- HL := memory [DE]
- arithmetic shift right HL
- rotate DE left through carry
- jump if status reg bit 5 set
- jump if status reg bit 5 not set
- RST 40 if overflow

The first five in this list would be especially useful in compiled code.

I have no idea whether any of the CMOS variants included these instructions; the CMOS parts might have been redesigned from the published specifications.

I've seen some vague references to the 8085A having some bug fixes compared to the original 8085, but nothing definitive, and I'm dubious. It seems more likely that it just had improvements to the electrical characteristics, as a result of layout changes or process tweaks. The 8085AH was redesigned in HMOS, Intel's high-density NMOS process, and ran faster. AFAIK, the undocumented instructions existed in all of the Intel NMOS/HMOS parts.

Hi, Since I am the original purchaser of my HP-41CV (in 1981) I feel no problems with using it regularly, since that is why I bought it. I figure that that way I will replace the batteries regularly.

I do, however, keep away from the kids. And it does not go travelling. I have a new (vintage 2003) HP for that, and occasionally I take a "beater" 6-inch slide rule for fun. I probably am showing my age to say that I used a slide rule in high school.

As far as I can determine, they are very resistant to normal wear and tear.

The small Voyager and Pioneer pocket calculators I own, are rotated on a weekly basis (but I still like most the 32SII, and dislike the cheeper 20S, 21S etc...). They sit in a corner of my desk in their hull and wait for their job.

The 41CV, 48SX, 48GX I own are the one I hold "under glass" with all the fine accessories arranged. But even they are still in use for grater programming stuff (or data collection) from time to time.

HP F1690A

*Message #1 Posted by **Larry** on 6 Sept 2005, 2:01 p.m.*

Can anyone tell me if this is part number F1690A (leather soft case for HP 48/49)?
http://tinyurl.com/aa5u3 http://tinyurl.com/acx3y
Its made of Leather and is a perfect fit for the HP 48 and 49 calculators. It has a genuine Hewlett Packard Logo. If its not an F1690A anyone know what it is? It was given to me by someone who found it in a "bits" box at an HP calculator distributor.

How does the HP 42S come apart?

*Message #1 Posted by **don wallace** on 5 Sept 2005, 10:55 p.m.*

Anyone have any experience with repairing these?

DW

Re: How does the HP 42S come apart?

*Message #2 Posted by **Tony Duell** on 6 Sept 2005, 6:28 a.m.,*
in response to message #1 by don wallace

Not so much repairing, as upgrading, but that involves taking them apart.

The case is heat-staked together, like most recent HPs :-(. The stakes are in the battery compartment, and under the metal overlay.

Take off the battery cover and cells. I find it best to carefully peel off the overlay -- use a thin screwdriver worked across the machine between the rows of keys. Don't try to pull it up starting at one end, that _will_ crease it. Then cut off the top of the stakes with a 3.5mm twist drill bit held in the fingers. The case will now open.

For _my own_ machines, I just clip the case back together. I find it says together well enough, even without the stakes, to stand up to the usage I give the machine.

Others have said you can leave the overlay in place, drill off the tops of the stakes in the battery compartment, and then pull the machine apart, breaking the stakes at the front edge (the tops of which are under the overlay). While this preserves the appearance of the overlay, I feel the forces involved could damage the keyboard or even the PCB, and I prefer to have a working machine to one that looks perfect (as I've said here and elsewhere, I don't really care what my machines look like).

On the main PCB there's a large TAB chip (CPU, display driver, ROM, etc), and a 8K*8 SRAM chip. Oh, and a few small components, IR LED, etc. There's not a lot to repair. What's the problem with your machine?

*Message #3 Posted by **adrian swanson** on 13 Sept 2005, 4:44 p.m.,*
in response to message #2 by Tony Duell

In my case something fell on the calc and now none of the keys 3 rows to the left dont work. May be a simple enough repair. What do you think.

Re: How does the HP 42S come apart?

*Message #4 Posted by **Paul Brogger** on 13 Sept 2005, 5:10 p.m.,*
in response to message #3 by adrian swanson

The keyboard contacts are contained in a multi-layer mylar "sandwich" with a 15-conductor edge connector. That connector's contact with the PCB is maintained by a rubbery cushion that sits a bit below the display, above the top row of keys, and behind the case front. (Don't confuse this with the longer, thinner, also rubbery LCD contact strips running above & below the LCD.) If you're living well, removing the PCB will allow you to beef up the cushion strip and re-establish keyboard contact.

I'm one who does NOT remove the overlay -- and I claim I've never damaged a Pioneer by taking it apart the other way. (That is, drilling the stakes in the battery compartment, then prying the case halves apart with my fingers.)

Read the two articles (linked-to elsewhere) and ask questions as they arise. Good luck!

Screwdrivers

*Message #1 Posted by **John Limpert** on 5 Sept 2005, 5:42 p.m.*

I recently picked up a HP-6S that appears to have a dead battery. The case is held together with some tiny phillips screws. None of my jeweler's screwdrivers are small enough to fit. Is there a standard for these tiny screws, so I can say what size the screw is and what size screwdriver will fit it? I've run into similar problems with other hardware that uses microscopic screws.

Re: Screwdrivers

*Message #2 Posted by **Gerson W. Barbosa** on 5 Sept 2005, 6:50 p.m.,*
in response to message #1 by John Limpert

I have a screwdriver set that looks like this one, only it has 5 screwdrivers and a tweezer:

http://www.allproducts.com.tw/sup2/powermost/hq1005.jpg

The second screwdriver from the left, the one marked **+ #0** fits the HP-6S screws nicely.

http://www.allproducts.com.tw/sup2/powermost/hq1005.html

Re: Screwdrivers

*Message #3 Posted by **Tony Duell** on 6 Sept 2005, 6:21 a.m.,*
in response to message #1 by John Limpert

From what I remember, there's not _a_ standard for small crosspoint screws, there are 2 or 3 (Phillips, JIS, Pozidriv (maybe).

You might want to look at MicroTools (http://www.micro-tools.com/). They specialise in small tools for camera repairs (another of my hobbies), and certainly sell small crosspoint screwdrivers. They're not cheap, but I've been very satisfied with the stuff I've bought from them.

Technology missing in calculators

*Message #1 Posted by **John L. Shelton** on 5 Sept 2005, 2:17 p.m.*

There are a number of technical advances used in other products that haven't shown up in HP or other mainstream calcs. Why? Wouldn't some of them be helpful? The technologies below are demonstrably useful and cheap.

- backlit display (see cellphones)
- bluetooth or wifi (cellphones, cordless mice)
- Speech recognition for handsfree operation (cell phones, phone systems)
- waterproofing, for outdoor operation (rugged cells, cameras, etc)
- Color hi-res display to show more math, documentation. (PDAs, cell phones)

Re: Technology missing in calculators

*Message #2 Posted by **Guest** on 5 Sept 2005, 3:19 p.m.,*
in response to message #1 by John L. Shelton

Battery life.

Also, many of those things are not that cheap. Calculators are currently aimed at high school and college students. Cost is a big factor, and the licensing costs for voice recognition software would not be worth the limited convenience. Voice recognition can't beat rpn, either. Waterproofing is also not worth is anymore, because the targets are students in classrooms, not surveyors.

The nice displays are the only thing that I am surprised at the lack of. I do wonder what the biggest reason is for not including high resolution color displays. For TI and HP, the biggest remaining obstacle could very well be backwards compatibility.

Re: Technology missing in calculators

> - Color hi-res display to show more math, documentation. (PDAs, cell phones)

I'll comment on items one by one...

- **Backlighting:** Marketing droid perception of calculators is that long battery life on a couple of "watch

batteries" is *de rigeur* - and size of device is important too. Don't see many calcs today taking AA batteries.

- **bluetooth/WiFi:** Or even Ethernet or USB. All the technologies are too expensive in chip count or chip area except for USB for top-end HP49G... You end up with a tail wagging the dog situation where there's more firmware running the WiFi card innards than there is running the whole calculator! Plus support costs would be high due to complexity (esp for WiFi - lotsa consumer electronic vendors making WiFi products are reporting huge support costs and high return rates.
- **Speech recognition:** Would require a DSP chip + firmware of more complexity than the calc itself. Another 'tail wagging the dog' configuration for dubious usefulness. Also, speech interfaces for many human control tasks are actually WORSE (less reliable, slower and more fatiguing) than other input methods.
- **Waterproofing:** Calcs are near-disposable items now, and biggest market is student market. And if the keyboard is reasoanbly tactile, a good clear ZipLoc bag could be useful. And I can't think of a project (except for some rare civil engineering field work) where numeric work couldn't be done back in vehicle, shed, etc.
- **Color Hi-res Displays:** Again, a tail-wagging-dog situation for many calcs. Prob a successor to the 49G, if HP still makes calculators in a year or so (!), could have one of these. Remember, these better displays cost more themselves than most *entire* calculators (chip, display, case, KB) do. More intense software development/maintenance, for no perceptible marketing/sales gain. Furthermore, you're pricing yourself into PDA territory. And battery life gets worse esp when backlight considered... one of the biggest things consuming juice in digital cameras these days is the LCD viewfinder and backlight; it's right behind the CCD sensor in terms of drain/battery life.

Re: Technology missing in calculators

*Message #4 Posted by **Meindert Kuipers** on 7 Sept 2005, 2:59 a.m.,*
in response to message #3 by Bill Wiese

I agree with all of this, except USB: a USB device (not a host!) is very simple and cheap to implement, and my MLDL2000 add-on for the HP41 adds the USB device with a two-chip solution (USB controller and EEPROM).

Meindert

Re: Technology missing in calculators

Meindert,

Yes, USB device software is relatively easy to implement. But I'd still bet a USB-enabled calculator doubles firmware size (KB) over a non-USB-enabled calc. A calc of HP41 complexity takes 12K or less in ROM space. From some of the example/demo code I've seen, a simple USB device, esp if supporting mass storage (a la USB stick drives) is gonna use up at least 8KB or more in firmware just

to support the RBC disk block device commands.

In high-volume low-cost microcontrollers - the kind that are used on calcs - chip area is king. Look at a photomicrograph of a USB-equipped microcontroller (one not requiring an external analog line driver chip) - the USB I/O area consumes a fairly large fraction of chip area.

Microcontrollers (a la SunPlus) suited for use in most calculators are often $0.75 or less in volume cost, varying on packaging & pin count.

An extra $0.75 in chip price to get in the pricing arena of USB-equipped microcontrollers, plus a $0.40 USB connector (estimate), will add over $3 to price of calc hardware at retail. Add in additional budgeting to cover tech support costs for PC connectivity ("my calc won't enumerate", etc.) and that's at least a $6 in retail price for a feature most won't use. $6 will control whether or not your calc fits in a pricing slot at WalMart, RiteAid, or other volume retail establishments.

Hi Meindert. What chips do you use / how do you implement USB? (In your MLDL2000)

DW

Re: Technology missing in calculators

*Message #8 Posted by **Meindert Kuipers** on 8 Sept 2005, 3:21 a.m.,*
in response to message #7 by don wallace

Hello Don,

The USB interface is the FT2232C from FTDI. There is also the FT245BM that can be useful, but it is much slower. These chips have license free drivers and loads of example programs. The cost of the FT2232C in small quantities is about 6 Euro's, and there are some companies offering the chip on a very small PCB for easy integration.

I have seen on your webpages that you have built a logic analyzer, well, I have done just that with the FT245BM. It is much slower than yours, but when connected to the HP41 it will gice a cycle-by-cylce trace of what the '41 is doing. I must credit Eric Smith for the original idea who uses a

similar approach for dumping all kinds of HP ROM images. This analyzer was very very helpful in debugging the MLDL2000 design.

I plan to add an HP41 bus analyzer later in the MLDL2000.

Re: Technology missing in calculators

*Message #9 Posted by **Holger Veit** on 7 Sept 2005, 5:30 a.m.,*
in response to message #3 by Bill Wiese

This seems to work for mobile phones and PDAs, though, and no such fuss is made about battery life or requirements of complex chips and software support there.

Given that PDAs, and to some degree also "universal mobile phone+PDA+MP3player+gameboy+videoviewer", may be considered an evolutional successor of plain calculators, the observation is:

* you have all these features in such a handheld device nowadays * it does no longer make sense to produce a high-quality calculation-only tool, except as a cheap throwaway gadget - you get more features with a "communicator" * PDAs normally don't reach the calculation features found in older HP and TI calculators, except with additional software which is often work of hobbyist calculator enthusiasts (like HP41 emulators etc.): this make be believe that there is no longer a real interest - read: market - in such complex machines at your fingertips. If you want to do mathematics, you use a full PC; for four-species arithmetic with a single "M"emory, even the lousiest mobile phone has a program built in.

Re: Technology missing in calculators

*Message #10 Posted by **don wallace** on 7 Sept 2005, 8:17 a.m.,*
in response to message #9 by Holger Veit

Hi Holger.

I could not be bothered to use a spreadsheet to do impedance calculations (extreme overkill), etc. I HATE having to do it on a four function calc. Ofen I want to do other stuff with the result, like a quick attenuation calculation in dB (for audio filter or "roll-off" calc or maybe curious about phase or time delay, too).

No calculator other than my 41CV with TIME module can tell me how many hours per week I will have to put in between now and Christmas to do the remainder of an allocated 150 hours on a technical project. I can't effortlessly tell my wristwatch to beep when the ebay auction is nearly closed (but the mobile phone timer will do that at least).

No four function calc can do any of the simple but neccessary calculations I like to do for my electronics "work". And a PC is VERY CUMBERSOME overkill...

So my 41CV is really quite important to me. I have survived without it and I like to keep my mind sharp enough to "do numbers in my head" but I miss it when I don't have it or it is down or (lately) in need of some repair or TLC. It is an indidspensible workhorse the like of which I have never seen before and never will again. It is one of my most used and valued possessions.

> This seems to work for mobile phones and PDAs, though, and no such fuss is made about battery life or requirements of complex chips and software support there.

A totally different pricing and distribution model makes the difference.

Support - that's handled by the phone carrier. At least in USA, phone manufacturer's customers are NOT the end-user but the cellphone carriers. When you have a phone problem you're often referred to your carrier as 1st line of support.

A phone is a $200-$300 device, even if you don't pay it directly. In USA (Europe/elsewhere may be different) you often get a 'free' or 'cheap' ($50) phone but have to keep service w/carrier for 2 years or you have to return phone or pay a service charge of several hundred dollars to terminate service (to recoup cost of 'free' phone).

Plus, you charge your phone every few days or even more often than that. The relative power budget for the display as opposed to the transmitter power amplifier and radio DSP allows some leeway there. And the color backlit LCDs DO have more drain than monochrome LCDs and battery life is less than roughly equivalent generation phones w/simpler LCD display - though that is narrowing a bit. (My next cellphone will NOT have a color display!)

By contrast, most people are accustomed to their calculator always being there and up & running without charging or worrying about batteries. Otherwise, LED calcs would still be on the market: 7-segment LED display sticks are cheaper than LCDs and zebra connectors. ;)

And a $35 calc can't afford to be sold expecting a 1 in 5 chance that customers will call an 800# with detailed tech questions requiring 10 minutes of a customer rep's time. The profit has just walked away if that's happened.

Bill Wiese

Not in my experience. LED displays have more components and require more manufacturing steps to assemble than LCDs, so they are more expensive for a comparable display (i.e., if both are 10 seven-segment digits).

Mathematical typesetting

*Message #1 Posted by **John L. Shelton** on 5 Sept 2005, 2:05 p.m.*

There's been recent discussion of math programs. And HP manuals. Combining the two, I'm curious: What are best programs/systems for designing truly beautiful documentation. In particular, showing complex mathematical and computer examples.

In the 1970s & 1980s, Don Knuth's TeX was the gold standard. I've lost touch. If you were writing a calculator manual or math paper today, and wanted highest visual quality, what would you use? Why? Can you post PDF examples showing elegance?

My own answer used to be Frame Maker (now from Adobe). But I had to switch to MS Word. It is "good," but fails several tests for true high-quality output.

Re: Mathematical typesetting

*Message #2 Posted by **Namir** on 5 Sept 2005, 2:21 p.m.,*
in response to message #1 by John L. Shelton

I used FrameMaker when I worked for Cisco as a documentation specialist. I was told that it handled multi-chapter documents better than MS-Word. I did not use it to create mathematical docuemnts.

Perhaps MathCAD can help. Alos someone on this website mentioned Mackichan Software's Scientific Notebook. Check the Mackichan Website to see their math software.

Re: Mathematical typesetting

*Message #3 Posted by **I, Claudius** on 5 Sept 2005, 10:11 p.m.,*
in response to message #2 by Namir

I've used MathCAD and found it to be quite poor for typesetting. Indeed, it is a poor program, period, using an outdated subset of Maple 5 commands. It has its users but I don't see how they are doing heavy duty engineering problems with it. Try solving even the most simple symbolic difeq with it. If a so called math program does not have some type of 'dsolve' command, along with accompanying numeric solvers, it can't call itself a math program.

Edited: 5 Sept 2005, 10:15 p.m.

Re: Mathematical typesetting

*Message #4 Posted by **Mark A. Ordal** on 9 Sept 2005, 9:55 a.m.,*
in response to message #2 by Namir

If you are just concerned with aesthetics, you could use QuarkExpress and an XTension "Mathsetter" ($399 from <http://www.bluesky.com>). The MathSetter XTension adds TeX/LaTeX math typesetting capability to some older versions of QuarkExpress (version 4.x or 3.3.x versions equal to or greater than 3.3.2).

If the long-term viability of your files is important, you will need to stay with LaTeX. FrameMaker is clearly not an option in this regard! FrameMaker's only champion at Adobe, John Warnock, is no longer with Adobe---he's the one man responsible for the purchase of FrameMaker. Adobe has already discontinued development of the Mac version and all UNIX versions except Solaris. It seems highly likely that FrameMaker will be discontinued as soon as Adobe can get away with it.

Addons for M$ Word, such as Mathtype (from <http://http://www.adeptscience.co.uk>) or Expressionist (now called MathEQ from <http://www.livemath.com>) aren't the answer either, in my opinion. For one thing, they are specific to Mac and Windows systems so you preclude any future move to a Linux/Unix system. (TeX/LaTeX doesn't suffer from that limitation.) Using these equaton editors with TeX/LaTeX involves some compromises too. For example, when I used Expressionist (about 10 years ago) it could export in TeX format for pasting into TeX/LaTeX files. HOWEVER, Expressionist didn't have a parser for TeX/LaTeX so you couldn't edit your equation again in Expressionist UNLESS the big block of comments Expressionist generated was kept intact. Those comments were Expressionist's notes to itself on how the equation was made. I'm sure MathType uses a similar scheme for TeX export.

I would expect the word-processor-like front-ends for LaTeX (e.g., Lyx <http://www.lehigh.edu/~dlj0/LyX.html> or Scientific Word <http://www.mackichan.com/>) would suffer to some degree from this problem as well. At least for me, there is a distinction between a "LaTeX compatible" file format and a "LaTeX" file.

As for Dave Shaffer's comment regarding TeX/LaTex:

"The main drawback as I see it is that high-priced scientists have been turned into secretaries."

I would have to strongly disagree. I've known and worked with many talented secretaries over the years and NONE of them could have done what I do with LaTeX. So I don't think that document preparation with TeX/LaTeX can be considered "secretarial work". The bottom line is: if you want it done right with TeX/LaTeX you are going to have to do it yourself.

--Mark

Re: Mathematical typesetting

*Message #5 Posted by **Dave Shaffer** on 9 Sept 2005, 12:16 p.m.,*

Mark,

re: "I would have to strongly disagree. I've known and worked with many talented secretaries over the years and NONE of them could have done what I do with LaTeX. So I don't think that document reparation with TeX/LaTeX can be considered "secretarial work". The bottom line is: if you want it done right with TeX/LaTeX you are going to have to do it yourself."

I don't think we disagree - That's exactly my point!

In the good old days (?!), you gave your secretary a handwritten draft, and she quickly produced an impeccable typewritten version, with equations handwritten in (maybe she did that, maybe you did that). Nowadays, virtually all my astronomer friends and I do all this work ourselves, including the TeX typesetting (which as you note, is far from trivial). Yes, I agree that is beyond the capability of most secretaries, which is why you have to do it yourself.

My point was that the time you spend typesetting is time that you are not collecting, reducing, analyzing, and perhaps most importantly contemplating data.

Re: Mathematical typesetting

*Message #6 Posted by **Doug Wilder** on 5 Sept 2005, 6:58 p.m.,*
in response to message #1 by John L. Shelton

There is an add-in for MS Word called MathType that has full mathematical features. It can even export the equations in TeX/Latex and a couple other formats for typesetters. LaTeX is alive and well in modern usage. Check out this thread for LaTeX usage on the net (doubleclick an equation for it's code):

So far I've seen no good reason to _downgrade_ from \TeX or \LaTeX.

Re: Mathematical typesetting

*Message #8 Posted by **Joao** on 6 Sept 2005, 6:41 a.m.,*
in response to message #7 by Tony Duell

I think the standard for maths papers is still TeX/LaTex. I use Scientific WorkPlace from Mackichan, which is a nice front end for LaTex and integrates Maple.

Re: Mathematical typesetting

*Message #9 Posted by **Dave Shaffer** on 6 Sept 2005, 1:34 p.m.,*
in response to message #1 by John L. Shelton

TeX/LaTeX is still the gold standard in astronomy. Most published meeting procedings want only a LaTeX file (with the relevent style file(s)) for the book which is the result of the meeting (means practically no typesetting or formatting effort on the part of the editors or publishers).

Many journals also want (La)Tex files as the final version of submitted papers - once again, a minimum of effort on the part of the publisher.

The main drawback as I see it is that high-priced scientists have been turned into secretaries.

HP manuals prepared on TeX/LaTeX?

*Message #10 Posted by **Karl Schneider** on 7 Sept 2005, 1:51 a.m.,*
in response to message #1 by John L. Shelton

Based on the font appearance, I believe the flat-bound 1990's HP-48G and HP-32SII manuals were prepared using TeX/LaTeX.

Does anyone know if this is true? The spiral-bound 1980's Voyager and Pioneer manuals look nicer, but were undoubtedly costlier to produce.

Re: Mathematical typesetting

*Message #11 Posted by **Thomas Okken** on 8 Sept 2005, 10:50 a.m.,*
in response to message #1 by John L. Shelton

If you don't mind using a non-interactive, non-WYSIWYG system (like TeX), you could try Lout. It generates PostScript, and can be customized using PostScript macros -- powerful, and its output quality is excellent. For mathematical equations, it includes a macro package based on the old Unix "eqn" tool, which is easy to use and I find works very well.

Re: Mathematical typesetting

*Message #12 Posted by **Ben Salinas** on 13 Sept 2005, 5:06 p.m.,*
in response to message #11 by Thomas Okken

You might try LYX as an editor for LaTeX. I had it recommended highly by a friend just a few days ago. Though I haven't used it, I understand that it is almost WYSIWYG.

Basically, as soon as you type the LaTeX command, it appears on the screen.

Try it out (though I hear it might be borken in windows)

-Ben

HP33S TTF: missing character... My fault!

*Message #1 Posted by **Vieira, Luiz C. (Brazil) - not logged** on 5 Sept 2005, 1:03 p.m.*

Hi, all;

those of you who have already installed and tried the TTF files specifically drawn to digital devices (mainly HP calculators, LCD and keyboard) probably missed the ":" in the HP33S set. I found this potencial flaw this very weekend and I'll soon post a new TTF file replacing the earlier version.

As no one complained so far, it is going to be easier to find a new arrangement to fit the new character. Those who have already tested the HP33S TTF (or at least read about it) know that I choose two characters for dot and comma: the original tinny in-between digits set and a full-digit set.

The problem is that I choose [:] and [;] to hold the tinny "." and "," respectively. Then I choose [.] and [,] to hold the full-digit, pseudo "." and ",". Now I see I made a bad choice...

Because the fonts ara available at HPCC site, I'll provide a copy of the updated font to them as well.

And Dave, what about hosting the fonts and a short PDF explaining how to use them? I'd gladly send you a copy of them all so any contributor/visitor would access them through the MoHPC. Is there available space to host them at the MoHPC? Let me know!

At last, forgive me for the possible troubles this missing character caused.

Cheers.

Luiz (Brazil)

HP collectables & eBay

*Message #1 Posted by **Wilson (Bill) Holes** on 5 Sept 2005, 12:47 p.m.*

Yesterday I put one of Redshift Software's few remaining HP-41 AECROM modules on eBay (see item 5805816021) to help raise funds for the victims of Hurricane Katrina. 100% of the final sale price realized in this 3-day auction will be automatically donated to the American Red Cross. Whatever the sale price is, it will be a just a "drop in the bucket," but every little bit helps.

My state, the state of Texas, is stepping up to the plate to help in every way. It occurred to me that the members of our great HP community could be inspired to do likewise.

eBay has made it relatively easy to automatically donate various percentages of your final sale price to virtually any charity you elect. I'd like to encourage everyone to give some thought to selling some of their duplicate HP collectables in this manner.

33s backspace key

*Message #1 Posted by **Hal** on 5 Sept 2005, 11:29 a.m.*

The backspace key function doesn't seem to be working on my new 33s. According to the manual, you should be able to use backspace during any data entry mode to delete the character to the left of the cursor. When I try to do this, the backspace key doesn't appear to be active (ie, I get the little exclamation point in a triangle annunciator). I'm using the left end of the cursor control bar as the back space key. Any ideas appreciated. Thanks, Hal

Re: 33s backspace key

*Message #2 Posted by **sjthomas** on 5 Sept 2005, 4:59 p.m.,*
in response to message #1 by Hal

The backspace/erase key is the left-pointing arrow -- located between the TAN and division keys.

Edited: 5 Sept 2005, 5:00 p.m.

HPIB connector size?

*Message #1 Posted by **marais** on 4 Sept 2005, 5:06 a.m.*

I am not sure this question belongs here - I'd like to try to readout my Fluke 8842A multimeter (GPIB option installed) with my 9825, for which I have the reqired HPIB card (my real objective would be to hook up the DMM to my HP85, but I haven't found the HPIB card yet). I am about confused about HPIB/GPIB/IEEE488 differences; I recall IEEE488 being compatible with the older HPIB standard. However, I notice that already the connectors aren't the same size. Does anybody here know about a site where these things are explained? I suppose adapter cables can be bought somewhere? Sorry if this doesn't belong here.

Andreas

Re: HPIB connector size?

*Message #2 Posted by **Tony Duell** on 4 Sept 2005, 6:34 a.m.,*
in response to message #1 by marais

HPIB, GPIB and IEEE-488 are all much the same, and all are electrically compatible. They all use the 24 pin 'Blue Ribbon' connector, which is similar to a Centronics printer connector, but smaller.

The HP98034 HPIB interface for the 9825 certainly came with that connector on the end of the cable.

There was also something called IEC625, which had the same signals, but which used a DB25 connector (like an RS232 connector).

What are the connectors on your instrument and on your interface?

Re: HPIB connector size?

*Message #3 Posted by **marais** on 4 Sept 2005, 10:19 a.m.,*
in response to message #2 by Tony Duell

Hi Tony, the instrument has a centronics-like connector, just smaller, 24 pin, properly labelled "IEEE STD 488 port", with a second label saying "SH1 AH1 T5 L4 SR1 RL1 DC1 DT1 PP0 C0 E1". The connector on the interface is similar, only larger. Or shouldn't that be an IEEE interface? Let me check, I start having a doubt.

Andreas

Re: HPIB connector size?

*Message #4 Posted by **Eric Smith** on 4 Sept 2005, 2:53 p.m.,*
in response to message #1 by marais

There are various slightly different looking connectors in metal and plastic, but the only functional difference you should see among actual IEEE-488/GPIB/HP-IB connectors is that newer ones use metric screws but older HP-IB ones did not. On genuine HP connectors, on both the cables and instruments, they color-coded it; IIRC

the black hardware is metric.

You can use the connectors with metric and non-metric hardware together as long as you don't try to screw them together (which will damage the screws).

Why so durned many connectors??

*Message #5 Posted by **John L. Shelton** on 4 Sept 2005, 3:07 p.m.,*
in response to message #4 by Eric Smith

In some idealistic future, we will have about 5 connectors from which to choose, not millions. Things being connected will negotiate with each other before applying voltage, so no damage is ever possible.

Our connectors will include:

- very small, easily attached and detached - for providing data or power (or both) to small devices, where accidental disconnection is acceptable (and perhaps desirable, instead of breaking something.
- Small, reliable (locking) connector for data or power to small and medium devices. Designed for less-frequent use, and difficult to accidentally disconnect.
- Heavy duty - suitable for delivery of lots of power. Probably comes in several sizes: 1KW, 10KW, 100KW, etc.
- environmentally secure - watertight, gas-tight, etc.

In this ideal future, gadgets will need only one connector, but will perhaps have extras, to allow easy daisy-chaining etc. Plugging a calculator into a wall outlet would require negotiation: "I need 12VDC. I can supply data at this rate." "OK. I can give you 12VDC. Tell me more about your data; I have a refrigerator that wants to know something."

Sound far-fetched? Imagine all the effort we've spent over the years designing millions of special-purpose connectors. And all the effort wasted trying to connect dissimilar devices. And the sheer stupidity of re-using the same physical connector for incompatible (and electronics-damaging) purposes. Like the good-old DB-25 connector, used in the 1960s - 1990s as an RS-232 serial connector. Used also 1990s - 2000s for PC Parallel printers. Used also 1980s-1990s as Macintosh SCSI connector. Oops - there goes another blown chip!

Re: Why so durned many connectors??

*Message #6 Posted by **don wallace** on 4 Sept 2005, 5:40 p.m.,*
in response to message #5 by John L. Shelton

Hi all. Hi John.

I am actually working on early prototypes of the sort of connectors you seek. Amazingly, I found some information on what my products will look like. The data comes from an e-mail mistakenly sent backwards in time to me from another e-mail box I set up in 2008...

ADVANCED CONNECTORS SET NEW STANDARDS IN DEVICE CONNECTIVITY

The new connectors from WALLACE LABS offer greatly increased ease in connecting devices together. Using advances in bio-psychic hybridization as a result of using living cells (the so-called "wet chip") running a custom genome with splices of DNA from PSYCHIC LAB RATS (descended from 1960's UCLA stock) and mature breeding salmon, the hybrid electro-biological interfaces are able to morph into various shapes on contact with each other to ensure machanical compatibilty. The custom electronics then adapts on-the-fly by "sensing" the other interfaces preferred data format, protocols, voltage and current levels by "feeling the VIBES, Man! (direct quote from a reply by an interrogated

chip)".

Connector performance is excellent. There are some special considerations and drawbacks however... Early users of the new products report that the data links, while very reliable, slow down when exposed to FUNK MUSIC from the early 1970's. They are prone, due to telepathic leakage currents, to "sulking" in office environments when there are stressed or frustrated humans around and refuse to operate at all if exposed to Hip-Hop or Opera. They will tolerate Stravinski, however and run well in an ambient environment of music by Frank Zappa, Pink Floyd or loudly played Led Zeppelin.

*Message #7 Posted by **Howard Owen** on 4 Sept 2005, 6:27 p.m.,*
in response to message #6 by don wallace

Careful with those things, Don. Don't let the blue nosed get hold of the technical details.

Gives a whole new meaning to the term "Xbox!"

Re: Why so durned many connectors??

*Message #8 Posted by **don wallace** on 4 Sept 2005, 8:04 p.m.,*
in response to message #7 by Howard Owen

Hi Howard.

IBM take on a scheme which ensured COMPATIBILITY?! With equipment from OTHER VENDORS?!

Don't worry; we're all quite safe, it will NEVER happen.

DW

P.S. An old joke:

Q. How many IBM executives does it take to change a light bulb? (I know, you all KNOW THIS ONE...)

A. 500. 1 to hold the light bulb and 499 to TURN THE COMPANY AROUND.

Re: Why so durned many connectors??

*Message #9 Posted by **Howard Owen** on 4 Sept 2005, 8:33 p.m.,*
in response to message #8 by don wallace

Hahaha!

I'll have to tell that one to my colleagues. 8)

But, I meant "blue nosed" not as in "big blue" but as in "member of the joy police." That usage, I now find after a Wikipedia and Google search, is quite rare. I only found two references to my favorite meaning of the phrase. It is swamped by the Nova Scotian schooner "Bluenose" on Google. And the London "Blue Nose Society" of poets outranks it too.

Regardless, I grew up with "blue nose" meaning "prude." It is death to a joke to have to explain its meaning, but you might try rereading my prior attempt with the correct definition in mind. 8)

Re: Why so durned many connectors??

*Message #10 Posted by **don wallace** on 4 Sept 2005, 9:23 p.m.,*
in response to message #9 by Howard Owen

Howard, I am sure that the "lab" could come up with "appropriate" firmware in the datalink products for the PC (politically correct, not personal computer)...

I am not sure that there will ever be a version which can withstand Hip-Hop or opera, though... That is just TOO MUCH to ask ;-)

42s: programming a line of -2

*Message #1 Posted by **rob** on 4 Sept 2005, 1:54 a.m.*

At Minehunt game , line 144 has me stumped. I don't know if I should enter this line as follows:

```
144 "-2"
```

or as

```
144 -2
```

I cannot figure out how to get the -2 to show up on the line for me without going to the next line automatically. There is another one of these later on, on line 249.

thanks, rob

Re: 42s: programming a line of -2

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 4 Sept 2005, 2:21 a.m.,*
in response to message #1 by rob

Hi, Rob;

to enter this program line, simply press

```
[2] [+/-]
```

The [+/-] key will change the sign of the number being currently entered, either in normal or in program mode. After the

```
[2] [+/-]
```

just press

```
[shift] [COMPLEX]
```

and go straight ahead with the next steps.

You can follow the same reasoning in step #249:

```
[1] [+/-]
```

I hope you succeed.

Luiz (Brazil)

Your Favorite Math Program

*Message #1 Posted by **I, Claudius** on 3 Sept 2005, 10:42 p.m.*

For some time I've been a Mathematica user, have had to use MATLAB for work purposes. Just recently I started using Scientific Workplace, an outstanding math word processor coupled with the MuPAD computer algebra system. The new version 5.5 is superb, very useful, powerful, and easy to use. It made me wonder, what are others using, for what purpose, how do you rate them?

Re: Your Favorite Math Program

*Message #2 Posted by **Namir** on 3 Sept 2005, 11:52 p.m.,*
in response to message #1 by I, Claudius

I use MATLAB. There is a wealth of toolboxes and books written for and about MATLAB. Also the MathWorks toolboxes are very powerful. It took me a little while to get the hang of vector/matrix programming, but now I can think using that paradigm.

Re: Your Favorite Math Program

*Message #3 Posted by **I, Claudius** on 4 Sept 2005, 8:08 a.m.,*
in response to message #2 by Namir

Namir, did you buy any books to help you learn MATLAB? I need to know that program better, and would like any recommendations you might have.

Re: Your Favorite Math Program

*Message #4 Posted by **Howard Owen** on 4 Sept 2005, 12:12 a.m.,*
in response to message #1 by I, Claudius

I'm a mathematical dilettante. I want to push past my hazy freshman's understanding of mathematics mostly for fun. You don't often use mathematical analysis in software systems design. Statistics is another matter. For that, there is GNU R, which is S on steroids and Free software.

I started my career in computers at UCSB Physics back in 1986. There I watched Mathematica take academia by storm when it was first released. That was 1989 or so. (The Physics department was also running Macsyma on Eunice, on a VAX. If you know what all that means, I'd like to talk to you.) I stopped working in Academia in 1992, and I've never gone back. So I miss those great academic discounts, among other things.

Checking out Mackichan Software's site, I see they are priced competitively to Mathematica, but still out of my reach for the whole bundle. However, "Scientific Notebook," Which appears to be Scientific Workplace minus the LaTeX output, is reasonable, at $222.00 for a commercial license. The student proce of $100.00 is more attractive, and better fits the use I would put the software to, but alas, I don't have a student ID. But the clincher for me is the lack of Linux support. I won't embark on projects that tie me to Windows, if I can help it. And since I want to use the software for recreation/education, I can certainly help it in this case.

My other alternative is to go back to poking at MuPAD in its no-cost form. I recall the interface wasn't all that

bad.

Re: Your Favorite Math Program

*Message #5 Posted by **I, Claudius** on 4 Sept 2005, 8:06 a.m.,*
in response to message #4 by Howard Owen

$222 for Scientific Notebook is $1658 less than Mathematica, priced off Wolfram's website. Mackichan also lets you load the program on multiple computers, whereas Wolfram extorts megabucks for additional platform you want. Your pocketbook is screaming to you...

Re: Your Favorite Math Program

Your Favorite Math BUG...

*Message #8 Posted by **Tizedes Csaba [Hungary]** on 5 Sept 2005, 3:26 a.m.,*
in response to message #1 by I, Claudius

Hello Claudius,

please try to solve with the new version of your math tool my "sceptical-killer" equation:

```
3*X+1/(X-5)=15+1/(X-5)

and SOLVE for X

(X=5 is a "bad" solution!!!)
```

Thank you!

Csaba

Ps.: I use my own routines for small applications, and the Matlab 6.5 for numerical simulations and Maple 7 for my own passions... ;)

Re: Your Favorite Math BUG...

*Message #9 Posted by **Karl Schneider** on 5 Sept 2005, 4:25 a.m.,*

in response to message #8 by Tizedes Csaba [Hungary]

Tizedes' acid test of a solver is:

> Quote:
>
> 3*X+1/(X-5)=15+1/(X-5)
>
> and SOLVE for X
>
> (X=5 is a "bad" solution!!!)

Certainly, neither side of the equation can be evaluated at X = 5. However, it can be stated that

```
3*X + 1/(X-5) = 15 + 1/(X-5)    (X != 5)

=>  3*X + 1/(X-5) - [15 + 1/(X-5)] = 0    (X != 5)

    lim    {3*X + 1/(X-5) - [15 + 1/(X-5)]}
    X->5

=   lim    [3*X - 15  + 1/(X-5) - 1/(X-5)]
    X->5

=    3*5 - 15  +  lim   [1/(X-5) - 1/(X-5)]
                  X->5

=    15  - 15  +  0

=    0
```

That is, if the expressions are combined by subtracting the expressions from each other, the singular terms cancel each other out in the limit case.

Similarly, X = 0 is not a valid solution to the equation

```
sin(X)/X = 1
```

but the limit of sin(X)/X as X->0 is 1.

(Edited to rephrase the last part.)

-- KS

Edited: 5 Sept 2005, 7:23 p.m.

Re: Your Favorite Math BUG...

*Message #10 Posted by **I, Claudius** on 6 Sept 2005, 10:40 p.m.,*
in response to message #9 by Karl Schneider

Using limit laws: lim_{x->5}(3x+1/(x-5))=lim_{x->5}(15+1/(x-5))

lim_{x->5}3x+1/(x-5)-(15+1/(x-5))

lim = 0

Correct. The algebraic isolation of x=5 is also 'correct' in manipulation of the original equation but since neither x={0,5} satisfy the equation there really is no solution and to my thinking is nonsensical. Definitely something I don't see every day.

There are bugs in every CAS, and it's not hard to get one to fail, even Mathematica. I've often wondered why those who always seem to come up with odd behavior/bugs in CASs don't work for the companies who make the programs.

Our european poster has put the problem before us to show how clever he is but has not given us the benefit of his ingenious solution. The next time I come in contact with our math Ph.D I'll put this before him, try to get a formal answer.

Re: Your Favorite Math BUG...

*Message #11 Posted by **don wallace** on 7 Sept 2005, 12:53 a.m.,*
in response to message #10 by I, Claudius

Discontinuities...

Just a thought: All computational systems use either binary or BCD DISCRETE NUMBER SYSTEM APPROXIMATIONS to the "real number" line (not to mention i and the S-plane).

So all we are ever gonna get out of any program is "approximate". Our computers are dealing with "DISCRETE number system analogues" of the real mathematical "universe"...

No wonder the odd program "bombs", even if it IS Mathematica...

DW

Re: Your Favorite Math BUG...

*Message #12 Posted by **Namir** on 5 Sept 2005, 6:14 a.m.,*
in response to message #8 by Tizedes Csaba [Hungary]

You can multiply both sides of the equation by (X-5), thus going from:

3*X+1/(X-5)=15+1/(X-5)

to:

3*X*(X-5) + 1 = 15*(X-5) + 1

which also gives:

(3*X - 15)*(X-5) = 0

and then:

3 * (X-5)^2 = 0

and then solve it. The solution is X = 5.

Re: Your Favorite Math BUG...

*Message #13 Posted by **I, Claudius** on 5 Sept 2005, 9:55 a.m.,*
in response to message #8 by Tizedes Csaba [Hungary]

Are you kidding? Any schoolchild can do this one, no CAS needed:

3x+(1/(x-5))=15+(1/(x-5)) => 3x+(1/(x-5))-15-(1/(x-5))=0 => (3x+(1/(x-5))=15+(1/(x-5)))(x-5) => (x/(x-5))-(5/(x-5))-15x+3x²=15x-(5/(x-5))+(x/(x-5))-75 => (x/(x-5))-(5/(x-5))-15x+3x²-(15x-(5/(x-5))+(x/(x-5))-75)=0 => 3(x-5)²=0 => x=5

Yes, there is a singularity in the original equation, but the singularity exists on both sides of the equation, and cancels with simple multiplying through by the LCD and simplifying. All CASs I have solve x=5, and I see no bug here. Basically, you've submitted a nonsense example for what purpose?

Edited: 5 Sept 2005, 9:57 a.m.

Re: Your Favorite Math BUG...

*Message #14 Posted by **Howard Owen** on 5 Sept 2005, 10:09 a.m.,*
in response to message #13 by I, Claudius

This is much simpler:

3*X + 1/(X-5) = 15 + 1/(X-5)

3*X + 1/(X-5) - 1/(X-5) = 15 + 1/(X-5) - 1/(X-5)

3*X = 15

X=5

Re: Your Favorite Math BUG...

*Message #15 Posted by **Namir** on 5 Sept 2005, 10:52 a.m.,*
in response to message #14 by Howard Owen

There you go! My approach would have restated the equation for a SOLVER to solve. We humans have a few million years of an evolutionary headstart so we can solve it on the fly. At least for the stated equation. Give us something like:

X = Ln(X^4)

And we have to resort to a calculator/computer.

Re: Your Favorite Math BUG...

*Message #16 Posted by **John** on 5 Sept 2005, 1:13 p.m.,*
in response to message #15 by Namir

I took the initial equation to actually mean (from the context)

(3*x+1)/(x-5)=(15+1)/(x-5)

which makes a difference.

Re: Your Favorite Math BUG...

in response to message #16 by John

Very elegant equation ... elegant indeed.

Re: Your Favorite Math BUG...

*Message #20 Posted by **GE** on 6 Sept 2005, 5:30 a.m.,*
in response to message #15 by Namir

x = ln(x^4) becomes, for y=-ln(x) : -1/4=y*exp(y)
and this equation can be related to the definition of the Lambert 'W' function (see V.Abillo's excellent site for more) :
z=w.exp(w) <=> w=LambertW(z)
So y=LambertW(-1/4) and the final solution is :
x=exp(-LambertW(-1/4))
If the very useful LambertW function were present on the keyboard of our beloves calcs, this kind of problem would be straightforward. I have always believed that LambertW belongs there as well as Gamma, or even Sin and log.

About Lambert's W function

*Message #21 Posted by **Valentin Albillo** on 6 Sept 2005, 6:54 a.m.,*
in response to message #20 by GE

Hi, GE:

GE posted:

" This equation can be related to the definition of the Lambert 'W' function (see V. Albillo's excellent site for more) [...] If the very useful LambertW function were present on the keyboard of our beloved calcs, this kind of problem would be straightforward. I have always believed that LambertW belongs there as well as Gamma, or even Sin and log."

Thanks for your kind comments. I do agree about Lambert's W, I think it actually belongs with the rest of usual transcendental functions. Of course, such well known functions as sin, cos, exp, and gamma do have thousands of applications where they're useful, but then they've been well known and studied for many centuries, while W's been under the limelight for only a handful of years.

Yet, more and more applications of W are being discovered continually, in a wide variety of engineering and mathematical fields, which only heightens its importance and further raises the general appreciation of its 'elementariness'.

As for it being included as a standard calculator function, I don't think this is likely to happen. Consider, for example, Bessel functions or elliptic functions. They do have tons of important applications, yet I've never seen a calculator with a built-in, keyboard elliptic sine. You get the regular 'circular' sine, and even the hyperbolic sine. But not the elliptic variety. So, Lambert's W isn't likely to make it.

That said, some HP models allow for user-defined functions that are as close as built-in in their handling as to be transparent to the user. For the HP-71B, for instance, you can enter:

```
DEF FNW(X) = FNROOT(0,10,FVAR*EXP(FVAR)-X)
```

as a program line. Then, from the keyboard, you can use W(x) as easily as sin(x). Say,to solve:

```
x^x = 5
```

you simply would key in:

```
EXP(FNW(LN(5))) [ENTER]
```

which would promptly return to the display the value:

```
 2.12937248276
```

which solves the equation. Notice that you've simply used FNW exactly as you use EXP or LN, i.e., as a built-in function, transparently to the user.

This is as near as it comes to have W directly in the keyboard.

Best regards from V.

I'd vote for built-in hypergeometric function support; I find that useful more often than the Lambert W-Function. But I don't expect a dedicated key for it.

Careful, now....

> Yes, there is a singularity in the original equation, but the singularity exists on both sides of the equation, and cancels with simple multiplying through by the LCD and simplifying. All CASs I have solve x=5, and I see no bug here. Basically, you've submitted a nonsense

example for what purpose?

A long time ago, when I was around 10 years old, my retired-engineer grandfather showed me a algebraically-based "trick proof" that 0 = 1. At the time, I did not have the background to understand what the illegal step was.

I saw that example again, much later. The equations included a denominator term of X-1 that was introduced and later cancelled out. With X=1, though, a divide-by-zero had been performed, making the "proof" invalid.

Namir states in his example that x = 5 is an invalid solution to the problem. In the strictest sense, it is true that the expressions cannot be legally evaluated at x = 5. However, as I had pointed out earlier in the thread, it is true that the limit of the difference of the expressions as x-> 5 is zero.

Perhaps the CAS implementations are falling into the same trap -- performing algebraic steps without observing restrictions and without validating after-the-fact...

*Message #25 Posted by **I, Claudius** on 5 Sept 2005, 10:06 p.m.,*
in response to message #23 by Karl Schneider

Ah, yes, I remember that one, I fell for it hook, line and sinker as a kid:

Given a = b => a^2 = ab => a^2 - b^2 = ab - b^2 => (a + b)(a - b) = b(a - b) => a + b = b => a = 0 => If a = 1, then 1 = 0

While algebraically 'correct', one is lulled into forgetting that since a = b, a - b is zero, and one is dividing by zero, and is the fatal error.

Re: Careful, now....

*Message #26 Posted by **don wallace** on 5 Sept 2005, 10:58 p.m.,*
in response to message #25 by I, Claudius

There's another one, which I think Karl had in mind. I don't really remember it.

Any place on Earth, any kind of mathematical education...

Thanks for response! Csaba

Re: Careful, now....

*Message #28 Posted by **I, Claudius** on 6 Sept 2005, 12:36 p.m.,*
in response to message #27 by Tizedes Csaba [Hungary]

If a = b

Then a^2 = ab

Also b^2 = ab

There is nothing incorrect here. Now I'm beginning to see why the equation you submitted earlier as an indicator of bugs in CASs didn't pan out...

This one's good, too

*Message #29 Posted by **Valentin Albillo** on 6 Sept 2005, 5:50 a.m.,*
in response to message #25 by I, Claudius

Hi all,

This one's very good too. It's based on the same principle, making people forget that you can't cross out a null factor, but here the factor's 'nullness' is even more concealed. Let's see:

Given that <u>a = b + c</u>, to try and prove that, indeed, <u>a = b</u>

1. Initially, we have:

```
a = b + c
```

2. Multiplying both sides by (b-a):

```
a * (b - a) = (b + c) * (b - a)
```

3. Expanding products:

```
a * b - a * a = b * b - a * b + b * c - a * c
```

4. Taking a * c to the other side:

```
a * b - a * a + a * c = b * b - a * b + b * c
```

5. Collecting terms:

```
a * (b - a + c) = b * (b - a + c)
```

6. Eliminating the common factor (b - a + c):

```
a  = b
```

7. Q.E.D.

The 'demonstration' is perfectly reversible, i.e., starting from "a = b" and demonstrating that actually "a = b + c", but it's simpler and more natural this way. When shown to the right people, you can leave them profoundly confused and intrigued. All the mistery goes out when you supply actual numbers, though.

Best regards from V.

... and a nice 'demonstration' that 3 = 2 !

*Message #30 Posted by **Valentin Albillo** on 6 Sept 2005, 6:22 a.m.,*
in response to message #25 by I, Claudius

Hi, all:

... and just to prove that not all fake demonstrations are based in illegally dividing by zero, have a look at this very nice 'demonstration' that 3 = 2. Let's see:

1. According to Calculus, the derivatives of f(x) = x^3 and f(x) = x^2 are, respectively:

```
D[x^3] = 3*x^2  ,  D[x^2] = 2*x
```

2. Also, we know from Calculus that the derivative of a sum of functions is the sum of the derivatives of each function being added, i.e.:

```
D[f(x) + g(x) + ...] = D[f(x)] + D[g(x)] + ...
```

3. Now, by definition, we have the identity:

```
x^3 = x^2 * x = x^2 + x^2 + x^2 + ... + x^2
                <---(x summands in all) -->
```

4. Let's take derivatives in both sides of that identity:

```
D[x^3] = D[x^2 + x^2 + ... + x^2]
```

5. As the derivative of a sum is the sum of the derivatives, we have:

```
D[x^3] = D[x^2] + D[x^2] + ... + D[x^2]
```

6. According to (1) above, we then have:

```
 3*x^2 = 2*x + 2*x + 2*x + ... + 2*x
```

```
                  <-- (x summands in all) -->

               = (2*x)*x

               = 2*x^2
```

7. So, we've got that 3*x^2 = 2*x^2, which for general, non-null x implies that **3 = 2**, Q.E.D.

Nice, uh ? And no divisions by 0 in sight ... Have your students try and pinpoint out what went wrong :-)

Best regards from V.

Re: ... and a nice 'demonstration' that 3 = 2 !

*Message #31 Posted by **Crawl** on 6 Sept 2005, 9:09 a.m.,*
in response to message #30 by Valentin Albillo

That's easy if you look carefully at

x^2 + x^2 + x^2 + ... + x^2 <---(x summands in all) -->

and would maybe be even easier if it was written in sigma notation.

The number of terms in the sum *also* depends on x, not just the terms themselves. So, you also have to differentiate with respect to that "x", which was hidden.

Another type of false proof involves applying the inverse of a function that isn't 1-to-1 on both sides of an equation, but using different branches for each side. Eg.,

(-1) = (-1) (-1)^2 = (-1)^2 = 1, so

(-1)^2 = 1

Taking squareroots cancels the square on the left, leaving

-1 = 1.

I've also seen a false geometrical proof that proves all angles are equal. The trick to that was drawing the picture slightly wrong, but so that the lines that are supposed to be congruent *look* about the same. Some steps in the "proof" were made by appealing to the picture, rather than rigorously deriving them purely through postulates.

After googling it, I found a link to it here:

http://www.jimloy.com/geometry/obtuse.htm

Getting back to calculators, I think the important thing to take from this is that calculators aren't substitutes for your brain. They really should just be used as time saving devices for problems you do understand, not as a "black box" to give you a solution that you couldn't get on your own. While the first example was for a symbolic calculation, there are tricky things that come up with purely numerical calculations. I had a book once that listed a bunch of problems that any calculator would eventually give a wrong answer for (of course, these calculations had to be long for the errors to build up). I can't remember them off the top of my head, but I do remember a different common example: Solving Schrodinger's

Equation to find an energy eigenvalue. If the energy in the equation is correct, then solving the equation should give a function that decays to zero at infinite position. Instead, if you solve it numerically (with Euler's rule, or Runge Kutta, or anything else you can think of), the function will always eventually exponentially diverge to infinity (or negative infinity). The reason is that the general solution of the equation is a linear combination of exponentially growing and decaying terms; at the proper energy only the exponentially decaying term is present. But inevitable accuracy errors will introduce the growing term, which will eventually dominate. It's not a big deal, so long as you know what's going on.

Re: ... and a nice 'demonstration' that 3 = 2 !

*Message #32 Posted by **unspellable** on 6 Sept 2005, 4:37 p.m.,*
in response to message #31 by Crawl

If you multiply both sides of the original equality you get a quadratic. If I haven't slipped up in solving the quadratic, X = +/-i*sqrt(15)

3x + 1/(x-5) = 15 - 1/(x-5)

3x(x-5) + 1 = 15(x-5) -1

3x(x-5) - 15(x-5) = 0

3x^2 - 15x -15x + 75 = 0

x^2 + 15 = 0

x = +/-sqrt(-60)/2

x = +/- i*sqrt(15)

Beware of explanations of fallacies. It's been my experience that a many of the explanations for fallacies contain fallacies themselves.

Re: ... and a nice 'demonstration' that 3 = 2 !

*Message #33 Posted by **Crawl** on 6 Sept 2005, 9:27 p.m.,*
in response to message #32 by unspellable

You made a mistake. A couple, actually.

> Quote:
>
> 3x + 1/(x-5) = 15 - 1/(x-5)

It should have been plus on both sides of the equation; however, you later cancelled those terms as though it was written correctly, so that had no effect. The bigger mistake is here.

> Quote:
>
> 3x^2 - 15x -15x + 75 = 0
>
> x^2 + 15 = 0

You cancelled the -15x - 15x terms, but they actually combine to form -30x.

Then dividing by 3 gives

x^2 - 10x + 25 = 0

(75/3 = 25, not 15)

This has the double root x = 5.

Taking squareroots ...

*Message #34 Posted by **Artur - Brasil** on 6 Sept 2005, 9:27 p.m.,*
in response to message #31 by Crawl

(-1)^2 = 1

Taking squareroots cancels the square on the left, leaving

-1 = 1.

As I remember:

sqrt(X^2) = abs(X), not X, isn't it?

Best regards! Artur

Re: Taking squareroots ...

*Message #35 Posted by **Crawl** on 6 Sept 2005, 10:08 p.m.,*
in response to message #34 by Artur - Brasil

Yes and no. That's the customary definition, but

a) It could just as easily be defined as -abs(x). That still restricts the squareroot to one branch, and would avoid the problem in the "proof".

b) It only works for real numbers. For imaginary numbers,

sqrt(z) = sqrt(abs(z))(cos(arg/2) + i sin(arg/2))

with arg limited to being between any two real numbers whose difference is 2 pi radians. (eg, it could be between -pi and pi, or 0 and 2 pi. The actual choice is arbitrary). With that restriction, you will be on only one branch of the squareroot function. If you let arg be *any* number, you can cross branches and get an error similar to the one in the "proof" (eg, let arg for -1 be 3 pi, and arg for +1 be 0).

Here's a slightly trickier version of the same "proof":

(-1)^2 = 1^2, evaluates to 1 = 1, so is obviously true.

Take logs of both sides:

log((-1)^2) = log(1^2)

Properity of logs

2*log(-1) = 2* log(1)

Divide by 2

log(-1) = log(1)

Exponentiate

-1 = 1.

Re: Taking squareroots ...

*Message #36 Posted by **Dave Shaffer** on 7 Sept 2005, 11:23 a.m.,*
in response to message #34 by Artur - Brasil

"sqrt(X^2) = abs(X), not X, isn't it?"

NOPE!

In the real world, you sometimes need to consider both the positive and negative square roots.

For example, in kinematics (the motion of bodies in physics), the relation between the acceleration of an object "a" (assumed to be constant during the problem), the displacement "x", and the initial and final velocities ("v0" and "v") is

v^2 = v0^2 + 2ax .

Consider that you are given the initial velocity, a negative acceleration, and displacement of a vehicle and then are asked to find the final velocity. There are TWO possible answers - the result of taking the + or - square root, where the sign of the answer indicates whether you are going forward or backwards at the end. The + answer corresponds to the vehicle still going forward (assuming the v0 was positive and x is positive) at position (displacement - we usually assume that you start at position x=0) x. The negative answer corresponds to the vehicle having overshot position x but continuing to slow down and finally reversing (as it continues to accelerate in the negative sense) and coming back to position x, now travelling in the negative (backwards) direction.

The square root function

*Message #37 Posted by **Karl Schneider** on 7 Sept 2005, 11:37 p.m.,*
in response to message #36 by Dave Shaffer

Dave Shaffer stated,

> Quote:
>
> *"sqrt(X^2) = abs(X), not X, isn't it?"*
>
> NOPE!
>
> In the real world, you sometimes need to consider both the positive and negative square roots.

If the absolute value were not taken, square root would not be a function in the strict mathematical sense. This is because a "function" has only one output value.

By convention, the positive value is defined as the output, even though the negative value is equally valid from a mathematical standpoint, and is often relevant.

Consider the well-known quadratic equation:

```
     a*x^2 + b*x + c = 0
==>
     x(1) =  [-b + sqrt(b^2 - 4*a*c)] / (2*a)

     x(2) =  [-b - sqrt(b^2 - 4*a*c)] / (2*a)
```

Only the positive square root is used, but it is subtracted in one case to effect the "negative" square root.

Re: The square root function

*Message #38 Posted by **don wallace** on 8 Sept 2005, 1:09 a.m.,*
in response to message #37 by Karl Schneider

Hi all.

The square root "function' is not really a "function"...

A root of an equation is just that: a ROOT.

The square roots of 4 are 2 AND -2.

In general terms a square root of a (real natural) number is only one of two roots.

A cube root of a (RN) number is only one of three roots.

Take 8 for example:

The cube root we all know is 2...

But there are two other complex roots of 8...

Sorry Karl, but I'm with Dave on this one (fwiw)...

DW

Re: The square root function

in response to message #38 by don wallace

Hello, Don --

> Quote:
>
> The square root "function' is not really a "function"... A root of an equation is just that: a ROOT.

So, $f(x) = e^{0.5*\ln(x)}$ isn't really a function? It gives the positive square root of every real x > 0...

Of course, x represents a number in this context, not a symbolic expression.

> Quote:
>
> The square roots of 4 are 2 AND -2. In general terms a square root of a (real natural) number is only one of two roots.
>
> A cube root of a (RN) number is only one of three roots. Take 8 for example: The cube root we all know is 2... But there are two other complex roots of 8...

Sure, that's all undisputed. (Primary) roots can be found for complex-valued numbers as well, using built-in functions on some calculators. Try it on the 15C, 42S, or RPL models!

The Fundamental Theorem of Algrebra, if I recall, is that a polynomial of order N has N roots.

> Quote:
>
> Sorry Karl, but I'm with Dave on this one (fwiw)...

I never said that Dave was wrong, only that, by convention, the positive-valued square root is the one returned.

> ```

I wonder how this "definition" can be applied to x=sqrt(2) for instance:

```
sqrt(2)^3 = 2 * sqrt(2) = 2 + 2 + 2 +    ...        + 2
                          <-(sqrt(2) summands in all)->
```

HP-67 - no battery - Bad Idea?

*Message #1 Posted by **Howard Owen** on 3 Sept 2005, 4:42 p.m.*

Should I be buying a battery pack for the 67 I just obtained before applying power? I believe I have a dead HP-45 with an equally dead battery pack. If it's not good to power the 67 without a battery installed, would a dead pack do the trick?

Thanks.

Re: HP-67 - no battery - Bad Idea?

*Message #2 Posted by **Andrés C. Rodríguez (Argentina)** on 3 Sept 2005, 5:27 p.m.,*
in response to message #1 by Howard Owen

I have no direct experience on such a case but, based on previous postings, you should have a GOOD (clean contacts AND charge keeping) battery pack, at least every time you use the card reader.

It should not be difficult to rebuilding the dead pack you have, using new AA cells. And check the contacts for oxide, corrosion, dirt, etc. which may prevent the cells to do their functions.

Re: HP-67 - no battery - Bad Idea?

*Message #3 Posted by **Howard Owen** on 3 Sept 2005, 5:47 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

Now, *this* is cool.

Your mentioning of AA cells gave me a Blinding Flash of the Obvious: I had recently rebuilt a battery pack with three AA size NiCads for one of my HP-75s! I pulled out the defunct HP-45, and sure enough, the battery pack was identical to the one I had rebuilt for the 75. So the next step was to yank that working pack out of the 75 and put it in the 67. I did that, and it worked! I had a big grin on my face until I noticed the "property of" sticker on the bottom of the calculator. My "new" 67 was pristine! What the heck??

I had put the working battery *into the "dead" HP-45!* Hee hee!

Edited: 3 Sept 2005, 5:47 p.m.

Re: HP-67 - no battery - Bad Idea?

*Message #4 Posted by **Eric Smith** on 3 Sept 2005, 6:46 p.m.,*
in response to message #2 by Andrés C. Rodríguez (Argentina)

> Quote:
>
> at least every time you use the card reader.

Actually the possibility of damage to the card reader circuitry exists regardless of whether you are actually

using the card reader. It's a matter of the unfiltered supply voltage from the adapter being wired directly to the sense amplifier chip.

The possibility of damage due to missing or bad battery packs is arguably about the dumbest thing HP did in their second-generation calculators. I can't imagine that it saved them more than $0.25 worth of components that would have prevented the damage, or $0.50 worth of components to make it actually work well without the battery.

Sigh.

Re: HP-67 - no battery - Bad Idea?

*Message #5 Posted by **Eric Smith** on 3 Sept 2005, 6:43 p.m.,*
in response to message #1 by Howard Owen

The card reader circuitry can be damaged if you run the HP-67 with no battery pack, a bad battery pack, or a battery pack making poor contact (e.g., corrosion).

Re: HP-67 - no battery - Very Bad Idea

*Message #6 Posted by **Randy** on 3 Sept 2005, 6:43 p.m.,*
in response to message #1 by Howard Owen

All the LED classics without card readers can safely be run with the wall charger only with no battery in place.

In the 65 and 67, the battery is directly connected to the card reader module to drive the motor. That also connects it to the sense amplifier chip. Without a battery, the open circuit voltage reaches 16 volts, more than enough to do some damage. There are cautions about this in the manuals.

The best solution is to test with a dc power supply capable of at least 1 amp. Actual operation is less than 300 ma but the c/r motor is a real current hog.

Many thanks to Tony Duell for pointing out this difference in a thread awhile back.

HP-67 - not a happy camper

*Message #7 Posted by **Howard Owen** on 3 Sept 2005, 11:31 p.m.,*
in response to message #1 by Howard Owen

Well, the 67 worked fine off my rebuilt battery pack, but when I plugged in the AC, a indicator "dot" appeared in the lower right of the display. (Low battery indicator?) After I removed the battery pack and reinserted it, the calculator again worked fine on battery alone, but would not turn on at all with AC plugged in. Flexing the machine slightly brought back the old behavior of the machine up with warning indicator lit.

I plugged the AC transformer into the (suddenly resurrected) HP-45, and it worked fine. The battery pack also works fine in the HP-45. And the combination of transformer and battery pack also is just fine in the 45. So I suspect a poor/intermittant connection somewhere in the external power circuit(s) of the 67. There's no obvious sign of corrosion either in the battery compartment, or on the three external power pins.

There is no service manual for the 67 on the museum DVD. It would be nice to have some kind of road map before opening this one up. Does the HP-67 service manual exist, and if so, does anyone have it in digital form? If not the latter, is someone on the North American continent (or a very patient South American, European, African, Asian or Australian) willing to send me the manual so I can scan it? (Micronesians and Antarcticans shouldn't feel left out, either. 8)

I've never seen a service manual for the 67, although one must have existed at HP service centres. There are basically 3 sources of information :

1) The HP97 service manual on the MoHPC CD-ROMs. The machines are similar, although obviously the 67 has no printer or PIK chip, and the PSU circuit is quite different

2) My HP67 Notes on the articles forum here

3) The HPCC schematics CD-ROM contains a hand-drawn schematic for the 67.

happy up

in response to message #7 by Howard Owen

Here's my take: a)your 67 works fine on battery power, b)you have two battery packs with two safe units to charge them in, and c)plugging an ac adapter into the 67 can be dangerous just because you don't know if a connection is good or bad at that moment.

Why not just run it on battery only? Save peeling up the (pristine?) back plate and taking apart a calc that works just to run it on ac; one unlucky speck of dust on the contacts and that can kill it even if you fix the present problem. I'm assuming that you don't need to do a gummy wheel repair anyway.

A note: I was having trouble with the battery connection on a 67 and the contacts looked clean but i lightly scotch brited both the ones on the calc and the battery anyway. It works fine now. I guess there was some invisible poop there.

Re: happy up

in response to message #9 by db (martinez, ca.)

Good thoughts, thanks.

However, the card reader *does* need the gummy wheel repair. It isn't urgent, however. I'll leave it be for now. I've just ordered to extra batteries so I can run two 75's, the 45 and the 67 on batteries. And I can charge in the 45. I will give the power posts a quick sanding and see if that helps. Thanks for the suggestion.

Re: HP-67 - no battery - No Danger !

*Message #11 Posted by **Bernhard** on 4 Sept 2005, 8:00 p.m.,*
in response to message #10 by Howard Owen

Hi folks,

the Classics HP wall charger (three pins) has a voltage regulator circuit which will absolutely prevent any damaging circuit EVER to appear on the calculator - as long as the regulator circuit has no failed component by itself.

The HP67, despite of being a Woodstock, uses a Classics wall charger.

So it is safe to use the HP67 without battery, running from its HP provided wall charger. When the calc is switched OFF, the output voltage is around five Volts - it will certainly NOT damage any chips.

The only problem is that the wall charger is too weak to run the card reader motor. From my reverse engineering work on these calcs I do see a remote possibility that the attempt to use the card reader without inserted battery might overload and damage the wall charger itself. And then, overvoltage might occur which damages the calculator.

But just using the HP67 (without attempting to use the card reader) from the wall charger - even without inserted battery - is safe.

On all of the other Woodstocks - HP21, 25, 27, 29 - with the two pin wall chargers, any attempt to run them without properly working battery and good battery contacts leads to overvoltage and killed chips in the calc.

best regards, Bernhard

Danger Will Robinson! Danger!

in response to message #11 by Bernhard

Bernhard,

There is a reason why HP warns of use without a good battery in place in both the 65 and 67 manuals.

Please see http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv015.cgi?read=71828#71828 for a recent discussion and explaination of the dangers.

(Sorry for the 1970's USA TV reference in the title)

Danger Will Robinson! Danger!

*Message #13 Posted by **Bernhard** on 5 Sept 2005, 9:56 a.m.,*
in response to message #12 by Randy

Hi Randy,

as far as I have guessed out the 1826-0322 innards, the unswitched battery voltage (which indeed may go to +15V if no battery is inserted and the wall charger used) just goes to a series power transistor which is part of the card reader motor speed control circuit. As long as this transistor is able to withstand the +15V, no damage will be caused. Typical 1970's bipolar process technologies were able to handle that (see the +/- 15V supply voltage on opamps of this time), and it is fair to assume HP engineers knew what they did when they designed the 1826-0322 and took the required precautions.

IMHO the danger of damage lurks in the charger circuit itself. They have a current source circuit which limits the charging current (and hence, the motor isn't able to pull a card through, as it is current starved), but the activated motor acts much like a short circuit. Then, the series transistor in the charger's current source circuit has to sustain significantly more power loss (heat) than during charging, where the battery consumes much of the power. It is

known that overheated bipolar transistors may break through, and then the current limiting gets lost, and whoever knows which component will give up next.

So there is certainly a danger involved when running a HP67 from a charger without any battery inserted, but as long as no attempt is made to use the card reader, IMHO it should be safe. I ran my own HP67 for years just on the charger without battery (and did not use the card reader) when I was fed up to pay HP's exaggerated prices for replacement batteries, and used it until I bought a HP15C years later. A while ago I rediscovered my HP67 (and some other LED HPs I used during school and university) and after fixing the gummy wheel problem the card reader still worked.

However, there is a proverb which says "Better safe than sorry". If anyone who has read my post feels uncomfortable about the alleged or presumed risk of blowing out the 1826-0322, then go the safe way and always use a battery.

I prefer to keep these acid - spitting beasts out of my valuable HPs whenever possible and charge them only in my least valuable (worn / corroded) calculators, and never in the good ones.

For the HP65, I can't give any testemonials as to the danger of damaging its card reader sense amplifier / motor control chip, as it is different from the chip used in the HP67 and I don't have a HP65 to experiment with.

best regards, Bernhard

Re: HP-67 - no battery - No Danger ! -- Oh yes there is!

*Message #17 Posted by **Tony Duell** on 5 Sept 2005, 9:47 a.m.,*
in response to message #11 by Bernhard

I disagree with you! There is a danger.

The classic-series (3 pin) adapter/charger has 2 outputs. One is a constant voltage of about 4.2V. The other is a constant current (about 50mA) to charge the NiCd cells. The voltage of that second output is unregulated and will rise to 16V or so if there's no load.

The 3 pins on the classic calculator connector are ground (in the middle), the +ve side of the NiCd battery, and the +ve supply to the on/off switch and thence to the logic. The last 2 pins are connected by a spring contact in the plug on the calculator, allowing the battery to supply power to the calculator. When you plug the charger in, the spring contact is forced aside, the battery pack is charged from the constant-current supply, the constant voltage supply feeds the logic.

BUT on the card reader models -- the 65 and 67, the card reader sense amplifier chip, the one on the card reader PCB itself, is powered from the battery pack directly. When you plug the charger in, it's effectively fed from the constant current supply. If the battery pack is in place, the battery effectively clamps that voltage to about 4.2V. If the battery is missing, dead, open circuit, etc, then the card reader sense amplifier gets 16V across it.

The sense amplifier was redesigned between the 65 and 67 (the latter chip is also used in the 97 and 82104 (HP41 card reader). The 2 chips have the same pinouts, and seem to be interchangeable. I conjecture that one of the changes was to make the chip less likely to be damaged if the battery back is missing (the 65 manual has a large warning about this, the 67 manual doesn't). However, I don't like risking it. This is a custom chip, spares are very hard to find.

There is no danger in running the 35, 45, 55, 70, 80 from the charger with no battery in place.

Re: HP-67 - no battery - Bad Idea?

*Message #18 Posted by **don wallace** on 5 Sept 2005, 3:45 a.m.,*
in response to message #1 by Howard Owen

For what it's worth I definitely agree with Randy.

I stayed out of the thread as it has been 25 years plus since I heard these warnings and I dodn't have time to look at any documentation I MAY have (I just rxed a DVD on HP stuff but haven't looked at it much yet; so many chips to solder, so little time...)

Randys warnings all sound perfectly logical to me. They match my recollections of what an HP65 (67?) owner I knew found out the hard way...

Nasty design flaw if you ask me... Oh well, nobody's perfect.

HP-65, ser. no. 1608S 02204

*Message #1 Posted by **langdon mcaninch** on 3 Sept 2005, 2:57 p.m.*

While cleaning out my garage, I found a box marked "engineering stuff" which contained a second black and blue box marked HP-65. Much to my suprise, it contained my HP-65 along with the whole anchalada, sales slip and all. It was purchased in June, 1976, and used until 1982 when I replaced it with a HP-16C.

It appears to be in excellent condition, and the battery pack holds a charge (3.96V, unloaded). However, when I try to download a program I feel opposition to the mag card and the card reader motor makes a loud squealing sound likes it needs to be lubricated. Can anyone send me a set of maintenance instructions including the type of lubricant and the lubricating points? Once I correct the problem, I will run a full diagnostic. I think there is a very good possibility that its fully functional.

Re: HP-65, ser. no. 1608S 02204

*Message #2 Posted by **Palmer O. Hanson, Jr.** on 3 Sept 2005, 8:16 p.m.,*
in response to message #1 by langdon mcaninch

There is a discussion of the repair of HP-65 and HP-67 card readers at Viktor Toth's site at http://www.rskey.org/hp67reader.htm but I don't see anything which specifically addresses lubrication.

HP65 lubrication

*Message #4 Posted by **Randy** on 3 Sept 2005, 10:29 p.m.,*
in response to message #1 by langdon mcaninch

Chances are actually rather *poor* that it is fully functional...

Squealing is usually the ball socket at the end of the drive lead screw in need of lubrication. HP typically used a dry graphite lubricant. A drop of penetrating oil on the end of the screw is all that is needed. It could also be a slipping clutch on the drive lead screw.

But - chances are that lubrication is just the tip of the proverbial iceberg. You'll most likely find a gooey mess on the magnetic side of the card once it has been through the reader. If so, you'll need to first replace the card reader drive wheel. It is/was originally latex tubing and it has long since decomposed into a gooey mess. It is a legendary problem with HP card readers and has been well documented. It's easy enough to fix, it just takes a

bit of electromechanical talent and some persistence.

HP-75 Docs

*Message #1 Posted by **Howard Owen** on 3 Sept 2005, 10:54 a.m.*

I'm trying to write a filter to convert HP-75 BASIC files directly into text. (Sort of an external TRANSFORM INTO TEXT command.) While a certain amount of reverse engineering of the file format and BASIC tokenisation is fun, a lot of it is pretty tedious. I was reading CHHU V1N2, and came across an article by Michael Markov entitled "Synthetic Programming on the HP-75". In it, he refers to documents I had seen other references to, the "HP-75 Description" or "HP-75 NOMAS". I already suspected that this could be helpful to me, and this CHHU article specifically mentioned "The HP-75 Byte Table (The Token Table)" on pp 24-30 of the NOMAS. The NOMAS documents aren't on the museum DVD. Does anyone have digital copies? If not, can someone lend me physical copies to scan and make available?

Thanks,

Re: HP-75 Docs

*Message #2 Posted by **Tony Duell** on 3 Sept 2005, 2:12 p.m.,*
in response to message #1 by Howard Owen

I have the NOMAS stuff, on paper. Alas I have no scanner...

Anyway, I sort-of looked into to doing what you want to do. Be warned that it's not that simple -- it's not just a simple tokenisation. From what I remember, it's almost reverse-polish in places.

The table has some examples, and working out how they translated them is not at all obvious!

Re: HP-75 Docs

*Message #3 Posted by **Howard Owen** on 3 Sept 2005, 4:23 p.m.,*
in response to message #2 by Tony Duell

Thanks for the response, Tony.

That's sort of what I figured, which was why I was hoping I could get the NOMAS stuff in digital form. Just looking at the bits, I've figured out a little. I have the following program:

```
0010 ! Just a bang comment
0020 REM This one is a rem
0030 I=1 ! i=1
0040 I$="1" ! i$="1"
0050 DIM A(20) ! dim a(20)
0060 DIM A$(20) ! dim a$(20)
0070 DIM B$[20] ! dim b$[20]
0080 J=1 @ I=2 @ K=J+I ! j=1@i=2@k=j+i
0090 DISP K ! disp k
0100 GOTO 10
0110 GOSUB 10
0120 IF A=1 THEN GOTO 10
0130 END
```

I've decoded part of the BASIC75 file like so:

```
?0000  05 86 c5 00  fe 42 a4 4a  a7 0a  header
 000a  77 6f 72 6b 66 69 6c 65           filename "workfile"
?0012  00 00 00 00 00 00  00 00 00 00   10d nulls. Padding?
 001c  10 00                            line number 10 (little endian 16 bit bcd )
 001e  17                               Distance to next instruction.

HP 15C problem

*Message #1 Posted by **Ulf Røgeberg** on 2 Sept 2005, 8:30 a.m.*

Hi, A small c is showing on my display. And my calculator does not give me the right answers trying to work out angles by using e.g. tan-1.

Does anyone have a clue??

Thanks

Ulf

Re: HP 15C problem

*Message #2 Posted by **Nelson M. Sicuro (Brazil)** on 2 Sept 2005, 9:06 a.m.,*
in response to message #1 by Ulf Røgeberg

Your HP-15C is in "Complex" mode, and in this mode all trig functions are in radians. All functions can accept complex numbers in this mode (IIRC). To exit from this mode, clear the flag number 8, pressing this key sequence:

g CF 8

("g" is the blue key, "CF" is the blue label from "5" key)

[]s

HP 35 CPU

*Message #1 Posted by **Tom Bagdas** on 1 Sept 2005, 1:35 p.m.*

Would anyone know of a source for a CPU for the HP 35. My 35 has some sentimental value and I would like to get it repaired. Also is there a source for the battey/ foil strip for the 41C/Cv/CX?

Re: HP 35 CPU

*Message #2 Posted by **Eric Smith** on 1 Sept 2005, 4:40 p.m.,*
in response to message #1 by Tom Bagdas

Since these chips haven't been made in almost 30 years, the only source is another 35, 45, 46, 55, 65, 70, 80, 81, 9805, or 1722 oscilliscope.

The CPU consists of two chips, the CTC and the ARC. Which one are you trying to replace, and how do you know that it has failed? There is also a clock driver, three ROMs, an anode driver, and a cathode driver.

Re: HP 35 CPU

*Message #3 Posted by **Tony Duell** on 2 Sept 2005, 3:39 p.m.,*
in response to message #2 by Eric Smith

I'd love to see you extract the individual A&R and C&T chips from an HP65!.

For those who don't realise the problem, the other classic-series machines have the A&R chip in a 16 pin DIL package, the C&T chip in a 28 pin one. They are easy to desolder from the PCB. The HP65 contains a multi-chip module (44 pins IIRC), containing 6 silicon dice, believed to be the A&R, C&T, clock buffer, card reader controller and 2 RAMs. The ROMs are certainly external, apparently so the firmware could be updated without replacing the multi-chip module.

I believe my notes on these machines (giving pinouts and testpoints) are in the articles forum here. There are schematics on the HPCC CD-ROM, but there's no data on the _internals_ of the multi-chip module.

in response to message #3 by Tony Duell

If you send me a hybrid, I'd be happy to extract the A&R and C&T chips from it for you. I'll do that for free (just pay the postage both ways), but if you want them bonded out in ceramic DIP packages, that will cost a few hundred dollars.

Re: HP 35 CPU

in response to message #4 by Eric Smith

> Eric, I've got an intermittant one if you want it. I haven't decapped it but I suspect it is nothing more than a failed wire bond. I also have some Pioneer's (10B/20S) and a 10Bii for the project if you're still looking.

Re: HP 35 CPU

*Message #6 Posted by **don wallace** on 1 Sept 2005, 5:24 p.m.,*
in response to message #1 by Tom Bagdas

Hi Tom. Eric is right, the CPU is a somewhat primitve two chip chipset.

I would suggest that you consider sending me your calc for repair. Unless the calc has been subjected to "abuse", disassembly and fiddling with the electronics, the actual devices are fine and it's an interconnect or cracked board problem.

I am pretty seasoned at digital (and analogue) electronics repairs. I built my first "computer" from chips according to my own design in 1984, so I know what I am doing ;-)

I worked for Canon Auistralia in my first full-time job in 1985, repairing calculators (all kinds!) and desk-top computers.

If you want me to repair your machine, please write to me at:

donwallace63@yahoo.com.au

stating in as much detail as possible what is wrong (won't turn on, strange display, crashes when running a program, bad keys, etc...) and how it got that way (got wet, dropped, on charger without battery pack inserted or battery leaked, etc...)

Only trying to help.

Best wishes,

Don Wallace

*Message #7 Posted by **don wallace** on 2 Sept 2005, 7:45 p.m.,*
in response to message #1 by Tom Bagdas

There are no sources for the interconnects for the 41C series. The products are long dead.

Some people like myself can repair the flexible pcb's. I have an aging 41C fullnut silverbird (one of the first non buggy ones out of the U.S.A.) and have done extensive repairs on it a number times, including repairs to the flexible interconnect you are talking about. My 41CV is 100% functional, although 24 years old.

If interested, write to me.

HP 27s

*Message #1 Posted by **ken** on 1 Sept 2005, 11:26 a.m.*

well these things appear to be a dying breed.

Is there another calculator which could solve like this one.

I would first create a formula using the calculator interface and it would be stored indefinitely (key feature)

P=I*E

when I would press calc I could solve for any value (key feature) I could press a number and select variable p soft button and then press value for I and then solve for E just by not typing a value. it would also solve any direction. Place any 2 values and get the third.(key feature

Is there a current calculator made by HP or anyone else which has a solver as flexible as the 27s. If so please do tell because I still cant find one.

Re: HP 27s

*Message #2 Posted by **Mike H** on 1 Sept 2005, 12:33 p.m.,*
in response to message #1 by ken

The 27s uses an algebraic solver. It is very easy to use and quite handy. Other HP models that used the algebraic solver were the 18C, 17B, 28C, 28S, and 19B. The new 17BII+ calculator also has this feature.

The 33S also has an algebraic solver that works very well, but it is not as intuitive as the 17B

More information about solvers can be found here: Solver

The discontinued HP-17BII carrid over the HP-17B algebraic solver, and "Let" and "Get" work properly in all respects (unlike in the 17BII+).

> Quote:

> The 33S also has an algebraic solver that works very well, but it is not as intuitive as the 17B

The HP-33S algebraic solver is the one from the discontinued HP-32SII and HP-22S. The 33S also will perform a "direct solution" (instead of numerically iterated) in some cases. Unfortunately, it will always return the direct solution when possible, no matter what solution range the user provides...

in response to message #3 by Karl Schneider

The solvers of the plamtop line can be used too : HP95LX, 100, 200... Maybe these are easier to get nowadays, and you get a nice DOS-capable device with a full keyboard.

*Message #5 Posted by **Gene** on 2 Sept 2005, 7:25 a.m.,*
in response to message #3 by Karl Schneider

I dont' believe that's true. It will return the direct solution if the equation is entered as "X^2-4", but if you put "X^2-0*X-4" as the equation, it will not directly solve it but will allow the user to give estimates that guide what the solver finds.

33S solver: We've discussed this before.

*Message #6 Posted by **Karl Schneider** on 3 Sept 2005, 3:42 a.m.,*
in response to message #5 by Gene

Gene stated,

> Quote:

> I dont' *[sic]* believe that's true *(that the 33S solver will always return a direct solution when its decision rules say it can)*. It will return the direct solution if the equation is entered as "X^2-4", but if you put "X^2-0*X-4" as the equation, it will not directly solve it but will allow the user to give estimates that guide what the solver finds.

Gene, I know that you have a vested interest in that you prepared the Learning Modules for the HP-33S, but we've covered this topic before.

Ading the superfluous term "+0*X" provides a second occurrence of the solution variable in the equation, precluding the 33S by its own strategem from attempting to find a direct solution.

Granted, this offers a workaround, but what rational user would include "+0*X" in an equation? It's just wrong that the calc cannot return -2.0 as a solution to "X^2-4 = 0, given an initial search range of -2.1 to -1.9.

I outlined quite clearly in this space how I thought the 33S' SOLVE decision tree was flawed, and I remember that you agreed. Shall I dig up the thread?

Re: 33S solver: We've discussed this before.

*Message #7 Posted by **Gene** on 3 Sept 2005, 9:23 a.m.,*
in response to message #6 by Karl Schneider

Hi Karl.

Oh, I don't disagree about the solver. It's just that in THIS thread, no mention was made about how to force the 33S to avoid the direct solve. That's all I was attempting to do here. Sometimes the only information people might have about a model is the current thread/discussion.

And, I would hope I'm not that biased in most posts. :-) Gene

"Algebraic" 17/19/27 solver: Same problem!

*Message #8 Posted by **Karl Schneider** on 4 Sept 2005, 8:38 p.m.,*
in response to message #7 by Gene

Gene --

The issue about the HP-33S solver, when in Equation mode, always returning the direct algebraic solution when its logic determined that it could, got me thinking about the vaunted "Algebraic" solver from the 17B/19B/27S models.

Same problem! The 27S and 17BII will always return X = 2.00 as the solution to "X^2-4" or "SQ(X)-4", even when -2.00 is pre-stored in X.

So, KinHPo apparently didn't put a lot of new work (of questionable value) into the SOLVE algorithm for the 33S, by adding an algebra-performing "direct solution" method in Equation mode. Instead, they just copied those algorithms -- warts and all -- from the 17BII, which then was still in production when the new-model efforts were initiated.

I should have suspected as much...

Re: ... and HP-17BII; -22S; -32SII

*Message #9 Posted by **Ken** on 2 Sept 2005, 8:36 a.m.,*
in response to message #3 by Karl Schneider

Well I bought the 32S yesterday. Returned it today. I guess I am just spoiled but the interface was a far cry from the 27s.

if I am going to go through all that work then I will stick to my 3 dollar TI calculator:)

I will still need to lay hands on the 19BII but have not found one on the shelf yet.

Re: ... and HP-17BII; -22S; -32SII

*Message #10 Posted by **Ron Ross** on 2 Sept 2005, 8:54 a.m.,*
in response to message #9 by Ken

And you won't unless you are extremely lucky. The Hp19Bii hasn't been made for about 5 years now. Ebay is where you will find this creature. You can buy the cheaper Hp19 (w/o RPN over the newer Hp19Bii which has RPN).

If you don't need trig, the Hp17Bii+ is very similiar aside from its being a business calculator w/o precidence in its algebraic mode. It has the same solver (aside from perhaps an unreliable Let and Get function) and has 32K of RAM vs 7K on your Hp27s. Or buy an older Hp17B or Hp17Bii (and get the Let and Get functions).

You might also consider an Hp38G or an Hp39G+. They only hold 10 equations at a time, and only allow single letter variable names (pathetic, I know). But they have an equation solver list which is functionally similiar to your Hp27s. Actually, if you can buy the new Hp40G series (overseas model), you get an equation writer that is compariable to the Hp48/49 and a nice algebraic calculator. But it is a graphics and not a pocket calculator like the Hp27s.

Re: HP 27s

*Message #11 Posted by **bill platt** on 1 Sept 2005, 12:55 p.m.,*
in response to message #1 by ken

The new 17bii+ has the same interface, but alas it has no trigonometric functions :-(

I like this solver interface a lot, too!

If you have a 49g+ or a 48g or any of the 48-49 models, you can build essentially the same interface quite easily, complete with soft menu keys and all. It even has more features. It does have a slightly different operating paradigm but it is not too terribly difficult to get used to and is more versatile to boot.

BTW, this is the sort of thing that the 48 series has that the classic RPN machines do not--a clean, direct interface for solving equations for any unknowns.

Re: HP 27s

*Message #12 Posted by **Jan (CH)** on 1 Sept 2005, 3:03 p.m.,*
in response to message #11 by bill platt

HP 27 S is truly an excellent machine. Particularly the solver is most useful, powerful and still easy to use. HP 27S are seldom and very difficult and expensive to get second hand. When my 27S was stolen, I bought a used HP 19BII. It should be much easier to find an used 19BII; may be even a new one. They are not so old.

19BII has almost the same capabilities as 27 S, even some extra goodies. It has algebraic and RPN logic, not implemented on 27S.

The solver has some implementation differences to 27S, but this has no consequences in practical life.

19BII was sold as “business consultant”, which is a bit misleading. It contains all the math functions available on 27S, such as trigonometric functions.

All in all 19BII is an excellent replacement for 27S

in response to message #12 by Jan (CH)

Well thank you all for your assistance. I am now confronted by a new problem who carries a line of

HP's.

I visited compusa, office max, Circuit city, office depot, I want to hold one and push a button before I find a fitting replacement for my deceased friend the 27s.

Re: HP 27s

*Message #14 Posted by **Charlie O.** on 1 Sept 2005, 3:51 p.m.,*
in response to message #13 by Ken

Walmart and Fry's Electronics both carry hp's. Walmart is easier to find but Fry's is more likely to have the calc you seek.

Re: HP 27s

*Message #15 Posted by **bill platt** on 2 Sept 2005, 9:27 a.m.,*
in response to message #13 by Ken

Hi Ken,

(Is your 27s still in existence? Many here can make good use of a "deceased" machine.)

You need to buy a *used* machine--forget the retailers. The models you are really going to appreciate:

27s, 19b, 19bii ,and I think the 18c will be good, too---check the description of it in the museum or at craig finseth's hpdatabase.

are no longer manufactured, so look in or post to the classified ad section of this forum, or go to ebay....

All you can get new from hp in your interest bracket (direct from HP via online interface):

17bii+ (no trig maths)

48gII (really a 49g+ with less memory and no expansion) 49g+ (current "top dog" of hp graphing) 39g+ ("high school" formula interpretive interface version of the 48gII)

note that the 39/49/48gII listed above all have "issues" with the reliability of the keyboard....search comp.sys.hp48 and you'll see what I mean.

You will get more for your money going used.

There are no scientifics with that hp27s interface anymore. The *only* scientific in current production is the 33s which has the less than optimum solver interface, though I use it and find it quite acceptable, though I like my 27s solver more.

If you need a solver with trig more than anything, then you can adjust to the 33s and because it has full RPN and Algebraic programming capability, you can in fact do more with it htan the 27s in terms of programming power; it is just that the equation interface is not so graphically cool. Do be sure to understand that there are a couple of bugs with the 33s (which one of these days I expect they will iron out) all of which can be worked aroundwithout to great trouble. The most serious generally are the rectangular to polar conversiosn bug, and hte h.ms to dec hrs conversion (for negative numbers ther eis a problem but ok in positive range). Both of these are easy to fix with simple short programmed routines.

I hope this helps you.

Regards,

Bill

What was the solver used in the old 34C?

Original HP solver [was: HP 27s]

*Message #17 Posted by **Karl Schneider** on 3 Sept 2005, 3:08 a.m.,*
in response to message #16 by Ed Look

Ed said,

> Quote:
>
> What was the solver used in the old 34C?

The original one, ported virtually without changes to the 15C and the 41C Advantage module and subsequently (with modifications to the interface) to the 32S and 42S and their successors.

The solver on the models specifically mentioned work only with an RPN program defining the mathematical equation.

The 34C/15C/41C-Advantage do not directly support multi-variable equations. However, more than a year ago, I posted a work-around for this limitation, using the indirect storage register.

Re: Original HP solver [was: HP 27s]

*Message #18 Posted by **Ed Look** on 19 Sept 2005, 1:12 a.m.,*
in response to message #17 by Karl Schneider

Ah, the i register! What an ingenious idea!

I wish I had the nerve to use my 34C again! It shows signs of advanced age. I'm not sure that one more power on will not kill it!

But I find that the 32SII is just as pleasurable to use, except that after all these years, I still know the 34C layout by heart (you know what they say about college sweethearts)... and believe it or not, I've found the 33S to be quite a joy to use, too! I use it the most these days (to spare the 32SII extra wear), much more than the more advanced 48G,

48G+, or 49G+. I had originally guessed that the 49G+ would be my workhorse; it turned out to be the much maligned, and undeservedly so, 33S!

If I have to do a similar program for the 33S, I will keep your brilliant idea in mind... if you don't mind!

SOLVE/INTEG with MISO functions on HP-15/34/41

*Message #21 Posted by **Karl Schneider** on 24 Sept 2005, 2:19 a.m.,*
in response to message #20 by Karl Schneider

Note: This is a first draft of material developed for an MoHPC Article that I announced an intention about 30 months ago to write. Comments are welcome and encouraged. If anyone can suggest a more practical equation for illustration, please suggest. The equation should be both solvable and integratable with reasonable calculation times.

==========

Using SOLVE and INTEG with MISO functions on HP-15C, HP-34C, and HP-41C/CV/CX

BACKGROUND OF "SOLVE" and "INTEG":

Numerical rootfinding ("SOLVE") and numerical integration ("INTEG") of single variables were built-in or made available as sophisticated machine-coded functions on seven RPN-based Hewlett-Packard scientific calculator models.

SOLVE and INTEG are present on the following models:

- HP-34C
- HP-15C
- HP-41C/CV/CX with Advantage Pac

- HP-32S
- HP-42S
- HP-32SII
- HP-33S

(Excluded from this list are the RPL-based models, the algebraic-entry models, and the HP-71B with Math ROM.)

The SOLVE and INTEG functions were introduced in their original paradigm on the HP-34C in 1979, and later carried over to the HP-15C in 1982. For the HP-41C/CV/CX, the same functions were adapted with only slight modification in the Advantage Pac introduced in 1985.

Two fine articles regarding SOLVE and INTEG on the HP-34C appeared in *HP Journal* in 1979 and 1980, respectively. These are available on CD Volume 3 and the DVD-ROM from the MoHPC.

This original paradigm requires that the function to be solved or integrated, be programmed as an RPN routine. The routine must be designed to accept an input value of the variable to be solved or integrated in the stack x-register, and to return the calculated value of the function to the x-register. This user program is executed repeatedly by the SOLVE or INTEG function in order to calculate the desired result. Moreover, the program may include a SOLVE or INTEG instruction, thus allowing INTEG to be executed within SOLVE, or vice versa. This capability, incidentally, was not provided on the successor Pioneer-series models HP-32S and HP-32SII, or on the present HP-33S.

STORAGE OF VARIABLES; MISO AND SISO FUNCTIONS

Storage registers for variables on the HP-32S, HP-32SII, and HP-33S are designated by single letters. The Pioneer-series HP-42S allowed alphanumeric identifiers for variables. SOLVE and INTEG on all four of these models require the user to specify (by letter or name) the root variable to SOLVE or the dummy variable of integration to INTEG. This feature is well-suited for multiple-input, single-output (MISO) functions.

The 34C, 15C, and 41C/CV/CX, however, provided only numbered and "indirect" storage registers. The paradigm of SOLVE and INTEG on these models was designed primarily for single input, single-output (SISO) functions.

It does not require that the input variable even be stored to a register.

TO USE 34C/15C/41C "SOLVE" AND "INTEG" WITH MISO FUNCTIONS:

Assume that a MISO function is to be programmed as an RPN routine on a HP-34C, HP-15C, or HP-41C/CV/CX. A user may wish to use SOLVE or INTEG successively for any selected "focus" variable with all others held constant, and without having to edit the RPN routine. Here is a simple procedure for this purpose:

1. Designate a numbered storage register for each variable in the function.

2. On the 41C/CV/CX, designate another numbered register as the indirect storage register. (Do not use a stack register, as it will be overwritten by SOLVE or INTEG.)

In PROGRAM mode:

3. Program the function as an RPN routine that meets the basic requirements and, also, always retrieves each variable from its designated storage register the first time it is used. (On the 41C/CV/CX, the label beginning the routine must be an external label.)

4. The second instruction of the routine (after LBL) should be "store to indirectly-referenced register". This is "STO (i)" on the 34C and 15C; "STO IND nn" on the 41C/CV/CX.

In RUN mode:

5. Store the desired constant values of the fixed-value variables to their storage registers.

6. Store the *register number* containing the floating variable to the indirect storage register.

7. Invoke SOLVE or INTEG in the usual manner.

This procedure utilizes indirect storage to make the RPN program more flexible. SOLVE and INTEG feed the each value of the floating variable as input to the user program, which immediately stores the value indirectly to its designated register. Each variable in the function is then recalled for use in calculations, so the user program need not be structured to receive any particular variable from the stack.

EXAMPLES:

```
f(x, y, z) = 2*x - ln y + 1/z

x in R1; y in R2; z in R3
indirect in R00 (HP-41 only)

HP-15C/HP-34C program:      HP-41C/CV/CX program:

LBL A                        LBL "AA"
STO (i)                      STO IND 00
RCL 1                        RCL 01
2                            2
```

```
*                           *
RCL 2                       RCL 02
LN                          LN
-                           -
RCL 3                       RCL 03
1/x                         1/x
+                           +
RTN                         RTN
```

In RUN mode, solve for x such that f(x, y=15.1, z=5.3) = 0

```
HP-15C/HP-34C:              HP-41C/CV/CX:

15.1                        15.1
STO 2                       STO 02
5.3                         5.3
STO 3                       STO 03
1                           1
STO I                       STO 00
0.5                         0.5
ENTER                       ENTER
5                           5
SOLVE A                     "AA"  (enter AA in alpha mode)
                            XEQ "SOLVE"
```

(Answer is 1.263007749)

Next, solve for y such that f(x=0.7, y, z=3.3) = 0

```
HP-15C/HP-34C:              HP-41C/CV/CX:

0.7                         0.7
STO 1                       STO 01
3.3                         3.3
STO 3                       STO 03
2                           2
STO I                       STO 00
0.5                         0.5
ENTER                       ENTER
6                           6
SOLVE A                     "AA"  (enter AA in alpha mode)
                            XEQ "SOLVE"
```

(Answer is 5.490560270)

Finally, integrate f(x=1.7, y=4.1, z) over z = 1.0 to 6.0.
Specify 5 decimal-digit absolute function accuracy:

```
HP-15C/HP-34C:              HP-41C/CV/CX:

FIX 5                       FIX 5
1.7                         1.7
STO 1                       STO 01
4.1                         4.1
STO 2                       STO 02
3                           3
STO I                       STO 00
1                           1
ENTER                       ENTER
6                           6
INTEG A                     "AA"  (enter AA in alpha mode)
                            XEQ "INTEG"
```

Can anyone tell me about the "41CY"?

*Message #1 Posted by **don wallace** on 31 Aug 2005, 5:50 a.m.*

Hi all.

I am curious about the capabilities of the "souped up" 41CV, the 41CY.

Can anyone enlighten me about the specs of these machines? And who did the soup-up? How far did they go? When was it done?

Thanks

Don W

Re: Can anyone tell me about the "41CY"?

*Message #2 Posted by **Meindert Kuipers** on 31 Aug 2005, 6:26 a.m.,*
in response to message #1 by don wallace

The HP41 CY is basically an HP41CX with the guts of the W&W Rambox built inside. It was done by W&W in Germany. The RAMBOX electronics are on a custom PCB (actually just the memories and an Asic) that is mounted between the keyboard PCB and the bridge PCB in the 41CX. I had the opportunity of looking at the insides when I visited W&W earlier this year.

They are very very rare and if one is available on ebay the price is really high.

Meindert

in response to message #2 by Meindert Kuipers

Hi Meindert!

Thanks for the response.

What are the specs? RAM size, etc...?

Cheers,

Don W

Re: Can anyone tell me about the "41CY"?

*Message #4 Posted by **Raymond Del Tondo** on 31 Aug 2005, 8:38 a.m.,*
in response to message #3 by don wallace

Hi Don,

the CY Turbo has 64K (2* 32K) RAM,
as well as a turbo switch for CPU clock speedup,
I think it was about 1.7x .

You can switch between the two 32K blocks via software.

There also existed a W&W HP-41CW,
which was a CV with a 32K RAM 'box' built-in.
The latter is even rarer than a CY.

Regards

Raymond

BTW: Your module is on its way to you;-)

*Message #5 Posted by **bill platt** on 31 Aug 2005, 1:10 p.m.,*
in response to message #4 by Raymond Del Tondo

Hi Raymond,

Do you have either of these delightful creatures? :-)

Regards,

Bill

Re: Can anyone tell me about the "41CY"?

*Message #6 Posted by **don wallace** on 31 Aug 2005, 4:45 p.m.,*
in response to message #5 by bill platt

Hi all. Thanks for your reply and looking forward to hacking my module. You were really patient with me (busy and disorganized at this end) and very easy to do business with. Thanks... (I never knew international bank transfers were so expensive).

I am looking at building one or two of these (41CW)babies, Bill. If you want one let me know. There's (quite) a bit of work (and reading) to do first...

BTW, does anyone know WHERE in the systems address space they stick a 32 kB block of RAM? And how do you access it from a system programming point of view? I am aware you can't use the "operating system" adddress pointer on the whole lot, as it's only 12 bits wide (giving 1024 registers maximum which can be "pointed to")? Meindert?

WHOOPS!

Sorry Raymond!

My previous post omitted: "Hi all. Hi Raymond." Thanks for the precise informative reply, Ray.

Don W (I am sometimes a bit "scattered" at 6:30 a.m. before I have my SECOND CUP of coffee. My g/friends a shift worker :-)

Where's the RAM??

*Message #8 Posted by **DavidY** on 31 Aug 2005, 7:50 p.m.,*
in response to message #6 by don wallace

Hi Don,

Quick answer is the W&W Rambox -- in its various versions -- simulates ROM Module memory so, by using a RAMbox you are giving up the ability to use ROM modules.

The "system memory" of the 41 consist of 16 4K x 12bit blocks: 0,1 & 2 are the main 12K system ROMS. Blocks 3 & 5 are reserved for the Time Module and the Extended Funcitons ROM (extended functions RAM registers are mapped into the "user" memory). Block 4 is special: it's designed to map a "takeover ROM" taking control from the OS ROMS. Block 6 is used by the Printer ROMS and Block 7 for the HPIL ROM. Finally Blocks 8-F are for "normal" ROMS. In use the 32K Rambox maps over Blocks 8-F: 4k * 8blocks = 32K. The 64K Rambox is simply 2 banks of 32k which can be switched with custom code.

Of course, it's not quite that limiting--you could map out blocks of RAM to allow space for ROM modules, map RAM to system blocks 3,4,5,6 & 7,etc.

Take a look at Diago's Clonix/NoVRAM and Meindert's MLDL2000. The MLDL is the Rambox on rocket power thanks to modern high density chips (and Meindert's hard work)--lots and lots of memory banks, very flexible mapping, the ability to load ROM module images -- think the entire 41 module library in a card reader case.

Re: Where's the RAM??

*Message #9 Posted by **don wallace** on 1 Sept 2005, 5:28 a.m.,*
in response to message #8 by DavidY

Thanks for the quick reply David.

Very interesting...

There certainly are a few talented people doing work in this area. I like Meindert's effort and am amazed at what Diego has already done and what Monte is doing...

At the moment I am interested in doing a FORTH41 module and a PPC module in one plug in ROMPACK. I am planning to use the quad flat pack version of a PIC chip which is backward compatible to the chip Diego was using, an 18LF2520. I have some pictures on my website, if anyone is curious.

Later I want to rewrite the code (if possible) to drop the PIC clock speed and lower the power consumption. It will be a while before I am ready to do that, though. I am far

from sure if it can be done. I like a challenge though.

Considering it's age, the 41 machine is very well designed. I don't have any other HP calcs (or other gear), but I remember when I first bought my CV in early 1981 it just mesmerized me... I still get a kick out of playing with it and use it to do simple project management using the TIME module I bought in 1985 from a guy who had upgraded to the CX, then brand new.

Since then my calculator has suffered some four different hardware failures, so I am not sure how much longer it will last, but it's an amazing, functional, beautiful relic from a bygone age. I am certainly getting good at fixing them... ;-)

*Message #10 Posted by **Meindert Kuipers** on 1 Sept 2005, 5:13 a.m.,*
in response to message #6 by don wallace

Don,

I do not know too many details about the Rambox operation. Probably the manuals are available on a DVD or downloadable from TOS. As I understand there are some possibilities with special key combinations, but I am not really certain. I think that the speed switching is with a key combination. The MLDL2000 operates in a totally different way, module assigment is best done for the outside with the USB interface under control of a PC.

Meindert

Re: Can anyone tell me about the "41CY"?

Sorry that's wrong, It's a seperate red switch on the left side of the calculator.

Calculator speed changing is only allowed in calculator off state.

Cheers

Christoph

Re: Can anyone tell me about the "41CY"?

*Message #13 Posted by **Klaus** on 3 Sept 2005, 9:37 a.m.,*
in response to message #12 by Christoph Giesselink

I think I also read something about switching speed via keyboard. If I am not wrong, it was the "W&W cursor" on TOS where I read it.

Maybe, the working CY Turbo I have seen, has the manual switch.

But there were other companies which sold speed doublers for the 41. W&W also sold the Turbo option for normal calculators. They maybe different from the CY one.

AFAIK all 48 speed doubler use a key combination at startup?

Cheers

Christoph

Re: Can anyone tell me about the "41CY"?

*Message #15 Posted by **don wallace** on 4 Sept 2005, 9:43 p.m.,*
in response to message #14 by Christoph Giesselink

Overclocking the 41CV due to the generous margins in the basic design, is quite simple. A timing capacitor is reduced in value or another one is put in series, dropping the capactiance.

From memory, in 1982 I used a 47 pF capacitor in series with the original which roughly doubled the machine speed. Anyone interested can write to me for details. Shorting my added capacitor with some fine wire restored normal operation without resoldering anything. I found the faster CAT display annoying and didn't need the extra speed anyway. I also disliked the "sped up beep" tone...

Switching a capcitor into and out of circuit while the oscillator is running

(calc powered up) generates a timing glitch kind of similar to what grounded Columbias (first space shuttle) maiden flight, (for different reasons). This glitch could perhaps cause some odd behaviour in the (memory access performance of) system.

It is possible that a keystroke sequence allowed special hardware to switch an extra timing capacitor into and out of circuit, but with such glitches... Maybe the people who thought this up had trouble and went back to a hardware switch which worked when the calc was off? Anyone?

From what I have read here the 48 speed doubler is a "software hack" so no hardware glitches...

DW

Re: Can anyone tell me about the "41CY"?

*Message #18 Posted by **Raymond Del Tondo** on 5 Sept 2005, 3:52 p.m.,*
in response to message #17 by don wallace

Hi Don,

at least my HP-48GY+ Turbo uses a hardware pcb
to hold the speed-up electronics and the additional RAM.
The speed-up is activated by holding the ON key
for some seconds longer than normally needed.

Maybe you meant the HP-28S and the HP-42S where
you could temporarily speed up the machine
by poking a different delay value at a certain RAM location.

Regards

Raymond

HP 33s low battery warning problem

*Message #1 Posted by **KC** on 31 Aug 2005, 2:46 a.m.*

Hello,

This post referred back to an older thread in which I posted up a question of the HP 33s displaying flashing "Memory Clear" message and doesn't respond to keystokes. After changing the batteries everything is fine again. So it is a matter of the fact that the 33S doesn't warn us to replace batteries. Just to remind all those who are using the calculator to keep in mind of that to prevent data loss. One way to check is to run a long program or a program that loops for say, 500 times. The battery warning sign would still come up in those case (but not in normal calculator operation).

Regards, KC

33s serial no production dates

*Message #1 Posted by **david bowers** on 30 Aug 2005, 8:17 a.m.*

hi my cousin in hatboro pa couldnt make sense of the manufature date on hp33s i called walmart from taiwan, the guy said it had hp 2003 on the packet . he said he couldnt find the 05 numbers to signify the 2005 year it was made, so i could get the pixel fix model. can someone enlighten me on what to look for, is the no. on the calculator or the packaging, can it be read easily or do you have to open up the blister pack or box to investigate and confirm cheers david

Re: 33s serial no production dates

*Message #2 Posted by **bill platt** on 30 Aug 2005, 8:59 a.m.,*
in response to message #1 by david bowers

You can turn the machine on through the blister pack--you just have to push hard through the plastic packaging.

Re: 33s serial no production dates

*Message #3 Posted by **david bowers** on 30 Aug 2005, 9:04 a.m.,*
in response to message #2 by bill platt

my cousins not so inlcined to tell the good from the bad, somebody had mentioned the year of ma. date on the pack thanks david

Re: 33s serial no production dates

*Message #4 Posted by **Ron Ross** on 30 Aug 2005, 9:31 a.m.,*
in response to message #3 by david bowers

I have an earlier model and while the decimal is not great, with the FIX function, the sorry Deciamal point does show and it is a usable calculator. I don't consider it on par to an older Hp 32sii for quality, but it is close.

My biggest gripe is that it is a FAT Glittery eye magnet, and not a true pocket calculator. It is much smaller than a graphics, but is still to big to fit in most shirt pockets. It is wider than the Hp32sii and I feel even the Hp32sii series was a bit too tall. I liked the size of the older Hp11c line best.

But hey, its a $50 RPN calculator that is the best available. That it isn't the size of the Casio FX250/260 or Hp6s line is too bad, but I am glad it is available.

I used mine extensively for 2 months (needed for an exam) and don't mind using it further, but I like the features of the Hp48/49G series on my desk. If I did field work, I would grab the Hp33s in a heartbeat (it is my least valuable Hp RPN calculator).

tests

*Message #5 Posted by **bill platt** on 30 Aug 2005, 1:48 p.m.,*
in response to message #4 by Ron Ross

Hi Ron,

So you passed your test? :-)

Do you have an original Walmart release, or the 1st batch that came out after the hiatus just before full release? I have a 1st Walmart and it has the "swap" in Algebraic which switches the order of the x and y registers. Do you have the newer "parallel algebraic stack" version? The newest one I checked, with big decimals, also has the parallel algebraic stack.

Regards,

Bill

My email is still the same.

Re: tests

*Message #6 Posted by **Ron Ross** on 30 Aug 2005, 2:33 p.m.,*
in response to message #5 by bill platt

Why, thanks for asking, and YES, I did!!!

I did have a difficult time just getting to take the exam. It seems they held a low regard for my BA degree and wanted to see an ABET accredited degree. I had to provide an extensive amount of references and work experience. It was a proverbial mountain to climb for me just to take the exam. After all that baloney, I certainly couldn't afford to fail (they would then get a second chance to change their minds).

Re: tests

*Message #7 Posted by **Ron Ross** on 30 Aug 2005, 2:44 p.m.,*
in response to message #5 by bill platt

I bought my 33s from Erik at Hpcalc.org back in January of 05. It has the small decimal place and I only used it in RPN mode. Never bothered to check the algebraic mode to any great extent. Now that I passed my exam, I tossed the Hp33s into the back of a drawer and use other Hp's for day to day use. If I still did field service, it would be a main calculator, for sure!

Re: 33s serial no production dates

*Message #8 Posted by **bill platt** on 30 Aug 2005, 1:44 p.m.,*
in response to message #3 by david bowers

Hi David,

Are you in Taiwan? Your cousin is in hatboro? You need hjim to buy it for you and send it? You cannot buy in Taiwan? What is the situation? (Maybe we can help).

Re: 33s serial no production dates

*Message #9 Posted by **david bowers** on 30 Aug 2005, 5:53 p.m.,*
in response to message #8 by bill platt

hi yes, my cousin is an accountant, hmmm, anyway as i lost the 11c last week, i will want to use the 33 in the field, i have a 48gx with cogo, 2x 32s2 and 2x 48g,and the 42s but on construction sites i crawl in and out of holes,up steel beams and cover so much ground, if i put it down i forget where, my rodman tires at times of finding my stuff, and its always half dark inside these places so i would find the smaller decimal point a bother as i do onsite calcs, i have since bought a better pouch as i have a feeling the 11c flipped out when i was walking. yes i would appreciate any help locating maybe 2 of the new ones. i dont want to shell out a few hundred for another 11c, its the second time i have lost a calc in 30 years, the other 42s i have, i had returned after it fell 10 metres and a chinese guy picked it up after i posted a 50usd reward, both on this construction site in taiwan thanks david

Re: 33s serial no production dates

*Message #10 Posted by **brian b** on 2 Sept 2005, 8:24 a.m.,*
in response to message #9 by david bowers

has HP fixed the display so that you can distinguish the decimal point from the 2, and have they done something to improve the shadows in the lcd display? My 33s has a serial number of 44204310, and it is very difficult to distinguish the decimal point when it is next to the number 2. Fixing the display would go a long way to improving this calculator, but in terms of user interface I still won't consider it on par with the 32SII. I really don't like the small ENTER key or its location.

ANSWERS to "Quiz: HP Voyagers"

*Message #1 Posted by **Karl Schneider** on 30 Aug 2005, 1:57 a.m.*

Here are my answers to the quiz I posted earlier today (subject: "Quiz: HP Voyagers", 29 Aug 2005, 10:21 p.m.)

The are correct to the best of my knowledge, and I do have a working unit and manual for each model in front of me. I have no excuse for any mistakes here!

I may not have stated several of the questions quite specifically enough, but declined to edit the quiz after posting.

1. Which model(s) provide all twelve conditional tests?

Answer: The 15C.

By "conditional tests", I refer only to those six possible comparisons of a full *floating-point value* against 0.00 or another floating-point value, for a total of twelve conditional tests. I did not intend to include flag comparison, bit comparison, or loop-counter functions (which also perform a comparison when invoked).

The complete set is x<0, x<=0, x=0, x!=0, x>=0, x>0, x<y, x<=y, x=y, x!=y, x>=y, x>y.

The 12 tests were provided by placing only two tests on the keyboard, then giving access to the remaining ten via the function TEST, followed by a one-digit code 0-9. This setup used only three keyboard positions.

2. Which model(s) provide only eight conditional tests?

Answer: The 11C and 16C.

The set of eight comparisons is identical to that in the HP-34C, omitting x<=0, x>=0, x<y, and x>=y from the complete set of 12.

The challenge of adding to the 15C these four tests missing from the 11C was ironically re-visited nine years later when the Pioneer HP-32SII was created from the HP-32S.

3. Which model(s) provide only two conditional tests?

4. Which model(s) do not provide insert/delete program editing?

5. Which model(s) do not provide a "delete digit" function?

6. Which model(s) do not provide any loop-counter functions?

Answer to 3, 4, 5, and 6: The 10C and 12C.

These two models had the rudimentary programming paradigm that was introduced in the short-lived HP-55 of the 1970's. Only overwriting of programmed instructions was allowed -- no insertions or deletions that make programming useful.

Not provided on the 10C and 12C were loop-counter functions (called DSE and ISG on the 11C and 15C; DSZ and

ISZ on the 16C). Only two condtional tests (x<=y and x=0) were provided on the 10C and 12C.

These models also lacked the convienient "delete digit" function and introduced on the predecessor HP-41C. "delete digit" is denoted as a backarrow on the 41C, 11C, and 15C; it is denoted as as "BSP" (backspace) on the 16C. In program mode, "delete digit" serves as "delete line".

In my opinion, this limited programming paradigm ought to have been abandoned, rather than carried forward on new lower-end models. The 10C might have found a niche as a non-programmable with more functions.

7. Which model(s) provide Solve, Integrate, matrix functions, and functions using complex-valued inputs?

Answer: The 15C.

Addition of this functionality to the already-capable 11C was the main design objective of the 15C. Solve and Integrate had already been introduced on the 34C, but the robust matrix and complex-number functionality was unprecedented.

To add all this capability, in the same package and hardware of the 11C (whose keyboard positions were already fully-occupied) was an impressive achievement. With some sharp thinking, all the functionality was added, even as the keyboard layout was slightly improved!

An excellent HP Journal article from 1983 (available on the MoHPC CD/DVD set) describes the development of the 15C.

8. Which model(s) provide an "exchange with memory register" function?

Answer: The 11C, 15C, and 16C.

The 11C and 16C offered x<>(i) and x<>I, which exchanged x direclty with the I register or indirectly with the numbered register referenced in I. The 15C offered an open-ended "x<> ", that could be completed with I, (i), or any numbered register 0-9 or .0-.9 This gave more functionality, saved one keyboard position, and improved keyboard layout.

9. Which model(s) do not provide trigonometeric functions?

Answer: The 12C and 16C.

HP's philosophy has been not to include unnecessary functionality in any model designed for a particular purpose. Trig functions are rarely needed in basic finance and computer-science tasks.

10. Which model(s) do not provide logarithmic or exponential functions?

Answer: The 16C.

These are provided on the 12C, however, because natural logarithms, base-e exponentials, and the related power function y^x [= e^(x ln y)] have a solid place in finance. A principal P, compounded at annual rate r for one year in n periods yields a final value F:

```
F = P*[1 + r/n]^n
```

As n gets ever-larger (infinite compounding),

```
F = P*e^r
```

11. Which model(s) provide a "modulo division" function?

Answer: The 16C.

It is called "RMD", and not "MOD" as on the other HP calculators.

12. Which model(s) allow "F" as a program label?

Answer: The 16C.

To provide its hexadecimal-representation capability, the letter "F" was required. So, F is also made available as a program label. The 16C has this in common with the Pioneer-series HP-20S. (Of course, "F" is also available as a label on HP's alphanumeric or quasi-alphanumeric models.)

13. Which model(s) provide a y-estimator regression function?

Answer: The 10C and 12C.

Ironically, for all the other features these models lacked (see questions 3-6), only these Voyager models offered y-estimator!

This was probably due to lack of available keyboard space on the 11C and 15C, which also included regression-analysis functions.

Hope you enjoyed the quiz, but sorry -- no prize for a perfect score.

-- KS

Re: ANSWERS to "Quiz: HP Voyagers"

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2005, 2:32 a.m.,*
in response to message #1 by Karl Schneider

(I missed two...)

Thanks, Karl; I had my memory cells tested for sure.

I hope you are not mad because I actualy posted an answer right after you post the quiz; somehow a lucky moment of mine.

I'd add that the HP16C is actually the only Voyager that shows labels from [A] to [E] (plus [F]) as alphabetic characters. The HP11C and HP15C use [11] to [15], instead. BTW, this is something I accepted with some reluctance because the HP15C has the matrix identifiers A to E, so it could show these labels as well. Anyway, if we consider the many resources the HP15C has that are completely equivalent to the ones found in the HP11C, leaving [11] to [15] as identifiers for labels [A] to [E] would help understanding programs in one or in the other without much confusion.

Best regards.

Luiz (Brazil)

Re: ANSWERS to "Quiz: HP Voyagers"

*Message #3 Posted by **Karl Schneider** on 30 Aug 2005, 2:57 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Luiz --

Thanks for your helpful replies. No, I'm not displeased at all that a quick response was posted. You might have prevented me from making a mistake, because I forgot that the 12C had y-estimator.

I also noticed that the 16C used A-F as keycodes, but those legends are on the keys, like 0-9.

In a way, I wish that the 15C did the same. It would make more sense for progam labels and matrices, but might be a bit confusing for the mathematical functions on keys 11-15, and for USER mode. There were also the issues of changing tried-and-true derivative 11C code and the limited ROM space.

It may seem kinda silly to be contemplate the quirks of a 23-year-old product, but it is an enlightening exercise to revisit the thinking of the first-class engineers who designed it.

11C's SCI 8, SCI 9, ENG 8 and ENG 9 (was: ANSWERS to "Quiz: HP Voyagers")

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2005, 3:28 a.m.,*
in response to message #3 by Karl Schneider

Hey, Karl;

you see, after 23 years we have still been surprised with the features of these little beasts. God bless the first-class engineers who worked on their design, development and production line. Amen!

I still feel compelled to comment these four HP11C not-programmable, yet valid entries, keystroke sequences. This is, as far as I know, the only case in all voyagers. If you try entering any of these as a program line, you'll always get [f][SCI]7 or [f][ENG]7. And there is no error message, neither [f][SCI][8], [f][SCI]9, [f][ENG]8 nor [f][ENG]9 can be coded as program lines in the HP11C. The HP10C accepts them, the HP15C accepts them, the HP11C doesn't. I guess that if we count all programmable keystroke conbinations plus these four ones in the HP11C repertoire, we'll reach 259 instead of 255. Anyway, if we consider the rounding factor, what if there is actualy no [f][SCI][8], [f][SCI]9, [f][ENG]8 nor [f][ENG]9 internally defined in the HP11C? Who can tell, except anyone from the project team? I mean, has anyone tested if there is any visible change in the display if we set [f][SCI][8] or [f][SCI]9 insstead of [f][SCI]7? Or if we set [f][ENG]8 or [f][ENG]9 instead of [f][ENG]7?

Maybe it also has to do with the limited ROM space... Or maybe this is old issue and I'm just talking about yesterday's news.

Cheers.

Luiz (Brazil)

Hmm, you're right [update!]...

*Message #5 Posted by **Karl Schneider** on 30 Aug 2005, 10:22 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

... interesting tidbit, Luiz!

The 11C apparently converts a requested 8 or 9 significant digits to 7 in [SCI] and [ENG] because that's all the Voyager display can handle. The 10C and 15C just accept the overambitious demand, but display only what is possible.

There apparently is no difference in how, e.g., "SCI 8" and "SCI 7" appear. Checking and changing the precision does add a bit of ROM code, which was an issue in the development of the 15C.

I believe that much of the HP-34C's ROM was used in the 11C. It turns out, in fact, that the 34C also changes "ENG 8" to "ENG 7", as well as the other three cases.

The 34C and the 11C share virtually the same storage setup for programming and numbered registers, the same automatic memory allocation, the same 8 conditional tests, the same programming paradigm, and other things. Since the 56-bit BCD number precision is identical, the mathematical algorithms are also probably the same ones.

The small quirk that Luiz pointed out is further indication of the product development strategies that were undertaken 25 years ago.

Re: Hmm, you're right [update!]...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 31 Aug 2005, 3:21 a.m.,*
in response to message #5 by Karl Schneider

Hey, Karl; I, again!

One small spot: the RAN# 'register' in the HP11C. Is it actually a register? If we go ahead and actually count, the permanent program steps in the HP11C are counted 63 only and go to a maximun of 203, against the 70 permanent stpes in a maximun of 210 available in the HP34. So, it seems that the RAN# uses these borrowed seven bytes to exist, what actually cause both calculators to precisely match the amount of available memory each one has when compared to the other.

I also remember that Valentin once brought to us a short and sweet quiz where a number could be stored in the HP15C and retrieved to its mantissa x 10^(-1). The HP15C not only allows [STO][RAN#] as a valid programmable keystroke sequence, it goes further and accepts [RCL][RAN#], too (they are coded as [STO][ENTER] and [RCL][ENTER], being the [f] prefix ommited). The HP11C accepts [STO][RAN#] as a valid instruction, but it does not allow [RAN#] contents to be retrieved. So, anytime you need a random number, you must generate a new one in the HP11C, you cannot recall the last one unless you store it somewhere else. The HP15C allows such retrieval, but it cuts out the exponent of ten.

As you said:

> Quote:
>

Spice, Coconut, and Voyager math routines

*Message #7 Posted by **Eric Smith** on 31 Aug 2005, 7:07 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

The 34C uses the Woodstock CPU architecture (but not an actual ACT chip). The CPU contains the A, B, and C working registers, of which A and B together form the user X stack register. The CPU also contains the Y, Z, and T registers of the stack, and two temporary registers called M and N (or M1 and M2). The 34C has 64 RAM locations. The solve and integrate functions use dedicated RAM that is not available for other uses.

The 41C, 11C and 15C use the Nut processor. It has the A, B, and C registers, and M and N, but does not contain the stack, so the stack is stored in the "status registers" (RAM external to the processor).

The 11C contains one R2D2 chip (ROM/RAM/Display Driver), which provides eight storage registers (intended for use as "status registers" as in the 41C), two bitmapped display registers, one hardware control register (possibly a timer), and 32 general registers. Thus there are a total of 40 registers available outside the CPU. The "status registers" include the stack, program pointer, partition pointer, return stack, flags, random number, etc.

The 15C contains two R2D2 chips, but in the second chip the display driver is not used, so the two display bitmap registers are available for general-purpose use. Thus the 15C has 18 "status registers" and 64 general registers. The status registers are used for basically the same purposes as in the 11C, and additionally for pointers and dimensions for the matrices, and pointers to the solve, integrate, and imaginary stack registers. Unlike the 34C, in the 15C solve and integrate do not have dedicated registers, but instead allocate registers out of the "free pool" between the user program and data registers.

The arithmetic, logarithmic, exponential, and trigonometric functions of the Spice series, 41C, and Voyager series are nearly identical. The Nut CPU introduced a few new instructions that could be used to optimize the math routines slightly. The 41C ROM source code (VASM listings) point out some of the places that optimizations could be made, but generally the optimizations were not actually used. In the Voyagers most of those optimizations were put into practice. However, I don't think there was any significant reduction in execution cycles as a result. Note that the Voyagers use a lower clock frequency than the 41C, so in generally they are significantly slower.

Eric

>
> Note that the Voyagers use a lower clock frequency than the 41C, so in generally they are significantly slower.

I've often wondered whether HP deliberately "de-clocked" the Voyagers so that they did not outshine their flagship 41C. I've noticed that the 41's are about twice as fast as Voyagers. If expandability, I/O, advanced RPN programming, and time functions are not of concern, the 15C is arguably a far superior calc to any 41, and much less expensive. If only it were at least as fast...

Your link to a short article (which I had actually read before) provided more clues:

11C/15C speedup

No. The 41C contains a switching power supply so that the voltage to the digital chips is constant even though the battery voltage declines. The Voyagers don't have a switching power supply; they operate directly on the three cells that may be as low as 1V each near end of life. Because of the lower supply voltage, the CMOS chips can't run as fast.

There is at least one usage of the SCI 8 setting: to round the mantissa to 9 digits with SCI 8 RND. This actually works from the keyboard. It can be used to get rid of the 10th digit during calculations to simulate a kind of guard digit.

> Quote:
>

Jean François Garnier posted:

"I counted 254 programmable keystroke combinations for the HP-11C, so your hypothesis may be right."

Same for the HP-34C, it also had 254 programmable keystroke combinations, but you could also enter the one unused keycode ('poor man's synthetic programming') in a number of ways.

It's quite remarkable that the HP-15C, in the very same form factor and external appearance as the HP-11C, does in fact manage to cater for more than twice as many (700+) programmable keystroke combinations, i.e., programmable operations. People not acquainted with both models would likely think they would be more similar.

Best regards from V.

*Message #14 Posted by **Vieira, Luiz C (from Brazil)** on 1 Sept 2005, 2:57 p.m.,*
in response to message #13 by bubba

Hi, Bubba;

yes, the HP15C has a set of many 2-byte instructions. As it has no ALPHA capabilities, it would be enough to add many 2-byte instructions in order to access its new, powerfull resources. I am not sure about which ones are the two-byte instructions, but I remember that most of them seem to be chosen because are not too much used as program lines. If I'm home later and no one else posts about it, I'll add a list of the 2-byte programmable instructions available in the HP15C repertoire.

Cheers.

Luiz (Brazil)

HP15C's 2-byte instruction set

*Message #15 Posted by **Vieira, Luiz C. (Brazil)** on 2 Sept 2005, 12:03 a.m.,*
in response to message #13 by bubba

Hi, all;

this is the main set of 2-byte instructions in the HP15C's repertoire (from the "HP15C Owner's Handbook", Appendix C):

```
[f][LBL]. (0 to 9)              [f][MATRIX] (0 to 9)
   [GTO]. (0 to 9)              [f][x<>] (2 to 9, .0 TO .9)
[g][CF] (0 to 9, I)             [f][DSE] (2 to 9, .0 TO .9)
[g][SF] (0 to 9, I)             [f][ISG] (2 to 9, .0 TO .9)
[g][F?] (0 to 9, I)             [STO]([+], [-], [×], [÷])
[f][FIX](0 to 9, I)             [RCL]([+], [-], [×], [÷])
[f][SCI](0 to 9, I)             [STO][MATRIX]([A] to [E])
[f][ENG](0 to 9, I)             [STO]([A] to [E], (i)) in USER mode
[f][SOLVE]                      [RCL]([A] to [E], (i)) in USER mode
[f][integral]                  [STO][g](i)    [RCL][g](i)
```

I hope this gives you extra info.

Cheers.

Luiz (Brazil)

Re: 11C's SCI 8, SCI 9, ENG 8 and ENG 9 (was: ANSWERS to "Quiz: HP Voyagers")

*Message #16 Posted by **Eric Smith** on 1 Sept 2005, 4:57 p.m.,*
in response to message #11 by J-F Garnier

There are 255; did you count "STO RAN#"?

Here's the HP-11C Hex Table.

By comparison, the HP-16C Hex Table has thirteen spare codes. The 12C uses all 256 codes, but I don't yet have the hex table online. I haven't yet investigated the 10C and 11C.

The techniques for mapping the hex tables are left as an exercise for the reader. :-)

Speculation time (Voyager hex codes)

*Message #17 Posted by **Cameron Paine** on 2 Sept 2005, 12:19 a.m.,*
in response to message #16 by Eric Smith

Those tables are fascinating Eric. I've thought about the internal representation of the 16C a *lot*. The comments/questions that follows may not apply to other Voyagers (but I don't see why not).

Consider the implementation of the set/clear/test bit functions which take the bit position parameter from the stack. Contrast this with the flag set/clear/test functions in which the flag number is implied by the low-order nybble of the opcode.

Since these two groups of functions could have been implemented in a substantially similar manner and since the bit functions are programmatically more flexible why were the flags implemented as they are?

On more than one occasion I've mapped the flags to bits and back to open up the range of logical operations (typically for branch determination). This chews up valuable keystrokes and (with the benefit of hindsight) the trade-off was seldom worth it. However had the flags (on all models) been like the bit functions the conversion overhead would never have been incurred.

As illustration, consider:

```
; if F0 AND F1 then do something else return
F? 0
GTO f0_is_set
RTN
LBL f0_is_set
F? 1
GTO do_something
RTN
LBL do_something
stuff
RTN
```

Contrasted with

```
; if F0 AND F1 then do something else return
RCL flags_stored_in_a_register
[3]
AND
X=0?
RTN
stuff
RTN
```

The latter saves three keystrokes (about 1.5% of total) and three labels (18.75% of total). The conservation of labels sometimes made this approach worth the effort.

One drawback of the flags-as-register approach is the stack management overhead which is not possible to illustrate in a trivial example. I concede that you also lose the keystroke storage that holds the flags in "user space" but had the architecture allowed this approach to the flags that storage would have been in "system space".

Now that I've posed a few (hopefully interesting) questions, what do all of you think?

Cameron

PS: which method of flag manipulation do the RPL calculators support?

Re: Speculation time (Voyager hex codes)

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 2 Sept 2005, 1:21 a.m.,*
in response to message #17 by Cameron Paine

Hi, Cameron;

I think something like this could do the job:

```
[0]
F? 0
1
F? 1
1
×
x=0?
RTN
stuff if flags 0 and 1 are set
RTN
```

No labels, no registers. The price: stack registers contents. One thing I do not like in this approach is that only x-register contents is known after these program steps are executed: x-register = 1 if both flags are set, x-register = 0 if at least one of them is cleared.

> Quote:
>
> PS: which method of flag manipulation do the RPL calculators support?

As for UserRPL manipulations, flags can be handled as a set, as separated memory space. You can retrieve flags status to stack level 1 by evaluating [RCLF], almost the same way it was done with the 41C/CV with X-functions, or an HP41CX, by using [RCLFLAG]. The main difference is that [RCLF] returns a list with two binary numbers: one reflecting system flags status, and another reflecting user flags status. Major problem is that extra manipulation must be performed to have access to any of them in this approach. But if you need to know flag status, like flags 1 and 2 (no flag numbered as '0' in RPL-based calculators), and want to handle their state, I think it's easier because RPL tests return flag status as 1 (true) or 0 (false) to the stack.

