will address some of the continuing shortcommings in a latter version.

If you need a basic RPN scientific with some programming capability, and don't want to pay over $150 for something for an old 32sII on ebay, then I recommend the 33S. Just make sure that you get one that has a serial number CNA 5XXXX or latter. I think that the one I just purchased is just a manufacturing fluke. Although the older HP's were designed much better, I'm sure that occaisionally a lemon slipped through the cracks. However, I agree that in the old days they would never have released a calculator for sale that had an unreliable keyboard or had a dsiplay with a decimal point that was indistinguishable from the number 2. I still find that mind boggling.

Re: ENTER key on HP 33S

*Message #11 Posted by **John Noble** on 25 Jan 2006, 10:59 a.m.,*
in response to message #10 by e. young

I agree with both the preceeding posts: I wish Agilent would make a 33sii (Voyager layout, 33s display and functionality, and some kind of I/O -- SD card?), but I have actually been enjoying my 33s in the few short days I've had it.

Yeah, the 33s is ugly. The keyboard is Good Enough(tm), though, and RPN programming is a boon. I don't mind the limited number of labels as long as I have a lot of memory to burn on strings of X=0? or FS? statements.

Why in the world should HP produce quality calculators when they can stamp their logo on cheap chinese calcs? They seem to sell. I mean have a look at the various comments in this forum. No one (ok, few are) is really satisfied with the product but since it is RPN and has the HP logo on it, they buy it. I certainly would buy one if it weren't for this terrible keyboard arrangement. I even bought a pioneer (48G) despite the fact that keyboards and displays fail quite often in pioneers and I knew about it. HP quality is gone since around 1985 IMHO and still, the company can safely rely on their brand name. Sometimes I can feel the hook in my cheek but not for very much longer>:(.

I suppose that year would separate the HP-71B from the HP-28C, making a reasonable distinction.

However, the fine Pioneer line was introduced in 1988. These models featured fine engineering (if not in every aspect), but all were well-made. They were also fast, with the Saturn processor.

in response to message #1 by e. young

I don't know about a typo. Isn't more likely that, in silkscreening that particular calculator's key (or batch of calculators' keys), the ink didn't stick on the lower leg of the "E"?

I believe I could make my 33s' ENTER key read all sorts of weird ways, using my Swiss Army Knife (and maybe some sort of clear-coat paint).

(It could be that the ink was worn off by people pressing through the clear plastic packaging, trying to test the display!)

I do sometimes get tired hearing about how wonderful HP calculators were in the good old days.

I bought a new HP33E in 1979 and it was a dog. It frequently failed during examinations and after 4 unsuccessful attempts to have it repaired, I bought a TI58 which worked fine for the rest of my university career. We now know that the early Spice design had a fundamental problem but it clearly wasn't tested adequately before it was released. The after sales service wasn't great either.

I have owned several HP calculators since then and they have been lovely machines to use. I would not use any other. However, the past just wasn't always that good and at least we can still buy an RPN calculator.

(p.s.- possibly I'm completely wrong and 33 is just an unlucky number for HP !)

in response to message #23 by John Noble

I am a big fan of snap on as well, though I only own 1 17 mm wrench. I did a break job on my pick up (about ten years ago) and had a bunch of lesser quality tools for the job. I broke every 17 mm wrench and socket in my home (and my breaker bar and two ratchets), and then went to the local Auto Zone about 6 miles away twice, buying life time warrented 17 mm tools each time until the third trip when I bought the sleek looking smooth finished (and much thinner) Snap On 17 mm wrench for 2-3 times the price of the previous wrenches (which I also expected to break with my pipe extension). It was really a job for pneumatic tools but since I did not have any air tools, I didn't buy them.

Well I broke that 17mm bolt loose (with a 3 foot pipe extension) and I finished the job. My mainstay tools are craftsman and they are okay for the amatuer, but I readily admit, if I worked as a mechanic, the Snap ons would be the better buy. Actually Craftsman only warrents their tools for the homeowner and not the professional and probably for that very reason.

Re: Craftsman Tools & Non-Tools

HP-16C programming challenge - Hamming distance

*Message #1 Posted by **Eric Smith** on 23 Jan 2006, 8:41 p.m.*

An n-bit binary word can represet 2^n possible values. For error detection (and/or correction), it is useful to add some redundancy to a data word, forming a code word. The code word will of necessity have more bits than the data word; the number of bits required depends on the amount of redundancy.

The degree of redundancy, and thus the code's capacity for detecting or correcting errors, may be measured as Hamming distance. The Hamming distance between two binary code words is the number of bits that differ between the two words. For instance, 01101000 and 00101010 differ in two bit positions, so they have a Hamming distance of two.

The mimimum distance of a code is the minimum Hamming distance between any two code words of that code.

The challenge is to write an HP-16C program that determines the maximum possible number of code words in an 8-bit code with minimum distance 3. If the program is run with flag 0 clear, it should end with the count of valid code words in the X register. If flag 0 is set, it should pause displaying each code word, then end with the count in X (the same as if flag 0 is clear).

I have written a C program that solves this class of problems, but I'll be working on the HP-16C program in parallel with anyone else that wants to try this challenge.

The HP-16C should have enough memory to solve this problem, and possibly problems with 9-bit and 10-bit code words, but I'm pretty sure that it won't be able to handle 11-bit code words or larger.

Conjecture about binary codes with minimum Hamming distance constraint

*Message #2 Posted by **Eric Smith** on 24 Jan 2006, 5:55 p.m.,*
in response to message #1 by Eric Smith

This is a conjecture, and I haven't figured out a way to prove or disprove it:

For an n-bit code (where n >= 4) with a Hamming distance of d (where 1 <= d < n/2), for odd valus of d there are 2^(n+2-2*d) code points, and for even values of d there are 2^(n+3-2*d) code points.

Based on this conjecture, the count for the challenge problem (n=8, d=3) would be 16.

I haven't yet figured out how to generalize the conjecture for n/2 <= d < n, though it is obvious that for the d = n case the count will always be 2.

Edited: 24 Jan 2006, 5:55 p.m.

Re: Conjecture about binary codes with minimum Hamming distance constraint

*Message #3 Posted by **Klaus** on 25 Jan 2006, 4:57 a.m.,*
in response to message #2 by Eric Smith

Hi Eric,

Aren't there multiple possibilities for a code with a distance d? If I recall right, you need a codeword to start with to define a unique code.

I do not have the time to program your challange, but determining the distance between two words should be easy: XOR the two words and use the [number of bits set] function. (certainly, you already use this approach). (1)First, I would zero all regs. (2)I would then use 0 as the first codeword, and store it in REG 0. (3)Increment this number and calculate the distance with all stored codewords. (4)if the minimum distance >=3, then store this number. Repeat steps 3+4 until Overflow bit is set after incrementing the number to test.

I hope this pseudocode isn't considered as an impolite posting, but as noone posted something, I decided to do so.

Greetings! Klaus

Re: Conjecture about binary codes with minimum Hamming distance constraint

in response to message #3 by Klaus

> Quote:
>
> Aren't there multiple possibilities for a code with a distance d? If I recall right, you need a codeword to start with to define a unique code.

Since XOR is a linear function, if you start with particular seed values A or B as the base for finding valid codewords, you end up with codeword sets Sa and Sb such that Sb = Sa XOR (A XOR B). If the value B is in Sa, the sets are identical.

Your proposed agorithm is the simpler of the two I've come up with, and is the one I've coded on the 16C. My other algorithm is in C code, and I haven't yet coded it for the 16C to compare run times.