```
IF 1 FS? 2 FS? AND
THEN stuff if both flags are set
END
```

Optionally:.

```
IF 1 FS? 2 FS? AND
THEN stuff if both flags are set
ELSE stuff if at least one of them is cleared
END
```

I like programming in RPL because of many reasons, and as I prefer using stack registers instead of regular memory registers (as long as it does no sacrifice performance neither stretches program lenght), RPL stack allows some maneuvers like handling flags status without loosing current contents. In the examples above, each FS? instruction removes the flag identificator and returns its status as 1 or 0. So, the AND operation will always find at least two arguments to combine and leave the result in stack level 1. Hence, the IF...THEN...(ELSE...)END structure removes the combined flag status left in stack level 1, and whatever existed in the remaining stack levels is left untouched. Based on these facts, the IF...THEN...(ELSE...)END structure needs something in stack level 1

prior to decide for THEN and opetionaly for ESLSE, so the flag manipulation may happen prior tho the structure itself. Like this:

```
1 FS? 2 FS? AND
IF
THEN stuff if both flags are set
END
```

Or:

```
1 FS? 2 FS? AND
IF
THEN stuff if both flags are set
ELSE stuff if at least one of them is cleared
END
```

This is something I like very much in RPL programming: you actually must keep track of what you leave in the stack registers. Trash must be removed, otherwise it will be left in the stack and if you have cyclic operations leaving trash, the stack may grow too fast and a Low Memory warnning is most likely to appear...

Hope this gives you a glimpse of what can be done.

Cheers.

Luiz (Brazil)

(BTW, Cameron, I think I lost the e-address to your HP16C page; would you post it, please?)

Re: 38C and 12C hex tables

*Message #20 Posted by **Vieira, Luiz C. (Brazil)** on 2 Sept 2005, 1:47 a.m.,*
in response to message #19 by Eric Smith

Hi, Eric;

[RCL][PSE] is the instruction that forces the IRR calculation to go beyong the Error 3 warnning (multiple roots). It is explained in Appendix B, under 'More about IRR'. In the

HP12C Owner's Handbook, [RCL][PSE] is coded as [RCL][g][R/S], and I think this is just a strategic way of calling the operation.

Either if invoked through the keyboard or through a program instruction, [RCL][PSE] takes x-register contents as a guess for [IRR] and tries to find an answer close to this guess. Once, some(how long) time ago, I wanted to investigate this particular case. I simulated a cash flow with a peculiar arrangement and by simply pressing [IRR] the calculator returned Error 3. I forced a wrong guess, too far from the possible answer, pressed [RCL][g][R/S] ([RCL][PSE]) and no Error 3 warnning occur, neither Error 7. The HP12C [IRR] routine ran for about an hour and I decided to stop the search with [R/S].

Just for the records...

Cheers.

Re: 38C and 12C hex tables

*Message #21 Posted by **Eric Smith** on 2 Sept 2005, 2:09 a.m.,*
in response to message #20 by Vieira, Luiz C. (Brazil)

OK, I edited my posting and the hex table web page and the list to use HP's "RCL g R/S" designation rather then "RCL PSE". Either way it seems like a pretty obscure sequence. "STO g R/S" would have made slightly more sense to me, i.e., "store a new guess and continue the IRR calculation".

I'm still not completely convinced that it would be useful in a program.

HP-12C: RCL g R/S in a program

*Message #22 Posted by **Valentin Albillo** on 2 Sept 2005, 4:16 a.m.,*
in response to message #21 by Eric Smith

Hi, Eric:

Eric posted:

"... to use RCL g R/S" designation rather then "RCL PSE". Either way it seems like a pretty obscure sequence. [...] I'm still not completely convinced that it would be useful in a program."

You can find a very useful (if unexpected) use of **RCL g R/S** as a program line in the HP-12C program featured in this article of mine (see line 22).

Best regards from V.

Re: ANSWERS to "Quiz: HP Voyagers"

*Message #24 Posted by **Thibaut.be** on 30 Aug 2005, 6:59 a.m.,*
in response to message #1 by Karl Schneider

> Quote:
>
> A principal P, compounded at annual rate r for one year in n periods yields a final value F:
>
> ```
> F = P*[1 + r/n]^n
> ```

Hi Karl,

Congratulations for this exhausted explanations.

A very quick comment on your formula. Yours is correct if the rate r is the american APR. But it is mathematically approximate.

If the period in n is not the same of the period of the rate (which is in most cases true, typically rate being annual and payment monthly), you need to convert the monthly rate to get the "true" annual rate, which turns out to be higher than expected.

For example, a 6% APR gives a .5% monthly rate. Compund the latter and you'll see that your rate is not 6% but 6.17%

In other words, unless we are talking about an APR and monthly payments, where n is always 12, the rate should not be divided by the number of periods (m) in the rate but "anti-coumpunded" by the formula ((1+i)^(1/m)-1).

An explanation

*Message #25 Posted by **Karl Schneider** on 30 Aug 2005, 9:29 p.m.,*
in response to message #24 by Thibaut.be

Thibault --

There may be differences in convention for reporting interest rates, but it's not really that complicated:

> Quote:
>
> A principal P, compounded at annual rate r for one year in n periods yields a final value F:
>
> ```
> F = P*[1 + r/n]^n
>
> As n gets ever-larger (infinite compounding),
> ```

```
F = P*e^r
```

The "annual rate r" is indeed intended as the simple-interest, uncompounded Annual Percentage Rate (APR), but it doesn't have to be annual -- it can be for any period of time. "n" is the number of equal-length compounding periods.

The equation simply illustrates that

```
 lim     [1 + r/n]^n  =  e^r
n->inf
```

showing the use for e^x, ln, and y^x in a financial calculator.

Your example is correct: $[1 + 0.06/12]^{12} = 1.06168$; a 6% simple-interest rate becomes a 6.17% "effective" interest rate, in our parlance.

Cool aproximation for simple calculators

*Message #26 Posted by **Namir** on 31 Aug 2005, 2:20 a.m.,*
in response to message #25 by Karl Schneider

Karl,

Your approximation is very interesting. It reminded me of a method I devised in the late 70s to calculate e^x on requglar calculators using:

e^x = (1 + x / 2048)^2048

1) Divide x by 2048 2) Add 1 3) Square the result 11 times (press the sequence [x][=] 11 times) 4) You get e^x to a good approximation

Likewise you can calculate ln(x) using a calculator with a square root function:

ln(x) = 2048 * [x^(1/2048) - 1]

1) Take 11 successive square roots of x 2) Subtract 1 3) Multiply by 2048 4) You get an approximation of ln(x)

This approximation allowed a calculator with a square root to approximate ln(x). Sotring 2038 in a memory reguster helps some.

Re: An explanation

*Message #27 Posted by **Thibaut.be** on 31 Aug 2005, 3:50 a.m.,*
in response to message #25 by Karl Schneider

Thanks Karl.

I'm not an engineer nor a mathematician, but I've had the opportunity of learning all these financial concepts (and a few others more), and be reassured, I'm (hopefully) aware of all you're writing.

This is all a parlance issue. I just wanted to emphasize that the formula you used is appropriate in US mortgage calculation, but not in other countries. For example, Canadian mortgages are compounded semi-annually. In Europe, we use the effective rate.

And last but not least, I also wanted to demonstrate that one should be careful when taking in consideration an APR : the effective rate is always higher.

Re: An explanation

*Message #28 Posted by **don wallace** on 31 Aug 2005, 4:35 a.m.,*
in response to message #27 by Thibaut.be

Interesting thread (I have a layman's interest in maths agorithms).

Karl, your comments reminded me of a calculator I begged my father to buy me in 1973 when I was ten. It was a SHEEN, with very limited functions (sixteen keys on the keybaord).

The "interesting feature" was an unusual implementation of a constant memory SHEEN called a RAM (! ;-).

The ram key (in the display filter-!) enabled you to add and multply, etc. using the constant so stored. Big deal...?!

BUT (<-- big "but")... the manual (yes it had one) had a really interesting little chapter on higher mathematical functions you could manually do by (very) creative use of the four function constant memory. There were (paper) algorithms for square root, using Newtons Method of iterative approximation, calculation of "e" and a few other things I've forgotten. I THINK you could do basic trigs (man, that was involved...)

Very off-topic but I thought I would share this little oddity...

Don W

Quiz: HP Voyagers!

*Message #1 Posted by **Karl Schneider** on 29 Aug 2005, 10:21 p.m.*

Fans of the HP-10C/11C/12C/15C/16C:

Here is a modest quiz about functionality of the five Voyager models. If you're interested, see how many you can answer without downloading the MoHPC's photos...

Answers with background and insight will be provided shortly in a separate post.

1. Which model(s) provide all twelve conditional tests?

2. Which model(s) provide only eight conditional tests?

3. Which model(s) provide only two conditional tests?

4. Which model(s) do not provide insert/delete program editing?

5. Which model(s) do not provide a "delete digit" function?

6. Which model(s) do not provide any loop-counter functions?

7. Which model(s) provide Solve, Integrate, matrix functions, and functions using complex-valued inputs?

8. Which model(s) provide an "exchange with memory register" function?

9. Which model(s) do not provide trigonometeric functions?

10. Which model(s) do not provide logarithmic or exponential functions?

11. Which model(s) provide a "modulo division" function?

12. Which model(s) allow "F" as a program label?

13. Which model(s) provide a y-estimator regression function?

Good luck!

*Message #2 Posted by **Vieira, Luiz C (from Brazil)** on 29 Aug 2005, 10:33 p.m.,*
in response to message #1 by Karl Schneider

Hi, Karl;

1. Which model(s) provide all twelve conditional tests?

HP15C

2. Which model(s) provide only eight conditional tests?

HP11C and HP16C

3. Which model(s) provide only two conditional tests?

HP10C, Hp12C and Platinum (should it be considered?)

4. Which model(s) do not provide insert/delete program editing?

HP10C and HP12C and Platinum

5. Which model(s) do not provide a "delete digit" function?

HP10C and HP12C and Platinum

6. Which model(s) do not provide any loop-counter functions?

HP12C and Platinum

7. Which model(s) provide Solve, Integrate, matrix functions, and functions using complex-valued inputs?

Hp15C

8. Which model(s) provide an "exchange with memory register" function?

HP15C (if we consider x<>(i) and x<>(I), HP11C and HP16C)

9. Which model(s) do not provide trigonometeric functions?

HP16C, HP12C and Platinum

10. Which model(s) do not provide logarithmic or exponential functions?

HP16C

11. Which model(s) provide a "modulo division" function?

HP16C

12. Which model(s) allow "F" as a program label?

HP16C

13. Which model(s) provide a y-estimator regression function?

HP12C and Platinum

Any prize? (kidding...)

(one edition...)

Re: Quiz: HP Voyagers!

*Message #3 Posted by **Howard Owen** on 29 Aug 2005, 10:59 p.m.,*
in response to message #2 by Vieira, Luiz C (from Brazil)

My 15C only has x=0, x<=y and F? on the keypad, but the TEST key gives you ten more. Tricky. That's thirteen if you don't count ISG and DSE.

My 16C appears to have ten. x<=y, x<0, x>y, x>0, x#y, x#0, x=y and x=0. That's eight, then there's F? and B?, the last unique to the 16C. But if you count ISG and DSE, that's twelve.

My 11C looks like it has nine, not counting the loop tests. All nine are the same as the 16C's, just leaving out B?.

I wouldn't know about the 10C, darn it!

My 12C is still in the mail.

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2005, 12:03 a.m.,*
in response to message #3 by Howard Owen

Hi, Howard;

I was leaving the University when I saw the quiz, so I just follow my memory. Yeap, no calculator in hands, no HoHPC site checking; I`m a teacher, cannot give a bad example, so, no cheating... I edited my first answer just because I forgot that the HP12C has [LN] and [e^x].

I took 'Conditional Tests' as described in the HP manuals. [F?] is named a 'flag test', and manuals do not exactly count it as conditional test, although I agree with you that it conditionally allows execution of (if flag set) or skips (if flag cleared) the instruction in the program step that follows it.

ISG and DSE (ISZ and DSZ in the HP16C) are mainly used as loop control instructions, and I also agree with you that there is a conditional test embeeded on both of them (four of them, if we count ISZ and DSZ inthe HP16C). Each of these instructions may be used as conditional tests, but as they perform three operations (change the register contents, tests the register contents in a very particular way, and perform or skips next program step), I think that they go beyond the single conditional test, probably the reason they are considered separately.

[B?] is a bit test instruction, and 'conditionally' skips or executes the next step if the flag (x-register) is set or cleared (in the binary number in y-register), respectively.

As the quiz was so precise mentioning the 12 conditional tests (found in the HP15C), the ten conditional test (also found in the HP11C and HP16C), I did not think twice. I agree with you, your answers are more precise when we consider the very instructions structure, and I must confess that if the figures were the ones you mention, I'd probably miss the answers.

Actually, I think I missed (I surely missed) the question about "no loop-counting", because I do not remember seeing such DSE or ISG in the HP10C. I do not even recall seeing the I register on it, neither the (i) indexer. In fact, thanks to a good soul (Hi, E.V.), I was able to complete my Voyager set some months ago with the addition of an HP10C to the other ones. I naver had an HP10C and actually could

touch one and test it in the mid 80's.

Maybe I'm just justifying my answers and trying to earn my prize... <8^)

Thanks and best regards.

Luiz (yet with no calcs at hand, just counting on memory)

Re: Quiz: HP Voyagers!

*Message #5 Posted by **Howard Owen** on 30 Aug 2005, 12:44 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

You did a lot better than I did, even without a calculator to manipulate. I knew I had no chance from memory, since I've only had the machines a short time. But my legalistic mind was at work again. He said "no checking the pictures on the museum site" and honest your honor, I didn't look at any pictures. 8)

Actually, I was enjoying the survey of quirky Voyager calculator features and matching your answers against what I saw in front of me. I agree about ISG and DSE being enough different to be classed seperately from the other conditionals. (I did *not* know that the 16C's loop tests were different. Interesting.) And I think you could argue that F? should be seperate since it is testing a quantity outside the X and Y registers. (And HP makes that distinction, as you noted.) But in order to exclude B? from the list of conditional statements, you would have to extend the definition of those statements. In the 15C manual, a ".. *conditional test* compares a number in the X-register either to zero or to the number in the Y register." (Italics in original.) I think you'd have to add "entire" like this: "the entire number in the Y register" in order to exclude B?. In the 16C manual, bit tests and the other conditional tests are in sperate sections, but the index has:

```
Conditional tests,88-89
 for bits,50-51
```

I therfore submit, ladies and gentlemen of the jury, that the prosecution has *not* proven beyond a reasonable doubt that my client, the B? test, is not, or should not be considered, a member of the elite group of Voyager calculator conditional tests. Your honor, the defense rests.

8)

Re: Quiz: HP Voyagers!

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 30 Aug 2005, 2:26 a.m.,*
in response to message #5 by Howard Owen

Hey!

> Quote:
>
> I therfore submit, ladies and gentlemen of the jury, that the prosecution has not proven beyond a reasonable doubt that my client, the B? test, is not, or should not be considered, a member of the elite group of Voyager calculator conditional tests. Your honor, the defense rests.

Does it mean I may not earn my prize? <*^C (BHWAA!)

(What else to say? I see no way out... Although it tests a single bit, [B?] indeed compares... Aha! It does not compare the contents of x- against y-register! It solely compares the state of bit #*n* (*n* is defined by x-register contents) that is actually located in word stored in y-register! Where is the jury? Oh, yeah; there!

So, ladies and gentlemen, members of the jury, distinctive attorney, your honor; I want to show exhibit #1 where we can clearly see [B?] comparing nothing but uniquely testing the status of a bit, where x-register contents was acting only a blind pointer, not a co-author. As my distinctive colleague mentioned in his clever defense:

> Quote:
>
> a ".. conditional test compares a number in the X-register either to zero or to the number in the Y register."

This characterizes a second flaw: the main number being tested is in y-register, not in x-register. So, as [B?] by itself cannot compare the contents of x- against y-register, [B?] is guilty as charged!

The state definitely rests.

(I don't know about the others, but I've been having as much fun going ahead with this discussion than I had answering the quiz... Hey, Howard, this is what I call a significant brainstorm! Cheers!)

Double speed 15C?

*Message #1 Posted by **Gerson W. Barbosa** on 29 Aug 2005, 11:00 a.m.*

Was there a double-speed 15C?

Tony (Anton), a German collector, claims one of his 15C's ran his performance index at twice the speed compared to another unit.

I've just run his test on my Voyagers and have obtained the following results:

11C's:	Performance Index
2711B***** : 21.9 s	1.6
2521B***** : 22.4 s	1.5
2540B***** : 23.5 s	1.5

15C's:

2547B***** : 24.3 s	1.4
2343B***** : 25.6 s	1.3

Tony's 15C, 2605A***** : 12.5 s , performance index = 2.7 !

(I have noticed the tests take up to 10% longer when using old battery sets. I used new battery sets when testing)

His performance index method may be found at:

http://www.thimet.de/CalcCollection/CalcPerformance.html

Here is the version for the 15C of his program, just in case someone want to check it out:

```
f LBL A
  10
  STO 0
f LBL B
  1
  +
  4.567
  EEX
  CHS
  4
  -
  70
  +
  69
  -
  7
  *
  11
  /
  RCL 0
  1
  -
```

```
  STO 0
g TEST 0 (x<>0)
  GTO B
  Rv
g LOG
  SIN
  SQRT
  SQRT
g RTN
```

> Quote:
>
> Tony's 15C, 605A*****

There is an issue with this S/N : all 15C should in theory have S/N that start with 22 to 29. Unless the S/N of this peculiar 15C is 26 and not 6 ?

Re: Double speed 15C?

*Message #3 Posted by **Gerson W. Barbosa** on 29 Aug 2005, 12:31 p.m.,*
in response to message #2 by Thibaut.be

Sorry, I had skipped a number:

It's serial number begins with 2605A.

Regards,

Gerson.

On the 33S

*Message #4 Posted by **Mike H** on 29 Aug 2005, 11:32 a.m.,*
in response to message #1 by Gerson W. Barbosa

Since it was not listed, I did a quick test on my 33s Resulting times ranged between 1.15 to 1.22 seconds (using a stop watch)

Re: On the 33S

*Message #5 Posted by **Gerson W. Barbosa** on 29 Aug 2005, 1:03 p.m.,*
in response to message #4 by Mike H

That gives a performance index of 29 (34/1.19), only 16% greater than the 32SII index. I suspect the 33S actual index should be greater than this. Once a noticed the 33S is 40% faster than the 32SII, but the program I tested did not use transcedental functions.

Tony's complete benchmark program includes the following routine, to add more loops. This may reduce

measurement errors when testing faster calculator:

```
LBL C
GSB A
RCL 3
1
-
STO 3
x<>0?
GTO C
RTN
```

The number of loops should be entered in register 3 before executing C. The performance index is calculated as

P=34/(T/n),

where T = execution time n = number of loops

It is interesting to notice the indeces for the HP-55 and HP-49G+: 1.0 and 258. Only 25700 % (not so great as it should be expected).

Regards,

Gerson.

The test is not being fair. For pure speed, a proper compiled language should be used - not an emulated, threaded language. The HP49 also uses BCD for floating point. BCD is a very, very poor choice for benchmarks.

I recompiled the provded C++ code for the calculator. It does 100,000 loops in ~26 seconds. This gives a rating of 130,770.

```
/*This program takes ~26 seconds to run 100000 loops*/

#include <hpgcc49.h>

static void test() {
  const int loops=100000;
  double x, r0;
  int i;
  for (i=0; i<loops; i++) {
    r0=10;
    do {
      x=r0;
      x+=1;
      x-=4.567E-4;
```

```
      x+=70;
      x-=69;
      x*=7;
      x/=11;
      r0-=1;
    } while (r0>0);
    x=log(x);
    x=sin(x);
    x=sqrt(x);
    x=sqrt(x);
  }
  printf("%f\n",x);
}

int main(){

        clear_screen();
        printf("Press ON to test");
        while(!keyb_isON());
        sys_slowOff();
        test();
        printf("\nDone, press Left Shift");
        sys_slowOn();
        while(!keyb_isLS());
        return 0;
}
```

You're not wrong, although C++ is not a language most 49G+ users are familiar with. But the index should be computed with the programming language primarily available to the user. This index could be much better if the 49G+ firmware had only native ARM code, though not so good as the index you achieved with the compiled C++ program. I think the 49G+ emulating the Saturn processor on the ARM is one of its weakness. By what I've been told, the batteries don't last long enough, perhaps because of this. That's why, among other reasons, I have preferred the 49G as a replacement for the 48GX, I don't like replacing batteries too often. (Sorry if I am wrong, this is just a conjecture).

Regards

Re: On the 33S

*Message #8 Posted by **Gerson W. Barbosa** on 29 Aug 2005, 6:32 p.m.,*
in response to message #5 by Gerson W. Barbosa

Running time on the 33S:

10.5 s, 10 loops.

Index: 32, 35% faster than the 32SII (14.2 s, 10 loops)

BTW, the program returns 0.264577498

Re: Double speed 15C?

*Message #9 Posted by **Eric Smith** on 29 Aug 2005, 1:19 p.m.,*
in response to message #1 by Gerson W. Barbosa

Does he know the provenance of the calculator? Possibly some installed a speedup modification?

Re: Double speed 15C?

*Message #10 Posted by **Gerson W. Barbosa** on 29 Aug 2005, 3:44 p.m.,*
in response to message #9 by Eric Smith

He doesn't say much in his site. He just says he acquired it in 2002. Most likely this is a modified unit. I just thought later Voyagers might be a little faster.

My newer 15C has the 1LM2 processor, so in theory it could run as fast as the 12C Platinum, or half the 42S speed. But I don't see any reason to speeding it up. Besides, it computes trigs in less than one second! :-)

Re: Double speed 15C?

*Message #11 Posted by **Tizedes Csaba [Hungary]** on 31 Aug 2005, 2:37 a.m.,*

Hello,

My 15C (SN: USA 2809A.....) produced 25.52s/25.42s/25.41s, so it's average time is 25.5s

If you want step-by-step builded Benchmark programs, see my post at My benchmarks - Message#25

Csaba

Re: Double speed 15C?

*Message #12 Posted by **Gerson W. Barbosa** on 31 Aug 2005, 12:28 p.m.,*
in response to message #11 by Tizedes Csaba [Hungary]

Hello,

Thanks for the interesting link. Your results match mine, which are a mean of three measurements too. For a while I thought there might have been a faster 15C but Tony's turbo 15C appears to be just a modified calculator. The only calculator I'd like to occasionally run at double speed is the 42S (ROM version B). However, as far as I know, with that ROM version this can be done only manually, by means of a somewhat cumbersome procedure.

Regards,

Gerson.

THERMAL PRINTER 82143A battery voltage=?

*Message #1 Posted by **don wallace** on 29 Aug 2005, 7:15 a.m.*

Hi all.

Wondering what the voltage of the rechargeable battery pack for the little thermal printer for the hp41 is supposed to be. I got one off ebay without a battery and don't want to muck with it without feedback from someone who actually has one...

Thanks!

Don Wallace

Re: THERMAL PRINTER 82143A battery voltage=?(few corrections...)

*Message #2 Posted by **Vieira, Luiz C (from Brazil)** on 29 Aug 2005, 8:25 a.m.,*
in response to message #1 by don wallace

Hi, Don;

the original pack is an assembly with four regular NiCad 1.2V battery connected in series, i.e., about 4.8Vcc. I rebuilt a battery pack to be used with an HP97 (same pack works with the Topcats - HP9X series - and some HPIL peripherals, like the cassette drive) with four NiMH batteries taken from a Motorola® mobile phone battery. In fact, the mobile battery pack had a bad cell (originally five cells) and I used the four good ones. It is working perfectly fine after almost two years. I'm lazy enough having the carcass of two other packs and enough batteries to rebuild them, so I can power the 82143A, the HP97 and have a spare, fully charged pack to be used anytime I need.

I scanned the final package and the Motorolla® batteries to give an idea of how the rebuilt pack looks like, but I had my images removed from the address they where (wiped out by some freak cracker...), but I still have it in one of my hard disks. If you believe it is sort of additional information, let me know and I'll upload the image again. In fact, there is a thread about this somewhere in the forum archive...

Best regards.

Luiz (Brazil)

Re: Srvice and repair of HP 35 & HP 21

*Message #3 Posted by **Jeff O.** on 29 Aug 2005, 12:34 p.m.,*
in response to message #1 by James W. Mar

James,
Are you having specific problems with your 35? Many problems that tend to afflict the 35 are easy for even a relatively unskilled person to address. If you post your problems, perhaps one or several of the many knowledgeable visitors to this Forum could guide you through a repair procedure.
Although there are a couple of simple problems that afflict the 21, it is subject to some relatively more serious problems that require expert attention. However, it couldn't hurt to also describe its problems for the community to comment on.

Happy to fix the 21 too. If it can be fixed, I'll do it... May not be economical to repair though..

Jeff is dead right about the help you get here. Great bunch of ppl.

Luiz was able to tell me about the battery voltage for a printer I got off ebay (believe it or not the service docs I had didn't mention what it was). I thought it should be 6V based on the the charger output voltage but although I have 20 years plus experience in repairs, I did not want to GUESS when there are poeple here to ASK. Luiz wrote back in 90 minutes...

I now have my thermal printer running fine (still gotta do that paper feed roller, though...)

THE MAIN THINGS YOU SHOULD KNOW: If you want to fix it (35) yourself, (1) get advice on disassemby first and (2) get advice on and take steps to AVOID DAMAGING the CIRCUITS WITH STATIC ELECTRICITY.

Cheers,

Don W P.S. I had a friend in high school in the late 1970's who disassembled his 34C (then kinda state-of-the-art). On that machine the chips are pressure connected (no soldering...[dumb]!) and when he got the case apart all the chips flew in different directions... He never got it working again... He then bought a 41C...

Srvice and repair of HP 35 & HP 21

*Message #1 Posted by **James W. Mar** on 27 Aug 2005, 9:20 p.m.*

Is there a company, like HP, that will service / repair my HP 35 and HP 21 calculators?

Re: Srvice and repair of HP 35 & HP 21

*Message #2 Posted by **don wallace** on 6 Sept 2005, 1:04 a.m.,*
in response to message #1 by James W. Mar

I started out in 1985 repairing desktop computers (NOT PCs) and calculators for Canon. I have repaired my HP41CV extensively over the years (five repairs).

Happy to have the opportunity to repair your 35 and 21.

What's wrong with them?

Write to me if interested.

You can try fixthatcalc but I believe they are rather backlogged? The guy is a plastics engineer and does repairs part time with his wife.

Don Wallace

Swap Command

*Message #1 Posted by **Will** on 27 Aug 2005, 1:37 p.m.*

On my 48SX I can swap a number that has not been entered onto the stack with a number already on the stack just by using the swap key.

On the 49g+ I have to go through "tools", "stack", then "swap", or enter the number on the stack with the number to be swapped and then hit the right arrow key.

Is there another way to make the 49g+ swap like the 48SX without having to go through all this?

Re: Swap Command

*Message #2 Posted by **John** on 27 Aug 2005, 1:49 p.m.,*
in response to message #1 by Will

Is it really so difficult to press ENTER and then right arrow? You make it out like it takes an extra hour each time you do it.

You could of course create a custom menu with the command listed in it.

You could also create a user key assignment in user mode and then press that key each time you wish to swap.

But, it's not that big a difference.

Re: Swap Command

*Message #3 Posted by **Will** on 27 Aug 2005, 2:00 p.m.,*
in response to message #2 by John

No it's not that much more to push enter, it's just seems asinine to add an extra keystroke to such a common application. Maybe you aren't calculating nearly as much as I am. I guess I will just define a key.

Re: Swap Command

*Message #4 Posted by **James M. Prange (Michigan)** on 27 Aug 2005, 9:13 p.m.,*
in response to message #3 by Will

But on the 48 series, with the command line open, you have to use LeftShift to invoke the SWAP command. So on the 48, I could use either LeftShift CursorRight or ENTER CursorRight, but on the 49, only ENTER CursorRight works for this. It's different, but I don't see an extra keystroke.

Regards,
James

Re: Swap Command

*Message #5 Posted by **James M. Prange (Michigan)** on 27 Aug 2005, 9:43 p.m.,*
in response to message #4 by James M. Prange (Michigan)

P.S.

Of course, on the 49 series, you could also invoke SWAP from the menu (TOOL NXT STACK SWAP), but unless the STACK menu is already open, that seems clumsy.

Note that on the 49 series, with the command line open, LeftShift CursorLeft or LeftShift CursorRight mean "move the cursor to the left or right edge of the current display, or if already at that edge, move one more screen in that direction". Whether the extra editing operations are worth losing GRAPH or PICTURE and SWAP as shifted keys is rather subjective.

Regards,
James

> ... is the "x<>y" key, always plainly labeled and never shifted or menued.

That's certainly convenient, but I don't think that it would be feasible to provide a separate key, or even shifted key, for every operation available on an RPL model.

Regards,
James

REPAIR FOR HP 11C

*Message #1 Posted by **LISA** on 27 Aug 2005, 12:37 p.m.*

WHERE CAN I SEND MY HP 11C CALUCALATOR TO FOR REPAIR? OR SHOULD I JUST BUY ANOTHER ONE?

Re: REPAIR FOR HP 11C

*Message #2 Posted by **Vieira, Luiz C (from Brazil)** on 27 Aug 2005, 4:16 p.m.,*
in response to message #1 by LISA

Hi, Lisa;

HP itself no longer saupports the HP11C. You can try fix that calc.

About buuying another unit, e-bay sems to be the only place you'll find another HP11C. Beware of high prices... It will not be cheap.

If you consider a newre model, the only one that gets close to the HP11C is the HP33S. You should at least have a look at it prior to buy one; it is not like the HP11C at all.

Anyway, give Fix That Calc (and your HP11C) a chance...

Success!

Luiz (Brazil)

Re: REPAIR FOR HP 11C

*Message #3 Posted by **Dave Shaffer** on 27 Aug 2005, 5:18 p.m.,*
in response to message #1 by LISA

And if you don't repair it - DON'T THROW IT AWAY!

It almost certainly has parts which would be useful for rescueing other calculators.

Somebody here (or ebay) would buy it.

speaking of the 11c

*Message #4 Posted by **david bowers** on 29 Aug 2005, 8:34 a.m.,*
in response to message #3 by Dave Shaffer

hi i am the surveyor who drops his 42s, retired it once i lost and found it, then bought an 11 c off randy then lost that after 3 months ownership in the mud onsite last friday in taiwan, have asked a rellie in the states to send the 05 serial numbered 33s, at leat i will only drop 60 bucks this time life could be worse, it doesnt revolve around calculators cheers david

Re: REPAIR FOR HP 11C

*Message #5 Posted by **don wallace** on 29 Aug 2005, 7:02 a.m.,*
in response to message #1 by LISA

Hi Lisa.

If you like, give me a go. I am mainly into the HP41. Have done a few repairs. But Fixthatcalc are really good, I think. Plastics engineer, I think. Nice guy.

My specialty is electronics design and repair (20 years experience) but I also know a bit about materials science and have experience in building and repairing all sorts of equipment and in the use of special glues, epoxies and composites.

If you want to send it to me, first write to me, describing the problem and how it happened. For example, was it dropped? Is the display black? Does it work but some keys are dead? etc...

Happy to help you if I can.

Don Wallace donwallace63@yahoo.com.au

Was the HP48 once made in America?

*Message #1 Posted by **Eddie Shore** on 27 Aug 2005, 11:27 a.m.*

In fact, has HP made any calculator in America? I am currently looking for a calculator Made in America to add to the collection.

Re: Was the HP48 once made in America?

*Message #2 Posted by **Randy** on 27 Aug 2005, 12:06 p.m.,*
in response to message #1 by Eddie Shore

Only the early S and SX's were made in the USA. You can verify by the letter A in the fifth position of the serial number. Later units were made in Singapore and finally Indonesia.

Some early Pioneers (17B/22S/27S/32S/42S) were made in USA.

All 10/11/15C Voyagers were made in the USA.

Almost all classic LED machines where made in the USA with the later units (67 and 97 come to mind) built in Singapore.

Edited: 27 Aug 2005, 12:10 p.m.

Re: Was the HP48 once made in America?

*Message #3 Posted by **Frank Boehm (Germany)** on 27 Aug 2005, 1:08 p.m.,*
in response to message #2 by Randy

Starting with the 35 V2 and ending with the 97 (?), HP manufactured the machines in USA *and* Singapore. There might be exceptions (maybe the 70), but I doubt it.

Re: Was the HP48 once made in America?

*Message #4 Posted by **Karl Schneider** on 27 Aug 2005, 4:49 p.m.,*
in response to message #2 by Randy

Randy posted,

> Quote:
>
> All 10/11/15C Voyagers were made in the USA.

And all 16C's as well. Also, early 12C's, probably until 1988 or so, when the first Pioneers were made in the USA. 12C production shifted to Singapore afterward, although Brazil was also a manufacturing center in 1990.

The earliest 41C models (1979-80) were US-made, and probably the first 41CV's from 1980.

[LONG] Signed integers: HP-16C vs. "the rest"

*Message #1 Posted by **Karl Schneider** on 27 Aug 2005, 1:07 a.m.*

Fellow calculator enthusiasts --

Recently, I was using Microsoft Word macro, when a Microsft Visual Basic error message came up:

"Run-time error 80004005 (-2147467259) ....."

I fixed the problem, but the simple math exercise intrigued me. It clearly looked like an eight-digit (32-bit) hexadecimal code converted to a signed decimal-integer equivalent. This task is basically the extraction of a typical C-language "long int" variable. How efficiently can various calculators with *built-in* binary ("base") conversions obtain the desired result? My findings may be disconcerting to the reader...

First up: the "gold standard"

HP-16C

The user hits DEC, enters "32" and hits WSIZE to set a 32-bit word. Then, the user can choose "2's" complement, and verify these settings using STATUS. Then, the user hits HEX, enters "80004005", hits DEC to convert and reads,

```
-47467259 .d   (in Window 0)
-21        d.  (in Window 1)
```

for a complete value of -2,147,467,259 -- the correct result.

Granted, it's a minor annoyance that the output is displayed in two parts. However, eight digits is a digestible size for "chunks" of long integers, and the user is given exacting control over the format of data. The "DEC" mode offers a true integer range up to 19 digits.

VERDICT: Rigorous and trustworthy.

Pioneer models:

On a 32SII, keying in "80004005" after selecting HEX, then converting with DEC yielded 2,147,500,037. That's the correct unsigned integer, but not the correct (2's complement) signed integer.

Experimentation (or RTFM) reveals that the Pioneer models use a 36-bit 2's-complement integer representation. This makes perfect sense with the 12-digit display, allowing full 12-digit octal and 9-digit hexadecimal. Decimal conversions return to normal floating-point mode (not decimal integer), but the results will not exceed 11 digits. Up to 36 binary digits can be entered or converted, displayable by scrolling 12-digit chunks.

However, 36 bits is not the same as 32 bits. To properly represent this particular complemented, signed integer requires that the hex value be preceded by an "F". This provides a sign bit and three leading complemented bits in the correct positions.

HEX, "F80004005", DEC yields -2,147,467,259.00 on the 20S, 27S, 32S, 32SII, and 42S (and probably the 22S?).

The 33S performs the same way.

VERDICT: The approach is not unreasonable, but the user must take caution to avoid incorrect results.

RPL-based models

I tried the 28C, 48G, and 49G.

The user can set word sizes from 1 to 64 bits using "STWS", but the values are treated only as unsigned. Thus, the RPL-based models cannot automatically handle signed integers. Also, these calculators will accept extra input digits beyond the word boundaries, then simply discard the superfluous high-order bits. The HP-16C and Pioneers do not accept invalid input.

After entering/selecting "HEX" and setting the word size if desired, the user must precede the entered value by a "#" and enter it onto the stack from the input buffer.

Even after setting the word to 32 bits, entering "#80004005" in HEX mode, then entering/selecting "DEC" gives the incorrect result of "#2147500037d" due to unsigned-integer representation.

The HP-48 and HP-49 models allow the user to do a "change sign" on a binary integer to get a 2's-complement conversion, but the HP-28C doesn't -- the user must do a "NOT", then add 1. Either of these approaches will give the result "#2147467259d", which is correct except for the missing sign.

The user would have to write an RPL program to automate this type of conversion.

VERDICT: Awful! Some simple problems are made complicated -- the functionality is there, but it's not implemented thoughtfully.

Non-HP "cheapos"

I also have several low-end calc's with base conversions built in -- a Casio fx-115MS and a Texas Instruments TI-36X. Both of these models are NCEES-approved for standardized EIT/FE and PE exams.

Each of these calculators limits the size of arguments in the respective bases by their 10-digit display length, not by bit count. So, on both calculators, base-2 binary integers are 10 bits, and base-8 octal integers are 30 bits. Base-16 hexadecimal integers are 32 bits on the Casio, and 40 bits on the TI. Integers are represented as signed 2's-complement on both.

Observing the 40-bit word length, the TI returned the correct -2147467259 when provided "FF80004005" as HEX-mode input, converted to floating-point using DEC.

Almost by happenstance, the Casio handled this particular problem most adroitly of any unit I tried. Its fixed 32-bit hexadecimal, 2's-complement signed integers and 10-digit display made it ideally suited for the task. "80004005=" entered in HEX mode and converted with DEC yielded -2147467259. Other values (e.g., 32-bit unsigned integers or shorter signed integers) would not be converted as conveniently; adjustments to input or output would be required.

The different word sizes can produce curious results. For example, -1 decimal on these units displays as octal "7777777777" or binary "1111111111", suggesting that a string of 30 bits can be represented as a string of 10 bits! Another consequence: what is representable on these calculators as hexadecimal might not be representable as octal, decimal, or binary. Attempts to convert "downward" a hexadecimal number within the uppermost range of representable values can produce a non-recoverable and bogus message of "Math Error" (Casio) or "Error" (TI).

One more thing: the Casio will simply return "Math Error" upon buffer entry after blithely accepting superfluous input digits.

VERDICT: The unwitting schoolkids and testees could be flummoxed.

In summary, let's acknowledge the fine and distinctive HP-16C, which also recognizes unsigned and 1's-complement signed integers (which were not yet antiquated in the 1980's).

Comments, experiences?

(a bit long) Re:[LONG] Signed integers: HP-16C vs. "the rest"

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 27 Aug 2005, 2:51 a.m.,*
in response to message #1 by Karl Schneider

Hi, Karl;

first of all, thanks for the so well written post. It is complete and allows us to see the 'great picture'.

The only actual addition of mine would be the following. One of the subjects I`m (gladly!) teaching again is 'Scientific Computing', that mainly deals with representing and handling floating point numbers with computer programs. Number representation (BCD and IEEE 754), error handling, transcendental functions calculation and specific math-related programs are in the menu.

Precisely this week I was showing them what do 1`s and 2`s complement representation are, and the first idea I brought to their minds was `How to represent a negative quantity by using binary numbers?`. Some of them ususaly ask me: `Is it possible to add a minus sign in a binary number?`, then I begin by defining word size, most- and least-significant bit, then binary addition and the concept of a negative representation. The single binary complement allows one representation for zero and another representation for its complement, hence the `-0` decimal equivalent. So, by using the 2`s complement representation, the system gives us one representation for zero and one 'extra' negative representation. Anyway, by using 2`s complement representation we can easily `see` negative quantities represented by binary numbers after subtracting.

Yes, I know that all of these facts are well known by those who deal with binary arithmetic and the like, but what I`d add as an experience of mine is that I use the HP16C User's Guide contents and examples as the main text for these particular classes, and I show both calculator and user's guide to the students (it always happens that someone tells `I was not known about this version of the HP12C! Where can I buy one like this?`. Not that tears come to my eyes when hearing this kind of question, but I actually feel sad for them...). And I also let clear to them that 1`s and 2`s complement representations are specific decimal representations that allow us, humans, to actually `see` negative numbers where there are only ones and zeroes, and that the HP16C actually holds internal binary representation even when showing the decimal negative complement, i.e., the binary number is not changed, only the decimal representation follows the negative complement convention. Neither binaries, nor octals nor hex numbers are shown with a minus sign, instead they must contain all leading bits till the MSB when they represent negative quantities when using 1`s or 2`s complement representation.

It is not too often that some students take some extra, significant time and many questions to be 'clicked on' to these concepts.

Just my 2¢.

Cheers.

Luiz (Brazil)

Re: (a bit long) Re:[LONG] Signed integers: HP-16C vs. "the rest"

*Message #3 Posted by **John L. Shelton** on 27 Aug 2005, 5:09 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

It's important to remember that the various internal representations were done many many years ago, when both computing power and memory were vastly more expensive. Would we use the same representations if we were starting from scratch today?

IBM's (and others) use of BCD in hardware suggests not. Even when computing was expensive, some thought that the internal representation should be closer to the way humans think about numbers. Modern languages give us support for arbitrary precision integers, fractions, etc. Perhaps modern hardware should do the same as well.

Despite the clear efficiency of using 2's complement binary math, we could do better today, trading some performance for more representative numbers.

Still, a great post! Thanks for the education.

Re: (a bit long) Re:[LONG] Signed integers: HP-16C vs. "the rest"

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 27 Aug 2005, 6:56 a.m.,*
in response to message #3 by John L. Shelton

Hi, John;

your question:

> Quote:
>
> Would we use the same representations if we were starting from scratch today?

I think I cannot dare answering such question because of some reasons I see right now.

As for what I know about today, computers usage differ from what they were mainly designed for: an aid for science and business in such a way problems in these fields could be faster and reliably solved. Now we have so many fields where computers are more than an aid, instead are the main reason for their existence, that it is somehow hard for me to think of a straight answer.

In fact, if we do not think of any particular development fields, binary arithmetic is faster than floating point. Anyway, in applications were building 3D images in real time with high resolution is the main concern, like 'games and fun', then we can count on about 8GHz core processors commercialy available, and I can't imagine any software that would be slow if running in these machines (add a low-cost 2-GByte RAM and we're done, here). So, your question is pertinent, and daring to answer goes to the hands of todays digital designers.

Any reading these posts?

Cheers.

Luiz (Brazil)

Re: (a bit long) Re:[LONG] Signed integers: HP-16C vs. "the rest"

*Message #5 Posted by **John Limpert** on 27 Aug 2005, 9:03 a.m.,*
in response to message #3 by John L. Shelton

IBM had a very good reason for using BCD on their business-oriented computers. Think of a typical job, payroll. It reads in a sequential file of punch cards containing employee ID and hours worked, computes wages and deductions, updates a master file, and prints thousands of checks. All I/O is fixed-record-length with data fields in EBCDIC or Hollerith code. Hardware multiply/divide, if present, is slow and avoided whenever possible. By using BCD, input and output format conversions are limited to conversion between a character code (EBCDIC or Hollerith) and BCD, which is simple and can be implemented in hard-wired logic. The system is optimized for very fast and efficient I/O, not number crunching. Throwing binary integers into the mix requires expensive conversions between strings in character code and binary integers for every record that is read or written. All of the peripherals are dumb by modern standards, relying on hard-wired logic, not microprocessors. They are incapable of converting between binary and character codes. Besides efficiency, BCD arithmetic avoids problems with errors introduced by using binary numbers to represent decimal numbers.

Re: [LONG] Signed integers: HP-16C vs. "the rest"

*Message #6 Posted by **Vassilis Prevelakis** on 27 Aug 2005, 5:41 p.m.,*
in response to message #1 by Karl Schneider

I know I am going to be flamed, but here it is:

You can use the Apple OSX calculator (which has an RPN programmer option!)

The wordsize is 64bits so you can either enter 0xFFFFFFFF80004005 in HEX mode and press DEC to see -217467259, or press the decimal number and then press HEX to see the 0xFFFFFFFF80004005

You can even select a binary display to see the binary representation of the number in addition to the HEC/DEC/OCT display

Re: [LONG] Signed integers: HP-16C vs. "the rest"

*Message #7 Posted by **Karl Schneider** on 27 Aug 2005, 6:10 p.m.,*
in response to message #6 by Vassilis Prevelakis

Vassilis --

No, certainly no flame from me...

I'm sure there exists much more-capable computer-based software to perform computer-science computations. It's probably why the full functionality of the 16C was never provided in any replacement HP calculator (as my comparison aptly showed).

The Mac OS-X calculator in an Apple desktop or laptop is not very portable, and the word size and complement may be fixed.

Is there any capable computer-science software for a PDA? Such a software package should also be able to convert text in various formats.

-- KS

Easily the best for the money!

*Message #8 Posted by **Palmer O. Hanson, Jr.** on 28 Aug 2005, 10:12 p.m.,*
in response to message #7 by Karl Schneider

I was in Wal-Mart today and checked the calculator display. I'm waiting and hoping for a sale price on the HP-33S but it hasn't happened yet. Then I spotted the LeWORLD Scientific Calculator priced at $4.23 ! At 2.75"x5"x0.5" thick it is truly shirt pocket size. It has all the usual scientific functions including hyperbolics. And, it has a base conversion capability with a forty bit hexadecimal display. To do the conversion discussed in this thread one simply has to press 2ndF HEX, enter FF80004005, press 2ndF DEC and -2147467259 appears in the display. No messing around with two's complement or word length commands. What could be easier than that? Back in the early sixties when we did conversions using a Friden we would have sold our soul for a capability such as that.

One entry in the thread asks "Would we use the same representations if we were starting from scratch today." Absolutely. Without the benefit of fifty years of development I can't see how we could do anything differently.

Here's a question related to a frequently discussed subject in the Museum. If LeWorld can deliver that much power in a scientific calculator for less than five dollars today then how long will it be before they can offer the capability of an HP-15C for less than twenty dollars?

You may have missed my point ... [HP-16C]

That sounds just like the TI-36X I described in my original post, or even a modern TI-30. I'll bet that it has the same limitations and pitfalls, too...

The user (probably a secondary-school student) must know that the hexadecimal word size is a fixed 40 bits, and must pre-pend enough "F"'s to fill out the word, *if and only if* the hex code represents a signed integer *and* the first hexadecimal digit is >= 8. Otherwise, *don't* "F-bomb" the input. ;-)

> Quote:
>
> No messing around with two's complement or word length commands. What could be easier than that?

Well, suppose that the input is <u>not</u> a 2's-complement, 40 bit word. The mathematical or logical operations might be erroneous, or the user could enter invalid input (e.g., too many digits).

That I can imagine. However, 20 years later (in 1982), one could have obtained the excellent capabilities of the HP-16C for less than $150, and *retained* his mortal soul... ;-)

After the Friden and before the HP-16C

*Message #10 Posted by **Palmer O. Hanson, Jr.** on 29 Aug 2005, 11:05 p.m.,*
in response to message #9 by Karl Schneider

Karl wrote "... 20 years later (in 1982), one could have obtained the excellent capabilities of the HP-16C ..." In 1977, five years before the advent of the HP-16C the TI Programmer had provided many of the same functions. I couldn't afford a TI Programmer but by 1979 I was using a Programmer Simulator which would provide the same capability on the TI-59. Hexadecimal operations were tortured since the TI-59 didn't have an alphanumeric display. That wasn't a big problem for me because most of the work I was doing at the time used octal not hexadecimal.

A historical note: Mier-Jedrzejowicz's Guide to HP Handheld Calculators and Computers notes on page 46 that the HP-16C was "...intended at least in part to compete with the TI Programmer calculator ..."

And before the TI Programmer, in 1973 TI introduced the SR-22, a desktop calculator that offered binary, octal, decimal, and hexadecimal modes. It did not have logical operations (e.g., OR, AND, XOR, NOT) though. But it did have floating point in all four bases, which the Programmer and HP-16C did not have.

I found some old correspondence with Gene and with Viktor Toth on the subject of base conversions. They told me that the HP-65 had a built-in conversion capability and that the HP-67 had a conversion capability in Math Pak 1. I don't have either the HP-65 or the Math Pak 1 in my collection so I can't confirm that.

Re: After the Friden and before the HP-16C

*Message #13 Posted by **Gene** on 2 Sept 2005, 7:23 a.m.,*
in response to message #12 by Palmer O. Hanson, Jr.

The hp65 had built in decimal to octal and octal to decimal.

There were many programs written for the hP67 to allow fairly arbitrary base conversions from any base to any base. Some were even small routines that showed up in the HP Key Notes magazine.

The engineers developing it may have put it in because they would find it useful themselves; octal was the base used in HP's internal calculator development tools from the HP-35 through the HP-41C and Voyager series. They only started using hexadecimal with the Saturn architecture introduced with the HP-71B, though most of the people outside HP that worked on reverse-engineering the HP-41C and writing their own microcode for it used hexadecimal.

The first-generation processor used in the HP-65 could only deal with BCD digits (0 through 9) and did not have any pure binary mode, so the only way they could have worked with hexadecimal and displayed it would have been as two-digit groups ("00" through "15").

*Message #15 Posted by **Palmer O. Hanson, Jr.** on 4 Sept 2005, 2:53 a.m.,*
in response to message #14 by Eric Smith

One of the more improbable places to have found a hexadecimal conversion capability was in the Radio Shack Color Computer which came out in 1980. In it's extended BASIC the user simply entered PRINT HEX$(n) where n was a decimal number between 0 and 65535 and the machine responded with a hexadecimal number between 0 and FFFF .

The processor for the Tandy Colour computer was a Motorola MC 6809. Very nice little 8/16 bit CPU for it's time. The 6809E was a true MULTIPROCESSING oriented CPU. Very interesting piece of hardware which didn't go all that far, but was used quite a bit in Japanese (CANON) electronic typewriters (built-in full function word processor with graphical layout tools anbd spell checker in system ROM, circa 1985.)

The 6809E was also used in a video game by Taito in 1983, called QIX. One could easily write high level compilers (like PASCAL, C)for the 6809 due to the really nice addressing modes in the instruction set. There was also a disk OS, "OS9".

It also was the base used in the HP3000 minicomputers, which were stack-based machines too. I remember using my HP-16C in octal mode many times while poring through HP3000 stack dumps.

And also the HP-2116/2100/21MX/1000 family of 16-bit minicomputers, which were not stack-based the way the 3000 was. It appears that the 21xx/1000 family was heavily used for calculator development into the early 1980s, after which 3000 (MPE) and 9000 (HP-UX) systems were used.

The world needs the 16C again.

*Message #19 Posted by **John Baldwin** on 10 Sept 2005, 9:47 p.m.,*
in response to message #18 by Eric Smith

I remember drooling over the 16C when it first came out, but couldn't afford it on my meagre student's budget.

Now here it is, years later, when I really need one, I ***still*** cannot afford a (real) HP-16C! **:-)**

I'm a software engineer writing network code and looking at bits in the debugger. I've got several calculator emulators and other tools on the PC; I've got several calculators accessible to me on my desk or from co-workers, and it would STILL be probably a lot easier if I just had the 16C. What a tribute to the HP way!

PS: Aside from spending all my birthday money for the next 3 years at eBay, what are my other options? How hard would it be to do an RPL emulation of the basic binary operations, either on the HP-28S or the HP-48G? (It's a "G" not a "GX" or "G+" so memory is limited.)

Cameron Paine has written a very nice simulator for the 16C. Well worth a look. You can write to him at:

cbp@null.net

If you can't find him, I could dig up the URL. I think he has written in the forum a bit too.

Nice simulator; though it's still in alpha I haven't noticed any bugs yet. Very nice machine, too. Indispensible for computer software (or hardware) engineering.

There's also the HP 16c "emulator" (technically I believe it is also a simulator) by Jake Schwartz, available at:

http://www.pahhc.org/mul8r.htm

It's pay-ware, but it's a good package, only $25, full-featured, and works as you'd hope it would.

*Message #23 Posted by **don wallace** on 12 Sept 2005, 9:16 p.m.,*
in response to message #22 by megarat

Hi Megarat. Thanks for the info. I heard of Jake Schwartz, but I can't remember where. I know he is an old hand...

Re your last post: Actually it's "just" a SIMULATOR. So you are right to point this out.

An emulator is HARDWARE (usually but not always plus software/ firmware) which "emulates" (dictionary def.)

some system or processor.

Simulators are good, well written ones are great, and a bug free one is a piece of software "art", imho.

But... they are NOT emulators...

I only wrote this post because a few people I have seen on the 'net who wrote simulators are so (perhaps justifiably) proud of them that they call them emulators, insisting that their "emulator" is so good it's different. Well it isn't... it's software.

(Calling a Goose a duck does not make it a duck; it's still a goose. Once a lot of people start calling geese ducks then they're well on the way to some real confusion...)

This is only offered as my opinion: Calling a simulator an emulator brands one as an amateur... (which is okay of course).

All the best everyone.

Yes. IBM invented computer emulation in the early 1960s, which they defined to be simulation assisted by special-purpose hardware and/or microcode. It was first done on the System/360; various models emulated various older IBM computers. For instance, the 360/30 could emulate a 1401.

None of the published calculator simulators I've seen use any special-purpose hardware or microcode.

HP did have a Saturn emulator for their own

software development efforts. It was a moderately large box. I haven't been able to get my hands on one of those, but I do have two of their Saturn memory emulator boxes.

> So, Emu41 & Emu71 by J. F. Garnier, V41 by Warren Furlow, Emu42 & Emu48 by Christoph Giesselink are all 'simulators', not 'emulators'?

Right. If you can download it (ie, software only), then it's only a simulator. An emulator includes hardware. Microprocessor simulators can be had for the downloading, but emulators have a pod that actually plugs into your printed circuit board, into your microprocessor socket, and runs just as the processor would, in the actual hardware, but gives you a "window" into the insides and some extra control too. It is unfortunate that the distinction has been fading as the term "emulator" gets abused so much, because we do still need a way to differentiate the two. It probably doesn't matter as much in the world of calculators where there's often no I/O at all except the keyboard and display, but it sure makes a difference where there's a lot of industrial I/O on a printed circuit board. That kind of thing cannot be emulated merely in software. I have an American Automation emulator catalog here someplace from some years back, and every emulator in it is thousands of dollars and has a pod to plug into your board, with cables that go to the PC.

Re: Simulators vs. emulators

*Message #27 Posted by **Gunnar Degnbol** on 13 Sept 2005, 6:57 a.m.,*
in response to message #26 by Garth Wilson

> Quote:

> It is unfortunate that the distinction has been fading as the term "emulator" gets abused so much, because we do still need a way to differentiate the two.

On the other hand, it is also useful to differentiate between on the one hand simulating the hardware (e.g. VMWare, Nonpareil and EMU48) and running the original software (Windows, Linux, calculator ROM) and on the other simulating a software or user interface at a higher level (e.g. WINE and Joseph M. Newcomer's HP16c).

WINE stands for "Wine Is Not an Emulator", this does not mean it is not a hardware emulator, because that is obvious, it means it does not emulate/simulate the hardware but the Windows API.

Since most people have no experience with hardware emulation, it is natural that the term emulator is recycled to provide this distinction. The kind of bugs or problems one can expect from the two kind of software simulators/emulators are very different.

Re: Simulators vs. emulators

*Message #28 Posted by **Les Bell** on 14 Sept 2005, 7:33 p.m.,*
in response to message #27 by Gunnar Degnbol

I'm with Gunnar on this one. I remember the original microprocessor in-circuit emulators (in fact, I used to sell the MDS-II and ICE for Intel), which would emulate the processor in hardware, with additional functionality for debugging.

However, in these days of amazingly fast processors, it's possible to emulate one processor, using software running on another. So, for example, a Mac can emulate a PC, and thus run PC applications like MS Office. A different program that ran natively on a Mac, but presented the same user interface and functionality, would be a simulation of MS Office. Same result, different ways of getting there.

So, over years of usage, I've concluded that when one runs the original code on a

different hardware platform, as Eric does with Nonpareil, that's emulation of the original hardware. However, a program that behaves the same way as an HP calc, but is not based on the original calculator firmware, is a simulation.

Over thirty years in this business, I've never had trouble communicating with these terms until recently. The definitions I use are consistent with IBM mainframe microcode emulation of earlier systems, simulation of physical/economic/ecological systems (remember doing foxes & rabbits with fourth-order Runge-Kutta?) and with a lookup of emulate & simulate on dictionary.com that I did a few minutes ago.

Personally, I suspect the growing confusion is mostly down to the WINE project promulgating their own definitions. IMHO, WINE emulates Windows, and they should get over it. Bah! Time for a second coffee, so I won't be so cranky.

Best,

--- Les

NO.

Any PC running any program that runs as a virtual calculator, etc. is:

a PC running a SIMULATOR (!)

(Your Goose honks!, It will never be a "Duck")

(For people who can't get the point the easy way is : if it has wires hanging out of it that go to a test clip that sits in the processor socket of a test system it's an EMULATOR. If it's just software its ALWAYS, and I mean ALWAYS, a SIMULATOR.)

It's pretty simple, really.

So the PDP-11 mode of the VAX is what?

(Hardware support for 16 bit emulation, but no wires sticking out. 8)

Re: Simulators vs. emulators

*Message #33 Posted by **Garth Wilson** on 14 Sept 2005, 10:47 p.m.,*
in response to message #32 by Howard Owen

The "wires sticking out" analogy was perhaps rather vulgar, but not totally irrelevant. To be a true emulator of a calculator that has I/O other than keyboard and display, I would consider it to have to be able to take the same modules the calculator does (since modules are about the only other hardware the calculator would interface to). Someone mentioned the HP-48. I'm not very familiar with that line, but I

believe at least one of them could take plug-in modules. I would say the HP-48 emulator would have to be able to handle the HP-48 modules, at least if the modules were other than RAM (which a PC does not lack). In the case of a 41, the emulator would have to be able to handle any module the 41's can, including ROMs, the timere module (which can wake up the calculator), HPIL, the first non-HPIL printer (I think 82143 was the number), the optical wand, the card reader, non-HPIL data acquisition accessories, etc..

A microprocessor emulator can be used to troubleshoot your computer board hardware, not just debug software. It actually plugs into the board and uses the board's memory, I/O, and so on. Similarly, I would expect that a calculator emulator should be able to help troubleshoot module-interfacing problems, which might be bus contention, timing problems, etc.. A mere simulator cannot do this.

Re: Simulators vs. emulators

*Message #34 Posted by **Howard Owen** on 14 Sept 2005, 11:20 p.m.,*
in response to message #33 by Garth Wilson

I'm reminded of one of the arguments against "hard" artificial intelligence. A very clever person from UC Berkeley made it. I can't recall his name at the moment. He asked if you would expect a stomach simulated in software to digest food the way a human stomach does. the point being that a simulation of intelligence on a computer is unlikely to start thinking at all, let alone like a human. I find that pursuasive argument, but the point in this context is that an emulator would be like an artifical brain, with artificial neurons whose functions would be close analogies of "real" neurons. It might actually think on its own.

Back to my point about the PDP-11 mode in the VAX-11 CPU. This involved a microcode implementation of

the 16-bit PDP-11 instruction set on the 32-bit VAX-11 CPU. The mode was changed by issuing a single instruction, if I recall correctly. You could do that with one VMS task, and the OS would manage switching in and out of PDP-11 mode as context switches were taken. I had my first course in assembly language in PDP-11 Macro Assembler running on a VAX in emulation mode. It sounds to me like this fits the definition of an emulator, since the machine interacts with the rest of the hardware like a PDP-11 when it is in that mode.

But what about the new(old) "virtualization" systems like VMware? This is a hybrid system in which the virtualization layer intercepts hardware access by the "guest" operating system, and provides services to that guest by interacting with the "host" OS and real computer hardware. That seems to have elements of emulation and simulation going at the same time.

Re: Simulators vs. emulators

*Message #35 Posted by **don wallace** on 16 Sept 2005, 1:32 a.m.,*
in response to message #34 by Howard Owen

VMware is a simulator, with access to real hardware (which is not missing). There is nothing special about it apart from it being a really nice piece of work.

The DEC VAX doing PDP-11 emulation requires a bit of hardware to do that, but it is all built-in to the system logic.

DG did a similar thing around the same time (for the same market) with it's 32 bit Eagle, back compatible to their 16 bit NOVA, selected on the fly with a "toggle" bit, in each 32 bit Eagle instruction. There is a really nice book about it's development in a book by very savvy Vietnam war journalist, Tracy Kidder. The book is called " Soul of a New Machine" A very good read!

Re: Simulators vs. emulators

*Message #38 Posted by **J-F Garnier** on 15 Sept 2005, 10:01 a.m.,*
in response to message #31 by don wallace

Hi,

From this point of view (which is in many respects correct), an EMULATOR is a piece of hardware that exactly replaces (emulates) a component or system.

So you should agree that my Emu41/71 are HP-IL system emulators: with the help of the HPIL/PC board they exactly replace a HP41- or HP71-based HP-IL controller :-) Except regarding the timing aspects maybe, but I never called them Real-Time-Emulators... (Actually they are much faster).

More seriously, the point of view from Don is for sure correct for ICs: an emulator is a piece of hardware that replaces the original IC, a simulator is software only. From this point of view, the core code that simulates the calculator or system's CPU should be called a SIMULATOR.

I just notice there are industrial (not 'amateur' ;-) counter-examples against this definition like the 68040 that 'emulates' by software some floating point operations originally handled by hardware on the 68881/2... And many FPU were fully 'emulated' by software on the time (for cost reasons) and many compilers were providing FPU 'emulation' packages.

But calc 'emulators' are more than just CPU simulation, IMHO. They are complete calc emulation in the sense that the PC or PDA hardware/CPU simulator/GUI combination exactly replaces the calc in all respects (same response to the same stimuli) in a very similar way than an IC hardware emulator replaces the actual IC, with the same kind of features (access to the internal) and limitations (different size, power consumption, etc...).

Again, it's just MY opinion and I fully accept and respect the other point of view, I'm a quite cool man and I'm not interested in fighting for just a question of words...

J-F

Hi Hrast. Have you done any more work on your SIMULATOR?

Hi Don,

I don't have any simulator yet, so I cannot work on it. I really didn't want to be involved into this discussion because I don't care if you call it 'simulator' or 'emulator' or 'interpreter' or whatever you want. I tried to find some appropriate name but 'emulator' was used by other people at the time I started to work on this software so it cannot be THAT wrong. Perhaps something like 'HP-41 machine code interpreter' would be a better name but I think I won't bother with this ...

Re: Simulators vs. emulators

Message #42 Posted by ***don wallace*** *on 16 Sept 2005, 1:24 a.m.,*
in response to message #38 by J-F Garnier

Hi Monsieur Garnier.

Hey I just want to say congrats on your nice emulation of hp-il along with Chris Klug and his ISA card.

No doubt your system is an emulator with the card and a simulator without!

On coprocessors: well that seems a tricky one until you look closely.

Motorola or Intel, it doesn't matter. The software is an emulator because (according to a MORE PRECISE definition of emulation, which is exactly replacing non-existent hardware in a HARDWARE SYSTEM) the software

actually couples very, very closely with specialized software flags which precisely "couple" (and therefore "mimick") flag pins on the missing co-processor.

I'd say an emulator is a system which has to couple to hardware it is directly involved with (even if some of that is meant to be emulated when missing, such as a co-processor). In general it is supposed to be able to run a the full speed of the target system. If it goes faster, then thats fine.

Strictly speaking, full hardware emulators MUST EXACTLY DUPLICATE ALL TIMING...

The calc simulators are categorically simulators because there is NO SPECIFIC HARDWARE underneath them. You cannot run a HP-WAND on your simulator. Also, you CAN recompile the simulator to run on something very different to an IBM PC. So there is no hardware dependence. Further, the software does not DUPLICATE the calculator, there IS NO REAL display, just a visual picure.

This difference may seem to you to be nit-picking; it definitely is not.

Flight simulators look real; they are a complete, very accurate fantasy. This the correct use of the term simulator.

There is nothing derogatory about the term simulator, so software writers don't need to be sensitive about it. But many are, for some strange reason. They also don't use their real name... Do they, Hrast. ;-)

My original point was just to try to educate a few people for the purpose of dispelling the loose use of language. It doesn't matter if people want to ignore me, I don't care. I still hear their geese honking and other peoples ducks quacking, and can easily tell the difference.

Once I did college with a student who

pressed the lecturer on the concept of emulating or simulating certain hardware functions like multipliers, shifters in software, etc...

He went so far with his quesioning (along the lines of: Well can't you do THAT in software too...) that eventually the lecturer got exasperated and said words to the effect that "You have to have SOME hardware t run it all on!", smoke starting to come out his ears as he spoke.

I wrote in a small (vain?) attempt to dispel similar ignorance on the part of a few people in the programming community. Their loss if they don't want to listen.

Interesting thread though and I really appreciated your comments.

DW

Software emulators, vs. simulators vs. hardware emulators

*Message #43 Posted by **Howard Owen** on 16 Sept 2005, 1:49 a.m.,*
in response to message #42 by don wallace

We all know that Wikipedia is the fount from which flows all wisdom (all hail, Wikipedia!) The article on emulation seems to draw a distinction between what it calls a "software emulator" and a "simulation." It doesn't mention hardware emulation at all. (You might want to go add to the article, Don. The hardware angle is missing, and strikes me as important.)

> Quote:
>
> An emulator, in the most general sense, duplicates (provides an emulation of) the functions of one system with a different system, so that the second system

appears to behave like the first system. Unlike a simulation, it does not attempt to precisely model the state of the device being emulated; it only attempts to reproduce its behavior.

In a technical sense, the Church-Turing thesis implies that any operating environment can be emulated within any other. In practice, it can be quite difficult, particularly when the exact behaviour of the system to be emulated is not documented and has to be deduced through reverse engineering. It also says nothing about timing constraints; if the emulator does not perform as quickly as the original hardware, the emulated software may run much more slowly than it would have on the original hardware.

A common form of emulation is that of a software emulator, a piece of computer software that allows certain computer programs to run on a platform (computer architecture and/or operating system) other than the one for which they were originally written. It does this by "emulating", or reproducing, the behavior of one type of computer on another by accepting the same data, executing the same programs, and achieving the same results.

They also don't use their real name... Do they, Hrast. ;-)

I don't think my real name is that important for this forum. And there is a simple practical reason for such name: my real name contains 2 characters which exist in my mother language but doesn't exist in english so replacing them with some "equivalents" would not be my name, either. Friends and users of my software know my real name, of course.

There is more then one person using the name '.'. I was the first. I don't know who the other guy is.

My 2 cents: I feel that if a program appears to the user to do the same thing as a calculator, but is rewritten 'under the hood', it is a simulator. If it actually runs the calculator's machine code via a software interpreter, it is a software emulator.

English is an evolving language. I think the term 'emulator' is perfectly acceptable.

Re: Simulators vs. emulators

*Message #56 Posted by **J-F Garnier** on 16 Sept 2005, 7:57 a.m.,*
in response to message #42 by don wallace

Hi Don,

[deleted]

Back to the subject:

- the flight simulator example is very interesting, the key point is that a simulator can't replace the original system: you can't travel with a flight simulator.
- I work in the electronic industry: the concepts of emulation and simulation are part of my everyday life. When the design engineer is in front of his workstation, he (or she) is dealing with simulation. When the test engineer is debugging his test program before the availability of the actual device, he/she has to use an emulator. The key point, again, is that a simulator can't physically act as the real thing, the emulator yes.

Just different points of view... It depends where you sit ...

Regards.

J-F

(Interesting thread, indeed).

P.S. added: Finally, it may really just depends where you sit: a prod engineer would see Emu48-like software as simulator, because he can't use it to replace (emulate) a real HP48 on the production line, but users can call it emulator because it can replace the HP calculator in all aspects. Maybe we could all agree on this, especially as there are no more

HP15/HP41/HP42/HP48/HP71 prod lines...

Re: Simulators vs. emulators

*Message #58 Posted by **.** on 16 Sept 2005, 10:33 p.m.,*
in response to message #57 by deleted

Hi,

I think that many engineers read this forum, myself included. Whilst the term 'emulator' had a specific meaning in an EE context, the word has evolved.

Since you are asking for evidence to back up my opinion I'll try and provide some.

Do a google search for 'emulator' or "what is an emulator". If you examine the results I think you will find the common usage of the word fits my description. Try searching for "define:emulator" w/o the "'s.

A common definition seems to be

"A device, computer program, or system that accepts the same inputs and produces the same outputs as a given system."

The English language is ambiguous. We are both right in different situations.

Thanks,

.

Re: Simulators vs. emulators

*Message #59 Posted by **Les Bell** on 16 Sept 2005, 8:17 p.m.,*
in response to message #56 by J-F Garnier

I concur with your understanding, J-F.

As someone who has spent many hours sweating inside flight simulators, I can tell you that the reason they're a simulation is that they don't work the same way as a real aircraft. The old analog simulators (like the ATC-810 I knew and "loved") had almost nothing in common with an aircraft cockpit other than appearance and approximate behaviour - behind the panel it was completely different, with the "air speed indicator" being electrically driven, rather than by dynamic air pressure, for example. With the advent of digital cockpits, it's possible for there to be a lot more commonality between the simulator and the real aircraft, but there are still obvious distinctions.

I think some people have gotten hung up on the term "emulator" as derived from the original microprocessor In-Circuit Emulator. I remember (I used to be a sales engineer for Intel, in a previous life) the Intel MDS systems, where ICE was introduced, in part because the 8080 was entirely dynamic internally - it *had* to be clocked, so you couldn't stop it in the middle of execution and examine the various pins (unlike the later Z-80, for which this was a major advantage). So the ICE was introduced as a device which plugged into the 40-pin socket where an 8080 would go, but would allow single-stepping through ROM code while examining what was going on.

Yes, it was hardware - it had to be, obviously - and it was a very faithful emulation of the 8080's internals. But it's just *one* type of emulator; there are others, including those implemented in software.

Of course, in the end, it really doesn't matter whether you call a thing a simulator or an emulator, as long as it does what you need sufficiently faithfully.

Best,

*Message #61 Posted by **Les Bell** on 16 Sept 2005, 11:37 p.m.,*
in response to message #60 by Howard Owen

Try http://www.dictionary.com, Howard; it seems to be more up-to-date. To my mind, it makes the key distinction quite nicely (reformatted slightly by me):

sim·u·late:
3. To create a representation or model of (a physical system or particular situation, for example).

em·u·late
3. (Computer Science). To imitate the function of (another system), as by modifications to hardware or software that allow the imitating system to accept

the same data, *execute the same programs*, and achieve the same results as the imitated system.

So a simulation is a model, with different internal operation; an emulation operates the same way internally. To bring this closer to home, a Java applet that looks and behaves like an HP-35 is a simulation, while a program like Eric Smith's Nonpareil, which uses the HP ROM code (and therefore *executes the same program*), is an emulation of the hardware.

Best,

*Message #64 Posted by **Howard Owen** on 17 Sept 2005, 1:34 a.m.,*
in response to message #61 by Les Bell

I'm not disputing those definitions. I'm pointing out that they are part of a specialized vocabulary. The Webster definitions are from 2002, not that long ago. The difference is that the Webster's unabridged dictionary, which doesn't try to be anywhere near as exhaustive as the OED, contains definitions developed from a broad sampling of English letters. In that context, the words "emulate" and "simulate" are nearly synonymous. If you look in the Webster's Collegiate dictionary, you'll find definitions closer to the ones you reference. That's because the Collegiate edition gives more weight to college textbooks, which are more likely to contain specialized jargon.

Most dictionaries are based on a sampling of some body of literature. The literature of Computer Science is pretty broad now, so I guess it makes sense to try and pin down meanings for specialized words like "emulate" and "simulate." The trouble with that is the rate of change keeps accelerating, and meanings can shift in that tide. To me, a "simulation" is a software system that implements a model of some sort. What you are modeling could be just about anything, hardware, software, physical process, anything. This usage seems to be in broad use in today's Computer Science literature. (c.f. An Interdisciplinary Approach to Scientific Modeling and Simulation and Fitting Time-Series Input Processes for Simulation, among many, many others.) Emulation, on the other hand, I have always understood to mean something like "simulation of some sort of computer hardware." I don't have any nice ACM citations to point to for that meaning, however. There isn't an "emulation" keyword in the "Guide," (there are several for "simulation") but

an advanced search of current titles for "emulation" shows lots of hits for "hardware" or "physical" emulation. These seem to match Don's definition of one set of circuits acting like another set for testing, development or experimental purposes. There are a few hits for "software" emulation as well, and these seem to describe systems like EMU41 or VMWare. So if this extremely informal sampling held up in the face of exhaustive analysis of the literature, a computer science dictionary editor would probably place Don's definition first, with JF's as a secondary meaning.

But there isn't a standard English dictionary of Computer Science that everyone recognizes, as far as I know. So there's room for this sort of discussion. Aren't we lucky? 8)

Re: Simulators vs. emulators

*Message #67 Posted by **Eric Smith** on 20 Sept 2005, 1:49 a.m.,*
in response to message #60 by Howard Owen

Yes, and Nonpareil (as well as V41 and other such programs) simulate the working of the real HP calculator at one particular level of abstraction: the execution of the microcode. Some other

simulators operate at a higher level of abstraction, such as user keystrokes; in principle another simulator could work at a lower level of abstraction such as an RTL (Register Transfer Level) description of the hardware, a netlist of the transistors, or even a GDS-II physical description of the chip geometry. It is silly to try to decide that simulating at some of those levels should be called "emulation", and others "simulation".

The definitions o fthe words "simulate" and "emulate" in Websters are general usage, not specific to Computer Science (or industry). IBM **invented** computer emulation in 1962 or so (announced in 1964). They defined emulation (with regard to computers) as simulation assisted by special-purpose hardware and/or microcode.

I don't have references close at hand to offer specific citations, though I remember that the invention of computer emulation was discussed in IBM's Early Computers by Bashe et al and in A History of Modern Computing by Ceruzzi, as well as many other books. The historical record on this is very clear; I don't really understand why it is controversial.

Re: Simulators vs. emulators

*Message #68 Posted by **Les Bell** on 20 Sept 2005, 2:58 a.m.,*

It's a useful distinction, Eric. I would expect Nonpareil, since it runs the actual firmware of an HP calculator, to exhibit the same bugs, limitations on accuracy, and BCD representational artifacts, etc. as the real calculator. On the other hand,

I would expect a simulation, written in C, C++ or Java using IEEE floating point, to be different in those respects, as well as perhaps others.

Best,

But a microcode-level simulator is potentially not as accurate as an RTL-level simulator, so maybe only the latter should be called an emulator...

But an RTL-level simulator is potentially not as accurate as a netlist-level simulator, so maybe only the latter should be called an emulator...

But a netlist-level simulator is potentially not as accurate as a Spice simuulator, so maybe only the latter should be called an emulator...

I don't buy calling some simulators and some emulators based on how accurate they are, because it isn't clear what would be "accurate enough" to be called an emulator under that criterion.

Beside which, since IBM invented computer emulation, I prefer to use their terminology, which actually makes a useful and non-arbitrary distinction.

Eric

Re: Simulators vs. emulators

*Message #70 Posted by **Les Bell** on 20 Sept 2005, 8:51 p.m.,*
in response to message #69 by Eric Smith

> Quote:
>
> I don't buy calling some simulators and some emulators based on how

> accurate they are, because it isn't clear what would be "accurate enough" to be called an emulator under that criterion.

It's not based on accuracy, Eric - it's based on whether the emulation uses the original firmware/software or some other component of the original (not microcode, because, for mainframes, the emulation is done *in* microcode) or not. A simulation is "black box", and may have no code in common with the system being simulated (or it may be a simulation of a physical system); emulation is "crystal box", done with the intention of usefully imitating another system by running its software. There are no degrees of accuracy involved.

Simulation also carries connotations of modelling and experimentation (e.g. simulations of networks used to model spread of viruses and worms), whereas emulation is done primarily for pragmatic purposes, such as maintaining backwards compatibility over multiple generations of hardware - but this is weaker than the distinction I'm making above.

> Quote:
>
> Beside which, since IBM invented computer emulation, I prefer to use their terminology, which actually makes a useful and non-arbitrary distinction.

OK, here's their terminology:

emulation:
The use of software, hardware, or both by one system to imitate another system. The imitating system accepts the same data, runs the same programs, and achieves the same results as the imitated system.

(See http://www-306.ibm.com/ibm/terminology/ef.htm)

I don't see the distinction of which you speak. I contract to IBM, doing mainfame Linux stuff, including booting the Linux kernel from a virtual card reader, then using emulated network connections and so on, so I use their terminology a lot. It's also noteworthy that the z/Architecture "Principles of Operation" manual (IBM document SA22-7832-03), which describes the mainframes where z/VM allows one machine to look like many, and you would expect to extensively discuss this, never uses the term "emulate" or "emulation". So it's not as simple as saying "IBM does it this way, so there".

All I can say is that in over 20 years of teaching courses on operating systems and applications software, these are the usages I've commonly encountered, and the context usually provides clarification when required. It's only in the last few years that confusion seems to have arisen (probably WINE-induced), and mostly in the last few days. ;)

Best,

in response to message #70 by Les Bell

emulation: The use of software, hardware, or both by one system to imitate another system. The imitating system accepts the same data, runs the same programs, and achieves the same results as the imitated system.

This one is good, too:

"Emulation program:

(2) A control program that permits functions written for one system or

device to be run on another system or device."

If IBM, who invented emulation, agree that emulation can be "the use of software, hardware or both" I think we can finally close this "simulators vs. emulators" discussion.

I would have to point out however that word meanings are not the only thing to have evolved. Back then, computers were mostly for data processing, which is only a tiny portion of today's computer field. If you use a computer for controling equipment and taking data in real time, simulation alone is almost hopelessly inadequate in my experience. The simulator (software only) requires files of simulated stimuli upon which to act at certain times. "Real-time" refers to the requirement to meet stringent deadlines. The controlling computer in one of our products switches tasks 4,000 times per second. If I were to slow it down just a little for debugging during development, the hardware it is connected to would not work at all. For that, a simulator would somehow have to simulate that remote hardware as well, whereas my workbench computer which I used to emulate the final controller actually connected to, and operated, the other physical hardware. The benefit of using it as an emulator (as opposed to just trying to develop the software on the actual controller that

would end up in the product) was that the workbench computer offered the added tools to interact with and modify the software on the fly while watching the behavior of the whole system on the workbench instruments.

Again for most calculators, since they have no I/O other than the keyboard and LCD, there would be virtually no diffence between a simulator and an emulator; but for something like the 41, the mere simulator would not be able to get programs off my old microcassettes, read bar code from my HP-41 books, or read the programs from various modules. That would require the emulator.

I suppose the actual names don't really matter to me, as long as the distinction between the two is maintained. I'm not aware of any other terms in use at this time though.

This discussion reminds me of something C.S. Lewis wrote in the Preface to "Mere Christianity." He was not talking about technical terms, but rather about the use of descriptive terms as terms of praise. However, I think it makes quite a good argument for preserving the meanings of words. (I apologize in advance for the long quote.)

"The word gentleman originally meant

something recognisable; one who had a coat of arms and some landed property. When you called someone a gentleman you were not paying him a compliment, but merely stating a fact. If you said he was not a gentleman you were not insulting him, but giving information. There was no contradiction in saying that John was a liar and a gentleman; any more than there now is in saying that James is a fool and an M.A. But then there came people who said - so rightly, charitably, spiritually, sensitively, so anything but usefully - 'Ah, but surely the important thing about a gentleman is not the coat of arms and the land, but the behaviour? Surely he is the true gentleman who behaves as a gentleman should? Surely in that sense Edward is far more truly a gentleman than John?' They meant well. To be honourable and courteous and brave is of course a far better thing than to have a coat of arms. But it is not the same thing. Worse still, it is not a thing everyone will agree about. To call a man a gentleman in this new, refined sense, becomes, in fact, not a way of giving information about him, but a way of praising him: to deny that he is a gentleman becomes simply a way of insulting him. When a word ceases to be a term of description and becomes merely a term of praise, it no longer tells you facts about the object: it only tells you about the speakers attitude to that object. (A nice meal only means a meal the speaker likes.) A gentleman - once it has been spiritualised and refined out of its old coarse, objective sense, means hardly more than a man whom the speaker likes. As a result, gentleman is now a useless word. We had lots of terms of approval already,so it was not needed for that use; on the other hand if anyone (say, in a historical work) wants to use it in its old sense, he cannot do so without explanations. It has been spoiled for that purpose."

Re: Simulators vs. emulators

Message #74 Posted by ***Howard Owen*** *on 19 Sept 2005, 12:57 p.m.,*

in response to message #73 by Wayne Brown

I take the general point that word meanings tend to evolve away from the concrete toward the abstract; from the objective toward the subjective. But I disagree with Lewis' conclusion that such an evolution renders the words "useless." Lewis correctly observes that the meaning of the word "gentleman," used as a term of praise, depends more on the attitudes of the speaker than specific characteristics of the object of the praise. But that's a clue to the speaker's thinking, isn't it? The word is more ambiguous, but it's use in the hands of a skilled writer can be that much more subtle and revealing. (I also think that, in the specific case Lewis cites, the word "gentleman" is not merely a term of praise. In the specific cultural context he is referring to, "gentleman" connotes a specific kind of praise: adherance to an elaborate set of norms that have all sorts of consequences and implications.)

So I enjoy hearing what JF, Don and the rest think words mean to them. This discussion taught me about the specific meaning of "emulator" to an electrical engineer, but also more about how Don views his world. I learned more about JF's technical world view, and also about certain attitudes he has about the meaning of the word "polite." These are gems, far exceeding the value of any concrete definition of any specific word!

in response to message #73 by Wayne Brown

Wayne, you are a scholar and a gentleman! ;)

Of course, what this reflects is that language is a living thing; it evolves and changes over time - look at current teen usage of terms like "sick", "evil", etc. which mean the opposite of what old f*rts like me think.

My wife, who has a degree in Linuguistics and English Lit., long ago convinced me that dictionaries are more descriptive than prescriptive.

It doesn't matter how much one protests - I've given up the struggle over the redefinition of the term "hacker", for example - so I probably shouldn't have joined the fray over emulation vs simulation. . .

Best,

--- Les

That's pretty cool!

I just recently got a Mac Mini, after simmering with resentment at Steve Jobs for making the original Mac unaffordable for starving students, like I was in 1984. That was one heck of a resentment to last that long. 8)

But OSX is pretty cool. And that calculator *is* very nice. It can be an "RPN Programmer" as in "it has bit manipulation and base conversion" not as in "it's programmable." Although, with the degree to which OSX apps can be scripted, maybe I'm not too sure about that.

Some other nice features of the programmer mode:

- The entire 64 bits in binary (in 2 rows of 32) are always visible, unless you turn that display off.
- There are "ASCII" and "Unicode" buttons that will show the character corresponding to the currently displayed number over on the left hand side of the screen.
- It has byte and word flips, great for switching big and little endian. Hmm, PPC, no wonder 8)

And the bad stuff:

- No stack! At least not a visible one.
- No X<>Y *or* swap.
- No roll-down, roll-up, over, pick or anything like that. In short,
- No stack!

ENTER does something stack-like.

But the other complaint I have is that it basically has the three modes, and the RPN switch, and that's it for customization. Oh yeah, and *no stack!*

It has a stack, although its not visible. It looks like its deep too. Try

1 ENTER 2 ENTER 3 ENTER ... 9 ENTER 10 + + + + + + + + + +

and you will see 55.

So it has a stack.

HP-75 HP-IL question

*Message #1 Posted by **Mike McWilliams** on 26 Aug 2005, 7:07 p.m.*

I am trying to resurrect an ancient Ludlum counter that uses an HP-IL interface. I'm using an HP-75 as a controller.

I am able to successfuly send commands to the counter via HP-IL using ASSIGNIO and PRINTER IS commands (I know this because I can see that parameters changing) but I don't know how to tell the HP-75 to expect and collect bytes from an HP-IL device. In other words, what is the input equivalent of the PRINTER IS command?

The metacode is something like this:

<ask counter to send count value> <counter sends a few bytes to HP-IL buffer> <HP-75 reads bytes and clears buffer> <repeat ad nauseum>

I'm sure this is simple, but I have no documentation and I'm piecing this together with bits I can glean from the net.

Thanks if you can help.

MM

Re: HP-75 HP-IL question

*Message #2 Posted by **Howard Owen** on 26 Aug 2005, 7:23 p.m.,*
in response to message #1 by Mike McWilliams

You probably need to program at a lower level than I/O redirection. Do you have the I/O ROM? it allows you to do more than the base HP-IL implementation will.

Re: HP-75 HP-IL question

*Message #3 Posted by **Vassilis Prevelakis** on 27 Aug 2005, 5:30 p.m.,*
in response to message #1 by Mike McWilliams

Check the I/O Utilities manual (75ioutil.pdf) on the MoHPC web site. It describes the facilities available on the HPILCMD LEX file (http://www.series80.org/Misc/HPILCMD.bin)

This should allow you to control you HP-IL device. For example the manual shows how to obtain readings from an HP Multimeter.

**vp

Re: HP-75 HP-IL question

*Message #4 Posted by **Howard Owen** on 27 Aug 2005, 6:24 p.m.,*
in response to message #3 by Vassilis Prevelakis

Those utilities will work. The LEX file contains SENDIO and READIO keywords, which are very low

level commands you can use to program HP-IL at the message level. However the I/O ROM is better, if you can get it, because it not only contains improved versioins of those keywords, but a lot of higher level words that allow great power without worrying about the low-level protocol as much. Depending on your application, these may well do the job you want, and with less effort. But the low-level stuff there too, if you need it.

Re: HP-75 HP-IL question

*Message #5 Posted by **Vassilis Prevelakis** on 27 Aug 2005, 11:55 p.m.,*
in response to message #4 by Howard Owen

Actually, they are not that different, if all you want to do is control instruments. True the I/O module commands are higher level, but the HPILCMDS commands can be used as macros without really understanding what is going on. E.g. I have this little program that randomly turns on the front panel lights (and associated relays) of an HP59306A relay actuator.

This is the HP-85 version (using the I/O ROM):

http://www.series80.org/Misc/HP85-RelayActuatrBlink.gif

and this is the HP-75C version (using the HPILCMDS SENDIO command):

http://www.series80.org/Misc/HP75-RelayActuatrBlink.gif

Comments:

When I ported this program to the HP-75C I expected that I'd only need to change a single line (the one doing the actual I/O). HA! It is **unbelievable** how many changes were necessary to move this 20 line program from one machine to another. Especially given that the two machines were nearly contemporary, were made by the same company and were even using the same processor architecture for crying out loud!

So, apart from the I/O statement I had to fix MOD (which is a function on the 75, as opposed to an operator on the 85), VAL$ is called STR$, and FN END is now called END DEF.

Plus, they redefined WAIT, so that instead of milliseconds, it expects seconds on the HP-75C. Surprise!

I am soooo glad I do not have to program these machines for a living :-)

Re: HP-75 HP-IL question

*Message #6 Posted by **Howard Owen** on 28 Aug 2005, 12:50 a.m.,*
in response to message #5 by Vassilis Prevelakis

Heh!

Yeah, I think playing with them is better than work. You get to stop when you get too disgusted!

I just back ported some code from the 71B to the 75C, and I ran into more incompatibilities. (That was made worse by my use of the JPC ROM on the 71, which gives you real structured programming.) Those were the days when HP was creating more standards than they could keep track of. Outside the languages I'm familiar with, BASIC for the 85, 75 and 71, plus RMB, there

was HPL, which was a dialect of BASIC running on some of the 98XX machines. There was a BASIC on the 110 and Portable Plus. I'm sure there were many others I 've never heard of.

I would point out that the second example of I/O is a bit more complex than the first. On the 85 you are dealing with HP-IB, and the way you are using it (the normal way) ignores the low level message passing on the bus. It's taken care of for you with the "OUTPUT" statement. That's not the case with the HP-IL example. There you have specified the HP-IL messages to send as controller to achieve communication with your device:

```
25 SENDIO 'ra:','unl,ren,lad#';D$
```

So, you are addressing the device with the name 'ra:' and sending 'unl' which turns off all listeners on the loop. Then you send "ren" which is remote enable, which tells potential listeners that they should accept remote commands, once the become enabled as listeners. Then you send 'lad#' which is the listener address of the guy you are talking to, :ra in this case. This tells the device to start listening for data. Since you set remote mode, that data will consist of commands to execute, rather than data to display or otherwise process. Finally, you send the data itself, in D$.

This all takes some knowledge of the low-level protocol of HP-IL. And you don't need comparable knowledge of HP-IB to get the job done on the 85. The 75 I/O rom provides OUTPUT and ENTER statements that allow you to use the loop in a way that is very similar to how you use the 85, but not exactly:

```
100 REMOTE ':ra' ! Sends the unt,ren,lad# combination.
110 OUTPUT ':ra',D$ ! Sends the data
```

Thats more lines, but it's much simpler, too. And it doesn't demand low level knowledge of the protocol.

Sometimes you can't get around using the low level stuff, and then you need knowledge of what messages to send. But that's not such a common case. However, most of the 85 guys I knew, back in the day, were very familiar with the low level workings of HP-IB. I had to get to know that pretty well too, even though I was coding in RMB, which had a very abstract interface to the bus, along with the low level one, of course.

So maybe it's a pipe dream to think you could get away with HP-IL coding on the 75 without learning details of the protocol. But the I/O module gives you choice. In fact, it has an even lower level interface that SENDIO/ENTIO to choose if you wish. It's called SEND, and it lets you compose arbitrary messages and send them on the loop. So instead of using the mnemonics for messages, you use a set of mnemonics for the upper three bits (CMD, IDY, RDY, DATA, END etc.) and an arbitrary bit pattern for the corresponding 8 bits in the message. So two machines with this capability might extend HP-IL in interesting ways, as long as their HP-IL ICs didn't balk! 8)

I just ran across yet another, even lower level interface offered by the I/O ROM. I think this one may be part of the I/O Utilities Pac too. This is RIO/WIO. These words read and write directly to the HP-IL IC's registers. So if your IC doesn't like what you are doing with SEND, you can try some very low level bit banging to coerce it into seeing things your way. 8) This could also be used to implement analyzer mode, where the read and write bits in r0 are both on. That makes the chip stop doing its part in the protocol. It reads the wire, then interrupts the CPU when data shows up. The ISR then must decide how to respond to the data. This is how EMU41 implements its virtual hardware, and also how the DEVIL module does its SCOPE mode. Of course, there's no "ON INTR" in the 75's BASIC, so maybe that wouldn't be possible without a special LEX to implement interrupt handling and ISRs.

```

Mpouahaha. HPL is as much a dialect of BASIC as English is a dialect of Chinese.

```
> I would point out that the second example of I/O is a bit more complex than
the first.
```

I **said** that the I/O ROM commands were higher level **but** its OK to use the HPILCMDS commands as macros, ie not to try to understand what is going on, but simply include them in your programs. For simple measurement applications you only need the equivalent of the INPUT and OUTPUT. You can easily write a subroutine or two implementing these two commands and get it over with.

Much easier than trying to find an I/O ROM for the HP-75. One went for more than $100 a couple of weeks ago.

```
> So maybe it's a pipe dream to think you could get away with HP-IL
> coding on the 75 without learning details of the protocol.
```

You bet! I had to bring to my desk a bunch of HP manuals and my HP59401 bus analyser to find out why the HP-75C would not make the Relay Actuator actuate any of its relays :-)

It turned out to have been a misunderstanding of the configuration of the HP82169A HP-IL/HP-IB converter, that is a long story.

What can I say, its a hobby, you are **supposed** to want to know everything about this stuff, its not like you can do something useful with them is it?

**vp

Thanks guys! You've done me a big favour:

You've talked me out of ever bothering with doing ANYTHING with HP-IL. I like it in some ways, but thought it antiquated and guessed it would be awkward to use and a hopelessly antiquated pain-in-the-arse.

THANK YOU for confirming my suspicions.

I do wonder WHY people NOW bother with HP-IL instrumentation...

Don W

Re: HP-75 HP-IL question

*Message #10 Posted by **Howard Owen** on 28 Aug 2005, 2:53 p.m.,*
in response to message #9 by don wallace

If you mean "why do people *in general* use HP-IL, then I think the short answer to your question is "they don't."

Why it was used back in the 1980s is clear. It was an extremely low cost alternative to other systems available. The only thing comparable in cost was RS232, and it had severe problems with varying interpretations of the standard. This was still a probelm in 1985 when I was programming instruments on a 9816.

As far as being ugly, well, have you looked under the hood of your network lately? TCP/IP is complicated. You just never have to think about it much because its details are hidden by multiple layers of fairly mature software. That's the situation with HP-IB nowadays, too. This is the parallel bus that HP invented, and later standardized as IEEE-488. It was a big hit in labs and instrumentation. It was also what HP-IL was patterned on. At a low level, HP-IB looks very much like the fragment of HP-IL you saw above. Today there's a high-speed version of "GPIB" (as National Instruments calls it) called IEEE-488.2. The protocol is still in very widespread use. The biggest difference, other than the speed, is that most people use software from NI called Labview to drive it under Windows. I've never used it, but it's supposed to be a Visual BASIC like environment where you can drag and drop to create a model of your setup. You can then go out and just turn it on. In other words, HP-IB, like TCP/IP, has a layer of software on top of it that hides the lower level details.

HP-IL never got such a layer because it never made the leap into a general standard. This probably has to do with HP not standardizing it like they did HP-IB. Or maybe the economics of hardware caught up with HP-IL so that its cost advantage was no longer attractive. However that was, HP-IL is dead, dead dead.

Which brings us to the question of "why do *I* use HP-IL? Vassilis put his finger on it. *Because I think it's fun.* I can well imagine that others might have a different reaction to HP-IL. You seem to have gotten a somewhat different impression. 8) But, the complexity for me is a challenge. Then too, there's the fact that HP-IL is the way a lot of the machines that I also consider to be great fun talk to each other. So something I consider *fun* (HP-IL) is used to connect machines that I think are *fun* (HP-41C, HP-75, HP-71) so I can have even more *fun* with them! The common element there is, of course, sheer misery and desperation. 8)

Re: HP-75 HP-IL question

*Message #11 Posted by **don wallace** on 28 Aug 2005, 8:22 p.m.,*
in response to message #10 by Howard Owen

Hi all. Hi Howard.

I really liked your answer. I wasn't teasing or goading anyone... I certainly didn't mean to stir anybody up, either. Well, not much anyway ;-)

Yeah, for it's time HP-IL and (at the time) HP-IB, before it got picked up and standardized , were really cool "monsters". I wondered about your background and thought you (and probably Vassily) were right in the thick of things at that time. That NI stuff is very smooth...

To me it was an amazing time, with everthing still pretty "raw". Those were the "good old, bad old" days of computer engineering, long before that horrid term I.T. was spawned (from the depths of somewhere hot and stinky).

Remember when all those "data clerks" (yes, I know we need them, but...) were in the Electronic Data Processing (EDP) industry? Now it's I.T. As you guys say over there, "Go Figure..."

Something happened one day when we all blinked ;-)

Anyone who thinks experimenting with HP-IL is WAY COOL with me!

As for me I have my own strange brand of eccentricity. I am hoping to roll a simple analogue input module for my 41C and maybe an IR module for it which is a bit faster or just different than the standard one. In my crasier moments I find myself wondering if I should do a module to implement a logic state analyzer interface for the darn thing...(!) as I am building a revamped version based loosely on something I made in 1987 anyway.

I always wondered where the engineers turned experimenters (or is that the other way around?) hung out on the 'net. So far I have met a few of you here. Pretty cool...

Best wishes, guys!

Don W

Re: HP-75 HP-IL question

*Message #12 Posted by **Howard Owen** on 28 Aug 2005, 9:06 p.m.,*
in response to message #11 by don wallace

I wrote in another thread about pioneers, and their attitude toward the evolved products of their pioneering. The monks who illuminated manuscripts as a devotional duty would scorn a paperback book. They might even be horrified by it. The same could be said of a watchmaker, seeing cheap quartz crystal driven LED watches being given away in the 1970s, as bait to draw you into a sales pitch for the new department store. And yet, both items, the paperback book and the cheap watch, are marvelous, democratizing miracles. (Well, maybe the paperback is more liberating than the watch.)

The monk never saw a paperback, centuries having elapsed between his cloister and the publishing format. But watchmakers in the 20th century certainly did see their business change when Japan started flooding world markets with cheap and accurate time pieces. But the true change from art to commodity in time-keeping took longer, perhaps on the order of a century. But for us, technology cowboys and girls, we have seen the most astonishing transformation in human history play out in a mere 20 years or so. And our technology was one of the principle driving forces of that change.

But we have to suffer, watching our "toys" being turned into manure scoops. Not only do we cope with the natural, useful, but crass and ungraceful transition from artistic expression by small groups of motivated people, to mass market, lowest-common-denominator products, but we also are faced with a world that has suddenly drawn in its horns. The crash of 2000 brought an end to unexamined claims of wonderful benefits to be had from just the right piece of software and/or business model. And September 11th, at least in the US, added to the sobering realization that the world wasn't the rosy garden Americans tended to see after the fall of Communism.

So the cautious ones, the actuaries, the managers and so forth, are now in the ascendency in our beloved technical playground. I've tried to show that this is not a unique occurance in history, but it's still painful to watch and live through.

But my real hope is that software will eventually trump all the calcifying calculations of the careful crew. "Thought and code are closely intertwined" I once wrote. That means that ideas still have a fast-track to reality that they never had in the past. Disruptive ideas *will* emerge. Change *will* continue to accelerate. None of the underlying conditions that made this true in the late 20th century have changed. The instrumentality of imagination is faster and more powerful every day. The challenges facing us as a global civilization are clearer and more pressing. This*will* make a difference.

Hallelujah, Amen. 8)

Re: HP-75 HP-IL question

*Message #13 Posted by **Mike McWilliams** on 29 Aug 2005, 2:05 p.m.,*
in response to message #12 by Howard Owen

Howard, Vassilis, Don

Wow. Thanks for all the responses. I won't presume to weigh in on the philosphical aspects of your comments, because you all know much more than I do.

Howard, I don't have the I/O module you refer to, all the ROM slots are filled with dummy ROMs.

To answer Howard ("Why is Mike doing this?"): I bought a Ludlum scaler/counter on eBay a while back to run an experiment here in my lab (we're on a budget, just poor university types). The prce was great and the counter works just fine, once you can talke to it. But it has no front panel controls, it was designed ONLY to work via HPIL commands. The manual shows examples of how to run it with an HP-41 via HP-IL, but I

didn't have an HP-41 but I did have an HP-75 that a colleague gave me. So I searched on eBay for a few HP-IL cables and eventually made it work (sort of, see next paragraph).

Using PRINTER IS I can send bytes to the device to turn on the high volts, set window sizes and initiate counting. What I can't seem to do is read bytes over HP-IL. The syntax is quite simple, i.e. send a count command, wait for counting to be done, then send a command to initiate the sending of a byte stream back to the HP-75.

Vassilis, thanks for the tip about the HPILCMD.bin file, I have downloaded this multiple times but can't seem to unpack it. My Mac and my PC both think it is MacBinary, but no PDF file results. Maybe it is a different kind of binary file?

Ultimately I will try to control this device via HP-IB, I found an 82169A interface that I am now experimenting with.

Again, thanks for all the help, we'll get it going soon I 'm sure.

MM

Re: HP-75 HP-IL question

*Message #14 Posted by **Howard Owen** on 29 Aug 2005, 2:57 p.m.,*
in response to message #13 by Mike McWilliams

The .BIN file is probably the raw bits the 75 needs to have residing in RAM before you can use SENDIO/ENTIO. (It is 'ENTIO', not 'READIO.') To get those bits onto your 75C, you need one of two things. Either an HP-IL disk/tape or other mass storage device onto which you can copy the bits from the PC, or else a copy of those bits on 75C magnetic cards. The former isn't impossible. I outline how I set up my system in an article here at the Museum. (" HP-IL, Linux and the Internet")

But the easiest way would be to get someone to write the data you need onto cards and mail them to you. I can do that, but I need you to go on eBay and look for the auctions that offer HP-75 magnetic cards. Purchase one package or so. I will send you the cards you need enclosed in the plastic tube they come in. When you get the cards, replace them in the tube with an equal number of blank cards and send them back.

Sound OK?

Re: HP-75 HP-IL question

*Message #15 Posted by **Mike McWilliams** on 29 Aug 2005, 6:25 p.m.,*
in response to message #14 by Howard Owen

Ah, right you are. Looking again at the message from Vassilis, the .bin file is the actual code and the manual pages that describe it are in PDF form "75ioutil.pdf".

I do actually have a stack of blank HP-75 ribbon tapes, as it turns out.

TI 59 RPN SIMULATOR MODULE

*Message #1 Posted by **amora1946** on 26 Aug 2005, 6:14 p.m.*

Hello HP lovers. I know this is an HP FORUM and i am an avid HP RPN Lover myself, however do any of you Babyboomers remember seeing a TI 58/59 witht the $50.00 RPN SIMULATOR Module circa '79? Reason i ask is that i acquired several TI 58C's and would like to acquire the RPN module. It turns the TI inato a 9 level stack RPN machine.

Warmest regards,

Andy Aerospace Mechanical Engineer So. Ca

How about you sell your TI's and buy some HP calculators **WITH SOEM REAL RPN STACKS!!!!!!!!!**

Re: TI 59 RPN SIMULATOR MODULE

*Message #3 Posted by **Howard Owen** on 26 Aug 2005, 11:44 p.m.,*
in response to message #2 by Namir

Who's selling them RPN stocks??

I'd be careful. Could be a swindle. I mean, there's not a lot of money in RPN, or so I've been told.

Re: TI 59 RPN SIMULATOR MODULE

*Message #4 Posted by **Andy** on 28 Aug 2005, 12:41 p.m.,*
in response to message #2 by Namir

Have most of the desired RPN HPs already. HP35, 28S, (3) HP 41CVS, 10C, 11C, 15C, plus some ALG units, 6s, 9s, 30s, 38G, 48G in addition to TIs.

Re: TI 59 RPN SIMULATOR MODULE

*Message #5 Posted by **db (martinez, ca.)** on 26 Aug 2005, 11:59 p.m.,*
in response to message #1 by amora1946

I'd like to find one too, although i've read that it's purpose was to allow one to enter HP 65/67 programs into a TI 59 series unit and somehow run them. I have not read that it will let you use the 58/59 as an RPN calc of any stack depth. It's possible though.
They were a good machine, robust with not-too-bad keys. Some surveyors used them and i remember being told that the TI program would store an amazing 20(!) coordinate pairs. That sounds paltry unless you consider that HP didn't market a point storage program of any size on a handheld till years later in the 71 - another non-

RPN.
Remember: The 58 series only holds one module at a time. If the chip works like you think it may; you probably can't use the math, statistics, navigation, or surveying modules with the RPN module since i never heard of anyone combining ROM's on a TI :-(
You could write to Joerg at Datamath and ask him about his but be careful. He may try to get you to go over to the dark side.

What the TI RPN simulator will and will not do

*Message #6 Posted by **Gene** on 27 Aug 2005, 8:37 a.m.,*
in response to message #5 by db (martinez, ca.)

What it does:

It ONLY allows you to key in the keycodes of programs from the hp97 into a TI58C or TI59.

The module will run a long long time and then spit out a print out (printer is required) of a translated TI program that performs equivalently to the original RPN program.

This program then must be re-keyed into the TI calculator from scratch to be run.

What it does not do:

It does NOT allow you to use the TI calculator in an RPN operational mode.

It does not support all HP97 features. It won't do rapid reverse branching for example. I think it also has problems (if I'm remembering correctly) with P<>S (primary to secondary) memory switches.

All in all, although I have had this module for years now, I have never once used it. I really can't imagine an HP97 program that was so compelling that I'd want to try to run it on a TI58C or TI59. I think I'd just run it on the original hp97.

Here's what I said about the module several years ago (which can be found on my old HP and TI website: http://www.rskey.org/gene/calcgene/59mods.htm)

"Module #13, RPN Simulator. Although I have one, I have never used it. This module was a very strange one for TI to make. Apparently, they were getting tired of people claiming HP's were better calculators so TI decided to make this module as its answer to HP and RPN. (Or they may have realized that there was a lot of software programs out there for HP's and wanted to give their users access to it). It's an entire module with one executable program on it. You run the program and key in HP-97 program KEY CODES. You could take a printed program listing for the HP-97 (this would NOT work for HP-67 key codes, only the HP-97) and key in the program steps keycode by keycode. When finished, the program would go off and compute and eventually (and this took a while) print out a TI-59 equivalent program. This then had to be KEYED back into the TI-59 to run. The usefulness of this module is somewhat suspect. First, only keycodes from a HP-97 listing can be used. Second, not all instructions from the HP-97 can be interpreted or emulated by this module. The manual (woefully concise) provides a list of these functions. Also, the resulting program often doesn't run very well at all speedwise. TI did give a very good effort, however. Their timing was terrible, as this module came out only a few months before HP introduced their HP-41. This module did NOT work except to translate programs."

Re: TI 59 RPN SIMULATOR MODULE

*Message #7 Posted by **Geir Isene** on 27 Aug 2005, 5:05 a.m.,*
in response to message #1 by amora1946

I started out programming calculators in the late 70's on a TI-57 and shortly after a TI-59. It is a great calc capable of self-modifying programs. I got converted to RPN by the HP-41. Having a beautiful working TI-59, I would love to do more experimenting with it - like adding the RPN simulation module. However, the module is not of much use - it allows you to input HP-65/67/97 programs into the TI-59 by its key kodes; it then prints out the corresponding TI-59 keykodes on a PC-100A/B/C printer. Then you can reenter the TI-59 keykodes into the 59 to get a working TI program. In short, you can only use it to translate HP programs to TI. The manual is availbale here:

http://bulk.rskey.org/BULK/CALCDOCS/TI/TI%2059%20RPN%20Simulator.pdf

The really cool thing would be to make a self-modifying program that lets you skip the re-entry of the translated program. It would be done by storing the program as codes in registers, only to convert those registers to program space.

Re: TI 59 RPN SIMULATOR MODULE

*Message #8 Posted by **Andy** on 28 Aug 2005, 12:36 p.m.,*
in response to message #7 by Geir Isene

Thanks to all for awesome input. BTW, iam a diehard RPN user and have most of the HP RPN Calcs already plus a few of the new ALG units. I may consider putting remainder of my TI 58C's on e-bay. Will keep my TI SR 50's for nostalga. They were made very robust like the HP35s

```
Geir Isene wrote:
I'd like a TI 58C...
```

I wish all wishes were so easy to fulfill. You can get very cheap TI-58Cs on eBay. Actually, for less than $25 (incl shipping). In some cases you even get the printer (PC-100C) thrown in for the same price.

At least for such a low price you won't feel bad when you throw it away after playing with it for a couple of hours.

These things were poorly made then and they have aged badly over the last 20 years. My first calc

was a TI-58 (then upgraded to a TI-59, before I sold it to get an HP-41C) and I can tell you that it was crap.

LIF Text Format(s)?

*Message #1 Posted by **Howard Owen** on 26 Aug 2005, 2:58 p.m.*

I'm converting all the LIF TEXT files I can find in the swap disks to ASCII as part of my plan to index and document those disks. It appears there are several "TEXT" formats in use. The 71B HP-IL interface manual says type "TEXT" is rquivilant to type "LIF" implying that there is one way to represent text. But using Tony Duell's "text75" program results in gibberish for several of the text files, making me think there is more than one format involved. I've developed a Perl script that converts TRANSFORMed 71 BASIC files to ASCII, but that's helped along by the fact that there are line numbers in such a listing.

What I'd like to find out, if someone knows off the top of their head, is where are the various formats defined? I'm going to conduct a search of my own, but I thought I might be able to shortcut the process a little by posting here.

Thanks, Howard

Re: LIF Text Format(s)?

*Message #2 Posted by **Tony Duell** on 27 Aug 2005, 6:15 a.m.,*
in response to message #1 by Howard Owen

There are at least 2 text formats...

There's what I call TEXT75, which is, AFAIK, used by the HP75 only. The structure of that is similar to a BASIC program from what I can tell

Then there's the normal LIF text file, which is used by just about every HP machine that supports LIF disks. It's the HP41 ASCII file, the HP71 text file, HP75's can produce it too, I've also come across it on larger machines.

This is handled by my hptext program in my LIF utilities for Linux distribution. I think the format is given in the back of the HP71 HPIL manual.

Re: LIF Text Format(s)?

*Message #3 Posted by **Howard Owen** on 27 Aug 2005, 3:39 p.m.,*
in response to message #2 by Tony Duell

Thanks again, Tony. I had missed hptext in your suite. Another of my Perl scripts bites the dust due to your effort! Thanks!

(**No irony** there. I really prefer to use someone else's tool, if it works as advertised, which yours do.)

30HPHW ???????

*Message #1 Posted by **unspellable** on 26 Aug 2005, 11:17 a.m.*

I have found a picture labeled as a 30HPHW. This calculator is in the same case as the 28C/s or 19BII. Anybody ever heard of it? If so, what is it? (The picture does not have enough resolution to read any of the key lables.)

Re: 30HPHW ???????

*Message #2 Posted by **Gene** on 26 Aug 2005, 12:22 p.m.,*
in response to message #1 by unspellable

It's just a 19bII picture. Nothing new (unfortunately). Not sure why dealtime appears to have labeled their picture that way, but ...

(did a google search on 30hphw and it came up with two hits at dealtime).

Batteries versus supercapacitors ...

*Message #1 Posted by **Artur - Brasil** on 26 Aug 2005, 11:02 a.m.*

In my last incursions on Internet, I found some interesting new (at least to me) electronic devices.

First, the big ones: Farad capacitors for car's audio systems. I've never had one in my hands, but I believe they are very big.

After some months, I saw in Ebay the little cousins: Panasonic 1Farad very small capacitors.

Very interesting, but, because its high internal resistance, the delivery current is small, just enough to keep memory circuits. Of course, there is a line that could delivery Amps, but their size does not allow their use in the 41C battery pack or battery holder.

Continuing my researches, I found the Aerogel Capacitor. They are small in size and don't lack the high internal resistance, allowing Amps to flow instantaneously.

Well, I was wondering in using 4x 3.3F , 2.5 V or the 1.0F, or 2x 5.0V in my 41.

The problem: they accept only 50US$ min. orders from internatinal buyers... anybody in USA could try and let us to get some these small wonderfulls?

Here are the links:

Manufacturer

Seller

The models I was wondering are B1020-2R5335 or PB-5R0V105

Best regards, Artur

Re: Batteries versus supercapacitors ...

*Message #2 Posted by **Klaus** on 27 Aug 2005, 5:02 a.m.,*
in response to message #1 by Artur - Brasil

Hi Arthur,

In Germany you can buy these Capacitors (sometimes called "goldcaps") from any electronic distributor. If you can't find these in your country, I offer you my help!

Help is welcome

*Message #3 Posted by **Artur - Brasil** on 27 Aug 2005, 12:03 p.m.,*
in response to message #2 by Klaus

Hi, Klaus

Here in my city they are not avaiable yet. But the GoldCaps aren't the ones from Panasonic? These have internal resistance too high and I believe they will not be usefull in calculators. If you have any time and could verify the other brand (Aerogel from CooperEt), I would appreciate very much your help. Thank you very much, Artur

Re: Help is welcome

*Message #4 Posted by **Klaus** on 28 Aug 2005, 5:30 a.m.,*
in response to message #3 by Artur - Brasil

Hi Arthur,

I don't knwo much about Gold Caps (regarding their resistance). I found a capacitor called "UltraCap", it is dischargable with a current of 400A and its capacity ranges from 4F to 110F at 2.3V

Dimensions in mm:

5x23.9x15.6 for 4F : 8€ 5x23.9x30.6 for 10F : 9€

110F is cylindric: Length = 67.5, diameter = 25.5 :35€

Are you planning to put in a voltage regulator as well?

Re: Help is welcome

*Message #5 Posted by **don wallace** on 28 Aug 2005, 7:41 a.m.,*
in response to message #4 by Klaus

Whats wrong with rechargeable nicad batteries?

I think you will find the capacitors you are talking about are unsuitable for the 41.

All I would say is: Make sure you don't wreck your calculator by mucking around with it. I don't think what you are doing is a very good idea.

Any high current high capacity capacitor is going to self-discharge and you know yourself the low current parts won't work. Why muck around if you don't know what you are doing? It's not worth it... It really isn't.

The high current high capacitance parts you are taling abut are massive. I have some out of a MAINFRAME COMPUTER power supply; they are 58000 uF (0.058F), 25 volt, very high current. The parts are FIVE INCHES round and stand about EIGHT inches high. No I am not kidding.

When it is running a program the HP41CV draw 4.5 millamps.

Kind regards,

Don W

Not practical at all

*Message #6 Posted by **Garth Wilson** on 28 Aug 2005, 8:19 p.m.,*
in response to message #5 by don wallace

To get as much use between charges as you'd get with one set of alkaline N cells, you'd need somewhere around 1kF-- yes, a thousand farads. That't assuming you used the energy before the capacitor's own leakage discharged it. The supercaps do hold a charge for a long time, but I don't know about years like alkaline batteries manage.

Farads=Amps x seconds / voltage_change

The alkaline N cell gives about a 500mA-hour (not amp-seconds). That's about 1800 amp-seconds, to get from 1.55V down to about 1.2V where the HP-41 low-battery indicator comes on. That's per battery, so multiply by four, assuming the capacitor can handle 6V so you don't have to put them in series. So in the equation above, the "voltage_change" term becomes 4(1.55-1.2), or about 4*.35, or 1.4. The result is almost 1,300 farads-- not microfarads, or even millifarads, but farads. Hardly practical.

To make it worse, suppose the capacitor can't handle the whole six volts. If it can handle three, you'll need two in series, each one of double the capacitance. If you need four in series, each one needs four times the capacitance, or about 5kF. If you say you're only going to charge the set up to 5V instead of 6V, now the "voltage_change" term above becomes smaller, and the required capacitance value further increases-- dramatically!

Edited: 28 Aug 2005, 8:26 p.m.

happy experimenting, you guys...

Don W

Thanks!

*Message #8 Posted by **Artur - Brasil** on 29 Aug 2005, 8:35 a.m.,*
in response to message #6 by Garth Wilson

Hi,

Thank you for the electronic class! It is really impossible to use the caps to run the HP. I believe not because it can deliver Amps instantaneously and this could damage the calculator, as the discharge current also depends on the internal resistance of the circuit that are being powered. If HP uses mA only, it will keep using the mA only, it doesn't matter if I use N cells or a truck battery with a voltage regulator, am I right? Just an examination (using 48's solve function) on the formula, with the DeltaV of 0.2V (1.5 to 1.3) and the time of 3600s, the F is very high! Any way, thank you for the class and saving my money!

Artur

HP 48SX failure

*Message #1 Posted by **will** on 26 Aug 2005, 6:20 a.m.*

Hi..i have a problem with my 48SX. Once i turn it on shows: try to recover memory (typical when you put on it new batteries)....if you try YES or NO this message still on screen, so i suppose the calc have a memory failure or need a memory (or calc) reset as i did with my 17BII sometime ago. I would be grateful for your help...

thanks...

Re: HP 48SX failure

*Message #2 Posted by **Namir** on 26 Aug 2005, 8:31 a.m.,*
in response to message #1 by will

Just choose NO ... and you will be fine. Your calculator is fine.

HP 48SX failure

*Message #3 Posted by **will** on 26 Aug 2005, 12:43 p.m.,*
in response to message #2 by Namir

Hi...You can choose YES or No...the calc return to the message once again....

Re: HP 48SX failure

*Message #4 Posted by **Namir** on 26 Aug 2005, 4:48 p.m.,*
in response to message #3 by will

Resetting the calculator or discharging any possible static electricity might help. To do the latter, remove the batteries and then connect the contacts with a piece of metal. Insert the batteries again and then turn the calculator on.

Re: HP 48SX failure

*Message #5 Posted by **Artur - Brasil** on 26 Aug 2005, 2:08 p.m.,*
in response to message #1 by will

Did you tryed the hard-reset? Remove one of the rubber foot on calculator's back (I don't remember which one). There will be a small hole. Insert a clip inside it until the calculator resets.

I hope this could help. Artur

Re: HP 48SX failure

*Message #6 Posted by **Randy** on 26 Aug 2005, 6:44 p.m.,*
in response to message #1 by will

The reset might fix it but I doubt it. It could be under either the right or left upper rubber foot - it changed sides during the SX's lifetime so you've got a 50-50 chance.

If it does not recover with either the YES or NO choice, you have a contaminated or otherwise shorted keyboard. You might be able to clear it out by cleaning with an ultrasonic cleaner but it is likely to return. As the SX is at the bottom end of vintage HP values, it might be wise to pick up a used replacement. The 48G is less costly if you don't need the expansion ports.

Re: HP 48SX failure

*Message #7 Posted by **Howard Owen** on 26 Aug 2005, 7:07 p.m.,*
in response to message #6 by Randy

> Quote:
>
> The 48G is less costly if you don't need the expansion ports.

And if you can get by with 32K of ram instead of 128K. And if you don't have too much time invested in learning the SX layout or else don't mind learning a slightly different one. You also get about 60% better performance with the G series, modulo the RAM issue.

Re: HP 48SX failure

*Message #8 Posted by **Randy** on 26 Aug 2005, 7:12 p.m.,*
in response to message #7 by Howard Owen

The SX also has 32K of ram. Only the G+ and GX had 128k...

Bring back ....

*Message #1 Posted by **Namir** on 25 Aug 2005, 6:19 p.m.*

I am amazed at the "bring back the 15C" nostaligia. Why stop there? How about bring back the 41CX? Or even the 67??? How about the 67CX (well it never was real to begin with)!

I have a much better solution that will make us ALL very happy on this website ... yes EACH AND EVRRYONE!

How about asking HP to turn back time! This way we ALL get one or more models we like!! Why chose just one? ?? WE GET THEM ALL.

So here I go!

HP! If you are listening. BRING BACK THE PAST!!!

There!!! Now we can ALL SIT BACK, RELAX, SMILE, AND WAIT FOR ALL THOSE BEAUTIES TO BE REAL AGAIN!

Hop HP will do it's magic by HHC2005 .. or even by HHC2006. I will wait for a year.

Re: Bring back ....

*Message #2 Posted by **Howard Owen** on 25 Aug 2005, 10:01 p.m.,*
in response to message #1 by Namir

Now *that* is the true spirit of nostalgia! 8)

There was an old joke about IBM that claimed they had invented a computer that was faster than light. As a result, it could predict the future. So IBM started delivering mainframes before the customer knew they needed one. 8)

Re: Bring back ....

*Message #3 Posted by **Dave Shaffer** on 25 Aug 2005, 10:51 p.m.,*
in response to message #2 by Howard Owen

"There was an old joke about IBM that claimed they had invented a computer that was faster than light. As a result, it could predict the future. So IBM started delivering mainframes before the customer knew they needed one. 8)"

I'm not sure about actual delivery, but they sure as heck would promise something long before they could really deliver it! This is back in the '60s.

Re: Bring back ....

*Message #4 Posted by **Hugh Evans** on 25 Aug 2005, 10:28 p.m.,*
in response to message #1 by Namir

Reissues of classic machines could actually be quite a cash cow for HP. The 15C would be a logical starting point. I don't know if the 12C uses the same CPU design as original voyagers, but if they do I would assume they could acquire a ROM dump from the community and be in business. Bring quality standards up to or exceeding those of the originals and it could be back on the market for the cost of tooling. Set a price point between $100-$150, ducplicate the original packaging and manual.

It's very low risk, and due to sunk costs for LCD, enclosure, and perhaps even the PCB I would imagine the margin would be astronomical. Injection molding the keys might cost $10k for tooling, but that's a drop in the bucket. Best of all, it wouldn't be competing with any of their current RPN scientific models. The price point, styling, and features set it apart.

Re: Bring back ....

*Message #5 Posted by **Holger Veit** on 26 Aug 2005, 6:57 a.m.,*
in response to message #4 by Hugh Evans

I think ou are overestimating the market for "classic" calculators by far. Surely, almost everyone here in this forum might buy re-issued classic HPs (not the Kinpo crap), but this collector's forum is the exception.

Look how the market for handheld devices is evolving: the calculator functionality is just an add-on of almost all mobile phones nowadays. Surely this is only the standard +-*/ calculator style, but apparently nowadays most people do no longer need computing power like a HP41 as a handheld - PCs with more speed and functionality are ubiquituous.

See the decrease of the BASIC-style Casio sliderules - does anyone, except collectors, still feel the need to have one and to program it - seriously? Their time was over when people could get C64 and Apple with faster or better BASIC built in.

Even if HP could make insane profits by buildung a classic HP calculator for 5$ and sell it for 100$ (but then: why not build it for 1$ at Kinpo and increase profit further?), would anyone seriously expect that people (again: collectors and students excluded) buy such a "calculator-something" with strange UPN entry logic for 100$ when you could get some noname-throwaway for 5$ at the local Walmart? Quality is no longer an argument - see again the mobile phone market - it may be crap, but it must be stylish and new, and your pals shouldn't have it already.

It is not a technical issue anymore.

Re: Bring back ....

*Message #6 Posted by **don wallace** on 26 Aug 2005, 7:58 a.m.,*
in response to message #5 by Holger Veit

Hi all.

Right On, Volger...!

It's sad, but the past IS JUST THAT: *past*.

However, at least people here have a place to chew the fat WITH FREINDS over the technical achievements of the 1970's, probably to be remembered ten years from now as THE HEIGHT OF CIVILZATION, when we all had nothing to worry about except when gas was going to pass 50 cents a gallon or whether we could scrape enough money together to buy that really nice State-Of-The-Art Stanton cartridge for the turntable we wanted to buy. Maybe if we worked in *aerospace we were worried about getting laid off, or were in high school, just worried about getting laid, (not fretting about Aids, Peak Oil and Permanent War... or permanent unemployment.)

This IS just my opinion, but I think we are at an unusual point in history. Lets enjoy the nostalgia and camaraderie while we still have the time and luxury for such indulgences...

As for me I may have had most of my CD's stolen, (and other more serious personal stuff I cannot share with you all) but I still have my STAX (SR5) headphones.... and my ageing hp 41CV. As important but no more or less so, is my hearing bandwidth to appreciate the STAX and my knowledge of maths and electronics and the accuity to appreciate and actually USE as a NEED, the performance of the hp41...

Whether I still have my perspective and mental health, well I leave THAT to the reader to judge. At least I haven't lost my sense of **humour (**yeah we spell it that way over here ;-)

Peace, Man! ;-)

Don W P.S.:

* jokes my lecturer told us: (he claimed to have worked at Lockheed in the mid seventies. I dunno...)

What's the definition of an optimist? A Lockheed engineer who brings his lunch to work.

What's the defintion of a pessimist? One who leaves his car running in the driveway.

Apologies if I have unwittingly offended anyone...

Re: Bring back ....

*Message #7 Posted by **Namir** on 26 Aug 2005, 8:29 a.m.,*
in response to message #5 by Holger Veit

In the mid 80s I had the chance to intreview Dr Jean Ichbia, teh father of the Ada language. He said something interesting about programming languages that seems even more true about our affinity to vintage HP calculators. Ichbia said "Programming languages are our interface with machines. We like to have new machines that are more powerful, yet we want to use the same programming languages to work with them."

The old HP calculator were new, cool, and empowering of us in our jobs and tasks. This was at a time when computers were not commonly used. We learned how to program these calculators. We mastered tricks of using the stack, indirect addressing, program flow control. **We invested a lot of ourselves.** Somehow we made a man-machine connection that made us stand out a bit -- we were the geeks that had those cool calculators.

The advent of the PC (generically speaking) seriously challenged the old HP calculators. The PCs became the new **HYPERCALCULATOR** that has a compfotable keyboard, screen, storgae device, printers, modems, and so on.

Part of us still years for that past. I think there is a big psychological factor here. I ask myself "What does that era represent to me?" Calculators came at an age when I was finishing college and starting to work. It represents an era of hope and potential. **Maybe we are longing to go back in that era and cut a new path. Perhaps after all it's about our personal history and making choices .. more so than teh actual vintage calculators.**

That's not the point. It was the willingness to PROGRAM (in any language) that vanished at that time. Average people were no longer 'programmers', but 'users'. Now they have become 'customers' or even 'consumers'.

Everyone has nostaligia for her (P.C. here) teenage years --- and it is not wrong ! Go calculator nostalgia !

I'm not so sure that programming has changed, just the things that users used to program have migrated to spreadsheets, or other custom software that provides functionality.

I am employed writing software that handles transactions on gas pipelines. Our users might once have 'allocated' gas to transactions using little programs, one aggregate point at a time. Now they simply 'program' how the software should do it, and assuming I've done my job, the software will pretty much do what the user wants, in a few minutes, for an entire pipeline.

It's still programming, just a bit more removed. And incidentally, I've never actually seen the box that my stuff runs on, but I think it's some NT cluster in a serverroom. That's kinda sad.

Infact, I do agree this is one point that can be obeserved frequently nowadays. OTOH, the market for the programmable calcs was never the common "need a mobile with MP3 and camera built in" people but the scientific, engineering community - they still have the need to have a suitable tool to solve their problems. And they do still write programs, maybe clicking them together with a Visual BASIC GUI, or write stuff down in Mathematica or Maple, or even write C++ with a VI under Linux. Problems are still there.

But maybe the skills to write efficient code has vanished. With a PC, you basically wouldn't need FOR loops any more - you could afford copying&pasting the loop body N times (if this wouldn't

need so many mouse clicks. You have a wealth of CPU and RAM resources, so you wouldn't need to think about fitting your calculation into meager 6144 bytes - just throw your poor hack onto the PC using 1GB memory and 10GB disk space (useless, but slick animation gimmicks included). I am still amazed what people those days could get out of a PDP-8 with their CPU almost as powerful as todays wristwatches ;-) Such knowledge and skills are gone, or rather they just still live in the memories of old men. Likewise to vintage calcs.

*Message #11 Posted by **Bill Wiese** on 26 Aug 2005, 2:37 p.m.,*
in response to message #4 by Hugh Evans

Quote:

Reissues of classic machines could actually be quite a cash cow for HP. The 15C would be a logical starting point. I don't know if the 12C uses the same CPU design as original voyagers, but if they do I would assume they could acquire a ROM dump from the community and be in business. Bring quality standards up to or exceeding those of the originals and it could be back on the market for the cost of tooling. Set a price point between $100-$150, ducplicate the original packaging and manual.

Hugh,

No way.

The biggest cost for most calcs today is not hardware but the packaging, marketing and jostling for shelf space at major merchandisers. (At quite a few stores you have to PAY to be on the shelf in a decent position.)

An HP15C-like calc can be made for $2-$3 in mass qtys. ($0.40 microcontroller, $.70 display, $1 case/KB, $0.35 batts) Maybe $5 if good keypad is used. If a manual is included (more than a folded sheet) add another $1.

HP wouldn't be able to roll this out either without getting a lot of staff involved - so whatever profits were even remotely there would be gone.

And then there's the 'marketing slot' issue. Even if an HP15C could be produced FOR FREE, it'd still cost at least $25ish to get on the shelf and that would be profoundly difficult since it would be an 'oddball' (RPN, etc.) Special marketing programs would need to be created just to get them to move off the shelf today. HP has a hard enough time competing against TI right now.

The teeming hordes now buying calcs are primary school kids, college students, etc. They just wanna press buttons. Elegance has no say anymore. People doing 'serious' math professionally are in general using desktop tools like Matlab, Maple, Excel etc. - and use a calc just for quick 'pushbutton' answers.

I think the only company that could make a calc like an HP-1X series and make a bit of money over long term would be a company like Calculated Industries who makes specialized calculators for very small markets (construction estimators, etc.) and can keep them in inventory for a long lifespan.

The market is by no means huge, but obviously the 15c is selling steadily on ebay for example. Do you really think all of the units sold on ebay are going to collectors? I would venture to guess that most are bought as replacements.

There is no way it could be sold in any great volume. The only redeeming value is profit on the order of 2000%. I seriously doubt a 15c reissue would be viable as a retail shelf item.

In short: it could be done but is too obscure for a company such as HP.

*Message #13 Posted by **John L. Shelton** on 26 Aug 2005, 4:56 p.m.,*
in response to message #12 by Hugh Evans

There are other channels besides brick-and-mortar stores. Recall that the original HP calcs were sold exclusively through the few hundred HP sales offices. It would be possible to sell, at much lower cost, through web channels, and bypass the stores entirely. How about an entire product family of HP Classics, kind of like the way Disney opens up their vault every few years. Tool up the factory, crank out a million units, and sell until gone. Then move on to another model.

Re: Bring back ....

*Message #14 Posted by **Namir** on 26 Aug 2005, 5:31 p.m.,*
in response to message #13 by John L. Shelton

I have mentioned this a few times in the web site. In last year's HHC2004 Richard Nelson proposed to HP to make an HP-45-like calculator that is so inexpensive that HP can give it away to teachers. This simple RPN calculator would get more teachers interested in RPN and RPN calculators.

I see a lot of merit in Richard's request, and he certainly knows the whole history of RPN calculators.

I think we can ask HP about this. I will certainly mention it to Cyril (the HP R&D guy) this HHC2005.

eBay is a special kind of market. And HP calculators are also a special kind of product. Surely many of them will go as replacements, maybe another large quantity is acquired for students' exams - given the strict NCEES rules the common "scientific calc" crap at retailer's shops appear to be too lousy, and high-end alphanumeric stuff is ridiculously forbidden. Vintage calcs of the 70s and 80s fill a specific gap there. The HP-33 is an example, but it seems to be in competition with the cheap

"scientifc calc" - too large a risk for HP marketing wimps who changed HP from a high-end, high-quality manufacturer to one of several ink-cartridge sellers.

HP vintage calcs might be revived, but as sure as the amen in the church, not by HP.

Great point, Namir! I've never truly understood the passion that many have here for simple scientific calcs. They always rationalize it with the "pocketsize" argument. I used scientifics for years, but when the HP48 came out, what a great thing that was. The 48/49 series is very easily carried around, and at least a hundred times more powerful than any scientific, thus infinitely more useful.

Bill Hewlett already had a production line of desktop calculators, when he got fet up with status quo and decided engineers needed a calculator that would fit in their shirt pocket. He orignially was only going to manufacture the Hp35 for internal use as his bean counters said there was no real market for it.

Does you Hp48/49G fit in your shirt pocket?

I believe that is why Bill might just turn over. Your embracing the situation, might make it twice.

That the Hp48/49g series is an ultra powerful computing device is without question. That it is a portable pocket calculator is stretching the definition of both portable and pocket.

"If anyone wants a CAS, they should use Mathematica on a PC" sounds like an argument similar to "If anyone wants scientific functions, they should use a desktop calculator" in the '60's.

Or, "For a pocket calculator, 4 functions is sufficient" from the 60's is like "For a pocket calculator, traditional scientific functions are sufficient."

I think the HP48/49 have the most powerful handheld mathematical tools at an affordable price. It doesn't seem that different to me from Hewlett's original goals. But I guess they don't fit in a shirt pocket (a pants pocket, maybe).

*Message #23 Posted by **I, Claudius** on 2 Sept 2005, 10:30 p.m.,*
in response to message #20 by Ron Ross

What's so special about a shirt pocket? Why not a pants pocket? For years the nerdy thing with slide rules was a custom leather case hung off the belt. Remember the HP41 belt case? My Dad used one of those.

I just don't see a calc's ability to fit a shirt pocket as anything special, except to say small and underpowered.

Re: Bring back ....

*Message #24 Posted by **don wallace** on 2 Sept 2005, 11:18 p.m.,*
in response to message #23 by I, Claudius

Hi all. HI I,Claudius.

I realise I was misinterpreted. The 48 is really, really smooth!

I lament the LOSS OF EXPERTISE in the modern crop of "programmers' and "engineers". Likewise the whole attitude of people in a society where the skill level on average has dropped so far that SOME managers and technicians can no longer do basic things central to

their roles. This is all glossed over with savvy back-stabbing of those more capable than they are. Some of the latest incumbents are so thick that you can't even have a technical CONVERSATION with them... They just have no background to draw on or work with...

Then people in wider society wonder WHY they can't get their computer networks / multi-user systems straightened out, or their calculators or digital equipment repaired AT THE CHIP LEVEL anymore.

Of course change is inevitable, Seneca said that about 2000 years ago. But although they could send men to the moon in the late 1960's (a waste of money though), dealing with terrorism and natural disaster seems TOTALLY beyond the capacity of the present civilization (Government). With New Orleans, Time will tell. I think the tale will pan out to be an unparalleled HORROR STORY.

Over here where I come from, in my opinion the incompetence of management is so bad that the Queensland Government and it's health department apparently could not even screen a rogue surgeon from Portland, who it seems through his very poor work killed about 85 people in the city of Bundaberg. The fall-out from this has been tremendous... Even, worse, it seems he wasn't the only crook surgeon they let through...

There is no doubt among anyone of us with a brain and a memory that the standards generally have fallen a LONG WAY.....!

That's what I lament: Loss of Quality in trained people. That is reflected in some of the mdern products from some companies like Hewlett Packard.

I think the 48/49 are FUNCTIONALLY great. Whether anyone will still be computing on one in the year 2017 is another question entirely. If they are then that alone will vouch for their BUILD QUALITY.

*Message #25 Posted by **don wallace** on 3 Sept 2005, 3:20 a.m.,*
in response to message #24 by don wallace

Hi all. Hi Crawl.

Just a note about your comment: In the '60's THERE WAS NO SUCH THING AS A POCKET CALCULATOR... They appeared in the early '70's In the '60's most machines were bare four function desktops built with RTL logic and over a thousand discrete transitors with percent, percent change and sqaure root. I know because I saw a few. Display was by a gang of NIXIE tubes. That's why the 9800 with a CRT to display three registers was such a big deal in 1968. And that's why the HP engineering calc range was/is such a big deal. They are (very) dated, but man, do they date WELL...

I am inclined to think the 48/49 is overkill but if I had one I suppose I would fall in love with it... not too sure about that.

In 1968 DEC PDP-8's were a very common mini-computer around the place. In the mid seventies there were some DATA GENERAL NOVAs around and by 1978 DG had a 32 bit machine (Eagle) which was back compatible to the NOVA. The MICRONOVA was released as a VLSI chipset in 1978 I think.

1981 saw the PDP-11 series of machines which had a range of buss widths and processor speeds. All done mainly with TTL OC logic. Floating point support was implemented in two VLSI chips. 1981 also saw early productio of the CV, at a time when a personal computer ran BASIC in ROM, had no real operating system and loaded from cassette. The TRS-80 in 1978 shipped in basic config with 4 k RAM and NO TRIGS AT ALL in ROM... Think about it.

1982? DEC VAXes came along and were obsolete by 1985.

Even UNIX was still quite raw at that time, even though it had been around since 1970.

So for it's time the HP41 series was very cutting edge - and very practical. The 48 is a completely different animal and if I had a 48 I would still want a 41CV...(as well). They are totally irreplaceable (imho). Mine is 24 1/2 years old and still going strong after five repairs by myself.

How USEABLE is the graphics on a 48?....

DW

Understand your point completely. I think it boils down to people love what they know. The majority of posters here used and grew up with the "pocketsize" hp scientifics, love them, and lament the fact they're no longer made.

As far as the breakdown in technological capability, yes, fewer US kids are going into engineering. We're being swamped with Indians and Chinese and so on. But there are still a lot of bright kids out there who love gadgets and science, so there's hope for the future.

Hi Howard.

How many people here NEED mathematica? Or a hp 48G? ;-)

DW P.S. There is some really good GPL maths software available. Quantian is a complete Linux distribution with some really powerful applications bundled with it. Persoanlly, I like Mathcad, although it is somewhat dated.

Re: Bring back ....

*Message #34 Posted by **I, Claudius** on 3 Sept 2005, 10:35 p.m.,*
in response to message #33 by don wallace

MathCAD has a niche following but has many limitations. Try to solve a symbolic difeq with it sometime. Mathematica is the premier math software. A close second is the not so well known Scientific Workplace, an outstanding math word processor coupled with the MuPAD CAS. The new 5.5 version is superb, runs rings around MathCAD, infinitely more useful.

Re: Bring back ....

*Message #35 Posted by **Howard Owen** on 3 Sept 2005, 11:07 p.m.,*
in response to message #34 by I, Claudius

I know MuPAD is freeware or otherwise obtainable at low cost. Is "Scientific Workstation" similarly available?

I would love to use Mathematica to do some self-directed learning, but the non-academic price is just too steep. (Since I can't justify it in terms of work.)

Even though I have two PCs on my desk (actually one is on the floor, but the two share the same monitor and keyboard), I still use my 41cx every day. Why? Because it's far better for certain jobs, regardless of the comparison of computing power.

> Quote:
>
> See the decrease of the BASIC-style Casio sliderules - does anyone, except collectors, still feel the need to have one and to program it - seriously? Their time was over when people could get C64 and Apple with faster or better BASIC built in.

I've never seen a BASIC as good as what's in my HP-71, which is due partly to all the LEX-file contributions from the user groups. After having used that a lot, we got a desktop PC to control automated test equipment in about 1989, and used HP's Rocky Mountain BASIC which turned out to be a huge disappointment. It was nowhere near as good as the 71. And as for the C64 and Apple II, as great as they were, their BASICs scored a zero compared to the hand-held HP-71's BASIC.

> Quote:
>
> The advent of the PC (generically speaking) seriously challenged the old HP calculators.

I totally disagree. The two have different functions. Some "visionaries" and marketing departments are always pushing to make one gadget do the functions of several. Some of the things they think of are about as apetizing as combining the toilet and the food processor.

We had tons of high-dollar HP RF test equipment where I was working in the mid-1980's (not the same job mentioned above), but much of it was used in engineering, not production. One day the HP rep brought in a HP3421A data acquisition unit with the optional relay card to be tried on a production setup. One of the engineers who had his own HP41cv took 20 minutes to write a program to control the production test. As I recall, it worked right the first time. It took a lot longer to set up the instruments that had to be connected to the 3421 than to write the program. Several engineers were called for a demo, including managers. Everyone was impressed. A requisition was filled out that included a 41cv with HPIL. Unfortunately, that part of the req was denied, with the explanation that the 41 would be much too easy to steal. So they opted for an IBM PC at several times the price and workbench space and no portability. The IEEE-488 card and software was included of course. It took weeks to get anything working with it, compared to the 20 minutes it took on the 41cv. I realize of course that PC software has come a long way since then in user-friendliness, but I think it still would not be able to compete in a productivity contest of this kind.

The PC will always need a big screen; and generally, the higher the resolution, the better. The hand-held, on the other hand, needs to be hand-held. In my case it has nothing to do with putting it in my pocket (which I would never do because that's a recipe to quickly ruin it by sitting on it, letting it fall out, etc.). I need to be

able to take it with me from the desk to the workbench for example, or to another room, while in the middle of calculations or entering data to process. Even a laptop is much to big for this.

> Quote:
>
> With a PC, you basically wouldn't need FOR loops any more - you could afford copying&pasting the loop body N times

If you've ever done any programming you should know that sometimes the value of N will be unknown until immediately before entering the loop, or it may not be the same every time you run the program, depending on conditions.

> Quote:
>
> just throw your poor hack onto the PC using 1GB memory and 10GB disk space

...and how long will that take to load up, compared to the calculator that's instant-on?

> Quote:
>
> And then there's the 'marketing slot' issue. Even if an HP15C could be produced FOR FREE, it'd still cost at least $25ish to get on the shelf and that would be profoundly difficult since it would be an 'oddball' (RPN, etc.)

That's irrelevant. The high-end HP calculator market was always kind of a niche market, and would still be today if these little machines were put back into production. Even in their heyday, the ones that were even in a store with a storefront were locked up in glass display cases. I bought most (maybe all) of my hand-held HP equipment through mail order.

As more than one person said however, there does seem to be a strong correlation to a loss in the kind of reasoning it takes to be a good programmer or engineer. The electronics industry magazines have a constant debate over the declining engineering-school enrollment and graduations in the U.S., and whether or not there really is a shortage of engineers, or will be soon. The 'shortage' part of the debate does not look like it will have any clear conclusions anytime soon.

Awww, gee, shucks. I'm crushed. You mean "Mary" isn't what she said she is? Dang!

Well, that's alright. I'm actually the ghost of Dave Packard come to haunt today's HP. I hang out here because a lot of the old *spirit remains*. (mwahahaha) If they don't give every one of you a 15CXS++, I'll make 'em pay!

Re: Of course, you guys are assuming Mary is really from HP

*Message #9 Posted by **Howard Owen** on 25 Aug 2005, 9:57 p.m.,*
in response to message #5 by John

And, the identity of our Mary aside, what do you think the odds are that there is *someone* in advertising at HP named Mary?

```
(ring) (ring)

Mary    Hello?
Dave P. Mary?
Mary    Yes, who's this?
Dave P. I'm the ghost of.. never mind about that.. do you know of
        any  other women named "Mary" in advertising at HP?
Mary    Any other ..
Dave P. Because I know YOU wouldn't hang out at a message board
        populated with old ..
Mary    Who IS this?
Dave    I said never mind about that ..
Mary   *click*
Dave P. Dang!
```

As you can see, it doesn't prove anything. 8)

Re: Of course, you guys are assuming Mary is really from HP

Why does 17BII maintain its value?

*Message #1 Posted by **Frank** on 25 Aug 2005, 1:04 p.m.*

I am auctioning a HP 17BII I purchased 14 years ago. The bidding is now reaching the original price I paid. OK, Present Value it is worth less at the same $ value. But, in this day & age it seem unusual that any digital device is not out-moded and obsolete in far less that a decade. I think I had a 5" floppydrive on my PC at the time and my seperate modem just had reached 1200 baud.

To what does this particular model owe it's longivity?

Re: Why does 17BII maintain its value?

*Message #2 Posted by **Gene** on 25 Aug 2005, 1:14 p.m.,*
in response to message #1 by Frank

Well,

1) business calculators have not evolved much in the last 10-15 years. There aren't that many models out there doing that much more than they did back then.

2) the 17bII was one of the old pioneer models and some people today still like the key material and the general build/style of the calculator more than they do the current offerings.

I think a combination of the two explains it.

Gene

Re: Why does 17BII maintain its value?

*Message #3 Posted by **bill platt** on 25 Aug 2005, 1:21 p.m.,*
in response to message #1 by Frank

The 17bii is worth its price primarily because it is a good device that is not outmoded. Another aspect: it is not a commodity, whereas a hard drive or a modem is. The 17bii is a unique patented finished product with capabilities and qualtiy that simply have not been surpassed. Yes, a computer is more powerful, but it is not compact!

Features that keep the 17bii value going:

1. The equation solving system. A really innovative way to do things. I was floored when I first saw it on a finance friend's calculator a bout 2 years ago. I vowed right then, "I've got to have one of these!"

2. The mechanical design. HP, not TI. That is worth something---perhaps more than any single other aspect, it is the physical nature of the HP that gives them a minimum floor value. Even the 20s manages to collect on this aspect.

3. RPN as well as algebraic.

4. A complete set of business functions in a well organized format.

5. Excellent documentation.

My thoughts.

Regards,

Bill

Re: Why does 17BII maintain its value?

*Message #4 Posted by **Ron Ross** on 25 Aug 2005, 1:35 p.m.,*
in response to message #1 by Frank

Because some Hp zealot DIMWIT thinks its worth it!

You can still buy an Hp17BII+ from Hp for $9-, oh, wait a minute, thats what the new Hp is worth, it still costs $99 retail. That old POS of yours was made with out of date, overly costly production methods that have since been replaced with newer, lower cost production methods (and it PROUDLY shows!).

Re: Why does 17BII maintain its value?

*Message #5 Posted by **Frank Knight** on 25 Aug 2005, 7:38 p.m.,*
in response to message #1 by Frank

Hi Frank, this is yet another Frank that also happens to have a as-new 17BII at ebay auction right now (small world!) and also sold one last week for only around 60$ including manual as I am having to substantially reduce my collection. Though it is currently about 1/2 the original MSRP, these are certainly quality machines compared to tadays offerings. I'm hoping HP will learn from the recent 49G+ keyboard fiasco, but I guess I should be pleased they are even still in the calculator business as that was uncertain just a couple of years ago and perhaps today as well. BTW Hello Gene, send me a note sometime I've misplaced your email address!

17BII+ Carrying Case

*Message #1 Posted by **Volguus Zildrohar** on 24 Aug 2005, 8:10 p.m.*

The 17BII+ case is HUGE. Does anyone know of any supplier of 3rd party cases?

Thanks.

Re: 17BII+ Carrying Case

*Message #2 Posted by **John L. Shelton** on 24 Aug 2005, 8:24 p.m.,*
in response to message #1 by Volguus Zildrohar

Are you talking about the "pouch" included from the factory? Could you post a picture of it, or at least dimensions as compared with the calculator dimensions?

The original hard-leather field cases for the HP-35 and successors were awfully large, too, but they did a good job of protecting the valuable units.

Re: 17BII+ Carrying Case

*Message #3 Posted by **Volguus Zildrohar** on 24 Aug 2005, 10:17 p.m.,*
in response to message #2 by John L. Shelton

Sorry - I didn't measure it before I returned it. I do recall that it was much bigger than the calculator itself. Very bulky.

HP Calc. Promo

*Message #1 Posted by **Mary** on 24 Aug 2005, 4:09 p.m.*

Hello, I work on advertising for HP and we are currently in the process of preparing for the 25th anniversary of the 12C calculator model-HP's longest and best-selling calculator. So I have two questions for all of you:

1) What do you do for a living and for what purpose do you use your calculators? 2) What sort of promotion would you like to see involving the 12c model?

thank you, Mary

Re: HP Calc. Promo

*Message #2 Posted by **Ron Ross** on 24 Aug 2005, 4:22 p.m.,*
in response to message #1 by Mary

I'd love to see a 12c with a 15c logo and layout. Toss in the functionality of the 15c and I will buy 3 NOW! Should be easy as the 12c and 15c are basically the same unit. GO FOR IT!!! And call it a 25 year aniversary model! I suspect I won't be the only one suggesting this.

Re: HP Calc. Promo

*Message #3 Posted by **Klaus** on 25 Aug 2005, 6:08 a.m.,*
in response to message #2 by Ron Ross

For me a 12C with a flashable firmware would be fine. By definition a HP user is a smart guy, so it won't take long until 15c functionality is available.

Re: HP Calc. Promo

*Message #4 Posted by **Howard Owen** on 24 Aug 2005, 4:27 p.m.,*
in response to message #1 by Mary

And I suspect I won't be the *last* one to emphatically ditto Ron's plea for a reissue of the 15C. Only, give it more RAM.

Oh, and I'd "only" buy two. 8) (Smiley, but that's no joke.)

in response to message #1 by Mary

I am an electronics engineer in the telecomms industry.
I use a 12C and an 11C.
Although the internal technology available for calculators has progressed enormously, the ergonomic design has not.
I think a new Voyager calculator with the functionality of the 15C and 11C, much bigger memory, clear dot matrix display and a USB2 mini interface would be perfect. BUT please keep the ergomomics of the original Voyagers, meaning the lovely feel, looks and tactile keys; the 12c platinum was a brave attemp but suffers from loss of clarity, cheaper looks, slightly rattly keys, less clear display and software bugs!!
So have another go at it after trying out the original 12C and 15C yourself.

. . . I think you may have the wrong number . . .

*Message #7 Posted by **Paul Brogger** on 24 Aug 2005, 6:09 p.m.,*
in response to message #1 by Mary

This is the MoHPC FORUM -- where curmudgeonly old calculator users gather to reminisce and sing praises of calculator models no longer manufactured, and of days long gone. ;^)

I suspect you're not asking about a new piece of *engineering* so much as ideas for using the advertising budget to leverage the successes of previous engineering efforts into increased sales of current models. (If I may, "the shoulders of giants as meal ticket", so to speak.) Right?

I'm a programmer, and use calculators to remember the good old days.

I suggest you craft an advertising campaign centered on a not-altogether-specious claim that the 12C was "the original PDA" or some such. You'll be able to utilize contemporary jargon to tie a widely-used piece of current technology back to a 25-year-old design. And offer the 12CP through Sharper Image and in the airlines' seat-back catalogs. Maybe you'll see enough of a bump in nostalgia-induced sales to make it all worthwhile.

Good luck!

Re: . . . I think you may have the wrong number . . .

Re: HP Calc. Promo

*Message #9 Posted by **bill platt** on 24 Aug 2005, 6:21 p.m.,*
in response to message #1 by Mary

I don't really like the 12c. I love the 11c and 15c. I am a designer and engineer. I still use htese old machines.

The 11c is very handy for repetitive little things--make a little routine and put it in USER mode and you can do one-button functions for special functions that you describe....

Why don't I like the 12c? Because I started on an 11c! The 12c has no backspace--only a clear x. How ridiculous! Its programming is even more stupid. It was OK in 1982 when RAM was expensive and the GUI was only an experiment at Xerox.

The 12c platinum did not improve these two critcally important basic elements. So why buy it?

The 17bii is so much more powerful and useful than the 12c--if you have never used a 12c. the 12c must have been good enough for the finance guys, though!

Re: HP Calc. Promo

*Message #10 Posted by **Guest** on 24 Aug 2005, 7:16 p.m.,*
in response to message #1 by Mary

If HP released any calculator that looked and felt as nice as the 12c, regardless of the niche it was for, everyone here would be happy. Any advertising for the 12c should be in the same spirit as the calculator itself: getting the job done right the first time.

P.S. I'm a student, and I'm frustrated by the fact that the 12c is worthless for physics homework.

That's not so absurd. Guest might be, for instance, a business School student who bought an HP-12C because was told it was one of the best financial calculators around. Probably it is, but unfortunately it lacks some basic scientific functions a Business student may need in the first college year. That is why I think a new 12C should include a basic set of scientific functions, not because they have real business application but because they may occasionally be needed. Some engineers, we have examples here, use a 12C and have to switch to a scientific calculator whenever a simple calculation involving trigometry is needed. By the time the HP-12C was released, it made a lot of sense not including scientific functions in the 12C because memory was very expensive back then. All available memory space had to be reserved for the new advanced financial functions. All is needed today are a few extra bytes of ROM and a little R&D, both not expensive.

business calculators & scientific functions

*Message #13 Posted by **Gene** on 25 Aug 2005, 10:33 a.m.,*

in response to message #12 by Gerson W. Barbosa

Gene here:

Apparently, Texas Instruments and even Casio agree that financial calculators should have basic scientific functions built in. Consider these models which are about $30 here in the US:

TI BAII Plus: Trig functions in radians/degrees, hyperbolic trig functions!, random number generator!, combinations and permutations built-in, ability to set algebraic hierarchy (1+2x3=7).

Casio FC-200V: Trig functions in radians/degrees, hyperbolic trig functions!, combinations and permutations built-in, ability to set algebraic hierarchy (1+2x3=7).

All for $30.

Sadly, this is why the university at which I teach has adopted the TI BAII Plus as the calculator for all business students. :-(

Gene ==========

That's the point! And once they get used to TI, why should they switch to HP?

Apparently HP is not worried in losing the calculator segment market share. Or they just prefer the much more profitable ink cartridge market: here three 57 cost the same as a 12C Platinum (about USD 160.00)!

Regards,

Gerson

(saving to buy a 56 and a 57 next month :-).

Hi,

I'm a financial director.

Why won't you make a 17C, likewise the 27 and 27S that were swiss knife do-it-all calculators, with the specs of a 12C and a 11C for example (or 15C if possible ?)

Or you could offer one spcial dedicated 25th anniversary 12C to any individual proving he owns 10+ HP calcs...

Well...I'm sure these are not feasible... The platinum is already an improvemnt on itself. Waht can you add more ? If you really want to wow this community, at least make sure it's qualitatively equivalent to the older 12C's !

Thanks

Re: HP Calc. Promo

*Message #17 Posted by **John L. Shelton** on 25 Aug 2005, 1:43 a.m.,*
in response to message #1 by Mary

I'm a business+technical consultant, an employee of a large company. I rarely use a calculator now, but have been a moderate user in the past. Typically, my business-calculation problems are better served by using spreadsheets. I have in the past used the -12C and other financial calculators when making mortgage comparisons.

For many years, people bought the -12C because it was the best tool out there, and they saw it being used by those whose judgment they valued. At the time, HP calculators had a reputation, deserved, of being better built, easier to use, and featureful. A "promotion" does not change the equation any - to succeed, you must still have the same attributes, or perhaps lead people to believe you do. 25 years is remarkably long to live on the reputation of a technology product.

I suspect many here would agree that the -12C (current incarnation) no longer excels in build-quality, ease-of-

use, and features. You have other models that compete in some ways, and overall quality has dropped in comparison to that of other companies.

How about building a calculator for the next 25 years, one that honors what the -12C offered for so long? Give us something to be proud of today. Heck, even just update the current model, with a return to the tip-top quality keyboard and add a backlit display. But HP can do better. And HP hasn't lost the business market the way it lost the education market. Consider addressing the business calculator market in an innovative way, such as making the pocket calculator a true extension of other devices, via downloading or networking.

Perhaps, though, dedicated calculators are a dead end. Perhaps the fitting tribute to the -12C is an HP-branded emulator running on Windows desktops and hand-held PDAs. *sigh*

Re: HP Calc. Promo

*Message #18 Posted by **Palmer O. Hanson, Jr.** on 25 Aug 2005, 2:33 a.m.,*
in response to message #1 by Mary

I am a retired aerospace engineer. I collect old hand-held calculators including business-oriented models. My collection includes several HP-80's, an HP-22, an HP-38C, several HP-12C's, several HP-10B's and an HP-17BII.

Suggestions:

1. Issue a commemorative model with an added logo mentioning the 25th anniversary. An example from my collection is an HP-28S with an added logo commemorating "100 Years American Mathematics 1888-1988". You will sell some of these to collectors.

2. Search for the oldest (i.e., the earliest serial numbers) HP-12C's still in use. Publish anecdotes concerning these oldest devices in advertisements.

3. Search for user programs and tips for the HP-12C. You will find some programs here in the Forum. Publish a collection of the best programs in a companion book to the manual. An example of such a book which sold well is the "HP-15C Advanced Functions Handbook."

4. Publish a commemorative issue of the HP-12C User's Manual.

Re: HP Calc. Promo

*Message #19 Posted by **GE** on 25 Aug 2005, 4:02 a.m.,*
in response to message #18 by Palmer O. Hanson, Jr.

It would be nice to read the story of users of the 12C. An anniversary model of the 12C (NOT the 12CP), better built (say a price target around twice the current price for the stock 12C). Also, you could reissue some of the original documentation or ardvertising material, stressing what has changed or, more interesting, what has not. How about an offer to repair old machines gone bad ? Of course a reissue of the 15C would be the best news for HP zealots out there...

Re: HP Calc. Promo

*Message #20 Posted by **Mike (Stgt)** on 25 Aug 2005, 9:57 a.m.,*
in response to message #1 by Mary

I suppose the HP-12C was so successful because only few tried to program on it and the vast majority just used it as 4-banger. An anniversary gadget I'd like would be a calculating World Band Receiver Travel Clock Radio, or a portable 20GB USB-disk (40?...60Gig??), or a full featured PODcast device. What about all in

one? Of cause in the case of the 12C (Gold! -- not Platinum) and the functionality of a 11C or 10C. (Who realy needs a 15C today, sorry!)

Ciao.....Mike

Re: HP Calc. Promo

*Message #21 Posted by **Ron Ross** on 25 Aug 2005, 10:48 a.m.,*
in response to message #20 by Mike (Stgt)

Considering that the cost of manufacturing any unit besides the Hp12c will be a fixed cost, why make anything less?

ie You need a car, and a ford pinto and a Porche are both a $1000 dollars, your going to buy a ford pinto?

The basic Hp15c has matrix features, a solver and a built in numerical integration feature, all of which are absent on the Hp11c. As an EE, I have used all of the above and wouldn't bother to buy if it had less (oh, ok, I would buy ONE).

I like the idea of just a Flashable ROM as noted by Klaus, more RAM (2-8K or hell, 32K) and a USB port to upgrade the ROM. That would allow us to customize it to any use. Want an old 15c, dump a 15c emulator into it. Want more (or less), modify to suit as it would be flexible enough to do what you wanted. Release an SDK to modify as you need. No, it still couldn't compete with an Hp41 but it may just be more functional than an Hp42s if given an I/O port (I didn't say better, as it wouldn't have a menu system if it were given an Hp12c LCD or keyboard layout).

*Message #22 Posted by **Karl-Ludwig Butte** on 25 Aug 2005, 10:18 a.m.,*
in response to message #1 by Mary

Hello Mary,

may I add the suggestion not to forget the German market. I haven't seen any HP calculator advertising in Germany for years! Go to a big city and try to buy an HP calculator somewhere: It will at least be difficult. Only some Online-Shops may still have them.

So in my opinion a 25th anniversary campaign should include: - the comeback of the proverbial HP-Quality of the 70's and 80's - something like the HP-67/97/41-Users-Library-Europe - Availability of the calculators at local HP-Dealers - not only the 12c but all the other calculators HP has at the moment - a special give-away-offer: e.g. "Buy a 12c now and get xx free". xx could be e.g. a booklet "The history of HP calculators" or a 2006-HP-Calculator-calendar - the comeback of a monthly periodical like e.g. "HP Journal" - a the "Design-that-calculator"-Contest-Offer here in Germany, too, and please not only for highschool-/unversity-Students but for all

I love the idea of an anniversary campaign and appreciate it very much that HP want to take the opportunity to do it. Maybe you can initiate similar campaigns for other models (especially my favourite 41C/CV/CX with the Interface-Loop). This would give HP the chance to get back to #1-Calculator-Manufacturer-Status like in the good old days and to resurrect the loyal fan base it once had.

And, as I said at the beginning: Don't forget the German market!

I'm an HP-User since 1976 working in the software-technical consultants business and still use one of my HP's nearly every day. If you have any questions or if I can be of help please don't hesitate to contact me.

*Message #23 Posted by **Katie Wasserman** on 25 Aug 2005, 11:02 a.m.,*
in response to message #1 by Mary

Mary,

Although I'm an active member of this forum and a collector of old calculators, including all of HP's -- in real life I'm a computer consultant working with wall street firms.

What I see at virtually all my clients is that each person is given an HP 12C on the day that they start work. It's a standard desk accessory and as indispensable as the stapler, tape dispenser and pen. I've tried to introduce the 17BII to them and other models over the years but they don't like it. They use almost all of the built-in functions on the 12C and typically put in a small program that helps in whatever their primary job function is (e.g., "linking" -- i.e., compounding interest rates).

These are no doubt your core clientele for the 12C and the reason why you're still making it. Frankly I don't think that any sort of promotion will make much difference to them, they just like it as is. They didn't buy the HP 12c platinum even though I thought the flashiness of it would appeal to them.

As for me personally, I'm with many of the other people here and would love to see more scientific functionality and programmability on a 25 year anniversary edition. Although I sometimes use a 12C (so that I can match what my clients are doing) I more often use a 32SII (I like the programming on it).

Thanks for asking,

Katie

Re: HP Calc. Promo

*Message #24 Posted by **unspellable** on 25 Aug 2005, 12:31 p.m.,*
in response to message #23 by Katie Wasserman

On the technical side I think it would be a good idea to make a calculator with FLASH ROM, a programming port, and interchangable keyboard overlay. This would allow one model to take the place of what used to be several models simply by loading an appropriate operating system.

On the promotional side, HP needs to get back into the stores. It's difficult to even find an HP these days. It looks like TI has taken over, not so much through TI's efforts, as because of HP appearing to have abandoned the market.

Additional how to manuals would be a good promotional idea. There used to be a number of these for the 28 and 48 series, some of the ones for the 28 series were published by HP. For a promotion, offer these as an extra in the package, or as a form of rebate.

A 25th anniversery logo on the calculator might help, can't hurt.

*Message #26 Posted by **Evan (San Jose, California)** on 26 Aug 2005, 12:40 a.m.,*
in response to message #1 by Mary

Hi Mary, I sure hope you are for real.

1) What do you do for a living and for what purpose do you use your calculators

Alas, I used my HP's a lot in college and sporadically in my career, but am probably best labeled 'a collector' today. I'm hoping that collectors are at least in some small part of your target market for an anniversary model.

2) What sort of promotion would you like to see involving the 12c model

Most of my suggestions have already been stated by others, but…

- I think it would be interesting to find some of the most significant decisions made with a 12c and the people whom made them. I suspect many important decisions were made by well recognized people on the 12c. I'll bet many 'famous' people carry one with them always.
- I would like to see the anniversary model at least cosmetically resemble the original with a special logo like other limited edition models. The additional logo should be something more substantial then additional silk screened art. (Yes, I too would love for the old build quality components and could enjoy some of the enhancement mentioned by others, but I think that may be out side the scope of your request)
- I really like Chris Woodhouse's idea of a nice leather case. It would be really nice if it were available separately and should have the HP logo on it.

Personally I like the idea of honoring the simple, powerful, and elegant solution the original design offered. I really appreciate you asking this community, and that HP would choose to commemorate this calculator.

Yes, this could be a good test for HP as to the size of the potential market we collectors represent! If it were nice enough, I would probably buy three; one for each Voyager calc I own.

New Clonix/NoVRAM site

*Message #1 Posted by **Diego Diaz** on 24 Aug 2005, 3:38 p.m.*

Hi all,

I've finally got http://www.clonix41.org (no banners) ;-)

I'll set it up with info on my projects Clonix, NoVRAM and the like.

BTW It seems like some interest has shown up lately on Forth-41, so I've also placed "Forth-41.HEX" file there.

Enjoy.

Best.

Re: New Clonix/NoVRAM site

*Message #2 Posted by **Meindert Kuipers** on 25 Aug 2005, 2:51 a.m.,*
in response to message #1 by Diego Diaz

Diego,

Congratulations on your new site! (and thanks for the link)

Meindert

in response to message #2 by Meindert Kuipers

As I wrote you in the mail today: I´m happy to see you have an own domain and no longer this poor provider (the server was very, very slow)... Also: Thanks for the link to my website.

Re: New Clonix/NoVRAM site

*Message #4 Posted by **Diego Diaz** on 25 Aug 2005, 3:23 p.m.,*
in response to message #3 by Matthias Wehrli

Hi there,

Thank you both for your kind words. Yes Matthias, it's an other provider with a much more serious hosting policy.

Not much for now on my site but links to your sites (and the others) are a *must* for a pretended HP-41 devoted site ;-))

Time will tell if I can make it grow up as I'd like...

Cheers.

Re: New Clonix/NoVRAM site

*Message #5 Posted by **don wallace** on 25 Aug 2005, 7:31 p.m.,*
in response to message #4 by Diego Diaz

Hi Diego.

Congratulations on getting your new site running. Congratulations too on getting the noVRAM code so polished. That would have really been an amazing effort. (My head is spinning at the thought...)

Thanks for putting up the HEX code for the FORTH system for the 41; I am looking forward to seeing what the firmware will do, though the idea of an integer "write-only" language running on a BCD floating point oriented platform is to me a little strange ;-) I wonder if it possible to add some extensions? Maybe a fun challenge for those in the community who can write such software...

Where did the forth cde come from, anyone? Who owns the firmware rights?

Don Wallace

HP-34C Power Circuit

*Message #1 Posted by **Julio Moreira** on 24 Aug 2005, 12:09 p.m.*

Hi to all.

Does anyone have a schematic of the flex circuit (ribbon) of the inside power supply of HP-34C ?

I have one HP-34C where the flex circuit is dead and I whish to make another one.

Thanks,

Julio César

Re: HP-34C Power Circuit

*Message #2 Posted by **Tony Duell** on 24 Aug 2005, 3:51 p.m.,*
in response to message #1 by Julio Moreira

Yes, it should be on the HPCC schematics CD-ROM. That disk contains 'representative' Spice schematics, I think it's the 32E and 33C. But all -E models are much the same as the first, all -C models much the same as the second -- in fact the main difference between -E and -C models _is_ the power converter circuit.

Re: HP-34C Power Circuit

*Message #3 Posted by **Julio Moreira** on 24 Aug 2005, 4:02 p.m.,*

HP 33s displayed "memory clear"

*Message #1 Posted by **KC** on 24 Aug 2005, 5:49 a.m.*

HP33s displayed a flashing "Memory Clear" message during my normal calculation. Doesn't respond to any keystoke including "C-e^x-Summation" reset. Take batteries out, put back in. The calculator worked again, though everything in memory were lost. Pass the self-test after another reset. Now the question: the low battery annunicator weren't on during my normal operation, though sometimes when I ran some long program it did show up. Is a just a matter of low power batteries in which the calculator failed to warn me, or what? Any idea?

KC

Anyone know what became of the NEWT project?

*Message #1 Posted by **don wallace** on 24 Aug 2005, 4:57 a.m.*

Hi all. I am wondering if the NEWT (souped up very fast 41 coconut compatible custom processor) ever got built?

I wonder if it is worth reviving?

Anyone with documents (other than the 134 page PDF document I have) could write to me as I may have a crack at it if it can be done.

Rather long term project though...

Thanks,

Don Wallace donwallace63@yahoo.com.au

Re: Anyone know what became of the NEWT project?

*Message #2 Posted by **Monte Dalrymple** on 24 Aug 2005, 10:54 a.m.,*
in response to message #1 by don wallace

There is some more information at http://www.systemyde.com/hp41

I am about halfway through the process of verifying the instruction set. I haven't looked at the turbo operation yet. The design fits in the target FPGA.

All of the voltage translation circuitry is designed, but I have a couple more things to do in the power supply, and I need to add an external latch to detect the "memory clear" state because the MMU information is held in RAM and won't be valid when starting from battery insertion.

I haven't started the board design yet because I need to learn Eagle first.

Re: Anyone know what became of the NEWT project?

*Message #4 Posted by **Monte Dalrymple** on 24 Aug 2005, 11:31 a.m.,*
in response to message #3 by Meindert Kuipers

Thanks for the Eagle offer. I need to learn it for other projects too, though. But if I get stuck I may ask a question or two.

I am using an Actel Pro-ASIC-Plus, specifically the APA075 in a 144 pin TQFP package, to hold the design.

Re: Anyone know what became of the NEWT project?

*Message #5 Posted by **Eric Smith** on 24 Aug 2005, 6:29 p.m.,*
in response to message #4 by Monte Dalrymple

Aside from not needing a separate configuration memory, was your choice influenced by any other notable advantages of the Actel parts over those of other vendors (e.g., Xilinx, Altera)?

Re: Anyone know what became of the NEWT project?

*Message #6 Posted by **Monte Dalrymple** on 24 Aug 2005, 8:24 p.m.,*
in response to message #5 by Eric Smith

The Actel parts are flash-based and are live at power-up. This allows me to exactly replicate the power-up behavior of the original design. SRAM-based FPGAs have huge power-on current requirements. You're probably thinking "configure it once and leave it powered, with the clock turned off". Unfortunately, the SRAM parts that are large enough to hold the design have quiescent current requirements of 1-5mA. This is going to eat batteries quickly. With the flash-based parts I will actually power-down the FPGA and include discrete logic to do the power-on detect. Of course, the design is technology-independent, so if someone wants to implement it in another technology that will certainly be possible (intellectual property issues aside).

Monte

The recent ones (e.g., Xilinx Spartan 3) don't.

> Quote:
>
> With the flash-based parts I will actually power-down the FPGA and include discrete logic to do the power-on detect.

Makes sense. The Panasonic/Quasar HHC (Hand Held Computer) from 1981 did that. It used an NMOS 6502, because there wasn't yet a CMOS part. It ran a Forth-like language called "SNAP", but I've never found the technical documentation on it.

I imagine that you're already taking care to make sure that the I/O pins of the FPGA are also open or grounded when power is removed. Otherwise, any inputs that are driven high by external circuitry (buffers, etc.) will cause substantial leakage current as the ESD protection clamp diodes effectively power the chip from the I/O pins.

Re: Anyone know what became of the NEWT project?

*Message #10 Posted by **Monte Dalrymple** on 25 Aug 2005, 3:23 p.m.,*
in response to message #9 by Eric Smith

Yes, I have to create a virtual "pad ring" to translate between the 3.3V FPGA signals and the 6V Nut-compatible signals. During power-down all FPGA inputs are clamped Low and all FPGA outputs have high-impedance pull-downs to provide a DC path to ground outside the FPGA itself.
I also have to be careful during operation to keep all FPGA inputs within the 3.3V FPGA supply rail.
The "pad ring" is why I have to learn the schematic entry/pcb layout tools, because it's a small pile of SMT devices. If the board only needed the FPGA and memories I could just do a hand- layout board.

Re: Anyone know what became of the NEWT project?

*Message #11 Posted by **Meindert Kuipers** on 25 Aug 2005, 4:17 p.m.,*
in response to message #10 by Monte Dalrymple

This looks like it will really work. I have done the same with the MLDL2000. I switch off the 3.3V power regulator when the NUT CPU is not running to save

battery. I would strongly recommend against hand layout. Eagle is free for non-commercial (two layer only) use and not very difficult. It will generate all data required for reliable production, and believe me, you do not want to handsolder TQFP1444 or TSOP devices! My MLDL2000 is professionally produced by an assembly house and is fully SMD, and without a CAD tool this would not have been possible.

> and believe me, you do not want to handsolder TQFP1444 or TSOP devices!

Actually they're pretty easy, unlike soldering the chip resistors and capacitors. Instead of trying to solder one lead at a time, you just put flux down the whole area, tack-solder a couple of opposite corners to hold the IC in place while you do the rest, and go down the rows soldering with the soldering iron tip as if you meant to make one continuous solder bridge. Then hold the board up vertically and go down the row again, and all the excess and bridging comes off on the soldering iron. It's ok if the iron tip is wide enough to cover several pins at once. It's rather quick to get a job that looks like it was done by machine. When you're done with the whole board, you wash the flux off.

Re: Anyone know what became of the NEWT project?

*Message #13 Posted by **Eric Smith** on 25 Aug 2005, 5:07 p.m.,*
in response to message #10 by Monte Dalrymple

What are you using for level shifters? In my own designs, I usually use 74LVC parts as 5V CMOS to 3.3V CMOS buffers, and 74HCT or 74ACT as 3.3V CMOS to 5V CMOS buffers. For bidirectional signals there are some nice TI parts whose numbers I don't recall.

But there don't seem to be many parts suitable for level-shifting signals that can exceed 6V. The 74LVC parts are only rated for operation with inputs up to 5.5V. It appears that some vendors 74HC4050 parts can tolerate 13V inputs or more, but I haven't found much for low-to-high shifting.

I suppose some of the old CD4504B, CD40109B, and HEF4104B level shifters might be suitable for a 41C. They're really slow, but so is the 41C bus. These really old parts tend not to be available in parts smaller than SO, though.

Best regards, Eric

Re: Anyone know what became of the NEWT project?

*Message #14 Posted by **Monte Dalrymple** on 25 Aug 2005, 5:47 p.m.,*
in response to message #13 by Eric Smith

The output level shifters use individual n-channel and p-channel MOSFETs. The p-fet pull-up needs level-shifted drive, which uses an n-fet and resistor to 6V to make an inverter. The FPGA outputs true and complement data to simplify the external circuitry. This approach allows me to build the necessary logic in this "pad ring". For example, the SYNC output passes DPWO when the CPU is off. For the inputs, I was just going to use a resistive divider feeding a CMOS gate. The gate is to hold the FPGA inputs Low without loading the "real" 41C bus signals. I'll obviously need to breadboard this before committing to a pcb.

Monte

Re: Anyone know what became of the NEWT project?

*Message #15 Posted by **don wallace** on 31 Aug 2005, 5:34 p.m.,*
in response to message #14 by Monte Dalrymple

Hi all. Hi Monte.

What is the expected size and cost of the finished unit? Are you going to be able to retrofit it into a 41CV? Am I missing the point entirely? What sort of current draw are you looking at?

Very interesting design project...

Don W

Re: Anyone know what became of the NEWT project?

*Message #16 Posted by **Monte Dalrymple** on 31 Aug 2005, 6:55 p.m.,*
in response to message #15 by don wallace

My intention has always been to build a drop-in replacement for the CPU board in a fullnut 41. I am doing everything I can, while keeping the design small enough to fit in the target FPGA, to minimize the current drain. But until I have a breadboard running it's hard to guess what it will be.

I haven't done a cost analysis yet, and it obviously is strongly dependent on volume. My target was $250, but it's too early to tell. I didn't go into this project to become rich. I mostly did it to dispell the myth that "it's too hard to translate the obsolete calculator CPU technology to a more modern implementation".

But what is a brain transplant for a 41 worth, bearing in mind that the transplant will hold nearly every 41 module ever made internally, have full x-memory, and RAM memory for a MLDL? Not to mention that it will run up to 50 times faster than the original 41? And are there more than three people on the planet interested in such a beast? I don't know.

Monte

Re: Anyone know what became of the NEWT project?

*Message #17 Posted by **don wallace** on 1 Sept 2005, 4:34 a.m.,*
in response to message #16 by Monte Dalrymple

Sounds really cool, Monte...

I kinda figured you were doing that. But I just had to ask. Well when you get it finished I want one...!

One question, though: Why did yu choose a clock rate of 50x, not 64x? You must have your reasons and I imagine they are very good ones.

Amazing project...

Don W

Re: Anyone know what became of the NEWT project?

*Message #18 Posted by **Monte Dalrymple** on 1 Sept 2005, 10:29 a.m.,*
in response to message #17 by don wallace

The choice of 50x was fairly arbitrary, but I wanted something that wouldn't push the capability of the FPGA. Since I had never used this family before I set an arbitrary limit of 20MHz. Fifty times the original 41 operating frequency of 360KHz came out to a nice 18MHz. 64x would have been 23MHz.

Of course, since the machine uses BCD it seems more poetic to use something other than a power-of-2...

Monte

*Message #20 Posted by **Garth Wilson** on 1 Sept 2005, 6:15 a.m.,*
in response to message #13 by Eric Smith

If you would even think of the slow 4000-series CMOS for level-shifting, how about using comparators like the LM339? Then you'd have static protection too, since they're not CMOS. You can set your input thresholds precisely, at any voltage you want, and the outputs can be pulled up a lot higher than 6V. (A brand new set of 4 alkaline cells will give you about 6.4V anyway, not just 6V.) I realize CMOS' power requirements when idle only consist of the microamp leakage current, but the comparators might offer a good solution depending on what you do with them and their pull-up resistor power when the calculator is asleep. You wouldn't need very many anyway, would you? I haven't studied the 41's innards to know if this is too off-the-wall, but I've used the LM339 for many level-translation jobs, including to continuously variable voltages instead

of just set voltages like you'd have going from 3V to 5V and vice-versa.

Re: Anyone know what became of the NEWT project?

*Message #21 Posted by **don wallace** on 1 Sept 2005, 7:35 a.m.,*
in response to message #20 by Garth Wilson

Hi all.

Well, Garth is right on with his tips for soldering smt. I scrounge smt parts from old motherboards and have done quite a bit of smt board component level repair...

On the level shifting question, yeah thats tricky but I think enhancement mode fets might be the best bet if you can get parts with the right on gate threshold? failing that yeah your standard depletion mde fets driven with inverted signals is the best bet I imagine Monte.

The 339 is a really nice comparator. But they do draw about 200 uA per comp I think. I wonder if there is a real low power or programmable (adjustable chip Iset) quad or octal part out there somewhere?

Maybe a very low power cmos opamp with hysteresis would be fast enough and have programmable Iset (I am thinking of some very old Intersil cmos linear parts but could bet they are gonna be way too slow. Maybe there is something more modern in the same vein?)

I have not thought this through at all but maybe you might even be able to use a BIPOLAR transistor in common base mode.

I can't draw the ascii art in this form...

But you set the base at a threshold plus (about) 0.6 volts. You pull down via a low value resistor on the emitter (of npn device) and the collector follows it down, but level shifted. Effectively open collector output ;-) Plus the collector comes right down to within the saturation voltage of where the emitter is dragged... Current gain is about 1.00 ;-)

Probably would not work for many of the signals but maybe worth thinking laterally like that anyway. Fast too. Maybe for one or two signals you can just shed volts by using a diode or two? IR led? Just a thought... Low parts count anyway.

Don W

part out there somewhere?

The LP339 takes less than 1/3 the power supply current of the LM339, but it's quite a bit slower too. But for logic-level-shifting, the open-collector arrangement has a big advantage over an op-amp-type arrangement. The down side in battery-powered applications is the power requirement.

I think the point gifron was trying to make is that there are so many ebay items discussed on this forum, that coming here is just like doing a search on ebay.

Re: No need to search eBay anymore...

*Message #4 Posted by **I, Claudius** on 24 Aug 2005, 8:32 a.m.,*
in response to message #3 by Ron

The curator Dave Hicks wisely included an "Ads Without Auctions" a while back for those wanting to buy/sell without the hustle of eBay. But, how does one get rid of any reference to eBay in the forum itself without tromping on free speech, or possibly a useful discussion? When the first posts regarding Cobubba came, I found them informative and entertaining as well. As many of us here buy/sell old stock or used calculators, the primary market, unfortunately, is eBay. Like it or not, eBay or some form of auction will probably be around forever now regarding the machines we love.

Nothing lasts for ever ... I remember the company that was selling VisiCalc (and all the Visi apps) .. and then Lotus that sold Lotus 123 ... I thought these companies would last forever.

While eBay has a lock on electronic auctions it has a few major weaknesses. The one that comes to mind is that it does not control or manage payments (like Amazon does). If members were forced to pay eBay directly then fraud would be less.

Soooo .. when a new auction company comes along that has addressed eBay's weaknesses .... eBay will be another Lotus ...

I think it was the french writer Molliere who said "The better is the enemy of the good!". Maybe Molliere was a die hard VisiCalc power user who was royally ticked to see Lotus stick it to Creative Arts.

How do you figure that? First of all eBay owns paypal which is the main way people pay for auctions. Second the fraud is perpetrated by sellers not buyers so what difference does it make how the money is transferred?

Chris W

Re: No need to search eBay anymore...

*Message #7 Posted by **Howard Owen** on 24 Aug 2005, 1:45 p.m.,*
in response to message #6 by Chris Woodhouse

The fraud you are aware of comes from sellers. But if you read the seller's forums, they talk about cases of buyer fraud all the time.

Perspective is key.

But I second the notion that eBay discussions, while they shouldn't be banned, ought not dominate this forum. Accordingly, I vow to try *really, really hard* to avoid mentioning Co-whozzits or likewise. On the other hand, marvelling at a $220 dollar price for an HP-97 manual does have relevance for a collector who might own one of those manuals, or be in the market for one.

Re: No need to search eBay anymore...

*Message #8 Posted by **Namir** on 24 Aug 2005, 5:23 p.m.,*
in response to message #6 by Chris Woodhouse

Most eBay members have PayPal ... yet some auctions accept other methods of payment which removes total cotnrol from eBay/PayPal.

As for fraud ... it is committed by both sellers and buyers: sellers who don't deliver at all or deliver items inferior to the ones they describe in their auctions. As for buyers, you have the ones who win the auction and never pay. I have seen both.

Re: Nothing lasts forever ...

*Message #9 Posted by **John L. Shelton** on 24 Aug 2005, 3:12 p.m.,*
in response to message #5 by Namir

One of the great things about the US, and in general free markets around the world, is that challengers can upset dominant companies. Even the mighty AT&T fell to competition, despite a 100 year government-granted monopoly. Many of the vastly powerful companies of my youth got toppled by upstarts: IBM, Sony, Sears, Pan American Airlinies, Safeway. In some cases, technological change thwarted a company's mission (such as Western Union and telegraphy), but in most cases, it's just that the large company was slower to respond, and a smaller company could better satisfy customers.

It's fun to watch the "upstarts" grow so large that they are targets themselves. Southwest Airlines, though still on top, is getting serious pressure. Microsoft, which challenged and bested IBM, has now been challenged by Google, and the NY Times reports that Google has gotten so big that people fear it, meaning it will be challenged.

eBay may have a temporary "lock" on some form of commerce, but it cannot survive in such a dominant role. Sooner or later, someone else will pick a niche and better fill customer needs. Personally, I belive eBay is vulnerable right now, though it would take about $50,000,000 US to launch an effective competitive attack. eBay has made many mistakes that a competitor could correct. But that's another topic....

Hooray for the overall process that satisfies customer needs through innovation!

Re: Nothing lasts forever ...

*Message #10 Posted by **Ron Ross** on 24 Aug 2005, 3:30 p.m.,*
in response to message #9 by John L. Shelton

And flawed as Ebay is, how would you correct it? Its customer is the seller and it offers its customer (the seller) the best place to sell his product (treasure or JUNK) at the maximum value possible. And the seller is supposed to go elsewhere?

That Ebay is flawed and badly skewed against the buyer is no real concern to Ebay's customer (the seller). And Ebay now has a relationship with Paypal to really rack up profits, expediate sales and cover all the loose ends.

Yeah, eventually something might replace Ebay, but like Microsoft, they are entrenced in a very solid business that seems to favor their existence.

Re: Nothing lasts forever ...

*Message #11 Posted by **Howard Owen** on 24 Aug 2005, 4:03 p.m.,*
in response to message #10 by Ron Ross

You're right about who eBay's customers are. But the sellers come because there are buyers. That alone is the reason eBay stays on top. It allows them to jack up seller fees periodically with no more harm to their business than a spate of extended whining on the seller's boards. They also do things like showing credit card logos with the Paypal ad on each auction. But the seller has to have a "Premium" PayPal account to be able to accept credit cards, and then they pay PayPal a 3% tax on every payment received, credit card based or not.

That eBay can get away with that sort of thing indicates that they have something more

attractive than those tactics are repellent. And that is *customers*. eBay couldn't get away with slapping (direct) fees on the buyers. People would move on, and eBay would no longer be the dominant player. So they make their site easy to use for buyers, and they charge them no direct fees. Plus the prices are still better than retail, if you're careful. And guess what? *it works*, for eBay at least.

Edited: 24 Aug 2005, 4:05 p.m.

I'm one of those who spend their money buying old calcs. My main search area is eBay. I've a few automatic searches regarding HP calculators active (It's a bit tricky to skip all those ink cartridges in the search).

What I post here are auctions with anomalies, like wrong photos or questionable info (like "HP 14C" instead of "HP 16C"). Sometimes, a precious device is discussed in a thread here. If I've the impression it is a rare item and I find one on eBay, I just tell the audience.

Anything wrong with that?

Re: Reasons to post eBay information here

HP 41C replacement LCD display?

*Message #1 Posted by **Vince** on 23 Aug 2005, 1:19 p.m.*

Anyone know where to procure the replacment LCD for this model? Exponent numerals are obscured by black due to an unfortunate drop.

s/n 2032A02705

Re: HP 41C replacement LCD display?

*Message #2 Posted by **David Smith** on 23 Aug 2005, 1:33 p.m.,*
in response to message #1 by Vince

The only source is another HP41 calculator. Replacement of "half nut" LCD screens is basically not possible without doing extensive damage to the machine.

Re: HP 41C replacement LCD display?

*Message #3 Posted by **Vince** on 23 Aug 2005, 3:02 p.m.,*
in response to message #2 by David Smith

What is "half nut"? I'm not familiar with that term.

Thanks

Re: HP 41C replacement LCD display?

*Message #4 Posted by **Vieira, Luiz (Brazil)** on 23 Aug 2005, 4:07 p.m.,*
in response to message #3 by Vince

Hi, Vince;

try this link, scroll down some three to five times (depends on your video resolution) and you´ll see the title **HP-41 Versions**. Right after this you´ll see the image

Check your HP41 and you'll probably see the difference.

Indeed, removing a halfnut LCD demands patience, good soldering iron, ESD protection and some precautions (electronic maintenance expertise is desirable). I have already completely disassembled a halfnut LCD and I scanned the disassembled unit and parts. I'll just find the images and post again.

Best regards and success.

Luiz (Brazil)

Re: HP 41C replacement LCD display?

*Message #5 Posted by **Randy** on 23 Aug 2005, 7:39 p.m.,*
in response to message #1 by Vince

Based on the serial number, you don't have a halfnut unless HP swapped the case back when it went in for service sometime after 1985.

The real issue is that David is correct - the only source is another 41. But, if it is original, you have a fairly early 41C. There where changes to later models so not only do you need to find another 41, you'll need to find one from about the same era. Later lcd driver modules where physically larger and will not mate to an earlier lcd nor will they fit into an early case. Early, square epoxy encapsulated chip versions are not compatible with later cpu's.

With all things considered finding a replacement part, you might just want to buy a used CV and be done with it.

Re: HP 41C replacement LCD display?

*Message #6 Posted by **don wallace** on 24 Aug 2005, 4:15 a.m.,*
in response to message #5 by Randy

It is possible if you wanted to save a little money that you could buy a 41C and remove the processor / memory board from your CV and fit it to the keyboard / display front half sheel of the purchased 41C. The keyboard / display unit is electrically identical between the C, CV and CX to the best of my knowledge.

The prblem is that all these units are getting old and the plastic components fail, leading to fatal problems with the interconnects, which connect under presure. I'm doing some research into this problem to try to extend the working life of the machines another five or maybe even ten years. I wonder how long the LCD units will last?

Don

Re: HP 41C replacement LCD display?

*Message #7 Posted by **Tony Duell** on 24 Aug 2005, 3:48 p.m.,*
in response to message #5 by Randy

What is the issue with particular LCD drivers and CPUs?

The service manual mentions the auto-power-off problem, where you have to change a capacitor on the logic board if you swap between early and late LCD drivers, but apart from that I can't find a problem.

Re: HP 41C replacement LCD display?

*Message #8 Posted by **Randy** on 24 Aug 2005, 7:23 p.m.,*
in response to message #7 by Tony Duell

It has nothing to do with CPU's...

The early 41's used LCD driver module 00041-80003, they were 16.5MM in height. The later models used 00041-60146 modules, they were 17.5MM in height. The 17.5MM modules do not fit into early

41C's without physically stressing the assembly. The keyboard mold was later modified to accept the higher LCD assembly by removing the heat stakes along the top row. The 00041-80004 pcb was later modified to remove the holes altogether, some units had holes in the pcb but no heat stakes during the transition. The unit on right shows the top row heat stakes in an early steep key 41, the left, a later CV.

http://fixthatcalc.com/images/early41.gif

The lcd's used different connection technologies (gold over copper vrs elastomeric zebras) and were of course different dimensions and therefore not 100% physically interchangeable.

Re: HP 41C replacement LCD display?

*Message #9 Posted by **Vince** on 24 Aug 2005, 4:17 p.m.,*
in response to message #5 by Randy

My 41C has never been serviced so it can't be a half nut. It has sharp corners.

I'm hooked on RPN (25 years) and would like to repair it or replace it. I guess I should have done it 10 years ago when the 12C was affordable.

What does a parts quality 41C fetch these days? Are there folks on this forum who stock these parts? What can I expect to pay?

Alternatively, is there an inexpensive less complicated RPN calculator avaliable today??

Re: HP 41C replacement LCD display?

*Message #10 Posted by **Vince** on 24 Aug 2005, 4:22 p.m.,*
in response to message #9 by Vince

Sorry about the typo, I meant to say 11C instead of the financial 12C.

Re: HP 41C replacement LCD display?

*Message #11 Posted by **Dave Shaffer** on 24 Aug 2005, 7:16 p.m.,*
in response to message #9 by Vince

Vince,

"Alternatively, is there an inexpensive less complicated RPN calculator avaliable today?? "

The cheapest available RPN calculator would appear to be the HP 33S, now in production by HP and costing around $50. It has a somewhat weird (to old-time HP afficionados!) keyboard. It looks more like a cell phone keyboard. It is available at (at least) WalMart and Frys.

This model has been both praised and panned here at the Museum, but the general consensus appears to be that it is at least OK, after you get used to the keyboard and the somewhat miniscule decimal point (which is said to be improved in the very latest models).

I'm sure others will add more (or subtract from) my comments!

Re: HP 41C replacement LCD display?

*Message #12 Posted by **Vince** on 25 Aug 2005, 9:37 p.m.,*

in response to message #11 by Dave Shaffer

Sounds like an affordable alternative. I will likely be posting for sale my 41C, printer, cardreader/cards, 3 single memory modules,quad memory module, manuals and boxes soon since fixing the display is probably not worth the effort.

Thanks to all of you for your assistance!!

Calculator site update

*Message #1 Posted by **Valentin Albillo** on 23 Aug 2005, 5:37 a.m.*

Hi all,

Just came back from (too short) summer holidays, and I've uploaded a new article (in PDF format) to my web site, namely:

HP-71B: Math ROM Baker's Dozen (Vol. 2)

```
8-page article, second part of a two-part article, featuring 13 assorted mini-topics
discussing novel, unusual, or otherwise interesting aspects of using the extremely
powerful and versatile Math plug-in ROM for the HP-71B.
```

This second part features the following advanced mini-topics:

- ***8. Tigth fitting***

  Fitting a N^{th}-degree polynomial to a set of arbitrary data points.

- ***9. What about fitting complex data ?***

  Same, for a set of complex data points.

- ***10. Multiple integrals made easy***

  Double integrals, triple integrals and beyond.

- ***11. And systems of simultaneous non-linear equations too !***

  Ditto.

- ***12. Synergic eigenvalues***

  Computing all eigenvalues, real and/or complex, of arbitrary square matrices, as well as their characteristic polynomial.

- ***13. Enter the MOB (Matrix Operations Benchmarks)***

  Timings for SYS, INV, +, -, *, TRN*, TRN, ZER, =(1), =(1,1), FNORM, CNORM, RNORM, and DET.

You can also find there the first part of this article (10 pages), as well as ten other HP-related articles by me, all in PDF format.

Best regards from V.

Hi, Bill:

Bill posted:

"Welcome back. Hope you had a great vacation."

Thank you very much, same to you. In my case it wasn't that great but never mind.

"Although I don't have the math rom, I am looking forward to reading your article and learning a little about how powerful a module it is."

Incredibly powerful, and I mean it. As for not having the ROM, I insist once more that you (and everyone else wanting to try) can google for and download the superb, absolutely-free Emu71 emulator, which does include the Math ROM as well.

That would allow you to enter the examples and routines from my articles and S&SMCs, and run them at 20x-70x the speed, with the convenience of large-window output for results instead of a 1-line display, not the mention a full size keyboard.

That's one of the main reasons I write routines specifically for the HP-71B: anyone can try them out for free, and they're very easy to write, test and debug. That can't be said for most other HP models, even if a Windows emulator/simulator does exist, mostly because of keyboard/menus emulation.

"Just to let you know, I finally put all your S&SMC in one PDF. The notice has been put in the Archives, so you may have missed it."

Why, thank you very much ! :-) I'm very glad that such kind persons like yourself find my humble attempts to enliven the forum from time to time worthwhile enough to dedicate their precious time to gather them all in a single, convenient PDF file. This actually encourages me to go on with new installments.

Also, your magnificent work is quite useful to me, because I didn't collect most of those postings at their time, so they were lost to me (which explains some problems with the numbering, etc).

Again, thank you very much, I certainly hope you'll enjoy my next S&SMC coming soon, as well as more articles I'll upload in the near future.

Best regards from V.

Thanks, Valentin!

Most likely the trouble in accessing Lycos is with some firewall settings, both at work and at home. I would appreciate if you sent me the articles: just remove NSPM from my email and replace AT and DOT with '@' and '.', of course. I'll make a backup and a hardcopy this time!

Best regards,

Gerson.

Merci beaucoup, J-F! J'avait déjà le trouvé là. Très bon travail! Peut-être une raison pour achéter un LX-200 parce que les 71B sont trop cher!

(Thank you very much. I had alread found it there. Very good job! Maybe a reason for purchasing a LX-200 as the 71B's are too expensive! - Sorry for the bad middle-school French :-)

Best regards,

Gerson.

Re: Calculator site update

*Message #9 Posted by **Palmer O. Hanson, Jr.** on 25 Aug 2005, 10:38 p.m.,*
in response to message #1 by Valentin Albillo

The HP-15C Nth Degree Polynomial Fitting Program and the HP-71B Tight Fitting Progam both fit an nth degree to polynomial to n + 1 data points. Many references suggest that this is a risky procedure; for example, Glen Kilpatrick's Polynomial Regression Program for the HP-42S which is in the Museum's software library includes the following cautionary note:

"... This program will yield a polynomial curve fit of arbitrary power. But this requires more discussion. It should be obvious that a linear regression requires a minimum of two points, a quadratic three, a cubic four, etc.

If that is the case, then why not always pick a power that is one less than the number of points. The curve generated will pass through every point in the set (note that I gloss over multivalued sets, a particular X must yield one and only one Y), and the fit will be "perfect". The problem with this is that inherent measurement noise will be magnified, the curve will gyrate wildly outside the points in the set, the "energy" will be nowhere near minimized, and nothing will have been made simple. ..."

So the obvious questions are:

When is it safe to use just one more data point than the degree of the polynomial to be fitted?

How does one tell?

Re: Calculator site update

*Message #10 Posted by **Dave Shaffer** on 25 Aug 2005, 10:49 p.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

"When is it safe to use just one more data point than the degree of the polynomial to be fitted?"

I'd say only when (and if you are sure) that you had a priori expectation that the polynomial degree was appropriate for this particular set of data.

For example, if you expected (or even knew by other means) that a linear relation was expected between two variables, then performaing a linear fit would be the proper thing to do, even if you had only three data pairs. You should also include, however, an estimate of the likely errors in your parameters, which requires of course some idea of the errors attached to each data point. Check any text on statistics for how to do this! (It's been a long time since I worried about such things!)

Re: Calculator site update

*Message #11 Posted by **Valentin Albillo** on 26 Aug 2005, 5:15 a.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

Hi, Palmer:

Palmer posted:

"Many references suggest that this is a risky procedure"

It may be a risky procedure for a number of reasons. Some depend on the kind of fitting you're up to (i.e., exact, mathematical data or experimental data), others depend on the size of the problem and the computing precision being used. Both can limit the accuracy and/or usefulness of the polynomial fit you get.

For high-degree exact polynomial fits to a set of data points, you're solving a large system of linear equations. The related matrix approaches a Hilbert matrix as the degree increases, and as has been mentioned a number of times (and you can see a thorough discussion in my article ***"Mean Matrices"***, published in Datafile V24N4 (July/August 2005)), Hilbert matrices are extremely difficult to handle numerically, as they're almost singular. Thus, exactly fitting an Nth-degree polynomial to N+1 data points involves numerically dealing with a close approximation to an NxN Hilbert matrix, and for large N this will quickly degrade precision to the point of the result being unusable.

"The curve generated will pass through every point in the set [...] and the fit will be "perfect". The problem with this is that inherent measurement noise will be magnified, the curve will gyrate wildly outside the points in the set, the "energy" will be nowhere near minimized, and nothing will have been made simple. ..."

That's not so simple. It depends on the nature of the problem, i.e.. if we're dealing with approximate, empirical data obtained via some measurement or experiment, or else it's just a mathematical problem of fitting some polynomial to a given data set or mathematical function (say y=exp(x)) over some range.

For this last case, approximating a polynomial to some given function, it further depends on the function being approximated AND the data points used in the approximation, i.e., equally-spaced or arbitrarily spaced.

For suitable functions (say y=sin(x)) and equally spaced data points, convergence does occur, and the polynomial thus fitted closely resembles the original function as the degree (i.e., number of points used) increases. But in the general case and for many transcendental functions, this convergences does not hold and the resulting polynomial, though passing through all data points used, oscillates wildly, and absolutely diverges from the function at all points except the fit set.

"When is it safe to use just one more data point than the degree of the polynomial to be fitted? How does one tell? "

As stated, it's a difficult theoretical question. As a rule of thumb, I would advice the following:

- If the data set are experimental and there are a large number of them, forget about an exact fit. Your best bet is to compute a number of *polynomial least-squares regressions* for degrees 1, 2, 3, ... and for each degree, compute the RMS of the error. As long as the RMS is decreasing sharply, keep on increasing the degree. When the RMS stops significantly changing, then halt.

  For instance, if for degrees 1 to 5 you get RMS errors 0.532, 0.183, 0.027, 0.019, 0.015, you should stick to degree 3 (RMS = 0.027). The 'extra' accuracy you seem to get with degrees 4 and 5 is just experimental noise in the data. Least-squares approximations are essentially a smoothing of data, which will remove most of the noise. Increasing the degree is just a senseless attempt to also fit the noise as well.

  There's also the fact that, as for the case of exact polynomial fit, the related matrix for least-squares regression is also nearly singular for large degree, but this can be avoided by using orthogonal polynomials instead of directly dealing with said matrix. However, for experimental data, high-degree least-square regressions are seldom justifiable, stick to the diminishing RMS criterium to decide where to stop. The computed polynomial will result in improved values bettering even the data points themselves, as most experimental noise will be smoothed out by the regression.

- If the data set is a mathematical set of data points or you're trying to fit a suitable polynomial to a mathematical function (say the Gamma function or some Bessel function), there's no smoothing of experimental noise involved and your best bet is not a least-squares polynomial fit but a *minimax polynomial fit*. This is a very complex subject and this is not the place to discuss it, have a look at my ***Minimax Polynomial Fit*** article in Datafile V24N5, where this is discussed at length.

  Using this kind of approximation will get you the absolute *optimal* fit, with *guaranteed* smallest maximum error over the whole specified interval, no oscillations or artifacts whatsoever.

Best regards from V.

Re: Calculator site update

*Message #12 Posted by **Thomas Okken** on 27 Aug 2005, 1:55 p.m.,*
in response to message #9 by Palmer O. Hanson, Jr.

The problem with fitting an n-th degree polynomial to n+1 data points is that it is an ill-conditioned procedure (results can fluctuate wildly for relatively small variations in the input data).

If you have a good reason (e.g., some plausible physical model) to assume fitting an n-th degree

polynomial is the right thing to do, try to collect more data points and perform polynomial regression, or, even better, use Chebychev polynomials to get a fit with limited local error.

Re: Calculator site update

Message #13 Posted by ***Palmer O. Hanson, Jr.*** *on 10 Sept 2005, 5:22 a.m.,*
in response to message #12 by Thomas Okken

Thanks to all the contributors, and particularly to Valentin, for thorough discussions of which method to use. In my old notes I found the following items which may be of interest:

1. On selecting which degree to use: The least squares polynomial regression program that I used on the Honeywell Computer Network in the late 1960's didn't calculate the RMS of the residual errors. Rather, it calculated the unbiased standard error defined as the square root of the sum of the squares of the residual errors divided by number of data points minus the degree of the polynomial minus one.

On the difficulty of the matrices involved: We recognized that a least squares polynomial regression solution is *algebraically* equal to a linear solution when the number of data points is equal to the order of the matrix (degree plus one). The solutions in a computer program are not *numerically* equal where the least squares polynomial regression solution is typically degraded by the larger matrix elements associated with the regression.

Tips to fix an IR printer (82240B)

*Message #1 Posted by **Geir Isene** on 23 Aug 2005, 1:50 a.m.*

Yesterday I got mye IR printer that I bought via eBay. When I tried to print (from either my HP-48GX or HP-17B), every third pixel row was blank - effectively rendering the printout unreadable. Is there anything I can do to fix this myself?

Re: Tips to fix an IR printer (82240B)

*Message #2 Posted by **James M. Prange (Michigan)** on 23 Aug 2005, 3:42 a.m.,*
in response to message #1 by Geir Isene

Just to clarify the situation, I take it that you mean the third pixel row within each print line?

How about the printer's self-test? With the printer off, hold down the line-feed button, turn the printer on, and then release line-feed.

Regards,
James

hi, Geir;

while keying this post in, James was faster and posted about the self test, too. I'll keep mine the same, just add these lines, O.K.? (Hi, James!)

chances are you have a bad connection. in the flex ribbon connecting the printing head to the mainboard. The October 1987 issue of the HP Journal, p.22, shows an HP82240A 'guts', and you can easily see the flex ribbon.

If you want to go for another test, what do you get with the HP82240B self test? If you did not perform it so far, simply keep the paper advance buttom pressed when turning the printer on. The complete character set and the battery condition are printed (battery condition is printed in a separated line).

Also, does it happen the same when printing graphics? I mean, with both the HP48GX and the printer ligned up for printing, if you press [ON] (hold it) and [1] simultaneously (release [1] prior to release [ON]) while the HP48GX is turned on, what do you get in the printer?

Maybe you are aware of that, but the [ON]&[1] cause the HP48G's LCD contents to be sent through the selected IO port. Considering that the IR port is the selected one (as you can print with the HP82240B), your printer should print the exact LCD contents when [ON]&[1] are pressed.

Let us know how does it go, or if you need further advice, O.K.?

Success!

Luiz (Brazil)

Re: Tips to fix an IR printer (82240B)

*Message #4 Posted by **Geir Isene** on 23 Aug 2005, 4:54 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi guys,

Thanks for the help. I tried the self-test and the 48 screen-print. Both show the same result - every third pixel row on the print-out is blank. It seems to me that the characters are 6 pixels high; from the top, row 3 and 6 are gone.

I'll go ahead and see if I can fix a loose connection. This is less hassle than returning the printer to get an other one.

Re: Tips to fix an IR printer (82240B)

*Message #5 Posted by **James M. Prange (Michigan)** on 23 Aug 2005, 7:44 a.m.,*
in response to message #4 by Geir Isene

Well, that it fails in the self-test confirms that the problem is definitely in the printer itself.

(Edited) The capital letters A-Z use, counting the top row as 1 and bottom as 8, rows 2-7, but the print head is 8 pixels high. Some characters use the other rows; for example, the parentheses, brackets, and braces use the top 7 rows, underscore (at the very beginning of the self-test as well as its ASCII position) uses only the bottom row, comma uses the bottom four rows, and underlining turns on the lowest row. To print (from your 48GX) a single column with all eight rows on, you could set up for printing via IR and run the program:

```
\<< 27 CHR 1 CHR + 255 CHR + PR1 DROP >>\
```

With the print intensity fairly light, and perhaps using a magnifier, you should see a column of eight dots from that program.

Note that the font of the 82240B differs from the 82240A; as well as the additional character set, many characters use one less row.

In case you need the owner's manuals for the printers, they're available on the current Museum DVD or Museum CD 8. For more technical information also see the HP 82240B Infrared Printer Technical Interfacing Guide.

Sorry, I don't know enough about the "internals" of the printers to be any help there, but hope for a loose connection.

Regards,
James

Re: Tips to fix an IR printer (82240B)

*Message #6 Posted by **Tony Duell** on 26 Aug 2005, 6:34 a.m.,*
in response to message #5 by James M. Prange (Michigan)

I would agree that the first step is to check the printhead.

The casing screws are under the feet and in the battery compartment. I think there's a total of 6. Undo them, take off the cover (don't lose the switch knobs, which are now lose). The printhead tapewire plugs into the PCB. Unplug it and check for continuity between the common connection and each of the others.

From what I remember, the printer is controlled by an 8048-series microcontroller. One of the 8 bit ports drives the printhead There's an 8-section driver chip, something like a ULN2803 (I am doing this from memory, I don't have my schematic in front of me...). 7 of the sections drive the 7 of the printhead rows, the last drives the motor. There's a separate discrete transistor for the last row, I think it's the bottom one.

If the printhead checks out, you could look for activity on the inputs to the driver chip when doing the self test. If some of those lines seem dead, then alas you need a new micrcontroller, which was custom-programmed for this printer (only source, therefore, being another 82240B). If the inputs to the driver are all toggling, then the driver chip might be defective.

I think you're thinking of the 82143 or 82162 (HP41 and HPIL thermal printers).

Re: Tips to fix an IR printer (82240B)

*Message #9 Posted by **David Smith** on 23 Aug 2005, 1:35 p.m.,*
in response to message #4 by Geir Isene

I suspect the problem is a burned out dot in the printhead. You can verify this by reading the resistance of each dot on the ribbon cable to the common connection (ground). They should all read the same. Bad dots will usually show a much higher reading.

Re: Tips to fix an IR printer (82240B)

*Message #10 Posted by **James M. Prange (Michigan)** on 25 Aug 2005, 6:54 p.m.,*
in response to message #9 by David Smith

A bad printhead was my first thought. I haven't heard of that being a common problem with the 82240 printers, but it's certainly plausible.

But it seems that Geir's printer has (at least) two dot rows not working; how likely is it that two elements would burn out? If that happened, I'd suspect that some other problem caused it, so would

be concerned that the same thing might happen to a replacement printhead.

Still, if there's nothing obvious wrong, such as a bad connection with the flex ribbon, it would certainly be worth the effort to check the resistance through each dot.

Finding a replacement printhead might be a bit of a problem; maybe from a printer with some other problem, such as damage from leaky batteries. In this case, if it is the printhead, I'd think it better to try for a refund or replacement from the seller.

Regards,
James

*Message #11 Posted by **David Smith** on 26 Aug 2005, 12:53 p.m.,*
in response to message #10 by James M. Prange (Michigan)

Bad printhead dots are a very common problem. More so than bad flex cables. I have seen numerous heads with multiple dots bad. It can be caused by either electrical problems (driver latched on) or physical problems (grit or pointy objects weilded by hairless apes). HP service people even had a form letter they sent out if they thought your printer was damaged by the latter.

Brazilian HP-85A on eBay

*Message #1 Posted by **Vassilis Prevelakis** on 22 Aug 2005, 11:01 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5233723613

If you look about 3/4 down the posting you can see the serial number label with the "MADE IN BRAZIL" tag. The serial number is difficult to read but it looks like 2326B... which makes one of the later HP-85As to be produced.

Anybody knows whether HP-85s (or other Series80) computers were made elsewhere? (I already know about the 9915A/B which were made in Germany).

Celebrating 30 years since I bought an HP-55

*Message #1 Posted by **Namir** on 22 Aug 2005, 9:04 p.m.*

I am celebrating today 30 years since I bought my first HP calculator -- an HP-55. I was in an engineering college and my parents showed me in 1974 an ad for the HP-65 -- the first personal computer. I had to have one. Because of the cost my parents gave it much thought. In August 75 I flew to Europe to join them for the rest of summer. As we drove from the airport I was handed several flyers for HP calculators-- HP-21, HP-25, HP-45, HP-55, and HP-65. I started studying the flyers for the 25, 55, and 65. I spent the next few days reading every word and going over the features of each calculator again and again. Finally I decided on the HP-55. It had built-in linear regression and basic stats, 20 registers, unit convertions -- all special features that meant a lot for me. I decided on that model and my family purchased it for me on August 22. I was not fulyl aware that the HP-55 had the least programming space and features (no subroutine like with the HP-65). I used the HP-55 for the next 2 years and pushed the machine to the limit of programming. In 1977 I bought an HP-67 and enjoyed the superior programming features (more steps and three levels of subroutines).

Today I took out my HP-55 (one I got recebtly from eBay) and played with it a bit. I wrote a few programs and keyed in others from the Math and Stat application booklet. This was the first step in a world of computers that because accessible to us.

Those were the days when HP was the calculator ACE!

Happy Programming!

Namir

in response to message #1 by Namir

Poor Namir, everyone ignored your post. I for one appreciate that story. I love hearing tales about the early days of calculators. I think anyone old enough to remember those days is lucky in a way, becuase it was a bigger step forward for personal computing in a relative sense than we're likely to see again. To get an idea of how revolutionary it was, my friend remembers a crowd gathered around a live demonstration at Macy's showing one of the first four function pocket calculators. No one could believe something that small could do what that thing did. A four function pocket calculator for $100 was considered a bargain.

in response to message #1 by Namir

Thanks guys for responding! I was celebrating a vintage HP calculator. After all, this is what this site is all about. It is amaizing how far calculators have progressed. I think we all recall that moment of aw when we held in our hands a small and sophisticated calculator that out-matchoeasd the common 4-function or basic scientific Casio, Sharp, and Cannon calculators.

*Message #5 Posted by **Howard Owen** on 25 Aug 2005, 1:27 p.m.,*
in response to message #4 by Namir

Yup. For me it was the 41C. It was the first programmable I ever saw.

Since taking up collecting (quite recently) I've had the opposite experience of learning how less capable - but not necessarily older - HP calculators were programmed. For some models that has been a real pleasure. I'm thinking of the HP-97 and [11|15|16]C here. For others it has been a cruel ordeal. Perhaps that's overstating it, but the HP-20S just sucks as a programmable. Never mind the limited memory, it's an algebraic that programs without mnemonics! So not only do I have to decode the keystrokes, but I have to completely rearrange the programming part of my brain. So Euclid's algorithm (my standard "benchmark" of programming simplicity) is really screwed up. And not just because there's no "MOD" function:

```
01 LBLA
02 STO2
03 SWAP
04 STO1
05 LBL1
06 RCL1
07 /
08 RCL2
09 =
10 FP
11 *
12 RCL2
13 =
14 RND
15 IP
16 STO3
17 X=0?
18 GTO2
19 RCL2
20 STO1
21 RCL3
22 STO2
23 GTO1
24 LBL2
25 RCL2
26 RTN
```

Eeeewww!

This monstrosity of a programming model, wherever it first showed up, seems to me to have been the beginning of the end. It's obvious the marketing guys had fought a battle over AOS vs RPN, and partially won. At the same time Wiliam Wickes et. al. were producing the 42S, this chimera between two incompatible phylae of calculation hit the streets. I don't know if its so terrible simply because that's how keystroke programming on an algebraic has to be, or because the team implementing the programming believed that it was.

However that may have been, it makes your reverence for your first HP all the more appropriate. The models we admire really were special and unusual, as the example of mediocraty that is the HP-20S shows.

Well, that means it's been 30 years since I got my first scientific, an APF Mark 51 purchased at Sears. It served well the first year till I got my first advanced scientific TI SR-51 and then in December 1976, the beloved TI-SR-56. Then a Commodore M-55 which Gene now has in the summer of 77 followed by finally a HP-29C later in 1977 after trying a 25C first. Had to work a lot of hours in the mid-70's at $2.20/hr while in school and summers to buy this stuff!

Printing Scientific Calculators

*Message #1 Posted by **John Limpert** on 21 Aug 2005, 3:54 p.m.*

Has any company made a printing scientific calculator in recent years? I haven't seen one since the HP-97. There are a large number of printing basic calculators that are still in production.

Re: Printing Scientific Calculators - there were some non-HPs...

*Message #2 Posted by **Bill Wiese** on 22 Aug 2005, 3:54 p.m.,*
in response to message #1 by John Limpert

I haven't seen printing scientific calcs on the shelves in years.

There are a few however, from the very late 70s, and into 80s.

Canon has produced a couple - I have an FP10 on my desk, has flourescent VFD ('green tube') display, basic sci functions (log, trig, P<->R, basic stats, along with a tape printer. This is certainly not a handheld calc but is not a full desktop either - it can be held/used in hand easily.

Canon produced a later version that had, as I recall, an LCD display and smaller printer. It was slightly smaller but still was not really 'pocketable' and was still best for desk use. I recall seeing these somewhere around 1982-1984 for some time. (They seemed to stay on stores' shelves, too!)

I believe TI had a printing version of something like a TI30. It was, as I recall, an LCD calc. Joerg's Datamath museum might have a pic/description of it.

Sharp produced a printing ELSImate scientific calc, EL550, in the 80s too. I have this and need to put some new thermal paper tape in it. This calc has an LCD, usual log/trig funcs, hyperbolics, P/R conversions, D.MS<>D.d conversions, and basic stats - along with a thermal printer. Its physical appearance and KB layout is very similar to the early 80s EL506P, which was a fairly thin-profile 'shirt pocket' LCD calc that came in a folding vinyl wallet. The EL550 printing calc is just 1/4" thicker (so as to take AA batteries and contain print unit) and about 1.6" longer (for printer unit above LCD).

Do remember that various Sharp, Casio (and thus Radio Shack) LCD 'pocket computers' that were programmed in BASIC but that also offered calculator modes sometimes had accesory printers for them - much like the HP41C. The TI95 calculator (as well as its sister, the TI74 pocket computer w/BASIC) had an accessory printer as well, as did its predecessor, the CC40 computer.

Re: Printing Scientific Calculators - there were some non-HPs...

*Message #3 Posted by **Howard Owen** on 22 Aug 2005, 4:19 p.m.,*
in response to message #2 by Bill Wiese

All the HP48's (possibly excepting the 48GII?) can print via IR. The 49G+ has IR, but I don't know if it

will print that way.

I know it's not the same. I posted my opinion in an earlier thread that HP lost something when they went to the systems approach with the 41C. The HP-97 is still my favorite machine to do calculation on, due to it's nice big buttons, gorgeous display and great printed output. I like the 41C, don't get me wrong. It's much nicer to program than the 97, and it has networking that's almost recognizable as such from today's perspective. But I'm not aware of any small desktop machine that comes anywhere near the HP-97 for usability as a calculator.

*Message #4 Posted by **Eric Smith** on 22 Aug 2005, 5:42 p.m.,*
in response to message #3 by Howard Owen

Hmmm... Maybe it would be fun to design an upgrade module for the HP-97 to add memory and make it (mostly) compatible program-wise with the HP-41C family. :-)

Re: Printing Scientific Calculators - there were some non-HPs...

*Message #5 Posted by **Bill Wiese** on 22 Aug 2005, 7:55 p.m.,*
in response to message #4 by Eric Smith

Hey Eric,

Your HP9x mod ideal would be wonderful and a good shortcut to reality.

All this talk here of building our wonderful supercalc has gotten into the minutiae of this vs. that CPU, C vs. assembly for emulation layers, what kinda display, etc. - when the bottom line is that the above is absolutely irrelevant, as any even 4-bit CPU today could emulate an HP. (Well, maybe that's pushing it for a 49, but then I'm only into 'real' RPN calcs up to, say 42S - no 48/49 for me.) And to have a daily-use calculator, you don't want it in a hokey RadioShack or Serpac 'project box'.

Folks here don't realize the ergonomics, look and feel of a good calc will be hard to duplicate by the midnight engineers unless we can pony up at least $100K for molds, keytops, etc. And that would just be for prototypes for a few of us. Wouldn't be in shape for sale. This has been the problem for the OpenRPN group.

Using existing HP desk calcs - whose KBs and cases and displays are often still in good shape - would be wonderful. For an HP9X desk calc, power and space are nonissues.

Dot-matrix alphanumeric red LED display sticks are available and are easy to 'talk to' - that way, we can have a 41C or even 42S-grade display. Dead or hard-to-talk-to printers can be replaced with printers from scrapped other new $15 four-banger accounting calcs (and small printers can be purchased from DigiKey, Mouser, etc. though it's prob cheaper to rape some new calcs.)

No need for card reader. Combined with scrap 32MB SD or CompactFlash storage, this hack calc will hold every known HP library program in existence plus data tables, text, etc. - plus whatever programs the owner has dreamed up. RS232 + GPIO parallel I/O is trivial.

Running a 41C or 42S emulator is entirely possible using a $1 8051 - with C code written in SDCC. The emulator code would have 'escapes' in it to translate to new display, I/O units, etc.

[I have a Rockwell 350 sci desk calc with a great fullsize KB and green VFD display. The accuracy of this calc is terrible, though. Time for some new brainpower - this would be a good HP45 candidate due to key labelling. Since this has 'normal' keys a la those on quality terminals, I'm sure

I can find a keycap that says "ENTER" on it (replacing 2 keys, but then parentheses are not needed w/RPN!).]

*Message #6 Posted by **Howard Owen** on 22 Aug 2005, 8:38 p.m.,*
in response to message #4 by Eric Smith

Someone mentioned in another thread that you had been thinking along those lines. It's very interesting to me. My question in that thread ("Last of the Topcats?") was what if HP had retained the Topcat form-factor into the HP-41C generation? Since that beautiful display is one of the HP-97's strong points, let's also assume they somehow decided not to go to an LCD display on the desktop version of the 41C (HP-98C?) Then they might have come up with something like you envision.

Mike's comments echo things that others have said in that he'd like modern I/O and memory options. I'm torn on that point. I'd like to be able to easily talk to the 21st century with a hybrid calculator. But I'd also want to be able to talk to my ancient machines, like the HP-41, 75 and 71. That means HP-IL. That also appeals to me since I think it's a cinch that HP would have included that if they had decided to build a high-end 41 in the Tomcat form factor.

On the other hand, there's nothing wrong with providing an SD or CF slot or two. I fear I risk displeasure from some of the purists when I suggest USB, but it's a widely adopted standard that would ease communication with a wide variety of modern platforms.

So, the guts could be a high-end StrongARM or PPC platform running an OS that could host a variety of emulations, one of which could be the stock 97, and another the souped up 41C. I wonder where we could get such an OS and such flexible software. Any thoughts? 8)

The primary UI would be the physical calculator, but you could also run X11. 8) 8)

Unless it has a USB device that looks like a serial device or bulk/mass storage, there's the issue of USB drivers on PC.

[quite] ...the guts could be a high-end StrongARM or PPC platform running an OS that could host a variety of emulations, one of which could be the stock 97, and another the souped up 41C. I wonder where we could get such an OS and such flexible software. [/quote]

This is the problem w/OpenRPN - why high-end? ARM, PPC? Are we trying to run a cruise

missile?

... wasting time with all the theoreticals and being good little CompSCI students when ANY $0.50 CPU (say, 8051, 6805, PIC, TI MSP430, fast Z80 CPUs, etc) with some banked ROM can emulate any and all HPs except maybe the (useless to many of us) 48/49 series.

Some of these faster CPUs can really blaze, tools are free & easy to use. Emulation layer per calc/architecture would prob take under 8KB in addition to native firmware of calc to be emulated, plus another 2-4 KB for changed I/O (different display, KB handling, external serial and/or storage device). That's if the code were written in nicely structured C. A mix of C & assembly and some dirty programming would collapse that nicely.

No OS is needed. The calc's firmware, in emulation, is essentially the "OS". An interrupt routine might do some timekeeping stuff or aid in KB scans due to different instruction cycle times (faster).

A dot-matrix LED stick array could simulate HP41C or 42S displays which fit in nicely w/HP97 display housing + red filter.

in response to message #7 by Bill Wiese

> Quote:
>
> why high-end?

Why not? 8)

Yes, it's more costly. But remember you are starting out with the shell of an HP-97. Those aren't cheap, so we are definitely talking a high-end system here, before we even start with the computing platform.

Since you are going to switch emulations, that implies some sort of OS, even if it's just DIP switch settings. I know that Eric's software runs on embedded Linux because I've ported it to pdaXrom on a clamshell Zaurus. So if I were doing the work, Linux would save me time and effort.

But what really is attractive to me about a fully modern platform housed in a well loved high-end antique case is the possibility of the wizardry being invisible on the one hand, and very obvious on the other. What I mean is that an HP-97 emulation running on this platform could be nearly indistinguishable from a "real" 97. A low end system could achieve that too, I concede your point. But the high-end system could serve out the same calculator software over an integrated network to my desktop. Eric has some really, really cool software in Nonpareil. It all works with an X11 interface. I have no doubt that he could adapt most of it to run with physical keys instead of virtual ones, but the graphical whiz-bang could come along for free!

So what I see is a calculation appliance that could be the best of all possible worlds. It would have a desktop PC interface as well as the physical one. It would have enough

computational power to make it a serious contender for the kinds of problems that are solved on PCs nowadays. (Matlab, R and many other such apps run fine on Linux, of course.) But it would also have the simplicity, tactile feedback and pure joy of using a wonderfully designed and executed piece of calculating hardware, the HP-97, the likes of which does not exist on the shelf today.

That's my "blue sky."

> Quote:
>
> Yes, it's more costly. But remember you are starting out with the shell of an HP-97. Those aren't cheap, so we are definitely talking a high-end system here, before we even start with the computing platform.

I'm only building this because I have a 97 or two hanging around, one prob broken, can't recall.

> Quote:
>
> Since you are going to switch emulations, that implies some sort of OS, even if it's just DIP switch settings.

Why would you think that? Not at all.

You're making the situation way too complex. Your whole baseline system without the application or emulation layer is 100X more complex than the calc emulation and original application!

On power-up, say, one could hold down [2] and [1] keys for HP21, [2] and [5] for HP25, etc. (Or any kinda variation on a similar theme.) This could simply latch a CPU GPIO pin in turn connected to encoder to select, say, an 8K bank of EPROM containing emulation code. The keyscan software, external to emulated firmware, would monitor for an "emulation switch" and change contexts. Or, just loads a few pointers to new code body and opcode decode/opcode emulation routines. Either way, this is maybe 50 bytes of code or a dozen lines of C code.

My definition of OS includes task switches, semaphores/mutexes, etc. even for a tiny 2-4KB RTOS. None of this is not needed here. We have one thread of operation w/occasional interrupt (if even necessary).

> Quote:
>
> I know that Eric's software runs on embedded Linux because I've ported it to pdaXrom on a clamshell Zaurus. So if I were doing the work, Linux would save me time and effort.

I have not seen the code lately but the core of Eric's emulation would be at least nearly platform independent. It's just moving data around in some emulated registers and performing some very very simple operations upon them. It wouldn't be hard to recast that to entirely neutral platform if necessary. The Linuxy stuff is only for display and KB traps and probably quite separable.

> Quote:
>
> But what really is attractive to me about a fully modern platform housed in a well loved high-end antique case is the possibility of the wizardry being invisible on the one hand, and very obvious on the other. What I mean is that an HP-97 emulation running on this platform could be nearly indistinguishable from a "real" 97.

So would mine. And that's what Eric is probably talking about too - doing a 41C-like project on a 97 platform.

[quoteA low end system could achieve that too, I concede your point. But the high-end system could serve out the same calculator software over an integrated network to my desktop. [/quote]

Why go to that grief? Just run the regular Ericware emulation. No need for 'server'.

> Quote:
>
> Eric has some really, really cool software in Nonpareil. It all works with an X11 interface. I have no doubt that he could adapt most of it to run with physical keys instead of virtual ones, but the graphical whiz-bang could come along for free!

It is very cool - for a PC Win or Linux box. On raw native simple hardware it's not needed, and I'd bet he'd agree with me.

> Quote:
>
> So what I see is a calculation appliance that could be the best of all possible worlds.

Ooooh, statements like that scare me ;)

> Quote:
>
> would have a desktop PC interface as well as the physical one.

I'd think at best just squirting text files over RS232 or onto a CF or SD card would be fine.

> Quote:
>
> It would have enough computational power to make it a serious contender for the kinds of problems that are solved on PCs nowadays. (Matlab, R and many other such apps run fine on Linux, of course.)

The only reason calcs had higher-order stuff like that was because calcs came of age when minicomputer time was valuable. As calcs evolved, PCs were too expensive for late HS and also colleget math students.

Anyone doing 'big math' on a calc has my sympathies. For that I use Matlab/Maple, etc.

Calcs are good for general 'playing with numbers'. Don't even need Solve & Integrate (unless it were for core of a calc-based application that I wanted - for example, ballistics for me.)

The HP48, 49 got so complex, to me, that they're lost causes. They solve problems that can be more appropriately solved elsewhere. I had a 48SX and gave it away. Someone else gave me another 48 and I gave that one away too.

in response to message #9 by Bill Wiese

This discussion may indicate why it's difficult to actually bring one of these projects to fruition. There are divergent views on what makes an ideal machine. I'll try to lay out my value system for you, to give you an idea of why I make proposals like the one above.

I hear your complexity argument. I also think the HP48 is overkill for a calculator. It seems to me that the complexity issue might have been as or more important a factor than cost in the loss of the education market to T.I. for example. I like the simple interface of the HP-97 and the HP-41.

But while I think the HP48 missed the mark of usability, I have lots of fun playing with its power. If I'm near my desk and I need to run a quick calculation, I use the 97. If I'm elsewhere, the 15C is handy. But if I sit down to have fun playing with a fascinating calculating machine, the HP-48 competes on an equal footing with any machine in my collection. So I appreciate a "gee-whiz" factor in my work, and in my hobbies.

But still there's the fact that I would choose the 97 over any machine I know to do strictly numeric computation. The great, easy to read display, the big fat keys that are perfect for all ten of my thumbs, the convenience and audit trail of the printer and the simple but powerful programming model I can call on if there's repetitive work all combine to make the machine seem ideal for that sort of stuff.

So here I have what might at first glance seem to contradictory values: simplicity in form and function, and complexity in pursuit of computational power and elegance. But they aren't contradictory. Complexity can be hidden from the user. Well crafted interfaces can do that. Now,

> Quote:
>
> Using existing HP desk calcs - whose KBs and cases and displays are often still in good shape - would be wonderful. For an HP9X desk calc, power and space are nonissues.

Oh, yeah! What is more elegant, more ergonomic, better designed or more appropriate for its task than the zenith of HP small desktop calculators? So I'm enthusiastic about that aspect. But why stop in the late 80's with the technology upgrade? If we want to implement a modern memory architecture, why not go all the way? I mean, cannabalizing (hopefully non-working) Topcat calculators to turn them into "frankencalcs" (In Luiz Vieira's memorable words) is never going to be a production effort. These would all be custom jobs to greater or lesser degree.

A digression about PDAs. They make lousy calculators, I'm sure we can agree. The reason is they aren't designed for that sort of thing, and so lack appropriate features like good keyboards. I have a Treo 600 smart phone. It's a PalmOS device with a keyboard that is fully alphanumeric, but so incredibly cramped that I'd rather chew glass than have to type on it for very long. Why do I put up with it? Well, combining the phone and the PDA means I only have to carry one device instead of two. But put the guts of the PDA into an HP97, and I think you have something that is greater than the sum of its parts.

So if you are going to do a custom job, why not customize to the hilt? What could you gain from that? Well, emulators like Nonpareil could run pretty much unchanged, for one thing. A new UI class or three would have to be written, but if that's done carefully, then it wouldn't have to be repeated for each new simulation. (I know that there are dependencies on the UI that Eric would like to remove. This could be the opportunity to do that.) You'd also gain instant compatibility with the 21st century. Forget USB, go for WiFi. Or just implement a CF slot or two and let the user decide how to fill them. Finally, there are oceans, mountains, planetoids of code out there being written for Linux, and most of it available for inspection and use under the GPL. Maybe 1/100th of 1% would be relevant to a project like this, but the total amount is really, staggeringly huge, so those end up not being bad odds.

Which also means I can't really tell you all the benefits that might accrue from making the hardware and software more capable than they need to be for the job at hand. My imagination, like everyone else's has limits. But those limits aren't the same for everyone. that means someone else could easily imagine something I'd struggle with, and vice versa. Making the machine as programmable as possible means you have a better chance of accomodating the next really good idea, whatever it might be.

Printing from RPL models

*Message #11 Posted by **James M. Prange (Michigan)** on 22 Aug 2005, 7:51 p.m.,*
in response to message #3 by Howard Owen

Agreed, being able to print to a separate printer isn't quite the same, but it can be quite useful, especially when the printer is "handheld" sized.

The 48gII and 49g+ can print via "RedEye" IR to the HP 82240A/B printers, and some Martel Instruments printers, but the range is greatly reduced. Of course the 28C/S and 48S/SX/G/GX/G+ will print to these via IR. Note that the 49G doesn't have any IR capability.

The 49g+ will also print via IrDA if you set it to print "via wire" and transfer via IR. Conn4x's "screen capture" capability depends on setting the calculator to both print and transfer via wire (meaning USB for the 49g+), and then doing a PRLCD operation.

The 48S/SX/G/GX/G+/gII and 49G can print via "RS-232 compatible" wire too, if set to both print and transfer via wire. If set to print "via wire" and transfer via IR, these models (except the 49G) will print via "Serial IR", which can be captured on another calculator using the INPRT program or one of its variants. It shouldn't be too terribly difficult to build a Serial IR to RS-232 adapter; maybe such adapters are commercially available?

In all cases of "via wire" printing, "special characters" can be translated, depending on the setting in the reserved variable IOPAR (which can be set with the TRANSIO command). In general, printing of the 48 and 49 series is affected by the reserved variables PRTPAR and IOPAR, and system flags -33, -34, -37, and -38.

Regards,
James

*Message #12 Posted by **Howard Owen** on 22 Aug 2005, 8:21 p.m.,*
in response to message #11 by James M. Prange (Michigan)

I'd heard the 49G lacked the IR port, but I wasn't sure about the 48GII.

To me, the appeal of the 48/49 machines is the sheer geek glory of hundreds of built in functions and a powerful programming model. (Models, actually.) I would never use the keyboard on one of those machines, even one of the well-built 48s, as a matter of preference to do ordinary calculation with. The keyboards cram too much into a small space for them to be easy to use.

Re: Printing Scientific Calculators - there were some non-HPs...

*Message #13 Posted by **James M. Prange (Michigan)** on 22 Aug 2005, 9:54 p.m.,*
in response to message #2 by Bill Wiese

Yes, my Sharp EL-5520 "Scientific Computer" can print to the Sharp CE-102 "Printer and Cassette Interface", and, with various level shifters, can communicate via RS-232 as well.

No doubt if the calculator is to be used only at a desk, a built-in printer is preferable, but if you want to also carry the calculator around, a separate printer seems better.

It's been a long time since I've really used the EL-5520, but if I recall correctly, in "CAL" mode, it's a non-programmable "scientific" calculator, and in "BASIC" mode it's programmable.

Regards,
James

That would be nice to see printing calculators again. The only ones I know of were produced in the 70s. I have a TI-58C attached to a printer.

HP produced two printing calculators, HP19C and HP29C.

Re: Printing Scientific Calculators

*Message #15 Posted by **Eric Smith** on 23 Aug 2005, 3:18 a.m.,*
in response to message #14 by Eddie Shore

> Quote:
>
> HP produced two printing calculators, HP19C and HP29C.

The HP-29C didn't have a printer. It was the non-printing equivalent of a 19C.

HP's calculators with built-in printers (standard or optional) were:

- HP-10 (but not the 10B or 10C)
- HP-19C
- HP-46
- HP-81
- HP-91
- HP-92
- HP-95C (allegedly still in "production hold")
- HP-97
- HP-97S
- HP 9805
- HP 9810
- HP 9815
- HP 9820
- HP 9821
- HP 9825

Strictly speaking, only the HP-10 and HP-19C qualify as "handheld", although the HP-9x (Topcat) series are close. I've used an HP-97 as a handheld, but it's awkward.

Re: Printing Scientific Calculators

*Message #16 Posted by **don wallace** on 26 Aug 2005, 1:39 a.m.,*
in response to message #15 by Eric Smith

This is quite sideways to topic (hp) but in 1985 I used to repair Canon desktop computers (in Brisbane, Queensland, Australia).

The BX-10 (IIRC) had a built-in thermal printer as well as a small CRT. Nice old machine with BASIC and all trig and transcendentals (not sure about the accuracy).

The beast packed a motorola MC6800 clocked at 2 MHz with 32 kB ram and similar amount of inb-oard firmware. One could load and dump to in-built mini-cassette for storage. CRT did dot and line graphics.

One of our cleints did custom roof truss design with them.

On the subject of coconut elulation, this subject interests me. I wonder how many people (if any) would be interested in a custom engineered pin-for-pin replacement for the coconut CPU. I am not sure, but such a thing (with really massive enhancements) might be do-able with QFP (quad flat pack) components. That puts it at but within the limit of something which could be made by hand...

Dreaming for a minute, one could clock a nice 8 or 16 bit CPU at 64 times the native speed (24 MHz) or down at 16 x (5.7 MHz) for lower power consumption. Doing the emulation in a high end PIC with flash rom and flash ram would give you a very, very nice "calculator".

Custom 30 pin "chip" could be retro-fitted into old coconut PCBs...

Just a thought...

Anyone interested, let me know (write to me)

Xpander on ebay

*Message #1 Posted by **Karl-Ludwig Butte** on 21 Aug 2005, 10:19 a.m.*

Hi all,

there's an HP Xpander on sale at ebay at the moment from Australia with a link to hpcalc.org. This web-page contains the following warning: "Note: All Xpander prototype units are the property of Hewlett-Packard. It is illegal to sell or buy these units, and they must be returned to HP if HP requests it. Please be warned before attempting to buy or sell one on eBay -- the auction could be cancelled, or the seller could be a fraud and you would have no recourse."

How serious one should consider this warning and how big is the risk that this auction is a fraud ? Has anyone experience with this ? Thank's for your opinion and information in advance.

Karl

Re: Xpander on ebay

*Message #2 Posted by **Thibaut.be** on 21 Aug 2005, 12:52 p.m.,*
in response to message #1 by Karl-Ludwig Butte

All distributed Xpanders were prototypes, basically a PDA running on Win CE, that were distributed to some teachers for feedback.

HP decided not to commercialize the Xpander and did not care that all protos were returned. Some persons had the chance to gather several on those and made a lot of $$$ on ebay in reselling them. The price is usually close to $500.

I own one that I never use but I thought it was valuable in a collection to have an item that was not even sold. I think we would all love to own Dave's 95C.

Regarding the (c) mention I guess the seller does not bother and should not be to much worried by HP. After all, I'm free to resell my Xpander as I legally purchased it, am I not ?

Ebay could eventually consider this item not valid, but we all know that ebay is a seller driven business and unless you can prove one is trying to avoid ebay fees, they mostly leave the auction run.

As for an example, I recently bought an ice machine to a 1000+ feedback wholeseller. You can easily see that it uses several 0 feedback ID's to make sure the auction reaches a minimum amount, on nearly all their $100+ items. I told this story ebay, and they said there was nothing to prove I was right...

Re: Xpander on ebay

*Message #3 Posted by **Eric Smith** on 21 Aug 2005, 2:59 p.m.,*
in response to message #1 by Karl-Ludwig Butte

The claim that all Xpanders are property of HP is incorrect. A fair number were sold or given away to HP

employees, and HP has no further say in the disposition of those units.

Re: Xpander on ebay

treasured HP-29c displaying jiberish

*Message #1 Posted by **Hal Bitton** on 21 Aug 2005, 2:51 a.m.*

I have a 29c which I bought new in the late 70's. When the last battery pack for it finally died, I read on a forum (I think this one) that you could just use AA's, put into the battery pack. I tried this and it worked great for a couple of weeks or so. Then, suddenly one day, it started displaying ridiculous results to keyboard entries (it usually displays 1500 when I hit CLX, and other number keys give random large positive and negative numbers. Occasionally it will display properly, but not very often.

Any ideas? Will cleaning any of the circuit boards help? Thanks in advance for any help. Hal

Re: treasured HP-29c displaying jiberish

in response to message #1 by Hal Bitton

> Quote:
>
> I have a 29c which I bought new in the late 70's.

Me too. And back then I also have used AA's which went well all the times. But I've read somewhere that the surplus voltage can be harmful to the calc. Also there's a risk of inadvertently charging the batteries with the adapter. Since then I've never used AA's anymore. I even charge the NiCd's or NiMh's (both work fine) always outside the calc, for I've read that the charging circuit is critical to the rechargables in the old times. If you can get them, 500 or 600 mAh NiCd are the best choice to use.
I cut the middle bar from the battery pack, fixed the springs with a piece of double sided tape and am now able to replace cells very easily.

> Quote:
>
> Occasionally it will display properly, but not very often.

I do hope it's not too late. Return to rechargables immediately.

O! And don't ever connect the calc to the mains without rechargables in it. That's definitaly harmful.

Re: treasured HP-29c displaying jiberish

*Message #3 Posted by **Vassilis Prevelakis** on 21 Aug 2005, 5:13 a.m.,*
in response to message #1 by Hal Bitton

make sure that the batteries make good contact with the terminals inside the battery compartment.

These terminals are very unreliable.

I have an HP-21 and I have been using it with alcaline batteries for the last year or so and I only have

problems every time I change the batteries and have to make sure that they make good contact.

in response to message #1 by Hal Bitton

Hi:

I read this article of katie long time ago and it was very helpful with an old HP-25 HP Articles forum (nº267) by Katie Wasserman. I had also an HP-29C with the same problem as yours and, although it was not tested with that model, I tried this solution. ¡¡¡ IT WORKS !!!

I think that it is worth you try it.

Regards

Jon

Re: treasured HP-29c displaying jiberish

*Message #5 Posted by **don wallace** on 1 Sept 2005, 10:27 p.m.,*
in response to message #4 by Jon

I think you have an intermittent electrical connection in your calculator. Data is getting scrambled while traversing the buss. Maybe you have some damage, but if the calc ever behaves normally you can basically rule this out and the actual logic is okay.

If you are really keen I can fix it for you...

Don W

Re: treasured HP-29c displaying jiberish

*Message #6 Posted by **Hal** on 5 Sept 2005, 11:39 a.m.,*
in response to message #5 by don wallace

Thanks Don for your response, My 29C is working normally now, aside from the fact that I have to reposition the battery pack occasionally to get it to come on. I think your intermittent connection theory is right on the money. It seems to be the battery contact buttons on the circuit board. I was thinking maybe re-tinning them with some fresh solder would help. What do you think? Hal

Re: treasured HP-29c displaying jiberish

*Message #7 Posted by **don wallace** on 5 Sept 2005, 6:40 p.m.,*
in response to message #6 by Hal

Ah! That's right! Thye had "rivets", didn't they?

(I remember an old friends 33E...)

Yes, for sure. But I'd try lightly sanding them with wet and dry emery paper, first. Tht's probably all you need to do.

You may have acracked track or the rivet may not be making contact with the PCB track it's attached to...

Re: treasured HP-29c displaying jiberish

*Message #8 Posted by **David Smith** on 7 Sept 2005, 3:49 p.m.,*
in response to message #7 by don wallace

I now clean Woodstock contacts by placing a good sized drop of De-Oxit contact cleaner on the contact and then use a wire brush attachment in a Dremel tool. It cleans the contact very well and does not remove as much metal as sandpaper.

Re: treasured HP-29c displaying jiberish

*Message #9 Posted by **David Smith** on 3 Sept 2005, 11:39 a.m.,*
in response to message #1 by Hal Bitton

A lot of funky HP problems can be fixed by cleaning the circuit boards with 91%+ isopropyl alcohol. Old solder flux, etc (often invisible) seems to the problem. Many machines had a least a few parts hand soldered at the factory and they never seemed to clean the flux on them, but even "clean" boards can have problems.

HOW TO RESET A HP 48G

*Message #1 Posted by **Jorge** on 21 Aug 2005, 1:32 a.m.*

Hi,I have a HP 48G with an "invalid card data" message.How can I reset it to get rid of the warning,it shows everytime I turn it on.Thanks

You can try...(was: HOW TO RESET A HP 48G)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 Aug 2005, 2:05 a.m.,*
in response to message #1 by Jorge

Hi, Jorge;

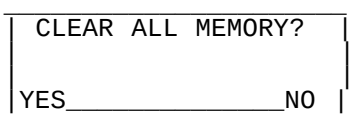
you can try resetting the calculator:

```
press [ON] and hold it;
press [C] and release it;
release [ON].
```

The calcualtor resets to a known condition. It is not supposed to clear memory contents. If it does not work, a hardware reset is available by carefuly removing (and placing in a safe place) the upper-right rubber feet, facing the back of the calculator, and gently inserting the tip of an unfolded paper clip in the small hole you'll find in the rubber-feet recess. As you feel the paper clip tip cannot go any further, it means you succeeded closing the reset contact in the mainboard. Hold the paper clip for a few seconds (three?), remove it and turn the calculator on again. If you still see the message, chances are you have some library installed in the calculator that is searching for some resource in a card. If yours is an HP48G (and not a GX), I see no way to originate this sort of message from an actual invalid data card, only from a program or library.

If neither of the procedures below succeed, I`d suggest trying a memory clear procedure:

```
press simultaneously [ON], [A] and [F];
release each of them in the opposed order;
you'll see the message:
```



```
if you decide for [NO], all memory is cleared.
```

If you want to keep current data and do not want to clear all memory contents, then wait for some other suggestions. I`d actualy like to know what else to do, too! q8^)

Success!

Luiz (Brazil)

*Message #4 Posted by **Howard Owen** on 21 Aug 2005, 2:40 a.m.,*
in response to message #1 by Jorge

If you really have a GX instead of a G, perhaps you also have a RAM card that isn't initialized?

If you dont mind losing the contents of your port RAM (not user memory,) a less drastic thing to try is left-shift 2 (Library), NXT, PINIT, That will initialize all the port RAM found in slot one and/or two. Then try turning the calc off, then on and see what you get.

HP 6S Solar - mini review

*Message #1 Posted by **John L. Shelton** on 20 Aug 2005, 8:12 p.m.*

Just for grins, I ordered a new-in-blister-pack HP 6S Solar. I figured it would be fun to experiment with HP's cheapest calculator. From the Museum description, I expected a minimal-feature machine. I was surprised to find a calculator fully worth the USD $8 I paid (shipping included.)

Although algebraic, not RPN, this is a full-featured calculator that is more powerful than my favorite HP-45.

It offers the following advantages over the HP-45:

- LCD display and solar power - always on, never needs recharging.
- 42 keys instead of 35
- slim size really does fit in a shirt pocket
- animal-friendly non-leather protective case. (Well, it's a cheap brown plastic envelope made out of environmentally non-friendly oil, but let's be polite and say something nice about it.)
- instruction manual in English and French.
- 6 levels of "stack" using parentheses
- Base 2, 8, 10, and 16 arithmetic with bit-logic operations
- more trig functions
- Fraction mode, allowing entry of numbers like "four and one-third" (4 1/3) Fraction calculations stay in fractions until mixed with decimal numbers, then get converted. E.g. 1/3 + 1/3 = 2/3, but 1/3 + 0.25 = 0.5833333333.
- Fixed or Floating display
- single-digit correction "backspace" key for editing entry

There are a few drawbacks:

- No RPN. Whoops.
- Inexpensive manufacture; probably will last 5 years, not 50.
- Statistics are 1-dimensional, not 2-d
- Only one memory location "M", plus a stack-constant
- Manual is poor quality without the traditional intelligence and useful examples
- Keyboard layout is non-intuitive. Example: the four (shifted) functions for display modes (Fix, Flo, Sci, Eng) are not on adjacent keys. And the "shift" key is labeled "INV".

I have not had a chance to check accuracy. The manual claims internal 11-digit arithmetic, displayed as 10 digits. Mantissas go up to E+99. There are no thousands-group display symbols. The decimal point is easy to read. Mantissas are in a smaller font, so are clearly distinguished from the Radix. Like some non-HP calculators, fractions are shown with a very strange notation (because the display digits are 7-segment.) Keyboard feel is acceptable, at least for its price. Keys are rubbery, but make a positive click as they engage; I have not found any missed or doubled keystrokes.

Performance is lackluster. 2^5 = 32 takes about 2 seconds. There is no "OFF" key, common on solar calculators. I prefer solars that do have an off key; that allows the internal capacitor to charge up a bit, rather than running low. The calculator works OK in a darkened room with a single 60 watt lamp, but display contrast isn't great. In a sunlit

room, display contrast is just fine.

All in all, a cute, semi-useful calculator with an HP brand name on it.

Re: HP 6S Solar - mini review

*Message #2 Posted by **Norris** on 22 Aug 2005, 6:12 p.m.,*
in response to message #1 by John L. Shelton

I've pointed out before that the 6S Solar is a superb field calculator.

The 6S Solar is small, thin, and light, and fits easily in a folding clipboard. It's already on whenever you open the clipboard. The display is legible in any kind of light, from flashlight to direct sun. And it apparently never, ever, ever runs out of power.

People in this forum rave about the shirt-pocket size and long battery life of Voyagers. Yet a 6S Solar is clearly far superior in both of these respects.

Does the 6S Solar have drawbacks? Most certainly. There is no RPN or programmability. The keys rock -- but not in a good way. It is clumsy with sexagesimal math, and so it is not handy for timed tests or surveyed angles. And sadly, it is no longer readily available or cheap.

For comparison, I recently got a Casio FX-260 for field use. The Casio offers some advantages. It has a better keyboard (still not great, but better). It offers real sexagesimal math. And it is still cheap and readily available.

But the Casio still does not match the 6S Solar in other respects. Most importantly, it has no battery backup. This means that it is awkward or impossible to use in dim light. It also means that the contents of the display and memory are lost whenever you close the clipboard.

Furthermore, the Casio is a tasteful brown color, which makes it easier to lose if you set it down on the ground. It is much less conspicuous than the 6S Solar, which has a flashy metallic faceplate. I suspect that the 6S Solar can generate enough bling-bling to serve as an signalling mirror on a bright day, but I have not actually tried it.

Bottom line: the Casio FX-260 is OK, but the 6S Solar is still my #1 choice as the best scientific calc for outdoor use on foot. You can easily carry it anywhere, and you'll never have to worry about bringing extra batteries.

Re: HP 6S Solar - mini review

*Message #3 Posted by **GE** on 23 Aug 2005, 5:05 a.m.,*
in response to message #2 by Norris

The 6S is rugged and reliable, it's my main machine at work.

However, I have a complaint that might seem silly : the [AC] key reverts to degree mode ! Aaaargh !!!! Every time I press that one key I curse HP for this misfeature.

Another minor point : press 0 . 1 2 3 4 5 6 7 8 9 Now press 1 - it is ignored. The machine always displays the leading zero, which is useful to no one (I agree however that no one needs 10 digits of precision in real life).

Leading zeroes

*Message #4 Posted by **Karl Schneider** on 24 Aug 2005, 12:40 a.m.,*
in response to message #3 by GE

GE's post, modified by me to omit the leading "0":

> Quote:
>
> press . 1 2 3 4 5 6 7 8 9 Now press 1 - it is ignored. The machine always displays the leading zero, which is useful to no one...

The HP-41 does not automatically display the leading zero as a sub-unity number is entered without it, but will display it when the number is fully "committed" by ENTER or an operation. Thus, it will allow entry of a tenth digit (1 in your example), but not any more, as it has a 10-digit display.

The Voyagers are the only "high-quality" HP calc's with a 10-digit display (10C/11C/12C/15C/16C) that came along afterward. They will automatically display the leading zero as the number is entered without it, then refuse to accept a tenth digit.

I disagree with you -- leading zeroes are useful in that they clearly indicate that there is a radix to the far left of the number, which might otherwise be overlooked. Since the US uses a period for the radix, this is important for prevention of errors.

That's why the numbers are properly written "$0.26", not "$.26".

-- KS

Re: Leading zeroes

*Message #5 Posted by **GE** on 24 Aug 2005, 4:59 a.m.,*
in response to message #4 by Karl Schneider

You're right, there should be no leading zero in my example. Actually, the 41 may accept a tenth digit, but the point was that the 6S does not.
I like this little beast, as a "lost-able" or "stolen-able" machine.

By the way, I found another 'bug' in the forum software : when using the buttons below the text area to compose a message, it inserts the marker at the end of the current text, no matter where the insertion point is at the time.

HP 35 adapter voltage

*Message #1 Posted by **Michael** on 20 Aug 2005, 5:47 p.m.*

Hello, what should be the correct voltage at the three pins of the connector of the HP 35 adapter? Thank you for your answers in advance.

Re: HP 35 adapter voltage

*Message #2 Posted by **Randy** on 20 Aug 2005, 7:11 p.m.,*
in response to message #1 by Michael

See Classic Charger Schematic for the internals. As viewed from the rear of the calculator, the left pin is battery charger supply (~16vdc open circuit), the center pin common and the right pin ~4-5vdc which powers the calculator when plugged in.

HP 35 adapter voltage

*Message #3 Posted by **Bernhard** on 20 Aug 2005, 7:15 p.m.,*
in response to message #1 by Michael

On the plug you see three pins, one with - one with + and one blank. The - is the ground reference. The + is the current source for charging, use an amperemeter to see about 50...60 mA there. The blank one is the positive supply which is about 3.6 Volts at full load (at a 25 Ohms resistor). You can't use a voltmeter without load resistor there because the circuit within the charger needs a load to work.

There are two most common problems with these adapters. 1) broken wire at the plug, cut open the plug, resolder, and reglue. 2) Bad Electrolytic capacitor in the adapter, then excessive ripple (seen by oscilloscope with calc as a load) or chaos in the display when attempting running calc from the adapter. Both can be fixed.

Regards, Bernhard

Re: HP 35 adapter voltage

*Message #4 Posted by **Michael** on 21 Aug 2005, 5:09 a.m.,*
in response to message #3 by Bernhard

It seems my adapter is broken at least by two ways: The blank pin shows correctly cca 5V DC, but on the plus pin there is upper half of the sinusoid, peak cca 15V, but the inverted lower part is missing completely, so peaks come only in one half of the period. It seems that one half of the diode bridge is faulty and moreover the capacitor is bad, too. Would it be possible to dissasemble the adapter without causing any damage to it?

Re: HP 35 adapter voltage

*Message #5 Posted by **Tony Duell** on 21 Aug 2005, 9:28 a.m.,*
in response to message #4 by Michael

I've only worked on the UK, US (dual-voltage) and car versions of the adapter, but on those there are 4 small screws on the bottom. Take those out, the case comes apart and you can get to the PCB.

On the dual-voltage version, the voltage selector switch falls apart when you remove the PCB. Make sure you don't lose any of the parts!

You must, of course, unplug it from the mains before opening it!

When re-inserting the screws, turn them counterclockwise until they seem to engage in the original threads, then tighten them. That way, you don't re-cut the threads in the plastic. It's less likely to strip that way.

Re: HP 35 adapter voltage

*Message #6 Posted by **Michael** on 21 Aug 2005, 10:52 a.m.,*
in response to message #5 by Tony Duell

I have the original old style recharger, US model 82002A. There are no screws visible, so it's probably unrepairable without visible damage.