Re: Conjecture about binary codes with minimum Hamming distance constraint

*Message #5 Posted by **Katie Wasserman** on 25 Jan 2006, 10:44 a.m.,*
in response to message #2 by Eric Smith

Eric,

Interesting problem. The 16C's #B (count the number of bits) function should make this a particularly small and easy to write program.

I assume that you've done some testing with various values of n,d to come up with this conjecture. But if the graph here http://www.personal.uni-jena.de/~pfk/mpp/ecc.html is correct I don't think your conjecture holds for larger values of n and d. Wouldn't this graph be linear for all values of n,d?

-Katie

Re: Conjecture about binary codes with minimum Hamming distance constraint

*Message #6 Posted by **Eric Smith** on 25 Jan 2006, 1:11 p.m.,*
in response to message #5 by Katie Wasserman

I'm not sure. Normally a Hamming code used for ECC imposes an additional requirement that may not be met by all codes of minimum distance.

For instance, suppose you have n data bits and want a Hamming code with a minimum distance of Hmin. You need a codeword size of cn, where cn is obviously larger than n. For efficiency in encoding and decoding, the code is constrained such that n bits of the codeword are identical to the n data bits (i.e., for a subset of n bits of the cn bit codeword, those n bits have all 2^n unique values).

I'm not certain whether there may exist a smaller value of cn such that there is a set of codewords of cn bits that meet the minimum distance Hmin but do not have the n bit subset.

Re: Conjecture about binary codes with minimum Hamming distance constraint

*Message #7 Posted by **Katie Wasserman** on 26 Jan 2006, 11:46 p.m.,*
in response to message #6 by Eric Smith

Eric,

I'm not sure about this -- there could be a bug in my program -- but I think that I found counterexamples to your conjecture.

n=15, d=7 gives 32 codewords

n=16, d=7 also gives 32 codewords

Am I wrong?

-Katie

Re: Conjecture about binary codes with minimum Hamming distance constraint

*Message #8 Posted by **Eric Smith** on 27 Jan 2006, 3:02 a.m.,*
in response to message #7 by Katie Wasserman

You're correct. I somehow missed that. The d < n/2 bound on my conjecture is wrong. Oh well.

Re: HP-16C programming challenge - Hamming distance

*Message #9 Posted by **PeterP** on 26 Jan 2006, 6:04 p.m.,*
in response to message #1 by Eric Smith

Eric,

please accept my appologies upfront for probably completely misunderstanding the problem - I have never dealt with codes, error correction, hammond, etc. yet due to the light responses as well as the opportunity to learn something, please find below some thoughts of mine. It will be great when you point out the flaws to me:

Asumption: For an 8-bit code with a minimum hamming distance of 3 I understood this to mean that all code words need to be different from all other code words by at least 3 bits.

Starting Case: Lets assume those three digits are in the first three places. xxx00000. ignoring whatever we have in the last 5 digits, there are 2*2*2 such words, that are different in at least the first 8 digits. I shall call those first three digits “significant digits” or SD vs the other 5 digits NSD (non-significant digits)

Extensions of starting case: Place 1 SD anywhere in the remaining 5 places to create another unique word, that is different in at least the three SD. There are 3*5 combinations of this rule However, halve the words created in such a way will be identical to all possible words that are created by having 3 SD and all combinations in the remaining 5 SD. Example: Starting Case: 101 xxxxx. This creates all words which have 101 in the first three digits and anything in the remaining 5 digits. The total of such IDENTICAL words is 2^5. One such words will be 101 xx1xx. If we now start switiching the first SD to another place, say the 6ht, we create words of the structure x01 xx1xx. This creates words of the structure 001 xx1xx and 101 xx1xx. As one can see, the second word is a combination we have seen already.

In a similar vein, one can place 2 SD in the remaining 5 places, for 3*5*4 ways (3 ways to pick a pair from the 3 SD, 5*4 ways to place the pair in the remaining spots). However one out of ever 4 words created that way will be pre-created.

And, last but not least, one can place all 3 SD in the remaining 5 places, 1*5*4*3 (1 way to pick 3 SD, 5*4*3 ways to place 3SD in 5 spots). However one out of ever 8 combinations we will have seen already.

In summary we should have the following number of words:

```
2^3 * (1 + 3*5 -3*5/2 + 3*5*4 – 3*5*4/4 + 1*5*4*3 – 1*5*4*3/8) = 968

In general terms, for m digits and n distance:
2^n*(1 + Sum[x = 1 to min(n,m-n)] { (n!/(n-x)! * (m-n)!/(m-n-x)!  * (1- 1/(2^x)) }
```

Cheers

Peter

Re: HP-16C programming challenge - Hamming distance

*Message #10 Posted by **Eric Smith** on 27 Jan 2006, 12:53 a.m.,*
in response to message #9 by PeterP

Now you've got me confused. With an eight bit code, there can't possibly be more than 256 codewords (minimum distance 1), and for larger minimum distances there have to be fewer valid codewords.

For instance, for an 8 bit codeword with minimum distance 3, there are 16 valid codes. One set (in hexadecimal) is { 00, 07, 19, 1e, 2a, 2d, 33, 34, 4b, 4c, 52, 55, 61, 66, 78, 7f }.

You can derive different sets, but they all are equivalent to that set with bit permutations and/or XOR by a constant.

Note also that only 7 bits of the 8 are actually needed. Typically the eight bit would be used for word parity, which actually increases it to minimum distance 4. (Confirmed by doing a search for 8 bit codewords with minimum distance 4, which also results in 16 valid codewords.)

I'm not distinguishing "data bits" from "ECC bits". I'm just considering the total number of bits in a codeword. Because an 8 bit codeword of minimum distance 3 (or 4) can have exactly 16 unique values, it can be used to encode 4 bits of data.

I still have not come up with an analytical way to determine the number of codewords for a given bit count and minimum distance. My conjecture was based on output of the brute-force search program, and the patterns for d_min >= bits/2 are not readily apparent, which I think corresponds to the fluctuations in the curves on the ECC page Katie referenced earlier.

Which calculator? I would like your advice

*Message #1 Posted by **Joe Edwards** on 23 Jan 2006, 8:30 p.m.*

Hello folks, I have hung around this forum for about three years now, posting occasionally, but for the most part just reading others' posts. You folks are very knowledgeable in regards to this subject, so I hope to gain some valuable insight with this post. I have returned to college after almost 20 years. During that 20 years I spent time in the military and held down a few non-technical jobs. I'm currently working on a geography degree and entertaining a second degree in mathematics. Teaching at the junior college level seems like a nice niche and I can do this with just a Master's. In 1987 (my first year of college) I bought a HP 32s and only lightly used the thing. It traveled with me during my stay in the army, but mostly just sat (unloved) in a desk drawer. The RPN idea seemed nice and the 32s always seemed like a wonderful machine, but I really had no reason to use it other than for simple calculations. I knew nothing else about the HP calculator line as I was still in high school in the early-to-mid 80s. Fast-forward 20 years and now the great HP calc is pretty much deal, with nothing but a few "zombie clones" passing themselves off as HP calcs. Nonetheless, I am considering a 33s and a 49g+ as day-to-day machines for my studies. I currently have the following HP calcs (15c x 4, 16c x 1, 11c x 1, 27s x 1, and a 32s x 1). I only plan on keeping three at most, but if they are vintage machines, I want them to be in solid condition. OR should I sell them all and just get the new "HP" machines and call it a day? EXCEPT for the 27s as I love that calc. So, what will I really need for a Geography and Mathematics degree...calculator wise? It would be easy to fall into the nostalgia trap (as I did with the use of the MINIDISC format) of the vintage machines, as they are built so well, but in the long run does it really matter? Or would I be better severed with just a 33s and a 49g+? Any and all opinons are welcome. Thanks in advance.

Joe Edwarads

1 + 1 still equals 2 (or 1 1 +, if you please), so your current stable of 15Cs and other delectable vintage gear should do all the math a calculator should do. Graphing and other stuff is better done on a computer, IMHO.

FWIW, I just got a 33S yesterday and I think it doesn't suck. Once I got past the silly cosmetics (and hard to read keyboard legends), it's everything I want in a calculator: good keyboard feel (much better than my 49G+, not as good as my 12C), nice easy RPN keystroke programming, ample memory, 2 visible stack elements, etc. I wrote a Gregorian -> Julian date conversion program without looking at the manual (much), right after opening the box, and it was actually fun.

My 49G+ is for sale since I really don't have the inclination to invest so much time in learning a calculator when I have access to much more powerful machines like the iBook I'm typing this on.

It's really just personal preference, I think: try *all* the options, which is an excuse for expanding your collection. (I'd like to try a 15C, for instance!)

in response to message #1 by Joe Edwards

Hi Joe. I got my Master's in Geography 32 years ago and I am getting a second Master's in teaching now (Middle School math). Based upon the college math courses I have taken the last couple of years, what you will need is (I know this is sacreligious in this forum) a TI 84 + silver edition, and that will be way more than you will ever need in Geography. I love RPN on my HP's, but you will never need it in college.

Re: Which calculator? I would like your advice

in response to message #3 by Don Shepherd

Don, What would be different if I just used a HP 49g+ versus a TI unit, as long as I know how to use it properly? What made you decide to go back for your education degree? Thanks.

Joe

*Message #5 Posted by **Don Shepherd** on 24 Jan 2006, 4:17 a.m.,*
in response to message #4 by Joe Edwards

Hi Joe. I guess the 49G+ would be sufficient for most purposes. The professors, however, will use the TI series, and there are lots of help resources available for the TI's versus very little for the HP. I have a 49G+ but I have never used it for graphing because the TI just seems easier.

I decided to leave the computer field after 28 years because I wanted to make a difference in the world, and I decided the middle school math classroom would be my stage. I am student-teaching right now, and I love it. The kids all say "hey, gray-haired dude, aren't you too old to be a new teacher?"

*Message #6 Posted by **Jan** on 24 Jan 2006, 7:08 a.m.,*
in response to message #1 by Joe Edwards

Hi Joe,

No matter what you do with your vintage calcs, if I were you I would keep at least one functioning HP15c and the 32S. They basically do all the math you will need, the 32S a little faster than the 15c. The 15c is a very versatile machine including calculations involving complex numbers and matrices in addition to a root-finder and numerical integration. Except for the matrix-calculations the 32S has similar features, however the complex number handling is somewhat limited when compared to the 15c. I have 15c and 32S units myself and as a scientist I am quite satisfied with both of them. If you would like to buy an additional calculator, I would choose a graphic one to complement the possibilities of the 32S and 15c, the 48 or 49 models being a fair choice.

*Message #7 Posted by **Ron Ross** on 24 Jan 2006, 9:10 a.m.,*
in response to message #1 by Joe Edwards

Your 27s is probably the best of the bunch for general math and certainly more than enough for your geography. Many on this board think highly of the rest though (including me, but the 27s blows them all away aside from some higher end functions of the Hp15c). I wouldn't part with any of the rest myself(but you could

sell an extra Hp15c or two and buy another Hp27s and/or a brand new Hp49G+)

The 27s is kind of tough to replace and you might consider buying a new Hp48GII or Hp49G+ and using in in algebraic mode. However, these calculators are not any better than a Ti-86 (and actually more awkward to use) if you do not take advantage of their RPN mode (many functions and features are much easier to use in RPN and flag 117 set).

It is true that most schools use the Ti-83/84 graphics calculator in their curiculum (they are nearly identical aside from I/O and extra RAM and some extra apps/programs included in the 84). They are not in the same league as an Hp49G+, but they are also much easlier to operate and use for the average user.

Since you really like the Hp27s, if you want a graphics, your best choice would be a Ti-86 or maybe even a Ti89. The Ti-86 offers a nice menu system, long variable names, like your 27s and a solver similar to your 27s as well.

Good luck with your shopping and let us know what you liked best.

*Message #8 Posted by **Joe Edwards** on 24 Jan 2006, 9:15 a.m.,*
in response to message #1 by Joe Edwards

Thanks for the info so far. I am glad to see someone else cares for the 27s besides myself! I guess I need to stir the pot a bit by adding another ingredient. What do you folks say to a HP 41c/v/x as a useable calc (with appropriate modules) versus say the 15c/11c or 32c (I don't have a 42s). Thanks.

Joe

*Message #9 Posted by **Ron Ross** on 24 Jan 2006, 10:00 a.m.,*
in response to message #8 by Joe Edwards

You might also consider an Hp19Bii. It is very similar to the Hp27s with the added feature of both more buisness functions and more importantly, units conversions. And if you don't mind giving up RPN, the older Hp19B can be purchased fairly reasonably via ebay (the Hp19Bii has RPN, the plain Hp19B doesn't).

Something else to consider. And the Hp19B is fairly easy to buy and replace vs your Hp27s. Drawbacks: Battery door and fold out book type interface (some like this though).

Re: Which calculator? I would like your advice

*Message #10 Posted by **Joe Edwards** on 24 Jan 2006, 10:23 a.m.,*
in response to message #9 by Ron Ross

I just took a look at the 17b and 17bii. That is one ugly calculator! To be truthful, I like RPN, but the 27s is hard to turn away from with all those extra features. I haven't found any of the new HP equipment very interesting. While I didn't spend the last 20 years in a career using the vintage HP models, I did buy one in '87 and have been hooked on the vintage HP design and the QUALITY of those "Made in USA" products. It just makes my head spin that 20 years later, we cannot (with better technology) make a product with the same QUALITY as the old HP units. I really doubt the current line of HPs will still be operational in 20 years...and IMHO no one will really care if they do. While shopping at the local office store I picked up a 12c and was disappointed to find that the thing weighed half(?) that of my 15c models...and it felt "cheap", if that makes any sense. Maybe another 27s will do and a 15c if I can learn to use it as well. Still, those old 41c models....sigh

Re: Which calculator? I would like your advice

*Message #11 Posted by **Ron Ross** on 24 Jan 2006, 12:40 p.m.,*
in response to message #10 by Joe Edwards

I did not suggest the Hp17B or Hp17Bii, I suggested the Hp19B or Hp19Bii. These are business calculators with trig functions and units conversions.

The Hp15c is a well made tool that is appreciated most by EE's or others with a need of complex number, matrix computations and possibly numerical integration. If you don't need these features, the Hp11c or Hp32s do just as well. To get the above on an Hp41, additional application modules are needed. That is the charm of the Hp15c over everything else except for the Hp42s or an Hp41c with an advantage pac module.

Simply put, the Hp19Bii may be worth looking into for an easy to find RPN with all the niceties of the 27s (same calculator from a functional point of view aside from the lack of HEX, OCT, BIN, Dec conversions, and no algebraic precidence in algebraic mode).

If you do like RPN, the Hp 48G (older and easily available for not a lot of $$$$ on ebay) is an excellent choice. Nice Hp feel, kind of bulky, but has a great solver w/ all the features of the Hp27s as well as many more. If you key in your own programs or equations, 32K is a lot, if you buy a cable and download, 32K don't go far. But you can download a couple of decent programs and with all the built in features, it is a graphics that will last a long time. It is slow in graphing compared to the Ti line, but I don't use it to graph functions anyway. The newer Hp's are far faster, but aren't of the same quality and the new Hp48Gii doesn't offer the built in equation library of the older Hp48G either.