Re: HP 35 adapter voltage

*Message #7 Posted by **Bernhard** on 21 Aug 2005, 6:08 p.m.,*
in response to message #6 by Michael

Dear Michael,

before trying to open the charger I'd advise you repeat the measurements on the plus pin towards the minus pin properly using an amperemeter on the plus pin (Only there !), see my post #3. Or put a known load resistor (such as 50...75 Ohms) there and then use the scope to see the voltage on the resistor, it should correspond to I = 50...60 mA (U = I * R) and not have much ripple. Measuring the active current source at the plus pin with a scope (no load) means that the voltage on the plus pin will fluctuate as the Electrolytic is charged and discharged by the sinusoid. If you saw 120 Hertz repeat rate (double the line frequency), the rectifier diodes most likely are good anyway. Then, if you put the 25 Ohms load resistor on the blank pin (against the minus pin) and still see about 3.6 Volts DC there, without larger dips below this value (dips at 120 Hertz), then the Electrolytic also most likely is good. So I don't see which problem you might have with your charger. To me, it seems to be good, at least based on the info you have posted.

best regards, Bernhard

Re: HP 35 adapter voltage

*Message #8 Posted by **Michael** on 22 Aug 2005, 10:27 a.m.,*
in response to message #7 by Bernhard

Hello Bernard, maybe my post was not correctly written, English is not my native language. The image at the oscilloscpe looks something like this: _n_n_n_n so IMHO half of the diode bridge should be faulty. Otherwise the image should look like nnnnnn. And if the capacitor would be OK, it would hold the steady voltage, since it couldn't be discharged when no load was present. So IMHO also the capacitor must be broken, otherwise the image without any load at the plus pin should look like this: _____ and so even with one diode burned. Now when the adaptor is attached to the calculator, erratic numbers appear and dissapear.

Re: HP 35 adapter voltage

*Message #9 Posted by **Bernhard** on 23 Aug 2005, 5:19 a.m.,*
in response to message #8 by Michael

Hi Michael,

I already had the symptom of erratic (flickering) garbage numbers when the calc is operated from the charger several times (the calc does not take any key entries), and replacing the Electrolytic capacitor always has fixed it. I never found any faulty diodes.

best regards, Bernhard

Re: HP 35 adapter voltage

*Message #10 Posted by **David Smith** on 22 Aug 2005, 5:02 p.m.,*
in response to message #6 by Michael

Al the HP35 adapters are screwed together. Some have the screws under the corners of the label. Also some used torx screws or even security torx screws (#6 if I remember corrctly). A very common failue is a bad electrolytic filter capacitor. The most common failure is broken wires in the calculator plug.

HP-67/97 special "synthetic" cards

*Message #1 Posted by **Geir Isene** on 20 Aug 2005, 4:15 p.m.*

I have heard rumors of special cards that enables some tricks on the HP-67 or 97. Anyone here having access to these cards and can send me a set of copies?

Re: HP-67/97 special "synthetic" cards

*Message #2 Posted by **Eric Smith** on 21 Aug 2005, 3:49 a.m.,*
in response to message #1 by Geir Isene

I don't have any of those cards, sorry.

A word of warning, though. Don't ever try to print "non-normalized numbers" (NNNs) on the 97. On some 97s, printing a number containing a hexadecimal "F" digit can cause the PIK chip which controls the printer to leave some of the drivers turned on, which burns out the printhead in a few seconds. If you ignore the warning and try to print NNNs anyhow, if you smell smoke or notice any other funny behavior from the printer, turn off the calculator IMMEDIATELY, and you *might* save the printhead. There is unfortunately no source for replacement printheads other than cannibalizing other Topcat series calculators.

Whether a given 97 has this problem apparently depends on whether the PIK chip was made by Mostek or AMI, but I'm not sure which is which. I wouldn't risk it on any 97.

On the 67 it is safe to play with NNNs. Aside from amusing displays, it isn't very practical.

The 67/97 have six undefined instruction codes. On the 67 it is possible to enter some from the keyboard using key sequences with simultaneous presses of two keys. On the 97 this is not possible, because the PIK chip has a hardwired keyboard encoder that rejects phantom keys. In any case, the six undefined instruction codes all execute as NOPs on both the 67 and 97.

Re: HP-67/97 special "synthetic" cards

*Message #3 Posted by **David Smith** on 22 Aug 2005, 5:05 p.m.,*
in response to message #2 by Eric Smith

I have been thinking about building a printer interface card that would allow the use of 82143A printers in the HP97, etc. It would need a DC-DC converter and a microcontroller to adapt the different speeds of the print mechanisms.

HP-IL over Cat5 - Compatible?

*Message #1 Posted by **Howard Owen** on 20 Aug 2005, 2:17 p.m.*

The HP-IL spec says cable can be up to 100 meters long and that it must have 100 Ohms impedance. I measure ~50 Ohm resistance on a single strand of Cat5 twisted pair cable that is many 10s of meters long. The Cat5 spec calls for 100 Ohm impedance, so I assume that's the sum of two strands or 1 pair. The HP-IL spec calls for sheilded twisted pair on lengths over 10 meters.

My question is, despite the HP-IL spec, has anyone had success using UTP (Cat5 or other) to connect HP-IL devices? I'd like to save money on the cable, but I'm not willing to go hacking on my existing cables without some idea the project may work. 8)

Re: HP-IL over Cat5 - Compatible?

*Message #2 Posted by **Tony Duell** on 20 Aug 2005, 2:37 p.m.,*
in response to message #1 by Howard Owen

The '100 ohms' impedance of the HPIL cable refers to the characteristic impedance of the cable, and not the DC resistance of one of the conductors. The chararacterist impedance is more a property of the dielectric (insulator) and the dimensions of the cable.

You cannot measure characteristic impedance with a DC ohmmeter (which is what I assume you used) -- about the only intstrument that will measure it is a time-domain reflectometer.

I can't remember the characteristic impedance of Cat5, but it should be a 'standard' value. For the use that Cat5 is normally put to, it would be a rather important parameter. I would guess it's somewhere around 100 ohms, but I wouldn't bet on it.

Re: HP-IL over Cat5 - Compatible?

*Message #3 Posted by **Howard Owen** on 20 Aug 2005, 3:05 p.m.,*
in response to message #2 by Tony Duell

Yes, the spec says 100 Ohms.

I'm a rank amateur when it comes to electronics. I read the wikipedia entry on impedence, saw where it mentioned that for a steady state circuit, the impedence == resistence (since inductors are closed and capacitors are open.) and assumed that if the Cat5 spec said 100 Ohms, it meant it was the same over the operating range of the cable. I tested the resistence for the only data point I could collect, since I don't have a TDR, or a function generator or a test oscillator. But I think the spec may save me trouble there.

The question I have is the STP vs UTP issue. 100 Ohm STP is scarce. Most STP is 150 Ohm stuff (for token ring I think.) There's 100 Ohm "Screened Twisted Pair" (ScTP) which has a shield around the cable bundle, but the pairs themselves aren't shielded. If the HP-IL connectors were commonplace, I wouldn't hesitate to hack a couple of cables to pieces and just give it a shot. But while you can scare them up from time to time, and while I do have more than I presently need, the fact that they aren't manufactured anymore makes me reluctant to start using the side cutters.

Re: HP-IL over Cat5 - Compatible?

*Message #4 Posted by **Eric Smith** on 21 Aug 2005, 3:52 a.m.,*
in response to message #1 by Howard Owen

I suspect that Cat 5 UTP should work fine, but I haven't tried it.

I think the requirement for shielding is a case of HP being overly conservative. UTP should be fine. Using non-twisted cable for more than 10 meters might well be problematic though.

Where are you going to get connectors for the ends? Or are you just trying to lengthen some existing cables?

Re: HP-IL over Cat5 - Compatible?

*Message #5 Posted by **Howard Owen** on 21 Aug 2005, 9:17 a.m.,*
in response to message #4 by Eric Smith

I was planning on hacking on two existing cables to produce a single lengthy one with two connectors on each end. The idea is to extend the loop from my computer room to the bedroom. Sort of an HP-IL LAN. 8)

Re: HP-IL over Cat5 - Compatible?

*Message #6 Posted by **don wallace** on 24 Aug 2005, 4:51 a.m.,*
in response to message #5 by Howard Owen

Hi Howard.

Tony is right. But all this is somewhat beside the point for you.

I would use flexible copper wire rather than CAT-5 which is semi-rigid single core wire and as the connectors may move around a bit you may end up with an open circuit and no loop. Thats not all that good for the HP-IL driver chip in the long run.

If you do not live near a radio station and you make sure your MOBILE PHONE is NOWHERE NEAR the loop (!), then you can use very light speaker cable for the HP-IL. The impedance is not dead rightbut it will work fine over the length you are talking about.

The HP-IL is designed to use in the control of among other things, RF (radio frequency) measurement equipment. This equipment or more properly the stuff it tests, generates interference which would stop HP-IL dead in it's tracks and probably do damage if the power level was high enough.

Since I assume you are not testing RF equipment at home twisted pair or even speaker wire shuld be fine for you at home.

If you are nervous then you can use twin core shielded audio coaxial cable. But be sure the shield is connected to ground and both signals wires are not connected to anything but the HP-IL pulse transformers. If you have a technical (good electronics repairman) friend with a CRO they can probably help you if the link doesn't work. Electrical "Reflections" can be seen (as ringing) using a CRO.

I would not use UTP CAT-5 cable for this app. myself. Just my opinion.

Further quiries, just write to me.

Don Wallace donwallace63@yahoo.com.au

P.S. Hope this helps.

Re: HP-IL over Cat5 - Compatible?

*Message #7 Posted by **don wallace** on 24 Aug 2005, 7:23 a.m.,*
in response to message #6 by don wallace

Hi Howard.

To clarify some omissions I made:

Very light speaker wire (instead of speaker wire).

RF equipment would stop HP-IL OPERATING OVER UNSHIELDED CABLE dead in it's tracks. That's why the HP-IL ssytem uses shielded cable.

HP-IL operates over a BALANCED LINE. In plain english this is two wires (shielded) which are both "floating" with respect to "ground" (a reference point) and "driven" with respect to EACH OTHER.

That is, you don't have one wire connected to ground.

When a "1" and then a "0" is sent, you get, on the cable: _ WIRE#1 ----------/ \--_/------------ _ WIRE#2----------_/--/ \------------

This is called a "differential signal" over a "balanced transmission line". It is inherently IMMUNE to NOISE. The impedance you are talking about (cable impedance), is the high frequency IMPEDANCE the two wires present to the pulse transformers. It's dependent on the insulating medium between them (which determines the CAPACITANCE) and the INDUCTANCE of the wires themselves...

Try the Wikipaedia on these terms, as you already know, it's really cool.

Please forgive my rough ASCII ART... ;-)

Don W

When a

Re: HP-IL over Cat5 - Compatible?

*Message #8 Posted by **Howard Owen** on 24 Aug 2005, 10:34 a.m.,*
in response to message #7 by don wallace

Thanks for the information, Don.

I have some questions.

- The short haul (<10 meters) HP-IL cable isn't shielded, is it? The cable feels very flexible, and the wires are quite thin.
- Your opinion on CAT-5 is that the solid core makes it unsuitable for mating to the HP-IL connectors? Or is there something else that makes it problematic?
- What is the issue in the gauge of the wire? Why would thin speaker wire be more suitable?

Thanks for the pointer to Wikipedia on impedence. It was helpful to reread the entry. I was already familiar with "balanced" circuits from using microphones with that feature. Also I read the discussion in the HP-IL spec that emphasized the good immunity to noise this offers.

Wikipedia to the rescue on "CRO"! In the states, we tend forget the "Cathode Ray" part and just say "Oscilloscope". If we want to shorten it, "scope" is often used.

Regards, Howard

Re: HP-IL over Cat5 - Compatible?

*Message #11 Posted by **Garth Wilson** on 25 Aug 2005, 7:33 p.m.,*

in response to message #6 by don wallace

I've used unshielded HPIL in the control of an RF test setup where we were doing repetitive production testing power amplifiers at 175MHz. No problem at all. Cell phones start at about 900MHz IIRC, and the HPIL transformers and circuitry would be much too slow to respond to, or interfere with, the cell phone stuff.

Characteristic impedance (Zo) is the impedance a cable will appear to have for RF when the load is at that impedance, regardless of length. IOW, for 50-ohm load out at the end of a 50-ohm cable will still appear to be 50 ohms, no matter how long the cable is. If the cable is sufficiently long, there will be a substancial amount of power lost in it, and of course it will introduce the propagation delay; but you'll still see 50 ohms looking into it. If the load is something other than the cable's Zo, some of the power fed into it will be reflected. For steady-state RF, you can use the Smith chart to determine the various effects like SWR, return loss, and the complex impedance looking into the cable. If the cable is long enough to present substancial losses, you'll need the attenuation data to get the right results with the Smith chart. What's more important with the fast digital work however is the reflections you get when the transmission line's Zo does not match the load. Those reflections will cause unwanted triggering of registers or otherwise be erroneously interpreted as data and cause problems. The cable would have to be pretty long to cause this kind of trouble with the slow edge rates of HPIL.

I have not tried to measure HPIL's voltages, rise times, or load impedances, but I don't think it would be difficult to get an extension cable to work. The transmission-line losses of 20 meters at the frequencies of interest will be minimal. IIRC, cat-5 cable is 100 ohms, which I think is what someone said HPIL wants. (I can't see the post now while writing the response.)

Re: HP-IL over Cat5 - Compatible?

*Message #12 Posted by **don wallace** on 25 Aug 2005, 9:45 p.m.,*
in response to message #11 by Garth Wilson

Hi all. Hi Garth.

In my posts to Howard I was being *exceedingly* cautious as I don't own any HP-IL gear.

The cellulars are very very (ultra ;-) high frequency. However, I have noticed serious interference with computer monitors (internal frequency response in the low MHz range for the gun drivers and deflection circuit operating frequency range of up to only say 40 kHz) from cell phones at close range.

Cell phones, as they are a spread-spectrum device and they frequency hop slowly, do give some LOW FREQUENCY MODULATION of the RF.

Also, the cell phones use data compression and idle their transmitters when there's no speech to save power, so the transmitters operate in a burst mode most of the time. The resultant "keying" of the RF on and off does generate a lot of hash. Also, they generate surprising pulsed levels of power, maybe half a watt or so?

I would imagine that one would not have trouble unless the mobile was within six inches (maybe three?) of the HP-IL cable. The wire conductors are close together in the cable so the differential signal would be quite small.

I also forgot about the effect the pulse transformers would have as effective RF chokes in limiting the transfer of power to the HP-IL chips. However I'm not sure about the possibiliy of some capacitive coupling... but the calc is not grounded so it shpouldn't matter...

Once in the HP-IL driver chip output driver, any RF would get recitifed by the junctions and you would need a bit of power to do damage, but how much power would get generated I am not sure. By that time of course, your link would not be still working as the data bits would be too noisy.

But yeah Garth you are dead right of course. You used it there so you would know. I was thinking of you and your worklab as I wrote that post.

I forgot something:

Speaker wire should wr\kr just fine.

On a different subject related to SHIELDING, many years ago as a fellow student one my my mates at uni told me that while working in the high voltage lab his hp41 lost all memory contents while in it's pouch. he asked me what could done about it.

I told him to line the pouch with Comalco ALFOIL. He did so and reported compete success (!)

The alfoil cooking foil acted as a simple Farady Cage ;-)

in response to message #1 by Howard Owen

Well, it works.

To all you hard core EE types, let me just say, I'm glad you're here. I'm a software guy. I figured it would be fun and interesting to hack on hardware as a hobby. But I lack skills in that area. Now, I'm not talking board design or anything like that. I'm talking basic electronic tech manual skills, like soldering. I've actually gotten fairly OK for crude work, once I got myself a temprature controlled iron and figured out that it has to be *really hot* to do any good. But I still appreciate the help and input I get from the more experienced folks here.

I happen to have a spool of Cat5 here in my work cabinet. That, and the fact that the specified impedence of Cat5 matches the HP-IL's spec, and that for lengths over 10 meters, that same spec calls for twisted pair are what motivated me to consider this approach. Don's warnings regarding the problem of mating the solid core Cat5 wire with the stranded HP-IL cable gave me pause, however. So I figured I'd solder decapitated HP-IL connectors onto Cat5 cable, and cover them with shrink wrap in an attempt to protect the awkward mechanical mating of the dissimilar wires. Through trial and error, I found that the following process worked pretty well:

1. Cut the heads off an HP-IL cable. (This is one of those "puckering" moments for an inexperienced electronic tech who is jumping into the unknown!)
2. Strip about 3/4" off the ends of a CAT5 pair and both wires of one end of the decapitated HP-IL cable.
3. If this isn't your first end, *mate the other end of the HP-IL to the one you are about to solder.* This makes it easier to be sure you solder the right wires.

4. Mount the wires to be soldered in some sort of frame. I use one of those el-cheapo soldering stations with the magnifying glass and alligator clips on rails. I remove the glass (since I use a larger illuminated one) and put each end of the work into one of a pair of clips. On the HP-IL side, the hard plastic connectors are a good place to appy the clip. On the Cat5 side, the cable itself is OK.
5. If this isn't your first end, check the end you already did to see which one of the Cat5 wires to solder to which HP-IL cable. The connections should be "straight through" as the mated cables will show.
6. Cut a two inch piece of 3/16" shronk wrap tubing and pass the Cat5 pair through it.
7. cut two one inch sections of 1/16" shrink wrap and thread *one* of the wires through each.
8. The bundle of shrink wrap should be able to move at least an inch away from the work, because you are about to apply lots of heat there. 8)
9. Maneuver the stripped ends so that they overlap each other on the same plane
10. Bend the *Cat5* wire around the *HP-IL* wire. This is the opposite of what the wires "want" to do. The reason is, the solid core Cat5 wire will retain its shape, which the soft HP-IL cable will conform to. This means that it will stay in place, which allows you to solder with both hands free.
11. Make only two to three revolutions around the HP-IL cable depending on the length of the stripped wire. This makes a nice flat arc to place the soldering iron tip on.
12. Heat your iron to above 600 degrees, Fahrenheit. I use 640. Tin the iron.
13. Place the soldering tip underneath the arc of the entwined wires at one end of the arc.
14. Count to three, moderately slowly
15. Apply the solder to the top of the wires, above where the iron is placed. It should immediately melt.
16. draw the iron along the underside of the wire bundle while dragging the (shortening line of) solder along the top.
17. Remove the iron and solder from the work.
18. After cooling and inspection, trim off excess wire at both ends of the new join.
19. If this is your second connector, you have reached your earliest opportunity to test the cable. If you find a problem here, you'll save youself some work compared with finding it later. Test continuity through both conductors. You got the right ones? Good. Be sure the cable doesn't short at either end and plug it in to a test bed. I used EMU71 running on a PC to CAT a real 9114 on a loop that included my cable.
20. Slide the small shrink wrap sections over the soldered wires and heat them until snug. (I use a cheap heat gun which works a lot better than the iron.)
21. If you don't get all the conductor covered with the shrink wrap (oops) dress it with electrician's tape.
22. Slide the larger shrink wrap over the two wrapped joins and shrink it into place.
23. Test the cable again!
24. You probably want to HP-IL out *and back* with the same cable. If so, do a second pair like the first on the same cable. (But with the gender switched, of course. You should have both a male and a female HP-IL connector at each end.)

And it works with about a 45' cable!

But that joint is still brittle. The shrinkwrap doesn't seem to do the trick. The stress occurs in the Cat5 copper just on the edge of the solder joint. Any ideas?

Update: It was brittle while I was trying to appy the shrink wrap. After I got that applied, I had no further trouble. It's undoubtedly still brittle, but protected somewhat by the plastic tubing. A radical bend at the end of the solder joint could still ruin my whole day, so I'm careful with it.

Well, I understood your objection, and tried to design around it.

The main deal for me is the fact that it's twisted pair, and the spec calls for that over 10 meters. The fact that the impedence is right also influenced me. And also there's the fact that Cat5 packs eight conductors - four pairs - into the cable. That means I only have to run one 50' cable instead of two. Plus, I have that big 'ol spool. 8)

Hi Howard.

General info for intrepid hobbyists like yourself (good onya!):

FYI, a soldering iron should be set at very close(+/- 5deg.) to 310 degrees celcius (deg.F? where's my calculator ;-)

The drama is measuring a temperature that "high" if you don't have any industrial thermometer gear...

The main rules for soldering are: 1: Cleanliness IS godliness: (keep your wires, iron [and for Mil-Spec work, the solder as well] clean)

2: DO NOT MOVE the wires before solder has set. 3: Avoid opens and shorts if at all possible! 4: Avoid wiring errors (!) 5: Avoid over-heating semiconductors (!)

Cheers,

Don

Thanks for the info, Don.

> Quote:

> FYI, a soldering iron should be set at very close(+/- 5deg.) to 310 degrees celcius (deg.F? where's my calculator ;-)

That works out to 590 degrees F. (599 F for 315 C.) So I'm "a bit" high in my estimate. 8)

I assume this has something to do with the melting point of standard rosin-core solder? Do different solders call for different temperatures, or is it more material dependent?

> Quote:
>
> The drama is measuring a temperature that "high" if you don't have any industrial thermometer gear...

I use a soldering station from Radio Shack with temperature sensing built in. It was under $100.00, so I imagine it isn't the highest quality obtainable.

Re: HP-IL over Cat5 - Compatible?

*Message #20 Posted by **don wallace** on 1 Sept 2005, 6:35 p.m.,*
in response to message #19 by Howard Owen

Hi Howard.

In answer to your last post:

H.O.: That works out to 590 degrees F. (599 F for 315 C.) So I'm "a bit" high in my estimate. 8)

D.W: That's ok. Better a ittle hot than a little cold...

H.O.: I assume this has something to do with the melting point of standard rosin-core solder? Do different solders call for different temperatures, or is it more material dependent?

D.W.: Without boring people here, Material Science is interesting if you don't have to study to pass an exam on it. Solder (for electronics) is an alloy of lead and tin. When mixed these metals change both the melting point and the characteristics of the alloy when "freezing".

The solder for electronics work is about 60% lead 40% tin. Ratios vary a bit but not much. The reason for this is that this ratio constitutes a "eutectic mix" of the two elements. A eutectic mix has the special property that the two components (lead / tin) both "freeze at the same time" put simply. This means the sloder will solidify rapidly and the chance of slight movement while this is happening causing "crystalline" or "cold" solder joints is minimized.

For plumbing you want the solder to go plastic for a while so it can be "wiped" (c.f. lead wiping from fifty years ago).

Brazing is similar to soldering but the metals are different (copper/tin=bronze [from memory]) but the process is very similar just at much higher temperature.

H.O.: I use a soldering station from Radio Shack with temperature sensing built in. It was under $100.00, so I imagine it isn't the highest quality obtainable.

D.W.: That's fine. Once you get your "chops" you shuld be able to do anything with that iron...

H.O.: With the procedure I outlined here, my soldering tip is nowhere near an IC, thank goodness! I'm working my way up to dealing with ICs and PCBs slowly.

D.W.: Suggestion; get some old electronics and try removing components. This is good practice and you will improve with time.

Cheers,

Don W

Re: HP-IL over Cat5 - Compatible?

*Message #21 Posted by **don wallace** on 1 Sept 2005, 10:23 p.m.,*
in response to message #20 by don wallace

I keep forgetting things...

Plumbers lead: a different ratio of lead and tin...

Brass=copper+tin? Bronze=copper+zinc?

For practice soldering easy stuff (cable terminbations and audio attenuators with resistors) is good to start with. That hadrware is very forgiving and if you use your fingers to hold the parts you will rapidly get an idea f what "too much heat for too long" means...

Non-destructive desoldering can be quite hard to do when you are beginning...

Final note: When soldering or desoldering, the thing is JOINT TEMPERATURE. This is dependent on good thermal conduction from iron tip to joint metal (both parts). So have enough solder to ensure the joint gets hot (the solder blob conducts the heat...) but not too much so you're swimming in it...

Have fun...

Don W

in response to message #21 by don wallace

Thanks for all the good advice, Don.

I do have plenty of old PCBs around that I can practice on. I just haven't squared the 'round tuit' up to now. I have practised desoldering using braid. I took apart a 41C single memory module and desoldered the PCB from the contact fingers. That went pretty well. And I've done several cables and odds and ends. My intermediate goal is to be proficient enough to do a 2X memory module using Cristoph Klug's instructions. That requires soldering jumpers between PCB's, on parts that average $50.00 apiece on eBay, and I need two! So I'm not going to attempt that until I've got concrete evidence I have a good chance of succeeding. 8)

LIF interchange (71B|75C|41C) <-> 85B

*Message #1 Posted by **Howard Owen** on 20 Aug 2005, 1:26 p.m.*

I have just taken delivery on a 9121D dual floppy unit. I hooked it up to my 85B and saved a couple of files onto a single sided disc. Then I placed this disc in my 9114 and did a CAT of the drive from my 71B. To my joy, the catalog appeared, albeit with unknown (to the 71B) file types listed against the HP85 BASIC files. Next I tried serving out a LIF image of one of Vassilis' HP85 disks to the 71B with EMU41. The idea was to copy these to the 9114 and thus sneakernet software onto the 85. Unfortunately, the 71B reported "Unknown file type" on any attempt to copy the files out of the virtual LIF disk and onto the 9114.

Does anyone know how to manipulate the LIF file type from a 71B? There must be a LEX file somewhere that lets you diddle the bits on disk. (I can do this in Linux, but while the resulting file should copy using the 71B, the result on the 85 would be an incorrect file type.)

Re: LIF interchange (71B|75C|41C) <-> 85B

*Message #2 Posted by **J-F Garnier** on 21 Aug 2005, 3:31 p.m.,*
in response to message #1 by Howard Owen

Hi Howard,

The basic HP-71B can't copy file of unknown format, but if you load the JPC ROM into Emu71 (or in a HP-71B), then you will be able to copy foreign file from one disk to another (but not to load them into the HP71 /Emu71 of course).

J-F

*Message #4 Posted by **Howard Owen** on 21 Aug 2005, 5:56 p.m.,*
in response to message #2 by J-F Garnier

No joy, I'm afraid. The JPC ROM (jcpromx.bin) correctly handles LIF files for HP-75 and HP-41, but not for HP-85.

Your software is still cool, though. 8)

Re: LIF interchange (71B|75C|41C) <-> 85B

*Message #5 Posted by **Howard Owen** on 21 Aug 2005, 9:10 p.m.,*
in response to message #2 by J-F Garnier

This is turning out to be kind of fun. The JPC ROM has a file type LEX that recognizes other handheld machine's files. So HP-75 and HP-41 file types are recognized by the 71B (or by EMU71) when that ROM is loaded. But it doesn't cope with HP85 file types. However, looking through Joe's LEX file index, I ran across EXTFILES, which is described like so:

> Quote:
>
> EXTFILES “External Files Poll Handler”. This lexfile does not add any keywords to BASIC, but extends the number of file types that the HP-71 recognizes. The HP-71 normally recognizes only BASIC, KEY, TEXT, SDATA, DATA, LEX and BIN file types, and refuses to copy files into memory (or from disc to disc) if they are of any other type. The FORTH ROM allows a new file type, FORTH files, to be copied, and identifies these files by putting “FORTH” into their catalog string. The EXTFILES lexfile takes this idea a step further. It makes just about every file type known to the handheld community recognizable to the HP-71, and not only allows it to copy them, it identifies them in their catalog listing. No longer do we need to decipher file type code numbers. SIZE: 502 bytes.

"Great," I thought, "this is just the code the JPC ROM used." But the part about "every file type known to the handheld community" made me decide to try it out. It's included in lexfl1.zip from JF's site. Sure enough, when I loaded it into EMU71 (after turning off the JPC ROM) I was able to list a LIF image of the HP-85 games pac with "PROG8" as the file type! Next I tried 'COPY "BLACKJ:3" to ":6"', with the 6th HP-IL device being my 9114, and I got "HPIL ERR:File Protect".

Bummer. Well, I know I skimmed past the informationo on how to remove that protection somewhere in the PPC or HPPC archives. I seem to recall it uses two characters as the unlock key, so brute force should work pretty well if nothing else. More research is called for. Good thing I enjoy that sort of thing. 8)

Re: LIF interchange (71B|75C|41C) <-> 85B

*Message #6 Posted by **Howard Owen** on 22 Aug 2005, 12:15 a.m.,*
in response to message #2 by J-F Garnier

As many will know, the "protected" status of a LIF file is merely a different file type in the directory. I believe there is also another method of locking up files that may involve encryption, but this isn't it. Just finding the appropriate unprotected type number of the file type and changing it in the directory is enough to allow the file to be copied. This is trivial when you are dealing with an image of the disk, of course.

Circumventing copy protection is not my usual modus when dealing with computers. My dislike of the DMCA notwithstanding, I usually try not to mess with that sort of thing. But the bits in this case were free to copy in the form of a disk image, but not as individual files. I believe that makes circumventing the non-protecting copy protection OK. That's a self serving interpretation, but I'll stick by it. 8)

Re: LIF interchange (71B|75C|41C) <-> 85B

*Message #8 Posted by **Howard Owen** on 24 Aug 2005, 9:48 a.m.,*
in response to message #7 by J-F Garnier

Thanks, Jeff!

It's a little cumbersome, but I've now copied over several of the disks available at Vassilis' site.

One other item of interest: the 71B thinks the disks have less capacity than they actually do. I recall reading about this in the PPC journals, together with a hack for getting around it. At any rate, it means that I have to copy the files to the real floppy in two passes. So here's the process:

1. Copy an HP-85 disk image to EMU71's hdrive2.dat
2. CATalog the disk to see if there are protected files
3. Use a hex editor in another window to modify the file type fields to the unprotected types.
4. Format a floppy *on the HP-85/9121*. (The 85 won't be able to read a disk formatted by the 71B)
5. Put this floppy in the 9114
6. Write a 71 BASIC program to copy the files from the LIF image to the 9114
7. Wait until the copy bombs out with "Disk Full"
8. Put the floppy back in the 9121
9. Format another floppy in the second 9121 drive
10. Write an HP-85 BASIC program to copy the files from the first floppy to the second
11. Delete all the files on the first floppy and PACK it. (Faster than reinitializing.)
12. Put it back in the 9114
13. Finish copying the balance of the files remaining in the disk image
14. Sneaker net the disk back to the 9121
15. Copy the rest of the files to the second floppy

The thing that stands out for me in trying to get stuff done on these old machines is the amount of grunt work involved. The above process is an example. On Linux, I do some bash scripting with a little Perl mixed in, or else (more rarely) a full-blown Perl program, and I get 99% of what I need done with comparatively little effort. the extra work in these 20th century models isn't just due to the more primitive tools available, though. It also has to do with the number of incompatible systems you have to traverse in order to get things done.

```
Howard Owen wrote:
>   4.Format a floppy on the HP-85/9121. (The 85 won't be able to read a disk
formatted by the 71B)
```

False! The 85 can read disks formatted by the 71B (and the 41C).

You are just using the wrong drive. The 9121 is SINGLE sided, while the 9114A/B are DOUBLE sided. If you use a double sided drive with you 85 (e.g. the 9122) you will be able to read 9114A/B disks.

BTW note that to use the 9122 with the HP85 you will need the EMS rom (available from http://www.series80.org).

Perhaps you should learn to use the English language properly before you attempt to write. You also should learn the difference between an **RPL** machine and a classic **RPN** programmable calculator. It might save you the embarrassment of calling someone an "idiot" when it's clear you don't understand what he meant.

in response to message #5 by Howard Owen

Well, I figured part of that out. What spelling (and grammar) has to do with things is consideration for those who may be trying to read what you've written. Your sloppiness seems just plain rude; surely you're not that ignorant of standard spellings.

That said, none of us are perfect, so the occasional typographical error, misspelling, or grammatical error is best ignored.

Regarding RPL versus RPN, personally, I consider RPL to be an enhanced form of RPN, but even I realize that in this forum, "RPN" usually refers to the (in some ways) simpler 4-level stack "Classic RPN".

Regards,
James

Re: your opinion of the HP49G

*Message #7 Posted by **Howard Owen** on 27 Aug 2005, 8:19 a.m.,*
in response to message #6 by James M. Prange (Michigan)

That was sarcasm, James, and not aimed at you. Please accept my apology if it seemed otherwise.

Whether "NA" is genuine or a troll, his typographical peculiarities are typical of "texting" services like IRC or AIM. The point of the severely garbled English used on those services is to reduce typing time, thereby increasing the rate of conversation. In particular, users of SMS - Short Message Service - tend to employ this strategem. Since they are typing their messages on mobile phone keypads, the economy of typing "u" instead of "you" is significant.

But using that abbreviated style on a forum like this is suspicious. If we are to take "NA" at face value, then he (or she) must be fairly young and stupid, not to have encountered the full use of English in an online setting. But this same stupid person supposedly uses the HP-49G. Whatever else you may think about that machine, it's not for the dim-witted. (For that, we have TI, of course. 8)

So I think it's more likely that "NA" is a role being played by someone else.

Re: your opinion of the HP49G

*Message #8 Posted by **James M. Prange (Michigan)** on 27 Aug 2005, 9:07 a.m.,*
in response to message #7 by Howard Owen

Sorry Howard, I was thinking that I was replying to "NA".

I hadn't heard of SMS. Trying to type something from a telephone keypad must difficult; don't they realize that they can simply talk into a phone?

In any case, as he posted on this forum, I expect that he was typing from a keyboard which includes the full alphabet, and I regard typing "u" instead of "you" as being rude.

Regards,
James

The typing of "u"

*Message #9 Posted by **Gene** on 27 Aug 2005, 9:55 a.m.,*
in response to message #8 by James M. Prange (Michigan)

While I don't like the ever increasing internet shorthand typing, it is very very common among those who spend much time using instant messenging software.

Abbreviations have been used a lot over the years (such as LOL, TTYL, IMO, IMHO, ROFL, etc), younger people are now abbreviating lots of stuff.

I see it in the emails my kids are sent from their friends.

It's not rude, it's just different.

You and I are free to dislike it, but that doesn't mean it's rude as such.

For me, it just means I don't understand what is being said many times, but then, most of the time when I see things like that, I don't care if I understand or not. :-)

Re: The typing of "u"

*Message #10 Posted by **James M. Prange (Michigan)** on 27 Aug 2005, 10:20 p.m.,*
in response to message #9 by Gene

I do understand the usefulness of abbreviations, particularly on the small screens of telephones, or, for that matter, calculators, as long as the intended reader will understand what the abbreviations mean.

Youngsters always invent new slang, and if today's kids think that it's "cool" to write "u" for "you", "2" for "to" or "too", and so on in their personal messages, that's fine with me. But I still think that it's rude to use it where "standard" writing is expected, as in this forum or the comp.sys.hp48 newsgroup.

Regard,
James

Re: The typing of "u"

*Message #11 Posted by **bill platt** on 29 Aug 2005, 10:57 a.m.,*
in response to message #10 by James M. Prange (Michigan)

In ham radio, using morse code, many many things are abbreviated. "thanks" is "tnx", "for" is "4", "you" is "u", "from" is "de" (from the french word) "over" is "k", "out" is "sk" etc etc etc.

Re: The typing of "u"

*Message #12 Posted by **gene** on 29 Aug 2005, 12:48 p.m.,*
in response to message #10 by James M. Prange (Michigan)

but how does anyone know that "standard" writing is expected here?

I do agree that too many of these abbreviations will inhibit the communication of ideas, but I was able to make out what the original poster intended.

Are we all getting "old" and cranky or can we all learn a few new tricks?

And, is it really worth the effort to get irritated or should we go with the flow?

Re: The typing of "u"

*Message #13 Posted by **Howard Owen** on 29 Aug 2005, 1:58 p.m.,*
in response to message #12 by gene

I can only speak for myself on the matter of tolerance toward different communication styles. If I can understand what's being said, I'm unlikely to complain about the way the information is delivered. But in this case, the poster turned belligerent with very little provocation. I think that the response to his abuse included the annoyance many of us felt regarding his spelling and grammer. That's probably not fair, but it is natural and understandable.

Re: The typing of "u"

*Message #14 Posted by **Wayne Brown** on 29 Aug 2005, 2:44 p.m.,*
in response to message #13 by Howard Owen

> Quote:
>
> I think that the response to his abuse included the annoyance many of us felt regarding his spelling and grammer.

In my case, although I find NA's writing style very annoying, I wouldn't have mentioned it (or responded at all) had I not been irritated by the rude response NA made to Vassilis. But it's human nature, when offering one piece of criticism, to bolster it by throwing in any other complaints that happen to be lying around handy. ("I think your political opinions are completely wrong -- and by the way, that tie you're wearing is really ugly.")

Lest anyone attribute my criticism to being "old and cranky," I should mention that I have been equally annoyed for most of my 50 years of life by advertisers and marketers who think it's cute to replace "C" with "K" and "S" with "Z" in product names. I also can remember being disgusted in grade school with things like Valentines that said "I luv u 4-ever." I guess I've been old and cranky since childhood. :-)

Let's stay "old and cranky"...

*Message #15 Posted by **Karl Schneider** on 29 Aug 2005, 3:33 p.m.,*
in response to message #12 by gene

As this is a Forum, and not a chat room, proper writing should be expected. Let's stay "old and cranky" about it.

I've found on this forum and Usenet groups that there usually is a strong (positive) correlation between the quality of someone's writing and the quality of his ideas. Review the posts of Valentin Albillo, Eric Smith, and "Norris" for examples of what I consider "highest quality". For examples of mediocre or poor writing with corresponding value of philosophy, those can also be found...

Re: your opinion of the HP49G

*Message #16 Posted by **Howard Owen** on 27 Aug 2005, 9:57 a.m.,*
in response to message #8 by James M. Prange (Michigan)

Yes, I agree.

In Europe, SMS is free or low cost. So messaging is popular among people who can't afford to inflate their phone bills. That includes many young people, among whom SMS is very popular.

In the US, SMS is treated as a premium service by the carriers. So naturally, it hasn't caught on here.

Re: your opinion of the HP49G

*Message #17 Posted by **Karl Schneider** on 19 Aug 2005, 11:53 p.m.,*
in response to message #1 by NA

A reasoned opinion?

The Good: It has impressive mathematical capabilities that improve upon those of the 48G series. It is solidly built and acceptably reliable.

The Bad: It is rather impractical as a general-purpose handheld calculator, due to its RPL-based, complicated HP-48 paradigm. It has software bugs. It has no IR printer link and is not expandable. Unhinged keys cannot be pressed quickly in sequence.

The Ugly:Goofy, hard-to-read dark-blue-and-red-on-light blue color scheme.

Are you actually referring to the successor KinHPo 49G+? That present model is faster and better-looking, but less reliable. It is expandable and has the IR printer link, I believe. Everything else in my critique applies equally.

Re: your opinion of the HP49G

*Message #18 Posted by **Don Shepherd** on 20 Aug 2005, 12:15 a.m.,*
in response to message #1 by NA

You know, lots of folks have spoken against this calculator, but I don't think I've seen anyone mention one of its most amazing (IMHO) features: essentially unlimited word size for integers. Every calculator I have ever seen, and most PC applications, have a fixed word size for integers, usually 32 or (more rarely) 64 bits. This calc, like Mathematica, has no such limits. You enter 2^750 and it shows the full 226-digit number. I personally think this is great! But that's just me. I agree that RPL programming is not as straightforward as RPN, and I'm an RPN fan. But I have seen some folks build some great RPL programs. I think the 49G+ is an impressive machine, despite some of its shortcomings.

Re: your opinion of the HP49G

*Message #19 Posted by **Vieira, Luiz C. (Brazil)** on 20 Aug 2005, 2:55 a.m.,*
in response to message #1 by NA

Hello, NA;

please, correct me if I am wrong, but it seems that you are "new on the block"; is that correct?

This is mainly because your three entries in this forum (so far) relate to the HP49G (shouldn't that be new HP49G+?). I myself sometimes post questions related to the new calculators, but I try to keep the subject as restricted as possible. Yeap, guilty as charged... <8^(

You see, most of the questions here are related to the earlier models (that's why we are at the Museum of HP Calculators...), their operation, some particularities and, most important, how to keep them 'alive'...

Well, no harm so far. I have at least one of each: 28S, 48SX, 48G+, 49G, 48GII and 49G+. I consider the HP48G as the best of the series because of many reasons. Because of the fact I got used to easily find anything I want in the HP48G, I think it is sometimes hard to easily find some resources in the HP49G. Now that both the HP48GII and 49G+ share the same keyboard, I feel as trapped twice...

But I must confess that having a calculator with upgradable OS is a bless. Both HP49G and 49G+ offer this particular feature, and I like it very much. I think any new calculator should offer such resourcefull feature. Add to this the SD card access and now I count on a 256MBytes(+) user-memory calculator. Now it`s worth getting acquainted with its reources.

If we go ahead and talk about SYSRPL and machine language... What about another forum?

Best regards.

Luiz (Brazil)

PS - as I`ve seen that sometimes a particular call may cause people to feel uncomfortable, please, consider my words as just some sort of common sense, already expressed feelings. O.K.?

Re: your opinion of the HP49G

*Message #20 Posted by **Geir Isene** on 20 Aug 2005, 5:00 a.m.,*
in response to message #19 by Vieira, Luiz C. (Brazil)

The RPL vs. RPN arguments come up now and then. This is one of the two most usual arguments between the old and the new HP calcs. The other being build quality. The two divisions do not coincide. HP went from RPN to RPL and later discarded the build quality.

As for the RPL vs. RPN; For me this constitute an indecision of which calculator I should settle for as my primary calc - my HP-41CX or my HP-48GX. Both are of good build quality.

The advantages of the 48 are many: Greater mathematical power, multiline screen suitable for graphing and text entry, far more sophisticated programs (like being able to use the 48 as an IR remote control), it's faster and has much more memory. But the RPL is somewhat tragic. I love the direct control and efficiency of the old RPN. When opting for structured programming, I would go with Forth. But not RPL. It is cumbersome and the programming environment is not as well suited for debugging as either RPN or Forth.

The advantages of the 41 are also many: Great program control and efficiency through RPN, it's very extensible through modules, peripherals and HP-IL, it's smaller than the 48 and it's clock accuracy is better (important for the UAC :).

Now, what I miss is a better programming language and programming environment for the 48. Being able to program the 48 with 41 RPN would be great. And no, I do not mean a 41 emulator. I mean programming the **48** with RPN. Or having real ANSI Forth on the 48. That would rock. Then I would use my 48GX as the primary calc. In the meantime I toggle the two.

*Message #22 Posted by **I, Claudius** on 20 Aug 2005, 5:33 a.m.,*
in response to message #1 by NA

If you can get over the rubber keys and frozen hamster-butt color:

1 MB of memory, same as a 48 with a 1 MB card. Memory structure with the Filer is outstanding. Using the ARCHIVE command to port 2, the calc is completely crash-protected. Very good CAS,actually more included commands than a TI89. Numeric and symbolic derivatives, integrals, difeqs, matrices, etc... Infinite precision arithmetic. Equation and matrix writers. Choice of fonts,mini-font is superb. Familiar RPN interface. Much faster than a 48. Flash upgradable OS, although there hasn't been a new one for the first 49 is many years, probably will never be upgraded again. Available on eBay as new old stock for less than $100 currently, compare that with $300 up for a 48GX.

*Message #25 Posted by **Howard Owen** on 20 Aug 2005, 1:13 p.m.,*
in response to message #1 by NA

This has been *very* civil so far.

As a relative newcomer to this forum myself, I appreciate the concise laying out of opinions regarding the newer HP calculators. I had heard fragments of these opinions in other threads, but this one summarizes those attitudes pretty well.

Regarding the HP-42S, other than the very early programmable models, whose maximum program length was tiny, I never could figure out why you'd pay so much for a calculator where you had to key in all your programs by hand. But now I begin to understand why the 42S commands a premium on eBay: It's the most advanced and developed example of the old-school RPN HP technology.

Re: your opinion of the HP49G

*Message #26 Posted by **Tony Duell** on 20 Aug 2005, 2:55 p.m.,*
in response to message #25 by Howard Owen

My $0.02....

About the 42S : I hate it. Yes, I have one, but I only use it for on-the-fly calculations (it spends much of its time on my workbench, if it gets mangled then I don't really care). It strikes me it's a 41 with all the good bits (synthetics, modules, HPIL, card reader, etc) taken out. I really can't understand why people prefer it to the 41 series.

About the 41 series : I love them _as programmable machines_. There are a lot of useful modules, HPIL is one of the best-designed interfaces ever, it's well-built. I've lost count of how many of them I've got ;-)

About the 48 series : I love those too. I have no problem with the RPL 'infinite stack', I like being able to push any object -- not just a real number -- onto the stack. I feel that RPL has got rid of many inconsitancies in the old-style RPN -- for example the kludge that is indirect addressing. The RPL idea, put the object and the variable name onto the stack, then STO, seems more logical.

About the 49G : This was the first HP calculator I ever wrote a letter of complaint about (and, I may add, didn't get a reply from HP). The build quality is poor. I hate the keyboard. The first few firmware versions were so buggy as to be unusable. However I do like the arbitrary-size integers, and the exact mode.

About the 49G+ : Can't really comment, after the 49G I am not likely to buy another new HP calculator. And I have no intention of builg a machine with a Useless Serial Botch port. RS232 is much more useful.

And a couple more :

The 67 : Love it. Solid build, does what it claims. I love the LED display, and it external storage (the magnetic cards) which I regard as essential. Quite like the 97 too, but that's harder to fit in a pocket.

The 9100B : Quite simply the most elegant piece of electronics it's been my pleasure to work on. Beautiful.

The 9810 : Another quite elegant design. Good keyboard and display, sensible I/O bus (unlike the 9100).

Re: your opinion of the HP49G

*Message #27 Posted by **Geir Isene** on 20 Aug 2005, 3:40 p.m.,*
in response to message #26 by Tony Duell

My NOK 0.02:

The 42S: Compared to the 41, it's inferior. Yes it is faster, has more memory, two-line display and is smaller (thinner). But, as Tony points out, the magick of the 41 was discarded.

More on the 48 vs. the 41. I disagree that the indirect addressing is a kludge. It is one of the most elegant features of the old calcs. There are quite a few times I have been forced to write more involved software for lack of indirect addressing (like in RPL or even Ruby).

As for the LED displays - these are my absolute favorites. The HP-97 is my primary calculator at work. Since I do not own a 67, the 41 or 48 gets to be the only real choice to carry around.

Re: your opinion of the HP49G

*Message #28 Posted by **Tony Duell** on 21 Aug 2005, 9:23 a.m.,*
in response to message #27 by Geir Isene

I think you may have misundersood me. Indirect addressing is a great feature, it's just that the way it's done on HP calculators is a mess, and doesn't fit the 'RPN model'.

I think it would have been 'cleaner' to have at least one more stack level, and for STO, etc, to take the register number from top of stack.

In other words, both arguments for STO (the number to store, and the register address to store it in) should be entered before pressing STO. That's how other functions work in RPN after all.

Re: your opinion of the HP49G

*Message #29 Posted by **Geir Isene** on 21 Aug 2005, 2:16 p.m.,*
in response to message #28 by Tony Duell

That would be way cool - like having an indirect indirect addressing. Taking the address from X to indirectly address would give you two levels of indirectness. But in the spirit of merging program steps, I don't think that STO IND 00 is so bad. In the spirit of Forth, even STO 00 would be wrong.

Re: your opinion of the HP49G

*Message #30 Posted by **Howard Owen** on 20 Aug 2005, 4:11 p.m.,*
in response to message #26 by Tony Duell

My brain may be calcifying, but RPL has been giving me pain. I think it's because I want to grasp it completely, the way I understand C, or Perl, or the 41C. I run into trouble because it's not just RPL, but the vast number of functions available in the 48G (for example) that I have to know in order to be

expert. I had a practise back in the 1980s, when I was first learning to program, of coding Euclid's algorithm on each new system and/or programming language I encountered. The first system I did that on was the 41C, which was also the first machine I learned to program. Anyhow, I reverted to my old practise to try to break through this impractical "I want it all, now" desire of mine with the 48. A concrete problem has always been a boon to me. I know the 48GX I used probably has a GCD function. I know the Sparcom Math card does, but that's not the point of the exercise. Here's what I came up with. It expects the two numbers to test on levels 1 and 2. It consumes these, and leaves the GCD in level 1:

```
<<
  WHILE DUP 0 # REPEAT
    DUP 3 ROLLD MOD
  END
  DROP
>>
```

Update: the "0 #" isn't required, since any non-zero numeric value is logical true. So the routine could be <<WHILE DUP REPEAT DUP 3 ROLLD MOD END DROP>>, which is even more unreadable.

So, that's short and sweet. It also isn't recursive. That's good because I dont know how you'd do recursion without names. (RPL has named routines and variables, I know. I just didn't use them for this example.) I then set out to code the same algorithm on my HP-41CX. This is probably a good deal better than the first time I coded this algorithm in 1982 or so. It turned out to be quite similar to the 48 version, in fact:

```
01 LBL 01
02 STO Z
03 MOD
04 X#0?
05 GTO 01
06 RDN
```

That's even more concise. The inputs and output are the same as for the 48 version.

The "Forthian" vocabulary of the 48 is less familar to me than the 41C's language. I learned Forth, back in the day, along with many other languages I never used for real coding problems. So the lack of practise hurts. And six months from now, if I don't continue to code on the 48, I'll forget that "3 ROLLD" is equivilant to "ROT SWAP" for example. The 41's language is so ingrained, and so much simpler, that I won't have that difficulty with its code until my dying day, assuming I keep my mental acuity that long. 8)

So I think I may be able to start enjoying the 48 more if I ask less of myself at one sitting. I may not master the device ever, since there is a lot to know that isn't interesting or relevant for me. But If I can find a way to pick through what is there, I may do better, and enjoy it more.

*Message #31 Posted by **Walter B** on 21 Aug 2005, 2:53 a.m.,*
in response to message #30 by Howard Owen

I agree with your opinion about the 48 and also (earlier in this thread) about the 42s being the top calculator of "the old line". My background: I started in 1976 with a 25c, moved to an 11c in 1982, a 32s in 1990 - and started collecting 10 years later, having some 48 and a 42s now, too. Nowadays I'm no more using my calc every day. Just want to add my 0,02 Euros:

BIG, BIG PLUS (compared to earlier and later models I know): The 42s is the one and only

programmable POCKET calc I know with:

- a quality keyboard (elegant + reliable + user friendly (not overloaded) = a pleasure to look at and use) AND
- well designed output (informative and readable, no kryptic codes, just the necessary information in good order) AND
- straightforward programming AND
- easy debugging (readable programs instead of keycodes) AND
- more than sufficient memory for practical life (never had to count steps or registers - if I really need more, I go to a PC).

SPACE FOR IMPROVEMENT (IMHO):

1. The dot matrix display was ok at that time, but is far off what's state of the art today. Contrast is even poor compared to the LCDs of cheaper Pioneers. Space or better resolution to display 1 or 2 lines more would be nice, too.
2. The keys of the Pioneers and later models are a step back from the earlier keys starting with hp65. A 2nd shift key would have allowed for more direct accessible functions - sometimes I find it difficult to remember where a particular function is hidden.
3. I admit something like a catalog is necessary to access as many functions as are implemented in this calc. But this catalog is just too cumbersome for "quick and dirty" calculations.
4. Regarding expandability and I/O capabilities in a calc, the 41c (cv, cx) is 2nd to none. In my worklife, however, I prefer a compact calc I can put in a pocket of my shirt or jacket without making me look out of balance (hope that's understandable ;)). And nowadays, I don't like these zippered belt cases no more - I'm neither a sheriff nor a handyman.

This is my point of view.

You've got the point !

I'm no one to counterdict Tony Duell, butjust want to bring my 2 €c. The 42s is definitely not the most powerful calc ever made, but certainly one of the most practical to use.

IMHO, I also love the 41, and even if I deeply regret there is no mass storage available to the 42S, it's still somehow superior on a daily use with its dot matrix dual line screen, higher memory and faster execution.

Again, should we need more, let's go to a PC...

There have been a few polls in the past and the 42S was the preferred calculator of the

community.

*Message #33 Posted by **GE** on 23 Aug 2005, 4:51 a.m.,*
in response to message #32 by Thibaut.be

There is something else that the 42 (or 41) has : the capability to suspend a program at any time. When my train arrives at the station, I just press [R/S], switch off the calc and voilà, it is ready to resume the calculation later without losing the work already done.

Not only this, but you can go to program mode and review or modify to your heart's content without losing the results calculated so far, you can restart from the same point or somewhere else (paying attention to GSB/XEQ levels however).

Try it on a so-called "structured programming" language. These are maybe smart but in that case are really painful (reminds me of the discussion of 'GOTO').

That capability to stop at any time, to edit on the fly, to resume without losing anything, is missing from 48s and other later machines (a weak point for other nice machines from Sharp too...).

The 41 and 42 (maybe all keystroke-programmable HPs?) clear the RTN stack when you edit a program, so if you edit a program on the fly while it's suspended in a subroutine, it won't return to the caller.

And, if you stop/turn the 41 off during a program

*Message #35 Posted by **Gene** on 26 Aug 2005, 3:35 p.m.,*
in response to message #34 by Thomas Okken

certain flags are cleared when turned on again.

The state of the machine is subtly different with an on/off in between.

Of course, if you're not using anything reset by an on/off, it won't matter.

in response to message #1 by NA

Highly capable for the 20-60$ they are currently selling for. I think the low price is a carry over from the deep discounts needed to get rid of the first edition 49G+ with the bad keyboard. I happened to get a first of the new version 49G+ from Amazon for the $77 and free ship. I suspect the 49G low price will not last, and it will become a collectable in it's own right. Not but a few years ago, the 48GX was selling for under $100 on ebay, as an example.

HP-71B + 96KB Port 5 == short battery?

*Message #1 Posted by **Howard Owen** on 19 Aug 2005, 4:08 p.m.*

I have two 71Bs now, The first one came with a 96K module plugged into the card reader port. I thought that was pretty cool, but I started noticing difficulty with powering the machine on. If I wasn't hooked up to AC, I tended to get "Memory Lost". Checking the batteries, they were indeed flat. This wasn't a huge deal as I could reload what I wanted from my 9114, but it was annoying. I switched the expansion RAM over to the second machine when it arrived, and discovered that its batteries too were dead, after only 24 hours in the machine.

My question is, generally, how much life do people get out of a set of alkaline AAA cells in the 71B? I may just be leaving the darned things on by mistake, assuming they have an "auto off" feature.

Re: HP-71B + 96KB Port 5 == short battery?

*Message #2 Posted by **Tom Sherman** on 19 Aug 2005, 8:43 p.m.,*
in response to message #1 by Howard Owen

Howard,

The 71B has a very slow resting metabolism, and when off it should maintain memory for many months on a set of alkaline AAA batteries. If left on by mistake, it should turn itself off automatically after ten minutes.

From what you have said, it sounds as if that 96K memory module has a short of some sort. In my experience, a 71B with 4K, 32K, or 64K front port RAM modules, or with a 128K card-reader port module, can still retain memory for many months on a set of batteries.

It is certainly possible for a faulty RAM expansion module to cause rapid battery drain. This has happened to me twice with expansion cards for my HP Omnibook 300/425/430 computers. I elected to throw the expansion cards away rather than lose the long battery-life in those computers. You will no doubt want to do further testing before taking such drastic action with that 96K module.

Good luck in solving the mystery,

Tom

*Message #3 Posted by **Howard Owen** on 19 Aug 2005, 9:36 p.m.,*
in response to message #2 by Tom Sherman

Is 96K a strange number for port 5? You mentioned 128K modules, which would seem to be more sensible. Maybe it's missing 32K, and that's another symptom.

Re: HP-71B + 96KB Port 5 == short battery?

*Message #4 Posted by **Tom Sherman** on 19 Aug 2005, 10:49 p.m.,*
in response to message #3 by Howard Owen

My only experience has been with the 128K module for the card-reader port, but 32K and 64K were also made for that port, so 96K is not unlikely. Someone else on this forum can probably tell us whether a 96K was made.

Tom

Howard,

According to this thread from the archives:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv001.cgi?read=2052

a 96K RAM module was made by Handheld Products for the 71B card-reader slot. That is probably what you have. And they were apparently quite rare -- a consolation to a collector, if not to a user!

Cheers, Tom

in response to message #6 by Howard Owen

Hi Howard.

I have no direct experience with those products but I think you may have a defective (static damaged) 128k memory module. Maybe it's a four chip module (32k per chip) and one ram chip is faulty or electrical connections to it inside the module are are bit funny (bad). If so then that may explain botht the odd size and the rapid power drain you get. The fact that it runs indicates to me it's probably quite salavageable.

I used to fix video arcade gae equipment so I've seen some real bizarre logic faults in my time. It sounds like maybe even you have a case where one or two chip select lines to one memory chip has been lost (open circuit) and it is (1) not "selecting" and (2) leaking power when system is shutdown. CMOS draws power at a high leakage level of up a few milliAmps if the logic control pins are left floating (open circuit)... and there are mains electric fileds around, which get picked up by the high impedance inputs and affect the circuitry (putting nodes all through the chip in a partially on (=leaky) state...).

Just a hunch, hope this helps...

Re: HP-71B + 96KB Port 5 == short battery?

*Message #8 Posted by **Howard Owen** on 2 Sept 2005, 1:20 a.m.,*
in response to message #7 by don wallace

I wondered about that. 96K seemed like a strange number. I believe the ports on the 71B take a maximum of 128K, without bank switching.

I've just been leaving the machine connected to line power all the time. The extra RAM is too useful for me to risk cracking the module open at the moment. (It has screws, so "crack" is metaphorical, probably.) I'm also deterred by the fact that I'd be clueless as to how to diagnose any fault that wasn't apparant from corrosion or heat damage. If they used standard RAM, I guess I could dig up pinouts for the ancient parts. And I'd presumably have three to 6 good chips to compare to one to two bad ones. But I'm nervous about sticking probes onto the pins of CMOS parts.

in response to message #8 by Howard Owen

Howard.

When you get a round tuit ;-) you could always take photos and e-mail them to me or post them here. That would help.

The approach I would take is to find out if the chips are socketed (unlikely) and swap chips. Failing that, if possible write software which tries to read and write to particular bytes. You won't see much with a 'scope, let alone a multimeter, but if the chips are socketed or other wise can be electrically disconnected (disconnect the "chip select line from the pc board and tie it "off" [usually +5 volts=logic 1]") that takes it out of circuit. A meter is good for checking power supply is good n all memory chips, though (first step I would take).

Assuming four 32kB chips (big assumption), doing this to each chip, one notes what memory capacity the machine reports or which bytes don't exist when peeked and poked ;-). When you find a chip which doing the above on gives no change, you have found your problem.

The other (perhaps better) way to do things is to use an electronic multimeter in OHMS mode (NOT the continuity test mode!), to check to see if all the common buss lines are intact from chip to chip.

(In ohms mode, the meter generates 0.3 volts across the tips, quite safe. In continuity mode it puts 3 volts across the tips with more current behind it. The logic chips may not tolerate such "abuse". I am being cautious, but that pays...)

In general do tests with all equipment power off and batteries removed! When working on the logic, touch a GROUND buss first to put yourself at the same potential as the logic to avoid static damage.

For example, one can check the address buss one line at a time, then the data buss, power supply rails and also the chip enable control lines. Laborious, but effective.

Also, if you had a practised eye you could look for "cold solder joints". I used to fix WYSE WY-60 terminals and they were notorious for really bad solder joints to the

stainless steel jumper wires that were used in copious numbers to avoid the cost of manufacturing a double sided PCB. They were a real pain in the ass, so I found it better to do all the joints that looked even slightly suss in one hit. That always worked...

Also, chip sockets sometimes give trouble.

Hope this helps.

Re: HP-71B + 96KB Port 5 == short battery?

*Message #10 Posted by **Garth Wilson** on 2 Sept 2005, 4:47 a.m.,*
in response to message #1 by Howard Owen

I have a 96K RAM in my main HP-71's card reader port, made by CMT. They offered 32K, 64K, 96K, 128K, and 160K in the card reader port. I wished I could have gone for the whole 160K, but memory was expensive at the time, and I set a budget and got what I could afford. (Later I did buy another 64K front-port RAM when I was able though, again CMT.) My card-reader RAM port numbers there are 5.00, 5.01, and 5.02. My batteries need changing maybe every year or two, but I have a friend who only has a 32K (I think) front-port RAM in his 71 and his batteries don't last nearly as long. I wonder if your internal module battery is not just dead, but maybe even shorted. It does seem however like the power-down memory-protection circuit should make the AAA batteries' current unable to get to the lithium battery.

There was a company at that time where you could send your 71 and have them install 256K of RAM internally, so it didn't take up *any* of the ports.

A couple of years ago I got to wondering if the old lithium batteries might leak, and if I should take them out. I called up CMT to ask if these batteries were capable of leaking, but there was no longer anyone there who even knew what an HP-71 was. What a shame! They took the stance though that if in doubt, you better remove the batteries. With the scores of files I have stored in there, I'd have to take some time to move things around to remove the modules, take the batteries out of them, and plug them back in with their memory lost, ready to re-load. I never did all of that, but I did open up the card-reader-port module without removing it, and found a little battery with leads. If memory serves me right, it was about the size of a shirt button. It showed no signs of leakage. I just put a sleeve over it and put things back together. Again if memory serves me right, I saw no IC packages in there-- just dice with little blobs of epoxy over them, right on the PC board. In any case, you certainly won't find DIPs or sockets if you have the CMT module.

The brushed aluminum piece around the LCD seems to be grounded internally through a very high resistor value for static-dissipation purposes, but it would be good to verify that before counting on being able to avoid damaging CMOS parts when you probe them by keeping a finger in contact with that aluminum. Does anyone else here know?

*Message #12 Posted by **Howard Owen** on 2 Sept 2005, 11:32 a.m.,*

in response to message #10 by Garth Wilson

There's no maker's mark on the outside of the module. Just a serial number. There are two screw holes. One has a very tiny torx head for which I don't have a small enough driver. The other looks into the module showing the side of one chip and part of the PCB. That side is held down with electrician's tape. The two halves of the module case don't mate very well, and you can see the PCB, plus chips on *both* sides.

I suspect that what I have here is a hardware hack that went horribly wrong. 8) ("Horrible" is overstating the case. The RAM works as RAM.)

Re: HP 49G Memory recover

*Message #2 Posted by **I, Claudius** on 20 Aug 2005, 5:49 a.m.,*
in response to message #1 by NA

RPN Mode - The command [:2:Home ARCHIVE] will store all your directories with programs, note files, plots, custom keys, etc, securely in in the Flash ROM of Port 2. The command [:2:Home RESTORE] will restore the saved Home setting of the archive.

If you have favorite flag settings, save them as a list. For example, {-117 SF -116 SF} 'Flags' STO. Then after the restore operation, put the Flags file on the stack, then EVAL. The same can be done for the ->KEYTIME command, if you have a favorite setting of that.

Museum Update Proposal

*Message #1 Posted by **Walter B** on 18 Aug 2005, 8:38 a.m.*

Quite often I find informations about vintage calcs I am looking for in the paragraph "Other". There I read repeatedly:

> Quote:
>
> This page lists calculators that are too new to be considered museum pieces.

This is certainly true for the KinPo models. I leave it for discussion whether they shall be granted access to the museum at all (I see no need). But there was more than metallized and/or coloured plastic earlier, which is not covered yet.

Proposal: Let's describe the last models with our beloved big ENTER key. ...the real thing! And if this will support the strive for new quality calcs showing this key again, also this will be OK for me ;)

On the scientific side, I think of the models 20s, 21s of 1989, 32sii of 1991 and the 48g family (g, gx, g+) starting 1993. Regarding financial ("business") calcs, I've no idea. But I'm confident enough folks in this forum know it by heart.

Nobody can argue we are too nervous (losing our towel), starting a description of these "junior veterans" 16 years after the first appeared. I am willing to help with pictures and/or writing some text, if wanted and within my possibilities.

Of course its up to the curator to decide about an update, the time and way to do it. I just wanted to express my feelings - perhaps some folks share them.

Just my 0,02 Euros.

in response to message #1 by Walter B

I agree with you, it would be nice to see the calc list expanded.

Re: Museum Update Proposal

*Message #3 Posted by **Karl Schneider** on 21 Aug 2005, 5:44 a.m.,*
in response to message #1 by Walter B

To summarize it concisely, I would just advocate that a separate section be created to cover the entire Pioneer series. The last ones made, to my knowledge (20S and 32SII), were discontinued in 2002. They are museum pieces now, but certainly much "alive".

Of course, I don't like to stridently recommend additional uncompensated work tasks for the Curator. Perhaps those with something to contribute should sumbit material about Pioneers for inclusion. I recently posted to the Forum a table that categorized the models by class and function.

Several of the models are covered in MoHPC already, but there are 11 Pioneer models in total -- nine originals and two second-generation upgrades. It's a reasonably-formidable task.

-- KS

Your Opinion of 17BII+ Calculator?

*Message #1 Posted by **Jeff** on 17 Aug 2005, 10:42 p.m.*

I did a search but couldn't find anything. My apologies if this has been discussed here before. I was wondering what you thought of the 17BII+.

Many thanks!

Re: Your Opinion of 17BII+ Calculator?

*Message #2 Posted by **Chris Dean** on 18 Aug 2005, 3:16 a.m.,*
in response to message #1 by Jeff

If you only want limited mathematical functionality (log, 10^x, ln,exp,N! and Pi) then it is great. The SOLVE function is a reasonable programming tool providing the user is aware of the L() and G() functions which are undocumented in the Owners manual Edition 1. These allow the user to to store and retrieve variables. The variables need to be registered first. There is a range of other functions that are available to the user IF, MAX, MIN, MOD, IP, FP, SUMMATION etc

There are articles and messages on this site for this calculator illustrating the power of the Solve function and how to use it to improve the mathematical functionality (sin, cos, tan ....).

It is a nice size calculator and has a reasonable 'HP' feel about it.

I found mine to be easier to program than an RPL calculator such as the 49G+ but very limited functionality wise in comparison.

Re: Your Opinion of 17BII+ Calculator?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2005, 4:29 a.m.,*
in response to message #1 by Jeff

Hi, Jeff;

I own many HP calculators, and I have some financial models (37E, 38E/C, 12C, Platinum, 14B, 17BII, 19BII, 10BII and recently an HP17BII+). I mainly use scientific models, but when needed, I prefer using either the HP12C or the HP17BII.

I must confess I did not use all features available in the high-end models (HP17BII, HP19BII and HP17BII+), but I tested each example in their manuals. Some features I take as necessary, others are not used that much, but if you need currency conversions, be aware of time and date, set appointments, use a custom set of expression to solve for any arbitrary variable or work with more than one single cash flow data set, then the HP12C cannot follow you. You`ll need something like the HP17BII+.

I must tell you I prefer the HP17BII or the HP19BII for the HP17BII+. Keyboard feel/reliability and layout are determining in this choice of mine.

And to tell you the very truth: if it is algebraic/RPN selectable instead of algebraic-only, I'd go for the HP14B. I like using it, but sometimes I key in one number, press [INPUT], key in the second and press some two-number function keys ([+], [÷], etc) waiting to see the answer... My bad, I know, my bad...

I bought the HP17BII+ in order to know about it and to be able to use it as it is. I just complaint about the right-most, top row key: it fails from time to time. All of the rest is fine so far.

Best regards.

Luiz (Brazil)

*Message #7 Posted by **Vincent Weber** on 19 Aug 2005, 2:58 p.m.,*
in response to message #1 by Jeff

The HP17BII"+" is a piece of crap.

I will justify this rather bold statement with some hard facts:

First of all, the pastic keys feel so cheap, noisy, and not reliable. Even the most controversial chevron keyboard of the 33S feels better than that !! Second, the SOLVE function is completely messed up compared to the good old 17BII. The first edition did not have the L() and G() most useful functions at all; the second one has them, but forces you to register the variables first for them to work properly, which you never had to

do on good old' 17BII. A good example of KinHPO QA standards. Third, the solver can't even work properly at times - something as simple as L(A:2*x)+G(A)=8 can't even find a root!

Give it a miss, and shop for the good old 17BII on ebay - a wonderful calculator.

Cheers,

Vincent

*Message #8 Posted by **Jeff** on 24 Aug 2005, 6:43 p.m.,*
in response to message #1 by Jeff

Thanks for your input. I returned it. It has some nice features, but I am going to stick with the despised 12C Platinum. I don't like the size of the 17BII+, and with the case, it's monstrous! There are several useless features, too. And why isn't there a USEFUL conversion tool - distance, speed, size, etc.?

difficult decision

*Message #1 Posted by **Mark Crispin** on 16 Aug 2005, 12:34 a.m.*

I now have two HP-65 calculators.

One (which I reported on earlier) has had the card reader pinch roller replaced by a previous owner. I also had to open it up, and remove and reinstall the motor; the motor squealed and eventually failed, but a tiny bit of Break-Free CLP completely repaired it. The rear label ("useful conversion factors") is quite obviously pulled back and the pulled back areas no longer adhere. It is now fully functional, including card reader, and cosmetically is about 85% condition.

The other is a virgin. It's newer (s/n 1606A 03xxx vs. 1333A 15xxx) in about 95% cosmetic condition. The rear label is the "user aids", and appears never to have been pulled back. The card reader's pinch roller has defintely turned to goo, but otherwise the calculator is fully functional.

I am trying to decide whether or not to do one or both of the following two restoration steps:

1) I have a replica rear label on order for the fully-functional 85% calculator. It's the newer style "user aids" because the vendor's "useful conversion factors" label has an obvious error ("B" instead of "8"). I would, of course, retain the old label after removal.

2) send the 95% calculator to the nice folks at fixthatcalc for a pinch roller transplant.

Here's where I'm having trouble.

The replica label would be less-authentic. But, as a calculator that is actually being *used* (I fully intend to submit some new programs to the MOHPC), it would be a desirable restoration especially since the old label is vulnerable to further damage.

Then again, replacing the pinch roller isn't fully-authentic either. Perhaps a virgin calculator in 95% condition should be left as a virgin, unsullied by any restoration. As long as the other one works, I have no need for a working card reader in the virgin, and I can always have it changed later.

My original plan was to keep one, and sell the other (with a working card reader). Now, I am tempted to change the label on the non-virgin, leave the virgin untouched, and keep both.

I'd like to hear feedback from other members of the forum.

Re: difficult decision

*Message #2 Posted by **Hewlpac** on 16 Aug 2005, 10:51 a.m.,*
in response to message #1 by Mark Crispin

You have hit the nail on the head...

I think you will be happiest keeping both calculators. One for use and programming and the other for the cosmetically optimal condition. Putting a replica label on for your enjoyment is no issue and you can replace it

with the original should you sell it in the future.

If you want to use your better unit you will need to replace the roller but what do you gain?

difficult decision

*Message #3 Posted by **Ronald** on 16 Aug 2005, 2:33 p.m.,*
in response to message #1 by Mark Crispin

Hi,

I agree: Keep both.

In respect to the replacement label: Personally I have no problem with that label, as long as you keep the original label stored away, so it can be replaced later if needed.

About "FixthatCalc", does anyone knows if they are able to repair without that it shows on the label, I assume you will always note it has been peeled off one time ?

Ronald

Re: Classic labels

*Message #4 Posted by **Randy** on 16 Aug 2005, 8:48 p.m.,*
in response to message #3 by Ronald

It's an aluminum foil. No matter how hard you try, there will be some evidence the corner was peeled. Same corner, different angles:

Re: difficult decision

*Message #5 Posted by **David Smith** on 16 Aug 2005, 3:22 p.m.,*
in response to message #1 by Mark Crispin

I prefer machines with folds on the original label over replica labels. I would just keep the original label on the calculator.

Don't replace the screws under the label and then reglue the label corners down. I usually remove all traces of the old adhesive with alcohol, then use a rubbery contact cement (made by Elmers). You brush it on the calculator case and the label (make sure it does not pool in the label crease), let dry, then stick the label to the case and rub with a soft cloth. This cement can be easily removed in the future.

French Spice models

*Message #1 Posted by **Tien** on 15 Aug 2005, 9:49 p.m.*

Hi,

I own the French versions of HP-32E and HP-34C (Spice models). I just wonder if there is some kind of "switch" inside the Spice calculator which allows to change the decimal mark from "," to "."? From a manufacturing point of view, would such a "switch" likely exist so the same hardware could be used to build the US and European versions?

--Tien

Re: French Spice models

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 Aug 2005, 11:43 p.m.,*
in response to message #1 by Tien

Hi, Tien;

in fact there is a small jumper that acts like this switch you mention. As you know, the 'E'-series Spices do not have continuous memory as the 'C'-series units have. Each model has a different DC converter: the one in the 'C'-series allows the RAM to be fed while the calculator off.

Some time ago (more than two years) Katie Wasserman added an image to one thread showing that the 'comma-or-dot' jumper was placed in the very DC converter PCB. I`m adding an image of mine (scanned) showing the jumper as it's seen in one of the DC-converter PCB's, but I do not remember which one is it: a 'C'-series or an 'E'-series Spice.

http://www.logeng.com.br/images/comma_jumper.jpg

I also do not remember if having it closed means dot as radix mark or the opposite; please, forgive me.

I think that adding a small dip-switch (or smthng like it) that could be accessed through a small cut in the back of the calculator would actually do the job of easily switching from one mode to the other.

Thanks to Katie for showing the path...

Cheers.

Luiz (Brazil)

in response to message #2 by Vieira, Luiz C. (Brazil)

Thanks Luiz!! That's very helpful information. I will definitely check out these comma-or-dot jumpers.

But I won't cut their backs for sure :-) :-). They mean a lot to me ... We went through the French high school together before I took them with me to the US.

in response to message #2 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Nice picture. Now if I ever get one of these, I know where the jumper is. It seems, however, that Tony Duell was the first one to mention the jumper here. I found this old thread last week, when looking for exactly that kind of information:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv006.cgi?read=10251

Cheers,

Gerson.

HP-35 display problems

*Message #1 Posted by **Robin F.** on 15 Aug 2005, 2:56 p.m.*

I have an HP-35 with a bad display: it only shows one digit on two of its segments, like this:

```
5     5
3     3
8     8
```

etc. When I input a long number, the display becomes brighter and brighter, and the numbers blur into an '8'. My guess is that the cathode driver is broken, and keeps on enabling these two digits instead of cycling through the display. Is it likely that this is indeed the cause, or could it also be caused by a bad connection somewhere?

HP-35 display problems

*Message #2 Posted by **Bernhard** on 15 Aug 2005, 6:06 p.m.,*
in response to message #1 by Robin F.

If you have an oscilloscope, look at pin 14 of the main PCB whether the signal is OK (pin 1 is on the right side when looking into an opened calc), this is the START of the display cycle. The STEP comes from the anode driver IC (1818-1029) pin 6 and goes to cathode driver pin 9. This should allow to find the causation either in the anode driver, cathode driver, contact spokes or the ARC chip. If you happen to have a HP45, too, you might swap PCBs - they are compatible.

regards, Bernhard

Re: HP-35 display problems

*Message #3 Posted by **David Smith** on 16 Aug 2005, 3:25 p.m.,*
in response to message #1 by Robin F.

I have seen the caused by old (often invisible) solder flux residue. Clean the keyboard traces around the display (and mayby the CPU card) very well with 91%+ isopropyl alcohol.

Re: HP-35 display problems

*Message #4 Posted by **Robin F.** on 17 Aug 2005, 6:44 a.m.,*
in response to message #3 by David Smith

I've already cleaned out a lot of green junk (copper oxide?) that was all over the inside of the calculator, maybe that's the problem. I'll try to clean some more, but what exactly do you mean by "keyboard traces"? You mean the traces on the keyboard PCB?

I don't have an oscilloscope, but by using a small loudspeaker with a 5 kOhm resistor I found out that the RCD signal is present, but I heard no "Step" signal (the one from the anode driver to its neigbour). Is it likely that the anode driver breaks in this way, or do you think something else is wrong? If it's just the Step signal, would it be possible to replace it by dividing the system clock or something like that?

Re: HP-35 display problems

*Message #5 Posted by **David Smith** on 17 Aug 2005, 4:13 p.m.,*
in response to message #4 by Robin F.

I would clean everything in sight. Most of the problems seem to occur around the IC and display chips, but the keyboard is scanned by the display signals. Problems can and do occur in the traces to the keyboard matrix. If you have access to an ultrasonic cleaner, you can try cleaning the circuit boards with it.

Re: HP-35 display problems

*Message #6 Posted by **Tony Duell** on 18 Aug 2005, 7:49 a.m.,*
in response to message #5 by David Smith

I thought that on the classics, the keyboard was scanned by the Control and Timing chip on the logic board, whereas the display was scanned by the cathode driver.

ACT-based machines (Woodstocks, Topcats, etc) use the cathode driver to scan both the keyboard and display, but I didn't think classics did.

SOLVE on 15C

*Message #1 Posted by **John** on 15 Aug 2005, 11:20 a.m.*

How does one use the SOLVE function on the 15C? I have misplaced my copy of the manual and would like to figure this one out.

- John

Re: SOLVE on 15C

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 15 Aug 2005, 12:50 p.m.,*
in response to message #1 by John

Hi, John;

first of all, you should express the expression to be solved in terms of a program, with a unique label in memory and a RTN as its last step (no [R/S] because it would stop SOLVE execution after a first scan, as well). The RTN is not necessary if the program is the last program (or the only one) in memory.

Consider that your program uses the stack information as the estimative for your reference variable, the one that the expression must be solved for. The SOLVE internal routine samples your program with the given estimates, so it leaves the a copy of the estimated value in all of the four stack registers, as an aid to help writing your program. Like this: solve the following equation for x.

```
y=x^3-2×LN(ABS(x)+1)
```

A possible program that represents this expression could be:

```
f LBL 0
  3
  y^x
  x<>y (x xchange y)
g ABS
  1
  +
g LN
  2
  ×
  -
g RTN
```

As you can see, we consider that a copy of the estimated x is available in all of the four stack registers.

After loading this program, enter two initial guesses (separated by [ENTER]) where the program should start searching for a root and press

```
f SOLVE 0
```

The [0] after f [SOLVE] means the SOLVE routine will search for a LBL 0 and sample it till it returns a zero.

If the root is not in the range you suggest, chances are that the SOLVE routine finds it anyway.

Hope this helps for now. If you need further advice, let us know.

Best regards and success.

Luiz (Brazil)

Gnarly problem, Luiz! [SOLVE on 15C]

*Message #3 Posted by **Karl Schneider** on 18 Aug 2005, 1:50 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Hello, Luiz --

Your example for John was actually a tough equation to solve, and especially for the HP-15C! Was that intentional? He might be disappointed in the performance of his fine HP calculator...

```
y=x^3-2×LN(ABS(x)+1)
```

This equation has solutions for y = 0 at x = 0 and x = 1.153299. There is a local minimum of y = -0.727258 at x = 0.637971. The solution at x = 0 is also a local maximum.

However, the solution at x = 0 is difficult for the HP Solve routine to obtain, because of the characteristics of equation's absolute value and natural logarithm functions at or near that point.

The slope dy/dx of the equation is

$3x^2$ - 2/(x+1) for x > 0
$3x^2$ - 2/(x-1) for x < 0

So, the slope is +2.00 for x = 0-, and -2.00 for x = 0+, and not defined at x = 0.

The 15C could obtain the solution at x = 1.153299 with certain choices of first guesses (including -0.1 and +0.1), but unsuccessfully tried to "home in" on x = 0 for first guesses near, but straddling 0. "Error 8" (NO ROOT FOUND) would result for some other choices.

The HP-32S and HP-32SII did better at obtaining the root at 0, but also tended to find the other root.

Re: Gnarly problem, Luiz! [SOLVE on 15C]

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 18 Aug 2005, 4:42 a.m.,*
in response to message #3 by Karl Schneider

Hi, Karl;

thank you for your comments. You`re right about the equation, but I did not mean to show such a 'darn' example... I actually did not take much care about the equation behavior, though.

I thought about an example were programming skills would be needed and I wrote the expression solely based on programming. I added 'ABS' and '+1' to avoid forbiden conditions, but I was aware of poles as I used 'x^3' and 'LN'.

After writing and loading the program from the equation, I ran it twice, first with x=1 and then with

x=2. As the y values returned with reversed signal, I ran the SOLVE with 1 and 2 as initial estimates. After a few seconds, the 1.1533 was shown in the display.

I was waiting for John's comments and feedback so I'd explain why I used such example. Now I see that I could use a better, more reasonable (and perhaps more generous) one. Anyway, now that you added such detailed analisys, I think my 'not so good' choice served with another purpose, instead.

Thanks, Karl. I myself added some of your considerations to my own after reading your post. I understood and, in fact, am aware of them, I actualy was lazy enough not going ahead as you've gone. My bad...

Best regards.

Luiz (Brazil)

Re: Gnarly problem, Luiz! [SOLVE on 15C]

*Message #5 Posted by **Karl Schneider** on 20 Aug 2005, 5:14 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Luiz --

Yes, indeed, your problem was (unintentionally?) revealing about the behavior of HP Solve on several RPN calc's. I'll try it on an RPL model or two.

The solution at x=0 lies in the "crook of a roofpeak", and the 15C/32S/32SII tend to approach the solution asymptotically, in ever-smaller increments, if they don't give up first. Solutions are readily obtained if a positive offset is added to the equation (say, 0.2). Then there are three solutions for the equation.

BTW, have you tried out my updated AC Power Transfer program in the MoHPC Software Library for the 32/33 models? It may be the finest power engineering program ever written for those platforms. (Of course, it's not a real powerflow solver, such as you wrote for the 42S.)

-- KS

AC Power Transfer [after "Gnarly problem, Luiz!", from "SOLVE on 15C"]

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 20 Aug 2005, 11:16 p.m.,*
in response to message #5 by Karl Schneider

Hi, Karl;

you wrote:

> Quote:
>
> Yes, indeed, your problem was (unintentionally?) revealing about the behavior of HP Solve on several RPN calc's.

You bet I did not intend to! d8^)

Now for the oter facts: thanks for telling me about the AC Power Transfer with the HP32/33. I

have not been visiting the library for a while, now I have a good reason to go there. About the HP42S, you brought to my mind that I still need to correct the output of my Load Flow program for the HP42S. Now that I have a 32K RAM HP42S, I'm gonna test it with a large array... I remember solving a 10-line power array with the original 8K RAM HP42S and it computed the output array correctly, just failled to show it. The original version was 510 steps long, and as soon as I have it working properly I`m posting about it.

I still have the 144-step partial listing of a first version writen for the HP41CX (could only build the Y-bus). As I bought the HP42S at that time, I ported the program and used the HP42S complex- and matrix-handling resources to go ahead with less subroutines and program steps. I wonder if it would have been possible to do what I wanted to in the HP41CX; I mean, if it would be possible to perform all necessary operations to compute the final current array with the HP41CX... I guess so!

Best regards and thanks again, Karl.

Luiz (Brazil)

When will HP make a good calculator again

*Message #1 Posted by **John** on 15 Aug 2005, 9:53 a.m.*

I was shopping for a calculator for my daughter this morning and I cam across a calculator that had a brushed metal face on it, a nice heavy feel to it, nice sturdy buttons, and overall, it was a quality looking unit. I was glad to see it. The only problem, it wasn't an HP. It was a TI BA-II Plus Pro.

When is HP going to wake up and make the quality units they used to?

- John

Re: When will HP make a good calculator again

*Message #2 Posted by **Namir** on 15 Aug 2005, 10:11 a.m.,*
in response to message #1 by John

No! HP has no financial interest in putting so much resources to restore the old HP glory in calculators. That glory is history now.

Re: When will HP make a good calculator again

*Message #3 Posted by **Ron Ross** on 15 Aug 2005, 10:43 a.m.,*
in response to message #1 by John

Hp isn't going to make a quality calculator like the Hp15c or Pioneer line again, because the majority of engineers won't buy it. Look at the Hp12c (the new one, that lists for $65-). Add $20 to that cost for an Hp15c (different manual and startup costs, keys etc and market strength). So Hp could market an Hp 15c for $85. vs Hp presently sells the Hp33s for $50. Which would you buy as an engineer (99% of us are Cheap Ba#$%^'s!). The quality of the two would be the same (ie chinese Hp 12c is comparable to the Hp33s). Both are compariable to the quality of the BA-II Plus (I suspect a bit less, but I can't complain about the keyboard quality on my Hp33s, but the decimal point warrents someone getting a butt kicking!, though this has been improved in the most recent releases).

If you really needed the extra math features of the Hp15c, your money would be better spent on a graphics, and if you don't need the matrix features or complex math, the Hp33s is certainly more capable and easy to use for run of the mill programming and customization (AND its only about HALF the cost!!!). And don't underestimate the power of marketing (vs reality), 32K RAM vs a meager 0.4K (I am sure they could add more, but anything less that 32K would lose in the marketing snow job that would be shown on the box).

The simple truth is the market is flooded with $10-20 scientifics that are fairly capable for most people. RPN commands a premium, but that too is a very small market for Hp to exploit.

I would have loved to see a return of the Hp20s with an RPN selection option and priced at $30. But that would probably eat into the sales of the new Hp33s and take $20 (Hp33s at $50 and no better made than the Hp20s) of pure profit from Hp's (and nobody else's) pocket. As far as price vs quality, nothing really beat the Hp20s at $30. It was an algebraic only calculator though and not all that feature packed either. But it was a decent scientific, made with Hp quality. It was also an AOS vs the new idiot proof EOS system that is

provided with all newer calculators (ie there are some exceptions, notiably the cheapest Sharps and some other low end calculators). I actually prefer the AOS over the newer EOS as you can save some keystrokes, but a moot point in most cases.

Ah well, I will end another rant.

Re: When will HP make a good calculator again

*Message #4 Posted by **John** on 15 Aug 2005, 11:00 a.m.,*
in response to message #3 by Ron Ross

Ron,

Actually, I already have a 15C, a 48GX, 16C, etc, so I have good calculators, but I just wish HP would get their but in gear. I was shocked when I saw the TI with the metal face and the solid build. All very simple things to do. I just don't get why they don't do the same with the current models.

As far as the 33S, I'd never buy one because of the keyboard layout.

- John

Only When...

*Message #5 Posted by **I, Claudius** on 15 Aug 2005, 6:53 p.m.,*
in response to message #1 by John

HP will never produce any decent calcs again until they stop outsourcing their engineering to the cheapest offshore firm (Kinpo) and bring R&D back under the HP umbrella. HP needs to make a firm commitment by forming a USA based calculator division staffed with the best and brightest. Only when this happens, which is probably just a pipe dream...

Re: Only When...

*Message #6 Posted by **Namir** on 15 Aug 2005, 7:55 p.m.,*
in response to message #5 by I, Claudius

I agree with you .. especially about the pipedream part ... **so the folks who want to bring the HP-15C back should stop dreaming ... whip up your wallets and start ordering expensive HP-15C from eBay if you really mean it!!!**

Re: When will HP make a good calculator again

*Message #7 Posted by **Bill Wiese** on 15 Aug 2005, 11:52 p.m.,*
in response to message #1 by John

HP will never make a good calc again - except by accident.

They're essentially order agents for customized Kinpos. The HP calc staff are marketing folks with a bit of consumer electronics background. Fred Valdez and that Goh chick are not math or engineering people. They're probably quite puzzled, in fact, at our fascination with older calcs, don't understand why we love real true 4-level RPN (as opposed to that multilevel crap on HP48s), etc.

Kinpo, in turn, is yet-another-schlocky-Asian company. They have no brand identity or reputation to maintain or build upon. They live from one contract to the next, and I suspect they throw their own name on production overruns for other co's.

I wonder about the accuracy of their transcendentals, how they do rounding, etc. No Kahans in Taiwan, and no one takes the time to do things right.

HP calc div can now barely spec a decent calculator, let alone validate its correct/ proper operation (a la HP12C-Platinum bugs, etc.) - so how could they *design* one??

HP calc build quality has gone way down but may burble upwards just by sheer luck (I like the new HP10BII) - and it's a nice design. Wish they'd take that pacakge, put an RPN prog calc on it with a large ENTER key, and I'd buy 10 of 'em.

All the HP calc brains have gone. They probably can't even find source code or algorithm documentation or architecture manuals for any of their earlier calcs. And since Nut, Yorke, etc chips aren't made now they wouldn't even comprehend doing emulation of an old calc and would try to write code from scratch, introducing even more bugs since QC staff/procedures so trimmed-down. (A Sunplus 65C02 platform could emulate a 41CX quite nicely.)

Wouldn't be surprised if HP stopped making calcs. It's such a small line item it wouldn't even be noticed in their budget...

Bill Wiese
San Jose, CA

Re: When will HP make a good calculator again

*Message #8 Posted by **I, Claudius** on 16 Aug 2005, 7:26 a.m.,*
in response to message #7 by Bill Wiese

That "multilevel crap on HP48s" is one of the things that made the 48 series so good as it was similar to a pc. Could you imagine a pc math program, such as Mathematica, without a multilevel history?

The rest of your comment is dead on. All the good heads have long been let go. I'm sure all programming/manufacturing procedures have been lost as well. Heck, Kinpo couldn't even get HP to find manuals for the old calcs! Remember when Dave Hicks had to send copies of the old manuals to them?

It really does make one wonder, who is charge of the (modern-day) HP calculator I'm using? If no one is employed that is truly capable of programming it, how accurate are its results? How can I trust it for anything? Jeez, I might as well use a TI, sigh...

Re: When will HP make a good calculator again

*Message #9 Posted by **Mark Crispin** on 16 Aug 2005, 12:04 p.m.,*
in response to message #8 by I, Claudius

In my humble opinion...

We should address some of our concerns and desires to Kinpo, not to HP. Two things that can be said about "schlocky Asian companies": they pay attention (especially to matters which others ignore) and they learn from their mistakes.

On such matters they can be relentless. Yes, they are price-conscious, but quality also means something to them. Asians like to win on both price and quality.

Some of us are old enough to remember when "Made in Japan" was considered a mark of junk rather than of best-quality.

A generation ago, the best thing that you could say about a Toyota Corolla is that "it's a Chevy II, too bad Chevrolet doesn't make them any more." Nonetheless, people who wanted to buy a Chevy II bought a Corolla; and presently came to decide that a Corolla was a pretty good Chevy II. A damn good Chevy II.

Today, nobody thinks of a Toyota as the car you had to settle for instead of a Chevy.

This doesn't mean that Kinpo will listen to us and 6 months later come back with our dream machine. It'll take time, and there'll be ruts in the road along the way.

And let's face it. We know the type of product that we want. It doesn't matter if the label says HP or Kinpo. Since HP wants to market the cheap stuff, they wouldn't mind if Kinpo came out with its own line in the US. Who knows, maybe in 10 years we'll talk about Kinpos as being "the good stuff that HP used to make" or even "what HP would have made if they hadn't stopped making the good stuff."

Okaaaaaaayyyy! Who will contact Kinpo????

Re: When will HP make a good calculator again

*Message #11 Posted by **Mark Crispin** on 16 Aug 2005, 2:00 p.m.,*
in response to message #10 by Namir

I'd be happy with a new model HP-35. To my mind, the HP-35 achieved perfection. There really needs to be a non-spacecadet RPN scientific calculator with HP-35 style standard display.

There's no rhyme nor reason to the layout on the HP-33s, and that chevron is ridiculous. The layout on the HP-30s is better, but its algebraic.

Re: When will HP make a good calculator again

*Message #12 Posted by **Bernhard** on 16 Aug 2005, 5:09 p.m.,*
in response to message #11 by Mark Crispin

I think the HP35 is a very fine calc, but it misses the engineering display format. And some simple form of programmability, just to allow for quick evaluation of functions, with maybe some simple conditional jumps, but nothing for which I'd need a manual, such as the ISG or DSG, or fancy indirect addressing. I don't need this on a calc, and if needed, I'd use a notebook computer and a real compiler instead. And it should have a good LCD display and good keyboard and need no battery (use solar cells). EEPROM technology would allow to keep programs stored even in darkness.

I think it even might be possible to achieve this with some of the larger japanese 4-bit microcontrollers they use in watches. If using a watch chip is not possible, and lowest possible power consumption is desired, a full custom chip needs to be done, but for an old and simple architecture like Classic or Woodstock this may use up only a man-year or so, if the designers do know all the secret tricks of the micropower guild. All this may be well within the reach of a smaller enterprise - and if they really want to do it, I think they still could find the brains who are able to it.

But somehow it did not happen yet - most likely, they don't see a profitable market. Otherwise, we could buy such calculators already.

Probably they did not forget the lesson from the 1970s when making calculators turned from a cash cow into a cutthroat business. The long and winding road of calculator history is littered with bankrupt and defunct companies that made them. I do always wonder how HP's calculator divison did survive these rough waters. There must have been some magic in their calcs. We all pretend to know that feeling - else we would not collect those calcs - but do we really know what it was ? Are we able to distill the essence of the special HP calculator feeling from our memories and calculator collections and will there be some daring entrepreneur who succeeds to put this essence, this soul into a new machine, so as to bring the feeling back ?

Then we would take such a new calc, admire its finish and quality manufacture, press some keys - aha - and if the magic is there, we will happily open our wallets and buy them. But if the magic is not there, and the feeling is missing, the project will be a certain failure. No good news for our daring entrepreneur - he might lose all the money he invested.

And we will wait forever for a good calculator.

Maybe the more viable road would be to set up a non-profit foundation which collects donations but guarantees nothing except that when enough money has been collected, a truly professional attempt will be done to design and build a few prototypes. Then, if this succeeds, and the prototypes happen to have that magic, starts to take prepaid orders and when a reasonable minimum lot size is together, have them manufactured and distributed.

Much like a lottery in which the player might win a damn good calculator, unavailable on the open market. What a thrill !

And also the acid test for the real - world feasibility of the business model - do those who now pretend to want good calculators back really dare to risk some $50 or $100 on such a venture ? If not, we could not reasonably expect some daring entrepreneur stand up and put his own money at risk.

Which is the current situation !

I don't know about the generalization, but if you look at what Kinpo has up on its website, it's hard to avoid the conclusion that the models they make for HP represent their highest quality effort. Or at least those closest to what this group would define as "quality."

How much leverage do we have with a global company like Kinpo? How large a percentage of the overall calculator market do we represent? Is the (fast disappearing) cachet of the old HP prestige enouh to overcome our lack of market weight? I don't think so.

Guitars are mass produced, both in Asia and the United States. (Perhaps in Europe too?) The Asian versions used to be trash. But around the same time Japan set out to seriously conquer the North American automobile market, they also seriously attempted to make decent guitars. In one year, 1980, they bought nearly all of the world supply of straight-grained spruce suitable for acoustic guitar tops. In that year, Martin, then a premier American guitar maker, came out with the D25-K2, with top and body made out of Koa, a Hawaiian wood normally used for ukeleles. (I have one. Sweet instrument.) The Japanese crop that year, from Yamaha and Takamini were of good to excellent quality. Subsequent years saw the guitar market, both for electrc and acoustic instruments, tend toward two extremes. The mass produced instruments were of better quality, and could be priced so as to grow the size of the target market. They were not of the quality demanded by discriminating musicians, but those folks represented a small part of the market - numerically. In monetary terms though, a small fraction of *that* fraction had more weight, of course. And successful professionals simply weren't going to use inferior instruments in their careers. So at the other extreme, you saw the growth of hand made guitars by expert luthiers charging astronomical prices. The instruments they produced were and are reportedly of exceptional quality. I wouldn't know, not being able to afford one.

The point is, if we, as an elite group that understands what exactly it takes to make an excellent calculator, are willing to pay the frieght, then there is room for one or more "boutique" vendors of excellent calculators. I see also where several folks have had the idea of producing a community designed and built machine, presumably with donated talent and money. That might work, but there seems to be a lot of negativity hearabouts toward those efforts. I don't know any of the history, so please forgive my ignorant blundering if I'm stirring a pot in the wrong direction.

My final point is that it is useless to bemoan the decline of a company like HP. Without the willingness and capacity to fight corporate battles on a global scale, you don't have a chance of changing the behavior you object to. The way forward, it seems to me, is to take your desire for better quality to a new venue, like a community effort, or a boutique startup, or else move on to something else. There are still plenty of areas in this world that could use and would not scorn a fine sensibility of craftsmanship and quality.

Wrong approach. We're not talking about reviving the old HP prestige; we're talking about a currently-unsatisfied market for a line of high-quality calculators. Concidentally, that market was once served by HP.

Put another way; we'd not be asking Kinpo to resume the production line on old HP calculators. We're asking Kinpo to produce new calculators that happen to share charactistics with the old HP calculators.

Maybe Japanese companies. But given Red China + HK (and to some extent Taiwan's) make-the-price-number at any cost, I've not seen good stuff come out from there.

The Chinese products offer a function, while Japanese products offer a quality end-result. Compare a Chinese vs Japanese stereo or digital camera - in general, the Japanese product is not only known for build quality but for quality output (images and sound).

> Quote:
>
> Today, nobody thinks of a Toyota as the car you had to settle for instead of a Chevy.

I do. Of course, Chevy's not making the Caprice V8 anymore - too bad, the idiotic soccer moms won.

There's not a single Toyota I'd want, including their pickup trucks. If I were given one, I'd sell it - and buy a Ford.

Some of us simply won't accept low-torque, front-wheel drive tin boxes designed for midgets.

> Quote:
>
> This doesn't mean that Kinpo will listen to us and 6 months later come back with our dream machine. It'll take time, and there'll be ruts in the road along the way.

Kinpo doesn't care what we think. We are never their customer. They're an OEM house. Kinpo's customers are HP and maybe TI and Casio.

This is much like the cellphone biz. Oftentimes we can't get phones w/features we want because Motorola, Nokia, etc. all sell into the carrier channel and only fraction of market is direct-to-consumer sales. So phones take on the characteristics that the marketing folks at cell carriers want, and there is less consumer pressure because folks are locked into contracts, averse to changing carriers, etc - that is, phone features are somewhat decouples from marketplace and phone vendor is isolated from end-user.

OT: cars!

*Message #16 Posted by **bill platt** on 16 Aug 2005, 5:52 p.m.,*
in response to message #15 by Bill Wiese

Hey Bill,

I think you are taking a flyer on the Toyota thing. Seriously, Fords have really poor

maintenance records compared to Toyotas. I know--I use them both--the fords have bad transmissions. The toyotas are more expensive, but have far more reliable transmissions.

Of course the Fords today are much better than 10 years ago--and have narrowed tha gap that was so extreme in the 80's.

I would say that the european ford (the focus) is superior to the domestic (contour, taurus). There was one bad year though. And the focus costs less than the Toyota and offers a better small wagaon platform. I may get one.

For GM, the small cars are nowhere near as good as the Toyotas--they are noisy, mushy, schlocky over-designerd fashionmobiles. Yet a Oldsmobile 88 (or the Buick equivb.) with 3.8 liter V-6 is a reliable battle wagon with superbe quality for the price. And at 22 mpg around town for a full-size car, is phenomenally efficient. And has leather and all that jazz. Perhapts the best total value in automobile today.

So I guess you really have to look at the details--or the specific offerings.

>
> Of course the Fords today are much better than 10 years ago....

Well my comparison set is small simply because I will not purchase a front-wheel drive car. (In fact, they should be firebombed ;-)

Front wheel drive cars are good occasionally for soccer moms in wet weather, but the prime motivation for their being sold is that it takes 10-12 minutes less vehicle assembly time. (About 7 years ago, I toured the NUMMI plant in Fremont, CA - it produced small Toyota pickups and the Geo Prizm, which was really a Corolla. It took 10+ min less to build the more complex, option-laden Corolla than it did to build a strippy truck since the powertrain could be dropped in at once w/front wheel drive setup.)

So now I am limited to the cars I can buy even in US: Crown Victoria/LTD (cop car), Mustang, Vette, pickup/SUV. A coupla years ago I could've still gotten a Camaro or Caprice (cop car).

I care little about JD Power ratings. Those essentially equate minor issues (doorknob failure, say) with major ones (engine stops running) and just go by count.

I've owned new Fords since 1989 (trucks, and a Thunderbird) and one GMC truck. Never had problems other than a (Japanese) fuel pump. When you buy rear-wheel drive you get a real transmission, and if it has problems it's much easier/cheaper to work on than a front-wheel drive.

Toyota's now making almost-full-sized trucks. They're having quite a few engine problems w/that "I-force V8".

Glad I have a new F150. Next year or so I might get a Crown Victoria.

Hi Bill & Bill,

How are you?

If there is a thing I reeeeeeaaaaaally like about America then this is a pickup :-)

I bought a brand new Nissan Pick-Up Navara Double-Cab, 133HP, 2.5 liters, turbo-diesel (I think it is called Frontier in USA) 3 years ago and I cannot describe the enjoyment of driving a big rear-drive truck compared to the regular car. Of course, there is some electronics inside the engine (unfortunatelly, you cannot buy a car without electronic engine management these days) but everything else is a pure mechanic including transmission (2H, 4H and 4L modes with limited-slip differential on the rear axle) and as primitive as you can expect from the 4x4 vehicle (more than 20 years old technology).

Other pickups you can buy here are Mitsubishi L200 (115 HP) and Mazda B2500 (109 HP). I don't know if Toyota HiLux is available. The only non-japanese truck is Ford Ranger (perhaps this is a F150 variant for Europe) but it comes, in fact, with an 109HP engine from Mazda B2500.

Best regards.

Hi, Hrast...

Congrats on your truck. Yes, they are called Nissan Frontiers here and have a pretty good reputation.

A decade ago I used to do 'power chips' for many cars, Nissan included. Their engine control units at the time were by a div. of Hitachi and used HD6303 CPUs (glorified 6800 variant) w/special external timing controller chip. Later, as I got out of that racket they were switching to a MELPS CPU (Mitsubishi 65C02 variants). Good chance they've switched to Hitachi H8s now.

The Mazda trucks are re-wrapped/re-badged Ford Rangers. The 105hp variant I believe is a 2.4L 4 cyl but not sure. Lotsa folks buy these trucks in US with 3.0L or 4.0L V6 engines.

These Nissan Frontier, Ford Ranger, Toyota pickup (we don't call 'em HiLux here, that's a non-US designation) are all considered small trucks in USA. The F150 is a full-size truck, and GMC and Chrysler (Daimler) also have rough equivalents in size, horsepower, tow capacity. Some of these trucks have V6 engines in 200HP range - my last GMC truck, in 2000, had a 4.3L Vortec V6 which was a solid engine, great lifespan, zero maintenance other than oil changes. My current 2004 F150 has a tried & true 4.6L V8 with around 240HP, and automatic. Large portion of trucks here ship w/automatic trans - esp as these days an auto tranny can shift as well as 90% of the population and no longer requires manifold vacuum to perform shifts.

You prob won't see too many F150s or GMC Sierras in Europe due to gas costs/taxes. They're a bit slow here too since gas has spiked to $2.75/gallon, but that's likely to drop back to $2.20 in a month or so. I get 20 miles/gallon on level freeway when no stop & go traffic.

I like my F150 because it has 2 regular doors and 2 smaller 'suicide' front facing doors to let you get at cargo behind the seat (there's around 18" of space there at bottom). I put a cross-bed toolbox on my bed and I now have more storage space, combined w/rear space back of seats, than most cars have.

I like trucks because I'm over 6'5" tall (that's 196+ cm) and I fit nicely. And, being rear-wheel drive, they're easy to fix.

Plus, this is America. You can put a gun rack on your truck - which'd be kinda silly on a Honda ;)

>
> Front wheel drive cars are good occasionally for soccer moms in wet weather, but the prime motivation for their being sold is that it takes 10-12 minutes less vehicle assembly time.

Huh?? FWD is ideally suited for compact cars without excessive power. A transverse-mounted in-line 4 or V-6 engine and one-piece transaxle (differential/transmission/axle) aligned with the front wheels provides a light and compact arrangement. Weight over the driving wheels, and no space-encroaching driveshaft well.

Of course, RWD is needed for carrying or towing heavy payloads (remember the low-powered, FWD Volkswagen Rabbit pickup of the 1970s?), and RWD (or especially AWD) is best for powerful cars.

I have two German cars from the 1980's -- one FWD and one RWD with limited-slip differential. The FWD car is surer-footed and much better-behaved on wet or slippery roads, even taking its newer all-season tires into account.

> Quote:
>
> When you buy rear-wheel drive you get a real transmission,

What does that mean -- higher torque and power ratings? That would be meaningful only if the vehicle has and needs the power...

> Quote:
>
> and if it has problems it's much easier/cheaper to work on than a front-wheel drive.

That would depend on the manufacturer and type of vehicle. There ain't nothin' cheap or easy about advanced performance cars from Porsche, BMW, Mercedes-Benz, Ferrari ...

>
> -- KS

Karl,

Rear-wheel drive American cars (and for that matter the few Japanese cars, more likely trucks) are simply easier to work on. When you work on a FWD car, the packaging's awfully tight to fit everything in engine bay.

And the 'advanced' things about transmissions (BMW, MBZ, etc.) are often not the things that fail - simple things like valve bodies, etc. are the parts that fail.

Out here, the labor costs of work, diagnostics, etc. often exceed the actual parts costs given that labor is often $70+/hour. A transmission overhaul can cost a decent fraction of a car's price.

Since I, and many other Americans, refuse to buy underpowered compact cars, we avoid FWD cars too. We want horsepower and torque. Plus RWD cars often handle better, no torque steer, etc. - I note the significance that BMW & MBZ car lines, at least in N. America, have no FWD cars in it. They're all RWD, with a few AWD (all-wheel drive) variants. In my area, we don't have snow or ice so FWD benefits are especially moot.

It is pretty common for Ford Crown Victoria sedans (large V8 RWD sedan often used as police cars) as well as pickup trucks that are used as commuter vehicles, to have not had any transmission work other than oil/filter changes for 250K miles. Mustangs and Camaros, do well too provided they're not abused with racing-like starts.

Unfortunately car makers want to spend less assembly time and the buying public is willing to spend more repair $$ 100,000 miles later, with FWD.

I know of two Crown Vics in my area that have not had major engine or tranny work and have almost 300K miles.

I will never, never buy a FWD car.

HI all.

Couldn't resist this (very) off-topic thread.

This comment is rather sidways to the general line of discussion but:

Twenty odd years ago I suped up an old Chrysler Valiant (Dodge) 265 c.i. sedan (VH, 1972). I love old cars and the beauty of these beasts is the kettering spark system (no electronics at all ;-) and rear wheel drive makes engine and gearbox replacement do-able. No expensive c.v. (Not hp41...) joints to wear out and cost u and arm and a leg...

All I did was drop a 350 Holley carb on it and slipped in a custom high-lift 25-65 camshaft. Dramatic performance improvement and if one drove sedately it gave about 27 m.p.g. on the highway.

If you got under it, the thing would do about 50 m.p.h. in first gear, 85 m.p.h. in second and heaven knows what in top. Engine revs to just under 6000 rpm. Never been stupid enough to have it valve bounce.

The sad shock absorbers were replaced with vari-rate gas struts and I dropped soft compostion Yokahamas on the wheels to improve the fairly sad stock handling.

The result: a nice old car. Recently I found out that 25-65 is indeed the "magic number" and was common in speedway racing valiants in the 1970's...

Of course I would like to own a Lamborgini Diablo or Countach...

My last car was a Holden (Isuzu) gemini and it's a big step down to 1.5 litres (!) But I have found that it's how smart you drive that counts. I like watching people passing me in their fairly exotic BMW's Merc Benzes etc., (nice cars, of course) and then passing them (!)later on; the gemini will just do about 90 mph.

Don

in response to message #20 by Karl Schneider

I had been resisting since it's so O.T., but I guess I'll give in and say something.

> Weight over the driving wheels

Not a valid argument. Some well-designed RWD cars (which are rare in the U.S. now) are approximately balanced anyway. Then when you add torque to the driving wheels, even more weight is borne by the rear. Unfortunately American and Japanese manufacturers like to put the front wheels too far behind the front bumper, and the

rear wheels too close to the rear bumper, and then they get a much heavier load on the front. European automakers seem to have figured this out.

> and no space-encroaching driveshaft well.

That "space-encroaching driveshaft well" strengthens the body though, so I suspect it allows the same amount of strength with a thinner, lighter sheet metal. It probably does not offset the greater weight of the driveshaft and rear end though.

I must second what someone said about reliability though. I don't know why there should be a correlation, but our FWD cars have needed multiple expensive transmission repairs, and the RWD ones have not.

Re: When will HP make a good calculator again

*Message #25 Posted by **Mark Crispin** on 16 Aug 2005, 6:14 p.m.,*
in response to message #15 by Bill Wiese

If you look on Kinpo's web page, you'll see that they're an OEM for Citizen (a Japanese company) as well. So I wouldn't be too quick to play the "Japanese stuff good, Chinese stuff crap" card.

It's a progression. The quality of goods coming out of Taiwan is steadily increasing. The same market forces that affected American companies is affecting Japanese companies -- Japanese workers are too expensive for consumer goods, and Taiwanese, Chinese, and Korean OEMs are stepping in to fill the void.

To return to the car analogy; a few years ago Korean cars were widely (and justifiably!) derided as crap. This year's batch, though, is getting some reluctant praise as being "not bad, not bad at all."

Don't forget as well that the cheap stuff (e.g., the four-function calculators on their web page) is what pays for the R&D on the good stuff.

Furthermore, I don't think that we should take our opinions so lightly. We aren't just calculator collectors (and thus easily dismissed as crackpots); we are also *engineers* who would pay a premium for the product we want.

What we want is not a single "one shoe fit all" calculator. I think that we want a product line with variation in feature set but with some characteristics in common (e.g., rugged construction).

*Message #27 Posted by **I, Claudius** on 16 Aug 2005, 8:39 p.m.,*
in response to message #26 by Bill Wiese

You echo the sentiments of many here who yearn for a return of an era of small, pocketsize RPN calculators. Nothing wrong with this opinion, HP should do a remake of say, the 15C with the 32/33 ROM. For anything higher you say you use a pc based program. If you can order your work around this, fine.

For me there are times when a pc with my favorites, Mathematica and Matlab are not available. And then, my 48/49 series have done a terrific job with integration, systems of equations, unit conversions, even a difeq or two. Of course these are later checked on the pc, but the initial work was set up by hand, and done with the calc. I also have dozens of small RPL programs that quickly take the grunt work out of many operations Truly, my 49 is a useful, valuable tool that no scientific could ever begin to approach.

To despise the 48 is a shame. It may very well be the best all around calculator ever produced by any company.

*Message #28 Posted by **Mike Sebastian** on 16 Aug 2005, 9:47 p.m.,*
in response to message #27 by I, Claudius

The Chinese are learning how to make decent calculators. One measure I use is the lowly one-dollar calculator.

I'll occasionally buy a one-dollar calculator to examine. I'll check out its usability, which includes the feel of the keys, how the keys are laid out, display readability, and how comfortable it is to hold (or how well it sits on a flat table). I'll also examine its general fit an finish. Then, I'll take it apart to check its internal construction quality.

In general, the quality of one-dollar calculators has improved dramatically in the past few years. The internal construction has improved dramatically. For most models, the PCB etching is clean and precise, the solder joints are clean (fewer cold solder joints), and the heat-seal is lined up squarely between the PCB and LCD. The quality of the molds, which directly affects the fit and finish has improved dramatically. And, the keyboards are also improving.

There are still junky one-dollar calculators being sold. But, there are others that are good quality and would be a good value at twice the price.

DEV7571 BASIC Files?

*Message #1 Posted by **Howard Owen** on 15 Aug 2005, 1:06 a.m.*

In the Computer Journal of the PPC, Volume 3, Number 5, in the Trading Post coulmn, there's an ad for a utility called DEV7571 that allows the 75C to act as a KEYBOARD IS device for an HP-71B. I ran across KEYBOARD IS in some documentation and software I purchased recently, and the thought struck me that the PC keyboard would be nice to use with the 71. But the 75C will do in a pinch!

Does anyone know if this software has survived anywhere?. If so, can we track down the authors and see if they will accept money for it, or else release it to the small but eager world that awaits it?

Regards, Howard

Question for HP-41 MCODE experts

*Message #1 Posted by **Monte Dalrymple** on 14 Aug 2005, 8:38 p.m.*

The David Assembler documentation lists three boundary conditions for the C=G instruction where the operation is strange. They all have to do with cases where the active pointer is (or was, or will be) pointing at the most significant nibble. Case 3 is when the pointer is decremented from pointing at the MS nibble immediately before the C=G instruction. This document explicitely states that this is for the DEC PT instruction only. But my reverse-engineered Nut CPU also does a similar thing for the case where the pointer is changed (from pointing at the MS nibble) with a PT=d instruction. In this case the behavior is identical to that listed for the DEC PT case, only relative to the new pointer value. Can anyone confirm that the original Nut CPU operates this way? Or is the operation "correct" in the case where the pointer is loaded with a new value, where it was previously a "B", followed immediately by C=G? Thanks in advance.

Monte

in response to message #2 by Matthias Wehrli

Hi Matthias,

I guess beauty (or value in this case) is in the eyes of the beholder. An HP41CY is perhaps cool, but when you look at what it can do it falls way short compared to what for example Matlab, SPSS, and Mathematica (to name a few) can do for folks like me. My interest in the 41 line (and in otehr HP calculators) is nostalgic. But, faced with a choice of buying an 41CY or an SPSS version 13, I will certainly put my money in the software that can run circles around any version of the HP41.

in response to message #1 by Howard Owen

This is one of the large batch of NOS 41CX's from 1990 that was discovered in a UK storeroom during 2002 or 2003. I was offered one at the time for $75 by a seller of these units, but I asked questions because the deal seemed too good to be true. After I saw the selling prices on dutch auctions, I wasn't cheeky enough to request the seller's offer...

These latest-manufuactured and unused halfnut 41's may well turn out to be the most reliable ones available. However, the solidness, key feel, and display are better on the fullnuts (1979-1984 + part of 1985?).

I wonder what's a blanknut CX would go for?

Re: $560 - not a record

*Message #10 Posted by **Ronald** on 16 Aug 2005, 2:38 p.m.,*
in response to message #9 by Chan Tran

How much do you want to pay for it ?

I guess that at some time there is always someone who wants it desparately and will go to the end so it could be one time 300 another time 800 dollar.

F.e. the HP29C that went a day ago was relative cheap, I also remember it went for 400 euro.

As we say in Dutch: It is what the fool wants to pay for it.

Ronald

*Message #1 Posted by **Bram** on 14 Aug 2005, 4:57 a.m.*

After a long time I just happen to click the bring-back-the-HP15C-site and notice that the calcs counter has reached well over 200.000
It has been dicussed before that HP wouldn't bother to make a few thousands of calcs, but I guess that this amount is becoming economically interesting, isn't it?

Re: 2E5

*Message #2 Posted by **Larry Corrado** on 14 Aug 2005, 6:55 a.m.,*
in response to message #1 by Bram

Yes, but how many of that 200,000 would really translate into sales? There's a big difference between filling in a number on a website and actually shelling out the money. Also, with only 3300 users having checked in, that averages some 60 HP 15Cs each. Very doubtful! I suspect that some joker(s) punched in some big numbers to make an average like that.

Also, re the $400 average EBay price: I bet the selling price would fall very rapidly if the supply increased significantly. I believe economists call a supply-demand relationship like that "inelastic."

Bottom line: I don't think the site provides much evidence for big 15C demand.

Larry

Re: 2E5

*Message #3 Posted by **Chris Woodhouse** on 14 Aug 2005, 10:42 a.m.,*
in response to message #2 by Larry Corrado

Actually it was two jokers or really probably one that made two entires. There are two signers that have said they would purchase 99,999 calculators. The names on those 2 entires are Bill Hewlett and David Packard. Then there is a guy from France that "wants" 5,000 and 2 in China that "want" around 1,000. If you disregard these 5 entries, the number drops to a more believable level of 11,707.

I keep the web site up mostly as a tribute to the 15C. Maybe someday if the site ever gets any real publicity the number of signers will move in to a high enough range to mean something. One of these days I will add more content with more help and information about the 15c with sample programs and stuff.

in response to message #3 by Chris Woodhouse

When my HP15C broke down after 15 years of daily reliable service, the autopsy of the corpse reveiled

the incurable disease of hairline cracks in the flexfoil wiring. Tried to fix it with a very fine soldering iron, came back to life for a short time, then another crack. In the end I had a dozen or so jumper wires soldered in and then dumped it into the garbage can. The flexfoil wiring was brittle like an old man's bones.

The more interesting point is how long I phoned around and ran up and down in town and all sorts of suspicious places where they use to sell NOS electronic gadgets. No trace of any HP15C anywhere. Even at $10 per hour, I think I could have bought an handful of them back in the good old times, just for the time I spent in vain searching for a replacement. I finally finessed a lowly but unused HP11C away from my father, a retired engineer, for a few bottles of valuable Bordeaux wine from my cellar. He had had the foresight to buy two of the last HP11C in town when they sold out.

Bottom line of this story: if all of the 10,000 or so HP15C aficionados who truly signed up on that list have invested about the same time, effort, and precious collectibles like me just to get a replacement, this translates to an amount of money where we could have reverse engineered and perfectly copied it even without any help of HP.

Regards, Bernhard

Mine had the same problem (was: 2E5)

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 14 Aug 2005, 2:43 p.m.,*
in response to message #4 by Bernhard

Hi, Bernhard;

I have on HP15C withthe same problem: the conductive trails of the flex circuit began to crack. I tried to solder them, but found no long-lasting solution I could think of.

I was given an HP11C with a broken LCD, so I used the case and internals to rebuild the HP15C. I had to remove the keyboard faceplate and the back label of both calculators, but it was somehow hard to remove the HP15C`s back label, so I was only able to use the riginal HP11C case with the HP15C's keys and keyboard faceplate. I also mixed the IC`s, so I used an earlier Voyager processor with a newer R2D2 (after reading it from a serious contributor, I cannot help thinking of the little StarWars robot, but in this case, R2D2 stands for RAM-ROM-Display-Driver...) withthe original HP11C mainboard, because the HP11C had the single maiboard structure. My little frankencalc survived the first lightning ("It`s alive!!") and it is working fine till today.

I wonder if there is a way to build a thin fiberglass PCB that fits the same as the orignal flex PCB so we could rebuild the Voyalgers with this sort of problem. Instead of using the small polymer, we could add a connector like those found in many portables available today.

I have the pictures of the inside of the rebuilt frankencalc, but I have to find them prior to post again. I`ll let you know.

Best regards.

Mine had the same problem (was: 2E5)

*Message #6 Posted by **Bernhard** on 15 Aug 2005, 7:26 a.m.,*
in response to message #5 by Vieira, Luiz C. (Brazil)

Hi Luiz,

thanks for the info / hints: now I do know the flexfoil wiring disease is most likely not a single event with these HPs. Your hint with building a frankensteinian HP out of the worn HP15Cs chips and the HP11C comes too late, I threw the remains of the HP15C into the waste basket years ago, before I became aware of the exorbitant prices even badly worn HP15C corpses fetch on Ebay. I could have at least sold the keyboard (which still had worked perfectly - after 15 years of hard engineering work, I did all my calculations with it on a daily basis), and possibly recover all the money I had paid for my HP15C back in the early 1980s... this feat, if accomplished, would have meant to have got HP calculation services over 15 years for free !!! This is the kind of bargain I like. However, I remember my HP15C had needed a set of three expensive batteries after 10 years of service or so. Maybe I could also have sold them on Ebay as being "perfect condition, at least still half full" to fully exploit the HP15C corpse. No I'm no Scotsman but only joking about the strange show we all can see on Ebay with HP calculators as the main protagonists.

best regards, Bernhard

Re: Mine had the same problem (was: 2E5)

*Message #7 Posted by **GE** on 16 Aug 2005, 3:41 a.m.,*
in response to message #6 by Bernhard

Regarding the flexfoil, there is such a problem on another (non-HP) machine, the (very nice) eMate made by Apple years ago. Someone created a replacement part, see http://www.pda-soft.de/ematecable.html for a review. So it can be done. Is it possible to solder a bunch of small wires instead of this dreaded flexfoil ?

Re: Mine had the same problem (was: 2E5)

*Message #8 Posted by **Bernhard** on 16 Aug 2005, 3:06 p.m.,*
in response to message #7 by GE

On the HP15C the flexfoil actually carries all chips, the display, and links this assembly to the keyboard, which is a real PCB. I think it's almost infeasible to replace the flexfoil with another one. Desoldering the precious chips and putting them on a real PCB won't help either because this assembly would be thicker than the flexfoil.

I still wonder what causes the failure of the flexfoil. The HP11C I am using now also has one, and if this one dies, I have to take one of the LED HPs from my collection to do my daily calculation work.

Of course I could use an emulator such as Nonpareil on a PC, but having a real HP keyboard instead of a mouse is more efficient.

Re: Mine had the same problem (was: 2E5)

*Message #9 Posted by **Vieira, Luiz C. (Brazil)** on 16 Aug 2005, 4:28 p.m.,*
in response to message #8 by Bernhard

Hi Bernhard, all;

I know this is not the thread's main issue, but I`d add that a thin fiberglass PCB built with the same layout found in the flexfoil would be a possible solution. I disassembled an HP41CV halfnut once and the hibrid LCD controler + RAM-ROM

(an earlier RADM-ROM-Display-Driver?) is assembled in a thin PCB. If this PCB in an earlier Voyager has connectors in the same configuration found in the connecting edge of the flexfoil, I thnk it can replace it with some additional advantages.

I still have the old flex-foil, and I remember I scanned it. Would someone try something like this? I have no such thin fiberglass PCB, but I think it`s worth trying.

Best regards.

Foothill Flea Market

*Message #1 Posted by **Eric Smith** on 14 Aug 2005, 1:26 a.m.*

Did anyone here happen to go to the Foothill Flea Market (Silicon Valley) this morning (Saturday, August 13, 2005)?

I was out of town, so I couldn't attend, but there was apparently one fairly uncommon HP calculator there. Unfortunately he didn't buy it for me, but maybe someone else here got it.

Re: Foothill Flea Market

*Message #2 Posted by **Eric Smith** on 15 Aug 2005, 9:16 p.m.,*
in response to message #1 by Eric Smith

Well, guess it wasn't one of the regulars here.

It was an HP-81, and the asking price was $50. Sigh.

Re: Foothill Flea Market

*Message #3 Posted by **Gerson W. Barbosa** on 15 Aug 2005, 10:22 p.m.,*
in response to message #2 by Eric Smith

Have you seen a 27 on eBay last month? Yes, an HP-27 not the 27S. Well, it first showed on our local auction. Half an hour to end, it was less than $40. It was midnight and I was not smart enough to wait till the last minute to bid. I thought the other bidder was sleeping, she was not. In short, I quit when the price went over $100. A week later it was on eBay: sold for $395 or so...

I have no special interest on the HP-27 (I would prefer an easier to find 34C) but it's one of the Woodstocks still unsupported by Nonpareil. If I'd gotten it for a low price, I would have sent it to you... Maybe in four or five years when one of these shows up again...

Regards,

Gerson

Thanks for your support of Nonpareil! As it happens, I now have ROM dumps from the 27 and 29C, and they will most likely be in the next release of Nonpareil. I have a few minor bugs to track down yet, and I need to put together suitable image and KML files.

I also have dumps from the 19C and 67, but they will require more work and won't be supported in Nonpareil as quickly.

The pre-1983 models that I still require in order to get ROM dumps are:

- 10C
- 81
- 92 (mine doesn't work; I might still be able to dump its ROM)
- 9100A, 9100B
- 9805
- 9821
- 9830
- 9831
- 9835A, 9835B
- 9845A, 9845C

Because they have different ROM revisions, it might be useful to dump ROMs from these models as well:

- early 19C
- early 29C
- early 67
- late 80 with two quad ROMs instead of seven-ROM hybrid
- early 97

In addition, I would like to find NON-WORKING units of the following models for destructive ROM dumping:

- 01 (watch)
- 10 (handheld printing four-function)

I have working units of those models but am unwilling to sacrifice them. An 01 *might* still be functional after I'm done with it, but it would have reduced long-term reliability, so I'd much rather start with one that is already broken.

For all pre-1983 models other than the 01 and 10, the ROMs can be dumped electrically with no harm to the calculator.

Best regards,
Eric

Re: models needed for ROM dumping for Nonpareil simulator

*Message #6 Posted by **Eric Smith** on 18 Aug 2005, 12:05 a.m.,*
in response to message #5 by Mark Hardman

I think I've got the 95C covered. I know where three working units are (including David's), and I'm pretty sure I can get at least one of the owners to let me dump the ROMs. One of them has said that once I can demonstrate dumping the 97 ROMs without damage (since it has very similar hardware aside from the card reader), that he'll let me do it. I haven't yet reached that milestone.

Re: models needed for ROM dumping for Nonpareil simulator

*Message #7 Posted by **Bernhard** on 20 Aug 2005, 6:58 p.m.,*
in response to message #6 by Eric Smith

As for the risk of "damage" when dumping HP ROMs, early this year it was necessary to desolder each and every of the ROMs. Then, if the ROMs got damaged by overheat, then the contents was lost, and so was the calc.

Since then, the reader hardware and software has improved and it's only necessary to desolder the CTC (on Classics) or the ACT (on Woodstocks) and after ROM reading, put them back.

If something evil happens to the CTC/ACT chips, they can easily be replaced by similar chips from other calcs.

BTW, from the many ROM chips I have desoldered and read out, *** NONE *** was damaged. But the new method that just puts the CTC / ACT chips on risk is the preferred one, especially for the rarer calcs such as the HP27 or HP70.

regards, Bernhard

Re: models needed for ROM dumping for Nonpareil simulator

*Message #8 Posted by **Eric Smith** on 22 Aug 2005, 12:38 a.m.,*
in response to message #7 by Bernhard

On the Spice and Voyager series, no desoldering is necessary.

On Topcat series, there is often a jumper in the ISA signal which was intended specifically to be removed for automated test, so only that jumper needs to be desoldered and resoldered.

However, I have an as yet untested idea as to how to dump ROMs from Classic/Woodstock/Topcat models without desoldering anything.

I'm not trying to convince anyone to subject their HPs to anything risky, nor would I ever do anything to someone's HP without fully explaining it first. And I'm not going to do anything that I wouldn't do to one of my own prized calculators.

10c rom

*Message #9 Posted by **Gene** on 21 Aug 2005, 9:45 p.m.,*
in response to message #6 by Eric Smith

Eric, will you be at hhc2005? Can you pull the roms from a 10c if I have one there on Saturday?

Re: 10c rom

*Message #10 Posted by **Eric Smith** on 22 Aug 2005, 12:43 a.m.,*
in response to message #9 by Gene

I expect to be at the conference, but that's not yet certain. I could bring the hardware necessary to dump the ROM contents. It's just a fairly small device that attaches to a USB port on my laptop, and has six HP logic analyzer test clips that attach to pins of the ICs. (Technically only four clips are necessary, for one clock phase, SYNC, ISA, and ground, but I usually wire up the other clock phase and the data line as well. The data line provides an additional check of the integrity of the dump.)

Have you already examined the innards of your 10C? Do you know whether it is of the original construction with the LCD and electronics module separate from the keyboard PCB, or the later single-PCB design? I've seen the innards of two 10Cs of the earlier design. Those are much harder to work with, which is why I'm hoping to find one of the later construction style. But I'm not actually certain whether HP made any 10Cs that way.

Thanks,
Eric

Last of the Topcats?