*Message #13 Posted by **Ron Allen** on 25 Jan 2006, 5:38 a.m.,*
in response to message #12 by Joe Edwards

Well, Joe, it looks like you got a lot of advice that many of us took note of as well. After about 30 years using programmable calculators beginning with the TI59, I have grown with the maximum versatility. I like the 49g+ preceded by the 48 series, but I am no math major. I like to experiment with programs in such disciplines as forestry using multiple regression techniques to estimate yields; financial equations involving random transactions, both amounts plus or minus and random dates; Real estate investment projections. I also take photography equations to the field to confirm my choices of settings for depth of field in closeup photos. I am able to perform and verify some recreational calculus up to simple linear differential equations and a healthy list of symbolic integrals and derivatives. If I were into serious math as a second major, I think I would get something more fundamental to replace my slide rule from the sixties, something to assist me at the chalk board, something highly portable. From everything I have heard, the 33 series seems to fit your needs for now.

Let us hear what you decide and why,

Ron

You just hit on something of interest. I am learning to us a Soroban (a Japanese abacus) and would love to learn to use a slide rule. Any advice on a nice slide rule?

Joe

Re: Learning the slide rule

*Message #15 Posted by **Tom Sherman** on 25 Jan 2006, 9:53 a.m.,*
in response to message #14 by Joe Edwards

Any slide rule will do for the basics, but if you want to get fancy, get a Log Log Duplex Decitrig slide rule by Keuffel & Esser (K&E), along with the original manual by Lyman M. Kells, Willis F. Kern, and James R. Bland. The manual is excellent and will teach you the basics of any slide rule. It can be obtained inexpensively from ABEbooks.com if you do not get it with the slide rule itself.

Cheers, Tom

Re: Which calculator? I would like your advice

*Message #16 Posted by **Ron Allen** on 25 Jan 2006, 4:33 p.m.,*
in response to message #14 by Joe Edwards

Joe, I have an old K&E Deci-Lon with 4 plus and 4 minus LN scales. It is great for estimating "LN+1" values for things like growth curves, half life calculations and compound interest problems. The best book for me in the sixties was the hardback manual that came with the slide rule, but it has no library of Congress number or ISBN. It has good examples of solved problems.

Brought back nostalgic stuff for me to break it out to get your info. You might locate one on eBay. The title of the booklet is simply "K&E Slide Rules," published by Keuffel & Esser Co. I remember our old badges of rites of passage strolling around campus wearing the foot-long scabbards containing one of those "mysterious devices" we serious students wore. Now they carry programmables and/or laptops in their backpacks. I'm green with envy just thinking of how much more time I could have spent on concepts instead of countless hours roughing out statistical data analysis with slide rules and old mechanical calculators.

An engieers supply store or college book store should have plenty of log/log engineer graph paper. Take two sheets of this and "slide" the nonlinear scales next to each other to set up divide by and multiply by situations and you will have the fundamental premise on which the slide rule is designed, (LOG Y + LOG X = LOG XY AND LOG X - LOG Y = LOG X/Y.) The LN scales are based on the premise that LOG X^Y = LOG X x Y, etc. These facts on which the rule is designed and the fact that engineering paper for log/linear, linear/log and log/log can display non linear curves as linear in the highest order helped me to understand how we can say

that differential equations are considered linear if the highest order equations are linear, while all lower order derivatives can be non linear.

I hope this helps in your search for a good slide rule book. I would say that, as a calculator, the slide rule is primitive and obsolete while, as a teaching tool, it contains a lot of promise. Good luck on your change of career!

Ron

"the slide rule is primitive and obsolete while, as a teaching tool, it contains a lot of promise."

I agree.

I used slide rules in high school and college - 1966-1970. Even now, 40 years later, there are two items that has stayed with me:

1. How to normalize numbers for calculating.

2. How to quickly do an estimate of what the answer should be. Had to know where to put the decimal point in the final answer.

I work for a design MEP enginering firm, and I find a lot of the young engineers do not know how to to quickly estimate the range of the final calculation. They are too dependent on the calculated value - even when the calculated value does not make sense from the input data.

HP 41 functions

*Message #1 Posted by **Paul** on 23 Jan 2006, 4:14 p.m.*

Need help. I have an HP 41CV that I have been using for years for simply math functions. While using the calculator recently I unknowingly hit a key which changed the display. I am trying to find someone who might be able to tell me which key I hit and how to get the normal display back. The present display is a number on the left followed by a decimal and then two numbers on the far right. The two numbers on the right correspond to hwo many decimal places are in the number that I enter. Can someone help?

Re: HP 41 functions

*Message #2 Posted by **randy** on 23 Jan 2006, 4:21 p.m.,*
in response to message #1 by Paul

You changed it to engineering or scientific notation. To go back to the usual fixed 4 decimal places:

1. [gold shift]
2. [1] (see the word FIX above the 1 key?)
3. [4]

and you'll be back to the default display format.

HP 21

*Message #1 Posted by **77Bronc** on 23 Jan 2006, 3:07 p.m.*

I still have the HP 21 that I used through engineering school, it does not have a battery pack or charger. I sure would like to get it back in operation. Can you direct me to anyone that can help me get it back working?

Thanks,

RLS

Re: HP 21

*Message #2 Posted by **John Noble** on 23 Jan 2006, 6:58 p.m.,*
in response to message #1 by 77Bronc

fixthatcalc.com could probably do it, and there have been some rebuilt battery packs listed on eBay recently, though others would know better than I if they are for 20-series calculators.

Re: HP 21

*Message #3 Posted by **Randy** on 23 Jan 2006, 9:47 p.m.,*
in response to message #2 by John Noble

The fabricated packs on eBay are for the Classics (35/45/55/65/67/70/80), they will not work for a 20 series Woodstock.

Woodstocks require a specific battery, a two piece plastic shell which got sealed together, encapsulating two AA rechargeable cells with a spring in one end. Very special and quite hard to find as they usually got thrown out years ago when they showed signs of leakage. HP ceased battery sales in 1995 (or thereabouts) so replacements are non-exsistent other than eBay and those usually come with a calculator...

Personally, I have more calculators and chargers than batteries for my 21/22/25/25C/29C and yes, I'm still looking for a 27 :(

Is the TI-57 a nonpareil?

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 23 Jan 2006, 3:10 a.m.*

Is the vintage TI-57 calculator a nonpareil? Consider that it came on the market in mid 1977 and then try the following demonstration program. Starting from turnon enter the program by pressing in sequence:

LRN
2 2nd Exc SST
2nd Lbl 0 R/S SST 5 R/S LRN RST R/S LRN
6 BST 2nd Ins LRN RST R/S LRN
5 BST 2nd Ins LRN RST R/S LRN
2 BST 2nd Ins LRN RST R/S LRN
4 BST 2nd Ins LRN RST R/S LRN
2 BST 2nd Ins LRN RST R/S LRN
7 BST 2nd Ins LRN

To run the program press GTO 2nd 0 4 R/S

Re: Is the TI-57 a nonpareil?

*Message #2 Posted by **HrastProgrammer** on 23 Jan 2006, 5:14 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Yes, beside digits 0..9, TI-57 has the ability to show A, b, C, d, E and F characters using synthetic programming.

I just entered your program into my TI-57E emulator running on HP-48G ... it displays FACAdES (if I entered it correctly) :-)

HP 32SII - which year is best?

*Message #1 Posted by * on 22 Jan 2006, 11:45 p.m.*

Hey everyone, I just bought an HP 32SII on Ebay and the serial number is 3619M08959. As I'm sure you know that implies it was made in Malaysia around May 1996. I also have a second one due any day in the mail.