*Message #1 Posted by **Howard Owen** on 13 Aug 2005, 6:18 p.m.*

I'm sure the answer is out there,in the historical record, or perhaps in the museum's archives, but I thought someone might know the answer(s) to this question: What was the HP-97S the last machine in the Topcat line? The 41C was expandable, and you could certainly spend more on a 41C system than on an HP-97, but is that the whole story, a different marketing model? I ask because I would love to have seen something in the Tomcat form-factor but with HP-41C guts. It would have had built-in HP-IL, 5 times the memory like the 41CV, and the larger keyboard would have accomodated more 41C functions. HP-98C? (Or CV, or CX).

Regards, Howard

Re: Last of the Topcats?

*Message #2 Posted by **Walter B** on 14 Aug 2005, 12:36 a.m.,*
in response to message #1 by Howard Owen

IMHO the HP71 covers what you request. HPIL, expandability etc. It just doesn't have RPN (well, that's a minor deviation). Valentin will praise this model better based on his vast experience for sure.

Re: Last of the Topcats?

*Message #3 Posted by **Howard Owen** on 14 Aug 2005, 12:52 a.m.,*
in response to message #2 by Walter B

It's the form factor I'm thinking of. The 71B isn't the easiest of HP's handheld machines to type on, although I can get by in a pinch. It's certainly more powerful than a 97 or even a 41C (since it can emulate one.) But the Topcats were great for cranking out calculations. The keys are BIG and hard to miss. The integrated printer is a boon for keeping track. And I just like the way they look. So my post was aimed at speculation about what HP might have produced in the Topcat line during the 41C era. And I was also interested in whether anyone knew why they didn't go forward with that layout.

Re: Last of the Topcats?

*Message #4 Posted by **Vassilis Prevelakis** on 14 Aug 2005, 1:19 a.m.,*
in response to message #1 by Howard Owen

Eric Smith was thinking about producing a microcontroller replacement of the the guts of an HP67 (and presumably an HP97). So you can have an HP97+ that can be more than 100 times faster than an original HP-97. But adding HP-IL will not be easy since you have no way of entering the commands from the keyboard (without redifining the keys that is). In any case what do you need the HP-IL for anyway? Just add a serial link so that you can download programs to your HP97+

I would add a wireless interface (e.g. bluetooth or even WiFi) so that you do not need to drill holes to the case.

Re: Last of the Topcats?

*Message #5 Posted by **Howard Owen** on 14 Aug 2005, 1:52 a.m.,*
in response to message #4 by Vassilis Prevelakis

I'm trying to keep it in the spirit of the times. What would Corvallis have produced if they had designed a Topcat-like machine with 41C guts? I think HP-IL would have been part of such a design.

What would the display have been like? The 97's LED display is nice and bright. You'd need backlighting to get close to that clarity in an LCD. How would the keys have been laid out given the added real estate available in the desktop form factor?

And once again, does anyone know why Corvallis italic]didn't[/italic] produce such a device?

Re: Last of the Topcats?

> Topcat-like machine with 41C guts?
> [...]
> And once again, does anyone know why Corvallis didn't produce such a device?
```

But they did. They produced the HP-71B. You see the original design was influenced by the assumptions of the designers. E.g. printing capability. Once you have HP-IL you don't need a built-in printer, so you can take it out. If you want alphanumeric output and reasonable power consumption you switch to LCD. Then you realize that you can shrink the batteries since you do not need all this capacity. And so on ....

Finally you end up with an HP-71B which combines a clean numeric keypad with an alpha keyboard that also contains lots of predefined operations (gold shifted alpha keys)

BTW the thing I love about my HP-97 is the display, I would NOT want a LCD replacement for it. For one, the LCD would ruin the colour scheme :-)

Re: Last of the Topcats?

*Message #7 Posted by **Howard Owen** on 14 Aug 2005, 3:56 a.m.,*
in response to message #6 by Vassilis Prevelakis

I agree about the 97 display. It is wonderfl to look at, and one of the best features of the machine.

I guess the relationship between the HP-71B and the HP-97 is obvious. Let's take the keyboard. The key with "5" on it is 1/2 inch wide on my 97. On my 71-B it's, well, 3/8 inches wide. But the seperation between it and the "5" key is 1/8 inch on the 71B and, um, 1/4 inch on the 97. Let's try something else, oh yes, the X<>Y key. On the 97, that's 1/2 inch wide also. On the 71B, wait a sec, oh, there is no X<>Y key on the 71B. How about the Enter key? Doggone, the 71B doesn't have one of those either. How the heck do you do number entry on the 71? Oh, algebraic mode. Yup, the 71B is a dead ringer for its lineal ancestor, the HP-97.

The two machines are about as different as any two calculators HP ever made. I haven't even

started on the software side. Now, I *like* my HP-71B. It has the coolest architecture of any of the BASIC models I've tried. It's my principle tool for the swap disk indexing project because of its superior HP-IL implementation. But I vastly prefer the 75C to type on. The keyboard on the 71B is a (very good) compromise. I can actually go fairly quickly with two thumbs. But, I can *touch type* on the 75C! And for doing ten-key numeric entry, the 97 beats the 71 *and* the 75 hands down.

I take your point that once you have HP-IL, you don't need the integrated printer and card reader. But which came first in the transition from the 97/67 to the 41C? Did they abandon that particular small desktop calculator form factor, never to revive it, before they decided to go with a component approach or afterwards? It's clear that they decided to cover both the low-mid and middle range calculating markets with one system: the 41C. Perhaps they couldn't afford to engineer and market seperate machines as they had before. Perhaps the sales of the 97 didn't justify the expense of a seperate product line. Or perhaps they got carried away with the component/system model and threw away a good thing in the process.

Does anyone know what the thinking around that decision was?

*Message #8 Posted by **db (martinez, ca.)** on 14 Aug 2005, 8:48 p.m.,*
in response to message #7 by Howard Owen

Howard: An answer to your original question might be the 9815 series. A desktop rpn, it sports a one line screen, user definable keys with i/o (IB & 8 bit since it predates IL) and lots of similarities to the 41's programming model. The mid range unit holds just a few less lines than a cv. It also has a built in tape drive and ribbon printer.
I have one (with tapes thanks to Katie) and i think it's a jewel.

Re: Last of the Topcats?

*Message #9 Posted by **Howard Owen** on 14 Aug 2005, 8:59 p.m.,*
in response to message #8 by db (martinez, ca.)

Right, I forgot about those. They are smaller than an 85, right? (An HP-85 isn't that large or heavy in any case.) So they just pushed the evolution of the desktop calculator design up a notch or two in size, and price too, I'd imagine. That implies to me that the 97 really had run out of steam in the market.

> Howard: An answer to your original question might be the 9815 series.
```

Howard is looking for a *descendant* of the HP-97. The 9815 and the 97 were both released on the same year. Note also the price difference: $2900 for the 9815A vs $750 for the 97.

Re: Last of the Topcats?

*Message #11 Posted by **Howard Owen** on 15 Aug 2005, 12:06 a.m.,*
in response to message #10 by Vassilis Prevelakis

Right on both counts.

But HP did continue to sell desktop machines. They just were closer to taking up a whole desktop! 8)

Now that I've had time to think about it, I do take your point that the HP-71 represented a successor to the HP-97. It filled the same market position the 97 did. But they really did turn their backs on a wonderfully compact little machine.

But HP experimented with a lot of other small form factor devices. The DOS plamtops are great, too. The keyboard on my 95LX has the Corvallis stamp on it. Did the later palmtops have as nice a keyboard?

Re: Last of the Topcats?

*Message #12 Posted by **Vassilis Prevelakis** on 15 Aug 2005, 6:40 a.m.,*
in response to message #8 by db (martinez, ca.)

I forgot, to add that the 9915 has a horrible chicklet keyboard (like the early 9825). No way that this thing can be compared with the beautiful HP-97 keyboard.

If you think data entry on the HP-71B is a pain, try entering data on the 9815.

Free42 is a wonderful application. However, a version is not available for PocketPC. Creation of a PocketPC version is on the bottom of Thomas' TODO list. He offers the source code, so perhaps someone could compile a PocketPC version?
I believe what Pio is after is Emu42S developed by Christoph Gießelink. That application takes a ROM image dumped from an actual HP42S. My understanding is that since HP still holds the copyright for the ROM and has not released it to the public domain, it cannot be distributed without risk of legal action by HP. It also cannot be distributed through or linked from this web site in accordance with Dave's policies.

Re: Okay I'm lazy but bitte...

*Message #5 Posted by **Thomas Okken** on 18 Aug 2005, 1:52 p.m.,*
in response to message #4 by Jeff O.

Free42 [...] is not available for PocketPC. Creation of a PocketPC version is on the bottom of Thomas' TODO list.

That will probably change... I'm on hiatus from Free42 development until October; at that time, I'll update the TODO list to reflect some requests I have received in the last couple of months, and I'll probably move the PocketPC version to the top of the list then (since this is the most frequently requested feature, not to mention it would bring Free42 to a wider audience).

Free42 for PocketPC

*Message #6 Posted by **Jeff O.** on 19 Aug 2005, 7:17 a.m.,*
in response to message #5 by Thomas Okken

Thomas,
I wasn't trying to "tweak" you into producing a PocketPC version, just clearing up any confusion over what 42S emulators/simulators run on what platforms. You have certainly earned some time off, I look forward to seeing what you will do come October.
Implementation of a PocketPC version will be great, but don't forget about some of the other features we have discussed, such as optional display of the whole stack, possible variable stack height, enhancements to handling of complex numbers, etc.
Best regards, and keep up the good work (when you're ready)!

Swap Disks Exploded

*Message #1 Posted by **Howard Owen** on 13 Aug 2005, 4:41 p.m.*

I like pyrotechnics, so it was great fun to blow up the swap file LIF images into individual files. They are on the web at http://retrocalculator.com/SWAP/exploded. I named the files with their LIF name as root, and their type (as reported by TD's lifdir) as the file extension. They live in a directory under the above mentioned path named after the disk they came from. They will also be available vi anonymous ftp to ftp.retrocalculator.com as soon as the new static IP propagates out. I can't tell for sure, but you may have to use a special username to get anonymous access. I'll see once ftp is up.

The purpose of doing this work is to facilitate the "Swapdex" project to index these files. You can access the swapdex Wiki here.

I've also thrown together a quick and dirty Mysql database of the files. It isn't accessible from the web yet, but it could and should be once the schema is better defined. If you would like to help do that, see the Wiki link above.

Regards,
Howard

```
Howard Owen wrote:
> I like pyrotechnics, so it was great fun to blow up the swap file LIF images
> into individual files.
```

I am not sure what you had in mind but the swap archives **are** split into individual files. At least the ones at ftp://ftp.hpmuseum.org/lif/swap

All files are encoded in swap file format documented in http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=24, which simply involves prepending 32 bytes of header to the file. The header is the LIF directory header for that file ONLY.

The swap file format is **not** LIF. It only contains some elements from the LIF directory. So you do not need to "expand" the files, you simply need to skip these 32 bytes.

E.g. if I want to see the contents of file chhu01/curlex.l71, I will simply do:

```
arrakis% dd if=chhu01/curlex.l71 ibs=32 skip=1 | xd
 000000000000    5e000000  00f00e00    00000800  10ff131b    *^..............*
 000000000010    694100d0  1bb013f7    f84c3641  0911db07    *iA.......L6A....*
 000000000020    10b17d11  88bf411b    ad139f69  d230019a    *..}...A....i.0..*
 000000000030    260c0013  44760013    43faa0ae  fa324181    *&...Dv..C....2A.*
 000000000040    bf431bda  1a3070f8    35b40187  5f431b70    *.C...0p.5..._C.p*
 000000000050    0118b1f8  c12310b1    5a4e0801  5be91108    *.....#..ZN..[...*
 000000000060    86bf411b  60f81bb4    01860428  0131051e    *..A.`......(.1..*
 000000000070    00000007  00011404    19528001  7b0d0000    *.........R..{...*
 000000000080    494e4b4a  45542020    2020e214  00000525    *INKJET    .....%*
 000000000090    00000004  00011404    19578001  19060000    *.........W......*
 0000000000a0    54454c44  49523731    5044e214  00000529    *TELDIR71PD.....)*
```

```
 0000000000b0    0000000b  00011404    24348001  4e140000    *........$4..N...*
 0000000000c0    4355524c  45582020    2020e208  00000534    *CURLEX    .....4*
 0000000000d0    00000001  00011512    06238001  db000000    *.........#......*
 0000000000e0    ffffffff  ffffffff    ffffffff  ffffffff    *................*
          *** SAME ***
 000000000100    ........  ........    ........  ........    *................*
```

Moreover, your "exploded" files appear to be corrupted as well. E.g. your version of CURLEX.LEX71 is:

```
arrakis% xd CURLEX.LEX71
 000000000000    5e000000  00f00e00    00000800  10ff131b    *^...............*
 000000000010    694100d0  1bb013f7    f84c3641  0911db07    *iA.......L6A....*
 000000000020    10b17d11  88bf411b    ad139f69  d230019a    *..}...A....i.0..*
 000000000030    260c0013  44760013    43faa0ae  fa324181    *&...Dv..C....2A.*
 000000000040    bf431bda  1a3070f8    35b40187  5f431b70    *.C...0p.5..._C.p*
 000000000050    0118b1f8  c12310b1    5a4e0801  5be91108    *.....#..ZN..[...*
 000000000060    86bf411b  60f81bb4    01860428  0131....    *..A.`......(.1..*
```

The length (0x6D) is also wrong. If we look at the curlex.l71 header we see:

```
arrakis% dd if=curlex.l71 ibs=32 count=1 | xd
 000000000000    4355524c  45582020    2020e208  00000000    *CURLEX    ......*
 000000000010    00000001  00010120    33568001  db000000    *....... 3V......*
```

that the file length should be 0xDB bytes, 219 in decimal (file length in bytes starts at offset 0x0C, and it is 3 bytes long (LSB first).

Note also that even files that are not encoded in any way (e.g. chhu01/acopy.text) are damaged. So you should check your program to make sure it decodes the files correctly.

Finally, simply looking at the filename inside the header and using this to name the extracted file is not sufficient as file names may have characters that are not acceptable to the local file system (e.g. \), you need some kind of mapping for the unacceptable characters.

Best Regards

**vp

Re: Swap Disks Exploded

*Message #3 Posted by **Howard Owen** on 14 Aug 2005, 4:59 a.m.,*
in response to message #2 by Vassilis Prevelakis

Thanks for the feedback, Vassilis!

I'll check on the corruption you noted. I'm pulling the files out of the LIF images (also on the museum site, but under the 'hpswap' directory) with lifget from a perl script. The script is in the "exploded" directory too, called "getem.pl". Perhaps lifget does *not* preserve the LIF header, and what you are looking at are the "raw" bits. I'll figure it out, either way. In the meantime, I've restricted access to the files. It won't do to distribute bogus date. I'm trying to reduce confusion, not add to it. 8)

My purpose in exploding the LIF images is to have bits I can work with in my indexing project. I plan to create descriptions and listings of all the program files, with Unix line endings rather than the interesting LIF TEXT format. I plan to drop these in beside the raw bits and refer to them in my database by URL. I may well be able to get by using the museum's copies, but I have to resolve the corruption issue before I can decide one way or the other.

Thanks again!

Corruption

*Message #4 Posted by **Howard Owen** on 14 Aug 2005, 12:02 p.m.,*
in response to message #2 by Vassilis Prevelakis

The files merely lack the LIF headers:

```
hbo@sol|1137> hexdump -C CHHU01/AST41N1.BASIC75 >AST41INI.hex
hbo@sol|1138> dd if=ast41n1.b75 ibs=32 skip=1 | hexdump -C >ast41n1.hex
48+0 records in
3+0 records out
hbo@sol|1140> md5sum *.hex
d919845771e9165ca64ac5177e508a20  AST41INI.hex
d919845771e9165ca64ac5177e508a20  ast41n1.hex
```

The file in caps is the one I produced with Tony Duell's lifget utility. The small case one is from the museum site.

The files here at the museum lack at least one disk that appears in the /hpswap directory. For that reason, and because I still think they could be useful for my Swapdex project, I'm going to leave the files up. I'm composing a plain text README now that explains how they differ from the museum's copies, and points here. Later I'll add a web page with links to all the other sources and better explanations of hat I'm trying to do.

For now, anon ftp is still hosed, but http://retrocalculator.com/SWAP/exploded works.

Thanks again for taking the time to look the files over!

Edited: 14 Aug 2005, 12:43 p.m.

Re: Corruption

*Message #5 Posted by **Vassilis Prevelakis** on 14 Aug 2005, 6:32 p.m.,*
in response to message #4 by Howard Owen

OK got them. I was in error. The 0xDB in the CURLEX directory entry is the length in NIBBLES! So its 219 nibbles or 109.5 bytes. So the length of 110 is correct.

I have been dealing mainly with HP-85 files which have the length in bytes and was unlucky to pick a very small file (CURLEX). This meant that my wrong file length would still be less than a block (256 bytes) and thus would not ring any bells. If I had chosen a file like BEEPLEX which is 411 nibbles long (clearly greater than the 1 block it occupies) I would have investigated further.

HP Portable Plus?

*Message #1 Posted by **Howard Owen** on 12 Aug 2005, 8:22 p.m.*

This thread from February 2004 mentioned manuals for the HP Portable Plus. Daniel Sancho mentioned having many manuals, including the more technical ones. The manuals on the museum CD are the standard user-oriented versions. I have a machine that doesn't respond when appropriate power is applied, and I'd like to have as much of a roadmap as I can get before I dive in to the case.

Thanks!

Re: HP Portable Plus?

*Message #2 Posted by **Tony Duell** on 14 Aug 2005, 6:26 a.m.,*
in response to message #1 by Howard Owen

I have the Portable Plus Technical Reference Manual, and the service manual. Both include schematics, the latter has some troubleshooting info too.

Let me know what you want me to look up.

Free42 for sale at eBay?

*Message #1 Posted by **Gerson W. Barbosa** on 12 Aug 2005, 8:15 p.m.*

http://cgi.ebay.com/HP-42S-calculator_W0QQitemZ7175779549QQcategoryZ182QQrdZ1QQcmdZViewItem

Re: Free42 for sale at eBay?

*Message #2 Posted by **Howard Owen** on 12 Aug 2005, 8:27 p.m.,*
in response to message #1 by Gerson W. Barbosa

Interesting. It's not against the GPL to charge for distributing software. The source needs to come with, or be otherwise accessible from the distributed package.

There's not much "value-add" that I can see in that offer, however. And with the software's name prominently displayed, I doubt he gets any bids.

Re: Free42 for sale at eBay?

*Message #3 Posted by **Gerson W. Barbosa** on 12 Aug 2005, 9:06 p.m.,*
in response to message #2 by Howard Owen

We could suggest the seller to add a link to Free42 so that potential buyers have a little more information about 'his' product... :-)

Re: However

*Message #4 Posted by **Mike** on 13 Aug 2005, 3:43 p.m.,*
in response to message #2 by Howard Owen

It is against eBay rules, if there is any shareware aspect to this calculator. I mean if he has any features that require a fee to access, it's an illegal auction.

Re: However

*Message #5 Posted by **Howard Owen** on 13 Aug 2005, 4:22 p.m.,*
in response to message #4 by Mike

That's interesting, I didn't know that.

GPL software isn't shareware, its free (like in freedom) software. The license states that you can charge for distribution of GPLd software if you like. That's what all the major Linux vendors do, for example. Is that different from selling your software for a fee, where "selling" means "selling the media and a right to use license?" I don't know.

Come to think, you can buy plain proprietary software on eBay. It even has a rather extensive category. So the difference must be the delayed payment in shareware. You "try before you buy" then eBay doesn't get a cut when you eventually pay. I'll bet that's it. So then the GPL software wouldn't differ

from proprietary in that respect, since all the money is transferred up front where eBay can tax it.

Re: Free42 for sale at eBay?

*Message #6 Posted by **Gerson W. Barbosa** on 14 Aug 2005, 5:57 p.m.,*
in response to message #2 by Howard Owen

> Quote:

I doubted it too but he's got two bids so far... Five hours to end and the price has reached 12 Euro.

Re: Free42 for sale at eBay?

*Message #7 Posted by **Namir** on 14 Aug 2005, 3:24 p.m.,*
in response to message #1 by Gerson W. Barbosa

I wrote Thomas Okken about this auction and provided him with the seller's email address.

Namir

Re: Free42 for sale at eBay?

*Message #8 Posted by **Thomas Okken** on 15 Aug 2005, 2:10 p.m.,*
in response to message #7 by Namir

I don't think this auction is against eBay's rules -- Free42 is not shareware; there are no optional features that require extra payment to unlock etc. As long as the seller is selling a version that has my copyright, my web site URL, and my email address, I don't see anything wrong with this... Woe to the suckers who don't Google "Free42" before making a bid.

Hmmm, maybe I should contact the winning bidder and ask them if the software they receive has been tampered with.

HP 11c display problem

*Message #1 Posted by **Scott** on 12 Aug 2005, 11:23 a.m.*

Something happened to my HP 11C display. "0,000" appears, and when I use it, a decimal appears where I don't want it. How do I get it to display "0000.0" without the comma?

Re: HP 11c display problem

*Message #2 Posted by **Namir** on 12 Aug 2005, 11:35 a.m.,*
in response to message #1 by Scott

This is the most asked question. Your HP11C has somehow switched the decimal point to a comma. I think you need to turn it off and then hold the decimal key while you press [ON] again. I believe that should restore the decimal point. If I am mistaken, then teh folks out there should correct me.

Namir

Re: HP 11c display problem

*Message #3 Posted by **Raymond Del Tondo** on 12 Aug 2005, 7:29 p.m.,*
in response to message #2 by Namir

Hi,

this is simply a RTFM,
because the answer to the original question
is in the HP-11C User's Handbook on page 16,
and clearly indicated in the manual's contents page...

Raymond

Re: HP 11c display problem

*Message #4 Posted by **scott** on 12 Aug 2005, 9:40 p.m.,*
in response to message #3 by Raymond Del Tondo

Hi Raymond, Thanks for your input, unfortunately, I lost the handbook years ago, so I can't RTFM...besides, it really isn't a life or death situation, and one of the readers of this board was kind enough to explain a solution, so the problem is fixed, but again, thanks for your concern.

Re: HP 11c display problem

*Message #5 Posted by **Scott** on 12 Aug 2005, 1:55 p.m.,*
in response to message #2 by Namir

Thanks...that worked. Now if only I can remember that when it happens again in another 30 years.

HP 33S new display identification

*Message #1 Posted by **Will** on 11 Aug 2005, 5:51 a.m.*

Hi Guys...I just decided to get a 33s to test it and look if it´s so bad as so many people say...i just want to know ways to identify the new ones using the improved display. (serial codes?)

Thanks for your help...

Will.

Re: HP 33S new display identification

*Message #2 Posted by **John Smitherman** on 11 Aug 2005, 8:28 a.m.,*
in response to message #1 by Will

Hi Will. During a visit to WalMart last weekend I saw 3 versions of the 33s display with the newest being the best yet as the numbers and characters were all visible. The units had a 502 date code.

It appears to me that units made before mid year 2004 have the poor display and small (,) and (.). Units made between mid year 2004 and end of year 2004 have the poor display but with larger (,) and (.). Units made in 2005 have a much improved display. I am hoping that the 2005 units have had the bugs removed as the product manual update was removed from the HP web site some time in the Spring of 2005.

I hope that this helps.

Regards,

John

Re: HP 33S new display identification

*Message #3 Posted by **Paul Brogger** on 11 Aug 2005, 10:16 a.m.,*
in response to message #1 by Will

I've only seen two displays. One has the decimal points noticeably smaller than the pixels in the 5x7 character grids. The newer (Wal-Mart) unit has decimal points approximately the same size as the character pixels.

If they're fixing bugs anyway, it seems to me the firmware solution is to sacrifice a digit and program a big, fat 4- or 6-pixel d.p. as a separate character. (But they didn't ask any of us, now did they?)

Re: HP 33S new display identification

*Message #4 Posted by **Namir** on 11 Aug 2005, 5:36 p.m.,*
in response to message #3 by Paul Brogger

I think the comma has been signifcantly improved. Not so sure about the beloved decimal point!

Re: HP 33S new display identification

*Message #5 Posted by **Paul Brogger** on 12 Aug 2005, 1:01 p.m.,*
in response to message #4 by Namir

I think they've both been increased in size. But as noted above, IMHO "improved" may be a bit of a stretch.

I do use the comma as the radix mark in both of my 33s' (while on no other calculator model do I do so). It just shows up a little bit better, and in this case every little bit helps.

Re: HP 33S new display identification

*Message #6 Posted by **John Smitherman** on 12 Aug 2005, 9:33 p.m.,*
in response to message #5 by Paul Brogger

Hi Paul. I picked up a new 33s from WalMart this afternoon with date code 524. It has a new and improved display and the bugs (hms and polar conversions, and nCr) have been fixed. Also, I find the keys are a bit easier to push and in my opinion have a better feel.

I gave my 417 33s a rating of three stars but the new and improved 524 33s rates four stars.

Regards,

John

HP9826 ??

*Message #1 Posted by **marais** on 11 Aug 2005, 5:40 a.m.*

I came across a strange machine, an HP9826. The number suggests a relationship with the 9825, but the screen and diskette drive rather make it look familiar to the 85 or so. It has GPIB built in - does anybody know more about this machine? It's no collectible I suppose.

Re: HP9826 ??

*Message #2 Posted by **Tony Duell** on 11 Aug 2005, 6:31 a.m.,*
in response to message #1 by marais

It's related to the 9836 (it only has one drive, the monitor is built in, but otherwise much the same). It was sort-of a replacement for the 9825, I think.

It's a 68000 based machine, takes the DIO cards that were used on many of the 9000/200 and 9000/300 machines.

I have no idea whether it's collectible or not, and frankly I don't care. I have a 9836 that I will investigate sometime fairly soon, I'm interested in how these machines were designed and how they work.

Re: HP9826 ??

*Message #3 Posted by **marais** on 14 Aug 2005, 2:18 p.m.,*
in response to message #2 by Tony Duell

well, if it's 68k-based the model number is somewhat misleading, in that it's not at all related to neither the 9825 nor the 9835 - machines that are more interesting because of their unique conception. The 9826 must be more recent then.

Andreas

They went nuts with model numbers about the time this machine was prduced. For instance, I believe the 9816, later renamed "HP-9000 model 216" was later than this machine.

The following is from hazy recollection, and maybe wrong. Corrections are welcome. What happened was, there was a transition from the home-built CPUs of the 98XX and 80 series to the Motorola 68000. At the same time, "HP Technical Basic" and HPL were shelved in favor of a new BASIC dialect, Rocky Mountain BASIC (RMB). I used this language on 9816s doing real time bathymetry and radio navigation data collection and reduction. Having been used to Applesoft and MBASIC, I was really impressed that you could do such a thing in an interpreted language. The key was the highly optimized I/O library and the relatively slow data rates of HP-IB at the time. RMB didn't resemble any

BASIC I had seen up to then, either. It did resemble the BASIC on the HP-85, up to a point, but departed significantly in its modularity. But I didn't play with an 85 until about a year after I started coding on the 9816. Anyway, RMB had elements of Pascal (REPEAT, and DO, I think) that made structured programming and modularity possible, and FORTRAN (COMMON) which allowed you to violate the modularity in a selective but documented way. Together with the fun and difficult work of interfacing cool devices, it made me a real enthusiast for the machines and the language.

As far as collectibility goes, the HP 9000/200 and 300 series machines don't seem to command high prices on eBay. They do come up from time to time. My impression is that there are still a fair number of the machines in active service. The 9816, at least, was rugged and water resistent, which made it good for offshore applications, and may explain the continuing health of any machines that are left.

*Message #5 Posted by **Vassilis Prevelakis** on 14 Aug 2005, 3:46 p.m.,*
in response to message #4 by Howard Owen

yes, the model numbering went crazy in the early eighties.

For example the 9826 became the 200 Series Model 26 and later on was renamed to HP 9000/226 (or HP 9000 Model 226).

I think they were trying to build a uniform product range that promised compatibility across the different models. Smth that was missing from the eralier models. Just try to port a BASIC program from the 9845 to the more recent HP-85 (or look at the HP-41 bar code generation programs for the two models, file hpbc.pdf in the MoHPC CDROM).

*Message #6 Posted by **Howard Owen** on 14 Aug 2005, 4:47 p.m.,*
in response to message #5 by Vassilis Prevelakis

One of HP's documents contains a joke that they were adopting new disk media because they had run out of incompatible formats. That could equally well apply to system software and programming languages.

The history of HP engineering from at least the 60's through to today has this theme of progressing from custom systems, lovingly crafted, to mass produced throwaway machines zillions of times more capable than the earlier models. That's the history of the industry, and our modern civilization too, for that matter.

Right after crowding all the "technical computing" products into the "9000" line, HP made the transition to Unix. This time they used another home built processor - PA-RISC - and a partly home-brewed OS, HP-UX. They had greater success with that line than with any of the previous efforts they made, except peraps the HP 3000, which was still gasping along the last I checked, in 1999. But they saved costs by doing away with the ideosyncratic parts of the company, like the calculator and instrument divisions. The crash of 2000 and the rise of Fiorina just put the coda on the long, sad song, whose motif had been set long before.

Re: HP9826 ??

*Message #7 Posted by **Vassilis Prevelakis** on 14 Aug 2005, 10:58 p.m.,*
in response to message #6 by Howard Owen

Your historical "facts" are a bit off. HP did indeed switch to Unix but using a standard processor (the MC68xxx series). Examples include the HP 9000/3xx (1985) series the Integral PC (1985) etc. All these run HP-UX. So the 9000 family included Unix machines. PA-RISC came later (first on the 800 series in 86 and then the 3000 series and a couple of years later on the 700 series).

Your use of "doing away" as applied to the calculator and instrument divisions is misleading and partially wrong. The intrument division was spun off as Agilent. HP may spin off the printer division, would you use the term "doing away" for that too?

**vp

Re: HP9826 ??

*Message #8 Posted by **Howard Owen** on 15 Aug 2005, 12:58 a.m.,*
in response to message #7 by Vassilis Prevelakis

I guess "doing away" is too harsh a word for one of the two divisions I listed. It certainly applies to the calculator division, though. And spinning of Agilent was part of the process of turning away from individualistic and expensive systems to standardized, homogenized and profitable PC clones. Since that's a sweeping generalization, it's bound to be unfair to some large fraction of today's HP, but I don't think it's far off the mark on the large scale. It's absolutely true when you look at their organization in the 1980s compared even to the mid 1990's. They were quite decentralized back in the day, with divisions doing their own R&D and marketing. Interestingly, that was also a problem at IBM in the late 1980s, according to Gerstner's "Who Says Elephants Can't Dance?"

You're right that HP-UX was available on the 9000 series. I installed it on a series 300 machine right after they came out with the version that ran there. But HP-UX wan't new on that platform either. It started on the HP 1000(?) series. And it was also available on the "Integral PC," which was 68K based. However it didn't really fly until HP bought out Apollo, integrated their technology and sold it to that customer base in addition to their existing customers. The Apollos were 68K based too, IRC. They gradually converged all their workstations onto a PA-RISC platform. At the same time, their RISC servers were scoring major successes.

So HP was relevant in the Unix market all through the late 90s boom. They were hurt by the failure of Itanium, their joint project with Intel. They still have a share of the Unix market. but that market is sinking fast due to Linux. So HP is doing Linux and selling Intel and AMD based servers to businesses. With Compaq's share, they are probably leading the server market now.

Their hardware is very nice, and soulless to a fault.

*Message #9 Posted by **Bernhard** on 15 Aug 2005, 6:34 p.m.,*
in response to message #6 by Howard Owen

Hi Howard,

your somewhat sad recollection of the good times where these things were "lovingly crafted" really hits a weak spot of mine and nearly made me weep. I remember one guy from Maroc or Tunesia (yeah !) who told me that chips are like babies, they must be made

with love, and risen carefully. He was a chip designer like me, in the old company, which I left after the '2000 crash had turned things into a nightmare, and when management cockroaches of Fiorina type had risen. The best chip designers of my country anyhow have left for the USA or for China/Asia, as to avoid socialistic taxation, so these imports from Maroc/Tunesia or other suppressed countries are Europe's last hope. I have worked with Bulgarians, Russians, Polish, Rumanians, all of the brightest of their nations, but this guy (from North Africa !) was the first one who was able to express what really makes a good chip.

What we witness now is the decline of our beloved technology, a decline that is caused by management cockroaches, which pretend to work for the shareholder value, and in the end, we all will lose, including the shareholders, which will lose their investments.

The only way out is a disease which weeds out the cockroaches, but sorry, I am chip designer, not genetic engineer, so I can't come up with the solution.

best regards, Bernhard

*Message #10 Posted by **Howard Owen** on 15 Aug 2005, 11:22 p.m.,*
in response to message #9 by Bernhard

I view the transition from art, to science, to pure commerce as an inevitable progression. I don't think that our experience is unique in human history. I think that Christian monks, whose devotional duty it was to illuminate manuscripts would have been horrified by a paperback book. But the paperback (some would say the handbill) is the ultimate evolution of the printing press, whose invention changed the world by liberating knowledge from those very same cloisters. I think master watchmakers must have been horrified to see the dominance of cheap, mass produced watches. yet these brought timekeeping to a much broader section of humanity.

There's a difference in the two examples. In the first the master craftsmen never saw the complete evolution of their art into commodity. But the young watchmaker of 1920 could well have lived to see plastic LCD watches given away as advertising in the 1980s. And for us, the compression of time from high art to crass commercialization is even more apparent.

Commercialization is the process whereby useful ideas get distributed to the greatest number. That the beauty of the artifacts that embody the ideas is diminished, that they seem cheapened as much by standardization for mass taste as by the reduction in price is just part of the process. So the artful soul in an age of rapid change has to stay two steps ahead of the full development of commercial interest. Sometimes that's not possible, sometimes it is. You win a few and lose a few.

Also, remember that the these crass machines being sold by Dell, HP Lenovo and others are unbelievably powerful. I can not only examine the inner workings of the calculators I love in a simulation layer, I can do so through four or more such layers (Linux->VMWare->WinXP->EMU48->HP41X!) and it *still* runs three times faster than the original! That kind of power promises more artistic acheivement by the generations coming up behind, and maybe for some of us fogeys, too. 8)

*Message #11 Posted by **Bernhard** on 16 Aug 2005, 8:53 a.m.,*

in response to message #10 by Howard Owen

Dear Howard,

your enthusiasm for these recent developments and the transformation processes in the industry is understandable, these new products indeed have tremendous power and still are cheap, but there are some evil by-effects of the transformation everyone should be aware of:

What I meant with the term "management cockroaches" is the type of management which destroys the unique culture, values and spirit of a company for a short - term profit.

Like the insect bearing the same name, they are quick, clever and once they got a foothold, they multiply until the place smells and living (or working) there gets unbearable. Of course all I have posted on this topic is allegoristic and to be interpreted as such.

In a real company infested by them you could only smell the fear of the employees. The situation gets worser and worser, so many key people who over decades have built the company opt to leave. Those who stay stop to lovingly craft their products, they just put them together under ever increasing time pressure. Products start to lack signs of the individuality that in the good old times was associated with the company, or even worse, products get too many annoying flaws. Once old customers find out, they will more and more refuse to buy these new products.

The irony is that all this act of destruction actually may increase revenues and profits, as new customers, who previously were unable to afford the brand, are attracted by the new, lower cost products. As they have never owned the older, quality products, they have no chance to compare, and so it is likely they even think the shoddy disposables they have just bought are of high quality, as they look, owing to clever industrial design, more valuable than they really are.

This lack of opportunity for comparision and the inability of human perception to make absolute measurements without having a standard to compare with is the key why this evil scheme works.

It is evil because in the end, a once reputable company, which had quality, lovingly crafted products of real value, and was a good place to work because spirit and morale was high, has been turned in just another sweatshop churning out cheap mee-too products with low profit margins.

On the long run, they will never be able to compete with Asian sweatshops even if they use them as their manufacturing backend, because those do also have local, and hence, much cheaper management, design and development.

When these far east competitors have learnt to make their own products and how to sell them on the world market, the once reputable company which once had had elitarian products will have lost the ability to compete and will go under. They simply can't go back and start making elitarian products again. They have lost the key people, the know-how, the spirit, and the old customer base who was willing to buy expensive products. The damage caused by the management cockroaches can't be undone. The only way then is to close down the company, and maybe sell off the brand name and other assets. Most likely, the buyers will be Asian companies.

At this point the shareholders will have lost all of their money.

Ah, yes, I forgot the management cockroaches. Quick and clever as they are, they will leave the company and move on to the next company to infest and destruct. Optimum timing, leaving at the zenith of their "success", guarantees a heartly welcome there.

So far the tale of the cockroaches. The foul fruits of their work are evident everywhere, ruined companies with demoralized workforce, shoddy products with lots of flaws that make using them a pain, or stealing a lot of time to find out how to dodge the flaws, which at normal hourly rates would cost more than buying a elitarian product, which however isn't available anymore, except at Ebay or flea markets, and overall, a decline of the industrial basis and a rise of unemployment and social unrest.

Some people call this "progress". Unfortunately, it is a process that can't be stopped. The industrialized era will soon come to an end, with natural ressources depleted, all of them turned into a flood of shoddy products that are made in such a way that there is no hope to repair them or recover useful parts. Living in the post-industrialized era will be no fun indeed.

*Message #3 Posted by **James M. Prange (Michigan)** on 11 Aug 2005, 4:59 a.m.,*
in response to message #1 by Jose Sanchez

Actually, the correct population standard deviation for that data set is about 8.16, not 8.85; are you sure that you're using the right numbers? As Thomas pointed out, the sample standard deviation is different, about 9.13 in this case.

Regards,
James

Re: rev HP17BII - stat problems and/or 42SX

*Message #4 Posted by **Chris Dean** on 11 Aug 2005, 6:41 a.m.,*
in response to message #3 by James M. Prange (Michigan)

I agree with Jame's results. The HP17bII+ manual states in Appendix B that the STDEV function calculates the **sample** standard deviation **(divide by root(n-1))** whereas the other answer (8.16) is the **population** standard deviation **(divide by root(n))**. I am not sure where 8.85 comes from.

Edited: 11 Aug 2005, 10:03 a.m.

Re: rev HP17BII - stat problems and/or 42SX

*Message #5 Posted by **Jose Sanchez** on 11 Aug 2005, 6:46 p.m.,*
in response to message #1 by Jose Sanchez

The 8.85 is the result derived from the TI83 or TI BA II PLUS.

The reason of my question is because the class and book are offering explanation with the TI "calculators". Indeed I get the 9.12 with the HP, but if my answers is distint from the others..... I will get an exponential grade drop !(don't want it to happen)

I do not want to go TI EITHER !! What parameter is not being accounted for ?

The answer 8.85 ..... Sum(data) = 230 {32,41,47,53,54} Sum x^2 = 10,972 Sum X = 30

S=1/n *(sqrroot(n(sumx^2) -(SumX)^2)

Any inputs?

Re: rev HP17BII - stat problems and/or 42SX

*Message #7 Posted by **Bob Wang** on 11 Aug 2005, 7:19 p.m.,*
in response to message #5 by Jose Sanchez

Jose:

There is an error in your sample set: {32,41,47,53,54} sums to 227 not 230.

I get 9.126883367 on my TI-83 Plus and TI BAII Plus using the 227 set.

Bob

Converting Sample Sdev to Population Sdev

*Message #8 Posted by **Marcus von Cube, Germany** on 12 Aug 2005, 3:17 a.m.,*
in response to message #5 by Jose Sanchez

You can convert from one value to the other by a simple calculation:

$Sdev_{pop}=Sdev_{sam}*SQRT((N-1)/N)$

In your case, multiply the result by SQRT(4/5).

The HP11C manual shows a different approach:

Simply add the mean of the data collected so far to the data and recalculate the standard deviation.

Re: Converting Sample Sdev to Population Sdev

*Message #9 Posted by **Chris Dean** on 12 Aug 2005, 6:13 a.m.,*

in response to message #8 by Marcus von Cube, Germany

Have you made sure all your registers/memories are cleared because sum^2 should be 10639 and sum 227. Possibly drastic action but reset the calculator and try again.

Edited: 12 Aug 2005, 9:08 a.m.

Re: Converting Sample Sdev to Population Sdev

*Message #10 Posted by **Margaret** on 12 Aug 2005, 4:27 p.m.,*
in response to message #9 by Chris Dean

9.126883367 is the STD for the sample

8.163332653 is the STD for the population

The numbers above come from Excel .. another wonderful technological product, and the formulas are STDEV(range) and STDEVP(range). The difference between the two numbers is a division by SQRT(n) versus SQRT(n-1). To verify the results with your preferred HP calculator, just enter the numbers in the key Ó+, and you will all the statistical parameters of the sample and population.

Greetings,

in response to message #1 by Jose Sanchez

Hola, Sanchez; como estás?

I loaded the data you provide and I obtained 9.12688336728 as for standard deviation (HP42S, [shift][SHOW]). I wonder what 8.85 stands for; should that be another statistical tool you actually used? Anyway, when you mention HP42SX do you mean HP42S or HP48SX? Each case is a different input sequence.

About the HP17BII, I also obtained the same value above. In the HP17BII you should follow this:

```
[shift]MAIN
[SUM] (optional: [shift][CLEAR DATA][YES] to start a new set)
```

key in each number and press

```
[INPUT] (the display shows index for next input and current total)
```

After last number, press

```
[INPUT]
```

and press

```
[EXIT]
```

to exit input sequence. To compute standard deviation press

```
[CALC]
```

You'll see many opetions. Press

```
[STDEV]
```

and you'll see

```
STDEV=9.13
```

Press

```
[shift][SHOW]
```

for full precision.

Please, let us know what is the other calculator you have (HP42S or HP48SX). Hope this helps for now. If not, please post again.

Best regards.

Luiz (Brazil)

Not about Cobubba -- Internationalization

*Message #1 Posted by **John Limpert** on 10 Aug 2005, 11:52 p.m.*

I've always been curious about non-English or non-European versions of calculators. As far as I can tell, HP just translates their manuals into the local language for major markets. i've seen pictures of calculators with Cyrillic keyboards. Are there calculators out there that are tailored for languages with non-Latin alphabets and/or non-Hindu/Arabic numerals?

Re: Not about Cobubba -- Internationalization

*Message #2 Posted by **Frank Boehm (Germany)** on 11 Aug 2005, 2:57 a.m.,*
in response to message #1 by John Limpert

There are calculators using arabic numbers (widespread in the Middle East) and "Soroban"-calculators, combining an abacus with a traditional LCD-calculator.

Re: Not about Cobubba -- Internationalization

*Message #3 Posted by **Gunnar Degnbol** on 11 Aug 2005, 6:00 a.m.,*
in response to message #2 by Frank Boehm (Germany)

Are you sure they are widespread? This page says the Al Hassibah 2000 calculator, introduced in 1991 and "not a stellar commercial success" was unique in its support for arabic-indic digits.

My Java RPN calculator Stak supports Arabic, Thai and many other digit shapes if the platform (phone or PC) does. My experience is that it is very easy to learn 10 different symbols for the digits, and I guess that most people in the world know the European digits as well as their own.

I think most websites in Arabic, for example Al Ahram (Egyptian newspaper) and Al Jazeera TV, or in Thai use European digits.

Re: Not about Cobubba -- Internationalization

*Message #4 Posted by **Frank Boehm** on 11 Aug 2005, 8:33 a.m.,*
in response to message #3 by Gunnar Degnbol

I have seen a couple of arabic models while visiting Egypt a couple of years ago. China makes it possible, I guess :)

*Message #2 Posted by **Namir** on 10 Aug 2005, 2:07 p.m.,*
in response to message #1 by Chris Woodhouse

I have seen both good and bad newbie eBay bidders with a 0 feedback. Some did come through and some thought it was fun to outbid others but forgot that they had to pay for the item.

Re: ebay

*Message #3 Posted by **Bill (Smithville, NJ)** on 10 Aug 2005, 2:15 p.m.,*
in response to message #1 by Chris Woodhouse

Keep in mind that we ALL had zero feedback until we made that first successful bid/purchase.

After watching ebay for the past year or so, I finally signed up and made my first successful bid a few weeks ago. Actually, it was a buy it now. But still counts.

So I went from feedback of ZERO to ONE. There's probally many savy ebayer's that will still view my ONE feedback as a problem.

Bill (12345)

Re: ebay

*Message #4 Posted by **Howard Owen** on 10 Aug 2005, 2:33 p.m.,*
in response to message #1 by Chris Woodhouse

Well, one is better than none, two is better than one and so forth.

I don't worry about shills automatically when I see a bidder with low experience. I'm more nervous about the inexperienced bidder jacking up the auction (if I'm a buyer) or backing out on the sale (if I'm a seller.) I *do* start worrying about shills when both the seller and the top bidder have little experience. I generally stay away from auctions like that. But you also have to be careful about the nature of feedback with some sellers. There's an industry on eBay that churns out positive feedback in exchange for one dollar bids on recipes or other intangible goods. I always, always, always try to drill down on the auctions a seller has listed in feedback. That gives me a good sense of whether or not the seller is legit. This also works with buyers. If you are in a

competitive bidding situation, you can gain understanding of the other guy by seeing what he's bought recently, and how much he paid for it.

BTW, I'm in the market for a 42S. I'd be bidding on yours, except I have another bid outstanding at the moment. Good luck!

It's all relative

*Message #5 Posted by **Mike** on 10 Aug 2005, 2:34 p.m.,*
in response to message #1 by Chris Woodhouse

I've seen zero feedback bidders that I'd rather deal with than positive feedback bidders. I've honestly had more problems with people that have had 5, 10 or 20 negatives that were masked by hundreds of positives.

I judge bidders by what their negatives say, moreso than their positives.

When you read someone's feedback, be sure to read the feedback of the other bidder or seller. You can generally get a good idea who was at fault and who is a problem by reading feedback comments for **negatives**. Positive feedback is usually just routine and gives little info. Negatives tell a lot however. .

If really "mint in box, you'd be lucky to get it for under $500. I have seen them hit $750. However, $200-$300 would be reasonable, by ebay standards.

Cobubba Smackdown!

*Message #1 Posted by **Howard Owen** on 9 Aug 2005, 7:27 p.m.*

I just won an auction for an HP-75C for a buck more than coburlin bid! *This makes me feel so good!* Now, it would be better if I had sniped the auction for a buck over his top bid exactly, but what actually happened is that *he sniped my auction!* (I've never seen him do that.)

So it is still possible to buy collectible HP hardware on eBay for a reasonable price.

So what's hard about that?

*Message #2 Posted by **Mike** on 9 Aug 2005, 11:54 p.m.,*
in response to message #1 by Howard Owen

He's actually very easy to outbid. [bole]He low-ball bids, on almost everything[/bold]. I use search for coburlin and filter out anything that's not a calculator. Saves a ton of time finding calculators.

But, like I said, coburlin is dirt easy to outbid.

Edited: 9 Aug 2005, 11:55 p.m.

Re: So what's hard about that?

*Message #3 Posted by **Howard Owen** on 10 Aug 2005, 1:15 a.m.,*
in response to message #2 by Mike

Of *course* he's easy to outbid, loballer that he is. I've done so many times. The trick here was, I outbid him *by one dollar!* That makes *me* a lowballer. hehehe. 8)

in response to message #4 by Coburlin

Hey Cobuba .. look who is talking!!!

Re: So what's hard about that?

*Message #6 Posted by **Namir** on 10 Aug 2005, 7:51 a.m.,*
in response to message #4 by Coburlin

You know Cobuba what stinks about you? It's your predictor's attitude and the illusion of feeling superior to newbie eBay buyers. I buy and sell, usually making a modest profit and sometimes taking a loss. It's a hobby not a living. In any case I ALWAYS repest the buyer and do my best to be of help and service. You are out for some sick and twisted revenge againt "engineers". **We REALLY DON'T LIKE YOUR ATTITUDE!**

Re: So what's hard about that?

in response to message #6 by Namir

> Quote:
>
> We REALLY DON'T LIKE YOUR ATTITUDE!

Speak for yourself. Not knowing the guy, I had zero opinion one way or another, but after considering your note I've decided I like him.

I like that he gets your goat. I like that he's successful in all his evil practices of making money on eBay. And I especially like the fact there's nothing you can do about it.

I say: GO COBURLIN! Well done!

Since these boys are too upset and/or dim to see it, allow me to thank you for providing a reality check.

Everybody else: Get a grip.

Re: So what's hard about that?

*Message #8 Posted by **Namir** on 10 Aug 2005, 2:04 p.m.,*

Re: So what's hard about that?

*Message #14 Posted by **Randy** on 10 Aug 2005, 8:23 a.m.,*
in response to message #3 by Howard Owen

Sounds like proxy bidding was working correctly if you won a bid by a minimum amount. It does not mean you were lo-balling at all. It just means you bid more than someone else.

Geeze, gimme a break!

*Message #15 Posted by **Howard Owen** on 10 Aug 2005, 8:32 a.m.,*
in response to message #14 by Randy

Yes, that's what my initial post says. I didn't bid the exact amount that was one dollar over what Cofuffa bid. Proxy bidding gave me the win for a very low price.

But it still felt great, all the qualifications and provisos notwithstanding.

Re: Cobubba Smackdown!

in response to message #1 by Howard Owen

Maybe Cobubba inherited $200 to buy something on eBay???

Re: Cobubba Smackdown!

*Message #17 Posted by **I, Claudius** on 10 Aug 2005, 3:44 a.m.,*
in response to message #1 by Howard Owen

Great! This is just the sort of thing needed to thwart bottom feeders.

Re: Cobubba Smackdown!

*Message #18 Posted by **Osvaldo** on 10 Aug 2005, 5:55 p.m.,*
in response to message #17 by I, Claudius

Sincerely: All this discussion about Ebay folks waste space of the main subject of this forum: HP calculators!

Ebay is an open world: If you think that the price is fair you bid. period

Everybody sometimes, including myself, bided too much for a good. But we learn and next time we do better. There where other guys asking for high prices but some of theme faded away with the zero bids wind of his own frustrated auctions.

As I said: Lets discuss more about calculator and less about people.

Best regards,

Re: Cobubba Smackdown!

*Message #19 Posted by **blurdybloop** on 12 Aug 2005, 1:59 p.m.,*
in response to message #1 by Howard Owen

Take a look at http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5797652763&rd=1&sspagename=STRK%3AMEWA%3AIT&rd=1 . Perhaps the picture doesn't do that HP-45 justice, but it sure doesn't look "museum grade" to me.

Nevertheless, our favorite sleaze actually put in a reasonable bid ($50) for it. Assuming that he gets it, I wonder what he'll ask when he turns around and sells it. His normal asking price is $329.

I wish that I could get those kinds of prices for my HP-320LX (not to mention my Newton 100!). I looked on eBay and quickly concluded that market value was so low it wasn't worth the bother.

Re: Cobubba Smackdown!

*Message #20 Posted by **Howard Owen** on 12 Aug 2005, 3:15 p.m.,*
in response to message #19 by blurdybloop

That's a very poor photograph. The apparent warping around the on-off switch may just be oil from

fingerprints. Still, it's impossible to tell from what's shown. Also, the mark at the upper right of the keyboard is less easily explained away.

I say give the devil his due. 8)

Re: Cobubba Smackdown!

*Message #21 Posted by **blurdybloop** on 14 Aug 2005, 3:48 a.m.,*
in response to message #1 by Howard Owen

Our favorite sleaze is a magician. By magic, he transformed a broken HP-35 calculator into a Trekker PS/2 scroll wheel mouse today. Such magic.

By the way, it appears that our boy has an apprentice. Take a look at http://cgi.ebay.com/HP-35-Calculator-in-MINT-condition_W0QQitemZ5798791585QQcategoryZ58039QQssPageNameZWDVWQQrdZ1QQcmdZViewItem. So, someone is supposed to pay $475 for an HP-35 based upon blurry photos (although not blurred enough to obscure that the case is damaged and the leather carrying case is worn).

Log Base 2 on HP15C

*Message #1 Posted by **John** on 9 Aug 2005, 1:44 p.m.*

Does anyone know how to do a Log base 2 on the HP15C? I am working on some issues and can do this easily with MS Excel, but it would be much quicker on the 15C.

Please respond to perrybucsdad@alltel.net

- John

Re: Log Base 2 on HP15C

*Message #2 Posted by **Howard Owen** on 9 Aug 2005, 2:15 p.m.,*
in response to message #1 by John

LOG(n)/LOG(2) = log base 2 of n. Where LOG is logarithm to any base.

Re: Log Base 2 on HP15C

*Message #3 Posted by **Chris Woodhouse** on 9 Aug 2005, 2:27 p.m.,*
in response to message #2 by Howard Owen

You could write a short program to do it.

```
f LBL C
g LOG
2
g LOG
/
g RTN
```

That should work and it will be on the same key as the LOG function.

Bring Back the HP 15C

Re: Log Base 2 on HP15C

*Message #4 Posted by **John** on 9 Aug 2005, 2:30 p.m.,*
in response to message #2 by Howard Owen

Howard... do you have the "special" HP15C with the Log(n) button? Don't see that on my model. Am I missing something?

Sorry for being a dolt! :)

- John

Re: Log Base 2 on HP15C

*Message #5 Posted by **Howard Owen** on 9 Aug 2005, 3:05 p.m.,*
in response to message #4 by John

Sorry, my post was in "pseudo-mathematics," a dialect of math you can only use when you have nothing but a computer keyboard to work with. 8)

The keystrokes are close to what Chris has in his program:

```
n
g LOG
2
g LOG
/
```

Here "n" is a number you key in and "g" is the blue shift key. So g LOG is g followed by the third key from the left in the upper row, marked "10^X". For example, to compute the logarithm base 2 of 16, you would do "16 g LOG 2 g LOG /" and see the answer of 4.000 (in FIX 4) in the display. Chris suggests writing a program if you do this calculation frequently. You would first do "g R/S" to enter program mode, then type Chris's keystrokes, then type "g R/S" again to leave program mode. Once you did that, pressing the 10^X key with user mode set ("f RCL", where f is the gold shift key, will toggle user mode) will run your program. The keystrokes to compute the logarithm base 2 of 16 would then be "16 10^X"

If this all makes sense, and the following *doesn't* make sense, then just ignore the stuff you don't understand.

The program and keystroke solution above would work just as well using the *second* key from the left in the top row, instead of the third. That's because, mathematically, the logarithm to any base of a number, divided by the logarithm to the same base of another number, will produce the logarithm to the second number's base of the first number. English has it's limitations in describing mathematical ideas, so that probably sounds confusing. Symbolically:

$$\frac{\log_{B_1}\mathbf{n}}{\log_{B_1}\mathbf{B_2}} = \log_{B_2}\mathbf{n}$$

Good thing I found the subscript function. It helps emphasize that this is a math formula and not a 15C program.

So in the first case, the third key from the left (blue shifted) is the logarithm base 10, so B_1 is ten. But you could use the (blue shifted) *second* key from the left just as well, because that's the logarithm base *e*, where *e* is a magic number that is useful in many areas of math. So B_1 in that case is *e*. But everything works because you use the same base in both logarithms, and that matches the formula.

Hope that helped.

Swap Disk Indexing Project

*Message #1 Posted by **Howard Owen** on 9 Aug 2005, 12:30 p.m.*

This is a call for data, and/or comment and/or participation in a project to produce an index for the varios LIF images collectively known as "the Swap Disks." I'm sure that this has been done, probably more than once over the years, but I don't see an extant index out on the Internet. What I plan to do is to put up a wiki (Twiki, probably) at retrocalculator.com where people can add entries against file names in the raw LIF directory listings. I will have to ask for registration, because of the problem of SPAM bombing and vandalism that wikis are subject to.

Some inital thoughts I have, open to discussion:

The index should be free, like in beer, as the swap disks themselves are.

Personally, I'd prefer if it were Free, like in freedom, as in the Gnu Free Documentation or one of several Creative Commons licenses. This is certainly open to discussion.

The index doesn't have to be comprehensive to be useful. Therefore, wiki content will be distilled into the canonical index on a frequent basis.

The wiki should be free-form, but the index should be rigidly structured. This matches the needs of humans on the one hand and computer searching on the other.

I propose not to provide a discussion forum, since there is already a very nice one here, and the subject is on-topic. This is, of course, subject to Dave's requirements.

I can host a mirror of the swap disk archive or use the (now canonical) copy here.

If there is interest, new swap disks could be produced. I see no archive of 71B software other than the swap disks, for instance. I'd be glad to host one.

(I think) I have every machine whose software appears on the swap disks except for the 75D. Those would be the 41C, 75C and 71B. I also have the capability to load LIF formatted data on to each of those. That means I can try figuring out what a particular file does for each of the three machines. I can also convert media from LIF to modern formats.

I'm willing to do much of the work. However, my day job is about to spin up again, so It will be a part-time effort after the initial push. Help would be very welcome, and ought to speed the process along. But I'm committed to following through on this regardless, since it falls squarely within my hobby interest: old calculator software and systems.

If you are interested, please drop me a line, or reply here. I need to gauge how much interest there is before I go through the not inconsiderable labor of setting up Twiki. If it's just me and one or two others, I won't bother with that part.

Regards
Howard

Re: Swap Disk Indexing Project

*Message #2 Posted by **John Pierce** on 9 Aug 2005, 2:47 p.m.,*
in response to message #1 by Howard Owen

In the last several years I have become interested in collecting, using, and "playing with" HP calculators. I own HP41C, HP71B, and HP75D calculators, and quite a few peripherals, and original software and ROM pacs. I have several original "swap" disks from Educalc. I do not know how to extract the LIF file images on the MoHPC ftp site for my use, although I have tried using HP utility files. I am willing to help, and support your effort any way I can. I am retired and have plenty of free time. And maybe I'll learn something. Let me know what I can do to help.

Thanks for your interest in this project.

Best regards John Pierce

Re: Swap Disk Indexing Project

*Message #3 Posted by **Howard Owen** on 9 Aug 2005, 3:28 p.m.,*
in response to message #2 by John Pierce

Hi, John!

Yes, that's the tricky part - getting the bits on to the calculator/computer. I do it with an HP-IL ISA card built by Cristoph Klug. You should also be able to use an original HP HP-IL ISA card for this purpse. There's one being offered on eBay, the last I looked. You need a PC at least one ISA slot, which means an older one. But given that, you can then run J.F. Garnier's EMU41 in a DOS box (on Windows) or under DOSEmu (under Linux.) This gives you the capability to serve out LIF images to the loop, where you calculators and computers can get at the contents.

There are other ways to go. For the HP-41C, you can convert the raw bits (extracted with available tools for DOS or Linux) to barcode files, which you can then print and scan with the wand. This is tedious, so I never do it unless I have a 41C program in barcode only. The approach doesn't work for the 75C or 71B, but might for the 75D and wand.

What you can't do is write LIF images to floppy (that could then be read by a 9114) because the sector size of 256 bytes is unsupported in any PC BIOS past 1990 or so. I recently saw a dual SCSI 5 1/4" floppy set, and it occurred to me that it might be possible to read and write the lif disks directly using such a beast. However I don't have a 5 1/4" HP-IL floppy.

Re: Swap Disk Indexing Project

*Message #4 Posted by **Tony Duell** on 10 Aug 2005, 6:08 a.m.,*
in response to message #3 by Howard Owen

The LIF Utilities for Linux don't use the BIOS at all (they use the linux floppy driver which talks directly to the hardware). I have certainly read/written physical 3.5" disks in my PC and then stuck them in the 9114 with no problems.

Of course my PC is a lot older than 1990, but I don't think that's necesary for it to work.

Re: Swap Disk Indexing Project

*Message #5 Posted by **Howard Owen** on 10 Aug 2005, 8:13 a.m.,*
in response to message #4 by Tony Duell

Well, I can't get lifimage or lifdump to work for me on a ca. 1994 Compaq Pentium machine running Slackware 10. I have many newer machines that I haven't tried, tunning a variety of Red Hat flavors. I'll try some of them and report back.

HP 37C calculator batteries

*Message #1 Posted by **Vivek Ghodekar** on 9 Aug 2005, 9:03 a.m.*

Can anyone tell me where I might be able to find batteries for this calculator mode (37C) and approximately what they might cost?

Thanks,

Vivek

Re: HP 37C calculator batteries

*Message #2 Posted by **Katie Wasserman** on 9 Aug 2005, 10:58 a.m.,*
in response to message #1 by Vivek Ghodekar

I think that you mean an HP-37E or an HP-38C. [But if it is a 37C. there are a lot of people on this forum that would love to get their hands on it :)]

Anyway, this is a really easy battery pack to replace with regular AA batteries or you can make one yourself out of ni-cad (or ni-mh) batteries. Here's more information:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv007.cgi?read=15700

http://www.hpmuseum.org/batts/bc30.jpg

Re: HP 37C calculator batteries

*Message #3 Posted by **Chan Tran** on 9 Aug 2005, 12:25 p.m.,*
in response to message #2 by Katie Wasserman

I wonder if a CRV3 battery would fit? The CRV3 which is basically 2 AA battery put together.

Re: HP 37C calculator batteries

*Message #4 Posted by **Katie Wasserman** on 10 Aug 2005, 9:51 a.m.,*
in response to message #3 by Chan Tran

It might, I haven't tried it. There are a few potential issues:

- There's a ridge on the bottom of the battery compartment in the calculator that may prevent the battery from fitting properly.

- The contacts may be too recessed on the battery to match up with the contact springs in the calculator.

- The battery pack might be a hair too long.

But it's a good suggestion that I'm going to try it. The extremely long shelf life and high energy density of lithium is a big plus! Besides I've never seen a lithium battery leak.

Re: HP 37C calculator batteries

*Message #5 Posted by **Peter Geiser** on 9 Aug 2005, 3:04 p.m.,*
in response to message #1 by Vivek Ghodekar

From what I see, I assume that all the Spice series calculators have the same betteries, i.e. it is possible to use the two AA batteries for a HP38C as well. Is this correct?

Re: HP 37C calculator batteries

*Message #6 Posted by **Katie Wasserman** on 10 Aug 2005, 10:00 a.m.,*
in response to message #5 by Peter Geiser

Yes, all the Spice series calculators (31E, 32E, 33E, 33C, 34C, 37E, 38E, 38C) use the same battery pack. In fact all the calculators in any HP calculator series use the same battery pack, the battery pack is a good way to define "series".

(Although some would argue that the 10, 19C, 67 and 9x are properly in the Woodstock series. Then there's the 75C/D which uses the same battery as the classic series, so that's sort of a problem too.)

Edited: 10 Aug 2005, 11:20 p.m. after one or more responses were posted

Re: HP 37C calculator batteries

*Message #7 Posted by **Peter Geiser** on 10 Aug 2005, 5:23 p.m.,*
in response to message #6 by Katie Wasserman

Thank you, Katie. So I'll try to create a battery pack fo my 38C with the info in your original links.

Re: HP 37C calculator batteries

*Message #8 Posted by **Klaus** on 10 Aug 2005, 11:06 a.m.,*
in response to message #1 by Vivek Ghodekar

There once was a thread on this forum about a picture an ebay with a spice powered by a 9V bat. I wonder if this calc still works!

matrix Inverse using Hp-17BII+

*Message #1 Posted by **chris dean** on 9 Aug 2005, 8:38 a.m.*

```
The HP 27S and 19B Technical Manual uses the matrix of
(cofactors / determinant) method to solve Ax=B. I originally
started doing the inversion using LU decomposition to be able
to invert N*N matrices but soon found that I could not enter
values into the ITEM() array at run time (i.e. whilst trying
to solve). Therefore I pursued a solution for a 3*3 matrix
only, just to say that I had done it!

The underlying equations using LU decomposition are shown below.

L11=A11
L21=A21
L31=A31
U12=A12 / L11
U13=A13 / L11
L22=A22 - L21.U12
U23=(A23 - L21.U13) / L22
L32=A32-L31.U12
L33=A33 - L31.U13 - L32.U23
Y1=1 / L11
Y2=-L21.Y1 / L22
Y3=(-L31.Y1 - L32.Y2) / L33
V31=Y3
V21=Y2 - U23.V31
V11=Y1 - V21.U12 - U13.V31
Y1=0
Y2=1 / L22
Y3=-L32.Y2 / L33
V32=Y3
V22=Y2 - U23.V32
V12=Y1 - U12.V22 - U13.V32
Y1=0
Y2=0
Y3=1 / L33
V33=Y3
V23=Y2 - U23.V33
V13=Y1 - U12.V23 - U13.V33

I had to split the equations into Z for variable registration,
SUM for the input array A and AINV for calculation otherwise
the equation seemed to run out memory at run time and did not
calculate the last few terms.

Z=V11+V12+V13+V21+V22+V23+V31+V32+V33+
L11+L21+L22+L31+L32+L33+U12+U13+U23+
Y1+Y2+Y3

AINV=0x(L(l11:ITEM(A:1))
+L(L21:ITEM(A:4))
+L(L31:ITEM(A:7))
+L(U12:ITEM(A:2)/G(11))
+L(U13:ITEM(A:3)+G(L11))
+L(L22:ITEM(A:5)-G(L21)xG(U12))
+L(U23:ITEM(A:6)- G(L21)xG(U13))/G(L22))
+L(L32:ITEM(A:8)-G(L31)xG(U12))
```

```
+L(L33:ITEM(A:9)-G(L31)xG(U13)-G(L32)xG(U23))
+L(Y1:1/G(L11))
+L(Y2:-G(L21)xG(Y1)/G(L22))
+L(V31:(-G(L31)xG(Y1)-G(L32)xG(Y2)/G(L33))
+L(V21:G(Y2)-G(U23)xG(V31))
+L(V11:G(Y1)-G(V21)xG(U12)-G(V31)xG(U13))
+L(Y2:1/G(L22))
+L(V32:-G(L32)xG(Y2)/G(L33))
+L(V22:G(Y2)-G(U23)xG(V32))
+L(V12:-G(U12)xG(V22)-G(U13)xG(V32))
+L(V33:1/G(L33))
+L(V23:-G(U23)xG(V33))
+L(V13:-G(U12)xG(V23)-G(U13)xG(V33)))

Use the SUM menu to input the values for the 9 matrix elements
where element k = (row-1)*3 + column. Click on NAME and save the
data as A.

Go to the solve menu, find the Z formula and click on CALC to
register the variables.

Find the AINV formula and click on CALC. Click on AINV, when it
is finished the display should show AINV=0.000…

Click on EXIT and go to the Z equation. Click on CALC and then
RCL V11, RCL V12, RCL …. to show all the elements of the inverse
matrix of A.

A useful test matrix is the Hilbert matrix 1, ½, 1/3, ½, 1/3, ¼,
1/3, ¼, 1/5 with the resultant inverse matrix elements 9, -36,
30, -36, 192, -180, 30, -180, 180 ignoring the rounding errors.

I have not studied the accuracy of the results as yet but
thought I would post it for any comments and hopefully any
improvements on technique. Also are there any tricks that I do
not know about that I could have used?
```

HP48 <-IR-> Nokia3650

*Message #1 Posted by **Tizedes Csaba [Hungary]** on 9 Aug 2005, 5:48 a.m.*

Hello,

heard about something Symbian prog to communicate a N3650 mobile phone with any HP IR device? Like a 48SX to write SMS or HP IR printer to print text files or SMSes...?!

Thanks for any answers or links!

Csaba

comma in lieu of decimal point

*Message #1 Posted by **Bill Nelson** on 9 Aug 2005, 4:19 a.m.*

a couple days ago i turned the calculator and now i get the "," in lieu of the decimal point in numbers and no longer get the comma at all in numbers of 1,000 or larger...is there a flag that needs to be set?

Re: comma in lieu of decimal point

*Message #2 Posted by **James M. Prange (Michigan)** on 9 Aug 2005, 4:42 a.m.,*
in response to message #1 by Bill Nelson

Which calculator model?

12C

Toggling the separator

*Message #4 Posted by **Evan (San Jose, California)** on 9 Aug 2005, 6:28 p.m.,*
in response to message #3 by D Cleland

With the 12c off, press and hold the decimal point key while then pressing the 'ON' key. This toggles the separator being used.

Andy Delano's 71B Page

*Message #1 Posted by **Howard Owen** on 8 Aug 2005, 10:56 p.m.*

Having just scored a 71B (with MEM reporting 123318!), I'm now in search of cool toys. JF Garnier's and Eric Smith's sites both refer to http://home.attbi.com/~andy.delano/index.htm as a resource page for the 71B. But that was the old cox@home hierarchy hastily converted over to attbi when the plug was pulled. And AT&T internet is now Comcast. Whatever, the address no longer exists. Does anyone know what became of the site?

Thanks

Re: Andy Delano's 71B Page

*Message #2 Posted by **David Smith** on 9 Aug 2005, 11:50 a.m.,*
in response to message #1 by Howard Owen

You might try the Wayback Machine and see if it archived the old site.

Re: Andy Delano's 71B Page

*Message #3 Posted by **Howard Owen** on 9 Aug 2005, 11:55 a.m.,*
in response to message #2 by David Smith

Duh! (*Smacks forehead with palm.*)

Re: Andy Delano's 71B Page

*Message #4 Posted by **Howard Owen** on 9 Aug 2005, 12:50 p.m.,*
in response to message #2 by David Smith

Well, it was a good idea. But Wayback comes up empty. The wole of "home.attbi.com" only has about a dozen pages, most referenced with HTTP GET URLs. The last page archived for the base page did point me to 'home.comcast.net' but http://home.comcast.net/~andy.delano/index.htm doesn't exist either.

Collector Responsibility?

*Message #1 Posted by **Russ in Charlotte** on 8 Aug 2005, 7:06 p.m.*

I recently bought a 32E (but the model isn't important for this thread). It's in beautiful physical condition, until you get to the internal corrosion issue. As a collector should I feel obligated to get the calculator functioning again, or is a lovely paper weight good enough?

Collector Responsibility?

*Message #2 Posted by **Bernhard** on 8 Aug 2005, 7:34 p.m.,*
in response to message #1 by Russ in Charlotte

In my opinion you don't have any obligation to fix it. It's your calc, you bought it, you can do with it whatever you want to do. The HP32E is quite common and easy to get. No big loss to the collector community if it is not restored. Other Spice models are rarer and more valuable. The common HP32E might serve as a transplant organ spender to revive some on the rarer Spices. Such as replacing burnt out LED displays or worn keyboards (I mean on the solderered variety, not the press-fit ones). I even must admit to have slaughtered a not so pretty but fully functional HP32E recently to get just the battery PCB and the flexfoil to fix a HP38C which also had corrosion by leaky batteries. The HP38C now is in perfect condition again, the HP32E is dead. Was it worth the sacrifice ? For me, yes. I also buy worn / ugly HP45 just to cannibalize them for LED display modules and chips to repair the more valuable Classics, the HP55s being particular notorious for burnt out LEDs. So there is nothing wrong with not restoring your HP32E. If you are new to restoring HPs and want to get a little practice, try to replace the corroded parts with thin wires. But don't blame me if you break the case in the process...

Regards, Bernhard

Re: Collector Responsibility?

*Message #3 Posted by **Mike (Stgt)** on 9 Aug 2005, 3:36 a.m.,*
in response to message #1 by Russ in Charlotte

Do you like just a paper weight or a paper wight that works?

Ciao.....Mike

Re: Collector Responsibility?

*Message #4 Posted by **Chan Tran (USA)** on 9 Aug 2005, 12:29 p.m.,*
in response to message #3 by Mike (Stgt)

it's certainly nice if you can fix it. I don't think as collector you should collect only working units. In fact many collectors as they don't actually use what they collect so they would collect units that is in good cosmetic condition but not functioning. Sometimes a collector only wants to have the unit to show others how it looks like.

Re: Collector Responsibility?

*Message #5 Posted by **Russ in Charlotte** on 9 Aug 2005, 9:49 p.m.,*
in response to message #4 by Chan Tran (USA)

Thanks all... I appreciate your imput. I'm tempted to try to repair, but as was mentioned, I could make matters worse. Hopefully, the corrision has stabized.

Re: Collector Responsibility?

*Message #6 Posted by **Howard Owen** on 9 Aug 2005, 10:27 p.m.,*
in response to message #1 by Russ in Charlotte

Assuming you'd rather have it working than not, because of your delight as a enthusiast, or your conscience as a collector, then one thing to look at would be risk:benefit. Though the current state of your machine could be described as "a pretty paperweight," that status actually has value in a display piece or conversation starter. So if you don't do anything to screw up this attribute of the device by opening it, then the only risk you run is that the machine won't work, and may be even more damaged, when you put it back together. If you are satisfied with the display piece, then that isn't really a risk at all. On the other hand, if that really is an unacceptable risk, then you can choose to send it off to one of the expert calculator repair people. This could be pricey, but may have a better chance of producing a working machine than if you attempt the repair yourself. Finally, you might get a benefit from opening your calculator, even if yo screw it up. You could end up learning something about how the machine ought to work. If this gives you pleasure, then I wouldn't discount it as a benefit.

Best of luck!

HP Forum

*Message #1 Posted by **disgruntled** on 8 Aug 2005, 4:30 p.m.*

Why not change the name from HP Forum to HP Calculator Forum so there is no mistaking what the forum is actually for.

Re: HP Forum

*Message #2 Posted by **Jim L** on 8 Aug 2005, 5:40 p.m.,*
in response to message #1 by disgruntled

I would think that if the "This forum is for discussion of HP calculators" printed in red above the message box doesn't stop people, then nothing will. ;-)

Re: HP Forum

*Message #3 Posted by **Howard Owen** on 8 Aug 2005, 6:44 p.m.,*
in response to message #2 by Jim L

Dave could try adding "laptop" and "printer" to his list of forbidden words. 8)

Actually, adding "Calculator to the forum title wouldn't hurt, and it might do some good. Knowing nothing about this site, J. Random User does a Google search for "HP Forum" and gets several hits in MoHPC. At the top of the page are the words "HP Forum" So she hauls off and asks her laptop question, ignoring the red letters because they probably just are telling her to be cool..

This seems pretty clear to me Mr. disgruntled

*Message #4 Posted by **Mike** on 8 Aug 2005, 11:39 p.m.,*
in response to message #1 by disgruntled

http://www.msdsite.com/temp/hp.jpg

HP Calculators is printed at the top of every page. How can one get confused. **Maybe you just get confused easily.**

I guess it could have been:

http: www.hpcalculatorNoWaitThatsTooRestrictiveForSomeMaybeOneOrTwoOfHPProductsIsBetter.com

What do you think about that one?

Try Google

*Message #5 Posted by **Howard Owen** on 9 Aug 2005, 12:59 a.m.,*
in response to message #4 by Mike

Guess what the second link on Google is for "HP Forum" **not** in quotes? It's the page just above this one. Look for "HP Calculators" on that page. Now look for "HP Forum." Which is easier to see?

Great picture by the way, Dave. 8)

Edited: 9 Aug 2005, 1:00 a.m.

Re: Try Google

*Message #6 Posted by **Jim L** on 9 Aug 2005, 9:13 a.m.,*
in response to message #5 by Howard Owen

I searched on Google. The first link is to HP's IT forums. The second link is to here but it is marked right on the Google search page as: "This forum is for discussion of HP calculators".

I went to the HP IT forum and it doesn't let you post without registering. I think many people just don't want to take the time to register so then they look for another forum. This forum is next on the list and doesn't require registration so...

Requiring registration might make a lot of off-topic posts go away, but it might make a lot of on-topic posts go away too.

Re: This seems pretty clear to me Mr. disgruntled

*Message #7 Posted by **disgruntled** on 9 Aug 2005, 4:48 a.m.,*
in response to message #4 by Mike

I have no confusion on the forums use as I would not respond non calculator based questions.

how reliable are HP laptops?

*Message #1 Posted by **L_ion** on 8 Aug 2005, 2:35 p.m.*

Hi, people! I never had a HP laptop, and i saw a DV 1355EA for a very reasonable price. How reliaeble them are?

Re: how reliable are HP laptops?

*Message #2 Posted by **Bob Wang** on 8 Aug 2005, 4:56 p.m.,*
in response to message #1 by L_ion

I have found them to be quite reliable. I know of two that have been dropped from different heights due to user carelessness. They both continued to function initially, but the one dropped from a standing position no longer boots. So, unless you are accident-prone, HPs should serve you well.

One piece of advice, unless you are saving a considerable amount, I would recommend ordering a customized model from HP's web site. That way you can get Windows XP Professional instead of the Home edition which is what is usually found in the off-the-shelf variety.

Oh, and Brightview is a must in my humble opinion ;-)

Bob

Re: how reliable are HP laptops?

*Message #3 Posted by **L_ion** on 8 Aug 2005, 6:33 p.m.,*
in response to message #2 by Bob Wang

Thanks, Bob!but what i meant was if the computer will not breack down will in work.(of course there is always such a posibility) my previsios packard bell got broken because of the hard disk wich overheated.(it was 5 months old, a really fast 3.2 Pentium 4) Now, i have the choise betveen sony or HP.

Re: how reliable are HP laptops?

*Message #4 Posted by **Juan J** on 8 Aug 2005, 8:12 p.m.,*
in response to message #3 by L_ion

I have used HP laptops for a while and have found them reliable. I have experienced the occasional 1-foot drop or a minor hit with a piece of furniture while carrying it around but nothing happened.

On the other hand, the CPU cooler of a Toshiba laptop I had ceased to function after the same 1-foot drop. Later examination showed that overheating had loosened the fan supporting screws and the entire assembly was loose and therefore suffered with the hit. I've had no such concern with HP laptops.

Whether you intend to carry it around or use it mainly as a dektop, you will not be disappointed.

Re: I have owned a couple

*Message #5 Posted by **Mike** on 8 Aug 2005, 11:32 p.m.,*
in response to message #1 by L_ion

I bought a Z5000 last year. It worked flawlessly. I replaced it this year (in fact last week), with a dv1000. They are great machines. I love this dv1000. It's small, lighweight, powerful and is great for my business trips.

Specifically, I have the dv1331se.

I have not had a single problem with either of the HP laptops that I have owned.

Edited: 8 Aug 2005, 11:33 p.m.

Re: I have owned a couple

*Message #6 Posted by **Ronald** on 9 Aug 2005, 8:37 a.m.,*
in response to message #5 by Mike

I have had 2 HP laptops and one Dell laptop the last years:

HP: Not a single glitch. I even droped one from meter high which did broke some of the plasctic form the corner, but nu function loss what so ever !. Hit the doorpost with the USB plugged in from my mouse, so the connector was heavely insulted, but kept on working. I travel quite a lot, also in airplanes etc. but it always kept working.

The Dell: The good news: had really perfect service, next day at your adress The bad news: I had in one (1) year time: One new LCD display, one motherboard, one powersupply and and keyboard. In a way hes stays always young but.....

For me the choice is clear HP laptops.

HP-48 indirect addressing of variables

*Message #1 Posted by **Geir Isene** on 8 Aug 2005, 4:41 a.m.*

Situation: I have a set of variables (arrays) in a directory and a program that access the variables. The program asks for user input - the name of one of those variables for which part of the content is to be altered.

Problem: How to change the content of a variable whose name is entered by the user?

Additional info: This problem is of course easily handled on an older HP calculator that has indirect addressing (STO IND 01). Little info exists on the net regarding indirect addressing on the 48. None of the links I found where applicable to this specific problem.

Help or pointers is appreciated.

Re: HP-48 indirect addressing of variables

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 8 Aug 2005, 6:24 a.m.,*
in response to message #1 by Geir Isene

Hi, Geir;

all of my answer is based on User RPL instructions, O.K.? I mean, the one you use regularly.

If you are indexing the contents of an array, you could use either PUT or PUTI provided that:

the name of the array in stack level 3 surrounded by ' (ex: 'MTX1'); this is the name you (user) enter
the location where the data will be placed in the array in stack level 2; if it is a one-row or one-column array, than one number is needed; if it is a bidimensional array, than a list like {row,column} is needed;
the data to be entered in stack level 1.

As an example: suppose you need to enter the number 10 in row 2, column 3 of MTX1 by using PUT. The followin is the stack contents representation:

```
4:
3:        'MTX1'
2:         {2,3}
1:            10
```

Than you just need to execute PUT.

Remember that all of the three objects above are removed from the stack after PUT is executed. PUTI automatically increments the index in level 2 and keeps both the name of the array (level 2) and the updated index (level 1) in the stack. This has to purpose to be an aid for successive input.

Hope this helps.

Luiz (Brazil)

Edited: 8 Aug 2005, 6:26 a.m.

Re: HP-48 indirect addressing of variables

*Message #3 Posted by **Geir Isene** on 8 Aug 2005, 7:11 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Yes, this helped.

Now I'd like to store the name 'MTX1' in a variable for later retrieval. How do I do that? As I store 'MTX1' in , let's say a variable named 'VAR1', any time I want to retrieve the variable name, it is automatically evaluated - I just want the name of tha variable back to further play with it.

Any way to convert "MTX1" to 'MTX1'?

Re: HP-48 indirect addressing of variables

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 8 Aug 2005, 12:30 p.m.,*
in response to message #3 by Geir Isene

Hi, Geir;

I'm not sure about what input command (there are many) you are actually using to capture the variable name (in this case, MTX1). BTW, which HP48 are you using? The S-series, the earlier G-series or the new GII?

If you have one of the earlier G-series model, the complement to the User's Manual (AUG, or Advanced User's Guide) has references to all available UserRPL commands/functions plus a friendly explanation on how to use the various input resources. I'm not sure about the best one in your case, but the INFORM is the most resourcefull of them. Anyway, you can check for input 'sintax' and data format by specifying some additional parameters, and then your name will be placed in the stack as 'MTX1' instead of "MTX1".

There is another handy command in the HP48, the OBJ->, that returns an object within another object. It is meant to 'disassemble' complex objects into elementary objetcs (a list into its individual objects, an array into its numbers, a program into its comands, etc.). I'm not sure if the OBJ-> actually evaluates the returned object(s); if so, any exisitng object named MTX1 in the current directory or in any subdirectory associated with the current directory will be returned and evaluated (I'm not so sure about this, should test or read about).

Anyway, you should try using the 'poor man' converter: add one "'" to both the head and tail of the name. Than you have "'MTX1'" instead of "MTX1". Now you use OBJ-> (or STR->) and the name 'MTX1' is returned, even if there is a variable named MTX1 in the same conditions explained below.

I'd try to go ahead with some experiences. Please, let us know what HP48 you have, so we can give you better guidance (by 'we' I mean anyone in this forum, OK?).

Best regards.

Luiz (Brazil)

Edited: 8 Aug 2005, 12:33 p.m.

Re: HP-48 indirect addressing of variables

*Message #5 Posted by **Geir Isene** on 9 Aug 2005, 2:52 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Thank you.

> Quote:
>
> Anyway, you should try using the 'poor man' converter: add one "'" to both the head and tail of the name. Than you have "'MTX1'" instead of "MTX1". Now you use OBJ-> (or STR->) and the name 'MTX1' is returned, even if there is a variable named MTX1 in the same conditions explained below.

This did the trick in my program. Great.

Info: I have a G+ and a GX.

Any idea about the next new HP or TI Calculators?

*Message #1 Posted by **Namir** on 8 Aug 2005, 4:34 a.m.*

Has anyone caught wind of rumors about the next HP or TI calculator? How about your own personal hunch for the new wave of calculators?

Re: Any idea about the next new HP or TI Calculators?

*Message #2 Posted by **I, Claudius** on 8 Aug 2005, 7:59 a.m.,*
in response to message #1 by Namir

I got to play with a 49+, CNA515... with the newest keys and the latest ROM. It was the first decent 49+ I've seen, what HP should have released in the first place. From the source who got the calc it's all HP can do to just to keep up with bug fixes. With the layoffs at HP, I wouldn't expect anything new.

TI's calculator division is raking in megabucks with very little effort these days, having completely cornered the educational market. Thus, here is no incentive currently to spend any money on developing anything new. The only thing new seem to be re-releases of existing models with new cases in an attempt to appeal to kiddies wanting a bizarre ultra-modern look.

Casio and Sharp continue to produce calcs that have a rather small market share. Casio actually may be the most innovative, coming up with a number of new models. These machines always to have some shortcoming, though. As an example, the Casio ClassPad had a pretty good computer algebra system, but lacked built-in units needed for science/engineering classes. Also, the OS of the ClassPad is poor for serious programming, a real shame.

Re: Any idea about the next new HP or TI Calculators?

*Message #3 Posted by **joan** on 8 Aug 2005, 10:23 a.m.,*
in response to message #2 by I, Claudius

Casio has release a new calc with a SD card slot.
http://web.educastur.princast.es/proyectos/aulamatematica/Imagenes_museo/FX_9860G_SD.jpg

Interesting But Casio Still Lacking

*Message #4 Posted by **I, Claudius** on 8 Aug 2005, 12:58 p.m.,*
in response to message #3 by joan

Could you provide a link in English to this calc? I found references to this machine in European forums, but all I could find on Casio's page was a link to the standard 9860.

Apparently there a computer algebra system. There are a few metric conversions but not a comprehensive set like the HP48/49. Such a machine is useless to me and many others who become used to such things via an HP48/49.

Edited: 8 Aug 2005, 1:15 p.m.

Re: Interesting But Casio Still Lacking

*Message #5 Posted by **Ron Ross** on 8 Aug 2005, 1:38 p.m.,*
in response to message #4 by I, Claudius

You will also have to get used to using single letter variables for most Casio Calculators aside from their Classpad. Casio's programming is not as extensive as the low end Ti-83 line the last time I checked/used it. While I have not bought any of the newer Casio's, my existing ones are not anything to bragg about.

Re: Any idea about the next new HP or TI Calculators?

I got this machine today and wrote some details here - but when posting the message the forum software told me I was not logged on. So hit the back button --- and lost my message. Could you come up with a solution to this bug ?

Sorry, I'll try to write again the message later. In any case, this Casio doesn't have a CAS.

Re: Any idea about the next new HP or TI Calculators?

Joan,

There is hardly any info about the new Casio 9860!!! It's like Casio's new secret. Any links to Casio's press releases or other info!

Please .. pretty with sugar!

Namir

in response to message #7 by Namir

http://www.casio.com/index.cfm?fuseaction=products.detail&catalog=Calculators&section=Graphing&product=FX%2D9860G

I've bought it last week, and to be honest don't get too excited. Nice body, lovely display, good keyboard, but ugly manual and lack of support, at least by now. I've been looking for the SDK the hole week without any succes. The SDK is what I need to install the RPN emulator.

Anyway, is quite curious to see how Casio an release a new product without any mention on their global website.

in response to message #1 by Namir

I would like to see a scientific calculator with the body of the 17BII+ and the functionality of the 27S. This should include its programming ability using the Solve function which the 17BII+ already has. I think basically what I am saying is that I would like a 17BII+ with more mathematical functions that I do not have to write myself and can be included in the programming. Possibly a 17SII+.

New Software Library program for HP-32/33: AC Power Transfer

*Message #1 Posted by **Karl Schneider** on 8 Aug 2005, 3:14 a.m.*

All --

This is a plug for the set of updated "AC Power Transfer" programs I wrote for the HP-32S, -32SII, and -33S. There are four versions of the program tailored for each calulator model, including separate "RPN" and "ALG" versions for the HP-33S.

The program calculates the transfer of active and reactive power through an AC transmission line modeled by series resistance, series reactance, and balanced shunt susceptance. This is a solid, real-world application that I have put to practical use in my line of work, and which Power Engineering students should also find helpful. The program's results match those of commercial powerflow programs for lines modeled as a single balanced-pi section.

The Museum Curator, David Hicks, graciously posted my original versions for the 32S and 32SII in late June, and then posted my updated versions (which by then included the 33S versions) on August 1. The updated versions use fewer labels, and they allow the user to modify any stack contents at an "INPUT" or "VIEW" breakpoint, without affecting program output.

I will gladly answer questions in this Forum as necessary to clarify the program or its ample documentation. However, I would rather not have to explain basic concepts, such as "per unit", "reactance" and "phase angle". Textbooks and reference books are available for that purpose.

Links to the programs in the MoHPC Software Library:

HP-32S version

HP-32SII version

HP-33S RPN version

HP-33S ALG version

NOTE: There is a minor error in the HP-32SII version. Line P30 should be deleted and re-entered to become the new line P32, as follows:

```
(incorrect)         (correct)
P29  STO P          P29  STO P
P30  VIEW P         P30  x<>y
P31  x<>y           P31  STO Q
P32  STO Q          P32  VIEW P
P33  VIEW Q         P33  VIEW Q
```

Comments, suggestions, and questions within the above guidelines are welcomed.

82104A card reader magnetic head

*Message #1 Posted by **Carlos** on 7 Aug 2005, 8:20 a.m.*

I'm trying to repair a 82104a card reader. I measured the two track magnetic head impedance. I used a Fluke 77 multimeter to do that. The instrument read ~51Ohms in one track and ~75Ohms in the other. Can somebody comfirm that? is unusual a magnetic head with diferent impedance in his tracks. Any information is welcomed. Thanks, Carlos.

Re: 82104A card reader magnetic head

*Message #2 Posted by **Tony Duell** on 8 Aug 2005, 12:59 p.m.,*
in response to message #1 by Carlos

Did you disconnect the head from the read/write PCB before you measured its resistance? It's possible the sense amplifier chip measures slightly different on the 2 channels.

Otherwise, I can see no reason why the 2 windings of the head would be different. It's possible (although unlikely) you have shorted turns in one winding which would lower the DC resistance.

Re: 82104A card reader magnetic head

*Message #3 Posted by **Carlos** on 8 Aug 2005, 1:47 p.m.,*
in response to message #2 by Tony Duell

I measured with the the head disconnected. The measure is the coil resistance without any active circuit connected. If somebody has a 82104a open and can mesure the coil resistance I will confirm (or not) the difference on coils resistance. Thanks

Re: 82104A card reader magnetic head

*Message #4 Posted by **Randy** on 8 Aug 2005, 9:47 p.m.,*
in response to message #3 by Carlos

I measured three that I have open. All 6 coils are between 46 and 48 ohms. Meter = Fluke 179 on manual 600 ohm range.

Edited: 8 Aug 2005, 9:49 p.m.

Re: 82104A card reader magnetic head

*Message #5 Posted by **Carlos** on 9 Aug 2005, 7:57 a.m.,*
in response to message #4 by Randy

Thanks for answer. The magnetic head has only two coils, one with red and yellow terminals and the other with blue and orange terminals, the black wire is a ground shield for minimize noise. I supouse that one coil is for timing porpouse an the other for data. Please take a impedance measure in the two coils terminals above descripted. Thanks again.

Re: 82104A card reader magnetic head

*Message #6 Posted by **Randy** on 10 Aug 2005, 12:09 a.m.,*
in response to message #5 by Carlos

3 each 82104 = 3 heads x 2 windings each = 6 coils. Just as you asked. All the same resistance since my Fluke doesn't have an impedance setting :^)

I have only seen one bad head ever, on a 97. It was open on one winding. I don't know if a 75 ohm winding would cause a problem. It's much more common for the card detect switches to be the issue as they are easily bent while handling.

Edited: 10 Aug 2005, 12:16 a.m.

Re: 82104A card reader magnetic head

*Message #7 Posted by **Carlos** on 10 Aug 2005, 10:01 a.m.,*
in response to message #6 by Randy

Thanks Randy. I supouse my 82104A head has some kind of problem because your heads coils has impedance consistent in ~50Ohms.

Re: 82104A card reader magnetic head -- minor correction

*Message #8 Posted by **Tony Duell** on 10 Aug 2005, 6:06 a.m.,*
in response to message #5 by Carlos

It's not clock and data. A pulse on one track is a '0', a pulse on the other track is a '1'. I don't know if simulateous pulses on both tracks are used for anything like a byte marker.

Re: 82104A card reader magnetic head -- minor correction

*Message #9 Posted by **Carlos** on 10 Aug 2005, 10:15 a.m.,*
in response to message #8 by Tony Duell

If this is rigth the two coils has the same porpouse and then they must have the same impedance. Thanks Tony

HP-41 UAC - Global user conference

*Message #1 Posted by **Geir Isene** on 5 Aug 2005, 10:30 a.m.*

The HP-41 UAC annual global user conference will be held in Oslo, Norway on August 6th. Since we are expecting an unprecedented attendance, it would be wise to book your seat now. Photos and possible DivX files will be presented to those of you who cannot attend.

The agenda will include:

- HP-41 UAC aboard the Space Shuttle

- Looking at HP-IL interfaces to the human body

- Possibility of expanding into WalMart with HP-41CXs preloaded with the UAC.

Tickets will be 50 Norwegian øre per seat.

Re: HP-41 UAC - Global user conference

*Message #2 Posted by **Howard Owen** on 5 Aug 2005, 1:30 p.m.,*
in response to message #1 by Geir Isene

Sort of gives new meaning to the term "embeddable" doesn't it?

Can I UNT my boss with that?

Re: HP-41 UAC - Global user conference

*Message #3 Posted by **Namir** on 6 Aug 2005, 3:22 a.m.,*
in response to message #1 by Geir Isene

Is there a website for that conference?

Re: HP-41 UAC - Global user conference

*Message #4 Posted by **Geir Isene** on 6 Aug 2005, 5:06 a.m.,*
in response to message #3 by Namir

Sorry. Even though there has been an avalanche of requests for an official HP-41 UAC Global User Conference website, we have not had time to put it up. We have simply been to busy setting up our new lab with all the equipment to start testing the human interface modules.

More coburlin on ebay

*Message #1 Posted by **Chris Woodhouse** on 4 Aug 2005, 3:06 p.m.*

I just put up my 42s for auction and coburlin sent a message with in 5 min wanting to know how much I would put it up for buy it now. What should I tell him ;)

Chris W

Re: More coburlin on ebay

*Message #2 Posted by **Howard Owen** on 4 Aug 2005, 3:13 p.m.,*
in response to message #1 by Chris Woodhouse

This one is listed for $288.80, so you can be sure he's looking for less.

He seems to try and buy for about 10% of what he sells. Why not reverse the ratio and ask for $2,888.00? :)

Re: More coburlin on ebay

*Message #3 Posted by **Namir** on 4 Aug 2005, 5:22 p.m.,*
in response to message #1 by Chris Woodhouse

Tell Cobuba that you will sell it for him for $500. It's TIME YOU MAKE SOME MONEY!!!

coburlin now has a disciple who goes beyond...

*Message #4 Posted by **K** on 4 Aug 2005, 11:06 p.m.,*
in response to message #1 by Chris Woodhouse

Check out these recent unsuccessful one-price BIN "auctions" for HP-11C's that exhibit even more chutzpah...

$375 11C

$279 11C

Re: More coburlin on ebay

*Message #5 Posted by **I, Claudius** on 5 Aug 2005, 4:01 a.m.,*
in response to message #1 by Chris Woodhouse

Oh Chris, what a marvelous opportunity to tweak one of eBay's lowest! I'd say a minimum of $400 plus some outrageous shipping charge... have fun!

Re: More cobuba on ebay

*Message #6 Posted by **Namir** on 5 Aug 2005, 5:06 a.m.,*
in response to message #5 by I, Claudius

That's right!! How about a really outrageous shipping charge ... say half a mil ... why stop there?

Re: More cobuba on ebay

*Message #7 Posted by **Chris Woodhouse** on 5 Aug 2005, 10:41 p.m.,*
in response to message #6 by Namir

Well we all know he wouldn't pay a fair price anyway. I never did respond to him and he placed a bid of only $85. Does he really win auctions biding that low? I think we should all keep an eye on all the HP stuff we are familiar with and if by some fluke he is the high bider we should out bid him. Even if you win doing that it will still be a good deal because he never seems to bid very much.

Chris W

Re: More cobuba on ebay

*Message #8 Posted by **Namir** on 6 Aug 2005, 3:21 a.m.,*
in response to message #7 by Chris Woodhouse

Agree. Cobuba has the habbit of contacting the seller to try to arrange an early end-of-auction. So when you outbid him, it encourages the seller to keep the auction going. Another point is: just about every eBay member has a limited budget to spend, so even by making cobuba spend more money to buy stuff, his moeny-making experience will be limited and less rewarding.

Re: More cobuba on ebay

*Message #9 Posted by **Ronald** on 6 Aug 2005, 10:38 a.m.,*
in response to message #8 by Namir

Interestingly enough when you look into his sales history on Ebay in 2 pages of feedback only one HP11 was sodl for his well knownm high price, I bet this guy can make quit a pile of all unsold HP stuff.

Ronald

Enough already about Coubby - nothing new

*Message #10 Posted by **John L. Shelton** on 7 Aug 2005, 2:18 p.m.,*
in response to message #5 by I, Claudius

While it's mildy amusing to watch this, nothing new is happening, and he's not doing anything wrong. Buy low, sell high, is what we'd all like to do. He just seems to be more successful and less respectful to the aura of HP.

If he, or another, is committing outright fraud, please do point it out. But I don't think we've heard that.

Suggesting inflated shipping prices, though probably in jest, is tantamount to recommending fraud. As honest people, we don't do that. eBay's policy, though un-enforced, is that shipping prices are "reasonable" and should be known in advance. One supposes that offering "$1000 shipping for gold-plated delivery" might be marginally acceptable, but surprise shipping costs beyond the actual cost-of-postage are certainly not reasonable.

A real service here would be hearing about

- Good sellers who deliver better than promised

- Fraudulent sellers, who fail to deliver as promised
- eBay sellers with particular knowledge or access to parts that might be useful to this community.

Re: Enough already about Coubby - nothing new

*Message #11 Posted by **blurdybloop** on 7 Aug 2005, 3:33 p.m.,*
in response to message #10 by John L. Shelton

What about the fact that he is accused of switching his exhorbitantly priced Buy It Now items 12 hours before closing to el cheapo "HP USB Optical Scroll Mouse Brand New" (with ridiculous shipping cost) in order to avoid paying eBay insertion fees?

That is cheating eBay. That may be eBay's problem, and eBay seems to consider him to be too small a fry to worry about. We needn't mourn about eBay's lost revenue.

Nonetheless, the community needs to be aware that he does this, and especially new members. He is not someone that you want to deal with.

"Buy cheap and sell dear" is not the issue. Being a cheat is the issue.

Re: Enough already about Coubby - nothing new

*Message #12 Posted by **Howard Owen** on 7 Aug 2005, 4:22 p.m.,*
in response to message #11 by blurdybloop

I couldn't believe that was really happening until I watched one of his auctions turn into a pumpkin (er.. mouse) at midnight.

I agree that his character should be known. Someone who resorts to fraud in one case is likely not to be trusted in another.

However I do think obsessing over his actions is over the top. Making fun of him is more amusing. 8)

Re: Enough already about Coubby - nothing new

*Message #13 Posted by **blurdybloop** on 8 Aug 2005, 1:52 a.m.,*
in response to message #12 by Howard Owen

I don't think that anyone is obsessing over his actions; and most people are making fun of them. Nevertheless, it's a good warning for newbies that there are periodic reminders out there.

The sad part of all of this is that if he didn't play that little switcheroo to avoid eBay insertion fees (or openly express his contempt for his market), he would have a much different reputation. We all can think of a dealer that we grumble about every time we pay their prices...but every so often we go to that dealer because it has what we want when we need it.

But, because he's the way he is, he's cut himself off from much of his market. Ultimately, that will be his punishment. He will go to a lot of work to accomplish each individual ripoff, yet in the end will sell much less than he would have if he had been less of a jerk.

Re: Enough already about Coubby - nothing new

*Message #14 Posted by **I, Claudius** on 8 Aug 2005, 8:11 a.m.,*
in response to message #13 by blurdybloop

Your post may be the best short assessment of Coburlin written here, I completely agree. As long as Coburlin and his ilk are active, they do need to be highlighted occasionally. This is a service to those that may be unaware that fraudsters are out there, ready to prey on them.

How does he make any money?

*Message #15 Posted by **Mike** on 7 Aug 2005, 5:09 p.m.,*
in response to message #1 by Chris Woodhouse

I'm just curious how he makes any money. He lists thousands of items for every one he sells. It costs him a few bucks for every listing. Insertion fees for $200-$500 is $3.60. If he lists 1000 items, he's nearly $4000 in the hole before he starts.

Even if he sells at these ridiculous prices, it's not enough to make up for the $4000 in listing fees. He must be doing a lot of outside ebay sells from these auctions to make that worthwhile.

Re: How does he make any money?

*Message #16 Posted by **Namir** on 7 Aug 2005, 6:29 p.m.,*
in response to message #15 by Mike

Mike,

He switches the auction in the last 12 hours into another completely different item that is priced very low. eBay knows that and they say it's fine because the rules allow him to do that!

I should have figured that out...

*Message #17 Posted by **Mike** on 7 Aug 2005, 8:12 p.m.,*
in response to message #16 by Namir

Interesting...

Probably explains why it is "Immediate Payment". That way he either sells it or gets a free listing. I'm surprised that ebay doesn't close that loophole. That is, in fact, precisely why they have an "insertion fee". It is to make sure they get a fee for overpriced auctions, for using their services.

Re: How does he make any money?

*Message #18 Posted by **Howard Owen** on 8 Aug 2005, 3:21 a.m.,*
in response to message #16 by Namir

No doubt I am taking another couple of whacks at a dead horse that has been thoroughly flogged here, but that "eBay says it's alright" caught my eye. Are you sure about that? Because if that's so, then it isn't fraud. (eBay is the entity that would be defrauded if it were..)

And if it isn't fraud, then coburlin is just annoying as hell, but not someone who should be painted with a scarlet letter here.

Re: How does he make any money?

*Message #19 Posted by **blurdybloop** on 8 Aug 2005, 12:06 p.m.,*
in response to message #18 by Howard Owen

Whether or not eBay sees it as fraud is beside the point. None of us need shed a tear about eBay

losing revenue.

Similarly, too many people have focused on the excessively low prices that he paid, and the exhorbitantly high prices that he asks. There is a legitimate place in the market for bottom-feeders.

The point is that he is dishonest. It's a petty sort of dishonesty that shows that it's not about profit; it's about ripping off. It poisons the well for everybody.

It doesn't really benefit him, either. He has an inventory that isn't moving. It isn't as if HP calculators are an investment; today's collector prices reflect substantial depreciation from the original market price.

9114B battery replacement: equivalents?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 3 Aug 2005, 4:00 p.m.*

Hi, all;

I am trying to organize my equipment after leaving them almost 8 months without being touched because of many reasons (only a few daily-use calculators). Now I see that the 9114B battery pack is barely able to move the disk drive´s head when it is turnned on.

In all of this ´resting´ time, I left the battery pack in charge for at least once a month for keeping the battery with the nominal charge. Now I left the battery pack in charge for more than 12 hours so it can make the drive´s head move, but the three power indicator LED´s simply go off if it tries to read any disk (DIR command), and I get [TRANSMIT ERROR] in the HP41 display. If I remove the disk and try [DIR] again, I get another message about the medium (no medium or medium error, I don't recall).

Maybe I'm wrong, but I understand that the TRANSMIT ERROR message in the HP41 display may be caused by a reset in the driver (and consequent communication loss) if the battery voltage goes low enough so the 9114B is reset when the main driver motor is turned on. Also, the medium error message instead of transmitt error when no disk is inserted on it corroborates my reasoning. Is there any other way to see this? I'd sadly accept a final word of R.I.P., but I'd like to be sure it is definitely bad. Also, should I try another power supply instead of the original batery pack? In this case, what are the recommended procedures to deal with the internal sealed battery? I thought about removing the sealed battery from the battery pack and charge it outside, but I would like to hear from you about the current values and monitoring.

Any guidance? Suggestions?

Thank you all.

Best rewgards.

Luiz (Brazil)

Re: 9114B battery replacement: equivalents?

*Message #2 Posted by **Ronald** on 3 Aug 2005, 4:23 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Louis,

Had about the same with my 9114A. I opened the batterypack, there is a simple lead battery inside. You can simply replace it. The original pack is the Panasonic LCR-226P (6V, 2.4Ah).

For testing if this is the cause take a stabilisid PSU capable of delivering 3 Ampere (peak currents when staring up) and test. Alternatievly take 4 normal batteries of 1.5 volt and connect these.

By the way, did you do a pwrup command first before accesing the drive, in my case this was mandatory to get it working after being switched off.

Br.

Ronald

Re: 9114B battery replacement: equivalents?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 4 Aug 2005, 2:26 a.m.,*
in response to message #2 by Ronald

Hi, Ronald;

thank you for your suggestions. I thought about going straight buying a new battery and replace the one in the battery pack. I`ll follow your suggestion, thank you.

About the PWRUP command: this 9114B I have with me (thanks, DM) worked perfectly fine about seven months ago. I don`t recall needing to use PWRUP to activate it. Anyway, I tested both PWRDN and PWRUP to see its reaction, but it remains the same 'no read disk' state.

I`ll go for the external package for a testing tomorrow and post results. In the meantime I`ll also try to externally check/charge the LCR-226P. Have you done this before? I know it is a sealed, high-current battery and I`ll take the necessary pecautions, and I`ll try to keep a 1/10 to 1/8 nominal current for charging. Should I use other figures?

Thanks again.

Luiz (Brazil)

Re: 9114B battery replacement: equivalents?

*Message #4 Posted by **Ronald** on 4 Aug 2005, 12:01 p.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi,

I charged it with 0.3 amp (10% - 15% of capacity) and keep a watch in the time. Normaly 130 - 140% should be sufficient. In this case 2.2 A/h capacity * 130% = 2.9 Ah needed. 2.9/0.3 --> 9 - 10 hours needed for a new accu.

In the case of the old accu I would feel it every now and then but on the other hand 0,3A * 6 volts is only 1.8 watt, so temperature should stay more or less acceptable. Please note that it is a sealed Lead accu and unlike the ones in a automobile not vented, so keeping the temperature down is important. Funny by the way you only had to a pwrup once, I need to do it every time (maybe a difference between the a and b model ?).

Ronald

Re: 9114B battery replacement: equivalents?

*Message #5 Posted by **Howard Owen** on 3 Aug 2005, 8:32 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

The first 9114B I got came with a AC/DC converter with 6V/2A output. This fed into the battery case, which was suspiciously light. Opening it up, I saw that the converters DC leads were wired to a fairly large capacitor (10000 uF, 10V) in parallel with the inputs to the disk drive. This obviously serves as a voltage regulator. If you open a standard battery pack, you'll see fair amount of electronics inside that must amount to the same

thing. (Regulated DC 6V/2A) The battery in the standard pack actually says 6V/2.5A, but the lash up with the AC/DC converter works fine for me.

Here's a picture:

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 4 Aug 2005, 2:36 a.m.,*
in response to message #5 by Howard Owen

Hi, all;

thanks for your valuable suggestions. I`ll go ahead trying an external power supply (as I mentioned in a recent post here) and see if the rechargeable pack is in trouble. I`ll also try to charge the LCR-226P externally. Any additional suggestions of yours? Anyone else?

Thanks for the enlightening picture, Howard. Just let me understand: your unit comes with an external, regulated power supply and a battery pack case with a single 1000µF/10Vcc capacitor inside? I mean, your 9114B with these components can only work when plugged in the AC outlet? Did I take it correctly? If so, that's interesting!

I remember reading about this possibility that was proposed by someone here about one year ago and I was not aware it was actually done somehow.

Best regards and thanks again.

Luiz (Brazil)

Re: 9114B battery replacement: equivalents?

*Message #9 Posted by **Howard Owen** on 4 Aug 2005, 3:16 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Yes, that's right. The external supply is an AC/DC transformer with a sticker that reads "Personal

Software." (I seem to recall that they were an HP dealer back in the day. If that's so, then I suspect this modification may have been made back in the 1980s.) The transformer is labeled "6V/2000mA". Since it works fine, I haven't measured to see if that's what it's putting out.

This is actually my only working power system for the 9114 drives, though I have four (!) drives that work otherwise. (These have been picked up in combination with various other bits of hardware.) I have one dead battery pack which I want to refurbish with a new battery. But the other two drives need a hack like this one in order to work independently. The tricky bit there will be the connector on the drive side of the pack.

in response to message #8 by Vieira, Luiz C. (Brazil)

Good evening Luiz,

I have encountered the same issue than you with the 9114B battery pack.

If I remember well, Tony Duell uses his 9114B directly with his bench PSP.

I found the following threads might be interesting to you :

Using the 9114B without the bulky, old, ugly polluting lead battery

Retiring 9114B battery pack once for all

Hope they help you as much as they helped me.

Solutions were provided by Tony Duell and Dale Richmond.

Warm regards from France!

Etienne

Re: 9114B battery replacement: equivalents?

*Message #12 Posted by **Tony Duell** on 4 Aug 2005, 6:41 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

You can run a 9114 (either version) off an external 6V power supply. I often run mine off my bench power supply, I also made up a PSU (just transformer + rectifier + smoothing capacitor) for an HPCC member. The supply should be around 6V, capable of supplying at least 2A, and doesn't need to be regulated.

You connect it to the 2 pin mini-jones plug inside the battery compartment at the back of the drive. I forget the polarity, but if you open up the drive unit and look at the wiring on the back of the plug, then red is +ve and black -ve as usual.

For testing you can also connect the same sort of PSU to the wiring inside the drive (this is easier if you don't have the mini-Jones socket). Connect the -ve side to the drive mechanism metalwork, and the +ve side to one of the wires on the back of the on/off switch. If you use one of the wires, you bypass the switch, the unit is powered up all the time. If you use the other one, then you have to turn the 9114's switch on

The battery pack opens easily (2 Torx screws on top). Inside is a charger PCB and a lead acid battery block. If you can't get the right replacement for the battery, you can use 3 2.5Ah Cyclon cells in series, connected to the wires that go to the original battery. These fit perfectly into the housing.

Schematics for these drives (including the charger PCB) are, as usual, on the HPCC CD-ROM

If everything goes as expected...(was: 9114B battery replacement: equivalents?)

Unfortunately...(was: 9114B battery replacement: equivalents?)

*Message #14 Posted by **Vieira, Luiz C (Brazil)** on 5 Aug 2005, 4:26 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

Hi, all;

The person who assured me he had a sealed 2800mAh battery had, in fact, a 1300mAh. I took it anyway and asked for another, 2500mAh or more. As I`m waiting for a new one, I decided to test the 1300mAh and I assembled it in place of the original 2400mAh battery. The fact is that the 9114B is actually working fine. I simply plugged the newly bought battery, connected the pack in the standard charger and inserted the battery pack in the 9114B battery compartment. The three LED's that indicate the battery charge did not even blink when the unit was turned on, all three LED`s on as well. With the HP41 connected to the 9114B (HPIL), one disk in place, I XEQ`ted DIR and the contents list was shown perfectly fine. As the battery is new, I accepted the mid-charge (two LED`s on, upper LED off) monitoring. Also, as the battery is about half the `ampacity` (sorry, no better word for that... anyway, what is the word for ampère capacity?), I must expect more charging cycles and a continuous check for temeperature while charging (higher charge current than the one specified as nominal). Well, at least I`ll keep it for necessary operation while some 2500mAh battery comes to take place.

Hope this is all for now. I`ll take a picture of the battery pack with the new 1300mAh battery inside of it later.

Best regards and thank you all, again.

Luiz (Brazil)

Re: 9114B battery replacement: equivalents?

*Message #15 Posted by **Vassilis Prevelakis** on 5 Aug 2005, 10:12 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

For topics that are certain to have been covered in the past (e.g. HP41 card reader repairs, floppies for the 9114, batteries, etc.) it is best to quickly search the archives. I find the best way to do this is to use the google search facility.

Go to www.google.com and type the following string

site:http://www.hpmuseum.org 9114 battery

and google will return only the results from the web site in the site: directive. This is fast and convenient.

Try it.

**vp

The 1300mAh battery replacement photo

*Message #16 Posted by **Vieira, Luiz C. (Brazil)** on 6 Aug 2005, 8:07 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, all;

as promissed:

http://www.logeng.com.br/images/batt_1300mah_s.jpg Click to enlarge

I added a small piece of transparent plastic to help isolating the battery contacts from the PCB surface. This piece o'plastic was cut from a regular calculator blister (I have found many usefull applications to those blisters...).

Data printed in the battery case is in Portuguese, but the main facts are:

fluctuation: 6.8 to 6.9 V
charging: 7.2 to 7.35 V
Starting current: .52A (max)
additional data refers to necessary care (no short circuiting, do not dispose with regualr trahs, return to the supplier instead of throwing away, etc.).

As I mentioned before, I`ll use this pack when it`s necessary till I find the correct replacement. I am aware of the fact that under regular use, it will demand at lest twice the number of charging cycles when compared to the origianl (1300mAh against 2400mAh).

Beest regards.

Luiz (Brazil)

latest hp33 display

*Message #1 Posted by **david bowers** on 3 Aug 2005, 7:18 a.m.*

hi thanks for the replies, i shall get my friend in frisco to order me a 33 from walmart for 49 bucks, she wont know if its the latest screen or not, i will get it out of curiousity, and charge it to my company, so does walmart stock the latest as i write or is there old stock around with the smaller pixals i often dream of driving around australia and the states looking at all the pawn shops getting old hps, i did get a 48 in boulder once for 40 usd and a 15c in oz for 30 bucks a funny thing ,when i first arrived in denver i would stop old people and ask for the nearest pawn shop not realising that my accent sounded like PORN shop, hence not many people helped me. i was in the office in taiwan the other day, couldnt see the lake 500 yards away, went to run out and get the survey gear thinking it was rain arriving and then i realised it was air pollution moving in. cheers david

Re: latest hp33 display

*Message #2 Posted by **Eamonn** on 3 Aug 2005, 10:48 a.m.,*
in response to message #1 by david bowers

David,

I had a look at the HP-33S recently at a Frys in San Jose. They had the models with both the larger and smaller decimal point.

I noticed that the models with the smaller decimal point were packaged with two manuals - one in French and one in English. The models with the larger decimal point were only packaged with the English manual.

I'm not sure that this is the case for all HP-33S's out there, but you may increase your chances of getting a model with the larger decimal point by ask your friend to make sure that there is only one manual, in English, in the blister pack.

Hope this helps,

Eamonn.

*Message #3 Posted by **John Limpert** on 3 Aug 2005, 6:47 p.m.,*
in response to message #2 by Eamonn

I have two HP-33S calculators, one with the old display and one with the new display. They both came with a single English manual. Besides the display, the only noticeable difference is the serial number. On the old model, the serial number is stamped into the plastic. On the new model, the serial number is printed on an adhesive label.

Re: latest hp33 display

*Message #4 Posted by **I, Claudius** on 5 Aug 2005, 4:04 a.m.,*
in response to message #3 by John Limpert

Out of curiousity, what are the serial numbers of your old vs. new 33s?

Re: latest hp33 display

*Message #5 Posted by **John Limpert** on 5 Aug 2005, 4:33 a.m.,*
in response to message #4 by I, Claudius

The old one is "CNA41204367". The new one is "CNA43508279".

Re: latest hp33 display

*Message #6 Posted by **Paul Brogger** on 3 Aug 2005, 7:36 p.m.,*
in response to message #1 by david bowers

I've got one of each. The newer display is really not much better than the old. They tried to make the decimal point and comma larger, but not at the expense of shoving aside the digit pixels on either side.

It's as if they tried to make do without major alterations to the "mask" (or whatever) used to manufacture the LCD. As a result, the d.p., when viewed in isolation, is indeed larger. But when squeezed between two digits (especially, between two 2's, as in "2.2") it disappears as readily as it did before -- maybe even more so.

I wouldn't waste a drop of sweat over it: either way it's THE major problem with the model. (Even more so, IMHO, than the weird keyboard, if you can believe that!)

Other than the decimal point, the HP-33s is a fun unit to use, and it's reassuring to have an almost-shirt-pocket portable RPN programmable available once more.

repairing card reader motor on HP-65?

*Message #1 Posted by **Mark Crispin** on 2 Aug 2005, 7:26 p.m.*

I have an HP-65 whose card reader motor squealed when I first got it (but otherwise worked). As time wore on, the motor got more intermittant in its performance, and now seems to have died.

Is the motor repairable? Or can it be readily replaced? If so, how?

Repairing card reader motor on HP-65? (just a possible cause)

*Message #2 Posted by **Vieira, Luiz C. (Brasil)** on 2 Aug 2005, 7:29 p.m.,*
in response to message #1 by Mark Crispin

Hello, Mark;

I'm not aware of how the motor is connected to the main voltage supply in the HP65, I guess it is through a transistor (PWM?). In this case, have you considered the possibility of having a good motor and a bad solid-state switch?

I'm sure others will come with more info, so it's worth waiting for other posts.

Best regards.

Luiz (Brazil)

Edited: 2 Aug 2005, 7:30 p.m.

Re: Repairing card reader motor on HP-65? (just a possible cause)

*Message #3 Posted by **marais** on 3 Aug 2005, 4:09 a.m.,*
in response to message #2 by Vieira, Luiz C. (Brasil)

I recomment to unsolder the motor and drive it directly with a 1.5V power supply. There's a capacitor parallel to the motor, the dot indicates plus. The motor alone should pull about 7-9mA. I would carry out this test before looking any further.

Andreas

Re: Repairing card reader motor on HP-65? (just a possible cause)

*Message #4 Posted by **Tony Duell** on 3 Aug 2005, 3:46 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brasil)

The motor control circuit is built into the sense amplifier chip (Only HP would try and put a low-level read amplifier and a DC motor controller on the same chip, only HP could get it to work :-)). It's possible that it's failed. The sense amplifier chip is the one on the card reader PCB, of course.

As others have suggested, disconnect the motor from that PCB (on most 65s the wires are soldered in place) and run it from a 1.5V -- 3V PSU. If it doesn't run, take the motor out (2 tiny screws alongside the worm gear) and try it again. If it runs properly now, look for mechanical problems.

If the bare motor doesn't work, try putting 1 drop of watch oil (not WD40!!!) on the bearings. That may get it going again.

I have never tried to open up one of these motors, but it might be possible.

Re: Repairing card reader motor on HP-65? (just a possible cause)

*Message #5 Posted by **Mark Crispin** on 7 Aug 2005, 1:23 p.m.,*
in response to message #4 by Tony Duell

OK, I unsoldered the motor and determined that it does run. I removed the motor, gave it power, and determined that it runs but squeals. I gave it a tiny drop of Break-Free CLP as suggested, and that solved the squealing.

I reinstalled the motor, and while still disconnected gave it power. It can pull a card through. I suspect that some lubrication in the card reader's roller would make it run a bit smoother but I decided not to do anything about that, for fear of possibly making it worse.

I reconnected the motor. I'm back to where I was before; there is no obvious attempt to pull the card through. I tried measuring voltage across the motor leads and didn't see anything, which would certainly explain why the motor wasn't running.

So, what now?

Re: Repairing card reader motor on HP-65? (just a possible cause)

*Message #6 Posted by **Mark Crispin** on 7 Aug 2005, 8:06 p.m.,*
in response to message #5 by Mark Crispin

Update:

Just now, when I poked a card in it, it grabbed the card and then stopped.

I tried a couple of additional times, including inserting the card just shy of where it could be grabbed, and I saw the start then stop behavior. I already know the motor turns with externally applied power (see previous messages), and even pulls a card through. So it's not excessive friction

So, this suggests that a sensor and/or switch is intermittant.

What now?

HP-65 card reader behavior has changed!

*Message #7 Posted by **Mark Crispin** on 8 Aug 2005, 1:33 a.m.,*
in response to message #6 by Mark Crispin

The behavior has changed yet again.

Now, if I insert a card very slowly until it reaches the sensor, it starts running the motor (it didn't do this before) but as I move the card forward it stops. It hasn't reached the roller yet (there's at least another millimeter or two before that) when it stops.

This definitely suggests some kind of sensor or switch problem. Any suggestions on how to proceed?

Re: HP-65 card reader behavior has changed!

*Message #8 Posted by **Tony Duell** on 8 Aug 2005, 11:02 a.m.,*
in response to message #7 by Mark Crispin

If you look at my HP65 notes (in the articles forum on this site), or better still get the HPCC schematics disk, you'll see there are 3 switches in the card reader assembly. Physically there's a leaf contact on the chassis that touches pads on the keyboard PCB when the card lifts it (via little plastic balls). The 3 contacts detect a card has been inserted (and start the motor), detect when the card has got to the head (to start reading/writing), and detect if the corner has been cliped.

My next move would be to use an ohmmeter to check these switches (chassis/keyboard screwed into the top case, but the logic board unplugged) as you put a card in by hand. Most likely there's a problem with them. Remove the keyboard assembly and clean the contacts. I normally wipe them with propan-2-ol first, and if that doesn't get them going, I gently clean them with an eraser (!).

it's working again!

*Message #9 Posted by **Mark Crispin** on 8 Aug 2005, 7:56 p.m.,*
in response to message #8 by Tony Duell

It's changed again.

After three weeks of non-functioning, it's working again, pulling the cards through without hesitation or problem.

I guess that this means that some debris got into those switches, and it's now cleared.

Thank you to everybody. You're a great bunch of people (but you knew that already).

Re: repairing card reader motor on HP-65?

*Message #10 Posted by **David Smith** on 3 Aug 2005, 4:15 p.m.,*
in response to message #1 by Mark Crispin

Squealing motors can be caused by two things. One is the tip of the worm gear rubbing on a steel ball in the reader housing (not all readers seem to have the steel ball). The other is the motor ball bearings (usually at the motor shaft end). The cure in each case for me has been a drop of Break-Free CLP gun lubricant. I apply it with a small disposable paint brush. It takes about an hour for the lube to work it's magic. Don't over do things. Lube on the motor shaft/work gear friction fit coupling can cause it to lose grip... but this happens to almost all readers over time. Now I always remove the worm gear, clean the shaft with alcohol, and reglue it with a very small amount of IC-2000 Tire Cement (a black rubbery super glue).

Re: repairing card reader motor on HP-65?

*Message #11 Posted by **Mark Crispin** on 4 Aug 2005, 2:49 p.m.,*
in response to message #10 by David Smith

I don't know if this is relevant or not.

As the squealing card reader failed, it increasingly failed to feed the card, including the card being stuck entirely in the calculator. Repeated power cycles were needed to move the card enough that it could be pulled out.

Now, the motor makes no obvious attempt to run at all.

Being a good gun nut, I have Break-Free CLP on hand. But I'm a bit reluctant to "go in" without explicit instructions on exactly what to do.

We can take this to email. I'm mrc at washington.edu. Or, if someone is local to the Seattle area, I'm willing to spring for a few beers in return for helping me get this working again.

Re: repairing card reader motor on HP-65?

*Message #12 Posted by **Bernhard** on 5 Aug 2005, 4:02 p.m.,*
in response to message #11 by Mark Crispin

Hi Marc,

a brief glance over your posts does not tell whether the card drive wheel was properly replaced (or did I miss something ?). If you still have a decomposing "gummy wheel" that wasn't replaced or a wrong replacement (diameter too large, material too stiff) then it is easy to get the symptoms you describe (or even ruin the motor). Did you open the calculator and inspect it (no further disassembly needed). Another tip: never, never use any oil or grease while the motor (or any other component to get lube) is in the calc. After some really big mistakes and lots of trouble I do now only apply oil / grease to HP card mechanisms when the parts are out and far away from the rest and the general idea is to apply it very very sparingly. The card reader ain't no gun, it's more than a wristwatch clockwork, and easily turned into a hopeless case. Before you even try to disassemble the card reader itself, read the card reader repair instructions available on this site.

best regards, Bernhard

Re: repairing card reader motor on HP-65?

*Message #13 Posted by **Mark Crispin** on 6 Aug 2005, 11:17 p.m.,*
in response to message #12 by Bernhard

Yes, the wheel was replaced before I got it.

Re: repairing card reader motor on HP-65?

*Message #14 Posted by **David Smith** on 8 Aug 2005, 11:43 a.m.,*
in response to message #13 by Mark Crispin

I would suspect that the coupling between the motor shaft and worm gear has either decomposed or come loose. If it is just loose, you can fix it with a drop of glue. I use IC2000 tire cement, a rubberized superglue used to secure RC car tires. If it is completely decomposed, you can replace it with a piece of the spray tube from a can of (egad) WD-40.

Re: repairing card reader motor on HP-65?

*Message #15 Posted by **David Smith** on 8 Aug 2005, 11:48 a.m.,*
in response to message #13 by Mark Crispin

I forgot to mention that to tell if the shaft coupling is at fault, remove the motor/worm gear (two

screws) and give the gear a gentle pull. If it comes off the motor shaft, you have found your problem.

Re: repairing card reader motor on HP-65?

*Message #16 Posted by **Mark Crispin** on 8 Aug 2005, 12:07 p.m.,*
in response to message #15 by David Smith

That doesn't seem to be the problem; see other messages in the thread.

I'll take a look at the switches.

All 11 SSMC's in One PDF File

*Message #1 Posted by **Bill (Smithville, NJ)** on 2 Aug 2005, 7:47 a.m.*

I finally had enough time last week to create a PDF file which has the complete message threads for all 11 Short and Sweet Math Challenges (SSMC). Thanks to Valentin for the Challenges, to all the members for their discussions, and to Dave for hosting the file.

The link is:

Link to ssmc110.pdf

There's a simple bookmark added to the start of each SSMC. Although the last SSMC was No. 10, there is actuall 11 total since No. 6 was used twice. I list them as No, 6 and No. 6A in the Booknmarks and kept the numbering the same for the remainder.

The only editing I did of the actual messages was to remove all the links. Otherwise, the messages appear with all the associated mis-spellings, etc, as originally written.

For those of you who have only recently discovered the fun of Valentin's challenges, this will give you the opportunity to try out some of the earlier ones.

Enjoy.

Bill

Thanks for the manual, it will be very useful for a lot of people.
How about publishing it as a .rtf file on here so others can contribute new sections?

in response to message #3 by Gordon Dyer

Nice idea! :) I work with OpenOffice(.sxw) but this is not the problem. But what kind of license should we use? GNU? And where could we store the file?

Re: Alternative HP-42S Manual (Another version)

*Message #5 Posted by **Gordon Dyer** on 9 Aug 2005, 3:25 p.m.,*
in response to message #4 by José Lauro Strapasson

Sorry for the long delay in replying.
I am sure Dave Hicks would host the file on here if you ask him. Or use email to only those who are interested and see what happens. I would like to contribute, but time pressures may make it slow. Any contributions by others can only help and you can remain as chief editor to make sure it all fits together.
.rtf or .html formats would be more universal than any other.

Hi;

forgive me if I`m asking silly questions, I just want to help if I can.

Do you have the Acrobat Reader already installed in your computer? If not, you cannot actually read a .pdf (pdf stands for Portable Document File);

have you tried to download the file prior to read it? In some cases, the www viewer (an additional plug in) may not be present, and the document shows blank;

when you wrote "*bringing up the 42s manual's *.pdf file*", which file are you actually reffering to?

Please, I`m not the author, I just want to help. So far I have not read about others trying to open without success, I myself could download and actually open the document. Would you, if applicable, briefly describe what did you do in order to view the file?

Thanks and forgive me if answers are obvious or if questions do not actually reffer to your needs.

Luiz (Brazil)

HP 2225A Thinkjet Printer not printing

*Message #1 Posted by **Ronald** on 1 Aug 2005, 4:06 p.m.*

Hello,

I have a non-printing HP 2225A Thinkjet Printer I am trying to fix, but sofar not succeeded. Seems to be working but puts nu ink on the paper. 1) The printhead is moving normally, also at start-up when you can have him print one page with all kind of test text. 2) I measured the print head resistors. I am not sure abou which contacts but between certain point I measure 120 ohhms. I checked this also at the connector at the main circuit board. There I head the same resistance. When removing the printhead then measured at the connector the resistance goes to infinity, so it seems to be oké. 3) The red powerlight always burns. I checked the battery under load in the printer, stays around 8 volts which seems reasonable given the fact that the accu is 6 cells.

For that I think it is something in the powersupply part in the printer.

Unfortunately I do not have the scematics of the printer.

Any suggestions where and how to proceed ?

Thank you.

Ronald

*Message #2 Posted by **Howard Owen** on 1 Aug 2005, 4:34 p.m.,*
in response to message #1 by Ronald

You didn;t mention if the print head was old or not. The print head and ink cartrdge are the same piece on the Thinkjets, of course. New cartridges are still available for those machines. The current HP part number is 51604A. I found some at a local Office Mart. They weren't on the shelf, but they showed up in inventory on the computer. It took me an hour to get the clerk to bump my complaint up to a manager. He said "no" right away too, but I pressed him on why he had them on the system. Eventually, he brought them out from a back room with an apology.

Re: HP 2225A Thinkjet Printer not printing

*Message #3 Posted by **Ronald** on 1 Aug 2005, 5:06 p.m.,*
in response to message #2 by Howard Owen

Hi Howard,

Yes, it is an old printhead. It was in the printer when I bought it last year. The ink itself is however still fluid and looks almost full. I remember from the past that when it get's empty the rubber bag get's a "dimple"if I express myself in English.

So far I was not able to locate a spare in the Netherlands. I will give the customer service at HP a call

tomorrow to see if they are able to get me a new one.

Ronald

*Message #5 Posted by **Ronald** on 2 Aug 2005, 2:46 a.m.,*
in response to message #4 by Wilson (Bill) Holes

Hi Wilson,

Thank you for Carrot ink. I just gave it a check. Due to the fact that I am not a US resident payment is very difficult (money order required, no foreign credit cards) and shipping to Europe is 33 dollars. This is unfortunately then a very expensive printhead (the cartridge itself is 13$). I will continue to search to find some Europe located suppliers.

Ronald

Re: HP 2225A Thinkjet Printer not printing

*Message #6 Posted by **Ulrich heller** on 6 Aug 2005, 12:00 p.m.,*
in response to message #5 by Ronald

Hi Gents! i´m following your conversation with great interest. I also bought an 2225B (HP-IL) Printer for my 41-collection at ebay from the U.S.. It isn´t working either. Yet i bought a new cartridge in Germany with expiry date May 2007! The adress is :

WENCOM GbR Danziger Platz 19 D 71332 Waiblingen GERMANY

www.wencom.de

It was 13.57 Euro´s + 4.10 p&p

The Thinkjet also looks pretty working mechanically but wasn´t printing a dot. Since this morning it refused mfrom power-up also. despite the battery looks fine. That´s why i´m also interested in schematics and any repair hints. BTW there is a printer repair page on the web. Just google "Thinkjet" and "repair". It gives some hints, but nothing that was not mentioned yet. Regards Uli

Re: HP 2225A Thinkjet Printer not printing

*Message #7 Posted by **Tony Duell** on 8 Aug 2005, 10:57 a.m.,*
in response to message #6 by Ulrich heller

Most of the time when a Thinkjet doesn't print, but the carriage and paper move correctly, it's the flexiprint cable, as discussed here over the last few days....

I have the service manual (with schematics). As ever I am happy to look things up for people who are repairing HP calculators/peripherals. But as mentioned in another thread I have no scanner, so I can't e-mail bits of the manual.

Re: HP 2225A Thinkjet Printer not printing

*Message #8 Posted by **Vassilis Prevelakis** on 2 Aug 2005, 1:45 p.m.,*
in response to message #1 by Ronald

have you tried to see if ink can come out of the printhead?

the manual suggests using a paperclip to push the bladder until a drop of ink appears on the printhead.

Wipe the printhead with a soft cloth and try the test again.

I may also be that the connections to the printhead are coated with leaked ink (unfortunately the 2225A and cartridge were designed to be in continous use and leak when left idle).

BE VERY CAREFULL WHEN CLEANING THE BASE OF THE CARTRIDGE (the black plastic holder that is visible when the print cartridge is removed). you can easily damage the contacts and then the entire assembly will have to be replaced (the contacts are bonded on the flexible PCB that runs to main PCB and I do not believe these can be repaired.

I would suggest removing the base and holding it under running water without any mechanical assistance (Q-tips, etc).

Re: HP 2225A Thinkjet Printer not printing

*Message #9 Posted by **Ronald** on 2 Aug 2005, 2:51 p.m.,*
in response to message #8 by Vassilis Prevelakis

Hi,

I tried pushing into the hole at the back of the printer head. I think I will be with black fingers for the rest of the week unfortunately, so the answer to that is yes. I will gently clean the base unit later tonight. I took a daring approach today and disassembled the complete printer and hooked my scoop to the print head connection on the circuit board. When i started the self test function I saw a lot of pulsing on the scope. For that reason I am continuing on the assumption that the electronics are oké. I also managed to find a Europe based supplier for new print heads so I ordered a new head. It will take about two weeks to arrive at my place. So except for cleaning again the base of the head I think I should wait now for the new print head and keep my fingers crossed it will work. If not back to disassembling again and maybe removing the whole print head to do a more thorough analysis, but to be honest it scares me a bit. I am not 100% convinced at this moment I will be able to get it in one piece again, but that is a worry for 2 weeks from now.

Ronald

Re: HP 2225A Thinkjet Printer not printing

*Message #10 Posted by **Howard Owen** on 2 Aug 2005, 4:12 p.m.,*

in response to message #9 by Ronald

If you aren't doing all this work for the love of it, remember that these printers come up on ebay fairly frequently. Even if you have to pay shipping from the US, the price might be cheap compared to the labor.

Re: HP 2225A Thinkjet Printer not printing

*Message #13 Posted by **Tony Duell** on 3 Aug 2005, 3:55 p.m.,*
in response to message #1 by Ronald

Firstly, I have the Thinkjet _service_ manual with full schematics. If you contact me at the above (unmunged) e-mail address I can look stuff up for you. This manual is not alongside me at the moment, so I am working from memory.

One thing confuses me. You mention that the battery is fully charged, but the Subject line refers to the 2225A which IIRC is the mains-powered HPIB model. There are significant internal differences mostly due to the different PSU (which leads to the motors being different!). What are you working on?

I think you've done the first test. The flexiprint cable to the PCB is the printhead connector. One of the tracks -- I think it's the middle one -- is obviously different to the others, it's the common connection. The others are the drives. With the cable disconnected from the PCB, check for resistance between the common connection and each of the others in turn. If any are open, suspect the printhead or the flexiprint. Be warned that ink leaking from the cartridge often corrodes the flexiprint at the carriage end, and AFAIK the flexiprint can't be repaired. I have dismantled a carriage to replace it, but getting the part is presumably next-to-impossible now.

The printhead drivers are ULN2803-like things (maybe 2003's). They take 12 outputs (IIRC) from the

processor chip (the big one, the other 2 large ICs are the font ROM and RAM, they communicate with the processor by something that's remarkably close to Saturn bus :-)).

In the battery-opperated Thinkjet (2225B and 2225P IIRC) there's a little switching converter to step the battery voltage up to drive the printhead. I think you should be able to measure something in excess of the battery voltage at the common connection to the printhead when the thing is printing. I can see if the manual gives a voltage for this point.

Re: HP 2225A Thinkjet Printer not printing

*Message #14 Posted by **Ronald** on 3 Aug 2005, 4:38 p.m.,*
in response to message #13 by Tony Duell

Hi Tony,

I thought it was the 2225A, but for it has an HP-IL interface it is probably a 2225B. On the printer (and carton box) it only indicates Thinkjet.

I will take it apart this weekend to measure the resistance between the center trace on the flexiprint and the other traces. The connectionpoints for the printhead were literally soaked in Ink which I cleaned more or less with some paper, assuming this was enough. I will revisit this when taken apart given your remark that the ink can be corrosive..

I think the switching converter is oké for the red light on the button circuit board is burning bright red continuously. Also when switching on and keepting two buttons pressed the printhead is swiftley moving formm left to right and the paper is advancing. The only thing lacking is the ink printed on the paper. If you have a few testpoint with the associated voltages I will make a check to that.

I will get back this weekend with the results after having it disaasembled.

Thank you

Ronald

Re: HP 2225A Thinkjet Printer not printing

*Message #15 Posted by **Tony Duell** on 4 Aug 2005, 6:32 a.m.,*
in response to message #14 by Ronald

I will have to check the schematics, but there are at least 2 power supply rails in this printer. A 5V line for the logic, and the stepped-up voltage for the printhead. I can't remember how the motors are powered, possibly straight off the battery.

IIRC (again) the printhead supply is only turned on when it's actually printing, to save the battery. The red LED does not depend on the printhead supply working.

A ruined flexiprint (due to ink corrosion) is a common cause of no printing in these printers. I can tell you how to replace it if you can get the part. It's the same part in all Thinkjets apart from the one built into the Integral PC, that one is longer.

Re: HP 2225A Thinkjet Printer not printing

*Message #16 Posted by **Tony Duell** on 5 Aug 2005, 6:36 a.m.,*
in response to message #15 by Tony Duell

I looked in the service manual last night, and I was basically correct.

The motors run off the unregulated 'Vbatt' line. This is regulated down for the logic. There's a step-up SMPSU for the printhead

That SMPSU provides around 22V to the printhead common line when the machine is printing. It's based round a 555 timer (wired as an astable) driving a power transistor. There's a voltage comparator between a divided-down version of the 22V output and a 1.2-ishV reference voltage. That comparator feeds the reset pin of the 555 to stop the oscillator when the output gets too high.

There's a 2-transsitor circuit to remove power from the 555 unless the machine is actually printing (this is to save the battery, of course).

So what I'd do next is find some way of connecting a voltmeter to the printhead common connection when the machine is running the selftest or similar, and see if that 22V is present.

Re: HP 2225A Thinkjet Printer not printing

*Message #17 Posted by **Ronald** on 5 Aug 2005, 9:40 a.m.,*
in response to message #16 by Tony Duell

Hi Tony,

I look already forward to the weekend to have hours going in again with voltmeters etc.

Ronald

Re: HP 2225A Thinkjet Printer not printing

*Message #18 Posted by **Ronald** on 6 Aug 2005, 11:53 a.m.,*
in response to message #16 by Tony Duell

Hi Tony,

Opened the 2225B again and went down deep until I had the flex connector out. 3 of the contacts were defective, which is really bad. It bad spot was between the flex cable itself and the contact point were the ink head is making contact. The worst of all places. I experimented at a corner to see if the base was heat resistant enough to solder one tiny wire over the gap, but even when coming close to the cable, it already started to melt.

I am afraid this printer therefore one has seen his Waterloo, unless I manage to get a spare flex cable somewhere. This is bad for it complete to the carton box, foam, everything and also still white, no yellowing at all. As a last rescue I will put an add to that matter in this website, but I have no great hopes to getting a spare part.

Thank you for your guidance,

Ronald

Re: HP 2225A Thinkjet Printer not printing

*Message #19 Posted by **Tony Duell** on 7 Aug 2005, 6:32 a.m.,*
in response to message #18 by Ronald

Unfortunately a defective flexiprint cable is a very common cause of no printing on these machines, and the point where it fails is where you're having problems, at the cartridge

contacts.

The good news is that it's the same part on _all_ Thinkjets (well, as I said earlier, apart from the one built into the Integral). If you can find another Thinkjet with other faults, or damaged case, or something, you can swap the part over.

Let me know if you find one, and I'll tell you what to undo. It's not totally obvious, you don't want to release the cable that moves the carriage. Re-threading that is 'fun'...

And for other Thinkjet (and Integral) owners here, please don't leave the cartridge in the printer if you're not using it. Leaking ink is the main cause of flexiprint damage

Re: Is this real?

*Message #20 Posted by **Ronald** on 7 Aug 2005, 5:30 p.m.,*
in response to message #19 by Tony Duell

Hi Tony,

Thank you, keep my finger crossed to another failed Thinkyet. I took of the carriage by loosening the screw and then winding some solder wire in a 8 like figure around the screw, so the transport wires could not get away from the screw.

Ronald

coburlin: solved!

*Message #1 Posted by **Vassilis Prevelakis** on 31 July 2005, 11:05 p.m.*

I have just realized that the eBay advanced search allows you to exclude sellers. By doing this I have managed to get rid of all the bogus auctions by coburlin.

Recommended!

Of course this will not solve the problem of inflated prices resulting from his outrageous asking prices, but then again anything you cannot see cannot hurt you, right? :-)

What did you have in mind? More to the point, who is going to do it?

Re: coburlin: solved!

*Message #4 Posted by **Ron Ross** on 1 Aug 2005, 11:17 a.m.,*
in response to message #1 by Vassilis Prevelakis

Coburlin just uses ebay like all commercial sellers that use ebay. He is not the villian, just an oportunist, and there is nothing wrong with that. While many of us don't like his methods, there is nothing wrong morally or legally with his methods and I won't bash him for that. (I am not happy with him, but he may have single handedly doubled the value of my own collection, so maybe I should be happy with him???).

Regardless, ebay started out with a garage sale mentality and now is a regular flea market for professionals that still allows the little guy to sell at a retail price. No seller is going to complain. And that is who pays ebay. The ONLY recourse (and the ONLY recourse) is for buyers to boycott ebay. And one little area of electronics

wont be missed (ie calculator sales). Therefore ebay has evolved away from the great bargain bin it once was. And that is the result of information exchange. It allows a seller to make his item available to the maximum audience of potential buyers. Therefore, I conclude that we can whine all we want, but that wont affect the price of tea from China (or our calcualtor market).

I guess I will end my moot rant here.

Re: coburlin: solved!

Quite so. And yet there are those among us that *just don't get it*, prefering instead the paranoid world of conspiratorial evil-doers, plotting to undermine the value and dignity of our quirky little calculator collections. Throw in PayPal and you've got a plot to take over the world.

You have been warned!

What rubbish and more importantly: Who cares?

Have you ever heard the joke about the amish man who was losing sleep at night worrying about the fun others were having? This is the same thing.

Re: coburlin: solved!

*Message #6 Posted by **Howard Owen** on 1 Aug 2005, 1:44 p.m.,*
in response to message #4 by Ron Ross

Bingo!

People who retail for a living tend to be hard-nosed about the old adage "buy low and sell high." they have to be, since that's what puts bread on the table. I dont know if cobaby is among the ranks of those who depend on selling retail to make a living, but he acts like he is.

I have a different approach to selling on eBay. Since I'm principally an enthusiast, my sales are mostly to help me to continue to build my collection. I tend to try to give value, not only because it feels right, but because I won't last long in the collecting community if I piss off my customers. So coburlin's tactics are repugnant to me, and I would never consider buying from him.

However, his presence on eBay has this one beneficial element for me: his bids on equipment I know nothing about give me some sense of the monetary value eBay will ascribe to the item when the bidding is over. Thus I pay no attention to his auctions, but I watch his bids closely.

As far as eBay not being a bargain anymore, I disagree. The price you pay for any one item may be higher than before, but those prices almost always beat comparable prices elsewhere. It's always a good idea to do a sanity check before purchasing by comparing other sources for the item you are considering a bid on. But that usually, not always, but usually, tends to show eBay in a favorable light price-wise. I'm not familiar with much economic theory, but it makes common sense that a large, unfettered market will end up assigning optimal values to prices for goods, where "optimal" is a complex winnowing of the interests of

both buyers and sellers. No market is completely "unfettered" but eBay's is closer to that ideal than the local electronics store, to judge by the price spread.

Your logic applies to 90% of ebay, but doesn't apply to calcualtors and ebay. This is one area where economics is perverted by an absense of retail substitutes in comparision to yesterday.

Almost everything has benefited with progress. Antiques do command Antique prices due to rarity, not because they are as useful or more useful today than anything else available. Only since Hp released an Hp33s has the price of the Hp32s returned to below the $200 value it once commanded, not because of its rarity, but because there was nothing to compare it too until the Hp33s appeared.

RPN is not a popular calculator OS, but those that learn it, tend to become fanatical about keeping it. And that is one of the few things that skew this market. Another is the superior quality that these same fanatics are used to in a calculator that only Hp used to provide. Those two features are what has fueled this somewhat unique market. Normal marketing common sense doesn't seem to hold up in this market.

Now that Hp has released the new Hp33s and Hp49G+, there should be no real market for the older, but not antique HP32s or Hp48G series. Yet, both will still sell for twice the newer calculators list prices (and truthfully, both are worth twice the newer replacements). But the market HAS changed and most people do not rely on a calculator for the majority of their work. Therefore I have to be thankful for the Hp's that are available new so as to keep the older calculators value from skyrocketing due to user demand, not just collector demand.

Re: coburlin: solved!

*Message #8 Posted by **Howard Owen** on 1 Aug 2005, 4:23 p.m.,*
in response to message #7 by Ron Ross

I don't think the market is "skewed", it's just complicated. The price for 48-GX machines is high because professional surveyors still use them. The fact that collectors value them too doesn't mean that you have a skewed market. It just means you have two value systems chasing the same goods. Personally, I can't bring myself to spend the money for a 48GX because I wouldn't use or othewise appreciate the expandibility. (That could change if I learn of an application that I really, really want that will only run out of one of the GX ports.) I've settled for a 48S and 48G+ instead, giving me two examples of those generations. These are enough for me to follow along in William Wickes' books, which is what I really get pleasure from.

The market for the other machines I'm interested in, the 41C, 75C/D and 71B, seem to be driven almost completely by enthusiasts and collectors. I distinguish the two, by the way. I'm an enthusiast, in that I like to play with the gadgets I buy. I set up networks with them, for example. I am also a collector in that I want to obtain examples of each major category I'm interested in. Thus

the 48S is not much use as an enthusiast's toy when compared to the 48G+, but it fills an interesting gap. Anyhow, I've noticed that the 71B is a lot harder to obtain than the 75C. They come up on eBay at about the same rate, so why should the 71B, a younger computer, command more than a 75C? Because it is *cooler*. It's more expandable, and has neater software in the swap disks. It also is the first machine to run the Saturn processor. All of these qualities are prized by enthusiasts and collectors.

Then too, trying to figure out what makes the retro calculator market tick is a fairly large slice of the fun of participation. I hope to expound on this at more length at my new website, http://retrocalculator.com. I was astonished that domain was available, but it was, so I snagged it this weekend. There's nothing up there now but a logo consisting of a 75C with HPIL cables attached. I hope to have more before I have to get back to work, probably next week.

in response to message #1 by Vassilis Prevelakis

Thanks for teh tip. This way I will not see Cobuba's stupid and trashy auctions. I don't think one person can influence prices. Behavioral psychologusts will tell you that when people don't get the reaction they want, they will do something else. Cobuba is no exception.

in response to message #1 by Vassilis Prevelakis

I'm just curious how he makes any money. He lists thousands of items **for every one he sells**. It costs him a few bucks for every listing. Insertion fees for $200-$500 is $3.60. If he lists 1000 items, he's nearly $4000 in the hole before he starts.

Even if he sells at these ridiculous prices, it's not enough to make up for the $4000 in listing fees. He must be doing a lot of outside ebay sells from these auctions to make that worthwhile.

At the last moment he changes the auction to a $1 mouse (with $10 shipping to prevent anybody from taking him up on his offer). He is, thus, paying only a fraction of the nominal insertion fee.

I have let ebay know about this behavior, but they have ignored me.

HP 41CV Power On

*Message #1 Posted by **eagre** on 31 July 2005, 9:23 p.m.*

I know I'm coming in very late - I just joined the forum. I have 41CV that I've used since the mid 80's (I earlier had a 35, 65, and 67). Recently it has often been reluctant to turn on, even though the N cells are fresh and the battery contacts are clean. I've heard this is a known problem. What is it? HP no longer suppoirts this calculator, but I have come to depend on it.

Ed Grens

*Message #2 Posted by **don wallace** on 31 July 2005, 11:38 p.m.,*
in response to message #1 by eagre

Hi Eager,

It could be that your calculators internal interconnects are giving trouble. The calculator can be disassembled and cleaned but can also be wrecked by static electricity damage.

I am able to safely repair these machines. Happy to quote you if you like. This is NOT a plug... ;-) Just trying to help.

Speaking of which, you could check out my pages on repairing the 41CV at either: www.furlow.org or my own pages at:

donwallace.customer.netspace.net.au

I have 20 years experience in electronics repairs and have similar timespan of experience in electronics engineering.

Good luck!

Don Wallace

*Message #3 Posted by **Howard Owen** on 1 Aug 2005, 3:34 a.m.,*
in response to message #2 by don wallace

Nice photo spread there!

Most of the 41s I've opened don't have the nuts on the screw posts, (I did open one that had that arrangement.) It seems like a much better plan than using the gripping power of the screws exclusively to press the processor PCB to the keyboard PCB, particularly given the tendency of the posts to crack with age and abuse. I also recognized a symptom you mentioned as being caused by static discharge - the strange behavior on "SIZE" and storing to registers. I have one calculator that starts showing garbled

program lines when size exceeds a certain value. I had concluded that this was a RAM problem, or possibly something with the CPU. Can you comment on whether one or the other is more likely? How would you go about distinguishing the two? (I might send it to you for repair, but mail between OZ and the US takes forever. 8)

in response to message #3 by Howard Owen

Hi,

Just a quickie: Is the black plastic piece for the electrical isolation still in place between the keyboard and the CPU board, I forgot to replace it one time myself and then I had also some strange behaviour on certain keys.

Good luck

Ronald

*Message #6 Posted by **don wallace** on 15 Aug 2005, 3:03 a.m.,*
in response to message #3 by Howard Owen

Hi Howard,

Thank you for the feedback on my photos of the 41CV repair. I shot them with a toy digital camera, so they are a bit rough.

Most definitely, you have a faulty RAM chip. I can replace it if you first get a sick 41CV from ebay and send me your machine and the one I'll use for parts to repair your calc. I will test the RAM first to ensure you get a functional system back. It's a long way to send a calculator for repair, so I would do the job properly.

Kind regards,

Don P.S. you may want to check my pages once in a while. The website is under heavy development with a lot of new material to be uploaded shortly. Any feedback or technical questions are welcome.

hp 33 display

*Message #1 Posted by **daid bowers** on 31 July 2005, 2:29 a.m.*

hi i am a surveyor, in china at the moment. i am going to get some dedicated programs written and i was told it would be better on the hp 33 as they are newer than my old 48 gx with cogo. has the display comma been enlarged, does anyone know a good u.s.online source which has the newer version or a shop in frisco where a friend of mine can buy one and mail it to me i see they are as low as 49 bucks.in australia they are about 150 u.s.d.which is a waste if i dont like it should i look for serial nos above a certain number to clarify this cheers david

Re: hp 33 display

*Message #2 Posted by **John Limpert** on 31 July 2005, 7:22 a.m.,*
in response to message #1 by daid bowers

The HP-33S may be newer, but that doesn't mean that it is better than the HP-48GX. They aren't addressed at the same set of problems. The HP-33S is a programmable scientific calculator with a programming model that is similar to that of pre-RPL HP calculators. The HP-48GX is a graphing calculator with more memory and a much more sophisticated programming model. Which is better is determined by your needs and personal preferences.

You can get the HP-33S from Amazon or Walmart. I bought one recently at my local Walmart store. It had the improved LCD display. I still don't like the legibility of the key labels, the shiny metallic finish isn't helpful. For $50, I can live with its defects. It's small, supports RPN, and is programmable. Its keyboard works reliably, unlike my HP-49G+, which was replaced under warranty and still doesn't work properly.

If they ever get the hardware problems corrected, you may be better off with the HP-49G+ with its support for removable flash memory cards. That way, you can offload and backup data to a computer with a flash memory card reader.

Re: hp 33 display

*Message #3 Posted by **George Rose** on 31 July 2005, 7:35 a.m.,*
in response to message #1 by daid bowers

David, I too am a surveyor in Maryland. I have an HP48GX with a COGO card installed and I also have an HP33S with some COGO programs that I wrote installed in it. Not to "pat myself on the back", but just so that you know my programs are not trivial, a college in Texas is using them in their curriculum. So I can tell you from experience, if you have an HP48, you don't need nor will you be impressed with the HP33S for field work. The only reason I can think of to use the 33S is for the NCEES exam as it is allowed and the HP48 is not.

Re: hp 33 display

*Message #4 Posted by **Norris** on 31 July 2005, 2:11 p.m.,*
in response to message #3 by George Rose

Agreed. The 33S is a great calculator for solving problems on surveyor's licensing exams (e.g. LSIT/FS,

PLS/PS exams), since NCEES has banned all other programmable calculators from such exams. But it cannot be used as a field data collector like the HP48GX traditionally was. The 33S only has about 32 variable memories, and no way to download data. A current 48 or 49 series model, or an older 48GX, would be a better choice.

If you are interested in 33S surveying software for exams, there are some inexpensive commercial options, like this one.

Free42 and Visor Deluxe

*Message #1 Posted by **Charles Oxford** on 30 July 2005, 4:29 p.m.*

I just got a Visor Deluxe and have spent alot of time trying figure it out. I managed to change owner to my name but all hotsync only uses previous owner name. I finally used that name and Free42 loaded. Can anyone tell me how to rid all memory of the previous owner? Also, what is the largest amount of flash ram can I use? Would the entire module be accessable or do you need multiple smaller modules? Hope this isn't too far off topic to be offensive. Thanks from a sweating Sonoran resident.

Re: Free42 and Visor Deluxe

HP97 Card Reader: recording problems (rephrased)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2005, 5:32 p.m.*

Hi all HP97 users and fans;

I had a somehow interesting experience with my HP97 yesterday night. After reading and writing a few magnetic cards, it started to show [Error] in the display when trying to write (read was fine). I disassembled the calculator and tried to readjust the sensors without success. Then, for the first time in this unit, I removed the card reader´s PCB and took a look at the contact plate.

It was slightly bent and I decided to remove it (five small screws). I cleaned it and decided to plain it. After a few small torque on the opposite direction, the contacts plate was almost plain again. I reassembled it and readjusted the contacts. Now it is working fine, again, but I noticed two small different behaviors in the card reader operation.

Although I've done all procedures the best of what I think, the card reader now seems to pull the cards a bit slowly, as if it is a bit more difficult to pull them in. Should that be due to excessive pressure in the contacts plate? Also, in one of the read/write operations, I touched the card prior to pull it out of the reader and it seems to me that it was slightly pushed back in backwards. The card reader motor started to run again and it stopped only after removing the card from the inside of it. An [Error] message was shown, again. Has anyone of you, guys, experienced such behavior?

I'm affraid of having to open the calculator again in order to readjust the plates. What I did was to slightly tighten the screws till each contact was close, by measuring the three connection points (M, F and H), and then slowly loose them back till the contact was open. Then I gently inserted and removed one card and checked if each contact was closed and opened. All seemed fine and after that, the card reader started to record again.

Any suggestions? Should I left it this way? If there is excessive pressure when the card is pulled inside the reader, both motor and magnetic head may be working outside their specifications. Is there any way to check for that?

BTW, I have some pictures of the reader PCB, component and solder sides. Should I post them here?

Best regards.

Luiz (Brazil)

Re: Is this real?

*Message #2 Posted by **Ronald** on 30 July 2005, 4:53 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I am not sure if the contacts are the rootcause. Couls it be that the pressure of the rubber capstan is a bit higher than before, did you tried to give the black axis a little turn. I hope my explanation makes sense, otherwise I can send a .jpg of what i mean.

Succes

Ronald

Re: Is this real?

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 30 July 2005, 9:18 p.m.,*
in response to message #2 by Ronald

HI, Ronald; thank you for your followup.

You see, I thought about adjusting the roller axis, but since I did not touch it, I thought it would be a good idea to leav it as it was. If the adjustment you mention is the same, or close to, as the adjustment of the HP41 card reader (82104A), then I know what you mean: the excentric axis.

Based on the fact that I actually tried to leave the contacts plate as plain as possible, I thought that, after readjusting the screws, the small plastic actuators, that cause the contact blades to touch the pcb when the card is pulled in, might be pressing the card surface a bit more than before. Also, the pcb screws themselves. They were somehow thighten when I removed them, so I tried to screw them back as tight as I thougth they were.

Thank you for your valid suggestion. You see, I try not to disassemble the HP97 too much because it has too many moving parts and connections, and I have to take care of them all when either openning or closing it back. I`ll do that tomorrow again. In addition to the axis, any other suggestion?

Best regards.

Luiz (Brazil)

Edited: 30 July 2005, 11:41 p.m.

Re: Is this real?

*Message #4 Posted by **Ronald** on 31 July 2005, 6:37 a.m.,*
in response to message #2 by Ronald

Hi Louis,

Yes I did mention the exectric axis. I have no other suggestion, assuming that the contacts are as clean en smooth as they were before.

There is one thing that comes to my mind now, there are 2 (if I recall th # correctly) small "guidance" springs in the side of the cardreader path(about 1 cm long and bend). I assume they are still in place, smooth surface and can move freely ?

Ronald

Re: 97 reader repair

*Message #5 Posted by **don wallace** on 1 Aug 2005, 1:43 a.m.,*
in response to message #4 by Ronald

Hi all.

Pardon me for commenting; I don't own a 97 or a 41C card reader. So I am sticking my nose in

possibly where it is not wanted.

From many years experience repairing a very wide range of equipment, for copiers to mining machines and computers, I know of the damage one can do if one modifies the machinery too much.

It sounds like the capstan pressure is indded a little higher that normal and the motor is EXCESSIVELY loaded. I suggest you carefully re-do the job to correct this, as you may get failure in the electronics (if any) which switches the motor. The ERROR message you are getting is IMHO, a timing error due to the slower card scanning speed, which I guess would now be at the margins of operability.

If you keep running the 97 in this state, don't be surprised if something fails. Just trying to help...

Kind regards from Down Under!

Don Wallace

HP97 Card Reader working smoothly...

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 2 Aug 2005, 9:24 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi, all;

first of all, thanks to all of you that either added valid suggestions to this subject or at least wish to help somehow and were not able to. Also, thanks to all of those who have already placed posts in the past about the HP67/97b reader; because I read many of those I agregated many new knowledge to my own about these masterpieces.

With no further ado, I opened the HP97 again and checked the excentric adjustment. After carefuly inserting a card, I tried to reduce the pressure by adjusting it and I noticed that it was almost in the lowest pressure adjustment. Based on the difficulty on inserting the card, I assumed that this unit has a new rubber puller, an O-ring perhaps (I did not open the card reader mechanics). So, by setting the lowest pressurew possible, I adjusted the contact blades again and now the cards smoothly 'walk' through the card reader´s head, either reading or writing. Even the noise from the motor + pulling gear has been reduced somehow.

About the contacts adjustment, I once read an adjustment procedure that worked for me. I'm not sure who posted it, so I'll not even try to wrongly refer to someone, so forgive me the one who posted it! The HP67/97 card reader has three contacts: one that senses a card has been inserted, another that senses the card 'position' so it can be read/written, and a third one that senses if the card is protected or not (read-olny card, cannot write on it). This adjustment procedure states something like to make sure the three contacts are closed wihtout a card inside the reader, then one should slowly recess (unscrew) each screw while measuring the related contact(ohmmeter) till it is opened. By finding the closer screw position where the contact is opened, recess it 1/4 of a turn (90 degrees). After doing that with the three contacts (and related screws), gently insert a card and check if the contacts close with it inside the reader. Remove it and confirm that they are opened. I'd also add that the small plastic actuators, the ones that actually push the contact blades when the card is inserted, should not offer too much resistence to the card insertion, and if that happens, maybe you should have a look at the contacts plate and check if it is not bent or twisted.

BTW, to those that have gone any further with these readers, I still have two questions: the 'normal', average current measured when motor is pulling a card and if there is any way to adjust the motor speed.

Wow! I wrote too much. Hope this helps as a partial guidance to those experiencing related problems with card readers. If anything I wrote here is not in accordance with either regular procedures or specific card reader adjustments, please, I'd thank for any corrections and/or additional info to this post in order to avoid dammage

to calculators or related devices.

Best regards and thanks again.

Luiz (Brazil)

Re: HP97 Card Reader working smoothly...

*Message #7 Posted by **Tony Duell** on 3 Aug 2005, 4:01 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

The procedure I use for adjusting 97 card reader contacts is essentially the one in the service manual (on the CD-ROM set).

With no card in the reader, connect an ohmmeter across each contact in turn (there are testpoints for this on the reader PCB). Screw in the appropriate adjusting screw until the contact just closes, then back it off 1/8 of a turn (or so). Check that the contact switches reliably when you put a card in (if it doesn't, suspect bent or dirty contacts).

HP97 Card Reader: recording problems (rephrased)

*Message #8 Posted by **Bernhard** on 3 Aug 2005, 6:40 p.m.,*
in response to message #7 by Tony Duell

Hi Luiz,

you asked:

"BTW, to those that have gone any further with these readers, I still have two questions: the 'normal', average current measured when motor is pulling a card and if there is any way to adjust the motor speed."

Please see my recent post on HP67 card reader speed adjustment on this list and the responses from various people - there is all the info you need to get your HP97 card reader into perfect condition.

BTW, for spare motors, I buy those HP41 card readers advertised as "defunct" on Ebay (cheap because defunct - always was just the rubber !) and put those motors into my HP67s. Alas, some of the motor screws are glued so the screw heads must be milled off.

Regards, Bernhard

HP 9825B Tape..still available?

*Message #1 Posted by **Neil** on 29 July 2005, 10:50 a.m.*

Hello, I just aquired a nice condition HP 9825B. Is there anyone still making the tapes for these machines?

Thanks for any help.

Regards, Neil

Edited: 29 July 2005, 10:52 a.m.

Re: HP 9825B Tape..still available?

*Message #2 Posted by **John Limpert** on 29 July 2005, 3:35 p.m.,*
in response to message #1 by Neil

I picked up several "new" 3M DC100A tape cartridges on eBay for a reasonable price, much less than what several media vendors were charging. I haven't had a chance to test them. I'm pessimistic that the tape drive still works, since capstan rot seems to be a common problem with these drives.

Re: HP 9825B Tape..still available?

*Message #3 Posted by **Neil** on 30 July 2005, 12:24 a.m.,*
in response to message #2 by John Limpert

HI, Thank for the info. It's funny, I never thought of ebay for them.

I know I used another tape in my HP-85, but I cant remember what it was. The HP-85 uses the same DC100 tape.

Thanks again,

Neil

HP9825 and HP9862A plotter - how ?

*Message #1 Posted by **marais** on 29 July 2005, 8:44 a.m.*

Dear community, I need help getting my 9862 plotter to work with my 9825. I was hoping my 16 bit interface would be suitable for the plotter, but looking at the plug I begin to have a doubt. Which interface is necessary to use this plotter? It's not an HPIB model as far as I know. Furthermore, a plotter I/O is needed, which I luckily have as a combined 9862A plotter - general I/O - extended I/O cartridge. However, I am currently using a general I/O-extended I/O-matrix cartridge, which I use for the matrix functions. What happens if two cartridges with partly identical contents are inserted into the 9825? I know that this would be forbidden on the 85, and could even damage the machine.

Andreas

Re: HP9825 and HP9862A plotter - how ?

*Message #2 Posted by **Achim** on 31 July 2005, 7:38 a.m.,*
in response to message #1 by marais

You must no use two ROM cartridges with identical functions (e.g. general I/O) because they have identical addresses and would be selected at the same time. This might damage one ore both cartridges. The best is, you use the dedicated matrix ROM cartidge. Eventually you find this on ebay. Regarding the 9862, you will need the 16 bit I/O interface. If you haven't the matching cable you might solder one. I have the same problem and the interface and cable is laying on my workbench since weeks because I didn't have the time to work out the correct connections. Maybe if someone has an original cable and could give us the layout or make photos we could save much time.

By the way, how's your 9810 repair going on? I have also three machines repaired, including the card reader, maybe I can help.

Achim

Re: HP9825 and HP9862A plotter - how ?

*Message #3 Posted by **marais** on 31 July 2005, 4:58 p.m.,*
in response to message #2 by Achim

Achim, thank you for your reply. I do have the 16 bit I/O interface, with the printer option, but since the connectors don't match, I ruled the idea out. Now if someone had the layout for the adapter cable, I would be most interested! My 9810 is doing better, thanks for asking! You can find a report on the current status on 9810 repair status I will next work on the printer, I found a 74107 on an old pcb, and am considering soldering it onto the printer pcb.

Andreas

the 9862 is even supposed to work with the 9810

*Message #4 Posted by **marais** on 2 Aug 2005, 4:54 p.m.,*

in response to message #3 by marais

According to the museum, the 9862A plotter can also be used with the older 9810. I know some interface exists for the 9825, but I've never seen one for the 9810. A mystery.

Andreas

Re: the 9862 is even supposed to work with the 9810

*Message #5 Posted by **Tony Duell** on 3 Aug 2005, 3:57 p.m.,*
in response to message #4 by marais

For both the 98x0 and 98x5 series there were 'generic' parallel interfaces -- the 11202 for the 98x0 and the 98032 for the 98x5 IIRC. Many peripherals (including printers, card readers, paper tape readers, punches) used these interfaces with the right links fitted and the right cable. I wonder if the 9862 used them as well.

Re: the 9862 is even supposed to work with the 9810

*Message #6 Posted by **Achim (Germany)** on 5 Aug 2005, 4:02 a.m.,*
in response to message #5 by Tony Duell

There is a special 8 bit parallel unidirectional 9862 interface for use with the 9810/20/30. It's schematic is decribed in the 9810 patent.

Achim

Re: the 9862 is even supposed to work with the 9810

*Message #7 Posted by **marais** on 6 Aug 2005, 5:49 a.m.,*
in response to message #6 by Achim (Germany)

I just got myself the patent, more than 400 pages, wow! You must be referring to figure 171 on page 184 "Interface logic to plotter". I found the pin-out of the I/O backplane on Tony Duell's schematics, what's missing is the pin-out of the plotter, and of course the time to wire up the two latches, a FF and some gates. I'll give it some thought.

HP LJ 2430 installation on WINNT

*Message #1 Posted by **ruben** on 29 July 2005, 7:07 a.m.*

Hi everyone,

First of all... I just noticed that this is a forum for HP Calulators... Sorry for my post in here, I saw it too late.

Anyway, since there are HP-experts here, perhaps someone could help me.

I need to install the HP LaserJet 2430 printer on a WINNT4.0 machine. So far I have done a network installation on the Windows XP machines.

After contacting HP Techsupport on how to correctly install this printer onto a WINNT4.0 machine, I learned that I need to create a new TCP/IP port and assign the printer's IP-address to that.

However when adding the port, it requests the files LexNetUI.cnt, LexNetUI.hlp and LexStart.exe

I have searched the net but can not find these files. I have already downloaded and used the following files successfully: mvntinst.dll, lexlmpm.dll, lexbce.dll, lexbcelm.dll, lexip32.dll and lexll32.dll

Can someone please tell me where I can find LexNetUI.cnt, LexNetUI.hlp and LexStart.exe?

Kind regards, Ruben.

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2005, 11:39 a.m.,*
in response to message #1 by ruben

Hi, Ruben;

by understanding that you posted wrongly, apologized and yet tried to find some help here, I see that you at least located yourself (never mind, `dot` is a little harsh, sometimes...)

I`m not sure about how new is the 2430 printer, and based on what you post, you may have probably searched for the files in its own installation CD set, right? Anyway, have you considered the Windows 2000 (or XP) instalation CD`s as a second source for these files? Windows NT is somehow old, and if the 2430 is too new, chances are you`ll not find these files accordingly.

Just a guess.

Last but not least... what do you have to offer now, related to HP calculators? It`s your turn...

Best regards.

Luiz (Brazil)

*Message #5 Posted by **Howard Owen** on 29 July 2005, 12:28 p.m.,*
in response to message #1 by ruben

Actually, I think the Windows NT CD is the place to look. What's needed is the TCP/IP print driver, which is not specific to the printer type, although I've only ever set up HP printers this way. From my dim recollections of NT, you have to go to the network settings for the interface and select "Add Component" or something like that. It may also be possible to do that from the add software/system components in Control Panel. In any event, it's an issue of NT, not the printer.

That's one bit of retro computing I'd rather forget. 8)

hp 41cx - Surveying COGO Program

*Message #1 Posted by **altanet** on 28 July 2005, 11:56 p.m.*

I had a full COGO program, given to me by a friend to the mid eighties (1984-85), he got it from a firm in Western Canada - BC I think, I had used it for years and it was a great tool for a field surveyor. Two years ago my truck got broken into and the theives made off with both my Hp 41CX treasured calculators. I am now trying to rebuild my old field survey computation ability and find a copy of the cogo program I once used in earnest. If anyone knows of such a program, it had all the basic routines and the abilty to store up to 180 pts with an extended memory card, please contact me....

regards jkl

*Message #2 Posted by **db (martinez, ca.)** on 29 July 2005, 12:31 a.m.,*
in response to message #1 by altanet

The TDS Co-Op 41 Surveying Module would store 170 or so points on one extended memory, and 299 on two. Might be that one.

41CX with Interesting Problem

*Message #1 Posted by **Howard Owen** on 28 July 2005, 8:09 p.m.*

I just obtained a halfnut CX that works great, except for one thing. The 'CLX' (left arrow) key doesn't work. What makes it interesting is that the key *does* work when doing a full reset. So "CLX-ON-release CLX" results in "MEMORY LOST," but pressing CLX after that doesn't clear the message. As far as I can tell, all the other keys are working. The calculator does seem reluctant to turn on from time to time.

Before I open it up, I thought I'd ask here to see if anyone had thoughts on that set of symptoms. Thanks for any help you can offer!

Re: 41CX with Interesting Problem

*Message #2 Posted by **Ángel Martin** on 29 July 2005, 7:33 a.m.,*
in response to message #1 by Howard Owen

Does CLA (CLX in ALPHA mode) or SHIFT-CLX work at all?

Re: 41CX with Interesting Problem

*Message #3 Posted by **Howard Owen** on 29 July 2005, 10:43 a.m.,*
in response to message #2 by Ángel Martin

I was going to say "NO" to both, but then I discovered that pressing SHIFT followed very rapidly by CLX works, both in alpha and normal mode. Pressing them simultaneously doesn't work, and any conscious delay beyond the shortest one I can manage won't work either.

Re: 41CX with Interesting Problem

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 29 July 2005, 11:29 a.m.,*
in response to message #3 by Howard Owen

Hi;

any related awkward behavior in PRGM mode, too? I mean, does it clear program steps as it should do the `back step` procedure?

Is there any chance that it has any additional module inside? Have you tried CAT 2 and observe if there is any occurrence?

This is actually interesting... I hope you succeed having your CX back into normal operation.

Luiz (Brazil)

Edited: 29 July 2005, 11:30 a.m.

Re: 41CX with Interesting Problem

*Message #5 Posted by **Howard Owen** on 29 July 2005, 12:21 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Yes, I thought it was interesting. 8)

Nothing unusual shows up in CAT 2. The machine came with an I/R module and a surveying module, but I've removed those. There was also a protected program in memory that went away when I reset the machine. I haven't asked the seller about that because he looks to be a surplus/second hand dealer with no other calculator stuff for sale. The machine came in a bundle of other machines from TI, Casio and Sharp. All that suggests the seller won't know anything specific about the machine.

The CLX key works the same in program mode. That is, pressing SHIFT-CLX in rapid succession enters "CLX" into the program. Pressing SHIFT, then SHIFT CLX rapidly deletes the current program line.

My theory is either that there there is internal corrosion that is affecting the CLX key press by itself due to increased resistance. In this scenario that resistence is overcome briefly by pressing the shift key. Or else there's a problem in the decoding of the key presses in the CPU. I guess it's also possible that it's the classic broken lower post problem. But pressing one or both keys forcefully doesn't seem to affect the behavior.

There's no sign of corrosion externally, but I sure hope I find some inside. There would be hope of fixing things in that case, whereas a bad CPU is probably the end of the line, since I don't have a spare halfnut CX. On the other hand, I find that I can reliably operate the key now that I have the hang of it. I think I'll make this my main 41 for a while. It has a scratch across the display too, which makes it less valuable for resale. My practice is to hold on to flawed but servicable equipment for my own use and sell the better quality stuff. I figure I add value through my selectivity in the base machine and the add-ons that way.

48g

*Message #1 Posted by **brian goodger** on 28 July 2005, 7:17 a.m.*

hi i bought a used 48 with 2 programs dumped on it, written by the owner for surveying, i went to the built in library to use the geometry stuff, but i cant recall the other 2 programs or get them displayed by name in the left hand corner, i dont have the books, which buttons recall these, please can anyone advise thanks brian

Re: 48g

*Message #2 Posted by **Jim Creybohm** on 28 July 2005, 3:18 p.m.,*
in response to message #1 by brian goodger

My GX has each program assigned to a variable name. So, use the "VAR" key to bring up a list of variables in the directory. From there, you can use the "NXT" key to move the next group to the display. Once you find your program simply press the corresponding key and your calc. will run it. If there is a subdirectory assigned to a var name, then you will scroll down through the directory until you find the program. I would think that anyone literate enough to write their own program would be literate enough to store them in a subdirectory.

Be forewarned; if the you have a lot of variables, you will find this to be a tedious techique as there is a lot of garbage that hangs around that you have to scroll through. You may wish to download a garbage collector program from www.hpcalc.org.

Hope this helps.

Re: 48g

*Message #3 Posted by **Howard Owen** on 28 July 2005, 3:50 p.m.,*
in response to message #1 by brian goodger

As mentioned, the calculator has a hierachical file system. To get to the "root" of the file system, press 'right-shift home'. From there you can proceed with your search as mentioned above.

If you recall the names of the programs, you can type the name and press EVAL to execute the program no matter where you are in the hierarchy. (Press alpha-alpha to set alpha lock, then type the name with the alpha keys. Press alpha again to exit alpha lock, then press EVAL.)

Finally, if you care about those programs, and if they are non-trivial in size, you should back them up to a PC using a serial cable and software. (You can get the latter at hpcalc.org.)

calling for wish-list on custom 41CV/X i/o slave

*Message #1 Posted by **don wallace** on 28 July 2005, 3:47 a.m.*

I have 20 years experience in electronics repairs starting at Canon Australia in 1985. Engineering design and machine code programming experience runs from 1984 to present day.

I am currently in early stages of developing prototypes for hardware expansion of the 41CV /CX.

Features of prototype includes: a slave RISC microcontroller with multi-channel analogue i/o and / or stepper motor drive (six channel) for use in robotics. Remote (timed and untimed) hardware wakeup of 41C by interrupt. Extra ROM and flash RAM, useable for both MCODE and USER CODE.

If anyone is interested or has a wishlist for features to be included, please write:

donwallace63@yahoo.com.au

You can reach me on mobile telephone at: +61432 261 292 In Australia this is 0432 261 292. Basic (text only) SMS is ok. I am yet to build a webpage, but it's coming. . . ;-)

Thanks!

Don Wallace

belt dimensions for tape drives

*Message #1 Posted by **marais** on 28 July 2005, 3:30 a.m.*

Good morning, I would like to ask if the belt specifications (width) of the various tape drives built into the HP calculators HP-85, 9815 and 9825 can be found somewhere? I'll visit a belt manufacturing company later this year and would like to use the opportunity to get some belts in anticipation. I know that part of the specs concerns the reinforcement cord inside the belt, which can be Kevlar (yellow in color) or polyester (white). I do not know if the HP belts had a reinforcement cord, or if the presence of such a cord would impact the function.

Thank you Andreas

Re: belt dimensions for tape drives

*Message #2 Posted by **Vassilis Prevelakis** on 28 July 2005, 4:07 a.m.,*
in response to message #1 by marais

I do not know about the 9815 and 9825, but the HP-85 tape drive does NOT have a belt. The capstan is attached directly to the motor.

I suspect that the HP-9815 and HP-9825 also do not have bands as I do not recall seeing such bands in the spare parts lists for these computers.

Perhaps you are talking about the band inside the tape CARTRIDGES?

11C aspect ratio

*Message #1 Posted by **Dave Chapman** on 27 July 2005, 1:39 p.m.*

Has anyone mentioned that the apsect ratio of the 11C and similar calculators is almost exactly the Golden Ratio, (Sqrt[5]+1)/2 ?

Re: 11C aspect ratio

*Message #2 Posted by **Howard Owen** on 27 July 2005, 2:09 p.m.,*
in response to message #1 by Dave Chapman

In nature when this shows up, we say it's the result of underlying physical processes that embody the mathematics that produce the ratio. In a calculator designed by HP in Corvalis, we'd have to say it's the result of underlying humor by mathematics geeks embodying the spirit of great engineering.

Where'd all that stuff go to, anyway?

Re: 11C aspect ratio

*Message #3 Posted by **don wallace** on 28 July 2005, 3:38 a.m.,*
in response to message #2 by Howard Owen

Hi all. IMHO, it's just (yet) another beautiful touch by the designers to enhance the visual beauty of the product. . .

Re: 11C aspect ratio

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 27 July 2005, 2:50 p.m.,*
in response to message #1 by Dave Chapman

Hi, Dave;

some time ago, Gerson mentioned this very fact in here. I tried to search the aschives but did not find it. If Gerson read this thread he'll probably remember when did he post it.

Sorry not being more precise about the message itself.

Best regards.

Luiz (Brazil)

Re: 11C aspect ratio

*Message #5 Posted by **Gerson W. Barbosa** on 27 July 2005, 6:13 p.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

Hi Luiz,

I coudn't find the post either. In short, the length/width ratio in the Voyagers is 12.7cm/7.87cm = 1.6137 very close to 1.6180 [Sqrt(5)+1]/2. In inches, 5"/3.1" = 1.6129. These are official specifications listed at:

http://www.hp.com/calculators/financial/12c/specs.html

Actually, the first one to have mentioned this here was John Ioannidis:

http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=170

Now we know what the Parthenon and the Voyagers have in common: the golden ration. No wonder they are so wonderful!

Cheers,

Gerson.

Re: 11C aspect ratio

*Message #6 Posted by **bill platt** on 27 July 2005, 3:55 p.m.,*

Copy permissions for 75C materials?

*Message #1 Posted by **Howard Owen** on 27 July 2005, 11:25 a.m.*

I have several Users Library Solutions books for the HP-75C that I'd like to scan and upload here. I also have the mag cards for some of them. I'm in the process of writing those to a 9114 floppy, and I could load an image file with the results fairly easily. (Not using the 9114 directly, but with HP-IL and EMU41) Since there are quite a few HP-41 materials of a similar provenence here at the museum, I'm wondering how permission was obtained to host those files? Could the curator comment on how to go about getting permission from HP for this stuff? I'd be delighted to share these materials with the museum if I can obtain the proper permission.

Thanks.
Howard

Re: Copy permissions for 75C materials?

*Message #2 Posted by **Vassilis Prevelakis** on 27 July 2005, 12:27 p.m.,*
in response to message #1 by Howard Owen

I suggest you search the archives, this topic (as you can well imagine) has been discussed to death.

**vp

Re: Copy permissions for 75C materials?

*Message #3 Posted by **Howard Owen** on 27 July 2005, 1:55 p.m.,*
in response to message #2 by Vassilis Prevelakis

Search. The archives. Hahahahaha!

Actually, although the PDFs on the DVD are not cross indexed, they consist mainly of text that pdftotext can process. After doing this for the first twelve archives, I *was* able to search the result. I discovered an early post about the User Library ending up in a landfill. The implication is that HP isn't interested in pursuing the copyrights for user library programs. I guess that means I can go ahead and scan and upload the items I have.

Someone please correct me if I'm wrong about that. I'd hate to do all that work for nothing. 8).

Re: Copy permissions for 75C materials?

*Message #4 Posted by **Vassilis Prevelakis** on 27 July 2005, 8:11 p.m.,*
in response to message #3 by Howard Owen

```
Howard Owen wrote:

Well it takes some talent. If you deposit $1.00 in my paypal account I can search the archives for you.

Best

**vp

Re: Copy permissions for 75C materials?

*Message #5 Posted by **Howard Owen** on 27 July 2005, 9:13 p.m.,*
in response to message #4 by Vassilis Prevelakis

It takes talent to click through the search form once for each archive? I never even ..

I guess that's worth a buck, but I prefer my expedient of stripping the text out of the PDFs so I can search the whole thing at once. Just a lack of talent, I guess. 8)

Re: Copy permissions for 75C materials?

*Message #6 Posted by **Howard Owen** on 27 July 2005, 9:27 p.m.,*
in response to message #1 by Howard Owen

I'm Going to do Some Scanning

.. and some transferring of programs to LIF format, thence to text listings. In addition to the 75C stuff, I just got several individual 41C library programs that aren't represented here. They are

- Mastermind (01608c, different from the one currently here)
- Swords and Sorcery (01763C)
- Precision Biorhythm Plot (00795, for pseudo-science fans)
- Sunrise/Sunset and Azimuth (02828D)

The last one has no machine readable copy, but it's also the shortest of the four, at 221 lines. (It uses the 1979 Nautical Almanac. It needs updating, or perhaps implementation of a perpetual almanac, if that's possible in the constraints of the machine. Does the Nav module have one?)

Re: Copy permissions for 75C materials?

*Message #7 Posted by **Olivier De Smet** on 5 Aug 2005, 6:08 a.m.,*
in response to message #1 by Howard Owen

I wonder if you have some informations about the hardware of the HP75?

I'm interested in I/O informations (I have rom dumps and some infos from Computer Journal and PPC) and VASM rom listing if someone have them.

Olivier

Re: Copy permissions for 75C materials?

*Message #8 Posted by **Tony Duell** on 5 Aug 2005, 7:12 a.m.,*
in response to message #7 by Olivier De Smet

I have the HP75C service manual (which includes schematics and _some_ I/O information IIRC). I also have the ROM source listing and comentary that was made available to PPC under the NOMAS scheme.

The problem, alas, is getting it to you. The listing in particular is very thing (I would estimate 1000 pages). I have no scanner, or anything to connect it to.

There is a chap in HPCC who offered to scan HP-related stuff for me, the idea being to give it to David Hicks to put on the museum CD-ROMs. I got the HPIL interface service manuals (things like the 82164 RS232 interface) to him, he scanned them, but apparently he couldn't produce a file format the David liked. In fact David's attitude was one of total non-interest from what I heard, so I couldn't be bothered to take any more of my manuals to him.

Pity, but there you are...

Re: Copy permissions for 75C materials?

*Message #9 Posted by **Olivier De Smet** on 5 Aug 2005, 7:55 a.m.,*
in response to message #8 by Tony Duell

Perhaps they could give the scan to www.bitsavers.org? So everyone could get it.

retrocalculator.com

*Message #10 Posted by **Howard Owen** on 5 Aug 2005, 10:22 a.m.,*
in response to message #8 by Tony Duell

I have a couple of scans of 41C materials up at retrocalculator.com:

Swords and Sorcery
Bode Plot of a General Transfer Function

There are no links pointing to these from the front page yet, but they are there nonetheless. The point is, I can host materials at retrocalculator.com. There is still the problem of getting it to me. Although I'm willing to do some scanning, shipping the paper across the Atlantic for that purpose seems impractical. (Speak up if you don't think so!). But if there are already existing scans, or if someone on the North American continent has something they'd like me to scan, I can make a home for it on the web.

I also intend to offer everything I do along these lines to David Hicks.

Re: Copy permissions for 75C materials?

*Message #11 Posted by **Howard Owen** on 5 Aug 2005, 10:09 a.m.,*
in response to message #7 by Olivier De Smet

Sadly, I don't have any materials like that. I'd love to see your 75C emulator succeed, though!

Complex Solving w HP15C?

*Message #1 Posted by **Matti Övermark** on 27 July 2005, 10:02 a.m.*

Hello Fellows,

I recall somebody mentioned that the solver built in into the HP-15C actually could be used to (numerically of course) solve complex roots. I did it in high school back in the early 80s, but being old has its disadvantages... ;). Anyone remember? I RCL flag 8 was set and that there was an swaprecall of the imaginary and real registers multiplied and absolutevalued = 0.

/Matti

Re: Complex Solving w HP15C?

*Message #2 Posted by **Miki Mihajlovic** on 27 July 2005, 10:06 p.m.,*
in response to message #1 by Matti Övermark

From HP-15 Advanced Function Handbook:

"The SOLVE and INTEGRATE functions use algorithms that sample your function at values along the real axis. In Complex mode, these functions operate with only the real stack, even though your function subroutine may have complex computations in it.

For example, SOLVE will not search for the roots of a complex function, but rather will sample the function on the real axis and search for a zero of the function's real part..."

In the other words, you have to write a program that will solve for imaginary roots. There are some examples in the handbook.

Re: Complex Solving w HP15C?

*Message #3 Posted by **Matti Övermark** on 28 July 2005, 4:51 a.m.,*
in response to message #2 by Miki Mihajlovic

Ok, thanks. /Matti

Based on the info from the AFH (which I have, and a scan on CD/DVD can be purchased from this website), it's quite easy to solve for the imaginary part of a complex-valued function: Calculate the function in Complex mode (SF 8), then do Re<>Im just before RTN in the function to leave the imaginary part as the return value of the function.

Complex-valued roots are a bit more complicated, but it seems that you might be referring to the technique and program listed on pp. 80-85 in the AFH. It uses SF 8, Re<>Im, as well as ABS on a complex-valued residual, to solve for complex-valued roots of a general equation (not merely a polynomial).

HP-75C "sendio" Lex?

*Message #1 Posted by **Howard Owen** on 26 July 2005, 4:53 p.m.*

I have just obtained a nice bundle of HP-75C gear, including the computer and the "I/O Utilities" solutions book. I have gotten it talking to EMU41 and to my 9114 over HP-IL, so I can move bits back and forth pretty easily. However the I/O book came without the card for the "sendio" utility. this is limiting my ability to load other programs that depend on it. Does anyone have a cache of those bits hanging around? The most convenient form for me would be as a LIF disk image, but I'll take them any way I can get them. 8)

Thanks in advance.

Edited: 26 July 2005, 4:53 p.m.

Re: HP-75C "sendio" Lex?

*Message #2 Posted by **Eric Smith** on 26 July 2005, 6:27 p.m.,*
in response to message #1 by Howard Owen

I'm in a similar position, as far as having a HP-75 but not some of the useful LEX files for it. Did any of the original series (pre-48) PPC swap disks have HP-75 related content? In addition to "sendio", I'd like to get one of the memory access (peek & poke) LEX files.

Eric

Re: HP-75C "sendio" Lex?

*Message #3 Posted by **Howard Owen** on 26 July 2005, 7:23 p.m.,*
in response to message #2 by Eric Smith

Yup, peek/poke would give you the whole machine, theoretically. There are several 75 lex files in the museum's collection that have peek and/or poke in their names, but I can't get any of them to work. That is, "PEEK <some integer>" always fails with "Syntax Error" after loading one of these LEX files. Here's a list of all lex75 files in the swap disks on the museum FTP site. I'm working through reading the old journals, starting with HPCC since they are well indexed, looking for references to these files. In a posting in this thread in the museum archives, Ellis Easley says that the RIOWIO lex (on the jpc01 swap file) gives you RIO(n) and WIO(n,x) where "n" is an HP-IL register number and "x" is a byte of data to store. This would be enough to eventually implement all of the HP-IL commands you could ever want. 8).

in response to message #4 by Eric Smith

You're welcome!

I'm finding the 75C to be lots of fun, particularly with the HP-IL stuff I already had going.

Complete Swap Disk 75C contents

*Message #6 Posted by **Howard Owen** on 26 July 2005, 7:46 p.m.,*
in response to message #1 by Howard Owen

While I'm at it, here's the complete list of 75C related files from the swap disk archives on the museum ftp site. I created this list using the following bash:

```
hbo@hpil|156> for l in *gz;do  echo $l;gunzip -c $l>lif; b=`basename
$l .gz`; echo "" >> 75;echo "$b" >> 75;echo "=========">> 75; lifdir
```

```
-f lif | perl -ane 'print if ($F[1]=~/75/);'>>75;done
```

So this extracts the directory listing using Tony Duell's **lifdir** utility, and prints only those entries with "75" in the second field, which is the file type.

```

One Key to HP-75 Understanding.

*Message #7 Posted by **Howard Owen** on 26 July 2005, 8:20 p.m.,*
in response to message #1 by Howard Owen

The HELP lex75 file on the hpcc88 swap disk was mentioned in an early DATAFILE article. This utility lists all the keywords in memory, including those in RAM resident LEX files, and ROMs. The text file describing this is HELPDOC on the same swap disk. I reproduce it here courtesy of Tony Duell's nice LIF utilities for Linux. Following that is the result of running HELP on my HP-75C with the Math ROM and one of the peek/poke LEX files loaded. This last was obtainable because of JF Garnier's great EMU41, which allows me to redirect display output to a DOS file. (This is really a Linux file since EMU41 is running under DOSEMU, a virtual machine for DOS, and FreeDOS under Slackware Linux. I just love these hall-of-mirrors layers, don't you? 8)

```
                              THE HP-75 LEX COLUMN

 CATALOGUE OF KEYWORDS

 I recently discovered that very few owners  of  HP-75s, other than those who got
 them in the early  days and were then members of PPC-UK (as HPCC then was), know
 that there is a LEXFILE which works rather like CAT 2 on  the  HP-41.   With the
 HELP  Lexfile  all  the  keywords  in  LEXFILES  in RAM and in ROM can be listed
 together  with  an indication of type (operator, statement, keyword etc)  and  a
 little more information including, for functions, the types of parameters.

 The HELP Lexfile adds one keyword to the system, HELP.  The syntax is

      HELP
         or
      HELP 'keyword'

 HELP without a parameter  will  scan  through all the LEXFILES, starting in RAM.
 When using this form of  HELP,  DELAY  should be set to a large value (eg 1000).
```

After invoking HELP almost any keyhit will move to the next available keyword. Hitting [ATTN] will jump to the beginning of the next LEXFILE. Running off the end of the list of keywords will end the HELP program. Alternatively, DELAY can be set to zero and a printer set as the DISPLAY IS device. The listing will then be printed.

HELP with a 'KEYWORD' as a parameter will display the available information about that keyword only.

The information provided by HELP takes the form:

```
      NNN x TYPE: NAME (parameter list)
        where
      NNN is the ROM ID as a decimal number
        x is a character giving the version number of the LEXFILE
        TYPE is the type of keyword which may be
      STMT: programmable statement legal after THEN etc
      stmt: programmable statement not legal after THEN etc
      CMND: not programmable
      FNC$: string function
      FNC#: numeric function
      OP#1: numeric unary operator
      OP#2: numeric binary operator
      OP$1: string unary operator
      OP$2: string binary operator
      OTHR: none of the above
 In the case of functions the parameter list will be shown.
 Parameters are defined as follows
      $ string parameter
      # numeric parameter
      #() numeric array parameter
      $() string array parameter
```

Below is a hexadecimal dump of the HELP LEXFILE that can be keyed in and turned into the LEX file by following the instructions given in my article on pages 28 and 29 of Volume 7 Number 2 (March 1988) of Datafile. In this case call the TEXT file HELPX (EDIT 'HELPX',TEXT) and MAKELX75 will produce the LEXFILE with the name HELP. If you need copies of the MAKELX75 and PEEKPOKE files mentioned in that article send me media (1 disk, 1 tape or 2 cards) and return postage and I will get them to you as quickly as possible.

HELP L 524 Bytes ROM ID: 101

 Roger Wiley, 1 Goughs Lane, BRACKNELL, Berkshire, RG12 2JR
```

And here is what the command produces on my machine. No wonder that "PEEK" alone didn't work!

Re: HP-75C "sendio" Lex?

*Message #8 Posted by **Vassilis Prevelakis** on 29 July 2005, 1:49 a.m.,*
in response to message #1 by Howard Owen

The SENDIO command is included in the HPILCMD LIF supplied with the HP-75 I/O Utilities.

http://www.series80.org/Misc/HPILCMD.bin

The file in HP LIFUTIL format (*DFS to LIF file type preserved* xfer type).

You can get the LIFUTIL binary from ftp://ftp.hpmuseum.org/lif/lifutil

If you run into trouble the easiest way to remove the header is to copy the file skipping the first 0x200 (512) bytes. i.e.

```
dd if=HPILCMD.bin of=HPILCMD bs=256 skip=2
```

And then you have to restore the directory info:

```
HPILCMD       -8055        5      256      18
```

Best Regards

**vp

Re: HP-75C "sendio" Lex?

*Message #9 Posted by **Howard Owen** on 29 July 2005, 11:38 a.m.,*
in response to message #8 by Vassilis Prevelakis

Thank you, Vassilis! That was exactly what I was looking for. I had no idea you had HP-75 stuff. I guess it makes sense though, seeing as how the 80 series and the 75 both run a capricorn processor.

I can use the LIF format directly, (see my latest addtion to the articles forum for a description,) but the file name doesn't work with the 75C. It's "WS_FILE" which results in "invalid filespec" on an attempt to copy. I edited the binary to remove the underscore and things went smoothly after that.

Thanks again. That certainly is worth a buck! 8)

E-bay 41-CV

*Message #1 Posted by **Tony** on 26 July 2005, 7:02 a.m.*

I can't believe this 41-CV is still only 7,50 GBP with 1 day left! http://cgi.ebay.ie/ws/eBayISAPI.dll?ViewItem&item=5791165035&rd=1&sspagename=STRK%3AMEWA%3AIT&rd=1

I won't be buying, but I thought someone here might like to.

Re: E-bay 41-CV

*Message #2 Posted by **Sean** on 26 July 2005, 10:37 p.m.,*
in response to message #1 by Tony

Of course you won't buy it; you're the seller .. :-)

Re: E-bay 41-CV

*Message #3 Posted by **Tony** on 27 July 2005, 3:45 a.m.,*
in response to message #2 by Sean

No, I'm not the seller, and I don't even know the seller. I seem to remember prices around €200 being fetched for second-hand 41-CV's, so I was amazed at the lack of interest being shown in that one.

Re: E-bay 41-CV

*Message #4 Posted by **Menno** on 27 July 2005, 7:06 a.m.,*
in response to message #3 by Tony

The prices were very high because the HP41's were used in the Concorde.

Air France was buying every available HP41.....

Re: E-bay 41-CV

*Message #5 Posted by **Howard Owen** on 27 July 2005, 2:20 p.m.,*
in response to message #1 by Tony

Three points:

1. It still has 3 hours to go and it's up to 54 bucks or so. It will probably move higher before it sells.
2. It's a bare 41-CV and it has stuff in the display. That won't command premium prices. (The photos are poor as well.)
3. It's listed in Consumer Electronics > Gadgets > Calculators, whereas most 41s go in Scientific Calculators > Hewlett Packard under that category. Misfiling is what a buyer looks for on eBay.

Re: E-bay 41-CV

*Message #6 Posted by **Howard Owen** on 27 July 2005, 9:45 p.m.,*
in response to message #1 by Tony

Final price: GBP 72.00

That's low in my opinion, but not out of line for the condition of the display.

9815 repairs: spare some silicone hose?

*Message #1 Posted by **John Ioannidis** on 25 July 2005, 6:30 p.m.*

I recently got an 9815 S on ebay. The electronics are functioning fine, but the tape had a gooey capstan. The repair requires either silicone tubing or heatshrink. I can't use the heatshrink because I can't get the motor/capstan out of its base without dangerously bending some cables that are in front of the holding screws. I've been scouring the hardware stores and Home Depot in Manhattan for silicone tubing, but the thing appears to be rarer than hens' teeth!

Does anyone (who has hopefully repaired a 98XX/HP85 tape drive) have a small piece of silicone tubing they can put in an envelope and post to me?

Thanks

/ji

Re: 9815 repairs: spare some silicone hose?

*Message #2 Posted by **Katie Wasserman** on 25 July 2005, 10:15 p.m.,*
in response to message #1 by John Ioannidis

Here's a nice writeup that Vassilis did with my advice and others. http://www.series80.org/Articles/capstan-repair.html

The HP85 uses the same drive mechanism as the 9815A and 9825A/B. You don't need to take the entire assembly apart when using the Magic Wrap tape.

how to repaur a 3.5" floppy drive

*Message #1 Posted by **Patrice** on 25 July 2005, 1:00 p.m.*

Hi all, I have some 3.5" floppy drives but the parts do not slide any more or with dificulty. The greace seems sticky.

What are your hints to clean it and to regreace the parts after.

Thanks for ,help Patrice

Re: how to repaur a 3.5" floppy drive

*Message #2 Posted by **Tony Duell** on 25 July 2005, 1:49 p.m.,*
in response to message #1 by Patrice

I am sure I've commented on this before, it may be worth searching the archives...

Anyway, the normal problem, at least on the earlier drive, the one used in the 9114A, is that the grease on the eject mechanism goes sticky. The thing then doesn't latch properly when you eject a disk, the upper disk head gets caught in the disk, and gets ripped off the gimbal spring. If this has happened, you need a new head assembly, and you have all the fun of aligning it...

If the head is still OK, then you need to dismantle the drive and clean off the old grease. Remove the drive from the unit and take off any mounting brackets/plates. Undo the single screw on the back and take off the top cover.

Untangle the wiring to the stepper motor. Take out the 3 screws on the bottom and take off the screening cover. Ease the PCB away from the drive chassis and unplug all the connectors (note where they all go, of course). Put the PCB aside in an anti-static bag.

Inside the drive chassis (on the bottom, where the PCB came from), take out the 2 screws at the very front. Remove the front panel, don't damage the in-use LED or lose the eject button or spring.

On top, take off the eject damper at the back left (1 screw). Undo the 2 screws on the head load bracket (one holds the earthing tag in place), put a piece of clean tissue between the heads and remove the bracket. Feed the solenoid wires through the chassis and remove the complete assembly.

Underneath again, undo the 4 screws at the sides which hold the disk holder/eject mechanism in place. Remove the mechanism.

Take off the E-clips that hold it together. Pull out the shafts (don't lose the spacers). Unhook the springs (note where they all go). Then clean the old grease off with propan-2-ol (isopropanol).

Put it all back together, and it should be fine again.

Re: how to repaur a 3.5" floppy drive

*Message #3 Posted by **John Limpert** on 26 July 2005, 6:43 p.m.,*
in response to message #1 by Patrice

I've fixed some larger drives by cleaning all of the gunk off the rails and worm screw, and applying a light coating of molybdenum grease.

What happened to OpenRPN?

*Message #1 Posted by **Walter B** on 24 July 2005, 1:42 a.m.*

For several days now, I cannot reach openrpn.org - seems this site is down, at least it doesn't respond :-(. Did they change their address? Google lists the old one still ...

Well...

*Message #2 Posted by **Aston** on 24 July 2005, 5:52 a.m.,*
in response to message #1 by Walter B

... Maybe they realized that talking is fun, but producing real-world products takes a little more than 3D drawings?

Re: Well...

*Message #3 Posted by **.** on 24 July 2005, 6:40 a.m.,*
in response to message #2 by Aston

I suspect that the site is down only for the short-term. However you have a point. The project is sadly on the decline.

Re: What happened to OpenRPN?

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 24 July 2005, 1:57 p.m.,*
in response to message #1 by Walter B

I think that the OpenRPN project starved to death...

I also think that the "thing" that they are building are anything but a calculator. For a PDA I'll go to the next store and buy one.

These are *my* opinions as an earlier collaborator to this project, before it was even founded. Now I'm only an eventual reader due to differences of what I expected from it.

Best regards,

Nelson

Re: What happened to OpenRPN?

*Message #5 Posted by **hugh steers** on 24 July 2005, 3:22 p.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

i wrote a functioning 20 digit bcd library with trig functions. i put some of these into a windows demo of what the calculator might be like. if interested, get the windows binary here;
www.voidware.com/tmp/rpndemo.zip

unfortunately, no one seemed to be able to make a decision on how the buttons should be laid out. my take was that i am happy to help write the software but i don't have time to drive the decision process.

the other thing was that i didn't really want to write the rpl system. the problem was over just how compatible it was supposed to be to the hp one. i didn't like the idea of 100% compatibility because then you're just reimplementing an hp. and on the other hand, i personally have never been a real big fan of rpl. i would prefer to see something like 71b basic which was really easy to work with.

on the hardware side, i don't have a strong preference as long as it works. although i did expect someone to, at least, make a prototype board with a display and maybe get it to add numbers or something.

otherwise what are you doing.

Re: What happened to OpenRPN?

*Message #6 Posted by **Hugh Evans** on 24 July 2005, 8:31 p.m.,*
in response to message #1 by Walter B

The site went down sometime last week while our admin was out of town. Everything will come back to life within the next 24 hours. Contrary to other posts in this thread the project is not starving to death (as for making too much of a PDA I will be posting some updates to thoroughly dispell this belief).

In addition I have worked out a tentative complete keyboard layout, and we are working on a dynamic wiki-based software development model and possibly a browser plugin. Hardware development has been going on behind the scenes.

In conclusion, OpenRPN is doing great. We bypass hosting costs by using our own servers... which saves money but occassionally bites us with reliability issues.

-HDE

Re: What happened to OpenRPN?

*Message #7 Posted by **Gene** on 24 July 2005, 11:24 p.m.,*
in response to message #6 by Hugh Evans

I'm beginning to really doubt that this will go far. The words are always the same, and the servers are down a lot.

However, I would be very glad to eat my words. I just don't expect to have to do so.

Gene

Yeah, sure...

*Message #8 Posted by **Aston** on 25 July 2005, 2:04 a.m.,*
in response to message #6 by Hugh Evans

Glad to know that you are "working" on yet another keyboard layout. Most urgent stuff, I guess.

Sorry guys, I've seen this kind of amateur projects fail so often. Nothing personal against you. Look at the previous months, look was was produced? Nope.

At the same time, it is possible to use a perfect simulator (V41, NonPareil, etc...) or buy real, solid, perfect vintage HP's on eBay.

Re: Yeah, sure...

*Message #9 Posted by **Hugh Evans** on 25 July 2005, 3:03 a.m.,*
in response to message #8 by Aston

No offense taken. The vast majority of this community will remain skeptical until calculators start arriving in their mailboxes :-)

Many achievements involve disproving skeptics... So that's my job here.

Re: Yeah, sure...

*Message #10 Posted by **Chan Tran** on 25 July 2005, 7:39 a.m.,*
in response to message #9 by Hugh Evans

I just read the FAQ for the first time. I think the goal of $100 for an all aluminum, water tight and with molded thru keys is too ambitious.

Re: Yeah, sure...

*Message #11 Posted by **Hugh Evans** on 25 July 2005, 1:46 p.m.,*
in response to message #10 by Chan Tran

Actually those features are among the least ambitious. We probably won't be using aluminum in our first production run since we need a material that is easy to machine and cut with a laser. Plastics will be used instead. Custom molded labels are nothing special to make given that you use modern technology.

The FAQ page you read is horribly out of date, please refer to this page (I will also correct the link on the OpenRPN site.):

OpenRPN FAQ

NEW HP 20S ?

*Message #1 Posted by **Walter B** on 24 July 2005, 1:23 a.m.*

Perhaps I missed something. Please look at this:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5792137082&category=58039&rd=1

Until now, I thought the only Pioneer with this colour scheme was the late HP 32SII. Does anyone of you know the production dates of these HP 20S? Thanks in advance!

Re: NEW HP 20S ?

*Message #2 Posted by **Karl Schneider** on 24 July 2005, 2:23 a.m.,*
in response to message #1 by Walter B

Walter --

That's what I believed, also. I'd guess that it's a warranty-replacement unit made in Indonesia (ID). I have an ID 20S with the yellow-and-blue scheme made in 1997. My co-worker has an ID 32SII (yellow-and-blue) made in 1998; my ID 32SII (green-and-lavender) is from 2001.

So, sometime between 1998 and 2001, HP made the decision to abandon the sensible colors on the 20S and 32SII in pursuit of trendiness and maybe lower production costs.

Re: NEW HP 20S ?

*Message #3 Posted by **Julian Miranda (Spain)** on 25 July 2005, 2:44 p.m.,*
in response to message #1 by Walter B

I don't know in the USA, in Europe you could buy one new at the stores.

Re: NEW HP 20S ?

*Message #4 Posted by **Norris** on 26 July 2005, 1:47 a.m.,*
in response to message #3 by Julian Miranda (Spain)

The collection at www.rskey.org shows two types of 32SII. The older type (brown bezel, yellow/blue labels) is dated 1991-1999. The newer type (silver bezel, teal/lavender labels) is dated 1999-2002.

If rskey is correct, then the 32SII was redesigned in 1999. This is consistent with my old-style 32SII, which is dated mid-1998. The redesign may have coincided with a packaging change in the US, from cardboard boxes to clear blister packs.

The 20S was apparently redesigned at about this time as well. The 20S underwent the same change in label colors (though the bezel stayed black). I have a 20S with teal/lavender labels dated mid-2001.

Curiously, the 20S owner's manual apparently did not get updated to reflect the new color scheme. The front cover of the manual that came with my teal/lavender 20S shows a model with yellow/blue labels, and the text inside explicitly refers to the yellow/blue labels. The manual is Edition 6, dated 11/94.

I can compare the two 20S color schemes by placing the calculator and the manual side by side. The yellow/blue scheme appears to be much superior.

Re: NEW HP 20S ?

*Message #5 Posted by **Frank K** on 26 July 2005, 8:43 a.m.,*
in response to message #4 by Norris

Yes, somehow, HP forgot these legends needed to be clearly seen rather than just an aestetic accent color, happened on the 10B also with the change from gold to green legends on the black background.

Re: NEW HP 20S ?

*Message #6 Posted by **Hugh Evans** on 26 July 2005, 8:48 a.m.,*
in response to message #4 by Norris

From an optical standpoint the blue and yellow color scheme is superior for only one reason: whoever selected them obviously did their homework on LAB colors and how to properly use the system. I'm planning to write a short article about color selection for the OpenRPN site. The later scheme could have worked just as well had higher luminance values been selected.

Here is the set from OpenRPN. Blue and yellow-orange will be the standard colors. Green may be used for alpha labels. Various combinations could be selected for color visual impairments as well.

HP-42S Rom Dumping using PalmOS.

*Message #1 Posted by **José Lauro Strapasson** on 23 July 2005, 9:24 p.m.*

Hi There!

I would like to get the rom from my brother's calculator but the problem is I never got the serial cable of my old hp-48g to work. So I was thinking about using my palmtop with Power48 or some other program. Is is possible?? Or does someone have another idea? Thank you very much!

José Lauro. jlstrapasson@uol.com.br

Printing barcodes with HP82162A

*Message #1 Posted by **Artur - Brasil** on 23 July 2005, 9:12 p.m.*

Hi,

Could someone help me on how to print my programs for HP41 in barcodes using the HP 82162A printer? Is there a way to print (list) directly from the calculator? Best regards, Artur

Re: Printing barcodes with HP82162A

*Message #2 Posted by **Vassilis Prevelakis** on 23 July 2005, 9:31 p.m.,*
in response to message #1 by Artur - Brasil

The easiest way is to use the printer/plotter module.

If you do not have the module itself you can buy a module emulator and use the ROM image from TOS.

Alternatively you may want to check old PPC journals on the MoHPC CDROM. I believe there is a program there that does what you want.

**vp

Program listings online here

*Message #3 Posted by **Gene** on 23 July 2005, 10:22 p.m.,*
in response to message #2 by Vassilis Prevelakis

http://www.rskey.org/gene/calcmuseum/41bc.htm

Five different programs with various requirements.

Enjoy!

Thanks!

*Message #4 Posted by **Artur - Brasil** on 23 July 2005, 11:02 p.m.,*
in response to message #3 by Gene

I'll try the programs in the link. As I don't have the plot module (any for sale/trade?), I'll try the dangerous synthetic programming ...

Thank to all of you again! Artur

and the 82143?

*Message #5 Posted by **marais** on 24 July 2005, 4:01 a.m.,*
in response to message #4 by Artur - Brasil

Do these programs also work for the non-IL version of the thermal printer, the 82143?

Andreas

No, only the HP-IL version...Re: and the 82143?

*Message #6 Posted by **Gene** on 24 July 2005, 7:25 a.m.,*
in response to message #5 by marais

Sorry...only the 82162 printer. Won't work with the original printer.

Gene

Re: No, only the HP-IL version...Re: and the 82143?

*Message #7 Posted by **marais** on 24 July 2005, 7:35 a.m.,*
in response to message #6 by Gene

Is there a fundamental reason, i.e. does the 82143 lack features that the IL has and that are essential for the barcodes?

Re: No, only the HP-IL version...Re: and the 82143?

*Message #8 Posted by **HrastProgrammer** on 24 July 2005, 12:31 p.m.,*
in response to message #7 by marais

AFAIK, HP-82143A doesn't have the ability to directly print bar codes (no #80..#8F sequence in 8-bit mode or ESC * z sequence in ASCII mode as on the HP-82162A printer). They can eventually be printed using column mode on HP-82143A with the aid of appropriate program.

Re: No, only the HP-IL version...Re: and the 82143?

*Message #9 Posted by **Eric Smith** on 24 July 2005, 2:39 p.m.,*
in response to message #8 by HrastProgrammer

Not even with column mode, because the print buffer is only forty-someodd bytes long, and because you can't control the vertical spacing of printed lines, so you can't get suitable bar widths lengthwise.

Re: No, only the HP-IL version...Re: and the 82143?

*Message #10 Posted by **HrastProgrammer** on 25 July 2005, 1:16 a.m.,*
in response to message #9 by Eric Smith

Yes, buffer size might be a big problem. I haven't been thinking about that because in my implementation of Helios printer the buffer size is 224 bytes :-)

Re: No, only the HP-IL version...Re: and the 82143?

*Message #11 Posted by **Eric Smith** on 25 July 2005, 6:13 p.m.,*
in response to message #10 by HrastProgrammer

I suppose I could make the buffer size configurable in Nonpareil, but thus far I've tried to keep things as close to identical to the real hardware as possible.

There may be 41 programs that depend on the behavior of the 82143A buffer, and generate incorrect output if the simulated printer has a larger buffer.

Eric

Problems!

*Message #12 Posted by **Artur - Brasil** on 24 July 2005, 7:27 p.m.,*
in response to message #4 by Artur - Brasil

```
Hi, Gene and other guys,

I have reformated the program listing and saw some problems:
-lines 183,187,209 - are they empty?
-lines 184,188,217, 259 show X="0?" - is that correct?

Best regards,
Artur

ps: my reformated program listing, for better printing (copy and paste):

Re: Problems solved!

*Message #13 Posted by **Gene** on 25 July 2005, 8:05 a.m.,*
in response to message #12 by Artur - Brasil

Best way to know the correct listing is to pull out your trusty PPC Journal collection:

"The program presented below is basically the program presented by Winfried Maschke of West Germany in the V9N4P44 PPC Journal (May/June/July 1982)."

What? You don't have physical copies of the PPC Journal?

Then surely you have the PDF copies from Jake Schwartz? If not, why not? :-) No collector should be without them.

1) Ignore the " " marks around the 0 in the X=0? lines. They are just normal x=0? lines. The HTML was giving me trouble with them for some reason.

2) Lines 183 and 187 and 209 should all be a - (minus).

Not sure why the formatting is off, but this agrees with the listing on page 44 of V9N4.

Gene

Problems solved! Many Thanks

*Message #14 Posted by **Artur - Brasil** on 25 July 2005, 8:32 a.m.,*
in response to message #13 by Gene

Thanks again, Genre! I'll try and verify if I have the PPC Journal in HPMuseum DVD. I'll also correct the reformated page I've listed and if you would like, put it in place of yours in your site. Best regards! Artur

The fixed listing

HP-41 UAC version 0.5.2 released

*Message #1 Posted by **Geir Isene** on 23 July 2005, 5:35 p.m.*

After an unprecedented effort from both the development community and the testing crew, we are now proud to present the new version of the HP-41 Ultimate Alarm Clock.

Version 0.5.2 offers improved functionality and is even more user frendly than the previous versions. From the change log:

- Added 10 minute snooze (pressing R/S after stopping the alarm when it has gone off)
- Added "LBL e" to "hold" the alarm
- Modified "LBL b" to be user defined. Enter the time to put the set alarm into the future
- Added version number to show as the third R/S press after the initial menu

Go to the Sourceforge project site for the download.

Obviously, these are great advancements in the program. However, as we aim to make this alarm clock a historical milestone, a full 0.6 release will require even greater feature enhancements. Future enhancements may include a plug-in (via HP-IL) to your body to sense your state of sleep and adjust the tones so that you get the best possible waking up in the morning.

Re: HP-41 UAC version 0.5.2 released

*Message #2 Posted by **Theo** on 24 July 2005, 7:31 a.m.,*
in response to message #1 by Geir Isene

Hello, This looks like a fun program, but on the site there is no download possibility. Clicking on download merely bring's one to a page with descriptions of the the program and a text doc, nothing else.... Am I missing something here? Thanks, Theo

Re: HP-41 UAC version 0.5.2 released

*Message #3 Posted by **Geir Isene** on 24 July 2005, 8:19 a.m.,*
in response to message #2 by Theo

Hello,

The program's official home page is http://www.isene.com/artweb.cgi?article=009-hp41alm.txt .

On the Sourceforge project site, the text file for download is the program listing itself. Here you can also enter feature requests and bug reports :)

Re: HP-41 UAC version 0.5.2 released

*Message #4 Posted by **doug** on 25 July 2005, 4:36 a.m.,*
in response to message #3 by Geir Isene

So, there is development community, testing crew and merchandise (T-shirts, teddybear and underwear) for a rather simple 174-line program any experienced HP-41C user on this forum can write ?!?

Re: HP-41 UAC version 0.5.2 released

*Message #5 Posted by **Geir Isene** on 25 July 2005, 6:23 a.m.,*
in response to message #4 by doug

Yes indeed, doug!

Would you like to join the HP-41 UAC community?

We have experienced an unprecedented growth of the community the last weeks (around 100% increase). The community is contributing in many ways - feature requests, feature discussions, buying mercandise and more. In fact, due to overwhelming interest in the T-shirt with the code listing on the back, we have started shipping the first few T-shirts to the most active community members

We would be happy to have you on our team, doug. That would lead to another 50% increase of our large and active community.

Re: HP-41 UAC version 0.5.2 released

*Message #6 Posted by **Theo** on 25 July 2005, 7:55 a.m.,*
in response to message #4 by doug

Well, all I would like to say is that in my personal opinion, (for whatever that's worth!) anyone who is doing something....on any level....to keep the interest in the HP 41 active for newbie collectors or high-end hacks...is fine with me!

Let everyone enjoy the 41 as they wish and according to their level. Maybe some people (like me mucho years ago) will have their first contact with very basic concepts of programming by completing a program like this for fun- and then have the pleasure to hear it work if they did a good job of it....

And no, I have nothing to do with this program or the people involved! Cheers all, Theo

Re: HP-41 UAC version 0.5.2 released

*Message #7 Posted by **don wallace** on 1 Aug 2005, 1:32 a.m.,*
in response to message #6 by Theo

Hi all.

Reading this thread sure did give me a laugh!

Congrats to the programming "team" at UAC; cool, really kewl!

Although programming the 41CV is not exactly rocket science, as an owner for 24 years who has written a lot of software for it, (one carefully written app of mine still filled the machine), I can appreciate what a 174 line program for a 41CV can actually do!

You can pack a lot of computation into the USER programs we all write. Anyone who disparages such efforts, well... Beneath me to comment on it.

Hp rpn programming is not BASIC ya know, "Doug"... Compare it to Forth, it's closer. ;-)

Kind regards,

Don Wallace

Those who talk do not know. Those who know do not talk

Best way to open a modul-housing

*Message #1 Posted by **Wilhelm Loidl** on 23 July 2005, 7:55 a.m.*

Hello!

In Gary Friedmans Book "Control the world with HP-IL" is an I/O-adaption of the HP-41c/cv time-modul desribed.

Can someone tell me how to "crack" the modul-case without problems ;)

Thank you

Wilhelm Loidl

Re: Best way to open a modul-housing

*Message #2 Posted by **Wilson W Holes** on 23 July 2005, 11:21 a.m.,*
in response to message #1 by Wilhelm Loidl

Check out --> http://www.tla.org/hp41/module.html

Other, possibly better methods exist but this has always worked well for me.

Re: Best way to open a modul-housing

*Message #3 Posted by **Wilhelm Loidl** on 23 July 2005, 11:32 a.m.,*
in response to message #2 by Wilson W Holes

Thank you!

Found another way:

http://www.hpmuseum.org/guest/klug/dblxmem.pdf

(but this finding was not nice: now I have to build a dblXmem modul too;)

Wilhelm Loidl

Re: Best way to open a modul-housing

*Message #4 Posted by **Miki Mihajlovic** on 23 July 2005, 1:48 p.m.,*
in response to message #3 by Wilhelm Loidl

I find that using long nose pliers (nozzle pliers) works best for me. This is the trick Diego Diaz told me about. The longer and thinner the nose the better. Put the nose of pliers in the module opening, and CAREFULLY open the pliers while at the same time applying counter pressure with your fingers opposite to pliers action (for balancing) until the module cracks. In 95% of cases the module opens

flawlessly.

Thank you!

*Message #5 Posted by **Wilhelm Loidl** on 24 July 2005, 11:20 a.m.,*
in response to message #4 by Miki Mihajlovic

Hello!

The "knife-method" works perfect for me - thank you again!

How to compare HP solvers ?

*Message #1 Posted by **jose goncalves (brasil)** on 22 July 2005, 10:22 p.m.*

I´ve been checking the different solvers for some HP calculators and I wonder if there is any organized paper that compares the features and limitations of of them. Since the one that we have in the HP 80, that might have been the very first one, HP created a whole family of those time saving tools.

I´ve seen several messages here at MoHPC discussing some types of solvcers, but I´m looking for something more comprehensive and complete. Can someone tell me where to find a paper on HP solvers ?

Thanks.

Re: How to compare HP solvers ?

*Message #2 Posted by **Vincent Weber** on 23 July 2005, 2:17 a.m.,*
in response to message #1 by jose goncalves (brasil)

Try this, a good detailed descriptions of HP solvers.

http://www.finseth.com/hpdata/solvers.html

To my mind, the best solver is the one featured on 17BII/19BII; also in 27S, even though it does not seem to have symbolic simplification (which is transparent in the user interface). More than a solver, this is a true programming language, almost as powerful as BASIC (unfortunately, the lack of user-defined functions limits its power). The L() and G() functions allows intermediate variables and true programming. A pity that despite this, the 17BII/19BII/27S are often refered to as 'non-programmable devices' !!

Next would be the 42S solver, which lacks algebraic equation entry (RPN is nice, but NOT for equation entry) and forces you to 'MVAR' any variable supposed to appear in the menu (But let you access to the full power of RPN programming). A pity, really - think of the killer machine a merge of 42S and 27S would be...

Next, the 32SII/33S solver - neat, simple to use, well integrated with RPN (a unique case in HP calcs of harmony between RPN and algebraic equations), but with severe limitations: no editing capabilities of equations, no long variable names, no implicit multiplication (a nonsense when you don't have long variable names - you could have at least the benefit when you pay for the cost !), and somewhat clumsy interface (you need to circulate through all variables instead of the neat menus of 17BII/19BII/27S/42S). However, this works well for most problems.

Hope this helps. Cheers, Vincent

Re: How to compare HP solvers ?

*Message #3 Posted by **Katie Wasserman** on 23 July 2005, 8:56 p.m.,*
in response to message #2 by Vincent Weber

I think that the solver on the 100LX/200LX (and 95LX?) is the most sophisticated. It interfaces with Lotus 1-2-3 as well as the other calc functions (like list-based statistics). You can use 1-2-3 as a R/W array and

really write BASIC-equivalent programs. Take a look at the this thread and the pi program at the bottom of it: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/archv014.cgi?read=49560

Re: How to compare HP solvers ?

*Message #4 Posted by **Namir** on 24 July 2005, 1:45 a.m.,*
in response to message #1 by jose goncalves (brasil)

I am preparing a presentation for the HHC2005 conference in Chicago this coming September to compare HP solvers. I expect it to be posted on the web. I am using a set of 17 equations to test various solvers, ranging from the HP34C to the HP49G+. The solvers seem to fall into a family of implementations:

1. The financial calculators 2. The HP28S, HP42s, and the graphics calculators (HP48SX did show some minor differences in results) 3 The HP32S, HP32SII, HP33s set of calculators.

I did test the TI-200 also and it showed superior results in the case of where the initial guess is near a minimum of an equation that has a root (y = exp(x) - 3 * x^2 + 8). None of the HP solvers found the root given initial guesses near the minimuum--most DID report the minimum value. The TI-200 found the root.

The HP solvers seem to have a common root (the HP34C solver) and share common criteria for when to continue to search and when to stop iterating.

Namir

Re: How to compare HP solvers ?

*Message #5 Posted by **Chris Dean** on 24 July 2005, 7:35 a.m.,*
in response to message #4 by Namir

Namir

Will you be posting your results anywhere on the internet as I am sure people including myself would be interested in your results? In fact I would expect the 17 equations would be enough to create some dialog.

You could possibly benefit by posting them early and see the programming techniques that are used by various people to solve them using the Solver function.

Chris Dean

Re: How to compare HP solvers ?

*Message #6 Posted by **Namir** on 24 July 2005, 9:14 a.m.,*
in response to message #5 by Chris Dean

I have the info on PowerPoint slides and will convert them into PDF that are easy to post. I also have a leading part of the presentation that includes a discussion (and brief comparison) between various algorithms (Bisection, Newton, Secant, Richmond (Halley), Householder, Brent, and Ridder). The presentation includes psuedo-code so folks can implement them in their favorite language. This too comes as a PowerPoint presentation that I will submit as a PDF. Both PDFs will be posted on the net. The presentation also includes a new algorithm that I designed that improves on Bisection. Moreover, I present a suggestion by DeMoivre that reduces the number of slope caculations. This has the effect of reeducing the number of function calls when approximating the derivatives using difference equations.

If you can't wait, then I encourage you to attent HHC2005 in Chicago.

Namir

Re: How to compare HP solvers ?

*Message #7 Posted by **Chris Dean** on 24 July 2005, 2:45 p.m.,*
in response to message #6 by Namir

namir

Thanks for the offer but work commitments will not allow going to conferences as I am based in England. I will await the PDFs.

Good luck with the presentation.

My name in the list (not the HHC2005...)

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 24 July 2005, 6:29 p.m.,*
in response to message #6 by Namir

Hi Namir, all;

this is one of the (so too many) subjects I`d like to enhance my knowledge about. I`m sad I have no means to go to the HHC2005, so please, my name in the list waitting for your papers.

Good luck in your presentation (should it be 'break a leg'?)

Best regards.

Luiz (Brazil)

Re: My name in the list (not the HHC2005...)

*Message #9 Posted by **Namir** on 25 July 2005, 8:17 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

Thank you guys for yoru comments. Root-finding has been my hobby for the last 30 years!! I recently switched to playing with optimization methods because you can use then to solve multiple nonlienar equations AS WELL AS non-linear regression.

I also have a C# and VB.Net listing of a class that solves for a root of single-variable nonlinear equations and take into account the weaknesses of Newton methods-- low slope value near root and functions with parallel assymptotes (such as artan or tanh functions). I have the pcode for that cobined algorithm, which should appear in the PDF file.

Namir

Re: My name in the list (not the HHC2005...)

*Message #10 Posted by **Vieira, Luiz C. (Brazil)** on 26 July 2005, 1:07 a.m.,*
in response to message #9 by Namir

Hello, Namir;

I`d like to drop you some lines related to numerical root-fiding for your appreciation. The

issue is related to the root-fiding process itself, but probably will not add anything to your words (and presentations) at HHC2005. Would you contact me so I can send you some files?

lcvieira at quantica dot com dot br

Thank you.

HP85 Games

*Message #1 Posted by **Mark Bielman (USA)** on 22 July 2005, 6:23 p.m.*

Looking for the GAMES II Pac for HP-85 (00085-13057). Far superior to the GAMES I Pac, GAMES II had such titles as BATS, FATCAT, ASTEROID and (I think) FOOTBALL.

Anyone out there have a copy of this? (my tape has turned to dust!)

Thanks in advance.

Mark

Re: HP85 Games

*Message #2 Posted by **bottles** on 11 Aug 2005, 3:44 a.m.,*
in response to message #1 by Mark Bielman (USA)

I have a copy of this cartridge (the files, the cartridge is long gone) on a hard disk attached to a hp85b. I dont know, however, how to get them off. Any suggestions and I will try to put them on a web page.

Re: HP85 Games

*Message #3 Posted by **Vassilis Prevelakis** on 11 Aug 2005, 12:06 p.m.,*
in response to message #2 by bottles

```
In order to tell you how to transfer stuff off you HP-85, I need to
know exactly what configuration you have. E.g.

        - You have n HP-85B. How much RAM does it have installed?
        - Adapter cards (obviously you have HPIB, anything else?)
        - ROM modules (e.g. EMS ROM, etc)
        - You have a hard disc drive, which model?
        - Floppy drives? (their size and whether they known to work)
        - anything else ...

Also I need to know what "modern" systems you have near the HP-85B
(e.g. PC running Windows/Linux/BSD*, etc.)

Differences between Classic ROMs from AMI or MOSTEK ?

*Message #1 Posted by **Bernhard** on 22 July 2005, 4:22 p.m.*

Question to the hardware hackers on this list (or maybe a retired HP engineer): is there some particular feature in the two Clocks, SYNC and POR which causes Classic HP Mostek ROMs to fail with a read timing that works with the like AMI parts having the same HP part number ? I have examined signals of CTCs from both Mostek and AMI on the scope and saw no feature that should make such a big diffence between go / nogo. The trouble is, the Mostek ROMs do not start up (they always give out the same dataword on IS) despite the addresses do count up. Seems some state machine within the ROM hangs, so there must be something wrong with the timing sequence, but what detail eluded me I don't know.

Any hint is much appreciated. You may use my above email address but remove everything after the first four lower case digits and the at.

Regards, Bernhard

Re: Differences between Classic ROMs from AMI or MOSTEK ?

*Message #2 Posted by **Michael F. Coyle** on 23 July 2005, 10:44 p.m.,*
in response to message #1 by Bernhard

Hi Bernhard,

I have an old article about the HP-35 which states in part

> Quote:
>
> Production models are either all-AMI or all-Mostek because the two suppliers' chips don't really run well together. Though the parts are the same electrically, the different locations of the precharge make it impossible for the Mostek A&R to operate with the AMI ROMs.

Although they mention a different combination of chips than you do I suspect it's the same problem.

The article also mentions that the prototype HP-35 did use chips from both vendors so apparently some combinations are possible.

Hope this helps.

Michael

Re: Differences between Classic ROMs from AMI or MOSTEK ?

*Message #3 Posted by **Bernhard** on 25 July 2005, 8:08 a.m.,*
in response to message #2 by Michael F. Coyle

Hi Michael,

"different precharge location" - a very good clue, I'll reexamine both AMI and MOSTEK CTCs, ARCs and ROMs again on the scope and watch out for what happens around the clock pulses. Maybe it's a combined effect in the chip set, like in the Woodstocks, where I also had some initital difficulty to operate ROMs without the ACT.

One odd observation, though: the stubborn Mostek ROM I have got is from a fully functional HP55 which has the following strange mix of ICs:

Mostek: RAMs and the 1818-0120 ROM (page 0...3) AMI: CTC, ARC and the two other ROMs

I also have a HP45 with all-AMI chipset except for the Mostek ARC.

Both machines are 1975 vintage. Maybe the progress in process technology since 1973 has helped to relax the timing issue so HP was able to start mixing chips from different manufacturers, but a small difference was left - which is not properly implemented in my current ROM reader hardware. AMI ROMs read perfectly, though.

best regards, Bernhard

Any Inside Photos of HP 12C Platinum

*Message #1 Posted by **Jeff** on 20 July 2005, 11:56 a.m.*

I know they are out there. Would anyone mind re-posting those, or e-mailing them to me? Thanks a million!

Re: Any Inside Photos of HP 12C Platinum

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 21 July 2005, 3:02 p.m.,*
in response to message #1 by Jeff

Hi, Jeff;

I have two HP12C Platinum and I can take some pictures of the inside of it (Nikon 3.2MP Coolpix). Should I send them to you by using the e-address you used in this thread? I could also let the pictures available for some time and share the link here.

Some time ago, prior to the HP12Cp being available for sale, G.W. posted some pictures of it, one of them showing the beast´s guts. The Chinese assy is easily verified: a big epoxy bubble in the mid-right of the mainboard and some spare SMD around it. For the sake of technology it's pretty neat, but when we actually think of an HP calculator...

Let me know what you (all) believe is the best choice. Sharing the pictures might be the best choice, though, but I'd like to know what's the best choice.

Cheers.

Luiz (Brazil)

*Message #3 Posted by **Jeff** on 22 July 2005, 9:50 a.m.,*
in response to message #1 by Jeff

Luiz,

Many thanks. Yes, I recall that Gene posted them here awhile back, but I could never open the images.

Yes, if you could put 'em on this site, I'm sure that others would like that, as well.

Thanks again, Jeff

Inside Photos of HP 12C Platinum

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 22 July 2005, 3:20 p.m.,*
in response to message #3 by Jeff

Hi, Jeff;

it took me more time to squeeze the files in the homepage's available space (had to remove a few) than to take the pictures themselves. Please, check them out:

Click to enlarge http://www.logeng.com.br/images/s_plat_screws.jpg
Prior to open. The new HP12Cp case has some tabs that serve as interlocks. I did not see that comming...

Click to enlarge http://www.logeng.com.br/images/s_plat_inside_.jpg
After removing the back case; and...

Click to enlarge http://www.logeng.com.br/images/s_plat_compon_.jpg
...the componnets themselves.

If you need some better images, let me know. I'll find a way to reduce the camera shaking somehow and try to zoom them in, if needed.

Best regards.

Luiz (Brazil)

9810 restoration - my report

*Message #1 Posted by **marais** on 19 July 2005, 6:19 p.m.*

...for those of you who remember the discussion about my dead 9810 in late december last year, I am glad to report that the machine now works again, at least partially. There is still some work to do on the printer and tape drive units, as well as on the power supply, but the calculator itself works flawlessly. I wrote a report on the repair hoping that it might be helpful to revive other 9810s:

9810 repair job

It's a fascinating machine, and I learned a lot about its architecture. Long live the 9810!

Andreas

Re: 9810 restoration - my report

*Message #2 Posted by **Vassilis Prevelakis** on 20 July 2005, 1:57 a.m.,*
in response to message #1 by marais

Congratulations, very nice page.

I also checked your HP 97 repair page, but since my German is prety weak, I didn't make much out of it.

How about translating that one as well?

**vp

Re: 9810 restoration - my report

*Message #3 Posted by **Tony Duell** on 20 July 2005, 3:36 p.m.,*
in response to message #1 by marais

When you want to sort out the printer or card reader, feel free to contact me. I've taken both sections _totally_ apart, and can explain how they should work and how to repair them.

Re: 9810 restoration - my report

*Message #4 Posted by **marais** on 21 July 2005, 3:50 a.m.,*
in response to message #3 by Tony Duell

Thank you Tony. I will soon replace the faulty 74107 in the printer, and frankly expect it to work right after that - the print head looks like new, as does the motor. The card reader however seems to require more work. I think I'll make it my christmas holiday project.

Re: 9810 restoration - my report

*Message #5 Posted by **don wallace** on 1 Aug 2005, 2:31 a.m.,*

in response to message #4 by marais

Hi Marias,

(Guten Tag!)

Had a look at your 9810 page; really cool!

I am wondering if you also have a failed driver transistor on the output side of the 74107 motor "state machine" logic?

Just a thought.

Kind regards from Down Under!

Don W

Re: 9810 restoration - my report

*Message #6 Posted by **marais** on 1 Aug 2005, 2:47 a.m.,*
in response to message #5 by don wallace

Don, that's quite likely, but these don't worry me, as I got plenty of transistors in my spare parts box. As soon as I found out that the 107 FF was dead, I did not bother to look any further. Maybe I'm in for a surprise when I replace the 107 - I'll keep reporting. Thank you for your suggestion!

33s -- Newton's Method

*Message #1 Posted by **Tim Wessman** on 19 July 2005, 4:01 p.m.*

As my teacher was talking (for a rather long time--I've teaken the class before) about newton's method in calculus I started trying to make a program on my 33s for calculating it step by step. I know the solver does basically the same thing, but it was really driving me nuts that I couldn't get something working.

Does anyone have a working newton's method program on their calcs that I could look at for starting? I haven't done much programming yet on the 33s. Is there a way to evaluate an equation from my list? Or would I have to edit my program for each equation?

TW

Re: 33s -- Newton's Method

*Message #2 Posted by **José Lauro Strapasson** on 19 July 2005, 8:28 p.m.,*
in response to message #1 by Tim Wessman

Here is a program to calculate with Newton methold. It is not for 33S but for Ada95 language (like Pascal), maybe it helps.

P.S. I have a 33S too (not that bad) I will try on it too!:)

with Ada.Float_Text_IO, Ada.Numerics.Elementary_Functions, Text_IO, Ada.Integer_Text_IO; use Ada.Float_Text_IO, Ada.Numerics.Elementary_Functions, Text_IO, Ada.Integer_Text_IO;

procedure Newton is

X1:Float; N:Integer;

function Funcao (X:Float) return Float is Y:Float; begin --Put here your function Y:=(abs(X))**2.0 - 5.0 * X + 4.0; return Y; end Funcao;

function Derivada (X:Float) return Float is YLinha,variacao:Float; begin Variacao:=abs(X/1000.0); --This gives the precision. YLinha:=(Funcao(X+Variacao)-Funcao(X))/Variacao; return Ylinha; end Derivada;

begin Put_Line("Enter X1 (not zero)"); Get(X1); Put_Line("Enter the number of interactions:"); Get(N);

for A in 1..N loop Put_Line("F(X" & Integer'Image(A) & ") is : "); Put(Funcao(X1)); New_Line; Put_Line("F'(X" & Integer'Image(A) & ") is : "); Put(derivada(X1)); New_Line; Put_Line("X" & Integer'Image(A+1) & " vale: "); X1:=X1- (Funcao(X1)/derivada(X1)); Put(X1); New_Line; end loop;

end Newton;

*Message #3 Posted by **José Lauro Strapasson** on 19 July 2005, 9:35 p.m.,*

in response to message #1 by Tim Wessman

Hi!

Here is your program. Write your function in program F using X as RCL X. (In the case shown it is x^2-5x+4) Put the initial value in A memory (STO A) Then XEQ N, XEQ N, XEQ N! Have fun!

José Lauro.

P.S. 1000.000 is for the derivative. To create the delta. P.S.2 Could someone delete my other message? Thank you!

LBL F RCL X 2 y^x RCL X 5 x - 4 + RTN

LBL D RCL A 1000000 / STO V RCL A RCL V + STO X XEQ F STO D RCL A STO X XEQ F STO –D RCL V STO / D RCL D RTN

LBL N RCL A STO X XEQ F STO N RCL A STO X XEQ D STO / N RCL A RCL N - STO A RTN

Re: 33s -- Newton's Method

*Message #4 Posted by **Karl Schneider** on 20 July 2005, 2:52 a.m.,*
in response to message #1 by Tim Wessman

Tim --

The 33S, as well as the predecessor 32SII and 32S upon which it was based, all include the SOLVE function. Therefore, I doubt that there would be a Newton's Method program in the manuals, because such a capability is already built in.

The programming and letter-variable paradigm is unique to those three models. However, there is an RPN-based Newton's Method program starting on p. 154 of the HP-11C manual.

Also, there are TVM Equation programs in the HP-11C manual (starting on p. 189) and in the HP-41 Finance and Advantage ROM's. These programs include code to iteratively solve for interest rate in terms of the other four variables, since no direct equation can be derived.

The HP-11C manual is on CD #1 of the MoHPC set for purchase.

These are big cuts indeed. In an other article I read that the cuts will concentrate on where hp does not meet its competitors' performance. How will this affect the calculators division?

Edited: 19 July 2005, 9:26 a.m.

Re: The New HP Way: Cut More Jobs

*Message #3 Posted by **Jim Creybohm** on 19 July 2005, 9:39 a.m.,*
in response to message #2 by Arnaud Amiel

Those of us who are facetious would say "Not at all".

Seriously though, I am glad to see that some of the cuts are coming into the accounting sections and the IT group. (IT group? The hardware people, the software people, or the support people?)

Having said that however, I am less inclined to think that the calculators division will survive the next four years unless they find a killer application/platform.

Re: The New HP Way: Cut More Jobs

*Message #4 Posted by **Bill Wiese** on 19 July 2005, 3:39 p.m.,*
in response to message #2 by Arnaud Amiel

I'm hearing that lots of the cuts will be in services/support groups - the 'consulting' groups that compete w/Big 4 accounting firms, IBM, Sun etc for customer tech implelemtations.

From what I've heard, much of the cuts in these groups will happen in Europe, apparently. IBM did this too a few months ago. European econimic growth just isn't there.

The calculator group is so small CEO Mark Hurd may not even know it exists. Dollar-wise compared to HPs other groups it's "in the noise". Even if it were brilliantly executing and was growing well it could still be cut since it's "small potatoes".

Bill Wiese

That is what I fear.

Re: The New HP Way: Cut More Jobs

*Message #6 Posted by **Eric Smith** on 19 July 2005, 2:51 p.m.,*
in response to message #1 by I, Claudius

A better solution would be for them to build a "B Ark" for the upper and middle management. But managers usually aren't willing to lay themselves off; they blame any problems on their underlings, who blame it on theirs, and so it's the individual workers, most of whom were hard-working and contributing directly to the bottom line, who get sacked. The managers that made the stupid decisions that hurt the company's P&L usually stick around forever.

Sigh.

An alternative HP-42S/Free42 Manual.

*Message #1 Posted by **José Lauro Strapasson** on 18 July 2005, 11:55 p.m.*

Hi There!

As it is hard to find the HP-42S manual I decided to create my own. It is in very begining stage and can be download at:

http://joselauro.tripod.com/chp.html

José Lauro. Brazil.

Re: An alternative HP-42S/Free42 Manual.

*Message #2 Posted by **Richard Garner** on 19 July 2005, 6:39 p.m.,*
in response to message #1 by José Lauro Strapasson

Nicely written so far. I am looking forward to reading more as you continue. I did find in section 2.7 where you first describe how the stack works. In ii and iii you swapped the T and Z registers. Other than that what you have started looks great.

Re: An alternative HP-42S/Free42 Manual.

*Message #3 Posted by **José Lauro Strapasson** on 19 July 2005, 8:18 p.m.,*
in response to message #2 by Richard Garner

Thank you very much!

P.S. It is said to realize that texas instruments give information about retired models and HP doesn't.:(And I bought a TI-36X Solar model from 1992 and even today the TI-36X solar is being manufactured while HP-48G, HP-42S, etc are long gone.:(

Re: An alternative HP-42S/Free42 Manual.

*Message #4 Posted by **José Lauro Strapasson** on 22 July 2005, 8:59 p.m.,*
in response to message #1 by José Lauro Strapasson

Hi There!

I just finished another version. It is at:

[link: http://jlstrapasson.sites.uol.com.br/42s.pdf] http://jlstrapasson.sites.uol.com.br/42s.pdf[/link]

José Lauro.

P.S. Dear Richard, I did not find the bug you talked about.:(

Re: An alternative HP-42S/Free42 Manual.

*Message #5 Posted by **Richard Garner** on 23 July 2005, 12:21 a.m.,*
in response to message #4 by José Lauro Strapasson

In section 2.7 you have:

i) The content of lines t and z are lost. ii) The content of line y goes to line t. iii)The content of line x goes to line z. iv)The content just entered goes to line y and line x.

Should it not read this way:

i) The content of line t is lost. ii) The content of line z goes to line t. iii)The content of line y goes to line z. iv)The content just entered goes to line y and line x.

I look forward to reading you new additions.

May I? (was: An alternative HP-42S/Free42 Manual.)

*Message #6 Posted by **Vieira, Luiz C. (Brazil)** on 23 July 2005, 3:07 p.m.,*
in response to message #5 by Richard Garner

Hi, Richard;

first of all, I`m sorry taking the priviledge of answering (espero que o José Lauro me perdoe - I hope José Lauro forgives me), but if you consider that the example José Lauro uses in his book is based on the sequence (2 [ENTER]), then his explanation is correct, meaning he considers the first and last stack contents in one shot. In this case, his analysis considers that the stack contents are liftted twice, one time after [2] and another time after [ENTER^].

Those who already know the stack lifting, enabling/disabling 'nuts and bolts' should take care when reading, but those who do not know the stack and are reading for the first time it might need some experiments to understand it in practice. Please, take this as my personal view.

Best regards.

Luiz (Brazil)

Edited: 23 July 2005, 3:10 p.m.

Re: May I? (was: An alternative HP-42S/Free42 Manual.)

*Message #7 Posted by **José Lauro Strapasson** on 23 July 2005, 9:15 p.m.,*
in response to message #6 by Vieira, Luiz C. (Brazil)

Ops, This things happens!:):) In fact when you type something enter this enter two times and we lost the content of the last two lines. (at least in Free42) Thank anyway Richard!:) And Thank you Luiz too! By the way Luiz, do you have an account in orkut? I am there now in a section about HP calculators (in portuguese).

P.S. As I said I finished version 0.2.;)

Display polish on vintage calculator displays?

*Message #1 Posted by **Arne Helme** on 18 July 2005, 2:00 a.m.*

Question: have any of you tried to remove scratches from vintage calculator displays (transparent or red) using display polishers such as the one sold under the name Displex? It's being advertised as doing wonders to the screens of mobile phones, PDAs, etc. I am just curious whether it will work on older synthetic materials too.

-- Arne

Re: Display polish on vintage calculator displays?

*Message #2 Posted by **Ronald** on 18 July 2005, 5:03 a.m.,*
in response to message #1 by Arne Helme

Hi,

My 2 cents: The polish works fine, only you loose the mate gloss of the display...

So at the end of the day it is a question of keeping the original little bit mate gloss and keeping it original or if loosing this and having a mirror in which you can comb you hair.

Personnaly I keep it original unless it is really badly damaged.

Ronald

Very funny! Thanks for the input :-)!

Arne

Re: Display polish on vintage calculator displays?

*Message #7 Posted by **don wallace** on 1 Aug 2005, 2:42 a.m.,*
in response to message #6 by Arne Helme

Hi Arne!

Yeah, as Albert says, toothpaste works fine as he suggested.

I use it sparingly on cotton wool to buff CDs and have done for 13 years, a few years before the CD repair "kits" came out.

If you can polish polycarbonate and perspex (and LEXAN) with toothpaste, then i think "reverse polish" is ok to use on the calcs. I'd watch how wet you got the cotton wool, though of course!

The key factor is the SIZE OF the PARTCLES in the paste.

Many years ago I built a 12" mirror (4 a reflecting telescope) so I picked up info on the physics of polishing versus grinding. In polishing, abrasive particles are fixed in a matrix which is dragged across the surface to be polished. In grinding the particles are free to roll around and do more "damage".

Cheers from Down Under,

Don W

Re: Display polish on vintage calculator displays?

*Message #8 Posted by **Paul Brogger** on 1 Aug 2005, 12:18 p.m.,*
in response to message #1 by Arne Helme

I've used Bon-Ami cleanser successfully on a large polycarbonate thermometer lens/cover. It ground out a lot of surface checking & scratches, leaving a very slightly "fogged" finish which then was clarified with a coat of

Armor-All.

But I haven't tried it on a calculator yet, so proceed with caution, and try a test application on a scrap unit before proceeding with something valuable.

Whatever you use, good luck! (& let us know how it turns out.)

Questions about the RDM Command

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 17 July 2005, 10:35 p.m.*

I was working with the 7x7 Hilbert on my HP-28S and decided that I wanted to work with the 5x5. I placed the 7x7 in level 2, placed {5,5} in level 1, and hit RDM. I didn't get a 5x5 Hilbert. Instead I got the following

```
  1     1/2     1/3     1/4     1/5

1/6     1/7     1/2     1/3     1/4

1/5     1/6     1/7     1/8     1/3

1/4     1/5     1/6     1/7     1/8

1/9     1/4     1/5     1/6     1/7
```

Wow! I decided to follow the advice I have often given to others "When all else fails, try reading the instructions." I found that my strange result was due to the way the 28 (and the 49) does a Redimension. Quoting from HP28S Reference Manual:

"... Elements taken from array1 preserve the same row order in array2. If array2 is dimensioned to contain fewer elements than array1, excess elements from array1 at the end of the row order are discarded. ..."

Once I understood what RDM did I could get from the 7x7 to the 5x5 with the following sequence:

7x7 matrix in level 1

{ 5,7} in the display

Press RDM - Discards the bottom two rows of the 7x7

Press TRN - Moves the 6th and 7th columns to the 6th and 7th rows

{5,5} in the display

Press RDM - Discards the 6th and 7th rows, which were the 6th and 7th columns

Press TRN

I now have a 5x5 matrix using the 5x5 elements from the 7x7 matrix. Of course, when working with symmetric matrices like the Hilberts I do not have to do the final TRN.

I have two questions:

Is there an easier way to accomplish the desired task?

What is an application for the RDM function as mechanized?

Re: Questions about the RDM Command

*Message #2 Posted by **chris dean** on 18 July 2005, 12:40 p.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Palmer

Surely it would have been easier to generate the new Hilbert matrix using a(i, j) = 1 / (i + j - 1) but this spoils the fun/challenge, doesn't it?

I would imagine most people would only use it to increase the size of matrices but they have covered themselves for the reduction process. The algorithm you have used to create the 5x5 appears correct mathematically.

Chris

Re: Questions about the RDM Command

*Message #3 Posted by **Palmer O. Hanson, Jr.** on 18 July 2005, 10:00 p.m.,*
in response to message #2 by chris dean

When I try to go the other way, say from a 5x5 to a 7x7, by placing the 5x5 in level 2, placing {7,7} in level 1 and pressing RDM I get

```
 1      1/2     1/3     1/4     1/5     1/2     1/3

1/4     1/5     1/6     1/3     1/4     1/5     1/6

1/7     1/4     1/5     1/6     1/7     1/8     1/5

1/6     1/7     1/8     1/9      0       0       0

 0       0       0       0       0       0       0

 0       0       0       0       0       0       0

 0       0       0       0       0       0       0
```

Double Wow! But, again, reading the manual explaiins what happened:

"...If array2 is dimensioned to contain more elements than array1, the additional elements in array2 at the end of the row order are filled with zeroes ..."

You are correct in surmising that my interest in this goes beyond finding an easy way to change the dimensions of Hilbert matrices using the HP-28S. One of my interests is in collecting calculators, and I am particularly interested in those machines which exhibit characteristics of which I would say "Why in the world did the manufacturer do it that way?" An obvious example is "Why did TI make the TI-59 with a multiply that was not commutative?"

The Dimension command (dim) in machines such as the TI-83+ and TI-85 does redimensioning as I would expect. The RDM command in machines such as the HP-28S and HP-49G doesn't. So I am asking "Does anyone know of an application where the RDM mechanization makes sense?"

Re: Questions about the RDM Command

*Message #4 Posted by **chris dean** on 19 July 2005, 6:10 a.m.,*
in response to message #3 by Palmer O. Hanson, Jr.

I cannot think why it is done like this. The algorithm seems to be very naive.

Re: Questions about the RDM Command

*Message #5 Posted by **Thomas Okken** on 19 July 2005, 6:55 a.m.,*
in response to message #3 by Palmer O. Hanson, Jr.

It makes sense only from an implementation standpoint. Bear in mind that internally, a matrix is stored as a one-dimensional array; depending on the platform or programming language you're using, that array can be organized in "row-major" or "column-major" order.

For example, the matrix

```
1   2   3
1   4   9
```

Would be stored as [1 2 3 1 4 9] in row-major order, or as [1 1 2 4 3 9] in column-major order.

The HP-28 and 48 series, and the HP-42S, store matrices in row-major order. The behavior of the RDM function (DIM on the 42S) that you describe is caused by the fact that these machines only resize the array, but don't make any effort to keep matrix elements at the same row/column positions.

- Thomas

Re: Questions about the RDM Command

*Message #6 Posted by **Chris Dean** on 19 July 2005, 1:33 p.m.,*
in response to message #5 by Thomas Okken

I think the conclusion is that RDM is great for 1 dimensional arrays otherwise use with care.

32SII Repair

*Message #1 Posted by **Neil Thomason** on 17 July 2005, 8:34 a.m.*

After following 32SII deconstruct instructions I am now at the reconstruct stage, however I did not take note of the "Zebra stripe's" orientation and a gut feeling tells me this is can be a show stopper.

The "zebra stripe" is one of the 2 the rubber spacers located between the LCD and the PCB. Its footprint matches the pinouts on the PCB and it may act as a ground or something.

if any one out there has useful info. Please advise

Re: 32SII Repair

*Message #2 Posted by **John Limpert** on 17 July 2005, 12:44 p.m.,*
in response to message #1 by Neil Thomason

Zebra stripes are use to connect signals between two assemblies, like a main board and a daughter board. They are composed of alternating sections of conductive and non-conductive material, hence the striped appearance. If you look at the signal contacts on each assembly, the placement of the zebra stripe should be obvious. Each dark section of the zebra stripe behaves like a jumper wire, connecting the adjacent contacts on the assemblies.

Re: 32SII Repair

*Message #3 Posted by **Neil Thomason** on 17 July 2005, 3:42 p.m.,*
in response to message #2 by John Limpert

Thanks John, I suspected somthing like this but what threw me was no signal when I dropped my tester along the dark stripe.

Best regards nth

in response to message #3 by Neil Thomason

P.S. I am assuming Dark side faces PCB

Re: "Zebra stripes"

*Message #5 Posted by **Paul Brogger** on 18 July 2005, 12:11 p.m.,*
in response to message #2 by John Limpert

I've only seen the "Zebra stripe" appearance in those from the earliest LCD calculators (not necessarily H-P) that I've disassembled. The most "zebra-like" examples I remember were strips of mylar (perhaps) with parallel conductive traces, wrapped around a squishy rubber core.

Later versions are rubbery (insulating) strips with conductors somehow embedded. In my experience, there isn't necessarily an obvious color coding to indicate which sides are conductive. Neither is it easy to determine with a multimeter, as the conductors themselves are tantamount to individual, fine wires, and it's hit-or-miss when you're trying to touch both sides of the thing with probes.

Also, while orientation is all-important, alignment isn't necessarily an issue for the later types. The pitch of the conductor grid being MUCH finer than that of the PCB/LCD contacts, when placed in approximation, correct connection of the various pads is virtually guaranteed, regardless of the left-to-right alignment of the conductor strip itself.

FYI

Re: "Zebra stripes"

*Message #6 Posted by **Neil thomason** on 18 July 2005, 8:18 p.m.,*
in response to message #5 by Paul Brogger

Hi Paul,

Repair now completed and tested, correct orientation for the zebra stripes is as follows:

Upper spacer dark stripe against LCD with white facing top of calculator Lower spacer dark stripe against LCD with white facing bottom of calculator

Thanks to all

HP-41 Ultimate Alarm Clock - merchandise!

*Message #1 Posted by **Geir Isene** on 17 July 2005, 3:56 a.m.*

Update: The merchandise for the project is now available at this place.

The only thing missing is the T-shirt with the code listing on the back. This will be available as soon as the demand is high enough (around 1000 requests for the T-shirt will do).

As the number of test users has increased by around 100% the last week, version 0.5.1 is soon production ready. Stay tuned.

Voyager feet

*Message #1 Posted by **Robert Hobbs** on 16 July 2005, 3:14 p.m.*

Hello, I am new to the forum and have some questions about voyager feet. I searched the archives and did not find a thread on this. Have I overlooked something?

I have two questions, the first is simple: Is there a source for replacement feet or the feet material (and glue)?

My second question has to do with the views of collectors on replacement feet. The situation arises because I acquired an HP-15c with rough-cut replacement feet. As I was thinking of getting feet for my main calculator anyway, I thought I would replace the poor ones on the other calculator. Then I began to wonder what collectors thought. Is a repaired calculator less valuable than an original? Does it depend on the quality of the repair or simply on the fact of the repair as it would for some other types of collectibles?

Thank you in advance for your thoughts on these questions.

Edited: 16 July 2005, 3:16 p.m.

Re: Voyager feet

*Message #2 Posted by **Chris dean** on 16 July 2005, 4:19 p.m.,*
in response to message #1 by Robert Hobbs

Look at item 5790041392 on ebay.

Re: Voyager feet

*Message #3 Posted by **Robert Hobbs** on 16 July 2005, 10:28 p.m.,*
in response to message #2 by Chris dean

Hey thanks! That is the first half solved. Since hp still makes the 12c, do they provide these feet?

Re: Voyager feet

*Message #4 Posted by **Chris Dean** on 18 July 2005, 12:17 p.m.,*
in response to message #3 by Robert Hobbs

Robert

I am surprised no one else has responded. I would expect that serious collectors would possibly do their own maintenance. If you are worried and you want to sell the calculator just advertise it as the calculator including a set of replacement Voyager feet not fitted.

Chris

Tips on Getting Publishing Permission

*Message #1 Posted by **Howard Owen** on 16 July 2005, 1:40 p.m.*

I just obtained a copy of "The HP-IL SYSTEM: An Introductory Guide to the Hewlett-Packard Interface Loop." With a view toward preservation, I've diassembled the book, which was having problems with the binding anyway, and scanned it into a PDF. I'd love to share this with the community. The copyright is held by "OSBORNE/McGraw-Hill" and is dated 1982.

It appears the above named entity may be the education division of McGraw-Hill now. I've found the address to write to in order to ask permission to redistribute "portions" of McGraw-Hill copyrighted material. What I want is to ask for permission to redistribute the whole enchilada. Basically, this would mean abandoning the copyright.

I have no idea how likely it is that McGraw-Hill will agree to this, but here is my pitch:

- The book is highly specialized and long out of print
- HP has made most of the source documents referred to free to redistribute
- There is a vibrant (take a bow) though small community with an interest in the material contained in the book.
- I'm not interested in making money off the text. I just want to add it to the public corpus of knowledge.
- Won't you please please please help?

As I say, I have no idea if this pitch will work. What do folks here think? Is there a way I can increase the (rather long, I think) odds that McGraw-Hill will be generous?

Thanks.

Re: Tips on Getting Publishing Permission

*Message #2 Posted by **John L. Shelton** on 16 July 2005, 1:45 p.m.,*
in response to message #1 by Howard Owen

Naturally, you will want to give them a copy of your PDF. You will state clearly that rights remain with the publisher, and all your copies will reflect that. Perhaps you can also inform them of various places that are accepting digitized book content "for the ages" (incuding MoHPC) so they see this is not just a one-of-a-kind effort.

Re: Tips on Getting Publishing Permission

*Message #3 Posted by **Howard Owen** on 16 July 2005, 3:03 p.m.,*
in response to message #2 by John L. Shelton

I'd be submitting my request on paper, so I can't include the PDF. I can offer to include any disclaimer or rights statement they might wish to add, however.

I guess your second point would fit pretty neatly in between the third and fourth bullets above.

Re: Tips on Getting Publishing Permission

*Message #4 Posted by **Eric Smith** on 16 July 2005, 5:03 p.m.,*
in response to message #2 by John L. Shelton

> Quote:
>
> Naturally, you will want to give them a copy of your PDF.

Um, no, you don't want to provide them with evidence that a copyright they hold has already been infringed. Converting a book to PDF, even just for your own use, is not clearly within the bounds of "fair use". Better to present a hypothetical question.

> Quote:
>
> Perhaps you can also inform them of various places that are accepting digitized book content "for the ages"

Been there, done that. Doesn't impress them, at least not in a positive way.

Eric

Re: Tips on Getting Publishing Permission

*Message #5 Posted by **Eric Smith** on 16 July 2005, 5:00 p.m.,*
in response to message #1 by Howard Owen

Your best bet is if the rights reverted to the author (Kane, IIRC). If not, you face an uphill battle.

I've been through this before. Publishers in general, and McGraw-Hill in particular, are not very willing to grant permission for reproduction of a complete work, even if it's something out of print and not generating any revenue. They are accustomed to granting permission for small excerpts or a chapter or two.

If I were doing this, my first question to them before even broaching the subject of permissions would simply be to ask if they have retained the copyright, or if it has reverted.

Eric

in response to message #9 by Dave Hicks

Ah, yes. A FVBNAKOSA. It's the kind of thing you get when you ask a corporate lawyer anything of substance. 8)

May I suggest...(was: Tips on Getting Publishing Permission

*Message #11 Posted by **Vieira, Luiz C. (Brazil)** on 16 July 2005, 9:50 p.m.,*
in response to message #1 by Howard Owen

Hi Howard, guys;

Howard wrote:

> Quote:
>
> HP has made most of the source documents referred to free to redistribute

As the codes from HP are free for redistribution, I'd volunteer myself to take the scanned images where the original HP codes are shown, cut them, úse an OCR to generate an ASCII equivalent text and send it back to you so you could release the codes in an original PDF file with the necessary comments of what can be done with the programs or the keystrokes, if applicable, without using the original text from the book. We have many known contributors that are experts on dealing with HPIL that could also add some original remarks, making this suggested original PDF even better. I guess you could also refer to both HP and the book as the sources, plus the names of all contributors who added something to the final text and McGraw Hill publishers will not be able to complaint for that (hope they are not reading this...)

I am trying to finish some repairs in some HP calculators with me (one CX mainboard that belongs to M.B., one HP29C that belongs to R.T. and two HP41 plus three HP25 that belong to J.E.), and I believe I'm having

time to generate these listings when taking a time to think of what to do next (I also have a few other HP calculator related activity, but they are not repair activities). If you actually can do that - use an OCR and generate typed text or simply key the programs in and save the final listings somehow - and you are willing to go ahead, wow! We will all be grateful. Otherwise, have you found yourself needing some help, let us know.

Best regards.

Luiz (Brazil)

Re: May I suggest...(was: Tips on Getting Publishing Permission

*Message #12 Posted by **Howard Owen** on 16 July 2005, 10:42 p.m.,*
in response to message #11 by Vieira, Luiz C. (Brazil)

Thanks for the offer, Luiz.

Unfortunately, it's not that kind of a book. It's a very detailed and technical description of HP-IL, but there isn't a single byte of actual code or a program listing anywhere. All of the information covered is in the other docs, such as the chip description, the spec and the technical notes. But the book's value is in organizing this information in a concise and readable form. Unfortunately, that's exactly the stuff that is covered by copyright.

I'm going to try to pick up where Dave left off in getting permission for publication. Eric's suggestion of asking whether M-H still retains the copyright is a good one. (But did Dave ask this question?) Otherwise, I think I will try to slip the request in to the company through the general legal department. The education legal department is set up to say "yes" to requests from educators for limited copying. I suspect they would say "no" to a request like this as a matter of reflex.

HP 42S Programming

*Message #1 Posted by **Bob Demers** on 16 July 2005, 7:58 a.m.*

Hi all,

I just came across a quadratic formula program that that I do not know how to enter. One of the lines is STO: ST Z and another line is simply :

Can anyone help.

Thanks,

Bob Demers

Re: HP 42S Programming (corrected)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 16 July 2005, 9:23 a.m.,*
in response to message #1 by Bob Demers

Hi, Bob;

the HP42S, as the HP41, allows the contents of the X-register to be directly sotred in any of the stack registers (as you probably know).

When you press [STO][.] in the HP41, you can add any of the following: [X], [Y], [Z], [T] or [L] (no need to press [ALPHA]. In the HP42S, you should press [STO][.] (wrongly posted as [shift], orange key) and locate the equivalent register is the softkeys: [ST X] for X-register, [ST Y] for Y-register and so.

If you want to use a valid register as for an index (IND) with [STO], in the HP41 you´d use [STO][shift] (golden key)and select a numbered register, or [STO][shift][.] and any stack-related key, as mentioned above. In the HP42S, the sequence should be [STO][.] and the softkey [IND] plus any valid register. If you choose either a numbered or a named register, simply idnetify it after the [IND] softkey. For a stack register identificator, you should press [STO][.][IND] and [.] again to invoke the stack-related softkeys again. I have no calculators in hands right now, so please, forgive me if I'm adding a senseless sequence.

> Quote:
>
> One of the lines is STO: ST Z and another line is simply :

I don´t recall having the ':' as a separated operation; could it be an ALPHA sequence, like