My question is whether there is any year or country of origin that would be most desirable?

It seems like the latest model of the brown bezel would be most desirable since it might have all the rom bugs fixed? Or maybe one made in Germany or Japan would be higher quality etc? Did the switch to silver bezel occur sometime after production moved to Indonesia in 1997?

Thanks!

Re: HP 32SII - which year is best?

*Message #2 Posted by * on 22 Jan 2006, 11:58 p.m.,*
*in response to message #1 by **

Another serial number for sale on Ebay:

ID90204491 Indonesia, Jan 1999.

Would this be better (in some way) than the one I have? It also has a brown bezel.

Thanks.

Re: HP 32SII - which year is best?

*Message #3 Posted by **Thomas Radtke** on 23 Jan 2006, 2:57 a.m.,*
*in response to message #2 by **

I'd go for a later Singapore model. Early ones had a bug in the fraction mode. Mine is from '91, Week 36 (3136S.....)and definitly has the bug. I think the Singapore keyboards are unbeaten, very soft but still with a good tactile feedback.

Thomas

*Message #4 Posted by **e. young** on 23 Jan 2006, 12:05 p.m.,*
*in response to message #1 by **

I do not like the Indonesian produced versions because the numbers are only painted on the keys. In my opinion, I would try to get one made in Singapore, and not later than 1994 sp you can get the keys with the numbers molded in. A coworker has a 32sii mf'd in Singapore in 1995, and it only has the painted-on numbers.

Re: HP 32SII - which year is best?

*Message #5 Posted by ***** on 23 Jan 2006, 12:39 p.m.,*
in response to message #4 by e. young

Thanks (to both of you)! This is the kind of info I was looking for. So hopefully one in 1993 has the fraction bug fixed and the molded keys. I wonder when the fraction bug was definitely fixed? Would it be obvious looking at a close-up photo whether it has the molded keys?

Re: HP 32SII - which year is best?

*Message #6 Posted by **Brock** on 28 Jan 2006, 9:16 a.m.,*
*in response to message #5 by **

I just bought a 32SII with a serial number of 3207S05688 that does not have the fraction bug. Hope that helps.

42X

*Message #1 Posted by **CW (Maui, Hawaii)** on 22 Jan 2006, 11:08 p.m.*

Greetings,

I am considering 42X. I was looking at a list of things about it when I came to line #6

(6) You own the HP-42S and you have the ability to dump the ROM contents from the calculator to the computer so I can incorporate your ROM into the emulator.

Does anyone have a description of how to do this with pictures?

Also I noticed elsewhere that you cannot save data to port memory, I assume then that you can save data to calculator memory?

Thanks, CW

Re: 42X

*Message #2 Posted by **Howard Owen** on 23 Jan 2006, 12:19 a.m.,*
in response to message #1 by CW (Maui, Hawaii)

The instructions that worked for me are in this archive at Christoph Gießelink's EMU42 site. It involves using a 128K HP48g,or an HP48sx with at least 70K or so free. That assumes the US version of the 42S, whose ROMs are 64K in size. The international versions use 2 such ROMs for 128K total, and you then need more than that amount of memory to hold the ROM images and the library that does the copying

Regards,
Howard

Re: 42X

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 23 Jan 2006, 12:49 a.m.,*
in response to message #2 by Howard Owen

Hi, Howard;

just a question: isn't the HP17BII the Pioneer with an extra ROM with messages in foreign languages, Portuguese included? I have a working HP42S (and one that's not) and had the chance to upgrade a few ones to 32KRAM, mainly models commercialized in Brazil. None of them had the extra ROM.

Is taht correct?

Cheers.

Luiz (Brazil)

Re: 42X

*Message #4 Posted by **Howard Owen** on 23 Jan 2006, 1:58 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi, Luiz,

You are right! I had read JF Garnier's document here "HP-42S - New Facts" that describes how there is provision for an add-on ROM in the HP-42S. When I read Christoph's document, I conflated his statement that the 17B had domestic and international versions with JF's write up on the 42S and drew the wrong conclusion. Since my 42S is a US English model, I never got corrected by reality, as it were. 8) Thanks for catching that!

So dumping a 42S ROM should never take more than 70K, as Christoph's document clearly states.

Regards,
Howard.

in response to message #1 by CW (Maui, Hawaii)

Also I noticed elsewhere that you cannot save data to port memory, I assume then that you can save data to calculator memory?

If you mean HP-42X 'virtual' ports then yes, you can save only programs there (this is some kind of static program storage). In extended version of HP-42X you have 96K RAM which so you have plenty of memory available for data (and programs), I think.

This is from my page:

In addition to the 96K of HP-42S RAM, some versions of HP-42X support the port memory. Its purpose is to store programs for long term use. Data cannot be stored to port memory. Programs cannot be directly executed from port memory but they can be dinamically loaded to the main memory and executed. There are two ports inside HP-42X: Port1 (RAM port, size 16K for HP42X48L, 30K for HP42X49L and 31K for EXTENDED versions) and Port2 (ROM port, size 32K). These are 'virtual' HP-42S ports which have nothing to do with the real HP-48/49 ports. Port memory isn't affected by "Memory Clear".

HP-67 Card reader repair

*Message #1 Posted by **Erin Finch** on 22 Jan 2006, 10:43 p.m.*

I have an HP-67 calculator that has been working great for years. I bought it on ebay from Mike Davis back in 2002 and up until just recently, it has seen little use. I decided this year to sell it. I felt it wasn't getting the proper respect it deserved since I aquired an HP-41, and it would be better off in the hands of another collector. When I got it out, I was dissapointed to find the card reader didn't function.

I'm going to summerize a long story: The calculator would pull cards through ok, but would emit a slight screech at the end of the read (like it was still trying to pull a card through when there was none left) and would display "error." First I suspected it was the "gummy wheel" problem, but I found the wheel wasn't gummy in the least. Then I looked into some guides online, and decided that the clutch must be going out. I used Mark Hoskins guide to repair the clutch via the less than ideal (but only method I could manage) super-glue method. The motor now feels and sounds (is more noise good?) like it has signifigantly more power, but still fails to read and write. I'm pretty novice at these repairs, and don't have a clue what to do beyond this point.

It seems to pull cards through fine, but entirely fails to read/write data to/from the card. I'm at my wits end. Any idea what could be the problem, or where I should even start to look?

Your help appreciated,

-Erin

Re: HP-67 Card reader repair

*Message #2 Posted by **David Smith** on 22 Jan 2006, 11:41 p.m.,*
in response to message #1 by Erin Finch

I would suspect one or more of the reader leaf switches is misadjusted. Since the motor seems to be starting properly the MOTOR switch is OK. I would first check the HEAD switch.

When you insert a card you should see the MOTOR switch close first, the the HEAD switch, then the WRITE PROTECT switch. If you don't have Tony Duell's excellent HP classic notes, you can trace the contacts on the back of the keyboard to the pins going to the CPU card.

Re: HP-67 Card reader repair

you can trace the contacts on the back of the keyboard to the pins going to the CPU card.

Sounds logical. I assume you are talking about those gold plated contacts inside the calculator. Is the a diagram somewhere of which contanct is which? (motor/Write Protect/head)

Thanks for the quick reply.

*Message #4 Posted by **Vassilis Prevelakis** on 23 Jan 2006, 11:16 a.m.,*
in response to message #3 by Erin Finch

While there is no service manual for the HP-67 (to the best of my knowledge), the MoHPC CDROM collection includes the service manual for the HP-97. Given identical architectures and the numerous similarities in the hardware of the two machines, I'd encourage anybody how wants to repair an HP-67 to check out this manual.