```
02 ":"
```

I don't know where did you take the listings from, but could you add the complete listing here for us? Is it in the HP42S manual?

Hope you succeed.

Luiz,

Wow, that was fast. The program was taken from this site and I have included the link below.

Thanks for your very fast response.

Bob Demers

http://www.hpmuseum.org/software/42squad.htm

Re: HP 42S Programming (corrected)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 16 July 2005, 10:50 a.m.,*
in response to message #3 by Bob Demers

Hi, Bob;

it seems to me that the ':' is, in fact, a division symbol (÷). In this case, the STO÷ ST Z is keyed in with:

```
[STO][÷][.][ST Z]
```

The other occurrences of ':' in the program (step #05 and step #08) should also be keyed in accordingly, with [÷].

Hope this is correct (I'm not home yet to test the program).

Best regards.

in response to message #1 by Gileno

Amazing!!! Well - if one can get $500,- for a HP-42S, I really have a true fortune displayed in my collector rack. I will not be surprised to dream something like the below tonight, thinking about that ebay-auction.

"Well - now it may be just the right time to put my fingerprints on ebay. They must be at least $300 worth, having held my hp-01, hp-10c, hp-12c, hp-..... Zzzzzzzzz.... Oh - my old desktop drawer, have contained about 12-15 different HP-calculators... Oh oh oh - my old school bag have held four different hp-calculators... AND my eyes have seen many many many HP-calculators... I might consider to donate them to a HP calculator collector, who just happens to have a couple of hundred thousand bucks laying around..."

Sleep tight!

Re: Look !!! HP42S = or > $500 !!!

*Message #4 Posted by **Howard Owen** on 16 July 2005, 2:59 p.m.,*
in response to message #1 by Gileno

That is indeed outrageous.

But I have noticed that the 42S goes for a fair premium on eBay compared to some other calculators. From playing with simulators and reading about the device, it seems like a nice machine. But why is it so pricey in general? It doesn't seem to be particularly rare, judging by the number of auctions.

Re: Look !!! HP42S = or > $500 !!!

*Message #5 Posted by **Johnny Bjoern Rasmussen** on 16 July 2005, 3:10 p.m.,*
in response to message #4 by Howard Owen

No - not rare here in Denmark. In my four-five years collecting HP's I have bought say 5 or 6 42S' for

trading. The most expensive I paid DKR 300,- for. That is about $ 20,- or so. I was given one of them, as it had a small dark spot in the display, and others I had for DKR 150,- (about $10,-), wich is the amount I always tell people with hp calcs laying around, that I want to pay for it. I always tell them that it might be more worth on say Ebay, but they allways say something like; "Well - I know that my old calc will get a good home at your place, or at least at somebody else if you trade it away..."

In Denmark you can ask almost any electronics engeneer graduated in the early nineties - 7 out of 10 have a HP-42S laying about some where...

Cheers!

Johnny

*Message #3 Posted by **Gene** on 15 July 2005, 3:39 p.m.,*
in response to message #1 by Gileno

Yes, we need to know what the display showed when you pressed "e" to initialize it.

There are several settings:

DE DB CE CB

as well as settings for compounding periods and payment periods that may affect it.

I really, really doubt there is any new bug in the FI routine after all these years.

Error in PPC ROM (FI) Finance routine !!!

Setting time on 48GX vs 48SX

*Message #1 Posted by **unspellable** on 15 July 2005, 9:57 a.m.*

On my 48SX it's a simple matter to add or subtract a second from the display time. On my 48GX the pull down menu makes this klutzy and difficult to set closely. (On the whole, I do not care for the pull down menu approach to soft key commands on the 48GX. It seems klutzy and like a step backwards from the 48SX's displaying soft key commands at the bottom of the display.)

On my 48SX I can also advance the clock by entering "n CLOCKADJ" where n equals 8192 ticks per second. Does "CLOCKADJ" do the same on the 48GX, and if so, what is the tick rate? Is it still 8192 or is it faster?

On my 48SX I have a simple program 'KORR' << n CLOCKADJ >> which is executed by the alarm function at 2 AM each day. By judicious choice of n I can correct for the clock running slightly slow. (Left to its own devices, it loses about a half second per day.)

(Wife says I'm nuts for trying to keep all the clocks and watches set so closely, but it compensates for my otherwise disorganized life.)

Re: Setting time on 48GX vs 48SX

*Message #2 Posted by **Jeff O.** on 15 July 2005, 12:54 p.m.,*
in response to message #1 by unspellable

I'm about as far from an HP48GX expert as you can get, but I'll have a go at your questions. If I get anything wrong, I'm sure others will correct me.
Regarding pull-down menus vs. soft keys, I was under the impression that in general, if you press left-shift instead of right-shift to access a menu, you get soft keys instead of the drop-down menu. For example, pressing left-shift 4 brings up the soft-keys DATE, ->DATE, TIME, etc. I don't know if this exactly mimics the SX behavior, but I think it is close.
Regarding "CLOCKADJ", on the 48GX it is "CLKADJ", and it behaves the same as you describe for the SX. "CLKADJ" is on the third "page" of soft keys that pressing left-shift 4 brings up. One second is 8192 ticks. I think your "KORR" program (using the "CLKADJ" command) will work just fine.
Regarding keeping all your watches and clocks set so closely, presumably synchronized with the correct time, well, I see nothing wrong with that. Come to think of it, my life is pretty disorganized, and my wife thinks I'm nuts (about that and many other things), so perhaps there is a connection....

Re: Setting time on 48GX vs 48SX

*Message #3 Posted by **unspellable** on 15 July 2005, 2:11 p.m.,*
in response to message #2 by Jeff O.

Well, it's a case of "when all else fails, read the instructions."

I have my trusty old HP48SX at home and do most of my messing around on it. My HP48GX sits in my desk drawer at work and is little used. "ClOCKADJ" was from memory, it's probably "CLKADJ" on both versions.

How many stack levels?

*Message #1 Posted by **Klaus** on 15 July 2005, 8:15 a.m.*

Has anyone ever calculated the stack levels needed to solve any problem? Since there are some projects to build custom rpn devices (like openrpn), I wondered if they just use 4 (like most HPs), or a infinite number, or if they did some serious calculations? It would be amusing defining the number of stacklevels to solve any problem - one could start with a problem that uses many stacklevels and then add a factor/therm/expression to see if the number of stacklevels grows. I it doesn't grow the stack, then we have the maximum number of stacklevels needed to solve any problem. Writing a compiler I got the impression that you don't need a infinite number of stacklevels, and I wonder if it is true?

Have a nice weekend!

Re: How many stack levels?

*Message #2 Posted by **Namir** on 15 July 2005, 8:54 a.m.,*
in response to message #1 by Klaus

Klaus,

I think that a dynamic stack level works well (with commands that can operate on a specific number of levels). My guess is the folks at HP asked themselves the same question. They came up with the dynamic stack that appeared with the HP-28C.

If you stick with a fixed stack, then I'd say a four-level or five-level stack is good. Use memory registers to store additional info and then pull them into the stack later.

Namir

Re: How many stack levels?

*Message #3 Posted by **John Limpert** on 15 July 2005, 9:02 a.m.,*
in response to message #1 by Klaus

Assuming you have storage registers, or some other type of memory, the problem can be restructured to use no more than N stack levels, where N is the maximum number of arguments for an operation. Otherwise, problems can be constructed that use an arbitrarily large number of stack levels.

Re: How many stack levels?

*Message #4 Posted by **Valentin Albillo** on 15 July 2005, 10:09 a.m.,*
in response to message #1 by Klaus

Hi, Klaus:

Klaus posted:

"Has anyone ever calculated the stack levels needed to solve any problem?"

To solve *any* problem you need an infinite stack. It's easy to concoct a problem which has any desired number of pending operations and operands.

That said, *most* problems can be solved with a fairly low number of stack (i.e., pending operands and operators) registers. Vintage SHARP handhelds had something like 8 stack registers for operands and 16 stack registers for operators, and never at all have I experienced a single "Stack full" or equivalent message.

In my RPN experience, 4 levels + LASTX are adequate for most problems, and perhaps a very convoluted one would require 5 or 6, but that's all, and very infrequently, so I'm happy with a 4-level + LASTX stack and never have felt the need for more. If a 5th number is *ever* needed, which happens once in a blue moon, I'd rather simply STOre it somewhere than have to deal with a 5-level stack at *all* times, whether I need it or not.

4 levels is optimum: you'll solve the vast majority of problems with them, and you can easily and effortlessly hold a mental picture of the stack's contents, what's in each register, and how to roll down, roll up, or exchange them to get what you need where you need it when you need it.

Add more stacks levels, or even an indefinite number of them (i.e., RPL-like) and you lose that.

I'd rather not.

Best regards from V.

Re: How many stack levels?

*Message #5 Posted by **Namir** on 15 July 2005, 12:04 p.m.,*
in response to message #1 by Klaus

I guess how you use the stack also matters. I am talking about the ratio of (values input)/(operations). An efficient way keeps this ratio at 1. An inefficient way would make the ratio higher than 1.

On the topics of memory registers. My question is where is your data coming from? A real time data acquisition process or a block of memory registers to begin with? In case of the latter, you can certainly store intermediate results in memory registers. My own guess is that a four-level stack and a handfull of memory registers (2, 3?) can do the job of evaluating expressions.

I have written several versions of math expression parsers that convert an algebraic expression into a an RPN expression. The RPN expression can then be evaluated as many times as needed. I typically use a limit stack and never had problems in the evaluation.

Namir

Re: How many stack levels?

*Message #6 Posted by **Guillermo** on 15 July 2005, 12:05 p.m.,*
in response to message #1 by Klaus

Until now, I believed that four stack levels was enough for any problem.

But I found a problem that can´t be solved with 4 levels.

My belief of years were destroyed ...

Re: How many stack levels?

*Message #7 Posted by **Klaus** on 15 July 2005, 12:58 p.m.,*
in response to message #6 by Guillermo

Yes, I tried to do a stack algorithm with rules of precedence, but similar to the flwochart in the HP-45 manual. It seems you really need infinite stacklevels:

a+b*c^(e+f*g^(h+i*j^(...))))

My question was just of theoretical nature, no practical use...

Thanks for the answers&inspiration!

Klaus

Re: How many stack levels?

*Message #8 Posted by **Guillermo C** on 15 July 2005, 2:17 p.m.,*
in response to message #7 by Klaus

I was talking about theoretical nature also. Your problem (with finite number of repetitions) can be solved with two levels. I mean if you want to solve it from left to right then you will need infinite number of levels, but if you begin from innermost parenthesis then you need only 2 levels. The problem I found need at least 5 levels no matter where you begin to solve:

((1+1)*(1+2))^3/((1+3)*(1+4))^2+((2+1)*(2+2))^3/((2+3)*(2+4))^2

Re: How many stack levels?

*Message #9 Posted by **Namir** on 15 July 2005, 3:13 p.m.,*
in response to message #8 by Guillermo C

I mentioned in an earlier message that using a few registers can help. The expression:

((1+1)*(1+2))^3/((1+3)*(1+4))^2+((2+1)*(2+2))^3/((2+3)*(2+4))^2

Can use a memory register to store the result of:

((1+1)*(1+2))^3/((1+3)*(1+4))^2+

And then evaluate in the stack:

((2+1)*(2+2))^3/((2+3)*(2+4))^2

which is then added to the contents of the memory register, or the value of the memory register is recalled for a final addition.

Using this approach I can solve an expression like:

((1+1)*(1+2))^3/((1+3)*(1+4))^2 + ((2+1)*(2+2))^3/((2+3)*(2+4))^2 +
((2+7)*(2+5))^3/((2+3)*(3+4))^2 + ((3+1)*(6+2))^3/((7+3)*(2+4))^2 + ...

Re: How many stack levels?

*Message #10 Posted by **Klaus** on 15 July 2005, 4:09 p.m.,*
in response to message #8 by Guillermo C

Yes, I came to exactly the same thoughts after posting my message, and wrote the following text offline, so forgive me repeating some of your ideas:

My equation above takes infinite stacklevels when parsing from left to right. Parsing from right to left needs only a limited number of stacklevels. Parsing from the innermost (correct word?) parenthesis (like the rpn-user does it) will also result in a fixed number of stacklevels for this equation. Perhaps I can solve it like this:

Let A be an equation that needs n stacklevels to be evaluated. Then A+b,A-b,A*b,A/b,A^b , b is a number, can be evaluated by evaluating A (and needing n levels), storing A in the top of Stack, putting b on top of A (needing 2 levels) and executing the operation.

The question is how this will behave with b being another expression.

Re: How many stack levels?

*Message #11 Posted by **htom** on 15 July 2005, 6:22 p.m.,*
in response to message #10 by Klaus

Let A take n levels, and A' be A with different values.

Then A+A' will take n+1 levels; call this expression B.

B+B' will take (n+1)+1 = n + 2 levels.

Eventually you need an infinite stack, or storage external to the stack.

Re: How many stack levels?

*Message #12 Posted by **Guillermo C** on 18 July 2005, 8:47 a.m.,*
in response to message #11 by htom

I not so sure.

Please, could you show me an example needing 10 stack levels? Could you show me an example needing 6 levels?

If they exists I would like to see them!

I am always suposing you only have the stack, no other registers. Also I supose you begin to solve in a smart order, not simply left to right.

Guillermo

Re: How many stack levels?

*Message #13 Posted by **Klaus** on 18 July 2005, 3:04 p.m.,*
in response to message #12 by Guillermo C

Thank you htom for your solution! I will try to show an example:

(1+2) uses 2 levels (1+2)+(3+4) uses 3 levels ((1+2)+(3+4))+((5+6)+(7+8) uses 4 levels
(((1+2)+(3+4))+((5+6)+(7+8)))+(((9+10)+(11+12))+((13+14)+(15+16))) uses 5 levels
((((1+2)+...+(15+16))))+((((17+18)+...+(a+b)))) takes 6 levels
(((((1+2)+...+(a+b))))))+(((((c+d)+...+(y+z)))))) takes 7 levels

By expanding the therm, you can overflow any limited stack.

Re: How many stack levels?

*Message #14 Posted by **Guillermo C** on 19 July 2005, 10:44 a.m.,*
in response to message #13 by Klaus

((1+2)+(3+4))+((5+6)+(7+8))

is equivalent to

1+2+3+4+5+6+7+8

so you only need two stack levels!

The same for the rest of the examples!

What I think interesting to find is the maximum stack levels necessary to solve any problem, if you solve the problem in the smartest way (minimizing stack levels)

(1+2)+(3+4) only needs 2 levels. (1+2)*(3+4) needs 3 levels

Considering this, until now I never found a problem needing more than 5 stack levels...

Re: How many stack levels?

*Message #15 Posted by **htom** on 19 July 2005, 2:50 p.m.,*
in response to message #14 by Guillermo C

That some expressions can be so collapsed does not mean that all of them can be.

```
In the following, the formation

A  B , term  term , factor  factor , or expression  expression
 op        op             op                       op

means (left op right) so that I don't have to type hundreds of ().

a b c d e f g h i j k l m n o p q r s t u v w x y z A B C D E F
 +   +   +   +   +   +   +   +   +   +   +   +   +   +   +   +
   *       *       *       *       *       *       *       *
       -               -                   -               -
               /                   ^               /
```

This evaluation calls for 6 layers of stack. If you substitute it for each of the letters, each letter will call for six layers (that is, it will take six layers to evaluate a, b, c ...), and combining them will call for another five////, for a total of 11// layers.

edit -- opps. will call for another six, total of 12 layers (forgot to evaluate b in counting)

Edited: 20 July 2005, 12:23 a.m.

Re: How many stack levels?

*Message #16 Posted by **Guillermo C** on 20 July 2005, 8:36 a.m.,*
in response to message #15 by htom

I thought that a limited stack could solve any problem, but your explanation shows that I was wrong! Now I see clearly. Thanks!

I had the solution at hand but I didn´t realize. My 5 level problem have the same "binary tree" structure that your explanation shows.

Your way to put the problem helps to show the relation between number of stack levels and number of operators:

2 stak levels can solve any problem up to 3 operands.

3 stak levels can solve any problem up to 7 operands.

4 stak levels can solve any problem up to 15 operands.

5 stak levels can solve any problem up to 31 operands.

n stak levels can solve any problem up to (2^n)-1 operands.

Of course if a problem has more operands but with a different structure could need less stack levels.

Re: How many stack levels?

in response to message #6 by Guillermo

Hi Guillermo,

I have run into this problem many times even early on, but it never hurt my belief in RPN....

Regards,

Bill

Re: How many stack levels?

*Message #18 Posted by **Tony** on 15 July 2005, 3:38 p.m.,*
in response to message #1 by Klaus

One situation where I find unlimited stack useful is for book-keeping jobs where lists of amounts need to be added and reconciled against a total. I put all the amounts onto the stack, then use my "STOT" program to get a sub-total. If that looks wrong, I can go back over the stack and edit it, then take another subtotal. Then finally use "TOTAL" to wipe the stack and return the total.

Which fixed-depth RPN calc has the most levels?

*Message #19 Posted by **Katie Wasserman** on 16 July 2005, 12:51 a.m.,*
in response to message #1 by Klaus

The subject states my question.

Not counting LASTx all the HP's except the 9100 and 9810 have 4 levels (I think). The Heathkit OC-1401 has 5 levels, are there others with 5 or more?

Re: Which fixed-depth RPN calc has the most levels?

*Message #20 Posted by **John Limpert** on 16 July 2005, 5:50 a.m.,*
in response to message #19 by Katie Wasserman

It isn't a calculator, but the Intel 8087 math coprocessor has an 8 level stack. It operates in a manner similar to RPN calculators.

Re: How many stack levels?

*Message #21 Posted by **Hugh Evans** on 17 July 2005, 3:11 a.m.,*
in response to message #1 by Klaus

We've never done any calculations on this for OpenRPN, just going with an infinite stack. This is an interesting thread. Rather than focusing on the hypothetical number of stack levels needed for any calculation, what would really be interesting is the number of levels needed for practical (yet extreme) use. My guess it that such an estimate will be suprisingly small number.

Best Regards, HDE

RPN stack levels: My recommendation

*Message #22 Posted by **Karl Schneider** on 17 July 2005, 4:53 p.m.,*
in response to message #21 by Hugh Evans

Hugh --

I would recommend for OpenRPN that an RPN calculator should have a user-settable fixed stack depth, with 2 as the minimum and 9 to 19 as the maximum, and 4 as the default. Commands for changing the stack depth should be short, simple, and programmable, such as:

```
f STACK 9  (9 levels)
f STACK .9 (19 levels)
```

Classical RPN stack functions Exchange, Roll Up, and Roll Down should be provided, along with direct access to stack elements that the 41/42-series models provide. (New identifiers for elements beyond "t" would need to be provided, such as "L5" through "L19").

I agree with Valentin that 4 levels is almost always adequate, but there are situations in which some forethought is necessary to avoid pushing data off the top.

Having up to 19 levels available would allow working with a large set of numbers -- which the dynamically-sized stack of the RPL-based 28/48/49 models allow -- without the numerous and complicated RPL stack operations.

Re: RPN stack levels: My recommendation

*Message #23 Posted by **Jonathan Purvis (New Zealand)** on 17 July 2005, 7:45 p.m.,*
in response to message #22 by Karl Schneider

One thing that has always confused me about RPN is why anyone would want **less** than the maximum

stack depth? With a dynamically sized stack, you can have as many items on the stack as you can fit in your head. Also, you don't have to worry about how many stack levels a subroutine uses, since it can't overwrite any of your values.

Re: RPN stack levels: My recommendation

*Message #24 Posted by **db (martinez, ca.)** on 18 July 2005, 2:00 a.m.,*
in response to message #23 by Jonathan Purvis (New Zealand)

It's useful to have a finite stack and a replicating "T" register if you sometimes do repetitive arithmetic. An example would be a surveyor checking cut sheets. Any HP, Corvus, Omron, or APF rpn and a couple of Novus/Nat Semi units as well as Katie's fabled Heathkit will operate like that.

Why a limited stack depth?

*Message #25 Posted by **Karl Schneider** on 18 July 2005, 3:37 a.m.,*

It becomes difficult for most people (including myself) to keep track of more than a few values on the stack, and their changing positions as computations are performed.

Four stack elements is adequate for almost any equation, if the user takes a true "pencil and paper"-style approach, working from the inside out, and checking every intermediate result. Having only three stack elements (as did National Semiconductor RPN calc's of the 1970's) can be constraining.

Four elements also gives easy access to every element using only x<>y, Rdown and Rup, even without the direct access that the 41/42 models did. (Compare that with the confusing plethora of stack-mainipulation commands offered by the dynamic-stack 28/48/49 models.)

> Quote:
>

True, but one way around that is to have all routines take input arguments from memory registers and named variables as much as possible, instead of expecting the arguments to be in certain positions on the stack. This is good programming practice.

How so? It seems to me to be very poor practice in general. Using named registers is like using global variables - something to be discouraged. Such functions are neither recursive nor reentrant.

Personally I only use RPN systems where I can see several stack levels on the screen. I find classic 4-level RPN too much work compared with modern algebraic calculators.

That's why RPL has local variables. The arguments to a function are still passed on the stack, but get moved into local variables so that they may be referenced by name. That way you don't have to track how far up the stack they are at any given time during the execution of the function.

The drawback is that they are less efficient than direct stack access. For a Saturn running at a relatively slow clock rate, that can be a problem. For a hypothetical new calculator that runs much faster, it would matter less.

Local variables also make it much easier to understand and modify an RPL function.

"." --

OK, I'll admit that my statement wasn't very precise, and will clarify it here. Again, I'm referring to RPN programming, not RPL, and especially not recursion-supporting high-level languages (e.g., C++).

The fixed stack, numbered registers, and named variables (HP-42S only) are all global on RPN calculators. There's nothing unsound about placing input arguments to an RPN subroutine on the stack. The risk of error occurs when a program is carrying arguments on the stack that are needed *upon return from* XEQ/GSB, INPUT, or VIEW.

- In the case of XEQ/GSB, the subroutine (or chain of subroutines) must be designed to leave the stack in the expected state upon return to the calling program.
- In the case of INPUT or VIEW, the user might ruin the stack while doing calculations before returning with R/S.

To avoid these problems, it's better for the program to copy the needed arguments to a numbered register or named variable prior to XEQ/GSB, INPUT, or VIEW, then recall them as needed rather than expect them to be there after the "interruption."

Hugh --

I would recommend for OpenRPN that an RPN calculator should have a user-settable fixed stack depth, with 2 as the minimum and 9 to 19 as the maximum, and 4 as the default.

Having a stack size different from the default (4) would break programs that assume that the stack is 4 deep (e.g. assuming that T replicates its value as the stack drops, that 4 ROLL-UPs or 4 ROLL-DOWNs would bring the stack to its original state, etc)

If you need more stack space (e.g. args, or temporary values) then you may be better off with a sliding register window, whereby you can position your 4 register stack anywhere within a register array, or, perhaps have a stack of stacks (i.e. being able to "push" the 4+1 register stack in a larger stack).

In this way, when you want a fresh stack to perform some calculations or to call a routine without destroying the cointents of the existing stack, you just push it, call your function and then pop it.

Absolutely right. That's why I said that the "set stack depth" function should be programmable, so that a "STACK 4" instruction would guarantee compatibility of older RPN programs.

That's rather complicated, in my estimation. Sounds more like RPL philosophy than RPN. Also, with ample RAM available for low cost, why overwite register space when plenty of free space is probably available?

Re: RPN stack levels: My recommendation

*Message #31 Posted by **John L. Shelton** on 19 July 2005, 1:40 a.m.,*
in response to message #29 by Vassilis Prevelakis

It seems important to differentiate between the issues of why the original RPN calculators had 3, 4, or 5 level stacks from the more modern "what's the right thing to do now." It's almost certain that the decision to have small, limited stacks was a compromise due to engineering cost, rather than a decision that 3, 4, or 5 are the "best" sizes of stack. A desktop calculator with a display of arbitrary size would have been much more expensive.

Once one makes a decision to have a small, fixed size stack, then one can decide whether the top stack variable replicates on stack drop. Was the original goal to have stack drop replication, and let that drive the decision to have a small, fixed-size stack? Probably not. It was probably a consequence, not a driver.

So, for nostalgic reasons, one might design a modern calculator with a fixed size stack. Particularly if compatibility with very old programs is important. But as we have found in many, many areas of computer programming, a fixed limit size to nearly anything winds up being a big headache later. (remember DOS 640kbytes? We could probably fill a screen with thread-headers on just that topic alone.)

In summary: For nostalgia: fixed size. For modern design: unlimited stacks.

> It's almost certain that the decision to have small, limited stacks was a compromise due to engineering cost, rather than a decision that 3, 4, or 5 are the "best" sizes of stack. A desktop calculator with a display of arbitrary size would have been much more expensive.

True, the 4-element stack of the HP-35 was probably a compromise of what was minimally sufficient and what could be done with limited resources in 1972. 4 is still enough for most every practical application, which is one reason why the stack on RPN HP's RPN never got larger (though the 42S should have had a larger stack due to complex-number operations). The 42S, BTW, is the first RPN HP handheld calc with a two-line display, after 14 years of production.

> Quote:
>
> Once one makes a decision to have a small, fixed size stack, then one can decide whether the top stack variable replicates on stack drop. Was the original goal to have stack drop replication, and let that drive the decision to have a small, fixed-size stack? Probably not. It was probably a consequence, not a driver.

Well, with a fixed stack, the choices were to zero out the "popped" elements or to replicate the top element. Replication gives the user an endless supply of repeatedly-used values -- useful for constant arithmetic.

> Quote:
>
> But as we have found in many, many areas of computer programming, a fixed limit size to nearly anything winds up being a big headache later. (remember DOS 640kbytes? ...

Your analogy is imperfect, I would say. The 640-kB memory "partition" was a serious encumbrance because there really is no limit to what one might wish a PC to do. However, I think there is a limit to what the vast majority of users would reasonably expect a true handheld calculator to do. Beyond that limit, a PC or even a PDA would be a better-sized tool for the task. One could argue that the HP-48/49 and TI-89 are overkill, but there was no practical alternative at the time they were designed.

If the task remains the same, the tool needn't get more elaborate. Has the shovel been fundamentally "modernized"? How many of us actually use an electric toothbrush?

> Quote:
>
> In summary: For nostalgia: fixed size. For modern design: unlimited stacks

"Nostalgia"? If modernity means replacing

x<>y, Rdn, Rup

with

DUP, SWAP, DROP, OVER, ROT, UNROT, ROLL, ROLLD, PICK, UNPICK, PICK3, DEPTH, DUP2, DUPN, DROP2, DROPN, DUPDUP, NIP, NDUPN

and the infamous (beep!) "DROP Error: Too few arguments",

then take me down "memory lane" every time!

-- Best regards from KS

then take me down "memory lane" every time!"

Amen ! I couldn't agree more. And it isn't just the overwhelming plethora of dismayingly redundant stack operators, it's also that while any RPN user worth his/her salt can easily keep in mind the contents of a 4-level stack without resorting to pencil and paper, fully aware of what is where, the task becomes sort of a "Mission: Impossible" case when dealing with a significantly larger stack, not to mention an "arbitrary length" one.

That's one of the main reasons why it's fairly easy and even *fun* to write a program for an HP-15C, HP-41C, or HP-42S, while doing the same in RPL demands much more effort on the user's part and easily becomes an exercice in frustration.

Best regards from V.

Re: RPN stack levels

*Message #34 Posted by **htom** on 21 July 2005, 4:38 p.m.,*
in response to message #33 by Valentin Albillo

After a period where I used Forth, I began to desire a command that would take strings like ztxly and deliver those values to the LXYZT registers. The expanded version allowed the digits 0-9 as recall locations for values as well, and then the extended version a preceeding "." as an indirect operator. Someone remembered the old CDC "indirect on negative address" thing then, and that's when I came to my senses.

As someone else pointed out, the major problem with pushing an entire stack is arranging the return value(s). It's relatively simple to design the syntax of the command, but very expensive in time, codespace, or hardware.

(Designate initial values as LXYZT, stack values on return execution as lxyzt, and add a five character field that holds the locations of the five values to be returned. And the status of the enter flag.)

Re: RPN stack levels: My recommendation

*Message #35 Posted by **Hugh Evans** on 21 July 2005, 3:33 p.m.,*
in response to message #22 by Karl Schneider

Since OpenRPN allows free access to our source code end users can modify, compile, and distribute ROMs freely. Therefore changing the depth of the stack is entirely possible. *fix, the programming language of OpenRPN, uses an RPL style stack. For the sake of nostaglia a variety of emulators and simulators could be written or ported and used.

As the listing indicates, US-made in the 1980's (not the lower-quality Indonesian and Chinese ones from the mid-1990's onward). Also appears to be in good cosmetic shape, athough the digital photo has mediocre resolution.

The price still seems a bit steep, but maybe the market is appreciating.

HP-41 Program Listings & Barcode via PC

*Message #1 Posted by **G.R. Harvey** on 14 July 2005, 10:31 p.m.*

MAKING HP-41 PROGRAM BARCODE &/or PROGRAM LISTINGS VIA a PC & PRINTER

The following programs/files are used in this process:

V41 - A virtual HP-41 that runs on the PC - Program files can be read or written in RAW format

HP41UC.Exe Win41UC.Exe - Format conversion program which uses as a subroutine, HP41UC.EXE

41_Lista.XLS - Prints Program Listings and Barcode

PROCEEDURE: 1) Using V41 on the PC, manually key in the program steps 2) Save the program as a RAW formatted file using the PUT function 3) Using Win41UC.Exe, convert the RAW file into BIN format 4) Now using 41_Lista.XLS, print a program Listing &/or the barcode usable by the HP Wand.

Program Sources and Credits: V41 Author: Warren Furlow and Frank Bauernoeppel

HP41UC.Exe Ver 1.22 Author: Leo Duran Available from: hpmuseum.org

Win41UC.Exe Author: Ulisse Quadri Available from: hpmuseum.org

41_Lista.XLS Author: Dam McDonald Available from: hpmuseum.org

Re: HP-41 Program Listings & Barcode via PC

*Message #2 Posted by **Tony Duell** on 15 July 2005, 3:47 p.m.,*
in response to message #1 by G.R. Harvey

Alternatively, if you want to avoid proprietary, non-open-source software :

Download the LIF Utilities for Linux from the HPCC web site.

Compile them (they're GPLed C source code)

Use lifget to read an HP41 program from a real HP41 floppy disk, or download a .raw file from somewhere, or... (if you have an HPIL module, 82164 HPIL-RS232 interface and an extended I/O module, you can use the OUTP command on a real 41 to transfer a program to the PC).

If you want a listing, run the raw file through prog41. Use the -x option to load XROM definition files so that commands from plug-in ROMs have sensible names (if you don't load an XROM file, such commands have names like XROM 01,14). Use the pr program (standard unix/linux utility) to format the output if you wish.

If you want barcode, run the raw file through prog41bar. Run the output of that through barps to make a printable postscript file of the barcode. Feel free to write other output drivers if you so wish (the format of all the necessary files is in the distribution). If you want to download the program direct to your HP41, there's a

description of a small modification you can make to the wand module, and an add-on circuit that goes between that an a PC parallel port. Then just send the output of prog41bar to that parallel port and the program will be downloaded to your 41 as if you'd scanned the appropriate barcode.

Note that all the programs read their input from STDIN, send their output to STDOUT. You can put them all together in a pipe if you want to.

Enjoy....

No. I just think it's a neat hack. I'm tempted to do it, but I think I'll wait until I have a second wand. (That's a reflection on my soldering skills, not your design. 8)

Re: Barcode Blinker (wand hack)

*Message #6 Posted by **Vassilis Prevelakis** on 30 July 2005, 12:07 a.m.,*
in response to message #4 by Tony Duell

Way back in the 80s I had the same problem (namely that I could get data out of my HP41, but I could not get them back in).

Given that I only had an HP wand (no money for HP-IL), I used blue tack to attach my wand over the caps-lock LED on the keyboard of my BBC micro. I then wrote a BASIC (IMHO) program that blinked the LED in such a way as to convince the Wand that it was seeing the reflection of of its own LED on the paper. (I also had to make sure the Wand button was held down by a rubber band).

In this way I could xfer programs and data (what I was really looking for in the 1st place) to my 41. I considered this "hack" very neat as the LED/WAND combination was effectively an opto-isolator protecting my 41 from being zapped (my HP-41 was one of the first batches to come out of the US production line and was thought to be more sensitive to static than later units).

Later on I was told that I was lucky to get away with this procedure as the external LED could have overloaded the wand sensor. I am not sure whether this is true though.

Quote:

> an H8 in a common calc? Wonder if it's flash(able)

Doubtful. It's almost certainly a masked-ROM part. They would only have used flash parts during software development, and perhaps for very limited pilot production.

common ROM code in Spice calculators

*Message #1 Posted by **Eric Smith** on 12 July 2005, 8:33 p.m.*

There were some ROMs shared beteen the 67 and 97, and between the 19C and 29C, which is not surprising because those were pairs of printing and non-printing machines that were otherwise nearly identical.

And there are certainly many code similarities between various models.

But I was surprised to discover that the Spice series has some large blocks of identical code shared between different models.

The 32E, 34C, and 38C all share the same ROM code for the first "quad", which is octal 0000-1777 (1 Kword). This contains the basic arithmetic, logarithmic, and exponential routines, and probably more that I haven't yet identified. There are several jump tables of entry points to the various routines; this is the first time that jump tables were used to provide stable entry point addresses in HP handheld calculators. The routines are quite similar to those of the 41C (File cn6b of the HP-41C mainframe VASM linstings), and somewhat different than those of the Woodstock calculators. It appears that this first quad was intended to be a general-purpose math ROM which could be exhausively tested and then reused as-is in multiple calculators, almost like a "BIOS". This is a departure from their earlier designs, in which even code shared between models, such as the math code, was massaged to fit into each model differently.

Similarly, the 37E and 38E share the same ROM code for the first "quad", but it is significantly different than the first quad of the 32E/34C/38C. In addition, the 37E and 38E share the code from octal 2000-2777, with the exception of eleven words which are different. I suspect that this region contains the core financial calculations, but have not yet attempted to identify the routines.

Interestingly, the 33C first quad does not match either the 32E/34C/38C or the 37E/38E. And it is particularly interesting that the 38E and 38C code does not match. There are probably few actual code differences, but the code organization in the ROM address space appears to be completely different.

I do not yet have ROM dumps of the 31E or 33E for comparison. I expect them both to use the same first quad as the 32E/34C/38C.

The Voyager calculators reverted to each calculator having a completely unique assembly code arrangement; although the math routines are similar if not identical, they are at different addresses in each calculator.

Eric

Re: common ROM code in Spice calculators

*Message #2 Posted by **HrastProgrammer** on 13 July 2005, 1:40 a.m.,*
in response to message #1 by Eric Smith

The Voyager calculators reverted to each calculator having a completely unique assembly code arrangement; although the math routines are similar if not identical, they are at different addresses in each calculator.

True. There is a lot of other (not only math) code which is the same in all Voyagers but at a different

addresses. And, as you already pointed in a document you sent me some time ago, there are a lot of math routines shared between HP-41C and Voyagers (especially HP-11C and 15C).

Best regards.

9100 display annotation plate backlit?

*Message #1 Posted by **marais** on 12 July 2005, 4:33 p.m.*

I don't own a 9100 (to my most sincere regrets), so I have to find the answer to my curiosity here: In pictures of the 9100, it often seems to me that the plate right to the display with the lettering "x-keyboard, y -accumulator, z-temporary" is backlit. Is this true or just due to the photographs? I have a 9810 with the same lettering, and it's definitely not backlit.

Just for curiosity -

Andreas (and if yes, what about the model B, would be the next question)

Re: 9100 display annotation plate backlit?

*Message #2 Posted by **Rick Bensene** on 13 July 2005, 1:17 a.m.,*
in response to message #1 by marais

The annotations are indeed backlit, on both the 9100A and 9100B.

Rick Bensene The Old Calculator Web Museum http://oldcalculatormuseum.com Beavercreek, Oregon

Re: 9100 display annotation plate backlit?

*Message #3 Posted by **David Smith** on 13 July 2005, 3:59 p.m.,*
in response to message #1 by marais

There are two small 2-pin 15V incandescent bulbs stuck into a plastic housing behind the display panel. These bulbs tend to have the bases break off or the part of the plastic housing that they stick into likes to crack.

Re: 9100 display annotation plate backlit?

*Message #4 Posted by **David Smith** on 13 July 2005, 4:00 p.m.,*
in response to message #3 by David Smith

Also, the silk screened display legend tends to wear and flake off.

Yellowed plastic case

*Message #1 Posted by **Arnaud Amiel** on 12 July 2005, 5:19 a.m.*

Just got my hands on a nice (Non HP) adding machine however its plastic case is all yellowed. Does anyone know to restaure it to its original colour. Is it even possible. How can I avoid my other calculators turning dirty yellow. Thanks for your suggestions.

Arnaud

Re: Yellowed plastic case

*Message #2 Posted by **Frank Boehm** on 12 July 2005, 8:21 a.m.,*
in response to message #1 by Arnaud Amiel

Assuming it is not dirt, you probably can't do anything about it. It's a non-reversible chemical reaction (UV rays modifying plastics). It might be possible to use H2O2 (try it on a hidden surface) to bright it up, I doubt it though.

The only way to prevent yellowing is to hide the item in a dark, dry, cold place. If you want to create a showroom, there is special glas (UV blocking) available - you do need special lighting as well (UV free).

Re: Yellowed plastic case

*Message #3 Posted by **Chan Tran** on 12 July 2005, 4:27 p.m.,*
in response to message #2 by Frank Boehm

If the calc isn't too valuable I would suggest to try chorine beach.

Re: Yellowed plastic case

*Message #4 Posted by **Gary** on 18 July 2005, 5:30 p.m.,*
in response to message #3 by Chan Tran

Some restoration may be possible by using using jewelers rouge to polish away a thin layer of plastic. If the yellowing is deep, this won't work. An alternative is vinyl dye or the new plastic bonding spray paint(assuming you can find a suitable color.).

Procedure to adjust card reader speed in HP65/67/97

*Message #1 Posted by **Bernhard** on 11 July 2005, 2:13 p.m.*

Dear fellow HP aficionados:

Some people owning old HP65/67/97 have reported difficulty with card reader speed adjustment, especially after mounting a new friction wheel. As my previous post on the topic did not yield any useful information on how to do it, I worked out a procedure that does not need a priori knowledge of any factory adjustment parameters:

The proposition is that HP orginal cards were written with in-spec bit density and did not change over the ~30 years. Just as you would expect from a top-quality manufacturer. (Hopefully so !)

So if we have a means to compare bit density on an original card with its copy written on a HP65/67/97, then the motor speed of the latter can be adjusted to yield the same bit density as was on the original HP card.

As a means to compare bit density we use another HP65/67/97 (not the one to be adjusted) with good card drive (not worn) but the speed of this one does not matter (may be a bit off) as long as it does not change much between reads, which can be verified by applying simple statistics on the measurements.

Bernies' procedure: put a digital sampling oscilloscope or a 30ms retriggerable monoflop followed by a digital timer / counter (I used a HP 5327A, has nice Nixie Tubes) on one of the two read lines coming from the card reader amplifier chip of the HP65/67/97 to be used as a measurement tool.

Set up to measure the total time interval from the first read pulse to the last read pulse. Run original HP card through for a few times (i.e. 20 times). Note the time intervals. Use a HP calculator to get mean and standard deviation. In my case, I got mean = 1110,6 milliseconds with a standard deviation sd = 4.4 ms. Beware: other cards / calculators may give different results.

3 * sd / mean is a indication of the accuracy you can achieve with this improvised measurement setup - in this case, about 1.2% accuracy with nearly full confidence, enough for the purpose.

The mean is the value you want to get from a card written on the HP to be adjusted. Then you have identical bit density on the original HP card and its copy.

Now the repeat loop for speed check / adjustment:

Copy the original HP card on the HP to be adjusted. Run the copy through the measurement HP. Compare the time interval of the copy with the mean "reference" time interval taken from the original HP card.

If the copy gives higher readings, bit density is too low, speed must be increased, and vice versa. After each speed adjustment, make a new copy to get the new bit density and repeat the measurement.

Replacing the original speed setting resistor of the HP to be adjusted with a trimpot / resistor combination is helpful, but only needed if speed needs be corrected, so don't solder before you have the first result. Some well - known tricks as marking the previous settings on the pot or measuring and noting the resistance before and during adjustment will help to quickly zero in to the final setting, on which both cards (original and copy) will yield the same time interval, and hence, will have the same bit density.

The beauty of this scheme is that no reference other than the original HP card (standard pac) is needed. The measurement HP can be adjusted afterwards by interchangig roles. One final hint: checking the measurement HP with the original card now and then will give confidence during the adjustment procedure. If the "reference" time interval starts to deviate, the motor speed of the measurement HP is not very stable (weak battery?) but the adjustment procedure can continue with targeting the new "reference" time interval. Always do the statistics to be sure to have reliable results.

I have tested the above on three HP67s, and all now work fine. One of them has a trimpot already installed (original HP ?) and someone had played with it. This unknown guy has forced me to think out the above procedure.

Comments / success stories invited !

Regards, Bernhard

Wonderful! But, What is the value of the speed-resistor and the trimpot? (more or less)

Re: Procedure to adjust card reader speed in HP65/67/97

*Message #3 Posted by **Tony Duell** on 12 July 2005, 6:29 a.m.,*
in response to message #1 by Bernhard

I seem to remember that the HP97 service manual (on the MoHPC CD-ROMs) contains a procedure for setting the motor speed. You record a card, then coat it with 'magnasee' (a coloidal suspension of iron oxide, used to show the magnetic pattern). Measure the total length of the recorded bit. If it's too long (the lengths are given in the manual), you slow the motor down, if it's too short, you speed it up.

The manual also gives the possible resistor values to use.

Since the 67 uses essentially the same card reader circuit, I think the procedure would work for that machine too.

Re: Procedure to adjust card reader speed in HP65/67/97

*Message #4 Posted by **Katie Wasserman** on 12 July 2005, 10:52 a.m.,*
in response to message #3 by Tony Duell

The 97 service manual has a simple procedure for adjusting the eccentric cam -- the little white screw-like piece that determines the pressure of the card against the roller. It tells you to turn this cam to get a specific current draw (180ma +/- 20ma) from the motor. It seems to me that this adjustment has a big impact on motor speed, perhaps it's the primary determinant.

I've repaired many card readers and find that the current draw is an excellent way to get the cam pressure correct and a good test to see if the card reader will work before you've got it fully reassembled. But I've also found that the reader can work well even if the current draw is off by a larger amount (in the range of 130ma - 220ma).

I've never had to resort to looking at bit patterns to get the motor speed right -- the cam adjustment has always worked. I'm I just lucky? I don't think so, rather there must be a huge tolerance for bit pattern length built into the firmware because my luck isn't that good :)

*Message #5 Posted by **David Smith** on 12 July 2005, 11:52 a.m.,*
in response to message #4 by Katie Wasserman

Basically, the card reader will work just fine at just about any reasonable speed while reading. The same is true for writing as long as the card is not moving so fast that you run out of card before you get to the end of the bits.

The silicone rubber fuel line seems to be soft enough that setting the cam tension has very little effect on the card reader. I do go through the motions of trying to set the cam about the middle of its pressure range. I seldom bother measuring motor current any more.

Re: Procedure to adjust card reader speed in HP65/67/97

*Message #6 Posted by **Bernhard** on 12 July 2005, 1:20 p.m.,*
in response to message #4 by Katie Wasserman

Torque of a small DC motor is roughly proportional to motor current. Speed of a small DC motor is roughly proportional to motor voltage minus motor current * armature resistance.

Bit density is influenced by many factors (including clock speed), so my desire was not to resort to second order effects but to measure bit density as directly and precisely as reasonably possible.

It's also a matter of philosophy - if you invest some of your valuable lifetime into restoring the best calculators ever built by mankind, why settle for less than the best possible precision.

Same thing if you choose a mechanic for restoring the engine of your vintage italian sportscar. The parts do cost the same. The labor is about the same. But hell, you better want to have the work done by a true master who is proud to deliver an absolute masterpiece, an engine that is better than the original from the factory.

This way of thinking is the only one (for me). All those who want to settle for less do just waste their money, ressources and lifetime.

Regards, Bernhard

The MoHPC DVD or CD set does include the 97 service manual. Unfortunately, no service

manuals have turned up for the 67, the other Topcats, nor any other handhelds prior to the 41C.

*Message #9 Posted by **Katie** on 13 July 2005, 2:40 a.m.,*
in response to message #7 by marais

The eccentric cam is simply the shaft that the pressure roller rotates on. If you look at it closely you'll see that it's not symmetric it's "eccentric". The slot in the end of this shaft allows you to use a screwdriver to rotate it and by doing so you'll move the pressure roller very slightly closer to or further from the R/W head.

Re: Procedure to adjust card reader speed in HP65/67/97

*Message #10 Posted by **marais** on 13 July 2005, 3:47 a.m.,*
in response to message #9 by Katie

KAtie, I did not realize it is slightly excentric. It IS! I never paid attention to this detail. But I suppose the power rates indicated in the service manual are for the original gummy wheel, and do not necessarily apply to our O-rings or fuel tube repairs. Or do they?

Andreas

Re: Procedure to adjust card reader speed in HP65/67/97

*Message #11 Posted by **Bernhard** on 13 July 2005, 4:43 a.m.,*
in response to message #10 by marais

Torque of a small DC motor is roughly proportional to motor current (see message #6). So if you adjust current, then you adjust torque, not bit density, but you are sure the motor and drive gears are not overloaded.

Using different materials for the friction roller may influence the torque needed to pull a card through. IMHO, the following procedure I use seems to make sense:

1. Adjust friction roller pressure such that you can gently push a card in and pull it out again, such that you can feel the friction roller just grips the card (calculator power off).

2. Then increase pressure by 1/8 turn. Now it should be impossible to gently push a card in while power off, but with power on the card should run through smoothly.

3. Measure motor current to make sure it does not exceed the spec given in the manual, just to be on the safe side.

4. Apply the bit density adjustment procedure (message #1). If adjustment is needed, use a resistor-trimpot series connection that allows adjustment to a resistance +/- 20% of the measured original value. This range should be sufficient in most cases. When the required value is found, replace by a series or parallel connection of temperature stable metal film resistors rated 250 mW and of course measure bit density again just to be sure.

5. Test the card reader with reading / copying a few cards from the standard pac.

I think that besides thoroughly cleaning the whole card reader and carefully greasing the gears (the teeth only, very very sparingly with a fine brush under a magnifying lens !!!) with silicone based grease this is all you could do to restore the card reader to the best possible

condition (mineral oil based grease may destroy plastics).

One final note to those who think that the card reader always works even without proper adjustment I'd recommend you first read the papers on the card reader design from the HP Journal available at this Museum. They also give some numbers on the required precision. These are quite demanding, and with my procedure you can get the bit density just right near these requirements, but not much better.

It all boils down to bit error rate. A card reader out of adjustment may appear to work, but with all the various factors thrown in, such as magnetic flux shift (over time), head alignment, head wearout, card flutter, drive train jitter, speed deviations, battery voltage fluctuations, etc., it is unlikely it will deliver reliable service especially if cards are to be interchanged between different machines. So it is advisable to have the best possible adjustment.

Regards, Bernhard

in response to message #3 by Tony Duell

Oh yes, Magnasee magic potion. Makes a mess all around. Contaminates all the workbench and all calcs that come even near the contaminated spots.

And then the imprecision of measuring length with a ruler.

I tried all that and I wanted a clean procedure using just common clean electronics lab equipment.

A National Energy/Recycling Plan (Long)

*Message #1 Posted by **Frank Travis** on 8 July 2005, 1:28 p.m.*

Perhaps the U.S. could help its energy problems by having a National Energy/Recycling plan as other countries do. For example, I like cars, but the supply of oil and gas is not limitless. Toyota and other Japanese companies are marketting hybrid cars. Japan is even more dependent on overseas oil (not to mention other raw materials) than the U.S. It was Japan's feeling of being strangled/pressured by the U.S. that led them to start World War II in the Pacific. Recycling started decades before in Japan and Europe than in the U.S. because they have very limited landfill space. Recycling an Aluminum can takes about 5% of the energy as it does to produce a brand new Aluminum can from raw Bauxite ore. I remember watching an episode of the old "To Tell The Truth Show" about 1976 when the topic was about a company that made a house from mostly recycled material valued at $60,000 (that's 1976 dollars). When I used to go to Michigan International Speedway and Indianapolis Motor Speeday in the 1980's and 1990's I was surprised at how many bottles and cans were thrown on the infield areas. Where I work we have paper recycling bins that are emptied into larger paper recycling dumpsters. I know such a plan will take time, but what could be done to speed up such a process?

*Message #3 Posted by **Thomas Radtke** on 8 July 2005, 3:43 p.m.,*
in response to message #2 by Forrest Switzer

HP calculators are never obsolete! The are timeless by design;)

Thomas

Re: A National Energy/Recycling Plan (Long)

*Message #4 Posted by **Forrest** on 8 July 2005, 8:34 p.m.,*
in response to message #3 by Thomas Radtke

Thomas,

When I buy one it is obsolete electronics. If I want to sell one, which I don't do very often, then it is an historic combination of art and technology created and implemented with near perfect bio-metrics. - maybe bio-metrics is not the proper word.

Re: A National Energy/Recycling Plan (Long)

*Message #5 Posted by **Tony** on 8 July 2005, 3:40 p.m.,*
in response to message #1 by Frank Travis

How about the Kyoto Treaty, which was rejected by the world's biggest polluter, the USA, because it would "damage their economy"?

Re: A National Energy/Recycling Plan (Long)

*Message #6 Posted by **Gene Wright** on 9 July 2005, 4:48 p.m.,*
in response to message #5 by Tony

IMO, Kyoto is a fraud.

Even if all the countries signed onto it, projections call for a 0.5 degree reduction from what the temperature would be in 100 years ANYWAY.

All that for $150 billion a year for 100 years. Wow. That's a lot of money.

How about $$ to get rid of malaria? How about $$ to get rid of AIDS?

My point is really this: Is spending $150 billion x 100 the best use of that money over the next 100 years?

The USA decided no.

Europe, who by and large signed up for Kyoto is nowhere near meeting the targets either.

And, it might do well to read this book:

http://www.amazon.com/exec/obidos/tg/detail/-/0521010683/qid=1120941976

The Skeptical Environmentalist by Bjorn Lomborg

Quote: "This is one of the most valuable books on public policy - not merely on environmental policy - to have been written for the intelligent general reader in the past ten years. The Skeptical Environmentalist is a triumph." The Economist "...a superbly documented and readable book." Wall Street Journal "...it is a surprise to meet someone who calls himself an environmentalist but who asserts that things are getting better....Strange to say, the author of this happy thesis is not a steely-eyed economist at a conservative Washington think tank but a vegetarian, backpack-toting academic who was a member of Greenpeace for four years....The primary target of the books, a substantial work of analysis with almost 3.000 footnotes, are statements made by environemtal organizations like the Worldwatch Institute, the World Wildlife Fund and Greenpeace. He refers to the persistently gloomy fate from these groups as the Litany, a collection of statements that he argues are exaggerations or outright myths." Science of the Times/New York Times "The Skeptical Environmentalist should be read by every environmentalist, so that the appalling errors of fact the environmental movement has made in the past are not repeated. A brilliant and powerful book." Matt Ridley, Author of Genome "Lomborg pulls off the remarkable feat of welding the techno-optimism of the Internet age with a lefty's concern for the fate of the planet." Rolling Stone "Bjørn Lomborg is an outstanding representative of the "new breed" of political scientists--mathematically-skilled and computer-adept. In this book he shows himself also to be a hardheaded, empirically oriented analyst. Surveying a vast amount of data and taking account of a wide range of more and less informed opinion about environmental threats facing the planet, he comes to a balanced assessment of which ones are real and which are over-hyped. In vigorous and what needs not to be done about those turning out to be pseudo-problems." Professor Jack Hirshleifer, Department of Economics, UCLA "The Skeptical Environmentalist should be read by every environmentalist, so that the appalling errors of fact the environmental movement has made in the past are not repeated. A brilliant and powerful book." Matt Ridley, Author of Genome "When Lomborg concludes that '...the loss of the world's rainforests, of fertile agricultural land, the ozone layer and of the climate balance are terrible...' I agree. But we also need debate, and this book provides us with that in generous amounts, incl 2428 footnotes. If you, like I do, belong to the people who dare to think

the world is making some progress, but always with mistakes to be corrected, this book makes important reading." Professor Lars Kristoferson, Secretary General, WWF Sweden "Lomborg's book sheds needed light on the real state of the world. I recommend it to anyone interested in our global environment...the book is a credible attempt at refuting many of the more outrageous environmentalist claims--a point of view that is seldom heard. The Skeptical Environmentalist is the most valuable book available in many years on public policy in general, not only environmental policy in particular. It should be required reading for all legislators, government bureaucrats and corporate executives who preside over the ever-increasing array of environmental regulations and policies." Geotimes "Lomborg is right on his points, that his critique of much green activism and its reporting in the media is just, and, above all, that where there is room for disagreement, Mr Lomborg invites and facilitates discussion, rather than seeking to silence it." The Economist Feb 2002"

All for now. Gene

*Message #7 Posted by **Howard Owen** on 8 July 2005, 4:48 p.m.,*
in response to message #1 by Frank Travis

If you can parallelize the problem, write it onto 40 million sets of HP82104A cards. Then find 40 million 41C owners, perhaps through an auction on eBay, and mail them each a set of cards. Have them run the problem and mail (e or snail) you back the results. Use an HP-48GX to integrate the final answer, and publish it here. You'll be a hero! 8)

Just to be clear, I don't think environmental matters are intriniscly funny. I do think an off-topic post like that deserves some sort of response. 8)

Re: A National Energy/Recycling Plan (Long)

Re: School content ...

*Message #14 Posted by **Andrés C. Rodríguez (Argentina)** on 9 July 2005, 5:11 p.m.,*
in response to message #11 by visitor

> Quote:
>
> This is not ... teach in our American schools:

Well, usually things are more complex than school content. Such content usually tends to be somewhat shallow and biased; because the mission of the school is not to make everyone an, er, *scholar* on a particular matter; **but** to integrate people in a shared, more-or-less useable body of

basic knowledge, making them a part of a society. If the result is a *working* part, better yet.

Alas, RPN is not taught at schools these days, as far as I know,

Please note: I have not accesed the controversial site mentioned above, so have no positive nor negative opinion about it and, by the way, about all the historic-political debate in previous messages.

Re: WWII Revisited

*Message #15 Posted by **Howard Owen** on 9 July 2005, 6:54 p.m.,*
in response to message #11 by visitor

I had no idea Churchill was a calculator enthusisast! It would have had to involve the mechanical variety up until 1941 or so. Did he know about Babbage? That *certainly* has never been taught in any classroom *anywhere!* But then, there's Bletchley Park and Alan Turing, which Churchill knew all about, of course. Are you suggesting that Turing went through all the trouble of theorizing the abstract idea of the stored program computer just to get his hands on a pocket calculator?? Sensational! I think we should put the problem of what Churchill knew and when did he know it on the MCBC and give it a spin. Who knows what fascinating things that have never shown themselves inside a classroom might be revealed?

To be clear, I don't think that character assassination in the guise of revisionist history is intrinsicly funny.. well, maybe I do..

Yes, a true visionary. Then there's Douglas Englebert, who invented the Macintosh. 8)

But I had no idea that Vannevar Bush invented the pocket electronic calculator! 8)

And both these gentlemen *were alive at the same time as Churchill!*

Let's get back on topic > RPN

*Message #18 Posted by **db (martinez, ca.)** on 9 July 2005, 10:35 p.m.,*
in response to message #15 by Howard Owen

Mr Owen's tongue-in-cheek post has raised an interesting question in my mind. Who in history (or fiction) would or wouldn't use rpn?
If i may, i'd like to make a few conjectures: Newton, yes - Velikovski, no. Mr. Spock, yes - Dr. Spock, no. Baha'u'llah, yes - Mohammed, no. Dave Hicks, yes - David Lee Roth, no. Harry Browne, probably a 12c - any other politician i can think of, no. Dr. Dean, yes - Dr. Laura , no, Mickey Hart, yes - Karen Carpenter, no. My ex brother in law, yes - my ex wife, no. Jung, yes - Freud, no. Ursula Leguin, yes - L Ron Hubbard, no.
Any ideas on this?

Re: Let's get back on topic > RPN

*Message #19 Posted by **Namir** on 10 July 2005, 1:32 a.m.,*
in response to message #18 by db (martinez, ca.)

I agree with your list .. espcially Jung and Freud. However, on a second thought I'd say Freud would use **Polish Notation** since it is based on the way we say an expression (e.g. add 1 and 2). This is inline with the **speak therapy** that Freud made popular. Jung might come out with something that is neither RPN nor algebraic. Maybe Jung would declare all operators are special archetypal functions and regard the intermediate stack as the unconscious part of evaluating an expression--the final result being projected by the ego.

Re: Let's get back on topic > RPN

*Message #20 Posted by **Karl Schneider** on 10 July 2005, 3:09 a.m.,*

db --

Fairly witty list about conjectured "users of RPN":

> Quote:
>
> Mickey Hart, yes - Karen Carpenter, no.

Hmm, Mickey is the drummer for the "cultish" Grateful Dead; the late Ms. Carpenter (who died of Anorexia Nervosa) performed rather mainstream, conventional songs.

I assume that's the intended analogy, and that (ahem) "counting calories" accurately was not the reference ...

in response to message #18 by db (martinez, ca.)

Namir; There is more to you than kludgy programs. We should have talked more at hhc '04.
Karl; I chose Mickey Hart because he writes songs in strange timeing, like "Playing in the band" (10), The Eleven" (11), the 7 beat one that i can't think of right now, and all that polyrythimic stuff. To keep track of that; he's obviously a candidate for RPN if he doesn't already use it. Karen Carpenter got thrown in there because i couldn't think of another pop drummer's name.
Mr. Owen; I have been out off-the-wall'd. I will remember in the future that i am playing with the big kids when you are around.
Thanks for your feedback.

Ultimate Alarm Clock - update

*Message #1 Posted by **Geir Isene** on 8 July 2005, 12:04 p.m.*

The HP-41 Ultimate Alarm Clock now has its own project site (http://sourceforge.net/projects/hp41uac) and its own homepage (http://www.isene.com/artweb.cgi?article=009-hp41alm.txt).

It is currently in production stable release v0.5. This release fixes some bugs and adds a couple of features beyond that originally released in the HP Museums HP-41 software archive. The project team is busy working on v0.51 that will add one small but important feature to its already impressing feature list.

Soon you will be able to order HP-41 UAC mercandise such as T-shirts with the logo on front and the program listing on the back as well as coffee mugs, teddy bears, underwear and more.

It seems the HP-41 UAC is the first HP-41 project ever hosted at Sourceforge.net.

Any contributions such as bug reports, feature requests etc. is highly appreciated by the project's large and busy development community. We are working day and night here now to bring you the best alarm clock that man has ever made.

Kind regards,

Geir Isene
Lead developer
HP-41 UAC

Chips other than ACT and RAMs going bad?

*Message #1 Posted by **Eric Smith** on 7 July 2005, 8:08 p.m.*

How common is it for HP calculator chips other than the ACT and RAMs to go bad?

In Woodstocks, the most common cause of bad chips is the use of the AC adapter without a battery pack, with a bad battery pack, or with the pack not making good contact. Due to uncharacteristically poor design, this allows the voltages to exceed the limits of the chips.

Similarly, the card reader sense amplifier of the HP-65 (and maybe the HP-67) may be damaged by use without a battery pack.

But have those of you that repair older HPs noticed many cases of other chips going bad?

I'm considering offering tiny modules that can replace the ACT of the Woodstock, Topcat, 67, and 19C calculators. The module would effectively replace the ROM and RAM chip as well, though the anode driver portion of the ROM/anode driver chip would still be required for the display to work.

But I'm wondering whether it's common for other chips in these calculators, or in the Classic or Spice calculators, to go bad. In particular, whether the CRC and PIK chips, or the series-30 CPU or ROM/RAM chips fail often.

Eric

Re: Chips other than ACT and RAMs going bad?

*Message #2 Posted by **Katie Wasserman** on 8 July 2005, 1:42 a.m.,*
in response to message #1 by Eric Smith

Eric,

It would GREAT if you could produce replacement chips/modules for some of dead circuits in these calculators.

In my experience by far the most problematic of all components in HP LED calculators are the chips in the HP-27. They are, of course, the NMOS chips and are only used in that model. I'll bet that there are more dead NMOS chips in the 27's than there are dead PMOS chips in all other Woodstocks calculators combined.

IIRC the anode driver chip in the 27 is NMOS too, so that might be an issue -- as I think that's one of the frequently failing chips.

-Katie

Re: Chips other than ACT and RAMs going bad?

*Message #3 Posted by **Eric Smith** on 8 July 2005, 4:07 a.m.,*
in response to message #2 by Katie Wasserman

I'll start with the PMOS ACT/ROM/RAM replacement, since I have more PMOS calculator models to test it in. I could probably do an NMOS-compatible version later.

I don't yet know what the cost of the replacement will be, but it may be high enough that it's not worthwhile for use in the more common models (e.g., 21, 25, 25C).

Replacing an anode driver chip is harder due to the smaller physical size constraint. The electronics isn't that hard to design.

If only the ROM part of a ROM/Anode driver chip fails, my replacement ACT will be sufficient, since it completely ignores the external ROMs and RAMs.

Eric

Re: Chips other than ACT and RAMs going bad?

*Message #4 Posted by **Nelson M. Sicuro (Brazil)** on 8 July 2005, 10:23 p.m.,*
in response to message #3 by Eric Smith

What chip will you use to replace those old chips? I plan to replace all electronic of my HP-21 with MSP430 plus some drivers for the LEDs and a switched power supply (all from TI, ironic...)

Best regards!

Nelson

Re: Chips other than ACT and RAMs going bad?

*Message #5 Posted by **Eric Smith** on 8 July 2005, 10:49 p.m.,*
in response to message #4 by Nelson M. Sicuro (Brazil)

A PIC18F microcontroller and a bunch of other stuff to interface to the PMOS signal levels. Packaging it in a module not too much larger than a 22 pin DIP will be somewhat challenging.

I've considered developing a board to replace the entire logic board of the Woodstock series. But that doesn't help any with the 67, 19C, and Topcat series, and I haven't found a source for the style of contact pins HP uses for the connections to the keyboard and display.

Re: Chips other than ACT and RAMs going bad?

*Message #6 Posted by **Bernhard** on 9 July 2005, 4:00 p.m.,*
in response to message #5 by Eric Smith

In most of the dead Woodstocks I had on my lab table, the 16 pin ROM chip not connected to the LED display was dead. As it is the same chip type as the ROM/anode driver, it might be that the LEDs act as a overvoltage clamp. This could also explain the burnt out LEDs on some Woodstocks. I never had one where the ROM/anode driver was really dead, except for one (HP29C, sigh). The next common loser is the ACT. So if you build a replacement module that sits in the ACT socket and does not use any ROM, I think you have a solution to fix most dead Woodstocks.

Redistributing HP manuals

*Message #1 Posted by **Thomas Okken** on 6 July 2005, 10:43 a.m.*

I would like to create an HTML version of the HP-42S manual, to distribute with Free42. Does anyone know what HP's position would be on something like that? I gather HP has no problem with Dave Hicks selling copies of their manuals on CD, but to use their documentation with what could be viewed as a competing product might be a different matter. Who could I contact within HP to request permission?

Any insights would be welcome!

- Thomas

A suggestion (was: Redistributing HP manuals)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 7 July 2005, 12:26 a.m.,*
in response to message #1 by Thomas Okken

Hi, Thomas;

if you accept my suggestion and if you are willing to go ahead with it, consider a quick reference guide or a brief guide, based on the original manual, where you explain each possible function in brief with som examples. There is no problem writing books about HP calculators, and I see no problem writing an on-line brief guide as well, just avoid copying the original text. There is already an index with references to all available operations/functions in the HP42S manual. You could start there, groupping commands/functions on areas, for example.

Success!

Luiz (Brazil)

Startup script for 49G+

*Message #1 Posted by **Tony** on 6 July 2005, 9:52 a.m.*

I want to have a particular User RPL program run automatically every time the calc is turned on. Can anybody tell me what I need to do?

Thanks.

Tony.

Re: Startup script for 49G+

*Message #2 Posted by **Raymond Del Tondo** on 6 July 2005, 10:44 a.m.,*
in response to message #1 by Tony

Hi,

store either the RPL program or better it's name into the variable STARTUP.

More info: comp.sys.hp48

Also try to RTFM;-)

Raymond

Re: Startup script for 49G+

*Message #3 Posted by **Arnaud Amiel** on 6 July 2005, 10:54 a.m.,*
in response to message #2 by Raymond Del Tondo

The question is not at Startup (RTFQ) but when turned on. To do this, you need to start your program like this << OFF ... >> and assign it to the OFF key

```
2: << OFF ... >>
1: 101.3
ASN
```

Then you need to get your calculator in user mode so it uses the new definition of the [OFF] key: -62 SF of [LS][ALPHA] until USR displays in the header. Also try asking questions on comp.sys.hp48 where people are more interested in the new hp calculators. Good luck

Arnaud

Re: Startup script for 49G+

*Message #4 Posted by **Tony** on 6 July 2005, 12:00 p.m.,*
in response to message #3 by Arnaud Amiel

Arnaud: Thanks, that seems to work.

Raymond: I did RTFM and TFUG, but couldn't find anything there about this. Maybe you could tell me where I could find it, for future reference.

All: I get the hint; this is a museum. I'll try comp.sys.hp48 in future.

Thanks a lot.

Tony.

Re: Startup script for 49G+

*Message #5 Posted by **Ron Ross** on 6 July 2005, 12:52 p.m.,*
in response to message #4 by Tony

Raymond is not being rude. He often answers questions in comp.sys.hp48 and you will see this when you visit there. It is just that experts here are more familiar with the older units (some are also very familiar with the newer ones too!). As such, you are best served by asking your questions there.

Another suggestion, visit hpcalc.org and download both the HP48G user's guide and more importantly, the Advanced User's Guide for the Hp48G series. This is a must have for any 48/49G owner.

Re: Startup script for 49G+

*Message #6 Posted by **Raymond Del Tondo** on 6 July 2005, 1:35 p.m.,*
in response to message #3 by Arnaud Amiel

Hi Arnaud,

your program only works if the user explicitely
turns off the calc by pushing buttons.
If the calc turns off automatically then
the program won't be executed.

I'm not too deep in the 49g+, I have to admit;-)
My favourite machines are the HP-41 and HP-48.
But I thought the Startup var of the 4g series would be evaluated
every time the calc is turned on, not only after a warmststart.

If it's the latter case, then the Startup var seems to be of limited use.

Recently there was a thread (either here or in c.s.hp48)
related to this topic, where I suggested to use kinda
startup library, which can perform various tasks.
At least that's what I use on my HP-48;-)

Raymond

Yes, the STARTUP var only works after a warmstart so it would be equivalent to your libary solution for the 48. My startup on sets up the flags and few parameters I want to run with.

Arnaud

Re: Startup script for 49G+

*Message #8 Posted by **Tony** on 6 July 2005, 2:37 p.m.,*
in response to message #6 by Raymond Del Tondo

I haven't been able to get the STARTUP variable (in the home directory) to have /any/ effect. Maybe I'm missing something.

Arnaud's solution is fine for my purposes; it's just a maintenance routine to clear out junk from the directories before I start work.

Tony.

Re: Startup script for 49G+

*Message #9 Posted by **Arnaud Amiel** on 6 July 2005, 3:16 p.m.,*
in response to message #8 by Tony

Just store << "It is working" 'Test' STO >> in 'STARTUP' in your HOME directory. Restart your calculator with [ON][C] and you should see the effect.

Arnaud

Re: Startup script for 49G+

*Message #10 Posted by **Tony** on 6 July 2005, 3:26 p.m.,*
in response to message #9 by Arnaud Amiel

Ah yes, that works alright. Thanks.

Tony.

Re: Startup script for 49G+

*Message #11 Posted by **James M. Prange (Michigan)** on 6 July 2005, 3:38 p.m.,*
in response to message #8 by Tony

STARTUP runs only after a "warmstart"; for examples, the hold down [ON] while pressing [C] combination, a "paper clip reset", or the ON.REBOOT operation from the [ON] and [F]

combination; basically the same situations that configure libraries on a 49 series.

STARTUP is a good place to ATTACH libraries that aren't attached automatically by their $CONFIG routines, and also a good place to DETACH libraries that attach automatically if you don't want them routinely attached, as well as running any other commands that you want run at every warmstart.

Holding down the backspace key while warmstarting prevents both running STARTUP and configuring libraries. This is good for when you have a bad library or a STARTUP variable that cripples your calculator.

Note that the library configuration isn't done at every ON on the 49 series, as it is on the 48 series, and the 48 series doesn't recognize STARTUP as a reserved variable or the special action of backspace while warmstarting.

For information on STARTUP and other "reserved names" on the 49 series, see http://www.hpcalc.org/search.php?query=Reserved+names.

Regards,
James

in response to message #11 by James M. Prange (Michigan)

That's a useful link. Thanks.

Tony.

Something all 49g+ owners should have in STARTUP

*Message #13 Posted by **Gene** on 7 July 2005, 10:28 a.m.,*
in response to message #12 by Tony

From Joe Horn:

"49g+ owners should set ->NDISP to 12, since the default is 9 which wastes some of the 49g+'s taller screen when the font is FONT7, FONT6, or the MINIFONT. Also, note that the ->NDISP setting is reset to 9 at every warmstart. Including << 12 ->NDISP >> in 'STARTUP' eliminates this problem."

9 works for the 48gII and the older 48G series. 12 is what the 49g+ should be set to.

Gene

Re: Something all 49g+ owners should have in STARTUP

*Message #14 Posted by **Arnaud Amiel** on 7 July 2005, 11:07 a.m.,*

Thanks for the tip but mine is set to 3 so I can still see the stack when I have big objects on it.

Arnaud

Re: Startup script for 49G+

*Message #15 Posted by **James M. Prange (Michigan)** on 6 July 2005, 5:34 p.m.,*
in response to message #6 by Raymond Del Tondo

Edited for corrections. STARTOFF (if found in the path) is what the calculator executes when it reaches the inactivity timeout. It doesn't include turning off the calculator, so you have to explicitely include the OFF command in the program if you want it to do that.

> Quote:
>
> But I thought the Startup var of the 4g series would be evaluated
> every time the calc is turned on, not only after a warmststart.
>
> If it's the latter case, then the Startup var seems to be of limited use.

Indeed it's the latter, but there's a work-around. There's also a reserved variable STARTOFF, that's executed only when the 49 turns off automatically, either after the default 300 seconds or the ticks value stored in the TOFF reserved variable. STARTOFF is not evaluated when you press the OFF key.

So store a program to be executed at every turn-on in a variable named, say 'AUTOEXEC'.

Store the program

```
\<< OFF AUTOEXEC \>>
```

in STARTOFF.

Asssign

```
\<< STARTOFF \>>
```

to the OFF key, and turn on USER mode. This way the program will be executed regardless of which way the calculator turns off, as long as USER mode is active.

If you also want it to be executed when warmstarting, then include AUTOEXEC in the STARTUP program

Caution; not tested, but the above makes sense to me.

> Quote:

> At least that's what I use on my HP-48;-)

Will that also work on the 49 series, where libraries aren't configured just by turning the calculator on?

Regards,
James

Edited: 6 July 2005, 7:44 p.m.

Re: Startup script for 49G+

Current TAM for specialized higher priced calculators

*Message #1 Posted by **tildeleb** on 5 July 2005, 7:17 p.m.*

Does anyone have any idea of what the Total Available Market (TAM) is for HP like calculators in either units for dollars? Perhaps there are some ex HP folks out there from the marketing side of the business that know these numbers? I am interested to know if the total units per year is over 100K, 250K, or 1M. Educated guess would also be appreciated. Specifically does anyone know how many units/yr of the following models are sold per year?

1. HP-12C

2. HP-19BII+

3. HP-48/HP-49

Don't read too much into these questions.

Best,

leb

in response to message #1 by tildeleb

Ex-HP employees would still be bound by confidentiality agreements (and ethics), and thus would not be able to divulge such information to you.

I doubt that there is any reliable source from which you can get such information without spending a lot of money to get it.

Confidentiality agreements sign that you when joining a company, NDAs, and "release" documents that you sign when leaving a company are not perpetual. Check the law.

Ethics are another matter. I find it kind of bizarre that my inquiry has generated an ethics question from someone who has created a microcode simulator of HP calculators from HP patents. While it's legal and HP didn't copyright older ROMs aren't there serious ethical issues with that? Your homepage has a link to

emu48 another HP calculator simulator that does use HP ROMs that DO HAVE HP copyrights and a number of these ROMS are available as a packaged file on SourceForge.

`http://prdownloads.sourceforge.net/emu48mac/Emu48files.sit?download`

I believe you also have participated in the creation of "skins" that mimic the look of HP calculators.

`http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/forum.cgi?read=75815#75815`

Aren't you trading on HP's brand? Is that ethical? Of course even if I am right, and you are not acting ethically, that would not justify poor ethical behavior on my part.

To make my case. I am not really convinced that asking for older data about the size of the market based on memories is unethical. If I meet an ex-HP sales person at a trade show and I ask him/her, "How many calculators did you move back in '94?" I don't see that as an ethical problem. Having said that I certainly expect that those people who feel that it is an ethical issue would not answer anyway.

If this is going to turn into an ethical thread, I withdraw my post.

> Quote:
>
> I doubt that there is any reliable source from which you can get such information without spending a lot of money to get it.

Get real. In Silicon Valley if you can find the right person you can probably get it for the cost of dinner or a drink.

Re: Current TAM for specialized higher priced calculators

*Message #4 Posted by **Eric Smith** on 6 July 2005, 2:05 a.m.,*
in response to message #3 by tildeleb

> Quote:
>
> I find it kind of bizarre that my inquiry has generated an ethics question from someone who has created a microcode simulator of HP calculators from HP patents.

I completely fail to see the relevance. I used publicly available, public-domain source material. I'm not divulging any HP proprietary information to third parties. The information I do provide does not in any way affect HP's business interests.

That seems *completely* different to me than if I was an ex-employee of HP and agreed to give someone confidential sales information (even though it is possible that an employee confidentiality agreement might have expired).

> Quote:
>
> Your homepage has a link to emu48

That seems even less relevant. You're suggesting guilt by association?

> Quote:
>
> that does use HP ROMs that DO HAVE HP copyrights and a number of these ROMS are available as a packaged file on SourceForge.

As I understand it, HP granted permission for HP-48 and HP-49 ROM images to be distributed for use with simulators.

> Quote:
>
> I believe you also have participated in the creation of "skins" that mimic the look of HP calculators.

Yes. How is that a problem?

> Quote:
>
> Aren't you trading on HP's brand?

I don't think so. I'm not trying to sell anything, nor am I trying to convince anyone to use my software instead of buying an HP calculator. I don't expect that anyone would want to do that. I'm not trying to confuse anyone into thinking that Nonpareil is an HP product, and in fact I explicitly state that it is not on the web page.

I don't think my references to specific HP calculator models in any way serve to confuse consumers nor to dilute the HP brand name. Therefore I don't understand your apparent objection.

> Quote:
>
> Is that ethical?

Is it unethical?

> Quote:
>
> If I meet an ex-HP sales person at a trade show and I ask him/her, "How many calculators did you move back in '94?" I don't see that as an ethical problem.

I don't see asking the question as an ethical problem. I never intended to suggest that you have done anything unethical. But if I was an ex-HP employee, I certainly would not provide such information. I can only conjecture as to what reaction you're likely to get from actual ex-HP employees. (Actually, that's not quite true. I know several ex-HP employees who would have the precise figures you're looking for, and theoretically I could ask them whether they'd be willing to divulge the information, but I don't particularly feel comfortable asking that.)

> Quote:
>
> If this is going to turn into an ethical thread, I withdraw my post.

If you didn't want this to turn into an ethical thread, you shouldn't have impugned my ethics. I was only commenting on ethical behavior of a hypothetical ex-HP employee.

> Quote:
>
> In Silicon Valley if you can find the right person you can probably get it for the cost of dinner or a drink.

Finding the "right person" would be quite a challenge, especially in Silicon Valley. Most of the people who have those numbers live in the Pacific Northwest and Singapore.

I'm sure you can get someone to give you some numbers in that manner. but having any confidence in the numbers is another matter entirely.

Eric

It seemed to me your were questioning the ethics of me asking the question.

For the record, I did not [mean to] impugn your ethics, I just questioned them. If you or others took it the wrong way, I apologize. Peace.

Look. I have an idea for a new kind of "calculator". I have a hardware and software platform in development that would be perfect for this. It's would not be based on any HP technology although RPN, SOLVE, and supporting many of the HP functions is an important goal. The rate of progress with calculators has certainly slowed over the years but hardware, software, and development technology has advanced a great deal. The concepts, the software, and the UI has not really been rethought since HP designed it. It's all been incremental. The combination of much better hardware and much better software development tools allows the bar to raised substainly. The question for me is; "Is there a large enough market for this kind of product?". To be honest I have no idea.

Fancy calculators aren't as important as they once were. I know many people at various labs, schools, and businesses that used to have and use HP calculators every day and no longer use them or even bring them to work. Laptops can do a lot. Excel is great and I use it all the time. My HP 19BII auto leasing program is better in Excel than it is on the HP-19BII, although the HP is faster because of the dedicated variable and numeric keys.

To get reasonable pricing on things like LCDs and ASICs you need to have a run rate of at least 100K units/yr. Since it's very unrealistic to think a new company could capture 100% of the TAM, the TAM probably needs to be at least 500K units/year and you hope you can capture 20% and get a foothold. To be honest I don't think the market is that big, but maybe it is. It would be nice to know which of the 2 big markets is biggest business or scientific/engineering? I assume

scientific/engineering but again I don't really know.

If anyone has any thoughts about this or would be interested in talking with me, I'd be interested in doing that in either in public or private. I do know about Qonos.

Re: Current TAM for specialized higher priced calculators

*Message #6 Posted by **Norris** on 6 July 2005, 12:53 p.m.,*
in response to message #5 by tildeleb

The biggest market for advanced calculators is neither business nor science/engineering. The biggest market, by far, is education.

TI began marketing graphing calculators in 1990, primarily to the education market. TI announced that their 20,000,000th graphing calculators was sold in 2000. According to the book "TI-83 Plus Graphing Calculator for Dummies," which was published in 2003, the TI-83 model alone was selling at a rate of more than 2,500,000 units per year.

The numbers for other markets, and for HP calculators, are not known, but are probably much, much lower. It seems likely, for example, that a significant fraction of all HP-33S calculators are sold to people taking US professional licensing exams in engineering and surveying (the 33S is the only RPN calculator allowed on such exams). But the total number of new examinees is less than 50,000 per year, and the number of 33S sales to such examinees can't be more than 10,000 to 20,000 units per year at best. If the professional exam market is indeed a significant fraction of all 33S sales, then it seems unlikely that total 33S sales are at the 100,000 unit per year level.

Re: Current TAM for specialized higher priced calculators

*Message #7 Posted by **tildeleb** on 6 July 2005, 8:14 p.m.,*
in response to message #6 by Norris

Now that's some useful insight for me at least. Thanks. 2.5M units x $150/unit = $375M for one product isn't too bad, eh? Now the question would is "How elastic is that price?" Could you capture 100K to 500K units @ $300 with a better product? In my experience better doesn't sell too well and price is really the big determiner which is how TI killed HP anyway. Most of my cost is in the LCD.

Education market is tough

*Message #8 Posted by **Norris** on 7 July 2005, 12:47 p.m.,*
in response to message #7 by tildeleb

Note that selling to the education market is *not* like selling to the business or scientific/engineering market.

You would have to convince teachers, professors, and administrators to adopt your calculator, instead of TI's. But education professionals are not simply interested in the capabilities of the calculator. They want to look at the entire educational package.

Can you supply dozens of student activity books and teacher guides so that calculator can be used in different classes and grades? Can you provide PC software that allows teachers to view the screen of any student's calculator? Do you offer teacher training on the use of the calculator? Do you sponsor annual teacher conferences?

TI does all these things. See education.ti.com. That's why TI has more than 95% of the graphing calculator market in the US (statistic is from "TI-89 Graphing Calculator For Dummies").

It isn't just a matter of price. Casio has been trying unsuccessfully to penetrate the US education market with cheap, capable graphing calculators for years (granted, they have been more successful overseas). HP isn't even a player.

Re: Education market is tough

*Message #9 Posted by **Namir** on 7 July 2005, 4:24 p.m.,*
in response to message #8 by Norris

Norris,

You are very right. The educational markey needs to vendor to **romance** the buyers (teachers and students in this case). TI has done a very good job, but it did not happen overnight. My wife sells calculators at a big college in town. Some professors are attached to specific models and will move to new ones with great difficulty. One case she told me, is a professor that hesitated to use the new TI-84 Plus because he was so used to the TI-83 Plus!!

In the HHC 2004 in San Jose I heard a presentation by Wlodek Mier-Jedrzejowicz about how HP tried to attack the educational market in a teachers' conference in Europe. Wlodek recounts how poor HP's efforts were compared to TI and Casio. I remember Richard Nelson addressing the folks from HP at the conference and commenting that it might be a wise move for HP to come out with an inexpensive HP-45-like non-programmable calculator that can be used to get teachers and students into RPN calculators. Of course if that succeeds (heaven forbids!) there is no law that says TI cannot make RPN calculators!!! That will be the day!!

> Quote:
>
> To get reasonable pricing on things like LCDs and ASICs you need to have a run rate of at least 100K units/yr.

To get **dirt cheap** pricing you need that many units. And for an ASIC you might need that many units. But you can get decent LCD pricing and masked-ROM microcontroller pricing at much lower volumes than that. And if you're not trying to compete with low-end calculators, flash-based microcontrollers are probably inexpensive enough. I've seen custom LCDs in $100 appliances that are only made in about 5K/year quantities.

AFAICT, the main entry barrier to calculator manufacturing isn't the electronics at all. It's the tooling for the plastics. If you don't mind rubber keys with silkscreened legends, even that cost can be mostly eliminated. Of course, most of us here **despise** rubber keys with silkscreened legends.

Eric

Good Keyboard is the Key to Calculator Success !

*Message #11 Posted by **Bernhard** on 7 July 2005, 8:23 a.m.,*
in response to message #10 by Eric Smith

IMHO, Eric's points in the previous post are correct, let me emphasize:

1. Use a mask-ROM off-the-shelf microcontroller instead of ASIC. If you choose a manufacturer which has a compatible FLASH part, you can start production with these and lower your risk.

2. There are so many small China based LCD manufacturers looking for business you will find someone who makes your custom LCD at very low cost (if ordered at least by the 1,000s). If you agree to pay all NREs up front it is likely they will even make you a lot of 1000 or even less.

3. Now the keyboard issue (hah !):

Except for HP, no pocket calculator manufacturer EVER has managed to build a good keyboard. The superior HP quality has several factors:

a) double injection molded keys with eternal and virtually indestructible legends that simply won't wear off

b) keys are hinged which gives them a unique feel of precision and quality (and increases operational life of the contact). They don't wobble under the finger. Just compare tactile key feedback of any Classic, Woodstock and Spice HP with a TI of the era (TI keys not hinged)

c) the snap-action contact strips themselves - not too much snap, just right to feel "easy", and not too soft (to feel "mushy"). Casio calculator keys always feel mushy, like poking your fingers in soft s... (you guess what I mean).

d) the gold-plated counter-contacts on the keyboard pcb for reliable contacts

e) the overall mechanical assembly (with calculator shell) so the keyboard does not twist and bend.

f) plastic membrane under keys to protect contacts from contamination.

So far the factors which made HP calculator keyboards absolutely superior.

One historical anecdote: when the TI scientific calculators came out (and were somewhat cheaper than HP) the purchasing department of a major defense contractor tried to talk their engineers into buying TIs instead of HPs. These however already knew the poor reliability of TI keys (often leading to miscalculations) and responded: with a HP, I need to do my calculations just two times, get two identical answers, and can use the result in full confidence, while with TI, I need to do them five times or even more and then, among the different results, pick the numbers which appear more often, as they seem to be the most likely ones, all just due to keyboard bounce or keys not responding. (It was the 1970s when they made very long calculations such as center of gravity of missiles using these pocket calculators, because PC's and CAD software didn't exist). Needless to say they got their HPs.

Bottom line: if you want to make a superior calculator for serious quality work, then you ought to have the best keyboard possible.

Before you find an answer how to manufacture such a keyboard (with the legendary HP look and feel and reliabilty) at affordable costs, your calculator project most likely won't succeed.

-----> Good keyboard is the key to calculator success ! <------

(The only other road is to make cheap throwaway disposables, like other calculator manufacturers do, even today's HP (sigh), but I'd doubt this road leads to sustainable success)

Good luck, Bernhard

> (The only other road is to make cheap throwaway disposables, like other calculator manufacturers do, even today's HP (sigh), but I'd doubt this road leads to sustainable success)

The only road to *sustainable* success, I would agree, with hope in my heart. It seems to me as though TI is selling baskets and barrels full of calculators, though I have no hard data to back it up. So for the education market, it may be enough for a machine to last one to four years. And what are students supposed to compare the keyboards on the throwaways to? If they can't touch a vintage HP calculator, they have no chance of judging the current crop fairly.

The "sustainable" qualification comes from the hope that someone will somehow find a way to engineer a production process that will allow keyboard quality comparable to the old HPs, but for a price point that doesn't rule out competing in the main calculator market. If they can do that, and produce a pricey high-end calculator that I would like to own with the profits from the good-quality bread-and-butter models, why I'd be delighted. Perhaps new materials will make this possible? Combine that with up-to-date electronics and brilliant software engineering in the spirit and tradition of Dr. Wickes et

al, and my hopes for old age geekery would be fulfilled. 8)

More general view of the Quality / Sustainability issue.

*Message #14 Posted by **Bernhard** on 7 July 2005, 5:58 p.m.,*
in response to message #13 by Howard Owen

We would expect that quality of merchandise has a distribution function much as people have ... the majority being mediocre, with a minority at each extreme being best or worst. It does not matter which characteristic considered for classification, be it beauty, IQ, muscles, wealth, etc., everywhere we find such a distribution function. Real people are a mix of all this. The unique mix makes people individuals. Each one is equally worthy (see the US Constitution), so don't misunderstand the above as a judgement.

From this, we would expect most products sold to belong to the mediocre variety. Not bad, but not good either. Not expensive, but not cheap either. Just somewhere in the middle. As are most people. A really great fit.

In the "good old times", this was true indeed. But now, we witness some development where people either buy:

a) the cheapest product, or

b) the best product (in most cases, the most expensive)

This even applies to food. Class a) buyers literally will eat s... or Soylent Green or whatever as long as it is cheap, tasty (= artificially flavored) and saturates the stomach.

How come ? I really have no idea why. Fact is, the mediocre ("normal") products are crushed between these two extremes. Just go to your local shopping mall and watch what merchandise is offered and what is really bought by the masses.

Manufacturers opting for a) must have strict cost controlling as profit margins are so thin there is no margin for error... as errors are inevitable (and would kill a small business on the spot) this is for the big international corporations only.

Manufacturers opting for b) must have strict quality control. They must offer the best quality technically possible. Period. Profit margins (without NRE) are high and cost controlling blunders are more easily absorbed. The catch is in the NREs: any underestimation about the selling numbers may be lethal.

In my personal opinion (and vision for the future), the class a) manufacturers will reign as long as energy and ressources are abundant and cheap, and then they will go under. Class b) manufacturers will face hard times (but many will make it) and they will reign the post-industrialized era (I guess > 2025 AD).

Maybe then we will be able to buy brand-new Classic HPs again.

Their technology seems to be sustainable for countless millennia.

They are useful tools that don't eat much energy (vs. a PC), could run on solar power alone, and would last for 30 or 40 years. Then you replace the worn keyboard PCB the first time and continue to use the calculator for the next 30 or 40 years. How

much do you need to pay for such a calculator ? One month of an engineer's salary ? No problem - just look how much time it will save (compared to calculating with pencil and paper) and how many decades it will last. Actually, it's a bargain.

Regards, Bernhard

Re: More general view of the Quality / Sustainability issue.

*Message #15 Posted by **Howard Owen** on 7 July 2005, 6:55 p.m.,*
in response to message #14 by Bernhard

Yes, but I don't want to wait until after the flood, dammit! 8) And of course I'm a cranky, spoiled boomer who helps drive the crazy economy of over abundance of which you speak.

All good points. I'd like to add another factor that I think is driving the throw-away/luxury culture besides overabundance. That's the rate of change that accellerated (2nd derivative of innovation?) during the last quarter of the 20th century. Future shock, and all that is a component. But so is the expectation that some marvelous and new gizmo will emerge next year, running on ever more capable hardware and incorporating more and more clever programming. This obviously discounts today's gizmo, let alone yesterday's. On the flip side, many people of means are willing to throw unheard of piles of cash at anything perceived to have lasting value against a background of unremitting novelty.

A real energy crunch is surely coming, I agree. That will divert the smarty pants of the world into looking for technical fixes for that problem. These may or may not be forthcoming, but the diverted effort will absolutely mean less glitzy new stuff. This will not only be because of the depletion of natural resources, but also because of the diversion of brain power to more urgent problems. But one beneficial side effect will clearly be a saner yardstick of value and quality, as you lay it out. Perhaps it won't be merely a side effect, come to think.

It's both fortunate and unfortunate for me, but I see the crunch happening later than you do. Fortunate, because I get to continue to ride the shockwave of change for the rest of my professional life, at least. I have grown up welcoming and adapting to change. It would be a change for me not to change, so to speak. Unfortunately, I will have to continue to cope with the skewed values engendered by the profligacy and genius of my age. Lack of a decent new calculator is nowhere near the worst of the consequences of that excess, but it's emblematic.

Edited: 7 July 2005, 7:02 p.m.

Good Keyboard is the Key -- so build to a proven keyboard

*Message #16 Posted by **Paul Brogger** on 7 July 2005, 4:29 p.m.,*
in response to message #11 by Bernhard

To satisfy the fanatic/hobbyist market, design to a proven keyboard component -- say, the HP-41 keyboard. They're generally available, still durable, and should be easily incorporated in an otherwise brand-new kit-type product.

And if the product takes off and the price of used HP-41s goes even FURTHER through the roof, making a new keyboard substitute will suddenly become economically viable.

Re: Current TAM for specialized higher priced calculators

*Message #18 Posted by **tildeleb** on 11 July 2005, 9:40 p.m.,*
in response to message #17 by Hugh Evans

I'd like to thank everyone for their input. It is all much appreciated.

As far as the keyboard "issue" is concerned I just would like to say that I think understand that issue completely. I've been involved with HP products since 1973, I used to receive the HP Journal, and I have owned a variety of HP calculators starting with the HP-65. I understand double-shot molding, the hinged keys, the metals involved, and so on. I believe I know how to create a quality product with a quality keyboard and I understand the NRE that would be involved in doing so.

> Quote:
>
> If you wouldn't mind elaborating on your ideas I'm sure everyone here would be interested. Please send me an e-mail, I may be able to lend some insight and/or assistance.

I have a hardware platform based on a SOC that I have access to. I have a software substrate platform based on a variety of technologies that I don't want to reveal right now. The hardware platform is probably overkill even for a next generation calculator but it is has superb power management capabilities. I have a number of candidate concepts for deploying the platform and a next generation calculator is one of them.

It would be "nice" for someone to offer a next generation calculator platform. I wanted to explore the issues involved in in doing so. As is often the case it's not the technical aspects that are the gating factor but the business details. Most people are happy with what TI sells. The price is right. They control the education market. HP doesn't sell many units anymore and the current models are just incremental retreads of the previous models. The barriers to entry in this market are large and many.

Having said that, I have no desire to build a huge company. If I could sell 50K units a year and make $5M ($100/unit) I'd be happy. I could even be happy with 10K units the first year, but I need some volume to get good LCD pricing.

As far as what the system would look like I have some ideas on that but I would prefer to keep those to myself.

My email address is available here (remove the spam blocking characters) if someone wants to contact me. Please use the word "calculators" in the subject.

Thanks. -- leb

What happened to Thomas Osborne after the 9100A?

*Message #1 Posted by **marais** on 5 July 2005, 1:56 p.m.*

Thomas Osborne's contribution to the HP 9100A is well documented, but I seem to be unable to trace back what he did after "the initial journey", as Steve Leibson phrased it on his gorgeous 9825 yet unfinished 9825 site. From what I read, he was a rather independent spirit, never hesitating to leave a company unable to follow his vision, and likewise did not stay with HP for long. Who knows more?

Andreas

Strange HP on eBay

*Message #1 Posted by **Marcus von Cube, Germany** on 5 July 2005, 12:45 p.m.*

Can any of you identify this device?

http://www.mvcsys.de/temp/CALC1.jpg

It is from eBay auction #5787103394.

Re: Strange HP on eBay

*Message #2 Posted by **Martin** on 5 July 2005, 12:49 p.m.,*
in response to message #1 by Marcus von Cube, Germany

I used to work for HP and remember these things, They are basically a security device to prevent anyone walking off with your calculator.

Re: Strange HP on eBay

*Message #3 Posted by **Marcus von Cube, Germany** on 5 July 2005, 12:53 p.m.,*
in response to message #2 by Martin

So it is a (then) standard calc, just secured inside a special cradle?

What type of calculator is it?

Strange HP on Ebay

*Message #4 Posted by **Bernhard** on 5 July 2005, 1:02 p.m.,*
in response to message #3 by Marcus von Cube, Germany

IMHO, it looks like a HP-21 in a theft protection device. I remember these had a thick steel cable. No problem for a bolt cutter, though. Vendor should offer the key, too, otherwise you can't get out the HP-21 undamaged except if paying a locksmith (who might cost you more than the HP-21 is worth).

Re: Strange HP on Ebay

*Message #5 Posted by **Dave Hicks** on 5 July 2005, 1:07 p.m.,*

Here's an old picture I took that I never got around to adding to the museum.

Re: Strange HP on Ebay

*Message #6 Posted by **Bob** on 5 July 2005, 1:13 p.m.,*
in response to message #4 by Bernhard

Yup, we used to have these contraptions bolted to the lab bench top in physics class years ago in college. They were purchased by a far-thinking professor who wanted the best tools possible for the class. However, the calcs were always dead because it was such a hassle to find the key and change the batteries.

Sadly, the TI's that were commonly available at the time I took the class were far cheaper and equal in function compared to the HP's in the security case by the time I got there.

To their credit, they were durable though.

Calcs in general were unique and much more valuable then.

Re: Strange HP on Ebay

*Message #7 Posted by **Dave Hicks** on 5 July 2005, 1:22 p.m.,*
in response to message #6 by Bob

When I was in high school, our chemistry lab had TI SR-10s bolted down like this. There was a "calculating station" with four of them - at standing height so you didn't get too comfortable and waste time with a precious resource. (The resource being essentially a 6 function calculator.)

Of course, an inflation calculator does say that they cost about $660 USD in today's dollars so I guess that was worth protecting.

Re: Strange HP on Ebay

*Message #8 Posted by **Evan (San Jose, California)** on 5 July 2005, 2:38 p.m.,*
in response to message #7 by Dave Hicks

The Woodstock series security cradle also had an additional 'lens' over the display that helped bend the display output. This helped to move the useable viewing angle closer to the keyboard and more suitable for use on the desktop. I'm not sure it was all that effective. The cradle certainly did make a pretty tough calculator nearly indestructible.

Cheers,

Evan (1st time poster, former HP'er (although not in calculators), and PPC member #7042)

So, how do you break in to one? (This one is missing the key, according to the auction.)

Re: Strange HP on eBay

*Message #11 Posted by **Etienne Victoria** on 5 July 2005, 7:42 p.m.,*
in response to message #10 by Howard Owen

Hi Howard et al,

Somebody kindly sold me an Hp-29C in a security device without key.

With my Dremel & a 9911 tungsten Carbide tool, I've drilled 5 holes in the lock (domino style) then tool 545 cutting between holes.

It works fine except that the lock is not intact anymore (just *"Near Mint" for Ebay* ;-).

Best regards

Etienne

Re: Strange HP on eBay

*Message #12 Posted by **George** on 15 July 2005, 6:09 p.m.,*
in response to message #10 by Howard Owen

The locks are relatively easy to pick. I obtained one with a cable that was locked with no key, and one without a cable that had two keys. It was easier than I expected to combine the keyed cradle with the cable. The unkeyed one was relegated to storage, as I didn't want rely on my amateur locksmithing skills to get a calculator out of it.

Re: Strange HP on eBay

Message #13 Posted by ***Vieira, Luiz C. (Brazil)*** *on 5 July 2005, 5:56 p.m.,*
in response to message #1 by Marcus von Cube, Germany

Hi;

I saw one of these in the 80's. I'm not sure if it can hold anything but a Woodstock.

At that time, the owner had the cradle and an HP29C, fortunately outside it, but he had no idea of where it was the key to open the security lock (the cradle was locked). The owner asked me for help, and I knew about one of the best 'key makers' (is it correct?) in the town.

I saw the man furiously trying for about half an hour to open the cradle with his tools. Finally, he gave up and told me: 'After more than 30 years, this is the second time I cannot open a custom lock'. The poor man was desolated.

The calculator in your picture is surely an HP21, the only Woodstock with a single shift key injected in blue. The HP21 had no inscriptions in the keyboard faceplate, only in the keys (slanted face).

I hope the buyer succeed opening it without destroying the cradle... or (worst) the calculator 8^(

Best regards.

Luiz (Brazil)

*Message #14 Posted by **Howard Owen** on 5 July 2005, 11:28 p.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

That is a *great* story! The unbreakable lock fits in with the whole HP calculator ethos perfectly.

Re: Strange HP on eBay

*Message #15 Posted by **Tony Duell** on 6 July 2005, 6:24 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

In my experience the locks on the HP security cradles are not difficult to pick. They are normal pin-tumbler cylinder locks and there are no spool pins or anything like that.

If the cradle is not fixed to anything, you can insert a finger through the hole in the back to apply torque to the locking mechanism in the 'opening' direction. Then just pick the pins as normal.

Re: Strange HP on eBay

*Message #16 Posted by **Howard Owen** on 6 July 2005, 9:56 a.m.,*
in response to message #15 by Tony Duell

Darn!

And here I thought we'd run across another piece of the HP calculator legend.

On the other hand, if I win the darned auction, there's some hope I can rescue both the cradle and the calculator. 8)

Re: Strange HP on eBay

*Message #17 Posted by **Bob** on 6 July 2005, 1:04 p.m.,*
in response to message #16 by Howard Owen

...and, thus the reason for them ALWAYS having dead batteries in them !

We could never find the keys, so they were like little museums holding one example of an HP.

...I wonder what happened to them. They were still bolted in place 5 years ago when I visited my old college?

Re: Strange HP on eBay

*Message #18 Posted by **Vieira, Luiz C. (Brazil)** on 6 July 2005, 1:25 p.m.,*
in response to message #15 by Tony Duell

Hi, Tony;

I do not recall it precisely (it was probably 1989 or 1990) but I remember that the cradle was empty, no

calculator on it, and I could not even see the locking 'tab', neither how were the top and botton halves kept together. Is it possible that different versions of the security cradle exist and at least one of them does not allow it to be openned without the keys? Just curious about it.

Thanks for the additional info.

Best regards.

Luiz (Brazil)

Re: Strange HP on eBay

*Message #19 Posted by **Etienne Victoria** on 6 July 2005, 4:09 p.m.,*
in response to message #18 by Vieira, Luiz C. (Brazil)

Hi Luiz,

Echoing your post, the Woodstock craddle I got also had a recessed lock.

That's why I resorted to virile brute force to free the calc (see my upper post)!

BTW thanks for your kind mail!

Best regards

Etienne (Fourqueux)

in response to message #2 by Arnaud Amiel

Thanks Arnaud for the reference, I have opted for the water submerge option and now had put it in the sun to dry out. Luckily I am in South Africa in even in our winter blessed with warm sunny days.

Re: HP42s spilled coffee

*Message #4 Posted by **David Smith** on 5 July 2005, 11:44 a.m.,*
in response to message #1 by Kobus Burger

If you have access to an ultrasonic cleaner, run it through three cycles. Reove the machine, shake it as dry as possible, and use fresh distilled water each time. Then let it dry very well. A hot car makes a nice oven for drying it out... but keep it out of direct sun.

More information on the Albillo Matrices

*Message #1 Posted by **Palmer O. Hanson, Jr.** on 4 July 2005, 11:34 p.m.*

In his April 26 submission "More Matrix Results on HP and TI Machines" Valentin Albillo proposed a seventh order matrix to be known as "Matrix No. 1" as a better test of computation capability than a seventh order Hilbert. In another April 26 submssion "There you are" Valentin proposed two more seventh order matrices, "Matrix No. 2" and "Matrix No. 3". In an April 27 submission "(LONG) Commented Results for HP-71B (and HP-15C)" he published the exact inverse for his No. 1 matrix. Exact inverses for matrices No. 2 and No. 3 have not been published to date. The exact inverses for those matrices as calculated using the exact mode on the HP-49 are:

```
Exact Inverse for Albillo's Matrix No. 2 :

 193969587   693099  -1665228    3111895  -14779418   67861431   -194191637
      7798       28       -67        125       -594       2728        -7807
    -64638     -231       555      -1037       4925     -22614        64712
    504013     1801     -4327       8086     -38403     176332      -504590
  -4282933   -15304     36769     -68712     326336   -1498410     4287836
  25738861    91971   -220968     412934   -1961160    9004896   -25768326
-193970402  -693102   1665235   -3111908   14779480  -67861716    194192453

Exact Inverse for Albillo's Matrix No. 3:

 294228951   702720  -1942323    4764003  -21337482   76325631  -294398186
     12108       29       -80        196       -878       3141      -12115
    -90417     -216       597      -1464       6557     -23455       90469
    512920     1225     -3386       8305     -37197     133056     -513215
  -4325606   -10331     28555     -70038     313693   -1122101     4328094
  36887482    88100   -243509     597263   -2675080    9568944   -36908699
-294230620  -702724   1942334   -4764030   21337603  -76326064   294399856
```

I had previously noticed that the first and last elements for every row and every column of the inverse of Matrix No.1 were approximately equal and larger than any other element in the row or column. I was surprised to see the same characteristic in the inverses of Matrix No. 2 and Matrix No. 3. When I looked more closely at the inverses I saw patterns in the individual inverses and among the inverses. The following table shows the results when I divide each element of the seventh row of Matrix No. 1 by the corresponding element of the sixth row, and do the same for the seventh and sixth column.

Element	row 7 / row 6	col 7 / col 6
1	-7.32762314181	-3.19606552693
2	-7.32758186686	-3.19586894587
3	-7.32762522837	-3.19606732481
4	-7.32762448362	-3.19606423358
5	-7.32762198907	-3.19606453553
6	-7.32762262334	-3.19606533695
7	-7.32762303367	-3.19606551596

I found similar consistencies in every set of ratios that I tried. If I do the row 7 divided by row 6 calculations for the inverses of Matrices No. 2 and No. 3 I get ratios of -7.53609... and -7.97643... If I do the column 7 divided by column 6 calculations for the inverses of Matrices No. 2 and No. 3 I get ratios of -2.861... and -3.857... .

When I worked with problems like the one near the end of Kahan's "Mathematics Written in Sand" , namely an 8x8

modified Hilbert where A(i,j) = 360360/(i + j - 1) I recognized that the test matrix was symmetric and expected that the exact inverse would also be symmetric, which it was. I could also see evidence of approximate symmetry in the non-exact inverses as delivered from my HP-28S and TI-59. So, I was surprised to find that I could see patterns in the inverses of the Albillo matrices while I could not see patterns in the original matrices that Valentin had described as random. .

In the thread that introduced the Albillo matrices Werner asked twice for information on how the matrices were formed. I, too, would like to have more information on how these matrices were formed.

Re: More information on the Albillo Matrices

I guess they just *look* random. I think Valentin has taylored the matrices in a way that computing the inverse yields to many differences of non integer numbers with very close values. In each such a subtraction a nonexact computer/calculator looses much of its accuracy.

Since the algorithms normally include pivoting (swapping rows or columns to avoid such situations) he must have done serious detective (or engineering) work!

Re: More information on the Albillo Matrices

*Message #3 Posted by **Valentin Albillo** on 27 July 2005, 6:01 a.m.,*
in response to message #1 by Palmer O. Hanson, Jr.

Hi, Palmer:

Sorry for not answering sooner but first I missed your post entirely, then was far too busy to be able to answer.

Thanks for your interest in my AM matrices, you can find a whole article on the subject in the very next August-September issue of Datafile, which not only discusses AM#1, #2, and #3 but introduces the yet unpublished AM#7, which is truly deadly as you'll see in the article.

So much so, indeed, that a **Mathematica(tm)** session is included as well to deal with it, because otherwise all you get is pure, meaningless *garbage* with the results having *no correct digits at all*. Instability problems are discussed and very graphically demonstrated for this AM#7 matrix. As the article discusses, *even using **Mathematica(tm)*** seems rather pointless in some particular AM#7 scenarios.

Hope you'll enjoy it.

Best regards from V.

Repairing HP 20s?

*Message #1 Posted by **Natasha** on 4 July 2005, 7:26 p.m.*

Hi all,

My beloved HP 20s recently started malfunctioning. Input from the +-*/ keys was ignored, so that the operation: 2 + 2 was treated as the entry of the number 22. I dug out the manual and ran a self test. The result was 20 - FAIL 8.

Working on the assumption that I can't send the calculator in for repair... I thought I'd try it myself. I'm posting in the remote hope that someone out there knows what this error code means, or better yet can point me to a service manual or schematic. Or can just give me any tips, such as about how to open the lid without damaging it.

Thanks much

Natasha

Re: Repairing HP 20s?

*Message #2 Posted by **Katie Wasserman** on 4 July 2005, 10:43 p.m.,*
in response to message #1 by Natasha

Natasha,

If you really want to try repairing your 20S here's what you need to read for starters: http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=5.

I doubt that HP will repair it for you as it must be out of warranty by now, but you can often find new (or nearly new) 20S's on ebay for around $30-$40.

-Katie

Edited: 4 July 2005, 10:43 p.m.

Test

*Message #3 Posted by **Paul Brogger** on 5 July 2005, 5:50 p.m.,*
in response to message #1 by Natasha

Try pinching the calculator firmly, front-to-back just below the display on the right side.

If the keys work while the calc is being squeesed in this manner, you've got a common problem: an atrophied rubber pressure strip that is meant to maintain contact between the keyboard assembly and the main printed circuit board.

It's a relatively easy fix -- though perhaps more than many would care to attempt. If you don't want to try yourself, chase down Randy Sloyer (www.fixthatcalc.com).

Good luck, and let us know how it comes out.

HP3421A

*Message #1 Posted by **Jeff** on 4 July 2005, 1:18 p.m.*

Have acquired a used HP3421A (to replace an older unit that died), and am having difficulty getting this unit to measure at AC voltages below ~60mV. The prior unit had no problem before it went on us. Generally, once you input a voltage higher than this (give or take), it begins to read more accurately (it needs cal. as its a bit off, but ok for now). Any thoughts?

Thanks,

Jeff

Re: HP3421A

*Message #2 Posted by **Christoph Klug** on 5 July 2005, 2:51 a.m.,*
in response to message #1 by Jeff

Dear Jeff,

may be your new HP4321 needs a new calibratio procedure. It would be possible, that the internal lithium battery cell now is failured, and the stored calbiration data are lost....

Best regards - Christoph Klug

Nonpareil: dot/comma reverse?

*Message #1 Posted by **R Lion** on 4 July 2005, 12:20 p.m.*

Any way for setting the 15C with decimal comma? Thnaks in advance Raul L

Re: Nonpareil: dot/comma reverse?

*Message #2 Posted by **Raymond Del Tondo** on 4 July 2005, 1:49 p.m.,*
in response to message #1 by R Lion

The usual method (also in the FAQ and RTFM;-)
to switch between decimal comma or point is to
hold the point key while the calc is off,
then pressing ON, then releasing the point key.

I guess this also works w/NonPareil somehow.

Raymond

Edited: 4 July 2005, 1:51 p.m.

Re: Nonpareil: dot/comma reverse?

*Message #3 Posted by **Gerson W. Barbosa** on 4 July 2005, 2:13 p.m.,*
in response to message #1 by R Lion

[ON] [.], as on the real calculator. You may have to try twice or three times before you do it right.

Regards.

Re: Nonpareil: dot/comma reverse?

*Message #4 Posted by **R Lion (Spain)** on 4 July 2005, 2:46 p.m.,*
in response to message #3 by Gerson W. Barbosa

Raymond: I am not talking about the real 15C..
Gerson: I've tried **much more** than twice or three times. As much that I thought this was not the way
At last, I got success.
Thanks

4th of July (O.T.)

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2005, 11:03 p.m.*

Hi, all North-Americans;

although it is not a regular subject, let me mention (remember) some facts, amongst many:

1) the ARPANET began in the North-America;
2) W. Hewlett and D. Packard funded HP in North-America;
3) Ed Roberts created the Altair 8080 in the North-America;
4) IBM engineers designed the PC in the North-America;
5) Dave Hicks created the MoHPC in the North-America...

So, I`d not be keying these words in my IBM-compatible PC, a single-unit personal computer, to post this message in the MoHPC through the www about HP calculators without knowing that all of the ones above came from the USA. Have you all the best celebration in this fourth of July. You deserve it.

Luiz, from the southern America.

Edited: 3 July 2005, 11:14 p.m.

Re: 4th of July (O.T.)

*Message #2 Posted by **Ed Look** on 3 July 2005, 11:37 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hey thanks!

But do you think point #5 has a chance of making it to children's history books?

;)

Re: 4th of July (O.T.)

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2005, 11:59 p.m.,*
in response to message #2 by Ed Look

All of the other four did that, didn't they? Why not the MoHPC and Dave being part of history as well? <8^D

Re: 4th of July (O.T.)

*Message #4 Posted by **Dave Hicks** on 4 July 2005, 12:07 a.m.,*
in response to message #2 by Ed Look

Maybe not the children's *history* books, but there is a word problem about me in an Addison Wesley 6th grade math text book. :-)

It has the URL too so I get questions from students and teachers.

Re: 4th of July (O.T.)

*Message #5 Posted by **GE** on 4 July 2005, 4:07 a.m.,*
in response to message #4 by Dave Hicks

Funny, could you copy here the text of the problem (in the hope we can solve it ... SSMC). Thx

By the way, I have a problem with the new forum : while it is VERY (very) nice to see a complete thread as a whole, the links to individual messages do not change color even if you have read them. So it is quite hard to keep track of what has been read or not.
We'll survive, I guess..

Re: 4th of July (O.T.)

*Message #6 Posted by **Dave Hicks** on 4 July 2005, 11:28 a.m.,*
in response to message #5 by GE

I'll see if I can find the math problem.

Unfortunately I don't see a way around the visited link coloring, except to use the (new) indicators instead of the link colors, or to use the individual message display (search/personalize: Display Messages = Individually.) Alternately, you could consider the "compressed" view for the list messages view and "the grouped into threads" for the message view. This provides one link from the main page per thread and shows the number of new messages.

Because of they way browsers color links, for a threaded list and a grouped into threads display, I can either do it like it is now, where the message you click on is colored as visited, or I can make it such that all the messages in a thread are colored as visited when you click on any - but then posts made after you view the thread would also be colored as visited. (I would do the latter by making the thread page look like a singe page to the browser - whereas now it looks like each message has it's own page - even though the content of each page is the same through-out the thread, when you set Display Messages to Grouped.)

There is nothing in HTTP that I know of that lets me tell a browser to mark some additional links as visited. Browsers manage that themselves.

Re: 4th of July (O.T.)

*Message #7 Posted by **Dave Hicks** on 3 July 2005, 11:44 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Thank you Luiz!

> Quote:
>
> So, I`d not be keying these words in my IBM-compatible PC, a single-unit personal computer

I keep saying this but someday I'm going to write a browser for my Altair so I can respond to that like:

And I'd not be keying these words in my Altair... :-)

Someday...

Kind thoughts and a gift for the 4th of July (OnTopic coz' it's a calc)

*Message #8 Posted by **Etienne Victoria** on 4 July 2005, 3:37 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

Hi all US citizens!

I'd like to add my french congrats to Luiz' for the Independence Day.

...and state the major features/inventions I love from your land (apart from the buggy Hp calcs and in increasing importance) :

- the man on the moon,

- peanut butter,

- my first girlfriend in Milwaukee,

- my caring, eternal american friends in Virginia whom I consider part of my family.

I'll keep those four in my heart but today I extend it to you all!

Have a nice day!

Etienne

PS : Please find hereafter as a gift the first BP (not HP) that started it all (I mean Luiz' list not mine ;-))

http://upload.wikimedia.org/wikipedia/commons/thumb/8/80/Arts_et_Metiers_Pascaline_dsc03869.jpg/800px-Arts_et_Metiers_Pascaline_dsc03869.jpg

Well... Wilhelm Schickard pictured hereafter: http://upload.wikimedia.org/wikipedia/en/a/a6/Gastonpied.gif did preceed it with his stunning achievement:

http://users.hol.gr/~helen/index.files/LE%20BOULIER.files/image010.jpg

123.456 to delete.....*just joking...*

Re: Kind thoughts and a gift for the 4th of July (OnTopic coz' it's a calc)

*Message #9 Posted by **Gerson W. Barbosa** on 4 July 2005, 2:42 p.m.,*
in response to message #8 by Etienne Victoria

Hi Etienne,

You forgot to include coca-cola (light coke!) in your list. You should have mentioned the Pascaline was

invented by Blaise Pascal (from France, of course), so some people don't think this was Bérnard Parisse's first computing device :-)

I have a theory that might explain why we Brazilians have not made so many inventions: it's Wintertime here and there's a blazing sun out there (24.5°C/76.1°F) - and I live in one of the coldest cities here. Who would be locked in a room inventing anything with such a weather?

I second you and Luiz on the 4th of July congratulations.

(Edited to update the temperature :-)

Welcome to the new forum software

*Message #1 Posted by **Dave Hicks** on 3 July 2005, 5:29 p.m.*

The new forum software is now running. If you like, you can keep using it more or less as you always have, but there are some new features like, formatting buttons, several different thread display formats and optional user accounts. (Notice the "Login / Accounts]" at the top right.

Account User's Guide

By request, I've kept most of the accounts from the Betas. (All the ones that looked like serious/non-test accounts.) If you created an account for fun, and it's still there and you don't want to use it, please let me know.

Please let me know about bugs.

Coming next: account-holders can ask for guest directories which they can manage themselves. Until then, you can keep sending things to me and I'll put them in your guest directories.

Re: Welcome to the new forum software

*Message #2 Posted by **Bob Wang** on 3 July 2005, 5:52 p.m.,*

>
> For example: Display all messages except those containing "C.....n"

It took me a while to figure out what "C.....n" meant :-)

That wasn't on my list because this is the first time anyone has asked. I'm not 100% sure you're serious, but if you are, I'll add it to the list of things to think about for the next version.

I've been hoping that the whole "C.....n" thing will taper off on it's own.

Re: Welcome to the new forum software

*Message #6 Posted by **Les Bell** on 3 July 2005, 7:45 p.m.,*
in response to message #1 by Dave Hicks

Very nice, Dave! I like the very clean design - it's a huge contrast to other forums and exceptionally easy to read.

Best,

*Message #8 Posted by **Vieira, Luiz C. (Brazil)** on 3 July 2005, 10:53 p.m.,*
in response to message #1 by Dave Hicks

Hi, Dave;

congratulations may sound a bit small close to what you`ve done. In fact, to what you`ve actually been doing.

Again, you are doing what you can to offer us all a better place to discuss some of the subjects we like most. I confess that for me, the existence of the forum itself is already a gift, so rearranging the space and giving it a new 'furniture' is somehow beyond the best. Thanks!

I feel sorry not visiting the Beta Forum as much as I`d like to.

Best regards from Brazil.

Luiz

Re: Welcome to the new forum software

*Message #9 Posted by **db (martinez, ca.)** on 4 July 2005, 2:15 a.m.,*
in response to message #8 by Vieira, Luiz C. (Brazil)

I like it that the entire thread is shown. I never thought about that. I do miss the old red and purple "(new)" highlights. Can that be re-written in the next version?

Re: Welcome to the new forum software

*Message #10 Posted by **Dave Hicks** on 4 July 2005, 3:08 a.m.,*
in response to message #9 by db (martinez, ca.)

You should see (new)s when you come back. A cookie needs to be set which indicates which messages existed the last time you visited. If you don't, please let me know.

There are only red ones now. Let me know if that's not OK. I'm not sure how I would do purple ones in the new system, but I can look at that if it's a problem.

The old (news) were generic to everyone and just indicated the most recent messages posted. The new (news) tell you which ones have been posted since your last "visit" began. (A "visit" is considered over if you haven't browsed in over 30 minutes.)

Re: Welcome to the new forum software

*Message #11 Posted by **db (martinez, ca.)** on 4 July 2005, 1:41 p.m.,*
in response to message #10 by Dave Hicks

Everything functions great. That'a some tight work man.

RE: the purple ones. Any **(new)** in a storm i say.

Re: Welcome to the new forum software

*Message #12 Posted by **Thomas Okken** on 4 July 2005, 11:08 a.m.,*
in response to message #1 by Dave Hicks

Dave, this new forum software looks excellent -- I particularly like the "private e-mail" feature and the use of cookies to keep track of what's been read.

However, I also second GE's comment about it now being much harder to know exactly which articles have been read within a thread. I hate myself for asking more when so much is already given for free, but still, I think it would be a nice option to be able to view threads one article at a time, so that the browser's visited-link highlighting will show you exactly which articles in a thread have been read (in the index/daily view).

Meanwhile I can probably cope by simply reading everything new whenever I log in. :-)

BTW, how have you implemented the forum? Just curious (I've done web applications using JSP in the past but I'm always interested in other ways of getting the job done).

- Thomas

P.S. I love the formatting buttons on the Edit Message page!

Edited: 4 July 2005, 11:35 a.m.

Re: Welcome to the new forum software

*Message #13 Posted by **Dave Hicks** on 4 July 2005, 11:40 a.m.,*
in response to message #12 by Thomas Okken

It's Perl and CGI. That's the only system I've used for web apps so I can't really compare it to anything else. Perl is not the most visually appealing language but it gets a lot of jobs done quite easily. If I were ever going start over, I would spend some time looking at other choices including PHP which seems quite popular now for this sort of thing.

Re: Welcome to the new forum software

Giancarlo's Formatting

*Message #15 Posted by **Marcus von Cube, Germany** on 5 July 2005, 2:58 a.m.,*
in response to message #14 by Giancarlo (Italy)

Hi Giancarlo,

I don't know what you are excactly doing, but to me all your posts appear as a single (sometimes extremely long) line per paragraph in a non proportional font. This makes reading extremly difficult. Are you using the [pre]-Tag for your posts?

Re: Giancarlo's Formatting

*Message #16 Posted by **Giancarlo (Italy)** on 5 July 2005, 5:05 a.m.,*
in response to message #15 by Marcus von Cube, Germany

```
Hi Marcus.
You're right: looking at my previous message, it was not formatted as I expected to
be.
I think I was wrong about the following:
when I write some longer sentences in the posting window, I see
that there is a sort of "automatic" newline when I reach the
border of the window, so I thought it would turn into real
newlines in the final message too.
In the present message, I pressed the "Return" key just before
reaching the window borders, so I expect everything should look
better (I'm gonna check).
Thanks for your point.
Cheers.
Giancarlo (Italy)
```

Re: Giancarlo's Formatting

*Message #17 Posted by **Dave Hicks** on 5 July 2005, 11:23 a.m.,*
in response to message #15 by Marcus von Cube, Germany

Giancarlo's posts have [pre] codes around them, as if he pressed the Preformatted button. Giancarlo, if you didn't put that in yourself, please let me know. Preformatted is meant for code listings rather than normal text and (example)

```
exactly
                                                shows the text

      as you typed it in.       (This block was surrounded by a [pre] and I
intentionally typed it all
over
the place
with spaces and returns in strange places to demonstrate.)
```

On other hand, if you use preformatted for a listing, then it looks nice like:

```
label code
      code
      code
      code
```

Re: Giancarlo's Formatting

*Message #18 Posted by **Dave Hicks** on 5 July 2005, 11:41 a.m.,*
in response to message #17 by Dave Hicks

Here's Giancarlo's original post with the original [pre] ... [/pre] blocks removed and couple of

double returns entered for paragraph breaks. (I could have done single line breaks by pressing Newline or entering [nl] too.) To do this, I just clicked Edit on the original post and then cut and pasted into this post. (Anyone can click Edit to see anyone else's codes. You just can't save it unless you're the original poster.)

Dave, I did not expect to get the new "Forum dress" so quickly..... Congratulations: everything seems to work fine - the new look is clear, functional and effctive.

Please, let me take the opportunity to say that this forum is the best I've ever read or participated on the Web. *Message #19 Posted by **Giancarlo (Italy)** on 6 July 2005, 2:28 a.m.,*
in response to message #18 by Dave Hicks

```
Hello Dave.
I used the preformatting tags indeed (as I do in the
present message), but I did not insert any
line break before the border of the message posting window.
A couple of questions:
1) I tried to edit my "one-long-line" message in the thread
about the 15C new bezel, but I did not succeed in saving
the edited message - seems due to a password problem.
I'm not sure I understood what the real reason was....
2) is it there a way to use/show a font different from the one
my browser let me use when writing a message?
Thanks.
Cheers.