There is also of course the circuit diagrams made by Tony Duell. The CDROM with these is available from the UK user's group (http://www.hpcc.org/cdroms).

Re: HP-67 Card reader repair

*Message #5 Posted by **David Smith** on 23 Jan 2006, 12:17 p.m.,*
in response to message #3 by Erin Finch

You can figure out what switch is what by the position of the nylon balls that press the gold leaves, but you really dont need to. Just make sure that each switch opens and closes cleanly as a card is inserted and removed. The switches are adjusted by turning the little screw at the base of each leaf. Generally you can crank down the screw until the switch is closed without a card in and then back it off a eigth to a quarter turn or so until the switch opens up. Then check with a card.

YATZ for the 48g! Please help

*Message #1 Posted by **Howard Owen** on 22 Jan 2006, 10:25 p.m.*

Hello MoHPC calculator enthusiasts.

I need your help in play testing my port of YatZ to the HP48g. I've actually ported the game to the 49G and the 49g+ as well, but I've released it first for the older machines. So I'm making the beta announcement here, in case there are folks who want to try it on the older hardware. I'll make a wider beta announcement later, but I thought I'd let you all have first crack!

Here are the URLs for source and binary versions.

YatZ48-1.0beta-bin.zip - Binary
YatZ48-1.0beta-src.zip - Source Code

I hope you enjoy the game. Comments and bug reports are very welcome.

Regards,
Howard

Old 48g menus on hp49

*Message #1 Posted by **Rui** on 22 Jan 2006, 4:51 p.m.*

I've heard that I can use old hp 48G on a hp 49g/+. I mean I type " 75 MENU " and I get hp48 solver menu. Anyone know how to find the list of menu numbers?

Thanks

Rui

Re: Old 48g menus on hp49

*Message #2 Posted by **Gene Wright** on 22 Jan 2006, 5:09 p.m.,*
in response to message #1 by Rui

The list of all menu numbers can be found in the HP49g+ Advanced User Reference Manual.

This is on hpcalc.org and the hp.com/calculators website on the 49g+ page under the manual link.

Gene

*Message #3 Posted by **Howard Owen** on 22 Jan 2006, 5:56 p.m.,*
in response to message #2 by Gene Wright

Hi, Gene,

Any news on whether we'll see a hardcopy version of the 49G+ AUR? I've been using the PDF version quite a lot, but a real manual (as in "hand"-ual) would be a boon.

Regards,
Howard

No printed 49g+ AUR

*Message #4 Posted by **Gene Wright** on 23 Jan 2006, 6:04 p.m.,*
in response to message #3 by Howard Owen

To my knowledge as of today, there are no plans by HP to offer a printed copy of the 49g+ AUR.

Note that there never were any plans to have an actual product offered by HP (with an HP product number) for sale of the printed copy of the 49g+ AUR, but there had been the possibility of some sort of deal/arrangement with another party to allow printed copies to be acquired/produced.

That does not appear to be in the offing now.

So, to get a printed copy of the AUR, take the PDF to a copy shop and start negotiating with the vendor.

Re: No printed 49g+ AUR

*Message #5 Posted by **Howard Owen** on 23 Jan 2006, 6:55 p.m.,*
in response to message #4 by Gene Wright

> Quote:
>
> So, to get a printed copy of the AUR, take the PDF to a copy shop and start negotiating with the vendor.

That was going to be my next question. 8)

The download site at HP has the following text:

> Quote:
>
> **About these files:**
> These manuals are provided as a courtesy to our customers for printing only. ..

That sounds like the sort of message I'd like my local copy shop to get, but it's vague as to whether "for printing only" means by the customer, or by a print shop on behalf of a customer. And then the manual itself has this standard clause:

> Quote:
>
> Reproduction, adaptation, or translation of this manual is prohibited without prior written permission of Hewlett- Packard Company, except as allowed under the copyright laws

And that's what the guy at the copy shop sees coming out of his machine.

Without getting too tangled up with corporate lawyers, do you know of a clearer statement of HP policy regarding printing the manuals?

Regards,
Howard

That's always the problem, of course.

I would think Kinko's would be ok with printing the PDF.

Best of luck, Gene

Re: No printed 49g+ AUR

*Message #7 Posted by **Ron Allen** on 24 Jan 2006, 2:24 a.m.,*

in response to message #6 by Gene Wright

FWIW, Staples has no problem producing a copy based on disclaimers for user's purposes. I imagine HP would be happy if someone else produced hard copy for say about $20. After all the "Guide" is only 861 pages using up nearly a reem of paper printed both sides, AUR is considerably less.

Kind of ridiculous to carry a calculator for field work while needing a laptop to read the manual The size of either manual has to impress clients, internal or external, when you show up with such power for field support. This little device has more functions than MathCad. Need a manual though to reference all its power and access to numbered menus, for example.

It was explained to me several months ago by tech support that a policy decision was made by senior management at HP to honor the environment by cutting back on paper and that user manuals weren't considered a priority item, especially when they could use Adobe and PDF files.

*Message #10 Posted by **John Limpert** on 25 Jan 2006, 2:30 a.m.,*
in response to message #4 by Gene Wright

I've used http://www.printfu.org in the past to print large PDF files, like HP calculator manuals. You upload the PDF file to their site, then they print it double-sided, bind it, and mail you the result. I'd recommend their service.

Re: Old 48g menus on hp49

*Message #11 Posted by **Rui** on 22 Jan 2006, 6:46 p.m.,*
in response to message #2 by Gene Wright

Thank you.

I didn't have the chance to put my hands on the manual yet, since I'm working with borrow hp 49g with no documentation.

I'll download it. :)

Hello Rolf,
Those battery packs are always on E-bay. here is a link to one of the offerings.... http://cgi.ebay.com/NEW-BATTERY-PACK-FOR-HP-35-45-55-65-67-80-CALCULATOR_W0QQitemZ5855556744QQcategoryZ11713QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

Best regards, Hal

Re: HP 45

*Message #3 Posted by **Jan** on 25 Jan 2006, 3:50 p.m.,*
in response to message #1 by Rolf Seitle

Hi,

If you bother about buying on ebay or if you don't want to spend too much money, there is the alternative of making a pack by yourself. Recently I got a 45 and a 67 with both packs gone. Since the 67 is still in workable condition (except for the rubber wheel of the card-reader) I wanted to have a replacement pack for it and decided that the easiest option is to make one myself. I took 3 NiCd cells and connected them in series, some good tape holding the entire thing (including contact-plates) together. With some appropriate wiring and 2 additional plates with the right aspect-ratio and bend into a V-shape along their longest side (all fixed to the "pack" with tape) it makes a working battery-unit. The NiCd cells are somewhat too short to fill the entire battery-compartment but with some "filler" (could be anything suitable even some folded paper) the pack's contacts remain in place. Be sure however that the pack's internal contacts as well as the contacts connecting it directly to the calc's terminals are ok. Although the 45's manual does not indicate that a pack has to be in the calculator when it is run on the AC line (the 67's handbook explicitely does to prevent calculator dammage) I would NOT recommend operating the 45 without a pack inside (which is in fact what you do when the (internal) wiring of the pack is faulty).

Re: HP 45

in response to message #3 by Jan

> Quote:
>
> I would NOT recommend operating the 45 without a pack inside

The 35 and 45 can safely be used on AC power without a battery! The power adapter has three pins from which one is ground, one feeds the battery pack and the third powers the calculator. As long as the power plug is connected to the calculator the battery is actually disconnected from the internals of the device.

This is not the case for later models where (as in older TIs) the battery pack is used to regulate and limit the external power. As far as I know, calculators with a card reader (65, 67, 97) need a battery a avoid damage to the card reader electronics!

Marcus

Re: HP 45

*Message #5 Posted by **Tony Duell** on 26 Jan 2006, 7:19 a.m.,*
in response to message #4 by Marcus von Cube, Germany

From what I remember of the schematics :

Classic models without a card reader (35, 45, 55, 70, 80) can be safely used on the adapter with no battery in place. When the adapter is plugged in, the battery is disconnected from the calculator.

Classic models with a card reader (65, 67) can damage the card reader sense amplifier chip if connected to the adapter with no battery fitted. This is particularly true of the 65 (the chip was re-designed in the 67).

Woodstock, spice and sting models without continuous memory should not be connected to an adapter with no battery in place. It is unlikely to cause damage, but I wouldn't risk it.

Woodstock, spice and sting models with continuous memory MUST NOT BE CONNECTED TO AN ADAPTER WITHOUT A BATTERY IN PLACE. Sorry for shouting, but this is the most common way to ruin the (HP custom) RAM chip and possibly other parts.

Topcat models without continuous memory (91, 92, 97, 97S) will not be damaged if connected to an adapter with no battery, but the printer and/or card reader may not work properly. There is a circuit built into these machines to limit the supply voltage under these conditions.

Topcat models with continuous memory (95C) must not be connected to the adapter without a battery in place. The same protection circuit as in the other topcats is there, but it only works with the power switch 'on'. There is a very real risk of damaging the always-powered RAM chip if connected to an adapter with the machine turned off.

Re: HP 45

*Message #6 Posted by **Tony Duell** on 26 Jan 2006, 7:20 a.m.,*
in response to message #5 by Tony Duell

One thing I forgot to add (for the legal people out there)

The information was offered in good faith, but obviously I am not responsible if you damage a calculator by following it.

trying to work with Zenrom, Novram and Advantage together

*Message #1 Posted by **Fulcrum** on 22 Jan 2006, 5:52 a.m.*

Hello, I have the Zenrom, Novram with Hepax and PPCROM flashed and advantage modules. I want to use them together, but no combination in the hp41 ports seem to make them work all. Sometimes advantage is not recognised and sometimes the zenrom displays strange chrs when I make a catalog 2. Is there any way they work together? Thank you very much

Re: trying to work with Zenrom, Novram and Advantage together

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 22 Jan 2006, 1:48 p.m.,*
in response to message #1 by Fulcrum

Hi, Fulcrum;

first, consider that HEPAX emulated by NoVRAM tries to allocate itself in the first, lower-numbered, available page (HEPAX documentation calls these 'blocks' instead of 'pages'). As each page is also switcheable into four banks, HEPAX uses the four banks in the lower available page; as each page addresses up to four banks, 4KBytes each bank, HEPAX is actually a 16KByte-ROM module. It might be good idea to also check how is the NoVRAM RAM addressed.

I am not sure about ZenROM, maybe it goes to the lower page related to the port it is plugged in. And the Advantage occupies two banks in the lower page plus one bank in the upper page of the port it is plugged in.

So, consider that only the NoVRAM is plugged in and you want to know which page is the PPCROM addressed. You can use HEXEDIT and test for each of the known page addresses. If yours is an HP41, plug only the NoVRAM and try this:

```
[XEQ][ALPHA]HEXEDIT[ALPHA]  [ADR:_ _ _ _      ]
5000 [ENTER]
```

If the HEPAX is actually allocated to page #5, you'll see

```
HEPAX ROM
```

briefly in the LCD and the input message [ADR:_ _ _ _] back to the display. Now you can try other addresses in the range 8000 to F000 so you can find which page is the PPC ROM allocated to. To try another address once you are already navigating in one page, press the back-arrow (correction) key and key another address in. To exit HEXEDIT, press back-arrow key in the [ADR: _ _ _ _] display.

Once you key in a valid address, you can navigate with [SST] and [TAN] keys, being [TAN] equivalent to BST. The regular HEXEDIT display is:

```
[XXXX YYY _ _ _  ]
```

where XXXX is the current address, YYY represents its contents (000 to 3FF) and _ _ _ is the input-cue reminder. If you see nothing but 000 in YYY field as you navigate through the page contents, this means the page is empty, i.e., no modules addressed to it. After finding where is the PPCROM image allocated to, you'll be able to plug the other modules accordingly. My suggestion is: plug the NoVRAM in the lower port (prot

#1), locate the PPCROM image, turn the calculator OFF, plug the other modules in, one at a time, locate where are they allocated, and see if there is no conflict. I'd suggest Advantage in port three and ZENROM in port four. This would give port 2 free for HEPAX RAM pages. In any way, Diego is the guy to tell you how it is organized.

I saw that in a halfnut HP41CV, HEPAX in NoVRAM occupies port #5, and in a halfnut HP41CX it goes to port #6 (port #5 in the HP41CX is internally used by X-Functions/Time Module).

Not so much of a help to solve the problem, but I guess it will help you going ahead.

Cheers.

Luiz (Brazil)

Re: trying to work with Zenrom, Novram and Advantage together

*Message #4 Posted by **Diego Diaz** on 22 Jan 2006, 5:42 p.m.,*
in response to message #3 by Fulcrum

Hi there,

Thanks Luiz, for your detailed explanation regarding page allocation "seeking". I certainly wouldn't have done it better. ;-))

Fulcrum, the main trouble with the configuration you've chosen is that there is not enough addressable space into 41's memory area for that number of modules.

Let's see:

HEPAX ROM is not a trouble as it will fit itself into page #5 (41C or CV) or page #6 (41CX), but HEPAX RAM is, as it will go from pages #8 thru #B. Therefore, you have just 4 free addressabe pages (#C - #F) but a 5 pages modules count: PCC (2 pages, into NoVRAM flash), Advantage PAC (2 pages, don't care about Bank-Switching) and ZenROM PAC(1 page)... Oops, one page too many!

Don't pannic, as usual NoVRAM (HEPAX) allows a nice workaround ;-)

- Just plug in your NoVRAM (port-1) along with ZenROM PAC (port 3 or 4 depending on where your PCC image is addressed to).

- Clear HAPAX RAM from page #B.

- [COPYROM] from wherever your ZenROM is, to page #B. Now you have a copy of ZenROM into NoVRAM's non volatile RAM wich you may handle as if it was ROM.

- Remove ZenROM pac and replace with Advantage.

Now you have them all running into your HP-41!!

Hope this helps.

Best regards.

Diego.

*Message #5 Posted by **Fulcrum** on 23 Jan 2006, 6:40 p.m.,*
in response to message #4 by Diego Diaz

Hello, Diego, thank you for your help, I am rather new to this hepax and memory structure of the 41, could you explain me how do I do the ram clearing and how could I find the zenrom location? Thank you

Re: trying to work with Zenrom, Novram and Advantage together

*Message #6 Posted by **Miki Mihajlovic** on 24 Jan 2006, 1:04 a.m.,*
in response to message #5 by Fulcrum

Zenrom module is allocated to the upper page of whatever port it is plugged into. So if you plug it into port say 1, Zenrom will be at page #9 (port 2 - Page #B, 3 - #D, 4 - #F). As per Zengrage "... the reason for this, is to accommodate the growing number of users who are installing modules inside their 41s. Because ZENROM is addressed to the upper 4k of a port, both ZENROM and another standard 4k module can be effectively plugged in to the same port..."

I would plug Zenrom into port 4, COPYROM from #F to #B and replace Zenrom with Advantage, as Diego suggested.