> Hello Dave. I used the preformatting tags indeed (as I do in the present message), but I did not insert any line break before the border of the message posting window.

That explains why it was so wide then. On the other hand, this message appears too narrow because it has so many line breaks and is also inside a preformatted block. Preformatted is meant for code listings where line breaks and white space must be exactly preserved. It's not meant for paragraphs of text.

> Quote:
>

I'm not either. When did you do this? Where you logged in or did you type your name and password?

> Quote:
>
> 2) is it there a way to use/show a font different from the one my browser let me use when writing a message?

Depending on your browser, you may or may not have a choice. You probably have at least some control. However, if you are trying to use this to make line breaks in preformatted messages appear in the "right place" then it's hopeless. Other people may have much wider or narrower browser windows and totally different font sizes so if you use preformatted, some people will find your text too narrow and some will find it too wide no matter where you put your line breaks. Without a preformatted block, your text will flow to whatever size the browser allows until you press Enter twice to start a new paragraph or [nl] to enter a line break. Try changing the width of your browser window, and notice how the other messages in this thread reformat themselves to fit different window sizes.

> Quote:
>
> I'm not either. When did you do this? Where you logged in or did you type your name and password?

Oh, now I understand. I thought you were referring to the message above in this thread and you should have no trouble editing that one. However, you meant an earlier post that was:

1. posted without a an account... and...
2. posted without a password

These messages are still un-editable in the new software because there's no way to verify whether you are the person who created them.

Re: Welcome to the new forum software

*Message #22 Posted by **tony** on 6 July 2005, 12:27 a.m.,*
in response to message #1 by Dave Hicks

Dave, it would seem that although individual messages in a thread do have different message numbers (the read=XXXXX at the end of the URL) it is not now possible to actually get individual messages without getting the whole thread. This is not a problem when reading via browser but it confuses my automated download. Cheers, Tony

Re: Welcome to the new forum software

*Message #23 Posted by **Dave Hicks** on 6 July 2005, 1:08 a.m.,*
in response to message #22 by tony

It would probably be better to select the individual display of messages or the compressed listing of threads (Both under Search / Personalize) Either of those should make the number of main page links = to the number of message pages.

Re: Welcome to the new forum software

*Message #24 Posted by **tony (nz)** on 8 July 2005, 2:02 a.m.,*
in response to message #23 by Dave Hicks

Yup it does but an anonymous "get" of a message url now gives the thread. Before it used to give the message only.

Re: Welcome to the new forum software

*Message #25 Posted by **Marcus von Cube, Germany** on 8 July 2005, 3:04 a.m.,*
in response to message #24 by tony (nz)

I guess that's due to the new defaults. In the old software, the single message per get was the (only available) standard; now it is an option that has to be selected with a cookie.

If Dave were to change the defaults to the old behaviour, you'd need no changes on your side. Otherwise, your "get" software needs to provide the cookie in the HTTP header. Dave just needs to tell you what his software expects.

Re: Welcome to the new forum software

*Message #26 Posted by **Dave Hicks** on 8 July 2005, 10:55 p.m.,*
in response to message #24 by tony (nz)

That's true. Please let me know if it works any better for you now.

If not, I will need to know more about your software to make further attempts.

Re: Welcome to the new forum software

*Message #27 Posted by **Marcus von Cube, Germany** on 6 July 2005, 2:11 p.m.,*
in response to message #1 by Dave Hicks

Dave,

I just noticed that the new software isn't too well suited to my own usage pattern:

I have more than one machine but the forum software stores my reading history and preferences in cookies on every machine, not in my profile (I have an account).

For me it would be nicer if my setup were stored in a central place, not separatly on every computer I use to browse the net.

Marcus

Re: Welcome to the new forum software

*Message #28 Posted by **Dave Hicks** on 6 July 2005, 2:36 p.m.,*
in response to message #27 by Marcus von Cube, Germany

I'll put that idea on the wish list. I think it's possible but non-trivial. Hopefully the new software is no worse than the old in this regard. The old software didn't store anything personal so the (news) were pretty "generic".

I've also added "Mark All Read" at the top which wasn't meant for exactly this but might be somewhat useful anyway.

SCAM: "HEWLETT PACKARD PROMOTIONAL LOTTERY"

*Message #1 Posted by **Les Bell [Sydney]** on 3 July 2005, 2:52 a.m.*

Watch out for some advance fee fraud spam doing the rounds which appears to come from "HEWLETT PACKARD PROMOTIONAL LOTTERY <hwplotterypromouk@yahoo.co.uk>".

I just received one of these; it starts like this:

```
HEWLETT PACKARD PROMOTIONAL LOTTERY
3b Olympic Way, Sefton Business Park,
Aintree, Liverpool, L30 1RD
FROM: THE DESK OF THE DIRECTOR PROMOTIONS,
INTERNATIONAL PROMOTIONS/PRIZE AWARD DEPARTMENT,
_____
RE: Official Notification of Winning (HWP 2005)
```

and the continues with the usual blurb. HP afficionados will spot the obvious errors - like referring to "HWP" rather than "HP". It's just interesting that the scammers are now using the name of a high-tech company (which obviously has nothing to do with lotteries). I wonder if they've harvested email addresses off this site in order to target their mailing? If so, they would have had to hand-edit mine. . .

Best,

--- Les
[http://www.lesbell.com.au]

33s Must Be EveryWhere

*Message #1 Posted by **I, Claudius** on 3 July 2005, 12:08 a.m.*

Stopped in the brand new Walmart in Socorro, New Mexico the other day. In the calc section was an HP33s. If it's made it to Socorro, it must be everywhere!

Re: 33s Must Be EveryWhere

*Message #2 Posted by **Dave Shaffer** on 3 July 2005, 12:21 a.m.,*
in response to message #1 by I, Claudius

Well, possibly contrary to your first impression, there are a LOT of scientists (and engineers) in Socorro!

First, that is the home of New Mexico Institute of Mining and Technology (with lots of scientists and engineers, and students aspiring to the same).

Second, it is the home of the National Radio Astronomy Observatory (NRAO) Array Operations Center (AOC). As I noted in my comments about scientists at NRAO using HP calculators, NRAO has a long tradition of HP calculators. There are some 30-40 PhD radio astronomers associated with the AOC, most of whom grew up using HP.

I would not be surprised if it turned out that Socorro has one of the highest ratios of PhD scientists and engineers to the general population compared to anywhere in the US. (Perhaps exceeded only by Los Alamos, New Mexico, about 200 miles to the north!)

*Message #6 Posted by **Palmer O. Hanson, Jr.** on 3 July 2005, 3:27 p.m.,*
in response to message #5 by Gerson W. Barbosa

I have seen the 33S in Wal-marts in Largo, Florida and Brevard, NC. I hoped to find one in the SAM's Club at Ashville, NC (and perhaps with the usual SAM's Club price break) but I couldn't find one there. At both the Largo and Brevard stores the decimal points were far too small to be easily read with these 76 year old eyes. I'll have to wait for a solution to that deficiency.

Re: 33s Must Be EveryWhere

Since last year I've been noticing a difficulty to read the numbers in my calculators. I know presbyopia is normal as we age, but I'd expect it to appear a little later (I'm about to get 44). By the pictures of the 33S display posted here some time ago, I would say it was not this time HP solved its deficiency. I just hope they have not ordered too many of these new displays...

Regards

Actually, Gerson, 44 is a bit late for the onset of presbyopia (which depends somewhat on your distance refraction and a few other factors). Consider yourself lucky -- I was 39 when I started requiring near correction.

hp 42s

*Message #1 Posted by **Wolfy** on 2 July 2005, 3:53 a.m.*

Could anyone tell me if water is necessarily fatal to a hp42s? my trusty hp42 was left overnight in the rain. Can it be dried out, or are there internal parts that just wont come back to life? What can i do? I feel like I've lost my best freind!

Re: hp 42s

*Message #2 Posted by **Thibaut.be** on 2 July 2005, 5:17 a.m.,*
in response to message #1 by Wolfy

Well... I guess it's bad news for you...

Try to remove the batteries and dry it up with an hair dryer. Insist on the battery compartment and pray for the internals to dry up without too much oxydation.

It is somehow possible to open the calculator but this is not a damageless solution...

I guess you want to browse ebay for a replacement unit...

Re: hp 42s

*Message #3 Posted by **Naim** on 2 July 2005, 6:24 a.m.,*
in response to message #2 by Thibaut.be

If you did not power it up when it was wet you have a chance. Just remove batteries and let it dry out for two 24 hours. Put in new batteries, it should power up. If not contact Randy and www.fixthatcalc.com he would advise you.

I'd also suggest...(was: hp 42s)

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 2 July 2005, 8:21 a.m.,*
in response to message #1 by Wolfy

Hi;

the rain water has chemicals taken in the atmosphere that may be harmfull to the metal surfaces (maybe some decades ago it would be harmless...). I'd suggest washing the HP42S with destiled water (after removing the batteries) to remove the residual chemicals that might react with the metal surfaces after drying the rain water. After that, drying out the calculator might be done without much worries.

Hope you succeed!

Luiz (Brazil)

Re: I'd also suggest...(was: hp 42s)

*Message #5 Posted by **wolfy** on 2 July 2005, 8:54 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

thanks, I removed batteries and battery cover and dried it (without actually opening the case) using a hair drier, then a blow heater for several hours at about 30degC but can't really tell if the insides are completely dry.

re-installed batteries several times but no luck. dried for a bit longer, inserted batteries and it came back to life and seemed to work , however the on/off/exit button does not function. if i remove the batteries and then replace them, there is no response. if i then leave it for an hour without batteries and replace them again, it starts up again but no on/of/exit key

any suggestions?

Re: I'd also suggest...(was: hp 42s)

*Message #6 Posted by **Hugh Evans** on 2 July 2005, 3:01 p.m.,*
in response to message #5 by wolfy

You really should wash it out with DI water. Water itself does not pose much of a threat to electronics until other subtances are dissolved in it, giving it conductive and corrosive properties. Take out the batteries and place it in a container filled just enough to cover it. Move it around a bit, perhaps flip it over, drain it out and repeat with fresh distilled water two more times. Place it in an oven or toaster oven at its' lowest setting for a few hours and remove it to cool down.

Good Luck, HDE

How to revive soaked electronics gear (HPs, too)

*Message #7 Posted by **Bernhard** on 2 July 2005, 4:11 p.m.,*
in response to message #6 by Hugh Evans

Standard procedure for reviving electronics gear which has fallen in sea water: 1) shake out the sea water 2) immediately put in fresh water (prolonged storage possible) 3) shake out fresh water 4) put in distilled / demineralized water - stir well / shake / press buttons 5) shake out distilled water 6) put in 100% alcohol (ethanol) - stir well / shake / press buttons 7) let it dry in sunlight (oven not recommended - may melt the plastic). 8) if alcohol smell is gone, try it with fresh batteries and cross your fingers.

Re: How to revive soaked electronics gear (HPs, too)

*Message #8 Posted by **db (martinez, ca.)** on 2 July 2005, 11:23 p.m.,*
in response to message #7 by Bernhard

I would suggest that you follow Luiz et al's instructions. Alcohol can and will leave the screen of some old calcs such as the 41 milky and ruined. You can use alcohol, just use destilled water afterward. I have read here that someone got good results by drying his calcs in a gas oven with only the pilot light on, the oven was something like 120 degrees and safe for the unit. A 100% solution of Sauza Hornitos tequila, applied internally to the calculator cleaner has worked well for me. PRN.

Re: I'd also suggest...(was: hp 42s)

*Message #9 Posted by **Thomas Radtke** on 3 July 2005, 6:24 a.m.,*

in response to message #6 by Hugh Evans

I've seen a nice experiment lately concerning a TV set and distilled water. You won't try this at home. The usual dust inside devices dissolves apparently quite well in ADest, making is conductive enough to have a fancy lightning show. Your post implied that but I wanted to point it out explicitly. Too bad that CFC is out of discussion (for a good reason)...

Thomas

I'd also suggest...(was: hp32s)

*Message #10 Posted by **Bernhard** on 4 July 2005, 6:40 a.m.,*
in response to message #9 by Thomas Radtke

Obviously the TV was powered up when the destilled water was spilled into it. Known to TV repairmen as the flower pot syndrome (light) or aquarium syndrome (severe). As for the soaked calculator (or any other such equipment) any person able to THINK would immediately remove the batteries before applying cleaning procedures, so it was implied. The ethanol indeed may be dangerous to some displays but does a very good job to dry the equipment. Finally, don't forget all this is a final rescue attempt to revive equipment that otherwise will be dead. Some make it, some don't. So it is worth a try.

HP - The calculator of choice of scientists and engineers

*Message #1 Posted by **Gerson W. Barbosa** on 1 July 2005, 11:28 p.m.*

I remember having read the subject title in an advertisement folder from HP. Most of us here believe this is true concerning engineers, but what about scientists?

Experimental physicist Richard A. Muller, author of the Nemesis Theory http://www.space.com/scienceastronomy/solarsystem/nemesis_010320-1.html, wrote in his book Nemesis:

> Quote:
>
> The major diameter of an elliptical orbit is the period of the orbit, in this case 26 million years, raised to the 2/3 power, and multiplied by 2. My Hewlett-Packard 11C pocket calculator quickly yielded the answer: 176,000 astronomical units,...

(The World Treasury of Physics, Astronomy and Mathematics - Edited by Timothy Ferris, ISBN 0-316-28129-8, pg 267)

Of course this single ocurrence does not prove HP is the calculator of choice of scientists, but has anyone seen other calculators being mentioned in a scientific work?

Re: HP - The calculator of choice of scientists and engineers

*Message #2 Posted by **Luis** on 2 July 2005, 6:01 p.m.,*
in response to message #1 by Gerson W. Barbosa

The 11C ... no doubt about that!

Re: HP - The calculator of choice of scientists and engineers

*Message #3 Posted by **Dave Shaffer** on 3 July 2005, 12:11 a.m.,*
in response to message #1 by Gerson W. Barbosa

I'd say that the HP line was THE CHOICE of scientists, too.

I am a radio astronomer, my wife is an optical astronomer, both with our PhDs from the early 70s, and we have a dozen or so HPs between us, both historic (I have an early '35, bought as soon as I could afford it) and recent (between us, we have at least 3 32S's, she has 2 and I have one and I have also a '42S and a 48GX). We also both have 11C's that we purchased separately (before we were married). An HP 41CX was a birthday present from my wife some years ago. She knew how important it was!

Whaen I went to the National Radio Astronomy Observatory in 1975 as a staff scientist, they had 20 or 30 HP 35s - one for EVERY staff scientist in his/her office. These were clearly the calculator of choice for scientists in the mid to late 70's.

Re: HP - The calculator of choice of business managers too!

*Message #4 Posted by **Margaret** on 3 July 2005, 10:48 a.m.,*
in response to message #3 by Dave Shaffer

And the choices for business managers are the 12c and the 17bii! Greetings,

These early devices had a personality of their own which modern computers lack. It is unlikely today that someone would write in a scientific article "my notebook brand X quickly yielded the result..."

I can realize what the HP-35 meant back then because as late as '78 we still used table of logarithms at high-school. It wasn't until '81 when I bought my first calculator, a non-programmable scientific model from Sharp. Maybe because of that I recently purchased a very good 35, even the silver trim, where they wear most, is perfect,

Congratulations for your careers in Astronomy. I am not a scientist but I like to read about science, Astronomy being one of my favorite topics.

Back to the topic, I believe you are right when you say the HP line WAS the choice of scientists. We have to admit calculators will never have the same importance they had in those years, when they were the only portable computing resource available.

These early devices had a personality of their own which modern computers lack. It is unlikely today that someone would write in a scientific article "my notebook brand X quickly yielded the result..."

Aah, but that's because PCs are standardized devices; it's the *software* that makes the difference there. For example, "Scilab 3.0 quickly yielded the result..." -- nobody cares that I ran said software on a Compaq Armada 7790DMT, for some reason, even though it really is a nice machine. :-)

On page 10 of the the 6/23/05 issue of Electronic Design magazine, one of the electronics industry magazines, they have the results of a poll. The question was, "What is your preferred tool for engineering calculations?" The top 3 answers were as follows. 21% of those responding said it was specialized math software. 26% said a spreadsheet. 36% said it was their old HP RPN calculator.

Re: HP - The calculator of choice of scientists and engineers

*Message #11 Posted by **Palmer O. Hanson, Jr.** on 4 July 2005, 11:00 p.m.,*
in response to message #10 by Rodolfo Canet-Castello

What if I had been asked to do this calculation back in 1946? I would have pulled out my slide rule, set the cursor at 26 in the middle section of the K scale, moved the index of the B scale under the cursor, moved the cursor to 2 on the B scale and read 1755 on the A scale. Then I had to select the position of the decimal point. I wouldn't have felt compelled to tell the reader that the calculation had been done on a K&E N4058W Beginner's Slide Rule.

Re: HP - The calculator of choice of scientists and engineers

*Message #12 Posted by **Gerson W. Barbosa** on 5 July 2005, 11:41 a.m.,*
in response to message #11 by Palmer O. Hanson, Jr.

My Archimedes Darmstadt LOG-LOG yielded the result 1755 too, but not so quickly (I followed the same steps you made). My guess is you would feel even less compelled to tell anyone if the calculation was made with help of a table of logarithms or by means of squaring, extracting a cube root and multiplying by 2.

What I intend to point out it the fact that, for the first time in computing history, scientists, engineers, (ok, financial managers too), had a tool they loved so much they'd eve mention it on their works.

(O.T.: Congratulations for your work with the TI-58. Back in 1982 I had one of them. Too bad it was stolen before I could explore it a little more).

Regards,

Gerson.

Nonpareil state files

*Message #1 Posted by **Gerson W. Barbosa** on 1 July 2005, 8:39 p.m.*

The release of Nonpareil for Windows opens up a new world of possibilities. One of these is providing state files for classical calculators programs at the Museum's Software Library or at the forums, so users may try them on the simulator before deciding to key them in on the real calculator. As an example, article #487 at the HP Articles Forum now includes a state file for the 12C (Thanks Dave for hosting the file).

Regards,

Gerson.

HP 9831

*Message #1 Posted by **Gordon Dyer** on 1 July 2005, 6:21 p.m.*

There is only a passing reference to this mdel in the MoHPC. Here are some pics:
http://www.decodesystems.com/hp9831.html

Re: HP 9831

*Message #2 Posted by **Tony Duell** on 2 July 2005, 6:06 a.m.,*
in response to message #1 by Gordon Dyer

What do you want to know about it (I have one)?. The hardware is the same as an early 9825 (with the system ROM module that slides in the right hand side under the keyboard). But those ROMs contain BASIC not HPL. And the keyboard has a few different keytops (it's the same arrangement of switches, same electrical matrix connections).

Re: HP 9831

*Message #3 Posted by **Eric Smith** on 2 July 2005, 1:46 p.m.,*
in response to message #2 by Tony Duell

So will the 9831A system ROM cartridge work in a 9825A, or vice versa?

Re: HP 9831

*Message #4 Posted by **Tony Duell** on 3 July 2005, 6:26 a.m.,*
in response to message #3 by Eric Smith

I believe it will. I've been told that that's what people at HP did -- they had one machine on their desk and slotted in the appropriate system ROMs.

I belive you have the HPCC schematics CD-ROM. If you look at the 9825 keyboard schematics, it lists the (few) keys that were different. It also shows the 9831 (and not 9825) ROM module schematic, as that's what I have...

Re: HP 9831

*Message #5 Posted by **Achim** on 6 July 2005, 11:39 a.m.,*
in response to message #4 by Tony Duell

What about making EPROM copies of the 9831? It would be extremly interesting for all 9825 owners.

Re: HP 9831

*Message #6 Posted by **Tony Duell** on 7 July 2005, 6:18 a.m.,*
in response to message #5 by Achim

Remember the ROM chips in these machines contain the address decoder and address latch circuits (it's a multiplexed address and data bus). You couldn't just replace them with EPROMs, and you can't read out the HP chips in a normal EPROM programmer.

It probably wouldn't be too complicated to make an interface to normal EPROMs, and, indeed, reading out these ROMs is on my to-do list...

HP-11C Disassembly - link

*Message #1 Posted by **Gordon Dyer** on 1 July 2005, 6:13 p.m.*

I found this site which contains calculator info and an 11C disassembly with a lot of good pictures. Hope you all enjoy it.
http://www.decodesystems.com/calculators.html
http://www.decodesystems.com/hp11c-apart.html

Re: HP-11C Disassembly - link

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 2 July 2005, 8:41 a.m.,*
in response to message #1 by Gordon Dyer

Hi, Gordon; (are you well?)

Thanks for the link. What I noticed in the process is that the worst part is not shown, i.e., dealing with the plastic rivets. Maybe I'm wrong, but it seems to me that part of the process is missing, I mean, at least one photo and one additional step might be added.

When separating top and botton halves of a regular HP11C (or any other voyager), the mainboard remains attached to the top half. The picture that´s refered to as the top and botton separation actually shows the mainboard after being dettached from the top half. The picture sequence does not show the process of separating the mainboard from the upper half case, although it mentions that it must be carefuly done. To those that have done it before, the sequence may be confusing.

All of the rest seem fine.

Best regards.

Luiz (Brazil)

Charging

*Message #1 Posted by **Juergen/Germany** on 1 July 2005, 5:53 p.m.*

The other day I got hands on a thermal printer HP 82162A. Alas U.S. version, so I cant use the charger with it here in Germany. Fortunately(?), I do have a compatible(?) charger European version (in fact a charger that came with a German HP 82162A). Question: Can I use my European type of charger (220 VAC that is) without doing harm to the (U.S. version) printer/batteries? Thanks a lot for your input.

Best, Juergen

Re: Charging

*Message #2 Posted by **Howard Owen** on 1 July 2005, 8:44 p.m.,*
in response to message #1 by Juergen/Germany

I believe the answer is "yes." I base that on the fact that you see different part numbers for the chargers, but not for the printers. That is, there's only one HP-IL thermal printer, and it has the part number 82162A. Whereas there are a half dozen or so chargers, each with a seperate part number, listed in the printer's manual.

Re: Charging

*Message #3 Posted by **Etienne Victoria** on 2 July 2005, 3:27 a.m.,*
in response to message #1 by Juergen/Germany

Hallo Jürgen,

Any European charger referenced 82066B or 82068B will work with your printer : I use them all.

MfG

Etienne

Re: Charging

*Message #4 Posted by **Tony Duell** on 2 July 2005, 6:10 a.m.,*
in response to message #1 by Juergen/Germany

Yes you can. There are no changes inside the printer -- you can use any printer (or for that matter tape drive, disk drive, interface, calcultor, etc) with any of the appropriate chargers.

At one time it was common for HP-IL enthusiasts in the UK to buy a couple of the UK chargers and then buy all the peripherals from dealers in the States (where they were considerably cheaper). Said peripherals came with 110V chargers of course, but they worked fine with the UK chargers off 240V mains.

Thermal Paper

*Message #1 Posted by **John Limpert** on 1 July 2005, 1:59 a.m.*

Can I use any brand of thermal paper on old HP handheld and desktop calculators? Most of the original HP part numbers are now discontinued products.

Re: Thermal Paper

*Message #2 Posted by **Stefan Hauschild** on 1 July 2005, 3:27 a.m.,*
in response to message #1 by John Limpert

I use the thermal paper rolls from the credit card terminal printers. It has the right size but the color is black instead of blue. But that doesn´t matter. The printed card acceptance agreement on the back cannot be seen from the front side even in direct sunlight so this is the perfect and inexpensive solution for me.

-Stefan

Re: Thermal Paper

*Message #3 Posted by **David Smith** on 1 July 2005, 11:41 a.m.,*
in response to message #1 by John Limpert

HP recommends using stndard off the shelf thermal paper. you can get at any office supply store. Most used to carry the NCR brand which had been extensively tested and worked much better than the old HP paper. Now it seems all the stores carry paper with their own brand labels. I know some is still made by NCR, but others seem to be using no-name stuff from who knows where. It should work just fine, but there is still a very slight chance it might hurt the printhead.

Hi,

I agree with you that links are a vital part of the web.

By "Courtesy", I meant giving credit to the Museum and David when using/linking information should it be from an Ebay auction or elsewhere.

Etienne

Linking: Courtesy & Honesty

Message #8 Posted by ***John L. Shelton*** *on 1 July 2005, 2:01 p.m.,*
in response to message #7 by Etienne Victoria

I am not a lawyer, and I don't portray one on TV. But I've been around a long time....

Links from Site A to Site B are generally legal provided that they do not constitute fraud or libel. For example, Google links to zillions of web sites don't require the permission of the site owner. Google links are not fraudulent, since they do not pretend that Google owns the content. Google links are not libelous, since they do not associate the link with malicious commentary.

A link from your site to another should always make clear that you are referring to another site. Traditional links, where the user clicks, and gets a new web page with that site's address displayed, are reasonable.

Using links to include other site's content (GIFs, JPGs, etc.) in your web page is *not* clearly referring someone elsewhere; it is a pretense that you own the content, so you are committing fraud.

Publishing content like "This site <link> is run by a &^$#%*&" may be libelous, and may be subject to restriction in your country. It is certainly dis-courteous.

If the purpose of your link is to dramatically increase traffic to the other site, as a courtesy, you owe the other site a notification.

If the purpose of your link is to confuse your visitors, or to cause difficulty to the other site (such as suggesting that MoHPC is a "great" link from an Adult Erotica site), you are being dis-courteous, and perhaps fraudulent.

Accessing Functions on HP41

*Message #1 Posted by **Mike T.** on 30 June 2005, 8:02 p.m.*

I've tried looking around for an answer to this very simple problem but can't find one - I'm proabably just asleep though.

How do I include the 'FRAC' function in a program on the HP41 ... ?

I thought I'd just take a quick look at the HP41CV in Nonpareil and just to get a feel for it, enter my 'favorite' psudo random number generator routine - but I couldn't work out how to get at the FRAC function, and now it is bugging me!

Thanks

Mike T.

Re: Accessing Functions on HP41

*Message #2 Posted by **Eric Smith** on 30 June 2005, 8:41 p.m.,*
in response to message #1 by Mike T.

Use the key sequence XEQ ALPHA F R C ALPHA.

You can find the function names of built-in functions using CATALOG 3.

If you use a function frequently, you may want to assign it to a key. For instance, if you're not using TAN, you could give the sequence shift ASN ALPHA F R C ALPHA TAN. Now if you put the calculator in user mode, the TAN key will instead act as FRC.

You can see what function a key is assigned by pressing and holding the key. The function name will be shown in the display. If you release the key, it will execute. But if you hold the key for more than a second or so, it will change to NULL, and then when you release it nothing will happen. That way if you're not sure about using a key, you can find out what it is.

Re: Accessing Functions on HP41

*Message #3 Posted by **Mike T.** on 3 July 2005, 5:23 a.m.,*
in response to message #2 by Eric Smith

Thanks - Success, I'd never 'used' and HP41 before - they are a little different from the older models..

Many thanks...

Mike T.

Specifications of the HP82120A batteries

*Message #1 Posted by **Gonzalo Fernandez** on 30 June 2005, 5:17 p.m.*

Hello:

I would like to know the exact specifications of the small 4 batteries that comprise the HP82120A HP41 battery pack. I know that are NiCD, 1.2V? , but what is the capacity? Can be safely replaced by NiMh?

thanks

Re: Specifications of the HP82120A batteries

*Message #2 Posted by **Chris Woodhouse** on 30 June 2005, 8:31 p.m.,*
in response to message #1 by Gonzalo Fernandez

I can't speak to the specifics of that battery pack, but I can tell you a little about NiCd and NiMH batteries. Both are 1.2 volt nominal cell voltage. Fully charged is 1.45 volts/cell, for a new battery (they may not charge that high after they get old), it will drop off from that after you take it off the charger pretty fast to about 1.35 or so, even if it isn't under a load, 1.1 volts/cell under load is pretty close to dead. NiMH generally have a higher capacity than NiCd for the same size. Any device that works with NiCd's should work fine with NiMH. The only exception is when it is a very high current drain device like an electric model airplane or large camera flash, in that case NiCd's preform better than some NiMH's but that is less true as of late. The problem is in charging. A fast charger for a NiCD won't charge a NiMH right, However a slow charger will charge either battery fine. On slow charging the question becomes how slow is it going to be. The typical slow charge rate is 1/10 of the battery capacity. In other words if it is a 2000mAh battery you should slow charge it at 200mA, and at that rate it should take 14 hours. If you do the math you will see that it takes about 40% more energy to charge a battery than is stored in it. This same ratio works if you charge it at a lower or higher rate but you don't want to go very much above or you enter fast charging range and you need a charger specifically for that. If you go too much slower I don't think it will charge at all. I would guess that a 1/20 rate would still do the job but I don't think if you went a lot lower it would ever get fully charged.

Chris W

Re: Specifications of the HP82120A batteries

*Message #3 Posted by **Gonzalo Fernandez** on 1 July 2005, 4:29 a.m.,*
in response to message #2 by Chris Woodhouse

Thanks for your clear explanation, but I need to replace some dead small batteries from an HP82120A and I need the exact dimensions and capacity of the batteries.

in response to message #3 by Gonzalo Fernandez

I have found in http://www.hpmuseum.org/cgi-sys/cgiwrap/hpmuseum/articles.cgi?read=335

thank you very much for your explanation

Re: Specifications of the HP82120A batteries

*Message #5 Posted by **David Smith** on 1 July 2005, 11:45 a.m.,*
in response to message #1 by Gonzalo Fernandez

The cells were 1/2N 70-80 maH NiCad cells. They are no longer being made. There are some 1/2N NiMH cells out there, but you won't be able to find them. Most people use a small NiMH cell and something to shim the space with. The NiMH cells that fit have around a 140-150maH capacity. The 1/3 AA cells are just a smidge too big to fit unless you want to carve up your case.

HP-45 keypad problem

*Message #1 Posted by **Mark Crispin** on 29 June 2005, 10:32 p.m.*

I have an HP-45 which is displaying the following symptoms:

The keys on the lowest row are not doing their proper function. In particular:

[divide] acts like +

0 acts like ENTER, and [Last X] acts like DEG

. acts like CHS, and [pi] acts like RAD

[sigma+] acts like EEX, and [sigma-] acts like GRD

I suspect that a signal line is bad, but I don't know how I would go about repairing it. Any suggestions?

Re: HP-45 keypad problem

*Message #2 Posted by **David Smith** on 30 June 2005, 1:27 p.m.,*
in response to message #1 by Mark Crispin

Most likely is some corrosion or (often invisible) grunge on the keyboard or CPU board. Open the machine (remember there are two screws under the upper corners of the rear label and under the two bottom feet) and clean everything with 91%+ isopropyl alcohol.

Never use Isopropanol on HP plastic shells !

*Message #3 Posted by **Bernhard** on 1 July 2005, 7:42 a.m.,*
in response to message #2 by David Smith

Hi Mark,

David is right, you can safely use Isopropanol to clean the electronics or keyboard contacts, but if you have it at hand, you may be tempted to use it to clean other parts (such as the plastic shell or keyboard legends) with it, too - DON'T DO IT ! It's a typical mistake of newcomers to HP restoring. Be warned. These plastics may turn white and the keyboard legends will disappear under the white mess.

Re: Never use Isopropanol on HP plastic shells !

*Message #4 Posted by **David Smith** on 1 July 2005, 11:51 a.m.,*
in response to message #3 by Bernhard

I have found that Armor All will clean up the white residue on the case.

For cleaning the plastic cases of grunge, label residue, and marker ink, I have found that white gas (Coleman camping fuel) works very well. It does not affect the display lens, but keep it off the

keyboard area. Also best to test your solvent on some very inconspicuous place first.

If you like Nonpareil

*Message #1 Posted by **Eric Smith** on 29 June 2005, 9:51 p.m.*

Two users have already made donations to support further Nonpareil development, and this is much appreciated. I've just added some PayPal donation buttons to the web page to make this more convenient. Credit card donations can be accepted even if you don't have a PayPal account and don't want to sign up for one.

Note that Nonpareil is Free Software, so donations are strictly optional. I originally had planned to sell the Windows version of Nonpariel, but I've decided not to do that. Still, donations help pay for web hosting, and some of the expenses involved in Nonpareil development.

There is a tradition in the amateur (ham) radio community of exchanging QSL cards (postcards) to confirm a radio contact. I'm not a ham (yet), but I think this is a great concept, and it would be cool to apply it to free software development. If you like Nonpareil, I'd appreciate receiving a picture postcard of your area, and in exchange I'd be happy to send you one of the San Francisco Bay area, the Computer History Museum, or something else interesting. The address is on the Nonpareil web page.

Thanks,
Eric

Re: If you like Nonpareil

in response to message #1 by Eric Smith

Eric,

Your donation buttons are in reverse. The one that says $10 takes you to PayPal for a $30 donation. The one that says $30 takes you to PayPal for a $10 donation.

Namir

Re: If you like Nonpareil

*Message #3 Posted by **Eric Smith** on 29 June 2005, 10:12 p.m.,*

Look HP41CX + QUAD MEMORY Module ?

*Message #1 Posted by **gileno** on 29 June 2005, 2:29 p.m.*

Does HP41CX use the quad memory?

http://cgi.ebay.com/ws/eBayISAPI.dll?
ViewItem&category=58039&item=5785738549&rd=1&ssPageName=WDVW

Edited: 29 June 2005, 5:41 p.m. after one or more responses were posted

Re: Look HP41CX + QUAD MEMORY Module ?

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2005, 4:59 p.m.,*
in response to message #1 by gileno

Hi, Gileno;

AFAIK, the HP41CX has all 'main memory' available, as it happens with the HP41CV. If you use a quad module, operation may disrrupt, i.e., in some circumstances the calculator may not work properly. All comands that access memory will cause both quad memory contents and main memory contents to answer, and if any of them delays a bit, bus may stuck. Anyway, it may work perfectly fine, though...

Cheers.

Luiz.

HP41 MLDL2000 update

*Message #1 Posted by **Meindert Kuipers** on 29 June 2005, 10:33 a.m.*

Just some quick news regarding MLDL2000 progress:

- Production is delayed with some days due to some SRAM devices being damaged in storage

- half of the MLDL2000's will be shipped with the regular amount of SRAM, the other half with double the size due to availability of components. Although I do not know yet if the double size will actually work (it requires an extra wire to connect the additional address line)

- The units with double SRAM storage will be made available (at no extra cost, since it does not cost me extra) to those who have ordered their MLDL2000 first

- The complete batch of MLDL's will be produced this week or beginning next week, meaning that all orders can be fulfilled probably before my vacation, depending on how testing and assembly goes

- After fullfilling all existing orders there will be about 10 units left. It is unlikely that any new PCB's will ever be manufactured so if you still want one let me know

Meindert Kuipers, MLDL2000 website

Re: HP41 MLDL2000 update

*Message #2 Posted by **Stephen Walters** on 29 June 2005, 3:03 p.m.,*
in response to message #1 by Meindert Kuipers

Will you make available all the source code of the project?

Re: HP41 MLDL2000 update

*Message #3 Posted by **Meindert Kuipers** on 29 June 2005, 3:17 p.m.,*
in response to message #2 by Stephen Walters

All source code, schematics, VHDL will be public. The MLDL2000 project is not for profit and units are sold at a price that allows me to cover the cost of creating the hardware. The MLDL2000 would have to sell in thousands in order to pay back the time I spent in making it. We all have our hobbies ;)

Meindert

Re: HP41 MLDL2000 update

*Message #4 Posted by **Howard Owen** on 30 June 2005, 1:14 a.m.,*
in response to message #3 by Meindert Kuipers

Hi, Meindert.

I'm particularly interested in the source for your Windows management application. I'd like to try to port it to Linux, or at least use it as a guide for a reimplementation.

This is starting to get exciting! 8)

Re: HP41 MLDL2000 update

*Message #5 Posted by **Meindert Kuipers** on 30 June 2005, 6:39 a.m.,*
in response to message #4 by Howard Owen

Linux would be really great. You could start with getting the Linux drivers for the FT2232C, and sort out how to interface with the MPSSE from an application program. Note that all my applications are written in Delphi.

Meindert

Re: HP41 MLDL2000 update

*Message #6 Posted by **Howard Owen** on 1 July 2005, 8:37 p.m.,*
in response to message #5 by Meindert Kuipers

I can at least read Delphi. 8)

There is no hope of a direct translation to Linux anyway. I could use the source as a guide to how you implemented a particular feature, though.

I'm currently writing my first-ever Linux driver for Cristoph Klug's HP-IL card. I'm hopeful I can get a first pass of that done over this weekend, a holiday in the US. Once I get my MLDL2000, I'm sure the pain of running the software under Windows XP will motivate me to do something about it. 8)

Question about storing NiCd batteries

*Message #1 Posted by **Namir** on 29 June 2005, 8:45 a.m.*

Hello,

I am rearranging my colelction of HP calculators. This process includes taking out batteries. In the case of the rechargeable NiCd batteries, would storing them in a freezer or just the regular part of a refreigirator be the best to preserve them? Any other suggestion?

Namir

Re: Question about storing NiCd batteries

*Message #2 Posted by **Frank Boehm** on 29 June 2005, 10:56 a.m.,*
in response to message #1 by Namir

I would suggest to store them dry and cold (room temperature); probably the best way would be to seal them inside a PE-bag, together with some silica gel (often to be found when you purchase electronic components).

Re: Question about storing NiCd batteries

*Message #3 Posted by **Namir** on 29 June 2005, 12:26 p.m.,*
in response to message #2 by Frank Boehm

Thanks Frank!

Re: Question about storing NiCd batteries

*Message #4 Posted by **John L. Shelton** on 29 June 2005, 2:05 p.m.,*
in response to message #3 by Namir

In general, chemical reactions slow at lower temperature. Placing batteries in a refrigerator should slow the eventual decay, somewhat. There are other considerations, however:

- Cool batteries may cause condensation when returned to room environment.
- Freezing may cause any batteries containing water to expand. I've never had that happen with carbon-zinc or alkaline batteries, which I've successfully frozen. But I haven't tried freezing NiCads.

Re: Question about storing NiCd batteries

*Message #5 Posted by **David Smith** on 29 June 2005, 3:16 p.m.,*
in response to message #1 by Namir

Read the manufacturers specs on the batteries. Many will be damaged by freezing. Refigeration might be OK, but the humidity will probably do more harm than the cold will help.

Re: Question about storing NiCd batteries

*Message #6 Posted by **Soueu** on 29 June 2005, 7:13 p.m.,*
in response to message #1 by Namir

Hello Namir;

Don't worry about the NiCds... I can send you brand new ones.... How many do you need ?.

Please note that I have no economic interest in this but we throw away so many cells after non-destructive testing that it's a shame.... (I work for a major japanese manufacturer of NiCd, NiMH and Li-Ion cells, and this may be a good way to help the HP community).

Really, if you need some NiCd or NiMH cells (and are available), let me know... (you pay postage).

BTW... Refrigerator is OK, freezer is not.

Regards;

Soueu

Re: Question about storing NiCd batteries

*Message #7 Posted by **Namir** on 29 June 2005, 9:58 p.m.,*
in response to message #6 by Soueu

The NiMH or Li-IOn batteries seem more attractive.

I studied chemical engineering and had a small lab at home. I used to do non-destructive battery tests too .. just for the fun of it.

Please email me your address. My email is:

n s h a m m m a s AT a o l DOT c o m

Please remove the spaces and replace AT with @ and DOt with the dot character.

How I Got a New Bezel for a HP15C

*Message #1 Posted by **Giancarlo (Italy)** on 29 June 2005, 8:10 a.m.*

Some weeks ago I bought a 15C at a reasonable price,
mostly due to its missing screen bezel
(as well as the back label...).
The "starting point" was the following:

http://www.hpmuseum.org/guest/mattioni/giancar1.jpg

I thought I could reconstruct the lost bezel, so I took
some dimensions (using a vernier digital slide gauge),
trying to be as accurate as possible (even though it was
not always easy, both because of the plastic material and
the lack of fixed reference points on the chassis).
Anyway I was able to get the technical drawing of the bezel
(anyone interested in it, please drop me an e-mail and I'll
send you a PDF file - about 233 kB).
At this point, as I work in an household appliances company,
I could take advantage of a "special tooling department"
of my company (specially skilled in stainless steel workings)
which could make laser cutting, trimming and bending.
So I got this piece:

http://www.hpmuseum.org/guest/mattioni/giancar2.jpg

The final result that I got is represented in this picture:

http://www.hpmuseum.org/guest/mattioni/giancar3.jpg

Now, only the final step is missing: I still have to decide
the best way to glue the steel bezel on the plastic chassis of the 15C.
I was thinking to use a both sides adhesive tape,
the thinnest that I can get (by 3M, like the VHB Series,
going down to a 0,38 mm thickness - please see
http://www.3m.com/us/mfg_industrial/adhesives/vhb/),
but on this point any suggestion or advise from the Forum
contributors will be more than welcome (I excluded using
cyanoacrylate-basis adhesives, as they would severely spoil
the plastic chassis, and any kind of hot-melt glue).

I hope my two-cent contribution will be interesting or
useful for someone.
Best regards.
Giancarlo (Italy)

Pretty good looking! (was: How I Got a New Bezel for a HP15C)

*Message #2 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2005, 11:05 a.m.,*
in response to message #1 by Giancarlo (Italy)

Hi, Giancarlo;

congratulations! It looks to me. Although it does not have the lowered, LCD-border frame, it is too far from better than having a fold-marked, scratched frame. About the lowered LCD border, maybe a plastic add-in

would do better. You see, a smaller plastic part, either peinted or already in semigloss silver, would both protect against dust and add finishing. Your solution is excellent, I'm just looking at details.

Best regards and thanks for your valuable contribution. (BTW, would you be as kind as for sending a copy of the PDF to lcviera at quantica dot com dot br ?)

Luiz (Brazil)

*Message #4 Posted by **Charles E. Oxford** on 29 June 2005, 1:04 p.m.,*
in response to message #3 by Giancarlo (Italy)

I think there is an "i" missing. Shame on Luiz.

You're both right!

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 29 June 2005, 4:51 p.m.,*
in response to message #3 by Giancarlo (Italy)

Hi, Giancarlo;

forgive me... I mispelled my own name ('senior moment'?) Charles is right: it misses an i. Try this, plese:

lcvieira at quantica dot com dot br

It seems to be correct, now (Oll Korrect...)

Thanks, guys.

Luiz (Brazil)

Re: Pretty good looking! (was: How I Got a New Bezel for a HP15C)

*Message #6 Posted by **Margaret** on 29 June 2005, 1:06 p.m.,*
in response to message #2 by Vieira, Luiz C. (Brazil)

Wonderful solution! The only question is ... can you share with the Forum an idea of the approximate cost of the new bezel? And ... could you e-mail (Please remove NOSPAM) me the PDF file at MVelcaNOSPAM@bellsouth.net

Greetings,

Re: Pretty good looking! (was: How I Got a New Bezel for a HP15C)

*Message #7 Posted by **Giancarlo (Italy)** on 29 June 2005, 4:06 p.m.,*
in response to message #6 by Margaret

```
Hello Margaret.
I just e-mailed the PDF file to you.
As far as the cost of the new bezel is concerned, it's quite difficult to make an
estimate.
For me, of course, it was completely free ;)
But its overall cost is the sum of material and processing.
Material: let's say 0,5 EUR
Processing: maybe 1 hour (to be multiplied for the unit labour cost).
Unfortunately, all of this does not take into account the mark-up that a company
would put on the component if it was to produce and to sell it....
Hope this helps a little bit.
Cheers.
Giancarlo
```

Pricing from emachineshop

*Message #8 Posted by **Hugh Evans** on 29 June 2005, 11:57 p.m.,*
in response to message #6 by Margaret

I took a few quick measurements from my 11c and put them into emachineshop's CAD program to get a few quotes. Laser cut 0.024" brushed stainless steel with all necessary bends came out to:

$85.90 (1 unit)=$85.90/part $94.50 (10 units)=$9.45/part $111.05 (25 units)=$4.45/part $137.05 (50 units)=$2.75/part $192.30 (100 units)=$1.93/part

If there's much community interest in buying a few of these I would be happy to organize an ordering pool so everyone can benefit from volume pricing. The CAD model and all specifications would, of course, be refined and reviewed before ordering. Lead time is currently about 3 weeks.

Re: How I Got a New Bezel for a HP15C

*Message #9 Posted by **Hugh Evans** on 29 June 2005, 1:15 p.m.,*
in response to message #1 by Giancarlo (Italy)

Congratulations on your new bezel! You will likely be best off using epoxy to attach it. Scuff up the back of the bezel just before you start gluing and at least clean off the plastic with 90%+ rubbing alcohol. It won't take much to form a good bond. Please post some pictures of the process you choose and the final result.

Since you have access to a tooling department, are you considering a similar treatment for the back label? It wouldn't be all that difficult to first have the shape cut as you did with the bezel, spray/anodized it black, cover it in masking tape, laser-etch labels through the tape, spray on a coat of white, clean off the tape, and put it on the calc. OR if you don't mind a cosmetic change simply etch the pattern into a piece of stainless.

Best of luck, HDE

Re: How I Got a New Bezel for a HP15C

*Message #10 Posted by **Ron** on 29 June 2005, 1:15 p.m.,*
in response to message #1 by Giancarlo (Italy)

Wow! You da man! That looks really good!

I have used some of the 3M 2-sided tapes for various things. I don't remember which ones, but they were thin and supposedly strong. In each case, they were fluid enough that the part could be wiggled around a little, and

the part eventually came off. Maybe I didn't clean the parts well enough.

Re: How I Got a New Bezel for a HP15C

*Message #11 Posted by **David Smith** on 29 June 2005, 3:20 p.m.,*
in response to message #1 by Giancarlo (Italy)

HP used a double sided sticky film (probably 3M). If you can get something like this, I would use it. Otherwise I would use something like 3M Super 77 spray adhesive (available at most hardware stores... except in Kaliphoneya)

Re: How I Got a New Bezel for a HP15C

*Message #12 Posted by **GWB** on 29 June 2005, 6:33 p.m.,*
in response to message #1 by Giancarlo (Italy)

What have you used for the plastic protection of the display, do you still have the original one?

By what I see, you had no original bezel to base yours upon.

(Gliene offrirei uno venuto da una vecchia HP-11C, se ancora lo vuole)

Regards,

Gerson.

Re: How I Got a New Bezel for a HP15C

*Message #13 Posted by **Giancarlo (Italy)** on 29 June 2005, 7:31 p.m.,*
in response to message #12 by GWB

```
Hi Gerson, and congratulations for your perfect Italian!
I didn't use any plastic protection for the LCD display, indeed, as I didn't have the
original one.
How would you suggest to replace / rebuilt that plastic protection as well?
For the 11C original bezel, please mail me some details.
Thank you for your feedback.
Cheers.
Giancarlo (Italy)
```

Re: How I Got a New Bezel for a HP15C

*Message #14 Posted by **GWB** on 29 June 2005, 10:28 p.m.,*
in response to message #13 by Giancarlo (Italy)

> Quote:
>
> ...and congratulations for your perfect Italian!

Grazie! Ho appena finito il quarto livello del corso elementare di lingua italiana per stranieri alla Dante Alighieri qui in Brasile :-) Still a lot to learn...

(Thanks! I've just finished the 4th stage of a basic course of Italian for foreigners, here in Brasil)

As a temporary solution for the plastic protection of the display, you can take a piece of hard plastic from a blister package like those that come with new HP calcs. Only, of course, if your 15C is one of those earlier model, or you won't be able to replace it later.

http://www.hpmuseum.org/10cint.jpg

As a definitive solution, you should take one from a cheap non-working 12C, in case you find one. I could send you the bezel, withouth the HP logo that was missing and the plastic protection because I needed it for my own 15C. It is not so good because the previous owner kept it in a drawer with other calculators, and it appears that some batteries leaked on it. But it might be good as a model. I could send it to you, you'd only send me a post card from Italy in return if you wanted. Just send me an e-mail (remove the obvious NSPM)

Regards,

Gerson.

Re: How I Got a New Bezel for a HP15C

*Message #15 Posted by **Artur - Brazil** on 30 June 2005, 4:25 p.m.,*
in response to message #14 by GWB

Hi,

One more message from Brazil. Well, about the bezel, I believe if you could make it from a thin steel sheet, you could add another piece under it and flue both. So, you could make the recessed frame inside the main hole. For the protective plastic, cut it from a CD case. It is great. Not so scratch resistant, but is what I have used to make HP 10 series restaurations. If desired, I could make a scan from one HP15C for you see the recessed part and get the actual measures.

Best regards from Brazil and congratulations! Artur

Re: How I Got a New Bezel for a HP15C

*Message #16 Posted by **Giancarlo (Italy)** on 1 July 2005, 8:33 a.m.,*
in response to message #15 by Artur - Brazil

```
Hi Artur!
One day I'll try to understand why there seem to be some "geography" for HP
enthusiasts (Brazil, Spain, USA of course, UK, .....).
Now back to the bezel: please, mail me (or, if you think it could be
interesting for the Forum, post on it) the scan of the 15C, because I'd like
to put in place your advise.
Thank you for your feedback.
Cheers.
Giancarlo (Italy)
```

What is your address?

*Message #17 Posted by **Artur - Brasil** on 3 July 2005, 10:38 p.m.,*
in response to message #16 by Giancarlo (Italy)

Hi, I took the pictures and measures. What is your email? (about 400Kb)

Best regards Artur

Another beta test please

*Message #1 Posted by **Dave Hicks** on 28 June 2005, 3:35 p.m.*

Hi everyone. I've just installed a new beta version of the forum software. You may recall of beta of this a long time ago. I got sidetracked by the new DVD release and other things but I'm back at work. I've done a few clean ups and added a few features. There's a link to an Account User's guide that doesn't exist yet - but equivalent content is below in this post. Accounts created during the first beta are still there.

Pleas start here (This has links to the other beta forums.)

if you read the following in the first beta - you can skip it - little has changed in the text that follows.

The first things you'll notice are that

1) There are now formatting buttons on the new message posting forms,

2) On Search / Personalize Display page there are options to display an entire thread on one page.

3) Ability to optionally create an account and login (see "login / register" in the upper right corner of each forum),

4) Each forum now displays (new) that is tailored to you personally and the basic personalization settings are now "sticky" ie if you set it to display the last day's worth, that's how it will stay even if you go away and return later. (Note that these features require your browser to be set to accept cookies and the formatting buttons require javascript be enabled. The cookies are used ONLY by the forum software. I can't use them to track you in the museum let alone the rest of the Internet.)

5) Posting to the classified ads, warns you about scammers.

These forums are using a snapshot of the forum messages from some time ago. When the beta ends, these messages will be lost, so have fun in the beta forums but please keep the important HP-related messages here in the "real" forums. Likewise, any account names you create in the beta forums are only temporary.

Here are the details:

Accounts

It is now possible to create an account and to log in to the forum. Having an account gives you several advantages: It prevents other people from using your (exact) name and logging in allows you to enter your name and password just once. Once you are logged in, you can create, edit and delete your posts without reentering a name, password, and email address each time. You can also create an account to reserve your name yet continue to post as before without logging in. In this case, you will need to supply your account password on each post. You can also mix and match - for example, log in on your home computer but post without logging in on a public computer.

Accounts are currently optional and I think you'll find that they make the forum more convenient. However, another reason for creating accounts is that we now occasionally get spammed. A few moderators have been successful in keeping most of you from seeing these spams, but if the spammers get more aggressive, the new software provides several new options such as requiring an account to post or sending anything posted without an account to the

moderators for approval before it appears on the forum. If you use an account, you'll never notice if these features are ever needed.

Email Options / Private email If you create an account, you have several email options. You can provide no forum email or obscure it in any way you like (such as meNO@SPAMdomain.com) or you can enter a valid email address but keep it private. If you use the latter option, someone who wishes to contact you will do so by clicking on your name and filling in a form. The text will be emailed to you, but your address will never be visible. Only forum users who are logged in can send you emails in this way. This should reduce the amount of spam and scam emails received. If you are a heavy user of the classified ads, you will need to decide whether a private email address is worth making it a little more difficult for a potential trader to contact you. Of course, I can't guarantee that scammers won't create accounts to contact you but it raises the bar for them a bit.

When you create an account, your are asked for two email addresses (which may be the same.). Your "Forum email address" is the address you wish other forum members to use (and possibly see). This could be your normal email address, a hotmail account, an obscured address or it could be left blank if you wish no email contact. Your "Activation Email Address" is the address that will be used to activate the account. It will never be displayed to other users. This address must be a valid non-blank non-obscured address and can't be a disposable "freemail" address such as hotmail, yahoo etc. These freemail addresses make it much too easy to a spammers to create accounts to be used only for activation of spam-and-run accounts. (The software checks for known freemail domains. If you manage to use an obscure freemail domain, it may work but your account might be deleted later if you draw attention to yourself by spamming or trolling.)

Accounts and older Posts When a new account is created, the forum treats any existing posts made without an account but with the same name as being possibly owned by this account. For anyone clicking on a name field, the forum will honor the email options of the current account of that name. This means that you can hide the email addresses in your previous posts by creating an account with the same name and setting the private email option. (Old Biographies require one additional step - see " Taking Ownership of your Biography" below.)

In order to edit or delete a post created before your account was created, your account password will need to match the password that was given when the message was saved. (In the case of the Classified ads, it is the forum email address on old ads that must match. This is because the Classified Ads posted without accounts don't have passwords.) This prevents random people from creating accounts that match existing messages and then editing or deleting those messages. Any NEW messages that you create are linked to your account such that you can freely change your account password and still be able to edit them. If you have an account with a new password but need to edit an old message, the easiest thing to do is to logout from your account, edit your old message the old way, and then log back in.

Classified ads posted with an account are protected by casual deletion by people typing in the email address. If you use an account, only you and moderators can delete your ads.

Taking Ownership of your Biography. Unlike the other forums, messages in the Biographies forum are stored under a person's Family Name, Given Name and there's no 100% safe programmatic way to link this format to the way you usually list your name. Therefore simply creating an account named Given Name Family Name, will not immediately cause your biography's email address to become private. To do this, your account must have the same password as your Biography and you must edit your biography. When you exit the edit screen by saving, the Biography will be assigned to your account and options like "Private email" will apply.

Contact Page When you click on a poster's name, you are now taken to a contact page, which may provide an email address, or a contact form if the user has selected private email. This page will also tell you if the person you are contacting is a registered user. (new) in all forums - now personalized The main forum used to print (new) on the last 20 posts. ALL forums now print (new) based on posts made since your last visit. (If you have cookies enabled.)

Report Post If you have an account and are logged in, you will notice that each post has a "Report Post" link. This may be used to notify the moderators of any posts that are offensive, harassing, rude, spam etc. The moderators will then take a look and may delete the post.

Basic personalization preferences are maintained ("sticky") Under "Search / Personalize Display", "List messages", "Display Messages" and "Posted within the last" are now "sticky" if you have cookies enabled. They are set on a per-forum basis and will be remembered even if you stay away for months. (astute readers will note that setting "Posted within the last" to "Two days" makes the daily view redundant and the daily view URL may be phased out over time. "Display Messages Grouped into threads" is new on the "Search / Personalize Display". Setting this causes an entire thread to be displayed with one click. Indentation and information in each message header will guide you on the thread structure. (There is also an option to display the entire thread flush left which is meant for very small displays as on PDAs.)

Formatting buttons The Post Message forms now include a row of buttons for adding links, images etc. These buttons require javascript to work but if you don't run Javascript, you can click on the "more" link to see a page which describes the formatting codes which you can just type in. You can thank Paul Brogger for this idea.

Cookies and Privacy The forum software now sends cookies under these conditions:

Logging in to the forum: Login in is optional but you must have cookies turned on in order to do so. You can an create an account and not log in if you really dislike cookies. This keeps people from using your name and deleting your ads but requires you to enter your password on each post/edit/delete.

Each display of the Index and Posting messages: These are simply set to save your list style and time preferences as well as to save the last message seen in order to update the (new) display. If you block these features then you won't see (new) and you're list style preferences won't stay "stuck" for very long.

If you really dislike cookies, then don't log in and blocking the preferences cookies will cause mostly the loss of minor conveniences. However, please note that these cookies are used ONLY in the HP forums. They are not shared with other sites or used to track you across the Internet or even in other parts of the HP museum. (They aren't even logged anywhere.) Also note that the information contained in the cookies is the information that you normally enter to post messages and set forum options. The just automate providing the information that you have been giving the forum software by hand all along. The museum does NOT send any third party cookies that would allow some third party to track you around the Internet.

Some Browsers such as Internet Explorer allow you to set cookie options on a site-by-site basis. For example, in IE you can go to Tools/Internet Options/Privacy and then click the Edit... button in the Websites panel. Then enter hpmuseum.org (and/or hpmuseum.com if you use that URL) and click Allow. This will allow the new forum features without affecting your cookie policies for other sites. (Likewise, you can go to Security and decide on which sites to allow Javascript. IE calls it "Active Scripting".) Javascript is required only to make the format buttons work.

How to clean a big vintage machine?

*Message #1 Posted by **marais** on 28 June 2005, 2:26 a.m.*

I always wonder - the machines on the museum look mint, like the fabulous 9100 or the gorgeous 9825. I suppose the machines were cleaned and failures on the finish repaired, maybe even with a new layer of paint? Even though I disassemble my machines as far as possible, in order to put them in a cleaning bath, I don't get the same results. And there are limits: A keyboard like the one in the 97 cannot be disassembled key by key (or am i wrong?), which means the whole plastic assemble must be washed. Worse on the 9810 - or am i wrong again? Please reveal your secret cleaning tips!

Andreas

Re: How to clean a big vintage machine?

*Message #2 Posted by **Frank Boehm** on 28 June 2005, 3:01 a.m.,*
in response to message #1 by marais

There is a trick involved: the machines *are* mint. The machines have been bought by universities (money didn't matter a lot in the 70s) and quickly been stored away, due to faster, better and cheaper machines being available. They only did serve a couple of hours by then - which means "no wear". Depending on the storage conditions they will stay in this condition for 30 years :)

After all, it doesn't make a lot of sense to "rework" a calculator, as mint ones are available easily (but being HP, not for cheap). When you really want to clean them, try water & soap and a soft sponge. For some dirt, window cleaner works great (this is what I use most of the time); you might want to try alcohol based cleaners as well (the more aggressive, the greater the chance to damage the surface - better try on an invisible part of the machine). For really tough dirt, aceton does a great job - it will most likely damage plastic parts though.

in response to message #2 by Frank Boehm

> Quote:
>
> There is a trick involved: the machines *are* mint.

Yes, this is by far the easiest way. Most of my machines have been dusted (brush/compressed air) and some have been gently washed in some areas with a soft cloth and soap and water. I don't dissemble, soak, repaint etc.

Some historians think that even the cleaning that I do is excessive. I think it's OK, but repainting etc. is out of the question in my opinion. Besides the hole historical issue, there's the practical question of whether the new paint will age the way old paint would over the next couple of decades. Be very careful about cleaning keypads. It's easy to put a shine on textured matt plastic.

I had the benefit of acquiring most of my calculators before ebay existed or at least was well-known. Over the years, I've seen some of my local equipment providers raise their prices by a factor of more than one hundred the day after they browsed ebay. But I still get lucky now and then.

*Message #4 Posted by **Tony Duell** on 28 June 2005, 6:53 a.m.,*
in response to message #1 by marais

I would not recomend dismantling a 97 (or other Topcat) keyboard. The 'hats' don't normally fit so well the second time round.. If you must, then after removing the PCB, contact sheets, etc, press on the bottom of each key stem with something like a screwdriver handle and remove the hat, key and spring. When reassembling, use a hot soldering iron to form over the end of any stem that doesn't hold that well.

To dismantle a 9100 keyboard, take off the baseplate and bezel, then remove the PCB (note where the screws go, some of the holes are used to hold the baseplate on). Remove the toggle switches (2 screws each). Loosen the nut on the decimal selector switch, slip that out of the frame. You can now separate all the electronic bits from the casing. Use a small screwdriver from inside the casing to free the locking hook on each key, slide out the key complete with the metal pin (don't try to separate those). When reassembling, put a new 'size 006' O-ring on each pin. They were fitted there originally, but they have long since cracked and fallen off in most cases.

The 9810 keyboard comes apart very easily. After removing the complete assembly from the machine, pull off the interconnect PCB at the side (this connects the encoder board to the key matrix). Disconnect the edge connector that connects the wiring harness to the encoder board, then undo the screws and take off the encoder. Undo the 6 screws that hold the keyboard to the bezel, take it off. If you want, you can remove the display window with the obvious screws. Back on the key chassis, take off the front strip by undoing the 6 larger screws. Then remove the mains switch (2 obvious screws). The keys just pull out complete with their plungers and springs -- you can separate the key from the plunger if you want to. Remove the screws and take off the PCB, then remove the key housings. Many of the screws in this assembly were fitted with 'threadlock'. I find it a good idea to run a tap (4-40 UNC) into all the holes and to run the screws into a die (same thread). Makes reassembling a lot easier.

The 9830 is somewhat similar. Unplug the interconnect PCB (which carries the wiring harness in this machine). Undo the screws and take off the encoder board. Then remove the bezel. Before removing the front strip, desolder the wires to the power-on lamp from the keyboard PCB. Remove the front strip, then the mains switch. The keycaps pull off, but if you want to remove the switches or the PCB, you have to desolder them. I don't normally do this!

If you must dismantle an HP chicklet keyboard (9815, original 9825, 9831, etc), remove the logic boards, etc. Then undo all the tiny screws on the back and pull off the keyboard PCB. Make sure you have a diagram of the key positions before doing this, some _will_ fall out. Recover the switch contacts, etc (like the slide switches on a handheld. When reassembling, put the casing on the edge of a table/board so that the key holes are over the table. You can then fiddle the keys into place and refit the PCB.

Re: How to clean a big vintage machine?

*Message #5 Posted by **Katie Wasserman** on 28 June 2005, 11:18 p.m.,*
in response to message #1 by marais

There is a trick to cleaning the plastic calculators it's Novus Plastic Polish. Use #2 to get out light scratches and/or #1 to clean it, but don't use #3 it's too abrasive. Anyway this stuff can make a calculator look brand new again assuming that it has no physical damage or paint issues.

But like you suggest, for best results it's necessary to remove the keys, display lens, etc. and clean them

separately from the rest of the case.

HP 19B Formulas

*Message #1 Posted by **barry d.** on 27 June 2005, 3:39 p.m.*

Hopefully someone can help me with a formula that appears to be reasonably simple to figure out, for any experienced HP user. I'm just not all that savvy when it comes to creating formulas.

Anyone familiar with the HP 19B calculator probably knows the formula below is the one used to solve for Present Value and loan calculations in leasing and loans.

ADV:PMT=(-PV-FV*(SPPV(I%YR/12:N)))/(USPV(I%YR/12:N-#ADV)+#ADV)

My goal is to simply add one simple step to the formula (or create another one if need be) to add "Annual Debt Service (ADS)calculation. In other words, once a payment is caluclated, I'd like to be able to have the calculator compute the payment AND multply by 12, which equals the ADS (Annual Debt Servive). This is a common component in real estate investment comparisions when analyzing the projected cash flow.

Thank you for your assistance.

Barry

Re: HP 19B Formulas

*Message #2 Posted by **Bob Wang** on 28 June 2005, 1:40 p.m.,*
in response to message #1 by barry d.

Barry:

Probably the easiest way is just to multiply by 12 to get ADS after you've calculated PMT. BUT you can save *2* keystrokes, i.e. RCL PMT, instead of *,1,2,= by using the following formula, solving for ADS, and recalling the PMT ;-)

ADV:12*L(PMT:(-PV-FV*(SPPV(I%YR/12:N)))/(USPV(I%YR/12:N-#ADV)+#ADV))-ADS+0*PMT

Bob

19B Lease with Advance Payments Annual Debt Service

*Message #3 Posted by **Bob Wang** on 29 June 2005, 12:41 p.m.,*
in response to message #1 by barry d.

Barry:

I thought a little more about your request, and here are 3 approaches. The first one is probably what you are looking for, but it comes with a BIG CAVEAT. You ABSOLUTELY, POSITIVELY MUST solve for PMT first, before pressing ADS. Otherwise, the ADS you get will be based on the old value stored in PMT. The other 2 alternatives will alert you with an error message:

Option 1: Enter all values, press MORE, PMT, *THEN* ADS:

ADV:IF(S(PMT):(-PV-FV*(SPPV(I%YR/12:N)))/(USPV(I%YR/12:N-#ADV)+#ADV)-PMT:12*PMT-ADS)

Option 2: Enter all values, press MORE, ADS, RCL PMT:

ADV:12*L(PMT:(-PV-FV*(SPPV(I%YR/12:N)))/(USPV(I%YR/12:N-#ADV)+#ADV))-ADS+0*PMT

Option 3: Enter all values, press MORE, PMT, RCL ADS:

ADV:L(ADS:12*(-PV-FV*(SPPV(I%YR/12:N)))/(USPV(I%YR/12:N-#ADV)+#ADV))/12-PMT+0*ADS

Hope this helps,

Bob

*Message #3 Posted by **Eric Smith** on 26 June 2005, 9:05 p.m.,*
in response to message #2 by Les Bell [Sydney]

I was quite astonished when people started asking for Nonpareil to support it. I had to search for it on Google. Apparently it's some sort of obscure operating system for PCs. The idea is that you have to pay actual money for it, and you get less functionality than you would from competing operating systems. And you don't get the source code.

I'm not sure why anyone would want that, but I guess it takes all kinds.

Re: Finally! For the first time on the Internet!

*Message #4 Posted by **Les Bell [Sydney]** on 26 June 2005, 9:19 p.m.,*
in response to message #3 by Eric Smith

Thanks for the explanation, Eric; I've found out a little more about it now.

Apparently, its major differentiating feature is that third parties are able to remotely install applications on it without any user involvement or even awareness! This seems to be an amazing breakthrough in user-friendliness!

I do hope it catches on - I find having to type "yum install *packagename*" whenever I want to install something to be a real drag. It must be a pleasant surprise to find that someone else has installed software for you!

Best,

--- Les

Re: Finally! For the first time on the Internet!

*Message #5 Posted by **hugh steers** on 27 June 2005, 9:22 a.m.,*
in response to message #3 by Eric Smith

they dont actually want it. its forced upon them, like some kind of conspiracy theory.

theres also a number of amusing "joke" features. for example, the open file dialog box usually starts up parked at a useless place (like "MyComputer"). it has a drop down tab. when you press this tab, the whole combobox vanishes from the dialog for around 30 seconds, during which period the machine is generally most unresponsive. eventually it will come back.

i have also found that there is often time for a bit of reading or tea making during the delay between pressing the mouse and a menu appearing, for example.

Re: Finally! For the first time on the Internet!

*Message #6 Posted by **Mike T.** on 26 June 2005, 9:11 p.m.,*
in response to message #1 by Eric Smith

And just as I **FINALLY** managed to get Nonpareil to compile under Debian too ... I've only just had time to take a quick look at the HP11C, HP33C and HP32E emulations and **WOW**, it was worth the effort!! As expected the accuracy of the simulation/emulation is spot on.

Well done Eric.

Now I just have to get 0.74 to build...

Mike T.

P.S - For anyone else having problems on Debian you need to install the lib-devel versions of the various packages to satisfy the dependencies in order to build Nonpareil, the libs packages won't do - several megabytes later...

Re: Finally! For the first time on the Internet!

*Message #7 Posted by **Namir** on 26 June 2005, 9:16 p.m.,*
in response to message #1 by Eric Smith

Well done Eric! I was able to install the files and add .exe to the nonpareil file. I ran it and it gave me a window with the list of calculators to choose from. I tried a few and they seem to pass preliminary tests. GOOD WORK!!

in response to message #10 by Klaus

> Quote:
>
> Activating the Easteregg carshes nonpareil on my machine

Probably a problem with the SDL sound code. I've only tested on Windows XP. What version of Windows are you running?

Do you know whether any other programs using SDL sound work on your system? Maybe you can try the audio test from SDL_plattest (though I haven't tried it on my system yet).

Currently Nonpareil doesn't use sound for anything important, though in the future I'll try to add support for the HP-41 tones. Does anyone want an option for key click sounds?

Eric

Re: Easteregg crashes

*Message #12 Posted by **Klaus** on 28 June 2005, 8:57 a.m.,*
in response to message #11 by Eric Smith

I use WinXP too, but have no soundhardware connected. That will be the problem.

Thanks, Klaus

Re: Nonpareil release 0.76

*Message #13 Posted by **GWB** on 27 June 2005, 10:18 a.m.,*
in response to message #9 by Eric Smith

```
Thanks!

Now HP-35 works (it would not yesterday). However the trigonometric functions don't
work:

     30 sin => 2.322863214-05
 .5 arc sin => blinking 0
     45 tan => 0
     etc...

On the voyagers, the "r" in "running" is formed with segments 'e' and 'g' rather
than with segments 'a' and 'f':

         unning
        r

Perhaps because I get these Gtk warnings on the DOS windows when Nonpareil starts?

------------------------------------------------------------

(nonpareil.exe:3124): Gtk-WARNING **: NÒo foi possÝvel encontrar o m¾dulo especi
ficado.

(nonpareil.exe:3124): Gtk-WARNING **: Loading IM context type 'cedilla' failed

------------------------------------------------------------

(First line translates as "It has not been possible to find the specified module")

Has any other user had these kind of trouble? Thanks.
```

Re: Nonpareil release 0.76

*Message #14 Posted by **Arnaud Amiel** on 27 June 2005, 2:14 p.m.,*
in response to message #13 by GWB

Actually here on windows XP no classic do the trigonometrics correctly. But appart from that, it looks great.

Arnaud

Re: Nonpareil release 0.76

*Message #15 Posted by **GWB** on 27 June 2005, 3:20 p.m.,*
in response to message #14 by Arnaud Amiel

I forgot to add it was on WinXP, but according to Eric's reply below this doesn't depend on the Windows version. So far, everything else looks pretty good!

Re: Nonpareil release 0.76

*Message #16 Posted by **Eric Smith** on 27 June 2005, 2:33 p.m.,*
in response to message #13 by GWB

> Quote:
>
> However the trigonometric functions don't work:

And if you think those examples are bad, try "0 cos" or "90 cos". I'll have to research this. In the mean time, I'll add mention to the release notes that the HP-35 trig functions aren't working correctly.

Eric

Re: Nonpareil release 0.76

*Message #17 Posted by **Eric Smith** on 27 June 2005, 4:36 p.m.,*
in response to message #16 by Eric Smith

I found the bug that was causing the trig functions of the Classics to fail. Back in May I was doing some code cleanup, and broke the "a + c -> c" instruction. There'll be a fixed release tonight or tomorrow.

Re: Nonpareil release 0.76

*Message #18 Posted by **Mark Hardman** on 27 June 2005, 8:39 p.m.,*
in response to message #17 by Eric Smith

I've died and gone to heaven! To think of the thousands of dollars I could have saved by just waiting for Nonpareil to be released!

I hate to point out issues. But, the HP-80 emulation has a few problems:

2 SQRT gives a result of 32

12 SAVE^ 12 X gives a result of 14.4

To name a few...

Eric, do you have a PayPal destination where we could contribute to your projects efforts?

Mark Hardman

Re: Nonpareil release 0.76

*Message #19 Posted by **Eric Smith** on 27 June 2005, 9:37 p.m.,*
in response to message #18 by Mark Hardman

> Quote:
>
> But, the HP-80 emulation has a few problems

I just verified that this is caused by the same bug as the trig problem on the HP-35 and HP-45. It will be fixed in release 0.77 which I'll make available tonight or tomorrow.

> Quote:
>
> do you have a PayPal destination where we could contribute to your projects efforts

Good question. For some time now, I've intended to sell the Windows version of Nonpareil. But more recently I've been thinking that I'll probably just give it away and try to encourage donations.

Eventually I'll put a PayPal donate button directly on the Nonpareil web site, but for now anyone that wants to contribute should just PayPal to my regular email address, and mention "Nonpareil donation" in the message. I'll probably put a list of names of donors in the CREDITS file, but anyone that wants to remain anonymous can just let me know.

Thanks!
Eric

Nonpareil release 0.77 fixes Classsics

*Message #20 Posted by **Eric Smith** on 28 June 2005, 4:21 a.m.,*
in response to message #17 by Eric Smith

Nonpareil 0.77 fixes the bug that was causing incorrect results for various functions on the Classic series calculators (35, 45, 55, 80). None of the later models were affected. Thansk to GWB and Mark Hardman for bringing this problem to my attention.

Windows error message

*Message #21 Posted by **Britt** on 28 June 2005, 9:41 a.m.,*
in response to message #20 by Eric Smith

On Windoze XP Pro with SP2 I always encounter the following error message when trying to run nonpareil.exe version 0.77 or 0.76:

---------- nonpareil.exe - Entry Point Not Found ---------- The procedure entry point gdk_pixbuf_new_from_file_utf8 could not be located in the dynamic link library libgdk_pixbuf-2.0-0.dll. ---------- OK ----------

*Message #26 Posted by **Eric Smith** on 27 June 2005, 12:14 a.m.,*
in response to message #25 by Namir

The HP-67 is not functional in Nonpareil. It shouldn't have been included.

Eric

Re: Finally! For the first time on the Internet!

*Message #27 Posted by **hugh steers** on 27 June 2005, 9:17 a.m.,*
in response to message #1 by Eric Smith

i can report that its working well so far under windows XP SP2. congratulations on this fine work.

i'd like to pass on a couple of minor glitches incase they are of help to anyone.

for some reason (could be my fault), the .exe and .dll files were not made executable. running the exe caused a

fatal error (application failed to initialise) and terminated. i needed chmod a+x *.exe *.dll and it worked fine.

i also get this when it starts up: (nonpareil.exe:2720): GLib-CRITICAL **: g_convert: assertion `str != NULL' failed

however, it still seems to work ok (unless im missing something i dont should be there).

Re: Finally! For the first time on the Internet!

Now, all we need is a version which runs on Palm OS and ARM-based Pocket PCs :-) :-) I'd love to carry a couple of dozen HP calcs in a single pocket!

For the while, what about three of 'em: HP-35, HP-45 and HP-55. See this port to PalmOS by Jonathan Purvis: http://one-two-three-four-five.com/palm/csim/

Gerson.

I'll probably add a PalmOS version since I want to run it on my Fossil Abacus WristPDA (about $150 from TigerDirect or Amazon).

I might eventually write a native Windows front end (to replace the use of GTK+); at that point a PocketPC version would be easy. But it's not high on my priority list.

I've had a chance to try out Nonpareil under Linux a bit since yesterday and I definatly think it is an great achevement.

The photo realistic panels look stunning - but in use I did find the more synthetic front panels much easier to read.

Mike T.

PS - Any chance of including the HP10C, just to complete the set!

>
> The photo realistic panels look stunning - but in use I did find the more synthetic front panels much easier to read.

The long term plan is to use the "synthetic" style by default for all the calculators.

The ones that are using photographs are doing so thanks to the generosity of the MoHPC curator, Dave Hicks.

As I get synthetic faces for more models, I will drop the corresponding photographs from the package, but I'll keep the KML files that work with the photographs, and provide instructions for users that want to download them from the MoHPC web site.

> Quote:
>
> Any chance of including the HP10C, just to complete the set!

I have two HP-10C calculators. One is old and beat up, and I don't mind dumping the ROM from that one, but I can't find it right now. The other is near-mint. That would still be OK, except that it's the old-style Voyager where the display and electronics are separate from the keyboard, and wrapped in what I assume to be antistatic tape. I've had some of those apart in the past, but it's a pain, and I don't want to do that to a pristine calculator. Also, it's much more difficult to probe the necessary IC leads on that style.

A friend opened up his 10C (also in excellent condition), and his is also of the old-style construction.

If anyone has a new-style 10C (single board with keyboard and chips) and is willing to make it available, I'd be happy to dump the ROMs. This involves removing the rubber feet and four screws, and attaching clips to four leads of an IC, but no permanent modification or damage.

Eric

Re: Finally! For the first time on the Internet!

*Message #41 Posted by **Eric Smith** on 2 July 2005, 3:16 a.m.,*
in response to message #40 by Mike T.

I think HP changed to the new Voyager internal design in late 1983 or early 1984. The new-style 11C, 12C, and 16C all use the same PCB, part number 00011-80012 (assembly 000xx-60012, but all models marked 00011-60012). I would expect the 10C to use that same board. The 15C uses a different board to make room for the extra ROM/RAM chip, and later Voyagers of other models might use that board too. There were several more redesigns, especially of the 12C, but the 10C probably wasn't made in any of the later designs.

If you take off the back, and there is a visible circuit board, that's the new style which is preferred for ROM dumping. If all you see after removing the back is black plastic flaps, it's the old style. I'm out of town now, so I can't take a photo of an old-style, but you can see the newer style at http://gallery.brouhaha.com/romsucker-voyager/img_4922.

*Message #44 Posted by **Mike T.** on 1 July 2005, 4:16 p.m.,*
in response to message #1 by Eric Smith

No problems yesterday however having loaded the printer module before exiting and shutting down last night I find that I cannot load the HP41CV.KML or HP41CV.KML in Nonpareil for Linux this evening. The last message is "fatal error: can't find chip 'Helios printer' addr 0".

Suspect that the calculator knows that it need to load the parinter module to restore it's prior state and can't find it because it isn't in the default directory or path...?

Anyway I hope this feedback helps

Mike T.

Re: Finally! For the first time on the Internet!

*Message #45 Posted by **Eric Smith** on 2 July 2005, 3:07 a.m.,*
in response to message #44 by Mike T.

Sorry, I should have put a warning about that in the release notes. Right now the state save files don't record the optional modules that are installed, but they do include the state information for those modules. So when a fresh Nonpareil instance tries to load the state save file, it gets unhappy.

In a future release, the state save files will have pointers to the relevant module files. In the nearer term, I'll try to make a release available which will ignore extra state.

The easiest way to recover from this problem with the current release on Nonpareil would be to delete the state save files (41CV.nst and 41CX.nst). They should be in "C:\Documents and

Settings\<username>\.nonpareil\" (old path) or "C:\Documents and Settings\<username>\Nonpareil\" (new path).

Sorry for the inconvenience.

Eric

Should we get back to this Coburlin issue again?

*Message #1 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2005, 6:08 p.m.*

Hi, all;

I'm completely sorry to bring back this issue again, and I hope that the regular contributors that actually are here for calculators and related subjects do not take it wrong, but we'd been invaded by the Coburlin matters a few weeks ago and Coburlin himself (or whatever it was) decided to express his own, totaly profit driven, thoughts amongst us.

I know that a few guys, that either do not want or do not have the intention to reveal their own names as many serious contributors in here do, may not be aware of these previous headake of ours, but I'd sinserely vote for removing any posts relating Coburlin when Coburlin is the only subject. C'mon, we're all here to discuss calculators subjects, not non-calculators subjects. We all know already what Coburlin does and I for one don't care a damn bit. I'd rather not seeing a thread with 14 entries about Coburlin that add nothing but waste space in this forum.

Thre is a lot more important and interesting things to be discussed here.

To those of you that are only accidental readers, please, I ask you not to consider this as personal or offensive, instead a call for peacefull, relaxing and constructive readings among the ones found here.

To those of you that are regular contributors and have already had the chance to contact me off-line and consider me as a serious contributor as well, please, forgive me again. I know that one of the subjects that is clearly mentioned as one of the discussed subjects here is 'tips on buying'. I see no actual contribution on discussing Coburlin's techniques here.

Thanks and forgive me.

Perhaps we could a seperate forum where we can discuss buying and selling HP calculators..?

Mike T.

Separate Forums - good idea

*Message #4 Posted by **John L. Shelton** on 26 June 2005, 9:29 p.m.,*
in response to message #3 by Mike T.

Occasionally, I enjoy the soap-opera issues, but I understand others don't.

I'd be in favor of dividing this Forum into a small number of sub-fora:

** Restoration/repair ** Simulation & new calculator efforts ** Programming & performance testing, programming puzzles ** advice on buying/selling ** soap opera, politics, news, etc - vaguely related to HP Calc.

Perhaps a few trusted people would have permission to bump any thread from specific fora to the General forum.

Re: Separate Forums - good idea

*Message #5 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2005, 10:16 p.m.,*
in response to message #4 by John L. Shelton

Hi, John;

I'm sorry if I put some rant in my words. I like reading funny things here, I actually tell my students that science proves men is the only animal that expresses hapinnes by laughing, and I like laughing when I see/hear something funny. I also tell my students that serious people are the ones that know when to start and stop laughing. Bad humorous people are not necessarily serious people, right?

I just think that this particular issue is anoying, although necessary sometimes (some medicine are, too). I agree with the fact that mentioning Coburlin's atrocities calls our attention to the dammage he can cause. And as you see, mentioning his name deviates our attention w=to what is, as I see, interesting to the main community.

I apologize for posting about this, I'd rather stay in silence, but I think if all of us who disagree stay in silence, this wonderfull place Dave Hicks offers us to spread our knowledge and common interests related to calculators around will be, in fact, spread appart. Many good voices stay in silence when Coburlin is the issue.

Thanks for your post. I agree that life diserves good moments. And laughing is part of it.

Best regards.

Luiz (Brazil)

This is a serious issue - there is a predator out there, clever, thoroughly dishonest, and totally disdainful of us calculator nerds. To him, we're just idiots to be preyed upon. By periodically informing the community of his current activities it may alert new guys that not all who come here have the best interests in mind.

Re: Should we get back to this Coburlin issue again?

*Message #7 Posted by **Dave Hicks** on 26 June 2005, 10:47 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

For as long as ebay has existed, there have been people who made money by snapping up items at low prices and selling them for much more. These people seem to fall into two distinct camps: People who use one ebay account to do everything, and people who use two. The two-accounters further break down as to how they obtain two accounts - some use relatives and friends giving them not only two account names but completely unrelated real names and mailing addresses.

People in the one-account camp get picked on. People don't like to see people buy an item on ebay and then sell it for much more. (Never mind that many items on ebay were picked up somewhere else for much less.) However, people who do the same thing with two accounts are frequently well-loved by the collecting community. The buyer identity is well-loved because he seems to be a regular guy just like the rest of us fanatics. We'll even overlook warning signs like that he only buys HP calculators and his feedback rating has four digits. Likewise the seller identity is also well-loved because he seems to have a magical source of so many HPs.

Honestly, I don't know why someone who buys a thousand or more HPs and never appears to sell them seems like a "good guy" anyway. If he was really taking HPs off the market at that rate, then prices would really go up.

People in the two-account camp have even used this forum (posting under an alias) to attack their one-account competitors. One of the harshest attacks on a one-accounter came from a person who was then believed to be a "good guy" but later was revealed to be a two-accounter.

I've come close to banning ebay talk on this forum, but I've avoided it because I really don't want to stop people from talking about what interests them, however, let's try this: The next time you want to post something about Coburlin, ask yourself: Is Coburlin doing anything really new? And is there really anything specifically HP calculator-related?

There are many more one-acounters, and you have no way of knowing how many two-accounters there are. You may have just bought something from someone doing exactly the same thing - only he's clever enough to hide it with two accounts.

I'm open to the idea of opening one or more additional forums, but I'm not sure an ebay discussion forum is the one I'd really most like to add at this time.

Re: Should we get back to this Coburlin issue again?

*Message #8 Posted by **Thibaut.be** on 27 June 2005, 7:18 a.m.,*
in response to message #7 by Dave Hicks

You're right Dave, there are far more interesting topics than Ebay on this forum.

Likewise TV programs such as "Cops live", everybody agrees that this is crap but there will still be a lot of people watching it... Coburlin is a "crap" topic but a lot of us will read the thread because it concerns almost everybody, as ebay is one of the only old HP distribution channel.

Therefore a forum split dedicated to ebay is for me a fine solution : likewise your auction / not auction filter in the classified ads section, everyone is free to volounteerly browse the topic. You could limit space by e.g. automatically deleting posts after X months, and refrain any HTML...

A second option would be to create an external ebay dedicated forum, but I prefer the former.

Re: Should we get back to this Coburlin issue again?

*Message #9 Posted by **Ron** on 27 June 2005, 9:52 a.m.,*
in response to message #7 by Dave Hicks

Please, no sub-forums. Topics overlap. Information in one sub-forum will often be relevant in another sub-forum. With the current format, it's easy enough to skip the posts we're not interested in.

Re: Should we get back to this Coburlin issue again?

*Message #10 Posted by **Dave Shaffer** on 27 June 2005, 12:32 p.m.,*
in response to message #9 by Ron

I tend to agree with Ron - leave it all in one big mess. We can skip whatever is not interesting.

Our Community College "everyone" address was terminated a few months ago, because somebody posted confidential information about a student. Instead of deleting the offender, the whole system was taken down. It was a GREAT way to keep up with whatever was interesting, current affairs, gossip, etc. The IT guys then established some kind of a bulletin board system (with lousy software - they shoulda checked here first!) where anybody could start a new topic, which was invisible unless you went looking for it. So, you wind up with 25 hard-to-find topics, that nobody reads. I haven't checked it in two months, whereas I used to check the original system several times a day. It's just not worth the effort.

Moral (IMHO): don't fragment things, and let individuals decide what they want to read or skip.

I love the format of this forum

*Message #11 Posted by **bill platt** on 27 June 2005, 2:01 p.m.,*
in response to message #7 by Dave Hicks

I have never found a better organized nor more approachable system ever.

Like Ron says, we can easily skip the stuff we don't want. At the same time, we can see everything that is available. And since the cookies keep track of what we personally have read, we can go quickly through. And the default tree system, the fact we can branch off down---all works great--much better than the locked-in single thread per topic type. Really, I am impressed more than words---I keep running into other forums and they just don't come anywhere close!

I would love to be able to search across archives, or do combined poster and topic refinement (like, "hmmm, what was it that Gene said about the BAII vs the 12c.....") but I think this is a minor enough thing that I am willing to be patient!

Thanks again Dave, for a great "universe."

Best regards,

Bill Platt

Re: Should we get back to this Coburlin issue again?

*Message #12 Posted by **James M. Prange (Michigan)** on 28 June 2005, 12:36 a.m.,*
in response to message #7 by Dave Hicks

True, there are certainly those who do far worse than Coburlin on eBay.

A nice things about him is that he bids early, so anyone who's willing to spend the money can always outbid him. Well, except in the case of "Buy it now" items, but I suspect that some of us might've bought those items if we'd happened to see them before he did.

As far as I can see, that auction that ended early to sell to the current highest bidder was an unusual case; who knows why the seller made that decision.

Regards,
James

Nonpareil is what's really happening

*Message #13 Posted by **Namir** on 26 June 2005, 11:00 p.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

I was gone for the weekend in the mountains in a resort with no TV, phone, and internet access. When I came back I saw the thread about coburlin and also one about nonpareil posted by Eric Smith. For me, clearly, Eric's message regarding posting a Windows version of the nonpareil IS BY FAR THE MORE RELEVANT! I downloaded Eric's software and ran the emulators of various calculators. WOW! That was really interesting! Whet Co-whatever does with his calculators on eBay means nothing here!

in response to message #16 by GWB

Too restrictive and unweildy.

We see mto be pretty darn good at self-policing here (with occasional very quiet help from our sponsor). I really like the fact that we seem to be able to resolve things here without lots of rules or overlording. It is such a wonderful breath of fresh air in our freedom-starved existence (seatbelts, bike helmets, boat driver licenses, expansion of eminent domain, ...not that they are all bad...but they certainly take the individual's freedom to choose away.....)

Re: Should we get back to this Coburlin issue again?

*Message #18 Posted by **GWB** on 27 June 2005, 3:42 p.m.,*
in response to message #17 by bill platt

I was just kidding. Anyway, whatever restriction is made, they are easily overcome: people would simply insert blank spaces, symbols or the like. I myself don't feel bother by hearing people complaing about you know who. Actually they sometimes gets frustrated when this guys tries to make money out of our 'sacred' calculators. I would like to add there still life off e-Bay, I recently purchased an excellent harldy used 35 complete with travel case, leather case, manual and charger for less than one third of that guy is asking for a worse one. And I've just traded a mint 11C for a 12C.

Best regards,

Gerson.

About the forum not having to be split into subgroups, I totally agree with you.

Gerson.

Re: (Oops!) Re: Should we get back to this Coburlin issue again?

*Message #21 Posted by **Ron** on 29 June 2005, 12:15 a.m.,*
in response to message #20 by GWB

Wait a minute...

You traded a Chinese 12C for a mint 11C?

When you find a non-Chinese 12C, you'll trade the mint 11C straight across - Right? I mean, we're all just as willing to trade down, as to trade up - Right? Because if we're only willing to trade up, that would seem to put us into the same category as what's-his-name. :^0

I'm not criticizing you, Gerson, as I wouldn't hesitate to make the same trade you just made. But for people like me (up-traders) to criticize Coburlin, seems a little like the hole calling the doughnut, "round."

IMHO

Re: (Oops!) Re: Should we get back to this Coburlin issue again?

*Message #22 Posted by **GWB** on 30 June 2005, 12:11 p.m.,*

As a rule I don't trade, neither down nor up. In fact, I did not want to trade that 12C. I just found an 11C announced on a local e-auction as like new and made a bid (the auction ended about USD $100.00). During the auction, the seller said he wanted a 12C, so I offered mine. After the auction, I warned him mine was a poor quality Chinese one, he said there was no problem, because he needed a 12C for his work. When he received the 12C he liked it very much.

When I was a student, like many others, I would sell an older calculator to buy a new one. The only calculator I sold recently (3 month ago), was a never used silver bezel 32Sii, sold for about $80.00 dollars (the same amount I had paid) to someone here who wanted it so much, because I have a Brown Bezel I like it better - but that was before I started collecting them. Anyway, I don't want to have each and every model, most likely my collection will never have more than 12 items. (However I appreciate those collections that include even all different ROM versions of the same model)

What I have so far:

1 HP-11C; 1 HP-15C; 1 HP-32SII; 1 HP-35; 1 HP-42S; 1 HP 48GX and 2 HP82240B IR printers, one new in box (but these don't count);

... and what is missing:

an HP-12C, an HP-28S, an HP-55, an HP-67, and, of course, an HP41CV or CX. (But please don't offer them to me now, as currently I am neither purchasing nor trading.)

Best regards,

Gerson.

Re: Should we get back to this Coburlin issue again?

*Message #23 Posted by **Blurdybloop** on 28 June 2005, 12:42 a.m.,*
in response to message #1 by Vieira, Luiz C. (Brazil)

I respectfully request that the forum *NOT* be censored of warnings about certain eBay sellers.

Nearly 32 years ago, I was a college freshman who went into debt for many months in order to buy an HP-35, and who really lusted after an HP-65 but could not think of buying on then. This itch finally demanded scratching, so I went to eBay.

I quickly observed a certain eBay seller, with ID starting with "C". Thanks to the forum here (and yes, I searched the archives as well), I determined that my suspicions were valid.

I understand how, to the regulars, repeated postings about someone's bad behavior can be annoying. Nevertheless, there are newcomers/short-time visitors who benefit by such postings.

I now have pretty much everything that I wanted, and so I'll probably be bowing out of both eBay's HP calculator market and this forum. But, I do not want to leave with saying "thank you."

Thank you. You're a great bunch of folks.

You're welcome!

Thanks for the collective acknowledgement. You're welcome!

My HP history has similarities -- I lusted after the HP-41 as a high school senior in 1980, but couldn't afford it; saw an appealing HP-34C the following year, and bought a HP-15C in 1983.

I also have most of what I want, mostly from eBay and a local seller -- the fine, "mature" HP calc's introduced between 1979-1993.

Are you sure that your collection is complete? There's a world of excellence beyond the early LED-based models (if, in fact, that's what you focused on).

I can understand bowing out of eBay's calculator market, but why bow out of this forum? If you do that, you'll miss out on a lot informative and entertaining discussion from a good group of people. You will also miss out on new developments, like Nonpareil, Free42, OpenRPN, etc. So stick around.

On eBay: "HEWLITT PACKARD HP 28C RED LED CALCULATOR"

*Message #1 Posted by **James M. Prange (Michigan)** on 25 June 2005, 8:38 p.m.*

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5784483327

I'm not sure what it is, but I'm sure that it isn't a 28C.

Does anyone here (besides Coburlin) recognize it?

Regards,
James

*Message #3 Posted by **Howard Owen** on 25 June 2005, 10:37 p.m.,*
in response to message #2 by GWB

Did the 38C have an IR printer? The auction text says the guy printed the self test on the IR printer.

That would match the 28C, which had the IR port, and the self test function. The picture clearly is not a 28C. So it looks like wholesale confusion, rather than a mere typo.

Sounds like a typical day, for me. 8)

I saw Coburlin was the highest bidder so I put in a bid. I was the highest bidder until a few hours ago and the seller some how cancelled all bids and sold it to a buy it now buyer for $50. The original post has no buy it now option. I am wondering what has happened? I don't know about Ebay rules as far as the seller simply cancels buyer bid without giving me reason.

HP-IL ISA Card + EMU41 + Linux!

*Message #1 Posted by **Howard Owen** on 25 June 2005, 5:03 p.m.*

It works! It works!

I purchased one of Cristoph's HPIL/PC boards because I wanted to transfer programs to my HP-41CX. I also wanted to look at the possibility of writing a Linux driver for the card, since DOS is not my favorite program loader.

I purchased an old Compaq P5 desktop, loaded it up with RAM, and stuck FreeDOS on one partition, and Slackware 10.1 on the rest of the 600MB disk. After confirming that the HP-IL card worked under native FreeDOS, I loaded the DOSEMU virtual machine on Slack. I already knew that EMU41 would run under DOSEMU (and FreeDOS) but the question remained: would it work with DOSEMU's primitive I/O port access? This just allocates a range of addresses and hands them to the virtual machine. I wasn't sure how many addresses to give DOSEMU, although I knew they would start at the base address of the ISA card, 0x700. The HP-IL chip docs said their were 8 8bit registers, but since I didn't know how they were mapped into the PC's memory (1 for 1?) I allocated 17 8bit addresses, 0x700 - 0x710 for the card in ~/.dosemurc. I also passed on IRQ 7 to the virtual machine. (Before doing this, I confirmed that neither the addresses, nor the IRQ were allocated in Linux.)

I connected my 41CX to the PC via the HP-IL, and fired up DOSEMU. I had the FreeDOS partition mounted at /dos, and mapped from autoexec.bat to drive E:. I changed to E:\EMU41 and fired up my (HP-IL enhanced copy of) EMU41. I turned on my 41CX, and saw the listing for Cristoph's HDRIVE1.DAT! I confirmed that I could transfer files between the PC and the 41CX.

So now I'm ready to start looking at a Linux driver for the card. I can use the debug facilities in DOSEMU to snoop on the communication between EMU41 and the real part of the loop through the card. Together with the copius docs from HP and others available for the chip and for the HP-IL protocol, that should help me write the Linux driver. I've never written one before, so this will be a fun challenge in itself. I'm already deeply into Linux Device Drivers, both the 2nd edition, covering 2.4 and the third edition, covering 2.6. Since Slack 10.1 runs 2.4.27, I'll probably start with that version.

I'll be adding a more extensive writeup to the articles area, but I wanted to report this success here, and engage discussion with all of you about the upcoming work.

*Message #2 Posted by **Les Bell [Sydney]** on 25 June 2005, 9:05 p.m.,*
in response to message #1 by Howard Owen

Excellent work, Howard!

I've never written a Linux device driver, but I'm part-way through Love's "Linux Kernel Development" book, and I understand a lot of the issues. An HP-IL driver would be a popular resource - every time I pick up "Linux Journal" I'm impressed by both the number and the quality of the scientific projects that are using Linux.

I don't have any HP-IL gear myself, but I'm tempted to get some. just to get involved!

Best,

--- Les

Re: HP-IL ISA Card + EMU41 + Linux!

*Message #3 Posted by **Howard Owen** on 25 June 2005, 9:50 p.m.,*
in response to message #2 by Les Bell [Sydney]

"Linux Kernel Development" is great. As the title suggests, it's focussed on writing code in the kernel. Most other books I've read on kernels, Linux, BSD SysV, are theoretical works. You need the theory to be able to code, but examples are darned helpful too! At the other extreme, there's the kernel source itself. But even when used together with LXR, that's an awfully large chunk to try to digest. So Love's book is a good balance.

"Linux Device Drivers" also has a practical focus with examples. It's a nice complement to LKD.

Re: HP-IL ISA Card + EMU41 + Linux!

*Message #4 Posted by **Vieira, Luiz C. (Brazil)** on 25 June 2005, 11:16 p.m.,*
in response to message #3 by Howard Owen

Hi, guys;

I'm addicted to Linux as well, but mainly because of professional demands, I must regularly use Windows® environment. Please, consider that I do not complain for the fact I must use Windows® environment, I'd just like to have more chances to use Linux in a regular basis.

About HP, Linux and RPN. The simplest calculator implementation under BASH is an RPN calc (forgive me, I don't recall the command line to invoque it). Another fact: HP used to fully support Linux about three to four years ago. Anyone knows about this? And Nonpareil is Unix/Linux based...

I read many texts concerning Linux development, HW and SW. I still want to deal with measurement under Linux-based PC's running graphics applications (GPL?) that read custom/commercial acquisition boards. Is there any public e-place (groups) where these issues are discussed? I remember reading a few, now I'm somehow off-line... Want to get on board again. Any suggestions?

Cheers and thanks.

Luiz (Brazil)

That's almost certainly dc. man dc for cryptic help on how to use it.

> Quote:
>
> HP used to fully support Linux about three to four years ago

If the latest sales figures are to be believed, HP is the leader in the Linux-on-Intel server market, selling approximately 1.5 times as many servers as IBM (going on memory of an article a few days ago, here). Personally, I think IBM *supports* Linux more, but HP probably makes more money from it.

> Quote:
>
> I still want to deal with measurement under Linux-based PC's running graphics applications (GPL?) that read custom/commercial acquisition boards. Is there any public e-place (groups) where these issues are discussed?

I'm not active in that field myself - just impressed by what I read - but you might want to start here: http://sal.linet.gr.jp/index.shtml. I'll have a look through my bookmarks and see what I might have on file, too.

One nice application that I *do* use from time to time is Octave: http://www.octave.org/.

Best,

Nup - arbitrary precision, set with the k command:

```
[les@sleipnir les]$ dc
2 k
4 2 + p
6
3 / p
2.00
4 / p
.50
```

(Disclaimer: I contract to IBM, supporting Linux.) ;)

Best,

Luis,

Sorry, I haven't had a chance to dig much in the way of data acquisition-related links out of my bookmarks. It's not an area I do any work in, anyway, so I doubt that I'd have all that much. When I get a chance, I'll do some digging.

Meanwhile, try this: head on over to http://www.linuxjournal.com and use the search box at the top left of the page to search for "data acquisition". I just tried it, and it returned what looks to be around 50 hits. One that caught my eye was "GPIB: Cool, It Works with Linux!". That little lot should keep you reading for a while!

Best,

--- Les

Re: HP-IL ISA Card + EMU41 + Linux!

*Message #11 Posted by **Howard Owen** on 26 June 2005, 12:18 a.m.,*
in response to message #4 by Vieira, Luiz C. (Brazil)

I work for IBM supporting Linux. And although HP is a competitor, they do support Linux on their hardware in a big way. Les's message has more information. 8)

> Quote:
>
> I must regularly use Windows® environment.

So must we all. I have to use Windows to work inside IBM, because there are still some applications that require IE. There is a big push underway to update those apps so they can be run using Mozilla or Firefox on any platform, but in a company the size of IBM, it takes a *long* time.

> Quote:
>
> Is there any public e-place (groups) where these issues are discussed?

I'm into HP calculators for the fun of it. The last time I was involved in scientific computing was in 1992. Les's links look like a good jumping off point. There are also some usenet groups that look relevent. (Links are to Google Groups).

- sci.engr.control
- natinst.public.measure.general
- natinst.public.gpib.general
- comp.graphics.visualization
- sci.image.processing

The first group is concerned with control systems generally. The next two are for National Instruments, so they contain a lot of information regarding GP(HP)-IB measurement and control equipment. Windows, MacOS and Linux all seem to be represented. The last two are more graphics oriented, in case that's your main interest.

As far as I know, HP-IL is mostly dead in actual production use. You do see volt meters and such go by on eBay with HP-IL interfaces occasionally. But I'm not sure if it's collectors buying them, or if there are actually HP-85s with HP-IL interfaces still working out there. (My HP-85 is on its way!

8)

Thanks, too! (was: HP-IL ISA Card + EMU41 + Linux!)

*Message #12 Posted by **Vieira, Luiz C. (Brazil)** on 26 June 2005, 6:40 p.m.,*
in response to message #11 by Howard Owen

Hi, Howard;

as I mentioned to Les Bell, sorry taking too long to answer.

I'll do my research, now. My interest on graphics is mainly on having an on-screen analog signal view (as in an oscilloscope) and digital bus signal analysis, as we can see in a digital analyzer. AFAIK, the acquisition board needs manily a fast A/D converter for analog signals and as many registers as the number of lines you want to analyze so you can capture the bus state from time to time. The way you see the resulting captured data depends on SW. With the new processing speed and with the help of Linux graphics development tools, I guess we can have many good stuff with low-budget capture boards. When I saw low-budget I do not mean bad quality products, instead the simplest HW possible so we can have faster capture times. About the SW, as I intend using these resources to analyze low-speed equipment, I guess it's not hard to try some homebrew solutions.

Best regards.

*Message #3 Posted by **Howard Owen** on 25 June 2005, 3:04 a.m.,*
in response to message #2 by Blurdybloop

Blurdyboop sed: "I noticed that he buys cheap & sells dear..."

Which is, of course, the way you make a living trading.

I couldn't believe that he could be successful selling at those prices, but looking at his feedback page, there are examples upon example of people paying the frieght for HP41s at extreme premium prices. It appears to me that everything he sells is well packaged, and very complete, but even so, I find the value proposition to be a big stretch. His auctions repeat a lot, so he has to wait for the right sucke^ucustomer to come along. But it looks like one eventually does.

Now the real trick is to buy at the absurdly low prices he manages to find. You can track those from his feedback page too.

in response to message #11 by Jonathan watmough

Why would a seller end his auction a few hours after submitting it to sell it for $11 ? The only possible answer is that Coburlin contacts the seller to make a deal off ebay in order to avoid ebay fees. He asks the seller to change his auction to put a low buy it now price and he gives the seller a higher price.

Re: Coburlin At It Again

*Message #13 Posted by **James M. Prange (Michigan)** on 26 June 2005, 4:39 a.m.,*
in response to message #12 by Pascal

Well, something like that could explain how he manages to "buy low" so often. I wonder if a lot of his purchases were from auctions that ended early.

Regards,
James

the 12c Platinum case

*Message #1 Posted by **megarat** on 24 June 2005, 4:50 p.m.*

i'm sure everyone here has seen the iterations of 12c Platinum cases for auction on eBay, touting them as superior cases to the original HP cases.

i have an earlier 16c, with the early-style slipcase, and i don't like the case as much as the one that came with my later-production 15c. i'm entertaining the notion of picking of a new/replacement one for it.

so just what are these cases like? are they okay, or are they substandard, akin to the later 12c cases?

thanks, -cam

Community interest in a new 49G+ enclosure and keyboard

*Message #1 Posted by **Hugh Evans** on 24 June 2005, 12:42 a.m.*

This relates loosely to the OpenRPN project. Virtually all of the complaints I've heard regarding the 49G+ relate to quality of build issues. Our proposed retrofit kit would include:

*Hinged keys *Molded labels on both keys and the keyboard fascia *Voyager style keys (no more side-by-side shift labels) *Optically optimized blue and orange shift labels *Plain black finish *A real double-width ENTER key and 48gx style layout *New tactile domes *Water resistant enclosure

The kit will likely cost in the neighborhood of $50. Profits will go directly toward equipment and development costs for OpenRPN (if this idea is successful our production facilities will be fully capable for OpenRPN hardware assembly and manufacturing!)

If you are interested in buying such a kit please send me an e-mail with "49G+ kit" somewhere in the subject heading and state how many you honestly anticipate buying.

Questions, comments and other ideas are welcome.

Best Regards, HDE

Re: Community interest in a new 49G+ enclosure and keyboard

*Message #2 Posted by **.** on 24 June 2005, 1:33 a.m.,*
in response to message #1 by Hugh Evans

I wish you luck with this, but I find it extremely hard to believe you could sell such a kit for fifty dollars, and actually turn a profit. Also, how do you plan to connect this new keyboard to the PCB? If the layout is different it seems like a lot of effort for the average user to install.

.

in response to message #2 by .

Considering I've spent over a year now designing production processes to make complete calculators with a price point of $100, the enclosure and keys are not the expensive part. Injection molding for the labels is being sidestepped by laser etching and filling with colored resin. Resin will be degassed and after filling will be allowed to set under high pressure to eliminate bubbles.

As for the change in keyboard layout, it should be possible using a thin one or two layer PCB piggybacked to make contact with the original pads. Only a few keys will be moved, so only a few traces will be needed to make the change possible.

This is more of a fundraising effort than anything else. In order to finance all of the equipment we need to

produce OpenRPN hardware will require ~$40,000.

-HDE

PS- if anyone has a spare 49G+ left over from warranty replacement, broken, non-functional, etc. that you are willing to donate it would be greatly appreciated. We will be more than happy to pay for all packing, shipping, and handling (and perhaps even a free kit if this idea pans out).

Re: Community interest in a new 49G+ enclosure and keyboard

in response to message #3 by Hugh Evans

I would purchase one kit at that price, Hugh.

49G+ enclosure and keyboard - Show The Process

*Message #5 Posted by **I, Claudius** on 24 June 2005, 9:42 a.m.,*
in response to message #1 by Hugh Evans

A photo sequence showing the process will do wonders to jumpstart this. Testimonials from users whose units have gone from missing keypresses to functioning perfectly, although anecdotal, will also help.

Drop testing the 49g+

*Message #1 Posted by **ECL** on 23 June 2005, 10:16 p.m.*

Regarding an earlier post about survival prospects for the 33s and 49g+,

The 49g+ comes prepared. Many have complained about buttons coming loose, or falling off (I saw one still in the box at school with a button popping out at an angle).

This is likely a built in energy expelling mechanism. It may work like one UAV, in that to land, it bursts into several segments to reduce the impact of hitting the ground.

HP-35 origonal 17 prototype?

*Message #1 Posted by **patrick earhart** on 23 June 2005, 6:10 p.m.*

I supposedly have one of the original 17 lab prototypes HP-35 calculators that I acquired from Tom Holden when he left HP back in the late 1980's. It came with an extra printed circuit board with the letters "B-211 -22 2323" on the top and "00035-60010" on the bottom. Does any one know how to decode these numbers? The story he told me was that the keyboard died on him so he replaced it with a newer keyboard and upgraded the printed circuit board to get rid of the 'bugs.' The 'extra' board was the original. Any help would be greatly appreciated. thanks, patrick

Re: HP-35 origonal 17 prototype?

*Message #2 Posted by **Eric Smith** on 23 June 2005, 7:35 p.m.,*
in response to message #1 by patrick earhart

00035-60010 is the HP part number of the printed circuit board assembly. The bare circuit board would have an 00035-800xx suffix, but they aren't always marked on the boards. The "B-..." number is probably a designation assigned by the fab house, for their own internal tracking purposes, and there's no real way to decode it without knowledge which fab house was used and what their specific codes were.

What I want to know is the part numbers on the chips, especially the ROMs (round metal cans). They're most likely 1818-xxxx and 1820-xxxx part numbers, though other designations might sometimes be used.

Re: HP-35 original 17 prototype?

*Message #3 Posted by **patrick earhart** on 23 June 2005, 7:58 p.m.,*
in response to message #2 by Eric Smith

The largest chip is on a ceramic package with a square metal lid 'AMi 7223KPH 1820-0849.' The next chip is marked 'AMi 7219KXP 1820-0848.' The next smaller chip is a plastic DIP marked 'hp 0855 1931-B' The round chip cans are labeled 'AMi K72238BC 1818-0017' 'AMi K7223AT 1818-0020' and 'AMi K7220C 1818-0006.' Man those numbers are HARD to read! Hope this helps. thanks, patrick

HP-35 original prototype

*Message #4 Posted by **Bernhard** on 24 June 2005, 3:50 p.m.,*
in response to message #3 by patrick earhart

The round chip cans are the ROMs and both their date codes and HP id number indicate a very early firmware version - bugs all included.

Patrick would you like to lend us the board to read the microcode ?

Re: HP-35 original prototype

*Message #5 Posted by **patrick earhart** on 24 June 2005, 4:26 p.m.,*
in response to message #4 by Bernhard

I would be willing to explore this idea. How would it be done? Where and how would it happen? And finally who are you and how do i know i will get my origional back? My understanding is that this board is VERY valuable. thanks, patrick earhart.

HP-35 original prototype / microcode preservation project

*Message #6 Posted by **Bernhard** on 25 June 2005, 7:19 a.m.,*
in response to message #5 by patrick earhart

Thanks, Patrick, for considering to help in conserving HP microcode. To answer your questions, I will contact you directly under your email address, since these matters are unlikely to be of interest to a public forum, except for the following public announcement:

a major technical breakthrough the last few days (!) has enabled me to construct a HP microcode reader that is able to handle all the Classic series ROMs and does not need desoldering of the ROMs, so the risk of damage is virtually nil.

Anyone willing to lend HP classic CPU boards to our microcode extraction / preservation project please contact me on my email.

Thanks, Bernhard

Re: HP-35 original prototype / microcode preservation project

*Message #7 Posted by **Peter Monta** on 27 June 2005, 6:36 a.m.,*
in response to message #6 by Bernhard

Good news about the microcode reader. What approach did you take? Do traces need to be cut? Is there, or will there be, a web site that contains the extracted code (and, ideally, details about the reader)?

Please keep this forum updated on the project---I think it would be of direct interest to many readers here.

I'm certainly willing to send you what versions I have: HP-35 v2 and v3, HP-45, and HP-80. I doubt that these are in any way unique or rare, though, so I'll send you the ROM markings first---you can check if they're duplicates of boards you already have access to.

Cheers, Peter Monta

On the HP microcode reader / microcode preservation project

*Message #8 Posted by **Bernhard** on 27 June 2005, 1:31 p.m.,*
in response to message #7 by Peter Monta

The current HP microcode reader emulates an ACT or CTC and generates "HP word cycles" by software running on an old 100 Mhz PC which I keep in my lab. Advantage: no delay loops needed, it is already slow enough ;-)

The software is written in C and debugged under Linux, then transported and recompiled on the DOS box.

The current hardware options are twofold:

For Woodstocks / Classics, desolder the ROM chips and plug one each into a simple

circuit providing power and level translators.

For Classics, desolder just the CTC and hook the reader to a few CTC pads and by microhooks, to a few holes on the main board. The mainboard itself provides the -12V/+6V power and the clock signal level translation.

The disadvantage is: some desoldering needed. But with professional tools and some skills, absolutely no traces need to be cut (I would never do such damage to any of my HPs) and after the chips are resoldered and in place again, and the board cleaned from flux residues, we still have a perfect HP mainboard without any damages.

For the Classics, desoldering the 16 pin ROM ceramic packages or the 10 pin TO cans proved to be too risky, so I reengineered the approach to desolder just the CTC. In the unlikely event that the CTC is damaged during the soldering process (i.e. heat and mechanical stress), a replacement CTC can be salvaged from lowly HP35s or 45s.

For Spice, I still don't have written any reader software. And I still lack a HP27 to see which logic / clock levels would be needed for these early NMOS HP chips.

This is work under progress. I have no doubt it will be of great benefit to the HP user community and schematics and software will be made available to the public domain in due time. First, I must have absolute confidence that the approaches and techniques chosen are sound and foolproof.

Volunteers may contact me under the email given above.

Regards, Bernhard

Re: HP-35 origonal 17 prototype?

*Message #9 Posted by **Frank Boehm** on 24 June 2005, 2:10 a.m.,*
in response to message #1 by patrick earhart

One of my prototype PCBs has no part# at all; the other two have part# "00035-60005" I think 60010 is "production quality" and not a prototype part, due to the early datecode (my prototype is about 7 weeks earlier) this is probably a V1 board.

41CV Processor/Memory Problem

*Message #1 Posted by **Howard Owen** on 23 June 2005, 12:18 p.m.*

I recently repaired corrosion damage in an HP-41CV I picked up on eBay. The calculator seems to work fine until I execute "SIZE 100". This is what I see when I do that right after an ON-CLX reset to MEMORY LOST. I get a delay before the calculator comes back. Switching to program mode, I see "00 REG 219" Pressing SST Gives me a long interval during which "01" is displayed in the *right* hand part of the display. Eventually, I get a program line. Continuing to press SST, I see successive lines, sometimes with long delays in between. Currently, I see the following program:

01 LN 02

02 LBL 01

03 RCL 12

04 LBL 03

04 DEG

06 LBL 07

07 .

08 CLS(sigma)

09 LBL 00

10 FRC

11 9

12 END

Doing "GTO.." results in a very quick "PACKING." Following this, the program listed above is still in memory, but the initial line has changed to another CLS(sigma).

The first line 01 is synthetic. 'LN 02' appears to be bytes 0x50 and 0x02. CLS is 0x70. There is a delay single stepping between lines 01 and 02 in the second form of the program. Clearly, the permenant .END. is missing on this machine after resizing.

This guy had a small crack in the lower left hand screw post. I decided not to mess with it since I hate removing the flexible connector and plastic frame from damaged posts. Can anyone venture an opinion whether the above symptoms could result only from a bad connection between the processor and keyboard PCBs? My guess is "No" because flexing the (fairly solid feeling) case doesn't effect the "program" I see, It sounds more like a bad RAM chip to me.

Any help and/or advice gratefully accepted.

Re: 41CV Processor/Memory Problem

*Message #2 Posted by **Howard Owen** on 23 June 2005, 2:57 p.m.,*
in response to message #1 by Howard Owen

The problem occurs at "SIZE 256" and not above, I've discovered. Nice power of two, that...

Re: 41CV Processor/Memory Problem

*Message #3 Posted by **Vieira, Luiz C. (Brazil)** on 23 June 2005, 10:15 p.m.,*
in response to message #2 by Howard Owen

Hi, Howard;

I consider that you have a full-nut HP41CV from now on. Is that valid?

The HP41CV main memory is divided in five blocks of (64x7) bytes, or 64 registers each. There is always a 1-register low counting, as you can see in the maximum 00 REG 319 (320 = 64 X 5). This is because of the permanent 3-byte .END., and you can check this by setting SIZE [319] and adding at least four [ENTER^] instructions (or any other 1-byte) prior to read PACKING and TRY AGAIN.

Now that you mention that you do not have troubles when executing [SIZE] 256 till [SIZE] 319, I'd guess your HP41CV has a problem with one (or some) of the lower-addressed RAM chip (maybe uper-addressed, I'm not sure right now). Have you noticed if you also have strange contents in the upper numbered registers? I mean, after executing [SIZE] 319, what do you have with 254 [RCL][IND]X, 255 [RCL][IND]X, 256 [RCL][IND]X... Chances are you'll get weird results, though.

If you have an available 41CV (fullnut) to donate parts, you could try replacing some of the RAM chips. I have an halfnut HP41CV that ony reads 64 registers, and anytime I load a program on it (keystrokes, card reader, etc.) it has bytes being changed after the first execution. I succeeded building its mainboard in an HP41C fullnut case, so I have one of each: full- and half-nut 41C, CV and CX, altough the HP41C halfnut is, in fact, a deffective HP41CV. Because the RAM, ROM and display driver are all located in the hybrid board in the LCD assembly, there are no chances to try repairing it... (sob!)

I hope you succeed. Let us know if you need guidance.

Luiz (Brazil)

Re: 41CV Processor/Memory Problem

*Message #4 Posted by **Howard Owen** on 24 June 2005, 12:06 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Thanks for your detailed reply, Luiz. It confirms my suspicion that this is a RAM problem.

Yes, the calculator is a "full-nut" 41-CV. It's the only CV I own. I have a fully functional CX and several scrap 41Cs. presumably none of those can provide replacement RAM chips.

I ran the following program at SIZE 315, which resulted in 0 free registers.

01 0.314

02 LBL 00

03 STO IND X

04 RCL IND X

05 X!=Y?

06 XEQ 01

07 STO Y

08 INT

09 VIEW X

10 X<>Y

11 ISG X

12 GTO 00

13 STOP

14 LBL 01

15 TONE 9

16 STOP

17 RTN

I never heard the beep when I ran this.

Re: 41CV Processor/Memory Problem

*Message #5 Posted by **Meindert Kuipers** on 24 June 2005, 2:55 a.m.,*
in response to message #4 by Howard Owen

If this is indeed a memory problem, then it might be solved by a future firmware version of the MLDL2000. Support for User Registers is planned as a feature (which can be upgraded by the user of course).

Meindert

Re: 41CV Processor/Memory Problem

*Message #6 Posted by **Howard Owen** on 24 June 2005, 10:02 a.m.,*
in response to message #5 by Meindert Kuipers

That would be *cool*.

It would also be an extremely useful diagnostic tool to be able to mask out or page portions of user memory. Add that to the capability of loading the service module, and you have a very

handy addition to the calculator repairman's toolkit!

Re: 41CV Processor/Memory Problem

*Message #7 Posted by **Meindert Kuipers** on 24 June 2005, 10:33 a.m.,*
in response to message #6 by Howard Owen

The Service Module should work in the MLDL2000 as it is, but I have not tested it. Some tests will fail since the Service Module is reported to have additional hardware.

Meindert

Re: 41CV Processor/Memory Problem

*Message #8 Posted by **Howard Owen** on 24 June 2005, 11:31 a.m.,*
in response to message #7 by Meindert Kuipers

Well, it should at least be interesting to see what doesn't work.

Are there any known surviving service modules out there? I imagine HP made a few over the years, but not nearly as many as the consumer modules.

Re: 41CV Processor/Memory Problem

*Message #9 Posted by **Eric Smith** on 24 June 2005, 7:58 p.m.,*
in response to message #7 by Meindert Kuipers

> Quote:
>
> Some tests will fail since the Service Module is reported to have additional hardware.

The module is just a ROM hard-addressed at 0x4000. There are tests that will fail without additional hardware, but that hardware isn't part of the service module. See the service manual for more information.

Re: 41CV Processor/Memory Problem

*Message #10 Posted by **Meindert Kuipers** on 25 June 2005, 7:34 a.m.,*
in response to message #9 by Eric Smith

I have just tested the Service Module, and it works fine in the MLDL2000, all tests seem to run just OK. Due to bank switching the Service Module has to be put in all 4 banks of Page 4.

I was mistaken by the Service Manual, there are some tests that require measurement of the current and somehow I was under the impression that the Service Module would measure voltage.

Meindert

Re: 41CV Processor/Memory Problem

*Message #11 Posted by **Eric Smith** on 24 June 2005, 7:56 p.m.,*
in response to message #5 by Meindert Kuipers

How would that work? Bad RAM chips generally still drive the bus when they are addressed; they just drive the wrong data. So adding an external device is unlikely to fix it, unless you also remove the bad chip.

Re: 41CV Processor/Memory Problem

*Message #12 Posted by **Meindert Kuipers** on 25 June 2005, 7:30 a.m.,*
in response to message #11 by Eric Smith

Unsoldering the bad chips is the best, but it depends on which part of the chip is failing. If the RAM IC fails to decode the address, it will not drive the bus.

Meindert

Oops! Wrong procedure of mine...(was: 41CV Processor/Memory Problem)

*Message #13 Posted by **Vieira, Luiz C. (Brazil)** on 24 June 2005, 6:55 a.m.,*
in response to message #3 by Vieira, Luiz C. (Brazil)

Hi, Howard;

I thought about one thing and wrote another...

Please, read:

> Quote:
>
> ... after executing [SIZE] 000, what do you have with 254 [RCL][IND]X, 255 [RCL][IND]X, 256 [RCL][IND]X...

instead of:

> Quote:
>
> after executing [SIZE] 319, what do you have with 254 [RCL][IND]X, 255 [RCL][IND]X, 256 [RCL][IND]X...

I read it now and I see the stupid instruction of mine... If you execute SIZE 319, there will be no registers to test. You mentioned it clearly, I just messed the nubers up.

Sorry!

Luiz (Brazil)

Re: Oops! Wrong procedure of mine...(was: 41CV Processor/Memory Problem)

*Message #14 Posted by **Howard Owen** on 24 June 2005, 11:26 a.m.,*
in response to message #13 by Vieira, Luiz C. (Brazil)

No problem, Luiz. We all make mistakes (see my note to JF below) and that one was minor. I appreciate your help.

*Message #15 Posted by **J-F Garnier** on 24 June 2005, 6:59 a.m.,*
in response to message #1 by Howard Owen

I wonder what is this "LN 02 synthetic line". I can't see any way for the HP-41 to generate it. Are you sure of this?

J-F

Re: 41CV Processor/Memory Problem

*Message #16 Posted by **Howard Owen** on 24 June 2005, 9:55 a.m.,*
in response to message #15 by J-F Garnier

You're right, Jeff. Thanks for pointing that out.

I think I merged the second line number with the first instruction while editing my post without noticing it. When I saw it later, I had already done GTO.. so the first instruction on the calculator had changed to CLS. I just rationalized my way into describing an impossible synthetic instruction. 8)

The first line is '01 LN' not '01 LN 02'. I have just reverified that GTO.. does change the first instruction to CLS. But now that makes better sense in bit flipping terms. We go from 0101 0000 to 0111 0000 without adding any bytes.

HP-27s Emulator Question

*Message #1 Posted by **carey** on 23 June 2005, 7:58 a.m.*

Hi,

I am attempting to dump the rom from either of my two hp27s calculators for use in EMU42 using Christoph Giesselink's dump assembler program contained in the pioneer text file within the CPROMUPL archive. However, both calculators freeze and I have to exit the memory scanner.

I have succeeded in accessing the resident memory scanner, navigating to address #52000, entering the assembly program, returning to address #52000, and pressing the period (.) key to execute the program. I was careful to find the rom revision of each calculator (one is A, the other is B) and make the necessary modification of one line of code for each rom version. I have double-checked my typing for each of the four times I have tried but may still be making a silly mistake.

I was wondering if anyone has succeeded in dumping the rom for an hp27s using this program. If so, it will encourage me to keep trying!

Thanks,

Carey

Site dedicated to the 9825

*Message #1 Posted by **Vassilis Prevelakis** on 23 June 2005, 1:45 a.m.*

I came across (by accident) a site that is devoted to the 9825 calculator (http://www.hp9825.com).

Although incomplete (the actual 9825 pages appear to be missing), it contains a very informative and extensive history of HP up to the introduction of the 9825. I am sure that the site's curator (Steve Leibson) will continue to add to the material.

I found very charming the item about Bill Hewlett's involvement in the 9100 project. He specified the 9100's dimensions by asking his product engineers to built a calculator that would fit on a pull-out typing stand built into his wooden work desk. When the 9100 protype was finished, the engineers tried to fit it in Bill's desk, but it would not fit. Since Hewlett was not present, they fixed the desk, by asking a shop carpenter to enlarge the opening.

Another item I found really amusing was the TI fighter going after the HP-ship cartoon:

http://www.hp9825.com/assets/images/db_images/db_TI_Fighters3.jpg

in response to message #6 by marais

The domain is registered to a Steven Leibson, see http://www.networksolutions.com/en_US/whois/index.jhtml for his email address and additional information.

Re: Site dedicated to the 9825

*Message #8 Posted by **Vassilis Prevelakis** on 24 June 2005, 6:31 p.m.,*
in response to message #4 by marais

Steve Leibson (the author of the web site), was an HP employee involved in the design of HPL (the 9825 language).

He also authored a series of BYTE articles on I/O. HP reprinted these articles.

He was editor-in-chief of the Microprocessor Report, EDN Magazine, and the Embedded Developer's Journal.

Currently he is "Technology Evangelist" for Tensilica, a company making high-end embedded processors (e.g. for switches, graphics cards, etc).

Thanks for the kind words about my site. It's definitely not finished yet, although I've gone about 3 months without updating it. My next steps are to finish documenting generation 2 of HP's desktop calculators (9810/20/21/30) and then to move on to the actual meat of the site: the 9825. I joined HP's Calculator Products Division in Loveland, Colorado in 1975 because I was completely bowled over by the HP 9830. I spent my first 5 years as an engineer at HP in Colorado. It was great work. What you see on my site is a tribute to the people I worked for and with. You can also thank Bill Hicks and this site, for the inspitation it gave me to create my own site.

Question

*Message #1 Posted by **Juan J** on 22 June 2005, 10:58 p.m.*

I have been busy lately, doing things here and there and traveling often. Thankfully, I've managed to lurk around the Forum.

After a while postponing, I finally moved from calculators to a PDA, namely an HP Jornada 690. A nice machine that avoids carrying a bulky laptop around. And the calculator collection can safely remain at home, away from wear and tear. It is even possible to dispense with the notebook, since the handy keyboard makes taking notes easy.

I like the built-in applications. There is even an RPN calculator. However, it is not as functional as a good old HP. Is there a good emulator, like V41, available for the Jornada 690?

Thanks in advance.

HP emulator for Jornada 690?

I don't have an answer for you. But may I suggest that next time you post with a more informative subject line, such as this one. This would save time for others who cruise the site.

Good luck.

Hi,

please take a look at the 'Calculator Simulations' page:

http://www.hpmuseum.org/simulate/simulate.htm

Raymond