Re: trying to work with Zenrom, Novram and Advantage together

*Message #7 Posted by **Fulcrum** on 24 Jan 2006, 5:05 a.m.,*
in response to message #6 by Miki Mihajlovic

ok and how do I put the address of b anf f pages in the x and y registers? Thank you

Re: trying to work with Zenrom, Novram and Advantage together

*Message #8 Posted by **Fulcrum** on 24 Jan 2006, 5:17 a.m.,*
in response to message #7 by Fulcrum

Hi again, I managed to copy the 15 (F) on the 11 B and now it works, still 1304 registers free, how is that possible, I thought it would use 4k and I have the same amount of registers free than before. Thank you

Re: trying to work with Zenrom, Novram and Advantage together

*Message #9 Posted by **Diego Diaz** on 24 Jan 2006, 9:12 a.m.,*
in response to message #8 by Fulcrum

Hi,

First a recomendation, it is important to read the HEPAX manual top to toe... :-)

Now for the details:

I'll suppose you've placed PCC images into pages #C and #D.

- Execute [HEPAX 002] to get a "Memory map".

- Clearing RAM is performed by HEPAX [CLRAM] function, you must enter "OK" into alpha register and place the number of the page (in decimal) into X register. It will be advisable to rebuild your HEPAX Filesystem completely, mostly because of the ill configurations you've been using (placing overlapped pages of ROM/RAM) which more likely have left garbage into NoVRAM RAM. So repeat the clearing procedure for every page from #B to #8. (Order is "somehow" relevant)

- Once your page #B (d'11) is cleared, then place source page d'15 (if you plug Zenrom into port 4) in X register, then destination page d'11 into X register, (source page nr. will be pushed to Y register by doing so), then [COPYROM]

- Switch OFF, replace Zenrom module with Advantage and ON again...

You're done!!

Now your register count [HEPROOM] shoud be ok.

Best regards.

Diego.

Re: trying to work with Zenrom, Novram and Advantage together

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 24 Jan 2006, 10:32 a.m.,*
in response to message #8 by Fulcrum

Hi, Fulcrum;

If you allow me a suggestion, mainly based on Diego's wise words, it's time to order a MoHPC DVD/CD Set, unless you already have them. All necessary manuals/books to master these modules (or most of them) are already there. A few others may also be found at TOS.

Please, consider this a suggestion. As I mentioned before, I think all contributors in here agree with me when I say it's a pleasure to help when I (we) can. Anyway, sometimes it is a good idea to have such reference/study material in hands so you can go ahead with 'interactive' experiments + knowledge base.

Cheers and success.

Luiz (Brazil)

Re: trying to work with Zenrom, Novram and Advantage together

*Message #11 Posted by **Fulcrum** on 24 Jan 2006, 11:22 a.m.,*
in response to message #10 by Vieira, Luiz C. (Brazil)

Hello again mates: First of all thank you for your help. I have some sets of

documentation, including Hepax, synthetic programming, extend your hp41, etc, they are overwhelming to me as I am starting and I am not used to manage this machines as a "hardcore user", so I am trying to do my best learning, the more I learn the more find this machine amazing, specially in such an old piece of equipment... See you

Re: trying to work with Zenrom, Novram and Advantage together

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 24 Jan 2006, 12:42 p.m., in response to message #11 by Fulcrum*

Hi,Fulcrum;

Just to keep suggestions 'up to date' (as you mentioned correctly, the HP41 is yet an amazing computational tool), one of the most interesting books I read (been reading, in fact) is "HP41 MCode for Beginners". It delves into the HP41 HW and MCODE structures, as a an 'in deep' complement to HEPAX Manual Vol. 2. You see, dealing with HP41 inner secrets demands knowing some tricks, if I can say so.

I myself am also new in the HP41 'insides', although I use it since the 80's. After I got the chance to put my hands in an MLDL2000 and both NoVRAM/NoV32 in the end of 2005, I started delving into the same secrets you are dealing with right now. I guess I know the feeling of wanting to go ahead and finding a bunch of documents to be understood. Based on all of what I've been reading so far, these documents are somehow compact, and sometimes I wish they have a few more pages to explain some details I know that were not mentioned.

Cheers and success.

Luiz (Brazil)

HP30S Numerical Anomaly

*Message #1 Posted by **Rodger Rosenbaum** on 22 Jan 2006, 12:16 a.m.*

Recently while looking at the calculator forensics web site,

http://www.rskey.org/~mwsebastian/miscprj/forensics.htm

I noticed that the HP30S was shown to pass the

arcsin(arccos(arctan(tan(cos(sin(9))))))

test with no error.

I wondered if this was really true, so I decided to look at all the intermediate results during the calculation. I discovered that the zero error result is the result of a peculiarity of the HP30S arithmetic.

The HP30S is apparently doing binary arithmetic internally, with 80 bit precision (about 24 digit decimal precision). It can be verified that ordinary operations such as +, -, * and / are giving 24 digit results. Some of the other mathematical functions don't do so well. Joe Horn discovered a while ago that square root only gives about 12 digit precision. The trig functions can give substantially less than 24 digits; sometimes as low as 14 digits.

The full precision of a particular result can be seen using the technique described on the calculator forensics web site to see guard digits: (http://www.rskey.org/~mwsebastian/miscprj/guard_digits.htm).

The idea is to make a calculation and then subtract some of the leading digits of the result and then you will see the rest of the digits. It may be necessary after the subtraction to multiply by some power of 10 to shift the remaining digits left so they can be seen.

The last calculation in the calculator forensics test is an arcsin, and while looking at the details, I discovered the following peculiar behavior of the HP30S.

In degrees mode, type the following into the HP30S (followed by enter):

Type arcsin(.156434465031) and see the result: 8.999999999

Type (arcsin(.156434465031)-8.999999999)*100000000000 and see: 46.45174843

The digits from the second calculation should be appended to the digits from the first calculation to give a multi-digit result of: 8.999999994645174843; the exactly correct result should be: 8.9999999946451748615554. In this case the HP30S gets 18 correct digits.

But now do the same calculation with a slightly greater argument:

Type arcsin(.156434465032) and see the result: 9

Type (arcsin(.156434465032)-8.999999999)*100000000000 and see: 100

The exact result should be: 8.9999999995252746476729

What happened? After some playing around, it seems that whenever the result of a calculation (of a trig function, at least) is an integer followed by .9999999995+, that is, the digits after the decimal point are nine 9's and a 5 plus just a few more non-zero digits, the HP30S just rounds up to the next integer. So what should have been:

8.9999999995252746476729

turns into 9.000000000000000000000000.

And the same thing happens on the other side of an integer (slightly greater than some integer). For example:

arcsin(.156434465049) returns 9.000000001:

(arsin(.156434465049)-9)*100000000000 returns 50.86970993

Realizing that the first result was actually 9.0000000005+some more digits (it got rounded up to 9.000000001 in the display), we can construct the full result of 9.0000000005086970993. The exact result should be: 9.000000000508697101168 52--the HP30S gets about 16 correct digits.

But now try arcsin(.156434465048) and get 9

Furthermore, (arsin(.156434465048)-9)*100000000000 returns 0
, indicating that there are no more digits after the integer 9.

Again the digits after the decimal point have been dropped, and we don't even get 12 digit accuracy.

It appears that whenever the digits after the decimal point are greater than .9999999995 or less than .0000000005, they get dropped--at least as a result of a trig calculation; I haven't checked all other caclulations, but this may happen always.

Why do they do this? Probably to avoid some of the apparent small errors that happen in simple calculations, which perplex naive calculator users. For example, do (sqrt(2))^2 on a typical calculator and get 1.99999999999...(depending on how many digits the calculator carries) instead of exactly 2. Or do sin(pi) and get something other than zero. Or do (6^-1)^-1 and get 5.99999999999... instead of exactly 6. The HP30S gets the exact expected result, but at the price of reduced accuracy when a result is near an integer.
